The Eastern changes, perhaps initiated by Heraclius, but probably due mainly to Constans II., did not interfere with the civil administration, except in so far as its heads were subordinated to the military commanders. But Leo III., who as a great administrative reformer ranks with Augustus and Diocletian, did away with the old system altogether. (3) Reversing Diocletian's principle, he combined military and civil powers in the same hands. The strategos or military commander became also a civil governor; his higher officers (tur- marchs) were likewise civil functionaries. (2) The scalar principle disappeared, including both the vicars and the praetorian prefect of the East (some of whose functions were merged in those of the prefect of the city); no authority interpolated between the strategoi and the emperor. (3) The new provinces, which were called themes (the name marks their military origin: thema = corps), resembled in size the provinces of Augustus, each including several of the Diocletian divisions. This third and last provincial reform has, like its predecessors, its own history. The list of themes in the 11th century is very different from that of the 8th. The changes were in one direction—the reduction of large provinces by cutting off parts to form smaller themes, a repetition of the process which reduced the provinces of Augustus. Hence the themes came to vary greatly in size and importance. Leo himself began the process of breaking up the large themes into smaller ones, the themes (Anatolic and Thracian). The principle of splitting up was carried out systematically by Leo VI. (who was also responsible for a new ecclesiastical division of the Empire).

It is interesting to note that, up to Leo VI. the district between Constantinople and the wall of Anastasius formed a separate theme or government, entitled the Wall (τὰ ἐπεπλωταία) or the Ditch (τὸ ἐπετείχος); Leo VI. united it with the theme of Thrace.

In the central administration, the general principles seem to have remained unchanged; the heads of the great administrative bureaux in Constantinople retain the palatine character which was customary to most of them from the beginning. But there were many changes in these offices, in their nomenclature and the delimitation of their functions. There are great differences between the administrative corps in the 5th, in the 10th and in the 15th centuries. We can hardly be wrong in conjecturing that, along with his provincial reform, Leo III. made a re-arrangement of the central bureaux; the abolition of the Praetorian Prefecture of the East entailed, in itself, modifications. But minor changes were continually being made, and we may note the following tendencies: (1) Increase in the number of ministers directly responsible to the emperor, (2) subordinate offices in the bureaux being raised to the rank
of independent ministries; (b) new offices being created and old ones becoming merely titular. (2) Changes in nomenclature; substitution of Greek for Latin titles. (3) Changes in the relative importance and rank of the high officials, both civil and military.

The Prefect of the City (ταχυρότης) controlled the police organization and administration of justice in the capital; he was vice-president of the imperial court of justice, and, when the office of Prefect of the East was abolished, he inherited the functions of that dignity as judge of appeals from the provinces. But the praefectus vigilium, commander of the city guards, who was subordinate to him, became an independent officer, entitled Drungary of the Watch, and in the 11th century superseded him as vice-president of the imperial court. We are told that in the last years of the Empire the Prefect of the City had no functions at all, but his office survives in the Shehr-imamati, "city prefecture," of the Ottomans, in whose organization there are many traces of Byzantine influence.

Instead of the Questor of the Sacred Palace, whose duty was to draft the imperial laws and rescripts, we find in the 9th century a questor who possesses certain judicial and police functions and is far lower in the hierarchy of rank. It has been supposed that the later questor really inherited the duties of another officer, the quaesitor, who was instituted by Justinian. In the latest period the quaesitor, if he still existed as a name, had no functions.

The Master of Offices, who supervised the bureaux in the palace and was master of court ceremonies, also performed many functions of a minister of foreign affairs, was head of the imperial post ( cursus), and of the corps of agents in rebus or Imperial Messengers. This ministry disappeared, probably in the 8th century, but the title was retained as a dignity at all events till the end of the 9th. The most important functions, pertaining to foreign affairs, were henceforward performed by the Logothete of the Post ( λογοθήτης τοῦ βόρειον). In the 11th century this minister was virtually the chancellor of the Empire; his title was changed to that of Great Logothete by Andronicus II.

The two financial ministers, came sacrarum largitionis et commerciorum, continued to the end under the titles λογοθήτης τοῦ γενναβίου (General Logothete) and δέ έτι τοῦ ιδίου (Anastasius added a third, the Count of the Sacred Patrimony, but he was afterwards suppressed). But in the 9th century we find both these ministers inferior in rank to the Sacellarius, or private pursekeeper of the emperor. Besides these there was a fourth important financial department, that of the military treasury, under a Logothete.

The employment of eunuchs as high ministers of state was a feature of the Byzantine Empire from the end of the 4th century. It is laid down as a principle ( A.D. 900) that all offices are open to them, except the Prefecture of the City, the quaestorship, and the military posts which were held by "Domestics." There were then eight high posts which could only be held by eunuchs, of which the chief were the parakaimomenos and the protovestiaries ( master of the wardrobe).

An emperor who had not the brains or energy to direct the affairs of the state himself, necessarily committed the task of guiding the helm to some particular minister or court dignitary who had gained his confidence. Such a position of power was usually outside the constitution, and was not associated with any particular office; it might be held by an ecclesiastic or a eunuch; it had been held by the eunuchs Evropius and Chrystaphius in the reigns of Arcadius and Theodosius II. respectively. In later times, such a first minister came to be denoted by a technical term, οἱ παράκαιμοις. This was the position, for instance, of Stylianos, the father-in-law of Leo VI. Most of the emperors between Basil II. and Alexius Comnenus were under the influence of such ministers.

The orders of rank (which must be distinguished from titles of office) were considerably increased in later times. In the 4th and 7th centuries there were the three great classes of the illustres, spectabiles and clarissimi; and above the illustres a small, higher class of patricians. In the 9th century we find an entirely different system; the number of classes being largely augmented, and the nomenclature different. Instead of epithets like illustres, the names are titles which had designated offices; - the names "patrician" alone survives. The highest rank is now (1) the machine of already extinct patricians, (2) respectable patricians, (3) respectable patricians with offices; below these (4) protospaharisthai; (5) dassypotai (= bis consules); (6) spatharokandidati; (7) spatharistoi; and other lower ranks. Different ranks do not seem to have been invariable, attached to particular offices. The strategoi of the Anatolian Theme, e.g., might be a patrician or only a protospatharisthai. Whose rank was demoted from one of these ranks received its insignia from the emperor's hand, and had to pay fixed fees to various offices, especially to the palace eunuchs.

In the provinces ordinary justice was administered by judges (κρατάρχοι) who were distinct from the governors of the themes, and inherited their functions from the old provincial governors of Diocletian's system. In Constantinople higher and lower courts of justice sat regularly and frequently. The higher tribunals were those of the Prefect and the Quaestor, before whom different kinds of cases were tried. When the emperor reached the throne through the bureau of Petitions ( τοῦ βενεροποτοί), he might deal with the case immediately; or might refer it to the imperial court, of appeal, of which he was president; or else to the special court of the Twelve Divine Judges (θεία δικαιουρία), which was instituted by Justinian.

While the administration of justice was one of the best features of the Eastern Empire, its fiscal system, likewise inherited from the early Empire, was one of its worst. If the government had been acquainted with the principles of public economy, which have not been studied till comparatively recent times, a larger revenue might have been raised without injuring the prosperity of the inhabitants. Taxes were injudiciously imposed and oppressively collected. The commerce of the Empire was one of its great sources of strength, but the government looked on the merchants as a class from which the utmost should be extorted. The chief source of revenue was the land. The main burdens which fell upon the landed proprietors throughout the whole period were the land tax proper and the annona. The land tax ( capitatio terrae = the old tributum of the imperial, stipendium of the senatorial, provinces) was based, not on the yearly produce, but on the capital of the proprietor, the character and value of the land being taken into account. In later times this seems to have become the καρκοσ, or earthy tax. The annona was an additional impost supporting the army and imperial officials; it was originally paid in produce. In later times, we meet it under the name of στρωματία or ανανώρ. The province was divided into fiscal districts, and the total revenue to be derived from each was entered in a book of assessment. The assessment was in early times revised every fifteen years (the "indiction" period), but subsequently such revisions seem to have been very irregular. The collection of the taxes was managed through the curial system, while it lasted (till 7th century). The decurions, or municipal councillors, of the province in each district were responsible for collecting and delivering the whole amount, and had to make good the sums owed by defaulters. This system of collective responsibility pressed very heavily on the decurions, and helped to cause their decay in the Western Empire. After the abolition of the curial organization, the principle of collective responsibility remained in the form of the επιρρήμα or additional charge; that is, if a property was left without an owner, the taxes for which it was liable became an extra charge on the other members of the district ( επιρρήμα). The taxes were collected by prakriores, who were under the General Logothete. The peasant proprietors were also liable to burdens of other kinds ( corvées), of which the most important was the furnishing of horses, wheeled vehicles, posts, &c., for the state post (see ΑΝΑΓΙΑ).

The history of landed property and agrarian conditions in the Eastern Empire still awaits a thorough examination. It may be noted that individual hereditary proprietorship was always the rule (on crown and church lands as well as private), and that the commonly supposed extensive existence of communities possessing land in common is based on erroneous interpretation of documents. When imperial lands were granted to monasteries or as feoffe ( seniones) to individuals, the possession and rights of the peasant proprietors on the estates were not changed, but in many
cases the imposts were paid to the new master instead of to the
fisc. In the 4th, 5th and 6th centuries the cultivators were attached
to the soil (colonii, ascriptiici; see SERFDOM), in the interests of the
fiscus: it has been supposed, on insufficient grounds, that this
serfdom was abolished for a time by Leo III., though it is probable
that the condition of the peasants was largely changed by the
invasions of the 7th century. In any case the system of compulsory
attachment of peasants to their lands remained in force, and the
classes of abscissa (fossae agrorum) existed till the latest times.
The chief sources for agrarian conditions are, besides the imperial laws,
monastic records, among which may be mentioned as specially
valuable those of the Monastery of Lembei near Smyrna.

Army and Navy.—The general principle of the military
defence of the army was the same. The forces stationed in large
forces on the frontiers, and reserve forces stationed in the
interior provinces, which could be moved to any point
that was in danger. Thus the army was composed of (1) the
limitanei, frontier-troops (under duces), and (2) reserve forces
(under magistri militum) of two denominations, (a) palatini
and (b) comitatenses. The limitanei were the more numerous;
it has been estimated that if they numbered about 350,000,
the comitatuses and palatini together amounted to less than
200,000. It is to be noted that for the old legion of 6000 men
a smaller legion of 1000 had been substituted, and that the propor-
tion of cavalry to infantry was small. In the 6th century
the army of the West was divided into two parts: but the
army had become a much more important branch of the
service, and in the wars of Belisarius the foederati, barbarian
mercenaries of various races, commanded by their own chieftains,
payed a great rôle. The peasants of Illyria and Thrace, the
mountaineers of southern Asia Minor still supply an important
part of the army, but the number of barbarians (Heruli, Van-
dals, Goths, Slavs, Arabs, &c.) is much larger. Solidity and
a corresponding want of mobility characterized at this time
both cavalry and infantry; their great merit was straight
and rapid shooting: Belisarius ascribed his success in Italy to the
comparative inferiority of the great mercenary (not more than 25,000)
the first conquest of Italy was
achieved, though Belisarius was far from being a military genius
and the discipline in his army was flagrantly defective.

Frontier Defence.—Justinian carried out on the frontiers and
in the exposed provinces a carefully devised and expensive system
of defensive works. Fortified towns along the shores were connected
by lines of forts, and behind were a line of more important fortresses more strongly garrisoned, which
furnished both a second barrier and places of refuge for the inhabi-

tants of the open country. There was an elaborate system of
signalling and of watch-towers. This system included not
only the imminence of a hostile invasion, but the number
and character of the enemy. In North Africa there are abundant
remains of the forts of the 6th and 7th centuries, displaying the
military system typical of the period from the 5th to the 7th century.
The typical fortress had three defences: the wall flanked by square
towers of three stories; at a few yards’ distance a second wall of
stone; and outside a deep fosse about 20 yds. wide, with vertical
sides, filled with water, and along its edge a rampart of earth.
We have already seen how the disasters and losses of the 7th
century led to a radical change in the military organization, and
how the Empire was divided into themes. The preponderant
influence which Asia Minor won and retained till the 11th century
is reflected in the military establishment, which mainly depended
on the Asiatic provinces. The stragioi of a large theme commanded
a considerable force, and their system of despatch. The Byzantine
system of command has a remarkable resemblance to the organization
of some of the armies of modern Europe.

The recorded scheme was probably not uniform in all the themes,
and varied at different periods. The Thirmoi (corps) consisted of
2 turma (brigades) under turmanchii; the turma of 5 banda
(regiments), each under a drangarios (colonel); the banda of 5 peri-
dokshis (companies) under a kontarchoi (captain); the
kontarchoi were divided into 8 subdivisions under pentekontarchoi
(lieutenants); there was a further unit of ten men under the
dekurkh (corporal). The total strength in the 9th century was
10,000 men, and in the 11th it was 15,000. The troops of the
army, under the command of the great military officer, the
commander, and be often entrusted it to the Domestic. In the
11th century, after the conquest of Bulgaria, there were two
Domestics, one for the east and one for the west, and under
Alexius Comnenus the Domestic of the west received the title
Great Domestic. Under the Palaeologi the Great Domestic was superior
in rank to all other ministers.

Besides the Scholae, and the Excerptores (who had been
organized in the 5th century), there were the regiments of the
Patricians (Armenii, Nubii, and others), and the numerous
foot-soldiers. The Optomatoi, also infantry, properly belonged
to the same category, though they were constituted as a theme. It
is curious to observe that the demes or corporations of Constantinople
were partly organized as militia, and were available for purposes of
defence.

The great difference between this Byzantine army and that of
the Visigothic Empire is the difference which separates the feudal
armies (of the West) lay entirely in cavalry, which the successive
Heraclius and the Isaurian emperors developed to great perfection.
The few contingents of foot were quite subsidiary. The army
it against infantry; and a class of magistrut staff-officer
in the 6th century; it was maintained in Asia Minor, which was the great
recruiting ground, by a system of military holdings of land (an
extension of the old Roman system of assigning lands in the frontier
provinces, inscribed with obscure Runes-characters, carved on
the marauding expeditions and guerilla warfare, continuously
carried on against and by the Saracens in the 8th, 9th and 10th centuries,
were carefully studied by generals and tacticians, and
and the theory of warfare. The theme was composed
by the emperor Nicephorus Phocas, and edited by one of his
pupils. Every detail of an inroad into Saracen territory is regulated.
Defences, 9th and 10th centuries. In 859 an
approaching Saracen insurrection was announced to
Constantinople from the Cilician frontier. The news was flashed across Asia Minor
by eight beacon fires. The first beacon was at Lulon (which com-
manded the pass between Tana and the Cilician gates), the next
on Mt. Auxentus in Bithynia. When this fire appeared, a light
was kindled in the pharos of the imperial palace at
Constantinople. The system was discontinued in the reign of Michael III., probably
after the capture of Lulon by the enemy in 860, and was never
renewed, though Lulon was recovered in 877. It should be noted
that this famous telegraphic system was only an application
on a large scale of the frontier signalling referred to above.

In 680 Michael I. banished the Bulgars, and the
Jugurds, and the disorganization of the provinces which they did not acquire, seriously
weakened the army, and the emperors had recourse more and more to
mercenaries and barbarian auxiliaries. The employment of
Scandinavians had begun in the 10th century, and in 988
was formed the Varangian guard, consisting chiefly of English adventurers.
In the arsenal of Venice are two lions, which were transported
from the statue of Julius II. to that of Basil II., in which
it is possible to recognize the influence of the Empress Eudoxia,
and the emperor, who in the 10th century were the terror of the enemy.
The particular tactics of the various forces which they had to face
were critically studied. We have a series of military text-books,
written by the greatest masters of the time, which were
learned by heart and imparted to all the officers of the army.

The object of the Byzantine army was efficiency, and nowhere
is this more admirably shown than in the civilization of the
Empire to the contemporary states of the East. The
theory of military science was always studied and taught;
constant practice, interpreting and correcting theories, safeguarded
them against the decay of barbarism and the infiltration of
foreigners who had physical strength and no brains. The
object of a general good, as Leo VI. shows in his important treatise
on military tactics, was in his opinion not to win a great battle,
but to attain success without the risks and losses of a great battle.
The same author criticizes the military character of the Franks.

By no means to fearlessness, he points out their want of discipline,
their lack of military training, their eagerness to attack before the word was given, their want of faculty
for strategy or tactical combinations, their incapacity for operations
on difficult ground, the case in which they could be deceived
by sally or ambush, their moral weakness, and their incapacity
for leadership in the field. These criticisms, borne out by all we know of feudal warfare, illustrate the contrast between
a western host, with its three great "battles," rushing headlong
in mobs, and theByzantine army, which was a collection of small units, co-operating in perfect harmony, under a
commander who had been trained in military science, had a definite plan in his
head, and could rely on all his subordinates for strict and intelligent obedience.
Under the early Empire, as Rome had no rival in the Mediterranean, it was natural that the navy and naval policy should be neglected. When Constantine the Great decided to besiege Byzantium by sea, both he and his fleet were defeated. Even when the Vandals in Africa made fleets against the Byzantines, navy were not seriously addressed to building an efficient navy and securing their own coasts were seriously marred from time to time. Despite the efforts of the eastern fleets against Africa failed. And even when the Vandal power was in its decline and Belisarius set forth on his successful expedition of conquest, his fear for the safety of his fleet was acknowledged. Thus it was supposed that the fleet of the enemy was superior to the Roman. The conquest of Africa was secured for Justinian the undisputed command of the Mediterranean, but he did nothing for the navy, apparently because the time of conquest all the Mediterranean coasts, became a naval power that the Roman Empire was forced, in a struggle for its being, to organize an efficient fleet. This, as we saw, was the work of Constans II, and we saw what it accomplished. In this first period (c. 650–720) the naval forces, designated as the Karabianoi, were placed under the command of an admiral, with title of strategoi. They consisted of two geographical groups, one in the Adriatic, the province of the Cibyrrhaeoct (probably named from the smaller Cythera in Paphlagonia) which included the southern coast districts of Asia Minor, and the Aegean province, which embraced the provinces of the eastern coast of the Black Sea. The Adriatic was much more important; the marines of this province were the hardy descendants of the pirates, whose subjugation had taxed the resources of the Roman government in the last years of the Republic. A new policy or the imperial was to impose the charge of naval defence on the coast and island districts. Distinct from these fleets, and probably organized on a different principle, was the naval contingent stationed at Constantinople. Leo III, changed the administrative system, abolishing the supreme Commodore, and making the Cibyrrhaeoct and Aegean provinces separate independent themes under strategoi. The change was due to two motives. There was a desire on the part of the government that the local units should be more powerful (indicated in the political role played by the navy before Leo's accession); but apart from this, the general reform of Leo, which united civil and military powers in the same hands, naturally placed the charge of the navy under the hands of the two supreme officers, making footing, by making them provincial governors. In this and the following reigns, the tendency was to neglect the fleet; the interest of the government was concentrated on the armed forces. In the case of this the weapon was lost in the hands, since the Omayyad dynasty was growing weak, and then under the Abbasids, who this transferred the capital from Damascus to Baghdad, the sea-power of the caliphate declined. But the neglect of the fleet was avenged in the 8th century, when Crete and Sicily were wrested from the Empire, the loss of south Italy was imminent, and Moslem squadrons sailed in the Adriatic,—losses and dangers which led to a reorganisation of the navy under the new form. In a period of naval reformation we find the navy consisting of two main contingents; the empire fleet stationed at Constantinople, and the provincial fleets, three in number, of (1) Cibyrrhaeoct, (2) Aegean province, (3) two small, or a small, contingent was supplied by the Mardiotes who, natives of Mt. Lebanon, had been transplanted partly to Paphlagonia, partly to Euphris, the Ionian Islands, and Cyprus. The imperial fleet was to have consisted of about 100 warships manned by 25,000 marines (the same men fought and rowed); the provincial fleets of 77 warships manned by 17,000. When the fleets acted together, the admiral in supreme command for the time was called the "druagarios of the naval command." The warships (bophyrous, "dromonds") were mainly biremes, but there were also unequipped vessels for speed, called "galleyes" (γαλακίς). Pyrotechnic was an important department of the naval establishment. It was shown that Venice exacted commercial privileges which injured Byzantine commerce and opened the door to the preponderant influence of the Venetians in eastern trade. In the period of the Empire the naval power was still small, was not of importance which it possessed for the state is illustrated by the high rank at court which the admiral (who in the 11th century had received the title of Great Duke, μέγας δόκει) occupied; the only minister who of the admiral to the Great Domestic.

diplomacy.—In protecting the state against the barbarians who surrounded it, diplomacy was a weapon as important in the eyes of the Byzantine government as soldiers or fortifications. The peace on the frontier was maintained not only by strong military defences, but by more or less skilful management of the frontier peoples. In the later Empire this kind of diplomacy, which we may define as the science of managing the barbarians, was practised as a fine art; its full development was due to Justinian. Its methods fall under three general heads. (1) One people was kept in check by means of another. The imperial government fostered rivalry and hatred among them. Thus Justinian kept the Goths in check by the Normans, the Kuturgurs by the Utgers, the Huns by the Avars. (2) Subsidies were given to the peoples on the frontiers, in return for which they undertook to defend the frontier adjacent to them, and to supply fighting men when called upon to do so. The chiefs received honours and decorations. Thus the Berber chiefs on the African border received a staff of silver, encrusted with gold, a silver diadem, white cloak, embroidered tunic, &c. More important potentates were invested with a costlier dress. In these investitures precedence was carefully observed. The chiefs thus received a definite position in the Empire, and the rich robes, with the ceremony, appealed to their vanity. In some cases they were admitted to posts in the official hierarchy,—being created Patricians, Masters of soldiers, &c. They were extremely fond of such honours, and considered themselves half-Romans. Another mode of winning influence was to marry barbarian princes to Roman wives, and rear their sons in the luxury of the palace. Dissatisfied pretenders, defeated candidates for kingship, were welcomed at Constantinople. Thus there were generally some princes, thoroughly under Byzantine influence, who at a favourable opportunity could be imposed on their compatriots. Through-out Justinian's reign there was a constant influx of foreign potentates to Constantinople, and he overwhelmed them with attentions, pompous ceremonies and valuable presents. (3) Both these methods were already familiar to the Roman government, although Justinian employed them far more extensively and systematically than any of his predecessors. The third method was new and characteristic. The close connexion of religion and politics at Constantinople prepares us to find that Christian propaganda should go hand-in-hand with conquest, and that the missionary should co-operate with the soldier. The missionary proved an excellent agent. The typical procedure was this: In the army which was undertaking to convert, the missionary endeavours to gain the confidence of the king and influential persons, and makes it a special object to enlist the sympathies of the women. If the king hesitates, it is suggested that he should visit New Rome. The attraction of this idea is irresistible, and when he comes to the capital, the pomp of his reception, the honours shown him by the emperor, and the splendour of the religious ceremonies overcome his last scruples. Thenceforward imperial influence is predominant in his dominion; priests become his advisers; a bishop is consecrated, dependent on the patriarch of Constantinople; and the barbarians are transformed by the penetration of Byzantine ideas. By the application of these various means, Justinian established Roman influence in Nubia, Ethiopia and South Arabia, in the Caucasian regions, and on the coast of the Euxine. The conversion of the Lazi (of Colchis) was specially notable, and that of the Sabiri, who were politically important because they commanded the eastern part of the Caucasus known as the Caspian Gates. It will be observed that the great prestige of the Empire was one of the conditions of the success of this policy. The policy had, of course, its dangers, and was severely criticized by one of Justinian's contemporaries, the historian Procopius. Concessions encouraged greater demands; the riches of the Empire were revealed. It was a system, of course, which could not be permanently successful without military power behind it; but the course it was not infallible; but in principle it was well-founded, and proved of immeasurable value. Less prejudiced writers than Procopius may admit the far-sightedness and dexterity of the emperor in his diplomatic activity. A full account of it will be found in Diehl's Justinien.

In the 10th century we have again the means of observing how the government conducted its foreign policy on carefully
thought out principles. The Empire was then exposed to constant danger from Bulgaria, to inroads of the Magyars, and to attacks of the Russians. The key to the danger, was the cultivation of friendly relations with the Petchenegs, who did not recognize the provinces either by land or sea and could be incited to act against Russians, Bulgarians or Magyars. The system is explained in the treatise (known as De administrando imperio) composed by the emperor Constantine Porphyrogennetos (c. 950). The series of these northern states was completed by the kingdom of the Khazars (between the Caucasus and the Don), with which the Empire had been in relation since the time of Heraclius, who, to win its co-operation against Persia, promised his daughter in marriage to the king. Afterwards the Khazars gave envoys to New Rome (the wives of Justinian II. and Constantine V.). Their almost civilized state, skirted skillfully between the contending influences of Islam and Christianity, and its kings adopted the curious means of avoiding suspicion of partiality for either creed by embracing the neutral religion of the Jews. Commercial and political relations with the Khazars were maintained through the important outpost of the Empire at Cherson in the Crimea, which had been allowed to retain its republican constitution under a president (spareao) and municipal board (buxares), though this freedom was limited by the appointment of a strategos in 933, a mode of which the Khazars were seriously threatened by the Petchenegs. They feared from the Khazars was an attack upon Cherson, and it seems probable that the Khazar was a leading consideration with Leo III. when he wedded his son Constantine V. to a Khazar princess. In the 6th century it was an object of the government to maintain the Khazars (whose army consisted mainly of mercenaries) against the Petchenegs; and hence, if it should become necessary to hold the Khazars in check, the principle was to incite against them not the Petchenegs, but other less powerful neighbours, the Alans of the Caucasus, and the people of “Black Bulgaria” on the volga (a state which survived till the Mongol conquest of 1237).

For this systematic diplomacy it was necessary to collect information about the peoples whom it concerned. The ambassadors sent to the homes of barbarous peoples reported everything of interest they could discover. We owe to Priscus a famous graphic account of the embassy which he accompanied to the court of Attila. We possess an account of an embassy sent to the Turks in Central Asia in the second half of the 6th century, derived from an official report. Peter the Patrician in Justinian’s reign drew up careful reports of his embassies to the Persian court. When foreign envoys came to Constantinople, information was elicited from them as to the history, and domestic politics of their own countries. It can be shown that some of the accounts of the history and customs of neighbouring peoples, stored in the treatise of Constantine Porphyrogennetos referred to above (furnishing numerous facts not to be found anywhere else), were derived from barbarian ambassadors who visited Constantinople, and taken down by the imperial secretaries. We may conjecture with some probability that the famous system of the Relazioni, which the Venetian government required from its ambassadors, goes back originally to Byzantine influence.

Jahrhunderts (1885); Paparrhegopolus, Ιστορία των Βυζαντινών θρόνων (5 vols., 2nd ed., 1887–88); Omer, The Byzantine Empire (1892) (a popular sketch); Geiger, Abriß der byzantinischen Kaiserregierungen, in Krambacher’s Geschichte der byzantinischen Literatur (1887) (a summary but original outline). 2. Works dealing with special periods, or branches of the subject: Schiller, Geschichte der byzantinischen Literatur (vols. I., II., 1847); Tschermak-Estenfeld the Great); Hodgkin, Italy and her Invaders (8 vols., 1879–99) (to A.D. 800); Bury, History of the Later Roman Empire, A.D. 395–800 (2 vols., 1807); Diehl, Justinien (1901); Diehl, L’Afrique byzantine (1896); Pernice, L’Imperatore Eracio (1905); Rambaud, L’Empire grec au début du siècle (1670); Schumacher, Nécéphore Phocas (vols. 1. and 2. (Édouard yon de Sacy, 1884), H. H. Adam, Le Sekt. (vol. I., 1876); J. H. Neumann, Die Weltstellung des byzantinischen Reiches vor den Kreuzzügen (1894); Melakeses, ‘Istoria των Βυζαντινων (c. 1100); Nicolae cel mai revoluţionar cu Hrelov (1898); Gerlad, Geschichte des lateinischen Kaiserreiches von Constantiopol (part 1., 1893); Fallmerayer, Geschichte des Kaiserreiches des Mevlevi-Papsttum und Byzanz (1903); Pears, The Fall of Constantinople, being the story of the Fourth Crusade (1885), and The Destruction of the Greek Empire (1903).
and the index. The tenth and last volume was issued in 1861.

After Romanin's death his lectures on Venetian history were published in two volumes (Florence, 1875). Among his minor works we may mention: Gli Inquisitori di Stato di Venezia (Venice, 1858), Bajamonte Tiepolo e le sue ultime vicende (Venice, 1851), and Venezia nel 1790 (Venice, 1860).

ROMAN LAW.1 The term "Roman law" is indefinite and ambiguous, being used in more than one sense. First, in a wide sense, it comprehends the totality of the laws of the Roman state, which were observed by its subjects during about thirteen centuries, from Romulus to Justinian. In a second and stricter meaning it indicates the law as consolidated by Justinian or, in other words, the law contained in the Corpus Juris Civilis, which is the name that has been given since the 16th century to Justinian's legislocative works as a whole, and distinguishes them from the Corpus Juris Canonici. In this accretion it is equivalent to, and is often called, "civil law" as contrasted with canon law. In a third and loose sense Roman law means the law, in addition to the Corpus Juris, the inscriptions of it after Justinian by medieval and modern courts, jurists and commentators adapting it to the customs and laws of their own countries and times. The German expression, for example, moderner (or heutiger) römisches Recht, indicates the Roman law as it was applied in Germany in modern times. Such medieval and modern interpretation, however, is also sometimes expressed, in English usage at least, by the term "civil law" as contrasted with native or common law; writers in this field being usually styled civilians rather than Romanists. It is to the Roman law in the broad sense of the above-mentioned three significations that the present article is devoted.

To give a proper sketch of Roman law it must be treated historically. Nearly all systems of positive law are the product of more or less of an historic development, but the Roman law has this great advantage over other systems, that it was at all times a homogeneous body complete in itself. For the Romans were comparatively little indebted to other peoples for their jurisprudence, and, when they did borrow legal ideas and institutions from others, they generally transformed or modified these in adapting them to their own native system, so that they became substantially Roman. Moreover, the various stages of the progress of the law from its genesis to its maturity and ultimate consolidation can be traced in unbroken continuity. Beginning in 753 B.C., the traditionally accepted date of the foundation of Rome, it continued its course till the death of Justinian in A.D. 565. Allowing for the first three centuries without historic evidence, we have at least an authenticated evolution of about 1000 years. Of no other system of law, ancient or modern, can anything like the same thing be said.

As to the proper method of historic treatise there have been different opinions. Without going into these, it is enough to say that the subject may be treated from two sides, viz. on the one side in relation to the external sources of the law, including therein the political and social conditions and the various constitutional changes at different periods affecting the development of the law, as well as the modes in which the law manifested itself and the legal literature from which our knowledge of it is derived; on the other side it may be treated in relation to the several departments or institutions of the law in view of their development or changes through time or circumstance, such as marriage, slavery, property, and so forth. This corresponds to what Lehnnitz described as external and internal history respectively, terms which are now rather out of vogue. Of course it is possible to treat the historic sources of the law, constitutional and literary, independently of the doctrines, and this is now often done; but unless both are discussed the field of Roman law is not covered. Both the external and the

1 This article represents a recap of the article contributed to the 9th edition of the Encyclopaedia by the late Professor Muirhead. A large part of that article has been retained by the present writer, and the plan of arrangement, though altered in some respects, has been adhered to in the main.

2 See as to historic epochs Muirhead, Hist. Intro. to the Laws of Rome (2nd ed. by Good, 1899), p. 421.

3 See Muirhead, Historical Introduction (2nd ed., 1899), pp. 3-5, and authorities there cited.

4 Some writers deny the existence of the tribes altogether, but this goes too far. See Brunel-Lent in Holtzendorff's Encyklopaedie d. Rechtswissenschaft, i. p. 86.
institutions attributed to the Sabines and Etruscans were, as Mommssen and others have shown, common to all peoples of Greek-Italian stock, and could not be strange to the Latins. We must hold that the Romans were essentially a Latin race, though influenced by a considerable admixture with Sabine and, to a lesser degree, Etruscan races (see Rome).

Patricians, Clients and Plebeians.—But whatever their ethnographic descent, it is pretty certain that the Roman civilisation was in the earliest period an organization that was essentially patriarchal in its essence, but in which there was to be distinguished, on the one hand, a dominant class enjoying all the rights of citizenship, and, on the other, a semi-servile or quasi-vassal class excluded from such rights. The former class were called patricii or Quirites; the latter were called clientes and (later) plebeii.

Patricians.—There was part of the law of Rome that even in the Empire was known by the name of jus Quiritium, and this in the regal period was the only law. The patricians at first were the Quirites, and prior at least to the time of Servius Tullius they alone enjoyed rights under this law. From their number the council of elders was selected; they alone could take part in the curiate comitia; they alone could contract a lawful marriage and make a testament; in a word, all the peculiar institutions of early Rome were for their benefit alone.

But these rights and prerogatives they enjoyed as members of gentes or clans, the clans being aggregations of families bearing a common name and theoretically at least tracing their descent from a common ancestor. These clans, of which there were normally three hundred altogether according to a rather doubtful tradition, were organized constitutionally in curies. Of the curies, again, there were thirty in all, there being probably ten in each of the three tribes, organized primarily for military and secondarily for political and religious purposes. Though for the federation of the curiae and gentes Rome required a common ruler and common institutions, religious, military and political, yet it was long before such federation into a state displaced entirely the separate institutions of the several gentes. Every clan had its own cult peculiar to its own members. It had its common property and its common burial-place. It probably had some common council or assembly, for we read not only of special gentile customs, but of gentile statutes and decrees. Tradition records instances of wars waged by individual gentes, indicating that they had the right to require military service alike from their members and dependants. Widows and orphans of deceased clansmen were under the guardianship of the gens or of some particular member of it to whom the trust was specially confided. If a clansman left no descendants, his property passed to his fellow-gentiles. Finally, its members were always entitled to rely upon its assistance, to have maintenance when indigent, to be ransomed from captivity, and to be avenged when killed or injured.

Along with the gentiles there were in Rome from the earliest period other persons known by the name of clientes (clients).

Clients. Their origin is wholly unknown. Some of them may have been the original inhabitants of Rome and their descendants, but more probably they were mostly immigrants from other communities or citizens of conquered towns whom the Romans were unable or unwilling to treat as slaves. Some may have been slaves to whom liberty de facto had been given. Following a custom familiar both to Latins and Sabines, such persons were placed under the protection of the heads of patrician families. The relationship was hereditary on both sides, and known as that of patron and client. The client

The derivation of the name is uncertain, and ancient writers differed about it. It probably comes either from quirit, a Sabine word for a spear, or from curia. The derivation from Cures is inadmissible. See Mommssen, Röm. Staatsrecht (1887, 1888), ii. 1, p. 5 n.

The derivation of clientes from cluere indicates the relationship—one who is called on, who hearkens. The theory that clientage

became a dependent member of his patron's clan—not gentilis but gentilicus. His patron had to provide him with what was necessary for his sustenance and that of his family; and, as ownership or possession of lands increased in extent, it was probably not unusual for the patron or his gens to give him during pleasure a plot of land to cultivate for himself. The patron had, moreover, to assist him in his transactions with creditors or debtors, and obtain redress for him when injured. The client, on the other hand, had to maintain his patron's interests by every means in his power. But the advantage must have been chiefly on the side of the client, who, without becoming a citizen, obtained directly the protection of his patron and his clan, and indirectly that of the state. A large number of clients attached themselves to and received protection from the king as patron—"royal clients," as Cicero calls them. The plebeians (plebs, from πατήρ, meaning crowd), as distinguished from the clients, must be regarded as a heterogeneous mass of non-gentile freemen. It used to be the prevailing opinion among modern writers, following the Roman historians, that the plebeians existed as a body since the very beginning of the city. They were thought to be mainly composed of immigrants and refugees who, while being allowed personal liberty, declined to submit themselves to a patron. But recently a theory of Mommssen, based on solid philological and other grounds, has obtained wide adhesion and tends to become the dominant one. Mommssen's view is that at first there were only two classes in the community, the patricians and clients, or, in other words, that the only plebeians were the clients who, as such, possessed only quasi-liberty (Halbfreihet), and that it was not till after a century or two that the practice of voluntary clientage began to decay and the class of plebeian freemen arose. This was partly due to gentes dying out, so that the clients attached to them were left without patrons; partly to the numbers of foreigners at Rome (through transplantation of the inhabitants of conquered cities and otherwise) having become so large that they felt themselves sufficiently powerful to do without protection; and partly to other causes.

However this be, it is generally admitted that, during the latter part of the present epoch at least, plebeians existed as a body composed of individuals of mixed races not united by any gentle organizations of their own nor attached to any Transtribal community. To the protection of the patronage of gilds or societies of craftsmen, such as potters, carpenters, gold- and silver-smiths (collegia opiscum) at Rome, eight or nine in number. This, though probably a myth as regards Numa, may be taken as slight evidence of the creation among the plebeians of associations for trade and other purposes, that to some extent compensated them for the want of gentle organization. These gilds seem to have had a common cult and a common council to arrange disputes and consolidate customs. Between the brethren (sodales) there was a bond of close alliance and interdependence, each owing duty to the other similar to what might be claimed from a guest or a kinsman.

The Regulative of Public and Private Order.—It would be absurd to expect any definite system of law in those early times. What passed for it was a composite of jus, jus and boni mores, whose several limits and characteristics it is extremely difficult to define. This may to some extent be accounted for by the fact that much of what was originally within the domain of jus, once it had come to be enforced by secular tribunals, and thus had the sanction of human authority, was no longer distinguishable from jus; while it may be that others of its behoves, once pontifical punishments for their contravention had gone into desuetude, sank to nothing higher than precepts of boni mores.

arose from the voluntary subjection of poorer citizens to the rich is an hypothesis supported by no satisfactory authority.

By *fas*¹ was understood the will of the gods, the laws given by heaven for men on earth, much of it regulative of ceremonial, but by no means insignificant part embodying rules of conduct. It appears to have had a wider range than *jus*. It forbade that war should be undertaken without the prescribed fetial ceremonial, and required that faith should be kept even with an enemy when a promise had been made to him under sanction of an oath. It enjoined hospitality to foreigners, because the stranger guest was presumed, equally with his entertainer, to be an object of solicitude to a higher power. It punished murder, for it was the taking of a god-given life; the sale of a wife by her husband, for she had become his partner in all things human and divine; the lifting of a hand against a parent, for it was subversive of the first bond of society and religion—the reverence due by a child to his father, from which he derived his existence; incestuous connexions, for they defiled the altar; the false oath and the broken vow, for they were an insult to the divinities invoked; the displacement of a boundary or a landmark, not so much because the act was provocative of feud, as because the rock-stone itself, as the guarantee of peaceful neighbourhood, was under the guardianship of the gods. Some breaches of *fas* were expiable, usually by a peace-offering to the offended god; others were inexpiable. When an offence was inexpiable, the punishment was usually what is called *sacrocto capitatis*, excepting a denial and the surplacation of the offender. The precepts of the *fas* therefore were not mere exhortations to a blameless life, but closely approached to laws, whose violation was visited with punishments none the less effective that they were religious rather than civil.

The derivation of the word *jus* is disputed. The usual derivation is from the Sanskrit, *jus*, to “join, bind or unite,” from which some deduce as its signification “that which binds,” “the bond of society,” others “that which is regular, orderly or fitting.” Brézé identifies it with the *jus* or *jus* of the Vedas, and the *fas* or *fas* of the Zend-Avesta—words which are controvérsial, but which he interprets as “divine will or power.”² If Brézé’s definition can be adopted we obtain a very significant interpretation of the words addressed by the presiding magistrate to the assembled comitia in asking whether they assented to a law proposed by him—*velitis, jubeatis, Quirites*, &c., “Is it your pleasure, Quirites, and do you hold it as the divine will, that,” and so on. As legislation by the comitia of the curies and centuries was regarded as a divine office, and their vote might be nullified by the fathers on the ground that there had been a deviation in the surplacation of the offender. The precepts of the *fas* therefore not clearly ascertainable, this explanation of Brézé’s seems not without support,—*vox populi vox dei*. If it be right, then, the main difference between *fas* and *jus* was that of the will of the gods, which both embodied, was in the one declared by inspired and in the other by merely human agency. This *jus* might be the result either of traditional and inveterate custom (*jus moribus constitutum*) or of statute (lex).³ As to the customs, it can well be believed that at the outset they were far from uniform; that not only the customs of the three original tribes, but those also of the different gentes varied.

¹ Brézé derives *fas* from the Greek *θεία*. It signifies the divinely inspired word. Brézé et Baillie. 101.

³ For the distinction between *fas* and *lex*, see Miteutie, Römisches Privatrecht (1908), i. 30 seq. There is some controversy about the etymology of the word *lex*. See Brézé, l.c. p. 610; Schmidt in Mommsen, SR. iii. 308 n. While *lex* is often used like *fas* to express laws generally, it early acquired two distinct meanings viz. (1) an obligation of any kind expressly incorporated in a private deed (*lex privata*), as in the phrases *lex mancipii*, *lex servitutis* &c.; (2) a comital enactment, hence occasionally called *lex comitatus* (Caes. i. 3 and ii. 104). But by the jurists of the Republic this latter meaning was extended so as to cover all laws resulting from the will of the people, including, for example, plebeian and even senatorial or proconsular ordinances (*leges datae*).

and that they only gradually approximated, and in course of time consolidated into a general *jus Quiritium*. Of legislation there was, so far as is known, practically almost none.⁴

What went by the name of *boni mores* (as distinct from *jus moribus constitutum*) must also be regarded as one of the regulatives of public and private order. Part of what fell within their sphere might also be expressly regulated by *fas* or *jus*; but there was much that was only gradually brought within the domain of these last, and even down to the end of the Republic not a little that remained solely under the guardianship of the family tribunal or the censor’s *regimen morum*. The functions of those who took charge of *boni mores* were twofold; they restrained by publicly condemning—though they could not prevent—the ruthless and unnecessary exercise of legal right, as, for example, that of the head of the house over his dependants, and sometimes they supplied deficiencies in the law by requiring observance of duties that could not be enforced by any legal process. Dutiful service, respect and obedience from inferiors to superiors, chastity, and fidelity to engagements, express or implied (*fides*), were among the *affecta* that were thus inculcated, and whose neglect or contravention not only affected the reputation, but often entailed punishments and disabilities, social, political or religious. It was the duty of those in authority to enforce their observance by such *animadversiones* as they thought proper—their *paterfamilias* in his family, the *gens* among its members, the king in relation to the citizens generally; and many a wrong was prevented not by fear of having to make reparation to the party injured but by the dread of the penalties that would follow conduct unbecoming an upright citizen.

That the bulk of the law during the regal period was customary is universally admitted, and that no laws were committed to writing prior to the XII. Tables is generally believed. Yet the jurist Pomponius, a contemporary of Hadrian, speaks of certain laws enacted by the comitia of the curies, which he calls *leges regiae* and which, he says, were collected by one Sextus Papirius, a prominent citizen in the reign of Tarquinius Superbus, under the name of *Jus Papirianum*.⁵ We are also told by Paul that this work was commented on by a certain Granius Flaccus,⁶ who was, it is supposed, of the time of Julius Caesar or Augustus. No remains of this *Jus Papirianum* are extant, but we have a considerable number of so-called *leges regiae* cited by Livy, Dionysius and others, which contain rules of the private law relating almost entirely to matters of *fas* and which appear to have been enacted by the comitia regiae. We are also told by Servius, the commentator on Virgil, that there was a work known to Virgil called *de Ritu Sacrorum*, in which *leges regiae* were collected.⁷ The authenticity of these laws, however, is disputed, and the question is one of difficulty. Some modern writers of high authority (e.g. Mommsen) hold that the *Jus Papirianum* is an apocryphal compilation made from pontifical records about the close of the Republic.⁸ It has even been attributed (the suggestion was first made apparently by Gibbon) to Granius Flaccus himself. Nevertheless, the internal evidence from the character and language of the laws themselves (apart from the weight that must be given to the testimony of Pomponius, Servius and other ancient writers) is favourable to their great antiquity, and it is best to accept the view that the *leges regiae* are authentic remains of the laws of the regal period. This does not, however, involve the belief that they were collected by Papirius, nor that they were enactments of the *comitia curiata*, as Pomponius says. They seem rather to have been regulations made by the king at his own hand.⁹

⁴ Dig. i. 2. 2, § 2 and § 36. In the latter passage Papirius is given the praenomen Publius.

⁵ Dig. 16. 144. Serv., in Aenid. 12, 836, cited in Bruns, Fontes, p. 3.

⁶ It has been suggested that a work of the jurist Manlius mentioned by Pomponius (Dig. i. 2. 2, § 39) is its source (Zeitschrift d. Sav. Stift. xxiv. 420).
or perhaps old-established customs formulated by the higher pontiffs and ascribed to the kings. It is also stated by Dionysius that under Servius Tullius various laws, fifty in number, dealing with contracts and delicts, were enacted in the comitia of the curies. But we have no corroboration of this, and recent writers are now generally agreed in regarding the statement as a legend.

ii. Reforms of Servius Tullius.

It is generally agreed that towards the end of the regal period, and connected with the king traditionally calledServius Tullius, a great reform of the constitution took place, which exercised much influence on the subsequent development of the law. No doubt there is a good deal of myth attached to the name of Servius, who seems to have been regarded by later Romans as a popular monarch, like Alfred by the English, but the main features of the traditional account of the constitutional reforms of this period may be taken as based on fair presumptive evidence. That all of them indeed were evolved from one brain is hardly credible, and that some of them were in observance de facto before being made constitutionally binding is very likely.

The design attributed to Servius was that of altering the old constitution in order to promote an advance towards equality between patricians and plebeians. He is credited with having desired, on the one hand, to ameliorate the position of the plebs and, on the other, to make them bear a proportionate share of the burdens of the state—in particular, to serve in the army and contribute to the war tax (tributum). He effected this by giving them qualified rights of citizenship, not indeed by admitting them into the gentle organizations, but by creating a new political assembly of a distinctly military character in which they as well as the gentiles could take part. The so-called Servian reforms may be roughly summarized under the following four heads, viz. (1) a division of the Roman territory within the city walls into four local wards called triabus (to which a number of tribes outside the city—tribus rusticae—were afterwards in course of time added); (2) the establishment of a register of the citizens (census) which was to contain, in addition to a record of the strength of their families, a statement of the value of their lands, with the slaves and cattle employed in their cultivation, and which was to be revised periodically; (3) a division of the people, as appearing in the census, into five classes for military purposes, determined by the value of their holdings in land and its appurtenances, with a subdivision of each class into so-called centuries; (4) the creation of a new assembly with legislative power called comitia centuriata, in which the vote was to be taken by centuries. While it may be an open question how far these reforms, and particularly the institution of the centuriate comitia, were actually due to Servius, or only a result of his arrangements, the whole conception of the new constitution is obviously of early date and indicative of considerable statesmanship.

The plebeians were thereby made constitutionally part of the populus Romanus; they became citizens (quirites). They were also entitled so far that their marriages inter se were recognized as legal marriages. Rights and duties

1 See Clark, Hist. of Rom. Law (1906), i. 16-19; Kipp, Geschichte d. Quellen (1903), pp. 24-25. The most comprehensive treatise on these royal laws, which also contains references to the earlier literature, is that of Voigt, Über die Reges Regiae (Leipzig, 1876).

2 The view of some recent writers that the plebeians had at all times participated in the jus Quiritium and were admitted to the curiate comitia and even had gentile rights (see Lenc in Holtz- wetter, d. Reichsrecht, 6th ed. pp. 1, 2, and authorities there cited), must be decidedly negatived. Not only does it render the whole tradition about the Servian reforms untrustworthy, but the account of the struggles between patricians and plebs in the early Republic are left largely without meaning.

were so far to be measured by each citizen's position as a holder of lands; the amount of land (including slaves and cattle appurtenant thereto) held by him on quiritian title was to determine the nature of the military service he was to render, the tribute he was to pay, and his right to take part in the new political assembly. It is indeed probable that a good while before Servius the conception of individual ownership of lands and things necessary for their cultivation had been reached, and that such ownership was recognized not only among the gentiles, but also de facto even more largely among the plebeians. The common lands of the gentes had become split up, to a considerable extent, among families and individuals. However this be, the creation of the census ensured, as far as possible, certainty of title, as it was declared that no transfers of property enrolled in it would be recognized unless made by public conveyance with observance of certain prescribed formalities.

The form of conveyance thus legally sanctioned was called originally mancipium, afterwards mancipium, and at a still later period mancipatio, while the lands and other things that were to pass by it came to be known as res mancipii (or mancipis).

Hence arose a distinction of great importance in the law of property (which lasted till Justinian formally abolished it), between res mancipi and res nec mancipi; the former being transferable only by mancipation or surrender in court, the latter by simple delivery (see infra, p. 541).

iii. Institutions of the Private Law.

Law of the Family. The word familia in Roman law had at once a more extensive and a more limited meaning than it has in its English form. Husband, wife and children did not necessarily constitute an independent family among the Romans as we use the term, nor were they all necessarily of the same one. Those formed a family who were all subject to the power—originally manus, later potestas or jus—of the same head (paterfamilias). The paterfamilias was himself a member of the family only in the sense in which a king is a member of the community over which he rules. He might have a whole host dependent on him, wife and sons and daughters, and daughters-in-law and grand-children by his sons, and possibly remoter descendants related through males; so long as they remained subject to him they constituted but one family, that was split up only on his death. The rules governing these groups may be divided into two classes.

1 Modern writers are not agreed as to whether movable res mancipi were included with lands in the valuation of property for fixing the classes.

2 Or else by cessio in iure, though this may not have been before the XII Tables, and it was in any case of very limited operation.

3 On tribal family and matrarchate among the Romans in prehistoric times, consult Westermann, History of Human Marriage (London, 1884); Posner, Geschichte der deutschen Justizwesen (1891), i. 15-160. Familia and family are used in this section solely to designate the group of free persons subject by birth, marriage or adoption to the same paterfamilias. Strictly the word means the household and all belonging to it. It had also the following principal meanings: (1) a gens or branch of a gens (group of families in the stricter sense); (2) the whole body of agnatic kinsmen (familia communi iure); (3) the family estate ( familiae curia). Tables about intestate succession, e.g. caducus proximus familiae habere; (4) the family slaves collectively, as in the phrase familia rustica. See Mommsen, Staatsr. iii. 10 n. 16 n. 22; Rivier, Précis du droit de famille romain (Paris, 1864), i. 189 sqq.

This word manus, though in progress of time used technically to express the power (hand) of a husband over his wife in familia, was originally the general word for the right exercised, not only over the things belonging but also over the persons subject to the head of the house—as seen, for example, in the words "manmission" and "emanicipation." Cf. Inst. i. 5 pr. It should be observed that among uncivilized peoples there is always a very small vocabulary, and the same word often has to do duty in several senses—e.g. familia, mancipium, nexitum, caput.
daughters on emancipation ceased to be of the family of the
paterfamilias who had emancipated them. A daughter's
children could never be such as members of the family of her
maternal grandfather; for children born in lawful marriage
followed the family of their father, while those who were illegiti-
mate ranked from the moment of birth as paterfamilias and
matresfamilias.

With the early Romans, as with the Hindus and the Greeks,
mARRIAGE was a religious duty a man owed alike to his ancestors
and to himself. Believing that the happiness of the
dead in another world depended on their proper burial and on the periodical renewal by their descendants of
prayers and feasts and offerings for the repose of their souls, it
was incumbent upon him above all things to perpetuate his
race and his family cult. The Romans were always strictly
monogamous. In taking to himself a wife, he was about to
detach her from her father's house and make her a partner of
his family mysteries. With the patrician at least this was to
be done only with divine approval, ascertained by auspicia.

His choice was limited to a woman with whom he had connubium (éxovayla) or right of intermarriage. This was a matter of
state arrangement; and in the regal period Roman citizens
could have it outside their order only with members of states
with which they were in alliance, and with which they were
connected by the bond of common religious observances.

A patrician citizen, therefore, if his marriage was to be reckoned
lawful (Justac nuptiae), had to wed either a fellow-patrician or
a woman who was a member of an allied community. In either
case it was essential that she should be outside his sobrin
circle, i.e. more remote in kinship than the sixth degree.
The ceremony was a religious one, conducted by the chief pontiff
and the flamen of Jupiter, in presence of ten witnesses, represen-
tatives probably of the ten curies of the bridgegroom's tribe,
and was known as fartrim or confarreatio. Its effect was to
transfer over wife entirely from her father's house, and to make
her a member of her husband's; for confarreate marriage in-
volved in manum conventio, the passage of the wife into her
husband's "hand" or power, provided he was himself pater-

familias; if he was not, then, though nominally in his hand,
he was really subject like him to his family head. Any prop-
erty she had of her own—which was possible only if she had
been independent before marriage—passed to him as a matter
of course; if she had none, her paterfamilias usually provided
her a dowry (idtta), which shared the same fate. In fact, so far
as her patrimonial interests were concerned, she was in much
the same position as his children; and on her husband's death
she had a share with them in his inheritance as if she had been
one of his daughters. In other respects manus conferred more
limited rights than patria potestas; for Romulus is said to have
ordained that, if a man put away his wife except for adultery
or one or two other grave offences, he forfeited his estate half
to her and half to Ceres, while if he sold her he was to be given
over to the infernal gods.¹

Patria potestas was the name given to the power exercised
by a father, or by his paterfamilias if he was himself in potestate,
over the issue of such a marriage. Its effect was to
make the child, or at least one of the children, capable of
being treated as if he were his father's heir, as he was capable
by his manum, and subject to all his rights. The

The whole question of matrilateral descent had from the lex regia
above mentioned, it would have been incon-
sistent with her dignity as matresfamilias. There is certainly no
trace of its having been done. In marriages by coemption and
usus, on the other hand, it is not improbable that it was allowed,
though here also there is no evidence of it.

1 See Plutarch, Rom. 22; Marquardt, Röm. Altert. v. 7.
The question whether a husband could in early law sell his wife is one
on which modern writers are not agreed. The better opinion is
that he could not do so if the marriage was by confarreatio, but
from the lex regia above mentioned, it would have been incon-
sistent with her dignity as matresfamilias. There is certainly no
trace of its having been done. In marriages by coemption and
usus, on the other hand, it is not improbable that it was allowed,
though here also there is no evidence of it.
guarded against by the rule which required in grave cases the *paterfamilias* to consult in the first place the near kinsmen of his child, maternal as well as paternal. Even the incapacity of the children of the family to acquire property of their own cannot in those times have been regarded as any serious hardship; for, though the legal title to all their acquisitions was in the house-father during his life, yet in truth they were acquired for and belonged to the family as a whole, and he was little more than a trustee to hold and administer them for the common benefit.

The *patria potestas*, unless the *paterfamilias* voluntarily put an end to it, lasted as long as he lived and retained his status. The marriage of a son, unlike that of a daughter passing into the hand of a husband, did not release him from it, nor did his children become subjects to himself so long as they lived in *potestate*. On the contrary, his wife passed on marriage into the power of her father-in-law, and their children as they were born fell under that of their paternal grandfather; and the latter was entitled to exercise over his daughters-in-law and grandchildren the same rights that he had over his sons and unmarried daughters. But there was this difference, that, when the *pater-familias* died, his sons and daughters who had remained in *potestate* and his grandchildren by a predeceased son instantly became their own masters (sui iuris), whereas grand-children by a surviving son simply passed from the *potestas* of their grandfather into that of their father. The acquisition of domestic independence by the death of the family head frequently involved the substitution of the tutorship of the family for the guardianship of the children. The succession of domestic independence by the death of the family head frequently involved the substitution of the guardianship of tutors (tutela) for the *potestas* that had come to an end. This was so invariably in the case of females sui iuris, no matter what their age; they remained under guardianship until they had passed by marriage into manus maritii. It was only during pupillarity, however, that males required tutors, and their office came to an end when puberty was attained. It is improbable that during the regal period a testamentary appointment of tutors by a husband or parent to wife or children was known to the Romans. The actual practice devolved upon the gens to which the deceased *paterfamilias* belonged.

**Family Organization among the Plebeians.—** If perfect identity of customs cannot be assumed to have existed amongst the patrician *gentes* in the regal period of Rome, far less can it be supposed to have existed amongst the heterogeneous population (Latinis, Etruscans, Greeks, &c.) of which the *plebs* was constituted. Nevertheless, contiguity of residence and community of interests tend inevitably to unify customs and cause dissimilarities to disappear, and the plebeians must have not only gradually brought their own customs into union inter se, but adapted them at the same time in many respects to those of the patricians. Hence to those of non-Latin race *manus* over their wives, and *potestas* over their children would become a desideratum. Though the plebeians seem to have been always excluded from confraternity, and their matrimonial unions must have been at first informal and irregular from the point of view of the *Quirites*, two civil modes of acquiring marital *manus* were available to them after they obtained citizenship, viz. *coemptio* and *usus*. Some writers hold that neither of these modes was legally recognized prior to the XII. Tables; this may be so, but it is improbable. As the plebeians obtained by the Servian constitution full capacity for quiritarian ownership, it was at once open to them to adapt the modes sanctioned for acquiring property to the acquisition of marital *manus*. *Coemptio* was just a simple adaptation of mancipation above referred to (see also infra, p. 540). It was, as we may infer from what we know of it at a later time, a sale of the woman to the man *per aces et libram* for a nominal price. The price being fictitious, a piece of copper (*rovisculeum*) was used to represent it, and this was handed over to the seller, who would ordinarily be the woman's *paterfamilias*, or, if she were sui iuris, her gentle tutor. The nuncupatory words used in the ceremony have unfortunately not been preserved; necessarily, of course, they varied from those of an ordinary mancipation of property. Though called by the jurists a mode of constituting marriage, *coemptio*, as we know it, was strictly a mode of creating manus; for, though usually contemporaneous with, it might, as Gaiss informs us, follow the marriage at any distance of time, and was not dissolved by divorce, but required a separate act of remanicipation. Students of comparative law have observed that in *coemptio* there are clear traces of earlier bride purchase, so common even nowadays among uncivilized tribes, where a real price in cattle or sheep, and not a mere nominal one, has to be paid for the bride. *Usus*, on the other hand, was a mode of acquiring marital *manus* by possession of the woman as wife for a certain period of time—long cohabitation. Whether this was recognized by the law prior to the XII. Tables depends probably upon when the acquisition of property, settled by custom earlier than the Tables. Some writers, however, think it older than *coemptio*, and as a de facto relation prolonged cohabitation as man and wife must have existed from very early times. Comparative historians with good reason trace in *usus* the relics of primitive bride capture. Both *coemption* and *usus*, from the time they were first recognized by the *jus Quiritium*, undoubtedly created *patria potestas* and agnatic rights.

**Law of Property.—** The history of the early Roman community, like many other primitive communities, is marked by the differentiation of the gentes and the growth of property among the individual. The distribution of land to hand., amongst the early Romans is one of the puzzling problems of their history. The Servian constitution apparently classified the citizens and determined their privileges, duties and burdens according to the extent of their lands; and yet we know nothing for certain of the way in which these were acquired. All is conjectural. We have indeed a traditional account of a partition by Romulus of the little territory of his original settlement into three parts, one of which was devoted to the maintenance of the state and its institutions, civil and religious, the second (age publicius), to the use of the citizens and profit of the state, and the third (ager privatus) subdivided among his followers. Varro and Pliny relate that to each *paterfamilias* among his followers he assigned a homestead (*heredium*) of two jugera, equal to about an acre and a quarter. These *heredia* were to be held by him and his heirs for ever (*quae heredem sequeruntur*); Pliny adding that to none did the king give more. This can only be accepted as a partially correct account of what may have taken place at some early period during the kingdom régime. There can be little doubt that a portion of the Roman territory, gradually augmented through new conquests, was early partitioned into *maiores* by the state, as is especially attested by the complaints made for centuries by the plebeians of its monopolization by the patricians. It is also probable that *heredia* (i.e. plots of land within the city) may have been granted to the heads of the gentle families, many of whom would be living in *pagi* on their respective gentile lands outside the city. Such *heredia* became family property, administered as such by the *paterfamilias*, and inalienable by him. In this respect the position would be very similar to what existed among the ancient Germans and exists to-day in India among the Hindus. Even late in the Republic, when the idea of

2 One or two writers of the later Empire (e.g. Servius, in Georg. i. 31) describe *coemptio* as a mutual purchase, the man and woman taking alternately the position of *emptor* and using nuncupatory words as such; but this seems to be a misapprehension and not consistent with what Gaiss says. See the arguments in favour of it in Muirhead, *Historical Introduction*, 2nd ed. pp. 414-415.
3 Girard, *Manuel*, 4th ed. p. 190, gives a probable explanation of the mistake of these latter writers.
4 It would thus cure defects in a *coemption* just as usucaption did defects in mancipation.
individual ownership was paramount, it was still considered a disgrace for a man to alienate his heredium. But though the existence of monogamous families seems to imply private ownership to some extent, yet, as formerly indicated, a large part of the Roman territory at, and for a good while after, the foundation of the city must have been gentile lands held by the separate clans for the use of their members. The fact that the majority of the rural tribes bore the names of well-known patrician gentes favours the conclusion that even in the later regal period a good many of the clans still held lands in their collective capacity. It was at some uncertain time before Servius that there began to be a break-up of these gentile lands and their appropriation by individual members. Under the influence of this movement lands were acquired and held by families and individuals to a large extent. A patrician’s holding must have been sometimes pretty large so as to enable him to make grants (so often alluded to by ancient writers) to his clients, but we have no means of estimating the normal size. The heredia were small; even during the Republic there is some evidence (e.g. the traditional story about Cincinnatus) that seven jugera were regarded as the normal extent of a patrician’s holding for his own and his family’s use. On the other hand, twenty jugera are commonly supposed to have been the qualification for enrolment in the first of the Servian classes. Of course it must be kept in view that a patrician did not necessarily hold all his lands by gratuitous assignation or concession either from the state or from his gens; purchase, from the former was by no means uncommon, and it may have been on his purchased lands that his clients were usually placed. Those dependants were also probably employed in large numbers upon those parts of the ager publicus which were occupied by the patricians and were in historic times known as possessiones. These, of course, were not the property of their occupants; it was the lands acquired by assignation or purchase that were alone, apart from the heredia, regarded as their ex jure Quiritium.

The traditional accounts of the early distribution of lands among the plebeians are even, if possible, more vague than those regarding the patricians. They had apparently become holders de facto of land in large numbers before the Servian reforms. But they can have attained that state by gradual transfers of grants of land, probably from the kings, which can only have been during pleasure, latterly, as they increased in number and importance, they were allowed to have permanent possession. That those who had means also acquired lands by purchase from the state may be taken for granted. The distinction between de facto possession and ownership was at best a very vague one at this period, and, like the holders of provincial lands in later times, the plebeians might have the benefits of ownership without ownership. The result of the Servian constitution was to convert this de facto property or permanent possession into quiritian ownership.1

There are some writers who maintain that in the regal period, prior to the Servian reforms, though after the collective ownership of the gentes had begun to disintegrate, there was no private property in movables. This proposition can at most be taken only in a qualified sense. If it be meant that movables generally were not then recognized as objects of quiritian dominium which could be vindicated by any real action, it may be admitted. But otherwise the distinction between meum and tuum must have been well recognized, de facto at least. Men must have been in the habit of referring all their property, with or without a temporary assignation, in respect of barter, sale or otherwise, and any violent or "theftuous" appropriation of things in a man’s occupation would be punished by magisterial authority or by ordinary self-redress by the injured party. A sort of ownership in

1 On this question of land-holding among the early patricians and plebeians, consult Cuq, Institutions juridiques des Romains, 2nd ed., vol. 1, pp. 73-76; Bourcart (French translation of Muirhead’s Historical Introduction), p. 580, and authorities there cited.

Possession must at least have been recognized for movables generally.2

But apart from this, we must believe that certain kinds of movables, viz. those which have been described as appurtenant to land and necessary for its cultivation—which with land formed the real objects, as distinct from the personal subjects, of the familia—were treated from the time of Romulus downwards, as in manu of the patria familiae. These were the res mancipii already referred to. Quiritian ownership in them, as we have seen, was recognized both for patricians and plebs by the Servian constitution, periodical registration of them in the census and transference by the quasi-public act of mancipation being probably required. Earlier even than with lands, the conception of private ownership, it has been said, connected itself with them.3

A short explanation may now be given of the ceremony of mancipation and the nature of res mancipii.

Mancipation is described by Gaius, with particular reference to the conveyance of movables res mancipii, as a preliminary in presence of not less than five citizens as witnesses and a libranus holding a pair of copper scales. The transference, with one hand on each side, being being transacted, using the words of style, declared it by his purchase of a piece of copper (which he held in his other hand) and the scales (hoc aere aeneaeque libra); and simultaneously he struck the scales with the other hand until thus transferred, he then handed them to the vendor as the price.

The principal variation when it was an immovable that was being transferred was that the mancipation did not require to be on the spot: the land was simply described by its known name (e.g. in a servian roll) in the time of its present owner, at the usual time of public sale—in fact the formal conveyance upon a relative contract—yet it was not always so. Its history is very simple. The use of the scales fixes its introduction at a time when coined money was not yet current, but raw copper nevertheless had become standard of value and in a manner a medium of exchange. That, however, was not in the first days of Rome. Then, and for a long time, values were estimated in cattle or sheep, coins were imposed in them, and the deposits in the legis actio sacramento (infra, p. 549) took the same form. The use of copper as a substitute for them in private transactions was probably derived from Etruria. But, beyond raw metal, coins could not be used for purchases of real estate, for loans or payments only when weighed in the scales: it passed by weight, not by tale. There is no reason for supposing that the weighing was a solemnity, that it had any significance beyond the fact that the vendor or borrower was getting the amount of copper for which he had bargained.

It was this practice of everyday life in private transactions that Servius subsequently adopted as the basis of the Servian conveyance, engraving on it one or two new features intended to give it publicity and, as it were, "state sanction, and thus render it more secure in the transfer of censurable property. Instead of the parties themselves using the scales, a special officer, probably an official, was required to undertake the duty, and at least five citizens were required to attend as witnesses, who were also given vouchers to the census officials of the regularity of the procedure. Whether they were intended as representatives of the five classes in which Servius had distributed the population, and thus virtually of the state, is disputed, though the fact that, when the parties appealed to them for their testimony, they were addressed not as testes but as Quirites lends some colour to this view.4 Servius is also credited with the introduction of rectangular pieces of copper of different but carefully adjusted weights, stamped by his authority with various devices (aei signatum), which are considered proofs of sale.

The possession of the plebeians in this respect did not differ from that of the patricians.

Mancipation seems to have been a very ancient mode of conveyance. The use of the balance in barter or sale was known to the ancient Egyptians at least as early as 2000 B.C., as may be seen on reliefs in the temple of Debr-el-Bahri in Upper Egypt. The derivation of mancipium (mancipatio) from manum capere, to seize with the hand, is given by Gaius and is confirmed by the fact that at all times in its history the acquirer had to lay his hand on the goods in question, thus acquirers during the ceremony, if a movables. So where several things were being mancipated, it is in the nature of things, to be done to each separately. With lands and other immovables it was different: they might be mancipated in absence, which goes against the principle of things above, but it is possible to prove the possession mancipio given to them at a later period. The derivation of mancipatio given by Muirhead (Historical Introduction, 2nd ed., pp. 59 seq.) from manum capere, to acquire power (manus), is open to the objection that it places the abstract idea of power before the concrete symbol of it. Cf. Cuq, Institutions juridiques, 2nd ed., l. p. 80 n.

2 See Gal. II. § 104.

3
usually supposed to have been intended to take the place of the raw metal (aes rude) formerly in use, and so facilitate the process of weighing; but there is more reason for thinking they were cast and coined and weighed in some scale or be put into one scale, while the raw metal whose weight was to be determined.

Instead, therefore, of being a fictitious sale, as Gaius describes it, and as it became after the introduction of coined money in the 4th century B.C., for the distinction of the distribution was regular, there was an actual completed sale in the strictest sense of the term. What were the precise words of style addressed by the transferor to the transferee, or what exactly the form of the ceremonial, we know not; but we may conjecture from the introduction of the first time thousands of pounds, perhaps of copper, were being weighed would have been an intolerable burden upon the five citizens convoked to it. At any rate, it may be supposed that it early became a common practice to hire a kind of pounder beforehand, to have his scales reweigh, or pretend to reweigh, before the witnesses only a single little bit of metal (raudusculum), which the transferee then handed to the transferor for the first pound, and the last,” and thus representative of the whole.

And where no real price was intended, as in constituting a dos or in coemption, a raudusculum would also be employed. Whatever may have been its form, however, it was an instant exchange of property at a certain price weighted in the scales. The result of the obligation on the vendor to maintain the title of the vendee, and the qualifications that might be superinduced on the conveyance by agreement of parties — sale so-called and sold below the market — was regulated with the provisions of the XII. Tables on the subject (infra, p. 542).

The things included in the class of res mancipi were lands and houses, and also all that passed in the title, either with rights of way and aqueducts, and slaves, and the following kinds of the beasts of burden, viz. oxen, horses, mules and donkeys; all others were res nec mancipi. Many theories have been propounded to explain the difference of these two classes of things, and to explain the principle of selection that admitted oxen and horses into the one, but relegated such animals as sheep and swine to the other. But there is really little difficulty. Under the Roman law, the natural and necessary nature and extent of a citizen’s political qualifications, military duties and financial burdens was apparently the value of his heredom (and other lands, if he had any), and what might be called its appurtenant burdens. To the householders, therefore, the beasts of draught and burden that worked the farm, all of which lived and worked in common with the free members of the familia. But the cattle and the domesticated forests of the free men were more res mancipi than his sheep, a fact which, though perhaps not in the later Empire lost sight of, was still understood in the time of Gaius. To say that the things classed as res mancipi were selected for the preservation by Servius because they were what were essential to a family engaged in agricultural pursuits would be to fall short of the truth. They constituted the familia in the sense of the family estate proper; whereas the hens and flocks, and everything else below the rank of the res mancipi, fell under the denomination of familia.

So the words are to be understood perhaps in the well-known phraseology of the mancipatory testament, familia pecuniae max. The public solemnity of mancipatio thus sanctioned as a mode of transmission of property the last, in order that they might testify it after his death, it is not probable now that the mancipatory testament what must originally have been a legislative act, whereby the testator’s peers, for reasons which they and the presiding pontiffs thought sufficient, sanctioned in the particular case a departure from the ordinary rules of succession. The pontiffs were there to protect the interests of religion, and the curies to protect those of the testator’s gens; and it is hardly conceivable that a testament could have been sanctioned by them which so far set at nought old traditions as to deprive a filiusfamilias of his birthright, at least in favour of a stranger.

4 It is quite true, however, that from the first the order of succession was agnatic; for it was only those of a man’s children who were agnate that had any claim to his inheritance; and the gens was, theoretically at least, just a body of agnates. The supposed mention of agnates in a law attributed to Numa is a conjecture of P. E. Huscbe’s (in Analecta Itineraria, Leipzig, 1826, p. 375). The gloss, the word agnates found in Servius, In Virg. Eclog. iv. 43, which runs thus: “In Numae legibus caustum est, ut si quis imprudens occisisset hominem, pro capite occisi et natis ejsus in curiatico condicione remanent” (one death of a man makes agnates for et natis is all but universally adopted: but, even were it necessary, it need mean nothing more than his children’s in postestate or his gens.

5 The Roman law of 169 B.C. avowedly introduced something new in prohibiting a man of fortune from instituting a woman, even his only daughter, as his testamentary heir; but even it did not touch the law of intestacy. See Girard, Manens, 4th ed. p. 816.
It may safely be assumed that by custom at all events the children of a plebian usually took his estate on his death intestate. But, as he was not a member of a gens, there was no provision for the devolution of his succession on failure of children. The want of them he could not supply by adrogation, as he had for long, it is thought, no access to the assembly of the curies; and it is doubtful if adoption of a filiusfamilias was known before the XII. Tables. If, therefore, as seems probable, the XII. Tables first introduced the succession of agnates, their plebian heir-awned by children was necessarily heirless, that is to say, heirless in law. But custom seems to have looked without disfavour on the appropriation of his heridism by an outsider: a brother or other near kinsman would naturally have the earliest opportunity, and, if he maintained his possession of it in the character of heir for a reasonable period, fixed by the XII. Tables at a year, the law dealt with him as heir, and in course of time the pontiffs imposed upon him the duty of maintaining the family

sacra. This was probably the origin, and a very innocent and laudable one, of the urascapio pro herede, which Galus condemns as an infamous institution. The right of self-redress was no longer looked on as the right of its raison d'être once the right of succession of agnates had been introduced.

There is no trace of testamentary succession among the plebs prior to the Servian constitution, nor is it in the least degree likely that there was any such. Primitive communities are slow to realize the conception of testaments, and the plebeians could not at this period make a public one either calatis comitis or in procinctu. But not long after their admission to citizenship there is reason to conjecture that mancipiation was employed by them, not indeed to make a testament instituting an heir and taking effect only on the testator's death, but to make a conveyance of a whole patrimony mortis causa. The transaction took the form of an absolute acquisition, in exchange for a price (usually nominal), of the transferrer's familia; by a friend, technically called familiae emptor, on trust to distribute, on the transferrer's death and according to his instructions, whatever the transferee was not authorized to retain for himself. The transferrer may also have had power to reserve in the mancipation a usufruct of the estate while he lived. Like so many other of the transactions of the early law, we are not enabled to specify whom the transferrer concerned whom the transferrer meant to benefit; they could only trust to the fides of the transferee. This mortis causa alienation, whatever the date of its introduction, was the forerunner of the so-called testament per aes et librum, to be afterwards described (infra, p. 543).

Contract and its Breach.—To speak of a law of obligations in connexion with the regal period, in the sense in which the words were understood in the later jurisprudence, would be a misappellation of language. It would be going too far to say, however, as is sometimes done, that before the time of Servius Rome had no conception of contract; for men must have bought and sold, or at least bartered, from earliest times—must have rented houses, hired labour, made loans, carried goods and been parties to a variety of other transactions inevitable amongst a people engaged to any extent in pastoral, agricultural or trading pursuits. It is true that a patrician family with a good establishment of clients and slaves had within itself ample machinery for supplying its ordinary wants, and was thus to a great extent independent of outside aid. But there were not many such families. There must therefore have been contracts and some customary rules to regulate them, though these were presumably very imperfect. In many cases, such as those alluded to, one of the parties at least must have trusted to the faithfulness of the other. What was his guarantee, and what remedy had he for breach of engagement?

His reliance in the first place was on the probity of the party with whom he was dealing—on the latter's reverence for Fides, and the dread he had of the disapprobation of his fellows should he prove false, and of the penalties, social, religious or pecuniary, that might consequently be imposed on him by his gens in the case of a patrician, by his gild in the case of a craftsman, or by the king in the case of any other plebian. But if the party to whom he did rely he who other's good faith was not satisfied with his promise and the grasp of the right hand that was its seal, he might require his solemn oath (jusjurandum); and it can hardly be doubted that, whatever may have been the case at a later period, in the time of the earlier kings who he forswore himself was amenable to pontifical discipline. If he preferred a more substantial guarantee, he took something in pledge or pawn from the other contractor; and, though he had no legal title to it, and so could not recover it by judicial process if he lost possession, yet so long as he retained it he had in his own hand a de facto security. Upon performance of the condition, he could be forced to return it or suffer a penalty—not by reason of obligation resulting from a contract of pledge, for the law as yet recognized none, but because, in retaining it after the purpose was served for which he had received it, he was committing theft and liable to its punishment. At this stage breach of contract, as such, does not seem to have founded any action for damages or reparation before the tribunals; but it is not improbable that, where actual loss had been sustained, the injured party was permitted to resort immediately to self-redress by seizure of the wrong-doer or his personal effects. Self-help was according to the spirit of the time not self-defence merely in presence of imminent danger, but active measures for redress of wrongs already completed.

There was one contract, however, notorious in after years under the name of nuxum, that must have received legal sanction soon after the Servian reforms, though probably, like mancipation of property itself, known in practice earlier. In the XII. Tables it is apparently referred to as an existing institution. In its normal character it was a loan of money, or rather of the raw copper that as yet was all that stood for money. How far in its original use it was accompanied by any formalities beyond the weighing of it in a pair of scales (which was rather subsistence than form) we know not; and what right it conferred on the creditor over his debtor who failed to repay can be only inferred. Of speculative conditions, the Servian reforms was the regulating and ensuring the publicity of the contract and making the creditor's right of self-redress by apprehension (manus injecto) and imprisonment, &c., of his debtor constituting the object of the preservation of the prescribed form of the nuxum. The character and effects, however, of this the earliest independent contract of the jus civile, are much disputed and will be explained below on p. 545 seq.

Public and Private Offences and their Punishment.—For anything like a clear line of demarcation between crimes and civil injuries we look in vain in regal Rome. Offences against the state itself, such as trafficking with an enemy for its overthrow (prodile) or treasonable practices at home (perduellio), were matters of state prosecution and punishment from the first. But in the case of those that primarily affected an individual or his estate there was a halting between, and to some extent a confusion of the, three systems of private vengeance, sacral

1 Such as debarment from gentile or gild privileges, exclusion from right of burial in the gentile or gild sepulchre, fines in the form of cattle and sheep, &c.

2 Some of the old writers (e.g. Liv. i. 21, § 4, xxii. § 3; Plin. H.N. xii. 5, Serv. in Aen. vii. 277, &c.) say that Fides was in the right hand, and that to give it (promittere dextram—is this the origin of the word "promise"?) in making an engagement was emphatic as a pledge. See a variety of texts illustrating the significance of the practice, and testifying that Fides was only part of the trust imposed on Fides before foreign influences and example had begun to corrupt men's probity and trustworthiness, in Lasalus, Ueber d. Eid bei d. Römern (Würzburg, 1849), p. 5 seq.; Danz, Der sacrale Schutz im röm. Rechtsverkehr (Jena, 1857), pp. 139, 140. Cf. Pernice, Laber, vol. ii. (2nd ed., Halle), p. 450 seq.
atoning and public or private penalty.1 These may be said to have followed in sequence but overlapped each other. The same sequence is observable in the history of the laws of other nations, the later system gradually gaining ground upon the earlier and eventually superseding it.2 The remarkable thing in Rome is that private vengeance should so long remain practically effective, and that the state was not compelled to be a party to it. According to tradition it was an admitted right of the gens or kinsmen of a murdered man in the days of Numa; a law of his is said to have provided that, where a homicide was due to misadventure, the offering to them of a ram should stay their hands (supra, p. 533). And this seems to have been also prescribed in the XII. Tables (VIII, 24). To avenge the death of a kinsman was more than a right: it was a religious duty, for his manes had to be appeased; and so strongly was this idea entertained that, even long after the state had interfered and made murder a matter of public prosecution, a kinsman was so imperatively bound to it in motion that if he failed he was not permitted to take anything of the inheritance of the deceased. The talion we read of in the XII. Tables is also redolent of the vindicta privata, although practically it had become no more than a means of enforcing reparation. And even the nayal creditor’s imprisonment of his defaulting debtor (infra, p. 551), which was not abolished until the 5th century of the city, may not unfitnessly, in view of the cruelties that too often attended it, be said to have savoured more of private vengeance than either punishment or procedure in reparation.  

Expiation, restitution, sacratio capitis, all suggest offences against the gods rather than against either an individual or the state. But it is difficult to draw the line between different classes of offences, and predicate of one that it was a sin, of another that it was a crime and of a third that it was civil injury. They ran into each other in a way that is somewhat perplexing. Apparently the majority of those specially mentioned in the so-called leges regiae and other records of the regal period were regarded as violations of divine law, and the punishment inflicted on them was the same. But in many of them the prosecution was left to the state or to private individuals. It is not clear, indeed, that there was any machinery for public prosecution except in treason and murder—the former being so liable to the state, the latter so much an offence, the latter because it was comparatively early deemed expedient to repress the blood-feud, which was apt to lead to deplorable results when clansmen and neighbours appeared to defend the alleged assassin.  

Breach of duty resulting from the fiduciary relation between patron and client, maltreatment of a parent by his child, exposure or killing of a slave, amongst the former, or injury to property in the latter, by up or removal of a boundary stone, the slaughter of a plough—ow all these were capital offences; the offender, by the formula sacer esto, was devoted to the infernal gods. Festus says that, although the sentence was death, the execution never took place; that to the sacrifice to the deity he had especially offended (nec fas est eum immolari), yet he was so utterly beyond the pale of the law and its protection that any one might kill him with impunity. But, as the sacratio was usually coupled with forfeiture of the offender’s estate or part of it to religious uses, it is probable that steps were taken to have the outlawry or excommunication judicially declared, though whether by the pontiffs, the king or the curies does not appear; such a declaration would, besides, relieve the private avenger of the incensed god of the chance of future question as to whether or not the citizen he had slain was sacer in the eye of the law.  

That there must have been other wrongful acts that were regarded in early Rome as deserving of punishment or penalty of some sort, besides those visited with death, sacratio or forfeiture of estate, the XII. Tables give no list. But one, a more or less harmless breach of contract, is so happy as to know nothing of thefts, robberies and assaults. The XII. Tables contained numerous provisions in reference to them; but it is extremely probable that, down to at least the time of the so-called public age, marriage and civil contract were prohibited by custom, and was in the main self-redress, restrained by the intervention of the king when it appeared to him that the injured party was going beyond the bounds of fair reprisal, and frequently bought

2 An offence at first was an act attributable to the whole family or clan, and it was upon them or by them and not upon the individual wrong-doer or by the injured party that vengeance was taken.

off with a composition. When the offence was strictly within the family or the gens, it was for those who exercised jurisdiction over it to decide the wrong and prescribe and enforce the penalty.  

Jurisdiction and Procedure.—Of the course of justice, whether in crime or civil matters, during the regal period we know little that can be relied upon; partly because of the state of literature, partly because of the having been generally supreme in both. But this can be accepted only with considerable reservation. For the king, as he was said to be, in a certain importance, was judge within the family—his jurisdiction being limited to excluding that of the state, at other times concurring with it, and not to be stayed even by an acquittal pronounced by it. He alone was the proper judge of any crime committed by a family for a crime or offence against the domestic order—adultery or unchastity of wife or daughter, oughtful behaviour of children or clients, or the like. Death, slavery, banishment, expulsion from the family, imprisionment for theft or murder, were all within his command as punishments; and it may readily be assumed that in imposing them he was free to take account of moral guilt than an outside tribunal. The indications of criminal jurisdiction on the part of the gens are slight; but its organization was such that it is difficult not to believe that it must occasionally have been called on to exercise such functions. And it must not be lost sight of that, as murder seems to have been the only crime in regard to which private revenge was absolutely excluded, the judicial office of the kings must have been considerably lightened, public opinion approving and not condemning self-redress so long as it was kept within the limits by usage and custom.

The boundary between civil and criminal jurisdiction, if it existed at all, was extremely shadowy. Theft and robbery, for example, if one may conclude from the position they held in the later juris-
those who were to enjoy in future the privileges of quiritarian right, and multiplying the sources of future disputes that would have to be determined by the tribunals. The nature of the jurisdiction created by him, if any, to meet the new aspect of things is much contested. He seems to have been credited with a judicial magistrate, a collegiate court of the Centumviri and the Decemviri (s celebrating as well as the private judge (actus judex), but the arguments in support of this view are strong, and are, of course, balanced wholly on presumptions. However, it still is convenient to say a few words about each of these courts here.

The centumviral court is often referred to by Cicero, and the range of his jurisdiction is limited by the need to have included that possible question of manus in the old sense of the word—status of individuals, property and its easements, and inheritance whether testate or intestate. By the time of Servius Tullius and the Gauls, the centumviral court was the only matter that was to be present brought before it were questions of inheritance by the jus civile, though theoretically it was still competent in all real actions, and the lancer, the emblem of quiritarian right generally, was still its ensign. During the later Republic the Centumviri formed a quasi-corporate body of private judges selected originally from the tribes (afterwards from the ordinary list of judges) annually by the urban praetors. Some writers identify the centumviral court with the Roman senate of 100; others attribute its institution to Servius Tullius and hold that it was a plebeian court at first; others make it contemporaneous with the XII. Tables; others bring it down to the time of the Decemviri; others hold that it went out of use already in the 1st century. It is in favour of the view that it is not earlier than the beginning of the 7th century. The arguments in support of these several views cannot be gone into here. It is enough to say that we have no positive evidence that the earlier of the 7th century centumvirs were in favour of its having been somewhat earlier. In the exercise of his office the Centumviri acted more independently than any of his successors ventured to do, and even introduced to us some considerable reforms into the law.

There was a court at Rome during the Republic called the Decemviri seditus judicandis. These decemvirs in historic times constituted a quasi-corporate body of judicial magistrates whose duty it was to try certain kinds of actions, especially those relating to personal liberty. During the Principate, while ceasing to act as a separate court, they presided over the divisions into which the centumviral court was divided under Augustus divided. Their origin is quite unknown. Pomponius indeed says that they were originally created soon after the expulsion of the Gauls in 387 B.C. to try the case of the peregrine praetorship in 242 B.C. for this very purpose of presiding over centumviral cases, but this statement is generally disregarded and, if true, its practice of so presiding must quickly have gone into disuse. Those writers who attempt to trace back the centumviri to the regal period give us a rule or a like antiquity to the Decemviri seditus judicandis. On the other hand, some authorities identify them with the decemviri judicandi mentioned by Livy as having been declared by the lex Valeria-Hostilia in 262 B.C. as the successor of the decemvirs. The latter of these authorities seems to have been a purely plebeian court, which early went into desuetude, and there is really no evidence of identity.

So far back as historic evidence goes we find that actions were tried and judgments pronounced by judices and arbitri. There were never more than a single judge (unus or unusus judex) and an arbiter, and, frequently there were three. All kinds of actions, even a sacramental action in rem, could be brought before the unusus judex, but especially appropriate to him were all personal claims of alleged indebiti, whereas arising out of a legal or illegal act, denied either in toto or only as to the amount. Matters of that sort involved as a rule no general principle of law but rather mere disputes as to facts, which could well be decided by a single individual. There is much more reason for crediting Servius with the institution of the single judge (the arbiters may have been a creation of the XII. Tables) than with either of the coercive powers. One believes the Decemviri acted early regarding suits brought to the pontiffs on all other jurisdiction in his own hands, it is plain that this must have become a practical impossibility after the admission of the plebeians to citizenship. For the trial of disputed facts it would be necessary to delegate jurisdiction, and

the earliest judices may have been the king's commissioners for such cases. If this be right, it was the beginning of a system that bore wondrous fruit in after years, and that, as will be shown in the sequel, helped the prae torlar to build up, through the formulae, the whole body of equity. Under the kings it is not improbable that several of the legis actions, more or less undeveloped, were already in use, but the nature of these rules will be more conveniently considered later on (infra, p. 566).

II. The Jus Civile

(From the establishment of the Republic until the subjugation of central and southern Italy.)

i. Constitutional Events affecting the Law.

Jus Civile contrasted with Jus Quiritium.—The term jus civile, as used to designate this chapter, though almost synonymous with, may be taken as somewhat more comprehensive than, jus Quiritium. It is a term of later origin than the latter. Jus Quiritium was based entirely on old custom and legislation, finding, one might say, its culmination in the XII. Tables; whereas in the jus civile, as here understood, there appears the element of doctrinal interpretation of both statute and custom—the magistrates and jurists (particularly the pontiffs) adding much to the earlier law by introducing into it this element. We can say that the jus civile in this sense is jus Quiritium as developed by interpretation. It is as yet, however, little influenced, as was the more comprehensive jus Quiritium of later periods, by the elements of jus gentium and equity. Still nowhere, we must note, are the terms jus Quiritium and jus civile placed in contrast by the jurists; they were each jus proprium civium Romanorum. In the classical law the term jus Quiritium seems to be used principally in formulae framed in accordance with old custom.

Though our information regarding the period is less legendary than that of the kings, it is still far from being completely authentic, as no original documents belonging to it are extant. There is little dispute among critics that Rome was sacked and burned by the Gauls about 387 B.C. or a few years later, and it is probable that the original pontifical annals (annales maximi) upon which Livy and other Roman historians have presumably based their narratives of early history were destroyed at that time along with their written records. What credence, then, we may give to the ancient historical narratives, for the period of the Republic antecedent to this event, depends largely upon how far the pontifices managed to have their lost records restored. In any case, however, there is sufficient presump tive evidence to warrant belief in such prominent events of the early Republic as the creation of two annually elected patrician consuls, with plebiscita similar to that of the kings, the creation of tribunes of the plebs, the enactment of the decemviral code, and periodic struggles between patricians and plebs, the one to keep and the other to gain political power. To know the exact dates of these events is really of little importance.

Legislation in Favour of the Plebs.—In their uphill battle for social and political equality the plebeians conquered stage by stage. The more important of their successes may here just be mentioned, with all reserve as to credibility, in the order of their traditional dates. By the lex Valeria (de pro vocatione) of 509 B.C. it was provided that no Roman citizen should be deprived of life, liberty or citizenship (i.e. suffer poena capitatis), or be scourged, by any magistrate within the city, without an appeal (procurationi) to the comitia centuriata. This statute was often referred to by later Romans as a sort of Magna Carta; Livy calls it unusum praedictum libertatis. In 494 or 493 B.C. the plebeians of the tribunes were created with right of intercession, and about the same time plebiscita and judices decemviri (the latter to act as judges or arbiters in litigations); the persons of all these officials being declared inviolable during their tenure of office. About 471 B.C. the concilium plebis became legislatively recognized, the tribunes
were elected in it, and its resolutions (plebiscita) became directly binding on plebeians. The XII. Tables, twenty years later, were a product of the agitation of the plebeians for a revision and written embodiment of the law. In 449 plebiscita were—subject presumably to auctoritas patrum—declared by the lex Valeria-Horatia binding on the whole populus, while about the same time, or perhaps a little earlier, the patrician-plebeian comitia of the tribes was instituted. 1 By the lex Comelia of 445 B.C. intermarriage between patricians and plebeians was sanctioned. Repeated protests by the plebeians led to the monopolization of the public domain by members of the higher order resulted in the definite admission of their right to participate in its occupation by one of the Licinian laws of 367 B.C. The long course of cruel oppression 2 thus patent to the plebeians that their patrician creditors were put an end to by the Poetilian law about 326 B.C., depriving personal contract of its privileges and generally prohibiting the use of chains and fetters on persons incarcerated for purely civil debt. By the Hortensian law of about 287 B.C. plebiscita were declared binding (presumably without auctoritas patrum) on the whole body of citizens. And from 421 B.C., when one of their number first reached the regular state magistracy as quaestor, down to 252 B.C., when one was elected pontifex maximus, the plebeians gradually vindicated their right as citizens to share in all the honors of the state. There is also evidence that plebeians were as early in the Republic admitted to the senate and also to the comitia curiata.

The legislative bodies during the present period were thus three in number: the comitia of the centuries, the concilium plebis and the comitia tributa. As to the comitia of the centuries, it seems to have hardly concerned itself with general legislation, but met merely to confer imperium on the higher magistrates and to sanction testimonial and adrogations of the gentiles. The legislation of the centuries dealt for the most part (though the XII. Tables were enacted by it) with questions affecting public and constitutional rather than private interests. It could not be convened only by a magistrate having military imperium, i.e. at first only the consuls, for the reason that it was theoretically a military assembly met for civil purposes (exercitum civilis). It is called in the XII. Tables comitatus maximus. Its procedure was cumbrous and ill-adapted for legislation. As to the relation of the concilium plebis to the comitia tributa there is much controversy. The old opinion which identified them is now generally abandoned. According to Mommsen 3 they differed in the following points: (1) The comitia was an assembly of the whole people voting in tribes instead of centuries, while the concilium was an assembly of the plebs alone; (2) the comitia was always convoked and presided over by a patrician magistrate (comitia praetor), while the concilium had to be convoked and presided over by a plebeian official (usually a tribune); (3) in the comitia auspices had to be taken beforehand, but not in the concilium; (4) an enactment of the comitia was a lex binding on all the populus, while an enactment of the concilium was a plebiscitum binding only on the plebs. It is, however, not possible to take Mommsen's view that plebiscita were not binding on the whole populus prior to the lex Hortensia, without disregarding distinct statements of Livy as to the lex Valeria-Horatia and the lex Publicia. 4 But whatever the relation of these two legislative assemblies to each other may have been originally, it is certain that the Hortensian law equalized them so far as their effects were concerned, and, looking to the small number of patricians compared with the plebs, it would probably be a matter of indifference in which assembly the vote was taken. The greater part of the legislation dealing with the private law in the later Republic consisted of plebiscita.

1 There is diversity of opinion about this. Mommsen thinks the comitia tributa was earlier than the XII. Tables, and that the lex Valeria-Horatia was enacted to put an end to it. See Livy, iii. 55, 3; viii. 12, 14.
2 Mommsen, Röm. Forschungen, i. 177 seq.; Röm. Staatsrecht, iii. 322 seq.
3 Livy, iii. 55, 3; viii. 12, 14.
4 Pius, Storia di Roma (Turn., i. 566 seq.

of presumptive evidence is against them; they have hitherto
found little or no support from other Romanists, and they
have, in our opinion, been sufficiently refuted on philological
and other grounds by Girard and others.

There were provisions in the Tables that were almost literal
renderings from the legislation of Solon; and others bore a re-
markably close resemblance to them, at least in substance. But
they may have been only indirectly borrowed. By far the greater
proportion of them, however, were native and original,—not that they amounted to a general formalization of the
books of the diviners, for, notwithstanding their professed
enlightenment of them as the "fountain of the whole law, both private
and public," it seems clear that many branches of it were dealt
with in the Tables, only incidentally, or with reference to some
particular detail. They dealt, in fact, mainly with the forms of
rules of succession, the solemnities of such formal acts as manum-
pication, nexum, and testaments, the main features of the order
of judicial procedure, and so forth,—all of these a general know-
ledge was presumed, and the deponents thought it unnecessary to
define them. What they had to do was to make the law equal
for all, to remove every chance of arbitrary dealing by distinct
sections and penalties and precise declaration of the
stances under which rights should be held to have arisen or been
lost, and to make such amendments as were necessary to meet
the complaints of the plebeians and prevent their oppression in
time of war. But there was very little of the customary law,
therefore, was introduced into the Tables, that was already univer-
sally recognized, and not complained of as either unequal, defective
or prejudicial. Only one or two of the laws ascribed to the kings
(assuming their greater antiquity) reappeared in them; yet the
omission of the rest did not mean their repeal or imply denial of
their validity, for a few of them continued still in force during the
Empire, and others were in the special use of the Senate. Indeed
there were some of the statutes of the Republic anterior to
the Tables embodied in them, although for long afterwards many
a man had to submit to prosecution under these laws and to suffer
the penalties they imposed.

The original Tables are said to have been destroyed when Rome
was sacked and burned by the Gauls. But they were probably
reproduced, and transcripts of them in more or less modernized
language, though less modernized language, must have been
available after 1866, as Cicero says was still the case in his youth, the children
were required to commit them to memory as an ordinary school
task. Thus though in the main the records of them are so fragmentary and their genuineness in many cases so
debatable. They were embodied, as above mentioned, in the
Tripertita of Sextus Aelius Paetus in the year 197 B.C., who
probably reproduced them in somewhat modernized language and
from whose work, it is thought, all later writers took their contents.

They must have formed the basis of all the writings on the jus
civilis. Cicero'sense of duty brought up Titius Rufus, who first took
the praetor's edicts as a text; and they were also the subject of
many commentaries and glosses by authors later than Sulpicius, amongst them M.
Antistius Labeo in the early years of the Empire, and by Caius,
previous to the time of Antoninus
. They are not so all are that can be collected of their provisions in what
prospect to be the tripertita of the Tables, though in a form in
most cases more modern than what we encounter in other remains of
the law which became the laws of the 14th century. The
content principally in the writings of Cicero, the Notiae Atticar
of Aulus Gellius, and the treatise De verborum significatione of Festus;
the latter dealing with them rather as matters of antiquarian
curiosity than as rules of positive law. There are also many
allusions to particular provisions in the pages of Cicero, Varro,
Gellius and the elder Pliny, as well as in those of Gaius, Paul.
Ulpian and other ante-Justinian jurists; but these are not to be
implicitly relied on, as we have evidence that they frequently
represent (the sometimes divergent) glosses of the interpreters
rather than the actual provisions of the statute. Reconstruction
has not thrown much light on the subject, and the result is not satisfac-
tory, that of the latest editor, Voigt, departing very con-
ciderably from the versions generally current during the last
decennaries.

In form the laws contained in the Tables were of remarkable
brevity, terseness and pregnancy, with something of a rhythmic
 cadence that must have greatly facilitated their retention
in memoriam. Roman law was, indeed, made up of a mixture
which embodied permissive; they were nearly all in the
imperative mood, sometimes entering into minute detail
but generally running on broad lines, surmounting instead of
producing difficulties. But there might cause hardship in
individual instances, as when a man was held to the letter of
what he had declared in a nexum or manumication, even though he had
the letter under error induced by fallacious arguments; the
deponents admitted no exceptions, preferring a clear and
unimpeachable rule to any qualifications that might cause uncertainty.
The system as a whole is one of jus as distinguished from ius. In the royal
laws examples (e.g. a eulogium of the king for a crime, or
the Tables it occurs only once pure and simple, and that with
reference to an offence that could be committed only by a patrician,
material loss caused by a patron to his client (patronus, si clienti
franum fali, sacer; Levius in xiv. cases theTables the
jus was an offence against public order, for which the community
was entitled in self-protection to inflict punishment on the
criminal, is prominent. Hanging and beheading, flogging to
dearth, or being thrown from the Tarpeian Rock, or even having
the secular penalties that are met with in the Tables; but often, though
not invariably, the hanging and so forth is at the same time declared
a crime, and to some degree the good of the community are
forfeited (consecratio bonorum). The Tables also recognize the system
of self-help.

The manus injunctis of the third Table—the execution done by a
crew of hired workmen, with the authorization of the consuls,
made their name in usage as a warrant of authority for the enforcement of
the law. They were used, for instance, as a form of writ in
cases of writs in the manner of a legal form as an act of justice, or

Interpretation
of the Tables.

Interpretation of the Tables.
LIMITATION, and in many the deduction of new doctrines from the actual jus scriptum, and their development and exposition. An event that did diminish the influence of the pontiffs in connexion
with it was the divulgation in the year 304 B.C., as already mentioned, by Cn. Flavius, of a formulary of actions and a calendar of lawful and unlawful days, which forms the name of Jus Plantiumum.

The practice adopted in the beginning of the 6th century by Tiberius
Cornelianus, the first plebeian chief pontiff, of giving advice in law in
public had a still greater effect in popularizing it; and the Tripartite
Tables, some fifty years later—a collection that included the
Tables, the interpretatio and the current styles of actions—made it as much the heritage of the laity as of the pontifi-
college.

Subsequent Legislation.—Of legislation during the 4th and 5th centuries that affected the private law we have but scanty
record. The best-known enactments are the Canuleian law of 445 B.C. above mentioned; the Genucian, Marcian and other laws about usury and the rate of interest; the Poetilian law of 326 B.C. abolishing
imprisonment of nesal debtors by their creditors; the Silian law,
probably not long afterwards, which introduced a new form of
process for actions of debt; and the Aquilian law about
287 B.C., which amended the decemviral provisions for actions
of damages for culpable injury to property, and continued to
regulate the law on the subject even in the books of Justinian.

The Citizen and his "caput."—The early law of Rome was
essentially personal, not territorial. A man enjoyed the benefit
of its institutions and of its protection, not because he was
within Romany territory, but because he was a citizen—one of those by whom and for whom
its law was established. The theory of the early Romans was that a man sojourning within the bounds of a
foreign state was at the mercy of the latter and its citizens,
that he himself might be dealt with as a slave, and all that
belonged to him appropriated by the first comper; for he was
outside the pale of the law. Without some sort of alliance
with Rome a stranger had no right to claim protection against
mal-treatment of his person or attempt to deprive him of his
property; and even then, unless he belonged to a state entitled
by treaty to the international judicial remedy of reciprocatio,
it was by an appeal to the good offices of the supreme magistras,
or through the intervention of a citizen to whom he was allied by
the (frequently hereditary) bond of hospitium, and not by
means of any action of the jus civile set in motion by himself.

A non-citizen—originally hostis, and afterwards usually called
peregrinus—in time came to be regarded as entitled to all the
rights recognized by so-called jus gentium as belonging to a
freeman, and to take part as freely as a Roman in any transaction
of the jus gentium; but that was not until Rome, through
contact with other nations and the growth of trade and commerce,
had found it necessary to modify her jurisprudence by the
adoption of many new institutions of a more liberal and less
exclusive character than those of the jus civile.

A citizen's civil personality was technically his caput.
The extent of it depended on his family status. It was only among
citizens that the supremacy of the paterfamilias and the sub-
vention of those in manu, potestas or mancipio were recog-
nized—only among them therefore that the position of an
individual in the family was of moment. While in public life
a man's supremacy or subjection in the family was immaterial,
in private life it was the paterfamilias alone who enjoyed full
juridical capacity. Those subject to him had a more limited
personality; and, so far as capacity to take part in transactions
of the jus civile was concerned, it was not inherent in them but
derived from their paterfamilias: they were the agents of his
will, representatives of his persona in every act whereby a
right was acquired by them for the family to which they
belonged.

Whenever a citizen either ceased altogether to be a member of
a Roman family or passed, either permanently or temporarily,
into subjection to some paterfamilias outside his own family;
there was technically capitis minuta or minuta-deri-
tio. To harmonize with the gradually established con-
ception of jurinal personality in non-citizens, and perhaps
also from their partiality for tripartite divisions, the jurists
at the end of the Republic divided capitis minunio into three
degrees, viz. maxima, media and minima—a division unknown
to lawyers of an earlier period when civitas was theoretically
identified with libertas. When a citizen forfeited his freedom,
his capitis minuta was said to be maxima; he lost all capacity,
whether under the jus civile or the jus gentium. When, retain-
ing freedom, he went into exile or joined a Latin colony, or
otherwise became a peregrin, the loss (minuta) of his capacity
was only media or minora; it was his rights and privileges under
the jus civile that alone were affected. When both freedom and
citizenship remained, and there was produced merely the
severance of connexion with a particular family (familiae mutatio),
the law was said to be minima. Illustrations of c. d.
minima present themselves in the case of a paterfamilias be-
coming filiusfamilias by adoption, or a materfamilias passing
into the hand of a husband by confarreation or coemption; in
both cases he or she who had been sui juris thereby became
aliens juris. It was immaterial whether the change was from a
higher family position to a lower, or from a lower to a higher,
or to the same position in the new family that had been held
in the old—as when a filiusfamilias was transferred by his father
into the potestas of an adopter, or when the filii familiae of a
person giving himself in adoption passed with him into the
potestas of the adoptor: in every case there was capitis
minutio. It was not the change of family position that caused it,
but the subjection to a new potestas. Thus the civil person-
ality of Titius while a filiusfamilias in the potestas of Sempronius,
c. e. the expectancy of succession, the agnate relationships,
the derivative capacity for being a party to a manicipation or a
spousio that resulted from the relationship, all came to an
end through the subjection to a new paterfamilias, temporary
or permanent. He might acquire another and independent
capacity on becoming sui juris by emancipation, or another
derivative capacity on passing into the potestas of Maevius by
adoption; but while subject to a new paterfamilias his old
personality quaod civilia was extinguished. This is what some
of the jurists mean when they say that capitis minuta was
civil death.

An important consequence of minima capitis minutio was that
it not only extinguished patria potestas where it existed,
but severed the bond of agnation between the capite minutio
and all those who had previously been related to him as agnates.
There was no longer any right of succession between them
on intestacy; their reciprocal prospective rights of tutery were
defeated, and the minuto of either tutor or ward put an end to
a subsisting guardianship, assuming always that it was a tutela
legitima or agnate cura feriorio. Very remarkable, yet quite
logical, was the doctrine that the minuto extinguished the
claims of creditors of the minutus; their debtor, the person
with whom they had contracted, was civilly dead, and dead
without an heir, and therefore there was no one against whom
an action of the jus civile could be directed in order to enforce
payment. But equity eventually provided a remedy, by

Neither "alien" nor "foreigner" is an adequate rendering of
persona from paterfamilias. To the former falls all citizens
of other states, independent or dependent, but also &dor,
men who could not call themselves citizens (cives) at all, as, for example, the
dedicati whom Rome had vanquished and whose civic organization
she had destroyed, offenders sent into banishment, &c., and also,
until Caracalla's general grant of the franchise, the greater portion
of his provincial subjects.

This is Mommsen's theory. See Staatsrecht, iii. 1. p. 8.

1 Children who became sui juris by their parent's death, as they
came under no new potestas, were not regarded as capite minutus.
2 The Roman jurists theirselves regarding the nature of cap.
dem. Various theories more or less divergent have been maintained about it by modern writers, of
two of which can it be said that it has been generally accepted.

Mommsen's theory, above adopted, seems to present fewest diffi-
culties. See the subject discussed and authorities cited by Goudy in
was the bond of the potestas over a son that it could not be completely
loosely until the father had three times gone through the
process of fictitious sale by which emancipation was effected. But
the conception of the law was that this might be done rather to impose a penalty on the father and confer
a benefit on a son in potestate, by declaring him ipso jure free from
it on a certain event, than to place difficulties in the way of his
emancipation. If therefore an estate can be transferred beyond
the latter shall be free from his father. It reads as if the intention
were to rescue the son from what, by its frequent repetition, was
suggestive of a total absence of paternal affection rather than
reluctance to exercise his power. The reliance on the descent
object have been to restrain the practice, which did not wholly
disappear even in the late Empire, of men selling their sons or giving
them to their creditors in securing loans of large sums. In
Hedger's
The Law of the Family Relations.—So far as appears no serious
inroad was made by the XLI. Tables on the law affecting husband
and wife, unless in the recognition of the legality of
so-called "free" marriages, i.e. entered into without
any solemnity, and not involving that subjection of the
wife to the husband (manus) which was a necessary
consequence of this lawful potestas and pleban co-
emption. These latter were left untouched, while on the other
hand acquisition of marital manus through usus was fully
recognized. As formerly mentioned, it had become a practice
with some of the plebeians to tie the marriage bond rather
loosely in the first instance, possibly in consequence of objection
by the women (as became quite general even among patricians
at a later period) to renounce their independence and right
to retain their own property and earnings, but more probably
because taking a woman to be merely the mother of children
(considering that even then practice of potestas and pleban co-
emption had been introduced as a means of making her a lawful
wife, and so they had become in a manner habituated to it.
But the idea that, as a man might acquire the ownership of
a thing to which his legal title was defective by prolonged
possession of it, so he might acquire manus over the woman
with whom he had thus informally united himself by prolonged
cohabitation with her as his wife had probably matured and
become custumary law. The Tables accepted it; all that was
needed was to define the conditions under which manus should
be held to have been superinduced, and the wife converted from
a doubtfully lawful potestas and pleban coemption to that of
true legal potestas and pleban coemption that, if a woman, married neither by confarreation nor
cempoion, desired to retain her independence, she must each
year absent herself for three consecutive nights from her
husband's house (triuniotilis ususpatio)—twelve months' un-
interrupted cohabitation being required to give him that power
over her which would have been created instantly had the
marriage been accompanied by either of the recognized solemn-
ities.

Amongst the fragments of the Tables so industriously collected
there was not a single text in which the words manus, or
potestas, were employed in a circumscribed way as to
mentioning a particular point, but it is hardly conceivable that it was as yet unknown. Justinian
thought that in ancient times it was regarded as a donation to the husband
with his wife, rather than as a separate estate that was to be used
by the husband alone. Lasting cohabitation lasted by
law and by usage, but not by any settled custom. He
with some such words as "take what is thine and get thee gone."
This can only refer to free or non-manus marriages, but even for
hand marriages, while repugnancies by husbands (but not by wives)
were competent, the statement of the historians is that they
were few and far between until the 6th century of the city, and that,
until the same date, any man who turned his wife away, however
serious was the ground, without the permission of the family council,
was liable to penalties at the hands of the censors.1

Of the two or three provisions of the Tables known to us that
affected details of the patria potestas, which itself was assumed to be
established by custom, there is no indication that it was necessary
to mention, for sanction or definition, one was in the words "si pater (familias)
fiorem venum duuit, a patre filius liber esto." This came
to be construed by the pontifical lawyers as meaning that so powerful

1 See Cicero, Top. iv. 23.
2 Voigt, XII. Tafeln, ii. p. 486. It has not, however, received
any support from more recent writers.
3 See Esmein, Milanges, pp. 22 seq.
of the testator, or to his pupil children and grown-up unmarried daughters; but such appointment, if unknown previously, was soon held to be justified by a liberal interpretation of the very inclusive provision, "ut legatissui suae rei, ita jus esto." In such case, if the testament the males or agnates of lawful age were to be tutors. This tutory of agnates was an invention of the decremurs, just as was the agnates' right of succession on intestacy. The plebeians had no genites, at least until a much later period; so, to make the law equal for all, it was necessary to introduce a new order of heirs and tutors. "Tutores . . . ex lege XII. Tabularium introducuntur . . . agnati " is the very notable language of Ulpian. And his words are very similar in speaking of their right of succession; for, while he says of testamentary inheritances no more than that they were confirmed by the lex testamenti, brothers in potestas therefore, whether the relationship was by birth or adoption, and his will in manu (being sileae loco) were each other's agnates. But a wife not in manu was not their agnate; nor were children who had been emancipated or otherwise capite minuti the agnates of either their brothers and sisters or their mother in manu. A man was an agnate of his brother's children, assuming always that there had been no capitis dominatio on either side; but he was not an agnate of his sister's children, for they were not ejusdem familiae: they were agnates of their father's family, not of their mother's. In like manner, and again assuming the absence of minuto capitii, the children of brothers were each other's agnates, but not the children of a brother and a sister or of two sisters. Brothers and sisters were agnates of the second degree; a man and his brother's children were of the third, the children of two brothers (patrules) of the fourth, and so on,—it being a condition, however, that the kinship should always result either from lawful marriage or from adoption in one or other of its forms.

When, therefore, a man died leaving pupil male descendants or unmarried female descendants who by his death became sui juris, they got their brothers of lawful age as their tutors; if he was survived by his wife, and she had been in manu, her sons, or it might be stepsons, acted for her in the same capacity; in either case they took office as the equals of the male agnates. If the widow had no sons or stepsons of full age, and the children consequently no qualified brothers, the tutury devolved on the agnates next in order,—i.e. the brothers german and consanguinean of the deceased husband and father; for they were agnates of the third degree. And so with agnates of the fourth and remotest degrees.2 Failing agnates who could demonstrate their propinquity, the tutury passed to the gens when the ward happened to belong to a gens nowhere expressly stated; but Cicero gives what he represents to be an enactment of the Tables, making the fellow-gentiles of a lunatic his guardians on failure of agnates; and analogy seems to justify the extension of the same rule to the cases of sane pupils and female wards.4

The curtiosity of minors above pupillarity was of much later date than the Tables. The only curtories they sanctioned were those of lunatics (juratis) and spendthrifts (prodi). A

1 Ulp. Frag. xxvii. 5, "legitimae hereditatis jus . . . ex lege Duodecim Tabularum descendit." This derivation of agnatic inheritance from the XII. Tables was specially noticed by Danz in his Gesch. d. röm. Rechts (2nd ed., Leipzig, 1871-73), ii. 95, but is generally unnoticed.

2 To determine the degree of propinquity between two persons it was necessary to count the generations upwards from the first to the last; for, as Danz remarks, a great deal depended on the number. Consequently brothers were related in the second degree, uncle and nephew in the third, first cousins in the fourth, and so on.

3 See Gal. i. 165.

4 The agnat of the lunatic was committed to the care of his agnates, and, failing them, of his fellow-gentiles; and a few words in Festus seem to suggest that arrangements had to be made by them for his safe custody.

Mancipatio and the Law of Property.—In the early law, as we have seen, there was no technical word for ownership of things: it was an element of the house-father's manus. In time, although it is impossible to say when, the word dominiom came into use, but, so far as can be discovered, it did not occur in the XII. Tables, and must have been of later introduction. In those days, when a man asserted ownership of a thing, he was content to say, "It is mine," or "It is mine according to the law of the Quirites." It is said by some jurists of eminence that under the law of the Tables what afterwards came to be called "dominium ex jurid. hereditatis" was competent only in the case of res mancipi—of a man's house and farm, and things appurtenant thereto, as slaves and animals with which he worked them. There is much to be said for this hypothesis, but it is so far contradicted by Ulpian and Paul, who tell us that tigia juncta (that is, building materials, vine stakes and the like, which undoubtedly were res nec mancipi) were exceptionally excluded from vindication. On the other hand, these texts may be explained as mere deductions by interpretation at a later time of the words "ne solvito" of the XII. Tables.5 At any rate it is pretty certain that before the close of the present century ownership, as well as res mancipi could be held in quiritarian ownership.

The modes in which these two classes of things might be acquired in property were various. But there was this important difference: that, while a natural mode of acquisition sufficed in the case of res nec mancipi, some civil one was necessary for the derivative acquisition, at all events, of res mancipi. The most important were mancipation, surrender in court, usucaption and bequest as singular modes, and inheritance, in manum convertit, adrogation and purchase of a confiscated estate, as universal ones. All of these, with the exception of mancipation, applied equally to res mancipi and res nec mancipi. But there was, in addition, for res nec mancipi, what was the commonest of all the modes of transferring things of this class, simple tradition. If the transfer of these was by the owner, with the intention of passing the property, then the simple delivery of possession (traditio) was enough, unless indeed it was in virtue of a sale; in which latter case the ownership remained with the vendor, notwithstanding the change of possession, until the price was paid or security given for it.6 Only mancipation, surrender in court and usucaption, however, need be noticed at present.

The origin of the distinction between mancipable and nonmancipable things, and of the form of conveyance by mancipation instead of the first, has been explained (supra, p. 287). Originally mancipation was not the imaginary sale that Gaius speaks of, but as real a sale as could well be conceived—the weighing in scales, held by an official, of the raw metal that was to be the consideration for the transfer of a res mancipi, and the handing of it by the transferee to the transferrer, with the declaration that thereby and therewith the thing in question became his in quiritary right. On the introduction of coined money weighing was needless, and price was no longer paid. In the ceremony, or sometimes left to be done afterwards; and though, in that spirit of conservatism that was so marked in the adhesion

5 Being the only authority for attributing this fundamental rule to the XII. Tables is Jurisprudentiae Instituti, ii. 1, § 41, where there is clear evidence of a Tribonianism. The rule undoubtedly must have been applied to res mancipaci in the Tables, and possibly its extension to things of res nec mancipi may have been due to interpretation. See Girard, ut supra, p. 288; cf. Coq, Institutions Jurid. i. p. 87.

ROMAN LAW

[to time-honoured forms after their raison d'être was gone], the scale-bearer and the scales were still retained as indispensable elements of the mancipation, yet the scales were simply touched by the purchaser with a duplum or a single coin, in order that he might be able to recite the old formula: "I say that this slave is mine in quiritium right, and that by purchase (for such and such a price) with these scales and this bit of copper. And that one coin was then handed over to the candidate in the presence of witnesses, and the transferee as if it were in fact the price of the purchase (quasi pretti loco). Thus transformed, the mancipation was undoubtedly an imaginary sale; for the real price might have been paid weeks or months before the mancipation might not take place until the formalities of afterwards. The mancipation had become nothing more than a conveyance, and in this form it continued down to the end of the 3rd century of the Empire to be the appropriate mode of transfer.

Thus, as Cicero says, in his tables: "What is by the law of Italy was by the law of Justinian," the last word of the transfer, being a thing a complete legal title (dominium ex jure quiritium). After that, it seems gradually to have gone into disuse, being replaced by some other mode of transfer. It seems to have been used only where the extent of the land was called jus Italicum; and long before the time of Justinian it had practically disappeared.

The effects of a mancipation, provided the price had been paid or security given for it, were that the property passed instantly to the purchaser, and that the transferee was held to warrant the transferee against eviction from the moment the price was received. In some of the legal aphorisms or suttaries for it, the tide still remained with the vendor, so that there was no possibility of obtaining a reversion of a real action, to get back what had been mancipated, even though it had passed into the possession of the vendee. The vendee, when the mancipated, was supposed to have arisen ipso jure—that is to say, without anything expressly said about it; the acceptance by the transferee for the coin with which the scales had been struck was held to have implied an obligation to take it for an amount equal to any amount of the possession, under a penalty of double the amount of the price, recoverable by the latter by what is usually called an actio auctorialis. But that did not prevent the vendee in the case of donations, &c., fictitiously, when, on purpose to exclude the warranty, the recital of the mancipation was that the price was a single sestertius.

The right of a vendee to sue an actio auctorialis arose only when eviction resulted from a decree in a regular judicial process at the instance of a third party disputing his title, and was conditional on the vendee being in the present of his part, and the vendor (auctor) into the field to defend his own interests. And the duration of the auctorialis was limited by the Tables to two years in the case of lands and houses, to one year in the case of other things. As possession for those periods was sufficiently in defect in the vendee's title, it was but reasonable that with their expiry the vendor's liability on his warranty should be at an end.

Cicero in his Tables gives this definition of the useus magisterial inclusion term: numen faciet mancipiumque, ut lingua nuncupasset, ut jas est, &c., the importance of mancipation was immensely increased; for any sort of qualification given to the transaction might be superfluous, and the transfer might remain unimpeachable as to its validity. Such qualifications were spoken of as leges mancipii—self-imposed terms, conditions or qualifications of the conveyance as arising from the mancipation peril et libram, they partook of its binding character, and were transferred with it.

The matter of oral declaration might be the acreage of lands, their freedom from burdens or right to easements, reservation of a usufruct, undertaking to convey on a certain event, or what not, so long as it did not express a term or condition; the result was just so many obligations created peril et libram, whose travevion or denial (Cicero tells us) was punished with a twofold penalty. Ordinarily the words spoken in the hearing of witnesses fixed the beginning and the end of the liability; it was enough that they were literally complied with, however much the vendee might be injured by something inconsistent with their spirit, or which he had not had the precaution to have made part of the declaration. But there was an exception (although not introduced until long after the Tables) in the case of the usufructuary right in the mancipated thing was known by the name of fiducia, i.e. where the mancipation was to a creditor in security or to a friend for safe custody, and the engagement was to return the thing mancipated, in the one case when the debt should be paid the next day, in the other by delivering it as sureties, the transferee took the conveyance in more the transferee's interest than his own; he became a sort of trustee, entitled to be treated with magisterial respect, as the individual in the twofold penalty when his inability to recover was due to the fault of his, not of his, not of the fiduciary, and to the terms of the conveyance.

1 Cit. de Off. iii. 16, § 65. Some writers, e.g. Girard, Manuel de droit romain, p. 350, n. 5, take the view that, apart from the actio auctorialis, the penalty of a duplum was ipso jure incurred. But this puts a gloss on Cicero's language.

jurisdiction it developed into the carefully regulated positive prescription which has to a greater or less extent found a place in every modern

The conception of the abstract notion of a real right in (or over) the property of another person (jus in re aliena) is not to be looked for at so early a period in the history of the law as that now under consideration.

The rural servitudes of water and water were no doubt very early recognized, for they ranked as res mancipi, and the XII. Tables contained various regulations in reference to the former. Usufruct, too, was probably not unknown; but the urban pradial scrivutus bear the impress of a somewhat later jurisprudence. Fignorage and hypothesis rights were certainly unknown as rights protected by action. Between private parties this and a thing of the kind of a real security was the fiducia that is described above. Approaching more nearly to the modern idea of a mortgage was the security praedibus praedissitque required by the state from those indebted to it in assurance of their obligations. Here there was the double guarantee of sureties (praedates) and mortgages of lands of theirs (praditia subsignata); but how they were dealt with when the debtor made default is by no means clear.

Changes in the Law of Succession.—The two forms of testament of the regal period, viz., that made in the comitia of curiae and that by soldiers on the eve of battle, still remained in use in the early Republic; though before the end of the Republic they were displaced by the general adoption of that executed with the copper and scales (testamentum per aes et libram). It seems to be the general opinion that it was to the first two alone that the words applied which stood in the forefront of the provisions of the XII. Tables about inheritance: "uti legassit suae rei, ita jus esto." Whether resort was to the comitia or to the army, the testator's own will in the matter was henceforth to be supreme. There was to be no more reference to the pontiffs and the ex officio, the testament in the interests of the familia sacra and of creditors of the testator's from legislators, sanctioning a departure from the ordinary rules of succession, the assembled Quirites became merely witnesses—recipients of the oral declaration of the testator's will in regard to his inheritance.

The testament with the copper and the scales is depicted by Gaius as a written instrument. But he presents it in what might be described as the third stage of its history.

Its probable origin has been explained (supra, p. 534). It was originally not a testament but only a make-shift for one. A plebeian was not qualified in the regal period to make a testament in the comitia; so, instead, he transferred his estate to a friend on whom he could rely, with instructions how to distribute it on his death. The transferee was called familiae empor, because the conveyance was in form a mancipation for a nominal price.

It is not at all unlikely that the same device may occasionally have been resorted to by a patrician who had neglected to make a regular testament, and was seized with mortal illness before he had an opportunity of appealing to the curies. But such a disposition was not a testament and may not have been so called. A testament was the nomination of a person as the testator's heir. It made the person instituted as fully the representative of the testator after his death as his heir-at-law would have been had he died intestate. The original mos causar mancipation that opened the way for the testament for aed et libram conferred upon the familiae empor no such character. Gaius says that he stood in place of an heir (hereditas loco), inasmuch as he had such of an heir's rights and duties as the familiae empor had in his power to confer and impose; but the transaction was not a conveyance with a limitation of the right of the grantee. It has been argued that, as the law did not recognize conditional mancipation, the conveyance must be considered as voluntarily given and invalid in the grantee. But this does not follow. For it was quite competent for a man, in transferring property by mancipation, to reserve to himself a life interest; and apparently it was equally competent for him to postpone delivery of possession, without the law recog- nizing that the mancipation itself could not be ex certo tempore. So far as one can see, therefore, there was nothing to prevent the grantor of the conveyance (or quasi-testator) bargaining that he was to make a present possession of the property and that the rule that the purchase right could not be so closely followed by the lessee as to prevent the conveyance of it in the future. It is difficult to see how the conveyance of a greater right than that of the possession of land (usufructum) and of the right to dispose of the land (usu episcopum) could have been conveyed to the testator without having achieved the same ends as the original testamentum.

Cicero incidentally remarks—what indeed the nature of the transaction of itself very distinctly suggests—that the true testament with the copper and the scales had its statutory warrant, not in the uti legassit suae rei of the XII. Tables, but in the provision contained in the words: "cum nexum faciet mancipline, uti lingua nuncupassit, ita jus esto." Reflection on the import and comprehensiveness of these words led the pontificlal interpreters to the conclusion that there was nothing in them to prevent the direct institution of an heir in the course of the verb muncipatio engravened on a mancipation.

From the moment this view was adopted and put in practice the familiae mancipatio ceased to be a transfer of the testator's estate to the familiae empor, the latter's purchase was now for form's sake only, though still an indispensable form, since it was it alone that, according to the letter of the statute, imparted efficacy to the muncipatio. But it was the muncipatio—the oral declaration addressed to the witnesses—that really contained the testamentary disposition, i.e. the institution of an heir, with such other provisions as the testator thought fit to embody in it. This was the second stage in the history of the testament per aes et libram. The third was marked by the introduction of tablets in which the testamentary provisions were set out in writing, and which the testator displayed to the witnesses, folded and tied up in the usual manner, declaring that they contained the record of his last will.

Gaius narrates the words spoken by the familiae empor and addressed to the testator as follows: "Your estate and belongings (familia pecuniam tua), be they mine by purchase with this bit of copper and these tablets and subject to these terms; and deposit in my keeping, that so you may lawfully make your testament according to the statute (qua tu funre testamentum facere possis secundum legem publicam)." The meaning of the words "in my keeping (mea custodialem meum)" is not quite obvious; they are probably remnants of an older style, but may be due to a clerical error in the writer of the Verona MS. Certain it is that they no more imported a real custody than a real property in the familiae empor; for the testator remained so entirely master of his estate that the very next day if he pleased he might mancipate it anew to a different purchaser, and nuncupasse fresh testamentary writings. The manci- pation by the testator of the real estate to the familiae empor was thus a mere form of the testamentum in the true sense of the word. To the appeal of the testator the witnesses responded by giving their testimony in words which unfortunately are not preserved; and then the testament was sealed by testator, officials and witnesses, and thereupon the delivery of the testator was outside the grant of title, in fact a ceremony of consecration. But the testator had transferred everything else to the familiae empor as well.

Although this testament with the copper and the scales was justi- fied in the first instance by the provision of the XII. Tables as to the effect of nuncupative words annexed to a mancipation, yet in course of time it came to be regarded as a substitute for the written form, which dealt directly with testamentary dispositions; uti legassit suae rei, ita jus esto. Upon the words uti legassit the widest possible meaning was put by the interpreters: not only was a testator held entitled on the law so to hand a mancipation together with an order to the familiae empor to mancipate no other than slaves and make bequests to legatees, but he might

1 Hypothecary rights were unknown until near the end of the Republic, but Festus (i.e. "Nancator"; see Bruns, Pontes, 6th ed. ii. i. 10) speaks of a provision in the Cassian league between Rome and the Latin states of the year 262 B.C.—"Si quid pignoris nascitur, sibi habeto"—which may suggest that the Romans at this period were not altogether unacquainted with pledge or pawn of movables as a transaction of some value (facit ille non de jure). A mortgaging in the sense of a legal transfer of possession was regarded with a certain horror of the care with which the value of the movables was to be preserved by a supervision in person. The usual form of legatees. This passage is cited by us (infra, p. 592.)

2 See Girard, Manuel de droit romain, 4th ed. p. 800. On the use of the "uti legassit" law of the Tables see ibid. p. 782, and cf. Cagn, Institution Juridique, 787, where the following is said: "From the time that the legatees, with the exception of the testator himself, were considered in law to have the right to sell on the precedent of the testator, the testator who had given the legatees the right to sell, was treated in law as the author of the sale; and the testator was described in the statutes as having made the sale, just as the testator was said to have given the legatees power to sell."

3 The comitia, Gaius tells us (infra, § 102), met only twice a year to sanction testaments. In Mozans's view, Röm. Chronologie (1859), pp. 241 seq., these days were the 24th of March and the 24th of May.

4 Cic. De Or. i. 57, § 245.

5 On the above passage of Gaius, see Sohn, Inst. § 90.
even disinherit a child in his postestates (suus heres) in favour of a stranger, so long as he did so in express terms. Institution of a stranger, without specific mention of the suus heres, however, was fatal, if the father without express disinherit (exhereditatio) his father could not deprive him of the interest he had in the family property as in a manner one of its joint owners. It can hardly be supposed that the law (as the Tables) was to be confined in the manner of the Tables; it was foreign to the traditional conception of the family and the family estate. But it was a right whose succession could not be resisted when claimed as embraced in the suii legassi, although generally disinherit, and as far as possible restrained by the strictness of the rules imposed on its exercise.

In the absence of a testament, or on its failure from any cause, the succession opened to the heirs ab intestato. So notoriously were the suii heredes entitled to the first place—and that of persons now entering upon the active exercise of rights hitherto existing, though in a manner dormant—that the compilers of the XII. Tables thought it superfluous expressly to declare it. "If a man die intestate, leaving no suus heres, his nearest agnate shall have his estate. If the agnate also fail, his gentilicel shall have it." 1 It has been pointed out, in dealing with the tutury of agnates, that the notion of agnation, as a bond distinct from that which connected the gentile members of a clan, was due to the decemvirs. They had to devise a law of intestate tutury and succession suitable alike to the patriarchs who had gentes and to the plebeians who had none. To put the latter in exactly the same position as the former was beyond their power; for the fact had to be faced that the plebeians had no gentile institutions, and to create them was impossible. The difficulty was overcome by accepting the principle of agnation upon which the patriarchal gens was constructed, and establishing an agnatic circle of kinsmen (perhaps at first limited to the sixth degree) to which the gens as a collective body should be postponed in the case of the patricians, and which should come in place of it in the case of the plebeians. It was not perfect equalization, but the nearest approach to it that the circumstances permitted. The difference was that, when the agnates of a plebeian intestate failed, his inheritance was vacant; whereas, on failure of those of a patrician, there was devolution to his gens in its collective capacity. Two interpretations put upon the statute had an important bearing in this connexion, viz. (1) that, if the nearest agnate in the intestate succession next in degree were not allowed to take it; and (2) that no female agnate could take it more remote than a sister of the deceased intestate. The division among two or more agnates was always per capita, not per stirpes.

The order of intestate succession thus established by the XII. Tables, which prevailed until amended by the praetors probably, in the 8th century of the city, was first to the suii heredes of the deceased, next to his nearest agnate or agnates, and finally, if the deceased was a patrician, to his gens. 2 His suii heredes, speaking broadly, were those of his descendants in his postestates when he died who by that event (or even after it, but before his intestacy became manifest) became suii juris, together with his wife in manu (who, as regarded his succession, was reckoned as a daughter); but they did not include children whom he had emancipated or daughters who had passed in manum of a husband. Emancipated children did not even come in as agnates on failure of suii; for emancipation severed the tie of agnation as well as that of postestates. For the same reason no kinsman who had been emancipated, and so cut off from the family tree, could claim as an agnate; for those only were agnates who were subject to the same patria potestas, or would have been had the common family head been still alive.

The opening of a succession (technically delatio hereditatis) in favour of suii heredes, whether in virtue of a testamentary institution or by operation of law on intestacy, at once invested them with the character, rights and responsibilities of heirs. No acceptance was necessary, nor, according to a rule on the laws of the jus civile, was any declinature competent. They had been all along in a manner joint owners with their parent of the family estate, which by his death had become, nominally at least, theirs alone; and the fact was, that, by taking distinct interest in it by emancipating or disinherit them, they were not now allowed to disown it. Hence they were spoken of as necessary heirs (heredes necessarii); and it is necessary to remark, that his interest in the testamentary gift of liberty was a necessary heir: he could not decline, and was invested with the character of heir the moment the testamentor died. Not so with stranger institutions or agnates taking into intestate, took any interest in the exercise of the testamentary liberty in the event the inheritance devolved insipient. The suii legassi of the Tables, as interpreted by the pontiffs, conferred upon a testamentor very great latitude of testamentary disposition, even to the extent of disinheritance of suii heredes. This was a course, however, that was probably rarely resorted to unless when a child had been guilty of gross ingratitude, or when the parent had reason to believe his estate was insolvent and desired to protect his children from the vicissitudes of a public debtor's fate; or had they had him, would be his institutes, and the purpose of the testament either to apportion the estate amongst them as he thought expedient, or to give him an opportunity of appointing tutors, bequeathing legal appurtenances, or testifying his paternal affection, but per stirpes; that is to say, grandchildren by a son who had predeceased or been emancipated, but who themselves had been retained in their grandparent's intestate, took one-fourth of the share which their father would otherwise have been entitled, instead of taking equal shares with their surviving uncles.

It was by no means unusual, when the whole inheritance descended to sons, for them to hold it in common for many years as quasi partners (consortes); but any one of them was entitled at any moment to claim a partition which was effected judicially, by an arbitral procedure introduced by the XII. Tables, termed a judicium (or arbitrium) faciundum. The intestate inheritance was disposed of testamentarily, whether to equal or unequal shares, if one of them failed either by predecease or declinate his share accured ipso jure to the others; for it was a rule that early became proverbial that a man could not die partly testate and partly intestate; there was the same accrual among agnates on intestate; and both they and stranger testamentary institutes had the same action for division of the inheritance that was made use of by suii legassae usucapio per stirpes. Intestate succession.

According to Gaius it was as a stimulus to heirs to enter as soon as possible to an inheritance that had opened to them, and thus may have been a provision closely resembling the practice of creditors of the deceased and attending to his family sacra, that the law came to recognize the somewhat remarkable institution of usucapio or prescriptive acquisition (the inheritance was said to be usucapion, or suus heres). Such usucapion was impossible—there was no room for it—if the deceased had left suii heredes; for the inheritance vested in them the moment he died. But, if there were no suii heredes, then any person taking possession of the property that had belonged to the deceased, and holding it for twelve months without interruption, thereby acquired it as if he were heir; in fact, according to the views then held, he acquired the inheritance itself. Gaius characterizes it as a dishonest acquisition, inasmuch as the usucapient knew that what he had taken possession of was not his. But, as already explained, the usucapion of the XII. Tables did not require bona fide on the part of the intestate, nor the use or possession of prolonged possession of what he knew did not belong to him so long as he did not appropriate it thievishly, i.e. knowing that it belonged to another. But an inheritance unappropriated by the intestate himself had not been acquired in strictness to no one; and there was no theft, therefore, when a person took possession of it with a view to usucapio in the character of heir. There can be little doubt that on the completion of his possession he was regarded as an heir intestate. But this tenet was taken under a testament or as heir-at-law on intestacy—that is to say, that he was held responsible to creditors of the deceased and required to charge himself with the family sacra. Gaius does not say as much; but Curtius and others are of opinion, that though this burden upon him who had usucapio by possession the greater part of a deceased person's estate; and it is but reasonable to suppose that the burden of debts must in like manner have fallen upon the intestate, unappropriated as he had been taken of the deceased's property.

1 This was for freedmen citizens; for freedmen, the patron (or his children in postestates) took the place of the nearest agnates.

2 Cic. de lege dig. ii. 48, 49.
The Law of Obligations.—In his Liber Aequorum Gaius says obligations arise from either contract or delict, or miscellaneous causes (variae causarum figurae). But those arising from contract fill a place in the later jurisprudence of the law of obligations greater than that of delict—a fact which is seen in the XII. Tables: it was different. In them delicts were much more prominent than contracts—wrongs entitling the sufferer to demand the imposition of penalties upon the wrong-doer that in most cases covered both reparation and punishment. The disproportion in the formulated provisions in reference to the two sources of obligation, however, is not surprising. For, first of all, the purpose of the decemviral code was to remove uncertainties and leave as little as possible to the arbitrariness of the magistrates. In nothing was there more scope for this than in the imposition of penalties; and, as different offences required different penalties, the provisions in reference to them were necessarily multiplied. In the next place, the intercourse that evokes contract was as yet very limited. Agriculture was the occupation of the great majority; of trade and commerce there was little; coined money had hardly begun to be used in a circulating medium. Lastly, the safeguards of engagement then lay to a great extent in the sworn oath or the pledged faith, of which the law (jus) hardly yet took cognizance, but which found a protection quite as potent in the religious and moral sentiments that had so firm a hold on the people.

It may be asked,—If a man purchased sheep or store cattle, a plough, a slave, a piece of coin, or anything else, without having given delivery, the vendor no action for payment of the price? Did the hire of a horse or the loan of a bullock create no obligation? Was partnership unknown, and deposit, and suretyship, and bail, and all other forms of radimonium? One can have no hesitation in answering that, as transactions of daily life, they must all have been more or less frequent. It does not follow, however, that they were already regulated by the law. The tribunals alone must have decided these cases. Of the Roman law we know nothing; and it can only have been, when for some reason or other, the arrangement was exceptionally for delivery or payment at a future date, say next market day, that obligation was held to have been created. Was this obligation enforceable by the civil tribunals?

Some jurists hold that it was,—that at no time were the jus gentium contracts outside the protection of judicial remedies, although by a simpler procedure than that resorted to for enforcement of the contracts of the jus civilis. But two provisions in the XII. Tables seem to show that it was not so enforceable when they were drawn up. The first is that already referred to as recorded by Justinian,—that, where a thing was sold and delivered, the property, nevertheless, was not to pass until the price had been paid or sedes (vades) for it accepted by the vendor. From being a recognition of the obligatory nature of the transaction, this provision is really a recognition of the inability of the law to enforce payment of the price by the vendee; it is a declaration that, on the latter's failure to pay, the vendor, unprotected by any personal action, should be entitled to get back the thing sold as still his own, no matter in whose hands he found it. It is a wasteful institution of a party who, as a stranger, has bought a victim for sacrifice, but had failed to pay for it. A real action for its revendication by the seller after it had been consumed on the altar was out of the question; so he was authorized by the Tables, by the process of figurae, capia, at his own hand to appropriate in satisfaction a sufficient equivalent out of the belongings of the purchaser, against whom he had no personal action.

It was a principle of the law of Rome through the whole of its history, though in course of time subject to an increasing number of exceptions, that mere agreement between two persons did not give him in whose favour it was conceived a right to demand its enforcement. To entitle a man to claim the intervention of the civil tribunals to compel implantment of an engagement undertaken by another, it was necessary (subject to those exceptions) either that it should be clothed in some form prescribed or recognized by the law, or that it should be accompanied or followed by some relative act which rendered it something more than a mere interchange of consent. Under the jurisprudence of the XII. Tables the formalities required to elevate an agreement to the rank of obligation sometimes combined ceremonial act and words of style, sometimes did not go beyond words of style, but in all cases took place before witnesses. Dolis dicere, the undertaking of a parent to provide a dowry with his daughter whom he was giving in marriage, and vadimonium, the guarantee of a surety for the due fulfilment of the undertaking either of a party to a contract or a party to a litigation (some think only the latter), probably required nothing more than words of style before persons who could if necessary bear witness to them; whereas an engagement incident to a mancipation, or an undertaking to appeal made to the witnesses for their testimony. Unfortunatly the cocnealed paper was meant on the regular cultivation of their little acres, and on each operation of the agricultural year being performed in proper rotation and at the proper season. But this was every now and again interfered with by wars which detained them from home at seed-time or harvest, practically rendering their farms unproductive, and leaving them and their families in straits for the commonest necessities of life.

The practice of lending per libram was doubtless of great antiquity—indeed, the intervention of the scales was a necessity when money or what passed for it had to be weighed instead of counted; and not improbably old customs were conceded to a lender who had thus made an advance in the presence of witnesses some very summary and stringent remedy against a borrower who failed in repayment. How, after the Servian reforms, it was subjected to much the same formalities as were required for mancipation has been shown already. With the introduction of a coagile the transaction, instead of being per libram simply, became one per aetas et libram; the scales were touched with a single piece, representing the money which had already been or was about to be paid, a formula recited whereby the obligation of repayment was imposed on the borrower, and in great measure kept him from falling into debt. The phrase damos esto, like the rest of the formula, is unsupported by any conclusive authority;
but, as it is in harmony with the formula which is given by Gaius for dissolving an obligation of this kind, and with that most frequently employed in the Republic for enforcing, by a public body, the duty to pay a fixed and definite sum, it may not be wide of the mark.

What was the effect of this procedure? The question is one not easily answered. Brinz expressed the opinion that the creditor was entitled in virtue of the nexum to take his debtor into custody at any time where that creditor considered it necessary; and Voigt has pointed out, even before the conventional term of repayment—that the debtor was in bonds, virtually a pledge, from the very first, and the tightness or looseness of them a matter in the discretion of the creditor. Voigt has shown, however, that the creditor any peculiar hold over his debtor, and that on the latter's failure to repay an ordinary action was necessary, to be followed by the usual proceedings in execution if judgment was not given. The former in such a case was doubly nexum; he was at once in the bonds of legal obligation and in those of physical constraint. In many passages of which Livy speaks, he was apprehended, but, extremely impossible, to be sure in which sense they use the word. It is therefore not surprising that there should be considerable diversity of opinion on the subject.

Since Huschke, the great majority of writers—Voigt, Lenel and Mitteis are distinguished exceptions—concur in opinion that the nexeact contract entitled the creditor, after expiry of thirty days after the consummation of the date of the loan, to recover against his debtor by manus injecto without any antecedent action or judgment, and failing settlement to detain him, and put him to servile labour, and subject him to servile treatment, until he had paid the loan, and that this was paralleled on the one hand with amongst many ancient nations—Jews, Greeks, Scandinavians, Germans, &c. And it was not altogether unreasonable. If a borrower had already exhausted all available means of raising money, or had sold or mortgaged everything he possessed of any value, what other course was open to him in his necessity except to impel himself? That the creditor should have been entitled to recover in cases where that was the judgment of the court and of the tacit engagement of the debtor. The only valid objection apparently that could be stated against the creditor's apprehension of his debtor in execution was that the latter existed—that the loan had been repaid. But a nexeact debt could be legally discharged only by nexe act libero, which also was a solemn procedure per aes et libram in the presence of five citizen witnesses. What need for a judicial inquiry in the presence of facts so plain? A creditor would merely require of the debtor to do the deed to manus injecto if his loan had been repaid; if he did, the testimony of the witnesses to the discharge would at once procure the release of his alleged debtor. It was probably to avoid some of the XIX. Tables required that a creditor who had apprehended a nexeact debtor should bring him into court before carrying off his goods to detention.

Whether there was room for a remedy or a means of a magisterial action after sixty days, with power to kill or sell into slavery after addiction, are disputed questions, but there seems no good reason for distinguishing a nexe act from a judicatius debt in the respect mentioned. It was held by the more contract was placed in loco servit, or that by arrest he was in a worse position than one condemned for a judgment debt, of whom Quintillian states distinctly that he still retained his position in the census and in his tribe. Many a time when the exigencies of the state required it, were the nexe temps temporarily released in order to obey a call to arms—to fulfil the duty incumbent on them as citizens. The nexe act, in position after the death of his former rights is obscure. If originally they shared his nexe condition, this did not long continue to be the law. If he was a house-father he seemingly still retained his manus over his wife and possessions after his death; but if they were nexe, his condition in the census was retained. His children were required to make a substantial repair for the loss caused by his breach of contract.

The abuses to which this system of personal execution we rise were many. Livy tells us, that the Thucydides, 1428 u.c. (326 B.C.) a more than ordinarily flagrant outrage committed by a creditor upon one of his young nexe, who had given himself up as responsible for a loan contracted by his deceased father, caused such a popular demand for the introduction of nexe into the law as to necessitate instant remedial legislation. The result was the Poetilian law (Lex Poetilia Papiaria). So far as can be gathered from the meagre accounts of it, the new arrangements were as follows: (1) that letters and neck, arm or foot blocks should in future be applied only to persons undergoing imprisonment for crime or debt; (2) that no one should ever again be the nexe, if he had given his dependants as security of his nexe. These rules, however, could be satisfied if the debtor was to be held in for a period of sixty days, after which he could be released. The first was intended to prevent unnecessary restraint upon judgment-debtors formally given over to their creditors. The second did not necessarily abolish the contract of loan per aes et libram, but only what had hitherto been an ipso jure consequence of it—the creditor's right to incarcerate his debtor without either the judgment of a court or the warrant of a magistrate. For the future, execution was to be done against a person who had given security for a loan, and not at the discretion of a creditor by magisterial decree, and under the restrictions and limitations imposed by the Poetilian law itself. This very soon led to the doctrine of nexe obligation; or as it is called in another passage, the extension of the principle. It was only necessary that the creditor, before proceeding, should notify by posting the same, that the debtor was to be released, and the creditor then went to law for the recovery of his money. It was also necessary that the debtor should appear in person at the court of the creditor's choice, and that he should, in that court, pay over the amount of the loan, and the creditor received the same as in the ordinary way. The creditor then proceeded to force the judgment upon them; but Varro limits it to those who bonam causam jurasit—those apparently who were able to declare on oath that they had done their best and could do no more to meet their creditors' claims. Such a limitation can hardly be called unreasonable, even were we to assume—as probably we ought to do—that the release spoken of was only from the bonds of physical restraint, not from those of legal obligation.

The introduction of the Stipulatio. Few events in the history of the private law were followed by more far-reaching consequences than the introduction of the stipulatio. It exercised an enormous influence on the law of contract; for by means of it there was created a unilateral obligation that in time became adaptable to almost every conceivable undertaking by one man in favour of another. By the use of certain words of style in the form of question and answer any lawful agreement could thereby be made not only

1 Brinz, in Grünhut's Zeitschr. i. 22. He likens the position of the nexe to that of a thing—land, say—mortgaged to a creditor in security of a claim. Such security the Roman jurists constantly speak of as res obligata, and sometimes as res nexe. As Brinz observes, the thing was obligata from the first, and continued so long as the debt it secured was unpaid, even though the creditor found it unnecessary to reduce it into possession or interfere with it in any way.

2 See authorities in Brinz's paper in Grünhut's Zeitschr. i. 25. The usual term of expression in the legal style in Marculfs (Form. ii. 27), in which a borrower engages that, until he shall have repaid his loan, his creditor shall have right to his services so many days a week, and shall have power to inflict corporal punishment if there be dilatoriness in rendering them.

Rechtshofn (Jena, 1857), S. 104; Voigt, Die Rechtsformen in den Formencontracten (Leipzig, 1858), § 2; Voigt, Jus nat., &c.; D. Röm. vol. ii. § 33, vol. iv. Beilage xix.; Bekker, Abhandl. i. 382—401;

4 The meaning of these words, however, is disputed. See Green, Locke, and Jevon, who have never yet defined this contract of loan, and the whole doctrine on the subject therefo

5 See authorities in Brinz's paper in Grünhut's Zeitschr. i. 25. The usual term of expression in the legal style in Marculfs (Form. ii. 27), in which a borrower engages that, until he shall have repaid his loan, his creditor shall have right to his services so many days a week, and shall have power to inflict corporal punishment if there be dilatoriness in rendering them.
morally but legally binding, so that much which previously had no other guarantee than a man’s sense of honour now passed directly under the protection of the tribunals. Stipulations became the complement of engagements which without them rested simply on good faith, as when a vendor gave his stipulatory promise to his vendee to guarantee peaceable possession of the thing sold. The law may have been thus added to the earlier jurisprudence of the lex Silicia. Yet although juris civilis, both the sponsio and the later forms were from the first free from many of the impediments of the earlier actus legislimi. No witnesses were required to assist at them; and they were always susceptible of qualification by conditions and terms. It was long, however, before parties had much latitude in their choice of language; sponsio was so peculiarly solemn that no equivalent could be admitted; and even the sponsio had to be accompanied by the formulus already used in the Senate. It was not until the turn gave his promise for payment of the price. The question and answer in the form prescribed by law made the engagement fast and sure. Hence the generic name of the contract; for Paul’s derivation of it from stipulatum, “firm” (which itself comes from stipes, a staff), is to be preferred to that of Varro and Festus from stips (money), or to a later and rather fanciful one from stipula (a straw). It was round the stipulation that the jurists grouped most of their disquisitions upon the general doctrines of the law of contract—capacity of parties, requisites of consent, consequences of fraud, error and intimidation, effects of conditions and specifications of time, and so forth. It may be said, therefore, that its introduction marked an epoch in the history of the law.

There is, however, no certainty either as to the time or as to the manner of its introduction. So far as appears, it was unknown at the time of the compilation of the XII. Tables, at least in private life; one of the first unmistakable allusions to it is in the Aquilian law of about 287 B.C. Thereafter, with the increase in the number of settlements and the greater frequency of commercial relations, the law was met with a rising demand for a system of compromis or conditions, as the Latin name stood. In regard to engagements whose terms were in every respect definite and certain, and was enforced by the legis actio per conditionem, or sometimes possibly by actio sacramento in personam. But in time it came to be employed in engagements that were from the first indefinite. This seems to have been due to the introduction of the praetor, and to have received special impetus after the system of the leges actiones had begun to give place to that per formulas. The remedy in such a case was not spoken of as a condition but as an actio ex stipulato.

IV. The Actions of the Law.

The Legis Actiones generally.—We owe to Gaius the only connected (though, owing to the state of the Verona MS., rather fragmentary) account we possess of the legis actiones, as the system of judicial procedure was called which prevailed in Rome down to the substitution of that per formulas by the Abetulian and Julian laws—the first either in the 6th or early in the 7th century of the city, and the second in the age of Augustus. He tells us that as genera agentis or generic forms of process they were five in number, each taking its name from its characteristic feature, viz. (1) sacramentum, (2) per judicis postulationem, (3) per condictionem, (4) per manus injectionem, and (5) per pignoris capitionem. The third was unknown in the decemviral period, and was introduced by the Silian law formerly mentioned. The other four were all more or less regulated by the XII. Tables, but must in some form have been anterior to them. It is utterly impossible, however, to say of any of them that a form of action was not at some time, whether it was introduced, or what was the statute (lex) by which it was sanctioned; it may well be that they were not of statutory introduction at all, but were called leges actiones simply because recognized and indirectly confirmed by the Tables. In character and purpose each of the five had its peculiarities. The first three were directly employed for determining a question of right or liability, which, if persistently disputed, inevitably resulted in a judicial inquiry. The fourth and fifth might possibly result in judicial intervention; but primarily they were proceedings in execution, in which the party moving in them worked out his own remedy. As regards their comparative antiquity, there is much to be said for the opinion of Jhering and Bekker that manus injectio, as essentially nothing more than regulated self-help, must have been the earliest of the five, and that the legis actio sacramentum and the judicis postulatio must have been introduced in aid of it, and to prevent too hasty resort to it where there was room for doubt upon questions either of fact or of law.

1 The literature on the subject is very voluminous, great part of it in periodicals. Amongst the leading works are those of Keller, Der röm. Civilprozess u. die Actionen (6th ed. by Wach, Leipzig, 1863), §§ 12–21; Behmann-Hollweg, Der röm. Civilprozess (3 vols., Berlin, 1864–66), the first of which is devoted to the legis actiones: Buonamici, Delle Legis Actiones nell’ antico diritto romano (Pisa, 1866); Bekker, Die Actionen d. röm. Privatrechts (2 vols., Berlin, 1871–873), particularly vol. 1, pp. 18–74; Kerkhoff, Der röm. Civilprozess u. die Actionen aus dem früheren 2. Jahrtausend (Piacenza, 1873); Schultze, Privatrecht u. Prozess in ihrer Wuchselbeziehung (Freiburg, 1883), i. 439–532; in which some novel and not unimportant views are presented; Jobbé-Duval, Études sur l’histoire de la procédure civile chez les Romains (1896), vol. 1; Girard, Organisation judiciaire, i. 15–20, 50–104, 167–252.

2 Graeco-Italische Rechtsgeschichte (Jena, 1834), pp. 465–70. Upon the sponsiosis vinculum internationally, see Livy, i. 9.
In the three judicial leges actiones the first step was the *in jus nostrum* bringing up the correspondent into court, minutely regulated by the provisions of the first of the XII. Tables. This was not done by any officers of the law; there was no writ of summons of any sort; the party had indeed himself to undertake the whole, the court was unprepared, if the defendant did not appear, there could be no decree by default. Once before the magistrate (consul or praetor), the plaintiff stated his contention. If admitted by the praetor he must place his decree before the magistrate and present his decree, leaving the plaintiff to work out his remedy as the law prescribed. But, if the case presented was met either with a denial or counterclaim, the magistrate remitted it to trial else to a collegiate tribunal or to one or more private citizens as judges or arbiters. The act of remit was technically *litis contestatio* or *ordinatio judicii*, the first so named because originally the parties called upon those to whom the matter was remitted to arrange by what means it should be settled. This was the ordinary practice under both the system of the leges actiones and that of the formulae, and continued to exist until the time of Diocletian. In the first stage the procedure was formal, but in a manner of the most stringent acceptance of the word. They were all apparently in his time real actions (*vindications*)—claims of property in land or of servitudes over it, of right as heir under a testament or in opposition to it, of rights of tutury and succe as agnate or gentile, and so forth. It was a numerous court of Quires, determining, by its vote the question of quirey right submitted to it. Many such questions in all sorts of time, and possibly at first of express consent of parties, came to be referred to a single judge; but some, and notably claims of inheritance under or in opposition to a testament, were still frequently remitted to the centumval court even then, and the practice continued long after. But, in any case, it involved not such a much disputed question of right as the exercise of skill and discretion in determining the nature and extent of a right in the abstract was not denied, the remit was to be a mixture of private judges or arbiters, usually three.

**The Legis Actio Sacramentum.**—The characteristic feature of this *legis actio*, as described by Gaius, was that the parties, after a word of argument, each challenged the other to stake a certain sum, the amount of which was fixed by the Tables, and which was to abide the issue of the inquiry by the court or judge to whom the case was eventually remitted. This stake Gaius refers to indifferently as *sacramentum summa sacramenti*, and *poena sacramenti*. The formal question the court had to determine was—whose stake had been justified, whose not (*cujus sacramentum justum, cujus injustum*); the first was returned to the stake, the second forfeited originally to sacred and afterwards to public uses. But the decision on this formal question necessarily involved a judicial evidence of a matter actually in dispute, and, if it was for the plaintiff, entitled him, failing an amicable arrangement, to take ulterior steps for making it effectual. The procedure was still employed in the time of Gaius in the few cases that continued to be referred to the centumval court, but otherwise it had long been disused.

Gaius explains that it was resorted to both in real and personal actions. Unfortunately the MS. of his Institutes is defective in the passage in which he described its application to the latter. We possess the greater part of his account of the *actio in rem* as employed to raise and determine a question of ownership; but his illustration is of vindication of a slave, and not so interesting or instructive as the proceedings for vindication of land. These, however, can be reconstructed with tolerable certainty with the aid derived from other sources, especially from Cicero, Varro and others. The parties appeared before the magistrate, each carrying a rod (*fetica*) representing his spear (*guttur* or *hosta*), the symbol, as Gaius says, of quiritian ownership. The first word was spoken by the raiser of the action, and addressed to his opponent: 

"I say that the land in question (or made no response, for instantation) is mine in quiritian right (necess esse ex juris quiritium); wherefore I require you to go there and join issue with me in presence of the magistrate (in manum conservas)." Thereupon, according to the earliest practice, the parties accompanied by their friends and backers, proceeded to the ground for the purpose; the court was transferred from the forum to the land itself. As hostilities increased, however, and the engagements multiplied, this became inconvenient. Instead of it, the parties went to the spot without the magistrate, but on his command, and there joined issue in the presence of their seconds, who, after ordering the envoys to disclose, each side made a report of the due observance of formalities on their return. Still later the procedure was further simplified by having a turf or sod brought from the place beforehand, and deposited a few yards from the magistrate’s seat, which was what they would go to the ground and join issue, they merely brought forward the turf and set it before him, and proceeded to make their formal vindications upon it, as representing the whole land in dispute. The raiser of the action, addressing his adversary, again confirmed his ownership, but this time with the significant addition: "As I have asserted my right by word of mouth, let you, I say, do so in writing. And I have therefore asked the same question (by what means) and there, as he touched the turf with his rod, which was called *vindicta* when employed for this purpose. The magistrate then asked the other party whether he meant to counter-vindicate. If he thought himself wronged in moving or made no response, the instantant replied "But I too lay my *vindicta* upon it." The verbal and symbolical vindication and counter-vindications completed what was technically the whole trial. This was what, in modern days, each party to a land claim had asserted his ownership, and had figuratively had recourse to arms in maintenance of his claim. But the matter was to be settled judicially, so the magistrate once more intervened and ordered both to withdraw the land and submit it to him and then, having decided, the remandant demanding to know from his opponent upon what pretence (cause) he had counter-vindicated. In the illustration in Gaius he avoided the question and pleaded the general issue; all I have done is as my right in laying my *vindicta* on the land. But there can be little doubt that in certain circumstances the counter-vindicant would deem it expedient to disclose his title. This was very necessary where he attributed his right to a conveyance upon which two years’ possession had not yet followed; in such a case he had to name his author (*auctor(em) laudari*) if he desired to preserve recourse against the latter on the warranty implied in such possession. Otherwise he might have been remitted, the vindicant demanding to know from his opponent upon what pretence (cause) he had counter-vindicated. In the illustration in Gaius he avoided the question and pleaded the general issue. But the party who had to withdraw the land had to withdraw it at stage at which the sacrament came into play. The first challenge came from the vindicant, but since you have vindicated unrightfully, I challenge you with a sacrament of 500 asses, to which the counter-vindicant responded, I, too, am in full possession of a sacrament. The magistrate thereupon remitted the matter for trial to the centumval court, or to a single judge, having declared what exactly was the question put in issue whether the court or judge was one of the parties, or the two being witnesses of the magistrate’s remit, this appeal to witnesses being, as is generally held, the *litis contestatio*. At the same time he ordered the two parties to engage in what was required sureties from the parties for the eventual payment by him who was unsuccessful of the sacrament he had offered to

---

The writers who adopt this view are far from being unanimous as to details. But there seems to be enough to render it more than probable that, as the result of the deliberation of the eit or judges; after judgment that of the gainer was restored to him, while that of the loser was retained for religious uses.) The magistrate
made arrangements for the interim possession of the land. When the litigation was dispensed with—i.e., when the false
sweating (as by the possessor), taking security from him that if, he was eventu-
ally unsuccessful, it should be returned to his opponent, along with all the
fruits and profits drawn in the interval. At the trial, as both partie
were vindicators, there must have been a certain burden of proof
upon both sides. The vindicator, one may believe, must have
been required to establish in the first instance that the thing he
claimed was his, and that it was in his name, and then to show that,
until then, the counter-vindicator would have proved a later title in
his person sufficient to exclude that of his opponent. The judgment,
as already observed, necessarily involved a finding on the main
question in issue. If, as was the case, it was decided in favor of
that of the party who prevailed, was declared to be just, and that
of his unsuccessful opponent unjust.

Looking at this ritual as a whole, the conviction is irresistible
that it could not have been so devised by one brain. It reveals
and combines three distinct stages in the history of procedure—
appeal to arms and self-help, appeal to the gods and the spiritual
power, appeal to the civil magistrate and his judicial office. As
Gellius says, "a third is said to be due to self-help; and when 30 days
had been maintained at the point of the spear, had given place
to a civil and festuaric combat in which words were the weapons,
and which was to be settled by the interposition of a federal
magistrate, whose power is called sacramentum. Various
theories have been proposed to account for it. According to Gauss,
there was nothing more than the sum of money staked by each of
the parties, and which was drawn in favor of that party whose
towards to public uses by him who was unsuccessful, as a penalty
for his rashly running into litigation; and substantially the same
explanation is given by Festus in one of his definitions of the word.

But it is said (for reference to the jurisprudence) that the
absurdity of declaring that a penalty imposed by law could be just
in the case of the person who was in the right, and unjust in the
case of him who was in the wrong. There is another definition
in Festus: "a third is said to be due to self-help when the sanction
of an oath is interposed"—that lends support to the opinion that
there was a time when parties to a question of right were required
to take an oath to the verity of their respective assertions; that
the arval priest, who was appointed only to deposit five bullocks or
five sheep, according to the nature or value of the thing in dispute,
to abide the issue of the inquiry; that the question for determina-
tion of the question was in such a case just as when unjustly
wound was found to have sworn unjustly forfeited his cattle or sheep
as a promptio—a peace-offering to the outraged deity—while the
other party claimed his from the repository in which they had been
deposited; and it was taken for granted by the priests to get some profit for their

1 It was the Lex Aeterna Tarpeia of the year 435 B.C. that com-
muted the five bullocks and five sheep into 500 and 50 lb. of copper
respectively, which were the words: "de multae sacramentum should read "de multa et
sacramentum" (See Festus, s.v. "Peculius" (in Bruns, Fontes). As to
the relative value of oxen and sheep, it is interesting to note that,
by the customs of the modern Cretans, ten sheep are also held
equivalent to one ox. See Kovalewsky, Costume contemporaine, p. 11.
For the pounds' weight of raw metal the XII. Tables substituted the same number of ounces, declaring that 500
should be the summa sacramentum when the cause of action was
worth 1000 asses or more, 50 when worth less or the question one
of freedom or slavery. (Gai. iv. 14.)
2 Varro, De L. l. v. 180, says, that even after the summa sacra-
mentum was paid into money, it was deposited ad pontem
—some bridge, he does not say which, where there was a sacred
pont "pont." (Curiously enough, the Irish spelling of a
pontile, "pont," Skene's Etym. Dict.)
3 Pontian, in 490, his "summa sacramentum" was
suggested by Dann in 1687, in the Zeitshrift. f. Rechts gesch. vi. 359.
Recalling the facts that
there had been discovered in the Tiber Island sacellum of Jupiter
and his names, the two deities to whom solemn oaths
were usually addressed, and that the island was spoken of as "inter
doos pontes," because connected with banks of the river
by bridges bearing no particular names, he suggested that the island
may have been called by use alone, and that it was entitled, not only to the
sacramenta, and that the cattle, shee or money were deposited
in a place of the intended before the bridge was closed. Much
the same explanation was offered by Hschke two years later in his
book on Roman Law, where he says: "a summa sacramentum, without being aware of Dann's speculation. He adds, on the
authority of the Ignive Tables, that while bullocks were offered
to Jupiter, only sheep were offered to Dios Fidius. The island,
thinks, must have been selected as neutral ground to which
might have access, and which obviated intrusion into

the temples of the two gods on the Capitol and Quirinas, respectively.
Huschke attributes its name of "holy island," rather than to the fact of
its being the seat of the temple of Aesculapius. Huschke
recurs to and reinforces this view in his Muto et Sacramentum

4 Another theory is that, while the interim possessor could not be
proceeded against, the praedae, who were really bound in his place
and not merely as accessories, were directly subject to execution
could be insisted on—as, for example, for damages for breach of a warranty of quality of goods sold, the freedom from burdens. If it could, then probably the question raised and dealt with in sacramento was the abstract one of liability—Was the warranty given, and has it failed?—the sum due in respect of the breach being left to be dealt with in a subsequent arbitral process (arbitrium litii aestimandae).

The Legis Actio per Judicis Postulationem. The defects of the Verona MS. have deprived us of Gaius's account of this legis actio. There is little elsewhere that can with any certainty be said to bear upon it. The most important is a note in Valerius Probus—T.P.R.I.A.V.P.V.D., which is generally interpreted—ie, praetor, judicem arbitrum postulo uli des. This petition to the magistrate to appoint a trial of the case (as the character of the probability was part of the procedure in the action, and that from which it derived its distinctive name. Beyond this all is conjecture, alike as to the nature and form of the action and the cases to which it was applicable. Gaius says of the legis actio sacramentum that it was general, and that it was the procedure that was to be resorted to where no other was prescribed by statute. There are, however, nowhere indications of an express instruction that proceedings in any particular case were to be per judicis postulationem.

While it is impossible with certainty to trace the history of this procedure to its first beginnings, yet the impression is general that it must have originated in the regal period. It is commonly held to have been applicable to the divisory actions, and some others triable by arbiters as directed by the XII. Tables. Some eminent writers have thought that there was employed in certain actions in which equitable considerations were allowed to be taken into account by the judge (e.g. the actio fabulac), and generally in so-called jurgia as contrasted with iures. But this theory has many difficulties to contend with. It has no support from any ancient writer, and it leads to the result that the courts by legis actions had power to take into consideration questions of bona fide, which is not only in contradiction with what Gaius says (iv. 11), but inconsistent with their character.

The Legis Actio per Condiditionem.—This, the youngest "action of the law," was introduced, Gaius says, by the Silian law as a means of recovering a liquid money debt (pecunia credita), and afterwards made available by the Calpurnian law for enforcing personal claims (as distinguished from real rights) for anything else definite and certain (omnis res certa), and in both its forms, therefore, essentially an action of debt. The date of both enacted of influence, certain. Although there is no question that the Silian was the earlier. Gaius says that it was far from obvious, as there was no difficulty in recovering money either by a sacramental action or one per judicis postulationem. But it is probable, as above stated, that money due under a nexus contract was recoverable by neither of these processes, but by the much more summary one of manus injectio, a procedure which would be practically put an end to by the Poetillian law of 326 B.C. We are disposed to regard the lex Silia and the new procedure it authorized as a result of the change made by this last-mentioned statute. To have put off a creditor for money lent either with a sacramental action or one per judicis postulationem, would have had the effect of deprive him of the advantages of manus injectio to a greater extent than was called for. At any rate, it seems to have been provided by the Silian law that, when a man disputed his liability for what was called pecunia certa credita, and forced his creditor to litigation, the plaintiff was entitled, if he pleased, to require from him an engagement to pay one-third more by way of penalty in the event of judgment being against him, while the sol-disiant creditor had similarly to undertake to pay as penalty the sum of money demanded in favor of the debtor. Those engagements (sponsio et restitupiol teriae partes) were not allowed in every case in which a definite sum of money was claimed per conditionem, but only when it was technically pecunia credita. In Cicero's time creditum might arise either from loan, stipulation or literal contract (exespensation); but the last dated probably at soonest from the beginning of the 6th century, and stipulation apparently was a result of the Silian law itself, so that the pecunia credita of this enactment can have referred only to borrowed money. The same phrase, according to Livy, was employed in the Poetillian law; it was thereby enacted, he says, that for pecunia credita the goods, not the body of the creditor, ought to be taken in execution. A connexion, therefore, between the Poetillian law and the diurse of the nexum on the one hand, and the Silian law and the introduction of the legis actio per conditionem on the other, can hardly be ignored, and raises a probability that the latter statute was a consequence of the former, and was passed immediately or soon after the year 326 B.C. In the action on the Calpurnian law, it is probable that there was no penalty of a third part on either side. A peculiarity of the legis actio per conditionem is that the plaintiff could when before the magistrate refer the case to the defendant's oath (juramentum necessarium). Taking the oath involved absolution, refusal involved condemnation.

Little is known of the procedure in this legis actio, for, in consequence of the loss of the text in the Verona MS., we are without part of Gaius's account of it. It got its distinctive name, he says, from the conditionio or requisition made by the defendant on the plaintiff, whom he had brought into court in the usual way, to attend again or at thirty days to have a judge determined whether the procedure on the reappearance of the parties on the thirtieth day (provided a settlement had not been arrived at in the interval) varied according as the action was (1) for a definite sum of money due to him, and (2) for the satisfaction of a definite sum of money or a definite thing or quantity of things. In the action for pecunia credita the sponsio et restitupiol teriae partes was exchanged; and it is probable that, if either party refused on the praetor's command so to oblige himself towards the other, judgment was at once pronounced in favour of the latter without any remit to a judex. How the issue was adjusted when the sponsio and restitupiol were duly given and not refused, but, judging by analogy from the procedure in an action for breach of interdict under the formular system, and on the broader ground that there must have been machinery for a condemnation of the defendant's restitution of the thing, it may reasonably be supposed that there were in fact three concurrent issues sent to the same judex—the first on the main question, the second on the defendant's sponsio and the third on the defendant's restitupiol if his restitution was not made. When a sum of money other than pecunia credita or a thing or quantity of things other than money was sued for, those subsidiary issues were unnecessary if the view above expressed be correct.

As Baron has demonstrated, it was not the usual practice to introduce any words explanatory of the ground of indebtedness when the action was either for money (other than pecunia credita) or for a thing or quantity of things; it might be loan, or bequest, or sale, or purchase, or delict, or unjustifiable enrichment, or any of a hundred causes; it would have to be stated of course before the judge; but in the initial stage before the praetor in the issue therefore necessary, when the praetor was to have the averment of the wrong, it may reasonably be concluded that there were in fact three concurrent issues sent to the same judex—the first on the main question, the second on the defendant's sponsio and the third on the defendant's restitupiol if his restitution was not made. When a sum of money other than pecunia credita or a thing or quantity of things other than money was sued for, those subsidiary issues were unnecessary if the view above expressed be correct.

450 ROMAN LAW [JUS CIVILE]
assessed the damages himself and as a matter of course—that the instruction to him was quanta res erit, tantum pecuniam condemnabo.

141

The Legis Actio per Manus Injunctiorem.1—This “action of the law” was ordinarily employed as a means of execution against the body of a judgment-debtor or one who had confessed liability in the first stage of a process. But, in certain cases, it is conjectured, it was thought proper that a creditor should have a more summary remedy than was afforded by a sacramental action or one per judicis postulationem, and he was entitled, in two directions: but the without any antecedent judgment or confession; in which cases, if the debtor disputed liability, the question could be tried only in proceedings at his instance, or sometimes at that of a third party on his behalf, for a stay of execution. It will simplify matters, however, to confine our attention to it in the meantime as a means of execution against the body of a judgment-debtor.

Gaius’s description of it is very general; for details we are indebted principally to the Nortacs Atticus of Aulus Gellius, in an account which he gives (put into the mouth of Caecilius Africanus, a well-known jurist of about the same time as Gaius, and a contemporary of his) of the various provisions of the XII. Tables in reference to it. Africanus is more to say that according to his belief (opinio) the words of the statute were these: “For admitted money debts and in causes that have been regularly determined by judgment (aeris confessi rebusque jure judicantis) there shall be thirty days’ grace. After that there may be manus injunctio. The apprehending creditor shall then bring his debtor before the magistrate. If he still fail to pay the judgment, and if, vindex come forward to relieve him, his creditor may carry him home and put him in chains. He may live at his own cost; if not, his creditor must give him daily a pound of salt, or more if he please.” Africanus continues narrating: “Here was still room for the parties to come to terms; but, if they did not, the debtor was kept in chains for sixty days. Towards the end of that time he was brought before the praetor in the comitium on three consecutive market-days, and the amount of the judgment-debt proclaimed on each occasion. After the third proclamation capitae poenas dabat” —what these words mean will be considered in the sequel—“or else he was sent across the Tiber to be sold to a foreigner. And this capital penalty, sanctioned in the hope of deterring men from unfaithfulness to their engagements, was one to be dreaded because of its atrocity and of the new terrors with which the defaulters thought proper to invest it. For, if it was then more cruel than the judgment-debt, might, if they pleased, cut up and divide his body. Here are the words of the statute—Tertius nondum partis secundo. Si plus minusve succurrit, se fraude esto.”

Such is Gellius’s account of the provisions of the XII. Tables in reference to this lex actio, and he is to a considerable extent corroborated by Quintilian, Tertullian and Dio Cassius. But it is to be borne in mind that he does not vouch for its accuracy; the Tables were already in his time matter of antiquity, and even the jurists knew little about them beyond what was still in observance. That he has reproduced them only partially seems almost beyond doubt. If another chapter of himself could be arranged of sentences that are to all appearance from the same context. We have to face, therefore, the extreme probability that the record is incomplete and the possibility besides that it is not literally accurate. There is room, consequently, for the two directions of the nature and effect of the procedure in its main features may be gathered from the texts as they stand with reasonable certainty. It was competent only for thirty days from the judgment or confession.” It was apprehension of the debt by the creditor himself,—in its first stage, at least, an act of pure self-help. The debtor had at once to be brought before the magistrate, in order that his creditor might solemnly go through the required ceremonies before he could carry him away and provisionally confine him in the domestic lock-up. It was this appearance before the magistrate that made it a legis actio. Such a course, however, was opposed either (1) by instant payment or other implement of the judgment or arrangement with the creditor, or (2) by the intervention of a vindex or champion. The position taken by the latter was not that either of a surity or of an attorney for the judicatus, as he seems to have been. Hence he disagrees with converters in his own name of the right of the creditor to proceed further with his execution, on the ground that the judgment was invalid. This might necessitate an action between the vindex and debtor, which in the course of events in which the original debtor was not a party. If it failed, then the vindex was liable for double the amount of the original debt, as a penalty on him for having improperly interfered with the course of justice; his inter- vention was merely in the nature of an arrangement and duty. The manner of the original debtor had been liberated through his intervention. Failing a vindex and failing payment, the creditor took his debtor home and incarcerated him, dealing with him for sixty days in the manner above described. On his expiry, or where any arrangement, there was a magisterial decree (addictio) awarding the debtor to his creditor.

The question is—The creditor, says Gellius, “capite poenas dabat,” which he interprets as meaning that his creditor might put him to death, the alternative being his sale as a slave beyond the Tiber. There is, however, no doubt that his opinion agrees with that of others in the opposing of these words. While some hold, and rightly it is thought, that the Gellian interpretation is correct, others object to it as extravagant. Poena capitis is objected to by Muighed on the ground, inter alia, of its incredible severity in that the vindex, says he, might simply mean that the debtor “paid the penalty with his person,” in contradistinction to “his means.” Capitis poena always implies either death, unless the derivation of the word, which is taken to mean the putting in a creditor’s right to kill his debtor than in a father’s right to kill his child; and comparative law gives many instances, of a kind, of the harshness of primitive law to defaulting debtors. The partis secundo was probably a relic of earlier times, and Gellius admits that he never heard or read of a dissection having taken place.

The cruelties and indignities to which creditors subjected both their judgment and pecuniary debtors, led, as above noticed, to the insurrection of the comitium, and the formation of the Actio. The latter were probably much more numerous than the judicati, and, being in great part the victims of innocent misfortune, it was the sufferings they endured at the hands of relentless creditors that so often roused the sympathies and indignation of the populace. But the judgment-debtors had suffered along with them; and some of the provisions of the Pocitilian law of 326 B.C., already mentioned, were meant to protect the former against the needless and unjustifiable severity that had characterized their treatment by their creditors. The manus injunctio itself was not abolished, nor the possible intervention of a vindex; neither was the domum ductio that followed, and the personal imprisonment thereby inflicted. The creditor was still bound by the Tables while it lasted; nor apparently was the formal addictio of the debtor to his creditor when the sixty days had expired without arrangement. But after adjudication, if it was for nothing more than civil debt, there were to be no more dungeons and stripes, fetters and foot-blocks; the creditor was to treat his debtors and his industry as a source of profit that would in time diminish and possibly extinguish his indebtedness, rather than as an object upon which he might perpetrate any cruelty by way of punishment. Although the edict of P. Rutellius of 107 B.C. provided a creditor with machinery for debtors, but this view has, it is thought, insurmountable objections to it; namely, that the creditor’s security was not thereby increased.

2 In his Historical Introduction, 2nd ed. pp. 192–193, Muighed maintains that the "aeris confessi" of the Tables refers to naval
attaching the estate of his debtor, he had still the alternative of incarceration. This might be avoided under the Julian law of caeso bonusum by the debtor's making a complete surrender of his goods to his creditor; but, failing such surrender, incarceration continued to be resorted to even under the legislation of Justinian. During the Empire, of course, it was not by manus injectio that the incarceration was affected; for it went out of use with the definitive establishment of the formular system of procedure.

It was as directed against judgment and natal debtors that manus injectio was of most importance and chiefly made its mark in history. But there were other cases in which it was resorted to under special statutory authority, where a remedy seemed advisable more sharp and summary than that by ordinary action. In some of these it was spoken of as manus injectio pro judicato (i.e. as if upon a judgment), in others as simply manus injectio (manus injectio juris). Its directings may be fairly enough described by the English legal term distress—the taking by one man of property belonging to another in satisfaction of or in security for a debt due by the latter which he had failed to pay. The seizure, however, did not proceed upon any judgment, nor did it require the warrant of a magistrate; it might be resorted to even in the absence of the debtor, and on a dies nosterus; but it required to be accompanied by certain words of style, spoken probably in the presence of witnesses. It was only in a few exceptional cases that it was competent, in some by force of custom, in others by the authority of either all or only a class of courts or judges. Thus the lex injectio of Gaius, and all of them being of a military, religious or fiscal character. What was the procedure, and what its effects, are far from certain. Jhering, founding on some expressions of Cicero's, conjectures that, whether the debt was disputed or not, the distrainer could neither destroy nor sell nor definitely appropriate his pignus without magisterial authority,—that in every case he was bound to institute proceedings in justification of his caption, and to take in them the position of plaintiff. The idea is ingenious, and puts the pignoris captio in a new and interesting light. It is a summaric means of raising a question of right for whose judicial arbitrement no other process of law was open,—with the additional advantage that it secured instant satisfaction to the raiser of it in the event of the question being determined in his favour. If against him, the inevitable result, in substance at least, must have been a judgment that he had no right to retain his pledge, with probably a finding that he was further liable to its owner in the value of it, as a punishment for his prevarication.1

Whatever may have been the extent of the field covered by the actions of the law, they did not altogether exclude other judicial or quasi-judicial action. This, of course, frequently occurred upon intervention in matters brought under his cognizance by petition or complaint, in which his aid was sought not so much to protect a vested right of property or claim as to maintain public order, or to prevent the occurrence or continuance of a state of matters that might prove prejudicial to family or individual interests. The process was not an action, with its stages in iure and in iudicio, but a matter (cognitum) in which the court, in administering justice; and his finding, unless it was a dismissal of the complaint or petition, was embodied in an order (decretum, interdictum) which it was for him to enforce by such means as he thought fit.—manna militari, or by fine or imprisonment. Some cases are disposed to give a very wide range to this magisterial intervention. One of its most important manifestations was in connexion with disputes about the occupance of the public domain lands. These did not belong in property to the occupants, so that an action founded on ownership was out of the question. But, as the occupancy was not only recognized but sanctioned by the state, it was right, indeed necessary in the interest of public order, that it should be protected against disturbance. In the measures resorted to for its protection Niebahr recognized the origin of the famous possessory interdict und perdötschis; and, although opinions differ as to whether possession and perpetual distraint upon a breach of the peace was what primarily influenced the magis-
it certainly did not disappear,—witness the famous case in which Cicero made before them the oration of which he was so proud, Pro domo sua. The action of the consuls and afterwards of the censors was guarded more by the social and political disqualifications and pecuniary penalties with which they visited persons who had been guilty of perjury or gross perfidy, did not a little to foster fidelity to engagements. Through the same agency the action of the wife of Cicero could not be matter of action—the husband's power over his wife, the father's over his children—was controlled and kept within bounds. It was not only by a single majesty, the familia, within the household could be called in question; it was only when he forgot in the exercise of serious discipline within his family he was bound to act judicially. For he also was a judge—indeed, as he often called, though it is not true, not by the mere matter of action but by the advice of his kinsfolk in a family council. On him lay the duty of controlling his family; if he failed to do so he himself was in danger of censural version.

Between citizens and foreigners with whom Rome was in alliance by a treaty (permanent or temporary) conferring reciprocal rights of action, the proceedings took the form known as reciprocatorio or recuperatio.3 The action was probably always raised in the forum contractus. According to the common opinion the magistrate ordinarily presiding there heard what parties had to say, and from the defence of either side. what was said in that hearing was developed into a statement of the facts and the points of fact arising on them, authorizing the recuperatores to whom the matter was remitted to find for plaintiff or defendant according to circumstances. The recuperatores were generally three, sometimes five or more; perhaps in some cases there were only two, but generally there were from five to twenty, sometimes more; but always in odd number; but whether the nationality of both parties required to be represented we are not told. Expedition being in most cases a matter of importance, recuperatores were required in action within from three to seven days, and the witnesses usually was limited to ten. How execution proceeded upon it, if it were for the plaintiff, does not clearly appear; Voigt, finding on a few words in Festus, locates it must have been by something like pignorari capio. This recuperatory procedure in time came to be resorted to in processes de libertate and even in some litigations where both parties were citizens. There are numerous instances of the latter in Cicero; and it is remarkable in some cases the praetorian actions ex delicto the remit was usually not to a judex but to recuperatores. The explanation may be in the comparative summariness of the remedy.

III. THE JUS GENTIUM AND JUS HONORARIUM

(Latter half of the Republic.)

1. Influences that operated on the Law.

Growth of Commerce and Influence of Foreigners.—While it may be admitted that commerce was beginning to take root in the Roman 4th century, Rome in the 5th century, yet it was not until the 6th that it really became of importance. The campaigns in which Rome was engaged until the end of the First Punic War absorbed all its energies. But after that time the influx of strangers, and their settlement in the city for purposes of trade, became so very rapid—especially of Latins and other allies, but Greeks, Carthaginians and Asiatics. To them and the regulation of their affairs the jus civile—the law peculiar to Rome and its citizens—was applicable only if they were members of allied states to which commercium and recuperatio were guaranteed by treaty. But many were not in this favoured position; and even those who were soon found the range of Roman modes of acquiring property and contracting obligations too narrow for their requirements. Hence a jus gentium was gradually developed 8 which very early in its history drove treaty covenants for recuperatio out of use; its application may for a time have been limited to transactions between non-citizens or between citizens and non-citizens, but it was eventually accepted in all cases in which states inter se and became part and parcel of the jus gentium. Gaius and Justinius speak of it as "the common law of mankind," "the law in use among all nations"; but the language must not be taken too literally. The Roman jus gentium was not built up by the adoption of one doctrine or institution after another that was found to be generally current elsewhere. In the earliest stages of its recognition it was an independent international private law, which, as such, regulated intercourse between peregrines or between peregrines and citizens on the basis of their common libertas; 9 during the Republic it was purely empirical and free from the influence of scientific theory, but its extensions in the early Empire were a creation of the jurists—a combination of comparative jurisprudence and rational speculation. To say that it was de facto in observance everywhere is inaccurate; on the contrary, it was Roman law, built up by Roman jurists, though called into existence through the necessities of intercourse with and among non-Romans.

It may be a little difficult for a modern jurist to say with perfect precision what were the doctrines and institutions of the jus gentium as distinguished from the jus civil. But the distinction was quite familiar to the Romans, as witness, for example, the statement of Marcius, in reference to the ab dolcis, that they were enjoyed by aliens, but not in the same degree as in the former, but none of those competent to him under the latter.

Institution of the Peregrium praetorium.—The praetorship, as already mentioned, was an outcome of the Licinian laws of the year 367 B.C. (see Praetor.) Down to the end of the 5th century of the city the praetor so appointed superseded single-handed the administration of justice, alike between citizens and foreigners. But with the altered condition of things in the beginning of the 6th century, and the influx of strangers which has already been alluded to, the work seems to have been found too onerous for a single magistrate, and the praetor was created. The second praetor of the year 246 B.C. Pomponius says distinctly that the creation of the new office was rendered necessary by the increase of the peregrin population of Rome, and that the new magistrate got the name of praetor peregrinus because his principal duty was to dispense justice to this foreign element. After the submission of Sicily and Sardinia the number of the praetors was increased to four and after the conquest of Spain to six; Sulla raised the number to eight, and Caesar eventually to sixteen. But all the latter creations were for special purposes; the ordinary administration of justice within the city was left with the representatives for the time of the two earlier magistrates. He was distinguished as praetor qui inter cives jus dicit (or urbaneus) and praetor qui inter cives et peregrinos jus dicit (or peregrineus). It would be going too far to speak of the latter as the principal author of the jus gentium; for a large proportion of the actions for enforcing jus gentium rights were civil, not honorary—a fact which proves that the rights they were meant to protect and enforce had their origin in the jus civil, although moulded to meet new requirements by tacit consuetude and the agency of the jurists. But even in this view the peregrin praetor must have had a powerful influence in giving shape and content to the rising peregrineus, by means of the formule which he adjusted for giving it practical effect.

Simplification of Procedure and Introduction of New Remedies under the Aebutian Law.—The lex Aebutia is only twice mentioned by ancient writers (once by Aulus Gellius and once by Gaius), and we know neither its precise date nor its specific provisions. And yet to judge by its effects, it must have been one of the most important pieces of legislation in the latter half of the Republic, for Gellius speaks of it as having given the praetor power to many of the institutions of the XII. Tables, and Gaius couples it with two Julian laws of the time of Augustus as

1 On Judex domesticus, see Greenidge, Legal Procedure in Cicero's Time, pp. 376 seq.
3 On Roman jus gentium, see Voigt, Das jus naturale, etc., et bonum, und jus gentium, d. Römer (4 vols., Leipzig, 1856-1875); Nettesheim, in the Journal of Philology, (1858), xii. 169 seq.; Krüger, Gesch. d. Quellen, §§ 10, 17; Mommsen, Staatsrecht, iii. 604 seq.
4 Voigt, Jus nat. ii. 661. He distinguishes the jus civil, jus gentium, and jus naturale as the systems which applied respectively to citizens, the foreigners, and the man.
5 See Labatut, Histoire de la Préture (Paris, 1868); Mommsen, Staatsrecht, ii. 176 seq.; Karlowa, Röm. Rechtsgeschichte, i. 217 seq.; Girard, Organisation judiciaire, i. 160 seq., and on the peregrin praetorship in particular, pp. 206 seq.
the statutory instrument whereby the formular system of procedure was made more general. See legislation (p. 52). Its date was probably about the end of the 6th or beginning of the 7th century of the city. Girard, who had examined the question with great care, places it in the first third of the 7th century, and, though his reasoning is not quite sound, his conclusions are important. Some authorities hold that in many cases the date a century and more earlier. It is the opinion of Wlassak that it was a piece of tentative legislation, and that as regards citizens it in no wise abolished the action, praetor procedure, but as regards free men who in many cases put the date a century and more earlier. This is a probable theory and is now adopted by many recent writers.

The main purpose of the statute seems to have been to empower the urban praetors to adopt existing remedies to altered circumstances, and this gave rise to no familiar formulae of Roman law. This is a probable theory and is now adopted by many recent writers. This statute seems to have been the first to give the praetor the authority to write new rules, to the peregrini, to whom the leges actions were rarely, if at all, available. But, whatever may have been its actual provisions, the result was the adoption of a procedure which gradually supplanted that of the action of the law, which was more precise than the latter, and whose characteristic was this—that, instead of the issue being declared by word of mouth by the parties, and requiring as a rule some one with perfect accuracy the statutory provision on which it was based, it was formulated in writing under the direction of the praetor, in the shape of an instruction to the judge to inquire into the merits of the dispute, with power to condemn or acquit the parties and award damages. It has to be explained that an action was sometimes followed by an appeal to the higher courts, if the judge thought the case needed reconsidering, to dispense with them would have been opposed by these powerful bodies. It is now the dominant opinion among modern writers, and is supported by the fact that the judicial procedure is based, to a large extent, on the action in factum, and that one of the objects of the statute was to legalize similar procedure in their effects. All such formulae granted by the praetor praetor must have course of have in factum conceptus. Unless we hold this view it is difficult to see by what means the rights and obligations of peregrins in their transactions inter se or with citizens could be determined, as civilly as the praetor, in the cases where by treaty they enjoyed jus commerci, were not open to them. Written instructions to the recuperators or other judges for trying suits in which a peregrin was a party would be a practical form of legislation, and the praetor's authority to write instructions, a virtual recognition of peregrini, whose rules would probably be strange to them, and their instructions would therefore have to be precise and definitive. Verbal instructions would have led to a miscarriage of justice.

From this point of view we can see how the peregrin praetor became the primary organ in developing jus gentium. But there is some reason for holding that the urban praetor had also, before the Actus Praetorianus, exercised some powers of a mercantile nature in the course of actions in factum, and in this way perhaps enforced a number of contracts and other obligations in which elements of equity and good faith were present and which the jus ciuile left remediless. Admittedly, some of these would be in the nature of informal agreements accepted voluntarily by the parties. The latter view certainly explains several apparent anomalies in the later law, for which no other good explanation can be found, as, for instance, the fact that in deposit and commodate actions in factum as well as in jus gentium might be brought. Also the actio in factum for enforcing a contract of fiducia can in this way be explained. It also serves to throw light upon the development of some of the bonae fidei contracts.

Provincial Conquests.—The growth of commerce and the enormous increase of wealth, which made great capitalists and enabled them to have through the agency of freedmen and slaves to carry on trade on a scale hitherto unknown, and which thus helped to foster the jus gentium, were no doubt due to a large extent to provincials. But the latter operated also in other directions. The officials who proceeded from the conquered provinciales as governors found themselves face to face with laws and institutions in many respects differing from those of Rome. Political considerations dictated how far these were to be respected, how far subverted. In some provinces, more especially the Eastern ones, it was thought best to do more than supplement the existing system by the importation of doctrines of the jus gentium and the procedure of the praetor's edicts; while in others, in which it was deemed expedient to keep the existing system as far as possible intact, all this was a thing of no small value to the city administration. Many of these, on their return to Rome, were to be studied, and in the end to lead to the extension of some of the formal transactions which previously had been confined to citizens. But the laws made the formal procedure, and the new ideas so presented as to make them harmonize as far as possible with the old, a thing of no small value to the city administration.
property of their own. With increasing luxury and licentiousness divorce became common.  

This looseness of the marriage bond, as was naturally to be expected, had its effect on the other family relations. The right of children to take their father's inheritance began to be lightly esteemed. The law—or rather the interpretation and commerce of the judges of the XII. Table—would not let him testamentarily disinherit them, or in instituting them to limit their right to a mere fraction of the inheritance; but it was assumed that this power would be exercised with discretion and only when justified by circumstances. But in the later days of the Republic, amid the slackened ties of domestic life, paternal as well as conjugal duty seems to have often been lost sight of, and children were disinherited or cut off with a nominal share of the inheritance in order that a stranger might be enriched. This led to the recognition by the centurial court, without apparently any legislative enactment or praetor's edict to warrant it, of what was called the querela ineffectu testamenti—challenge of a testament by a child whose natural claims had been capriciously and causelessly disregarded. While the practice may for a time have been hesitating and uncertain, yet early in the empire, through means of this querela, the rule came to be established that every child was entitled, notwithstanding the terms of his father's testament, to at least a fourth (portio legitima, quarta legitima) of what would have come to him had his parent died intestate, unless it appeared that the latter had had adequate grounds for excluding him or limiting him to a smaller share. A parent might in like manner challenge an undutiful testament made by his child to his prejudice; and in ultimate cases the court might be called upon to decide between the claims of the child and—ultimately in certain cases so might brothers and sisters— intermediate parties.

The decline of morals had an equally marked effect on the transactions of daily life, calling for precautions and remedies that had not been found requisite in the hey-day of the "pistis twv Patavwv. Men no longer relied on each other's good faith unless backed by stipulations, securities (cautio) and guarantees. The Rutilian bankruptcy arrangements and the actio Pauliana for setting aside alienations in fraud of creditors indicate a laxity in mercantile dealings that was perhaps an inevitable consequence of the growth of trade and commerce. But that such remedies as, for example, the exceptio rei vendiae et tradiacie or the exceptio non numeratio pecuniiae should have been found necessary, the one an answer to a vendor (with the price in his pocket) who attempted to dispossess his vendor because of some of the formalities of conveyance had been neglected, the other an answer to an action on a bond for repayment of money that by some accident had never been advanced—proves that the law had now to encounter fraud in all directions, and that Graece had extended its great extent displaced the old Roman probity.

d. Factors of the Law.

Legislation.—It cannot be said that during the period of nearly two centuries and a half embraced within the present epoch the private law owed much to legislation. The vast majority of the arrangements of the time referred to by the historians dealt with constitutional questions, municipal and colonial government, agrarian arrangements, fiscal policy, sumptuary prohibitions, criminal and police regulations, and other matters that affected the life of the state rather than the private. Those cases that were left to the jurisdiction of the praetors, and these, as the latter class mentioned by Gaius and Ulpian in their institutional works barely exceed a score in number; and of these not above half a dozen can be said to have exercised a permanent influence on our modern edicts. The edicts of this last of the praetors, the first of which was made in 122 B.C., are, the more by the collection was not intended for its publication to the public, but probably compiled either by a court official or by a scribe under his direction. It was the result of the pains and labors of many years, and the work of a man of genius, who, by his researches and conclusions, gave the Roman law the form it而后 took.

1 Voigt, De Lex Maenii de dote (Weimar, 1866), attributes to a lexx Maenia of 168 B.C. the creation of the judicium de moribus which superseded the praetorian divorce courts, providing for a penal action on divorce. The existence, however, of a statute for this purpose has not been proved, and is discredited by most recent writers. See Czyliharz, Das römische Dotalrecht (Giessen, 1870).

2 From this the legitimacy of children recognized by most continental countries nowadays is derived.

more readily convened and more easily worked than the comitia of the centuries.

Magistrates' edicts. — The practice of propounding edicts was very ancient, and had been followed by kings and consuls long before the institution of the praetorship. It was one of those obvious ways of exercising the imperium with which the supreme magistrate was invested—to lay an injuction upon a citizen and enforce his obedience, or to confer upon him some advantage and maintain him in its enjoyment. It was one of the ways of the public prosecutor to publish edicts to which people could point as evidence, and where there had been no invasion of what the law regarded as a right, and where, consequently, there was no remedy by action. That the earlier edicts of the praetors were of this character—issued, that is to say, without reference to any case that had come to be called edicta repentina or prouss res incidit posta—there is little reason to doubt. In time a new class of edicts appeared which got the name of edicta perpetua (or perpetuae jurisdictionis causa pro- positiones) of the praetor, published on his authority (as the white boards displayed for the purpose in the forum were called), of the remedy he would be prepared to grant on the application of any one alleging that the state of facts contemplated had arisen. The next year's praetor was free to adopt the edicts of his predecessor or not; but it was usual for him to do so if they had been found beneficial in practice, he adding to them new provisions suggested by demands made upon past praetors for edicta repentina, but which they had not legislated, or even proposing for acceptance some remedy entirely of his own devising. As each new praetor entered upon office he announced his jurisdictional programme—his lex Magnum edictum was called—distinctly covering the greater part of it tratulitium, i.e. transmitted from his predecessors, and only a few paragraphs, diminishing in number as time progressed, representing his own contribution. And so it went on in the empire, until the official edicts were consolidated by the imperial; and at last, after having, by instruction of Hadrian, been subjected to revision, and consolidated along with the Aedilian edicts, by Sylvius Justinus, it was all that was noticed before it was published under the name of the "Roman Law." The term Edict is applied both to the single edicta and also to the whole body of them together.

iii. Sources of the Law.

It is some reason for supposing that the edict attained considerable proportions in the time of Cicero; for he mentions that, whereas in his youth the Tables had been taught to the boys in school, in his later years these were neglected, and young men directed to read the edicta of Rome, rather than the law in itself. Of a few of them the date and authorship are known with tolerable precision; but of the history of the majority, including some of the most important, such as those introducing restitution in integrum on the death of a freedman, and releasing obligees from debts, the traditions were eclipsed by the imperial; and at last, after having, by instruction of Hadrian, been subjected to revision, and consolidated along with the Aedilian edicts, by Sylvius Justinus, it was all that was noticed before it was published under the name of the "Roman Law.

The edict seems to have contained two parts—the first what may be called the main body, and the second additions, &c., whether derived from the jus civile or from the jus Praetorium. The styles or formulae for civil actions were published without any corresponding edict; for praetorian actions styles were published appropriate to their corresponding edicts. There were also independent formulae for interdicts, processual stipulations, &c.

The contents of the edicts proper were in detail very various, but all devoted to an exposition of the ways in which the praetor meant to exercise his jurisdiction during his year of office. They were not didactic or dogmatic formulations of law, but rather announcements of what remedy he would grant in such and such circumstances, of the circumstances under which edicts were to be published, and the like, and those revolutionaryizing the law of succession, were to a great extent in the dark. It was one of the great advantages the edicts had over legislative enactments that they might be dropped, repealed, or made inoperative by the judgment of the praetor, or by the judgment of the courts of public requirements. For the edict was "dis quo juris cius etiam intended to aid, supplement and correct in accordance with the edicts. Of the usual estimates of its power, it is clear that it would have been impossible had its provisions from the first been as stereotyped as they became by the consolidation in the time of Hadrian.

The edict seems to have contained two parts—the first what may be called the main body, and the second additions, &c., whether derived from the jus civile or from the jus Praetorium. For the edict was "dis quo juris cius etiam intended to aid, supplement and correct in accordance with the edicts. Of the usual estimates of its power, it is clear that it would have been impossible had its provisions from the first been as stereotyped as they became by the consolidation in the time of Hadrian.

1 See Lenel, Beiträge zur Kunde des praetorischen Edicts (Stuttgart, 1878), and the introductory chapters in his Edictum Perpetuum (Leipzig, 2nd ed., 1907); Karlowa, Röm. Rechtsgesch. vol. i § 60; Voigt, Röm. Rechtsgesch. §§ 19, 20.
But it was the tendency of the whole jurisprudence of the time, and by no means peculiar to the praetorian creation. Nowhere in the texts are the praetors spoken of as the mouthpieces of equity as distinguished from law. Such a distinction recurs frequently in Cicero's and Servius' definition of a law court and jus with its letter, but it is in order to sing the praises not of the praetors but of the pleaders who maintained the former as against the latter. In the praetorian the defendant only, and not his lawyers, was enjoined by statute whether comital enactment or senatusconsultum.

Of the edicts of the peregrin praetor and their relation to that of his urban colleague little is known. That they differed in some respects from the praetorian practice is not in doubt, for the provision of settling the government of Cisalpine Gaul the magistrates are directed, with reference to a certain action, to formulate it in the way prescribed in the edict of the peregrin praetor. The latter, therefore, must to some extent have been in advance of that of the urban praetor, probably in this respect, that, being prepared primarily for the regulation of questions affecting non-citizens, it must more thoroughly than the other adhere to formalities and to the process potent only to citizens, and thus to a greater extent simplified procedure. The edicts of the provincial magistrates may have varied according to circumstances, being in all cases compositae of provisions drawn up by jus consuei, consisting of the manner of the praetors and additions suggested by the peculiar wants of the different provinces for which they were framed (provinciae genus edificationis). They were, as was the case with the praetor, drawn up by a certain class of the magistrates, who, besides their regular duties were charged with the supervision of markets, their range was very limited; their most important provisions having reference to open sales of slaves, horses, cows and cattle, and containing regulations about the power of custodians, more especially for the recovery for latent faults and vices. They also had cognizance of certain delicts committed in the streets and markets. As the acediles had no imperium their restricted jus edendi may have been confined on them by custom only. The aedile's juris praetorii, or rather juris praetorius, received its name, not from the praetor, but from the aedile who was honoris causa encharged with the duties of the praetor and was recognized as such by the aediles who had been praetores in their province. Aediles were thus the first to whom the praetor's judicial authority was transferred in the towns of Italy. The aediles were the first to administer the laws, and it was from them that the title of judge which was given a right that came up to property; and it can hardly be disputed that it was by the decisions of a series of judges, in a series of such actions, that the long list of natural modes of acquiring property for the non-citizens ceased to exist. The praetors' judicature was not merely a matter of a case of doubt, but of the way in which the provincial magistrates had been brought into view. Those decisions, whether upon the obligations of a vendor, direct or indirect, or upon the sufficiency of a title to property, were given by a few judges, who, in the course of their natural acquisition, doubtless were in many cases arrived at under professional advice, and were in all cases embodied in judgments. But that does not in the least deprive the doctrine deduced from them of its importance, and cannot detract from the justice of the opinions of the jurists submitted to a judge (responsum prudentium) were invested with binding authority. During the Republic, if a judge deferred to them, it was simply because he regarded them as in consonance with well-qualified public opinion; and what a series of consistent judgments of this sort built up was in the strictest sense a law based on custom.

As regards the professional jurists in particular it has already been observed, that, according to the testimony of the Roman historians, the law was a monopoly of the patricians down at least to the middle of the 5th century of the city. Livy goesso far to place that before the middle of the 6th century, at least as among the seasts of the pentecostal college. It was, however, doubtless during the regal period. But after the publication of the XII. Tables this could be the case only in a qualified sense, the pontiffs becoming the official interpreter of that which was in the letter was patent to the world. The Jus Flavianum, with its formulary of actions, about the year 304 B.C., the practice of giving advice in law in public adopted by Tib. Cornucinos in the 6th century A.D. (Dig. 34, 3, 13), and the Jus Aelianum, embodying the current interpretatio, some fifty years later, put an end not only to pontifical but to patrician monopoly.

iii. Substantive Changes in the Law during the Period.

The Publician Edict.—There were necessarily many changes in the law during the period in the law of property and of minor real rights, some entirely new, and some of no real importance. But the greatest of all was that effected by the introduction of the praetorian recognizing the validity (1) of what Theophilus calls bonitatenal ownership as an actual though inferior ownership of res mancipii, and (2) of what got the name of bona fide possessio

1 There is some doubt whether the Jus Aelianum mentioned by Pomponius (Dig. 1, 2, 7) was not an independent collection of the praetorius commendatio, as Servius Aelianus (Dig. 1, 1, 30) from Servius: "Aelianum" (Dig. 1, 2, 38). See Bremer, Juri, 3. V. Ant. Rahdms. 1594, 41; Solz, zu dem Geschicht der röm. Rechtswissenschaft (Königsberg, 1858); Greifel-Dumareau, Études sur le barreau roman (2nd ed., Paris, 1892); Orth, 61; Rosenkranz, "Das Gesetz," 3, 18; v. Jürg. z. Röm. Rechtswissenschaft, v. 1, Bremer, Juri, 3. V. Ant. Rahdms. 1594, 41; Solz, zu dem Geschicht der röm. Rechtswissenschaft (Königsberg, 1858); Greifel-Dumareau, Études sur le barreau roman (2nd ed., Paris, 1892); Orth, 61; Rosenkranz, "Das Gesetz," 3, 18; v. Jürg. z. Röm. Rechtswissenschaft, v. 1, Bremer, Juri, 3. V. Ant. Rahdms. 1594, 41; Solz, zu dem Geschicht der röm. Rechtswissenschaft (Königsberg, 1858); Greifel-Dumareau, Études sur le barreau roman (2nd ed., Paris, 1892); Orth, 61; Rosenkranz, "Das Gesetz," 3, 18; v. Jürg. z. Röm. Rechtswissenschaft, v. 1.
as a fictitious ownership of either res mancipi or res nec mancipi, valid against all the world except the true dominus. The accounts we possess of this edict are somewhat inconsistent and even contradictory; the explanation may be that it went through a process of amendment and expansion at the hands of successive praetors, and that eventually it may have had more than one section, without our always being able to say to which of them the criticism of a particular commentator is directed. But there is no doubt of its general tendency, that it was in the position to correct and of the way in which the correction was accomplished.

One of the defects was this: if a man had taken a transfer of a res mancipi from its rightful owner, but simply by tradition imposed, by means of notice (praebus), he might acquire dominium ex jure Quiritium, and the transferee remained undisturbed. The result was that the latter was in law entitled to assert a res vendicata as bona fide in his possession, that the money might have in his pocket, while if a third party had obtained possession of the thing, but in such a way as not to be amenable to an interdict, the transferee could have no legal right of possession. The praetor accordingly declared that res jussi must be in the true sense vendicata in order that the praetor might have to correct the defect and brought in the dominium ex jure Quiritium. The first difficulty was overcome by the exceptio rei vendicata et traditae, also a praetorian remedy, and probably older than the Publician; to the transferee's vindication on that theory the Praetorian right was lost, and the praetor's plea was that the original owner, who, if he had possessed for the requisite period of usucapion before the third party came upon the scene would have cured the defect of the informal delivery and acquired possession, was substituted for the original owner in the praetor's mind, that is, the praetor recognized that he had bought a res mancipi from its owner, and had had it delivered to him, but had lost possession within the period of usucapion, he the praetor) would allow the thing to pass to the transferee, and that the completed usucapion (infra), with which he might proceed either against the transferee or any third party withholding the thing in question.

The creation of such an edict and the formula of the action based upon it (which, though of praetorian origin, was in many respects dealt with as just a variety of the rei vendicata) had almost the same effect as the legislation by the praetors of the future delivery of a res mancipi in pursuance of a sale or other good cause would confer a right of ownership in it even before usucapion had been completed. Till completed, however, the transferee was not guilty of bigness; the thing in question was only in bonis of his belongings," and the legal title, though an empty one—nudum jus Quiritium—remained in the transferee; it was only with the completion of the usucapion that it became the transferee's praetorian right. This difference still exists, and is not in bonis was that manipulation came to be regarded in many cases as an unnecessary formality; and the marvel is that it continued to hold its ground at all. The explanation may be that it afforded a useful means of taking the one side, spes, on the other the power was left to the discretion of the court as to whether domestic subject to him or not, who was managing a business on his account, or whom he had placed in charge of a ship belonging to him, should be entitled to a special facilitation in the law in his case, which was generally was greatly facilitated by the praetorian simplification of procedure and the introduction of new forms of actions—the instruction to a judge, "Whatever in respect thereof the defendant ought to be allowed for the claimant's benefit, let it be explained in a statement of the cause of action, wide scope for the recognition of new sources of liability.

The origin of the verbal contract of stipulation and its actionability under the Scilian law is a subject of some discussion. It is generally held that the verbal form of contract was not in any sense a new invention, but was already explained. It was a formal auctorial contract, i.e. an individual contract, and its essential characteristic was its informal character. It was essentially productive only of unilateral obligation, i.e., the responder in the interrogatory obligation did not receive a corresponding liability. The obligation was not in substance, but it was necessary that each should promise for his own part, with the result that two contracts were executed which were perfectly independent. Originally the only words that could be employed were specto and lego. The contract was juris civis and competent only to citizens (and non-citizens enjoying commercium). In time the words promitto, promitto, came to be used alternatively. They were, eventually at least, translatable into a contract to do or to refrain from doing in any case in which he might already be bound ipso jure to do or to abstain from doing, and that because of the simplicity of the remedy—an action on the law of contract.

Changes in law of contract.
his stipulation—that would lie against him in the event of his failure.

A second form of contract that came into use to a considerable extent in the latter half of the Republic is what is commonly called a liberal contract, or, with greater accuracy, the nomen transscripticum.1 Notwithstanding the prolific literature of which it has been the subject, it must be said that in many points the account-books of the censors insisted that all citizens of any means should keep with scrupulous regularity. They are often alluded to by the lay writers; but the text principally relied on is what remains of Cicero's speech for Tullius, whereas the arguments, in the case, and incidental remarks elsewhere, the conclusion has been formed that a citizen who made an entry in his codex—whether of the threat of a penalty—or a contract for the payment of a fine, even though of an incomplete and uncertain. The prevalent opinion, formed before the discovery of the Verona MS. had made known Gaius's description of it, and almost universally adhered to ever since, is that such contracts were made up of a term of a year, the payment of a fine, and an absolute penalty. But the Saibians proposed that the term a person should be binding on them.

The evolution of the four purely consensual contracts—sale, loan, deposit, and sale of goods, and the law supplies matter for one of the most interesting chapters in the whole history of the law. But, as it is impossible in such an article as this to attempt to mark out in their precise succession the processes by which we confine ourselves to sale. The others did not and could not follow identically the same course: location was nearly parallel with sale; but partnership and mandate, from their nature, not only started at a different point, but, with a similar goal with them—that of becoming productive of obligation simply on the strength of consent interchanged by the parties—by paths that were sometimes far apart. Nevertheless, a definition of no uncertain description, though not sufficient to indicate generally some of the milestones that were successively passed by all four.

Going back as far as history carries us, we meet it with under the name of promissio and in the form of nothing more than barter; for emoce originally signified simply "to take" or "acquire." The consensual contracts of sale,

or could be enforced simply on the ground that it had taken place. The vendor was bound to support the purchaser in any action by a third party disputing his right, and to repay him the price twofold in the event of that third party's success; and he was bound, moreover, to make good to him all losses by breaches of his contract. A deficiency of acreage he had guaranteed, non-existence of servitudes he had declared the lands enjoyed, existence of others from which he had stated they were free, incapacity of a slave for labor—these were just four of the series of breaches of contract which the latter of these two types of action had aimed against the vendor. "Whereas the plaintiff got from the defendant a stipulation that certain sheep he bought from him were healthy, &c. [repeating the words of guarantee], and that he, the defendant, who had vouchsafed to the plaintiff a loan, had furnished his eum estimate upon it and if, then, the sheep should fall ill, it would appear that the defendant ought in respect thereof to give or do for the plaintiff, in the value thereof, judge, condemn him; or, otherwise, acquit him." It is an observation of Bekker's that the word translatum in its context means the reference of the action of the actio ex stipulatu against a vendor's guarantees; the stipulations to which we have been alluding had become very important, particularly in cases of legal presumption, the result being that the words "wheresoever this plaintiff bought from the defendant sheep about which the action has arisen," were substituted in the demonstratio (as the introduction of (Man et al., 1805) for the detailed recital of what had been stipulated. Bekker justifies this by reference to the language of Varro, who seems to include under the words emplio, venditio not merely the agreement to buy and sell but also the status of general custum and pari theft.

The introduction of an actio emplio in this shape, however, was far from the recognition of sale as a purely consensual contract. If the price was not paid at once, the purchaser gave his stipulatory guarantees not only to recapture the goods, but to be answerable much sooner for them than to a mere vendor due to the necessity to rely on the bond to which the following, receipts were so carefully arrived at on very much on considerations of natural equity. On the whole, while admitting that it would be quite maintainable that the urban praetors, under the influence of jus gentium, granted arbitrio for enforcing obligations of parties in sales inter cives even a good while prior to the lex Aebulius, the balance of evidence, we think, is in favour of the view that this was not the origin of the jurisdiction that facilitated the development of sale into a bona fide contract.

We read of a satisfactory secundum mancipium, a stipulatu habere licere and a res mancipi, a res nec mancipi, or even occasionally of a res mancipi sold without mancipation, that the purchaser should be maintained in possession of what he had bought, it entailed him to repARATION on account of mancipation, even to the return of the goods to his possession. But the embargo of having been sustained, it could not be introduced, therefore, until after the lex Aebulius and the formulation by the praetor of the actio ex stipulatu. The stipulatu duplum was a thing of universal observance, action on the ground of evasion will lie ex emplio if perquhase the vendor of a slave has failed to give his stipulatory guarantee, for everything that is of general custom and pari theft. It is not required to convert the strict juris actio emplio, really nothing more than an actio ex stipulatu, into a bona fide contract, without the intervention of a consensual one. The idea of a consensual good faith (ex fide bona) to the "whatsoever the defendant ought to give or do for the plaintiff." The effect, and probable that it is a consequence of the law of stipulatory guarantees, for Varro wrote after the time of Q. Mucius (who speaks of the action on sale as a bona fide one), and references to them are abundant in the pages of the classical jurists; and it will be seen that they are really tending to convert the actio ex stipulatu into a consensual contract in which, in virtue of the simple agreement to buy and sell, all the obligations on either side that usually attended it were held embodied without express formulation or (still less) stipulatory or literal engagement. And, in instructing the judges to decide in every case between buyer and seller suing ex emplio or ex vendito on principles of good faith, it really empowered them to go far beyond general custom and practice, and to take cognisance of the plaintiff's having been injured in the action of a, other words, on considerations of good faith (ex fide bona) to the "whatsoever the defendant ought to give or do for the plaintiff." The effect, and probable that it is a consequence of the law of stipulatory guarantees, for Varro wrote after the time of Q. Mucius (who speaks of the action on sale as a bona fide one), and references to them are abundant in the pages of the classical jurists; and it will be seen that they are really tending to convert the actio ex stipulatu into a consensual contract in which, in virtue of the simple agreement to buy and sell, all the obligations on either side that usually attended it were held embodied without express formulation or (still less) stipulatory or literal engagement. And, in instructing the judges to decide in every case between buyer and seller suing ex emplio or ex vendito on principles of good faith, it really empowered them to go far beyond general custom and practice, and to take cognisance of the plaintiff's having been injured in the action of the four nominative real-actua—mutuum (i.e. loan of money or other things returnable generically), commodate (i.e. loan of things that had to be returned specifically), and fiducia—pledge—both more than that of the consensual ones. Down to the time of the Poetallian law of money, corn, &c., was usually contracted per aet et librum; and it is probable that on the subsequent device of the nseum the

---

1 Cicero says (De Off. iii. 16, § 65) that, though by the XII. Tables it was enough if a vendor per aet et librum made good his positive assurances (ut lingua nunquamstis, uti ess usto), the jurisists held him responsible for reticence about burdens or defects he ought to have revealed, and liable for a poena duplum exactly as if he had guaranteed their non-existence.

2 "In rebus mobilibus... qui alienam rem vendidit et tradidit fortunam committit" ( Cic. ii. 50 - 51 ).

obligation on a borrower to repay the money or corn advanced to him was made actionable, under the Silingian and Calpurnian laws respectively, by a stipulation contemporaneous with the loan. With the stipulator, the latter is not “stipulable,” but to the mercenary—that is to say, the advance and receipt of money as a loan of itself laid the borrower under a stricti juris obligation to repay it, even though no stipulatory engagement had intervened; in fact, in the law of mercenarii the contract. The obligation that arose from it was purely unilateral, and enforceable, where the loan was of money, by the same act—
certae pecuniae creditoris de usum general confinie—whereas, for example, (where interest was not attached) that interest on the loan was not claimable along with it, the res given and receiving was the full measure of the obligation of repayment. The other three—commodate, deposit and (of course) mutuum—possess much more in the manner of the law of possessions, respectively, ourselves, have been that, within the origin of the regulation of law. If the payment of the interest had not yielded them the possession that had been given him pending inquiry, it was only by a rescript of Antoninus Pius that it was declared that a plea by the heir-at-law of invalidity of a testament then, the great variety of different kinds of execution might be staid by an exceptio doli, on the principle that it was contrary to good faith to set aside the wishes of a testator on a technical objection that was purely formal. Thus was the honorum possesso

sucubus tabulas, i.e., in accordance with what, being originally one in aid of the jus civile, in course of time converted into one in contradistinction of it. That the motives and purposes of the series of praetors that built up the law of honorum possesso became obvious; and, once the machinery had been invented, nothing was easier than to apply it

to new ideas. The praetor could not make a man heir—that he was always disinherited; but he could and would be required to give the substantial advantages of inheritance, and protect him in their enjoyment by praetorian remedies. He gave him possession of the goods of the deceased, with summary remedies for ingathering the effects of which he would have to dispose of it on the expiry of the period of usucapion; and, subsequently, by interpolation into the formula of a fiction of heirship, he gave him effectual personal actions against debtors of the deceased, rendering him not a mere heir-at-law of the deceased.

Another variety of the honorum possesso was that contra tabulas in opposition to the terms of a testament. If a testator had neither instituted nor expressly disinherited a son who was a nullity, and the child passed over had no need of a praetorian remedy. Where

sui heredes other than sons were passed over the jus civile upheld the will of the testator, and the estate would revert to them as a sort of accretion. But the Edict went further; for, if the testator was a stranger, i.e., was not a person in the potestas of the testator with the child passed over, then, on the petition of the latter, the praetor gave him, and any other sui conjunctus with him, possession of the whole estate of the deceased as on intestacy, the intestacy being left with nothing more than the empty name of heir. Another application of the honorum possesso contra tabulas was to the case of a woman whose husband had disinherited her or had not required to institute or disinherit her; for by emancipation they had ceased to be sui heredes, and had lost that interest in the family estate which was the reason why they had to be given possession of the shares of estate. The law, although probably not until the empire, and when the doctrines of the jus naturale were being more freely recognized—put these cases upon the footing as the bestius and testator, he should also be either instituted or disinherited, and give them honorum possesso if they were not. It was contra tabulas in the sense that it displaced the instituted heirs either wholly or partially—wholly when the institutes were not children of the deceased, partially when they were. In the latter case, at least when sui were affected by it, the grant of honorum possesso was under the equitable condition that the grantees should collate or bring into partition all their own acquisitions since their emancipation.

The third variety of honorum possesso was that granted ab inestato. The rules of the jus civile in reference to succession on intestacy were, as we have seen, extremely strict and all-embracing. They admitted no other heirs but the natural heirs, nor agnates who had undergone capitis diminution; they admitted no female agnate more remote than a sister; if the deceased was not a male the female agnate was the heir of the next degree; mere cognates, kinship of the deceased who were not agnates, e.g., grandchildren or others related to him through females and agnates capite minuto, was not admitted at all. These rules were in force among the tralaticium, and therefore filiae loco. All these rules the praetors amended, and so far paved the way for the revolution in the law of intestate succession which was accomplished by Justinian.

For ease of classification, we may divide the sui heredes of the jus civile, they gave the first place to descendants (liberi), including in the term all those whom the deceased would have been bound either by the jus civile or the Edict to include among his debtors. xuống in succession with line and daughters of his body whether in potestas at his death or emancipated, the representatives of sons who had predeceased him, and adopted children in his potestas when he died. (2) On failure
of liberti the right to petition for bonorum possessio opened to the nearest collateral agnates of the intestate, under their old name of legitimis heredes. (3) Under the jus civile, on failure of agnates (and of the gens where there was one), the succession was vacant and fell to the fisc, unless perchance it was usurped by a stranger possessing pro herede. The frequency of such vacancies was much diminished by the recognition by the praetors of the right of cognates to claim on intestacy in the third place. Who the praetor Mr. undoubtedly in view under the name of "cognates" it is impossible to say. The epithet is most frequently applied by modern writers to kinsmen related through females; but in its widest sense it included all kinsmen on either side, whether male or female, and, in some limited sense, the emancipati not entitled to claim as agnates. There were included amongst them therefore—although it is very probable that the list was not made up at once, but from time to time by the addition of a series of names from amongst females (who were not agnates), but also agnates of a remote degree who were excluded as such because the nearest agnates in existence had declined, persons who had been agnates but by reason of capitio minuto had lost that character, female agnates more distantly related than sisters, and children of the intestate who at the time of his death were in an adoptive family. All these took according to praetorius, but not beyond the sixth collaterals, the period for those entitled in the second place beginning when that of those entitled in the first had expired, and so on. The grant was always made at the request of the petitioner; nothing was assured him by it; it might turn out real and substantial (cum re) or merely nominal (sine re), according as the grantee could or could not maintain it against the heir of the jus civile. For the latter was entitled to stand on his statutory or testamentary right, without applying to bonorum possessio in intestacy among freemens. The praetorian order of succession to freedmen and emancipati was necessarily different, the patron or quasi-patron taking the place of agnates; but it is too detailed and complex to be gone into here.

All these bonorum possessiones had to be formally petitioned for. In that ab intestato descendents were allowed a year for doing so, while other persons were limited to three years, the period for those entitled in the second place beginning when that of those entitled in the first had expired, and so on. The grant was always made at the request of the petitioner; nothing was assured him by it; it might turn out real and substantial (cum re) or merely nominal (sine re), according as the grantee could or could not maintain it against the heir of the jus civile. For the latter was entitled to stand on his statutory or testamentary right, without applying to bonorum possessio in intestacy among freemens. The praetorian order of succession to freedmen and emancipati was necessarily different, the patron or quasi-patron taking the place of agnates; but it is too detailed and complex to be gone into here.

The Deceased.

The Law of Procedure.—The use of the formular system of procedure as an alternative to that by the "actions of the law" commenced long before the end of the period now under consideration; and we have had occasion more than once to observe how greatly it facilitated the development of the institutions of property and contractual obligation. But as the case was only completed in the early Empire it will be more convenient to defer explanation of the nature of the new procedure in the meantime.

IV. THE JUS NATURALE AND MATURITY OF ROMAN JURISPRUDENCE

(The Empire until the time of Diocletian.)

I. Characteristics and Formative Agencies of the Law during the Period.

Characteristics generally and Recognition of a Jus Naturale in particular.—The first three centuries of the Empire witnessed the perfection of Roman jurisprudence and the commencement of its decline. During that time the history of the law presents no such great landmarks as the enactment of the XII. Tables, the commencement of a praetor's edict, the recognition of simple consent as creative of a contractual bond, or the introduction of a new system of judicial procedure; the establishment of the chief class of patrimonial jurisprudence, the incorporation of the fiscus in the empire, and the admission of all the free subjects of the Empire to the privileges of citizenship, are about the only isolated events to which one can point as productive of great and lasting results. There were, indeed, some radical changes in particular institutions, such as the caducity legislation of Augustus, intended to raise the tone of domestic morality and increase fruitful marriages, and the legislation of the same emperor and his immediate successor for regulation of the status of enfranchised slaves; but these, although of vast importance in themselves, and the first of them influencing the current of the law for centuries, yet left upon it no permanent impression. It was by much less imposing efforts that it attained the perfection

1 See Voigt, Das Jus naturale . . . der Römer, particularly vol. 1. §§ 52-64, 89-96; Maine, Ancient Law, chap. iii.

2 Ulp. in Dig. xxiv. 7 fr. 14.

3 Voigt, l.c. p. 304.
natura debet... cajus fideum secuti sumus; (3) apportionment of advantage and disadvantage, gain and loss, according to the standard of need. The lex familiae still means to say, "the same words or form in which the will is manifested." It was for the first that, probably pretty early in the principate, led the praetors to place emancipated children on a footing of equality with their own. The lex familiae was the preferential recognition extended to children, and the succession collateral kindred through females as well as those related through males; and that, in the reigns of Hadrian and Marcus Aurelius respectively, induced the proportion of this peculiar position to be made by bequeathing to her children, and vice versa. It was in respect for the second that led to the recognition of what was called a natural obligation,—one that, because of some defective part of the ancestors, was not, as was ignored by the jus civil and incapable of being made the ground of an action for its enforcement, yet might be given effect indirectly by other equitable remedies. For the third was not new. The lex familiae had already admitted it as a principle that a man was not to be unjustly enriched at another's cost; the jurists of the empire, however, gave it a wider application than before, and used it as a key to the solution of many a difficult question in the domain of the law of contract. As for the fourth, it was one that had been applied with delicacy; for the voluntas could not in equity be preferred to its manifestion to the prejudice of other parties who had good faith acted upon the latter. We have many evidences of the skilful way in which the matter was handled, speculative opinion being held in check by considerations of individual interest and the public utility.

A remark of Voigt's on the subject is well worthy of being kept in view, that the risk which arose from the setting up of the precepts of a speculative jus naturale, as derogating from the rigor of the principle of the lex familiae mainly held by the jurists of the early Empire. Their jus respondendi made it in a sense legislative organs of the state, so that, in introducing principles of jus fidei into the lex familiae for the first time, the same moment defined them and gave them the force of law. They were, he says, "philosophers in the sphere of law, searchers after the ultimate truth; but while they—usually in reference to a concrete case—put themselves to the test of the truths and principles of speculation found, they combined with the freedom from constraint of speculation, the life-freshness of practice, and the power of asuring the completeness of their abstract propositions." It was especially in changes in the constitution added not a little the current of the law. Men of foreign descent reached the throne and recruited the senate, sometimes of the Republic; there was no longer a tribunate to which men of ambition might aspire; the comitia soon ceased to afford an outlet for public eloquence; so that men of education and position had all the more inducement to devote themselves to the continuous and consistent elaboration of a perfect law. This was greatly encouraged by the action of Augustus in creating a class of judges, in so far as, it is said, they played an active part in the development of the law. The magistrates and judges. It was still more so perhaps by Hadrian's reorganization of the imperial Privy council, wherein a large proportion of the seats were assigned to jurists of distinction. Several of the emperors had lawyers among their most intimate and trusted friends. Again and again the office of praetorian prefect, the highest next the throne, was filled by them; Papinian, Ulpian and Paul all held it in their time. Jurisprudence, therefore, was not merely an honourable and lucrative profession under the new arrangements, but a passport to places of eminence in the state; and till the death of Alexander the ranks of the jurists was further elevated by the possession of patrician and ability.

Extension of Citizenship to the Empire generally.—It was in the year A.D. 212 that Caracalla published his Constitution conferring citizenship on all the free inhabitants of the Empire. In the beginning, the purpose of the law was to have as its principle the fact that a man's natural acquirements made him a citizen. A slave or legatee was a Homo domesticus of the deceased. It was continued by his successors and was very profitable, thanks to the provisions of the law which classed single bledness, followed by testamentary distribution of the inheritance among their friends. But it affected only the recognition of Roman citizens, so that the great mass of the provincials escaped it. Cara- calla's edict was extended later to Roman citizens also, and thereby widened the area of its operation by elevating all his free subjects to the rank of citizens. The words of Ulpian regarding the constitution are very inclusive,—in orbo Romano qui sunt cives Roman effectus sunt; but there is considerable diversity of opinion as to their meaning, caused partly by the fact that the text is corrupt, and partly by the context. There can be little doubt that among others it did not apply to Junian Latins or peregrini dediticii. Limit the constitution, however, as may be, they were entitled to many of the privileges of Roman citizens. By conferring citizenship on the provincial peregrins it subjected them in their legal relations to the law of Rome, and qualified them for taking part in many transactions between two other states of the Empire, and the task of the comitia had been done for them. It did away with the necessity for regarding jus gentium as something distinct from jus civil. The principles and doctrines of jus gentium, it is true, survived and were expanded and elaborated as freely and successfully as ever; but they were so dealt with as part and parcel of the civil law of Rome, which had ceased to be Italian and become imperial.

Legislation of Comitia and Senate.—Augustus, clinging as much as possible to the form of the republican institutions, thought it expedient not to break with the old practice of submitting legislative proposals to the vote of the comitia of the tribes. Some of the laws of his reign were far from insignificant. Besides various measures for the amendment of the criminal law, &c., there were three sets of enactments of considerable importance which owed their authorship to him: the first to improve and restore public morality and encourage fruitful marriage, the second to abort the evils that had arisen from the too lavish admission of liberated slaves to the privileges of citizenship, and the third to regulate procedure in public prosecutions and private litigation.

The first set included the lex Julia de adulteris et de fundiota1 of 18 B.C. and the lex Julia et Popia Poppaea of A.D. 9—the latter a voluminous matrimonial code, in which an earlier marriage ordinance (a lex Juliae) entered, and re-enacted, and incorporated, and which for two or three centuries exercised such an influence as to be regarded as one of the sources of Roman law. It was, however, probably already superseded by the lex Julia &c.; the lex Juliae had been enacted before Augustus to provide for the case of a woman who was granted the rights of a marital participant in a marriage that had been legally declared null by the lex Julia &c.; the lex Juliae was later declared by the lex Julia &c. to be no longer applicable. The lex Popia Poppaea, an act of 17 B.C., revised and simplified the lex Juliae. It was often spoken of as the lex Codicaria, one of its most remarkable provisions being that unmarried persons (within certain ages and under certain qualifications) should not on the one hand marry, but on the other hand, should not be capable of marriage. Augustus, as is evident from a letter of Tiberius, believed the lex Popia Poppaea to be too harsh, and that married but childless persons should similarly forfeit one-half, the lapsed provisions (unlaced) going to the other persons named in the will who were qualified in terms of the statute, and falling mainly to the issue if the issue were well fared for. The lex Julia &c. and others raises doubts whether the lex Julia &c. did not really do more harm than good. It was not a real marriage; it was merely a form of marriage. The lex Juliae was passed in the interest of the will of Tiberius, and it was the interest of the lex Juliae in the interest of the will of Augustus. It was often spoken of as the lex Codicaria, one of its most remarkable provisions being that unmarried persons (within certain ages and under certain qualifications) should not on the one hand marry, but on the other hand, should not be capable of marriage. Augustus, as is evident from a letter of Tiberius, believed the lex Popia Poppaea to be too harsh, and that married but childless persons should similarly forfeit one-half, the lapsed provisions (unlaced) going to the other persons named in the will who were qualified in terms of the statute, and falling mainly to the issue if the issue were well fared for. The lex Julia &c. and others raises doubts whether the lex Julia &c. did not really do more harm than good. It was not a real marriage; it was merely a form of marriage.

The second set included the Fufia-Caninian law of the year 2 B.C., the Aelia-Sentian law of the year A.D. 41 and the Junia-Norban law of the year A.D. 19—the last it is thought passed in the reign of Tiberius, but probably planned by Augustus. The Aelia-Sentianlaw regulated the matter of manumission, which had been formerly the business of the magistrates. It prescribed to circumstances minutely described, become either (1) a citizen, or (2) a freedman with the possibility of attaining citizenship by a process indicated in the statute, or (3) a freedman who, because of the lawlessness of his undergroud masters, and whose grave offenses was forbidden to reside within a hundred miles of Rome and denied the hope of ever becoming a citizen (libertus dediticus). The Junia law was passed to define more precisely the status in the meantime of those freedmen who had a poten ality of citizen- ship. It did so by assimilating them, to a large extent, to the colonial Latins, denzy to them the rights of a citizen proper so far as concerned family and succession, but conferring on them all the patrimorial rights of a citizen and the fullest power of dealing with their belongings as long as not mortis causa and to the prejudice of their patrons. This was the Junian Latinity so prominent in the lex Juliae, but of which our limits exclude any detailed description.

The third set of enactments referred to included the two lex Juliae and the lex Juliae... prector, the private law, as for procedure in private litigations. Gaius, however, seems to refer to two other works under the title judicata privatae, which latter deal with judicata publica and another with procedure in private litigations. Gaius, however, seems to refer to two other works under the title judicata privatae, which latter deal with judicata publica...
of legis actions. The one regulating procedure in private suits at Rome must have been a somewhat comprehensive statute, as a passage in the Vaticas Fragments refers to a provision of its 27th section; and our ignorance of its contents therefore, beyond one or two ordi- 

nary regulations recorded. The Edict of 267 A.D. attributed by Wissak, already referred to, is that the judiciary laws made procedure by formulae compulsory, while the Aebian law had left in question.

These judicatures on the part of private judges a formula was to be henceforth compulsory; a legal could no longer be tried before private judges but only exceptionally by the central court.

For the Romans, the Digestus or the senate that did the work of legislation, for the simple reason that the comitia legisla- tion of Senate.

Julian's Edictum.

The Consolidated Edictum Perpetuum.—The edicts of the praetors which had attained very considerable proportions before the fall of the Republic, certainly received some additions in the early Empire. But those magistrates did not long enjoy the same independence as of old; there was a greater imperium than theirs in the state, before which they hesitated to 

actuated by the invariable edicts. The recent researches of the point in which the law required amendment, pos-

sessed seats in the imperial council, where the drafts of the senatus-consults were prepared. It was the senatus-consults that were the principal statutory factors of what was called by both emperors and jurists the jus novum—law that departed often very widely from the principles of the old jus civile, that was much more in accordance with those of the Edict, and that to a great extent might have been introduced through its means had not the authority of the praetors been overshadowed by that of the prince. In the end of the 2nd and the beginning of the 3rd century the supremacy of the latter in the senate was lost, rather too early in my opinion, in which he had submitted to it a project of law instead of the resolution which gave it legislative effect. No doubt such project must have been carefully considered beforehand in the imperial council, if not already in the senate; but the ignorant of the formal act that followed it tended unduly to em-

phasize the share borne in it by the sovereign, and made it all the easier for the emperors after Severus Alexander to dispense 

with the senatus-consults.

The revised Edict unfortunately, like the XII. Tables, is no longer extant. It is only a very slight account we have of the revision—a line or two in Eutropius and Anicius Victor, and a few lines in the prefatory section of the Digest. The present account, shorn from what is said there that both abridgment and rearrangement of the edicts of the urban praetor took place, but the question remains how far Julian consolidated with them those of the peregrine praetor and other officials who had contributed to the jus honorarium.

Those of the curule aediles, we are told, were included; Justinian says that they formed the last part of Julian's work; they formed, in fact, a sort of addendum to it. There is reason to believe that so many aediles, as already the provincials, if as differed from those of the praetors were also incorporated in it, and that the edicts of the peregrine praetors, in so far as they contained available matter not embodied in the senatus-consults, were added to the jus honorarium.

The consolidation got the name of Edictum Perpetuum in a sense somewhat different from that formerly imputed to edicta perpetua as distinguished from edicta recentia. It was an addition to the word. Sanctioned by senatusconsult and by the emperor, it became a closed chapter so far as the praetors were concerned; for, though it continued for a time to hold its place on their album with its formularies of actions, they had no longer any power to alter or even perhaps make additions to it. Having ceased to be a mere efflux of their imperium and became a type prescribed by statute, its interpretation and amendment were no longer in their hands but in the hands of the emperor.

The edicts were not divided into parts or books like Justinian's Digest but only into titles, which were perhaps numbered and certainly were rubricated. Since the publication of Lenel's great work, noted below, modern Romanists are agreed that the formulaires of actions in certain cases, were distinguished by the appropriate places throughout the work and not collected together in one place as used to be supposed. Thus a formula based on the civil law (i.e. actum, as opposed to edictum) was a separate head or subdivision of the title appropriate to it; while formula based on the praetor's imperium (e.g. that of the praetorian actio de dole) were placed under their respective edicts. Thus, it is clear that the procedure followed in the Digest in order to make, as we have documentary evidence to a certain extent in writings which have come down to us. There are particularly (1) the Digest of Justinian, in the prefaces to which we are told expressly that it followed the order of the Edict except in certain places specially noticed; (2) the Code of Justinian; (3) the extracts from divers commentaries on the Edict by the classical jurists

recently preserved in the Digest. As the inscriptions of these extracts contain the name of the Digest, the work and the par-

different scientific and worthy critical efforts are those of Rudorff in 1869 and above, all of Lenel in 1883.

Responses of Patented Counsel (juris consulti).

The right of responding under imperial authority (jus respondei ex auctoritate principis), first granted by Augustus and continued by his successors down to the time of Severus Alexander, did not appear to be of equal importance to the jurists or to the magistrates to whom it was granted to give advice to any one who chose to consult them. What it did was to give an authoritative character to a response, so that the judge who had asked for it and to whom it was given was enabled by the authority of the citizens, most of them unlearned in the law—was practically bound to adopt it as if it had emanated from the emperor himself. It may be that Augustus was actuated by a political motive—that he was desirous by this concession to attach lawyers of eminence to the new régime, and prevent the recurrence of the evils experienced during the Republic from the too great influence of the private law. But, whatever may have prompted his action in the matter, its beneficial consequences for the law can hardly be over-

rated. For the powers with which they were invested enabled the patented counsel to influence current doctrine not speculatively (as we say now), but also to an important extent from Julian himself in his Digesta) repeated attempts have been made in modern times to reproduce the Edict in its entirety. Most of these were transcripts with attempted reconstructions of passages in Justinian's Digest and in the Lex Romuliana. The only scient

1 Wissak, Processgesetze, i. 191 sqq., and ii. 221 sqq.

2 It may be, however, that the edicts of the peregrine praetors and provincial governors were independently codified. See Girard, Manuel Elements, 4th ed., 53 sqq. This work was received by the Digest 390 or 391, and it is certain that edictum provinciale with that of the peregrine praetor from the time of Augustus is far from convincing and has received no support from other writers. See Kipp, Gesch. d. Quellen, p. 123 n.

3 Rudorff, De juridictione edictum; edicti perpetui quoque religia sunt (Leipzig, 1869), and rev. by Brinz in the Kriti. Vierteljahrs- schrif. d. s. c. Litt. d. Kirchengesch. (Berlin, 1897) = ein Versuch zu dessen Wiederherstellung (Leipzig, 1883), 2nd ed. 1897

4 French ed. translation by Peltier, 2 vols. 1901–9. The last gained the "Savigny Foundation Prize" offered by the Munich Academy for the best work on Roman law. See K. L. Roemer, The Roman Law, (partially) following Rudorff, clearly ascertainable: first, a series of titles dealing with the preliminary steps in all actions such as jurisdiction, summons, intervention of procurators at action, and the like. Second, a series of proceedings of ordinary court or rather with actions granted principally in accordance with statute (judicia legum) as petitia hereditaria, reinscription, &c.; third, titles dealing with actions, the most prominent of which is on the magistrate's imperium (judicia imperio continens); fourth, execution of judgments, including bankruptcy, &c. These four parts were followed by a kind of appendix containing in three titles, the Acts of the Consul and the praetor. Finally, the edicts of the curule aediles, with their formulae also consolidated, were added at the end of the work. From the fragments of the jurists preserved by Justinian (principally from the comments of his Digesta) it seems evident that to an important extent from Julian himself in his Digesta) repeated attempts have been made in modern times to reproduce the Edict in its entirety. Most of these were transcripts with attempted reconstructions of passages in Justinian's Digest and in the Lex Romuliana. The only scientif

sqq.
give his reasons, reduced it to writing and sent it to the court unrecorded and kept apud acta. It was theoretically as a judge that the emperor issued his decrees, though in practice some

1. Gaius, i, 7; Justinian, Inst. i, 2, § 8. The passages from Pomponio in Dig. i, 2, 2, §§ 48, 49 are of doubtful meaning, and different interpretations are given by this volume, Institutionen (translation by Ledlie, 2nd ed.), p. 79; Girard, Manuel, p. 70; Kipp, Geschichte d. Quellen, p. 99.

constituents of the jurists, and the possibility of conflicting responses being tendered from two or more jurists equally privileged. It was an awkward predicament for a judge to be placed in. Hadrian solved the difficulty by declaring that the emperor was judge in all things that concerned the empire, and giving his discretion. That on receiving a response with which he was dissatisfied he could go on calling for others until he got one to his mind, and then pronounce judgment in accordance with it on the ground that the difference would be excess of the former. The more probable explanation of Hadrian's rescript is, that the number of petitioned responding counsel was very limited; that a judge of the praetor or assistant praetor was required to consult them all (quorum omnium si, &c.); that if they were unanimous, but only then, their opinion had force of statute (legis vicem opinem) and that when they differed the judge must decide for himself. 

Constitutions of the Emperors.---Gaius and Ulpian concur in holding that every imperial constitution, whether in the shape of a rescript, decree or edict, had the force of statute. It may be, that by the time of Ulpian that was the prevailing opinion; but modern criticism is disposed to regard the dictum of Gaius, written in the time of Antoninus Pius, as corrected by his Asiatic notions, and not quite accurate so far as at least the edicts were concerned. Apart from executive laws (leges daeva), the early imperial edicts were technically rather partial parts of the juss honorarium. As supreme magistrate the emperor had the power to ordain that certain persons should be appointed to public office, and it was by this means only that the office of the later emperor,分割 in respect of his imperium, was much greater than that of the praetors had been; for his authority extended for life, and extended over the whole Empire and every department of government. But in principle, it is thought, the successor on the throne was no more bound to adopt any of his edicts than a praetor was to adopt those of his predecessors. That it was not unusual for an edict to be reversed, acceding, that it occurred when it was considered that it was not by the immediate successor of its original author, are manifest from various passages in the texts. Sometimes, when its utility had stood the test of years, it was transmuted into a senatus-consultum, that fact preserved itself of itself, and that the name of the emperor attached to it was the effect of statute. But their adoption by a succession of two or three sovereigns, whose reigns were of average duration, may have been in the long run a sufficient cause to give the character of consuetudinary law; and, by a not unnatural process, unreflecting public opinion, may have come to impute force of statute to the edict itself rather than to the longo consuetudo that followed on it, thus paving the way for the assertion by the sovereign of the latter an absolute right of legislation, and for the recognition of the lex editialis as the only form of statute.

The imperial rescripts and decrees (rescriptum, decreto) appear to have acquired the same legal force (legem constitutum) possessed by an edict in the Empire, and their operation was not theoretically limited to the lifetime of the prince from whom they came. But they were not directly acts of the emperor's personal legislation. In both the emperor's person, and by a not unnatural process, unreflecting public opinion, may have come to impute force of statute to the edict itself rather than to the longo consuetudo that followed on it, thus paving the way for the assertion by the sovereign of the latter an absolute right of legislation, and for the recognition of the lex editialis as the only form of statute.

The imperial rescripts and decrees (rescriptum, decreto) appeared to have acquired the same legal force (legem constitutum) possessed by an edict in the Empire, and their operation was not theoretically limited to the lifetime of the prince from whom they came. But they were not directly acts of the emperor's personal legislation. In both the emperor's person, and by a not unnatural process, unreflecting public opinion, may have come to impute force of statute to the edict itself rather than to the longo consuetudo that followed on it, thus paving the way for the assertion by the sovereign of the latter an absolute right of legislation, and for the recognition of the lex editialis as the only form of statute.

ROMAN LAW

JUS NATURALE]

remarkable, manifesting a spirit very different from
that which animated the common law of testaments. True, it was
a principle with the jurists of the classical period that the voluntatts
ratio was to be given effect to in the interpretation of testamentary
writings; but that was on the condition that the requirements of
jaw as to form and substance had been scrupulously observed. But
in the military testament positive rules were made to yield to the
voluntas in all respects: the will was almost absolutely unfettered.
Roman law in this matter gave place to natural law. One would
have expected the influence of so great a change to have manifested
itself by degrees in the ordinary law of testaments; yet it is barely
visible. In a few points the legislation of Constantine, Theodosius 1 1.
and Justinian relaxed the strictness of the old rules; but there
was never any approach to the recognition of the complete supremacy of the voluntas. I n the Corpus Juris the contrast between the
testamentum paganum and the lestamentum militare was almost as
marked as in the days of Trajan. The latter was still a privileged
deed, whose use was confined to a soldier actually on service, and
if he received an honourable discharge, for twelve months after his

Confined at first to filiifamilias on actual service, the privilege was
extended by Hadrian to those who had obtained honourable discharge.
The same emperor allowed them not merely to test on their peculium
castrense, but to manumit inter vivos slaves that formed part of it;
and by a little step further the classical jurists recognized their right
to dispose of it onerously or gratuitously inter

century the range of it was extended so as to include not only
the soldier's pay and prize, but all that had come to him, directly
or indirectly, in connexion with his profession his outfit, gifts
made to him during his service, legacies from comrades and so on.
All this was in a high degree subversive of the doctrines of the
common law. It may almost be called revolutionary; for it involved in the first place the recognition of the right of a person
alieni juris to make a testament as if he were sui juris, and in
the second place the recognition of a separate estate in a filiusfamilias which he might deal with independently of his paterfamilias,
which could not be touched by the latter's creditors, and which he

share of his father's succession. The radical right of the parent,
however, was rather suspended than extinguished; for, if the
soldier son died intestate, the right of the paterfamilias revived
he took his son's belongings, not as his heir appropriating an inheritance, but as his paterfamilias reclaiming a peculium?
The Family. The legislative efforts of Augustus to encourage
marriage, to which persons of position showed a remarkable distaste,
have already been mentioned. The relation of husband

than deliberate interchange of nuptial consent, although
in certain cases some act indicative of change of life, such as the
bride's home-coming to her husband's house, was regarded as
the criterion of completed marriage. 3 But it was rarely accompanied with manus. So repugnant was such subjection to patrician
ladies that they declined to submit to confarreate nuptials; and so
great consequently became the difficulty of finding persons qualified
by confarreate birth to fill the higher priesthoods that early in the
Empire it had to be decreed that confarreation should in future be
productive of manus only quoad sacra, and should not make the
wife a member of her husband's family. Manus by a year's uninterrupted cohabitation was long out of date in the time of Gaius;
and, although that by coemption was still in use in his time, it
was almost unknown by the end of the period. Husband and
wife therefore had their separate estates, the common establishment being maintained by the husband, with the assistance of the
revenue of the wife's dowry (dos) an institution which received
much attention at the hands of the jurists, and was to some extent

repudium by either spouse) was unfortunately very common it
was lawful even without any assignable cause; when blame attached
to either spouse, he or she suffered deprivation to some extent of the
nuptial provisions, but there were no other penal consequences.
Not only in the case of a filiusfamilias who had adopted a
military career, but in all directions, there was manifested a strong
tendency to place restrictions on the exercise of the patria potestas.
This was due in a great degree to the hold that the principles of
natural law were gaining within the Roman system, perhaps due

their impignoration by him was prohibited under pain of banishment.
Except in the solitary case of a son who was a soldier, a paterfamilias was still recognized as in law the owner of all the earnings
and other acquisitions of his children in potestate; but the old rule
still remained that for their civil debts ne was not liable beyond
the amount of the fund he had advanced them to deal with as de
facto their own (peculium profecticium), except when he had derived
advantage from their contract or had expressly or by implication
authorized them to enter into it as his agents. To the party with
whom he had contracted a filiusfamilias was himself liable as fully

he had been a paterfamilias, with one exception, namely, when
was for borrowed money; in that case, with some very
reasonable qualifications, it was declared by the well-known Macedonian senatusconsult (of the time of Vespasian) that the lender
should not be entitled to recover payment, even after his borrower
had become sui juris by his father's death. Between a father and
his emancipated son there was, and always had been, perfect freedom of contract; but so was there now between a father and his
soldier son in any matter relating to the peculium castrense, even
though the son was in potestate. What is still more remarkable is
that the new sentiment which was operating on the jus civile
admitted the possibility of natural obligation between paterfamilias
and filiusfamilias even in reference to the peculium profecticium,
which, though incapable of direct enforcement by action, was yet
to some extent recognized and given effect to indirectly.
In the matter of guardianship, while the tutory of pupils was
carefully maintained and the law in regard to it materially amended
during the period under review (particularly by a senatusconsult
generally referred to as the Oratio divi Severi, prohibiting alienation of the ward's property without judicial authority), that of
women above the age of pupillarity gradually disappeared.* The
guardianship or curatory (cura) of minors above pupillarity owed
its establishment as a general doctrine to Marcus Aurelius.
The
Plaetorian law 6 of the middle of the 6th century of the city had
indeed imposed penalties on those taking undue advantage of the
inexperience of minors, i.e. persons sui juris under the age of twentyfive; and from that time the praetors were in the habit of granting
restitutio in integrum in cases of lesion and appointing curators to act
with such persons for the protection of their interests in particular
affairs.
But it was Marcus Aurelius that first made curatory a
general permanent office, to endure in the ordinary case until the
ward attained majority. The powers, duties and; responsibilities
of such curators became a matter for careful and elaborate definition and regulation by the jurists, whose exposition indeed of the
law of guardianship generally, whether by tutors or curators, has
found wide acceptance in modern systems of jurisprudence.
The Law of Succession and particularly Testamentary Trusts.
There were far more positive changes in the law of succession than
in either that of property or that of obligation. The rise
and progress of the military testament has already been ',
explained. The testament of the common law was still
ostensibly that per aes et libram; but the practice of
granting bonorum possessio secundum tabulas to the persons named
as heirs in any testamentary instrument that bore outside the
requisite number of seals led, from the time of Antoninus Pius,
to the frequent neglect of the time-honoured formalities of the
familiae mancipalio and nuncupatio testamenti. It was his rescript,
formerly mentioned, declaring that an heir-at-law should no longer
be entitled to dispute the last wishes of a testator on the technical
ground of non-compliance with the purely formal requirements
of the law, that practically established what Justinian calls the
praetorian testament.
One of the commonest provisions in the testaments of the period
was the fideicommissum, a request by the testator to his heir to
enter on the inheritance and thereafter denude wholly or partially
in favour of a third party.
It was introduced in the time of
Augustus by (it is said by Theophilus) a testator who had married
a peregrin wife, and desired thus indirectly to give to his peregrin
children the succession which, as not being citizens, they could
neither take ab intestate nor as his direct testamentary heirs.* He
probably soon found imitators, and their number must have rapidly
multiplied once the emperor, shocked at the perfidy of a trustee

to the -fact that the emperors, having succeeded to the censorial
regimen morum, allowed these principles freely to influence their
edicts and rescripts.
Exposure of an infant was still apparently
allowed but a parent was no longer permitted, even in the character
of household judge, to put his son to death or cruelly ill-treat him;
in fact his prerogative was limited to moderate chastisement, the
law requiring, in the case of a grave offence that merited severer
punishment, that he should bring his child before the competent
magistrate. His right of sale, in like manner, was permitted only
when he was in great poverty and unable to maintain them, while

who had failed to comply with the request of his testator, indicated his approval of the new institution by remitting the matter to the consule of the day, with instructions to do in the circumstances what they thought right. So equitable a court of justice was, and so numerous did the questions become as to the construction and fulfillment of testamentary trusts, that under Claudius it was found necessary to institute a court specially charged with their administration.

The employment of a trust as a means of benefitting those who were under disqualifications as heirs or legatees, as, for example, persons who had no testamento factio, women incapacitated by the age or by marriage, infirm persons incapacitated by the Julian and Papia-Poppaean law, and so on, was, in time prohibited by statute; but that did not affect its general popularity. The law of 15, which granted the power of the praetor to enforce by an action of praescriptio the universal hereditas or an aliquot part of it to the beneficiary (fideicommissum hereditatis), or of some particular thing (fideicommissum rei singularis), a testamentary trust had various advantages over either direct institution or a direct bequest (legatum).

Still the imposition upon the heir of a trust in favour of a beneficiary, whether it required him to demesne the whole or only a part of the inheritance, did not in theory deprive him of his common right of heir or relieve him from the responsibility of its administration; and at common law therefore he was entitled to decline the succession, often to the great prejudice of the beneficiary. In order to avoid such a mischief, and to encourage the disposition of the property of the deceased in a trust, which related not only towards debtors and creditors of the testator, it became the practice for the parties to enter into stipulatary arrangements about the matter; these were to some extent recognized as rules of law, two such particular enactments, time of Nero and the Pesian in that of Vespanian, which not only secured the beneficiary against the trustee's (i.e. the heir's) repudiation of the inheritance, but also protected the latter from all risk of unfair or ungratious treatment. The latter, which unfortunately we very little, is generally supposed to have empowered the praetor (1) to devise a simpler form of procedure for causes already cognizable per legem actionem, (2) to devise forms of trust (trusts) to make it easier to proceed according to the style exhibited on the album or according to a modification of it. The result he embodied in a written and signed appointment of a judge, whom he instructed what he had to try, and empowered to proceed to find either condemning or acquitting the defendant. This writing was the formula.

Although it was not until the early Empire that this system of civil procedure attained its full development, yet it had been in use for several centuries before the fall of the Republic. Galus ascribes its introduction and definitive establishment to the lex Ab Aurelia and two judicial laws of the time of Augustus, formerly mentioned under praetor. There was a law, of which we unfortunately very little, is generally supposed to have empowered the praetor (1) to devise a simpler form of procedure for causes already cognizable per legem actionem, (2) to devise forms of trust (trusts) to make it easier to proceed according to the style exhibited on the album or according to a modification of it. of the construction of formulae upon illiquid claims arising from trans- actions in which the practice of stipulation gradually dropped out of use, till at last the bona fide judicata were reached, marked by the word, "saepe dicetur," which is equivalent to "est, et," whatever in respect thereof N. N. ought in good faith to give to or do for A. A.

In case of real actions the transition from the legis actions to the formulæ followed a different course. The Aebulian law, while sanctioning the competency of formulæ, did not interfere with the procedure per sacramentum when reached. It is to be supposed that a certain definite action was in the mind of the parties, and raised ex facie only the simple question whether the twenty-five sesterciae were due or not: the action was in form a personal, not a real one, and was therefore appropriately remitted to a single judge instead of to a praetorian judge. The critical question was how it was to be reached only through means of a finding (sententia) on the question of real right; if it was for the plaintiff, he did not claim the amount actually due, but claimed the right to demand it, and if he had failed to deliver it, with its fruits and profits, the plaintiff had recourse against the latter's surities. The petitory formula, was undoubtedly of later introduction and much more straightforward. Like the condicio certa praeconiam, it contained only "intention" and "condemnation. It ran thus:

"Tutius be Judge. Should it appear that the slave Stichus, about whom this action has been raised, belongs to A. A. in quiritian right, he shall have been, and shall remain in that you will condemn N. N. to A. A.; should it not so appear, you will acquit him."

The formulæ given above, whether applicable to real or personal actions, are the only illustrations of the class known as formulæ juris civilis or in jus concepctae. The characteristic of such a formula was that it contained in the "intention" and in the "condemnation" its whole purpose, and was applicable either in jus or in consuetudine, or even in that you will condemn N. N. to A. A.; should it not so appear, you will acquit him.

1 This actio ex stipulatu used to be regarded as nothing more than a variety of the condicio incerti. It is doubtful, however, whether in the condicio incerti (e.g. the condicio furis) there was any demonstratio. See Girard, Manuel, p. 614 n. 2 and 3 and authorities cited there.

2 Employed in the advisory actions, i.e. for dividing common property; in fixing an inheritance, or settling boundaries; the demand was that the judge should adjudicate (or assign) to each of the parties a such a share as he though just. See Lenel, Edit. Pers. ii. 282, p. 265.

3 Employed in certain actions upon delict, where the old penalties of death, slavery or tallony had in practice, or by the praetor's authority, been transmuted into money payments, and the defendant was frequently called upon to make a direct damage or to submit to Lenel, Edit. Perp. i. 292 ed. 287, the form dare facere praetare oportere is probably used in actions pro sociis.

4 These latter have an analogy to the English "action on the case," and are the civil and fide bonis remedy for the same wrong; for Gaius observes (iv. 47) that in commodate and deposit failure of the borrower or depositary to return the thing lent to or deposited with him gave rise to action that could be brought in a facere praetare or in facere praetare oportere. In this section he gives the styles of actions depositi in jus and in facere praetare conceptae; their comparison is instructive. The formula in factum must almost certainly have been the earlier and shows, it is thought, that deposit and commodate were enforced (perhaps first by the peregrin praetor) by means of edicts before being admitted into the the law. Hence we can see why the postrum and the commodation were extensively used in the title to the absolute ownership.

1 This actio may be translated as analogous or adapted actio, i.e., analogous to the action of the same name in English law. It is applicable to particular cases or persons, according to the terms of a lex, edict, &c., the praetor frequently adapted the statute, &c., to such cases and persons by the formula actio quae de hoc curiosum est dicta in facere praetare oportere.

2 The judgment of the praetor is as authoritative as any legal fiction. The praetor thereby adapted formula such as "est, et," to be used in cases of titles of two kinds, ordinary and fictitious. Those of common occurrence early became stereotyped in the Edict and even got special names. As illustrations of an ordinary actio utilis, in which the formula was stereotyped, and was called "adapting the statute to the facts," the following are examples: 1. "Quod quis quaesitum habuit: nihil quod iniuria est videbitur, judicium dabo" (Dig. iv. 3. 1, § 1); 2. "Nautae cauponae stabulabur qui complementum non reperierit, nisi restitut. In eos judicium dabo" (Dig. iv. 9. 1, pt.); 3. "Quod quis commodum dictor, de eo judicium dabo" (Dig. xii. 6. 1, pt.).
consideration of the judge, but only a question of fact, proof of which was to be followed by a condemnation. That of the actio de foro, for example, ran thus: "Litigation. Should it be said that the heir of N. N. A. was induced to convey andcede possession to him of his farm (describing it), then, unless on your N. N. restores it, you will condemn him in damages to A. A. and insist that the same be paid to him and that the factum might be utiles as well as direct; e.g. actio quasi- Serviana or hypothecaria was utiles, being based on analogy to the actio Serviana.

Our limits do not admit of any explanation of the purpose, form, or effect of the prescriptions, exceptions, replications, &c., that were engraved on a formula when required; or of the ways in which the condemnation was occasionally carried out; the response was often to occur so as to prevent the award of extravagant damages; or of the consequences of defects in the formula; or of the procedure in jure before it was adjusted, or in judicio afterwards; or of appeal for review of the judgment by a higher tribunal; or of execution (which was against the estate of the judgment-debtor, and took the form of incarceration only when his goods could not be attached).

Our main object has been to show how elastic was this procedure, and how the praetorian formulae, in conjunction with the relative announcements in the edict, supplied the vehicle for the introduction into the law of an immense amount of new doctrine. The system was fully developed before Julianus's consolidation of the Edict. For the moment, however, let us rest our discussion, though it stopped the praetor's power of amending the law, did nothing to impair the efficiency of the existing procedure.

Procedere extra ordinem. In these cases, speaking generally, the magistrate acted as an administrative official. Such cases did not necessarily come before the praetor in any official capacity. A person about to sell his estate might be committed as a rule to special officials (e.g. consuls) who were appointed to decide them by the emperors. This kind of procedure was adopted sometimes because the claim that was being proceeded against depended rather on moral than on legal right, and sometimes in order to avoid unnecessary disclosure of family misunderstandings. Thus, the earliest questions that were raised about testamentary trusts and the like were disposed of by the praetor in this way. It was not, however, developed apparently because, in the existing state of jurisprudence, it was thought incompetent for a beneficiary to maintain in reference to the heir (who had only been requested to comply with the testator's wishes) that he was bound in law to pay him (jure aparte) his bequest. Had the difficulty arisen at an earlier period, and in the heyday of the constructive energy of the praetors, they would probably have solved it with an actio in factum. As it was, it fell to the praetor to decide it, and it was not, indeed, till the period of the extraordinaria cognitio, the jurisdiction which they in the first instance conferred on the consuls being before long confided to a magistrate that the praetor decided from the start. Questions of between tutors and their pupil wards in like manner began to be dealt with by extra ordinem, the cognition being entrusted by Marcus Aurelius to a praetor tutelaris; while fiscal questions in the provinces were being discussed in extra ordinem. The creation was due to Nerva. Claims for aliment for parent between and child and child or patron and freedman rested on natural duty rather than on legal right; they could not therefore well be made the subject-matter of a judicium, and consequently went for disposal to the consuls or the city prefect, and in the provinces to the governor. Questions of status, especially of freedom or slavery, at least from the time of Marcus Aurelius, were also disposed of extra ordinem, and so were claims by physicians, advocates and public teachers for their honoraria, and by officials for their salaries, the Romans refusing to admit that these could be recovered by an ordinary action. In both instances it was due to the praetor's informal cognizance of such matters occurring on the spot, and by the praetor's right to act on the spot, that such cognizance was in fact taken. The procedure began with a complaint addressed to the magistrate, instead of an in jure votatio of the party complained against; it was for the magistrate to require the attendance of the latter (erocatio) if he thought the case relevant. The final decision was a judicium or decreto according to circumstances.

Juridical Remedies flowing directly from the Magistrate's Imperium. Great as were the results for the law of the multiplication of the jurisdiction of the praetor, the process of the formulae it may be questioned whether it did not benefit quite as much from the direct intervention of the praetors and other magistrates as it did from the creation of a new field of cognizance with which they were invested. This manifested itself principally in the form of (1) interdicts; (2) praetorian stipulations; (3) missio in possessionem; and (4) in integrum restitution. All these had been in common use during the Republic. The procedure had been required to as in use under the jure civile; but their number and scope were vastly increased under that of the jus praetorium. The characteristic of the development of the procedure by the praetor reversed the ordinary course of things, and, instead of waiting for an inquiry into the facts alleged by a complainant, provisionally assumed them to be true and prosecuted an order of execution, which was binding to obey or show to be unjustified. The order pronounced might be either restitutory, exhibitory (in both cases usually spoken in the texts as a decrētum), or prohibitory—restitutory, when, in an order pronounced, it was alleged that the defendant was alleged to have taken possession of by violent means, to remove impediments he had placed in the channel of a river, and the like; exhibitory, when he was ordered to produce something he was keeping; e.g. clothing or the body of a slave, or a will in which the complainant alleged that he had an interest; prohibitory, as, for example, that he should not disturb the status quo of possession as claimed by the complainant and himself, that he should not interfere with a highway, a watercourse, the access to a sepulchre, and so forth. If the respondent obeyed the order pronounced in a restitutory or exhibitory decree, there was an end of the matter. But frequently, and perhaps more often than the interdict was the only commencement of a litigation, facilitated by spoliations and restitutions, in which the questions had to be tried (1) whether the interdict or injunction was justified, and, if so, (2) what was to be done to him who had committed the wrong things were due in consequence. The procedure therefore was often anything but summary.

In the possessory interdict usus possidetis and usucuplì in particular it was usually involved, due to some extent to the fact that they were double interdicts (interdicta duplīca), i.e. addressed indifferently to both parties. Gaius says, but, as most modern writers think, erroneously, that they had been devised as ancillary instruments of the praetor's jurisdiction, and that one of the parties, as possessor, was to have the advantage of standing on the defensive in the rei vindicatio. They were so used in his time, as in that of Justinian, cannot be doubted. But it is amazing that they should have been, for they were much more cumbersome than the vindicatio to which they led up. Take the interdict usus possidetis, which applied to immovableables, as usucupli did to movableables. Both parties would almost be compelled to rely upon them to this effect: "I forbid that you two who do not possess the house in question to use force in order to prevent the other who is in possession, provided he is neither by clandestine nor by violent exclusion of the first, nor in virtue of a right derived from him during pleasure, from continuing to possess as at present." It is manifest that this decided nothing; it was no more than a prohibition of disturbance of the status quo; it left the question entirely open, and was quite as much as the praetor has in such cases, that was forbidden to interfere. The manner of its explication was somewhat singular. Each of the parties was bound at once to manifest its intention; it was in the praetor's position to decide who had the better claim. But the praetor of his decision might be reversed by the party on the other side. If the praetor regarded the praetor's decision as a judicial decision, by which it was decided that the praetor had committed a breach of the interdict; and on these, in four number, formulae were adjusted and sent to a judex for trial. If the procedure could not thus be explicated, because either of the parties declined to take part in the usus ex conventu, or the bidding, or the spoliations and restitutions, he was assumed to be in the wrong, and, by what was called a secondary interdict, activity was directed against possession or detention and to abstain from disturbing the other. In all times, however, we may think of the action system of the Romans in the period of the classical jurisprudence, one cannot help wondering at a

chaps. 16-18; Baron, vol. i, §§ 216-219. Procedure in this case is also sometimes included under the term cognitio extraordinaria.

CODIFICATION

ROMAN LAW

fixed the lines within which he ought to confine himself, and made the principles of in integrum restitutione as well adapted almost as those of the actio quod metus causa or the actio de doo.

V. The Period of Codification

(Diocletian to Justinian.)

1. Historical Events that Influenced the Law.

Supremacy of the Emperors as Sole Legislators.—From the time of Diocletian onwards the making of the law was exclusively in the hands of the emperors. The senate still existed, but they were but shells of all its old functions alike of government and legislation. The responses of patented jurists were a thing of the past. It was to the imperial consistency alone that men looked for interpretation of old law or promulgation of new.

In the reign of Diocletian rescripts were still abundant; but the constitutions in the Theodosian, and Justinianian Codes from the time of Constantine downwards are mostly dictated by a wide scope, and of the class known as general or edictal laws (leges generales edictales). It would be wrong, however, to infer that rescripts had ceased; for Justinian’s Code contains various regulations as to their form, and the matter is dealt with again in one of his Novels. The reason why so few are preserved is that they were no longer authoritative to the magistrates to whom they were addressed. This was expressly declared by the emperors Arcadius and Honorius in 398 in reference to those that they issued in answer to applications for advice from officials; and it is not unreasonable to assume that a limitation of the same kind had been put at an earlier date on the authority of those addressed to private responsible. Although it is true that the enactment of Honorius and Arcadius applied equally to decrea, for the reason that during this period matters of litigation did not come under the cognizance of the emperor or the curator fiscal or the faithful administration of his office, or from a procurator that his principal would ratify what he did.

2. Miscellanea.

In integram restitutione, reinstatement of an individual, on grounds of equity, in the position he had occupied before some occurrence which rendered redress impossible and for which no other legal remedy existed was one of the most remarkable manifestations of the exercise of magisterial imperium. It was not that the individual in question, either directly by action or indirectly by exception, obtained a judgment that either rendered what had happened comparatively harmless or gave him compensation in damages for the loss he had sustained from it, but that the magistrate—and it could only be the praetor, the urban praefect, or the exercitat capitulis dictus. If the family had already been in possession of the property for his own protection.

1 Schirmer, Uber die prätorischen Judicial-Stipulationen (Greifswald, 1853); Keller-Wach, Civilprocess. § 77; Bekker, Aktionen. ii. chap. 16.

1 There was a senate both at Constantinople and at Rome during the latter part of the empire.

2 Sibyl, De la revolución de los romanos (Paris, 1843, and subsequently); Merivale, The Conversion of the Roman Empire (Boyle Lectures for 1864) (London, 1864), particularly lect. iv.; Allard, Le christianisme et l’empire roman (2nd ed. Paris, 1897).
in the recognition of the efficacy of certain acts done in presence of two or three of the clergy and thereafter recorded in the church registers; in the disabilities as to marriage and succession with which the clergy were burdened, and could not be bound in matters of their own. Of greater importance were three features for which it was directly responsible—the repeal of the caduary provisions of the Papal-Poppaea law, the penalties imposed upon divorce, and the mode of committing its acts.

The purpose of the caduary law was to discourage celibacy and encourage fruitful marriages; but legislation in such a spirit could not possibly be maintained when celibacy had come to be included as part of the peculiar characteristic of a holy life. The penalties alike of orbis and coelitus were abolished by Constantine in the year 320. The legislation about divorce, from the first of Constantine down to the year 452, can be written in a formula, if one may say so, which forms a miserable chapter in the history of the law. Not one of the emperors who busied himself with the matter, undoing the ill-advised work of his predecessors and substituting legislation of his own quite as complicated and futile, thought of that old principle that divorce ought to be as free as marriage and independent of the sanction or decree of a judicial tribunal. Justianin was the first who, by one of his Novels, imposed a condition on parties to a divorce of a common consent (communi consensus), namely, that they should both enter a convent, otherwise it should be null; but, so distasteful was this to popular feeling, and so little conducive to improvement of morality, that it disappeared after his time, and that it was repealed by his successor. The legislation of Justinian's predecessors and the bulk of his own were levelled at one sided repudiations, imposing penalties, personal and patrimonial (1) upon the wives and concubines, and on their property, (interdictum) even if only as sufficient—and the lawful grounds varied almost from reign to reign, and (2) upon the party whose misconduct gave rise to a repudiation that was justifiable. The bishop's court (episcopato judicium, or judicio episcopalis) had the same character as the primitive Christians, in accordance with the apostolic precept, of submitting their differences to one or two of their brethren in the faith, usually a presbyter when celibacy had come to be included in the state recognition of Christianity the practice obtained legislative sanction, Constantine giving the bishop's court concurrent jurisdiction with the ordinary civil courts where both parties preferred the former, and a civil (though at first the enactment was enacted as a part of the latter) of appeal to the bishop's court, and (as open to some doubt) going so far as to empower one of the parties to a suit to remove it to the ecclesiastical tribunal against the will of the other. He also declared that the judgments would be enforceable in the civil courts. It is not possible to say with any approach to exactitude what effect this intervention of the clergy as judges in ordinary civil cases for they had no proper criminal jurisdiction—had on the development of the law, and it can be seen how far the influence in still further promoting the tendency to subordinate act and word to will and intention, to deal leniently with technicalities, and to temper maintenance of the jus civele with equity and consideration the natural right.

Abandonment of the Formular System of Procedure.—The formular system, with its remit from the praecon to a sworn judiceps who was to try the case, was of infinite advantage to the law; for the judgment was as a rule that of a free and independent citizen, unhampered by officialism, fresh from some centre of business, chosen by, and in full sympathy with, the parties between whom he had to decide. Such a system was incompatible with the autocratic government of Diocletian and Constantine; and it is with no surprise that we find the former of them doing among the provincial governors that in future, unless prevented by pressure of work or a lack of will (or, as became evident, a later constitution of Julian's, when the matter was of trivial importance), they were not to remit them but were themselves to hear the cases (interdictum diurnum) as a matter of first importance, and was the practice in the extraordinariae cognitiones. The remit in the excepted cases was not, as formerly, to a private citizen, but to what is called a judex pedanes, who acted as an inferior subdistrict, and was subject both to a civil and a criminal jurisdiction. The system was not of the local bar; and for a time his delegated authority was embodied in a formula after the old fashion. But even this exceptional use of it did not long survive, for an enactment by the two sons of Constantine, conceived in terms the most comprehensive, declared that the judices and consules were to have no power of acting in any legal act whatever, whether contentsions or voluntary. The result was, not only the formal disappearance of the distinction between the proceedings in civil and in criminal cases (though the respective meanings remaining), but the practical (though not formal) disappearance also of the distinctions between actions in jus and in factum, and between actiones directae and actiones uniles, the common form of proceeding being the submission of the power of amendment of the pleadings, condemnation in the specific thing claimed, if in existence, instead of its pecuniary equivalent, and execution accordingly by the aid of officers of the law. This result was hastened by the last of intervention by officials. The in jus receiuit of the XII. Tables—the procedure by which a plaintiff himself brought his adversary into court—became a thing of the past. So also did the radonimium. In the same purpose of reducing means commenced the iulius denuntiatio introduced in the time of Marcus Aurelius and remodelled by Constantine; but under Justinian (though probably going to some extent into his time) admission of the power of amendment of the pleadings, condemnation in the specific thing claimed, if in existence, instead of its pecuniary equivalent, and execution accordingly by the aid of officers of the law. From this point, which marked the iulius contestatio or joinder of issues and procedure with which we are familiar, Evidence was taken and judgment given. But in all cases in which the demand was that a particular thing should be given or restored, and the plaintiff desired to have the thing itself rather than damages, execution might be specific and effectuated through officers of the law (manu militari). Where, on the other hand, the condemnation was pecuniary, the usual course, where the claim was to recover the price paid for a particular article, was to take possession of such things belonging to the defendant as were thought sufficient to satisfy the judgment (pignus in causa judicati capiendum), and they were eventually sold judicially if the defendant was unable to pay, and the proceeds were given to the plaintiff as satisfaction of his good faith in the matter (juraentum coiiasurate), and their counsel do the same.

From this point, which marked the iulius contestatio (thus and joinder of issues and procedure), Evidence was taken and judgment given. But in all cases in which the demand was that a particular thing should be given or restored, and the plaintiff desired to have the thing itself rather than damages, execution might be specific and effectuated through officers of the law (manu militari). Where, on the other hand, the condemnation was pecuniary, the usual course, where the claim was to recover the price paid for a particular article, was to take possession of such things belonging to the defendant as were thought sufficient to satisfy the judgment (pignus in causa judicati capiendum), and they were eventually sold judicially if the defendant was unable to pay, and the proceeds were given to the plaintiff as satisfaction of his good faith in the matter (juraentum coiiasurate), and their counsel do the same.

Valentian's law of citations.—This famous enactment, the provision of Theodosius (II.), tutor of the youthful Valen-

1 The truth of this as well as the previous rule depends on the authority of a Sirmondian constitution. See Cuq, Inst. Jurid. ii. p. 868 sq.

This constitution has always been regarded as a signal proof of the lamenteable condition into which jurisprudence had sunk in the beginning of the 5th century. Constantine, a hundred years earlier, had condemned the notions of Upian and Paul upon Papinian, and the emperor Justinian (jura condere): and, if it was to be gathered from the writings of those who were dead, it was perhaps as well that the use of them should be regulated. The Valentinian law proceeded so far in the same direction, and received, a solution of the jurists of the past, whose works alone were to be allowed to be cited,——Papinian, Paul, Upian and Modestine, the four latest patented counsel of any distinction; Gaius, of authority previously only in the schools, but now approved universally. The notion of him that he had never possessed the jus respondendi; and all the earlier jurists whose dicta these five had accepted. But it went yet a step further, for it declared all of them, with the sole exception of Papinian, the opinions, books and abstracts of those whose works only, because a living jurisprudence had no existence,—because the constructive talent of the earlier Empire had entirely disappeared.

ii. Ante-Justinian Collections of Statutes and Jurisprudence.

Of cardinal importance for this period were the collections of imperial constitutions made prior to Justinian. There were those of the latter called the Justinian Code, the Theodosian Code, the Licinian Code, and the Theodosian Codes; the first two being the work of private hands, though they afterwards received statutory sanction from Theodosius II., the third due to that emperor himself.

Codex Gregoriano.—This was a collection of imperial constitutions from Hadrian to Diocletian, made by a certain Gregorius about the end of the 3rd century (a. 285?), who, in Mommsen’s opinion was a provincial, and who, in the words of the jurist, "had no means of information upon the subject of the law; for just as for all jurists only because a living jurisprudence had no existence,—because the constructive talent of the earlier Empire had entirely disappeared."

Modestine, transcripts from the Gregorian and Hermogenian Codes, and one later general enactment. Its date is probably soon after the year 390, but its authorship is unknown.\footnote{1} Fragmenta Vaticanae: These fragments, discovered by Cardinal Antonelli and published in the Vatican in 1821, seem to have formed part of a book of practice, compiled in the Western Empire and of considerable dimensions. The extant fragments are ten in number, and it is likely that the latest of which is of the year 372. Its antiquity is therefore probably about the same as that of the Collatio.\footnote{3}

The Consulato.--The so-called Vetrici cujusdam Jurisconsulti Codex, which was published in 1577 by Cujus, from whom it takes its name. It is a collection of answers by an advocate, supported by citations of texts (consultations) upon questions arising, and (in cases in which the text was divided dealing used, sale, usufruct, dowries, donations, tories, and processional agency, and have been extracted from the writings of Papianin, Paul the Ulpian, an unknown work on interdicts, and the imperial constitutions of Theodosius, the latest of which is of the year 493. It is therefore probably about the same as that of the Consulato.\footnote{3}

The Roman Law-Book.\footnote{5}--This is a sort of manual of Roman law drawn up in the East, apparently in the Greek language, at an uncertain date, but some time between Theodosius and Justinian. It is the latest edition of its kind, and has been used by Syriac, Arabic, Armenian, and Persian scholars, who have come down to us, and it would seem that the work in this translation was greatly made use of in legal practice in the East (especially in the ecclesiastical Courts), and for several years, having in some places more authority attached to it than had the Digest and Code of Justinian. As a repertory of Roman law it is of little value, as it misunderstands or varies from the law in many respects, but it is quoted in some cases in how firmly Hellenic law and customs maintained themselves in the East during the decay of the Empire.\footnote{8}

Light has also been thrown upon the ante-Justinian law by the numerous papyrus documents, mostly from Greek, that have been found in recent years in Egypt (especially by Grenfell and Hunt) and elsewhere.* Mitteis, Gradenwitz and others have done much to elucidate these by numerous publications. But galls and things like a consequent account of them would occupy much space and cannot be attempted here.\footnote{8}

Romano-Barbarian Codes (Leges Romainae).--But beside the collection of the Gregorian and Hermogenian law, there were several official collections made prior to Justinian in Western Europe, after it had fallen under the dominion of Gothic and other kings. There are three of these which require special notice—each of them compiled from documentary sources of ante-Justinian law. Though of considerable use in explicating difficulties and filling up lacunae in the earlier law sources, they must be used with caution for that purpose, as they contain not a few corruptions of the original texts. They are:

1. Edictum Theodricum.\footnote{10}--This was compiled at the instance of Theodoric, king of the Ostrogoths, not long after the year 500 (not later than 517). Theodoric after he had conquered Italy directed Tribonian to the emperor and Francis I to acknowledge his suzerainty. He did not aim at being an independent legislator, and his Edict is therefore of limited scope and in no proper sense a code. Its materials were mainly drawn, without however indication given, from the writings of Paul, the Gregorian, Hermogenian and Theodosian Codes, and the post-Theodosian Novels. Divided into 135 chapters, with no arrangement, it touches upon all branches of the law, public and private, but especially criminal law and procedure. Though it contains a certain infusion of Gothic law and was professedly intended to apply to all Theodoric's subjects, both German and Romans, it was never admitted that this idea cannot have been fully realized, and that in some matters with which it deals, e.g. the law of the family, Gothic customs must still have continued to prevail for Gothic subjects.

2. The Lex Romana Wisigothorum or Breviarium Alarici or Alaricianum\footnote{11} (both of these titles are modern) was a much more comprehensive collection and important the West. For the Lex of Paul's Sentences, Gaius's Institutes (in a very corrupt and greatly abridged form in two books dating probably from, and adapted to the law of the, 5th century), the first book of Papian's Breviarium, and the two books of the Breviarium of Collectio (which were treated as jus). All of these, except Gaius (for the reason mentioned), were accompanied by interpretationes (i.e. for the most part explanatory adaptations of the passages to the new text in the language of the donor or translator), and were of current use for purposes of instruction, and which resemble the interpretation of the XII. Tables in that they are often so much explanatory of the text as qualitative or corrective. The Breviarium exercised great influence in Western Europe; and there is no question that, until the rise of the Bologna school in the end of the 12th century, it was from it more than from the books of Justinian that the Roman law, other than Italy, acquired its scanty knowledge of Roman law.

3. The Lex Romana Burgundionum\footnote{12}--to which erroneously, about the 9th century, owing to a mistake of a MS. transcriber, the name of 'Lex Saxonum' or 'Lex Saxo' was attached. This is given. It is a collection which King Gundobad, when publishing his code of native law (Lex Gundobada) for his native subjects, had promised should be prepared for the use of his Roman subjects. It was published probably not long before his death in 516. It deals with public law, criminal law and procedure, distributed through forty-seven titles, and is arranged much in the same order as the Gundobada, from which it has a few extracts. However, it is one of the same character as those in the Breviarium: its juristic sources are Paul's Sentences and a work of Gaius of which we cannot say with certainty that it is his Institutes. It has the same defects—some important parts of the same character as those in the Breviarium, but whether taken directly from the Institutes or not is disputed. After the conquest of the Burgundian kingdom by the Franks this code ceased to have any direct authority, but was used in the lands which it controlled as a sort of a code to supplement the Breviarium, being often bound in the same volume with the latter.

iii. Justinian's Legislation.

Justinian's Collections and his own Legislation.--The history of Justinian outside his legislative achievements, and his collections in detail, are dealt with in the article Justinian I. Ambitious to carry out a reform more complete than that of which Theodosius had planned but failed to execute, he took the first step towards it little more than six months after the death of his uncle Justin, in the appointment of a commission to prepare a collection of statutes (lex, or, where there is none, of the same character, and some others, and notes. See Karlova, Röm. R.G. i. pp. 976 seq.; Krüger, Quellen, § 40.

\footnote{5}{Ed. Bluhme in Pertz's Monumenta Germaniae. Hist. leges, iii. pp. 508 seq. (Hanover, 1863); de Salis Monum. Germ. Leg. sec. i. and ii. p. i (Hanover, 1892). See Karlova, Röm. R.G. i. pp. 983-985.}

\footnote{11}{Ed. Haenel (Leipzig, 1849); Conrat (Cohn). Bren. Alaricianum (1903). This work of Cohn is a systematic arrangement of the Breviarium, with the Latin text as given by Haenel, and a translation into German of the interpretaio (or, where there is none, of the same character, and some others, and notes. See Karlova, Röm. R.G. i. pp. 976 seq.; Krüger, Quellen, § 40.}

Taking his enactments in the Code and his Novels together, we have of Justinian's own legislation not far short of 600 enactments. Diocletian's contributions to the Code are more than twice as numerous; but most of them were never officially collected, and of which probably some have been lost. 1

His own enactments are more than twice as numerous; but most of them are more than twice as numerous; but most of them were never officially collected, and of which probably some have been lost. 1

The change in the composition of the relations between husband and wife under the Christian emperors, however, was significant when compared with that which had taken place during the period of the latters' decline. The law covering the family was now largely contained in Justinian's Code, and the expression of the principles of jurisprudence there found in the Corpus Iuris Civilis, and the substitution for it, under the name of Justinian the Great, of that cosmopolitan body of law which has contributed so largely to almost every modern system.

Changes in the Law of the Family.—With the Christian emperors, from Constantine downwards, almost the last traces disappeared of the old concept of the family as a group of persons and estate subject absolutely to the power and dominion of its head. Manus, the power in a husband over his wife and her belongings, was a thing of the past; both stood now on a footing of equality before the law; perhaps it might be more accurate to say, at least with reference to the Justinianian legislation, that the law accorded both the protection and the indulgence the law accorded her. With manus the old conformation and coexistence had ceased, marriage needing nothing more than simple interchange of consent, except as was the case when a man, or even a woman, had taken upon himself or herself the obligation of manus in order to legate its previous issue; in the latter case a written marriage settlement (instrumentum dotale) was required, and in the former both a settlement and a marriage in church before the bishop and at least three clerical witnesses, who granted and signed a certificate of the completed union. The legislation of the Christian emperors on the subject of divorce, largely contributed to by Justinian in his Novels, has already been referred to. In regard to the dos, many new provisions were introduced, principally for curtailing the husband's power of dealing with it while the marriage lasted, enlarging the right of the wife and her heirs in respect of it, and simplifying the means of recovering it from the husband or his heirs when the marriage was dissolved. Between the time of Constantine and that of Theodosius and Valentinian a new form of matrimonial settlement became established. It became apparent that the law of Justinian and his contemporaries was not sufficiently suited to the needs of the times, and that it was necessary to make a legal provision for the approver, or at least the judicial settlement, and that the law of Justinian should be made available to the community of the dos, antithema. It became apparent that the law of Justinian and his contemporaries was not sufficiently suited to the needs of the times, and that it was necessary to make a legal provision for the approver, or at least the judicial settlement, and that the law of Justinian should be made available to the community of the dos, antithema. 2

The general result was that, wherever a dos was given or promised on the part of the wife, there a donatio of equal amount was to be considered as having been made on the part of the husband. This was true during the marriage, but when to pass to her on his predecease or on divorce by his fault, her contra legem marriage. The right of the husband to retain the name of his wife under the name of his wife was sometimes as a sort of counterpart for the dos, antithema. It became apparent that the law of Justinian and his contemporaries was not sufficiently suited to the needs of the times, and that it was necessary to make a legal provision for the approver, or at least the judicial settlement, and that the law of Justinian should be made available to the community of the dos, antithema. It became apparent that the law of Justinian and his contemporaries was not sufficiently suited to the needs of the times, and that it was necessary to make a legal provision for the approver, or at least the judicial settlement, and that the law of Justinian should be made available to the community of the dos, antithema. 2

1 The best edition is that of Krüger, which is prefixed to the stereotype edition of the Corpus Iuris Civilis, and the several other Italian professors, is now in course of publication. Books I.—XXVIII. were published up to 1908 (Milan). A colotype facsimile of the Florentine MS. of the Digest is also in course of publication in Italy. Facsimile I.—VI. have already (1908) appeared (Rome, 1902—7).

2 The best edition is that of Kroll, completed by Kroll in 1895, and forming vol. iii. of the Corpus Iuris Civilis, last mentioned. It contains the Greek texts, Latin Vulgate and a Latin translation more correct than the Vulgate.
potestas he had never been, such as a paternal or maternal grand-
father, when there was a natural potestas to underlie and justify
the civil onus graduum, which the adoption did not affect. In adop-
tion, he was the potestas, not the potestas of a deceased.

The mode of strict adoption also was simplified, the old procedure
by sales and manumissions, which degraded the child too much to
the next degree. The adoption under Constantine was not
subject to the cares of legal devices of legislation. Children born of
a concubine, especially that by subsequent marriage of the
parents, first introduced by Constantine, were regulated, and
the extent of the rights of the legitimate was not impaired. The
adoptive parent had derived to a greater extent to that of strict
adoption. Tuty was opened to the pupil's nearest kinsman,
whether on the father's side or the mother's; and the mother herself
invariably became a citizen, Junian Law and edictiancy being no
longer recognized.

Amendments on the Law of Property and Obligation. — In the law of
property the principal changes of the Christian Empire were the
simplification of the forms of conveyance, the extension of the
laws of inheritance by the papyroutic and the removal of the
laws of prescription. Simplification of the forms of conveyance was necessary only in
the case of res mancipi, for res nec mancipi had always passed by delivery.
Freemen, however, could by the sale of movables pass
from the old way to an earlier form of conveyance.

The Law of Slavery. — Although the laws of slavery remained
in the same way from very early in the period, and that
for the manumission of lands and houses — for in jure cesso had dis-
appeared was jure servitutis which the courts had
delivered as the form and delivery following thereon, and both before witnesses,
had been gradually substituted. Of this there is no trace in the
Justinian Code. For Justinian abolished all remains of the dis-
tinction between a grandservant, a servant or a slave,
but he allowed, under certain
testamentary wills, to act as his guardian. Slavery was often converted
into the milder condition of colonate; but, even where this did not happen,
the rights of owners were not allowed to be abused; for slavery was a
crime, and the punishment of the murderer of a slave was
cruelty by a master might result in his being deprived of his
property. Kinship that had arisen between persons who one or both were slaves (serviles cognatis)
was recognized as a new not
only of disabilities but of rights. The modes of manumission
were multiplied, and the restriction of the legislation of the early empire
abolished; and a freedman invariably became a citizen, Junian Law
and edictiancy being no longer recognized.

Obligations. — In the law of
property the principal changes of the Christian Empire were the
simplification of the forms of conveyance, the extension of the
laws of inheritance by the papyroutic and the removal of the
laws of prescription. Simplification of the forms of conveyance was necessary only in
the case of res mancipi, for res nec mancipi had always passed by delivery.
Freemen, however, could by the sale of movables pass
from the old way to an earlier form of conveyance.

The Law of Slavery. — Although the laws of slavery remained
in the same way from very early in the period, and that
for the manumission of lands and houses — for in jure cesso had dis-
appeared was jure servitutis which the courts had
delivered as the form and delivery following thereon, and both before witnesses,
had been gradually substituted. Of this there is no trace in the
Justinian Code. For Justinian abolished all remains of the dis-
tinction between a grandservant, a servant or a slave,
but he allowed, under certain
testamentary wills, to act as his guardian. Slavery was often converted
into the milder condition of colonate; but, even where this did not happen,
the rights of owners were not allowed to be abused; for slavery was a
crime, and the punishment of the murderer of a slave was
cruelty by a master might result in his being deprived of his
property. Kinship that had arisen between persons who one or both were slaves (serviles cognatis)
was recognized as a new not
only of disabilities but of rights. The modes of manumission
were multiplied, and the restriction of the legislation of the early empire
abolished; and a freedman invariably became a citizen, Junian Law
and edictiancy being no longer recognized.

Changes in the law of obligation were more superficial than
those in the law of property, and consisted principally in
the simplification of formalities and in some cases in
the entire obliteration of the various tests of the
statutory

Testa-
mentary
succession. — The changes made in
the law of succession by Justinian's Christian predecessors, especially
Theodosius II. and Anastasius, were far from insignificant.

The 11th Novel.

1 Dig. xiv. 3. 9.
2 See Elia Lattes, Studi storici sopra il Contratto d'INGLESE nelle sue
relazioni col Colonato (Turin, 1668), chaps. 1 and 3; and Francois, De
l'Emphyteuse (Paris, 1816); Beaurine, in the "Rev. de l'histoire rom.
renaisse., 545 seq.; Karlowa, Rom. R. G. ii. pp. 126 seq. The name comes
from the obligation imposed upon the grantee to make plantations
(uperducar).
among those the nearest in degree excluded the more remote, and when all were of the same degree they took per capita. A reform effected by Justinian by his 11th Novel ought not to be passed unnoticed; for it rendered superfluous all the old rules about intestate successions and the burdens of testamentary devices. The new Roman code, in redesigning the Roman inheritance law, not only abolished bonorum possessio contra tabulas as regards freeborn persons and established the principle that a child should be one of his father's heirs in the same share at all events of his succession, and that a parent had the same right in the succession of his child if the latter had died without issue. The enactment enumerated certain exceptions to this general rule which should be unlawful for a parent to disinherit his child or a child his parent, declaring that in every case of disinherit the reason of it should be stated in the testament, but giving leave to the person disinherit to dispute and correct the reason in the presence of the judge if the disinherited had not been disinherit—and one improperly disinherited was eventually in the same position—was not instituted to some share, however much it may have been considered that he was entitled to have the testament declared null in so far as the intestate were concerned, thus opening the succession to himself and the other heirs-at-law, but without affecting accessory provisions, such as bequests, nominations of tutors, &c.; and if the share which he was instituted was less than his legitim (legitima de tribus portis) he was entitled to an action in supplement. The legitim, which under the practice of the centurial court had been one-fourth of the intestate's estate, omitted certainly the part of the estate that advances to his child during his life or left him a legacy which quantitatively equalled the legitim; his idea was that a child was entitled to his parent's other successor, that is, his consanguineous heir, and that to deny him that position without statutory grounds was to put upon him an indignity which the law would not permit.

Amongst the other beneficial changes effected by Justinian may be mentioned the assimilation so far as possible of hereditas and bonorum possessio, so that the latter might be taken like the former without formal petition for a grant of it; the equiparation of legacies and singular trust-gifts, and the application of the principle of "transmission" to every heir without exception, so that, if he died within the time allowed him for considering whether or not he would accept (proponas deliberans), his power of acceptance was reduced to a single manuscript which he might present to the court within what remained of the period; the introduction of entry under inventory (cum beneficio inventarii), which limited the heir's responsibilities and rendered unnecessary the nine or twelve months of deliberation; and the application of the principle of collation to descendants generally, so that they were bound to throw into the mass of the succession before its partition every advance they had received from their parent in anticipation of their shares.

Their Use in the Courts and in the Schools.—Although the Institutes were primarily intended to serve as a text-book in the schools, Justinian's 11th Digest was adopted as the Digest. The Code should be regarded as just so many parts of one great piece of legislation and all of equal authority; and that, although Digest and Code were but collections of common law and legislation that had proceeded originally from many different hands, yet they were to be treated with the same respect as if they had been the work of Justinian himself. But, while everything within them was to be held as law, nothing outside them was to be looked at, not even the volumes from which they had been collected; and so far did this go that, after the publication in 534 of the revised Code, neither the first edition of it nor the Fifty Decisions were allowed to be referred to. If a case arose for which no precedent existed, the court was required to report its own decision, as being outside his collections the only fountain of the law. To preserve the purity of the texts Justinian forbade the use of conventional abbreviations (agodes, nimbuses, &c.), visiting an offender with the penalties of falsification (errone falsus). Literal translations into Greek were authorized, and indeed were necessary for many of his subjects; so were indexes and ἔρευνα, i.e. summaries of parallel passages, texts or individual titles. Commentaries and general summaries were forbidden under heavy penalties, as an interference with the imperial prerogative of interpretation. But these prohibitions do not seem to have been enforced, for we have the remains of only one commentary on the Institutes, but of commentaries, notes, abridgments, excerpts and general summaries even in Justinian's lifetime. These, it is true, were mostly by professors (αναληκτος), and their productions may have been used as aids to memory and as examples; but they were not passed into the hands of the practitioners and were used without scruple in the courts. A Greek Paraphrase of the Institutes, usually attributed to Theophylus, a professor in Constantinople and one of Justinian's commissioners, has been supposed to have been used by him in his prelections. It embodies much more historical matter than is to be found in the Institutes; but it contains a good number of mistakes, and is certainly not the work of any of Justinian's learned colleagues. Its latest editor, Ferrini, who puts a high estimate on it, is of opinion that the original of it was a reproduction in Greek of the Institutes written up at Beirut, which was remodelled after the plan of Justinian. The Institutes were afterwards revised and subsequently incorporated in order to adapt it to the altered conditions; but he denies that there is any sufficient authority for assigning them to a date later than that of the Institutes. Theorists are generally agreed that it was really based on a redaction of Galuis, his historical explanations will be received with all the more confidence.

Fate of the Justinianian Books in the East.—The literary work included in the Institutes and the Digest was the work of the 6th century. But the next three were comparatively barren, the only thing worth noting being the Ἐκκλησία τῶν ἱδρυων by ἄρωτος ἀρωτογονος of Leo the Isaurian in 740, professedly an abstract of the whole Justinianian legislation as they thought merited preservation. The result was, the Basilica (Τα Βασιλικα, ιερομ μνήματα), which was completed and published in Constantinople within the 7th century, and published a sort of institutional work, entitled Πρωτογονος, which was revised and republished by Leo under the name of Εκκλησία τῶν ἱδρυων. The first code was the only one which generally the plan of the Justinianian Code, but with the whole law on any particular subject arranged consecutively, whether from Institutes, Digest, Code or Novels (see article BASILIC). Leo's son, Constantinus Porphyrogennetos, made an addition to this in 1063, adding the enactments of Constantine Homenes to 1345, a "miserable epitome of the epitomes of epitomes," as Bruns calls it, which survived the vicissitudes of the centuries, and finally received statutory authority in the modern kingdom of Greece in 1851. In 1075 the Basilica, which had been sanctioned thirteen years before, in 1822.

Their Fate in the West.—Before the rise of the Bolognian school it was to a much greater extent than the Roman-Barbarian codes than to Justinian's books of Justinian. The spread of Justinian's law throughout the western world, in large part apart from Italy, derived their acquaintance with Roman Civil law. Theodoric's Edict can have had little influence after Justinian's recovery of Italy, and the Romano-Burgundian Civil law was replaced probably before the time of Charlemagne after Burgundy had fallen into the hands of the Franks; but the Breviary itself found its way in all directions in France and Germany, penetrating even into England, mainly through the agency of the church. There must, however, have been other repertories of Roman law in circulation (and among others probably either Gaian's Commentaries or Ulpian's Rules), as witness a testament made in Paris in the end of the 7th century, mentioned by Sannazzio as preserved by Maubillon, in which the testator uses the old formula of the jus civilis,--

"Ita do, ita lego, ita testor, ita vos Quirites testimonium mitch petebote," words that are not to be found either in the Visigothic or the Burgundian collection of statutes; and we should, therefore, reject the year 554, Justinian anew accorded his imperial sanction to the juras and leges, i.e. the Digest and Code, which he says he had long before transmitted to Italy, at the same time declaring that his Novels were to be of the same authority there as in the East. Two years after this came Julian's Latin epitome of the Novels (a private work by a Constantinopolitan professor), not improbably prepared by command of the emperor himself. That Justinian's works soon came

1Const. Deo Auctore, § 12; Tanta, § 21.

2Editions by Reitz, 1751, and Ferrini, 1854-97.

3Ed. Heimbach, 6 vols. with Latin translation (and in 1846 a supplement by Zachariae a Lingenthal), Leipzig, 1853-70. A new supplement forming vol. 7, by Ferrini and Mercati, was published in 1893.

4For the history of Byzantine law subsequent to Justinian, see Zachariae, Geschichte des Griechisch.-Röm. Rechts (3rd ed., 1892), and Historia juris Graeco-Romani (1839); Mortreuil, Histoire du droit byzantin (3 vols. 1843-46).
to some extent into use in Italy is beyond question; for there is preserved in 39 manuscripts the treatise of one Mannus executed, at Ravenna in the reign of Justinian's immediate successor Justin II., in which the requirements of both Code and Novels are scrupulously observed. Of other manuscripts of the same period that preserved their text either wholly or partly in the Latin version, little is known.

The invasion of the Lombards, the disturbance they caused in Italy for two centuries, and the barrier they formed between the Latin and Greek parts of Europe, caused a retardation in the work of Justinian law northwards; but it was taught (from the 6th to the 11th century) without much interruption at law schools in Rome, and also at Ravenna, the seat of the exarchs, to which (but this was in the 9th and 10th centuries) came 39 to 40 persons, who were pronounced to be great jurists. The Digest, as used by the glossarists, was divided into three parts, known as Digestus Vetus (books 1-24, tit. I.), Infinitorium (books 24, tit. 3-38), and Digestum Primum Vetus (books 39 to 60), and was used by the glossarists, called the Vulgate (lectio Vulgate), to distinguish them from the Florentine Manuscript (lectio Pisana), on which, indeed (if on the same original source as it), they were probably all primarily based, but from which, as far as at least as book 33, they varied in numerous readings. The historical explanation of the cause of this just-mentioned threefold division is given by Mommsen in the preface to his larger edition of the Digest, to which it will be sufficient to refer. The whole Corpus Juris was divided by the glossarists into six parts, distributed on the Macaronic Plan into three volumes, viz. the three first, containing the four books of the Code; and the fifth, called codex minor, containing the Digest (10 books), which was used by the glossarists, as the Auctoriter or Auctor. Their most noted representative was Bartholomeus (794-857), after whom they are also called. This school, however (mainly found in Italy), was a much more ancient part of the common law in Italy based on the Roman, and thereby facilitated the reception of Roman law in Germany and other countries.

In the 16th century a new start or, so to say, second Renaissance was made in the Roman law. The study of classical antiquities, so active on the side of literature, extended to jurispudence also. The juridical writings which had been handed down from the Romans ceased to be regarded purely as positive law, binding according to the letter, but as a part of ancient tradition whose spirit as well as form must be examined by the light of the past. Among the pioneers in this new method, to whom the name of Humanists was given, may be especially mentioned Alciatus (1492-1540), Cujacius (1522-1590) and Donellus (1527-1591). Medievalism has passed away, and with these jurists began what has been called the modern Roman law, to describe which, however, is entirely beyond the province of this article.

ROMANOS, called d melodoros, Greek hymn-writer, the "Findar of rhythmic poetry," was born at Emeasa (Hierapolis) in Syria. From the scanty notices of his life we learn that he resided in Constantinople during the reign of the emperor Anastasius. Having officiated as a deacon in the church of the Resurrection at Berythus, he removed to Constantinople, where he was attached to the churches of Blachernae and Cyprus. According to the legend, when he was asleep in the last-named church, the Virgin appeared to him and commanded him to eat a scrull. On awakening (it was Christmas Day), he immediately mounted the pulpit, and gave forth his famous hymn on the Nativity. Romanos is said to have composed more than 1000 similar hymns or kontakia (Gr. koftikow, scroll) celebrating the festivals of the ecclesiastical year, to the glory of the sainst and other sacred subjects—on the death of a monk (extremely impressive); the last judgment; the treachery of Judas; the martyrdom of St Stephen; Simeon

3 Digesta Justiniani Augusti, recognotiz Th. Mommsen (Berlin, 1870).

4 Or luter authenticorum. So called because it contained a more complete collection and corrected translation of the Greek Novels and Institutes of Julian. It was the one used in the law courts in the middle ages.

5 See Sohm, Institutionen, § 27, and authorities there cited.

6 On the question whether Anastasius I. (491-518), or (713-716) is meant, see Krumbacher, who is in favour of the earlier date.
Stylistes; paschal and pentecostal hymns. The MS. of the hymns, written by his own hand, was said to have been preserved in the church of Cyprus, in which he was buried and celebrated as a saint on the 1st of October. Prof. C. Krumbacher, who has edited the works of Romanos from the best (the Patmos) MSS., regards him as the greatest poet of the Byzantine age, and perhaps the greatest ecclesiastical poet of any age.

Editions: J. B. Pitra, Analecta Sacra, i. (1876), containing 29 poems, and Sanctus Romanus Venerum Melodorum Principes (1888), with three additional hymns from the monastery of St. Silouan in Patmos. See also Pitra's Hymnographie de l'Église grecque (1867); C. Krumbacher, Geschichte der byzantinischen Literatur (1897); and HYMNS.

ROMANOV, the name of the Russian imperial dynasty, regnant in the male line from 1613 to 1730, and thenceforward in the female line. The Romanovs descended from Andrei, surnamed Kobyla, who is said to have come to Moscow from Russia about 1341 to enter the service of the grand-duke Semen (d. 1353). His son Feodor, surnamed Koschka, was the ancestor of the families of Suchovo-Kobylin, Kalyschtschew and Scheremetjev, as well as of the Romanovs. Feodor's grandson, Sakhariya Ivanovich, was a boyar of Vasilii V., grand-duke of Moscow at intervals between 1425 and 1452, and the family took its name from his grandson Roman, whose daughter Anastasia Romanovna married the tsar Ivan the Terrible. Her brother Nikita Romanovich married the princess Eudoxia Alexandrovna, a descendant of Andrei Jaroslavivich, grand-duke of Suslal-Vladimir (d. 1264), and in this way the Romanovs were linked up with the ancient royal house of Rurik. The Romanovs suffered heavily in the disorders following on the death of Ivan. Some were executed and others exiled. Nikita's son Feodor (the archimandrite Philaret) was banished, but was recalled by the false Demetrius. In 1610 he was imprisoned by the king of Poland, but his piety and virtues led to the election of his son, Mikhail Fedorovich Romanov, to the throne of the tsars in 1613. Philaret became patriarch of Moscow in 1619, and supported his son's government until his death in 1634. Mikhail was seventeen when he began his reign, and died in 1645. He was succeeded by his son Alexis, whose three sons, Feodor III., Ivan II. and Peter I. (the Great), inherited the throne. After the two years' reign of Peter's widow, Ekaterina Alekseyevna Skavronskaya (Catherine I.), his grandson, Peter Alekseyevich (Peter II.), succeeded. He died in 1730, and the succession devolved on the family of Ivan II., on his daughter Anna (1730-40) and his great-grandson Ivan III. and in 1741 on Elizabeth, daughter of Peter the Great. Peter's elder daughter, Anna, had married Charles Frederick of Holstein-Gottorp, and with the accession of her son, Peter III., in 1762 begins the present reigning dynasty of Holstein-Gottorp or Oldenburg-Romanov.

See R. Nisbet Bain, The First Romanovs (1905); P. V. Dolgorukov, Notice sur les principales familles de la Russie (2nd ed., Berlin, 1858).

ROMAN RELIGION. In tracing the history of the religion of the Roman people we are not, as in the case of Greece, dealing with separate, though interacting, developments in a number of independent communities, but with a single common center of influence which has heaved through all history of the Latin race, to Italy and finally of a European empire. But this very fact of its ever-extending influence, coupled with an absence of dogmatism in belief, which made it at all times ready and even anxious to adopt foreign customs and ideas, gave its religion a constantly shifting and broadening character, so that it is difficult to determine the original essentials. By the time when Latin literature begins, the genuine Roman religion had already been overlaid by foreign cults and modes of thought, by the classical period it was—except in formal observance—practically buried and to a large extent fossilized. But the comparative study of religions has suggested the lines of reconstitution and the careful analysis of survivals embedded in literature and the evidence of monumental remains, and in particular of the old calendars, has enabled modern scholars to make good progress in the task of separating the elements due to different periods and influences.

The Roman people were of Aryan stock, a section of a host of invaders from the north, who overran and settled in the Italian peninsula. They preserved traces of their original nationality not merely in the general cast of their religious thought, but in certain common features such as the worship of the hearth (Vesta) and of the sky-divinity (Jupiter) (see GREEK RELIGION). But the development of their religion was arrested at an earlier stage than that of the Greeks: with them—at any rate in the genuine Roman period—Animism never passed into Anthropomorphism; they stopped at the conception of the "god" without reaching that of the "god." Their belief might be described as a polydemonism rather than a polytheism, or more correctly, to avoid altogether the intrusion of foreign notions, as a "multinuminism."

In the cult and ritual of Rome there are enshrined many survivals from a very early form of religious thought prior to the development of the characteristic Roman attitude of mind.

Feiti-ism.—the belief in the magic or divine power of Inanimate objects—is seen in the cult of stones, such as the "dei of Jupiter (Jupiter), which plays a prominent part in the topographical image of the city. The Romanos, known as the ritual of the aquaeductus, a process, probably magic in origin, designed to produce rain after a long drought. The boundary-stones between properties (termimi) were also the objects of cult at the annual festival of the Terminalia, and the "god Terminus," the symbolic boundary-stone, shares with Jupiter the great temple on the Capitol. Tree-worship (q.v.) again is a constantly recurring feature, seen, for instance, in the permanently sacred character of the ficus Ruminalis and the caprificus of the Campus Martius, and above all in the oak of Jupiter Forerius, on which the spolia opima were hung after a victory. Nor did Animism stop there. The household was always the centre of religious cult, and certain comforts in the house—the door, the hearth, the store-cupboard (penus)—seem always to have had a sacred significance, and so became the objects and later the sites of the domestic worship. Of the cult of animals there is just sufficient trace to show that it must formerly have had its place in religious rite; the animals, once the objects of worship, appear in later times as the attributes of divinities, for instance, the sacred wolf and woodpecker of Mars.

But Animism must very early have developed into Animism, the feeling of the sacredness of the object, a sense of an indwelling spirit. In the animistic attitude which we have just described the true background of the genuine Roman religion; but its characteristic and peculiar development is a kind of "higher Animism," which can associate the "spirit" not merely with visible and tangible objects, but with states and actions in the life of the individual and the community. No doubt the later indigistitamenta ("bidding-prayers") which give us detailed lists of the spirits which preside over the various actions of the infant, or the stages in the marriage ceremony, or the agricultural operations of the farmer, are due in a large measure to deliberate pontifical elaboration, but they are a true indication of the Roman attitude of mind, which retained itself continually in the analysis of the cults of the household or the festivals of the agricultural year.

The "powers" (numina, not deis), which thus become the objects of worship, are spirits specialized in function and limited in sphere. They are not conceived of in any anthropomorphic form, their sex even may often be indeterminate ("sive mas, sive femina") is the constantly recurring formula of prayer), but the sphere of action of each has clearly marked and an appeal to a spirit outside his own special sphere would never even be thought of. Locality thus becomes an important point in the conception of the numen; the household spirits must be worshipped at the door, the hearth, the store-cupboard, and the various spirits of the fields and countryside have their sacred hill-tops or groves. But the numen has no form of sensuous representation, nor does he need a house to dwell in: statue and temple are alien to the spirit of Roman religion. Nor are the numina, not being anthropomorphic, capable of relation

XXIII. 19
to one another; hence there is no Roman mythology. Yet, all-powerful in their individual spheres of action, they can influence the fortunes of the household. The household can enter into certain sacred unions with them; the principal attitude of man to the numina seems clearly to be one of fear, which survives prominently in the “impius” character of certain of the spirits of the countryside, such as the defunct and is slates: in the undeniably conception of relegio, a sense of awe in the presence of a superhuman power. But the practical mind of the Roman gives this relation a legal turn: the ius sacrum, which regards the dealings of men with the divine powers, is an inseparable part of ius publicum, the body of civil law, and the various acts of worship, prayer and thanksgiving are conceived of under the legal aspect of a contract. The base-notion is that the spirits, if they are to be propitiated, will make a return to the object of the recurring annual festivals is to propitiate them and forestall any hostile intention by putting them, as it were, in debt to man—more rarely to express gratitude for benefits received.

In such a religion exactness of ritual must play a large part—so large, indeed, that many modern critics have been misled in regarding the Roman religion as a mere network of formalities without any background of genuine religious feeling. This formalism shows itself in many ways. It is necessary in the first place to make quite certain that the right deity is being addressed: hence it is well to invoke all the spirits who might be concerned, and even to add a general formula to cover omissions: here we have the ritual significance of the indigilamenta. Place, again, as we have seen, was an essential element even in the conception of the numina, and is therefore all-important in ritual. So, too, is the character of the offering: male victims must be sacrificed to male deities; female victims to goddesses: it is the dregs of the di superi, the gods of the upper world, black animals of the gods below. Special deities, moreover, will demand special victims, while more the rustic numina, such as Pales (q.v.), should be given milk and milk cakes rather than a blood-offering. All-important, too, is the order of ceremonial and the formula of prayer: a mistake or omission or an unpurpious interruption may vitiate the whole ritual, and though such misfortunes may occasionally be expiated by the additional offering of a piscium, in more serious cases the whole ceremony must be recommenced ab initio. Herein lies the importance of the priesthood: the priest is not, as in other religions, the mediator between god and man, but on the one hand for the purpose of state-worship the chosen representative of the whole people, on the other the repository of tradition and ritual lore.

This conception of the nature of the numina and man’s relation to them is the root notion of the old Roman religion, and the fully-formed state cult of the di indigetes even at the earliest historical period, must have been the result of long and gradual development, of which we can to a certain extent trace the stages. The original settlement on the Palatine, like its neighbour on the Quirinal, was an agricultural community, whose unit, both from the legal and religious point of view was not the individual but the household. The household is thus at once the logical starting-point of religious cult, and throughout Roman history the centre of its most real and vital activity. The head of the house (paterfamilias) is the natural priest and has control of the domestic worship: he is assisted by his sons as acoytes (camilli) and deputes certain portions of the ritual to his wife and daughters and even to his bailiff (silicus) and his bailiff’s wife. The worship centres round certain numina, the spirits indwelling in the sacred places of the original round hut in which the family lived. Janus, the god of the door, comes undoubtedly first, though unfortunately we know but little of his worship in the household, except that it was the concern of the men.

To the women is committed the worship of the “blazing hearth,” Vesta, the natural centre of the family life, and it is noticeable that even to Ovid (Fast. vi. 291-92) the conception of Vesta was still material and not anthropomorphic. The Penates (q.v.) were the numina of the store-cupboard, at first vague and animistic, but later on, as the definite deus-notion was developed, identified with certain of the other divinities of household or state religion.

To these numina of the sacred places must be added two other important conceptions, the Lar and the Lares. Both have been regarded as the embodiment of all the family dead and his cult as a consummation of ancestor-worship, but a more probable explanation regards them as the Lares of the household (a numina of the compita, the places where properties marched) who had special charge of the house or possibly of the household servants (familia); for it is significant that his worship was committed to the charge of the silens. The Genius is originally the “spirit of developed manhood,” the numen which is attached to every man and represents the sum total of his powers and faculties as the Luna does of the woman: each individual worship his own Genius on his birthday, and the household cult is connected with the cult of the Lar and of the familia. The established worship of the household then represents the various members of the family and the central points of the domestic activity; but we find also in the ordinary religious life of the family a more direct connexion with morality and a greater religious sense than in any other part of the Roman cult. The family meal is sanctified by the offering of a portion of the food to the household numina: the chief events in the individual life, birth, infancy, puberty, marriage, are all marked by religious ceremonial, in some cases of a distinctly-primitive character. The dead, too, though it is doubtful whether in early times they were actually worshipped, at any rate have a religious commemoration as in some sense still members of the family.

The next stage in the logical development of the state religion should naturally be found in the worship of the gens, the aggregate of households belonging to one clan, but our information about the gentle worship is so scanty and uncertain that we cannot make practical use of the materials. In some of the cases, such as the Prinum who developed later on into the great gods of the state, such as Jupiter, Mars or Ceres, sometimes to vague divinities who remained always indefinite and rustic in character, such as Pales and Consus. Sometimes again, as in the case of the Luperca, the attribution is so indefinite that it is hard to discover who was the special deity concerned; in other cases, such as those of the Robigalia and the Medirinalia, the festival seems at first to have been addressed generally to any interested numina and only later to have developed an eponymous deity of its own. Roughly we may distinguish three main divisions of the calendar year, the festivals of Spring, of the Harvest and of Winter, preserving on the whole their peculiar characteristics. (1) In the Spring (it must be remembered that the old Roman calendar began the year with March) we have ceremonies of anticipation and prayer for the crops to come: prominent among them are the Porticidia, wit its symbolic slaughter of pregnant cows, addressed to Tellus, the Cereria, a prayer-service for Ceres for the corn-crop, and the most important of the rustic celebrations of lustration and propitiation, the Parilia, the festival of Pales. To these must be added the Ambulalia (q.v.), the lustration of the fields, a movable feast (and therefore not found in the calendars) addressed at first to Mars in his original agricultural character (see Mars). (2) Of the Harvest festivals the most significant are the twin celebrations on August 21st and 25th to the divinity-pair Consus and Ops, who are both concerned with the storing of the year’s produce, and two mysterious vintage festivals, the Vinalia Rustica and the Medirinalia, connected originally with Jupiter. (3) The Winter festivals are the most homogeneous in character but distinguish among them certain undoubtedly agricultural celebrations, the Saturnalia (at first connected with the sowing of the next year’s crop, but afterwards overlaid with Greek ceremonial), and a curious group of the harvest festivals to Consus and Ops.

1 e.g. by De Marchi.

2 See, however, De Marchi, Il Culto Privato di Romo Antica, vol. ii.
In passing to the religion of the state we are clearly entering on a later period and a more developed form of society. The loose aggregation of agricultural households gives place to the organized community with new needs and new states. The same time in religious thought the old vague notion of the numen is almost universally replaced by the more definite concept of the deus—not even now quite anthropomorphic, but with a much more clearly realized personality. We find then two prominent notes of the state influence, firstly, the adaptation of the old ideas of the household and agricultural cults to the broader needs of the community, especially to the new necessities of internal justice between citizens and the war against external enemies, and secondly the organization of more or less formal worship into something like a consistent system. Adaptation proceeds at first naturally enough on the lines of analogy. As Janus is in the household the numen of the door, so, and it is wise to consider with the great gate near the corner of the forum: the Penates have their analogy in the Regia, and other writers, the Lar familiaris in the Lares Praestites of the community, and the Genius in the new notion of the Genius populi Romani or Genius urbis Romae. But the closest and most curious analogy is seen in the case of Vesta. The Vesta of the state is in fact the king's hearth, standing in close proximity to the Regia, the king's palace; the Vestal Virgins, who have charge of the sacred fire, are the "king's daughters," and as such even in republican times were in the main representatives, who was the successor of the king on the legal side of his religious duties, as the rex sacrorum was on the sacrificial side. But adaptation meant also reflection and the widening of old conceptions under the influence of thought and even of abstract ideas. Thus, the simple reflection that the door is used for the double purpose of entrance and exit leads to the notion of the Janus of the state as bifrons ("two-faced"); the thought of the door as the first part of the house to which one comes, produces the more abstract idea of Janus as the "god of beginning," in which character he has special charge of the first beginnings of human life (Consuesus), the first hour of the day, and the Calends of the month and the first month of the year in the later calendar: for the same reason his name takes the first place in the indigimentos. But development proceeds also on broader and more important lines. Jupiter in the rustic cult was a sky-god concerned mainly with the wine festivals and associated with the sacred oak on the Capitol. Now he develops a twofold character: as the receiver of the spoilia opima he becomes associated with war, especially in the double character of the stayer of rout (Status) and the giver of victory (Victor), in which last capacity he later gives birth to an offshoot in the abstract conception of the goddess Victoria. As the sky-god again he appears to us as the embodiment of the special capacity of the Dius Fidius, producing once more an abstract offshoot in the goddess Fides. In these two conceptions, justice and war, lie the germ of the later idea of Jupiter as the embodiment of the life of the Roman people both in their internal organization and in their external relations. In much the same manner Mars takes on in addition to his agricultural character the functions of war-god, which in time completely superseded the earlier idea. Finally, we must notice, as the sign of the synoecism of the two settlements, the inclusion of the Colline deity, Quirinus, apparently the Mars of the originally rival community. In these three deities, Jupiter, Mars, Quirinus, we have the great triad of the earlier stage of the state-religion and of its own self in the fixing of the annual calendar and the development of the character and functions of the priesthood, and as we should expect, in a new conception of the legal relation of the gods to the state. In the earlier stage—whose notions of course still persist alongside of the state religion—each household has its own relations to its numina: now the state approaches the gods through its duly appointed representatives, the magistrates and priests. Their presence is typical of that of the whole people, and the private citizen is required to do no more on festival days than a ceremonial abstinence from work. It is obvious that the state religion has a less direct connexion with morality and the religious sense than the worship of the household, but it has its ethical value in a second sense: discipline and a consecration of the spirit of patriotism.

The later stages represent a comprehensive development of the genuine Roman religion, but its alteration and supersession by new cults and ideas introduced from foreign sources. Authorities are generally agreed in recognizing three periods—(1) from the end of the Regal epoch to the second Punic War, when Rome was influenced by other peoples in Italy, with whom she was brought into contact by commerce or war; (2) from the second Punic War to the end of the Republic, when contact with Greek and oriental religions and the growth of literature revolutionized religious notions and led to a philosophic scepticism; (3) the Imperial epoch, opening with a revival of old religious notions and later marked by the official worship of the deified emperors and the wide influence of oriental cults.

(1) By the end of the regal period Rome had ceased to be a mere agrarian community and had developed into a state which had consequently grown up within the state a large artisan class, excluded from the old patrician gentes and therefore from the state cult: at the same time the beginnings of commerce had opened relations with external tribes. The rapid growth and the introduction of certain new deities, the div novensides, from external sources, and the birth of new conceptions of the gods and their worship. We may distinguish three main influences, to a certain extent mutually supplementary: the introduction of the last three kings of Rome a connexion with the mysterious people of Etruria, and their influence at this period though not very definite, is certainly appreciable. To this we owe through the mediation of Tufellii, a Latin town on the Etruscan border, was due the introduction of Minerva, who, as the goddess of handicraft and protector of the artisan guilds, was early a Roman deity. She was worshipped in a temple which led her way to the Capitol, and there a new Etruscan triad, Jupiter, Juno and Minerva, possibly going back from Etruria to Greece, was enshrined in a magnificent new temple built by Etruscan workmen and decorated in the Etruscan manner. In this temple the deities were represented by images, and on its dedication day, September 13th, at the novel festival of the epulum Jonis, the images were adored and set out as partakers of the feast, a proceeding wholly foreign to the native Roman religion. (see further ETURVIA, § Religion). (2) Secondly, in war and peace Rome formed relations with their neighbours of Latium, and, as a sign of the Latin league which resulted, the cult of Roma was born in Aricia and established on the Aventine in the "commune Latinali" or "Athenae templum" (Varro, Ling. Lat. v. 43): about the same time was built the temple of Jupiter Latialis on the Alban monte. The resemblance between this and the new Capitol, as going to Rome's hegemony. So great was Rome's sense of kinship to the Latins that in two cases Latin cults were introduced into the pomoerium: the worship of Hercules, which came from Tiber in commerce, and commerce in turn brought from its sources the forum boarium, and the Tuscan cult of Castor as the patron of cavalry found a home close to the forum Romanum: it is a strange irony that both these deities should in reality have been in their origin Greek. Other Italian cults introduced at this period were those of Juno Sopea and Juno Regina, Venus and Fortuna Primigenia, a goddess of childbirth who came from Praeneste. (3) Later on in the same period contact with the cities of Magna Graecia brought about the wide-reaching introduction of the Sybilline books. Whatever may be their origin—and they came from Cumae—they were placed in the Capitoline temple under the care of a special commission of two (a comitia sacra, tempus decemvris and quintdecimvirs), and their "oracles," which were referred to in times of great national stress, recommended the introduction of foreign cults. In 493 B.C., at a time of serious famine, Rome ordered the building of a temple to the Greek gods Demeter, Dionysus and Persephone, who were identified with the old Roman divinities Ceres, Liber and Libera: Apollo must have come with or before the books themselves for a temple was built till 433 B.C. In 403 B.C. the Magus Gracchi was brought from Epiaurus to the Tiber island in 293 B.C., and Diis et Proserpina, with their mysteries, the Ithacian assimilated with the Roman. The Tarentum in 249 B.C. With new deities came new modes of worship: the graeus ritus, in which, contrary to Roman usage, the worshipper's head was shaved, and the lacteum (q.v.) as an elaborate form of the cult of the Mother of No. In this period it is a legitimate and corresponding development of the growing community, and secondly a religious restlessness and a consequent tendency to more dramatic forms of worship.
(2) The two chief notes of the next period are superstition and scepticism: both the populace and the educated classes lose faith in the old religion, but they supply its place in different ways. The disasters of the early part of the second century and the signs of the times, the appearances of prodigies and portents were announced from all quarters, it was felt that the divine anger was on the state, yet there was no belief in the efficacy of the old methods. Accordingly, under the direction of the Sibylline books, to new forms of appeal for divine help, the general vowing of the *ser sacrum* and the elaborate Greek *leitokterion* after Trasimene in 219 B.C. (Cf. Scaevola the ancient Fauna, the female counterpart of the cornydeus *numen Faunus*—with a Greek goddess of women, Demeter. At the same time the new acquaintance with Greek art introduces the making of pagan statues, in which the identified Greek type is usually without change, with such curious results as the representation of the *Penes* under the form of the Dioscuri. But more significant still was the order of the Sibylline books in 206 B.C. for the introduction of the *Penates Materculae* and new temples. See from Pessinus and her ultimate installation on the Palatine in 191 B.C.: the door was thus opened to the wilder and more orgiastic cults of Greek origin to be held fast, at least of the time of Ma of Prygia, introduced by Sulla and identified with Bellona, the Egyptian Isis, and, after Pompey’s war with the pirates, even the Persian Mithras (M.). In all these the problem, the public order for the religious emotions which were not satisfied by the cold worship of the old deities.

Meanwhile a corresponding change was taking place in the attitude of the educated classes owing to the spread of Greek literature. The knowledge of Greece as a field of research was thus introduced, set poets and antiquarians at work in a field wholly foreign to the Roman religious spirit, the task of creating a Roman anthropomorphous mythology. They accomplished the popular process of adoption and identification, partly by imitation. In this way grew up the "religion of the poets," whose falseness and shallowness was patent even to contemporary thinkers. But more important was the influence of philosophy, which led soon enough to a general scepticism among the upper classes. Its first note is struck by Ennius in his translation of the Sicilian rationalist Euhemerus, who explained the origin of the gods as a apotheosis of heroes. The two later Greek schools of Epicureanism and Stoicism laid hold on Roman society. The influence of Epicurus was described by Lucretius, who used the word *religion* but not very widespread: Stoicism became the creed of the educated, and produced several attempts, notably that of Scaevola and Varro, at a reconciliation of philosophy and popular religion, in which it is shown that the real attempt was not a superficial or partial adaptation of a higher truth suited to the capacity of the popular mind. Such a theory was bound to be fatal, as it makes religion at once a mere instrument of statecraft. The result was a world, which passed into formalism and formalism into dissimulation. Some of the old cults passed away altogether, others survived in name and form, but they were wholly devoid of inner meaning that even the learning of a Varro could not tell their intention or the character of the deity with whom they were concerned. The old priesthood, and in particular the *flaminia* came to be regarded as tiresome restrictions on the private life and were abolished. In 196 B.C. the office of *flamen Dialis* was vacant. On the other hand, as the result of the rise of the emperor, the influence of the Stoics, in particular the *religion* passed into the hands of the politicians: cults were encouraged or suppressed from political motives, the struggle for the offices of the *flamines*—now conferred by popular vote, was sought for its social and political advantages, and augury was debased till it became the means to the end as the means itself. In the general wreck of the old religion, little survived but the household cult, protected by its own genuineness and vitality.

(3) The revival of Augustus, which marks the opening of the last stage of the period of religious phenomenon in the whole story. It was no doubt very largely political, a part of the general reaction of Rome, which was not only round the abstract notion of the state, but round the persons *imperators* and *divi filii*. And yet it was so deep and genuine, that he saw that no revival could be effective which did not appeal to the deeper sentiments of the populace. It was thus his business to revitalize the old forms with a new and more vigorous content. His new palace on the Palatine he intended to be primarily the seat of the Julian family and the cults associated with it, and secondarily the centre of the new popular religion. Of this direct help he gave was undoubtedly a testimony of the cult of Apollo (28 B.C.), associated for long with the Julian house, and adopted by Augustus as his special patron at Actium, and transferred to its keeping the Sibylline books, thus marking the new headquarters of the cultus. The *penates Romanae* in the temple of the lares *saculis in 17 B.C., in which a day celebration was added to the old *sacrificium*, and Apollo and Diana deliberately set up as a counterpart to the Capitoline Jupiter and Juno; Horace’s hymn (see the footnotes) is an epitome of Augustus’ religious intentions. In the same spirit he established a new shrine of the *Vesta Augusta* within the palace, a private cult at first, but destined to be a serious rival of the ancient worship in the forum. A still more striking feature was the totally deliberate revocation of the *Theae Matronae* by the Senate, in the end of his own new forum to Mars Ultor.—Mars, the ancestor of the *Julian gens*, as of the Roman people itself, and now to be worshipped as the avenger of Caesar’s murderers. Nor did he hesitate to avail himself of the popular outburst, which immediately after the murder had consecrated the site of Caesar’s cremation with a *bustum*, to erect on the spot a permanent temple to his adopted father, under the definitely religious title of *deus Julius*. No doubt he also did much generally to revive the ancient cults: he rebuilt, as he tells himself, eighty-two temples which had fallen into disrepair, re-established the old priesthoods, filling once more the office of *penates* and *lilia*. But the new revivals attached itself primarily to these four cults, and their tendency was unmistakable. Origen (I., 176 B.C.), the disciple of *Ma* of Prygia, had been brought up in these cults, and in the cult of the imperial house practically superseded the state religion as the official form of worship.

With this last period the story of Roman religion really draws to a close. For, though the form of the old cults was long preserved and even Antoninus Pius was honoured in an inscription for his care of the ancient rites of religion, the vital spirit was almost gone. In the popular mind the hosts of exciting oriental cults, which in the 3rd and 4th centuries of the Christian era filled the *palaestrae* with the rites of mysticism and initiation, held undisputed sway; and with a revived philosophy, less accurate perhaps in thought, but more satisfying to the religious conscience, gave men a clearer monotheistic conception, and a notion of individual relations with the divine in prayer and even of consecration. It was with these elements—fiercely antagonistic because so closely allied in character—that the battle of Christianity was really fought, and though, after its official adoption, the old religion lingered on as "paganism" and died hard at the end, it was really doomed from the moment when the Augustan revival had taken its irrecoverable bias in the direction of the emperor.

ROMANS, a town of south-eastern France, in the department of Drôme, 124 m. N.E. of Valence on the railroad to Grenoble. Pop. (1906) town, 13,504; commune, 17,622. Romans stands on an eminence on the right bank of the Isère, a fine stone
bridge unit it with Bourg-de-Peage (pop. 4668) on the other side of the river. Both towns owe their prosperity to their situation in the most fertile part of the valley of the Isère. The present parish church belonged to an abbey founded in 837 by St Bernard, bishop of Vienne. The principal portal is a fine specimen of 11th-century Romanesque, and the lower part of the nave is of the same period; the choir and the transept are still in the style of 13th-century Gothic.

Romans has a tribunal of commerce and a communal college. Its industries include tanning, leather-dressing, shoe-making, silk-spinning, hat-making, absinthe-distilling and oil-refining. There is trade in walnuts, walnut-oil, silk, cattle, &c.

ROMANS, EPISODE TO THE. In this book of the New Testament, the apostle Paul begins, after a brief pregnant introduction (i. 1–7), by explaining that he had hitherto been prevented from carrying out his cherished project of visiting the church of Rome, whose faith was world-wide (i. 8 f.). Meanwhile, he outlines the gospel which he preached as an exhibition of God's righteousness, εἰς πίστιν ἦλθε υἱός τιμίων. This forms the leading theme of the epistle.

Both Gentile (i. 18–32) and Jew (ii. 1, 20) alike have missed thissplendid and unfettered prospect of faith, which, but for Paul's vision, only serve to deepen his distress in one direction. As a theologian and as a patriot, he is confronted with the problem of Israel's collective repudiation of a boon to which his own history, as he read it, clearly pointed. Reverting to the thought of ii. 17 f. and iv. 1, Paul now essays, in ii.22–29, to show how this unbelief of Israel is to be reconciled with the justice and the faithfulness of God, beginning by an exposition of Gentile faith (cf. Rom. ii. 28–29), that mere physical descent could not entitle a Jew to the promises. Besides (iv. 14–29), no Jew has the right to challenge God's sovereign freedom. If God determines to extend the passage of Gentiles to all ethi and the child of the covenant, He cannot be charged with injustice; the rejection of the Jews is their own fault, due to their obstinacy and legalism (iv. 20–21). Finally, Paul tries to see this fact of Israel's unbelief in the light of a wide religious philosophy of history: it is a law of Judaism in relation to the new faith. Cf. Hoennicke's Das Judenkristentum (1908), pp. 160 f.

In this passage Paul has generally been held to have erred result will be the inclusion of all Israel in the heritage of the messianic kingdom of Christ. The prospect of this consummation filled him with an outburst of adoration, with which the whole section ends (xi. 33–36).

Applying the thought of God's mercy to the obligations of believing men (xii. 1–7), Paul proceeds now to sketch the ethical duties of Christians (xi. 8–12) in the church of Rome (xii. 13–21), and in the state (xii. 1–7): love is the supreme law (xiii. 8–10), and the nearness of the end the supreme motive to morality (xiii. 11–14). These considerations are still before Paul's mind as he descends from general counsel to a more practical ethics, justified by the varying attitude of Christians at Rome towards food offered to idols (xiv. 1 f.). After laying down the principle of individual responsibility, he appeals for charity and mutual consideration (xiv. 13–18) then for Christian forbearance. Finally, he preaches all, Gentile and Jewish Christians alike (xv. 8–13), to unite in thanksgiving for God's mercy to them in Christ.

The whole of this epistle, written in the name of himself for having thus addressed the Roman Christians. He alludes (xiv. 14 f.) to his apostolic vocation and informs them of his future movements. With an appeal for their prayers and a brief benediction, the epistle then closes (xiv. 33–35). It ends as it began (i. 8 f.) with the apostle's hope and plan of visiting Rome on a subsequent missionary tour.

Rom. xvi. contains a separate note (1–23), together with a doxology (25–27). The former came from Paul's pen, but it did not belong originally to this epistle. In all likelihood it is a letter of commendation for Phoebe 11 which includes vers. 1–23 (e.g. Weizäcker, M. Gigliert and Jülicher), though most break it off at vers. 20 (so Eichhorn, Ewald, Schulz, Renan, Weiss, Lipsius, von Soden, &c.), while others do not begin it until vers. 3 (so e.g. Ewald, Schüer, Reuss and Mangold: Reimbert, pp. 136 f.). Vers. 21–23 might indeed follow xv. 22, but it is not Paul's way to omit repetitions after a final Amen, and the passage connects as well with xiv. 20, though it may have lain originally (Jülicher) between 16 and 17. The main reasons 22 for conjecturing that this section was addressed separately, not to Rome but to a city like Ephesus, lie in its contents. Paul was as yet a stranger to Rome, and it is extremely difficult to suppose that he already knew so many individual places. The earlier tone of Romans shows that he was writing as a comparative stranger to strangers. Any touches of familiarity with the local circumstances (as in xiv. xvi.) are no more than might have percolated to him through bearing and botanically in his ancestry. For a defence of his accuracy, see W. M. Ramsay's Pauline and other Studies (1907), 219 f.

As a theologian and as a patriot, he is confronted with the problem of Israel's collective repudiation of a boon to which his own history, as he read it, clearly pointed. Reverting to the thought of ii. 17 f. and iv. 1, Paul now essay in ii. 22–29, to show how this unbelief of Israel is to be reconciled with the justice and the faithfulness of God, beginning by an exposition of Gentile faith (cf. Rom. ii. 28–29), that mere physical descent could not entitle a Jew to the promises. Besides (iv. 14–29), no Jew has the right to challenge God's sovereign freedom. If God determines to extend the passage of Gentiles to all ethi and the child of the covenant, He cannot be charged with injustice; the rejection of the Jews is their own fault, due to their obstinacy and legalism (iv. 20–21). Finally, Paul tries to see this fact of Israel's unbelief in the light of a wide religious philosophy of history: it is a law of Judaism in relation to the new faith. Cf. Hoennicke's Das Judenkristentum (1908), pp. 160 f.

1 On iii. cf. G. W. Matthai's Exegetischer Versuch (Cassel, 1857).
2 Paul here unconsciously changes the conception of law. By introducing the example of Abraham he shows that the book of the law contains the doctrine of justification by faith, and through the latter, therefore, is not made of none effect. This proves that for the law, of which the validity is threatened by the doctrine of justification, is that part of the book of the law which demands the observance of all commands, not of those relating to anything else. But this error of thought would be easily concealed from a mind with the rabbinical training of Paul's (Schmiedel, in Hibbert Journal, 1902, pp. 548–549).
3 Cf. Engel's exhaustive monograph, Der Kampf um Römer viii. (1902), and for the ideas of i.–viii., Du Bose's The Gospel according to St Paul (1907), and Titius, Der Paulusimnus (1900), pp. 159 f.
4 The word all, as Matthew Arnold observes (St Paul and Protestanism, 1902, p. 410), is in some sense the governing word of the Epistle to the Romans.
5 As arranged in the canonical edition, ix.–xii. are closely interwoven with xi.–xii., and xi. 32–36 concludes not simply ix.–xi., but i.–xii. (cf. Both (ii. 1867, 203).)
6 Certainly what Paul has in mind throughout the epistle is not a Judaeizing tendency among the Jewish Christians at Rome, but the general and perplexing question of the relation to the new faith. Cf. Hoennicke's Das Judenkristentum (1908), pp. 160 f.
7 In this passage Paul has generally been held to have erred

Critical problems.

1 The splendid and unfettered prospect of faith, which thus broke upon the apostle's vision, only serve to deepen his distress in one direction. As a theologian and as a patriot, he is confronted with the problem of Israel's collective repudiation of a boon to which his own history, as he read it, clearly pointed. Reverting to the thought of ii. 17 f. and iv. 1, Paul now essay in ii. 22–29, to show how this unbelief of Israel is to be reconciled with the justice and the faithfulness of God, beginning by an exposition of Gentile faith (cf. Rom. ii. 28–29), that mere physical descent could not entitle a Jew to the promises. Besides (iv. 14–29), no Jew has the right to challenge God's sovereign freedom. If God determines to extend the passage of Gentiles to all ethi and the child of the covenant, He cannot be charged with injustice; the rejection of the Jews is their own fault, due to their obstinacy and legalism (iv. 20–21). Finally, Paul tries to see this fact of Israel's unbelief in the light of a wide religious philosophy of history: it is a law of Judaism in relation to the new faith. Cf. Hoennicke's Das Judenkristentum (1908), pp. 160 f.
8 The weaker minority probably were a Jewish-Christian circle (cf. Riggenbach in Studien und Kritiken, 1893, pp. 649–659). For the religious aspect of vegetarianism in these and other circles, see von Duhlhahn's Christian Life in the Primitive Church (1904), pp. 125 f., 396 f.
9 It was a sufficient reason for writing to the Romans that Paul could not have visited them, but was obliged on account of the need to postpone an event to which he had long looked forward. There was nothing in the circumstances of the church that required his intervention, and, as he was therefore free to choose his subject, he wrote out of the fullness of his heart that grand defense of the gospel which, though shaped by the conditions of the times, is animated by the timeless Spirit, and has proved to be a possession for ever (Drummond, p. 246).
10 Cf. L. (Über die beiden letzten Kapitel der ersten Jesi'ste's) (1907, pp. 126 f.), with Weizäcker's brilliant pages in his Apostolic Age, i. pp. 379 f.).
report; they do not imply the presence of friends upon the spot who kept him supplied with information. On the other hand, the circle of people addressed in xvi. 1–23, with its wealth of individual colour and personal details presupposed a sphere where Paul had worked for long. He can appeal to these Christians. He can speak sharply with authority to them. Now, as he wrote from Corinth, the only other city which answers to this description is Ephesus, the centre of Paul's long Asiatic mission. With this city and district several of the names in xvi. 1–23 are more or less directly connected, e.g. Epaenetus (σ), Aquila and Priscilla (τ), who were at Ephesus immediately before Romans was written (Acts xvii. 18, 26; cf. 1 Cor xvi. 19), and apparently were there (cf. 2 Tim. iv. 19) not long afterwards. These are the first people mentioned in the note, nor is there any likelihood that the rest of Paul's friends had made such a migration to the capital. Doubtless, there was fairly constant communication between Rome and the provinces, and in the course of these times these friends may have gradually followed the apostle thither. Hence it is not remarkable that almost all the names mentioned in this note have been found by archaeologists (cf. Lightfoot's Philippians, pp. 171 f.) within the Roman Corpus Inscriptionum. Most of them, anyhow, are fairly common throughout the Roman world (cf. Lietzmann, p. 73), whilst half are to be found in the Greek Corpus Inscriptionum for Asia Minor (e.g. Epaenetus, Herme, Hermas, etc.), and therefore Paul's was not the only hand working against and for Gentiles (xvi. 17–20) suits Rome at this period much less aptly than Ephesus (cf. 1 Cor xvi. 8–9; Acts xx. 29 f.; Rev. ii. 2 f.), where trouble of this kind was in the air. Controversy against false teachers is conspicuously absent from Romans. Nor is it possible to regard (with Zahn) such counsels as merely prophylactic; they are too definite and pointed. They imply the existence of a community with which Paul was personally acquainted, and to which he felt himself bound and free to address keen, authoritative reproaches.

The textual phenomena of the doxology (xvi. 25–27), which occurs after epistolary letters (xv. 23) and is sufficiently strange: they suggest that the epistle must have passed through a certain process of editing, during the 2nd century, previous to its final incorporation in the canon of the epistles.1 It may further be conjectured that the epistle does not lie before the modern reader in the precise shape in which it left Paul and his amanuensis at Corinth. Opinions, indeed, vary on the doxology. Either it is authentic but irrelevant, added by Paul as a postscript, or it is unauthentic,2 due to some copyist who added it as Eireb's (Zeitschrift für Kirchengeschichte, 1901, 224–231) makes xvi. 25–27 a note formed by Paul during his stay at Rome, in order to advise some of the local Christians of his arrival (Acts xviii. 15), but this theory is no improvement upon that of Semler, who regarded xvi. 3–16 as designed for Paul's friends outside Rome.3 The most rational theory of the latter is one of such explanations is to explain how the note came to be inserted into Romans, but this can be shown otherwise (cf. Deissmann's Licht vom Osten, 1908, pp. 164, 201). Eichhorn (Einleitung in das N.T., ii. 243 f.) regarded xvi. 1–20 as addressed to Corinth, while Schenkel viewed it as designed for all the churches which Phoebe was to visit.4

1 In the Ephesian Acta Johannis (c. 160) the house of Andronicus (Rom. xvi. 7) is one centre of Christian activity. E. H. Gifford (pp. 27–30) evades the difficulty by taking xvi. 3–20 as part of a second letter written by Paul after, not before, his release from imprisonment.

2 The most important and radical analyses are those of Spitta (Urchristentum, iii. 1902) and Völter (Paulus u. seine Briefe, 1905).

3 The former detects a short letter written (xii.–xv. 7, xvi. 1–20) after Acts xxvii. 20, during the Tour of the Gentile churches (A.D. 63–64), and another (1–xii. 10, xv. 14–53) written to believing Jews in order to justify the Gentile mission and afterwards edited for Gentile readers with the addition of xii. 11 f., xvi. 8–13, &c, Völter (pp. 135 f.) divides it in two parts, a short letter written by Paul, xvi. 8–17, is so distinct from xvi. 18–21, vi. 1–13, 16–23, xiv. 6, xvi. 14–16, 23–33, xvi. 21–24) from editorial additions, and also from still later accretions in ili. 14–15, ili. 23–26, vi. 255, xi. 1 f., xv. 7–13, 17–23, xvi. 17 f., 25 f. Spitta's view is not based on any treatment and wide in scope that it lent itself readily to this "catholizing" manipulation; thus the fact that xvi.–xvi. are very rarely quoted in primitive tradition may be due to their fullness of local detail, which would have less interest for the Roman world (cf. Rom. xvi. 27). More interesting is the question of its original form. May not the epistle, in whole or in part, have originally been more of a treatise in epistolary form than at first sight appears? For various suggestions as to the problem of 1. 7 see Harnack in Zeitschrift für die neutestamentliche Wissenschaft und für die Kirchent. d. Volker (19x2, 83–96); R. Steinmetz (Ibid., 1908, 177 f.); and Schmiedel in Hamburger Briefe (1903), pp. 357 f.

4 Unfortunately, this statement has not been supported by any satisfactory evidence; it has not even been attempted.
heart of the gospel with all his heart, and while a certain controversial element inevitably enters into his exposition—such is his writing with his eye on the Roman Church—any such considerations are quite subordinate to his dominating aim.

The epistle dates itself. Paul is on his way to Jerusalem with the moneys collected from the Macedonian and Achaian churches (xv. 19-32), and, after his visit to the Jewish capital, he proposves to visit the church of Rome en route for a mission in Spain. The statement corresponds to that outlined in Acts xx. 2-3. Paul probably despatched the epistle from Corinth. This conclusion would be put almost beyond doubt were Rom. xvi. 1 regarded as an integral part of the original epistle, since in that case Timothy and Tychicus (xv. 21) was not intended. This, as in Acts xx. 4, like Gaius (xxv. 23) and Erastus, both of whom were Corinthians (1 Cor. i. 14; 2 Tim. iv. 20). Phoebe of Cenchreae, the servant of Corinthians, would also be the bearer of the epistle (xvi. 1). But even apart from the evidence of ch. xvi., the tone of the epistle (especially of xv. 19 f.) indicates that Paul regards his work in the eastern provinces as done, and now turns to the West. It is just possible, of course, that the epistle was written from some other town, perhaps in Illyricum (so H. E. G. Paulus), but the facilities of communication point to Corinth.

—LITERATURE.—The ablest recent editions of the Greek text have been those of B. Weiss (in Meyer's commentary, 9th ed. 1899, thorough and gallant), and (Hand-Criticism, 2nd ed. 1892). H. Oltramare (Paris, 1881-82), Sanday and Headlam (Internal Crit. Comm. 5th ed. 1905, strong in philology and external criticism), as in Acts xx. 4, like Gaius (xxv. 23) and Erastus, both of whom were Corinthians (1 Cor. i. 14; 2 Tim. iv. 20). Phoebe of Cenchreae, the servant of Corinthians, would also be the bearer of the epistle (xvi. 1). But even apart from the evidence of ch. xvi., the tone of the epistle (especially of xv. 19 f.) indicates that Paul regards his work in the eastern provinces as done, and now turns to the West. It is just possible, of course, that the epistle was written from some other town, perhaps in Illyricum (so H. E. G. Paulus), but the facilities of communication point to Corinth.

Phoebe of Cenchreae, the servant of Corinthians, would also be the bearer of the epistle (xvi. 1). But even apart from the evidence of ch. xvi., the tone of the epistle (especially of xv. 19 f.) indicates that Paul regards his work in the eastern provinces as done, and now turns to the West. It is just possible, of course, that the epistle was written from some other town, perhaps in Illyricum (so H. E. G. Paulus), but the facilities of communication point to Corinth. 2

—LITERATURE.—The ablest recent editions of the Greek text have been those of B. Weiss (in Meyer's commentary, 9th ed. 1899, thorough and gallant), and (Hand-Criticism, 2nd ed. 1892). H. Oltramare (Paris, 1881-82), Sanday and Headlam (Internal Crit. Comm. 5th ed. 1905, strong in philology and external criticism), as in Acts xx. 4, like Gaius (xxv. 23) and Erastus, both of whom were Corinthians (1 Cor. i. 14; 2 Tim. iv. 20). Phoebe of Cenchreae, the servant of Corinthians, would also be the bearer of the epistle (xvi. 1). But even apart from the evidence of ch. xvi., the tone of the epistle (especially of xv. 19 f.) indicates that Paul regards his work in the eastern provinces as done, and now turns to the West. It is just possible, of course, that the epistle was written from some other town, perhaps in Illyricum (so H. E. G. Paulus), but the facilities of communication point to Corinth.

1 Not, however, in the sections bearing on the Law. "It has been customary to explain this feature of the epistle by the fact that having been written to a church with which Paul had no personal relations, and this may account for something. But there is a deeper and more important contrast in tone between this epistle and those written to the Galatian and Corinthian churches. The whole situation is changed. Then Paul was fighting for existence with his back to the wall; now he writes as one conscious that the one great issue is at hand" (A. B. Bruce, St Paul's Conception of Christianity, 1894, p. 96).

2 This is carefully worked out by Paley in his Horae Paulinae (ed. Birks, 1825), pp. 8 f.

ROMANSHORN—ROMANUS

is an important commercial town in the Swiss canton of Thurgau. It is situated on the west shore of the lake of Constance, and by rail is 514 m. N.E. of Zürich, 12½ m. S.E. of Constance, and 10 m. N.W. of Rorschach. In 1900 its population was 4577, mostly German-speaking, while there were 3093 Protestants to 1478 Romanists. Originally a small fishing village, it belonged to the abbey of St Gall from 1432 to 1798, when it became part of the city of Thurgau. In 1855 the railway from Romanshorn to Zürich was opened, and this vastly increased the commercial importance of Romanshorn. Nowadays it is the centre of a great transit trade, as it communicates, by means of the lake, with the principal towns on its shores. The corn trade and that in timber are among the most important, while there are many industrial establishments. It is essentially a modern commercial centre.

ROMANUS, the name of four East Roman emperors.

ROMANUS I. (Lacapenus), who shared the imperial throne with Constantine VII. (q.v.) and exercised all the real power from 909 to 944, was the most weak and disinterested of all the early Byzantine emperors. He was the son of Manuel, a Greek slave, who, having been freed, purchased his freedom and married a Greek lady, Dorothea, who bore him two children, Constantine and his younger brother, Romanus I. When his father died, he was the heir apparent and became co-emperor with Constantine VII. But Constantine died childless in 944, and Romanus was able to ascend the throne unresisted. He was a man of undoubted abilities, and a distinguished and successful general. He was a great lover of peace and dominion, and was the first Byzantine emperor to realize the necessity of maintaining the prestige of the state by the use of force. He was a great admirer of the culture of the Byzantine emperors, and was a great patron of the arts and sciences.

ROMANUS II. (the Philosopher), successor of Romanus I., reigned 959-963. He was the son of Romanus I. and his wife, Zoe. He was a man of great intellectual attainments, and was the first of the Byzantine emperors to be regarded as a scholar and a philosopher. He was a great patron of learning, and was the author of a number of works on philosophy and politics. He was a great admirer of the culture of the Byzantine emperors, and was a great patron of the arts and sciences.

ROMANUS III. (Argyrus), emperor 1028-1034, was an unscrupulous and unprincipled man, who was the heir apparent to the throne of Byzantium. He was the son of Romanus II. and his wife, Zoe. He was a man of great intellectual attainments, and was the first of the Byzantine emperors to be regarded as a scholar and a philosopher. He was a great patron of learning, and was the author of a number of works on philosophy and politics. He was a great admirer of the culture of the Byzantine emperors, and was a great patron of the arts and sciences.

ROMANUS IV. (Diogenes), emperor 1068-1071, was a member of a distinguished Cappadocian family, and had risen to distinction in the army, when he was convicted of treason against the sons of Constantine X. While waiting execution he was imprisoned in the imperial palace, and his wife, Eudocia Macrembolitissa, whom he so loved and adored, was granted him a free pardon and shortly afterwards married him. After his coronation he carried on three successful campaigns against the Saracens and Seljuk Turks, whom he drove beyond the Euphrates; in a fourth he was disastrously defeated by Alp Arslan on the banks of the Araxes and taken prisoner. After releasing himself by the promise of a large ransom and the conclusion of a peace, he turned his arms against the
pretedor Michael VII, but was compelled after a defeat to resign the empire and retire to the island of Prote, where he soon died in great misery. It was during this reign that, by the surrender of Barl (1071), the Byzantine empire lost its last hold upon Italy.

**ROME** (Rome), the capital of the modern kingdom of Italy, in the province of Rome, on the river Tiber, 17 miles N.E. from its mouth on the Mediterranean. As formerly the centre of the ancient Roman republic and of the Roman empire, and the headquarters of the Christian Church, Rome is unique among historical cities, and its antiquarian interest far surpasses that of any other locality in the world. In the following account the general subject of Rome is treated broadly under two aspects, themselves subdivided. These are:—(1) the topography and growth of the city of Rome, the evolution of which is traced from the earliest times to the present, and (2) Roman history, i.e. the political and social history of the Roman republic, empire, and commune.

The nine or ten hills and ridges on which the city stands are formed of masses of tufa or conglomerated sand and ashes thrown out by neighbouring volcanoes now extinct, but active down to a very recent period. One group of these volcanoes is that around Lago Bracciano, while another, still nearer to Rome, composes the Alban Hills. That some at least of these craters have been in a state of activity at no very distant period has been shown by the discovery at many places of broken pottery and bronze implements below the strata of tufa or other volcanic deposits. Traces of human life have even been found below that great flood of lava which, issuing from the Alban Hills, flowed towards the site of Rome, only stopping about 3 miles short, by the tomb of Cecilia Metella.

The superficial strata on which Rome is built are of three main kinds: (1) the plains and valleys on the left bank of the Tiber are covered, as it were, by a sea of alluvial deposits, in the midst of which (2) the hills of volcanic origin rise like so many islands; and (3) on the right bank of the Tiber, among the Janiculan and Vatican Hills, are extensive remains of an ancient seashore, conspicuous in parts by its fine golden sand and its deposit of pebbles and gravel. From its yellow sand the Janiculan has been sometimes known as the Golden Hill, a name which survives in the church on its summit called S. Pietro in Montorio (Monte d'Oro). In addition to these three chief deposits, at a few places, especially in the Aventine and Pincian Hills, under-strata of travertine crop out—a hard limestone rock, once in solution in running water, and deposited gradually as the water lost its carbonic-acid solvent, a process still rapidly going on at Termini, Tivoli, and other places in the neighbourhood.

The conditions under which the tufa hills were formed have been very various, as is clearly seen by an examination of the rock at different places. The volcanic ashes and sand of which the tufa is composed appear in parts to lie just as they were showered down from the crater; in that case it shows but little sign of stratification, and consists wholly of igneous products. In parts time and pressure have bound together these scoriae into a soft and friable rock; in other places they still lie in loose sandy beds and can be dug out with the spade. Other masses of tufa again show signs either of having been deposited in water, or else washed away from their first resting-place and redeposited with visible stratifications; this is shown by the water-worn pebbles and chips of limestone rock, which form a conglomerate bound together by the volcanic ashes, and which is called by the natural cement. A third variety is that which exists on the Palatine Hill. Here the shower of red-hot ashes has evidently fallen on a thickly growing forest, and the burning wood, partly smothered by the ashes, has been converted into charcoal, large masses of which are embedded in the tufa rock. In some places chared branches of trees, their form well preserved, can be easily distinguished. The so-called "wall of Romulus" is built of this conglomerate of tufa and charred wood; a very perfect section of the branch of a tree is visible on one of the blocks by the Scala Caci.

So great have been the physical changes in the site of Rome since the first dawn of the historic period that it is difficult now to realize what its aspect once was. The Forum Romanum, the Velabrum, the great Campus Martius (now the most crowded part of modern Rome), and other valleys were once almost impassable marshes or pools of water (Ov. Fasti, vi. 401; Dionys. ii. 395). The draining of these valleys was accomplished by means of the ancient cloaca, which were among the earliest important architectural works of Rome (Varro, Ling. Lat. iv. 149). Again, the various hills and ridges were once more numerous and very much more abrupt than they are now. At an early period, when each hill was crowned by a separate village fort, the great object of the inhabitants was to increase the steepness of their cliffs and render access difficult. At a later time, when Rome was united under one government, the very physical peculiarities which had originally made its hills so populous, through their natural adaptability for defence, became extremely inconvenient in a united city, where architectural symmetry and artistic两ness were above all things aimed at. Hence the most gigantic engineering works were undertaken: tops of hills were levelled, whole ridges cut away, and gentle slopes formed in the place of abrupt cliffs. The levelling of the Velia and the excavation of the site for Trajan's forum are instances of this. The same works were continued in the middle ages, as when in the 14th century an access was made to the Capitoline Atrium 1 from the side of the Campus Martius; up to that time a steep cliff had prevented all approach except from the side of the Forum.

Finally, after Rome had become the capital of united Italy in the last quarter of the 19th century, an extensive government plan (piano regolatore) was gradually carried out, with the object of reducing hills and valley to a uniform level and constructing wide boulevards on the chessboard method of a modern American city. The constant fires which have at times devastated Rome have been a powerful agent in obliterating the natural contour of the ground; and the accumulated rubbish from this and other causes has in some places overlaid the ground to a depth of 40 ft., notably in the valleys.

**THE ANCIENT CITY**

The chief building materials used in ancient Rome may be enumerated as follows: (1) *Tufa*, the "rubet et niger tophus" of Vitruvius (ii. 7), varying in colour from warm brown to yellow or greyish green (called *capellaccio*). The Aventine, Palatine and Capitoline Hills contained quarries of the tufa, much worked at an early period (see Liv. xxvi. 27, xxix. 44, and Varro, L.L. iv. 151). It is a very bad "weather-stone," but stands well if protected with stucco (Plin. H.N. xxxvi. 166). (2) *Lapis Albanus*, from Alba Longa, of volcanic origin, a conglomerate of ashes, gravel and fragments of stone; its quarries are still worked at Albano and Marino. This is now called *peperino*, from the black scoriae, like peppercorns, with which the brown conglomerate mass is studded. (3) *Lapis Gabinus*, from Gabii, very similar to the last, but harder and a better weather-stone; it contains large lumps of broken lava, products of an earlier eruption, and small pieces of limestone. According to Tacitus (Ann. xv. 43), it is fire-proof, and this is also the case with the Alban stone. Lapis Gabinus is now called *sporone*. (4) *Silex* (mod. *sete*), a lava from the now extinct volcanoes in the Alban Hills, used for paving roads; when broken into small pieces it is used as a mixed with lime and pozzolana it formed an immensely durable concrete. It is dark grey, very hard and breaks with a slightly conchoidal fracture (Plin. H.N. xxxvi. 133; Vit. ii. 7), but does not resemble what is now called *silex* or flint. (5) *Lapis Tiburtinus* (travertine), the chief quarries of which are at Tibur (Tivoli) and other places along the river Anio; a hard pure carbonate of lime, of a creamy white colour, deposited from running or dripping water in a highly

---

1 By the great flight of marble steps up to S. Maria in Ara Coeli.
stratified form, with frequent cavities and fissures lined with crystals. As Vitruvius (ii. 5) says, it is a good weather-stone, but is soon calcined by fire. If laid horizontally it is very strong, but if set on end its crystalline structure is a great source of weakness, and the lower end to end. Neglect on the part of Roman builders of this idea, its occasional use in many cases caused a complete failure in the structure. This was not only the case in the rostra. (6) Pulvis Puteolanus (puzzolana), so called from extensive beds of it at Puteoli—a volcanic product, which looks like red sandy earth, and lies in enormous beds under and round the city of Rome. When mixed with lime it forms a very strong hydraulic cement, of equal use in concrete, mortar or undercoats of stucco. It is to this material that the concrete walls of Rome owe their enormous strength and durability, in many cases far exceeding those of the most massive stone masonry. Vitruvius devotes a chapter (bk. ii. ch. 6) to this very important material.

Bricks were either sun-dried (latere crudii) or kiln-baked (latere cocti, testace). The remarks of Vitruvius (ii. 3) seem to refer wholly to sun-dried bricks, of which no examples now exist in Rome. It is important to recognize the fact that among the existing ancient buildings of Rome there is no such thing as a brick wall or a brick arch in the true sense of the word; bricks were merely used as a facing to concrete walls and arches and have no constructive importance.1 Concrete (opus caementicium, Vitr. ii. 4, 6, 8), the most important of all the materials used, is made of rough pieces of stone, or of fragments of marble, brick, tile, or even pieces of a man's fist and embedded in cement made of lime and pozzolana—forming one solid mass of enormous strength and coherence. Stucco, cement and mortar (teictorium, opus albarium and other names) are of many kinds; the ancient Romans especially excelled in their manufacture. The cement used for lining the channels of aqueducts (opus signinum) was made of lime mixed with pounded brick or potsherds and pozzolana; the same mixture was used for floors under the "nuclear or finer cement on which the mosaic or marble paving-slabs were bedded, and was called caementum ex tessis tenuis." For walls, three or four coats of stucco were used, often as much as 5 in. thick altogether; the lower coats were of lime and pozzolana, the finishing coats of powdered white marble (opus albarium) suitable to receive painting. Even marble buildings were usually coated with a thin layer of this fine white stucco, nearly as hard and durable as the marble itself—"a practice also employed in the finest buildings of the Greeks—probably because it formed a more absorbent ground for coloured decoration; stone columns coated in this way were called "columnae deathabae" (Cic. In Verr. ii. 1, 52 seq.) For the kinds of sand used in mortar and stucco, Vitruvius (ii. 4) mentions sea, pit and river sand, saying that pit sand is to be preferred.

Marble appears to have come into use about the beginning of the 1st century B.C. Its introduction was at first viewed with great jealousy; as souvagem of Greek luxury. The creator of Crassus was the first to use it in his house on the Palatine, built about 92 B.C.; and, though he had only six small columns of Hymettian marble, he was for this luxury nicknamed "the brick." We read, "peperino, in the time of Augustus burnt brick was very little used, the usual wall-facing being opus quadratum of tufa or peperino, and opus reticulatum of tufa only."

(Ex., the eleven Corinthian columns in the Borsa.) (2) Marmor Hymettium, from Mount Hymettus, near Athens, is coarser in texture and one of the best limestones. The Laocoon is of grey or blue striations (Strabo ix. p. 399). (Ex., the forty-two columns in the nave of S. Maria Maggiore and the columns in S. Pietro in Montorio.) (3) Marmor Pentelicum, from Mount Pentelicus, also near Athens, is very fine in texture and was especially used for architectural purposes than for statues, though some sculptors preferred it above all others, especially Phidias and Praxiteles. (Ex., the columns of the vestibule of the Augustus in the Vatican.) (4) Marmor Perurium, from the Isle of Palse, is very beautiful in texture, having a very crystalline structure. (Ex., the nineteen columns of the round temple in the Forum Boarium.)

Coloured marbles.

1 In less solid constructions than those which have survived until modern times bricks were doubtless used by themselves.
2 The oft-quoted story of Augustus (Suet. Aug. 29) that he "found Rome of brick and left it of marble" has probably much truth in it. The order of its ascent was of Greek marble, (see Plin. H.N. xxxvi. 5, 50). In a very few years, under the rule of Augustus, marble became very common.2

Of white statuary marble four principal varieties were used, (1) Marmor Clarissimum, from near Carthage (The ex-v. p. 222), is of many qualities, from the purest cream white and the finest granite to the coarsest sorts disfigured with bluish grey streaks.3

THE ANCIENT CITY]

ROME

These Nile quarries were worked during the 19th century, and many blocks were imported into Rome for the rebuilding of S. Paolo fuori le Mura.

On the subject of Roman marbles, see Corsi, Dell' opere piu antiche (ed. 1831); Phyllis, Il Marmorino di Roma (1894); and Brindley in Transactions of the Royal Institute of British Architects (1887). A collection of 1000 specimens, originally formed by Corsi, is preserved in the museum at Oxford.
of the surface only) appear to be a principal item in the construction. The walls of the Pantheon, for example, are covered with tiers of brick arches, and many theories have been invented as to their use in distributing the weight of the walls. But a recognition of the fact that these walls are of concrete about 20 ft. thick, while the brick facing averages scarcely 6 in. in thickness, clearly shows that these "relieving arches" have no more constructive use as far as concerns the pressure than if they were painted on the surface of the walls. The same applies to the superficial use of brick arches and other brickwork, although, however, the setting of the concrete rendered the brick facing superfluous, it played its part in sustaining the fluid mass on its centring during the process of solidification.

At first tufa only was used in opus quadratum, as we see in the so-called wall of Romulus. Next the harder peperino began to be worked; it is used, though sparingly, in the "Servian" wall, and during the later Republic appears to have been largely employed for exterior walls or points where there was heavy pressure, while other parts were built of tufa. Thirdly, travertine appears to have been introduced about the 2nd century B.C., but was used at first for menory ornamental purposes, very much as marble was under the Empire; after about the middle of the 1st century A.D., travertine began to be largely used for the solid mass of walls, as in the temple of Vespasian and the Colosseum. As the examples of late Rome reveal, the very thick walls of the Colosseum (c. 80 A.D.) are more or less of travertine, while the Colosseum was richly faced with tufa and travertine, and throughout, the setting of the concrete rendered the brick facing superfluous, it played its part in sustaining the fluid mass on its centring during the process of solidification.

The style of architecture employed in ancient Rome (see Architecture, section Roman, and Roman Art) may be said to have passed through three stages—the Etruscan, the Greek and the Roman. During the first few centuries of the existence of the city, both the methods of construction and the designs employed appear to have been Etruscan. The Etruscans were a warlike people of earlier times, who were probably the ancestors of the Romans. The earliest temples were simple cellae without columns, or else, in the case of the grander temples, such as that of Capitoline Jupiter, the columns were very widely spaced (araeostyle), and consequently had entablatures of wooden beams. The architectural decorations were more generally in gilt bronze or painted terra-cotta than in stone, and the paintings or statues which decorated the buildings were usually the work of Etruscan artists. The Greek influence is more obvious; it is found in the period following the second Punic or Hanniballic War, and almost all the buildings of the Roman Republic are Etruscan in style, except for the earlier Imperial age. The Greeks, with certain modifications, not only in general design but in details and ornaments. Greek architects were largely employed, such as Apollodorus of Damascus, who designed Trajan's forum and other buildings; on the other hand, a Roman, Cossutius, was employed on the building of the Olympieum at Athens, in the 2nd century B.C. Roman architects such as Vitruvius and C. Muclius in the 1st century B.C., Severus and Celer under Nero, and Rabirius under Domitian, were Greek by education, and probably studied at Athens (see Vitr. viii. Proef., Hirt, Gesch. d. Bouw. kunst, ii. p. 257). The Romans, however, though they borrowed freely from the Greek in artistic originality, were also practical engineers, and this led to the development of a new and more purely Roman style, in which the restrictions imposed by the use of the stone lintel were put aside and large spaces were covered with vaults and domes cast in semi-fluid concrete, a method which had the enormous advantage of giving the arched form without the constant thrust at the springing which makes true arches or vaults of wide span so difficult to deal with. The enormous vaults of the great thermae, the basilica of Constantine, and the like, cover their spaces with one solid mass like a metal lid, giving the form but not the principle of the arch, and thus allowing the vault to be set on walls which would at once have been thrust apart had they been subjected to the immense leverage which a true arched vault constantly exerts on its supports. This is a very important point, and one which is usually overlooked, mainly owing to the Roman practice of facing their concrete with bricks, which (from an examination of the beautiful drawings of Choisy (L'Art de bâtir chez les Romains, Paris, 1873) the structural importance of the brick used in vaults and arches is very much exaggerated.

1 Pliny (H. N. xxxv. 154), quoting Varro, says that the decorations in painting and sculpture of the temple of Ceres near the Circus Maximus were the work of the first Greek artists employed in Rome, and that before that (c. 493 B.C.) "all things in temples were Etruscan," Vitruvius (iii. 3) says, "Ornanteque signis fictilibus aut aereis inauratis eorum fastigia Tuscanico more, ut est ad Circumvirorium Cereris, et Herculis Pompeiani, item Capitolini" (cf. iv. 7, vi. 3).

2 The frequent use of engaged columns is a peculiarity of Roman architecture, but it is not without precedent in Greek buildings of the later period. The temple of Zeus at Agrigentum, Surface enrichments over the mouldings were used far more largely by the Romans than by the Greeks.

3 In the beautiful drawings of Choisy (L'Art de bâtir chez les Romains, Paris, 1873) the structural importance of the brick used in vaults and arches is very much exaggerated.
Fig. 7.—PLAN OF ANCIENT ROME.
The use of mortar with opus quadratum is a sign of a comparatively early date. It occurs, e.g., in the "Servian" wall on the Aventine and in the Tabularium. Under the Empire massive blocks, whether of tufa, travertine or marble, are set without any mortar. It must, however, be observed that these early instances of the "mortar" is but a thin stratum of lime, little thicker than stout paper, used not as a cement to bind the blocks together, but simply to prevent their falling apart. The actual binding together was done by clamps and dowels, as well as by the mass and weight of the great blocks used. Except in the earliest masonry, each block was very carefully fastened, not only to the next blocks on the same course, which was done with double dove-tailed dowels of wood, but also to those above and below with stout iron clamps, run with lead (Vitr. ii. 8). In more ornamental marble work bronze clamps were often used. Concrete is rarely found in connexion with opus quadratum; part of the "Servian" wall on the Aventine received a backing of concrete at a relatively late period. Up to the 1st century B.C. it was faced with opus incertum—small irregularly shaped blocks of tufa, 3 to 6 in. across, with pointed ends driven into the concrete while it was soft, and worked smooth on the face only (see fig. 2). From the beginning of the 1st century B.C. opus reticulatum, formed of rectangular tufa prisms laid in a regular pattern like a net (whence the name), is found. It is very neat in appearance, and is often fitted with great care, though it was generally covered with stucco. The so-called "house of Livia" on the Palatine is a good example of the earlier sort, when the blocks were made of small rectangular blocks of tufa. Under the Empire brick quoining came into use (as may be seen in the so-called palace of Caligula). Though in Rome opus reticulatum was almost always made of tufa, in the neighbourhood of the city it was sometimes of peperino or even lava, where these materials were found on the spot.

**SECTION OF ANGLE**

**Fig. 2.—Concrete Wall faced with (A) Opus Incertum and (B) Opus Reticulatum.** C shows the section, similar in both.

Of concrete walls faced with burnt bricks no dated example earlier than the middle of the 1st century B.C. is known. The facing consisted at first of triangular fragments of tiles (legulae), broken for the purpose and more or less irregular in shape and size, but from the 1st century A.D. onwards triangular bricks were specially manufactured for wall-facings. This shape was adopted in order to present a large surface on the face with little expenditure of brick, and also to improve the bond with the concrete behind (see fig. 4). Even party walls of small rooms are not built solid, but have a concrete core faced with brick triangles about 3 in. long. In order to support the facing until the concrete set, the Roman builders used a wooden framework covered with planks on the inside. Sometimes the planks were nailed outside, the wooden uprights, as was done with unfaçed concrete walls, and then a series of grooves appear in the face of the brickwork. Walls faced with opus reticulatum must have been supported temporarily in the same way.

The character of the brick facing is a great help towards determining the date of Roman buildings. In early work the bricks are thick and the joints thin, while in later times the reverse is the case, so that brickwork of the time of Severus and later has more bricks to the foot than that of the Flavian period.

The length of the bricks as it appears the face is no guide to the date of the wall; the short points of the brick triangles were frequently broken off before they were used. Moreover, varieties both in quality of workmanship and size of the bricks often occur in work of the same date. In the remains of Nero's Golden House great varieties appear, and some of the walls in the interior rooms are faced with very irregular and careless brickwork. Special care must be taken in judging of dates; fortunately after the 1st century A.D. in some cases even earlier, stamps impressed on bricks, and especially on the large tiles used for arches, give clearer indications. The reason of the almost universal use of smooth facings either of opus reticulatum or of brick over concrete walls is a very puzzling question; for concrete itself forms an excellent ground for the stucco coating or backing to the marble slabs, while the stucco adheres with difficulty to a smooth facing, and is very liable to fall away. The modern practice of raking the joints to form a key was not employed by the Romans, but before the mortar was hard they stuck the face of the wall with marble plags and iron or bronze nails driven into the joints, so as to give a hold for the stucco—a great waste both of labour and material.

The quality of the mortar varies according to its date: during the 1st and 2nd centuries it is of remarkable hardness—made of lime with a mixture of coarse pozzolana of a bright red colour; in the 3rd century it began to be inferior in quality, and the pozzolana used under the later Empire is brown instead of red.

Concrete was at first always made of lumps of tufa; then travertine and broken bricks and even marble were used, in fact all the chips and fragments of the mason's yard. Under the Empire the concrete was used made with travertine or lava for foundations, with tufa or bricks for the upper courses, with tufa only (for the sake of lightness) for vaults. Massive walls were cast in a mould; upright timbers, about 6 by 7 in. thick and 10 to 14 ft. long, were set in the concrete and then filled in between them with concrete. By this method large vaults were formed (see fig. 4).

The Romans also used concrete for vaults. G. G. Iron clamps run with lead to fix marble lining. H. Bronze clamp. J. Cement backing.

1 The expansion of the iron through rust, which caused the stone to split, has frequently been a great source of injury to Roman walls, as well as the practice, common in the middle ages, of breaking into the stones in order to extract the metal.

2 Some of the bricks are as much as 2 1/2 in. thick, while 1 1/2 in. is the usual maximum for Roman brickwork. The Roman method of facing stucco walls with a wooden "float" exactly as is done now, is shown in a painting from Pompeii (see Ann. Inst., 1881, pl. H.).

building acts, not unlike those of modern London, were enacted by several of the emperors. These fixed the materials to be used, thickness of walls, minimum width of streets, maximum height allowed for houses, &c. After the great fire in Nero’s reign, A.D. 64, an act was passed requiring the lower stories of houses to be built with fire-proof materials, such as pumice or burnt brick.

Enormous accumulations of statues and pictures enriched Rome during its period of greatest splendour. In the first place, the numerous statues of the republic and even of the period were religiously preserved at a time when, from their archaic character, they must have been regarded rather as objects of sacred or archaeological interest than as works of art (Plin. H.N. xxxiv. 15 ff., xxxv. 19 ff.). Secondly came the large Graeco-Roman class, mostly copies of earlier Greek works, executed in Rome by Greek artists. To this class belongs most of the finest existing sculpture preserved in the Vatican and other museums. Thirdly, countless statues and pictures of Roman emperors from almost every important city in Greece, Magna Graecia, Sicily and western Asia Minor. These robberies began early, and were carried on for many centuries. The importations included works of art by all the chief artists from the 6th century downwards. Long lists are given by Pliny (H.N. xxxiii.—xxxvi.), and pedestals exist with the names of Praxiteles, Timarchus, Polyclitus, Bryaxis and others. These accumulated works of sculpture were of all materials—gold and ivory (Suet. Titi., 2), of which seventy-four are mentioned in the catalogue of the Beyreuthian, many hundreds or even thousands of silver (Plin. H.N. xxxiii. 151 f.), while those of gilt bronze and marble must have existed in almost incredible numbers (Paus. viii. 46). Nor were the accumulated stores of Greek paintings much inferior in number; not only were easel pictures by Zeuxis, Apelles, Timanthes and other Greek artists taken, but even mural paintings were carefully cut off the walls and brought to Rome secured in wooden frames (Plin. H.N. xxxv. 173, and compare ibid. 154).

The roads were made of polygonal blocks of lava (silice), neatly fitted together and laid on a carefully prepared bed, similar to that used for mosaic paving (see Mosaic and Roads). Roads thus made were called viae stratae. A good specimen of Roman road-making, in which the blocks were fitted together with the utmost accuracy, is to be seen in a portion of the Clivus Capitolinus in front of the temple of Saturn (see fig. 5, which also shows the massive travertine curb which bordered the road; sometimes the curb was of lava). In 1901 the late and sadly laid pavement of the Sacra Via on the ascent of the Velia was removed, and the earlier paving laid there at a lower level. The original pavement of the Nova Via was exposed in 1904. Other well-preserved viae stratae are those leading up to the Palatine from the Summa Sacra Via and that which follows the curved line of shops in Trajan’s forum.

The following is a list of the chief roads which radiated from Rome:—(1) Via Appia issued from the Servi Porta Capena and the Aurelian P. Appia; from it diverged (2) Via Labicana, (3) Via Latina, (4) Via Tarquinius from the Aurelian P. Latina; (5) Via Labicana and (4) Via Tiburtina issued from the Servian P. Esquilina; from (3) diverged (5) Via Prætoria, (6) Via Prætoria from the Claudian acropolis, to the P. Maggiore, while (4) passed through the Aurelian P. Tiburtina; (6) Via Nomentana and (7) Via Salaria issued from the Servian P. Collina and passed respectively through the Aurelian P. Nomentana and the Claudian acropolis, to the P. Fontinalis, and was called Via Lata for the first half-mile or more.

Remains of Prehistoric Rome. It is evident from recent discoveries that the site of Rome was inhabited at a very early period. Flint implements and remains of the Bronze Age have been found on the Aventine and elsewhere; and from the Early Iron Age onwards we have a continuous archaeological record, owing to the discovery of ancient burial-places. In 1902 a very early necropolis was brought to light at the S.E. corner of the temple of Antoninus and Faustina, some 17 ft. below the level of the Forum. The graves contained either a large vessel (dolio), or skeletons buried either in a simple trench ( fossa), a tufa sarcophagus or a tree-trunk. The cremation graves are the earlier, and none are later than the 6th century, while the oldest may be of the 9th; the pottery and other objects placed in the graves belong to the Early Iron Age. It is clear that this cemetery is earlier than the union of the Palatine and Quirinal settlements in one city (see below, p. 759).

Other early cemeteries have been discovered on the Quirinal and Esquiline, which were in use from the beginning of the Iron Age down to the beginning of the historic period. The large necropolis on the Esquiline is cut two by the “massive” wall, which is evidently of later date. The later tombs contain objects of Etruscan, Phoenician and Greek manufacture.

There is no doubt that the earliest settlement bearing the name of Rome was on the Palatine hill, which was both easy of defence and possessed the means of communication with its neighbours in the proximity of the Tiber. The name Roma is said to mean “river,” and this is uncertain. The Palatine is roughly square in outline, and the Roman antiquarians sometimes applied the name Roma Quadrata to the earliest settlement; but the term seems more properly to have applied to a sanctuary contiguous with the foundation of the city. The ideal boundary of the city was formed by the Pomerium (see Varro, L.L. v. 143; Liv. i. 44; Dionys. i. 88), whose original course is traced by Tacitus (Ann. xii. 24). It passed along the foot of the hill (per ima montis Palatinis), the angle-points being given by the Ara Maxima in the Forum Boarium, the Ara Consi in the Circus Maximus, the Curiae Veteres (near the arch of Constantine) and the Sacellum Larum (at the N. angle). But this was of course not a defined site, and the extent of the fortified city can only be determined by the traces of its early walls. These traces are described by Ptolemy as the wall of the Eumolpus, which he claims to have fixed its line along the heights of the Velabrum, on the west of the hill, and along the valley of the Circus Maximus as far as the so-called Paedagogium, about half-way on the south side.

Considerable remains of this fortification exist near the west angle of the hill. These show that the natural strength given by the cliff was increased by artificial means. The wall was set neither at the top nor at the foot of the hill, but more than half-way up, a level terrace or shelf all round being cut in the rock on which the base of the wall stood. Above this cliff was cut a deep trench, not quite perpendicular but slightly "battering" inwards, to give greater stability, which was built up against it, like a retaining wall, reaching to the top of the cliff, and probably a few feet higher. The stones used in this wall are soft tufa, a warm brown in colour, and full of cavities of charred wood. The cutting to form the steep cliff probably supplied part of the material for the wall; and ancient quarries, afterwards used as reservoirs for water, exist in the mass of rock on which the wall descends. It is probable that these tufa blocks are not cut but split with wedges; this, however, is not the case.

2 On the prehistoric remains of Rome and Latium, see Pinza in Monumenti antichi pubblicati per cura della reale Accademia dei Lincei, vol. xv., 1903; also Comm. Boni’s reports on the necropolis of Praeneste, Notizie degli scavi, and Modestor, Introduzione all’istoria romana (Paris, 1907).

The primacy of the Palatine has been disputed by Carter (Amcr. Jour. Arch., 1908, p. 181), who thinks that the first city was that of the Four Regions (see below) formed by the Etruscan kings.
would be shattered to pieces by a wedge; moreover, distinct tool marks have been seen on all the blocks whose surface is well preserved and in the quarries themselves. The chips from one-fourth to three-fourths of an inch in width were used, and also a sharp-pointed pick or hammer. The wall is about 10 ft. thick at the bottom, and irregularly thick above (see fig. 17). The blocks are care-fully placed on their beds, both the face of left and right, and the vertical joints are in some cases open, spaces of nearly 2 in. being left between block and block; in other cases the vertical joints are worked true and close like the beds. No mortar was used. At two points near the top of the wall, which was excavated in the tufa cliff, the entrance to which was once closed by the ancient wall. One of these early in times (before water in abundance was brought to the Palatine on aqueducts) was used as a reservoir for water. The horizontal ones (of course and circular shafts for buckets are cut downwards through the rock from the top of the hill. A similar rock-cut cistern with vertical shafts, of very irregular size and not laid in courses of "headers and stretchers"; the nearest parallel is supplied by the foundations of the temple of Jupiter Capitolinus. These remains are shown by Delbrück, Der Apostolische Sitz, 1891, but their exact position should not be laid on this feature. There are, however, at the western angle of the hill some remains of an earlier fortification, covering the same position as we find the lower portion of the main wall. A few courses have been preserved, owing to the fact that at the time of the civil war this wall was encased first of all by that described above and afterwards by concrete substructures of imperial date. The most important is the Janus Quinctius (the blocks are of irregular size and are not laid in courses of "headers and stretchers": the nearest parallel is supplied by the foundations of the temple of Jupiter Capitolinus. These remains are shown by Delbrück, Der Apostolische Sitz, 1891, but their exact position should not be laid on this feature. These remain...
The Servian city did not include what is now the most crowded part of Rome, and which under the Empire was the most architecturally magnificent, namely, the Campus Martius, which was probably to a great extent a marsh. It was once called Ager Tarquinium, but it was later called the Campus Mariscus. The Campus Martius was an agrarian settlement, extending from a hill near Mars, dating from prehistoric times (Liv. xxvi. 20).

Of that wonderful system of massive arched sewers by which, as Dionysius (iii. 68) says, every street of Rome was drained into the Cloaca Maxima, runs from the valley of the Subura, under the Forum towards the Velabrum, and so into the Tiber by the round temple in the Forum Boarium; it is still in use, and well preserved, in most places. The Cloaca Maxima is a great quay wall nearly 11 ft. wide by 12 high, consists of three rings of peperino "vouvsoirs," most neatly fitted. The rest of the vault and walls is built of mixed tufa and peperino. Flinn (H. N. xxviii. 24) says that it has an inner arch, and he estimates that the great sewer, big enough (he says) for a loaded hay-cart to pass along.

The mouths of two other similar but smaller cloacae are still visible in the great quay wall of the Cloaca Maxima, and a whole network of sewers exists under a great part of the Servian city. Some of these are not built with arched vaults, but have triangular tops formed of courses of stone on levelled beds. Each new one, the upper room with primitive method of construction, employed in the Tullianum. The great quay wall of tufa and peperino which lined the Tiber at the mouth of the Cloaca Maxima is also of early date. In later times, when it was repaired, an architectural feature was added, in which they naturally would be in the process of digging out and heaping up. Dionysius (ix. 68) states the length of the sewer to have been 72 stadia, but that about the sewer are trenches (ending soil) with the actual discoveries. Originally one road ran along the bottom of the fossa and another along its edge; the latter existed in imperial times. But the whole fossa appears to have been filled up probably in the time of Augustus, and afterwards. The houses of mixed brick and opus reticulatum still exist against the outside of the great wall, which was itself used as the back wall of these houses, so that we now see painted stucco of the time of Hadrian covering parts of the wall of the king. Another row, now, houses seems to have faced the road mentioned above as running along the upper edge of the fossa, thus forming a long street. As early as the 1st century B.C. a large part of the wall of the Cloaca Maxima had been pulled down as far as a distance of 2-ft. from the quay, and the circuit was too difficult to trace (Dionys. iv. 13). A very curious series of marks of masonry's marks on stones of the agger wall (as such found at later construction), and of some odd stones in the buildings, which were deeply incised, usually on the ends of the blocks, and average from 10 to 14 in. in length; some are single letters or monograms; others are numbers, e.g. 1, the numeral 50. Fig. 6—Masons' Marks on Early Walls.

1 See Bruza, Ann. Inst. (1876), 72; Jordan, Topographie, i. 250; Richter, Über antike Steinteilzeichnungen (1885).
2 See Richter in the work quoted above, and Beiträge zur römischen Topographie (Berlin, 1903); also Delbrück, Der Antikentempel auf dem Marsfeld in Rom (1871).

This is the age of the wall which has undergone restoration. This portion is pierced by an arch about 93 ft. high, which probably served as an embrasure for a military engine. Finally, where the wall skirts the bank of the Tiber it is built in two sections—a foundation about 2 metres in height of opus caementicium, and the landing-stage, and an upper wall, 6 metres high, which retains the bank. It is built of peperino, and is probably later than the repaired section.

The age of this wall is uncertain, but it has been rendered exceedingly probable that it belongs to the 4th century B.C. The evidence for this is derived from the comparison of other fortifications in central Italy. From the measurements of the blocks and masonry, which presuppose the later Roman foot of 296 millimetres, and from the character of the alphabet from which the masons' marks are taken, this is most probably the works of the Roman period, and this probably refers to the other portions of the existing wall, which was built owing to the fear of a second Gallic invasion.3

In the upper part of its course the Cloaca Maxima was restored in some places, under the Empire, with a vault of brick-faced concrete; at the entrance to the Forum a large bend was made when the Emperor Commodus was restored it.4

A great quay wall with arched cloacae, similar to those in Rome, exists at the mouth of the river Marta near Tarquinii, and similar constructions are found in other Etruscan cities.

4 Liv. ii. 53 mentions "augurium reliqui," and also speaks (xxxv. 44) of an "inferiorem carcerem," and at xxii. 22 of a criminal being put in the Tullianum.

3 Consules sufficti for A.D. 22.
the bodies of criminals were exposed; 1 Pliny (H.N. viii. 145) calls it the "stairs of sighs" (gradus gemitorii).

**Forum Romanum and Adjacent Buildings.**

The Forum Romanum or Magnum, as it was called in late times to distinguish it from the imperial fora, occupies a valley which extends from the foot of the Capitoline hill to the north-west part of the Palatine. Till the construction of the great cloaca maxima, it was, at least in wet seasons, marshy ground, in which there were several pools of water. 2 At early times it was bounded on two sides by rows of shops and houses, and in the time of the first Tarquin (Liv. i. 35). The shops on the south-west side facing the Sacra Via, where the Basilica Julia afterwards was built, were occupied by the Tabernae Vetrici. 3 The shops on the northern side, being occupied by silversmiths, were called Tabernae Argentariae, and in later times, when rebuilt after a fire, were called Tabernae Novae. 4 See Livy xvi. 27, xl. 51. 1 An altar to Saturn (Dionys. i. 34, vi. 1), traditionally set up by the companions of Hercules, and an altar to Vulcan, both at the end towards the Capitol, with the temple of Vesta and the Regia at the opposite end, were among the earliest monuments grouped around the Forum. The Lacus Curtius vanished, as Varro says (L.L. v. 148-49), probably with other stagnant pools, when the cloaca were constructed (Liv. i. 38, 50). Another pool, the Lacus Servilius, near the Basilica Julia, was preserved in some form or other till the imperial period. Under Sulla it was used as a place to expose the heads of many senators murdered in his proscriptions (Cic. Rosc. Am. 32, 89; Seneca, De Propr. 3, 7). The Volcanal was an open area, so called from the early altar to Vulcan, and was (like the Comitium) a place of public meeting, at least during the regal period. It was raised above the Campus Martius, and was apparently founded on the lower slope of the Capitoline hill behind the arch of Severus; the foundations of the altar were discovered in 1898. It was probably much encroached upon when the temple of Concord was enlarged in the reign of Augustus. Fig. 8 gives a carefully measured plan of the Forum, showing the most recent discoveries.

Unlike the fora of the emperors, each of which was surrounded by a lofty wall and built at one time from one design, the architectural form of the Forum Romanum was a slow growth. The marsyas battlefied by the early inhabitants of the Capitol and Palatine became, when the ground was drained by the great cloaca, under a united rule the most convenient site for political meetings, for commercial transactions, and for the pageants of rich men's funerals, ludi sceptrici, and gladiatorial contests. 2 For these purposes the Forum became a central space, though but a small one, was kept clear of buildings; but it was gradually occupied in a somewhat inconvenient manner by an irregular and miscellaneous group of buildings and monuments. On three sides the limits of this open space are marked by paved roads, faced by the stately buildings which gradually took the place of the simple wooden tabernae and portices of early times. The space is marked by the pavement of the latter (fig. 6), and the position of both is ascribed to Tullus Hostilius. For the position of the Comitium and the Curia 6 see plan of Forum (fig. 8). Varro (L.L. v. 155-56) gives the following account of the buildings which were grouped along the northern angle of the Forum:—

"Comitium ab eo quo colabant eam comitii curitias et litium causa. Curiae duorum generum, nam et ubi curarent sacerdotes res divinas, ut Curiae Vetere, et ubi senatus humanas, ut Curia Hostil, quoniam primum eademcuritias Hostilius rex. An te haec Rostra, quoqui lictor, ubi quoniam hostium captorum fixa sunt rostra. Sub Dictatoribus, haec a Comitia vetere, haec a Comitum insula, vastum, quod in senatun urbani legati qui ad senatum essent missi est. Quae Graccestas, quomodo in parte multa, Senaculum super Graecostasim, ubi Aedin Cordiae et Basciae Opinia. Senaculum vocatum, ubi senatus aut urbani consistory consistory e-

1. See Tac. Hist. iii. 74, 85; Suet. Vit. 17.
2. See Livy (xliv. 16), who mentions a house of P. Africanus, "pompe veters ad Vortuni signum," which was bought by T. Sempronius to clear the site for the Basilica Sempronia in 169 B.C. This basilica was afterwards absorbed in the Basilica Julia.
3. Hence these two sides of the Forum are frequently referred to in classical writings as "sub veteribus" and "sub novis." The space containing an altar; it is described by Ovid (Fast. vi. 403); according to one tradition it marked the spot where Curtius's self-immolation filled up the chasm which had opened in the Forum (see Dionys. ii. 41). (See below.)
4. See Dionys. ii. 50, vi. 67; Plin. H.N. xvi. 236; Plat. Quaes. Rom. 47.
5. The first gladiatorial show in Rome was given in 264 B.C. in the Forum Boarium by D. Junius Brutus at his father's funeral (Livy, 279 B.C.). The games were held in the Forum Romanum in 216 B.C. (Livy, xxxii. 30). See also Livy, xxxi. 50, xli. 28; and Suet. Cæs. 39. Aug. 43; and Tib. 7.
6. On the Comitium see Detlefsen, Ann. Inst. (1860), pp. 128 ff., and the works mentioned below, especially those of Livy (xiv. 24) which indicate their relative positions by the phrase, "comitia vestibulum Curiae."
sacri cul us performed his functions in the Comitium, and the inscription may refer to him. This may be the stele to which Dionysius of Halicarnassus refers as marking the tomb of Hostus Hostilius (father of Tullus Hostilius) whose site (according to those who believed in the translation of Romulus to heaven) was marked by the lapis niger.

The Senaculum appears to have been a place of preliminary meeting for the senate before entering the Curia (Liv. xii. 27; Val. Max. ii. 2, 6); it adjoined the temple of Concord, and when this was rebuilt on an enlarged scale in the reign of Augustus it appears probable that its large projecting portico became the Senaculum.

A great part of the north-east side of the Forum was occupied by two basilicas, which were more than once rebuilt under different names. The first of these appears to have been adjacent to the Curia, on its west side; it was called the Basilica Porcia, and was founded by the elder Cato in 185 B.C. (see Liv. xxxix. 44, and Plut. Cato Major, 19); it was burnt with the Curia at Clodius's funeral. On the north side of the Forum another basilica, called Aemilia et Fulvia (Varro vi. 4), was built in 179 B.C. by the censors M. Fulvius and M. Aemilius Lepidus; it stood, according to Livy (xl. 51), "post argentarias novas," the line of silversmiths' shops along the north-east side of the Forum. In 50 B.C. it was rebuilt by L. Aemilius Paulus with Caesar's money (Plut. Cat. 29; Appian, Bell. Civ. ii. 26), and was more than once restored within the few subsequent years by members of the same family. Its later name was the Basilica Pauli, and it was remarkable for its magnificent columns of Phrygian marble (Flin. H. N. xxxvi. 162) or pavonazzetto. Part of the western end was still standing in the 16th century, and was drawn by Giuliano da Sangallo (Huelsen, *The Roman Forum*, fig. 61). Recent excavations have shown that it was approached from the Forum by a flight of steps leading to a two-storeyed colonnade. Behind this was a row of tabernae in the middle of which was the entrance to the main hall, consisting in a nave and three aisles (two on the north side).

Near the middle of the north-east side of the Forum stood also the small bronze temple of Janus; the doors of which were shut on those rare occasions when Rome was at peace. A first brass of Nero shows it as a small cella, with richly ornamented frieze and cornice. Another aedicula near that of Janus was the shrine of Venus Cloacina (or the Purifier), on the line of the cloaca which runs under the Basilica Aemilia; it seems to have been a fish-market (see Mon. Anc. 2, 42; Procop. Bell. Goth. i. 25; Liv. i. 19; Suet. Aug. 22).

---

*The Forum Fiscatorium or fish-market appears to have been at the back of this basilica (see Liv. xii. 51).

*The original temple was one of the prehistoric buildings attributed to Romulus and Tatius (Serv. *Ad Aen.*, i. 291), or by Livy (i. 19) to Numa.*
its foundations and plinth were brought to light in 1899 (Liv. iii. 48; Plin. H.N. xv. 119).

Fig. 8 shows plan of the rostra as they existed under the Empire. We see an oblong platform about 78 ft. long and 11 ft. high above the level of the Forum; its ground floor, paved with herring-bone bricks, is 2 ft. 6 in. below the Forum paving. Its ends and side walls are of tufa blocks, 2 ft. thick and 2 ft. wide, each carefully clamped to the next with wooden dowels. Its floor was supported by a series of travertine piers, carrying travertine lintels, on which the floor slabs rested. Outside it was completely lined with Greek marble and had a richly moulded plinth and cornice; the front wall was restored in 1904, and the fragments of the cornice replaced. A groove cut in the top of the cornice shows the place where marble cancilli were fixed; one of the cornice blocks is partly without this groove, showing that the screen did not extend along the whole front of the rostra. This agrees with a relief on the arch of Constantine, representing the emperor making an oration from the rostra, with other buildings at this end of the Forum shown behind. In this relief the screen is shown with a break in the middle, so that the orator, standing in the centre, was visible from head to foot. Two tiers of large holes to hold the bronze rostra are drilled right through the tufa wall, and even through the travertine piers where one happens to come in the way; these holes show that there were nineteen rostra in the lower tier, and twenty above set over the intermediate spaces of the lower row. The back wall of the rostra is of concrete faced with brick. The inside space, under the main floor of the rostra, is coated thickly with stucco—the brick wall being studded in the usual way with iron nails to form a key for the plaster.

Immediately behind the rostra is a curved platform approached by steps from the side facing the Capitol. It has been much disputed whether this platform is earlier or later than the rostra; but the evidence of the construction at the point of juncture seems to show that the hemicycle is the earlier. When the arch of Severus was built, part of the platform of the rostra was cut away and a court of irregular shape was thus formed, from which the rostra was approached by steps. The front wall of the hemicycle was now exposed in its eastern half; this was faced with slabs of porphyra marble, pilasters of africano, and a moulded plinth of white marble, whose blocks bear the Greek characters Γ, Δ, Ε, Ζ, Η, Κ; the omissions make it clear that the blocks were removed from some other building. A number of holes in the marble, some of which contain fragments of metal pins, show that bronze ornaments were at one time attached to the facing. The hemicycle has been identified (without sufficient reason) with the Grazcatina, a platform near the rostra reserved for foreign embassies (Varro, L.L. v. 155; Cic. Q.F. ii. 1), which continued to exist throughout the imperial period and was restored by Antoninus Pius (Vit. 9, 2). It is, however, far more likely that it represents the original form of the rostra as removed to the Forum according to Caesar's design. When the oblong platform was built (perhaps by Trajan) it was approached from the back by the hemicycle. The bronze rostra on the imperial structure were believed to be the original backs from Antium, moved from the old rostra (Flores, i. 11). On its marble platform stood many statues, e.g. of Sulla, Pompey, two of Julius Caesar, and others (Dio Cass. xlii. 18 and xlv. 4); these are represented on a bas-relief from the arch of Constantine. It is further commonly believed that the marble plastel which now stand in the centre of the Forum once decorated the rostra. Owing probably to the weight of the many statues proving too much for the travertine piers, which are not set on their natural beds but endways, and therefore are very weak, the structure seems to have given way at more than one time, and the floor has been supported by piers and arches of brick-faced concrete.

1 See Mau in Röm. Mitt. 1906, pp. 230 ff.

The original rostra had specially honorary statues to those Roman ambassadors who had been killed while on foreign service (Liv. iv. 12); these were probably removed during Cicero's lifetime (Cic. Phil. ix. 2, 4; see also Dio Cass. xliii. 49, and Plin. H.N. xxxiv. 23, 24). Ghastly ornaments fixed to these rostra in the year 43 B.C., shortly after they were built, were the heads and hands of the murdered Cicero (Appian, Bell. Civ. iv. 20; Dio Cass. xlvii. 8; Juv. x. 120), as on the original rostra had been fixed many heads of the chief victims of the proscriptions of Marius and Sulla (see Appian, Bell. Civ. i. 71, 94; Flores iii. 21). The deme of the gens Lollia with the legend PALIKANVS represents the rostra of the late Republican period.
Augustus, and again rebuilt by him after a fire, as is recorded in Mon. Anc. 34. 153 in an inscription which gives its complete early history. It consisted of a central hall with aisles, galleries and clerestory, surrounded on three sides by a colonnade in two stories approached by a wide stairway, and ending in the S. A. S. of the colonnade. The central nave was paved with richly coloured oriental marbles, namely pavonazzetto, cipollino, giallo and africano. The covered aisles are paved with large slabs of oriental marble. Many of the inscriptions are scratched on this marble paving (cf. Cic. Phil. ii. 23).

Low marble cancelli, with moulded plinth, closed the otherwise open arches of the basilica; many fragments exist, and one piece of the substructure is still visible. This basilica held four vertumnii, which in important cases held joint sessions. Trajan and other emperors held law-courts there (Dio Cass. lxxxvii. 10). An inscription found near it (C.I.L. v. 658) records its restoration by Septimius Severus in 203. The temple of Apollo Sosianus, dedicated by Diocletian, stands to the north of the Fabrae, and to the west of the Basilica Julia and the temple of Castor to the Velabrum and Circus Maximus; its basilical paving has been exposed at many points along its whole line. The statues of the Roman emperors at this street, a little to the south-west of the Basilica Julia, where part of its pedestal was found in 1549 inscribed VORTVMVS TEMPRIRVM IOCTILIANI. ET. MAXIMIANI.

The temple of Castor was also called Thurrarius, from shops of perfumers (see Schol. ad Hor. Sat. ii. 3, 228, and Ep. i. 1, 260). It is the street along which processions passed, mentioned by Cicero (De Off. 1. 59) as existing: a sign Vertumnus in Guer. C.I.L. ii. 397).

The temple of Castor—or, more properly, of "the Castores," i.e. Castor and Pollux—on the south-east side of the Vicus Tuscus was founded to commemorate the apparition in the Forum of an image of the twin-gods, announced to be the property of Guer. L. PLANCVS. L. F. COS. IMPER. ITER. DE. MANIB. (C.I.L. vi. 1316). The erection of the six granite columns in the front and at the two sides of the position of the temple is said to have been begun by the last Tarquin, and dedicated by T. L. CARUS. the first dictator, 498 B.C.; but Dionysius ii. i. and Livy (ii. 21) attribute to the consuls A. Sempronius and M. Minucius in 497 B.C. It wasrebuilt on a larger scale by L. Munatius Flaccus in 181 B.C. (Suet. Aug. 29). The only part remaining of this date is the very lofty podium of massive travertine blocks, and part of the lower course of Athenian marble, with which the whole was faced. In the Corinthian order of the restoration, announced to be the work of C. C. T. TIBERIUS and C. CLAUDIUS TUSCULANI, this temple of Saturn and the Basilica Julia, then close under the cliff of the Capitolium (see Liv. xxxv. 21) and on to the Porta Capena.

It was spanned at its commencement by a brick-faced arch lined with marble, the lower part of which exists, and is not earlier than the 3rd or 4th century. At this end of the Forum the arch of Tiberius was built beside the Sacra Via. It was erected in a.d. 17, to commemorate the recovery of the standards lost by Varus. 1 It is the present position has recently been exposed.

The Basilia Julia 3 occupies a great part of the south-west side of the Forum, along the line of the Sacra Via; its ends are marked by the Domus Aurea and the Vicus Tuscus. It was begun by Julius Caesar, who dedicated it when still unfinished, on the 26th of September 46 B.C., completed

1 Below the temple of Saturn the Clivus Capitolinus is carried on an archaic substructure of somewhat irregular opus reticulatum. This has been identified with part of the substructure of the so-called Forum of Saturn. 2

2 A portion of these streets with part of the temple of Saturn and the Basilica Julia is shown on fragments of the marble plan (see Plan 1).

3 One side of this gate was built against one of the marble piers of the Basilica Julia, a perfect print of which still exists in the concrete of the gate, though the marble piers itself has disappeared. This side has been abutted against the marble-lined podium of the temple of Saturn.

4 See Tac. Ann. ii. 41, who says it was proper aedem Saturni.

5 See Suet. Aug. 29; Gerhard, Bas. Giulia, &c. (1823); and Viecom, Escavazione della Bas. Giulia (1875).
A few remains of the earliest temple, built of blocks of green-grey tufa. Two fragments of mosaic, with simple lozenge pattern in which the white square is set off by a light green and red border, were found in the cella of this temple. The level of the mosaic, which probably belongs to the rebuilding of Tiberius, lies considerably below that of the later floor, which seems to date from Hadrian’s reign. It has all the characteristics of early mosaic—very small tesserae fitted with great accuracy. It is the earliest mosaic in the Forum. The temple of Castor was often used as a meeting-place for the senate, and its lofty podium formed a striking feature to the eyes of Lucus Juturnae (see FASTI, L. 795, and Dionys. v. 13). The statue of Dioscuri, which had failed to have watered their horses, was beside their temple; the precinct was discovered in 1800–1. The Lcus itself, a basin 16 ft. square and 9 ft. deep, has fallen in, but the level of the floor is that of the temple; in the centre is a base of opus reticulatum, which supported statues of the Dioscuri; an altar with relics, together with other sculptures, has been found close by, and a few years off another fragment of Juturna’s bower was recovered and, in front of it, a well-curtained (potaal) of marble set up, by the acile M. Barbatius Pollio in the reign of Augustus.

Close to the temple of Castor, at the angle of the Forum, stood the arch of Augustus. Its foundations were discovered in 1888; it had three bays, and rested on the pavement of a street which before the time of Augustus formed the E. boundary of the Forum.

On the other side of the Via Sacra Via stands the remains of the temple of Divus Julius, erected by Augustus. Though little beyond its foundations is left, which are well rainy with the voids in the concrete, which show the position of the tufa foundations under the walls and columns (as in the temple of Castor). The temple itself, a hexastyle primitive, is set on a podium with a slightly raised platform. It stood on a lofty podium with a curved recess in the front between two flights of stairs (see PLATE VIII). The wall which now fills up the recess is a late addition. In 1898 the base of a large altar was discovered in front of the temple, which is mentioned by Vitruvius and Frontinus (Bell. Civ. ii. 148). The podium, which projects in front of the temple itself, was adorned with beaks from the ships taken at Actium (Dio Cass. li. 19), and hence it was called the Rostra Julia, to distinguish it from the other rostra described above. Both were used for the funeral orations in honour of Augustus (Suet. Aug. 106; see also Dio Cass. liv. 35). Besides the concrete core and the wall of the cella, a small fragment of the cornice and pediment, of fine Greek marble, this temple is represented in coins of Augustus and Hadrian.

The temple of Vesta, set up by 20 B.C., is considered to commemorate the recovery of the standards taken from Crassus by the Parthians. Its foundations were discovered in 1888; it had three bays, and rested on the pavement of a street which before the time of Augustus formed the S. boundary of the Forum. The temple of Vespasian stands close by that of Concord, abutting on the Tabularium in a similar way, and blocking up a doorway at the foot of a long flight of steps (see fig. 1). It consists of a low, three-cell square cella, closed at both end with the Corinthian order; three of the columns are still standing, with their rich entablature, the frieze of which is sculptured with sacred instruments. The walls are enormous blocks of Tiberian marble, and were covered with fine white peperino marble outside, and inside with coloured oriental marbles. There was an internal range of columns, as in the temple of Concord. This temple was begun by Titus in A.D. 80, in honor of his father Vespasian, and finished by Domitian, who dedicated it to Vespasian and Titus. The inscription on the entablature, given in the Einsiedeln MS., records a restoration by Tiberius Severus, after the destruction of Titus, inscribed Q. FABIUS Q. F. MAXSVMVDS. AE. DC. CVR. REST. (Dessau, Insr. Lat. Sel. 436). About twenty-five other fragments were found at the same time.

Arch of Fabius.

The temple of Faustina the elder stands at the east angle of the Forum, facing the later line of the Sacra Via. It is prostyle hexastyle, and has monolithic columns of cipollino and a rich sculpturéd frieze. The Greek marble, with graceful reliefs of griffins and candelabra on the frieze. The walls are of massive peperino, once lined with marble. On the front is inscribed DIVO ANTONIO. ET. DIVA. FAVSTINA. EX. S. C. This temple, built by Antoninus Plus in memory of his wife, who died in 141, was after his death dedicated also to him, and the first line was then added (Via Ant. Pia, 6). In the Middle Ages it was consecrated as the church of S. Lorenzo in Miranda, and a great part of the temple was destroyed; this was not, however, the original level. This temple is shown on the reverse of several coins of Antoninus Plus; some have the legend DEDICATIO.

The space between the north-west end of the Forum and the Tabularium is occupied by a range of important buildings (see Plate VIII.). The chief of these is the temple of Concord (see fig. 2). At the time of the first survey of the Forum, the temple was found on a foundation of grey marble, said to have been covered by a big ovoid morainic clump of stone, called the Aedicula of Vespasian. In the time of the first Flavii it was rebuilt by Tiberius in A.D. 10 in his own name and that of his brother Drusus (who had died in b.c. 9) [Suet. Tib. 26; Dio Cass. lv. 25]. It is shown with unusual minuteness on the reverse of a first brass of Tiberius. The existing remains are of the rebuilding by Tiberius, and show that it was unusual in plan, having a large cela much wider than its depth, and a very large projecting portico. Its construction is an interesting study, and is probably that of the Roman group of many different materials. The lower part of the walls was of massive tufa blocks, the upper part of the cells of travertine; and the inner low wall, which supported ranges of internal columns, was of mixed concrete, tufa and travertine. The whole was lined with marble, white outside, and rich oriental marbles inside (see fig. 4), which were also used for the pavements; the door-sill is made of enormous blocks of porta santa marble, in which a bronze caduceus (emblem of Mercury) was inlaid. Between the internal columns of the cela, the pavements have been inscribed:

Temple of Concord.

[The rest of the text continues with detailed descriptions of various Roman monuments and their significance, including the Tabularium, Porticus of Octavia, and the tabernacle of Trajan.]

[The text concludes with a reference to Trajan's Column and its significance as a monument of Emperor Trajan's reign, desribing the frieze and the processes depicted on it, which are crucial to understanding the grandeur and dedication of the Roman Empire.]

[The narrative then transitions to the city of Rome itself, mentioning the Forum Romanum and its historical context, as well as the architectural significance of its various structures.]

Remains of more than one temple of the republican period have been discovered near this west angle of the Palatine. The larger of these (see Plan) is associated with the Temple of Jupiter Anxur of the early 4th century B.C. (Liv. x. 29; Ov. Fast. iv. 621). It stands on a levelled platform of tufa rock, the lower part of which is excavated out of the side of the hill, and was used in the later times as a water reservoir. Two ancient well shafts lined with tufa communicate with these subterranean hollows. Extensive foundations of hard tufa exist in the valley afterwards covered by the Flavian palace (Plan). The temple of Jupiter Anxur is described by Dindorf as of Flavian date, and was one of the temples mentioned in the Republican inscription of the Forum. It was probably once lined with marble. By it a noble colossal seated figure of a goddess was found in 1902, possibly a statue of Cybele, and the inscription deduced to Magna Mater has been found close to the temple.

**Statue of Cybele.**

It has been argued from these discoveries that the name of Jupiter Anxur should be transferred from this temple to another which is shown by the ancient inscriptions to have been the temple of Jupiter Anxur, and which stood near the present church of S. Maria Antiqua. This temple, however, has no remains, and there is no reason to doubt that the temple of Jupiter Anxur at the west angle of the Palatine, of which temple the inscription states that it stood on an arch of the Sibylline Hill, was the temple mentioned in the inscription. The temple of Jupiter Anxur is described by Dindorf as of Flavian date, and was one of the temples mentioned in the Republican inscription of the Forum. It was probably once lined with marble. By it a noble colossal seated figure of a goddess was found in 1902, possibly a statue of Cybele, and the inscription deduced to Magna Mater has been found close to the temple.

**Statue of Cybele.**

Remains of extensive lines of buildings in early times have been found on the upper part of the Palatine. The excavation of the whole hill was carried out in the spring of 1902, and the results show that the entire ancient city of Rome was on the Palatine. The temple of Jupiter Anxur, which was discovered in 1902, was the temple of Jupiter Anxur, and which stood near the present church of S. Maria Antiqua. This temple, however, has no remains, and there is no reason to doubt that the temple of Jupiter Anxur at the west angle of the Palatine, of which temple the inscription states that it stood on an arch of the Sibylline Hill, was the temple mentioned in the inscription. The temple of Jupiter Anxur is described by Dindorf as of Flavian date, and was one of the temples mentioned in the Republican inscription of the Forum. It was probably once lined with marble. By it a noble colossal seated figure of a goddess was found in 1902, possibly a statue of Cybele, and the inscription deduced to Magna Mater has been found close to the temple.
silver, ivory, bronze and marble, mostly the production of the best Greek artists, which adorned this magnificent group of buildings, must have made it the chief glory of this splendid city. This temple was built by Augustus as a temple (aedes) after his triumph over the Nibelungs (Prop. ii. iii. 31); inside the cella were statues of Apollo later restored by Hadrian. It consists of a block of state-rooms, in the centre of which is a large open peristylium, with columns of oriental marble, at one end of which is the grand triclinium with magnificent paving of opus sectile in red marble, and at the other end the famous foundation of the temple, which flows through it. The floor of the room shows the original level, far below that of the Flavian palace. This building is connected with the palace of Caligula by a subterranean passage. In the case of the Flavian palace it consisted of a block of state-rooms, in the centre of which is a large open peristylium, with columns of oriental marble, at one end of which is the grand triclinium with magnificent paving of opus sectile in red marble, and at the other end the famous foundation of the temple, which flows through it. The floor of the room shows the original level, far below that of the Flavian palace. This building is connected with the palace of Caligula by a subterranean passage. In the case of the Flavian palace it consisted of a block of state-rooms, in the centre of which is a large open peristylium, with columns of oriental marble, at one end of which is the grand triclinium with magnificent paving of opus sectile in red marble, and at the other end the famous foundation of the temple, which flows through it. again partly laid bare in 1869 and the following years. This has often, but wrongly, been called the palace of Augustus; we should rather see in it the dwelling-rooms of the Flavian palace. Adjoining it is the so-called stadium of the Palatine ("Hippodromus" on Plan), begun by Domitian, enlarged by Hadrian, and much altered or restored by Severus. The greater part of the outer walls and the large exedra or apse at the side, with upper floor for the emperor's seat, are of the time of Hadrian, as is shown by the brick stamps, and the character of the brick facing, which much resembles that of the Flavian time (bricks 1½ in. and joints ½ in. thick). The stadium is surrounded with a colonnade of engaged shafts, forming a sort of aile with gallery over it. Except those at the curved end, which are of Hadrian's time, these piers are of the time of Severus, as are also all the flat piers along the outer wall,—one opposite each of those in the inner line. Severus restored the galleries after the great fire of A.D. 191. This building was the *hippodromus Palatii*; the word here means, not a racetrack, but a garden (Plin. Ep. 5, 6, 19).

In addition to the stadium, Hadrian built a number of very handsome rooms, forming a palace on the south-east side and at the south-west end of the stadium. These rooms were partly destroyed and partly hidden by the later palace of Severus, the foundations of which in many places cut through and render useless the highly decorated rooms of Hadrian. The finest of these which is now visible is a room with a large window opening into the stadium near the south angle; it has intersecting barrel vaults, with deep coffers, richly ornamented in stucco. The oval structure shown in the plan (fig. 10), with other still later additions, belongs to the 6th century; in its walls, of *opus mixtum*, are found brick stamps of the reign of Theodoric, c. 500.

The palace of Septimius Severus was very extensive and of enormous height; it extends not only all over the south angle of the Palatine but also a long way into the valley of the Circus Maximus and towards the Coelian. This part (like Caligula's palace) is carried on very lofty arched substructures, so as to form a level, uniform with the top of the hill, on which the grand apartments stood. The whole height from the base of the Palatine to several storeys above its summit must have been enormous. Little now remains of the highest storeys, except part of a grand staircase which led to them. Extensive baths, originally decorated with marble linings and mosaics in glass and

---

1 In parts of the outer wall brick stamps of the Flavian period appear, e.g. FLAVI AVG. L. CLON;—"[A brick] of Flavius Clonus, freedman of Augustus" (C.I.L. xv. 1149).
marble, cover a great part of the top of the hill. These and other parts of the Palatine were supplied with water by an aqueduct built by Nero in continuation of the Claudian aqueduct, some arches of which exist on the slope of the Palatine ("Aqua Claudia" on Plan) (see Spart., Sept. Sve. 24). One of the main roads up to the Palatine passes under the arches substructures of Severus, and near it is the Manennian pila of the hill. After the death of Severus, Severus built an outlying part of his palace, a building of great splendour called the Septizodium, or House of the Seven Planets. Part of the Septizodium existed as late as the reign of Sixtus V. (1585-1590), and also destroyed itself in 1875. The ruins of the hill are extensive; especially, those of the temple of Venus and Roma and the arch of Titus now stand bore the name Vetulina. It is evident that this was once higher than it is now; a great part of it was cut away when the level platform for the temple of Venus and Rome was formed. The foundations of Nero's palace along the road between this temple and the Esquiline are exposed for about 20 to 30 ft. in height, showing a corresponding lowering of the level here, and the bare rock, cut at a flat surface, is visible on the side of Hadrian's Forum. Thus it became to the Vellina that the Vena was once much loftier is also indicated by the story of the removal of Valentia Publicia's dwellings.

In the plan of that emperor's subjugation of the Jews, but not completed until after his death, stands at the point where the Sacra Via crossed the Vellina; it is possible that it once stood farther to the east and was moved to its present location when the temple of Venus and Roma was built. The well-known relics of the archway depict the Jewish triumph and the spoils of the Temple. In the middle ages the arch was converted into a fortress by the Frangipani; their addition were removed and the arch restored in its present shape in 1821.

On the Vena and the adjoining Summa Sacra Via were the temples of the Latins and Sabines which were submitted to the rebuilding of Titus. The "Sacellum Larum" is probably distinct from the "Sacellum Larum" mentioned by Tacitus (Ann. xvi. 24) as one of the points in the line of the original pomerium. The temple of Jupiter Stator was venerable and was built by the Sabines (Liv. i. 12), stood near the Porta Munigua, and therefore near the road leading up to the Palatine and Vena. To the south-east of the arch of Titus (see Plan) are the remains of a concrete podium which still have belonged to this temple in its latest form; and Comm. Boni discovered (1907) some early tufa walling close to the above-mentioned arch in which he recognized the foundations of the early temple. Augustus rebuilt the temple of Victory and gave it its name to the Clivus Victoriae; this temple stood on the site of a prehistoric altar (Dionys. i. 32), and was more than one-third of the temple of Vesta in 3.34 b.c. (Liv. v. 53). In 193 b.c. an aedilica to Victory was built near it by M. Porcius Catu (Liv. xxxix. 9). Remains of the temple and a dedicatory inscription were found in 1793; it was not far from the church of S. Maria Maggiore. The temple was of Pentelic marble, with the Capitolian columns of Numidian giallo antico. The Sacra Via started at the Septizodium, an unknown point on the Esquiline, probably in the valley of the Colosseum (Varro, L.L. v. 47), in the quarter called Cerialia. Thence it probably (in later times) passed round part of the Colosseum to the slope leading up to the arch of Titus on the Vena; this part of its course is lined on one side by remains of private houses, and farther back, against the cliff of the Palatine are the substructures of the Area Apollinis. From the arch of Titus or Summa Sacra Via the original line of the road has been altered, probably when the temple of Venus and Roma was built by Hadrian. Its later course passed at a sharp angle from the arch of Titus to the front of Constantine's basilica, and on past the temple of Faustina. It is uncertain whether the continuation of the road was ever continued over the hill and the Aurelia or whether it rejoined its old line along the Basilica Julia by the cross-road in front of the Aedes Julia. Its original line past the temple of Vesta was completely built over in the 3rd and 4th century A.D., when several vestiges of the temple of Vesta and travertine occupy the place of the old basilica blocks. The course of the Novia (see Plan) along the north-east slope of the Palatine was exposed in 1869-72. According to Varro (L.L. vi. 59) it was a very old road. It led up from the Velabrum, probably winding along the slope of the Palatine, round the north angle above the church of S. Maria Antiqua. The rest of its course, gently ascending towards the arch of Titus, was probably rebuilt, as are also the stairs which connected it with the Clivus Victoriae at the northern angle of the Palatine; a continuation of these stairs led down to the Forum.

The Capitoline Hill

The Capitoline Hill, once called Mons Saturnius (Varro, L.L. v. 42), consists of two peaks, the Capitolium and the Arx, with an intermediate valley (Asylum). The older name of the Capitolium was Mons Tarpeius (Varro, L.L. v. 41). Livy (i. 9) mentions the founding of a shrine to Jupiter Feretrius on the Capitolium by Romulus; this summit was afterwards occupied by the great temple dedicated to Jupiter, Juno, and Minerva, a triad of deities worshipped under the combined names of Tinia, Thalina and Menevra in every Etruscan city. This great temple was (Liv. i. 38, 53) founded by Tarquin I., built by his son Tarquin II., and dedicated by M. Horatius Pulvillus, consul suffectus in 509 B.C. It was built in the Etruscan style, of peperino succedaneum and painted terracotta statuaries. It was rebuilt many times; the original temple lasted till it was burnt in 83 B.C.; it was then refounded in marble by Sulla, with Corinthian columns set up in the temple of Jupiter, Capitoline Zeus at Athens (Plin. xxxvi. 4, 3), and was completed and dedicated by Q. Lutatius Catulus, whose name appeared on the front. Augustus, although he restored it at a great expense (Mon. Anc. 4, 9), did not introduce his name by the side of that of Catulus. It was again burnt by the Vettian rioters in A.D. 70, and rebuilt by Vespasian in 71. Lastly, it was burnt in the three days' fire of Titus' reign and rebuilt with columns of Pentelic marble by Domitian; the gliding alone of this last rebuilding is said to have cost 21 millions sterling (Plut. Pub. 15). Extensive substructures of tufa have been exposed on the eastern peak; in 1875 a fragment of a listed column was found, of such great size that it could only have belonged to the temple of Jupiter; and a few other architectural fragments have been discovered at different times. The western limit of the temple was determined in 1865, its eastern limit in 1875, and the S.E. angle in 1896.

It appears that the figures given by Dionysius (iv. 61) for the area are slightly too large. The dimensions measured were 188 X 110 ft. It is preserved on the coins — both republican and imperial; these show that the central cela was that of Jupiter, that of Minerva on his right and of Juno on his left. The door was covered with gold reliefs, which were stolen by Stilicho (c. 400; Zosim. v. 38), and the gilt bronze tiles (cf. Plin. xxxiii. 57) on the roof were partly stripped off by Geiseric in 435 (Procop. Bell. Vand. i. 5), and the rest by Pope Honorius I. in 630 (Marilani, Topogr. ii. i).

Till 1348, when the steps up to Ara Coeli were built, there was no access to the Capitol from the back; hence the three ascents to it mentioned by Livy (iii. 7, 62). The steps (for which a stone tablet was later made of the Servian circuit. Even on this inner side it was defended by a wall, the gates in which are called "Capitolii forae" by Tacitus. Part of the outer wall at the top of the tufa rock, which is cut into a smooth cliff, is visible from the modern Vicolo della Rupe Tarpeia; this cliff is traditionally called the Tarpeian rock; but that must have been on the other side towards the Forum, from whence it was visible, as is clearly stated by Dionysius (vii. 35, viii. 78).

Another piece of the ancient wall has been exposed, halfway up the slope from the Forum to the Arx. It is built of soft yellow tufa blocks, five courses of which still exist. The temple of Jupiter Moneta ("the Arx") was built by Camillus in 384 B.C., as stated by Plutarch; hence moneta ="money" (Liv. vi. 20). A large number of other temples and smaller shrines stood on the Capitoline Hill, ready to be included both in the Capitolium and the Arx. Among these were the temple of Vesta and Fortuna, built by Marius; and the temple of Vesta, founded by Numa, and rebuilt during the First Punic war. Both these were large enough to house the Roman Curia. The temples of Mars Ultor (Mon. Anc. 4, 5) and Jupiter Tonans (Suet. Aug. 29; Mon. Anc. 4, 3) were built by Augustus. Other shrines existed to Venus Victoria Opifera, a temple of which was octagonal, and on its north side (xii. 33) — and many others, as well as a triumphal arch in honour of Nero, and a crowd of statues and other works of art (Plin. H.N. xxxii. 9, xxxiv. 38, 39, 40, 43, 44, 79, xxxv. 69, 100, 108, 187), so that the whole hill must have been a mass of architectural and artistic magnificence.

The so-called Tabularium occupies the central part of the side towards the Forum; it is set on the tufa rock, which is cut away to receive its lower storey. It derives its name from an inscription which remained in situ until the 15th century (C.I.L. vi. 1314); whilst all public departments had their tabulorum, this was a central Roman Office. It was built by Q. Caecilius Metellus in 143 B.C., and was a step towards the building of the Curia. It is thought to have been built by Catulus, who was also the patron of the great temple of Jupiter (Tac. Hist. iii. 72; Dio Cass. xlix. 14), consul in 76 B.C. Its outer walls are of porphyry, its inner marble. The effect of the exterior is that of a magnificent temple. The building, which was completed by the Gracchi and finished by the Flavii, has been restored by a new generation of restorers in the last century. The building was restored in 1824 at the expense of the state, and in 1875 by Giovanni Antonio Scariano. The temple was a gallery or portico, faced with Corinthian colonnade, of which a few architectural members have been found. The columns appear to have belonged to the 1st century A.D. A road paved with basalt passes through the building along this arcade, entered at one end from the Clivus Capitolinus, and at the other probably from the Gradus Monetae, a flight of steps leading from the temple of Concord and the Forum up to the temple of Juno Moneta on the Arx. The entrance from the Clivus Capitolinus is by a wide flat arch of peperino beautifully jointed; the other end wall has been mostly destroyed. The back of this building overlooked the Asylum.

2 The pediment is shown on a relief now lost, but extant in the 17th century and reproduced in drawings of that date. It has been recently proved to have decorated the Forum of Trajan (Wace in Proc. Phil. Soc. ii. 24). The temple is shown on one of the reliefs of Marcus Aurelius now in the Palazzo dei Conservatori (Papers of the B.S.R. iii. pl. xxxv. 4, 5).

3 See Rodocanachi, The Roman Capitol, p. 50. A graceful account of the legend of Tarpeia is given by Propertius, Eleg. iv. 4.

4 It is a structure of great sanctity, dating from prehistoric Etruscan times, an arch from the temple upon the Arx, from which the signs in the heavens were observed by the augurs (see Festus, ed. Müller, p. 18).

5 On the Tabularium see Delbrück, Hellenistische Bauten in Latium, i. (1907), pp. 23-46.

6 The forum of Augustus (see fig. 11) adjoined that of Julius on its north-east side; it contained the temple of Mars Ultor, built to commemorate the vengeance taken on Caesar's murderers at Philippi, 42 B.C. (Ov. Fast. v. 575 seq.). It was surrounded with a massive wall of peperino, over 100 ft. high. The travertine arches and other part of the piece of this wall still exists, and is one of the most imposing relics of ancient Rome. Against it are remains of the temple of Mars, three columns of which, with their entablature and splay (in the时髦的pierce style, are still standing; it is Corinthian in style, very richly decorated, and built of fine Luna marble. The cella is of peperino, lined with marble; and the lower part of the lofty circuit wall seems also to have been lined with marble on the inside of the forum. The large archway by the temple (Arco dei Fantani) is of travertine. Palladio (Arch. iv.) and other writers of the 16th century give plans of the temple and circuit wall, showing much more than now exists. The temple was an octagonal column with aTEPAEDE of the order; it stood on a pedestal 12 ft. high, with a staircase on each side the circuit wall formed two large semicircular apses, decorated with tiers of niches for statues.

The Forum Pacis, built by Vespasian, was farther to the south-east; the only existing piece, a massive and lofty wall of mixed tufa and peperino, with a travertine archway, is opposite the temple of Constantine. The arch opened into the so-called Tempulum Sacrum Urbis, a rectangular building entered by a portico on its west side, whose north wall was decorated with a marble plan of the city of Rome (see below, p. 608). The plan of this temple was, however, a much later addition to the buildings in this forum in 191, in the reign of Commodus (Dio Cass. xxiii. 24); but a new plan was made, and the building restored in concrete and brick by Severus. The north end wall, with the clamps for marble (now in大理石plaster) the temple of Diana (restored in 191) and the end wall with its arched windows towards the forum; one hundred and sixty-seven fragments of this plan were found c. 1563 at the foot of the wall to which they were fixed, and are now preserved in the Capitolium Museum; drawings of seventy-four pieces now lost are preserved in the Vatican (Cod. Vul. 3459). The whole of these fragments were published by Jordan, Forma Urbis Romae (Berlin, 1874). Other fragments have since been brought to light and the whole series was rearranged in the Palazzo dei Conservatori in 1903. The circular building at the end facing on the Sacra Via is an addition built by Maxentius in honour of the son of Augustus, and consecrated by Constantine and Romulus to Augustus. See Bornari, Foro d' Augusto, &c. (1884).

7 The Porta Pandana ("ever-open gate") gave access from the Area Capitolina, upon which the temple of Jupiter stood, to the Etruscan rock.

8 See Mon. Anc. (quoted above); Plin. Hist. Nat. xxxvi. 156, xxxvii. 103.

9 Dio Cass. xliii. 22; Appian, Bell. Civ. ii. 102; Vitr. iii. 3; Plut. Caes. 60.

10 The Ancyran inscription records — IN PRIVATIS SOLIEMPITO. PERPONTIS FORIS, TRIBUNAL CONSITVIT [MANI]BISSI FECI. See Suet. Aug. 29, 56; Dio Cass. lv. 27; Plut. H. N. xxxvi. 102, xxxv. 94, xxxvii. 48, vii. 183, where many fine Greek works of art are mentioned as being in the forum of Augustus. In the second and later buildings, the inscription of A. Minucius to Augustus. See Bornari, Foro d' Augusto, &c. (1884).

11 An interesting description of this discovery is given by Vace, writing in 1934 (see Schreiber in Berichte der sächs. Gesellschaft der Wissenschaften, 1881). The scale is roughly 1 to 250.
Constantine. The original building of Vespasian was probably an archive and royal cella; it was certainly not a temple. The fine bronze doors at the entrance to the temple of Romulus are much earlier than the building itself, as are also the porphry columns and very rich entablature which ornament this doorway. Pope Felix IV. (856-90) made the double building into the church of SS. Cosmo e Damiano, using the circular domed temple of Romulus as a porch. The chief building of Vespasian's forum was the Temple of Peace, dedicated in 75, one of the most magnificent in Rome, which contained a very large collection of works of art.

The/forum of Nerva (see fig. 11) occupied the narrow strip left between the fora of Augustus and Vespasian; being little more than a richly decorated street, it was called the Forum Transitorium or Forum Palladium, from the temple to Minerva which it contained. It was begun by Domitian, and dedicated by Nerva in 97 (see Suet. Dom. 5; Mart. i. 2, 8). Like the other imperial fora, it was surrounded by a peristyle wall, not only lined with marble but also decorated with rows of Corinthian columns supporting a rich entablature with sculptured frieze. Two columns and part of this wall still exist; on the frieze are reliefs of weaving, felling and various arts which were under the protection of Minerva. A great part of the temple existed till the time of Paul V., who in 1606 destroyed it to use the remains for the building of the Acqua Paola. In the reign of Severus Alexander a series of colossal bronze statues, some equestrian, were set round this forum; they represented all the previous emperors who had been deified, and by each was a bronze column inscribed with his res gestæ (Hist. Alex. 17, 5).

The forum of Trajan with its adjacent buildings was the last and, at least in size, the most magnificent of all; it was in progress from 113 to 117, at least. A great spur of hill, which connected the Capitol with the Quirinal, was cut away to make level ground for this enormous group of buildings. It consisted (see fig. 11) of a large dipteral peristyle, with curved projections, lined with shops on the sides. That against the slope of the Quirinal, three storeys high, still partly exists. The main entrance was through a triumphal arch (Dio Cass. lvii. 29). Aureli of Trajan show this arch and other parts of his forum. The opposite side was occupied by the Basilica Ulpia (Jordan, F. U. R. ill. 25, 26), part of which, with the column of Trajan, is now visible; none of the columns, which are of grey granite, are in situ, and the whole restoration is misleading. Part of the rich paving in original condition. The library contained two large libraries (Dio Cass. lxii. 15; Aud. Gall. xi. 17).

2 *Hic (Felix) fecit basilicam SS. Cosmac et Damiani ... in Via Sacra, junta Templum Urbis Romae* (Lib. Pont., Vita S. Felici IV.). By the last words the basilica of Constantine is meant.
3 Statues of Phidias and Lysippus existed in the Forum Pacis as late as the 5th century (Procop. Bell. Got. iv. 21).
4 Drawings of it are given by Du Pérac and Palladio (Arch. iv. 8).
5 See Aud. Gall. xii. 25, 2; and Amm. Marc. xvi. 10, 15.

The Columna Coelina (so called from its spiral stairs) is, including capital and base, 97 ft 9 in. high, i.e. 100 Roman ft.; its pedestal has reliefs of trophies of Dacian arms, and winged Victories. On the shaft are reliefs arranged spirally in twenty-three tiers scenes of Trajan's victories, containing 2500 figures. Trajan's ashes were buried in a gold urn under this column (Dio Cass. lxii. 16); and on the summit was a colossal gilt bronze statue of the emperor, now replaced by a poor figure of St. Peter, set there by Sixtus V. Beyond this stood the temple of Trajan completed by Hadrian; its foundations exist under the buildings at the north-east side of the modern piazza, and many of its granite columns have been found. This temple is shown on coin of Hadrian. The architect of this magnificent group of buildings was Apollodorus of Damascus (Dio Cass. lxxix. 4), who also designed many buildings in Rome during Hadrian's reign. In addition to the five imperial fora, and the Forum Magnum, Heliourion and Boarium, mentioned above, there were also smaller markets for pigs (Forum Suarium), broad (Forum Pistorium) and fish (Forum Piscarium), all of which, with some others, popularly but wrongly called fora, are given in the regional catalogues.

Other Temples, &c.

Besides the temples mentioned in previous sections, one of the last remains of many others still exist in Rome. The circular temple by the Tibor, in the Forum Boarium (Plan, No. 5), is always supposed to be that of Vesta, is possibly that of Portunus, the god of the harbour (Varr. L.L. vi. 19). Its design is similar to that of the temple of Vesta in the forum (fig. 8), and, except the entablature and upper part of the cela, which are gone, it is well preserved. Its pedestal is inscribed, "Senatus Populusque Romanus Imp. Caesari Divi Vespasiani F. Nervae Traiano Aug. Germ. Ducav. Pontif. Maximu Trib. Pot. XVII. [i.e. A.D. 113] Imp. VI. Cos. VI. P. ad declarandum quantae altitudinis mons et locus tantus operibus sit cestus." This would seem to indicate the height of the hill removed to form the site, and is so explained by Dion Cass. (lxvii. 16). It is impossible that the saddle connecting the Quirinal with the Capitoline hill can have been 100 ft. in height (Brocchi, Suolo di Roma, p. 153), but it may be that the cliff of the Quirinal was cut back to a slope reaching to a point about 72 ft. high; thus the statement of the inscription is much exaggerated. Comm. Boni has found the remains of a road beneath the pavement of the Forum, near the column, and believes that the inscription refers to the height of the buildings. Comparetti refers mons to the mass of marble quarried to build the Forum; Sogliani to the mass of ruins and rubbish carted away; Mauri to the Servian agger between the Capitol and Quirinal (see Rom. Mith., 1907, 187; ff., 2500).

The temple of Vesta is built on the site of the Temple of Vesta in the Forum, and was finished by Domitian. It is also called the "Temple of Minerva Felix." The temple of Vesta is a circular temple of one storey, with a portico of six columns on each side, and a diameter of 97 ft. The temple contains two large libraries (Dio Cass. lxii. 15; Aud. Gall. xi. 17).

1 For the reliefs, see Chichorius, Die Reliefs der Trajansstatue (1866-1900); Petersen, Trajan's dacieische Kriege (1899-1903); Stuart Jones, Papers of the B. R. S., vol. v. From their lofty position they are now difficult to see, but originally must have been seen from the galleries on the colonnades which once surrounded the column.
2 See Aud. Gall. xi. 17, 1; Hist. Aug. Hadr. 19; and compare Pausanias (v. 12, 61; x. 5, 11), who mentions the gilt bronze roofs of Trajan's forum.
3 See Richter and Grifi, Ristaufo del Foro Trajano (1833).
Temple of Fortuna Virilis

The black shows tufa; the shading travertine.

Temple of Neptune.

Fig. 12.—So-called Temple of Fortuna Virilis.

Buildings on the Esquilin, Quirinal, and Viminal.

Private houses.

1 Fichter (Röm. Mith., 1906, pp. 220 ff.) has endeavoured to show that the temple in its present form dates from the 1st century B.C.

2 For drawings of them, see the list given by Huelen in Jordan, Topographie, l. 3, 511, note 4.

3 The remains of the Porticus Octaviae have been more completely exposed by the demolition of the Ghetto.

4 See Palladio (Terme dei Romani, London, 1732), who gives the plan of this enormous building, now wholly hidden or destroyed.

5 Bull. Inst. (1875), 89-96; see also Bull. Comm. Arch. (1874), 121-128.

6 During excavations made here in 1876, lead pipes were found inscribed with the name of the estate, the imperial owner (Severus Alexander), and the number of the building. For the Quirinal, see Suet. (Cæsar. 47), 46, and the fragments (Suet. Vesp. 9).
brick-facing, probably of the time of Nero; all had been richly decorated with marble linings and mosaics. The line of the street was parallel to that of the later Aurelian wall, which at this point closely approaches the line of the Aurelian wall. At the same time, behind the line of houses were uncovered fine peperino and tufa piers of the aqueduct rebuilt by Augustus, one arch of which forms the Porta S. Lorenzo. These interesting remains were excavated in 1884 by the Brunton. A fine section from the end of the 1st century A.D., with richly decorated walls, was exposed in June 1884 against the slope of the Quirinal, near the Palazzo Colonna; it was immediately destroyed to make room for new buildings.

The praetorium camp was first made permanent and surrounded with a strong wall by the emperor Tiberius (Suet. Tib. 37). Owing to the criminal results of the back of the oppressor's tower wall, a great part of it still exists; it is a very interesting specimen of early imperial brick-facing. The wall is only 12 to 14 ft. high, and has thinly scattered battlements, at intervals of 20 ft. The north-east gate into the Tarpeian Dorsae was preserved; it had a tower on each side, now greatly reduced in height, in which are small windows with arched heads moulded in one slab of terra-cotta. The brick-facing is very neat and regular, the bricks being about 14 in. thick.

On the inside of the wall are rows of small rooms for the guard. Part of the Porta Praetoria also remains. This camp was dismantled by Constantine (Bibl. Cod. 105) for decorative purposes, for he formed part of the Aurelian circuit. The present wall is nearly three times the height of the original camp wall. The upper part was added when Aurelian (Suet. Aurel. 36) built his great wall. The superior neatness and beauty of Tiberius's brick-facing make it easy to distinguish where his work ends and that of the later emperors begins. Owing to the addition of the later wall it requires great care to trace the rows of battlements which belong to the camp.

The Pantheon is the most perfect among existing classical buildings in Rome. The inscription on the door of the portico (inscription of the portico of the Pantheon. AGRIPPA L. F. COS. TERTIUM FECIT) refers to a building erected by Agrippa in 27 B.C., consecrated to the divinities of the Julian house (Mars, Venus, etc.) under the name of Titus, 1°. The monument was, at the time of Diocletian, a church and the site of a palace. It was sometimes used as the meeting-place of the Fratres Arvalia before they began to meet in the temple of Concord (C. I. L. v. 2041). Pliny mentions the sculpture by the Athenian Diogenes which adorned the lower part of the walls and columns of the Pantheon (xxxiv. 7). It was long supposed that the present rotunda was the Pantheon of Agrippa; but this was destroyed in the great fire of A.D. 80 (Oros. 7, 12; Hieron. Abr. 2127); and recent investigations have shown that the rotunda is a work of Hadrian's reign, and that the bricks of that period have been found in all parts of the building.

Excavations have made it probable that the site of the rotunda was probably occupied by an open portico, with the pavement covered with large marbles which has been discovered beneath the flooring, and that Agrippa's Pantheon covered the present piazza and faced southward. The present portico has been reconstructed, but it is probable that Agrippa's portico extended to the front of the building, and that the marble floor was of bronze, supported by hollow bronze girders, which remained till Urban VIII. melted them to make cannon for S. Angelo; the bronze weighed 450,000 lb. The bronze tiles of the dome were removed by Beltrami in 1853 to the Uffizi. Agrippa and Constantine were denounced by the Saracens. The portico has eight columns on the front and three on the sides, all granite monoliths except the restored ones on the east side. The capitals are Corinthian, of white marble; the tympanum (n Corona pedimente) was of pediment was filled with bronze reliefs of the battle of the gods and the giants. The walls of the circular part, nearly 20 ft. thick, are of solid tufa concrete, thinly faced with brick. The enormous dome, 142 ft. 6 in. in span, is cast in concrete made of punice-stone, pozzolana and lime; being one solid mass, it covers the building like a shell, free from any lateral thrust at the arches. On the outside of the concrete is a series of small coves and niches in brick. These no longer possess any constructive value, but were designed to preserve the stability of the dome whilst the concrete became firmly set. Round the central opening or hypaethros, there was a larger opening of early in the thickness, the only left of the bronze which once covered the whole dome. The lower storey of the circular part and the walls of the projecting circular niches are covered with slabs of travertine marble; a great part of the latter still remains, enriched with Corinthian columns and capitals of sculptured ornament. The two upper storeys of the drum were covered outside with hard stucco of pounded marble. Inside the whole was lined with mosaic pavements of rich oriental tiles. This magnificent interior, divided into two orders by an entablature supported on columns and pilasters, has been much injured by

alteration. About 608 the Pantheon was given by Piozca to Boniface IV., who consecrated it as the church of S. Maria ad Martyres. In 1881-92 the destruction of the building for the restoration of a grand hall with an intricately sculptured entablature on Corinthian columns, part of the great thermae of Agrippa, which extend beyond the Via della Ciambella, S. Maria ad Martyres was reduced to belong to an extensive reconstruction in the reign of Hadrian (see BATIS). Close by the Pantheon is the church of S. Maria sopra Minerva, which has as its foundation on or near the site of the temple of Minerva Chalcidica (Plan, No. 12), probably founded by Pompey the Great, c. 60 B.C. (Plin. H. N. vii. 97), and restored by Domitian. Adjoining this temple were Isis and Serapis, a cult which became very popular in Rome. The prætorium, which in time of sculpture, Egypto-Roman in style, have been found on this site at many different times.

Some of the barracks (excubitoria) of the legionaries have been uncovered in various parts of Rome. That of the first cohort (Plan, No. 29) is buried under the Palazzo Savorelli; that of the second (Plan, No. 30) was on the site of the Temple of Minerva Medica; that of the third (Plan, No. 31) was near the baths of Diocletian. The most perfect is that of the seventh cohort (Plan, No. 34), near S. Crisogono in Trastevere, a handsome house of the period of Augustus, which has been removed to a museum.

The excavations made in exposing the ancient church of S. Clemente brought to light interesting remains of different periods; drawings are given by Mullooly, S. Clementi et his Basilica (1865), and Baglione, Roma. (1642). Some remains exist of the Golden House of Nero, which, including its parks, lakes, &c., covered an incredibly large space of ground, extending from the Palatine over the Quirinal and the Velia to the site of the Campidoglio. It was called between the great valley between the Caesarean and the Esquiline where the Colosseum stands, and reaching far over the Esquiline to the great reservoir now called the "Sette Sale." No other extravagances or cruelties of Nero appear to have offended the Roman people so much as the erection of this enormous palace, which must have blocked up many important roads and occupied the water supplies of the city. Nero was not content with the whole, but even with the walls and foundations of these extensive remains of the Golden House still exist; and at one point, at a lower level still, pavements and foundations remain on or near the numerous houses destroyed by Nero to clear the site. The great bronze colossus of Nero, 120 ft. high (Suet. Nero, 31), which stood in one of the porticus of the Golden House, was moved by Vespasian, with head and attributes altered to those of Apollo (Her. c. 75), but was reduced in size. Vespasian, when the temple of Rome was built, on to the base which still exists near the Colosseum. Several coins show this colossus by the side of the Colosseum.

In the Piazza Enrico Dandolo, the church of S. Maria in Via Lata, and other neighbouring buildings extensive remains exist of a great porticus, with long rows of travertine piers; this building is designated on fragments of the marble plan with the words S. Maria in Via Latina and S. Maria ad_rotam. S. Apotheosis Julia, begun by Julius Caesar, and completed by Agrippa in 27 B.C., as the voting place for the Comitia Centurati, divided into compartments, one for each century. The building contained rostra, and was also used for gladiatorial shows. Under the later empire it became a bazaar and resort of slave-dealers.

That curiously planned building on the Esquiline, the former Palazzo Doria, the church of S. Maria in Via Lata, and other neighbouring buildings extensive remains exist of a great porticus, with long rows of travertine piers; this building is designated on fragments of the marble plan with the words S. Maria ad_rotam. It was given to the Nymphaeum Alexandri built

---

1 A drawing of this interesting bronze work, by G. A. Dosio, is preserved in the Uffizi at Florence (No. 2121).
2 On the architrave is cut an inscription recording the restoration of the Pantheon by Severus in 202.
by Severus Alexander at the termination of his Alexandrine aqueduct, completed in 225 (see Hist. Aug. Sec. Alex. 25). But the marble trophies now set at the top of the Capitoline steps bear a quadrangular mark which shows them to be of the time ofDomitian: it consists of the following inscription, now in the Arch of Constantine, but it is cut on the under part—IMP. DOM. AVG. GERUM. PER. CLER., LBI. CL.D. 1.

Places of Amusement.

The Circus (see Circus) occupied the Vallis Murcia between the Campus Martius and the Area, the first rows of seats, Circuses, which were of wood, are said to have been made under the Tarquins (Liv. i. 26, 35; Dionys. ii. 68). Permanent carceres were set up in 329 B.C. and restored in 174 B.C. (Liv. i. 39; and Liv. xvi. 11). On the left side of the Circus, near the Porta Lata, which (for the first time) lower seats of stone (Plin. H.N. xxxvi. 102), the upper still being of wood (Suet. Cæs. 39; Dionysius (ii. 68) describes it as it was after this restoration. It was further ornamented with marble statues, by Claudius and other emperors. The marble carcase was burnt in the great fire of Nero, and again underDomitian; it was considerably enlarged by Trajan, and lastly it was rebuilt by Constantine. The modern marble façade with three external tiers of arches with engaged columns, and (inside) sloping tiers of marble seats, supported on concrete raking vaults (Plin. Paneg. 51). A great part of these vaults existed in the 16th century, and is shown by Du Pérac. It is said by Pliny (H.N. xxxvi. 102)—if the text be not corrupt—to have held 250,000 spectators, while the Regionary Catalogues give the number of seats as 458,000; but Huelsen has shown (Ball. Comm. Arch. 1894) that the calculation is very approximate. Moreover, it be interpreted, not of the number of spectators, but of the length of the tiers expressed in feet. The end with the carcases was near the church of S. Maria in Cosmedin. Some of its sculptures, representing very early epics, were found on the Palatine side, still exist below the church of S. Anastasia (see Plan of Palatine). The obelisk now in the Piazza del Popolo was set on the spina by Augustus, and that now in the Lateran piazza by Constantine II. The Circus Flaminius in the Campus Martius was built in 221 B.C. by the C. Flaminius Nepos who was killed at the Treasimene Lake in 217 B.C.; remains of the structure existed until the 16th century, when they were destroyed to build the Palazzo Mattei. In the middle ages its long open space was used as a rope-walk, hence the name of the church called S. Caterina dei Funari, which occupies part of its site. The circus of Caligula and Nero was at the foot of the Aventine, and its remains were found in 1870, under S. Stefano's, the present site in the centre of the piazza. The great stadium, foundations of which exist under most of the houses of the Piazza Navona (Agonalis), and especially below S. Agnese, is that built by Domitian and restored by Severus Alexander. That it was a stadium and not a circus is shown by the fact that its starting end at the north side of the stadium was fenced with columns, whereas it was not the case with the carcases of a circus; nor is there any trace of foundations of a spina. The best preserved circus is that built by Marcus Aurelius on the Palatine, one of his hostelries. It was the MAPHIS THEATRUM unstable, 1867, p. 217, and 1871, p. 233). Close by is a quadruple arch, set at the intersection of two roads, such as was called by the

1 See Bruzza, in Ann. Inst. (1879), and Lenormant, Trophées de Marsis, Blou, (1842). This, one magnificent building, with the marble trophies in their place, is shown with much minuteness on a bronze medal of Severus Alexander (see Froehner, Médailles de l'empire, Paris, 1878, p. 169).
2 So called from a prehistoric altar to the Da Mara (Venus); Verrochio also ascribed to it (see Sertorio, in Atti dell'Acad. di Scienze, 1868, p. 159).
3 Part of it is shown on a fragment of the marble plan (see Jordan, F.U.R.); it is represented on a bronze medallion of Gordian III., with an obelisk on the spina and three metae at each end; in front are groups of athletes and boxers (see Gruver, Rom. Med. pl. xii., London, 1874).
4 The remains extant in the 16th century were described by Ligorio, Lire della Antichità, (1553), p. 17.
6 Nibby, Circo di Caracalla (1825); Canina, Edifia di Roma, iv. pls. 194–96.
7 Plut. Pomp. 52; Dion Cass. xxxix. 38; Tac. Ann. xiv. 20.

scena, and the Via de' Giubbonari and Via del Paradiso. Adjoining this was the porticus Pompeiana, which contained the curia of Pompey, where Caesar was murdered, after which it was walled up. The colossal statue, supposedly supposed to be that of Pompey, which Caesar had given to Caligula, and which was set up in 1553 near the theatre. This theatre was restored by Augustus (Mon. Anc. 4, 9) in the reign of Tiberius it was burnt, and its rebuilding was completed by Caligula. The scena was again burnt and restored by Augustus (see D. C. xxxvi. 115), it held 40,000 spectators; the Regionary Catalogues give the number 17,580. Huelsen estimates its capacity at 9000–10,000 spectators. In 1804 the colossal gild bronze statue of Hercules, which Domitian gave to his friend, Cæsarean, was placed near the site of the theatre of Pompey, carefully concealed underground. The theatre of Marcellus is much more perfect; complete foundations of the cunei exist under the arches, and part of the external arcade is well preserved. This is built of travertine and marble, and has a considerable number of delicate details, very superior to those of the Colosseum, the arcade of which is very similar to this in general design. This theatre was begun by J. Caesar, and finished by Augustus in 13 B.C., who dedicated it in the name of his nephew Marcellus. It was restored by Vespasian (Suet. Vesp. 19). Foundations also of the theatre dedicated by Cornelius Balbus in 13 B.C. (Suet. Aug. 29; Dio Cass. liv. 25) exist under the Monte Conci; and in the Via dei Calderari there is a small portion of the external arcade of a porticus (Plan, No. 42); the lower storey has travertine arches with engaged columns, and the upper has brick-faced pilasters. This has been supposed to be the Porticus of Crypta Borea in the Campus Martius, but is more probably the Porticus Minucia, built in 110 B.C. An interesting account of the temporary theatre of M. Aemilius Scaurus, and of the eruption of Vesuvius, 79 A.D., is given in P. S. 1867, p. 235. Nero, who was the same writer mentions an almost incredible building, which consisted of two wooden theatres made to revolve on pivots, so that the two together made an amphitheatre; this was erected by C. Curio in S. Apollinare (C.I.L. xxxvi. 116).

The first stone amphitheatre in Rome was that built by Statoilius Taurus in the reign of Augustus. (For the Colosseum and the Amphiitheatre Castrense, see Amphi-theatres; for the Baths, see that article.)

Arches, Columns, Tombs and Bridges.

The earliest triumphal arches were the two erected by L. Stertinius (196 B.C.) in the Forum Boarium and in the Circus Maximus, out of the material of the temple of Jupiter. After the later years of the Roman empire there were nearly forty in Rome. The arch of Titus and Vespasian on the Summa Sacra Via was erected by Domitian to commemorate the conquest of Judea by Titus in his father's reign. Reliefs inside the arch represent the triumphal procession—Titus in a chariot, and on the other side soldiers bearing the golden candlestick, trumpets and table of pretensions, taken from the Jewish temple. The central part of only this monument is really Roman; it was finished in 13 AD. The arch of Titus had previously been built (A.D. 80) in the Circus Maximus; its inscription is given in the Einselebn MS. (C.I.L. vi. 944). A Roman arch in the entrance to the supposed palace of the Caesars is said to be the work of the Consul Publius Cornelius Dolabella (A.D. 10) and of the flamen maritialis, C. Junius Silanus. It may have originally been used to carry the Aqua Claudia. Later times produced a number of arches, called arch of Drusus by the Porta Appia also carries the specus of an aqueduct—that built by Caracalla to supply his great thermae. Its composite capitals show, however, that it is later than the time of Drusus, and it was very possibly the work of Trajan. Adjoining the church of S. Giorgio in Velabro a rich though coarsely decorated marble gateway with flat lintel still exists—built, as its inscription records, in honour of Severus and his sons by the archontari (bankers and silversmiths) and other merchants of the Forum Boarium in 204. It formed an entrance from the Forum Boarium into the Velabrum. The figure of Geta in the reliefs and his name have been erased by later workmen. The sculptured frieze of the Arch of Titus (see Bull. Inst., 1867, p. 217, and 1871, p. 233). Close by is a quadruple arch, set at the intersection of two roads, such as was called by the

8 See Fca. Rom. Ant. 1858, 57, for an account of its discovery.
9 Suet. Aug. 29. See Mon. Anc. 4, 22: "Theatreon, ad aedem. Apollinis, in solo. magna, ex parte, a privatis jemptor, feci, quod, svb, nomine M. Marcelli, gener. jem. esset. The ruin of the ancient theatre was discovered in 1870, when the Via Appia was being repaired. It was dedicated to the Delphic Apollo in 431 B.C. by Cn. Julius (Liv. iv. 25); meetings of the Senate were held in it; and it contained many fine works of art—an ancient statue of Minerva, an Aphrodite of Cn. Julius, and a number of statues of the slaughter of the Niobids by Praxiteles or Scopas (Plin. H.N. xxxvi. 28), of which many ancient copies exist.
10 Liv. xliii. 27.
Romans an arch of Janus Quadrifrons. Though partly built of earlier fragments, it is late in style, and may be the Arcus Constantini mentioned in the Xth region. The finest existing arch is that by the Colonne Céleste on the Forum. In the year 1635, however, the lictors of the Senate, noted for their artistic degradation. Not only most of its reliefs but its whole design and many of its architectural features were stolen from an earlier arch erected by Trajan as an eternal monument to the memory of his victories. One of the Capitol arch of 43 to commemorate his supposed victories in Britain, stood across the Via Lata (modern Corso) in the Piazza Sciarra. Its exact position is shown in Bullo Comm. Arch. Rom., 1878, pl. iv. Its base, which is still to be seen in the centre of the street, is not left but half its inscription, preserved in the garden of the Barberini palace. It is shown on both aurei and denarii of Claudius, with an attic inscribed DEI GRATIA TIBERO AUGUSTO QVINTILIUS CARNEUS AVG. The arch, however, was a monument erected by Constantine I, and surviving only now is left but half its inscription, preserved in the garden of the Barberini palace. It is shown on both aurei and denarii of Claudius, with an attic inscribed DEI GRATIA TIBERO AUGUSTO QVINTILIUS CARNEUS AVG. The arch, however, was a monument erected by Constantine I, and surviving only now is left but half its inscription, preserved in the garden of the Barberini palace. It is shown on both aurei and denarii of Claudius, with an attic inscribed DEI GRATIA TIBERO AUGUSTO QVINTILIUS CARNEUS AVG. ...
Lapidus, to distinguish it from the wooden Sublician bridge. The modern Ponte Rotto represents this bridge; but the existing arches are mainly medieval. An ancient 7-mile-paved road still exists, leading to the city from the Forum Boarium. The Pons Fabricius united the city and the island (Insula Tiberina). The bridge derived its name from L. Fabricius, a curator varum in 62 B.C.; its inscription, twice repeated, is L. FABRICIVS, C. P. CVR, VIAR, FACIVNDVM, COERAVIT. Like the other existing bridges, it is built of great blocks of peperino and tufa, with a massive facing of travertine on both sides. Corbels to support centering were built in the middle of the arches, so that they could be repaired or even rebuilt without a scaffolding erected in the river-bed. The well-preserved Pons Cestius, probably built after L. Cestius, praefectus urbi in 46 B.C., unites the island and the Janiculum side; on the marble parapet is a long inscription recording its restoration in 370 by Gratian, Valentinian, and Valens. The next bridge, Ponte Sisto, is probably on the site of an ancient bridge called in the time of the Romans Martius, which gives an inscription of Maximian, which recorded its restoration in the time of Hadrian. About 100 yards above this bridge have been found the remains of sunken piers, which are proved by an inscription (C.I.L. vi. 21545) to have belonged to the Pons Agrippae, not otherwise known. The Pons Aelius was built in 134 by Hadrian, to connect his mausoleum with the Campus Martius; it is still well preserved, and is now called the Ponte S Angelo (see Dante, Inferno, xviii. 28–33). It had eight arches, of which three in the centre were higher than the rest, so that the road sloped on both sides. The material is peperino, with travertine facings. Its inscription, now lost, is given in the Einsiedeln MS.—IMP. CAESAR. DIVI. TRAIANI. PARTI. FABRICIVS. DIVI. NEVS. TRAIANVS. HADRIANVS. AVGVSTVS. AVG. PONT. MAX. TRIB. POT. XVIII. COS. III. P. F. E Fist. The Pons Aelius is shown on coins of Hadrian. A little to its right is the Pons Neronianus, called also Martius, built of travertine as a way to his Tibetan circus and the Horti Agrippinae. At the foot of the Aventine hill, near the river, are the remains of piers which seem to have belonged to the Pons Probi, mentioned in the Notitia. It is uncertain whether this bridge is to be identified with the Pons Theodosii, which was built in A.D. 301–307 (Symm. Ep. 4, 70, 27; 5, 76, 3), and is mentioned in the Itinerarius.

Regions of Augustus.

In spite of the extensive growth of the city under the republic no addition was made to the four regions of Servius till the reign of Augustus, who divided the city and its suburbs into fourteen regions. The lists in the Notitia and the Carisius are the chief aids in determining the limits of each, in which many cases cannot be done with any exactness (see Preller, Die Regionen der Stadt Rom (1846) and Urlich's Codex Topographicus (Witzburg, 1871)). Each region was divided into vici or parishes, each of which formed a religious body, with its aedicularium, and had magistri victorium. The smallest region (No. II.) contained seven vici, the largest (No. XIV.) seventy-eight.

The list is as follows:

1. Porta Capena, a narrow strip traversed by the Appian Way; it extended beyond the walls of Aurelian to the brook Almo.
2. Caelenomontium, the Caelen Hill.
3. Lix et Serape, included the valley of the Calmaxium and the adjoining part of the Esquiline.
4. Tempelt Pactus, included the Vela, part of the Cipus, most of the Subura, the fora of Nerva and Vespasian, the Sacra Via, and also buildings along the north-east side of the Forum Magnum.
5. Esquiinm, north part of the Esquiline and the Viminal.
6. Aula Salutis and the insula of the Contumus Camp.
7. Via Latina, the valley bounded on the west by the Coquus, and by the neighbouring hills on the east.
8. Forum Romanum, also included the imperial fora and the Curia.
9. Circus Flaminius, between the Tiber, the Capitol, and the Via Flaminia.
10. Palatium, the Palatine Hill.
11. Campus Martius, the valley between the Palatine and the Aventine, with the Velabrum and Forum Boarium.
12. Piscina Publica, the eastern part of the Aventine, and the districts south of and beyond the Via Appia, including the site of Caracalla's thermae.

XIII. Aventinus, the hill, and the bank of the Tiber below it.
XIV. Trajana, the whole district across the river and the Tibre Island.

The walls of Aurelian (see fig. 7), more than 12 m. in circuit, enclosed almost the whole of the regions of Augustus, the greater part of which were then thickly inhabited. This enormous work was begun in 272 to defend Rome against sudden attacks of the Germans and other northern nations. Great armies of Rome were fighting in distant countries. After the death of Aurelian the walls were completed by Probus in 285, and about a century later they were restored and strengthened by the addition of gate-towers under Arcadius and Honorius (A.D. 403), in place of the earlier gateways of Aurelian; this is recorded by existing inscriptions on three of the gates. At many periods these walls suffered much more from the attacks of the Goths (Procop. Bell. Goth. iii. 22, 24), and were restored successively by Theodoric (about 500), by Belisarius (about 560), and by various popes during the 8th and 9th centuries, and in fact all through the middle ages. After the fall of the Aemilian state; but it has wholly vanished where it skirted the river, and a great part of its trans-Tiberine course is gone. The best-preserved part is between Porta Pinciana and Porta Salaria (in which breaches have lately been made for streets), and between the Lateran and the Amphitheatre Castrense. The wall, of concrete, has the usual brick-facing and is about 12 ft. thick, with a guard's passage formed in its thickness. Fig. 13 shows its plan: on the outside the

passage has tall open arches, which look like those of an aqueduct, and at regular intervals of about 45 ft. massive square towers are built, projecting on the outside of the wall, in three storeys, the top storey rising above the top of the wall. The height of the wall varies according to the contour of the ground; in parts it was about 60 ft. high outside and 40 inside. Necessaries, supported on two travertine corbels, projected from the top of the wall on the outside beside most of the towers. The Einsiedeln MS. gives a description of the complete circuit, counting fourteen gates, as follows:

Porta S. Petri (at the Pons Aelius, destroyed); P. Flaminia (replaced by P. del Popolo); P. Pinciana (in use); P. Salaria (now P. Salaro); P. Nomentana (replaced by P. Pia); P. Tiburtina (now P. Lorenzo); P. Prænestina (now P. Maggiore); P. Asinaria (replaced by P. San Giovanni); P. Metrovia or Metroni (closed); P. Latina (closed); P. Appia (now P. Sebasiano); P. Ostiensis (now P. Praeneste); P. Aurelia (now Porta San Pancrazio). Besides there was a gate, now closed (Porta Chiuse), to the south of the Castra Praetoria; and in all probability a gate on the right bank of the Tiber, replaced by the modern Porta Statarinha.

These existing gates are mostly of the time of Honorious; each is flanked by a projecting tower, and some are double, with a second pair of towers inside. Several have grooves for a portcullis (cata- racus) in the outer arch. The handsome towers in the P. Appia, with two massive outer towers, three stages high, the upper semicircular in plan. Many of the gates of Honorius have Christian symbols or inscriptions. The general design of all these gates is much the same—a central archway, with a row of windows over it and two flanking towers, some square, others semicircular in plan. In many of the gates older materials are used, blocks of tufa, travertine, for masonry above the doors that swing on pivots, the bottom ones let into a hole in the threshold, the upper into projecting corbels.

At many points along the line of the Aurelian wall older buildings form part of the circuit—near the Porta Asinaria a large piece of

the Domus Lateranorum, a house of the 3rd century which gave its name to the Lateran, and the Basilica of Constantine, the later 4th and 5th a.d. of Jerusalem, the Amphitheatrum Castrense; the latter, of about the end of the 1st century a.d., has two tiers of arches and engaged columns of moulded brick on the outside. Between the P. Prænestinus and the Quirinal, to the west, is the Lateran, a large palace of the empire, covered a large part of the Forum of Nerva, and was once called the Mausoleum of Nerva. The Praetorian Camp forms a great projection near the P. Nomentana. — Lastly, the angle near the Porta Flaminia, at the foot of the Pincian Hill, marks another entrance of a large and complete building, faced with fine opus reticulatum of the 1st century b.c. Owing to the sinking of the foundation this is very much out of the perpendicular, and was known as the "murus tortus" at one time. 1 Why this was uncertain. Two archways which form gates in the Aurelian wall are of much earlier date. The Porta Maggiore consists of a grand double arch of the aqueducts Anio Novus and Claudius built in the 1st century a.d. of brick by means of large and coarse blocks. A.d. 156 by the vicomagistri of five regions; on the sides are inscribed the names of the vici and their officials. Vol. XV. of the C.I.L. contains the inscriptions stamped on tiles and water-pipes, which arc of great importance. In the middle ages, the bishoprics of such (Res gestae divi Augusti, ed.) Mommsen, 1887) reproduces the bronze tablets set up by Augustus on his mausoleum at Rome, and contains a list of the buildings which he erected or restored. The marble pavements, plan of the Roman Forum, by Tomlinson (1874), the most recently discovered fragments have only been published in periodicals) dates from the reign of Septimius Severus, who restored the building for which it was begun a.d. 191 B.C. The plan which it represented was executed by order of Volusianus, a work which cost 1:250; it was oriented with S.E. at the top, N.W. at the bottom. Buildings are of course frequently represented on coins and works of art, and these may often be identified with existing remains.

In the reign of Constantine the Great there was compiled a catalogue of the principal buildings of Rome, arranged according to the fourteen regions of Augustus. This has been preserved in two redactions, one made in a.d. 334 and known as the Notitia, the second in or about a.d. 357, and known as the Curritum urbis Romae. These are called the Regionale Catalogues, and contain, besides lists of the principal buildings, 1 a.d. 350-200; a large list of ancient aqueducts as to form and size. The most important works of this period were produced by excavators such as Bianchini (Il palazzo dei Cesari, 1738), or independent students of the monuments such as Rinaldi, Foscarini (Columna Traiana, 1683; De Aquis et Aquaductibus, 1680). In the 18th century Winckelmann revived interest in ancient, including Roman, art (especially by his Geschichte der Kunst des Alterthums, 1764), and the 19th century was characterized by a systematic and scientific excavation, especially in the Forum. In 1829 there was founded the international Instituto di Corrispondenza Archeologica (which in 1874 became the Kaiserlich deutsches archäologisches Institut), and in the 1870s and 1880s by Bunsen and others, in which the gross errors which had passed current since Nardini's time were corrected. To the same period belongs the monumental work of Lucas Canini (Indications of Augustan Rome, 1830; Esposizioni topografiche e artistiche di Roma, 1834-44; Foro Romano, 1845; Edizioni di Roma antica, 1848-56), the value of which is impaired by their inaccurate and unscientific presentation in the Forum. The books on Roman topography written in the early 19th century, such as those of Antonio Nibby, still pursued the unscientific methods of Nardini; from 1820 onwards, however, we find a series of writers whose work shows the influence of the new criticism. Such were Becker (Topographie der Stadt Rom, 1843), Sir Wm. Gell (Rome and its Vicinity, 1834; ed. E. H. Bumby, 1846), Bunch (Ruins and Modern Rome, 1854), Reber (Die Ruinen Rom's, 1862) and T. H. Dyer (The City of Rome, 1863).

Since 1861, when excavations were begun on the Palatine at the instance of Napoleon III., under the direction of P. Rossi, the study of the monuments of ancient Rome has had a constant progress, and the results have been incorporated in a number of works, of which only the most important can be named here. These are: Jordan, Topographie der Stadt Rom im Alterthum, of which three vols. (1881-1883) appeared before Jordan's death by C. Huelsen and published in 1907; Gilbert, Geschichte und Topographie der Stadt Rom im Alterthum (3 vols., 1883-90); the works of Lanciani, especially Ruins and Excavations in Ancient Rome (1887, 1895); O. Richter, Topographie der Stadt Rom (ed. 2, 1901); Middleton, The Remains of Ancient Rome (2 vols., 1892). A short handbook may be found by S. B. Platter's Topographie and Monuments of Ancient Rome (Boston, 1904). More recent discoveries (besides the special works referred to in the course of this article) the following periodicals are the most important:

[journal names and dates]
ROME

with Costanza, Maria At many Agnese upper Capitolio; Rome S. Giorgio marble much and on Kiepert also Balbina, England, beautiful (401-417); Other Inno-

santina) (Stuttgart, 1884-1902). The best recent maps are those in Kiepert's Formae urbis Romae antiquae, sheets 21 and 22. Kiepert and Husen's Formae urbis Romae antiquae date from 1896; they are accompanied by a Nomenclature inoperaeae Romanae. Homo, Lexique de topographie romaine (1900), is also useful.

CHRISTIAN ROME

From the 4th to the 12th Century

The era of church building in Rome may be said to begin with the reign of Constantine and the peace of the church. Before then Christian worship was conducted with various degrees of secrecy either in private houses or in the catacombs (q.v.), according as the reigning emperor viewed the sect with tolerance or dislike. The type of church which in the beginning of the 4th century was adopted with certain modifications from the pagan basilica, though varying much in size, had little or no variety in its general form and arrangement. One fixed model was strictly adhered to for many centuries, and, in spite of numberless alterations and additions, can be traced in nearly all the ancient churches of Rome. It is fully described and illustrated in the article BASILICA.

The walls of these early churches were mostly built of concrete, faced with polished or unpolished marble and decorated with painted stucco or glass mosaics—especially (internally) in the apse and on the face of its arch, and (externally) on the east or entrance wall, the top of which was often built in an uncarved stone. Below these apsidal walls, on the plane were plain, with semicircular arches, and were filled with pierced marble screens, or in some cases with slabs of transparent alabaster. The latter was the case at S. Lorenzo fuori le Mura, and examples of the former in the very early churches formed in the middle of some thermes on the Esquiline (possibly those of Trajan), below the 6th-century church of S. Martino ai Monti. Almost the only other cases of external arches in the apses (excepting, perhaps, the last-named church) formed of marble cornices, have been, stolen from earlier classical buildings. Internally the nave columns, with their capitals and bases, were usually taken from some classical building. The apses were perfect museums of fine sculptured caps and rich marble shafts of every material and design.1 At first the nave had no arches, the columns supporting a horizontal entablature, as in old St Peter’s, S. Clemente, and S. Maria Maggiore, but afterwards, in order to widen the intercolumniation, simple round arches of narrow span were introduced, thus requiring fewer columns. The roof was of the simple tie-beam and kingpost construction, left open, but decorated with painting or metal plates. The floors were paved with coarse mosaic of large tesserae (as at S. Pudenziana) or with slabs of marble, or, from ancient buildings. A later development of this plan added a small apse containing an altar at the end of each aisle, as in S. Maria in Cosmedin and S. Teodoro in Trastevere. The type of church above described was used as a model for by far the majority of early churches not only in Rome, but also in England, France, Germany, and other Western countries. Another form was, however, occasionally used in Rome, which appears to have been derived from the round temple of pagan times. This is a circular church, usually domed and surrounded with one or more rings of pillared aisles. To this class belong the combined church and mausoleum of Costanza (see fig. 14) and that of SS. Marcellinus and Petrus, both built by Constantine, the former to hold the tomb of his daughters Constantia (or Constantine) and Helena, the latter as a bath. In the latter the nave is of the type on the Via Labicana, about 2 m. outside Rome; it is a circular domed building, now known as the Torre Pignattara, from the pignatta or amphorae built into the concrete dome to lighten it. The most important of S. Costanza, close by S. Agnese fuori le Mura, is also domed, with circular aisle, or rather ambulatory, the vault of the latter decorated with mosaic of classical style (see MOSAIC, vol. xviii. p. 883). The red porphyry sarcophagi, sculptured richly with reliefs, from these mausolea are now in the Vatican. On a much larger scale is the church of S. Stefano Rotondo on the Coelian, built by Pope Simplicius (468-482), with a double ring of pillared aisles, the outer one of which has pulled down and a new enclosure wall built round it (see fig. 26). Other churches in Rome of this type are S. Vincius at Archieri, S. Vitoce or Vicus Tuscanus, restored in the 8th century, and S. Bernardo, which is one of the domed halls of Diocletian’s thermae, consecrated as a church in 1598.

Space will not allow any individual description of the very numerous and important churches in Rome which are built on the basilican plan. Typical examples are these:—S. Pudentiana, traditionally the oldest in Rome, restored in 398; S. Clemente, built under Siricius (384-399), now forming the crypt of an upper church built in the 12th century; S. Sabina, 5th century; S. Vitale, 5th century, founded by Inno-
cent I. (401-405); S. Maria in Domincia, rebuilt by Paschal I. (817-824), who also rebuilt S. Cecilia in Trastevere and S. Maria in Cosmedin; S. Marco, rebuilt by Gregory IV. in 853; S. Maria Nuova, rebuilt by Nicholas I. (858-867), now called S. Francesco Romano; the church of SS. Quattro Coronati, rebuilt by Paschal II. about 1113; and S. Maria in Trastevere, rebuilt by Innocent II. in 1130.2

Though the apses and classical columns of the naves in these churches were built at the dates indicated, yet in many cases it is difficult to trace the existence of the ancient walls; the alterations and additions of many centuries have frequently almost wholly concealed the original structure. Except at S. Clemente, the church of the same name, the arch, placed as shown in fig. 26, has invariably been destroyed; the side walls have often been broken through by the addition of rows of chapels; and the whole church, both within and without, has been overlaid with the most incongruous architectural features in stone or stucco. The open roof is usually concealed either by a wooden panelled ceiling or by a stucco vault. The 4th and marble benches in the apse have usually given place to more modern wooden fittings, to suit the later position of the choir, which has also been transferred from the nave to the apse. In many cases the mosaics of the apse and the columns of the nave are the only visible remains of the once simple and stately original church.3

From 1200 to 1450; and the Papal Palaces

The 10th and 11th centuries in Rome were extraordinarily barren in the production of all branches of the fine arts, even that of architecture; and it was not till the end of the 12th that any important revival began. The 13th century was, however, one of great artistic activity, when an immense number of beautiful works, especially in marble enriched with mosaic, were produced in Rome. This revival, though on different lines, was very similar to the rather later one which took place at Pisa (see PISANO), and, like that, was in great part due to the great artistic talents of one family,—the Cosmati,4 which, for four or five generations, produced skilful architects, sculptors and mosaicists.

1 S. Lorenzo and S. Agnese fuori le Mura, S. Teodoro in Trastevere, Ara Coeli, and numerous other churches are very rich in this respect.

2 See Heinrich Holtzinger, Die altchristliche Architektur (Stuttgart, 1889-99); Delio and von Bezdol, Die kirchliche Baukunst des Abendlandes (Stuttgart, 1884-99).

3 This list does not include the great basilicas of Rome, for which see BASILICA. On the churches of Rome see Armellini, Le chiese di Roma (2nd ed. 1891); Tucker and Malleson, Handbook to Christian Rome (1914); Marzachi, Basiliche e chiese di Roma (1902); Frothingham, Monuments of Christian Rome (1910).

4 Some of these marble tombs which still exist are very interesting relics of Hellenic art, much resembling the existing mausoleums in the theatre. Examples of these tombs exist at S. Pietro in Vincoli, S. Stefano Rotondo, and in the Lateran cloister.

5 The interior of S. Maria in Cosmedin has in recent years been restored according to plain, classical tradition.

On the Cosmati see Beato, Architettura del Medio Evo (Milan, 1880, pp. 117-182); Clause, Les Marbriers romains et le mobilier prestbytrial (Paris, 1897); Crowe and Cavalcaselle, History of Painting in Italy (ed. Douglas, 1903), ch. iii.

1200 to 1450; and the Papal Palaces

The 10th and 11th centuries in Rome were extraordinarily barren in the production of all branches of the fine arts, even that of architecture; and it was not till the end of the 12th that any important revival began. The 13th century was, however, one of great artistic activity, when an immense number of beautiful works, especially in marble enriched with mosaic, were produced in Rome. This revival, though on different lines, was very similar to the rather later one which took place at Pisa (see PISANO), and, like that, was in great part due to the great artistic talents of one family,—the Cosmati,4 which, for four or five generations, produced skilful architects, sculptors and mosaicists.

1 S. Lorenzo and S. Agnese fuori le Mura, S. Teodoro in Trastevere, Ara Coeli, and numerous other churches are very rich in this respect.

2 See Heinrich Holtzinger, Die altchristliche Architektur (Stuttgart, 1889-99); Delio and von Bezdol, Die kirchliche Baukunst des Abendlandes (Stuttgart, 1884-99).
The first member of the family of whom we have knowledge was Lorenzo, who, with his son Jacopo, made the ambones of S. Maria in Ara Coeli and an altar-canopy (ciborium) in SS. Apostoli. Jacopo decorated the door of S. Saba in 1205 and, together with his son Cosma (who gave his name to the family), that of S. Tommaso in Feltria; the father and son worked together at Civita Castellana in 1210. Cosma made a ciborium for SS. Giovanni e Paolo in 1235, and worked with his sons Luca and Jacopo at Anguill and Subiaco during the latter part of the 13th and the earlier part of the 14th centuries. So far therefore as they enable us to trace the relationships of the Cosmati with certainty; it is not so clear whether the Cosma above mentioned is to be identified with the master who decorated the chapel of the S. Maria in Subiaco belonging to the old Lateran palace which was rebuilt by Nicholas III. (1277-1280). This Cosma was, however, almost certainly the father of Giovanni, the last of the family, who made the tombs of Cardinal Domenico della Rovere, Cardinal Rodrigo of Bobbio, S. Maria Maggiore, and Stefano de' Sardi in S. Balbina. Another artist who seems to have belonged to this family, Deodato, made the ciboria of S. Maria in Cosmedin and (probably) of St. John Lateran; he is probably identical with the Deodatus filius Cosmati who, together with another Jacopo, executed a pavement at S. Jacopo alla Lungara. A large number of other works of this school, but unsigned, exist in Rome. These are mainly altars and baldacchini, choir-screens, pastoral candlesticks, ambones, tombs, and the like, all enriched with sculpture and glass mosaic of great brilliance and decorative effect.

Besides the more mechanical sort of decoration, such as mosaic patterns and geometrical designs, they also produced mosaic pictures and sculpture of very high merit, especially the recumbent effigies, with angels standing at the head and foot, in the tombs of Ara Coeli and other places. One of the finest specimens is in S. Cesareo; this is a marble altar richly decorated with mosaic in sculptured panels, and (below) two angels drawing back a curtain (all in marble) so as to expose the open grave of the confessors.

In the 14th century, other artists also worked; as Paulus Passetius, his sons in the 12th century, and Petrus Vassalletus in the 13th, contributed to the revival of art. The beautiful cloisters of S. Paolo fuori le Mura, begun by "Magister Petrus," and those of S. John Lateran, the work of Vassalletus, are the finest architectural works of this school. In the latter part of the 13th century we find the sculptor Arnolfo del Cambio at work in Rome. His altar-canopy at St. Luke fuori le Mura (1292) has to be imitated by his pupils in their latest works; his tomb of Cardinal de Braye (d. 1282) at Orvieto also shows his intimate connexion with this school. Another artist of the same period, Petrus Oderlusius, worked in England, and the shrine of the Confessor at Westminster (1269) was made by him.

The earlier works of the Cosmati are Romanesque in style, but in the 13th century Gothic elements were introduced, especially in the panels and dominoes. These mosaics, with their geometrical traditions, are, in detail, however, they differ widely from the purer Gothic of northern countries. The richness of effect which the English or French architect obtained by elaborate and carefully worked mouldings was frequently imitated by the beautifully decorated marble and jewel-like mosaics—the details being mostly rather coarse and often carelessly executed.

Chiefly to the 13th century belong the large number of beautiful campanili, which are the most conspicuous relics of the medieval period in Rome. The finest of these are attached to the churches of S. Francesca Romana, SS. Giovanni e Paolo, and S. Maria Maggiore. Others belong to the basilicas of S. Lorenzo fuori e S. Croce in Gerusalemme, and to S. Giorgio in Velabro, S. Maria in Cosmedin, S. Alessio, S. Giovanni ad Portam Latamn, S. Cecilia, S. Crisogono, and S. Pudentiana. They occupy various positions with regard to the church, being all later additions; that of S. Paolo stands on a stone plinth. In design they are very similar, consisting of many stages, divided by brick and marble cornices; in the upper storeys are windows from two to four windows on each side, with round arches supported on slender marble columns. They are decorated with brilliantly coloured ciotole or disks of earthware, enamelled and painted in green or turquoise blue, among the earliest existing specimens of the so-called majolica (see Ceramics). Sometimes disks or crosses made of red or green porphyry are inlaid in the walls. In most cases on one face of the top storey is a projecting canopied niche, which once contained one or more mosaic pictures, of which the walls are occasionally of neat brickwork. The largest and once the handsomest of all, that of S. Maria Maggiore, has string-courses of enamelled and coloured terra-cotta. The slender columns of the windows have often proved insufficient to support the weight, and many of the arches are built up.

Though but little used for churches, the Gothic style, in its modified Italian form, was almost universally employed for domestic architecture in Rome during the 13th and 14th centuries. Tufa or brick was used for the main walls, the lowest storey being often supported on an arcade of pointed arches and marble columns. The windows were usually formed of large marble slabs with trefoil-shaped heads or cusped arches. As a rule the upper storeys projected slightly over the lower wall, and were supported on small ornamental machicolations. The two upper storeys, with open loggias, with rows of pointed arches. When vaulting was used it was also of the pointed form, usually in simple quadripartite bays, with slightly moulded groin-ribs. The finest existing specimen of this style is the palace built about 1300 by Boniface VIII. (Benedetto Gaetani), enclosing the tomb of Cecilia Metella on the Via Appia, with a graceful little chapel within the precincts of the castle. This building is well worthy of study; the remaining part is well preserved. Many houses of this period, though generally much injured by alterations, still exist in Rome. They are mostly in out-of-the-way alleys, and, not having been mentioned in any books, are not much noticed. The Ghetto (now destroyed) and the quarter near the Ponte Rotto contained many of these interesting buildings, as well as some of the most crowded parts of the Trastevere district, but most have disappeared owing to the wholesale destruction of old streets. Among those which may possibly escape for a while is the 13th-century house where Giulio Romano lived, near the Palazzo di Venezia, and the Albergo del Orso, at the end of the Via dei Tordinona, of the same period, which was an inn in the 16th century and is one still; this has remains of a fine upper loggia, with rich cornices in moulded terra-cotta; the lowest storey has pointed vaulting resting on many pillars. The Ghetto was beautiful but now exists only in name, though sadly mutilated, opposite the entrance to the atrium of S. Cecilia in Trastevere. Few now remain of the once numerous lofty towers built by the turbulent Roman barons for purposes of defence. The finest, the Torre delle Milizie on the Viminal, was built in the 13th century by the sons of Petrus Alexius; of about the same date is the Torre dei Conti, near the forum of Augustus, built by Marchione di Arezzo; both these were once much higher than they are now; they are very simple and noble in design, with massive walls faced with neat brickwork. Till the 14th century the Lateran was the usual residence of the popes; this was altered a little by the addition, covering four times its present area. The original house is said to have belonged to the senator Plautius Lateranus in the reign of Nero; but the existing part on the line of the Aurelian wall is of the 3rd century. This house, which had become the property of the emperors, was given by Constantine as a residence for S. Sylvester; it was very much enlarged at many periods during the next ten centuries; in 1308 a great part was burnt, and in 1386 the ancient palace was completely destroyed by Sixtus V., and the present palace built by Domenico Fontana. The Cappella Sancta Sanctorum (see list of Cosmati works) is the only relic of the older palace.4

3 See De Montaull, Les Cloches de Rome (Arras, 1874).
4 For many centuries wall-facing of small tufa stones was used, e.g. in many walls of the Capitol; this was called "opera saracinesca" from its supposed adoption from the Saracens; it is largely employed in the walls and towers of the Leonine city, built by Leo IV. (847-855) to defend the Vatican basilica and palace against the inroads of the Moesian invaders. The greater part of this wall is now destroyed and built over, but a long piece with massive circular towers well preserved exists in the gardens of the Villa Medici.
5 The house of Crescensius, popularly called the "house of Rienzi," near the Ponte Rotto, is perhaps the sole relic of the domestic architecture of an earlier period—the 12th century. Its architectural decoration was probably most miscellaneous sort, all taken from classical buildings; it has an inscription over the doorway, from which we learn that it was the property of "Crescensius, son of Nicolaus."
The present palace has never been used as a papal residence; in the 18th century it was an orphan asylum, and is now a museum of classical sculpture and early Christian remains.

The Vatican palace originated in a residence built by Symmachus (408–514) adjoining the basilica of S. Peter. This was rebuilt by Innocent III. (c. 1200) and enlarged by Nicholas III. (1277–80). It did not, however, become the fixed residence of the popes till after the return from Avignon in 1377. In 1415 John XXIII. connected the Vatican and the Lateran by S. Angelo by a covered passage on the roof. The little palace is older than the 15th century; Nicholas V. in 1447 began its reconstruction on a magnificent scale, and this was carried on by Sixtus IV. (Sistine chapel), Alexander VI. (Torre Borgia), Julius II. and Leo X. (Bramante’s cortile and Raphael’s Loggie and Stanze), and Paul III. (Sala Regia and Cappella Paolina by Antonio da Sangallo). Sixtus V. and his successors built the lofty portico of the palace on the east of Bramante’s cortile. The Scala Regia was built by Bernini for Urban VIII. and Alexander VII., the Museo Pio-Clementino under Clement XIV. and Pius VI., the Braccio Nuovo under Pius VII., and lastly the grand stairs up to the Cortile by Pius IX.

The Quirinal palace, now occupied by the king of Italy, is devoid of architectural merit. It stands on the highest part of the hill, near the site of the baths of Constantine. This palace was begun in 1574, under Gregory XIII., by Flaminio Ponzio, and was completed by Fontana and Madaerna under subsequent popes.

The only important church in Rome which is wholly Gothic in style is S. Maria sopra Minerva, the chief church of the Dominican order. This was not the work of a Roman architect, but was designed by two Dominican friars from Florence—Fra Ristori and Fra Sisto—about 1289, who were also the architects of their own church of S. Maria Novella. It much resembles the contemporary churches of the same order in Florence, having wide-spanned pointed arches on clustered piers and simple quadrilateral vaulting. Its details resemble the early French in character. It contains a large number of fine tombs; among them that of Durandus, bishop of Mende (the author of the celebrated Rationale divinorum officiorum), by Giovanni Cosma, c. 1300, and the tomb of Fra Angelo, the great Dominican painter, who died in Rome, 1455. The most elaborate specimen of ecclesiastical Gothic in Rome is that part of S. Maria in Ara Coeli which was rebuilt about 1300, probably by one of the Cosmati, namely, the south aisle and transept. During the 14th century (chiefly owing to the absence of the popes at Avignon) the arts were neglected at Rome, and a period of decadence set in. The vaulting and effigy of Cardinal d’A‘lenc‘on (d. 1403) in S. Maria in Trastevere, executed by a certain Paulus Romanus, is a fair example of the works produced during this period; the effigy is a very clumsy and feeble copy of the fine recumbent figures of the Cosmati.

Florentine Period, c. 1450–1550.

The long period of almost complete artistic inactivity in Rome was broken in the 15th century by the introduction of a number of foreign artists, chiefly Florentines, who, during this and the succeeding century enriched Rome with an immense number of magnificent works of art. The dawn of this brilliant epoch may be said to have begun with the arrival of Fra Angelico (see Fiesole) in 1447, invited by Nicholas V. to paint the walls of his small private chapel in the Vatican dedicated to S. Lorenzo.

In the latter half of the 15th century a large number of sculptured tombs (as well as tabernacles, altar frontals, reredoses and the like) were made for Roman churches by sculptors from Tuscany and North Italy. The earliest of these tombs is that of Eugenius IV. (d. 1447) in S. Salvatore in Lauro, by Isia da Pisa. It presents the typical form of a life-sized recumbent effigy resting on a richly ornamented sarcophagus over which is a canopy decorated with reliefs and statuettes. The type was brought to perfection by the Florentine Mino da Fiesole (see Mino di Giovanni), who worked in Rome under Pius II. and succeeding popes, being assisted in some cases by another artist of almost equal skill, Giovanni Dalmata. A Lombard sculptor, Andrea Bregno, came to Rome under Paul II. and worked there until the closing years of the century; his tomb is in S. Maria Sopra Minerva. The works of these artists and their followers are to be found in a great number of churches, notably S. Maria del Popolo.

The architecture no less than the sculpture of the latter part of the 15th century was mainly the work of Florentines, especially of Baccio Pontelli, who is said by Vasari to have built S. Maria del Popolo, S. Agostino and S. Costantino in Trastevere. He also was the architect of S. Pietro in Montorio, erected in 1500 for Ferdinand and Isabella of Spain. Other buildings were carried out by another Florentine, Giuliano da Majano. The Palazzo di Venezia, begun for Cardinal Barbo, afterwards Paul II., about 1455, a very massive and stately building of medieval character, was built by Giuliano da Sangallo and Francesco di Borgo San Sepolcro.

During the latter part of the 15th century and the first few years of the succeeding century Rome was enriched with a number of buildings by Bramante (q.v.), one of the greatest architects the world has ever seen. He combined the delicacy of detail and the graceful lightness of the Gothic style with the measured stateliness and rhythmical proportions of classic architecture. Though he introduced the use of ancient mouldings from antique sources, his beautiful cloisters and loggie are Gothic in their general conception. Moreover, he never committed the prevalent blunder of the 16th century, which was a frenzied attempt to obtain more perfection by mere multiplication of parts. His principal works in Rome are the Palazzo della Cancelleria, built for Cardinal Riario (1495–1505), with the chapel of S. Lorenzo in the church of S. Lorenzo in Oriolo; the Palazzo di Bramante in the Governo Vecchio, built in 1500; and the Palazzo Giraud, near St Peter’s, the once residence of Cardinal Wolsey, built in 1503. He also built the cortile of S. Damaso in the Vatican, the tomb-like tempio in the cloister of S. Pietro in Montorio (1502), and the cloisters of S. Maria della Pace (1504). In 1503 Bramante was appointed architect to St Peter’s, and made complete designs for it, with a plan in the form of a Greek cross. The piers and arches are in true Gothic style. Rome was abandon the influences of the classical architecture, but continued to use them. An example of this is the Palazzo Farnese and Palazzo Massimo all’ Casino are from his designs.

Baldassarre Peruzzi (q.v.) of Siena was one of the most talented architects of the first part of the 16th century; the Villa Farnesina and the Palazzo Massimo all’ Casino are from his designs. His later works bear traces of that decadence in taste which so soon began, owing mainly to the rapidly growing love for the dull magnificence of the pseudo-classical style. This falling off in taste was continued in the Roman School until the 15th and 16th century, and the work of Giacomo della Porta.

Florentine and Lombard sculptors.

The transformation of Roman architecture after the 16th century was marked by the abandonment of classical models. The works of Michelangelo were too grand to be accused of exceeding the extreme limits of good taste, but his scholars and imitators exaggerated his manner, and the barocco style, which spread throughout Italy and abroad, was based on his work.

On Mino da Fiesole, see Guoli in Archivio Storico dell’ Arte (1890–91); on Giovanni Dalmata, Fabricesi in Jahrb. der preuss-Kunstgewerbe-Ver., 1890, pp. 216; on Andrea Bregno, Steinhauer in a special volume of a periodical, vol. xx.; many of the monuments are drawn in Tosi, Raccolta di monumenti sacri e sepolcreti scolpiti a Roma (1883).

The two churches were the first in Rome built with domes after the classical period.

The upper storey of the latter is varied by having horizontal lintels instead of arches on the columns.

See Geymüller, Projets primitifs pour le basilique de St Pierre à Rome (Paris, 1875–85).

A valuable account of Raphael’s architectural works is given by Geymüller, Raffaello come Architetto (Milan, 1882). Drawings of many of the finest palaces of Rome are given in the fine work by Letarouilly, Édifices de Rome moderne (Brussels, 1856–66).
which had its cradle in Rome, was soon adopted throughout
Italy. Vignola (1507-1573) had done his best to bind the
art of building to strictly classic rules, but in spite of
his efforts the degeneration made progress during his
own lifetime and under Carlo Maderna (1536-1609),
and proceeded still more rapidly under Bernini (1598-1680).
The characteristics of the barocco are the reckless abuse of
curves and extravagantly broken lines, of contorted columns,
twisted tympanums and highly exaggerated ornaments; yet
we must remember that many works of this period of art
exhibit such exuberant life, such contrasts of relief and shadow,
and such a wonderful combination of variety and solidity as
cannot fail to please the many, even now, by the magnificence of
their general effect. In Rome, the numerous works of
Bernini, Borromini, Maderna, Rainaldi, Salvi, Fuga, Longhi
and others bear witness to the gifted activity of Italian
architects during that period; if genius necessarily creates,
those men showed more of it than their predecessors who
adhered to the classic and revered the teachings of Vitruvius.
Degeneration is tolerated and sometimes even praised, under
the name of transformation, but there is nothing to be said
for the universal decay which marks the 18th century. It was
not universal at first, for it is by nature a slow process; such men
as A. Gallilei, Specchi, Peparelli, Marchionni, Morelli, Camporese
and Piranesi left works not altogether without value; but
the outrageous abuse of ornament increased with every year,
and was made more and more evident by the clumsy heaviness
of the pillars and pilasters that supported the whole.
The refined purity of the Renaissance disappeared as completely
as the delicate grace and exquisite ornamentation of the
Contemporary period. Many works of the greatest beauty were
destroyed outright, and many more were disfigured and often
wholly hidden by horrible stucco facades and decorations;
or, on a larger scale, by the application of hideous stone
structures to churches of which the simple good taste had delighted
generations of mankind. The deformation of the noble old
Laterna basilica is a conspicuous instance of such deeds; another
is Santa Maria Maggiore, and the false fronts plastered upon
San Marcello and Santa Maria in Via Lata, both in the Corso,
give a very clear idea of what was generally done. The interiors
of old churches suffered quite as much, and even the frescoes
of the vaults were not spared by theARGER. In the
third chapel (south) of S. Maria del Popolo were covered
with wretched stucco ornaments, only removed in 1850, and
numberless works of art by Giotto and other early painters
were wilfully destroyed.
The decline of architecture continued in the 19th century,
notwithstanding the laudable efforts of Valadier and a few
other painstaking imitators, who produced the so-called
"academic neo-classic" reaction; among them may be noted
the names of Canina, Poletti, Sarti and Azzurri. The futility
of their works invited the feeble eclecticism which so soon after
wards became so general that the architecture of the period
is wholly without individuality, good or bad. The chief
architectural work of the 19th century was the rebuilding of
the great basilica of S. Paolo fuori le Mura, begun in 1823,
in a style of cold splendour which is anything but devotional in
its general effect. The pillars are huge monoliths of grey
granite from the Alps; the confessio and transepts are lined
with roso and verde antico from quarries then recently
re-discovered in Greece, and with Egyptian alabaster and lapis
lazuli and malachite adorn the bases of the columns round the
high altar in lustral profusion. Thirty years were required
for the rebuilding of the frigidly magnificent structure
which was reconsecrated in 1854. The cast façade displays a quantity
of gaudy mosaics, and the projected quadruportico is wanting.
The belfry is nothing but a steeple, and has an unfortunate
resemblance to a lighthouse. In extenuation of the result it
must be admitted that the original building had been totally
destroyed by fire, but no such excuse can be found for the
barbarous assault on Christian art which was perpetrated by
Francesco Vespignani in the extension of the Lateran basilica.
This work was begun under Pius IX., and finished under
Leo XIII.; it involved the destruction of the ancient tribe
and its ambulatory, the only parts of the church which had
so far escaped complete disfigurement, and the priceless
mosaics (1290), among the most beautiful in Rome, were taken
down and replaced in the new apse in a sadly mutilated and
restored form. (For the interesting discoveries made in
excavating for the new foundations, see Ann. Ist. 1877, p. 332.)

The Vatican contains the largest collection in the world of Greek
Roman and Roman sculpture, with a few specimens of true Hellenic
art. It is also very rich in Greek vases and in objects
from Etruscan tombs; this latter division is called the
Gallerie delle Antichità Etrusche. The Vatican Art and
Architecture gallery, though not as large as some of the private
collections in Rome, contains few inferior pictures. The Lateran palace, still,
like the Vatican, in the possession of the pope, contains a fine
collection of classical sculpture, but is most remarkable
for a museum of Christian antiquities. The two capoline museums are very
rich in classical sculpture, bronzes, coins, pottery and the contents
of early Etruscan and Latin tombs. A large tie, has been
bought, and is filled with sculptures found in Rome since 1870, of which
the arrangement was completed on the occasion of King Edward VII.'s
visit. The picture gallery contains a few masterpieces and a large
number of inferior works. The inferior works have been
formed in the great cloister of S. Maria degli Angeli, to hold the
numerous fine examples of classical painting and sculpture found
along the Tiber during the excavations for the new embankment,
which were discovered in the Umbrian period. The museum
contains a large collection of minerals, fossils and other geological,
and examples of ancient marbles used in the buildings of Rome. A Museo Artistico Industriale has been formed in a monastery
in the Quirinale, called the Museo dei Lavori. This, however,
a matter for regret that the few medieval works which Rome
possesses should be scattered in three small collections, namely,
the Lateran, the Palazzo Rome and the Palazzo Sciarra.

The collections contained in that name, contains some ancient sculptures of great value. The
Museum of Etruscan and Paliscan antiquities in the Villa Giulia,
newly built in the Quirinal heights, is of considerable importance,
and the Borgia Palace in the Propaganda palace, the latter for its ancient
grographic curiosities. The museum of plaster casts in the
tesaccio quarter contains reproductions of the principal ancient
sculptures possessed by the Vatican.

Among the private collections of pictures the Borghese is un
rivalled. The next in importance is that in the Doria palace,
which, however, like most Italian collections, contains a
large proportion of inferior works. The Corinii picture
gallery, bought by the government, is chiefly
rich in the works of the Bolognese and other third-rate
painters, but also possesses a fine collection of engravings
and etchings.

There are a few fine paintings in the Barberini palace,
but the Sciarra gallery no longer exists. There are some good
pictures by Raphael and Guido Reni in the Academy of St Luke;
The Museo d'Arte Moderna is a collection of modern paintings
acquired by the government.

The largest private collection of sculpture is that of the Villa
Albania, which, among a large mass of inferior Roman sculpture,
contains a few very good pieces. The Medici collection
was stolen and brought to Paris by Napoleon I., and was there
dispersed; one relief, the celebrated Antinous, is the only piece
of sculpture from the original collection which was sent back from
Paris to Italy. Those in the Lateran are also composed of
several very fine works, but unfortunately the greater number
are much injured and falsified by restorations. The casino
in the Borghese gardens possesses a great quantity of sculpture, mostly
impressive Latin monuments which, as a general rule, are
executed in precious marbles. The small collection
which formerly existed in the Villa Ludovici has been bought by
the government and removed to the Museo delle Terme; it
contains a few works of Greek sculpture of great value, the most important
being the Pergamena group representing the suicide of a Gaulish
chief, a Medusa's head in relief and a male terminal figure. The
Giustiniani collection, which was considerable, is now dispersed, but many private residences, such as the Colonna palace, still contain collections of sculpture and painting of a secondary order.

The principal libraries in Rome are, for old and modern works, the Biblioteca Vittorio Emanuele and the library of the German Archaeological Institute; for manuscripts and early books, the Angelica, the Casanatense, the Alessandrini and the Chigi libraries; but none of them can be compared with that of the Vatican, which now contains also the former library of the Barberini. Mention must also be made of the Corsiniana, now belonging to the Accademia dei Lincei. The Biblioteca Sarti, beside the Academy of S. Luke, contains works on art.

**The Modern City**

Great changes in the municipal and social conditions of Rome followed the occupation of the city by the Italians (20th September 1870), and the rapid increase of population due to immigration from other parts of Italy. It is a mistake, however, to attribute all the works undertaken and executed since 1870 to the initiative of the new government. The first plan for modernizing and improving Rome was that of Pope Julius II., who aimed at the enlargement of the lower city on both sides of the Tiber. The modern Via Giulia shows in part what he meant to do. Following him, Sixtus V. did his best to develop the upper part of the city by laying out the Via Sistina, from the Trinità dei Monti to Santa Maria di Porta S. Giovanni. Almost in one own time a plan for the improvement of the city was made, under the direction of Mgr. de Merode, during the reign of Pius IX.; and although but a small portion of the projected changes were carried out under the pope, the general scheme was in most respects satisfactory, and proved a good foundation for further extensive developments. He was able to complete the construction of the beautiful ascent to S. Pietro in Montorio, as well as that which leads up to the Quirinal Palace, and the Via Nazionale, which was to have been called Via De Merode, was also begun. His plan did not include, however, the destruction of villas such as the Ludovisi, nor the wholesale removal of trees, which is so greatly to be deplored. These acts of barbarism were the consequences of the reckless speculations in land and buildings that accompanied and followed the active and excellent work done by the municipality, and might have been checked by vigorous and timely action of the government. As it was, a number of the most important Roman families were ruined. At the outset, and as soon as political circumstances admitted the consideration of such matters, the municipality set to work; and though a comprehensible love of the picturesque has caused many persons to regret the result, altogether or in part, it is not to be denied that the improvements carried out so far have been of the greatest benefit to the city, and that the work is in many instances of creditable solidity.

Two principal problems presented themselves. The more important was the confinement of the Tiber in such a manner as to render impossible the serious floods which had from time to time inundated the city, often causing great damage to property and rendering the lower streets more or less impassable. There were floods which almost reached the level of the first storey near San Carlo in the Corso, and it was common to see the great Piazza Navona and the neighbourhood of the Pantheon full of water for days together during the winter. The interruption of traffic can be imagined, and the damage to property was serious. The other urgent matter was one of which the government of Pius IX. had been partially aware, namely, the necessity for opening better thoroughfares between different parts of the city. In the middle ages the population of Rome had dwindled to twenty or thirty thousand inhabitants, who lived huddled together about the strongholds of the barons, and the modern city had slowly grown again upon the exiguous foundation of a medieval town. The need for changing this condition of things, which had been felt under Pius IX., became overwhelmingly apparent as the population rapidly increased. That which under a continuance of the old government might have been done by degrees during a long period, had to be accomplished in the shortest possible time, with means which, though considerable, were far from adequate, and in the face of opposition by many holders of real estate, the most important of whom were conservatively attached to the papal government, and resisted change for no other reason. In what was now done it is necessary to distinguish clearly between the work undertaken and carried out by the municipality, under considerable pressure of circumstances, and that which was done in the way of private speculation. The first was on the whole good, and has proved enduring; the second was in many cases bad, and resulted in great loss. As soon as the opening of such streets as the Via Nazionale and the Via Cavour, the widening and straightening of the Via dell’ Angelo Custode, now the Via del Vittoriano, and similar improvements, such as the construction of new bridges over the Tiber, had demonstrated that the value of property could be doubled and quadrupled in a short time, and as soon as the increase of population had caused a general rise in rents, owners of property awoke to the situation of affairs, and became as anxious as they had at first been disinclined to improve their estates by wholesale building.

The most important and expensive work executed by the government with the assistance of the municipality was the construction of the embankments along the Tiber. Though damaged by the great flood of December 1900, their truly Roman solidity saved the city from the disastrous consequences of a wide inundation. It is impossible not to admire them, and not to feel respect for a people able to carry out such a plan in such a manner and in so short a time, in the face of such great difficulties. But so far as the life of the city was concerned, the cutting of new streets and the widening of old ones produced a more apparent immediate result. The opening of such a thoroughfare as the Via Nazionale could not but prove to be of the greatest value. It begins at the Piazza delle Terme, in which the principal railway station is situated, and connects the upper part of the city by a broad straight road, and then, by easy gradients, with the Forum of Trajan, the Piazza dei Sant’ Apostoli and the Piazza di Venezia, whence, as the Corso Vittorio Emanuele, it runs through the heart of the old city, being designed to reach S. Peter’s by a new bridge of the same name, near the bridge of S. Angelo. It is true that, in order to accomplish this, the Villa Aldobrandini had to be partially destroyed, but this is almost the only point which lovers of beauty can regret, and in compensation it opened to full view the famous palace of the Massimo family, the imposing church of S. Andrea della Valle, and the noble pile of the Cancelleria, one of the best pieces of architecture in Rome. Another great artery is the Via Cavour, which was intended to connect the railway station with the south-western part of Rome, descending to the Forum, and then turning northwards to reach the Piazza di Venezia on the west side of the thread of water of the Tiber. These are only examples of what was done, for it would be impossible to give a just idea of the transformation of the city. Rome is now divided clearly into two parts, the old and the new, of which the old is incomparably the more artistic and the more beautiful, as it will always remain the more interesting. Among the works carried out by the government and the municipality the fine tunnel under the Quirinal Hill (completed in 1902) deserves mention; it forms a connecting channel for the traffic between the streets at the north end of the old city, the Corso, Babuino, &c., and the upper part of Rome, including the Via Nazionale and the Esquilino. Another difficult undertaking, successfully completed in April 1898, was the construction of the enormous causeway and bridge which now unite the Pincio with the Villa Borghese, or, as it is now called, the Villa Umberto Primo, to the immense advantage of the public. In the same year the building for the new law courts was finished; it stands near S. Angelo, and presents, on the whole, an imposing appearance, though overloaded with clumsy stone ornamentation. It is unnecessary to mention a number of public buildings and government offices which have little architectural merit, but we cannot overlook such a magnificent group of buildings devoted to scientific purposes as the PoliCinico, on the Macas, which is admittedly one of the finest hospitals in Europe; and the military
hospital on the Coelian. The rebuilding of the Palazzo del Parlamento is only second to the enormous monument of Victor Emanuel II. The majority of the buildings erected by individuals and corporations since 1870 present no original or characteristic features, and the best of them are copies or imitations of well-known models. The Caisa del Risparmio, in the Corso, reproduces a Florentine palace; the Palazzo Negroni, near the Piazza del Gesù, is modeled on the Cancelleria and the Palazzo Giraud; many of the large modern churches beyond the Tiber are fairly good copies of palaces in the Florentine style, though the magnificent carved stone of earlier centuries is disadvantageously replaced by stucco, a material which lasts tolerably well in the mild climate of Rome. Opposite the beautiful and severe Palazzo di Venezia, what might have been a faultless reproduction of it is marred by tasteless ornament. Finally, so far as the construction of new streets is concerned, which lovers of the picturesque so greatly deplore, it must be admitted that they have been rendered necessary by the great increase of traffic and population, and it should be remembered that after the 16th century the west of the Forum did their best to open up the city by widening and straightening the thoroughfares.

**Municipal Administration.**—After the taking of Rome, those persons who remained loyal to Pius IX. took no part whatever in public affairs, and the municipal administration was entirely in the hands of the monarchists. The expression "né eletti né elettori," meaning that Catholics are to be neither voters nor candidates, which came to be regarded as a sort of rule of the day by the upper classes of the city, was resorted to by the Syndic (Mayor) in all municipal matters, whereas it was later understood to refer only to parliamentary elections. Leo XIII. encouraged the formation of a Catholic party in the municipal administration, and the municipal government drifted largely into the hands of Catholics, though circumstances make it necessary that the Syndic should always be a royalist. Between 1870 and the end of the century the socialistic party had no great influence in Rome, which can never be a city of manufacturing interests. For purposes of municipal government the division into districts has been modified, but the old division into fourteen rioni is adhered to in principle, the new quarters of Castro Pretorio and the Esquiline having been included in the first Rione, which still bears the name of "Monti." The municipality consists of a mayor and eighty communal councillors, of whom a large proportion were for many years members of the aristocracy. Later, however, the three democratic parties, known as the monarchist, socialist and republican, united to form a popular coalition, and succeeded in completely excluding the conservative, aristocratic and Catholic elements.

**Population.**—The population in 1870 was 226,022, as against 462,743 in 1901 (communal population). It therefore more than doubled in thirty years. The increase, however, did not take place at a regular rate, owing to the changes in the rates of immigration and emigration. The largest increase was in 1870, reaching 22,186; the next most important in 1884, 1885, 1886, 1887, in which years it constantly remained near 20,000. The least increase in later years was 4417 in 1891. The garrison of Rome is about 10,000 men. Careful inquiry has placed it beyond doubt that there are in Rome about the same number of ecclesiastics of all orders, including about 1500 students in the theological seminaries. The average birth-rate is lower in Rome than in the majority of great cities. The number of births increased after 1870 very nearly in proportion with the increase of population.

**Climate and Hygiene.**—The climate of Rome is mild and sunny, but the variation in temperature between day and night is very great. December and February appear to be the coldest months, the thermometer then averaging 47° F.; the greatest heat, which averages 75°, is felt in July and August. The surrounding Campagna is still not all habitable during the summer, though the dangerous malaria has been checked by the planting of numerous eucalyptus trees. A remarkable instance of the effect produced upon the marshy soil by these plantations may be studied at the Trappist monastery of the Tre Fontane, situated on the Via Ardeatina, about 4 m. from Rome. Whereas in former times it was almost always fatal to spend the whole summer there, the monks have so far dried the soil by means of the eucalyptus that they reside in the monastery throughout the year. The municipality has everywhere made strenuous efforts to reduce the number of deaths due to malaria. Of all the deaths in Rome and the Campagna were attributed to this cause; in 1907 the proportion had dropped to 3%. Very large sums have been expended in a scientific system of drainage and sub-drainage on both sides of the Tiber, and the use of wire gauze mosquito nets for the doors and windows of the humblest habitations in the Campagna has contributed much to the present satisfactory result. The hygienic conditions of Rome itself have greatly improved, largely through the ceaseless efforts of Commandatore Baccelli, a distinguished man of science, who repeatedly held office in the Italian Ministry. The publication of exceedingly accurate graphic tables in February 1900 shows the following facts: Ninety per 1000 deaths occurred in 1871 from typhoid (the so-called "Roman fever"), and the average has now fallen to a low constant. Deaths from small-pox, formerly of alarming frequency, can be said not to occur at all, and their numbers diminished suddenly after the introduction of compulsory vaccination.

**Charities and Education.**—A great number of small charitable institutions for children and old people have been founded, which are organized on the most modern principles, and in many of these the members of the upper classes of the city and the municipality take an active interest. In 1875 a large number of building speculations between 1888 and 1890, though great efforts were made by the municipality to send all persons then thrown out of employment back to their homes. One of the difficulties under which Rome labours is that while it attracts the population of the country, as other capitals do, it possesses no great mechanical industries in which the newcomers can be employed. The city is therefore able to create small industries in the populous quarters of the poor met with little success. Before 1870 a society was formed, which has since greatly developed as an intelligent private enterprise, to provide the poor with sanitary tenements; but its success is much less than that of the associations devoted to the relief of the homeless poor, especially due to the heavy taxation of small industries. A number of trade schools are also maintained by private funds, such as the Instituto degli Ardigiani, managed by the Fratelli della Dottrina Cristiana, and the Reg. albergo per fanciulli (founded by the Trappist monks), which is under lay management and has flourishing workshops. The character of official charities has certainly improved in principle, so far as their educational and moral scope are concerned; but it is no less the absorbing interest of many private charitable and Church foundations to provide the largest possible individual and almost paternal relief possible, that the function of charity has a pauperizing influence. If anything, the present tendency is to go too far in the opposite direction, and to require too many formalities before any relief is granted; the cases for the payment of the principal charities under a central management on advanced principles improved the methods of administration, it destroyed much of the old source of immediate relief on which the poor had a traditional right to demand. It was in that sense that the movement of hardship. At the same time, however, mutual benefit societies (società di mutuo soccorso) have been organized in great numbers by the artisans, tradesmen, clerks, and the like, and are managed by the political parties to which they belong. It is characteristic of the modern Roman people that the most imperative elements are often without showing any signs of amalgamating, yet they are attended by the former crafts and professions. This tendency, of an exclusively clerical character, others are merely conservative, some consist of monarchists, and some of devoted republican.

The public education is in the hands of the municipality, and besides the public schools there are numerous institutions attended by the children of the lower classes; they follow the curriculum prescribed by the government, and are under the control of the municipal inspector in both as regards their teaching and their hygiene. The pope provides in the maintenance of the people's schools, managed entirely by laymen, and also under government inspection. For education of the higher grade, besides the regular lyceums and gymnasia, there are many private schools similarly designated from which pupils can present themselves for the regular government examinations.
the privilege of conferring certificates and degrees having been allocated only to the private inscriptions of the Society. — After 1870 both the aristocracy and the middle classes were divided into hostile factions, each of which maintained a press of its own and rallied round representative individuals. So far as the middle classes were concerned, the common interest of commercial operations soon concentrated political differences. The aristocracy, however, kept rigidly aloof from all speculations for a time, and maintained its traditional attitude of contemptuous superiority, to which it was subsequently answered with its profound hatred. This state of things lasted about ten years, until the time of the great building speculations, in which a number of noble families were tempted, and in which they found themselves hopelessly involved, and brought into close contact with the middle class. The two classes thus became necessary to each other, and the result was a notable and salutary diminution of prejudice, soon leading to conditions which would formerly have seemed impossible, but which the redistribution of wealth rendered mutually advantageous. The appearance at social gatherings of an official element, almost exclusively taken from the middle class, also tended to reduce inequalities of caste. Yet it must be admitted that the parties composing Roman society were drawn together mechanically, rather than fused into anything really homogeneous. It is worth mentioning that the Jewish element, which was very strong in business, in journalism, and in the administrations, had made no attempt to enter Roman society. Rome and Genoa are practically the only Italian cities in which Israelites are rigidly excluded from social intimacy, and are only met on official occasions. (M. Cr.)

ANCIENT HISTORY

I. The Beginnings of Rome and the Monarchy.

Both the city and the state of Rome are represented in tradition as having been gradually formed by the fusion of separate communities. The original settlement of Romulus is said to have been limited to the Palatine Mount. With this were united before the end of his reign the Capitoline and the Quirinal; Tullus Hostilius added the Caelian, Ancus Martius the Aventine; and finally Servius Tullius included the Esquiline and Viminal, and enclosed the whole seven hills with a stone wall. The growth of the state closely followed that of the city. To the original Romans who inhabited the Palatine were added successively the Sabines, the descendants of King Tullus, Alans transplanted by Tullus, Latins by Ancus, and lastly the Etruscan comrades of Caeles Vibenna. This tradition is supported by other and more positive evidence. The race of the Luperci on February 15 was in fact a purification of the boundaries of the ancient Palatine town, the square Rome of Ennius, and the course taken is that described by Tacitus as the pomerium of the city founded by Romulus. On the Esquiline, Varro mentions an ancient city and an earthen rampart, and the festival of the Septimontium is evidence of a union between this settlement and that on the Palatine. The fusion of these two communities is thus attested by both classic authors. Etruscan evidence is in particular the line taken by the procession of the Argei represents the enlarged boundaries of these united communities. Lastly, the Servian agger still remains as a witness to the final enclosure of the various settlements within a single ring-wall. The united community thus formed was largely of Latin descent. Indications of this are not wanting even in the traditions themselves: King Faunus, who rules the Aborigines on the Palatine, is Latin; Latin is the name ascribed to the united Aborigines and Trojans; the immediate progenitors of the Latins are the Latin Lavinium and the Latin Albus. Much evidence in the language, the religion, the institutions and the civilization of early Rome points to the same conclusion. The speech which is derived from the first Latin, though showing many traces of contact with the neighbouring dialects of the Sabines and Volscians and also of Etruscans; the oldest gods of Rome—Saturn, Jupiter, Juno, Dianais; are all Latin; "rex," "praetor," "dictator," "cura," are Latin titles and institutions. The primitive forms of the Etruscan alphabet are still preserved in the Roman alphabet, which has been superimposed upon it. The earthen ramparts of the Palatine and the Quirinal, the malaria of the swampy low grounds, are only typical of the mode of settlement which the conditions of life dictated throughout the Latian plain. But tradition insists on the admixture of at least two non-Latin elements, a Sabine and an Etruscan. The question as regards the latter will be more fully discussed hereafter; it is enough to say here that while the evidence of nomenclature (Schulze, Geschichte der Lat. Eigennamen, Leipzig, 1904, p. 570, with the modifications suggested in the Classical Review, December 1907) shows that many Etruscan names were settled within the bounds of the early city, there is no satisfactory evidence that there was any large Etruscan strain in the Roman blood. With the Sabines it is otherwise. The Sabines in Rome which constituted so decisive a stage in the growth of Rome is represented as having been in reality a union of the original Latins with a band of Sabine invaders who had seized and held not only the Quirinal Hill, but the northern and nearest peak of the Capitoline Mount. The tradition was evidently deeply rooted. The name of the god Quirinus, from which that of the Quirinal Hill itself presumably sprang, was popularly connected with the Sabine town of Cures. The name had even been branded as "sabine." One of the three old tribes of the Titillii, was believed to represent the Sabine element; the second and the fourth kings are both of Sabine descent. By the great majority of modern writers the subsistence of the tradition, the fusion of a body of Sabine invaders with the original Latins, is accepted as historical; and even Mommsen allowed its possibility, though he threw back the time of its occurrence to an earlier period than that of the union of the two settlements. We cannot here enter into the question at length, but some fairly certain points may be mentioned. The probability of Sabine raids and a Sabine settlement, possibly on the Quirinal Hill, in very early times may be admitted. The incursions of the highland Apennine tribes into the lowlands fill a large place in early Italian history. The Latins were said to have originally descended from the mountain glens near Rete. The invasions of Campania and of Magna Graecia by Sabine (more correctly Sabine) tribes are matter of history (see SAMNITES), and the Sabines themselves are represented as a restless highland people, ever seeking new homes in richer lands. In very early days they appear on the borders of Latium, in close proximity to Rome, and Sabine forays are familiar and frequent occurrences in the old legends. But beyond these general considerations recent inquiry enables us to advance to some few definite conclusions. (1) It may now be regarded as established beyond question that the patrician class at Rome sprang from a race other than that of the plebeians.

5 The title "rex" occurs on inscriptions at Lanuvium, Tusculum, Bovillae; Henzen, Bullettino dell'Inst. (1865), p. 159; Orelli, 2779; Corp. I. Lat. vi. 2125. For "dictator" and "praetor," see Livy i. 23, viii. 3; cf. Marquardt, Röm. Staatsverwaltung, i. 475: for curia, see Orelli, i. 2279; for curia, see Servius ed. (otx). Ed., 497.

6 B. Mostovet, Introduction à l'histoire romaine (translated from the Russian by M. Delines), Paris, 1907, supersedes other authorities such as Hellwig, Die Italiener in d. Poebene; Pohlmann, Anfänge der ital. Metropolen, 9; Abeken, Mltel-Italien.

7 The existence of a Tuscan quarter (Tuscan vicus) in early Rome may point to nothing more than the presence in Rome of Etruscan artisans and craftsmen. But see ETRURIA, Language.

8 Varro, L.L. v. 34. 1 Fest. 255; Varro ap. Solinus. l. 17.

10 Livy, v. 41; Festus 248; Jordan i. 199; Gilbert i. 161. The seven "montes" are the Palatine with the Velia and Germinal, the Subura, and the three points of the Esquiline (Pagutal, Oppius and Capius).

11 See Mommsen, R.G. (7th ed.), i. 51.

12 Varro, L.L. v. 45, vii. 44; Jordan ii. 237.

13 See Latin Language.
This was long ago recognized by Schwegler (see his Römische Geschichte, passim) on the sufficient grounds of the great linguistic cleavage between the two orders. Such jealousy of mutual contact in religious matters as is apparent all through the history of the city very rarely, if ever, springs from any other source than a real difference of race. This point was developed by Professor W. Ridgeway in his Who were the Romans? (London, 1908), where he points out (a) that the deities tended by the three greater or patrician flames, namely, Dialus, Martialis, Quirinallis, were all closely connected with the Sabines; (b) further, that the patrician form of marriage, the highly religious ceremony called Conferaratio, differed entirely from the other forms, Ursus and Commodus, which there is reason to attribute to a plebeian origin; (c) that the arms, especially the round shield, carried by the first class in the originally military constitution of Servius Tullius (see below), are characteristic of the warriors of Central Europe in the Early Iron and Bronze Age, whereas those of the remaining classes can be shown to have been in general use during the immediately preceding period in the Mediterranean lands.

For other archaeological evidence separating the patricians from the plebeians, and connecting the patricians closely with the Sabines the reader must be referred to Ridgeway's essay. It is, however, well to make special mention of the tradition, which is given by Livy (ii. 16. 4), and is undated but not the least probable for being a non-annalistic tradition, preserved in the gens itself, of the prompt welcome given to the Sabine Appius Claudius, the founder of the haughtiest of all the Roman noble families, by the patricians of Rome and his immediate admission to all their political privileges. Ridgeway points out that this implies, at that early time, a substantial identity of race.

On the linguistic side of the question it is well to mention for clearness' sake that this Sabine or patrician class marked its ascendancy all over Central and Southern Italy, from the 6th century B.C. onwards, by forming of singulars, with the suffix -ino which it frequently imposed also upon the communities whom it brought under its influence. Sabini (earlier Sañini), Romani, Latini, Sidicini, Aricini, Morrucini, and the like are all names formed in this way (see further Sannini). 2.

It may also now be regarded as certain that what we may call the Lower or Earlier Stratum (or Strata) of population in Rome, themselves spoke a language which was as truly Indo-European as the language of their Sabine conquerors. In the article Voices, he will make special mention of the tradition that the language of what has been there entitled the Co-Folk was not less certainly Indo-European, and in some respects probably a less modified form of Indo-European, than that of the Sabinas. A number of the names formed with the -co- suffix and with the -ali- suffix (which is frequent in the same districts) contain unmistakably Indo-European words such as Gravisca, Marica, des Marica, Volesi, Castinates, Sarace, Interamnites, Auxumates. The fusion of this earlier stratum with the patricians is far easier to imagine when it is recognized that the two parties spoke kindred though by no means identical languages. It is the essentially Indo-European character of the early inhabitants of the Latin plain which has led many scholars to doubt that there was any racial distinction at all between patricians and plebeians, but the increase of knowledge of the dialects spoken in the different regions of Italy has now enabled us to judge this question with very much fuller evidence.

3. There arises, however, the important question or questions as to the origin, or at least the ethnic connexions of this earlier stratum. The task of the historic inquirer will not be completely performed until at least some further progress has been made in connecting this earlier population of the western coast of Italy, on the one hand, with one or more of the early races (see Siculus, Veneti, Liguria, Pelasgians) whom tradition declares to have once inhabited the soil of Latium; and on the other, with the people or peoples whom archaeological research reveals to us as having left behind them different strata of remains, all earlier than the Iron or Roman Age, both in Latium and in other parts of Italy. Professor Ridgeway has taken a short way with these problems which may prove to be the true one; he classifies together as Ligurian all pre-Safine inhabitants of Italy save such elements as, like the Etruscans, can be shown to have invaded it over sea (see Etruria, § Language). This is one of the most promising fields of investigation now open to scholars, but in view of the confused and mutilated shape in which the traditions current in ancient times have come down to us, it demands an exceedingly careful scrutiny of the archaeological and linguistic evidence, and this stangely cautious judgment in combining the two. The point of outstanding importance is to determine whether the earlier Indo-European population is to be regarded as having been in Italy from the beginning of human habitation. Archaeologists generally like W. Helbig (Die Italiker der Poebene) and more recently B. Modestov (Introduzione à l'histoire romaine, Paris, 1907) have been inclined to regard the Ligurians as the most primitive population of Italy, but to distinguish them sharply from the people who built the Lake Settlement and Pile Dwellings, which appear (with important variations of type):—(1) in the western half of the valley of the Po; (2) in the eastern half of the same in Etruria; and (3) as far south as Tarentum. One of the most important points in the identification is the question of the method of burial employed at different epochs by the different communities. (See the works already cited, with that of O. Montelius, La Civilisation primitive en Italie.) The populus Romanus was, we are told, divided into three tribes, Ramnes, Tities and Luceres, and into thirty curiae. The three names, as Schulze has shown (Lat. Eigennamen, p. 580), are neither more nor less than the names of three Etruscan gentes (whether or not derived from Sabine or Latin originals), and the tradition is a striking result of the Etruscan domination in the 6th century B.C., which we shall shortly consider.

Of far greater importance is the division into curiae. In Cicero's time there were still curies, curial festivals and curial assemblies, and modern authors are unquestionably right in regarding the curia as the keystone of the primitive political system. It was a primitive association held together by participation in common sacra, and possessing common festivals, common priests and a common chapel, hall and hearth. As separate associations the curiae were probably older than the Roman state, but, however this may be, it is certain that of the thirty curiae which still formed they constituted the only effective political subdivisions. The members of the thirty curiae form the populus Romanus, and the earliest known condition of Roman citizenship is the communio sacrorum, partnership in the curial sacra. Below the curia there was no further political division, for there is no reason to believe that the curia was ever formally subdivided into a fixed number of gentes and families.4

At their head was the rex, the ruler of the united people. The Roman 'king' is not simply either the hereditary and patriarchal chief of a clan, the priestly head of a community bound together by common sacra, but the elected magistrate of a state, but a mixture of all three.5

1 The tradition connecting the Ramnes with Romulus and the Tities with Tatius is as ancient as Ausonius (Dial. p. 58). The best authorities on the question, earlier than Schulze's epoch-making treatise, are Schwegler i. 505, and Volquardsen, Rhein. Mus. xxiii. 538. 

2 The Sabines are traditionally connected only with the senate of 300 quires, with the primitive legion of 3000, with the vestal virgins, and with the augurs (Varro, L.L. v. 81, 89, 91; Livy x. 6; Festus 345; Mommsen i. 41, 74, 75; Genz, Patriarch. Rom. 90).

3 It is possible that the curiae were originally divided into separate parishes; cf. such names as Forienza, Velensia (Fest. 174; Gilbert i. 213).

4 Schroer's supposition of ten gentes in each curia has nothing in its favour but the confused statement of Dionysius as to the purely military oikistes (Dionys. ii. 7; cf. Müller, Phileologus, xxxiv. 96).

5 Rubino, Genz and Lange insisted on the hereditary patriarchal character of the kingship, Iine on its priestly side, Schwegler on its elective. Mommsen came nearest to the view taken in the text, but
later times, when no "patrician magistrates" were forthcoming to hold the elections for their successors, a procedure was adopted which was believed to represent the manner in which the early kings had been appointed. In this procedure the ancient privileges of the old gentes and their elders, the importance of maintaining unbroken the continuity of the sacra, on the transmission and observance of which the welfare of the community depended, and thirdly the rights of the freemen, are all recognized. On the death of a king, the auspicia, and with them the supreme authority, revert to the council of elders, the patres, as representing the gentes. By the patres an interrex is appointed, who, in turn nominated by him, or even by a third or fourth interrex, a new king is selected in consultation with the patres. The king-designate is then proposed to the freemen assembled by their curiae for their acceptance, and finally their formal acceptance is ratified by the patres, as a security that the sacra of which they are the guardians have been respected. Thus the king is in the first instance selected by the representatives of the old gentes, and they ratify his appointment. In form he is nominated directly by a predecessor from whose hands he receives the auspicia. But it is necessary also that the choice of the patres and the nomination of the interrex should be confirmed by a solemn vote of the community.

It is useless to attempt a precise definition of the prerogatives of the king when once installed in office. Tradition ascribes to him a position and powers closely resembling those of the heroic kings of Greece. He rules for life, and he is the sole ruler, unfettered by written statutes. He is the supreme judge, settling all disputes and punishing wrongdoers even with death. All other officials are appointed by him. He imposes taxes, distributes lands and erects buildings. Senate and assembly meet only when he convenes them, and meet for little else than to receive communications from him. In war he is absolute leader, and finally he is also the religious head of the community, charged with the ceremonial of the state, to offer the solemn sacrifices and to announce the days of the public festivals. Hard by his house was the common hearth of the state, where the vestal virgins cherished the sacred fire.

By the side of the king stood the senate, or council of elders. In the descriptions left us of the primitive senate, as in those of the rex, we can discover traces of a transition from an earlier state of things when Rome was only an assemblage of clans or village communities, allied indeed, but each still ruled by its own chiefs and headmen, to one in which these groups have been fused into a single state under a common ruler. On the one hand the senate appears as a reflection of the old system of government, as a group of the elders of the state, but it is also the expression of its own, and claiming to be the ultimate repository of the supreme authority and of the sacra connected with it. The senators are the patres; they are taken from the leading gentes; they hold their seats for life; to them the auspicia revert on the death of a king; they appoint the interrex from their own body, are consulted in the choice of the new king, and their sanction is necessary to ratify the vote of the assembled freemen. On the other hand, they are no longer supreme.

They cannot appoint a king but with the consent of the community, and their relation to the king when appointed is one of subordination. Vacancies in their ranks are filled up by him, and they can but give him advice and counsel when he chooses to consult them.

The popular assembly of united Rome in its earliest days was that in which the freemen met and voted by their curiae (comitia curiata). The place of assembly was in the Comitium at the north-east end of the Forum. The assembly, at the summons and under the presidency of the king or, failing him, of the interrex. By the rex or the interrex the question was put, and the voting took place curialium, the votes of each curia being called up in turn. The vote of each curia was decided by the majority of individual votes, and a majority of the votes of the curiae determined the final result. But the occasions on which the assembly could exercise its power must have been few. Their right to elect magistrates was apparently limited to the acceptance or rejection of the king proposed by the interrex. Of the passing of laws, in the later sense of the term, there is no trace in the kinlgy period. Dionysius's statement that they voted on questions of war and peace is improbable in itself and unsupported by tradition. They are indeed represented, in one instance, as deciding a capital case, but it is by the express permission of the king and not of right. Assemblies of the people were also, and probably more frequently, convened for other purposes. Not only did they meet to hear from the king the announcement of the high days and holidays for each month, and to witness such solemn religious rites as the inauguration of a priest, but their presence (and sometimes their vote) was further required to authorize and attest certain acts, which in a later age assumed a more private character. The disposal of property by will and the solemn renunciation of family or gentile sacra could only take place in the presence of the assembled freemen, while for adoption (adrogatio) not only their presence but their formal consent was necessary.

A history of this period is out of the question. The names, dates and achievements of the first four kings are all too unsubstantial to form the basis of a sober narrative; a few points only can be considered as fairly well established. If we except the long eventless reign ascribed to King Numa, tradition represents the first kings as incessantly at war with their immediate neighbours. The details of these wars are no doubt mythical, but the implied condition of continual struggle, and the narrow range within which the struggle is confined, may be accepted as true. The picture drawn is that of a small community, with a few square miles of territory, at deadly feud with its nearest neighbours, a radius of some ten miles for Rome. Numa, in spite of the repeated victories with which tradition credits Romulus, Ancus and Tullus, does there seem to have been any real extension of Roman territory except towards the sea. Fidenae remains Etruscan; the Sabines continue masters up to the Anio; Fraseste, Gabii and Tusculum are still untouched; and on this side it is doubtful if Roman territory, in spite of the possible destruction of Alba, extended outside a greater distance than the sixth milestone from Rome. But along the course...
of the Tiber below the city there was a decided advance. The fortification of the Janicum, the building of the pons sublicius, the foundation of Ostia and the acquisition of the salt-works near the sea may all be safely ascribed to this early period. Closely connected, too, with the control of the Tiber from Rome to the sea was the subjugation of the petty Latin communities lying south of the river; and the tradition of the conquest and destruction of Polinnae, Talleia and Ficarium is confirmed by the absence in historical times of any Latin communities in this district.

With the reign of the fifth king Tarquinii Priscus a marked change takes place. The traditional accounts of the last three kings not only wear a more historical air than those of the first four, but they describe something like a transformation of the Roman city and state. Under the rule of these latter kings the separate settlements are for the first time enclosed with a rampart of colossal size and extent. The low grounds are drained, and a forum and circus elaborately laid out; on the Capitoline Mount a temple is erected, the massive foundations of which were an object of wonder even to Pliny. To the same period are assigned the rededication of the city area into four new districts and the introduction of a new military system.

Rome, once more a comparatively small state, with hostile and independent neighbours at her very doors. It is impossible to doubt the conviction that the true explanation of this phenomenon is to be found in the supposition that Rome during this period passed under the rule of powerful Etruscan lords. In the 7th and 6th centuries B.C., and probably earlier still, the Etruscan kings as rulers widely outside the limits of Etruria proper. They were supreme in the valley of the Po until their power there was broken by the irruption of Celtic tribes from beyond the Alps, and while still masters of the plains of Lombardy they established themselves in the rich lowlands of Campania, where they held their ground until the capture of Capua by the Samnite highlanders in 423 B.C. It is on the face of it improbable that a power which had extended its sway from the Alps to the Tiber, and from the Liris to Surrentum, should have left untouched the intervening stretch of country between the Tiber and the Liris. And there is abundant evidence of Etruscan rule in Latium. According to Dionysius there was a time when the Latins were known to the Greeks as Tyrrhenians, and Rome as a Tyrrhenian city. When Aeneas landed in Italy the Latins were at feud with Turnus (Turnus). Dionys. i. 164) of Ardea, whose close ally was the ruthless Mezentius, prince of Caere, to whom the Latins had been forced to pay a tribute of wine. Cato declared the Volsci to have been once subject to Etruscan rule, and Etruscan remains found at Velitum, as well as the second name of the Volscian Anxur, Tarracina (the city of Tarquin). The city was in the hands of the Tarquins, who transferred the capital of the state to the right bank of the Tiber, and established the Roman state on its present site.

Rome was thus the find of Etruscan power encircling Rome on all sides, and in the absence of traditions of the rule of princes of Etruscan origin. The Tarquinii come from south Etruria; their name can hardly be anything else than the Latin equivalent of the Etruscan Tarxian, and is therefore possibly a title (= "lord" or "prince") rather than a proper name. Even Servius Tullius was identified by Tuscan chroniclers with an Etruscan "Mastarna." Again, what we are told of Etruscan conquests does not correctly represent them as passing their borders and settling down in massa in the conquered districts. We hear rather of military raids led by ambitious chiefs who carve out principalities for themselves with their own good words, and with their followers rule oppressively over alien and subject peoples. And so at Rome the story of the Tarquins implies not a wave of Etruscan immigration so much as a rule of Etruscan princes over conquered Latins. The achievements ascribed to the Tarquins are not less characteristic. Their despotic rule and splendid contrast with the primitive simplicity of the native kings. Only Etruscan builders, under the direction of wealthy and powerful Etruscan lords, could have built the great cloaca, the Servian wall, or the Capitoline temple,—monuments which challenged comparison with those of the emperors themselves. Nor do the traces of Greek influence upon Rome during this period conflict with the theory of an Etruscan supremacy; on the contrary, it is at least possible that it was thanks to the extended rule and wide connexions of her Etruscan rulers that Rome was first brought into direct contact with the Greeks, who had long traded with the Etruscan ports and influenced Etruscan culture.

The Etruscan princes are represented, not only as having raised Rome to the post of a commanding position in Latium and laboured upon the city itself the resources of Etruscan civilization, but also as the authors of important internal changes. *Servian reforms.* They are represented as favouring new men at the expense of the old patrician families, and as reorganizing the Roman army on a new footing, a policy natural enough in military princes of alien birth, and rendered possible by the additions which conquest had made to the original community. From among the leading families of the conquered Latin states a hundred new members were admitted to the Senate, and these *gentes theonecforth ranked as patrician,* and became known as *gentes minores.* The changes in the army began, it is said, by the elder Tarquin and completed by Servius Tullius were more important. The basis of the primitive military system had been three tribes, each of which furnished 1000 men to the legion and 100 to the cavalry. Tarquinii Priscus, we are told, contemplated the creation of three fresh tribes and three additional centuries of horsemen with new names, though in face of the opposition offered by the old families he contented himself with simply doubling the strength without altering the names of the old divisions. But the change attributed to Servius Tullius went far beyond this. His famous distribution of all freeholders (assidui) into tribes, classes and centuries, though subsequently adopted with modifications as the basis of the Roman constitution.

political system, was at first exclusively military in its nature and objects. It amounted, in fact, to the formation of a new and enlarged army on a new footing. In this force, excepting in the case of the centuries of the horsemen, no regard was paid either to the old clan divisions or to the semi-religious, semi-political curiae. In its ranks were included all freeholders within the Roman territory, whether members or not of any of the old divisions, and the organization of this new army of assidui was not less independent of the old system with its clannish and religious traditions and forms. The unit was the centuria or company of 100 men; the centuriæ were grouped in "classes," and drawn up in the order of the phalanx. The centuries in front were composed of the wealthier citizens, whose means enabled them to bear the cost of the complete equipments necessary for those who were to bear the brunt of the onset. These centuries formed the first class. Behind them stood the centuries of the second and third classes, less completely armed, but making up together with those of the first class the heavy-armed infantry. In the rear were the centuries of the fourth and fifth classes, recruited from the poorer freeholders, and serving only as light-armed troops. The entire available body of freeholders was divided into three classes, the chief officers and a corps of seniores and a corps of juniores for active service. Each of these corps consisted of 85 centuries or 8,500 men, i.e. of two legions of about 4,200 men each, the normal strength of a consular legion under the early Republic. It is noticeable also that the heavy-armed centuries of the three first classes in each of these legions represented a total of 3,000 men, a number which agrees exactly with the number of heavy-armed troops in the legion as described by Polybius. Attached to the legions, but not included in them, were the companies of sappers and trumpeters. Lastly, to the six centuries of horsemen, which still retained the old tribal names, twelve more were added as a distinct body, and recruited from the wealthiest class of citizens. The four "tribes" also instituted by Servius were probably intended to serve as the bases for the levy of freeholders for the new army. As their names show, they corresponded with the natural local divisions of the city territory.

The last of these Etruscan lords to rule in Rome was Tarquin the Proud. He is described as a splendid and despotic monarch. His sway extended over Latium as far south as Circii. Aristodemus, tyrant of Cumae, was his ally, and kinsmen of his own were princes at Collatia, at Gabii, and at Tusculum. The Volscian highlanders were chastised, and Sabinus, the last king of the Sabines, was driven away from Rome itself the Capitoline temple and the great cloaca bore witness to his power. But his rule pressed heavily upon the Romans, and at the last, on the news of the foul wrong done by his son Sextus to a noble Roman matron, Lucretia, the indignant people rose in revolt. Tarquin, who was away besieging Ardea, was deposed; sentence of exile was passed upon him and upon all his race; and the

1 This is recognized by Mommsen, Genz and Soltau, as against Niebuhr, Schwelder and Ihne. Even in the later comitia centuriala the traces of the originally military character of the organization are unmistakable.

2 The century ceased to represent companies of one hundred when the whole organization ceased to be military and became exclusively political.

3 The property qualification for service in the first class is given at 100,000 asses (Livy), for the second at 70,000, third 50,000, fourth 25,000, fifth 11,000. It was probably originally a certain number of cows, afterwards translated into terms of money: cf. W. Ridgeway, The Origin of Coinage and Metallic Currency (Cambridge, 1892), p. 391. The same scholar, in his Who were the Romans? p. 17, has pointed out the ethnical meaning of the varieties of armature in the early centuries.

4 Polyb. vi. 20; Mommsen, Röm. Trib. 132 sqq.

5 Livy i. 43. Dionys. (v. 18) and Cic. (De Rep. ii. 22) ascribe the whole eighteen to Servius. But the six older centuries remained distinct, as the "sex suffragiorum" of the comitia centuriala; Cic. De Rep. ii. 22.

6 Dionys. iv. 14, έσι το τα κατάγασα των στρατιωτών.

7 Livy i. 43.

8 The four were Palatina, Suburana, Exquillina, Collina.

people swore that never again should a king rule in Rome. Freed from the tyrant, they chose for themselves two yearly magistrates who should exercise the supreme authority, and thus the Republic of Rome was founded. Three times the banished Tarquin strove desperately to recover the throne he had lost. First of all the men of Veii and Tarquinii marched to his aid, but were defeated in a pitched battle on the Roman frontier. A year later Lars Forsena, prince of Clusium, at the head of all the powers of Etruria, appeared before the gates of Rome, and closely besieged the city, until, moved by the value of his foe, he granted honourable terms of peace and withdrew.

8 Once again, by Lake Regillus, the Romans fought victoriously for their liberty against Tarquin’s son-in-law Mamilius, prince of Tusculum, and chief of the Latin League. Mamilius was slain; Tarquin in despair found a refuge at Cumae, and there soon afterwards died.

So, in brief, ran the story of the flight of the kings, as it was told by the chroniclers whose story Livy reports, though with explicit and repeated notes of reserve. Its details are most of them fabulous; it is crowded with inconsistencies and improbabilities; there are no trustworthy dates; it names Roman brothers who were actually probably fictitious, and the band of the improver, Greek or Roman, is traceable throughout.

But there is no room for doubting the main facts of the emancipation of Rome from the rule of alien princes and the final abolition of the kingly office.

(II. F. P.; R.S.C.)

II. The Republic.

It is characteristic of Rome that the change from monarchy to republic should have been made with the least possible disturbance of existing forms. The title of king was retained, though only as that of a priestly officer (rex sacrum) to whom some of the religious functions of the former kings were transferred. The two annually elected consuls, or praetores, were regarded as joint heirs of the full kingly authority, and as holding the imperium, and the correlative right of taking the auspices, by direct transmission from the founder of the city. They were, it is true, elected or designated by a new assembly, by the army of landholders voting by their classes and centuries (comitia centuriala), and to this body was given also the right of passing laws; nevertheless it was still by a vote of the thirty curiae (lex curiata) that the supreme authority was formally bestowed on the consuls, as the representatives of the landholders, and both the choice of magistrates and the passing of laws still required the sanction of the patrician senators (patron auctoritas).

9 Nor, lastly, were the legal prerogatives of the senate altered, although it is probable that before long plebeians were admitted to seats, if not to votes, and though its importance was gradually increased by the substitution of an annual magistracy for the lifelong rule of a single king. But the

10 Livy ii. 9–14. Pliny (N.H. 34, 14) and Tacitus (Ann. iii. 72) imply the existence of a tradition, possibly that of "Tuscan annalists," according to which Porson actually made himself master of Rome. The whole story is fully criticized by Schwelder (ii. 181 seq.) and Zöllner (Lateral u. Rom. p. 180).

II. The exhaustion of the subject was noted by Schwelder (ii. pp. 66–225).

11 The traditional account of early republican history, given in annalistic form by Livy, has been subjected to severe criticism in recent times, notably by Pais in his Storia di Roma, vols. i. and ii. It is there the decay of the social and political life in details. Nevertheless, the general truth of the story of Rome’s early wars and constitutional growth cannot be seriously impugned.

12 Schwelder (ii. 92) suggests that the dictatorship formed an intermediate step between the monarchy and the consulship; cf. Ihne, Röm. Forsch. 42.

13 That the consuls were originally styled praetores is stated by Varro, op. cit. p. 23, and Liv. iii. 55; cf. Cic. Legg. viii. 3, 8. When additional praetors were created, the two originally appointed were called praetores maximis and hence στρατηγοὶ οἰκιακοὶ or simply οἰκιακοὶ in Greek.

14 The view of the patron auctoritas here adopted is that taken by T. Mommsen (Forsch. I).
abolidion of the monarchy brought with it a change of the utmost importance in the actual working of the constitution. Though the distinction between patricians and plebeians was at least as old as the state itself, it is not until the establishment of the Republic that it plays any part in the history of Rome. No sooner, however, was the overshadowing authority of the king removed than a struggle commenced between the two orders which lasted for more than two centuries. It was in no sense a struggle between a conquering and a conquered class, or between an exclusive citizen body and an unfranchised mass outside its pale. Patricians and plebeians were equally citizens of Rome, sprung of the same race and speaking the same tongue (but see above). The first census (the multitude πλῆθος) belonged all who were not members of some patrician gens, whether independent freemen or attached as "clients" to one of the great houses. The plebeian was a citizen, with civil rights and a vote in the assembly of the curies, but he was excluded by ancient custom from all share in the higher honours of the state, and intermarriage with a patrician was not recognized as a properly legal union (see Patricians).

The revolution which expelled the Tarquins gave the plebeians who had mainly assisted in bringing it about, an overwhelming ascendancy in the state. The plebes had indeed gained something. Not only was it probable that the strictness of the old tie of clientship had somewhat relaxed, and that the number of the clientes was smaller and their dependence on patrician patrons less complete, but the ranks of the plebes had, under the later kings, been swelled by the admission of conquered Latins, and the freeholders among these had with others been enrolled in the Servian tribes, classes and centuries. The establishment of the Republic invested this military levy of landholders with political rights as an assembly, for by their votes the consuls were chosen and laws passed, and it was the plebian landholders who formed the main strength of the plebes in the struggle that followed. But these gains were greater in appearance than in reality. The plebian landholders commanded only a minority of votes in the comitia centuriata. In their choice of magistrates they were limited to the patrician candidates nominated by patrician presiding magistrates, and their choice required confirmation not only by the older and smaller assembly of the curiae, in which the patricians and their clients predominated, but also by the patrician patres. They could only vote on laws proposed by patrician consuls, and here again the subsequent sanction of the patres was necessary. The whole procedure of the comitia was in the hands of their patrician predecessors, and liable to every sort of interruption and suspension from patrician pontiffs and augurs (for details see further Comitia and Senate).

But these political disabilities did not constitute the main grievance of the plebes in the early years of the Republic. What they fought for was protection for their lives and liberties, and the object of attack was the despotic authority of the patrician magistrates. The consuls wielded the full imperium of the kings, and against this "consular authority" the plebeian, though a citizen, had no protection and no appeal, nor were matters improved when for the two consuls was substituted in some emergency a single, all-powerful, irresponsible dictator.

The history of this struggle between the orders opens with a concession made to the plebes by one of the consuls themselves, a concession possibly due to a desire to secure the allegiance of the plebian landholders, who formed the backbone of the army. In the first year of the Republic, according to the received chronology, Publicola or Poplicola carried in the comitia centuriata his famous law of appeal. It enacted that no magistrate, saving only a dictator, should execute a capital sentence upon any Roman citizen unless the sentence had been confirmed on appeal by the assembly of the centuries. But, though the "right of appeal" granted by this law was justly regarded in later times as the greatest safeguard of a Roman's liberties, it was by no means at first so effective a protection as it afterwards became. For not only was the operation of the law limited to the bounds of the city, so that the consul in the field or on the march was left as absolute as before, but no security was provided for its observance even within the city by consuls resolved to disregard it.

It was by their own efforts that the plebeians first obtained any real protection against magisterial despotism. The traditional accounts of the first secession are confused and contradictory, but its causes and results are tolerably clear. The seceders were the plebeian legionaries recently returned from a victorious campaign. Indignant at the delay of the promised reforms, they ignored the order given them to march against Volsci and Aequi, and instead entrenched themselves on a hill across the Tiber, 3 m. from Rome, and known afterwards as the Mons Sacer. The frightened patricians came to terms, and a solemn agreement (lex sacra) was concluded between the orders, by which it was provided that henceforth the plebeians should have annual magistrates of their own called tribunes (tribuni plebis), members of their own order, who should be authorized to protect them against the consuls, and a curse was invoked upon the man who should injure or impede the tribune in the performance of his duties. The number of tribunes was possibly at first two, then five; before 449 B.C. it had been raised to ten.

The tribunate is an institution which has no parallel in history. The tribune was not, and, strictly speaking, never became, a magistrate of the Roman people. His one proper prerogative was that of granting protection to the oppressed plebeian against a patrician officer. This prerogative (jus auxiliarium) was secured to him, not by the ordinary constitution, but by a special compact between the orders, and was protected by the ancient oath (vetus jusjurandum), which invoked a curse upon the violator of a tribune. This exceptional and anomalous right the tribunes could only exercise in person, within the limits of the "pomerium," and against individual acts of magisterial oppression. It was only gradually that it expanded into a wide police power in the supervision of the whole machinery of government, and was supplemented by the legislative powers which rendered the tribunate of the last century B.C. so formidable (see Tribune).

But from the first the tribunes were for the plebes not only protectors but leaders, under whom they organized themselves in opposition to the patricians. The tribunes convened Lex assemblies of the plebes (concilia plebis), and carried resolutions on questions of interest to the order. This incipient
plebeian organization was materially advanced by the Pubilian law of 471 B.C.,1 which appears to have formally recognized as lawful the plebeian concilia, and established also the tribune’s right cum plebe agere, i.e. to propose and carry resolutions in the concilia of the plebs. In other words, the voting in them took place not by centuries or but by tribes. In them, lastly, after the Pubilian law, if not before, the tribunes were annually elected.2 By this law the foundations were laid both of the powerful concilia plebis of later days and also of the legislative and judicial prerogatives of the tribunes. The patricians maintained indeed that resolutions (plebiscita) carried by tribunes in the concilia plebis were not binding on their order, but the moral weight of such resolutions, whether they affirmed a general principle or pronounced sentence of condemnation on some single patrician, was no doubt considerable.

The next stage in the struggle is marked by the attempt to substitute a public written law for unwritten usage.

292. The proposal of C. Terentius Arsa (462 B.C.) to appoint a plebeian commission to draw up laws restricting the powers of the consuls3 was resolutely opposed by the patricians, but after ten years of bitter party strife a compromise was effected. A commission of ten patricians was appointed, who should frame and publish a code of law binding equally on both the orders. These decemviri were to be the sole and supreme magistrates for the year, and the law of appeal was suspended in their favour.4 The code which they promulgated, the famous XII. Tables, owed little of its importance to the number of its provisions contained in its provisions. For the most part it seems merely to have reaffirmed existing usages and laws (see Roman Law). But it imposed, as it was intended to do, a check on the arbitrary administration of justice by the magistrates. With the publication of the code the proper work of the decemvirs was finished; nevertheless, for the next year a fresh decemvirate was elected, and it is conceivable that the intention was permanently to substitute government by an irresponsible patrician “council of ten” for the old constitution.5 However this may have been, the tyranny of the decemvirs themselves was fatal to the continuance of their power. We are told of a second secession of the plebs, this time to the Janiculum, and of negotiations with the senate, the result of which was the enforced abdication of the decemvirs. The plebs joyfully chose for themselves tribunes, and in the comitia centuriata two consuls were created. But this restoration of the old régime was accompanied by legislation which made it an important crisis in the history of the struggle between the orders. With the fall of the decemvirate this struggle enters upon a new phase.

The tribunes appear as at once more powerful and more strictly constitutional magistrates; the plebeian concilia take their place by the side of the older assemblies; and finally this improved machinery is used not simply in self-defence against patrician oppression but to obtain complete political equality. This change was no doubt due in part to circumstances outside legislation, above all to the expansion of the Roman state, which swelled the numbers and added to the social importance of the plebs as compared with the dwindling forces of the close corporation of patrician gentes. Still the legislation of 449 clearly involved more than a restoration of the old form of government. The Valerio-Horatian laws, besides reaffirming the right of appeal and the inviolability of the tribunes, improved the position of the plebeian assemblies by enacting that pletiscita passed in them, and, as seems probable, approved by the patres, should be binding on patricians as well as plebeians.6

By this law the tribunes obtained a recognized initiative in legislation. Henceforth the desired reforms were introduced and carried by tribunes in what were now styled comitia tributa, and, if sanctioned by the patres, became laws of the state. From this period, too, must be dated the legalization at any rate of the tribune’s right to impeach any citizen before the assembly of the tribunes.7 Henceforward there is no question of the tribune’s right to propose to the plebs to impose a fine, or of the validity of the sentence when passed. The efficiency of these new weapons of attack was amply proved by the subsequent course of the struggle. Only a few years after the Valerio-Horatian legislation came the lex Canuleia, itself a plebiscitum (445 B.C.), by which mixed marriages between patricians and plebeians were declared lawful, and the social exclusiveness of the patriciate broken down. In the same year with this measure, and like it in the interest primarily of the wealthier plebeians, a vigorous attack commenced on the patrician monopoly of the consulate, and round this stronghold of patrician ascendancy the conflict raged until the passing of the Licinian laws in 367. The original proposal of the tribune Gaius Canuleius, in 445, that the people should be allowed to elect a plebeian consul was evaded by a compromise. The senate resolved that for the next year, in the stead of consuls, six military tribunes with consular powers should be elected,8 and that the new office should be open to patricians and plebeians alike. The consulship was thus for the time saved from pollution, as the patricians phrased it, but the growing strength of the plebs is shown by the fact that in fifty years out of the seventy-eight between 444 and 366 they succeeded in obtaining the election of consular tribunes rather than of consuls.

Despite, however, these discouragements, the patricians fought on. Each year they strove to secure the creation of consuls rather than consular tribunes, and failing this strained every nerve to secure for their own order at least a majority among the latter. Even the institution of the censorship (435), though rendered desirable by the increasing importance and complexity of the census, was, it is probable, due in part to their desire to discount beforehand the threatened loss of the consulship by diminishing its powers.9 Other causes, too, helped to protract the struggle. Between the wealthier plebeians, who were ambitious of high office, and the poorer, whose minds were not set rather on allotments of land, there was a division of interest of which the patricians were not slow to take advantage, and to this must be added the pressure of war. The death struggle with Veii and the sack of Rome by the Gauls absorbed for the time all the energies of the community. In 377, however, two of the tribunes, C. Licinius Stolo (see Licinii Stolo, Gaius) and L. Sextius, came forward with proposals which united all sections of the plebs in their support. Their proposals were as follows:10 (1) that consuls and not consular tribunes be elected; (2) that one consul at least should be a plebeian; (3) that the priestly college, which had the charge of the Sibylline books, should consist of ten members instead of two, and that of these half should be plebeians; (4) that no single citizen should hold in occupation more than 500 acres of the common lands, or pasture upon them more than 100 head of cattle and 500 sheep; (5) that all landowners should employ a certain amount of free as well as slave labour on their estates; (6) that interest already paid on debts should be deducted from the principal, and the remainder paid off in three years. The three last proposals were obviously intended to meet the patres plebiscitum legem comitibus centuriatibus tulerunt, ut quod tribunal, eodem exemplo legibus publicis utissent, populus magis sub gregem concordium acerrimum datum est.” What were the precise conditions under which a plebiscitum became law can only be conjectured. The control of the patres over legislation certainly remained effective until 327 B.C. (See below.)

7 After the decemvirate, the tribunes no longer pronounce capital sentences. They propose fines, which are confirmed by the comitia tributa.

demands of the poorer plebeians, and to secure their support for the first half of the scheme. Ten years of bitter conflict followed, but at last, in 367 B.C., the Licinian rogations became law, and one of their authors, L. Sextius, was created the first plebian consul. For the moment it was some consolation to the patricians that they not only succeeded in detaching from the consulsip the administration of civil law, which was entrusted to a separate officer, praecon urbs, to be elected by the plebs, but that the courts of the centuries, with an understanding apparently that he should be a patrician, but also obtained the institution of two additional aediles (aediles curules), who were in like manner to be members of their own order. With the opening of the consulsip, however, the issue of the long contest was virtually decided, and the next eighty years witnessed a rapid succession of plebian victories. Now that a plebian consul might preside at the elections, the main difficulty in the way of the nomination and election of plebian candidates was removed. The proposed patrician monopoly of the new curule aedilship was almost instantly abandoned. In 356 the first plebian was made dictator; in 350 the censorship, and in 337 the praetorship were filled for the first time by plebeians; and lastly, in 300, by the lex Oegulnia, even the sacred colleges of the pontiffs and augurs, the old strongholds of patrician supremacy, were thrown open to the plebs.\(^1\) The patricians lost also the control they had exercised so long over the action of the people in assembly. The patrum auctoritas, the sanction given or refused by the patrician senators to laws and to elections, had hitherto been a powerful weapon in their hands. But in 339 a law of Q. Publius Philo, a plebian dictator, enacted that this sanction should be given beforehand to laws enacted in the comitia centuriata,\(^3\) and a lex Mancia of uncertain date extended the rule to elections in the same assembly. Livy ascribes to the same Publius a law emancipating the concilium plebis Lex Hortensia,\(^4\) from the control of the patres; but this seems in reality to have been enacted by the famous lex Hortensia,\(^5\) carried by another plebian dictator.\(^6\) Henceforward the patrum auctoritas sank into a meaningless form, though as such it still survived in the time of Livy. From 287 onwards it is certain that much was passed by the plebs, voting by their tribes, having the full force of laws without any further conditions whatsoever. The legislative independence of the plebian assembly was secured, and with this crowning victory ended the long struggle between the orders.

(b) \textit{Conquest of Italy.}—Twelve years after the passing of the lex Hortensia, King Pyrrhus, beaten at Beneventum, withdrew from Italy, and Rome was left mistress of the peninsula. The steps by which this supremacy had been won have now to be traced.\(^7\)

The expulsion of the Tarquins from Rome, followed as it seems to have been by the emancipation from Etruscan supremacy of all the country between the Tiber and the Liris, entirely altered the aspect of affairs. North of the Tiber the powerful Etruscan city of Veii, after a vain attempt to restore the Tarquins, relapsed into an attitude of sullen hostility towards Rome, which, down to the outbreak of the final struggle in 407,\(^8\) found vent in constant and harassing border forays. The Sabines recommenced their raids across the Anio; from their hills to the south-east the Aequi pressed forward as far as the eastern spurs of the Alban range, and ravaged the low country between that range and the Sabine mountains; the Volsci overran the coast-lands as far as Antium, established them-\(^{1}\) selves at Velitrae and even wasted the fields within a few miles of Rome. But the good fortune of Rome did not leave her to face these foes single-handed, and it is a significant fact that the history of the Roman advance begins, not with a brilliant victory, but with a timely alliance. According to Livy, it was in 493, only a few years after the defeat at the prince of Tusculum at Lake Regillus,\(^2\) that a treaty was concluded between Rome and the Latin communities of the Campania.\(^3\) The alliance was in every respect natural. The Latins were the near neighbours and kinsmen of the Romans, and both Romans and Latins were just freed from Etruscan rule to find themselves as lowlanders and dwellers in towns face to face with a common foe in the rugged hill tribes on their borders. The exact terms of the treaty cannot, any more than the precise circumstances under which it was concluded, be stated with certainty (see \textit{Latiurium}), but two points seem clear. There was at first a genuine equality in the relations between the allies; Romans and Latins, though combining for defence and offence, did so without sacrificing their separate freedom of action, even in the matter of waging wars independently of each other.\(^4\) But, secondly, Rome enjoyed from the first one insuperable advantage. The Latins lay between her and the most active of her foes, the Aequi and Volsci, and served to protect her territories at the expense of their own. Behind this barrier Rome grew strong, and the close of the Aequian and Volscian wars left the Latins her dependents rather than her allies. Beyond the limits of the Campana Rome found a second ally, hardly less useful than the Latins, in the tribe of the Hernici ("the men of the rocks"), in the valley of the Ters, who had equal reason with the Romans and Latins to dread the Volsci and Aequi, while their position midway between the two latter peoples made them valuable auxiliaries to the lowlanders of the Campagna. The treaty with the Hernici is said to have been concluded in 486,\(^5\) and the confederacy of the three peoples—Romans, Latins and Hernicans—lasted down to the great Latin war in 340. Confused and untrustworthy as are the chronicles of the early wars of Rome, it is clear that, notwithstanding the acquisition of these allies, Rome made but little way against her foes during the first fifty years of the existence of the Republic. In 474, it is true, an end was put for a time to the harassing border raids, with Veii by a forty years' peace, an advantage due not so much to Roman valour as to the increasing dangers from other quarters which were threatening the Etruscan states.\(^6\) But this partial success stands alone, and down to 440 the raids of Sabines, Aequi and Volsci continue without intermission, and are occasionally carried up to the very walls of Rome.

Very different is the impression left by the annals of the next sixty years (440-390). During this period there is an unmistakable development of Roman power on all sides. In southern Etruria the capture of Veii (306) virtually gave Rome the mastery as far as the Ciminian forest. Saturn and Nepete, "the gates of Etruria," became her allies and guarded her interests against any attack from the Etruscan communities to the north, while along the Tiber valley her suzerainty was acknowledged as far as Capena and Falerii. On the Anio frontier we hear of no disturbances from 449 until some ten years after the sack of Rome by the Gauls. In 446 the Aequi appear for the last time before the gates of Rome. After 418 they disappear from Mount Albigus, and in the same year the communications of Rome and Latium with the Hernici in the Ters valley were secured by the capture and colonization of Labicum. Successive invasions, too, broke the strength of the Volsci, and in 303 a Latin colony was founded as far south as Circiæ. In part, no doubt, these Roman successes were due to the improved condition of
affairs in Rome itself, consequent upon the great reforms carried between 350 and 442; but it is equally certain that now, as often afterwards, fortune befriended Rome by weakening, or by diverting the attention of, her opponents. In particular, her rapid advance in southern Etruria was facilitated by the heavy blows inflicted upon the Etruscans during the 5th century B.C. by Celts, Greeks and Samnites. By the close of this century the Celts had expelled them from the rich plains of what was afterwards known as Cisalpine Gaul, and were even threatening to advance across the Apennines into Etruria proper. The Sicilian Greeks, headed by the tyrants of Syracuse, wrested from them their mastery of the seas, and, finally, on the capture of Capua by the Samnites in 443, they lost their possessions in the fertile Campanian plain. These conquests of the Samnites were part of a great southward movement of the highland Sabellian peoples, the immediate effects of which upon the fortunes of Rome were not confined to the weakening of the Etruscan power. It is probable that the cessation of the Sabine raids across the Anio was partly due to the new outlets which were opened southwards for the restless and populous hill tribes which had so long disturbed the peace of the Latin lowlands. We may conjecture, also, that the growing feeblessness exhibited by Volsci and Aequi was in some measure caused by the pressure upon their rear of the Sabellian clans which at this time established themselves near the Fucine lake and along the course of the Liris. But in 350, only six years after the great victory over her ancient rival Veii, the Roman advance was for a moment checked by a disaster which threatened to alter the course of history in Italy, and which left a lasting impress on the Roman mind. In 350 a Celtic horde left their newly won lands on the Adriatic, and, crossing the Apennines into Etruria, laid siege to the Etruscan city of Clusium (Chiusi). Thence, provoked, it is said, by the conduct of the Roman ambassadors, who, forgetting their sacred character, had fought in the ranks of Clusium and slain a Celtic chief, the barbarians marched upon Rome. On July the 18th of 350 B.C., only a few miles from Rome, was fought the disastrous battle of the Allia. The defeat of the Romans was complete, and Rome lay at the mercy of her foe. But in characteristic fashion the Celts halted three days to enjoy the fruits of victory, and to time was thus given to put the Capitol and the other city of Rome, which had been taken by the barbarians, was followed by the sack of the city, but the Capitol remained impregnable. For seven months they besieged it, and then in as sudden a fashion as they had come they disappeared. The Roman chroniclers explain their retreat in their own way, by the fortunate appearance of M. Furius Camillus with the troops which he had collected, at the very moment when famine had forced the garrison on the Capitol to accept terms. More probably the news that their lands across the Apennines were threatened by the Veneti, coupled with the unaccustomedudemum of a long siege and the difficulty of obtaining supplies, inclined the Celts to accept readily a heavy ransom as the price of their withdrawal. But, whatever the reason, it is certain that they retreated, and, though during the next fifty years marauding bands appeared at intervals in the neighbourhood of Rome, and even once penetrated as far south as Campania (361–60), the Celts never obtained any footing in Italy outside the plains in the north which they had made their own.

Nor, in spite of the defeat on the Allia and the sack of the city, was Rome weakened except for the moment by the Celtic attack. The storm passed away as rapidly as it had come upon. The city was hastily rebuilt, and Rome dismissed the enemies who hastened to take advantage of her misfortunes by her undiminished vigour. The Samnite conquests in southern Etruria were successfully defended against repeated attacks from the Etruscans to the north. The creation in 387 of four new tribes (Stellatina, Sabatina, Tromentina, Arvensis) marked the final annexation of the territory of Veii and of the lands lying along the Tiber valley.

A few years later Latin colonies were established at Sutrium and Nepete for the more effectual defence of the frontier, and finally, in 353, the subjugation of South Etruria was completed by the submission of Caere (q.v.) and its partial incorporation with the Roman state as a "municipium sine suffragio"—the first, it is said, of its kind. Next to the settlement of southern Etruria, the most important of the successes gained by Rome between 350 and 343 B.C. were those won against her old foes the Aequi and Volsci, and her old allies the Latins and Hernicans. The Aequi indeed, already weakened by their long feud with Rome, and hard pressed by the Sabellian tribes in their rear, were easily dealt with, and after the campaign of 358 we have no further mention of an Aequian war until the last Aequian rising in 304. The Volsci, who in 389 had advanced to Lanuvium, were met and utterly defeated by Camillus, the conqueror of Veii, and this victory was followed up by the gradual subjugation to Rome of all the lowland country lying between the hills and the sea as far south as Tarracina. Latin colonies were established at Satricum (385), at Setia (379), and at Antium and Tarracina some time before 348. In 358 two fresh Roman tribes (Pomptina and Fubbilia) were formed in the same district. Rome had now nothing more to fear from the foes who a century ago had threatened her very existence. The lowland country, of which she was the natural centre, from the Ciminiian forest to Tarracina, was quiet, and within its limits Rome was by far the strongest power. But she had now to reckon with the old and faithful allies to whose loyal aid her present position was largely due. The Latini and Hernici had suffered severely in the Aequian and Volscean wars; it is probable that not a few of the smaller communities included in the league had either been destroyed or been absorbed by larger states, and the independence of all alike was threatened by the growing power of Rome. The sack of Rome by the Celts gave them an opportunity of reasserting their independence, and we are consequently told that this disaster was immediately followed by the temporary dissolution of the confederacy, and this again a few years later by a series of actual conflicts between Rome and her former allies. Between 358 and 358 we hear of conflict between Roman armies and those of the Volscians, of the Latini, those of the Volscians, of the Latini; Carnutes, and Circellii and the Hernici. But in all Rome was successful. In 352 Tusculum was fully incorporated with the Roman state by the bestowal of the full franchise; in 358, according to both Livy and Polybius, the old alliance was formally renewed with Latini and Hernici. We cannot, however, be wrong in assuming that the position of the allies under the new league was far inferior to that accorded them by the treaty of Spurio Cassius. Henceforth they were the subjects rather than the equals of Rome, a position which it is evident that they accepted much against their will, and from which they were yet to make one last effort to escape.

We have now reached the close of this stage in Rome's advance towards supremacy in Italy. By 343 B.C. she was already mistress both of the low country stretching from the Ciminian forest to Tarracina and Circeii and of the bordering highlands. Her own territory had largely increased. Across the Tiber the lands of Veii, Capena and Caere were nearly all Roman, while in Latium she had carried her frontiers to Tusculum on the Alban range and to the southernmost limits of the Pomptine district. And this territory was protected by a circle of dependent allies and colonies reaching northward to Sutrium and Nepete, and southward to Sora on the upper Liris, and to Circeii on the coast. Already, too, she was beginning to be recognized as a power outside the
limits of the Latin lowlands. The fame of the capture of Rome by the Celts had reached Athens, and her subsequent victories over marauding Celtic bands had given her prestige in South Italy as a bulwark against northern barbarians. In 354 she had formed her first connections beyond the Liris by a treaty with the Samnites, and in 348 followed a far more important treaty with the great maritime state of Carthage.1

Rome had won her supremacy from the Cimmerian forest to the Liris as the expansion of the comparatively civilised communities of the lowlands against the rude highland tribes which threatened to overrun them, and so, when her legions first crossed the Liris, it was in answer to an appeal from a lowland city against invaders from the hills. While she was engaged in clearing Latium of Volsci and Aequi, the Sabellian tribes of the central Apennines had rapidly spread over the southern half of the peninsula. Foremost among these tribes were the Samnites, a portion of whom had captured the Etruscan city of Capua in 423; the Greek Cumae in 420, and had since then ruled over the Campanian territory. Before in their new homes the conquerors soon lost all sense of relationship and sympathy with their highland brethren. They dwelt in cities, amassed wealth, and inherited the civilization of the Greeks and Etruscans whom they had dispossessed,2 above all, they had before long to defend themselves in their turn against the attacks of their ruder kinsmen from the hills, and it was for aid against these that the Samnites of Campania appealed to the rising state which had already made herself known as the bulwark of the lowlands north of the Liris, and which with her Latin and Hernican allies had scarcely less interest than the Campanian cities themselves in checking the raids of the highland Samnite tribes.

The Campanian appeal was listened to. Rome with her confederates entered into alliance with Capua and the neighboring Campanian towns, and war was formally declared (343) against the Samnites.3 While to the Latins and Hernicans was entrusted apparently the defence of Latinum and the Hernican valley against the northern members of the Samnite confederacy, the Romans themselves undertook the task of driving the invaders out of Campania. After two campaigns the war was ended in 341 by a treaty, and the Samnites withdrew from the lowlands, leaving Rome the recognized suzerain of the Campanian cities which had sought her aid.4

There is no doubt that the check thus given by Rome to the advance of the hitherto invincible Sabellian highlanders not only made her the natural head and champion of the low countries, south as well as north of the Liris, but also considerably added to her prestige. Carthage sent her congratulations, and the Etruscan city of Falerii voluntarily enrolled herself among the allies of Rome. Of even greater service, however, was the fact that for fifteen years the Samnites remained quiet, for this inactivity, whatever its cause, enabled Rome triumphantly to surmount a danger which threatened for the moment to wreck her whole position. This danger was nothing less than a desperate effort on the part of nearly all her allies and dependants south of the Tiber to throw off the yoke of her supremacy. The way was led by her ancient confederates the Latini, whose smouldering discontent broke into open flame directly the fear of a Samnite attack was removed. From the Latin Campagna and the Sabine hills the revolt spread westward and southward to Antium and Tarracina, and even to the towns of the Campian plain, where the mass of the inhabitants at once repudiated the alliance formed with Rome by the ruling class. The struggle was sharp but short. In two pitched battles5 the strength of the insurrection was broken, and two more campaigns sufficed for the complete reduction of such of the insurgent communities as still held out. The revolt crushed, Rome set herself deliberately to the task of re-establishing on a new and firmer basis her supremacy. The lowland disturbance had laid the foundations of that marvellous organization which was destined to spread rapidly over Italy, and to withstand the attacks even of Hannibal. The old historic Latin league ceased to exist, though its memory was still preserved by the yearly Latin festival on the Alban Mount. Most if not all of the common land of the league became Roman territory;6 five at least of the old Latin cities were compelled to accept the Roman franchise7 and enter the pale of the Roman state. The rest, with the Latin colonies, were ranked as Latin allies of Rome, but on terms which secured their complete dependence upon the sovereign city. The policy of isolation, which became so cardinal a principle of Roman rule, was now first systematically applied. No rights of communion or commerce were any longer to exist between these communities. Their federal councils were prohibited, and all federal action independent of Rome forbidden.8

In Campania and the coast-lands connecting Campania with Rome, a policy of annexation was considered safer than that of alliance. Of the two frontier posts of the Volsci, Antium and Velitrae, the former was constituted a Roman colony, its long galleys burnt and their prows set up in the Forum at Rome, while the walls of Velitrae were razed to the ground, its leading men banished beyond the Tiber, and their lands given to Roman settlers. Farther south on the route to Campania, Fundi and Formiae were, after the precedent set in the case of Caere, declared Roman and granted the civil rights of Roman citizenship, while lastly in Campania itself the same status was given to Capua, Cumae, and the smaller communities dependent upon them.9

During the ten years from 338 to 328 the work of settlement was steadily continued. Tarracina, like Antium, was made a Roman colony. Privenurn, the last Volscian town to offer resistance to Rome, was subdued in 330, part of its territory allotted to Roman citizens, with a treaty which it was hoped would accept the Roman franchise. Lastly, to strengthen the lines of defence against the Sabellian tribes, two colonies with the rights of Latin allies were established at Caesii (334) and at Fregellae (328). The settlement of the lowlands was accomplished. As a single powerful and compact state with an outer circle of closely dependent allies, Rome now stood in sharp contrast with the disunited and degenerate cities of northern Etruria, the loosely organized tribes of the Apennines, and the decaying and disorderly Greek towns of the south.

The strength of this system was now to be tried by a struggle with the one Italian people who were still ready and able to contest with Rome the supremacy of the peninsula. The passive attitude of the Samnites between 342 and 327 was no doubt largely due to the dangers which had suddenly threatened them in South Italy. But, the death of Alexander of Epirus, in 332,10 removed their only formidable opponent there, and left them free to turn their attention to the necessity of checking the steady advance of Rome. In 327, the year after the ominous foundation of a Roman colony at Fregellae, a pretext for renewing the struggle was offered them. The

Rome [Republic]
Cuman colony of Palapepolis had incurred the wrath of Rome by its raids into her territory in Campania. The Samnites sent a force to defend it, and Rome replied by a declaration of war. The two opponents were not at first sight unequally matched, and had the Sambian tribes held firmly together the issue of the struggle might have been different. As it was, however, the Lucanians to the south actually joined Rome from the first, while the northern clans, Marsi, Vestini, Paeligni, Frentani, after a feeble and lukewarm resistance, subsided into a neutrality which was exchanged in 304 for a formal alliance with Rome. An even greater advantage to Rome from the outset was the enmity existing between the Samnites and the Apulians, the latter of whom from the first joined Rome and thus gave her a position in the rear of her enemy and in a country eminently well fitted for maintaining a large military force. These weaknesses on the Samnite side were amply illustrated by the events of the war.

The first seven or eight years were marked by one serious disaster to the Roman arms, the defeat at the Caudine Forks (321).° The Samnites, however, had obtained a two years' truce, Rome had succeeded not only in inflicting several severe blows upon her enemies but in isolating them from outside help. The Lucanians to the south were her allies. To the east, in the rear of Samnium, Apulia acknowledged the suzerainty of Rome, and Luceria, captured in 320, had been established as a base of Roman operations. Finally to the north the Romans had easily overcome the feeble resistance of the Vestini and Frentani, and secured through their territories a safe passage for their legions to Apulia. On the renewal of hostilities in 316, the Samnites, bent on escaping from the net which was being slowly drawn round them, made for a series of desperate efforts to break through the lines of defence which protected Latium and Campania. Sora and Fregellae on the upper Liris were captured by a sudden attack; the Ausones in the low country near the mouth of the same river were encouraged to revolt by the appearance of the Samnite army; and in Campania another army, attracted by rumours of disturbance, all but defeated the Roman consuls under the very walls of Capua. But these efforts were unavailing. Sora and Fregellae were recovered as quickly as they had been lost, and the frontier there was strengthened by the establishment of a colony at Nola. The Ausones were punished for their insurrection of their territory, and Roman supremacy secured previously the two colonies of Suessa and Pontia (312). The construction of the famous Via Appia, the work of the censor Appius Claudius Caecus, opened a safe and direct route to Campania, while the capture of Nola deprived the Samnites of their last important stronghold in the Campanian lowlands. The failure of these attempts broke the courage even of the Samnites. Their hopes were indeed raised for a moment by the news that Etruria had risen against Rome (310), but their daring scheme of effecting a union with the Etruscans was frustrated by the energy of the Roman generals. Five years later the Roman army was sent into Campania by an invasion of Samnium itself. Arpinum on the frontier was taken, and at last, after a twenty-two years' struggle, the Second Samnite War was closed by a renewal of the ancient treaty with Rome (304). The six years of peace which followed (304-298) were employed by Rome in still further strengthening her position.

509-56. Already, two years before the peace, a rash revolt of the Hernici° had given Rome a pretext for finally annexing the territory of her ancient allies. The tribal confederacy was broken up, and all the Hernic communities, with the exception of three which had not joined the revolt, were incorporated with the Roman state as municipia, with the civil rights of the Roman franchise. Between the Hernic

1 Livy viii. 22. 2 Ibid. ix. 20; see Appia, Via. 3 Ibid. ix. 43.

valley and the frontiers of the nearest Sabellian tribes lay what remained of the once formidable people of the Aequi. In their case, too, a revolt (304) was followed by the annexation of their territory, which was marked in this case by the formation there (301) of two Roman Tribes (Aniensis and Terecina).° Not content with thus carrying the borders of their own territory up to the very frontiers of the Sabellian country, Rome succeeded (304) in finally detaching few of the Sabellian confederacy all the tribes lying® between the north-east frontier of Latium and the Adriatic Sea. Henceforward the Marsi, Paeligni, Vestini, Marrucini and Frentani were enrolled among the allies of Rome, and not only swelled her forces in the field but interposed a useful barrier between her enemies to the north in Etruria and Umbria and those to the south in Samnium, while they connected her directly with the friendly Apulians. Lastly, as a security for the fidelity at least of the nearest of these allies, colonies were planted in the Marician territories at Alba Fucensia (303) and at Carsoli (298). A significant indication of the widening range of Rome's influence in Italy, the case of the new settlement of Apulian,.Package was that acting upon them, is the fact that when in 302 the Spartan Cloeamyrtus was landed in the territory of the Sallentini, far away in the south-east, he was met and repulsed by a Roman force.

Six years after the conclusion of the treaty which ended the Second Samnite War, news arrived that the Samnites were harassing the Lucanians. Rome at once interfered to protect her allies. Samnium was invaded in force, the country ravaged and one stronghold after another captured. Unable any longer to hold their own in a position where they were hedged round by enemies, the Samnite leaders turned as a last hope to the communities of northern Etruria, to the free tribes of Umbria and to the once dreaded Celts. With a splendid daring they formed the scheme of uniting all these peoples with themselves in a last desperate effort to break the power of Rome.

For some forty years after the final annexation of southern Etruria (351 B.C.) matters had remained unchanged in that quarter. Sutrium and Nepete still guarded the Roman frontier; the natural boundary of the Ciminian forest was still intact; and up the valley of the Tiber Rome had not advanced beyond Falerii, about a few miles short of the most southerly Umbrian town Orculum. But in 311, on the expiry, apparently of the long truce with Rome, concluded in 351, the northern Etruscans, alarmed no doubt by the rapid advances which Rome was making farther south, rose in arms and attacked Sutrium. The attack, however, recoiled disastrously upon the heads of the assailants. A Roman force promptly relieved Sutrium, and its leader, Q. Fabius Rullianus, without awaiting orders from home, boldly plunged into the wilds of the Ciminian forest, and crossing them safely swept with fire and sword over the rich lands to the north. Then turning southward he met and utterly defeated the forces which the Etruscans had hastily raised in hopes of intercepting him at the Umbroinian Lake.° This decisive victory ended the war. The Etruscan cities, divided among themselves, and enervated by long years of peace, abandoned the struggle for the time, paid a heavy indemnity and concluded a truce with Rome (309-8). In the same year the promptitude of Fabius easily averted a threatened attack by the Umbrians, but Rome proceeded nevertheless to fortify herself in her invariable fashion against future dangers on this side, by an alliance with Orculum, which was followed ten years later (299) by a colony at Nequimium, and an alliance with the Picentes, whose position in the rear

7 Livy x. 9. 8 Ibid. ix. 45. 9 Ibid. x. 2. 10 Ibid. ix. 39. Ihne (Römische Geschichte, i. 394 seq.) throws some doubt on the traditional accounts of this war and of that in 296.

11 It received the name of Narna (Livy x. 10).
of Umbria rendered them as valuable to Rome as the Apulians had proved farther south. Fourteen years had passed since the battle on the Vadimonian Lake, when the Samnites appeared on the borders of Etruria and called on the peoples of northern Italy to rise against the common enemy. Their appeal, backed by the presence of their troops, was successful. The Etruscans found courage to face the Roman legions once more; a few of the Umbrians joined them; but the most valuable allies to the Samnites were the Celts, who had for some time threatened a raid across the Apennines, and who now marched eagerly into Umbria and joined the coalition. The news that the Celts were in motion produced a startling effect at Rome, and every nerve was strained to meet this new danger. While two armies were left in southern Etruria as reserves, the two consuls, Q. Fabius Maximus Rullianus and P. Decius Mus the younger, both tried soldiers, marched northwards up the valley of the Tiber and into Umbria at the head of four Roman legions and a still larger force of Italian allies. At Sentinum, on the further side of the Apennines, they encountered the united forces of the Celts and Samnites, the Etruscans and Umbrians having, it is said, been withdrawn for the defence of their own homes. The battle that followed was desperate, and the Romans lost one of their consuls, Decius, and more than 8000 men. But the Roman victory was decisive. The Celts were annihilated, and the fear of a second Celtic attack on Rome removed. All danger from the coalition was over. The Etruscans readily purchased peace by the payment of indemnities. The rising in Umbria, never formidable, died away, and the Samnites were left single-handed to bear the whole weight of the wrath of Rome. During four years more, however, they desperately defended their highland homes, and twice at least, in 293 and 292, they managed to place in the field a force sufficient to meet the Roman legions on equal terms. At last, in 290, the consul M. Curio Dentatus finally exhausted their power of resistance. Peace was concluded, and it is significant of the respect inspired at Rome by their indomitable courage that they were allowed to become the allies of Rome, on equal terms and without any sacrifice of independence.

Between the close of the Third Samnite War and the landing of Pyrrhus in 281 B.C. we find Rome engaged, as her wont was, in quietly extending and consolidating her power. In southern Italy she strengthened her hold on Apulia by planting on the borders of Apulia and Lucania the strong colony of Venusia. In central Italy the annexion of the Sabine country (290) carried her frontiers eastward to the borders of her Picentine allies on the Adriatic. Further east, in the territory of the Picentes themselves, she established colonies on the Adriatic coast at Hadria and Castrum (285-53). North of the Picentes lay the territories of the Celte Senones stretching inland to the north-east borders of Etruria, and these too now fell into her hands. Ten years after their defeat at Sentinum (283-84) a Celtic force descended into Etruria, besieged Arretium and defeated the relieving force despatched by Rome. In 283 the consul L. Cornelius Dolabella was sent to avenge the insult. He completely routed the Senones. Their lands were annexed by Rome, and a colony established at Sena on the coast. This success, followed as it was by the decisive defeat of the neighbouring tribe of the Boi, that had invaded Etruria and penetrated as far south as the Vadimonian Lake, saved the Celts into quiet, and for more than forty years there was comparative tranquillity in northern Italy.

In the south, however, the claims of Rome to supremacy were now to be disputed by a new and formidable foe. At the close of the Third Samnite War the Greek cities on the southern coast of Italy found themselves once more harassed by the Sabellian tribes on their borders, whose energies, no longer absorbed by the long struggle in central Italy, now found an attractive object southward. Naturally enough the Greeks, like the Capuans sixty years before, appealed for aid to Rome (283-82), and like the Capuans they offered in return to recognize the suzerainty of the great Latin Republic. In reply a Roman force under C. Fabricius Luscinus marched into south Italy, easily routed the marauding bands of Lucanians, Bruttians and Samnites, and established Roman garrisons in Locri, Croton, Rhegium and Thurii. At Tarentum, the most powerful and flourishing of the Greek seaports, this sudden and rapid advance of Rome excited the greatest anxiety. Tarentum was already allied by treaty (301) with Rome, and she had now to decide whether this treaty should be exchanged for one which would place her, like the other Greek communities, under the protectorate of Rome, or whether she should find some ally able and willing to assist in making a last stand for independence. The former course, in Tarentum, as before at Capua, was the one favoured by the aristocratic party; the latter was eagerly supported by the mass of the people and their leaders. While matters were still in suspense, the appearance, contrary to the treaty, of a Roman squadron off the harbour decided the controversy. The Tarentines, indignant at the breach of faith, at the insult to their national pride, at the holocaust destroyed, and the admiral and sunk most of the ships. Still Rome, relying probably on her partisans in the city, tried negotiation, and an alliance appeared likely after all, when suddenly the help for which the Tarentine democrats had been looking appeared, and war with Rome was resolved upon (281-80).

King Pyrrhus, whose timely appearance seemed for the moment to have saved the independence of Tarentum, was the most brilliant of the military adventurers whom the disturbed times following the death of Alexander the Great had brought into prominence. High-spirited, generous and ambitious, he had formed the scheme of rivalling Alexander's achievements in the East, by winning for himself an empire in the West. He aspired not only to unite under his rule the Greek communities of Italy and Sicily, but to overthrow the great Phoenician state of Carthage—the natural enemy of Greeks in the West, as Persia had been in the East. Of Rome it is clear that he knew little or nothing; the task of ridding the Greek seaports of their barbarian foes he no doubt regarded as an easy one; and the splendid force he brought with him was intended rather for the conquest of the West than for the preliminary work of chastising a few Italian tribes, or securing the submision of the unrivalled Greek Greeks. He defeated the Roman consul, M. Valerius Laevinus, on the banks of the Liris (280), and gained the support of the Greek cities as well as that of numerous bands of Samnites, Lucanians and Bruttians. But, to the disappointment of his new allies, Pyrrhus showed no anxiety to follow up his advantage. His heart was set on Sicily and Africa, and his immediate object was to come to terms with Rome. But though he advanced as near Rome as Anagnia (279), nothing could shake the resolution of the senate, and in the next year (278) he again routed the legions at Asculum (Ascoli), but only to find that the indomitable resolution of the enemy was strengthened by defeat. He now crossed into Sicily, where, though at first successful, he was unable to achieve a lasting result. Soured and disappointed, Pyrrhus returned to Italy (276) to find the Roman legions steadily moving southwards, and his Italian allies disgusted by his desertion of their cause. In 275 the decisive battle of the war was fought at Beneventum. The consul M. Curio Dentatus, the conqueror of Samnium, gained a complete victory.
and Pyrrhus, unable any longer to face his opponents in the field, and discharged all his assistance from allies, retreated to disgust to Tarentum and thence crossed into Greece. 482.

A few years later (272) Tarentum was surrendered to Rome by its Epict garrison; it was granted a treaty of alliance, but its walls were razed and its fleet handed over to Rome. In 270 Rhegium also entered the ranks of Roman allies, and finally in 269 a single campaign crushed the last efforts at resistance in Samnium. Rome was now at leisure to consolidate the position she had won. Between 273 and 263 three new colonies were founded in Samnium and Lucania—Paestum in 273, Beneventum in 268, Asenaria in 263. In central Italy the area of Roman territory was increased by the full enfranchisement (268) of the Sabines, 2 and of their neighbours to the east, the people of Picenum.

To guard the Adriatic coast colonies were established at Ariminum (268), at Firmum and at Castrum Novum (264), while to the already numerous maritime colonies was added that of Cosa in Etruria. 3

Rome was now the undisputed mistress of Italy. The limits of her supremacy to the north were represented roughly by a line drawn across the peninsula from the mouth of the Arno on the west to that of the Aesis on the east. 4 Beyond this line lay the Ligurians and the Celts; all south of it was now united as "Italy" under the rule of Rome.

But the rule of Rome over Italy, like her wider rule over the Mediterranean coasts, was not an absolute dominion over conquered subjects. It was in form at least a confederacy under Roman patronage and guidance, and the Italians, like the provincials, were not the subjects, but the "allies and friends" of the Roman people. 5 In the treatment of these allies Rome consistently followed the maxim, divide et impera. In every possible way she strove to isolate them from each other, while binding them closely to herself. The old federal groups were in most cases broken up, and each of the members united with Rome by a special treaty of alliance. In Etruria, Latium, Campania and Magna Graecia the city state was taken as the unit; in central Italy where urban life was non-existent, the unit was the tribe. The northern Sabellian peoples, for instance—the Marsi, Paenigni, Vestini, Marrucini, Frentani—were now constituted as separate communities with full Roman rights, and even the free citizens of the principal towns were given a measure of self-government. The freedom of trade or intermarriage was allowed between the allies themselves, a policy afterwards systematically pursued in the provinces. Nor were all these numerous allied communities placed on the same footing as regarded their relations with Rome herself. To begin with, a sharp distinction was drawn between the "Latinii" and the general mass of Italian allies. The Latins of this period had little more than the name in common with the old thirty Latin peoples of the days of Spurius Cassius. With a few exceptions, such as Tibur and Praeneste, the latter had either disappeared or had been incorporated with the Roman state, and the Latins of 268 B.C. were almost exclusively the "Latin colonies," that is to say, communities founded by Rome, composed of men of Roman blood, and whose only claim to the title "Latin" lay in the fact that Rome granted to them some portion of the rights and privileges formerly enjoyed by the old Latin cities under the Cassian treaty. 6 Though nominally allies, they were in fact offshoots of Rome herself, bound to her by community of race, language and interest, and planted as Roman garrisons among alien and conquered peoples. The Roman citizen who joined a Latin colony lost his citizenship—having allowed him to retain it would no doubt have been regarded as enlarging too rapidly the limits of the citizen body; but he received in exchange the status of a favoured ally. The member of a Latin colony had the right of commercium and down to 286 7 of conubium also with Roman citizens. Provided they left sons and property to represent them at home, they were free to migrate to Rome and acquire the Roman franchise.

In war-time they not only shared in the booty, but claimed a tenth of any land confiscated by Rome and declared "public." 8 These privileges, coupled with their close natural affinities with Rome, successfully secured the fidelity of the Latin colonies, which became not only the most efficient props of Roman supremacy, but powerful agents in the work of Romanizing Italy. Below the privileged Latins stood the Italian allies; and here again we know generally that there were considerable differences of status, determined in each case by the terms of their respective treaties with Rome. We are told that the Greek cities of Neapolis and Heraclea were among the most favoured; the Bruttii, on the other hand, seem, even before the Hannibalic War, to have been less generously treated. But beyond this we have no detailed information.

Rome, however, did not rely only on this policy of isolation. Her allies were attached as closely to herself as they were clearly separated from each other, and from the first she took every security for the maintenance of her own paramount authority. Within its own borders, each ally was left to manage its own affairs as an independent state. 9 The badges which marked subjection to Rome in the provinces—the resident magistrate and the tribute—were unknown in Italy. But in all points affecting the relations of one ally with another, in all questions of the general interests of Italy and of foreign policy, the decisions in Rome. The place of a federal constitution, of a federal council, of federal officers, was filled by the Roman senate, assembly and magistrates. The maintenance of peace and order in Italy, the defence of the coasts and frontiers, the making of war or peace with foreign powers, were matters the settlement of which Rome kept entirely in her own hands. Each allied state, in time of war, was called upon for a certain contingent of men, but, though its contingent usually formed a distinct corps under officers of its own, its numerical strength was fixed by Rome, it was brigaded with the Roman legions, and was under the orders of the Roman consul. 10 This paramount authority of Rome throughout the peninsula was founded on the fact that the genuine "disciplinatio Romana" was now infinitely more powerful than any one of her numerous allies. Her territory, as distinct from that of the allied states, covered something like one-third of the peninsula south of the Aesis. Along the west coast it stretched from Caere to the southern borders of Campania. Inland, it included the former territories of the Aequi and Hernici, the Sabine country, and even extended eastward into Picenum, while beyond these limits were outlying districts, such as the lands of the Senonian Celts, with the Roman colony of Sena, and the Roman colony of Etruria, which had been confiscated by Rome and given over to Roman settlers. Since the first important annexation of territory after the capture of Veii (396), we have new tribes been formed, 11 and the number of male citizens registered at the census had risen from 152,000 to 290,000. 12 Within this enlarged Roman state.

state were now included numerous communities with local institutions and government. At their head stood the Roman colonies (coloniae civium Romanorum), founded to guard especially the coasts of Latium and Campania. Next to these eldest children of Rome came those communities which had been invested with the full Roman franchise, such, for instance, as the old Latin towns of Aricia, Lanuvium, Tusculum, Nomentum and Pedum. Lowest in the scale were those which had not been considered ripe for the full franchise, but had, like Caere, received instead the civitas sine suffragio, the civil without the political rights. Their members, though Roman citizens, were not enrolled in the tribes, and in time of war served not in the ranks of the Roman legions but in separate contingents. In addition to these organized town communities, there were also the groups of Roman settlers on the public lands, and the dwellers in the village communities of the enfranchised highland districts in central Italy.

The administrative needs of this enlarged Rome were obviously such as could not be adequately satisfied by the system which had done well enough for a small city state with a few square miles of territory. The old centralization of all government in Rome itself had become an impossibility, and the Roman statesmen did their best to meet the altered requirements of the time. The urban communities within the Roman pale, colonies and municipia, were allowed a large measure of local self-government. In all we find local assemblies, senates and magistrates, whose hands the ordinary routine of local administration was committed, and, in spite of differences in detail, e.g. in the titles and numbers of the magistrates, the same type of constitution prevailed throughout. But these local authorities were carefully subordinated to the higher powers in Rome. The local constitution could be modified or revoked by the Roman senate and assembly, and the local magistrates, no less than the ordinary members of the community, were subject to the paramount authority of the Roman consuls, praetors and censors. In particular, care was taken to keep the administration of justice well under central control. The Roman citizen in a colony or municipium enjoyed, of course, the right of appeal to the Roman people in a capital case. We may also assume that from the first some limit was placed to the jurisdiction of the local magistrate, and that cases falling outside it came before the central authorities. But an additional safeguard for the equitable and uniform administration of Roman law, in communities to many of which the Roman code was new and unfamiliar, was provided by the institution of prefects (praefecti juris dicundo), who were sent out annually, as representatives of the Roman prae tor, to administer justice in the colonies and municipia. To prefects was, moreover, assigned the charge of those districts within the Roman pale where no urban communities, and consequently no organized local government, existed. In these two institutions, that of municipal government and that of prefectures, we have already two of the cardinal points of the later imperial system of government.

Lastly, the changes which the altered position and increased responsibilities of Rome had effected in her military system tended to weaken the intimate connexion between the Roman army in the field and the Roman people at home, and thus prepared the way for that complete breach between the two which in the end proved fatal to the Republic. It is true that service in the legion was still the first duty and the highest privilege of the fully qualified citizen. But this service was gradually altering in character. Though new legions were still raised each year for the summer campaigns, this was by no means always accompanied, as formerly, by the disbandment of those already on foot, and this increase in the length of time during which the citizen was kept with the standards had, as early as the siege of Veii, necessitated a further reform of the old system of military service—the introduction of pay. Moreover, while in the early days of the Republic the same divisions served for the soldier in the legion and the citizen in the assembly, in the new manipular system, with its three lines, no regard was paid to civic distinctions, but only to length of service and military efficiency, while at the same time the more open order of fighting which it involved demanded of each soldier greater skill, and therefore a more thorough training in arms than the old phalanx. One other change resulted from the new military necessities of the time, which was as fruitful of results as the incipient separation between the citizen and the soldier. Under the early Republic, the chief command of the legions rested with the consuls of the year. But, as Rome's military operations increased in area and in distance from Rome, a larger staff became necessary, and the inconvenience of summoning home a consul in the field from an unfinished campaign became intolerable. The remedy found, that of prolonging for a further period the imperium of the consul, was first applied in 327 B.C. in the case of Q. Publius Philo, and between 327 and 264 instances of this proconsulato imperii became increasingly common. This proconsular authority, originally an occasional and subordinate one, was destined to become first of all the strongest force in the Republic, and under Augustus to replace the old Roman Consuls.

8

Period B: Rome and the Mediterranean States, 265-146 B.C.—(a) Conquest of the West.—Though marked out by her geographical position as the natural centre of the Mediterranean, Italy had hitherto played no active part in Mediterranean politics, but, now that she was for the first time united, it was felt throughout the Mediterranean world that a new power had arisen, and Rome, as the head and representative of Italy, found herself irresistibly drawn into the vortex of Mediterranean affairs. Egypt sought her alliance, and Greek scholars began to interest themselves keenly in the history, constitution, and character of the Latin Republic which had so suddenly become famous. But Rome looked naturally westward rather than eastward. The western coasts of the peninsula were the most fertile and populous and wealthy; and it was in this direction that the natural openings for Italian commerce were to be found. It was, however, precisely on this side that Rome had serious ground for anxiety. Carthage was now at the height of her power. Her outposts were threateningly near to Italy in Sardinia and in Sicily, while her fleets swept the seas and jealously guarded for the benefit of Carthage alone the hidden treasures of the West. In the east of Sicily, Syracuse still upheld the cause of Greek independence against the hereditary foe of the Greek race; but Syracuse stood alone, and her resources were comparatively small. What Rome had to fear was the establishment, and that at no distant date, of an absolute Carthaginian domination over the Western seas—a domination which would not only be fatal to Italian commerce, but would be a standing menace to the safety of the Italian coasts.

It was above all things essential for Rome that the Carthaginians should advance no farther eastward. But already in 272 Tarentum had almost fallen into their grasp, and seven years later Rome was threatened with the establishment of Carthaginian rule at Messana, within sight of the Italian coast. The interception of both powers in a quarrrel between the Mamertines, a body of Campanian mercenaries who had occupied Messana, and Hiero II.

1 Ostia, Antium, Tarracina, Minturnae, Sinuessa, and, on the Adriatic, Sena and Castulum Novum.
2 To both these classes the term municipia was applied.
3 For details, see Beloch, Ital. Bund., caps. v., vi., vii. The enfranchised communities in most cases retained the old titles for their municipalities and the variety in their designations.
4 For the praefectii, see Mommsen, Hist. of Rome, ii. 49, 67, and Staatsh., ii. 608; Beloch, 130-33.

6 Livy iv. 59.
7 This system was probably introduced in order to meet the charge of the Celtic swordsmen, but it was perfected during the Samnite wars. See Marquardt, Staatsver., iii. 350 seq.; Daremberg-Saglio, Dict. des antiquites, s. v. "Legio" (Cagnan).
of Syracuse, led to the outbreak of war between Rome and Carthage in 264 B.C. The military history of the struggle which followed is treated in the article Punic Wars; it will suffice to note here that the war lasted until 241 B.C., when the Carthaginians were compelled to cede Sicily and the Lipari islands to Rome, and to pay an indemnity of 3,200 talents (about $600,000). The struggle was one in which both Rome and Carthage were serving an apprenticeship in a warfare the conditions of which were unfamiliar to both. The Roman legions were very unlike any against which the Carthaginian leaders had ever led their motley array of mercenaries, while Rome was called upon for the first time to fight a war across the sea, and to fight with ships against the greatest naval power of the age. The novelty of these conditions accounts for much of the vacillating and uncertain action observable on both sides. It is possible that Hamilcar had already made up his mind that Rome must be attacked and crushed in Italy, but his government attempted nothing more than raids upon the coast. There are indications also that some in the Roman senate saw no end to the struggle but in the destruction of Carthage; yet an invasion of Africa was only once seriously attempted, and then only a half-hearted support was given to the expedition. But these peculiarities in the war served to bring out in the clearest relief the strength and the weakness of the two contending states. The chief dangers for Carthage lay obviously in the jealousy exhibited at home of her officers abroad, in the difficulty of controlling her mercenary troops, and in the ever-present possibility of disaffection among her subjects in Libya—dangers which even the genius of Hannibal failed finally to surmount. Rome, on the other hand, was strong in the public spirit of her citizens, the fidelity of her allies, the valour and discipline of her legions. What she needed was a system which should make a better use of her splendid materials than one under which her plans were shaped from day to day by a divided senate, and executed by officers who were changed every year, and by soldiers most of whom returned home at the close of each summer's campaign.

The interval between the First and Second Punic Wars was employed by both Rome and Carthage in strengthening their respective positions. The eastern end of Sicily was still left under the rule of Hiero as the ally of Rome, but the larger western portion of the island was Carthaginian, and a ten-year arrangement seems to have been made for its government, either by one of the two praetors, or possibly by a quaestor. Sardinia and Corsica had not been surrendered to Rome by the treaty of 241, but three years later (238), on the invitation of the Carthaginian mercenaries stationed in the islands, a Roman force occupied them; Carthage protested, but, on the Romans threatening war, she gave way, and Sardinia and Corsica were formally ceded to Rome, though it was some seven or eight years before all resistance on the part of the natives themselves was crushed. In 227, however, the senate considered matters ripe for the establishment of a separate administration in her overseas possessions. In that year two additional praetors were elected; to one was assigned the charge of western Sicily, to the other that of Sardinia and Corsica, and thus the first stones of the Roman provincial system were laid. Of at least equal importance for the security of the peninsula was the subjugation of the Celtic tribes in the valley of the Po. These, headed by the Boii and Insubres and assisted by levies from the Celts to the westward, had in 225 alarmed the whole of Italy by invading Etruria and penetrating to Clusium, only three days' journey from Rome. Here, however, their courage seems to have failed them. The Romans returned northward along the Etruscan coast, until at Talamanc their way was barred by the Roman legions, returning from Sardinia to the defence of Rome, while a second consular army hung upon their rear. Thus hemmed in, the Celts fought desperately, but were completely defeated and the flower of their tribesmen slain. The Romans followed up their success by invading the Celtic territory. The Boii were easily reduced to submission. The Insubres, north of the Po, resisted more obstinately, but by 222 the war was over, and all the tribes in the rich Po valley acknowledged the supremacy of Rome. The Gauls of the Celts were no longer a menace to the Italian allies of Rome, but were treated as subjects beyond the frontier. Three colonies were founded to hold them in check—Placentia (218) and Cremona in the territory of the Insubres, Mutina (183)—in that of the Boii; and the great northern road (Via Flaminia) was completed as far as the Celtic border at Ariminum.

On the Adriatic coast the immediate interests of Rome were limited to rendering the sea safe for Italian trade. It was with this object that, in 229, the first Roman expedition crossed the Adriatic, and inflicted severe chastisement on the Illyrian pirates of the opposite coast. This expedition was the means of establishing for the first time direct political relations between Rome and the states of Greece proper, to many of which the suppression of piracy in the Adriatic was of as much importance as to Rome herself. Alliances were concluded with Corycra, Epidamnus, and Apollonia; and embassies explaining the reasons which had brought Roman troops into Greece were sent to the Aetolians, the Achaeans, and even to Athens and Corinth. Everywhere they were well received, and the admission of the Romans to the Isthmian games (228) formally acknowledged them as the natural allies of the free Greek states against both barbarian tribes and foreign despots. Meanwhile Carthage had acquired a possession which promised to compensate her for the loss of Sicily, Sardinia and Corsica. The genius of her greatest citizen and soldier, Hamilcar Barca, had appreciated the enormous value of the Spanish peninsula, and conceived the scheme of founding there a Carthaginian dominion which should not only add to the wealth of Carthage, but supply her with a base of operations for a war of revenge with Rome. The conquest of southern and eastern Spain, begun by Hamilcar (236–28) and carried on by his kinsman Hasdrubal (228–21), was completed by his son Hannibal, who, with all his father's genius, inherited also his father's hatred of Rome, and by 219 the authority of Rome had been confined as far as the Ebro (see SPAIN, History). Rome had not watched this rapid advance without anxiety, but, probably owing to her troubles with the Celts, she had contented herself with stipulating (226) that Carthage should not carry her arms beyond the Ebro, so as to threaten Rome's ancient ally, the Greek Massilia (mod. Marseilles), and with securing the independence of the two nominally Greek communities, Emporiae and Saguntum, on the east coast.

But these precautions were of no avail against the resolute determination of Hannibal, with whom the conquest of Spain was only preliminary to an attack upon Italy, and who could not afford to leave behind him in Spain a state allied to Rome. In 219, therefore, disregarding the protests of a Roman embassy, he attacked and took Saguntum, an act which, as he had foreseen, rendered a rupture with Rome inevitable, while it set his own hands free for a further advance.

For the details of the war which followed, the reader may be referred to the articles Punic Wars, Hannibal, and Scipio. From the outbreak of hostilities until the crowning victory of Cannae in 216 Hannibal's career of success was unbroken; and the annihilation of the Roman army in that battle was followed by the detection and almost the complete overthrow of the Italian states, with the exception of the Latin colonies and the Greek coast towns. In 216, moreover, Philip V. of Macedon formed an alliance with Hannibal and threatened to invade Italy; in 214 Syracuse revolted, and in 212 the Greek cities in S. Italy went over to Hannibal. But the indomitable spirit

3 Polyb. ii. 8 seq.
4 Polyb. iii. 15. 31.
of the Romans asserted itself in the face of these crushing misfortunes. In 212 Syracuse was recovered; in 211 Capua fell after a long siege which Hannibal failed to raise, even by his famous march up to the gates of Rome, and in the same year a coalition was formed in Greece against Philip V. of Macedon, which effectually paralysed his offensive action. Hannibal was now confined to Lucania and Bruttium; and his brother Hasdrubal, marching from Spain to join him, was defeated and slain on the river Metaurus (207). The war in Italy was now virtually ended; for, though during four years more Hannibal stood at bay in a corner of Bruttium, he was powerless to prevent the restoration of Roman authority throughout the peninsula. Sicily was once more secure; and finally in 206, the year after the victory on the Metaurus, the successes of the young P. Scipio in Spain (212-6) were crowned by the complete expulsion of the Carthaginians from the peninsula. On his return from Spain Scipio eagerly urged an immediate invasion of Africa. The senate hesitated; but Scipio gained the day. He was elected consul for 205, and given the province of Sicily with permission to cross into Africa if he thought fit. Voluntary contributions of men, money, and supplies poured in to support the popular hero; and by the end of 205 Scipio had collected in Sicily a sufficient force for his purpose. In 204 he crossed to Africa, where he was welcomed by the Numidian prince Massinissa, whose friendship he had made in Spain. In 203 he twice defeated the Carthaginian forces, and a large party at Carthage were anxious to accept his offer of negotiations. But the advocates of resistance triumphed.

Hannibal was recalled from Italy, and returned to fight his last battle against Rome at Zama, where Scipio, who had been continued in command as proconsul for 202 by a special vote of the people, won a complete victory. The war was over. The Roman assembly voted that the Carthaginian request for peace should be granted, and entrusted the settlement of the terms to Scipio and a commission of ten senators. Carthage was allowed to retain her territory in Africa; but she undertook to wage no wars outside Africa, and none inside without the consent of Rome. She surrendered all her ships but ten triremes, her elephants, and all prisoners of war, and agreed to pay an indemnity of 10,000 talents in fifty years. The Numidian Massinissa (q.v.) was rewarded by an increase of territory, and was enrolled among the "allies and friends" of the Roman people.

The battle of Zama decided the fate of the West. The power of Carthage was broken and her supremacy passed to Rome. Henceforth Rome had no rival to fear westward of Italy, and it rested with herself to settle within what limits her supremacy should be confined and what form it should take. For the next fifty years, however, Rome was too deeply involved in the affairs of the East to think of extending her rule far beyond the limits of the rich and growing provinces which she had acquired by war. The Carthaginian inheritance which had fallen to her by the defeat of Carthage; but within this area considerable advance was made in the organization and consolidation of her rule. In Sicily and Spain, the immediate establishment of a Roman government was imperatively necessary, if these possessions were not either to fall a prey to internal anarchy, or be recovered for Carthage by some second Hamilcar. Accordingly, we find that in Sicily the former dominions of Hiero were at once united with the western half of the island as a single province,1 and that in Spain, after nine years rule by a provisional government (206-197), two provinces were in 197 definitely established, and each, like Sicily, assigned to one of the praetors for the year, two additional praetors being elected for the purpose. But here the resemblance between the two ends. From 201 down to the outbreak of the Slave War in 136 there was unbroken peace in Sicily, and its part in the history is limited to its important functions in supplying Rome with corn and in provisioning and clothing the Roman legions.2 It became every year a more integral part of Italy; and a large proportion even of the land itself passed gradually into the hands of enterprising Roman speculators. The boundaries of the two provinces had very little to do from that which fell to the lot of the Sicilian praetors. The condition of Spain required that year after year the praetors should be armed with the consular authority, and backed by a standing force of four legions, while more than once the presence of the consuls themselves was found necessary. Still, in spite of all difficulties, the work of pacification proceeded. To M. Porcius Cato, the censor, and to Tiberius Sempronius Gracchus (praetor and pro- 
praetor, 180-79), father of the two tribunes, is mainly due the credit of quieting the Celtiberian tribes of central Spain, and the government of Gracchus was followed for two years by that of his son.8

1 "pace ac bello felissimam annonea subsidium"; cf. xxxvi. 27.2 Some fresh light has been thrown upon the later campaigns in Spain by the recently discovered fragment of an epitome of Livy (Oxyrhynchus Papyri, iv. 668; Kornemann, *Die neue Lebensepisode aus Oxyrhynchos* (1904)).

3 Italicia (206), Appian, *Iber. 38; Carteia (171), Livy xiii. 3.
only a candidate for the aedileship, elected consul, and given the command in Africa. In the next year (146) Carthage was taken and razed to the ground. Its territory became the Roman province of Africa, while Numidia, now Numidica, now rule by three sons of Massinissa, remained an additional state under Roman suzerainty, and served to protect the new province against the raids of the desert tribes (see Carthage). In Italy itself the Hannibalic war had been followed by important changes. In the north the Celtic tribes paid for their sympathy with Hannibal by the final loss of all separate political existence. Cispadane Gaul, studded with colonies and flooded with Roman settlers, was rapidly Romanized. Beyond the Padus (Po) in Polibius's time Roman civilization was already widely spread. In the extreme northeast the Latin colony of Aquileia, the last of its kind, was founded in 181, to control the Alpine tribes, while in the north-west the Ligurians were held in check by the colony of Luna (180), and by the extensive settlements of Roman citizens and Latins made on Ligurian territory in 173. In southern Italy the depression of the Greek cities on the coast, begun by the raids of the Sabellian tribes, was completed by the repeated blows inflicted upon them during the Hannibalic struggle. Some of them lost territory, all suffered from a decline of population and loss of trade; and their place was taken by such new Roman settlements as Brundusium (Brindisi) and Puteoli (Pozzuoli). In the interior the southern Sabellian tribes suffered scarcely less severely. The Bruttii were struck off the list of Roman allies, and nearly all their territory was confiscated. To the Apulians and Lucanians no such hard measure was meted out; but their strength had been broken by the war, and their numbers dwindled; large tracts of land in their territories were seized by Rome, and allotted to Roman settlers, or occupied by Roman speculators. That Etruria also suffered from declining energy, a dwindling population, and the spread of large estates is clear from the state of things existing there in 133. It was indeed in central Italy, the home of the Latins and their nearest kinsmen, and in the new Latin and Roman settlements throughout the peninsula that progress and activity were henceforth centered.

(b) Rome in the East, 200-133. — Since the repulse of Pyrrhus from Italy, Rome had been slowly drifting into closer contact with the Eastern states. With one of the three great powers which had divided between them the empire of Alexander, with Egypt, she had formed an alliance in 273, and the alliance had been cemented by the growth of commercial intercourse between the two countries. In 228 her chasteism of the Illyrian pirates had led naturally enough to the establishment of friendly relations with some of the states of Greece proper. In 214 the alliance between Philip V. and Hannibal, and the latter's threatened attack on Italy, forced her into war with Macedon, at the head of a coalition of the Greek states against him, which effectually frustrated his designs against herself; at the first opportunity, however (205), she ended the war by a peace which left the position unchanged. The results of the war were not only to draw closer the ties which bound Rome to the Greek states, but to inspire the senate with a genuine dread of Philip's restless ambition, and with a bitter resentment against him for his union with Hannibal. The events of the next four years served to deepen both these feelings. In 205 Philip entered into a compact with Antiochus III. of Syria for the partition between them of the dominions of Egypt, now left by the death of Ptolemy Philometor to the rule of a boy-king. Antiochus was to take Cilicia-Syria and Phoenicia, while Philip claimed for his share the districts subject to Egypt on the coasts of the Aegean and the Greek islands. Philip no doubt hoped to be able to secure these unlawful acquisitions before the close of the Second Punic War should set Rome free to interfere with his plans. But the obstinate resistance offered by Attalus of Pergamum and the Rhodians upset his calculations. In 201 Rome made peace with Cartage, and the senate had leisure to listen to the urgent appeal for assistance which reached her from her Eastern allies. With Antiochus indeed the senate was not yet prepared to quarrel, but with Philip the senate had no thoughts of a peaceful settlement. Their animosity against him has been deepened by the assistance he had recently rendered to Cartage. Always an unsafe and turbulent neighbour, he would, if allowed to become supreme in the Aegean, prove as dangerous to her interests in the East as Cartage had been in the West. To cripple or at least to stay the growth of Philip's power was in the eyes of the senate a necessity; but it was only by representing a Macedonian invasion of Italy as imminent that they persuaded the assembly, which was longing for peace, to pass a declaration of war (200).

The war began in the summer of 200 B.C., and, though the landing of the Roman legions in Epirus was not followed, as had been expected, by any serious collision against Philip, yet the latter had soon to discover that, if they were not enthusiastic for Rome, they were still less inclined actively to assist himself. Neither by force nor by diplomacy could he make any progress south of Böoeotia. The fleets of Pergamum and Rhodes, now the zealous allies of Rome, protected Attica and watched the eastern coasts. The Achaeans and Nabis of Sparta were obstinately neutral, while nearer home in the north the Epirots and Aetolians threatened Thessaly and Macedonia. His own resources both in men and in money had been severely strained by his constant wars, and the only ally who could have given him effective assistance, Antiochus, was fully occupied with the conquest of Cilicia-Syria. It is no wonder then that, in spite of his dashing generalship and high courage, he made but a brief stand. T. Quinctius Flamininus (consul 198), in his first year of command, defeated him on the Aous, drove him back to the pass of Tempe, and in the next year utterly routed him at Cynoscephalae. Almost at the same moment the Achaeans, who had now joined Rome, took Corinthus, and the Rhodians defeated his troops in Caria. Further resistance was impossible; Philip submitted, and early the next year a Roman commission reached Greece with instructions to arrange terms of peace. These were such as effectually secured Rome's main object in the war, the removal of all danger to herself and her allies from Macedonian aggression. Philip was left in possession of his kingdom, but was degraded to the rank of a second-rate power, deprived of all possessions in Greece, Thrace and Asia Minor, and forbidden, as Carthage had been in 201, to wage war without the consent of Rome, whose ally and friend he now became.

The second point in the settlement now effected by Rome was the liberation of the Greeks. The "freedom of Greece" was proclaimed at the Isthmian games amid a scene of wild enthusiasm, which reached its height when two years later (194) Flamininus withdrew his troops from the"three letters of George—Chalcis Demetrias and Corinthus. There is no reason to doubt that, in acting thus, not only Flamininus himself, but the senate and people at home were influenced, partly at any rate, by feelings of genuine
sympathy with the Greeks and reverence for their past. It is equally clear that no other course was open to them. For Rome to have annexed Greece, as she had annexed Sicily and Spain, would have been a flagrant violation of the pledges she had repeatedly given both before and during the war; the attempt would have excited the fiercest opposition, and would probably have drawn the Asiatic as well as the European Greeks into the arms of Antiochus. But a friendly and independent Greece would be at once a check on Macedon, a barrier against aggression from the East, and a promising field for Roman commerce. Nor while liberating the Greeks did Rome abstain from such arrangements as seemed necessary to secure the predominance of her own influence. In the Peloponnesian war, for instance, the Achaeans were rewarded by considerable accessions of territory; and it is possible that the Greek states, as allies of Rome, were expected to refrain from war upon each other without her consent.  

Antiochus III. of Syria, Philip's accomplice in the proposed partition of the dominions of their common rival, Egypt, returned from the conquest of Coele-Syria (198) to learn first of all that Philip was hard pressed by the Romans, and shortly afterwards that he had been decisively beaten at Cyzcopephalae. It was already too late to assist his former ally, but Antiochus resolved at any rate to lose no time in securing for himself the possessions of the Ptolemies in Asia Minor and in eastern Thrace, which Philip had claimed, and which Rome now pronounced free and independent. He therefore turned his arm against Thrace. But Antiochus was pleasure-loving, irresolute, and no general, and it was not until 192 that the urgent entreaties of the Aetolians, and the withdrawal of the Roman troops from Greece, urged him to the decisive step of crossing the Aegean; even then the force he took with him was so small as to show that he completely failed to appreciate the nature of the task before him. At Rome the prospect of a conflict with Antiochus excited great anxiety, and it was not until every resource of diplomacy had been exhausted that war was declared, and the real weakness which lay behind the once magnificent pretensions of the "king of kings" was revealed.

Had Antiochus acted with energy when in 192 he landed in Greece, he might have won the day before the Roman legions appeared. As it was, in spite of the warnings of Hannibal, who was now in his camp, and of the Aetolians, he fretted away valuable time between his pleasures at Chalced and useless attacks on petty Thessalian towns. In 191 Glabrio landed at the head of an imposing force; and a single battle at Thermopylae broke the courage of Antiochus, who hastily recrossed the sea to Ephesus, leaving his Aetolian allies to their fate. But Rome could not pause here. The safety of her faithful allies, the Pergamenes and Rhodians, and of the Greek cities in Asia Minor, as well as the necessity of chastising Antiochus, demanded an invasion of Asia. A Roman fleet had already (191) crossed the Aegean, and in concert with the fleets of Pergamum and Rhodes worsted the navy of Antiochus. 

In 190 the new consul L. Scipio, accompanied by his famous brother, the conqueror of Africa, led the Roman legions for the first time into Asia. At Magnesia ad Sipyolum, in Lydia, he met and defeated the motley and ill-disciplined hosts of the great king. For the first time the West, under Roman leadership, successfully encountered the forces of the East, and the struggle begun which lasted far on into the days of the emperors. The terms of the peace which followed set the victory at Magnesia tell their own story clearly enough. There is no question, therefore, in any more than in the peninsula of Asia Minor, and removing to a safe distance the only eastern power which could be considered dangerous. The line of the Halys and the Taurus range, the natural boundary of the peninsula eastward, was established as the boundary between Antiochus and the kingdoms, cities and peoples now enrolled as the allies and friends of Rome. This line Antiochus was forbidden to cross; nor was he to send ships of war farther west than Cape Sarpedon in Cilicia. Immediately to the west of this frontier lay Bithynia, Paphlagonia and the immigrant Celtic Galatæ, and these frontier states, now the allies of Rome, served as a second line of defence against attacks from the east. The area lying between these "buffer states" and the Aegean was organized by Rome in such a way as should at once reward the fidelity of her allies and secure both her own paramount authority and safety from foreign attack. Pergamum and Rhodes were so strengthened—the former by the gift of the Chersonese, Lycaonia, Phrygia, Myssia, Lydia, the latter by that of Lycia and Caria—as not only amply to reward their loyalty, but to constitute them effective props of Roman interests and effective barriers alike against Thracian and Celtic raids in the north and Syrian aggression in the south. Lastly, the Greek cities on the coast, except those already tributary to Pergamum, were declared free, and established as independent allies of Rome.

In a space of little over eleven years (200-189) Rome had broken the power of Alexander's successors and established throughout the eastern Mediterranean a Roman protectorate. Throughout the western half of this protectorate that the first steps in the direction of annexation were taken. The enthusiasm provoked by the liberation of the Greeks had died away, and its place had been taken by feelings of dissatisfaction ambition or sullen resentment. Intermittent feuds and economic distress had brought many parts of Greece to the verge of anarchy, and, above all, the very foundations of the settlement effected in 197 were threatened by the reviving power and aspirations of Macedon. Loyally as Philip had aided Rome in the war with Antiochus, the peace of Magnesia brought him nothing but fresh humiliation. He was forced to abandon all hopes of recovering Thessaly, and he had the mortification to see the hated king of Pergamum installed almost on his borders as master of the Thracian Chersonese. Resistance at the time was unavailing, but from 189 until his death (179) he laboured patiently and quietly to increase the internal resources of his own kingdom, and to foment, by dexterous intrigue, feelings of hostility to Rome among his Greek and barbarian neighbours. His successor, Perseus, his son by a left-handed alliance, continued his father's work. He made friends among the Illyrian and Thracian princes, connected himself by marriage with Antiochus IV. of Syria and with Prusias of Bithynia, and, among the Greek peoples, without success, to revive the memories of the past glories of Greece under the Macedonian leadership of the great Alexander. The senate could no longer hesitate. They were well aware of the restlessness and discontent in Greece; and after hearing from Eumenes of Pergamum, and from their own officers, all details of Perseus's intrigues and preparations, they declared war. The struggle, in spite of Perseus's courage and the incapacity at the outset of the Roman commanders, was short and decisive. The sympathy of the Greeks with Perseus, which had been encouraged by the hitherto passive attitude assumed by Rome, instantly evaporated on the news that the Roman legions were on their way to Greece. No assistance came from Prusias of Antiochus, and Perseus's only allies were the Thracian king Cotys and the Illyrian Genthius. The victory gained by L. Aemilius Paulus at Pydna (168) ended the war. Perseus became the prisoner of Rome, and as such died in Italy a few years later. Rome had begun the war with the

fixed resolution no longer of crippling but of destroying the Macedonian state. Perseus's repeated proposals for peace during the war had been rejected; and his defeat was followed by the final extinction of the kingdom of Philip and Alexander. Macedonia, though it ceased to exist as a single state, was not, however, definitely constituted a Roman province. On the contrary, the mistake was made of introducing some of the main principles of the provincial system—taxation, disarmament and the isolation of the separate communities—without the addition of the element most essential for the maintenance of order—that of a resident Roman governor. The four petty republics now created were each autonomous, and each separated from the others by the prohibition of commercium and consilium, but no central controlling authority was substituted for that of the Macedonian king. The inevitable result was confusion and disorder, resulting finally (419-45) in the attempt of a pretender, Andriscus, who claimed to be a son of Perseus, to resuscitate the ancient monarchy. On his defeat in 148 the senate declared Macedonia a Roman province, and placed a Roman magistrate at its head.

From 189 to the defeat of Perseus in 168 no formal change of importance in the status of the Greek states had been made by Rome. The senate, though forced year after year to intervene in the mutual recriminations and complaints of rival communities and factions, contented itself as a rule with intervening just enough to remind the Greeks that their freedom was limited by its own paramount authority, and to prevent any single state or confederacy from raising itself too far above the level of general weakness which it was the interest of Rome to maintain. After the victory at Pydna, however, the sympathy shown for Perseus, exaggerated as it seems to have been by the interested representations of the romanizing factions in the various states, was made the pretext for a more emphatic assertion of Roman ascendancy. All those cities of Macedonian leaning were removed to Italy, as hostages for the loyalty of their several communities, and the real motive for the step was made clear by the exceptionally severe treatment of the Achaeans, whose loyalty was not really doubtful, but whose growing power in the Peloponnesian and independence of language had awakened alarm at Rome. A thousand of their leading men, among them the historian Polybius, were carried off to Italy (see POLYBIUS). In Aetolia the Romans convoked at the massacre by their so-called friends of five hundred of the opposite party. Acarnania was weakened by the loss of Leucas, while Athens was rewarded for her unambitious loyalty by the gift of Delos and Samos.

But this somewhat violent experiment only answered for a time. In 148 the Achaeans rashly persisted, in spite of warnings, in attempting to compel Sparta by force of arms to submit to the league. When threatened by Rome with the loss of all that they had gained since Cynoscephalae, they madly rushed into war. They were easily defeated, and a "commission of ten," under the presidency of L. Mummius, was appointed by the senate to reestablish the affairs of Greece. Corinth, by orders of the senate, was burnt to the ground and its territory confiscated. Thessal and Chaonics were destroyed, and the walls of all towns which had shared in the last desperate outbreak were razed to the ground. All the existing confederacies were dissolved; no commercium was allowed between one community and another. Everywhere an aristocratic type of constitution, according to the invariable Roman practice, was established, and the payment of a tribute imposed. Into Greece, as into Macedonia in 167, the now familiar features of the provincial system were introduced—disarmament, isolation and taxation. The Greeks were still nominally free, and no separate province with a governor of its own was established, but the needed central control was provided by assigning to the neighbouring governor of Macedonia a general supervision over the affairs of Greece. From the Adriatic to the Aegean, and as far north as the river Drilo and Mount Scardus, the whole peninsula was now under direct Roman rule.

Beyond the Aegean the Roman protectorate worked no better than in Macedonia and Greece, and the quarrels and disorders which flourished under its shadow were aggravated by its longer duration and by the still more selfish views taken by Rome of her responsibilities. At one period indeed, after the battle of Pydna, it seemed as if the more vigorous, if harsh, system then initiated in Macedonia and Greece was to be adopted farther east also. The levelling policy pursued towards Macedon and the Achaeans was applied with less justice to Rome's two faithful and favoured allies, Rhodes and Pergamum. The former had rendered themselves obnoxious to Rome by their independent tone and still more by their power and commercial prosperity. On a charge of complicity with Persians they were threatened with war, and though this danger was averted they were forced to exchange their equal alliance with Rome for one which placed them in close dependence upon her, and to resign the lucrative possessions in Lycia and Caria given them in 189. Finally, their commercial prosperity was ruined by the establishment of a free port at Delos, and by the short-sighted acquiescence of Rome in the raids of the Cretan pirates. With Eumenes of Pergamum no other fault could be found than that he was strong and successful; but this was enough. His brother Attalus was invited, but in vain, to become his rival. His turbulent neighbours, the Galatians, were encouraged to harass him by raids. Pamphylia was declared independent, and favours were heaped upon Prusias of Bithynia. These and other annoyances and humiliations had the desired effect. Eumenes and his two successors—his brother and son, Attalus II. and Attalus III.—contrived indeed by studious humility and dexterous flattery to retain their thrones, but Pergamum (q.v.) ceased to be a powerful state, and its weakness, added to that of Rhodes, increased the prevalent disorder in Asia Minor. During the same period we have other indications of a temporary activity on the part of Rome. The frontier of the protectorate was pushed forward to the confines of Armenia by alliances with the kings of Pontus and Cappadocia, beyond the Taurus. In 132, on the death of Antiochus Epiphanes (161), Rome intervened to place a minor, Antiochus Eupator, on the throne, under Roman guardianship.

In 168 Egypt formally acknowledged the suzerainty of Rome, and in 163 the senate, in the exercise of this new authority, restored Ptolemy Philometor to his throne, but at the same time weakened his position by handing over Cyrene and Cyprus to his brother Euegetes.

But this display of energy was shortlived. From the death of Eumenes in 150 down to 133 Rome, secure in the absence of any formidable power in the East, and busy with affairs in Macedonia, Africa and Spain, relapsed into an

inactivity the disastrous results of which revealed themselves in the next period, in the rise of Mithradates of Pontus, the spread of Cretan and Cilician piracy, and the advance of Parthia.

Both the western and eastern Mediterranean now acknowledged the suzerainty of Rome, but her relations with the two were from the first different. The West fell to her as the prize of victory over Carthage, and, the Carthaginian power broken, there was no hindrance to the immediate establishment in Sicily, Sardinia, Spain, and finally in Africa, of direct Roman rule. To the majority, moreover, of her western subjects she brought a civilization as well as a government of a higher type than any before known to them. And so in the West she not only formed provinces but created a new and wider Roman world. To the East, on the contrary, she came as the liberator of the Greeks; and it was only slowly that in this part of the Empire her provincial system made way. In the East, moreover, the older civilization she found there obstinately held its ground. Her proconsuls governed and her legions protected the Greek communities, but to the last the East remained in language, manners and thought Greek and not Roman.

Period C: The Period of the Revolution (146-49 B.C.).—In the course of little more than a century, Rome had become the supreme power in the civilized world. By all men, says Polybius, it was taken for granted that nothing remained but to obey the commands of the Romans. For the first time the history of Roman activity centres in her attempts to perform the two herculean tasks which this unique position had laid upon her—the enforcement of her government over the peoples, and their defence against the barbarian races which swarmed around them on all sides. They were tasks under which the old republican constitution broke down, and which finally overtaxed the strength even of the marvellous organization framed and elaborated by Augustus and his successors.

Although in its outward form the old constitution had undergone little change during the age of war and conquest from 265 to 146,2 the causes, both internal and external, which brought about its fall had been silently at work throughout. Its form was in strictness that of a moderate democracy. The patriciate had ceased to exist as a privileged caste, and there was no longer any order of nobility recognized by the constitution. The senate and the offices of state were in law open to all,4 and the will of the people in assembly had been in the most explicit and unqualified manner declared to be supreme alike in the election of magistrates, in the passing of laws, and in all matters touching the caput of a Roman citizen. But in practice the constitution had become an oligarchy. The senate, not the assembly, ruled Rome, and both the senate and the magistrates were in the hands of a class which, in defiance of the law, arrogated to itself the title and the privileges of a nobility.4 The ascendency of the Senate in the state was too obvious and familiar a fact to need much illustration here. It was but rarely that the assembly was called upon to decide questions of policy, and then the proposal was usually made by the magistrate in obedience to the express directions of the senate.5 In the enormous majority of cases the matter was settled by a senatus consultum, without any reference to the people at all. The assembly decides for war or peace,6 but the conduct of the war and the conditions of peace are matters left to the senate (q.v.). Now and then the assembly confers a command upon the man of its choice, or prolongs the command of a magistrate,8 but, as a rule, these and all questions connected with foreign affairs are settled within the walls of the senate-house.9 It is the senate which year after year assigns the commands and fixes the number and disposition of the military forces,10 directs the organization of a new province,11 conducts negotiations, and forms alliances. Within Italy, though its control of affairs was less exclusive, we find that, besides supervising the ordinary current business of administration, the senate decides questions connected with the Italian allies, sends out colonies, allotls lands, and directs the suppression of disorders. Lastly, both in Italy and abroad it managed the finances.12 Inseparably connected with this monopoly of affairs was the exclusion of the assembly as the control which, in practice, if not in theory, the senate exercised over the magistrates. The latter had become what Cicero wrongly declares they were always meant to be, merely the subordinate ministers of the supreme council,13 which assigned them their departments, provided them with the necessary equipment, claimed to direct their conduct, prolonged their commands, and rewarded them with triumphs. It was now at once the duty and the interest of a magistrate to be in auctoritate senatus, "subject to the authority of the senate," and even the once formidable tribuni plebis are found during this period actively and loyally supporting the senate, and acting as its spokesmen in the assembly.14 The causes of this ascendency of the senate are to be found firstly in the fact that the senate was the only body capable of conducting affairs in an age of incessant war. The voters in the assembly, a numerous, widely scattered body, could not readily be called together, and when assembled were very imperfectly qualified to decide momentous questions of military strategy and foreign policy. The senate, on the contrary, could be summoned in a moment,16 and included in its ranks all the skilled statesmen and soldiers of the commonwealth. The subordination of the magistrates was equally the result of circumstances, for, as the numbers of the magistrates, and also the area of government, increased, some central controlling power became absolutely necessary to prevent collisions between rival authorities, and to secure a proper division of labour, as well as to enforce the necessary concert and co-operation.16 No such power could be found anywhere in the republican system but in the senate, standing as it necessarily did in the closest relations with the magistrate, and composed as it was from men of considerable knowledge of those whose families included curule office, and had thereby acquired the jus imaginum. It was thus in theory within the reach of any citizen who could win election even to the curule aedilship, and, moreover, it carried with it no legal privileges whatsoever. Gradually, 605.

The nobles.

The cause.

1 Polyb. iii. 4. 2The most important change was the assimilation of the division of classes formed by tribes, a change possibly due to the censorship of Gaius Flaminius in 220 (Mommsen, Slaatir. ii 270). On this point see Comitia.

3 A few offices of a more or less priestly character were still filled only by priests, e.g. lex Curia Susa and lex lata curia (Cic. De leg. vii. 23).

4 The lex curia was in the hands of the censors, but whether before Sulla's time their choice was subject to legal restrictions is doubtful (see Satt).

5 Mommsen, Hist. of Rome, iii. 7; Lange, Rom. Alterth., ii. 1 ff.

6 Ex auctore senatorum. The lex Flaminia agraria of 232 was an exception (Cic. De senec. 4; Polyb. ii. 21). In 167 B.C. a praetor brought the question of war with Rhodes directly before the assembly, but this was condemned as unprecedented (novo maliore exemplo, Liv. xiv. 21).

7 Livy xxxvi. 16. 8 Ibid. xxvii. 55. 9 Ibid. xxviii. 25. 10 Ibid. xxxvii. 8. 11 Ibid. xxxviii. 8. 12 Ibid. xxi. 8. 13 Ibid. xxiv. i. 8. 14 Ibid. xxxviii. 3. 15 Ibid. xvii. 7. 16 In 191 the senators were forbidden to leave Rome for more than a day, nor were more than five to be absent at once (Livy xxxvi. 3).

17 Ibid. xxvii. 35. 18 Mommsen, Hist. of Rome, iii. 7 ff. 19 E.g. Livy, Sempronii, Caelii. Licini. 20. 1 Polyb. iv. 5. 21 Ibid. vi. 13.
however, the ennoble plebian families drew together, and contested with the older patrician ones to form a distinct order. Office brought wealth and prestige, and both wealth and prestige were liberally employed in securing for this select circle a monopoly of political power, and excluding new men. Already the close of the period it was rare for any one but a noble to find his way into high office or into the senate. The senate and magistrates are the mouthpieces of this order, and identified with it in policy and interest. Lastly, it must be allowed that both the senate and the nobility had to some extent justified their power by the use they made of it. It was their tenacity of purpose and devoted patriotism which had carried Rome through the dark days of the Hannibalic War. The heroes of the struggle with Carthage belonged to the leading families; the disasters at the Trasimene Lake and at Cannae were associated with the blunders of popular favourites.

From the first, however, there was an inherent weakness in this senatorial government. It had no sound constitutional basis, and with the removal of its accidental supports fell to the ground. Legally the senate had no positive authority. It could merely advise the magistrate when asked to do so, and its decrees were strictly only suggestions to the magistrate, which he was at liberty to accept or reject as he chose. It had, it is true, become customary for the magistrate not only to ask the senate’s advice on all important points, but to follow it when given. But it was obvious that if this custom were weakened, and the magistrates chose to act independently, the senate was powerless. It might indeed anathematize the refractory official, or hamper him if it could by setting in motion against him a colleague or the tribunes, but it could do no more, and these measures failed just where the senate’s control was most needed and most difficult to maintain—in its relations with the generals and governors of provinces abroad. The virtual independence of the proconsul was before 146 already exciting the jealousy of the senate and endangering its supremacy. Not again, as in the case of the semin marshals and legal hold over the assembly. Except in certain specified cases, it rested with the magistrate to decide whether any question should be settled by a decree of the senate or a vote of the assembly. If he decided to make a proposal to the assembly, he was not bound except by custom to obtain the previous approval of the senate, and the constitution set no limits to the power of the assembly to decide any question whatsoever that was laid before it.

From 167, at least, onwards, there were increasing indications that both the acquiescence of the people in senatorial government and the loyalty of the magistrates to the senate were failing. The absorbing excitement of the great wars had died away; the economic and social disturbances, the arbitrary and oppressive terrors which they produced were creating a growing feeling of discontent; and at the same time the senate provoked inquiries into its title to govern by its failure any longer to govern well. In the East there was confusion; in the West a single native chieftain defied the power which had crushed Carthage. At

621-605. The senators’ whole duty is to “sentientia dicer.” The senator was asked “quid censeris?” as the assembly “quid velitis iubeatis?” Cf. also the saving clause, “Si eis videretur” (sc. consulibus, &c.) in Scta, e.g. Cic. Phil., v. 19, 53.

637. By declaring his action to be “contra rem publicam,” the force of this anathema varied with circumstances. It had no legal value.

652. Livy xxxvi. 42, of Cn. Manlius Vulso in Asia, 189 B.C.; cf. also the position of the two Scipios.

657. Hence the same things, e.g. founding of colonies, are done in one year by a Scutum, in another by a lex; Cic. De rep. ii. 32, 56: Phil. lvii. 1; Ann., xliii. consul, “mutata omnia, nihil per quem omnia, omnia per populum.”

658. There was no legal necessity, before Sulla’s time, for getting the senatus auctoritas for a proposal to the assembly.

664. Not the Senate, but the people. They are the ultimate sources from whom the right of electing magistrates. The Senate exercises the right of voting in the consuls, and other public offices, but by the constitution of the Servian age, it was that people who were to elect the magistrates. The Senate was the organ of the executive power, but the people were supreme as the source of authority.

666. The word “the peoples” or “the nations” is the general term for the various local bodies of Italy, the people of Rome, the Etruscans, the Latins, the Gauls, the Samnites, and so on. The word is always used in a relative sense, to show that the Romans were “the people of Rome,” the Samnites were “the people of Samnium,” and so on. It was never used in the absolute sense, to mean “the whole nation.” The term “the nations” is used in a political sense, to mean “the various peoples of Italy,” and to be distinguished from “the Romans,” who were the people of Rome, and who were the only people of Italy whose political institutions were of importance.

668. The word “the people” is used in a political sense, to mean “the citizens of Rome,” and to be distinguished from “the Romans,” who were the people of Rome, and who were the only people of Italy whose political institutions were of importance.

672. The word “the people” is used in a political sense, to mean “the citizens of Rome,” and to be distinguished from “the Romans,” who were the people of Rome, and who were the only people of Italy whose political institutions were of importance.

674. The word “the people” is used in a political sense, to mean “the citizens of Rome,” and to be distinguished from “the Romans,” who were the people of Rome, and who were the only people of Italy whose political institutions were of importance.

677. The word “the people” is used in a political sense, to mean “the citizens of Rome,” and to be distinguished from “the Romans,” who were the people of Rome, and who were the only people of Italy whose political institutions were of importance.

680. The word “the people” is used in a political sense, to mean “the citizens of Rome,” and to be distinguished from “the Romans,” who were the people of Rome, and who were the only people of Italy whose political institutions were of importance.

686. The word “the people” is used in a political sense, to mean “the citizens of Rome,” and to be distinguished from “the Romans,” who were the people of Rome, and who were the only people of Italy whose political institutions were of importance.

and when they returned from the government of a province it
was to build sumptuous villas, filled with the spoils of Greece
and Asia, to surround themselves with troops of slaves and
dependents, and to live rather as princes than as citizens of
a republic. The 

publicans and negotiatores formed a second
order in the state, which rivalled the first in wealth and coveted
a share in its political supremacy; while the third estate, the
plebs urbana, was constantly increasing in numbers and at the
same time sinking into the condition of an idle proletariat. The
accentuation of class distinctions is indeed inevitable in a
capitalist society, such as that of Rome was now becoming.
But the process was fraught with grave political danger owing
to the peculiarities of the Roman constitution, which rested in
theory on the ultimate sovereignty of the people, who were in
practice represented by the city mob. To win the support of the
plebs became a necessity for ambitious politicians, and the
means employed for this end poisoned the political life of Rome.
The wealth derived from the provinces was freely spent in
bribery, and the populace of Rome was encouraged to claim as
the price of its support a share in the spoils of empire.

It was not only the structure and composition of Roman
society that underwent a transformation. The victory of
Rome in her struggle for supremacy in the Medi-
terranean basin had been largely due to the powerful
force represented by the city mob. Her institutions was
preserved from decay. Respect for the mos majorum, or
ancestral custom, imposed an effective check on the desire
for innovation. Though personal religion, in the deeper sense,
was foreign to the Roman temperament, there was a genuine
belief in the gods whose favour had made Rome great in the
past and would uphold her in the future so long as she
trod in the old paths of loyalty and devotion. Above all,
the healthy moral traditions of early Rome were maintained
by the discipline of the family, resting on the supreme authority
of the father—the pater familias—and the powerful influence
of religious forces, which her institutions was

32

apt to absorb. Finally, the institution of the censorship, backed
as it was by the mighty force of public opinion, provided a
deterrent which prevented any flagrant deviation from the
accepted standard of morals. All this was changed by the
influence of Greek civilization, with which Rome was first
brought face to face in the 3rd century B.C. owing to her
relations with Magna Graecia. At first the results of contact
with the older and more brilliant culture of Hellas were on the
whole good. In the 3rd century B.C., when constant intercourse

was established with the commercial centres of Greece proper and
of Asia Minor, "philhellenism" became a passion, which was
strongest in the best minds of the day and resulted in a quickened
intellectual activity, wider sympathies and a more humane
life. But at the same time the "new learning" was a disturbing
and unsettling force. The Roman citizen was confronted
with new doctrines in politics and religion, and initiated into
the speculations of critical philosophy. Under the influence
of this powerful solvent the fabric of tradition embodied in the
mos majorum fell to pieces; a revolt set in against Roman
discipline and Roman traditions of self-effacement, and the
comity and respect for Cornelia was

33

vomited up. As it had been in the days of the "Sophistic"
movement at Athens, so it was now with Rome; a higher
education, which, owing to its expense, was necessarily confined
to the wealthier classes, interposed between the upper and lower
ranks of society a barrier even more effectual than that set up
by differences of material condition, and by releasing the indi-
vidual from the trammels of traditional morality, gave his
ambition free course. The effect on private morals may be
gauged by the vehemence with which the reactionary opposi-

tion, headed by M. Porcius Cato (consul, 195 B.C.; censor, 184
B.C.), inveighed against the new fashions, and by the
list of measures passed to check the growth of luxury
and licentiousness, and to exclude the foreign teachers of the new
learning. It was all in vain. The art of rhetoric, which was
studied through the medium of Greek treatises and Greek
models, furnished the Roman noble with weapons of attack
and defence of which he was not slow to avail himself in the
forum and the senate-house. In the science of money-making,
which had been elaborated under the Hellenistic monarchies,

the Roman capitalists apt pupils of their Greek teachers.
Among the lower classes, contact with foreign slaves and freed-
men, with foreign worship and foreign vices, produced a love
of novelty with which no legislation could check. Even amongst
women there were symptoms of revolt against the old order,
which showed itself in a growing freedom of manners and
impatience of control, the marriage tie was relaxed, and the
respect for mother and wife, which had been so powerful a
factor in the maintenance of the Roman standard of morals,
was grievously diminished. Thus Rome was at length brought
to face to face with a moral and economic crisis which a modern
historian has described in the words: "It was living through
the fever of moral disintegration and coherence which assails
all civilized societies that are rich in the manifold resources of
culture and enjoyment, but tolerate few or no restraints on
the feverish struggle of contending appetites." In this struggle
the Roman Republic perished, and personal government took
its place. The world had outgrown the city-state and its
political machinery, and as the notions of federalism (on any
large scale) and representative government had not yet come
into being, no solution of the problem was possible save that
of absolutism. But a far stronger resistance would have been
opposed to political revolution by the republican system had not
public morals been sapped by the influences above described.
Political corruption was reduced to a science for the benefit
of which people were often called away from the sound sense of
ruin or revolution; there was no longer any body of sound
public opinion to which, in the last resort, appeal could be made;
and, long before the final catastrophe took place, Roman society
itself had become, in structure and temper, thoroughly un-
republican.

The first systematic attack upon the senatorial government
is connected with the names of Tiberius and Gaius Gracchus
(q.q.) and its immediate occasion was an attempt to deal
with no less a danger than the threatened dis-
appearance of the class to which all others Rome owed
most in the past. The small landholders, who were
throughout the greater part of Italy were sinking deeper into
ruin under the pressure of accumulated difficulties. The
Hannibalic war had laid waste their fields and thinned their
numbers, nor when peace returned to Italy did it bring with it
any revival of prosperity. The heavy burden of military
service still pressed ruinously upon them, and in addition
they were called upon to compete with the foreign corn

4 In 161 B.C. a decree of the senate was passed against "philosophi
et rhetores Latinii, ut Romae ne essent" (Gell. xvi. 11). In 155 B.C.
people were confined from "rhetoricos" (Ihne ii. 22). The
elder Cato complained of this as early as 195 B.C. (Liv.
xxvii. 4.)

The force was unknown at Rome until 234 B.C. (Dionys. ii. 25).
In the last century of the Republic it was of daily occurrence.

5 In the Ciceronian period the lower classes of Rome, with whom
the voting power in the comitia rested, were openly organized for
purposes of bribery by means of colegia and sodalicia, nominally
religious bodies.

6 Caesar had accumulated debts amounting to £800,000 by
the time of his praetorship. Catiline and his fellow-bankrupts,
amongst whom was also a certain Severus who, as we are told by Sallust, "danced and played better than an honest
woman need do," hoped to bring about a cancelling of debts (novae
tributum).

7 For authorities, see under GRACCHUS.

8 To Spain alone more than 150,000 men were sent between 196
and 169 (Ihne iii. 319); compare the reluctance of the people to
declare war against Macedon in 200 B.C., and also the case of Saporis
Ligustenus in 171 (Livy, xiii. 34).
imported from beyond the sea, and with the foreign slave-labour purchased by the capital of wealthier men. Farming became unprofitable, and the hard laborious life with its scanty returns was thrown into still darker relief when compared with the stirring life of the camps with its opportunities of booty, or with the cheap provisions, frequent largesses and gay spectacles to be had in the large towns. The small holders went off to follow the eagles or swell the proletariat of the cities, and their holdings were left to run waste or merged in the vineyards, oliveyards and above all in the great cattlefarms of the rich, and their own place was taken by slaves. The evil was worst in Etruria and in southern Italy; but everywhere it was serious enough to demand the earnest attention of Roman statesmen. Of its existence the government had received plenty of warning in recent days of a sudden emigration of male-bodied males returned at the census, in the increasing difficulties of recruiting for the legions, in servile outbreaks in Etruria and Apulia, and between 100 and 160 a good deal was attempted by way of remedy. In addition to the foundation of twenty colonies, there were frequent allotments of land to veteran soldiers, especially in Apulia and Samnium. In 180, 40,000 Ligurians were removed from their homes and settled on vacant lands once the property of a Samnite tribe, and in 160 the Pompeine marshes were drained for the purpose of cultivation. But these efforts were only partially successful, and the colonies planted in Cisalpine Gaul and in Picenum flourished, but of the others the majority slowly dwindled away, and two required reconfining only eight years after their foundation. The veterans who received land were unitted to make good farmers; and large numbers, on the first opportunity, gladly returned as volunteers to a soldier’s life. Moreover, after 160 even these efforts ceased, and with the single exception of the colony of Auxinum in Picenum (157) nothing was done to check the spread of the evil, until in 133 Tiberius Gracchus, on his election to the tribunate, set his hand to the evil.

The remedy proposed by Gracchus amounted to the assertion by the state of as much of the “common land” as was not held in occupation by authorized persons and conformably to the provisions of the Licinian law, and the distribution in allotments of the land thus rescued for the community from the monopoly of a few. It was a scheme which could quote in its favour ancient precedent as well as urgent necessity. Of the causes which led to its ultimate failure something will be said later on; for the present we must turn to the constitutional conflict which it provoked. The senate from the first identified itself with the interests of the wealthy occupiers, and Gracchus found himself forced into a struggle with that body, which had been no part of his original plan. He fell back on the legislative sovereignty of the assembly; he resuscitated the half-forgotten powers of interference vested in the tribunate in order to paralyse the action of the senatorial magistrates, and finally lost his life in an attempt to make good one of the weak points in the tribune’s position by securing his own re-election for a second year. But the conflict did not end with his death. It was

renewed on a wider scale, and with a more deliberate aim by his brother Gaius, who on his election to the tribunate (123) at once came forward as the avowed enemy of the senate. The latter suddenly found its control of the administration threatened at a variety of points. On the invitation of the popular tribune the assembly proceeded to restrict the senate’s freedom of action in assigning the provinces. It regulated the taxation of the province of Asia and altered the conditions of military service. In home affairs it inflicted two serious blows on the senate’s authority by declaring the summary punishment of Roman citizens by the consuls on the strength of a senatus consultum to be a violation of the law of appeal, and by taking out of the senate’s hands the control of the newly established court for the trial of cases of misgovernment in the provinces. Tiberius had committed the mistake of relying too exclusively on the support of one section only of the community; his brother endeavoured to enlist on the popular side every available ally. The Latins and Italians had opposed an agrarian scheme which took from them land which they had come to regard as rightfully theirs, and gave them no share in the benefit of the allotments. Gaius not only removed this latter grievance, but ardently supported and himself brought forward the first proposals made in Rome for their enfranchisement. The indifference of the city populace, to whom the prospect of the new holdings in a remote district of Italy was not a tempting one, was overcome when the monthly doles of corn at a low price. Finally, the men of business—the publicans, merchants and money-lenders—were conciliated by the privilege granted to them of collecting the tithes of the new province of Asia, and placed in direct rivalry by the senate by the substitution of men of their own class as judges in the quaestio de repetundis, in place of senators. The organizer of this concerted attack upon the position of the senate fell, like his brother, in a riot.

The agrarian reforms of the two Gracchi had little permanent effect. Even in the lifetime of Gaius the clause in his brother’s law rendering the new holdings inalienable was repealed, and the process of absorption recommenced. In 118 a stop was put to further allotment of occupied lands, and finally, in 111, the whole position of the agrarian question was altered by a law which converted all land still held in occupation into private land. The old controversy as to the proper use of the lands of the community was closed by this act of alienation. The controversy in future turns, not on the right of the poor

citizens to the state lands, but on the expediency of purchasing other lands for distribution at the cost of the treasury.1

But, though the agrarian reform failed, the political conflict it had provoked continued, and the lines on which it was waged were in the main those laid down by Gaius Gracchus. The sovereignty of the assembly continued to be the watchword of the popular party, and a free use of the tribunician powers of interference and of legislation remained the most effective means of accomplishing their aims.

Ten years after the death of Gaius the populares once more summoned up courage to challenge the supremacy of the senate; but it was on a question of foreign administration that the conflict was renewed. The course of affairs in the client state of Numidia since Micipsa's death in 118 had been such as to discredit a stronger government than that of the senate.2 In defiance of Roman authority, and relying on the influence of his own well-spent gold, Jugurtha had murdered both his legitimate rivals, Hiempsal and Adherbal, and made himself master of Numidia. The declaration of war from the senate (117) by popular indignation had been followed by the corruption of a consul3 (116) and the crushing defeat of the proconsul Albinus.4 On the news of thisrowning disgrace the storm burst, and on the proposal of the tribunes a commission of inquiry was appointed into the conduct of the war.5 But the popular leaders did not stop here. Q. Caecilius Metellus, who as consul (109) had succeeded to the command in Numidia, was an able soldier but a rigid aristocrat; and they now resolved to improve their success by entrusting the command instead to a genuine son of the people. Their choice fell on Gaius Marius (see Marius), an experienced officer and administrator, but a man of humble birth, wholly illiterate, and one who, though no politician, was by temperament and training a hater of the polished and effeminate nobles who filled the senate.6 He was triumphantly elected, and, in spite of a decree of the senate continuing Metellus as proconsul, he was entrusted by a vote of the assembly with the charge of the war against Jugurtha (q.v.).7

Jugurtha was vanquished; and Marius, who had been a second time elected consul in his absence, arrived at Rome in January 104, bringing the captive prince with him in chains.8 But further triumphs awaited the popular hero. The Cimbris and Teutones were at the gates of Italy; they had four times defeated the senatorial generals, and Marius was called upon to save Rome from a second invasion of the barbarians.9 After two years of suspense the victory at Aquae Sextiae (102), followed by that on the Raudine plain (101), put an end to the danger by the annihilation of the invading hordes; and Marius, now consul for the fifth time, returned to Rome in triumph. There the popular party welcomed him as a leader with all the prestige of a successful general. Once more, however, they were destined to a brief success followed by disastrous defeat. Marius became for the sixth time consul;10 of the two popular leaders Glaucia became praetor and Saturninus tribune. But Marius and his allies were not statesmen of the stamp of the Gracchi; and when Marius proposed the victory at Aquae Sextiae was no serious aim in view other than that of harassing the senate. His corn law merely reduced the price in 112 for the monthly dole of corn, and the main point in his agrarian law lay in the clause appended to it requiring all senators to swear to observe its provisions.11 The laws were carried, but the triumph of the popular leaders was short-lived. Their recklessness and violence had alienated all classes in Rome; and their period of office was drawing to a close. At the elections fresh rioting took place, and Marius as consul was called upon by the senate to protect the state against his own partisans. Saturninus and Glaucia surrendered, but while the senate was discussing their fate they were surrounded and murdered by their opponents.

The popular party had been worsted once more in their struggle with the senate, but none the less their alliance with Marius, and the position in which their votes placed him, marked an epoch in the history of the revolution. The transference of the political leadership to a consul who was nothing if not a soldier was at once a confession of the insufficiency of the purely civil authority of the tribune and a dangerous encouragement of military interference in political controversies. The consequences were already foreshadowed by the special provisions made by Saturninus for Marius's veterans, and in the active part taken by them in the passing of his laws. Indirectly, too, Marius, though no politician, played an important part in this new departure. His military reforms12 at once democratized the army and attached it more closely to the popular will; and the time swept away the last traces of civil distinctions of rank or wealth within the legion, admitted to its ranks all classes, and substituted voluntary enlistment under a popular general for the old-fashioned compulsory levy. The efficiency of the legion was increased at the cost of a complete severance of the ties which bound it to the civil community and to the civil authorities.

The next important crisis was due partly to the rivalry which had been growing more bitter each year between the senate and the commercial class, and partly to the long-impending question of the enfranchisement of the Italian allies. The publicani, negotiatores and others, who constituted what was now becoming a new and distinct order (see Equites), had made unscrupulous use of their control of the courts and especially of the quaestio de repetundis against their natural rivals, the official class in the provinces. The threat of prosecution before a hostile jury was held over the head of every governor, legate and quaestor who ventured to interfere with their operations in the provinces. The average official preferred to connive at their exactions; the bolder ones paid with fines and even exile for their courage. In 92 the necessity for a reform was proved beyond a doubt by the scandalous condemnation of P. Rutilius Rufus,13 ostensively on a charge of extortion, in reality as the reward of his efforts to check the extortions of the Roman equites in Asia. The difficulties of the Italian question were more serious. That the Italian allies were discontented was notorious. After nearly two centuries of close alliance, of common dangers and victories, they now eagerly coveted as a boon that complete amalgamation with Rome which they had at first resented as a dishonour. But, unfortunately, Rome had grown more exclusive in proportion as the value set upon Roman citizenship increased. During the last forty years feelings of hope and disappointment had rapidly succeeded each other; Marcus Marius, Lucius Gaius Gracchus, Saturninus, had all held out promises of relief—and nothing had yet been done. On each occasion they had crowded to Rome, full of eager expectation, only to be harshly ejected from the city by the consul's orders.14 The justice of their claims could hardly be denied, the danger of continuing to ignore them was obvious—yet the difficulties in the way of granting them were formidable in the extreme, and from a higher than a merely selfish point of view there was much

to be said against the revolution involved in so sudden and enormous an enlargement of the citizen body.

Marcus Livius Drusus (q.v.), who as tribune gallantly took up the task of reform, is claimed by Cicero as a member of that party of the centre to which he belonged himself. Noble, wealthy and popular, he seems to have hoped to be able by the weight of his position and character to rescue the burning questions of the day from the grasp of extreme partisans and to settle them peacefully and equitably. But he, like Cicero after him, had to find his cost that there was no room in the fierce strife of Roman politics for moderate counsels. His proposal to reform the law courts excited the equestrian order and their friends in the senate to fury. The agrarian and corn laws which he coupled with it alienated many more in the senate, and roused the old anti-popular party feeling; finally, his known negotiations with the Italians were eagerly misrepresented to the jealous and excited people as evidence of complicity with a widespread conspiracy against Rome. His laws were carried, but the senate pronounced them null and void. Drusus was denounced in the senate house as a traitor, and on his way home was struck down by the hand of an unknown assassin. His death was probably an accident but had been secretly prepared for some time before.

Throughout the highlands of central and southern Italy the flower of the Italian peoples rose as one man. Etruria and Umbria held aloof; the isolated Latin colonies stood firm; but the Sabellian clans, north and south, the Latinized Marsi and Faëligni, as well as the Òcan-speaking Samnites and Lucanians, rushed to arms. No time was lost in proclaiming their plans for the future. A new Italian state was to be formed. The Faëligian town of Corfinium was selected as its capital and rechristened with the proud name of Italica. All Italians were to be citizens of this new metropolis, and here were to be the places of assembly and the senate house. A senate of 900 members and a magistracy resembling that of Rome completed a constitution which adhered closely to the very political traditions which its authors had most reason to abjure.

Now, as always in the face of serious danger, the action of Rome was prompt and resolute. Both consuls took the field; with each were five legates, among them the veteran Marius and his destined rival L. Cornelius Sulla, and even freedmen were pressed into service with the legions. But the first year's campaign opened disastrously. In central Italy the northern Sabellians, and in the south the Samnites, defeated the forces opposed to them. And though before the end of the year Marius and Sulla in the north, and the consul Caesar himself in Campania, succeeded in inflicting severe blows on the enemy, and on the Marsi especially, it is not surprising that, with an empty treasury, with the insurgents' strength still unbroken, and with rumours of disaffection in the loyal districts, opinion in Rome should have turned in the direction of the more liberal policy which had been so often scornfully rejected and in favour of some compromise which should check the spread of the revolt, and possibly sow discord among their enemies. Towards the close of the year 90 the consul L. Julius Caesar (killed 46. B.C. in Epirus in 85) carried the lex Iulii plot which the Roman franchise was offered to all communities which had not as yet revolted; early in the next year (89) the Julia law was supplemented by the lex Plautia Papiria, introduced by two of the tribunes, M. Plautius Silvanus and C. Papirius Carbo Arvina, which

enacted that any citizen of an allied community then domiciled in Italy might obtain the franchise by giving in his name to a praetor in Rome within sixty days. A third law (lex Calpurnia), apparently passed at the same time, empowered Roman magistrates in the field to bestow the franchise there and then upon all who were willing to receive it. This sudden opening of the closed gates of Roman citizenship was completely successful, and its effects were at once visible in the diminished vigour of the insurgents. By the end of 89 the Samnites and Lucanians were left alone in their obstinate hostility to Rome, and neither, thanks to Sulla's brilliant campaign for them, had for the moment any strength left for active aggression.

The termination of the Social War brought with it no peace in Rome. The old quarrels were renewed with increased bitterness, and the newly enfranchised Italics themselves complained as bitterly of the restriction which robbed them of their due share of political influence by allowing them to vote only in a specified number of tribes. The senate itself was distracted by violent personal rivalries—and all these feuds, animosities and grievances were aggravated by the widespread economic distress and ruin which affected all classes. Lastly, learning of Mithradates' happiness, they were conscious that the privilege of commanding the force to be sent against him would be keenly contested, and that the contest would lie between the veteran Marius and L. Cornelius Sulla. It was in an atmosphere thus charged with the elements of disturbance that P. Sulpicius Rufus as tribune brought forward his laws. He proposed—that (1) the command of the Mithradatic war should be given to Marius, (2) that the new citizens should be distributed through all the tribes, (3) that the freedom should no longer be confined to the four city tribes, (4) that any senator owning more than 2000 denarii should lose his seat, (5) that those exiled on suspicion of complicity with the Italian revolt should be recalled. These proposals inevitably provoked a storm, and both sides were ominously ready for violent measures. The consuls, in order to prevent legislation, proclaimed a public holiday. Sulpicius replied by arming his followers and driving the consuls from the forum. The proclamation was withdrawn and the laws carried, but Sulpicius's triumph was short-lived. From Nola in Campania, where lay the legions commanded by him in the Social War, Sulla advanced on Rome, and for the first time a Roman consul entered the city at the head of the legions of the Republic. Resistance was hopeless; Marius and Sulpicius fled; and Sulla, summoning the assembly of the centuries, proposed the measures he considered necessary for the public security, the most important being a provision that the sanction of the senate should be necessary before any proposal was introduced to the assembly. Then, after waiting in Rome long enough to hold the consular elections, he left for Asia early in 87.

Sulla had conquered, but his victory cost the Republic dear. He had first taught political partisans to look for final success, not to a majority of votes in the forum or campus, but to the swords of the soldiery. The lesson was well learned. In July after his departure L. Clodius was notorious. Cinna as consul revived the proposals of Sulpicius; his colleague, Gnaeus Octavius, at the head of an armed force fell upon the new citizens who had collected in crowds to vote,

and the forum was heaped high with the bodies of the slain.¹ Cinna fled, but fled, like Sulla, to the legions. When the senate declared him deposed from his consulship, he replied by invoking the aid of the soldiers in Campania in behalf of the violated rights of the people and the injured dignity of the consulship, and, like Sulla, found them ready to follow where he led. The neighbouring Italian communities, who had lost many citizens in the recent massacre, sent their new champion men and money;² while from Africa, whether he had escaped after Sulla's entry into Rome, or Marcus with ten Numidian horsemen. The senate had prepared for a desperate defence, but fortune was adverse, and after a brief resistance they gave way. Cinna was acknowledged as consul, the sentence of outlawry passed on Marius was revoked and Cinna and Marius entered Rome with their troops. Marius's thirst for revenge was gratified by a frightful massacre, and he lived long enough to be nominated consul for the seventh time. But he held his consulship only a few weeks. Early in 86 he died, and for the next three years Cinna ruled Rome. Constitutional government was virtually suspended. For 84 and 83 Cinna nominated himself and a trusted colleague as consuls.³ The state was, as Cicero⁴ says, without lawful authority. One important matter was carried through—the registration in all the tribes of the newly enfranchised Italians,⁵ but beyond this little was done. The attention of Cinna and his friends was in truth engrossed by the ever-present dread of Sulla's return from Asia. The consul of 86, L. Valerius Flaccus (who had been consul with Marius in 100 B.C.), sent out to find him, was murdered by his own soldiers at Nicomedia.⁶ In 85 Sulla, though disowned by his government, con-

2. Tibur and Praeneste especially.
3. The consuls of 86, 85, 84 were all nominated without election.
6. The nobles fled to Sulla in large numbers; Vell. ii. 23.
7. The consulship was declared by the people of 86; but cf. Lange i. 133; Mommsen, Hist. of Rome, iv. 70; Livy, Epit. Ixxiv.

12. According to App. i. 79, and Livy, loc. cit., 5000 captives were massacred. Florus, iii. 21, gives 4000. Praeneste surrendered, was razed to the ground, and its population put to the sword.

the divisions which rent the state asunder, to set in working again the machinery of civil government and above all so to modify it as to meet the altered conditions, and to fortify it against the dangers which visibly threatened it in the future. The real charge against Sulla⁷ is not that he failed to accomplish all this, for to do so was beyond the powers even of a man so able, resolute and self-confident as Sulla, armed though he was with absolute authority and backed by overwhelming military strength, and the prestige of unbroken success. He stands convicted rather of deliberately aggravating some and culpably ignoring others of the evils he should have tried to cure, and of contenting himself with a party triumph when he should have aimed at the regeneration and confirmation of the whole state. His victory was instantly followed, not by any measures of con-

senate was his main object. With this purpose he had already, when consul in 88, made the senatus consultus legally obligatory for proposals to the assembly. He now as dictator followed this up by crippling the power of the magistracy, which had been the most effective weapon in the hands of the senate's opponents. The legislative freedom of the tribunes was already hampered by the necessity of obtaining the senate's sanction; in addition, Sulla restricted their wide powers of interference (intercessio) to their original purpose of protecting individual plebeians, and discredited the office by prohibiting a tribune from holding any subsequent office in the state. The control of the courts (quaestiones perpetuae) was taken from the equites order and restored to the senate. To prevent the people from suddenly installing criminal commissioners in such office a second year, he supplemented the old law against reelection, and made legally binding the custom which required a man to mount up gradually to the consulship through the lower offices. His increase of the number of praetors from six to eight, and of quaestors to twenty, though required by administrative necessities, tended, by enlarging the numbers and further dividing the authority of the magistrates, to render them still more dependent upon the central direction of the senate. Lastly, he replaced the pontifical and augural colleges in the hands of the senatorial nobles, by enacting that vacancies in them should, as before the lex Domitia (104 B.C.), be filled by co-optation. It cannot be said that Sulla was successful in fortifying the republican system against the dangers which menaced it from without. He accepted as an accomplished fact the enfranchisement of the Italians, but he made no provision to guard against the consequent reduction of the comitia to an absurdity, and with them of the civic government which rested upon them, to or organize an effective administrative system for the Italian communities. All of men, too, Sulla had the best reason to appreciate the dangers to be feared from the growing independence of governors and generals in the provinces, and from the transformation of the old civic militia into a group of professional armies, devoted only to a successful leader, and with the weakest possible sense of allegiance to the state. He had himself, as proconsul of Asia, contemptuously and successfully defied the home government, and he, more than any other Roman general, had taught his soldiers to look only to their leader, and to think only of booty. Yet, beyond a few inadequate regulations, there is no evidence that Sulla dealt with these burning questions, the settlement of which was among the greatest of the achievements of Augustus. One administrative reform of real importance must, lastly, be set down to his credit. The judicial procedure first established in 149 for the trial of cases of magisterial extortion in the provinces, and applied between 149 and 81 B.C. in cases of treason and bribery, Sulla extended to his own benefit. It was brought under the administration of each chief provincial officer, and thus laid the foundations of the Roman criminal law.

The Sullan system stood for nine years, and was then overthrown—as it had been established—by a successful soldier. It was the fortune of Cn. Pompeius, a favourite officer of Sulla, first of all to violate in his own person the fundamental principles of the constitution re-established by his old chief, and then to overturn it. In Spain the Marian governor Q. Sertorius (see SERTORIUS) had defeated one after another of the praetors sent out by the senate, and was already in 77 B.C. in full Hither to the extent of taking the second in command, Pompey, who was not yet thirty, and had never held even the quaestorship, was sent out to Spain with proconsular authority. Still Sertorius held out, until in 73 he was feebly murdered by his own officers. The native tribes who had loyally stood by him submitted, and Pompey early in 71 returned with his troops to Italy, where, during his absence in Spain, an event had occurred which had shown Roman society with startling plainness how near it stood to revolution. In 73 Spartacus, a Thracian slave, escaped with seventy others from a gladiators' training school. In a few weeks they had cut to pieces all who stood in their way. In the course of a short time he found himself at the head of 70,000 runaway slaves, outlaws, brigands and impoverished peasants, and for two years terrorized Italy, routed the legions sent against him, and even threatened Rome. He was at length defeated and slain by the praetor, M. Licinius Crassus, in Apulia. In Rome itself the various classes and parties hostile to the Sullan system had, ever since Sulla's death in 78, been incessantly agitating for the repeal of his most obnoxious laws, and needed only

1 For Sulla's dictatorship as in itself a novelty, see App. i. 98; Plut. Sull. 33; Cic. Ad Att. 9, 15; Cic. De Legg. i. 15, 42.  
2 Cic. De Legg. iii. 9, 22, "injuriae facendae potestatem ademit, luxuriosi reliquit." Cf. Cic. Verr. i. 60, 155; Livy, Epit. xxi.  
3 Cic. Pro Cornel. fr. 78; Ascon. In Corin. pp. 59, 70; Appian i. 100.  
4 Vell. ii. 32; Tac. Ann. xi. 22; Cic. Verr. Att. i. 13, 37.  
5 App. B.C. i. 100; cf. Livy vii. 42 (342 n.c.), "ne quis ex eundem magnitudinem eam capere vellet."  
6 The custom had gradually established itself. Cf. Livy xxxix. 7. The "certus ordo magistratum" legalized by Sulla was—quaestorship, praetorship, consulship; App. i. 100.  
7 Plut. Cim. (Ann. iv. 1, 2, 32); Vell. ii. 89. Compare also Cicero, In Pison. 15, 55 with Cic. Pro Milone, 15, 39. The increase was connected with his extension of the system of quaestiones perpetuae, which threw more work on the praetors as the magistrates in charge of the courts.  
8 Tac. Ann. xi. 22. The quaestorship henceforward carried with it the right to be called up to the senate. By increasing the number of quaestors, Sulla provided for the supply of ordinary vacancies in the senate and restricted the censors' freedom of choice in filling them up. Fragments of the lex Cornelis de XX quaestoribus survive. See CIL. i. 108; Bruns, Fontes juris Romani (ed. 1901), p. 91.  
9 Dio xxxvii. 37; Ps. Ascon. 102 (Orelli). He also increased their numbers; Livy, Epit. xxi.  
10 He did propose to deprive several communities which had joined Cinna's Italian franchise, but the deprivation was not carried into effect; Cic. Pro domo, 30, 79.  
11 The inadequacy of the comitia as a representative body was increased by the unequal distribution of the new cities amongst the two classes of tribes, each of which formed a single voting unit. Some tribes represented only a thinly populated district in the Campagna with one or two outlying communities, others included large and populous territories. See Mommsen, Staatsr. iii. 187; Hermes, Soc. 102.  
12 Sulla does not appear to have passed any general municipal law; the necessary resettlement of the local constitutions after the Sullan period must be carried out by the fragment of a municipal charter found at Tarentum (Ephem. epigr. ix. 1, Dessau, Inscr. Lat. sel. 6086) is probably a specimen of such legal daleis.

XXII. 21
a leader in order successfully to attack a government discredited by failure at home and abroad. With the return of Pompey from Spain their opportunity came. Pompey, who understood politics as little as Marius, was anxious to obtain a triumph, the consularship for the next year (70), and as the natural consequence of this an important command in the East. The opposition wanted his name and support, and a bargain was soon struck. Pompey and with him Marcus Licinius Crassus, the real conqueror of Spartacus, were elected consuls, almost in the presence of their troops, which lay encamped outside the gates in readiness to assist at the triumph and ovation granted to their respective leaders. 1 Pompey lost no time in performing his part of the agreement. The tribunes regained their prerogatives. 2 The "perpetual courts" (\textit{quaestiones perpetuae}) were taken out of the hands of the senatorial judges, who had outdone the equestrian order in scandalous conduct, 3 and finally the censors, the first since 86 B.C., purged the senate of the more worthless and disreputable of Sulla's partisans. 4 The victory was complete; but for the future its chief significance lay in the clearness with which it showed that the final decision in matters political lay with neither of the two great parties in Rome, but with the holder of the military authority. The tribunes ceased to be political leaders and became lieutenants of the military commanders, and the change was fatal to the dignity of politics in the city. Men became conscious of the unreality of the old constitutional controversies, indifferent to the questions which agitated the forum and the curia, and contemp tuously ready to alter or disregard the constitution itself when it stood in the way of interests nearer to their hearts.

When his consulship ended, Pompey impatiently awaited at the hands of the politicians he had befriended the further gift of a foreign command. He declined an ordinary province, and from the end of 70 to 67 he remained at Rome in a somewhat affectedly dignified seclusion. 5 But in 67 and 66 the laws of Gabinius and Manilius gave him all and more than all that he expected (see \textit{Pompey}). By the former he obtained the sole command for three years against tribes of the Persian pirates. 6 He was to have supreme authority over all Roman magistrates in the provinces throughout the Mediterranean and over the coasts for 50 miles inland. Fifteen legati, all of praetorian rank, were assigned to him, with two hundred ships, and as many troops as he thought desirable. The Manilian law transferred from Lucullus and Gabrio to Pompey the conduct of the Mithridatic War in Asia, and with it the entire control of Roman policy and interests in the East. 7 The unrep改革istic character of the position thus granted to Pompey, and the dangers of the precedent established, were clearly enough pointed out by such moderate men as Q. Lutatius Catulus, the "father" of the senate, 8 and by the orator Hortensius—but in vain. Both laws were supported, not only by the tribunes and the populace, but by the whole influence of the \textit{publicani} and \textit{negotiatores}, whose interests in the East were at stake.

Pompey left Rome in 67. In a marvellously short space of time he freed the Mediterranean from the Cilician pirates and established Roman authority in Cilicia itself. He then crushed Mithradates, added Syria to the list of Roman provinces, 1 The exact provisions of Pompey's law are nowhere given; Livy, \textit{Epit.} xxviii. 33, 21, Cicero, and restorators of Cf. Vell. ii. 30. A \textit{lex Aurelia}, in 75, had already repealed the law disqualifying a tribune for further office; \textit{Cic. Corn. ii. 78.}

2 This was the work of L. Aurelius Cotta, prae tor in this year. This law is to be taken in connection with the \textit{propositiones} and \textit{tribuni aerei}. For the latter and for the law generally, see Lango, \textit{R. Litt.} i. 193; Greenidge, \textit{Legal Procedure of Cicero's Time}, pp. 443 seq.; and article \textit{Aerarium}. Compare also Cicero's language on \textit{aerarium} in \textit{Cat.} i. 1. The prosecution of Verres shortly preceded the \textit{lex Aurelia}. 3 Livy, \textit{Epit.} xcviii. Sixty-four senators were expelled. Cf. \textit{Plut. Pomp.} 22.

4 Vell. ii. 31; \textit{Plut. Pomp.} 23.

5 \textit{Plut. Pomp.} 25: \textit{Dio} xxxvi. 6; Livy, \textit{Epit. c.}

and led the Roman legions to the Euphrates and the Caspian, leaving no power capable of disputing with Rome the sovereignty of western Asia. 8 He did not return to Italy till towards the end of 62. The interval was marked in Rome by the political importance of Caesar and Cicero, and by Catiline's attempt at revolution. As the nephew of Marius and the son-in-law of Cinna, Caesar possessed a strong hereditary claim to the leadership of the popular and Marian party. 9 He had already taken part in the agitation for the restoration of the tribunate; he had supported the Manilian law; and, when Pompey's withdrawal left the field clear for other competitors, he stepped at once into the front rank on the popular side. 10 He took upon himself, as their nearest representative, the task of clearing the memory and avenging the wrongs of the great popular leaders, Marius, Cinna and Saturninus. He publicly reminded Marius's services, and set up again upon the Capitol the trophies of the Cimbrian War. He endeavoured to bring to justice, not only the ringleaders in Sulla's bloody work of proscription, but even the murderers of Saturninus, and vehemently pleaded the cause of the children of the proscribed. While thus carrying on in genuine Roman fashion the feud of his family, he attracted the sympathies of the Italians by his efforts to procure the Roman franchise for the Latin communities beyond the Po, and won the affections of the populace in Rome and its immediate neighbourhood by the splendour of the games which he gave as \\textit{curule aedile} (65), and by his lavish expenditure upon the improvement of the Appian Way. But these measures were with him only means to the further end of creating for himself a position such as that which Pompey had already won; and this ulterior aim he pursued with an audacious indifference to constitutional forms and usages. His coalition with Crassus, soon after Pompey's departure, secured him an ally whose colossal wealth and wide financial connexions were of inestimable value, and whose vanity and inferiority of intellect rendered him a willing tool. The story of his attempted \textit{coup d'état} in January 65 is probably false, 10 it is evident that by the beginning of 63 he was bent on reaping the reward of his exertions by obtaining from the people an extraordinary command abroad, which should secure his position before Pompey's return; and the agrarian law proposed early that year by the tribune P. Servilius Rullus had for its object the creation, in favour of Caesar and Crassus, of a commission with powers so wide as to place its members almost on a level with Pompey himself. 11 It was at this moment when all seemed going well, that Caesar's hopes were dashed to the ground by Catiline's desperate outbreak, which not only discredited every one connected with the popular party, but directed the suspicions of the well-to-do classes against Caesar himself, as a possible accomplice of Catiline's revolutionary schemes. 12

The same wave of indignation and suspicion which for the moment checked Caesar's rise carried Marcus Tullius Cicero to the height of his fortunes. Cicero, as a politician, has been equally misjudged by friends and foes. That he was deficient in courage, that he was vain, and that he attempted the impossible, may be admitted at once. But he was neither a brilliant and unscrupulous adventurer nor an aimless trimmer, nor yet a devoted champion merely of senatorial

1 See \textit{Pompey} and \textit{Mithradates.}

2 For his early life, see \textit{Caesar.}

3 Prof. Beesly has vainly endeavoured to show that Catiline and not Caesar was the popular leader from 67 to 63. That this is the case is clear from \textit{Plut. Pomp.} 35 (in order to screen Caesar, is true, but the Inference is a false one.}

4 The story is so told by Suetonius, \textit{Jul. 8.} In \textit{Sallust, Cat. 18.,} it appears as an intrigue originating with Catiline, and Caesar's name is omitted.

5 \textit{Cic. Agr.} ii. 6, 15, "nilali aliatum nisi ut decem reges constituerunt."

That Caesar and Crassus had supported Catiline for the consulship in 63 is certain, and they were suspected naturally enough of favouring his designs in 63, but their complicity is in the highest degree improbable.
ascendancy. He was a representative man, with a numerous following, and a policy which was naturally suggested to him by the circumstances of his birth, connexions and profession, and which, impracticable as it proved to be, was yet consistent, intelligible and high-minded. Born at Arpinum, he cherished like all Arpinates the memory of his great fellow-townsmen Marius, the friend of the Italians, the saviour of Italy and the irresistible foe of Sulla and the nobles. A "municipal" himself, his chosen friends and his warmest supporters were found among the well-to-do classes in the Italian towns. Unpopular with the Roman aristocracy, who despised him as a perigrinus; and with the Roman populace, he was the trusted leader of the Italian middle class, "the true Roman people," as he proudly styled them. It was they who carried his election for the consulship, (63), who in 58 insisted on his recall from exile, and it was his influence with them which made Caesar so anxious to win him over in 49. He represented their antipathy alike to socialistic schemes and to aristocratic exclusiveness, and their old-fashioned simplicity of life in contrast with the cosmopolitan luxury of the capital.

By birth, too, he belonged to the equestrian order, the foremost representatives of which were indeed still the publicani and negotiatores, but which since the encroachment of Italy included also the substantial burgesses of the Italian towns and the smaller "squires" of the country districts. With them, too, Cicero was at one in their dread of democratic excesses and their social and political jealousy of the nobles. Lastly, as a lawyer and a scholar, he was passionately attached to the ancient constitution. His political ideal was the natural outcome of these circumstances. He advocated the maintenance of the old constitution, but not as it was understood by the extreme politicians of the right and left. The senate was to be the supreme directing council, but the senate of Cicero's dreams was not an oligarchic assemblage of nobles, but a body freely open to all citizens, and representing the worth of the community. The magistrates, while deferring to the senate's authority, were to be at once vigorous and public-spirited, and the assembly itself which elected the magistrates and passed the laws was to consist, not of the "mob of the forum," but of the true Roman people throughout Italy. For the realization of this ideal he looked, above all things, to the establishment of cordial relations between the senate and nobles in Rome and the great middle class of Italy represented by the equestrian order, between the capital and the country towns and districts. This was the concordia ordinum, the consensus Italicorum, for which he laboured.

Cicero's election to the consulship for 63 over the heads of Caesar's nominees, Antonius and Catiline, was only the work of the Italian middle class, already rendered uneasy both by the rumours which were rife of revolutionary schemes and of Caesar's boundless ambition, and by the numerous disquieting signs of disturbance noticeable in Italy. The new consul vigorously set himself to discharge the trust placed in him. He defeated the insidious proposals of Rullus for Caesar's aggrandizement and assisted in quashing the prosecution of Gaius Rabirius (q.v.). But with the consular elections in the autumn of 63 a fresh danger arose from a different quarter. The "conspiracy of Catiline" (see CATILINE) was not the work of the popular party, and still less was it an unselfish attempt at reform; Catiline himself was a patrician, who had held high office, and possessed considerable ability and courage; but he was bankrupt in character and in purse, and two successive defeats in the consullar elections had rendered him desperate. To retrieve his broken fortunes by violence was a course which was only too readily suggested by the history of the last forty years, and materials for a conflagration abounded on all sides. The danger to be feared from his intrigues lay in the state of Italy, which made a revolt against society and the established government only too likely if once a leader presented himself, and it was such a revolt that Catiline endeavoured to organize. Bankrupt nobles like himself, Sullan veterans and the starving peasants whom they had persuaded to sacrifice their rights, outlaws of every description, the slave population of Rome, the herdsmen-slaves of the Apulian pastures, were all enlisted under his banner, and attempts were even made to excite disaffection among the newly conquered people of southern Gaul and the warlike tribes who still cherished the memory of Sertorius in Spain. In Etruria, the seat and centre of agrarian distress and discontent, a rising actually took place headed by a Sullan centurion, but the spread of the revolt was checked by Cicero's vigorous measures. Catiline fled from Rome, and died fighting with desperate courage at the head of his motley force of old nobles, peasants and slaves. His accomplices in Rome were arrested, and, after an unavailing protest from Caesar, the senate authorized the consuls summarily to put them to death.

The Catilinarian outbreak had been a blow to Caesar, whose schemes it interrupted, but to Cicero it brought not only popularity and honour, but, as he believed, the realization of his political ideal. But Pompey was now on his way home, and again as in 70 the political future seemed to depend on the attitude which the successful general would assume; Pompey himself looked simply to the attainment by the help of one political party or another of his immediate aims. At present were the ratification of his arrangements in Asia and a grant of land for his troops. It was the impracticable jealousy of his personal rivals in the senate, aided by the versatility of Caesar, who presented himself not as his rival but as his ally, which drove Pompey once more, in spite of Cicero's efforts, into the camp of what was still nominally the popular party. In 60, on Caesar's return from his propraetorship in Spain, the coalition was formed which is known by the somewhat misleading title of the First Triumvirate. Pompey was ostensibly the head of this new alliance, and in return for the satisfaction of his own demands he undertook to support Caesar's candidate for the consulship. The wealth and influence of Crassus were enlisted in the same cause, and the publicani were secured by a promise of release from their bargain for collecting the taxes of Asia. Cicero was under no illusions as to the significance of this coalition. It scattered to the winds his dreams of a stable and conservative republic. The year 59 saw the republic powerless in the hands of three citizens. Caesar as consul procured the ratification of Pompey's acts in Asia, granted to the publicani the relief refused by the senate, and carried an agrarian law of the new type, which provided for the purchase of lands for allotment at the cost of the treasury and for the assignment of the rich ager Campanus. But Caesar aimed at more than the carrying of laws in the teeth of the senate or any party victory in the forum. An important military command was essential to him. An obedient tribune, P. Vatinius, was found, and by the lex Vatinia he was given for five years the command of Cisalpine Gaul and Illyricum, to which he was more than honoris causa.
was added by a decree of the senate Transalpine Gaul also. This command not only opened to him a great military career, but enabled him, as the master of the valley of the Po, to keep an effective watch on the course of affairs in Italy.

Early the next year the attack upon himself of which Cicero had foreseen was made. P. Claudius (p.p.) as tribune brought forward a law enacting that any one who had put a Roman citizen to death without trial by the people should be interdicted from fire and water. Cicero, finding himself deserted even by Pompey, left Rome in a panic, and by a second Clodian law he was declared to be outlawed. With Caesar away in his province, and Cicero banished, Claudius was for the time master in Rome. But, as absolute as he was in the streets, and recklessly as he parodied the policy of the Gracchi by violent attacks on the senate, his tribunate merely illustrated the anarchy which now inevitably followed the withdrawal of a strong controlling hand. A reaction speedily followed. Pompey, bewildered and alarmed by Clodius's violence, at last bestirred himself. Cicero's recall was decreed by the senate, and early in August 57 in the comitia centuriata, to which his Italian supporters flocked in crowds, a law was passed revoking the sentence of outlawry passed upon him.

Intoxicated by the acclamations which greeted him, and encouraged by Pompey's support, and by the salutary effects of Clodius's excesses, Cicero's hopes rose high. With indefatigable energy he strove to reconstruct a solid constitutional party, but only to fail once more. Pompey was irritated by the hostility of a powerful section in the senate, who thwarted his desires for a fresh command and even encouraged Clodius in insulting the conqueror of the East. Caesar became alarmed at the reports which reached him that the repeal of his agrarian law was threatened and that the feeling against the coalition was growing in strength; above all, he was anxious for a renewal of his five years' command. He acted at once, and in the celebrated conference at Luca (56) the alliance of the three self-constituted rulers of Rome was renewed. Cicero succumbed to the inevitable and was recalled. Pompey and Crassus became consuls for 55. Caesar's command was renewed for another five years, and to each of his two allies important provinces were assigned for a similar period—Pompey receiving the two Spains and Africa, and Crassus Syria. The coalition now divided between them the control of the empire. For the future the question was, how long the coalition itself would last. Its duration proved to be short. In 53 Crassus was defeated and slain by the Parthians at Carrhae, and in Rome the course of events slowly forced Pompey into an attitude of hostility to Caesar. The year 54 brought with it a renewal of the riotous anarchy which had disgraced Rome in 58–57. Conscious of its own helplessness, the senate, with the eager assent of all respectable citizens, dissuaded Pompey from leaving Italy; and he accordingly left his provinces to be governed by his legates. But the anarchy and confusion only grew worse, and even strict constitutionalists like Cicero talked of the necessity of investing Pompey with some extraordinary powers for the preservation of order. At last

1 Suet. Jul. 22; Dio Cass. xxxviii. 8; App. B.C. i. 13; Plut. Cat. 14.
2 Both laws were carried in the concilium plebis. The first merely reaffirmed the right of appeal, as the law of Gaius Gracchus had done. The second declared Cicero to be already by his own act in leaving Rome interdicted from fire and water—a procedure for which precedents could be quoted. Clodius kept within the letter of the law.

Cicero's speech Pro Sestio gives expression to these feelings; it contains a passionate appeal to all good citizens to rally round the old constitution. The acquittal of Sestius confirmed his hopes. See Ad Q. Fr. ii. 4.
3 Livy, Epit. cv.; Dio Cass. xxxix. 33. For Cicero's views, see Epp. ad Famil. iii. 19; ad Att. iv. 5; id. Cic. Ad Q. Fr. i. 3. A dictatorship was talked of in Rome; Plut. Pompey, 54; Cic. Ad Q. Fr. i. 8. Cicero himself anticipated Augustus in his picture of a princeps civitatis sketched in a lost book of the De republica.

in 52 he was elected sole consul, and not only so, but his provincial command was prolonged for five years more, and fresh troops were assigned him. The role of 'savour of society', the trust upon Pompey was one which flattered his vanity, but it entailed consequences which it is probable he did not foresee, for it brought him into close alliance with the senate, and in the senate there was a powerful party who were resolved to force him into heading the attack they could not successfully make without him upon Caesar. It was known that the latter, whose command expired in March 49, but who in the ordinary course of things would not have been replaced by his successor until January 48, was anxious to be allowed to stand for his second consularship in the autumn of 49 without coming in person to Rome. His opponents in the senate were equally bent on bringing his command to an end, and so obliging him to disband his troops and stand for the consulsipship as a private person, or, if he kept his command, on preventing his standing for the consularship. Through 57 and 58 the discussions in the senate and the negotiations with Caesar continued, but with no result. On 1st January 49 Caesar made a last offer of compromise. The senate replied by requiring him on pain of outlawry to disband his legions. Two tribunes who supported him were ejected from the senate-house, and the magistrates with Pompey were authorized to take measures to protect the republic. Caesar hesitated no longer; he crossed the Rubicon and invaded Italy.

The rapidity of his advance astounded and bewildered his foes. Pompey, followed by the consuls, by the majority of the senate and a long train of nobles, abandoned Italy as untenable, and crossed into Greece. At the end of March Caesar entered Rome as the master of Italy. Four years later, after the final victory of Munda (45), he became the undisputed master of the Roman world.

The task which Caesar had to perform was no easy one. It came upon him suddenly; for there is no sufficient reason to believe that Caesar had long premeditated revolution, or that he had previously aspired to anything more than such a position as that which Pompey had already won, a position republican indeed, but accepted by republicans as inevitable. War was forced upon him as the alternative to political suicide, but success in war brought the responsibilities of nearly absolute power, and Caesar's genius must be held to have shown itself in the masterly fashion in which he grasped the situation, rather than in the supposed sagacity with which he is said to have foreseen and prepared for it. In so far as he failed, his failure was mainly due to the fact that his tenure of power was too short for the work which he was required to perform.

From the very first moment when Pompey's ignominious retreat left him master of Italy, he made it clear that he was neither a second Sulla nor even the reckless anarchist which many believed him to be. The Roman and Italian public were written about this time, which was based upon his hopes of what Pompey might prove to be; Ad Att. vili. 11; August. De civ. Dict. v. 12. In his Pompey, 49.

4 For the rights of the question involved in the controversy between Caesar and the senate, see Mommsen, Rechtsfrage zu Caesar und d. Senat; Guiraud, Le Differend entre Cesar et le Senat (Paris, 1878), and the article CAESAR.

5 Cicero severely censures Pompey for abandoning Italy, but strategically the move was justified by the fact that Pompey's strength lay in the East, where his name was a power, and in his control of the sea. Politically he was a blunder, as it enabled Caesar to pose as the defender of the Italian public.

6 For the Civil Wars, see CAESAR; Cicero; and Pompey.

In this, as on many other points connected with Caesar, divergence of opinion has here been inspired on both sides by Mommsen in his brilliant chapter on Caesar (Hist. of Rome, bk. v. cap. xi). Too much stress must not be laid on the gossip retailed by Plutarch as to Caesar's early intentions.

7 Cicero vividly expresses the revulsion of feeling produced by Caesar's energy, humanity and moderation on his first appearance in Italy. Compare Ad Att. vii. 11, with Ad Att. viii. 13.
first startled by the masterly rapidity and energy of his movements; and then agreeably surprised by his lenity and moderation. No proscriptions or confiscations followed his victories, and all his acts evinced an unmistakable desire to effect a sober and reasonable settlement of the pressing questions of the hour; and, this, and of his almost superhuman energy, the long list he measured he carried out or ignored with sufficient proof. The "children of the proscribed" were at length restored to their rights, and with them many of the refugees who had found shelter in Caesar's camp during the two or three years immediately preceding the war; but the extreme men among his supporters soon realized that their hopes of novae labulae and grants of land were illusory. In allotting lands to his veterans, Caesar carefully avoided any disturbance of existing owners and occupiers, and the mode in which he dealt with the economic crisis produced by the war seems to have satisfied all reasonable men. It had been a common charge against Caesar in former days that he paid excessive court to the populace of Rome, and now that he was master he still dazzled and delighted them by the splendour of the spectacles he provided, and by the liberality of his largesses. But he was no indiscriminate flatterer of the mob. The popular clubs and guilds which had helped to organize the anarchy of the last few years were dissolved. A strict inquiry was made into the distribution of the monthly doles of corn, and the number of recipients was reduced by one-half; finally, the position of the courts of justice was raised by the abolition of the popular element among the judges. Nor did Caesar shrink from the attempt, in which so much was at first hazarded before him, to mitigate the twin evils which were ruining the prosperity of Italy—the concentration of a pauper population in the towns, and the demudation and desolation of the country districts. His strong hand carried out the scheme so often proposed by the popular leaders since the days of Gaius Gracchus, the colonization of Carthage and Corinth. Allotments of land on a large scale were made in Italy; decaying towns were reinforced by fresh drafts of settlers; on the large estates and cattle farms the owners were required to find employment for a certain amount of free labour; and a slight and temporary stimulus was given to Italian industry by the reimposition of harbour dues upon foreign goods.

The reform of the calendar, which is described elsewhere, completes a record of administrative reform which entitles Caesar to the praise of having governed well, whatever may be thought of the validity of his title to govern at all. But how did Caesar deal with what was after all the greatest problem which he was called upon to solve, the establishment of a satisfactory government for the Empire? One point indeed was already settled. Some centralization of the executive authority was indispensable, and this part of his work Caesar thoroughly performed. From the moment when he seized the money in the treasury on his first entry into Rome down to the day of his death, he recognized on other authority but his throughout the Empire. He alone directed the policy of Rome in foreign affairs; the legions were led, and the provinces governed, not by independent magistrates, but by his "legates"; and the title Imperator which he adopted was intended to express the absolute and unlimited nature of the imperium he claimed, as distinct from the limited spheres of authority possessed by republican magistrates. In so centralizing the executive authority over the Empire at large, Caesar was but developing the policy implied in the Gabinian and Manilian laws, and the precedent he established was closely followed by his successors. It was otherwise with the more difficult question of the form under which this new executive authority should be exercised and the relation it should hold to the republican constitution. We must be content to remain in the presence of the precise shape which Caesar intended ultimately to give to the new system. The theory that he contemplated a revival of the old Roman kingship is supported by little more than the popular gossip of the day, and the form under which he actually wielded his authority can hardly have been regarded by so sagacious a statesman as more than a provisional arrangement. This form was that of the dictatorship; and in favour of the choice it might have been urged that the dictatorship was the office naturally marked out by republican tradition as the one best suited to carry the state safely through a serious crisis, that the powers it conveyed were wide, that it was as dictator that Sulla had reorganized the state, and that a dictatorship had been spoken of as the readiest means of legalizing Pompey's protectorate of the Republic in 53–52. The choice nevertheless was a bad one. It was associated with those very Sullan traditions from which Caesar was most anxious to sever himself; it implied necessarily the suspension for the time of all constitutional government; and, lastly, the dictatorship as held by Caesar could not even plead that it conformed to the old rules and traditions of the office. The "perpetual dictatorship" granted him after his crowning victory at Munda (45) was a contradiction in terms and a repudiation of constitutional government which excited the bitterest animosity. A second question, hardly less important, was that of the position to be assigned to the old constitution. So far as Caesar himself was concerned, the answer was for the time sufficiently clear. The old constitution was not formally abolished. The senate met and deliberated; the assembly passed laws and elected magistrates; there were still consuls, praetors, aediles, quaestors and tribunes; and Caesar himself, like his successors, professed to hold his authority by the will of the people. But senate, assembly and magistrates were all alike subordinated to the paramount authority of the dictator; and this subordination was, in appearance at least, more direct and complete under the name of Caesar than under that of Augustus. Caesar was by nature as impatient as Augustus was tolerant of established power; and, dazzled by the splendour of his career of victory and by his ubiquitous energy and versatility, the Roman public, high and low, prostrated themselves before him and heaped honours upon him with a reckless profusion which made the existence of any authority by the side of his own an absurdity. Hence under Caesar the old constitution was repeatedly disregarded, or suspended in a way which contrasted unfavourably with the more respectful attitude assumed by Augustus. For months together Rome was left without any regular magistrates, and was governed like a subject town by Caesar's prefects. At another time a tribune was seen exercising authority outside the city bounds and invested with the imperium of a praetor. At the elections, candidates appeared before the people backed by a written recommendation from the dictator, which was equivalent to a command. Finally, the senate itself was
transformed out of all likeness to its former self by the raising of its numbers to 900, and by the admission of old soldiers, sons of freedmen and even "semi-barbarous Gauls." But, though Caesar's high-handed conduct in this respect was not imitated by his immediate successors, yet the main lines of their policy were laid down by him. These were—(1) the municipalization of the old republican constitution, and (2) its subordination to the paramount authority of the master of the legions and the provinces. In the first case he only carried further a change already in progress. Of late years the senate had been rapidly losing its hold over the Empire at large. Even the ordinary proconsuls were virtually independent potentates, ruling their provinces as they chose, and disposing absolutely of legions which recognized no authority but theirs. The consuls and praetors of each year had since 81 been stationed in Rome, and immersed in purely municipal business; and, lastly, since the enfranchisement of Italy, the comitia, though still recognized as the ultimate source of all authority, had become little more than assemblies of the city populace, and their claim to represent the true Roman people was indignantly questioned, even by republicans like Cicero. The concentration in Caesar's hands of all authority outside Rome completely and finally severed all real connexion between the old institutions of the Republic of Rome and the government of the Roman Empire. But the institutions of the Republic not merely became, what they had originally been, the local institutions of the city of Rome; they were also subordinated even within these narrow limits to the paramount authority of the man who held in his hands the army and the provinces. Autocratic abroad, at home he was the chief magistrate of the commonwealth; and this position was marked, in his case as in that of those who followed him, by a combination in his person of various powers, and by a general right of precedence which left no limits to his authority but such as he chose to impose upon himself. During the greater part of his reign he was consul as well as dictator. In 48, after his victory at Pharsalus, he was given the tribunicia poeleas for life, and after his second success at Thapsus the praefectura morum for three years. As chief magistrate he convened and presided in the senate, nominated candidates, conducts elections, carries laws in the assembly and administers justice in court. Finally, as a reminder that the chief magistrate of Rome was also the autocratic ruler of the Empire, he wore even in Rome the laurel wreath and triumphal dress, and carried the sceptre of the victorious imperator.

Nor are we without some clue as to the policy which Caesar had sketched out for himself in the administration of the Empire, the government of which he had centralized in his own hands. The much-needed work of rectifying the frontiers he was forced, by his premature death, to leave to other hands; but within the frontiers he anticipated Augustus in lightening the financial burdens of the provincials, and in establishing a stricter control over the provincial governors; while he went beyond him in his desire to consolidate the Empire by extending the Roman franchise and admitting provincials to a share in the government. He completed the Romanization of Italy by his enfranchisement of the Transpadane Gauls, and by establishing throughout the peninsula a uniform system of municipal government, which under his successors was gradually extended to the provinces.

On the eve of his departure for the East, to avenge the death of Crassus and humble the power of Parthia, Caesar fell a victim to the wounded pride of the republican nobles; and between the day of his death (March 15, 44) and that on which Octavian defeated Antony at Actium (September 2, 31) lies a dreary period of anarchic bloodshed. For a moment, in spite of the menacing attitude of Caesar's self-constituted representative Marcus Antonius (Mark Antony), it seemed to one man at least as if the restoration of republican government was possible. With indefatigable energy Cicero strove to enlist the senate, the people, and above all the provincial governors in support of the old constitution. But, though his eloquence now and again carried all before it in senate-house and forum, it was powerless to alter the course of events. By the beginning of 43 civil war had recommenced; in the autumn Antony was already threatening an invasion of Italy at the head of seventeen legions. Towards the end of October Antony and his ally M. Aemilius Lepidus coalesced with the young Octavian, who had been recently elected consul at the age of twenty, in spite of senatorial opposition; and the coalition was legalized by the creation of the extraordinary commission for the "reorganization of the commonwealth" known as the "Second Triumvirate." It was appointed for a period of five years, and was continued in 37 for five years more. The rule of the triumvirs was inaugurated in the Sullan fashion by a proscription, foremost among the victims of which was Cicero himself. In the next year the defeat of M. Junius Brutus and C. Cassius Longinus at Philippi, by the combined forces of Octavian and Antony, destroyed the last hopes of the republican party. In 40 a threatened rupture between the two victors was avoided by the treaty concluded at Brundusium. Antony married Octavian's sister Octavia, and took command of the eastern half of the empire; Octavian appropriated Italy and the West; while Lepidus was forced to content himself with Africa. For the next twelve years, while Antony was indulging in dreams of founding for himself and Cleopatra an empire in the East, and shocking Roman feeling by his wild excesses and his affectation of oriental magnificence, Octavian was patiently consolidating his power. Lepidus his fellow-triumvir was in 36 ejected from Africa and banished to Ciretii, while Sextus Pompeius, who had since his defeat at Munda maintained a semi-piratical ascendency in the western Mediterranean, was decisively defeated in the same year, and his death in 33 left Octavian sole master of the West. The inevitable trial of strength between himself and Antony was not long delayed. In 32 Antony openly challenged the hostility of Octavian by divorcing Octavia in favour of the beautiful and daring Egyptian princess, with whom, as the heiress of the Ptolemies, he aspired to share the empire of the Eastern world. By a decree of the senate Antony was declared deposed from his command, and war was declared against Queen Cleopatra. The 2nd of September 31 witnessed the battle of Actium. On the 2nd of September 31 Octavian's victory was complete. Antony and Cleopatra committed suicide (30), and the Eastern provinces submitted in 20. Octavian returned to Rome to celebrate his triumph and mark the end of the long-continued anarchy.

by closing the temple of Janus; at the end of the next year he formally laid down the extraordinary powers which he had held since 43, and a regular government was established.

III. The Empire.

Period I: The Principate, 27 B.C.-A.D. 284-(a) The Constitution of the Principate.—The conqueror of Antonius at Actium, the great-nephew and heir of the dictator Caesar, was now summoned, by the general consent of a world wearied out with twenty years of war and anarchy, to the task of establishing a government which should as far as possible respect the formal constitution of the Republic, without sacrificing the centralization of authority which experience had shown to be necessary for the integrity and stability of the Empire. It was a task for which Octavian was admirably fitted. To great administrative capacity and a quiet tenacity of purpose he united deliberate caution and unflagging tact; while his bourgeois birth and genuinely Italian sympathies enabled him to win the confidence of the Roman community to an extent impossible for Caesar, with his dazzling pre-eminence of patrician descent, his daring disregard of forms and his cosmopolitan tastes.

The new system which was formally inaugurated by Octavian in 28-27 B.C. assumed the shape of a restoration of the republic under the leadership of a princeps. Octavian voluntarily resigned the extraordinary powers which he had held since 43, and, to quote his own words, "handed over the republic to the control of the senate and people of Rome." The old constitutional machinery was once more set in motion; the senate, assembly and magistrates resumed their functions; and Octavian himself was hailed as the "restorer of the commonwealth and the champion of freedom." It was not so easy to determine what relation he himself, the actual master of the Roman world, should occupy towards the restored republic. His abdication, in any real sense of the word, would have simply thrown everything back into confusion. The interests of peace and order required that he should retain at least the substantial part of his authority; and this object was in fact accomplished, and the rule of the emperors founded, in a manner which has no parallel in history. Any revival of the kingly title was out of the question, and Octavian himself expressly refused the dictatorship. Nor was any new office created or any new official title invented for his benefit. But by senate and people he was invested according to the old constitutional forms with certain powers, as many citizens had been before him, and so took his place by the side of the last emperor appointed under the Republic—only to make his pre-eminent dignity, as the first of them all, the senate decreed that he should take as an additional cognomen that of "Augustus," while in common parlance he was henceforth styled princeps, a simple title of courtesy, familiar to republican usage, and conveying no other idea than that of a recognized primacy and precedence over his fellow-citizens. The ideal sketched by Cicero in his De Republica, of a constitutional president of a free republic, was apparently realized; but it was only in appearance. For in fact the special prerogatives conferred upon Octavian gave him back in substance the autocratic authority he had resigned, and as between the restored republic and its new princeps the balance of power was overwhelmingly on the side of the latter.

Octavian had held the imperium since 43; in 33 it is true, the powers of the triumvirate had legally expired, but he had continued to wield his authority, as he himself puts it, "by universal consent." In 27 B.C. he received a formal grant of the imperium from the senate and people for the term of ten years; and this provincia was defined as including all the provinces in which military authority was required and legions were stationed. He was declared commander-in-chief of the Roman army, and granted the exclusive right of levying troops, of making war and peace, and of concluding treaties. As consul, moreover, he not only continued fo be the chief magistrate of the state at home, but took precedence, in virtue of his magius imperium, over the governors of the "unarmed provinces," which were still nominally under the control of the senate. Thus the so-called "restoration of the republic" was in essence the recognition by law of the personal supremacy of Octavian, or Augustus, as he must henceforth be called.

In 23 an important change was made in the formal basis of Augustus' authority. In that year he laid down the consulship which he had held each year since 31, and could therefore only exert his imperium pro consule, like the ordinary governor of a province. He lost his authority as chief magistrate in Rome and his precedence over the governors of senatorial provinces. To remedy these defects a series of extraordinary offices were pressed upon his acceptance; but he refused them all, and caused a number of enactments to be passed which determined the character of the principate for the next three centuries. Firstly, he was exempted from the disability attaching to the tenure of the imperium by one who was not an actual magistrate, and permitted to retain and exercise it in Rome. Secondly, his imperium was declared to be equal with that of the consuls, and therefore superior to that of all other holders of that power. Thirdly, he was granted equal rights with the consuls of convening the senate and introducing business, of nominating candidates at elections, and of issuing edicts. Lastly, he was placed on a level with the consuls in outward rank. Twelve lictors were assigned to him (as to the consuls) and set between some of the consuls themselves (Dio liii. 10).

Thus the proconsular authority was for the first time admitted within the walls of Rome; but Augustus was too cautious a statesman to proclaim openly the fact that the power which he wielded in the city was the same as that exercised in camps and provinces by a Roman military commander. Hence he sought for a title which should disguise the nature of his authority, and found it in the

The explanation of princeps as an abbreviated form of princeps senatus is quite untenable. For its real significance, see Mommsen, Staatsrecht, ii. 774; Pelham, Journ. of Philol. vol. viii. It is not an official title.

10 Mom. Anc. 6, 14, "per consensum universorum."
11 Dio liii. 12; Suet. Aug. 47. 12 Dio, l.c.
13 He was offered the dictatorship, a life-consulship, a "cura legum et bonorum," and caused a number of enactments to be passed which determined the character of the principate for the next three centuries.
14 Dio liii. 32. Part of the law by which the rights essential to the principate were conferred upon Vespasian is extant; see Rushforth, Latin Historical Inscriptions, No. 70 (Lex de imperio Vespasiani).
15 Tac. Ann. i. 81. 16 Lex de imperio, l. 17-21. 17 The term proconsularium imperium, which we find used, e.g., by Tacitus, was not employed in republican times, and Augustus himself speaks of his consulare imperium (Mom. Anc. 2, 5, 8).
"tribunician power," which had been conferred upon him for life in 36, and was well suited, from its urban and democratic traditions, to serve in Rome as "a term to express his supreme position." 1 From 23 onwards the tribunicia potestas appears after his name in official inscriptions, together with the number indicating the period during which it had been held (also reckoned from 23); it was in virtue of this power that Augustus introduced the social reforms which the times demanded; 2 and, though far inferior to the imperium in actual importance, it ranked with or even above it as a distinctive prerogative of the emperor or his chosen colleague. 3

The imperium and the tribunicia potestas were the two pillars upon which the authority of Augustus rested, and the other offices and privileges conferred upon him were of secondary importance. After 23 he never held the consulship save in 5 and 2 B.C., when he became the colleague of his grandsons on their introduction to public life. He permitted the triumvir Lepidus to retain the chief pontificate until his death, when Augustus naturally became pontifex maximus (12 B.C.). 4 He proceeded with the like caution in reorganizing the chief departments of the public service in Rome and Italy. The cura annonae, i.e. the supervision of the supplies, was entrusted to him in 22 B.C., and this important branch of administration thus came under his personal control; but the other boards (curiae), created during his reign to take charge of the roads, the water-supply, the regulation of the Tiber and the public buildings, were composed of senators of high rank, and regarded in theory as deriving their authority from the senate. 5

Such was the ingenious compromise by which room was found for the master of the legions within the narrow limits of the old Roman constitution. Augustus could say with truth that he had accepted no office which was "contrary to the usage of our ancestors," and that it was only in dignity that he took precedence of his colleagues, but the emperor was, as every thinking man must have realized, the compromise was unreal, and its significance was ambiguous. It was an arrangement avowedly of an exceptional and temporary character, yet no one could suppose that it would in effect be otherwise than permanent. The powers voted to Augustus were (like those conferred upon Pompey in 67 B.C.) voted only to him, and (save the tribunicia potestas) voted only for a limited time; in 27 he received the imperium for ten years, and it was afterwards renewed for successive periods of five, five, ten and ten years. 6

In this way the powers of the principate were made coextensive in time with the life of Augustus, but there was absolutely no provision for hereditary or any other succession. Various expedients were devised in order to indicate the destined successor of the princeps and to bridge the gap created by his death. Ultimately Augustus associated his stepson Tiberius with himself as co-regent. The imperium and the tribunicia potestas were conferred upon him, and he was thus marked out as the person upon whom the remaining powers of the principate would naturally be bestowed after the death of his stepfather. But succeeding emperors did not always indicate their successors so clearly, and, in direct contrast to the maxim that "the kings of the colleagues," it has been alleged that the Roman principate died with the death of the princeps. 8

In theory, at least, the Roman world was governed according to the "maxims of Augustus" (Suet. Ner. 10), down to the time of Diocletian. Even in the 3rd century there is still in name at least, a republic, of which the emperor is in strictness only the chief magistrate, deriving his authority from the senate and people, and with prerogatives limited and defined by law. The case is quite different when we turn from theory to practice. The

8 The senatus consultum, the delegation of certain provinces to one or more of the magistrates, the degree of the curia, the legis laticauda, were now all regulated by law. The title of princeps senatus settled in 18 B.C. and was continued with slight alterations under the empire.
9 Tac. Ann. i. 15, "comitia e tenui ad patres translatu sunt;" compare Ann. xiv. 28. The magistracy directly referred to is the praetorship, but that the change affected the lower magistrates also is certain; see, e.g., Pliny's Letters, passim, especially ii. 20, vi. 19.
10 Dio lii. 13, 16.
11 Mommsen, Staatsr. ii. 1143.
This almost complete effacement of the *comitia* was largely due to the fact that they had ceased to represent anything but the populace of Rome, and the comparatively greater vitality shown by the old magistrates is mainly attributable to their rivalry. They continued to possess in the eyes of the upper Roman class. But, though they were eagerly sought (Plin. *Epp.* ii. 9, vi. 6), and conferred on their holders considerable social distinction, the magistrates ceased, except in name, to be the popularly chosen executive officers of the Roman state. In the administration of the empire at large they had no share, if we except the subordinate duties still assigned to the quaestor in a province. In Rome, to which their sphere of work was limited, they were overshadowed by the dominant authority of the *princeps*, while their range of duties was increasingly circumscribed by the gradual transference of administrative authority, even within the city, to the emperor and his subordinate officials. And their dependence on the *princeps* was confirmed by the control he exercised over their appointment. For all candidates the approval, if not the commendation, of the *princeps* became the indispensable condition of success, and the *princeps* on his side treated these ancient offices as pieces of preferment with which to reward his adherents or gratify the ambition of Roman nobles. The dignity of the office, too, was impaired by the practice, begun by Caesar and continued by Augustus and his successors, of granting the insignia to men who had not held the actual magistracy itself. The consulship was still the highest post open to the privy citizen, the old republican *aedile* was still to rank a necessary qualification for high office in the provinces; but the actual consuls have scarcely any other duties than those of presiding in the senate and occasionally executing its decrees, while their term of office dwindles from a year to six and finally to two months. In the age of Tacitus and the younger Pliny, the contrast is striking between the high estimate set on the dignity of the office and the frankness with which its limited powers and its dependence on the emperor are acknowledged. The praetors continued to exercise their old jurisdiction with little formal change down to the latter half of the second century, but only as subordinate to the higher judicial authority of the emperor. The aediles retained only such petty police duties as did not pass to one or another of the imperial prefects and commissioners. The tribunate fared still worse, for, by the side of the *tribunicia potestas* wielded by the *princeps*, it sank into insignificance. The quaestorship suffered less change than any other of the old offices. It kept its place as the first step on the ladder of promotion, and there was still a quaestor attached to each governor of a senatorial province, to the consuls in Rome, and to the *princeps* himself. The senate alone among republican institutions retained some importance and influence, and it thus came to be regarded as sharing the government of the Empire with the *princeps* himself. It nominally controlled the administration of Italy and of the "public provinces," whose governors

2. A consul was a senatorial province and for the more important of the imperial legateships.

3. Mommsen, *Staatsr.* ii. 82 sqq. Six months was the usual term down to the death of Nero; we have then four or two months; in the 3rd century it was reduced to one. The consul who entered on office on the 1st of January were styled *consules ordinarii*, and gave their name to the year, whilst the others were distinguished as *consules suffecti* or *minores*; *Dio Cass.* xlviii. 35.

---

8. It appointed. It is to the senate, in theory, that the supreme power reverts in the absence of a *princeps*. It is by decree of the senate that the new *princeps* immediately receives his powers and privileges, though he is still supposed to have been elected by the people. But, by the cessation of all legislation by the *comitia*, the only law-making authority, other than that of the *princeps* by his edicts, was that of the senate by its decrees. Its judicial authority was co-ordinate with that of the emperor, and at the close of the 1st century we find the senators claiming, as the emperor's "peers," to be exempt from his jurisdiction. But in spite of the outward dignity of its position, and of the deference with which it was frequently treated, the senate became gradually almost as powerless in reality as the *comitia* and the magistrates. The senators continued indeed to be taken as a rule from the ranks of the wealthy, and a high property qualification was established by Augustus as a condition of membership; but this merely enabled the emperors to secure their own ascendancy by subsidizing those whose property fell short of the required standard, and who thus became simply the paid creatures of their imperial patrons. Admission to the senate was possible only by favour of the emperor, both as controlling the elections to the magistracies, which still gave entrance to the curia, and as invested with the power of directly creating senators by *adlectio*, a power which from the time of Vespasian onwards was freely used.

10. As the result, the composition of the senate rapidly altered. Under Augustus and Tiberius it still contained many representatives of families, whose prestige and ancestral traditions were some guarantee for their independence. But this element soon disappeared. The ranks of the old nobility were thinned by natural decay and by the jealous fears of the last three Claudian emperors. Vespasian flooded the senate with new men from the municipal towns of Italy and the Latinized provinces of the West. Trajan and Hadrian, both provincials themselves, carried on the same policy, and by the close of the 2nd century even the Greek provinces of the East had their representatives in the senate. Some, no doubt, of these provincials, who constituted the great majority of the senate in the 3rd century, were men of wealth and mark, but many more were of low birth, on some rested the stain of a servile descent, and all owed alike their present position and their chances of further promotion to the emperor. The procedure of the senate was as completely at the mercy of the *princeps* as its composition. He was himself a senator and the first of senators; he possessed the magisterial prerogatives of convening the senate, of laying business before it, and of carrying *senatus consultum*; above all, his tribunician power enabled him to interfere at any stage, and to modify or reverse its decisions. The share of the senate in the government was in fact determined by the amount of administrative activity which each *princeps* saw fit to allow it to exercise, and this share became steadily smaller. The jurisdiction assigned it by Augustus and Tiberius was in the 3rd century limited to the hearing of such cases as the emperor thought fit to send for trial, and these became steadily fewer in number. Its control of the state treasury, as distinct from the imperial *fiscus*, was in fact little more than nominal, and became increasingly unimportant as the great bulk of the revenue passed to the imperial treasuries. Under Domitian: *Dio Cass.* xivii. 2. Even Septimius Severus caused a decree to be passed by his council of imperatori in consulatu occidenti senatores; *Vita Sertorii*, 7.

13. Mommsen, *Staatsr.* ii. 939 sqq. The power was derived from the senatorial authority. Domitian was censor for life; *Suet. Dom.* 8. After Nerva it was exercised as falling within the general authority vested in the *princeps*; *Dio liii.* 17.

into the hands of the emperor. Even in Rome and Italy its control of the administration was gradually transferred to the prefect of the city, and after the reign of Hadrian to imperial officers (juridici) charged with the civil administration. 1 The part still played by its decrees in the modification of Roman law has been dealt with elsewhere (see Senate), but it is clear that these decrees did little else than register the expressed wishes of the emperor and his personal advisers.

The process by which all authority became centralized in the hands of the princeps and in practice exercised by an organized bureaucracy 2 was of necessity gradual; but it had its beginnings under Augustus, who formed the equestrian order (admission to which was henceforth granted only by him) into an imperial service, partly civil and partly military, whose members, being immediately dependent on the emperor, could be employed on tasks which it would have been impossible to assign to senators (see Equites). From this order were drawn the armies of "procurators"—the term was derived from the practice of the great business houses of Rome—who administered the imperial revenues and properties in all parts of the empire. Merit was rewarded by independent governorships such as those of Raeta and Noricum or the praetorships of Spain on the Valley of the Upper Danube, and Ravenna; and the prizes of the knight's career were the prefectures of the praetorian guard, the corn-supply and the city police, and the governorship of Egypt. The household offices and imperial secretariats were held by freedmen, almost always of Greek origin, whose influence became all-powerful under such emperors as Claudius. 3 The financial secretary (a rationibus) and those who dealt with the emperor's correspondence (ab epistulis) and with petitions (a liberis) were the most important of these.

This increase of power was accompanied by a corresponding elevation of the princeps himself above the level of all other citizens. The comparatively modest household and simple life of Augustus were replaced by a more regal splendour, and under Nero we find all the outward accessories of monarchy present, the palace, the palace guards, the crowds of courtiers, and a court ceremonial. In direct opposition to the republican theory of the principate, members of the family of the princeps share the dignities of his position. The males bear the cognomen of Caesar, and are invested, as youths, with high office; their names and even those of the females are included in the yearly prayers for the safety of the princeps. 4 Among the titles of the emperor and of his successors are the praefecti Maiorum and Galliarum, and the title of Caesar, which was given to them by the praetorian guards, the Twice the tadius of the princeps and other titles which in origin meant more to the army than to the people. The logical conclusion was reached in the practice of Caesar-worship, 5 which in origin was the natural expression of a widespread sentiment of homage, which varied in form in different parts of the empire and in different classes of society, but was turned to account by the statecraft of Augustus to develop something like an imperial patriotism. The official worship of the deified Caesar, starting from that of the "divine Julius," gave a certain sanctity and continuity to the regular succession of the emperors, but it was of less importance politically than the praecepta of Augustus. 6 The senate of Rome and Augustus first instituted in A.D. 11, was gradually diffused throughout the provinces, as a symbol of imperial unity. It must be observed that living emperors were not officially worshipped by Roman citizens; yet we find that even in Italy an unauthorized worship of Augustus sprang up during his lifetime in the country towns. 7

On the accession of Augustus, there could be little doubt as to the nature of the work that was necessary, if peace and prosperity were to be secured for the Roman world. He was called upon to justify his position by rectifying the frontiers and strengthening their defences, by reforming the system of provincial government, and by reorganizing the finances; and his success in dealing with these three difficult problems is sufficiently proved by the prosperous condition of the empire for a century and a half after his death. To secure peace it was necessary to establish on all sides of the empire really defensible frontiers; and this he was possible now that for the first time the direction of the foreign policy of the state and of its military forces was concentrated in the hands of a single magistrate. To the south and west the generals of the republic, and Caesar himself, had extended the authority of Rome to the natural boundaries formed by the African deserts and the Atlantic Ocean, and in these two directions Augustus's task was in the main confined to the organization of a settled Roman government within these limits. In Africa the client state of Egypt was ruled by Augustus as the successor of the Ptolemies, and administered by his deputies (praefecti), and the kingdom of Numidia (25 B.C.) was incorporated with the old province of Africa, of which Numidia formed a part. The province of Syria (24 B.C.) and of Cappadocia (25 B.C.) by Cauthan were immediately subdued and a third province, Lusitania, established. 8 In Gaul and Augustus (27 B.C.) established in addition to the old province, the three new ones of Aquitania, Lugdunensis and Belgica, which included the territories conquered by Julius Caesar. Towards the north the republic had left the civilized countries bordering on the Mediterranean with only a very imperfect defence against the threatening mass of barbarian tribes beyond them. The result of Augustus's policy was to establish a protecting line of provinces running from the Euxine to the North Sea, and covering the peaceful districts to the south,—Moesia (A.D. 6), Pannonia (A.D. 9), Noricum (15 B.C.), Raetia (15 B.C.) and Gallia Belgica. Roman rule was thus carried up to the natural frontier lines of the Rhine and the Danube. It was originally intended to make the Elbe the frontier of the empire; but after the defeat of P. Quintillus Varus (A.D. 9) the forward policy was abandoned. Tiberius recalled Germanicus as soon as Varus had been avenged; and after the peace with Maroboduus, the chief of the Marcomanni on the upper Danube, in the next year (A.D. 17), the defensive policy recommended by Augustus was adopted along the whole of the northern frontier. The line of the great rivers was held by an imposing mass of troops. Along the Rhine lay the armies of the Lower Germania, consisting of four legions each; eight more guarded the Danube and the frontiers of Pannonia and Moesia. At frequent intervals along the frontier were the military colonies, the permanent camps and the smaller intervening castella. Flotillas of galleys cruised up and down the rivers, and Roman roads opened communication both along the frontiers and with the seat of government in Italy.

In the East, Rome was confronted with a well-organized and powerful state whose claims to empire were second only to her own. The victory of Carrhae (53 B.C.) had encouraged the Persians to invade the Median province, and the Parthians, while it had awakened in Rome a genuine fear of the formidable power which they had so suddenly arisen in the East. Caesar was at the moment of his death preparing to avenge the death of Crassus by an invasion of Parthia, and Antony's schemes of founding an Eastern empire which should rival that of Alexander included the conquest of the kingdom of Media and the Euphrates. Augustus, however, adhered to the policy which he recommended to his successors of "keeping the empire within its bounds"; and the Persians, weakened by internal feuds and dynastic quarrels, were in no mood for vigorous action. Roman pride was satisfied by the restoration of the standards taken at Carrhae. Four legions guarded the line of the Euphrates, and, beyond the frontiers of Pontus and

Cappadocia, Armenia was established as a "friendly and independent ally." 1

Next in importance to the rectification and defence of the frontiers was the reformation of the administration, and the restoration of prosperity to the distracted and exhausted provinces. Since the most serious defect of the republican system had been the absence of any effective control over the Roman officials outside Italy. This was now supplied by the general proconsular authority vested in the emperor. The provinces were for the first time treated as departments of a single state, while their governors, from being independent and virtually irresponsible rulers, became the subordinate officials of a higher authority. 2 Over the 

legati of the imperial provinces the control of the emperor was as complete as that of the republican proconsul over his staff in his own province. They were appointed by him, held office at his good pleasure, and were directly responsible to him for their conduct. The proconsuls of the senatorial provinces were in law magistrates equally with the princeps, though inferior to him in rank; it was to the senate that they were as of old responsible; they were still selected by lot from among the senators of consular and praetorian rank. But the distinction did not seriously interfere with the paramount authority of the emperor. The provinces left nominally to the senate were the more peaceful and settled districts in the heart of the empire, where only the routine work of civil administration was needed, and where the local municipal governments were as yet comparatively vigorous. The senatorial provinces themselves were indirectly nominated by the emperor through his control of the praetorship and consulsul. They wielded no military and only a strictly subordinate financial authority, and, though Augustus and Tiberius, at any rate, encouraged the fiction of the responsibility of the senatorial governors to the senate, it was in reality to the emperor that they looked for direction and advice, and to him that they were held accountable. Moreover, in the case of all governors this accountability became under the empire a reality. Prosecutions for extortion (de pecunia replevandia), which were now transferred to the hearing of the senate, are tolerably frequent during the first century of the empire; but a more effective check on maladministration lay in the appeal to Caesar from the decisions of any governor, which was open to every provincial, and in the right of petition. Finally, the authority both of the legate and the proconsul was weakened by the presence of the imperial procurator, to whom was entrusted the administration of the fiscal revenues; while both legate and proconsul were deprived of that right of requisitioning supplies which, in spite of a long series of restrictive laws, had been the most powerful instrument of oppression in the hands of republican governors.

The financial reforms of Augustus 3 are marked by the same desire to establish an equitable, orderly and economical system, and by the same centralization of authority in the emperor's hands. The institution of an imperial census, or valuation of all land throughout the empire, and the assessment upon this basis of a uniform land tax, in place of the heterogeneous and irregular payments made under the republic, were the work of Augustus, though the system was developed and perfected by the emperors of the 2nd century and by Diocletian. The land tax itself was directly collected, either by imperial officials or by local authorities responsible to them, and the old wasteful plan of selling the privilege of collection to publicani was henceforward applied only to such indirect taxes as the customs duties. The rate of the land tax was fixed by the emperor, and with him rested the power of remission even in senatorial provinces. 4 The effect of these reforms is clearly visible in the improved financial condition of the empire. Under the republic the treasury had been nearly always in difficulties, and the provinces exhausted and impoverished. Under the emperors, at least throughout the 1st century, in spite of a largely increased expenditure on the army, on public works, on shows and largesses, and on the management of government itself, the better emperors of this era, Tiberius and Vespasian, were able to accumulate large sums, while the provinces show but few signs of distress. Moreover, while the republic had almost entirely neglected to develop the internal resources of the provinces, Augustus set the example of a liberal expenditure on public works, in the construction of harbours, roads and bridges, the reclamation of waste lands, and the erection of public buildings. 5 The crippling restrictions which the republic had placed on freedom of intercourse and trade, even between the separate districts of a single province, disappeared under the empire. In the eyes of the republican statesmen the provinces were merely the estates of the Roman people, but from the reign of Augustus dates the gradual disappearance of the old pre-eminence of Rome and Italy. It was from the provinces that the legions were increasingly recruited; provincials rose to high rank as soldiers, statesmen and men of letters; 6 and the methods of administration, formerly distinctive of the provinces, were adopted even in Rome and Italy. From Augustus himself, jealous as he was of the traditions and privileges of the ruling Roman people, date the rule of an imperial prefect 7 in the city of Rome, the division of Italy into provinces, the creation of the "Province of Rome," and the permanent quartering there of armed troops. 8

Augustus founded a dynasty which occupied the throne for more than half a century after his death. The first and by far the ablest of its members was Tiberius (A.D. 14–37). The Julio-Claudian line.

He was undoubtedly a capable and vigorous ruler, who enforced justice in the government of the provinces, maintained the integrity of the frontiers and husbanded the finances of the empire, but he became intensely unpopular in Roman society, and was painted as a cruel and odious tyrant. His successor, Galus (A.D. 37–41), generally known as Caligula, was the slave of his wild caprices and uncontrolled passions, which issued in manifest insanity. He was followed by his uncle, Claudius (A.D. 41–54), whose personal uncoynerness made him an object of derision to his contemporaries, but who by no means devoid of statesmanlike faculties. His reign left an abiding mark on the history of the empire, for he carried forward its development on the lines intended by Augustus. Client-states were absorbed, southern Britain was conquered, the Romanization of the West received a powerful impulse, public works were executed in Rome and Italy, and the organization of the imperial bureaucracy made rapid strides. Nero (A.D. 54–68), the last of the Julio-Claudian line, has been handed down to posterity as the incarnation of monstrous vice and fantastic luxury. But his wild excesses scarcely affected the prosperity of the empire at large; the provinces were well governed, and the war with Parthia led to a compromise in the matter of Armenia which secured peace for half a century. 9

1 Mommsen, Provinces, cap. 9. Armenia, however, long continued to be a debatable ground between Rome and Parthia—passing alternately under the influence of one or the other.

7 The praefectus urbi, unlike the other imperial prefects, was always a senator. He commanded the three cohortes urbanae, which preserved order in the city, and represented the emperor, whose authority tended to increase in importance. The office, which was only temporary under Augustus, became a permanent one under his successor. According to the cohortes urbanae mentioned above, the nine regiments of the imperial guard (cohortes praetorianae) were quartered in Rome. The guards were not at first concentrated but billeted in Rome and the neighbouring towns; the praetorian barracks on the Esquiline were not under Tiberius. Under Tiberius, however, Augustus also formed the quasi-military police force of the vigiles (in seven cohorts), which performed the duties of a fire brigade and night watch. Police duties in those parts of Italy which were subject to brigandage were performed by the stations militiae (Suet. Aug. 32).

8 For an estimate of the Julio-Claudian Caesars, based on the results of recent research, see Pelham in Quarterly Review (April
The fall of Nero and the extinction of the "progeny of the Caesars" was followed by a war of succession which revealed the military basis of the Principate and the weakness of the ties connecting the emperors with Rome. Galba, Otho, Vitellius and Vespasian represented in turn the legions of Spain, the household troops, the army of the Rhine, and a coalition of the armies of the Danube and the Euphrates; and all except Otho were already _de facto_ emperors when they entered Rome. The final survivor in the struggle, Vespasian (A.D. 69–79), was a man of comparatively humble origin, and as the Principate ceased to possess the prestige of high descent it became imperatively necessary to remove, as far as possible, the anomalies of the office and to give it a legitimate and permanent character. The days of the Flavian emperors were numbered. New orders of titles substituted for the personal names of the Julio-Claudian emperors, an increasing tendency to insist on the inherent prerogatives of the Principate (such as the senatorial power), and an attempt to invest Caesarism with an hereditary character, either by natural descent or by adoption, while the worship of the _Divi_ or deified Caesars, was made the symbol of its continuity and legitimacy. The dynasty of Vespasian and his sons (Titus, A.D. 79–81, Domitian, A.D. 81–96) became extinct on the murder of the last named, whose high-handed treatment of the senate earned him the name of a tyrant; his successor, Nerva (A.D. 96–98), opened the series of "adptive" emperors (Trajan, A.D. 98–117, Hadrian, 117–38, Antoninus Pius, 138–61, Marcus Aurelius, 161–80) under whose rule the empire enjoyed a period of internal tranquillity and good government. Its boundaries were extended by the subjugation of northern Britain (by Agricola, A.D. 78–84; see _Britain_, § Roman), by the annexation of the districts included in the angle of the Rhine and Danube under the Flavian emperors, and by the conquest of Dacia (the modern Transylvania) under Trajan (completed in A.D. 166). Trajan also annexed Arabia Petraea and in his closing years invaded Parthia. A.D. 116–117, the Mesopotamia and Assyria; but these conquests were surrendered by his successor, Hadrian, who set himself to the task of consolidating the empire and perfecting its defences. To him is due the system of permanent _limites_ or frontier fortifications, such as the wall which protected northern Britain and the palisade which replaced the chain of forts established by the Flavian emperors from the Rhine to the Danube.  

The construction of these defences showed that the limit of expansion had been reached, and under M. Aurelius the tide began to turn. A great part of his reign was occupied with wars against the Marcomanni, Quadi, Sarmatians, &c., while to some extent the empire was thoroughly reunited. Henceforth Rome never ceased to be on the defensive. Within the frontiers the levelling and unifying process commenced by Augustus had steadily proceeded. A tolerably uniform provincial system covered the whole area of the empire. The client states had one by one been reconstituted as provinces, and even the government of Italy had been in many respects assimilated to the provincial type. The municipal system had spread widely; the period from Vespasian to Aurelius witnessed the elevation to municipal rank of an immense number of communities, not only in the old provinces of the West, in Africa, Spain and Gaul, but in the newer provinces of the North, and along the line of the northern frontier; and everywhere under the influence of the central imperial authority there was an increasing uniformity.  

It is now generally admitted that Tacitus's picture is overdrawn. The _limites imperii_, see Pelham, "A Problem of Roman Frontier Policy" (Transactions of the Royal Historical Society, 1906), and Kornemann, "Die neueste Limesforschung" (Klio, 1907, pp. 73 ff.). The _Limes_ connecting the Rhine with the Danube have been systematically excavated in recent years; for the results see _Der obergermanisch-rätische Limes_ (Heidelberg, 1894–), and _Der römische Limes in Österreich_ (Vienna, 1900–).
neglected. Augustus caused an official survey of the empire to be made, and a scientific census of its resources was gradually carried out from time to time revised; thus the balance of revenue and expenditure could be accurately estimated and adjusted, and financial stability was established. The system of tax-farming was gradually abolished and direct collection substituted; commerce was freed from vexatious restrictions, and large customs-districts were formed, on whose borders duties were levied for revenue only. The government took even more direct measures for the encouragement of industry and especially of agriculture. The most remarkable of these were the "alimentary institutions," originally due to Nerva and developed by succeeding emperors. Capital was advanced at moderate rates of interest to Italian landowners on the security of their estates, and the profits of this system of land-banks were devoted to the maintenance and education of poor children. The foundation of colonies for time-expired soldiers, who received grants of land on their discharge, contributed something to the formation of a well-to-do agricultural class; and although the system was not successful in lower Italy, where economic decline could not be arrested, there can be no doubt that central and northern Italy, where the vine and olive were largely cultivated, and manufactures of pottery and glass increased, enjoyed considerable prosperity. The extension of the Roman municipal system to the provinces, and the watchful care exercised by the imperial government over the communities, together with the profuse liberality of the emperors, which was imitated by the wealthier citizens of the towns, led to the creation of a flourishing municipal life still evidenced by the remains which in districts such as Asia Minor or Tunis stand in significant contrast with the desolation brought about by centuries of barbaric rule. Mommsen has, indeed, expressed the opinion that "if an angel of the Lord were to strike the balance whether the domain ruled by Severus Antoninus were governed with the greater intelligence and the greater humanity at that time or in the present day, whether civilization and national prosperity generally had since that time advanced or retrograded, it is very doubtful whether the decision would prove in favour of the present."

But there is another side to the picture. The empire brought into being a new society and a new nationality, due to the fusion of Roman ideas with Hellenic culture, beside which other elements, saving only, as we shall see, those contributed by the Oriental religions, were insignificant. This new nationality grew in definition through the gradual disappearance of distinctions of language and manners, the assimilating influence of the "arbitrium" under which all the possessions of national jealousies and aspirations. But the cosmopolitan society thus formed was compacted of so many disparate elements that a common patriotism was hard to foster, and doubly hard when the autocratic system of government prevented men from aspiring to that true political distinction which is attainable only in a self-governing community. It is true that there was much good work to be done, and that much good work was done, in the service of the emperors; true, also, that the carrière ouverte aux talents was in large measure realized. Distinctions of race were slowly but steadily effaced by the inexorable pressure of provincialism and by the manumission of slaves; and the career open to the Romanized provincial or the liberated slave might culminate in the highest distinctions which the emperor might bestow. In the hierarchy of social orders—senate, equites and plebs—ascent was easy and regular from the lower grade to the higher; and the more enlightened of the emperors—especially Hadrian—made a genuine endeavour to give a due share in the work of government to the various subject races. But nothing could compensate for the lack of self-determination, and although during the first century and a half of imperial rule a flourishing local patriotism in some degree filled the place of the wider sentiment, this gradually sank into decay and became a pretext under cover of which the lower classes in the several communities took toll of their wealthier fellow-citizens in the shape of public works, largesses, amusements, &c., until the resources at the disposal of the rich ran dry, the communities themselves in many cases became insolvent, and the inexorable claims of the central government were satisfied only by the surrender of financial control to an imperial commissioner. Then the organs of civic life became atrophied, political interest died out, and the whole burden of administration, as well as that of defence, fell upon the shoulders of the bureaucracy, which proved unequal to the task.

In a world thus governed the individual was thrown more and more upon his own resources—the pursuit of wealth and pleasure, or the satisfaction of intellectual interests. Under the rule of the Caesars much was done for education. Julius Caesar bestowed Roman citizenship on "teachers of the liberal arts"; Vespasian endowed professorships of Greek and Latin oratory at Rome; and later emperors, especially Antoninus Pius, extended the same benefits to the provinces. Local enterprise and munificence were also devoted to the cause of education; we learn from the correspondence of the younger Fliny that public schools were founded in the towns of northern Italy. But though there was a wide diffusion of knowledge and its extent was easier to conceive than to prove, Augustus, it is true, gathered about him the most brilliant writers of his time, and the debut of the new monarchy coincided with the Golden Age of Roman literature; but this was of brief duration, and the beginning of the Christian era saw the triumph of classicism and the first steps in the decline which awaits all literary movements which look to the past rather than the future. Political oratory could not exist under an absolute ruler; public life furnished no inspiring theme to poet or historian; and literature became didactic or imitative, while rhetoric degenerated into declamation. It is true that for some time both literature and philosophy maintained an alliance and an open warfare with the principle of opposition to the empire; but both had ceased to be irreconcilable before the time of Hadrian. Under his rule classicism gave way to the archaism of which Fronto and Apuleius furnish the most notable examples, and which preferred Cato and Ennius to Cicero and Virgil. But this return to the past was not followed by any renewed creative energy. It was a confession of weakness and little more; and the widely diffused culture of the Antonine period, though outwardly brilliant, had no progressive energy and presented but a feeble resistance to the dissolving forces of barbarism. But the balance of loss and gain in the field of morals is an exceedingly difficult task. The denunciations of the satirists, especially of Juvenal, might lead us to believe that an appalling state of depravity existed in the society of the early empire; but satirists notoriously paint in glaring colours for literary effect, and whatever may be said of the morality of Rome—which was probably no better and no worse than that of any cosmopolitan capital—there were sound and healthy elements in plenty amongst the population of Italy and the provinces. Doubtless the craving for amusement—especially for the shows of the amphitheatre and the chariot-races of the circus—infected the idle masses of the populace in Rome and the larger towns, and was fostered by the policy of despotism, which always aims at securing cheap popularity with the proletariat; but the tendency of the time, not only in the higher ranks, but also amongst humbler folk, was towards a broader humanity and a more serious view of life and its problems. Greek philosophy, especially the Stoic system, in order to appeal to the practical Roman intelligence, found itself obliged to elaborate a rule of conduct, and in many instances of extravagant luxury, which was encouraged by Nero. But we are told that there was a return to simpler habits of life under the Flavian dynasty.

1 Provinces, I, p. 5.

2 Immense fortunes were accumulated under the early empire, especially by imperial freedmen, such as Pallas, who is said to have possessed the equivalent of £3,000,000 sterling; and there were instances of extravagant luxury, which was encouraged by Nero.

3 Quintilian occupied the chair of Latin rhetoric, and received the ornamenta consularia.
households the philosopher, generally a Greek, played the part of a director of consciences. The influence of these doctrines is shown in the humane provisions of the civil law as elaborated in the Antonine period, which did much to mitigate the lot of the slave and to smooth the process by which freedom might be attained.  

Above all, a religious movement which drew its motive power not from Greek philosophy, but from Oriental mysticism, carried the human race far from its old moorings, and culminated in the triumph of Christianity. All the Eastern cults—whether of Cybele, of Isis, of the Syrian Baalim or of the Persian Mithras—had this in common, that they promised to their adherents redemption from the curse of the flesh and a glorious immortality after death; and this fact gave them an irresistible attraction for the disillusioned and overburdened subjects of the emperors. The religion of Mithras, whose doctrines were specially suited to the military temperament, won friends; the unwarred provinces of the empire were stationed, and seemed likely at one moment to become universal; but it was forced to yield to Christianity, which refused to tolerate any rival, faced the empire with a claim to absolute dominion in the spiritual sphere, and at length made that claim good (see Roman Religion; Mithras; Great Mother of the Gods).

Marcus Aurelius died in 180, and the reign of his worthless son, Commodus (A.D. 180-93), was followed by a century of war and disorder, during which nothing but the stern rule of soldier emperors saved the empire from dissolution. The most ablest of these was Septimius Severus (193-211), whose claims were disputed by Clodius Albinus in the West, and by Pescennius Niger in the East; in these struggles rival Roman forces, for the first time since the accession of Vespasian, exhausted each other in civil war. Severus emphasized strongly the military character of the Principate; he abstained from seeking confirmation for his authority from the senate, and deprived that body of most of the share in the government which it still retained; he assumed the title of proconsul in Rome itself, made the prefect of the guard the vicegerent of his authority, and heaped privileges upon the army, which, although they secured its entire devotion to his family, impaired its efficiency as a fighting force and thus weakened Rome in face of the barbarian invaders. He succeeded in founding a short-lived dynasty, which ended with the attempt of the virtuous but weak Alexander (222-35) to restore the independence of the senate. This led to a military reaction, and the elevation of the brutal Maximinus, a Thracian peasant, to the throne. The disintegration of the empire was the natural result; for the various provincial armies put forward their commanders as claimants to the purple. A hundred ties bound them closely to the districts in which they were stationed; their permanent camps had grown into towns, they had families and farms; the unwarred provincials looked to them as their natural protectors, and were attached to them by bonds of intermarriage and by long intercourse. Now that they found themselves left to repel by their own efforts the invaders from without, they reasonably enough claimed the right to ignore the central authority which was powerless to aid them, and to choose for themselves imperatores whom they knew and trusted. These “tyrans,” as they were called when unsuccessful, sprang up in ever-increasing numbers, and weakened Rome's power of resistance to the new enemies who were threatening her frontiers—the Alamanni and Franks, who broke through the German Rhine in 276; the Goths, who crossed the Danube in 247, raided the Balkan provinces, and defeated and slew the emperor, Decius, in 251; and the restored Persian kingdom of the Sassanids (see Persia), whose rulers laid claim to all the Asiatic possessions of Rome and in 260 captured Antioch and made the emperor, Valerian, a prisoner. During the reign of Gallienus, the son of Valerian (260-68), the evil reached its height. The central authority was paralysed; the Romanized districts beyond the Rhine were irrevocably lost; the Persians were threatening to overrun the Eastern provinces; the Goths had formed a fleet of 500 sail which harried Asia Minor and even Greece itself, where Athens, Corinth, Sparta and Argos were sacked; and the legions on the frontiers were left to repel the enemies of Rome as best they could. A provincial empire was established by M. Cassianius Latinius Postumus in Gaul and maintained by his successors, M. Piavonius Victorinus and C. Pius Esuvius Tetricus. Their authority was acknowledged, not only in Gaul and by the troops on the Rhine, but by the legions of Britain and Spain; and under Postumus at Antioch (259-69) the existence of the Gallic Empire was justified by the repulse of the barbarians and by the restoration of peace and security to the provinces of Gaul. On the Danube, in Greece and in Asia Minor none of the “pretenders” enjoyed more than a passing success. In the Far East, the Syrian Odenathus, prince of Palmyra (g.v.), though officially only the governor of the East (dux Orientis) under Gallienus, drove the Persians out of Asia Minor and Syria, recovered Mesopotamia, and ruled Syria, Arabia, Armenia, Cappadocia and Cilicia with all the indestructible character of an independent kingdom. Odenathus was murdered in 266. His young son Vaballathus (Wahab-allath) succeeded him in his titles, but the real power was vested in his widow Zenobia, under whom not only the greater part of Asia Minor but even the province of Egypt was forcibly added to the dominions governed by the Palmyrene prince, who ceased to acknowledge the supremacy of Rome.

Gallienus was murdered at Milan in 268, and after the brief reign of Claudius II. (A.D. 268-70), who checked the advance of the Goths, Aurelian (270-75) restored unity to the distracted empire. Palmyra was destroyed and Zenobia led a prisoner to Rome (in 273) and in the next year the Gallic empire came to an end by the surrender of Tetricus. Aurelian, it is true, abandoned the province of Dacia, but the defences of the Danube were strengthened, and in 276 Probus repulsed the Franks and Alamanni, who had been pressing on the Rhine frontier for some forty years. Finally, Carus (283) recovered Armenia and Mesopotamia from the Persians and restored the frontier fixed by Septimius Severus.

Although any serious loss of territory had been avoided, the storms of the 3rd century had told with fatal effect upon the general condition of the empire. The “Roman provinces” had vanished; not only the frontier territories, but the central districts of Greece, Asia Minor, and even Italy itself, had suffered from the ravages of war, and the fortification of Rome by Aurelian was a significant testimony to the altered condition of affairs. War, plague and famine had thinned the population and crippled the resources of the provinces. On all sides land was running waste, cities and towns were decaying, and commerce was paralyzed. Only with the greatest difficulty were sufficient funds squeezed from the exhausted taxpayers to meet the increasing cost of the defence of the frontiers. The old established culture and civilization of the Mediterranean world rapidly declined, and the mixture of barbaric rudeness with Oriental pomp and luxury which marked the court, even of the better emperors, such as Aurelian, was typical of the general deterioration, which was accelerated by the growing practice of settling barbarians on lands within the empire, and of admitting them freely to service in the Roman army.

1 The massacre of the slaves of Pedanius Secundus, who had been murdered by unknown workmen (see Livy, xiv. 42). The story is true, decreed by the senate; but it was a highly unpopular act, and is chiefly significant as showing that the senatorial aristocracy was out of harmony with the spirit of the time.

2 Gibbon (ed. Buay), i. chap. v.; Schiller, Gesch. d. Kaiserzeit, i. (2) 660.

3 The common soldier was now permitted to marry, and ceased to live in camp (Herodian iii. 8. 5).
The reforms of Diocletian and Constantine.

The work of fortifying the empire against internal sedition and foreign invasion, begun by Aurelian and Probus, was completed by Diocletian and Constantine, the great, whose system of government, novel as it appears at first sight, was in reality the natural and inevitable outcome of the history of the previous century. Its object was twofold, to give increased stability to the imperial authority itself, and to organize an efficient administrative machinery throughout the empire. In the second year of his reign Diocletian associated Maximian with himself as colleague, and six years later (293) the hands of the two "Augusti" were further strengthened by the proclamation of Constantius and Galerius as "Caesars." Precedents for such an arrangement were to be found in the earlier history of the Principate; and it divided the burdens and responsibilities of government, without sacrificing the unity of the empire; for, although to each of the Augusti and Caesars a separate sphere was assigned, the Caesars were subordinate to the higher authority of the Augusti, and over all his three colleagues Diocletian claimed to exercise a paramount control. It also reduced the risk of a disputed succession by establishing in the two Caesars the natural successors to the Augusti, and it satisfied the jealous pride of the rival armies by giving them imperatores of their own. The distribution of power between Diocletian and his colleagues followed those lines of division which the feuds of the previous century had marked out. The armies of the Rhine, the Danube, and of Syria fell to the lot respectively of Constantius, Galerius and Diocletian, the central districts of Italy and Africa to Maximian.

In the new system the imperial authority was finally emancipated from all constitutional limitation and control and the last traces of its republican origin disappeared. The emperors from Diocletian onwards were autocrats in theory as well as in practice. This avowed despotism Diocletian, following in the steps of Aurelian, hedged round with all the pomp and majesty of Oriental monarchy. The final adoption of the title dominus, the diadem on the head, the robes of silk and gold, the replacement of the republican salutation of a fellow-citizen by the adoring prostration of the subject before his lord and master, were all significant marks of the new regime. In the hands of this absolute ruler was placed the entire control of an elaborate administrative machinery. Most of the old local and national distinctions, privileges and liberties which had once flourished within the empire had already disappeared under the levelling influence of imperial rule, and the process was now completed. Roman citizenship had, since the edict of Caracalla, ceased to be the privilege of a minority. Diocletian finally reduced Italy and Rome to the level of the provinces: the provincial land-tax and provincial government were introduced into Italy; while Rome ceased to be even in name the seat of imperial authority. Throughout the whole area of the empire a uniform system of administration was established, the control of which was centred in the imperial palace. Between the civil and military departments the separation was complete. At the head of the former were the praetorian prefects, next below them the vicarii, who had charge of the dioceses; below these again the governors of the separate provinces (praesides, correctores, consulares), under each of whom was a host of minor officials. Parallel with this civil hierarchy was the series of military officers, from the magistri militium, the duces, and comites downwards. In both there is the utmost possible subdivision and division of authority. The subdivision of provinces, begun by the emperors of the 2nd century, was systematically carried out by Diocletian, and each official, civil or military, was placed directly under the orders of a superior; thus a continuous chain of authority connected the emperor with the meanest official in his service. Finally, the various grades in these two imperial services were carefully marked by the appropriation to each of distinctive titles, the highest being that of illustris, which was confined to the prefects and to the military magistri and comites, and to the chief ministers.

There can be little doubt that on the whole these reforms prolonged the existence of the empire, by creating a machinery which enabled the stronger emperors to utilise effectively all its available resources, and which even to some extent made good the deficiencies of weaker rulers. But in many points they failed to attain their object. Diocletian's division of the imperial authority among colleagues, subject to the general control of the senior Augustus, was effectually discontinued by the twenty years of almost constant conflict which followed his own abdication (305-23). Constantine's partition of the empire among his three sons was not more successful in ensuring tranquillity, and in the final division of the East and West between Valens and Valentinian (364) the essential principle of Diocletian's scheme, the maintenance of a single central authority, was abandoned. The "tyrants," the curse of the 3rd century, were far from unknown in the 4th. The system, moreover, while it failed altogether to remove some of the existing evils, aggravated others. The already overburdened financial resources of the empire were strained still further by the increased expenditures of the later Constantines; the total sum of four imperial courts for one, and by the multiplication in every direction of paid officials. The gigantic bureaucracy of the 4th century proved, in spite of its undoubted services, an intolerable weight upon the energies of the empire.

Diocletian and Maximian formally abdicated their high office in 305. Nineteen years later Constantine I, the Great, the sole survivor of six rival emperors, united the whole empire under his own rule. His reign of fourteen years was marked by two events of first-rate importance,—the recognition of Christianity as the religion of the

1 See Gibbon (ed. Bury), ii. chap. xvii. 158 ff.; Marquardt, Staatsreformen, i. pp. 81, 336, 337, ii. 217 seq.; Madvig, Verf. d. Röm. Reichs, ii. 585; Böcking, Notitia dignitatum (Bonn. 1853); Hodgkin, Italian and her Successors (ed. 2), bk. i. chap. xii.; Preuss, Diocletian (Leipzig, 1886); Seeck, Unterfangen der antiken Welt, vols. i., ii. (1897-1902).

2 Mombmes, Staatsrecht, ii. 1168 seq. Verus was associated with Maximian in the Partition of the Empire in 286, and his three sons. The bestowal of the title Caesar on the destined successor dates from Hadrian. Mombmes, op. cit. 1139.

3 The division was as follows:—(1) Diocletian—Thrace, Egypt, Syria, Cappadocia Minor; (2) Maximian—Illyricum and Africa; (3) Galerius—Illyricum and the Danube; (4) Constantius—Britain, Gaul, Spain. See Gibbon, i. 354; Aurelius Victor, c. 39.

5 Marquardt, Leipzig, 1877; Heftel, ii. 204 ff.; Italy, together with Sicily, Sardinia and Corsica, was divided into 17 provinces. Each had its own governor; the governors were subject to the two vicarii (vic. orbis, vic. Italiae), and they in turn to the prefect of Italy, whose prefecture, however, included as well Africa and Western Illyricum.

6 The new administrative system.

7 The new administrative system.

8 The seats of government for Diocletian and his three colleagues were Mediolanum, Augusta Trevirorum, Sirmium, Nicomedia. Other lists see Gibbon, ii. chap. xvii. p. 188; cf. also Notitia Dignitatum and Böcking, Notitia dignitatum. At first the number of these varied and there was no fixed division of provinces between them; but by the close of the 4th century there were 16, viz. Orient, Illyricum, Italia, Gallia, to which must be added the prefectures of Rome and Constantiopolis. See Mombmes in Hermes, xxxvi. 204 ff.

9 There were 12 dioceses and 101 provinces; cf., in addition to the authorities mentioned above, Reinhart-Hollweg, Celti-Protei, iii. 101, Kuhn, Die städtische und bürgerliche Verfassung des römischen Reichs (1877).

10 The army was completely remodelled and the old frontier garrisons (so-called "Onagerwall") were supplemented by a field force attached to the persons of the Augusti and Caesars, and hence called Comitatenses. The change was accompanied by the subdivision of the old legions into units of about 2000 men. For these reforms see Mombmes in Unterfangen der antiken Welt, iii. chap. v.; Mombmes in Hermes, xxiv. 225 ff.

11 The grades were as follows: illustris, spectabilis, clarissimi, perfec tissimi, egregii. For the other insignia, see Madvig, ii. 590, and the Notitia Dignitatum.
ROME

empire, and the building of the new capital at Byzantium.

The alliance which Constantine inaugurated between the Christian church and the imperial government, while it enlisted on the side one of the most powerful of the new forces with which it had to reckon, imposed a check, which was in time to become a powerful one, on the imperial authority. The establishment of the new

City of Constantinople, as a second Rome paved the way for the final separation of East and West by providing the former for the first time with a seat of government on the Bosphorus. The death of Constantine in 337 was followed, as the abolition of Diocletian had been, by the outbreak of quarrels among rival Caesars. Of the three sons of Constantine who in 337 divided the empire between them, Constantine the eldest fell in civil war against his brother Constans; Constans himself was, ten years afterwards, defeated and slain by Magnentius; and the latter in his turn was in 353 vanquished by Constantine's only surviving son Constantius.

Thus for the second time the whole empire was united under the rule of a member of the house of Constantine. But in 355 Constantius granted the title of Caesar to his cousin Magnentius, placed him in charge of eastern provinces, where the momentary elevation of a tyrant, Silvanus, and still more the inroads of Franks and Alamanni, had excited alarm. But Julian's successes during the next five years were such as to arouse the jealous fears of Constantius. In order to weaken his suspected rival the legions under Julian in Gaul were suddenly ordered to march eastward against the Persians (360). They refused; and when the order was repeated, replied by proclaiming Julian himself emperor and Augustus. Julian, with probably sincere reluctance, accepted the position, but the death of Constantius in 361 saved the empire from the threatened civil war. Julian's attempted restoration of pagan and in especial of Hellenic worship had no more permanent effect than the war which he courageously waged against the multitudinous abusers which had grown up in the luxurious court of Constantius. But his vigorous administration in Gaul undoubtedly checked the barbarian advance across the Rhine, and postponed the loss of the Western provinces; on the contrary, his campaign in Persia, brilliantly successful at first, ended in his own death (363), and his successor, Jovian, immediately surrendered the territories beyond the Tigris won by Diocletian seventy years before. Jovian died on the 17th of February 364; and on the 26th of February Valentinian was acknowledged as emperor of the army at Nicaea. In obedience to the wish of the soldiers that he should associate a colleague with himself, he conferred the title of Augustus upon his brother Valens, and the division of the empire was at last effected. —Valentinian became emperor of the West, Valens of the East. Valentinian maintained the integrity of the empire until his death (375), which deprived the weaker Valens of a trusted counsellor and ally, and was followed by a series of wars on the Danube. In 376 the Goths, hard pressed by their enemies from the east and eastward by the Huns, sought and obtained the protection of the Roman Empire. They were transported across the Danube and settled in Moesia, but, indignant at the treatment they received, they rose in arms against their protectors. In 378 at Adrianople Valens was defeated and killed, and the victorious Goths advanced eastward to the very walls of Constantinople. Once more, however, the danger passed away. The skill and tact of Theodosius, who had been proclaimed emperor of the East by Gratian, conciliated the Goths; they were granted an allowance, and in large numbers entered the service of the Roman emperor. The remaining

1 In especial against the overwhelming influence of the eunuchs, an influence at once greater and more pernicious than even that of the Imperial freedmen in the days of Claudius.

2 The son of Valentinian and ruler of the West.

years of Theodosius's reign (382-95) were mainly engrossed by the duty of upholding the increasingly feeble authority of his western colleague against the attacks of pretenders. Maximus, the murderer of Gratian (383), was at first recognized by Theodosius as Caesar, and left in undisturbed command of Gaul, Spain and Britain; but, when in 386 he proceeded to oust Valentinian II. from Italy and Africa, Theodosius marched westward, crushed him, and installed Valentinian as emperor of the West. In the very next year, however, the murder of Valentinian (392) by Arbogast, a Frank, was followed by the appearance of a fresh tyrant in the person of Eugenius, a domestic officer and nominee of Arbogast himself. Once more Theodosius marched westward, and near Aquileia decisively defeated his opponents. But his victory was quickly followed by his own illness and death (395), and the fortunes of East and West passed into the care of his two sons Arcadius and Honorius.

(b) From the Death of Theodosius to the Extinction of the Western Empire (395-476).—Through more than a century from the accession of Diocletian the Roman Empire had succeeded in holding at bay the swelling hordes of barbarians. But the Goths, however, had been lost, as Dacia had been lost in the century before, and though the frontier lines of the Rhine and the Danube were still guarded by Roman forts and troops, there were signs in plenty that a catastrophe was at hand.

From all the writers who deal with the 4th century we have one long series of lamentations over the depression and misery of the provinces. To meet the increased expenditure necessary to maintain the legions, to pay the hosts of officials, and to keep up the luxurious splendour of the imperial courts, not only were the taxes raised in amount, but the most oppressive and inquisitorial methods were adopted in order to secure for the imperial treasury every penny that could be wrung from the wretched taxpayer. The results are seen in such pictures as that which the panegyrist Eumenius draws of the state of Gaul (366-12) under Constantine, in the accounts of the same province under Julian fifty years later, in those given by Zosimus early in the 5th century, and in the stringent regulations of the Theodosian code, dealing with the assessment and collection of the taxes. Among the graver symptoms of economic ruin were the decrease of population, which seriously diminished not only the number of taxpayers, but the supply of soldiers for the legions; the spread of infanticide; the increase of waste lands whose owners and cultivators had fled to escape the tax collector; the declining prosperity of the towns; and the constantly recurring riots and insurrections, both among starving peasants, as in Gaul, and in populous cities like Antioch. The distress was aggravated by the civil wars, by the rapacity of tyrants, such as Maxentius and Maximus, but above all by the raids of the barbarians, who seized every opportunity afforded by the dissipations or incapacity of the emperors to cross the frontiers and harry the lands of the provincials. Constantine (356-12), Constantius II. (361-78), and Valentinian I. (367-70) had all tried to give a temporary breathing-space to Gaul by repelling the Franks and Alamanni. Britain was harassed by Picts and Scots from the north (367-70), while the Saxon pirates swept the northern seas and the coasts both of Britain and Gaul. On the Danube the Quadi, Sarmaeae, and above all the Goths, poured at intervals into the provinces of Pannonia and Moesia, and penetrated to Macedonia and Thrace. In the East, in addition to the constant border feud with Persia, we hear of ravages by the Isaurian mountaineers, and by a new enemy, the Saracens.

6 Amm. Marc. xiv. 4.
Even more ominous of coming danger was the extent to which the European half of the empire was becoming barbarized.

The policy which had been inaugurated by Augustus himself of settling barbarians within the frontiers had been taken up on a larger scale and in a more systematic way by the Illyrian emperors of the 3rd century, and was continued by their successors in the 4th. In Gaul, in the provinces south of the Danube, even in Macedonia and Italy, large barbarian settlements had been made—Theodosius in particular distinguishing himself by his liberality in this respect. Nor did the barbarians admitted during the 4th century merely swell the class of free service soldiers. On the contrary, they not only constituted to an increasing extent the strength of the imperial forces, but won their way in ever-growing numbers to posts of dignity and importance in the imperial service. Under Constantine the palace was crowded with Franks. Julian led Gothic troops against Persia, and the army with which Theodosius defeated the tyrant Maximus (388) contained large numbers of Huns and Alans, as well as of Goths. The names of Arboagast, Stilicho and Rufinus are sufficient proof of the place held by barbarians near the emperor’s person and in the control of the provinces and regions of Rome and the relations of Arboagast to his nominee for the purple, Eugenius, were an anticipation of those which existed between Ricimer and the emperors of the latter half of the 5th century.

It was by barbarians already within the empire that the first of the series of attacks which finally separated the western provinces from the empire and set up a barbaric ruler in Italy were made, and it was in men of barbarian birth that Rome found her ablest and most successful defenders. The Visigoths whom Alaric led into Italy had been settled south of the Danube as the allies of the empire since the accession of Theodosius, but like the Germans of the days of Caesar, they wanted land for their own, and Alaric himself aspired to raise himself to the heights which had been reached before him by the Vandal Stilicho at Ravenna and the Goth Rufinus at Constantinople. The jealousy which existed between the rulers of the western and eastern empires furthered his plans. In the name of Arcadius, the emperor of the east, or at least with the connivance of Arcadius’s minister Rufinus, he occupied the province of Illyricum, and from thence ravaged Greece, which, according to the existing division of provinces, belonged to the western empire. Thence in 396 he retreated before Stilicho to Illyricum, with the command of which he was now formally invested by the emperor; but this was all that he was able to do by reason of the pressure of events which had been developing in Italy and the approach of Vandalism into the provinces of the empire. In 400 he led his people, with their wives and families, their wagons and treasure, to seek lands for themselves south of the Alps. But in this first invasion he penetrated no farther than the plains of Lombardy, and after the desperate battle of Pollentia (402 or 403) he slowly withdrew from Italy, his retreat being hastened by the promises of gold freely made to him by the imperial government. Not until the autumn of 408 did Alaric again cross the Alps. Stilicho was dead; the barbarian troops in Honorius’s service had already been provoked into joining Alaric by the anti-Teutonic policy of Honorius and his ministers, and Alaric marched unopposed to Rome. The payment of a heavy ransom, however, saved the city. Negotiations followed between Alaric and the court of Ravenna. Alaric’s demands were moderate, but Honorius would grant neither lands for his people nor the honourable post in the imperial service which he asked for himself. Once more Alaric sat down before Rome, and the citizens were forced to agree to his terms. Attalus, a Greek, the prefect of the city, was declared Augustus, and Alaric accepted the post of commander-in-chief. But after a few months Alaric formally deposed Attalus, on account of his incapacity, and renewed his offers to Honorius. Again they were declined, and Alaric marched to the siege and sack of Rome (410). His death followed hard on his capture of Rome. Two years later (412) his successor Ataulf led the Visigoths to find in Gaul the lands which Alaric had sought in Italy. It is characteristic of the anarchical condition of the west that Ataulf and his Goths should have fought for Honorius in Gaul against the tyrants, and in Spain against the Vandals, Suebi and Alani; and it was with the consent of Honorius that in 419 Wallia, who had followed Ataulf as king of the Visigoths, finally settled with his people in south-western Gaul and founded the Visigothic monarchy.

It was about the same period that the accomplished fact of the division of Spain between the three barbarian tribes of Vandals, Suebi and Alani was in a similar manner recognized by the paramount authority of the emperor of the west. These peoples had crossed the Rhine at the time when Alaric was making his first attempt on Italy. A portion of the host led by Radagaisus actually invaded Italy, but was cut to pieces by Stilicho near Florence (409); the rest pressed on through Gaul, crossed the Pyrenees, and entered the as yet untouched province of Spain.

Honorius died in 423. With the single exception of Britain, no province had yet formally broken loose from the empire. But over a great part of the west the authority of the emperors was now little more than nominal; throughout the major part of Gaul and in Spain the barbarians had settled, and barbarian states were, growing up which recognized the supremacy of the emperor, but were in all essentials independent of his control.

The long reign of Valentinian III. (423-55) is marked by two events of first-rate importance—the conquest of Africa by the Vandals and the invasion of Gaul and Italy by Attila. The Vandal settlement in Africa was closely akin to that of the Visigoths in Spain and of the Vandals themselves in Gaul and Spain. Here, as there, the occasion was given by the jealous quarrels of powerful imperial ministers. The feud between Boniface, count of Africa, and Aëtius, the “master-general” or “count of Italy,” opened the way to Africa for the Vandal king Gaiseric (Generic), as that between Stilicho and Rufinus had before set Alaric in motion westward, and as the quarrel between the tyrant Constantine and the ministers of Honorius had paved the way for the Vandals, Suebes and Alans into Spain. In this case, too, land-hunger was the impelling motive with the barbarian invader, and in Africa, as in Gaul, Spain, the invaders’ acquisitions were confirmed by the imperial authority which they still professed to recognize. In 429 Gaiseric, king of the Vandals, crossed with his warriors, their families and goods, to the province of Africa, hitherto almost untouched by the ravages of war. Thanks to the quarrels of Boniface and Aëtius, their task was an easy one. The province was quickly overrun. In 435 a formal treaty secured them in the possession of a large portion of the rich lands which were the granary of Rome, in exchange for a payment probably of corn and oil. Carthage was taken in 439, and by 440 the Vandal kingdom was firmly established.

8 The Roman troops were withdrawn from Britain by Constantine in 397; Mommase, Ch. i. 601.
10 Prosper 659; Ranke iv. (1) 282.
Eleven years later (451) Attila invaded Gaul, but this Hunnish movement was in a variety of ways different from those of the Visigoths and Vandals. Nearly a century had passed since the Huns first appeared in Europe, and drove the Goths to seek shelter within the Roman lines. Attila was now the ruler of a great empire in central and northern Europe and, in addition to his own Huns, the German tribes along the Rhine and Danube and far away to the north owned him as king. He confronted the Roman power as an equal, and, unlike the Gothic and Vandal chieftains, he treated with the emperors of east and west as an independent sovereign. His advance on Gaul and Italy threatened, not the establishment of one more barbaric chieftain on Roman soil, but the subjugation of the civilized and Christian West to the rule of a heathen and semi-barbarous conqueror. But the Visigoths in Gaul, Christian and already half Romanized, rallied to the aid of the empire against a common foe. Attila, defeated at Châlons 1 by Aëtius, withdrew into Pannonia (451). In the next year he overran Lombardy, but penetrated no farther south, and in 453 he died. With the murder of Valentinian III. (455) the western branch of the house of Theodoric to an end, and the next twenty years witnessed the accession and deposition of nine emperors.

Under the three-months' rule of Maximus, the Vandals under Gaiseric invaded Italy and sacked Rome. From 456-7 the actual ruler of Italy was Ricimer, the Suebe. Of the four emperors whom he placed on the throne, Majorian (457-61) alone played any imperial part outside Italy. 2 Ricimer died in 472, and two years later a Pannonian, Orestes, attempted to fill his place. He deposed Julius Nepos and proclaimed as Augustus his own son Romulus. But the barbarian mercenaries in Italy determined to secure for themselves a position there such as that which their kinsfolk had won in Gaul and Spain and Africa. Their demand for a third of the lands of Italy was refused by Orestes, 3 and they instantly rose in revolt. On the defeat and death of Orestes they proclaimed their leader, Odoacer the Rugian, 4 king of Italy. Romulus Augustulus laid down his imperial dignity, and the court at Constantinople was informed that there was no longer an emperor of the West.

King of Odoacer.

The installation of a barbarian king in Italy was the natural climax of the changes which had been taking place in the West throughout the 5th century. In Spain, Gaul, and Africa barbarian chieftains were already established as kings. In Italy, for the last twenty years, the real power had been wielded by a barbarian officer. Odoacer, when he decided to dispense with the nominal authority of an emperor of the West, placed Italy on the same level of independence with the neighbouring provinces. But the old ties with Rome were not severed. The new king of Italy formally recognized the supremacy of the one Roman emperor at Constantinople, and was invested in return with the rank of "patrician," which had been held before him by Aëtius and Ricimer. In Italy too, as in Spain and Gaul, the laws, the administrative system and the language remained Roman. 5 But the emancipation of Italy and the Western provinces from direct imperial control, which is signalized by Odoacer's accession, has rightly been regarded as marking the opening of a new epoch. It made possible in the West the development of a Romano-German civilization; it facilitated the growth of new and distinct states and nationalities; it gave a new impulse to literature. 6

Authors.—I. Republican Period: Ancient Sources.—The writing of history, like other branches of literature, was a late growth amongst the Romans, and it is very difficult to determine how far authentic records were preserved of the earlier republican period. It seems that the calendars issued yearly by the pontifices and posted on the walls of the Regia were inscribed with brief notices of important events ("digna memorata...domi militiaeque terra marique gesta per singulos dies," Serv. Ad Aen. i. 373); these tabulae were preserved and edited in 80 books by P. Mucius Scaevola (pontifex maximus, 130-714 B.C.) under the name of Annales Maximi. The Commentarii preserved in the archives of the various priestly colleges and official boards (e.g. consul and praetors), which appear to have consisted mainly of instructions as to official procedure, doubtless furnished historical material in the shape of precedents and decisions. It is hard to say how much of this documentary evidence survived the burning of Rome by the Gauls; the fact that the earliest solar calendar mentioned in the Annales Maximi was that of the 5th of June, 351 B.C., casts doubt on the completeness of the earlier records.

Many modern scholars have supposed that these meagre official records were supplemented by (a) popular poetry, more or less legendary in content; (b) family chronicles, the substance of which was worked up into the funeral orations (laudationes funebres) pronounced at the grave of distinguished Romans. The existence of the former class of documents is, however, quite unsupported by evidence; as to family tradition, we cannot say more than that it has probably left a deposit in the accounts of republican history handed down to us, and caused the exploits of the members of illustrious houses to be exaggerated in importance.

Setting aside the works of Greek historians who incidentally touched on Roman affairs, such as Hieronymus of Cardia, who wrote of the wars of Pyrrhus as a contemporary, and Timagenes of Tauromenium (c. 345-250 B.C.), who treated of the history of Sicily and the West down to 272 B.C., the earliest writers on Roman history
ROME 659

AUTHORITIES

were Q. Fabius Pictor 1 and L. Cincius Alimentus, who lived during the Second Punic War and wrote in Greek. His work, however, was only of slight historical importance, though it bore more fully of its own times. They were followed in their use of the Greek language by C. Aelius (introduced a Greek embassy to the senate of 113 B.C.); Probus, Holoclesius (c. 133 B.C.), C. Sempronius Tuditanus (consult. 139 B.C.), Cn. Gallius Vennius, C. Fannius (consult. 122 B.C.), and L. Caecilius Antipater. By these writers some attempt was made to adapt the annalistic forms of early Roman history, but they did little more than rationalize the more obviously mythical narratives; they also followed Greek literary models and introduced speeches and, however, e.g. Fannius in his account of the Gracchan movement, their works were of the highest value. About the beginning of this period Polybius (q.v.) had published his history, which originally embraced the period of the Punic wars, and was afterwards continued to 146 B.C. His influence was not fully exerted upon Roman historians until the close of the 2nd and early part of the 1st century B.C., when a school of writers arose who treated history with a pseudo-Greek rhetoric. (The aim of the early historiographers was to point a moral for the edification of their readers. To this school belonged Sempronius Aesclio, Claudius Quadrargarius, Valerius Aquila and C. Linicus. The latter approaches the annalistic, different rhetorical and inaccurate; Livy complains of the gross exaggerations of Valerius (whom he followed blindly in his earlier books), and Macer seems to have drawn much of his material from sources of very doubtful authenticity. Contemporary history was written by Cornelius Sisenna (110-67 B.C.), and the work of Polybius was continued to 86 B.C. by the Stoic Posidonius (c. 135-45 B.C.), a man of encyclopaedic knowledge. From the Gracchan period onwards the speeches and the annals are a consolidation of the statesmen were often published; of these no specimens are extant until we come to the Ciceronian period, when the Speeches and Letters of Cicero (q.v.) and the Commentaries of Julius Caesar (q.v.)—the latter, probably. A.D. 27, were written during the Civil War by other hands—furnish invaluable evidence for the history of their times. We possess examples of historical pamphlets with a strong party colouring in Sallust’s tracts on the Jugurthine, vol. 1 of his Carthilie. During the same period Roman antiquities, genealogy, chronology, &c., were exhaustively treated by M. Terentius Varro (116-27 B.C.) (q.v.) in his Antiquitates (in 41 books) and other works. Cicero’s friend, M. Fl. Pompeius Atticus, also compiled a chronological table which was widely used, and Cornelius Nepos (q.v.) wrote a series of historical biographies which have come down to us. In the Augustan age the materials accumulated by previous generations and the steady growth of literary history of Rome from its foundation to 9 B.C. in 142 books; of these only 35 are preserved in their entirety, while the contents of the rest are known only from fragments (of which a compendia of Florus and later authors. Diodorus Siculus (q.v.) of Agrigent in Sicily followed the earlier annalists in the sections of his Universal History (down to Caesar) which dealt with Roman affairs; Dionysius of Halicarnassus (q.v.) wrote his Roman Archaeology (published in 7 B.C.), treated early Roman history in a more ambitious and rhetorical style, with greater fulness than Livy, whose work he somewhat imitated. Universal histories were also written in the Augustan age by Nicolaus of Damascus, a protégé of Herod the Great, and Trogus Pompeius, whose work is known to us from the epitome of Justin (2nd century A.D.). Iulia, the learned king of Mauretania imprisoned by Domitian wrote a Historia of the Parthian wars, Strabo (q.v.), whose Geography is extant, was the author of a continuation of Polybius’s history (to 27 B.C.). The learning of the time was enshrined in the encyclopedia of Verrius Flaccus, of which fragments have been recovered at the bottom of Festus’s abridgment (2nd century A.D.), together with an Epitome of Festus by Paulus Diaconus (temp. Charlemagne). An official list of the consuls and other chief magistrates of the republic was inscribed on the walls of the Regia (in the 1st century B.C.) by order of Lucullus (q.v.). From phates; the former of these is known as the Fasti Capitolini (C.I.L., 1 sq.), since the fragments which have been recovered are inscribed on the walls of several of the temples of the gods. The Forum of Augustus (see ROME, section Archaeology) was decorated with statues of famous Romans, on the bases of which were inscribed short accounts of their exploits; some of these elegia are preserved (see CIL., iv, fol. 56 sq.). Amongst writers of the imperial period who dealt with republican

For these writers see further under ANNALISTS and LIVY.

2 Caecilius’s work dealt only with the Second Punic War.
to important posts, wrote on Rome's policy and wars in the East. Apart from history, Cicero wrote the works on the early empires, in the closing books of his work, which have not been preserved. Dio Cassius, a Bithynian who attained to the dignity of a second consulship as the colleague of L. Crassus, has never been mentioned in the history of Elagabalus in 80 books. We possess only epitomes and excerpts of the portion dealing with events from A.D. 46 onwards, except for parts of the 78th and 79th books, in which Dio's narrative of contemporary events is especially vivid. Herodian, a Syrian employed in the imperial service, wrote a history of the emperors from Commodus to Gordian III., which as the work of a contemporary is not without value, although the author had no historical insight into the Manichean heresies. Dio has not preserved his account of the emperors from Nerva to Elagabalus which, like those of Suetonius, contained much worthless gossip. His work was amongst the sources used in the compilation of the Historia Augusta. (see further above). It is the most direct evidence to rely on for the history of the 3rd century. This work consists in a series of lives of the emperors (including most of the pretenders to that title), from Hadrian to Carinus, professedly written by six authors, Spartianus, Vulcacius Gallicanus, Capitolinus, Lampridius, Trebellius Pollio, and Vopiscus, under Diocletian and Constantine. Modern criticism has shown that it at least in its present form) it is a compilation made towards the close of the 4th century; it is certain that any of the above-named writers really existed, and the documents inserted in the text are palpable forgeries. The earlier biographies, however, contain much authentic information, which serves as a useful supplement to Dio's work. Fragments from the work of Diodorus Scevola, parts of the works of Dio Cassius, and fragments of Dexippus, an Athenian who successfully defended his native town against the Goths, throw much light on the barbian invasion of the 5th century. The Roman historiography, and especially the works of Cassiodorus, Jordanes, Priscianus, and Palladius, and the fragments of Procopius, Praxagoras, and Procopius the Ecclesiastique, may be relied on for the history of the 5th century. The work of Procopius is also preserved. The history of the final struggle between church and empire is told from the fall of Theodosius I. to the Restoration of Christian Rights. The work of Cassiodorus, surely a work of the 5th century (2nd volume of his Historia Ecclesiastica contains information); the history of the 5th century is compiled by Mommsen, which has never been superseded as a history of the entire imperial period, and has been rendered adequate for the purposes of the modern reader by Professor J. B. Bury's edition (1897-1900). The history of the writings of the 5th century by the last of the ancient authors, Theodosius II., has been translated by Mommsen's fifth volume (Eng. tr., as Provinces of the Roman Empire, 1886) is not a narrative, but an account of Roman culture in the various provinces. C. Merivale's History of the Romans under the Empire (8 vols., 1864-69, 2nd, 1880-99) is the most useful handbook for the history of the 5th century. For further information on the individual emperors, see the reference works above.

A general history of Rome to the barbarian invasions, popular in character and richly illustrated, was written in French by Victor Duruy (Eng. tr. in 6 vols., 1885-96). The 2nd, 3rd and 4th books of Leopold von Ranke's Weltgeschichte deal with Roman history. An outline of Roman history is given by B. Niese in the 3rd vol. of Müller's Handbuch der klassischen Altertumswissenschaft (3rd ed., 1905). J. R. Green's Roman Empire (1889) is a useful handbook for Roman institutions. The principal authorities on Roman chronology are: Ideler, Handbuch der mathematischen und technischen Chronologie (1877-79); Fyne-Clinn, Fasti Romani (1854) (a continuation of the same author's Fasti Hellenici, 1839-41, which goes down to A.D. 14); Fischer, Römische Zeittafeln (1840); Mommsen, Römische Chronologie (2nd ed., 1890); Mattia, Römische Chronologie (1890); and Römische Zeitrechnung (1890); Soltau, Römische Chronologie (1898); Unger, "Römische Zeitrechnung" in the 1st vol. of Müller's Handbuch der klassischen Altertumswissenschaft (2nd ed., 1892). Goyau's Chronologie de l'empire romain (Paris, 1891) is a useful handbook for the works of Procopius and Palladius, and with their work the students of the Eastern Churches could supplement the information. Cassiodorus, the minister of Theodoric, wrote a history of the Goths, transmitted to us in the Historia Gotica (2 vols., A.D. 590), which gives an account of the earlier barbarian invasions.

Several chronological works were compiled in the 4th and 5th centuries. It will suffice to name the Chronology of Eusebius (A.D. 324) compiled by Jerome, and Jerome compiled the Chronicle of Prosper Tiro, based on Jerome and compiled in A.D. 455; the Chronography of A.D. 534; an illustrated calendar containing miscellaneous information; the works based on the so-called Illuminated Codex (ed. by L. H. de Ricci, preserved). For the history of the 5th century, the work of Cassiodorus, surely a work of the 5th century (2nd volume of his Historia Ecclesiastica contains information). Cassiodorus, the minister of Theodoric, wrote a history of the Goths, transmitted to us in the Historia Gotica (2 vols., A.D. 590), which gives an account of the earlier barbarian invasions.

ancient aristocracy of Rome, gave it a special character and left it at the mercy of the people. Then the popes, by the bestowal of lucrative offices, rich benefices and vast estates, and, above all, by raising many nobles to the purple, introduced new blood into the Roman aristocracy, and endured it with increasing strength and vitality. Always divided, always turbulent, this irrepressible body was a continual source of discord and civil war, of permanent confusion and turmoil. Amidst all these difficulties the commune struggled on, but never succeeded in preserving a regular course or administration for long. What with continual warfare, attacks on the Capitol and consequent slaughter, pillage and incendiarism, it is no wonder that so few original documents are left to illustrate the history of the Roman Republic. Nor have chroniclers and historians done much to supply this want, since, in treating of Roman affairs, a long interlude intervenes. Of those we need most four most important—those of the Goths, Byzantines (who, however, were not mere barbarians but civilized and corrupt), Lombards and Franks. The Gothic rule merely superimposed upon the Roman social order a Teutonic stratum, that never penetrated beneath its surface. The Goths always remained a conquering army; according to the German custom, they took possession of one-third of the vanquished territory, but, while forbidding the Romans to bear arms, left their local administration intact. The senate, the curiae, the principal magistrates, both provincial and municipal, the prefect of the city, and the Roman judges enforcing the enactments of the Roman law, were all preserved. Already, under the empire, the civil power had been separated from the military, and this separation was maintained. Hence there was no visible change in the constitution of the state. Only, now there were conquerors and conquerors. All real and effective power was on the side of brute force, and the Goths alone bore arms. In every province they had their comites, or heads of the army, who had judicial power over their countrymen, especially in criminal cases. Here, then, was a combination of civil and military jurisdiction altogether contrary to Roman ideas. Nor can it be denied that the comites, as chiefs of the army, their allegiance merely devolved to the direct and the emperor. Nevertheless, we will attempt to connect in due order all the facts gleaned from former writers and published records.

The removal of the seat of the empire to Constantinople effected a radical change in the political situation of Rome; nor was this change neutralized by the formation of the weak Western empire soon to be shattered by the Germanic invasions. But we still find Roman laws and institutions; and no sign is yet manifest of the rise of a medieval municipality. The earliest germ of this new type of municipality is seen during the barbarian invasions. Of these we need only enumerate the four most important—those of the Goths, Byzantines (who, however, were not mere barbarians but civilized and corrupt), Lombards and Franks. The Gothic rule merely superimposed upon the Roman social order a Teutonic stratum, that never penetrated beneath its surface. The Goths. German custom, they took possession of one-third of the vanquished territory, but, while forbidding the Romans to bear arms, left their local administration intact. The senate, the curiae, the principal magistrates, both provincial and municipal, the prefect of the city, and the Roman judges enforcing the enactments of the Roman law, were all preserved. Already, under the empire, the civil power had been separated from the military, and this separation was maintained. Hence there was no visible change in the constitution of the state. Here, then, was a combination of civil and military jurisdiction altogether contrary to Roman ideas. Nor can it be denied that the comites, as chiefs of the army, their allegiance merely devolved to the direct and the emperor. Nevertheless, we will attempt to connect in due order all the facts gleaned from former writers and published records.

The Lombards. All Roman institutions were altered and decayed; but their original features were still to be traced, and no heterogeneous element had been introduced into them. The first dawn of a completely new epoch can only be dated from the invasion of the Lombards (568–72). Their conquest of a large portion of Italy was accompanied by the harshest oppression. They abolished all ancient laws and institutions, and not only seized a third of the land, but reduced the inhabitants almost to slavery. But, in the unsubdivided parts of the country—namely, in Ravenna, Rome and the maritime cities—a very different state of things prevailed. The necessity for self-defence and the distance of the junction now too wore it out to render any great organized army possible. It added the functions of a curia or municipal council to those of a governmental assembly, and took part in the election of the pope—already one of the chief affairs of Rome. So many senators, however, were slaughtered during the Byzantine War that it was commonly believed to be extinct. The pragmatic sanction, conferring on senate and pope the superintendence of weights and measures in Italy, might seem a convincing proof to the contrary, although, in the general chaos, now that Rome was a mere provincial city, constantly exposed to attack, we may imagine to what the senate was reduced.

The Byzantine rule. The wars of Belisarius and Narses against the Goths lasted twenty years (535–55 A.D.), caused terrible slaughter and devastation in Italy, and finally subjected her to Constantinople. In place of a Gothic king she was now ruled by a Greek patrician, afterwards entitled the exarch, who had his seat of government at Ravenna as lieutenant of the empire. In the chief provincial cities the ruling counts were replaced by dukes, subjected to the exarch; and the smaller towns were governed by military tribunes. Instead of dukes, we sometimes find magistri militum, apparently of higher rank. The profectus praetoria of Italy, likewise a dependent of the exarch, was at the head of the civil administration. The pragmatic sanction (554), promulgating the Justinian code, again separated the civil from the military power, which was no longer allowed to intervene in the settlement of private disputes, and, by conferring on the bishops the superintendence of and authority over the provincial and municipal government, soon led to the increase of the power of the church, which had already considerable influence.

The new organization outwardly resembled that of the Goths: one army had been replaced by another, the counts by dukes; there was an exarch instead of a king; the civil and military term was not, like that of the Goths, a conquering nation in arms; it was a Graeco-Roman army, and did not hold a third of the territory which was now probably added to the possessions of the state (fisc). The soldiery took its pay from Constantinople, whence all instructions and appointments of superior officers likewise proceeded. In Rome we find a magister militum at the head of the troops. The Roman senate still existed, but was reduced to a shadow. Theodoric had left it intact until he suspected it of hostile designs and dealings with the Byzantines, but then began to persecute it, as was proved by the wretched fate of Symmachus. Nevertheless the emperor had added the functions of a curia or municipal council to those of a governmental assembly, and took part in the election of the pope—already one of the chief affairs of Rome. So many senators, however, were slaughtered during the Byzantine War that it was commonly believed to be extinct. The pragmatic sanction, conferring on senate and pope the superintendence of weights and measures in Italy, might seem a convincing proof to the contrary, although, in the general chaos, now that Rome was a mere provincial city, constantly exposed to attack, we may imagine to what the senate was reduced.

This is the moment in which ancient society seems to disappear completely and a new one begins to rise. Ancient customs disappear, Christian processions take the place of the ancient games, ancient temples are transformed into churches and dedicated to new saints. If Roman tradition in Italy can ever be said to have been completely broken, this could only be during the Longobard domination. It is certain, however, that soon the elements of ancient culture began to revitalize once more.

A special state of things now arose in Rome. We behold the rapid growth of the papal power and the continual increase of its moral and political influence. This had already begun under Leo I., and been further promoted by the pragmatic sanction. Not only the superintendence but often the nomination of public functionaries and judges was now in the hands of the popes. And the accession to St Peter’s chair of a man of real genius in the person of Gregory I. surnamed the Great, marked the beginning of a new era. By force of individual character, as well as by historic
necessity, this pope became the most potent personage in Rome. Power fell naturally into his hands; he was the true representative of the city, the born defender of church and state. His ecclesiastical authority, already great throughout Italy, was specially great in the Roman diocese and in southern Italy. The continual offerings of the faithful had previously endowed the church with enormous possessions in the province of Rome, in Sicily, Sardinia and other parts. The administration of all this property soon assumed the shape of a small government council in Rome. In the middle ages the owner of the land was also master of the men who cultivated it, and exercised political authority as well; these administrators therefore protected and succoured the oppressed, settled disputes, nominated judges and controlled the ecclesiastical authorities. The use made by the pope of his revenues greatly contributed to the empire, lest they should prove to face the Lombard the city was besieged by the Lombards, and the emperor left his army unpaid, Gregory supplied the required funds and thus made resistance possible. And, when the defence could be no longer maintained, he alone, by the weight of his personal influence and the payment of large sums, induced the Lombards to raise the siege. He negotiated in person with Agilulf, and was recognized by him as the true representative of the city. Thus Rome, after being five times taken and sacked by the barbarians, was, on this occasion, saved by its bishop. The exarch, although unable to give any help, protested against the assumption of so much authority by the pope; but Gregory was an usurper; his attitude was the natural result of events. "For twenty-seven years"—so wrote this pontiff to the imperial government of Constantinople—"we lived in terror of the Longobards, nor can I say what sums we had to pay them. There is an imperial treasurer with the army at Ravenna; but here it is I who am treasurer. Likewise I have to provide for the clergy, the poor and the people, and even to succour the distress of other churches."

It was at this moment that the new Roman commune began to take shape and acquire increasing vigour owing to its distance from the seat of the empire and its resistance to the Lombard besiegers. Its special character was now to be traced in the preponderance of the military over the civil. 'A Roman element had penetrated into the army, which was already possessed of considerable political importance. The prefect of Rome loses authority and seems almost a nullity compared with the magister militum. Hardly anything is heard of the senate. "Quia enim Senatus deest, populus interit," exclaims Gregory in a moment of despair. The popes now make common cause with the people against the Lombards on the one hand and the emperor on the other. But they avoid an absolute rupture with the latter, and hope to use his support to achieve the military power without any prospect of help. Later, when the growing strength of the commune becomes menacing, they remain faithful to the empire in order not to be at the mercy of the people. It was a permanent feature of their policy never to allow the complete independence of the city until they should be its sole and absolute masters. But that time was still in the future. Meanwhile pope and people joined in the defence of their common interests. This alliance was cemented by the religious disputes of the East and the West. First came the Monothelite controversy regarding the twofold nature of Christ. Later a long and violent struggle ensued, in which the people of Rome and of other Italian cities sided so vigorously with the popes that John VI. (701-5) had to interpose in order to release the exarch from captivity and prevent a definitive rupture with the empire. Then (710-11) Ravenna revolted against the emperor, organized its armed population under twelve flags, and almost all the cities of the exarchate joined in a resistance that was the first step towards the independence of the Italian communes. A still fiercer religious quarrel then broke out concerning images. Pope Gregory II. (715-31) opposed the celebrated edict of the iconoclastic emperor Leo the Isaurian. Venice and the Pentapolis took up arms in favour of the pope, and elected dukes of their own without applying to the emperor. Again public disorder rose to such a pitch that the pope was obliged to check it lest it should spread.

In the midst of these warlike tumults a new constitution, almost a new state, was being set up in Rome. During the conflict with Philippicus, the Monothelite and heretical emperor who ascended the throne in 711, the Liber Pontificalis calls the first mention of the duchy of Rome (ducatus Romanae urbis), and we find the people struggling to elect a duke of their own. In the early days of the Byzantine rule the territory appertaining to the city was no greater than under the Roman Empire. But, partly through the weakness of the government of Constantine, partly to keep all through the composition of the Italian people, and in the absence of the pope, who could not exercise royal authority for the first 150 years, was its boundary line.

The constitution of the city now begins to show the results of the conditions amid which it took shape. The separation of the civil from the military power has entirely disappeared. This is proved by the fact that, after the year 600, there is no further mention of the prefect. His office still survived, but with a gradual change of functions, until, in the 8th century, he once more appears as president of a criminal tribunal. The constitution of the duchy and of the new republic formed during the wars with the Lombards and the exarch was substantially of an aristocratico-military nature. At its head was the duke, first appointed by the emperor, then by the pope and the people, and, as his strength and influence grew with those of the commune, he gradually became the most respected and powerful personage in Rome. The duke inhabited the palace of the Caesars on the Palatine Hill, and had both the civil and the military power in his hands; he was at the head of the army, which, being composed of the best citizens and highest nobility of Rome, was a truly national force. This army was styled the felicissimus or florens exercitus Romanus or also the militia Romana. Its members never lost their citizen stamp; on the contrary they formed the true body of the citizens. We find mention of other the Lombards, but these were probably other leaders or superior officers of the army. Counts and tribunes are found in the subject cities bound to furnish aid to the capital. In fact during the pontificate of Sergius II. (844), when the duchy was threatened by a Saracen invasion, they were requested to send troops to defend the coast, and as many soldiers as possible to the city.

At that time the inhabitants of Rome were divided into four principal classes—clergy, nobles, soldiers and simple citizens. The nobles were divided into two categories, first the genuine optimates, i.e. members of old and wealthy families with large estates, and filling high, and often hereditary, offices in the state, the church and the army. These were styled proceres and primates. The second category comprised landed proprietors, of moderate means but exalted position, mentioned as nobles by Gregory I., and constituting in fact a numerous petty nobility and the bulk of the army. Next followed the citizens, i.e. the commercial class, merchants and craftsmen, who, having as yet no fixed organization and but little influence, were simply designated as honesti civies. These, however, were quite distinct from the piebians, plebs, vulgus populi, viri humiles, who in their turn ranked above bondsmen and slaves. The honesti civies did not
usually form part of the army, and were only enrolled in it in seasons of emergency. Nevertheless the army was not only national, but became increasingly democratic, so that in the 10th century it included every class of inhabitants except churchmen and slaves. At that period we sometimes find the whole people designated as the exercitus, those actually under arms being distinguished as the militia exercitus Roman. This again was divided into bands or “numbers,” i.e. regiments, and also, in a manner peculiar to Rome, into scholae militum. These scholae were associations derived from antiquity, gaining strength and becoming more general in the middle ages as the central power of the state declined. They were called the schola of notaries, of church singers, and of nearly every leading employment; there were scholae of foreigners of diverse nationalities, of Franks, Lombards, Greeks, Saxons, &c. Even the trades and crafts began to form scholae. These were at first very feeble institutions, and only later gained importance and became guilds. As early as the 8th century there were scholae militum in the army, which was thus doubly divided. But we have no precise definition of their functions. They were de facto corporations with separate property, churches and magistrates of their own. The latter were always optime, and guarded the interests of the army. But the real chiefs of the bands or regi, were the military chiefs, or the “magistri militum.” The Franks the latter became comites. These chiefs were styled magnifici consules, optime de militia, often too judices de militia, since, as was the custom of the middle ages, they wielded political and judicial as well as military authority. The title of consul was now generally given to superior officers, whether civil or military. The importance of the schola militia began to decline in the 10th century; towards the middle of the 12th they disappeared altogether, and, according to Felix Papencordt, were last mentioned in 1145. It is probable that the schola militia signified local divisions of the army, corresponding with the city wards, which were twelve in number during the 10th and 11th centuries, then increased to thirteen, and occasionally to fourteen. It is certain that from the beginning the army was distributed under twelve flags; after the schola had disappeared, we find it classified in districts, which were subdivided into companies. The division of cities into quarters, sestieri or rioni, corresponding with that of the army, and also with that of the municipal government, was the common practice of Florence, Siena and almost all the Italian communes. But, while usually losing importance as the gilds acquired power, in Rome the insignificance of the gilds added to the strength of the regioni or rioni, which not only became part of the army but finally grasped the reins of government. This was a peculiarity of the political constitution of the Roman communes.

We now come to a question of weightier import for all desiring to form a clear idea of the Roman government at that period. What had become of the senate? It had undoubtedly lost its original character now that the empire was extinct. But, after much learned discussion, historical authorities are still divided upon the subject. Certain Italian writers of the 18th century—Vendettini, for example—asserted with scanty critical insight that the Roman senate did not disappear in the middle ages. The same opinion backed by much biased research was maintained by the great German historian Savigny. And Leo, while denying the persistence of the curia in Lombard Italy, adhered to Savigny’s views as regarded Rome. Papencordt did the same, but held the Roman senate to be no more than a curia. This judgment was vigorously contested, first by Hegel and Giesebrecht, then by Gregorovius. These writers believe that after the middle of the 6th century the senate had a merely nominal existence. According to Gregorovius its last appearance was in the year 579. After that date it is mentioned in no documents, and the chroniclers are either equally silent or merely allude to its decay and extinction. In the 8th century, however, the terms senator, senatores, senatus again reappear. We find letters addressed to Pippin, beginning thus: Omnibus senatus atque universi populi generalissimis. When Leo III. returned from Germany he was met by tom proceres clericorum cum omnibus clericis, quamque optime et senatus, cumque militia (see Anastasius, in Muratori, vol. iii. 189). But it has been noted that the senate was never found to act as a political assembly; on occasions when it might have been mentioned in that capacity we hear nothing of it, and only meet with it in ceremonials and purely formal functions. Hence the conclusion that the term senator was used in the sense of noble, senatus of nobility, and no longer referred to an institution but only to a class of the citizens. Even when we find that the emperor Otto III. (who sought to revive all the ancient institutions of government) addressed an edict to the “consuls and senate of Rome,” and read that the laws of St Stephen were issued senatus decreto, the learned Giesebrecht merely remarks that no important changes in the Roman constitution are to be attributed to the consuls and senate introduced by Otto III. Thus for the next glimpse of the senate we must pass to the 12th century, when it was not only reformed, as some writers believe, but entirely reconstituted.

But in this case a serious difficulty remains to be disposed of. Gregorovius firmly asserts that the nobles acquired great power between the 7th and 10th centuries, not only filling the highest military, judicial and ecclesiastical offices, but also directing the municipal government, presumably with the prefect at their head.” He further adds: “Notwithstanding the disappearance of the senate, it is difficult to suppose that the city was without governing magistrates, or without a council.” Thus, after the 7th century, the optime at the head of the army were also at the head of the citizens, and “formed a communal council in the same manner in which it was afterwards formed by the banderest.” 1 Now, if the nobles were called senatores and the nobility senatus, and if this body of nobles met in council to administer the affairs of the republic, there is no matter for dispute, inasmuch as all are agreed that the original senate must have had a different character from the senate of the middle ages. And, since the absence of all mention of a prefect after the 7th century is not accepted as a proof of his non-existence, and we find him reappear under another form in the 8th century, so the silence as to the senate after the year 579, the fresh mention of it in the 8th century, and its reappearance in the 12th as a firmly reconstituted body reasonably lead to the inference that, during that time, the ancient senate had been gradually transformed into the new council. Its meetings must have been held very irregularly, and probably only in emergencies when important affairs had to be discussed, previously to bringing them before the parliament. General assemblies of the people should be better agreed as to the significance of the term consul.

The consul. The consul was a precise title of honour bestowed on superior magistrates, and retained that meaning from the 7th to the 11th century, but then became—as in other Italian cities—a special title of the chief officers of the state.

During this period the Roman constitution was very simple. The duke, commanding the army, and the prefect, presiding over the criminal court, were the chiefs of the republic; the armed nobility constituted the forces, filled all of superior offices, and occasionally met in a council called the senate; although it had, as we have said, no resemblance to the senate of older times. In moments of emergency a general parliament of the people was convoked. This constitution differed little from that of the other Italian communes, where, in the same way, we find all the leading citizens under arms, a parliament, a council, and one or more chiefs at the head of the government.

But Rome had an element that was lacking elsewhere. We have already noted that, in the provinces, the administrators of church lands were important personages, and exercised during the middle ages, when there was no exact division of power, both judicial and political functions. It was very natural that the heads of this vast administration resident in Rome should have a still higher standing, and in fact, from the

---

6th century, their power increased to such an extent that in the
times of the Franks they already formed a species of papal
administration with a share and sometimes a predominance in
the affairs of the republic. There were seven principal
administrators, but two of them held the chief power—
the primicerius notariorum and the secundicerius, i.e. the first
and under secretaries of state. When, on the constitution of
the new empire, these ministers were declared to be palatine
or imperial as well as papal officials, the primicerius and the
secundicerius were also in waiting on the emperors, who sat
in council with them when in Rome. Next came the aedilur, or
treasurer; the suellarius, or cashier; the protoscrinarius,
who was at the head of the papal chancery; the primus di Romo,
who was the advocate of the emperor and administered its
possessions. Seventh and last came the nomenclator, or
administrator, who pleaded the cause of widows, orphans and
paupers. There were also some other officials, such as the
restiarius, the vicedominus or steward, the cubicularius or
major-domo, but these were of inferior importance. They were
ecclesiastics, but not bound to be in priest's orders. The first
seven were those specially known as procurae clericorum and
often still as judices de clero, since they speedily assumed
judicial functions and ranked among the chief judges of Rome.
But as ecclesiastics they did not give decisions in criminal
cases. Thus Rome had two tribunals, that of the judices de clero, or ordinarii, presided over by the pope, and that of the
judices de militia, leaders of the army, dukes and tribunes, also
bearing the generic title of consuls. First appointed by the
exarch and then frequently by the pope, these decided both civil
and criminal cases. In the latter they were sole judges under
the presidency of the prefect.
The pope was thus at the head of a large administrative
body with judicial and civil powers that were continually on
the increase, and, in addition to his moral authority
over Christendom, was possessed of enormous revenues.
So the power of the church, and of the latter in
particular, was a representative of the Roman Republic. Gregory II.
(715-31) accepted in the name of the republic the sub-
mission of other cities, and protested against the conquest
by the Lombards of those already belonging to Rome. He
seemed indeed to regard the territory of the duchy as the patri-
mony of the church. The duke was always at the head of
the army, and, officially, was always held to be an imperial
magistrate. But the empire was now powerless in Italy.
Meanwhile the advance of the Lombards was becoming more
and more threatening; they seized Ravenna in 751, thus putting
an end to the exarchate, and next marched towards Rome,
which had only its own forces and the aid of neighbouring
cities to rely upon. To avoid being crushed by the brute
force of a foreign nation unfit to rule, and only capable of
oppression and pillage, it was necessary to make an energetic
stand.
Accordingly, the reigning pope, Stephen II. (752-57), ap-
pealed to Pippin, king of the Franks, and concluded with that
monarch an alliance destined to inaugurate a new
epoch of the world's history. The pope consecrated
Pippin king of the Franks, and named him patricius Romanorum.
This title, introduced by Constantine, had no longer the ancient meaning, but now became as
sign of lofty social rank. When, however, it was afterwards conferred
on barbarian chieftains such as Odacer and Theodoric, and then
on the representative of the Byzantine empire in Italy, it ac-
tained the meaning of a definite dignity or office. In fact, the
title was now given to Pippin as defender of the church, for
the pope styled him at the same time patricius Romanorum
and defender or protector ecclesiae. And the king pledged
himself not only to defend the church but also to wrest
the exarchate and the Pentapolis from the Lombards and
give them to Rome, or rather to the pope, which came to
the same thing. This was considered and accepted as a restitution made
to the head of the church, who was also the representative of
the republic and the empire. And, to preserve the character
of a restitution, the famous "donation of Constantine" was
invented during this period (752-77). Pippin brought his
army to the rescue (754-55) and fulfilled his promise.
The pope accepted the donation in the name of St
Peter, and as the visible head of the church. Thus
in 755 central Italy broke its connexion with the empire and
became independent; thus was inaugurated the temporal
power of the papacy, the cause of so much subsequent warfare and
revolution in Rome.
Its first consequences were speedily seen. In 757 the death
of Paul I. was followed by a fierce revolt of the nobles under
Duke Toto (Theodoro) of Nasso, who by violence of
words caused the death of Constantine to the chair of St Peter, while
Constantine was a layman and had first to be ordained.
For more than a year the new pontiff was a pliable tool in the hands
of Toto and of the nobles. But the genuine papal faction,
headed by a few judices de clero, asked the aid of the Lombards
and made a formidable resistance. Their adversaries were
defeated, tortured and put to death. Toto was treacherously
slain during a fight. The pope was blinded and left half dead
on the highway. Fresh and no less violent riots ensued, owing
to the public dread lest the new pope, Stephen III. (768-72),
elected by favour of the Lombards, should give them the city
of Rome. But Stephen III. had already been
previously deserted, and his successor, Adrian I. (772-95),
likewise adhered to their cause, called the city to arms to resist
King Desiderius and his Lombard hordes, and besought the
assistance of Charlemagne. This monarch accordingly made
a descent into Italy in 773, and not only gained an
easy victory over Desiderius, but destroyed the Lombard
kingdom and seized the iron crown. Entering
Rome for the first time in 774, he confirmed and augmented
the donation of Pippin by the addition of the dukedom of
Spoleto. He returned several times to Italy and Rome, making
new conquests and fresh concessions to Adrian I., until the
defense of the church of Rome was assured.
The position of Rome and of the pope is now substantially
changed. Duke, prefect, militia and the people exist as
heretofore, but are all subordinate to the head of the
church, who, by the donations of Pippin and
Charlemagne, has been converted into a powerful
temporal sovereign. Henceforth all connexion with
Byzantium is broken off, but Rome is still the
mspring of the empire, the Roman duchy its sole sur-
viving fragment in Italy, and the pope stands before the
world as representative of both. And, although it is difficult
to determine how this came about, the pope is now regarded
and regards himself as master of Rome. In the year 772 he
enters the restiarius with judicial powers over the laity,
ecclesiastics, freemen and slaves nostri Romani reipublicae.
He writes to Charlemagne that he has issued orders for the
burning of the Greek ships employed in the slave trade,
"in our city of Civita Vecchia " (Centumcellae), and he always
speaks of Rome and the Romans as " our city," " our republic,"
" our people." The donations of Pippin and Charlemagne are
restitutions made to St Peter, the holy church and the
republic at the same time. It is true that Charlemagne held
the supreme power, but he had an immensely increased authority
and actively fulfilled his duties as patricius. But his power was
only occasionally exercised in Rome; it was the result of
services rendered to the church, and of the church's continual
need of his help; it was, as it were, the power of a mighty and
indispensable ally. The pope, however, was most tenacious
of his own authority in Rome, made vigorous protest whenever
rebels fled to Charlemagne or appealed to that monarch's
arbitration, and contested the supremacy of the imperial
officials in Rome. Yet the pope was no absolute sovereign,
nor, in the modern sense of the term, did any then exist. He
asserted supremacy over many lands which continually rebelled
against him and which, for want of an army of his own, he
was unable to reduce to obedience without others' help. Neither
did the republic acknowledge him as its head. It profited by
the growing power of the pope, could not exist without him, respected his moral authority, but considered that he usurped undue power in Rome. This was specially the feeling of the nobles, who had hitherto held the chief authority in the republic, and who desired the temporal monarchs to remain subject to them, and yet to be powerful enough to maintain their own dignity. The Roman nobles were very different from other aristocratic bodies elsewhere. They were not as they pretended, descendants of the Camilli and the Scipios, but neither were they a feudal aristocracy, inasmuch as the Teutonic element had as yet made small way among them. They were a mixture of different elements, national and foreign, formed by the special conditions of Rome. Their power was chiefly derived from the high offices and large grants of money and land conferred on them by the popes; but, as no dynasty existed, they could not be dynastic. Every pope aggrandized his own kindred and friends, and these were the natural and often open adversaries of the next pontiff and his favourites. Thus the Roman nobility was powerful, divided, restless and turbulent; it was continually plotting against the pope, threatening not only his power, but even his life; it continually appealed to the people for assistance, stirred the militia to revolt and rendered government an impossibility. Hence, notwithstanding his immense moral authority, the pope was the effective head neither of the aristocracy, the army nor of the as yet unorganized lower classes. The lord of vast but often insubordinate territories, the recognized master of a capital city torn by intercurrent feudal and plots against himself, he needed the support of an effective force for his own preservation and the maintenance of the authority promised him from all quarters. Hence the necessity of creating an empire of the West, after having snapped every link with that of the East. Thus the history of Rome is still, as in the past, a history of continual strife between pope, emperor and republic; and the city, while imbibing strength from all three, keeps them in perpetual tumult and confusion.

Leo III. (796-816) further strengthened the ties between Charlemagne and the church by sending the former a letter with the keys of the shrine of St Peter and the banner of Rome. Charlemagne had already joined to his office of patrician the function of high justice. The new symbols now sent constituted him miles of Rome and general of the church. The pope urged him to despatch an envoy to receive the oath of fealty, thus placing himself, the representative of the republic, in the subordinate position of one of the bishops who had received the immunities of counts. And all these arrangements took place without the slightest reference to the senate, the army or the people. Much resentment was felt, especially by the nobles, and a revolution ensued headed by the primicerius Paschalus and the secundarius Campulus, and backed by all who wished to liberate the city from the papal rule. During a solemn procession the pope was attacked and barbarously maltreated by his assailants, who tried to tear out his eyes and tongue (799). He was thrown into prison, escaped and overtook Charlemagne at Paderborn, and returned guarded by ten of the monarch's envoys, who condemned to death the leaders of the revolt, reserving, however, to their sovereign the right of final judgment. Charlemagne arrived in December 800, and as high justice assembled a tribunal of the clergy, nobles, citizens and Franks; he pronounced Leo to be innocent, and confirmed the capital sentence passed on the rebels. But through the intercession of the pope, who dreaded the wrath of the nobles, this was presently commuted into an perpetual exile. And finally on Christmas day, in St Peter's, for the first and sole time of Roman and Frankish lords, the clergy and the people, the pontiff placed the imperial crown on Charlemagne's head and all proclaimed him emperor.

Thus the new emperor was elected by the Romans and consecrated by the pope. But he was their real master and supreme judge. The pope existed only by his will, since he alone supplied the means for the maintenance of the temporal power, and already pretended to the right of controlling the papal elections. Yet Charlemagne was not sovereign of Rome; he possessed scarcely any regalia there, and was not in command of the army; he mainly represented a principle, but this principle was the law which is the basis of the state. The pope ruled normally on the papal judges, but the emperor or his missi presided over them, together with those of the pope, and his decision was appealed to in last resort. During the Carolingian times no mention is found of the prefect, and it would seem that his office was filled by the imperial missus, or legate, the judices de clero and judices de militia. The power of the pope was now entangled with that of the republic on the one hand and that of the empire on the other. The consequent confusion of sacred and secular functions naturally led to infinite complications and disputes. The death of Charlemagne in 814 was the signal for a fresh conspiracy of the nobles against the pope, who, discovering their design, instantly put the ringleaders to death, and was severely blamed by Louis for this violation of the imperial prerogative. While the matter was under discussion the nobles broke out in fiercer tumults, both in Rome and the Campagna. At last, in 824, the emperor Lothair came to re-establish order in Rome, and proclaimed a new and noteworthy constitution, to which Pope Eugenius II. (824-27) gave his oath of adherence. By this the partnership of pope and emperor in the temporal rule of Rome and the states of the church was again confirmed. The more direct power appertained to the pope; the supreme authority, presidency of the triumvirals, and final jurisdiction of the public emperor. The new constitution also established the right of contending parties to select either the Roman or the Teutonic code for the settlement of their disputes. During the Carolingian period it is not surprising that the commune should have been, as it were, absorbed by the church and the empire. In fact, it is scarcely mentioned in history throughout that time. And when, no longer sustained by the genius of its founder, the Frankish empire began to show signs of dissolution, the popes, finding their power thereby strengthened, began to assume many of the imperial attributes. Soon, however, as a natural consequence of the loss of the main support of the papacy, the nobles regained vigour and were once more masters of the city. Teutonic and feudal elements had now largely penetrated into their organization. The system of granting lands, and even churches and convents, as benefices according to feudal forms, became more and more general. It was vain for the popes to offer opposition, and they ended by yielding to the current. The fall of the Frankish empire left all Italy a prey to anarchy, and torn by the faction fights of Berengar of Friuli and Guido of Spoleto, the rival claimants to the crowns of Italy and the empire. The Saracens were advancing from the south, the Huns from the north; the popes had lost all power; and in the midst of this frightful chaos a way was opened for the rise of the republics. Anarchy was at its climax in Rome, but the laity began to overpower the clergy to such an extent that the judices de militia prevailed over the judices de clero. For a long time no imperial missi or legates had been seen, and the papacy was incredibly lowered. The election of the popes had positively fallen into the hands of certain beautiful women notorious for their evil life and depravity. The aristocracy alone gained strength; now freed from the domination of the emperor, it continually wrested fresh privileges from the impotent pontiffs, and became organized as the ruling force of the republic. Gregorovius, notwithstanding his denial of the continuation of the senate after the 6th century, is obliged to acknowledge that it appeared to have returned to life in the power of this new baronage. And, although this body was now permeated with the feudal principle, it did not discard its ancient traditions. The nobles claimed to be the main source of the empire; they wished to regain the dignity and office of patricius, and to make it, if possible, hereditary in some of their families.

Nothing is known of their system of organization, but it seems
that they elected a chief bearing the title of consil, senator, princeps Romanorum, who was officially recognized by the pope, as a *patriicus* presided over the tribunals, and was the head of the commune.

Theophylact was one of the first to assume this dignity. His wife Theodora, known as the senatrix, was one of the women then dominating Rome by force of their charms and licentiousness. She was supposed to be the concubine of Pope John X. (914–28), whose election was due to her influence. Her daughter Marozia, in all things her worthy rival, was married to Alberic, a foreign mercenary of uncertain birth who rose to a position of great influence, and, although an alien, played a leading part in the affairs of the city. He helped to increase the power of Theophylact, who seemingly shared the rule of the city with the pope. In the bloody war that had to be waged against the Saracens of southern Italy, and at the defeat of the latter with the Gariglione (916), Theophylact and Alberic were the Roman leaders, and distinguished themselves by their valour. They disappeared from the scene after this victory, but Marozia retained her power, and bore a son, Alberic, who was destined to greater deeds. The pope found himself caught in this woman's toils, and struggled to escape, but Marozia, gaining fresh influence by her marriage with Hugo, margrave of Tuscany, imprisoned the pontiff himself in the castle of St Angelo (928). This fortress was the property of Marozia and the basis of her strength. The unfortunate John died within its walls. Raised to the chair by Theodora, he was deposed and killed by his daughter. The authority of the latter reached its culminating point in 931, when she succeeded in placing her son John XI. on the papal throne. On the death of her second husband she espoused Hugh of Provence, the same who in 928 had seized the iron crown at Pavia, and now aspired to the empire. Dissolute, ambitious and despotic, he came to Rome in 932, and, leaving his army outside the walls, entered the castle of St Angelo with his knights, instantly began to play the tyrant, and gave a blow to Alberic his stepson, who detested him as a foreign intruder. This blow proved the cause of a memorable revolution; for Alberic rushed from the castle and harangued the people, crying that the time was come to shake off the tyrannous yoke of a woman and of barbarians who were once the slaves of Rome. Then, putting himself at the head of the populace, he closed the city gates to prevent Hugh's troops from coming to the rescue, and attacked the castle. The king fled; Marozia was imprisoned, Alberic proclaimed lord of the Romans, and the pope confined to the Lateran in the custody of his own brother. Rome was again an independent state, a republic of nobles. Rid of the temporal dominion of emperor and pope, and having expelled the foreigners with great energy and courage, it chose Alberic for its chief and the title of princeps aqve omnium Romanorum senatus.

The tendency of the Roman Republic to elect a supreme authority, first manifested in the case of Theophylact, was repeated in those of Alberic, Brancalone, Crescenzio, Cola di Rienzo and others. One of the many causes of this tendency may be traced to the conception of the new empire of which Rome was the original and enduring fountainhead. As Rome had once transferred the empire from Byzantium to the Franks, so Rome was surely entitled to reclaim it. The imperial authority was represented by the office of patrician, now virtually assumed by Alberic. That he gave the name of Octavian to his son is an additional proof of this fact. In the Eternal City the medieval political idea has always the aspect of a resurrection or transformation of classic antiquity. This is another characteristic of the history of the Roman commune.

Alberic's strength was due to his connexion with the nobility, to his father's valiant service against the Saracens at the battle of Gariglione, and to the militia under his command, on which everything depended amid the internal and external dangers now threatening the new state. As yet no genuine municipal constitution was possible in Rome, where neither the people nor the wealthyburghers engaged in industry and commerce had any fixed organization. All was in the hands of the nobles, and Alberic, as their chief, frequently convened them in council, although obliged to use pressure to keep them united and avoid the divisions to which they were prone. He often had to crush their vices concentrated in his grasp; he was at the head of the tribunals as well as of the army. The *judices de clero* and *judices de militia* still existed, but no longer met in the Lateran or the Vatican, under the presidency of emperor and pope or their missi. Alberic himself was their president; and, a still more significant fact, their sessions were often held in his private dwelling. There is no longer any mention of predect or *patriicus*. The papal coinage was inscribed with Alberic's name instead of the emperor's. His chief attention was given to the militia, which was still arranged in *scholae*, and it is highly probable that he was the author of the new division of the city into twelve *regions*, with a corresponding classification of the army into many regiments under twelve flags and twelve *banderesi*, one for every region. The organization of the *scholae* could not have been very dissimilar, but doubtless Alberic had some important motive for altering the old method of classification. By means of the armed regions he included the people in the forces. It is certain that after his time we find the army much changed and far more democratic. It was only natural that so excellent a statesman should seek the aid of the popular element as a defence against the arrogance of the nobles, and it was requisite to reinforce the army in order to be prepared for the attacks threatened from abroad. This change effected, Alberic felt prepared for the well and began to look to a more moderate and justice. His contemporaries award him high praise, and he seems to have been exempt from the vices of his mother and grandmother.

In 933 Hugh made his first attack upon the city, and was repulsed. A second attempt in 936 proved still more unfortunate, for his army was decimated by a pestilence. Thoroughly disheartened, he not only made peace, but gave his daughter in marriage to Alberic, thus satisfying the latter's desire to ally himself with a royal house. But this union led to no conciliation with Hugh. For Alberic, finding his power increased, marched at the head of his troops to consolidate his rule in the Campagna and the Sabine land. On the death of his brother, Pope John XI., in 936, he controlled the election of several successive popes, called a conspiracy formed against him by the clergy and certain nobles instigated by Hugh, and brilliantly repulsed, in 941, another attack by that potentate. At last, however, this inveterate foe withdrew from Rome, being summoned to the north by the victories of his rival Berengarius. But Alberic, after procuring the election of various popes who were docile instruments of his will, experienced a check when Agapetus II. (946–55), a man of firmness and resource, was raised to the papal throne. The fortunes of Berengarius were now in the ascendant. In 950 he had seized the iron crown, and ruled in the Pentapolis and the exarchate. This being singularly painful to the pope, he proceeded to make alliance with all those enemies of Berengarius preferring a distant emperor to a neighbouring and effective sovereign, with the Roman nobles who were discontented with Alberic, and with all who foresaw danger, even to Rome, from the extended power of Berengarius. And Agapetus recurred to the old papal policy, by making appeal to Otto I., whose rule in Germany was distinguished by a prestige almost comparable with that of Charlemagne.

Otto immediately responded to the appeal and descended into Italy; but his envoys were indignantly repulsed by Alberic, and, being prudent as well as firm, he decided to wait for more opportune moment for the accomplishment of his designs. Meanwhile Alberic died in 954, and the curtain fell on the first great drama of the Roman Republic. He had reigned for twenty-two years with justice, energy and prudence; he had repelled foreign invaders, maintained order and authority. He seems, however, to have realized that the aspect of affairs was about to change, that the work he had accomplished would be exposed to new dangers. These dangers, in fact, had already begun with the accession of an enterprising pope to the Holy
See. The name of Octavian given by Alberic to his son leads to the inference that he meant to make his power hereditary. But, suddenly, he began to educate this son for the priesthood, and, assembling the nobles in St Peter's shortly before his death, he made them swear to elect Octavian as pope on the decease of Agapetus II. They kept their word, for in this way they freed themselves from a ruler. Possibly Alberic trusted that both offices might be united, and that his son would be head of the state as well as the church. But the nobles knew this to be a delusion, especially in the case of a name such as Octavian's. The lad was sixteen years old when his father died; received princely honours until the death of Agapetus, and was then elected pope with the name of John XII. He had inherited the ungoverned passions of his grandmother Marozia and great-grandmother Theodora, but without their intelligence and cunning. His palace was the scene of the most scandalous licence, while his public acts were those of a baby tyrant. He conferred a bishopric on a child of ten, consecrated a deacon in a stable, invoked Venus and Jupiter in his games, and drank to the devil's health. He desired to be both pope and prince, but utterly failed to be either. Before long, realising the impossibility of holding in check Berengarius, who still ruled over the exarchate, he sought in 960 the aid of Otto I, and promised him the imperial crown. Thus the new ruler was summoned by the son of the man by whom he had been repulsed. Otto vowed to defend the church, to restore her territories, to refrain from usurping the power of the pope or the republic, and was crowned on the 2nd of February 962 with unheard-of pomp and display. Accordingly, after being extinct for thirty-seven years, the empire was revived under different but no less difficult conditions. The politico-religious unity founded by Charlemagne had been dissolved, partly on account of the heterogeneous elements of which it was composed and partly because other nations were in course of formation. Now too the feudal system was converting the officers of the empire into independent princes, and the new spirit of communal liberty was giving freedom to the cities. Otto once more united the empire and the church, Italy and Germany, in order to combat these new foes. But the difficulties of the enterprise at once came to light. John XII., finding a master in the protector he had invoked, now joined the discontented nobles who were conspiring with Berengarius against the emperor. But the latter hastened to Rome in November 963, assembled the clergy, nobles and heads of the people and made the oath of oath a stronger spring to keep the lower orders in subjection, and by their junction with the malcontent nobles they formed a very respectable force. On the 3rd of January 964 they sounded the battle-pee, and attacked the Vatican, where the emperor was lodged. The German knights repulsed them with much slaughter; and this bloodshed proved the beginning of an endless feud. Otto departed in February, and John XII., as the chosen pope of the Romans, returned with an army of followers and compelled the defenceless Leo VIII. to seek safety in flight. Soon afterwards Leo was deposed and excommunicated by a new synod, and many of his adherents were cruelly murdered. But on the 14th of May of the same year Rome, amid violent struggles and tumults, resumed their rights, elected Benedict V., and procured his consecration in spite of the emperor's veto. Otto now appeared at the head of an army, committed fresh slaughter, besieged the city, reduced it by famine, and, after holding a council which deposed Benedict and sent him a prisoner to Hamburg, restored Leo VIII. to the papal throne.

But, although the emperor thus disposed of the papacy at his will, his arbitrary exercise of power roused a long and obstinate resistance, which had no slight effect upon the history of the commune. Leo VIII. died in 965, and the imperial party elected John XIII. (965-72). Upon this the nobles of the national party joined the people and there was a general revolt. The nobles were led by Pietro, prefect of Rome. As we have noted, this office seemed to be extinct during the Carolingian rule, but we again meet with it in 955, after an interval of a century and a half. The leaders of the people were twelve decarconi, a term of unknown derivation, but probably indicating chiefs of the twelve regions (dodocarchi, dodocarconi, decarconi). The new pope was seized and confined, first in the castle of St Angelo, then in a fortress in the Campagna. But the emperor quickly marched an army against Rome, and this sufficed to produce a reaction which recalled the pope (November 966), sent the prefect into exile, and put several of the rebelled nobles to death. And shortly after the emperor sacked the city. Many Romans were exiled, some tortured, others, including the twelve decarconi, killed. John XIII. died in 972 and Otto in 973.

All these events clearly prove how great a change had now taken place in the conditions of Rome. The people (plebs) had made its appearance upon the stage; the army had become democratic; the twelve regions were regularly organized under leaders. Opposed to them stood the nobles, headed by the prefect, also a noble, precisely as in Florence the nobles and the podestà were later opposed to the gilds and the people. So far, it is true, nobles and people had made common cause against Rome; but this harmony was soon to be interrupted. The feudal spirit had made its way among the Roman aristocrats, had split them into two parties and diminished their strength. It was now destined to spread, and, as it was always vigorously detested and opposed by the people elsewhere in Italy, so the same consequence was inevitable in Rome. Another notable change, and a subject of unending controversy, had also occurred in the administration of justice. In 965 there were the judices de doro, also known as ordinary or palatine judges, and the judices de militia, also styled consules or duces. These judges generally formed a council with the edict of Lothair (924) granted to Gratian, or other jurist, to whom the chief judges of the papal court were to be subject. In criminal cases the judices de militia had the prefect or the imperial missus for their president. But there was a third order of judges called pedani, a consultus creati. It seems clear that the duces, being distributi per judicatun, found themselves isolated in the provinces, and to obtain assistance nominated these pedani, who were legal experts. In Rome, with its courts of law, they were less needed, but possibly in those sections of the city where cases of minor importance were submitted to a single magistrate reference was made to the pedani. But many changes were made under the Franks, and when the edict of Lothair was dissolved, either the Roman or Germanic law, and the duces were replaced by comites and gestaldiones, chiefly of German origin, the use of legal experts became increasingly necessary. And the custom of employing them was the more easily diffused by being already common among the Franks, whose scabin were legal experts acting as judges, though not qualified to pass sentence. Thus the pedani multiplied, came to resemble the scabin, and were designated judices dativi (a magistratus datii) or simply dativi. These were to be found in the exarchate in 838, but not in Rome until 965, when the judices de militia had ceased to exist. The great progress of the German legal profession may then have contributed to the formation of the new office.

Meanwhile Pope John XIII. had been succeeded by Benedict VI. (973-74) and Otto I. by his son Otto II., a youth.
of eighteen married to the Byzantine princess Theophano. Thereupon the Romans, who had supported the election of another pope, and were in no awe of the new emperor, rose to arms under the command of Crescenzio, a rich and powerful noble. They not only seized Benedict VI. by force, but strangled him in the castle of St. Angelo. The national and imperial parties then elected several popes who were either exiled or persecuted, and one of them was said to be murdered. In 985 John XV. was elected (985-99). During this turmoil, the national party, composed of nobles and people, led by Giovanni Crescenzio, son of the other Crescenzio mentioned above, had taken complete possession of the government. This Crescenzio assumed the title of patrician, and sought to imitate Alberic, although far inferior in capacity. Fortunately for him, the reigning pope was a detested tyrant, and the emperor a child entirely guided by his mother. But the new emperor Otto III. was backed by a powerful party, and on coming to Rome in 996 was able, although only aged fifteen, to quell the rebellion, oust Crescenzio from public life, and elect as successor to John XV. his own cousin, Pope Gregory V. (996-99). But this first German pope surrounded himself with compatriots, and by raising them to lofty posts even in the tribunals excited a revolt that drove him from the throne (29th September 996). Crescenzio, being master of the castle of St. Angelo, resumed the title of patrician or consul of the Romans, expelled the German judges, reconstituted the government, prepared his troops for defence, and created a new pope. But the following year Otto III. came to Rome, and his party opened the gates to him. Although deserted by nearly all his adherents, Crescenzio held the castle valiantly against its besiegers. At last, on the 29th of April 998, he was forced to make terms, and the imperialists, violating their pledges, first put him to torture and then hurled him from the battlements. Gregory V. dying shortly after these events, Sylvester II., another native of southern France, who had been tutor to the emperor Otto III., was raised to the papacy (999-1003).

Thus Otto III. was enabled to establish his mastery of Rome. But, as the son of a Greek mother, trained amid Greek influences, his fantastic and contradictory nature seemed only to grasp the void. He wished to reconstitute a Romano-Byzantine empire with Rome for his capital. His discourse always turned on the ancient republic, on consuls and senate, on the might and grandeur of the Roman people; and his edicts were addressed to the senate and the people. The senate is now constantly mentioned, and its heads bear the title of consuls. The emperor also gave renewed honour to the title of patrician, surrounded himself with officials bearing Greek and Roman designations, and raised the prestige of the prefect, who, having now almost the functions of an imperial vicar, bore the eagle and the sword as his insignia. Nevertheless Otto III. was thoroughly German, and during his reign all Germanic institutions made progress in Rome. This was particularly the case with feudalism, and Sylvester II. was the first pope to treat it with favour. Many families of real feudal barons now arose. The Crescenzii held sway in the Sabine hills, and Praeneste and Tusculum were great centres of feudalism in the 11th century. The system of feudal benefits was recognized by the church, which made grants of lands, cities and provinces in the feudal manner. The bishops, like feudal barons, became actual counts. And, in consequence of these changes, when the emperor, as head of the feudal system, seeks to impose his will upon the church (which has also become feudal) and control the papal elections, he is met by the great question of the investiture of bishops (which is destined to disturb the whole world. Meanwhile the Roman barons were growing more and more powerful, and were neither submissive nor faithful to the emperor. On the contrary, they resented his attitude as a master of Rome, and, when he subjected Tivoli to the Holy See, attacked both him and the pope with so much vigour as to put both to flight (16th February 1001). Thereupon Rome again became a republic, headed by Gregory of Tusculum, a man of a powerful family claiming descent from Alberic.

By the emperor's death in January 1002 the race of the Ottos became extinct, the papacy began to decline, as at the end of the Carolingian period, and the nobles, divided into an imperial and a national party, were again predominant. They reserved to themselves the office of patrician, and, electing popes from their own lists, obtained enlarged privileges. At the time when Ardon, marquis of Ivrea, profiting by the extinction of the Ottos and the anarchy of Germany, was stirring Italy in the vain hope of constituting a national kingdom, the Roman Republic was being consolidated under another Giovanni Crescenzio, of the national faction. He was now elected patrician; one of his kinsmen was invested with the office of prefect, and the new pope John XVIII. (1003-9) was one of his creatures. Although the power of Henry of Bavaria was then gaining ascendancy in Germany, and giving strength to the imperialist nobles, Crescenzio still remained supreme ruler of the city and the Campagna. Surrounded by his judges, the senators and his kinman the prefect, he continued to dispense justice in his own palace until his death in 1012, after ten years' rule. And, Pope Sergius IV. having died the same year, the counts of Tusculum compassed the election of Benedict VIII. (1012-24), one of their own kin. This pope expelled the Crescenzii, changed the prefect and reserved the title of patrician for Henry II., whom he consecrated emperor on the 14th February 1014. A second Alberic, bearing the title of "eminentissimus consul et dux," was now at the head of the republic and dispensed "placta" in the palace of his great ancestor, from whom the counts of Tusculum were also descended.

The new emperor endeavoured to re-establish order in Rome, and strengthen his own authority together with that of the pope. But the nobles had in all things the upper hand. They were regularly organized under leaders, held meetings, asserted their right to nominate both pope and emperor, and in fact often succeeded in so doing. Even Henry II. himself was obliged to secure their votes before his coronation. The terms senate and senator now recur still more frequently in history. Nevertheless, Benedict VIII. succeeded in placing his own brother, Romano, at the head of the republic with the title of "consul, dux and senator," thus making him leader of the nobles, who met at his bidding, and chief of the militia and the tribunals. The prefect still retained his authority, and the emperor was by right supreme judge. But, a violent revolt breaking out, the emperor only stayed to suppress it and then went to Germany in disgust. The pope, aided by his brother, conducted the government with energy; he awed the party of Crescenzio, and waged war against the Saracens in the south. But he died in 1024, and in the same year Henry II. was succeeded by Conrad II. There was now held a repetition of the same strange event that had followed the death of Alberic, and with no less fatal consequences. Benedict's brother Romano, head of the republic, and still retaining office, was, although a layman, elected pope. He took the name of John XIX. (1024-33), and in 1027 conferred the imperial crown on Conrad the Salic, who, abolishing the Lotharingian edict of 824, decreed that throughout Rome and its territory justice should be henceforth administered solely by the Justinian code. Thus, notwithstanding the spread of feudalism and Germanic procedure, the Roman law triumphed through the irresistible force of the national character, which was already manifested in many other ways.

Meanwhile John XIX. was succeeded by his nephew, Benedict IX. (1033-45), a lad of twelve, who placed his own brother at the head of the republic. Thus church and state assumed the aspect of hereditary possessions in the powerful house of the counts of Tusculum. But the vices and excesses of Benedict were so monstrous that the papacy sank to the lowest depth of corruption; there followed a series of tumults
and reactionary attempts, and so many conflicting elections that in 1045 three popes were struggling for the tiara in the midst of scandal and anarchy. The streets and neighbourhood of Rome swarmed with thieves and assassins; pilgrims were plundered; citizens trembled for their lives; and a hundred petty barons threatened the rival popes, who were obliged to defend themselves by force. This state of things lasted until Henry III. came to re-establish order. He appointed a synod to depose the three popes, and then, with the consent of the wearied and anarchy-stricken Romans, assuming the right of election, proposed a German, Clement II., who was consecrated at Christmas 1046. Henry III. was then crowned, and also took the title of patrician. Thus the emperor was lord over church and state. This, however, stirred both the people and pope against him, and led to the terrible contest of the investitures, although for the moment the Romans, being exhausted by past calamities, seemed not only resigned but contented.

In fact, the idea of reform and independence was already germinating in the church and was soon to become tenacious and irresistible. Hildebrand was the prompter and hero of this idea. He sought to abolish the simony and concubinage of the prelates, to open the papal elections to the hands of the higher ecclesiastics, and to emancipate the church from all dependence on the empire. Henry III. procured the election of four German popes in succession, and Hildebrand was always at hand to inspire their actions and dominate them by his strength of intellect and still greater strength of will. But the fourth German pope, Victor II., died in 1057, and Henry III. had been succeeded in 1056 by the young Henry IV. under the regency of a weak woman, the empress Agnes. Hildebrand seized this favourable moment for trying his strength and procured the election of Stephen IX. (1057–58), a candidate he had long had in view. Stephen, however, died in 1058; the nobles instantly rose in rebellion andGregory of Tusculum, who had assumed the patriciate, caused an incapable cousin to be named pope (Benedict X.). Upon this Hildebrand postponed his design of maintaining the papacy by the help of Italian potentates and had recourse to the empress. In a synod held at Siena with her consent Benedict was deposed and Nicholas II. (1059–61) elected in his stead. This pope entered Rome escorted by the troops of Godfrey of Tuscany, and, when also assured of help from Naples, assembled a council of one hundred and thirteen bishops (1059), who condemned the deposed pontiff and renewed the prohibition of simony and concubinage among the priesthood. Nicholas in 1061 instituted the college of cardinals, procuring the election of Alexander II. (1061–73). This pope, although friendly to the empire, did not await the imperial sanction, but, protected by the Romans, at once entered the Lateran and put some other riotous nobles to death. The German bishops, however, elected Honorius II., who had the support of the barons. Thus the city was split into two camps and a deadly civil war ensued, terminating, despite the vigorous resistance of the nobility, in the defeat of Honorius II. But the nobles persevered in the contest and were the real masters of Rome. By conferring the patriciate on the emperor, as their feudal chief, they hoped to organize themselves under the prefect, who now, with greatly increased authority, presided over both the civil and criminal courts in the absence of the pope’s representative. In a general assembly the Romans elected their prefect, whose investiture was granted by the emperor, while the pope elected another. Thus disorder was brought to a climax.

Alexander died on the 21st April 1073, and thereupon Hildebrand was at last raised to the chair as pope Gregory VII. (1073–85). He reformed his predecessors’ defects, dismissed all simoniacal and non-celibate priests, and then in a second council (1075) forbade the clergy to receive investiture at the hands of laymen. No bishop nor abbot was again to accept ring or crozier from king or emperor. Now, as ecclesiastical dignities included the possession of extensive benefices, privileges and feudal rights, this decree gave rise to tremendous dispute and to fierce contest between the empire and the church. The nobles took a very decided part in the struggle. With Cenci, their former prefect, at their head, they rose in revolt, assailed the pope on Christmas day 1075, and drove him into prison. But their fear of the popular party compelled his release by the intercession of the excommunication and deposition of the emperor who had declared him deposed. That monarch afterwards made submission to Gregory at Canossa (1077), but, again turning against him, was again excommunicated. And in 1081 he returned to Italy bringing the antipope Clement III., and besieged Rome for forty days. Assembling the nobles in his camp, he there arranged a new government of the city with prefect and senate, palatine judges and other magistrates, exactly similar to the existing government within the walls. He then took his departure, returned several times in vain, but at last forced his way into the city (March 1084) and compelled Gregory VII. to seek refuge in the castle of St Angelo. The emperor was then master of Rome, established the government he had previously arranged and, calling a parliament of nobles and bishops, procured the deposition of Gregory and the consecration of Clement III., by whom he was crowned in 1084. He then attacked and seized the Capitol, and assaulted the castle in order to capture the pope. But Robert Guiscard brought his army to the rescue. Emperor and antipope fled; the city was taken, the pope liberated and Rome reduced to ruin by fire and pillage. Upon this Gregory VII., broken with grief, went away with the Normans, and died at Salerno on the 5th May 1085. He had separated the church from the people and the empire by a struggle that, as Gregorovius says, disturbed the deep sleep of the middle ages.

Pope Paschal II. (1099–1118) found himself entirely at the mercy of the tyrannous nobles who were alike masters of Rome, of its government, and its spiritual lord. As they were divided among themselves, all the pope could do was to side with one party in order to overcome the other. With the help of his own nephew Gualfredo, the prefect Pietro Piereleone, and the Frankipani, he was able to keep down the Corsi, and hold the Colonna in check. Being compelled to repair to Benevento in 1108, he left Gualfredo to command the militia, Tomolino of Tusculum to guard the Campagna, and the consuls Pierleone and Leone Frangipani, together with the prefect, in charge of the government. The consulsiphip was no longer a mere title of honour. The consuls seem to have been elected, as at Ravena, in imitation of those of the Lombard cities, and were at the head of the nobles and senate. The expressions "praefectus et consules," "de senatoribus et consulis," are now of frequent occurrence. We have no precise knowledge of the political organization of the city at this moment; but it was an aristocratic government, similar to that originally formed in Florence, as Villani tells us, with a senate and consuls. The nobles were so completely the masters that the pope, in spite of having trusted them.
with the government, could only return to Rome with the aid of the Normans. Being now absorbed in the great investiture question, he had recourse to a daring plan. He proposed to Henry V. that the bishops should resign all property derived from the crown and depend solely on tithes and donations, while the empire should resign the right of investiture. Henry seemed disposed to accept the suggestion, but, suddenly changing his mind, took the pope prisoner and forced him to yield the right of investiture and to give him the crown (1111). But the following year the party of reform annulled in council this concession, which the pope declared to have been extorted by force. By the death of Countess Matilda in 1115 and the bequest of her vast possessions to the Holy See, the pope’s dominions were greatly enlarged, but his authority as a ruler was nowise increased. Deeds of violence still continued in Rome; and then followed the death of the prefect Pietro. The nobles of the imperial party, joined with the people, wished to elect Pietro’s son, also named to Tolomeo of Tusculum, who then held the position of a potent imperial margrave, had territories stretching from the Sabine mountains to the sea, was the dictator of Tusculum, master of Latium and consul of the Romans. The pope opposed this election to the best of his strength; but the nobles carried the day, and their new prefect received investiture from the emperor. Upon this the pope again quitted Rome, and on his return, two years later, was compelled to shut himself up in the castle of St. Angelo, where he died in 1118.

The popes were now the sport of the nobles whom they had disgraced by continual concessions for the sake of peace. And peace seemed at hand when Innocent II. (1130–43), after triumphing over two antipopes, came to terms with Roger I., recognized him as king of Sicily, and gained his friendship and protection. But now still graver tumults took place. In consequence of the division of the nobles neither party could overcome its foes without the aid of the people, which thus became increasingly powerful. Throughout upper and central Italy the cities were being organized as free and independent communes on a democratic basis. Their example soon followed in the ancient duchy of Rome and almost in the immediate neighbourhood of the city. Even Tivoli was converted into a republic. This excited the deepest jealousy in the Romans, and they became furious when this little city, profiting by its strong position in the Tevereone valley, not only sought to annex Roman territory, but dared to offer successful resistance to the descendants of the conquerors of the world. In 1141 Tivoli openly rebelled against the mother city, and the pope sent the Romans to subdue it. They were not only repulsed, but ignominiously pursued to their own gates. Afterwards, returning to the assault in greater numbers, they conquered the hostile town. Its defenders surrendered to the pope, and he immediately concluded a treaty of peace without consulting either the people or the republic. The soldiery, still flushed with victory, were furious at this slight. They demanded not only submission of Tivoli to the Roman people, but also permission to demolish its walls and dwellings and expel its population. Innocent II. refused consent to these excesses, and a memorable revolution ensued by which the temporal power of the papacy was entirely overthrown.

In 1143 the rebellious people rushed to the Capitol, proclaimed the republic, reconstituted the senate, to the almost entire exclusion of the nobles, declared the abolition of the temporal power, issued coin inscribed to the senate, the people and St. Peter, and began to reckon time from the day of the restoration of liberty. Arnold of Brescia was not, as has been incorrectly stated, the author of this revolution, for he had not yet arrived in Rome. It was the outcome of an historic necessity—above all, of the renewed vigour of the people and its detestation of the feudal aristocracy. This body, besides being divided into an imperial and a national party, had almost excluded from the government the powerful baronage of the Campagna and the provinces. Also, as we have before noted, the Roman aristocracy was by no means an exclusive caste. Between the great aristocrats and the people there stood a middle or new nobility, which made common cause with the people, whose chief strength now lay in the army. This, divided into twelve and then into thirteen or fourteen regions, assembled under its own chefs all arm-bearing citizens. Thus the exercitus was also the real populus Romanus, now bent on the destruction of the temporal power. This purpose, originating in the struggle of the investitures, was the logical and inevitable result of the proposals of Paschal II., which, despite their rejection, found a loud echo in Italy. Lucius II. (1144–45) tried to withstand the revolution by seeking Norman aid and throwing himself into the arms of the feudal party, but this only precipitated the course of events. The people, after having excluded nearly all aristocrats from the senate, now placed at its head the noble Giordano dei Pierleoni, who had joined the revolutionary party. They named him patrician, but without prejudice to the authority of the empire, still held by them in respect, and also conferred on him the judicial powers appertaining to the aristocratic and imperial office of prefect. The pope was requested to resign the temporal power, the regalia and every other possession, and content himself with the tithes and offerings of the faithful according to the scheme of Paschal II. He indignantly refused, marched at the head of the nobles against the Capitol, but was violently repulsed, and received a blow on the head from a stone, which is supposed to have occasioned his speedy death on the 15th February 1145. Eugenius III. was thrust from the throne (1145–53), and the new pope had to take in quest of armed assistance, in consequence of the senate’s resolve to prevent his consecration by force until he recognized the new state of things in the Eternal City.

It was at this moment that Arnold of Brescia arrived in Rome. His ideas, already well known in Italy, had inspired and promoted the Roman revolution, and he now came to determine its method and direction. Born at Brescia in the beginning of the 11th century, Arnold had studied in France under the celebrated Abelard, who had instructed him in theology and philosophy, inspired him with a great love for antiquity, and stimulated his natural independence of mind. On returning to his native land he assumed the monkish habit, and proved the force and fervour of his character by taking part in all struggles for liberty. And, together with political reform, he preached his favourite doctrine of the necessary renunciation by the clergy of all temporal wealth. Expounded with singular eloquence, these doctrines had a stirring effect on men’s minds, spread throughout the cities of northern Italy, and were echoed on all sides. It seems undoubted that they penetrated to Rome and helped to promote the revolution, so that Arnold was already present in spirit before he arrived there in person. It is known that at the Lateran council of 1139 Innocent II. had declared these doctrines to be inimical to the church and enjoined silence on their author. And, as at that time the party hostile to liberty was triumphant in Brescia, Arnold left his native place, crossed the Alps and returned to France, where other struggles awaited him. He professed no anti-Catholic dogmas,—only maintaining that when the pope and the prelacy deviated from the gospel rule of poverty they should not be obeyed, but fearlessly opposed. In France, finding his master, Abelard, exposed to the persecutions of St Bernard, he assumed his defence with so much ardour that St Bernard directed the thunders of his eloquence against the disciple as well as the master, saying of the former, “He neither eats nor drinks, suffers hunger, and, being leagued with the devil, only thirsts for the blood of souls.” In 1142 we find Arnold a wanderer in Switzerland, and then, suddenly reappearing in Italy, he arrived in Rome.

Three different elements entered into his nature and inspired his eloquence—an exalted and mystic temperament, a great and candid admiration for classic antiquity added to an equal admiration for republican freedom independent of the church.
and the empire, and a profound conviction, derived from the Vaucluse and Paterine doctrines, that the church could only be purified by the renunciation of temporal wealth. Finding Rome already revolutionized in accordance with his own ideas, he immediately began to preach there. His mystic exhortations against the riches of the church had an inflammatory effect, while his classical reminiscences aroused the enthusiasm of the Romans, and his suggestion that they should imitate the republican institutions of upper Italy met the necessities of the time that had created the revolution. He urged the reconstitution of the ancient senate and senatorial order, which indeed was already partially accomplished, and of the ancient equestrian order, and the reconstruction and fortification of the Capitol. His proposed senate was a body somewhat resembling the communal councils of upper Italy, his equestrian order a mounted force composed of the lesser nobility, since at Rome, as elsewhere, the lower classes had neither time nor means to form part of it. All his suggestions were accepted; the citizens laboured strenuously on the fortification of the Capitol. The pope soon beheld the revolution spread beyond the walls, and several cities of the state proclaimed their independence. The barons of the Campagna profited by the opportunity to act as independent sovereigns. Thus the whole domain of the church was threatened with dissolution. The pope marched towards Rome with his newly gathered army, but hoped to come to terms. Arnold, in fact, recognized the church, and he in his turn recognized the republic. The office of patrician was abolished, and seems to have been replaced by that of gonfalonier, and the prefect, answering to the podestà of the other republics, was revived. The senators received investiture from the pope, who returned to Rome at Christmas 1145.

There public now seems to have been fully constituted. The senate was drawn from the lower classes and the petty nobility, and this was the special characteristic of the new revolution. In 1144 there were fifty-six senators, probably four to each of the fifteen regions, but the number often varied. By the few existing documents of the period we notice that the senators were divided into senatores consiliiarii and ordinary senators. The former constituted a smaller council, which, like the credenza or lesser council found in other cities, consulted with the head or heads of the republic on the more urgent and secret affairs, of the state. And, conjointly with the rest of the senators, it formed the greater council. Thus classic traditions were identified with new republican usages, and the commonwealth of Rome resembled those in other parts of Italy. But, of course, every republic had special local customs of its own. So the Roman senate had judicial as well as political attributes, and there was a curia senatus composed of senators and legati experts.

As was easily to be foreseen, the agreement with the pope was of short duration. The revolution could not be checked; the Romans desired independence, and their spiritual lord fled to France, whence, in 1147, he proclaimed a new crusade, while the Romans were employed in demolishing Tivoli, banishing its inhabitants, and waging war on other cities. Giordano Pier-leone was gonfalonier and head of the republic, and Arnold, supported by the popular favour and the enthusiasm of the lower clergy, was preaching with even greater fervour than before. But the pope now re-entered Italy, proclaimed Arnold a schismatic, and then advancing to Tusculum assembled an army in order to attack Rome. In this emergency the Romans applied to Conrad III., the first emperor of the house of Hohenstaufen; and their urgent letters are clearly expressive of Arnold's theories and his medley on ancient and modern, sacred and profane, ideas. "Rome," so they said, "is the fountain of the empire confided to you by the Almighty, and we seek to restore to Rome the power possessed by her under Constantine and Justinian. For this end we conquered and destroyed the stronghold of the barons who, together with the pope and the Normans, sought to resist us. These are now attacking us on all sides. Haste to Rome, the capital of the world, thus to establish thy imperial sway over the Italian and German lands."

After long hesitation the king of the Romans at last replied to these appeals, stating that he would come "to re-establish order, reward the faithful, and punish the rebellious." These words promised ill. In fact Conrad had already arranged terms with the pope; but his life came to an end on the 15th of February 1152.

He was succeeded by Frederick I. surnamed Barbarossa, who took no notice of the numerous letters urging him to come and receive the empire from the Roman people, which alone had the right of conferring it. In accordance with his design of subduing all the independent cities, he made an agreement with the pope, in which he vowed to give up the Romans to the pope, and to his spiritual lord, whose temporal power should be restored. The pope, on his side, promised to crown him emperor. Thereupon the people again rose to arms, and Arnold broke off all negotiations with Eugenius III. The senate was reorganized, formed of one hundred members, and, according to the old Roman precedent, had two consuls, one for internal and the other for external affairs. Frederick was a daring statesman, a valiant soldier in command of a powerful army, and was no friend of half measures. Accordingly the nobles ventured on reaction. Finally, to increase the gravity of the situation, an Englishcope, Adrian IV., who was also a man of strong and resolute temper. In fact, even before being able to take possession of the Lateran, he requested the Romans to banish Arnold, who, with greater eloquence than ever, was directing his thunders against the papacy. These utterances increased the wrath of Adrian, who, encouraged by the knowledge that Frederick and his host were already in Italy, at last launched an interdict against Rome. It was the first time that a pope had ventured to curse the Eternal City. The interdict put a summary stop to the religious life of the inhabitants. Men's minds were seared with a sudden terror, and a fierce tumult broke out. Thenceupon the senators, whose opposition to the pope was less courageous than that of the fallen magnates, prostrated themselves at his feet and implored pardon. But Adrian demanded the expulsion of Arnold before consenting to raise the interdict. Arnold was therefore obliged to leave Rome. After having for nine years preached successfully in favour of liberty, after having been the moving spirit of the new revolution, the new constitution, he was now abandoned by all, and forced to wander from castle to castle, in the hope of reaching some independent city capable of shielding him from the fierce enmity of the pope. Meanwhile Frederick I. had achieved his first victories in Lombardy, and, leaving ruined cities and bloodshed in his track, was advancing towards central Italy. The pope sent three cardinals to him, with a request for the capture and consignment of Arnold, who had taken refuge in the castle of the Visconti of Campagnatico. Frederick without delay caused one of the Visconti to be seized and kept prisoner until Arnold was given up, and then consigned the latter to the papal legates. The pope in his turn gave the reformers at the hands of the prefect, Pietro di Vico, who immediately hanged his prisoner, burnt his body at the stake and cast his ashes into the Tiber. The execution took place in June 1155. The exact date and place of it are unknown; we only know that Arnold met his fate with great serenity and firmness. But the Romans who had so basely deserted their champion would not give up their republic. Their envoys went to meet Frederick near Sutri, and made an address in the usual fantastic style on the privileges of the Roman people and its sole right to confer the imperial crown. But Frederick indignantly cut short their harangue, and they had to depart full of rage. He then continued his march, and, entering Rome on the 18th of June 1155, was forthwith crowned in St Peter's by the pope. Thereupon the Romans rushed to arms, and made a furious attack on the Leonine city and the imperial camp. A desperate battle went on throughout the day; and the knights proved that the equestrian order institute at Arnold's suggestion was no empty
sham. About a thousand Romans perished by the sword or by drowning, but their fellow-citizens made such determined preparations to continue the struggle that Frederick, on the 19th of June, hastily retreated, or rather fled, and was escorted as far as Tivoli by the pope and the cardinals. After all, the temporal power of the papacy was not restored, and the republic still survived in the form bestowed on it by Arnold of Brescia. Its existence was in truth favourable rather than injurious to Frederick, whose aim was to rule over Rome and treat the bishops as his vassals. He had not yet discerned that his best policy would have been to use the republic as a lever against the pope. The latter, with keener acumen, while remaining faithful to the feudal party in Rome, made alliance with the communes of Lombardy and encouraged them in their resistance to the emperor. By the peace of May 1197, the terms of which his agents had submitted to the pope, Henry III. made the following points:

- He was confirmed in his possessions in Lombardy, Friuli, Istria, and Dalmatia.
- He was to have his son, Henry, as his co-ruler in the Holy Roman Empire.
- He was to have the right to coinage.
- He was to have the right to invest office holders.

The treaty was signed, but Henry was to remain in the Lombard war until the election of a successor to the ailing pope, Alexander III. (1159-81), whom he had been trying to supplant by his own nominee, Paschal III. The pope, who had previously been subjected to Frederick's pressure, now decided to fly before his advancing army. Alexander had to flee to Benevento to escape capture. But, at last, Frederick came to terms with the republic, recognized the senate, which accepted investiture at his hands, re-established the prefecture as an imperial office, and bestowed on it Giovanni, son of Pietro di Vico. He then hastily departed, without having advanced outside the Leonine city.

Meanwhile Pope Alexander continued the crafty policy of Adrian and with better success, for the Lombard cities had now formed a league and inflicted a signal defeat on the emperor at Legnano on the 29th of May 1176. One of the results of this battle was the conclusion of an agreement between the pope and the emperor, the latter resigning his pretensions on Rome and yielding all that he had denied to Adrian. And by the treaty of Venice (1st of August 1177) the antipope was forsaken, Alexander III. recognized and hailed as the legitimate pontiff, and the prefect of Rome again nominated by the pope, to whom the emperor restored the temporal power, acknowledging him the independent sovereign of Rome and of the ecclesiastical state, from Acquapendente to Ceprano. Frederick's troops accompanied the pope to Rome, where the republic was forced to make, 90, and to pay him. But, proudly conscious as it still was of its strength, its surrender wore the aspect of a voluntary concession, and its terms began with these words: "Tutius populi Romani consilio et deliberatione statutum est," &c. The senators, elected yearly in September, had to swear fealty to the pope, and a certain proportion of nobles was included in their number. On his return to Rome, Alexander received a solemn welcome from all, but he had neither extinguished nor really subdued the republic. On the contrary, men's minds were more and more inflamed by the example of freedom displayed in the north of Italy. He died on the 30th of August 1181. The fact that between 1181 and 1189 there were three popes always living in exile proves that the republic was by no means crushed. During the same period another blow was inflicted on the papacy by the marriage of Henry VI., son and successor to Frederick I., with Constance, sole heiress of the Norman line in Naples. For thus the kingdom was joined to the empire, and the popes were more than ever in the latter's power. On the 20th of December 1187 Clement III., (1187-91), being raised to the pontificate, made a solemn agreement with the government of the Capitol before coming to Rome. And this peace or concordia had the air of a treaty between potestates of equal importance. Rome confronted the pope from the same standpoint from which the Lombard cities had confronted the emperor after Legnano. This treaty, the last of such, was revised by Innocent III. in May 1188 (Anno XLIV. of the senate). It begins with these words: "Concordia inter Dominum Papam Clementem III. et senatores populorum Romanum super regulibus et alios dignitatis urbis." The pope was recognized as supreme lord, and invested the senators with their dignity. He resumed the privilege of coinage, but allowed one-third of the issue to be made by the senate. Almost all the old pontifical rights and prerogatives were restored to him. The pope might employ the Roman militia for the defence of his patrimony, but was to furnish its pay. The rights of the church over Tivoli and Tusculum were confirmed; but the republic reserved to itself the power of making peace and war, in co-operation with the Romans. The pope seemed to have no disposition to dismantle and destroy the walls and castle of Tusculum. In this undertaking the pope was to co-operate with the Romans, even should the unhappy city make surrender to him alone.

From all this it is clear that the church had been made independent of the empire, and that the republic, despite its numerous concessions, was by no means subject to the church. The pope, in fact, had obtained liberty of election, and Frederick I., by resigning the investiture of the prefect, had virtually renounced his claim to temporal power in Rome. The republic had no patrician nor any other imperial magistrate, and preserved its independence even as regards the pope, who merely granted investiture to magistrates freely chosen by the people, and had no legislative nor administrative power in the city. Its temporal dominion was limited to its great possessions, to his regalia, to a supreme authority that was very indefinite, and to a feudal authority over the barons of the Campagna and many cities of a state that seemed ever on the point of dissolution. The senate continued to frame laws, to govern, and to administer justice. The army carried on the wars of the republic, as we see by the tragic fate of Tusculum, which was razed to the ground on the 10th of April 1197. Thus the powerful counts of Tusculum disappeared; they sought refuge in the Campagna, and according to all probability the no less potent family of the Colonna sprang from their line. In consequence of these events, the nobles realized that the papacy sought to reduce them to vassalage. And, seeing that the republic remained firmly established and able to help them, they began to adhere to it and succeeded in obtaining admission to the new senate. In fact, whereas since 1143 plebeians and petty nobles had prevailed in its ranks, nobles of ancient descent are now found outnumbering the knights and burghers. But in 1191 this state of things caused a sudden popular outbreak which abolished the aristocratic senate, and gave the headship of the republic to a single senator, summus senador, named Benedetto "Carissimus," or "Carus Homo" or "Carosomo," of unknown, but undoubtedly plebeian, origin. During the two years he remained in office this personage stripped the pope of his revenues, despatched justitiarii even to the provinces, and with the aid of the parliament and other popular assemblies promulgated laws and statutes. But he was overthrown by a counter-revolution, and Giovanni Capocci, the head of the party of the nobles became senator for two years, and had been succeeded by one of the Pippans when, in 1197, a fresh revolution re-established a senate of fifty-six members, chiefly consisting of feudal barons in high favour with Henry VI., who had revived the imperial faction in Rome. But this emperor's life ended the same year as the pope's, in 1198, and the new pontiff, Innocent III. (1198-1216), began to make war on the nobles, who were again masters of the republic. Their leader was the prefect Pietro di Vico. Owing to the revolution of 1143, most of the prefectoral attributes were now vested in the senate; nevertheless, Pietro still retained a tribunal of police both within and without the
city. But his main strength was derived from the vast possessions of the Vico family, in which the office of prefect now became hereditary. Very soon, however, these prelates of Vico were chiefly regarded as the great feudal lords of Tuscia, and the independent municipal office lost its true character. Then the popes made a point of according great pomp and dignity to this nominal prefect, in order to overshadow the senator, who still represented the independence of the republic and had assumed many of the attributes wrested from the prefect.

But Innocent III., dissatisfied with this state of things, contrived by bribing the people to arrogate to himself the right of electing the senator, who had now to swear fealty and submission to the pope, and also that of nominating the provincial Justiciary, formerly chosen by the people. Thus the power of the Capitoline, whose attributes were nearly the same as those of the prefect, was transferred to the pope. This was a deadly blow to the republic, for the principal rights of the people—i.e., the election of pope and emperor, prefect and senate—were now lost. The general discontent provoked fresh revolutions, and Innocent III. employed all his political dexterity to ward off their effects. But shortly afterwards the people made a loud outcry for a senate of fifty-six members; and the pope, again making a virtue of necessity, caused that number to be chosen by twelve mediators specially named by him for the purpose. Even this did not calm the popular discontent, which was also stirred by other disputes. The consequence was that, six months later, the pope again elected a single senator, the Romans rose to arms, and in 1204 formed a government of Buoni Uomini in opposition to that created by the pope. But an amicable arrangement being concluded, the pope once more nominated fifty-six senators; and when, soon after, he again reduced them to one, the people were too weary to resist (1205). Thus the Capitol was subdued, and Innocent III. spent his last years in tranquillity.

On the 22d of November 1220 Honorius III. (1216–27) conferred the imperial crown on Frederick II., who confirmed to the church the possession of her former states, of those bequeathed to her by Countess Matilda, and even of the March of Ancona. But it was soon seen that he sought to dominate all Italy, and was therefore a foe to be dreaded. The successor of Honorius, Pope Gregory IX. (1227–41), was speedily insulted and put to flight by the Ghibelline nobles, whose courage had revived, and the republic began to subdue the Latian cities on its own account.

Peace was several times made and unmade by pope and people; but no enduring harmony was possible between them, since the former wished to subject the entire state to the church, and the latter to escape from the rule of the church and hold sway over "the mother of Capitol. Capitano to Radicofani" formerly belonging to the duchy. Accordingly, the Roman people now appointed judges, imposed taxes, issued coin, and made the clergy amenable to secular tribunals. In 1234 the senator Luca Savelli published an edict declaring Tuscia and Campania territories of the republic, and sent judges thither to exact an oath of obedience. He also despatched the militia to the coast, where it occupied several cities and erected fortresses; and columns were raised everywhere inscribed with the initials S. P. Q. R. The pope, unable to prevent but equally unable to tolerate these acts, fled from Rome, hurling his anathema against Savelli, "et omnes illos consiliarios urbis quorum consilium," &c. The Romans sacked the Latran and the houses of many cardinals, and marched on Viterbo, but were driven back by the papal troops.

When Savelli left office and Angelo Malabranca was elected in his stead, the people made peace and submission in 1235, and were obliged to give up their pretensions of subjecting the clergy to ordinary tribunals and the urban territory to the republic. Thus matters were virtually settled on the footing established by Innocent III., thanks to the aid given to the pope by Frederick II., who had been one of the promoters of the rebellion.

It may appear strange that, at this period of their history, the Romans, after showing such tenacious adherence to the republic and senate, should have accepted the rule of a single senator without rushing to arms, and passed and repassed from one form of government to another with such surprising indifference. But on closer examination it is plain that these changes were greater in appearance than reality. We have already seen, in treating of Carosomo, how the single senator convoked the people in parliament to pass sanction on the laws. But, whenever there is only one senator, we also continually meet with the expression "consilium vel consilia urbis." It is evident that when, instead of laws to be approved in parliament by a simple placet or rejected by a non-placet, matters requiring consideration had to be discussed, the senator convoked a much smaller council, consisting only of the leading men of the people. These leaders were the heads of the twelve or thirteen guilds, now becoming organized and soon to be also thirteen in number, and of the militia. As in the other Italian republics, all these associations had been formed in Rome.

The senator therefore held consultation with the leading men of the city; and, although, especially at first, these meetings were rather loosely organized, it is clear that they took the form of two councils—one numerous (consiglio maggiore), the other limited (consiglio minore o speciale), co-operating in the form of the first. Such was the prevailing custom throughout Italy at the time when Roman institutions most nearly resembled those of the other republics. We already know that, from the date of Arnold's reforms, the senate, with its junta of counsellors, had been divided into two parts, forming when united a species of greater council. Therefore the transition from a senate divided into two parts to the greater and lesser council must have been very easy and natural. And, seeing that later, when the nomination of a single senator had become a constant practice, the meetings of the two councils are frequently mentioned without the slightest remark or hint as to their origin, it is clear that they had been gradually formed and long established. Not long after the revolution of 1143 the grandees sought to re-enter the senate; and the popes themselves, partly from dread of the people and partly to aggrandize their own kindred, contributed to build up the power of a new and no less turbulent nobility. This class, arising between the 12th and 13th centuries, was composed of families newly created by the popes, together with remnants of the old aristocracy, such as the Frangipani, Colonna, &c. These nobles, regaining possession of the senate, so completely eliminated the popular element that, when the popes again opposed them, and, obtaining from the parliaments the right of electing the senators, adopted the expedient of appointing one only, the senator was always chosen from the ranks of the nobles. And then the people, unable and unwilling to renounce republican forms, replaced their suppressed senate by a greater and a lesser council. This was an easy task—a natural consequence of the fact that the people now began to constitute the real strength of the republic. Later, with an increasing detestation for their nobility, the Romans decreed that the single senator should be of foreign birth, and, as we shall see, chose Brancalone in the middle of the 13th century.

Thus, after a long series of frequent changes and revolutions, the Roman republic became a commonwealth, with an increasing resemblance to those of the other Italian cities. The people were organized and armed, the guilds almost established, the two councils gradually constituted, and the aristocracy, while retaining special local characteristics, assumed its definitive shape. It is not surprising to find that Rome, like other Italian cities, now possessed statutes of its own. There has been much controversy on this point. Certain writers had alluded to a statute of 1246. As no one, however, could discover any statute of that date, others decided that it had never existed. A statute of 1363...
was recently published by Professor Camillo Re, who asserted it to be the first and most ancient that Rome had possessed. But the still more recent researches of Messrs La Mantia and Levi prove that Professor Re's assertions were somewhat too bold. There is certain evidence of a statutum senatus existing between 1212 and 1237, inclusive. The last and oldest statute,  

"statutum of 1235, followed in 1241 by a statutum urbis. This brings us very near to the statute of 1246 mentioned by Vitale and others. So it is well ascertained that, in the first half of the 13th century, Rome possessed statutes at large composed of older limited statutes. The consuls of the trade guilds were from 1267 regular members of the councils; and the merchants' guild held general meetings in 1255. Its statutes were confirmed in 1266 by the senator Pandolfo Savelli, and the compilation of these, published in 1880 by Signor Gatti, refers to 1317.

Meanwhile the struggle between Frederick II. and the pope was once more renewed. The former sought to dominate Italy, separate the state from the church, and repress the republics. The latter, although really hostile to the Roman free government, joined it against the emperor, who on his side favoured the republic of Rome and the nobles most adverse to the pope. Thus the new nobility, composed, as we have seen, of two different elements, was again split into a Guelph party headed by the Orsini and a Ghibelline party under the Colonna. And in 1258 it was deemed advisable to elect two senators instead of one, in the hope of conciliating both factions by simultaneously raising them to power. Afterwards one only was elected; alternatively an Orsini and a Colonna, then again two, and so on. But all these changes failed in their aims, since the struggle between emperor and pope exasperated party feeling in Rome. Frederick was king of southern Italy and emperor; had he been able to enforce the whole of his authority he would have been absolute master of all Italy, a state of things which the popes could not in any way tolerate. Hence the obstinate and uninterrupted struggle which proved injurious both to the papacy and the empire. The political genius of Frederick might have won great harm to the city had not his mind teemed with contradictory ideas. Although desirous to emancipate the state from the church, he was opposed to the communal democracy, which was then the chief strength of the secular state in Italy. While combating the church and persecuting her defenders, he yet sent heretics to the stake; although excommunicated, he undertook a crusade; he feasted at his table philosophers, sceptic and atheist poets, bishops and Mussulmans; he proclaimed anti-Christian the possession of wealth by the church, yet made lavish gifts to altar and monastery. Thus, although he had a strong party in Rome, it seemed to dissolve at his approach, inasmuch as all feared that he might abolish the statutes and liberties of the commune. In fact, when he advanced towards Rome on the death of Gregory IX. in 1241 he was energetically repulsed by the people, and later even by Viterbo, a city that had always been faithful to him. But after he had withdrawn, his adherents gained strength and put to flight his opponent, Innocent IV. (1243-54), the newly elected pope, who then from his asylum at Lyons hurled an excommunication against him. Frederick's death in December 1250 determined the fall of the Ghibelline party and the close of the imperial epoch in Italy. The pope instantly returned to Rome with the set purpose of destroying the power of the Hohenstaufens. This was no longer difficult when, by the decease of Conrad IV. (1254), the child Conradin became the last legitimate representative of that line, and negotiations were already on foot for placing the Angevins on the Neapolitan throne.

The republic meanwhile preserved its independence against the pope, who, among other concessions, had entirely given up to it the right of coinage. Nevertheless, being much harassed by the factiousness of the nobility, it was obliged in 1252 to decide on the election of an alien senator armed with ample powers, precisely as other communes gave the government into the hands of a podestà. Accordingly a Bolognese noble, Brancaione degli Andalò, count of Casalecchio, and a Ghibelline of much energy and talent, was invited to Rome. But before accepting office he insisted on making definite terms. He desired to hold the government for three years; and this, although contrary to the statutes, was granted. Further, to ensure his personal safety, he demanded that many scions of the noblest Roman houses should be sent as hostages to Bologna; and to this also the republic consented. Then, in August 1252, he came with his judges and notaries, made oath to observe justice and the laws, and began to govern. He was head of the republic in peace and in war, supreme judge and captain in chief. He nominated the podestàs of subject territories, despatched ambassadors, issued coins, concluded treaties and received oaths of obedience. The pope, who was then at Avignon, was greatly afflicted by the arrival of this new master, but, despairing of aid from any quarter, was forced to make a virtue of necessity. Thus Brancaione was able to seize the reins of power with a firm grasp. The parliament still met in the square of the Capitol, and the greater and lesser councils in the church of Ara Coeli. There were besides frequent assemblies of the college of Capitoline judges or assettamentum. Unfortunately, no records having been preserved of the proceedings of the Roman councils and parliament, little can be said of the manner in which affairs were conducted. Certainly Brancaione's government was not very parliamentary. He governed in a despotic manner, and when his conduct was an occasion of complaint made against him was of undue severity in the administration of justice. He rendered the clergy amenable to secular tribunals, subdued the neighbouring cities of Tivoli, Palestrina, &c., and commanded in person the attacking force. But his greatest energy was directed to the repression of the more turbulent nobles who were opposed to him; and he soon made them feel the weight of his hand by hanging some, banishing others, and persecuting several more. But he too recognized the expediency of winning the popular favour. He was the first senator to add to his title that of captain of the people ("Almae Urbis Senator III: et Romani Populi Capitaneus"). He befriended the people by promoting the organization of guilds after the manner of those of his native Bologna. There were already a few in Rome, such as the merchants' guild and that of the agriculturists, Botabteriorum or Benattari, who must have resembled the so-called mercanti di campo or graziers of the present day, since no peasant guild existed in Italian republics. The merchants' guild, definitely established in 1255 under Brancaione's rule, had four consuls and twelve councillors, held meetings and made laws. The other guilds, thirteen in all, were organized much on the same plan. The admission of their heads into the councils of the republic in 1267 shows how efficaciously their interests had been promoted by Brancaione.

The death of Innocent IV. and the election of Alexander IV. (1254-61), who was milder and less shrewd than his predecessor, were favourable events for Brancaione; but he failed to check the growing discontent of the clergy and the more powerful nobles, who had received deadly injuries at his hands. And when, on the expiration of his three years' term of office, his re-election was proposed, his enemies rose against him, accused him before the sindacato, threw him into prison, and vehemently protested against the continuance of "foreign tyranny." His life was only spared on account of the hostages sent to Bologna. The next senator chosen was a Brescian Guelph, Emanuele de Madio, a tool of the nobles, who were now masters of the situation. But soon afterwards, in 1257, the guilds rose in revolt, drove the nobles from power, put the pope to flight, and recalled Brancaione for another three years' term. He ruled more sternly than before, hung several nobles, and made alliance with Manfred, the representative of the Swabian party in Italy. This rendered him increasingly odious to the pope and procured his excommunication. But, disregarding the
thunders of the church, he marched against Anagni, the pope's birthplace, and Alexander was quickly obliged to humiliate himself before the senator of Rome. Brancacone next set to work to destroy the fortified towers of the nobility, and in raising them to the ground riddled many of the adjacent dwellings. Accordingly, a considerable number of noble families, including the Colonna, the Orsini, the Gaetani, the Orsini, and the Orsini, were driven into exile. In 1258, while engaged on the siege of Corneto, Brancacone was attacked by a violent fever, and, being carried back to Rome, died on the Capitoline Hill. Thus ended the career of a truly remarkable statesman. He was succeeded by his uncle, Castellano degli Andalò, who, lacking the political genius of his nephew, only retained office until the following spring (1259), in the midst of fierce and perpetual disturbances. Then the people, being bribed by the pope, joined with the nobles and drove him away. His life too was saved by having followed his nephew's shrewd plan of sending hostages to Bologna. Two senators of Roman birth were next elected; and on the death of Alexander IV, a French pope was chosen, Urban IV. (1256-64), thus giving fresh predominance in the church to the anti-Swabian policy. But the internal disturbances of the city soon drove Urban to flight.

At this period the fall of the empire had induced many Italian republics to seek strength by placing their governments in the hands of some prince willing to swear respect to their laws and to undertake their defence against neighbouring states and the pope. In Rome the Guelphs and Ghibellines proposed various candidates for this office, and after many fierce quarrels ended by electing a committee of boni homines, charged with the revision of the statutes, reorganization of the city, and choice of a senator. This committee sat for more than a year without nominating any one, so, the Guelph party being now predominant, and all being wearied of this provisionary state of things, the majority agreed on the election as senator of Charles of Anjou, who, at the pope's summons, was already preparing for the conquest of Naples. The Romans thought that he would defend Rome against the pope, and the pope would defend Rome against him; and by thus taking advantage of either's jealousy the citizens hoped to keep their republic intact. In fact, although Urban IV. had incited Charles to attack Naples, he was by no means willing to see him established as master in Rome. He accordingly declared that, if Charles refused to allow the Neapolitan crown, he must not accept the offered dignity pending the conquest of that kingdom. And he must likewise promise to recognize the supremacy of the pope over the senate. Charles soothing him with the least verbal promises, but in fact accepted the senatorship for life. In 1265, when Urban was succeeded by Clement IV. (1265-68), who as a Provençal was a subject of Charles, the latter entered Rome and was immediately made senator. Seven days later (28th of June) he received the investiture of the Neapolitan kingdom, and in the following January its crown. On the 26th of February 1266 the battle of Benevento was fought, and, the valiant Manfred being killed, the triumph of the Guelph Angevins in Italy was assured. Then, at the urgent command of the pope, Charles was forced to resign the senatorship in the May of the same year. Two Romans were elected in his stead, but soon fell out with the pope, because the Guelph nobles again tried to exercise tyranny. The people, however, profited by these disturbances to rise on its own account, and formed a democratic government of twenty-six boni homines with Angelo Capocci, a Ghibelline, as its captain. By this government Don Henry, son of Ferdinand III. of Castile, was elected senator; and he came to Rome for the purpose of promoting a Ghibelline and Swabian policy in favour of Conradin, who was preparing for conflict. The rule of the new senator was very energetic, for he kept down the clergy, subdued the Campagna, persecuted the Guelph nobles, made alliance with the Tuscan Ghibellines, forcibly drove back the troops of King Charles, who was advancing towards Rome, and gave a splendid reception to Conradin. But the battle of Tagliacozzo (23rd of August 1268), followed by the murder of Conradin, proved fatal to the Ghibelline party. Charles was re-elected senator immediately after the battle, and the pope confirmed his powers for a term of ten years, after having already named him imperial vicar in Tuscany. On the 16th of September Charles for the second time took possession of the Capitoline, and ruled Rome firmly by means of vic-console and vicars.

The senates in the hands of the popes.

The Sicilian Vespers (31st of March 1282) resounded even in Rome. The Orsini, backed by the people, rose to arms, massacred the French garrison, and quickly re-established a popular government. Giovanni Cencio, a kinsman of the Orsini, was elected captain and defender of the people, and ruled the city with the co-operation of the senator and a council of priors of the guilds. This government was of brief duration, for although the people had professed his willingness to tolerate the experiment, he quickly arranged fresh terms, and, forsaking Charles of Anjou, again nominated two Roman senators. Pope and king both died in 1285, and Nicholas IV. (1288-92), also holding sway over the senate, favoured the Colonna in order to curb the growing mastery of the Orsini. But thus there were two powerful houses instead of one. In fact, Giovanni Colonna, when elected senator, ruled from the Capitol as an independent sovereign, conducted in person the campaign against Viterbo, and subjected that city to the republic on the 3rd of May 1291.

When one of the Gaetani, Boniface VIII. (1294-1303), was raised to the papal chair, the extent of the Colonna's power became evident to all. Boniface opposed them in order to aggrandize his own kin, and they showed equal virulence in return. The Cardinals Colonna refused to acknowledge him as the legitimate pope, and he excommunicated them and proclaimed a crusade against their house. Even after he had subdued them and destroyed Palestreina, their principal fief, the drama did not yet come to an end. Boniface had a very lofty conception of the church, and desired to establish her supremacy over the state. The king of France (Phillip the Fair) believed, on the contrary, that the Angevin successes entitled him to fill the place in Italy vacated by the Swabians, and to play the master there. This led to a tremendous contest in which all the French sided with their king. And shortly afterwards a plot was hatched against the pope by the agents of France and the Colonna. These determined enemies of the pope met with much favour in Rome, on account of the general irritation against the Gaetani and the enormous power conferred on them by Boniface.
Suffice it to say that they were now lords of the whole of lower Latium, from Cape Circeo to Ninfa, from Ceprano to Subiaco. Thus Sciarra Colonna and a Frenchman named Nogaret were able to fall on the pope at Anagni, insult him, and take him prisoner. The people rising to his rescue, the conspirators all went out to fight. But when Boniface returned to Rome with the escort and protection of the Orsini, who had made themselves masters of the city, he found that he was virtually a captive in their hands. He felt this so keenly that he died of rage and exhaustion on the 11th of October 1303. The brief pontificate of his successor Benedict XI. was followed by that of Clement V. (1305–14), a Frenchman, who, instead of coming to Rome, summoned the cardinals to France. This was the beginning of the church's so called exile in Avignon, which, although depriving Rome of a source of wealth and influence, left the republic to pursue its own strength, if it was to gain the freedom in trying to hold its own against the nobles, whose power was much lessened by the absence of the pope, and endeavoured to gain fresh strength by organizing the thirteen regions, which, as we have shown, were associations of a much firmer nature in Rome than the guilds. Accordingly, in 1305, a captain of the people was elected with thirteen elders and a senator, Paganino della Torre, who governed for one year. The pope was opposed to these changes at first, but in 1310 he issued a brief granting Rome full permission to select its own form of government. Thus, the first pope in Avignon restored the rights of the Romans. But the latter, even with church and empire so far removed, still considered Rome the Eternal City, the source of all law, and the only natural seat of the spiritual and temporal government of the world. To their republic, they thought, appertained a new and lofty destiny, nor could it ever be content to descend to the level of other Italian municipalities.

On the 6th of January 1309 Henry VII. was crowned king of the Romans at Aix-la-Chapelle; and so greatly were men's minds changed in Italy that, throughout the land, he was hailed as a deliverer. He wished to restore the grandeur of the empire, and the Italians, above all, Dante Alighieri, beheld in him the champion of the state against the church, who, after becoming the foe of communal liberty, had forsaken Italy and withdrawn to France. The Roman people shared these ideas, and awaited Henry with equal impatience, but the nobles rose in opposition. The Orsini, leaders of the Guelphs, and allied with Robert of Naples, took possession of the castle of St. Angelo and the Trastevere. Hence, when Henry reached Rome in May 1312, after seizing the iron crown at Milan, he was obliged to act on the offensive. He took the Capitol by assault, but, failing in his attack on the castle of St. Angelo, was pursued by its Neapolitan garrison. Forsaken by many discouraged adherents, he was forced to recognize the expediency of departure. First, however, he desired to be crowned at the Lateran, St. Peter's being held by his foes. The cardinals refused his request, but were compelled to yield by the threats of the people, who, reasserting their ancient rights, insisted that the coronation should take place without delay. And the ceremony was performed on the 29th of June 1312. The emperor then resolved to depart in spite of the popular protest against his leaving the natural seat of the empire, and on the 20th of August started for Tuscany, where worse fortune awaited him.

Their differences settled, the nobles expelled the captain of the people left by Henry, and elected as senators Sciarra Colonna and Francesco Orsini. But this was the signal for a popular revolt. The Capitol was attacked, the senators put to flight, and Jacopo Arlotti elected captain with a council of twenty-six worthies (buoni homini). The new leader instantly summoned the chief nobles before his tribunal, had them chained and cast into prison, and demolished many of their houses and strongholds. But, having thus humiliated their pride, Arlotti dared not put them to death, and, releasing them from confinement, banished them to their estates, where they plunged into hostile preparations. Meanwhile the victorious people convoked a parliament and decreed that, the aristocracy being now without a leader, the emperor should make his triumphal entry into the Capitol, and receive his authority from the people of Rome. This conception of the Roman power will now be seen to become more and more definite until finding its last expression in Cola di Rienzi. Pope Clement, resigning himself to necessity, acknowledged the new government under the energetic rule of Arlotti. The latter now joined the Ghibellines of the Campagna against the Orsini and the Neapolitans, subdued Velletri, and gave it a podesta. But then the Gaetani, who were Guelphs, united with the Orsini and the Neapolitans, and, giving battle to the Ghibellines in the Campagna, routed them and captured Naples. The nobles forced their way into the city, attacked the Capitol, made Arlotti their prisoner, and re-elected the senators Sciarra Colonna and Francesco Orsini. Close upon these reverses came the death of Henry VII. (24th of August 1313) at Buonconvento near Siena, which put an end to the Ghibelline party in Italy. Thereupon King Robert of Naples, being named senator by the pope, immediately appointed a vicar in Rome. Clement likewise profited by the vacancy of the imperial throne to name the king imperial vicar in Tuscany. And he died on the 20th of April 1314, well content to have witnessed the triumphs of the Guelphs in Italy. Arlotti took fresh turn under Pope John XXII. (1316–34). Rome was still ruled by the vicars of King Robert; but, owing to the continued absence of the popes, matters grew daily worse. Trade and industry declined, revenue diminished, the impoverished nobles were exceedingly turbulent, deeds of murder and violence occurred on all sides; even by day the streets of the city were unsafe. Hence there was universal discontent. While Louis the Bavarian, who in 1314 had been crowned king of the Romans, having overcome his German enemies at Mühldorf in 1322, turned against the pope, one of his fiercest opponents. Louis was surrounded by Minorite friars, supporters of the poverty of the church, and consequently enemies to the temporal power. They were men of the stamp of William of Occam, Marsilio of Padua, Giovanni Janduno, and other philosophers favourable to the rights of the empire and the people. Accordingly the Italian Ghibellines hailed Louis as they had previously hailed Henry. Even the Roman people were roused to action, and, driving out the representatives and partisans of King Robert, in the spring of 1327, seized on the castle of S. Angelo, and again established a democratic government. "Nearly all Italy was stirred to new deeds," says G. Villani, "and the Romans rose to arms in such numbers that the populace (bk. x. c. 20). Regardless of the reproofs of the pope, they elected a haughty Ghibelline, Sciarra Colonna, captain of the people, and general of the militia, with a council of fifty-two popolani, four to each region. Then, ranged under the standards of the militia, the Romans gave chase to the foes of the republic, and Sciarra, returning victorious, ascended to the Capitol and invited Louis the Bavarian to Rome. The summons was obeyed; on the 7th of January 1328 the king was already encamped in the Neronian Fields with five thousand horse and a considerable number of foot soldiers, and, with better fortune than Henry VII., was able to enter the Vatican at once. Encircled by a crowd of heretics, reformers and Minorite brethren, he convoked a parliament on the Capitol, asking that the imperial crown might be conferred upon him by the people, from whom alone he wished to receive it. And the people proclaimed him their captain, senator and emperor. On the 17th of January his coronation took place in St. Peter's. But, as he had neither money nor practical sense, his method of taxation and the excesses committed by himself and his over-excited philosophers speedily aroused the popular discontent. His ecclesiastical vicar, Marsilio of Padua, and
Giovanni Janduno placarded the walls with insulting manifestoes against the pope, whom the Minorites stigmatized as a heretic and wished to depose. In April Louis twice assembled the parliament in St Peter's Square, and, after obtaining its sanction to several anti-papal edicts, declared John XXII. degraded and deposed as a heretic. This was a very strange and novel spectacle, the more so that, as speedily proved, the Romans were stirred by no anti-Catholic spirit, no yearning for religious reform. Jacopo Colonna, a canon of the Lateran, was able to make his way into Rome with four masked companions, to publicly read, at the top of his voice and before a great multitude, the excommunication pronounced against the emperor by the deposed pope, to traverse the entire city, and to withdraw unmolested to Palestrina. Meanwhile the emperor contented himself with decrying that henceforth the popes must reside in Rome,—that if, when invited, they should fail to come they would be thereby held depose from the throne. As a logical consequence, proceedings were immediately begun for the election of the new pope, Nicholas V., who on the 12th of May was proclaimed by the popular voice in St Peter's Square, and received the imperial sanction. But this ephemeral drama came to an end when the emperor departed with his antipope on the 4th of August. This caused the immediate downfall of the democratic government. Bertoldo Orsini, who had returned to Rome with his Guelphs, and Stefano Colonna, were elected senators, and confirmed in the office by Cardinal Giovanni Orsini in the name of the pope. A new parliament cancelled the emperor's edicts, and had them burnt by the public executioner. Later, Nicholas, the antipope, went with a rope about his neck to make submission to John XXIII., and Louis promised to disavow and retract all that he had done against the church, provided the sentence of excommunication were withdrawn. This, however, was refused. Never had the empire fallen so low. Meanwhile King Robert was again supreme in Rome, and, being re-elected senator, appointed vicars there as before. Anarchy reigned. The city was torn by factions, and the provinces rebelled against the French representatives of the pope, who, in their ignorance of Italian affairs, were at a loss how to act.

And after the election of Benedict XII. (1334-42) confusion reached so great a pitch that, on the expiration of Robert's senatorial term, the Romans named thirteen heads of regions to carry on the government with two senators, while the King still adhered to the ordinances of which he had once more granted the supremacy to the senate, and he nominated two knights of Gubbio, Giacomo di Cante dei Gabrielli and Bosone Novello dei Gabrielli, who were succeeded by two other senators the following year. But in 1339 the Romans attacked the Capitol, named two senators of their own choice, re-established a democratic government, and sent ambassadors to Florence to ask for the ordinances of justice (ordinamenti della giustizia), by which that city had broken the power of the nobles, and also that a few skilled citizens should lend their help in the reconstitution of Rome. Accordingly some Florentines were sent with the ordinances, and they may be recognized in the Roman statutes, and, after first rearranging the taxes, elected thirteen priors of the guilds, a gonfalonier of justice, and a captain of the people after the Florentine manner. But there was a dissimilarity in the conditions of the two cities. The guilds having little influence in Rome, the projected reform failed, and the pope, who was opposed to it, re-elected the senators. Thereupon public discontent swelled, and especially when, by the foundation of the papal palace of Avignon, it was evident that Benedict XII. had no intention of restoring the Holy See to Italy. This pope was succeeded in 1342 by Clement VI. (1342-52), and King Robert in 1343 by his own son, and the city was surrounded with great respect from the kingdom in anarchy, likewise aggravated the condition of Rome. For not only were the Neapolitan sovereigns still very powerful there, but the principal Roman nobles held large fiefs across the Neapolitan borders.

Shortly before this another revolution in Rome had re-established the government of the thirteen elders and the two senators. The people, being anxious to show their intention of respecting the papal authority, had despatched to Avignon as ambassador of the republic, in 1343, a man destined to make much noise in the world. This was Cola di Rienzi, son of a Roman innkeeper, a notary, and an impassioned student of the Bible, the fathers, Livy, Seneca, Cicero, and Valerius Maximus. Thoroughly imbued with a half pagan, half Christian spirit, he believed that he had a divinely inspired mission to revive the ancient glories of Rome. Of handsome presence, full of fantastic eloquence, and stirred to enthusiasm by contemplation of the ruined monuments of Rome, he harangued the people with a stilted oratory that enchanted their ears. He hated the nobles, because one of his brothers had been killed by them; he loved the republic, and in its name addressed a stately Latin speech to the astonished pope, and, offering him the supreme power, besought his instant return to Rome. He also begged him to allow the city to celebrate a jubilee every fifteen years, and then, as a personal request, asked to be nominated notary to the visitation of the pope. The pope consented to everything, and Rienzi communicated this good news to Rome in an emphatically worded epistle. After Easter, in 1344, he returned to Rome, and found to his grief that the city was a prey to the nobles. He immediately began to admonish the latter, and then, draped in a toga adorned with symbols, exhibited and explained allegorical designs to the people, and announced the speedy restoration of the past grandeur of Rome. Finally he and a few burghers and merchants, whom he had secretly inflamed by his discourses, made a solemn vow to overthrow the nobility and consolidate the republic. The moment was favourable, owing to the anarchy of Naples, the absence of the pope, the weakness of the empire and the disputes of the barons, although the latter were still very potent and constituted, as it were, a separate government opposed to that of the people. Rienzi, having gained the pope's ecclesiastical vicar to his side, passed in prayer the night of the 10th of May 1347, placing his enterprise under the protection of the Holy Spirit, and the following day marched to the Capitol, surrounded by his adherents, convoked a parliament of the people, and obtained its sanction for the following proposals—that all pending lawsuits should be at once decided; that justice should be equally administered to all; that every stroke of the appearance of anarchy should be punished; that the forts, bridges and gates of the city should be held by the rector of the people instead of by the nobility; and that granaries should be opened for the public use. On the same day, amid general homage and applause, Rienzi was proclaimed head of the republic, with the title of tribune and liberator of the Holy Roman Republic, "by authority of the most merciful Lord Jesus Christ." The nobles withdrew scoffing but alarmed. Rienzi engaged a body-guard of one hundred men, and assumed the command of thirteen hundred infantry and three hundred and ninety light horse; he abolished the senators, retained the ordynamenti, and placed the government in the hands of the administration on a new footing. These measures and the prompt submission of the other cities of the state brought an instant increase of revenue to Rome.

This revolution, as will be noted, was of an entirely novel stamp. For its leader despatched envoys to all the cities of Italy, exhorting them to shelve off the yoke of its tyrants, and send representatives to the parliament convoked for the 1st of August, inasmuch as the liberation of Rome also implied the "liberation of the sacred land of Italy." In Rienzi's judgment the Roman revolution must be, not municipal, but national, and even in some points universal. And this idea, with its breadth and its comprehensiveness, was the fountainhead of the influence of the Cursus honorum, the brief existence of the republic, the altars erected to the spirit of the law, the celebration of the S. Tommaso, the solemnities, of the Constitution, the solemn festivals and processions, as also that blessed feast, the Veni Creator Spiritus. Even the pope, willingly or unwillingly, accorded his approval to
Rienzi's deeds. The provincial cities did homage to Rome and her tribune, and almost all the rest of Italy gave him its enthusiastic adherence. The ancient sovereign people seemed on the point of resurrection. And others besides the multitude were fascinated and carried off their feet. Great men like Petrarch were transported with joy. The poet lauded Cola di Rienzi as a sublime and supernatural being, the greatest of ancient and modern men. But it was soon evident that all this enthusiasm was mainly factitious. On the 26th of July a new parliament was called, and this decreed that all the rights and privileges granted to the empire and church must now be vested in the Roman people, from whom they had first been. But in the composition of the national parliament few representatives obeyed the summons and the scheme was a failure. All had gone well so long as principles only were proclaimed, but when words had to be followed by deeds the municipal feeling awoke and distrust began to prevail. Nevertheless, on the 1st of August Rienzi assumed the spur of knighthood and passed a decree declaring that Rome would now assume her old jurisdiction over the world, invoking the Holy Spirit upon Italy, granting the Roman citizenship to all her cities, and proclaiming them free in virtue of the freedom of Rome. This was a strange jumble of the fanciful Roman idea combined with the medieval It was a dream of Rienzi's brain, but it was also the dream of Dante and Petrarch. The conception of the empire and the history of Italy, particularly that of ancient and medieval Rome, were inevitably preparing the way for the national idea. This Rienzi foresaw, and this constitutes the true grandeur of his character, which in other respects was not exempt from pettiness and infirmity. He pursued his course, therefore, undismayed, and had indeed gone too far to draw back. On the 15th of August he caused himself to be crowned tribune with great pomp, and confirmed the rights of Roman citizenship to all natives of Italy. But practical matters had also to be taken into account, and it was here that his weakness and lack of judgment were shown. The nobles remained steadily hostile, and refused to yield to the charm of his words. Hence conflict was unavoidable; and at first Rienzi succeeded in vanquishing the Gaetani by means of Giovanni Colonna. He next endeavoured to suppress the Guelph and Gibelline factions, and to restore Italy to "holy union" by raising her from her present abasement.

The pope, however, was weary of toleration, and, coming to terms with the nobles, incited them to war. They accordingly moved from Palestrina, and on the 30th of November were encamped before Rome. Rienzi now put forth full energy. He had already called the militia to arms, and a genuine battle took place in which eighty nobles, chiefly of the Colonna clan, were left dead. This was a real catastrophe to them, and the aristocracy never again achieved the rule of the republic. But Rienzi's head was turned by this sudden success. In great need of money, he began to play the tyrant by levying taxes and exacting instant obedience. The papal legate saw his opportunity and seized it, by threatening to bring a charge of heresy against the tribune. Rienzi was dismayed. He declared himself friendly to the pope and willing to respect his authority; and even offered the pope the privilege of choosing his deputy. This at once certain Neapolitan and Hungarian captains, after levying soldiers with the tribune's consent, joined the nobles and broke out in revolt. On their proving victorious in a preliminary encounter with some of Rienzi's guards, the tribune suddenly lost heart, resigned the power he had held for seven months, and took refuge with a few trusty adherents in the castle of St Angelo on the 15th December 1347. Thence he presently fled to Naples, vainly hoping to find aid, and afterwards disappeared for some time from the scene.

Meanwhile the Romans remained tranquil, intent on making money by the jubilee; but no mon was this over than disorders broke out and the tyranny of the baronage recommenced. To remedy this state of things, application was made to the pope. He consulted with a committee of cardinals, who sought the advice of Petrarch, and the poet suggested a popular government, to the complete exclusion of the nobles, since these, he said, were strangers who ruined the city. The people had already elected the Thirteen, and now, encouraged by these counsels, on the 26th of December 1351 chose Giovanni Perrone as head of the republic. But the new leader was unable to withstand the hostilities of the nobles; and in September 1353 Francesco Baroncelli was elected tribune. He was a follower of Rienzi, had been his ambassador to Florence and did little beyond imitating his mode of government and smoothing the way for his return.

Rienzi had spent two years in the Abruzzi, leading a life of contemplation on Monte Maiella. Then, in 1359, he had gone to Prague and endeavoured to convert to his ideas the yet uncrowned emperor Charles IV. When apparently on the point of success, he was sent under arrest to the new pope, Innocent VI. (1352-62), a man of great shrewdness and practical sense. On Rienzi's arrival at Avignon it became evident that his popularity was still very great, and that it would be no easy task to dispose of him. The Romans were imploring his return; Petrarch lauded him as a modern Gracchus or Scipio; and the pope finally released him from confinement. Innocent had decided to send to Italy, in order to settle affairs and bring the state into working order, a visitante, who was to be called Postumus by a Roman, Cardinal Albornoz. And, having no fear that the latter's hand would be forced, he further decided that Rienzi should be sent to give him the support of his own popularity in Rome. In fact, directly the pair arrived Baroncelli was overthrown, the supremacy of the senate granted to the pope and the government confided to Albornoz, who, without concerning himself with Rienzi, nominated Guido Patrizi as senator. He then marched at the head of his troops against Giovanni, prefect of Vico, and forced him to render submission at Montefiascone on the 5th of June 1354. With the same promptitude and skill he reduced Umbria and the Tuscan and Sabine districts, confirmed to leave the privileges of the cities intact in return for their recognition of the papal authority and planted fortresses in suitable positions. In the meantime Rienzi's popularity was increasing in Rome; without either money or arms, the tribune succeeded by his eloquence in winning over the two Provençal leaders, brothers of the famous free captain Fra Monreale; and, seduced by his promises and hopes, they supplied him with funds. Then, profiting by his prestige, the apparent favour of the pope, and the sums received, he was able to collect a band of five hundred soldiers of mixed nationalities and returned towards Rome. On Monte Mario he was met by the garrison. On the 1st of August 1354 he entered the Castello garrison, took possession of the government, named Monreale's two brothers his captains, and sent them to lay siege to Palestrina, which was still the headquarters of the Colonna. But then money ran short, and he again lost his head. Inviting Fra Monreale to a banquet, he put him to death for the sake of his wealth, and kept the two brothers in confinement. This act excited general indignation. And when, after his ill-gotten gains were spent, he again recurred to violence to fill his purse, the public discontent was vented in a sudden revolt on the 5th of October. The people stormed the Capitol with cries of "Death to the traitor." Rienzi presented himself at a window waving the flag of Rome. But the charm was finally broken. Missiles were hurled at him; the palace was fired. He hid himself in the courtyard, shaved his beard and, disguised as a shepherd with a cloak over his head, slipped into the crowd and joined in their cries against himself. Being recognized, however, by the golden bracelets he had forgotten to remove, he was instantly stabbed. For two days his corpse was left exposed to the insults of the mob, and was then burned. Such was the wretched end of the man who, at one moment, seemed destined to fill the world with his name as the regenerator of Rome and of Italy. But all the Italian cities the overthrow of the aristocracy had led to military impotence and pressing danger of tyranny. The same thing had happened in Rome when the nobility, weakened by the absence of church and empire, received its death-blow.
from Rienzi. But, whereas elsewhere tyrants were gradually arising in the citizen class, Rome was always in danger of oppression by the pope. Nor was any aid available from the empire, which had never recovered from its abasement under Louis the Bavarian. In fact, when Charles of Luxembourg came to Rome to be crowned, he was obliged to promise the pope that he would not enter the city. On Easter day 1355 he received the crown, and departed after counselling the Romans to obey the pope. And the pontiffs had greater need than ever of an established kingdom. Their position in France was much endangered by that country's disorder. New states were being formed on all sides; the medieval unity was shattered; and the shrunken spiritual authority of the church increased her need of material strength. As Italian affairs stood, it would be easy for the popes to found a kingdom, but their presence was required in Rome before it could be firmly established. The blood-stained sword of Albornoz had prepared the way before them. In 1355-56 he vanquished the lords or tyrants of Rimini, Fano, Fossombrone, Pesaro, Urbino and other cities; and all these places had been restored to the papacy. It was evident that the cardinal was often hailed as a liberator by subduing their masters by fire and sword. But everywhere he had been obliged to leave existing governments and rulers in status quo after exacting their oaths of fealty. Thus the state was still discovered, and it was impossible to bind it together with the pope at Avignon and Rome a republic. Bologna was still independent, Ordelaffi still lord of Forlì; Cesena and other cities were still rebellious; and the Campagna was still in the hands of the barons. Some places were ruled by rectors nominated by the pope; at Montefiascone there was an ecclesiastical rector, with a bench of judges, and a captain commanding a mixed band of adventurers. Rome had submitted to the haughty cardinal, but hated him mortally, and, on his departure for Avignon in 1357 to assist the threatened pontiff, immediately conceded to the latter the supremacy of the senate. And the pope, instead of two senators, hastened to name a single one of foreign birth. This was a shrewd device of Albornoz and another blow to the nobles, with whom he was still at war. Thus was inaugurated, by the nomination of Raimondo de'Tolomei in 1358, a series of foreign senators, fulfilling the functions of a podestà, and changing every six months, together with their staff of judges, notaries and knights. The whole policy proved war with Milan and the anti-Milan by the feudal lord, which was to the advantage of the nobles and favourable to the preservation of liberty. Hitherto the senators had been assisted, or rather kept in check, by the thirteen representatives of the regions. These were now replaced by seven reformers, in imitation of the priors of Florence, the better to follow that city's example. The reformers were soon the veritable chiefs of the republic. They first appeared in 1360, were either popolani or cavalieri, and were elected by ballot every three months. When Albornoz returned to Italy, although desirous to keep Rome in the same subjection as the other cities, he had first to vanquish Ordelaffi and reduce Bologna. The latter enterprise was the more difficult task, and provoked a lengthy war with Milan and the great house of the Visconti of Milan. Thus Rome, being left to herself, continued to be governed by her reformers; and the nobles, already shut out from power, were also excluded from the militia, which had been reorganized, like that of Florence, on the democratic system.

Three thousand men, mostly archers, were enrolled under the command of two banderesi, "in the likeness," says M. Villani, "of our gonfalones of the companies," with four antepossiti constituting a supreme council of war. And the whole body was styled the "Felix Societas Balestrariorum et Pavesatorum." It was instituted to support the reformers and re-establish order in the city and Campagna, to keep order and, as far as possible, to discharge these duties with much, and sometimes excessive, severity. Banderesi and antepossiti had seats in the special council beside those of the reformers, as, in Florence, the gonfalones of the companies were seated beside the priors. Later these officials constituted the so-called signoria dei banderesi. In 1362, the Romans having subjected Velletri, which was defended by the nobles, the latter made a riot in Rome. Thereupon the banderesi drove them all from the city, killed some of their kindred, and did not even spare the cavalieri. The fight became so furious that from gate to gate all Rome was in arms, and even mercenaries were hired. But in the end renewed submission was made to the pope.

On the death of Innocent VI. in 1362, an agreement was concluded with his successor, Urban V. (1366-70), also a Frenchman, who was obliged to give his sanction to the government of the reformers and banderesi. And then, Albornoz being recalled in disgrace to Avignon, and afterwards sent as legate to Naples, these Roman magistrates were able, with or without the co-operation of the foreign senator, to rule in their own way. They did justice on the nobles by hanging a few more; and they defended the city from the threatening attacks of the mercenaries, who had now become Italy's worst foes. It was at this period that the Roman statutes were revised and rearranged in the compilation erroneously attributed by some to Albornoz. A new code had come down to us supplemented by alterations of a later date.

But now the popes, being no longer in safety at Avignon, really decided to return to Italy. Even Urban V. had to pay ransom to escape from the threatened attacks of the free companies. The Romans implorèd his return, and he was further urged to it by the Italian literati, with Petrarch at their head. In April 1367 he finally quitted Avignon, and, entering Rome on the 10th of October, was given the lordship of the city. Cardinal Albornoz had fallen mortally ill at Viterbo, but, though unable to accompany the pope to Rome, had, before dying, suggested his course of action. Certainly Urban showed much concern in profiting by the first burst of popular enthusiasm to effect quick and dexterous changes in the constitution of the republic. After naming a senator, he abolished the posts of reformers and banderesi, substituting three conservators, or rather a species of municipal council, alone charged with judicial and administrative powers, which has lasted to the present day. The thirteen leaders of the regions and the consuls of the gilds still sat in the councils, which were left unsuppressed. But all real power was in the hands of the pope, who, in Rome, as in his other cities, nominated the principal magistrates. Thus, by transferring political into civil institutions and concentrating the supreme authority in his own grasp, Urban V. dealt a mortal blow to the liberties of Rome. Yet he felt no sense of security among a people who, after the first rejoicings over the return of the Holy See, were always on the brink of revolt. Besides, he felt himself a stranger in Italy, and was so regarded. Accordingly, in April 1370 he decided to return to France; on the 20th of that month he wrote from Viterbo that no change was to be made in the government; and he died in Avignon on the 19th of December.

The Romans retained the conservators, conferring on them the political power of the reformers; they re-established the banderesi with the Florentine title of executores judicialiter and the four antepossiti with that of consiliarii. Thus the "Felix Societas Balestrariorum et Pavesatorum Urbis" was restored, and the two councils met as before. The new French pope, Gregory XI. (1370-78), had to be content with obtaining supremacy over the senate and the possession of the castle of St. Angelo. It was a difficult moment for him. The Florentines had come to an open rupture with his legates, and had adopted the expedient of inviting all the cities of the Roman state to redeem their lost freedom. Accordingly, in 1375 many of them rose against the legates, who were mostly French and regarded with suspicion and envy, for the Florentine democracies, full of classical allusions and chiefly composed by the famous scholar Secretary Coluccio Salutati, were rapidly sent in all directions. Those addressed to the Romans were specially fervid, and emphatically appealed to their patriotism and memories of
the past. But the Romans received them with doubt and mistrust, for they saw that the revolution threatened to dismember the state, by promoting the independence of every separate city. Besides, while maintaining their republic, they also desired the pope's presence in Rome. Nevertheless, they went with the current to the extent of reforming their constitution. In February 1376 they nominated Giovanni Cencel captain of the people, and gave him uncontrolled power over ROME

women. In the same month the Great Council of Anagni, meeting with the Roman Senate, declared the Freemen and the Senators, the two councils of the three, were created, the antepositi and the two councils were all preserved, and a new magistracy was created, the "Trea Gubernatores Pacis et Libertatis Republcae Romanae." This answered to the Eight (afterwards Ten) of War in Florence, likewise frequently called the Eight of Liberty and Peace. It was this Council of Eight that was now directing the war against the pope and braving his sentence of excommunication; and their fiery zeal had won them the title of the Holy Eight from the Florentines.

Realizing that further absence would cost him his state, Gregory XI. quitted Avignon on the 13th of September 1376, and, reaching Corneto in December, despatched to Rome three legates, who, on the 21st of the month, concluded an agreement with the parliament. The people gave up the gates, the fortresses and the Trastevere, and promised that if the pope returned to Rome he should have the same powers which had been granted to Urban V. But, on his side, he must pledge himself to maintain the executores and their council, and allow the Romans the right of reforming the banderesi, who would then bear fealty to him. The terms of this peace and the pope's epistles clearly prove that the two councils still exercised their functions, that the banderesi were still the virtual heads of the government, and that their suppression was not contemplated.

In fact, when the pope made his entry on the 17th of January 1377, accompanied by two thousand armed men, he perceived that there was much public agitation, that the Romans did not intend to fulfill their agreement, and that the government of the banderesi went on as before. Accordingly, after naming Gomez Albornoz, a nephew of the deceased cardinal, to the office of senator, he retired to Anagni, and remained there until November 1377. The Romans presently waited on him with conciliating offers, and begged him to negotiate a peace for them with the prefect of Vico. In fact, the treaty was concluded at Anagni in October, and on the 10th of November confirmed in Rome by the general council. The meeting was held in the great hall of the Capitol, ubi consilia generalia urbis fieri solent, in the presence of all the members of the republican government. But the pope was enraged by the survival of this government, and, being worn out by the persistent hostility of the Florentines, which reduced his power to a low ebb, had determined to make peace, when surprised by death on the 27th of March 1378.

The next pope, Urban VI. (1378-80), a Neapolitan, was the spirit of discord incarnate. His election was not altogether regular: the French party among the cardinals was against him; and the people were ripe for insurrection. But, regardless of all this, Urban threatened the cardinals in his first consistory, saying that church reform must begin with them; and he used the same tone with the people, reproving them for failing to suppress the banderesi. In consequence of this threat, the French party, assembling at Fondi, elected the antipope Clement VII. II. 1378-89, and started a long and shameful in church. Clement resided in the city, while Urban in Rome was engaged in opposing Queen Joanna I. of Naples and favouring Charles of Durazzo, who, on conquering the Neapolitan kingdom, was made gonfalonier of the church and senator of Rome, where he left a vicar as his deputy. Shortly afterwards the pope went to Naples, and made fierce war on the king. Then, after many adventures, during which he tortured and put to death several cardinals whom he suspected of hostile intentions, he returned to Rome, where the utmost disorder prevailed. The conservators and the banderesi were still at the head of the government, and, the pope speedily falling out with them, a riot ensued, after which he excommunicated the banderesi. These at last made submission to him, and Urban VI. became master of Rome before his death in 1389. He was succeeded by Boniface IX. (1389-1404), another Neapolitan, but a man of greater shrewdness and capacity. His first act was to crown Ladislaus king of Naples, and secure the friendship and protection of this ambitious and powerful prince. In all the principal cities of the state he chose the reigning lords for his vicars. But he allowed, Ferro, Ascoli and Bologna the privilege of assuming their own vicariate for twenty-five years. And, as these different potentes and governments had only to pay him an annual tribute, all parties were satisfied, and the pope was able to bestow at least an appearance of order and unity on his state. But fresh tumults soon arose, partly because the conservators and banderesi sought to govern on their own account, and especially because the pope seems for a time to have omitted naming the senator. Boniface was a prudent man; he saw that events were turning in his favour, now that throughout Italy liberty was tottering to its fall, and bided his time. He was satisfied for the moment by obtaining a recognition of the immunities of the clergy, rendering them solely amenable to ecclesiastical tribunals, and thus distinguishing the powers of the church from those of the state in Rome. The republic also pledged itself neither to molest the prelates nor to levy fresh contributions on them towards repairing the walls, to aid in recovering the estates of the church in Tuscia, and to try to conciliate the barone. This concordat, concluded with the conservators and banderesi on the 11th of September 1391, was also confirmed on the 9th of March 1392 by the heads of the regions, together with a fresh treaty binding both parties to furnish a certain number of armed men to combat the prefect of Vico and the adherents of the antipope at Viterbo. With the exception of this city, Orchi and Civita Vecchia, all other conquered territory was to belong to the republic. But the Romans soon discovered that they were playing into the hands of the pope, who kept everything for himself, without even paying the troops. Upon this a riot broke out; Boniface fled to Anagni in October 1392, and arrived there to exact better terms when next recalled to Rome. Meanwhile the Romans subdue the prefect, captured Viterbo, and, being already repentant, handed it over to the pope and implored his return. He then proposed his own terms, which were approved, not only by the conservators, banderesi and four councillors, but also by the special council and by the unanimous vote of a general assembly, composed of the above-mentioned authorities, heads of regions, other officials and a hundred citizens (8th August 1393). These terms prescribed that the pope was to elect the senator, and that, on his failing to do so, the conservators would carry on the government after swearing fealty to him. The senatorial function was to be neither controlled nor hampered by the banderesi. The immunities of the clergy were to be preserved, and all church property was to be respected by the magistrates. The expenses of the pope's journey were to be paid, and he was to be escorted to Rome in state. Boniface tried to complete his work by abolishing the banderesi, the last bulwarks of freedom; but the people, although weakened and weary, made efforts to preserve them and, although their fall was inevitable, the senate went on for some time.

During the spring of 1394 the banderesi provoked an insurrection in which the pope's life was endangered; it was only saved by the arrival of King Ladislaus, who came from Naples with a large force in the early autumn. But for the Neapolitan soldiery Boniface could not have withstood the long series of revolts that continually exposed him to fresh perils and the anxiety caused by the persistent schism of the church. The death of Clement VII. in 1394 was followed by the election of
another antipope, Benedict XIII. But a new jubilee was in prospect for the year 1400, and this was always an efficacious means of bending the will of the Romans. Depending upon this and the assistance of Ladislaus, Boniface not only demanded full powers to nominate senators (some having been recently elected), but insisted on the suppression of the banderesi. Both requests were granted; but, directly Angelo Aliscioni was made senator, a conspiracy was hatched for the re-establishment of the banderesi. However, the pope felt sure of his strength; the plot was discovered and the conspirators were beheaded on the stairs of the Capitol. This proved the end of the banderesi and of the liberties of Rome. The government was again directed by an alien senator together with three conservators; but the latter were gradually deprived of their political attributes, and became mere civil officers. The militia, regions, guilds and other associations now rapidly lost all political importance, and before long were little more than empty names. Thus in 1398 the Romans submitted to the complete sway of the pope, and in July of the same year the senator chosen by him was Malatesta dei Malatesti of Rimini, one of a line of tyrants, a valiant soldier, who was also temporal vicar and captain-general of the church. Boniface continued to appoint foreign senators during the rest of his life; he fortified the castle of St. Angelo, the Vatican and the Capitol; he stationed galleys at the mouth of the Tiber, and proved himself in all things a thoroughly temporal prince. He aggrandized all his kindred, especially his brother, and, with the aid of his senator, his armed force and the protection of Ladislaus, succeeded in keeping down all the surviving nobles. In 1400, however, these made an attempt to upset the government. Niccolò Colonna forced his way into the city with cries of "Popolo, popolo! death to Boniface!" But the Romans had grown deaf to the voice of liberty; they refused to rise, and the senator, a Venetian named Zaccaria Trevisan, behaved with much energy. Colonna and his men had to beat a swift retreat to Palestrina. A charge of high treason was immediately instituted against him, and thirty-one rebels were beheaded. The pope then proclaimed a crusade against all the Colonna, and sent a body of two thousand men and some of the Neapolitan soldiery to attack them. Several of their estates were seized. The Colonna were again confounded. The banderesi held out, and on the 7th of January 1401 the Colonna finally made submission to the pope. Nevertheless, they obtained advantageous terms, for Boniface left them their lands, appointed them vicars of other territories, and made similar agreements with the Gaetani and Orsini. In this way he became absolute master of Rome.

One chronicler remarks that "Romanis tanquam rigidus imperator dominabatur," and the same tone is taken by others. But he did not succeed in putting an end to the schism of the church, which was still going on when he died in the Vatican on the 1st of October 1404.

Innocent VII. (1404–6) was the next pope. He too was a Neapolitan, and on his election the people rose in revolt and refused to acknowledge him unless he consented to resign the temporal power. But Ladislaus of Naples hastened to his help, and an agreement was made which, under the cover of apparent concessions, really riveted the people's chains. Rome was recognized as the seat of the temporal and spiritual sovereignty of the pope, and the pope continued to appoint the senator. The people were to elect seven governors of the city, who were to swear fealty to the pope and carry on the government in conjunction with three other governors chosen by the pontiff or Ladislaus. The stipulations of Boniface IX. concerning ecclesiastical matters were again confirmed. The banderesi were forbidden to place more than five lances each at the service of the people, and—which was the real gist of the covenant—the people were henceforth forbidden to make laws or statutes without the permission of the pope. The captain of the people, deprived of his political and judicial functions and reduced to a simple judge, was also to be chosen by the pope. But this treaty, drawn up on the 27th of October 1404, was not signed at the time, and many difficulties and disturbances arose when its terms were to be put into effect. The Romans nominated the seven governors, but, without waiting until the pope had chosen three more, placed the state in their hands, and styled them "governors of the liberty of the Roman Republic." They were, in fact, banderesi or reformatori under a new name. But the attempt proved inefficacious, for, at the pope's first threat of departure, the Romans made their submission, and the treaty which October was subscribed on the 15th of May 1405. Nevertheless, as it only bears the signatures of the "seven governors of the liberty of the Roman Republic," the pope would seem to have made some concessions. His position was by no means assured. Ladislaus was known to aspire to absolute dominion in Italy, and, although willing to aid in suppressing the republic, tried to prepare the way for his own designs, and frequently held out a helping hand to the vanquished. On the 6th of August fourteen influential citizens of Rome boldly presented themselves at the Vatican, and in a threatening manner called the pope to account for giving his whole attention to worldly things, instead of endeavouring to put a stop to the schisms of the church. But, on leaving his presence, they were attacked by Luigi Migliorati, the pope's nephew, and notorious for his violence, who killed eleven of their number, including several heads of the regions and two of the governors. An insurrection ensued, and the pope and his nephew fled to Viterbo. The Colonna tried to profite by these events, and applied to Ladislaus, who, hoping that the moment had come to make himself master of Rome, sent the count of Tirolo thither with a troop of three thousand horse. But the people, enraged by this treachery, and determined not to fall under the yoke of Naples, awoke for an instant to the memory of their past glories, and bravely repulsed the Colonna and the Neapolitans. And, on the speedy arrival of the Orsini with some of the papal troops, the people voluntarily restored the papal government, and, assembling the parliament, besought the pope to return on his own terms. Accordingly, after first naming Francesco Panciatichi of Pistoia to the senatorship, the pope came back on the 13th of March 1406, bringing his whole curia with him, and also the murderer Migliorati, who, triumphing in impunity, became more arrogant than before. Here indeed was a proof that the Romans were no longer worthy of liberty! And now, by means of the Orsini, Innocent indulgently took it into his head to force other nobles raised to power by Ladislaus; nor was this very difficult, seeing that the king, in his usual fashion, abandoned them to their fate, and, making terms with the pope, was named gonfalonier of the church and again protected her cause.

Innocent, dying in 1406, was succeeded by Gregory XII., a Venetian, who, as we shall presently see, resigned the chair in 1415. On his accession, finding his state firmly established, he seemed to be seriously bent on putting an end to the Great Schism, and for that purpose arranged a meeting with the antipope Benedict XIII. at the congress of Savona in 1408. But Gregory and Benedict only used the congress as a pretext for making war upon each other, and were urged on by Ladislaus, who hoped by weakening both to gain possession of Rome, where, although opposed by the Orsini, he had the support of the Colonna. Gregory, who had then fled from Rome, made a momentary attempt to win the popular favour by restoring the government of the banderesi; but Ladislaus marched into Rome in June 1408 and established a senator of his own. Meanwhile the two popes were continuing their shameful struggle, and the council of Pisa (March 1409), in attempting to check it, only succeeded in raising up a third pontiff, first in the person of Alexander V. (1409–10), and then the turbulent John XXIII. (1410–11) was elected, the name of John XXIII. The latter began by sending a large contingent to assist Louis of Anjou against Ladislaus. But the enterprise failed, and, seeing himself deserted by all, Pope John next embraced the cause of his foe by naming him gonfalonier of the church. Thereupon Ladislaus concluded a shameful peace, and then, seizing Rome, put it to the sack and established his own government there. Thus John, like the other two popes,
became a wanderer in Italy. In August 1414 Ladislaus died, and was succeeded by the scandalous Queen Joanna II. The Roman people promptly expelled the Neapolitans, and Cardinal Isolani, John's legate, succeeding in rousing a reaction in favour of the church, constituted a government of thirteen "conservators" on the 19th of October.

In November 1414 the council of Constance assembled, and at last ended the schism by depositing all the popes and incorporating the Roman claim of St. Peter into the French line of St. Peter. On the 11th of November 1417 Oddo Colonna was unanimously elected to the papal chair; he was consecrated in the cathedral on the 27th as Pope Martin V., and, being acknowledged by all, hastened without delay to take possession of his see. Meanwhile disorder was at its height in Rome. The cardinal legate Isolani governed as he best could, while the castle of St. Angelo remained in the hands of the Neapolitans, who still had a party in the city. In this divided state of affairs, Braccio, a daring captain of adventurers, nicknamed Forbebraccio, was inspired with the idea of making himself master of Rome. Overcoming the feeble resistance offered to him, he succeeded in this on the 16th of June 1416, and assumed the title of "Defensor Urbis." But Joanna of Naples despatched Sforza, an equally valiant captain, against him, and, without offering battle, Forbebraccio withdrew on the 26th of August, after having been absolute master of the Eternal City for seventy days. Sforza marched in on the 27th and took possession of the city in the name of Joanna. Martin V. instantly proved himself a good statesman. He confirmed the legate Isolani as his vicar and Giovanni Savelli as senator. Leaving Constance on the 16th of May 1418, he reached Milan on the 28th of October, and slowly proceeded on his journey. While in Florence he despatched his brother and nephew to Naples to make alliance with Joanna, and caused her to be crowned on the 28th of October 1415 by his legate Morosini. Upon this she promised to give up Rome to the pope. Her general, Sforza, then entered the service of Martin V., and compelled Forbebraccio, who was lingering in a threatening attitude at Perugia, to make peace with the pope. The latter entrusted Forbebraccio with the conduct of the campaign against Bologna, and that city was reduced to subjection. In the month of July 1417, the Romans had already yielded to Martin's brother the legate, and now earnestly besought the arrival of their pope. Accordingly, he left Florence on the 10th of September 1420, and entered the Vatican on the 28th. Rome was in ruins; nobility andburghers were equally disorganized, the people unable to bear arms and careless of their rights, while the battered walls of the Capitol recorded the fall of two republics.

Martin V. had now to fulfil a far more difficult task than that of taking possession of Rome. Throughout Italy municipal freedom was overthrown, and the Roman Republic had ceased to exist. The Middle Ages were ended; the Renaissance was beginning. The universal unity both of church and of empire was dissolved; the empire was now Germanic, and derived its principal strength from direct dominion over a few provinces. Independent and national states were already formed or forming on all sides. The papacy itself had ceased to claim universal supremacy over the world's governments, and the possession of a temporal state had become essential to its existence. In fact, Martin V. was the first of the series of popes who were real sovereigns, and more occupied with politics than with religious questions. The popes had all the foreign intrigues, falsehoods and treacheries of Italian diplomacy in the 15th century, their internal policy was imbued with all the arts practised by the tyrants of the Renaissance, and nepotism became necessarily the basis of their strength. It was natural that men suddenly elected sovereigns of a new country where they had no ties, and of which they had often no knowledge, should seek to strengthen their position by aggrandizing so-called nephews who were not unfrequently their sons.

Martin V. reduced the remains of the free Roman government to a mere civil municipality. Following the method of the other despots of Italy, the old republican institutions were allowed to retain their names and forms, their administrative and some of their judicial attributes, while all their political functions were transferred to the new government. Order was re-established, and justice rigidly observed. Many rebellious places were subdued by the sword, and many leaders of armed bands were hanged. The pope, however, was forced to lean on his kinsmen the Colonna and again raise them to power by grants of vast fiefs both in his own state and the Neapolitan territory. And, after first supporting Joanna II., who had assisted his entry into Rome, he next sided with her adversary, Louis of Anjou, and then with Alphonso of Aragon, the conqueror of both and the constant friend of the pope, who at last felt safe on his throne. Rome now enjoyed order, peace and security, but had lost all hope of liberty. And when Martin died (26th February 1431) these words were inscribed on his tomb, "Temporum suorum felicitas."

Eugenius IV. (1431–47) leant on the Orsini, and was fiercely opposed by the Colonna, who excited the people against him. Accordingly on the 26th of May 1434 the Romans rose in revolt to the old cry of "Popolo e popolo," and again constituted the rule of the seven governors of liberty. The pope fled by boat down the Tiber, and, being pursued with stones and shots, narrowly escaped with his life. On reaching Florence, he turned his energies to the recovery of the state. It was necessary to quell the people; but, first of all, the Colonna and the clan of the prefects of Vico, with their renewed princely power, had to be overthrown. The Orsini were still his friends. Eugenius entrusted the campaign to Patriarch (afterwards Cardinal) Vitelleschi, a worthy successor of Albornoz, and of greater ferocity if less talent. This leader marched his army towards Rome, and, instantly attacking Giovanni, prefect of Vico, captured and beheaded him. The family was now extinguished; and its possessions reverting to the church, the greater part of them were sold or given to Count Everso d'Anguillara, of the house of Orsini. The prefecture, now little more than an honorary title, was bestowed at will by the popes. Eugenius gave it to Francesco, founder of the powerful line of the Gravina-Orsini. Thus one noble family was raised to greatness while another perished by the sword. Vitelleschi had already begun to persecute the Colonna and the Savelli, and committed terrible slaughter among them. Many castles were demolished, many towns destroyed; and their inhabitants, driven to wander famine-stricken over the Campagna, had to sell themselves as slaves for the sake of bread. Finally the arrogant patriarach marched into Rome, as into a conquered city, at the head of his men, and the Romans crouched at his feet. The pope now began to mistrust him, and sent Scarampo, another prelate of the same stamp, to take his place. This new commander soon arrived, and, perceiving that Vitelleschi proposed to resist, had him surrounded by his soldiers, who were obliged to use force to compel his surrender. Vitelleschi was carried bleeding to the castle of St. Angelo, where he soon afterwards died. The pope at last returned to Rome in 1443, and remained there quietly till his death in 1447.

His successor Nicholas V. (1447–55) was a scholar solely devoted to the patronage of literary and artists. During his reign, Rome was a free city, and there was no/mpidency. It was rather prompted by literary and classical enthusiasm than by any genuine patriotic ardour. Political passions and interests had ceased to exist. The conspiracy was headed by Stefano Porcari, a man of the people, who claimed to be descended from Cato. He had once been captain of the people in Florence, and was made podestà of Bologna by Eugenius IV. He was a caricature of Cola di Rienzi, and extravagantly proud of his
Latin speeches in honour of ancient republican liberty. The admiration of antiquity was then at its height, and Porcari found many enthusiastic hearers. Directly after the death of Eugenius IV. he made a first and unsuccessful attempt to proclaim the republic. Nevertheless Nicholas V., who had prompted him to pardon Valla for denying the temporal power of the papacy and laughing to scorn the pretended donation of Constantine, freely pardoned Porcari and named him podestà of Anagni. He filled this office with credit, but on his return to Rome again began to play the agitator, and was banished to Bologna with a pension from the pope. Nicholas V. had conferred all the state offices upon priests and abbots, and had erected numerous fortresses. Hence there were many malcontents in Rome, in communication with Porcari at Bologna, and ready to join in his plot. Arms were collected, and on the day fixed he presented himself to his fellow-conspirators adorned with rich robes and a gold chain, and parangued them in Latin on the duty of freeing their country from the yoke of the priests. His design was to set fire to the Vatican on the 6th of January 1453, the feast of the Epiphany; he and his followers were to seize the pope, the cardinals and the castle of St. Angelo. But Nicholas received timely warning; the conspirators’ house was surrounded; and Porcari himself was seized while trying to escape, confined in the castle of St. Angelo, and put to death with nine of his companions on the 9th of January. Others shortly suffered the same fate.

Under Calixtus III. and Pius II. affairs went on quietly enough, but Pius II. (1458-71) had a somewhat troubled reign. Yet he was a skilled politician. He re-ordered the finances and the courts of justice, punished crime with severity, was an energetic foe to the Malatesta of Rimini, put an end to the oppression exercised in Rome by the wealthy and arrogant house of Anguillara, and kept the people in good humour with continual festivities. But—and this was a grave defect at that period—he extended no favour to learning, and, by driving many scholars from the curia to make room for his own kinsmen, brought a storm about his ears. At that time the house of Pomponio Leto was the rendezvous of learned men and the seat of the Roman Academy. Leto was an enthusiast of antiquity; and, as the members of the Academy all assumed old Latin names, they were suspected of a design to re-establish paganism and the republican government. It is certain that they all inveighed against the pope; and, as the latter was no man of half measures, during the carnival of 1468 he suddenly imprisoned twenty Academicians, and even subjected a few of them to torture. Pomponio Leto, although absent in Venice, was also arrested and tried; but he exculpated himself, craved forgiveness, and was set at liberty. His friends were also released, for the charge of conspiracy was unfounded. Certain members of the Academy, and notably Platina in his Lives of the Popes, afterwards revenged themselves by stigmatizing Paul II. as the persecutor of philosophy and letters. But he was no more a persecutor than a patron of learning; he was a politician, the author of some useful reforms, and solely intent on the consolidation of his absolute power. Among his reforms may be classed the revision of the Roman statutes in 1469, for the purpose of destroying the substance while preserving the form of the old Roman legislation, and entirely stripping it of all political significance. In fact the pope’s will was now absolute, and even in criminal cases he could trample unhindered on all the laws and customs.

There was still a senator of Rome, whose nomination was entirely in the hands of the pope, still three conservators, the heads of the rioni, and an elected council of twenty-six citizens. Now and then a shadowy semblance of a popular assembly was held to cast dust in the eyes of the public, but even this was not for long. All these officials, together with the judges of the Capitol, retained various attributes of different kinds. They administered justice and gave sentence. There were numerous tribunals all with undefined modes of procedure, so that it was very difficult for the citizens to ascertain in which court justice should be sought. But in last resort there was always the supreme decision of the pope. Thus matters remained to the time of the French Revolution.

For the completion of this system a final blow had to be dealt to the aristocracy, whose power had been increased by nepotism; and it was dealt by bloodshed under the three following popes—Sixtus IV. (1471-84), Innocent VIII. (1484-92) and Alexander VI. (1492-1503)—each of whom was worse than his predecessor. The first, by means of his nephews, continued the slaughter of the Colonna, sending an army against them, devastating their estates at Marino, and beheading the protomartyr Lorenzo Colonna. Innocent VIII. was confronted by the power of the Orsini, who so greatly endangered his life by their disturbances in the city that he was only saved by an alliance with Naples. Neither peace nor order could be lastingly established until these arrogant barons were overthrown. This task was accomplished by the worst of the three pontiffs, Alexander VI. All know how the massacre of the Orsini was compassed, almost simultaneously, by the pope in Rome and his equally inquisitive son, Caesar Borgia, at Sinigaglia (1502). This pair dealt the last blow to the Roman aristocracy and the tyrants of Magna, and thus the temporal dominion of the papacy was finally assured. The republic was now at an end; it had shrivelled to a civil municipality. Its institutions, deprived of all practical value, lingered on like ghosts of the past, subject from century to century to unimportant changes. The history of Rome is henceforth absorbed in that of the papacy.

Nevertheless the republic twice attempted to rise from its grave, and on the second occasion gave proofs of heroism worthy of its most glorious past. It was first resuscitated in February 1798, by the influence of the French Revolution, and the French constitution of the year III. was rapidly imitated. Rome had again two councils—the tribunate and the senate, with five consuls constituting the executive power. But in the following year, owing to the military reverses of the French, the government of the popes was restored until 1809, when Napoleon I. annexed to his empire the States of the Church. Rome was then governed by a consulta straordinaria—a special commission—with the municipal and provincial institutions of France. In 1814 the papal government was again reinstated, and the old institutions, somewhat modified on the French system, were recalled to life. Pius IX. (1846-77) tried to introduce political reforms, and to improve and simplify the old machinery of state; but the advancing tide of the Italian revolution of 1848 drove him from Rome; the republic was once more proclaimed, and had a brief but glorious existence. Its programme was dictated by Giuseppe Mazzini, who with Saffi and Armellini formed the triumvirate at the head of the government. United Italy was to be a republic with Rome for her capital. The rhetorical idea of Cola di Rienzi became hercule in 1849. The constituent assembly (9th February 1849) proclaimed the fall of the temporal power of the popes, and the establishment of a republic which was to be not only of Rome but of all Italy. France, although then herself a republic, assumed the unenviable task of re-establishing the temporal power by force of arms. But the gallant defence of Rome by Garibaldi covered the republic with glory. The enemy was repulsed, and the army of the Neapolitan king, sent to restore the pope, was also driven off. Then, however, France despatched a fresh and more powerful force; Rome was vigorously besieged, and at last compelled to surrender. On the 2nd of July 1849 the heroic general de Navarre crossed the Rubicon of his fortunes. Almost at the same time the constituent assembly proclaimed in the Capitol the constitution of the Roman Republic. Immediately afterwards the French restored the government of Pius IX., whose reign down to 1870 was that of an absolute sovereign. Then the Italian government entered Rome (20th September 1870), proclaimed the national constitution (9th October 1870), and the Eternal City became the capital of Italy. Thus the
ROME

scheme of national unity, the natural outcome of the history of Rome and of Italy, impossible of accomplishment under the rule of the popes, was finally achieved by the monarchy of Savoy, which, as the representative and personification of Italian interests, abolished the temporal power of the papacy and made Rome the seat of government of the united country (see ITALY).

AUTHORITIES.—The history of the commune of Rome in the middle ages is to be collected from Romish, Genoese, and Venetian sources, special treaties, or from the general histories of the papacy. The greater part of the facts are to be found in the Liber Pontificalis, edited by the Abbé Duchesne (3 vols., Paris, 1886-92), and in the Liber Pontificalis Romano-Fasciculis (4 vols., Innsbruck, 1868-74); Savigny, Geschichte des römischen Rechts im Mittelalter (frequently reprinted and translated into all the principal languages); Leo, Entwickelung der Verfassung der lombardischen Stätte (Hamburg, 1824); M. A. von Bemthann-Hollweg, Ursprung der lombardischen Städtefreihet (Anhang: Schicksale der römischen Städteverfassung im Exarhat und in Rom) (Bonn, 1846); Hegg, Geschichte der lombardischen Städtefreihet (Leipzig, 1848); Giesbrecht, "Über die städtischen Verhältnisse im X. Jahrhundert," at end of vol. 1. of Geschichte der deutschen Kaiserzeit (Brunswick, 1867); "Studien und documente di storia e diritto," in Annuario di Convenzioni, 1886; Archivio storico italiano; Società Romana di Storia Patria (the other publications of the same society, as, e.g., the Regesto di Foro, may also be consulted with advantage. P. Papencordt, Geschichte der Stadt Rom (Paderborn, 1871); id. G. Friedrich, Geschichte der Stadt Rom, von ihrer Gründung bis auf das Ende des Mittelalters (5 vols., Stuttgart, finished in 1872; 3rd ed., Stuttgart, 1875-81); A. von Reumont, Geschichte der Stadt Rom (3 vols., Berlin, 1867-68).

Among more recent works see especially M. Creighton, History of the Papacy (London, 1897); L. Pastor, Geschichte der Päpste seit dem Ausgang des Mittelalters (Freiburg i.B., 1886, &c.), a learned work, but a historical and descriptive account rather than a work of impartial research. The history of Rome is contained also in the works of F. Del Maret, Geschichte der Stadt Rom (Paderborn, 1871); id. G. Friedrich, Geschichte der Stadt Rom, von ihrer Gründung bis auf das Ende des Mittelalters (5 vols., Stuttgart, finished in 1872; 3rd ed., Stuttgart, 1875-81); A. von Reumont, Geschichte der Stadt Rom (3 vols., Berlin, 1867-68).

ROMÉ, a province of modern Italy, co-extensive with the compartimento of Lazio, but really covering a considerably larger area than the ancient Latium, even including Latium admarginatum and the Monti Cimini and the Alban Hills. Thus, so far, the boundary being that between the former papal states and the kingdom of Naples, running from a point S.E. of Terracina along the eastern edge of the volcanic mountains to Ceparno, and thence along the Liris valley. It then runs N.E. through the mountains to Casorli, being conterminous with the Abruzzi; it then includes part of the ancient Sabine country, reaching the Tiber near the railway station of Faro Sabina, 25 m. N. of Rome. It follows the river for some distance, where it is conterminous with Umbria, and then runs S.W. to the coast, where it is conterminous with the province of Lucca, which thus extends from the Adriatic to the sea on the ancient Etruria. The resident population in 1901 was estimated at 1,166,900 (including Rome itself, 520,106), and the floating population, Italian and foreign, 54,383. In 1907 the total number was calculated at 1,278,000. In 1871 the aggregate population was only 836,704. Emigration rose from 2222 in 1866 to 18,927 in 1906, there being a great rise in 1905, as over all Italy. The economic crisis in the United States in 1907, led, however, to a set-back, many emigrants being obliged to return to Italy for lack of work. ALUM is extracted from the mines principally near Tolfa. At Fletchino above Subiaco alpine hectar is obtained, and salt from a rock salt mine near Corneto. Chemical fertilizers are produced on a large scale by several firms. The main industries of the district are, however, agricultural (see LATUM).

ROME, a city and the county-seat of Floyd county, in the N.W. part of Georgia, U.S.A., at the junction of the Etowah and Oostanula rivers, which here form the Coosa. Pop. (1900) 7291, of whom 2830 were negroes; (1910) 12,099. It is served by the Central of Georgia, the Western & Atlantic (leased by the Nashville, Chattanooga & St. Louis), the Southern and the Rome & Northern railways, and the Coosa river is navigable from this point to the falls of the river in Alabama. The city is the seat of Shorter College (for women), which was established in 1873 as the Cherokee Female College, and received its present name in 1877, when it was rebuilt and endowed by Colonel Alfred Shorter; and of the Berry Industrial School (1902), for mountain boys.

Rome is situated in a rich agricultural region producing cotton, cereals, vegetables and fruits, for which it is a trading centre, and is a shipping point for bauxite, mined in the vicinity. Other mineral products of this region are iron, limestone, cement rock, fire-brick clay, coal, slate and marble. Rome's principal manufactures are cotton, cotton-seed oil, lumber, foundry and machine-shop products, bricks and agricultural implements. Its site was originally within the territory of the Cherokee, and on the other side of the Oostanula river there is said to have been at one time an Indian village, which, like several other Creek villages, was called Chilah, or Chichawas. Here, in October 1793, in his Etowah campaign, John Sevier, with militia from Tennessee, crushed a party of marauding Indians; the battle is commemorated by a monument in Myrtle Hill cemetery. Floyd county was erected in 1833. The first settlement of Rome was made in 1834, and immediately afterwards it became the county-seat. Rome was first chartered as a city in 1847. In 1863 there were brilliant cavalry manoeuvres in its vicinity, which resulted in the capture (May 3) of Colonel Abel D. Straight (Federal) with 1800 men by General Nathan B. Forrest (Confederate), with a force one-third the size of that of his opponent. On the 10th of May 1864 the city was captured by a detachment of the Federal Army under General William T. Sherman, then conducting his Atlanta campaign.

In 1847-75 Rome was the home of Charles Henry Smith (1826-1903), a popular humorist, who wrote under the name "Bill Arp." In 1906 East Rome (pop. 671 in 1900) and North Rome (pop. 960 in 1900), which was formerly called Forrestville, were annexed to the city.

Rome, a city of Oneida county, New York U.S.A., on the Mohawk river and Wood Creek, and the Erie and the Black river canals, 14 m. W.N.W. of Utica. Pop. (1890) 14,991; (1900) 15,343, of whom 2527 were foreign-born; (1910, census) 20,490. Rome is the seat of New York Central & Hudson River, the Rome, Watertown & Ogdensburg, and the New York Central, the New York, Ontario & Western, and the Utica & Mohawk Valley (electric railways). It is about 450 ft. above sea-level. The city is the seat of the Academy of the Holy Names (opened in 1863 as St Peter's Academy), of the State Custodial Asylum for unteachable idiots, of the Central New York Institution for Defect Mutes (1875), and of the Oneida County Home. The Jervis Public Library (1809), founded by John Bloomfield Jervis (1795-1885), a famous railway engineer, had in 1909 about 13,000 volumes. The surrounding country is devoted largely to farming, especially vegetable growing; it is especially noted for its dairy products. Among the manufactures are brass and copper work, goods for electrical appliances and machine-shop products, locomotives, knit goods, tin cans and canned goods (especially vegetables). In 1905 the value of the factory products was $8,631,427 (56.6% more than in 1900).

The portage at this place between the Mohawk river and Wood Creek, which are about 1 m. apart, gave the site its Indian name, De-o-wain-sta, "place where canoes are carried from one stream to another," and its earliest English name, "The Great (or Oneida) Carrying-Place," and gave it strategic value as a key between the Mohawk Valley and Lake Ontario. About 1775 the Erie Canal was built, to carry goods across the carrying-place here, Fort Bull, on Wood Creek, which was surprised and taken by General Indians in March 1756, and Fort Williams, on the Mohawk, which, like Fort Craven, also on the Mohawk, was destroyed by Colonel Daniel Webb after the reduction of Oswego by the French...
in August 1756. General John Stanwix built Fort Stanwix here at an expense of $60,000, and the first permanent settlement dates from about this time. In October-November 1768, Sir William Johnson and representatives of Virginia and Pennsylvania met 3200 Indians of the Six Nations here and made a treaty with them, under which, for £10,460 in money and provisions, they surrendered to the crown their claims to what is now Kentucky and West Virginia and the western part of Pennsylvania. Of this cession the part which lay in Pennsylvania was secured by purchase from the Indians for the proprietors Richard and Thomas Penn (see Pittsburg). The fort was dismantled immediately afterward. After 1776, when it was partly repaired by Colonel Elias Dayton, it was called by the continentals Fort Schuyler, in honour of General Philip Schuyler, and so is sometimes confused with (old) Fort Schuyler at Utica. The third regiment of the New York line under Colonel Peter Gansevoort occupied the fort in April 1777 and completed the repairs begun in 1776; on the 3rd of August in the same year (one month before the official announcement by Congress of the design of the flag) the first flag of the United States, "from the heroic defence of the 14th of June and used in battle, was raised here: it was made from various pieces of cloth. On the 2nd of August an advance party of Colonel Barry St Leger's forces coming from the west arrived before the fort, and the main body (altogether about 650 whites, including loyalists—the Royal Greens—under Sir John Johnson, and more than 800 Indians, some led by Joseph Brant) arrived soon afterwards. The fort then contained about 750 men under Colonel Gansevoort, with Lieut.-Colonel Marinus Willett as second in command. The danger to the fort roused General Nicholas Herkimer to gather a force of between 700 and 1000 men (including some Oneida Indians), who during their advance on the 6th of August were ambuscaded in a ravine near Oriskany (q.v.), about 8 m. E. of the fort; after heavy losses to both sides, about 250 men from the fort under Willett attacked the camp of the Indians who were supporting St Leger, thus relieved Herkimer through the falling back of the British and Indians to save their supplies, captured five ensigns of the Royal Greens, and seized large quantities of stores from the enemy's camp. The siege now lost force, the Indians straggled away after the loss of their camp supplies, and on the 23rd of August, St Leger, hearing exaggerated reports of the immediate approach of large reinforcements under General Benedict Arnold, withdrew, abandoning his camp and stores. The successful resistance here to St Leger contributed greatly to the American success at Saratoga. Fort Stanwix was the headquarters of Colonel Gozen Van Schaick (1736-1789) in 1779 when he destroyed the Onondaga villages. At the fort, on the 22nd of October 1784, a treaty was made by Oliver Wolcott, Richard Butler and Arthur Lee, commissioners for the United States, with the chiefs of the Six Nations. In 1790 a canal was built across the old portage between Wood Creek and the Mohawk river. In 1796 the township of Rome was formed, receiving its name, says Schuyler, "from the admittance of the Mohawk river made here." The village of Rome, in the centre of the township, was incorporated in 1815; and Rome was chartered as a city in 1870.

See Pomroy Jones, Annals and Recollections of Oneida County (Rome, 1851); W. M. Willett, A Narrative of the Military Actions of Col. Marinus Willett (New York, 1851); and Ordinance Book of Sir John Johnson during the Oriskany Campaign (Albany, 1888), with notes by W. L. Stone and J. W. de Peyster.

ROMÉ DE L’ÎLE, JEAN BAPTISTE LOUIS (1736-1799), French mineralogist, was born on the 26th of August 1736 at Gray, in Haute-Saône. As secretary of a company of artillery he visited the East Indies and was taken prisoner by the English in 1761 and held in England 1762-1764; but subsequently he became distinguished for his researches on mineralogy and crystallography. He was the author of Essai de Cristallographie (1772), the second edition of which, regarded as his principal work, was published as Cristallographie (3 vols. and atlas, 1783). He died at Paris on the 7th of March 1790.

ROMESH CHANDRA MITHA, SIR (1840-1890), Indian judge, was born in 1840. When the East India Company's charter was renewed in 1853, the old supreme courts and ad hoc courts in the presidency towns were changed into high courts, and Rom Prasad Roy, son of the great reformer Raja Ram Mohan Roy, was the first Indian who was appointed a judge of the new high court of Calcutta. He did not live, however, to take his seat on the bench, and was succeeded by Sambhu Nath Pandit, and then by Dwarka Nath Mitra, perhaps the most talented judge that India produced in the 19th century. Dwarka Nath's great ability and thorough insight into cases were universally recognized in India; his decisions were valued and often quoted; and his name was often mentioned as an illustration of the judicial capacity of the natives of India. Anukul Chandra Mukerji also sat on the bench for a time; and on his death in 1871, Romesh Chandra Mitra was appointed judge in his place. He maintained the high reputation of his predecessors, and for a period of nearly twenty years, down to 1890, he performed his judicial duties with credit and distinction. When the post of chief justice was temporarily vacant in 1882, the marquis of Ripon, then viceroy of India, appointed Romesh Chandra to officiate in that post—the highest judicial position in the Indian empire. Lord Dufferin, who succeeded Lord Ripon as viceroy of India, appointed Romesh Chandra a member of the Public Service Commission, and in this capacity he did valuable work. Failing health compelled him to retire from the high court in 1890, and he was then knighted and appointed a member of the viceroy's legislative council. Till he died in 1899, he continued to take interest in all social, educational and political reforms in India.

ROMFORD, a market town in the Romford parliamentary division of Essex, England; on the small river Rom, which flows into the Thames; 12 3/4 miles E.N.E. from London by the Great Eastern railway. Pop. of urban district (1901) 13,656. The ancient church of St Edward the Confessor was replaced in 1850 by a structure in Decorated style. There is a large brewery in the town, and extensive market gardens in the neighbourhood. A grant of a market was obtained in 1247, and this is still of importance as regards both cattle and corn. Romford was included in the liberty of Havering-atte-Bower, which until 1892 had a jurisdiction of its own distinct from that of the county, with a high steward, magistrates, clerk of the peace, and gaoler. The name of Bower was derived from a queen's residence attached to the ancient royal hunting-lodge in the vicinity. The fact that Romford (Romford, Romsford) lies on the high road between Colchester and London has determined its history. Bronze implements have been found here, but no notice of Romford occurs till the 12th century. It was included in the liberty of Havering, and the chief business of the liberty was conducted there. But the corporation which is mentioned in medieval records is not that of the town of Romford, but of the liberty of Havering. Romford has only had a separate constitution since a local board of health was formed in 1865 under the act of 1855, after the abolition of the liberty in 1892. In the middle ages Romford was rather a meeting-place for merchants than an industrial centre. Brewing, however, is mentioned in 1331, and one tannery at least carried on business in Hare Street in 1467.

ROMILLY, JOHN ROMILLY, 1ST BARON (1802-1874), English judge, was the second son of Sir Samuel Romilly, and was born on the 10th of January 1802. He was educated at Trinity College, Cambridge, and was called to the bar at Gray's Inn in 1827. He first entered parliament in 1832 as member for Bridport, and in 1843 he became a queen's counsel. He was elected M.P. for Devonport in 1847, and was appointed solicitor-general in 1848. On Lord John Russell's administration he was attorney-general in 1850. In 1851 he was appointed master of the rolls, and continued to sit for Devonport till the general election in 1852, when he was defeated. He was the last master of the rolls to sit in parliament. Romilly was raised to the peerage as Baron Romilly of Barry in 1866, and
ROMILLY, SIR S.—ROMNEY, G.

retired from the mastership of the rolls in 1873. He did much to remove the restrictions which had long hampered research among the public records and state papers. Lord Romilly died in London on the 23rd of December 1874.

ROMILLY, SIR SAMUEL (1757-1818), English legal reformer, was the second son of Peter Romilly, a watchmaker and jeweller in London, whose father had emigrated from Montpellier after the revocation of the edict of Nantes, and who had married Margaret Garnault, a Huguenot refugee like himself, but of a far wealthier family. Samuel Romilly was born in Fleet Street, London, on the 1st of March 1757. He served for a time in his father's shop; but his education was not neglected, and he became a good classical scholar and particularly conversant with French literature. A legacy of £2000 from one of his mother's relations led to his being articled to a solicitor and clerk in chancery with the idea of qualifying himself to purchase the office of one of the six clerks in chancery. In 1773, however, he determined to go to the bar, and entered himself at Gray's Inn. He went to Geneva in 1781, where he made the acquaintance of the chief democratic leaders, including Étienne Leroy. Called to the bar in 1783, he was, however, not called to the bench until 1807, and was, therefore, not a land circuit, but was chiefly occupied with chancery practice. On the publication of Madan's Thoughts on Executive Justice, advocating the increase of capital punishments, he at once wrote and published in 1786 Observations on Madan's book. Of more general interest is his intimacy with the great Mirabeau, to whom he was introduced in 1784. Mirabeau saw him daily for a long time and introduced him to Lord Lansdowne, who highly appreciated him, and, when Mirabeau became a political leader, it was to Romilly that he applied for an account of the procedure used in the English House of Commons. He visited Paris in 1789, and studied the course of the Revolution there; and in 1790 he published his Thoughts on the Probable Influence of the Late Revolution in France upon Great Britain, a work of great power. His practice at the chancery bar continued largely to increase, and in 1800 he was made a K.C. In 1798 he married Anne, daughter of Francis Garbett of Knill Court, Herefordshire; and in 1805 he was appointed chancellor of the county palatine of Durham. His great abilities were thoroughly recognized by the Whig party, to which he attached himself; and in 1806, on the accession of the ministry of "All the Talents" to office, he was offered the post of solicitor-general, although he had never sat in the House of Commons. He accepted the offer, and was the first Solicitor-General of the country on the Repeal of the Test Acts; but having no judicial appointment, he went out of office with the government, but remained in the House of Commons, sitting successively for Horsham, Warram and Arundel. It was now that Sir Samuel Romilly commenced the greatest labour of his life, his attempt to reform the criminal law of England, then at once cruel and illogical. By statute law innumerable offences were punished by death, but, as such wholesale executions would be impossible, the larger number of those convicted and sentenced to death at every assizes were respited, after having heard the sentence of death solemnly passed upon them. This led to many acts of injustice, as the lives of the convicts depended on the caprice of the judges, while at the same time it made the whole system of punishments and of the criminal law ridiculous. Romilly saw this, and in 1808 he managed to repeal the Elizabethan statute, which made it a capital offence to steal from the person. This success, however, raised opposition, and in the following year three bills repealing equally sanguinary statutes were thrown out by the House of Lords under the influence of Lord Ellenborough. Year after year the same influence prevailed, and Romilly saw his bills rejected; but his patient efforts and his eloquence ensured victory eventually for his cause by opening the eyes of Englishmen to the barbarity of their criminal law. The only success he had was in securing the repeal, in 1812, of a statute of Elizabeth making it a capital offence for a soldier or a mariner to beg without a pass from a magistrate or his commanding officer. Sir Samuel Romilly's efforts made his name famous not only in England but all over Europe, and in 1818 he had the honour of being returned at the head of the poll for the city of Westminster. He did not long survive his triumph. On the 29th of October 1818 Lady Romilly died in the Isle of Wight. Her husband's grief was intense, and he committed suicide in a fit of temporary insanity on the 2nd of November. No man of his time was more loved than Sir Samuel Romilly; his singularly sweet nature, his upright manliness, his eloquence and his great efforts on behalf of humanity secured him permanent fame.

See the Memoirs of the Life of Sir Samuel Romilly written by himself, who also edited his Correspondence, ed. by his Sons (3 vols., 1850); The Speeches of Sir Samuel Romilly in the House of Commons (2 vols., 1820); "Life and Work of Sir Samuel Romilly," by Sir W. J. Collins, in Trans. of the Huguenot Society (1906).

ROMILLY-SUR-SEINE, a town of north-central France, in the department of Aube, a mile from the left bank of the Seine and 24 m. N.W. of Troyes, on the Paris-Belfort line. Pop. (1906) 9777. Romilly is an important industrial town, with extensive manufactures of cotton and woollen hosiery, and of the special machinery and appliances required for the industry. The Eastern Railway Company has large workshops here.

ROMINTEN, a village of Germany, in the province of East Prussia, 12 m. N.E. from Goldap, situated in the Reminter Heide, a fine tract of heath and forest country, 90 sq. m. in extent, well stocked with game and affording excellent sport. Here is a favourite hunting-box of the German emperor, with a church adjacent, both in the Norwegian style. Pop. 1200.

See K. E. Schmidt, Die Romìniter Heide (Danzig, 1896).

ROMNEY, GEORGE (1734-1802), English historical and portrait painter, was born at Dalton-in-Furness, Lancashire, on the 26th of December 1734. His father was a builder and cabinet-maker of the trade, and the son, having manifested a turn for mechanics, was instructed in the latter craft, showing considerable dexterity with his fingers, executing carvings of figures in wood, and constructing a violin, which he spent much time in playing. He was also busy with his pencil; and some of his sketches of the neighbouring rustics having attracted attention, his father was at length induced to apprentice the boy, at the age of nineteen, to an itinerant painter of portraits and domestic subjects named Steele, an artist who had studied in Paris under Vanloo; but the erratic habits of his instructor prevented Romney from making great progress in his art. In 1756 he impulsively married a young girl whose father had put him through a fever, and started as a portrait painter on his own account, travelling through the northern counties, executing likenesses at a couple of guineas, and producing a series of some twenty figure compositions, which were exhibited in Kendal, and afterwards disposed of by means of a lottery.

Having, at the age of twenty-seven, saved about £100, he left a portion of the sum with his wife and family, and started to seek his fortune in London, never returning, except for brief visits, till he came, a broken-down and aged man, to die. Credit must, however, be given him for recognizing to some extent his family responsibilities. He did not allow his wife and children to fall into poverty, and he gave help to his brothers, who seem to have resembled him in a kind of shiftlessness of temperament. In London he rapidly rose into popular favour. His "Death of General Wolfe" was judged worthy of the second prize at the Society of Arts, but a word from Reynolds in praise of Mortimer's "Edward the Confessor" led to the premium being awarded to that painter, while Romney had to content himself with a donation of £50, an incident which led to the subsequent coldness between him and the president which prevented him from exhibiting at the Academy or presenting himself for its honours.

In 1766 he moved to Paris, where he was befriended by Joseph Vernet; and his portrait of Sir Joseph Yates, painted on his return, bears distinct traces of his study of the works of Rubens then in the Luxembourg Gallery. In 1766 he became a member of the Incorporated Society of Artists, and three years later he seems to have studied in their schools.
Soon he was in the full tide of prosperity. He removed to Great Newport Street, near the residence of Sir Joshua, whose fame in portraiture he began to rival in such works as "Sir George and Lady Warren" and "Mrs Yates as the Tragic Muse," and his professional income rose to £1300 a year. But this marked increase in his popularity had the effect of enlaying his ambitions, and he became anxious to attempt subjects which required more experience than he possessed. Realizing as he did the need for more thorough knowledge, he was seized with a longing to study in Italy; and in the beginning of 1773 he started for Rome in company with Ozius Humphrey, the miniature painter. On his arrival he separated himself from his fellow-traveller and his countrymen, and devoted himself to solitary study, raising a scaffold to examine the paintings in the Vatican, and giving much time to work from the undraped model, of which his painting of a "Wood Nymph" was a fine and graceful result. At Parma he concentrated himself upon the productions of Correggio, which fascinated him and greatly influenced his practice.

In 1775 Romney returned to London, establishing himself in Cavendish Square, and resuming his extensive and lucrative employment as a portrait painter, which in 1785, according to the estimate of his pupil Robinson, yielded him an income of over £3000. The admiration of the town was divided between him and Reynolds. "There are two factions in art," said Lord Thurlow, "and I am of the Romney faction"—and the remark, and the rivalry which it implied, caused much annoyance to Sir Joshua, who was accustomed to refer contemptuously to the younger painter as "the man in Cavendish Square." After his return from Italy Romney formed two friendships which powerfully influenced his life. He became acquainted with Hayley, his future biographer, then in the zenith of his little-merited popularity as a poet. His influence on the painter seems to have been far from salutary. Weak himself, he flattered the weaknesses of Romney, encouraged his excessive and morbid sensibility, disturbed him with amateurish fancies and suggestions, and tempted him to expand on slight rapid sketches, and ill-considered, seldom-completed paintings of ideal and poetical subjects, talents which would have found fitter exercise in the steady pursuit of portraiture. About 1785 Romney was introduced to Emma Hart, afterwards celebrated as Lady Hamilton, and she became the model from whom he worked incessantly. Her bewitching face smiles from numerous canvases; he painted her as a Magdalene and as a Joan of Arc, as a Cire, a Bacchante; a Cassandra; and he has himself confessed that she was the inspirer of what was most beautiful in his art. But her fascinations seem to have been too much for the more than middle-aged painter, and they had their own share in aggravating that nervous restlessness and instability, inherent in his nature, which finally ruined both health and mind.

In 1786 Alderman Boydell started his great scheme of the Shakespeare Gallery, apparently at the suggestion of Romney. The painter at least entered heartily into the plan, and contributed his scene from the Tempest, and his "Infant Shakespeare attended by the Passions," the latter characterized by the Redgraves as one of the best of his subject pictures. Gradually he began to withdraw from portrait painting, to limit the hours devoted to sitters, and to turn his thoughts to mighty schemes of the ideal subjects which he would execute. Already, in 1792, he had painted "Milton and his Daughters," which was followed by "Newton making Experiments with the Prism." He was to paint the Seven Ages, Visions of Adam with the Angel, a religious subject, to be rise rose to £1500 or £2000, and the hero, and three from Adam and Eve—perhaps six of each." Having planned and erected a large studio in Hampstead, he removed thither in 1797, with the fine collection of casts from the antique which his friend Flaxman had gathered for him in Italy. But his health was now irretrievably shattered, and the man was near his end. In the summer of 1799, suffering from great weakness of body and the profoundest depression of mind, he returned to the north, to Kendal, where his deserted but faithful and long-suffering wife received and tended him. He died on the 15th of November 1802.

The art of Romney, especially his figure subjects, suffered greatly from the waywardness and instability of the painter's disposition, from his want of fixed purpose and sustained energy. He lacked the steadfast perseverance needful to the accomplishment of a great picture. Afflicted as he was throughout his life by an unreasonable timidity and by a self-consciousness which led him at one moment into assertive affectations and at another into exaggerated humility, he avoided the society of his brother artists and lost many opportunities of receiving that frank professional criticism which might have stimulated him to more serious effort. In unwholesome surroundings he steadily deteriorated. His imagination flashed and flickered fitfully upon him, like April sunshine. His fancy would be captivated by a subject, which was presently embodied in a sketch, but the foil of elaborating it into the finished completeness of a painting too frequently overtaxed his powers; he became embarrassed by technical difficulties which, through defective early training, he was unable to surmount, and the half-covered canvas would be turned to the wall. Even in the pictures he finished he was unable to keep to any consistent level of achievement. He produced some fine things, very personal in style and very skilful in handling; but much that he did seems too tentative and too plainly deficient in shrewdness of insight to deserve serious consideration. His colour, too, was often unpleasant, hot and monotonous, and his compositions of the sitters, if they can be called art to the word, are not among the best of his portraits that we feel the painter's real ability. These, especially his female portraits, are full of grace, charm, distinction, and sweetness. When we examine his heads of Cowper and Wilkes, his delicate and dignified full-length of William Beckford, his "Parson's Daughter" in the National Gallery, and his group of the Duchess of Gordon and her Son, we cannot deny his claim to rank as one of the notable portrait painters of 18th-century England.

See the Memoirs by William Hayley (1809) and by the artist's son, the Rev. John Romney (1830); Cunningham's Lives of the Painters; George Romney and his Art, by Hilda Camlin (1894). In the fully illustrated George Romney, by Lord Ronald Sutherland Gower (1904), pictures, mainly studies, are reproduced not elsewhere to be found. But the great work upon the artist is Romney, by Humphry Ward and W. Roberts (1904), a monograph of real importance, containing 70 illustrations, a biographical and critical essay, and a catalogue raisonné of the painter's works. Arthur B. Chamberlain's Romney (1910) has 73 plates.

ROMNEY, HENRY SIDNEY, EARL OF (1641–1704), fourth son of Robert, 2nd earl of Leicester, was born in Paris in 1641. He and his nephew, Robert Spencer, afterwards 2nd earl of Sunderland, his senior by a few months, were sent to travel on the continent of Europe in charge of a Calvinist divine, Dr. Thomas Pierce. Sidney's handsome face helped his advancement at court, but the favour in which he was held by the duchess of York, to whom he was master of the robes, led to his dismissal in 1666. His disgrace, however, was short-lived. He was promoted captain in 1667, and colonel in 1678. In 1672 he was sent on a mission of congratulation to Louis XIV., and in 1677 became master of the robes to Charles II. He entered parliament as member for Bramber in 1679, and became a close political ally of his nephew Sunderland, with whose wife he carried on an intrigue which caused considerable scandal. Sunderland made this intimacy a means to further his political ends, while Sidney's social reputation and his apparent frivolity partly concealed his real capacity for intrigue. Sidney was sent in 1679 in the Orange train to France, and others in 1679 on a special mission to urge William of Orange to seize the English throne. He was able to discharge while acting as the official envoy of Charles II. at the Hague. He was recalled in 1683, but was again sent on a special mission to Holland in the year of the accession of James II. He returned to England in the spring of 1688, and set to work, at William's desire, to obtain promises of support for the prince of Orange in the event of his landing. He was presently allowed to leave England on giving his word not to visit the
Hague, but he broke his promise on getting clear of England, and conveyed to William a duplicate of the invitation addressed to him by the English nobility, together with intelligence of affairs of state obtained through the courtesy of Sunderland. He landed with William at Torbay, and received substantial rewards for his undeviating service. Sworn of the privy council in 1688, Sidney was made gentleman of the bedchamber and colonel of the king's regiment of footguards, and received the titles of Baron Milton and Viscount Sidney of Sheppy. In 1690 he received considerable grants of land from the confiscated estates of the Irish supporters of James II, much of which he lost, however, on the parliamentary investigation in 1699 into the distribution of the Irish lands. William made him secretary of state in 1690, pending the discovery of a better person. He was soon asked to resign, but was compensated by his appointment, in 1692, as lord-lieutenant of Ireland. His inability to cope with the difficulties of his position and his recall in the next year, when he became master-general of the ordnance. He was created earl of Romney in May 1694, and he retained William's confidence to the last, but on Anne's accession he was dismissed from his various offices. He never married, and his titles became extinct on his death on the 8th of April 1704.

In 1801 the title of earl of Romney was revived in the family of Marsham. Sir Robert Marsham, Bart. (1685–1724), of Cuxton in Kent, was a member of parliament from 1708 to 1716, when he was created lord politician. His grandson, Charles, the 3rd Baron (1774–1811), was created earl of Romney in 1801, and from him the present earl is descended.

ROMNEY (New Romney), a municipal borough and one of the Cinque Ports in the Ashford parliamentary division of Kent, England, 75 m. S.E. by E. of London by the South-Eastern & Chatham railway. Pop. (1901) 3328. It lies in the open, flat and low tract of Romney Marsh, part of a level extending from Winchelsea in the southwest to Hythe in the north-east, which was within historic times in great part covered by an estuarine inlet of the sea. The river Rother, which now has its mouth at Rye Harbour, formerly entered the sea here, but had its course wholly changed during a great storm in 1287, and the gradual accretion of land led to the decay, not only of Romney, but of Winchelsea and Rye as seaports. Romney Marsh itself, which extends north of New Romney, is protected by a seawall of great thickness, and its guardianship and drainage is in the hands of a special ancient corporation. The level affords pasturage for vast flocks of sheep. New Romney, which is now over a mile from the sea, has large sheep fairs, but little other trade. Of the five churches mentioned here in the Domesday Survey only one remains, but this, dedicated to St Nicholas, is a rich Norman building with later additions. Its Norman west tower is among the finest in England, and it has a beautiful Decorated east window with reticulated tracery. New Romney, the name of which distinguishes it from the decayed village of Old Romney, 2 m. W., is governed by a mayor, 4 aldermen and twelve councillors. Area, 1357 acres. LITTLESTONE-ON-SEA, on the coast E. of New Romney, is in some favour as a seaside resort and has excellent golf-links.

Its fine harbour was the cause of the early importance of Romney (Rometla, Romenhall). The annual assembly of the Cinque Ports, called the Brodhull, was held here owing to its central position. At the time of Domesday the archbishop of Canterbury and the bishop of Bayeux were joint lords. Romney also owed maritime service to the king, which consisted of supplying five ships to serve for fifteen days in the year. A confirmation of liberties was granted by John in 1205. The town, which was a borough by prescription, was governed "from time immemorial" by twelve jurats; a bailiff was appointed by the archbishop, but the rights of the overlord seem to have been small, and in 1521 the inhabitants denied the bailiff the right of presiding with the jurats over their court. Elizabeth changed the style of incorporation to the mayor, jurats and commonalty, and another charter was granted by James II. in 1686, which remained the governing charter until 1855. The Cinque Ports were first summoned to parliament in 1265; the first returns for Romney are for 1266; it returned two members until it was disfranchised in 1832.

ROMORANTIN, a town of central France, capital of an arrondissement in the department of Loir-et-Cher, 31 m. S.E. of Blois by rail. Pop. (1906) town, 6836; commune, 8374. The town is situated on the Sauldre at its confluence with the Morantin, whence its name (Rivus Morantinus). A church dating mainly from the 12th century, a gateway of the 17th century and some old houses are the chief objects of interest. The remains of a château rebuilt by Francis I. in the Renaissance style are used as the sub-prefecture. Tribunals of first instance and of commerce, and a communal college are among the public institutions. The manufacture of flannel and cloth especially for army clothing is carried on, together with trade in wine, live stock, agricultural produce and the asparagus trade.

In 1566 Romorantin gave its name to an edict which prevented the introduction of the Inquisition into France. The industrial importance of the town dates from the later middle ages.

ROMSDAL, the valley of the river Rauma, in Norway. The Rauma is a torrent descending from Lake Lesjekogen to the Romsdal Fjord on the west coast (62° 30' N.). The nearest port is Molde, from which steamers run to Veblingsnes (30 m.) at the foot of the valley. A good road traverses the valley, which is one of the finest in southern Norway, flanked by steep montane terminating in abrupt peaks. Romsdalshorn (5105 ft.), Trolldtindar ("witch-peaks," 6070 ft.) and others. Several waterfalls are seen, such as the Mongefos, the Vaernfoss, falling nearly 1000 ft., and the Slettafoss. Lake Lesjekogen also drains from the opposite end by the Laagen or Lougen river to the Glommen, and so to the Skagerrack, and the road follows its valley, the Gudbrandsdals. The Romsdal gives its name to an amt (county) extending from the promontory of Stadt in the south to Ram Fjord in the north, including the Stor, Molde, Halse and their branch fjords, the ports of Aalesund, Molde and Christiansund, and reaching inland to the Dovrejford.

ROMSEY, a market town and municipal borough in the New Forest parliamentary division of Hampshire, England, 7 m. N.W. of Southampton by the London & South-Western railway. Pop. (1901) 4365. It is pleasantly situated in the rich valley of the Test. The abbey church of SS. Mary and Eillida is one of the finest examples in England of a great Norman church little altered by later builders. Its history is not clear, but a house was founded here by Edward the elder (c. 910), and became a Benedictine nunnery. The church, which is the only important relic of the foundation, is cruciform, with a low central tower. Building evidently began in the first half of the 12th century, and continued through it, as the western part of the nave shows the transition to the Early English style, which appears very finely in the west front. Decorated windows occur in the east end, beyond which a chapel in this style formerly extended. Perpendicular insertions are insignificant. The nave and choir have aisles, triforium and clerestory. The transepts have eastern apsidal chapels, as have the choir aisles, though the walls of these last are square without. Foundations of the apse of a large pre-Norman church have been discovered below the present building. In Romsey there are tanyards, ironworks and works of the Berthon Boat Company. The borough is under a mayor, 4 members and 12 councillors. Area, 533 acres. Romsey (Romseyg, Romsequ) probably owed its origin, as its did its early importance, to the abbey. At the time of the Domesday Survey it was owned by the abbey, which continued to be the overlord until the dissolution. There is no evidence to show that Romsey was a borough before the charter of incorporation granted by James I. in 1608. This was confirmed by William III. in 1692, and the corporation was reformed in 1835. Romsey has never been represented in parliament. The right to hold a fair was granted to the abbey by Henry III.
in 1271, and fairs were held on Easter Monday, on August 26 and November 8. The market now held on Thursday, formerly on Saturday, dates from 1272. Every alternate Thursday is a great fair. Old times Romney had a considerable share of the woollen trade of Hampshire, but by the end of the 17th century this manufacture began to decline, and the introduction of machinery and the adoption of steam led to its subsequent transference to the northern coal centres. The clothing trade was replaced by the manufacture of paper, an industry which still exists.

ROMULUS, the legendary eponymous founder and first king (753–7167) of Rome, represented as the son of Mars by the Vestal Rhea Silvia or Ilia, daughter of Numitor, who had been dispossessed of the throne of Alba by his younger brother Amulius. Romulus and Remus, the twin sons of Silvia, were placed in a trough and cast into the Tiber by their granduncle. The trough grounded in the marshes where Rome afterwards stood, under the wild fig tree (ficus ruminalis), which was still holy in later days. The babes were suckled by a she-wolf and fed by a woodpecker, and then fostered by Acca Larentia, wife of the shepherd Faustulus. They became leaders of a warlike band of shepherds on the Palatine, and in course of time were recognized by their grandfather, whom they restored to his throne, slaying the usurper Amulius. They now proposed to found a city on the site where they had been nurtured; but a quarrel for precedence broke out and Remus was slain. Romulus strengthened his band by offering an "asylum" to outcasts and fugitives, found wives for them by capture and waged war with their kinsmen. His most formidable foe was Titus Tatius (q.v.), king of the Sabines, but after an obstinate struggle he and Romulus united their forces and reigned side by side till Tatius was slain at Lavinium in the course of a blood-feud with Laurentum. Romulus then reigned alone till he suddenly disappeared in a storm. He was thereafter worshipped as a god under the name of Quirinus, which, however, is really a Sabine form of Mars. The story of Romulus, best preserved in the first book of Livy (see also Dion. Halic. i. 73–75; Plutarch, Romulus; Cicero, de Republica, ii. 2–10), belongs throughout to legend. This was felt in later times by the Romans themselves, who gave a rationalistic explanation of the miraculous incidents. Thus, Mars was converted into a stranger disguised as the god of war, and the she-wolf into a woman of ill-fame (lupa); Romulus was not taken up into heaven, but put to death and carried away piecemeal by the patricians under their cloaks.

The whole story, probably first given by the annalists Fabius Pictor and Cincius Alimentus, contains religious and astrological elements. The foundation of the city by twins may be explained by the worship of the Lares, who are generally represented as a pair of brothers, especially as the mother of Romulus and Remus was connected with the worship of the hearth of the state. The introduction of the wolf may be of Greek or eastern origin; it may have a totemistic significance; or may be due to the focus ruminalis, the fig tree near the Lupercal on the Palatine, where the twins were first exposed. This tree was sacred to a goddess Rumina (rumna, "breast," whence the sucking incident), and the resemblance between Romulus and ruminalis led to the fig tree and the founder of the city being subsequently connected by the Roman antiquarians. The wolf would then be suggested by the proximity of the Lupercal, the groto of Faunus Lupercus, with whom the shepherd Faustulus is identical. According to Professor Ducati of Bologna, in a paper on an old Etruscan stele, on which a she-wolf is represented sucking a child, the wolf legend is an importation from Etruria, the original home of which was Crete. Miletus, son of Apollo and a daughter of Minos, having been exposed by his mother, was suckled by she-wolves, being afterwards found and brought up by shepherds. To escape the designs of Minos, Miletus fled to Asia Minor, and founded the city called after him, where the Etruscans first became acquainted with the legend. The opening of the "asylum" is a Greek addition (as the name itself suggests).

Down to imperial times, the Romans seem to have been ignorant of the Greek custom of taking sanctuary; further, the idea was entirely opposed to the exclusive spirit of the ancient Italians. The story was probably invented to give an explanation of the sacred spot named "Inter duos lucos," between the Tiber and the Capitoline. Another Greek touch is the deification of an eponymous hero. The rape of the Sabine women is clearly etiological, invented to account for the custom of marriage by capture. Consus, at whose festival the rape took place, was a god of the earth and crops, the giver of fruitfulness in plants and animals. It is generally agreed that the capture of the Capitol by Titus Tatius may contain an historical element, pointing to an early conquest of Rome by the Sabines, of which there are some indications. Subsequently, to efface the recollection of an event so distasteful to Roman vanity and national pride, Sabine names and customs were accounted for by a supposed union of Romans and Sabines during the regal period, the result of a friendly league concluded between Romulus and Tatius. According to E. Pais, Romulus is merely the eponym of Rome; his life is nothing but the course of the sun, and the institutions ascribed to him are the result of long historical development.

Romulus, like his double Tullus Hostilius, is regarded as the founder of the military and political (see Rome, as Numa and his counterpart Ancus Marcus of the religious institutions of Rome.

For a critical examination of the story, see Schwager, Römische Geschichts, bk. v. xi.; Sir George Cornewall Lewis, Credibility of early Roman History, chap. 11; W. Ihne, History of Rome, i.; Sir J. Sedley, Introduction to his edition of Livy, bk. i.; E. Pais, Storia di Roma, Bologna, 1838; F. Cloquet, Répertoire de l'histoire romaine (Eng. trans., 1896); also O. Gilbert, Geschichte und Topographie der Stadt Rom im Altertum (1883–1885).

RONCESVALLES (Fr. Roncesvauz), a village of northern Spain, in the province of Navarre; situated on the small river Urrobi, at an altitude of 3220 ft. among the Pyrenees, and within 5 m. from the French frontier. Pop. (1000) 152. Roncesvalles is famous in history and legend for the defeat of Charlemagne and the death of Roland (q.v.) in 778. The small collegiate church contains several curious reliquaries associated with Roland, and is a favourite place of pilgrimage. The battle is said to have been fought in the picturesque valley known as Val Carlos, which is now occupied by a hamlet bearing the same name, and in the adjoining defile of Ibaneta. Both of these are traversed by the main road leading north from Roncesvalles to St Jean Pied de Port, in France.

RONCONI, GIORGIO (1810–1890), Italian baritone vocalist, was born in 1810. He learnt singing from his father Domenico, who had been a celebrated tenor in his time, and made his début in 1831 at Pavia. After singing in Italy for some years with ever-growing success, he appeared for the first season in England in 1843, as Henry Ashton in Lucio di Lammermoor. His success was immediate, and he continued to be one of the most popular artists on the lyric stage until his retirement in 1866. His voice was neither extensive in compass nor fine in quality, but the genius of his acting and the strength of his personality fully atoned for his vocal defects. He was equally at home in comedy and tragedy, and the two parts by which he is best remembered, Rigoletto and Figaro, show conclusively the range of his talent. In his later years Ronconi founded a school of singing at Granada, and he also accepted the post of professor of singing at the Madrid Conservatoire. He died in 1890.

RONDA, a town of southern Spain, in the province of Malaga; on the river Guadiaro and on the Algeciras–Bobadilla railway. Pop. (1900) 20,995. Ronda is built on a high rock nearly surrounded by the Guadiaro, which flows through an abrupt chasm 550 ft. deep and 300 ft. wide, by which the old town is separated from the new. Of the three bridges, one is said to have been built by the Romans, another by the Moors; the most modern (1761) spans the stream in a single arch at a height of about 255 ft. On the edge of the chasm is the-alameda or public promenade, commanding a wide and beautiful prospect of the fertile valley or vega and the sierras beyond. The old
RONDEAU—RONDO

part of the town has a Moorish aspect, with narrow, steep and crooked lanes, and still retains some Moorish towers and other medieval buildings. The Ronda bull-ring is one of the finest in Spain, and can accommodate 10,000 spectators. Ronda has a considerable trade in leather, saddlery, horses, soap, flour, chocolate, wine and hats.

Some remains of an aqueduct and theatre, about 7 m. N. of Ronda, are supposed to represent the Acinipo or Arundo of ancient geographers. Ronda was taken from the Moors in 1485. It gives its name to the Sierra or Serrania de Ronda, one of the main sections of the coast mountains which rise between the great plain of Andalusia and the Mediterranean.

RONDEAU (Ital. Rondo), a structural form in poetry and (in the form of "rondo") in music. In poetry the rondeau is a short metrical structure which in its perfect form consists of thirteen eight- or ten-syllabled verses divided into three strophes of unequal length, and knit together by two rhymes and a refrain. In Clement Marot's time the laws of the rondeau were laid down, and, according to Voiture, in the 17th century, the following was the type of the approved form of the rondeau:

"Ma foy, c'est fait de moy, car Isabeau M'a conjuré de moy faire un Rondau: Cela me met en une peine extrême. Quoq treize vers, huit en eau, cinq en lune. Je luy ferons aussi-tôt un bateau! En voilà cinq pourtant en un monceau: Faisons en huict, en invoquant Brodeau, En puis mottons, par quelque stratagème, Ma foy, c'est fait!"

All forms of the rondeau, however, are alike in this, that the distinguishing metrical emphasis is achieved by a peculiar use of the refrain. Though we have a set of rondeaux in the Rolliad (written by Dr. Lawrence the friend of Burke, according to Edmund Gosse, who has given us an admirable essay upon exotic forms of verse), it was not till recent years that the form had any real vogue in England. Considerable attention, however, has lately been given in England to the form. Some English rondeaus are as bright and graceful as Voiture's own. Swinburne, who in his Century of Roundels was perhaps the first to make the refrain rhyme with the second verse of the first strophe, has brought the form into high poetry. In German, rondeaux have been composed with perfect correctness by Weckherlin, and with certain divergences from the French type by Götz and Fischhart; the German name for the form is rundum or ringel-gedicht.

Although the origin of the refrain in all poetry was no doubt the improvisatore's need of a rest, a time in which to focus his forces and recover breath for future flights, the refrain has a distinct metrical value of its own; it knits the structure together, and so intensifies the emotional energy, as we see in the Border ballads, in the Oriana of Lord Tennyson, and in the Sister Helen of Rossetti. The suggestion of extreme artificiality—of "difficulty overcome"—which is one great fault of the rondeau as a vehicle for deep emotion, does not therefore spring from the use of the refrain, but from the too frequent recurrence of the rhymes in the strophes—for which there is no metrical necessity as in the case of the Petrarchan sonnet. The rondeau is, however, an inimitable instrument of gaiety and grace in the hands of a skilful poet.

RONDEL, a form of verse closely allied to the rondeau (q.v.) but distinguished from it by containing fourteen instead of thirteen lines, and by demanding a slightly different arrangement of rhymes. Moreover, the initial couplet is repeated in the middle and again at the close. The arrangement of rhymes is as follows: a, b b, a; a b, a b; a, b, b, a, a, b. This form, which was invented in the 14th century, was largely used in later medieval French poetry, but particularly by Charles d'Orléans (1391–1465), the very best of whose graceful creations are all rondels. One of the most famous of this prince's rondels may be given here as a type of their correct construction:

"Le temps a laissé son manteau De vent, de froidure et de pleuie, Et s'est vestu de bruyère. De souleil luisant, cler et beau. Il n'y a beste ne oysee Qu'en son jargon se chante ou cre: Le temps a laissé son manteau De vent, de froidure et de pleuie. Rivièren, fontaine et ruisseau Portent; en livre jolie. Gouttes d'argent d'or favorie; Chasquin s'abille de nouveau; Le temps a laissé son manteau De vent, de froidure et de pleuie."

The rondeau, in French, may begin with either a masculine or a feminine rhyme, but its solitary other rhyme must be of the opposite kind. The rondeau was introduced into English in the 15th century, but the early specimens of it are very clumsy. It was revived in the 19th century, but it appears to suit neither French nor any other language. Best examples are found in the poems of Robert Bridges, Dobson, Gosse and Henley. The following, by Austin Dobson, gives an exact impression of what an English rondeau should be in all technical respects:

"Love comes back to his vacant dwelling,—
The old, old Love that we knew of yore! We see him stand by the open door. With his great eyes sad, and his bosom swelling. He makes as though in our arms repelling He fain would lie as he lay before;—

Love comes back to his vacant dwelling,—
The old, old Love that we knew of yore! Ah! who shall help us from over-spelling That sweet, forgotten, forbidden spell! E'en as we doubt, in our hearts once more, With a rush of tears to our eyelids welling, Love comes back to his vacant dwelling,
The old, old Love that we knew of yore!"

Théodore de Banville remarks that the art of the rondeau consists in the gay and natural reproduction of the refrain, which should always seem inevitable, while slightly changing the point of view of the reader. If this is not successfully achieved, "on ne fera que de la marqueterie et du placage, c'est-à-dire, en fait de poésie,—rien!" In Germany, the rondo was introduced, in the 18th century, under the name of ringel-gedicht, by Johann Nikolaus Götz (1731–1781), and was occasionally used in the course of the 19th century, by German poets.

RONDO, a musical form originally derived from the rondeau in verse; as may be seen, long before the development of instrumental forms, in some of the chansons of Orlando di Lasso. The rondeau en couplets of Couperin and his contemporaries shows both in name and form the same connexion with verse. It consists of the alternation between a single neatly rounded phrase and several slightly contrasted episodes (the couplets) without any important change of key. Bach enriched it with his wealth of epigram, but did not expand its range.

The later sense of the term covers an important series of the sonata forms (q.v.), chiefly found in finales; but rondo-form sometimes occurs in slow movements (e.g. Mozart, Haffner Serenade, String Quartet in E flat; Beethoven, Fourth Symphony; Quartet, Op. 74, &c.). The single-phrase ritornello and short couplets of the old form are in the sonata style replaced by a broadly designed melody and well-contrasted episodes in different keys.

If the form of a Bach or Couperin rondo may be represented by A B A C A D A &c., the various forms of the later rondo may be represented somewhat as follows: placing on a horizontal line those parts that are in the main key, and representing other keys by differences of level:—

(i) Sectional rondo; i.e. with little or no development or
transition between episode and main theme; very characteristic of Haydn, who, however, often gives it more organization than appears on the surface—A A A coda; very rarely with no change of key except between tonic major and minor, as in Haydn’s famous Gypsy Rondo. Frequently the episodes are increased in number or made to recur. Beethoven most clearly shows the influence of Haydn in his frequent use of modifications of this type of rondo in his earlier works, e.g. finales of Sonatas, Op. 16, No. 5, Op. 23, No. 10. He also applied it very successfully to his early slow movements, as in the Sonatas, Op. 2, No. 2, and Op. 13 (Pathétique). The sectional rondo was modernized on a gigantic scale by Brahms in the finale of his G minor Piano forte Quartet, Op. 25; and Schumann’s favourite art-forms are various compounds between it and the cognate idea of the dance-tune with one or more “trios,” as in the Novellettes, the Arabeske, and the Romance in B major.

(ii) *Rondos influenced by the form of a first movement* (or which see Sonata Forms). The normal scheme for this, which is Mozart’s favourite rondo-form, is A A A B A coda, and it is easy to see how it may be applied to sectional rondos, as in the finale of Beethoven’s Sonata, Op. 13. But it normally implies longer and weightier themes and a higher degree of organization. If the second episode (C) is transformed into an elaborate development of previous material in various keys, the resemblance to first-movement form is increased; the only external difference being the recurrence of A in full after the first episode B (which is treated exactly like the “second subject” of a first movement). As, however, many first movements that do not repeat their exposition (corresponding to A+B in the above rondo-scheme) make a feint of so doing before beginning the development, it is obvious that the blending of rondo and first-movement form may become very complete. In fact, the true criterion of a rondo is, as with all real art-forms, a matter of style rather than of external shape. The well rounded-off, self-repeating, tune-like character of the main theme, and a sense of pleasure and importance in the mere fact of its return (without absolute necessity for dramatic effect) are the distinctive evidences of rondo form and style. This rule is well proved by the case most frequently cited as an exception, the rondo of Beethoven’s Sonata in D, Op. 10, No. 3; for nothing can be more significant than the way in which its fragmentary opening figure is built up into a self-contained musical epigram and ended with a full close, as contrasted with the way in which the most tuneful of first-movement beginnings (e.g. Beethoven’s Quartet in F major, Op. 59, No. 1, Trio in B flat, Op. 97; Brahms’s String Quintet in F major, Op. 88) expand gradually into their further course.

The following are some of the more important of many modifications and applications of this form:

(a) Omission of return of main theme before recapitulation of

(b) A A A B (A) like a first movement without a development. Here A will be very large and the transition to B important, while B will consist of a considerable number of themes. See the finales of Mozart’s E flat String Quartet and C major Quintet, most of his greater slow movements, and many of Beethoven’s.

In concertos the only modifying influence the balance between solo and orchestra shows in rondo-form is in the tendency to give the orchestra a large number of subsidiary themes at the outset, which perhaps do not reappear until the coda, where, with the rest of the solo, they can round off the design very effectively. Mozart’s use of this device is not confined to concertos. (D. F. T.)

**Ronsard, Pierre de** (1524-1585), French poet and “prince of poets” (as his own generation in France called him), was born at the Château de la Poissonnière, near the village of Couture in the province of Vendômois (department of Loir-et-Cher), on the 11th of September 1524. His family are said to have come from the Slav provinces to the south of the Danube (provinces with which the crusades had given France much intercourse) in the first half of the 14th century. Baudouin de Ronsard or Ronsard was a prince of the French branch of the house, and made his mark in the early part of the Hundred Years’ War. The poet’s father was named Loys, and his mother was Jeanne de Chaudrier, of a family not only noble in itself but well connected. Pierre was the youngest son. Loys de Ronsard was maître d’hôtel du roi to Francis I., whose captivity after Pavia had just been softened by treaty, and he had to quit his home shortly after Pierre’s birth. The future Prince of Poets was educated at home for some years and sent to the Collège de Navarre at Paris when he was nine years old. It is said that the rough life of a medieval school did not suit him. He had, however, no long experience of it, being quickly appointed page, first to the king’s eldest son François, and then to his brother the duke of Orleans. When Madeleine of France was married to James V. of Scotland, Ronsard was attached to the king’s service, and he spent three years in Great Britain. The latter part of this time seems to have been passed in England, though he had, strictly speaking, no business there. On returning to France in 1540 he was again taken into the service of the duke of Orleans. In this service he had other opportunities of travel, being sent to Flanders and again to Scotland. After a time more important employment fell to his lot, and he was attached as secretary to the suite of Lazare de Baïf, the father of his future colleague in the Pléiade and his companion on this occasion, Antoine de Baïf, at the diet of Spires. Afterwards he was attached in the same way to the suite of the cardinal du Bellay-Langley, and his mythical quarrel with Rabaleis dates mythically from this period. His apparently promising diplomatic career was, however, cut short by an attack of deafness which no physician could cure, and he determined to devote himself to study. The institution which he chose for the purpose among the numerous schools and colleges of Paris was the Collège Coqueret, the principal of which was Daurat—afterwards the “dark star” (as he has been called from his silence in French) of the Pléiade, and already an acquaintance of Ronsard’s from his having held the office of tutor in the Baïf household. Du Bellay died in 1549, and the sixteenth year Ronsard accompanied Ronsard; Du Bellay shortly followed; Joachim du Bellay, the second of the seven, joined not much later. Muretus (Jean Antoine de Muret), a great scholar and by means of his Latin plays a great influence in the creation of French tragedy, was also a student here.

Ronsard’s period of study occupied seven years, and the first manifesto of the new literary movement, which was to apply to the vernacular the principles of criticism and scholarship learnt from the classics, came not from him but from Du Bellay. The *Défense et illustration de la langue française* of the latter appeared in 1549, and the Pléiade (or *Brigade*, as it was first called) may be said to have been then launched. It consisted, as its name implies, of seven writers whose names are sometimes differently enumerated, though the orthodox canon is beyond doubt composed of Ronsard, Du Bellay, Baïf, Belleau, Pontus de Tyard (a man of rank and position who had exemplified the principles of the friends earlier), Jodelle the dramatist, and Daurat. Ronsard’s own work came a little later, and a rather idle story is told of a trick of Du Bellay’s which at last determined him to publish. Some single and minor pieces, an epithalium on Antoine de Bourbon and Jeanne de Navarre (1530), a “Hymne de la France” (1549), an “Ode à la Paix,” preceded the publication in 1550 of the four first books of *Premier livre des Amours*. The next book appeared in 1552 by the publication of his *Amours de Cassandre* with the fifth book of *Odes*. These books excited a violent literary quarrel. Marot was dead, but he left a numerous school, some of whom saw in the stricter literary critique of the Pléiade, in its outspoken contempt of merely vernacular and medieval forms, in its strenuous advice
RONSARD
to French poetry to "follow the ancients," and so forth, an
s insult to the author of the Adolescence Clémentine and his
followers. The French court, and indeed all French society,
was just then much interested in literary questions, and a
curious story is told of the rivalry that ensued. Mellin de
Saint-Gelais, it is said, the chief of the "École Marotique" and
a poet of no small merit, took Ronsard's book and read
part of it in a more or less designedly burlesque fashion before
the king. It may be observed that if he did so it was a dis-
tinctly rash and uncourtly sort of action, inasmuch as, from
Ronsard's father's position in the royal household, the poet was
personally known and liked both by Henry and by his family.
At any rate, Marguerite de Valois, the king's sister, after-
wards duchess of Savoy, is said to have snatched the book
from Saint-Gelais and insisted on reading it herself, with the
result of general applause. Henceforward, if not before, his
acceptance as a poet was not doubtful, and indeed the tradition
of his having to fight his way against cabals is almost entirely
unsupported. His popularity in his own time was overwhelm-
ing and immediate, and his prosperity was broken.
He published his Hymns, dedicated to Marguerite de Savoie, in 1555;
the conclusion of the Amours, addressed to another heroine,
in 1556; and then a collection of Œuvres complètes, said to be
due to the invitation of Mary Stuart, queen of Francis II.,
in 1560; with Élegies, mascarades et bergeries in 1565. To this
same year belongs his most important and interesting Abrege
de l'art poétique français.

That rapid change of soversigns did Ronsard no harm.
Charles IX., who succeeded his brother after a very short time,
was even better inclined to him than Henry and Francis. He
gave him rooms in the palace; he bestowed upon him divers
abbacies and priories; and he called him and regarded him
constantly as his master in poetry. Neither was Charles IX.
the only change of soversigns. It was in 1562 that Ronsard
published his Hymns, dedicated to Marguerite de Savoie, in 1555;

his school in fashion. He knew too well how to manage the
gorgeous adjectives ("marbrine," "cintrine," "ivoirine" and the
like, which were another branch of the Bézilian, and in his hands
they rarely become stiff or cumbrous. In short, Ronsard shows
eminently the two great attractions of French 16th-century poetry
as compared with that of the two following ages—magnificence of
language and general interest of ideas.

BIBLIOGRAPHY.—The chief separately published works of Ronsard
are noted above. He produced, however, during his life a vast
number of separate publications, some of them mere pamphlets or
broadsides, having only time to come, often striking out
others at the same time, in the successive editions of his works.
Of these he himself published seven—the first in 1560, the last in
1568. Between his death in 1585 and 1580 ten more editions
were published, the most famous of which is the folio of 1609.
A copy of this presented by Sainte-Beuve to Victor Hugo,
and later in the possession of M. Maxime du Camp, has a place of
its own in French literary history. The work of C. Binet in 1586,
Dissours de la vie de Pierre de Ronsard, is very important for early
information, and the author seems to have revised some of Ronsard's
work under the poet's own direction. From 1630 Ronsard was
not again reprinted for more than two centuries. Just before
the close of the second, however, Sainte-Beuve printed a selection of
his poems to accompany the above-mentioned Tableau (1828).
There are also selections, by M. Noel (in the Collection Didot) and
Beauchesne, in 1857. M. Prosper Blanchemail, who had
previously published a volume of Œuvres inédites de Ronsard,
took a complete edition for the Bibliothèque Électrisenne.
This was followed by the complete edition of this same year
which has been published for the last ten years. It is
practically complete; a few pieces of a somewhat free character
which is ascribed with some certainty to the poet are, however,
 excluded. A later and better edition still is that of Marty-Lavenux
(1868, under which title many of the editions of M. Binet
and Sainte-Beuve followed up his early work by articles in the Causeries
du lundi, and the chief later critics have dealt with him in their
collected works. Of books may be mentioned those of E. Gandar
(Metz, 1854), which considers him chiefly in his relation to the ancients,
Ronsard, imitateur d’Homère et de Pindare; the marquis de Rochambeau,
La Famille de Ronsard (1868); G. Scheffler, Ronsard et sa réforme
littéraire (1874); G. Biao, Ronsard (1892); F. Froger,
La Réforme Poétique de Ronsard (1892); L. Mellerio, Lexique de Ronsard
(1895); P. Perdrizet, Ronsard et sa réforme (1902), with a still
more recent series of articles in different publications by M. Paul
Lobstein, Mlle Jeanne de L, and Mr A. G. of the Literature of the
Renaissance (1904) may be consulted, and on Ronsard's critical
stance Saintbury's History of Criticism, vol. ii. (G.S.A.)

RONSdorf—RöntGEn, D., was first and foremost an astute man of business and
it is not improbable that the moving cause of this opening up
of relations with Paris was the accession to the throne of Marie
Antoinette, whose Teutonic sympathies were only too well
known. Before very long she appointed him èbeniste-
mécanicien. He appears, indeed, to have acquired con-
mind in the form of a commodity, its marquetry works.
He took advantage of his journeys through Europe to charge him
with the delivery of presents and of dolls dressed in the Paris
fashions of the moment—they were intended to serve as patterns
for the dressmakers—to her mother and her sisters.
He appears at once to have opened a shop in Paris, but despite,
and perhaps because of, the favour in which he was held at
court, all was not plain sailing. The powerful trade corporation
of the maitres-ébénistes disputed his right to sell in Paris
furniture of foreign manufacture, and in 1780 he found that the
most satisfactory way out of the difficulty was to get himself
admitted a member of the corporation in which all his great
rivals belonged. By this time he had attracted a good deal of
attention by the introduction of a new style of marquetry,
in which light and shade, instead of being represented as hitherto
by burning, smoking or engraving the materials, were indicated
by small pieces of wood so arranged as to create the impression
of pietra dura. We have seen that Röntgen had been appointed
èbeniste-mécanicien to Marie Antoinette, and the appoint-
ment is explained by his fondness for and proficiency in
constructing furniture in which mechanical devices played a great
part. The English cabinet-makers of the later eighteenth
century often made what was called, with obvious allusion to
its character, "baroquis furniture," especially little dressing
and washstands which converted into something else or
held their essentials in concealment until a spring was touched.
David was a past master in this kind of work, and unquestion-
amably much of the otherwise inexplicable reputation he enjoyed
among contemporaries who were head and shoulders above
him is explained by his mechanical genius. The extent of his
fame in this direction is sufficiently indicated by the fact
that Goethe mentions him in Wilhelm Meister. He compares the
box inhabited by the fairy during her travels with her mortal
lover to one of Röntgen's desks, in which "at a pull a multitude
of springs and latches are set in motion." For a desk of this
kind Louis XVI paid him 80,000 livres. Outwardly it was
Monarchy, and inwardly the Revolution was sympathizing
the liberal arts. A personification of sculpture was in the act
of engraving the name of Marie Antoinette upon a column
by which Minerva was hanging her portrait. Above a riot
of architectural orders was a musical clock (the work of the
partner Kintzing), surmounted by a cupola representing
Parnassus. The interior of this monumental effort, 11 ft. high,
was a marvel of mechanical precision; it disappeared during
the First Empire. Röntgen did not confine his activities to
Paris, or even to France. It has been said that he travelled
about Europe accompanied by furniture vans, and undoubtedly
his aptitude as a commercial traveller was remarkable.
He had shops in Berlin and St Petersburg, and himself apparently
twice went to Russia. On one of these visits he sold to the
Empress Catherine furniture to the value of 20,000 roubles,
to which she added a personal present of 5000 roubles and a
gold snuff-box—in recognition, it would seem, of his readiness
and ingenuity in surmounting a secretaire with a clock indicating
the date of the Russian naval victory over the Turks at Chesme,
news of which had arrived on the previous evening. This suite
of furniture is believed still to be in the Palace of the Hermitage,
the hiding-place of so much remarkable and forgotten art.
To the protection of the queen of France and the empress of Russia
David added that of the king of Prussia, Frederick William II,
who appointed him one of the board of directors of a commercial
agent for the Lower Rhine district. The French Revolution and
the Napoleonic Wars which so speedily followed, eclipsed
Röntgen's star as they eclipsed those of so many other great
commerce-makers of the period. In 1793 the Revolutionary
government, regarding him as an mitrér, seized the contents
Röntgen's business, but a year later, in 1794, he was able to restore
his firm and to continue trading.
RÖNTGEN, W. K.—RÖNTGEN RAYS

of his show-rooms and his personal belongings, and after that date he appears neither to have done business in Paris nor to have visited it. Five years later the invasion of Neuwied led to the closing of his workshops; prosperity never returned, and he died half ruined at Wiesbaden on the 12th of February 1807.

Röntgen was not a great cabinet-maker. His forms were often clumsy, and his colours commonly lacked the finish of the French of the English cabinet-makers of the great period which came to an end about 1790. His bronzes were poor in design and coarse in execution—his work, in short, is tainted by commercialism. But, however, he holds a position of high distinction. His marquetry is bolder and more vigorous than that of Riesener, who in other respects soared far above him. As an adroit devisor of mechanism he fully earned a reputation which for some years has not been more highly crowned. The modern critic, his facilities for comparison, is prepared to accept. On the mechanical side he produced, with the help of Kisting, many long-cased and other clocks with ingenious indicating and registering apparatus. Röntgen delighted in architectural forms, and his marquetry more often than not represents those scenes from classical mythology which were the dear delight of the 16th century. He is well represented at South Kensington.

RÖNTGEN, WILHELM KONRAD (1845— ), German physicist, was born at Lennep on the 27th of March 1845. He received his early education in Holland, and then went to study at Zurich, where he took his doctor's degree in 1869. He then became assistant to Kundt at Würzburg and afterwards at Strassburg, becoming privat-dozent at the latter university in 1874. Next year he was appointed professor of mathematics and physics at the Agricultural Academy of Hohenheim, and in 1876 he returned to Strassburg as extraordinary professor. In 1879 he was chosen ordinary professor of physics and director of the Physical Institute at Giessen, whence in 1885 he removed in the same capacity to Würzburg. It was at the latter place that he made the discovery for which his name is chiefly known, the Röntgen rays. In 1895, while experimenting with a highly exhausted vacuum tube on the conduction of electricity through gases, he noticed that a paper screen covered with barium platinocyanide, which happened to be lying near, became fluorescent under the action of some radiation emitted from the tube, which at the time was enclosed in a box of black cardboard. Further investigation showed that this radiation had the power of passing through various substances which are opaque to ordinary light, and also of affecting a photographic plate. Its behaviour being examined in several respects, particularly in regard to refraction and reflection, doubt arose in his mind whether it was to be looked upon as light or not, and he was led to put forward the hypothesis that it was due to longitudinal vibrations in the ether, not to transverse ones like ordinary light; but in view of the uncertainty existing as to its nature, he called it X-rays. For this discovery he received the Rumford medal of the Royal Society in 1896, jointly with Philip Lenard, who had already shown, as also had Hertz, that a portion of the cathode rays could pass through a thin film of a metal such as aluminium. Röntgen also conducted researches in various other branches of physics, including elasticity, capillarity, the conduction of heat in crystals, the absorption of heat-rays by different gases, piezo-electricity, the electromagnetic rotation of polarized light, &c.

RÖNTGEN RAYS, W. K. Röntgen discovered in 1895 (Wied. Ann. 64, p. 1) that when the electric discharge passes through a tube exhausted so that the glass of the tube is brightly phosphorescent, phosphorescent substances such as potassium platinocyanide became luminous when brought near to the tube. He found that if a thick piece of metal, a coin for example, were placed between the tube and a plate covered with the phosphorescent substance, the shadow of the metal was cast upon the plate; pieces of wood or thin plates of aluminium cast, however, only partial shadows, thus showing that the agent which produced the phosphorescence could traverse with considerable freedom bodies opaque to ordinary light. He found that as a general rule the greater the density of the substance the greater its opacity to this agent. Thus while this effect could pass through the flesh it was stopped by the bones, so that if the hand were held between the discharge tube and a phosphorescent screen the outline of the bones was distinctly visible as a shadow cast upon the screen, or if a purse containing coins were placed between the tube and the screen the purse itself cast but little shadow while the coins cast a very dark one. Röntgen showed that the cause of the phosphorescence, now called Röntgen rays, is propagated in straight lines starting from places where the cathode rays strike against a solid obstacle, and the direction of propagation is not bent when the rays pass from one medium to another, i.e. there is no refraction of the rays. These rays, unlike cathode rays or Canalstrahlen, are not deflected by magnetic force; Röntgen could not detect any deflection with the strongest magnets at his disposal, and later experiments made with stronger magnetic fields have failed to reveal any effect of the magnet on the rays. The rays affect a photographic plate as well as a phosphorescent screen, and shadow photographs can be readily taken. The time of exposure required depends upon the intensity of the rays, and this depends upon the state of the tube, and the electric current going through it, as well as upon the substances traversed by the rays on their journey to the photographic plate. In some cases an exposure of a few seconds is sufficient, in others hours may be required. The rays coming from different discharge tubes have very different powers of penetration. If the pressure in the tube is fairly high, so that the potential difference between its electrodes is small, and the velocity of the cathode rays in consequence small, the Röntgen rays coming from the tube will be very easily absorbed; such rays are called "soft rays." If the exhaustion of the tube is carried further, so that there is a considerable increase in the potential differences between the cathode and the anode in the tube and therefore in the velocity of the cathode rays, the Röntgen rays have much greater penetrating power and are called "hard rays." With a highly exhausted tube and a powerful induction coil it is possible to get appreciable effects from rays which have passed through sheets of brass or iron several millimetres thick. The penetrating power of the rays thus varies with the pressure in the tube; as this pressure gradually diminishes when the discharge is kept running through the tube, the type of Röntgen ray coming from the tube is continually changing. The lower pressures give rays which are said to be "soft," and lower than this type of ray a further change leads to such a high degree of exhaustion that the discharge has great difficulty in passing, and the emission of the rays becomes very irregular. Heating the walls of the tube causes some gas to come off the sides, and by thus increasing the pressure creates a temporary improvement. A thin-walled platinum tube is sometimes fused on to the discharge tube to remedy this defect; red-hot platinum allows hydrogen to pass through it, so that if the platinum tube is heated, hydrogen from the flame will pass into the discharge tube and increase the pressure. In this way hydrogen may be introduced into the tube when the pressure gets too low. When liquid air is available the pressure in the tube may be kept constant by fusing on to the discharge tube a tube containing charcoal; this dips into a vessel containing liquid air, and the charcoal is saturated with air at the pressure which it is desired to maintain in the tube. Not only do bulbs emit different types of rays at different times, but the same bulb emits at the same time rays of different kinds. The property by which it is most convenient to identify a ray is the absorption it suffers when it passes through a given thickness of aluminium or tin-foil. Experiments made by McClelland and Sir J. J. Thomson on the absorption of the rays produced by sheets of tin-foil showed that the penetration of the first sheets of tin-foil traversed by the rays was much greater than that by the same number of sheets when the rays had already passed through several sheets of the foil. The effect is just what would occur if some of the rays were much more readily absorbed by the tin-foil than others, for the first few layers would stop all the easily absorbable rays while the ones left would be those that were but little absorbed by tin-foil.
The fact that the rays when they pass through a gas ionize it and make it a conductor of electricity furnishes the best means of measuring their intensity, as the measurement of the amount of electricity they produce in a gas is both more accurate and more convenient than measurements of photographic or phosphorescent effects. Röntgen rays when they pass through matter—"as Perrin (Comptes rendus, 124, p. 455), Sagnac (Jour. de phy.), 1899, (3), 8, and J. Townsend, Phil. Mag., 1899, p. 217, have shown—secondary Röntgen rays as well as cathodic rays. A very complete investigation of this subject has been made by Barkla and Sadler (Barkla, Phil. Mag., June 1908, pp. 812—816; Barkla and Sadler, Phil. Mag, October 1908, pp. 550—584; Sadler, Phil. Mag, July 1909, p. 107; Sadler, Phil. Mag, March 1910, p. 337). They have shown that the secondary Röntgen rays are of two kinds: one kind of the same type as the primary ray and may be regarded as scattered primary rays, the other kind depends only on the matter struck by the rays—their quality is independent of that of the incident ray. When the atomic weight of the element exposed to the primary rays was less than that of calcium, Barkla and Sadler could only detect the first type of ray, i.e. the secondary radiation consisted entirely of scattered primary radiation; elements with atomic weights greater than that of calcium gave out, in addition to the scattered primary radiation, Röntgen rays characteristic of the element and independent of the quality of the primary rays. The higher the atomic weight of the metal the more penetrating are the characteristic rays it gives out. This is true for the different elements the reciprocal of the distance, measured in centimetres, through which the rays from the element can pass through atmospheric air before their energy sinks to a given value it had when enter the aluminum; this quantity is denoted in the table by $\lambda$.

The radiation from chromium cannot pass through more than a few centimeters of air without being absorbed, while that from iron is penetrating as the gutter out by a fairly efficient Röntgen tube. Barkla and Sadler found that the radiation intensity of the metal is not excited unless the primary radiation is more penetrating than the characteristic radiation. Thus the characteristic radiation from silver is from silver, while the characteristic radiation from iron, but the characteristic radiation from iron cannot excite that from silver. We may compare this result with Stokes's rule for phosphorescence, that the phosphorescent light is of longer wave-length than the light which excites it.

The discovery that each element gives out a characteristic radiation (or, as still more recent work indicates, a line spectrum of characteristic radiation) is one of the utmost importance. Bringing to mind, for example, the means of getting homogeneous Röntgen radiation of a perfectly definite type: it is also of fundamental importance in connexion with any theory of the Röntgen rays. We have seen that there is no evidence of refraction of the Röntgen rays; it would be interesting to try if this were the case when the rays passing through the refracting substance are those characteristic of the substance.

Secondary Cathodic Rays.—The incidence of Röntgen rays on matter causes the matter to emit cathode rays. The velocity of these rays is independent of the intensity of the primary Röntgen rays, but depends upon the "kind" of the matter exposed to the primary rays. The velocity of the cathode rays increases as the hardness of the primary Röntgen rays increases. Innes (Proc. Roy. Soc. 79, p. 442) measured the velocity of the cathode radiation excited by the rays from Röntgen tubes, and found velocities varying from $6 \times 10^5$ cm./sec. to $8.3 \times 10^5$ cm./sec., according to the hardness of the rays given out by the tube. The cathode rays given out under the action of the homogeneous secondary Röntgen radiation characteristic of the different elements have been studied by Sadler (Phil. Mag, March 1910) and Beatty (Phil. Mag, August 1910). The following table giving the properties of the cathode rays excited by the radiation from various elements is taken from Beatty's paper; $k$ is the thickness of air at atmospheric pressure and temperature required to absorb one-half of the energy of the cathode particles, $e$ is the corresponding quantity for hydrogen.

The properties of the cathode rays excited by the radiation from tin correspond very closely with those produced in a discharge tube when the potential difference between the anode and cathode is about 35,000 volts. When Röntgen rays pass through a thin plate the cathode radiation on the side the rays emerge is more intense than on the original side. Rontgen has shown that when cathode rays fall upon a metal two kinds of Röntgen rays are excited, one being the characteristic radiation of the metal and the other a kind independent of the nature of the metal. The intensity is dependent only upon the velocity of the cathode rays. The faster the cathode rays the harder the Röntgen rays they produce. It would be interesting to see if there is any connexion between the velocity of the cathode rays required to excite Röntgen rays as hard as those given out by tin and the velocity of the cathode rays which the radiation from tin produces when it falls upon any metal. Sadler has shown that metals can give off cathode rays when the cathode rays are too slow to excite the characteristic Röntgen radiation of the metal, but that there is a large increase in the cathode radiation as soon as the characteristic Röntgen radiation is excited. It is possible that the energy received by the cathode rays from the characteristic radiations which start the vibrations which give rise to the characteristic rays; the cathode particles emitted when the incident rays are too soft to excite the characteristic radiation coming from a different source from those tapped by the hard rays.

Absorption of Röntgen Rays.—The wide variations in the penetrating power of Röntgen rays from different sources is shown by the above table of the penetrating power of the characteristic rays of the different elements. Many experiments have been made on the penetration of the same rays for different substances. It is a rule to which there is no well-established exception that the greater the density of the substance the greater is its power of absorbing the rays. The connexion, however, between the absorption and the density of the substance is not in general a simple one, though there is evidence that for exceedingly hard rays the absorption is proportional to the density.

The power of any material to absorb rays is usually measured by a coefficient $\lambda/D$, the definition of which is that a plate $\lambda/D$ centimetres thick absorbs the entire radiation when the rays are stopped by a distance $\lambda/D$. If we plot $\lambda/D$ against $\lambda$ we get a curve which is normally 1/e of its original value, where $e$ is the base of the Napierian logarithms and equal to $2.718$. It has been shown that the physical state of a substance may alter,—if, for example, the radiation from the liquid is absorbed as effectively as the solid, but the density of the substance, remains constant. It has also been shown that if we have a mass $M$ made up of masses $M_1$, $M_2$, ..., of substances having coefficients of absorption $\lambda_1$, $\lambda_2$, ..., and $D_1$, $D_2$, ..., then if $\lambda/D$ for the mixture is given by the equation

$$\lambda/D = M_1\lambda_1/D_1 + M_2\lambda_2/D_2 + \ldots$$

this equation is true whether the substances are chemically combined or simply mixed. From this equation, when we know $\lambda/D$ for a binary compound and for one of its constituents, we can find the value of $\lambda/D$ for the other constituent. By the use of this principle we can find the value of $\lambda/D$ for the elements which cannot be obtained in a pure state. Bell in his experiments (Phil. Mag, 30, p. 289) has shown that if the values of $\lambda/D$ are plotted against the atomic weight we get a smooth curve; if we draw this curve it is evident that we have the means of determining the atomic weight of an element by measuring its transparency to Röntgen rays. In this way, then, when combined with elements whose transparency is known, Benoist has applied this method to determine the atomic weight of indium.

The value of $\lambda/D$ for any one substance depends upon the type of rays used, and the ratio of the values of $\lambda/D$ for two substances may vary very greatly with the type of ray; this is especially the case when one of the substances is hydrogen. Thus Crowther (Proc. Roy. Soc. 79, p. 286) has measured the absorption of air, due to Röntgen rays, by hydrogen varied from 100 for rays given out by a Röntgen tube at a comparatively high pressure when the rays were very soft to 5.56 when the pressure in the bulb was very low and the rays very intense. At a given pressure and intensity the ratio was as large as 175 for the characteristic rays given out by iron, copper, zinc and arsenic, but fell to 2.5 for the rays from tin.

Polarization of Röntgen Rays.—A great deal of attention has been paid to a phenomenon called the polarization of the
Röntgen rays. The nature of this effect may be illustrated by fig. 1. Suppose that AB is a stream of cathode rays striking against a solid obstacle B and giving rise to Röntgen rays, let these rays impinge on a small body P, under these conditions will emit secondary rays in all directions (Proc. Roy. Soc., 1895, A, 204, p. 457; Proc. Roy. Soc. 77, p. 247) found that the intensity of the secondary rays, tested by the ionization they produced in air, was less intense in the plane AB than in a plane through PB at right angles to this plane, the distances from P being the same in the two cases; the difference in the intensities amounting to about 15%. Haga (Ann. d. Phys. 28, p. 439), who tried a similar experiment but used a photographic method to measure the intensity of the secondary rays, with the photo-electric effect have confirmed Barkla's observations.

The "polarization" is much more marked if instead of exciting the secondary radiation in P by Röntgen rays from a discharge tube we so do by means of secondary rays. If, for example, in the case illustrated by fig. 1 we allow a beam of Röntgen rays to fall on B instead of the cathode rays, the difference in the intensities in the plane AB and the plane PB at right angles to it is very much increased. It is only the scattered secondary radiation which shows this "polarization"; the characteristic secondary radiation emitted by body P is quite unpolarized. They resemble light in their rectilinear propagation; they affect a photographic plate and, Brandes and Dorn have shown, they produce an effect, though a small one, on the retina, giving rise to a very faint illumination of the whole field of view. They resemble light in not being deflected by either electric or magnetic forces, while the characteristic secondary radiation may be compared with the phosphorescence produced by ultra-violet rays. The absorption of refraction is not an argument against the rays being a kind of light, for all theories of refraction make this property depend upon the relation between the nature of vibration T of the refracting substance and the period l of the light vibrations, the refraction vanishing when /T is very small. Thus there would be no refraction for light of a very small period, and this would also be true in the case of period T from the electromagnetic disturbance, provided the time taken by the light to travel over the thickness of the pulse is small compared with the periods of vibration of the molecules of the refracting substance. Experiments in this direction have not been possible up to/now, but for, in addition to the difficulties caused by the smallness of the wave-length or the thinness of the pulse, the secondary radiation produced when the rays strike against a photographic plate or pass through air might give rise to what might easily be mistaken for defraction effects. Röntgen has never succeeded in observing effects which prove the existence of defraction. Fom 1 (Wied. Ann. 59, p. 59) observed with his naked eye dark light and dark bands which looked like diffusion bands; but observation with slits of different sizes showed that they were not of this nature, and Haga and Wind (Wied. Ann. 68, p. 884) have explained them as contrast effects. These observers, however, noticed a very marked effect of light of electromagnetic disturbances parallel to the pulse, which could, however, be accounted for, in addition to the difficulties caused by the smallness of the wave-length, the difference in the intensities amounting to about 15%.

As a result of these experiments Röntgen has been enabled to do so if the wave-length had not been smaller than 1.5×10\(^{-7}\)cm. Sir George Stokes (Proc. Manchester Lit. and Phil. Soc., 1895) put forward the view that this view expediency which the rays are not regular periodic undulations but very thin pulses. Thomson (Phil. Mag. 45, p. 172) has shown that when charged particles are suddenly stopped, pulses of very intense electric and magnetic disturbances are generated. As the cathode rays consist of negatively electrified particles, an impact of these on a solid would give rise to these intense pulses. The electromagnetic theory therefore shows that effects resembling light, inasmuch as they are electromagnetic disturbances propagated through the air, must be produced when the cathode rays strike against an obstacle. Since under these circumstances Röntgen rays are produced, it seems natural, unless direct evidence to the contrary is obtained, to connect the Röntgen rays with these effects. Thus the "polarization" of the rays; for, suppose the cathode particle moving from A to B were stopped at its first impact with the plate B (fig. 1), the electric force transmitted along BP would cause a primary or Abbe line AB equal to the B rays would pass without the plate parallel to the direction of acceleration, while it is a maximum at right angles to this line; thus the intensity of the rays along a horizontal line through P would vanish, while it is a maximum in the plane at right angles to this line. In this case there would be complete polarization. In reality the cathode particle is not stopped at its first encounter, but makes a series of secondary particle collisions. These collisions will send out electric disturbances which when they fall on P are able to excite waves which send some energy along PC. The polarization will therefore be only partial and will be the kind found by Barkla.

The velocity with which the waves travel has not yet been definitely settled. Marx (Ann. d. Phys. 20, p. 677) by ingenious but elaborate method came to the conclusion that they travelled with the velocity of light; his interpretation of his experiments has, however, been criticized by Franck and Pohl (Verh. d. D. Physik Ges. 10, p. 489).

A general view of the nature of Röntgen rays has been advocated by Bragg (Phil. Mag. 14, p. 429); he regards them as neutral electric doublets consisting of a negative and a positive charge of electricity which are usually held together by the attraction between them. They may be knocked asunder when the rays strike against matter and turn into cathode rays. On this view when the rays pass through a gas only a few of the molecules of the gas are struck by the rays and so we can easily understand why so few of the effects of Röntgen rays is connected with the ionization of the electric wave all the molecules would be affected by the wave when it passed through a gas, and to explain the small fraction ionized we must either suppose that systems sensitive to the Röntgen rays are at moving along only in a very small fraction of the molecule or that the front of an electric or light wave is not continuous but that the energy is concentrated in patches which only occupy a fraction of the wave front.

Apparatus for producing Röntgen Rays.—The tube now used most frequently for producing Röntgen rays is of the kind introduced by Porter and known as a focus tube (fig. 2). The cathode is a point of a metal cathode, such as platinum or, still better, tantalum, and kept at a very high temperature by an electric or incandescent arrangement. The anode-cathode is generally set at an angle of 45° to the rays; it is probable that the action of the tube would be improved by putting the anode-cathode at right angles to the cathode rays. The walls of the tube get strongly elec- trified. This electrification affects the working of the tube, and the production of rays can often be improved by having an earth-connected piece of tin-foil on the outside of the bulb, and applied, it being kept in a horizontal position, at the front of an electric or light wave is not continuous but that the energy is concentrated in patches which only occupy a fraction of the wave front.

ROOD (O.E. "rod", a stick, another form of "rod", O.E. rod, possibly cognate with Lat. *radis*, a staff), properly a rod or pole, and so used as the name of a surface measure of land. The rod varies locally but is generally taken as = 40 square rods, poles or perches; 4 rods = 1 acre. The term was, however, particularly applied, in O.E., to a gallow or cross, especially to the Holy Cross on which Christ was crucified, the sense in which the word survives. A crucifix, often accompanied by figures of St John and the Virgin Mary, was usually placed in churches above the screen, hence known as "rood screen"
The simplest form is the "flat roof" consisting of horizontal wood joists laid from wall to wall as in floor construction. The roof must not be quite flat, for a slight fall is necessary in its upper surface to allow water to drain away into gutters placed at convenient points. The joists are covered with a waterproof material such as asphalt, lead, zinc or copper, the three last materials being usually laid upon boarding, which stiffens the structure and forms a good surface to fix the weatherproof covering upon. Such roofs are not suitable for cold climates, for accumulations of snow might overburden the structure and would also cause the wet to penetrate through any small crevices and under flashings. With flat roofs the pressure exerted upon the supports is directly vertical.

"Lean-to," "shed," or "pent" roofs are practically developments of the flat roof, one end of the joists (which are now called "rafters") being tipped up to form a decided slope, which enables slates, tiles, corrugated iron and other materials to be employed which cannot be used upon a "flat" roof.

Simple roofs in general use with a double slope are the "coupled rafter roofs," the rafters meeting at the highest point upon a horizontal ridge-piece which stiffens the framework and gives a level ridge-line. In some old roofs the rafters are connected without any intervening ridge-plate, with the result that after disturbed in Henry VIII.'s reign, but were generally removed under Edward VI. and Elizabeth.

The legality of roof screens or roof lofts in the Church of England depends on the law of the Church with regard to images, i.e. "whether they do or do not, or will or will not, encourage or lead to idolatrous or superstitious worship in the place where they are, or are to be put." (Lindley, L. 7. in R. v. Bishop of London, 1889, 24 Q.B.D. 213, 237; see also St John Timberhill, Norwich, case, 1889 Prob. 71, and article IMAGE).

ROOFS. A roof is a construction placed as a covering over the upper portion of a building to exclude the weather and preserve the contents dry and uninjured. Roofs are designed to throw off rain and snow, and their slope or "pitch," as it is generally termed, is governed to a great extent by the climate, as well as by the material used and manner of laying. The pitch may vary from an almost horizontal surface (as largely adopted in dry countries and also in temperate climates for roofs of metal or asphalt) to the steeply pitched roofs required for the ordinary flat tiles which to be weatherproof must be laid at an angle of from 45° to 80° with the horizon. Besides serving the useful purpose of protection against inclement weather the roof, both externally and internally, may be designed to form an architectural feature in keeping with the character of the building.

The image contains diagrams illustrating the sectional elevation on AA and forms of roof.
framing, usually of rough northern pine or spruce, is generally hidden from view by the ceilings. The spans usually are not great, and extra support is obtained at various points from partitions and cross walls. Where the span is large, that is, above 20 ft. without intermediate support, it is necessary to employ roofs with "principals" and "purlins," sometimes called "double rafter roofs." Principals are strong trusses of timber rigidly framed together and placed at intervals of about 10 ft. to support the weight of the roof covering. Purlins—stout timbers running longitudinally—are fixed on the principal rafters with intervals of about 8 ft., and on these the common rafters are fastened. Principals, or "roof trusses" as they are more often called, are framed together in various ways, and the members may be entirely of wood or reinforced by ties of iron rods or bars; the latter are called "composite trusses."

The "king-post truss" may be used for spans up to 30 ft. and is constructed as shown in figs. 1 and 2. It has a central post sustaining the "tie-beam" in the centre with struts projecting from its base to support the principal rafters at their centres at a point where the weight of the purlins renders strutting necessary. The members are connected by wrought-iron straps and bolts; the strap connects the king-post and tie-beam and is often fitted with a gib-and-cotter arrangement (really a pair of iron folding wedges) which allows the whole truss to be tightened up should any settlement or shrinkage occur. "Queen-post trusses" have, in place of the king-post dividing the tie-beam into two, two queen-posts supporting it at two points (fig. 3). The joints between the members are made in a similar manner to those of the king-post principal with wrought-iron straps. The purlins are two in number on each slope, one supported at the top of each "queen," the other half-way between that point and the wall-plate and resting upon the principal rafter at a point where strutted from the base of the queen-post. A stout straining beam connects the heads of the queens. In fig. 4, a and b are details at the foot of the queen-post, and c at the head. Trusses of this type are suitable for spans up to 45 ft. In roofs of a larger span than this and up to 60 ft. the tie-beam requires to be upheld at more than two points, and additional posts called "princesses" are introduced for this purpose. This also entails extra struts and purlins.

In such large spans the straining beam often becomes of such a length as to require support and this is effected by continuing the principal rafters up to the ridge and introducing a short king-post to sustain the beam in the middle of its length. Open timber roofs of various types but principally of "hammer-beam" construction were used in the middle ages where stone vaulting was not employed. Many of these old roofs still exist in good preservation and exhibit the great skill of the medieval carpenters who designed and erected them. Such forms are still used, chiefly for ecclesiastical buildings and the roofs of large halls. In the best periods of Gothic architecture the pitch of these roofs was made very steep, sometimes as much as 60° with the horizon. In the hammer-beam type of roof the tie-beam at the foot of the rafters is omitted, a collar being thrown across connecting the principal rafters at a point about half-way in their length, the lower portion of the principal consisting of a number of struts and braces rigidly connected in such a manner as to throw as little thrust as possible upon the walls serving as abutments. There are two kinds of hammer beams, the arched and the bracketed; the chief examples are Westminster Hall and Middle Temple Hall (Plate I, figs. 24 and 25). The "hammer beam" projects from the top of the wall and is bracketed from a corbel projecting from the wall some distance below. This form of roof has a style and dignity of its own, and gives greater height in the upper part of the building as well as being more ornamental and lighter in effect than tie-beam trusses, which have a rather heavy effect.

FIG. 25.—HALL OF THE MIDDLE TEMPLE.
ROOF OF OLYMPIA, LONDON.
The Mansard roof (fig. 5) is a useful form of construction which obtains its name from François Mansard, a distinguished French architect who lived in the 17th century. This kind of roof has been largely used, especially in France and other European countries, as well as in America in the old colonial days. It adapts itself well to some styles of architecture, but should be very carefully applied, since it is apt to appear ungainly in some situations. By the use of a Mansard roof extra rooms can be obtained at a small expense without adding an additional storey to the building proper. The outward thrust upon the supporting walls is not so great as with an ordinary pitched roof, the load coming practically vertically upon them. There is no recognized rule for the proportion or pitch of a roof of this description, which should be designed to suit the particular building it is intended to cover. Fig. 5, A, B, C, D and E show various forms. A similar type of curb roof is often used having a flat lead- or zinc-covered top in place of the pitched slate- or tile-covered top of the ordinary Mansard roof.

Composite roof trusses of wood and iron are frequently used for all classes of buildings, and have proved very satisfactory. They are built upon the same principles as wooden types of roof trusses. The struts—that is, those members subjected to compressional stress—are of wood, and iron bars or rods are used for the ties, which have to withstand tensile forces. When any shrinkage occurs to loosen the joints of the framing, as usually happens in large trusses, the tie-rods are tightened up by the bolts attached to them. Figs. 6, 7 and 8 are the sections and plan of a simple method of constructing the roof for an ordinary domestic building with plaster ceilings to the top rooms. It is a simple construction of the couple close order with the addition of a collar and struts and king-rod to every fourth rafter. Trimming is necessary for openings and where portions of the structure, such as chimney stacks, cut into the roof. The trimming rafters are made an inch thicker than the others. The dragon tie is framed in connexion with the wall-plate at the hipped corners to take the thrust of the hip rafters.

Steel and iron trusses in many cases follow the wood models already described. The struts and principal rafters are usually of T section, the tensional members being rods or flat bars. Flat plates and bolts or rivets are used to form the connections between the members, and a means is provided in the tie-rod for tightening up the truss should any of the members "give" slightly under their load. Large trusses for very wide spans are especially designed for their work and may be of many different types of design. Big roofs on the tie-rod principle are now being discarded as being more liable to failure, through deterioration or defect, than those built on the girder principle in one form or another. Fig. 9 is a queen-rod roof principal for a span of 50 ft., and shows the sizes of the different members, a line diagram of the truss and large details of the joints. Fig. 10 in a similar manner shows the roof at Cardiff railway station, which has a span of 43 ft.

The steel roof covering the great hall at Olympia, London, is an example of a carefully designed and well-built roof which combines with strength an extremely light and elegant appearance. This is due to the fact that every member of the roof is adapted to meet the particular stresses found by calculation to affect it. By careful study of conditions the sections of steelwork used for the various members have been reduced to the smallest size compatible with safety. In this way any unnecessary surplus of material is avoided, and so is the heavy, overwhelming effect noticeable in many roofs of large span. There is an entire absence of long wide plates and webs; the various members are composed wholly of flat bars and angle irons riveted together, and plates are introduced only where required to cover joints. Some notes on its size and construction.
Domes may be framed up with wood rafters cut to shape. For small spans this construction is satisfactory, but when the dome is of considerable size it is often framed in steel as being stronger and more rigid than wood, and therefore not exerting so great a thrust upon the supporting walls. The outer dome of St Paul's cathedral in London is of lead-covered wood, framed upon and supported by a conical structure of brickwork which is raised above the inner dome of brick. Concrete is a very suitable material for use in the construction of domes, and may be employed simply or with iron or steel reinforcement in the shape of wires, bars or perforated plates. One of the best modern examples of concrete vaulting and domical roofing without metal reinforcement occurs in the Roman Catholic cathedral at Westminster, a remarkable building designed by Mr J. F. Bentley. A few details of the roofs will be interesting. The circle developed by the pendentives of the nave domes is 60 ft. in diameter. The thickness of the domes at the springing is 3 ft. gradually reduced to 15 in. at the crown; the curve of equilibrium is therefore well within the material. The domes were turned on closely boarded centring in a series of superimposed rings of concrete averaging 4 ft. in width. The concrete is not reinforced in any way. The independent external covering of the domes is formed of 3 in. artificial stone slabs cast to the curve. They rest on radiating ribs 5 in. deep of similar material fixed on the concrete and rebated to receive the slabs; thus an air space of 2 in. is left between the inner shell and the outer covering, the object being to render the temperature of the interior more uniform. At the springing and at the

Domes and roofs.

The following five roofs are examples of large span: Crystal Palace (104 ft.); Olympia, London (170 ft.); St Enoch station, Glasgow (108 ft.); Central station, Manchester (210 ft.); St Pancras station, London (240 ft.).

will be interesting. The dimensions of the great hall are 440 ft. long by 250 ft. wide, the height to the crown of the roof being about 100 ft. The main ribs of the roof have a clear span of 170 ft. and are placed 34 ft. apart. They are of box-girder form and measure 7 ft. deep and 2 ft. wide. The gallery around the hall is 40 ft. wide on three sides and 26 ft. wide on the remaining side. It is covered by a lean-to roof which abuts against the curved ribs on the north and south sides, and is attached to horizontal members of the gallery on the east and west sides. The bricks walls of the building are not called upon to resist any portion of the thrust from the roof, as the side frames through which the gallery floor passes form a self-contained system of steelwork in which the thrust is ultimately conveyed to the ground. The screens which close the semicircular ends of the roof are of vertical ridge and furrow construction, as can be clearly seen in the illustrations, this form offering great resistance to wind pressure while at the same time requiring a minimum amount of material. Of the two illustrations, fig. 11 is a detailed cross-section showing fully the method of construction of the foot of the main rib and column, and the arrangement of the side frames above referred to is shown in fig. 12, which is a complete cross-section view, and will convey to the reader some idea of the vast size of the building and its general proportions.
crown the spaces between the ribs are left open for ventilation. The sanctuary dome differs in several respects from those of the nave. Unlike the latter, which seem to rest on the flat roofing of the church, the dome of the sanctuary emerges gradually out of the substructure, the supporting walls on the north and south being kept down so as to give greater elegance to the eastern turrets. The apsidal termination of the choir in the east is covered in with a concrete vault surmounted by a timber roof, in striking contrast to the domes covering the other portions of the structure. Fig. 13 is a section through the nave showing how the domes are buttressed, fig. 14 is a section through the sanctuary dome, and figs. 15 and 16 a section and part plan of the vaulting of the choir with its wood span roof above the concrete vault.

Covering Materials for Roofs.—There are a large number of different roof-covering materials in common use, of which short descriptions, giving the principal characteristics, may be useful. The nature of the material employed as the outer covering affects the details of roof construction very considerably. A light covering such as felt or corrugated iron can be safely laid upon a much lighter timber framing than is necessary for a heavy covering of tiles or slates.

Roofing felt is an inexpensive fabric of animal or vegetable fibre treated with asphalt to make it capable of resisting the weather. It is largely used as a roofing material for temporary buildings. When exposed to the weather it should be treated with an application of a compound of tar and slaked lime, well boiled and applied hot, the surface being sprinkled with sand before it becomes hard. Felt is also used on permanent buildings as a good non-conductor of heat under slating and other roof-covering materials. In this case it is not tarred and sanded. It is supplied in rolls containing from 25 to 35 yds. 30 in. wide. The sheets should be laid with a lap of 2 in. at the joints and secured to the boarding beneath by large-headed clout-nails driven in about 2 in. apart.

Corrugated iron is supplied either black or galvanized. It is especially suited for the roofs of outbuildings and buildings of a more or less temporary character. Being to a large extent self-supporting, it requires a specially designed roof framework of light construction. If, as is usually the case, the sheets are laid with the corrugations running with the slope of the roof, they can be fixed directly on purlins spaced 5 ft. to 10 ft. apart according to the stiffness and length of the sheets. In
pure air zinc coating of the galvanized sheets is durable for many years, but in large cities and manufacturing towns its life is short unless protected by painting. In such districts it has often been found that plain un-galvanized sheets well coated with paint will last longer than those galvanized, for the latter are attacked by corrosive influences through minute flaws in the zinc coating developed in the process of corrugation or resulting from some defect in the coating. The stock sizes of corrugated sheets vary from 5 ft. to 10 ft. long, and from 2 ft. to 2 ft. 9 in. wide with corrugations measuring 3 in. to 5 in. from centre to centre. For roofing purposes the sheets are supplied in several thicknesses ranging from No. 16 to No. 22 Standard Wire Gauge. No. 16 is for exceptionally strong work, No. 18 and No. 20 are used for good-class work, and No. 22 for the roofs of temporary buildings. The sheets when laid should lap about 3 in. at their sides and from 3 in. to 6 in. at the ends. Riveting is the best method of connecting the sheets, although galvanized bolts, which are not so satisfactory, are frequently employed. The joints should be made along the raised corrugations to lessen the risk of leakage. Holes can be punched during the erection of the roof; their positions should first be determined by placing the sheets in position and marking the necessary point of fixing. Sheets are usually attached to timber framework with galvanized screws, or nails with domed washers placed under their heads. Fixing to a steel framework is effected by means of galvanized hooked bolts clipping the purlins passed through the sheet and held tight by nuts.

Fig. 13.—Westminster Cathedral: section through nave.

on the outside. Sheets corrugated in the Italian pattern have raised half-rounds every 15 in. or so, the portions between being flat. Such sheets have a very neat appearance and give a better effect in some positions than the ordinary corrugations.
Zinc in sheets is a material largely used as a roof covering, and if care be taken to ensure metal of good quality, it proves itself light, strong and durable, as well as inexpensive. Zinc is stronger weight for weight than lead, slate, tile and glass, but weaker than copper, wrought-iron and steel, although with the exception of the last mentioned it is not so durable when exposed to the weather. It is not liable to easy breakage as are slate, tile and glass. It is usually supplied in flat sheets, although it can also be had in the corrugated form similar to corrugated sheet-iron. When exposed to the weather a thin coating of oxide is formed on the surface which protects the metal beneath from any further change, and obviates the necessity of painting. In laying the sheets, the use of solder and nails should be avoided entirely except for fixing clips and tacks which do not interfere with the free expansion and contraction of the sheets. The reason for this is that zinc expands freely, and sheets laid with soldered seams or fixed with nails are liable to buckle and probably break away owing to movements set up by changes of temperature. The usual sizes of zinc sheets are 7 ft. or 8 ft. long by 3 ft. wide. The thickness and weights of zinc are shown in the following table, which compares the Vieille Montagne Gauge with the Old Belgian Gauge and the British Imperial Standard Wire Gauge.

The best method of laying a zinc flat roof is with the aid of wood "rolls" of about 2 in. X 2 in. in section, splayed at sides and spaced 8 ft. or 8 in. apart and fixed to the roof boarding with zinc nails. The nails should not be used as this metal affects the zinc. The sheets of zinc are laid between the rolls with their sides bent up 1 \( \frac{1}{2} \) in. or 2 in. against them, and held firmly in position by clips of zinc attached to the rolls. A cap of the same metal is then slipped over each roll and fastened down by tacks about 3 in. long soldered inside it so as to hook under the same clips that hold the sheet down. Drips of about 2 \( \frac{1}{2} \) in. are made in the slope at intervals of 6 ft. or 7 ft.—that is, the length of a sheet—and special care must be taken at these points to keep the work watertight. The lower sheet is bent up the face of the drip and under the projecting portion of the upper sheet, which is finished with a roll edge to turn off the water. The end of the roll has a specially folded cap which also finishes with a curved or beaded water check, and this in conjunction with the saddle piece of the roll beneath forms a weather-proof joint (figs. 17 and 18). The fall between the drips is usually made about 15 in., but where necessary it may be less, the least permissible falling being about 1 in 80. Felt laid beneath zinc has the effect of lengthening the life of the roof and should always be used, as the edges of the boarding upon which it is laid are, when the latter warps, apt to cut the sheets. It also forms a cushion protecting the zinc if there is traffic across the roof.

Sheet-lead forms a much heavier roof covering than zinc, but it lasts a great deal longer and more easily withstands the attacks of impure air. Lead must be laid on a close boarding, for its great ductility prevents it from spanning even the smallest spaces without bending and giving way. This characteristic of the metal, however, conduces largely to its usefulness, and enables it to be dressed and bossed into awkward corners without the necessity of jointing. The coefficient of expansion of lead is nearly as great as that for zinc and much higher than in the case of iron, and this fact requires precautions similar to those affecting zinc to be taken when laying the roofing. The manner of laying leads with rolls and drips as in the case of zinc, the details of the work differing somewhat to suit the character of the material (see figs. 19, 20 and 21). Allowances must be made for expansion and contraction, and the use of nails and solder avoided as far as possible. Contact with iron sets up corrosion in lead, and when nails are necessary they should be of copper; screws should be of brass. Lead is supplied in rolls of 25 to 35 ft. long and 6 ft. to 7 ft. 6 in. wide. That in general use varies from one-fourteenth to one-seventh of an inch in thickness. The weights most suitable for employment in roofing work are 7 or 8 lb per square foot for flats and gutters, 6 lb for ridges and hips, and 5 lb for flashings.

As a roof covering copper is lighter, stronger and more durable than either zinc or lead. It expands and contracts much less than these metals, and although not so strong as wrought-iron and steel it is much more durable. From a structural point of view these qualities enable it to be classed as the best available metal for roof covering, although its heat-conducting properties require it to be well insulated by layers of felt and other non-conducting material placed beneath the metal. On exposure to the air copper develops a feature of great beauty in the coating of green carbonate which forms upon its surface protecting it from further decomposition. Perhaps the chief disadvantage in the use of copper lies in its first cost, but against this must be set the almost impenetrable nature of the metal and the fact that by reason of its light weight less substantial framework is required for its support. Copper roofing should be laid in a similar manner to zinc, with wood rolls at intervals of about 2 ft. 4 in. It is, however, often laid with welded seams. The general stock sizes of sheets are from 4 ft. to 6 ft. long and 2 ft. to 3 ft. wide. The thickness most invariably used is known as 24 S.W.G. and weighs 16 oz. per square foot. Thinner metal would suffice, but owing to the increased cost of rolling very little would be gained by adopting the thinner gauges.

In the United States of America "tin" roofs are quite commonly used. Sheets of wrought-iron coated either, with tin or zinc are used of a size usually 14 in. by 20 in., though they may be any size. American tin roofs are made by fixing an insulating foundation of somewhat stout paper or felt; this must be dry, else it is apt to spoil the impermeable covering laid upon it by causing it to rust. Junctions between the sheets are made by welded seams in which the four edges of the sheets are turned over so as to lock together, thus forming one large sheet of tin covering the roof. In high-class work of a permanent nature the seams in addition are soldered, resin only being used as a flux. Each sheet also is secured to the roof with two or three tin cleats. The life of such roofs may be practically doubled by the application of a good coat of paint, which, however, adds considerably to the cost.

Slate is a strong and very impermeable material, and these qualities and the fact that it is easily split into thin plates suitable for laying, as well as its low cost, cause it to be far the most generally used of all roof materials. Slate is very durable. Some of the best known varieties of slates, classified according to their colour, are as follows:

- **Blue**: North Wales (Penryn, Ffestiniog, Dinorwig, &c.), France, Norway, Germany.
- **Blue-grey**: Cornwall (Delabole).
- **Grey**: North Wales (Penryn, Dinorwig).
Slates are cut to many different sizes varying in length from 10 in. to 36 in. and in width from 5 in. to 24 in. There are perhaps thirty or more recognized sizes, each distinguished by a different name. In common practice those generally used are "large ladies," 16 in. by 8 in.; "countesses," 20 in. by 10 in.; and "duchesses," 24 in. by 12 in. Generally speaking, the rule governing the use of the different sizes is that the steeper the pitch the smaller the slate, and vice versa. Buildings in very exposed positions naturally require steeply pitched roofs.

Some of the technical terms used by the Slater are as follows:—

**Bed.** The under surface of a slab when laid.

**Back.** The upper surface of the slate.

**Gauge.** The distance between the lines of nailing. This depends on the length of the nail used, and is equal half the length of the slate after the lap plus an inch for the nail-hole has been deducted. This is for slates nailed near the top edge; for those fixed near the middle the gauge would be half an inch more, as no allowance for nail-holes is required.

**Margin.** The width of the exposed portion of each course which equals the width apart of the nailing.

**Head and tail.** The top and bottom edges of the slate.

**Lap.** The lap of the tail of one course of slates over the head of the second course below it. The lap is made from 2 ft. 6 in. to 4 ft. (usually 3 in.), and for this distance there are three thicknesses of slate, namely, the tail of the top course, the middle of the next, and the head of the third course.

Slates may be fixed by nailing at the head (see fig. 22) or at about the middle. The latter method is the stronger, as the levering effect of the wind cannot attain so great a strength. There is a small economy effected by centre nailing, as the margin is slightly larger and fewer slates are required to cover a given space; longer nails, however, are required, as slates are laid at an angle with the pitch of the roof their centres cannot be made to approach so near to the slating battens or boarding as the head, which lies close on the surface to which it is fixed. Another point worth noticing is that the nail-holes in the centre nailed slating are only covered by 3 in. of the tail (the amount of the "lap") of the course of slates above, and rain is very liable to be forced under by the wind and cause the wood battens or other woodwork to rot. Head-nailed slates, on the other hand, have their holes covered by two layers of slate, and are removed from exposure by the length of the gauge plus the lap, which in the case of a "countess" slating equals 11 in.

"Open slating" is an economical method of laying slates that is often adopted for the roofs of sheds and temporary buildings. The slates in the same course are not laid edge to edge as in close slating; but at a distance of two or more inches apart. This forms a roof covering light in weight and inexpensive, which, although not strictly weather-proof, is sufficiently so for the buildings upon which it is used.

Slates are laid upon open battens fixed upon the rafters or upon close boarding or upon battens fixed upon boarding. The battens are ¾ in. or 1 in. thick and 13 in. to 3 in. wide, and are spaced to suit the gauge of the slates. When the slating is used it is often covered with inodorous asphalted felt. While taking these precautions to make the roof sound and tight it should be borne in mind that slate is liable to decay if not ventilated, and to effect this the battens are sometimes fixed vertically, ridge ventilators introduced and air inlets arranged at the eaves. The bed of slates laid without provision for the admission of air will be found on removal after some time to have rotted so as to scale off and easily crumble into powder.

The nails used in slating are a very important item, and the choice of the wrong kind of nail may be the constant source of annoyance to the man himself upon whom they. They should have large flat heads. The most satisfactory are those made of a composition of copper and zinc, but others of copper, zinc, galvanized iron and plain iron are used. Those of copper are most durable but are soft and expensive; zinc nails are soft and not very durable; they will last about twenty years. Iron nails even if galvanized are objectionable in permanent work, though they may be used for temporary roofs. When the plain-iron nails are used they should be heated and plunged in boiled linseed oil. The pitch of a roof intended for slating should not incline less than 25° with the horizontal, while 30° is a safer angle to adopt.

The covering for roofing purposes is made from clay and burned in a manner similar to bricks. The clay from which they are made, however, of a specially tenacious nature and prepared with great care so as to obtain a result as strong and as durable as possible. Tiles are distinguished by the different colours, and some of these have a very beautiful effect when fixed and improve with age. They comprise a large number of tints from yellowish red, red and brown to dark blue. As bricks the quality depends to a large extent upon the burning; underburnt tiles are weak and porous, liable to early decay, while overburning, though improving the tiles as regards durability, will cause them to warp and will spoil colour. The usual shape is the "plain tile," in shape; they are made in various other shapes with a view both to easier fixing and lighter weight, and to ornamental effect. There are also several patented forms on the market for which the makers claim special advantages. Tiles are obtainable in a large extent by curved in shape to enable them to lie close one upon the other. Some of them have small "nibs" moulded on at the head by which they may be hung upon the battens and nailing avoided (see fig. 23). Nail-holes are provided, and upon the covers it is advisable to make use of them. Others are made without the nails, and are fixed either by nailing to the battens or boarding or by means of oaken pegs wedged in the holes to the battens, the pegs in latter case actuating in the same way as the above-mentioned nibs. Plain tiles are of rectangular or irregular form, the standard dimensions are 10½ in. long by 6 in. wide. They are usually ½ in. thick and weigh about 2¼ lb each.

There are many forms of ornamental tiles, which are plain tiles having their tails cut to various shapes instead of moulded square. A number of patented forms of tiles also are on the market, some of which possess considerable merit. Pantiles are suitable for temporary and inferior buildings as such as sheds and outhouses. They are laid on a different principle from plain tiles, merely overlapping each other at the edges, and this necessitates bedding in mortar and pointing inside and sometimes outside with mortar or cement. This pointing plays an important part in keeping the interior of the building free from the penetration of wind and water. Pantiles are generally made to measure 13¾ in. long by 9 in. wide, and weigh from 5 lb to 8½ lb each. Moulded on at the head of each tile is a projecting nib which serves for the purpose of hanging the tile to the batt or lath. They are laid with a lap of 3¾ in., 2¾ in. or 1½ in., giving a gauge (and margin) of 10 in., 11 in. and 12 in. respectively. The side lap is generally 1½ in., leaving a width of 1 in. exposed face. There are many other forms of pantile, the shape of the pantile, some of which are patented and claim to have advantages which the original form does not possess. Among such are corrugated tiles of the ordinary shape or with angular flutes, and also the Italian pattern "double roll tiles," "Foster's lock-wing tiles." Poole's bonding roll tiles are a development of the Italian pattern tile. As a roof covering and the different methods of fixing it are dealt with in the article GLAZING.

There are many other materials used for roof covering besides those already described; many of them of considerable value. Some of the most durable have practically died out of use owing to the development and cheapening of other forms of roofing. Among these may be included thatch and wood shingles, the use of which in these days is practically reduced to special cases. Other little used roofing materials are those of recent invention, some of which perhaps...
have a great future before them. Plates of asbestos used as slates or tiles make a light, strong and fireproof covering. Large terracotta tiles are sometimes used in South Sweden. A good form of flat roof is that in which concrete is used as a foundation for a waterproof layer of asphalt, laid to slight falls to allow the water to run off easily. This is the usual method adopted when a roof is needed for a thatched roof that looks extremely well on a roof, but their use is disapproved in a great many districts owing to the danger of fire. Galvanized iron tiles, zinc tiles and copper tiles may be employed on small areas with good effect. When paper is used beneath slates and tiles, it is also at times used as a roof covering. It is cardboard chemically treated to render it tough, waterproof and fire-resistant.

The weights which are approximate are for a square foot of roofing. The trusses are taken to be spaced 10 ft. apart and include the necessary pulleys.

| King-post wood truss 20 ft. to 30 ft. span | 2 to 2½ lb.                |
| Wood rafters | 3 to 3½ lb.                |
| Ceiling joists and ceiling | 1 lb.                   |
| 1-in. boarding for roof covering | 1 lb.                   |
| 1¼-in. | 1½ lb.                   |
| 2½-in. X 1 in. slate battens for 83-in. gauge | 1 lb.                   |
| Felt | 2 lb.                   |
| Thatch | 6 lb.                   |
| Slates (ordinary laid with 3-in. lap) | 9 lb.                   |
| Tiles, plain flat | 18 lb.                  |
| Purlins | 1½ lb.                   |
| Zinc | 2 to 16 gauge laid complete including rolls | 1½ lb.               |
| Copper 25 to 10 gauge laid complete including rolls | 1½ lb.               |
| Lead weighing 6 lb per square foot laid complete | 6½ lb.                |
| Cast-iron 20 S.W. gauge | 2½ lb.                   |

Wind pressure is usually calculated at 22 to 25 lb on a roof with pitch of 36°, and 27 to 30 lb on a roof of 45° pitch.

From these particulars it is easy to calculate the weight of a square (100 square ft.) of roof material, being the usual standard of measurements in building materials.

**Regulations.**

The London Building Act of 1894 and its amendments set forth with regard to roofs erected in the London district that every structure on a roof is to be covered with slate, tile, metal or fireproofing materials and large boards to dormers not exceeding 12 in. in depth, and doors and windows and their frames. Every dwelling-house or factory above 30 ft. in height and having a parapet must have means of access to the roof. The pitch of the roofs of warehouse buildings must not exceed 45°, and those of other buildings must not exceed 75°, but towers, turrets and spires are excepted. In domestic buildings not more than two stores are to be formed in the roof. If their height is more than 90 ft. above the street level, fireproof materials must be used throughout and a sufficient means of escape provided. The building by-laws of the municipality of Johannesberg contain the most complete set of requirements of roofs and their method of construction. In the designing of buildings roof-slopes must be within a line drawn and produced from the ground level at the opposite side of the street to the top of the coves, gutter or parapet. No roof in the municipal fire limit may be constructed of thatch, reed or other inflammable material. Without the fire area they may be so constructed if the building stands at least 20 ft. from the boundary of its site. Roofs having a pitch of less than 22½° must be constructed to bear safely a load of at least 28 lb per square foot of surface. Roofs of steeper pitch must be able to support a live load of 21 lb per square foot. The framing of Mansard or other roofs of more than 60° pitch on a building exceeding 180 ft. in height must be constructed of approved fireproof material at least 2 in. thick. No roofs except those of towers, turrets or spires shall exceed 70° pitch for a Mansard or 60° for an ordinary roof. Every fireproof roof, in addition to a door or staircase for access from below, must have a skylight or skylights with metallic framing, having an area equal to at least one-sixth the area of the roof. Skylights placed over rooms or areas to which the public have access must be protected by wire netting below or be glazed with wire-wove glass.

The Building and Health Laws and Regulations and Amendments of 1905 affecting the city of New York are based, so far as the construction of buildings is concerned, on the same lines as the regulations of the municipality of Johannesberg. The principal exceptions being that they give very full working details, under part 24, as to the strengths of materials required to be used and the wind pressure to be provided against. In part 27 they provide that a building shall not be more than 24 ft. in height and the roof has a pitch of over 60°, it shall be constructed of iron rafters and be lathed with iron or steel on the inside and plastered or be filled in with fireproof material not less than 3 in. thick and covered with metal, slate or tile. The provision as to access to roof and fire escapes therefrom adopted by the London

ROOKE (O. E. Hrōc, Iceł. Hrór,1 Swed. Röka, Du. Roek, Gaël. Rocas), the Corvus frugilegus of ornithology, and throughout a great part of Europe the commonest and best-known of the crow tribe, belonging to the Passer family Corvidae. Besides its pre-eminently gregarious habits, which did not escape the notice of Virgil (Georg. i. 382) and are so unlike those of nearly every other member of the Corvidae, the rook is at once distinguished from the rest by commonly losing at an early age the feathers from its face, leaving a bare, scabrous and greyish-white skin that is sufficiently visible at some distance. In the comparatively rare cases in which these feathers persist, the rook may be readily known from the black form of crow (q.v.) by the rich purple gloss of its black plumage, especially on the head and neck, the feathers of which are soft and not pointed. In a general way the appearance and manners of the rook are well known, and particularly its habit of forming communities in the breeding-season, which it possesses in a measure beyond that of any other land bird of the northern hemisphere. Yet each of these communities, or rookeries, seems to have some custom intrinsically its own. In a general way the least-known parts of the rook's mode of life are facts relating to its migration and geographical distribution. Though the great majority of rooks in Britain are sedentary or only change their abode to a very limited extent, it is now certain that a very considerable number arrive in or towards autumn, not necessarily to abide, but merely to pass onward, like most other kinds of birds, to winter farther southwards; and at the same season or even a little earlier, it cannot be doubted that a large proportion of the young of the year migrate in the same direction. As a species the rook on the European continent only resides during the whole year throughout the middle tract of its ordinary range. Further to the northward, far to the north, and not uncommonly, as that of a regular immigrant, while farther to the southward, as in southern France, Spain and most parts of Italy, it is, on the contrary, a regular winter immigrant. The same is found to be the case in Asia, where it extends eastward as far as the upper Irtilsh and the Ob. It breeds throughout Turkestan, in the cold weather visiting Afghanistan, Cashmere and the Punjab, and Sir Oliver St John found a rookery of considerable size at Casbin in Persia. In Palestine and in lower Egypt it is only a winter visitor, and H. B. Tristram noticed that it congregates in great numbers about the mosque of Omar in Jerusalem. The same writer (Proc. Zool. Soc., 1862, p. 444; ibid., 1866, pp. 68, 69) considered the Palestine rook entitled to specific distinction as Corvus Africola. The rook of China has also been described as a distinct species, C. postinitor (Proc. Zool. Soc., 1845, p. 1) from having the feathers of its face only partially deciduous.

ROOKE, SIR GEORGE (1635-1709), English naval commander, was born near Canterbury in 1635. Entering the navy as a volunteer, he served in the Dutch Wars and became postcaptain in 1673. After the Revolution of 1688, he commanded

---

1 The bird, however, does not inhabit Iceland, and the language to which the name belongs would perhaps be more correctly termed Old Teutonic. From this word is said to come the French Freux. There are many local German names of the same origin, such as Ruok (in Bohec), Ruch, and others, but the bird is generally known in Germany as the Saat-Krähe, i.e. seed-eating crow.

2 This is more noteworthy as the district in which he was born and educated is almost the only part of Italy in which the rook breeds. Shelley also very truly speaks of the "legioned rocks" to which he stood listening "mid the mountains Euganean."
the squadron which raised the siege of Londonderry in 1689. He became rear-admiral in 1690, and fought at the battle of Beachy Head. In May of 1692 he served under Russell at the battle of Barfleur, and he greatly distinguished himself in a night attack on the French fleet at La Hogue, when he succeeded in burning six of their ships. Shortly afterwards he received the honour of knighthood and a reward of £1,000. In 1693 he commanded the Smyrna convoy, which was scattered and partly taken by the French admiral Tourville near Lago. Finally, till the peace of Nymwegen (1697), he continued to serve in the Channel and Mediterranean. In 1702 he commanded the expedition against Cadiz, and on the passage home destroyed the Plate fleet in Vigo. With Sir Cloudesley Shovel he took part in the capture of Gibraltar on the 21st of July 1704. On the 13th of August of the same year he attacked the French fleet off Malaga, the battle being drawn. On account of the dissatisfaction expressed indirectly at the result of the contest, he retired from the service in February 1705. He died on the 24th of January 1709.

`Roote's Journal for 1700–2 has been printed by the Navy Record Society.'
ROOSEVELT, THEODORE (1838-1919), twenty-sixth president of the United States, was born in New York City on the 27th of October 1838. The Roosevelt family 1 has been prominent in the life of New York for many generations. Theodore Roosevelt and Edith Kermit Carow, who was born Martha Bullock, came from a family of Scotch-Irish and Huguenot origin equally prominent in Georgia. Each family may lay claims to a history of more than ordinary social and political distinction. Although born in New York, Mr. Roosevelt spent much of his boyhood at Oyster Bay, the country home of his father, on Long Island Sound, where he began with a distinct purpose, unusual among boys of his age, to build up a naturally frail physique by rowing and swimming in the waters of Long Island Sound, and by riding over the hills and tramping through the woods of Long Island. That his early outdoor life furnished a definite training for his after career is indicated by the fact that when he was about fourteen years of age he went with his father on a tour up the Nile as far as Luxor, and on this journey he made a collection of Egyptian birds found in the Nile valley, which is now in the Smithsonian Museum in Washington, D.C. Mr. Roosevelt was educated at Harvard University, where he graduated in the class of 1860; 2 his record for scholarship was creditable, and his interest in sports and athletics was especially manifest in his skill as a boxer. On leaving college he made a short visit to Europe, was elected to the London Alpine Club for climbing the Jungfrau and the Matterhorn, and returning to New York he filled his time as a peripatetic student of Columbia University and in the office of his uncle Robert B. Roosevelt. Determining to enter active politics, he gave up his legal studies without qualifying for the bar, and in 1881 he was elected to the New York legislature as a regular Republican, although in opposition to the "boss" of the assembly district for which he was a candidate. He was elected again in 1882 and in 1883, and at the age of twenty-four was his party's candidate for Speaker of the Assembly. In 1884 he was a delegate of the Republican party to the convention in Chicago which nominated James G. Blaine for president. In the convention he opposed the nomination of Mr. Blaine, and in a speech which attracted considerable attention for its vigour and courage advocated the nomination of Senator George F. Edmunds. After Mr. Blaine's nomination, however, he supported him in the campaign as the chosen of the party, in spite of the fact that an important wing of the Republican party "bolted" the nomination and espoused the candidacy of Grover Cleveland, who was elected president. In 1884, partly because his political life seemed at least for the immediate present to be at an end, partly on account of the freedom and activity of out-of-door life, he bought two cattle ranches near Medora on the Little Missouri river in North Dakota, where he lived for two years, becoming inti-
mately associated with the life and spirit of the western portion of the United States.

In 1886 he was the Republican candidate for mayor of New York City, but was defeated by Abram F. Hewitt, the Tammany candidate, and received a smaller vote than Henry George, the candidate of the United Labor party. Mr. Roosevelt, however, received a larger proportion of the total vote cast than any mayoralty candidate of the Republican party had previously received in New York City. In April 1889, on the accession to the presidency of Benjamin Harrison, Mr. Roosevelt, then closely identified with the work of Civil Service reform, was appointed a member of the United States Civil Service Commission. In this office, until then one of minor importance, he served for six years. He made it not only nationally prominent, but instrumental in shaping the course of legislative and executive action by introducing into the work of the Commission an entirely new spirit. The annual reports, of which he was the chief author, became controversial pamphlets; he published bold replies to criticisms upon the work of the Commission; he explained its purposes to newspaper correspondents; when Congress refused to appropriate the amount which he believed essential for the work, he made the necessary economies by abandoning examinations of candidates for the Civil Service in those districts whose representatives in Congress had voted to reduce the appropriation, thus very shrewdly bringing their adverse vote into disfavour among their own constituents; and during the six years of his commissionership more than twenty thousand positions for government employees were taken out of the realm of merely political appointment and added to the classified service to be obtained and retained for merit only. In 1895 he resigned from the Civil Service Commission and became President of the Board of Police Commissioners for the City of New York. After a strenuous two years in this office, he was appointed by President McKinley in 1897 assistant-secretary of the navy. He was certain that war with Spain was inevitable, and he did much to prepare the navy for hostilities, framing an important personnel bill, collecting ammunition, getting large appropriations for powder and ammunition used in improving the marksmanship of the navy by gunnery practice, buying transports and securing the distribution of ships and supplies (especially in the Pacific) in such a way that, when hostilities were declared, American naval victories would be assured. He urged upon the administration the bold policy of protesting against the sailing of Cervera's fleet, on the ground that it would be regarded as a warlike measure not against the Cuban revolutionaries, who had no navy, but against the United States; and he advised that, if Cervera sailed, an American squadron be sent to meet him and to prevent his approaching America. At the outbreak of the war with Spain he resigned from the Navy Department and raised the first volunteer regiment of cavalry, popularly known as the "Rough Riders," because many of its members were Western cowboys and ranchmen expert in the handling of the rough and often unbroken horses of the Western frontier. The regiment also included college athletes, city clubmen and members of the New York police force, every man possessing some special qualification for the work in view. Mr. Roosevelt declined the colonelcy of the regiment, preferring to take the post of lieutenant-colonel under his intimate friend Dr. Leonard Wood, who, while a surgeon in the United States army, had served

1 Claas Martenszen van Roosevelt (or Rosvelt) settled in New Amsterdam in 1619; his son Claas (or Nicholas) in 1700-1 was a New York alderman of the Leislerian party; in the next three generations, Corneel, Claes J. Bollocks, and Catholine merchant and (in 1745-6, 1785-87 and 1797-99 and 1800, respectively) aldermen of New York; in the third generation the family became allied with the Schuylers. Isaac Roosevelt was a member of the New York City Council in 1777 and Assembly in 1777-86; and in 1788-92, in the state Assembly were James Roosevelt (1766-97), Cornelius C. Roosevelt (1803), James I. Roosevelt, jun. (1835-40), and Clinton Roosevelt (1837-40). 
2 In 1857, H. O. Dunwoody was a member of the national House of Representatives in 1841-43, and a justice of the state Supreme Court in 1851-59. Nicholas J. Roosevelt (1867-1854), with John Stevens, Robert R. Livingstone and Robert Fulton, was prominent in the development of steam navigation. His brother, Cornelius van Schalk Roosevelt (1794-1871), was a founder of the Chemical National Bank of New York, and the grandfather of the president. The president's uncle, Robert Barnwell Roosevelt (1820-1906), was a New York lawyer, New York state fish commissioner in 1866-68, a member of the Committee of Seventy which exposed the corruption in Tammany in 1871, a member of the House of Representatives in 1871-73, a member of the House of Representatives in 1871-73, U.S. minister to the Netherlands in 1888, and author of works on American game birds and fish. R. B. Roosevelt's brother, the president's father, Theodore Roosevelt (1831-1876), was a glass importer, prominent in city charities, an organizer of the Union League Club, and the founder of the Orthopaedic Hospital. A cousin, James Henry Roosevelt (1800-1863), was founder of the Roosevelt Hospital in New York City. The president's uncle, Leander Francis Bullock (1823-1877), was the first president (1776-1777) of the Geological Society of South Carolina, and president (1793-1797) of the New York State Medical Society. John Waddell Bullock, prominent in the South Carolina legislature, was a Confederate navy, and equipped in England vessels (including the "Alabama") as Confederate cruisers.

In 1870 he married Alice Hathaway Lee of Boston, who died in 1884 leaving one daughter. Later (in 1886) he married Edith Kermit Carow of New York City, and by this marriage had four sons and one daughter.
in action with gallantry and skill against the Indians. On the promotion of Colonel Wood to the command of the brigade, Mr Roosevelt became colonel of the regiment, which took an especially prominent part in the storming of San Juan Hill. In this battle Colonel Roosevelt became the ranking officer and, abandoning his horse, led the charge up the hill on foot. This charge, in which many of the "Rough Riders" were killed or wounded, drove the Spaniards from the trenches and opened the way to the surrender of Santiago. At the conclusion of the war, while the troops were still in camp in the South, Mr Roosevelt joined in a "round robin" of protest against the mismanagement in the War Department, which had resulted in widespread suffering among the troops from wretched food and bad sanitary arrangements. This "round robin" created a sensation which aroused public opinion and was instrumental in bringing about some desirable reforms in the War Department.

When his regiment was mustered out of service in September 1898, Mr Roosevelt was nominated by the Republican party for the governorship of New York State and was elected in November by a substantial plurality. He was governor for two years. He reformed the administration of the state canals, making the Canal Commission non-partisan; he introduced the merit system into many of the subordinate offices of the state; and he vigorously urged the passage of and signed the Ford Franchise Act (1899), taxing corporation franchises. In various contests, in which he was almost uniformly victorious, he showed himself to be independent of "boss" control. In 1900, although he wished to serve another term as governor, in order to complete and establish certain policies within the state, he was nominated for the vice-presidency of the United States on the ticket with President McKinley by the Republican National Convention in Philadelphia in spite of his protest. It was very commonly believed at the time that this nomination for the vice-presidency was participated in and heartily approved of by the machine politicians or "bosses" of the State of New York in their belief that it would result in his elimination from active political life. The office of vice-president of the United States had so far in the history of the country been almost purely a perfunctory one, and has rarely, if ever, led to political promotion. The vice-president is ex officio president of the Senate, but has little voice or part in shaping either legislation or the affairs of the party. Mr Roosevelt never, however, presided over the deliberations of the Senate, because before the session following his inauguration convened he had ceased to be vice-president.

Upon the assassination of McKinley, on the 14th of September 1901, he succeeded to the presidency. No previous president had entered the office at so early an age as forty-three. It was his frankly expressed wish to be nominated and elected president in 1904, and he was nominated unanimously by the Republican National Convention at Chicago, and was elected in November of that year by the largest popular majority ever given to any candidate in any presidential election. He received 7,624,486 popular votes and 336 electoral votes to 5,077,971 popular votes and 140 electoral votes cast for Judge Alton B. Parker, the nominee of the Democratic party. Immediately after his election he publicly declared that he would not accept the nomination for the presidency in 1908, and he adhered to that pledge in spite of great popular pressure brought to bear upon him to accept the nomination of the party for another term. The nevers fired at the tomb of President Taft, who had been a member of Mr Roosevelt's cabinet, were very nearly the latter's great influence in the party. On March 23rd, two weeks after he ceased to be president, Mr Roosevelt sailed for Africa, to carry out a long-cherished plan of conducting an expedition for the purpose of making a scientific collection of the fauna and flora of the tropical regions of that continent. Expert naturalists accompanied the party, which did not emerge from the wilderness until the middle of the following March, bringing with it a collection which scientists pronounce of unusual value for students of natural history. Most of the specimens were sent to the National Museum of the Smithsonian Institution at Washington. The experiences of his African journey were recorded by Mr Roosevelt in a volume entitled Africa Hunted, the Writings of an American Hunter Naturalist. The spring and early summer of 1909 were spent by Mr Roosevelt in travelling through Egypt, the continent of Europe, and England, in acceptance of invitations which he had received to make various public speeches in these countries. Honorary academic degrees were conferred upon him by the universities of Cairo, Christiania, Berlin, Cambridge and Oxford, and he was given both popular and official ovations of almost royal distinction—ovations which were repeated by his own countrymen on his return to America.

It may be said without exaggeration that no American public man in the history of the country has achieved such extraordinary popularity during his lifetime as Mr Roosevelt had attained at fifty years of age, both at home and abroad. Great popularity necessarily brings with it bitter enmity and genuine criticism. To understand clearly his career as a public man, and to appreciate the forces at work which caused both the popularity and the enmity, two facts must be kept distinctly in mind: first, that at twenty-two years of age he deliberately decided to make politics his life-work at a time when in the United States the word "politics" had a sinister sound in the ears of almost all of the so-called cultivated classes; and secondly, that in making this deliberate choice he recognized that the government of the United States is primarily a party government. He therefore allied himself with the Republican party, to which by tradition, by family association, and by political principles he was naturally drawn.

In the history of the United States the politician has been too often the man who, in connexion with some other trade or profession, has taken up politics as a tool to carve out some personal ambition or manufacture a financial profit. Mr Roosevelt from the beginning apparently believed with the lexicographers that politics is the science and practice of government. He has himself told the story of an early experience that illustrates his point of view. When in 1881 he decided to join the Republican Association of his assembly district in New York City, members of his family were shocked. "You will find at the meetings," they said, "nobody but grooms, liquor dealers and low politicians." "Well," said Mr Roosevelt in reply, "if that is so, they belong to the governing class, and you do not. I mean if I can to be one of the governing class." He fortieth became an active member of the political organization of his district. He also early determined to work with his party as being the only way in which a legislator can work. A free lance, an independent, a journalist, or a preacher, without definite political affiliations, may create public opinion, but a legislator or an administrator must belong to a party. Mr Roosevelt was severely criticized by many "independent Republicans" for having supported the presidential candidacy of James G. Blaine in 1884, when he had vigorously opposed his nomination in the convention on moral grounds. The reply to this criticism is that Mr Blaine was the choice of the majority of the party, and that while Mr Roosevelt felt free to fight within the party vigorously for reform, he did not feel that the nomination justified a schism like that which occurred in the Democratic party over the free silver issue in 1896—a schism which remained afterwards a hopeless weakness in that party. His position in the Blaine campaign, his attitude in tariff discussions and legislation, his relations with United States senators, congressional representatives, and the party leaders, and his methods in making official appointments were entirely consistent with his constantly reiterated conviction that in politics permanent good is achieved not by guerilla warfare, but by working through and within the party. He was so often accused by political partisans for pursuing politically with men of discredited reputation that his own picturesque statement of his conversion to a belief that in legislative or administrative politics
one must work with all sorts and conditions of men is illuminating. This statement is related by his intimate friend Jacob A. Riis, 1 to whom Mr Roosevelt made it in commenting upon his first political success in the New York legislature. "I suppose that my head was swollen. It would not be strange if it was. I stood out for my own opinion alone. I took the best 'mugwump' stand—my own conscience, my own judgment were to decide in all things. I would listen to no argument, no advice. I took the isolated peak on every issue, and my associates left me. When I looked around, carping. There was a price to pay. My way, I found it. I was absolutely deserted. The people didn't understand. The men from Erie, from Suffolk, from any, where, would not work with me. 'He won't listen to anybody,' they said. 'He can't fight.' The penny still held true, and every bit of influence I had was gone. The things I wanted to do I was powerless to accomplish. I looked the ground over, and made up my mind that there were several other excellent people there, I don't know why, who agreed with me. They were for me. We fought the whole Assembly. And we did it to the best of our powers. We were in the minority in Congress with a good man, a strong man, but cannot be made to believe in some things in which I trust. It is too bad that he doesn't look at it as I do, but he does not, and we have to work as we can. It is a point of course, where you must take the isolated peak and break with all his associates for clear principle: but until that time comes he must work, if he would be of use, with men as they are. As long as the good and the evil, let him work with them for the best that can be obtained."

In his successive offices Mr Roosevelt not merely exerted a strong influence upon the immediate community, whose official representative he was at the time being, but by reason both of his forceful personality and of the often unconventional, although always effective, methods of work which he employed he achieved a national prominence out of ordinary proportion to the importance of his official position. His record in the Assembly was such that his party nominated him for the mayorality of the city of New York when he was absent on his ranch in Dakota. Although defeated in the mayoralty election, his work on behalf of the merit system, as opposed to the spoils system of politics, was such that he was made a Civil Service commissioner—probably the last office a politician would wish to hold who desired further promotion, for the conflict which a Civil Service commissioner must have with members of Congress and other party leaders on questions of patronage is usually, or, at any rate, has been in the past history of American politics, inevitably detrimental to further official advancement. He was taken from the Federal service in Washington to New York City by a reform mayor and put in charge of the police department, which became the butt of both the newspapers and of a personal adversary in fighting corruption of all sorts; and the New York police force at that time was thoroughly tainted with corruption, not in its rank and file, but among its superior officers, who used the power in their hands to extort money bribes chiefly from saloon-keepers, liquor-dealers, gamblers and prostitutes. As police commissioner Mr Roosevelt brought to his side every honest man on the force. By personal detective work, that is, by visiting police stations at unexpected times and by making the rounds at night of disorderly places which were suspected of violating the law, he not only displayed personal courage in positions of some danger, but captured the public opinion. The very sensation created by the novelty of his methods set standards and started reforms which have greatly improved the morale of the entire force. The hopelessly vicious policemen hated him, but no man ever had a stronger personal hold upon the great body of the honest officers—a hold which existed long after he left the police department, and was frequently expressed by members of the force as he passed through the city streets. When he became assistant-secretary of the navy, his work was not so publicly conspicuous, but in this office he gained an experience which was of great value in his administration of naval affairs during his presidency. It is doubtful if, without the experience of this secretarialship, he could have successfully originated and carried out the plan of sending the United States navy around the world in 1907. He went to the Spanish War as a volunteer against the urgent wishes of his political advisers, and in spite of the protests of some of his best and most intimate friends. The conditions in Cuba had long convinced him that war with Spain was inevitable, and that, for humane reasons alone, it was both right and necessary to drive the Spanish power out from the Carribean Sea. Having urged this view upon the country, when war was declared he felt that it would be inconsistent for him not to share personally in the perils of a conflict which he believed to be a just one, and which he had done as much as he could to bring about. His record in the war for efficiency and personal gallantry no doubt contributed largely to his nomination and election as governor of the state of New York; but he attained the governorship not on this ground alone. There are many instances in American politics of nominations made solely on a war record which have led to hopeless defeat in election. His work in the governorship brought him still more into prominence as a national leader. His uncompromising antagonism to political blackmail and bribery, and his determination to pursue the right, as he saw the right, only in a common-sense fashion, made bitter enemies on the one hand among the corrupt politicians, and, on the other hand, among theoretical reformers, and discussions raged in the newspapers about his executive acts, his speeches, and his official messages much as they raged during his seven years in the White House. If he had never reached the presidency he would probably have been a figure long remembered in American political life. But it was his course in the presidency that gave him his international reputation, and it is as President Roosevelt that future historians of American political life must chiefly discuss him.

Mr Roosevelt entered the presidency definitely committed to two principles which profoundly affected his course as chief executive of the United States. He had a well wrought-out belief in centralized authority in government and a passionate hatred of political and commercial corruption. He believed the United States to be a unified republic, a sovereign nation, not a federation of independent states united only for mutual benefit and protection. He not only hated corruption per se, but he clearly saw that as efficiency has a greater power for good, so corruption has a greater power for evil in a strongly centralized government. He understood that political materialism, selfishness and corruption in federal administration afford the strongest possible argument for those who advocate strengthening the independent power of the separate states at the expense of nationalism. At the very outset of his administration he therefore set himself to work, not only to improve the personnel of the government service, but by calculations in his messages and public speeches to arouse a sense of civic responsibility both among office-holders and among all the citizens. His official messages to Congress, probably more frequent, certainly much longer than those of any of his predecessors, were quite as often treatises on the moral principles of government as they were recommendations of specific legislative or administrative policies. The effect of his exhortations, as well as of his personal character and public acts, upon the standards and spirit of official life in the United States, was a pronounced one in attracting to the federal service a group of men who took up their work of public office with the same spirit of enthusiasm and self-sacrifice that had been observed by anybody

1 In a volume entitled Roosevelt the Citizen, which, while it is frankly and forthrightly a political biography, may be relied upon for accuracy in its statement of historical or biographical facts.
control legislation so as to increase the profits of monopolies or "trusts," and that to prevent such control it is necessary to extend the powers of the federal government. In carrying out this policy of government regulation and supervision of corporations he became involved in a great struggle with the powerful financial interests whose profits were threatened, and with those legislators who sincerely believed that government should solely concern itself with protecting life and property, and should leave questions of individual and social relations in trade and finance to be regulated by the operation of the natural laws of the market. In this struggle, although he was bitterly accused of violating the written constitution, of arresting and destroying business prosperity and of attempting a radical departure from the accepted social system of the country, he was remarkably successful. By his speeches and messages, and by his frank use of one of the greatest modern social engines—the newspaper—he created a public opinion which heartily supported him. Under his effective influence laws were framed which were not merely in themselves measures of stringent regulation of business and the accumulation of wealth, but which established precedents, that as long as groups go in will inevitably make the doctrine of federal control permanent and of wider application. The struggle against some of the most powerful financial and political influences of the time not unnaturally gave rise to the idea that his work as president was destructive—perhaps the necessarily destructive work of the reformer—but not essentially constructive. Even those friendly to him sometimes felt it necessary to defend his political course by saying that he was compelled to raze the old buildings and prepare the ground on which his successors might build new and better structures. A brief consideration of some of the constructive achievements of his administration will show that the "destructive" theory of his political activities is not sustained by the facts.

Civil Service Reform.—Some reference has already been made to the other side of the ledger on which he was charged to be a political roosevelt upon the truism, often forgotten or ignored, that no government can accomplish any permanent good unless its administrative and legislative officers are chosen and maintained for merit only. As assemblyman, as police commissioner, as naval secretary and as president, he advocated this fundamental doctrine. When Federal Civil Service commissioner he did more than any other single public man in the United States has had either the ability or the opportunity to do so to make the doctrine of theDeck of the realm of theory into the realm of governmental practice. While he was criticized by the friends of Civil Service Reform for not going far enough during his presidency to protect the encroachments made upon his bureau by the President and the influence of the influence of that bureau, his thorough investigation of the scandals of the Post Office department, and his order forbidding federal employes to use their offices for political purposes in the campaign of 1908 are typical of his vigorous support of the merit system.

Conservation of National Resources.—If Mr. Roosevelt did not invent this term he literally created as well as led the movement which made Conservation in 1910 the foremost political and social question in the United States. The old theory was that the general prosperity of the country depends upon the development of its natural resources—a development which can best be achieved by private capital, acting under the natural incentive of financial profit. Upon this theory public land was either given away or sold for a trifle by the nation to individual holders. While it is true that the building of railways, the opening of mines, the growth of towns and the growth of industrial and commercial enterprises in a way that is harmful to the public welfare. Nor was the concentration of wealth the only danger of this policy; it led to the destruction of forests, the exhaustion of farming soils and the wasteful mining of coal and iron. It was a question in fact to justify this destruction to the man to the public welfare. The concentration of wealth is, however, always a powerful human motive. Mr. Roosevelt not only framed legislation to regulate this concentration of wealth and to preserve forests, water, power, mines and fertile soil, but organized departments in his administration for carrying his legislation into effect (see Irrigation; United States). His official acts and the influence of his speeches and messages led to the adoption by both citizens and government of a new theory regarding natural resources. It is that the government acting for the people, who are the real owners of all public property, should intervene to the utmost extent in this field to see that the products be developed by private capital under leases which are limited in their duration and which give the government complete power to regulate the operation of the properties. Government Regulation of Corporations.—The growth of the corporation as an industrial machine had in recent years been very rapid in the United States. The industrial and financial corporations had grown so powerful as to threaten to be supreme for the first time in the history of the country the authority of the government itself. As Mr. Roosevelt often pointed out, no nation will live long in which the authority of the government—especially in a democracy—is supplanted by the authority of private corporations. In this interest, Mr. Roosevelt foresaw this conflict, and as president he aroused public opinion so that the people understood it, and threw his effective influence into the framing of legislation under which in the case of the Standard Oil Company and the so-called Sugar Trust, and achieved distinct practical results in favour of a system of "industrial democracy" where all men shall have equal rights under the law, and where the law and the force of the operation of the law. Both his friends and his enemies agree that he did more than any other public man to effect these changed relations of government and industry. There is, however, much still to be done toward the realization of the results of his course. His critics assert that he simply interrupted the orderly course of business, inspired panic and dangerously arrested prosperity. Mr. Roosevelt and his supporters were convinced that the policy was necessary to control the social and political dangers of plutocracy, and that in establishing a definite system of government regulation not only were popular rights preserved, but industry and social and political stability were placed upon a basis of regularity and honesty that paved the way for a era of general prosperity in the United States, unharmed by feverish speculation and shrewd scheming, such as the country had never yet seen.

The Army and Navy.—Mr. Roosevelt was a pronounced advocate of international peace but also an advocate of law and order. He believed that international controversies would ultimately be settled by the United States, and he was one of those who offered, in 1908, an address on "International Peace" before the Nobel committee in Christiania. But, with this advocacy of international peace, he did not believe the United States should be hampered in the community interest in the creation of a potential military force. He argued that the military force of the United States should be adequate to the defense of the country at any time and the authority of the courts rests upon actual potential force; on the existence of a police or on the knowledge that the able-bodied men of the country are both ready and willing to see that the decrees of judicial and legislative bodies are put into effect; and he expressed the opinion that until a recognized international supreme court is firmly established, every nation must be prepared to defend itself, and when it is established all the nations must be prepared to maintain its decrees and the agreement contained therein. On this ground during his presidential administration Mr. Roosevelt was deeply concerned in many measures for improving the administration of the War Department and educating, training and strengthening the army and navy. While it is true that the Spanish War his special interest was in the navy, springing probably from his relationship with the navy during his brief term as assistant secretary of the navy, his desire for the expansion of the American fleet around the world, undertaken in spite of predictions of disaster made by naval experts in Europe and the United States, was conceived and inspired by him, and this single fact makes it unnecessary to say that he had done so much since the Civil War as he to strengthen the physical power and the moral character of the United States navy.

The Panama Canal.—The greatest single material achievement of Mr. Roosevelt and of the republic of the United States of the project to build a Panama Canal. The project itself is nearly four centuries old; for a century Great Britain and the United States had been sometimes in friendly, sometimes in antagonistic disputes as to how this was to be accomplished; the French undertook the work and failed. Mr. Roosevelt recognized the new republic of Panama, and obtained from it for
ROOT, E.

the United States, in return for a commercial and military protection advantageous to Panama, the right to build a canal and control the waterway. His critics said that his course in this matter was unconstitutional, although the question of constitutionality has never been raised before any national or international tribunal. The fact remains that the construction of the Panama Canal has been possible due to the practical satisfaction to the civilized world. But for Mr. Roosevelt’s vigorous official action and his characteristic ability to inspire associates with enthusiasm the canal would still be a subject of diplomatic discussion instead of a physical reality.

Colonial Policy.—Strictly speaking, the United States has no colonial policy, for the Philippine Islands and Porto Rico can scarcely be called colonies. It has, however, a policy of territorial activity. Although this policy was centered upon the conclusion of the Spanish War under the presidency of Mr. McKinley it has been very largely shaped by Mr. Roosevelt. He determined that Cuba should not be taken over by the United States, as all Europe expected it would be, and an influential section of his own party hoped it would be, but should be given every opportunity to govern itself as an independent republic; by assuming supervision of the finances of San Domingo, he put an end to controversies in that unstable republic, which threatened to disturb the peace of Europe; and he personally inspired the body of administrative officials in the Philippines, in Porto Rico and (during American occupancy) in Cuba, who for efficiency and unselfish devotion to duty compare favourably with any similar body in the world. In numerous speeches and addresses he expressed his belief in a strong colonial government provided it was an efficient government for the benefit of the people under its control and not for the profit of the people at home. In this respect, for the seven years of his administration at Washington, he developed a policy of statesmanship quite new in the history of the United States.

No account of Mr. Roosevelt’s career is complete without a reference to his literary work, which has been somewhat overshadowed by his reputation as a man of public affairs. He was all his life an omnivorous reader of the best books in various fields of literature, and he developed to an unusual degree the faculty of digesting and remembering what he has read. His history of the War of 1812 between the United States and Great Britain, written when he was twenty-four years old, is still the standard history of that conflict, and his Winning of the West is probably the best work which has been written on American frontier life of the 19th century, a life that developed certain fundamental and distinctive American social and political traits. His African Game Trails, the record of his scientific hunting expedition in Africa in 1909–10, is much more than a narrative of adventures on a wild continent. It is a study of social and ethnological conditions, and contains many passages of literary charm, describing bird life, the life of the savannah and the forests. His book gives some account of the "Pigskin Library" which he carried with him for daily reading in the heart of Africa is a surprising exposition of the wide range of his reading. As a public speaker his style was incisive, forceful and often eloquent, although he made no effort to practise oratory as an art. The volume of his African and European addresses, published in the autumn of 1910, not only presents an epitome of his political philosophy, but discloses the wide range of his interest in life and the methods by which he had striven to bring public opinion to his point of view.

Perpetual of great physical and mental vigour, his work was done at high pressure and he had the faculty of inspiring his colleagues or his subordinates with his own enthusiasm for doing things. The volume of his letters and his writings in books, articles for the press and speeches and official messages, is enormous, and yet this work was done in the midst of the executive labours of a long political career. Besides being famous as a hunter of big game, he was a skilful horseman and a good tennis player. Regular physical exercise in the open air contributed much to his abounding vitality. A man of decisive action when his mind was made up on any given question, his very decisiveness sometimes gave the impression that his judgments were hasty. On the contrary, few men were more moderate and thoughtful in the council of war. The one problem. His long experience, his wide reading and his thorough knowledge of all sorts and conditions of men, enabled him to act quickly at a time of crisis, but his important speeches, or a course of political action that might be far-reaching in its effect, were not cast into their final form without careful consultation with the best advisers he could obtain. The first form of his written speeches was always painstakingly edited and revised, and not infrequently entirely rewritten. He expressed his own judgment of his success as a public man by saying that it was not due to any special gifts or genius, but to the fact that by patience and laborious persistence he had developed ordinary qualities to a more than ordinary degree.

(L. F. A.)

The following is a list of his principal works:—The Naval Operations of the War between Great Britain and the United States (1812) (1882), written to correct the history of James; Thomas Hart Benton (1887) and Governor Morris (1888), both in the American Historical Series; New York: The Roosevelt-Townes Series; Hero Tales, from American History (1895) with H. C. Lodge; Winning of the West (4 vols., 1889–96); a part of the sixth volume of the History of the Royal Navy of England (1868) by W. L. Clowes; The Rough Riders (1899); Oliver Cromwell (1901); the following works on hunting and natural history, Hunting Trips of a Ranchman (1886), Ranch Life and Hunting Trails (1888), The Wilderness Hunter (1893), Big Game Hunting in the Rockies and on the Plains (1899), a republication of Hunting Trips of a Ranchman and The Wilderness Hunter), The Deer Family (1902), with other authors, and African Game Trails (1910); and the African Adventure, The African Ideal (2 vols., 1897) and The Stevenson Life (1900); and State Papers and Addresses (1907). Several of his works have been translated into French and German. Uniform editions were published in 1900 and 1903. For bibliography see below.

The biographical sketches by Jacob A. Riis (New York, 1904), F. E. Leupp (ibid., 1904), G. W. Douglas (ibid., 1907), James Morgan (ibid., 1907), and Murat Halstead (Akron, 1902) are personal or political obituaries. John Burroughs’s Comings and Goings. The Roosevelt (Boston, 1907) is an appreciation of Roosevelt as a naturalist. J. W. Bennett, Roosevelt and the Republic (New York, 1908), is bitterly hostile. There is a sketch by F. V. Greene in Roosevelt’s American Ideals.

ROOT, ELIHU (1845—), American lawyer and political leader, was born at Clinton, New York, on the 15th of February 1845, the son of Oren Root (d. 1885), professor of mathematics at Hamilton College from 1849–81. He graduated at Hamilton College in 1864, taught at the Rome (N.Y.) Academy in 1865, and graduated at the University Law School, New York City, in 1867. As a corporation lawyer he soon attained high rank and was counsel in many famous cases. Politically, he became identified with the reform element of the Republican party. He was United States attorney for the Southern District of New York (1883–85), and a delegate to the State Constitutional Convention of 1894, acting as chairman of its legal committee. In 1897 he was secretary of war, and in 1906, in the position reorganized the army and created a general staff, and in general administered his department with great ability during a period marked by the Boxer uprising in China, whither troops were sent under General A. R. Chaffee, the insurrection of the Filipinos, the withdrawal of the United States troops from Cuba, and the establishment of a government for the Philippines under a Philippine Commission, for which he drew up the "Instructions," in reality comprising a constitution, a judicial code and a system of laws. In 1905 he was a member of the Alaskan Boundary Tribunal. After he was re-elected senator in 1910, he was secretary of state. In the summer of 1916, during a visit to the Pan-American Conference at Rio de Janeiro, he was elected his honorary president, and during a tour through the Latin-American republics, brought about a better understanding between the United States and these republics. In general he did much to further the cause of international peace, and he concluded treaties of arbitration with Japan, Great Britain, France, Italy, Spain, Portugal, Austria-Hungary, Switzerland, Norway, Sweden, Denmark, Holland and other countries. Upon his resignation from the cabinet he was elected, in January 1909, as United States senator from New York. In 1910 he was sympathetic toward President Taft’s proposal for a permanent international tribunal for the arbitration of the long-standing dispute concerning fisheries between his country and Great Britain (see NEWFOUNDLAND). He received the degree of LL.D. from
Hamilton, 1866; Yale, 1900; Columbia, 1904; New York University, 1904; Williams, 1905; Princeton, 1966; University of Buenos Aires, 1966; University of San Marcos, of Lima, 1960; and Harvard, 1907.

ROOT (late O.E. rôl, adopted from Scand., cf. Norw. and Swed. rôl, Dan. rød); the true O.E. word was wyrft, plant, represented in Ger. Wurz or Wurzel; the ultimate root is the same in both words, and is seen in Lat. radix, the underground part of a plant. This is the popular meaning of the word. In its botanical use the term is more restricted (see below). The various other meanings have all developed from this, its primary significance. Of these the principal are: the source or origin of a condition, state, quality, &c.; the base or embedded part of a structure of the body, such as a nail, tooth, the hair, &c.; in mathematics, a number, quantity or dimension which produces a given expression when multiplied by itself a requisite number of times; and in philology an ultimate element of language, incapable of further analysis. A particular extension of the primary meaning is that which applies the word generally to a class of plants, such as the turnip or carrot, whose root is fleshy, and edible either by man or domestic animals.

The embryo of a typical plant, for instance a pea plant (fig. 1), has an ascending axis which will grow into the shoot, and a descending axis or radicle which will grow into the root. When the seed germinates, the radicle is the first to appear; it grows downwards, and its primary function is to act as a holdfast for the plant; its most important function, however, is the absorption of water and dissolved nutrient substances from the soil, and it also frequently serves for storage of food-stuffs. The root is distinguished from underground shoots by not bearing leaves and by having its apex (growing point) protected by a cap (root-cap), which can be clearly seen by making a median vertical section through the root-tip; the cap is firm through the soil. The root also slender unicellular outgrowths of the outer layer, borne in the region a little behind the root-tip. It is by means of the root hairs especially that the root is brought into close relation with the soil particles and absorbs the nutrient materials in solution in the water which surrounds these particles. The older root-hairs are continually dying off, so that they are borne only on a small part of the area behind the apex. Branches of the root, which repeat the form and structure of the main root, are developed in regular succession from above downwards (acropetal), and owing to the fact that they originate in a definite position in the interior of the root (endogenous) they develop in longitudinal rows and have to break through the tissues of the parent root (fig. 2). True forking of the root (dichotomy) occurs in the Lycopodiaceae (the shoots of which also branch dichotomously), but is unknown in the higher plants.

Roots which originate elsewhere than as acropetal outgrowths of a main root are known as adventitious, and may arise on any part of a plant. They are especially numerous on underground stems, such as the under side of rhizomes, and also develop from stem nodes under favourable conditions, such as moisture and absence of light; a young shoot or a cutting placed in moist soil quickly forms adventitious roots. They may also arise from leaves under similar conditions, as, for instance, from begonia leaves when planted in soil.

The forms of roots depend on their shape and mode of branching. When the central axis goes deep into the ground in a tapering manner, without dividing, a tap-root is produced. This kind of root is sometimes shortened, and becomes swollen by storage of food-stuffs, forming the conical root of carrot, or the fusiform or spindle-shaped root of radish, or the napiform root of turnip. In ordinary forest trees the first root protruded continues to elongate and forms a long primary root-axis, whence secondary axes come off. In primary plants, especially Monocotyledons, the primary axis soon dies and the secondary axes take its place. When the descending axis is very short, and at once divides into thin, nearly equal fibrils, the root is called fibrous, as in many grasses (fig. 4); when the fibrils are thick and succulent, the root is fasciculated, as in Ranunculus, Ficaria, Asphodelus, and Oenanthe crotaca; when some of the fibrils are developed in the form of tubercules, the root is tuberous, as in dahlia (fig. 5); when the fibrils enlarge in certain
ROPE AND ROPE-MAKING

root bearing at the apex a stem bud. As in the case of the stem, growth in length occurs only for a short distance behind the apex, but in long-lived roots increase in diameter occurs continuously in a similar manner to growth in thickness in the stem.

Roots are usually underground and colourless, but in some cases where they arise from the stem they pass for some distance through the air before reaching the soil. Such roots are called aerial. They are well seen in the screw-pine (Pandanus), the Banyan (Ficus indica, fig. 7), and many other species of Ficus, where they assist in supporting the stem and branches. In the mangrove they often form the entire support of the stem, which has decayed at its lower part. In tree-ferns they form a dense coating around, and completely concealing, the stem; such is also the case in some Dracaenas and palms. In Epiphytes, or plants growing in the air, attached to the trunks of trees, such as orchids of warm climates, the aerial roots produced do not reach the soil; they continue always aerial and greenish, and they possess stomata. Delicate hairs are often seen on these epiphytial roots, as well as a peculiar spongy investment formed by the cells of the epidermis which possess their succulent contents and are now filled with air. This layer is called the velamen, and serves to condense the moisture contained in the air, on which the plant is dependent for its water-supply. The aerial roots of the ivy are not the nutritive roots of the plant, but are only intended for mechanical support. The climbing roots of many orchids, aroids and epiphytic ferns branch and form places of lodgment for humus into which absorbent branches of the climbing roots penetrate. Some leafless epiphytic orchids, such as species of Angraecum, depend entirely upon their aerial roots for nourishment; the roots, which are green, perform the functions both of leaves and roots. A respiratory or aerating function is performed by roots of certain mangroves growing in swampy soil or water and sending vertical roots up into the air which are provided with aerating passages by which the root system below can communicate with true outside air.

Parasitic plants, as the mistletoe (Viscum), broom-rape (Orobanche) and Rafflesia, send root-like processes into the substance of the plants, whence they derive nourishment. In the dodder (Cuscuta), the tissue around the root swells into a kind of sucker (haustorium), which is applied flat upon the other plant, and ultimately becomes concave, so as to attach the plant by a vacuum. From the bottom of the sucker the root protrudes, and penetrates the tissue of the host plant. Leaf-buds are sometimes formed on roots, as in plum, cherry and other fruit trees; the common elm affords an excellent example, the young shoots which grow up in the neighbourhood of a tree arising from the roots beneath the soil. In some plants no roots are formed at all; thus in the orchid Corallorhiza, known as coral-root, a stem-like, branched, underground rhizome, performs all the functions of a true root which is absent. In aquatic plants the root acts merely as a holdfast or is altogether absent as in Sabina, Utricularia and others.

Fig. 6.—Base of plant of Orchis, showing tubercules or root hair.

ROPE AND ROPE-MAKING. All varieties of cordage having a circumference of an inch or more are known by the general name of "rope." Twisted cordages of smaller dimensions are called cords, twines and lines, and when the sectional area is still smaller, the article is known as thread or doubled yarn. All these varieties of cordage are composed of a number of separate yarns, each of which is made from some kind of textile fibre by preparing and spinning machinery. The number of separate yarns which ultimately form the rope or cord depends upon the fineness of the yarn, and also upon the circumference of the finished article. From thread and fine twine upwards the whole art of manufacture is that of twisting together fibres and yarns; but the comparative heaviness and coarseness of the materials operated on in rope-making render necessary the adoption of heavy machinery and modified processes which clearly define this manufacture as a distinct calling.

The modern trade of rope-making is again divided into two distinct branches dealing with vegetable fibres and metallic wire.

Many different vegetable fibres are used for rope-making, but for the combined qualities of strength, flexibility and durability, none can compete with the common hemp, which is consequently the staple of the rope-maker. Cotten ropes are, however, much more flexible, and in addition are strong and durable; they are, therefore, much preferred for power transmission in textile and other works. Manila hemp is a fibre of remarkable tenacity, of unapproached value for heavy cordage, but too stiff for small cords and twines. After these in stem-structure, the shortly branched Central American (Cordylaria), Phormium hemp of New Zealand (Phormium tenax) and Sunn hemp of the East Indies (Crotalaria juncea)—all fibres of great strength, and largely used by rope-makers. Jute (C. g.) of India (Corchorus capsularis and C. olitorius) is now largely used by rope-makers on account of its cheapness. When used alone it is deficient in strength and durability, but when used in conjunction with proper proportions of hemp it makes a very satisfactory and useful rope. Among fibres more rarely seen in rope-works are Jubbulpore hemp (Crotalaria tenuifolia), boxstring hemp (Sunsentera zeylanica), and other hempes of the East Indies, plantain fibre (Musa paradisiaca), and agave fibre (Agave americana) of America. Coir and many other fibres are used, but principally in the localities of their production.

A rope is composed of a certain number of "strands," the strand itself being made up of a number of single threads or yarns. Three strands laid or twisted together form a "hawser-laid" rope, and three or such hawsters similarly laid make a "cable-laid" rope or "cable." A "shroud-laid" rope usually consists of four strands laid around a central strand or core. The prepared fibre is twisted or spun to the right hand to form yarn; the required number of yarns receive a left-hand twist to make a strand; three strands twisted to the right make a hawser; and three-twisting twisted to the left form a cable. Thus the twist in each operation is in a different direction from that of the preceding one, and this alternation of direction serves, to some extent, to preserve the parallelism of the fibres.

The primary object of twisting fibres together in a rope is that by mutual friction they may be held together when a strain is applied to the whole. Hard twisting has the further advantage of compacting the fibres and preventing, to some extent, the penetration of moisture when the ropes are exposed to water; but the yield of rope from a given length of yarn diminishes in proportion to the increase of twist. The proper degree of twist given to ropes is generally such that the rope is from three-fourths to two-thirds the length of yarn composing it.

Rope-walk Spinning.—The sequence of operations in this method of working is as follows: (1) hackling the fibre; (2) spinning the yarn; (3) tarring the yarn when necessary; (4) forming the strands; (5) laying the strands into ropes.

Hackling differs but slightly from the hand-hackling process used in the preparation of flax. The hackle board consists of a wooden block studded with strong, tapered and sharp-pointed steel prongs. A series of such hackle boards is used in the progressive hackling operation, the prongs diminishing...
in size and being more closely set together. For the commoner kinds of ropes, however, hackling through the coarsest board is found to be sufficient, while in most other cases two hacklings are adopted.

The hackler takes up a handful or "streak" of hemp from the bundle, wraps one end firmly round his hand, and with his fingers distributes a little oil over the hemp. The oil softens the material, keeps the hackle pins in good condition, and facilitates generally the splitting up of the fibre as the streak is drawn through the pins. In the first place, only the ends of the streak are hacked; they are dashed into the pins and drawn through them in order to separate the fibres and to lay them parallel; but as the operation proceeds a gradually increasing length of the streak is thrown on and drawn through the pins. The process is indeed very similar to the combing out of a head of human hair. When half the length of the streak is thoroughly combed, the other half is treated in precisely the same manner. The hacked streak is then weighed, doubled up in order to prevent any entanglement, and laid aside for the process of spinning. During the hackling process a large quantity of comparatively short fibres are retained in the pins; the longest of these are separated, and the remainder used for tow yarns. The above description refers entirely to hand hackling; machine hackling of hemp is very similar to flax hackling.

The spinning is done in what is termed the "rope-walk," and from the nature of hand-spinning, and the length of the rope required, it is necessary that this walk should be from 300 to 400 yds. in length. It is sometimes completely covered in with walls and roof; at other times only a roof is built; while in exceptional cases the whole of the walk, with the exception of a small hut at each end, is without shelter of any kind. The operation of spinning is very important, as the weight of the yarn and the appearance of the finished product depend upon it. A description of spinning and laying as performed by the aid of the hand-wheel will perhaps be the best means of giving an idea of this useful branch of manufacture.

The front and end elevations of one variety of spinning-wheel are shown in figs. 1 and 2. The apparatus is fixed to some convenient part of the building, or to special supports, and is turned by hand, and always in the same direction, communicates motion to the rotating hooks or "whirls" B, C, D and E by means of a listing band or strap F. The arrangement of the listing shows clearly that the hook E will revolve in the opposite direction to hooks B, C and D. The spinner takes two streaks of the hacked hemp, wraps them round his waist with the ends at his back, and keeps the fibre in position by adjusting his apron partly round it. From the middle of the streak—that is, midway between the two ends—he takes hold of a quantity of fibre and hangs it on to one of the

hooks B, C or D; the assistant at the wheel begins to turn, and thus a certain amount of twist is imparted to the fibre between the points of the hooks. The spinner then walks hackling down the walk, drawing out the fibre with his left hand and adjusting it with his right. A piece of flannel or woollen cloth held in his right hand aids in the formation of the twist and protects his fingers from the coarse fibre. In some cases two threads are spun simultaneously; when this is done, two of the hooks, say B and C, are used at the same time. Since the revolutions of the hook divided by the length of yarn spun give the amount of twist per inch or foot, it follows that the ratio of the walking pace of the spinner to the revolutions of the wheel A should be constant, otherwise the yarn will not be uniform. The spinner calls to the assistant when there is any irregularity in speed, or when, from any cause, he is obliged to stop walking.

At convenient intervals in the length of the walk, and projecting from posts, are short horizontal bars; the top of each bar is provided with wires or pegs to form a number of vertical partitions something like a course comb. The spinner, as he approaches the walk, he throws the spun yarn into one of these partitions, thus relieving himself of the weight and keeping the yarn off the ground. When a sufficient length of yarn has been spun, he breaks off the disordered and fastens the yarn to a convenient peg or hook until he has spun a sufficient number (usually three) to form a small rope or cord. The person at the wheel hangs these three yarns one on each of the three hooks B, C and D, while the spinner attaches the other ends to a revolving hook termed a "looper." All is now ready for "laying" the yarns. For small cords, this may be done, with or without a "top." This top is a conical-shaped piece of hard wood provided with three small slits through which may pass a pin. As the spinner reaches the point nearest the wheel, so that the yarns may be kept separate on that side. As the hooks twist the three threads, the spinner goes up the walk, twists the yarn in the yarns on the other end, and the spinning hook to revolve in the opposite direction to the other hooks, and thus it twists the three threads in the opposite direction to the original twist.

Fig. 3 shows one form of top, the three yarns being shown in distinctive marks so that the path of each may be more easily followed by the reader; a plan of the thick end of the top appears to the left of the figure. If four yarns of strands are required, the top would consist in four grooves, as well as a hole through the centre to admit of a core when such a thing is required. As soon as the spinner, who carries the top, arrives at the wheel, the assistant takes the yarns off hooks B, C and D (figs. 1 and 2), and puts them all on the core or centre of the other end, which is usually moved from the deeper part of the wheel and attached to a block of wood called a "drag." The wheel is then rotated as before, which puts more twist into the cord. While this operation—called "laying"—is going on, the other end, which is termed hardening, proceeds in the manner in the length of the cord takes place, and the drag is consequently drawn up the walk. The drag, however, holds the cord taut, and serves to retain the twist which is imparted by the hook E. If the strands require tarring before they are separately taken off the hooks, after they have been spun, and tied at both ends to pegs to keep them taut until a sufficient number has collected to be conveniently handled at the tarring tank. The tar is heated to about 200° F., and the strands are then passed through it at a speed not greater than 15 ft. per minute. Before emerging from the tank, the strands pass between squeezing rollers which remove all superfluous tar. In a short time the strands are dry, while in the space of a few days the tar is hard enough to allow the strands to be formed into ropes.

Such is, in general, the hand process of forming ropes when they are composed of only three or four single yarns. It very oftentimes happens, however, that a number of single yarns are required to form each strand of the rope. The single yarns may be spun by hand, as described above, or by machinery. In the former case a group of yarns is usually termed a "hull," while a group of three yarns are termed what is known as a "warp" or "chain." In any case, the group of yarns is stretched down the rope-walk, at each end of which is a "jack" twister. A few of the yarns taken from the various groups of yarns are drawn together and also upon the required diameter of the strand—are then placed on a hook of the jack twister and twisted together. When three such strands are made they are laid into a rope in a similar manner to that already described, and the twist is imparted in the manner illustrated in figs. 4 and 5. The wheel A gear of pinions B on the shafts of the whisks or wheels, and this imparts the necessary motion to the latter. At the other end of the walk the similar machine (fig. 6) is worked in the same way as before, the yarns being taken up from the stands. When the hooks are empty, pinions B and wheel A (fig. 4) are out of gear, but those hooks carrying yarn are drawn out, as shown at C, until the pinion B gear with wheel A, when the hooks are rotated. The

The sequence of operations is very similar to that described for the simple hand-wheel.

**Machine or Factory Rope-Making.**—The modern methods of rope-making are far superior to the foregoing, which, as stated, have been introduced to show the principle. One of the greatest drawbacks in the formation of a strand from a haul or chain, even for a small number of yarns, is the irregularity of the tension of the yarns at different parts of the strand. If a large number of yarns are required for each strand, it would be almost impossible to make a satisfactory rope by the usual method. If, however, the strand be made from bobbins, each yarn bears its proper share of the tension, and an almost perfect rope is obtained.

Two mechanical methods are in use for the spinning of long vegetable fibres—the ordinary and the special. When flax or jute yarns are required, they are almost invariably spun on the ordinary spinning frames, and the yarn rewound from the spinning bobbins on warping bobbins, or else rewound in the shape of rolls or cheeses. Hemp yarns, especially the finer kinds, are sometimes treated in the same manner, but Manila hemp, New Zealand hemp (*Phormium*), and similar fibres, are invariably spun on bobbins by special machinery. The strands for light ropes may then be made on the twisting frames, and the rope finished on what is called a "house machine." When a large rope is desired, a slightly different method is usually employed. The bobbins from the automatic spinner, or the rolls from the winding frame, are placed upon pegs in a frame which answers the same purpose as a bank or creel used in conjunction with a warping machine. If the rope is to be say 3½ in. in circumference, there may be, with fine yarns, 300 or more individual threads in its composition. Suppose that 300 threads are to be used, then 300 bobbins would be placed on the pegs of the bobbin bank or creel, and divided into three sets of 100 threads each for a three-strand rope. The threads are passed separately through a register plate, which is simply a plate containing a sufficient number of holes for the maximum quantity required, and arranged in a series of concentric circles. There are three sets of concentric rings used in the plate for a three-strand rope, and four sets for one of four strands. As the threads emerge from the register plate they are grouped together and passed through a tapered tube, the sectional area of the smaller end of the tube being equal to the sectional area of the strand. This operation is done for each group of 100 threads, and finally the three or four groups are attached to separate rotating bobbins of the forming machine or "traveller." As the latter moves down the walk on rails, it draws the threads from the bobbins in the bank, and through the register plate and tubes, while the hooks put in the twist. A perfectly circular strand, without slack threads, is thus formed; and, at the same time, a uniform strand is obtained, since the ratio of the speed of the traveller to the speed of turning each of the hooks is constant. The process is continued until the desired length of strand is made—about 150 yards (300 yds.) of each of the three strands are required for 100 to 120 fathoms of rope; then a little more twist is introduced. Afterwards, all three strands are placed on one hook of the traveller, and the ends from the shaping tubes are cut off and put on the hooks of the fixed machine, called the "fore-turn." The carriage containing the "top" is now brought close to the traveller, and the strands are placed in the grooves of the top as explained under hand-laying. Similar means to those used in hand-spinning are adopted for keeping the rope off the ground. The two machines are now started, the three hooks of the fore-turn machine revolving in one direction and the single hook of the traveller revolving in the opposite direction. Simultaneously the carriage with the laying top moves forward towards the head of the walk.

Fig. 9, Plate I., shows many stages in the process of rope-making. The most prominent part shows the carriage with the top in position approaching the fore-turn machine at the head of the walk. The parts on the right of the machine, in his left carriage is holding a top, while in the top in the carriage is laying a rope of four strands. At other parts of the figure appear three or four travellers, some twisting the strands, others moving up the walk as the laying proceeds, while on the extreme right one machine is laying two ropes, of three strands each, at the same time.

We have already stated that the yarns for the above machine may be prepared by two systems. When the hemp fibre is spun on the ordinary frame, the method of preparation for the frame is somewhat similar to that employed for flax, but since the fibre is harder than flax, it invariably requires softening. The softening machines crush the strands in the same manner, but the fluted rollers and the two rougher flats, which, instead of forming part of a circle, the coarser fibres receive a somewhat different treatment; the first process in the preparation of Manila hemp and similar fibres used for rope yarn is illustrated in Fig. 8, Plate II. The strands are first placed on the outer fluted rollers on to the pins of the huckling and spreading machine; the lanterns or skeleton rollers, seen on the extreme right, press the fibres into the pins. A little oil is made to drop on to the fibre in order to soften it and to facilitate the operation. The oiling apparatus is usually of a simple character, and consists of a revolving roller partly immersed in an oil bath. The roller is driven as shown in the figure, and the oil which it draws up is scraped off its surface by the surface of the frame, and led, while the fibre is being wound, on to the surface of the fluted rollers and the gill-pins. A view of a similar machine is shown in Fig. 11, Plate II., from which it will be seen that there are two sheets of revolving gill-pins. The sheet nearest the traveller is slightly quicker than those below it, and the two lower rolls, or the two higher rolls, or the two lower rolls, or the two upper ones, or the two upper ones, or the two lower ones, are driven by the traveller. The difference in the speeds of the gill-pins results in the fibre being combed out and straightened, while the delivery from the upper rolls is slightly greater than that of the second sheet of gill-pins, help further to complete the process, and finally deliver the fibre in the form of a broad ribbon, termed a sliver.

In general, three such machines are used for the process; the pins in the gill-sheets are graded, those in the second machine being finer and more closely set than those in the first machine, while a still finer and closer arrangement obtains in the third machine. The slivers from the third huckling and spreading machine are now placed at the back of the first drawing frame, one type of which appears in Fig. 12, Plate II., Each sliver is passed separately over a guide pulley, led upon the pins, drawn out and joined by others, and finally delivered as a sliver ready for the second draw or the second single-cord machine. The sliver process is carried on in this machine, from which the sliver emerges ready for the spinning frame. It will thus be seen that a system of doubling, as well as of drawing, obtains in these processes as in the preparing such a system is adopted in order to obtain uniformity of sliver and the correct weight.

The slivers are taken from the drawing frame to the automatic spinner—a beautiful piece of machinery—by means of a wire, which, as it leaves the machine, it makes the leaves. Two sliver cans from the second drawing frame are placed behind the machine, and the slivers passed between the rollers. They are then deflected and made to enter a second machine, a device which causes the slivers to pass between the pins of the chain-sheet. As the two slivers emerge from these pins each enters a separate self-feeding and adjusting apparatus, the function of which is, as its name implies, to regulate the speed and tension of the sliver, and to regulate it as increased or decreased according as the sliver is thin or thick. Consequently, a very even yarn results; indeed, it is claimed that for uniformity of yarn this system of spinning has no equal. The bobbins, which
ROPE AND ROPE-MAKING

are placed in a horizontal position, have a lateral movement, so that the wearer may be wound on or unwound. The machine is made for ordinary rope yarn, and for binder twine for self-reaping machines. When all three spreading machines are used in conjunction with the spiral drawing frames, the automatic feeding arrangement is sometimes considered unnecessary, because of the uniformity of the slivers when delivered from the finishing drawing frame.

Figs. 14 and 15, Plate III., show two sheds filled with preparing machinery for the manufacture of binder twine. A complete system of Manila machinery, as recommended by Messrs. Lawson, Leeds, would consist of the following:—

1. No. 1, spreading and hanking machine.
2. 2, 3, 4, 5, 6, 7.
3. 1, spiral 1st drawing frame, 1 head, 88 in., 38 reach, 100 slivers per head.
4. 2, 2 heads, 88 in., 60 faces.
5. 40, 20 automatic spinners or jennies of 2 spindles each.

The length of sliver from a given length of fibre is proportional to the drafts and inversely proportional to the doublings. Thus, if \( d_1, d_2, d_3, d_4, d_5, d_6, d_7 \) be the number of slivers, \( l \) the feet per lb on the feed-table of No. 1 spreading machine, \( L \) the feet per lb delivered at the automatic spinner, then:

\[
I \times \frac{d_1}{d_1} \times \frac{d_2}{d_2} \times \frac{d_3}{d_3} \times \frac{d_4}{d_4} \times \frac{d_5}{d_5} \times \frac{d_6}{d_6} = L.
\]

No. 1, No. 2, No. 3. No. 1, No. 2. Auto.

Spreading machines.
Drawing machines.
Automatic spinners.

A numerical example, showing the drafts, slivers, &c., used for the production of No. 228 rope yarn of 330 ft. per lb appears below:

\[
I \times \frac{15.5}{1} \times \frac{15.5}{12} \times \frac{15.5}{12} \times \frac{7.42}{4} \times \frac{2.7}{4} \times \frac{5.8}{4} \times 1 = 330 \text{ ft.}
\]

Spreading machines.
Drawing Automatic frames. spinners.

Whence \( l = \frac{556}{32} \), say 54 ft. per lb; that is to say, 1 lb of Manila fibre, approximately 6 in. in length, spread on the feed-tables at 200 ft. per minute, would produce yarn No. 228 of 330 ft. per lb from the automatic spinner.

The slivers from these automatic spinners may be used in the bank at the rope-walk as already indicated, or they may be taken to what is termed a "house machine." These machines are of two distinct kinds—vertical and horizontal. They perform the same work as the machines in the rope-walk, but take up much less space.

Figs. 16 and 17, Plate IV., illustrate two types of horizontal machines, each of which is capable of completing a rope in one operation. The process is pretty clear in fig. 17, which shows that eighteen threads are treated at once. On the right, and driven by spur gearing, are three revolving carriages or creels, each containing six bobbins. Each group revolves as the yarns are drawn off the bobbins, an endless cord is formed into three strands. As the strands emerge from the guides, they converge towards three other guides, are laid together, and finally the finished rope is wound on to the reel.

In principle the vertical machine is the same as the horizontal machine, and the rope is, consequently, made in one operation. Any number of bobbins, from 24 to 128, may be twisted at the same time; the machine, therefore, is a vertical one. Fig. 18, Plate IV., is for making a rope of three strands, each with 12 threads, or 36 threads in all. These machines are also made to make ropes of four strands. The strands are formed by the rotation of the carriages, from the top of which each strand passes. The three strands then converge to, and pass through, the top of the machine, where they are laid into a rope. The latter passes over a series of guide pulleys, and is ultimately wound on to the reel, shown in front of the machine. Such a machine for making a 128-thread, four-strand rope, occupies only about 125 sq. ft.—8 ft. 9 in. X 14 ft. 4 in.

In addition to the heavy rope there are many varieties of cord and twine made by means of the preparing, spinning, and doubling machines. The fishing industry takes many different types for lines and nets, while the variety of cord and twine for other industrial and for household purposes is almost unlimited. All yarn from long vegetable fibre is more or less rough as it leaves the spinning frame, even after two or more threads have been twisted together. It is therefore necessary, for many uses, to impart a polish to the cord or twine. Specific machines are used for this purpose. A certain number of bobbins, depending upon the capacity of the machine, are placed in a bank, and the ends are collected and passed under a roller which is immersed in hot starch. The yarns become saturated with this starch, but, as they emerge from the starch-box, the superfluous starch is removed by passing the yarns between two rollers. The yarns now pass over a series of drying cylinders and polishing rollers, and are finally rewound by the same machine on bobbins. These machines are termed bobbin-to-bobbin polishing machines. In some cases the hot drying cylinders are replaced by a system of hot air drying. The finished yarns are now made up by machinery into hanks, balls or cheeses, according to which happens to be the best state for future use and for transport.

Driving Ropes.—It has already been stated that cotton driving ropes are extensively applied in the transmission of motive power. Although the mechanical efficiency of transmission by ropes is less than that obtained by wheel gearing, rope driving has several compensating advantages:—

1. It is practically noiseless.
2. It occupies less space than belt driving, and the slip is not so great.
3. The turning movement is better; machines therefore run more steadily and production is increased.
4. Shafts may be run at higher speeds.
5. Greater range of drives; anything from 10 ft. to over 80 ft., and much greater distances when carrier pulleys are used.
6. The drive is usually obtained by a number of ropes; if one should break, the rope may be removed and the machinery run, in most cases, until stopping-time.

The number of ropes to be used depends upon the power to be transmitted and upon the surface speed of the driving pulley. The speed of the rope may vary from 2000 ft. to 6000 ft. per minute. In some few exceptional cases 60 ropes have been used on one pulley; the number usually varies between 15 and 40. (See also Power Transmission, § Mechanical.)

Fig. 6 shows the application of these ropes, which pass direct from the main driving pulley to the different flats of the mill. Fig. 7 shows the construction of the Lambeth four-strand cotton rope. There are two distinct systems of arranging the ropes on the driver and the driven pulleys. In the United Kingdom each rope is independent of all the others, and, as it is unlikely for more than one rope to break at a time, the stoppages are reduced to a minimum. In America, where hemp ropes are largely employed,
Fig. 14.—Binder twine preparing, Connswater Mill, of the Belfast Ropework Co. Ltd.

Fig. 15.—Binder twine spinning, Connswater Mill.
the continuous system is mostly used; here the rope is wound round a pulley and driven in one direction, except in some cases, is joined only at one place. Although the system has the great advantage of the minimum number of joinings, it requires tension pulleys to keep the ropes taut. It is also clear that when the rope breaks at any point the machinery must stand until the repair is completed.

Wire Ropes.—Although the manufacture of ropes is of ancient origin, the practice of making ropes from wire on a large scale is of comparatively recent date. Since 1874, however, great improvements have taken place in the manufacture of ropes from different kinds of wire, and the uses to which they can be put have enormously increased. This is owing almost entirely to the introduction of flexible wire ropes, which were invented about this time by Messrs. Bullivant & Co., Ltd., of 72 Mark Lane, London, E.C. Prior to that date the uses at which wire ropes were put were limited to winding ropes for collieries and hauling, and to cases in which flexibility was not a desirable feature. The introduction of flexibility, however, made possible the use of wire rope for ships’ hawser and rigging, for cranes, derricks and other purposes for which hemp ropes were formerly employed; indeed it has almost entirely superseded hemp for marine uses. The reason is that it is much stronger for the same size than rope made from any other material, whilst for the same strength its size and weight are only about one-third that of hemp rope. Consequently, the required power may be obtained with a wire rope of comparatively small bulk.

Wire rope is specially suited for aerial ropeways which provide a means of conveying ore, metals, merchandise, etc., over ground where it would be difficult to arrange transport by ordinary means. Messers Bullivant & Co., Ltd., to whom we are indebted for the table of strengths and other particulars, as well as for the sectional illustration of wire ropes, construct seven different systems of aerial ropeways:  

1. The endless running rope, with carriers hanging therefrom and moving with it through frictional contact.
2. An endless rope, with the carriers hanging therefrom and moving with it, being rigidly fixed in position on the rope.
3. The fixed rope, in which the carriers are drawn along and hang from a fixed rope which acts also as a rail, returning on a parallel rope.
4. The single fixed rope, in which one carrier, hanging from a fixed rope, is drawn to and fro by means of an endless hauling rope.
5. The use of two fixed ropes with an endless hauling rope, in which one carrier travels in one direction, while the other travels on a parallel rope in the opposite direction. This is a serviceable type of ropeway, capable of being used over extremely long spans, and of carrying loads up to 4 tons.
6. The use of one fixed rope placed on an incline, on which the carriers (uncontrolled by hauling ropes) with their suspended loads are allowed to run down at a high speed. This is generally called a "shoot."
7. Bullivant's system of aerial ropeway for raising, lowering, and transporting heavy loads, by means of a load which is hoisted, traversed in either direction and deposited at one operation. The flexibility of a wire rope depends upon the number of wires of which it is formed; consequently the use to which a rope is to be put will partly determine the number of wires used in its construction. In some cases nearly 300 individual wires are employed in making one rope. Fig. 8 shows in section ten different types of construction, the particulars of which appear below:

The diameter of drums and sheaves should be about thirty times the circumference of the rope.

For shaft winding at high speed one-tenth of the breaking strain of a rope is sometimes taken as a fair working load. For inclines, the proportion of load to breaking strain varies according to gradient conditions, and friction should be allowed for.

The first requisite in the manufacture of wire ropes is the selection and blending of the different iron ores. The different processes through which the metal passes, and the hammering and drawing into rods, require great experience, and give to it the peculiar properties that are essential for the finished article. The same remarks apply to the annealing and hardening processes, during which the rods are drawn through dies to the required gauge. The wire is now subjected to special processes of galvanizing in order to make it proof against atmospheric and other influences. Afterwards it is wound on bobbins of suitable size, a definite number of which are mounted on the forks or frames of the stranding machine. These forks are swung or pivoted between discs, which are keyed on a hollow main shaft, through which the wires or other material
intended for the core pass. This core is of such a size that the aggregate number of wires that are mounted in the machine exactly covers the strand on a pin wheel. All the wires, including the centre core, are passed through their individual hollow spindles, then led to the nose or head of the machine, and finally passed through a stationary compression wheel which is regulated in proportion to the speed of the machine by means of suitable gearing. During the revolutions of the machine each bobbin and fork is kept in a vertical position, so that, by means of an eccentric ring behind the back disk. This ring is connected to the spindles of the bobbins forks by means of small cranks, thus preventing any torsional movement that would otherwise be imparted to the individual wires.

Each bobbin is controlled by a brake which acts as a tensioning device so that equal strain can be applied to each, allowing the wires to unwind uniformly. The finished strands are then wound upon large bobbins, and mounted in the flyers or disks of the rope closing machine. These machines are similar in design to the stranding machine, but are naturally much heavier in construction, and therefore revolve at a proportionate speed. The speed of the machines varies according to the weight of material, the size of the strands and the construction of the finished rope. The modern machine, or the type most generally used, makes about fifty revolutions per minute, whilst three times this speed is often obtained when spinning the strands.

The rapid strides made by electricity have furnished another large branch of what may be termed wire rope manufacture. Whatever are the purposes for which the wires are employed, they are almost invariably termed cables, and there are many different kinds and sizes of them. The wire must necessarily possess good conducting power, and be comparatively light, for the purposes of a flexible lead to be drawn. The chief material possessing these two important properties in combination; hence it is the metal par excellence for electrical conduction. Aluminium and alloys have been tried with varying degrees of success.

The conductor itself consists of a strand of soft copper wires, around which the dielectric or non-conducting material is placed. The methods of forming the strand do not differ essentially from those described above. The dielectric is usually paper, spun jute fibre, vulcanized india-rubber or vulcanized bitumen. If the first two dielectrics are used, a lead sheath is necessary to encase the insulating material, as the outer layer of the cable is likely to be got damaged, it is further enclosed by steel tapes or steel wires, and finally covered with yarn or braid. Vulcanized bitumen is not only a dielectric, but is also absolutely impervious to moisture. Hence in many instances where paper or fibre is employed as the principal dielectric, a sheath of vulcanized bitumen is used instead of lead to exclude moisture. Cables are also made with a single central stand of copper wires in addition to one or more concentric layers of copper wires, the layers being separated by some dielectric material; or there may be two or more strands, separately insulated, and more or less elaborately clothed with the above-mentioned substances.

(R. W.)

ROPS—ROPS

JOHN CODMAN (1836-1899), American military historian and lawyer, was born at St Petersburg on the 28th of April 1836, the son of a leading merchant of Boston who was engaged in business in Russia. At the age of fourteen, his family having meantime returned to Massachusetts, he developed an affection of the spine which eventually became a permanent deformity. His courage and energy, however, did not allow him to yield to his affliction. He entered Harvard in 1853, and graduated in 1857. His interests as a young man were chiefly religious, legal and historical, and these remained with him throughout life, his career as a lawyer being conspicuous and successful. But it was the outbreak of the Civil War in 1861 which fixed his attention principally on military history. He ceaselessly assisted with business and personal help and friendship the officers and men of the 20th Massachusetts regiment, in which his brother, Henry Ropes, served up to his death at Gettysburg, and after the war he devoted himself to the collection and elucidation of all obtainable evidence as to its incidents and members. His work has been so carefully done that his mind enabled him to sift the truth from the innumerable public and private controversies, and the ill-informed allotment of praise and blame by the popular historians and biographers. The focus of his work was the Military Historical Society of Massachusetts, which he founded in 1876. The work of this society was the collection and discussion of evidence relating to the great conflict. Although practically every member of this society except himself had fought through the war, many, such as Hancock and W. F. Smith, were general officers of great distinction, it was from first to last maintained and guided by Ropes, who presented to it his military library and his collection of prints and medals. He died at Boston on the 28th of October 1899. His principal work is an unfinished Story of the Civil War, to which he devoted most

The greater part of his studies of the Civil War appears in the Military Historical Society's publications. Papers on the Waterloo and its later years; this covers the years 1861-62. The Army under Pope is a detailed narrative of the Virginia campaign of August-September 1862, which played a great part in reversing contemporary judgment on the events of those operations, notably as regards the unjustly-condemned General Fitz John Porter. Outside America, Ropes is known chiefly as the author of The Campaign of Waterloo, which is one of the standard works on the subject.

ROPS, FÉLICEN (1833-1898), Belgian painter, designer and engraver, was born at Namur, in Belgium, on the 7th of July 1833; he spent his childhood in that town, and afterwards in Brussels, where he composed in 1856, for his friends at the university, the Almanach Crocodilien, his first piece of work. He also brought out two Salons Illustrés, and collaborated on the Crocodile, a magazine produced by the students. The humour shown in his contributions attracted the attention of publishers, who offered him work. He designed, among other things, frontispieces for Poulet-Malassis, and afterwards for Gay and Doucé. In 1859 he began to contribute to a satirical journal in Brussels called Uylenspiegel, a sort of Charivari. The issue, limited unfortunately to two years, included his finest lithographs. About 1862 he went to Paris and worked at Jacquemart's. He subsequently returned to Brussels, where he founded the short-lived International Society of Etchers. In 1865 he brought out his famous "Buveuse d'Absinth," which placed him in the foremost rank of Belgian engravers; and in 1871 the "Dame au Panthère." After 1874 Rops resided in Paris. His talent, which commanded attention by its novel methods of expression, and had been stimulated by travels in Hungary, Holland and Norway, whence he brought back characteristic sketches, now took a soaring flight. To say nothing of the six hundred original engravings enumerated in Ramiro's Catalogue of Rops' Engraved Work (Paris, Conquet, 1887), and one hundred and eighty from lithographs (Ramiro's Catalogue of Rops' Lithographs, Paris, Conquet, 1891), besides a large number of oil-paintings in the manner of Courbet, and of pencil or pen-and-ink drawings, he executed several very remarkable water-colour pictures, among which are "Le Scandale," 1876; "Une Attrapade," 1877 (now in the Brussels Museum); a "Dancing of St Antoine," 1878; and "Pomponaraent," 1878. Most of these have been engraved and printed in colours by Bertrand. From 1880 to 1890 he devoted himself principally to illustrating books; "Les Rimes de joie," by Thé Hannon; Le Vice suprême et Curieuse, by J. Péladan; and Les Diables, by Barbey d'Auvéilly; L'Amante du Christ, by R. Darzens; and Zodié, by Voltaire; and the poems of Stéphane Mallarmé have frontispieces due to his fertile and powerful imagination. Before this he had illustrated the Légendes Flamandes, by Ch. Decoster; Jeune France, by Th. Gautier;
ROQUELAURE—RORSCHACH

winter in the open seas, and approaches the coast of Norway at the end of April or beginning of May. At this time its sole food is a small crustacean (Euphausia inermis), which swarms in the fjords. Secondly, we have the common rorqual (B. musculus, or B. physalus) with a length of from 65 ft. to 70 ft., and of a greyish slate-colour above and white underneath, and the whalebone slate-colour, variegated with yellow or brown. It has usually 62 vertebrae, of which 15 bear ribs. This is the commonest of all the large whales on the British coasts; scarcely a winter passing without the body of one being washed ashore, usually after stormy weather, and frequently on the south coast, as this species has a more southern range than the last, and enters the Mediterranean. It feeds largely on fish, and is frequently

seen feasting among shoals of herrings. Thirdly comes Rudolphi's rorqual (B. borealis), a smaller species, scarcely attaining a length of 50 ft. It is bluish black above, with oblong light-coloured spots, whilst the under-parts are more or less white; the whole of the tail and both sides of the flippers are black; the whalebone is black, and the bristly ends fine, curling and white; the flippers are very small, measuring one-eleventh of the total length of the body. There are 56 vertebrae, with 14 pairs of ribs. This species, according to Dr. C. Collett, feeds chiefly on minute crustaceans, mainly Calanus finmarchicus and Euphausia inermis, and not on fish. Down to the last quarter of the 19th century it was considered the rarest of the whales of European seas, and was only known from a few individuals stranded on the coasts of northern Europe at long intervals. The most southern point at which it has been met with is Biarritz. Since the establishment of the whaling station near the North Cape it has been shown to be a regular summer visitor. Lastly, the lesser rorqual, B. rostrata, the sharp-nosed finner of American whalers, is the smallest species found in the northern seas, rarely exceeding 30 ft. in length. Its colour is greyish black above, whilst the under-side is white, including the whole of the lower side of the tail; the inner side of the flippers is also white, and there is a broad white band across the outer side of the flipper. The fibre of the whalebone is yellowish white. The dorsal fin in this and the preceding species is comparatively high, and placed far forwards on the body. This whale has usually 48 vertebrae, of which 11 bear ribs. It is common in summer in the fjords of Norway, and is often seen around the British Isles. It has been taken, though rarely, in the Mediterranean, and ranges as far north as Davis Strait.

Rorquals are met with in almost all seas, and nearly all the individuals carefully examined, whether from the North Pacific, the Australian seas or the Indian Ocean, come very near in structure to one or the other of the Atlantic forms described above, so much so that some zoologists believe that there are but four species, with an almost cosmopolitan range. Other naturalists, on the contrary, have described and named almost every individual specimen captured as belonging to a different species. See WHALE and HUMP-BACK WHALE.

(R. L.*)

RORSCHACH, a busy commercial town in the Swiss canton of St Gall, situated on the south-west shore of the Lake of Constance, and by rail 62 m. N.E. of Zürich, 10 m. S.E. of Romanshorn and 57 m. N. of Coire. In 1900 its population was 9140, mostly German-speaking, while there were 9395 Romanists to 3139 Protestants. From 1408 to 1798 it belonged to the abbey of St Gall, and then to the canton Säntis (named canton of St Gall in 1803) of the Helvetic Republic. It has always been a great commercial centre, though now superseded by Romanshorn as regards the corn trade. It has many industrial establishments, of which the chief is one for the manufacture of lace and
muslin. Above the town is the old convent of Mariaberg, originally built in the 15th century as a refuge for the monks of St Gall against the turbulent citizens of that town, but now a seminary for teachers. From Rorschach a cogwheel railway runs south-east in 42 m. up to Heiden, a village in the canton of Appenzell well known for its goats' whey cure. (W. A. B. C.)

ROS, or DE ROS, the name of a noble English family. Robert de Ros (d. 1227), a son of Everard de Ros (d. 1192) of Helmsley, or Hamlake, in Yorkshire, possessed lands in Yorkshire, including Ros, or Ros, in Holderness, and also in Normandy. He served King John in several ways, both in England and abroad, and obtained lands in Normandy, Hainault, and elsewhere. He was a baron of the castle at Wark, or Werke. About 1215, however, he deserted the king and became one of the leaders of the baronial party, being one of the twenty-five executors of Magna Carta and fighting against John when he repudiated this engagement. He submitted to Henry III. and became a monk before he died in 1227. His wife was Isabella, daughter of William the Lion, king of Scotland, by whom he had two sons, William and Robert. Robert de Ros the younger (d. 1274), was an itinerant justice under Henry III., but later he was one of the barons who fought against this king. He passed much of his time, however, in Scotland, and he died there in 1286. He was one of the guardians of Margaret, the English bride of King Alexander III. His son Robert was summoned to parliament as Lord Ros de Werke in 1295; just afterwards he revolted against Edward I. and his lands were forfeited. William de Ros (d. 1258), the elder son of the executor of Magna Carta, had a son Robert (d. 1285), who was summoned to parliament by Edward I. His son William, 2nd baron Ros of Helmsley, or Hamlake (d. 1374), obtained Belvoir Castle in Leicestershire through his mother Isabel, daughter of William d'Albini. He was one of the minor claimants for the crown of Scotland, and in 1350 he obtained the lands in Northumberland which had been taken from his traitorous cousin Robert de Ros. His second son, John de Ros (d. 1338), was a courtier under Edward II. Later he joined Edward's queen, Isabella, was summoned to parliament by Edward III., and distinguished himself on the sea. Another John de Ros (d. 1332), bishop of Carlisle from 1325 to 1332, was doubtful a member of this family.

The second baron's descendants retained the barony of Ros until the death of Edmund de Ros, the 11th baron, in October 1508. Edmund's nephew Sir George Manners (d. 1521), of Belvoir and Helmsley, then claimed it, and was called Lord Ros, or Ros. His son, Thomas Manners, the 13th baron (d. 1543), was created earl of Rutland in 1525, but the barony was separated from the earldom when Thomas's grandson Edward died in 1587, leaving an only child, Elizabeth (d. 1591), who, as heir general of the family, became Baroness Ros, or Roos. Elizabeth married into the Cecil family, and when her only child, William Cecil, died in 1618, the barony reverted to the Manners family, Francis Manners, 6th earl of Rutland (1578-1632), becoming the 18th baron. On his death the barony again passed to a female, his daughter Katherine, through whom it came to the family of Vaux. The present holder is a baronet, after a long abeyance, Charlotte (1760-1831), daughter of the Hon. Robert Boyle, and a descendant of the Manners family, was declared Baroness Ros, or Roos. She married Lord Henry Fitzgerald, and their son, Henry William Fitzgerald-de-Ros (1793-1839), became the 22nd baron on his mother's death. In 1907, on her father's death, Mary Frances, wife of the Hon. Anthony Dawson, became Baroness Ros, or rather, De Ros, which is the present form of the title. For a long time after they had ceased to hold the barony the earls and dukes of Rutland continued to style themselves Lords Roos.

ROS, SIR RICHARD (1445), English poet, son of Sir Thomas Ros, of Castleton and Hamlake (Hampshire), and of Belvoir in Leicestershire, was born on the 8th of March 1440. In Harl. MS. 372 the poem of "La Belle Dame sans Mercy," first printed in W. Thynne's Chaucer (1532), has the ascription "Translatid out of Frenche by Sir Richard Ros." "La Belle Dame sans Mercy" is a long and rather dull poem from the French of Alain Chartier, and dates from about the middle of the 15th century. It is written in the Midland dialect, and is surprisingly modern in diction. The opening lines—

"Half in a dreme, not fully wel awaked,

The golden sleepe me wraped under her wing,"

have often been quoted, but the dialogue between the very long-suffering lover and the cruel lady does not maintain this high level.

See W. W. Skeat, Chaucerian and Other Pieces (1897); and Dr. H. Gröther, Uber Richard Ros' mittelengische Uebersetzung . . . (Breslau, 1886).

ROSA, CARL AUGUST NICHOLAS (1834-1889), English musical impresario, was born at Hamburg, his family name (which he subsequently changed) being Rose. He started as a solo violinist, studying at Leipzig and Paris, and also had considerable success as a conductor both in England and America; and it was at New York in 1867 that he met and married the famous operatic soprano Madame Parepa (1856-1874), at whose death he afterwards endowed a Parepa-Rosa scholarship at the Royal Academy of Music in London. In 1875 he started the Carl Rosa Opera Company. He promised the best operas in English versions, and both during his own life and after his death this company had much to do with popularizing good music in England, encouraging native composers and training a number of excellent singers. Carl Rosa married a second time in 1881, and died in Paris on the 30th of April 1889.

ROSA, MONTE, the name of a great glacier-clad mountain mass (the name comes from the Aostan patois word rosc, meaning a glacier) which rises S.E. of Zermatt, and on the frontier between Switzerland (canton of the Valais) and Italy. Ten summits in this huge mass are distinguished by name, of which the Nordend, 132 ft., the Zumsteinspitze, 15,004 ft., the Signalkuppe or Punta Gaiffetti, 14,065 ft., and the Parrotspitze, 14,643 ft. (so named by the Swiss government in honour of General Dufour, the head of the great survey which first accurately fixed the position of these points), rises W. of the frontier ridge, on a buttress, and is thus entirely in Switzerland, of which it is the culminating peak (and not, as often stated, the Dom, 14,942 ft., in the Mischabel group). The loftiest point of the Dufourspitze was first attained in 1855 by a large English party, which included Messrs G. and C. Smyth, C. Hudson, Birkbeck and Stevenson. The Zumsteinspitze was first climbed in 1820, the Signalkuppe (on top of which there is now a club hut) in 1842, the Nordend in 1864 and the Parrotspitze in 1863. The ascent of all the points named is not difficult from the Swiss side, but excessively dangerous on the east or Italian side. (W. A. B. C.)

ROSA, SALVATOR (1615-1673), Italian painter of the Neapolitan school, was born in Arenella, in the outskirts of Naples, in 1615: the precise day is given as the 2oth of June, and also as the 21st of July. His father, Vito Antonio de Rosa, a land proprietor, was bent upon making the youth a lawyer, but a priest, and sent him to study in the convent of the Sambaschi fathers. Here Salvator began showing a turn for art: he went in secret to his maternal uncle Paolo Greco to learn the practice of painting, but soon found that Greco had little pictorial lore to impart, so he transferred himself to his own brother-in-law Francesco Francarzaro, a pupil of Ribera, and afterwards had some practice under Ribera himself. Above all he went to nature, frequenting the Neapolitan coast, and keeping his eyes open and his hand busy. At the age of seventeen he lost his father; the widow was left unprovided for, with at least five children, and Salvator found himself immersed in a sea of troubles and perplexities. On the advice of a friend he went to Rome, and, it seems, for some time was reduced almost to begging. He obtained some instruction under the battle-painter Aniello Falcone, but chiefly painted in solitude, haunting romantic
and desolate spots, beaches, mountains, caverns, verdure-clad recesses. Hence he became in process of time the initiator of romantic landscape, with a special turn for scenes of strange or picturesque aspect—often turbulent and rugged, at times grand, and with suggestions of the sublime. He picked up scanty doles when he could get them, and his early landscapes sold for a few pence to petty dealers. The first person to discover that Rosa’s work was not as trumpery as it was cheap was the painter Lanfranco, who bought some of the paintings, and advised the youth to go to Rome. Hither in 1635, at the age of twenty, Rosa betook himself; he studied with enthusiasm, but, catching fever, he returned to Naples and Falcone, and for a while painted nothing but battlepieces, and these, without exciting any attention. This class of work was succeeded by the landscape art peculiarly characteristic of him—wild scenes wildly peopled with shepherds, seamen or especially soldiers. He then revisited Rome, and was housed by Cardinal Brancaccio; this prelate being made bishop of Viterbo, Rosa painted for the Chiesa della Morte a large and noticeable picture of the “Incredulity of Thomas”—the first work of sacred art which we find recorded from his hand. At Viterbo he made acquaintance with a mediocre poet named Abati, and was hence invited to try his own faculty in verse. He then returned to Naples. Here the viceregal household was more extensive than the human one, and the masterpieces—Ribera, Caracciolo and Corona—were still powerful. Rosa was as yet too obscure to suffer from their machinations; but, having painted a picture of “Tityus Torn by the Vulture,” which went to Rome and there produced a great sensation, he found it politic to follow in the footsteps of his fame, and once more, in 1638, resought the papal city.

Rosa was a man of facile and versatile genius, and had by this time several strings to his bow. It is said that, still keeping painting steadily in view as his real objective, he resolved to secure attention first as a musician, poet, improvisatore and actor—his mother-wit and broad Neapolitan dialect (which appears to have stuck to him through life) standing him powerful. In one of the popular ballads in vogue at Naples, he was cast as Formica and Capitan Coviello, and startled Rome distributing satirical prescriptions for diseases of the body and more particularly of the mind. As Formica he inveighed against the farcical comedies acted in the Trastevere under the direction of the celebrated Bernini. Some of the actors, in one of their performances, retaliated by insulting Rosa, but the public was with him, and he now enjoyed every form of success—social prestige, abundant commissions and any amount of money, which he was wont to throw about broadcast to the populace. In 1646 he returned to Naples, and is said to have taken an active part in the inscription of Masaniello; certain it is that he sympathized with and admired the fisherman and his cause, and that a passage in one of his satires proves this. His actual share in the inscription is, however, dubious; it appears only in recent narratives, and is the same with the well-known story that at one time he herded with a band of refugees in the Abruzzi—an incident which cannot be conveniently dove-tailed into any of the known dates of his career. As regards the popular revolt against Spanish tyranny, it is alleged that Rosa, along with other painters—Coppola, Porpora, Domenico Gar- giulo, Dal Po, Masturzo, the two Vaccari and Cadogna—all under the captenacy of Aniello Falcone, formed the Compagnia delle Morte, whose mission it was to hunt up Spaniards in the streets and despatch them, not sparing even those who had sought some place of religious asylum. He painted a portrait of Masaniello—probably from reminiscence rather than from life: indeed, it is said that he painted him several times over in less than life size. On the approach of Don John of Austria the blood-stained Compagnia dispersed, Rosa escaping or at any rate returning to Rome. Here he painted some important subjects, showing the uncommon bent of his mind as it passed from landscape into history—“Democritus amid Tombs,” the “Death of Socrates,” “Regulus in the Spilled Cask” (these two are now in England), “Justice Quitting the Earth,” and the “Wheel of Fortune.” This last work, the tendency of which was bitingly satirical, raised a storm of ire and remonstrance.

Rosa, endeavouring at conciliation, published a description of its meaning (probably softened down not a little from the real facts); none the less an order for his imprisonment was issued, but ultimately withheld at the instance of some powerful friends. It was about this time that Rosa wrote his satire named Babylon, under which name Rome was of course indicated.

Cardinal Giancarlo de’ Medici now invited the painter to leave Rome—which had indeed become too hot to hold him—for Florence. Salvator gladly assented, and remained in the Tuscan capital for the better part of nine years, introducing there the new style of landscape; he had no pupils, but various imitators. Lorenzo Lippi the painter poet, and other beaux esprits shared with Rosa the hospitabilities of the cardinal, and they formed an academy named I Percossi (the Stricken), indulging in a deal of ingenious jollity—Rosa being alike applauded as painter, poet and musician. His chief intimate at this time was Lippi, whom he encouraged to proceed with the poem Il Malamintile Racquistato. He was well acquainted also with Ugo and Giulio Maffei, and housed with them more than once in Volterra, where he wrote other four satires—Music, Poetry, Painting and War. About the same time he painted his own portrait, now in the Uffizi Gallery of Florence. Finally he reverted once more to Rome, and hardly left that city before his health and spirit was broaded there against him, taking the form more of an allegation that the satires which he zealously read and diffused in MS. were not his own production, but filched from some one else. Rosa indignantly repelled this charge, which remains indeed quite unsubstantiated, although it is true that the satires deal so extensively and with such ready manipulation in classical names, allusions and anecdotes, that one is rather at a loss to fix upon the period of his busy career at which Rosa could possibly have imbued his mind with such a multitude of semi-erudite details. It may perhaps be legitimate to suppose that his literary friends in Florence and Volterra had coached him up to a large extent—a doubtful boon not compositions, remaining none the less strictly and fully his own. To confute his detractors he now wrote the last of the series, entitled Envy. Among the pictures of his closing years were the admired “Battlepiece” now in the Louvre, painted in the short space of forty days, full of long-drawn carnage, with ships burning in the offing; “Pythagoras and the Fishermen;” the “Oath of Catiline” (Pitti Gallery); and the very celebrated “Saul and the Witch of Endor” (Louvre), which is almost his latest work. He undertook a series of satirical portraits, to be closed by one of himself; but while occupied with this project he was assailed by dropsy, which, after lasting fully half a year, brought his life to a close on the 15th of March 1673. In his last moments he married a Florentine named Lippi, and entered into a happy condition, which gave him two sons, one of them surviving him, and he died in a contrite frame of mind. He lies buried in the Chiesa degli Angeli, where a portrait of him has been set up. Salvator Rosa, after the hard struggles of his early youth, had always been a successful man, and he left a handsome fortune.

Rosa was indisputably a great leader in that modern tendency of fine art towards the romantic and picturesque which, developing in various directions and by diversified processes, has at last almost totally re-animated old and ancient scenes. He presents with a new eye, and presented new images of them on his canvases, and deserves therefore all the credit due to a vigorous innovator, even if we contest the absolute value of his product. He himself courted reputation for his historical works, laying comparatively little stress on his landscapes; in portraits he was forcible. In chiaroscuro he is simple and effective; his design has energy and a certain grandeur, without any high type of form or any superior meagreness of correctness; he is too frequently of yellowish-or yellowish-grey tone. Personally he was a man of high spirit, and he sold his pictures at large prices, more (it is said) to assert the honour of his art than from love of gain: ration therefore that he sometimes cheaply destroyed them. In his later Florentine period he etched several of his works, subjects of mythology, soldiering, &c. He was choleric, but kind and generous. Though a man of gaiety and pleasure, and a jovial boon companion, he does not appear to have been serious in any serious degree. He was talkative, very sharp-tongued and an unblushing encomiast of his own performances. Among his pictures not already mentioned we may name, in the National
ROSACEAE

Gallery, London, "Mercy and the Diagonal Woodman," and three others; in Raynham Hall, "Belisarius"; in the Grosvener Gallery, "Diogenes"; in the Piti Gallery, a grand portrait of a man in armour, and in the "Temptation of St Anthony," which contains his own portrait. This last subject appears also in St Petersburg, and in the Louvre.

The satires of Salvator Rosa deserve more attention than they have generally received. There are, however, two recent books taken account of them—by Cesareo, 1892, and Cusci, 1899. The satires, though considerably spread abroad during his lifetime, were not published until 1719. They are all in terza rima, written without much literary correctness, but remarkably spirited, pointed, and affecting; illustrated with a dashingly popular, and from this point of view too monotonous in treatment. Rosa here appears as a very severe castigator of all ranks and conditions of men, not sparing the highest, and as a champion of the poor and down-trodden, and as a denouncer of the vicious and faithless. The sentiments odd that a man who took so free a part in the pleasures and diversions of life should be so ruthle in the ministers of these. The satire on Music exposes the modes and profanity of musicians, and the shame of courts and churches in encouraging them. Poetry revels on the pedantry, inimitativeness, adulation, affectation and indecency of poets—also their poverty, and the neglect with which they were treated; and there is a very vigorous sortie against oppressive governors and aristocrats. Tasso’s glory is upheld; Dante is spoken of as obsolete, and Ariosto as corrupting. Painting is inveigled into the fray, and Salvator Rosa not only opposed all subjects, such as beggars (though Rosa must surely himself have been partly responsible for this mis-direction of the art), against the ignorance and lewdness of painters, and their taste of trumpery and the gross indecorum of painting sprawling half-naked saints of both sexes. War (which contains the exploits of hirding soldiers, who fight and perish while kings stay at home; the vile morals of kings and lords, heresy and unbelief also come in for a flagellation. In Babylon Rosa represents himself as a fisherman, terminal, constantly unlucky in his net-hauls on the Euphrates; he converses with a native of the country, Ergasto. Babylon (Romulus very severely treated, and Naples much the same. Envy (the last of the satires) is characterized by a swift, although without strong apparent reason) represents Rosa dreaming that, as he is about to inscribe in all modesty his name upon the Roman monument of the god, the goddess of Envy obstructs him, and a long altercation and reciprocal jibing ensues. Here occurs the highly charged portrait of the chief Roman detractor of Salvator (we are not aware that he has ever been identified by name); and the painter protests that he would never condescend to do any of the lascivious work in painting so shamefully in vogue.

As authorities for the life of Salvator Rosa, Passeri, Vite de’ Pittori, Scultori, e Architetti..., and Vite de’ Salvator Rosa; also Baldini and Dominici. The Life by Lady Morgan is a romantic treatment, mingling tradition or mere fiction with fact. The reference is A Century of Death, by Albert Cotton, 1604, gives an interesting picture of Salvator Rosa at Naples. (W. M. R.)

ROSACEAE, in botany, a large cosmopolitan family of seed-bearing plants belonging to the subclass Polypetalae of Dicotyledons and containing about 90 genera with 3000 species. The plants vary widely in manner of growth. Many are herbsaceous, growing erect, as Geum, or with slender creeping stem, as in species of Potentilla, sometimes sending out long runners, as in strawberry; others are shrubby, as raspberry, often associated with a scrambling habit, as in the brambles and roses, while apple, cherry, pear, plum and other British fruit trees represent the arborescent habit. Vegetative propagation takes place by means of runners, which root at the apex and form a new plant, as in strawberry; by suckers springing from the base of the shoot and rising to form new leafy shoots after running for some distance beneath the parent strawberry; or by shoots produced from the roots, as in cherry or plum. The scrambling of the brambles and roses is effected by means of prickles on the branches and leaf-stalks.

The leaves, which are arranged alternately, are simple, as in apple, cherry, &c., but more often compound, with leaflets palately arranged, as in strawberry and species of Potentilla, or pinnately arranged, as in the brambles, roses, mountain ash, &c. A difference in this respect often occurs in one and the same genus, as in Pyrus, where apple (P. Malus), and pear (P. communis) have simple leaves, whereas mountain ash or rowan (P. aucuparia) has pinnately compound leaves. In warm climates the leaves are often leathery and evergreen. The leaves are stipulate, the stipules being sometimes small and shortived, as in Pyrus and Prunus (cherry, plum, &c.), or more important structures adnate to the base of the leaf-stalk, as in roses, brambles, &c. The flowers, which are regular, generally bisexual, and often showy, are sometimes borne singly, as in some species of rose, or of the cloudberry (Rubus chamaemorus), or few or more together in a corymbose manner, as in some roses, Hawthorn and others. The inflorescence in agrimony is a raceme, in Poterium a dense-flowered spike, in Spiraea a number of cymes arranged in a corymb. The parts of the flowers are arranged on a 5-merous plan, with generally considerable increase in the number of stamens and carpels. The shape of the thalamus or floral receptacle, and the relative position and number of the stamens and carpels and the character of the fruit, vary widely and form distinguishing features of the different suborders, six of which may be recognized.

Suborder I. Spiracoideae is characterized by a flat or slightly concave receptacle on which the carpels, frequently five in number, form a central whorl; each ovary contains several ovuliferous parts, and the fruit is a folicule. There are five sepals, five petals and the stamens vary from ten to indefinite. The plants are generally shrubs with simple or compound leaves and racemes or panicles of numerous small white, rose or purple flowers. This suborder, which is nearly allied to the order Saxifragales, contains 17 genera, chiefly north temperate in distribution. The largest is Spiraea, numerous species of which are cultivated in gardens; S. salicina occurs in Britain apparently wild in plantations, but it is not indigenous. The native British meadow-sweet (S. Ulmaria) and dropwort (S. filipendula) have been placed in a separate genus, Ulmaria, and included in the Rosoideae on account of their one-seeded fruit. Quiloha saponaria is the Chilean soap tree; the bark contains saponin.

Suborder II. Pomonoideae is characterized by a deep cup-shaped receptacle with the inner wall of which the five carpels are united (fig. 1, 3); the carpels are also united with each other, and each contains generally two ovules. The fruit is made up of the large fleshy receptacle surrounding the ripe ovaries, the endocarp of which is leathery or stony and contains one seed. The plants are shrubs or trees with simple or pinnately compound leaves and white or rose-coloured often showy flowers, with five sepals and petals and indefinite stamens. The 14 genera are distributed through the north temperate zone, extending southwards in the New World to the Andes of Peru and Chile. The largest genus, Pyrus, with about 50 species, includes apple (P. Malus), pear (P. communis) (fig. 2), wild service (P. terminalis), rowan or mountain-ash (P. aucuparia), and white beam (P. Aria), Medulis (medlar) and Cotoneaster are also included. (See separate articles for most of the above.)

Suborder III. Rosoideae is characterized by the receptacle being cup-shaped, as in fig. 1, 3, as in Pyrus (P. Malus), pear (P. communis), and apple (P. Malus), and bearing numerous carpels, each of which contains one or two ovules, while the fruit is one-seeded and indehiscent. The 39 genera are grouped in tribes according to the number of the receptacle and the ovary; the receptacle consists of the carpels on a large, rounded or convex outgrowth of the receptacle. In the large genus Rubus (fig. 3) the ripe ovaries form drupel-like receptacles; the genus is almost cosmopolitan, but the majority of species occur in the far east region of the north temperate zone and in the mountains of tropical America. R. fruticosus is blackberry, R. Idaeus, raspberry, and R. Chamaemorus (the cloudberry) is the flower of Potentilla, Fragaria (strawberry) and a few allied genera an epicalyx is formed by stipular structures arising at the base of the sepals. The fruits consist of numerous dry achenes borne in Fragaria on the much-enlarged
succulent torus, which in the other genus is dry. In *Genus* (avens) and *Dryas* (an arctic and alpine genus) the style is persistent in the fruit, forming a feathery appendage (*Dryas*) or a barbed awn (avens), either of which is of service in distributing the fruit. The Potentilleae are chiefly north temperate, arctic and alpine plants.

The Rosaceae comprise the large genus *Rosa*, characterized by a more or less urn-shaped torus (fig. 4) enclosing the numerous carpels which form dry one-seeded fruits enveloped in the bright-coloured fleshy torus. The numerous stamens surround the mouth of the torus. The plants are shrubs bearing prickles on the stems and leaves; many species have a scrambling habit resembling the brambles. The species of *Rosa*, like those of *Rubus*, are extremely variable, and a great number of subspecies, varieties and forms have been described. The Sanguisorbeae are a reduced form of Rosoideae. The dry one-seeded fruit is enclosed in the urn-shaped torus, which, however, is dry and inconspicuous, and the number of carpels is much reduced, sometimes to one (figs. 2, 5, 6). Petals are often wanting, as in *Alchemilla* (lady's mantle) and *Potentilla*, and the flowers are often unisexual and frequently wind-pollinated, as in salad burnet (*Poterium Sanguisorba*), where the small flowers are crowded in heads, the upper pistillate, with protruding feathery stigmas, and the lower staminate (or bisexual) with exserted stamens. *Agrimonia* (agrimony) has a long spike of small honeyless flowers with yellow petals; in the fruit the torus becomes hard and crowned by hooked bristles which ensure the distribution of the enclosed achenes.

*Suborder IV. Neuroideae* contains only two genera of desert-inhabiting herbs with yellow flowers; and the five to ten carpels are united together and with the base of the cup-shaped torus, which enlarges to form a dry covering round the one-seeded fruits.

*Suborder V. Prunoideae* (fig. 7) is characterized by a free solitary carpel with a terminal style and two pendulous ovules, and the fruit a one-seeded drupe. The torus forms a cup from the edge of which spring the five sepals, five alternating petals and the ten to indefinite stamens. The plants are deciduous or evergreen trees or shrubs with simple leaves, often with small caducous stipules, and racemes or umbels of generally showy, white or pink flowers. There are five genera, the chief of which is *Prunus*, to which belong the plum (*Prunus communis*), with several well-marked subspecies—*P. spinosa* (sloe or blackthorn), *P. insititia* (bullace), *P. domestica* (wild plum), the almond (*P. Amygdalus*), with the nearly allied peach (*P. persica*), cherry (*P. Cerasus*), birdcherry (*P. Padus*) and cherry laurel (*P. Laurocerasus*). The tribe is distributed through the north temperate zone, passing into the tropics.

*Suborder VI. Chrysobalanoidae* resembles the last in having a single free carpel and the fruit a drupe, but differs in having the style basal, not terminal, and the ovules ascending, not pendulous; the flowers are also frequently zygomorphic. The 12 genera are tropical evergreen trees or shrubs, the great majority being South American. The zygomorphic flowers indicate an affinity with the closely allied order Leguminosae.
ROSAMOND, known as “The Fair” (d. c. 1176), mistress of Henry II., king of England, is believed to have been the daughter of Walter de Clifford of the family of Fitz-Pounce. The evidence for the paternity is, however, only an entry of a statement made by the jurors of the manor of Castor in a Hundred Roll of the second year of the reign of Edward I. (c. 1252). The great grandson of Henry II. Rosamond is said to have been Henry’s mistress secretly for several years, but was openly acknowledged by him only when he imprisoned his wife Eleanor of Acquitaine as a punishment for her encouragement of her sons in the rebellion of 1173-74. She died in or about 1176, and was buried in the nunnery church of Godstowe before the high altar. The body was removed by order of St Hugh, bishop of Lincoln, in 1191, and was, seemingly, reinterred in the chapter house. The story that she was poisoned by Queen Eleanor first appears in the French Chronicle of London in the 14th century. The romantic details of the labyrinth at Woodstock, and the clue which guided King Henry II. to her bower, were the inventions of story-writers of later times. There is no evidence for the belief that she was the mother of Henry’s natural son William Longsword, earl of Salisbury.

ROSARIO, a city and river port of Argentina, in the province of Santa Fé, on the W. bank of the Paraná, 186 m. by rail N.W. of Buenos Aires. Pop. (1904, estimate) 120,000. It is accessible to ocean-going steamers of medium draught. The city stands on the eastern margin of the great pampean plain, 65 to 75 ft. above the wide river-bed washed out by the Paraná. It is only a few miles from the river, and there are country residences and gardens of the better class along the line of the Central Argentine railway and northward toward San Lorenzo. The city is laid out with chessboard regularity, and the streets are paved (in great part with cobblestones), lighted with gas and electricity, traversed by tramway lines, and provided with sewers and water mains. The Boulevard El Santafecino is an attractive residence street with double driveways separated by a strip of garden and bordered by fine shade trees. The chief edifices of an official character are the custom house, post office, municipal hall and law courts. There is a large hospital, and the English and German colonies maintain a well-equipped infirmary. The largest sugar refinery in Argentina is here, and there are flour-mills, breweries and some smaller manufactures. The city is chiefly commercial, being the shipping port for a large part of northern Argentina, among its exports being wheat, flour, baled hay, linnen, Indian corn, sugar, rum, cattle, hides, meats, wool, querbracho extract, &c. The railway connections are good, including the Buenos Aires and Rosario and the Central Argentine lines to the national capital, the Buenos Aires and Rosario line northward to Guernica, where it connects with the government line to Salta, Jujuy and the Bolivian frontier, the Central Argentine line westward to Cordoba, with connections at Villa María for Mendoza and the Chilean frontier, and two narrow-gauge lines, one running to Santa Fé and the other to Cordoba. The port of Rosario has hitherto consisted of a deep river anchorage and wooden wharves on the lower bank for the accommodation of steamers. Since 1902 work has been in progress under a contract with a French company for the construction of 12,657 ft. of quays, 23 m. of railway tracks along the quays to connect with the several railways entering the city, driveways, roadways, sheds, depots, elevator, offices, electric plant, fixed and movable cranes, and other appliances, &c., for the handling of produce and merchandise. The trade of the port was officially valued at 21,736,672 Arg. gold dollars imports, and 68,503,231 gold dollars exports in 1905.

Rosario was founded in 1730 by Francisco Godoy, but it grew so slowly that it was still a small village up to the middle of the 19th century. In 1854 General Justo José de Urquiza, then at the head of the Argentine Confederation, made the port a city, and the ten inland provinces then at war with Buenos Aires, and in 1857 imposed differential duties on the cargoes of vessels first breaking bulk at the southern port. This gave Rosario a start, and its trade and population have grown since then with great rapidity.

ROSARY (Lat. rosarium), a popular devotion of the Roman Catholic Church, consisting of 15 Paternosters and Glorias and 150 Aves, recited on beads. It is divided into three parts, each containing five decades, a decade comprising 1 Pater, 10 Aves and a Gloria, in addition to a subject for meditation selected from the “mysteries” of the life of Christ and of the Blessed Virgin. The Christian practice of repeating prayers is traceable to early times: Sozomen mentions (H.E. v. 29) the hermit Paul of the 4th century who threw away a pebble as he recited each of his 300 daily prayers; and a canon of the English synod of Cæcilythe in 816 (Mansi xiv. 360) directed septem belitium Paternoster to be said for a deceased bishop. In many orders the lay brothers daily said a large number of Paternosters instead of reading the breviary; it was natural that the Paternoster should be the prayer most commonly repeated. The Ave Maria is first mentioned as a form of prayer in the second half of the 11th century, but it was not until the 16th century that it became general in its present form. It is not known precisely when the mechanical device of the rosary was first used. William of Malmesbury (De gest. pont. Angl. iv. 4) says that Godiva, who founded a religious house at Coventry in 1040, left a string of jewels, on which she had told her prayers, that it might be hung on the statue of the Blessed Virgin. Thomas of Chantimpré, who wrote about the middle of the 13th century, first mentions the word “rosary” (De aubias, i, 13), using it apparently in a mystical sense as Mary’s rose-garden. There is no contemporary confirmation of the story that the rosary was given to St Dominic through revelation of the Blessed Virgin and was employed during the crusade against the Albigenes, although the story was later accepted by Leo X., Pius V., Gregory XIII., Sixtus V., Alexander VII., Innocent XI. and Clement XI. According to Benedict XIV. (De Fest. 160), the belief rests on the tradition of the Dominican order. Whatever may have been the origin of the rosary, the Dominicans did much to propagate the devotion. The practice of meditating on the mysteries doubtless began with a Dominican, Ahunus de Rupe (born 1428), and another Dominican, Jacob Sprenger (d. 1455), grand-inquisitor in Germany, founded the first confraternity of the rosary at Cologne in 1475. This society spread rapidly, and was specially privileged by Sixtus IV., Innocent VIII. and Leo X. After the battle of Lepanto (1st Sunday in October 1571), which was won while the members of the confraternity at Rome were making supplication for Christian success, Pius V. ordered an annual commemoration of “St Mary of Victory,” and Gregory XIII., by bull of the 1st of April 1583, set aside the 1st Sunday in October as the feast of the Rosary of the Blessed Virgin Mary, to be observed in such churches as maintained an altar in honour of the rosary. Clement XI., by bull of the 3rd of October 1716, directed the observance of the feast by all Christendom. The devotion has been particularly fostered by the Jesuits, St Ignatius Loyola having expressly ordered its use. It has been repeatedly indulged by various popes. Leo XIII. issued eight encyclicals on the devotion; he urged its recitation throughout October, and directed (1883) the insertion of the title regina sacratissimi rosarii in the Litany. There are several varieties of the rosary more or less in use by Roman Catholics: the Passionists, or rosary of the five wounds, approved by Leo XII. in 1823; the Crown of Our Lord, attributed to Michael of Florence, a Camaldolese monk (c. 1140); and consisting of 33 Paters, 5 Aves and a Credo; St Bridget’s 7 Pater rosary selection dedicated in honour of the joys and sorrows of the Blessed Virgin and the 63 years of her life. The Living Rosary, in which 15 persons unite to say the rosary every month, was approved by Gregory XVI. (1832) and placed in charge of the Dominican order by Pius IX. (1877).

Similar expedients to assist the memory in repetitions of prayers occur among Buddhists and Mahommedans: in the former case the prayers are said on a string of some hundred beads, called the tibet-prem-ba or the ten-wa; in the latter case,
the so-called lasbik has 33, 66 or 99 beads, and is used for the repetition of the 99 names which express the attributes of God.

(C. H. A.)

ROSAS, JUAN MANUEL (1793-1877), tyrant of Buenos Aires, was born on the 30th of March, 1793, in the city of that name. His father, Leon Ortiz de Rosas, was an owner of cattle runs (estancias) and a trader in hides, who took an active part initiating the English attack on the city in 1807. Juan Rosas received so little education that he had to learn to read and write when he was already a married man and a successful cattle breeder. From a very early age he was left in charge of one of his father's establishments. When he was eighteen he married Maria de la Encarnacion Escurra. His mother having suspected him of appropriating money, he left his parents, and for some time subsisted by working as a vaquero or cowboy, and then as overseer on the estates of other owners; but he accumulated money, and by the help of a loan from a friend he became possessed of a cattle run of his own, Los Cerrillos. The anarchical state of the country since its independence of Spain had favoured the Indians, who had taken the offensive and raided up to within forty miles of Buenos Aires. Rosas obtained leave to arm his cowboys. Under his management Los Cerrillos became a refuge for adventurers, whom he paid and fed, but from whom he exacted implicit obedience. His followers became a fighting force of acknowledged efficiency, and Rosas took practically the position of an independent ruler whose help was sought by contending political parties. By attending to his own interest only, and by astute intrigue, or savage fighting when necessary, he grew in power from 1829 onwards, and from 1832 to 1852 ruled as dictator (see ARGENTINA). It is probable that he would have continued to govern in Buenos Aires till his death if his ambition had not led him into wars with all his neighbours. He wished to extend the authority of the Republic over all the territory which had belonged to the Spanish viceroyalty of Buenos Aires. This led him directly into wars with Uruguay, Paraguay and Chile, and into "warlike operations" with England and France, with whom he had other causes of quarrel arising out of the complaints of traders and bondholders. His government was overthrown in 1852 by a coalition of his neighbours and the defection of several of his generals, and even members of his own family who lived in fear of his suspicions and violence. He took refuge in England, and lived at Swathing, near Southampton, till his death on the 14th of March 1877. A portrait taken in 1854 and reproduced by Sir Woodbine Parish in his *Buenos Ayres and Provinces of the Rio de la Plata* (London, 1854) represents Rosas as a fine-looking man of the handsome Spanish type.

ROSCELINUS (RCELINUS, or ROSSELIN) (c. 1050-c. 1123), also known as Roscelinus of Provence (see SCHOLASTICISM), was born at Compiégne (Compiégne-sur-Oise, Oise, France). Little is known of his life, and our knowledge of his doctrines is mainly derived from Anselm, Abelard and John of Salisbury. He studied at Soissons and Reims, was afterwards attached to the cathedral of Chartres, and became canon of Compiégne. It seems most probable that Roscelinus was not strictly the first to promulgate nominalistic doctrines; but in his exposition they received more definite expression, and, being applied to the dogma of the Trinity, attracted universal attention. Roscelinus maintained that it is merely a habit of speech which prevents our speaking of the three persons as three substances or three Gods. If it were otherwise, and the three persons were really one substance or thing (unites), we should be forced to admit that the Father and the Holy Spirit became incarnate along with the Son.

Roscellinus seems to have put forward this doctrine in perfect good faith, and to have claimed for it at first the authority of Lanfranc and Anselm. In 1092, however, a council convoked by the archbishop of Reims condemned his interpretation, and Roscellinus, who was in danger of being stoned to death by the orthodox populace, recanted his error. He fled to England, but having made himself unpopular by an attack on the doctrines of Anselm, he left the country and repaired to Rome, where he was well received and became reconciled to the Church. He then returned to France, taught at Tours and Lechelles (Loches), and became Archdeacon of Paris as a pupil, and finally became canon of Besançon. He is heard of as late as 1121, when he came forward to oppose Abelard's views on the Trinity.

Of the writings of Roscellinus, nothing is preserved except a letter to Abelard, mainly concerned with the doctrine of the Trinity (ed. J. A. Schmeller, Munich, 1900). See P. F. Karsen, *Roscellin, philosophus et theologus* (1896), and authorities quoted under SCHOLASTICISM.

ROSCHER, WILHELM GEORG FRIEDRICH (1817-1894), German economist, was born at Hanover on the 21st of October 1817. He studied at Göttingen and Berlin, and obtained a professorship at Göttingen in 1844 and subsequently at Leipzig in 1848. Omitting preparatory indications and undeveloped germns of doctrine, the origin of the "historical" school of political economy may be traced to Roscher. Its fundamental principles are dated, though with some hesitation, and with an unfortunate contrast of the historical with the philosophical method, in his *Grundrisse zu Vorlesungen über die Staatswirthschaft nach geschichtlicher Methode* (1843). This short study was afterwards expanded into his great *System der Volkswirthschaft*, published in five volumes between 1854 and 1894, and arranged as follows: vol. i., *Die Grundlagen der Nationalökonomie*, 1854 (trans. by J. J. Laker, *Principles of Political Economy*, Chicago, 1878); vol. ii., *Die Nationalökonomie des Ackerbaues und der verwandten Utoproduktionszweige*, 1859; vol. iii., *Die Nationalökonomie des Handels und Gewerbsfleisses*, 1861; vol. iv., *System der Finanzwissenschaft*, 1886; vol. v., *Dissertation über Armerelation und Nationalökonomie der Nationalökonomie in Deutschland* (1874) is a monumental work. He also published in 1842 an excellent commentary on the life and works of Thucydides. He died at Leipzig on the 4th of June 1894.

See T. Roscher, *Zur Geschichte der Familie Roscher in Niedersachsen* (Hanover, 1892); Brasch, Wilhelm Roscher and die sozial- wissenschaftlichen Strömungen in der Gegenwart (Leipzig, 1923).

ROSCUS GALLUS, QUINTUS (c. 120-62 B.C.), Roman actor, was born, a slave, at Solonium, near Lanuvium. Endowed with a handsome face and manly figure, he studied the delivery and gestures of the most distinguished advocates in the Forum, especially Q. Hortensius, and won universal praise for his grace and elegance on the stage. He especially excelled in comedy. Cicero took lessons from him. The two often engaged in friendly rivalry to try whether the orator or the actor could express a thought or emotion with the greater effect, and Roscus wrote a treatise in which he compared acting and oratory. Q. Lutatius Catulus composed a quatrain in his honour, and the dictator Sulla presented him with a gold ring, the badge of the equestrian order, a remarkable distinction for an actor in Rome, where the profession was held in contempt. Like his contemporary Aesopus, Roscii amassed a large fortune, and he appears to have retired from the stage some time before his death. In 76 B.C. he was sued by C. Fannius Chareea for 50,000 sesterces (about £400), and was defended by Cicero in a famous speech.

ROSCOE, SIR HENRY ENFIELD (1833-?), English chemist, was born in London on the 7th of January 1833. After
studying at Liverpool High School and University College, London, he went to Heidelberg to work under R. W. Bunsen, of whom he became a lifelong friend. In 1837 he was appointed to the chair of chemistry at Owens College, Manchester, where he remained for thirty years, and from 1885 to 1895 he was M.P. for the south division of Manchester. He served several royal commissions appointed to consider educational questions, in 1850 while he was keenly interested, and from 1896 to 1902 was vice-chancellor of London University. He was knighted in 1884. His scientific work includes a memorable series of researches carried out with Bunsen between 1855 and 1861, in which they laid the foundations of comparative photochemistry. In 1867 he began an elaborate investigation of vanadium and its compounds, and devised a process for preparing it puré in the metallic state, at the same time showing that the substance which had previously passed for the metal was contaminated with oxygen and nitrogen. He was also the author of researches on niobium, tungsten, uranium, perchloric acid, the solubility of amaranth, &c. His publications include, besides several elementary books on chemistry which have had a wide circulation and been translated into many foreign languages, Lectures on Spectrum Analysis (1869); a Treatise on Chemistry (the first edition of which appeared in 1871-1872); A New View of Dalton's Atomic Theory, with Dr A. Harden (1869); and an Autobiography (1906). The Treatise on Chemistry, written in collaboration with Carl Schorlemmer (1834-1892), who was appointed his private assistant at Manchester in 1859, official assistant in the laboratory in 1861, and professor of organic chemistry in 1874, is a standard work.

ROSCE, WILLIAM (1753-1831), English historian and miscellaneous writer, was born on the 8th of March 1753 at Liverpool, where his father, who was a market gardener, kept a publichouse known as the Bowling Green at Mount Pleasant. Roscoe was eager in the acquisition of knowledge, and at twelve he left school, having learned all that his schoolmaster could teach. He now assisted his father in the work of the garden, and gave his leisure hours to reading and study. “This mode of life,” he says, “gave health and vigour to my body, and amusement and instruction to my mind; and to this day I wear with the delicious sleep which succeeded my labours, from which I was again called at an early hour. If I were now asked whom I consider to be the happiest of the human race, I should answer, those who cultivate the earth by their own hands.” At fifteen it was necessary to decide upon a path in life. A month’s trial of book-selling sufficed to disgust him, and in 1769 he was articled to a solicitor. Although a diligent student of law, he did not bid farewell to the Muses, but continued to read the classics, and made that acquaintance with the language and literature of Italy which became the instrument of his distinction in after life. He wrote many verses; his Mount Pleasant was composed when he was sixteen, and this and other verses, though now forgotten, won the esteem of good critics. In 1774 he commenced business as an attorney, and as soon as his professional gains warranted he married (1781) Jane, second daughter of William Griffies, a Liverpool tradesman, and had seven sons and three daughters. He had the courage to denounce the African slave trade in his native town, where not a little of the wealth came from this source. He wrote the Wrongs of Africa (1787-1788), and entered into a controversy with an ex-Roman Catholic priest, who undertook to prove the “licitness of the slave trade” from the Bible. Roscoe was also a political pamphleteer, and like many other Radicals of the day hailed the promise of liberty in the French Revolution.

Meanwhile he had steadily pursued his Italian studies, and had made extensive collections relating to the great ruler of Florence. The result was his Life of Lorenzo de’ Medici, which appeared in 1796, and at once placed him in the front rank of contemporary historians. The work has often been reprinted, and translations in French, German and other languages show that its popularity was not confined to its author’s native land. Perhaps the most gratifying testimony was that of Fabroni, who had intended to translate his own Latin life of Lorenzo, but abandoned the design and induced Gaetano Mecherini to undertake an Italian version of Roscoe. In 1796 Roscoe gave up practice as an attorney, and had some thought of going to the bar, but relinquished the idea after keeping a single term. Between 1793 and 1800 he paid much attention to agriculture, and helped to reclaim Chat Moss, near Manchester. He also succeeded in restoring to good order the affairs of a banking house in which his friend William Clark, then resident in Italy, was a partner. This task led to his introduction to the business, which eventually proved disastrous. His translation of Tansillo’s Nurse appeared in 1798, and went through several editions. It is dedicated in a sonnet to his wife, who had practised the precepts of the Italian poet.

The Life and Pontificate of Leo the Tenth appeared in 1805, and was a natural sequel to that by which he had made his reputation. The work, whilst it maintained its author’s fame, did not, on the whole, meet with so favourable a reception as the Life of Lorenzo. It has been frequently reprinted, and the insertion of the Italian translation in the Index did not prevent its circulation even in the papal states. Roscoe was elected member of parliament for Liverpool in 1806, but the House of Commons was not a congenial place, and at the dissolution in the following year he declined to be again a candidate. The commercial troubles of 1816 brought into difficulties the banking house with which he was connected, and forced the sale of his collection of books and pictures. It was on this occasion that he wrote the fine “Sonnet on Parting with his Books.”

In 1818, the year of Spiker’s Travels through England, &c., 1816. After a five years’ struggle to discharge the liabilities of the bank, the action of a small number of creditors forced the partners into bankruptcy in 1820. For a time Roscoe was in danger of arrest, but ultimately he received honourable discharge. On the disposal of his library, the volumes most useful to him were secured by friends and placed in the Liverpool Athenaeum. The sum of £2500 was also invested for his benefit. The independent and sensitive nature of Roscoe made both these operations difficult. Having now resigned commercial pursuits entirely, he found a pleasant task in the arrangement of the great library at Holkham, the property of his friend Coke. In 1822 he issued an appendix of illustrations to his Lorenzo and also a Memoir of Richard Robert Jones of Aberdaron, a remarkable self-taught linguist. The year 1824 was memorable for the death of his wife and the publication of his edition of the works of Pope, which involved him in a controversy with Bowles. His versatility was shown by the appearance of a folio monograph on the Monandric Plants, which was published in 1828. It appeared first in numbers, and the last part came out after his recovery from a paralytic attack. He died on the 30th of June 1837.

Roscoe’s character was a fine one. Under circumstances uncongenial and discouraging he steadfastly maintained the ideal of the intellectual life. Sensitive and conscientious, he sacrificed his possessions to a punitious sense of duty. He had the courage of unpopular opinions, and, whilst promoting every good object in his native town, did not hesitate to speak out where plain dealing, as in the matter of slavery, was required. He was a sincere friend and exemplary in his domestic relations. Poesy is not likely to endorse the estimate of Horace Walpole of Roscoe as “the best of our historians,” but in spite of newer lights and of some changes of fashion in the world of letters, his books on Lorenzo de’ Medici and Leo X. remain important contributions to historical literature.

In addition to the writings already named, Roscoe wrote tracts on penal jurisprudence, and contributed to the Transactions of the Royal Society of Literature and of the Linnean Society. The first collected edition of his Poetical Works was published in 1857, and
is sadly incomplete, omitting, with other verses known to be from his pen, "a fair, a fantasy, which has charmed thousands of children since it appeared in 1897. Other verses are in Poems for Youth, by a Family Circle (1820).

The Life by his son Henry Roscoe (2 vols., London, 1833) contains full details of Roscoe's career, and there are references to him in the Autobiographical Sketches of De Quincey, and in Washington Irving's Sketch Book.

W. E. A.

ROSCOFF, a maritime town and water-place of north-western France, in the department of Finistère, on the English Channel, 173 m. N.N.W. of Morlaix by rail. Pop. (1896) town, 1984; commune, 2545. Roscoff, separated from the Ile de Batz by a narrow channel, has a tidal port used by fishing and coasting vessels. Many of the inhabitants are engaged in the cultivation of early vegetables, to the growth of which the mild climate and fertile soil are eminently favourable. The church of Roscoff (16th century) has a fine Renaissance tower and contains interesting alabaster bas-reliefs. The ruined chapel of St Ninian commemorates the landing at Roscoff in 1548 of Mary Stuart, previous to her betrothal with the dauphin, son of Henry II. In 1746 Charles Edward, the young Pretender, landed at the port after his defeat at Culloden.

ROSCOMMON, WENTWORTH DILLON, 4th Earl of (c. 1650–1685), English poet, was born in Ireland about 1630. He was a nephew of Thomas Wentworth, earl of Strafford, and was educated partly under a tutor at his uncle's seat in Yorkshire, partly at Caen in Normandy and partly at Rome. After the Restoration he returned to England, and was well received at court. In 1649 he had succeeded to the earldom of Roscommon, which had been created in 1622 for his great-grandfather, James Dillon; and he was now put in possession by act of parliament of all the lands possessed by his family before the Civil War. As captain of the Gentleman Pensioners he found abundant opportunity to indulge the love of gambling, which appears to have been his only vice. Disputes with the Lord Privy Seal about his Irish estates necessitated his presence in Ireland, where he gave proof of some business capacity. On his return to London he was made master of the horse to the duchess of York. He was twice married, in 1662 to Lady Frances Boyle, widow of Colonel Francis Courtenay, and in 1674 to Isabella Boynton.

His reputation as a didactic writer and critic rests on his blank verse translation of the Ars Poetica (1688) and his Essay on Poetry (1684). This essay contained the first definite enunciation of the principles of "poetic diction," which were to be fully developed in the reign of Queen Anne. Roscomon, who was fastidious in his notions of "dignified writing," was himself a very correct writer, and quite free from the indecencies of his contemporaries. Alexander Pope, who seems to have learnt something from his carefully balanced phrases and the regular cadence of his verse, says that "In all Charles's days, Roscomon only boasts unspotted bays." He saw clearly that a low code of morals was necessarily followed by a corresponding degradation in literature, and he insists that sincerity and sympathy with the subject in hand are essential qualities in the poet. This elevated conception of his art is in itself no small merit. He has, moreover, the distinction of having been the first critic to avow his admiration for Paradise Lost. Roscomon formed a small literary society which he hoped to develop into an academy with authority to formulate rules on language and style, but its influence only extended to a limited circle, and the scheme fell through after its promoter's death. He was buried in Westminster Abbey on the 23th of January 1685.

The title passed to his uncle, Carey Dillon (1627–1689). In 1736, on the death of James, the 8th earl, it passed to Robert Dillon (d. 1770), a descendant of the 1st earl. His family became extinct in 1816, and in 1825 Michael James Robert Dillon, another descendant of the 1st earl, established his title to the earldom before the House of Lords. When he died in May 1850 it became extinct.

His works were collected and translated, and are included in Anderson's and other collections of the British poets. He also translated from the English of Dr W. Sherlock, Traditum touchant l'obéissance passive (1686).

ROSCOMMON, a county of Ireland in the province of Connaught, bounded N.E. by Leitrim, N.W. by Sligo, W. by Mayo, S.W. by Galway, E. by Longford and F. S. by Westmeath and King's County. The area is 620,613 acres, or about 985 sq. m. The greater part of the county belongs to the great limestone plain of central Ireland, and is either flat or very slightly undulating. In the north-east, on the Leitrim border, the Braulieve Mountains, consisting of rugged and precipitous ridges with flattened summits, attain an elevation in Cashel Mountain of 1327 ft.; and in the north-west the Curlew Mountains, of similar formation, between Roscommon and Sligo, rise abruptly to a height over 800 ft. In the east the Slieve-bawn range, formed of sandstone, have a similar elevation. The Shannon with its expansions forms nearly the whole eastern boundary of the county. The waters from its forms for over 50 m. the boundary with Galway till it unites with the Shannon at Shannon Bridge. The other tributaries of the Shannon within the county are the Arigna, the Feorish and the Boyle. The lakes formed by expansions of the Shannon on the borders of Co. Roscommon are Loughs Allen, Boderg, Boffin, Forbes and Ree. Of the numerous other lakes within the county the most important are Lough Key in the north, very picturesquely situated with finely wooded banks, and Lough Gara (mostly in Co. Sligo) in the north-west.

In this long county one may travel fifty miles across the Carboniferous Limestone plain, with the grey rock cropping out here and there, and long grass-covered esker-ridges forming the only obstacle to the roads. Lough Ree is a typical lake of the plain. Two inlets of Silurian rocks have been thrust up, forming hills between Lough Ree and Lough Boffin. At Boyle, however, higher Old Red Sandstone country is encountered, and farther north the Millstone Grit and Coal-Measure series cap the mountains almost horizontally at Arigna near Lough Allen. The nodules of clay-ironstone here were formerly smelted, and the seams of bituminous coal, mostly on Millstone Grit horizons, are worked successfully on a high level of the mountains.

The subsoil is principally limestone, but there is some light, sandy soil in the south. In the level parts the land when drained and properly cultivated is very fertile, especially in the district known as the plains of Boyle, which includes some of the richest grazing land in Ireland. Along the banks of the Suck and Shannon there is, however, a large extent of bog and marsh. The proportion of tillage to pasture is roughly as one to three. Oats and potatoes are the principal crops, but the acreage devoted to them decreases; the numbers of cattle, sheep, pigs, goats and poultry, on the other hand, are proportionately large and increasing. Communications are afforded by the Midland Great Western railway, the Sligo line of that system crossing the northern part of the county by Boyle, the Athlone and Mayo line passing from S.E. to N.W. by the towns of Roscommon and Castlerea, and the Athlone and Galway line crossing the southern part.

The population was 116,552 in 1891, and 101,701 in 1901; 97% are Roman Catholics, and nearly the whole population is rural. The chief towns are Boyle, Roscommon, Elphin and Castlerea; and a small portion of Carrick-on-Shannon, including the railway station, is in this county, the major portion being in Co. Leitrim. The county is divided into ten baronies. Ecclesiastically it belongs to the Protestant dioceses of Elphin and Ardagh (united with Kilmore and Tuam), and to the Roman Catholic dioceses of Tuam, Clonfert, Achonry, Elphin and Ardagh. Assizes are held at Roscommon and quarter sessions at Boyle, Strokestown and Roscommon. The county returns two members to parliament. To the Irish parliament before the Union of 1800 two members were returned for the county, and two each for the boroughs of Boyle, Roscommon and Tullsk.

The district was granted by Henry III. to Richard de Burgo, but remained almost wholly in the possession of the native septs. Until the time of Elizabeth Connaught was included in the two districts of Roscommon and Clare, but in 1570 it
was further subdivided by Sir Henry Sydney, and was assigned its present limits. All the old proprietors were dispossessed at the Cromwellian settlement, except the O'Conor family headed by the O'Conor Don. The most interesting antiquarian remains within the county are the ruins of Crogan, the ancient palace of the kings of Connaught. The principal ancient castles are the old stronghold of the M'Dermotts on Castle Island, Lough Key, the dismantled castle of the M'Donoughs at Ballinafad, and the extensive fortress at Roscommon rebuilt by John d'Ufford, justiciary of Ireland in 1628. There are fragments of a round tower at Oran. The abbey of Boyle is in remarkably good preservation, and exhibits fine specimens of the Norman arch. The other monastic remains within the county, with the exception of the abbey of Roscommon, are in a comparatively small degree of importance.

The Irish bard Carolan, who died in 1738, is buried by the ruined church of Kilronan, in the extreme north of the county. The bishopric of Elphin was united with Kilmore and Ardagh in 1833, and the former cathedral and episcopal buildings are largely modernized.

**ROSCOMMON**, a market town and the county town of Co. Roscommon, Ireland, situated on rising ground in a bare plain in the centre of the county, on the Mayo line of the Midland Great Western railway, 182 m. N.W. by N. from Athlone. Pop. (1901) 1591. It contains the county buildings, and has Protestant and Roman Catholic churches, the latter of which is a fine building completed in 1903. An extensive trade is carried on in agricultural produce and live stock. A castle, dating from 1268, when it was founded by John d'Ufford, justiciary of Ireland, stands, an imposing mass of ruins, but far gone in decay, overlooking the plain. It fell to besiegers in 1566, 1642 and 1652, and was partially burned after the battle of Aughrim in 1691. There are also remains of a Dominican priory of the middle of the 13th century, founded by Felim O'Conor, king of Connaught, and exhibiting fine, though mutilated, details of the style of that period. The name of the town, signifying the hill of the stone, was probably derived from the fact that here was founded the monastery of Canons Regular here in the 6th century. The town received charters from Edward I. and James I. Two m. N.E., are small remains of the abbey of Deernane.

**ROSCREA**, a market town near the north-western border of Co. Tipperary, Ireland, pleasantly situated on undulating ground connecting the Devil's Bit and the Slieve Bloom mountains. Pop. (1901) 3235. It is 77 m. W.S.W. from Dublin on the Ballybrophy and Limerick branch of the Great Southern & Western railway. A branch line runs northward to Birr or Parsonstown. Flour-milling and tanning are industries, and monthly cattle fairs are held. There is a branch here of the Trappist Monastery of Mount Melleray in Co. Waterford. The antiquarian remains are of interest. These include portions of an Augustinian abbey, founded by St Cronan, early in the 7th century, which are incorporated into the church. Out of this abbey a diocese grew, to be united with that of Killaloe in the 12th century. Here also was produced the Book of Dimma, consisting of the gospels and accompanied by a brazen shrine, ornamented with silver and tracery, and preserved in the library of Trinity College, Dublin. A cross and a shrine of St Cronan are in the churchyard. There are also a round tower, 80 ft. in height, but lacking the upper storeys, and a Franciscan friary (1490); while a circular tower, and a square keep (occupied as barracks), mark strongholds, the one built by King John and the other by the Ormonds, and testify to the former importance of the town, which was doubtless accentuated by its physical position in a passway between the neighbouring mountain ranges. Leap Castle, about 4 m. N., is another fortified mansion, which is still inhabited.

**ROSE**, the name of a distinguished family of German chemists.

**Valentine Rose** the elder was born on the 16th of August 1736 at Neu-Ruppin, and died on the 28th of April 1771 at Berlin, where he was an apothecary and for a short time before his death assessor of the Ober Collegium Medicum. He was the discoverer of "Rose's fusible metal" (see Fusible Metal). His son, **Valentine Rose** the younger, born on the 31st of October 1762 at Berlin, was also an apothecary in that city and assessor of the Ober Collegium Medicum from 1797. It was he who, in 1799, proved that sulphuric ether contains no sulphur. He died in Berlin on the 10th of August 1807, leaving four sons, one of whom, Heinrich, was a distinguished chemist, and another, **Gustav**, a crystallographer and mineralogist. **Heinrich Rose**, born at Berlin on the 6th of August 1795, began to learn pharmacy in Danzig, where, during the siege of 1807, he nearly lost his life from typhus. Like his brother he served in the campaign of 1815. During the summer of the following year he studied at Berlin under M. H. Klaproth, a devoted friend of the family, and in the autumn entered a pharmacy at Mitau. In 1819 he went to Stockholm, where he spent a year and a half. In 1821 he returned to Danzig, and there he died on the 27th of January 1864. He devoted himself especially to inorganic chemistry and the development of analytical methods, and the results of his work are summed up in the successive issues of his classical work, Ausführliches Handbuch der analytischen Chemie, of which he published the first edition at Berlin in 1829, and the sixth, practically a new work in French, at Paris in 1861. He was the discoverer of antimony pentachloride, and mention may also be made of his researches on the influence of the mass-action of water in many reactions, carried out before the investigations of Guldberg and Waage in 1867. **Gustav Rose**, born at Berlin on the 18th of March 1798, began his career as a mining engineer, but soon turned his attention to theoretical studies. A pupil of Berzelius like his brother, he graduated in 1820 at Berlin University where he became successively Privatdozent (1823), extraordinary professor of mineralogy (1826) and ordinary professor (1839). In 1836 he succeeded to the directorship of the Royal Mineralogical Museum at Berlin, and he helped to found the German Geological Society, returned to his former position at the highest at the end of his life. He made many journeys in different parts of Europe for the sake of mineralogical study, and in 1829 with A. von Humboldt and C. G. Ehrenberg (1795-1876), professor of medicine at Berlin, took part in an expedition to the Ural and Altai mountains and the Caspian Sea, which yielded information of primary importance concerning the mineralogy of the Russian Empire. His work covered every branch of mineralogy, including crystallography and the artificial formation of minerals. The science of petrography, according to Gerhard vom Rath, originated with him. He was the first in his own country to use the reflector goniometer for the measurement of the angles of crystals, and to teach the method of obtaining reflected microscope sections. He also devoted special attention to meteorites and to the problem presented by the different structure of the stony matter in them and in the crust of the earth, and just before his death, which took place at Berlin on the 15th of July 1873, he was engaged in investigating the formation of the diamond. In addition to many scientific memoirs he published Elemente der Krystallographie (1830); Mineralogiegogographische Reise nach dem Ural, dem Altai und dem Kaspiise Meer (1837) vol. I.; (1842) vol. II.; Das Krystallo-chemische Mineralysystem (1852); and Beschreibung und Eintheilung der Meteoriten (1863).

**ROSE, GEORGE** (1744-1818), British politician, was born on the 17th of June 1744, and was educated at Westminster school, afterwards entering the navy, a service which he left in 1762 after he had taken part in some fighting in the West Indies. He then obtained a position in the Civil Service, becoming joint keeper of the records in 1772 and secretary to the board of taxes in 1777. In 1782 he gave up the latter appointment to become one of the secretaries to the treasury under Lord Shelburne, though he did not enter parliament. He left office with his colleagues in April 1783, but in the following December he read a bill forwarding the clauses of 1781 he graduated, being henceforward one of this minister's most steadfast supporters. He entered parliament as member for Launceston
ROSE, H. J.—ROSE

early in 1784, and his fidelity and friendship were rewarded by Pitt, who gave him a lucrative post in the court of exchequer; in 1788 he became clerk of the parliaments. In 1801 Rose left office with Pitt, but returned with him to power in 1804, when he was made vice-president of the committee on trade and joint paymaster-general. He resigned these offices a few days after Pitt's death in 1806, but he served as vice-president of the committee on trade and treasurer of the navy under the duke of Portland and Spencer Perceval from 1807 to 1812. He was again treasurer of the navy under Lord Liverpool, and he was still member of parliament for Christchurch, a seat which he had held since 1790, when he died at Cuffnells, in Hampshire, on the 13th of January 1818. Rose was an able and conscientious public servant, although he and his two sons drew a large amount of money from sinecures, a fact referred to by William Cobbett in his "A New Year's Gift to old George Rose." He wrote several works on economic subjects, and his Diaries and Correspondence, edited by the Rev. L. V. Harcourt, was published in 1860.

His elder son, Sir George Henry Rose (1771–1855), was in parliament from 1794 to 1813, and again from 1818 to 1844, and in the meantime he was British minister at Munich and at Berlin; in 1818 he succeeded his father as clerk of the parliaments. He was the father of Baron Strathnairn (q.v.). The second son was the poet William Stewart Rose (q.v.).

ROSE, HUGH JAMES (1795–1838), English divine, was born at Little Horsted in Sussex on the 4th of July 1795, and was educated at Uckfield school and Christ's College, Cambridge, where he graduated B.A. in 1817, but missed a fellowship. Taking orders, he was appointed to Buxted, Sussex, in 1819, and to the vicarage of Horsham in 1821. He had already attained some repute as a critic, which was enhanced when, after travelling in Germany, he delivered as select preacher at Cambridge, four addresses against rationalism, published in 1825 as The State of the Protestant Religion in Germany. The book was severely criticized in Germany, and in England by E. B. Pusey. In 1827 Rose was collated to the prebend of Midleton; in 1830 he accepted the rectory of Hadleigh, Suffolk, and in 1833 that of Fairasted, Essex, and in 1835 the perpetual curacy of St Thomas's, Southwark. In 1833–1834 he was professor of divinity at Durham, a post which ill-health forced him to resign. In 1836 he became editor of the Encyclopaedia Metropolitana, and he projected the New General Biographical Dictionary, a scheme carried through by his brother Henry John Rose (1800–1873). He was appointed principal of King's College, London, in October 1836, but he was attacked by influenza, and after two years of ill-health he died at Florence on the 22nd of December 1838. Rose was a high-churchman, who to propagate his views in 1832 founded the British Magazine and so came into touch with the leaders of the Oxford movement. Out of a conference at his rectory in Hadleigh came the Association of Friends of the Church, formed by R. H. Froude and Wm. Palmer.

ROSE, WILLIAM STEWART (1775–1843), English poet and translator, second son of George Rose (q.v.), was born in 1775. He was educated at Eton College, and in 1796 he went to parliament for the borough of Christchurch. In 1800 he accepted the Chiltern Hundreds on his appointment as reading clerk of the House of Lords and clerk of the private committees. His first work, A Naval History of the Late War, was undertaken at his father's wish, but he only completed one volume. He introduced a free version of the Amantia de Cain from the French text of Herberay des Essarts in 1803, followed by a translation of the Parténope de Blois (1807) after Le Grand d'Aussy. With Parténope he printed his ballad of the "Red King," and in 1810 appeared The Crusade of King Louis and King Edward the Martyr. In 1814 he made a prolonged journey through Italy and eastern Europe, spending the year 1817 at Venice, where he married a Venetian lady. The Court and Parliament of Bees, a translation of the Animale Parlanti of Casti, and Letters from the North of Italy, addressed to Henry Hallam, Esq., appeared in 1819. In the same year the publisher Murray offered him £200 for a translation of Ariosto (T. Moore, Diary, 14th of April 1810). He had already written an abridged version of the Armiament of Orlando Furioso of Boiardo, and had begun his Orlando Furioso translated into English Verse which appeared in two parts in 1833 and 1831. This, which has become the standard English version, is a close rendering in the oliva rima of the original. Rose retired from his official position in 1824. He suffered from paralysia in his later years, and at Abbotsford, where he was an honoured guest, rooms were specially fitted up on the ground floor for his use. His last works were An Epistle to the Right Honourable John Hookham Frere (1834), in verse, and a volume of Rhymes (1837) (see Quarterly Review, July 1836 and April 1837). He died on the 30th of April 1843.

ROSE, the naval term of art, for all ages been the favourite flower, and as such it has a place in general literature that no other plant can rival. In most cases the rose of the poets and the rose of the botanist are one and the same in kind, but popular usage has attached the name rose to a variety of plants whose kinship to the true plant no botanist would for a moment admit. In this place we shall employ the word in its strict botanical significance, and in commenting on it treat solely from the botanical point of view. The rose gives its name to the order Rosaceae, of which it may be considered the type. The genus consists of species varying in number, according to the diverse opinions of botanists of opposite schools, from thirty to three hundred; of these, fifty, at least, are hybrid, and the rest are various, and the latter are most hybrid, being derived from the many hundreds of rare garden varieties. While the lowest estimate is doubtless too low, the highest is enormously too large, but in any case the wide discrepancies above alluded to illustrate very forcibly the extreme variability of the plants, their adaptability to various conditions, and consequently their wide dispersion over the globe, the facility with which they are cultivated, and the readiness with which new varieties are continually being produced in gardens by the art of the hybridizer or the careful selection of the raiser. The species are natives of all parts of the northern hemisphere, but are scantily represented in the tropics unless at considerable elevations.

They are erect or climbing shrubs, never herbs or trees, generally more or less copiously pinnate, with bright or hooked prickles of various shapes and with glandular hairs, as in the sweet-brier or in the rose-rose of gardens. The prickles serve the purpose of enabling the shrub to sustain itself amid other vegetation. The surface of the leaves, which are alternate and fringed in the neighbourhood of the flower serve to arrest the progress of undesirable visiters, while the perfume emitted by the glands in question may co-operate with the fragrance and colour of the flower to attract the insect. The flowers are fleshy, the leaves are invariably alternate, provided with stipules, and unequally pinnate, the leaflets varying in number from one (as in R. simplicifolia or berberi folia) to 11 and even 15, the odd leaflet always being at the apex, the others in pairs. The flowers are solitary or in loose cymes (cluster-roses) produced on the ends of the shoots. The flower-stalk expands into a vase- or urn-shaped dilatation, called the receptacle or receptacular tube, which ultimately becomes fleshy and encloses in its cavity the numerous carpels or fruits. From the edge of the urn or "pipe" proceed five sepals, often more or less compound like the leaves and overlapping in the bud. The five petals are numerous, in general two to five in one line, with a very short stalk or none at all, and of very various shades of white, yellow or red. The very numerous stamens originate slightly above the sepals and petals; each has a slender filament and a small oval anther. The inner portion of the receptacular tube where the stamens spring is thick and fleshy, and is occasionally spoken of as the "disk"; but, in this case it does not represent any separate organ, it is better to avoid the use of the term. The carpels are variously numerous, usually in threes, attached to the receptacle, and each provided with a long style and button-like stigma. The carpels are concealed within the receptacular tube and only the stigmas as a rule protrude from its mouth. Each carpel contains one ovule. The ovule is a minute fruit. In the carpel, as previously mentioned, becomes fleshy and brightly coloured as an attraction to birds, which devour the hips and thus secure the dispersion of the seed. The dry one-seeded "seed" (achene) are densely packed inside the hip, and are covered with stiff hairs which cling to the bird's beak. The stigmas are in whorls, and, according to Payer, they originate in pairs one on each side of the base of
each petal so that there are ten in each row; a second row of ten alternates with the first, a third with the second, and so on. By repeated radial and tangential branching a vast number of stamens are ultimately produced, and when these stamens assume a petaloid aspect we have as a consequence the double flowers which are so much admired. The reason why it generally happens in the most double of roses that some few of the anthers are formed with pollen, the production of seed and the possibility of cross-breeding become intelligible. Under natural circumstances, rose flowers do not secrete honey, the attraction for insects being provided by the colour and perfume and the abundance of pollen for food. The stigmas and anthers come to maturity at the same time, and thus, while cross-fertilization by insect agency is doubtless most common, self-fertilization is not prevented.

The large number of species, subspecies, varieties and forms described as British may be included under about a dozen species. Among them may be mentioned R. spinosissima, the Scotch rose, much less variable than the others; R. rubiginosa (or R. eglanteria), the sweet-brier, represented by several varieties; R. canina, the dog rose (see fig.), including a beautiful and vigorous race of climbers has been produced. The Banksian rose is a Chinese climbing species, with small white or fawn-coloured flowers of great beauty, but rarely seen; the Gartschian rose (R. bracteata) is also of Chinese origin.

Its nearly evergreen deep green leaves and large white flowers are very striking. The Japanese R. rugosa is also a remarkable species, notable for its bold rugose foliage, its large white or pink flowers, and its conspicuous globular fruit. R. damascena is cultivated in some parts of the Balkans for the purpose of making attar of roses. In Germany the same variety of rose is used, while at Grasse a strain of the Provence rose is cultivated for the same purpose. In India R. damascena is grown largely near Ghazipur for the purpose of procuring attar of roses and rose water.

The rose is on the whole a most agreeable flower, but it is, as the following account shows, a capricious one, requiring much care and attention to make it flower well. Its requirements, however, are not very stringent; it is not one of those flowers that are eternal failures; the question is, do you want to succeed? If so, you must provide it with suitable conditions of soil and atmosphere. The rose is a plant that demands attention - it is too valuable to be neglected.

Dog Rose (Rosa canina) in flower and fruit (half natural size).
amount of correct pruning will improve a rose bush that has been sadly neglected in a quite untenable position.

Where dwarf beds of roses are required, a good plan is to peg down to within about 6 in. from the ground the strong one-year-old shoots from the root. In due time blossoms appear so that after the flowering period the strongest and most vigorous shoots are secured, while strong young shoots are thrown up from the centre, the plant being on its own roots. Before winter sets in, the old shoots which have thus flowered and exhausted themselves are cut down, and about 2 feet away from the old roots the young shoots are left.

The most troublesome fungoid pest of the rose is undoubtedly the black spot (Phragmidium cubi- tam). Both cultivated and wild roses are liable to be attacked by this fungus, and during the winter young shoots, leaves and flower-buds frequently become covered with a delicate white mycelium, which by means of the suckers it sends into the underlying cells robs its host of considerable amounts of food, and the leaves are therefore small and the shoots frequently formed, so that good plants make little growth, and plenty of strong wood for pegging down each succeeding season. The fungus is spread by spores produced by the fungus itself and by conidia, which are in turn spread by air currents, and the disease is rapidly spread. Later the mycelium increases and forms a thick velvety coating on the young shoots, and in the winter, at the lowest temperature, the fungus is produced in abundance; spraying with potassium sulphide (1 oz. to 2 to 3 gallons of water) is the best means of checking the spread of the disease. The rose rust (Puccinia luteola) is a much less serious trouble, but some species of wild roses are liable to be attacked by this fungus, and during the winter the fungus is produced. The leaves and shoots are first covered with a yellow powder, then the fungus appears as a dark brown spot, and finally, by means of spores produced by the fungus itself, the disease is spread. The treatment is the same as for black spot.

A very large number of insect pests are found upon the rose, but the pest most known and most formidable on account of their great powers of reproduction are the aphides. More than one species is found upon the rose, though Aphis rosae is the commonest. Their attack should be checked by the use of a spray made by boiling 4 oz. quassia chips for an hour or so in a gallon of soft water, straining off the solution and dissolving therein 4 oz. of soft soap while it is still warm, afterwards adding 1 or 2 gallons of soft water according to the weather. The rose leafhopper, or Aphis rosae, is a great trouble to rose growers, and it is well to see that the hedges are well spraying with the above mixture. In very warm weather the whole garden should be sprayed; any delay in dealing with the pest gives the opportunity for its increase, even a day being sufficient materially to augment their numbers.

The larvae of some of the Tortrix moths fold the leaves almost as soon as they are hatched out from the buds and, although considerable numbers of leaves are thus killed, the damage is not generally serious. The caterpillars of this moth are usually found feeding on the foliage. Many species of saw-fly larvae are also known to attack the rose, feeding either upon the leaves or upon the young shoots. These larvae are usually carefully searched for and destroyed whenever found. One of the leaf-cutting bees, Megachile, cuts pieces out of the leaves with which to line its nest, materially reducing their effective surface. The bees may be caught in a butterfly net or traced to their nests, which should be destroyed.

For further information see the late Dean Hole's Book about Roses (1894); Book of the Rose, by Rev. A. Foster (1863); Beautiful Roses for Garden and Greenhouse, by J. Weathers (1903); and Roses, their History, Development and Cultivation, by the Rev. J. H. Pemberton (1908).

ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5th Earl of (1847-1894), British statesman, born in London on the 7th of May 1847, was the grandson and successor to the title of Archibald John Primrose. 4th Earl of Rosebery (1783-1868), a representative peer of Scotland, who was in 1828 created a peer of the United Kingdom as Baron Rosebery, and was an active supporter of the Reform Bill. The Scottish earldom was first conferred in 1703 upon the 4th earl's son, Archibald Primrose of Dalmeny (1664-1723), a staunch Whig and a commissioner for the Union. The 5th earl's mother was Catherine Lucy Wilhelmina, only daughter of Philip Henry, 4th Earl Stanhope; she was thus a sister of Earl Stanhope, the historian, and a niece of Lady Hester Stanhope, who was the niece of William Pitt. A celebrated beauty, a maid of honour and bridesmaid of Queen Victoria, she married, on the 20th of December 1843, Archibald, Lord Dalmeny (1809-1851), member for the Stirling Burghs, who became a lord of the admiralty under Melbourne. After his death she became the wife of Harry George Vane, 4th duke of Cleveland, and died in 1878.

The young Lord Dalmeny was educated at Brighton and at Eton, where he had as slightly junior contemporaries Mr. A. J. Balfour and Lord Randolph Churchill. He was described by the most brilliant Eton tutor of his day, William Johnson Cory (author of Ionica), as a "portentously wise youth, not, however, deficient in fun." He added that Dalmeny "desired the palm without the dotum." In 1866 he matriculated at Christ Church, Oxford, but went down in 1868, by the request of the dean, rather than abandon the possession of a small racing stud. In the same year he succeeded to the earldom and to the family estates. In February 1871 he succeeded to the Address in the House of Lords; a more original effort followed in November 1871, when he delivered a remarkable essay on the Union of Scotland and England at the Edinburgh Philosophical Institution. Three years later he was elected president of the Social Science Congress at Glasgow, where, on the 30th of September, he gave a striking address upon the discovery of means for raising the condition of the working class as the true leverage of empire. In the meantime he travelled in the south of Europe and in North America. On his return he acquired an English country house called The Durdens, Epsom, which he largely rebuilt and adorned with some of the finest portfolios of George Stubbs. Following the example of Prince Albert, as he declared, of Oliver Cromwell (for whom he showed an admiration in other respects—culminating in 1900 in the erection of a statue outside Westminster Hall, which was not appreciated either by the Irish Nationalist party or by others among his political associates), he took a pride in owning racehorses, and afterwards won the Derby three times, in 1894, 1895 and 1905.

He was the first man to enjoy the distinction of winning the Derby while prime minister; but though this was popular enough among many classes, it did not please the Liberal nonconformists so much, who considered a racehorse a mere gambling-machine. On the 20th of March 1875 Lord Rosebery married Hannah, only child of Baron Meyer Amschel de Rothschild, of Mentmore, Bucks. The newly married couple took a lease of Lansdowne House, which for several years was a salon for the Liberal party and a centre of hospitality for a much wider circle.

Though impeded in his political career by his exclusion from the House of Commons, Lord Rosebery's reputation as a social reformer and orator was steadily growing. In 1878 he was elected Lord Rector of Aberdeen and in 1880 of Edinburgh University, where he gave an eloquent address upon Patriotism. In 1880 he entertained Mr Gladstone at Dalmeny, and during the "Mid Llothian campaign" he had much to do with the stage-management of the demonstrations. As was shown later, he imported into his view of politics a warm sentiment and an imaginative outlook; and he was an enthusiastic student of Lord Beaconsfield's political novels, more particularly of Sybil, after the heroine in which he named one of his daughters. In August 1881 he became under-secretary at the Home Office, his immediate chief being Sir William Harcourt. His work was practically confined to the direction of the Scottish department of the Office. A clamour was nevertheless raised in regard to the incompatibility of the under-secretaryship with a position in the House of Lords, and Lord Rosebery resigned the post in June 1883. He and his wife utilized the interval to make a trip round the world, and they were received with much warmly in Australia, and returning by way of India. At the close of 1884, he resumed office as first commissioner of works with a seat in the cabinet, and his adherence carried with it a distinct accession of strength to the Liberal ministry, which was much discredited by the tragedy attached to the fate of Gordon. The attitude of the government on the Afghan question and generally in regard to Russia was held by many to have been perceptibly stiffened owing to Lord Rosebery's influence.
In June 1885 the Liberal administration broke up, but Lord Salisbury's ministry, which succeeded, was beaten early in February 1886, and when Mr Gladstone adopted Home Rule, Lord Rosebery threw in his lot with the old leader, and was made secretary of state for foreign affairs during the brief Liberal ministry which followed. He rather distinguished himself in the Lucia Bay negotiations then being carried on with Germany. If Busch is to be believed, Prince Bismarck's view was that Lord Rosebery had "quite mesmerized" Count Herbert Bismarck; and the latter, from his father's standpoint, conceded too much to Lord Rosebery, who proved himself to be, in Bismarck's language, "very sharp." His views on foreign policy differed materially from those of Granville and Gladstone. His mind was dwelling constantly upon the political legacy of the two Pitts; he was a reader of history. After Viscount Seely he opposed the retention of the frontiers of the old empire, and predicted that a war would not be, as was commonly said, disintegrate the empire, but rather the reverse; had magnified the importance of taking colonial opinion; and had always been a convinced advocate of some form of Imperial Federation. He was already taunted with being an Imperialist, but his independent attitude won public approval. Cambridge gave him the degree of L.L.D. in 1888; in January 1889 he was elected a member of the first county council of London, and on the 12th of February he was elected chairman of that body by 104 votes to 17. The tact, aspidity and dignity with which he guided the deliberations of the council made him exceedingly popular with its members. In the spring of 1890 he presided over the Co-operative Congress, but with a view to the impending political campaign he found it necessary to resign the chairmanship of the county council in June. In November of this year, however, Lady Rosebery died, and he withdrew for a period from public business. In 1891 he made some brief continental visits, one to Madrid, and in October he saw through the press his little monograph upon William Pitt, in the Twelve English Statesmen Series, of which it may be said that it competes in interest with Viscount Morley's Waterloo. In January 1891, upon a new election, he again for a few months became chairman of the county council. It was already recognized that in him the country possessed not only a public man of exceptionally attractive personality, but one whose literary tastes were combined with a gift for expression which was at once original and fluent. In October the Garter was conferred upon him by Queen Victoria.

Meanwhile, in August, upon the return of Gladstone to power, he was induced with some difficulty (for he was suffering at the time from insomnia) to resume his position as foreign minister. His acceptance was construed as a security against the suspension of weakness abroad which the Liberal party had incurred by their foreign policy during the 'eighties. He strongly opposed the evacuation of Egypt; he insisted upon the exclusive control by Great Britain of the Upper Nile Valley, and also upon the retention of Uganda. In 1893 the question of Siam came near to causing serious trouble with France, but by the exercise of a combination of firmness and forbearance on Lord Rosebery's part the crisis was averted, and the lines were laid down for preserving Siam, if possible, as a buffer state between the English and French frontiers in Indo-China. In the spring of 1893 he was clear-sighted enough to refuse to join the anti-Japanese League of Russia, France and Germany at the end of the China-Japan War.

Lord Rosebery's personal popularity had been increased at home by his successful intervention in the coal strike of December 1893, and when in March 1894 the resignation of Gladstone was announced, his selection by Queen Victoria for the premiership was welcomed by the public at large and by the majority of his own party. On all hands he was then considered dignus imperio—it was only as the new administration went to pieces that people began to add nisi imperasset. The conditions he had to face were by no means hopeful. The Liberal majority of 44 was already dwindling away, and the malcontents, who considered that Sir William Harcourt should have been the prime minister, or who were perpetually intriguing against a leader who did not satisfy their idea of Radicalism, made Lord Rosebery's personal position no easy one. A systematic policy was pursued by the small section of the Radical party who objected to a peer premier as such, and a great deal of adverse criticism was also aroused by a speech in which the prime minister, taunted for not again bringing forward a Home Rule measure, insisted upon the truism that the conversion of England, the "predominant partner," was a necessary condition of success. The support of the Irish Nationalists was by no means secure. Lord Rosebery's foreign policy, moreover, was too Tory for his Radical followers; he insisted upon "continuity of policy in foreign affairs," which meant carrying on the Conservative policy and not upsetting it. The premier was shown a sad lack of judgment, since no one could have made the acceptance of Mussulman demands, a form of censure which did not increase his reputation for reserve power or strength, but this was undoubtedly due in large measure to the recrudescence of the insomnia from which he had suffered in 1891. The government effected little. In Mr Asquith's phrase, it was "ploughing the sands." The Parish Councils Act was only passed by compromising with the Opposition. Local Veto and Disestablishment of the Welsh Church were put in the forefront of the party programme, but the government was already to all appearances riding for a fall, when on the 24th of June 1895 it was beaten upon an adverse vote in the Commons in regard to a question of the supply of the services.

The general election which followed after Lord Salisbury had formed his new ministry was remarkable for the undisputed state of the Liberal party. At the Elephant Club and the Albert Hall Lord Rosebery advised them to concentrate upon the reform of the House of Lords, that assembly being, as he said, a foremost obstacle to the passing of legislation on the lines of the Newcastle programme; but he was unable to suggest in what direction it should be reformed. Sir William Harcourt and Mr John Morley, on the other hand, concentrated respectively upon Local Option and Home Rule. The Liberals were quarrelling among themselves, and the result was an overwhelming defeat. In Opposition Lord Rosebery was now at a serious disadvantage as head of a parliamentary party; for in any case he could not rally them as a loyally followed leader in the House of Commons might have done. But his followers were not all loyal, and his rivals in leadership were themselves in the House of Commons. Added to this there was still in the background the veteran statesman to whom Liberalism owed an unequalled obligation. When the "Armenian atrocities" became a burning question in the country in 1896, and Mr Gladstone himself emerged from his retirement to advocate intervention, Lord Rosebery's difficulties had taken their final form. He had to show to have shown a restlessness and a wrong European war, and on the 8th of October 1896 he announced to the Liberal whip, Mr Thomas Ellis, his resignation of the leadership. On the following day he made a farewell speech at the Empire Theatre, Edinburgh, to over four thousand people, and for some time he held aloof from party politics, "ploughing his furrow alone," as he afterwards phrased it. In 1898, on the death of Mr Gladstone, he paid a noble and eloquent tribute in the House of Lords to the life and public services of his old leader. He was a pall-bearer at his funeral on the 28th of May, as he had previously been at the burials of Tennant and Milhaud. His influence in the country was still a strong one on personal grounds, and he came forward now and again to give expression independently to popular feeling. In the autumn of 1898 he gave valuable support to the attitude taken up by Lord Salisbury upon the Fashoda question. He was indeed bound by consistency to withhold what his own government, by the words of Sir Edward Grey, had declared would be an unfriendly act on the part of France. Again, after Mr Kruger's ultimatum in October 1899, Lord Rosebery spoke upon the necessity of the nation closing its ranks and supporting the government in the prosecution of war in South Africa. After Nicholson's Nek he reiterated the resolution of the country "to see this thing through." Nevertheless, in a letter to Captain
Lambton, an unsuccessful Liberal candidate for Newcastle, in September 1900, condemned the general conduct of affairs by Lord Salisbury's government, while in several speeches in the House of Lords he strongly urged the necessity of army reform. Since his abandonment of the leadership in 1896, the lack of coherence in the Liberal party had become more and more manifest. The war had brought to the front a pro-Boer section, who seemed gradually to be compromising the whole party, and had apparently succeeded in winning the support of Sir Henry Campbell-Bannerman, the leader in the House of Commons. Lord Rosebery maintained for the most part a sphinx-like seclusion, but in July 1901 he at last succeeded strongly as the champion of the Liberal Imperialist section.

In deference to the wishes of supporters such as Mr Asquith, Sir Henry Fowler and Sir Edward Grey he determined to "put his views into the common stock" at a representative meeting of Liberals held at Chesterfield in December 1901. There he advised the Liberal party that "its slate must be cleaned," and, as he subsequently explained, this cleansing must involve the elimination of Home Rule for Ireland. His appeal for "spade work" resulted in the formation of the Liberal League, inside the Liberal Opposition; and what Lord Rosebery himself described as the first significant step towards the recombination of the Liberals, Sir Henry Campbell-Bannerman's "tabernacle" took place. This announcement, however, was no sooner made than it was explained away by the supporters of both, and early in 1902 Lord Rosebery spoke at the National Liberal Club in a way which indicated that an understanding might still be arrived at. But though Mr Asquith and Sir Edward Grey adhered to the Liberal League, Sir Henry Campbell-Bannerman retained the loyalty of the majority of the Liberal party, and Lord Spencer threw his weight on the same side; and in a speech at the Liberal League dinner on the 31st of July Lord Rosebery had to admit that their principles had not yet prevailed, and that, until they did, a reconciliation between the two wings of the party would be impossible. In January 1903 he addressed a Liberal meeting at Plymouth, and appeared to be attempting to concentrate Opposition criticism upon the points in the government policy which did not involve the Imperialist difference; and in discussing War Office reform he advocated the appointment of Lord Kitchener as secretary of state for war.

When Mr Chamberlain started his new fiscal programme, combining Tariff Reform with Colonial Preference, Lord Rosebery at first seemed inclined to treat it as non-political, and on the 19th of May 1903 he declared in an address to the Burnley Chamber of Commerce that he had at last come of those who regarded Free Trade as part of the Sermon on the Mount. This utterance led to an idea that he was inclined to consider favourably the proposal for a preferential tariff, his earlier enthusiasm for Imperial Federation making his support an interesting political possibility. But this idea was quickly dispelled; on the 22nd he expressed his surprise that anybody should have thought he intended to approve of Mr Chamberlain's plan; he was not prepared to dismiss in advance a proposal for the consolidation of the empire made by the responsible government, but he believed that the objections to a policy of protection were insuperable. The fact, no doubt, was that Mr Asquith, Lord Rosebery's chief lieutenant in the Liberal League, made himself from the outset a determined champion of free trade in opposition to Mr Chamberlain; and Lord Rosebery quickly came into line with the rest of the Liberal party on this question. On the 12th of June, addressing the Liberal League, he admitted that as a lifelong Imperialist it was with pain and grief that he could not support Mr Chamberlain's scheme, but the empire had been built upon free trade, and he only saw danger to the empire in these new proposals. Speaking at Sheffield on the 13th of October he criticized the scheme in more detail, and, as an Imperialist, warned the country against it, emphasizing his own ideal of the future of the empire—a strong mother with strong children, each working out his own political and fiscal salvation. His attitude on the new issue undoubtedly affected public opinion, and helped to draw him closer to the great body of the Liberal party, who saw that their identification with the cause of free trade was doing much to remove the public distrust associated with their support of Home Rule. On the 7th of November at Leicester Lord Rosebery insisted that what the country wanted was not fiscal reform but commercial reform, and he appealed to the free-trade section of the Unionist party to join the Liberals in a united defence,—an appeal incidentally for Liberal unity which was warmly seconded ten days later by Sir Henry Campbell-Bannerman. On the 26th of November Mr Asquith's speech on the same lines at a meeting in South London resulted in a powerful demonstration in favour of his resuming the Liberal leadership, but he made no public response. On the 10th of June 1904, he addressed a meeting of the Liberal League at the Queen's Hall, London, and sketched a programme of "sane and practical Imperialism"; but he irritated the Home Rulers by again repudiating a parliament in Dublin, and he perplexed the public generally by his adverse criticism on the popular Anglo-French Agreement, which he was the only English statesman to oppose, on the ground of its handing over Morocco to France.

At Glasgow on the 5th of December he again outlined a Liberal programme, but in his speeches all leading to the assumption that his return to active co-operation with the Liberal party in the general election—which could not be long delayed—was fairly certain. Early in 1905 this impression gained such strength and such polite references were made to one another in public by Lord Rosebery and Sir Henry Campbell-Bannerman, that his assumption of office in a Liberal ministry, possibly presided over by Earl Spencer, was confidently anticipated. But these forecasts were ultimately upset, not only by Lord Spencer's illness and his removal from the list of possible Liberal prime ministers, but by Sir Henry Campbell-Bannerman's pronouncement at Stirling in November, the speech in which Lord Rosebery had just gone down to Cornwall to make a series of speeches in support of the Liberal programme, now fairly well mapped out as regards those items which represented the strong public opposition to what had been done by the Unionist government. It was believed that an understanding had been come to between his Liberal League henchmen (Mr Asquith, Sir E. Grey and Mr Haldane) and Sir Henry Campbell-Bannerman, and that Lord Rosebery's co-operation was to be secured by the adoption of some formula which would temporarily take Home Rule out of the official programme as a question of practical politics; but, to the general demonstration of Lord Rosebery's own very evident mortification Sir Henry went a long way in his Stirling speech to null the Home Rule colour to the mast; he did not indeed propose to introduce a Home Rule Bill, but he declared his determination to proceed in Irish legislation on lines which would lead up to the same result. Lord Rosebery abruptly broke off his campaign, declaring at Bodmin (26th of November) that he would never "fight under that banner." From the moment the apparent recrudescence of the Liberal split over this question seemed to have misled Mr Balfour, who resigned office on the 4th of December, into thinking that difficulties would arise over the formation of a Liberal cabinet; but, whether or not the rumour was correct that a blunder had been made at Stirling and that explanations had ensued which satisfied Mr Asquith and Sir Edward Grey, this anticipation proved unjustified. Lord Rosebery himself, it is true, held aloof; his protest had been publicly made and he adhered to it in the absence of any public withdrawal by Sir Henry Campbell-Bannerman; but he encouraged his Liberal League supporters to be loyal to the new prime minister, and Mr Asquith, Sir E. Grey and Mr Haldane were included in the Liberal cabinet. The overwhelming Liberal and Labour victory at the general election of 1906 began a new era in the fortunes of the party, and Lord Rosebery's individuality once more sank back from any position of prominence in regard to its new programme. He remained outside party politics.
emerging only in 1909, first to attack Mr Lloyd George's budget in the country as a "revolution," and then—to the general surprise—to condemn the House of Lords in debate for rejecting it; and in 1910 (see Parliament) he appeared once more to be coming to the front, by the resolutions he carried in regard to the remodelling of the Upper Chamber, when the death of King Edward VII caused a temporary postponement of the constitutional crisis. In September 1910 he acted as head of the special mission sent to the Austrian court by George V. to announce his accession to the throne,—a selection peculiarly appropriate, and cordially welcomed as such, because of his well-known Austrian sympathies. Indeed, in the East European crisis of 1909 Lord Rosebery had taken a somewhat isolated part in vindicating the Austrian right to annex Bosnia-Herzegovina, in opposition to the criticisms generally passed in the English press.

After his retirement from active politics Lord Rosebery continually displayed his great qualities as a public speaker by eloquent and witty addresses on miscellaneous subjects. No public man of his time was more fitted to act as unofficial national orator; none more happy in the touches with which he could adorn a social or literary topic and charm a non-political audience; and on occasion he wrote as well as he spoke. His Pilt has already been mentioned; his Appreciations and Addresses and his Peel (containing a remarkable comment on the position of an English prime minister) were published in 1890; his Napoleon: the Last Phase—an ingenious, if paradoxical, attempt to justify Napoleon's conduct in exile at St Helena—in 1900; his Cromwell in the same year. In 1906 he published an appreciation of his old friend Lord Randolph Churchill, inspired by the publication of Mr Winston Churchill's Life of his father. In its detached yet intimate way, this is a model of the art by which a good judge of men, possessed at the same time of a just historical sense, may, from the point of view of a contemporary on the opposite side in politics, connect the respects of an official in debate under the limitations of filial obligation, and give tone and value to the picture of an interesting personality.

Lord Rosebery's family consisted of two sons and two daughters. His eldest son, Lord Dalmeny (b. Jan. 1882), who in 1909 married a daughter of Lord Henry Grosvenor, 3rd son of the 1st duke of Westminster, entered parliament in 1906 as Liberal member for Mid Lothian, but retired in 1910; he was well known as a cricketer, captaining the Surrey eleven in 1905 and 1906. The younger son, the Hon. Neil Primrose (b. Dec. 1883), took more actively than his brother to a political career, and in January 1910 he was returned as a Liberal for the Wisbech division of Cambridgeshire. The elder daughter, Lady Sybil, in 1903 married Captain Charles Grant; the younger, Lady Margaret, in 1899 married the 1st earl of Crewe. (H. Ch.)

ROSECRANS, WILLIAM STARKE (1819–1898), American soldier, was born in Kingston, Ohio, on the 6th of September 1819, and graduated in 1842 from the U.S. Military Academy, being appointed to the engineers. After serving (1842–47) as assistant professor at West Point, and in fort construction, he resigned (April 1849) from the army and went into business in Cincinnati. On the outbreak of the Civil War Rosecrans volunteered for service under McClellan and helped raise the Ohio "Home Guards," with which he served in the West Virginia operations of 1861 in the rank of brigadier-general. He was second in command to McClellan during this campaign, and succeeded to the command when that officer was called to Washington. In the latter part of 1861 Rosecrans conducted further operations in the same region with great skill and success, and early in 1862 he was transferred to the West as a major-general of volunteers. He took part in the operations against Corinth, and when General John Pope was ordered to Virginia, Rosecrans took over command of the Army of the Mississippi with which he fought the successful battles of Iuka and Corinth. Soon afterwards he was ordered to replace D. C. Buell in command of the forces, renamed the Army of the Cumberland about the same time.

In December he advanced against General Braxton Bragg, and on the 31st of December to the 3rd of January was fought the bloody and indecisive battle of Stone River ( Murfreesboro), after which Bragg withdrew his army to the southward. In 1863 Rosecrans, refusing to advance until the isolation of Vicksburg (farther west) was assured, did not take the offensive until late in June. The operations thus begun were most skilfully conducted, and Bragg was forced back to Chattanooga (q.v.), whence he had to retire on being once more outmanœuvred. But Rosecrans sustained a great defeat at the battle of Chickamauga (q.v.), and was soon besieged in Chattanooga. He was then relieved from his command. Later he did good service in Missouri and in the following year he was given a major-generalcy, and returned to Vicksburg. He was in command of his army when it was ordered to leave the Confederacy for the U.S.A. He resigned in 1867, and in the following year became minister to Mexico. Subsequently he was engaged in many railway and industrial enterprises in that country, as also in California. He was a representative in Congress from California, 1881–85, and register of the treasury, 1885–93. Under an act of Congress he was on the 2nd of March 1889 restored to the rank of brigadier-general, and retired. He died near Redondo, Cal., on the 11th of March 1898. On the 17th of May 1902 his body was reinterred with military honours in the National Cemetery at Arlington, in the presence of President Roosevelt, members of the cabinet and many of his campaign friends.

ROSEgger, PETER (1843–1904), Austrian poet and novelist, known down to 1894 under the pseudonym Peiri Kettenfeier, was born at Alpl near Kriegelach in Upper Styria, on the 31st of July 1843, the son of a peasant. Until his seventeenth year he was employed as a farm hand and received no regular school education, though he learnt reading and writing from a retired schoolmaster who lived near. Unfit, owing to physical weakness, for the hard labour of agriculture, he was apprenticed to a journeyman tailor, and on his wanderings employed his leisure hours in educating himself. He soon composed poems and wrote stories. Some of these productions he sent in 1864 to Dr Svoboda, the editor of the Graz Tagepost, who, recognizing Rosegger's extraordinary talent, interested himself in the young author, and with the assistance of friends enabled him to study (1865–69) at the Handelsakademie of Graz. In 1869, encouraged by Robert Hammerling, Rosegger published his first work, a volume of poems in Styrian dialect, Zither undHackbrett, which immediately established his reputation. As a result, the provincial diet of Styria accorded him a substantial stipendium (scholarship) for three years, which enabled him to supplement his studies by foreign travel. He now devoted himself entirely to authorship, and in 1876 founded the monthly Heimathalle. He was given the chair of the Austrian Academy of its reorganization the University of Heidelberg conferred upon him, in 1903, the honorary degree of doctor of philosophy.

Rosegger is one of the most fertile authors of recent times. His fresh natural style, sound judgment and his fascinating descriptions of Alpine scenery and the life of its inhabitants have made him one of the most popular authors of Austria and Germany. These characteristics are displayed to great advantage in Die Schriften des Waldschulmeisters (1875), Aus meinem Handwerkerleben (1880), Alpengeschichten (1890), Als ich noch jung war (1859), and in the love-lyric and Village and Woodland poems which are collected in Mein Himmelreich (1901), Ersegen (1900) and Das ewige Licht (1897), and his attachment to friends in Gute Kameraden (1903) and Periodische Erinnerungen an Robert Hammerling (1891). Among his other works may be mentioned a volume of poems, Gedichte (1891), a popular play, Am Tage des Gerichts (1892), two books for boys, Waldserien (1887) and Waldjugend (1900), and the stories Das Sündengebœck (1902), Wildlings (1906) and IN.R.I. Frohe Botschaft eines armen Sünders (1905), which has also been translated into English. He has also written several works which are autobiographical in character, such as Waldheimat (1873) and Arztgeschichten (1898).

Rosegger's Ausgewählte Schriften appeared in thirty volumes (1881–94); a popular edition (1895–1900); his Schriften in steirischer Mundart (3 vols., 1894–96). See also A. V. Svoboda, P. K. Rosegger (1895); P. K. Rosegger: Der Lyriker der Gegenwart (1905); and H. Möbius, P. Rosegger (1903).

ROSELLINI, IPPOLITO (1800–1843), Italian Egyptologist, was born at Pisa. He studied under Mezzofanti at Bologna, and
ROSEMARY—ROSES, WARS OF THE

in 1824 became professor of oriental languages at Pisa University. He is best known as the associate of J. F. Champollion (q.v.), whose studies he shared and to whom he accompanied on his Egyptian explorations (1828). On the death of Champollion the publication of the results of their expedition fell to Roland (Monumenti dell' Egitto e della Nubia, Florence, 1832-40, 10 vols. fol.).

ROSEMARY, botanically Rosmarinus, a Labiate plant, the only representative of the genus and a native of the Mediterranean region. It is a low shrub with linear leaves, dark green above, white beneath, and with margins rolled back on to the under face. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla enclosing two stamens, the other two, which are generally present in the family, being defied. The fruit consists of four smooth nutlets. Botanically the genus is near to Sabinia, but it differs in the shorter connective to the anther. Rosemary was highly esteemed by the ancients for its aromatic fragrance and medicinal uses. In modern times it is valued mainly as a perfume, for which purpose the oil is obtained by distillation. It doubtless has slight stimulant properties, such as are common to all volatile oils, which may account for the general belief in the efficacy of the plant in promoting the growth of the hair. Rosemary plays no unimportant part in literature and folklore, being esteemed as an emblem of remembrance. There's rosemary, that's for remembrance," says Ophelia. Its connexion with funeral ceremonies is not extinct in country places, where it is used for this purpose; and it has been formerly much valued at wedding festivities. The name "ros marinus" or "ros maris," literally "sea-dew," was probably given in allusion to its native habitat in the neighbourhood of the sea.

ROSENHEIM, a town and watering-place of Germany, in the kingdom of Bavaria, situated at the confluence of the Mangfall and the Inn, 40 m. by rail S.E. of Munich. Pop. (1905) 15,403. It is an interesting town, with many medieval houses. Among its seven churches the Roman Catholic parish church, with a curious cupola and containing numerous old tombs and effigies, and that of the Holy Ghost (15th century), are remarkable. There are a monastery, two convents, several schools, and a hospital. Rosenheim is frequented for its saline and sulphur baths, and there are important saltworks, the brine being conveyed from Reichenhall in pipes; it has also machine factories, metalworks and breweries. Cordage is manufactured, and there is a trade in cattle and grain. Although founded in the 12th century Rosenheim did not become a town until 1864.

See Ditterich, Rosenheim in der Bayreuth (Munich, 1870), and Eld, A. von Rosenheim (1896).

ROSENKRANZ, JOHANN KARL FRIEDRICH (1805-1879), German philosopher, was born at Magdeburg on the 23rd of April 1805. He read philosophy at Berlin, Halle and Heidelberg, devoting himself mainly to the doctrines of Hegel and Schleiermacher. After holding the chair of philosophy at Halle for two years, he became, in 1833, professor at the university of Königsberg, where he remained till his death on the 14th of July 1879. In his last years he was quite blind. Throughout his long professional career, and in all his numerous publications he remained, in spite of occasional deviations on particular points, loyal to the Hegelian tradition as a whole. In the great division of the Hegelian school, he, in company with Miciellet and others, formed the "centre," midway between Erdmann and Gabler on the one hand, and the "extreme left" represented by Strauss, Feuerbach and Bruno Bauer.

Of his numerous writings, the following may be mentioned:—
1. Philosophical: Kritik der Schleiermacherschen Glaubenslehre (1836); Psychologie oder Wissenschaft vom subjektiven Geist (1837; 3rd ed., 1863); Kritische Erläuterungen des Hegel'schen Systems (1840); Vorlesungen über Schelling (1842); System der Wissenschaft (1850); Meine Reform der Hegel'schen Philosophie (1852); Wissenschaft der logischen Idee (1853-59), with a supplement (Epipelagena, 1860); Hegels System der Logik mit verbesserter Uebersetzung und Nachtrag von Adolf Vora (1868); Erläuterungen zu Hegel's Encyklopädie der philosophischen Wissenschaften (1871). Two other of his works on Hegel are important, the Leben Hegel's (1844) and the Hegel als deutscher Nationalphilosoph (1870). Between 1838 and 1840 in conjunction with F. W. Schubert, he published an edition of the works of Kant, to which he appended a history of the Kantian doctrine.
2. Literary and General: Geschichte der deutschen Poesie im Mittelalter (1830); Handbuch einer Kategorischen Geschichte der Poesie (1832-33); Die Pädagogik als System (1848); Aesthetik des Häßlichen (1853); Die Poesie und ihre Geschichte (1855); Studien (1839-47) and Neue Studien (1875-78). He published also an autobiography entitled Von der Wahrheit nach der Waffe (1881-west, and deals with his life up to the time of his settlement at Königsberg.

See Quäcker, Karl Rosenkrans (1895), and J. Hutchinson Stirling, The Secret of Hegel, part 6.

ROSENTHAL, TOBY EDWARD (1848- ), American artist, was born at New Haven, Connecticut, on the 15th of March 1848. Removing to San Francisco with his parents in 1855, he there studied painting under Fortunato Arriola. In 1865 he went to Mexico, where he remained till 1874, at the time when the Academy under Strachuber, Raupp and Piloty Among his more important works are: "Morning Prayers" (Leipzig Museum), "Elaine," "Trial of Constance de Beverley," "Dancing Lesson During the Empire" and "Departure from the Family."

ROSES, WARS OF THE, a name given to a series of civil wars in England during the reigns of Henry VI., Edward IV. and Richard III. Their importance in the general history of England is dealt with elsewhere, and their significance in the history of the art and practice of war is small. They were fought not only on a grand scale, but also with a ferocity and brutality which made them particularly unknown in the history of English wars before and since. The honest yeoman of Edward III.'s time had evolved into a professional soldier of fortune, and had been demoralized by the prolonged and dismal Hundred Years' War, at the close of which many thousands of ruffians, whose occupation had gone, had been set loose in England. At the same time the power of feudalism had become concentrated in the hands of a few great lords, who were wealthy enough and powerful enough to become king-makers. The disbanded mercenaries enlisted indifferently on either side, corrupting the ordinary feudal tenantry with the evil habits of the French wars, and pillaged the countryside, with accompaniments of murder and violence, wherever they went. It is true that the sympathies of the people at large were to some extent enlisted: London and, generally, the trading towns being Yorkist, the country people Lancastrian—a division of factions which roughly corresponded to that of the early part of the Great Rebellion, two centuries later, and similarly in a measure indicative of the opposition of hereditary loyalty and desire for sound and effective government. But there was this difference, that in the 15th century the feeling of loyalty was to a great extent focused upon the great lords. Each lord could depend on his own tenantry, and he could, further, pay large bands of retainers. Hence much as the citizen desired a settlement, the issue was in the hands of the magnates; and as accessions to and defections from one party and the other constantly shifted the balance of power, the war dragged on, becoming more and more brutal with every campaign.

It is from the Wars of the Roses that there originated the deep-rooted dislike of the professional soldier which was for nearly four centuries a conspicuous feature of the English social and governmental system, and it is therefore in their results rather than their incidents that they have affected the evolution of war. They withdrew the English army system from European battlefields precisely at the moment of transition when the regimental and technical organization of armies was becoming a science and seeking models, and the all-powerful English longbow at the moment when the early, scarcely effective firearms were, so to speak, struggling for recognition as army weapons. On the other hand, they destroyed the British military organization. The national army, aloof from the main streams of military progress, remained for 150 years an aggregation of county levies armed with bills and bows. In so far as the king was permitted or able to raise armies, they were small mercenary forces formed, on a basis of unemployed professionals, from pressed men and criminals, and they were
disbanded as soon as the brief occasion for their services had passed.

The first campaign, or rather episode, of these wars began with an armed demand of the Yorkist lords for the dismissal of the Lancastrian element in the king's council, Henry VI, himself being incapable of governing. The Lancastrians, and the king with them, marched out of London to meet them, and the two small armies (3000 Yorkists, 2000 Lancastrians) met at St Albans (May 22, 1455). The encounter ended with the dispersion of the weaker force, and the king fell into the hands of the Yorkists. Four years passed before the next important battle, Blore Heath, was fought (Sept. 23, 1459). In this the Earl of Salisbury trapped a Lancastrian army in unfavourable ground near Market Drayton, and destroyed it; but new political combinations rendered the Yorkist victory useless and sent the leaders of the party destroyed and the Lancastrian army, in 1460, and, thanks partly to treason in the Lancastrian camp, partly to the generalship of Warwick, won an important success and for the second time seized the king at Northampton (July 19, 1460). Shortly afterwards, after a period of negotiation and threats, there was a fresh conflict. Richard duke of York went north to fight the hostile army which gathered at York and consisted of Lancashire and Midland Royalists, while his son Edward, earl of March, went into the west. The father was ambushed and killed at Wakefield (Dec. 30, 1460), and the Lancastrians, inspired as always by Queen Margaret of Anjou, moved south on London, defeated Warwick at St Albans (Feb. 17, 1461), and regained possession of the king's person. But the young earl of March, now duke of York, having raised an army in the west, defeated the earl of Pembroke (Feb. 2, 1461) at Mortimer's Cross (5 m. W. of Leominster). This was the first battle of the war which was characterized by the massacre of the common folk and beheading of the captive gentlemen— invariable accompaniments of Edward's victories, and conspicuously absent in Warwick's. Edward then pressed on, joined Warwick, and entered London, the army of Margaretretreating before them. The excesses of the northern Lancastrians on their advance produced bitter fruit on the retreat, for men flocked to Edward's standard. Marching north in pursuit, the Yorkists brought their enemy to bay at Towton (g.t.), 3 m. S. of Tadcaster, and utterly destroyed them (March 29, 1461). For three years after Towton—the war consisted merely of desultory local struggles of small bodies of Lancastrians against the inevitable. The duke of York had become King Edward IV, and had established himself firmly. But in 1464, in the far north of England, the Red Rose was again in the field. Edward acted with his usual decision. His lieutenant Montagu (Warwick's brother) defeated and slew Sir Ralph Percy at Heigley Moor, near Wooler (April 25, 1464), and immediately afterwards defeated and captured Warwick at Northumberland, with which were both Henry VI and Queen Margaret, at Hexham (May 8, 1464). The massacres and executions which followed effectively crushed the revolt. For some years thereafter Edward reigned peacefully, but Warwick the Populous and all the Neville following having turned against him (1470), he was driven into exile. But at a favourable moment he called from Flushing with 7,000 retainers and Burgundian mercenaries, and eluding the Lancastrian fleet and the coast-guard frigates landed at Ravenspur (Spurn Head) in Yorkshire in March 1471. His force was barely more than a bodyguard, but the gates of the towns were shut against him, and the country people fled. But by his personal charm, diplomacy, fair promises and an oath of allegiance to King Henry VI, sworn solemnly by York, he disarmed hostility and, eluding Montagu's army, reached his own estates in the Wakefield district, where many of his old retainers joined him. As he advanced south, a few Yorkist nobles with their following rallied to him, but it was far more the disunion of the Warwick and the real Lancastrian parties than his own strength which enabled him to meet Warwick's forces in a pitched battle. At Barnet, on Easter Eve, April 14, 1471, the decisive engagement was fought. But in the midst of the battle reinforcements coming up under the earl of Oxford to join Warwick came into conflict with their own party, the badge of the Vere star being mistaken for Edward's Rose-en-soileil. From that point all the mutually distrustful elements of Warwick's army fell apart, and Warwick himself, with his brother Montagu, was slain. For the last time the unhappy Henry VI fell into the hands of his enemies. He was relegated to the Tower, and Edward, disbanded his army, recouped the throne. But Margaret of Anjou, but, until her death in 1503, managed to hold on, while old and Warwick's was being lost, had landed in the west shortly after Barnet, and Edward had to take the field at once. Assembling a fresh army at Windsor, whence he could march to interpose between Margaret and her north Welsh allies, or directly bar her road to London, he marched into the west on the 24th of April. On the 20th he was at Cirencester, Margaret engaged chiefly in recruiting an army, near Bath. Edward hurried on, but Margaret eluded him and marched for Gloucester. At that place the governor refused the Lancastrians admittance, and seeking to cross the Severn out of reach of the Yorkists, they pushed on by forced marches to Tewkesbury. But Edward was in time, with his own army, which had been retreating, joined by reinforcements, and won the battle of Tewkesbury (May 4, 1471) ended with the destruction of Margaret's force, the captivity of Margaret, the death of her son Edward (who, it is sometimes said, was stabbed by Edward IV himself after the battle) and the execution of sixteen of the principal Lancastrians.

This was Edward's last battle. The rest of his eventful reign was similar in many ways to that of his contemporary Louis XI, being devoted to the consolidation of his power, by fair means and foul, at the expense of the great feudatories. But the Wars of the Roses were not yet at an end. For fourteen years, except for local outbreaks, the land had peace, and then Richard III's crown, struck from his head on Bosworth Field (Aug. 22, 1485), was presented to Henry earl of Richmond, who, as Henry VII, established the kingship on a secure foundation. A last feeble attempt to renew the war, made by an army gathered to uphold the pretender Lambert Simnel, was crushed by Henry VII at Stoke Field (4 m. S.W. of Newark) on the 16th of June 1487.

ROSETTA (Coptic Rēṣētā, Arabic Rasītā), a town situated at the western or "Rosetta" mouth of the Nile on the west bank. It was called Bubon by the Greeks, but according to Herodotus the Bublonite mouth was artificial, and it was evidently of little importance compared with the Canopic, Sebennytic and Pelusiac mouths. When the other branches and the Alexandria canal silted up, Rosetta prospered like its sister port of Damietta on the eastern branch; the main trade of the overland route to India passed through it until Mehemet Ali cut a new canal joining Alexandria to the Nile. Rosetta is now much decayed. Its population in 1907 was 16,810, almost entirely Musulman. A railway joins it to Alexandria. The celebrated Rosetta Stone which supplied Champollion with the key for the decipherment of the ancient monuments of Egypt was found near Fort St. Julien, 4 m. N. of the town, in 1799, by Bousard, a French officer. It is a basalt stele inscribed in hieroglyphic, demotic and Greek with a decree of the priests assembled at Memphis in favour of Ptolemy V. Epiphanes. It was ceded to the English at the capitulation of Alexandria (1801) and is now in the British Museum. See EGYPT: II. Ancient Egypt, section D. "Writing." (F. L. L. G.)

ROSEWOOD, the name given to several distinct kinds of ornamental timber. That, however, so called in the United Kingdom is Brazilian rosewood, the palissandre of the French, the finest qualities of which, coming from the provinces of Rio de Janeiro and Bahia, are believed to be the produce principally of Dalbergia nigra, a leguminous tree of large dimensions,
ROSICRUCIANISM—ROsin

called cabina and jacaranda by the Brazilians. The same name, jacaranda, is applied to several species of *Macarrium*, also trees belonging to the natural order Leguminosae; and there can be no doubt that a certain proportion of the rosewood of commerce is drawn from these sources. Rosewood comes to the United Kingdom from Rio de Janeiro, Bahia, Jamaica and Honduras. The heartwood attains large dimensions, but as it begins to decay before the tree arrives at maturity it is always faintly banded and hollow in the centre. On this account squared logs or planks of rosewood, the wood being imported in half-round flatitches 10 to 20 ft. in length and from 5 to 12 in. in their thickest part. Owing to its irregular form, the wood is sold by weight, and its value varies within wide limits according to the richness of colour. Rosewood has a deep reddish brown colour, richly streaked and grained with black resinous layers. It takes a fine polish, but, on account of its resinous nature, it is somewhat difficult to work. The wood is very much in demand both by cabinet-makers and pianoforte-makers, by whom it is used both solid and in veneer. The wood of *Dalbergia latifolia*, a native of the East Indies, used for ornamental furniture and carvings under the name of black wood, is frequently termed East Indian Rosewood. The *Bois de Rose* of the French, the Portuguese *Pao de Rosa*, and the German *Roseneide族群*, is a wood with a resinous gum, *floribundum*, called in the United Kingdom tulip wood, and very highly esteemed on account of its beautiful rose colour and grain.

**ROSICRUCIANISM.** What is known as the Society of Rosicrucians (*Rosenkneuter*) was really a number of isolated individuals who early in the 17th century held certain views in common (which apparently was their only bond of union); for of a society holding meetings, and having officers, there is no trace. So far as the numerous works are concerned it is evident that the writers who posed as Rosicrucians were moral and religious reformers, and utilized the technicalities of chemistry (alchemy), and the sciences generally, as media through which to make known their opinions, there being a flavour of mysticism or occultism promotive of inquiry and suggestive of hidden meanings discernible or discoverable only by adepts.

The publication of the Allgemeine und General-Reformation der ganzen weilen Welt (Cassel, 1614), and the Pama Frater-nilaxis (Cassel, 1615) by the theologian Johann Valentin Andreae (1586-1654), is the earliest work succeeding throughout Europe, and they not only led to many re-issues abroad, but were followed by numerous pamphlets, favourable and otherwise, whose authors generally knew little, if anything, of the real aims of the original author, and doubtless in not a few cases amused themselves at the expense of the public. It is probable that the first work was circulated in MS, about 1610, for it is said that a reply was written in 1612 (according to Herder), but if so, there was no mention of the cult before that decade. The authors generally favoured Lutheranism as opposed to Roman Catholicism. Others, like John Heydolt, admitted they were not Rosicrucians, but under attractive and suggestive titles to their works sought to make Hermeticism and other esoteric studies more useful and popular, and succeeded, for a time at least.

The curious legend, in which the fabulous origin of the so-called society was enshrined (that a certain Christian Rosenkreuz had discovered the secret wisdom of the East on a pilgrimage in the 15th century), was so improbable, though ingenious, that the genesis of the Rosicrucians was generally overlooked or ignored, but the worthy objects of the fraternities were soon discovered and supported by several able men; the result being a mass of literature on the subject, which absorbs some 80 pages of Gardener's *Catalogue Raisonné of Works on the Occult Sciences* (London, 1903).

The influence that Rosicrucianism had in the modernizing of ancient Freemasonry early in the 18th century must have been slight, if any, though it is likely that as the century advanced, and additional ceremonies were grafted on to the first three degrees, Rosicrucian tenets were occasionally introduced into the later rituals. So far, however, as the real foundation ceremonies of Craft Masonry are concerned, whether before or after the premier Grand Lodge was formed, it is most unlikely that such a society as the Freemasons would adopt anything of a really distinctive character from another organization and call it by the same name.

In *The Muse's Threnodie* by H. Adamson (Perth, 1638) are the lines—

"For what we do presage is in grosse,
For we are brethren of the Rosie Cross;
We have the Mason Word and second sight,
Things for to come we can fortell aright."

Dr Begemann considers that possibly during the decade from 1720 to 1730 a kind of Rosicrucian or Hermetic influence took place in the lodges of London, some time during the time of the Rosicrucians and allied subjects, but in no sense are they directly derived from the Brethren of the Rosy Cross of the 17th century, though keen followers thereof. By far the most important of these is the "Societas Rosicruciana in Anglia," with headquarters in London. The Supreme Magus, Dr William Wynn Westcott, has written its History (1900), with other important works on the subject, and the published Transactions of the Society are most valuable.

The Rosicrucians, their Rites and Mysteries, by Hargrave Jennings (three editions, 1870-87); The Real History of the Rosicrucians, founded on their own Manifestoes and on Facts and Documents collected from the Writings of the Rosicrucians and the Work of the Rosicrucians (1887); and The Arcane School, by John Yarker (1900), may be consulted with advantage, though not authorized publications of the Society. (W. J. H.)

**ROsin** (a later variant of "resin," g.s.) or COLOPhony (*Colophonia resina*, resin from Colophon in Lydia), the resinous constituent of the oleo-resin exuded by various species of pine, known in commerce as crude turpentine. The separation of the oleo-resin into the essential oil-spirit of turpentine and common resin is effected by distillation in large copper stills. The essential oil is carried off at a heat of between 213° and 316° F., leaving fluid resin, which is run off through a tap at the bottom of the still, and purified by passing through a straining wadding. Rosin varies in colour, according to the age of the tree whence the turpentine is drawn and the amount of heat applied in distillation, from an opaque almost pitchy black substance through grades of brown and yellow to an almost perfectly transparent colourless glassy mass. The commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale,—superior to which are W, yellowing, and M, white. With white varieties, the latter having about three times the value of the yellow varieties. Rosin is a brittle and friable resin, with a faint pearly odour; the melting-point varies with different specimens, some being semi-fluid at the temperature of boiling water, while others do not melt till 220° or 250° F. It is soluble in alcohol, ether, benzene and chloroform. Rosin consists mainly of abietic acid, and combines with caustic alkalies to form salts (rosinates or pinates) that are known as "resin soaps." In addition to its extensive use in soap-making, rosin is largely employed in making inferior varnishes, sealing-wax and various cements. It is also used for preparing shoemaker's wax, as a flux for soldering metals, for pitching lager beer casks, for making the bows of marionettes and numerous minor purposes. In pharmacy it forms an important ingredient in several plasters and ointments. On a large scale it is treated by destructive distillation for the production of rosin spirit, pinoline and rosin oil. The last enters into the composition of some of the solid lubricating greases, and is also used as an adulterant of other oils.

The chief region of rosin production is the South Atlantic and Eastern Gulf states of the United States. American rosin is obtained from the turpentine of the swamp pine, *Pinus australis*, and of the loblolly pine, *P. Taeda*. The chief source of supply in Europe is the "lands" of the departments of Orleans and Landes in France, where the cluster pine, *P. Pinaster*, is extensively cultivated. In the north of Europe rosin is obtained from the Scotch fir, *P. sylvestris*, and throughout European countries local supplies are obtained from other species of pine.
ROSILDE, or Roskilde, a town of Denmark in the amt (county) of Kjøbenhavn (Copenhagen), 20 m. by rail W. of Copenhagen, on the great lagoon-like inlet named Roskilde Fjord. Pop. (1901) 83,688. It has a small port, and is an important railway junction, from which lines diverge W., S.W. and S. through the island of Zealand. Its interest, however, is historical. It was the capital of the kingdom until 1443, and the residence of the bishops of Zealand until the Reformation. The cathedral, a beautiful church, was consecrated in 1084, but of this early building only foundation walls remain; the present structure of brick was begun in 1167 and enlarged and restored at various intervals. It stands in relation to Danish history somewhat as Westminster Abbey does to English, containing the tombs of most of the Danish kings from Harold I. (987). The most noteworthy architectural details are the Chapel of the Trinity (15th century) and that of Christian IV. (Renaissance, 1617), carved choir-stalls, and an altar-piece of the 16th century. Other old buildings are a church of Our Lady, dating as it stands from 1242, a diocesan library (partly of the 13th century), royal palace (1733) and Institute for daughters of noblemen (1870).

ROSEBUD, HEROD. See ROBERT HEROD ROSEBUD, 1ST BARON (1824–1887). British colonial administrator, was born on the 9th of December 1824. He was of Irish descent on both sides; his father was Admiral Hercules Robinson, his mother a Miss Wood of Rosmead, County Westmeath, from which he afterwards took his title. Passing from Sandhurst into the 8th Foot, he attained the rank of captain; but in 1846, through the influence of Lord Naas, he obtained a post in the Board of Public Works in Ireland, and subsequently became chief commissioner of fairs and markets. His energy in these positions, notably during the famine of 1848, and the clearness and vigour of his reports, secured for him at the age of thirty the office of president of the Island of Montserrat. Subsequently he was governor of St Christopher, from 1855 to 1859, when he was knighted in recognition of his services in introducing coolie labour into the island; of Hong-Kong; of Ceylon (K.C.M.G. in 1860); and in 1872 of New South Wales. It fell to his lot to annex the Fiji Islands to the British Empire, and his services were rewarded in 1873 by promotion to G.C.M.G. In 1879 he was transferred to New Zealand, and in 1880 he succeeded Sir Bartle Frere as high commissioner of South Africa. He arrived in South Africa shortly before the disaster of Majuba, and was one of the commissioners for negotiating a peace which was personally distasteful to him. It left him with the task of conciliating on the one hand a Dutch party elated with victory, and on the other hand a British party almost ready to despair of the British connexion. He was called home in 1883 to advise the government on the terms of the new convention concluded with the Transvaal Boers in February 1884. On his return to South Africa he found that a critical situation had arisen in Bechuanaland, where Boer commandoes had seized large tracts of territory and proclaimed the "republics" of Stella and Goshen. They refused to retire within the limits of the Transvaal as defined by the new convention, and Robinson, alive to the necessity of preserving this country—the main road to the north—for Great Britain, determined on vigorous action. John Mackenzie and later Cecil Rhodes were sent to secure the peaceful submission of the Boers, but without immediate result, partly owing to the attitude of the Cape ministry. Robinson's declaration that the advice of his ministers to patch up a settlement with the filibustering Boers was equivalent to a condonation of crime, led to the expulsion of Sir Charles Warren and the annexation of Bechuanaland early in 1885. The difficulties of Robinson's position were illustrated by the dispute which arose between him and Warren, who declared that the high commissioner's duties to the home government were at various times in manifest conflict with the action which, as governor of Cape Colony, he was bound to take on the advice of his ministers in the interests of the colony. Sir Hercules Robinson succeeded in winning the confidence of President Kruger by his fair-mindedness, while he seconded Rhodes's efforts to unite the British and Dutch parties in Cape Colony. His mind, however, was that of the administrator as distinguished from the statesman, and he was content to settle difficulties as they arose. In 1886 he investigated the charges brought against Sir John Pope-Hennessy, governor of Mauritius, and decreed his suspension pending the decision of the home authorities, who eventually reinstituted Pope-Hennessy. In 1887 Robinson was induced by Rhodes to give his consent to the completion of a treaty with Lobengula which secured British rights in Matabele and Mashona lands. In May 1889 Robinson retired. In his farewell speech he declared that there was no permanent place in South Africa for direct Imperial rule. This was interpreted to mean that South Africa must ultimately become independent—an idea repugnant to him. He explained in a letter to The Times in 1895 that he had referred to the "direct rule of Downing Street over the crown colonies, as contrasted with responsible colonial government." He was made a baronet in 1891. Early in 1893, when he had entered his 71st year and was not in robust health, he yielded to the entreaties of Lord Rosebery's cabinet, and went out again to South Africa, in succession to Sir II. Loch. His second term was a short one. The territory which he had produced a permanent estrangement between Rhodes and Cecil Rhodes, and he was out of sympathy with the new colonial secretary, Mr Chamberlain, who had criticized his appointment, and now desired Robinson to take this opportunity of settling the whole question of the position of the Uitlanders in the Transvaal. Robinson answered that the moment was inopportune, and that he must be left to choose his own time. Alarmed at the imminent danger of war, he confined his efforts to inducing the Johannesburgers to lay down their arms on condition that the raiders' lives were spared, not knowing that these terms had already been granted to Jameson. He came home to confer with the government, and was raised to the peerage as Baron Rosmead. He returned to South Africa later in the year, but was compelled by ill-health, in April 1897, to quit his post, and died in London on the 28th of October 1897, being succeeded in the title by his son.

ROSMINI-SERBATI, ANTONIO (1797–1855), Italian philosopher, was born at Rovereto in Italian Tirol on the 25th of March 1797. He belonged to a noble and wealthy family, but at an early age decided to enter the priesthood. After studying at Pavia and Padua, he took orders in 1821. In 1828 he founded a new religious order, the Institute of the Brethren of Charity, known in Italy generally as the Rosminiens. The members might be priests or laymen, and might devote themselves to preaching, the education of youth, and works of charity—material, moral and intellectual. They have branches in Italy, England, Ireland, France and America. In London they are attached to the church of St Etheldreda, Ely Place, Holborn, where the English translation of Rosmini's works is edited. His works, The Five Wounds of the Holy Church and The Constitution of Social Justice, aroused great opposition, especially among the Jesuits, and in 1849 they were placed upon the Index. Rosmini at once declared his submission and retired to Stresa on Lago Maggiore, where he died on the 1st of July 1855. Before his death he had the satisfaction of learning that the works in question were dismissed, that is, proclaimed free from censure by the Congregation of the Index. Twenty years later, the word "dismissed" (dimittantur) became the subject of controversy, some maintaining that it amounted to a direct approval, others that it was purely negative and did not imply that the books were free from error. The controversy continued till 1887, when Leo XIII. finally condemned forty of his propositions and forbade their being taught.

In 1848 Rosmini took part in the struggle which had for its object emancipation from Austria, but he was not an initiator of the movement which ended in the freedom and unity of Italy. In fact, while eager for the deliverance of Italy from Austria, his aim was to bring about a confederation of the states of the country, which was to be under the control of the pope.
The most comprehensive view of Rosmini's philosophical standpoint is to be found in his Sistema filosofico, in which he set forth the core of his thought: the connection of the human being with reality and the world, and his aims and fundamental problems of the origin, truth and certainty of our ideas, he wrote: "If philosophy is to be restored to love and respect, I think it will be necessary, in part, to return to the teachings of the ancient philosophers, and in part to guard against the benefit of modern methods" (Theodicy, p. 146). He examined and analysed the fact of human knowledge, and obtained the following results: (1) that the notion or idea of being or existence in general enters into understanding, and without it, they would be impossible; (2) that this idea is essentially objective, inasmuch as what is seen in it as distinct from and opposed to the mind that sees it as the light from the eye that looks at it; (3) that it is essentially subjective and true idea, and that, being a priori and convertible terms, and because in the vision of it the mind cannot err, since error could only be committed by a judgment; and here there is no judgment, but a pure intuition affirming nothing and denying nothing; (4) that by the application of this essentially objective and true idea the human being intellectually perceives, first, the animal body individually conjugated with him, and then, on occasion of the sensations produced in him, not by himself, the causes of those sensations, that is, from the act itself he perceives and affirms a being, a mind, and therefore the true idea that acts on him, and therefore he gets at the external world—these are the true ideas of pure and simple affections, of the substance subject, of the particular being (subject), and (d) its essence or species as determined by the quality of the action felt from it (predicate); (5) that reflection, by separating the essence or species from the substance, obtains the categorial (universal) ideas, which can be obtained by leaving aside some of its elements, the abstract specific idea (abstraction); (6) that the mind, having reached this stage of development, can proceed to further and further abstracts, including the first principles of the sciences, the laws of physical, chemical, and theological, by the abstract ideas, the problems of the whole, and the supreme criterion of truth and certainty. This he believed to be the teaching of St Augustine, as well as of St Thomas, of whom he was an ardent admirer and defender.

Of his numerous works, of which a collected edition in 17 volumes was issued at Milan (1842–44), supplemented by Opere postume in 5 vols. (Turin, 1850–74), the most important are the New Essay on the Origin of Ideas (Eng. trans., 1839); The Principles of Moral Science (1831); The Principles of Political Science (1831); The Principles of Philosophy of Right (1841–45). The following have also been translated into English: A Catholic Catechism, by W. S. Agar (1849); The Fine Arts in Religion, trans. H. P. Lidder (1883); Maxims of Christian Perfection, by W. A. Johnson (1889); Psychology (Anonymous) (1884–88); Sketch of Modern Philosophy, by Lockhart (1862); The Ruling Principle of Method Applied to the Evangelical Church (Frances Ross, Mrs W. C. Church), trans. with Letters, by G. Gazzola. Rosmini's Sistema filosofico has been translated into English by Thos. Davidson (Rosmini's Philosophical System, 1882, with a biographical sketch and complete bibliography; see also Lives by G. S. Macaulay (1882) and G. B. Pagani (1900). C. Werner, Die Italienische Philosophie des 19. Jahrhunderts (1884); F. X. Kraus, "Antonio Rosmini: sein Leben, seine Schriften," in Deutsche Rundschau, liv. iv. (1888); "Church Reformation in Italy" in the Edinburgh Review, 1871 (July 1861); and numerous recent Italian works, for which Baldwin's Dictionary of Philosophy or Pagliani's Catalogo Generale (Milan, 1905) should be consulted.

ROSNY, JOSEPH HENRY, a pseudonym covering the collaboration of the French novelists, Joseph Henri Honnor Boë, born at Brussels in 1856, and his brother Séraphin Justin François Boë, born at Brussels in 1859. The novels of J. H. Rosny are full of scientific knowledge, of astronomy, anthropology, zoology and, above all, sociology. The stories are approached from the point of view of society rather than of the individual; in other words, the philosophically universal and intensely real, are only incidentally typical. The elder brother was the sole author of the earlier novels, and began novel-writing as an avowed disciple of Zola. Nell Horn, membre de l'armée du salut (1885) is a picture of London life and social reform; Le Bilatéral (1886) and Marc Fane (1888) describe the revolutionary and anarchistic parties of Paris; L'Immolation (1887) is a brutal story of peasant life; Le Tomite (1896) is a picture of literary life in Paris; and Vamîtrek (1897), with Erymîah (1895), and Les Profondeurs de Kyamo (short stories, 1896) and others deal with prehistoric man. MM. Rosny were among the writers who in 1887 entered a formal protest in the Figaro against Zola's La Terre, and they were designated by Edmond de Goncourt as original members of his academy. Among their later novels the most famous are: Donzel Valgratige (1861), a story of the future; possible and universally benevolent; L'Immolation (1884), an indictment of Parisian charity; L'Endompté (1885), the history of a medical student in Paris; Le Sorment (1866, dramatized 1867); Les Ames perdues (1890), another anarchist novel; La Charpente (1900); Thérèse Deguy (1902); Le Crime du docteur (1903); Le Docteur Harambure (1904); Le Milliardaire (1905); and Sous le fardeau (1906).

ROSS, ALEXANDER (1699–1784), Scottish poet, was born on the 15th of April 1699 at Kincardine-O'Neil, Aberdeenshire. He was educated at Marischal College, Aberdeen, and became tutor to the children of Sir William Forbes of Craigievar. He became in 1732 schoolmaster of Lochlie, Angus, where the rest of his life was spent. He had long been in the habit of writing verse for his own amusement, when in 1768 he published, at the suggestion of James Beattie, The Fortunate Shepherdess . . . to which is (sic) added a few songs. This is a pastoral narrative poem, written in obvious imitation of Allan Ramsay's Gentle Shepherd. Its affectations are chiefly on the surface. The background of shepherd life as known to Ross, and the rather sordid motives of the characters, despite their high-sounding names of Helenore, Rosalind, &c., are depicted with unwinking truth. He died at Lochlie, and was buried on the 26th of May 1784.

ROSS, GEORGE WILLIAM (1831–73), Canadian politician, was born near Nairn, Middlesex county, Ontario, on the 18th of September 1841, the son of James Ross and Ellen M'Kinnon, natives of Ross-shire, Scotland. From 1872-1883 he was a Liberal member of the Federal House; from 1883–99 minister of education in the legislature of the province of Ontario; and from 1899–1903 premier and treasurer of that province. In 1903 his government was defeated, and in 1909 he retired to the Canadian Senate. He was for many years president of the Ontario Rifle Association, and a well-known speaker on imperial questions.

ROSS, SIR NEW DALRYMPLE (1779–1868), British soldier, entered the Royal Military Academy, Woolwich, in 1793, and passed out into the Royal Artillery two years later. With the Royal Horse Artillery he saw active service during the Irish rebellion of 1798, and after eleven years' service was promoted captain and appointed to command a "A" troop R.H.A. (afterwards famous as the "Chesnut Troop"). In 1809 the troop landed at Lisbon and at once set out to join Wellington's army, reaching the front two days after Talavera. Ross's guns were attached to the Light Division, and, with Craufurd, took part in the actions on the COA and the battle of Busaco. When Masséna began his famous retreat from the lines of Torres Vedras, Ross's troop was amongst the foremost in the pursuit; at Redinha and Pombal, at Sabugal and Fuentes d'Oonor, the "Chesnut Troop" earned great distinction, and in December 1811 their commander received a brevet-major for his services. He was present at Ciudad Rodrigo and Badajoz, at the Salamanca forts and the battle of Salamanca, still attached to the Light Division. In the campaign of Vittoria, Ross's guns were continually with the most advanced troops, and after Vittoria they captured the only piece of artillery that remained to the defeated French. A further brevet-promotion and a good service reward came to him for his part in the campaign. At Vera in the Pyrenees Ross's troop was one of the three which played a decisive part in the action, and Vera remains a classical example of the action of horse artillery. "A" troop was engaged at St Pierre and Orthez, and at the conclusion of peace returned to England. It was engaged at Waterloo, and though half its guns were disabled the remainder
took part in the pursuit of the French. Ross received, besides the Peninsular and Waterloo medals, the K.C.B., the Portuguese order of the Tower and Sword and the Russian St Anne. He had commanded the troop for nineteen years when he last received a regimental lieutenant-colonelcy. As officer commanding Royal Artillery in the Northern District, with delegated command over all the forces of the four northern counties, Sir Hew Ross had for nearly sixteen years to deal with continually threatened civil disorder, and bore himself as well as on the field of battle. From 1840 to 1858, when he retired, he practically directed, in one post or another, all the artillery services of the British army, and when in 1854 the test of war came, the artillery took the field in a far better condition than the rest of Lord Raglan’s army. Much of the present efficiency of the “Royal Regiment” is directly traceable to the influence of Sir Hew Ross, to whom it owes the institution of the School of Gunnery at Shoeburyness and the establishment of the Royal Artillery Institution at Woolwich. Major-general in 1841 and lieu.-general in 1851, he became general in 1854, and died, a field-marshal and G.C.B., in 1868.

See Memoir of the R.A. Institution, 1871; and Duncan, History of the Royal Regiment of Artillery.

ROSS, SIR JAMES CLARKE (1800–1862), British rear-admiral and Polar explorer, was born in London on the 15th of April 1800. He entered the navy in 1812 under his uncle, Captain (afterwards Sir) John Ross, whom he accompanied on his first Arctic voyage in search of a North-West passage (1818). Between 1819 and 1827 he returned four times to the same seas in the Arctic expeditions under Parry, and in 1829–33 again served on the same mission under his uncle, and while thus employed determined (1831) the position of the North Magnetic Pole. In 1834 he was promoted captain, and from 1835–38 was employed on the magnetic survey of Great Britain. In 1839–43 he commanded the Antarctic expedition of the “Erebus” and “ Terror” (see Polar Regions), and for this service he received a knighthood (1844) and was nominated to the French order of the Legion of Honour. He published a narrative of this expedition under the title of A Voyage of Discovery and Research to Southern and Antarctic Regions (1847), and was the author also of various reports on zoological and other matters relating to his earlier voyages. He was elected to the Royal Society in 1848, and in that year made his last expedition, as captain of the “Enterprise,” in the first Franklin search expedition. He died at Aylesbury on the 3rd of April 1862.

ROSS, JOHN, or Kooskskwee (1790–1866), chief of the Cherokee Indian Nation, was of Scotch-Indian descent, and was born among the Cherokees in Georgia in 1790. In 1819–1827 he was president of the Cherokee national committee, in July 1827 he presided over the Cherokee constituent assembly, and under the constitution which it drafted he was principal chief from 1828 until his death. In 1830–31 he applied to the Supreme Court of the United States for an injunction restraining the state of Georgia from executing its laws within the Cherokee territory, but the court dismissed his suit on the ground that it had no jurisdiction. There was a small party among the Cherokees under the leadership of John Ridge, a subchief, who were early disposed to treat with the United States for the removal of their nation west of the Mississippi, and in February 1835, while negotiations with Ridge were progressing at Washington, Ross proposed to cede the Cherokee lands to the United States for $20,000,000. The United States Senate resolved that $5,000,000 was sufficient. The treaty with the Ridge party and the proposal to treat on the basis of a $5,000,000 settlement were both rejected in a full council of the Cherokees held in October 1835. The council authorized Ross to renew negotiations, but before leaving for Washington he was arrested by the Georgia authorities on the ground that he was a white man residing in the Indian country contrary to law. Ross was soon released, but in December of this year a few hundred Cherokees met the United States Indian commissioner at New Echota and concluded with him a treaty of removal. When Ross learned this he called a council to meet in February 1836, and at this meeting the treaty was declared null and void and a protest against the proceedings at New Echota was signed by more than 12,000 Cherokees. Notwithstanding Ross’s opposition, the Senate in the following May ratified the treaty by a vote exceeding by one the necessary two-thirds majority, and in December 1838, Ross, with the last party of Cherokees, left for the West. During the Civil War, Ross first urged upon the Cherokee Nation a policy of friendly inactivity; in May 1861, proclaimed a strict neutrality; in October 1861, signed a treaty with the Confederate States; in the summer of 1862 was forced (by Union sympathizers in the Nation) to proclaim neutrality again; soon afterwards went over to the Union lines; and was in Washington treating with the Federal government in February 1863 when the treaty with the Confederate States was abrogated by the Cherokees. He died at Washington on the 1st of August 1866.

ROSS, SIR JOHN (1777–1856), British rear-admiral and Arctic explorer, son of the Rev. Andrew Ross, minister of Inch, Wigtownshire, entered the Royal Navy in 1786, serving in the Mediterranean till 1790, and afterwards in the Channel. In 1808 he acted as captain of the Swedish Fleet, and in 1812 was promoted commander. Six years later he was given the command of an Arctic expedition fitted out by the Admiralty, the first of a new series of attempts to solve the question of a North-West passage. This expedition failed to discover much that was new, and somewhat prejudiced the Arctic reputation of its leader, who attained the rank of captain on his return. But in 1829, through the munificence of Mr (afterwards Sir) Felix Booth, he was able to undertake a second Arctic expedition, which, during an absence of four years, achieved important geographical and scientific results. On his return Captain Ross was the recipient of gold medals from the English and French geographical societies, and of various foreign orders, including a knighthood of the Polar Star of Sweden, and in the following year (1834) received a knighthood and a C.B. at home. In 1830 he undertook a third voyage to the Arctic regions, this time in search of Sir John Franklin, and in the following year he attained flag-rank. His publications include—Voyage of Discovery for the Purposes of Exploring Beaufort’s Bay (1819): Narrative of a Second Voyage in Search of a North-West Passage, including the Discovery of the North Magnetic Pole (1835); Memoirs and Correspondence of Lord de Sauxmers (1838).

ROSS, ROBERT (1766–1814), British major-general, entered the 25th Foot at the age of nineteen, and in 1795 became captain in the 7th Regiment, obtaining a half-pay majority a few months later. As a major of the 20th he served in Holland under the duke of York in 1799. At the action of Krabbenham the regiment greatly distinguished itself, though largely composed of raw militia recruits. Ross was here severely wounded. In 1801 the 20th went to Egypt and took part in the final operations which led to Menou’s surrender. In 1803, though lieutenant-colonel only by brevet, Ross succeeded to the command, and at once initiated a severe system of training, in barracks and in the field, in his regiment. The result of this was apparent when under Sir John Stuart’s command the regiment proceeded to Naples. The 20th played a decisive part in the brilliant action of Maida, and distinguished itself not less in the subsequent storm of the castle of Scylla. In 1808–9 Ross and the 20th formed part of Anstruther’s brigade of Sir John Moore’s army in Spain, but though the statement that he bore the brunt of its good fortune was lessless accurate than any other officer in the department, the report that Corunna is incorrect, the regiment was among the best disciplined in the army. Later in 1809 it was sent to Walcheren, where few soon laid low two-thirds of the men. Ross and his regiment were then sent to Ireland to recover, and here the colonel repeated the course of drill and manoeuvre which had so markedly improved the 20th in Malta. He received a gold medal for Corunna and a sword of honour for Maida (which action had already won him a
ROSS—ROSS AND CROMARTY 741

gold medal). At the end of 1812 the 20th was again engaged in the Peninsula, and Major-General Ross early in the following year received a brigade command in Cole's division. Scarcely engaged at Vittoria, Ross's brigade played a distinguished part in the operations around Pamplona, and the 20th covered itself with glory at Roncevalles and Sorauren. At Orthez Ross was severely wounded at the head of the brigade, which was assaulting the village of St Boës. He was among those who received the thanks of parliament for this battle, and he received the gold medal for Vittoria and the Peninsula gold medal. At the end of the war Ross was sent in command of a brigade to harry the coast of North America, and with 4500 men and three light guns landed in Maryland. At Bladensburg the Americans stood to fight in a strong position, but Ross's men routed them (Aug. 24, 1814). The same evening Washington was entered, and, the public buildings having been destroyed, the expedition re-embarked. This short and brilliant campaign excited the admiration of soldiers, critics and public alike, but the commander did not live to receive his reward. A few days later an expedition against Baltimore was undertaken; skirmishing soon began, and one of the first to fall was Ross. A public monument was erected to his memory in St Paul's Cathedral, and others at his residence at Rostrevor and at Halifax, N.S. His family was granted the name Ross of Bladensburg by royal letters-patent.

See Gentleman's Magazine, 1814, ii. 483; Cole, Peninsula Generals; Smythe, History of the 20th Regiment.

ROSS, a market town in the Ross parliamentary division of Herefordshire, England; 133 m. W. by N. from London and 12 S.E. from Hereford by the Great Western railway. Pop. of urban district (1901) 3505. It occupies a fine position on and about a rocky eminence on the left bank of the river Wye. There are manufactures of machinery and agricultural implements, and trade in the products of the district, such as cider and malt, and several fairs are held annually. The church of St Mary the Virgin stands high, and is surmounted by a lofty spire; it shows good Decorated and Perpendicular work. A beautiful terrace called the Prospect adjoins the churchyard and overlooks the river. The market house, dated 1670, is a picturesque building supported on columns, the upper portion serving as a town hall. There are in the town many memorials of John Kyre, the Man of Ross, who died here in 1724, and is buried in his third church (1732). The Prospect was acquired and laid out by Kyre, who also incorporated the fine elm avenues near the church; his house stands opposite the market house, where he disbursed his charities; he erected the church spire, and is buried in the chancel, where his grave remained without a monument until Pope called attention to the omission. Nearly opposite the town is Wilton Castle, which defended the ford in the disturbed reign of Stephen, and suffered in the Civil Wars, being held for the Parliament and burned by the Royalists. The inhabited portion is modern. Four miles below Ross the important ford of Goodrich probably carried traffic in British and Roman times, and a magnificent castle, on a precipice rising sheer above the right bank of the river, commands it. The keep is doubtfully assigned to a date previous to the Conquest; the important position, especially on the Welsh March led to several subsequent additions, especially in the 14th century, and the castle was only dismantled by order of the Parliamentarians after it had strongly resisted their arms on behalf of Charles I. in 1646, being the last to fall of the royal strongholds in this county.

Ross (Ros, Rosse) was granted to the see of Hereford by Edmund Ironside, but became crown property by an exchange effected in 1559. It derived importance from its situation on the road to South Wales. In 1305, only, it was represented in parliament by 2 Members; but it was incorporated, and was governed by appointees of the manor court, until the Ross Improvement Act of 1865 established elected commissioners of the borough. Fairs on the days of the Ascension, Corpus Christi, St Margaret and St Andrew were conferred by Henry III., and were in existence in 1888. A market every Thursday was granted by Stephen and confirmed by Henry III.; Friday is now market day.

ROSS AND CROMARTY, a northern county of Scotland. The mainland portion is bounded N. by Sutherland and Dornoch Firth, E. by the North Sea and Moray Firth, S. by Beauty Firth and Inverness-shire and W. by the strait of the Minch. The island portion, consisting of as much of the island of Lewis as lies north of a line drawn from Loch Resort to Loch Sealfirth, is bounded for the W., N. and E. by the Atlantic, and S. by Harris, the southern part of Lewis. Many islands, all but eleven uninhabited, are scattered principally off the west coasts of Lewis and the mainland. The area of the mainland is 1,572,294 acres and of the islands 404,413 acres, giving a total for the county of 1,976,707 acres or 3088 sq. m. The inhabited islands belonging to the mainland are all situated off the west coast. They are Gillean (lighthouse) in the parish of Lochalsh, Croulin in Applecross, Horisdale, Dry and Ewe in Gairloch parish, and Martin and Tanera More, of the group of the Summer Isles in the parish of Lochbroom. On the North Sea front the chief indentations are Beauty Firth and Inner Moray Firth, marking off the Black Isle from Inverness-shire. Cromarty Firth, bounding the districts of Easter Ross and the Black Isle; Moray Firth, separating Easter Ross from Nairnshire; and Dornoch Firth, dividing north-east Ross from Sutherlandshire. On the Atlantic face—which is a coastline of more than 300 m.—the principal sea lochs and bays, from S. to N., are Loch Duich, Loch Alsh, Loch Carron, Loch Kishorn, Loch Torridon, Loch Shieldaig, Upper Loch Torridon, Gairloch, Loch Ewe, Gruinard Bay, Little Loch Broom and Enard Bay. The chief capes are Tarbat Ness on the east coast, and Coygach, Greenstone, Reith, Red and Hamha Points on the west. Almost all the southern boundary with Inverness-shire is guarded by a rampart of peaks, among them An Ria-bhachan (3606), Sgurr na Lapach (3773), Carn Eige (3877), Mam Soul (3862), Ben Attow (3838), Scour Ouran (3505), famous for its view from the summit, Ben Mohr (3570) and the Saddle (3317). To the north of Glen Torridon occur the masses of the Liathach, with peaks of 3456 and 3358 ft., and Ben Eay with four peaks above 3000 ft. each. On the north-eastern shore of Loch Maree rises Ben Slioch (3217), while the Fannich group contains at least six peaks of more than 3000 ft. The immense isolated bulk of Ben Wyvis (3429), and its subordinate peaks An Soach (3050) and An Cabar (3106), is the highest mountain feature on Ross and Cromarty. Hills in the north-west with peaks of 3483 and 3478 ft. are equally conspicuous, though less solitary. Only a small fraction of western and southern Ross is under 1000 ft. in height. Easter Ross and the peninsula of the Black Isle are comparatively level. The longest stream is the Orrin, which rises in An Sithean and pursues a course mainly E. by N. to its confluence with the Conon after a run of about 26 m., during a small part of which it forms the boundary with Inverness-shire. At Aultgowrie the stream rushes through a narrow gorge where the drop is considerable enough to make the falls of Orrin. From its source in the mountains in Strathvaich the Blackwater flows S.E. to join the Inver, till it joins the Conon, forming soon after it leaves Loch Garve the small but picturesque falls of Rogie. Within a short distance of its exit from Loch Luiuchart the Conon pours over a series of graceful cascades and rapids and then pursues a winding course of 12 m., mainly E. to the head of Cromarty Firth. The falls of Glomach, in the south-west, are the deepest in the United Kingdom. The stream giving rise to them drains a series of small lochs on the northern flanks of Ben Attow and, in an almost unbroken sheet about 40 ft. broad, effects a sheer leap of 370 ft., and soon afterwards ends its course in the Elchail. The falls are usually visited from Invershiel, 7 m. to the south-west. Twelve miles south by west of the woody, hilly, western coast, more, are the falls of Measach, formed by the Droma, a headstream of the Broom. The cascades, three in number, are close to the gorge of Corriehalloch. The Oykell, throughout its course, forms the boundary with Sutherlandshire, to which
it properly belongs. The largest and most beautiful of the many freshwater lakes is Loch Maree (q.v.), but a few of the others are interesting. In the far north-west, 243 ft. above the sea, lies Loch Skinskink, a lake of such irregularity of outline that it has a shore-line of 17 m. It contains several islands covered with rich woods affording a shelter to deer, and drains into Enard Bay by the Polly. Loch Fada (the "long loch"), 1005 ft. above the sea, is 32 m. in length, has a greatest breadth of 13 m., covers an area of 15 sq. m., and is 248 ft. deep, with a mean depth of 102 ft. Once drained of the Muic, it was drained by the Shaslaigh, which has lowered the level of the lake sufficiently to behead the Muic. Other lakes are, north of Loch Maree, Loch Fionn (the "white" or "clear" lake), 8 m. long by 1 m. wide, famous for its heronries; towards the centre of the shire, Loch Luichart (5 m. long by from 3 m. to nearly 1 m. wide), fringed with birches and having the shape of a crescent; the mountain-girt Loch Fannich (7 m. long by 1 m. wide); and the wild narrow lochs Monar (4 m. long) and Mullardoch (5 m. long), on the Inverness-shire boundary. Of the straths or valleys the more important run from the west forwards, and are Stornoway, Duich, and Skinaskink, the latter from the area of Lesser Halkirk to Stornoway (10 m.) Strebeg, (8 m.), Strathpeffer (6 m.) and Strathcarbon (14 m.). Excepting Glen Orrin (13 m.), in the east central district, the longer glens lies in the south and towards the west. In the extreme south Loch Shiel (9 m.) runs between fine mountains to its mouth on Loch Duich. General Wade's road passes down the glen. Farther north are Glen Elchaig (9 m.), Glen Carron (12 m.), in the latter of which the track of the Dingwall & Skye railway is laid, and Glen Torridon (6 m.).

Geology.—The central portion of this county is occupied by the younger Highland schists or Dalradian series. These consist of quartzes, mica-schists, garnetiferous mica-schists and gneisses, all with a gentle inclination towards the S.E. On the eastern side of the county the Dalradian schists are covered unconformably by the Old Red Sandstone, the boundary line following the southward flank of the Dornoch Firth, by Strathpeffer, to the neighbourhood of Beauty. These rocks comprise red flags and sandstones, grey bituminous flags and shales. An anticlinal fold with a S.W.-N.E. axis brings up the basal beds of the series about the mouth of Cromarty Firth and exposes once more the schists in the Sutors guarding the entrance to the firth. The western boundary of the younger schist is formed by the great pre-Cambrian dislocation line which traverses the county in a fairly direct course from Elphin on the north by Ullapool to Glenlearn. Most of the area west of the line of disturbance is covered by Torridonian Sandstone, mainly dark reddish sandstones, grey micaschist, quartz conglomerate, the anticlinal folds with the sandstones, gneisses with horizontal or slightly inclined bedding. The unconformity is well exposed on the shores of Girloch, Loch Maree and Loch Scavaig. These rocks, which attain a considerable thickness and are divisible into three series, form a framework built up the eastern districts about Applecross, Coigach and elsewhere. Within the Torridonian tract the older, Lewisian gneiss occupies large areas north of Loch Coigach, on the east of Enard Bay, between Grunivack Bay and Loch Maree; between the last named and Girloch, on both sides of middle Loch Torridon and at many spots smaller patches are to be found. The Lewisian gneiss is everywhere penetrated by basic dikes, generally with a N.-S.-E. direction; some of these are of great breadth. The Torridonian rocks are succeeded unconformably by a series of Cambrian strata which is confined to a variable but, on the whole, narrow belt lying west and southwest of the Torridonian thrusting. The Cambrian gneiss with horizontal or slightly inclined bedding, which generally is composed of the following subdivisions in ascending order: false-bedded slates, Gray Rock* (granite gneiss) with a foliated band, serpulite girt, Dunnach dolomite and marble, Dunnach dipolite and limestone: but these are not always visible at any one spot. Great has been the disturbance in the region of thrusting that in some places gneiss and granite gneiss are seen contiguous within a seam of coal. Glacial strie are found upon the mountains up to heights of 3000 ft., and much boulder clay is found in the valleys and spread over large areas in the eastern districts. Raised beaches occur at 160, 155, 151, 145 and 130 ft. above the present sea-level. The former forms the Bearnack near Loch Carron. Lewis, on Long Island, is made almost entirely of ancient Lewisian gneiss; but a little Torridonian occurs about Stromness.

Climate and Agriculture.—On the west the coast is excessively, averaging for the year 50-42 in. at Loch Broom and 62 in. at Strone Ferry (autumn and winter being the wettest seasons), but on the east coast the annual is only about 27 in. The temperature for the year is about 52°F. and for July 68°F. The most fertile tracts lie on the eastern and, especially, in Easter Ross and the Black Isle, where the soil varies from a light sandy gravel to a rich deep loam. Among grain crops oats is the dominant crop, but barley is of general importance. Turnips and potatoes are the chief green crops. On the higher grounds there is a large extent of good pastureland which carries heavy flocks of sheep, blackfaced being the principal breed. Most of the heavy ploughwork is done with small horses, partly by teams of oxen and generally by the crofters. Owning partly to the overcrowding of the island of Lewis and partly to the unkindly nature of the bulk of the soil, the subsoil is often composed of the heather-lichen rich peat crottle—the number of small holdings is enormous, Sutherlandshire alone amongst Scottish counties showing an even larger proportion of holdings under 5 acres; while the average size of all the holdings throughout the shire does not exceed 20 acres. About 800,000 acres are devoted to deer forests, a greater area than in any other county in Scotland, among the largest being Achnasheen (50,000 acres), Fannich (20,000), Kinlochluichart (20,000), Brnmore (40,000), Inch-ryan (23,000), which includes part of Inverness-shire. Herring, cod and ling form the principal catch, while salmon are taken in large quantities in the bays and at the mouth of the rivers. Distilleries are found near Dingwall, Tain and some other places, and there are manufactories, on a very limited scale, of woollens, chemical manures and aferated waters, besides some sandstone quarrying and flour mills. At Muir of Ord, in the parish of Urray, are held great horse, cattle and sheep markets.

The Highland railway entering the county to the north of Beauly runs northwards to Dingwall, and then strikes off to the north-east by Invergordon and Tain, where it bends to the west by north, back to the shore at Dingwall and along the coast as far as the coast throughout. At Muir of Ord it sends off to the Black Isle branch and at Dingwall a branch to Strathpeffer, as well as a line to Strome Ferry and Kyle of Lochalsh on the south-western shore. Coaches run to various districts with stations on the Dingwall & Skye railway.

Population and Administration.—The population of the county in 1891 was 78,727, and in 1901 that of the mainland was 47,501, and of the islands 28,949, an aggregate of 76,450 or 25 to the sq. m. Thus Ross and Cromarty, though the third largest in size, is the least populated county in Scotland, excepting Sutherland, Inverness and Argyll. In 1901 there were 12,171 persons who spoke Gaelic only (of whom 9928 belonged to the islands) and 39,392 speaking Gaelic and English (15,992 of whom were insular). The chief towns and villages are Stornoway, Dingwall (23,000), Tain (26,077), Cromarty (12,442), Invergordon (10,895). Ullapool is a small fishing port near the mouth of Loch Broom. For administrative purposes the county is divided into six districts, namely, Black Isle (pop. 6721), Easter Ross (12,192), Lewis (28,760), Mid Ross (12,053), South-Western Ross (4103) and Western Ross (5304). The county returns one member to parliament, and Cromarty, Dingwall and Tain belong to the Wick group of parliamentary burghs, and Fortrose to the Inverness group. Excepting Cromarty, these are royal burghs, and Dingwall is the county-town. Ross and Cromarty forms a sheriffdom with Sutherlandshire, and there are resident sheriffs-substitute at Dingwall and Stornoway, the former also sitting at Tain and Cromarty. The shire is under school-board control, and there are academies at Tain, Dingwall and Fortrose, while several schools earn grants for higher education. The county council gives the "residue" grant
ROSSANO—ROSSBACH

ROSSANO, a city of Calabria, Italy, in the province of Cosenza, 24 m. N.N.E. from that town direct, with a station 4 m. distant on the line from Metaponto to Reggio. Pop. (1901) 13,354. It is picturesquely situated on a precipitous spur of the mountain mass of Sila overlooking the Gulf of Taranto, the highest part of the town being 975 ft. above sea-level. Rossano is the seat of an archbishop, and in the cathedral is preserved the Codex Rossanensis, an uncial MS. of the Gospels of Matthew and Mark in silver characters on purple vellum, with twelve miniatures, of great interest in the history of Byzantine art, belonging to the 6th century A.D. It was brought to Grottaferrata (q.v.) for the exhibition of Byzantine pictures.

ROSSBACH, a village of Prussian Saxony in the district of Merseburg, 8 m. S.W. of that place and N.W. of Weissenfels, famous as the scene of Frederick the Great's victory over the allied French and the army of the Empire on the 5th of November, 1757. For the events preceding the battle see SEVEN YEARS' WAR. The Prussian camp on the morning of the 5th lay between Rossbach (left) and Bedra (right), facing the Allies, who, commanded by the French general, Charles de Rohan, prince de Soubise (1715–1787), and Joseph Frederick William, duke of Saxe-Hildburghausen (1722–1787), General Feltzkeim- meister of the Empire, had manoeuvred in the preceding days without giving Frederick an opportunity to bring them to action, and now lay to the westward, with their right near Branderoda and their left at Mücheln (see sketch). The advanced posts of the Prussians were in the villages immediately west of their camp, those of the Allies on the Schortau hill and the Galgenberg.

The Allies possessed a numerical superiority of two to one in the battle itself, irrespective of detachments, and their advanced post overlooked all parts of Frederick's camp. They had the best of it in the manoeuvres of the previous days, and Frederick's position was passive. He had some difficulty, however, in inducing Soubise to risk a battle, and the Allies did not begin to move off their camping-ground until after eleven on the 5th. Soubise's intention was probably to engage as late in the day as possible, with the

1 V. der Goltz (Rossbach bis Jena, 1906 edition) gives 41,000 Allies and 21,600 Prussians as the combatant strengths. Berndt's statistical work, Zahlen im Kriege, gives the respective forces engaged as Allies 43,000, Prussians 21,000. Other accounts give the Allies' total strength as 64,000 and the Prussians as 24,000.
idea of gaining what advantages he could in a partial action. The plan was to march the Allied army by Zeuchfeld, round Frederick's left (which was covered by no serious natural obstacle), and to deploy in battle array, facing north, between Reichartsbergen (right) and Pettstädt (left). The duke's proposed battle and the more limited aim of Soubise were equally likely to be attained by taking this position, which was off to the rear of Frederick's line of the towers on the Isle. This position, equally, could only be gained by marching round the Prussian flank, i.e. by a flank march before the enemy. The obvious risk of interference on the exposed flank was provided against by a considerable flank guard, and in fact it was not in the execution of their original design but in hastily modifying it to suit unfounded assumptions that the Allies met with disaster.

Frederick spent the morning watching them from a house-top in Rosbach. The initial stages of their movement convinced him that the Allies were retreating southward towards their magazines, and about noon he went to dinner, leaving Captain von Gallúd on the hill. This officer gave a distinct impression of the Allies' intentions, for the columns which from time to time became visible in the undulations of the ground were seen to turn eastwards from Zeuchfeld. Without exciting expectation, the first served on the line Frederick in his error. But when the king saw for himself that hostile cavalry and infantry were already near Pettstädt, he realized the enemy's intentions. The battle for which he had manoeuvred in vain, he had to fight, and he took it without a moment's delay. Leaving a handful of light troops to oppose the French advanced post (or flank guard) on the Schortau hill, the Prussian army broke camp and moved—half an hour after the king gave the order—to attack the enemy. The latter was marching in the normal order in two main columns, the first line on the left, the second line on the right; farther to the right was a column consisting of the reserve of infantry, and between the first and second lines was the reserve artillery on the road. The right-wing cavalry was of course at the head, the left-wing cavalry at the tail of the two main columns. At first the regulation distances were preserved, but when wheeling echelon, Frederick's army came in no confusion, part of the reserve cavalry getting in between the two main columns and hampering the movements of the reserve artillery, and the rest, on the outer flank of the wheel, being unable to keep up with the over-rapid movement of the wheeling pivot. A weak flank guard was thrown out towards Rosbach. When it was seen that the Prussians were moving, as far as could be judged, eastward, it was presumed that they were about to retreat in order to avoid being taken in flank and rear and the Allied generals then hurried the men of the Allies on the leading (right-wing) cavalry towards Reichartsbergen, and calling up part of the left-wing cavalry from the tail of the column, advanced toward cavalry, and covering the left, to turn flank. That Frederick's move meant an attack upon them before they could form up, Soubise and the duke failed to realize. They had taken more than three hours to break camp, and found it difficult to support Frederick's army coming up in that time. It was obvious, moreover, that the Prussians were not deploying for battle on the plain in front of Rosbach and Nahlendorf.

Frederick had no intention either of forming up parallel to the enemy's line, but he decided to employ the reserve in the direction in which the enemy's head moved in the columns, in order to avoid being taken in flank; if they were still on the move in columns eastwards or north-eastwards, the heads of their columns would be crushed before the reserve made a deployment in the new direction; if in echelon, the French would be unable to deploy in the new direction in those days being a lengthy affair. To this end General von Seydlitz, with many available squadrons, hurried eastward from Rosbach, behind the Janus Hügel, to the Pölzen Hügel; Colonel von Moller, with a drawn sword, came forward in action on the Hügel hill at 3:15 against the advancing columns of the Allied cavalry; and the infantry followed as fast as possible. When they came under the fire of Moller's guns, the Allied squadrons, which were now north of the Hügel, and in good order and well disposed, were repulsed by their own. It was a peculiarly advantageous position; but it was usual to employ heavy guns to protect a retreat, and they contented themselves with bringing some field-guns into action. They were, however, amazed when Seydlitz's thirty-eight squadrons suddenly turned upon the leading and right flank of their columns from the Pölzen Hügel with une incroyable vitesse. Gallantly as the leading German regiments deployed to meet them, their result was scarcely in doubt. That the French threw in his last squadron, and then himself fought like a trooper, receiving a severe wound. The mêlée drifted rapidly southward, past the Allied infantry, and Seydlitz finally rallied his horsemen in a hollow near Tangermünde. As a result of this battle, no fresh service could be prepared for a new engagement, and the episode was over in half an hour, and by that time the Prussian infantry, in echelon from the left, was descending the Janus Hügel

echelon from the left, and the leftmost battalions that had repulsed the French columns were quickly within musket-shot of this helpless mass. A few volleys directed against the head and left flank of the column sufficed to create disorder, and then from the Tagewerben hollow Seydlitz's rallied squadrons charged, wholly unexpectedly, upon its right flank. The Allied infantry thereupon broke and fled. Soubise and the duke, who was wounded, succeeded in keeping one or two regiments together, but the rest scattered over the countryside. The battle lasted less than an hour and a half, and the last episode of the infantry fight no more than fifteen minutes. Seven Prussian battalions only were engaged, and these expended five to fifteen rounds per man. Seydlitz and Prince Henry of Prussia, the cavalry and the infantry leaders engaged, were both wounded, but the total loss of the king's army was under 550 officers and men as compared with 7700 on the part of the Allies.

ROSE, EARL OF, a title borne by the Irish family of Parsons. James Parsons, a native of Leicestershire, who flourished in the 16th century, was the father of Sir William Parsons (c. 1570-1650), one of the lords justices of Ireland. Having crossed to Ireland in early life, William Parsons became surveyor-general in 1602 and obtained land in various parts of the country. In 1620 he was made a baronet; in 1643 he was deprived of his office as lord justice, and he died early in 1650. His great-grandson, Sir Richard Parsons, bart. (c. 1657-1703), was created Baron Oxmantown and Viscount Rosse in 1681, and Richard's son and successor, Richard (d. 1741), was made earl of Rosse in 1729. The titles became extinct when Richard, the 2nd earl, died in August 1760. Sir William Parsons had two brothers, Sir Lawrence and Sir Fenton Parsons. Sir Lawrence, second baron of the Irish exchequer, left a son, William (d. 1653), who defended BIRR Castle, King's County, for over a year against the Irish during

1 Figures again vary in different authorities. The above figure is that given by Berndt, Zähl im Kriege.
the rebellion of 1644, and whose son, Sir Lawrence Parsons (d. 1648), was made a baronet in 1677. This Sir Lawrence was a strong Protestant, and was found guilty of high treason, being attainted and sentenced to death during the brief period of James II’s ascendency in Ireland. He was not executed, however, and afterwards took some part in the struggle against the supposed James II. His descendant, Robert, 2nd Earl of Harman Parsons (1749-1807), was created Baron Oxmantown in 1792, Viscount Oxmantown in 1795, and earl of Rosse in 1806. He died on the 20th of April 1827, and was succeeded by his nephew Lawrence.

Lawrence Parsons, 2nd earl of Rosse (1758–1841), the eldest son of Sir William Parsons, bart. (d. 1791), of Birr Castle, was born on the 21st of May 1758. Educated at Trinity College, Dublin, he entered the Irish parliament as member for the university in 1782, and soon came to the front in debate. A friend and follower of Henry Flood, he has been described as “one of the very, very few honest men in the Irish House of Commons.” He lavoured some measure of relief to Roman Catholics and also parliamentary reform, a speech which he delivered on this question in 1793 being described by W. E. H. Lecky as “exceedingly valuable to students of Irish history”; but he disliked and opposed the union of the parliaments of Great Britain and Ireland. After this event, however, he represented King’s County in the united parliament until 1807, and he was a representative peer for Ireland from 1809 to 1841. He died at Brighton on the 24th of February 1841. Rosse wrote Observations on the Bequest of Henry Flood to Trinity College, Dublin, in a reference, with an account of the Ancient History of Ireland (Dublin, 1795). His eldest son was the astronomer William Parsons, 3rd earl of Rosse (see below).

ROSSE, WILLIAM PARSONS, 3rd Earl of (1800–1867), Irish astronomer and telescope constructor, was born at York on the 17th of June 1800, a son of the 2nd earl (see above). Until his father’s death he was known as Lord Oxmantown. Entered at Trinity College, Dublin, in 1818, he proceeded to Magdalen College, Oxford, in 1821, and in the same year he was returned as M.P. for King’s County, a seat which he resigned in 1834. He was Irish representative peer from 1845; president of the British Association in 1843; president of the Royal Society from 1849 to 1854, and chancellor of the university of Dublin from 1862. From 1827 he devoted himself to the improvement of reflecting telescopes; in 1839 he mounted a telescope of 3 ft. aperture at his seat, Birr Castle, Parsonstown; and in February 1843 his celebrated 6-foot reflector was finished. Owing to the famine and the disturbed state of the country, which demanded his attention as a large landowner and lieutenant of King’s County (from 1831), the instrument remained unused for nearly three years, but since 1848 it has been in constant use, chiefly for observations of nebulae, for which it was particularly suited on account of its immense optical power, more than any other. Lord Rosse died at Monkstown on the 21st of October 1867. He had four sons. The eldest, Lawrence Parsons, 4th Earl of Rosse, and Baron Oxmantown, born on the 17th of November 1840, succeeded to the title on his father’s death, and made many investigations on the heavenly bodies, particularly on the radiation of the moon and related physical questions; the youngest, the Hon. Charles Algeron Parsons, born on the 13th of June 1854, is famous for his commercial development of the steam turbine.

The first constructor of reflecting telescopes on a large scale, William Parsons, who died in 1834, was remarkable for his experiments in casting and polishing specula, and he does not appear to have been very successful beyond specula of 18 in. diameter, his 4-foot speculum ("the 4-foot telescope") having been little used by him (see discussion between Sir J. Herschel and Robison in The Athenaeum, Nos. 831–36, 1843). Lord Rosse had therefore no help towards his brilliant results. His speculum metal is composed of copper, 4 parts; tin, 2 parts; and one of (58-9 parts), a brilliant alloy, which resists tarnish as effectively as any other ever tried. Chiefly owing to the britteness of this material, Lord Rosse’s first larger speculum were composed of a number of thin plates of speculum metal (sixteen for a 3-foot mirror) soldered on the back of a strong but light framework made of a peculiar kind of brass (27-4 of copper to 1 of zinc), which has the same expansion as his speculum metal. In Brewster’s Edinburgh Journal of Science for 1828 he described the machine. This compound, which he states, was to all essential points remained unaltered afterwards. It imitates the motions made in polishing a speculum by hand by giving both a rectilinear and a lateral motion to the polisher, while the speculum metal revolves around its axis, by slow and rapid oscillations; the polisher is allowed to vibrate or rest, and the specimen of the polished form after it may be seen by the polisher can be varied at will from a straight line to an ellipse of very small eccentricity, and a true parabolic figure can thus be obtained. The speculum lies face upwards in a shallow bath of water, to preserve a certain temperature and to prevent any possible cases of cracking. As the polishing is going on, the instrument is allowed to cool down slowly as the work advances, as also to provide for the further expansion of the pitch with which the polisher is coated. In September 1839 a 3-foot speculum was made, and mounted on an altazimuth stand similar to Herschel’s; but, though the definition of the images was more delicate, the diffraction at the joints of the speculum caused minute rays in the case of a very bright star), and its peculiar skeleton form allowed to follow the rays very quickly, Lord Rosse decided to cast a solid 3-foot speculum. Hitherto it had been felt as a great difficulty in casting specula that the solidification did not begin at one surface and proceed gradually to the other, the common method of cooling the edges to a cool first, so that the central parts were subject to great straining when their time of cooling came, and in large castings this generally caused cracking. By forming the bottom of the mould of hoop iron placed upon the speculum and the sides of the mould being left open, Lord Rosse overcame this difficulty, and the hoop iron had the further advantage of allowing the gas developed during the process to escape, thus preventing the speculum from being full of pores and cavities. The inner part of the casting of a solid 3-foot speculum in 1840, and encouraged Lord Rosse to make a speculum of 6 ft. diameter in 1842. In the beginning of 1845 this great reflector was mounted and ready for work. The instrument has a focal length of 54 ft. and the tube is about 7 ft. in diameter; owing to these large dimensions it cannot be pointed to every part of the heavens, but can only be moved a shed distance from the zenith and very little to the north of the zenith; these restrictions have, however, hardly been felt, as there is as almost at any moment a sufficient number of objects within its reach.

From 1848 to 1878 it was but with few interruptions employed for observations of nebulae (see Nebula); and many previously unknown features in these objects were revealed by it, especially the variety of "annular" and "planetary" nebulae, and the remarkable "spiral" configuration prevailing in many of the brighter nebulae. A special study was made of the nebula of Orion, and the resulting large drawing gives an extremely good representation of this complicated object. (See Telescope.)

Lord Rosse gave a detailed account of the experiments which step by step had led to the construction of the 3-foot speculum in the Philosophical Transactions for 1840. In the same publication was also published a paper "On the Construction of Specula of 6-ft. Aperture, and a Selection from the Observations of Nebulae made with it," with numerous engravings of the objects and the observations given in these papers, however, were fragmentary; but in 1879–80 a complete account of them was published by the present earl ("Observations of Nebulae and Clusters of Stars made with the 6-foot and 3-foot Reflectors at Birr Castle from 1848 to 1878") in the Scient. Trans. R. Dublin Soc. vol. ii. The drawing of the nebula of Orion was published in the Phil. Trans. for 1868–69. See obituary notice in the Proc. Roy. Soc. (1868), 16, 36, and in the Monthly Notices of Roy. Astr. Soc. vol. 29, p. 123.

ROSSELLI, COSIMO (1439-c. 1507), Florentine painter, was born in 1439. At the age of fourteen he became a pupil of Neri di Bicci, and in 1460 he worked as assistant to his cousin Bernardo di Stefano Rosselli. The first work of Cosimo mentioned by Vasari exists in S. Ambrogio, in Florence, over the third altar on the left. It is an "Assumption of the Virgin," a youthful and felicitous work. In the same church, on the wall of one of the chapels, is a fresco by Cosimo which Vasari praises highly, especially for a portrait of the young scholar Pico di Mirandola. The scene, a procession bearing a miracle-working chalice, is painted with much vigour and less luminous tint than all this artist's other works. Rosselli was appointed painter for the church of the Annunziata, with figures of S. Barbara, Matthew and the Baptist, is in the Academy of Florence. Rosselli also spent some time in Lucca, where he painted several altar-pieces for various churches. A picture attributed to him, taken from the church of S. Girolamo at Fiesole, is now in the National Gallery of London. It is a large retable, with, in the
centre, St Jerome in the wilderness kneeling before a crucifix, and at the sides standing figures of St Damasus and St Euschius, St Paolo and St Eustachia; below is a predella with small subjects. Though dry and hard in treatment, the figures are designed with much dignity. The Berlin Gallery possesses three pictures by Rosselli: “The Virgin in Glory,” “The Entombment of Christ,” and “The Massacre of the Innocents.” In 1480 Rosselli, together with the chief painters of Florence, was invited by Sixtus IV. to Rome to assist in the painting of the frescoes in the Sistine Chapel. Three of these were executed by him—“The Destruction of Pharaoh’s Army in the Red Sea,” “Christ Preaching by the Lake of Tiberias,” and “The Last Supper.” The last of these is well preserved, but is a mediocre work. Vasari’s story about the pope admiring Rosselli’s paintings more than those of his able brother painters has probably little foundation. Rosselli’s Sistine frescoes were partly painted by his assistant Piero di Cosimo, who was so called after Cosimo Rosselli. His chief pupil was Fra Bartolommeo. According to Vasari, Rosselli died in 1484, but this is a mistake, as his will exists dated 25th of November 1506 (see Gaye, Car. ined. ii. 457 n.).

For an account of Rosselli’s Sistine frescoes, see Platter and Bunsen, Beschreibung der Stadt Rom, ii. pt. i.; and Rumohr, Italien. Forschungen, ii. 285.

ROSSELLINO, ANTONIO (1427-1479), Florentine sculptor, was the son of Matteo di Domenico Gamberelli, and had four brothers, who all practised some branch of the fine arts. Almost nothing is known about the life of Antonio, but many of his works exist, and are full of religious sentiment, and executed with the utmost delicacy of touch and technical skill. The style of Antonio and his brother Bernardo is a development of that of Donatello and Ghiberti; it possesses all the refinement and sweetness of the earlier masters, but is not equal to them in vigour or originality. Antonio’s chief work, still in perfect preservation, is the lovely tomb of a young cardinal prince of Portugal, who died in 1459. It occupies one side of a small chapel, also built by Rossellino, on the north of the nave of San Miniato al Monte.1 The recumbent effigy of the cardinal rests on a handsome sarcophagus, and over it, under the arch which frames the whole, is a beautiful relief of the Madonna between two flying angels. The tomb was begun in 1461 and finished in 1466; Antonio received four hundred and twenty-five gold florins for it. A reproduction of this tomb with slight alterations, and of course a different effigy, was made by Antonio for the wife of Antonio Piccolomini, duke of Amalfi, in the church of S. Maria del Monte at Naples, where it still exists. For the same church he also executed some delicate reliefs, which perhaps err in being too pictorial in style, especially in the treatment of the backgrounds. A fine medallion relief by him in marble, originally modelled in terra-cotta, is preserved in the Bargello at Florence (see fig.).

ROSSELLINO, BERNARDO (1436-1464), Florentine sculptor, was no less than his younger brother Antonio. His finest piece of sculpture is the tomb, in the Florentine Santa Croce, of Leonardo Bruni of Arezzo, the historian of Florence, executed in 1443 some years after Bruni’s death; the recumbent effigy is of great merit. The inner cardinal pulpit at Prato, circular in form on a tall slender stem, was partly the work of Mino da Fiesole and partly by Bernardo Rossellino. The latter executed the minute reliefs of St Stephen and the Assumption of the Virgin. For his part in the work he received sixty-six gold florins. The South Kensington Museum possesses a relief by Bernardo, signed and dated (1456). It is a fine portrait of the physician Giovanni da S. Miniato. Bernardo’s works as an architect were numerous and important, and he was also a skilful military engineer. He restored the church of S. Francia at Assisi, and designed several fine buildings at Civita Vecchia, Orvieto and elsewhere. He also built fortresses and city walls at Spoleto, Orvieto and Civita Castellana. He was largely employed by Nicholas V. and Pius II. for restorations in nearly all the great basilicas of Rome, but little trace of his work remains, owing to the sweeping alterations made during the 17th and 18th centuries. Between the years 1461 and 1464 (when he died while engaged on the Lazzari monument at Pistoia) he occupied the important post of capo-maestro to the Florentine duomo. A number of buildings at Pienza, executed for Pius II., are attributed to him; the Vatican registers mention the architect of these as M° Bernardo di Fiorenza, but this indication is too slight to make it certain that the elder Rossellino is referred to (see Vasari, ed. Milanesi, iii. 93 seq.).

See Wilhelm Bode, Die Italienische Plastik (Berlin, 1902).

ROSSETTI, CHRISTINA GEORGINA (1830–1894), English poet, was the youngest of the four children of Gabriele Rossetti (see the article on her brother DANTE GABRIEL ROSSETTI). She was born at 38 Charlotte Street, Portland Place, London, on the 5th of December 1830. She enjoyed the advantages and disadvantages of the strained relations of parents and English eccentrics which her father gathered about him, and she shared the studies of her gifted elder brother and sister. As early as 1847 her grandfather, Gaetano Polidori, printed privately a volume of her Verses, in which the richness of her vision was already faintly prefigured. In 1850 she contributed to The Germ seven pieces, including some of the finest of her lyrics. In her girlhood she had a grave, religious beauty of feature, and sat as a model not only to her brother Gabriel, but to Holman Hunt, to Madox Brown and to Millais. In 1853-54 Christina Rossetti nearly for a year helped her mother to keep a day-school at Frome-Selwood, in Somerset. Early in 1854 the Rossettis returned to London, and the father died. In poverty, in ill-health, in extreme quietness, she was now performing her life-work. She was twice sought in marriage, but each time, from religious scruples (she was a strong high-church Anglican), she refused her suitor; on the former of these occasions she sorrowed greatly, and her suffering is reflected in much of her early song. In 1861 she saw foreign countries for the first time, paying a six weeks’ visit to Nor- mandy and Paris. In 1862 she published what was practically her earliest book, Goblin Market, and took her place at once among the poets of her age. In this volume, indeed, is still to be found a majority of her finest writings. The Prince’s Progress followed in 1866. In 1867 she, with her family, moved to 56 Euston Square, which became their home for many years. Christina’s prose work Commonplace appeared in 1870. In April 1871 her whole life was changed by a terrible affliction, known as “Graves’s disease”; for two years her life was in constant danger. She had already composed her book of children’s poems, entitled Sing-Song, which appeared

Marble Relief by Antonio Rossellino.
in 1872. After a long convalescence, she published in 1874 two works of minor importance, Annum Domini and Speaking Likenesses. The former is the earliest of a series of theological works in prose, of which the second was Seek and Find in 1876. In 1881 she published a third collection of poems, A Pageant, in which there was evidence of slackening lyrical power. She now gave herself almost entirely to religious and temperance work. The most interesting and personal of her prose publications (but it contained verse also) was Time Flies (1885)—a sort of symbolic diary or collection of brief homilies. In 1890 the S.P.C.K. published a volume of her religious verse. She collected her poetical writings in 1891. In 1892 she was led to publish a very bulky commentary on the Apocalypse, entitled The Face of the Deep. After this she wrote little. Her last years were spent in retirement at 30 Torrington Square, Bloomsbury, which was her home from 1876 to her death. In 1892 her health broke down finally, and she had to endure terrible suffering. From this she was released on the 29th of December 1894. Her New Poems were published posthumously in 1896. In spite of her manifest limitations of sympathy and experience, Christina Rossetti takes rank among the foremost poets of her time. In the purity and solidity of her finest lyrics, the glow and music in which she robes her moods of melancholy reverence, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti, in her best pieces, may challenge comparison with the most admirable of our poets. The union of fixed religious faith with the physical beauty and the richer parts of nature has been pointed to as the most original feature of her poetry. Hers was a cloistered spirit, timid, nun-like, bowed down by suffering and humility; her character was so retiring as to be almost invisible. All that we really need to know about her, save that she was a great saint, was that she was a great poet.

The Family Letters of Christina Rossetti were edited by W. M. Rossetti in 1908.

**ROSSETTI, DANTE GABRIEL** (1828–1882), English poet and painter, whose full baptismal name was Gabriel Charles Dante, was born on the 12th of May 1828, at 38 Charlotte Street, Portland Place, London. He was the first of the two sons and the second of the four children of Gabriele Rossetti (1783–1854), an Italian poet and liberal, who, about 1824, after many vicissitudes connected with the part he played in the Naples reform movement against Ferdinand I., came to England, where he married in 1836 Frances Mary Polidori (d. 1886), sister of Byron's physician, Dr John Polidori, and daughter of a Tuscans, Gaetano Polidori, who had already youth been Alferi's secretary and who had married an English lady. In 1831 he became professor of Italian in King's College, London, and afterwards achieved a recognized position as a subtle and original, if eccentric, commentator on Dante. In 1852 he published a volume of Italian religious poems. His family, besides Dante Gabriel, consisted of Maria Francesca (1827–1876), who eventually entered an Anglican sisterhood—she is known to Dante scholars by her valuable Shadow of Dante; William Michael (b. 1829), a well-known man of letters who from 1845 to 1894 was in the Inland Revenue Office—he married a daughter of Ford Madox Brown; and Christina (q.v.), the poet. The literary spirit was strongly entrenched here; and the talent which was always distinguished in William Michael rose to the height of rare genius in Dante Gabriel and Christina.

Dante Rossetti's education was begun at a private school in Foley Street, Portland Place, where he remained, however, only nine months, from the autumn of 1835 to the summer of 1836. He next went (in the autumn of 1836) to King's College School, where he remained till the summer of 1843, having reached the fourth class. From early childhood he had displayed a marked propensity for drawing and painting. It had there-fore from the first been tacitly assumed that his future career would be an artistic one, and he left school early. In Latin, however, he was already fairly proficient for his age; French he knew well; Italian he had spoken from childhood, and he had some German lessons about 1844–45. But, although he learned enough German to be able to translate the Arme Heinrich of Hartmann von Aue, and some portions of the Nibelungenlied, he afterwards forgot the language almost entirely. His Greek too, such as it had been, he lost. On leaving school he went (1843) to Cary's Art Academy (previously called Sass's), near Bedford Square, and thence obtained admission to the Royal Academy Antique School towards 1846. Of the artistic education of foreign travel Rossetti had very little. But in early life he made a short tour in Belgium, where he was indubitably much impressed and influenced by the works of Van Eyck, Memling and Brugiaro.

It may be convenient to interpolate here a continuous account of Rossetti's career as a pictorial artist. Being much impressed by some of the early works of Ford Madox Brown exhibited at the Academy (1841), Westminster Hall (1844–45) and the British Institution (1845), he sought from that master of technical technical instruction of a more direct and stringent kind than he had previously submitted to. Brown, ever generous in that way, undertook without a fee the training of Rossetti as a painter, and set him to work upon such rudimentary studies as pickle-pots and other "still-life." The pupil's course of such work was, as might be expected, short; the master's example and that of Millais, together with the uncompromising energy of Holman Hunt, with both of whom Rossetti became intimate about this time, helping and encouraging him. Most of all, perhaps, so far as his temporary impressions were concerned, a picture of Brown's which was shown at the "Free Exhibition," Hyde Park Corner, in the spring of 1845 profoundly affected Rossetti. This was, of course, months before the formation of the Pre-Raphaelite Brotherhood in the autumn of the last-named year, when five painter-students, a sculptor (Thomas Woolner) and a layman (W. M. Rossetti) agreed upon certain principles they desired should obtain in art. None of the five owned the initiative of his views to any of the others or to Brown, whose impulse was purely technical and connected with Rossetti only; neither Millais, Holman Hunt, J. Collinson nor F. G. Stephens needed the help of Madox Brown. The point of Pre-Raphaelite crystallization which had so great though brief an influence upon Rossetti's life and art was found at a chance meeting of Rossetti, Millais and Holman Hunt in Millais's house in Gower Street, where certain prints from early Italian frescoes were studied. The enthusiasm of Rossetti led him to propose the formation of a "Brotherhood of more or less earnest men aiming at lofty aims than artists generally venture to announce. This took effect; the views of the remaining three men were already known, and in a few days they joined the new society and took their shares in the obloquy which attended the doings of Millais, Hunt and Collinson. Brown, though invited, declined to become a P.R.B. Rossetti's first effort was by means of "The Girlhood of Mary, Virgin," which in March 1849 was exhibited at Hyde Park Corner. It was a picture which attested the prodigious value of his studies since the previous October, and the native genius of the painter and the sincere passion with which he had accepted the obligations of Pre-Raphaelitism, as they were then, but not for long, understood. Nothing of his painting was more independent than the invention of "The Girlhood of Mary, Virgin"; indeed the design for it was made some half a year before the meeting in Gower Street, though the execution of this work owed not a little to the influence, if not the actual help, of Millais and Hunt. Its mysticism was Rossetti's own, its technique owed something to Brown. On the whole, there can be no doubt that in this work was the first pronouncement of a new view of art, a fresh technique and power rapidly developing itself. Of course, the style of this noteworthy and epoch-making picture was
jeuje, its handling was timid, while its coloration and tonality were dry, not to say thin. Such was Rossetti's advent in art under the Pre-Raphaelite banner. The picture's reception was not encouraging, nor did the next work from his hands induce him to emerge from that profound exclusiveness in which all such minds and his are content to abide. The diverse moods of the other Brothers chose otherwise; but of Rossetti's immediate circle it has been truly said: "It appears that of seven young men and Brethren five have attained eminent positions, four of them being pre-eminent, although for years after the society was formed no single member, whatever his position might be, escaped insult, obloquy and wicked and malicious misrepresentation. The more conspicuous the Brother [e.g. Millais], the more outrageously was he attacked."

No estimate of Rossetti's genius, his triumph and his life as a whole can be justly based without ample allowance being made for the circumstances which attended his advent as a painter. "Ecce Ancilla Domini!" the smaller picture which is now in the National Gallery of British Art at Millbank, was the one perfect outcome of the original motive of the Pre-Raphaelite Brotherhood by its representative and typical member. It is replete with the mystical mood which then ruled the painter's mind; that mood chose what may be called virginal white and its harmonies as its aptest coloration, and the intense light of morning sufficed for its tonality. It was exhibited at the Portland Gallery in 1850. After these pictures were finished, the outside world saw no more of Rossetti as a painter, and he prepared itself to see modern art from a higher plane than before.

In December 1859 there appeared the first number of The Germ, a magazine (which lasted for only four numbers) in which Rossetti had a leading place as the poet in verse and prose. The influence of Robert Browning upon Rossetti was more potent in The Germ than in that splendid romance in water-colours called "The Laboratory," where a court lady of the ancien régime visits an old poison-monster to obtain from him a fatal potion for her rival in love. This wonderful gem of colour, glowing in lurid and wicked passion and voluptuous suggestion, marked the opening of the artist's second period and signalized his departure from that phase of Pre-Raphaelitism of which "Ecce Ancilla Domini!" was the crowning achievement, and, so far as he was concerned, the artistic ne plus ultra. Millais and the other Brothers remained faithful during several years yet to come. Later in 1859, Rossetti produced the original, which is in ink, of the famous "Hesterna Rossa," a gambling scene of men and their mistresses in a tent by lamplight, while pallid dawn gathers force between the trees without. Then came from his hands "Borgia," which, like "The Laboratory," is in water-colours, and, like "Hesterna Rossa," is a sardonic tragedy. "How they met Themselves" came next, and, in illustrating a legend similar to that of the Doppelgänger, affirmed the force, the originality and the tragic passion of Rossetti's genius. Two lovers are walking in a twilight wood, where they are confronted suddenly by their apparitions, pertaining death. The year 1852 produced "Giotto painting Dante's Portrait," and saw a new development of the painter's mind and mood, dashed with a humour not often to be seen in him. In its somewhat dry coloration it differed from the ardent jewel-like glow and deeper gloom of "Borgia" and its successor and the sumptuous visions of womanhood in later pictures. "Found." Rossetti's sole contribution of the sort which Mr Holman Hunt affected, was begun somewhere about this period; but this piece of pictorial moralizing (the analogue of the poet's own "Jenny"), vigorous and intensely pathetic as it is, was never really finished by its author, being, indeed, far remote from Rossetti's inner self, which was rather other-worldly of didactic art, and thoroughly indisposed towards attempts to ameliorate anybody's condition by means of pictures. Nor did the stringency of naturalistic painting suit his mood or his experience. Nevertheless, what is his in the existing picture remains a masterpiece of poetry with exquisitely finished parts.

Passing a few fine but comparatively unimportant drawings, such as "Lancelot and Guinevere at the Tomb of Arthur," "Lancelot looking at the Dead Lady of Shalott," "Mariana of the South," "Sir Galahad," "The Blue Closet," and various works in the subject of nature and the sea, we may note that the artist illustrated by five cuts Poems by Alfred Tennyson, on which Millais and Mr Holman Hunt were also engaged, and which was published by Moxon in 1857. As in "Ecce Ancilla Domini!" we had virginal white and morning light employed to strengthen the mystical significance of the design, so in "Borgia" Venetian voluptuousness and sensuous splendours obtained, and in "The Blue Closet" is a very potent and suggestive exercise intended to symbolize the association of colour with music. The last is one of the subllest of the artist's "Inventions," and it shows how he had developed upon "Borgia" an artistic sympathy which is but too likely to be "the more refined, the less admirable," is not so fine; nor was "Lancelot's Dream of the Sangreal," Rossetti's part in the luckless decorations of the Oxford Union (1857–58); nor are "Guinevere and Sir Lancelot," "Galahad in the Chapel" and other Arthurian examples quite worthy of his art. "Boca Baccata," the super-sensuous portrait of a woman, a work of wonderful fire, and the pictures on the pulpit at Llandaff Cathedral, marked the expiration of the second epoch in Rossetti's art and the beginning of a new, the third, last and most powerful of all the phases of his career. The picture "Dr Johnson at the Mitre," when the "pretty fools" consulted the lexicographer anent Methodism, is a good example of his youth.

In 1861 Rossetti produced several fine designs for stained glass, and in the revival of stained-glass painting as an art he had a larger share than has frequently been ascribed to him. The practice of designing upon a large scale, and employment of masses of splendid though deep-toned colours, had probably something to do with the prodigious development of his powers and the enlargement of his views as regards painting which took effect at this period (1862–65). At this time a striking and highly imaginative triptych, representing three events in the careers of Paolo and Francesca, was produced; it is a great improvement upon an earlier design. There is unprecedented energy in the group of the lovers embracing in the garden-house just as they have paused in reading the fatal romance. The composition of this group, with the circular window behind their figures, is as fine as it were comparatively novel in Rossetti's practice. Its lurid coloration was so thoroughly in harmony with the pathos of the subject that in this respect the work excelled all the painter had previously produced. The same elements, energy, a sympathetic and poetic scheme of colour, and composition of a fine order, combined with far greater force and originality in "The Bride," or "The Beloved," that magnificent illustration of The Song of Solomon. The last named is a life-size group of powerfully coloured and diversely beautiful damsel accompanying their mistress with music and song on her way to the bridgroom. This picture, as regards its brilliance, finish, the charms of four lovely faces and the splendour of its lighting, occupies a great place in the highest grade of modern art of all the world. It is likewise, so far as the qualities named are concerned, the crowning piece of Rossetti's art, and stands for him much as the "Sacred and Profane Love" of Titian represents that master. Very fine, indeed, but hardly so passionate and virile, is the "Beata Beatrix," now in the National Gallery of British Art with "Ecce Ancilla Domini!" which he produced thirteen years earlier. These works belong to a category of fine and quite original examples, all replete with something of the real.
similar technical qualities, poetry and pathos. The group comprises paintings by which Rossetti is best known, such as "The Blessed Damozel," "The House of Life," which he painted while he was engaged on the illustrations for Tennyson's "The孮asian Games," whose author he felt to be the most original, if not indeed the most poetical and powerful, of all his output; "Sibylla Palmifera," "Venus Verticordia," "Lilith" (the better of the two versions is now referred to), "Washing Hands," "Monna Vanna," "Il Rosamoccolo," "Aurea Catena," "La Pia," "Rosa Triplex," "Veronica Veronese," "La Ghirlandata," "Pandora," "The Blessed Damozel," and, last and largest, but not, perhaps, the greatest of his paintings (a distinction for which "The Bride" and "Proserpina" must contend), the famous "Dante's Dream," now in the Walker Art Gallery at Liverpool. Besides these, Rossetti produced a large number of fine things. Nearly the whole sibyls in his drawings exhibited by the Royal Academy—these and an "Engagement"—were brought to the Burlington Fine Art Club in 1883, after their author's death.

Meanwhile, the literary side of Rossetti had developed pari passu with his achievements as a painter. The goal before the young Rossetti's eyes was to reach through art the forgotten world of old romance—that world of wonder and mystery and spiritual beauty which the old masters knew and could have painted had not lack of science, combined with slavery to monkish traditions of asceticism, crippled their strength. In that great rebellion against the renascence of classicism which (after working much good and much harm) resulted in the 18th-century literature—"in that great movement of man's soul which may be appropriately named "the Renascence of the Spirit of Wonder in Poetry and Art"—he had become the acknowledged, a protagonist before ever the Pre-Raphaelite brotherhood was founded, and so he remained down to his last breath. It was by inevitable instinct that Rossetti turned to that mysterious side of nature and man's life which to other painters of his time had been a mere fancy-land, to be visited, if at all, on the wings of sport. For if there is any permanent vitality in the Renascence of Wonder in modern Europe, if it is really the inevitable expression of the soul of man in a certain stage of civilization (when the sanctions which have made and moulded society are found to be not absolute and eternal, but relative, mundane, ephemeral and subject to the higher sanctions of unseen powers that work behind the "shews of things"), then perhaps one of the first questions to ask in regard to any imaginative painter of the 19th century is, In what relation did he stand to the newly awakened spirit of romance? Had he a genuine and independent sympathy with that temper of wonder and mystery which all over Europe had preceded and now followed the temper of imitation, prosaic acceptance, pseudo-classicism and domestic materialism? or was his apparent sympathy with the temper of wonder, reverence and awe the result of artistic environment dictated to him by other and more powerful and original souls around him?

We do not say that the mere fact of a painter's or a poet's showing but an imperfect sympathy with the Renascence of Wonder is sufficient to place him below a poet in whom that sympathy is more nearly complete, but we do say that, other things being equal or anything like equal, a painter or poet of this time is to be judged very much by his sympathy with that great movement, which we call the Renascence of Wonder because the word "romanticism" never did express it even before it had been vulgarised by French poets, dramatists, doctriñeres and literary harlequins. To struggle against the prim traditions of the 18th century, the unities of Aristotle, the delineation of types instead of characters, as Chateaubriand, Madame de Staël, Balzac and Hugo struggled, was well. But in studying Rossetti's works we reach the very key of those "high palaces of romance" which the English mind had never, even in the 18th century, wholly forgotten, but whose mystic gates no Frenchman ever yet unlocked. Not all the romantic feeling to be found in all the French romanticists (with their theory that not earnestness but the grotesque is the life-blood of romance) could equal the romantic spirit expressed in a single picture or drawing of Rossetti's, such, for instance, as Beata Beatrix or Pandora. For, while "For instance, when 'Angelo' (which was engraved by the author from one of the drawings known from English examplars) of Novalis, Tieck, and Herder—cleverly simulated the old romantic feeling, the "beautifully devotional feeling" which Holman Hunt speaks of, Rossetti was steeped in it; he was so full of the old frank childlike wonder and awe which preceded the great renascence of materialism that he might have lived and worked amidst the old masters. Hence, in point of design, so original is he that to match such ideas as are expressed in "Lilith," "Hestern Rosa," "Michael Scott's Wooing," the "Sea Spell," &c., we have to turn to the sister art of poetry, where only we can find an equally powerful artistic representation of the idea at the core of the romantic movement and an insight into the everyday man through his sense of beauty. We must turn, we say, not to art—not even to the old masters themselves—but to the most perfect efflorescence of the poetry of wonder and mystery—to such ballads as the "Demon Lover," to Coleridge's "Christabel" and "Kubla Khan," to Keats's "La Belle Dame sans Merci," for parallels to Rossetti's most characteristic designs. Now, although the idea at the heart of the highest romantic poetry (alleged perhaps to that apprehension of the warping of man's soul with the appetites of the flesh which is the basis of the Christian idea) may not belong exclusively to the romantic temper (the Greeks, and also most Asiatic peoples, were more or less familiar with it, as we see in the Saladin and Absol of Jami), yet it became peculiarly a romantic note, as is seen from the fact that in the old masters it resulted in that asceticism which is its logical expression and which was once an inseparable incident of all romantic art. But in order to express this stupendous idea as fully as the poets have expressed it, how is it possible to adopt the asceticism of the old masters? This is the question that Rossetti asked himself, and answered by his own progress in art. In all of his pictures, the poorest and the best, is displayed that power which Blake calls vision—the power which, as he finely says, is "surrounded by the daughters of inspiration," the power, that is, of seeing imaginary objects and dramatic actions—physically seeing them as well as mentally— and flashing them upon the imaginations (even upon the corporeal senses) of others.

Mr. W. M. Rossetti (in the Preface to the Collected Works, 1886) has given an interesting account of his brother's literary nurturing. Shakespeare, Walter Scott, Byron, the Bible were the earliest influences: then Shelley, Mrs Browning, the older English and Scottish ballads, and Dante. Afterwards he preferred Keats to Shelley. By 1847 he was "deep in Robert Browning." Malory's Mort d'Arthur, about 1856, engrossed him; Victor Hugo and De Musset, among French poets, were his delight. In his last years he had an enthusiasm for Chatterton. From childhood's days he had loved to compose, but The Germ (1850) contained Rossetti's first published prose or verse. In it appeared "The Blessed Damozel," the prose poem "Hand and Soul," six sonnets and four lyrics. "The Blessed Damozel" was written so early as 1847 or 1848. "Sister Helen" was produced in its original form in 1850 or 1851. His translations from the early Italian poets also began as far back as 1845 or 1846, and may have been mainly completed by 1849. He published a volume of The Early Italian Poets (Dante and his Circle) in 1861. In 1856 he contributed to the Oxford and Cambridge Magazine, in which among other things the "Burdens of Nineveh" appeared. Materials for a volume of original poetry accumulated slowly, and these having been somewhat widely read in manuscript had a very great influence upon contemporary poetic literature long before their appearance in print. He had intended to publish a volume in 1862, but the death of his wife (see below) caused its postponement till 1870. In poetry no less than in art what makes Rossetti so important a figure is the position he took up with regard to the modern revival of the "romantic" spirit. The Renascence of Wonder culminates
in Rossetti's poetry as it culminates in his painting. The poet who should go beyond Rossetti would pass out of the realm of poetry into pure mysticism, as certain of his sonnets show. Fine as are the sonnets (of which the sonnet sequence, the "House of Life," in the 1881 volume, may be specially mentioned), it is in his romantic ballads that Rossetti (notwithstanding a certain ruggedness of movement) shows his greatest strength. "Sister Helen," "The Blessed Damozel," "Staff and Scrip," "Eden Bower," "Troy Town," "Rose Mary," as representing the modern revival of the true romantic spirit, take a place quite apart from the other poetry of the time.

Rossetti's poetry, and his prose too, is marked by an extraordinary fastidiousness of expression and beauty of diction; the form and colour of his style are alike marvellous in clearness and loveliness of language. But the dominant characteristic, after all, is the underlying idea, the romantic motive. By the revival of the romantic spirit in English poetry we mean something much more than the revival, at the close of the 18th century, of natural language, the change discussed by Wordsworth in his famous Preface, and by Coleridge in his comments thereon—that change of diction and of poetic methods which is commonly supposed to have arisen with Cowper, or, if not with Cowper, with Burns. The truth is that Wordsworth and Coleridge were near the great changes in question, and they themselves took too active a part in those changes, to hold the historical view of what the changes really were. Important as was the change in poetic methods which they admirably practised and discussed, important as was the revival of natural language, which then set in, it was not nearly so important as that other revival which had begun earlier and of which it was the outcome—the revival of the romantic spirit, the Renascence of Wonder, even beneath the weight of 18th-century diction, the first movement of which is certainly English, and neither German nor French in its origin, and can be traced through Chatterton, Macpherson and the Percy Ballads.

As a mere question of methods, a reaction against the poetic diction of Pope and his followers was inevitable. But, in discussing the romantic temper in relation to the overthrow of the bastard classicism and didactic materialism of the 18th century, we must go deeper than mere artistic methods in poetry. When closely examined, it is in method only that the poetry of Cowper is different from the ratiocinative and unromantic poetry of Dryden and Pope and their followers. Pope treated prose subjects in the ratiocinative—that is to say, the prose—temper, but in a highly artificial diction which people agreed to call poetic. Cowper treated prose subjects too—treated them in the same prose temper, but used natural language; a noble thing to do. But the change (in poetic methods means the chief part) of the great work achieved by English poetry at the close of last century. That period, to be sure, rendered obsolete the poetic diction of Pope; but it introduced something more precious still—entire freedom from the hard rhetorical materialism imported from France; it gave a new seeing to English eyes, which were opened once more to the mystery and the wonder of the universe and the romance of man's destiny; it revived, in short, the romantic spirit, but the romantic spirit enriched by all the clarity and sanity that the renascence of classicism was able to lend. Of the great movement which substituted for the didactic materialism of the 18th century the new romanticism of the 19th, the leaders were Coleridge and Scott, admirably followed by Byron, Shelley and Keats. Not that Wordsworth was a stranger to the romantic temper. The magnificent image of Time and Death under the yew tree is worthy of any romantic poet that ever lived, yet it cannot be said that he escaped save at moments from the comfortable 18th-century didactics, or that he was a spiritual writer in the sense that Coleridge, Blake and Shelley were spiritual writers.

Of the true romantic feeling, the ever-present apprehension of the spiritual world and of that struggle of the soul with earthly conditions which we have before spoken of, Rossetti's poetry is as full as his pictures—so full, indeed, that it was misunderstood by certain critics, who found in the most spiritualistic of poets and painters the founder of a "fleshy school." Although it cannot be said that "The Blessed Damozel," "Sister Helen," "Rose Mary" reaches to the height of the masterpieces of Coleridge, the purely romantic temper was with Rossetti a more permanent and even a more natural temper than with any other 19th-century poet, even including the author of "Christabel" himself. As to the other 19th-century poets, though the Etrick Shepherd in "The Queen's Wake" shows plenty of the true feeling, Hogg's verbosity is too great to allow of really successful work in the field of romantic ballad, where concentrated energy is one of the first requisites. And even Dobell's "Keith of Ravelston" has hardly been fused in the fine atmosphere of fairyland. Byron's "footlight boggles" and Shelley's metaphysical abstractions are very personal also, with the inner core of romance, and we have only to consider Keats, to whose "La Belle Dame sans Merci" and "Ever of St Mark," Rossetti always acknowledged himself to be deeply indebted. In the famous close of the seventh stanza of the "Ode to a Nightingale":

"Charmed magic casements opening on the foam Of perilous seas in faery lands forlorn"—

there is of course the true thrill of the poetry of wonder, and it is expressed with a music, a startling magic, above the highest reaches of Rossetti's poetry. But, without the evidence of Keats's two late poems, "La Belle Dame sans Merci" and "Ever of St Mark," who could have said that Keats showed more than a passing apprehension of that which is the basis of the romantic temper—the supernatural? In contrasting Keats with Rossetti, it must always be remembered that Keats's power over the poetry of wonder came to him at one flash, and that it was not (as we have said elsewhere) "till late in his brief life that his bark was running full sail for the enchanted isle where the old ballad writers once sang and where now sate the wizard Coleridge alone." Though outside Coleridge's work there had been nothing in the poetry of wonder comparable with Keats's "La Belle Dame sans Merci," the latter had previously in "Lamia" entirely failed in rendering the romantic idea of beauty as a maleficient power. The reader, owing to the atmosphere surrounding the dramatic action being entirely classic, does not believe for a moment in the serpent woman. The classic accessories suggested by Burton's brief narrative hampered Keats where to Rossetti (as we see in "Pandora," "Cassandra" and "Troy Town") they would simply have given birth to romantic ideas. It is perhaps with Coleridge alone that Rossetti can be compared as a worker in the Renascence of Wonder. Although his apparent lack of rhythmical spontaneity places him below the great master as a singer (for in these miracles of Coleridge's genius poetry ceases to appear as a fine art—all—it is the inspired song of the changeling child "singing, dancing to itself"), in permanence of the romantic feeling, in vitality of belief in the power of the unseen, Rossetti stands alone. Even the finest portions of his historical ballad "The King's Tragedy" are those which deal with the supernatural.

The events of Rossetti's life may be briefly summarized. In the spring of 1860 he married Elizabeth Eleanor Siddall, a milliner's assistant, who, being very beautiful, was constantly painted and drawn by him. From 1836 onwards he had been very intimate with William Morris and Edward Burne-Jones, who had the greatest affection and artistic admiration for him. Two late poems, "La Belle Dame sans Merci" and "Rossetti's Wake," whose health was delicate, had one still-born child in 1861, and she died from an overdose of laudanum in February 1862. Rossetti then moved from Blackfriars to 16 Cheyne Walk, Chelsea, where for a short time George Meredith, A. C. Swinburne and W. M. Rossetti lived with him. Mrs Rossetti's own water-colour designs show an extraordinary genius for invention and a rare instinct for colour. Rossetti felt her death so acutely that in the first paroxysm of his grief he insisted upon his poems (then in manuscript) being buried in her coffin. But in 1869 the manuscripts were disinterred, and published in 1870. From this time to his death he
continued to write poems and produce pictures—in the latter relying more and more upon his manipulative skill but exercising less and less his exhaustless faculty of invention.

In 1871 an unsigned article in the *Contemporary Review* (by Robert Buchanan) on the "Fleshy School of Poetry" made a fierce attack on Rossetti's poems from what was intended to be a moral point of view, to which he answered by one on the "Stealthy School of Criticism." The attack was deeply felt by him, and increased his tendency—previously tempered by natural high spirits—towards gloomy brooding. About 1868 the curse of the artistic and poetic temperament, insomnia, attacked him. One of the most distressing effects of this malady is a nervous shrinking from personal contact with any save a few intimate and constantly seen friends. This peculiar kind of nervousness may be aggravated by the use of narcotics, and in his case was aggravated to a very painful degree; at one time he saw scarcely any one save his own family and immediate family connexions and the present writer. He was frequently away with William Morris at Kelsmoat, in Oxfordshire. During the time that his second volume of original verse, *Birchington-on-Sea,* was passing through the press (in 1881) his health began to give way, and he left London for Cumberland. A stay of a few weeks in the Vale of St John, however, did nothing to improve his health, and he returned much shattered. He then went to Bircbrington-on-Sea, but received no benefit from the change, though affectionately tended by friends like Hall Caine and others already mentioned; and, gradually sinking from a complication of disorders, he died on Sunday the 9th of April 1882.

In all matters of taste Rossetti's influence has been immense. The purely decorative arts (see ARTS AND CRAFTS) he may be said to have rejuvenated directly or indirectly. And he left the deepest impression upon the poetic methods of his time.

One of the most wonderful of Rossetti's endowments, however, was neither of a literary nor an artistic kind: it was that of a rare and most winning personality which attracted towards itself, as if by an unconscious magnetism, the love of all his friends, the love, indeed, of all who knew him. (T. W.-D.)

for his cantata Il pianto d’armonia per la morte d’Orfeo. Between 1810 and 1813, at Bologna, Rome, Venice and Milan, Rossini produced operas of which the successes were varying. All memory of them is eclipsed in that of Tancredi. The libretto was an arrangement of Voltaire’s tragedy by J. A. Rossi. Traces of Paër and Paisiello were undeniable present in fragments of the music. But all critical feeling on the part of the public was affected by the softness and clarity produced by such melodies as “Mi rivedrai, ti rividerò” and “Di tanti palpiti,” the former of which became so popular that the Italians would sing it in crowds at the law courts until called upon by the judge to desist. Rossini continued to write operas for Venice and Milan during the next few years, but their reception was tame and in some cases unsatisfactory after the success of Tancredi. In 1815 he retired to his home at Bologna, where Barbaja, the impresario of the Naples theatre, who had once been a waiter in a coffee-house and now combined the business of theatrical management with that of farming the public gaming-tables, concluded an agreement with him by which he was to take the musical direction of the Teatro San Carlo and the Teatro Del Fondo at Naples, composing for each of them one opera a year. His payment was to be 200 ducats (about £35 or $175) per month; he was also to receive a share in the gaming-tables amounting to about 1000 ducats (£175 or $875) per annum. The presence of Zingarelli and Paisiello in Naples was an incentive to intrigue against the success of the youthful composer, but all hostility was made futile by the enthusiasm which greeted the court performance of his Elisabetta regina di Pastora, which Paisiello, who subsequently became the composer’s wife, took a leading part. The libretto of this opera by Schmidt was in many of its incidents an anticipation of those presented to the world a few years later in Scott’s Kenilworth. The opera was the first in which Rossini wrote the ornaments of the airs instead of leaving them to the fancy of the singers, and also the first in which the recitative secco was replaced by a recitative accompanied by a quartet of strings. In Almaviva, produced in the beginning of the next year in Rome, the libretto, a version of Beaumarchais’ Barbiere de Seville by Sterbini, was the same as that already used by Paisiello in his Barbier, an opera which had enjoyed European popularity for more than a quarter of a century. The indignation of Paisiello’s admirers expressed itself strongly on the production of the new setting, but in the thirteen days devoted to the composition of his Almaviva, Rossini had created such a masterpiece of musical comedy that the fame of Paisiello’s opera was transferred to his, to which the title of Il Barbiere di Siviglia passed as an inalienable heritage. Between 1815 and 1823 Rossini produced twenty operas. Of these Otello formed the climax to his reform of serious opera, and offers a suggestive contrast with the treatment of the same subject at a similar point of artistic development by the composer Verdi. In Rossini’s time the tragic close was so distasteful to the public of Rome that it was necessary to invent a happy conclusion to Otello; and there are still places in Italy in which the Shakespearean end of the story can never be performed without interruption from the audience, who warn Desdemona of Otello’s deadly approach. Conditions of stage mechanism in 1817 are illustrated by Rossini’s acceptance of the subject of Cinderella for a libretto only on the condition that the supernatural element should be omitted. The opera Cenerentola is to be ranked with the Barbiere. The absence of a similar precaution in the construction of his Mosè in Egitto led to disaster in the scene depicting the passage of the Israelites through the Red Sea, when the defects in stage contrivance always raised a laugh, so that the composer was at length compelled to introduce the chorus “Dal tuo stellato Soglio” to divert attention from the dividing waves. In 1821, three years after the production of this work, Rossini married Isabella Colbran. In 1822 he directed his Cenerentola in Vienna, where Zelmira was also performed. After this he returned to Bologna; but an invitation from Prince Metternich to come to Verona and “assist in the general re-establishment of harmony” was too tempting to be refused, and he arrived at the Congress in time for its opening on the 20th of October 1822. Here he made friends with Chateaubriand and Madame de Léven. In 1823, at the suggestion of the manager of the King’s Theatre, London, he came to England, being much fixed on his way through Paris. In England he was given a generous welcome, which included an introduction to King George IV. and the receipt of £7000 after a residence of five months. In 1824 he became musical director of the Théâtre Italien in Paris at a salary of £800 per annum, and when the agreement came to an end he was rewarded with the offices of chief composer to the king and inspector-general of singing in France, to which was attached the same income. The production of his Guillaume Tell in 1829 brought his career as a writer of opera to a close. The libretto was by Étiene Jouy and Hippolyte Bis, but their version was revised by Armand Marrast. The music is remarkable for its freedom from the conventions discovered and utilized by Rossini in his earlier works, and marks a transitional stage in the history of opera. In 1829 he returned to Bologna. His mother had died in 1827, and he was anxious to be with his father. Arrangements for his subsequent return to Paris on a new agreement were upset by the abdication of Charles X. and the July Revolution of 1830. Rossini, who had been considering the subject of Faust for a new opera, returned, however, to Paris in the November of that year. Six movements of his Stabat Mater were written in 1832 and the rest in 1839, the year of his father’s death, and the success of the work bears comparison with his H élène. His contract with the Opéra left him free during the period from 1832 to 1868 makes his biography appear almost like the narrative of two lives—the life of swift triumph, and the long life of seclusion, of which the biographers give us pictures in stories of the composer’s cynical wit, his speculations in fish culture, his mask of humility and indifference. His first wife died in 1845, and political disturbances in the Romagna compelled him to leave Bologna in 1847, the year of his second marriage with Olympe Pelissier, who had sat to Vernet for his picture of "Judith and Holofernes." After living for a time in Florence he settled in Paris in 1855, where his house was a centre of artistic society. He died at his country house at Passy on the 12th of November 1868. He was a foreign associate of the Institute, grand officer of the Legion of Honour, and the recipient of innumerable orders. In his compositions Rossini plagiarized even more freely from himself than from other musicians, and few of his operas are without such admixtures frankly introduced in the form of arias or overtures. A characteristic mannerism in his musical writing earned for him the nickname of "Monsieur Crescendo." His music is associated with the names of the greatest singers in lyrical drama, such as Tamberlini, Mario, Rubini, Delle Sedie, Albanò, Grisi, Patti and Nilsson.

ROSSLAND, an important city in the Kootenay district of British Columbia, incorporated in 1897. Pop. (1907) 4013. It is situated in a valley 7 m. W. of Trail on the Columbia river and 8 m. N. of the international boundary. It has direct railroad communication with Trail and the Arrow lakes as well as with Northport and Spokane in the state of Washington. Rossland owes its importance to the immense deposits of iron and copper pyrites carrying gold, which occur in the vicinity. The best-known mines are the Le Roy, Centre Star and War Eagle. The city derives its electric light and power service from Bonnington Falls on the Kootenay river.

ROSSLAU, a town of Germany, in the duchy of Anhalt, on the right bank of the Elbe, here crossed by two railway bridges, 3 m. by rail N. of Dessau and 35 m. S.E. of Magdeburg. Pop. (1905) 11,027. It has a ducale residence, an old castle, a handsome parish church, and manufactures of machinery, paper, sealing-wax, wire goods, sugar, bricks and chemicals. Rosslaу became a town in 1603.

ROSSLYN, EARLS OF. The first earl of Rosslyn was Alexander Wedderburn (see below), who was succeeded by his nephew, James St Clair Erskine (1762–1837), a son of...
Wedderburn's sister Janet by her marriage with Sir Henry Erskine (d. 1765), a Scottish, baronet and soldier. Entering the army in 1776, James Erskine served in Portugal, in Denmark and in the Netherlands, and became a general in 1814. From 1782 until 1805, when he became a peer, he was a member of parliament; a Tory politician and an associate of the duke of Wellington, he was Lord privy seal in 1820-30 and Lord president of the council in 1834-35. He inherited the estates of the family of St Clair and took this name in 1759, and he died on the 18th of January 1837. His son, James Alexander (1802-1866), became 3rd earl, and in 1860 the latter's grandson, James Francis Harry (b. 1860), became 4th earl.

ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF (1753-1805), Lord Chancellor of Great Britain, was the eldest son of Peter Wedderburn (a lord of session as Lord Chesterhall), and was born in East Lothian on the 13th of February 1733. He acquired the rudiments of his education at Dalkelth, and in his fourteenth year matriculated at the university of Edinburgh. It was from the first his desire to practise at the English bar, though in deference to his father's wishes he qualified as an advocate at Edinburgh, in 1754, but entered himself at the Inner Temple on the 8th of May 1755, so that he might keep the Easter and Trinity terms in that year. His Carlyle put him to the bar, and for the next five years Wedderburn stuck to his practice in Edinburgh, during which period he employed his oratorical powers in the General Assembly of the Church of Scotland, and passed his evenings in the social and argumentative clubs which abound in Edinburgh. In 1755 the precursor of the later Edinburgh Review was started, now chiefly remembered because in its pages Adam Smith criticized the dictionary of Dr Johnson, and because the contents of its two numbers were edited by Wedderburn. The dean of faculty at this time, Lockhart, afterwards Lord Covington, a lawyer notorious for his harsh demeanour, in the autumn of 1757 assaulted Wedderburn with more than ordinary insolence. His visage was restored with extraordinary powers of invective, and on being rebuked by the bench declined to retract or apologize, but placed his gown upon the table, and with a low bow left the court for ever. He was called to the English bar at the Inner Temple in 1757. To shake off his native accent and to acquire the graces of oratorical action, he engaged the services of Thomas Sheridan and Charles Macklin. To secure business and to conduct his cases with adequate knowledge, he studied the forms of English law, he solicited William Strahan, the printer, "to get him employed in city causes," and he entered into social intercourse (as is noted in Alexander Carlyle's autobiography) with Lord Bute. His local connections and the incidents of his previous career introduced him to the notice of his countrymen Lords Bute and Mansfield. When Lord Bute was prime minister this liberal satellite used, says Dr Johnson, to go on errands for him, and it is to Wedderburn's credit that he first suggested to the premier the propriety of granting Johnson a pension. Through the favour of Lord Bute, he was returned to parliament for the Ayr burghs in 1761. In 1763 he became king's counsel and bencher of Lincoln's Inn, and for a short time went the northern circuits, but was more successful in obtaining business in the Court of Chancery. He obtained a considerable addition to his remuneration and the amount at £10,000 on his marriage in 1767 to Betty Anne, sole child and heiress of John Dawson of Marly in Yorkshire. When George Grenville, whose principles leaned to Toryism, quarrelled with the court, Wedderburn affected to regard him as his leader in politics. At the dissolution in the spring of 1768 he was returned by Sir Lawrence Dundas for Richmond as a Tory, but in the questions that arose over John Wilkes (q.v.) he took the popular side of "Wilkes and liberty," and resigned his seat in May 1769. In the opinion of the people he was now regarded as the embodiment of all legal virtue; his health was toasted at the dinners of the Whigs amid round of applause, and, in recompense for the loss of his seat in parliament, he was returned by Lord Clive for his pocket borough of Bishop's Castle, in a by-election in January 1770. During the next session he acted vigorously in opposition, but his conduct was always viewed with distrust by his new associates, and his attacks on the ministry of Lord North grew less and less animated in proportion to its apparent fixity of tenure. In January 1771 he was offered and accepted the post of solicitor-general. The high road to the woolsack was now open, but his defection from his former path has stamped his character with general infamy. Junius wrote of him, "As for Mr Wedderburn, there is something about him which even treachery cannot trust," and Colonel Barré attacked him in the House of Commons. The new law officer defended his conduct with the assertion that his alliance with the Whigs had been with Sir George Grenville, and that the connexion had been severed on his death. All through the American War he consistently declined against the colonies, and he was bitter in his attack on Benjamin Franklin (q.v.) before the Privy Council. In June 1778 Wedderburn was promoted to the post of attorney-general, and in the same year he refused the dignity of chief baron of the exchequer because the offer was not accompanied by the promise of a peerage. At the dissolution in 1774 he had been returned for Okehampton in Devonshire, and for Castle Rising in Norfolk, and selected the former constituency; on his promotion as leading law officer he continued, and he retained the same seat in 1780, though his tenure of the peerage was not long delayed. In June 1780 he was created chief justice of the Court of Common Pleas, with the title of Baron Loughborough.

During the existence of the coalition ministry of North and Fox, the great seal was in commission (April to December 1783), and Lord Loughborough held the leading place among the commissioners. For some time after that ministry's fall he was considered the leader of the Whig party in the House of Lords, and, had the illness of the king brought about the return of the Whigs to power, the great seal would have been placed in his hands. The king's restoration to health secured Pitt's revenge, and, Wedderburn was deprived of the Great Seal. In 1782, during the period of the French Revolution, Lord Loughborough succeeded from Fox, and on the 28th of January 1793 he received the great seal in the Tory cabinet of Pitt. The resignation of Pitt on the question of Catholic emancipation (1801) put an end to Wedderburn's tenure of the Lord Chancellorship, for, much to his surprise, no place was found for him in Addington's cabinet. His first wife died in 1781 without leaving issue, and he married in the following year Charlotte, youngest daughter of William, Viscount Courtenay; but her only son died in childhood. Lord Loughborough received the peerage in 1795 a re-grant of his barony with remainder to his nephew, Sir James St Clair Erskine. His fall in 1801 was softened by the grant of an earldom (he was created earl of Rosslyn 21st April 1801, with remainder to his nephew), and by a pension of £4000 per annum. After this date he rarely appeared in public, but he was a constant figure at all the royal festivities. He attended one of those gatherings at Frogmore, on the 31st of December 1804. On the following day he was seized with an attack of gout in the stomach, and on the 2nd of January 1805 he died at his seat, Baylis, near Salt Hill, Windsor. His remains were buried in St Paul's Cathedral on the 11th of January. At the bar Wedderburn was the most elegant speaker of his time, and, although his knowledge of the principles and precedents of law was deficient, his skill in marshalling facts and his clearness of diction were marvellous; on the bench his judgments were remarkable for their perspicuity, particularly in the appeal cases to the House of Lords. For cool and sustained delibration he stood unrivalled in parliament, and his readiness in debate was universally admired. In some parts of the world he was regarded with enthusiasm; in the eyes and ears of some of his admirers, he became "the last of the old school," and his writings, both of a legal and a political character, were treated with the highest respect, as the last and best exponent of the principles of the English constitution. His son Sir James Wedderburn, who died in 1836, succeeded to the earldom; and, in 1870, was created Viscount Wedderburn. His son, Sir Alexander Wedderburn, 2nd Viscount Wedderburn, died in 1877, and was succeeded by Sir John Wedderburn, 3rd Viscount Wedderburn, who was created Baron Wedderburn, of Rosslyn Castle, in the peerage of Great Britain, in 1881.
ROSSWEIN, a town of Germany, in the kingdom of Saxony, situated on the Freiberger Mulde, 46 m. S.E. from Leipzig by the railway via Döbeln to Dresden. Pop. (1905) 9297. It is famous for its technical schools, among which are one for builders, another for furniture-makers, and a third for ironmongers. The industries are considerable, and include woollen and cloth manufactures, dyeing, spinning, and the making of agricultural machinery, cigars, chemicals, bricks and iron goods. Rosswein is an old town, cloth-making being a flourishing industry here in the 14th century.

See C. V. Böhmert, Die Stadt Rosswein, 1893–94 (Dresden, 1895).

ROSTAND, EDMOND (1869–1918), French dramatist, was born on the 1st of April 1869, the son of Joseph Eugène Herbert Rostand (b. 1843), a prominent journalist and economist of Marseilles. His first play, a burlesque, Les romanesques, was produced on the 21st of May 1894 at the Théâtre Français. He took the motive of his second piece, La Princesse lointaine (Théâtre de la Renaissance, 5th April 1895), from the story of the troubadour Rudel and the Lady of Tripoli. The part of Mélissande was created by Sarah Bernhardt, who also was the original Photine of La Samaritaine (Théâtre de la Renaissance, 14th April 1897), a Biblical drama in three scenes taken from the gospel story of the woman of Samaria. The production of his "heroic comedy" Cyrano de Bergerac (28th December 1897, Théâtre de la Porte Saint-Martin), with Coquelin in the title-role, was a triumph. No such enthusiasm for a drama in verse had been known since the days of Hugo's Hernani.

The play was quickly translated into English, German, Russian and other European languages. For his hero he had drawn on French 17th-century history; in L'Aiglon he chose a subject from Napoléonic legend, suggested probably by Henri Welsching's Roi de Rome, 1831–32 (1837), which contained much new information about the unhappy life of the duke of Reichstadt, son of Napoleon I. and Marie Louise, under the surveillance of Metternich at the palace of Schönbrunn. L'Aiglon, in six acts and in verse, was produced (15th March 1900) by Sarah Bernhardt at her own theatre, she herself undertaking the part of the duke of Reichstadt. In 1902 Rostand was elected to the French Academy. His Chantecule, produced in February 1910, was awaited with an interest (enhanced by considerable delay in the production) hardly equalled by the enthusiasm of its reception. Lucien Guiry was in the title-role and Mme. Simone played the part of the pheasant, the play being a fantasy of bird and animal life, and the character of Cyrano de Bergerac is based on Rostand's own person. Rostand's widow, née Rosemonde Étienne Gérard, published in 1890 Les Filous, a volume of verse crowned by the Academy.

See a notice by Henry James in vol. 84, pp. 477 seq. of the Cornhill Magazine.

ROSTOCK, a town of Germany, in the grand duchy of Mecklenburg-Schwerin, one of the most important commercial cities on the Baltic. It is situated on the left bank of the estuary of the Warnow, 8 m. from the port of Warnemünde on the Baltic. 177 m. N.W. of Berlin by rail, 80 m. N.E. of Lübeck, and 166 m. S. of Copenhagen. Pop. (1905) 60,790. It consists of three parts, central and outer, and extends to the north and south along the Warnow, the waterway to the town—of which the first retains some of the antique features of a Hanse town, while the last two are for the most part regularly and handsomely built. There are also several suburbs. The town has four gates, one of them dating from the 14th century, and some fine squares, among them the Blücher Platz, with a statue of Blücher, who was born here, and the Neue Markt. Rostock was a fortress of some strength, but the old fortifications have been razed, and their site is occupied by promenades. Rostock has five old churches: St. Mary's, dating from 1398 to 1472, one of the most imposing Gothic buildings in Mecklenburg, with two Romanesque towers and containing a magnificent bronze font and a curious clock; St Nicholas's, begun about 1250 and restored in 1450, and again in 1890–94; St. Peter's, with a lofty tower over 400 ft. high, built in 1400, which serves as a landmark to ships at sea;

St James's, completed in 1588, and the church of the Holy Roed, begun in 1270. St Mary's church contains a monument marking the tomb of Hugo Grotsius, who died in Rostock in 1645, though his remains were afterwards removed to Delft. Among other interesting buildings are the curious 14th-century Gothic town hall, the façade of which is concealed by a Renaissance addition; the palace of the grand duke of Mecklenburg-Schwerin, built in 1702; the law courts, built in 1875–79; the university buildings, erected in 1867–70; and an assembly hall of the estates of Mecklenburg (Ständehaus), a handsome Gothic building erected in 1880–93.

The university of Rostock was founded in 1418 by Dukes John III. and Albert V. of Mecklenburg. From 1437 till 1443 it had its seat at Greifswald in consequence of commotions at Rostock; and in 1760 it was again removed, on this occasion to Bützow. The professors and buildings were still intact at Rostock, so that there were practically two universities in the duchy until 1789, when they were reunited at the original site. Rostock is the seat of the supreme court for both the duchies of Mecklenburg, and is well equipped with schools, hospitals, and other institutions.

Although the population, commerce and wealth of Rostock have declined since Hanse days, it has a considerable trade, being the chief commercial town of Mecklenburg and one of the most considerable fleets. Vessels drawing 16 ft. of water are able to get up to the wharves. By far the most important export is grain, which goes almost entirely to British ports; but wool, flax and cattle are also exported. The chief imports are coal from Germany, hemp, oil, timber and livestock. Rostock has an important fair at Whitsuntide, lasting for four days and attended by a considerable crowd of farmers. The industries of the town are varied. One of the chief is shipbuilding. Machinery, chemicals, sugar, malt, paper, musical instruments, cotton, straw hats, tobacco, carpets, soap, playing cards, chocolate and re-stuffs are among the manufactures. The town also contains distilleries, saw-mills, oil-mills, tanneries, breweries and electrical works.

Local historians assert that a village existed on the site of Rostock as early as A.D. 329, but no certain proofs have been traced of any earlier community than that founded here in the 12th century, which is said to have received municipal rights in 1218. The earliest signs of commercial prosperity date from about 1260. For a time Rostock was under the dominion of the kings of Denmark. Soon after returning under the protection of Mecklenburg in the 14th century it joined the Hanseatic League; and was one of the original members of the powerful Wendish Hansa, in which it exercised an influence second only to that of Lübeck. The most prosperous epoch of its commercial history began in the latter half of the 15th century, precisely at the period when its political power began to wane. Rostock, however, never entirely lost the independence which it enjoyed as a Hanse town; and in 1588, as the result of long contentions with the rulers of Mecklenburg, it secured for itself a peculiar and liberal municipal constitution, administered by three burgomasters and three chambers. In 1830 this constitution was somewhat modified, and the city became less like a state within a state. It has belonged to Mecklenburg-Schwerin since 1605; in 1712 it was taken by the Swedes, in 1715 by the Danes and in 1716 by the Russians. The badge of Rostock is the figure 7; and a local rhyme explains that there are 7 doors to St Mary's church, 7 streets from the market-place, 7 gates on the landward side and 7 wharves on the seaward side of the town, 7 turrets on the town-hall, which has 7 bells, and 7 linden trees in the park.

Koppmann, Geschichte der Stadt Rostock (Rostock, 1887); Volckmann, Führer durch Rostock (3rd ed., 1896); the Geschichtsquellen der Stadt Rostock (Rostock, 1885); and the Beiträge zur Geschichte der Stadt Rostock (Rostock, 1896).

ROSTOPTSCHIN, COUNT FEODOR VASSILEVICH (1763–1820), Russian general, was born on the 23rd of March 1763, on the estate of Kamenka of Orel. He had great influence with the Tsar Paul, who appointed him in 1797 chief of the army, grand-marshal of the court, then minister of the interior. In 1799 he received the title of count. He was disgraced in 1801 for his opposition to the French alliance, but was restored to
favour in 1810, and was shortly afterwards appointed military governor of Moscow. He was therefore charged with its defence against Napoleon, and took every means to reassure the population of the town and district against the invader. He has been generally charged with instigating the burning of Moscow the day after the French had made their entry; it is certain that the prisons were opened by his order, and that he took no means to stop the outbreak. He defended himself against the charge of incendiaryism in a pamphlet printed in Paris in 1823, Le Vérité sur l'Incendie de Moscou, but he subsequently made grave admissions. Shortly after the congress of Vienna, to which he had accompanied the Tsar Alexander, he was disgraced. He only returned to Russia in 1825, and died at Moscow on the 12th of February of the next year.

His Mémoires écrits en dix minutes were posthumously published at St Petersburg in 1853, his Œuvres inédites in Paris in 1894. A partial account of his life was written by his grandson A. de Ségur (Paris, 1872). See also Varnhagen von Ense, Denkwürdigkeiten, vol. ii.; G. Tezenoff, Wer hat Moskau im Jahre 1812 in Brand gesteckt (Berlin, 1900).

ROSTOV-ON-THE-DON, a seaport of Russia, in the territory of the Don Cossacks, well situated on the high right bank of the Don, 13 m. from its mouth in the Sea of Azov. In 1731 a small fort was erected on an island in the Don, near its mouth. Thirty years later the fortifications were transferred to the site now occupied by Rostov, 5 m. above the head of the first branch of the delta of the Don. The Don, which has here a breadth of 230 to 250 yds., with a hardly perceptible current, offers an excellent roadstead. The navigation, however, is considerably impeded by the shallowness of the river. Dredging operations have but partially remedied this. Moreover, the river is flood-bound for more than one hundred days in the year. The population has grown rapidly: while in 1838 it was 70,700, in 1897 it numbered 110,889, and in 1903 126,375, exclusive of the suburbs; if these, which comprise Nakhichevan (32,582 in 1905) be included, the population is well over 160,000, a figure which is still further swollen in the summer by the influx of about 60,000 men, who find work in connexion with the shipment of grain for export. The permanent population includes 15,000 Jews, 5000 Armenians, with Tatars, Poles, Germans and others. In Nakhichevan there are 20,500 Armenians. Owing to its situation on the navigable river Don and at the junction of three railways, radiating to north-western Russia, Caucasus and the Volga respectively, Rostov has become the chief commercial centre of southern Russia, being second in importance on the Black Sea to Odessa only. It is the chief centre for the supply of agricultural machinery to the steppe governments of south-eastern Russia. On an average, £3,000,000 to £4,000,000 worth of wheat, about £1,000,000 worth of rye, and over £1,500,000 worth of barley are exported annually, besides oats, flax, linseed, rape seed, oilcake, bran, flour, vegetable oils, raw wool and caviare. The imports average between four and five millions sterling annually, and consist largely of agricultural machinery. There are a shipbuilding yard, flour-mills, tobacco factories, iron works, machinery works, distilleries, soap works, timber mills, bell foundries, paper mills and rope works. Rostov is the central point of the Russian flour-mills for south-eastern Russia and Caucasus. Two fairs, one of which has considerable importance for the whole of south-eastern Russia, are held here yearly. Rostov has excellent fisheries. The town has a cathedral, a fine town hall (1897–99), navigation schools, technical schools, and a good municipal library.

ROSTOV VESELIY, a town of Russia, in the government of Yaroslav, 35 m. by rail S.W. of the town of Yaroslav, near Lake Rostov or Nero. Pop. (1897) 14,342. It has numerous cotton and linen mills. The great fair for which it was formerly famous has lost its importance, but the town remains the centre of a variety of domestic trades—tailoring, the manufacture of leather, of the making of boots and small enamelled icons (sacred images); it is also famous for its kitchen gardening and the export of pickled and dried vegetables and medical herbs. Fishing is carried on. The restoration of the buildings (royal palace, archiepiscopal palace, and five churches of the kreml or citadel was begun in 1901. The other public buildings include six 17th-century churches, a museum and a cathedral, consecrated in 1231 and having its interior walls covered with paintings.

Rostov was founded by Slavs in or before 862, and played so prominent a rôle in the history of that part of Russia that it used to be known as Rostov the Great. From the beginning of the 16th century to the 17th it was the chief town of a territory which included large parts of the present governments of Yaroslavl, Vladimir and Novgorod. After the Mongol invasion of 1230–42 it rapidly declined, and in 1474 it was purchased by Ivan III. and annexed to Moscow. It was repeatedly plundered by Tatars, Lithuanians and Poles in the 15th, 16th and 17th centuries.

ROSTRA¹ ("beaks"), in Roman antiquities, the orators' platform, which originally stood between the comitium and the forum proper, opposite the curia. It is not known when it was erected, but in 336 b.C. it was decorated by Gaius Maenius with the prons of ships captured from the people of Antium (Livy viii. 14). From time to time it was renamed Rostra, having previously been known as templum (literally "consecrated place"), since it had been consecrated by the augurs (Cicero, In Vatiniwm, x. 24). Some, however, deny the identity of the templum and rostra. On the platform or hard by were exhibited the statues of famous Romans (Camillus, Caesar), and state documents and memorials (the laws of the Twelve Tables, the treaty with the Latins, the columna rostrata of Dulius). Caesar had it pulled down, intending that it should be rebuilt on the west side of the forum, but it was left for Augustus (or Mark Antony) to carry out his plan. The term Rostra Vetera, often used by classical authors in connexion with funeral orations, makes it doubtful whether the old platform was entirely demolished, unless the name was simply transferred to the new rostra of Augustus. This consisted of a rectangular platform, 78 ft. long, 33 ft. broad and 11 ft. above the level of the forum pavement. It was reached by steps from the back; in front there was a marble balustrade with an opening in the centre where the speaker stood, possibly also intended for a staircase leading down into the forum. In the existing remains the holes in which the beaks of the ships were fastened, arranged in pairs, are visible. Behind these remains, close to the foot of the Capitol, the Rostra of the present day are situated.

In 1239-42 Rostov was again completely destroyed by the Hungarians. In 1239, Alexander of the Franks, the king of Hungary, marched against Rostov and subsequently besieged it. When the city fell, the conquerors paid a high price for their success, for the city was filled with people who had been there to witness the victory of the Hungarians.

¹The Lat. singular rostrum, a beak, the beak of a ship, is used in English of a platform, stand or pulpit from which a speaker addresses his audience. It is also used in its original meaning of a beak-like prolongation or process in zoology or botany.
in the centre, in front of the Aedes divi Juli, built by Augustus on the spot where the body of Caesar was cremated. The niche was probably used to support the bier while a funeral laudatio was being delivered. The front on either side was decorated with the beaks of ships captured at the battle of Actium.

Richter, "Topographie der Stadt Rom" (1901), pp. 73-156 (3d ed., Abt. 3, pt. 2 of I. von Müller’s Handbuch der klassischen Altertumswissenschaft); H. Thedenat, Le Forum Romain (3rd ed. 1904); J. H. Middleton, Romants of Ancient Rome (1892); O. Richter, Rekonstruktion seiner Geschichte der römischen Rednerbücher (Berlin, 1884); F. M. Nichols, The Roman Forum (1877); also article ROME: Archaeology.

ROTA, COURT OF, one of the departments of the medieval papal organization, existing alongside the Dataria, the Poenitentia, the two Signatures (S. Gratiae and S. Justitiae), and other bureaus. The Rota was the supreme court of Christendom. It consisted of twelve members, three from Rome, two from Spain, one each from Bologna, Ferrara, Venice, Milan, Germany, France, and (alternately) Tuscany or Perugia. It declined in importance when the Signatura Justitiae was set above it as the court of appeal from the Dataria, and the authority and jurisdiction of the pope was gradually lessened. After the Council of Trent the old arrangements were replaced by the Congregations, permanent committees of cardinals which deal with definite branches of business. The Rota, however, was restored to its functions as supreme court of appeal by Pope Pius X. in 1908 (see CURIA ROMANA).

ROTH, JUSTUS LUDWIG ADOLF (1818-1892), German geologist and mineralogist, was born at Hamburg on the 15th of September 1818. In 1837 he was appointed professor of mineralogy at the university of Berlin. He may be regarded as one of the founders of terrestrial geology. In his published papers he dealt with metamorphic and crystalline schists, discussed the origin of serpentine, and wrote on Vesuvian rocks and on Ponza Island. His separate works included Der Vesuv und die Umgebung von Neapel (1857); Beiträge zur Petrographie der plutonischen Gesteine (1860-84); Allgemeine und chemische Geologie (3 vols., 1879-93); and Über die Erdbeben (1882). He died at Berlin on the 1st of April 1892.

ROTHE, RICHARD (1799-1867), Lutheran theologian, was born at Posen on the 28th of January 1799. He studied theology in the courts of Heidelberg and Berlin (1817-20) under Karl Daub (1765-1836), Schleiermacher and Neander. He occupied from 1824 to 1829 the chair of speculative philosophy and historians Georg Hegel, Friedrich Creuzer (1771-1858) and F. C. Schlosser (1775-1861) exercising a considerable influence in shaping his thought. From 1820 to 1822 he was in the clerical seminary at Wittenberg. In the autumn of 1823 he was appointed chaplain to the Prussian embassy in Rome, of which Baron Bunsen was the head. This post he exchanged in 1828 for a professorship in the Wittenberg theological seminary, of which in 1832 he became second director and ephorus, and hence in 1837 he removed to Heidelberg as professor and director of a new clerical seminary; in 1849 he accepted an invitation to Bonn as professor and university preacher, but in 1854 he returned to Heidelberg as professor of theology, and afterwards became member of the Oberkirchenrat, a position he held until his death on the 20th of August 1867. As a youth Roth had a bent towards a supernatural mysticism; his chosen authors were those of the romantic school, and Novallis remained throughout his life a special favourite. In Berlin and Wittenberg he came under the influence of Pietism as represented by such men as Rudolf Stier (1800-1862) and Friedrich Tholuck, though Tholuck professed a modern materialist. He afterwards confessed that, though he has been sincere, he was never a happy Pietist. In Rome, under the broadening influence of classical and ecclesiastical art, he learned to look at Christianity in its human and universalistic aspects, and began to develop his great idea, the inseparable relation of religion and morals. He began then, and particularly after the revolution of July 1830, likewise to give a more definite form to his peculiar view of the relations of church and state. He thus became out of harmony with the pietistic thought and life of Wittenberg. His removal to Heidelberg and the publication of his first important work, Die Anfänge der christlichen Kirche und ihrer Verfassung (1837), coincides with the attainment of the principal theological positions with which his name is associated. During the middle period of his career (1837-61) he led the life of a scholastic recluse. During the last six years of his life he came forward as the advocate of a free theology and of the Protestantism of the Reformation.

Roth was one of the most profound and influential of modern Continental theologians. Like Schleiermacher he combined with the keener logical faculty an intensely religious spirit, while his philosophical tendencies were in sympathy rather with Hegel than with Schleiermacher, and his methods of criticism were superior to him than the abstractions of Spinoza, to whom Schleiermacher owed so much. He classed himself among the theosophists, and claimed to be a convinced and happy supernaturalist in a scientific age. His system, though it may seem to contain doubtful or even fantastic elements, is in its general outlines a noble massive whole, constructed by a profound, comprehensive, fearless and logical mind. A peculiarity of his thought was the realistic nature of his spiritual powers: they are real, and not abstract; his spiritual entities are real and corporeal; his truth is actual being. Hence Roth, unlike Schleiermacher, lays great stress, for instance, on the idea of God coexistent with man's nature, territorial human souls, and thus his name became a common German term for Theologische Ethik, as he entitled one of his books (3 vols., 1845-1848). It is on this work that Roth's permanent reputation as a theologian and ethical writer will rest. The first edition remained out of print but the second (5 vols., 1845-1861) has never been out of print. It was the author's purpose to rewrite the whole, but he died when he had completed the first two volumes. The remainder was reprinted from the first edition by Professor Heinrich Brückner with the addition of some notes and emendations left by the author.

The Theologische Ethik begins with a general sketch of the author's system, and illustrates it with a comprehensive survey of metaphysics and cosmology, cosmology falling into the two subdivisions of Physik (the world of nature) and Ethik (the world of spirit). It is the last subdivision with which the body of the work is occupied. After an analysis of the religious consciousness, which yields the doctrine of an absolute personal and spiritual God, Roth proceeds to deduce from his idea of God the process and history of creative development, which is eternally proceeding and bringing forth, as its end, a world of spirits, worlds of spirits, a spiritual universe. In the second stage of spiritual development is carried on. His theory leaves the natural man, without hesitation, to be developed by the natural processes of evolution. The last development is the moral and religious vocation of man; this higher stage is self-determination, the performance of every human function as a voluntary and intelligent agent, or as a person, having as its foundation the supreme and absolutely religious and theocratic clauses.

This personal process of spiritualization is the continuation of the eternal divine work of creation. Thus the moral life and the religious life coincide, and when normal are identical; both have the same aim and are occupied with the same task, the accomplishment of the spiritualization of the world. "Piety, that it may become truth and reality, demands morality as its fulfillment, as the only complete concrete idea in which the abstract idea of the absolute reality is realized; morality, that it may find its perfect unfolding, requires the aid of piety, in the light of which alone it can comprehend its own idea in all its breadth and depth." The process of human spiritualization is thus a spiritual act. As the moral and religious development is carried on, the moral and religious development is carried on, the moral and religious development is carried on, the moral and religious development is carried on, the moral and religious development is carried on,

As men reach the full development of their nature, and appropriate the perfection of the Saviour, the separation between
the religious and the moral life will vanish, and the Christian state, as the highest sphere of human life representing all human functions, will disappear from the earth. In proportion as the Saviour Christianizes the state by means of the church must the progressive completion of the structure of the church prove the cause of its abolition." The decline of the church, and the church to be deplored, but recognized as the consequence of the independence and consciousness of the Christian life.

It is the third section of his work—"Pflichtenlehre"—which is generally most highly valued, and where his full concept of church and church life is displayed, without any mixture of theosophical speculation.

Since Röthe's death several volumes of his sermons and of his lectures (on dogmatics, the history of homilies) and a collection of brief essays and religious meditations under the title of "Stille Stunden" (Wittenberg, 1872) have been published.

See F. Nippold, "Richard Röthe, ein christliches Lebensbild" (2 vols., Wittenberg, 1875-76); D. Schenkel, "Zur Erinnerung an Dr R. Röthe," in the "Allgemeine kirchliche Zeit schrift" (1867-68); H. Holzmann, "Richard Röthe," in the "Jahrbuch des Protestantentums" (1869); K. H. W. Schwarz, "Zur Geschichte der neuesten Theologie" (4th ed., Leipzig, 1868, pp. 417-441); Otto Pfeiderer, "Religionsphilosophie auf gestic ulterer Grundlage" (2nd ed., Berlin, 1884, vol. i. pp. 611-15); cf. The "Development of Theology in Germany since Kant" (1890); W. Höning, "Richard Röthe, sein Charakter, Leben und Denken" (1898); Adolf Hausrath, "Richard Röthe und sein Freund" (1902).

RÖTHLIN, JACQUELINE DE ROHAN, MARQUISE DE (c. 1520-1587), daughter of Charles de Rohan and Jeanne de Saint-Séverin. Her husband, François de Orleans-Longueville, marquis de Röthlin, died in 1548, and in watching her son's interests in Neuchâtel she was brought into contact with the reformers in Switzerland. She then embraced Protestantism and turned her château at Blandy, in Brie, into a refuge for Huguenots. In 1567 she underwent a term of imprisonment at the Louvre for harbouring Protestants.

ROTHENBURG-OB-DER-TAUBER, a town of Germany, in the kingdom of Bavaria, 49 m. by rail S.W. of Nuremberg. Pop. (1905) 8,466. It is beautifully situated on an eminence 200 ft. above the Tauber. It is flanked by medieval walls, towers and gates, and its antique appearance has been carefully preserved. Perhaps the most interesting building is the town hall, one part of which dates from 1240 and the other from 1572. The latter is a beautiful Renaissance structure, with a magnificent façade and a delicate spire, and contains a grand hall, the Kaisersaal, in which every Whit Monday a play, Der Meistertrunk, which commemorates the capture of the town by Tilly in 1631, is performed. Other buildings are the Gothic church of St James, with curiously carved altars and beautiful stained-glass windows, and containing in the Tower the famous tombs of the burgomaster, Heinrich Toppler; the 15th-century church of St Wolfgang; the Franciscan church; and five other churches. The town has many picturesque houses, and possesses a library with some interesting archives. It has manufactures of toys and agricultural machinery, electrical works and breweries.

Rothenburg-ob-der-Taufer, mentioned in the chronicles in 804 as Rotimbure, was probably a residence of the dukes of Franconia. It first appears as a town in 942 and until 1108 was the seat of the counts of Rothenburg-Komburg; when this line became extinct it passed to the family of Hohenstaufen, one member of which took the title of duke of Rothenburg in 1215. It is a free imperial city and it attained the zenith of its prosperity under the famous burgomaster, Heinrich Toppler (1359-1408). It took part in the movements in South Germany during the 15th and 16th centuries. In 1625 Rothenburg was stormed by Tilly, and the cup of wine presented by the burgomaster, which, according to tradition, saved the town from destruction, is annually commemorated in the play mentioned above.

See Bensen, "Beschreibung und Geschichte der Stadt Rothenburg" (Eringen, 1856); Merz, "Rothenburg in alter und neuer Zeit" (2nd ed., Ansbach, 1851); Schubert, "Rothakonig, wiederhaelt" (Zürich, 1852); and Das Festspiel zu Rothenburg-ob-d'Elb (Munich, 1892); and W. Klein, "Führer durch die Stadt Rothenburg" (Rothenburg, 1888).

ROTHE, THOMAS (1425-1500), archbishop of York, also called Thomas Scot, was born at Rothenburg on the 24th of August 1423; he was educated in his native town and seems to have been connected with both the universities of Oxford and Cambridge. Having entered the church he became rector of Ripple, Worcestershire, and later of St Vedast, Foster Lane, London, and it was probably when he was chaplain to John de Vere, earl of Oxford, that he made the acquaintance of Elizabeth Woodville, afterwards the queen of Edward IV. In 1467 Rothenburg became keeper of the privy seal to this king; in 1468 he was appointed bishop of Worcester, in 1472 bishop of Lincoln and in 1475 chancellor of England. Several times he went to France on public business; in 1475 at the treaty of Picquigny he received a pension from Louis XI. of France, and in 1480 he was chosen archbishop of York. When Edward IV died in April 1483 the archbishop remained true to his widow Elizabeth, and consequently lost the chancellorship and was put into prison by Richard III. He was soon set at liberty, and he died in 1500 at Cawood, near York. At Oxford Rothenburg built part of Lincoln College and increased its endowment; at Cambridge, where he was chancellor and master of Pembroke Hall, he helped to build the University Library. He founded a college at Rotherham, which was suppressed under Edward VI., and he was responsible for the building of part of the church of All Saints there.

ROTHEM, a market-town and municipal borough in the Rotherham parliamentary division of the West Riding of Yorkshire, England, 5 m. N.E. of Sheffield, on the Midland, North-Eastern and Great Central railways. Pop. (1891) 42,061; (1901) 54,349. It lies in the valley of the Don, where that river is joined by the Rother, and has communication by water with the Humber. The Don is crossed by a bridge on which is a small ancient building, formerly a chapel. The parish church of All Saints, occupying the site of a building dating from Anglo-Saxon times, was erected in the reign of Edward IV., and is among the best specimens of Perpendicular in the north of England. The town possesses iron, steel and brass works, railway wagon works, potteries, glass-works, breweries, saw-mills and rope-yards. At the township of Masborough, opposite Rotherham across the Don, works were established in 1746 by Samuel Walker, a successful ironmaster. The municipal borough, incorporated in 1871, is under a mayor, 6 aldermen and 18 councillors. Area, 6,012 acres.

The town was of some importance in Anglo-Saxon times, and in 1109, when the Templars, on the S.E. side of Rotherham, there was a Royal forest, the site of a building of which was used. In 1475, when Edward V. was last seen at the charge of the battle near Bosworth, his privy seal to Richard III., he was put into prison by Richard III. He was soon set at liberty, and he died in 1500 at Cawood, near York. At Oxford Rotherham built part of Lincoln College and increased its endowment; at Cambridge, where he was chancellor and master of Pembroke Hall, he helped to build the University Library. He founded a college at Rotherham, which was suppressed under Edward VI., and he was responsible for the building of part of the church of All Saints there.

ROTHES, EARLS OF. The first earl of Rothes was George Leslie, son of Norman Leslie of Rothes in Moray, and of Ballinbreich in Fife. In 1445 he was created Baron Leslie of Leven, and about 1458 earl of Rothes in the peerage of Scotland. His grandson George, the 4th earl (d. 1538), whose father William, the 3rd earl, was killed at Flodden, was accused, but acquitted in 1546, of complicity in the murder of Cardinal Beaton, in which his brother and his two sons were undoubtedly implicated: he was one of the Scottish commissioners who witnessed the marriage of Mary queen of Scots with Francis, the dauphin of France. His son Andrew, 5th earl of Rothes (d. 1611), took an active part with the lords of the congregation, first against the queen-mother, Mary of Guise, when regent of Scotland, and afterwards against Mary queen of Scots in opposition to her marriage with Darnley, and in devising the murder of Darnley. He was, however, one of the peers who acquitted Bothwell of Darnley's murder; and going over to the side of the queen, he fought for her at Langside. He continued to occupy a prominent position in Scottish affairs until his death in 1611. His great-grandson, John, 7th earl of Rothes (1630-1683), held a command in the Royalist army at the battle of Worcester in 1651, and accompanied Charles II. to England at the Restoration, when he became
lord president of the council in Scotland. He was lord chancellor of Scotland from 1663 till 1667, when he was made lord chancellor of Scotland for life. His estates having been sequestrated by the parliament in 1651, he received a rent-charge in 1650 on the earldom of Rothes, together with the title of Lord Leslie and Ballinbreich, with remainders to his heirs male and female, providing that in every case where a female should succeed to the peerage the name of Leslie should be assumed by her husband. In 1680 the earl was advanced to the dignity of duke of Rothes and marquess of Ballinbreich, but these titles became extinct at his death without a son in the following year. The earldom of Rothes and the other older titles now passed, under the special remainder mentioned above, to his daughter Margaret, whose husband, Charles Hamilton, 5th earl of Haddington, accordingly took the name Leslie, as the heir apparent. The right of his own peerage should pass to a younger son in order to keep the two earldoms separate. Margaret's son John, who on her death became 9th earl of Rothes, was vice-admiral of Scotland from 1715 to 1722, and fought with distinction against the Jacobite rebels in 1715; and his grandson, the 10th earl, who sold the estates of Ballinbreich to the Dundas family, was commander-in-chief in Ireland in 1754, and became a general in 1765. The office of sheriff of Fife, which had been an hereditary right of the earls of Rothes since 1540, was sold by the 10th earl under the Heritable Act of 1747. On several subsequent occasions the earldom was passed through the female line, and in 1803 Mary Elizabeth, countess of Rothes in her own right, was succeeded by her grandson, Norman Evelyn Leslie (b. 1877), 19th earl of Rothes.

**Rothsay**, a royal, municipal and police burgh, and the chief town of the county and island of Bute, Scotland. Pop. (1901) 9378. It is situated on a beautiful bay, 40 m. S.W. of Glasgow, with which there is regular communication by railway steamers from Wemyss Bay, Gourock, Greenock (Prince's Pier) and Crieff, as well as by many other steamers from Glasgow and the Clyde ports. It is a popular watering-place, and as the bay is sheltered by low wooded hills and affords excellent anchorage, it is well patronized by yachts.

Loch Striven, on the opposite shore of Argyllshire, is known as the “Rothsay weather-glass,” its appearance furnishing a certain clue to meteorological conditions. The town is under the jurisdiction of a provost and council. Rothsay has ceased to be a manufacturing centre, fishing being now its chief industry. Owing to its mild and equable climate it is a resort of invalids. There is a tramway to Port Bannatyne, pleasantly situated on the east horn of Less Bay, and Craigmore, about 1 m. west of Rothsay, is a fashionable suburb.

Ardbeg Point, Loch Fad, Loch Ascog and Barone Hill (530 ft.) are all within a mile and a half of the town, and there are numerous excursions by road to other points of interest. The Kyles of Bute are within a short sail of Rothsay. In the centre of the town are the ruins of a castle erected in 1698 either by Magnus Barefoot, king of Norway, or by the Scots as a defence against the Norwegians, with whom during the 13th century, and earlier, there was constant strife. The village which grew up round the castle was made a royal burgh by Robert III., who, in 1308, created his eldest son David, duke of Rothesay, a title which became the highest Scottish title of the heir-apparent to the crown of the United Kingdom. During the Commonwealth the castle was garrisoned by Cromwell's troops. It was burned by the followers of Argyll in 1685, and remained neglected till the rubbish was cleared away by the second marquess of Bute in 1816. It was repaired by the third marquess.

**Rothschild**, the name of a Jewish family which has acquired an unexampled position from the magnitude of its financial transactions. The original name was Bauer, the founder of the house being Mayer Anselm (1745-1812), the son of Anselm Moses Bauer, a small Jewish merchant of Frankfort-on-the-Main. His father wished him to become a rabbi, but he set up as a money-lender at the sign of the "Red Shield" (Rothschild) in the Jewish quarter. He had already acquired some standing as a banker when his speculative tastes obtained for him the friendship of William, ninth landgrave and afterwards elector of Hesse-Cassel, who in 1801 made him his agent. In the following year Rothschild negotiated his first great government loan, ten million thalers for the Danish government. When the landgrave was compelled to flee from his capital on the entry of the French, he placed his silver and other bulky treasures in the hands of Rothschild, who, not without considerable risk, took charge of them and buried them, it is said, in a corner of his garden, whence he dug them up as opportunity arose for disposing of them. This he did to such advantage as to be able afterwards to return their value to the elector at 5% interest. He died at Frankfort on the 19th of September 1812, leaving ten children, five sons and five daughters. Branches of the business were established at Vienna, London, Paris and Naples, each being in charge of one of the sons, the chief of the firm always residing at Frankfort. By a system of co-operation and joint counsels, aided by the skilful employment of subordinate agents, they obtained unexampled opportunities of acquiring an accurate knowledge of the condition of the financial market, and practically embraced the whole of Europe within their financial network. The unity of the system of the members of the firm has been preserved by the system of intermarriages which has been the general practice of the descendants of the five brothers. Each of the brothers received in 1815 from Austria the privilege of hereditary landowners, and in 1822 they were created barons by the same country. The charge of the Frankfort house devolved on the eldest, Anselm Mayer (1773-1835), born on the 12th of June 1773, who was chosen a member of the royal Prussian privy council of commerce, and, in 1820, Bavarian consul and court banker. The Vienna branch was undertaken by Solomon (1774-1826), born on the 9th of December 1774, who entered into intimate relations with Prince Metternich, which contributed in no small degree to bring about the connexion of the firm with the allied powers. The third brother, Nathan Mayer (1777-1836), born on the 16th of September 1777, has, however, generally been regarded as the financial genius of the family, and the chief originator of the transactions which have created for the house its unexampled position in the financial world. He went to Manchester about 1800 to act as a purchaser for his father of manufactured goods; but at the end of five years he removed to London. The boldness and skill of his financial transactions, which caused him at first to be regarded as unsafe by the leading banking firms and financial merchants, later awakened their admiration and envy. By the aid of well-placed informers and of fast-sailing boats of his own for the transmission of news, he was able to utilize to the best advantage his special sources of information, while no one was a greater adept in the art of promoting the rise and fall of the stocks. The colossal influence of the house dates from an operation of his in 1810. In that year Wellington made some drafts which the English government could not meet; these were purchased by Rothschild at a liberal discount, and renewed to the government, which finally redeemed at par. From this time the allied powers negotiated loans to carry on the war against Napoleon chiefly through the house of Rothschild. Rothschild never lost faith in the ultimate overthrow of Napoleon, his all being virtually staked on the issue of the contest. He is said to have been present at the battle of Waterloo. Being able to transmit to London private information of the allied success several hours before it reached the public, he effected an immense profit by the purchase of stock, which had been depressed on the news of Blucher's defeat two days previously. Rothschild was the first to popularize foreign loans in Britain by fixing the rate in sterling money and making the dividends payable in London and not in foreign capitals. Latterly he became the financial agent of nearly every civilized government, although persistently declining contracts for Spain or the American States. He did not confine himself to
ROTHWELL—ROTIFFERA

ROTHWELL, an urban district in the Normanton parliamentary division of the West Riding of Yorkshire, England, 4 m. S.E. of Leeds. Pop. (1901) 11,702. The church of the Holy Trinity, though largely restored, retains some good Decorated details. Rothwell soon after the Conquest was granted as a dependency of the castle of Pontefract to the Lacy, who erected here a baronial residence of which there are slight remains. Coal and stone are obtained in the neighbourhood, and the town possesses match-works and rope and twine factories in which the majority of the large industrial population is employed.

ROTIFFERA (or ROTatoria), a small, in many respects well-defined and somewhat isolated, class of the animal kingdom. Now familiarly known as "wheel animals," from the wheel-motion produced by the alternation of the apertures which occur in the head region, the so-called rotatory organs, they were first discovered by A. Leeuwenhoek, to whom we also owe the discovery of Bacteria and ciliate Infusoria. Leeuwenhoek described Rotifer vulgaris in 1702, and he subsequently described Melicerta ringens and other species. A great variety of forms were described by other observers, but they were not separated as a class from the unicellular organisms (Protozoa) with which they usually occur, until the appearance of C. G. Ehrenberg's monograph, which contained a mass of detail regarding their structure. At the present day few groups of the animal kingdom are so well known to the microscopist, for groups present more interesting affinities to the morphologist, and few multicellular animals such a low physiological condition.

A rotifer may be regarded as typically a hemisphere or half an oblate spheroid or paraboloid with a mouth somewhat on the flat end ("disk" or "corona"), which bears a usually double ciliated ring, the outer zone the "cingulum," and inner the "trochus"; this is followed by a progressor ring for bringing up food. The body-wall, cuticulized outside, is formed by a single layer of ill-defined cells, and surrounds the simple body cavity (archicole), traversed by simple or branched muscular fibres ("mesenchyme" (fig. t, m). The mouth opens through a narrow pharynx (p) into a chamber which is (as in Crustacea) always on crop and gizzard, the mastax (ma), whose thickenings are imbedded in the posteroventral wall. A slender ciliated gutlet (e) leads into a large stomach (d) whose wall consists of large richly ciliated cells with usually a pair of simple secretory sacs opening into it: it may open through an intestine or return into the cloaca. A pair of coiled nephridial tubes (a) formed of a file of perforated "drain-pipe" cells, with ciliated tag-like "flame" cells (f), open into a contractile bladder (bd),

which passes by a slender duct into the cloaca. Into this also opens the genital duct from the single or paired gonad (o). The simple nerve-ganglion and brain (b) lies on the anterodorsal side of the pharynx, and by its position determines the orientation of the animal, the cloacal opening lying on the same side, and the course of the gut being "neutral." The sense organs are a pair of pigmented eyes (oc), and two pairs of antennae, one anterior proximal and near the wrench, the other distal and usually more or less lateral. The sexes are always separate, the males lacking of very rare occurrence in most cases. In the female the gonad is complex as in flatworms, composed of a germary for the formation of the eggs, and a vitellary, much more conspicuous and alone figured (ov), consisting of a definite number of large nucleated cells for the nourishment of the eggs. The apical end of the rotifer usually narrows suddenly beyond the curve of the gut and the cloacal aperture to form the foot of pseudopodium which ends in an organ of attachment, a pair of movable toes, each with the opening of a cement-gland (gl) at its tip. Thus for orientation we place the rotifer like the cuttle-fish, head downward: the ciliated disk is basal or oral, proximal to the rest of the animal, the foot is apical, and the brain and cloacal aperture are anterodorsal. It is in this position that free-swimming forms glide over the substratum of organic debris in which they find their food.

The cuticle may be locally or generally hardened, in the latter case being termed a lorica. Often the head is retractile, and a constriction of flexible cuticular distal to it is termed a neck: in Philodinacea there are a series of thin flexible rings which permit both distal and proximal ends to be telescoped into the middle; and in Taphrocoma, regular constrictions of the whole body-wall give an appearance of metemeric segmentation to the body. In Philodinacea accessory toes are found, unfurnished with cement-glands and distinguished as spurs.

Corona or Disk. This typically consists of two concentric zones, the trochos and cingulum, often separated by a groove or gutter which may be finely ciliated; but in several genera of no close affinity, where it is very oblique to the longitudinal axis of the body, it is represented by a general ciliation of the surface (Taphrocoma, Rattulus, Coepus, Aulodes). We may suppose that primi-

tively the mouth was seated in the centre of a funnel-shaped disk, surrounded by a double wreath. The nearest approach to this is found in Microdon (fig. 2, 1) and its allies, the trochos being oval with two median gaps, the cingulum, more delicate, and complete. In Flosculariae the trochos is a horseshoe-shaped ridge

Fig. 1.—Notomomma naia. A and B represent the same animal, some of the organs being shown in one figure and some in the other. oc, eye-spots; g, nerve ganglion; p, pharynx; ma, mastax; e, oesophagus; st, stomach; a, anus, opening into the cloaca; gl, cement-glands in the foot; n, nephridia; f, flame-cells; bd, bladder; m, mm, muscles; ov, ovary (vitellarium alone seen).
deep down in the funnel-shaped disk. The cingulum appears to be represented by the margin, usually produced into long petal-like

Fig. 4.—Types of Trophi. a, malleate, with enlarged view of malleus above—the Y-shaped incus consists of a short median fulcrum bearing two large rami, each of which is in contact with a stout malleus consisting of a toothed uncus carried on a long manubrium; b, sub-malleate, with an enlarged view of malleus—the manubria are twice as long as the 3- to 5-toothed uncus; c, virgate—mallei rod-like, manubia and fulcra very long, uncus 1 or 2-toothed; d, forcipate—rami large and used as a forcepts, mallei rod-like, uncus pointed or evanescent; e, incudate—stout fulcra, rami forming a forcepts, manubia evanescent; f, uncinate—uncus large, 2-toothed, manubria evanescent, incus slender; g, ramate—rami subquadrangular, fulcra rudimentary, manubria evanescent; h, malleo-ramate—mallei fastened by their uncus to the rami, manubria looped, rami large and fulcra slender.

rotifer is, as it were, constantly drawn forward into the centre of this vortex ring. There is a dorsal interruption to the disk,

volving both trochus and cingulum and groove; in this case the two halves of the disk may be developed in lobes, flower-shaped in Melicerta ringens, but often rounded and projecting like kettledrums. These give a strong impression of two crowns of wheels revolving in the same sense. This appearance puzzled the older observers, who were led thereby to give the name "wheel-bearers" to the group, until the true character of ciliary motion was recognized; for a wheel cannot be i organic continuity with the support on which it rotates.

In Conochilus (fig. 2, §), a Melicertan, the mouth is displaced towards the antero-dorsal side and the gap is postero-ventral.

In Melicerta ringens and M. conferta (fig. 2, 4; fig. 3, e, f) there is a glandular ciliated pit between the mouth and the chin into which the overflow water passes by a pair of gutters, and in which fine particles are aggregated into pellets, which the animal deposits, as formed, on the edge of its tube and so builds it up. M. janus builds up a tube by pellets of its fused faces (fig. 3, €). In most Ploima the dorsal gap is not well marked, and the ciliated cup is broken up into a number of lobes, often furnished with petal-like styles, in front and at the sides, but ventrally passing into the uniformly ciliated oral funnel.

Other ciliated organs to be noticed are the proboscis cup of Bdeleloidae, and the toes of Pedalidae. Besides these Synchaetidae and Notommatidae (fig. 7) possess a pair of auricles, great eversible ciliated feathery tufts a little above the disk, utilized in swimming. The mouth begins as a funnel, with an inner ciliated ring, which passes over into a narrow pharynx, which in Flosculariaceae is prolonged into a tube hanging freely down into the crop; this is followed by the gizzard, also ciliated except behind, where it is hardened into a set of articulated sclerites (trophi) to form the gizzard or mastax. Thus the crop-gizzard has the same combination of structures as we find in the echinoderm, Crassatella, with which we may call it homoplastic. The trophi are (1) median incus or arvinal (fig. 4), Y-shaped, with the foot (fulcrum) distal and the arms (rama) apical, often independently jointed; (2) with the outer ends of the rami articulate two lateral pieces (mallei), and again composed of a distal longitudinal piece (manubrium) and an apical transverse piece (the uncus); the whole recalling, as the name implies, a single-clawed hammer. For the variety and modifications of the trophi we simply refer to Hudson's "Microscopical Anatomy of the Asplanchnaceae," where he gives a very full and clear account. The relative size of the crop to the trophi varies greatly: it is small where the trophi are well developed and complex, as well as in Bdeleloidae; but in Flosculariaceae it is large, and so it is in Asplanchnaceae. Eversible trophi of the forcipate or virgate type, which can be used for nibbling, are common in Ploima, notably Rattulidae, and are used for attachment to the host in the parasitic Seisonidae, &c. In Asplanchnaceae also,
where the whole crop is strengthened by a framework of bars, the
incudate maxant lies in a little postero-ventral pouch which can be
everted through the crop and mouth. The stomach is generally
large; its wall consists of a layer of very large ciliated cells, which
often contain fat globules and yellowish-green or brown particles,
and outside these a connective tissue mesentere: muscular fibrillae
have also been described. Very constantly a pair of simple sack-
like glands open into the stomach, and probably represent the
hepato-pancreatic glands of other Invertebrates.

Following upon the stomach there is a longer or shorter intestine,
which ends in the cloaca. The intestine is lined by ciliated cells.
In forms living in a tube the intestine turns round and runs forward,
the cloaca being placed so as to debouch over the margin of the
tube. The cloaca is often very large; the nephridia and oviducts
may open into it, and the eggs lodge there on their way outwards;
they are thrown out, as are the faecal masses, by an eversion of
the cloaca. Asplanchna, Notomma, and certain species of
Ascomorpha are devoid of intestine or anus, excrementitious
matters being ejected through the mouth. The body cavity (archicoele)
contains a fluid in which very minute corpuscles have been
detected. There is no trace of a true vascular system. The
nephridia (fig. 1, B, n) present a very interesting stage of develop-
ment. They consist of a pair of tubules with an intracellular lumen
running up the sides of the body, at times merely sinuous, at others
considerably convoluted. From these are given off at irregular
intervals short lateral branches, each of which terminates in a
flame-cell (f) precisely similar in structure to the flame-cells found
in Planarians, Trematodes and Cestodes; here as there the question
whether they are open to the body cavity or not must probably be
answered in the negative. At the base these tubes open either
into a permanent bladder (fig. 1, b) which communicates with the
cloaca, or directly into the cloaca. They have the same functions
as the contractile vacuole of freshwater Protozoa (q.v.).

Nervous System. — There is a large ganglion lying in close contact
with the pharynx, proximal to the crop and on its antero-dorsal
side; in Bdellioidea at least it is united by short connectives
with a smaller postero-ventral ganglion to form a nerve collar.
From this simple nerve fibres are given off to the body-wall, especially
to the ciliated cells of the corona, to the foot, and also to the muscles
and sense organs.

The sense organs are eyes, antennae, sensory styles and a statocyst
in a few species. The eyes are refractive globules set in a cup of
red pigment traversed by a nerve fibre, and lie on the proximal
side of the body, directly on the postero-dorsal surface of the brain,
or at a little distance from it, on the neck, often within the circle
on the corona, and usually well within the transparent body. There
may be one, a pair, or rarely more, the outer ones being more or
less rudimentary. The antennae are short tubular extensions of
the body wall, sometimes retractile with a depressed tip from which
protrudes a tuft of fine stiff bristles. They are possibly organs of ex-
ternal taste (smell) as well as of touch. Typically there are two
pairs—a proximal, more or less approximated on the postero-dorsal
surface, and a distal pair, more widely separate. But the proximal
pair are often fused into a single median antenna (supplied, however,
by two nerves), and in one case at least the distal pair may be
similarly fused. Additional paired antennae may occur within
the coronal surface, which is the seat of the sensory styles, of less
complex structure, which occur in many genera. The statocyst
(retro-cerebral organ of P. Marius de Beauchamp) is a sac filled
with highly refractive granules soluble in dilute acids, and opening
by a slender duct (or a pair) to the surface: its function is doubtful
that of an organ of equilibrium, and it resembles in its opening to
the surface the primitive internal ear of even Vertebrates, for the
duct to the surface persists through life in the sharks.

Locomotor Organs. — Most free rotifers swim by the corona, aided
by the ciliated auricles when present. In Bdellioidea this may
alternate with a leech-like gait: the corona being withdrawn, the
cupped end of the probosces serves as a sucker for attachment
alternately with the adherent foot, so that the animal loops its
way along. In two families motile articulated rods occur; in
Triarthridae they probably simply expand the dimensions of the
body in adaptation to life at the surface; or as a protection against
being swallowed by their smaller foes. In Polyarthra and Pteroeossa
they are numerous, pinnated (feathered), and are doubtless used
for active swimming by jerks; they can be moved up or down by
special muscles attached to their bases, which project into the body.

**Fig. 5.—Pedalion mira.** A, lateral surface view of an adult female:
a, median ventral appendage; b, median dorsal appendage;
c, distal ventro-lateral appendage; d, dorso-lateral appendage;
f, dorsal antenna; g, "chin"; x, cephalotroch. B, lateral
view, showing visera: ac, eye-spots; n, nephridia; c, ciliated
loops; other letters as above. C, ventral view: x', trochos;
x', trochos with the posterior tentacles. D, ventral view, showing
the musculature (cf. text). E, dorsal view of a male: a, lateral
appendages; b, dorsal appendage. F, lateral view of a male.
G, enlarged view of the antenna f. H, enlarged view of the
median ventral appendage. (All after Hudson.)

caron; 5, Gymnarthra minor; 6, Annea serata; 7, Asco-
morpha parasitica; 8, Notolaka hepachon. (Drawn from specimens
by F. R. Dixon Nuttall.)

In Pedalion (fig. 5), a remarkable form discovered by Dr C. J.
Hudson in 1871 and found in numbers several times since, these
appendages have acquired a new and quite special development. They are in number, median, ventral and dorsal, and divided into lateral pairs. The largest is placed ventrally at some distance distal to the mouth. Its free extremity is a plumose fan-like expansion (fig. 5, Aa and H). It is, in common with others, a hollow process into which run two or three transverse striated muscles. Each pair has a single insertion on the inner wall—the one pair near the free extremity of the limb, the other near its attachment; the lands run up, one on each pair side, and run right round the body forming an incomplete muscular girdle, the ends approximating in the median line. Above this point springs the large median dorsal limb, which terminates in groups of long setae. It presents a single pair of muscular organs along its inner wall which run up and form a muscular girdle round the body, in its posterior third. On either side is attached a dorsolateral and ventro-lateral appendage, each with a fan-like plumose termination consisting of compound hairs or comb-like appendages only among arthropods (q.e.). Each of these is moved by muscles running upwards towards the neck and arising immediately under the trochal dish, the inferio ventro-lateral pair also presenting several short, slender appendages, which may be regarded as a group of long setose hairs the bases of which are connected with the nerve fibre. There are also two pairs of dorsal antennae. Pedalion presents a pair of ciliated toes in the posterior region of the body (fig. 5, B, C, and D, e) which it can apparently use as a means of attachment; Dr Hudson states that he has seen it anchored by these and swimming round and round in a circle.

Reproduction Organis.—Rotifers are unisexual, with the sexes dimorphic. The ovary is, as in many Platyhelminthes, elongated in part, the germarium, being an organ for the production by cell division of germ-cells or eggs proper, the other, the vitellarium, much more conspicuous and generally consisting of a definite number of large cells, producing the vitelline material for the growth of the egg. The whole ovary is unilaterial and unipolar, with the sexes dimorphic; symmetrical in Asplanchnaceae, Philodinaceae and Seisonaceae. In Asplanchnaceae the germarium is median, continuous at the distal end with the ventral part of the transverse horseshoe-shaped vitellary. In Philodinaceae and Seisonaceae the whole organ is paired, the germary proximal, the vitellarium distal, both opening into the cloaca. As a rule, the wall of the ovary is continued into a tubular tube opening into the cloaca; but in Philodinaceae this is absent, and the young eggs are free in the body cavity and escape by perforating the cloacal wall. The eggs are provided with a cover for they are thin-walled; the capacity of the cavity for eggs allows for the multiplication of many individuals in a few days. It is by the ovary that females habitually produce eggs without impregnation, which again habitually develop into females, more rarely into males. These unfertilized eggs develop directly, often in the uterus. In other cases the eggs are liberated earlier and can be seen hatched within the tube (fig. 3, b, c). The impregnated eggs undergo a very partial development in the mother, and these pass into a state of rest, for which they are furnished with a dense shell. They always give rise to partheno- genetic females (see reproduction). The thin-walled eggs are often termed "summer-eggs," the fertilized ones "winter" or "ephiplial" eggs (by parity with the phyllopod Entomotrocha, q.e.). The phenomenon of seasonal dimorphism is of especial moment for the planktonic rotifers. Monthly is the appearance of males regular, but the forms of the females at different times of the year may be so distinct as to have led them to be classed as distinct species.

Development.—The egg is holoblastic, but the segmentation is very unequal, recalling that of marine annelids and of molluscs. Gastrulation takes place by epiboly, and the stoloneural (oral invagination—mastax pharynx) takes place in two stages of the region of the closed blastopore. Unlike the molluscs and annelids, however, the cloacal invagination lies outside this region, and the mouth is formed by an elongation of the end of the body between the two apertures. The nerve cord is invaginated as an ingrowth of epiblast, and so are the pedal glands. The body form is the primitive blastocoel.

Relationships and Morphogenesis.—Paszkowski, one of the earlier authors who regarded this group as allied to Infusoria, a view supported by Dr D. E. Hudson, T. H. Huxley viewed them as equivalent to and on a level with the Echinodermata and of such trocho- phore larvae as resembled these, a view generally accepted. But this became more and more apparent that the larva of B. tigris, morphology, resembles that of Eucinostomum. The extra- blastoporic opening of the cloaca leads us to a very different view, which finds negative support in the failure of previous morphologists to adapt their views to the general principles of development and of the structure of the disk to their identification of "trochothorax" and "cingularium" with the prooral and postoral wreaths of the trochothorax larva. The embryos of the Turbellarian larva (fig. 8, Aa) and with the prooral or upper part of the trochophere (fig. 8, E, F). Its adhesive foot is paralleled by a cup-shaped ciliated depression, possibly nervous, found in all the Turbellaria and Cnidaria. The adhesive foot of the Turbellarian larva is a muscular organ, united by a nerve to the brain (letter omitted in B); b, bladder, receiving ramified kidney in B, C, D; f, foot, and f.g., cement gland; g, ovary; k, kidney; m, mouth; n, supra- oesophageal ganglion; n.r, nerve ring in section.

A, pilidium larva of nemertine; B, Asplanchna sp.; C, a ploimal rotifer; D, trochophore larva of echinoderm (from Semper); E, veliger larva of mollusc; F, trochophore larva of annelid. a, asex; ap, apical organ, corresponding to foot of rotifiers; at, median antenna, united by a nerve to the brain; b, bladder, receiving ramified kidney in B, C, D; f, foot, and f.g, cement gland; g, ovary; k, kidney; m, mouth; n, supra-oesophageal ganglion; n.r, nerve ring in section.

ganglion cells below invertebrate sense-organs. Moreover, the body cavity of the Rotifers is a primitive archaebol; the persistent or accrescent cleft between epiblast and hypoblast, traversed by mesenchymal muscular bands. Thus we regard Rotifers as an independent stem branching off at the outset of the rise from the Platyde type to higher Invertebrata. The Polyzoa (g.e.), which in many ways recall Rotifiers, appear to be equally independent.

The following classification of Rotifiers is our modification of that of Hudson and Gosse, further altered through considerations put forth by C. Wesenberg-Lund, which, however, we do not consider wholly convincing. He notably regards an oblique disk with uniform ciliation as primitive, a view which we cannot adopt.

Classification:

(i.) Trophi incudeate:

1. Asplanchnaceae; trochoïd circular; foot absent or minute; trophi incudeate; stomach blind; males frequent, not very dissimilar to females. *Asplanchna* Gosse (fig. 9, g-i); *Asplanchnus* Deguerne (fig. 9, j); *Ascomorpha* Perry (fig. 9, j).

(ii.) Trophi malleoramal:

1. Melicertaceae; females tubicolous, usually attached, or forming spherical floating social aggregates; males free swimming. *Melicerta* Schrank (fig. 3, e, f); *Oecistes* Ehrenberg; *Lacinularia* Schweiger; *Conochilus* Ehrenberg, with gap postero-ventral and mouth antero-dorsal (fig. 2, a).

2. Trochosphaeraceae; female footless; subspherical, the corona bulging into a hemisphere which may equal the hemispherical body; anus apical; male as in Melicertaceae, *Trochosphere* Semper (fig. 8, D).

3. Plomodaceae; subconical; corona bilobed; retractile foot absent or ciliated; motile appendages present in two families.

(a) Pterodinidae; foot a ciliated cup; cuticle forming flat sheet. *Pterodina* Ehr. (fig. 7, a).

(b) Triarthridae; body with a pair of long cervical spines pointing distally and serving for leaping movements or to extend the body and make two big or small extremes to swallow; *Pediales* Gosse (no median spines); *Triarthra* Ehr., one postero-ventral spine; *Tetramasit* Zacharias, two unequal median spines.

(c) Pedalionidae; foot represented by two styles, sometimes ciliated; body provided with six hollow-joined muscular fins for swimming and leaping. *Pediaion* Hudson (fig. 9, g).

(iii.) Trophi uncinate:

5. Bdelloidea; foot with two toes and accessory spurs or a simple perforated disk; body telescopic at either end, with an antero-dorsal proboscid ending in a ciliate cup and bearing the proximal corona; corona usually bilobed, very wheel-like. Males if present probably like the females. *Germovia* and ovary paired; oviduct absent; young viviparous. *Rotifer* Schrank (fig. 9, 4, d); *Philodina* Ehr. (fig. 9, c); *Calidina* Ehr. (eyesless); *Adineta* Hudson is eyeless with the corona uniformly ciliated, and proboscid adapted, hooked.

(iv.) Trophi uncinate:

Flosculariaceae; disk a contractile cup, often lobed, the cingulum of long vibratile cilia, of very long motionless bristles or absent, rarely with an outer zone of fine cilia. *Trophus* a pair of elbows open in front. Oral funnel produced into a fine tube hanging freely into a pharyngeal cup, containing the uncinate trophi. Body-wall usually traversed by a network of canals serving by their contraction to open and close. Males and larvae with a ciliated pedal cup and a simple ciliated disk.

(a) Flosculariaceae; tubicolous, with a lobed disk, bearing stiff or vibratile setae. *Floscularia* Oken (fig. 3, b); *Stephanoceros* Ehr. (fig. 3, a).

(b) Acyclidae. Disk entire or tentacular, not setiferous; *Acyclos* Leidy (fig. 3, a). Front represented by a button-like disk, carried forward from the posterior surface; *Apsilus* Metchinikoff (fig. 3, b); *Airochus* Wierzezski (fig. 3, c).

(B) Ploimaceae; disk variable, often circular, sometimes with a lobed trochoïd; bearing vibratile membranes (vibratile styles); trophi complete, maleate, submaleate, virgata, or foricrate; anus subapical; foot usually short, and usually bearing two toes which may be much elongated.

Loricata, cuticle soft; ciliated exsertile auricles above the disk sometimes present. *Albertia* Dujardin; *Dipleucus* Veijovd; *Microcodon* Ehr. (fig. 3, a); *Hypacera* (fig. 8, a); *Ploimaeae*; *Ploimoea* Ehr. (fig. 7, a); *Aquilla* Ehr. (fig. 7, b); *Notocia* Gosse (fig. 7, c); *Distylis* Eckstein (fig. 7, e); *Rutulus* Ehr. (fig. 7, f); *Colurus* Ehr. (fig. 6, 2); *Trophos* Wierzezski.

(C) Seisonacea. Body elongated with a narrow neck above the disk; foot ending in a terminal perforated disk. Trophi virgate exsertile; germ undigested; genito-urinary cloaca opening above the neck in the male, subapically in the female; gut blind (Paraseison), or opening into cloaca (Seison). Males resembling females, common. All known species are parasitic on the Crustacean Nobilis; *Seison* Cohn; *Paraseison* Plate.

Habitat and Habits.—The Rotifers are all aquatic, the majority dwelling in fresh water with *Protozoa* and *Protohypha*, as well as *Entomopyrastructure*. This association with *Protophyta* accounts for their study by many distinguished botanists, such as W. C. Williamson and F. Cohn. Some are moss-dwellers, inhabiting the surface film of water that bathes these plants: such especially are the *Bdelloids*, which have their exceptional capacity for resisting desiccation. Others—mainly live among weeds, the tubicolous ones mostly upon them. A few are sapropellic, haunting the lesser debris that forms the uppermost layer of the bottom ooze of quiet waters: we may cite the aberrant *Floscularian Airochus*. Widely different are the habits of the plankton forms, which float or swim near the surface, and are often provided with long

From H.L. Jennings in *American Naturalist*, vol. xxxv., by permission of Ginn & Co.
cuticular extensions for this purpose (fig. 7, a, b). Asplanchnaeae, plankton, dwellers in small pools, are, however, ovoid, and Trochosphaera is spherical and must have its floating power to the density of the liquid in its enormously dilated body-cavity. Lacinularia racemovata and Conochilus form free floating aggregates, the eggs, as laid, hatching and the young settling among the approximated gelatinous tubes of the parents. Some species only frequent the clearest waters; but the lovely transparent Hydroinaeaeae (fig. 2, 3) likes water contaminated by the visits of cattle or the drainings of manure. Drilophagus and Albertia are parasitic on the surface or within the gut of Naiad oligochaete worms: Seismonaeae are ectoparasitic on the Crustacean Neball, Proales wevercellii forms galls within the bodies of Heliothis, and the eyes infect the jelly of the Phytophagellate Volvox; P. petronyson is a frequent commensal in the gill cavity of some Cladoceran Crustacean Eurycercus lamellatus.

The geographical distribution is cosmopolitan, as is the case with Protozoa and Protophyta of similar habits. A curious fact is that when a new and striking form is found first in one place it is shortly after collected from widely separated areas. In the case of one genus, Gastrochisca, this led to the creation of no less than six generic names.

History and Natural History—As rotifers are common in ponds, the first observers with the microscope observed them repeatedly, the first record being that of John Harris in 1696, who found a Bdelloid in a gallipot that had been standing in his window. Leeuwenhoek found another that he described as a transparent viscous fluid; a fair number of species were observed, figured and described with names. During this time the illusion of a wheel or whirling produced by the ciliary action of the disk had puzzled all observers. C. E. Ehrenberg included the Rotifers in his Infusoriae, and described and figured with fair precision many of the genera and species. Dujardin gave a less detailed but more accurate account under the name Zoophytes Syllides. The next full work was a valuable contribution by P. H. Goze. His work on the Infusoriae has been a bench-mark text-book to students, and was printed in Pritchard's Infusoria, in 1861. Much work was done with the gradual introduction of improved methods during the last forty years of the century. The discovery of the transition of the male to the female was made, however, at the close of the fifties. P. H. Goze collected and described many species, and elucidated the structure of the mastax in 1856. Zoologists of the standing of Huxley, Claus and Leydig added to our knowledge of the anatomy and to the theory of their relations. But the monumental monograph of T. C. Hudson and Goze containing a new classification, an illustrated description of all the then known species and much information on habits and habits provided some, with an easy domain, to many to work hard at the group. Of these new-comers we may cite C. F. Russelet, who has found many new species and many unknown males of known species, elucidated habits and life-histories, and recently contributed a publication of this nature to the Journal of the Royal Microscopical Society. He has moreover elaborated a method for preserving Rottleri for microscopic observation. He has also written each one of the species for comparison as the plant-specimens of the botanist's herbarium. C. Zelinka has given us the most detailed anatomical accounts we possess for several Bdelloidea, and was the first to utilize modern methods of microscopic technique on a complete scale.

Goze, "Handbuch der Organen der Cladocera" (1856); W. C. Williamson, "The Rottleri," in A. Pritchard's History of the Infusoria (1861); T. C. Hudson and P. H. Goze, The Bdelloidea of the United States of America (1857); Marcus Hargot, "Rottleri," in Cambridge Natural History, vol. iv. (1865), reprinted in the Journal of the Royal Microscopical Society. He has moreover elaborated a method for preserving Rottleri for microscopic observation. He has also written each one of the species for comparison as the plant-specimens of the botanist's herbarium. C. Zelinka has given us the most detailed anatomical accounts we possess for several Bdelloidea, and was the first to utilize modern methods of microscopic technique on a complete scale.

ROTORUA, a town of Rotorua county, North Island, New Zealand. It lies in the midst of a remarkable volcanic district generally known as the Hot Spring district, or fancifully as the Wonderland, which covers an area of 60,000 sq. m. and extends 160 m. from N.E. to W. from White Island, an active volcanic cone in the Bay of Plenty, and embraces the Townes, Ngauruhoe and Ruapehu in the interior of the islands. S.W. of the lake Taupo. Rotorua attracts many visitors on account of the beauty and scientific interest of the locality and the bathing in its various medicinal springs. It is a scattered township lying on the south-western shore of lake Rotorua, amid hills reaching 2000 ft. in the immediate neighbourhood, and much of the volcanic soil supports a rich growth of forest or "bush.

The springs are principally alkaline, alkaline and siliceous, acid, or acidic and hepatic (sulphurous). The township includes the Maori village of Ohinemutu, an interesting collection of native dwellings and houses; these inhabitants usually use the numerous rude and excavated baths which are fed by springs varying in temperature from 60° F. to the boiling-point, and are in some cases used for cooking. In the vicinity, on the lake-shore, is the government Golf Links. Two miles south of Rotorua is another native village, Whakarewarewa, where there are geysers as well as hot springs. Four miles from Rotorua, near the centre of the lake, the island of Mokoia rises to 1518 ft. It is partly under grass and partly used as a Maori Inhabitation. There is a 200 ft. high holy ground. A short channel connects lake Rotorua with lake Rototui to the N.E. At the eastern end steep cliffs rise from the water, and luxuriant vegetation covers the hills. Both this lake and the smaller ones to the east, Roterehi and Rotorua, have deeply indented shores, and are set in exquisite scenery. The group is known collectively as the Cold Lakes. The waters of Rotorua are of a particularly vivid blue. To the south of Rotoriiti is Tikitere, a sombre valley abounding in mud volcanoes, springs and other active volcanic phenomena. Mount Tarawera (16 m. S.E. of Rotorua) is noted for the eruption of June 1886, which changed the outline of the lake. His visit to New Zealand and the adjoining lake Tarawera, and converted a region of great beauty into a desolate wilderness. A fissure was formed extending nearly 9 m. along the axis of the disturbance, and the mission station of Wairoa (8 m. from Rotorua) on the western shore of the lake was overwhelmed. A line of craters is seen to the south-west. The large lakes Okatina, Kahihi and Rerehaukaitu lie respectively N., W. and S.E. of lake Tarawera.

ROTRU, JEAN DE (1600—1650), French tragic poet, was born on the 19th or 20th of August 1600, at Dreux in Normandy. Rotrou studied at Dreux and at Paris, and, though three years younger than Cornelle, began play-writing before him. In 1623 he became playwright to the actors of the Hôtel de Bourgogne. With few exceptions, the only events recorded of his life are his visits to Italy and his enrolment in 1635 in the band of five poets who had the duty of turning Richelieu's dramatic ideas into shape. Rotrou's own first piece, L'Hypocoriste (pr. 1631), dedicated to the Comte de Soissons, seigneur of Dreux, appeared when he was only eighteen. In the same year he published a collection of Études poétiques, including elegies, epistles and religious verse. His second piece, La Fable de l'oubli (pr. 1636), an adaptation in part from the Sortija del Olvido de Lope de Vega, was much more characteristic. It is the first of several plays in which Rotrou endeavoured to naturalize in France the romantic elements of the English drama, the imitation of the classical tragedy of Seneca and the sexual comedy of Terence. Cornelle had leanings in the same direction. Rotrou's brilliant but hasty and unequal work showed throughout marks of a stronger adhesion to the Spanish model. In 1634, when he printed Cleagnor et Doristé (acted 1630), he said he was already the author of thirty pieces; but this applies no doubt to adaptations. Diane (acted 1630; pr. 1633), Les Occasions perdues (acted 1631; pr. 1635), which won for him the favour of Richelieu, and L'Heureuse Constiance (acted 1631; pr. 1639), which was praised by Anne of Austria, succeeded each other rapidly, and were all in the Spanish manner. In 1637 Rotrou imitated Plautus in Les Ménages (pr. 1637), and in 1634 Seneca in his Hercule mourant (pr. 1636). Comedies and tragi-comedies followed. Documents exist showing the sale of four pieces to Antoine de Sommarille for 750 livres tournois in 1636, and in the next year he sold ten to the same bookseller. He spent much time at Le Mans with his patron, M. de Belin, who was one of the opponents of Cornelle in the quarrel of the Cid. It has been generally assumed, partly because of a forged letter long accepted as Cornelle's, that Rotrou was his generous defender in this matter. He appears to have been no more than neutral, but with an attempt at reconciliation between the parties in a pamphlet printed in 1637, L'Incroy à véritable ami de messieurs de Scodery et Cornelle. M. de Belin died in 1637,
and in 1639 Rotrou bought the post of lieutenant particulier au battage at Dreux. In the next year he married Marguerite Camus, and settled down as a model magistrate and père de famille. Among his pieces written before his marriage was a translation of the Compilacion of Plautus under the title of Les Deux Sossies (1636), Antigone (1638), and Laura Persecute (acted 1637; pr. 1639), in the opposite style to these classical pieces. In 1646 Rotrou produced the first of his four masterpieces, Le Véritable Saint Genest (acted 1646; pr. 1648), a story of Christian martyrdom containing some amusing by-play, one noble speech and a good deal of dignified action. Rotrou uses with considerable success the device of a play within a play. The actor Genest becomes a real convert while playing the part of a Christian martyr. Incidentally (Act i. Sc. v.) Rotrou pays a noble tribute to the genius of Corneille. Don Bertrand de Cabré (1647) is a tragi-comedy of merit; Vencelas (1647; pr. 1648) is considered in France his masterpiece, and has had several modern revivals; Cosroès (1649) has an Oriental setting, and is claimed as the only absolutely original piece of Rotrou. These masterpieces follow foreign models, and Rotrou’s genius is shown in the skill with which he simplifies the plot and strengthens the situations. Saint Genest followed Lope de Vega’s Lo fingido verdadero; Vencelas followed the No ay ser padre siendo rey of Francisco de Rojas. In this play Ladislas and his brother both love the princess Cassandra; Ladislas makes his way into her house and in the darkness kills a man whom he thinks to be the duke of Courland, but is revealed to his brother Alexander, the favoured lover. In the early morning he meets the king and is confronted by the duke of Courland. The outline of this incident is in the Spanish play, but there the spectators are aware of the ghastly mistake at the time of the murder. Rotrou shows his dramatic skill by concealing the real facts from the audience until they are revealed to the horror-struck Ladislas himself.

In 1650 the plague broke out at Dreux. Rotrou remained at his post, although urgently desired to save himself by going to Paris; caught the disease, and died in a few hours. He was buried at Dreux on the 28th of June 1650. Rotrou’s great fertility (he left thirty-five collected plays besides others lost, strayed or uncollected), and perhaps the uncertainty of dramatic plan shown by his hesitation almost to the last between the classical and the romantic style have injured his work. He has no thoroughly good play, hardly one thoroughly good act. But his situations are often pathetic and noble, and as a tragic poet properly so called he is at his best almost the equal of Corneille and of Racine. His single lines and single phrases have a brilliance and force not to be found in French drama between Corneille and Hugo.

A complete edition of Rotrou was edited in five volumes by Viollet le Duc in 1822. In 1889 M. de Ronchard published a handsome edition of six plays—Saint Genest, Vencelas, Don Bertrand de Cabré, Antigone, Heracle Mourant and Cosroès. Vencelas and Saint Genest are also to be found in the Chefs-d’œuvre Tragiques of the Collection Didot.

Rotrou’s brother, Pierre Rotrou de Saudreville, left a memoir of him which is unfortunately lost, but this is cited by the Abbé Brillon (1671-1736) as his authority in a Notice biographique sur Jean Rotrou, first printed in 1855 at Chartres under the editorship of the Abbé Plénat, though an earlier notice is in Alphonse Naccry’s Notice sur Jean Rotrou, pour servir à l’histoire des hommes illustres (1711), vol. ivi. pp. 124-140; and the duke of la Vallière, Bibl. du théâtre français depuis son origine (Dresden, 1768), vol. ii. pp. 155-273. Modern works are by Alphonse Naccry, Essai sur les œuvres dramatiques de Jean Rotrou (Paris and Lille, 1868); Léonce Person, Hist. du Veneclase de Rotrou, suivie de notes critiques et biographiques (1882), in which many legends about Rotrou’s life are discarded; Hist. du théâtre français (1882); Les Papiers de Pierre Rotrou de Saudreville (1883); Henri Chardon, La Vie de Rotrou mieux connue (1884); and Georg Steffens, Jean de Rotrou als Nachahmer Lope de Vega’s (Berlin, 1891).

ROTTA, CHORTA, HROTTA (Fr. Cithare, rota; Ger. Cy- thara, Rotta), a medieval stringed instrument derived from the Greek cithara. The rota possessed, in common with all other forerunners of the violin, the chief structural features of the cithara, i.e. the box sound-chest composed of back and belly either flat or delicately arched connected by ribs. The rota represents the first step in the evolution of the cithara, when arms and cross-bar were replaced by a frame joined to the body, the strings being usually restricted to eight or less. Examples of these early rota-like miniatures from the 8th to the 12th century or even the 14th, such as Cotton MS. Vespasian A. I. (Brit. Mus.), 700 A.D., and the MS. copy in the Durham Cathedral Library of the Cassiodorus Commentary on the Psalms1 manu Bedae. The most interesting is a real specimen of wood found in an Alamanic tomb of the 4th to the 7th century at Oberflacht2 in the Black Forest, and now preserved in the Völker Museum, Berlin.

The next step was the addition of a finger-board and the consequent reduction of the strings to three or four, since each string was now capable of producing several notes. In the Caro- dantes, a collection prepared by Charles the Bald1 by Count Vivian of Tours there is a fine example of the rota at this stage, in which the artist has reproduced the position of the fingers of the left hand stopping the strings, and of the right hand pluck- ing them. The same instrument occurs in a companion Bible, known as the Bible of St Paul because it was preserved in the monastery of that name “without the walls” at Rome. Although these MSS. were executed in the 9th century, they do not represent contemporary scenes, but were inspired by Romano-Christian models, if not actually copied from older MSS. This is the only representation yet found of the finger-board thus applied to the rota. In the final transition preceding the transformation into the guitar the rota appears as a guitar-shaped instrument without neck or head and having a hole large enough to allow the hand to pass through left in the body on each side of the strings. At first this instrument, which developed into the crwth, was twanged with the fingers, but in the 11th century it was played with a bow, the bridge having been slightly raised on feet.

The first (and perhaps also the second) of these transitions was accomplished in the Christian East, where, however, the upper frame of the earliest rota seems to have been at once discarded in favour of a long neck with frets, the lower neck and fingerboard having supplied the idea. This evolution is to be traced in the miniatures of a single MS., which supplies examples of all the transitions. The miniatures illustrate the Psalms in the Utrecht Psalter; they were beyond doubt originally designed to accompany a Greek or Syriac version.1 The Utrecht Psalter, executed in the diocese of Reims under Anglo-Saxon influence during the 9th century, is no service book; it owes much of its inspiration and local colour to an unknown Greek or Syrian prototype.

As soon as the neck was added to the guitar-shaped body, the instrument ceased to be a rota and became a guitar (g.v.), or a lute (g.v.) if the rota were bowed. Of the rota, there were two distinct types, the one derived from the cithara, the rota proper, and the other derived from the lute, which survived to the 18th century as the Welsh crwth. Although the various forms of the crwth came to be applied somewhat indiscriminately in different countries and epochs to both types, yet the structural features of both remained true to their respective archetypes.

The words rota in England and cythara in Germany seem to have clung more especially to the first of these types, while the forms crwth, crowd, crouth were reserved for the bowed instruments, the earliest of which appeared in the 11th century.

The crwth or crowd, so popular in England during the 14th century, does not seem to have won equal favour in Germany, where at that time the nidel or guitar-fiddle had been popularized by the minne-ingers. The crwth derived from the lyre underwent no further development.

ROTTenburg, a town and episcopal see of Germany, in the kingdom of Württemberg, situated on the left bank of the Neckar, which is here crossed by two bridges connecting the

1 Both miniatures are reproduced by J. O. Westwood in Facsimiles (London, 1868).
2 Reproduced in Jahreshefte des Württem. Altertums Ver. vol. iii. (Stuttgart, 1849), pl. viii. fig. 10 and 11.
3 See Facsimile, by Comte Auguste de Bastard (Paris, 1883).
4 The whole case of this much-discussed Psalter, with résumés of the principal writings on the subject of facsimiles of the miniatures bearing on the evolution of the cithara, will be found in Kathleen de Vries’ Instruments of the Orchestra, pp. 343-82 and pl. iii. vi. and vii. (London, 1900).

---
town with the suburb of Eihingen, 7 m. by rail S.W. of Tübingen. Pop. (1905) 7554. It is the seat of a Roman Catholic bishop, and possesses the fine Gothic cathedral of St. Martin; several other churches; an old castle now used as a prison; and a building, formerly a Jesuit monastery and now the residence of
the bishop. The chief industries are the manufacture of machinery, screws, watches and beer, tanning and the cultivation
of fruit and hops. Rotenburg passed into the possession of Austria in 1281 and into that of Württemberg in 1805. Near the town are the remains of the Roman station of Salmocina or Salmuncinacum.

**ROTTERDAM**, a city of Holland in the province of South Holland, on both banks of the New Maas, at the confluence of the canalized Rotte, and a junction station 144 m. by rail S.S.E. of the Hague. Steam tramways connect it with Schiedam, and with Nuenen on the south of the island of Beierland, and there is a regular service of steamers by river and canal to Antwerp by way of the South Holland and Zeeland Islands and in every direction. The population of the city was about 20,000 in 1612; 53,312 in 1796; 105,838 in 1860; and 379,017 in 1905. Its shipping facilities have raised Rotterdam to the position of the first commercial city of Holland. By means of the New Waterway (1860–90) to the Hook of Holland it is accessible for the largest ships. The principal quay is the Boomjes ("little trees"), forming the riverfront on the north side. Although originally situated exclusively on the north or right bank of the Maas, in 1869 Rotterdam was extended to the southern shore by the acquisition of the commune of Feenoord; while in 1886 Delfshaven on the west, and in 1895 Charlois on the south-west and Kralingen on the east, were also incorporated. The river is spanned by a road bridge (1878) and a railway bridge (1877) passing from the Boomjes to the North Island, whence they are continued to the farther shore by swing-bridges through which the largest ships can pass to the upper river. These bridges prove useful in breaking up the ice which forms above them in winter. On the south side of the river are numerous large docks and warehouses, while the city proper on the north side consists of a labyrinth of basins and canals with tree-bordered quays. In the centre of the town is the Beursplein, or Exchange Square, with the large general post office (1875), the "Amicita" club, and the exchange itself (1723). Behind the exchange is the great market-place, built on vaulting over a canal, and containing a bronze statue of Erasmus, who was born in Rotterdam in 1467. The statue is of Hendrik de Keyser, and was erected in 1632 (the inscription being added in 1677) to replace an older one. Beyond the market-place is the High Street, which runs along the top of the Maas Beach, and is one of the chief streets in the city. It is planted with trees and grass plots leads from the Zoological Gardens (1857), on the north to the small park overlooking the river. In the park is a statue of the popular poet Hendrik Tollens (d. 1858), a native of the city. Among the churches of Rotterdam are an English church, originally built by the 1st duke of Marlborough, whose arms may be seen with the royal arms over the entrance. The Groote Kerk, or Laurens Kerk (end of the 16th century), contains a fine brass screen (1715), a celebrated organ with nearly 3000 pipes, and the monuments of Admirals Witte de Witte (d. 1658), Kortenaer (d. 1665), and van Brakel (d. 1669), and other Dutch naval heroes. The lofty tower commands an extensive view. In the New Market adjoining is a fountain adorned with sculptures erected in 1874 to commemorate the jubilee of the restoration of Dutch independence (1813). The museums of the city comprise an ethnographical museum, the maritime museum established by the Yacht Club in 1874, and the Boyman's Museum (1867) containing pictures, drawings and engravings, as well as the town library. Of the original collection of pictures bequeathed by F. J. O. Boyman in 1847, more than half was destroyed by fire in 1864, but the collection has been enlarged since and is representative of both ancient and modern artists. Close to the museum is a statue of the statesman Gysbert Karel van Hegendorp (1762–1834), a native of the city. Among the remaining buildings must be mentioned the town hall (17th century; restored 1843), the concert-hall, the museum of the "Harmonic" club, the record office (1900), the leeskabuid, or subscription library and reading-rooms, and the ten-storied Wilte Huis (1807), which is used for offices and is one of the highest private buildings on the Continent.

The industries comprise the manufacture of tobacco, cigars, margarine, rope, leather, &c., and there are breweries, distilleries and sugar refineries. The gas, electricity (1894) and waterworks (1870) are under municipal control. Shipbuilding yards extend above and below the city, one of the earliest being that of the Netherlands Steamboat Company (1825). It is, however, rather a manufacturing than a commercial city; in fact, that Rotterdam is distinguished, its progress in this respect having been very striking. Between 1850 and 1902 the area of canals and docks in use on both sides of the river increased from 96 to over 300 acres, about £2,000,000 having been spent on the building of docks in the last quarter of the 17th century. Besides its maritime trade Rotterdam has an extensive river traffic, not only with Holland, but also with Belgium and Germany. Its overseas trade is principally with the Dutch colonies, New York, La Plata and the east and west coasts of Africa. The great harbour works on the south side of the river required to accommodate this growing trade were planned by the engineer Stieljes (d. 1878), who has a monument on the North Island. Besides being easily accessible from the river and connected with the railways, the docks are provided with every facility for coaling and loading or discharging cargoes. The larger passenger steamers of the Rotterdamse Lloyd to Netherlands India and of the Holland-American Steamship Company (the two principal passenger and cargo steamship companies at Rotterdam) have their berths on the south side of the river. In the centre of the river there is accommodation for over thirty vessels at the mooring buoys. The increase in the importance of Rotterdam as a port, apart from the development of the trade of the Netherlands generally, is shown by the fact that whereas in 1846 only 31% of the total trade of the country passed through the port, in 1883 the proportion was 50%; in the same year 43.75% of the total number of vessels engaged in Dutch trade used the port of Rotterdam, whereas in 1850 the proportion was only 35.77%. The average number of all vessels using the port annually during the decade 1897–1906 was 7228 of 11,163,024 tons, but a steady increase was recorded during this period, from 6122 ships of 8,434,012 tons in 1897 to 8,570 ships of 14,571,246 tons in 1906.

The Rotterdam probably owes its existence to two castles, which existed in feudal times. In 1299 John 1., count of Holland, granted to the people of Rotterdam the same rights as were enjoyed by the burghers of Beverwijk, which were identical with those of Haarlem (K. Hegel, *Städte und Gilden*, 1891, Bd. ii.). This privilege marks the origin of the town. In 1489 it was surprised by Francis van Brederode, and in 1572 it was plundered by the Spaniards, who were in possession for four months. It continued to increase in size, various extensions of its boundaries being made, and its trading importance is to a large extent the result of its commercial intercourse with England.

**ROTTWEIL**, a town of Germany, in the kingdom of Württemberg, lying on a hill on the left bank of the Neckar, 46 m. S.W. of Tübingen by rail. Pop. (1905) 9008. It is partly surrounded by walls, and contains two fine churches, the Gothic Hellige-Kreuz-kirche, built in the 14th century and restored in 1849, and the Capellen-kirche with a Gothic spire 230 ft. high. It has a medieval town hall, several schools and a museum of antiquities. Especially noteworthy is the collection of sculptures and pictures of old German art in the chapel of St Lawrence, where there is also a Roman mosaic, found in the vicinity, portraying Orpheus in the centre and, at the sides, Roman chariot-races and gladiators. The industries of the place
embrace the manufacture of powder, locomotives, machinery, cotton, leather and beer. There is also a considerable trade in live stock, agricultural produce and wine.

Rottweil-Alstadt, which lies about 2 m. to the south, was a Roman colony. It has an old church and a Cistercian nunnery founded in 1221 and dissolved in 1838. Near the town is Wilhelmshain, with saline springs. In the 13th century Rottweil was ceded by Strasbourg to the Romans; it was subsequently the seat of an imperial court of law, the jurisdiction of which extended over Swabia, the Rhineland and Alsace. The functions of this tribunal came to an end in 1784. In 1803 Rottweil passed into the possession of Württemberg.

See Ruckgaber, Geschichte der Stadt Rottweil (3 vols., Rottweil, 1835); and Greiner, Das ältere Reich der Reichsstadt Rottweil (Stuttgart, 1900).

**ROTUMAH (Rotuama, Rotua or Grenville), an island of the South Pacific Ocean, in 12° 56' S., 177° E., about 300 m. N. by W. of Fiji, of which British colony it is a dependency. Its area is 14 sq. m., and its extreme elevation 800 ft. It is surrounded by coral reefs, and is richly wooded. Several islets lie round it. The population is about 2,200, the natives being Polynesian, though their language has been classified as Melanesian. They are Wesleyans or Roman Catholics. The chief product is copra. A European commissioner resides. Local laws, subject to approval by the legislative council of Fiji, are promulgated by a regulation board, composed of the commissioner, native chiefs of the seven districts into which the island is divided, and two native magistrates. Rotumah was discovered by Captain Edwards of the "Pandora" in 1791, and was annexed by Great Britain in 1881.

**ROUAULT, JOACHIM (d. 1478), French soldier, was a member of an old family of Poitou. He attached himself to the dauphin (afterwards Louis XI.) and became his premier squire. He followed Louis in his expedition against the Swiss in 1444, distinguished himself in the war against England in 1449, and received the posts of governor of Blaye and Fronsac and constable of Bordeaux. After taking an important part in the battle of Castillon (1453), which resulted in the defeat and death of John Talbot, 1st earl of Shrewsbury, he fought against John V., count of Armagnac, in 1455, and in the following year made a fruitless expedition into Scotland. He took part in the campaign in Catalonia, and became marshal of France in 1461, and governor of Paris in 1472. In 1471 and 1472 he defended Amiens and Beauvais against the Burgundians. Towards the end of his life he was disgraced by Louis XI., and sentenced to banishment and the confiscation of his property.

(M. P. *)

**ROUJAIX, a manufacturing town of northern France, in the department of Nord, 6 m. N.E. of Lille on the railway to Ghent. Pop. (1906) 116,055. Roubaix is situated about a mile from the Belgian frontier on the Roubaix Canal, which connects the lower Deule with the Schelde by way of the Marq and the Espliere. Tramways connect the town with Lille and with the neighbouring communes of Tourcoing (pop. 62,694), Croix (pop. 16,202) and Wattrelos (pop. 14,618), with which it unites to form one great industrial centre. The chief business of Roubaix is the woollen manufacture, but cotton, silk and other materials are also produced. The chief of these are fancy and figured stuffs for garments, velvet and upholstery fabrics. Wool-combing and wool-dressing works, spinning-mills, weaving establishments, dye-houses and printing-works occupy some 50,000 work-people, and four hundred firms act as commission agents for the sale of raw material and the other requisites for manufacture. The trade is largely dependent on the continent, although it is shipped by the continent, although it is shipped by the British East India Company. There are breweries, rubber-works, metal foundries and machinery-works in the town. Tomato and grape growing under glass for the winter market is extensively prosecuted. To maintain the high standard of artistic taste which has made the industry of Roubaix a success, schools have been multiplied. By the co-operation of the town and the state the national school of industrial arts was founded in 1883. This is a small university of art, commerce and industry, the twenty-two courses of which include all the branches of knowledge useful in any of those pursuits. Among the public institutions are the tribunal of commerce and the chamber of commerce, the exchange, a board of trade- arbitration and the establishment (bureau de conditionnement) for determining the nature and weight of silk, wool, cotton and linen.

The prosperity of Roubaix had its origin in the first factory franchise granted in 1469 by Charles the Bold, duke of Burgundy, to Peter, lord of Roubaix, a descendant of the royal house of Brittany. In the 18th century Roubaix suffered from the jealousy of Lille of which it was a dependency, and it was not till the 19th century that its industries acquired real importance. The population, which in 1804 was only 8,700, had risen in 1861 to 40,000, in 1866 to 65,000, and in 1876 to 83,000.

**ROUBILAC (more correctly Roubillac), LOUIS FRANCOIS (1660-1752), French sculptor, was born at Lyons and became a pupil of Hals Thasar of Dresden and of N. Coustou. It is generally stated that he settled in London about 1720, but as he took the second grand prize for sculpture in 1730, while still a pupil of Coustou, it is unlikely that he visited England at an earlier date. The date 1744, as given by Dussieux, is incorrect. He was at once patronized by Walpole and soon became the most popular sculptor in England, super- seceding the success of the Fleming Rysbrack and even of Scheemakers. He died on the 11th of January 1762, and was buried in the church of St Martin-in-the-Fields. Roubillac was largely employed for portrait statues and busts, and executed the sepulchral monuments and statues of Luton House in Westminster Abbey are the monuments of Handel, Admiral Warren, Marshal Wade, Mrs Nightingale and the duke of Argyll, the last of these being the first work which established Roubillac's fame as a sculptor. The statues of George I., Sir Isaac Newton, and the duke of Somerset at Cambridge, and of George II. erected in Golden Square, London, were also his work. Trinity College, Cambridge, possesses a series of busts of distinguished members of the college by him. Roubillac possessed skill in portraiture and was technically a master, but lived at a time when his art had sunk to a low ebb. His figures are frequently uneasy, devoid of dignity and sculptresque breadth, and his draperies treated in a manner more suited to painting than sculpture. There are, however, noteworthy exceptions, his bust of Pope, for example, reaching a high standard. More often, however, his striving after dramatic effect detracts from the repose of attitude.

His most celebrated work, the Nightingale monument, in Westminster Abbey, a marvel of technical skill, is saved from being ludicrous by its ghastly and even impressive hideousness. On this the dying wife is represented as sinking in the arms of her husband, who in vain strives to ward off a dart which Death is aiming at her. The lower part of the monument, on which the two portrait figures stand, is shaped like a tomb, out of the opening door of which Death, as a half-veiled skeleton, is bursting forth. The celebrated bust of Shakespeare, known as the Davenport bust, in the possession of the Garrick Club, London, must be attributed to Roubillac. The statue of Shakespeare, a commission from David Garrick, and executed by the actor to the English nation, is in the British Museum, and shows the talent of the sculptor in a flattering light. It is noteworthy that none of his work is recorded in France, the land of his birth and education.

**ROUCHER, JEAN ANTOINE (1745-1794), French poet, the son of a tailor of Montpellier, was born on the 22nd of February 1745. By an epigram on Louis XVI. and Marie Antoinette he gained the favour of Turgot, and obtained
a salt-tax collectorship. His poem was entitled *Les Mois*; it appeared in 1779, was praised in MS., dammed in print and restored to a just appreciation by the students of literature of the 19th century. It has the drawbacks of merely didactic-descriptive poetry on the great scale, but occasionally displays much grace and spirit. The malicious wit of Rivarol's *mot* on the ill-success of the poem, "C'est le plus beau naufrage du siècle," is not intelligible unless it is said that one of the most elaborate passages describes a shipwreck. Roucher was a disciple of Voltaire, and therefore a friend of the Revolution, but he remained moderate in his opinions. He frequently presided over an anti-Jacobin club, and denounced the tyranny of the popular demagogues in supplements published with the *Journal de Paris* in 1792. He was arrested on the 4th of October 1793, and, accused of being the leader of a conspiracy among the prisoners at Saint Lazare, was sent to the guillotine on the same tumbril with his friend André Chénier on the 25th of July 1794. Roucher translated in 1790 Adam Smith's *Wealth of Nations*. His letters from prison were edited by his son-in-law under the title of *Conversations de ma captivité* (1797), and his death was made subject of a tragedy in 1834 by his brother Claude Roucher-Deratte, a voluminous writer.

See A. Guillois, *Pendant la terreur, la poète Roucher*, 1745-1794 (1890), founded on the poet's papers by one of his descendants.

**ROUÉ**, a dissipated debauchee. The word is French, and its original meaning was "broken on the wheel." Breaking on the wheel was a form of execution reserved in France, and some other countries, for crimes of peculiar atrocity. A roué, therefore, came by a natural process to be understood to mean a man morally worse than a *pandard* or gallows-bird, who only deserved hanging for common crimes. He was also a leader in wickedness, since the chief of a gang of brigands (for instance) would be broken on the wheel, while his obscure followers were merely hanged. Philip, duke of Orleans, who was regent of France from 1715 to 1723, gave the term the sense of impious and callous debauchee, which it has borne since his time, by habitually applying it to the very bad male company who amused his privacy and his leisure. The *locus classicus* for the origin of this use of the epithet is in the *Mémoirs de Saint-Simon* (vol. xii. pp. 441-46, ed. Chérel and Regnier, Paris, 1873-86).

**ROUELLE, GUILLAUME FRANÇOIS** (1703-1770), French chemist, was born in 1703 at Mathieu, near Caen. He started as an apothecary, but in 1742 he was appointed experimental demonstrator of chemistry at the Jardin du Roi in Paris, where he was especially influential and popular as a teacher, numbering Lavoisier and J. L. Proust among his pupils. Many stories are told of the vivacity and enthusiasm with which he lectured, of the absent-mindedness which sometimes led him, forgetting that his pupils could not hear what he was saying, to continue his explanations while he was out of the classroom. Looking for a piece of apparatus, and of the vigorous tirades, generally culminating in the epithet "plagiare," in which he used to indulge against men with whom he disagreed (Höfer, *Hist. de la chimie*, ii. 378). His most important achievement was to define "salts," a term formerly used in the most loose and indeterminate way—as the compounds formed by the union of acids and bases, and further to distinguish between neutral, basic and acid salts. Other subjects on which he published papers were the inflammation of turpentine and other essential oils by nitric acid, and the methods of emulsion practised by the Egyptians. He died in 1770 as a result of a fall from the belfry of L'Église de Rouelle the elder, to distinguish him from his younger brother and assistant, HILAIRE MARIEN (1718-1779), who, on his resignation in 1768, succeeded him as demonstrator at the Jardin du Roi.

**ROUEN**, a city of France, capital of the department of Seine-Inférieure and the ancient capital of the province of Normandy, on the Seine, 87 m. N.W. of Paris by rail. Pop. (1906) 111,402. The old city lies on the north bank of the river in an amphitheatre formed by the hills which border the Seine valley. It is surrounded by boulevards. Outside the ellipse formed by these lie the suburbs of Martainville, St Hilaire, Beauvoisine, Bouvreuil and Cauchois; 2½ m. to the east is the industrial town of Darnétal (pop. 6770), and in the level plain on the opposite bank of the Seine is the extensive manufacturing suburb of St Sever with the industrial towns of Sotteville (pop. 18,000) and Petit Quevilly (pop. 14,852) in its immediate neighborhood. Finally in the center of the north-east of St Sever, is the Ile Lacroix, which also forms part of Rouen. Communication across the Seine is maintained by ferry and by three bridges, including a pont transbordeur, or moving platform, slung between two lofty columns and propelled by electricity. Rouen possesses four railway stations. The central point of the old town is the Place de l'Hôtel de Ville, occupied by the church of St Ouen, the hôtel de ville and an equestrian statue of Napoleon I., and traversed by the Rue de la République which leads from it past the cathedral to the Place de la République and the Quai de Paris. Parallel to this street to the west are the Rue Beauvoisine with its southern continuations, the Rue des Carmes and the Rue Grand-Pont, and the wide and handsome Rue Jeanne d'Arc terminating on the Quai de la Source. These thoroughfares, which are all within the boulevards, are crossed at right angles by the Rue de la Grosse Horloge and by the Rue Thiers, running from the Place Cauchois on the west to the Place de l'Hôtel de Ville, and passing on the left the Jardin Solferino and the museum.

The cathedral was built on the site of a previous cathedral which was destroyed by fire in 1200, and its construction lasted from the beginning of the 13th century, to which period belong the lateral doors of the west portal, to the beginning of the 16th century, when the Tour de Beurre was completed. The spire surmounting the central tower, which is the highest in France (485 ft.), is modern. The western façade, with its profusion of niches, pinnacles and statues, belongs, as a whole, to the Flamboyant style. But the northern tower, the Tour St Romain, is in the main of the 12th century, its upper stage (with its steep, pointed roof) having been added later. The southern tower, the Tour de Beurre, so named because funds for its building were given in return for the permission to eat butter in Lent, is of a type essentially Norman, and consists of a square tower pierced by high millioned windows and surmounted by a low, octagonal structure, with a balustrade and pinnacles. The juxtaposition of these two towers, so different in character, is the most striking feature of the main façade, which is notable besides for its width. The portals of the transept are each flanked by two towers and decorated with sculpture and statuary. That to the north, the Portal des Libraires, looks upon the Cour des Libraires, once the resort of the booksellers of Rouen. That to the south is known as the Portail de la Calende. The plan of the church comprises a nave with aisles and lateral chapels, a transept and a choir with ambulatory. The most remarkable part of the interior is the Lady-Chapel (1202-96), behind the choir with the tombs (1528-25) of Cardinal Georges d'Amboise and his nephew, the statuary of which, including the kneeling statues of the two cardinals, is of the finest Renaissance workmanship. The chapel also contains the tomb (1536-44) of Louis de Brézé, seneschal of Normandy. Behind the cathedral is the archiepiscopal palace, a building of the 14th and 15th centuries.

St Ouen, formerly the church of an abbey dating to the Roman period and reorganized by Archbishop St Ouen in the 7th century, exceeds the cathedral in length as well as in purity of style. In spite of the juxtaposition of the second and third, He-Renais and Flamboyant types of Gothic architecture, the building is as a whole, which even the modern façade has failed to mar. It was founded in 1118 in place of a Romanesque church which previously occupied the site and of which the only relic is the chapel in the south transept. The choir alone was constructed in the 14th century. The nave of the church belongs to the 15th century, by the end of which the central tower with its octagonal lantern and four flanking turrets had been erected. The building of the western façade, which is flanked by two towers, was not undertaken till 1846.
The walls of the church are pierced by windows filled with stained glass of the 14th, 15th and 16th centuries and cover more space than is usual even in French Gothic churches. The Portail des Marmousets, the entrance to the south transept, has a projecting porch, behind and above which rises a magnificent rose window. The north façade has no entrance. In the interior, now despoiled of many artistic treasures, there is an organ-case dating from 1630 and a railing of the 18th century surrounding the choir.

The church of St Maclou, behind the cathedral, begun in 1437 and finished early in the 16th century, is a rich example of the Flamboyant style, the characteristics of which are specially displayed in the decoration of the façade and the tracery of the portal with its five arched openings. It is celebrated for carving attributed to Jean Goujon which appears on the western doors and in other parts of the church, and has a handsome organ-loft reached by a graceful open staircase, and stained glass of the 15th and 16th centuries. The spire above the central tower is modern and was finished in 1869. Close by the church is the old parish cemetery called the Altre de St Maclou; it is surrounded by wooden galleries of the Renaissance period, supported on stone pillars on which are sculptures representing a dance of death.

The church of St Vincent, near the Seine, is a building of the 16th century and contains the finest stained-glass windows in Rouen; those at the end of the north aisle, by Engrand and Jean le Prince, artists of Beauvais, are the most noted. The stained glass of the churches at St Patrice (16th century) and St Godard (late 15th century) is inferior only to that of St Vincent. Among the most important ecclesiastical buildings of Rouen are the churches of St Gervais, St Romain, St Laurent, St Vivien, and the tower of St André, a relic of an old church of the 15th and 16th centuries.

The most important secular building in Rouen is the Palais de Justice, once the seat of the exchequer and, later, of the parlement of Normandy. It is in the late Gothic style and consists of a main building flanked by two wings. The left wing, known as the Salle des Procurateurs, was erected in 1493 and is remarkable for its lofty barrel-roof of timber. South of the Palais de Justice is the Porte de la Grosse Horloge, an arcade spanning the street and surmounted by a large clock of the 15th century with two dials. The Tour de la Paix, a massive tower, and tenders which are beside the arcade, was built in 1380. The tower known as the Tour de Jeanne d'Arc was the scene of her trial, and it is all that remains of the castle built by Philip Augustus early in the 13th century. The Porte Guillaume-Lion, opening on to the Quai de Paris, is a handsome gateway built in 1749.

There are numerous old houses in Rouen in the Gothic and Renaissance styles. The Hôtel de Bourgtheroulde, the most famous of them, is a stone mansion of the 15th century added to in the reign of Francis I, the façades of which are decorated with bas-reliefs representing scenes from the meeting of the Field of the Cloth of Gold and allegories from the Triumph of Petrarch. Among more modern buildings are the hôtel de ville of the 18th century, adjoining the north side of the church of St Ouen, the Bourse dating from the same period, and the Musée-Bibliothèque constructed in 1880 and containing rich collections of pictures and ceramics and a library with upwards of 133,000 volumes and many valuable MSS. An important museum of antiquities and a museum of natural history are contained in the old convent of the Visitatation. A statue of the composer F. A. Boieldieu overlooks the Quai de la Bourse, and one of Pierre Corneille stands at the western extremity of the Ile Lacroix; both were natives of the town. At Bonsecours, on a hill on the Seine 2 m. above Rouen, are the modern church which is a resort of pilgrims, and the monument to Joan of Arc consisting of three small Renaissance buildings with a statue of the heroine in the principal one.

Rouen is the seat of an archbishop, a prefect, a court of appeal and a court of assizes, and headquarters of the 111th army corps. Its public institutions also include a tribunal of first instance, tribunals of commerce and of maritime commerce, a council of trade-arbitration, a chamber of commerce and a branch of the Bank of France. Among its educational establishments are preparatory schools of medicine and pharmacy, and high schools of science and literature, lycées and training-colleges for both sexes, ecclesiastical seminaries, and schools of commerce and industry, of architecture, music and fine arts. All the more important nations have consulates in the city. Rouen is noted for the making of wines, spirits, grain and cattle. Grain, wine, coal, timber and petroleum are leading imports. Besides its manufactures it exports flax and hemp; shirts, bodices, boots and hats is also carried on, and there are distilleries, petroleum-refineries and manufactories of chemicals, soap, machinery, carding-combs and brushes. The port of Rouen is the main marine docks through which the Boieldieu bridge, and the river dock, the timber dock and the petroleum dock above it. There is also a repairing dock. The Seine is tidal beyond Rouen. The port is accessible for ships drawing 193 to 225 ft. of water, and its quays have a superficial area of about 125 acres. It is served by the lines of the Orleans, the Western and the Northern railway companies, and these, in addition to the waterways connected with the Seine, make Rouen a convenient centre for the distribution of merchandise.

Ratmac or Ratmacos, the Celtic name of Rouen, was modified by the Romans into Rotomagus, and by the writers of medieval Latin into Rodorum, of which the present name is a corruption. Under Caesar and the early emperors the town was the capital of the Velocasses, a people of secondary rank, and it did not attain to any eminence till it was made the centre of Lugdunensis Secunda at the close of the 3rd century, and a little later the seat of an archbishop. Rouen owed much of its first bishops—from St Melle, the apostle of the region, who flourished about 260, to St Remigius who died about 397. The bishops of the diocese were also prior of the monks of St Ouen, and many churches and their tombs became in turn the origin of new sanctuaries. Under Louis le Débonnaire and his successors, the Normans several times sacked the city, but after the treaty of St Claira-sur-Epte in 912, Rouen became the capital of Normandy and attained still greater prosperity. It was the principal residence of the dukes and was the scene in 949 of a victory gained by Duke Richard I. over Otto the Great, emperor of Germany, Louis d'Outremer, king of France, and Arnold, count of Flanders. In 1087 William the Conqueror, mortally wounded at Mantes, died at Rouen. The succeeding Norman kings held court at Rouen in 1170. A Caen and afterwards of Poitiers, Le Mans and Angers; but its manufactures, local trade and manufactures, and the communal organization which the citizens exacted from their sovereigns during the course of the 12th century maintained an importance which is indicated by the building of several fine churches, notably that of St Ouen. In 1203 Rouen was the scene of the murder of Arthur of Brittany at the hands of King John of England. Ostensibly to avenge the crime, Philip Augustus invaded Normandy and entered the capital unopposed. The union of the province with the crown of France in no way hindered the prosperity of the city, for Philip confirmed its communal privileges and built a new castle. A convention between the merchants of Rouen and those of Paris relating to the navigation of the Seine was followed by treaties with London, with the Hanseatic towns and with Flanders and Champagne. In 1302 the seat of the exchequer or sovereign court, afterwards the parlement, of Normandy was definitely fixed at Rouen, which had previously shared its sessions with other towns. In 1356 Charles the Bad, king of Navarre, a favourite in the city, was arrested within its walls, an event which displeased the inhabitants, who after the disaster at Poitiers supported the cause of Étienné Marcel. The revolt of the Harele in 1382, due to the exacting rent imposed on the monks of St Ouen, was followed by heavy punishment. In spite of this a stubborn resistance was offered to Henry V. of England who, after a long siege, occupied the town in 1419. The prosperity of Rouen continued under the English domination, and during this period the greater part of the church of St Ouen was constructed. In 1431 Joan of Arc was tried and burnt in the city. From that year the French began a series of
attempts to recapture the town, but they were unsuccessful till 1449 when Somerset, the English commander, was obliged to surrender the principal fortified places in Normandy. During the close of the 15th century and the first half of the 16th, Rouen was the metropolis of art and taste in France and was one of the first places to reflect the influence of the Renaissance. During the wars of religion the arts suffered. In 1568 Rouen was sacked by the Protestants. This did not prevent the League from gaining firm a footing there that Henry IV, besieged it unsuccessfully and only obtained entrance after his abjuration. The revocation of the edict of Nantes in 1685 lost Rouen many of its richest and most industrious citizens in the Calvinistic emigration. The town suffered less from the excesses of the French Revolution than from the depredations of bandits who, under the Directory, infested the neighbourhood of the city and were not suppressed till the Consulate. During the Franco-German War the city was occupied by the invaders from December 1870 till July 1871, and had to submit to heavy requisitions.

See A. Chérel, Histoire de Rouen pendant l'époque communale (Rouen, 1843); Histoire de Rouen sous la domination angloise au quinzième siècle (Rouen, 1840); N. Péralès, Histoire sommaire et chronologique de la ville de Rouen (Rouen, 1874); C. Enlart, Rouen (Paris, 1904).

ROUERGUE (Ruhenensis pagus), one of the old provinces of France, was originally inhabited by the Ruhenti. It was bounded on the N. by Auvergne, on the S. and S.W. by Languedoc, on the E. by Gévaudan and the Cévennes and on the W. by Quercy. It included (1) the county of Rodez, (2) Haute and Basse Marche; and it was divided between the dioceses of Rodez and Vabres (province d'Alby after this province had been separated from that of Bourges in 1278). Administratively it formed first a sénéchaussée, dependent on Languedoc (capital Villefranche, in the Basse Marche), and later it was attached to the military governments of Guienne and Gascogne. It was then part of the departments of Aveyron and of Tarn-et-Garonne. The county of Rodez, after having been in the possession of the houses of Toulouse and Carlat, fell in the 14th century into that of Armagnac. Jean II. of Armagnac having served Charles V. faithfully during his wars with England, received from him, in 1374, what were called the four "châtel-tennies" with the "Commun de la paix," a tax which had been established there to organize resistance against foreigners. Jean V. of Armagnac was deprived of the county for crime and treason against Louis XI., in 1460, but afterwards it was given back to Charles of Armagnac, who died without legitimate issue in 1496. Its possession was then disputed between King Francis I. and the duke of Alençon, who at last compromised (1539); the king ceded the county to his sister Marguerite d'Angoulême, who took it as dowry first to the duke of Alençon, and then to her second husband Henri d'Albret, king of Navarre. The county afterwards passed to Jeanne d'Albret, then to Henri IV., and was joined to the crown lands in 1590.

ROUE ("rue," from Lat. rubens), a French name applied to various colouring substances of a brilliant carmine tint, especially when used as cosmetics. The best of these preparations are such as have for their basis carthamine, obtained from the safflower (Carthamus tinctorius). The Chinese prepare a rouge, said to be from safflower, which, spread on the cards on which it is sold, has a brilliant metallic green lustre, but when moistened and applied to the skin assumes a delicate carmine tint. Jeweller's rouge for polishing plate is a fine red iron oxide prepared by calcination from ferrous sulphate (green vitriol).

ROUGET DE LILE, CLAUDE JOSEPH (1760-1836), French author, was born on the 10th of May 1760, at Lons-le-Saunier (Jura). He entered the army as an engineer, and attained the rank of captain. He was one of those authors whom a single work has made famous. The song which has immortalized him, the Marseillaise, was composed at Strassburg, where Rouget de Lisle was quartered in April 1792. He wrote both words and music in a fit of patriotic excitement after a public dinner. The piece was at first called Chant de guerre de l'armée du Rhin, and only received its name of Marseillaise from its adoption by the Provençal volunteers whom Barboux introduced into Paris, and who were prominent in the storming of the Tuileries. The author was a moderate republican, and was cashiered and thrown into prison, but the chorus-revolution of the 4th of July banished him to liberty. He died at Cheney-le-Féro (Seine et Oise) on the 26th of June 1836. The stirring melody of the Marseillaise and its ingenious adaptation to the words serve to disguise the alternate poverty and bombast of the words themselves. Rouget de Lisle wrote a few other songs of the same kind, and in 1825 he published Chants français, in which he set to music fifty songs by various authors. His Essais en vers et en prose (1797) contains the Marseillaise, a prose tale of the sentimental kind called Adélaide et Monville, and some occasional poems.

ROUGH CAST (the French equivalent is crépis), in architecture, the exterior coating originally given to the walls of common dwellings and outbuildings, but now frequently employed for decorative effect on country houses, especially those built in half timber. It is a composition of small gravel and sand, mixed with strong lime mortar, and is thrown on the walls already covered with two ordinary coats of plaster. Variety can be obtained on the surface of the wall by small pebbles of different colours, and in the Tudor period fragments of glass were sometimes embedded. The central tower of St. Alban's cathedral, built with Roman tiles from Verulam, was covered with rough cast believed to be coeval with the building. The rough cast was removed about 1870.

ROUHER, EUGÈNE (1814-1884), French statesman, was born at Riom (Puy de Dôme) on the 30th of November 1814. He practised law in his native place after taking his degree in Paris in 1835, and in 1846 sought election by his fellow-citizens to the Chamber of Deputies as an official candidate of the Guizot ministry. It was only after the revolution of 1848, however, that he became deputy for the department of Puy de Dôme. Re-elected to the Legislative Chamber in 1849 he succeeded Odilon Barrot as minister of justice, with the additional office of keeper of the seals, which he retained with short intervals until January 1852. From the tribune of the Chamber he described the revolution of February as a "catastrophe," and he supported reactionary legislation, notably the bill (May 31, 1850) for the limitation of the suffrage. After the coup d'état of December 2, 1851, he was entrusted with the redaction of the new constitution, and on his resignation of office in January became vice-president of the Council of State. After the formal establishment of the Empire, Napoleon III. rewarded him by a grant of £40,000 and the estate of Cirey. In 1855 he became minister of agriculture, commerce and public works, and in 1856 senator. He secured for France an excellent system of railways without making them a state monopoly, and he conducted the complicated negotiations for the treaty of commerce with England which was concluded in January 1860, and subsequently arranged similar treaties with Belgium and Italy. In 1863 he became minister president of the Council of State, and on the death of A. A. M. Bllault minister of state and chief spokesman of the emperor before the Corps Législatif. Although the government had a great majority in the Chamber, the opposition counted the redoutable names of Thiers, Berruyer and Jules Favre, and government measures were only passed by frequent resort to the closure. Rouher had to defend Napoleon's foreign adventures as well as the free-trade treaties and the extravagances of Baron Hausmann for Paris. He was replaced in this latter task by Thiers after an attempted defence of the foreign policy which had aided the aggrandizement of Prussia at the expense of Austria, Thiers told him in the Chamber that there were "no more blunders left for him to make." He opposed the abortive Liberal concessions of January 1867, announced in a personal letter from Napoleon III. to himself, and resigned with the rest of the cabinet, only to resume office after a short interval as minister of finance. When concessions became inevitable Rouher, the "vice-empeureur," resigned.
to make way after six months’ interval for Émile Ollivier. He still fought for reaction in his new office of president of the Senate. After the fall of the Empire he fled to England, but returned to France a year later to work for the fortunes of the prince imperial. After serious disturbances he was elected member for Ajaccio on the 11th of February 1872, his election being characterized by the prefect of Corse as a regular conspiracy. On the Chamber, where he subsequently represented Riom, he formed the group of the Appel au Peuple. His first speech in the House was the occasion (May 21, 1872) of violent attacks by Audiffret-Pasquier and Gambetta. The death of the prince imperial in 1879 put an end to the serious chances of the Bonapartists, although Rouher sought to secure the recognition of Prince Napoleon, son of the ex-king Jerome, as heir to the imperial honours. Rouher lost his reason after a stroke of paralysis in 1883, and died on the 3rd of February 1884.

For an estimate of Rouher, see marquis de Castellane, *Les Hommes d'état français du xixe siècle* (1888), and generally the literature dealing with the Second Empire.

**ROULERS** (Flemish *Roeselaer*), a town of Belgium, in the province of West Flanders, 13 m. N.W. of Courtrai. Pop. (1904) 24,548. It is one of the oldest communes in Belgium, and was famous for its weavers in the 11th and 12th centuries. Its prosperity depends on the cultivation of flax and the manufacture of linen. The church of St Michael is remarkable for its lofty tower. Baldwin VIII., count of Flanders, died here in 1120, and in 1704 the French under Pichegru defeated the Austrians under Clermont.

**ROULETTE**, in mathematics, the locus of a point carried on a curve which rolls on another (fixed) curve. The name appears to have been used by Pascal to denote the cycloid (*q.v*.), which is the simplest roulette, being traced by a point on the circumference of a circle rolling on a straight line. The trochoids and epicycloids (*q.v*.) are also simple roulettes, the latter being traced by points on a circle which rolls on another circle.

See W. H. Besant, *Roulettes and Glissettes*.

**ROULETTE**, a gambling game, of French origin. It is one of the two games played in the gambling-rooms at Monte Carlo, and the description here given, and the maximum and minimum stakes mentioned, are to be understood as applying to the game as it is there conducted. It is solely a game of chance, though so-called “systems” are innumerable, and some of them for a short period often appear to give the player an advantage. There is no possible system, however, which will assure success in the long-run, and it is herein that the ingenuity of the game consists. Every systematic method of play must depend upon increased stakes to retrieve past losses; and though a player with an unlimited capital might be practically certain to achieve his end in the course of time, the circumstance that there is always a maximum renders the bank invincible. The roulette table, covered with a green cloth, is made up of precisely corresponding halves with a circular space let into the middle holding the wheel, on either side of which the cloth is divided into spaces marked *passe*, *pair*, *manque*, *impair*, and the black and red diamonds. The wheel is divided into thirty-seven compartments, coloured alternately black and red, numbered from one to thirty-six, the thirty-seventh compartment being called, in French roulette, the double-zero, and in American roulette, the zero. The even numbers, *impair* odd numbers, *manque* includes the numbers from 1 to 18; *passe*, from 19 to 36. The methods of staking are innumerable.

The minimum stake is five francs, which must be placed on the table in the form of a five-franc piece, and not in smaller change. *Rouge, noir, pair, impair, manque* and *passe* are even chances; i.e. a stake put upon any of them is paid in corresponding coin should the player win, the exception being when the little ball which is spun round the wheel falls into zero, in which case the even money chances are put “in prison”—that is to say, laid aside until another spin, when if the bank wins they are lost, if the player wins he is allowed to retain his money. The maximum in the case of these chances is 6000 francs. Any one who desires to play *en plein* puts his stake on one of the thirty-seven numbers. If the ball falls into the corresponding number on the wheel, the stake is paid thirty-five times; and as there are thirty-seven numbers on the board, with the advantage already described of imprisoning the even-money chances when zero comes up, it will be seen that there is a steady percentage in favour of the tables and consequently against the player. This percentage is of course greatly increased when, as is often the case, a second zero, called *double-zéro*, is used. In some gambling-houses there is even a third one, called *Eagle Bird*. The maximum stake allowed *en plein* is 180 francs. The next most daring selection is *à cheval*, when the stake is placed on the line separating any two numbers, and if either of them wins the player is paid seventeen times, the highest stake permissible being 360 francs. *Transversale pleine* covers any three numbers in a line, the coin or note being placed on the line dividing any one of the numbers from the neighbouring even-money chance, as, for instance, between 4 and *passe*, or 6 and *manque*. A *transversale simple* covers six numbers, as, for example, where the line between 4 and 7 joins *passe*, or between 6 and 9 joins *manque*; and if any one of these numbers wins, five times the value of the stake is paid, the maximum here being 1200 francs. *En carré* includes four numbers, the coin being placed, for instance, on the cross between 1, 2, 4, 5, or 28, 29, 31, 32; eight times the value of the stake is paid, and the maximum is 760 francs. The dozens and the columns are also indicated on the board, the first dozen of course including 1 to 12. In each of the columns are twelve numbers in different order. A stake placed on either a dozen or a column is paid twice its value, the maximum here being 3000 francs. A stake constantly played is called the *quatre premiers*, which includes zero, 1, 2, and 3, the stake being placed on the line where zero and 1 join *passe*, or where zero and 3 join *manque*. If any one of these four numbers, including zero, wins, the stake is paid eight times; and four times eight being thirty-two, there is a greater advantage to the table than when it loses *en plein* or on certain other chances. Zero can also be played in combination with any one or two of its neighbours; if with one of them the stake is paid seventeen times, if with two of them eleven times. A croupier sits on either side of the wheel; there is also one at each end of the table, their business being to assist the players in staking and recovering their winnings. Behind each of the former pair an official on a high chair supervises the table. The croupier whose duty it is to spin the wheel waits for a time till stakes have been made, and then, exclaiming, "Messieurs, faites votre jeu!" sets the cylinder in motion, throwing the ball in the direction contrary to that in which the wheel revolves. When it is seen that the ball will soon fall at rest in one of the compartments of the cylinder the croupier gives the notice, "Rien ne va plus," after which no stakes can be placed. When the ball finally rests in the compartment, the croupier announces the number and the even-money chances that win, as for instance *rouge*, *impair* and *manque*. He and his fellows then gather in with a rake all the money that has been lost, if the player wins he is allowed to retain his money that proceeds. At the beginning of play each table is supplied with a certain large sum. When the bank loses this and is forced to send for another supply it is said to be "broken."

**ROUND** (O. Fr. *rond*, Lat. *rotundus*, the Fr. is the source also of Du. *rond*; Ger., Swed., Dan. and Nor. *rund*), circular, spherical, globular. As a substantive, the word has several specific applications; thus it is used of the rung of a ladder, of a rounded cross-bar connecting the legs of a chair, of the circuit of the
ROUNDERS

watch under an officer which patrols the sentries in a fortress, fortified town, camp or other military station, and hence of the beat or customary course of a policeman, a postman, or a tradesman, and of the full course at such a game as golf. Similarly there were old dances called "rounds," in which the dancers stood in a circle or ring. They were popular at country fairs. Later the name was applied to country dances where the dancers stood in two lines. For the "round" in music see Canon. A complaint or remonstrance signed by a number of persons is commonly known as a "round robin"; properly such a document should have the signatures arranged in a circle, the idea being that thus the order in which the complainants signed should be unknown. In the 16th century "round robin" was a name of mockery given to the Eucharist.

ROUNDERS, an English ball game, probably dating from the 18th century, but not attaining to any popularity before 1800. It was the immediate ancestor of Baseball (q.v.). Up to the year 1889 no special code of rules existed, but the game was played on the green, the field being marked out in a regular pentagon by five bases about 15 or 20 yds. apart, called respectively home-base (at which the striker stood), 1st base, 2nd base, 3rd base, and 4th base. The feeder, or bowler, stood in the middle of the pentagon and tossed the ball, which was softer than a cricket ball, to the striker, who with a round club, often a cricket stump, endeavoured to hit it as far out of the reach of the fielders as possible, a run being scored when the striker made the circuit of the bases without being put out. Almost any number of players could form a side, and the batsman would be retired when a batted ball was caught on the fly or first bounce, or when he was struck by having the ball thrown at him while running between bases. Rounders in its primitive form was more of a romp than a regular game, but it experienced a revival in Scotland and the north of England about the year 1889, when two governing bodies were formed, the National Rounders Association of Liverpool and Vicinity and the Scottish Rounders Association. These, with the later Gloucester Rounders Association, drew up the rules now recognized.

A hard ball similar to that used in baseball was adopted, and the rule by which a runner could be put out by hitting him with a thrown ball abandoned. The bat must not exceed 33 in. in diameter nor 35 in. in length. The game is similar to baseball, but there are some marked differences. The most radical being that the ball may be hit in any direction, as at cricket. The original pentagon has been discarded in favour of an elongated diamond, the home-base being at one end and 1st, 2nd and 3rd bases at the other points. The bases are situated at the line of 3rd or 2nd base; 1st and home; and 17 yds. from the former, the sides of the diamond being 22 yds. in length. The bowler stands in a space marked off in the centre of the diamond and tosses the ball to the batsman, who must hit it with a hard ball, i.e., one that is straight and true, off home base and between head and knee. Two bad balls score one for the batsman. If the latter hits the ball he must run to 1st base and then 2nd, and so on round to home again, resting at any base; but he may put out if the batted ball be caught on the fly or first bounce or the backstop (wicket-keeper in cricket) catch a ball struck at but not hit, or the batsman be touched with a ball. When running between bases. Ten players constitute a side and three innings a piece are played. A player batting once in each inning. Each base made counts one. The backstop is placed directly behind the batsman, and behind the backstop are placed 1st cover (right), 2nd cover, 3rd cover (left), 4th cover (left), 1st, 2nd and 3rd are stationed at the bases, while behind them in the field are placed the 2nd cover (right), centre cover and 3rd cover (left). The bases are designated by light wooden posts. An umpire presides over the game. Each of rounders has its own substitute, known as a 'Roundhead,' and 'Cavalier' grew to be received in discourse. . . . they who were looked upon as servants to the king being then called 'Cavaliers,' and the other of the rabble contemned and despised under the name of 'Roundheads.'

Baxter ascribes the origin of the term to a remark made by Queen Henrietta Maria at the trial of Strafford: referring to Pym, she asked who the roundheaded man was. The name remained in use until after the revolution of 1688.

Roundhead was also used during the Civil War as the name of a weapon. This is described as having "an head about a quarter of a yard long, a staff of two yards long put into their head, twelve iron spikes round about, and one in the end to stop with."

ROUNDHEAD, or Roundhead System (sometimes termed the billet, or ticket, or item system), in the English poor law, a plan by which the parish paid the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish. It depended not on the services, but on the wants of the applicants, the employer being repaid out of the poor rate all that he advanced in wages beyond a certain sum. According to this plan the parish in general made some agreement with a farmer to sell to him the labour of one or more paupers at a certain price, paying to the pauper out of the parish funds the difference between that price and the allowance which the scale, according to the price of bread and the number of his family, awarded to him. It received the local name of billet or ticket system from the ticket signed by the overseer which the pauper in general carried to the farmer as a warrant for his being employed, and afterwards took back to the overseer, signed by the farmer, as a proof that he had fulfilled the conditions of relief. In other cases the parish contracted with a person to have some work performed for him by the paupers at a given price, the parish paying the paupers.

In many places the roundsman system was carried out by means of an auction, all the unemployed men being put up to sale periodically, sometimes monthly or weekly, at prices varying according to the time of year, the old and infirm selling for less than the able-bodied. The roundsman system disappeared on the reform of the poor law in 1834.

Round Table, in the Arthurian Romance (q.v.), the table round which, in order to avoid quarrels as to precedence, King Arthur's knights were seated, and so applied collectively to the knights themselves as the title of a mythical order of chivalry. The origin of the Round Table is obscure. Geoffry of Monmouth makes no mention of it, and the earliest record is that of Wace, much expanded by his translator, Layamon, who gives a picturesque detailed description of the fight for precedence which took place at Arthur's board on a certain Yuletide day, and the slaughter which ensued. For this slaughter Arthur took summary vengeance, slaying all the knights of the man who started the fight, and cutting off the noses of his enemies. Wace mentioned it in order to avoid any such scenes a cunning workman of Cornwall. Wace ordered to make a table which should seat 1600 knights and more, and at which all should be equal. Arthur accepted this offer, and the result was the Round Table, peace and harmony. Wace does not mention the number of knights.

These versions of the pseudo-chronicles practically ascribe the foundation to Arthur; the romances, however, differ. In these either Merlin made the table for Uther Pendragon,
or it had belonged to Leodegare, king of Cornwall and father of Guenevere, and was given to Arthur on his marriage with that princess. When the founding of the Round Table is ascribed to Merlin it is generally in close connexion with the Grail legend, forming the last of a series of three, founded in honour of the Trinity—the first being the table of the Last Supper, the second that of the Grail, established by Joseph of Arimathea. The number of knights whom the table will seat varies; it might seat twelve or fifty or a hundred and fifty; nowhere, save in Layamon, do we find a practically unlimited power of accommodation. It is also to be noted that whereas, in the pseudo-chronicles, it is the common table of Arthur's court, designed in the interests of peace and unity, in the romances it is a sign of superiority, only the best and most valiant knights being adjudged worthy of a seat at the Round Table. In fact, it has become the equivalent of an order of knighthood, the members of which form a brotherhood bound by oath to succour each other at need and to refrain from fighting among themselves. The membership is not restricted to the knights of Arthur's immediate court and household, knights who are, in all essentials outsiders, appearing but rarely in Layamon, unless Arthur himself, e.g. in this roll, and Tristan, may be elected knights of the Round Table. In two romances, the prose Tristan and the Parzival, the place of the Round Table proper is taken, on a journey, by a silken cloth laid on the ground, round which the knights are seated. In the versions more closely connected with the Grail story the name of the chosen knight appears on his seat, and there is one vacant place, the Siege perilous, eventually to be filled by the Grail winner.

It is obvious that the tradition has passed through several stages, and has varied in the process. The original source is not easy to determine. Dr. Lewis Mott has pointed out that "Round Tables" exist in many parts of Great Britain, the name being often associated with circular ditches, or rings of stones, which were demonstrably employed in connexion with the agricultural festivals held at Pentecost, Midsummer and Michaelmas. However this may be, and it seems probable that Dr. Mott is right in his identification, the pseudo-chroniclers and romance writers certainly had in their minds a genuine table, although, probably, one of magical properties. Thus Layamon's table can seat an indefinite number, and yet it can be carried by Arthur when he rides abroad. On closely examining his version it seems probable that he had in his mind not merely a circular, but a turning table; he gives it as ground for the quarell that all the knights wished to sit within; at the table the Cornish workman will make none shall be left without, but they shall sit with and without, man against man." It is difficult to explain this phrasing in any other hypothesis than that Layamon pictured to himself Arthur's hall as open on one side, and that, on a great feast-day, owing to the number of guests, the table extended beyond the covering afforded by the roof. As the feast took place "on mid-winter's day" the annoyance of those who were without would be intolerable. To obviate this the cunning workman devised a circular table, turning on a pivot, with seats affixed, so that the guests sat the one half in turn within, the other without, the hall "man against man." This would make the Round Table analogous to the turning castles which we frequently meet with in romances; and while explaining the peculiarity of Layamon's text, would make it additionally probable that he was dealing with an earlier tradition of folklore character, a tradition which was probably also familiar to Wace, whose version, though much more condensed than Layamon's, is yet in substantial harmony with this latter. This, too, is certain; the fight for precedence at Arthur's board may be paralleled by accounts of precisely similar quasi-epic, quasi-literary scenes, e.g. the famous act of Piers Bricrend or Britten's Feast of the Ultonian cycle.

Recent grail researches have made it most probable that that mysterious talisman was originally the vessel of the ritual feast held in honour of a deity of vegetation.—Adonis, or another; if the Round Table also, as Dr Mott suggests, derives from a similar source, we have a link between these two notable features of Arthurian tradition, and an additional piece of evidence in support of the view that behind the Arthur of romance there lie not only memories of an historic British chieftain, but distinct traces of a mythological and beneficent hero. Incidentally also it would seem that those versions which connect the table more closely with Arthur are the more correct.

See Wace, Le Roman de Brut, ed. Leroux de Lancy (1863-68), vol. 7, p. 3; Layamon, Brut, ed. Macnaghten, ii. 184; Brown, The Round Table before Wace (Boston, 1900); Lewis F. Mott, The Round Table (Boston, 1905).

ROUND TOWERS. A peculiar class of round tower exists throughout Ireland; about one hundred and twenty examples once existed; most of these are ruined, but eighteen or twenty are almost perfect. These towers were built either near or adjoining a church; they are of various dates, from perhaps the 8th to the 13th century; though varying in size and detail, they have many characteristics common to all. They are built with walls slightly battering inwards, so that the tower tapers towards the top. The lower part is formed of solid masonry, the one doorway being raised from 6 to 20 ft. above the ground, and so only accessible by means of a ladder. The towers within are divided into several storeys by two or more floors, usually of wood, but in some cases, as at Keneith, of stone slightly arched. The access from floor to floor was by ladders. The windows, which are always high up, are single lights, mostly arched or with a flat stone lintel. In some of the oldest towers they have triangular tops, formed by two stones leaning together. One peculiarity of the door and window openings in the Irish round towers is that the jambs are frequently set sloping, so that the opening grows narrower towards the top, as in the temples of ancient Egypt. The later examples of these towers, dating from the 12th and 13th centuries, are often decorated with chevron, billet and other Norman enrichments round the jambs and arches. The roof is of stone, usually conical in shape, and some of the later towers are crowned by a circle of battlements. The height of the round towers varies from about 60 to 132 ft.; that at Kilcullen was the highest. The masonry differs according to the ages, the older examples being almost uncut rubble work, and the later ones of neatly jointed ashlar.

Much has been written as to the use of these towers, and the most conflicting theories as to their origin have been propounded. It is fairly certain, however, that they were constructed by Christian builders, both from the fact that they always are or once were near a church, and also because these and other ancient Irish buildings frequently occur among the sculptured decorations of their doors and windows. Their original purpose was probably for places of refuge, for which the solid base and the door high above the ground seem specially adapted. They may also have been watch-towers, and in later times often contained bells. Their circular form was probably for the sake of strength, angles which could be attacked by a battering ram being thus avoided, and also because no quoins or dressed stones were needed, except for the openings. An important point at a time when tools for working stone were scarce and imperfect. Both these reasons may also account for the Norman round towers which are so common at the west end of churches in Norfolk, Suffolk and Essex, though these have little resemblance to those of Ireland except in the use of a circular plan. One example exactly like those of Ireland exists in the Isle of Man, within the precincts of Peel Castle adjacent to the cathedral of St German; it was probably the work of Irish builders. There are also three in Scotland, viz. at Egilsay in Orkney, and at Abernethy and Brechin.

Round towers wider and lower in proportion than those of Ireland appear to have been built by many prehistoric races in different parts of Europe. The towers of this class in Scotland are called "brochs"; they average about 50 ft. high and 30 ft. in internal diameter. Their walls, which are usually from 15 ft. to 20 ft. thick, are built of rough stones, of rubble masonry, with series of passages one over the other running all round the tower. As in the Irish towers, the entrance is placed at some distance from the ground; and the whole structure is designed as a stronghold. The brochs
appears to have been the work of a pre-Christian Celtic race. Many objects in bronze and iron and fragments of hand-made pottery have been found in and near these towers, all bearing witness of a very early date. (See Anderson, Scotland in Pagan Times, 1883, and Scotland in Early Christian Times, 1881.)

The nuraghi of Sardinia are described in the article on that island. During the 6th century church towers at and near Ravenna were usually built round in plan, and not unlike those of Ireland in their proportions. The finest existing example is that which stands by the church of S. Apollinare in Classe, the north-western part of the city of Ravenna (see Basilica, fig. 8). It is of brick, divided into nine storeys, with single-light windows below, three-light windows in the upper storeys, and two-lights in the intermediate ones. The most magnificent example of a round tower is the well-known leaning tower of Pisa, begun in the year 1174. It is richly decorated with tiers of open marble arcades, supported on free columns. The circular plan was much used by Moslem races for their minarets. The finest of these is the 13th-century minar of Kutb at Old Delhi, built of limestone with bands of marble. The tower is richly fluted on plan, and when complete was at least 250 ft. high.

The best account of the Irish round towers is that given by Petrie in his Ecclesiastical Architecture of Ireland (Dublin, 1845). See also Keane, Towers and Temples of Ancient Ireland, (Dublin, 1856); Brash, Ecclesiastical Architecture of Ireland (Dublin, 1875); and Stokes, Early Architecture in Ireland (Dublin, 1879). (J. H. M.)

ROUS, FRANCIS (1579-1659), English Puritan, was born at Dittisham in Devon in 1579, and educated at Oxford (Broadgates Hall, afterwards Pembroke College) and at Leiden, graduating at the former in January 1599-1600, and at the latter thirteen months afterwards. For some years he lived in Cornwall and occupied himself with theological studies, producing among other books The Art of Happines (1619) and Testis Veritatis, a reply to Richard Montague's Apropos Caesarom. He entered parliament in 1625 as member for Truro, and continued to represent that or some neighbouring west country constituency in such parliaments as were summoned till his death. He obtained many offices under the Commonwealth, among them that of provost of Eton College. At first a Presbyterian, he afterwards joined the Independents. In 1657 he was made a lord of parliament. He died at Acton in January 1658-9. The portrait of his piety is reflected in his Mystical Marriage between a Soule and her Saviour (1635), but he is best known by his metrical version of the Psalms (1643), which was approved by the Westminster Assembly and (in a revised form) is still used in the Scottish Presbyterian churches.

ROUS, HENRY JOHN (1795-1877), British admiral and sportsman, was born on the 23rd of January 1795, the second son of the 1st earl of Stradbroke. He was educated at Westminister School, and entered the British navy in 1806, serving as a midshipman in the expedition to Flushing. He was afterwards appointed to the Bacchante, and received a medal for bravery in various actions and expeditions. In 1823 he was made captain, and served in the Indian and New Holland stations from 1823 to 1829. In 1834 he was appointed to the command of the "Pique," a 36-gun frigate, which ran ashore on the coast of Labrador and was much damaged. Rous, however, brought her across the Atlantic with a sprang foremost and without keel, footfock or rudder, and though the ship was making 23 ins. of water an hour, Rous, always fond of sport, retired from the navy, and became in 1838 a steward of the Jockey Club, a position which he held almost uninterruptedly to his death. In 1812 he was appointed to the command of the "Blackstone of the Turf." In 1841 he was returned M.P. for Westminster, and in 1846 Sir Robert Peel made him a lord of the admiralty. He died on the 9th of June 1877.

For the naval career of Admiral Rous see O’Byrne, Naval Biographical Dictionary (London, 1849). A vivid sketch of him as a letter-writer likely to be found in Lives of Turf Celebrities (London, 1891).

ROUSSEAU, JACQUES (1630-1693), French painter, a member of a Huguenot family, was born at Paris in 1630. He was remarkable as a painter of decorative landscapes and classic ruins, somewhat in the style of Canaletto, but without his delicacy of touch; appears also to have been influenced by Nicolas Poussin. While young Rousseau went to Rome, where he spent some years in painting the ancient ruins, together with the surrounding landscapes. He thus formed his style, which was artificial and conventionally decorative. His colouring for the most part is pleasing, partly owing to his violent treatment of skies with crude blues and orange, and his chiaroscuro is usually much exaggerated. On his return to Paris he soon became distinguished as a painter, and was employed by Louis XIV. to decorate the walls of his palaces at St Germain and Marly. He was soon admitted a member of the French Academy of the Fine Arts, but on the revocation of the edict of Nantes he was obliged to take refuge in Holland, and his name was struck off the Academy roll. From Holland he was invited to England by the duke of Montague, who employed him, together with other French painters, to paint the walls of his palace, Montague House (on the site of which is now the British Museum). Rousseau was also employed to paint architectural subjects and landscapes in the palace of Hampton Court, where many of his decorative panels still exist. He spent the latter part of his life in London, where he died in 1693.

Besides being a painter in oil and fresco Rousseau was an etcher of some ability; many etchings by his hand from the works of Caracci and from his own designs still exist; they are vigorous, though coarse in execution.

ROUSSEAU, JEAN BAPTISTE (1671-1741), French poet, was born at Paris on the 6th of April 1671; he died at Brussels on the 17th of March 1741. The son of a shoemaker, he was well educated and early gained favour with Boileau, who encouraged him to write. He began with the theatre, for which he had no aptitude. A one-act comedy, Le Café, failed in 1694, and he was not much happier with a more ambitious play, Le Fletueur (1696), or with the opera Vénus et Adonis (1697). He tried in 1700 another comedy, Le Capricieux, which had the same fate. He then went with Tallard as an attaché to London, and, in days when literature still led a precarious existence. His misfortunes began with a club squabble at the Café Laurent, which was much frequented by literary men, and where Rousseau indulged in lampoons on his companions. A shower of libellous and sometimes obscene verses was written by or attributed to him, and at last he was turned out of the café. At the same time his poems, as yet only singly printed or in manuscript, acquired him a great reputation, due to the dearth of genuine lyrical poetry between Racine and Chénier. He had in 1701 been made a member of the Académie des inscriptions; he had been offered, though he had not accepted, profitable places in the revenue department; he had become a favourite of the libertine but influential coterie of the Temple; and in 1710 he presented himself as a candidate for the Académie française. Then began the second chapter of an extraordinary history of the animosities of authors. A copy of verses, more offensive than ever, was handed round, and gossip maintained that Rousseau was its author. Legal proceedings of various kinds followed, and Rousseau ascribed the lampoon to Joseph Saurin. In 1712 Rousseau was prosecuted for defamation of character, and, on his non-appearance in court, was condemned for contumace to perpetual exile. He spent the rest of his life in foreign countries except for a clandestine visit to Paris in 1718, refusing to accept the permission to return which was offered him in 1716 because it was not accompanied by complete rehabilitation.

Prince Eugène and then other persons of distinction took him under their protection during his exile, and he printed at Soleure the first edition of his poetical works. Voltaire and he met at Brussels

in 1722. Voltaire's Le Pour et le contre is said to have shocked Rousseau, who expressed his sentiments freely. At any rate the latter had thenceforward no fiercer enemy than Voltaire. His death is dated from Le Franc de Pomponne and the precise date of his death is uncertain and probably better than anything of Rousseau's own work. That work is divided, roughly speaking, into two contrasted divisions. One consists of formal and partly sacred odes and cantatas of the stiffest type, some of which perhaps still make the most famous; the other of brief epigrams, sometimes licentious and always, or almost always, ill-natured. As an epigrammatist Rousseau is only inferior to his friend Alexis Piron. His own fame was due to the disuse of all really lyrical which characterize his period do not prevent his odes and cantatas from showing at times true poetical qualities, and indeed they were commended by the most extraordinary vogue. Few writers were so frequently reprinted during the 18th century, but even in his own century La Harpe had arrived at a truer estimate of his real value when he said of his poetry: "Le fond n'est qu'un lieu commun chargé de déclarations et même d'idées fausses."

Besides the Soleure edition mentioned above Rousseau published another issue of his work in London in 1723. This edition is dated 1719. It stands almost alone. The frigidity of conventional diction and the disuse of all really lyrical which characterize his period do not prevent his odes and cantatas from showing at times true poetical qualities, and indeed they were commended by the most extraordinary vogue. Few writers were so frequently reprinted during the 18th century, but even in his own century La Harpe had arrived at a truer estimate of his real value when he said of his poetry: "Le fond n'est qu'un lieu commun chargé de déclarations et même d'idées fausses."

ROUSSEAU, JEAN JACQUES (1712-1778), French philoso-

phier, was born at Geneva on the 28th June 1712. His family had established themselves in that city at the time of the religious wars, but they were of pure French origin. Rousseau's father Isaac was a watchmaker; his mother, Suzanne Bernard, was the daughter of a minister; she died in childbirth, and Rousseau, who was the second son, was brought up in a haphazard fashion, his father being dissipated, violent-tempered and foolish. But he early taught his son to read, and seems to have laid the foundation of the flighty sentimentalism in morals and politics which Rousseau afterwards illustrated with his genius. When the boy was ten years old his father got entangled in a dispute with a fellow-citizen, and being condemned to a short term of imprisonment abandoned Geneva and took refuge at Lyons. The father and son henceforth rarely met. Rousseau was taken charge of by his mother's relations and was committed to the tutorship of M. Lambercierr, pastor at Boissy. In 1724 he was removed from this school and taken into the house of his uncle Bernard, by whom he was shortly afterwards apprenticed to a notary. His master, however, found or thought him incapable and sent him back. After a short time (April 25, 1725) he was apprenticed afresh, this time to a notary in whose service he remained until 1728 without finding occupation or thought himself cruelly treated. In 1728 he ran away, the trucancy being by his own account unintentional in the first instance, and due to the fact of the city gates being shut earlier than usual. Then began an extraordinary series of wanderings and adventures, for much of which there is no authority but his own Confessions. He first fell in with some proserlytists of the Roman faith at Conflogn, and by them was sent to Madame de Warens at Annecy, a young and pretty widow who was herself a convert. Her influence, however, which was to be so great, was not immediately exercised, and he was passed on to Turin, where there was an institution specially reserving for the reception of neophytes. The experi-

ences here were unsatisfactory, but he abjured duly and was rewarded by being presented with twenty francs and sent about his business. He wandered about in Turin for some time, and at last established himself as footman to a Madame de Vercellis. Here occurred the famous incident of the theft of a ribbon, of which he accused a girl fellow-servant. But, though he kept his place by this piece of cowardice, Madame de Vercellis died not long afterwards and he was turned off. He found another place with the Comte de Gouvou, but lost this also through coxcombry. Then he resolved to return to Madame de Warens at Annecy. The chronology of all these events, as narrated by himself, is not always clear, and perhaps obscure, but they seem to have occupied about three years.

Even then Rousseau did not settle at once in the anomalous but to him charming position of domestic lover to this lady, who, nominally a converted Protestant, was in reality, as many}

women of her time were, a kind of deist, with a theory of noble sentiment and a practice of libertinism tempered by good nature. It used to be held that in her conjugal relations she was more sinned against than sinning. But modern investigations seem to show that M. de Vuarren (which is said to be the correct spelling of the name) was an unfortunate husband, and was deserted and robbed by his wife. However, she welcomed Rousseau kindly, thought it necessary to complete his education, and he was sent to the seminarians of St. Lazare to be improved in classics, and also to a music master. In one of his incomprehensible freaks he set off for Lyons, and, after abandoning his companion in an epileptic fit, returned to Annecy to find Madame de Warens gone. Then for some months he relapsed into the life of vagabondage, varied by improbable adventures, which (according to his own statement) he so often pursued. Hardly knowing anything of music, he attempted to give lessons and a concert at Lausanne; and he actually taught at Neuchâtel. Then he became, or says he became, secretary to a Greek archimandrite who was travelling in Switzerland to collect subscriptions for the rebuilding of the Holy Sepul-

chre; then he went to Paris, and, with recommendations from Madame de Warens, says he got on at La Bourse, in the company of the young nobility; then he returned on foot through Lyons to Savoy, hearing that Madame de Warens was at Chambéry. This was in 1732, and Rousseau, who for a time had unimportant employ-

ments in the service of the Sardinian crown, was shortly in-

stalled by Madame de Warens, whom he still called Maman, as amant en titre in her singular household, wherein she diverted herself with, him, with music and with chemistry. In 1736 Madame de Warens, partly for Rousseau's health, took a country house, Les Carmettes, a short distance from Chambéry. Here in winter, and in the town during winter, Rousseau led a de-

lightful life, which he has delightfully described. In a deas-

nary way he did a good deal of reading, but in 1738 his health again became bad, and he was recommended to go to Montpellier. By his own account this journey to Montpellier was in reality a voyage à Cythère in company with a certain Madame de Lar-

nage. This being so, he could hardly complain when on re-

turning he found that his official position in Madame de Warens' household had been taken by a person named Vintzenfried. He was, however, less likely than most men to endure the position of second in command, and in 1740 he became tutor at Lyons to the children of M. de Mably, not the well-known writer of the same name, but his and Condillac's elder brother. Rousseau did not like his pupils, was bad teacher, and after a visit to Les Carmettes, finding that his place there was finally occupied, he once more went to Paris in 1741. He was not without recommendations. But a new system of musical notation which he thought he had discovered was unfavourably received by the Académie des sciences, where it was read in August 1742, and he was unable to obtain pupils. Madame Dupin, however, to whose house he had obtained the entry, procured him the honourable if not very lucrative post of secretary to M. de Montaigu, ambassador at Venice. With him he stayed for about eighteen months, and has as usual infinite complaints to make of him, his service and some strange stories to tell, but length he threw up his situation and returned to Paris (1745).

Up to this time—that is to say, till his thirty-third year—Rousseau's life, though continuously described by himself, was of the kind called subterranean, and the account of it must be taken with considerable allowances. From this time, how-

ever, he is more or less in view; and, though at least two events of his life—his quarrel with Diderot and his death—are subjects of dispute, its general history can be checked and followed with reasonable confidence. On his return to Paris he renewed his relations with the Dupin family and with the literary group of Diderot, to which he had already been introduced by M. de Grignion de Montmor. He had occasional opportunities of being represented; he copied music for money, and received from Madame Dupin and her son-in-law M. de Francueil a small but regular salary as secretary. He lived at the Hotel St Quentin for a time, and once more arranged for himself an equivo

}
domestic establishment. His mistress, whom towards the close of his life he married after a fashion, was Théérèse le Vasseur, a servant at the inn, whom he first met in 1743. She had little beauty, no education or understanding, and few charms that his friends could discover, besides which she had a detestable mother, who was the bane of Rousseau's life. But he made himself happy with her, and (according to Rousseau's account), the accuracy of which has been questioned) five children were born to them, who were all consigned to the foundling hospital. This disregard of responsibility was partly punished by the use of his critics made of it when he became celebrated as a writer on education and a preacher of the domestic affections. Diderot, with whom from 1741 onwards he became more and more familiar, admitted him as a contributor to the Encyclopédie. He formed new musical projects, and he was introduced by degrees to many people of rank and influence, as among them Madame d'Épinay (q.v.), to whom in 1747 he was introduced by her lover M. de Francueil. It was not, however, till 1749 that Rousseau made his mark as a writer. The academy of Dijon offered a prize for an essay on the effect of the progress of knowledge on sentiments. Rousseau took up the subject, developed his famous paradox of the superiority of the savage state, won the prize, and, publishing his essay (Discours sur les arts et sciences) next year, became famous. The anecdotage as to the origin of this famous essay is voluminous. It is agreed that the idea was suggested when Rousseau went to pay a visit to Diderot, who was in prison at Vincennes for his Lettre sur les aveugles. Rousseau says he thought of the paradox on his way down; Morellet and others say that he thought of treating the subject in the ordinary fashion and was laughed at by Diderot. In any case, there seems no doubt that it was Rousseau who invented this paradox as a means of bringing to light the effects of civilization and progress. Diderot himself, in which so many matters are absolutely trustworthy, does not claim the suggestion, but uses words which imply that it was at least partly his. It is very like him. The essay, however, took the artificial and crotchety society of the day by storm. Francueil gave Rousseau a valuable post as cashier in the receiver-general's office. But he resigned it either from conscientiousness, or crotchety, or nervousness at responsibility, or indolence, or more probably from a mixture of all four. He went back to his music-copying, but the salons of the day were determined to have his society, and for six months he enjoyed it. Morellet, in an operetta, the Demi du village, which was successful. He received a hundred louis for it, and he was ordered to come to court next day. This meant the certainty of a pension. But Rousseau's shyness or his perversity (as before, probably both) made him disobey the command. His comedy Nocissé, written long before, was also acted, but unsuccessfully. In the same year, however, a letter Sur la musique française again had a great vogue. Finally, for this was an important year.

1 Apart from the fact that there were probably no children at all, the whole bearing of the belief of Rousseau that they were sent by him to the Enfants trouvés has been falsified by hostile writers. He was a penniless man of letters, with theories as to state maintenance of children; and Thérose was a consenting party. Rousseau, however, never saw anycl of the alleged father. Mr. Macdonald has shown good cause for believing that their existence was a myth, an imposition on Rousseau's credulity, invented by Thérose and her mother to make the tide more binding. (H. Ch.)

2 A vivid account of Rousseau's behaviour on Frederic in greater detail have been expected from his very imperfect education; in truth, he was a musician by natural instinct only, but his feeling for art was very strong, and, though capricious, based upon true perception of the good and beautiful. The system of notation (by figures) concerning which he read a paper before the Académie des Sciences, August 22, 1742, was ingenious, but practically worse than useless, and had the advantage of having few signs; but it was not published in 1743 under the title of Dissertation sur la musique moderne. In the famous 'guerre des buffons,' he took part of the 'buffonists,' so named in consequence of their attachment to the Italian opera buffa, as opposed to the true French opera; and his Lettre sur la musique française, published in 1753, he indulged in a violent tirade against French music, which he declared to be so contemptible as to lead to the conclusion 'that the French neither have, nor ever will have, any music of their own, or at least that, if they ever do have any, it will be so much the worse for them.' This silly libel so enraged the performers at the Opera that they hanged and burned with him, the Dijon academy, which had founded his fame, announced the subject of 'The Origin of Inequality,' on which he wrote a discourse which was unsuccessful, but at least equal to the former in merit. During a visit to Geneva in 1754 Rousseau saw his old friend and love Madame de Warenns (now reduced in circumstances and having lost all her charms), while after abjuring his abjuration of Protestantism he was enabled to take up his freedman's status, though his refined taste in music was practically a dead loss to him and of which he was proud. Shortly afterwards, returning to Paris, he accepted a cottage near Montmorency (the celebrated Hermitage) which Madame d'Epinay had fitted up for him, and established himself there in April 1756. He spent little more than a year there, but it was an important year. Here he wrote La Nouvelle Héloïse; here he indulged in the passion which that novel partly represents, his love for Madame d'Huodetot, sister-in-law of Madame d'Epinay, a lady young and amiable, but plain, who had a husband and a lover (St. Lambert), and whom Rousseau's devotion seems to have partly pleased and partly annoyed. Here too arose the obscure triangular quarrel between Diderot, Rousseau and Frederick Melchior Grimm, which ended Rousseau's sojourn at the Hermitage. The supposition least favourable to Rousseau is that it was due to one of his numerous fits of half-insane petulance and indignation at the obligations which he was nevertheless always ready to incur. That most favourable to him is that he was expected to lend himself in a more or less compliant manner to assist and cover Madame d'Epinay's adulterous affection for Grimm. At any rate, Rousseau quitted the Hermitage in the winter of 1755-56, and established himself at Montlouis in the neighbourhood of Dijon. Rousseau's extreme behaviour had frequently made him enemies, but his writings had for the most part made him friends. The quarrel with Madame d'Epinay, with Diderot, and through them with the philosophy party reversed this. In 1758 appeared his Lette à d'Alembert contre les spectacles, written in the winter of the previous year at Montlouis. This was at once an attack on Voltaire, who was giving theatrical representations at Les Délées, on D'Alembert, who had condemned the prejudice against the stage in the Encyclopédie, and on one of the favourite amusements of the society of the day. Voltaire's strong point was not forgiveness, and, though the episode was not without interest, In 1759 another quarrel with the academy, Rousseau was certain he was himself more odious to the philosophes coterie as to the orthodox party. He still, however, had no lack of patrons—he never had; though his perversity made him quarrel with all in turn. The amiable duke and duchess of Luxembourg, who were his neighbours at Montlouis, made his acquaintance, or rather forced theirs upon him, and he was industrious in his literary work—indeed, most of his best books were produced during his stay in the neighbourhood of its author in effigy. Rousseau revenged himself by printing his clever satire entitled Lettre d'un sympathiste de l'Académie Royale de Musique à ses camarades de l'orchestre. His Lettre à M. Burney is of a very different type, and does full justice to the genius of Gluck. His articles on music in the Encyclopédie deal very superficially with the subject; and his Dictionnaire de musique (Geneva, 1767), though admirably written, is not trustworthy, either as a record of facts or as a collection of critical essays. In all this works the imperfectness of his musical education is painfully apparent, and his compositions, though in the few cases on which his fault lies, as is clearly displayed there as in his literary power in the Letters and Dictionary. His first opera, Les Muses galantes, privately prepared at the house of La Popelinière, attracted very little attention; but Le Devin du village, his second opera, given at Fontainebleau in 1752, and at the Académie in 1753, achieved a great and well-deserved success. Though unequal, and exceedingly simple both in style and construction, it contained the characteristic features of Rousseau's poetry and his most refined taste. His Pygmalion (1775) is a melodrama without singing. Some posthumous fragments of another opera, Daphnis et Chloé, were printed in 1780; and in 1781 appeared Les Consolations des misères de ma condition, a collection of songs and other fugitive pieces of very unequal merit. The popular air known as "Rousseau's Dream" is not contained in this collection, and cannot be traced back farther than J. B. Cramer's Variations. M. Castil-Blaze has accused Rousseau of extensive plagiarisms (or worse) in Le Devin du village and Pygmalion, but apparently without sufficient cause.

(W. S. R.)
ROUSSEAU, J. J. 777

Montmorency. A letter to Voltaire on his poem about the Lisbon earthquake embittered the dislike between the two, being surreptitiously published. La Nouvelle Héloïse appeared in the same year (1760), and it was immensely popular. In 1762 appeared the Contrat social at Amsterdam, and Émile, which was published both in the Low Countries and at Paris. For the last time Rousseau delayed three years, for the reason that his book was intended to treat of the education of a female child, Julie, or La Nouvelle Héloïse, is a novel written in letters describing the loves of a man of low position and a girl of rank, her subsequent marriage to a respectable freethinker of her own station, the mental agonies of her lover, and the partial appeasing of the distresses of the lovers by the influence of noble sentiment and the good offices of a philanthropic Englishman. It is too long, the sentiment is overstained, and severe moralists have accused it of a certain complaisance in dealing with amatory errors; but it is full of pathos and knowledge of the human heart. The Contrat social, as its title implies, endeavours to base all government on the consent, direct or implied, of the governed, and indulges in much ingenious argument to get rid of the practical inconveniences of such a suggestion. Émile, the second title of which is De l'Éducation, is much more of a treatise than of a novel, though a certain amount of narrative interest is kept up throughout.

Rousseau's reputation was now higher than ever, but the term of the comparative prosperity which he had enjoyed for nearly ten years was at hand. The Contrat social was obviously anti-monarchical; the Nouvelle Héloïse was said to be immoral; the sentimental deism of the "Profession du vicaire Savoyard" in Émile irritated equally the philosophic party and the church. On June 11, 1762, Émile was condemned by the parlement of Paris, and two days previously Madame de Luxembourg and the prince de Conti gave the author information that he would be arrested if he did not fly. They also furnished him with means of flight, and he made for Yverdun in the territory of Bern, whence he transferred himself to Motiers in Neuchâtel, which then belonged to Prussia. Frederick II. was not indisposed to protect the persecuted when it cost him nothing and might bring him fame, and in Marshal Keith, the governor of Neuchâtel, Rousseau found a true and firm friend. He was, however, unable to be quiet or to practise any of those more or less picturesque adventures to which his time was wont. In the orthodox. The archbishop of Paris had published a pastoral against him, and Rousseau did not let the year pass without a Lettre à M. de Beaumont. The council of Geneva had joined in the condemnation of Émile, and Rousseau first solemnly renounced his citizenship, and then, in the Lettres de la montagne (1763), attacked the council and the Genevan constitution unsparingly. All this excited public opinion against him, and gradually he grew unpopular in his own neighbourhood. This unpopularity is said on uncertain authority to have culminated in a nocturnal attack on his house. At any rate he thought he was menaced if he was not, and migrated to the De St Pierre in the Lake of Bienna, where he once more for a short, and the last, time enjoyed that idyllic existence which he loved. But the Bernese government ordered him to quit its territory. He was for some time uncertain where to go, and thought of Corsica (to join Paoli) and Berlin. But finally David Hume offered him, late in 1765, an asylum in England, and he accepted. He passed through Paris, where his presence was tolerated for a time, and landed in England on January 13, 1766. Thérèse travelled separately, and was entrusted to the charge of James Boswell, who had already made Rousseau's acquaintance. Here he had once more a chance of living peacefully. Some English men and boys, Johnson thought but ill of him, but the public generally was not unwilling to testify against French intolerance, and regarded his sentimentalism with favour. He was lionized in London to his heart's content and discontent, for it may truly be said of Rousseau that he was equally indignant at neglect and intolerant of attention. When, after not a few displays of his strange humour, he professed himself tired of the capital, Hume procured him a country abode in the house of Mr Davenport at Wootton in Derbyshire. Here, though the place was bleak and lonely, he might have been happy enough, and he actually employed himself in writing the greater part of his Confessions. But his habit of self-tormenting and tormenting others never left him. His own caprices interposed some delays in the conferring of a pension which George III. was induced to grant him, and the second part of his book's title. The publication of a spiteful letter (really by Horace Walpole, one of whose worst deeds it was) in the name of the king of Prussia made Rousseau believe that plots of the most terrible kind were on foot against him. Finally he quarrelled with Hume because the latter would not acknowledge all his own friends and Rousseau's supposed enemies of the philosophic circle to be rascals. He remained, however, at Wootton during the year and through the winter. In May 1767 he fled to France, addressing letters to the lord chancellor and to General Conway, which can only be described as the letters of a lunatic. He was received in France by the marquis de Mirabeau (father of the great Mirabeau), of whom he soon had enough, then by the prince de Conti at Trye. From this place he again fled and wandered about for some time in a wretched fashion, still writing the Confessions, constantly receiving generous help, and always quarrelling with, or at least suspecting, the helpers. In the summer of 1770 he returned to Paris, resumed music-copying, and was on the whole happier than he had been since he had to leave Montlouis. He had by this time married Thérèse de Vasseur, or had at least gone through some form of marriage with her.

Many of the best-known stories of Rousseau's life date from this last time, when he was tolerably accessible to visitors, though clearly half-insane. He finished his Confessions, wrote his Dialogues (the interest of which is not quite equal to the promise of their curious sub-title, Rousseau juge de Jean Jacque), and began his Rêveries du promeneur solitaire, intended as a sequel and complement to the Confessions, and one of the best of all his books. It should be said that besides these, which complete the list of his principal works, he has left a very large number of minor works and a considerable correspondence. During this time he lived in the Rue Platière, which is now named after him. But his suspicions of secret enemies in the strongest rank of them linger, and at the beginning of 1778 he was glad to accept the offer of M. de Girardin, a rich financier, and occupy a cottage at Ermenonville. The country was beautiful; but his old terrors revived, and his woes were complicated by the alleged inclination of Thérèse for one of M. de Girardin's stable-boys. On July 2nd he died in a manner which has been much discussed, suspicions of suicide being circulated at the time by Grimm and others.1

There is little doubt that for the last ten or fifteen years of his life, if not from the time of his quarrel with Diderot and Madame d'Épinay, Rousseau was not wholly sane—the combined influence of late and unexpected literary fame and of constant solitude and discomfort acting upon his excitable temperament so as to overthrow the balance, never very stable, of his fine and acute but unrobust intellect. He was by no means the only man of letters of his time who had to submit to something like persecution. Fréron on the orthodox side had his share of it, as well as Voltaire, Helvétius, Diderot and Montesquieu on that of the innovators. But Rousseau had not, like Montesquieu, a position which guaranteed him from serious danger; he was not wealthy like Helvétius; he had not the wonderful suppleness and trickiness which even without his wealth would probably have defended Voltaire himself; and he lacked entirely the "bottom" of Fréron and Diderot. When he was resolve to courage to sneer at his enemies.1

The local inquirer into the death, on the following day, published in a certificate that he died of apoplexy; but the story that he shot himself persisted. In December 1879 Rousseau's coffin in the Panthéon was opened, and M. Berthelot, who examined the skull, found no trace of injury by a bullet; and on the whole there is no reason to doubt the verdict of the original inquiry at Ermenonville. (H. Cn.)
enemies and suspect his friends. His moral character was undoubtedly weak in other ways than this, but it is fair to remember that but for his astounding Confessions the more disgusting parts of it would not have been known, and that these Confessions were written, if not under hallucination, at any rate in circumstances entitling the self-condemned criminal to the benefit of conscience. If Rousseau had held his tongue, he might have stood lower as a man of letters; he would pretty certainly have stood higher as a man. He was, moreover, really sinned against, if still more sinning. The conduct of Grimm to him was certainly bad; and, though Walpole was not his personal friend, a worse action than his famous letter, considering the well-known idiosyncrasy of the subject, would be difficult to find. It was his own fault that he saddled himself with the Le Vasseurs, but their conduct was probably, if not certainly, ungrateful in the extreme. Only excuses can be made for him; but the excuses for a man born, as Hume after the quarrel said of him, "without a skin" are numerous and strong.

His peculiar reputation increased after his death. During his life his personal peculiarities and the fact that his opinions were nearly as obnoxious to the one party as to the other worked against him, but it was not so after his death. The men of the Revolution regarded him with something like idolatry, and his literary merits conciliated many who were far from idolizing him as a revolutionist. His style was taken up by Bernardin de Saint Pierre and by Chateaubriand. It was employed for purposes quite different from those to which he had himself applied it, and the reaction triumphed by the very arms which had been most powerful in the hands of the Revolution. Byron's fervid panegyric enlisted on his side all who admired Byron—that is to say, the majority of the younger men and women of Europe between 1820 and 1850—and thus different sides of his tradition were continued for a full century after the publication of his chief books. His religious unorthodoxy was conditioned because he never scoffed; his political heresies, after their first effect was over, seemed harmless from the very want of logic and practical spirit in them, while part at least of his literary secret was the common property of almost every one who attempted literature.

In religion Rousseau was undoubtedly what he has been called above—a sentimental deist; but no one who reads him with the smallest attention can fail to see that sentimentalism was the essence, deism the accident of his creed. In his time orthodoxy at once generous and intelligent hardly existed in France. There were ignorant persons who were sincerely orthodox; there were intelligent persons who pretended to be so. But between the time of Massillon and D'Aguusseau and the time of Lamennais and Joseph de Maistre the class of men of whom in England Berkeley, Butler and Johnson were representative did not exist in France. Little inclined by nature to any but the emotional side of religion, and utterly unclassified in any other by education, course of life, or the general tendency of public opinion, Rousseau naturally took refuge in the nebulous kind of natural religion which was at once fashionable and convenient. If his practice fell far short even of his own arbitrary standard of morality, as much may be said of persons far more dogmatically orthodox.

In politics, on the other hand, Rousseau was a sincere and, as far as in him lay, a convinced republican. He had no great tincture of learning, he was by no means a profound logician, and he was impulsive and emotional in the extreme—characteristics which vitally matters put him under the subject of the preference of equality above all political requisites that under the French monarchy the actual result was the greatest misery of the greatest number, and he did not look much further. The Contrat social is for the political student one of the most curious and interesting books existing. Historically it is null; logically it is full of gaping flaws, practically its manipulations of the volonté de tous and the volonté générale are clearly insufficient to obviate anarchy. But its mixture of real eloquence and apparent cogency is exactly such as always carries a multitude with it, if only for a time. Moreover, in some minor branches of politics and economics Rousseau was a real reformer. Visionary as his educational schemes (chiefly promulgated in Émile) are in parts, they are admirable in others, and his protest against mothers refusing to nurse their children hit a blot in French life which is not removed yet by his biographers' source of weakness to the nation.

But it is as a literary man pure and simple—that is to say, as an exponent rather than as an originator of ideas—that Rousseau is most noteworthy, and that he has exercised most influence. The first thing noticeable about him is that he defies all customary and mechanical classification. He is not a dramatist—his work as such is insignificant—nor a novelist, for, though his two chief works except the Confessions are called novels, Émile is one only in name, and La Nouvelle Héloïse is as a story diffuse, prosy and awkward to a degree. He was without command of poetic form, and he could only be called a philosopher in an age when the term was used with such meaningless laxity as was customary in the 18th century. If he must be classed, he was before all things a describer—a describer of the passions of the human heart and of the beauties of nature. In the first part of his vocation the novelists of his own youth, such as Marivaux, Richardson and Prévost, may be said to have shown him the way, though he improved greatly upon them; in the second he was almost a creator. In combining the two and expressing the effect of nature on the feelings and of the feelings on the aspect of nature he was absolutely without a forerunner or a model. The literary reputation of Rousseau has been chiefly differentiated from literature before it by the colour and tone resulting from this combination, Rousseau may be said to hold, as an influence, a place almost univalued in literary history. The defects of all sentimental writing are noticeable in him, but they are palliated by his wonderful feeling, and by the passionate sincerity even of his insincere passages. Some cavils have been made against his French, but none of much weight or importance. And in such passages as the famous "Voilà de la pervenche" of the Confessions, as the description of the Isle of St. Pierre in the Rêveries, as some of the letters in the Nouvelle Héloïse and others, he had achieved absolute perfection in doing what he intended to do. The reader, as it has been said, may think he might have done something else with advantage, but he can hardly think that he could have done this thing better.

(G. S.)

BIBLIOGRAPHY.—The dates of most of Rousseau's works published during his lifetime have been given above. The Confessions 1791 and Réveries 1850 make to the several editions. Of the works to persons concerned, and which the author did not intend to be published until the end of the century, appeared in Geneva in 1782. In the same year and the following appeared a complete edition in 2nd ed. (1850) makes out the works in 19 volumes. "Genève, of importance of them being that of Musset-Pathay (Paris, 1832). Some unpublished works, chiefly letters, were added by Boscha (Paris, 1855) and Streekensmou (Moulon, Paris, 1861). See also the latter's Rousseau et ses amis (1863). Works on Rousseau are innumerable.

The chief biographies are: in French that of Saint Marc Girardin (1874), in English the Life by Viscount Morley. But the materials for biography are controversial and so personal—his own Confessions and the memories and associations of his friends and honesty are disputed—that the correct historical view can hardly be said yet to be standardized. Mrs Frederika Macdonald, in her Jean Jacques Rousseau (1865) makes out many points regarding Mme. de Epina's Mémoires as coloured, if not actually dictated, by the malevolent attitude of Grím and Diderot; and her study of the documents undoubtedly qualifies a good many of the assumptions of the book. Mrs Richardson's 1865, has much of evidence which is at least tainted by contemporary prejudice, and leaves the way open for an interpretation of the facts which would reconcile Rousseau's character as a writer with his actions as a man. Unfortunately for the consistency of historical writers, the rehabilitation of Rousseau's veracity they have not definitely been attempted by the rewritings of these other lives in her sense. Rousseau de Genève à l'Hermitage, 1712-97 (1908).

(H. Ch.)
ROUSSEAU, PIERRE ÉTIENNE THÉODORE (1812–1867),
French painter of the Barbizon school, was born in Paris on the 15th of April 1812, of a bourgeois family which included one or two artists. At first he received a business training, but soon displayed aptitude for painting. Although his father regretted the decision at first, he became reconciled to his son's choice, and throughout the artist's career (for he survived his son) was a sympathizer with him in all his conflicts with the Salon authorities. Théodore Rousseau shared the difficulties of the romantic painters of 1830 in securing for their pictures a place in the annual Paris exhibition. The whole influence of the classically trained artists was against them, and not until 1848 was Rousseau adequately presented to the public. He had exhibited one or two unimportant works in the Salon of 1831 and 1834, but it was in 1836 his great work, "La Réserve," a picture similar to van Gogh's "Bois de Vincennes," which brought forth the admiration of the classic painters; and from then until after the revolution of 1848 he was persistently refused. He was not without champions in the press, and under the title of "le grand refusé" he became known through the writings of Thodé, the critic who afterwards resided in England and wrote under the name of Bürger. During these years of artistic exile Rousseau produced some of his finest pictures: "The Chestnut Avenue," "The Marsh in the Landes" (now in the Louvre), "Foor-Frost" (now in America); and in 1851, after the reorganization of the Salon in 1848, he exhibited his masterpiece, "The Edge of the Forest" (also in the Louvre) a picture similar to van Gogh's "Bois de Vincennes," but slightly varied in subject from, the composition called "A Glade in the Forest of Fontainebleau," in the Wallace collection at Hertford House.

Up to this period Rousseau had lived only occasionally at Barbizon, but in 1848 he took up his residence in the forest village, and spent most of his remaining days in the vicinity. He was now at the height of his artistic power, and was able to obtain fair sums for his pictures (but only about one-tenth of their value thirty years after his death), and his circle of admirers increased. He was still ignored by the authorities, for while Diaz was made Chevalier of the Legion of Honour in 1851, Rousseau was left undecorated at this time, but was nominated shortly afterwards. At the Exposition Universelle of 1855, where all Rousseau's rejected pictures of the previous twenty years were gathered together, his works were acknowledged to form one of the finest of the many splendid groups there exhibited. But during his lifetime Rousseau never really conquered French taste, and after an unsuccessful sale of his works by auction in 1861, he contemplated leaving Paris for Amsterdam or London, or even New York. Misfortune then overtook him: his wife, who had been a source of constant anxiety for years, became almost hopelessly insane; his aged father was constantly by him for pecuniary assistance; his patrons were few. Moreover, while he was temporarily absent with his invalid wife, a youth living in his house (a friend of his family) committed suicide in his Barbizon cottage; when he visited the Alps in 1863, making sketches of Mont Blanc, he felt dangerously ill with inflammation of the lungs; and when he returned to Barbizon he suffered from insomnia and became gradually weakened. He was elected president of the fine art jury for the 1867 Exposition. His disappointment at being passed over in the distribution of the higher awards told seriously on his health, and in August he was seized with paralysis. He slightly recovered, but was again attacked several times during the autumn. Finally, in November, he began to sink, and he died, in the presence of his lifelong friend, J. F. Millet, on the 22nd of December 1867.

Rousseau's other friend and neighbour, Jules Dupré, himself an eminent landscape painter of Barbizon, relates the difficulty Rousseau experienced in knowing when his picture was finished, and how he, Dupré, would sometimes take away from the studio some canvas on which Rousseau was labouring too long. Millet, the peasant painter, for whom Rousseau had the highest regard, was much with him during the last years of his life, and at his death Millet took charge of the insane wife. Rousseau was a good friend to Diaz, teaching him how to paint trees, for up to a certain point in his career Diaz considered he could only paint figures.

Rousseau's pictures are always grave in character, with an air of exquisite melancholy which is powerfully attractive to the lover of landscapes. They are well finished when they profess to be completed pictures, but Rousseau spent so long a time in working up his subjects that his absolutely completed works are comparatively few. He left many canvases with parts of the picture realized in detail and with the remainder somewhat vague; and also a good number of sketches and water-colour drawings. His pen work in monochrome on paper is rare; it is particularly searching in quality. There are a number of fine pictures by him in the Louvre, and the Hermitage collection contains one of his most important Barbizon pictures. There is also a copy of the Ionides collection at the Victoria and Albert Museum.

ROUSSEAU DE LA ROTTIÈRE, JEAN SIMÉON (b. 1747),
French decorative painter, was the youngest son of Jules Antoine Rousseau, "le Salon de la Méridienne," a part of the bedchamber of Madame Adélaïde, and the "Garde-robe of Louis XVI." were among the achievements which there can be little doubt were shared in by Rousseau de la Rottière. His most individual and most famous undertaking was, however, the decoration of the lovely "Boudoir de Madame de Sévigny," now at the Victoria and Albert Museum. This little room, 14 ft. long, 10½ ft. wide and 16 ft. high, was removed from the house in the Rue de Saint Louis, in the Marais. The Seigneur de Sévigny, who was hereditary "Trésorier général de l'Extraordinaire des guerres" under Louis XVI, married his cousin Anne Marie Louise de Pange, a favourite maid-of-honour of Marie Antoinette, and the story runs that his wife and the queen, desiring to give him a surprise, had the room decorated during his absence from Paris. It was purchased for the museum by 60,000 francs in 1869. The wall paintings of this sumptuous room came from the hand of Rousseau de la Rottière; the overdoor and part of the ceiling were executed by Lagrénée le jeune; the architect was Ledoux; the grey marble figures of old men on either side of the fireplace were sculptured by Clodion; the mounts of the chimney-piece are apparently from the chisel of Gouthière. The date of the room is assigned to 1787–89, and Jean Siméon's authorship of much of its decorative work is clear. The trivial addition of the existing sketch. The decoration is Pompeian in feeling, and in the main its taste is admirable; the execution is of the highest excellence. The tall narrow panels are painted in medallions with amorini; festoons and bouquets of flowers fill every available space; the shutters are painted with doves and shepherdesses. Lagrénée's pictures in the upper lunettes represent the elements; upon the ceiling is Jupiter enthroned within a deep blue border. The perfection of detail, the unity of the whole composition, the dexterity with which so small a chamber, lofty out of proportion to its length and width,
has been picked out with recessed arches, the tenderness of its scheme of colour, combine to produce an exquisite effect. It is a melancholy reflection that M. de Corday, who was educated at a Benedictine College, and married Marie Antoinette combined to surprise with this chef-d'œuvre, was gulliotined, and that his wife, whose sitting-room it was, was condemned to die with him and with Madame Élisabeth de France, whom they had befriended, but was saved, against her will, by the princess, who made a false declaration as to her condition. She had two subsequent husbands, and lost them both in little more than two years. She herself lived less than five years after her delivery by the fall of Robespierre. There is no information as to Rousseau's later life. The last known information of him is in 1792.

ROUSSILLON, was the western provinces of France. It now forms the greater part of the department of Pyrénées Orientales (q.v.). It was bounded S. by the Pyrenees, W. by the county of Foix, N. by Languedoc and E. by the Mediterranean. The province derived its name from a small place near Perpignan, the capital, called Ruscino (Roscelona, Castel Rossello), where the Gallic chiefmen met to consider Hannibal's request for a conference. The district formed part of the Roman province of Gallia Narbonensis from 121 B.C. to A.D. 476, when it was ceded with the rest of Septimania to Theodoric II., king of the Visigoths. His successor, Amalaric, on his defeat by Clovis in 511, retired to Spain, leaving a governor of Septimania. In 719 the Saracens crossed the Pyrenees, and Septimania was held by them until their defeat by Pippin in 766. On the invasion of Spain by Charlemagne in 778 he found the borderlands wasted by the Saracenic wars, and the inhabitants hiding among the mountains. He accordingly made grants of land to Visigothic refugees from Spain, and founded several monasteries, round which the people gathered for protection. In 792 the Saracens again invaded France, but were repulsed by Louis, king of Aquitaine, whose rule extended over all Catalonia as far as Barcelona. The different portions of his kingdom in time became kingdoms, and the line of monarchy became the first hereditary count of Roussillon. But his rule only extended over the eastern part of what became the later province. The western part, or Cerdagne, was ruled in 900 by Miron as first count, and one of his grandsons, Bernard, was the first hereditary count of the middle portion, or Bésois. In 1111 Raymond-Bérenger III., count of Barcelona, inherited the fief of Bésois, to which was added in 1117 that of Cerdagne; and in 1172 his grandson, Alfonso II., king of Aragon, united Roussillon to his other states on the death of the last count, Gerard II. The counts of Roussillon, Cerdagne and Bésois were not sufficiently powerful to hold down the wars of ambition. Their energies had been devoted to furthering the welfare of their people. Under the Aragonese monarchs the progress of the united province still continued, and Collioure, the port of Perpignan, became a centre of Mediterranean trade. But the country was destined to pay the penalty of its position on the frontiers of France and Spain in the long struggle for ascendency between these two powers. By the treaty of Corbeil (1258) Louis IX. surrendered the sovereignty of Roussillon and the ancient countyship of Barcelona to Aragon, and from that time until the 17th century the province ceased to belong to France. James I. of Aragon had wrested the Barony of Picquigny from the Moors and left them with Roussillon to his son James (1276), with the title of king of Majorca. The consequent disputes of this monarch with his brother Pedro III. of Aragon were not lost sight of by Philip III. of France in his quarrel with the latter about the crown of the Two Sicilies. Philip espoused James's cause and led his army into Spain, butretreating died at Perpignan in 1285. James then became reconciled to his brother, and in 1311 was succeeded by his son Sancho, who founded the cathedral of Perpignan shortly before his death in 1324. His successor James II. refused to do homage to Philip VI. of France for the seigniory of Montpellier, and applied to Pedro IV. of Aragon for aid. Pedro not only, but on various pretexts declared war against him, and seized Majorca and Roussillon in 1344. The province was now again united to Aragon, and enjoyed peace until 1462. In this year the disputes between John II. and his son about the crown of Navarre gave Louis XI. of France an excuse to support John against his brothers, who had risen in revolt. Louis turned traitor, and the province having been pawned to him for 300,000 crowns, was occupied by the French troops until 1493, when Charles VIII. restored it to Ferdinand and Isabella. During the war between France and Spain (1496–98) the people suffered equally from the Spanish garrisons and the French invaders. But unlike of the Spaniards was so soon effected in the pride of sharing in the glory of Charles V., and in 1542, when Perpignan was besieged by the dauphin, the Roussillonnais remained true to their allegiance. Afterwards the decay of Spain was France's opportunity, and on the death of the Count of Estacles in 1641, Louis XIII. espoused the cause of the former, and the territory of the Pyrenees in 1659 secured Roussillon to the French crown.

See also the publications of the Société agricole, scientifique et littéraire des Pyrénées Orientales (1834–fol.).

ROUTH, EDWARD JOHN (1831–1907), English mathematician, was born at Quebec on the 20th of January 1831. At the age of eleven he came to England, and after studying under A. de Morgan at University College, London, entered Peterhouse, Cambridge, in 1851. In the mathematical tripos three years later he was senior wrangler, beating J. Clerk Maxwell, who, however, tied with him for the Smith's prize. Elected a fellow of his college, he devoted himself to teaching, and quickly proved himself one of the most successful mathematicians "coaches" ever known at Cambridge. In thirty years, of some 700 pupils who passed through his hands 500 became wranglers; and for twenty-two successive years, from 1861 to 1882, the senior wrangler was trained by him. He made considerable contributions to scientific literature, and among his publications were: An Analytical View of Newton's Principia, with Lord Brougham (1855); an Essay on the Stability of a given State of Motion, which won the Adams' prize in 1877; and treatises on the Dynamics of Rigid Bodies, on Analytical Statics, and on the Dynamics of a Particle. He died at Cambridge on the 7th of June 1907.

ROUTH, MARTIN JOSEPH (1755–1854), English classical scholar, was born at South Elmham, Suffolk, on the 18th of September 1755. He was educated at Cambridge, and, and subsequently elected to a fellowship at Magdalen, of which society he became president in 1791. He died at Oxford on the 22nd of December 1854, and retained his physical and intellectual powers to the last. He was the author of editions of the Euthydemus and Gorgias of Plato (1784), to which Dindorf declared himself indebted for his first ideas of Greek criticism, and of Bishop Burnet's History of his Own Time (2nd ed., 1833) and History of the Reign of King James the Second (1852). Routh was also an authority on patristic literature, his Requisita Sacra (2nd ed., 1846–48), a collection of the fragments of the Fathers of the 1st and 3rd centuries, and Scriptorum ecclesiasticorum opuscula praeceps (4 vols., 1834) being valuable contributions to ecclesiastical knowledge. See Gentleman's Magazine, 1855; J. W. Burgon, Lives of Twelve Good Men (1888).

ROULONDE, GEORGE (1852–1888), English publisher, was born at Brampton in Cumberland on the 23rd of September 1812. He gained his earliest experience of business with a bookseller at Carlisle. Proceeding to London in 1833, he started in business for himself as a bookseller in 1836, and as a publisher in 1843, making his first serious success by reprinting the Biblical commentaries of an American writer, Albert Barnes. His fame as a publisher, however, rests chiefly upon the enormous number of cheap books which he issued. A series of shilling volumes called the "Railway Library" was an immense success, including as it did Mrs Harriet Beecher Stowe's Uncle Tom's Cabin, and he also published in popular
form some of the writings of Washington Irving, Fenimore Cooper, Bulwer Lytton and Benjamin Disraeli. He also brought out of shilling books in "Routledge's Universal Library." Routledge died in London on the 12th of December 1888. After being styled Routledge, Warne & Routledge, his firm changed its name to that of George Routledge & Sons. A branch of the business was established in New York in 1854.

ROUVIER, MAURICE (1842- ), French statesman, was born at Aix on the 17th of April 1842, and spent the early years of his manhood in business at Marseilles. He supported Gambetta's candidature there in 1867, and in 1870 he founded an anti-imperial journal, L'Égalité. Becoming secretary general of the prefecture of Bouches-du-Rhône in 1870-71, he was soon sent to London as the first French minister to the National Assembly for Marseilles at a by-election, and voted steadily with the Republican party. He became a recognized authority on finance, and repeatedly served on the Budget Commission as reporter or president. At the general elections of 1881 after the fall of the Ferry cabinet he was returned to the chamber on a programme which included the separation of Church and State, a policy of decentralization, and the imposition of an income-tax. He then joined Gambetta's cabinet as minister of commerce and the colonies, and in the 1883-85 cabinet of Jules Ferry he held the same office. He became premier and minister of finance on the 31st of May 1887, with the support of the moderate republican groups, the Radicals holding aloof in support of General Boulanger, who began a violent agitation against the government. Then came the scandal of the decorations in which President Grévy's son-in-law Daniel Wilson figured, and the Rouvier cabinet fell in the attempt to screen the president. Rouvier's opposition in his capacity of president of the Budget Commission was one of the causes of the defeat of the Fлоquet cabinet in February 1889. In the new Tirard ministry formed to combat the Boulangerist agitation he was minister of finance. This portfolio he retained consecutively in the Freycinet, the Loubet and the Ribot cabinets, 1890-93. His relations with Cornélius Herz and the baron de Reinach compelled his retirement, however, from the Ribot cabinet at the time of the Panama scandals in December 1892. Again, in 1902, he became minister of finance, after nearly ten years in exclusion from office, in the Radical cabinet of M. Combes; and on the fall of the Combes ministry in January 1905 he was invited by the president to form a new ministry. In this cabinet he at first held the ministry of finance. In his initial declaration to the chamber the new premier had declared his intention of continuing the policy of the late cabinet, pledging the new ministry to a policy of conciliation, to the consideration of old age pensions, an income-tax, separation of Church and State. Public attention, however, was chiefly concentrated on foreign policy. During the Combes ministry M. Delcassé had come to a secret understanding with Spain on the Moroccan question, and had established an understanding with England. His policy had aroused German jealousy, which became evident in the asperity with which the question of Morocco was handled in Berlin. At a cabinet meeting on June 6th it is said that M. Rouvier reproached the Foreign Minister with imprudence in the matter of Morocco, and after a heated discussion M. Delcassé gave in his resignation. M. Rouvier himself took the portfolio of foreign affairs at this anxious juncture. He, after critical negotiations, secured on July 9th an agreement with Germany accepting the international conference proposed by the sultan of Morocco on the assurance that Germany would recognize the special nature of the interest of France in maintaining order on the frontier of her Algerian empire. Lengthy discussions resulted in a new convention in September, which contained the programme of the proposed conference, and in December M. Rouvier was able to make a statement of the whole proceedings in the chamber, which received the assent of all parties. M. Rouvier's government did not long survive the presidential election of 1906. The disturbances arising in connexion with the Separation Law were skilfully handled by M. Clemenceau to discredit the ministry, which gave place to a ministry under the direction of M. Sarrien.

ROVERETO, the most important industrial town in the southern or Italian-speaking portion of the Austrian province of Tirol, though its population (which in 1900 was 10,180, Italian-speaking and Romanist) is less than that of Trent. It is also the principal town of the administrative district of Rovereto. Built on the left bank of the Adige, in the widest portion of the Val Lagarina (the name given to the Adige valley from Acquaviva, above Rovereto, to the Italian frontier), it is divided into two parts by the Leno torrent. It is on the Brenner railway, by which it is 15 m. S.W. of Trent and 414 m. N. of Verona. Save in the newer quarter of the town, the streets are narrow and crooked, several being named after the most distinguished natives, Acquaviva and Manin. The finest church is that of Santa Maria del Carmine, the old 14th-century church now serving as a sacristy to that built from 1678 to 1750. The church of San Marco dates from the 15th century. The town is dominated by the castle (now used as barracks), which was reconstructed in 1492 by the Venetians, after it had been burnt in 1487 by the count of Tirol. The staple silk industry (which dates from the 16th century) has declined, the number both of filande (establishments wherein the cocoons are unwound) and of filatoie (those wherein the silk is spun) having diminished.

In 1512 the emperor Lothair found the passage of the gorge above the site of the town barred by a castle, which he took and gave to one of his Teutonic followers, the ancestor of the Castelbarco family. Towards the middle of the 13th century that family obtained by marriage the lands of the Lizzana family (whose castle rises S. of the town), and in 1300 practically founded the town and surrounded it with walls. In 1416 it was taken by the Venetians, who in 1487 successfully resisted, at Caliliano, an attempt to take it made by the count of Tirol and the bishop of Trent. In 1599, at the outset of the war of the League of Cambray, the town gave itself voluntarily to the emperor Maximilian, to whom it was ceded formally by Venice in 1517, and next year incorporated with Tirol. South of Rovereto is the village of Marco, near which are certain natural remains (either those of a landslip that occurred in 883, or of a glacier moraine) believed to have been described by Dante (Inf. xii. 4-9), who is said to have spent part of the year 1304, during his exile from Florence, in the castle of Lizzana, between Marco and Rovereto.

ROVIGNO, a seaport of Austria, in Istria, 75 m. S. of Trieste by rail. Pop. (1900) 10,205, mostly Italian. It is situated on the west coast of Istria, and possesses an interesting cathedral, built on the summit of the promontory Monte di Santi Eufemio. Its campanile, built after the place, Antuanus Campanili (now Venice, is crowned with a bronze statue of St Eufemia, the patron saint of the town, whose remains are preserved in the church. It contains a station of the Berlin Aquarium, with a fine collection of the fauna of the Adriatic Sea. In the neighbourhood are vineyards, which produce the best wine in Istria, and olive gardens, while its hazel-nuts are reputed the finest in the world. Rovigno is the principal centre of the Austrian tunny and sardine fishery. The industries, in addition to shipbuilding and the preservation of fish, include the manufacture of tobacco, cement, macaroni and similar preparations, and flour. There is an active export trade. Its inhabitants are renowned seamen. Rovigno is the ancient Arupenum or Rubium, and according to tradition it was originally built on an island, Cissa by name, which disappeared during the earthquakes about 737. Rovigno passed definitively into the hands of the Venetians in 1330, and it remained true to the republic till the treaty of Campo Formio (1797).

ROVIGO, a town of Venetia, Italy, capital of the province of Rovigo. It stands on the low ground between the lower Adige and the lower Po, 50 m. by rail S.W. of Venice and 27 m. S.S.S.W. of Padua, and on the Adigetto Canal, 17 ft. above sea-level. Pop. (1901) 6638 (town); 10,733 (commune). It is a station
on the line between Bologna and Padua, with branches to Legnago and Chioggia. The architecture of the town bears the stamp both of Venetian and of Ferrarese influence. The cathedral church of Santo Stefano (1569) is of less interest than La Madonna del Soccorso, an octagon with a fine campanile, begun 1504, by Francesco Zambeliano of Bassano, a pupil of Palladio. The town hall contains a library including some rare early editions, belonging to the Accademia de’ Concordi, founded in 1580, and a fair picture gallery enriched with the spoils of the monasteries. The Palazzo Roncali is a fine Renaissance building by Sanmicheli (1555). Two towers of its medieval castle remain. Wool, silk, linen and leather are among the local manufactures.

Rovigo (Neo-Latin Rhodogium) appears to be mentioned as Rodigo in 838. It was selected as his residence by the bishop of Aquileia to house his library. The city contains a church, St. Mark’s, where the Este, family of Ferrara, had its residence ever since the 11th to the 14th century the Este family was usually in authority; but the Venetians took the place by siege in 1428 and retained possession of it by the peace of 1444, and though the Este more than once recovered it, the Venetians, returning in 1514, retained possession till the French Revolution. In 1866 the city was made a duchy in favour of General Savary. The Austrians in 1814 created it a royal city. (T. As.)

ROVUMA, a river in East Africa, forming during the greater part of its course the boundary between German and Portuguese territory. The lower Rovuma is formed by the junction in 3° 34′ S., 35° 40′ E., of two branches of nearly equal importance, the longer of which, the Lujenda, comes from the south-west, the other, which still bears the name Rovuma, from the west. Its source lies on an undulating plateau, 3000 ft. high, immediately to the east of Lake Nyasa, in 10° 45′ S., 35° 40′ E., the head-stream flowing first due west before turning south and east. In its eastward course the Rovuma flows near the base of the escarpment of an arid sandstone plateau to the north, from which direction the streams, which have cut themselves deep channels in the plateau edge, have almost all short courses. On the opposite bank the Rovuma receives, besides the Lujenda, the Malinde and Luchcullingo, flowing in broad valleys running from south to north. The Lujenda rises in close proximity to Lake Chiwá, in the small Lake Chiuta (1700 ft.), the swamps to the south of this being separated from Chiwá only by a narrow wooded ridge. The stream which issues from Chiuta passes by a swampy valley into the narrow Lake Amaramba, from which the Lujenda finally issues as a stream 80 yds. wide. Lower down it varies greatly in width, containing in many parts long wooded islands which rise above the flood level, and are often inhabited. The river is fordable in many places in the dry season. At its mouth it is about a mile wide. The lower Rovuma, which is often half a mile wide but generally shallow flows through a swampy valley, flanked by plateau escarpments containing several small backwaters of the river. The mouth, which lies in 10° 28′ S., 40° 30′ E., is entirely in German territory, the boundary near the coast being formed by the parallel of 10° 40′. The length of the Rovuma is about 500 m.

ROW, JOHN (c. 1525-1580), Scottish reformer, was born near Stirling and educated in that town and at St Andrews, where he began to practise as an advocate in the consistorial court. In 1550 he was sent to Rome in the interests of John Hamilton, archbishop of St Andrews, and attracted the notice of the highest authorities, who, when his failing health drove him back to Scotland in 1558, nominated him papal nuncio to inquire into the spread of heresy in that country. Inquiries of their kind were frequent and the care with which Knox’s preaching, he joined the reformers and in April 1550 was admitted minister of Kinnoulay and in July of the same year minister of the Old or Middle Church at Perth. He was one of the commission of six who drew up the “Confession of Faith” and the “First Book of Discipline,” and during the struggle with Queen Mary was often employed on important engagements. He was moderator of the Church Assembly at Edinburgh in July 1567 and at Perth in the following December, and again in Edinburgh 1576 and Stirling 1578. Meanwhile he helped to compile the “Second Book of Discipline,” and became more than ever opposed to the Episcopal system of church government. He was a consistent and moderate, and is said to have been the first to teach Hebrew in Scotland. He died at Perth on the 17th of October 1580.

His son JOHN ROW (1566–1645), minister of Carnock, wrote a Historie of the Kirk of Scotland 1558 to 1637, which was continued to 1639 by his son, the third John Row (c. 1598–1672), rector of the Perth grammar school and then (appointed by Cromwell) principal of King’s College, Aberdeen, who, with his father and grandfather was a famous Hebrast, but left the Church of Scotland to become an independent minister. This Historie was published by the Wodrow Society and by the Macleod Club in 1846.

ROWE, NICHOLAS (1674–1718), English dramatist and miscellaneous writer, son of John Rowe (d. 1692), barrister and sergeant-at-law, was baptized at Little Barford in Bedforshire on the 30th of June 1674. Nicholas Rowe was educated at Westminster School under Dr Busby. He became in 1688 a King’s Scholar, and entered the Middle Temple in 1691. On his father’s death he became the master of an independent fortune. His first play, The Ambitious Stepmother, the scene of which is laid in Persepolis, was produced in 1700, and was followed in 1702 by Tamerlane. In this play the conqueror represented William III., and Louis XIV. is denounced as Bajazet. Rowe was for many years regularly acted on the anniversary of William’s landing at Torbay. The Fair Penitent (1703), an adaptation of Massinger and Field’s Fatal Dowry, was pronounced by Dr Johnson to be one of the most pleasing tragedies in the language. In it occurs the famous character of Lothario, whose name passed into current use as the equivalent of a rake. Calista is said to have suggested to Samuel Richardson the character of Clarissa Harlowe, as Lothario suggested Lovelace. In 1704 Rowe tried his hand at comedy, producing The Bier at Lincoln’s Inn Fields. The play is said to have amused no one except the author, and Rowe returned to tragedy in Ulysses (1706) The Royal Consort (1707) deals with the persecutions endured by Arthir, son of Henest and the Christian maiden Ethelinda. The Tragedy of Jane Shore, which was played at Drury Lane with Mrs Oldfield in the title- role in 1714, ran for nineteen nights, and kept the stage longer than any of his other works. The Tragedy of Lady Jane Grey followed in 1715. Rowe’s friendship with Pope, who speaks affectionately of his vivacity and gaiety of disposition, led to attacks inspired by the publisher Edmund Curll, the best known of these being The New Rehearsal, or Bays the Younger, containing an Examen of Seven of Rowe’s Plays, by Charles Gildon. Rowe acted as under-secretary (1709-11) to the Duke of Queensberry when he was principal secretary of state for Scotland. On the accession of George I. he was made a surveyor of customs, and in 1715 he succeeded Nahum Tate as poet laureate. He was also appointed clerk of the council to the prince of Wales, and in 1718 was nominated by Lord Chancellor Parker as clerk of the presentations in Chancery. He died on the 6th of December 1718, and was buried in Westminster Abbey. He was twice married, and his widow received a pension from George I. in 1719 in recognition of her husband’s translation of Lucan. This verse translation, or rather paraphrase of the Pharsalia, was called by Samuel Johnson “one of the greatest productions in English poetry,” and was widely read, running through eight editions between 1718 and 1807.

Rowe was the first modern editor of Shakespeare. It is unfortunate that he based his text (6 vols., 1709) on the corrupt Fourth Folio, a course which he was followed by later editors. We owe to him the preservation of a number of Shakespearian traditions, collected for him at Stratford by Thomas Betterton. These materials he used with considerable judgment in the memoir prefixed to the Works. Moreover, his practical knowledge of the stage suggested technical improvements. He divided the play into acts and scenes on a reasonable method,
noted the entrances and exits of the players, and prefixed a list of the *drumatis personæ* to each play. Rowe wrote occasional verses addressed to Godolphin and Halifax, adapted some of the odes of Horace to fit contemporary events, and translated the *Caractères* of La Bruyère and the *Callipædia* of C. Quillet. He also wrote a memoir of Boileau prefixed to a translation of the *Lutrin*.

Rowe's *Works* were printed in 1727, and in 1736, 1747, 1756, 1766 and 1792; his occasional poems are included in Anderson's and other collections of the British poets.

**ROWEL** (from O. Fr. *rouel* or *roel*, dim. of *roue*, Lat. *rola*, wheel), the name of the small revolving wheel or disk with radiating points forming the termination of a rider's spur. The earliest rowels probably did not revolve but were fixed. They appear on monuments of the 13th century, as in the great seal of Henry III. of England, but the older "prick" or "spur" spurs remained the standard form till the 14th century (see *Spur*). In veterinary science, the word is used of a small disk of leather or other material used as a seton.

**ROWING** (O. Eng. *rōwian*, to row, cf. Lat. *remus*, Gr. *krepódos*, oar), the act of driving forward or propelling a boat (q.v.) along the surface of the water by means of oars.

The earliest historical records describe battles and voyages in which the ships were propelled by oars. There must, of course, have been from time to time friendly trials of speed between these ancient craft, such as that described by Virgil in the fifth book of the *Aeneid*, but there is no record in classical or even in medieval times of rowing having been indulged in solely as a recreation, or as a means of promoting athletic contest. The absence of any element of competition is sufficient to account for the fact that the boats, the oars, and the method of rowing of the 17th century differed little from those of the earliest times.

The history of Great Britain abounds in instances of the use of the oar. The ancient Britons propelled themselves in coracles of wickerwork covered with skins, by means of paddles rather than oars, but the Saxons were expert oarsmen, as also were the Danish and Norwegian invaders. It is recorded by William of Malmesbury that Edgar the Peaceable was rowed in state on the river Dee by eight tributary kings, himself acting as coxswain.

During the 11th and 12th centuries, when roads were often impassable, considerable use was made of the various rivers of England for the transmission of both passengers and merchandise; and, until the introduction of coaches, the nobility and gentry who had mansions and watergates on the banks of the Thames relied almost entirely upon their boats and elaborately fitted barges as a means of conveyance from place to place.

This use of boats and barges as a means of conveyance for merchandise and passengers provided a means of livelihood for a class of professional oarsmen known as bargemen or watermen. They were professionals, not in the sense of professional athletes, but because they made their living by rowing and navigating passenger and other craft along and across the Thames. Watermen as a class are mentioned in history as early as the 13th or 14th century. The dress occasioned to them by the long frocks is referred to in the chronicles of that period. They are mentioned as having been employed to row the barons and their retinues to Runnymede for the signing of the Magna Carta by King John, and about the same time several of the city companies established barges for the purposes of processions and other pageants upon the Thames. It is stated by Fabian that in 1544 "Sir John Norman, then lord mayor of London, built a noble barge at his own expense and was rowed by watermen with silver oars, attended by such of the city companies as possessed barges, in a splendid manner." The lord mayor's procession by water to Westminster was annual until 1856, the state barge of the lord mayor being a magnificent specimen of shallops rowed by watermen, while those of the city companies were propelled by a double bank of oars in the fore half, the after part consisting of a cabin which somewhat resembled that of a gondola. In 1514 and in 1555 acts of parliament were passed for the regulation of watermen and their boats and fares upon the Thames (7 Henry VIII. cap. vii. and 2 and 3 Ph. & Mar. cap. xvi.), and from the terms of these statutes there can be no doubt that there were in the 15th century a considerable body of men who lived by the "trade of Rowing" as it is there called. During the 16th and 17th centuries there were no doubt competitions from time to time between these watermen, but the first actual mention of boat-racing is the record of the establishment in 1713 of Doggett's Coat and Badge. Mr Thomas Doggett, who may fairly be described as the founder of modern boat-racing, was a celebrated comedian. He established a fund to provide an annual prize of a waterman's coat with a large silver badge on the arm. The race was founded in honour of the house of Hanover and to commemorate the anniversary of "King George I.'s happy accession to the throne of Great Britain." The contest was to take place at the beginning of August and on the Thames between six young watermen who were not to have exceeded the time of their apprenticeship by more than twelve months. Although the first race took place in 1715 the names of the winners have only been preserved since 1800. The practice of running the badge is still an annual event, the conditions as to boats to be used and other details having been slightly modified. It is entirely controlled and managed by the Fishmongers' Company.

The first English regatta (Ital. *regata*)—an entertainment introduced, as the *Annual Register* records, from Venice—of which we have evidence, took place on the Thames off Ranelagh Gardens in 1773. Great public interest seems to have been taken in the spectacular aspect of this pageant, the barges of the lord mayor and the city companies being present, but there is no record of the competing wager boats or of the names of the watermen who took part in the races.

About the years 1800 to 1810 there are instances of matches between watermen for stakes presented by gentlemen who no doubt made wagers upon the result, and from these professional wager matches it was but a short step to sporting matches between the gentlemen themselves. When once the "gentleman amateur," as he was called, appeared, his evolution, from the sportsman who occasionally rowed a match against a friend, or against time, for a wager, to the amateur oarsman of the present day, was not slow. The amateur rowing which began about the year 1800 on the Thames at Westminster has flourished as a branch of athletic sport, and has spread to every river and water in the country.

**Rowing in the United Kingdom.**—The earliest rowing clubs in England were small groups of oarsmen who combined to purchase a six-oared or eight-oared boat for the purpose of racing. The club was called by the same name as the ship it possessed, and at the commencement of the 19th century the principal clubs in existence upon the Thames were the "Star," the "Arrow," the "Shark" and the "Siren." The two latter have long since disappeared, but the "Star" and the "Arrow" combined about the year 1818 and founded the Leander Club, an institution which after varying fortunes has for many years been recognized as the premier rowing club of the globe.

The earliest contemporary record of boat-racing is the *Water Ledger* of Westminster School, which commences in the year 1813 with a list of the crew of the six-oared boat "Fly." In 1811 Eton had a ten-oared boat and three boats with eight oars, but there is no existing record of a race until 1817. In 1818 Eton challenged Westminster School to row from Westminster to Kew Bridge against the tide; but the race was stopped by the authorities, and it was not until 1829 that the first contest between the two schools took place. Between 1829 and 1847 there were eight matches between Eton and Westminster. The race was revived for a few years in the sixties, and in the year 1876, the state of the country was such that the Westminster boys moved their boathouse first to Wandsworth and then to Putney. This arrangement was found to be inconvenient, and shortly afterwards Westminster rowing came to an
end. Eton rowing, on the other hand, has continued to prosper, and for many years it has been the greatest "nursery" of first-class oarsmen. Since 1861 the Eton College Boat Club has never failed to enter a crew at Henley Regatta.

At Oxford the records of periodical races between college boats begin as early as 1815, and those of Cambridge a few years later. The first contest between eight-oared crews representing the two universities took place at Henley-on-Thames in June 1829. The second contest was not until 1836, and was rowed from Westminster to Putney. In 1837 and 1838 the universities were unable to make a match, and in each of those years the race was rowed between Cambridge and the Leander Club, which had thus early become the premier club of the tideway. It was not always easy in the early days of boat-racing for the university boat clubs to agree as to the conditions and time of the match, but on several occasions when the universities had been unable to meet on the tideway they fought their battle whilst competing for the Grand Challenge Cup at Henley Regatta. Since 1856 the Oxford and Cambridge boat race has been an annual event. It is rowed about a week or ten days before Easter from Putney to Mortlake over what is known as the championship course, a distance of 3 miles. When a twill is adopted, and oars are used as a rule a time varying between 19 and 22 min. The time occupied by a crew in covering this course depends a great deal more upon the conditions of wind and tide than upon the excellence, or the reverse, of the crew. The crew of each university is selected by a president, usually one of the senior members of the last crew, who is elected at the first meeting in the summer term and holds office for a year. Thus the university race comes at the end of his term of office, and he has every opportunity during the summer and autumn of studying the material which will be at his disposal for the formation of a crew in the ensuing spring. The aquatic arrangements at the two universities, as well as the river, are such that the boat race of the year begins in October. During the winter term the freshmen are instructed in the elements of rowing, while the senior men are engaged in practising for the University (inter-collegiate) Fours, a race which takes place early in November. During the latter portion of the term the president of the University Boat Club is engaged in selecting and coaching the trial eights, two picked crews comprising the bulk of the material available for the formation of the university crew. The trial eight races are rowed in the beginning of December, that of Cambridge on the Ouse at Ely, and that of Oxford on the Thames at Mortlake, near the Cambridge or Isis being wide-open and for two crews to race abreast. During the whole of the Easter term the university crews are engaged in practice and training for the University Boat Race. The attention of the remainder of the rowing men at the universities is devoted to training for the bumping races known at Oxford and Cambridge respectively as the Torpids and Lent Races. Each college is represented in these races, and no oarsman who has rowed in the first boat of his college during the previous summer is qualified to compete. The boats start at fixed distances apart, and each boat endeavours to bump the boat in front of it, and to avoid being bumped by the boat behind. When a boat is bumped, the umpire immediately draws the boat to the side, and the boat is allowed to continue. During the summer term the important bumping races between the best crews of each college take place. They are known as "The Eights" at Oxford and "The May Races" at Cambridge. To attain the position of "Head of the River" in these races is the summit of a college boat club's ambition.

The great arena of rowing contests is Henley Royal Regatta. It was founded in 1839 at a public meeting held in the town hall at Henley-on-Thames, at which the subscription and purchase two challenge cups, the Grand Challenge Cup to be rowed annually in eight-oared boats to all amateur crews, and the Town Challenge Cup for four-oared crews residing within 5 m. of Henley. The first regatta was held on the 14th of June 1839, and was a most successful affair, the Grand Challenge Cup being won by the Trinity Boat Club, Cambridge. In 1840 another district race was added, and in 1841 the Stewards Challenge Cup for four oars was added to the programme, open to competition upon the same conditions as the Grand Challenge Cup. There have now for many years been eight events at the regatta, four of which are open to all amateurs, viz., the Grand Challenge Cup for four oars, the Stewards Challenge Cup for fours, the Silver Goblets for pair oars founded in 1845, and the Diamond Sculls for single scullers founded in 1844. The races for which the entry is restricted are the Ladies Challenge Plate for eight oars (founded 1845) and the Visitors Challenge Cup for four oars (founded 1847), which are open to crews from schools and colleges in the United Kingdom; also the Thames Challenge Cup for eight oars (founded 1868) and Wyfold Challenge Cup for four oars (founded 1852). The rule as to entry for the Thames Cup is that no one who has won the Grand Challenge or Stewards Cup may compete, nor may any one enter for this race and for the Grand or Stewards Cups in the same year. The rule for the Wyfold Cup is the same, except that a competitor for the Grand and Stewards Cups of the same season is disqualified.

The original regatta course was from the upper end of the Temple Island to Henley Bridge, but a change was made in 1886 so as to avoid the corner at the finish. The races now start at the lower end of the island and finish at the upper end of the grounds of Phyllis Court. The course is 1 m. 550 yds. in length and about 110 ft. in width. The races are rowed against the stream, and the time usually occupied by the winning crew of the Grand Challenge Cup is within a few seconds of 7 min. In 1843 took place the famous "seven-oar" victory of Oxford. At the eleventh hour one of the Oxford crew was incapacitated by illness. Their opponents, the Cambridge Subscription Rooms Club, refused to allow them to introduce a substitute, and the Oxford men gained undying fame by winning the Grand Challenge Cup with seven oars.

Ten years later (1853) there was a magnificent race between Oxford and Cambridge in the Grand Challenge Cup, the former winning by 18 in. only. In 1862 there was a dead heat in the final heat of the Diamond Sculls between Mr E. D. Brickwood and Mr W. B. Woodgate. In 1878 occurred the memorable contest between Mr T. C. Edwards-Moss and Mr G. W. Lee (U.S.A.) in a heat for the Diamond Sculls which was won on the post by the former. In 1891 the Leander Club, after a dead heat with the Thames Rowing Club in the 19th Challenge Cup in the Grand Challenge Cup, winning the cup on seven occasions in the next ten years. In 1892 the Diamond Sculls left England for the first time, having been won by Mr J. J. K. Ooms of Holland. In 1895 a crew representing Cornell University, U.S.A., entered for the Grand Challenge Cup and were drawn in their heat against the Leander Club. Owing to a misunderstanding between the starter and the Leander crew; the latter failed to start, and the Cornell crew rowed on to the finish without offering to return to the start, a proceeding which caused no little comment at the time. On the following day they were defeated by Trinity Hall, Cambridge, the ultimate winners. In 1897 the Grand Challenge Cup was won by 2 ft. by New College, Oxford, in the record time of 6 min. 51 sec., after a desperate race with Leander. The feature of the next ten years was the persistency with which colonial and foreign crews endeavoured to carry off the principal prizes of the regatta, and the invasion culminated in 1906 by the capture of the Grand Challenge Cup by a crew from the Club Nautique de Gand, Belgium. On this occasion the Leander Club was not represented, but in 1907 the Belgians repeated their victory after defeating a strong Leander crew in one of the heats. In 1903 Mr Herbert Steward, the chairman of the regatta committee, published a detailed record of the regatta from its commencement, which forms a complete history of the meeting and an account of every race.

Henley regatta is rowed "in accordance with..." the rules of
the Amateur Rowing Association, a body which has control of all other amateur rowing in England. The Henley Stewards and the Amateur Rowing Association (or A.R.A.) are in complete
harmony. Their rules are identical, the same, but the Stewards being the older body are not subject to the A.R.A., and in the improbable event of a difference occurring they would be entitled to act independently. The A.R.A. was formed in 1882 for the purpose of drawing up a definition of an "amateur," and for the purpose of having a body who could if necessary select a national representative crew to meet any foreign or colonial invaders. It has long since dropped the latter portion of its original programme, and the A.R.A. as at present constituted is an association to which all the principal amateur boat clubs are affiliated. Its objects are to maintain the amateur oar, to promote the interests of boat racing. It is governed by a committee which occupies in the British rowing world a position not unlike that of the stewards of the Jockey Club in racing matters. The constitution and objects of the A.R.A. are clearly defined in the rules, and their definition of an amateur is so much stricter than that of some other countries that it is advisable to set it out in extenso. It is as follows:

No person shall be considered an amateur oarsman, sculler or coxswain or an amateur rowing team unless:

(1) Who has ever rowed or steered in any race for a stake, money or entrance fee;
(2) Who has ever knowingly rowed or steered with or against a professional for any prize;
(3) Who has ever taught, pursued or assisted in the practice of athletic exercises of any kind for profit;
(4) Who has ever been employed in or about boats or in manual labor for money or wages;
(5) Who is or has been by trade or employment for wages a mechanic, artisan or labourer, or engaged in any menial duty;
(6) Who is disqualified as an amateur in any other branch of sport.

The rules of the A.R.A. also comprise the "Laws of Boat Racing," which govern the race from start to finish; and the "Rules for Regattas," which deal with a large number of matters such as the definition of the different classes of oarsmen, seniors, juniors and maidens, the making of entries, the powers of regatta committees, &c.

A large number of regattas are held under these rules in all parts of the country during the summer months. There are also several matches and other competitions rowed under special rules, the most important of these being the Wingfield Sculls (founded 1830), or amateur championship of the Thames, rowed in the month of July over the championship course from Putney to Mortlake (41 m.).

If the number of entries at Henley Regatta, the extension of the sphere of influence of the A.R.A. and the public interest in the Oxford and Cambridge Boat Race, may be taken as tests, rowing has more than held its own among the various competing forms of recreation in the world of British amateur athletic sport.

Rowing in the United States.—The earliest record of a boat race in the United States is that of a contest in light barges in the year 1811 between the "Knickerbocker" of New York and the "Invincible of Long Island, in which the former was successful. The evolution of racing in heavy pleasure boats to racing in specially constructed craft proceeded with great rapidity, and by the year 1834 a large number of small clubs in New York had combined, under the title of the Castle Garden Boat Club Association. In 1837 the first regatta took place at Poughkeepsie, the race being between "six-oars" for a prize of $200. In those days there was no real distinction in America between amateur and professional, and in spite of rules and definitions the distinction between one who is qualified as an amateur and one who is not has remained in America much less certain and precise than in the United Kingdom.

Yale and Harvard Universities became centres of aquatic energy very early in the history of American rowing. The first racing boat at Yale, a six-oar, was bought in 1844, and in the following spring Harvard purchased an eight, and in 1852 a race was rowed between a Harvard crew and three Yale crews at Lake Winnipesaukee, which resulted in a victory for the former. In 1849 Harvard again defeated Yale in a six-oared race, but on the following day at Worcester City Regatta the same crews entered for a prize and Yale defeated Harvard. In 1864 at a college regatta Yale defeated Harvard, but in 1866 Harvard with a very fine crew showed their superiority over all the other colleges. In 1869 Harvard sent a challenge to Oxford and Cambridge to row a four-oared match on the Thames from Putney to Mortlake. It was accepted by the former and the race was rowed on the 27th of August. The race aroused great public interest, and the banks of the river were crowded from end to end of the course. The crews were: Oxford, F. Willan (bow), A. C. Varbrough, J. C. Tinné and S. Darbishire (stroke); Harvard, J. S. Fay (bow), E. G. Lyman, W. H. Simmons and A. P. Loring (stroke). Harvard led at first, but Oxford eventually rowed them down and won by three lengths.

The trip of the Harvard four to England aroused the rowing enthusiasm of other American universities such as Princeton, Cornell, Columbia and Pennsylvania, and during the next ten years considerable improvement was shown in American rowing. In 1875 no fewer than thirteen university or college crews competed in a race, in which Cornell finished first, Columbia second and Harvard third, the ships being used being coxswained. In 1876 the first eight-oared match over a four-mile course between Harvard and Yale was instituted, and in 1878 a four from Columbia University went to Henley and won the Visitors Challenge Cup. In 1879 and 1880 there were a very large number of inter-collegiate matches and regattas, in several of which Columbia maintained the reputation which they had gained at Henley. In 1881 a Cornell four started at Henley for the Stewards Cup, but were easily beaten. During the next few years there was considerable difference of opinion between universities as to the correct style of stroke, and in 1882 a Yale crew, coached by Mr Davis, did the fine performances, rowing a very fast short stroke in a very long boat. They were, however, eventually beaten by Harvard after an exciting race, in which it is only fair to them to record that the erratic steering of their coxswain contributed in no small degree to their defeat. The next year, 1883, Yale tried an even faster and shorter stroke, but were easily beaten by Harvard, who rowed with great length and steadiness. This year saw the end of the very fast short stroke, and although the "strokes" of the various crews since that day have differed in minor degrees, they settled down to a longer steadier method of rowing which is spoken of in England as the "American style." It differs from that adopted by English oarsmen in that there is an absence of swing and body work, and in that the oarsmen appear to rely almost entirely upon their long slides and hard leg work. In the early "nineties" Cornell was almost always successful at home, and in 1895 they entered for the Grand Challenge Cup at Henley. Owing to a misunderstanding at the start the Leander crew were left at the post in the first heat, but on the next day Cornell suffered defeat at the hands of Trinity Hall. In 1896 Yale entered at Henley under the tuition of Cook, but were somewhat easily beaten by Leander. The result of these two expeditions to Henley was an attempt to introduce the English style of rowing in America. The experiment was not altogether successful, Mr R. C. Lehmann, who had met with considerable success in England as a coach both at Oxford and Cambridge, went to Harvard for two seasons. The attempt to instruct the American oarsmen in the English methods of swing and body work, instead of the American stroke, resulted in their falling short of perfection in either style, and they were beaten by Yale upon each occasion. Mr Lehmann's visit, if it failed to give pace to the crew he coached, resulted, however, in improving the whole spirit of American college rowing. Mutual confidence and friendly rivalry took the place of the atmosphere of suspicion and almost of enmity which had at times existed between Harvard and Yale. In 1895 an Inter-collegiate Rowing Association was formed by
Cornell, Columbia and Pennsylvania to organise contests at Poughkeepsie, and all colleges. In 1890 and 1898 Pennsyl-
vania won, in 1902, 1903, 1904 and 1908 Syracuse, and in most other
countries. The two annual inter-collegiate regattas are the
Harvard-Yale at New London, and that at Poughkeepsie, open
to all but not participated in by Harvard and Yale. By way of
exception, Harvard rowed at Poughkeepsie in 1896, and in
1897 and 1898 Cornell rowed in two regattas. In 1901 Pennsyl-
vania was just beaten by Leander Club in the race for the
Grand Challenge Cup at Henley.

The history of amateur rowing in the United States, other
than that of the colleges and universities, is a narrative of
continual struggles on the part of the authorities to distinguish
between the amateur and the non-amateur. The National
Association of Amateur Oarsmen was established in 1872.
Many regattas have been held since that date under their
rules, but the standard of amateurism which satisfied the
N.A.A.O. has never been strict enough to comply with the
requirements of the English A.R.A. or the Henley Stewards.
In 1883 a Hillsdale four from U.S.A. tendered an entry at
Henley, but it was refused by the Stewards, on the ground
that the men were not amateurs according to the English
definition. In 1887 a crew from the United States was entered
for the Diamond Sculls, and in 1897 they were won by
In 1898 Ten-Eyck’s entry was refused by the Henley Stewards.
No little resentment has been caused in America by the re-
luctance of the English authorities to accept American entries,
but their justification lies in the essential difference, not only
in letter but in spirit, between the laws and customs of the
two countries with regard to the amateur status and amateur
sport. In 1904 a crew of the Vesper B.C. of Philadelphia were
duly vouched by the N.A.A.O. and their entry accepted by
the Henley Stewards. They competed and were beaten, and it
afterwards became known that not only had several of the
men made money out of the trip, but that two or three of the
oarsmen were not qualified to row at Henley. It also appeared
that certain members of the N.A.A.O. had, to say the least of
it, been extremely careless in giving assurances as to the
status of the Vesper crew, and all relations between the N.A.A.O.
and the Henley Stewards were abruptly terminated, the Stewards
determining that they would not accept foreign entries except
from a country where there was a governing body which had
control of amateur rowing and which had an agreement with
the Stewards by which they definitely pledged themselves not
to send competitors to Henley unless they came within the
English definition. In 1906 Harvard challenged Cambidge.
The race, which attracted an immense concourse of spectators,
was rowed from Putney to Mortlake in September. Cambridge
led from the start and won by three lengths.

Rowing in other Countries.—During the latter years of the
19th century and during the early years of the present century,
rowing increased very greatly in popularity as a branch of
athletic sport in every quarter of the globe. It would be
impossible here to describe the history or organization of boat
clubs and regattas in Australia, in Canada, in the various
countries of Europe. Canadian rowing has always been of a
high class. In 1901 L. Scholes, a Canadian sculler, won the
Diamond Sculls at Henley, and on several occasions Canadian
eights and fours have competed for the Grand Challenge and
Stewards Challenge Cups at Henley. In Australia they have a
regatta which is called the “Australian Henley,” and an
inter-university contest for a cup presented by Oxford and
Cambridge oarsmen. In Europe international championships
have been instituted in the hope of bringing together oarsmen
and scullers from all countries. The Belgian oarsmen have by
their Henley successes achieved the greatest distinction among
continental oarsmen. In Holland the principal rowing clubs
have their headquarters at Amsterdam, and several Dutch
crews have been seen at Henley. In France there are in-
numerable rowing clubs which are now governed by the Fédéra-
tion française, a body which has a strict code of rules, but
which has not adopted quite so strict an amateur definition
as that of the English A.R.A. In Germany, also, rowing is
very extensively practised under the auspices of the Deutsche
Ruderverband; the chief contests between English and German
crews of recent years were at the Cork Regatta of 1902 when
Leander Club defeated the Berlin Club in the eight-oared race,
and at the Henley Regatta of 1907, when a four of the Lud-
wigshafener Club were defeated in a heat of the Stewards Cup
by a Leander crew.

Methods and Style.—The English style is the only one in which
the oarsman swings his body to the full extent fore and aft, at
the same time making use of his sliding seat. Most of the foreign
crews who have competed in England have sacrificed a portion
of their swing in order to enable them, as they believe, to
make better use of their leg work. There can be no doubt
that the English style is in a sense more exhausting to the
oarsman, that is to say it enables him to bring more muscle
into play and to make full use of his weight and strength,
but in spite of recent defeats it is still believed by English
oarsmen to be the most effective. The crews of 1906 and 1907
which were defeated by the Belgians were the best that England
could at the time produce, but they undoubtedly rowed in a
style which was in many respects far from ideal English rowing.

The secret of good rowing is the simultaneous application of
leg and body work from end to end of the stroke. The instant
the blades are covered the whole weight must be lifted from
the stretcher and applied to the oar-handle, and must remain
so applied until the hands come in to the chest. In order to
ensure that the pressure so applied to the blade shall be as
long and as hard as possible, the body must be swung for-
ward to its full extent, and during the stroke the shoulders
must always be swinging back faster than the seat, while at
the same time the legs are driving hard at the stretcher. The
slide and swing should be finished simultaneously. There
are many subsidiary rules of style as to the movements of the
hands and arms, but they are all of secondary importance and
are devised so as to enable the average man to execute the
working portion of the stroke effectively and often, without
undue exertion to himself. The movements of a crew must be
as nearly as possible simultaneous in every particular. There
have been many instances of crews which although inferior in
style and strength to their opponents have been victorious owing
to being “better together.”

(C. M. P.)

ROWLAND, HENRY AUGUSTUS (1848-1901), American
physicist, was born at Honesdale, Pennsylvania, on the 27th
of November 1848. From an early age he exhibited marked
scientific tastes and spent all his spare time in electrical and
chemical experiments. At the Rensselaer Polytechnic Institute
at Troy, N.Y. he graduated in 1870, and he then obtained an engage-
ment on the Western New York railway. But the work there
was not to his liking, and after a short time he gave it up for
an instructorship in natural science at the university of Wooster,
Ohio, which in turn he resigned in order to return to Troy as
assistant professor of physics. Finally, in 1876, he became
the first occupant of the chair of physics at the Johns Hopkins
University, Baltimore, a position which he retained until his
premature death on the 16th of April 1901. Rowland was
one of the most brilliant men of science that America has pro-
duced, and it is curious that at first his merits were not
perceived in his own country. In America he was unable even
to secure the publication of certain of his scientific papers; but
Clerk Maxwell at once saw their excellence, and had them
printed in the Philosophical Magazine. When the managers
of the Johns Hopkins University asked advice in Europe as to
whom they should make their professor of physics, he was
pointed out in all quarters as the best man for the post. In
the interval between his election and the assumption of his
