SCURVY (Scorbutus), a constitutional disease, characterized by debility, morbid conditions of the blood, spongy gums, impairment of the nutritive functions, and the occurrence of haemorrhagic extravasations in the tissues of the body. In former times this disease was extremely common among sailors, and gave rise to a frightful amount of mortality. It is now, however, of rare occurrence at sea, the simple means of prevention being well understood. Scurvy has also frequently broken out among soldiers on campaign, in beleaguered cities, as well as among civilians in some cities of the United States and in New York and London (pub. by Archæological Institute, 1866), p. 159 seq.; G. G. Scott, Gleanings from Westminster (London, 1862); W. Bell Scott, British School of Sculpture (London, 1873); W. M. Rossetti, "British Sculpture," in Fraser's Mag. (April 1860). The subject of recent British literature has been curiously neglected, except in newspaper notices and occasional articles in the periodical press, such as Edmund Gosse's "Living English Sculptors" in the Century Magazine for July 1883. The only volume published is M. H. Spielmann's British Sculpture and Sculptors of To-day (London, 1901).

For American sculpture, see Henry T. Tuckerman, Book of the Artists: American Art in Life (New York, 1878); William J. Clark, Jr., Great American Sculptures (Philadelphia, 1877); Charles H. Caffin, American Masters of Sculpture (New York, 1902); Sadakichi Hartmann, Modern American Sculpture (New York).

Caffin, American Masters of Sculpture (New York, 1902); Sadakichi Hartmann, Modern American Sculpture (New York).
that scutage was first introduced in 1156 or on the occasion of Henry II.'s expedition against Toulouse in 1159; but it is now recognized that the institution existed already under Henry I. and Stephen, when it occurred as scutageum, scutagium or escuage. Its introduction was probably hastened by the creation of fractions of knights' fees, the holders of which could only discharge their obligation in this fashion. The increasing use of mercenaries in the 13th century would also make a money payment of greater use to the crown. Levies of scutage were distinguished by the names of the districts for which they were raised, as "the scutage of Toulouse" (or "great scutage"), "the scutage of Ireland" and so forth. The amount demanded from the fee was a marc (138.4 d.), a pound or two marks, but anything between these was deemed abnormal. Under Henry I.'s reign, when levies of two marks were made in most years without even the excuse of a war. The irritation caused by these exacts reached a climax in 1214, when three marks were demanded, and this was prominent among the causes that led the barons to insist on the Great Charter (1215). By its provisions the crown was prohibited from levying any scutage save by "the common counsel of our realm." In the reissue of the Charter in 1227 it was provided, instead of this, that scutages should be levied as they had been under Henry II. In practice, however, under Henry III. scutage was usually levied in twos, but the assessment of the barons was deemed realistic, and they were only levied on adequate occasions.

Meanwhile, a practice had arisen, possibly as early as Richard I.'s reign, of accepting from great barons special "fines" for permission not to serve in a campaign. This practice appears to have been based on the crown's right to decide whether personal service should be exacted or scutage accepted in lieu of it. A system of special composition thus arose which largely replaced the old one of scutage. As between the tenants-in-chief and villeins, and between holders of the fief and tenants of the fief, the amount of scutage continued and was often stereotyped by the terms of charters of subinfeudation, which specified the quota of scutage due rather than the proportion of a knight's fee granted. For the purpose of recouping themselves by levying from their under-tenants the tenant-in-chief received from the crown writs de scutaggio habendo. Under Edward I. the new system was so completely developed that the six levies of the reign, each as high as two pounds on the fee, applied only in practice to the under-tenants, their lords compounding with the crown by the payment of large sums, though their nominal assessment sometimes continued. The form of the writs was Scutage and Marshals' (Knutgur Service). Scutage was rapidly becoming obsolescent as a source of revenue, Edward II. and Edward III. only imposing one levy each and relying on other modes of taxation, more uniform and direct. Its rapid decay was also hastened by the lengths to which subinfeudation had been carried, which led to constant dispute and litigation as to which of the holders in the descending chain of tenure was liable for the payment. Apart from its financial aspect it had possessed a legal importance as the test, according to Bracton, of tenure by knight-service, its payment, on however small a scale, proving the tenure to be "military" as with all the consequences involved.

The best monograph on the subject (though not wholly free from error) is J. F. Baldwin's *The Scutage and Knight Service in England* (1897), a dissertation printed at the University of Chicago Press. Madox's *History of the Exchequer* was the standard authority formerly, and is still of use. The view now held was first set forth by J. H. Round in *Feudal England* (1895). In 1896 appeared the *Red Book of the Exchequer* (Rolls series), which, with the *Testa de Nevill* (Record Commission), and the *Pipe Roll* (published by the Record Commission and the Pipe Roll Society), is the chief record authority on the subject; but many of the scutages are wrongly dated by the editor, which conclusions have been severely criticized by J. H. Round in his *Studies on the Red Book of the Exchequer* (privately printed, 1906), and his *Commune of London and other Studies* (1899). Pollock and Maitland's *History of English Law* (1895) should be consulted.

**SCUTARI** (Turkish, Uşkudar, anc. Chrysopolis), a town of Turkey in Asia, on the E. shore of the Bosporus, opposite Constantinople of which it forms the 9th Cercle Municipale. Its painted wooden houses and white minarets piled upon the slopes of the shore and backed by the cypresses of the great cemetery farther inland present a very picturesque appearance from the sea. The town contains eight mosques, one of them, the Valideh Jami, built in 1547, of considerable beauty. Other remarkable buildings are the vast barracks of Selim III. and a hospital used during the Crimean War (see NIGHTINGALE, FLORENCE). The chief industry of Scutari is the manufacture of silk, muslin and cotton stuffs. The population is estimated at 105,500, of which two-thirds are Mahommedan. The most striking feature of Scutari is its immense cemetery, the largest and most beautiful of all the cemeteries in and around Constantinople; it extends through an area of nearly 300 acres. Between Scutari and Haidar Pasha the English army lay camped during the Crimean War, and in a cemetery on the Bosphorus are buried the 8000 English who died in hospital. At Haidar Pasha is the terminus of the Angora, Konia and Smyrna railways. Chrysopolis ("Golden City"), the ancient name of Scutari, most probably has reference to the fact that there the Persian tribute was collected, as at a later date the Athenians levied there a tenth on the ships passing from the Euxine. Scutari was formerly the post station for Asiatic troops in the Bosphorous (a platoon of cavalry, as guards). As also down to the introduction of steam the terminus of the caravan routes from Syria and Asia.

**SCUTARI** (anc. Scodra, Slav. Skadar, Albanian Shkodër, or with the definite article Shkodër), the capital of the vilayet of Scutari and principal city of Albania, European Turkey; on the south-eastern shore of Lake Scutari, near the confluence of the Drin and Boyana rivers, and 14 m. inland from the Adriatic Sea. Pop. (1905) about 32,000. The plain in which Scutari is built extends southwards to Alessio and northwards to the Montenegrin frontier. It is enclosed by lofty mountains on every side except where it adjoins the lake. It is very liable to be flooded, and this liability was greatly increased towards the close of the 19th century by the deflection of the Drin and its junction with the Boyana. Its bazars and mosques give Scutari an oriental appearance, but the finest of its buildings are Italian—an old Venetian citadel on a high crag, and a Roman Catholic cathedral. The city is the seat of a Roman Catholic archbishop and a Jesuit college and seminary, which are subsidized by the Austrian government. The trade of Scutari extends to the Balkan ports and to the Adriatic, and has been very greatly augmented by the extension of the railway connection with Boyana and also by the opening of the line to Skadar (a postal and commercial link), as also down to the introduction of steam the terminus of the caravan routes from Syria and Asia.

**SCUTARI**

Livy relates that Scodra was chosen as capital by the Illyrian king Gentius, who was here besieged in 168 B.C. and carried captive to Rome. In the 7th century Scutari fell into the hands of the Servians, from whom it was wrested by the Venetians, and finally, in 1479, the Turks acquired it by treaty.

**LAKE SCUTARI** is almost bisected by the line of the Montenegrin frontier. It occupies one of the depressions, known as poljes, which are common throughout the Illyrian Karst region. It generally forms part of the estuary of the river Moratcha, and by a long, narrow inlet which stretches towards the North is connected with the sea. The depth of the lake is usually less than 10 ft., but a series of soundings taken in 1901 by Dr Jovan Cvijic revealed the existence of a series of deep holes south-west of the lake, one of which attained a depth of 144 ft. The surface is 20 ft. above sea-level. The principal affluent of Lake Scutari is the Moratcha, which enters it, after forming two small lakes, near the Montenegrin port of Valvatiza. It is drained by the Boyana, which issues from its south-eastern extremity and flows to the Adriatic. Lake Scutari abounds in aquatic birds and fish; its brilliantly clear water, its archipelago
of wooded islets, and its setting of rugged mountains, some of which are covered with snow during the greater part of the year, render it one of the most beautiful lakes in Europe.

SCUTTLE, a term formerly applied to a broad flat dish or platter; it represents the O. Eng. scutel, cognate with Ger. Schlüssel, dish, derived from Lat. scutella, a square salver or tray, dim. of scutum, a platter, probably allied to scutum, the large oblong shield, as distinguished from the clupeus, the small round shield.

In the Romance languages the term scuttle was adapted to the coal-scuttle, styled "purdonium" in English auctioneers' catalogues. The assumption was made that this piece was conceived of as a maiden above, with dogs or wolves' heads growing out of her body, and the tail of a fish.

Another Scylla, confounded by Virgil (Ecl. vi. 74) with the sea-monster, was a daughter of Nysus (q.v.), king of Megara.

See O. Waser, Skylla und Charybdis in der Literatur und Kunst der Griechen und Römer (1894); and D. Jobst, Skylla und Charybdis (Würzburg, 1902), who endeavours to show that the Homeric description really referred, as the ancients assumed, to the Sicilian straits.

SCYMNUS of Chios, the name assigned to a Greek geographer of uncertain date, commonly taken to be the author of a fragmentary anonymous Paraphrasis in verse describing the northern coasts of the Mediterranean and the shores of the Black Sea, a work which, in the first edition (Augsburg, 1660) was ascribed to Marcianus of Heraclea. Meinke's edition (Berlin, 1846) and later classical authorities have shown that this piece cannot be by Scymnus. It is dedicated to a King Nicomedes, probably Nicomedes III. of Bithynia (91-76 B.C.), and so would date from the beginning of the 1st century B.C. Its most valuable portions relate to the Euxine regions and to the Hellenic colonies of those shores as well as of the coasts of Gaul, Italy, and Spain.

See Meinke's edition (Berlin, 1846; C. Müller, Geographi Graeci minores, vol. i., where the poem is edited with sufficient prolegomena, pp. lxxix.-lxviii.); E. H. Bunbury, Ancient Geography, i. 99, 100, 102, 128, 183; ii. 26, 69-74.

SCYMMODEUSAE or ACALYPHAE, one of the two subdivisions of the Hydrozoa (q.v.), the other being the Hydroidea (q.v.). The subclass Scyphomedusae contains a number of animals which in the adult condition are medusae or jellyfishes (see MEDUSA), exclusively marine in habitat and found in all seas. They are chiefly pelagic organisms, floating at or near the surface of the water, but occur also at great depths, and are sometimes fixed and sessile in habit. Many species attain a large size and by their brilliant coloration are very conspicuous objects to the mariner or traveller. In spite of the soft nature of their bodies, a number of Scyphomedusae have been found fossil; see especially Maas (g and 12).

A scyphomedusa is distinguished from a hydrozoan medusa chiefly by the following points. The umbrella has a lobed, indented margin, a character only seen amongst Hydrozoidea in the Scyphomedusae, and it is without the characteristic veil of the Hydrozoa; hence the Scyphomedusae are sometimes termed Hydrozoa Acraspeda. The sense-organs are always concealed by flaps of the umbrellar margin (hence "Stegonophthalmata"), and are always tentaculocysts, that is to say, reduced and modified tentacles, which bear usually both ocelli and otocysts, and are hollow. The gonads are formed in the endoderm (hence "Entocarpaea"), and the generative products are shed into the gastric cavity and pass to the exterior by way of the mouth. The development from the egg may be direct, or may take place with an alternation of generations (metagenesis), in which a non-sexual individual, the so-called scyphistoma or scyphopolyp, produces by budding the sexual medusae.

Morphology of the Scyphomedusa.—As already stated, a medusa of this order may be free-swimming or sessile in habit. Intermediate between these two types are species which have the power of temporal fixation by the exumbral surface. Such forms when undisturbed fix themselves to the bottom and rest with their mouths and tentacles uppermost. If disturbed they swim about like other medusae until a favourable opportunity presents itself for resuming the sedentary habit. A well-known example of a permanently sessile form is Lucernaria, common on the Atlantic coasts of Europe, in Zostera beds, attached to the weed. It resembles in general appearance a polypl, lacking even the characteristic medusan sense-organs, which are present,
The mouth may be a simple structure at the extremity of the manubrium, or may be four-cornered, with the corners drawn out into so-called oral arms, each of which bears on the inner side a groove continuing the angle of the mouth (fig. 2a). In some genera the oral arms are of great length, and in the suborder Rhizostomeae they usually form a concrescence (fig. 2b, c), in such a way that the mouth becomes nearly obliterated, and is reduced to a system of fine canals opening to the exterior by small pores.

The mouth leads into the spacious stomach, which is typically four lobed (fig. 2b, e). On the floor of the stomach are borne the conspicuous gonads (ov), and also tentacle-like processes termed gastric filaments or phacellae, projecting into the cavity of the stomach. The gonads are of the endoderm containing generative cells, and are primitively four in number, situated interradially, but each gonad may be divided into two by the partition which separates the adjacent lobes of the stomach, that is to say, by one of the areas of concrescence between exumbral and subumbral endoderm, whence arises a condition with eight gonads which is by no means uncommon. As a rule these medusae are of separate sexes, but hermaphroditic forms are known, for example, the conspicuous British (east-Atlantic) medusa Chrysaora (fig. 3, b).

Immediately below each gonad the subumbrelal ectoderm is pushed in, as it were, to form a pit or deep cavity (fig. 2a)

x, y) opening by a wide aperture (GP). These cavities are known as the subumbral or subgenital cavities. They serve probably for the aeration of the gonads by admitting to their vicinity water with its dissolved oxygen; they never serve as genital ducts, since the generative products are always dehisced into the stomach and pass out by the mouth. In some genera, for instance, Cyanea and its allies the gonad as a whole protrudes through the subgenital cavity as if it had undergone a hernia, and hangs down in the subumbrelal space as if suspended by a mesentery (fig. 15). Usually the four subgenital cavities are distinct from each other (so-called tetrademmic condition), but in many Rhizostomeae, for example, Craspedoa, the subgenital cavities join together under the subumbrelal floor of the stomach (so-called monodemmic condition) and coalesce to form a so-called subgenital portico placed on the oral side of the stomach, opening by four interradial apertures between the oral arms, that is to say, by the four primitive apertures of the subgenital pits. In Nausithoe subgenital pits are absent altogether, and the same condition may be found in Charybdea.

o, Ovaries. The gastric filaments near to these are not drawn.  

off branches, and both stem and branches ending in the eight tentaculocysts, which are lodged in the notches between the lobes of the umbrellar margin. The adradial canals are unbranched and run to the middle point of one of the marginal lobes. The system of canals shows great variation even in the same species.

The muscular system of the Scyphomedusae is developed on the subumbonal surface as a system of circularly disposed fibres which by their contraction make the umbrella more concave and diminish its

cavity. The circular muscles usually form two chief portions, a peripheral wreath-muscle (Kranzmuskel), subdivided into four, eight or sixteen areas, and an oral ring-muscle round the mouth. The radial muscles are found in the phacellae, and in such forms as Lucernaria, longitudinal (vertical) muscular tracts or bands are found in the taeniodae, which, according to some authorities, are of endodermal origin, but which, according to recent observations, are formed in the walls of the infundibular cavities, and are therefore of ectodermal origin.

The nervous system consists as in Hydrodela of a diffuse plexus beneath the ectoderm, concentrated in certain places to form a central nervous system. In these medusae, however, the central nervous system does not form continuous rings, but occurs as four or eight separate concentrations at the margin of the umbrella, centred each round one of the sense-organs (tentaculocysts). Each nerve-centre controls its own antimere or segment of the body, receiving sensory impressions from the tentaculocysts and inverting its special subdivision of the muscular system. The separate nerve-centres are placed in communication only by the general nerve-plexus, but in Charybdea there is a zigzag marginal nerve connecting them up. The sense-organs of the Scyphomedusae are on the whole of a very uniform type. They are always tentaculocysts, as already stated, and they always have a hollow axis, unlike the tentaculocysts of Hydrodela, in which group these organs, when they do occur (as in Trachy- 
linea) are always solid. Two types of tentaculocyst must be distinguished, the former occurring only in the order Stauron- 
edusae, the other in all orders of the group. The second and commoner type is known as a rpohalium (fig. 6) and consists of a short hollow rod, the wall of which is composed of the two body layers, ectoderm and endoderm, enclosing a cavity continuous with that of the gas- 

trovascular system. At the apex of the rhopalium the endoderm is greatly thickened and cons- 
sists of concentric cells secreting ooliths (Ccm). The more proximal portion of the rhopalium usually bears one or more ocelli (oc). The rhopalia are lodged in the notches be- 

tween the marginal lobes of the umbrella, and each rhopalium is covered over by a little protecting flap or lappet. On the external (i.e. exumbrella) surface of the lappet there is usually a patch of sensory ciliated epithelium regarded as olfactory in function and termed the olfactory pit (fig. 6, 4). Each rhopalium is a centre round which, as already stated, nervous tissue is concentrated.

In Aurelia there are found numerous ooliths arranged irregularly. In Charyb- 

dea (fig. 7, o) the ooliths are larger but fewer in number and have a definite arrangement. In Nautilia a single large oolith is found.

Ve, Velarium.  
Fr, Frenum of the velarium.  
TCa, Tentaculocyst.
The ocelli vary greatly both as regards number and complexity of structure. In some genera they are absent, as, for instance, in *Pelagia*, *Cyanea* and *Rhistesena*. In * Aurelia* there are two on each rhopalium, a simple ocellus on the exumbral side, and a capped ocellus on the subumbral side (not present in young individuals). In *Charybdaea* there are no less than six ocelli on each of the four rhopalia (fig. 7); on the exumbral aspect there are two median ocelli (oc², oc³), a distal and a proximal, each of them a vesiculate ocellus with a lens, and on the sides of the rhopalium are two pairs of ocelli without lenses (oc¹); sometimes also an exceptional seventh ocellus occurs, a pit-like structure without a lens, either between the two median ocelli, or placed asymmetrically near the median proximal ocellus.

Ectodermal pigment (ocells). The drawing represents a section, taken in a radial vertical plane so as to pass through the long axis of the tentaculocyst.

---

The interior of which the pigment-cells secrete a gelatinous substance forming a rudimentary vitreous body. As a further advance, the pit becomes widened out into a cup, as in the lateral ocelli of *Charybdaea*. The acomplaining stage of evolution is seen in the median ocelli of *Charybdaea* (fig. 8); the primitively open cup has now closed over to form a vesicle lying beneath the ectoderm; the outer wall of the vesicle becomes thickened to form a cellular lens (l), while the proximal wall consists of sensory and pigmented cells and forms a retina. In this way the ocellus becomes a true eye, very similar in plan to the eyes of *Gastropods* and other molluscs. The ectoderm continued over the optic vesicle forms a transparent cornea (fig. 8, c) (better perhaps termed a conjunctiva), below which the spherical lens projects into the optic vesicle, imbedded in the vitreous humour (v.b) which fills it; the retina (r) consists of visual cells with long cones (fig. 9) alternating with pigment-cells. The high development of the eyes of *Charybdaea* is very remarkable, and so of their close resemblance to the eyes found in other groups of the animal kingdom, with which they have no genetic relation. Highly developed eyes, with ectodermal pigment and lens, are found also on the rhopalia of *Paraphyllia* (Mats [2]).

The subumbrellar ocellus of *Aurelia* is found to be of the inverted type, with the visual cones turned away from the light, as in *Tiaraopsis* amongst Hydromedusae, and here also the pigment is furnished by the endoderm, forming a typical ocellus, which the ectodermal visual cells project (Schewiakoff [1]).

In the Stauromedusae tentaculocysts are either absent altogether, as in *Lucernaria*, or represented by peculiar structures termed "colletocystophores" or "marginal anchors" (fig. 1, IV). Each such body has a basal hollow portion (en) surrounded by a glandular cushion (kl), from the centre of which projects a small, solid, club-shaped process or tentacle (t). The basal portion bears an ocellus (oc) of simple structure. The distal club corresponds to the crystal-sac of an ordinary rhopalium, but bears a battery of nematocysts in place of the true ocelli. These organs are said to be used for purposes of adhesion, for fixing a cup-like holdfast which the animal sinks into the substrate of sand or mud. These organs have the function of sense organs.

The histological structure of the ocelli, \( \text{o}_1 \), \( \text{o}_2 \), Distal and proximal median of the Scyphomedusae is in the main similar to that of \( \text{o}_1 \), Lateral ocelli. The Hydromedusae, see the mesogloea is more abundantly developed in the free-swimming forms, and contains special mesogloeaal corpuscles, derived by inheritance from the ectoderm, and generally occurring in the form of stellate or bipolar cells.

*Development of the Scyphomedusae.—* No adult Scyphomedusae are known to reproduce themselves by budding or by any method other than the sexual one. The course of the development in this group is best made clear by taking as a type *Aurelia*, which, together with certain other common genera, such as *Chrysaoa* and *Cotylorhiza*, has been studied in detail. Unfortunately the statements concerning some points are very contradictory.

**Fig. 7.**—Tentaculocyst of *Charybdea*.  
**Fig. 8.**—Vertical section of the Median Distal Ocellus (\( \text{o}_3 \)) of the preceding figure of *Charybdea*.  
**Fig. 9.**—Nerve supply of the Tentaculocyst.
The ovum undergoes total cleavage, giving rise to a bластula which forms a gastrula (fig. 10, A) by invagination (see article HYDROZOA). This is a type of germ-layer formation never found in the Hydrozoa, though of universal occurrence in all groups of animals is about the Coelentera. We may regard it as a form of uninodal invagination in which the immigrating cells pass into the interior in a connected epithelial layer, instead of going in singly and independently. The embryo is set free as a planula larva (fig. 10, B) in the gastrula stage, and the orifice of invagination is blastopore, which persists, at the hinder pole. After a time the planula fixes itself by the anterior pole, with the blastopore uppermost. The larva after fixation changes into a polyplacoid organism termed a scyphistoma or scyphophy (fig. 10, C, D). The body becomes in shape like a vase or urn attached by a narrow stalk, round which a free collar is secreted. The edges of the vase the four primary tentacles grow out, each a slender filament with a solid endodermal axis. The tentacles border a broad, flattened peristome, from the centre of which arises the hypostome with the mouth at its extremity; the hypostome is at first low, but soon becomes high and prominent like a tube. This has been sought to prove that the interior of the hypostome is lined by ectoderm, so as to form a stomodeum or ectodermal oesophagus similar to that of the Anthozoa, but this has been disproved by the most recent investigations of Hein (4) and Friedemann (5), who have shown that the mouth at the extremity of the hypostome represents the persistent blastopore of the gastrula stage. 

The internal gastric cavity of the scyphistoma is not a simple space as in the hydrophysol, but is subdivided by four ridges or taeniola, arising one in each interradius (fig. 11, B). Each taeniola is similar in its anatomical relations to the similarly named structures in the Hydrozoa, and becomes perforated in the same way at its outer side by a "septal ostium," forming as it were the rudiment of a ring-canal. Each taeniola bears a strongly developed longitudinal muscle-band, stated by Claus and Chun to be developed from the endoderm, like the reticulum muscles of the anthophysol, but by other investigators it is affirmed that this reticulum muscle of the scyphistoma arises from the lining of a funnel-shaped ectodermal ingrowth ("Septaltrichter") growing down from the peristome inside each taeniola, in a manner similar to the infundibular cavities of Lucernaria, which in their turn are homologous with the subintestinal cavities of other Scyphomedusae. It is asserted, however, by Friedemann (5), a recent investigator of the subject, that the infundibular cavities appear late in the scyphistoma and have nothing either to the septal muscles or to the subintestinal cavities of other Scyphomedusae. It is so formed that the peristome may become a projecting, chimney-like tube. The mouth, the hypostome and the subintestinal cavities are attached to the peristome and extend downwards as a tube with orifice at its upper end and broad base at its lower end. The subintestinal cavities remain in this position until the animal reaches the medusa stage, when they undergo a transformation and become the gonads. 

The scyphistoma with four pericentral tentacles and horny basal perisarc. 

The oral surface of the scyphistoma of Aurelia, with commencement of four interradial tentacles. 

The four gastric interradial ridges are seen through the mouth. 

The first constriction of the Aurelia scyphistoma to form the pile of ephyrae or young medusa. The single ephyra carries the sixteen scyphistoma tentacles, which will atrophy and disappear. The four longitudinal gastric ridges are seen by transparency.

The four primary interradial cathammatas disappear in the fully formed ephyra and become replaced by sixteen subradial concrescence-areas without any ostia or ring-canal at the margin. 

1 The four primitive interradial cathammatas disappear in the fully formed ephyra and become replaced by sixteen subradial concrescence-areas without any ostia or ring-canal at the margin.
SCYPHOMEDUSAE

ephyra grows in size it gradually takes on the form and structure of the young medusa. The adradial regions grow (fig. 11, F) so as to change the star-like contour into one more evenly circular, the tentacles grow out and the various parts become complicated and take on the structure of the adult medusa.

The course of development sketched out above is that which is typical of the higher forms of Scyphomedusae, and is by no means to be regarded as the most primitive type of development. The complicated alternation of generations seen in such a form as Aurelia does not occur in the more primitive genera. Thus in Pelagia the scyphistoma-stage is free-swimming and changes directly into the ephyra, which in its turn grows into the adult form. On the other hand, such a form as Lucernaria or Halicyclis may be regarded simply as a scyphistoma which has become adult and mature.

The comparison of the metagenetic type of development, such as that of Aurelia, with the more primitive genera of Scyphomedusae, indicates clearly that the scyphistoma and ephyra are re-capitulative larval stages which are represented by the adult forms of the conclusive organ, making such allowances as are necessary when comparing adult and larval forms. The metagenesis has arisen through the scyphistoma-larva acquiring the power of larval proliferation by budding. A similar origin for metagenesis has been discussed under the Hydromedusae (q.v.).

The above comparison further indicates that the scyphistoma should not be regarded as a polyp, but rather as a medusoid organism. The only certain criterion of a medusa-individual is the presence of definite sense-organs, but in cases where the organism is much reduced, this criterion may fail us, as it does in the genus Lucernaria. Nevertheless a comparison between Lucernaria and its close ally Halicyclus shows clearly that the absence of sense-organs in the former is the result of secondary reduction, so that a true medusa, may lose its most characteristic feature. Hence the absence of sense-organs in the scyphistoma does not necessarily disprove its medusoid character, while its anatomical structure resembles that of a simple scyphomedusa, such as Lucernaria, rather than that of a polyp.

Affinities of the Scyphomedusae.—By some authorities the Scyphomedusae have been removed from the Hydrozoa and united with the Anthozoa in a common group termed Scyphozoa. The diagnostic features of the class Scyphozoa thus constituted are supposed to be (1) an ectodermal oesophagus or stomoaema, (2) a gastrica cavity subdivided by mesenteries, (3) gonads formed in the endoderm. It appears, however, that the first of these characters is non-existent, and that the so-called mesenteries are simply the concrescence-areas found in all medusae. There remains only the third feature, the endodermal gonads, as an argument for uniting the Scyphomedusae with the Anthozoa, against which must be set all the peculiarities of medusan organization in which the Scyphomedusae resemble the Hydrozoa. The fact that the Scyphomedusae have a number of well-marked peculiarities of form and structure is not incompatible with placing them in the Hydrozoa as a distinct sub-class, contrasting sharply in many ways with the Hydrozoa.

Classification of the Scyphomedusae

Order I. Cubomedusae or Charybdeidae.—Medusae more or less cubical in form, with four perradial rhopalia alternating with four interradial tentacles or groups of tentacles; oral arms short; stomach a wide cavity bearing four interradial groups of phacellae and giving off four broad perradial pouches completely separated from each other by four interradial septa (i.e. ring-canals absent); gonads divided each into two by the septa, hence eight in number; sub-oral pits small or absent.

This order stands very much apart from the other orders of the Scyphomedusae. It has been proposed by Maas to divide the first entire subclass Acraspeda into A, Charybdeidae and B, Acraspeda typica. The Charybdeidae comprise three families:

1. Charybdeidae.—With four interradial tentacles. Charybdea morsupialis (fig. 4) is a familiar Mediterranean medusa; the wonder-ful development of the ciliature organs in this genus has already been described (figs. 7-9). The species of Charybdea are stated to be quick and active in their movements and to be voracious feeders.

2. Chirodroidae.—With four interradial groups of tentacles. Chirodrysus.

3. Tripedaliidae.—With four interradial groups of tentacles, three in each group. Tripedalia.

Order II. Stauromedusae or Lucernariidae.—Medusae of deep pyramidal form, often sessile, attached by a stalk developed from the oral disk; the endodermal surface; rhopalia absent or represented by colletocystophores. Four families:

1. Lucernariidae.—Sessile, stalked, with capitellate tentacles arranged in groups on eight projecting marginal lobes. Eight gonads. Lucernaria, without, and Halicyclus (fig. 1) with colletocystophores, two well-known genera.

2. Tesseridae.—Free, with eight or more tentacles, without tentaculocytes. Tesseria, &c.

3. Paraptylidae.—Sessile, stalked, with eight shallow marginal lobes bearing one or more rows of tentacles; without tentaculocytes; with four gonads. Depastrum is a British genus.

4. Stenocyphidae.—Sessile, with the margin undivided; with eight colletocystophores and eight adradial groups of capitellate tentacles. Stenocyphinus inaba, from Japan.

Order III. Coronata.—Free medusae with rhopalia of the normal type; the umbrellae is divided by a circular, so-called coronal groove, into two parts, a central portion, which is conical, thimble-shaped, or domed in form, and a peripheral portion, the pedal zone, which bears the marginal lobes, tentacles and rhopalia; the pedal zone is subdivided into areas termed pedalia, from each of which arises a tentacle or rhopallum in the inter-space between two adjacent lobes of the margin. The order contains the following families:

1. Periphyllidae.—With sixteen marginal lobes, four rhopalia and twelve tentacles; the rhopalia are interradial. Periphylla (fig. 13), a widely distributed deep-sea genus.

2. Paraptylidae.—With sixteen marginal lobes, four rhopalia and twelve tentacles; the rhopalia perradial in position corresponding to the angles of the stomach. Paraptylina recent; Paraptyllidae fossil (see Maas (8 & 12)).

3. Aioellidae.—With twelve marginal lobes, six rhopalia and six tentacles. Aioella.

4. Pteropidae.—With eight marginal lobes, four rhopalia and four tentacles. Pteropida. Linergidae (Aioellidae).—With sixteen or thirty-two rhopalia, marginal lobes and tentacles often very numerous. Aiolida (fig. 14) is a well-known deep-sea genus.

5. Ephyreopidae.—With sixteen marginal lobes, eight rhopalia and eight tentacles. Nausifera, a small medusa of world-wide distribution, the type of the subfamily Nausioidae; the subfamily Linergidae includes the genera Linerges, &c., medusae confined to tropical seas. By Maas and others the Nausioidae and Linergidae are ranked as independent families.

Order IV. Discophora.—Medusae with umbrella flattened or disk-like, without coronal groove; lips always prolonged into long oral arms. The most prolific and dominant group of the Scyphomedusae, containing two suborders; the Semaeostomeae, in which the oral arms remain separate, and the Rhizostomeae, in
which the oral arms become fused together to form a proboscis. Nine families, three of Semaeostomeae, six of Rhizostomeae:—

1. Pelagiidae.—Semaeeostomeae with wide gastric pouches not united by a ring-canal. Pelagia, an oceanic genus with direct development. Chrysaora (fig. 36), a common British medusa, with a scyphistoma stage and alternation of generations, Dactyloaetra, a common American medusa of the Atlantic shores, differs from Chrysaora in small points.

2. Cyaneidae.—Semaeeostomeae with sixteen gastric pouches sending off canals to the margin not united by a ring-canal; tentacles in branches on the margin. Cyanea (fig. 15), represented in the British fauna by two species.

3. Ulmaridae.—Semaeeostomeae with gastric pouches relatively small, sending off branching canals to the margin, where they are united by a ring-canal. Ulmaris, from the South Atlantic, has only eight adradial tentacles. Aurelia (fig. 2), with numerous marginal tentacles, is one of the commonest and most familiar of jelly-fishes.

4. Cassiopeidae.—Rhizostomeae with subumbllar musculature arranged in feather-like arcades (Arcadiumyria, Maas); oral arms pinnate. Cassiopea.

5. Cebethidae.—Rhizostomeae with subumbllar musculature in radial tracts (Radiomyria, Maas); oral arms bifid. Cephea, Cotylorhiza.

6. Rhizosomatidae (Pilemidae).—Rhizostomeae with subumbllar musculature in circular bands (Cyclomyria); oral arms bifid or very complicated; sixteen radial canals. Rhizostoma (Pilema) is a very common genus (fig. 36).

7. 8. 9. The families Lyschnorhizidae, Leptobrachidae and Catostomidae resemble the preceding in the arrangement of the musculature. In Lychenorhizidae only eight of the sixteen radial canals are much the ring-canal; the genus Crambessa is the best-known representative of the family. In the other two families there are eight radial canals, and between them a network of canals with many openings into the ring-canal.

SCYROS, a small rocky barren island in the Aegean Sea, off the coast of Thessaly, containing a town of the same name. In 469 B.C. it was conquered by the Athenians under Cimon, and it was probably about this time that the legends arose which connect it with the Attic hero Theseus, who is said to have been treacherously slain and buried there. A mythic claim was thus formed to justify the Athenian attack, and Cimon brought back the bones of Theseus to Athens in triumph. The inhabitants of Scyros, or the Athenians who conquered the island, were descendants of Pelasgians or Carians as the earliest inhabitants. There was a sanctuary of Achilles on the island, and numerous traditions connect Scyros with that hero. He was concealed, disguised as a woman, in the palace of Lycomedes, king of the island, when his mother wished to keep him back from the Trojan War; he was discovered there by Odysseus, and gladly accompanied him to Troy. An entirely different cycle of legends relate the conquest of Scyros by Achilles. The actual worship on the island of a hero or god named Achilles, and the probable kinship of its inhabitants with a Thessalian people, whose hero Achilles also was, form the historical foundation of the legends. Scyros was left, along with Lemnos and Imbros, to the Athenians by the peace of Antalcides (387 B.C.). It was taken by Philip, and continued under Macedonian rule till 196, when the Romans restored it to Athens, in whose possession it remained throughout the Roman period. It was sacked by an army of Goths, Heruli and Peucini, in A.D. 269. The ancient city was situated on a lofty rocky peak, on the north-eastern coast, where the modern town of St George now stands. A temple of Athena, the chief goddess of the island, was on the shore near the town. The island has a small stream, called in ancient times Cephissus.

SCUTHAE (Gr. Σωθά), in Herodotus (iv. 1-142) and Hippocrates (De aere, 24 sqq.), a definite nation giving its name to Scythia (q.v.); in later writers a general term for the inhabitants of that country without distinction of race.

SCYTHE, an implement for mowing grass or reaping corn or grain, consisting of a curved steel blade fastened to a long wooden handle with a slight double curve from which project two small pieces by which the handle is held. The handle is
technically known as the "anaeth, " snead " or " snead " (sneadan to cut, cf. Ger. schneiden). The word in O.E. is sice or sige M.E. sike; the mis-spelling " scythe " is paralleled by " scint " and is possibly due to the Fr. scier, saw; the word means " an instrument for cutting," and is derived from the root sok-, seen in Lat. secure, to cut, " saw " and " sickle," the oldest of reaping implements, with deep curved blade and short handle. The same root is seen in the " sedge," i.e. cutting or sword-grass, strictly applied to plants of the genus Carex, but loosely used of flags, rushes and other grasses growing in marshy places (see reading).

SCYTHIA. (Gr. Σκύθεα), originally (e.g. in Herodotus iv. 1-142), the country of the Scythaec or the country over which the nomad Scytheaems were lords, that is, the steppe from the Carpathians to the Don. With the disappearance of the Scytheaec as an ethnic and political entity, the name of Scythea gives place in its original seat to that of Sarmatia, and is artifically applied by geographers, on the one hand, to the Dobrudzha, the lesser Scythea of Strabo, where it remained in official use until Byzantine times; on the other, to the unknown regions of northern Asia, the Eastern Scythea of Strabo, the " Scythea inetr et extra Imaum " of Ploene; but throughout classical literature Scythea generally means regions in which, in our sense, we do not find nomads, but roving tribes, and a Scythian (Scythea) any barbarian coming from those parts. Herodotus (i.e.), to whom Hippocrates (De aere, &c. 24 sqq.) we owe our earliest knowledge (Homer, II. xiii. 5, speaks of " mere-milkers," and Hisiod, op. Strabo viii. 3 (7) mentions Scythea) of the land and its inhabitants, tries to restrict this merely geographical usage and to confine the word Scythe to a certain race or at any rate to that race and its subjects, but even he seems to slip back into the wider use. Hence there is much doubt as to his exact meaning.

His account of the geography falls into two irreconcilable parts; one (iv. 90 sqq.), in connexion with the tale of the invasion of Darius, makes of Scythea a kind of chessboard 4000 stades square on which the combatants can make their moves quite unhindered by the great rivers: the other (16-20), founded on what he learned from Greeks of Olbia and supplemented by the tales of the 7th century traveller Aristoc of Proconnesus, is not very far removed from first-hand information and can be made more or less to tally with the lie of the land. In accordance with this we can give the relative positions of the various tribes, and an excursus on the rivers (47-57) lets us define their actual seats. In western Scythea, starting from Olbia and going northwards, we have Cappadocia on the lower Hypanis (Bug), Alazenes where the Tyrans (Dniester) and Hypanis come near each other in their middle courses, and Arotetes (" Ploughmen ") above them. These tribes raised wheat, presumably in the river valleys, and sold it for export; in the eastern half from west to east were Georgi (perhaps the same as Arotetes) between the Ingul and the Borysthenes (Dnieper), nomad Scythea and Royal Scythea between the Borysthenes and the Tana (Don). Above all these stretched a row of non-Scythea tribes from west to east: on the Maris (Maros) in Transylvania the Agathyrsi; Neuri in Podolia and Kievi, Androphi and Melanchlaeni in Poltava, (Ryazan) and Tarnov. On the lower Don and Volga we have the Sauromatae, and on the middle course of the Volga the Budini with the great wooden town of Gelonos and its semi-Greek inhabitants. From this region started an important trade route eastward by the Thyssagetae among the southern Uralis, the Irycne on the Tobol and Irtysh to the Kirgiz steppe. west, where dwelt other Scythea, regarded as colonists of those in Europe: then by the Argippaei in the Altai and the Issedones in the Tarym basin, to the Asts, steppe on the borders of Chirmeralo, stole their gold from the watchful griffins, and who marched with goat-footed men and Hyperboreans reaching to the sea.

To the south of Scythea the Crimean mountains were inhabited by a non-Sythic race, the Tauri. (See also articles on these tribes.)

Ethnology.—Herodotus expressly divides the Scytheaems into the Agriculturists, Callipodae, Alazones, Arotetes and Georgi in the western part of the country, and the Nomads with the Royal Scythea to the east. The latter claimed dominion over all the rest. The question arises whether we are to do with the various tribes of one race in different stages of civilization, or with a mixed population called by foreigners after the ruling tribe. The latter seems by far the more probable. The affinities of this tribe have been sought in various directions, and the evidence suggests that it was itself of mixed blood. We know that in the 2nd century A.D., when the stelae were dominated by the Sarmaeae (sarmae), the majority of the barbarian names in the inscriptions of Olbia, Tana, and Panticapaeum were Iranian, and can infer that the Sarmaeae spoke an Iranian language. Perhaps the seed of their or less native shape, is shortly this. The tribe is autochthonous, claiming descent from a son of the river Borysthenes Targaros, who lived a thousand years before. Of his three sons the youngest Colaxas is preferred by an ordeal of picking up certain objects which fell from heaven,—a plough, a yoke, an axe and a cup,—and becomes the ancestor of the ruling clan of Paralatae; from the other sons, Lipoxaesi and Harpoxaesi, are descended minor clans, and the name of the whole people is Sclothi, not Scythea, which is used by the Greeks alone. In this story the names make sense in Iranian, the tribes are not again mentioned except when this passage is copied, the objects are rarely such as would be held sacred by nomads. The form of ordeal is to be paralleled in Iranian legends, and the people say themselves that they are not really Scythea. Surely this is the national legend of the agricultural Scytheaems about Olbia, and the name Sclothi, by which careful modern writers designate the Royal Scythea, is the true designation of the subject race. The royal line of these is quite distinct from the true Royal Scythea, who, like most nomad conquerors, allowed their subjects to preserve their own organizations.

The third account fails chiefly in being too plausible, but there seems no reason to reject it as an artificial combination of unconnected facts. According to it the Scythea ems dwell in Asia, and were forced by the Massagetae over the Araxes (Volga?) into the land of the Cimmeria. Aristaeas says that the first impulse came from the Arimasi, who displaced the Issedones, who in turn fell upon the Scythea. This comes to much the same thing, as the Massagetae seem to have contained an element which had come in from the land of the Issedones. The Scythea having fallen upon them from the north-east, the Cimmeria appear to have given way in two directions, towards the south-west, where the tombs of their kings were shown on the Tyrsus (Dniester) and one body joined with the Tereres of Thrace in invading Asia Minor by the Hellespont; and towards the south-east where another body threatened the Assyrians, who called them Gimuria (Hebrew Gomer; Gen. xi.). They were followed by the Scythea (Ashguzai, Heb. Ashkenaz) whom the Assyrians welcomed as allies and used against the Cimmeria, against the Medes and even against Egypt. Hence the references to the Scythea in the Hebrew prophets (Jer. iv. 3, vi. 7). This
The physical features of the Scyths are not described by Herodotus. Hippocrates (i.e.) draws a picture of them which makes them very similar to the Mongols as they appeared to the Franciscan missionaries in the 13th century. He says they are quite unlike any other race of men, and very like each other. The main point seems to be a tendency to slackness, fatness and excess of humour. The men are said to be in appearance very like eunuchs, and both sexes have a tendency to sexual indifference amounting in the men to impotence. When a man finds himself in this condition he assumes the women's dress and habits. Herodotus mentions the existence of this class, called the ἢνεγγες, as a step made to save them from the woe owing to the wrath of the goddess of Ascalon whose shrine they had plundered. Reinegg describes a similar state of things in the Nogai in the 18th century. The whole account suggests a Tatar clan in the last stage of degeneracy. Hippocrates says that this only applies to the ruling class, not to the slaves, but gives as the reason the want of exercise among the former. The skulls dug up in Scythic graves throw no light on the question, some being round and some long. The representations of nomads on objects of Greek art show people with full beards and shaggy hair, such as cannot be reconciled with Hippocrates; but the only reliefs which seem to be accurate belong to a late date when the ruling clan was Sarmatian rather than Scythian.

Custums.—Herodotus gives a good survey of the customs of the Scyths: it seems mostly to apply to the ruling race. Again the closest analogy is the state of the Manes in the 13th century, but too much weight must not be put on this, as the naturopathical conditions of steppe-ranging nomads dictated the greater part of them. Still the correspondence of religion and of funeral rites is very close. The Scyths lived upon the produce of their herds of cattle and horses, their main food being the flesh of the latter, either cooked in a cauldron or made into a kind of haggis, and the milk of mares from which they made cheese and kumiss (a fermented drink resembling butter) and sour cream. In the spring the grounds were covered with patches of fresh pasture, spending the spring and autumn upon the open steppe, the winter and summer by the rivers for the sake of moisture and enough water. If they were attacked by a tribe, the women in wagons with felt tilts. These were drawn by horses, both the men and homes of each family. Hence the Greek names, Abi, Hippomolgi, Hamaoochi. The women were kept in subjection, and were far from being regarded as equals. They married young, the day of their marriage marked, and they did not join the army; but they rode on horseback and engaged in war. Polygamy was practised, the son inheriting his father's wives. Both men and women avoided washing, but there was something of the nature of a vapour bath, with which Herodotus has confused a custom of using the smoke of hemp as a narcotic. The women daubed themselves with a kind of cosmetic paste. The dress of the men is well shown upon the Kol Oba and Chertomyk's vases, and upon other Greek works of art made for Scythic use. It must not be confused with the fanciful barbarian costumes that are so common upon the Attic pots. They wore coats confined by belts, trousers tucked into soft boots, and various kinds of head-dresses, coats, robes, tall pointed caps, and veils descending over most of the figure. Both sexes wore many stamped gold plates sewn upon their clothes in lines or bands. Their horses had severe bits, and were adorned with ornaments. The Scyths were distinguished in battle, when they were not alone. The commander honoured the warriors who had slain one or more of their enemies. As early as the 6th or 7th century, such prowess, and as a token of his right to a share of any spoil, the warrior was accustomed to scalp his enemy and adorn his bridle with it. The horseman was also the one habitually in the house of special enemy or to attack him. He would select a private or public enemy, enter into a private dispute before the king, he would make a cup of the skull, mounting it in bull's hide or in gold. The tactics in war are described in the traditional nomad tactics of harassing the enemy on the march, by raiding and in the use of the bow engaging. Their weapons consisted of bow and arrows, short swords, spears and axes. The government was a despotic, but a

king who aroused the extreme dissatisfaction of his subjects was liable to be murdered.

Religion.—The religion of the Scyths was nature worship. Herodotus (iv. 59) gives a list of their gods, but with Greek deities corresponding to all these, but we can hardly be wrong in thinking the authenticity of the list is in question. He says they chiefly reverence Tabiti (Hestia), the god of home and family. And the Nymphae of the Scyths.1 They set up no images or altars or temples save to Ares only. To Ares they make a heap of faggots three stades square, with the heaviest trees at one inclined, and bring to it a hundred and fifty fresh loads of logs every year, and hold up a sword which is the image of Ares; to this they sacrifice captives, pouring their blood over it. The account of the cult of Ares, for whom the Scythian soldiers were to be consecrated, and the mention of such masses of faggots suggests the wooded district of the agricultural Scyths, not the treeless steppe of the Royal tribes. The Scythian pantheon is not distinctive, and can be paralleled among the Tartars and among the Irmakians. The Scyths had a method of divination with sticks, and the Enarces, who claimed to be soothsayers by grant of the goddess who had afflicted heathen another method, splitting hazel sticks. They intervened in case of the king's falling sick, when it was assumed that some man had sworn by the king's heart and broken his oath. If a man accused of this denies it, other diviners are called, and if they all agree, the accused is burnt. The diviners are chosen by lot, and 37, and not by the king. They held in their honour, and then burned forty days after death. They buried the deaths of the kings were much more elaborate. They removed to the extreme corner of the hill as a principle of surrounding the dead man with everything in which he found any pleasure in life.

The tombs of the kings were in the land of Gurrhus near the great bend of the Dnieper where the chief tumuli have been excavated. The body was embalmed and placed in a coffin with a saddle on it and a sword by its side, with a great deal of clothing which was burned with the body. The coffin was closed with a stone, and two or three layers of faggots, which were burned. Arrived at the place of burial, the body was set in a square pit with spears marking out its sides and a roof of matting. Then one of the chief bedfellows of the dead, a groomsman, messenger and horses were strangled and laid by him, and round about were offered all of his gold and cups of gold—no silver or bronze. After this they raised a great mound, striving to make it as high as possible. A year later they strangled fifty youth of the dead man's servants (all Scyths born) and fifty of the best horses, studded them and mounted them in a circle about the mound.

Tombs.—The description is generally borne out by the evidence of the tombs opened in the Crimea and southern Russia but almost every detail finds a close parallel in some tomb or other. The chief divergency is in the presence of silver and copper objects, and in the profusion and variety of the ornaments. They are also the most distinctively Scythian of all the tombs. The Scythian tombs are generally opened in the tombs. Arrived at the place of burial, the body was set in a square pit with spears marking out its sides and a roof of matting. Then one of the chief bedfellows of the dead, a groomsman, messenger and horses were strangled and laid by him, and round about were offered all of his gold and cups of gold—no silver or bronze. After this they raised a great mound, striving to make it as high as possible. A year later they strangled fifty youth of the dead man's servants (all Scyths born) and fifty of the best horses, studded them and mounted them in a circle about the mound. The tombs are cut into the mountains. They are generally opened in the tombs. Arrived at the place of burial, the body was set in a square pit with spears marking out its sides and a roof of matting. Then one of the chief bedfellows of the dead, a groomsman, messenger and horses were strangled and laid by him, and round about were offered all of his gold and cups of gold—no silver or bronze. After this they raised a great mound, striving to make it as high as possible. A year later they strangled fifty youth of the dead man's servants (all Scyths born) and fifty of the best horses, studded them and mounted them in a circle about the mound.
they were heaped up, before the beams supporting the central chamber had rotted, slaves made a practice of driving a mine into the mound straight to where the valuables were deposited, and it is only by the collapse of this mine and the crushing of the robber after his death that we have the chance to see what it was that the Chortomlyk barrow, on the whole the most typical, were preserved to us. This was 60 ft. high and 1100 ft. round; it was a stone plinth, and it was approached by a kind of stone aisle. A huge mound of earth covered the whole, and from each corner of it at the bottom opened out side chambers. The north-west chamber communicated with a large irregular chamber containing a wonderful brazier, shaped like a central pit all was in confusion, but here the king seems to have lain. His belongings, found piled up near the mine, seem to have included a combined bow-case and quiver and a sword sheath, each with its own separate gold plate, the three were covered with gold hafts, a hone with gold mounting, a whip, many other gold plates and a heap of arrow-heads. In the north-west chamber was woman's skeleton, and she had her jewels, mostly of Greek work. She was attended by a number of men, and she had heaps in the other chambers. They were supplied with simpler weapons and adornments, but even so their clothes had hundreds of stamped gold plates and strips of various shapes sewn on to them, every skeleton were drinking vessels. Store of wine was contained in six amphorae, and in two bronze cauldrons were mutton-bones. The most wonderful object of all was a great two-handled vase standing in the middle of the main chamber. The greatest of its beauty is covered by a pattern of acanthus leaves, but on the shoulder is a frieze showing nomads breaking in wild mares, our chief authority for the use of these vessels. The way in which the main shaft were three square pits with horses and their harness, and by them two pits with men's skeletons. In the heap itself was found an immense quantity of pieces of harness and what may be remains of a funeral car. Greek work would seem to date the burial as of the 3rd century B.C.

At Alexandria in the same district was an even more elaborate tomb, but its contents were in even greater confusion. Another tomb in this region, Melgunov's barrow, found as long ago as 1760, contained a dagger-sheath and pommel of Assyrian work and Greek things of the 6th century. In the Kul Oba tomb mentioned above there was gold work and one or two objects, of purely Greek workmanship, but the ideas underlyng the are the same—the king has his wife, his servant and his horse, his amphora with wine, his cauldron with mutton-bones, his drinking vessels, and his clothing, all with the one object of barbarian style. One of the cups has a frieze with reliefs of natives supplementing that on the Chortomlyk vase.

East of the Maeotis on the Kuban we have many barrows; the most interesting are the groups called the Seven Brothers, and those of Karagodemush, Kostromskaya, UI and Kelermes, the latter remarkable for objects of Assyrian style, the others for the enormous slaughter of horses; on the UI were four hundred in one grave.

Art.—Certain of the objects which occur in these Scythian graves are of special forms typical for the Scythian area. Most interesting of these is the dagger or sword, always very short, save in the later grave types, where a dagger was found one or two combinations, of purely Greek workmanship, but the ideas underlyng the are the same—the king has his wife, his servant and his horse, his amphora with wine, his cauldron with mutton-bones, his drinking vessels, and his clothing, all with the one object of barbarian style. One of the cups has a frieze with reliefs of natives supplementing that on the Chortomlyk vase.

Further, there is the peculiar cauldron on one conical foot, round which the fire was built, the cylindrical horn pierced for suspension, and the cup with a rounded bottom. Assyrian and afterwards Greek craftsmen working for Scythian employers were compelled to decorate these outlandish forms, which they did according to their own fashion; but there was also a native style with considerable beast decoration, which was almost always employed for the adornment of the handles and weapons.

This style and the types of dagger, cauldron, bit and two-looped socketed axehead run across from Hungary to the upper Volga, and from the Caucasus to the Cimmerian Bosphorus. Age culture seems to have developed largely the Scythian Rome and the zoomorphic decoration of the early middle ages.

The Scyths from the Yenisel to the Caspatians are of distinct style of art which, whatever its original elements may have been, seems to have taken shape as far east as the Yenisel basin is an additional argument in favour of a certain movement of population from the east, which may have finally made the Scythian types which correspond in time with the movement of the Scyths of which Herodotus speaks, and it may be inferred that immigrants coming from those regions were rather allied to the Tatar family of nations than to the Scyths. It is possible that the Scyths of the early Scythian period, who lived on the same lands, have already penetrated into the Yenisel basin, and that the resemblance between the dress and daggers of certain classes of warriors on the sculptures of Persopolis and those shown on the Kul Oba vase in the Iranian origin would not account for the presence of analogous types on the Yenisel.

History.—To sum up the history of Scythia, the oldest inhabitants of whose hearth in Scythia were the Cimmerii; the Scythia of the country makes it probable that some of them were nomads, while others no doubt filled the river valleys and in the Crimea, where they left their name to ferrys, earthworks and the Cimmerian Bosporus. They were probably of Iranian race: among the Persians Herodotus describes a similar mixture of nomadic and settled tribes. In the 7th century B.C. these Cimmerians were attacked and partly driven out by a horde of newcomers from upper Asia called Scytoi; these imposed their name and their yoke upon all that were left in the Euxine steppe, but probably their coming did not really change the basis of the population, which remained Iranian. The new owners adopted the language of the conquered, but brought with them new customs and a new artistic taste probably largely borrowed from the metal-working tribes of Siberia. About the same time similar peoples harassed the northern frontier of Iran, where they were called Sakas (Sace), and in later times Saka and Scythi, whether they were originally the same or not, were regarded as synonymous. It is difficult always to judge whether given information applies to the Saces or the Scyths.

About 575 B.C. Darius, having conquered Thrace, made an invasion of Scythia, which, according to the account of Herodotus, he crossed as far as the Oarus, a river which Pliny says was burnt the town of Gelenus and returned in sixty days. In this march he was much harassed by the nomads, with whom he could not come to close quarters, but no mention is made of his having any difficulty with the rivers (he gets his water from wells), and no reason for his proceedings is advanced except a desire to avenge legendary attacks of Scyths upon Asia. After losing many men the Great King comes back to the place where he crossed the Danube, finds the Ionians still guarding the bridge in spite of their attempts the Scyths to make them desert, and safely re-enters his own dominions. Ctesias says that the whole campaign only took fifteen days and that Darius did not get beyond the Tyres (Dinister). This is also the view of the reasonable Strabo; but it does not account for the genesis of the other story. It seems best to believe that Darius made an incursion in order to secure the frontier of the Danube, suffered serious reverses and retired with loss, and that this offered too good a chance to be missed for a moral tale about the discomfiture of the Great King by a few poor savages. The Greeks had been trading with the Scyths ever since their coming, and when Darius retired the Ionians re-entered the Scythian lands, and some time before 512 B.C. the Scyths had were received as allies by the Ionians and by the King of Thrace, who had been made subject to the Great King. It is possible to make a list of Scythian kings—Sparagapetles, Lycurgus, Saulius (whose brother, the famous Anacharsis (q.v.), travelled over all the world in search of wisdom, was reckoned a sage among the Greeks and was slain among his own people because they did not like his foreign ways), and Idanthrysus, the head king at the time of Darius, probably the father of Ariapheites. This latter had three wives, a Greek woman from Istris, Opea a Scythian, and a Thracian daughter to the great chief Teres. Syles, his son by the Greek mother, affected Greek ways, had long hair, and even took part in Bacchic rites. When this came to the knowledge of his stepfather, he was murdered, and Ocamatas, his son by the third wife, reigned in his stead. Herodotus adds this to show how much the Scyths hated foreign customs, but with the things found in the graves it rather prove how strong was the attraction exercised upon the nomads by the higher culture of their neighbours. Ocamatas died shortly before the time of Herodotus. We cannot place Arianthes, who made a kind of census of the nation by exacting an arrow-head from each warrior and cast a great cauldron out of the bronze, nor Taxacis and Scoropis, the under-kings in the time of Idanthrysus. After the retreat of Darius the Scyths made a raid as far as Abydos, and even sent envoys to King Cleomenes III. of Sparta to arrange that they should attack the Persian Empire from the Phasis while the Spartans
SEA—SEA, COMMAND OF THE

should march up from Ephesus. The chief result of the embassy was that Cleomenes took to the Scythian habit of drinking his wine neat and went mad therefrom (Herodotus vi. 84). Henceforward the Scyths appear as a declining power; by the middle of the 4th century their eastern neighbours the Sarmatae have crossed the Tanaiss (Don) and the pressure of the Scyths is felt on the Danube. Here Philip II. of Macedon defeated and slew their king Atæas in 339 B.C., and from this time on the representatives of the old Scythic power are petty chieftains in the western part of the country about Olbia, where they could still be dangerous, and about Tomi. Towards the second half of the 2nd century B.C. this kingdom seems to have become the nucleus of a great state under Scillus, whose name appears on coins of Olbia, and who at the same time threatened Chersonese in the Crimea. Henceforward the name “Scythian” is purely geographical. Meanwhile Scythia had become the land of the Sarmatae (q.v.). These, as has been seen, spoke a cognate dialect, and the tombs which belong to their period show exactly the same culture with Greek and Siberian elements. It is probable that the Iranian element was stronger among the Sarmatae, whose power extended as the ruling clan of the Scyths became extinct; but it is quite likely that they in their turn were offered by some new horde from the north. The Sarmatae, like the Scyths, seem to have been a sea-faring nation, and the west by yet newer swarms, and with the coming of the Huns Scythia enters upon a new cycle, though still keeping its old name in the Byzantine historians.

AUTHORITIES.—(1) Ancient: Herodotus iv. 1-142 (editions of Blakelsey, Rawlinson, Macan); Hippocrates, De Aere, &c., c. 24 sqq.; for geography alone: Strabo vii. cc. 3, 4; xi. cc. 1, 2, 5; Pliny iv. 75 sqq.; Ptolemy, Sarmatia; Diodorus Sic. ii. 2, 45-47; and Justin i. cc. 8, 11; ii. 1. 4, do not seem to add anything of which we can be certain. SEA (in O. Eng. see, a common Teutonic word; cf. Ger. See, Dutch Zee, &c.; the ultimate source is uncertain), in its widest sense that part of the surface of the globe which consists of salt water, in distinction from dry land. The greater divisions of the sea, according to expression, are the ocean, or the sea proper, for which name, as the name of the part of the globe which is covered with the heaving Ocean and Oceanography, the latter being the term now generally applied to the scientific study of the sea. The word “sea,” however, is also used, in a restricted sense, in application to specific parts of the great oceans, more or less clearly defined by a partial land-boundary. Such are the Mediterranean Sea and the Caribbean Sea, connected with the Atlantic Ocean; the Arabian Sea, a division of the Indian Ocean, and the China and Japan Seas of the western Pacific Ocean. Subdivisions of great seas are similarly defined (e.g. the Adriatic Sea), and a few large bodies of salt water entirely land-locked are also sometimes called seas, for example, the Dead Sea. Sea-level is the assumed mean level of the sea, serving as a datum from which to calculate the elevation of land in surveying (q.v.).

SEA, COMMAND OF THE, a technical term of naval warfare, which indicates a definite strategical condition. (For its difference from “sea-power,” see the separate article on that subject.) The term has been substituted sometimes for the much older “Dominion of the sea” or “Sovereignty of the sea,” a legal term expressing a claim, if not a right. It has also been sometimes treated as though it were identical with the rhetorical expression “Empire of the sea,” Captain A. T. Mahan, instead of it, uses the term “Control of the sea,” which has the merit of precision, and is not likely to be misunderstood or mixed up with a form of words meaning something different. The expression “Com-
Dutch in objecting to pay the old-established mark of respect to the English flag was quite reason enough: in the eyes of most Englishmen, and probably of most Dutchmen also, to justify hostility which other reasons may have rendered inevitable.

The remarkable thing about the Dutch wars is that in reality what England gained was the possibility of securing an absolute command of the sea. She came out of the struggle a great, and in a fair way of becoming the greatest, naval power. It is this which prompted Vice-Admiral P. H. Colbom to hold that there are various kinds of command, such as "absolute or assured," "temporary," "with definite ultimate purpose," &c. An explanation that would make all these terms intelligible would be voluntary by explanation of the event. Enough is certain to say that the absolute command—of which, as Colbom tells us, the Anglo-Dutch were the most complete example—is nothing but an attribute of the nation whose power on the sea is paramount. It exists and may be visible in time of peace. The command which, as said above, expresses a definite strategical condition is existent only in time of war. It can be easily seen that the former is essential to an empire like the British, the parts of which are bound together by maritime communications. Inability to keep these communications open can have only of real strength the power be destroyed and destroyed. Experience of war as well as reason will have made it evident that inability to keep open sea-communications cannot be limited to any single line, because the inability must be due either to incapacity in the direction of hostilities or insufficiency of force. If Great Britain has not force enough to keep open all the communications of her widely extended empire, or if—having force enough—she is too foolish to employ it properly, she does not hold the command of the sea, and the empire must fall if seriously attacked.

The strategic command of the sea in a particular war of campaign has equal concern for all maritime belligerents. Before seeing what it is, it will be well to learn on high authority what it is not. Mahan says that command, or, to use his own term, "control of the sea, however real, does not imply that an enemy's single ships or small squadrons cannot steal out of port, cannot cross more or less frequented tracts of ocean, make harassing descents upon unprotected points of a long coast-line, or enter blockaded harbours. On the contrary, history has shown that such evasions are always possible, to some extent, to the weaker party, however great the inferiority of material force. See "Of Sea-Power on History," London, 1890, p. 14). The Anglo-French command of the sea in 1854-1856, complete as it was, did not enable the Allies to intercept the Russian ships in the north-western Pacific, nor did that held by the Federals in the American Civil War put an early stop to the cruises of the Confederate vessels. What the term really does imply is the power possessed from the first, or gained during hostilities, by one belligerent of carrying out considerable over-sea expeditions at will. In the Russian war just mentioned the Allies had such overwhelmingly superior sea-power that the Russians abandoned to them without a struggle the command of the sea; and the landing in South Africa (1899-1902), more than six thousand miles away, of a large British army without even a threat of interruption on the voyage is another instance of unchallenged command. In wars between great powers and also between secondary powers, if nearly equally matched, this absence of challenge is rare. The rule is that the command of the sea has to be won after hostilities begin. To win it the enemy's naval force must be neutralized. It may be driven into its ports and there blockaded or "masked," and thus rendered void of use, or it must be defeated and destroyed. The latter is the preferable, because the more effective plan. As was perceptible in the Spanish-American War of 1898, as long as one belligerent's fleet is intact or at large the other is reluctant to carry out any considerable expedition over-sea. In fact, the command of the sea has not been secured whilst the enemy continues to have a "fleet in being" (see Sea-Power).

In 1782 a greatly superior Franco-Spanish fleet was covering the siege of Gibraltar. Had this fleet succeeded in preventing the revictualling of the fortress the garrison would have been starved into surrender. A British fleet under Lord Howe, though much weaker in numbers, had not been defeated and was still at large. Howe, in spite of the odds against him, managed to get his supply-ships in to the anchorage and to fight a partial action, in which he did the allies as much damage as he received. There has never been a display of higher tactical skill than this operation of Howe's, though, curiously enough, he owes his fame much more to his less meritorious performance on the 1st of June. The revictualling of Gibraltar surpassed even Suffren's feat of the capture of Toulon. Incomparable as this was, it was only temporary. Assuming that a temporary superiority in the Mediterranean had given them a free hand on the water, sent a great expedition to Egypt. Though the army which was carried succeeded in landing there, the covering fleet was destroyed by Nelson at the Nile, and the army itself was eventually forced to surrender. The French had not perceived that, except for a short time and for minor operations, you cannot separate the command of the Mediterranean or of any particular area of water from that of the sea in general. Local command of the sea may enable a belligerent to make a hasty raid, seize a relative importance from its opponent's communications, or even be able to effect anything requiring considerable time for its execution, or, in other words, anything likely to have an important influence on the course of the war. If Great Britain has not naval force enough to retain command of the Mediterranean she will certainly not have force enough to retain command of the English Channel. It can be easily shown why it should be so. In war danger comes less from conditions of locality than from the enemy's power to hurt. Taking up a weak position when confronting an enemy may help him in the exercise of his power, but it does not constitute it. A maritime enemy's power to hurt resides in his fleet. If that can be neutralized his power disappears. It is in the highest degree improbable that Great Britain could attain this end by splitting up her fleet into fragments so as to have a part of it in nearly every quarter in which the enemy may try to do her mischief. The most promising plan—as experience has often proved—is to meet the enemy when he shows himself with a force sufficiently strong to defeat him. The proper station of the British fleet in war should, accordingly, be the nearest possible point to the enemy's force. This was the fundamental principle of Nelson's strategy and is still applicable now as ever it was. If Great Britain succeeds in getting into close proximity to the hostile fleet with an adequate force of her own, her foe cannot obtain command of the sea, or of any part of it, whether that part be the Mediterranean or the English Channel, at any rate until he has defeated her. If he is strong enough to defeat her fleet he obtains the command of the sea in general; and it is for him to decide whether he shall show the effectiveness of that command in the Mediterranean or in the English Channel.

In smaller operations of war temporary command of a particular area of water may suffice for the success of an expedition, or at least will permit the execution of the preliminary movements. When the main fleet of a country is at a distance—which it ought not to be except with the object of nearing the opposing fleet—a small hostile expedition may slip across, say, the English Channel, throw shells into a coast town or burn a village, and get home again un molested. Its action would have no sort of influence on the course of the campaign, and would, therefore, be useless. It would also most likely lead to reprisals; and, if this process were repeated, the war would probably degenerate into the antipodal system of "cross-raiding," discarded centuries ago, not at all for reasons of humanity, but because it became certain that war could be more effectually waged in other ways. The power in command of the sea may resort to raiding to expedite the formal submission of an already defeated enemy, as Russia did when at war with Sweden in 1719; but in such a case the other side cannot retaliate. Temporary command of local waters will also permit of operations rather more considerable than mere raiding attacks; but the
duration of these operations must be adjusted to the time available. If the duration of the temporary command is insufficient the operation must fail. It must fail even if the earlier steps have been taken successfully. The command of the English Channel, which Napoleon wished to obtain when maturing his invasion project, was only temporary. It is possible that a reminiscence of what had happened in Egypt caused him to falter at the last; and that, quite independently of the proceedings of Villeneuve, he hesitated to risk a second battle of the Nile and the loss of a second army. It may have been this which justified his later statement that he did not really mean to invade England. In any case, the British practice of fixing the station of their fleet wherever that of the enemy was, would have seriously shortened the duration of his command of the English Channel, even if it had allowed it to be won at all. Moreover, attempts to carry out a great operation of war against time as well as against the efforts of the enemy to prevent it are in the highest degree perils.

In war the British navy has three prominent duties to discharge. It has to protect the maritime trade, to keep open the communications between the different parts of the empire and to prevent invasion. If Great Britain commands the sea these duties will be discharged effectually. As long as she does that, the career of cruisers sent to prey on her commerce will be precarious, because command of the sea carries with it the necessary protection of cruisers. Even as long as the condition mentioned is satisfied her ocean communications will be kept open, because an inferior enemy, who cannot obtain the command required, will be too much occupied in seeing to his own safety to be able to interfere seriously with that of any part of the British empire. This being so, it is evident that the greater operation of invasion cannot be attempted, much less carried to a successful termination, by the side which cannot make head against the opposing fleet. Command of the sea is the indispensable preliminary condition of a successful military expedition. In the above cited Chartist article it is said that he possesses it to attack its foes where it pleases and where they seem to be most vulnerable. At the same time it gives to its possessor security against serious counter-attacks, and affords to his maritime commerce the most efficient protection that can be devised. It is, in fact, the main object of naval warfare.

Authorities for the above may be given as naval histories in general, placing in the first rank the well-known works of Captain A. T. Mahan, U.S.N. The book which must be specially referred to is Vice-Admiral P. H. Colomb's Naval Warfare (3rd ed., London, 1900). See also the article Navy.

SEABURY, SAMUEL (1720-1796). American missionary. Born on the 30th of November 1720, in Ledyard, Graven, Connecticut. His father, Samuel Seabury (1706-1764), originally a Congregationalist minister in Graven, was ordained deacon and priest in the Church of England in 1731, and was a rector in New London, Conn., from 1732 to 1743, and in Hempstead, Long Island, from 1743 until his death. The son graduated at Yale in 1748; studied theology with his father; studied medicine at Edinburgh in 1752-1753; was ordained deacon by the bishop of Lincoln and priest by the bishop of Carlisle in 1753; was missionary in New Brunswick, New Jersey and New York; was consecrated bishop in New York, in 1777-1776, and of St. Peter's, Westchester, New York, in 1766-1775. He was one of the signers of the White Plains protest of April 1775 against "all unlawful congresses and committees," in many other ways proved himself a devoted loyalist, and wrote the Free Thoughts on the Proceedings of the Continental Congress (1774) by "A. W. Farmer" (i.e. a Westchester farmer), which was followed by a second "Farmer's Letter," The Congress Conquessed (1774), answered by Alexander Hamilton in A Full Vindication of the Measures of the Congress, from the Calumnies of their Enemies. A third "Farmer's Letter" replied to Hamilton's View of the Controversy between Great Britain and her Colonies, in a broader and abler treatment than in the previous pamphlets. To this third pamphlet Hamilton replied with The Farmer Refuted (1775). These three "Farmer's Letters"—a fourth was advertised but apparently was never published—were forcible presentations of the pro-British claim, written in a plain, hard-headed style; their authorship was long in question, but it is certain that Seabury claimed them in England in 1783 when he was seeking episcopal consecration. At the same time he claimed the authorship of a letter, not signed by the Westchester farmer, which under the title An Alarm to the Legislature of the Province of New York (1775) discussed the power of this the only legal political body in the colony. He was arrested in November 1775 by a mob of lawless Whigs, and was kept in prison in Connecticut for six weeks; his parochial labours were broken up, and after some time in Long Island he took refuge in New York City, where he was appointed in 1778 chaplain to the king's American regiment. On the 25th of March 1783 he was chosen their bishop by ten Episcopal clergymen of Connecticut, meeting in Woodbury;—he could not then take the British oath of allegiance, Seabury was shut out from consecration by the English bishops, and he was consecrated by Scotch bishops at Aberdeen on the 14th of November 1784. He returned to Connecticut in 1785 and made New Haven his home, becoming rector of St. James's Church there. The validity of his consecration was at first questioned by many, but was recognized by the General Convention of his church in 1789. In 1790 he took charge of the diocese of Rhode Island also. In 1792 he joined with Bishops William White and Samuel Provost, who had received English consecration in 1785, and James Madison (1749-1812), who had received English consecration in 1790, in the consecration of Bishop Thomas J. Cragglett of Maryland in 1792, thus uniting the Scotch and the English successions. He died in New London on the 25th of February 1796. He was a great organizer and a strict churchman: it is noteworthy that after his consecration he used the signature "Samuel Bp. Connect." Seabury's "Farmer's Letters" rank him as the most vigorous American loyalist controversialist and as one of the greatest masters of style of his period.

His son Charles (1770-1844) was rector in various Long Island churches. He and his brother, Samuel Seabury, who graduated at Columbia in 1825, were rector of the Church of the Annunciation in New York in 1838-1868, and from 1862 professor of Biblical learning and the Interpretation of Scriptures in the General Theological Seminary. William Jones Seabury (b. 1837), son of the last named, was rector of the Church of the Annunciation from 1868 to 1898, professor of ecclesiastical polity and law in the General Theological Seminary from 1875, and published a Manual for Choristers (1878), Lectures on Apostolic Succession (1893) and An Introduction to the Study of Ecclesiastical Polity (1894).

S. E. Edwards Beardsley, Life and Correspondence of the Rt. Rev. Samuel Seabury (Boston, 1884).

SEADIAH (or SAADIA; in Arabic Sa' id) BEN JOSEPH (920-942) was born in A.D. 892 at Dilaz in the Fayyum, whence he is often called al-Fayyūmī. Although he is justly regarded as the greatest figure in the literary and political history of medieval Judaism, nothing certain is known of his father or of his early life. Even the names of his teachers, generally recorded in the case of Jewish scholars, are unknown, with the exception of a certain Avai Katri, who is himself obscure, and left no writings. Saadia's principal work, and it is in fact the only one that appears, is his Talmud commentary, which he wrote at a comparatively early age. This appears at a time when learning seemed to be dead both in East and West. Since the completion of the Talmud very little of any literary importance, if we except certain midrashim, had been produced among the orthodox (Rabbinate) Jews, although the Babylonian schools at Sura and Pumbeditha continued to enjoy a somewhat intermittent prosperity. On the other hand, learning was cultivated among the Qaraite (q.v.; see also Hebrew Literature), a sect of Jews who rejected the oral tradition, restricting their practice to the ordinances of scripture (miqr'ah). It even seemed for a time as if conservative hereay would prevail against progressive orthodoxy. In Saadia, however, the Rabbanites found a powerful champion. Almost his first work, written at the age of twenty-three, was an attack on the teaching of 'Anan, the founder of Qaraism, who lived in the 8th century. This, like most of Saadia's polemical writings, is no longer extant,
but we can gather something of its contents from references in the author’s other works, and from the statements of his opponents. The controversy turned largely on the calendar, which of course involved the dates of festivals, and, since the Rabbanite calendar had come down from ancient times, opened up the whole question of oral tradition and the authority of the Talmud. The conflict raged for many years, the chief representative of the other side being Solomon ben Yeruham, a virulent if not successful opponent. It was not, however, the only controversy in which Saadia was engaged. In 932 Ben Meir, a person of importance in the Antioch synagogues, attacking the Rabbanite calendar, against the authority of the Babylonian schools. Saadia, who was then at Baghdad, warned him of his errors, refused him a work called Sefer ha-Moadidim (The Book of the Festivals), and finally procured his excommunication by David ben Zakkaï, the exilarch or head of the Jewish community in Babylon. The vigorous action of Saadia seems to have brought him more prominently to the notice of the exilarch, and that at a time of more than usual difficulty. The honourable rivalry of the two schools of Sura and Pumbeditha, as the recognized authorities in matters of halakha, eventually came to a reconciliation and Saadia was the author of a work called the Gaon to the Rabbinic authorities and Gaon. The Gaon (931) or President of Pumbeditha, taking advantage of his own position and of a vacancy in the Gaonate of Sura, wished to abolish the rival school. The exilarch, however, no doubt in recognition of his recent services, appointed Saadia as Gaon of Sura, although it was against the usual custom to appoint a person who was not a member of the school. Unfortunately this step did not lead to peace. Pumbeditha was jealous: the exilarch was weak and not very scrupulous. Money had to be raised not only for the support of the schools, but also to buy immunity from the government, and Saadia was not the man to hesitate at the corruption and oppression practised by the exilarch to raise it. Within two years matters had come to a crisis, and the exilarch dismissed Saadia, while Saadia retorted by declaring the exilarch deposed (930). After three years of contention David succeeded in sufficiently bribing the new and newly Caliph (Qāhir, 932-934; see Caliphate, § 13), who definitely forbade Saadia to act as Gaon. The next four years, spent in retirement at Baghdad, were devoted to literary labours, which had no doubt been impossible during the previous years of trouble, and in fact it was at this time that most of Saadia’s works were produced. Even a treatise on theology was effected with David, favoured probably by the new Caliph Rādi (934-940; see Caliphate, § 20), and Saadia was reinstated as Gaon of Sura in 938. Under his rule the school attained the highest reputation among the Jewish communities of East and West—but it was not of long duration. His health had been impaired by the strenuous life he had led, and in his later years he suffered from melancholia. In 942 he died, two years after the exilarch.

That some of the many works of Saadia, in spite of their merits, have been neglected, and others partly or entirely lost, is not as surprising as it appears at first sight. They were for the most part written in Arabic, the vernacular of the Jews in the East, so that after the break-up of the Babylonian schools in the middle of the 11th century, they would only be studied in Spain, the new centre of Jewish learning, and in Egypt. After the expulsion of the Jews from Spain, Arabic practically ceased to be used by them for literary purposes, and in the rest of Europe (except perhaps in S. Italy) it was never understood. Even some Hebrew works, of great interest to us now, must have been regarded at the time as of purely temporary value, such as e.g. the Sefer ha-Mozairit, fragments of which have only recently been recovered in the Geniza at Cairo. The anti-Qaraite works against ’Aanān, Ibn Sīkawayh, and Ben Zakkaī, the Kitāb al-tamyez, Kitāb al-Shara‘, Kitāb al-l‘ibbur (calendar) and a book on anthropomorphisms, all in Arabic, are now lost or forgotten from quotations. So also are the refutation of the sceptic Hīfī of Balikh, and the Sefer ’Orayyōth (on prohibited marriage, against Qaraite). Of the Sefer ha-Moadidim and Sefer ha-Galūd (against David ben Zakkaī), both in Hebrew, some fragments have been recovered recently.

Closely allied to his polemical writings are his exegetical works. He translated most of the Bible into Arabic, and commented on at least some of the books. The memorial edition contains (1) the version of the Pentateuch (1853), (3) of Isaiah (1865), (4) of Job (1869), (5) of Proverbs (1864), the last three with commentary. The translation of the 5 Meghillot, and of Daniel (with commentary), usually ascribed to Saadia, is not really by him, but a genuine translation of Daniel, with commentary, from the Arabic. There is also an excellent work on the Decalogue. These all, no doubt, exhibit the defects necessary to the time in which their author lived. But it must be remembered that Saadia was a pioneer. Hayyuj, the father of Hebrew grammar, was not yet born, nor had the scientific and comparative study of the language begun. In this respect Saadia contributed little to the subject. Moreover, he shows a tendency, common at all times and perhaps due to a particular theory of inspiration, to get more out of the text than it contains, and to interpret it in accordance with preconceived philosophical opinions. Numerous other works are remarkable for their great learning, sound sense and an honest endeavour to arrive at the true meaning of the original. They were thus admirably suited for their purpose, which was, like the earlier Targums and the later work of Moses Mendelssohn, to render the sacred text more intelligible to the faithful generally and to check the growth of error.

The grammatical work called Agor, a sort of dictionary, is now lost, as are also the Kitāb al-Lughah and perhaps other treatises on Hebrew grammar. The explanation of the 70 (really 90) hapsagœmena in the Bible is still extant, and a poem on the number of letters in the Bible.

On Talmudic subjects again little is preserved beyond the Kitāb al-Mawārith, which was published as vol. ix. of the Œuvres complètes, together with the short treatise in Hebrew on the 13 Midrash or canons of exegesis of R. Ishmael and some Responsa mostly in Hebrew. The translation of the Mishna, the introduction to the Talmud and other works of the kind are known only by repute.

Of the Siddur or arrangement of the liturgy by Saadia, a large part exists in a single manuscript at Oxford, and several fragments have been recovered from the Cairo Geniza. Numerous other liturgical poems, or parts of them, have been obtained from the same source, and several have been published in periodicals. His Asharōth, a poetical enumeration of the 613 precepts, in Hebrew, is included in vol. ix. of the Œuvres complètes.

His philosophical works are (1) a commentary on the Sefer Yeẓira, a mystical treatise ascribed to the patriarch Abraham, which, as the foundation of the Kabballa, had great influence on Jewish thought, and was the subject of numerous commentaries; (2) the Kitāb al-Amadāt wa-l-imādāt (Book of Beliefs and Creeds), written in 933, called, in the Hebrew translation by Judah ibn Tibbon, Emdanūd ve-Dafōth. Its system is based on reason in conjunction with revelation, the two being not opposed, but mutually complementary. It is thus concerned, as the title implies, with the rational foundation of the faith, and deals with creation, the nature of God, revelation, free will, the soul, the future life and the doctrine of the Messiah. It shows a thorough knowledge of Aristotle, on whom much of the argument is based, and incidentally refutes the views of Christians, Moslems, Brahmins and sceptics such as Hīfī. From its nature, however, the work, although of great interest and value, has never had the wide influence which R. Joseph, mentioned above, had.

The Arabic text was published by S. Landauer (Leiden, 1880), the Hebrew version at Constantinople in 1562 and frequently since.

SEAFIELD, EARLS OF—SEA-HORSE

The 1st earl of Seafield, in the Scottish peerage, was James Ogilvy (1663-1730), son and heir of James Ogilvy, 3rd earl of Fidlistarter. Although in the convention parliament of 1689 he had spoken for James II., he took the oath of allegiance to William and Mary, and after filling some minor official positions he was made secretary of state in 1696, and lord chancellor in 1702. In 1707 he was made chief baron in the court of exchequer. In 1710 he was created earl of Seafield, and in 1711 succeeded to his father's earldom of Fidlistarter. When his great grandson, James, 7th earl of Fidlistarter and 4th earl of Seafield died in October 1811 the earldom of Fidlistarter became dormant or extinct, while the earldom of Seafield passed to a cousin, Lewis Alexander Grant (1677-1840), who was descended from Margaret, a daughter of the 2nd earl. He took the name of Grant-Ogilvy and was succeeded as 6th earl by his brother, Francis William Ogilvy-Grant (1778-1853), whose descendant, James Ogilvie-Grant (b. 1876) became the 11th earl in 1888. The earl of Seafield is a peer of the United Kingdom as Baron Strathspey.

SEAFORD, an urban district and watering-place in the Eastbourne parliamentary division of Sussex, England, 58 m. S. by E. from London by the London, Brighton & South Coast railway. Pop. (1901) 3355. In recent years there has been a considerable increase in the number of visitors. The climate is bracing, and the town is sheltered by high cliffs. There are golf links on the neighbouring downs. The church of St Leonard is Norman of various dates, but received large additions in the Perpendicular period. In former days the river Ouse entered the English Channel here, and the natural harbour so formed accounts for the origin of Seaford (Safford, Sufford, Seford), probably in Roman times. In the "Domesday of Cinque Ports" (which entered this reign of Edward III., but was lost before 1728) it stood first among the members of Hastings, and was doubtless of considerable importance until about the end of the 14th century, when its rapid decline began owing to the constant alteration of the sea-coast and the decay of the harbour. In the 16th century the town was finally deserted by the Ouse, which now runs into the sea at Newhaven, 2 m. westward, and no revival of its prosperity occurred until the early 19th century, when it began to be frequented as a watering-place. Fishing has always been the chief industry.

Seaford is not mentioned in Domesday Book, but evidently pertained to the wardship of the 1st Earl Warren and his descendants, who were succeeded in 1347 by the earls of Arundel. It was probably a mesne borough in the 12th century, growing up under the protection of the earls of Warren and, was certainly a borough in 1326. Balliffs are mentioned in the 14th century, but the town was not incorporated until 1544, when notwithstanding its decayed condition Henry VIII. annexed it to Hastings by charter, and incorporated it under the title of ballif and commonalty, presumably as a reward for assisting the head port to provide its proportion of ships to the crown. The corporation was dissolved by an act of 1885. The town returned two representatives to parliament from 1326 until 1832 when it was disfranchised. In the 15th century the earls of Warren held a market or fair, or both, apparently by prescriptive right. In 1792 the fair days were Whit-Monday and the 10th of August, and the market-days Wednesday and Saturdays, but no market or fair now exists.

SEAFORTH, EARL OF, a Scottish title held by the family of Mackenzie from 1633 to 1716, and again from 1771 to 1781. The Mackenzies trace their descent to one Colin of Kintail (d. 1278), and their name is a variant of Mackenneth. Kenneth, the 12th head of the clan, was made Lord Mackenzie of Kintail in 1609, and his son Colin, who succeeded his father as 2nd Lord Mackenzie in March 1611, was created earl of Seaforth in 1623. Colin's successor was his half-brother George (d. 1651), who became the 2nd earl in 1653. George was alternately a royalist and a covenantor between 1636 and 1646, and was afterwards in Holland with Charles II., who made him secretary of state for Scotland. His grandson, Kenneth, the 4th earl, followed James II. to France and was with the deposed king in Ireland. Sent by James in 1692 to head a rising in Scotland, he was captured and imprisoned, but in 1697 he was released and he died in Paris in January 1701. His successor was his son William, who joined the Jacobite standard at Braemar in 1715, and then, having raised 3000 men, was present at the battle of Sheriffmuir and was appointed lieutenant-general of the northern counties. He also took part in the Jacobite enterprise of 1719, being wounded at Glenshie. In 1716 he was attainted and his titles and estates forfeited; before his death in January 1740, he had been relieved of some of the penalties of his treason, although the title was not restored. His son Kenneth (c. 1718-1761), who but for the attainder would have been the 6th earl, helped the English government during the rising of 1745, and was a member of parliament for some years. His son Kenneth (c. 1744-1781) was created earl of Seaforth in 1771, but his peerage became extinct when he died in August 1781, although there were still heirs to the older earldom, which was under attainder. This earl raised the regiment of Highlanders, the 78th, known later as the 2nd battalion of the Seaforth Highlanders.

SEAHAM HARBOUR, a seaport and urban district, in the South-eastern parliamentary division of Durham, England, 6 m. S. of Sunderland by the North-Eastern railway. Pop. (1901) 10,163. The harbour was built (1828) by the 3rd marquis of Londonderry to facilitate the export of coal from the mines on his adjacent property. Besides the coal trade there are extensive bottle and chemical works.

SEA-HORSE. Sea-horses (Hippocampus) are small marine fishes which, with pipe-fishes (Syngnathina), form the Lophophor-branchiate division of the suborder Thoracocephali. The gills of the members of this group are not arranged in leaf-like series as in other fishes, but form a convex mass composed of small rounded lobes attached to the branchial arches, as shown in the accompanying figure (fig. 1) of the head of a sea-horse, in which the gill-cover has been pushed aside to show the interior of the gill-cavity. Sea-horses differ from pipe-fishes by having a prehensile and invariably finless tail; it is long, slender, tapering, quadrangular in a transverse section, and, like the rest of the body, eneased in a dermal skeleton, which consists of horny segments, allowing of ventral, and in a less degree of lateral, but not of dorsal, flexion. The typical sea-horse (Hippocampus) can coil up a great portion of its tail, and firmly attach itself by it to the stems of sea-weeds or similar objects. The body is compressed and more or less elevated, and the head terminates in a long tubiform snout, at the end of which is the small mouth. The configuration of the fore part of the body, as well as the peculiar manner in which the head is joined to the neck-like part of the trunk, bears a striking resemblance to a horse's head. Sea-horses are bad swimmers and are unable to resist currents. With the aid of their single dorsal fin, which is placed about the middle of the fish's body and can be put into a rapid undulatory motion, they shift from time to time to some object near them, remaining stationary among vegetation or coral where they find the requisite amount of food and sufficient cover. Their coloration and the tubercles or spines on the head and body, sometimes with the addition of skinny flaps and filaments, closely resemble their surroundings, and constitute the means by which these defenceless creatures escape detection by their enemies. These protective

![Fig. 1. Gills of Hippocampus abdominalis.](image-url)
structures are most developed in the Australian genus Phyllopteryx, one of the most singular types of littoral fishes.

Sea-horses belong to the tropics and do not extend so far north as pipefishes. They are abundant at suitable localities, chiefly on the coral-banks of the Indo-Pacific Ocean. Some forty species are known, of which the majority belong to the genus Hippocampus. They vary from 2 to 12 in. in length; but in China and

SEA-KALE—SEAL

Australia a genus (Solenogatus) occurs, the species of which attain to a length of nearly 2 ft.; they, however, in form resemble pipe-fishes rather than sea-horses. The species which may be sometimes seen in European aquariums is Hippocampus antiquorum, common in the Mediterranean and on the coasts of Portugal and France. It is rare on the south coast of England, but it has often been captured on the Essex coast. About 1885, according to Dr. J. Murie, two Leigh fishermen when shrimp-fishing at Harwich during the summer season succeeded in procuring altogether between 100 and 120 specimens. The food of the sea-horses consists probably of very small invertebrates, and the fry of other fishes. Like the other Lophophorids, they take great care of their progeny. The male Hippocampus carries the ova in a sac on the lower side of the tail, in which they are hatched; in the other genera no closed pouch is developed, and the ova are embedded in the soft and thickened integument of either the abdomen or the tail.

All that is known of the habits of these interesting fishes will be found summarized in a valuable paper by T. Gill, "The Life History of the Sea-Horses (Hippocampi)," in Proc. L. S. Nat. Mus. xviii. (1905), p. 805.

SEA-KALE, Crambe maritima, a hardy, perennial, a member of the natural order Cruciferae, which grows wild along the coasts of England, of Ireland and of the Scottish lowlands, along the western coasts of Europe, and on the Baltic, reappearing on the Black Sea.

In cultivation sea-kale prefers a light dry soil, and when manure is necessary it should consist of sea-weed or well-rotted dung; or a dressing of 8 oz. or of nitrate of soda may be given. When raised from seeds, they should be sown in March or April in rows 1 ft. asunder, the plants being thinned to 6 in. apart. In the following March these should be planted out in trenched well-prepared ground, 2 ft. asunder, in rows 2 to 3 ft. apart. The top with the crown buds should be cut off before planting to prevent them from running to seed. In the spring of the second year the young shoots if blanched will be fit for use, and therefore the summer growth should be promoted by the use of water and liquid manure. Tolerably blanched stalks may be produced by plants only nine months old from the seed, and after two summers seedling plants will have acquired sufficient strength for general cropping. The seeds, instead of being sown in rows and transplanted, may be deposited in patches of three or four together, where they are to remain. In the autumn, after the leaves have been cleared off, the ground should be forked up, and 6 or 8 inches' depth of leaves or of light sandy soil laid over the plants, by either of which means they will be blanched, though not forced. The blanched sprouts should be cut for use whilst they are crisp, compact and from 3 to 6 in. in length, the stem being cut quite down to the base.

Sea-kale beds may be made from cuttings of the roots of very healthy plants, the extremities of the roots, technically called “thongs,” being best adapted for this purpose. They should be taken up at a suit, cut into lengths of about 4 in., and laid in a heap of sand or earth till spring, when they should be planted out like the seedlings.

Forcing—Sea-kale may be forced in the open beds by the aid of sea-kale pots or covers, which are contracted a little at top, with a movable lid. One of the earthenware covers, or an inverted flower-pot, is placed over each plant, or each patch of plants, and leaves are closely packed round the pots, and raised to about 1 ft. above them. When fermentation commences, the temperature within should not exceed 60°F. If the crowns are thus covered up by about the end of October, the crop may be cut by about the third week of December, and by starting a batch at various times a supply may be kept up till the middle of May.

Strong plants may also be taken up and planted on hotbeds, the ashes being kept covered close; or they may be set thickly in boxes as recommended for rhubarb, and placed in any heated structure, or in the mushroom house; but, to have the shoots crisp and tender as well as blanched, light must be completely excluded. Besides the common purple-leaved, there is a green-leaved sort, which is said to blanch better.

SEA, strictly speaking the name of the common European representative of that group of marine carnivorous mammals constituting the suborder Pinnipedia of the order Carnivora, but in a wider sense used to designate all the members of that group, except the walrus. The common seal (Phoca vitulina) is the typical representative not only of that group (see Carnivora), but also of the family Phocidae and the subfamily Phocinae, and it is to this latter group that the present article is restricted.

Although seals swim and dive with the greatest ease, often remaining as much as a quarter of an hour or more below the surface, and are dependent for their sustenance entirely on living prey captured in the water, all the species frequently resort to sandy beaches, rocks or ice-floes, either to sleep or to bask in the sun, and especially for the purpose of bringing forth their young. The latter appears to be the universal habit, and the young seals—of some species at least—take to the water at

![Fig. 1.—Common Seal (Phoca vitulina).](image1)

![Fig. 2.—Phyllopteryx eques.](image2)
use the fore-paws, either alternately or simultaneously, pressing the palmar surface on the ground and lifting and dragging the body forwards in a succession of short jumps. In this way they can move so fast that a man has to step out beyond a walk to keep up with them; but such rapid action costs considerable effort, and they soon become exhausted. These various modes of progression appear to be common to all species so far as has been observed.

Most kinds of seals are gregarious and congregate, especially at the breeding season, in immense herds. Such is the habit of the Greenland seal, which roared in the spring to the ice-floes of the North Sea around Jan Mayen Island. Others, like the common seal of the British Islands, though having a wide geographical range, are never met with in such large numbers or far away from land. This species is chiefly seen among the more sequestered coastlands or among the ice and snow, and is there alone or in small herds. The California or northern elephant-seal (Mirounga angustirostris), in the first place the abnormal season of reproduction in this species is unique; it is the only seal which has its young in the late autumn. Other species are more or less inoffensive to man, but there are others whose presence is a perpetual menace to the fisher. The grey seal (Halichoerus grypus) is of considerably larger size, the males attaining when fully adult a length of 8 ft. from the nose to the tail. The American or ringed seal (Phoca barbula), the following account, by T. Southwell, of the distinctions between the two may be quoted:—

As to the external features by which the grey seal may at any age be distinguished, it is the large size of its ears, by which it can be distinguished from the others. In winter, it is not unamusing to observe the extraordinary contrast between the short ears of the others and the erect ears of the Bear-seal. The shape of the head is peculiar to each species, the mouth and nostrils of the grey seal being more oblong than those of its congeners, and the distance of the latter from the body is greater.

A new and enlarged collection of sea laws, purporting to be an extract of the ancient laws of Oléron, made its appearance in the latter part of the 15th century in Le Grand routier de la mer, printed in London by John Gough. The text contains forty-seven articles, of which the first twenty-two are identical with articles of the "Judgments of the Sea," in the Liber Memorandum, the remaining articles being evidently of more recent origin. A black-letter edition of this work in French, without a date, is preserved in the Bodleian Library at Oxford, and to the library of the Admiralty at London. In this edition, the copies of the first three articles are identical with the text of the Maritime Law of Oléron. On the other hand, the introductory clause which ushers in the fortieth article is identical with the title that is generally prefixed
to MSS. of the maritime Ordinances of Amsterdam, and the text of this and of the following articles down to the sixty-fifth inclusive is evidently of Dutch origin and more or less identical with Verwer's text of the usages of Amsterdam. M. Fardessus, in his valuable "Colloquia de Nautica," pub. at Paris, 1871, and of which Breuning and Schlyter made known the result of his researches, justly remarked "that the provision of various articles of the last division of the sea law, standing by itself nothing, is mutually corroborated by analogies in the national law of different countries." It may be observed that the sixty-sixth article of the MS. is, a Lübeck law identical with the first article of the first series, which is of Lübeck origin. No colophon is appended to this final article in the MS. of 1494, but in the MS. of 1537, which breaks off in the middle of the sixty-sixth article of the MS., has the following colophon: "Here end the Gotland sea laws, which the community of merchants and skipper have ordained and made at Visby, that all persons who are found therein, and may God send us His grace, Amen." We are disposed to think that Gemen himself devised this colophon. He was engaged in printing textbooks of merchant law for commercial purposes, and yet not long after his death, the government, and, as Gottenland was at that time a possession of Denmark, he may have thus distinguished the sea laws from another collection, namely, of land laws. Professor Schlyter, however, believes that some other printer, who wrote it, may have inserted it at all events without the knowledge of Gemen himself. There seems to be no help to this view in the fact that in the archives of the guildhall of Lübeck there is preserved a MS. of 1573 which contains a Low German version of the same collection of sea laws, with a rubric prefixed to the first article, announcing to be the "water law or sea law, which is the oldest and highest law of Visby," and there are good reasons for supposing that there was at the same time an English MS. in the possession of the Copenhagen MS. The same observation will apply to a second MS. of a similar character preserved in the library of the gymnasion of Lübeck, which purports to have been written in 1537. But as regards the MSS. of 1494 and 1537, there is nothing to show of its having contained colophon as proofs of the facts recited in them, though they may be valuable as evidence of the reputed origin of the sea laws at the time when the scribe completed the MS. In illustration of this view it may be stated that in the same year in which the more recent of these two MSS. purports to have been completed—namely 1537 there was printed at Lübeck an enlarged edition of the sea laws consisting of seventy-two articles, being a Low German translation of a Dutch text, in which six additional Dutch laws were inserted which are not found in the Copenhagen MS., nor have a place in Gemen's text, yet to this edition is prefixed the title, "This is the highest and most useful of all the laws which shipmasters have ordained and made at Visby, that all persons who would be secure may regulate them by it." Further, it has an introductory clause to its thirty-seventh article which is the one upon which the controversy on the title of the "visby sea laws" has been resolved upon, themselves as ship law, which the men of Zealand, Holland, Flanders hold, and with the law of Visby, which is the oldest ship law." At the end of the seventy-second article there follows this colophon: "Here ends the Gotland sea law, which the community of merchants and mariners have ordained and made at Visby, that each may regulate himself by it. All honour be to God, mission, etc." Each article of this edition has prefixed to it, after its particular number the word "believing" (judgment). It would thus appear that the Visby sea laws have fared like the Oleron sea laws: they have gathered bulk with increasing years. Even so much of the French text of the Lübeck sea laws acquire the title of the "Visby sea laws" outside the Baltic, for under such title they were received in Scotland in the 17th century, as may be inferred from extracts from them cited in Sir James D. Smith, "History of the Church in Scotland," chapter xi, page 1641 in his "Us et coutumes de la mer," and is abbreviated, and in many respects mutilated, version of the original sea laws. This inquiry, however, would open a new chapter on the subject of the nature of the Visby law which, for the history of Visby exercised in the 13th century through their factories at Novgorod, linking thereby the trade of the Baltic to that of the Black Sea.

**SEAL-FISHERIES.** Seals of all descriptions (see Seal)—whether belonging to the typical family Phocidae, or true seals, or to the Otariidae, or sea-lions and sea-bears—are of great commercial value. Whereas, however, the true seals and the sea-lions are hunted only for the sake of their hides and blubber, the sea-bears are sought on account of their valuable "seal-skin" (see Carnivora; also Fur). Walruses (Odoabenaes) are hunted not only for their hides and blubber but also for the ivory of their tusks, which is, however, far less valuable than elephant-ivory. Among the more important species of sea-bears or fur-seals, which yield commercial "seal-skin," may be mentioned Otaria (Arctocephalus) ursina of South America and the adjacent islands, including the Galapagos group and Tierra-del-Fuego; O. (A.) antarctica or pusa of South America and the Crozets; O. (A.) gazella of Kerguelen Island; and O. (A.) Forsteri of the coasts of New Zealand and South-Western Australia. This group was widely distributed over the pelagic islands of the southern hemisphere, but is now practically extinct in the greater part of its habitat, although remnants of importance exist on Lobos Island in the mouth of the river Plata in Uruguay, and on the islands off Cape Horn, both of which are under the protection of the government. A second group is represented by Otaria (Callorhinus) ursina of the Commander Islands and Pribilof Islands in Bering Sea, Robben Island and the Kurile Islands, Sea of Okhotsk, and other parts of the North Pacific; the forms from the different islands having received distinct specific names.

Of the southern herds little authentic information exists, but the records for the northern herds are fairly complete. At the period of its maximum development, 1870 to 1880, the herd of the Pribilof Islands numbered about 2 million animals; the island is now under government supervision. A second group in the Sea of Okhotsk is one of minor importance, numbering in 1897 less than 1,000 animals on Robben Island. All these herds became greatly reduced, and in 1866-1879 numbered in all not more than 60,000 animals. The typical adult male or bull (sikatch) of the second group attains maturity about the seventh year, and weighs from 400 to 500 lb. It is 6 ft. in length, with a girth of 4½ ft. The fur is blackish or dark brown, with long yellowish-white hairs, especially long and firm on the back of the neck, forming the so-called "wig" or mane. The animal stands erect and runs or "lopolo" along the ground when young. The adult female (female), is much smaller, averaging about 80 lb in weight, with length and girth in proportion. The fur is of varying shades of brown; she bears her first young at the age of three years.

The breeding-grounds are boulder-strewn beaches or rocky hill slopes near the shore. On these the sea-bears congregate in close-set masses called "rookeries." The unit of rookery life is the family group, or "harem," each bull collecting as many females as he can control. The number ranges from 1 to 100 or more, averaging about 30. The bulls reach the islands early in the year and take up their places on the shores in the last week in June. The number on the rookeries from day to day grows steadily to a climax about the middle of July, when about one-half are present, the number actually on the ground diminishing to about one-fourth and after the close of the breeding season with the end of July. The single young, or pup (kotik), weighing 10 to 12 lb and jet black in colour, is born within six to forty-eight hours after the arrival of the cow. Within a week the latter is served by the bull, and by the end of another week he goes to sea to feed, returning at gradually lengthening intervals through the summer to nourish her young, left in the meantime to care for itself on the rookeries. The bulls, having fasted since their arrival in May, go away in August to feed. The pups learn to swim at the age of a month or six weeks, and in November, with the approach of winter, swim away with their mothers to the south. The winter migration of the
SEALING WAX

Pribiloff seals extend as far south as the latitude of southern California, to return course following the coast. The Commander seals reach the latitude of southern Japan and return on their course. The fur-seals find their food, chiefly squid, Alaska pollack, and especially a small smelt-like fish (Theragra chalcogramma), in deep water, and their feeding-grounds in Bering Sea and on the migrations lie mainly along the 100-fathom curve.

The Commander Islands were discovered by Vitus Bering in 1741, and our first knowledge of the northern fur-seal herds comes from the notes of Georg Wilhelm Steller, a German naturalist accompanying Bering's expedition. The Pribiloff Islands were discovered in 1812, and in the intervening years there was no seals shipped to the United States in 1867. Up to 1867 the catch taken by the Russian Company holding the Alaska monopoly was about 75,000 yearly. Between 1868 and 1897 the reported catch of seals from the Pribiloff herd on land was 2,440,213, and 63,282 were reported as taken by pelagic sealing; but the latter is certainly greatly under the truth. From 1867 to 1902 the fur-seal catch was worth, it has been estimated, about $30,000,000. From 1870 to 1890 the United States government leased the islands to the Alaska Commercial Company, and in 1890 the monopoly of the Commander Islands was transferred to the Russian Company, which culminated in 1892 by a treaty by which it was agreed to submit to arbitration the claims of the United States to jurisdiction in Bering Sea in regard to the northern fur-seal herd when beyond the ordinary territorial limits. The Arbitral Tribunal met in Paris in 1893 (see BERING SEA ARBITRATION). Its decision was adverse to the contents of the United States, and equally adverse to the life of the northern fur-seals. It is agreed upon that skins shipped in 1893, 1894, 1895, and 1896 for investigation of the fur-sea fisheries in 1896–1899; besides this, from 1890 to 1895 the government expended $1,410,722 for the policing of Bering Sea and the prevention of illegal pelagic hunting.

The Russians worked out the principle, based on the polygamous habitat of the animals, of affording absolute protection to the breeding female herd, and confining the killing to the superfluous males. The young males, or bachelors, "haul out" to rest and sleep on beaches adjacent to, but distinct from, the breeding grounds, and are thus protected. The sealing, by the sealing gangs, rounded up in droves from 1000 to 3000, and driven inland to the killing-grounds. The large droves of males to success to escape. The females, of which from 20 to 50, of which the "killing" (animals of three years of age or approximating to such in size) are knocked down with clubs, those too large or too small being allowed to escape. The skins are removed, the bladders and viscera are exported. Two important processes in dressing the skins are the removal of the long hairs which grow out through the short thick fur, and the dying of the fur itself black.

The decline in the fur-seal herds of Bering Sea is due to the growth of a rival sealing industry—the hunting of the animals at sea with spear or shot-gum, known as pelagic sealing.1 Stragglers from the migrating herd had from the earliest times been taken by the Indians of Cape Flattery and Vancouver Island, going out from the shore in their canoes, but the number so captured was small. In 1879, however, sealing vessels began to be used to carry the hunters and their equipment to the main body of the herd, and to follow its movements. The industry developed rapidly, by 1892 employing a fleet of 122 sealing vessels, each with from five to twenty hunting crews. The catch at sea grew to a maximum in 1894 of 131,422, and was annually increased until 1899, when an effort was made to cover the entire migration route of the herd, and in 1893 the sealers entered its summer feeding-grounds in Bering Sea. Pelagic sealing, necessarily indiscriminate, affected most seriously the herd of breeding females. Investigations carried on in Bering Sea in 1895 and 1896 show that from 62 to 84% of the pelagic catch were of this class, the death of the female involving the death of her unborn offspring, as well as that of the unwed young. From 1890 to 1902 the "pelagic" catch has been estimated (Jordan) as 1,000,000, nearly half the corresponding total for the land-catch.

1 A temporary cause for the shrinkage of the herd was the ravages of the Uncinia, a worm which attacked the infant seals; in 1906 it seemed no longer to be present.

SEALING WAX

In medieval times, when the principal use of sealing wax was for attaching the impression of a seal to official documents, the composition used consisted of a mixture of Venice turpentine, beeswax and colouring matter, usually vermilion. The preparation now employed contains no wax. Fine red stationery sealing wax is composed of about seven parts by weight of shellac, four of Venice turpentine, and three to four of vermilion. The resins are melted together in an earthenware pot over a moderate fire, and the colouring matter is added slowly with careful stirring. The mass when taken from the fire is poured into oiled tin moulds the form of the sticks required, and when hard the sticks are polished by passing them rapidly over a charcoal fire, or through a spirit flame, which melts the superficial film. For the brightest qualities of sealing wax bleached lac is employed, and a proportion of neutral matter, as balsam or balsam of Peru—is added. In the commmoner qualities of sealing wax, talc, carbonate of magnesia, baryta white or other earthy matters are employed, and for the various colours appropriate mineral pigments. In inferior waxes ordinary resin takes the place of lac, and the dragon gum of Australia (from Xanthorrhoea hastilis) and other resins are similarly substituted. Such waxes, used for bottling, parcelling and other coarser applications, run thin when heated, and are comparatively brittle, whereas fine wax should soften slowly and is tenacious and adhesive.
SEALS

The idea of testifying the personal presence or the agency of an individual on some particular occasion, by affixing the impression of his seal (Lat. signillum, O. Fr. seal) to the record or object connected with the transaction of the moment, can be traced back among the nations of the old world when advanced only a comparatively short way on the path of civilization.

In the East the custom which has prevailed for centuries, and which is a practice at the present day, of using the seal as a stamp wherewith to print its device in ink or pigment in authentication of a document is parallel to our western habit of inscribing a signature for the same purpose. In the West, too, the impression of the seal has, at certain periods, had the same value as the signature; and at all times the connexion between the signature and the seal has been intimate in European practice (see AUTO-GRAPHS and DIPLOMATIC).

But the western method of obtaining the impression has differed from the eastern method. With us, the notion of a seal is an impression in relief, obtained from an incised design, either on a soft material such as wax or clay, or on a harder material such as lead, gold or silver. By common usage the word "seal" is employed as a term to describe both the implement for making the impression, and the impression itself; but in the latter case, the grave impression being technically called the matrix.

The earliest examples of seals, both matrices and impressions, are found among the antiquities of Egypt, Babylonia and Assyria. On the clay stoppers of wine jars of the remote age which goes by the name of the pre-dynastic period, and which preceded the historic period of the first Pharaohs, there are seal impressions which must have been produced from matrices, like those of Babylonia and Assyria, of the cylinder type, the impression of the design having been repeated as the cylinder was rolled along the surface of the moist clay. Two such engraved cylinders of this archaic period are in the British Museum collections. The cylinder, however, seems to have been generally superseded in Egypt by the engraved scarab, or beetle-shaped object, which, it may be assumed, was used at an early time, as it certainly was in later Egyptian history, for sealing purposes, although its proper function was that of an amulet. Still, the fashion for cylinders appears to have revived at intervals, for they are found in the 6th, the 12th and the 18th dynasties. Even in the 1st dynasty, about 4500 B.C., the Egyptian Pharaohs had their official sealers, or, to use a modern expression, keepers of the Royal Seal. Egyptian signet-rings, which were used for sealing, date back to the 12th dynasty.

As already stated, the matrices of ancient Babylonian and Assyrian seals, usually cut on precious stones, are in cylinder form.

The fine collection in the British Museum presents us with Babylonian specimens of even archaic times, followed by an historical series, the earliest of which is of nearly 4500 years B.C. The Assyrian series is not so full. The engraved subjects are chiefly mythological. Impressions are to be found on many of the cuneiform clay tablets. Early in the 7th century B.C. the cylinder seal gave place to the cone, the impression being henceforth obtained after the fashion followed to the present day.

The Phoenicians, as was only to be expected of those traders and artisans of the ancient world, appear to have adopted both the cylinder of Assyria and the scarab of Egypt as patterns for their seals. Examples indeed are rare, but that these people were acquainted with both forms is certain. Phoenician names are found cut both on cylinder matrices and on scarabs by the Phoenician engravers employed in Assyria and Egypt, and, when the cone-shaped matrix superseded the cylinder in Western Asia, the Phoenicians conformed to the change.

In Europe, the use of seals among the early Greeks is well known. Of the Mycenaean period numerous seal-impressions in clay have been found. Also from ancient times have survived the numerous engraved stones or pebbles, technically called gems, which served as matrices and in most instances were undoubtedly mounted as finger-rings or were furnished with swivels. At first being used in their natural forms, these pebbles or gems have been grouped as lenticular or bean-shaped, and glandular or of the sling-bolt pattern; later, from the 6th to the 4th century B.C., they were fashioned as scaraboids, that is, in the general form of the Egyptian scarab, but without the sculptured details of the beetle's body. To these, by a natural process, succeeded the matrix formed of only a thin slice of stone, which was more conveniently adapted for the bezel of the ring; and in this shape the engraved matrix passed on from the Greeks to the Romans. Signet-rings also with fixed metal bezels were in common use among the Greeks from about 600 B.C.

But while the scarab met with little favour in Greece, where, as just stated, the scaraboid was preferred, among the Etruscans its adoption was complete, and with them it became the commonest form of the seal-matrix, dating from the latter part of the 6th century B.C., engraved chiefly with subjects derived from Greek art.

Impressions of late Greek or Roman gems in clay have survived in a few instances. A series of impressions from Greek seals was found at Selinus in Sicily, dating before 249 B.C.; a small collection of sealed Greek documents on papyrus of the 4th and 3rd centuries B.C. was discovered at Cyzicus and Tarsus in Pontus; while in recent times a number of the Ostraca and Stelae of the fifth and fourth century B.C., found at Eryx, have been published. These, though not bearing the impress of a proper seal, are of importance as instances of the forms of seals in use among the Etruscans.

The Etruscan seals.

It is not the object of this article to deal further with the history of antique seals (see NUMISMATICS; also GEMS, JEWELRY and KING), but to give some account of European seals of the middle ages, when the revival of their use for the authentication of documents resulted in their universal employment among all classes of society. Hence it is that we are in possession of the vast number of impressions still to be found in public museums and archives, and in private muniment rooms and antiquarian collections, either attached to the original charters or other deeds which they authenticated, or as independent specimens. Hence, too, have survived a fairly large number of matrices.

The connecting link between the general use of the signet, which was required by the Roman law for legal purposes, but which had died out by the 7th century, and the revival of seals in the middle ages is to be found in the chanceries of the Merovingian and Carolingian sovereigns, where the practice of affixing the royal seal to diplomas appears to have been generally maintained (see DIPLOMATIC). Naturally, surviving examples of such seals are rare, but they are sufficient in number to indicate the style adopted at different periods. The seal-ring of Childeric II. (d. 673) was found in his tomb, bearing a full-face bust and his name; and impressions of seals of later monarchs of the Merovingian line, engraved with their busts and names, have survived. Pippin the Short and the early Carolings made use of intaglios, both actual antiques and copies from them; their successors had seals of ordinary types usually showing their busts. One of the oldest matrices is an intaglio in rock crystal, now preserved at Aix-la-Chapelle, bearing a portrait head of Lothair II., king of Lorraine (A.D. 855-860), and the legend "Xπ [Christe] Adiva hltharum Reg." At time advanced there was a growing tendency to enlarge the royal seal. Under Hugh Capet there was (A.D. 889) a further development, the king being represented half-length with the royal insignia; and at last under Henry I. (A.D. 1031-1060) the royal seal of France was complete as the seal of majesty, bearing the full effigy of the king enthroned. In Germany, however, this full type had already been attained somewhat earlier in the seal of the emperor Henry II. (A.D. 1002-1024); and it had been used even earlier by Arnulf, count of Flanders, in 942. The royal seal thus developed as a seal of majesty became the type for subsequent seals of dignity of the monarchs of the middle ages and later, the inscription or legend giving the name and titles of the sovereign concerned.

All the early royal seals which have been referred to were affixed to the face of the documents, that is, en placard; but in the 11th century the practice of appending the seal from thongs or cords came into vogue; by the 12th century it was universal.
SEALS

Naturally, the introduction of the pendant seal invited an impression on the back as well as on the face of the disk of wax or other material employed. Hence arose the use of the counter-seal, which might be an impression from a matrix actually so called (contra sigillium), or that of a signet or private seal (secretum), such countersealing implying a personal corroboration of the sealing. The earliest seal of a sovereign of France to which a counter-seal was added was that of Louis VII. (A.D. 1141), an equestrian effigy of the king as duke of Aquitaine being impressed on the reverse. When, in 1154, Aquitaine passed to the English crown, this counterseal disappeared, and eventually in subsequent reigns a fleur-de-lis or the shield of arms of France took its place. In the German royal seals the imperial eagle or the imperial shield of arms was the ordinary counterseal.

To turn to England: it appears that the kings of the Anglo-Saxon race, or at least some of them, imitated their Frankish neighbours in using siglets or other seals. There are still extant an impression of the seal of Offa of Mercia (A.D. 799) bearing a portrait head; and one of the seal of Edgar (A.D. 960), an intaglio gem. The first royal seal of England which ranks as a "great seal" is that of Edward the Confessor, Impressions of which were furnished with a counterseal, the design being nearly identical with that of the obverse (fig. 1). William the Conqueror, as duke of Normandy, used an equestrian seal, representing him mounted and armed for battle. After the conquest of England, he added a seal of majesty, copied from the seal of Henry I. of France, as a counterseal. In subsequent reigns the order of the two seals was reversed, the seal of majesty becoming the obverse, and the reverse being the equestrian seal: a pattern which has been followed, almost uniformly, down to the present day.

Besides the two royal seals of Anglo-Saxon kings that have just been noticed above there are extant a few other seals, and there is documentary evidence of yet others, which were used in England before the Norman Conquest; but the rarity of such examples is an indication that the employment of seals could not have been very common among our Anglo-Saxon forefathers. Berhtwald the thane, in 788, and Æthelwulf of Mercia, in 857, affixed their seals to certain documents. In the British Museum are the bronze matrices of seals of Æthelwald, bishop of Dunwich, about 800; of Æthelric, alderman of Hampshire, about 858; and the finely carved ivory double matrix of Godwin the thane (on the obverse) and of the nun Godcythe (on the reverse), of the beginning of the 11th century. In the Charter Library of Durham there is the matrix of the monastic seal of about the year 970; and in the British Museum, appended to a later charter (Harl. 45 A. 36), is the impression of the seal of Wilton Abbey of about 974.

The official practice of the Frankish kings, which, as we have seen, was the means of handing down the Roman tradition of the use of the signet, was gradually imitated by high officials of state. In the 11th century the mayors of the palace are found affixing their personal seals to royal diplomas; and, once the idea was started, the multiplication of seals naturally followed. From the end of the 10th century there was a growing tendency to their general use. From the 12th to the 15th century inclusive, sealing was the ordinary process of authenticating legal documents; and during that period an infinite variety of seals was in existence. The royal seals of dignity or great seals we have already noticed. The sovereign also had his personal seals: his privy seal, his signet. The

provinces, the public departments, the royal and public officers, the courts of law: all had their special seals. The numerous class of ecclesiastical seals comprised episcopal seals of all kinds, official and personal; seals of cathedrals and chapters; of courts and officials, &c. The monastic series is one of the largest, and, from an artistic point of view, one of the most important. The topographical or local series comprises the seals of cities, towns and boroughs and of corporate bodies. Then come the vast collections of personal seals. Equestrian seals of barons and knights; the seals of ladies of rank; the armorial seals of the gentry; and many examples, chiefly of private seals, of all kinds, sacred and profane, ranging from the finely engraved work of art down to the roughly cut merchant's mark of the trader and the simple initial letter of the yeoman, typical of the time when everybody had his seal. The ordinary shape of the medieval seal is round; but there are certain exceptions. Ladies' seals and some classes of ecclesiastical and monastic seals are of pointed oval form, which is best adapted to receive the standing figure of lady, bishop, abbot or saint: the common types in such classes. Fanciful shaped seals also occur, but they are comparatively rare.

In the middle ages the metal chiefly employed in the manufacture of matrices was bronze. Among the wealthy, silver was not uncommon; among the poor, lead was in general use. The matrices of steel were more made at a later time in the 16th and 17th centuries. In the 11th century a fairly large number of matrices were cut in ivory. The use of engraved gems in the early middle ages had already been indicated; but the taste for antique intaglios was not confined to any one period. In the later centuries also, particularly in the 14th century, they were set in seal matrices and finger rings. A fine Graeco-Roman gem, bearing a female head, full face and set in a medieval setting, does duty for the head of Mary Magdalcn as seen in the accompanying cut (fig. 2).

The ordinary matrix of the middle ages was provided with a ridge on the back (or, in some instances, with a vertical handle), by which it could be held while being used for sealing, and which might be pierced for suspension. Sockets for the insertion of handles are of comparatively late make. The matrix was in most instances simple, the design giving a direct impression once and for all. But there are examples of elaborate matrices composed of several pieces, from the impressions of which the seal was built up in an ingenious fashion, both obverse and reverse being carved in hollow work, through which figures and subjects impressed on an inner layer of wax are to be seen. Such examples are the seal matrix of the Benedictine priory of St Mary and St Blaise of Boxgrove in Sussex, 13th century, in the British Museum (fig. 3); and the matrix of Southwick Priory in Hampshire, of the same period (Archaeologia, xxii. 374). The matrix of one of the seals of Canterbury Cathedral was also constructed in the same manner.

It has usually been the custom to break up or deface the matrices of official seals when they have ceased to be valid, as, for example, at the commencement of a new reign. The seals of deceased bishops or abbots were solemnly broken in presence of the chapter or before the altar. But the legal maxim that corporations never die is well illustrated by the survival of the matrix of the fine series of the great seals of the crown, indeed, but very full, of the matrices of English corporations, beginning with the close of the 12th century. A fine example is the corporate seal of Rochester, of the 13th century, showing the keep and battlements of the castle (fig. 4) in high relief.

The common material for receiving the impressions from the matrices was beeswax, generally tempered with various other substances, such as resin, pitch and even hemp and hair. The employment of chalk as an ingredient in many seals of the 12th century has caused them to become extremely fragile; it was a common practice to apply to such seals a coating of brown varnish. Besides the transparent yellowish-brown of the wax when used in its natural state, as it very frequently was used in the earlier middle ages, many other colours,
especially red, dark green and dark brown, and even black, are found in medieval seals. Any attempt to classify examples by their colours fails, for, while at some periods the particular tints employed in certain chanceries may have been connected with the device or with the occupation of the owners, to marking the character of the documents so sealed, such practice was not consistently followed.

For the protection of the impression, in the 12th and 13th centuries, when it was an ordinary custom to impress the seals on thick cakes of wax, the surrounding margin was almost always formed into a suitable fender; at other times, as in the 14th century, a so-called wreath, or twisted shred of parchment, or plaited grass or reed, was placed in the wax round the impression. But the most common process was to sew up the seal in a cloth or canvas bag, which was called a reed, and the fender that it supported was known as a bulwark or buldow.

Seals of cloth or canvas, with the mistaken notion that this would ensure the seal's integrity; the ordinary result being that, on the assumption that seals thus protected needed no further care, they have been in most instances either broken or crushed to powder. In later times, seals, especially great seals, have been frequently fitted in metal or wooden boxes.

The medieval seal may be said, in general, to be composed of two essential parts: the device, or type, as it is sometimes called, and the inscription or legend. It is the existence of the legend, surrounding the device as with a border, that distinguishes such a seal from the gem, which rarely bore an inscription and then only its field. Such antique gems as were adopted for matrices in the middle ages were usually set in metal mounts, on which the legends were engraved. The first and obvious reason for an inscription on a seal was to ensure identification of the owner; and therefore the names of such owners appear in the earliest examples. Afterwards, when the use of seals became common, and when they were as often a signet as a signet, fanciful legends or mottoes appropriate to the devices naturally came into vogue. Examples of such mottoes will be given below.

A few words may be said regarding the different kinds of types or devices appropriate to particular classes or groups of medieval seals; and, although these remarks have special reference to English seals, it may be noted that there is a common affinity between the several classes of seals of all countries of western Europe, and that what is said of the seal-devices of one country may be applied in general terms to those of the rest. The types of the great seals of sovereigns have already been mentioned: a seal of majesty on the obverse, an equestrian seal on the reverse. Other devices were borne on the obverse the king enthroned or mounted, and the royal arms on the reverse. Among other official seals a very interesting type is that of the Lord High Admiral in the 15th century, several matrices of the seals of holders of the dignity having survived and been exhibited in the British Museum. That of John Holland, earl of Huntingdon, Admiral of England, Ireland and Aquitaine, 1435-1442, is here given (fig. 5), having the usual device of a ship, on the mainail of which are the earl's armorial bearings. In ecclesiastical seals generally, in the seals of religious foundations, cathedrals, monasteries, colleges and the like, sacred subjects naturally find a place among other designs. Such subjects as the Ascension, the Trinity, the Annunciation, the Nativity, the Crucifixion, the Coronation of the Virgin, are not uncommon. Episcopal seals more generally show the prelate prominently as a kneeling figure, sometimes conspicuously, as kneeling in prayer before the Deity or patron saint; the counterseal, the figure of patron saint or founder, or of abbot or abbess; or the conventual building. If there be a counterseal, the figure of patron saint or founder may stand there, while the building occupies the obverse. Each abbot, too, would have his own seal of dignity, generally showing him standing. Local seals of town or borough may have the image of a patron saint, or armorial device, or crest of the bridge or other building (see fig. 4), or the town itself. A seal-press will be indicated by a ship on the waves. The baronial seal bears the armed and mounted knight. On ladies' seals the owner is often gracefully depicted standing and holding lower or higher, with shields of arms. After the 14th century, the figures of ladies, other than queens, vanish from seals. Armorial devices of the gentry first appear on seals at the close of the 12th century, and from that time there is a gradual development of the heraldic seal, which in the 14th century was often a work of fine decorative sculpture. And, lastly, the devices on fancy seals are without end in their variety.

As in all other departments of medieval art, the engraving of seals in the middle ages passed through certain well-marked developments and changes characteristic of different periods. Fine seal engraving is to be found in the productions of many of the continental nations; but in the best periods nothing can excel the work of English cutters. Beginning with the examples of the 11th and 12th centuries, we find the subjects generally of an archaic style, which is evidence of an early stage of the art. In the 13th century this undeveloped stage has passed, and a fine, but still restrained, quality of engraving ensues, which, like all the allied arts of that century, charms with its simple and unpretending precision. For example, in the great seals of Henry III., something of the antique stiffness remains, but the general effect and the finish of the details are admirable. We may refer also again to the Boxgraves seal (fig. 3) as a fine specimen of 13th century architectural carving. But the most beautiful seal of this period, perhaps, is the monastic seal of the most beautiful medieval seal in existence, the monastic seal of Merton Priory, in Surrey, of the year 1241. An engraving of the obverse, the Virgin and Child, is here given (fig. 6). The Merton seal is the work of a master hand treating his subject with wonderful breadth and freedom. As the century advances, a more graceful movement in the figures is discernible. For instance, the great seal of Edward I. shows a departure from the severe simplicity of his predecessor in the addition of decorative architectural details, and in the easier action of the equestrian figure, which in this instance is of a strikingly fine type. Comparable with it is the remarkable baronial equestrian seal of Robert Fitz-Walter (fig. 7), 1298-1304, the silver matrix of which is in the British Museum collections.

The work of the 14th century is marked by a great development in decoration. Where the artist of the former century would have secured his effect by simple, firm lines, the new school trusted to a more superficial style, in which ornament rather than

---

**Fig. 4.—Corporate Seal of Rochester.**

- A corporate seal typically represents the authority of a city or corporation. It may feature symbols associated with the city's history, such as a castle or a coat of arms.

**Fig. 5.—Seal of Lord High Admiral Huntingdon.**

- This seal is marked with a ship, which could symbolize the owner's connection to the sea or maritime activities.

**Fig. 6.—Merton Priory Seal.**

- This seal showcases the Virgin and Child, reflecting the religious significance and artistic style of the period.

**Fig. 7.—Seal of Robert Fitz-Walter.**

- This seal depicts a more ornate style, with intricate designs that reflect the artistic trends of the 14th century.
form is the leading motive. The new style is conspicuous in the
great seals and other official seals of Edward III., as well as in
other classes. The 14th century is also the period of enriched
canopies, of niches and pinnacles and of other details of mono-
mental sculpture reproduced in its seals. A very beautiful and
typical example of the best work of this period is to be seen in the seal
of Richard de Bury, bishop of Durham from
1333 to 1345 (fig. 8). It
is to be remarked that
the standing figure of the
bishop in episcopal
seals, of the abbot in
monastic seals and of
the lady in ladies' seals,
which was so persistent
in the 13th century onwards, proved to be
the happy cause of the maintenance of
the elegant oval shape in examples of these
classes, wherein some of the best balanced de-
signs are to be found.

The 15th century brought it to seal-
engraving, as it did to other departments of
medieval art, the elements of decadence.
The execution becomes of a more mechanical type; the strength of
the 13th century and the gracefulness of the 14th century have
passed; and, while examples of great elaboration were still
produced, the tendency grows to overload the decoration. This
defect is noticeable, for example, in the elaborate great seals of
the Henries of the 17th century, as compared with the finer
types of their predecessors. As a good example of the middle
of the century, the seal of King's College, Cambridge, of about
the year 1443, is here given (fig. 9), showing the Virgin in glory in
the centre, between St Nicholas and King Henry V. E.

With the rise of the period of the Renaissance, like other
medieval arts, seal-engraving passed out of the range of the
traditions of the middle ages and came under the influence of
the derived classical or pseudo-classical sentiment. There is,
therefore, no need to pursue the subject further.

We close this portion of the present article with specimens of
the legends or mottos which are to be found on the innumerable
personal seals of the 13th, 14th and 15th centuries.

Mottos. They are of great variety, and many of them are very
interesting, both on account of the devices which they accompany
and the sentiments which they express. In English seals they
are found composed in Latin, in French, and in the vernacular.
First there are legends describing the quality of the seal or
conveying a message to the recipient of the missive, as:—Prévè su
su (suiss); privé su et poi conu (peu connu); sigillum secreti;
secreti nuntius; je su mutè; le l(eoil) ami mutè; je su sel bon c
leel; veidi pardi lel; clausa secreta tego; signo secreta signo;
secreta gero; si frangis, reveolo; frange, lege, tege; brusset,
liet, et celet; accipe, frange, lege; clade, repone, tege; missa
lege, lecta tege; tecta, lege, tege; briset, vaee, lize;
creas; tene fidem; tenet la foy; softe and fayre. Seals with
love mottos are numerous:—sigillum pacis et amoris; je su
amurs; je su seel damar lel sel de sulu ex damur; de li
penset par ki me avet; jeo su ci en lu dami; penset de li par ki
su ci; ase for the tresveste; ami amet, car lel ami avet; amye
amet, mon quer avet; mun quer avet, ben le gardè; mun cuer
avet, ne le deceve; penset de moi, e je de vus; mon quer jolye
a vos doin, amye; je suy fluer de lel amur; love me and I the;
if the liket, mi love holde; poi vaut vivre sans lel ami. The lion
is a not uncommon device:—Je su lion bon par avisoun; sum
leo, quovis eo, non nisi uero veho; je su rey des bestes; leo
tegit secretum. A lion dormant:—Ci repose le lion; ici dort
le lion fort; wake me no man. A lion dormant on a rose, the
symbol of secrecy:—Ben pur celer, gis sur rose; ici repose le
in la rose; de su la rose le lion repose. Rustic life is represented
by a squirell:—I crake notis; I krak notis; I bite notes:—by
a hare, or a hare riding a dog:—Sooh, sohou; sohou, mutel;
sohou, Robiin; sohou, je le voii; sohou, je la trouyve; je vois
a bois; by a hare in a tree:—Sooh, scut, ware I cut: by a monkey
riding a dog or goat:—Allone I ride, I hunt; allone I ride, have
I no swyan: by a stag:—Alas, Bowles: by a dog:—hobbe,
dogge, hobbe; garez ben le petit chen: by a hawk seizing a
bird:—Alas, je su pris. And more than one example bears the
motto:—By the road, woman and wood (mad).

Bullae. As stated above, metal seals, as well as seals in soft
materials, have been employed in European countries under
certain conditions. These are technically called "bullae" (Lat.
bulla, a boss, or circular metal ornament), and necessarily they
were in all cases suspended from the documents, and they bore a
design on both obverse and reverse. In the southern countries
of Europe, where wax would be affected by the warmth of the
climate, it was natural that a harder material should also be used.
Hence the leaden bulla was a recognized form of seal during the
middle ages in the Peninsula, in Italy, Great Britain, and, to a
lesser extent, in France. In the East, bullae seem to have been
common in the Latin East. The best-known series is the papal series
of leaden seals which have lent their name to the documents of
the papal chancery which they authenticate, popularly known as
papal "bulls." The earliest extant example of this series is of
the year 746 (see DIPLOMATIC). Leaden seals were also used by
the archbishops of Ravenna and other prelates of Italy; also
to some extent by officials of a lower rank, and by certain
communes. The official seals of the doges of Venice and of Genoa
and of other dignitaries of those states were also of lead. The
seals of Spain, too, made use of the same material; and in
the Byzantine empire leaden bullae seem to have been universally
employed, not only by emperors and state officials but also by
private persons. Even in the north, metal bullae were also
occasionally in use. Certain Carolingian monarchs, probably
copying the practice of the papal chancery, issued diplomas
authenticated by leaden seals, examples of the reign of Charles
the Bald being still extant. The fashion even spread to Britain,
as is proved by the existence in the British Museum of a leaden
bull of Conwull of Mercia, A.D. 800–810. In Germany, too,
hierarchs occasionally made use of leaden seals. But, while lead
was the ordinary material for the metal seal, a more precious
substance was occasionally used. On special occasions golden
bullae were issued by the Byzantine emperors, by the popes,
by the Carolins, although no actual examples of the last have survived, by the emperors of Germany, and by other sovereigns and rulers. Such specimens as have descended to us show that the golden bulla of the middle ages was usually hollow, being formed of two thin plates of metal stamped with the designs of obverse and reverse, soldered together at the edges and padded with wax or plaster. On rare occasions it was of solid gold. The popes attached golden bullae to their confirmations of the elections of the emperors in the 12th and 13th centuries; and they issued them on such occasions as when Leo X. conferred on Henry VIII. the title of Defender of the Faith, in 1521; on the coronation of Charles V., 1530; on the erection of the archbishopric of Lisbon into a patriarchate in 1716, &c.; and quite recently papal golden bullae have been conferred on royal persons. comparatively few examples of golden bullae have survived. The value of the metal sufficiently accounts for their scarcity. Some examples are in the British Museum, viz. of Baldwin II. de Courtenay, formerly emperor of Constantinople, attached to a charter of 1269; of Edward of England, and of the emperor Henry III. of England; and of the emperor Frederick III., 1452-1503. In the Public Record Office, of Alfonso X. of Castile, ceding Gascony to Edward, son of Henry III. of England, 1254; of Clement VII. confirming to Henry VIII. the title of Defender of the Faith, 1524 (this example being the work of Benvenuto Cellini); and of Francis I. of France, ratifying the treaty with Henry VIII., 1527 (the counterpart with Henry's bulla being in Paris).

Pedrick, Borough Seals of the Gothic Period (1904); H. Laing, Catalogue of Ancient Scottish Seals (1858, 1866); Douet d'Arbo, Collection de sceaux (Inventaires et documents des archives de l'Empire) (3 vols., 1865-1868); G. Demay, Inventaire des sceaux de la Flandre (2 vols., 1873), de l'Artois et de la Picardie (1877), de l'Aisne et de l'Oise (1878); Onslow, Sigillographie de l'Empire byzamien (1884); J. Walther, Hartung, Catalogue des sceaux armor. pontificalc Romanorum (for papal bullae) (1885-1897); Catalogue of Engraved Gems in the Dept. of Greek and Roman Antiquities (1893); Catalogue of Engraved Gems in the Dept. of Etruscan, Greek and Roman Seals, etc., in the British Museum (1907); E. Babelon, Histoire de la gravure sur gemmes en France (1902). There are also numerous papers on seals in Archaeologia and in the Journal of Glass and China. Handbooks on diplomatic devote some attention to seals, e.g. A. Giry, Manuel de diplomatique (1894); H. Bresslau, Handbuch der Urkundenlehre für Deutschland und Italien (1896). (E. M. T.)

SEALSFIELD, CHARLES, the pseudonym of KARL ANTON PREUSCHER (1831-1906), was born at Leisnig, Saxony, on 2nd March 1830 at Popitz near Znaim in Moravia. His schooling completed, he entered the Kreuzherrenorden in Prague, where he became a priest, but in the autumn of 1852 he fled to America, where he assumed the name of Charles Sealsfield. In 1856 he returned to Germany and published a book on America (Die Vereinigten Staaten von Nordamerika), which was followed by an outspoken criticism of Austria, written in English (Austria as it is, 1858) and published anonymously in London. Meanwhile he had returned to America, where he published his first novel, also in English, Tokeh, or the White Rose (1858). He now turned journalist, first in New York and subsequently in Paris and London, as correspondent for various journals. In 1832 he settled in Switzerland, and in 1856 purchased a small estate near Solothurn. Here he died on the 26th of May 1864. His will first revealed the fact that he was the former monk, Postl.

It is as a German novelist that he is best known. His Tokeh appeared in German under the title Der Legende und die Republikaner (1838), and was followed by Der Virey and die Aristokraten (1835). "Lebensbilder aus beiden Hemisphären (1835-1837), Staats-, Land- und Seebilder (1838), Das Kabinet, oder Nationale Charakter-. "The development of the German historical novel at a period when Scott's influence was beginning to wane. He endeavoured to widen the scope of Peter Hain, great national and political movements, without forfeiting the sympathy of his readers for the individual characters of the story. Sealsfield's Gesammelte Werke appeared in 16 vols. (1843-1846): his chief novels are also to be obtained in modern reprint. See Kerbény, Erinnerungen an Sealsfield (1864); L. Schmolle, Charles Sealsfield (1875); L. Hamburger, Sealsfield-Postl, bisher unveröffent- lichte Briefe (1879); A. B. Faust, Charles Sealsfield, der Dichter beider Hemisphären (1896).

SEAMAN, OWEN (1861— ), English humorist and author, was educated at Shrewsbury school and Clare College, Cambridge, where he took a first class in the classical tripos in 1883; in the next year he became a master at Rossall school; and in 1890 he was appointed professor of literature at the Durham College of Science, Newcastle-on-Tyne. He was called to the bar at the Inner Temple in 1897. He was introduced to Punch in 1894, with his "Rhyme of the Kipperling," a parody of Rudyard Kipling's "Rhyme of the Three Sealers." He also wrote for The National Observer and The World. In 1894 he published a volume of parodies which is a classic of its kind, Horace at Cambridge, followed by The Battle of the Bays (1896), In Cope and Bells (1899), Borrowed Plumes (1902), A Harvest of Chaff (1904). He joined the staff of Punch in 1897, and shortly afterwards became assistant-editor, succeeding Sir F. C. Burnand as editor in 1906.

SEAMANSHIP, the general term for the art by which vessels of all classes and sizes are handled in all conditions of weather. It is commonly distinguished from "boatmanship," but the distinction is arbitrary. In ordinary speech it is frequently used as meaning the same thing as navigation (q.v.). But the two subjects are essentially different. Navigation is a science based on observation of the sun and stars in their apparent movements, on their bearings to one another, and the earth, and on time. It may be acquired from the study of books, and it is possible, although it would be difficult, for one to have a general sight of it as an art. Its principles may be stated in literary form, but a mastery of it can only be acquired by actual practice on the sea. The art is far older than the science, but because of its practical character its history is much more difficult to trace. Navigation, being one form of the study of mathematics and astronomy, has been written about from the beginning. Seaman ship has been practised in perfection by men who were perfectly illiterate for thousands of years before any treatise on it appeared. Seamen have at all times been, as Clarendon noted, a people apart. Till recently they have believed in practice only, and being jealous of, and hostile to, landmen, have generally endeavoured to preserve their knowledge as an "art and mystery" to be handed down by oral instruction from master to apprentice. Sir Henry Manway ring, whose Seaman's Dictionary appeared in 1694, claimed that it was the first treatise on seaman ship ever written. After explaining that a writer who had not acquired the art by practice could not expound it, he goes on: "And as for the profess ed Seamen they either want ability and dexterity to express themselves, or (as they do generally) will, to instruct others. If there was a will among the vulgar sort of Seamen hate landmen so much, either he or I shall never find out why they are so unwilling to instruct them in their art, whence it is that so many gentlemen go long voyages, and return (in a manner) as ignorant and as unable to do their country service as when they went out." Though the Seaman's Dictionary did not appear in print till 1694, it is described on the title-page as having been presented to George Villiers, duke of Buckingham, the lord high admiral of Charles I., who was murdered in 1628. Manway ring's book is therefore probably, if not the first treatise on seaman ship written in English, at least as old as its only rival, the Accidents, or the Pathology necessary for all young seamen, published in 1626, by the famous Captain John Smith, of Virginia. On the continent of Europe, as in England, while works on navigation and gunnery were common, treatises on practical seamanship date from the 17th century. The books of Manway ring and Smith are rather glossaries of terms than expositions of principles. We are therefore left with very few documents from which to learn what the seaman ship of antiquity and the middle ages was. But such testimony as we have confirms the conclusion to be drawn from our general knowledge of the construction of their ships, and of the scientific learning of their times. The old seamen were coasters, who acted on the fisherman's adage—
SEAMANSHIP

"If you cannot steer by the compass, steer by the land," because they had no choice. War ship and merchant ship alike clung to the coast—or if they ventured out to sea, they did so for a voyage to be counted by the hour, as, for instance, from the south-west of Sicily to the opposite coast of Africa—or they relied on regular trade winds, like the seamen who sailed from the Red Sea to the coast of Malabar going and coming with the monsoons. In spite of exceptions, more apparent than real, contact of the British with the commerce of the Orient and of the Norsemen to that island, and to Greenland, seamanship continued to be the art of the coast till the close of the middle ages. Chaucer's sailor has hardly lost sight of the coast. Such treatises as were written for seamen were books of pilotage. Examples will be found at the end of the Hakluyt Society's edition of *Hues Tractatus de globis*. The warships, Phoenician, Greek, Roman, Norse, Byzantine and Italian throughout the middle ages, used sails only when not in action. They were rowed in battle, and the mast was lowered, or left on shore. We know how they avoided passing the lee side. Their galleys were beached or anchored close to the shore and the men landed. We know from Thucydides' narrative of the expedition to Syracuse, that the crews were landed even for their meals; from the chronicle of Ramon de Muntaner, we know that this was also the case with the best Mediterranean squadrons at the end of the 13th century. The Athenians, clinging to the coast, spent two months in going from Athens to Syracuse. Roger di Lauria, the admiral of Aragon, when coming from Sicily in circumstances of great urgency to Catalonia, went round by the coast of Africa and Spain. In 1450, a group of English merchants alike had, at the outside, very few sails, and generally only one great course (see *Sails*) square and slung by the middle of the yard. It could be trained fore and aft by bowlines, so as to enable the vessel to sail on the wind. Under these restrictions seamanship was necessarily a limited art. From Marco Polo we learn that the seamen of the China Sea and of the Indian Ocean were coasters as their European contemporaries. Though the art of seamanship is distinct both from the art of shipbuilding and the science of navigation, it has naturally developed with them. The discovery of the marine compass, the advance of astronomical knowledge, the invention of the rude early instruments of navigation, the astrolabe, the back staff, the quarter staff, loosened the dependence of the sailor on the shore. Thence came the need for larger ships, and they demanded a more developed rigging (q.v.). Modern seamanship begins with the voyage of Columbus. The previous and contemporary voyages of the Portuguese were coasting voyages round Africa. But Columbus struck across the ocean, and within thirty years Sebastian de Elcano, who accompanied Magellan, had sailed the world.
SEAMEN, LAWS RELATING TO

In most legal systems legislation has interfered to protect the seaman from the consequences of that impudence which is generally supposed to be one of his distinguishing characteristics. In the United Kingdom legislation has dealt with the interests of seamen with unusual fulness of detail, proving the care bestowed by a maritime power upon those to whom its commercial success is so largely due. How far this legislation has had the efficiency which was expected may be doubtful.

For legislative purposes seamen may be divided into three classes—seamen in the royal navy, merchant seamen, and fishermen.

Seamen in the Royal Navy.—It is still lawful to impress men for the naval service (see IMPRESSMENT), subject to certain exemptions (13 Geo. II. c. 17, 1740). Among persons exempt are seamen in the merchant service. In cases of emergency officers and men of the coastguard and revenue cruisers, seamen and riggers and pensioners may be required to serve in the navy (Naval Volunteers Act 1853). There appears to be no other instance (now that balloting for the militia is suspended) where a subject may be forced into the service of the crown against his will. The navy, however, at the present day wholly re-狂欢 acts of a compulsory enlistment (see the Naval Enlistment Acts, 1825 to 1884). Special advantages are afforded by the Merchant Shipping Act 1894 to merchant seamen enlisting in the navy. They are enabled to leave their ship without punishment or forfeit in order to join the naval service. The discipline of the navy is, unlike that of the army, for which an annual act is necessary, regulated by a permanent act of parliament, that now in force being the Naval Discipline Act 1866. In addition to numerous hospitals and infirmaries in the United Kingdom and abroad, the great charity of Greenwich Hospital is a mode of provision for old and disabled seamen in the navy. At present such seamen are out-pensioners only; the hospital has been for some years used as the Royal Naval College for officer students. The enactments of the Merchant Shipping Act 1854 as to savings banks are extended to seamen in the navy by the Merchant Shipping Act 1894, s. 148. Enlistment without the licence of the crown in the naval service of a foreign state at war with another foreign state that is at peace with the United Kingdom is an offence punishable under the Foreign Enlistment Act 1870. Any person buying from a seaman or enticing a seaman to sell government property is liable to the penalties under the Seamen’s Clothing Act 1864 (see NAVY).

Merchant Seamen.—Most of the acts dealing with this subject, commencing with 8 Eliz. c. 13, were repealed in 1854 and have since been consolidated and extended by the Merchant Shipping Acts 1894 and 1906; the act of 1894 being the longest act on the statute roll. The main part of the legislation affecting seamen in the merchant service occurs in the second part of the act of 1894 and the fourth part of the act of 1906. The act of 1894 defines a seaman to be “every person (except, masters, pilots, and apprentices duly indentured and registered) employed engaged and on any capacity on board any ship” (s. 742).

The act of 1894 is largely a re-enactment of the previous acts of 1825, 1826, and 1842. The law as to the engagement and discharge of seamen has not been altered. These must take place before a superintendent only when the employment is on a foreign or adjacent vessel. If the signing on and discharge take place before a superintendent only if the master so desire. But if the signing on does not take place before a superintendent, the master must cause the agreement to be read and explained to the seaman, and the seaman must sign it in the presence of a witness; copies of all such agreements must be transmitted to the Board of Trade. A copy of every agreement with the crew must be posted in some part of the ship. In any British possession abroad other than that in which the ship was originally registered, a seaman who is engaged on a British ship bound to the port in His Majesty’s dominions at which he was originally shipped, or to a port in the United Kingdom agreed to by the seaman, shall be furnished, at any place where he obtains the sanction, endorsed on the agreement with the crew, of the like officials or, in their absence, of merchants there resident. A seaman discharged in a foreign country is entitled to be provided with a written certificate of discharge, and of any port abroad where he was engaged when he was discharged or versioned, or on his return. Discharge of a seaman is not an offence punishable with imprisonment or fine. If a seaman is discharged by the master, the warrant of discharge is to be delivered to the seaman when he is discharged. It is an offence punishable with imprisonment to discharge a seaman without his consent or without the consent of the master. In discharge, if the master’s discharge is opposed by the seaman, the consular officer of the ship may give the discharge. A seaman discharging in a country where the master is not resident shall obtain the discharge of the return of the ship to the United Kingdom. The only persons by whom seamen may be engaged or supplied in the United Kingdom are a superintendent, the master, the mate, a servant bond fide in the constant employ of the owner, and any person holding a licence from the Board of Trade.

At common law there was no obligation of the owner to provide a seaworthy ship, but by the act of 1894, part v, every person who sends or attempts to send, or is party to sending or attempting to send, a British ship to sea in such unseaworthy state that the life of any person is likely to be endangered by reason of any negligence is guilty of a misdemeanour, and that he used all reasonable means to ensure her being sent to sea in a seaworthy state, or that her going to sea in such unseaworthy state was under the circumstances reasonable and justifiable. A master may be held guilty of a breach of this act as to the supply of seamen, and that the life of any person is likely to be thereby endangered is guilty of a misdemeanour. Every contract of apprenticeship, an obligation is implied that the owner, master and agent shall use all reasonable means to ensure the seaworthiness of the ship. By the act of 1906 many of the provisions as to seaworthiness have been extended to foreign ships, and they may be detained in a proper case. A return of certain particulars, such as lists of crews and of distressed seamen sent home from abroad, reports on discharge, births and deaths at sea, must be made to the registrar of shipping and be available for inspection. (See also SHIP.)

The seaman is privileged in the matter of wills (see WILL), and is exempt from serving in the militia (42 Geo. III. c. 90, s. 43). Assaults upon seamen with intent to prevent their working at their occupation are punishable summarily by the Offences against the Person Act 1861, s. 40. There are special enactments in favour of Lascars and foreign seamen on British ships, e.g. s. 125 of the act of 1884.

In addition to this legislation directly in his interest, the seaman is indirectly protected by the provisions of the Merchant Shipping Acts requiring the possession of certificates of competence to engage seamen, the annual survey and examination by the Board of Trade, and the enactments against deck cargoes, and overloading, as well as by other acts, such as the Registration of Apprentices and Apprenticeship Acts, against the strength of cables and anchors, and the Passenger Acts, under which a proper supply of life-boats and life-buoys must be provided. The duties of the seamen appear to be to obey the master in all lawful orders, to guard against the misuse of a ship, and to encourage him in which he may become entitled to prize money under 22 and 23 Car. II. c. 11 (see PRIZE). Any services beyond these would fall under the head of salvage service and be recompensed accordingly. There are certain offences for which the seaman is liable to be summarily punished under the act of 1894. They comprise desertion, neglect or refusal to join his ship or absence without lawful cause, disobedience of lawful commands, consorting in security, wilful disobedience to a lawful command, either on one occasion or continued, assault upon a master or mate, combining to disobey lawful commands or to neglect duty, or to impede the exit of the ship from port, or to attempt, or attempt to extort from the ship, or embezzlement of or willful damage to her stores or cargo and smuggling. The punishment varies from forfeiture of all or part of his wages to twelve weeks’ imprisonment. Any offence involving his being the owner, master, or any other person who has any interest in the ship, forgery of a certificate of service or discharge is an offence punishable by summary jurisdiction by the Seamen’s and Soldiers’ False Character Acts, 1906.

Engagement and discharge of Seamen.

There are numerous Orders in Council dealing with seamen, especially as to the registration of fishing boats and the rights to be shown by them. XXIV. 18

Duties of Masters and Seamen.
SEAMEN, LAWS RELATING TO

The Steam Trade Acts. A riotous assembly of seamen to prevent the loading or unloading of any ship or to prevent others from working is an offence under 33 Geo. III. c. 67. Deserters from Portuguese ships are punishable by 12 and 13 Vict. c. 35, and from any foreign ships by 18 & 19 Vict. c. 196, as well as with Portugal and other foreign powers. The rating of seamen is now regulated by the Merchant Shipping Act 1894, s. 126. By that act a seaman is not entitled to the rating of "A.B." unless he has served for six months on a British registered vessel. This act also makes it possible for a master or owner desiring to secure registered decked fishing vessel and one year at sea in a trading vessel.

The act of 1894 enables contributions to seamen's refuges and hospitals to be charged upon the mercantile marine fund. There appears, however, to be no grant in support of seamen's hospitals out of any public funds. The principal seamen's hospital is that at Greenwich. Seamen may also contribute to the fund for the expense of the hospital from the funds of the hospital. These "Greenwich Hospital six-

The remedies of the seamen for wages are an ordinary action in the king's bench division or plaint in a county court, an action in

Wages cannot be attached. They may be forfeited or reduced by desertion, smuggling, and other kinds of misconduct. In O'Neill v. Armstrong, 1895, 2 K.B. 418, it was held by the court of appeal that a seaman, though he had not completed the voyage, could recover his full wages where war breaking out alleged a risk to the employment which amounted to a breach of contract at the time of his engagement. In actions in all courts of admiralty jurisdiction the seaman has a maritime lien on the ship and freight, ranking next after claims for salvage and lawful expenses in the payment of wages. The limit of the amount of wages recoverable is £50. Orders may be enforced by distress of the ship and her tackle. Proceedings must be taken within six months. A naval court on a foreign station may determine questions as to the payment of wages and contributions, and the rule a court has jurisdiction over wages due abroad for a voyage to terminate in the United Kingdom. The superintendent of a mercantile marine office has power to issue a warrant whenever between a master or owner and any of his crew which both parties in writing agree to submit to him. These summary remedies are all preserved by the act of 1894. The act further provides that, where a question as to wages is raised before a superintendent, if the amount in question does not exceed £5, the superintendent may adjudicate finally, unless he is of opinion that a court of law ought to decide it. The Merchant Seamen Act 1886, by a section not repealed by the act of 1894, and the Masters, Mates and Seamen's Act 1893, provide for the appointment of inspectors to inquire into complaints of undermanning, and the act of 1894 gives a concurrent jurisdiction with other workmen. A county court or court of summary jurisdiction (the latter limited to claims not exceeding £10) may under the act of 1875 determine all disputes between an employer and workman arising out of their relation as such. The jurisdiction of courts of summary jurisdiction is protected by the enactment of the act of 1894, that no proceeding for the recovery of wages under £50 is to be instituted in a superior court unless the employer or workman is bankrupt, or the ship is under arrest or sold by the authority of such court, or the justices refer the case to such court, or neither owner nor master is or resides within 20 m. of the place where the suit is brought. Summary proceedings may be brought in all county courts and before justices without any limit as to amount. In Scotland the sheriff court has concurrent jurisdiction with justices in claims for wages and upon allotment notes. The representatives of a deceased seaman may claim damages for his death in cases within the Fatal Accidents Acts 1846 and 1864. It has been held that the action lies where the deceased is a foreign seaman on a foreign ship (Davidson v. Hill, 1901, 2 K.B. 609).

Where a seaman is discharged before a superintendent in the United Kingdom, his wages must be paid through or in the presence of the superintendent. The case of a master discharged may be allowed if they have been entered by the master during the voyage in a book kept for that purpose, together with a statement of the matters in respect of which they are made. Where a seaman is left at a port of foreign or British registry by the crew, it is not sufficient, under the act of 1894, to state, by the master, that he has received the wages due from the voyage, the account of wages must be delivered to the superintendent, chief officer of customs, consular officer, or merchants, from whom the master has been paid the wages, and those wages must not be retained by the seaman behind. To protect seamen from crimps, advance notes, or documents authorizing or promising the future payment of money on account of a seaman's wages conditionally on his going to sea or remaining in the service of the ship, or engaged to serve on a foreign ship, or losing the ship, or being made before those wages had been earned, were from 1880 to 1889 wholly void. No money paid in respect of any such document could be deducted from a seaman's wages. Since 1890 this restriction has been removed to the extent that a seaman may accept notes or documents which the crew contains a stipulation for such advance, but this does not extend to cases where the seaman is going to sea from any port not lying in the United Kingdom. In Johnson v. King, 1900, 1 Ch. 471, it was held that there is no limitation on the right to make any agreement for advances or to make advances to any amount. As under the former law, the scale of provisions as amended by the act of 1894 is subject to the master, provided they have been furnished, and compensation made for short or bad provisions, and means are provided whereby the crew can raise complaints. In addition, in the case of ships trading or going from any port in the United Kingdom through the Suez Canal or round the Cape of Good Hope or Cape Horn, the provisions and water are put under inspection by the Board of Trade, and if they are deficient, the ship may be detained until the inspectors are satisfied. If the inspector is satisfied that the cook must be provided for foreign-bound ships. If a seaman receives hurt or injury in the service of the ship, the expense of medical attendance and maintenance, together with the cost of bringing him home, if necessary, to be borne by the owner of the ship, and cannot be deducted from wages.

The safety of the crew is aimed at by provisions which are designed to prevent overloading and undermanning, and generally to prevent shipping from being sent to sea in an unseaworthy state. The stringency of these provisions has been much increased. Life-saving appliances, according to a scale and rules prescribed by the Board of Trade, must be carried by every British ship. Except where the ship is under 80 tons register, employed solely in the coasting trade, or is employed solely in fishing, or in a pleasure yacht, the position of each deck above water shall be marked off by a line 6 ft. 6 in. from the side. If such line is marked in salt water, to which it shall be lawful to load the ship, must be marked at such level as may be approved by the Board of Trade. The length of a ship's keel shall not exceed the regulations prescribed by the Board of Trade. It is this load line which is commonly known as the Plimsoll mark. It is an offence to load a ship so as to submerge the load line, and a ship so loaded may be detained as unsalvageable. Dangerous goods, e.g., explosives, must not be shipped or carried without being distinctly marked as such. Timber must not be carried on deck in the winter months. In the carriage of grain cargoes, rules prescribed by the Board of Trade to prevent shifting must be complied with. The officers of the Board of Trade (subject to a court of survey from an order of final detention) have power to detain a ship which is, by reason of the defective condition of her load line, the height of her freeboard, overloading or improper loading, unfit to proceed to sea without serious danger to human life. Provision is made for the investigation of complaints by seamen that a ship is unfit to proceed to sea. The Public Health Act 1904 enables regulations to be made for carrying into effect international conventions as to insanitary vessels and conveyance of infection by vessels. By s. 11 of the Workmen's Compensation Act 1906, a ship may be detained by order of a court of summary jurisdiction, or if a seaman who has an action under the act shows that a foreign owner is liable to, in compensation under the act.

The meaning of British merchant ships has received much consideration, but has hitherto been little affected by statute law. The effect of the act is thus given in the report, issued in 1896, by a Board of Trade committee on the meaning of merchant ships: "Since the final repeal of the Navigation Laws, which required that the master and three-fourths of the crew of every British ship should be British subjects, and reserved the coasting trade entirely to
British ships and British seamen, the whole world has been open as a recruiting ground to British shipowners, who have not been hampered in their selection by any restriction as to colour, language, qualification, age or strength. Except with regard to certificates, which must be held by masters, officers, and engineers in certain cases, and which, moreover, may be obtained by men of any nationality, there is at present practically no bar to the employment of any person of any nationality in any capacity, whether master, engine-room, or deck-hand. The Merchant Shipping Act 1857 gave power to the Board of Trade to detain ships unseaworthily by reason of undermanning, but prescribed no rules for determining when a ship is to be deemed to be undermanned. Apart from that act the law does not interfere with the number of qualifications of the crew. Nearly one-fourth the seamen employed on British ships are foreigners. Another fourth are Lascars. The figures in 1904, as given by Mr. Lloyd-George in introducing the bill of 1906 in the House of Commons, were 176,000 British subjects, 39,000 aliens, 42,000 Lascars. Aliens serving on British ships may be by a regulation of the secretary (20th April 1904) be naturalized without fee. The act of 1906 (s. 12) provided that after the 31st of December 1907 no seaman may be shipped who does not possess a sufficient knowledge of the English language to understand necessary orders, with an exception in favour of Lascars and inhabitants of a British protectorate. Pilotage certificates are not to be granted unless to British masters and mates (s. 73).

Certificates of competency as masters, mates, and engineers are granted by the Board of Trade, free of charge, for those up to grades, viz. master or first mate, or second mate, or only mate of a foreign-going ship, master or mate of a home-trade passenger ship, first or second class engineer. By virtue of Orders in Council under section 102 of the act of 1894, certificates granted in many of the British colonies have the same force as if granted by the Board of Trade. The following are the requirements of the act as to the officers to be carried by ships:—Masters: A properly certificated master must be carried by every foreign-going ship and every home-trade passenger ship, whatever their tonnage. Mates: A mate, with the certificate of the grade required by the ship, or, if no such certificate exists, in addition to the certificated master, be carried by every foreign-going ship of 100 tons or upwards, unless more than one mate is carried, in which case the first and second mates must have valid certificates appropriate to their respective grades. A mate, with a certificate of the grade of first or only mate or master, must, in addition to the certificated master, be carried by every home-trade passenger ship of 100 tons or upwards. Engineers: Every foreign-going steamship of 100 nominal horse power or upwards must have two certificated engineers—the first possessing a first-class engineer’s certificate, and the second possessing a second-class engineer’s certificate, and both of these to be certificated to the ship or by the ship’s company, and a vessel of the same or greater tonnage, or any other foreign-going steamship, and every sea-going home-trade passenger steamship, is required to carry as the first or only engineer an engineer having a second-class certificate, or a certificate of the higher grade, if no such certificate exists. Mates and engineers of vessels of less than 100 tons are not required to carry a certificate unless before the vessel was shipped they were in the service of a mercantile marine office, that no boy under thirteen is to be employed in sea-fishery, that agreements with seamen on a fishing-boat are to contain the same particulars as those with merchant seamen, and that every man going to sea for the first time, and who has not been in the service of the metropolitan police, that reports of the names of the crew are to be sent to a superintendent of a mercantile marine office, and that accounts of wages and certificates of discharge are to be given to seamen. No fisheries in 1906 were to be opened with a duly certificated skipper. Allusion is also made for special reports of cases of death, injury, ill-treatment or punishment of any of the crew, and for inquiry into the cause of such death, &c. Disputes between skippers or owners and seamen are to be determined at request of any of the parties concerned by a superintendent. Fishermen are exempt from Trinity House dues. There are numerous police provisions contained in the act regulating acts of parliament dealing with the breaching of fishing regulations. These provisions act as an indirect protection to honest fishermen in their employment. The rights of British fishermen in foreign or British bottoms and foreign fishing vessels are regulated by treaty generally confirmed in the United Kingdom by act of parliament. A royal fund for widows and orphans of fishermen has been formed, the nucleus of the fund being part of the profits of the Fisheries Exhibition held in London in 1885. Special provisions as to fishermen in Scotland are contained in s. 389 of the act of 1894 and s. 83 of the act of 1906.

India and Colonies.—In India and in most British colonies there are laws affecting merchant seamen. In some cases such legislation is identical with the imperial act, but in most are differences of more or less importance, and the colonial statutes should be consulted.

United States.—The law of the United States is in general accordance with that of England. The law relating to seamen in the navy will be found in the articles for the government of the navy (Revised Statutes, s. 1624). Legislation in the interests of merchant seamen dates from 1797. A list of the crew must be delivered to a collector of customs. The shipping articles are the same as those in use in the United Kingdom. For vessels in the coasting trade they are, with some modifications, excepting as to writing and signing, in the case of foreign-bound ships signed before a shipping commissioner appointed by the circuit court or a collector of customs, or (if entered into shall be in the form of a treaty, and must be acknowledged by his signature in a prescribed form. One-third of a seaman’s wages earned up to that time is due at every port where the ship unloads and delivers the cargo before the voyage is completed. If any vessel is detained in port by the order of the court, or for any other cause for a period of twenty days, the discharge of the cargo. Advance notice can be made only in favour of the seaman himself or his wife or mother. There is a summary remedy for wages before a district court, a justice of the peace, or a commissioner of a district court. A shipping
SE-A-POWER.

This term is used to indicate two distinct, though cognate, things. The affinity of these two and the indissoluble manner in which the term has been applied to each have tended to obscure its real significance. The obscurity has been deepened by the frequency with which the term has been confounded with the old phrase, "Sovereignty of the sea," and the still current expression, "Command of the sea" (vide SEA, COMMAND or). A discussion—etymological, or even archaeological in character—of the term must be undertaken as an introduction to the explanation of its now generally accepted meaning.

It is one of those compound words in which a Teutonic and a Latin (or Romance) element are combined, and which are easily formed and become widely current when the sea is concerned. Of such are "sea-coast," "sea-forces" (the "land- and sea-forces" used to be a common designation of what we now call the "Army and Navy"); "sea-service," "sea-serpent" and "sea-officer" (now superseded by "naval officer"). The term in one form is as old as the 15th century. Edward III., in commemoration of the naval victory of Sluys, coined gold "nobles" which bore on one side his effigy "crowned, standing in a large ship, holding in one hand a sword and in the other a shield."

An anonymous poet, who wrote in the reign of Henry VI., says of this coin:

"For four things our noble shouweth to me, King, ship and sword, and power of the sea."

Even in its present form the term is not of very recent date. Grote (Hist. of Greece, v. 67, published in 1849, but with preface dated 1848) speaks of "the conversion of Athens from a land-power into a sea-power." In a lecture published in 1853, but probably delivered earlier, the late Sir J. R. Seeley says that "commerce was swept out of the Mediterranean by the besom of the Turkish sea-power" (Expansion of England, p. 86). The term also occurs in Browne's "medicinal" and antiseptics must volume xviii. p. 574, in the article "PERSIA," where we are told that Themistocles was "the founder of the Attic sea-power." The sense in which the term is used differs in these extracts. In the first it means what we generally call a "naval power"—that is to say, a state having a considerable navy in contrast to a "military power," a state with a considerable army but only a relatively small navy. In this sense there are many uses of the phrase. In the last two extracts it means all the elements of the naval strength of the state referred to; and this is the meaning that is now generally, and is likely to be exclusively, attached to the term owing to the brilliant way in which it has been elucidated by Captain A. T. Mahan of the United States Navy.

The double use of the term is common in German, though in that language both parts of the compound now in use are Teutonic, one having been out of use during the Teutonic wars of the Netherlands. (The term was in use in the 14th century, but had "eine bedeuende Seemacht," i.e. an important naval power. He also says that the term was first employed by H. Holm, in 1743; that "eine bedeuende Seemacht," had "eine bedeutende Seemacht," meaning a considerable navy. The term, in the first of the two senses, is old in German, as appears from the fact that in 14th century English literature (see e.g. Grote, History of England, vol. xxxv. (Leipzig and Halle, 1743); "Seemachten, Seepotentenzen; Latin, summae potestates mari potentes.") "Seepeutenzen" is probably obsolete now. It is interesting as showing that German no longer uses "macht" to mean power, but "Seepotentzen," which is the English. We may note, as a proof of the indeterminate meaning of the expression until his own epoch-marking works had appeared, that Mahan himself in his earliest book, Influence of Sea-power on History (1860), used it in both senses. He says (p. 25), "The Spanish Netherlands ceased to be a sea-power." He alludes (p. 42) to the development of a nation as a "sea-power," and (p. 43) to the introduction of the "sea-power" into the French Navy. He remarks of the war of the Spanish Succession that "before it England was one of the sea-powers, after it she was the sea-power without any second. In all these passages, as appears from the term's etymology, Mahan means article, what is meant is a naval power, or a state in possession of a strong navy. The other meaning of the term forms the general subject of Mahan's writings. In his earlier works Mahan writes "sea power" as two words; but in a published work after 1884 it is one word (e.g. "Sea Power," 1884). Mahan defends this formation of the term and the sense in which he uses it. We may regard him as the virtual inventor of the term in its modern meaning, after the publication of his book. It is well to note that Mahan was not alone in this respect. Our passage is from a French writer, in that sense—it is beyond all question who has given it general currency. He has made it impossible for any one to treat of sea-power without frequent reference to his writings and conclusions.

There is something more than mere literary interest in the fact that the term in another language was used more than two thousand years ago. Before Mahan no historian—not even one of those who specially devoted themselves to the narration of naval occurrences—had evinced a more correct appreciation of the general principles of naval warfare than Thucydides. He alludes several times to the importance of getting command of the sea. Great Britain would have been saved some disasters and been less often in peril had British writers—taken as guides by the public—possessed the same grasp of the true principles of defence as Thucydides exhibited. One passage in his history is worth quoting. Brief as it is, it shows that on the subject of sea-power he was a predecessor of Mahan. In a speech in favour of prosecuting the war, which he puts in the mouth of Pericles, these words occur: οἱ μὲν γὰρ οἱ ξένοι αἵλθρα ἀντιλαμβάνεται ὁμαχεῖ, ἴδια δὲ ἐστὶ τῇ πολλῇ καὶ ἐν νήσοις καὶ κατ᾽ ἄρσενον μέγα γὰρ τὸ τῆς θαλάσσης ἐργῶν. The last part of this extract, though often translated "command of the sea," or "dominion of the sea," really has the wider meaning of sea-power, the "power of the sea" of the old English poet above quoted. This wider meaning should be attached to certain passages in Herodotus (iii. 122 in two places; v. 85), which have been generally interpreted "commanding the sea," or by the mere titular and honorific "having the dominion of the sea." One editor of Herodotus, Ch. F. Baeher, did, however, see exactly what was meant, for, with reference to the allusion to Polycrates, he says, class: maxima solis. This is perhaps as exact a definition of sea-power as could be given in a sentence. One instance out of many may be cited from the historian ADOLPHUS BERNHARD KOCH. In his History only of the "principal conditions affecting the sea-power of Italy, nations," but he does not attempt to give a concise definition of it. Yet no one who has studied his works will find it difficult to understand what it indicates. Our present task is, within the necessarily restricted limits of an article in an encyclopedia, to put readers in possession of the means of doing this.
SEA-POWER 549

best, indeed—as Mahan has shown us—the only effective way of attaining this object is to treat the matter historically. Whatever date we may agree to assign to the formation of the term itself, the idea—as we have seen—is as old as history. It is not intended to give a condensed history of sea-power, but rather an analysis of the idea and what it contains, illustrating this analysis with examples from history ancient and modern. It is impossible that the idea is not something which originated in the middle of the 17th century, and having seriously affected history in the 18th, ceased to have weight till Captain Mahan appeared to comment on it in the last decade of the 19th. With a few masterly touches Mahan, in his brief allusion to the second Punic war, has illustrated its importance in the struggle between Rome and Carthage. What has to be shown is that the principles which he has laid down in that case, and in cases much more modern, are true and have been true always and everywhere. Until this is perceived there is much history which cannot be understood, and yet it is essential to the welfare of Great Britain as a maritime power that she should understand it thoroughly. Her failure to understand it has more than once brought her, not to the verge of destruction, at any rate within a short distance of serious disaster.

The high antiquity of decisive naval campaigns is among the most interesting features of international conflicts. Notwithstanding the much greater frequency of land wars, the course of history has been profoundly changed more often by contests on the water. That this has not escaped the notice it deserved is true, and Mahan tells us why. "Historians generally," he says, "have been unfamiliar with the conditions of the sea, having as to it neither special interest nor special knowledge; and the profound determining influence of maritime strength on great issues has consequently been overlooked." Moralizing on that which might have been is admittedly a sterile process; but it is sometimes necessary to point, if only by way of illustration, to a possible alternative. As in modern times the fate of India and the fate of North America were determined by sea-power, so also at a very remote epoch sea-power decided whether or not Hellenic colonization was to take root in and Hellenic culture to dominate central and northern Italy as it dominated southern Italy, where traces of it are extant to this day. A moment's consideration will enable us to see how different the history of the world would have been had a Hellenized city grown and prospered on the Seven Hills. Before the Tarquins were driven out of Rome a Phoenaean fleet was encountered (537 B.C.) off Corsica by a combined force of Etruscans and Phoenicians, and was so handled that the Phoenaeans abandoned the island and settled on the coast of Lucania (Mommsen, Hist. Rom., English trans., i. p. 118). The interpreters of their navarick had built up the Phoenician cities and their great off-shoot Carthage, a sea-power which enabled them to gain the practical sovereignty of the sea to the west of Sardinia and Sicily. The control of these waters was the object of prolonged and memorable struggles, for on it—as the result showed—depended the empire of the world. From very remote times the consolidation and expansion, from within outwards, of great continental states have had serious consequences for mankind when they were accompanied by the acquisition of a coast-line and the absorption of a maritime population. We shall find that the process loses none of its importance in recent years. "The ancient empires," says the historian of Greece, Ernst Curtius, "as long as no foreign elements had intruded into them, had an invincible horror of the water."

When the condition, which Curtius notices in parentheses, arose the "horror" disappeared. There is something highly significant in the uniformity of the efforts of Assyr, Egypt, Babylon and Persia to get possession of the maritime resources of Phoenicia. Our own immediate posterity will perhaps have to reckon with the results of similar efforts in our own day. It is this which gives a living interest to even the very ancient history of sea-power, and makes it a duty to consider the Phoenicians as the forerunners of the nations that later reappeared with striking regularity in successive periods. Looked at in this light the great conflicts of former ages are full of useful, indeed necessary, instruction.

In the first and greatest of the contests waged by the nations of the East against Europe—the Persian wars—sea-power was the governing factor. Until Persia had expanded to the shores of the Levant the European Greeks had little to fear from the ambition of the great king. The Peace of Antalcidas, 386 B.C., was a conference between Persians and Greeks. "It confers a formidable ambition could be when supported by an efficient navy. With the aid of the naval forces of the Phoenician cities the Persian invasion of Greece was rendered comparatively easy. It was the naval contingents from Phoenicia which crushed the Ionian revolt. The expedition of Mardonius, and still more that of Datis and Artaphernes, had indicated the danger threatening Greece when the master of a great army was likewise the master of a great navy. Their defeat at Marathon was not likely to, and as a matter of fact did not, discourage the Persians from further attempts at aggression. But this advance of Cambyses into Egypt had been flanked by a fleet, so also was that of Xerxes into Greece. By the good fortune sometimes vouchsafed to a people, which, owing to its obstinate opposition to, or neglect of, a wise policy, scarcely deserves it, there appeared at Athens an influential citizen who understood all that was meant by the term sea-power. Themistocles saw more clearly than any of his contemporaries that, to enable Athens to play a leading part in the Hellenic world, she needed above all things a strong navy. He had already in his eye the battle-field of the future. He felt, and probably expressed the feeling, exactly as—in the war of American Independence—Washington did in the words, "Whatever efforts are made by the land armies, the navy must have the casting vote in the present contest." The decisive event was the naval action of Salamis. To have made certain of success, the Persians should have first obtained a command of the Aegean, as complete for all practical purposes as the French and English had of the sea generally in the war against Russia of 1854–56. The Persian sea-power was not equal to the task. The fleet of the 360 ships at king was numerically stronger than that of the Greeks, but it was inferior to that which was a natural element of the vitality of her foes. Ionia was lost and Greece in the end enslaved, because the quarrels of Greeks with Greeks led to the ruin of their naval states.

The Peloponnesian War was largely a naval war. The confidence of the Athenians in their sea-power had a great deal to do with its outbreak. The immediate occasion of the hostilities, which in time involved so many states, was the opportunity offered by the conflict between Corinth and Corcyra of increasing the sea-power of Athens. Hither felt sure that the naval predominance had been so long confined to the Aegean Sea. The Corcyraean envoy, who pleaded for help at Athens, dwelt upon the advantage to be derived by the
Athenians from alliance with a naval state occupying an important situation "with respect to the western regions towards which the views of the Athenians had for some time been directed" (Thirlwall, Hist. Greece, iii. 96). It was the "weapon of her sea-power," to adopt Mahan's phrase, that enabled Athens to maintain the great conflict in which she was engaged. Repeated invasions of her territory, the ravages of disease among her people and the rising disaffection of her allies had been more than made up for by her predominance on the water. The scale of the subsequent Syracusan expedition showed how vigorous Athens still was down to the interruption of the war by the peace of Nicias. The great expedition just mentioned overtaxed her strength. Its failure brought about the ruin of the state. It was held by contemporaries, and has been held in our own day, that the Athenian defeat at Syracuse was due to the omission of the government at home to keep the force in Sicily properly supplied and reinforced. This explanation of failure is given in all ages, and should always be suspected. The wrong before Nicias was in the character of the men who swayed the popular assemblies and held high commands. A people which remembered the administration of a Pericles, and yet allowed a Cleon or an Alcibiades to direct its naval and military policy, courted defeat. Nicias, notwithstanding the possession of high qualities, lacked the ironism, and firmness, and resolution, which posterior examples have shown not the obstacle consequent on withdrawal from an enterprise on which the popular hopes had been fixed; and therefore he allowed a reverse to be converted into an overwhelming disaster. "The complete ruin of Athens had appeared, both to her enemies and to herself, impending and irreparable. But so astonishing, so rapid and so energetic had been her rally, that (a year after Syracuse) she was found again carrying on a terrible struggle" (Grote, Hist. Greece, v. p. 354). Nevertheless her sea-power had indeed been ruined at Syracuse. Now she could wage war only with impaired resources and on a purely defensive system. Even before Nicias, it was seen that "superiority of nautical skill had passed to the Peloponnesians and their allies" (ibid., p. 503).

The great, occasionally interrupted, and prolonged contest between Rome and Carthage was a sustained effort on the part of one to gain and of the other to keep the control of the western Mediterranean. So completely had that control been exercised by Carthage, that she had anticipated the Spanish commercial policy in America. The Romans were precluded by treaties from trading with Carthaginian possessions on both continents. Rome, as Mommsen tells us, "was from the first a maritime city, and, in the period of its vigour, never was so foolish or so untrue to its ancient traditions as wholly to neglect its war marine and to desire to be a mere continental power." It may be that it was lust of wealth rather than lust of dominion that first promoted a trial of strength with Carthage. The vision of universal empire could hardly as yet have formed itself in the imagination of a single Roman. The area of Phoenician maritime commerce was vast enough both to excite jealousy and to offer vulnerable points to the cupidities of rivals. It is probable that the modern estimate of the sea-power of Carthage is much exaggerated. It was great by comparison, and of course overwhelmingly great when there were none but insignificant competitors to challenge it. Mommsen holds that, in the 4th and 5th centuries after the foundation of Rome, "the two main competitors for the dominion of the Western waters" were Carthage and Syracuse. "Carthage," he says, "had the preponderance, and Syracuse sank more and more into a second-rate naval power. The maritime importance of the Etruscans was wholly gone. . . . Rome itself was not exempt from the same fate; its own waters were likewise commanded by foreign fleets." The Romans were for a long time too much occupied at home to take much interest in Mediterranean matters. The position of the Carthaginians in the western basin of the Mediterranean was very like that of the Portuguese long afterwards in India. The latter kept within reach of the sea; "nor did their rule ever extend a day's march from their ships" (R. S. Whiteway, Rise of the Portuguese Power in India. Westminster, 1889, p. 12). The Carthaginians in Spain," says Mommsen, "made the effort to acquire the interior territory of the warlike native nations; they were content with the possession of the mines and of stations for traffic and for shell and other fisheries." Allowance being made for the numbers of the classes engaged in administration, commerce and supervision, it is nearly certain that Carthage could not furnish the crews required by both a great war- navy and a great mercantile marine. No one is surprised on finding that the land-forces of Carthage were composed largely of alien mercenaries. We have several examples from which we can infer a parallel, if not an identical, condition of her maritime resources. How, then, was the great Carthaginian carrying-trade provided for? The experience of more than one country will enable us to answer this question. The ocean trade of those off-shoots or dependencies of the United Kingdom, viz. the United States, Australasia and India, is largely or chiefly conducted by shipping of the "old country." So that of Carthage was largely conducted by old Phoenicians. These have obtained a "Carthaginian Register," or the contemporary equivalent; but they could not all have been purely Carthaginian or Liby-Phoenician. This must have been the case even more with the war-navy. British India for a considerable time, indeed, was no more efficient in this respect than Carthage; but it was officered entirely and manned almost entirely by men from the old country. Moreover, it was small. The wealth of India would have sufficed to furnish a larger material element; but, as the country could not supply the personnel, it would have been absurd to speak of the sea-power of India apart from that of England. As soon as the Romans chose to make the most of their natural resources the maritime predominance of Carthage was doomed. The artificial basis of the latter's sea-power would not enable it to hold out against serious and persistent assaults. Unless this is perceived, it is impossible to understand the carrying-trade of the Punic Wars. Judged by every visible sign of strength, Carthage, the richer, the more enterprising, ethnically the more predominant among her neighbours, and apparently the more naval, seemed sure to win in the great struggle with Rome which, by the conditions of the case, was to be waged largely on the water. Yet those who had watched the struggles of the Punic city with the Sicilian Greeks, and especially that with Agathodemos, must have seen reason to cherish doubts concerning her naval strength. It was an anticipation of the case of Spain in the age of Philip II. As the great Elizabethan seamen discerned the decline of Spanish efficiency, so men at Rome discerned those of the Carthaginian. Dates in connexion with this are of great significance. A comprehensive measure, with the object of "rescuing their marine from its condition of impotence" was taken by the Romans in the year 267 B.C. Four quasestos classici—in modern naval English we may perhaps call them port-admirals—were nominated, and one was stationed at each of four ports. The objects of the Roman Senate, so Mommsen tells us, were very obvious. They were "to recover their independence by sea, to cut off the maritime communications of Tarentum, to close the Adriatic against fleets coming from Epirus, and to emancipate themselves from Carthaginian supremacy." Four years afterwards the first Punic War began. It was, and had to be, largely a naval contest. The Romans waged it with varying fortune, but in the end triumphed by means of their sea-power. The victory of Catulus over the Carthaginian fleet off the Aegean Islands decided the war and left to the Romans the possession of Sicily and the power of possessing themselves of Sardinia and Corsica. It would be an interesting and perhaps not barren investigation to inquire to what extent the decline of the Carthaginian power, under the dominion of Alexander the Great, had helped to enable the naval efficiency of the Carthaginian defences. One thing was certain. Carthage had
now met with a rival endowed with natural maritime resources greater than her own. That rival also contained citizens who understood the true importance of sea-power. “With a statesmanlike sagacity from which succeeding generations might have drawn a lesson, the leading men of the Roman Commonwealth perceived that all their coast fortifications and coast garrisons would prove inadequate unless the war-marine of the state were again placed on a footing that should command respect” (Mommsen, i. 427). It is a gloomy reflection that the leading men of the United Kingdom could not see this in 1860. A thorough comprehension of the events of the first Punic War enables us to solve what, until Mahan wrote, had been one of the standing enigmas of history, viz. Hannibal’s invasion of Italy by land instead of by sea in the second Punic War. Mahan’s masterly examination of this question has set at rest all doubts as to the reason of Hannibal’s action (Influence of Hist. pp. 13-31). The naval predominance in the western basin of the Mediterranean acquired by Rome had never been lost. Though modern historians, even those belonging to a maritime country, may have failed to perceive it, the Carthaginians knew well enough that the Romans were too strong for them on the sea. Though other forces co-operated to bring about the defeat of Carthage in the second Punic War, the Roman navy, as Mahan demonstrates, was the most important. As a navy, he tells us in words like those already quoted, “acts on an element strange to most writers, the element of the sea.” Hannibal’s strange race apart, without prophets of their own, neither themselves nor their calling understood, its immense determining influence on the history of that era, and consequently upon the history of the world, has been overlooked.”

The attainment of all but universal dominion by Rome was now only a question of time. “The annihilation of the Carthaginian fleet had made the Romans masters of the sea” (Schmitz, Hist. Rome, p. 256). A lodgment had already been gained in Illyricum, and countries farther east were now open to the mind of the Roman people. A glance at the map will show that to effect this the command of the eastern basin of the Mediterranean, like that of the western, must be secured by the Romans. The old historic navies of the Greek and Phoenician states had declined. One considerable naval force there was which, though it could not have prevented, was strong enough to have delayed the Roman progress eastwards. This force belonged to Rhodes, which in the years immediately following the close of the second Punic War reached its highest point as a naval power (C. Torr, Rhodes in Ancient Times, p. 40). Far from trying to obstruct it, the fleet of Rhodes deserted Hannibal, in his exile, saw the necessity of being strong on the sea if the East was to be saved from the grasp of his hereditary foe; but the resources of Antiochus, even with the mighty co-operation of Hannibal, were insufficient. In a later and more often quoted struggle between East and West—that which was decided at Actium—sea-power was again seen to “have the casting vote.” When the whole of the Mediterranean coasts became part of a single state the importance of the navy was naturally diminished; but in the struggles within the declining empire it rose again at times. The contest of the Vandal Generics with Majorian and the African expedition of Belisarius—as also mentioned others—were largely influenced by the naval operations (Gibbon, Decline and Fall, chaps. xxxvi., xli.).

A decisive event, the Mahomedan conquest of northern Africa from Egypt westwards, is unintelligible until it is seen how great a part sea-power played in effecting it. Purely land expeditions, or expeditions but slightly supported from the sea, had ended in failure. The emperor at Constantinople still had at his disposal a fleet capable of keeping open the communications with his African province. It took the Saracens half a century (A.D. 647-698) to win “their way along the coast of Africa as far as the Illar of Hercules” (Hallam, Mid. Ages, chap. vi.); and, as Gibbon tells us, it was not till the Commander of the Faithful had prepared a great expedition, this time by sea as well as by land, that the Saracenic dominion was definitely established. It has been generally assumed that the Arabian conquerors who, within a few years of his death, spread the faith of Mahomet over vast regions, belonged to an essentially non-maritime race; and little or no stress has been laid on the extent to which they required great naval forces to support their conquests. In parts of Arabia, however, maritime enterprise was far from non-existent; and when the Mahomedan empire had extended onwards from Mecca and Medina till it embraced the coasts of various seas, the consequences to the neighbouring states were as serious as the rule above mentioned would lead us to expect that they would be. “With the conquest of Syria and Egypt a long stretch of sea-board had come into the Saracenic power; and the creation and maintenance of a navy for the protection of the maritime ports as well as for meeting the enemy became a matter of under the most serious attention was paid to the manning and equipment of the fleet” (Amir Ali, Syed, Short Hist. Saracens, p. 445). At first the fleet was manned by sailors drawn from the Phoenician towns, where nautical energy was not yet quite extinct; and later the crews were recruited from Syria, Egypt and the coasts of Asia Minor. Ships were built at most of the Syrian and Egyptian ports, and “also at Obolla and Bushire on the Persian Gulf,” whilst the mercantile marine and maritime trade were fostered and encouraged. The sea-power thus created was largely artificial. Ministers— as in similar cases— when the special encouragement was withdrawn. “In the days of Arabian energy,” says Hallam, “Constantinople was twice, in 668 and 716, attacked by great naval armaments.” The same authority believes that the abandonment of such maritime enterprises by the Saracens may be attributed to the removal of the capital from Damascus to Bagdad. The removal indicated a lessened interest in the affairs of the Mediterranean Sea, which was now left by the administration far behind. “The Greeks in their turn determined to dispute the command of the sea,” with the result that in the middle of the 10th century their empire was far more secure from its enemies than under the first successors of Heraclius.” Not only was the fall of the empire, by a rational reliance on sea-power, postponed for centuries, but also much that had been lost was regained. “At the close of the 10th century the emperors of Constantinople possessed the best and greatest part of southern Italy, part of Sicily, the whole of what is now called the Balkan Peninsula, Asia Minor, with some parts of Syria and Armenia (Hallam, chap. vi.; Gibbon, chap. ii.).

Neglect of sea-power by those who can be reached by sea brings its own punishment. Whether neglected or not, if it is an artificial creation it is nearly sure to disappoint those who wield it when it encounters a rival power of natural growth. How was it possible for the Crusaders, in their various expeditions, to achieve even the transient success that occasionally crowned their efforts? How did the Christian kingdom of Jerusalem contrive to exist for more than three-quarters of a century? Why did the Crusades more and more become maritime expeditions? The answer to these questions is to be found in the decline of the Mahomedan naval defences and the rising enterprise of the seafaring people of the West. The Venetian and Genoese transported crusading forces, kept open the communications of the places held by the Christians and hampered the operations of the infidels. Even the great Saladin failed to discern the important alteration of conditions. This is evident when we look at the efforts of the Christians to regain the lost kingdom. Saladin “forgot that the safety of Phocian lay in immunity from naval incursions, and that no victory on land could ensure him against an influx from beyond the sea” (Amir Ali, Syed, pp. 359-360). Not only were the Crusaders helped by the fleets of the maritime republics of Italy, they also received reinforce-ments by sea from western Europe and England, on the “arrival of Malik AHBtir [Richard Cœur de Lion] with twenty ships-loaded of fighting men and munitions of war.”

Participation in the Crusades was not a solitary proof of the
importance of the naval states of Italy. That they had been able to act effectively in the Levant, may have been in some measure due to the weakening of the Mohammedans by the disintegration of the Seljukian power, the movements of the Moguls and the confusion consequent on the rise of the Ottomans. However that may have been, the naval strength of those Italian states was great absolutely as well as relatively. Sismondi, speaking of Venice, Pisa and Genoa, towards the end of the 11th century, says "these three cities had more vessels on the Mediterranean than the whole of Christendom besides" (Ital. Repubb. English ed. p. 29). Dealing with a period two centuries later, he declares it "difficult to comprehend how two simple cities could put to sea such prodigious fleets as those of Pisa and Genoa." The difficulty disappears when we have Mahan's explanation. The maritime republics of Italy—like Athens and Rhodes in ancient, Catalonia in medieval and England and the Netherlands in more modern times—were "peculiarly well fitted, by situation and resources, for the control of the sea by both war and commerce." As far as the western Mediterranean was concerned, Genoa and Pisa had given early proofs of their maritime energy, and fixed themselves in succession to the Saracens, in the Balearic Isles, Sardinia and Corsica. Sea-power was the Themistoclean instrument with which they made a small state into a great one.

A fertile source of dispute between states is the acquisition of territory beyond sea. As others have done before and since, the English and the Spanish made a point of attacking the coast of Sardinia and the Straits of Messina into which the Mediterranean Sea partakes. As early as 1506 the Sardinian coast of Italy was attacked by the Turks, and the Spanish used the coast of the Straits of Messina as a stepping stone for their expeditions. The Turks had established a foothold in the Sardinian coast of Italy as early as 1506, and the Spanish used the coast of the Straits of Messina as a stepping stone for their expeditions.

The capture of the town of Messina by the Spanish in 1506 was a serious check to the expansion of the Ottoman Empire in the Mediterranean. In the meantime the state which had a leading share in winning the victory of Lepanto had been growing up in the West. Before the union of its crown with that of Aragon and Navarre, its maritime power was limited to the confines of the Mediterranean, and it had never before been a great power on the sea. The Spanish monarchy, however, had already begun to take shape, and its maritime power was greatly augmented by the discovery of gold in America. their squadron was permanently hired to the kings of Spain." Spanish supremacy at sea was established at the expense of France (G. W. Prothero, in M. Hume's *Spain 1479-1788*, p. 65). The acquisition of a vast domain in the New World had greatly developed the maritime activity of Castile, and Spain was as formidable on the ocean as in the Mediterranean. After Portugal had been annexed the naval forces of that country were added to the Spanish, and the great ports of Lisbon became available as a source of equipment and as an additional base of operations for oceanic campaigns. The fusion of Spain and Portugal, says Seeley, "produced a single State of unlimited maritime dominion. . . . Henceforth the whole New World belonged exclusively to Spain." The story of the tremendous catastrophe—the defeat of the Armada—by which the decline of this dominion was heralded is well known. It is memorable, not only because of the harm it did to Spain, but also because it revealed the rise of another claimant to maritime pre-eminence—the English nation. The effects of the catastrophe were not at once visible. Spain still continued to look like the greatest power in the world; and, though the English seamen were seen to be something better than adventurous pirates—a character suggested by some of their contemporary exploits—few could have comprehended that they were engaged in building up what was to be a sea-power greater than any known to history.

They were carrying forward, not beginning, the building of this. "England," says Sir J. K. Laughton, "had always believed in her naval power, had always claimed the sovereignty of the Narrow Seas; and more than two hundred years before the death of the man who sat on the throne, Edward III. had testified to his sense of its importance by ordering a gold coinage bearing a device showing the armed strength and sovereignty of England based on the sea" (Armada, Introd.). It is impossible to make intelligible the course of the many wars which the English waged with the French in the middle ages unless the true naval position of the former is rightly appreciated. Why were Crécy, Poitiers, Agincourt—not to mention other combats—fought, not on English, but on continental soil? Why, during the so-called "Hundred Years' War," was England in reality the invader and not the invaded? Was of the present generation greater at last aware of the significance of naval defence, and know that, if properly utilized, it is the best security against invasion that a sea-surrounded state can enjoy. It is not, however, commonly remembered that the same condition of security existed and was properly valued in medieval times. The battle of Sluys in 1340 rendered invasion of England as impracticable as did that of La Hogue in 1692, that of Quiberon Bay in 1750 and that of Trafalgar in 1805; and it permitted, as did those battles, the transport of troops to the continent to support Great Britain's allies in wars which, had she not been strong at sea, would have been waged on the soil of her country. Her early continental wars, therefore, are proofs of the long-established efficiency of her naval defences. Notwithstanding the greater attention now paid to naval affairs, it is doubtful if Great Britain even yet recognizes the extent to which her security depends upon a good fleet as fully as her ancestors did seven centuries ago. The narrative of pre-Elizabethan campaigns is interesting merely as a story; and, when told—as, for instance, D. Hannay has told it in the introductory chapters of his *Short History of the Royal Navy*—it will be found instructive and worthy of careful study at the present day. Early of the principal events in England's early naval campaigns may be taken as an illustration of the idea conveyed by the term "sea-power," and of the accuracy with which its meaning was apprehended at the time. To take a very early case, we may cite the defeat of Eustace the Monk (see DOVER: Battle of) by Hubert de Burgh in 1217. Reinforcements and supplies had been collected at Calais for conveyance to the army of Prince Louis of France and the rebel barons who had been defeated at Lincoln. The reinforcements tried to cross the Channel under the escort of a fleet commanded by Eustace. Hubert de Burgh, who had stoutly held Dover for King John, and was faithful to the young Henry III., heard of the enemy's movements. "If these people land," said he, "England is lost; let us therefore boldly meet them." He reasoned in almost the same words as Raleigh about four centuries afterwards, and undoubtedly " had grasped the true principles of the defence of England." He put to sea and defeated his opponent. The fleet on which Prince Louis and the rebellious barons had counted was destroyed; and with its fleet which, so admirably planned, no more fruitful battle has been fought by Englishmen on water?" (Hannay, p. 7.) As introductory to a long series of naval operations undertaken, with a like object it has deserved detailed mention here.

The sixteenth century was marked by a decided advance in both the development and the application of sea-power. Previously its operation had been confined to the Mediterranean or to coast waters outside it. Spanish or Basque seamen—by their proceedings in the English Channel—had proved the practicability of, rather than been engaged in, ocean warfare. The English, who withstood them, have since learned to sea so rough, to seasons so uncertain and to weather so boisterous, that the ocean had few terrors for them. All that was wanting was a sufficient inducement to seek distant fields of action and a development of the naval art that would permit them to be reached. The discovery of the New World supplied the first; and consequently increased length of voyages and of absence from the coast led to the second. The world had been moving onwards in other things as well as in navigation. Intercommunication was becoming more and more frequent. What was done by one people was soon known to others. It is said that the English, with their new knowledge, would have been in the exploration of remote regions, they were wanting in maritime enterprise. The career of the Cabots would of itself suffice to render such a supposition doubtful. The English had two good reasons for postponing voyages to and settlement in far-off lands. They had their hands full nearer home; and they thoroughly, and as it were by instinct, understood the conditions on which permanent expansion must rest. They wanted to make sure of the line of communications first. To effect this a sea-going marine of both war and commerce, and, for further expansion, stations on the way were essential. The English, in the course of time, furnished evidence of the wisdom and thoroughness of their procedure. Taught by the experience of the Spaniards and the Portuguese, when unimpeded by the political circumstances of the time, and provided with suitable equipment, the English displayed their energy in distant seas. It now became simply a question of the efficiency of sea-power. If efficiency was not a quality of the English sea-power, then their efforts were bound to fail; and, more than this, the position of their country, challenging as it did what was believed to be the greatest of maritime states, would have been altogether precarious. The principal expeditions now undertaken were distinguished by a characteristic peculiar to the people, and not to be found in connexion with the exploring or colonizing activity of most other great nations even down to our own time. They were really unofficial speculations in which, if the government took part at all, it was for the sake of the profit expected, and almost, if not exactly, like any private adventurer. The participation of the government, nevertheless, had an aspect which it is worth while to note. It conveyed a hint—and quite consciously—to all whom it might concern that the speculations were "underwritten" by the whole sea-power of England. The forces of more than one state had been used to protect its maritime trade from the assaults of enemies in the Mediterranean or in the Narrow Seas. They had been used to ward off invasion and to keep open communications across not very extensive areas of water. In the sixteenth century they were first relied upon to support distant commerce, whether carried on in a peaceful fashion or under aggressive forms. This, naturally enough, led to collisions. The contention waxed hot, and was virtually decided when the Armada shaped course to the northward after the fight off Gravelines.

The expeditions against the Spanish Indies and, still more, those against Philip II.'s peninsular territory had helped to define
the limitations of sea-power. It became evident, and it was made still more evident in the next century, that for a great country to be strong it must not rely upon a navy alone. It must also have an adequate and properly organized mobile army. Notwithstanding the number of times that this lesson has been repeated, Great Britain has been slow to learn it. It is doubtful if she has learned it even yet. English seamen in all ages seem to have mastered it fully; for they have always had considerable experience. As regards three centuries—that expeditions against foreign territory overseas should be accompanied by a proper number of land-troops. On the other hand, the necessity of organizing the army of a maritime insular state and of training it with the object of rendering effective aid in operations of the kind in question, has rarely been perceived and acted upon by others. The result has been a long series of inglorious or disastrous affairs, like the West Indies voyage of 1595-1596, the Cadiz expedition of 1625 and that to the Île de Ré of 1627. Additions might be made to this list. The failures of the English were explained by alleging differences or quarrels between the naval and the military commanders. This way of explaining them, however, is nothing but the inveterate critical method of the streets by which cause is taken for effect and effect for cause. The differences and quarrels arose, no doubt; but they generally sprang out of the reconciliations consequent on, not producing, the want of success. Another manifestation of the way in which sea-power was first observed in the 17th century. It suggested the adoption of, and furnished the instrument for, carrying out a distinct maritime policy. What was practiced during the 17th century had taken place, therefore, England this phenomenon was now of respectable age. Long voyages and cruises of several ships in company had been frequent during the latter half of the 16th century and the early part of the 17th. Even the grandfathers of the men who sailed with Blake and Penn in 1652 could not have known a time when ships had never crossed the ocean, and squadrons kept together for months had never cruised. However imperfect it may have been, a system of provisioning ships and supplying them with stores, and of preserving discipline, had been developed. The English fleet had not only been improved, but had proven fairly satisfactory. The parliament and the Protector in turn found it necessary to keep a considerable number of ships in commission, and make them cruise and operate in company. It was not till well on in the reign of Queen Victoria that the man-of-war's man was finally differentiated from the merchant seaman; but, two centuries before, some of the distinctive marks of the former had already begun to be noticeable. There were seamen in the time of the Commonwealth who rarely, perhaps some who never, served aloft except in a man-of-war. Some of the interesting naval families which were settled at the mouth and the eastern ports, and which—from father to son—helped to recruit the ranks of bluejackets till a date later than that of the launch of the first ironclad, could carry back their professional genealogy to at least the days of Charles II., when, in all probability, it did not first start. Though landsmen continued even after the Civil War to be given naval appointments, and though a permanent corps, through the ranks of which every one must pass, had not been formally established, a body of real naval officers—men who could handle their ships, supervise the working of the armament and exercise military command—had been formed. A navy, accordingly, was now a weapon of undoubted keenness, capable of very effective use by any one who knew how to wield it. Having tasted the sweets of intercourse with the Indies, whether in the occupation of Portugal or of Spain, both English and Dutch were desirous of getting a larger share of them. English maritime commerce had increased and needed naval protection. If England was to maintain the international position to which, as no one denied, she was entitled, that commerce must be permitted to expand. The minds of men in western Europe, moreover, were set upon obtaining for their country territories in the New World, the amenities of which were now known. From the reign of James I. the Dutch had shown great jealousy of English maritime enterprise. Where it was possible, as in the East Indian Archipelago, they had destroyed it. Their naval resources were great enough to let them hold English shipping at their mercy, unless a grand effort were made to protect it. The Dutch conducted the carrying trade of most of the world, and the monopoly of this they were resolved to keep, while the English were resolved to share in it. The exclusion of the English from every trade-route, except such as ran by their own coast or crossed the Narrow Seas, seemed a by no means impossible contingency. There seemed also to be but one way of preventing it, viz. by war. The supposed unfriendliness of the Dutch, or at least of an important party amongst them, to the regicide government in England helped to force the conflict. The Navigation Act of 1661 was passed and regarded as a covert declaration of hostilities. So the first Dutch war began. It established England's claim to compete for the position of a great maritime commercial power.

The rise of the sea-power of the Dutch, and the magnitude which it attained in a short time, and in the most adverse circumstances, have no parallel in history. The case of Athens was different, because the Athenian power had not so much been unconsciously developed out of a great maritime trade, as based on a military marine deliberately and persistently fostered during many years. Thirlwall believes that it was Solon who "laid the foundations of the Attic navy" (Hist. Greece, ii. p. 55), century before Sallust describes the Athenian navy. The Athenian war-chest convinced his fellow-citizens that their navy ought to be increased. Perhaps the nearest parallel with the power of the Dutch was presented by that of Rhodes, which rested largely on a carrying trade. The Rhodian undertakings, however, were by comparison small and restricted in extent. Motley declares of the Seven United Provinces that they "commanded the ocean" (United Provinces, ii. 132), and that it would be difficult to exaggerate the naval power of the young Commonwealth. Even in the days of Spain's greatness English seamen positively declined to admit that she was stronger than England on the sea; and the story of the Armada justified their view. The first two Dutch wars were, therefore, contests between the two foremost naval states of the world for what was primarily a maritime object. The identity of the cause of the first and of the second war will be discerned by any one who compares what has been said about the circumstances leading to the former, with Monk's remark as to the latter. He said that the English wanted a larger share of the trade enjoyed by the Dutch. It was quite in accordance with the spirit of the age that the Dutch should try to prevent, by force, this want from being satisfied. Anything like free and open competition was repugnant to the general feeling. The highroad to both individual wealth and national prosperity was believed to lie in securing a monopoly. Merchants or manufacturers who called for the abolition of monopolies granted to particular courtiers and favourites had not the smallest intention, on gaining their object, of throwing open to the enterprise of all what had been monopolized. It was to be kept for the exclusive benefit of some privileged or chartered company. It was the same in greater affairs. As Mahan says, 'To secure to one's own people a disproportionate share of the benefit of sea-commerce every effort was made to exclude others, either by the peaceful legislative methods of monopoly or prohibitory regulations, or, when these failed, by direct violence.' The apparent wealth of Spain was believed to be due to the rigorous manner in which foreigners were excluded from trading with the Spanish overseas territories. The skill and enterprise of the Dutch having enabled them to force themselves into this trade, they were determined to keep it to themselves. The Dutch East India Company was a powerful body, and largely dictated the maritime policy of the country. We have thus come to an interesting point in the historical consideration of sea-power. The Elizabethan conflict with Spain had practically settled the question whether or not the
expanding nations were to be allowed to extend their activities to territories in the New World. The first two Dutch Wars were to settle the question whether or not the ocean trade of the world was to be open to any people qualified to engage in it. We can see how largely these were commercial questions, how much depended on the solution found for them, and how plain it was that they must be settled by naval means.

Mahan’s great survey of sea-power opens in 1660, midway between the first and second Dutch Wars. “The sailing-ship era, with its distinctive features,” he tells us, “had fairly begun.” The art of war by sea, in its more important details, had been settled by the first war. From the beginning of the second the general features of ship design, the classification of ships, the armament of ships, and the handling of fleets, were as a rule without essential alteration until the date of Navarino. Even the tactical methods, except where improved on occasions by individual genius, altered little. The great thing was to bring the whole broadside force to bear on an enemy. Whether this was to be impartially distributed throughout the hostile line or concentrated on one part of it depended on the character of particular admirals. It would have been strange if a period so long and so rich in incidents had afforded no materials for forming a judgment on the real significance of sea-power. The text, so to speak, chosen by Mahan is that, notwithstanding the changes wrought in naval material since 1660, which is told in the history of the past instructive illustrations of the general principles of maritime war. These illustrations will prove of value not only in those wider operations which embrace a whole theatre of war,” but also, if rightly applied, “in the tactical use of the ships and weapons” of our own day. By a remarkable coincidence the same doctrine was being preached at the same time and quite independently by Vice-Admiral Philip Colobm in his work on Naval Warfare. As a prelude to the second Dutch War we find a repetition of a process which had been adopted somewhat earlier. That was the permanent conquest of transoceanic territory. Until the 17th century had well begun, naval, or combined naval and military, operations against the distant possessions of an enemy had been practically restricted to raiding or plundering attacks on commercial centres. The Portuguese territory in South America having come under Spanish dominion in consequence of the annexation of Portugal to Spain, the Dutch—as the power of the latter country declined—attempted to reduce part of that territory into permanent possession. This improvement on the practice of Drake and others was soon seen to be a game at which more than one could play. An expedition sailed under Cornelis Houtman in 1595, another under Willem Bontekoe in 1596, and the Spanish islands of the East Indies were seized by the Dutch during the century. In 1664 an English force occupied the Dutch North American settlements on the Hudson. Though the dispossessed rulers were not quite in a position to throw stones at sinners, this was rather a raid than an operation recognized warfare, because it preceded the formal outbreak of hostilities. The conquered territory remained in English hands for more than a century, and thus testified to the efficacy of a sea-power which Europe had scarcely begun to recognize. Neither the second nor the third Dutch War was a decisive turning point in the history of either country, though Mahan, who lived to see the loss of the French fleet at Trafalgar, would have been pleased to have been spared the necessity of writing about it. The service of the year 1665 of the English fleet under the Prince of Orange against the Dutch on the coast of the Baltic is, according to Mahan, the only success which can be claimed for any English fleet in the whole of this period. But it may well be doubted if it did any permanent good. Mahan’s survey answers, in a sense, a formal warning to his fellow-citizens not to adopt it. In France, within the last years of the 19th century, it found, and appears still to find, adherents enough to form a school. The reappearance of belief in demonstrated impossibilities is a recognized incident in human history; but it is usually confined to the emotional or the vulgar. It is serious and filled with menaces of disaster when it is held by men thought fit to administer the affairs of a nation or advise concerning its defence. The third Dutch War may not have settled the question of whether England was a great maritime power; but it seems likely to have helped to place that country above all other maritime states—indeed, it has been noted, in the position, in fact, which Great Britain, the United Kingdom, the British Empire, whichever name may be given it, has retained up to the present. It also manifested in a very striking form the efficacy of sea-power. The United Provinces, though attacked by two of the greatest monarchies in the world, France and England, were not destroyed. Indeed, they preserved much of their political importance in the state system of Europe. The Republic owed this astonishing result partly to the skill of one or two men, but mainly to its sea-power. Mahan, however, has had many respectable defenders. Mahan’s work has been used, it is true, to justify the overthrow of the French empire by the English in the greater war; but it has not been skilfully used in the cause of the United Kingdom. The annexation of New Zealand, for instance, is not to be explained on Mahan’s principles. The war, which was ended by the Peace of Ryswick in 1697, presents two features of exceptional interest: one was the havoc wrought on English commerce by the enemy; the other was Torrington’s conduct at and after the engagement off Beach Head. Mahan discusses the former with his usual lucidity. At no time has war against commerce been conducted on a larger scale and with greater results than during this period. England suffered “infinitely more than in any former war.” Many of her merchants were ruined; and it is affirmed that the English shipping was reduced to the necessity of sailing under the Swedish and Danish flags. The explanation is that Louis XIV. made great efforts to keep up powerful fleets. The English navy was so fully occupied in watching these that no ships could be spared to protect England’s maritime trade. This is only
another way of saying that her commerce had increased so largely that the navy was not strong enough to look after it as well as oppose the enemy's main force. Notwithstanding her losses she was on the winning side in the conflict. Much misery and ruin had been caused, but not enough to affect the issue of the war.

Torrington's proceedings in July 1690 were at the time the subject of much angry discussion. The debate, still meriting our attention, was, however, about the question, whether the clergy of the Church of England, through its head the archbishop of Canterbury, had not been too indulgent to the late bishops and to the clergy of the Protestant establishment. What is happening now will probably be pertinent and needful in the consideration of the question of how the clergy of the Church of England, through its head the archbishop of Canterbury, has not been too indulgent to the late bishops and to the clergy of the Protestant establishment.

The "Fleet in being." The matter has to be noticed here, because it involves the consideration of a question of naval strategy which must be understood by those who wish to know the real meaning of the term sea-power, and who ought to learn that it is not a thing to be idly risked or thrown away at the bidding of the ignorant and the irresponsible. Arthur Herbert, earl of Torrington—the last peerage is a viscountcy held by the Byng family—was in command of the allied English and Dutch fleet in the English Channel. The disparity of force, "he says, "was still in favour of France in 1690, but not so great as the year before." We can measure the ability of the then English government for conducting a great war, when we know that, in its wisdom, it had still further weakened the fleet by dividing it. Vice-Admiral Killigrew had been sent to the Mediterranean with a squadron, and had neglected, and indeed refused when urged, to take the necessary steps to repair this error. The government having omitted, as governments sometimes do, to gain any trustworthy intelligence of the strength or movements of the enemy, Torrington suddenly found himself confronted by a considerably superior French fleet under Tourville, one of the greatest French admirals. Whether he would have done as well had he engaged it instead of the other unoccupied fleet with any hope of success, he would not be able to estimate, for the fleet was at anchor in the Channel, and Torrington had no opportunity of doing battle with it. The French fleet might have manoeuvred to slip past it to the westward and join his force with that under Killigrew, which would make him strong enough to hazard a battle. This proved impracticable. There was then one course left—to retire before the French, but not to keep far from them. This course Torrington did not believe to be the best. He knew that, though not strong enough to engage their whole fleet, he would be quite strong enough to fight and most likely beat it, when a part of it was trying either to deal with our ships to the westward or to cover the disembarkation of an invading army. He, therefore, proposed to keep his "fleet in being" in order to fall on the enemy when the latter would have two affairs at the same time on his hands. Vice-Admiral Colbom rose to a greater height than was usual even with him in his criticism of this campaign. What Torrington did was merely to reproduce on their house parties, and to have been noticed dozens of times on shore, viz., the menace of the flanking enemy. In land warfare this is held to give exceptional opportunities for the display of good generalship, but, to quote Mahan over again, a navy "acts on an element strange to most writers, its members have been from time immemorial a strange race apart, without prophets of their own, neither themselves nor their calling understood." Whilst Torrington has had the support of the seamen, his opponents have been landmen. For the crime of being a good strategist he was brought before a court-martial, but acquitted. His sovereign, who had been given the crowns of three kingdoms to defend our late kings showed his respect for officers, for they did not make "idle and contrary" proposals, and disregarding its solemn finding. The admiral who had saved his country was dismissed from the service. Still, the principle of the "fleet in being" lies at the bottom of all sound strategy.

Admiral Colbom has pointed out a great change of plan in the later naval campaigns of the 17th century. Improvements in naval architecture, in the methods of preserving food, and in the arrangements for keeping the crews healthy, the change in naval operations. The Dutch, as allies of the Spanish, kept a fleet in the Mediterranean for many months. The great de Ruyter was mortally wounded in one of the battles there fought. In the War of the Spanish Succession the Anglo-Dutch fleet found its principal scene of action eastward of Gibraltar. This, as it were, set the fashion for future wars. It became a kind of tacitly accepted rule that the operation of British sea-power was to be felt in the enemy's, rather than in British waters. The hostile coast was regarded strategically as the British frontier, and the sea was looked upon as territory which the enemy must be prevented from invading. Acceptance of this principle led in time to the so-called "Inches des "Brest and Toulon. The name was misleading. As Nelson took care to explain, there was no desire to keep the enemy's fleet in; what was desired was to be near enough to attack it if it came out. The wisdom of the plan is undoubted. The hostile navy could be more easily watched and more easily followed if it put to sea. To carry out this plan a navy stronger in number of ships or in general efficiency than that of the enemy was necessary. With the exception of that of American Independence, which will, therefore, require special notice, England's subsequent great wars were conducted in accordance with the rule.

In the early part of the 18th century there was a remarkable manifestation of sea-power in the Baltic. Peter the Great, having created an efficient army, drove the Swedes from the coast provinces south of the Gulf of Finland. Like the earlier monarchs of which we have spoken, sea-power. Russia, in the Baltic at least, now became a naval state. A large fleet was built, and, indeed, a considerable navy established. It was a purely artificial creation, and showed the merits and defects of its character. At first, and when under the eye of its creator, it was strong; when Peter was no more it
dwandered away, and, when needed again, had to be created afresh. It enabled Peter the Great to conquer the neighbouring portion of Finland, to secure his coast territories and to dominate the Baltic. In this he was assisted by the exhaustion of Sweden consequent on her endeavours to retain, what was no longer possible, the position of a quasi-great power which she had held since the days of Gustavus Adolphus. Sweden had been further weakened, especially as a naval state, by almost incessant wars with Denmark, which prevented all hope of Scandinavian predominance in the Baltic, the control of which sea has in these days passed into the hands of another state possessing a quickly created navy—the modern German empire.

The War of the Spanish Succession left Great Britain a Mediterranean power which she had been, as the result of twice losing Minorca, she still holds. In the War of the Austrian Succession, France was forced to give up her conquests for want of a navy, and England saved her position by her sea-power, though she had failed to use it to the best advantage” (Mahan, Influence on Hist. p. 280). This shows, as we shall find that a later war showed more plainly, that even the government of a thoroughly maritime country is not always sure of conducting its naval affairs wisely. The Seven Years’ War is included, in the display of the efficacy of sea-power.

It was this which put the British in position to seize the Carlisle and which European race was to rule in India, and led to a British occupation of Havana in one hemisphere and of Manila in the other. In the same war Great Britain learnt how, by a feeble use of sea-power, a valuable possession like Minorca may be lost. At the same time, the maritime trade and the general prosperity of the kingdom increased enormously. The result of the conflict made plain to all the paramount importance of having in the principal ports in the government men capable of understanding what war is and how it ought to be conducted.

This lesson, as the sequel demonstrated, had not been learned when Great Britain became involved in a war with the insurgent colonies in North America. Mahan’s comment is striking: “The magnificence of sea-power and its value had perhaps been more clearly shown by the uncontroverted sway and consequent exaltation of one belligerent; but the lesson thus given, if more striking, is less vividly interesting than the spectacle of that sea-power meeting a foe worthy of its steel, and excited to exertion by a strife which endangered not only its most valuable colonies, but even its own shores” (Influence on Hist. p. 338). Great Britain was, in fact, drawing too largely on the prestige acquired during the Seven Years’ War, and was governed by men who did not understand the first principles of naval warfare, and would not listen to those who did. They quite ignored the teaching of the then comparatively recent wars which has been alluded to already—that the enemy’s coast should be looked upon as the frontier. A century and a half earlier the Dutchman Grotsius had written—

“Quae meta Britannis
Litora sunt aliis.”

Though ordinary prudence would have suggested ample preparation, British ministers allowed their country to remain unprepared. Instead of concentrating their efforts on the main objective, they fluttered away force in attempts to relieve two beleaguered garrisons under the pretext of yielding to popular pressure, which is the official term for acting on the advice of irresponsible and uninstructed busi-bodies. “Depuis le début de la crise,” says Captain Chevalier, “les ministres de la Grande-Bretagne s’étaient montrés inférieurs à leur tâche.” An impressive result of this was the repeated appearance of powerful and indeed numerous British hostile fleets in the English Channel. The war—notwithstanding that land operations constituted an important part of it, and in the end settled the issue—was essentially oceanic. Captain Mahan says it was “purely maritime.” It may be true that, whatever the belligerent result, the political result, as regards the status of the insurgent colonies, would have been the same. It is in the highest degree probable, indeed it closely approaches to certainty, that a proper use of the British sea-power would have prevented independence from being conquered, as it were, at the point of the bayonet. There can be no surprise in store for the student acquainted with the vagaries of strategists who are influenced in war by political in preference to military requirements. Still, it is difficult to repress an emotion of astonishment on seeing that a British government intentionally permitted de Grasse’s fleet and the French army in its convoy to cross the Atlantic unmolested, for fear of postponing for a time the revictualling of the garrison beleaguered at Gibraltar. Washington’s opinion as to the importance of the naval factor has been quoted already; and Mahan does not put the case too strongly when he declares that the success of the Americans was due to “sea-power being in the hands of the French and its improper distribution by the British.” The French navy, misdirected as it was, made a good fight of it, never allowed itself to be decisively beaten in a considerable battle, and won at least one great victory. At the point of contact with the enemy, however, it was not in general so conspicuously successful as it was in the Seven Years’ War, or as it was to be in the great conflict with the French republic and empire. The truth is that its opponent, the French navy, was never so thoroughly a sea-going force as it was in the War of American Independence; and never so closely approached the British in sea experience as it did during the American Revolution. It is a fact that Great Britain was very nearly, but fortunately not quite, as familiar with the sea as she was; and she never found it so hard to beat them, or even to avoid being beaten by them. An Englishman would, naturally enough, start at the conclusion confronting him, if he were to speculate as to the result of more than one battle had the great Suffren’s captains and crews been quite up to the level of those commanded by stout old Sir Edward Hughes. Suffren, it should be said, before going to the East Indies, had “thirty-eight years of almost uninterrupted sea-service” (Laughton, Studies in Naval Hist. p. 103). A glance at a corner of the world, with the scenes of the general actions of the war dotted on it, will show how notable oceanic the campaigns were. The hostile fleets met over and over again on the far side of the Atlantic and in distant Indian seas. The French navy had penetrated into the ocean as readily and as far as the British could do. Besides this, it should be remembered that it was not until the 12th of April 1782, when Rodney in one hemisphere and Suffren in the other showed them the way, that British officers were able to escape from the fetters imposed on them by the Fighting In-structions—a fact worth remembering, in days in which it is sometimes proposed, by establishing schools of naval tactics on shore, to revive the pedantry which made a decisive success in battle nearly impossible.

The mighty conflict which raged between Great Britain on one side and France and her allies on the other, with little intermission, for more than twenty years, presents a different aspect from that of the war last mentioned. The victories which the British fleet was to gain were generally to be overwhelming; if not, they were looked upon as almost defeats. Whether the fleet opposed to the British was or was not the more numerous, the result was generally the same—the enemy was beaten. That there was a discoverable reason for this is certain. A great deal has been made of the disorganization in the French navy consequent on the confusion of the Revolution. That there was disorganization is undoubted; that it did impair discipline and, consequently, general efficiency will not be disputed; but that it was consideruble enough to account by itself for the French naval defeats is altogether inadmissible. Revolutionary disorder had invaded the land-forces to a greater degree than it had invaded the sea-forces. The British ship-of-the-line, with the fighting of her officers, had been beyond measure more frequent than was the case with the naval officers. In spite of all this the French armies were on the whole—even in the early days of the Revolution—extraordinarily successful. In 1792 “the most formidable invasion that ever threatened France,” as Alison calls it, was repelled, though the invaders were the highly disciplined and veteran armies of Prussia and Austria. It was nearly two years
later that the French and British fleets came into serious conflict. The first great battle, "The Glorious First of June," though a tactical victory for Great Britain, was a strategic defeat. Villaret Joyeuse manœuvred so as to cover the arrival in France of a fleet of merchant vessels carrying sorely needed supplies of food, and in this he was completely successful. His plan involved the probability, almost the necessity of fighting a general action which he was not at all sure of winning. He was beaten, it is true; but the French made so good a fight of it that their defeat was not nearly so disastrous as the later defeats of the Nile or Trafalgar, and—at the most—not more disastrous than the battle of the Virginia capes, as indeed it was not more than a disorder or disorganization in the French fleet at the date of any one of those affairs. Indeed, if the French navy was really disorganized in 1794, it would have been better for France—judging from the events of 1798 and 1805—if the disorganization had been allowed to continue. In point of organization the British navy was inferior, and in point of discipline not much superior to the French at the earliest date; at the later dates, and especially at the latest, owing to the all-prevailing energy of Napoleon, the British was far behind its rival in organization, in science, and lack of the patriotic spirit of its officers which parted without going to sea. Great Britain had the immense advantage of counting among her officers some very able men. Nelson, of course, stands so high that he holds a place entirely by himself. The other British chiefs, good as they were, were not conspiciously superior to the Hawkes and Rodneys of an earlier day. Howe was a great commander, but he did little more than just appear on the scene in the Revolutionary War. Almost the same may be said of Hood, of whom Nelson wrote, "He is the greatest sea-officer I ever knew" (Laughton, Nelson's Lett. and Desp. p. 71). There must have been something, therefore, beyond the meritorious qualities of the principal British officers which helped the navy so consistently to victory. The many triumphs won could not have been due in every case to the individual superiority of the British admiral or captain to his opponent. There must have been bad as well as good among the hundreds on the lists; and we cannot suppose that Providence had so arranged it that in every action in which a British officer of inferior ability commanded, a still more inferior French commander was opposed to him.

The explanation of the nearly unbroken success is that the British was a thoroughly sea-going navy and, became more and more so every month; while the French, since the close of the American War, had lost to a great extent its sea-going character and, because it had been shut up in its ports, became less and less sea-going as hostilities continued. The war had been for the British, in the words of Theodore Roosevelt, "a continuous course of victory won mainly by seamanship." The British navy, as regards sea experience, especially of the officers, was immensely superior to the French. This enabled the British government to carry into execution sound strategic plans, in accordance with which the coasts of France and its allied countries were regarded as the British frontier to be watched or patrolled by British fleets.

Before the long European war had been brought to a formal ending we received some rude rebuffs from another opponent of unsuspected vigour. In the quarrel with the United States, the so-called "War of 1812," the great sea-power of the British in the end asserted its influence, and the Americans suffered much more severely, even absolutely, than their enemy. At the same time the British might have learned, for the Americans did their best to teach it, that over-confidence in numerical strength and narrow professional self-satisfaction are nearly sure to lead to reverses in war, and not unlikely to end in grave disasters. The British had now to meet the elite of one of the finest communities of seamen ever known. Even in 1776 the Americans had a great maritime commerce, which, as Mahan says, "had come to be the wonder of the statesmen of the mother country." In the six- and thirty-years which had elapsed since then this commerce had further increased. There was no finer nursery of seamen than the then states of the American Union. Roosevelt says that "there was no better seaman in the world" than the American, who "had been bred in his work from infancy." A large proportion of the population "was engaged in sea-going pursuits of a nature strongly tending to develop a resolute and hardy character in the men that followed them" (Naval War of 1812, 3rd ed., pp. 29, 30). Having little or no naval protection, the American seaman had to defend himself in many circumstances, and was compelled to familiarize himself with the use of arms. The men who passed through this practical, and therefore supremely excellent, training school were numerous. Very many of the first trained by the English men-of-war, and sons in French ships. The state navy which they were called on to man was small; and therefore its personnel, though without any regular or avowed selection, was virtually and in the highest sense a picked body. The lesson of the War of 1812 should be learned by Englishmen of the present day, when a long naval peace has generated a confidence in numerical superiority, in the mere possession of heavier matériel, and in the merits of a rigidly uniform system of training, such confidence, as experience has shown, being often the forerunner of misfortune. It is true that in the last great war, the American sea-power came to its own.

Indeed, they certainly have been exaggerated by Americans and even by the British. To take the frigate actions alone, as being those which properly attracted most attention, the captures in action amounted to three on each side, the proportionate loss to the Americans, considering the smallness of their fleet, being immensely greater than to the British. We also see that no British frigate was taken after the first seven months of a war which lasted two and a half years. Attempts have been made to spread a belief that British reverses were due to nothing but the greater size and heavier guns of the enemy's ships. It is now established that the superiority of these details, which the Americans certainly enjoyed, was not great, and not of itself enough to account for their victories. Of course, if superiority in mere matériel, beyond a certain well-understood amount, is possessed by one of two combatants, his antagonist can hardly escape defeat; but it was never alleged that size of ship or calibre of guns—greater within reasonable limits than the British had—necessarily led to the defeat of British ships by the French or Spaniards. In the words of Admiral Jurien de la Gravière: "The ships of the United States constantly fought with the chances in their favour." All this is indisputable. If a still more pre-eminent than ever. The words used half a century before by a writer in the great French Encyclopédie seemed more exact than when first written. "L'Empire des mers," he says, is "le plus avantageux de tous les empires; les Phéniciens le possédaient autrefois et c'est aux Anglais que cette gloire appartient aujourd'hui sur toutes les puissances maritimes" (Encyclopédie, 7th January 1765, art. "Thalassarchie"). Vast outlying territories had been acquired or were more firmly held, and the communications of all the overseas possessions of the United States were secure against all possibility of serious menace for many years to come. Her sea-power was so ubiquitous and all-pervading that, like the atmosphere, Great Britain rarely thought of it and rarely remembered its necessity or its existence. It was not till a late date that the greater part of the nation—for there still are some exceptions—perceived that it was the medium apart from which the British empire could no more live than it could have grown up. Forty years after the fall of Napoleon she found herself again at war with a great power. She had as her ally the owner of the greatest
sea-power

nearly in the world except her own. Her foe, as regards naval forces, came the next in order. Yet so overwhelming was the strength of Great Britain and France on the sea that Russia never attempted to employ her navy against them. Not to mention other expeditions, considerable enough in themselves, military operations on the largest scale were undertaken, carried on for many months, and brought to a successful termination on a scene so remote that it was two thousand miles from the country of one, and three thousand from that of the other partner in the alliance.

"The stream of supplies and reinforcements, which in terms of modern war is called "communications," was kept free from even the threat of molestation, not by visible measures, but by the undisputed efficacy of a real, though imperceptible sea-power. At the close of the Russian War there were, even in influential positions, men who, undismayed by the consequences of mimicking in free England the cast-iron methods of Frederick the Great, began to measure British requirements by standards borrowed from abroad and altogether inapplicable to British conditions. Because other countries wisely abstained from relying on that which they did not possess, or had only imperfectly and with elaborate art created, the mistress of the seas was led to proclaim her disbelief in the very force that had made and kept her domain, and was urged to defend herself with fortifications by advise who, like Charles II. and the duke of York two centuries before, were "not ashamed of it." It was long before the peril into which this brought the empire was perceived; but at last, and in no small degree owing to the teaching of the experienced naval officers that in hand and insisted that a great maritime empire should have adequate means of defending all that made its existence possible.

In forms differing in appearance, but identical in essentials, the efficacy of sea-power was proved again in the American Civil War. If ever there were hostilities in which, manifestly, to the unobservant or short-sighted, naval operations might at first seem destined to count for little they were these. The sequel, however, made it clear that they constituted one of the leading factors of the success of the victorious side. The belligerents, the Northern or Federal states and the Southern or Confederate states, had a common land frontier of great length. The capital of each section was within easy distance of this frontier, and the two were not far apart. In wealth, population and resources the Federals were enormously superior. They alone possessed a navy, though at first it was a small one. The one advantage on the Confederate side was the large proportion of military officers which belonged to it and their rare excellence as soldiers. In physique as well as in moral the army of one side differed little from that of the other, perhaps the Federal army was slightly superior in the first, and the Confederate, as being recruited from a dominant white race, in the second. Outnumbered, less well equipped, and more scantily supplied, the Confederates nevertheless kept up the war, with many brilliant successes on land, for four years. Had they been able to maintain their trade with neutral states they could have carried on the war longer—and—not improbably—have succeeded in the end. The Federal navy, which was largely increased, took away all chance of this. It established effective blockades of the Confederate ports, and severed their communications with the world beyond. The Confederates, however, were able to supply themselves and their blockade runners with the necessary equipment, and at the same time, with a small force of ships were able to maintain an active commerce.
was what, in accordance with the limitations of sea-power, may be expected of a navy. It made the transport of the army across the sea possible, and enabled it to do what of itself the army could not have done, viz. overcome the last resistance of the enemy.

The issue of the Spanish-American War, at least as regards the defeat of Spain, was a foregone conclusion. That Spain, even without a serious insurrection on her hands, was unequal to the task of meeting so powerful an antagonist as the United States must have been evident even to Spaniards. However that may be, an early collapse of the Spanish defence was not anticipated, and however one-sided the war may have been seen to be, it furnished examples illustrating the economies of naval warfare and the advantage of numbers.

"while possessing, as every war does, characteristics of its own, it is peculiar, even to Spaniards. However that may be, an early collapse of the Spanish defence was not anticipated, and however one-sided the war may have been seen to be, it furnished examples illustrating the economies of naval warfare and the advantage of numbers.

What it is, may be, is a foregone conclusion. That Spain, even without a serious insurrection on her hands, was unequal to the task of meeting so powerful an antagonist as the United States must have been evident even to Spaniards. However that may be, an early collapse of the Spanish defence was not anticipated, and however one-sided the war may have been seen to be, it furnished examples illustrating the economies of naval warfare and the advantage of numbers.

SEARCH, or Visit and Search, a term used in international law and apparently derived in some confused way from the French word *visite*, which means search, combined with the English translation of the word *visite*. An attempt made by some writers to distinguish between visit and search only leads to misunderstanding. Search is the exact English equivalent of *visite*, and in the translation of the Declaration of London (Feb. 26, 1909) the translator has rightly rendered it so (art. 63).

The right of search belongs to belligerents alone. Its object is to verify the nationality of the vessel and if neutral to ascertain whether it carries contraband. The consequence of resistance to search is capture and trial in a Prize Court. "Forcible resistance to the legitimate exercise of the right of stoppage, search and capture," says art. 63 of the Declaration of London, 1909, "involves in all cases the condemnation of the vessel. The cargo is liable to the same treatment as that of an enemy vessel. Goods belonging to the master or owner of the vessel are treated as enemy goods." At the Hague Conference of 1907 the question of the liability to search of mail-ships gave rise to much discussion based on incidents arising out of the South African and Russo-Japanese Wars. It was ultimately decided that postal correspondence of neutrals and even of belligerents, and whether official or private, found on board a neutral or even an enemy ship should be "inviolable," and that though the ship should be detained, this correspondence had to be forwarded to its destination by the captor "with the least possible delay." The question of search and its consequence destined for or proceeding from a blockaded port. As regards the mail-ships themselves, apart from this inviolability of the correspondence, no exemption or privilege is extended beyond the injunction that they should not be searched, except when absolutely necessary, and then only "with as much consideration and expedition as possible," which might just as well be said of all ships stopped or searched on the high seas.

SEA-SERPENT. The belief in enormous serpents, both terrestrial and marine, dates from very early times. Homer (H.N. viii. 14), following Livy (Epit. xviii.), tells us of a land-serpent 120 ft. long, which Regulus and his army besieged with balistae, as though it had been a city, and this story is repeated by several other writers (Florus ii. 2; Val. Max. i. 8; Gallus vi. 3). The most prolific in accounts of the sea-serpent, however, are the early Norse writers, to whom the "Sö-Odn" was a subject both for prose and verse. Olaus Magnus (Hist. gent. sept. xxi. 24) describes it as 200 ft. long and 20 ft. round, and states that it not only ate calves, sheep and swine, but also "disturbs ships, rising up like a mast, and sometimes snaps some of the men from the deck," illustrating his account with a vivid representation of the animal in the very act. Pontoppidan, in his Natural History (Eng. trans., 1755, pp. 195 seq.), says that its existence was generally believed in by the sailors and fishermen of his time, and he recounts the means they adopted to escape it, as well as many details regarding its habits. The more circumstantial records of comparatively modern times may be conveniently grouped according to the causes which presumably gave rise to the phenomena described. (1) A number of porpoises swimming one behind another may, by their characteristic mode of half emerging from and then re-entering the water during respiration, produce the appearance of a single animal showing a succession of snake-like undulations. The figure given by Pontoppidan was very likely suggested by such an appearance, and a sketch of an animal seen off Llandudno by

1 Convention relative to certain restrictions on the exercise of the right of capture in wartime (art. 1).
SEa-SERPENT 561

several observers looks as though it might have had a similar origin, notwithstanding that this hypothesis was rejected by them. (2) A flight of sea-fowl on one occasion recorded by Professor Aldis produced the appearance of a snake swimming at the surface of the water. (3) A large mass of seaweed has on more than one occasion been cautiously approached and even harpooned under the impression that it was such a monster. (4) A pair of basking sharks (Selache maxima) furnishes an explanation of some of the recorded observations, as was first pointed out by Frank Buckland. These fish have a habit of swimming in pairs, one following the other with the dorsal fin and the upper lobe of the tail just appearing above the water, and, as each animal is fully 30 ft. long, the effect of a body of 60 or more ft. long moving through the water is readily produced. To this category belongs the famous serpent cast up on Strossnay, one of the Orkneys, of which its account was read to the Wernerian Society of Edinburgh; some of its vertebrae were preserved in the Royal College of Surgeons of London, and identified as those of Selache maxima by both Home and Owen. There is also evidence to show that specimens of Carcharodon must have existed more than 100 ft. long. (5) Ribbon-fish (Regalecus), from their snake-like form and great length (sometimes as much as 20 ft.), have been suggested as the origin of so-called "sea-serpent," amongst others by Dr. Andrew Wilson; but Dr. Günter, from what is known regarding the habits of these fish, does not regard the theory as tenable. (6) A gigantic squid (Architeuthis) was most likely the foundation of the old Norse accounts, and also of those which in the early part of the 19th century came so frequently from the United States as to gain for the animal the sobriquet of "American sea-serpent." These stories were so circumstantial, so consistent, and vouched for by persons of such eminence, that no doubt was possible (notwithstanding the cavilling of Mitchell) as to the existence of a strange marine monster of very definite character in those regions. The description commonly given of it has been summed up by Cool, somewhat thus:-(i.) general form of a serpent; (ii.) body, when viewed from above, a large flattened, eye generally not mentioned, some distinctly stating that it was not seen; (iv.) neck 12 to 16 in. in diameter; (v.) appendages on the head, neck or back (accounts here variable); (vi.) colour dark, lighter below; (vii.) swims at the surface, head thrown forward and slightly elevated; (viii.) procession steady and uniform, body straight but capable of being bent; (ix.) water spouting from its; (x.) in shape like a "run bogy." The annexed figure (fig. 1) represents one which was seen from H.M.S. "Daedalus," To show the reasonableness of this hypothesis, it may be added that gigantic Cephalopods are not uncommon on the shores of Newfoundland, and are occasionally met with on the coasts of Scandinavia, Denmark and the British Isles, and their extreme size seems to be above 60 ft., and, furthermore, that their mode of progression is by means of a jet of water forcibly expelled from the siphon, which would impart that equable motion to which several observers allude as being evidently not produced by any serpentine bending of the body. A very interesting account of a monster almost certainly originating in one of these squids is that of Hans Egede, the well-known missionary to Greenland; the drawing by Bing, given in his work, is reproduced here (fig. 3), an action which they have been observed in aquaria habitually to perform. Numerous other accounts seem to be explicable by this hypothesis, among them may be mentioned that of a huge "snake" seen by certain of the crew of the "Pauline" in the South Atlantic Ocean, which was said to be coiled twice round a large sperm whale, and then towered up many feet into the air and finally dragged the whale to the bottom. It is now well-known that the sperm whale kills and devours Architeuthis and other large oceanic Cephalopods, and no one who has read Bullen's vivid description, in The Cruise of the Cachalot, of the struggle between a cachalot and a giant squid, can doubt that it was a combat of this kind which was thus erroneously described. The immensely long arms of Architeuthis would not unnaturally be mistaken for a snake by sailors, and instead of being dragged to the bottom the whale doubtless sounded of its own accord as whales usually do (see CUTTLEFISH). (7) A sea-lion, or "Anson's seal" (Murina elephantina), was suggested by Owen as a possible explanation of the serpent seen from H.M.S. "Daedalus"; but as this was afterwards rejected by Captain M'Quahie, who stated that it could not have been any animal of the seal kind, it seems better to refer the appearance to a squid. (8) A plesiosaurus, or some other of the huge marine reptiles usually believed to be extinct, might certainly have produced the

phenomena described, granting the possibility of one having survived to the present time. Newman 1 and Gosse 2 have both supported this theory, the former citing as evidence in its favour the report of a creature with the body of an alligator, a long neck and four paddles having been seen by Captain Hope of H.M.S. "Fly" in the Gulf of California. 3) No satisfactory explanation has yet been given of certain descriptions of the sea-serpent. Perhaps the most remarkable of these is Lieutenant Hayne's 4 account of a creature seen from H.M. yacht "Osborne." Two different aspects were recorded—the first being a ridge, 30 ft. in length, of triangular fins, each rising 5 to 6 ft. above the water, while the second view showed a large round head 6 ft. in diameter, with huge flappers, which moved like those of a turtle.

A more recent record of the appearance of a mysterious sea-monster is that of Messrs Meade-Waldo and Nicoll, both fellows of the Zoological Society, in the Proceedings of that Society for 1906, p. 719. These two gentlemen on the 7th of December 1905 were on board the yacht "Valhalls" off the coast of Brazil when at 10:15 A.M. they saw, 100 yards from the ship, a large fin projecting above the water to a height of 18 in. or 2 ft., and 6 ft. in length. Under the water to the rear of the fin was the shadow of a considerable body. When Mr Meade-Waldo directed his field-glasses upon the object he saw a great head and neck rise out of the water in front of the fin. The neck appeared about the thickness of a man's body, and 7 to 8 ft. in length. The head was of the same thickness and had a very turtle-like appearance, eye and mouth being distinctly seen. The object was going very slowly and shortly disappeared from view. In this case as in others the objects seen were not sufficient to identify the nature of the animal. It is difficult to attribute such a head and neck to any known fish, and turtles have no dorsal fin. It would thus appear that while, in every few exceptions, all the so-called "sea-serpents" can be explained by reference to some well-known animal or other natural object, there is still a residuum sufficient to prevent modern zoologists from denying the possibility that some such creature may after all exist.

Distinct in origin from the stories already touched on is the legend of the sea-serpent or bimam among the Arabs (Mae'di-i 266 seq.; Kazwini i. 132 seq.; Damiri i. 186 seq.), which is described in such a way as to leave no doubt that the waterspout is the phenomenon on which the fable rests. The bimam is the Hebrew lamman (E.V. "whale," "dragon"), which in Ps. cxlviii. 7 might in the context be appropriately rendered "waterspout." In addition to the sources already cited, the reader may consult Bland's Magazine, vol. iii. (1815); Lee, Sea Monsters Unsolved (International Fisheries Exhibition Handbook, London, 1883); Cowgell, Zoologist, pp. 1841, 1911 (1847); and Hoyle, Proc. Roy. Phys. Soc. Edin. vol. ix.

SEA-SICKNESS, the symptoms experienced by many persons when subjected to the pitching and rolling motion of a vessel at sea, of which depression, giddiness, nausea and vomiting are the most prominent. They generally show themselves soon after the vessel has begun to roll by the onset of giddiness and discomfort in the head, together with a sense of nausea and sinking at the stomach, which soon develops into intense sickness and vomiting. At first the contents of the stomach only are ejected; but thereafter bilious matter, and occasionally even blood, are brought up by the violence of the retching. The vomiting is liable to exacerbations according to the amount of oscillation of the ship; but seasons of rest, sometimes admitting of sleep, occasionally interpose. With the sickness there is great physical prostration, as shown in the palor of the skin, cold sweats, and feeble pulse, accompanied with mental depression and wretchedness. In almost all instances the attack has a favourable termination, except in the case of persons weakened by other diseases.

The conditions concerned in the production of the malady are apparently the presence of the ship; the sudden rise and fall of its movements; the emptying of the vessel disturbs that feeling of the relation of the body to surrounding objects upon which the sense of security rests. The nervous system being thus subjected to a succession of shocks fails to effect the necessary adjustments for equilibrium. Giddiness and with it nausea and vomiting follow, aided probably by the profound vasomotor disturbance which produces such manifest depression of the circulation. The displacement of the abdominal viscera, situated by the rolling and pitching of the vessel, may possibly operate to some extent, but it can only be as an accessory cause. The same may be said of the influence of the changing impressions made upon the visual organs by the shifting of the scene from the dark, and in the case of blind persons. Other contributory causes may be mentioned, such as the feeling that sickness is certain to come, which may bring on the attack in some persons even before the ship begins to roll, and the sea-nights of long duration, yielding medium, the varied odours met with on board ship, and circumstances of a like nature tend also to precipitate or aggravate an attack.

No means has yet been discovered which can altogether prevent the occurrence of sea-sickness, nor is it likely any will be found, until the pitching movements of the vessel are done away with. Sedatives are among the most potent drugs which can be employed; and doses of bromide of potassium, bromural or chloral, appear to act usefully in the case of many persons. On the other hand, some high authorities have recommended the employment of nerve stimulants such as coffee, cacao, and grog, which, if taken about two hours before sailing, will frequently prevent or mitigate the sickness. When the vessel is in motion, or even before starting, the recumbent position with the head low and the eyes closed should be assured, these being likely to prevent the sudden change in the weather, on deck rather than below—the body, especially the extremities, being well covered. Many persons, however, find comfort and relief from lying down in their berths with a hot blanket to the feet, by which means sleep may be obtained, and with it a temporary abatement of the giddiness and nausea. Should sickness supervene small quantities of some light food, such as thin arrowroot, greed, or soup, ought to be swallowed if possible, to lessen the sense of exhaustion. The vomiting may be mitigated by saline effervescing drinks, ice, chloriform, hydrocyanic acid or opium. Alcohol, although occasionally producing a general abatement of the symptoms, is generally rather to aggravate the sickness. Dr Chapman, in accordance with his view that the cause of the sickness is an undue influx of blood to the spinal cord, introduced a spinal ice-bag; but, like every other plan of treatment, it has only occasional success. Such remedies as nitrite of amyl and cocaine do not seem to yield any better results.

SEASON (O. Fr. sezon, sciezon, mod. saison, Lat. saeza, sowing time, the spring, from serere, to sow; in Lat. Lat. the word is found with its present meaning, the spring being considered as particularly the season of the year), a period of time, in particular, of the four periods into which the year is divided by the changing of the temperature, rainfall, and growth and decay of vegetation due to the annual motion of the sun in declination. Divided strictly according to this motion the year falls into four nearly equal seasons, "spring" (i.e. the springing time, when vegetation rises or shoots), "summer" (O. Eng. summer, cf. Dutch somer, Ger. Sommer, probably connected with Skt. sama, year), "autumn" (Lat. autumnus, autumnus, from awere, to increase, the period of ripening or fruiting) and "winter" (common Teutonic, possibly a nasallized form of root seen in "wet"). (See further Climate, Meteorology.)

SEATON, SIR JOHN COLBORNE, 1st BARON (1778-1863), British field marshal, was born at Lyndhurst, Hants, on the 16th of February 1778 and entered the 2oth (Lancashire Fusiliers) in 1794, winning thereafter every step in his regimental promotion without purchase. He first saw service in the Helmarsh expedition of 1799, and as a captain he took part in Sir Ralph Abercromby's attack on the fort on the 2oth of March 1801. He landed at Egypt, which he commanded, in the spring of 1802, and soon afterwards was brought under the notice of Sir John Moore, who obtained a majority for him and made him his military secretary. In this capacity he served through the Corunna campaign, and Sir John Moore's dying request that he should be given a lieutenant-colonelcy was at once complied with. In the summer of 1808 Lieut.-Colonel Colborne was again in the Peninsula, and before taking command of the 6thth regiment, he witnessed the defeat of the Spaniards at Ocaña. With the 66th he was present at Busaco and shared in the defence of the
lines of Torres Vedras, and next year, after temporarily com-
manding a brigade with distinction at the battle of Albuera,
he was gazetted to command the famous 32d Light Infantry
(Oxfordshire and Bucks L.I.) with which corps he is most closely
identified. He led it and was very severely wounded at Ciudad
Rodrigo (1812), and only rejoined in July 1814. Shortly after-
wards he was placed in temporary charge of a brigade of the
Light Division which he commanded in the Pyrenees engage-
ments. In 1849 he obtained his promotion to Major-General
by ballot of the House of Commons, and on the 14th he was
made colonel, aide-de-camp to the Prince Regent and K.C.B.
In 1815 Colborne and the 52nd at Waterloo played a
brilliant part in the repulse of the Old Guard at the close of the
day. Promoted major-general in 1825, Colborne was soon after-
wards made lieutenant-governor of Guernsey. In 1830 he served
as lieutenant-governor of Upper Canada. In 1838 at the moment
of his vacating the post on promotion to lieutenant-general,
the rebellion broke out, and he was ordered to assume the func-
tions of governor-general and commander-in-chief. He quickly
repressed the revolt, and in 1839, returning home, he was
posted to the peerage as Baron Seaton of Seaton in Devonshire.
From 1843 to 1849 he was high commissioner of the Ionian islands.
In 1854 he was promoted full general, and from 1855 to 1860 he
was commander-in-chief in Ireland. He died at Torquay on
the 17th of April 1863.

See the Life by G. C. Moore Smith (1906).

SEATTLE, the county-seat of King county, Washington,
U.S.A., and the largest city in the state, situated on a neck
of land between Elliott Bay (an eastern arm of Admiralty Bay), Puget
Sound, and the fresh-water Lake Washington; about 865 m.
by water N. of San Francisco, and 841 m. by rail N. of the penin-
insula, and about 28 m. N. of Tacoma. Pop. (1870) 1107;
(1880) 3533; (1890) 42,837; (1900) 80,671; (1910 U.S. census)
237,104. Of the population in 1900, 41,483 were of
foreign parentage and 22,003 were foreign-born. The area of
the city in 1910 was about 83,459 sq. m., of which 29,424 sq. m.
were water surface, 23 sq. m. being salt water. Seattle is
the terminus of the Northern Pacific, the Canadian Pacific (using
the tracks of the Northern Pacific), the Great Northern, the
Chicago, Milwaukee & Puget Sound (1900), the Oregon &
Washington (1901), a joint extension to Puyallup Sound of the
Pacific and Union Pacific), the Chicago, Burlington &
Quincy (using the tracks of the Northern Pacific), and the
Columbia & Puget Sound railways. It is served by inter-urban
electric lines to Tacoma and Everett; is the starting-point for
steamers to Alaska and to Prince Rupert, British Columbia
(Grand Trunk Pacific line), and for lines to Japan, China, Siberia,
Hawaii, the Philippines, Australia, Mexico, South America and
Pacific coast ports of the United States; and is a port of call for
coasting vessels. The city has the excellent salt-water harbour
of Elliott Bay to the W.; and to the E. there is a fresh-water
harbour, Lake Washington, connected with Puget Sound by the
Lake Washington Canal, an artificial improvement of the natural
waterway by Lake Union, a great V-shaped body of water in
the north-central part of the city, and by Salmon Bay, a narrow
channel setting in from Puget Sound on the N.W. Crossing the
S.W. part of the city is Duwamish river, which empties into
Elliott Bay. At Bremerton, Kitsap county, about 15 m. W. by
S. of Seattle, is the Puget Sound Navy Yard, protected by Fort
Ward, with one dry dock (1910) 836 ft. long and 110 ft. wide,
another 627 ft. long, and two docks 650 ft. long.
The surface of the city is hilly, the greatest height being 500 ft.
above sea-level. The higher hills, the better residential parts
of the city, are reached by cable railways or by electric railways
following winding routes. Many of the higher hills, especially
in the business district, have been removed by hydraulic power
and large parts regraded. Lake Washington, to the E., is 22 m.
long, and 1 to 4 m. wide, with an area of 50 sq. m., a shore line
of 80 m. and a maximum depth of 225 ft; its waters are deep
and clear and never freeze. In the north-central part of the city
is Green Lake, about 1 m. long and ½ m. wide. On Puget Sound
and Lake Union and about these two lakes, both with well-
wooded shores and both furnishing excellent boating and
 canoeing, are the principal parks of the city. In 1910 the total
park acreage under the park commissioners was 19,548 acres.
Immediately S. of Green Lake is Woodland Park (179 acres) with
athletic fields and a zoological collection. On the southern
shore of Union Bay (a circular, nearly landlocked arm of Lake
Washington) in the east-central part of the city is Washington
Park (163 acres). Farther S. near Lake Washington are Madrona
Park (9 acres), Frink Park (20 acres), which adjoins Leschi Park
(32 acres), and Beacon Hill Park (12 acres). Near Lake Union
is Volunteer Park (45 acres) on Capitol Hill, containing a public
observatory (460 ft. above sea-level) and a statue of W. H.
Seward by Richard Brooks. Schmitz Park (30 acres) is woodland
on the West Seattle peninsula, overlooking the Sound; and
between Volunteer Park and Washington Park is Interlaken
(46 acres). Kinnear Park (14 acres) is near the entrance to
the harbour. Nearly all these parks command views of the Cascade
and Olympic ranges. The city owns large areas which are
to be improved as parks, including Ravenna Park, which has a
noble native fir and cedar forest and sulphur springs. Private
parks include the White City (on Lake Washington), Golden
Gardens (50 acres) and, in West Seattle (annexed in 1907),
Luna Park, an amusement place with a natorium. North
of the city on Lake Washington are the links of the Seattle
Golf and Country Club. Practically a part of the city's park
system and to be crossed by its boulevards are the campus
of the university of Washington, and the fine grounds (605 acres
given to the Federal government by the city) of Fort Lawton.
On the campus of the university are a statue of Washington by
Lorado Taft and a bust of J. J. Hill by Ben Proctor.

The principal public buildings are the county court house
(on a commanding site), the county almshouse, the municipal
building, a federal building, the Y.M.C.A. building, a Labor
Temple, a Carnegie library (1905), with several branches through-
out the city and about 128,000 volumes in 1910, and the buildings
of the university of Washington. In Georgetown, immediately
S. of the main part of Seattle and nearly hemmed in by parts
of the city, is the county hospital. The city has many churches,
including Chinese, Japanese, Finnish, Scandinavian, German
and Russian. Seattle is the see of a Roman Catholic bishop,
and St James Cathedral is the finest church in the city.
The First Presbyterian Church has a large auditorium.

Of the many educational institutions, the most important is
the university of Washington, Washington Hall (under the
directorship of Professor (Mary) Lady of Llewellyn) and the
Washington School; the University of Washington College;
the Brothers' School; the Seattle College; three business
colleges; the Seattle Art School, in connexion with which the
Art Students' League of Seattle was formed in 1909; and a good
public school system including six high schools in 1910, one of
which has an excellent collection of the fauna and flora of the Pacific
Coast. On Mercer Island in Lake Washington is the parental school
of the municipal public school system. The city has a cosmopolitan press,
including two Japanese dailies.

There are an associated charities organization and a "charities
endorsement committee" (1903), which is under the auspices of
three commercial associations; there are a recovery home
(1896, under the Washington Children's Home Society); the
Seattle Children's Home (1884, under the Ladies' Relief Society
of Seattle); the children's orthopaedic hospital (1913), which
the Seattle Federation of Women's Clubs supports a Girls' Home
and Training School (1900). Under Roman Catholic control are
a Deaconess Home, the Mount Carmel Home (under the Missionary
Sisters of Charity of the Sacred Heart of Jesus), and the House of the Good
Shepherd (under the Sisters of the Good Shepherd). The Ladies'
Hebrew Benevolent Society, the Ladies' Montefiore Aid Society and
the Hebrew Benevolent Association are Jewish charities. Other
charities are the Seattle Society for the Blind, the Salvation
Army, the Union of Good Samaritans, the Salvation Army
Crittenton Home, the Lebanon Rescue Mission, the Japanese
Women's Home, the Seattle Fruit and Flower Mission, and
the Women's Relief Corps for Old Age (Presbyterian). The principal
hospitals are the Pacific (1899), the Seattle General (1894, under the Deaconess
Home Association), the Providence (1877, under the Sisters of
Charity), the Minor, the Wayside Emergency (1900), the Municipal
and the County.

The situation of Seattle makes it important commercially
and industrially. For its manufactories electric power is derived
SEA-URCHIN

from Snoqualmie Falls (N.E. of Seattle) from Puyallup river (S.W.) and from Cedar river.

The largest sea-urchin product in 1905 (excluding Ballard) was $25,406,574 (nearly one-fifth of that of the state), or 65-9% more than in 1900. The increase was particularly marked in the value of flour, $4,933,666, or 253-9% more than in 1900. Other important manufactured products of the state, being the commercial and industrial centre for the customs district of Puget Sound. In 1900 the net tonnage of vessels entering the harbour (local figures) was 2,457,451 tons. The foreign imports in 1908 (Harbor Master's Report) were valued at $16,413,735, the foreign imports at $23,805,727. Its exports and imports make up the greater part of the commerce of the district, which has Port Townsend as its port of entry, and the city is rivalled only by San Francisco among the cities of the Pacific coast in the amount of its water-borne traffic. The chief exports are wheat, flour, timber, hay, potatoes, live stock, fruit, fish (salmon), oats, coal (from the mines E. of Lake Washington), hops, cotton (from the Southern States), dairy products and general merchandise; and the imports include silk, rice, coffee, tea, sugar, spices, indigo and other Oriental products. Practically all the gold from Alaska and the Yukon territory is received here, and about 20% of all the trade through Seattle, the foreign trade is with China, Japan, Siberia, Hawaii, the Philippines, Australia, Mexico, South America and Europe. The Chamber of Commerce, and other organizations, use the following system, with its source at Cedar Lake and Cedar River, 28 m. S.E., and an electric lighting plant (for which power is derived from the falls of the Cedar river), but most of the lighting is supplied by private companies. The city has undertaken the regaining necessitated by the hilly site of Seattle. In 1909 the assessed valuation of the city was $185,317,470 and the city's debt was $8,570,380 (bonded) and $8,933,973 (net debt for local improvements).

The first permanent settlement here was made in 1852 by settlers who a year before had established New York, a village at Alki Point, on the W. side of Elliott Bay and in the present city limits. This group of settlers was provided with patent in honour of a Dwaiten chief of that name, who died in 1866 and who was friendly to the whites. In 1853 a town plat was filed, King county was erected, and Seattle became the county seat. In 1855 Seattle had a population of 300. In January 1856 in an attempt to exterminate the whites the neighbouring Indians unsuccessfully attacked Seattle, which was defended by the U.S. sloop-of-war "Decatur." The first railway reached Seattle in 1884. In 1886-1887, when there were anti-Chinese riots here led by the Knights of Labour, many Chinese were attacked and their houses ransacked. There was therefore a very close vigilance committees. A destructive fire in 1887 and the financial depression of 1893 checked the city's growth, which, however, received a new impetus from the discovery of gold in Alaska and the Yukon territory in 1897, as Seattle became the outfitting place for prospectors and the port to which gold was shipped. The Town of Seattle was annexed in 1905; and the city of South-east Seattle, the town of Ravenna, the town of South Park, the city of Columbus, the city of Ballard, the city of West Seattle, and Dunlap, Rainier Beach and Atlantic City were annexed in 1907. From the 1st of June to the 15th of October 1907 the Alaska-Yukon-Pacific Exposition was held in Seattle on grounds which now form part of the university campus, between Lake Union and Lake Washington; of the twelve central Exposition buildings some were afterwards turned over to the university. The purpose of the Exposition was to exploit Washington, the Yukon and the entire north-west on the Pacific slope.

SEA-URCHIN. These animals belong to the great group of Echinoderms (see Echinodermata) and to its class Echinoidea. Both the scientific and the English names denote their resemblance to the urchin or hedgehog, the resemblance lying in the prickles with which the skin is covered. The skin itself is stiffened by a deposit of calcite (crystalline carbonate of lime) in the form of plates. If the prickles be scraped away, these plates will be seen to form a hard shell or test, in which are two openings, for the mouth and the anus. According to the position of these openings the urchins are described as Regular or Irregular. In the Regular urchins, of which Echinus esculentus, the edible egg-urchin (fig. 1), and Dorocidaris papilla, the piper (fig. 2), are familiar examples, the test is spherical with the mouth at the top and the anus at the upper. In the Irregular urchins, of which Spatangus purpurascens, the purple heart-urchin (fig. 3), is a common type, the test has been drawn out into an oval or heart shape, with the mouth shifted towards the front end and the anus towards the hinder end.

The greater part of the test of a Regular urchin is divided, as a globe by meridians of longitude, into ten areas, each composed of two columns of plates. In five of these areas the plates are pierced by pairs of pores (fig. 2, Ambulacrum), and in life there issues from each pair a tubular process with a sucking disk at its end (fig. 1). Within the test these processes or podia are connected with five tubes arising from a tubular ring round the mouth and running upwards to the apex, where each passes out as a single process through a special plate at the end of the area to which it belongs. This is the ambulacral system. In the process is sometimes surrounded by pigment, as are organs susceptible to light, it has been regarded as an eye and the plate through which it passes called an ocular (fig. 2). From the ring-canal round the mouth a single tube passes straight through the test to an orifice by the apex, where it opens through a sieve-like plate—the madreporite (fig. 2). Thus all this system of tubes is placed in connexion with the outer sea-water, and is filled with it. Within the test the bottom of each podium is swollen into a little bag—amphulla—likewise full of water, and when the muscles with which it is provided pull the sides of the bag together, the water is squeezed into the podium and dilates it, so that it is stretched far out (see Echinodermata, fig. 12 D). The podium can then wave about and attach its sucker to any smooth object within reach. Each of these five areas, with the podia on each side of it extended and waving, looks like a garden avenue—Latin ambulacrum—and the animal is thus described. The five interambulacral areas, the plates composing them ambulacral, and the whole system of water-vessels the ambulacral system. This system forms perhaps the most characteristic feature of all living Echinoderms, but it reaches its highest development in the urchins.

The five areas of the test, with the exception of the central area, are called interambulacral (fig. 2, Interambulacrum); their plates are not pierced by pores but are generally ornamented by large tubercles bearing little prickles (spines or radicles), between and around which are smaller prickles (fig. 2). The madreporite is one of five plates that surround the anal opening and alternate in position with the oculars. Each of these plates is pierced by a pore, communicating with the inside of the test, and opening to the hind end, giving passage to the eggs or milt when they are ripe; hence these plates are called genital plates (fig. 2). The five genital and five ocular areas form the apical system of plates (see Echinodermata, fig. 3, A.B.). From the mouth to the anus the gut follows a coiled course, first going round the cavity of the test in one direction and then turning back on itself, while the two limbs of the loop thus formed are themselves thrown into festoons attached by strands to the wall of the test. The lower coil, next the mouth, is the stomach.
in which food accumulates, while the upper coil is the intestine proper. In *Echinus*, but not in the Cidarids, a narrow tube branches from the gut at the beginning of the first coil, runs alongside the stomach, and re-enters the gut at the end of the coil; this, which is called the siphon, permits a flow of water through the gut however full of food the stomach may be. Round the gutule is a jaw-apparatus, consisting essentially of five hard, pointed teeth, the ten jaw-pieces in which they are held, five struts between the pairs of jaws, and five cambered stays for the attachment of ligaments to keep the whole apparatus in position. The jaws are worked by muscles in such a way as to draw the teeth together or apart, inwards or outwards. This apparatus is often called "Aristotle's lantern," though it is extremely doubtful whether Aristotle (Hist. Anim. iv. 5) was allied to this structure. The whole of it is covered by the membrane lining the body-cavity, and from the space thus enclosed there

**SEA-WOLF**

skin, and often a gland which secretes a poison. The pedicellariae were once supposed to be parasites, but they are really organs of the same nature as the radioles; they are of four different forms, three of which undoubtedly serve for defence, while the shortest ones clean the test from impurities and sand-grains that have entered the radiolae. Sea-urchins other than Cidarids also bear on the test minute sensory organs called sphaeridia, each consisting of a small hard knob, supported by a stalk which may be partly calcified but always contains many nerve-fibres. It is generally supposed that they are sensitive to vibrations in the water, and to any change from the normal position which the animal may assume or be forced into. Such a regular urchin as has here been described passes from the mouth downwards, preferring a hard floor, on which it creeps by its podia and its radioles, constantly scraping the algae and seaweeds from the rock with its teeth and so feeding itself. If it does not bore a hole, or is not protected by long needle-like radioles, it may grasp bits of sea-weed or other objects with its pedicellariae and hide beneath them from the fish that seek it for food.

The irregular urchins (fig. 3) have been modified for another way of life. Some of them live in mud or ooze, through which they creep. The mouth has moved forward, has lost its jaws and often has a lip, projecting so as to scoop up the mud. The prickles have become smaller, often almost silky, and are generally directed backwards so as not to oppose the passage of the body. The podia of the under surface still aid locomotion, but those of the upper surface, which are concentrated in five petal-shaped areas, act mainly as gills. These urchins often assume a heart shape, owing to the greater development and sinking in of the front petal. The sand-dollars and their allies, which live half-buried in sand without moving through it, retain a more or less circular outline, as well as the central portion of the mouth, which has not lost its jaws; the anus, however, has moved to the side, while the podia of the upper surface are concentrated in petals and many of them are fused into branched gills. The sand-dollars proper are very thin and flat, but the shield-urchins (Clypeaster, &c.) have the central region of the upper surface raised in a boss, which reaches above the sand, so that the animal can still breathe through the whole blistered under-surface. In many irregular urchins the petals of the ambulacra are deeply sunk, and serve as a nursery for the young, which are covered by the spines of the parent.

Sea-urchins live only in the sea, from between tide-marks down to all but the greatest depths. The abyssal forms have very thin tests, which are often flexible. Urchins eat all kinds of animal and vegetable food, and are themselves attacked by fish, by starfish, and even by other urchins. The ripe egg-bunches are a favourite article of diet with dwellers round the Mediterranean; in other respects sea-urchins are of small importance to man, being neither useful nor harmful. In older times the larger radioles were recommended to be powdered and taken as a remedy for the stone.

For details of classification, see under *Echinoderma*, in the article *ECHINODERMA*.

**SEA-WOLF**, also *SEA-CAT* and *WOLF-FISH* (*Anarrhichas lupus*), a marine fish, the largest of the family *Blenniidae* or blennies. In spite of its large size, it has retained the bodily form and general external characteristics of the small blennies. Its body is long, subcylindrical in front, compressed in the caudal portion, smooth and slippery, the rudimentary scales being embedded and almost hidden in the skin. An even dorsal fin extends the whole length of the back, and a similar fin from the vent to the caudal fin, as in blennies. The pectorals are large and rounded, the pelvic fins entirely absent. Its dentition distinguishes the sea-wolf from all the other members of the family. Both jaws are armed in front with strong conical teeth, and on the sides with two series of large tubercular molars, a biserial band of similar molars occupying the middle of the palate. By these teeth the sea-wolf is able to crush the hard carapaces or shells of the crustaceans and molluscs on which it feeds; that it uses

---

**Fig. 2.—A Regular Sea-urchin, *Dorocidarlis papillata*. The test seen from above, with most of the spines removed. Natural size.**

**Fig. 3.—An Irregular Sea-urchin, *Spatangus irregularis*.**
the teeth as a weapon of defence and deserves the character of ferocity generally attributed to it would appear to be rather questionable. Sea-wolves are inhabitants of the northern seas of both hemispheres, one (A. lupus) being common on the coasts of Scandinavia and North Britain, and two in the seas round Iceland and Greenland. Two others occur in the corresponding latitudes of the North Pacific. They attain to a length exceeding 6 ft., and in the north are esteemed as food, both fresh and preserved. The oil extracted from the liver is said to be in quality equal to the best cod-liver oil.

To the fishermen of the North Sea this fish is generally known as ‘catfish,’ and is among the most valuable of this species has been marketed. As it would be impossible to sell the fish in its natural state on account of its forbidding appearance, it is skinned and beheaded, and the flesh sold under the name of rock-salmon.

**SEAWRECK**, the detached seaweeds thrown up, often in great quantities, by the sea and used for manure, also formerly for making kelp. It consists largely of species of _Fucus_—brown seaweeds with flat branched ribbon-like fronds, characterized in _F. serratus_ by a saw-toothed margin and in _F. vesiculosus_, another common species, by bearing air-bladders. Also of _Zotera marina_, so-called sea-grass, a marine flowering plant with bright green long narrow grass-like leaves.

**SEBASTIAN, ST.**, a Christian martyr whose festival is celebrated on the 20th of January. According to St Ambrose (in Psalm 118, oct. 20) Sebastian was a native of Milan, went to Rome at the height of Diocletian's persecution, and there suffered martyrdom. The _Acta_ of St Sebastian, falsely attributed to the same St Ambrose, are far less sparing of details. They make him a citizen of Narbonne and captain of the first cohort under the emperors Diocletian and Maximian. Having secretly become a Christian, Sebastian was wanted to denounce those of his brethren who in the hour of trial seemed wavering in their profession. This was conspicuously the case with the brothers Marcus and Marcellinus. He made many converts, several of whom suffered martyrdom. Diocletian, having been informed of this conduct, sent for him and earnestly conversed with him, but, finding him inflexible, ordered him to be bound to a stake and shot to death. After the archers had left him for dead, a devout woman, Irene, came by night to take his body away for burial, but, finding him still alive, carried him to her house, where his wounds were dressed. No sooner had he wholly recovered than he hastened to confront the emperor, reproaching him with his impiety; Diocletian ordered him to be instantly carried off and beaten to death with rods. The sentence was forthwith executed, his body being thrown into the cloaca, where, however, it was found by another pious matron, Lucina, whom Sebastian visited in a dream, directing her to bury him _ad Catacumbas justa vestigia apostolorum_. It was on this spot, on the Appian way, that was built the basilica of St Sebastian, which was a popular place of pilgrimage in the middle ages. The translation of his relics to Soissons in 826 made that town a new centre of his cult. St Sebastian is specially invoked against the plague. As a young and beautiful soldier, he is a favourite subject of sacred art, being most generally represented undraped, and severely though not mortally wounded with arrows.

See _Acta Sanctorum_, January, ii. 257-296; _Bibliotheca hagiographica Latina_ (Brussels, 1899), n. 7543-7549; A. Bell, _Lives and Legends of the Evangelists, Apostles and other Early Saints_ (London, 1901), pp. 238-240. (H. Dr.)

**SEBASTIAN, king of Portugal (Port. Sebastião) (1554-1578)**, the posthumous son of Prince John of Portugal and of his wife Joanna, daughter of the emperor Charles, was born in 1554, and became king in 1557, on the death of his grandfather John III. of Portugal. During his minority (1557-1568), his grandmother Queen Catherine and his great uncle the Cardinal Prince Henry acted jointly as regents. Sebastian's education was entrusted to a Jesuit, D. Luiz Conçalves da Camara and to D. Aleixo de Menezes, a veteran who had served under Albuquerque. He grew up resolved to emulate the medieval knights who had reconquered Portugal from the Moors. He was a mystic and a fanatic, whose sole ambition was to lead a crusade against the North-West Afrika. He entrusted the government to the Jesuits; refused either to summon the Cortes or to marry, although the Portuguese crown would otherwise pass to a foreigner, and devoted himself wholly to hunting, martial exercises and the severest forms of asceticism. His first expedition to Morocco, in 1574, was little more than a reconnaissance; in a second expedition Sebastian was killed and his army annihilated at Al Kasr al Kebir (4th of August 1578). Although his body was identified before burial at Al Kasr, reinterred at Catta, and thence (1582) removed by Philip II. of Spain to the Convento do Jero, beginning 1581, many Portuguese refused to credit his death. "Sebastianism" became a religion. Its votaries believed that the _rei encouberto_, or "hidden king," was either absent on a pilgrimage, or, like King Arthur in Avalon, was awaiting the hour of his second advent in some enchanted island. Four pretenders to the throne successively impersonated Sebastian; the first two, known from their places of birth as the "King of Penamacor" and "the King of Ericeira," were of peasant origin; they were captured in 1584 and 1585 respectively. The third, Gabriel Espinosa, was a man of some education. These impostors involved members of the Austrian and Spanish courts and of the Society of Jesus in Portugal. He was executed in 1594. The fourth was a Calabrian named Marco Tullio, who knew no Portuguese; he impersonated the "hidden king" at Venice in 1603 and gained many supporters, but was ultimately captured and executed. The Sebastianists had an important share in the Portuguese insurrection of 1640, and were again prominent during the Miqueille wars (1828-34). At an even later period Sir R. F. Burton stated that he had met with Sebastianists in remote parts of Brazil (Burton, _Camoes_, vol. i.p. 363, London, 1881), and the cult appears to have survived in Brazil, in the 19th century, although it ceased to be a political force after 1834.

**SÉBASTIANI, HORACE FRANÇOIS BASTIEN, COUNT (1772-1851)** French marshal and diplomatist. Of Corsican birth, he was in his early years banished from his native island during the civil disturbances, and in 1780 he entered the French army. In 1793, as a French lieutenant, he took part in the war in his native island, after which he served in the Army of the Alps. He became _chef de brigade_ in 1799. Attached by birth and service to the future Emperor Napoleon, he took part in the _Comp' d'État_ of 18th Brumaire (9th November 1799). He was present at Marengo in 1800. Sébastiani next appears in his first diplomatic post, in Turkey and Egypt (1802). Promoted general of brigade in 1803, he served in 1805 in the first of the great campaigns of the Empire. His conduct at Austerlitz (2nd December), where he was wounded, won him promotion to the rank of general of division. Sébastiani soon returned to Continental service, and was French ambassador to Constantinople in 1811. He was the first to encourage the Porte to declare war on Russia, as a soldier he directed with success the defence of Constantinople against the British squadron of Admiral (Sir) J. T. Duckworth. But the deposition of the Sultan Selim III. put an end to French diplomatic success in this quarter, and Sébastiani was recalled in April 1807 (see _La Politique orientale de Napoléon; Sébastiáni et Gardane_, by E. Driault, Paris, 1903). He was at this time made Count of the Empire. As the commander of a corps he served in the Peninsular War, but his cavalier genius did not shine in the
laborious and painful operations against the careful English and the ubiquitous guerrilleros. In the more congenial grande guerre of Russia and the Germanic war of colour, was then a Smolensk, Borodino and Leipzig he did brilliant service. He accepted the Restoration government in 1814, but rejoined his old leader on his return from Elba. After Waterloo he retired into England for a time, but soon returned, and was placed on half-pay. From 1819 onwards he was a prominent member of the Chamber of Deputies. He held the posts of Minister of Marine, and, later, of Foreign Affairs. In this latter capacity he was the author of the historic saying “Order reigns at Warsav.” In 1832 he was a Minister of State without portfolio, next year, he was ambassador at Naples, and from 1835 to 1840 was lieutenant-general to Great Britain. On his retirement from this post he was made Marshal of France. He was a brilliant social figure in Paris. His last years were clouded by the death of his daughter at the hands of her husband, the due de Praslin. He died at Paris on the 21st of July 1851.

His brother, Jean André Tiburce Sébastien (1786–1871), entered the army in 1806, served in the Peninsula from 1809 to 1811, and in the great campaigns of Russia, Germany, France and Belgium. He took part in the war of Greek independence under General Maison. In 1813, on the retreat of the emperor, he was appointed to command the military division of Paris. But he proved incapable of dealing with the Revolution of 1848, and the remainder of his life was spent in retirement in Corsica.

SEBASTIANO DEL PIOMBO (1485–1547), Italian painter, was born at Venice in 1485. His family name was Luciani. He belongs to the Venetian school, exceptionally modified by the Florentine or Roman. At first a musician, chiefly a solo-player on the lute, he was in great request among the Venetian nobility. He soon showed a turn for painting, and became a pupil of Giovanni Bellini, and afterwards of Giorgione. His first painting of note was done for the church of San Giovanni Crisostomo in Venice, and is so closely modelled on the style of Giorgione that in its author’s time it often passed for the work of that master. It represents Chrysostom reading aloud at a desk, a grand Magdalene in front, and two other female and three male saints. Towards 1512 Sebastiano was invited to Rome by the wealthy Sienese merchant Agostino Chigi, who occupied a villa by the Tiber, since named the Farnesina; he executed some frescoes here, other leading artists being employed at the same time; and the next year the painter and his wife, Isabella, who accompanied him, were appointed to command the military division of Paris. But he proved incapable of dealing with the Revolution of 1848, and the remainder of his life was spent in retirement in Corsica.

and Pietro Aretino. One likeness of the last-named sitter is in Arazzo and another in the Berlin gallery.

See his general histories of art; and, with regard to his designs, Bernhard Berenson, The Drawings of Florentine Painters (1904).

The decision as to the authorship of various pictures which may or may not be attributable to Sebastiano del Piombo is necessarily a matter of contemporary connoisseurship, and it need only be noted that Mr Berenson is inclined to give increased importance to his master.

(W. M. R.)

SEBEINICO (Serbo-Croatian, Sibenik), an episcopal city, and the centre of an administrative district in Dalmatia, Austria; at the end of a branch railway from Knin (southern end of city and commune, 24 7 51). Sebenico is built on a hill overlooking a river Kerka, which here forms a broad basin, connected by a winding channel with the Adriatic Sea, 3 m. S.W. The city is partly walled, and guarded on the seaward side by the 16th-century castle of St Anne and two dismantled forts. Venetian influence is everywhere manifest; the Lion of St Mark is carved over the main gateway and on many public buildings; and among the narrow and steep lanes of the city there are numerous examples of Venetian Gothic or early Renaissance architecture. Sebenico has been the seat of a Roman Catholic bishop since 1358. The Roman Catholics, who constitute the majority of citizens, possess a lofty and beautifully cruciform cathedral, built entirely of stone and metal. Probably no other church of equal size in Europe is similarly constructed. Even the wagoon vaults over the nave, choir and transepts are of stone unprotected by lead or tiles. The older part of the cathedral, dating from 1430 to 1441, and including the fine north doorway, is Italian Gothic. Giorgio Orsini of Zara, who had studied architecture in Venice and been strongly influenced by the Italian Renaissance, carried on the work of construction undertaken by his predecessor. The Roman Catholics, who in 1441, was finished early in the 16th century; and thus the cathedral belongs to two distinct periods and represents two distinct styles.

Sebenico is lighted by electric light; the power being supplied by the celebrated falls of the Kerka, near Scardona, on the north. Sebenico is a steamship station, with an excellent harbour. Wine, oil, corn and honey are produced in the neighbourhood; many of the inhabitants are fishermen and seamen.

The Latin name of Sibenik is adopted in public inscriptions; but the city cannot be identified with the town of Sibunum, which was probably situated farther south. Sebenico first became prominent as the residence of the Croatian kings. From 1358 to 1412 it was ruled by Hungary; it subsequently formed part of the Venetian dominions. In 1647 it was unsuccessfully besieged by the Turks.

SEBORROEAE, a medical term applied to describe an accumulation on the skin of the normal sebaceous secretion mixed with dirt and forming scales or a distinct incrustation. On the head, where it is commonly seen, it may interfere with the nutrition of the hair and cause partial baldness. A form of this disease occurs in young infants. The main treatment consists in thoroughly cleansing the parts. The crusts may be softened with oil and the affected skin regularly washed with soft soap and rectified spirit. The sebum frequently accumulates in the sebaceous ducts, giving rise to the minute black points often noticed on the face, back and chest in young adults, to which the term comedones is applied. A form of this disorder, of larger size and white appearance, is termed milium. These affections may to a large extent be prevented by strict attention to ablution and brisk friction of the skin, which will also often remove them when they begin to appear. The retained secretion may be squeezed out or evacuated by incision and the skin treated with some simple sulphur application.

SECCI, ANGELO (1818-1878), Italian astronomer, was born on the 9th of June 1818 at Reggio in Lombardy, and entered the Society of Jesus at an early age. In 1839 he was appointed director of the observatory of the Collegio Romano, which was rebuilt in 1853; there he devoted himself with great perseverance for researches in physical astronomy and meteorology till his death at Rome on the 26th of February 1878.

The results of Secchi's observations are contained in a great number of papers and memoirs. From about 1864 he occupied himself almost exclusively with spectrum analysis, both of stars (Catalogo delle stelle di cui si è determinato lo spettro luminoso, Paris, 1867, 8vo; "Sugli spettri prismatici delle stelle fisse," two parts, 1868, in the Atti della Soc. Ital. and of the sun (Le Soleil, Paris, 1870, 8vo; 2nd ed., 1877).

For a list of his publications see Poggendorff, Biographisch-Literarishe; also see Monthly Notices R.A.S., No. 39, and Carlo Bricarelli, "Vita e opere di A. Secchi," Nuovi Lincei Mem. (1888), vol. 4.

SECESSION, a term used in political science to signify the withdrawal of a state from a confederacy or composite state, of which it had previously been a part; and the resumption of all powers formerly delegated by it to the federal government, and of its status as an independent state. To secede is a sovereign right; secession, therefore, is based on the theory that the sovereignity of the individual states forming a confederacy or federal union has not been absorbed into a single new sovereignty. Secession is a right claimed or exercised by weaker states of a union whose rights are threatened by the stronger states, which seldom acknowledge such a principle. War generally follows the secession of a member of a union, and the seceding state, believing itself to be able to stand alone, often is unable to do so. The history of Europe furnishes several examples of secession or attempts to secede; in 1500 the Swiss cantons withdrew from the Empire and formed a confederacy from which, in 1843-1847, the Catholic cantons seceded and formed a new confederacy called the Sonderbund, which was crushed in the war that followed; in 1523 Sweden seceded from the Kalmarian Union formed in 1397 of Denmark, Sweden and Norway; and in 1814 Norway seceded and entered into a union with Sweden, from which, in the same year, it attempted to secede but was forcibly restrained; in 1792, as a sequel to the American revolution, an attempt was made to secede from the Union in 1805 and resumed her independent status; in 1818-1849 Hungary attempted to withdraw from the union with Austria but the attempt was defeated; Prussia and other north German states withdrew in 1866-1868 from the German Confederation and formed a new one; a late instance of successful secession is that of Panama, which seceded in 1903 from the Republic of Colombia. But secession in theory and practice is best exhibited in the history of the United States. Most of the original states, and many of the later ones, at some period when rights were in jeopardy proclaimed that their sovereignty might be exercised in secession. The right to secede was based, the secessionists claimed, upon the fact that each state was sovereign, becoming so by successful revolution against England; there had been no political connexion between the colonies; the treaty of 1783 recognized them "as free, sovereign and independent states"; this sovereignty was recognized in the Articles of Confederation, and not surrendered, they asserted, under the Constitution; the Union of 1776 was really formed by a secession from the Union of 1776-1787. New states claimed all the rights of the old ones, having been admitted to equal standing. Assumptions of the right and necessity of secession were frequent from the beginning; separatist conspiracies were rife in the West until 1812; various leaders in New England made threats of secession in 1799-1796 and 1800-1815—especially in 1803 on account of the purchase of Louisiana, in 1811 on account of the proposed admission of Louisiana as a state, and during the troubles ending in the War of 1812. Voluntary separation was frequently talked of before 1815. Two early commentators on the Constitution, St George Tucker in 1803 and William Rawle in 1825, declared that the sovereign states might secede at will. In 1832-1833 the "Union" party of South Carolina was composed of those who rejected nullification, holding to secession as the only remedy; and from 1830 to 1860 certain radical abolitionists advocated a division of the Union. But as the North grew stronger and the South in comparison grew weaker, as slavery came to be more and more the dominant political issue, and as the South made demands concerning that "peculiar institution" to which the North was unwilling to accede, less was heard of secession in the North and more in the South. Between 1845
and 1660 succession came to be generally accepted by the South as the only means of preserving her institutions from the interference of the North. The first general movement toward secession was in 1850. In 1860-1861, when the federal government passed into the control of the stronger section, the Southern states, individually, seceded and then formed the Confederate states, and in the war that followed they were conquered and forced back into the Union. So, in the United States, secession along with state sovereignty is of the past. From the historical point of view it may be suggested that neither North nor South was correct in theory in 1861: the United States were not a nation; neither were the states sovereign, but the federal policy of 1776-1789, in which no proper sovereignty existed anywhere, two nationalities were slowly evolving and two sovereignties were in the making; the North and the South each fulfilled most of the requirements for a nation and they were mutually unlike and hostile.

SECKENDORF, FRIEDRICH HEINRICH, COUNT VON (1673-1763), German soldier, nephew of Veit Ludwing von Seckendorf (q.v.), was born at Königsberg in Franconia. His father was an official of Saxe-Gotha. In 1693 he served in the allied army commanded by William III. of England, and in 1694 became a cornet in a German cavalry regiment, stationed at Boston. In 1696 he was appointed an infantry officer in the service of Venice, and (1697) in that of the margrave of Anspach, who in 1698 transferred the regiment in which Seckendorf was serving to the imperial army. In 1699 he married and returned to Anspach as a court officer, but the outbreak of the War of the Spanish Succession called him into the field again as lieutenant-colonel of an Anspach regiment, which was taken into the Dutch service. He distinguished himself at Oudenarde (1708), and was severely wounded at the siege of Ryssedt. Disappointed of promotion in Holland and Austria, he entered the Polish-Saxon service in 1711, and fought as a volunteer at the siege of Tournai and the battle of Malplaquet. He continued to serve in Flanders to the end of the war, acted in a diplomatic capacity in the peace negotiations, and in 1713 suppressed an insurrection in Poland. In 1715, as a lieutenant-general, he commanded the Saxon contingent at the siege of Stralsund, defended by Charles XII. of Sweden. In 1717 Seckendorf once more entered the service of the emperor, with the rank of lieutenant field marshal, and he was present at the siege of Belgrade by Prince Eugène. In 1718 and 1719 he fought in Italy, and in the latter year he was made a count of the empire. In 1726, at the instance of Prince Eugène, he was made the Austrian representative at the court of William II. He remained at Berlin, with short intervals, up to 1735, and for the greater part of this time exercised a strong influence over Frederick William II. He was deeply involved in the family quarrels which embittered the lives of Frederick William, his queen and the crown prince (Frederick the Great), which culminated in the prince's condemnation to death by court martial, and is presented by Carlyle (Frederick the Great, vol. II) as a cold, passionless intriguer, tacturn, almost stolid, and absolutely unscrupulous in the furtherance of Austrian political aims. In 1728 Seckendorf was appointed general of cavalry of the army of the Holy Roman Empire, and served with such distinction as was to be gained in a war of positions in the Rhine campaigns of the War of the Polish Succession (1734-35). His dissensions with Prince Leopold of Anhalt-Dessau (q.v.)—the "old Dessauer" was Seckendorf's declared enemy at the Prussian court—made the conduct of operations impossible, and, after placing the Austrian and German armies in favourable positions, Seckendorf departed to Hungary to report on the state of the Austrian army there—a task which brought him fresh enemies. In 1737 the emperor Charles VI., however, made Seckendorf commander-in-chief in Hungary, at the same time giving him the right of field marshal. The new commander began well, but failed at the end, and his numerous enemies at Vienna brought about his recall, trial and imprisonment. He remained a prisoner till 1740, and was then reinstated by order of Maria Theresa, but being denied his arrears of pay he laid down all his Austrian and imperial offices and accepted from the emperor Charles VII., elector of Bavaria, the rank of field marshal in the Bavarian-Gutenfeld (1742). His last campaigns were those of 1743 and 1744 in the Austrian Succession War (q.v.), and, after the death of Charles VII. and the election of Maria Theresa's husband to the imperial dignity, he became reconciled with the Austrian court. From 1745 his life was spent more or less in retirement at Meuselwitz, near Altenburg. In 1757 the death of his wife, for whom, harsh and unamiable as he was, he had a deep and abiding affection, broke down his already failing health. He fell into the hands of a Prussian hussar party in December 1758, and was for five months held prisoner by Frederick the Great, who had little love for him either as his former court enemy or as his unsatisfactory ally in the first Silesian war. He died at Meuselwitz on the 23rd of November 1763.

SECKENDORF, VEIT LUDWIG VON (1626-1692), German statesman and scholar, was a member of a German noble family, which took its name from the village of Seckendorf between Nuremberg and Langenzenn. The family was divided into eleven distinct lines, but only three survive, widely distributed throughout Prussia, Wurttemberg, and Bavaria. In 1656 Veit Ludwig von Seckendorf, son of Joachim Ludwig von Seckendorf, was born at Herzogenaurach, near Erlangen, on the 20th of December 1626. In 1639 the reigning duke of Saxe-Coburg-Gotha, Ernest the Pious, made him his protégé. Entering the university of Strassburg in 1642, he devoted himself to history and jurisprudence. The means for his higher education came from Swedish officers, former comrades of his father who had been actively engaged in the Thirty Years' War and who was executed at Salzwedel on the 3rd of February 1642 for his dealings with the Imperialists. After he finished his university course Duke Ernest gave him a commission in the Bavarian general service. In 1662 he laid the foundation of his great collection of historical materials and mastered the principal modern languages. In 1662 he was appointed to important judicial positions and sent on weighty embassies. In 1666 he was made judge in the ducal court at Jena, and took the leading part in the numerous beneficent reforms of the duke. In 1664 he resigned office under Duke Ernest, who had just made him chancellor and with whom he continued on excellent terms, and entered the service of Duke Maurice of Zeitz (Altenburg), with the view of lightening his official duties. After the death of Maurice in 1670 Seckendorf entered the estate of Menselwitz in Altenburg, resigning nearly all his public offices. Although living in retirement, he kept up a correspondence with the principal learned men of the day. He was especially interested in the endeavours of the pietist Philipp Jakob Spener to effect a practical reform of the German church, although he was hardly himself a pietist. In 1692 he

Besides Friedrich Heinrich, count von Seckendorf, separately noticed, other members of the family were Adolf Franz Karl (1742-1818), who was made a count by Frederick William III. of Prussia; Eduard Christoph Ludwig Karl von Seckendorf-Gutenfeld (1813-1875), a Württemberg official; Karl Sigmund (1744-1875), writer; Franz Karl Leopold v. Seckendorf-Aberdour (1775-1809), poet, literary man and soldier; the brothers Christian Adolphe (1767-1833) and Gotthold Adolphe (1775-1832), both literary men; some note, and Arthur v. Seckendorf-Gudten (1845-1880), student of forestry.
SECKER—SECOND SIGHT

was appointed chancellor of the new university of Halle, but he died a few weeks afterwards, on the 18th of December.

Seckendorf's principal works were the following:—Teutscher Fürstenstaat (1656 and 1678), a handbook of German public law; Der Christenstaat (1685), partly an apology for Christianity and partly a history of the church; Bemerkungen zur Geschichte des Lutheranismus (1692), a defense of the Lutheran church against the attacks of the Rationalists; and Die Kirchenzuge des Herrn Jesus Christi (1699), a chronological account of the Christian church. He was also the author of several collections of legal decisions and a number of other works of a similar character. Seckendorf was a man of great learning and ability, and his works have been widely influential in the history of German law and church history.

SECOND SIGHT, a term denoting the opposite of its apparent significance, meaning in reality the seeing, in vision, of events before they occur. "Foresight" expresses the meaning of second sight, which perhaps was originally so called because normal vision was regarded as coming first, while supernormal vision is a secondary thing, confined to certain individuals.

Though we hear most of the "second sight" among the Celts of the Scottish Highlands, it must be noted also that the Celts of Ireland, who were the most advanced of the races of the British Isles, had a similar practice of second sight. The Ossianic stories of the Scottish poets, such as "The Battle of the Nations," tell of warriors who were able to see into the future and to consult with the dead. This practice of second sight is also found in the sagas of the Icelandics, especially in "Riđr's Saga," where the seers are able to see into the future and to consult with the gods. In the Highlands of Scotland and in the Hebrides, the chief symbols beheld are the shroud, and the corpse candle or other spectral illumination. The Rev. Dr Stewart, of Nether Lochaber, informed the present writer that one of his parishioners, a woman, called him to his door, and pointed out to him a rock by the sea, which shone in a kind of phosphorescent brilliance. The doctor attributed the phenomenon to decaying sea-weed, but the woman said, "No, a corpse will be laid there to-morrow." This, in fact, occurred, a dead body being found in a boat for which there was no record, and a woman was carried down to the foot of the rock, where, as Dr Stewart found, there was no decaying vegetable matter.

Second sight flourished among the Lapps and the Red Indians, the Zulus and Mohicans, to the surprise of travellers, who have recorded the puzzling facts. In these cases the visions were usually "induced," not "spontaneous," and should be considered as "clairvoyance" (q.v.). Ranulf Higdon's Polychronicon (14th century) describes Scottish second sight, adding that strangers "setten their feet upon the feet of the men that londe for to see such sights as the men of that londe does." Some of the anecdotes relating the vision is still practised, with success, according to the late Dr Stewart. The present writer once had the opportunity to make an experiment, but to him the vision was not imparted. (For the method see Kirk's Secret Commonwealth of Elves, Fauns and Fairies, 1691, 1815, 1893.) It is, by some, believed that if a person tells what he has seen before the event occurs he will lose the faculty, and recently a second-sighted man, for this reason, did not warn his brother against taking part in a regatta, though he had foreseen the accident by which his brother was drowned. Where a boy on the edge of a pool in the quarry was to be drowned, the vision ever occurred. There are many seers, as Lord Tarbat wrote to Robert Boyle, to whom the faculty is a trouble, "and they would be rid of it at any rate, if they could."

Perhaps the visions most frequently reported are those of funerals, which later occur in accordance with "the sight," of corpses, and of "arrivals" of persons, remote at the moment, who later do arrive, with some distinctive mark of dress or equipment which the seer could not normally expect, but observed in the vision. Good examples in their own experience have been given to the present writer by well-educated persons. Some of the anecdotes are too surprising to be published without the names of the seers. A fair example of second sight is the following from Balachulish. An aged man of the last generation was troubled by visions of armed men in uniform, drilling in a particular field near the sea. The uniform was not "England's cruel red," and he foresaw an invasion. "It must be of Americans," he decided, "for the soldiers do not look like foreigners." The Volunteer movement later came into being, and the men drilled on the ground where the seer had seen them. Another case was that of a man who happened to be sitting with a boy on the edge of a pool in the quarry. Suddenly he caught the boy and leaped aside with him. He had seen a runaway trolley, with men in it, dash down the path; but there were no traces of them below. "The spirits of the living are powerful to-day," said the percipient in Gaelic, and next day the fatal accident occurred at the spot. These are examples of what is, at present, alleged in the matter of second sight.

"The sight" may, or may not, be preceded or accompanied by epileptic symptoms, but this appears now to be unusual. A learned minister lately made a few inquiries on this point in his parish, at the request of a gentleman of his acquaintance. His head had "the sight," in rich measure: "it was always preceded by a sensation of discomfort and anxiety," but was not attended by convulsions. Out of seven or eight seers in the parish, only one was not perfectly healthy and temperate. A well-known seer, now dead, whom the writer consulted, was weak of body, the result of an accident, but seemed candid, and ready to confess that his visions were occasionally failures. He said that "the sight" first came on him in the village street when he was a boy. He saw a dead woman walk down the street and enter the house that had been burned. He gave a few examples of his foresight of events, and one of his failure to discover the corpse of a man drowned in the loch.
The phenomena, as described, may be classed under "clairvoyance," "premonition," and "telepathy" (q.v.), with a residuum of symbolical visions. In these, "corpuscles" and spectral lights play a great part, but, in the region best known to the writer, the "lights" are visible to all, even to English tourists, and are not hallucinatory. The conduct of the lights is brilliantly eccentric, but, as they have not been studied by scientific specialists, their natural causes remain unascertained. It is plain that there is nothing peculiar to the Celts in second sight; but the Gaelic words for it and the prevailing opinion in individual cases of it, the account of it in the literature, and the duty of the main agents. Yet, in cases of premonition, this explanation is difficult. Conceivably an engineer, in 1881, was thinking out a line of railway from Oban to Balachulish, at the moment when four or five witnesses were alarmed by the whizz and thunder of a passing train on what was then the road, but was later (1905) usurped by the railway track. (For this amazing anecdote the writer has the first-hand evidence of a highly educated peripct.)

If the speculation of the engineer was "wired on," telepathically, to the witnesses, then telepathy may account for the premonition, which, in any case, is a good example of collective second sight. The second sight has died out, under the influence of education and newspapers, is an avowment of popular superstition in the south. The examples given, merely a selection from those known to the present writer, prove that the faculty is believed to be as common as in any previous age.

The literature of second sight is not insignificant. The Secret Committees on Monsters, i.e. Fears, was published by Sir Walter Scott in 1815 (a hundred copies), and by Andrew Lang in 1893, is in line with cases given in Trials for Witchcraft (cf. Dalrymple's Darker Superstitions of Scotland, and Wodrow's Analecta). Aubrey has several cases on this subject in his Miscellanies, and the correspondence of Robert Boyle, Henry More, Glanvil and Pepys, shows an early attempt at scientific examination of the alleged faculty. The great treatise on Second Sight by Theophilus Insulans (a Macleod) may be recommended; with Martin's Description of the Western Isles (1703-1716), and the work of the Rev. Mr Fraser, Dean of the Isles (1707, 1820). Fraser was familiar with the contemporary scientific theories of hallucination, and justly remarked that "the sight" was not peculiar to the Highlanders; but that, in the south, people dared not confess their experiences, for fear of ridicule.

SECRET (Lat. secretum, hidden, concealed), that which is concealed from general knowledge. In special senses the word is applied to (a) a prayer in the Roman and other liturgies, said during the mass by the priest in so low a voice that it does not reach the congregation, and (b) a covering or skull-cap made of steel fitting close to the head.

In law, the question of secrecy is an important one. Generally, English law does not require a solicitor or barrister to disclose secrets entrusted to them by a client, and the same probably holds good in the case of medical men. In the case of ministers of religion, it has never been definitely settled how far they can be compelled to disclose in evidence what has been confided in the secrecy of the confessional. But according to the 113th Canon, a priest of the Church of England would commit an ecclesiastical offence in revealing a secret disclosed to him in confession "except it be such as by the laws of this realm his own life may be called into question for concealing the same." As to what are called "trade secrets," it had been decided (Merryweather v. Moore, 1892, 2 Ch. 518) that it is a breach of contract to reveal trade secrets acquired during service.

Official Secrets.—By the Official Secrets Act 1889 it was made a misdemeanor for an official to communicate any information or documents concerning the military or naval affairs of Her Majesty, to any person to whom it ought not to be communicated. If the information be communicated to a foreign state it is a felony. In Great Britain the breach of military secrets is punishable under an imperial law of 1893.

Secret Service.—In practically every civilized country, there is always a department of the government charged with the duty of espionage, either diplomatic or domestic. Its officials work in secret, and certain sums of money are placed at the disposal of the head of the department, and expended as he may think fit, without having to account for their proceedings. The governments of the United States of America and the various departments of the government of France have also their own departmental secret service, for the better guarding against frauds, such as in the United States, the Treasury Department and the Post Office.

The various European codes generally have dealt with breach of secrecy, e.g. § 300 of the German Penal Code imposes a fine up to 1500 marks and imprisonment up to three months on doctors, attorneys and other professional persons who reveal a secret entrusted to them in their professional capacity. For this offence also the French code, art. 378, imposes imprisonment of from one to six months and a fine of from 100 to 500 francs, See Brouardel, Le Secret médical (Paris, 1893); Hallays, Le Secret professionnel (Paris, 1890).

SECRÉTAN, CHARLES (1815-1895), Swiss philosopher, was born on the 10th of January 1815, at Lausanne, where he died on the 21st of January 1895. Educated in his native town and later under Schelling at Munich, he became professor of philosophy at Lausanne (1838 to 1846), and at Neuchâtel (1850 to 1866). In 1866 he returned to his old position at Lausanne. In 1837 he founded, and for a time edited, the Revue suisse. His principal works were La Philosophie de la liberté (1848); La Raison et le Christianisme (1863); La Civilisation et les croyances (1882); Mon Utopie (1892). The object of his writing was to build up a rational, philosophical religion, to reconcile the ultimate bases of Christianity with the principles of metaphysical philosophy.

For a detailed examination of his philosophy, see Pillon, La Philosophie de Charles Sèrètàn.

SECRETARY-BIRD, a very singular African bird, first accurately made known, from an example living in the menagerie of the prince of Orange, in 1769 by A. Vosmaer, in a treatise published simultaneously in Dutch and French, and afterwards included in his collected works issued, under the title of Regnum Animale, in 1804. He was told that at the Cape of Good Hope this bird was known as the "Sagittarius" or Archer, from its striding gait being thought to resemble that of a Bowman advancing to shoot, but that this name had been corrupted into that of "Secretarius." In August 1770 G. Edwards saw an example

(apparently alive, and the survivor of a pair which had been brought to England) in the possession of a Mr Raymond near Ilford in Essex, and, being unacquainted with Vosmaer's work, he figured and described it as "of a new genus" in the Philosophical Transactions for the following year (Ixi. pp. 55, 56, pl. II.). In 1776 P. Sonnerat (Voy. Nouv. Guinée, p. 87, pl. 50) again described and figured, but not at all correctly, the species, saying (but no doubt wrongly) that he found it in 1771 in the Philippine Islands. A better representation was given by D'Aubenton in 1779.

1 Le Vaillant (Sci. Vocaire, ii. p. 273) truly states that Kolben in 1710 (Caput Bono Seri Hodierum, p. 182, French version, ii. p. 198) had mentioned this bird under its local name of "Snake-eater" (Slangeneter, Dutch translation, i. p. 214); but that author, who was a bad naturalist, thought it was a Pelican and also confounded it with the Spoonbill, which is figured to illustrate his account of it.
SECRETARY OF STATE—SECULAR

the Planches voluminees (721); in 1780 Buffon (Oiseaux, vii. p. 330) published some additional information derived from Querhoent, saying also that it was to be seen in some English menageries; and the following year J. Latham (Synopsi, i. p. 20, pl. 2) described and figured it from three examples which he had seen alive in England. Nonne, however, gave the bird its true name, and the first conferment upon it seems to have been that of Falco serpens, inscribed on a plate bearing date 1779, by John Frederick Miller (Ill. Nat. History, xxviii.), which plate appears also in Shaw’s Cimelia Physica (No. 28) and is a misleading caricature. In 1786 Scopoli called it Otis secretarius—thus referring it to the Bustards, and Cuvier in 1798 designated the genus to which it belonged, and of which it still remains the sole representative, Serpensauria. Succeeding systematists have, however, encountered it with many other names, among which the generic terms Gypogon, Rana, Ranaonyx, and Opisthoglossus, and the specific epiteths reticulatius and eristatis, require mention here. The Secretary-bird is of remarkable appearance, standing nearly 4 ft. in height, the great length of its legs giving it a resemblance to a Crane or a Heron; but unlike those birds its tibiae are feathered all the way down. From the back of the head and the nape hangs, loosely and in pairs, a series of black elongated feathers, capable of erection and dilation in periods of excitement. The skin round the eyes is bare and of an orange colour. The head, neck and upper parts of the body and wing-coverts are bluish grey; but the carpal feathers, including the primaries, are black, as are also the upper tarsus and the tip of the lower tibiae—the last being in some examples tipped with white. The tail-quills are grey for the greater part of their length, then barred with black and tipped with white; but the two middle feathers are more than twice as long as those next to them, and drooping downwards present a very unique appearance.

Its chief prey consists of insects and reptiles, and as a foe to snakes it is held in high esteem; although it is undoubtedly also destructive to the destruction of snakes, and successfully attacks the most venomous species, striking them with its knobbled wings and kicking forwards at them with its feet, until they are rendered incapable of offence, when it swallows them. The nest is a huge structure, placed in a bush or tree, and in it two white eggs, spotted with rust-colour, are laid. The young remain in the nest for a long while, and even when four months old are unable to stand upright. They are very frequently brought out tame. The Secretary-bird is found, but not very abundantly and only in some localities, over the greater part of Africa, especially southwards on the west of the Congo and in the interior to Khartum. The systematic position of the genus Serpensauria has long been a matter of discussion, and is still one of much interest, though of late years, however, there have been pretty well agreed in placing it in the order Accipitr. Most of them, however, have shown great want of perception by putting it in the family Falcinae. It cannot doubt its forming a peculiar family, Serpensauridae, differing much in habits from any other. Above all, the tibiae are bare, the entire structure of the foot being somewhat simile to that of the Secretary-bird, and not being, as the last are, in order to support the body while perched. The name, however, has been applied to it by Linnaeus, in his Systema Naturae, 1758, and is in the genus Serpensauria of the family Falcinae. In the Systema Naturae, 1758, the Secretary-bird is described as a motley, and very contrary bird, and that its young are of a very light grey. A. Milne-Edwards having recognized in the Micene of the Allier the fossil bone of a species of this genus, S. robustus (Ost. fols. France, ii. pp. 465-468, pl. 186, figs. 1-6), proves that it is an ancient form, one possibly carrying on a direct and not much modified descent from a generalized form, whence may have sprung not only the Falconidae but perhaps the progenitors of the Ardeidae and Ciconiidae, as well as the puzzling Caprimulgidae (Seriematidae, q.c.—(A. N.).

SECRETARY OF STATE, in England, the designation of certain important members of the administration. The ancient English monarchs were always attended by a learned ecclesiastical, known at first as their clerk, and afterwards as secretary, who conducted the royal correspondence; but it was not until the end of the reign of Queen Elizabeth that these functionaries were called secretaries of state. Upon the direction of public affairs passing from the privy council to the cabinet after 1688 the secretaries of state began to assume those high duties which now render their office one of the most influential of an administration.

Until the reign of Henry VIII. there was generally only one secretary of state, and in 1689 the post was disfranchised by being made by act of Parliament a sinecure. There have since been three secretaries of state, the first secretary being the head of the line of business of the king, having the title of Lord High Steward, Lord High Admiral, Lord High Treasurer, and Secretary of State, and being appointed by the king. The second secretary is the senior member of the board of the king’s council, and is appointed by the sovereign. The third secretary is the secretary of state, and is appointed by the king, having the rank of a peer of the realm. The office of the secretary of state is one of great importance, and is usually held by a man of great ability and capacity, and is a position of great honor and influence.

In the United States the secretaries of state are the executive of the executive, who deals with foreign affairs, and who, in the United States, is a member of the cabinet, and is in charge of the foreign office. The chief function of the secretary of state is to execute any part of the duties of the secretary of state, the division of duties being a mere matter of arrangement. For the existing division of duties, see under separate headings, Colonial Office, Foreign Office, &c.

In the United States the secretary of state is a member of the executive, who deals with foreign affairs, and who, in the United States, is a member of the cabinet, and is in charge of the foreign office. The chief function of the secretary of state is to execute any part of the duties of the secretary of state, the division of duties being a mere matter of arrangement. For the existing division of duties, see under separate headings, Colonial Office, Foreign Office, &c.

The latter use has been influenced by the false etymology which makes the word mean "cut off" (L. secare, to cut). The derivation has been long a matter of dispute. The Latin secta was used in classical Latin first of a way, a trodden or beaten path; it seems to be derived from secare, to cut, cf. the phrase secare stiam, to travel, take one’s way, Gr. ἄρχωμεν ἄδον. From the phrase sectam sequi, to follow in the footsteps of any one, the word came to mean separation, division. Another transferred sense is a manner or mode of life, so hanc sectam rationemque vitae . . . sectat sumus (Cic. Cat. 17, 40). It was also the regular word for a school of philosophy and so translates εἶδος, lit. choice (εἰδόθαι, to know), the school which one follows. The English word sect is a transfer, and is not an equivalent. The Latin word is the derivation of secta adopted by Skeat (Etym. Dict., 1910), which connects the word with sequi, to follow. Whether derivation is accepted a "sect" does not mean a part "cut off" from the church.

SECTION (L. sectio, cutting, secare, to cut), the act of cutting or a part cut off, thus used of any division of a subject, as the paragraph of a book, article, statute, &c., of a division of land, &c., or a separate class of a community or race; the term is more particularly applied to a thin slice of any substance prepared for examination by the microscope (see Microscopy) or to a diagram of any structure showing the internal plan as if exposed by the cutting off of an external surface; thus, in architecture, a section is a drawing of a building cut in half, so as to show the relative height of the floors, the depth of the foundation and its footings, the framing of the roof, if in timber or iron, or the construction of the vault or dome, if in masonry. The term is also applied to the details of the structure, such as the cornice and the various mouldings showing their profile.

SECULAR (L. sacellum, of or belonging to an age or generation, sacellum), a word with two main branches of meaning (1) lasting or occurring for a long indefinite period of time, and (2) non-spiritual, having no concern with religious or spiritual matters. The first sense, which is directly taken from the classical
SECULAR GAMES—SECUNDUS, PUBLIUS POMPONIUS

Latin, is chiefly found in scientific applications, of processes or phenomena which are continued through the ages and are not regularly recurrent or periodical, e.g. the secular cooling of the earth, secular change of the mean annual change of the temperature. The word is thus used widely of that which is lasting or irremediable, and Late Latin consequens was particularly used of that which belongs to this world, hence non-spiritual, lay. It is thus used, first to distinguish the "regular" or monastic clergy from those who were not bound by the rule (regula) of a religious order, the parish priests, the "seculars," who were living in the world, and secondly in the wide sense of anything which is distinct, opposed to or not connected with religion or ecclesiastical things, temporal as opposed to spiritual or ecclesiastical. Thus property transferred or alienated from spiritual to temporal hands is said to be "secularized" by the secularization act in 1792.

According to tradition, the secular games had their origin in certain imperial ritual rites of the gens Valeria, which were performed at the Terentum, a volcanic cleft in the Campus Martius. According to the Roman antiquarians themselves, they were derived from the Etruscans, who, at the end of a mean period of 100 years (as representing the longest human life in a generation), presented to the chthonian deities an expiatory offering on behalf of the coming generation. The first definitely attested celebration of the games took place in 249 B.C., on which occasion a vow was made that they should be repeated every hundredth year (their name being derived from the centenary of the games). The games were held in the month of February, in the first half of the month, and though saeculum (200 years) after the Augustan celebration; 248 (under Philip the Arabian), the 1000th year of the city; 262 (under Gallienus), probably a special ceremony in time of calamity; in 304 (which should have been 314) Maximian intended to hold a celebration, but does not appear to have been done so. From this time nothing more is heard of the secular games, until they were revived in the year 1300 as the Spanish jubilees instituted by Boniface VIII.

At the beginning of the harvest, heralds went round and summoned the people to the festival. The quindecimviri distributed to all free citizens on the Capitol and in the temple of Apollo on the Palatine four saecula, four saecula were given to the poor in the Church and to the poor in the temple of Diana on the Aventine, wheat, barley, and beans were distributed, to serve as an offering of firstfruits. The festival then began, at which offerings were made to various deities. On the first night the emperor sacrificed three rams to the Parcae at an underground altar on the banks of the Tiber, while the people lighted torches and sang a special hymn. On the same day of the next month, a white or black hog and a black pig were sacrificed to Tellus, and dark victims were sacrificed. In the year 399, the first day white bulls and a white cow were offered to Jupiter and Juno on the Capitol, after which scenic games were held in honour of the goddesses. The following day, the emperor took the saeculum hymns to Juno on the Capitol; on the third, white oxen were sacrificed to Apollo and twenty-seven boys and maidens sang the secular hymn "in Greek and Latin.

Valerius Maximus, ii. 4, and Horace (Carmen Saeculare) is the chief ancient authority on the subject; see also Mommsen, Römische Chronologie (1858); C. L. Roth, "Pompeian Secular Games," in the Rheinisches Museum, viii. (1853); and Marquardt, Römische Staatsverwaltung, iii. (1885), p. 368. The inscription commemorating the ludi of 17 B.C. was discovered in 1909 and is printed in Epigrapher epigraphica, vol. vii. The best modern work on the whole subject is in H. Diels, Syllogeis Blätter (1890), p. 109 foll.

SECULARISM, a term applied specially (see Secular) to the system of social ethics associated with the name of G. J. Holyoake (q.v.). As the word implies, secularism is based solely on considerations of practical morality with a view to the physical, social and moral improvement of society. It neither affirms nor denies the theistic premises of religion, and is thus a particular variety of utilitarianism. Holyoake founded a society in London which subsequently under the leadership of Charles Bradlaugh advocated the disestablishment of the Church, the abolition of the Second Chamber and other political and economic reforms.

See Holyoake's Principles of Secularism (1895).

SECUND (Lat. secundus, following), a botanical term used of plants when similar parts are directed to one side only, as flowers on an axis.

SECUNDERABAD, one of the chief British military stations in India, situated in the state of Hyderabad or the Nizam's Dominions, 1830 ft. above sea-level, and 6 m. N.E. of Hyderabad city. Pop. (1901) 85,550. It is now the headquarters of the 3rd division of the southern army. Secunderabad includes Bolaram, the former cantonment of the Hyderabad contingent (now merged in the Indian army), and also Trumilgherry, the artillery cantonment, covering a total area of 22 sq. m. These two places have an additional population of 12,888.

SECUNDUS, JOHANNES, whose real name was JOHANN EvertS (1511-1536), Latin poet, was born at The Hague on the 10th of November 1511. He was descended from an ancient family in the Netherlands; his father, Nicholas Everts, or Everard, seems to have been high in the favour of the emperor Charles V. On what account the son was called Secundus is not known. His father died before he was born, but though he took his degree at Bourges it does not appear that he devoted much time to legal pursuits. Poetry, painting and sculpture engaged his mind at a very early period. In 1533 he went to Spain, and soon afterwards became secretary to the cardinal-archbishop of Toledo, in a department of business which required no other qualification than that of writing Latin with elegance. During this period he composed his most famous work, the Basia, a series of amatory poems, of which the fifth, seventh, and ninth Carmi nas of Catullus seem to have given the hint. In 1535 he accompanied the emperor Charles V, from the siege of Tunis to the subsequent campaign. After quitting the service of the archbishop, Secundus was employed as secretary by the bishop of Utrecht; and so much did he distinguish himself by his compositions that he was called upon to fill the important post of private Latin secretary to the emperor, who was then in Italy. But, having arrived at St Amand, near Tournay, he died of fever on the 8th of October 1536.

SECUNDUS, PUBLIUS POMPONIUS, Roman general and tragic poet, lived during the reigns of Tiberius, Caligula and Claudius. He was on intimate terms with the elder Pliny, who wrote a biography of him (now lost). The chief authority for his life is Tacitus, according to whom he joined the legions in Britain and was a man of marked and brilliant intellect. His friendship with Sejanus and his brother made him politically suspect, and he only escaped death by remaining practically a prisoner in his own brother's house until the accession of Caligula. During his enforced retirement he composed tragedies, which were put on the stage during the reign of Claudius. In A.D. 50 he distinguished himself against the Chatti and obtained the honour of the triumphal Insignia. Quintilian asserts that he was far superior to any writer of tragedies he had known, and Tacitus expresses a high opinion of his literary abilities. Secundus devoted much attention to the niceties of grammar and style, on which he was recognized as an authority. Only a few lines of his work remain, some of which belong to the tragedy Aeneas.

See O. Ribbeck, Geschichte der römischen Dichtung, iii. (1892).
SECURITY

(Securitas, free from care, safe), in general, the condition of being secure. In law, a security is a document evidencing the right to money, goods, or other property, e.g., stocks, shares, bills of exchange, mortgages, &c. A security is termed collateral when it is given merely as a guarantee for the repayment of money; personal, when it gives a right of action against a person for the recovery of money. A convertible security is one which can be readily converted into money, e.g., as contrasted with land or buildings, sometimes termed "dead" security. A person who holds himself responsible for the fulfilment of another's obligations or goes surety for him is called a security.

SEDNAIE, MICHEL JEAN (1719-1797), French dramatist, was born at Paris on the 4th of July 1719. His father, who was an architect, died when Sedaine was quite young, leaving no fortune, and the boy began life as a mason's labourer. He was at last taken as pupil by an architect whose kindness he eventually repaid by the help he was able to give to his benefactor's grandson, the painter David. Meanwhile he had done his best to repair his deficiencies of education, and in 1750 he published a Recueil de pièces fugitives, which included fables, songs and pastoral. His special talent was, however, for light opera. He produced Le Diable à quatre (1756), the music being by several composers; Blaise le Savelier (1759), for the music of Danican Philidor; On ne s'aise jamais de tout (1761) and others with Pierre Alexandre de Monsigny; Aucassin et Nicolete (1780), Richard Cœur de Lion (1784), and Amphitryon (1788) with André Grétry. Sedaine's vaudevilles and operettas attracted the attention of Diderot, and two plays of his were accepted and performed at the Théâtre François. The first and longest, the Philosophe sans le savoir, was acted in 1765; the second, a lively one-act piece, La Gageure impu集体经济 in 1768. These two at once took their place as stock pieces and are still ranked among the best French plays, each of its class. Except these two pieces little or nothing of his has kept the stage or the shelves, but Sedaine may be regarded as the literary ancestor of Scribe and Dumas. He had the practical knowledge of the theatre, which enabled him to carry out the ideas of Diderot and give him claims to be regarded as the real founder of the domestic drama in France. Sedaine, who became a member of the Academy (1786), and secretary for architecture of the fine arts division, died at Paris on the 17th of May 1797. He wrote two historical dramas, Raymond V. comte de Toulouse, et Maillard, ou Paris sauvé. His Œuvres (1826) contain a notice of his life by Ducis.

SEDALIA, a city and the county-seat of Pettis county, Missouri, U.S.A., a little W. of the centre of the state. Pop. (1900) 1,521; (1725 negroes; 972 foreign-born); (1910) 17,822. Sedalia is served by the Missouri Pacific and the Missouri, Kansas & Texas railway systems, and is a transportation centre with good facilities. The city has a high and pleasant site (about 900 ft. above sea-level) on a rolling prairie, and is laid out as an exact square. Among the public buildings much the handsomest are the court house, built of Warrensburg blue sandstone (1884), and the Public Library (1900), given by Andrew Carnegie. Sedalia is the seat of the George R. Smith College (M.E., founded in 1894) for negroes. Liberty Park (60 acres), in the W. part of the city, is owned by the municipality. Broadway, the principal residence street, is 120 ft. wide, and is parked on either side. The State Board of Agriculture has a splendid fairgrounds (now 210 acres) adjoining the city on the S.W. in 1895. Sedalia is noted for its fair, which attracts many visitors. The water supply is derived from a storage lake on Flat Creek, 3 m. from the city, settling basins being used to clarify the water. There are a city hospital and the Maywood, a private hospital; and the Missouri, Kansas & Texas railway maintains here a hospital for all parts of its system. The surrounding country is a magnificent livestock and farming region, and in the immediate vicinity are valuable deposits of coal, limestone, of shale suitable for sewer pipe and of fireclays. The city has important horse and mule yards. The Missouri Pacific, three of whose operating divisions end at Sedalia and thus make the city its central division point, in 1904 established large shops (129 acres) in a suburb E. of the city. These shops and those of the Missouri, Kansas & Texas railway, of which Sedalia is the central division point on the N. end of its system, add greatly to the industrial importance of the city. The total value of the factory product in 1905 was $1,691,727, showing an increase of 31-8% since 1900.

Sedalia was established as a station on the Missouri Pacific railroad in 1857. In 1864 it was chartered as a town and was made the county-seat, succeeding Georgetown (then a flourishing town especially with a large trade in wool) which had the advantage of being on the old plank road taking place in 1865. Sedalia was a Union military post throughout the Civil War; on the 15th of October 1864 a detachment from Sterling Price's raiding column dislodged a small Union force that was occupying the town, but the Confederate occupation lasted only one day. Sedalia was chartered as a city in 1889. In 1896 a constitutional amendment to remove the state capital from Jefferson City to Sedalia was defeated by popular vote.

SEDAN, a town of northern France, capital of an arrondissement, in the department of Ardennes, on the right bank of the Meuse, 12 m. E.S.E. of Mézières by rail. Pop. (1906) town 16,014; commune 19,590. Sedan is built on the right bank of the Meuse round a bend in the river forming a peninsula. On the left bank stands the suburb of Torcy, situated partly within the bend, partly beyond the canal which cuts across the neck of the peninsula. There is a statue of Turenne (born at Sedan in 1611), remains of a castle of the 15th century and a Protestant temple dating from 1593. Sedan is the seat of a sub-prefecture and has a municipal school of weaving. The manufacture of fine black cloth established in the middle of the 17th century by Cardinal Mazarin, held its place as the staple industry of the town till towards the end of the 19th century. A large variety of woolen fabrics are produced, and there are flour mills and factories for industrial machinery, boilers and heavy iron goods, chocolate, &c.

Sedan was in the 14th century a dependency of the abbey of Mouzon, the possession of which was disputed by the bishops of Liége and Reims. United to the crown of France by Charles V., it was ceded by Charles VI. to Guillaume de Braqemont, whose son sold it to his brother-in-law Évrard de la Marck. For two centuries this family continued masters of the place in spite of the bishops of Liége and the dukes of Burgundy and Lorraine; and Henri Robert adopted the title "prince of Sedan." In the 16th century the town was an asylum for many Protestant refugees, who laid the basis of its industrial prosperity, and it became the seat of a Protestant seminary. Robert I. de la Marck (d. 1560), also marshal of France, erected Sedan on his own authority into an independent principality. By the marriage of his granddaughter Charlotte with Henry I. de la Tour d'Auvergne, the duchy of Bouillon and the principality of Sedan passed to the house of Turenne. When the new duke attempted to maintain his independence, Henry IV. captured Sedan in three days; and the second duke Frédéric Maurice de la Tour d'Auvergne, eldest brother of the great marshal, who had several times revolted against Louis XIII., was, after his share in the conspiracy of Cinq-Mars, obliged to surrender his principality. Sedan thus became part of the royal domain. On the 1st of September 1870 the fortress was the centre of the most disastrous conflict of the Franco-German War (see below). The village of Bazilles, 3 m. S.E. of Sedan, contains the great ossuary. The house, rendered famous by Neuville's paintings, "Les Dernières Cartouches," now contains objects found on the battlefield. At Donchery, 3½ m. to the west of Sedan, is the château of Belle-Neuve, where Napoleon III. surrendered his sword and where the terms of capitulation of Sedan were agreed upon.
**Battle of Sedan (September 1st, 1870).—**During the course of the 31st of August (see Franco-German War) the retreating French army (1st, 5th, 7th and 12th corps) under Marshal MacMahon assembled in and around Sedan, watched throughout the day by the German cavalry but not severely pushed by them. Sedan is a small old-fashioned fortress, lying in a depression between two ridges which converge in the plateau of Illy about 2½ m. north-east of the town. The only part which its defences played, or might have played, in the ensuing battle lay in the strategic possibilities contained in the fine and rocky bridge-head of Torcy, covering an elbow bend of the Meuse whence the whole French army might have been hurled into the gap between the German III. and Meuse armies, had there been a Napoleon to conceive and to execute this plan. But MacMahon seems to have been too despondent to contemplate anything further than a battle for the honour of the army, and though communications with Mezières, where Vinoy's corps (13th) was gathering, lay open throughout the day, he neither sent orders to it nor made any arrangements to meet the coming danger.

The troops received food and ammunition, the disorders consequent on the successive days' fighting in retreat were remedied, and the men themselves what they needed most of all, an almost unbroken day's rest. Locally their positions were strong, particularly to the east, where the stream flowing through the Fond du Givonne, though fordable, presented a serious obstacle to the tactical handling of the German infantry. But as a whole it was far too cramped for the numbers crowded into it; it could be completely overlooked from the heights of Frénois, where the king of Prussia's headquarters took their stand, and whence in the afternoon the German artillery fire began to cross over the town itself. At nightfall on the 31st the leading German infantry were approaching. The Army of the Meuse on the right bank of the river, with the II. Bavarians moving towards Bazelles to reinforce it, and the III. Army, consisting of the V. and XI. corps with the Württemberg division, was heading for Donchery to cut off the French from Mezières, and only a weak cavalry screen closed the gap between them.

During the night of the 31st of August the Bavarians threw a pontoon bridge across the Meuse below Rémy-lès, and soon after daybreak, in a fog which lay thickly over the whole country, they began their advance towards Bazelles, held by Vassogne's division of the 12th corps and fairly prepared for defence. The firing called all troops within reach of the sound to arms, and before 5 A.M. the Meuse Army was marching to the battle-field, the Guards on the northern road via Villers-Arany, the Saxons and IVth corps to the south along the river.

Vassogne's division contained a number of Marine battalions, and their stubborn resistance completely disconcerted the Bavarians. Deprived of artillery co-operation owing to the fog, the latter spent themselves in fruitless and disconnected efforts in the gardens and streets of the village, and reinforcements were soon urgently needed. About 6 A.M. the fog lifted, and the German batteries at once took part in the struggle. One of the first shells wounded Marshal MacMahon. The next senior officer, General Ducrot, at once assumed command (7 A.M.). But it happened that General Wimpffen, who had only joined the army from Algiers on the night of the 30th, brought with him a secret commission to assume command in the event of the death or disablement of MacMahon. Of this power he did not at first avail himself, since he was a stranger both to the army and the country, whilst Ducrot possessed the confidence of the one and the knowledge of the other in the highest degree. But when about 9 A.M. he learnt that Ducrot proposed to move the whole army under cover of rearguards to the west towards Mezières, he produced his commission and countermanded the movement, being himself convinced that eastward towards Bazaine at Metz lay the road to salvation. Orders once issued on a battle-field are not easily recalled, and the result of this change of command was dire confusion. The French troops northward of Bazelles, along the Fond du Givonne, were already commencing their withdrawal, when the leading troops of the Saxon XII. corps began to arrive about Daigny, and being only opposed by a weak rearguard, easily carried the ridge south of the Givonne-Sedan road, thus threatening the retreat of Vassogne's division in and about Bazelles, which then fell into the hands of the Bavarians between 10 and 11 A.M. At the same moment the Guard corps had begun to form up between Daigny

**Sedan**

[Map of Sedan showing battlefield positions and strategic points]
and Givonne, and there being no serious force of the enemy in front of them, the artillery was deploying along the western heights above the valley of Givonne, covered only by weak advanced guards of infantry, when suddenly a great column of French infantry, some 6000 strong, moving west in pursuance of Wimpffen's orders, came over the eastern border of the valley and charged down at full speed towards the guns. Then followed one of the most dramatic spectacles of the entire war. The whole of the corps artillery of the Guard turned upon these devoted men, and tore the column in half, shrouding it in dense clouds of dust and smoke from the bursting shells, above which could be seen the trunks and limbs of men flung upwards by their explosion. The head of the column, perhaps 2000 strong, nevertheless kept on its way, but under the combined fire of the Guard rifle battalion and the flanking fire from other guns its impetus died out and its débris disappeared by degrees under convenient cover. The German Guards were now free to stretch out their right towards the Belgian frontier (where the scouts of the III. Army were already moving) and prepare with all deliberation for the attack on the Bois de la Garenne.

The III. Army had moved off as early as 2.30 A.M., and by 4 A.M. was already crossing the Meuse at Donchery, aided by several pontoon and trestle bridges thrown over during the night. Their right was covered from sight by the peninsula formed by a bend of the river, and the march of the several columns was unopposed till, clearing its northern extremity, they began to deploy to their right between St. Menges and Floing. Here they on their right and west, respecting the position on the ridge, to the south of the Floing-Illy road. Against this position the German artillery now pressed forward, and seeing their exposed position, General Galliet brought forward his brigade of Chasseurs d'Afrique and delivered a most dashing charge. But being unsupported he was compelled to withdraw again behind the cover of the Cazal-Illy ridge. It was now about 11 A.M., and, whether moved by the belated impulse of Ducrot's orders or attracted by the apparent weakness of the Prussians within sight, the French infantry now made a brilliant counter-attack out of their position in their usual manner. But German reinforcements coming suddenly into view, and their Evan having spent itself, they fell back again, holding only to Floing, whence it required nearly two hours more to expel them.

About noon Wimpffen rode up to General Douay and asked him whether he could hold on to his position. The latter, possibly elated by the success of his recent attack, replied in the affirmative, pointing out only the importance of maintaining the Calvaire d'Illly to the north. De Wimpffen promised him support from the 1st corps on the right rear, part of which, hidden in the woods of la Garenne, had as yet been little engaged, and then rode south to Balan, where he found the 12th corps fighting desperately. He then sent back to Douay for reinforcements, and the latter despatched all he could spare. These, marching south, crossed the troops of the 1st corps sent to Douay's assistance. The Prussian shells were already crashing into the woods from all sides, and countless stragglers and riderless horses caused most serious delay. To gain time, Margueritte's division was ordered to charge. Margueritte was killed as he rode forward to reconnoitre, and Galliet took command. "For the next half hour the Prussian official account, "the scene defies description. Galliet and his squadrons covered themselves with glory, but he had not 2000 sabres at his disposal. Under the storm of shell and over the broken ground maneuvering was impossible. But a series of isolated charges were delivered with results which convinced well-nigh every survivor that the day of cavalry, in sufficient numbers and properly handled on the battle-field, was by no means spent." About an hour after the cavalry charges, between 3 and 4 P.M., the Germans at length gathered weight enough to attempt the assault of the French main position, and moved by a common instinct, lines of men almost 2 m. in extent, pressed on, gaining cover from the convex slope of the hill, till at length they were able to storm the stubbornly-defended ridge. Meanwhile, Wimpffen had initiated a fresh counter-stroke from the Fond du Givonne against Balan and Bazelines. Carried out with magnificent courage, it swept the Bavarians out of both villages, and for a moment the road seemed open for escape, but Wimpffen did not know that the 1V. Prussian corps stood waiting behind the gap.

Riding back to the town to seek the emperor and implore him to plait himself at the head of all available reinforcements, he saw a white flag break out from the steeple of the church tower, but almost instantaneously disappear. He did indeed reach the emperor, but, delayed by the appalling confusion, was too late. The flag had gone up again and he knew that further resistance was hopeless. The fighting did not cease at once. The troops he had directed to make the final effort, their eyes fixed on the enemy in front of them, never saw the flag; and until 6 P.M. a series of isolated attempts were made to break the iron circle with which the Germans had surrounded them. The emperor, who during the early hours of the day had fearlessly courted death, at length, over come by extreme physical pain and exhaustion, had ridden back to the town, and about 4 P.M., seeing no hope of success, had sent a parlementaire conveying his personal surrender to the king of Prussia, at the same time ordering the white flag to be hoisted. It was torn down by a Colonel Fauve, but was hoisted again half an hour later, when Prussian troops from Cazal were almost at the western gates of Sedan. It only remained for Wimpffen to make terms for the army, and after a long and gallant effort to avert the inevitable, he at length signed an unconditional surrender, with the sole alleviation (introduced as a truce) that the gallantry shown by his men) that all officers were to retain their swords.

Thus passed into captivity 82,000 men, 558 guns and stores to an immense amount. The price to the victors for this result was in round numbers 9000. The French killed and wounded numbered about 17,000. It is indicative of the demoralization in the French army that this figure is 1000 less than the cost of the victory to the Germans at Wörth, although on that occasion the French troops actually engaged numbered one half those available at Sedan. The duration of the fighting was the same in both cases.

**SEDAN-CHAIR**, a portable chair or covered vehicle, with side windows, and entrance through a hinged doorway at the front, the roof also opening to allow the occupant to stand. It is carried on poles by two "chairmen." Alike in Paris and in London the sedan-chair man was an institution—in the one city he was usually an Auvergnat, in the other an Irishman. The sedan-chair was a fashionable mode of transport in towns up to a century or so ago. It took its name from the town of Sedan, in France, where it was first used, and was introduced into England by Sir S. Dunscombe in 1634. Although a typically 18th-century vehicle it was used in the 17th, and had been known much earlier. Indeed, the ancient seda gestatoria of the popes is really a rudimentary form of sedan-chair. These vehicles were
often beautifully painted, even the greatest French pastoralists not disdaining to embellish their panels. It is still in use at the public baths at Ischl, in Austria, and also in the city of Bath, England, as a mode of transit in connexion with the medical baths. The sedan-chair can be taken into the force among the invalid conveyed without exposure to the outer air to and from the mineral-water bath. The poles are so arranged that the chair may be carried up and down stairs and still preserve its horizontal position.

SEDBERGH, a market town in the Skipton parliamentary division of the West Riding of Yorkshire, England, 28½ m. S.S.E. of Penrith by a branch of the London & North-Western railway. Pop. (1901) 2430. It is pleasantly situated at the junction of several small streams forming the river Lune, in a deep valley surrounded by high-lying moors of the cuvierian, St. A. The church is principally late Norman. The grammar school was founded by Dr Roger Lupton, provost of Eton College, in 1528, but as it was connected with a chantry it was suppressed by Henry VIII., to be refounded in 1551 by Edward VI.; it now takes rank among the important public schools.

SEDGON, RICHARD JOHN (1845-1906), New Zealand statesman, was born at Eccleston, Lancashire, England, in 1845, his father being a schoolmaster at Eccleston Hill school. He was brought up to the engineering trade, and when eighteen went to Australia and entered the railway workshops at Melbourne. He was sent to New Zealand as a surveyor of the public works, and defence and mines; and on Ballance’s death (1853) became premier, a position he retained till his sudden death on the 20th of June 1856. During these years Seddon held a unique place in the public life of New Zealand, and in its relations with the empire. He combined his premiership with various offices—as colonial treasurer, minister for education, postmaster-general, telegraph commissioner, minister of marine, minister for land purchase, and minister for labour—but his strenuous personality, and the confidence inspired by his determination to make New Zealand a first rank empire among the British dominions, was the dominating feature in all his course of action. His large physique, his profound earnestness, his gift of popular oratory, his expansive kindliness and his power of dealing with men, made him supreme among his own people. He became known in a wider sphere after his attending the colonial conference in London in 1897, and thenceforth he was regarded as one of the pillars of British imperialism. During the Boer War, and afterwards in the movement for preferential trade with the colonies, he was an enthusiastic supporter of Mr Chamberlain, though he was characteristically outspoken in his opposition to the unpleasant policies of his minister in South Africa. His rough and ready views were frequently open to criticism, but his vigorous patriotism and intensity of character give him a permanent place among those who have worked for the consolidation of the British dominions.

SEDGAN, THOMAS (1821-1856), English landscape painter, was born in London on the 28th of August 1821. His father was a cabinetmaker, and the son for some time followed the same occupation; but in 1842 he went to Paris to study ornamental art. On his return he executed designs for furniture for his father. In 1849 he made sketching expeditions in Wales and France, and in 1852 began to exhibit in the Royal Academy, sending a figure-piece, Penelope, and afterwards landscapes, deriving their subjects from Britanny. In the end of 1853 he joined Holman Hunt at Cairo. He worked for a year in Egypt and Palestine, executing views which Ruskin pronounced to be the first landscapes uniting perfect artistic skill with topographical accuracy; being directed, with stern self-restraint, to no other purpose than that of giving to persons who cannot travel trustworthy knowledge of the scenes which ought to be most interesting to them,” Seddon’s Eastern subjects were exhibited in Berners Street, London, in 1853, and in Conduit Street in 1856. In October 1856 Seddon again visited Cairo, where he died on the 23rd of November. In 1857 his works were exhibited in the rooms of the Society of Arts, and his important and elaborately finished picture, “Jerusalem and the Valley of Jehoshaphat,” was purchased by subscription and presented to the National Gallery.

A memoir of Seddon, by his brother, was published in 1859.

SEDERUNT, ACT OP, in Scots law, an ordinance for regulating the forms of judicial procedure before the Court of Session, passed by the judges under authority of a power originally conferred by an act of the Scottish parliament, 1540, c. 93. A quorum of nine judges is required to pass an act of Sederunt.

SEDLEY, an urban district of Staffordshire, England, between Dudley and Wolverhampton, in the parliamentary borough of Wolverhampton. Pop. (1901) 15,951. The district abounds in coal, lime and ironstone. Nails, rivets, chains, fire-irons, locks and safes are produced. The parish includes the large manufacturing districts of Upper and Lower Gornal, Congleton, Boreham and Whiston. In 1822 the last factory he grasped the prime ministerial of the London & North-Western railway, 10 m. W.N.W. from Birmingham.

SEGDWICK, ADAM (1785-1873), English geologist, was born on the 22nd of March 1785 at Dent in Yorkshire, the second son of Richard Sedgwick, vicar of the parish. He was educated at the Grammar Schools of Dent and Sedbergh, and at Trinity College, Cambridge, where he graduated B.A. as fifth wrangler in 1808, and two years later was elected a fellow of his college. For several years he was occupied as private tutor and afterwards as assistant mathematical tutor at Trinity College. In 1818 he was admitted to priests’ orders. He had at this time paid no serious attention to geology. As a lad he had collected fossils from the Mountain Limestone near Dent, and in 1813 he had visited the mines near Furness and Coniston. Nevertheless, when the Rev. John Hallstone retired in 1818 from the post of Woodwardian professor of geology, Sedgwick applied for the vacancy, and was so strongly supported by his college as a man of talent that he was elected by a large majority. He now took up the study of geology with intense zeal, traversed large areas in the south of England, and, becoming acquainted with W. D. Conybeare, regarded him as his master in geology. It is said that Conybeare and Sedgwick spent many hours with their microscopes, comparing fossils and discussing stratigraphical geology and the relationships of rocks in the field. In papers read before the Cambridge Philosophical Society, 1820-1821, on the structure of parts of Devonshire and Cornwall, he made observations of exceptional interest and value. Of this society in 1819 he had been one of the founders with J. S. Henslow. Every year for a long period now brought its season of field-work. Sedgwick dealt with the geology of the Isle of Wight, and with the strata of the Yorkshire coast (in papers published in the Annals of Philosophy, 1822, 1826); and his researches on the Yorkshire rocks were published in Murchison’s 1827. He contributed an important essay On the Geological Relations and Internal Structure of the Magnesian Limestone to the Geological Society of London (1828). As early as 1822 he had begun to make a detailed geological map of the older rocks of the Lake District; he continued these researches whereby the main structure of this mountain region was first unravelled, in succeeding years; and the principal results were brought before the Geological Society (1831-1836). Meanwhile he was elected president of the Geological Society in 1839-1830, and in 1831 he commenced field-work in North Wales. His chief attention was now concentrated on the older rocks of England and Wales. Murchison began the task of unravelling the structure of the older rocks on the Welsh borders in the same year. They had intended to start together, but the arrangements fell through, and thus they began their labours independently
SEDGWICK, J.—SEDILIA

and from opposite sides of the principality. Eventually Sedgwick founded the Cambrian system for the oldest group of fossiliferous strata, and Murchison the Silurian system for the great group immediately below the Old Red Sandstone. Their systems were found to overlap—Sedgwick's Upper Cambrian and Murchison's Lower Silurian being practically equivalent. Hence arose a painful controversy that has only of late years been terminated by the adoption of Professor C. Lapworth's term Ordovician in place of the Upper Cambrian of Sedgwick and the Lower Silurian of Murchison.

Sedgwick was ever actively interested in the work of his university. His famous Discourse on the Study of Geology was delivered at the opening of the twenty-fifth anniversary of the Geological Society of Cambridge in 1833; it reached a fifth edition in 1850. The studies were reviewed under the headings of (1) The laws of nature, (2) Ancient literature and language, and (3) Ethics and metaphysics; and the volume had so grown that it ultimately consisted of 442 pages of preface, or preliminary dissertation on the history of creation, with arguments against the transmutation of species, and an essay on the evidences of Christianity; the discourse occupied 94 pages; and there was an appendix of notes, &c., that filled 295 pages.

Sedgwick was president of the British Association at the first Cambridge meeting, and in 1834 he was appointed a canon of Norwich. In 1836 with Murchison he made a special study of the Culm-measures of Devonshire, which until that time had been grouped with the greywacke, and together they demonstrated that the main mass of the strata belonged to the age of the true Coal Measures. Continuing their researches into the bordering strata they were able to show in 1839, from the determinations of William Lonsdale, that the fossils of the South Devon limestones and those of Ilfracombe and other parts of North Devon were of an intermediate type between those of the Silurian and Carboniferous systems. They therefore introduced the term Devonian for the great group of slates, grits and limestone, now known under that name in West Somerset, Devon and Cornwall. These results were published in the great memoir by Sedgwick and Murchison, "On the Physical Structure of Devonshire" (Trans. Geol. Soc., 1839). Of later published works it will be sufficient to mention A Synopsis of the Classification of the British Palaeozoic Rocks (1839), which contained a systematic description of the fossils by F. McCoy. Also the preface by Sedgwick to A Catalogue of the collection of Cambrian and Silurian Fossils contained in the Geological Museum of the University of Cambridge, by J. W. Salter (1873).

The Wollaston Medal of the Geological Society was awarded to Sedgwick in 1851, and the Copley Medal of the Royal Society in 1863. He continued to lecture until 1872, when ill-health rendered necessary the appointment of a deputy (Professor J. Morris). He died at Cambridge on the 27th of January 1873.

In 1865 the senate of the university received from A. A. van Sittart the sum of £500 "for the purpose of encouraging the study of geology among the resident members of the university, and in honour of the Rev. Adam Sedgwick." Thus was founded the Sedgwick prize to be given every third year for the best essay on some geological subject. The first Sedgwick prize was awarded in 1870. In 1878 it was decided that his memorial should take the form of a new and larger museum. Hitherto the geological collections had been placed in the Woodwardian Museum in Cockerell's Building. Through the energy of Professor T. McK. Hughes (successor to Sedgwick) the new building termed the Sedgwick Museum was completed and opened in 1903.

See the Life and Letters, by John Willis Clark and Thomas McKenny Hughes (1890).

SEDGWICK, JOHN (1813-1864), American general, was born in Cornwall, Connecticut, on the 13th of September 1813, and graduated at West Point in 1837. Amongst his classmates were Joseph Hooker, Braxton Bragg and J. A. Early. He saw active service against the Seminoles in Florida, and took part as an artillery officer in the Mexican War, winning the brevets of captain and major for his conduct at Contreras-Churubusco and Chapultepec. In command first of a brigade and later of a division in the Army of the Potomac, he took part in the Seven Days' and Maryland campaigns. At the battle of Antietam he was twice wounded, but remained on the field. Soon afterwards he was given command of the VI. corps, in which position he took an important part in the battle of Chancellorville, following the famous lines of Fredericksburg and fighting the severe battle of Bank's Ford. The VI. corps bore a share in the battle of Gettysburg, having made a fine forced march to the field. Sedgwick had been offered the chief command of the army upon Hooker's resignation; but he declined, and retained his command of the VI. corps during the Virginia campaign of the autumn of 1863, being on several occasions placed by Meade in charge of a wing of the army. He was also given the command of the whole Army of the Potomac (August 27, 1863). The action of Rappahannock station Sedgwick by a brilliant night attack destroyed two brigades of Early's division (November 7th). When Grant became commanding-general and the Army of the Potomac was reorganized in three corps, the VI. was one of these, and Sedgwick thus led his old corps, now greatly augmented, at the battle of the Wilderness. At the opening of the battle of Spottsylvania Court House, Sedgwick was killed (9th of May 1864) by a shot from a Confederate skirmer. A monument to his memory, cast from the guns taken in action by the VI. corps, was erected at West Point in 1869.

SEDILIA (the plural of Lat. sedile, seat), in ecclesiastical architecture, the term given to the seats on the south side of the chancel near the altar for the use of the officiating priests. They are generally three in number, for the priest, deacon and sub-deacon. The custom of recessing them in the thickness of the wall began about the end of the 12th century; some early examples consist only of stone benches, and there is one instance of a single seat or arm-chair in stone at Lenham in Kent, thought by some to be a confessionals. The niches or recesses in which they are sunk are often richly decorated with canopies and subdivided with moulded shafts, pinnacles and tabernacle work; the seats are sometimes at different levels, the eastern being always the highest, and sometimes an additional niche is provided in which the piscina is placed.

SEDITION (Lat. se or sed, apart, and ire, to go, a going apart, dissension), in law, an attempt to disturb the tranquillity of the state. In Roman law sedition was considered as majestas or treason. In English law it is a very elastic term, including offences ranging from libel to treason (q.v.). It is rarely used except in its adjectival form, e.g. seditious libel, seditious meeting or seditious conspiracy. As to sedition itself, it is generally held by English law' (Hist. Crim. Law, vol. ii. chap. xxiv.); the principal enactments now in force dealing with seditious offences were all passed during the last twenty-five years of the reign of George III. They are the Unlawful Oaths Act 1797, prohibiting the administering or taking of unlawful oaths (see OATH) or the belonging to an unlawful confraternity; the Unlawful Drilling Act 1819-1820 prohibited unlawful drilling and military exercises; and the acts for the suppression of corresponding societies, the Unlawful Societies Act 1799 and the Seditious Meetings Act 1817. No proceedings can be instituted under these last two acts without the authority of the law officers of the crown (Corresponding Societies, &c., Act, 1846). Under the head of statutes aimed at seditious offences may also be classed statutes of Richard II. (1378, 1388) against scandalum magnatum or slander of great men, such as peers, judges or great officers of state, whereby discor ay may arise within the realm, and a statute of Charles II. (1661) against tumultuous petitioning (see Pettition). There has been no prosecution for many years for seditious words as distinguished from seditious libel, but such words have been admitted as evidence in proceedings for seditious conspiracy (q.v.), as in the prosecution of O'Connell in 1844, and of C. S. Parnell and others in 1886 (see Reg. v. Parnell, Cox's Criminal Cases, vol. xiv. 508). By the Prize Act 1877, any prisoner under sentence for sedition or seditious libel is to be treated as a misdemeanant of the first division.

1 The word "sedition" occurs, however, in the Prize Act 1877, s. 40.
SEDLEY—SEDUCTION

579

Scotland.—"All acts by which the minds of the people may be incited to defeat the government or control legislation by violent or unconstitutional means are seditions." (Macdonald, Criminal Law, 229.) Sedition is punishable by fine or imprisonment or both (Pittsburgh Daily Post). In 1814 every broadcast speech of the acts of the Scottish parliament dealt with sedition, beginning as early as 1184 with the assize of William the Lion, c. 29. Leasing-making is to be distinguished from sedition, as it attacked only the revenue of the government.

United States.—In the acts of Congress the word "sedition" appears to occur only in the army and navy articles. A soldier joining and acting against his country is considered as sedition. A use of the utmost endeavour to suppress the same, is punishable with death or such other punishment as a court-martial shall direct (U.S. Rev. Stats. § 1342, arts. 22, 23). A sailor uttering seditions being court-martialled, and sentenced to perpetual banishment, having an act of Congress called the Sedition Act was passed, which expired by effluxion of time in 1801. Its constitutionality was violently assailed at the time and has been by all question condemned by public sentiment as "susceptible of being used for purposes of oppression and terrorism." (See Story on the constitution of the United States, §§ 1293-1294.) Several prosecutions under the act will be found in Wharton's State Trials. Sedition is also defined by the state laws mostly in a very liberal spirit. Thus the Louisiana Code, § 304, enacted that "there is no such offence known to our law as defamation of the government or either of its branches, excepting sedition, as it has never been written, nor ever defined, nor of its appellation." By § 111, to constitute the offence of sedition "there must be not only a design to dismember the state, or to subvert or change the form of government, but the attempt must be made by force of arms." It has been held that publications which tend to degrade and vilify the constitution, to promote insurrection and encourage discontent through its members, to asperse its justice and align cumbersome "charges of misgovernment, have been held within the peculiar rigour of the law (1805, Respub. v. Dennis, 4 Yeates (Penn.) 267). The defendant was indicted "as a factitious and seditionists person of a wicked mind and unquiet and turbulent dis- position and conversation, seditionally, maliciously and wilfully intending as much as in him lay to bring into contempt and hatred the independence of the United States, the constitution of this country, and the constitution of the States, and the people, and to produce much and dissatisfaction against the scheme of polity instituted and upon trial in the said United States and in the said common- wealth, to molest, disturb and destroy the peace and public tran- quility of the State, and to condemn the principles of revolution and revile, depreciate and scandalize the characters of the revolutionary patriots and state men, to endanger, subvert and totally destroy the republican constitutions and free government of the United States. To involve (it) . . . in civil war, desolation and anarchy and to procure by art and force a radical change and alteration in the principles and forms of the said constitutions and governments within the free will and concurrence of the people of the United States, and to fulfil, perfect and bring to effect his wicked, seditious and detestable intentions aforesaid he said Joseph Dennis on the 23rd of April 1803 at the city of Philadelphia in the State of Pennsylvania published, did make, compose, write and publish the following libel, to wit, a democracy is scarcely tolerable at any period of national history. Its omens are always sinister and its powers are unpropitious; it was not the form of government from which Rome . . . It was tried in England and rejected with the utmost loathing and abhorrence. It is on its trial here and its issue will be civil war and political anarchy. No people can be safe in the fraud, and no brave man but draws his sword against its force, &c., &c." The defendant was found not guilty.

Confinement of Europe.—The continental codes as a rule are little more definite than English law in their treatment of sedition. In Germany a distinction is drawn between Aufstand, the remaining together of a mob after the authorities have thrice bid it disperse, and Aufdruck or Aufstand, an organized resistance to the authorities; but the French penal code defines the term. An armed body of men is defined Aufstand to be an armed assembly which has the intention of attacking a class of citizens, a nationality or a religious body. The French penal code recognizes a difference between sedition and réunion séduisante. If carried out with sufficient numbers and sufficient force stidetion becomes rebellion. Section 100 exempts from the penalties of sedition those who have merely been present at an unlawful assembly. In 1819 the penalties of this charge have dispersed at the first warning of the military or civil authorities.

SEDLEY, SIR CHARLES (c. 1630-1701). English wit and dramatist, was born about 1630, and was the son of Sir John Sedley of Aylesford in Kent. He was educated at Wadham College, Oxford, but left without taking a degree. Sedley is famous as a patron of literature in the Restoration period, and was the "Lisideus" of Dryden's Essay of Dramatic Poesy. His most famous song, "Phyllis is my only joy," is much more widely known now than the author's name. His first comedy, The Mulberry Garden (1668), hardly sustains Sedley's contemporary reputation for wit in conversation. The best, but most licentious, of his comedies is Bellamire; or The Mistress (1683), an imitation of the Enanus of Terence, in which the heroine is supposed to represent the Duchess of Cleveland, the mistress of Charles II. His two tragedies, Antony and Cleopatra (1667) and The Tyrant King of Crete (1702), an adaptation of Henry Killigrew's Palladius and Eudora, have little merit. He also produced The Grumblour (1702), an adaptation of Le Grondeur of Brueys and Palaprat. An indecent frolic in Bow Street, for which he was heavily fined, made Sedley notorious. He was member of parliament for New Romney in Kent, and took an active part in the government. A speaker of his on the civil list after the Revolution is cited by Macaulay, and throughout his reputation as a man of wit and ability was deserved. His bon mot at the expense of James II is well known. The king had seduced his daughter and created her countess of Dorchester, whereupon Sedley remarked that he hated ingratitude, and, as the king had made his daughter a countess, he would endeavour to make the king's daughter a queen. He died on the 20th of August 1701.

His only child, CATHERINE, countess of Dorchester (c. 1657-1747), the mistress of James II both before and after he came to the throne, and was the queen of France by marriage, was in her elevation which aroused much indignation and compelled Catherine to reside for a time in Ireland. In 1669 she married Sir David Colyer, Bart. (d. 1730), who was created earl of Portmore in 1703, and she was thus the mother of Charles Colyer, 2nd earl of Portmore (1700-1785). She died at Bath on the 26th of October 1717, when her life peerage became extinct. By James II. Lady Dorchester had a daughter Catherine (d. 1743), who married James Annesley, earl of Anglesey (d. 1702), and after his death married John Sheffield, duke of Buckingham. Through Catherine, her daughter by her first husband, she was the ancestress of the Barons Mulgrave.

See The Works of Sir Charles Sedley in Prose and Verse (1778), with a slight notice of the author.

SEDUCTION (from Lat. seducere, to lead astray), a term generally used in the special sense of wrongfully inducing a woman to consent to sexual intercourse. The action for seduction of an unmarried woman in England stands in a somewhat anomalous position. The theory of English law is that the woman herself has suffered no wrong; the wrong has been done to the parents or the parent or parents in loco parentis, who must sue for the damages resulting from the breach of the duty of seduction of the woman. Some evidence of service must be given, but very slight evidence will be sufficient, even making of tea, milking cows, minding children or any small household work. It is no bar if a daughter is out at work during the day time, provided she assists in the household when she comes home in the evening. The relationship of master and servant must, however, exist, and the action must be brought by the person with whom the seduced girl was residing at the time, whether in the capacity of daughter and servant, ward and servant, or servant only. It is so seldom indeed that an action is brought against a seducer when the seduced girl is a servant only, that what Servant Manning wrote many years ago is still painfully true: "The quasi fiction of seditum amitis affords protection to the rich man whose daughter occasionally makes his tea, but leaves without redress the poor man whose child is sent unprotected to earn her bread amongst strangers" (note to Grinnell v. Wells, 1844, 7 M. & G. 1044). This capricious working of the action for seduction is somewhat obviated in Scots law, under which the seduced woman may sue on her own account, but only if deceit has been used, and most often there is a difficulty in showing that the deceit alone was the cause of the injury. Although the action is nominally for loss of service, still exemplary damages are given for the dishonour of the plaintiff's family beyond recompense for the mere loss of service. An action for seduction cannot be brought in the county court except by agreement of the parties. As to seduction of a married woman, the old action for criminal conversation was abolished.
SEDULIUS

by the Divorce Act 1857 which substituted for it a claim for damages against the co-respondent in a divorce suit; but if a married woman were living apart from her husband in her father's house, and giving her services to her father in the slightest degree, an action for seduction would lie. Seduction in England is not as a rule a criminal offence. But a conspiracy to seduce is indictable at common law. And the Criminal Law Amendment Act 1885 (which extends to the United Kingdom) makes it felony to seduce a girl under the age of thirteen, and misdeemour to seduce a girl between thirteen and sixteen (§§ 4, 5). The same act also deals severely with the cognate offences of procuration, abduction and unlawful detention with the intent to seduce a woman of any age. The Children Act 1908 gave a further protection to young people, enacting that if any person having the custody, charge or care of a girl under the age of sixteen causes or encourages the seduction of that girl shall be guilty of a misdemeanour, and be liable to imprisonment, with or without hard labour, for a term not exceeding two years.

**United States.—** In the United States state legislation has generally modified the common law. In some states the father brings the action as the representative of the family; while part of it has been invaded; in others the woman herself may bring the action. In many states there is a criminal as well as a civil remedy. The penal codes of New York, New Jersey, Louisiana and other states make it a crime to seduce under promise of marriage an unmarried woman of good reputation. Subsequent intermarriage of the parties is in most cases a bar to criminal proceedings. The state legislation of the United States is remarkable opposition to the rule of the canon law, by which the seduction of a woman by her betrothed was not punishable on account of the inchoate right over her person given by the betrothal.

**SEDULIUS,** **COELTIUS OR CAELIUS** (a paenomen of doubtful authenticity), a Christian poet of the first half of the 5th century, is termed a presbyter by Isidore of Seville and in the Gelasian decree. He must not be confused with Sedulius the Irish-Scott grammarian of the 9th century. His fame rests mainly upon a long poem, *Carmen paschale,* based on the four gospels. In style a bombastic imitator of Virgil, he shows, nevertheless, a certain freedom in the handling of the Biblical story, and the poem soon became a quarry for the minor poets. A hymn by Sedulius in honour of Christ, consisting of twenty-three quatrains of iambic dimeters, has partly passed into the liturgy, the first seven quatrains forming the Christmas hymn *A solis ortus cardine,* and some later the hymn *In multitudinem,* *Hostis Hercules impie.*

*Sedulaet* and *Novi Testamenti collatio* in elegiac couples has come also down, and we have grounds for ascribing to him the Virgilian cento, *De verbi incarnatione.*

**SEDUM,** in botany, a genus of the natural order Crassulaceae, containing about 120 species, natives chiefly of the north temperate and frigid regions, and mostly perennial herbs with succulent leaves of varied form, but never compound. The white or yellow, rarely pink or blue, flowers are usually small and grouped in cymes. They have a calyx of five sepals, as many petals, usually ten stamens and five distinct carpels, which have as many glands at their base and ripen into as many dry seed-pods. Several species are British, including some with tuberous roots and large leaves (*Telephium,* and others of smaller size, chiefly found on rocky places and dry banks; *S. acre* is stonewort, *S. calcareum* is a well known also in gardens, a variety of which, aureum, is in cultivation with golden-yellow tips to the leaves and shoots. Many others are cultivated for the beauty of their foliage or flowers, and many are remarkable for their vitality under adverse circumstances. They succeed on rockwork, old walls or as border plants; some, e.g. *S. Lydium*, a native of Asia Minor, are excellent for carpet bedding. *S. spectabile,* 1 to 1½ ft., with pink flowers in great cymose heads, is a fine plant for the borders, in hanging pots or baskets in cottage windows. *Sedums* are very closely allied to *Semprevivums* (see *Houseleek*).

**SEE** (Lat. *sedes,* a seat), a seat or throne, particularly the throne of a bishop, the *cathedra,* the symbol of his office and dignity, the placing of which in a church makes it a cathedral (q.v.). The term is thus applied to the place where the bishop's cathedral is situated and from which he properly takes his title, and so is to be distinguished from diocese (q.v.), the territorial province over which his jurisdiction extends (see *Bishop*).

**SEEBAACH, MARIE** (1835–1867), German actress, was born at Riga, in Russia, on the 24th of February 1830, being the daughter of an actor, Wilhelm Friedrich Seebach (1798–1863). After appearing first at Nuremberg as Julie in *Kean,* she played soubrette parts at Lubeck, Danzig and Cassel. In 1852 she achieved her first great success at the Thallatheater in Hamburg as Gretchen in Goethe's *Faust,* and she remained there until 1854, when she appeared in Vienna. She then played in Munich, establishing her reputation as a tragic actress with the roles of Jane Eyre and Adrienne Lecouvreur. From 1855 to 1866 she was engaged at the court theatre at Hanover, and there in 1859 she married the tenor Albert Niemann. In 1866 she followed her husband to Berlin, but separated from him after two years. In 1870–1871 she visited the United States, and gave in seventeen cities no less than 160 performances—mostly of *Faust,* and in 1886 she accepted a permanent engagement at the Schauspielhaus in Berlin. She retired from the stage in 1897, and died on the 3rd of August of that year. In 1895 she endowed a home for poor actors and actresses at Weimar, called the Marie Seebach Stiftung.

See *Gensichen,* *Aus Marie Seebachs Leben* (Berlin, 1900).

**SEED** (from the root seen in Lat. *serrare,* to sow), the fertilized ovule of plants. The seeds of the cryptogams or flowerless plants are not true seeds and are properly designated "spores" (see *Fruit*); for the sowing of seed see *Sowing*.

**SEELEY, SIR JOHN ROBERT** (1834–1895), English essayist and historian, was born in London in 1834. His father, K. B. Seeley, was a publisher, and author of several religious books and of *The Life and Times of Edward I,* which was highly esteemed by historians. From his father Seeley doubtless derived his taste for religious and historical subjects. He was educated at the City of London School and at Christ's College, Cambridge, where he was head of the classical tripos and senior chancellor's medallist, was elected fellow and became classical tutor of his college. For a time he was a master at his old school, and in 1863 was appointed professor of Latin at University College, London. His essay *Ecce Homo,* published anonymously in 1866, and afterwards owned by him, was widely read, and called forth
many replies, being held to be an attack on Christianity. Dealing only with Christ's humanity, it dwells on his work as the founder and king of a theocratic state, and points out the effect which this society, his church, has had upon the standard and practical practice of morality among men. Some who condemned the book seem to have forgotten that it was crowning a "Marchen," and that the author does not deny the truth of doctrines which he does not discuss. Its literary merit is unquestionable; it is written with vigour and dignity; its short and pointed sentences are never jerky, and there is a certain stateliness in the admirable order of their sequence. His later essay on *Natural Religion*, which, premising that supernaturalism is not essential to religion, maintains that the negations of science tend to purify rather than destroy Christianity, satisfied neither the Christian nor the scientist, and though well written excited far less interest than his earlier work. In 1869 he was appointed professor of modern history at Cambridge. His influence as a teacher was stimulating; he prepared his lectures carefully and they were largely attended. In historical work he is distinguished as a thinker rather than a scholar. Avoiding research and disliking all attempts at a picturesque representation of the past, he valued history solely in its relation to politics, as the science of the state. He maintained that it should be studied scientifically and for a practical purpose, that its function was the solution of existing political questions. Hence he naturally devoted himself mainly to recent history, and specially to the relations between England and other states. His "Life and Times of Lord Clive" (1869) was by Phillott, himself a voluminous writer, but it was under Stein's instigation, written under German influence, and shows little of the style of his short essays. Its length, its colourlessness, and the space it devotes to subsidiary matters render it unattractive. Far otherwise is it with his *Expansion of England* (1883). Written in his best manner, this essay answers to his theory that history should be used for a practical purpose; it points out how and why Great Britain gained her colonies and India, the character of her empire, and the light in which it should be regarded. As an historical essay the work is a fine composition, and as a defence of the empire it is answerable and inspiring. It appeared at an opportune time, and did much to make Englishmen regard the colonies, not as mere appendages, but as an expansion of the British state as well as of British nationality, and to remind them of the value of Great Britain's empire in the East. Seeley was rewarded for this public service by being made K.C.M.G., on the recommendation of Lord Rosebery. His last book, *The Growth of British Policy*, written as an essay and intended to be an introduction to a full account of the expansion of Great Britain, was published posthumously. Seeley died on the 13th of January 1895. He married in 1869 Miss Mary Agnes Philpot, who survived him.

**Sées**, a town of north-western France, in the department of Orne, on the river Orne 3 m. from its source and 13 m. N.N.E. of Alençon by rail. Pop. (1906) town, 2622; commune, 3982. The town is a bishop's see and has a Gothic cathedral remarkable for the boldness of its architecture. The church dates from the 13th and 14th centuries and occupies the site of three earlier churches. The west front, which is disfigured by the buttresses projecting beyond it, has two stately spires of open work 230 ft. high. The nave was built towards the end of the 13th century. The choir, built soon afterwards, is remarkable for the lightness of its construction. In the choir are four bas-reliefs of great beauty representing scenes in the life of the Virgin; and the altar is adorned with another depicting the removal of the relics of St Gervais and St Protais. The church has constantly been the object of restoration and reconstruction. Other noteworthy buildings are the episcopal palace (1798), with a pretty chapel; the ancient hospital, located in the old St Mary's; St Martin (supposed to be one of the fourteenth or fifteenth century); the former Benedictine monastery (12th century); and the sumptuous modern chapel of the Immaculate Conception, a resort of pilgrims.

The first bishop of Sées (Saium, Sagium) was St Lain, who lived about the 4th century. In the 9th century Sées was a fortified town and fell a prey to the Normans. At that period Sées consisted of two distinct parts, separated by the Orne—the bishop's burgh, and to the south, the new or count's burgh (Deing le Comité). Constantinople, where he stayed six months, thence through Asia Minor to Smyrna, then again through the heart of Asia Minor to Aleppo, where he remained from November 1803 to April 1804, and made himself sufficiently at home with Arabic speech and ways to travel as a native. Now began the part of his travels of which a full journal has been published (April 1805 to March 1809), a series of most instructive journeys in western and eastern Palestine and the wilderness of Sinai, and so on to Cairo and the Fayum. His chief exploit was a tour round the Dead Sea, which he made without a companion and in the disguise of a beggar. From Egypt he went by sea to Jidda and reached Mecca as a pilgrim in October 1809. In Arabia he made extensive journeys, ranging from Medina to Lahak and returning to Mocha, from which place his last letters to Europe were written in November 1810. In September of the following year he left Mocha with the hope of reaching Muscat, and was found dead two days later, having, it is believed, been poisoned by the command of the imam of Sana.

For the parts of Seezen's journeys not covered by the published journal (Riezen, ed. Kruse, 4 vols., Berlin, 1854), the only printed record is a series of letters and papers in Zach's *Monatliche Correspondendes* and Hammer's *Friede*.

**Segantini, Giovanni** (1858-1899), Italian painter, was born at Arco in the Trentino on the 15th of June 1858. His mother, who died in 1863, belonged to an old family of the mountain country. His father, who was a man of the people, went to Milan, whence he set forth with another son to seek his fortune, leaving Giovanni behind. At the age of seven the child ran away; he was found perishing of cold and hunger, and was obliged to earn his bread by keeping the flocks on the hills. He spent his long hours of solitude in drawing. Having reached the age of thirty, he was sent back to Milan; but, unable to endure domestic life, he soon escaped again, and led a wandering life till he met at Arco with his half-brother, who offered him the place of cashier in his provision shop. After more flights and more returns, Segantini remained at Milan to attend classes at the Brera, earning a living meanwhile by giving lessons and painting portraits. His first picture, "The Choir of Sant Antonio," was noticed for its powerful quality. After painting this, however, he shook himself free by degrees of academic teaching; as in his picture "The Ship." He submitted "The Dead Hunter" and was rejected; and then settled in Brianza, near Como. There he gave himself up to the study of mountain life, and became in truth the painter of
the Alps. At this time he painted the "Ave Maria," which took a gold medal at the Amsterdam Exhibition (1883), "Mothers," "After a Storm in the Alps," "A Kiss," and "Moonlight Effect." Deeply impressed by Millet, the artist nevertheless quickly strove to assert his individuality, as may be seen in "The Drinking-place," which gained a gold medal in Paris (1889), "In the Sheep-fold," "By the Spinning-wheel," and "Ploughing in the Engadine," for which he was awarded a gold medal at the Turin Exhibition (1892). Besides those works in which he studied simple effects of light and Alpine scenery, such as "Midday on the Alps" and Winter at Savognin," he also painted sym- bolic and romantic landscapes: "Tunziina," the "Greek Building," and the "Umbral Mother" (in the Walker Art Gallery, Liverpool).

Segantini died at Maloja in October 1899. An exhibition of his works was held in London, and afterwards at Brussels in 1899, and at Milan in 1900.

SEGESTA (Gr. Ἑρυξα), an ancient city of Sicily, 8 m. W.S.W. of the modern Alcamo and about 15 m. E.S.E. of Eryx. It was a city of the Elymi, but, though the Elymi were regarded as barbari, Segesta, in its relations with its neighbours, was almost like a Greek city. Disputes with Selinus over questions of boundary seem to have been frequent from 586 B.C. onwards. In 454 B.C. we hear of dealings—possibly even an alliance—between Athens (the authority being a fragmentary inscription, see E. A. Freeman, History of Sicily, ii. 554), and in 426 B.C. an alliance was concluded by Lacedaemon. One of the ostensible objects of the Athenian expedition to Sicily in 415 was to aid Segesta against Selinus in a dispute, not only as to questions of boundary, but as to rights of marriage. After the Athenian débacle, the Segestans turned to Carthage; but when Hannibal in 409 B.C. firmly established the Carthaginian power in western Sicily, Segesta sank to the position of a dependent ally, and was indeed besieged by Dionysius in 397, being at last relieved by Himilco. In 307 Athagobus marched on the city, massacred 10,000 men, sold the rest of the inhabitants into slavery and changed its name to Dicaeopolis; but it soon recovered its old name and returned to the Carthaginians. Early in the First Punic War, however, the inhabitants, having massacred the Carthaginian garrison and allied themselves with Rome, had to stand a severe siège from the Carthaginians. Segesta was treated with favour by the Romans, retaining its freedom and immunity from tithe; indeed it seems probable that the municipal constitution of Eryx was suppressed and its territory assigned to Segesta. It received Latin rights before Caesar's concession of them to the rest of Sicily.

The site is now absolutely deserted. The town lay on the Monti Varvaro (1345 ft.): considerable remains of its external walls, of houses and of a temple of Demeter are to be seen. The theatre is well preserved: its diameter is 205 ft. It is partly hewn in the rock, the rest (especially the back wall of the stage) being of very roughly hewn, long, thin blocks of hard limestone, approximately rectangular, with smaller pieces filling up the interstices. To the W.N.W., 350 ft. below the theatre, is a temple, 200 ft. long and 86 ft. wide. In the steps; it is a hexastyle peripteros, and has 56 columns, 29 ft. in height, 61 ft. in lower diameter. The building was, however, not completed; the cela was never built, and the columns, not having been fluted, have a heavy appearance. It is, however, so well preserved that a portion of its construction between 430 and 420, so that the interruption of the work must be due to the events of 416 or 409 B.C. The Thermæ Segestanae were situated about 5 m. to the north on the road to Castellammare, but not so near to use.

SEGESVÁR (Ger. Schäßburg), a town of Hungary, in Transylvania, the capital of the county of Nagy-Küküllő, 126 m. S.E. of Kolozsvár by rail. Pop. (1900) 10,837. Amongst the principal buildings are a Gothic church of the 12th century, the town and county hall, a German gymnasium with a good collection of antiquities, and the municipal museum. In front of the county hall is a bronze statue of the Hungarian poet Alexander Petöfi (1823-1849), erected in 1897. Segesvár has a good woollen and linen trade, as well as exports of wine and fruit. Segesvár was founded by Saxon colonists at the end of the 12th century; its Latin name was Castrum Sex. Here, on the 31st of July 1849, the Hungarian army under Bem was defeated by the overwhelming numbers of the Russian General Légers. Petöfi is generally believed to have met his end in this battle.

SEGOVIA, a province of central Spain, formerly part of Old Castile, bounded on the N. and N.E. by the provinces of Burgos and Soria, S.E. by Guadalajara and Madrid, S.W. by Ávila, and N.W. by Valladolid. Pop. (1900) 159,243; area, 2635 sq. m. The greater portion of the country consists of an arable tableland, some 2500 ft. above the sea, monotonous enough in appearance, with the Ebro, Duero, and its tributaries. The most valuable product is some of the finest corn in the Peninsula. Along the whole southeastern boundary the Sierra de Guadarrama rises up suddenly, like a huge barrier, separating Old from New Castile and the basin of the Duero from that of the Tagus. The province is well watered by the streams which rise in the Guadarrama range and flow northwards to the Duero, and by carefully irrigated. The Eresma, Cega, Duraton and Riaza are the principal watercourses. Except the capital, Segovia, there is no town of more than 5000 inhabitants; but Segovia and other small towns are remarkable for the completeness of their monuments and for the richness of their collections of art. At the foot of the Navacerrada pass lies the royal demesne and summer residence of La Granja (a.). After the completion (1883) of the railway from Medina del Campo to the city of Segovia, and its subsequent extensions to Madrid and Aranda de Duero, the towns adjoining these lines showed signs of increased prosperity and animation. There are manufactures on a small scale of coarse pottery, dyes, paper, alcohol, rosin, hats, pins and needles, flour, oil and beer. Such prosperity, however, as Segovia retains is dependent upon its agricultural produce—wheat, rye, barley, peas, hemp, flax, &c.—together with the rearing of sheep, cattle, mules and pigs. There are extensive forests in the sierras, which yield excellent granite, marble and limestone; but the difficulty of transport has prevented any systematic development of these resources.

SEGOVIA, the capital of the Spanish province of Segovia; on the railway from Madrid to Valladolid and Zamora. Pop. (1900) 14,547. Segovia is built upon a narrow ridge of rock which rises in the valley of the Eresma, where this river is joined by its turbulent tributary the Chamores. It is an episcopal see in the archiepiscopalric of Valladolid. Founded originally as a Roman monument of some historical interest and ecclesiastical interest, it was the seat of one of the most ancient religious centres and seats of the Castilian church. The place itself, with its fine monuments of the many vicissitudes of fortune and art which it has passed, foremost among the latter being the ancient alcázar or citadel, the cathedral, the aqueduct of Trajan, and a notable array of churches and other ecclesiastical remains.

The alcázar is perched upon the western tip of the long tongue of rock upon which the city is built. Of the original medieval fortress but little remains save the noble façade—the building has been largely wanted out by the presence of the school then domiciled within its walls, and all but destroyed. The work is Moorish, with an admixture of Renaissance in the decoration. The 16th-century cathedral (1521-1577), the work of Juan Gil de Ontañon and his son Rodrigo, occupies the site of a former church of the 11th century, of which the present cloisters, rebuilt in 1524, formed part. It is a well-proportioned and delicate piece of Late Gothic—the latest of its kind in Spain—and contains some very fine stained glass. The most remarkable of the many other churches are those of La Vera Cruz (Knights Templar, Romanesque of the early 13th century), San Millán and San Juan (both Romanesque of second half of 13th century), El Parral (Gothic of early 16th century), and Corpus Christi, an ancient Jewish sanctuary and an interesting specimen of Moorish work. The towers and external cloistering, or corredores, of several of the later churches—most notable of these is that of El Parral—are open works. The great aqueduct, however, called El Puente del Diablo, usually ranks as the glory of Segovia, and is remarkable alike for its colossal proportions, its history, its picturesqueuess, and the art with which
it is put together. Erected or rebuilt, according to fairly trust-
worthy tradition, in the time of the emperor Trajan (c. A.D. 53–112),
and several times barely escaping destruction, it is now in perfect
working order, bringing the waters of the River Frio down from
the Sierra Fuendra, 10 m. S. The bridge portion striding across the
valley into the city, is 88 yds. long and of a castellated, or sup-
supposedly of a donjon of the sort built of rough-hewn granite blocks, laid
without lime or cement. (For illustration, see AQUEDUCT.) Segovia
lost its ancient prosperity when it was taken and sacked by the French
in 1323. Since then, however, suburbs have sprung up on all
sides, outside the walls. The woollen industry decayed, but its
place was taken by dyeing, iron foundry, and manufacturers of
paper, flour, earthenware, and coarse porcelain. Segovia has
two public libraries, and two remarkable collections of archives.
Public education is provided by an institute, a dozen primary
schools, a school for teachers, and schools of art and handicrafts.
The first art or technical school of Spain is also established here.

SEGRAVE, the name of an English baronial family. Stephen
de Segrave, or Sedgrave (d. 1241), the son of a certain Gilbert
de Segrave of Segrave in Leicestershire, became a knight and was
made constable of the Tower of London in 1203. He obtained
lands and held various positions under Henry III., and in 1232
he succeeded Hubert de Burgh as chief justiciar of England.
As an active coadjuator of Peter des Roches, bishop of Winchester,
Segrave incurred some share of the opprobrium which was lavished
on the royal favourites, and in 1234 he was deprived of his office.
Soon, however, he was again appointed, and was, in fact, influential in
Henry's court, pardoned in 1235, and retained this until his death on
the 9th of November 1241. His son and heir, Gilbert de Segrave
(d. 1254), who was also a judge, died in prison at Pons in France,
whether he had gone to fight for Henry III.

Gilbert was the father of Nicholas de Segrave, 1st Baron
Segrave (c. 1238–1303), who was one of the partisans of Simon
de Montfort; he led the Londoners at the battle of Lewes, and
was a member of Earl Simon's famous parliament of 1265.
He was wounded at the battle of Evesham, and was afterwards
among those who defied the royal authority in the Isle of Ely.
Soon after, he joined the fleet, and was taken to the Holy
Land with his future sovereign, Edward I. In 1283 he was
summoned to parliament as a baron, and he served the king in
various ways. He had six sons, three of whom, John (who
succeeded him), Nicholas and Gilbert (bishop of London from
1313 until his death in December 1316), were men of note.
Nicholas the younger (c. 1260–1322) was summoned to parliament
in 1295, and was present at the battle of Falkirk and at the siege of
Carlaverock Castle. In 1305 he was found worthy of death
for deserting the English army in Scotland and for crossing over
to France in order to fight a duel with Sir John de la Broche; he
was pardoned and summoned to Edward I. in Scotland.
Under Edward II., Nicholas, who was one of Piers
Gaveston's few friends, was made marshal of England, but
lost this office definitely in 1316. Later he associated himself
with Thomas, earl of Lancaster. Through marriage he obtained
the manor of Stowe in Northamptonshire, and he is generally called lord of Stowe.

John de Segrave, 2nd Baron Segrave (c. 1255–1329), was
one of those who supported the earls of Norfolk and of Hereford
in their refusal to serve Edward I. In Gascony in 1297, he
partook in campaigns in Scotland, and peace, and another Nicho-
sesigned the letter which was sent in 1307 by the barons at Lincoln
to Pope Boniface VIII. repudiating the papal claim to the
suzerainty of Scotland. Having been appointed warden of
Scotland, Segrave was defeated at Roslin in February 1303;
after the capture of Stirling he was again left in charge of this
country and was responsible for the capture of Sir William
Wallace, whom he conveyed to London. He was also warden of
Scotland under Edward II., and was taken prisoner at Ban-
nockburn, being quickly released, and dying whilst on active service in Aquitaine. His grandson and heir, another John
(c. 1295–1353), married Margaret, daughter and heiress of
Thomas of Brotton, earl of Norfolk, a son of Edward I.
Their daughter Elizabeth married John de Mowbray, and the
barony of Segrave was united with, and shared the fate of, that
of Mowbray (q.v.).

Other celebrated members of the Segrave family are Sir Hugh
Segrave (d. 1360), treasurer of England from 1328 until death,
and Stephen de Segrave (d. 1333), a noted pluralist, who was
archbishop of Armagh from 1323 until his death on the 27th of October
1333.

SEGURIER, PIERRE (1588–1672), chancellor of France, was
born in Paris on the 28th of May 1588, of a famous legal family
originating in Quercy. His grandfather, Pierre Ségurier (1504–
1580), was président à mortier in the parlement of Paris from 1554
to 1576, and the chancellor's father, Jean Ségurier, a seigneur
d'Autry, was civil lieutenant of Paris at the time of his death
in 1596. Pierre was brought up by his uncle, Antoine Ségurier,
président à mortier in the parlement, and became master of
requests in 1620. From 1621 to 1624 he was intendant of
Guérande, where he became closely allied with the duc d'Epernon.
In 1624 he succeeded to his uncle's charge, in the parlement.
On 14th of August 1642 Ségurier was sent to the parlement
to regulate its proceedings. On the way he was assailed by rioters
on the Pont-Neuf, and sought refuge in the house of Louis
Charles d'Albert, duc de Luynes. In the course of the con-
cessions made to the Fronde in 1659, Ségurier was dismissed from
his office of keeper of the seals. He spent part of his retirement
at Rosny, with his second daughter Charlotte and her husband,
the duke of Sully. He was recalled in April 1651, but six
months later, on the king's attaining his majority, Ségurier was
again disgraced, and the seals were given to President Mathieu
Molé, who held them with a short interval until his death in 1656.
But they were given back to Ségurier. Ségurier lived for some
time in extreme retirement in Paris, devoting himself to the
affairs of the academy. When Paris was occupied by the
princes in 1652, he was for a short time a member of their
council, but he joined the king at Pontoise in August, and became
president of the royal council. After Mazarin's death in 1661
Ségurier retained but a shadow of his former authority. He
showed a great violence in his conduct of the case against Fouquet
(q.v.), voting for the death of the prisoner. In 1666 he was placed
at the head of a commission called to simplify the police organi-
zation, especially that of Paris; and the report of the royal
collection. It contained no less than 4000 MSS. in various languages,
the most important section of them being the Greek MSS. A
catalogue was drawn up in Latin and in French (1685–1686) by the

1 Meine de Coislin became a widow, and in 1644 married clandes-
tinously Guy de Lavai, chevalier de Bois-dauphin, afterwards
marquis of Laval.

He afterwards contracted a second marriage with Henri de
Bourbon, duke of Verneuil, a grandson of Henry IV.
RAYMOND JOSEPH PAUL, comte de Ségur d'Aguessau (1803-1889), third son of Count de Ségur, took his mother's family name in addition to his own. He studied law at Aix and Paris. As procureur général of Amiens he gave in March 1830 a decision on the question of the electoral lists which pleased the liberal party, but late in the year, as substitute in the royal court of Paris, he ordered the suppression of certain liberal journals, and in other civil appointments was accused of re-actionary administration. He gave his adhesion to Prince Louis Napoleon, and became a member of the consultative commission in 1851, and of the senate in 1853. After the fall of the empire he retired into private life.

Louis Alexandre de Segur (1808–1877), son of Eugène de Ségur and Sophie Rostopchine, was a prelate of the papal court, and canon-bishop of Saint-Denis. He was a champion of the ultra-montane party and wrote a number of Catholic works, collected in ten volumes (Paris, 1876–1877). His life was written by his brother Anatole, who edited two collections of his letters in 1882 and 1890.

ANATOLE HENRI PHILIPPE DE SÉGUR (1823-1902), Gaston's brother, became councillor of state in 1872, serving until 1879. His works include the life of his grandfather Count Rostopchine (1845), Les Épistres de la Terreur (1863), Paul Marie Charles Bernard (1875).

His son, PIERRE MARIE MAURICE HENRI, marquis de Ségur (b. 1853), wrote a life (1895) of the marshal of Ségur, which was crowned by the French Academy. His book on Madame Geoffrin, Le Royaume de la rue Saint-Honoré (1897), also received a prize. His principal work is the three volumes devoted to Marshal Luxembourg—La Jeunesse du maréchal de Luxembourg, 1628–1668 (1900); Le Maréchal de Luxembourg et le prince d'Orange, 1668–1708 (1903); Le Tapisseur de Notre-Dame. Dernières années du maréchal de Luxembourg, 1678–1695 (1904); Julie de Lespinasse (1906); and Au cœur de la monarchie Louis XV et Turgot (1906) (Paris, 1910). He was elected to the French Academy in 1907.

There is much general information on the family of Ségur in A. de Ségur’s Le Maréchal de Ségur, 1724–1801 (Paris, 1895), and in L. P. de Ségur’s Recueil de famille (1866).

SÉGUR, LOUIS PHILIPPE, COMTE DE (1753-1830), French diplomatist and historian, son of Philippe Henri, marquis de Ségur, was born in Paris on the 10th of December 1753. He entered the army in 1776, served in the American War of Independence in 1781 as a colonel under Rochambeau, was appointed by the Congress of 1783 as a general in the United States, and was sent as minister plenipotentiary to St Petersburg, where he was received into the intimacy of the empress Catherine II. and wrote some comedies for her theatre. At St Petersburg he concluded (1 January 1787) a commercial treaty which was exceedingly advantageous to France, and returned to Paris in 1789. He took up a sympathetic attitude towards the Revolution at its outset and in 1791 was sent on a mission to Berlin, where he was badly received. After fighting a duel he was forced to leave Berlin, and went into retirement until 1801, when, at Bonaparte's instance, he was nominated by the senate to the Corps Législatif. Subsequently he became a member of the council of state, grand master of the ceremonies, and senator, 1813. In 1814 Ségur voted for the deposition of Napoleon and entered Louis XVIII's Chamber of Peers. Deprived of his offices and functions in 1815 for joining Napoleon during the Hundred Days, he was reinstated in 1816, supported the revolution of 1830, but died shortly afterwards in Paris on the 27th August 1830. By his wife, Antoinette d'Aguessau, he had two sons, of whom Count Philippe Paul is separately noticed. Among his writings may be mentioned those on the American Revolution and the Réflexions sur l'attitude de l'aristocratie française en 1789. His Histoire de St Petersburg (1801-1802); Histoire de France (11 vols., 1824-1834); Histoire des jumeaux (1827); Mémoires (3 vols., 1824); and Centes (1800). His Oeuvres complètes were published in 34 volumes in 1824 et seq.

See du Bregille, " Deux Français aux États-Unis " in Mélanges publiés par la Société des Bibliophiles français (2nd part, 1903); A. Cornu, " La Mission du comte de Ségur dans la crise d'une guerre militaire," in the Mémoires de la Société bourgeoisienne de géographie et d'histoire (vol. 17, 1901).
SÉGUR, PHILIPPE HENRI, MARQUIS DE (1724-1801), marshal of France, son of Henri François, comte de Ségur, and his wife Angelique de Froissy, was appointed to the command of an infantry regiment of eighteen, and served under his father in Italy and Bohemia. He was wounded at Roucoux in Flanders in October 1746, and lost an arm at Lauffeld in 1747. In 1748 he succeeded his father as lieutenant-general of Champagne and Brie; he also received in 1753 the governorship of the county of Foix. During the Seven Years’ War he fought at Hastenbeck (1757), Creteil (1758) and Minden (1759). In 1760 he was taken prisoner at Kloster-campen. The ability which he showed in the government of Franche-Comté in 1775 led in 1780 to his appointment as general in chief of the forces in France. He was created in 1783 a prominent general staff, and made admirable regulations with regard to barracks and military hospitals; and though he was officially responsible for the reactionary decree requiring four quarterings of nobility as a condition for the appointment of officers, the scheme is said not to have originated with him and to have been adopted under pretense. In 1783 he became a marshal of France. He resigned from the ministry of war in 1787. During the Terror he was imprisoned in La Force, and after his release was reduced to considerable straits until in 1800 he received a pension from Napoleon. He died in Paris on the 9th of October following the latter year. See A. de Ségur, Le Maréchal de Ségur, 1724-1801 (Paris, 1895).

SÉGUR, PHILIPPE PAUL, COMTE DE (1780-1873), French general and historian, son of Louis Philippe, comte de Ségur, was born in Paris on the 4th of November 1780. He enlisted in the cavalry in 1800, and forthwith obtained a commission. He served with General Macdonald in the Grisons in 1800–1801, and published an account of the campaign in 1802. By the influence of Colonel Durou (afterwards duc de Froul) he was attached to the personal staff of Napoleon. He served through most of the important campaigns of the first empire, and was frequently employed on diplomatic missions. During the campaign in Poland in 1807 he was taken prisoner by the Russians, but was exchanged at the peace of Tilsit. His brilliant conduct in the cavalry charge at Somo Sierra on the 30th of November 1808 (see Peninsular War) won him the grade of colonel, but his wounds compelled him to return to France. As general of brigade he took part in the Russian campaign of 1812, and in the campaigns of 1813 and 1814 he repeatedly distinguished himself, notably at Hanau (October 1813), and in a brilliant affair at Reims (March 1814). He remained in the army at the Restoration, but, having accepted a command from Napoleon during the Hundred Days, he was retired until 1818, and took no further active part in affairs until the revolution of 1830. During his retirement he wrote his Histoire de Napoléon et de la grande armée pendant l’année 1812 (Paris, 2 vols., 1824), which ran through numerous editions, and was translated into several languages. The unfavourable portrait of Napoleon given in this book provoked representations from General Gourgaud, and eventually a duel, in which Ségur was wounded. On the establishment of the July monarchy he received, in 1831, the grade of lieutenant-general and a peerage. In 1839 he was admitted to the French Academy, and he became grand cross of the Legion of Honour in 1847. After the revolution of 1848 he lived in retirement. He died in Paris on the 25th of February 1873. His works include: Histoire de Russie et de Pierre le Grand (1829); Histoire de Charles VIII. (2 vols., 1834–1842), in continuation of the history of France begun by his father; and the posthumous Histoire et mémoires (8 vols., 1873). See Un Aide-de-camp de Napoléon (1800–1812), mémoires du général comte de Ségur, new edition by his grandson Louis de Ségur (3 vols., 1864–1865), of which an abridged English version was published in 1895.

SEGURA (anc. Tader), a river of south-eastern Spain about 150 m. long. It is formed by the confluence of three head-streams, one of which rises on the northern versant of La Saga (787 ft.), a mountain in Granada, while the other two spring from the Sierra de Segura, in Jaen. From the junction of these three streams below Yeste the river winds in an easterly and south-easterly direction past the towns of Ciez and Archena to Murcia. Thence it trends N.E. and passing Orchuela falls into the Mediterranean 19 m. S.W. of Alicante. Its chief tributaries are the Mundo and Arroyo del Jua on the left, and the Caravaca, Quipar and Sangonera on the right. It is only navigable by small sailing-vessels, even in its estuary, but its waters are extensively utilized for irrigation.

SÉGUSIO (mod. Susa, q.v.), an ancient town in north Liguria, the capital of the Cottii (see COTTI REGNUM). Here the son of King Donnus, Cottius—who held the rank of imperial praefect over the fourteen tribes over which his father had ruled as king, so that the inscription he calls himself “M. Iulius regis Donni (Ilius) Cottius praefectus provinciae Galliae et Galliarum”—saw erected a triumphal arch in honour of Augustus in 9–8 B.C., which is still standing. The style of the sculptures on the frieze is quite barbaric, with archaic elements, and is probably derived from Gaul. His tomb, situated near the city walls, mentioned by Ammianus Marcellinus, has long since disappeared. Claudius restored the royal titles to the family; but, after the death of its last member, Nero made the district into a province, and the town into a municipium. It was strongly fortified and garrisoned, and remains of its walls, including those of a double bastioned rampart, exist. Among the other two towns, one of them mentioning baths erected by Gratian. Constantine captured the town, which offered some resistance to him, on his march against Maximoustis.

SEHESTED, HANNIBAL (1609–1666), Danish statesman, born at Arentsborg Castle on Ósel. After completing his education abroad, he returned to Denmark in 1632 and was attached to the court of Christian IV. Two or three years later he was sent to Wismar to negotiate a treaty with the Swedish chancellor, Axel Oxenstjerna, and, if possible, bring about a match between Christian’s son Frederik and Gustavus Adolphus’s daughter Christina. Though failing in both particulars, he retained the favour of the king, who had marked him out as one of his seven sons-in-law, by whose influence he hoped to increase the influence of the crown; and in 1636 he was betrothed to one of the daughters, the countess Christine, then in her tenth year, whom he married in 1642. In May 1640 Sehested became a member of the august Rigsråd. He imagined, with some reason, that the crown found it expedient to use the influence of his talents in its diplomatic service, and openly aspired to be minister of foreign affairs. Despite a successful embassy to Spain in 1640–1641 he did not obtain the coveted post, but was appointed viceroy of Norway (April 1642). He had now the opportunity of displaying an administrative and organizing ability, united with a zeal for reform, as remarkable as unexpected, which raises him high above his contemporaries. He made it his first object thoroughly to develop Norway’s material resources, and reorganize her armaments and fiscal system; and he aimed at giving her a more independent position as regards Denmark. During Christian IV’s second war with Sweden (1643–1645), Sehested, as viceroy of Norway, assisted his father-in-law materially. He invaded Sweden four times; successfully defended Norway from attack; and, though without any particular military talent, won an engagement at Nysaker in 1644. After the war he renewed his reforming efforts, and during the years 1646–1647 strove to withdraw his viceroyalty from the benumbing influence of the central administration at Copenhagen, and succeeded with the help of Christian IV in creating a separate defensive fleet for Norway and giving her partial control of her own finances. He was considerably assisted in his endeavours by the fact that Norway was regarded as the hereditary possession of the kings of Denmark. At the same time Sehested freely used his immense wealth and official position to accumulate for himself property and privileges of all sorts. His successes finally excited the envy and disapprobation of the Danish Rigsraad, especially of his rival Korffs Ulfeldt (q.v.), also one of the king’s sons-in-law. The quarrel became acute when Sehested’s semi-independent administration of the finances
of Norway infringed upon Ulfeldt's functions as lord treasurer of the whole realm; in November 1647 Ulfeldt carried his point, and a decree was issued that henceforth the Norwegian provincial governors should send their rents and taxes direct to Copenhagen. On the accession of Frederick III. (1648), Sehested strove hard to win his favour; but an investigation into his accounts as viceroy, conducted by his enemies, brought to light such wholesale embezzlement and peculation that he was summoned to appear before a herreddog, or assembly of notables, in May 1551, and given an account of his whole administration. Unable to meet the charges brought against him, he compromised matters by resigning his viceroyalty and his seneshalship, and surrendering all his property to Norway to the crown. Throughout his trial Sehested had shown consummate prudence. He surrendered voluntarily thrice as much as he had ever embezzled, and, calculating on the secret fondness of Frederick III. for a man of his monopolarchical tendencies, carefully abstained from the wild and treacherous projects of revenge which were the ruin of Korfits Ulfeldt. From 1651 to 1660 he lived abroad. At the end of 1655 he met the exiled Charles II. of England at Cologne, and lived a part of the following year with him in the Spanish Netherlands. In the summer of 1657 he returned to Denmark, but Frederick III. refused to receive him, and he finally compromised his rights by the treaty of Copenhagen. During the crisis of the war of 1658 he was at the headquarters of Charles X. of Sweden. In seeking the help and protection of the worst enemy of his country, Sehested approached the very verge of treason, but he never quite went beyond it. When, at last, it seemed probable that the war would not result in the annihilation of Denmark, Sehested strained every nerve to secure his own future by working in the interests of his native land while still residing in Sweden. In April 1660 he obtained permission from Frederick III. to come to Copenhagen, and was finally instructed by him as plenipotentiary to negotiate with the Swedes. The treaty of Copenhagen, which saved the honour of Denmark and brought her repose, was very largely Sehested's work. He was one of the willing abettors of Frederick III. at the revolution of 1660, when he re-entered the Danish service as lord treasurer and councillor of state. Both at home and on his frequent foreign missions he displayed all his old ability. As a diplomatist he, in some respects, anticipated the views of Griffenfeldt, supporting the policy of friendship with Sweden and a French alliance. He died suddenly on the 23rd of September 1666 at Paris, where he was conducting important negotiations. His political testament is perhaps the best testimony to his liberal and statesmanlike views.

SEHORE, a British station in Central India, within the state of Bhopal, with a station on the Bhopal-Ujain section of the Indian Midland railway, 24 m. E. from Bhopal. Pop. (1901) 16,864. It is the headquarters of the political agent for Bhopal, and a British military cantonment. For many years it was also the headquarters of the Bhopal contingent, raised in 1818, which was in 1903 incorporated in the Indian army. It is an important centre of trade.

SEICHE (Fr. siče, fem. of sec, dry), in limnology, an irregular fluctuation of the water-level of lakes, first observed and so named in Switzerland. (See LAKE, and GENEVA.)

SEIDL, ANTON (1850–1898), Hungarian operatic conductor, was born at Budapest on the 7th of May 1850. He entered the Leipzig Conservatorium in October 1870, and remained there until 1872, when he was summoned to Bayreuth as one of Wagner's copyists. There he assisted to make the first copy of "Der Ring des Nibelungen." Thoroughly imbued with the Wagnerian spirit, it was natural that he should take a part in the first Bayreuth Festival in 1876. His chance as a conductor came when, on Wagner's recommendation, he was appointed to the Leipzig Stadt-Theater, where he remained until, in 1882, he went on tour with Angelo Neumann's Nibelungen Ring company. To his conducting the critics attributed much of such artistic success as attended the production of the Trilogy at Her Majesty's Theatre in London in June of that year. In 1883 Seidl went with Neumann to Bremen, but two years later was appointed successor to Leopold Damrosch as conductor of the German Opera in New York, and in the same year he married Früholen Kraus, the distinguished singer. In America Seidl's orchestra became famous. In 1886 he was one of the conductors at Bayreuth, and in 1897 at Covent Garden, London. He died in New York on the 28th of March 1898.

See the memorial volume prepared by H. T. Finck, H. E. Krethbiel and others (New York, 1897).

SEIGNIORAGE, the dues levied by the authority that possesses the right of coinage on the metal that it manufactures into coin. The term "brassage" has been used to describe this due, when confined to the mere cost of the process; the wider term "seigniorage" being employed when the charge is so raised as to become a profit to the imposer. The exercise of the right of seigniorage has been the instrument by which most of the debasements of currency have been carried out. Under feudalism, especially in France, the chief nobles had this prerogative. In the modern state it is reserved for the sovereign authority. Most countries adopt a moderate seigniorage charge. Thus the French crown levies a current tax which produces only the "expense of coinage" shall be charged. At present this due is 6 fr. 70 c. per kilo of gold, 3½ c. fine, or 0.24%. The charge by the same law on silver was 3 fr. per kilo, or 1.66%. The limitation on the coinage of silver in practically all countries has made the seigniorage on that metal very heavy. The policy of England in respect to gold has been peculiar. Since 1666 it has been freed from any charge, though the delay in return amounts to a small due. In consequence of this gratuitous coinage, English gold has been regarded as equivalent to bullion, and exchange fluctuations have been reduced. The policy was severely criticized by Adam Smith, and it does the same amount to a bounty on the coinage of gold. The amount is, however, too insignificant to deserve attention, especially as there are compensating gains. The employment of a seigniorage of about 1% on the "sovereign" was suggested by the proceedings of the Paris Monetary Conference of 1867, in order to bring about an assimilation of English and French money. By reducing the amount of gold in the sovereign to that in the proposed 2½-franc piece an exact par would have been created, and, so it was hoped, the English currency and accounts need have undergone no change. The scheme was, however, rejected by a Royal Commission on the ground that an adjustment of obligations would be required.

The theory of the effects that a seigniorage produces have been discussed at length. The definitive results obtained may be briefly stated as follows:—(1) A seigniorage charge is the same as a debasement, but its evil effect may be avoided by limiting the amount of coin issued. (2) Seigniorage operates as a tax on the metal subject to it, and this tax tends ultimately to fall on the producers, or rather on the rent obtained through the production. A heavy seigniorage on gold would tend to lower the profits derived from the gold mines of the world, and might even compel the abandonment of the least productive ones.

See Money, Monetary Conferences, and Token Money. (C. F. B.)

SEIGNORY, or SEIGNEURY (Fr. seigneur, lord; Lat. senior, elder), in English law, the lordship remaining to a grantor after the grant of an estate in fee-simple. There is no land in England without its lord: "Nulle terre sans seigneur" is the old feudal maxim. Where no other lord can be discovered the crown is lord as lord paramount. The principal incidents of a seignory were an oath of fealty; a "quit" or "chief" rent; a "relief" of one year's quit rent, and the right of escheat. In return for these privileges the lord was liable to forfeit his rights if he neglected to protect and defend the tenant or did anything injurious to the feudal relation. Every seignory now existing must have been created before the Statute of Quia Emptores (1290), which forbade the future creation of estates in fee-simple by subfeudation. The only seignories of any importance at present are the lordships of manors. They are regarded as incorporeal hereditaments,
SEINE—SEINE-ET-MARNE

and are either appendant or in gross. A seignory appendant passes with the grant of the manor; a seignory in gross—that is, a seignory which has been severed from the demesne lands of the manor to which it was originally appendant—must be specially conveyed by deed of grant.

Freehold land may be enfranchised by a conveyance of the seignory to the freehold tenant, but it does not extinguish the tenement in the seignory. By s. 3 (tit) of the Settlement Act 1882, the tenant for life of a manor is empowered to sell the seignory of any freehold land within the manor, and by s. 21 (v) the purchase of the seignory of any part of land held in fee by a freehold tenant is an authorized application of capital money arising under the act.

SEINE (Lat. Sequana), one of the chief rivers of France, rising on the eastern slope of the plateau of Langres, about 5 m. N.W. of St Seine-l’Abbaye and 15 m. N.W. of Dijon. It keeps the same general direction (north-westwards) throughout its entire course, but has numerous windings: between its source and its mouth in the English Channel the direct distance is only 250 m., but that actually traversed by the river (through the departments of Côte-d’Or, Aube, Marne, Seine-et-Marne, Seine-et-Oise, Seine, Eure and Seine-Inférieure) is 482 m. Though shorter than the Loire and Rhone, and inferior in volume to the Loire, Rhone and Gironde, the Seine derives an exceptional importance from the regularity of its flow. This feature is due to the geological character of its basin, an area of 30,000 sq. m., entirely belonging to France (with the exception of a few communes in Belgium), and formed in three-fourths of its extent of permeable strata, which absorb the atmospheric precipitation to restore it gently to the river by perennial springs. At Paris the average volume of the river per second is 5,000 cuf. ft., after it has received all its tributaries the volume is about 10,000 cuf. ft. At Paris it falls as low as 1550 cuf. ft., and in exceptional droughts the figure of 1200 is reached. During the flood of 1658 the volume between the quays at Paris is believed to have risen to 88,000 cuf. ft. per second. The height of the river above the normal at Paris was probably on that occasion about 2 ft., whereas in the disastrous floods of January 1910 it was over 2 ft. Other notable floods are recorded in 1740, 1799, 1802, 1876 and 1883.

Rising at a height of 1545 ft. above sea-level, at the base of the statue of a nymph erected on the spot by the city of Paris, the Seine is at first such an insignificant streamlet that it is only dry in summer as far as Châtillon (705 ft.) some 31 m. from its source. At Bar its waters feed the Haute-Seine Canal, though navigation thereon only begins at Troyes. It next passes Marcy, and at Marclhelle, the Aube (right), at which point the canal terminates and the river itself is canalized; here it is deflected from its north-north-westward course. It thus continues in a northwest direction, along the shore of the lake of St Rémy (left) at Moret; having passed Melun it is joined at Corbeil by the Essonne (left), and after its junction with the Marne (right), a tributary longer than itself by 31 m. at the confluence, reaches Paris. From this point to the sea its channel has been so deepened that vessels of 9 to 10 ft. draught can reach the capital. The river then winds through a pleasant campaign country past St Cloud, St Denis, Argenteuil, St Germain, Conflans (the town is girt by the right of the Oise, 60 ft. above the sea), Poissy, Marly-le-Roi, Andelys, between which and the sea the river is remarkable for its detours, as also in the vicinity of Paris. At Poissy the tide first begins to be felt, and at Les Andelys it rises as much as 6 ft. at the Pont de l’Arche, Eilefne and Rouen, where the sea navigation commences. The river is dyked below Rouen so as to admit vessels of 20 ft. draught, and large areas have thus been reclaimed for culture. At Conflans it is 20 m. wide, and at the Mare (left) at Moret, rising usually from 8 to 9 ft., and attaining its maximum from Quillebeuf to Caenbec. Below Quillebeuf (where the Risle is rejoined from the left) the estuary begins, set with extensive sandbanks, between which are the towns of Château-Thierry (25 m.) and Châlons. Above Montargis (right) is the starting-point of a canal to enable river boats for Havre to avoid the sea passage. The river enters the English Channel at the sea town of Le Havre.

The Marne brings to the Seine the waters of the Orne, the Ourcq, and the Morin; the Oise those of the Aisne; the Yonne those of the Arroux. The low elevation of the bounding hills has rendered it possible to direct the discharge of its affluents into the adjoining river basins by means of canals. The Oise and Somme are connected to the Picardy or Crozet Canal, which in turn is connected to the Sceidt by means of the St Quentin Canal and the.

Oise, and to the Sambre by that of Oise and Sambre. Between the Aisne and the Meuse is the Ardennes Canal, and the Aisne and the Marne are united by a canal which passes Reims. The Marne has a navigation communication with the Meuse and the Rhone, the Yonne with the Seine (by the Burgundy Canal) and the Sambre by the Canal dividing at Montargis into two branches—those of Orleans and Briare.

SEINE, the department of northern France which has Paris as its chief town, formed in 1790 of almost the entire district of Brie (half of which belonged to Champagne and half to Ille-et-France) and a portion of Gâtinais (from Ile-de-France and Orléanais). Pop. (1906) 361,939. Area, 2280 sq. m. Seine-et-Marne is bounded N. by the department of Oise, N.E. by that of Aisne, E. by Marne and Aube, S.E. by Yonne, S. by Loiret and W. by Seine-et-Oise. The department belongs to the basin of the Seine, and is drained partly by the Oise and partly by the Marne, the latter bearing the Yonne and the Loing from the left, and from the right, the Vouzou, the Yères and the Marne, with its affluents the Ourcq, the Petit Morin and the Grand Morin. With the exception of the Loing, flowing from south to north, all these streams cross the department from east to west, following the general slope of the surface, which is broken up into several plateaus from 300 to 500 ft. in height (highest point, in the north-east, 705 ft., lowest 105), and separated from each other by deep valleys.
the plateaus belong to the Brie, a fertile well-wooded district of a chaley character. In the south lie the dry sandy district of the Fontainebleau sandstone and part of the region known as the Gâtinais. The climate is rather more "continental" than that of Paris—the summers warmer, the winters colder; the annual rainfall does not exceed 16 in. There is a striking difference in temperature between the south and the north of the department, where the famous white grape (chasselas) of Fontainebleau ripens, and the country to the north of the Marne—this river marking pretty exactly the northern limit of the vine. The wheat and oats of Brie are especially esteemed; potatoes, sugar beet, mangold-wurzel and green forage are also important crops, and the dairy-farming is also flourishing. Provins, the town of the great cloisters, sheep and poultry are reared. The forests (covering a fifth of the area) are planted with oak, beech, chestnut, hornbeam, birch, willow, linden, willow, poplar and conifers. Best known and most important is the forest of Fontainebleau. Large areas are devoted to game-preserves. Excellent freestone is quarried in the department, notably at Château-Landon in the valley of the Loing, mill-stones at La Ferté-sous-Jouarre; the Fontainebleau sandstone is used for pavements, and the white sand which is found along with it is used for the manufacture of glass. Along the Marne are numerous gypsum quarries; lime-kilns occur throughout the department; and peat is worked at Villers-Saint-Paul, in the Yonne. Beds of common clay and porcelain clay are used in the manufacture of porcelain at Argenteuil. Other industrial establishments are numerous large flour-mills, notably those of Meaux, the chocolate works of Noisiel, sugar-refineries at Épernay, distilleries (pop. 11,000), paper and mill manufactures bank-notes, &c., both for France and for foreign markets), saw-mills, printing works (Colommiels, &c.) and tanneries. Much of the motive-power used is supplied by the streams. Paris is the chief outlet for the industrial and agricultural produce of the department. Coal and raw material for the manufactures are the chief imports. The Seine, the Yonne, the Marne, and the Grand Morin are navigable, and, with the canals of the Loing and the Ourcq and those of Châtillon, Cornillon and Chelles, which cut off the windings of the Marne, form a total waterway of over 200 m. Seine-et-Marne has 2 arroundisements (Melun, Coulommiers, Fontainebleau, Montargis, Provins, Nemours, and Montereau (g.g.), are the most important towns in the department. Among other interesting places are La Ferté (pop. 3,500), with an abbey-church of the 13th century; Briare-Comte Robert, with a church of the early 13th century: Ferrières, with a house of the 12th century; Argenteuil, by Baron Alphonse Rothschild; Moret-sur-Loing, which preserves fortifications dating from the 15th century including two remarkable gateways; Étampes: Oise-le-Vieux, dating from the 12th century; Jouarre, where there is a church of the 15th century built over a crypt containing worship of the Merovingian period; and Vaux-le-Vicomte, with the famous château built by Fouquet de Villars.

SEINE-ET-OISE, a department of northern France, formed in 1790 of part of the old province of Ile-de-France, and traversed from south-east to north-west by the Seine, which is joined by the Oise. Pop. (1906) 749,753. Area, 218 sq. m. It is bounded by the departments of Seine-et-Marne on the E., Loiret on the S., Eure-et-Loir on the W., Eure on the N.W. and Oise on the N. It encloses the department of Seine. The Oise on the north-west is the only natural boundary on the department. The streams (all belonging wholly to the basin of the Seine) are: on the right the Yères, the Marne, the Oise and the Epte, on the left the Essonne (joined by the Juine, which passes Étampes), the Orge, the Bièvre and the Mauldre. Seine-et-Oise belongs in part of the tableland of Beauce in the south and to that of Brie in the east. In the centre are the high wooded hills which make the charm of Versailles, Marly and St Germain. But it is in the north-west, in the Vexin, that the culminating point (600 ft.) is reached, while the lowest point, where the Seine leaves the department, is little more than 40 ft. above the sea. The mean temperature of the Seine-et-Oise is a flourishing agricultural and horticultural department. Wheat, oats, potatoes and sugar-beet are important crops. Versailles, Rambouillet, Argenteuil are among the numerous market-gardening and horticultural centres, and wine is grown at Argenteuil and in other localities on the right bank of the Seine. Milk-cows and draught-oxen are the chief livestock, and poultry farming is prosperous, the town of Houdean giving its name to a well-known breed of fowls. Forests occupy about 190,000 acres, the largest of which are at Marly-le-Roi (about 32,000 acres). Oak, hornbeam, birch and chestnut are the commonest trees; the paving and mill stones, gyspum, cement, &c., are produced by the department which is very rich in quarries. There are mineral springs at the north-east and Fontainebleau-Hauterive elsewhere; agricultural and engineering, metallurgical or railway works at Évre-Petit-Bourg, Villeneuve-Saint-Georges (pop. 9508) and elsewhere; agricultural establishments are the national porcelain factory at Sevres; government powder-mills of Sevran and Bouchet; paper-mills, the glass manufactories of Essonnes and its vicinage, which are among the most important in the department, and the famous porcelain factories, close to Paris; factories for chemical products, candles, perfumery, shoes and buttons; zinc, works, saw-mills, potteries, and cotton mills. Its imports include coal, raw material for its industries, wine, kaolin and wood. The Seine and Oise are the great rivers of France (except the Southern) traverse the department, but a part of the line of the Seine, and the canals of Ourcq and Chelles provide about 120 m. of waterway. Seine-et-Oise is divided into six arrondissements (Versailles, Corbeil, Étampes, Mantes, Pontoise, Rambouillet) with 37 cantons and 681 communes. It forms the diocese of Versailles and part of the educational circumscription (académie) of Paris and of the administrative unit of the department; Gendarmes and troops are under the command of the military government of Paris. Its court of appeal is also at Paris. The most notable towns in the department are Versailles, the capital, Corbeil, Seyne, Étampes, Mantes, Montereau, Argenteuil, Poissy, St Cloud, St Cyr, St Germain-en-Laye, Meudon, Montmorency, Rueil and Marly-le-Roi (see separate articles). Other interesting places are the Château of Amanour, which has a Renaissance château with fine stained glass, a gateway of the 15th century and a ruined château once the seat of the powerful family of Montfort; Montrichard, which preserves the keep (13th century) and other ruins of a celebrated fortress which commanded the road from Paris to Orleans; Roche-Guyon, seat of the family of that name, which has two châteaux, one a feudal stronghold, the other also medieval but preserved in the 18th century; Vigny, with a Gothic château of the 15th century; Écouen, with a château of the 15th century; Evry-Petit-Bourg, once the property of the Condé family, now a school for daughters of members of the Legion of Honour; Dampierre, which has a château of the 17th century once the property of Charles, Cardinal of Lorraine; Maisons-Laffitte (pop. 8117), with a château of the same period once belonging to the family of Longueil. The château of Malmaison (18th century) is famous as the residence of the Empress Josephine.

Of the churches of the department, which are very numerous almost every town of 500 or more has its church. The most notable may be mentioned of those of our lists, those of Beauvoir (11th and 12th centuries), Beaumont-sur-Oise (13th century), Taverny (12th and 13th centuries), Longserrant (11th century), L'Étang (11th to the 13th centuries). Near Cernay-la-Ville are interesting remains of a Cistercian abbey and each Saint-Vincent-le-Poiré. The château of Champagne, with a church (13th century) with stalls which are among the oldest in France and the tombs of the Lévis-Mirepoix family.

SEINE-INFERIEURE, a department of the north of France, formed in 1790 of four districts (Norman Vexin, Bray, Caux and Roumois) belonging to the province of Normandy. Pop. (1906) 863,879. Area 4428 sq. m. Seine-Inferieure is bounded N.W. and N. by the English Channel for a distance of 80 m., N.E. by Somme, from which it is separated by the Bresle, E. by Oise, S. by Eure and the estuary of the Seine, which separates it from Calvados. It is divided almost equally between the basin of the Seine in the south and the basin of certain coast streams in the north. Seine-Inferieure takes the right hand before it reaches the department the Oise and the Ancre, until the Rhône, Rambouillet, and then the Darnétal, the Cailloy, the Austreberthe, the Bolbec and the Lézarde. The main coast streams are the Bresle (which forms the ports of Eu and Tréport), the Yères, the Barques or Dieppe stream (formed by the junction of the Varennes, the Béthune and the Enault), the Scie, the Saane, the Dardent. The Pays de Caux, the most extensive natural division, is a system of plateaux separated by small valleys, terminating along the Seine in high cliffs and towards the sea in deep chalk cliffs 300 to 450 ft. high, which are continually being eaten away and terminating into beds of shingle. In the south-east is a broad valley of denudation formed by the sea, as it retired, and traversed by valleys covered with excellent
pasture. The highest point (about 800 ft.) is on the eastern border of the department. In the comparatively regular outline of the coast there are a few breaks, as at Le Tréport, Dieppe, St Valery-en-Caux, Fécamp and Havre, the Cap de la Hève, which commands this last port, and Cape Antifer, 12 or 13 m. farther north. Le Tréport, Dieppe, Veules, St Valery, Veulettes, Fécamp, Yport, Étretat and Ste Adresse (to mention only the more important) are fashionable watering-places. Forges-les-Eaux (in the east of the department) has cold chalybeate springs of some repute. The water is not particularly mineral, but hither it has been considerably thinned by the effects of the abundant rainfall. In Paris, but the average temperature of the year is higher. The rainfall at Rouen is 28 in. per annum, increasing towards Dieppe.

In general the department is fertile and well cultivated. Along the Seine fine meadow-land has been reclaimed by dyking; and sandy and loamy soils, under intensive rearing, produce excellent wheat and beeches, and they often attain magnificent dimensions, especially in the forest of Arques and along the railway from Rouen to Dieppe. Pinus sylvestris is the principal component of the forest of Rouvray opposite Rouen. The forest of Eu covers 30 sq. m. in the north-east. Of the arable crops wheat and oats are the principal, rye, flax, colza, sugar beet and potatoes being also of importance. Milk cows are kept, and the milk is partly consumed at home, partly sent to Paris, where it is used for the manufacture of butter and Gournay and Neufchâtel cheese are in repute. The farms of the Seine plateau are each surrounded by an earthen dyke, on which are planted forest trees, generally beech and oak. Within the shaded belt between the dyke and the road, meadows and pastures are grazed by the inhabitants. With the exception of a little peat and a number of quarries, Seine-Inférieure has no mineral source of wealth; but manufacturing and especially the textile industries are important. Rouen is the chief centre of the cotton trade, which comprises spinning and the weaving of rouenneries, insennes (cotton prints), cretonnes and other cotton goods. Dieppe is a regular port, and the Havre, Dieppe and Fécamp. Other establishments of importance are the national tobacco factories at Dieppe and Havre, sugar-refineries, distilleries, glass-works, potteries, paper works, soap-works, chemical works, flour-mills, oilfactories, leather and tanneries, &c. The Seine is the chief river of the department, which is traversed by the fine fleet of the French battleships. Fécamp, which plays a very important part in the New-land fisheries, sends large quantities of cod, herrings, mackerel, &c., into the market; Dieppe supplies Paris with fresh fish; St Valery sends boats as far as Iceland. The principal ports for foreign trade are Havre, Rouen and Dieppe. The chief imports of the department are cotton, wool, cereals, hides, tallow, coffee, tea, sugar, and dyewoods, indigo and other dyes, and coal products, coal, petroleum, &c. The exports include industrial and dairy products. Seine-Inférieure is served principally by the Western railway, but the Northern railway, which was completed in 1853, joins Rouen and St Malo. The Seine is navigable for lighters 85 m. of navigable waterway. The canal of Tancarville from Chillebeuf to Havre is about 15 m. long, that from Eu to Tréport about 2 m. The department is divided into 7 cantons, and contains 2 arrondissements, Havre and Rouen. Neufchâtel-en-Vexin (Voyet) 55 cantons and 750 communes. It forms the diocese of the archbishopric of Rouen and part of the region of the III. army corps and of the académie (educational division) of Caen. Its court of appeal is at Rouen, the capital.

Rouen, Havre and Dieppe and in a lesser degree, Beuzeville, Fécamp, Harfleur, Lillebonne, Voyet, Eu, Le Tréport, Aumale, Étretat, Bolbec, Barentin and Caudebec-en-Caux (see separate articles) are noteworthy towns for commercial, architectural or other reasons.

The following places are also of architectural interest. St Martin-des-Bois and Belves, where there are remains of an important abbey including the ruins of a chapel, a church and a Gothic chapter-house of the latter half of the 12th century; Valmont, which has fine ruins (16th century) of the choir of a Cistercian abbey-church; Varengeville, well known for the manor (14th century) of the Valois, and a church (see separate article) with a Romanesque church and other remains of an ancient abbey; Montivilliers, which has a fine abbey-church of the 12th and 13th centuries; and Amfreville, with Romanesque and Trouvère castles and châteaux of various periods.

SEISEN (from M. Eng. saysen, seysen, in the legal sense of to put in possession of, or to take possession of, hence, to grasp, to seize; the O. Fr. seiser, saisir, is from Low Lat. sacire, generally referred to the same source as Goth. satijan, O. Eng. seytan, to put in place, set), the possession of such an estate in land as was anciently thought worthy to be held by a free man (Williams, On Seisen, p. 2). Seisen is of two kinds, in law and in deed. Seisen in law is where lands descend and the heir has not actually entered upon them; by entry he converts his seisen in law into seisen in deed. Seisen is now confined to possession of the freehold, though at one time it appears to have been used for simple possession without regard to the estate of the possessor. Its importance is considerably less than it was at one time, owing to the old form of conveyance by feoffment with livery of seisen having been superseded by a deed of grant (see Feoffment), and the old rule of descent from the person last seised having been abolished in favour of descent from the purchaser. At one time the right of the wife to dower and of the husband to an estate by curtesy depended upon the doctrine of seisen. The Dowser Act (1833–1834), however, rendered the fact of the seisen of the husband of no importance, and the Married Women's Property Act 1882 practically abolished the old law of curtesy.

Primer seisen was a feudal burden at one time incident to the king's tenants in capite, whether by knight service or in socage. It was the right of the crown to receive of the heir, after the death of a tenant in capite, one year's profits of lands in possession and half a year's profits of lands in reversion. The right was abandoned by the act abolishing feudal tenures (12 Car. II. c. 24, 1706).

In Scots law the corresponding term is "sasine." Like seisen in England, sasine has become of little legal importance owing to modern legislation. By an act of 1845 actual sasine on the lands was made unnecessary. By an act of 1858 the instrument of sasine is the register of the conveyance with a warrant of registration thereon.

SEISIMOMETER (from Gr. σεισμός, earthquake, and μέτρον, a measure). This name was originally given to instruments designed to measure the movement of the ground during earthquakes (q.v.). Observations have shown that, in addition to the comparatively great and sudden displacements which occur in earthquakes, the ground is subject to other movements. Some of these, which may be called "earth-tremors," resemble earthquakes in being imperceptible (owing to the smallness of the motion) until instrumental means are used to detect them. Others, which may be called "earth-tiltings," show themselves by a slow bending and unbending of the surface, so that a post stuck in the ground, vertical to begin with, does not remain vertical, but inclines now to one side and now to another, the plane of the ground in which it stands shifting relatively to the horizon. No sharp distinction can be drawn between these classes of movements. Earthquakes and earth-tremors grade into one another, and in almost every earthquake there is some tilting. The sasine or seismograph is, in fact, a simple device which (when properly used) can be extended (and will here be understood) to cover all instruments which are designed to measure movements of the ground.

Popularly it is supposed that earthquake recorders are instruments so sensitive to slight vibrations that great care is necessary in selecting a site for their installation. Although this position is correct for a certain class of apparatus, as for example that which will record rapid elastic vibrations produced by the movement of a train a mile distant, it is far from being so for the ordinary apparatus employed by the seismologist. What he usually aims at is either to record the more or less rapid movements of the ground upon which we can feel, or the slow but large disturbances which do not appeal to our unaided senses. Generally speaking, the instruments used for these purposes are not disturbed by the vibrations, but are set up at some distance so that something may be found which will respond to a gentle shaking of the ground. Sometimes it is a loosely-fitting shutter or window-frame, a hanging drawer-handle, or a lamp-shade which will rattle; the timbers in a roof may creak, or a group of wine-glasses with their rims in contact may chatter. Any of these sounds may call attention to movements which otherwise would pass unnoticed. Specially arranged contrivances which tell us that the ground has been shaken are called seismoscopes or earthquake indicators. A small column, as for example a lead pencil standing on end, or a row of pins propped up against suitable supports, or other bodies which are easily overturned, may be used as seismoscopes. Experience, however, has

1 Up to the middle of the 15th century "seisen" was applied to chattels equally with freeholds, the word "possessed" being rarely used. In course of time the words acquired their modern meaning. In Ireland the word seiseen is still used for the freehold.
shown that contrivances of this order are wanting in sensitiveness, and often remain standing during movements that are distinctly perceptible. A more satisfactory arrangement is one where the body to be overthrown is placed upon a seismograph which exaggerates the movements of the ground. For example, the platform \( h \) (see fig. 1) may be on the top of a small rod \( r \), fixed at its lower end by a base \( b \) of Paraffin, with a glass \( w \), and carrying a disk or sphere of lead at \( l \). When the stand on which \( w \) is fixed is in a horizontal position, that is, if \( w \) is no longer required. In this case the motion at \( h \) is that of elastic switch- or destructive. Apparatus of this kind may be employed for several purposes beyond the one which is indicated, namely, that of recording an earthquake has taken place.

For example, if the falling body \( a \) is attached by a thread to the pendulum of a seismograph, it may be used to stop it and indicate the approximate time at which the tremor occurred. When the pendulum is set into motion, it gives a dia-graph. The pendulum may be employed for several purposes beyond the one which is indicated, namely, that of recording an earthquake has taken place.

The next class of instruments to be considered are seismometers or earthquake measurers, and seismographs or instruments which are used to record the effects of an earthquake on the ground. Although a seismograph may be designed that will not only respond to fairly rapid elastic vibrations, but will also record very slow and slight undulatory movements of the ground, experience has shown that the instrument which is most sensitive to slow movements is the pendulum, and that of very long period pendulums may be employed for slow movements of the ground.

First we will consider the types of apparatus which are used to record the rapid back-and-forth movements of earthquakes which can be distinctly felt and at times are even destructive. The essential feature in these seismographs is a heavy mass of metal, so suspended that although its supports are moved, some point in the mass remains practically at rest. For example, if the movement is rapid, the bob of a very long and heavy pendulum will practically comply with these conditions. If a straight line from this pendulum rests upon a small point at the top of a vertical plate fixed to the ground, the vibratory motion of the ground will be recorded on the glass plate as a set of superimposed vibrations. To obtain a complete record of movements the plate must be moved, say by clockwork.

Experience, however, has shown that even when the movements of the ground are alarming the actual range of motion is so small that a satisfactory record can be obtained only by some mechanical (or optical) method of multiplication. This was usually accomplished as shown in fig. 2, where \( b \) is the bob of a pendulum, with its style \( s \) passing through a slot in the top of a light lever, which is pivoted at \( a \), and with its outer end resting upon a revolving cylinder covered with silk or paper. As shown in the figure, it is evident that the motion of \( a \) in the line \( s b \) would not be recorded, and to obtain a complete record of horizontal movements it is necessary to have two or more such threads to record the movements of \( b \) to each other. A complete arrangement of this kind is shown in the plan of fig. 2. Here the style \( s \) of the pendulum rests in slots in the short arms of two writing levers placed at \( a \) and \( b \). Motion of the ground in the direction of \( c \) actuates only the lever \( a c \), motion in the direction of \( d \) actuates only \( b e \), whilst motion in intermediate directions actuates both. The length of the short arms of the levers is usually \( \frac{a}{2} \) or \( \frac{c}{2} \) of the long arms.

This type of apparatus has been replaced in Japan by what are usually called duplex pendulums. The change was made because it frequently happened that in consequence of the movement of the ground, the marking of the pendulum was not steady enough to read the record with any measure of accuracy. A duplex pendulum (fig. 3) consists of an ordinary pendulum diagrammatically represented by \( a b \), connected by a universal joint to an ordinary pendulum, which holds a rod pointed at its lower end and loaded at \( e \), would be unstable if it were not connected with \( b \). Now imagine this system so displaced so that \( a \) moves to \( a' \) and \( d \) moves to \( d' \). In the new position \( b \) would tend to follow the direction of its point of support, whilst \( c \) would tend to fall in the opposite direction, and the bob of \( b \) would exercise a restraint upon the motion of the other. If, as in practice, the moment of \( b \) is made slightly greater than that of \( c \), the system will tend to a steady state and is made extremely light. In this way, by coupling together an ordinary pendulum about 3 ft. in length with an inverted pendulum 6 in. long, it is possible to obtain a slow-moving very long pendulum which is too light to follow the back-and-forth movements of its supports.

To describe an instrument of this description (see fig. 4) a point in the steady mass \( b \) is used as the fulcrum for a light-writer. This has a ball joint at \( a \), a universal joint at \( c \) and a writing point at \( p \), resting upon a piece of smoked india paper. Attention was first called to the possibility of rendering ordinary pendulums more truly astatic by Professor Thomas Gray, who suggested methods by which this might be accomplished. The apparatus shown in fig. 5, designed by Professor J. A. Ewing, Records obtained from instruments of this description give information respecting the range and principal direction of motion, and show us that in a given earthquake the ground may move in many directions.

For obtaining an open diagram of an earthquake the best type of apparatus consists of a pair of horizontal pendulums writing its movements upon a moving surface. A simple form of horizontal pendulum as shown in fig. 5, consists of a rod \( o p \), free to swing like a gate round a vertical or nearly vertical axis, \( o d \), and loaded at some point \( b \). In practice the weight \( b \) is pivoted on the rod whilst its outer end, \( b p \), which rests on a steady surface, is made extremely light. When the frame of this arrangement is rapidly displaced through a small horizontal range to \( b p \), its motion the inclination of the axis of vibration \( e f \), forwards. Although by corresponding portions of the diagrams given by instruments of this type, it is possible to determine the range and direction of motion, it is evident that of which they are the resolved parts, their chief value is that they enable us to measure with ease the extent of any vibration, half of which is called its amplitude, and the time taken to make a complete back-and-forth movement, or its period. Now if \( a \) be the amplitude expressed in millimetres, and \( t \) the period expressed in seconds, then the maximum velocity of an earth particle vibrates to and fro equals \( 2\pi a \), while the maximum acceleration equals \( 4\pi^2a/t^2 \). The former quantity determines the distance to which a body, as for example the capping
by means of simple formulae calculate quantities closely agreeing with those obtained from the seismogram. For example, if a body, say a coping-stone, has been thrown horizontally through a distance \( a \), and fallen from a height \( b \), the maximum horizontal velocity with which it was projected equals \( \sqrt{2gb(a/b)} \); or if the height of the centre of gravity of a column like a gravestone above the base on which it rests is \( y \), and \( x \) is the horizontal distance of this centre from the edge over which it has turned, then the acceleration or suddenness of motion which caused its overthrow is measured, as pointed out by C. D. West, with fair accuracy by \( gx/y \).

To measure vertical motion, which with the greater number of earthquakes is not appreciable, a fairly steady mass to which a multiplying light-writing index can be attached is obtained from a weight carried on a lever held by any form of spring in a horizontal position. Such an arrangement, for which seismologists are indebted to Professor T. Grav, is shown in fig. 6, in which \( B \) is the mass used as the steady point. This, when supported as shown, can be arranged to have an extremely slow period of vertical motion, and in this respect be equivalent to a weight attached to a very long spring, an alternative which, however, impracticable. The value of these records, as is the case with other forms of seismographs, is impaired by pronounced tiltings of the ground.

We next turn to types of instruments employed to record earthquakes which have radiated from their origins, where they may have been violent, to such distances that their movements are no longer perceptible. In these instruments the same principles are followed as in the construction of horizontal pendulums, the chief difference being that the so-called steady mass is arranged to have a much longer period than that required when recording perceptible earthquakes. Instruments largely employed for this purpose in Italy are ordinary pendulum seismographs as in fig. 2. One at Catania consists of a weight of 300 kilos suspended by a wire 25 metres in length, the movements of which by means of writing indices are multiplied 12-5 times. With pendulums of shorter length, say 2 metres, it is necessary to have a multiplication 80 to 100 fold by a double system of very light levers, in order to render the extremely slight tilting of their support perceptible. This arrangement, as devised by Professor G. Vicentini of Padua, will yield excellent diagrams of the gentle undulations of earthquakes which have originated at great distances, but for local disturbances, even if the bob of the pendulum acts as a steady point, the highly multiplied displacements are usually too great to be recorded.

In Japan, Germany, Austria, England and Russia horizontal pendulums of the von Rebeer-Paschewitz type are employed, which by means of levelling screws are usually adjusted to have a natural period or double swing of from 15 to 30 seconds. These pendulums are usually very small. The swinging arm or boom is from 4 to 8 in. long horizontally, and carries at its extremity a weight of a few ounces. A simple form, which is sometimes referred to as a conical pendulum, may be constructed with a large sewing needle carrying a galvanometer mirror, suspended by means of a silk or quartz fibre as shown in fig. 7. To avoid the possibility of displacements due to magnetic influences, the needle may be replaced by a brass or glass rod. The adjustment of the instrument is effected by means of screws in the bed-plate, by turning which the axis of \( \omega \) may be brought into a position nearly vertical. As this position is approached the period of swing becomes greater and greater, and sensitivity to slight tilting at right angles to the plane of \( \omega \) is increased. The movements of the apparatus, which when complete should consist of two similar pendulums in planes at right angles to each other, are recorded by means of a beam of light, which, after reflection from the mirror or mirrors, passes through a cylindrical lens and is focussed upon a moving surface of photographic paper. The more distant this is from the pendulum the greater is the magnification of the angular movements of the mirror. With a period of 18 seconds, and the record-receiving paper at a distance of about 15 ft., a deflection of 1 millimetre of the light spot may indicate a tilting of \( 3 \) part of a second of arc, or 1 in. in 326 miles. Although this high degree of sensibility, and even a sensibility still higher, may be required in connexion with investigations respecting changes in the vertical, it is not necessary in ordinary seismographs. A very sensitive modified von Rebeer instrument was employed by O. Hecker in his measurement of the variation in the vertical and of tidal earth tremors.

A type of instrument which has sufficient sensibility to record the various phases of unfelt earthquake motion, and which, at the suggestion of a committee of the British Association, has been adopted at many observatories throughout the world, is shown in fig. 8. With an adjustment to give a 10-second period, a deflection of 1 mm., at the outer end of the boom corresponds to a tilting of the bed-plate of \( \alpha \)-5, or 1 in. in 6-4 m. The record is obtained by the light from a small lamp reflected downwards by a mirror so as to pass through a slit in a small plate attached to the outer end of the boom. The short streak of light thus obtained moves with

Provisions in Seistan are as a rule sufficient, though sheep and oxen, what people call their wool and bag, are not good enough to be exchanged for the daily bread of the natives at less than a halfpenny the pound. Vegetables are scarce, and rice is chiefly obtained from Ferat. The inundated lands about with water-fowl. Partridges and sand-grouse are occasionally seen. River fish are plentiful enough, but confined to one species, the barbel.

The population is about 205,000, but the country, even with the lazy methods of the present day, furnishes a very large amount of grain and food-supplies in excess of local requirements, and it could, of course, be made to furnish very much more.

Under improved government Seistan could with but little trouble be made a great revenue producer.

The inhabitants of Seistan are mainly composed of Kainais, descendants of the ancient rulers of the land; Sarbandis and Shaharakis, tribes supposed to have consisted originally of immigrants from western Persia; and Baluchis of the Nahrui and Sanjuranii (Tokii) clans. Bellew separates the "Seistanis"; but it is a question whether this term is not in a large measure applied to fixed inhabitants of the country, whatever their descent and nationality. The dense reed-beds (Naizar) skirting the Hamun, often several miles in width and composed of reeds 10 ft. or more high, are a favorite haunt of large numbers of wild ducks and other water-fowl. These people live all the year round at the water's edge, in huts made of reeds, and change their abodes as the waters advance or recede. They have a language of their own, and an uncivilized people, suspicious of strangers, ever ready to decamp if they think a tax-collector is near.

History.—The ancient Dranglani (Zaraya, Darunaka, "lake land") received the name of "land of the Sacae" after this country was permanently occupied by the "Scyths" or Sacae, who overran Iran in 1235 b.c. It was included in the Sassanian empire, and then in the empire of the caliphs. About A.D. 860, when it had undergone many changes of government under lieutenants of the Bagdad caliphs, or bold adventurers acting on their own account, Yakub b. Laith al-Saharan god made it the seat of his power. In 901 it fell under the power of the Samanids, and a century later into that of the Ghaznevidees. An invasion of Jagatais and the irruption of Timur are salient points in the history of Seistan prior to the Safavid conquest (1508). Up to 1722 Seistan remained more or less a Persian dependency. At the time of the Afghan invasion of Mir Mahmud (1722), Malik Mohammmed Kaiani was the resident ruler in Seistan, and by league with the invader or other intrigue he secured for himself that particular principality and a great part of Khorasan also. He was slain by Nadir Kuli Khan, the general of Shah Tahmasp, who afterwards, as Nadir Shah, became possessor of Seistan as part of his Persian dominions. Shortly after the death of Nadir (1751) Seistan passed, together with other provinces, into the hands of Ahmad Shah Abdali, the first sovereign in a united Afghanistan. On the death of Ahmad Shah in 1773 the country became a recognized bone of contention, not so much between Persians and Afghans as between Ferat and Kandahar; but eventually the internal dissensions of Afghanistan gave Persia the desired opportunity; and by a steady course of intrigue and encroachment she managed to gain within her grasp the better lands on the left bank of the lower Helmund and something on the right bank besides. When the British arbitrator appeared on the scene in the beginning of 1872, though compelled to admit the Shah's possession of what has been called "Seistan Proper," he could in fairness insist on the evacuation of Nad Ali, Kala Fath, and all places occupied on the right bank by Persian troops; and furthermore he left to the Afghans both sides of the river above the dam of Kuhak to the dam of Kandahar.

A part of the work of General Sir Frederic J. Goldsmid, K.C.S.I., who conducted the first Seistan demarcation commission in 1872, was left undone and completed only in 1903-1905 by Col Sir Henry McMahon, K.C.I.E.

(F. J. G.; A. H.-S.)
SEJANUS, LUCIUS AELIUS, favourite and minister of the Emperor Tiberius. He was the son of Setus Strabo, prefect of the praetorians, and was adopted into the Aelian gens. After his father's departure from Rome to take up the governorship of Egypt, Sejanus was made prefect in his stead. He gained the confidence of Tiberius, and, supported by the praetorians, whom he concentrated in a camp on the Viminal Hill, became virtually ruler of Rome. But he aimed still higher, and determined to put all the members of the royal house out of his way. Having removed Drusus (the son of Tiberius) by poison, he persuaded the emperor to retire the infant Caligula. Drusus was followed some years later by those of Agrrippina (the wife of Germanicus) and her sons Drusus and Nero. Tiberius at last saw through his designs, and caused Sejanus to be put to death (A.D. 31).

SEKONDI, a port on the Gold Coast in 4° 57' N., 1° 42' W., and 167 m. by rail S. by W. of Kamasi. Pop. (1908) about 5000, of whom some 200 were whites. Sekondi is one of the old trading stations on the Guinea coast, and Fort Orange was built here by the Dutch about 1649, the English later on building another fort near by. In 1694 the Dutch fort was plundered by the Ahanta, who in 1689 burnt the English fort. It was not rebuilt, and it was not until 1872 that the place became definitely British. The town was of comparatively little importance until it was chosen as the sea terminus of the railway serving the gold-mining districts and Ashanti. The railway reached the Tarkwa gold-fields in 1901 and the Obuasi mines in 1902. From that date Sekondi became the chief port of the Gold Coast colony, gold, rubber and timber being the principal exports. In 1906 the total trade of the port was £2,121,420. There is no sheltered harbour, but at the landing place are piers provided with cranes. Landing is effected in lighters, ships anchoring in the roadway a mile from the shore. The public buildings include Fort Orange, a church, court-house, government offices and hospital. The mean temperature is about 79° F.; the rainfall about 40 in. a year. The climate is unhealthy for Europeans, but by the reclamation of the neighbouring lagoons its sanitary condition has been improved. Sekondi is governed by a municipality, created in 1905. It is in telegraphic communication with Europe by submarine cable, and is served by British, German and Belgian lines of steamers.

SELACHIANS, or Elasmobranchii, a subclass of fishes, including the various kinds of Sharks and Rays.

**Structural Features.**—The general shape is somewhat spindle-like in the Sharks, while in the Rays—in correlation with the ground-feeding habits—the body has become greatly depressed. Departures from the normal are seen in the Hammerheads (Sphyraena), where the sides of the head are so convex that the anterior wall of the hydrobranchial clefts and vestigial lamellae on the anterior wall of the spiracle where they form the "pseudobranch." In the Basking Shark *Cetorhinus* the pharyngeal openings of the last pair of gills are of very large size. The intestine is provided with an elaborated representative of the small conical "gill rakers" found in this position in other fishes. These structures form a sieve-like arrangement for preventing the minute creatures (plankton) on which this shark feeds from passing out through the gill clefts.

There appears to be no representative of the lung or swimbladder, and in the body of no specific caecum. The intestine is provided with a spiral valve in its interior which varies in character in different forms (1). A glandular caecum—the rectal caecum—opens into the dorsal side of the rectum. In regard to the coelomic spaces the only peculiarities are the parasitic relations of the pericardial cavity in the adult in communication with the general splanchnococele by an open channel sometimes forked at its posterior end. This communication apparently arises secondarily and is not due to a persistence of the embryonic communication (3). In the case of *Torpedo* and in the ordinary Rays certain portions of the muscular system are converted into electrical organs. In the Skates and Rays the electrical disturbance is relatively small, imperceptible by human beings—but in *Torpedo* it is very considerable. No doubt the electric organs subserve a defensive function.

The kidney of the adult is a mesonephros. The pronephros is represented normal, though vestigial in the embryo. The mesonephros shows a division into a broader posterior portion which alone is renal in function, and a slender anterior portion which subserves as a genital function. The female ureter duct is a typical Müllerian duct having at its anterior end a wide coelomic funnel and lined by glandular epithelium whose secretion forms adventitious coats round the egg during its downward passage. The spermatophores find their way to the cloaca by means of the mesonephric duct, the hinder portion of which is dilated to form a vesicular seminalis. The urino-genital sinus—formed by the fusion of the mesonephric ducts at their hinder ends—projects forward as a pair of pockets (the so-called sperm sacs).

The skeleton of the Selachian shows remarkably archaic features, inasmuch as the internal skeleton is entirely cartilaginous, the bones being merely the calcified shelly derivatives of the primitive cartilage and not showing in any part a tendency to sink or spread forwards for the reinforcement of the cartilaginous skeleton. The vertebral column is of the chordacentrous type, although in some of the more archaic of known fossil forms (Pleuropterygi, Ichthyostega, Icthyodaeus, Ibyodus) the chondrified secondary sheath of the notochord apparently remained in the adult the unsegmented condition. The same holds for the Holocephali and for the hinder part of the vertebral column of the existing Chlamydoselachus. The centra are usually, if not always, strengthened in the adult by the deposition of lime salts in the intercellular matrix: such calcified cartilage must be regarded as the original condition, and the calcified tracts shows differences which are of taxonomic importance.

In the *cyclospondylous* type (fig. 1, A) the calcified tract has the form of a double cone—of the wall of a dice-box—and in the section, as in the other types, the test (coelacanthian) appears as a simple circle (*Paleonichthys, Stenacanthus, Scymnus*). In the *tectospindylous* (fig. 1, B) type, additional calcified tracts are developed outside and concentric with the original sheath (Batrachodeliches, Bathypterygis); while in the *asterospondylous* (fig. 1, C) type the calcified tracts (haemal arches, radiating outwards) are of the type of vertebrae. The plates are haemal arches, the cartilaginous trabeculae. A, primitive centra of the *tectospindylous* type. B, the anterior centra of the *cyclospondylous* type. C, the anterior centra of the *asterospondylous* type.
SELACHIANS

centrally with the fundamental body metamorphism, as shown by the neuro-muscular segments; e.g., there are frequently in the caudal region in sharks (3) two centra to each neuro-muscular segment, while in part of the trunk in Notitiadidae one centrum corresponds to two neuro-muscular segments.

The chondrocranium retains life through its primitive character. The ethmoidal region is prolonged forwards into a rostrum—which may be highly developed, as in the mesopterygium (Pristis), or may be of insignificant dimensions as in most sharks.

The jaw apparatus is also remarkably archaic: the functional jaws being the palatoquadrate cartilage and Meckel’s cartilage respectively. The suspension from the skull is typically edentary, except in Notidionus where it is amphistylic, in the Holocanthus where it is autostylic, and in Heterodontus where it approaches the autostylic condition.

The gill arches of the postmandibular visceral arches consists of a half hoop of cartilage on each side divided into a number of segments: the two half hoops are connected ventrally by a median conoid plate (pharyngobranchial, mesopterygium). Each segment shows a division into a dorsal (hyomandibular) and a ventral (ceratiomyarian) element, and except in the Notitiadidae the dorsal segment is of large size in correlation with its function in the suspension of the jaws. This enlargement of the hyomandibular is particularly marked in the case of the Rays (Raja) where it may become freed from the ventral segmental part of the arch which articulates directly with the skull. The branchial arches usually are segmentated on the basis of more or less other similar rules. In addition there are the ceratohyal and hypohyal arch in the alimentary canal.

All these visceral arches bear on their outer surface a number of elements known as placoid scales, which are greatly developed in the gill septa. Those attached to the hyoid arch (branchiopterygial rays) show by their large size a foreshadowing of the development of the operculum of the higher group of fishes.

The visceral arches of the postbranchial are so reduced that all cartilaginous rods of doubtful significance are found superficial to the jaw cartilage (labial) and to certain of the branchial arches (extrabranchial).

The limb girdles of the Selachians are very simple—a loop of cartilage incomplete dorsally in the case of the pectoral, a transverse bar of cartilage in the case of the pelvic girdle.

The pectoral girdle includes the two halves of the pectoral girdle remained distinct in the adult, and each was segmented into three pieces, showing a remarkable correspondence with the visceral arches lying in front of them. (For the bearing of this on the development of the pectoral appendages of the Teleostei, see E. E. Williams.) In the living sharks (e.g. Acanthias) a relic of this condition is found—the dorsal extremity of the girdle being segmented off from the rest.

The cartilaginous skeleton of the pectoral limb consists of numerous small pieces which typically are connected with the girdle through an intermediary of three basal pieces known as propetrygium, metastereygium and metastereygium. In the Rays, in correlation with the gigantic development of the pectoral fins, the propetrygium and metastereygium become greatly enlarged in an antero-posterior direction—the former becoming attached to the side of the cranium or even meeting and fusing with its fellow in front (Trygon). In the living sharks it does not bear any external expression, but is an inner side of a single backwardly projecting basal piece (metastereygium). In the male this is continued backwards to form the skeleton of the pen and testis.

The limb skeleton shows remarkably interesting features in the ancient extinct sharks Cladoselache and Plesacanthus.

The placoid or bony skeleton is seen in its most archaic form in Selachiens. The placoid plates, of delicate form, may be uniform in size forming the characteristic shagreen of the various sharks, or scattered scales may be greatly enlarged as in the thornbacks, or finally the scales may have completely atrophied in the electric ray (Torpedo).

Local placoid elements or aggregations of placoid elements may become specially enlarged to form defensive or offensive weapons. In these cases the plates are not only longitudinally elongated but also along each side of the rostrum form the “teeth” of the saw, and a similar condition occurs in the sharks of the genus Pristiophorus. In the sting-rays the side armed with a large spined spine taking the place of the dorsal fin and having the lateral line in front of one of which increases in size and becomes functional if the previously functional spine is broken off.

The portion of skin involved to line the buccal cavity carries with it a considerable layer of local connective tissue (labial). Normally these undergo atrophy except near the margin of the cavity where they are greatly enlarged to form the teeth. These vary greatly, as in the Squaleae, in the size, number and shape of their teeth. Segments of the teeth may be sharp, conical, or triangular with serrated edges (e.g. caracalodon and other sharks) or flattened adapted to crushing Moluscan shells (e.g. various rays).

Various other parts of the shark's body are also of interest. Ventral opening into the atrium is a well-developed sinus venous and leading from ventricle into ventral aorta is a well-developed rhythmically contractile conus arteriosus, containing a complex arrangement of fibres and vessels. This conus may be sharply pointed spines, or triangular cutting blades with serrated edges (e.g. carcharodon and other sharks) or flattened adapted to crushing Moluscan shells (e.g. various rays).

Ventrally opening into the atrium is a well-developed sinus venous and leading from ventricle into ventral aorta is a well-developed rhythmically contractile conus arteriosus, containing a complex arrangement of fibres and vessels. This conus may be sharply pointed spines, or triangular cutting blades with serrated edges (e.g. carcharodon and other sharks) or flattened adapted to crushing Moluscan shells (e.g. various rays).
tendril-like structures (Scylium) which serve to anchor it to seaweed.

In a large number of Selachians the adoption of internal fertilization has been followed by the retention of the embryo within the ovipositor (uterus). In some, such as the deep-water Chlamydoselachus, not only are the ovaries larger but the act of oviposition is greatly reduced. The valves may be folded in such a way as to present a single opening, and on the upper surface of this opening there may be a small external scute or point which is a vestige of the ovipositor. In other cases the surface of the ovipositor is as smooth as that of a whale's fin, as in the case of some of the Squaliformes. In recent years some authors have asserted that the ovipositor is a vestige of the outer ear, but this view is not generally accepted.

S Selborne, Roundell Palmer, 1st Earl of (1812–1895), English lawyer and statesman, was born at Mixbury, in the county of Oxford, on the 27th of November 1812. His father was rector of the parish; his grandfather and great-grandfather were merchants in the City of London, where their descendants are still numbered among the merchants; and, according to the most reliable tradition, his mother belonged to the family of Roundell, which had been settled in the county of Yorkshire for four centuries in the West Riding of Yorkshire. He was educated at Rugby and at Winchester, and in 1830 went into residence in the university of Oxford as a scholar of Trinity College. Here he lived in intimacy with many friends, especially P. C. Claughton and Charles Wordsworth. In 1834 he took a first class in Literae Humaniores; he won the Eton scholarship and was elected to a fellowship at Magdalen College; and after a year, spent chiefly in private tuition, partly in Lord Winchilsea's house and partly in the university, he was removed to London (November 1835) and commenced reading for the bar.

He was called to the bar on the 7th of June 1837, the same day on which John Rolt (1804–1871), a man of very different antecedents, but afterwards a worthy rival of Palmer, was also called. Through his family connections in the City of London, clients soon came to Palmer's chambers, and his business at the Chancery bar increased rapidly. Meanwhile his interests were not wholly confined to law; for some time (1834–1843) he wrote for The Times and the British Critic; he made a plunge into patriotic learning, from which he soon recollected; he was much interested in the controversies which distracted the Church on the subject of Tract 90; in the treatment of the Episcopal Church in Canada by the Canadian government and the Colonial Office; in the establishment of the crown, in conjunction with the king of Prussia, of the Jerusalem bispochic; and in the contest for the professorship of poetry at Oxford on Keble's retirement.

In 1847, and again in 1853, Palmer was returned as member of Parliament for Plymouth, as a Peelite, and in the House of Commons he took an active and independent part. He advocated the admission of Jews to parliament; he opposed Lord John Russell's measure to repel the so-called papal aggression; he opposed the admission of Dissenters into the university of Oxford; and he was hostile to the action of the government in the Crimean War. On the question of the reform of the university of Oxford, he sympathized with the reformers, but felt himself prohibited, by the oaths which he had taken, from assuming any active part. In 1855 he supported Gladstone in the efforts to bring about peace with Russia before the capture of Sevastopol; in 1856 he opposed the opening of museums on Sunday; in the following year he supported Cobden in his disapproval of the second Reform Bill, and with him in the debate on the second Reform Bill with China. At the general election on March 27, 1857, Palmer, finding that the independent part he had taken, especially in reference to the Chinese question, had alienated from him many of his constituents in Plymouth, abandoned the prospect of re-election for that borough, and did not seek for election elsewhere. In 1848 he married Lady Laura Waldegrave, daughter of Earl Waldegrave. In 1849 he had become a Q.C.; and in 1853 he took his seat in the Rolls Court, where he soon obtained a leading practice, and was engaged in many of the most important cases in the Court of Chancery. In July 1861 he accepted from Lord Palmerston the office of solicitor-general, a knighthood, and a safe seat for the borough of Richmond in Yorkshire, secured for him through the friendly action of Lord Zetland, and thus began the second spell of Palmer's membership of the House of Commons, which continued till his elevation to the woollack and the peerage. In September 1863 he became attorney-general, and so continued till the government of which he was a member resigned in 1866.

The Civil War in America, and the questions which arose from the relations of Great Britain with both belligerents, rendered Palmer's members of the law officers of the crown more than usually onerous, and Palmer was called upon to take part, as adviser of the ministry, in the courts, and in the House, in the questions which arose in respect of the "Trent" and the "Peterhoff," the cruisers "Alabama" and "Florida" and the "Alexandria," a ship which was seized by the government, and other matters. In 1865 he took a large part in the passing of the act under which all the law courts were gathered together in the Strand. In 1866 he expressed himself favourable to the making of household suffrage the basis of representation, an expression of opinion which probably influenced the Reform Bill of the following year—in that Palmer and Cobden took the same line of conduct, and especially in opposition to the so-called "fancy franchises" originally proposed by its authors. In the same year he took part in supporting the measure for the abolition of compulsory Church rates.

In 1868 occurred an event of great importance in his career. In April of that year Gladstone proposed his resolutions with reference to the Irish Church on which the bill for its disestablishment was subsequently based. This measure was opposed by many of the deepest feelings of Palmer, and he evidenced his disapproval by abstaining from voting on the resolutions. At the election of November 1868 Palmer was again returned for Richmond, and Gladstone offered him the office of lord chancellor or the office of a lord justice with a peerage; both offers were declined by Palmer, and he assumed a position of independent opposition to the measure relative to the Irish Church. On the 22nd of March 1869 he delivered a very powerful speech against the second reading of the bill, and during its later stages exercised a considerable influence in modifying the severity of its provisions. The position of Palmer at this time was a remarkable one. The foremost advocate at the bar, he was known to have great power of popular appeal, neither to promote the success of the proposition, nor to promote a measure of which he disapproved; a very prominent member of the House of Commons, whose action had been more than usually independent of party, he had separated himself from his political friends and maintained a position as the dignified and forcible opponent of disestablishment. Without office and without combination with the Conservative Opposition, he exercised great influence within and without the walls of St Stephen's. What made his position the more remarkable was that he was frequently consulted by the government which he had declined to join, and that on some occasions they invoked the assistance which his great influence in the House enabled him to afford them.

In 1869 he sought to modify rather than to oppose the bill for the abolition of tests in the universities. In 1870 he gave a qualified support to Gladstone's first Irish Land Act, and in the same year he supported Forster's Education Act. In 1872 he undertook the defence of his friend Lord Chancellor Hatherley, when attacked for his appointment of Sir Robert Collier to the judicial committee of the Privy Council, and, by a line of argument much more ingenious than convincing, secured a majority for the government.

The treaty of Washington was the means of casting a great duty upon Palmer. After the conclusion of the Civil War in America very large claims were preferred against Great Britain for alleged breaches of her duty as a neutral power; and after long negotiations, England and the United States agreed to arbitration. Palmer, who had been advising the British government during these negotiations, and who (4th August 1871) had defended the treaty in the House of Commons, was briefly
on behalf of Great Britain. In the end the Geneva tribunal made an award requiring the payment by Great Britain to the United States of a sum of about $5,000,000. To those who, in order to promote the cause of international arbitration, are desirous of acquiring a knowledge of the dangers and difficulties which beset this mode of settling disputes for which Palmer has left no precedent, arbitration may be commenced.

In September 1872 Gladstone again offered him the great seal, which Lord Hatherley had resigned; in the same year he took up his residence in his newly erected house at Blackmoor, in the parish of Selborne, in the county of Hampshire, from which he took his new title as a peer. In the following year (1873) Lord Selborne carried through parliament the Judicature Act. The foundations of this measure were laid so long ago as February 1867, when Palmer had moved for a royal commission on the constitution of the courts, and had taken an active part in the work of that commission, of which the first report was made in 1869. The result of this act of 1873 was to effect a fundamental change in the judicature system. By the operation of the Judicature Act one supreme court with several divisions was constituted; each division could administer the whole law; the conflict of divergent systems of law was largely overcome by declaring that when they were at variance, the principles of equity should prevail over the doctrines of the common law. The details of this great change were embodied in a code of general rules prepared by a committee of judges, over which Lord Selborne presided, and handed over to the care of Lord Selborne, as her chancellor and as the head of this great body, was impressive as an outward and visible sign of the silent revolution, which owed more to Lord Selborne than to any other individual. To the student of the natural history of jurisprudence the fusion of the two systems of law and equity may well recall a similar result brought about in imperial Rome; to the student of British institutions, the supreme court, for once presided over in person by the sovereign, could not but recall the Aula Regia, where the Norman kings sat amid their counsellors before equity had arisen to correct law, and before the separation between the three great common law courts had begun. As the principal incident in the history of the assembly of the one great court on that day. The queen, on the prayer of the attorney-general, ordered that the proceedings of the day should be recorded, an order which caused a momentary embarrassment to the lord chancellor, as the court had no existing registrar, and no existing book in which the record should be made. On the occasion of the opening of the Royal Courts Lord Selborne received an earldom.

The year 1885 was marked in Lord Selborne’s life by the death of his wife, and by his final separation from the party of which Gladstone was head. Gladstone’s work had come to be treated not only by the legislature but by the public with which Lord Selborne, in the latter part of the year indicated his leaning towards the disestablishment of the Church of England, and towards Home Rule for Ireland. Both these leanings were opposed to the deepest convictions of Lord Selborne; and it was an inevitable result that when in January 1886 Gladstone resigned office as premier, Lord Selborne should not be again his chancellor: on the 30th of January in that year they parted for ever; and Lord Selborne felt that his public life, except so far as he might serve his country by voice or pen, was now over. But neither his colleagues nor his judicial kinsfolk missed him; and he found, in opposing the new views of his old colleague, ample scope for both voice and pen; and as a member of the House of Lords he continued almost to the last to take part in hearing and deciding appeals, and sometimes in the ordinary business of the House.

In addressing the electors of Midlothian in September 1885, Gladstone had suggested the severance of the Church of England from the state as a subject on which the foundation of discussion had already been laid, and he averred the existence of “a current almost throughout the civilized world, slowly setting in the direction of disestablishment.” He declared that an utterance from such a man greatly excited the hopes of Nonconformists, who had previously published a manifesto under the title of “The Case for Disestablishment.” This stirring of the question deeply moved Lord Selborne, who was strongly opposed alike to disestablishment and disendowment, and in the following year, 1886, he published a work entitled A Defence of the Church of England against Disestablishment, with an introductory letter addressed to Gladstone. In the introductory letter he criticized Gladstone’s pronouncement on the subject, and especially examined the allegation of a general tendency towards disestablishment in the civilized world at large, and arrived at a negative conclusion.

In the body of the book the learned author treated of the history of the English Church, its endowments and the case of the advocates of disestablishment. The work is throughout characterized by an abundant supply of learning and of information as to the history and the state of the Church of England at that time, and by great dialectical acuteness. It is a powerful defence as well as a valuable summary of the history of the established Church in England. In 1888 Lord Selborne published a second work on the Church question, entitled Ancient Facts and Modern Tendencies. There he reviewed the whole series of acts which by degrees had disestablished the Church of England, and more critically than in his earlier book the developments of early ecclesiastical institutions, both on the continent of Europe and in Anglo-Saxon England, which resulted in the formation of the modern parochial system and its general endowment with tithes. A second edition of this work, embodying the result of its author’s subsequent researches in the Vatican library and elsewhere, was published in the year 1892. A perusal of these books will show with how wide a range of investigation and with what care Lord Selborne prepared himself for the discussion of these ecclesiastical questions. But Lord Selborne did not carry on his opposition to Gladstone’s proposals only in his library or by his pen; in the year 1886-1887 he travelled to many parts of the country, and addressed meetings in defence of the union between the Church and state and against Home Rule; and in September 1893, in his eighty-first year, he addressed a powerful speech to the House of Lords in opposition to the Home Rule Bill.

Lord Selborne’s health had, with the exception of two collapses in 1883 and 1888, which appear to have been due to overwork, continued excellent till February 1895, when he was attacked by some form of influenza. He died on the 5th of May 1895 at his seat in Hampshire, full of years and of honours.

To the subject of university education Lord Selborne at different times in his life gave much time and attention. As a fellow of Magdalen College, he had been desirous of changes which he felt himself bound by his oath from advocating; and he had taken part in the discussions on the abolition of tests in the old universities. He gave much time and attention to his duties as chairman of the second Oxford commission under the act of 1876; in 1878 he filled the office of lord rector of the university of Cambridge, which position he filled with much ability. But Lord Selborne did not carry on a commission on the subject of university education in London. Lord Selborne’s literary labours included the publication in 1862 of a selection of hymns, under the title of The Book of Praise, a work in which he was greatly assisted by Daniel Sedgwick (1814-1879), a bookseller and publisher in the city of London. The work was characterized by the great pains taken to ascertain the true authorship of hymns which were either anonymous or attributed to those who had not composed them, and by a like effort to exclude all variations granted on the authority of copies. In 1867 he founded an association for the improvement of legal education, in the hope of bringing about the establishment or the restoration of a general school of law in London on a scale worthy of the importance of the law and of the resources of the Inns of Court. This enterprise was not successful. The opposing forces were too strong to permit Lord Selborne to succeed.
original language, and to give the hymns “in the genuine uncorrupted text of the authors themselves." In the course of his labours as editor of this volume he was struck by the unity which was presented by Christian hymnody, “binding together by the force of a common attraction, more powerful than all causes of difference, times ancient and modern, nations of various race and language, Churchmen and Nonconformists, Churches reformed and unreformed” (Preface). In the same field of literature Lord Selborne further laboured by the publication of another collection called The Book of Praise Hymnal; a second edition was published to an editorial approval of the English Church Hymnody at a Church Congress; and the article in the Encyclopaedia Britannica on “Hymns” (q.v.), which was republished as a separate volume in 1892.

During the last few years of his life Lord Selborne engaged in the composition, for the benefit of his children, of memorials of his own life and of the lives of many members of his family. These Memorials, Part I., Family and Personal, in 2 vols., which were published in 1896, Memorials, Part II., Personal and Political, also in 2 vols., were edited by his daughter, Lady Sophia Palmer, and published in 1898. In the years 1880-1881 Lord Selborne wrote to his son a series of letters on religious subjects, dealing in an elementary way with natural and revealed religion, the inspiration of the Bible and Biblical criticism. These were published in 1898, under the title of Letters to His Son on Religion, by Roundell, First Earl of Selborne.

In person Lord Selborne was of about the average height: his manner when among strangers was somewhat reserved; his style, both in speaking and writing, became more and more courteous, his judgements in all branches of knowledge were marked by uniform good sense and lucidity, both of arrangement and language; and if he never reached the highest level of oratorical excellence, he never descended to what was commonplace or irrelevant. As a judge, whether in the Supreme Court or in the House of Lords, he displayed high qualities: he was patient, courteous, logical and learned, and his judgments contain many valuable expositions of the principles of law. The fusion of law and literature, the assimilation of the whole judicial system of England, and the association of all the supreme tribunals in one common home were works of no ordinary magnitude or importance, and give a character of unusual importance to his chancellorship. That Lord Selborne was a truly religious man it is impossible to doubt; his whole life was regulated and inspired by a sense of his duty towards God and his fellowmen, and a long life spent amid the temptations of legal and public life left not the faintest stain on his memory. He was a devout member of the Church of England, to which he looked up with unstinted affection and reverence; and he found in its service and formularies an adequate satisfaction for all his religious needs. He attended the High Church school, which was influenced by the teaching of Newman and Pusey and the Oxford teachers of their day; but he by no means slavishly followed those teaching but approached them with an independent mind. Although described as Ritualist, he had less sympathy. His life was prosperous, for from his first prize at the university till his acquisition of an earldom, he went on a course of almost unbroken success. He had the double dignity and comfort of a peer, as well as a high place in his Church, for he was always described as Ritualist, and of having accepted that dignity without loss of consistency; in his life he acquired a high reputation and the sincere admiration of his fellowmen, as well as an abundant fortune and ample titular distinctions. His life was also happy: he had in his work, his god and his children; he was a strong constitution, and retained his bodily and mental powers to the last, and his work was never shaken to the end; and he lived throughout his long life with the consciousness of rectitude.

SELBORNE, WILLIAM WALDEGRAVE PRAGUE, 2ND EARL OF SELBY (1850— ), son of the preceding, was educated at Winchester and University College, Oxford, where he took a first class in history. In 1883, being then Viscount Wolmer, he married Lady Beatrice Cecil, 3rd daughter of the 3rd marquess of Salisbury. His first political function was that of attorney to the chancellor of the exchequer (Mr Childers) from 1882 to 1885, when he was elected Liberal member of parliament for East Hampshire. Like his father, he became a Liberal Unionist when in 1886 Mr Gladstone proposed Home Rule for Ireland, and he retained his seat till 1892, when he was elected for West Edinburgh. From 1895 to 1900 he was under-secretary for the colonies, having Mr Chamberlain as his chief, and during the difficult period before the outbreak of the South African War he came rapidly to the front. In 1900 he entered the cabinet as first lord of the admiralty, and held this office till 1905, when he succeeded Lord Milner as high commissioner for South Africa and governor of the Transvaal and Orange River colonies. He assumed office at Pretoria in May of that year. He had gone out with the intention of guiding the destinies of South Africa during a period when the ex-Boer republics would be in a transitional state between crown colony government and self-government, and letters patent were issued granting the Transvaal representative institutions. But the Liberal party came into office in England in 1905 only to find that, when Lord Milner's constitution had been actually established, and the decision was now taken to give both the Transvaal and Orange River colonies self-government without delay. Lord Selborne gladly accepted the changed situation, and it was due in considerable measure to his moderation, common sense, administrative gifts and appreciation of the Boers' standpoint, that the experiment proved successful. He ceased to be governor of the Orange River Colony on its assumption of self-government in June 1907, but retained his other posts until May 1910, retiring on the eve of the establishment of the Union of South Africa. No one had done more for the achievement of the Union.

SELBORNE, a village in the Petersfield parliamentary division of Hampshire, England, 43 m. S.S.E. of Alton station, on the London & South-Western railway. It is pleasantly situated in a thickly wooded valley, and is celebrated as the birthplace and scene of the work of Gilbert White the naturalist; his house is in the village, and his memorial and grave are in the ancient churchyard.

SELY, WILLIAM COURT GULLY, 1ST VISCOUNT (1835—1900), Speaker of the British House of Commons, was born on the 29th of August 1835, the son of Dr James Manby Gully of Malvern. His grandfather was Daniel Gully, a Jamaican coffee-planter. He was educated at Trinity College, Cambridge, where he was president of the Union. He was called to the bar in 1860, went the northern circuit, and took silk in 1871. In 1880 and 1885 he unsuccessfully contested Whitehaven as a Liberal, but was elected for Carlisle in 1886, and continued to represent that constituency until his elevation to the peerage. In April 1895 he was elected Speaker by a majority of eleven votes over Sir Matthew White Ridley (cr. Viscount Ridley, 1900), the Unionist nominee. In 1905 he resigned and was raised to the peerage with the title of Viscount Selby, the name being that of his wife, Miss Elizabeth Selby (d. 1906), whom he married in 1865. He died on the 6th of November 1909, and was succeeded by his son, James William Herschell Gully (b. 1867).

SELY, a market town in the West Riding of Yorkshire, England, 14 s. 3 m. S. of York on the Great Northern and North-Eastern railways. Pop. of urban district (1901) 7786. It stands in a level plain on the left bank of the river Ouse, by which communication is provided with the Humber. The church of St Mary and St German belonged to a Benedictine abbey founded under a grant from William the Conqueror in 1069 and raised to the dignity of a mitred abbey by Pope Alexander II. The monastic buildings have practically disappeared, but the church was a splendid building of various dates from Norman to Decorated, the choir
and Lady chapel representing the later period. The nave passes from Norman to Early English in the course of its eight bays from east to west and also from the arcade through the triforium to the clerestory. About midnight of the 19th–20th of October 1606, a fire broke out in the Latham chapel adjoining the north choir aisle, in which a new organ had recently been erected, and soon involved the whole building. Specially serious damage was done in the immediate neighbourhood of the chapel, the oak-groined roof and rich fittings of the choir were wholly destroyed, but the finely moulded arches and the magnificent tracery of the east window survived in great part. Much damage was done to the tower, and the nave roof perished, for the fire had reached the east end of the church before the firemen could lay their hoses. The physical damage, however, was not so great as the shock to the congregation of the House of Commons, which was affronted by the loss of a house built by the Commons and occupied by its Members, and in which no less than six members were lost. The shock was felt in the country in general, and was a warning to the nation that the fire might have been caused by treasonable designs. The fire was extinguished about six o'clock in the morning, but the firemen remained at the church until after noon, when the last of the flames were quenched. The church was immediately set on foot, the architect being Mr Oldrid Scott.

Selden is the centre of a rich agricultural district, and its industries include rope and twine making, flax-scutching, boat-building, iron-founding, tanning and brewing. Tradition indicates Selden as the birth-place of Henry I, and thus accounts for the high privileges conferred upon the abbey. The town had a notable share in the operations of the Civil Wars, and the role played at the outset by the Parliamentarians, and captured by the Royalists in 1644, but soon retaken by Sir Thomas Fairfax.

Selden, John (1584–1654), English jurist, legal antiquary and oriental scholar, was born on the 16th of December 1584 at Salvington, in the parish of West Tarring, Sussex. His father, also John Selden, held a small farm. It is said that his accomplishments as a violin-player gained him his wife, whose social position was somewhat superior to his own. She was Margaret, the only child of Thomas Baker of Rustington, a village in the vicinity of West Tarring, and was more or less remotely descended from a knightly family of the same name in Kent. John Selden commenced his education at the free grammar-school at Chichester, whence in 1600 he proceeded to Hart Hall, Oxford. In 1603 he was admitted a member of Clifford’s Inn, London, and in 1604 migrated to the Inner Temple, and in 1612 he was called to the bar. His earliest patron was Sir Robert Cotton, the antiquary, by whom he seems to have been employed in copying and abridging certain of the parliamentary records then preserved in the Tower. For some reason which has not been explained, Selden never went into court as an advocate, save on rare and exceptional occasions. His work, as a conveyancer and consulting counsel is stated to have been large, and, if we may judge from the considerable fortune he accumulated, it must also have been lucrative.

It was, however, as a scholar and writer that Selden won his reputation both amongst his contemporaries and with posterity. His first work, an account of the civil administration of England before the Norman Conquest, is said to have been completed when he was only two- or three-and-twenty years of age. But if this was the Analest Anglo-Britannico, as is generally supposed, he withheld it from the world until 1613. In 1610 appeared his England’s Epimoniom and Janus Anglorum; Facieci Altera, which dealt with the progress of English law down to Henry II.; and The Duelle, or Single Combat, in which he traced the history of trial by battle in England from the Norman Conquest. In 1613 he supplied a series of notes, enriched by an immense number of quotations and references, to the first eighteen cantos of Drayton’s Polychion. In 1614 he published Titles of Honour, which, in spite of some obvious defects and omissions, has remained to the present day the most comprehensive and trustworthy work of its kind that we possess; and in 1616 his notes on Fortescue’s De laudibus legum Angliae and Ralph de Hengham’s Summae magna et para. In 1617 his De diis Syris was issued, and immediately established his fame as an oriental scholar among the learned in all parts of Europe. It is remarkable for its brilliant use of the comparative method, in which it was far ahead of its age, and is still consulted by students of Semitic mythology. In 1618 his History of Tithe, although only published after it had been submitted to the censorship and duly licensed, nevertheless aroused the apprehension of the bishops and provoked the intervention of the king. The author was summoned before the privy council and compelled to retract his opinions, or at any rate what were held to be his opinions. Moreover, his work was suppressed and himself forbidden to reply to any of the controversialists who had come or might come forward to answer it.

This seems to have introduced Selden to the practical side of political affairs. The discontent which a few years later broke out into civil war were already forcing themselves on public attention, and it is pretty certain that, although he was not in parliament, he was the instigator and perhaps the draftsman of the Petition of Right, a document which set out the rights and privileges of the House affirmed by the Commons on the 18th of December 1621. He was as well as several of the members committed to prison, at first in the Tower and subsequently under the charge of Sir Robert Dacie, sheriff of London. During his detention, which only lasted a short time, he occupied himself in preparing an edition of Eadmer’s History from a manuscript lent to him by his host or jailor, which he published two years afterwards. In 1623 he was returned to the House of Commons for the borough of Lancaster, and sat with Coke, Noy and Ym on Sergeant’s Bench. There he remained for eight months, when he was removed from Lyon’s Inn, an office which he declined to undertake. For this the benchers of the Inner Temple, by whom he had been appointed, fined him £20 and disqualified him from being chosen one of their number. But he was relieved from this incapacity after a few years, and became a master of the bench. In the first parliament of Charles I. (1625), it appears from the “returns of members” printed in 1626 that, contrary to the assertion of all his biographers, he had no seat. In Charles’s second parliament (1626) he was elected for Great Bedwin in Wiltshire, and took a prominent part in the impeachment of George Villiers, duke of Buckingham. In the following year, in the “benevolence” case, he was counsel for Sir Edmund Hampden in the court of king’s bench. In 1628 he was returned to the third parliament of Charles for Ludgershall in Wiltshire, and had a large and important share in drawing up and carrying the Petition of Right. In the session of 1629 he was one of the members mainly responsible for the tumultuous passage in the House of Commons of the resolution against the illegal levying of tonnage and poundage, and, along with Eliot, Holles, Long, Valentine, Strode, and the rest, he was sent once more to the Tower. There he remained for eight months, as a member of the Committee of Privy Council, and was a part of the time of the use of books and writing materials. He was then removed, under less rigorous conditions, to the Marshalsea, until not long afterwards owing to the good offices of Archbishop Laud he was liberated. Some years before he had been appointed steward to the earl of Kent, to whose seat, West in Bedfordshire, he now retired. In 1628 at the suggestion of Sir Robert Cotton he had compiled, with the assistance of two learned coadjutors, Patrick Young and Richard James, a catalogue of the Arundel marbles. He employed his leisure at West in writing De successionibus in bona defuncti secundum leges Ebraeorum and De successionibus in postfaciis Ebraeorum, published in 1631. About this period he seems to have inclined towards the court rather than the popular party, and even to have secured the personal favour of the king. To him in 1635 he dedicated his Mare clausum, and under the royal patronage it was put forth as a kind of state paper. It had been written sixteen or seventeen years before; but James I. had prohibited its publication for political reasons; hence it appeared a quarter of a century after Grotius’s Mare liberum, to which it was intended to be a rejoinder, and the pretensions advanced in which on behalf of the Dutch fishermen to poach in the waters off the British coasts it was its purpose to explode. The fact that Selden was not retained in the great case of ship money in 1637 by John Hampden, the cousin of his former client, may be accepted as additional evidence that his zeal in the popular cause was not so warm and unsuspected as it had once been. During the progress of this momentous constitutional conflict, indeed, he seems to have been absorbed in his oriental
SELENÉ—SELENIUM

referred to as the "Whitefriars chariot" (Haggard, "Pandia," 1898). Nilson and Grimston, in "The Whitefriars Calendar," 1645, also dilute potassium, mentioning it in their treatment of the subject.

SELENGA-ORKHON, a river of Central Asia, which rises in two principal head-streams, the Selenga and the Orkhon, on the plateau of N.W. Mongolia, not far apart in 10E. It flows generally E.N.E. as far as its confluence near Kiakhta, on the frontier of Mongolia and Siberia, at the eastern extremity of the Sayan Mountains. Beyond Kiakhta the river flows generally N., nearly as far as 52°N., where it turns W. and enters Lake Baikal on the S.W., forming a delta. It is navigable from Kiakhta downwards, a distance of 210 m., its total length being 750 m. From the left it receives the Eghin-gol and the Jida, and from the right the stream of the Largest and the others are the Orkhon and its branches. The average width of the river is about 150 m., and the depth of water varies from 6 to 12 m. The river contains fish, the chief of which is a species of carp known as Carassius gibelio or the Orkhon carp.

Several remarkable inscriptions were discovered here in the 19th century, and were interpreted by Professor V. Thomesen of Copenhagen Inscriptions de l'Orkhon (Helsingborg, 1900).

SELENIUM [symbol Se, atomic weight 79.2 (O=16)], a non-metallic chemical element, discovered in 1817 by J. Berzelius, who named it selenium (Gr. σέλην, the moon) on account of its close analogy with tellurium (Lat. tellus, the earth). It is occasionally found in the native condition, but more frequently in combination with metals in the form of selenides, the most important seleniferous minerals being euchlorite, crookesite, clausenthalite, manannite and zorgite. It is also found as a constituent of various pyrites and galena, and in some specimens of native sulphur. The element is usually obtained from the flue dust or chamber deposits of sulphuric-acid works in which a seleniferous pyrites is burned. In this process, the residues are boiled with a dilute sulphuric acid to which nitric acid and potassium chlorate are added in order to transform the element into selenic acid, H₂SeO₃, which is then reduced to selenious acid, H₂SeO₄, by boiling with hydrochloric acid, and finally to selenium by sulphur dioxide.

L. F. Nilson (Ber., 1874, 7, p. 1719) digests the well-washed chamber mud with a moderately concentrated solution of potassium cyanide, whereby the element goes into solution in the form of potassium selenocyanide, K₂Se(CN)₃, from which it is precipitated by hydrochloric acid. As alternative methods, F. Wöhler (Ann., 1859, 109, p. 375) heats the well-washed chamber residues with potassium nitrate and carbonates in order to obtain an alkaline selenate, which is then boiled with hydrochloric acid, yielding selenious acid, from which the element is obtained as above; whilst H. Rose (Pogg. Ann., 1828, 90, p. 471) obtained it by chlorination of selenite tetrachloride, which is converted into selenic acid, and then to selenious acid by boiling with hydrochloric acid.

The commercial element usually contains a certain amount of sulphur, and some tellurium, and various methods have been devised for its purification.
SELENIUM

for its purification. L. Oppenheim (Journ. prakl. Chem., 1857, 71, 279) fuses the commercial selenium with potassium cyanide in a stream of hydrogen through the tube and seizes up the resulting red powder with water; the precipitated tellurium is filtered off, and the solution then supersaturated with hydrochloric acid, when selenium is gradually deposited. E. Divers, (Chem. News, 1885, 51, p. 199) dissolves the obtained in hot water, the precipitate obtained by filtering off, the solution acidified by hydrochloric acid and reduced with sulphur dioxide.

Several allotroic forms of selenium have been described, but the work of A. P. Saunders (Journ. Phys. Chem., 1900, 4, p. 423) seems to establish that the element exists in three distinct forms, namely liquid selenium (which includes the vitreous, soluble and amorphous forms), crystalline red selenium (which includes, perhaps, two very closely allied forms), and crystalline, grey or metallic selenium. Liquid selenium becomes more and more red when heated, so that at 200° C. to 60° C. it becomes red at about 60° C., and is hard and brittle between 30° and 40°. It shows a conchoidal fracture. The amorphous variety, which only differs from the vitreous form in its state of aggregation, is obtained by reducing solutions of selenious acid with sulphur dioxide. It is slightly soluble in carbon bisulphide. The red crystalline variety is obtained by crystallization of selenium from carbon bisulphide, or by leaving the amorphous form in contact with the same solvent. The grey crystalline form is obtained by heating the other varieties, and is the most stable of the three. Various forms of selenium dissolve in concentrated sulphuric acid, forming a green solution (see also R. Maré, Ber., 1906, 39, p. 697; and W. Oechsler de Coinck, Comptes rendus, 1896, 145, p. 682). A colloidal selenium was obtained by C. Paal and C. Koch (Ber., 1905, 38, p. 526) by reducing selenium acid dissolved in an aqueous solution of sodium sulphate with hydrazine hydrate and hydrochloric acid, the precipitate obtained being then dissolved in sodium carbonate. The specific gravity of selenium is 4.8; the specific heat varies from 0.0716 to 0.1147, depending upon the particular form. Selenium combines directly with hydrogen, but dissolves in the gas, and with fluorine in the cold. It burns with a blue flame when heated in the air or in oxygen, at the same time giving a characteristic smell of rotten horseradish, a reaction which serves for the recognition of the element. It combines directly with nitrogen, phosphorus, antimony and carbon; and with all the metals except gold) to form selenides, of which those of the alkali and alkaline earth metals are soluble in water. Metallic selenium is a conductor of electricity, and its conductivity is increased by light; this property has been utilized in apparatus for transmitting photographs by telegraphy (see TELEGRAPH).

Selenurated Hydrogen, HSe, is obtained by the direct union of its constituent elements in the heat; by the decomposition of various selenides with mineral acids; by the decomposition of aluminium selenide, or phosphorus selenide, with water; by the action of selenium on a concentrated solution of hydriodic acid; and by heating selenium with colophene (H. Moissan), or better with paraffin wax (H. Wuyts and A. Stewart, Bull. Soc. chim. Belg., 1909, 23, p. 231). This selenurated hydrogen is a gas which has a strong characteristic odour, and which is more unpleasant than sulphhydrated hydrogen. Its physiological effects are much more permanent and injurious than sulphhydrated hydrogen, producing temporary paralysis of the olfactory nerves and inflammation of the conjunctiva of the animal eye of which it is a cause more unpleasant than sulphured hydrogen. Its physiological effects are much more permanent and injurious than sulphured hydrogen, producing temporary paralysis of the olfactory nerves and inflammation of the conjunctiva of the eye. It is produced by heating, burns with a blue flame, and behaves as a reducing agent.

Selenium, red, as obtained from the action of chlorine on the action of zinc, is also obtained in the form of its potassium salt by the action of potassium hydrogen sulphite on a selenous acid. It is readily decomposed by acids with liberation of sulphur dioxide and selenium.

Nitrogen selenide, N₂Se, is formed by the decomposition of selenium chloride with ammonia (A. Verneuil, Bull. soc. chim., 1882, 38, p. 548). It crystallizes readily from benzene or acetic acid and evolves the characteristic smell of a selenous compound. When dry ammonia gas is passed into a dilute solution of selenyl chloride in benzene, the precipitate produced is digested with potassium cyanide to remove any selenium (V. Lenher and E. Schindler, Proc. R. Acad., 1909, 46, 623). It is obtained as a red powder which explodes when heated to 130° C. Selenium cyanide, SeCN, is obtained by decomposing silver selenocyanate with cyanogen iodide, or by the action of silver cyanide on a solution of metallic selenium. It explodes with a characteristic smell when dry, and is very soluble in water. A more complex cyanide, Se(CN)₂, is obtained by passing a current of chlorine and air into an aqueous solution of selenium. Selenium is also obtained from the action of selenium on solutions of the metallic selenides, and is very soluble in water. A more complex cyanide, Se(CN)₂, is obtained by passing a current of chlorine and air into an aqueous solution of selenium. Selenium is also obtained from the action of selenium on solutions of the metallic selenides, and is very soluble in water.
SELEUCIA—SELEUCID DYNASTY

possessed an alkaline reaction, and is readily decomposed by acids with liberation of selenium. It forms numerous double salts.

The pioneers of selenium chemistry have been made. The earlier results of J. J. Berzelius from an analysis of the chloride gave values from 79.2 to 79.35. Later determinations by V. L. Pecherskii (Jour. Amer. Chem. Soc., 1892, 20, p. 593), from the analysis of silver selenide and the reduction of the double selenide ammonium bromide, give values from 79.27 to 79.27; and J. Meyer (Ber., 1902, 35, p. 1591) by the electrolysis of silver selenite in the presence of potassium cyanide obtained the value 79.23.

SELEUCIA. The Seleucids were the ancient Greek cities named after Seleucus I. Nicator, founder of the Seleucid dynasty. The following are the most important.

1. Seleucia on the Tigris, at the mouth of the great royal canal (Nahr al-Muluk, mod. Radwaniyah) from the Tigris to the Euphrates, about 50 m. N. of Babylon and 15 m. S. of Bagdad. It was founded by Seleucus Nicator (see SELEUCID DYNASTY), ruler of Babylonia from autumn 312. Seleucus, departing from the precedent of Alexander the Great, who, after his return from India, had settled in Babylon, preferred to build a new capital of a decided Greek character. Seleucus’ new city “was faced with the object of exhausting Babylon.” (Pline, vi. 122; Strabo vi. 738); a legend says that the Chaldaean priests, when they were consulted about the right hour for the initiation of the city, tried to frustrate the design of the king by naming a wrong hour, but that by chance the work was begun in the moment predicted by the stars and the decree of fate accomplished (Appian, Syr. 58). Seleucia was peopled with Macedonians and Greeks; Syrians and Jews were admitted to the citizenship (Joseph., Ant. xviii. 9, 8). It obtained a free constitution. A great many Seleucid Greek cities were founded in Babylonia in the course of Seleucid I. and Antiochus I., while Babylon and the other ancient cities (Sippara, Erech, Ur, Borsippa) decayed into mere villages. Here the Chaldaean priests continued to teach their astrological wisdom (we possess many astrological tablets in cuneiform writing from the time of the Seleucids and the earlier Arsacids); but Seleucia became the centre of the new hellenistic civilization (see HELLENISM). A great many Greek authors were born here (e.g. the Stoic Diogenes of Babylonian, 2nd century), though the inhabitants of Seleucia in Babylon generally are simply called Babylonians by the Greeks. In the time of the Seleucids and the reduction of the double selenide ammonium bromide, gave values from 79.27 to 79.27; and J. Meyer (Ber., 1902, 35, p. 1591) by the electrolysis of silver selenite in the presence of potassium cyanide obtained the value 79.23.

Seleucia was taken by Avidius Cassius in 164, and then the Romans did what the Parthians had not dared to do: they burnt down the great Greek town with 300,000 inhabitants (Dio Cass. lxxi. 2; Zonar, xii. 2; Capitol. Vit. Veri, 8; Eutrop. 8. 10; Ammian. Marc. xxiii. 6. 24; xxiv. 3. 3). The great plague, which laid waste the Roman empire during the next years, is said to have sprung from the ruins of Seleucia. The destruction of Seleucia may be considered as the end of Hellenism in Babylonia. (See also SELEUCID DYNASTY and HELLLENISM.)

2. A city on the north frontier of Syria towards Cilicia about 4 m. N. of the mouth of the Orontes, near the shore at the foot of Mount Pieria (hence called Seleucia Pieria). This town also was founded by Seleucus I. It served as the port of Antioch (Acts xiii. 4), and with Apamea, Laodicea and Antioch formed the Syrian tetrastyle. Considerable remains are still visible: the chief are those of a cutting through the solid rock nearly 1100 yds. long, which Polybius describes as the road from the city to the sea; the triple line of walls; amphitheatre, cemetery, citadel, temples. It was of great importance in the struggle between the Seleucids and the Ptolemies; captured by Ptolemy Euergetes in 246, it was recovered by Antiochus III. the Great in 219. It was recognized as independent by the Romans in 70, but little of its subsequent history is known. It had practically ceased to exist in the 5th century A.D. The district stretching inland was known as Seleucis.

3. Seleucia Trachonitis, sometimes called Tracheia, a city of Cilicia on the Calycadnus (Geuk Su), also founded by Seleucus I. about 350 B.C., near the older Olbia. It had considerable commercial prosperity (Pliny, H. N. xiii. 34). Seleucia Trachonitis became the capital of the Seleucid satrapy (the land of Tarsus). In 1137 it was besieged by Leon, king of Cilician Armenia. On the 10th of June 1190 the emperor Frederick Barbarossa was drowned in trying to cross the Calycadnus. In the 13th century it was captured by the Seljuks. There are many ancient remains, and on the Acropolis the ruins of a castle; many rock-cut tombs with inscriptions have been found. On the site is the modern Seleke, the chief town of the Ichi-li sanjak.

Other towns bearing the name Seleucia were—(4) Seleucia in Mesopotamia, the modern Birejik; (5) in the Persian Margiana, founded as Alexandria by Alexander the Great and rebuilt as Seleucia by Antiochus I. (of Syria); (6) in Pisdia; (7) in Pamphylia; (8) on the Belus in Syria. The city of Tralles (96.) also bore the name for a short period.

SELEUCID DYNASTY, a line of kings who reigned in Nearer Asia from 312 to 65 B.C.

The founder Seleucus (surnamed for later generations Nicator) was a Macedonian, the son of Antiochus, one of Philip's generals. Seleucus, as a young man of about twenty-three, accompanied Alexander into Asia in 333, and won distinction in the Indian campaign of 326. When the Macedonian empire was divided in 'Partition of Babylon') Seleucus was given the office of chilarch (Gr. χιλιαρχός, a thousand), which attached him closely to the person of the regent Perdiccas. Seleucus himself had a hand in the murder of Perdiccas in 321. At the second partition, at Tripolitania (321), Seleucus was given the government of the Babylonian satrapy. In 316, when Antigonus had made himself master of the eastern provinces, Seleucus felt himself threatened and fled to Egypt. In the war which followed between Antigonus and the other Macedonian chiefs, Seleucus actively co-operated with Ptolemy and commanded Egyptian squadrons in the field. The victory won by Ptolemy at Gaza in 312 opened the way for Seleucus to return to the east. His return to Babylon in that year was afterwards officially regarded as the beginning of the Seleucid empire. Master of Babylonia, Seleucus at once proceeded to wrest the neighbouring provinces of Persis, Susiana and Media from the nominees of Antigonus. A raid into Babylonia conducted in 311 by Demetrius, son of Antigonus, did not seriously check Seleucus's progress. Whilst Antigonus was occupied in the west, Seleucus during nine years (311-302) brought under his authority the whole eastern part of Alexander's empire as far as the Jaxartes and Indus. In 305, after the extinction of the old royal line of Macedonia, Seleucus, like the other four principal Macedonian chiefs, assumed the style of king.
SELEUCID DYNASTY

His attempt, however, to restore Macedonian rule beyond the Indus, where the native Chandragupta had established himself, was not successful. Seleucus entered the Punjab, but felt himself obliged in 302 to conclude a peace with Chandragupta, by which he ceded large districts of Afghanistan in return for 500 elephants. The pressing need for Seleucus once more to take the field against Antigonus was at any rate in large measure the cause of his abandonment of India. In 301 he joined Lysimachus in Asia Minor and Antioco of Pergamum in their designs to drive detached Greek hordes out of the region. A new partition of the empire followed, by which Seleucus added to his kingdom Syria, and perhaps some regions of Asia Minor. The possession of Syria gave him an opening to the Mediterranean, and he immediately founded the new city of Antioch upon the Orontes as his chief seat of government. His previous capital had been the city of Seleucia which he had founded upon the Tigris (almost coinciding in site with Bagdad), and this continued to be the capital for the eastern satrapies. About 293 he installed his son Antiochus there as vicerey, the vast extent of the empire seeming to require a double centre. With his father's murder, Antiochus continued to enjoy his father's armaments. The unpopularity of Lysimachus after the murder of Agathocles gave Seleucus an opportunity for removing his last rival. His intervention in the west was solicited by Ptolemy, Cerasusus, who, on the accession to the Egyptian throne of his brother Ptolemy II., had at first taken refuge with Lysimachus and then with Seleucus. War between Seleucus and Lysimachus broke out, and on the field of Coru-pedon in Lydia Lysimachus fell (281). Seleucus now saw the whole empire of Alexander, Egypt alone excepted, in his hands, and moved to take possession of Macedon. Antigonus, however, who had intended to use his combined power content himself for the remainder of his days with the Macedonian kingdom in its old limits. He had, however, hardly crossed into the Chersonese when he was assassinated by Ptolemy Ceraunus near Lysimachia (281).

Antiochus I. Soter (324 or 323–262) was half a Persian, his mother Apame being one of those eastern princesses whom Alexander had given as wives to his generals in 324. On the assassination of his father (281), the task of holding together the empire was a formidable one, and a revolt in Syria broke out almost immediately. With his father's murder, Antiochus was soon compelled to make peace, abandoning apparently Macedonia and Thrace. In Asia Minor he was unable to reduce Bithynia or the Persian dynasties which ruled in Cappadocia. In 278 the Gauls broke into Asia Minor, and a victory which Antiochus won over these hordes is said to have been the origin of his title of Soter (Gr. for "saviour"). At the end of 275 the question of Palestine, which had been open between the houses of Seleucus and Ptolemy since the partition of 301, led to hostilities (the "First Syrian War"). It had been continuously in Ptolemaic occupation, but the house of Seleucus maintained its claim. War did not materially change the outlines of the two kingdoms, though frontier cities like Damascus and the coast districts of Asia Minor might change hands. About 262 Antiochus tried to break the growing power of Pergamum by force of arms, but suffered defeat near Sardis and died soon afterwards (262). His eldest son Seleucus, who had ruled in the east as vicerey from 275 (?) till 268/7, was put to death in that year by his father on the charge of rebellion (Wace, J.H.S., xxv., 1905, p. 101 l.). He was succeeded (261) by his second son Antiochus II. Theos (260–246), whose mother was the Macedonian princess Stratonice, daughter of Demetrius Poliorcetes. The War with Egypt still went on along the coasts of Asia Minor (the "Second Syrian War"). Antiochus also made some attempt to get a footing in Thrace. About 250 peace was concluded between Antiochus and Ptolemy II., Antiochus repudiating his wife Laodice and marrying Ptolemy's daughter Berenice, but by 246 Antiochus had left Berenice and her infant son in Antioch to live again with Laodice in Asia Minor. Laodice poisoned him and proclaimed her son Seleucus II. Callinicus (reigned 246–227) king, whilst her partisans at Antioch made away with Berenice and her son. Berenice's brother, Ptolemy III., who had just succeeded to the Egyptian throne, at once invaded the Seleucid realm and marched victorious to the Tigris or beyond, receiving the submission of the eastern provinces, whilst his fleets swept the coasts of Asia Minor. In the interior of Asia Minor Seleucus maintained himself, and when Ptolemy returned to Egypt he recovered Northern Syria and the nearer provinces of Iran. In Asia Minor his younger brother Antiochus Hierax was put up against him by a party to which Laodice herself adhered. At Ancyra (about 235?) Seleucus sustained a crushing defeat and left the country beyond the Taurus to his brother and the other powers of the peninsula. Of these Pergamum now rose to greatness under Attalus I., and Antiochus Hierax perished as a fugitive in Thrace in 228/7. A year later Seleucus was killed by a fall from his horse. His elder son, Seleucus III. Soter (reigned 227–223), took up the task of reconquering Asia Minor from Attalus, but fell by a conspiracy in his own camp.

Antiochus III. the Great (242–187), Callinicus's younger son, a youth of about eighteen, now succeeded to a disorganized and broken power in Asia Minor. Not only was Asia Minor detached, but the further eastern provinces had broken away, Bactria under the Greek Diadotus (q.v.), and Parthia under the nomad chieftain Arsaces. Soon after Antiochus's accession, Media and Persis revolted under their governors, the brothers Molon and Alexander. The young king was in the hands of the bad minister Hermias, and was induced to make an attack on Palestine instead of going in person to face the rebels. The attack on Palestine was a fiasco, and the generals sent against Molon and Alexander met with disaster. Only in Asia Minor, where the Seleucid cause was represented by the king's cousin, the able Antiochus, was it possible to hold the country back to its earlier limits. In 227 Antiochus at last went east, and the rebellion of Molon and Alexander collapsed. The submission of Lesser Media, which had asserted its independence under Artabazanes, followed. Antiochus rid himself of Hermias by assassination and returned to Syria (220). Meanwhile Achaean himself had revolted and assumed the title of king in Asia Minor. Since, however, his power was not well enough grounded to allow of his attacking Syria, Antiochus considered that he might leave Achaean for the present and renew his attempt of 221. The campaigns of 220 and 219 carried the Seleucid arms almost to the confines of Egypt, but in 217 Ptolemy IV. confronted Antiochus at Raphia and inflicted a defeat upon him which nullified all Antiochus's successes and compelled him to withdraw north of the Lebanon. In 216 Antiochus went north to deal with Achaean, and had by 214 driven him from the field into Sardis. Antiochus contrived to get possession of the person of Achaean (see POLYIUS), but the citadel held out till 213 under Achaean's widow and then surrendered. Having thus recovered the central part of Asia Minor—the dynasties in Pergamum, Bithynia and Cappadocia the Seleucid government was obliged to tolerate—Antiochus returned to recover the outlying provinces of the north and east. Xerxes of Armenia was brought to acknowledge his supremacy in 212. In 209 Antiochus invaded Parthia, occupied the capital Hecatopymylus and pushed forward into Hyrcania. The Parthian king was apparently granted peace on his submission. In 209 Antiochus was in Bactria, where the original rebel had been supplanted by another Greek Euthydemus (see further BACTRIA and articles on the separate rulers). The issue was again favourable to Antiochus. After sustaining a famous siege in his capital Bactra (Baktria), Euthydemus obtained an honourable peace by which the hand of one of Antiochus's daughters was promised to his son Demetrius. Antiochus next, following in the steps of Alexander, crossed into the Kabul valley, received the homage of the Indian king Sophaganesus and returned west by way of Seistan and Kerman (206/5). From Seleucia on the Tigris he led a short expedition down the Persian Gulf against the Gerrheans of the Arabian coast (205/4). Antiochus seemed to have restored the Seleucid empire in the east, and the achievement brought him the title of "the Great King." In 204/3 the infant Ptolemy V. Epiphanes succeeded to the Egyptian throne, and Antiochus concluded a secret pact with Philip of
Macedonia for the partition of the Ptolemaic possessions. Once more Antiochus attacked Palestine, and by 190 he seems to have had possession of it. It was, however, recovered for Ptolemy by the Aetolian Scopas. But the recovery was brief, for in 198 Scopas was defeated by Antiochus at the battle of the Pannion, near the sacred trees of the Roman god which marks the entrance of Ptolemaic rule in Palestine. In 197 Antiochus moved to Asia Minor to secure the coast towns which had acknowledged Ptolemy and the independent Greeks. This was an enterprise which brought him into antagonism with Rome, since Smyrna and Lampsacus appealed to the republic of the west, and the tension became greater after Antiochus had in 196 established a footing in Thrace. The evacuation of Greece by the Romans gave Antiochus his opportunity, and he now had the fugitive Hannibal at his court to urge him on. In 192 Antiochus invaded Greece, having the Aetolians, and other Greek states as his allies. In 191, however, he was routed at Thermopylae by the Romans under Manius Acilius Glabrio, and obliged to withdraw to Asia.

But the Romans followed up their success by attacking Antiochus in Asia Minor, and the decisive victory of L. Cornelius Scipio at Magnesia ad Sipylum (190), following on the defeat of Hannibal at sea off Side, gave Asia Minor into their hands. By the peace of Apamea (188) the Seleucid king abandoned all the country north of the Taurus, which was distributed among the friends of Rome. As a consequence of this blow to the Seleucid power, the outlying provinces of the kingdom were recovered by Antiochus at the expense of their independence. Antiochus persisted in a fresh expedition to the east in Lusitan (187).

The Seleucid kingdom as Antiochus left it to his son, Seleucus IV. Philopator (reigned 187-176), consisted of Syria (now including Cilicia and Palestine), Mesopotamia, Babylonia and Near Iran (Media and Persis). Seleucus IV was compelled by financial necessities, created in part by the heavy war-indemnity exacted by Rome, to pursue an unambitious policy, and was assassinated by his minister Heliodorus. The true heir, Demetrius, son of Seleucus, being now retained in his homeland, turned to his younger brother of Seleucus, Antiochus IV. Epiphanes (i.e. "the Manifest [god]"), parodied Epiphanes, "the mad"). who reigned 176-164.

In 170 Egypt, governed by regents for the boy Ptolemy Philometer, attempted to reconquer Palestine; Antiochus not only defeated this attempt but invaded and occupied Egypt. He failed to take Alexandria, where the people set up the younger brother of Philometer, Ptolemy Euergetes, as king, but he left Philometer as his ally installed at Memphis. When the two brothers combined, Antiochus again invaded Egypt (168), but was compelled to retire by the Popillia rebellion (167-162), after the historic scene in which the Roman drew a circle in the sand about the king and demanded his answer before he stepped out of it. Antiochus exercised his contemporaries by the riddle of his half-brilliant, half-crazy personality. He had resided at Rome as a hostage, and afterwards for his pleasure at Athens, and had brought to his kingdom an admiration for republican institutions and an enthusiasm for Hellenic culture— or, at any rate, for its externals. There is evidence that the forms of Greek political life were more fully adopted under his sway by many of the Syrian cities. He spent lavishly on public building, a屬于 whether the people of the city, serving the additional purpose of relieving his financial necessities. It was a measure of a very different kind when, a year or two later (after 168), Antiochus tried to suppress the practices of Judaism by force, and it was this which provoked the Maccabean rebellion (see Maccabees). In 166 Antiochus left Syria to attempt the reconquest of the further provinces. He seems to have been signally successful. Armenia returned to allegiance, the capital of Media was re-colonized as Epiphanea, and Antiochus was pursuing his plans of the East when he died at Tabae in Persis, after exhibiting some sort of mental derangement (winter 165/4).

He left a son of nine years, Antiochus V. Eupator (reigned 164-162), in whose name the kingdom was administered by a camarilla. Their government was feeble and corrupt. The attempt to check the Jewish rebellion ended in a weak compromise. Their subservience to Rome so enraged the Greek cities of Syria that the Roman envoy Graeus Octavius (consul 165 B.C.) was assassinated in Laudicea (162). At this juncture Demetrius, the son of Seleucus IV., escaped from Rome and was received in Syria as the true king. Antiochus Eupator was put to death. Demetrius I. Soter (reigned 165-150) was a strong and ambitious ruler. He crushed the rebellion of Timarchus in Media and reduced Judea to new subjection. But he was unpopular at Antioch, and fell before a coalition of the three kings of Egypt, Pergamum and Cappadocia. An impostor, who claimed to be a son of Antiochus Epiphanes, Alexander Balas (reigned 150-145), was installed as king by Ptolemy Philometor and given Ptolemy's daughter Cleopatra to wife, but Alexander proved to be dissolve and incapable, and when Demetrius, the son of Seleucus I., was brought back to Syria by Cretan condottieri, Ptolemy triumphed over him and restored his rightful heir. Alexander was defeated by Ptolemy at the battle of the Oenoparas near Antioch and murdered during his flight. Ptolemy himself died of the wound he had received in the battle.

Demetrius II. Nicator (first reign 145-140) was a mere boy, and the misgovernment of his Cretan supporters led to the infant death of Balas. At last, the Romans, during the war with Rome, sent Demetrius I. in 130 against him (145) by Tryphon, a magnate of the kingdom. Demetrius was driven from Antioch and fixed his court in the neighbouring Seleucia. In 143 Tryphon murdered the young Antiochus and assumed the throne as Demetrius II. Nicator. The Romans, who had no sympathy with the eastern provinces from the Parthians, leaving Queen Cleopatra to maintain his cause in Syria. When Demetrius was taken prisoner by the Parthians, his younger brother Antiochus VII. Sidetes (164-129) appeared in Syria, married Cleopatra and crushed Tryphon. Antiochus VII. was the last strong ruler of the dynasty (152-129). He took Jerusalem and once more brought the Jews, who had won their independence under the Hasmonian family, to subjection (see Maccabees). He led a new expedition against the Parthians in 130, but, after signal successes, fell fighting in 129 (see also Persia, History). Demetrius (second reign 129-126), who had been allowed to return to Antioch by the Parthians, was again driven from Antioch by a pretender, Alexander Zabas, who had the support of the king of Egypt. Demetrius was murdered at the instigation of his wife Cleopatra in 126. The remaining history of the dynasty is a series of warring pretenders, many of whom were claimants, while the different factors of the kingdom, the cities and barbarian races, more and more assert their independence. Both Demetrius II. and Antiochus VII. left children, who formed rival branches of the royal house. To the line of Demetrius belong his son Selucus V. (126), assassinated by his mother Cleopatra, Antiochus VIII. Grypus (141-96), who succeeded in 126 the younger brother ofSeleucus V., the sons of Grypus, Seleucus VI. Epiphanes Nicator (reigned 95-95), Antiochus XI. Epiphanes Philadelphus (reigned during 95), Philip I. (reigned 95-83), Demetrius III. Eupator (reigned 95-88), and Antiochus XII. Dionysus (reigned 83-78). The last was, however, the son of Philip I., who appears momentarily on the stage in the last days of confusion. To the line of Antiochus VII. belong his son Antiochus IX. Cyzicenus (reigned 119-95), and Antiochus X. Eupator (reigned 95-83) and the son of Eusebes, Antiochus XIII. Asiatcus (reigned 69-65). In 83 Tigranes, the king of Armenia, invaded Syria, and by 69 his conquest had reached the Euphrates, which blanked the end of his own kingdom from the Romans. When Pompey appeared in Syria in 64, Antiochus XIII. begged to be restored to his ancestral 1

Some of the indications of our documents would make it older, and these are followed by Niese (iii. p. 276, note 5). But in that case Demetrius I. must have already had a wife and children, and been in the west for some time. For it is improbable that such a material factor in the situation would have been left out of account in Polybius's full narrative. After all, it is only a question of probabilities, and the difficulties of the period make it quite admissible that he might be living to be brought up by the Romans, or sent out of the country before him.
SELF—SELIM

knighted or what shrewd was left of it. Pumpey refused and made Syria a Roman province. Antiochus Grypus had given his daughter in marriage to Mithrades (q.v.), a king of Commagene, and the subsequent kings of Commagene (see under Antiochus) claimed in consequence to be the legitimate emperor of Syria, although this fact was not known to the ancients. After its extinction in the male line, and adopted Antiochus as the dynastic name. The kingdom was extinguished by Rome in 72. The son of the last king, Gnaeus Julius Antiochus Epiphanes Philopappus, was murdered in 190.

SELF (O.Eng. seolf, sifu, &c., cf. Dutch zelf, Ger. selbe, selbst), as a pronoun, an element attached to a personal pronoun or preposition, or both. It is the Mhd. Mahabba, and as an adjective a word properly meaning same, identical, also very (see in the expression "self-same"), hence single, plain, not mixed with another colour. It is also a florist’s term for a flower which has uniformity of tint, without markings or other tints. As a noun "self" means one’s own person; for the psychological use of the term see PSYCHOLOGY, and for its ethical aspect EGOSM.

SELIGMAN, EDWIN ROBERT ANDERSON (1861- ), American economist, was born in New York on the 25th of April 1861. He was educated at Columbia University, and, after studying for three years in Germany and France, became prize lecturer at Columbia University in 1885, being made adjunct professor of political economy in 1888. He became McKiver professor of political economy in the same university in 1904. His principal works are Railway Tariffs (1887), The Shifting and Incidence of Taxation (1899; 3rd ed., 1910), Progressive Taxation in Theory and Practice (1894; 2nd ed. 1908), Economic Interpretation of History (1902; 2nd ed. 1907), and Principles of Economics (1907).

SELIM, the name of three sultans of Turkey. Selim I. (1465-1521) succeeded in 1512 his father Bayezid II. whom he dethroned, and whose death, following immediately afterwards, gave rise to suspicions which Selim’s character certainly justified. He signalized his accession by putting to death his brothers and nephews; and gave early proof of resolution by boldly cutting down before their troops two officers who showed signs of insubordination. A bigoted Sunni, he resolved on putting down the Shi’ite heresy, which had gained many adherents in Turkey: the number of these was estimated as high as 40,000. Selim determined on war with Persia, where the heresy was the prevalent religion, and in order that the Shi’ites in Turkey should give no trouble during the war, "measures were taken," as the Turkish historian states, which may be explained as the reader desires, and which proved fully efficacious. The campaign which followed was a triumph for Selim, whose firmness and courage overcame the pusillanimity and insubordination of the Janissaries. Syria and Egypt next fell before him; he became master of the holy cities of Islam; and, most important of all, he induced the last Caliph of the Abbasid dynasty formally to surrender the title of caliph (q.v.), as well as its outward emblems, viz. the holy standard, the sword and the mantle of the prophet. The dignity with which the Ottoman sultans have thereby become invested lends them that prestige throughout the Mussulman world which is of such importance to the present day, and which has thrown into oblivion the condition that the caliph ought to be an Arab of the tribe of Korish. After his return from his Egyptian campaign, he was preparing an expedition against Rhodes when he was overtaken by sickness and died, on the 22nd of September 1521, in the ninth year of his reign, near the very spot where he had attacked his father’s troops, not far from Adrianople. He was about fifty-five years of age. He was bigoted, bloodthirsty and relentless, though one Turkish historian praises his humanity for having forbidden the cutting up alive of condemned persons, or the roasting of them before a slow fire; and at one time he was with difficulty dissuaded from ordering the complete extirpation of all the Christians in Turkey. His ambition was insatiable; he is said to have exclaimed when looking at a map that the whole world did not form a sovereignty vast enough for one monarch. His four months’ victorious campaign against Persia was undertaken and successfully carried through contrary to the wishes of his most trusted minister, several of whom he executed for their opposition to his plans; and he achieved an enterprise which neither Jenghiz Khan nor Timur was able to carry out. It is said that he contemplated the conquest of India and that he was the first to conceive the idea of the Suez Canal.

Selim II. (1524-1574) was a son of Suleiman I. and his favourite Roxelana, and succeeded his father in 1566. He was the first sultan entirely devoid of military virtues and wishing to abandon all power to his ministers, provided he were left free to pursue his orgies and debauches. Fortunately for the country, an able vizier, Sokoll, was in his service. Selim II. ruled seven years, and was assassinated ten years after Selim’s accession succeeded in concluding at Constantinople an honourable treaty with the emperor Maximilian II., whereby the emperor agreed to pay to Turkey an annual “present” of 30,000 ducats (Feb. 17, 1568). Against Russia he was less fortunate, and the first encounter between Turkey and her future northern rival gave preface of disaster to come. A plan had been elaborated at Constantinople for uniting the Volga and Don by a canal, and in the summer of 1569 a large force of Janissaries and cavalry were sent to lay siege to Astrakhan and begin the canal works, while an Ottoman fleet was destroyed by a storm. Early in 1570 the ambassadors of Ivan the Terrible concluded at Constantinople a treaty which restored friendly relations between the sultan and the tsar. Expeditions in the Hejaz and Yemen were more successful, and the conquest of Cyprus in 1571, which provided Selim with his favourite vintage, led to the calamitous naval defeat of Lepanto in the same year, the remnants of which has often been under-estimated, and which at least freed the Mediterranean from the corsairs by whom it was infested. Turkey’s shattered fleets were soon restored, and Sokoll was preparing for a fresh attack on Venice, when the sultan’s death on the 12th of December 1574 cut short his plans. Little can be said of this degenerate son of Suleiman, who during the eight years of his reign never girded on the sword of Osman, and preferred the clashing of wine-goblets to the shock of arms, save that with the dissolute tastes of his father he had not inherited herplicity.

Selim III. (1762-1808) was a son of Sultan Mustafa III. and succeeded his uncle Abd-ul-Hamid I. in 1789. The talents and energy with which he was endowed had endeared him to the people, and great hopes were founded on his accession. He had associated much with foreigners, and was thoroughly persuaded of the necessity of reforming his state. But Austria and Russia gave him no time for anything but defence, and it was not until the peace of Jassy (1792) that a breathing space was allowed him in Europe, while Bonaparte’s invasion of Egypt and Syria soon called for Turkey’s strongest efforts and for the time shattered the old-standing French alliance. He was induced by the repulse to abolish the military tenure of fiefs; he introduced salutary reforms into the administration, especially in the fiscal department, sought by well-considered plans to extend the spread of education, and engaged foreign officers as instructors, by whom a small corps of new troops called nisam-i-jedid were collected and drilled. So well were these troops organized that they were able to hold their own against rebellious Janissaries in the European provinces, where disaffected governors made no scruple of attempting to make use of them against the reforming
sultan. Emboldened by this success, Selim issued an order that in future picked men should be taken annually from the Janissaries to serve in their ranks. Hereupon the Janissaries and other enemies of progress rose at Adrianople, and in view of their number, exceeding 10,000, and the violence of their opposition, it was decided that the reforms must be given up for the present. Servia, Egypt and the principalities were successively the scene of hostilities in which Turkey gained no successes, and in 1607 a British fleet appeared at Constantinople, strange to say to insist on Turkey's yielding to Russia's demands besides dismissing the ambassador of Napoleon L. Selim was, however, thoroughly under the influence of this ambassador, Sebastiani, and the fleet was compelled to retire without effecting its purpose. But the anarchy, manifest or latent, existing throughout the provinces proved too great for Selim to cope with. The Janissaries rose once more in revolt, induced the Sheikhh-ul-Islam to grant a fevta against the reforms, dethroned and imprisoned Selim (1807), and placed his nephew Mustafa on the throne. The pasha of Rustuchuk, Mustafa Bairakdar, a strong partisan of the reforms, now collected a force of 40,000 men and marched on Constantinople with the purpose of reinstating Selim. But he came too late; the ill-fated reforming sultan had been strangled in the seraglio, and Bairakdar's only resource was to wreak his vengeance on Mustafa and to place on the throne Mahomed II., the sole surviving member of the house of Osman.

For authorities see TURKEY: History.

SELINUS (Σελίνους), an ancient city on the S. coast of Sicily, 27 m. S.E. direct from Lilybaeum (the modern Marsala) and 7 m. S.E. of Castel Vetranio, which is 74 m. S.S.W. of Palermo by rail. It was founded, according to Thucydides, in 628 B.C. by colonists from Megara Hyblaea, and from the parent city of Megara (see SICILY: History). The name, which belonged both to the city and to the river on the W. of it, was derived from the wild celery 1 which grows there abundantly, and which appears on some of its coins (see Numismatics, Greek, § "Sicily 2"). We hear of boundary disputes with Segesta as early as 380 B.C. Selinus soon grew in importance, and extended its borders from the Mazurus to the Halycus. Its wealth is shown by the fact that several of its temples belong to the first half of the 6th century B.C. Its government was at first oligarchical, but about 510 B.C. a short-lived despotism was maintained by Peithagoras and, after him, Euryleon (Herod. v. 43, 46). In 480 B.C. Selinus took the Carthaginian side. After this it seems to have enjoyed prosperity: Thucydides (vi. 20) speaks of its wealth and of the treasures in its temples, and the city had a treasury of its own at Olympia.

A dispute between Selinus and Segesta (probably the revival of a similar quarrel about 454, when an Athenian force appears to have taken part 3) was one of the causes of the Athenian expedition of 415 B.C. At its close the former seemed to have the latter at its mercy, but an appeal to Carthage was responded to, and an overwhelming force (the Sicilian cities delaying too much in coming to the rescue) under Hannibal took and destroyed the city in 409 B.C.; the walls were razed to the ground; 6000 inhabitants were killed, 5000 taken prisoners, and only 2600 escaped to Agrigentum (Acracas). 4 In 408 Hermocrates, returning from exile, occupied Selinus and rebuilt the walls; and it is to him that the fine fort on the neck of the acropolis must be attributed. Hence he attacked Motya and Panormus and the rest of Punic Sicily. He fell, however, in 407 in an attempt to enter Syracuse, and, as a result of the treaty of 405 B.C., Selinus became absolutely subject to Carthage, and remained so until its destruction at the close of the first Punic War, when its inhabitants were transferred to Lilybaeum. It was never afterwards rebuilt, and Strabo (vi. p. 272) mentions it as one of the extinct cities of Sicily.

The ancient city occupied a sand-hill running N. and S.; the S. portion, overlooking the sea, which was the acropolis, is surrounded by fine walls of masonry of rectangular blocks of stone, which show traces of the reconstruction of 408 B.C. It is traversed by two main streets, running N. and S. and E. and W., from which others diverged at right angles. There are, however, some traces of earlier buildings at a different orientation. Only the S.E. portion of the acropolis, which contains several temples, has been excavated: in the rest private houses seem to predominate. The delites to whom the temples were dedicated not being certainly known, they are as a rule indicated by letters. In all the large temples the cella is divided into two parts, the smaller and inner of which (the adytum) was intended for the cult image. The opisthodomus is sometimes omitted. All of them lie in a state of ruin, and, from the disposition of the drums of the columns, it is impossible to suppose that their fall was due to any other cause than an earthquake. Temple C is the earliest of those on the acropolis. It had six columns at each end (a double row in the front) and seventeen on each long side. From it came the three arcahic metopes now in the museum at Palermo, which are of great importance in the history of the development of art, showing Greek sculpture in its infancy. Portions of the coloured terra-cotta slabs which decorated the cornice and other architectural members have also been discovered. Next to it on the N., lies temple D, both having been included in one temenos, with other buildings of less importance: to the E. of D is a large altar. B is a small temple of comparatively late date; while A and O lie on the S. side of the main street from E. to W. in another peribolos.

At the N. end of the acropolis are extensive remains of the fortifications of Hermocrates across the narrow neck connecting it with the rest of the hill. In front of the wall lies a deep trench, into which several passages descend, as at the nearly contemporary fort of Euryclus above Syracuse (p. 43). Outside this again lies a projecting semicircular bastion, which commands the entrance from the exterior of the city on the E., a winding trench approached by a pair of double gateways, which are not vaulted but covered by the gradual projection of the upper courses. Capitals and triglyphs

1 The plant was formerly thought to be wild parsley. It is now generally agreed that it is celery.
from earlier buildings have been used in the construction of these fortifications: from their small size they may be mostly attributed to private houses. A wayfarer, among the less<br>subservient of the Ghuzz, would have perceived at a glance that they were quite alone and unprotected. It is likely that they were outside the town, but stood in a sacred enclosure. All of them have fallen, undoubtedly owing to an earthquake.

A peculiarity of the construction of this temple is that all the intercolumniations were closed by stone screens. In it were found the lower parts of two metopes. Next in date is the huge temple G, which, as an inscription proves, was dedicated to Apollo; though it was never entirely completed (many of the columns still remain unfluted), it was in use. The columns vary somewhat in diameter (more than even the difference caused by fluting would warrant), and the crowning parts are not entirely similar. The plan is a curious one: despite the comparative narrowness of the cella, it had two rows of ten columns in it, in line with the front and back walls. The temple E, however, was identified by the discovery of an inscription to have been dedicated to Hera. It is famous for its fine metopes now in the museum at Palermo, belonging to the beginning of the 5th century B.C.

Selçuk, Selçuk, or Selçûq, the name of several Turkish dynasties issued from one family, which reigned over large parts of Asia in the 11th, 12th and 13th centuries of the Christian era. The history of the Seljuk forms the first part of the history of the Turkish empire. Proceeding from the deserts of Turkestan, the Seljuks reached the Hellespont; but this barrier was crossed and a European power founded by the Ottomans (Osmanli). The Seljuks inherited the traditions and at the same time the power of the Arabian caliphate, of which, when they made their appearance, only the shadow remained in the person of the Abbasiid caliph of Baghdad. It is their merit from a Mahomedan point of view to have re-established the power of orthodox Islam and delivered the Moslem world from the subversive influence of the ultra-Shiite tenets, which constituted a serious danger to the duration of Islam itself. Neither had civilization anything to fear from them, since they represented a strong neutral power, which made the intimate union of Persian and Arab impossible, and which was an essential support of the national Turkish—Italian movements in that language being during the whole period of the Seljuk rule exceedingly rare.

The first Seljuk rulers were Toghrul Beg, Chakir Beg and Ibrahim Niyal, the son of Mikhail, the son of Seljuk, the son of Tukak, or Tuqaq (also styled Timurlyük, "iron bow"). They belonged to the Turkish tribe of the Ghuzz (Oğuz or Oeschn of Const. Porphyry. and the Byzantine writers), which traced its lineage to Oghuz, the famous epic hero not only of this but of all Turkish tribes. There arose, however, at some undefined epoch a more powerful tribe, the Ghuzz, that conquered the Turks, because, as the latter allege, Ghuzz, the son of (or grandson) of Yafeth (Jobeth), the son of Nuh (Noah), had stolen the genuine rain-stone, which Turk, also a son of Yafeth, had inherited from his father. By this party, as appears from this tradition, the Ghuzz were not considered to be genuine Turks, but to be Turkman (that is, according to a popular etymology, resembling Turks). But the native tradition of the Ghuzz was unquestionably right, as they spoke a pure Turkish dialect. The fact, however, remains that there existed a certain animosity between the Ghuzz and their allies, the rest of the Turks, which increased as the former became co-extensive with the latter (in the course of the 4th century of the Flight). The Ghuzz were settled at that time in Transoxiana, especially at Jand, a well-known city on the banks of the Jaxartes, not far from its mouth. Some of them served in the armies of the Ghaznavids Sabuktigin (Bukht-chin) and Mahmud (997–1030); but the Seljuks, a royal family among them, had various relations with the reigning princes of Transoxiana and Khwarizm, which cannot be narrated here. But, friends or foes, the Ghuzz became a serious danger to the adjoining Mahomedan provinces from their predatory habits and continual raids, and the more so as they were very numerous.

It may suffice to mention that, under the leadership of Fige Arslan Israil, they crossed the Oxus and spread over the eastern provinces of Persia, everywhere plundering and destroying. The imprisonment of this chieftain by Masud, the son and successor of Mahtmud, was of no avail: it only furnished his nephews with a ready pretext to cross the Oxus likewise in arms against the Ghaznavids. We pass over their first conflicts and the unsuccessful agreements that were attempted, to mention the decisive battle near Merv (1040), in which Masud was totally defeated and driven back to Ghazni (Ghazna). Persia now lay open to the victors, who proclaimed themselves independent at Merv (which became from that time the official capital of the principal branch of the Seljuk), and acknowledged Toghrul Beg as chief of the whole family. After this victory the three princes Toghrul Beg, Chakir Beg and Ibrahim Niyal separated in different directions and conquered the Mahomedan provinces east of the Tigris; the last named, after conquering Hamadan and the province of Jebel (Irak i Ajam), penetrated as early as 1048, with fresh Ghuzz troops, into Armenia and reached Manzikert, Erzerum and Trebizond. This excited the jealousy of Toghrul Beg, who impressed a number of prisoners of Jebel; but Ibrahim refused, and the progress of the Seljukian arms was for some time checked by internal discord—an ever-recurring event in their history. Ibrahim was, however, compelled to submit.

At this time the power of Qaim, the Abbasiid caliph of Bagdad (see CALIPHATE, section C, § 26), was reduced to a mere shadow, as the Shiite dynasty of the Buγids and afterwards his more formidable Fatimite rivals had left him almost wholly destitute of authority. The real ruler at Bagdad was a Turk named Basasiri, lieutenant of the last Buγid, Malik-ar-Rahim. Nothing could, therefore, be more acceptable to the caliph than the protection of the orthodox Toghrul Beg, whose name was read in the official prayer (khutba) as early as 1050. At the end of the same year (1053) the Seljuk entered the city and after a tumult seized the person of Malik-ar-Rahim. Basasiri had the good fortune to be out of his reach; after acknowledging the right of the Fatimites, he gathered fresh troops and incited Ibrahim Niyal to rebel again, and he succeeded so far that he re-entered Bagdad at the close of 1058. The next year, however, Toghrul Beg got rid of both his antagonists, Ibrahim being taken prisoner of Jebel; but Ibrahim refused, and the progress of the Selejukian arms was for some time checked by internal discord—an ever-recurring event in their history. Ibrahim was, however, compelled to submit.

rizm," in Sitzungsberichte of the Vienna Acad., lxxiv. 304 seq.
bowed string put an end to his life (1073). Malik Shāh regulated also the affairs of Asia Minor and Syria, conceding the latter province as an hereditary fief to his brother Tutush, who established himself at Damascus and killed Atšiz. He, however, like his father Alp Arslān, was indebted for his greatest fame to wise and salutary measures of their vizier, Nizām ul-Mulk. This extraordinary man, associated by tradition with Omar Khayyām (q.v.), the well-known mathematician and free-thinking poet, and with Hassan (ibn) Šahāb, afterwards the founder of the sect of the Assassins (q.v.), was a renowned author and statesman of the first rank, and immortalized his name by the foundation of the hospitals (the left of Aūtāb at Bagdad), observatories, mosques, hospitals and other institutions of public utility. At his instigation the calendar was revised, and a new era, dating from the reign of Malik Shāh and known as the Jelalian, was introduced. Not quite forty days before the death of his master this great man was murdered by the Assassins. He had fallen into disfavour because of his unwillingness to join in the intrigues of the princess Turkan Khātūn, who wished to secure the succession to the throne for her infant son Māḥmūd at the expense of the elder sons of Malik Shāh.

The Constitution and Government of the Seljūk Empire. — It has been already observed that the Seljūks considered themselves the defenders of the orthodox faith and of the Abbāsid caliphate, while they on their side represented the temporal power which received its support from the church. In the first instance there was and it was always the case that the members of the Seljūk house had the same obligations in this respect, but they had not the same rights, as one of them occupied relatively to the others a place almost analogous to that of the greatest monarch of his time. The position was changed between father and son, though the old Turkish idea of the rights of the elder brother often caused rebellions and violent family disputes. After the death of Jelalian Shāh the family was not strong enough to enforce obedience, and consequently the central government broke up into several independent dynasties. Within the limits of these minor dynasties the same rules were observed, and the fiefs belonging to the family were divided among the sons and their descendants. These were the royal fiefs of the Tangarids, of the Khwarizmians, and of the Seljūks themselves, the latter having the right to sell their lands or castles in which they stood to the prince, — as lala, "tutor." The affairs of state were managed by the divān under the presidency of the vizier; but in the empire of Rūm its authority was inferior to that of the persevār, whom we may name "lord chancellor." In Rūm the feudal system was extended to Christian princes, who were acknowledged by the sultan on condition of paying tribute and serving in the armies. The court dignitaries and the governors of provinces were often members of the royal family, the vizier was elected, and expressed the relation in which he stood to the prince, — as bāb, "door." The Seljūks of Persia, like the Seljūks of northern Iraq, were divided into two lines. One of these was formed by the dynasty of Arslān, vizir of Shiraz, which became the hereditary fief of Kāvūr, the son of Chāki Beg. Mention has been made of his war with Malik Shāh and of his ensuing death (1073). Nevertheless his descendants were left in possession of their ancestor's dominions; and till 1170 Kermān, to which belonged also the opposite coast of Omān, enjoyed a well-ordered government, except for a short interruption caused by the deposition of İrān Shāh, who had embraced the tenets of the Ismā'īlītes, and was put to death (1101) in accordance with a fatwa of the ulamas. But after the death of Toğrul Shāh (1170) his three sons disputed with each other for the possession of his dominions; till the country became utterly devastated and fell an easy prey to some bands of Ghuzzs, who, under the leadership of Malik Dinār (1185), marched into Kermān after harassing Sinjar's dominions. Afterwards the shāhs of Khawarizm took this province.

The Seljūkian dynasty of Syria came to an end after three generations, and its later history is interwoven with that of the crusaders. The first prince was Tutush, mentioned above, who perished, after a reign of continuous fighting, in battle against the Seljūk near Baiṣāyra (Basyar) in 1055. Of his two sons, the elder, Rīdūn, established himself at Aleppo (d. 1113); the younger, Duqāq, took possession of Damascus, and died in 1103. The sons of the former, Alp Arslān and Sultan Shāh, reigned a short time nominally, though the real power was exercised by Lūlā till 1117.

After the great victory of Alp Arslān in which the Greek emperor was taken prisoner (1071), Asia Minor lay open to the inroads of the Turks. Hence it was easy for Suleimān, the son of Kutulumish, the son of Arslān Pāgū (Israil), to penetrate as far as the Hellespont, the more so after the captivity of Romanus and his sons, and the destruction of their capital Nicae. In 1069 he himself captured Constantinople and reorganized the empire, which continued to flourish under his successors, the Patschavars. The Seljūks of Kerman, however, under the emir of Soltān Shāh, were unable to prevent the growth of the power of the Seljūks of Turkestan; and the last Seljūk prince of Persia, Māḥmūd, was driven from his capital and his dominions.

1 See Demétreffy, Journ. asiatique (1853), I. 425 seq., II. 217 seq.

2 An outline of the history of this branch of the Seljūks is given in Z.D.M.G. (1885), pp. 362-401.

3 This prince rebelled against Alp Arslān in 1064, and was found dead after a battle.

SELJUKS

as long as the important city of Antioch belonged to the Greeks, so that we may date the real foundation of this Seljuk empire from the taking of that city by the treason of its commander Philarctus in 1084, who afterwards became a vassal of the Seljuks. The conquest involved Suleiman in war with the neighbouring Mahommedan princes, and he met his death soon afterwards (1091), in a battle against the Seldjucks. The Seljuk family discorded the decision of Malik Shāh was necessary to settle the affairs of Asia Minor and Syria; he kept the sons of Suleiman in captivity, and committed the war against the unbelieving Greeks to his generals Bursuq (Ippauros) and Buzān (Ippauros). Barkiyăroq, however, on his accession (1092), allowed Kiliš Arslân, the son of Suleiman, to return to the dominions of his father. Acknowledged by the Turkish amirs of Asia Minor, he took up his residence in Nicaea, and defeated the first bands of crusaders under Walter the Penniless and others (1096); but, on the arrival of Godfrey of Bouillon and his companions, he was prudent enough to leave his capital in order to attack them as they were besieging Nicaea. He suffered, however, two defeats in the vicinity, and Nicaea surrendered on the 23rd of June 1097. As the crusaders marched by way of Doryaleus and Iconium towards Antioch, the Greeks subdued the Turkic amirs residing at Smyrna, Ephesus, Sardis, Philadelphus, Laodicea, Lampe and Polybotus; and Kiliş Arslân, with his Turks, retired to the north-eastern parts of Asia Minor, to act with the Turkish amirs of Sivas (Sebaste), known under the name of Danishmand.

The history of the dynasty of the Danishmand is still very obscure, notwithstanding the efforts of Mordtmann, Schloumberger, Karaşag¬ç, Sallet and others to fix some chronological details, and it is almost impossible to harmonize the different statements of the Armenian, Syriac, Greek and Western chronicles with those of the Persian, Arabic and Turkish. The coins are few in number, very difficult to decipher, and often without date. The founder of the dynasty was probably Malik Tālšī, who is said to have been a schoolmaster (danishmand), probably because he understood Arabic and Persian. His descendants, therefore, took the title of "Ibn Danishmand," often without their own name. They took possession of Sivas, Troad, Nikaia, ḇela, Malatia, possibly after the occupation of Nicaea by Suleiman, though they may have established themselves in one or more of these cities much earlier, perhaps in 1071, after the defeat of Romanus Diogenes. During the first crusade the reigning prince was Kumushtegi (Ahmed Gbāš), who defeated the Franks and took prisoner the prince of Antioch, Bohemund, afterwards ransomed. He died probably in 1106, and was succeeded by his son Mahommed (d. 1143), who reigned Jâş and Iṣkandar. It is very difficult to ascertain that other members of the same dynasty reigned at the same time in the cities already named, and in some others, e.g. Kastamuni.

Afterwards there arose a natural rivalry between the Seljuks and the Danishmand, which ended with the extinction of the latter about 1175. Kiliş Arslân took possession of Mosul in 1107, and declared himself independent of the Seljuks of Irak; but in the same year he was drowned in the Khaboras through the treachery of his own amirs, and the dynasty seemed about to decay, as his sons were involved in the power of his enemies. The Seljuk Mahommed, however, set at liberty his eldest son Malik Shāh, who reigned for some time, until he was treacherously murdered (it is not quite certain by whom), being succeeded by his brother Masûd, who established himself at Konia (Iconium), from that time the residence of the Seljuks of Rüm. During his reign— he died in 1155—the Greek emperors undertook various expeditions in Asia Minor and Armenia; but the Seljuk was cunning enough to profess himself their ally and to direct them against his own enemies. Nevertheless the Seljukian dynasty was perpetuated, and the importance and not insignificance to this son and successor, Kiliş Arslân II., had subdued the Danishmands and appropriated their possessions, though he thereby risked the wrath of the powerful atabeg of Syria, Nureddin, and afterwards that of Saladin. But as the sultan grew old his numerous sons, who held each the command of a city of the empire, embittered his old age by their mutual rivalry, and the eldest, Kutb ed-din, tyrannized over his father in his own capital, exactly at the time that Frederick I. (Barbarossa) entered his dominions on his way to the Holy Sepulchre (1190). Konia itself was taken and the sultan forced to provide guides and provisions for the crusaders. Kiliş Arslân lived two years longer, finally under the protection of his youngest son, Kaikhosro, who held the capital after him (till 1199) until his elder brother, Rukneddin Suleimān, after having vanquished his other brothers, ascended the throne and obliged Kaikhosro to seek refuge at the Greek emperor's court. This valiant prince saved the empire from destruction and conquered Erzerûm, which had been ruled during a considerable time by a separate dynasty, and was now given in fief to his brother, Mughūt ud-din Togrul Shāh. But, marching thence against the Georgians, Suleimān's troops suffered a terrible defeat. After this Suleimān set out to subdue his brother Masûd Shāh, at Angora, who was finally taken prisoner and treacherously murdered. This crime is regarded by Oriental authors as the reason of the premature death of the sultan (in 1197) but it is more probable that he was murdered because he displeased the Mahommedan clergy, who accused him of atheism. His son, Kiliş Arslân III., was soon deposed by Kaikhosro (who returned), assisted by the Greek Maurzomizes, whose daughter he had married in exile. He ascended the throne the same year in which the Latin empire was established in Constantinople, a circumstance highly favourable to the Turks, who were the natural allies of the Greeks (Theodore Lascaris) and the enemies of the crusaders and their allies, the Armenians. Kaikhosro, therefore, took in 1207 from the Italian Alberandini the important harbour of Attila (Adalia); but his conduct in his relations with the Armenians, Kaikobad, was induced to the capture of the important city of Aleppo, which time governed by the descendants of Saladin; but the affair miscarried. Soon afterwards the sultan died (1219) and was succeeded by his brother, All ud-din Kaikobad I., the most powerful and illustrious prince of this branch of the Seljuks, renowned not only for his successful wars but also for his magni¬cent structures at Konia, Alaîa, Sivas and elsewhere, which belong to the best specimens of Saracenic architecture. The town of Alaîa was the creation of this sultan, as previously there existed on that site only the fortress of Candeler, at that epoch the property of an Armenian chief, who was expelled by Kaikobad, and shared the fate of the Armenian and Frankish knights who possessed the fortresses along the coast of the Mediterranean as far as Seleukeia (Seleucia). Kaikobad extended his rule as far as this city, and desisted from further conquest only on condition that the Armenian princes would enter into the same kind of relation to the Seljuks as had been imposed on the Comnenians of Trebizond. But his greatest military fame was won by a war, which however glorious, was to prove fatal to the Seljuk empire in the future: in conjunction with his ally, the Ayyubite prince of Egypt, he defeated the Shâh Jâsh and captured Erîzûm near Erzûnûg (1236). This victory removed the only barrier that checked the progress of the Mongols. During this war Kaikobad put an end to the collateral dynasty of the Seljuks of Erzerûm and annexed its possessions. He also gained the city of Khâlišt with dependencies that in former times had belonged to the Shâh-i-Armen, but shortly before had been taken by Jâsh ud-din; this aggression was the cause of the war just mentioned. The acquisition of Khâlišt led, however, to a new war, as Kaikobad's ally, the Ayyubite prince, envied him this conquest. Sixteen Mahommedan princes, mostly weak, revolted under the leadership of Malik al-Kâmil, prince of Egypt, marched with considerable forces into Asia Minor against him. Happily for Kaikobad, the princes mistrusted the power of the
Egyptian, and it proved a difficult task to penetrate to the mountainous, well-fortified accesses to the interior of Asia Minor, so that the advantage rested with Kaikobad, who took Kharput, and for some time even held Harran, Ar-Roha and Rakka (1252). The latter conquests were, however, soon lost, and Kaikobad himself died in 1254 of poison administered to him by Mongols with the aid of his son-in-law, Ghiyass ed-din Rukneddin, sultan of Erzincan. The unworthy son inherited from his father an empire embracing almost the whole of Asia Minor, with the exception of the countries governed by Vatatzes (Vatases) and the Christian princes of Trebizond and Lesser Armenia, who, however, were bound to pay tribute and to serve in the armies—an empire celebrated by contemporary reports for its wealth. But the Turkish soldiers were of little use in a regular battle, and the sultan relied mainly on his Christian troops, so much so that an insurrection of dervishes which occurred at this period could only be put down by their assistance. It was at this epoch also that there flourished at Konia the founder of the order of the Mevlevis or Mawlawis, Jâld ed-din Rûmi (see RûMî), and that the dervish fraternities spread throughout the whole country and became powerful bodies, often discontended with the liberal principles of the sultans, who granted privileges to the Christian merchants and held frequent intercourse with them. Notwithstanding all this, the strength and reputation of the empire were so great that the Mongols hesitated to invade it, although standing at its frontiers. But, as they crossed the border, Kaikobad marched against them, and suffered a formidable defeat at Kuzadâg (between Erzingân and Sivas), in 1245, which forced him to purchase peace by the promise of a heavy tribute. The independence of the Seljûks was now for ever lost. The Mongols retired for some years; but, Kaikobad II. dying in 1245, the joint government of his three sons gave occasion to fresh intrusions, till one of them died and Hulagu divided the empire between the other two, Izz ed-din (Kaikaua II.) ruling the districts west of the Halys, and Rukneddin (Kilîj Arslan IV.) the eastern provinces (1259). But Izz ed-din, intriguing with the Mameluke sultans of Egypt to expel his brother and gain his independence, was defeated by a Mongol army and obliged to flee to the imperial court. Here he was imprisoned, but afterwards released by the Tatars of the Crimea, who took him with them to Sarai, where he died. Rukneddin was only a nominal ruler, the real power being in the hands of his minister, Mu'inn ed-din Suleimân, who in 1267 procured an order of the Mongol Khan Abaka for his execution. The minister raised his infant son, Ghiyâs ed-din Kaikobad III., to the throne, and governed the country for ten years longer, till he was entangled in a conspiracy of several amirs, who proposed to expel him and place his son on the throne. In the meantime, however, Masûd, the son of Kaikobad's brother Ghiyâs, had been admitted into the service of the Mongol Khan Khatâr, and a combined force, which included some of the best officers of the Seljûk sultans of Erzincan, had been sent for the purpose of putting down revolt in the Crimea. The rebellion of the Seljûk chieftains was easily quelled, and their leader, Jâld ed-din Rûmi, was taken prisoner and brought to Khatâr. In 1269, in the same year in which the chief of the Khatârians was invested with the title of sultan, Kaikobad II. died at the age of sixty-six. His son and successor, Masûd, was only six years old, and thus the sultanate of Erzincan was again reduced to a mere shadow of a kingdom. It was not long, however, before the Seljûk power was completely extinguished in this quarter of Asia Minor. The Ottomans, who at length prevailed, took possession of the whole of Asia Minor, and, as they advanced, the Seljûks were driven farther and farther to the north and west, till 1300, others till 1315. With him ended the dynasty of the Seljûks; but the Turkish empire founded by them continued to exist under the rising dynasty of the Ottomans. (See TURKEY.)

BIBLIOGRAPHY.—The best, though insufficient, account of the Seljûk Selcuk, d'Aubigny de Guise (1730-1787), Scottish sailor, commander of the "Duke," privateer, from whom Gibbon borrowed his dates. Among translations from original sources of which the most trustworthy are yet unprinted, comp. Mirkhoud's Geschichte der Seljûken (ed. Vollers), Giessen, 1787, "Tartarii-Caostăeq, French translation by Defremy in the Journal asiatique, 1848, i. 417 sqq., ii. 259 sqq., 334 sqq.; Seid Loomani et libro Turcicher qui Oghuzname inscriviit excerpta (ed. J. H. W. Robinson, 1754) (the Seljûks of Asia Minor exclusively, but of little value); and a translation respect ed to its period in the works of Von Hammer and d'Oebisso (see Bibliography to Turkey: History), and in Stanley Lane Poole's Moham medanin Harbiyetleri (1861). M. T. H.

SELKIRK (OF SELCRAIG), ALEXANDER (1676-1721), Scottish sailor, the prototype of "Robinson Crusoe," seventh son of John Selcraig, shoemaker and Tanner of Largo, Fifeshire, was born in 1676. In his youth he displayed an unruly disposition, and, having been summoned on the 27th of August 1695 before the kirk-session for his indecent behaviour in church, "did not comport, being gone away to the sea." In May 1703 he joined Dampier in a privateering expedition to the South Seas, going with the "Cinque Ports" galley as sailing master. In September 1704 the "Cinque Ports" put in at Juan Fernandez Island, "an unknown place; here Selkirk had a dispute with his captain, Thomas Stradling, and at his own request he was transferred to a few ordinary necessaries. Before the ship left he begged to be readmitted, but this was refused, and Selkirk remained alone in Juan Fernandez four years and four months, till on the 31st of January 1709 he was found, and on the 12th of February following taken off, by Captain Woods Rogers, commander of the "Duke" privateer (with Dampier as pilot), who made him his mate and afterwards gave him command of one of his prizes, the "Increase." (March 29th.) Selkirk returned to the Thames on the 14th of October 1711; he was back at Largo in 1712, in 1717 we find him again at sea, and in 1722 he died as master's mate of H.M.S. "Weymouth." (December 12th.)

See Woodses Rogers, Cruising Voyage round the World (1712), and Edward Cooke, Voyage in the South Sea and round the World (1712), the earliest descriptions of Selkirk's adventures; also Providence Displayed, or a Surprising Account of one Alexander Selkirk, etc., written by H. Richardson in 1719, and Funnell's Voyage round the World (1707). Steele made Selkirk's acquaintance, and gave a sketch of the adventurer and his story in a letter to Abington for the Gentleman's Magazine, 1713. The first publication of Selkirk's story was in a second edition of Rogers' Voyage, and appeared in 1718. Defoe published Robinson Crusoe. While this is clearly indebted in its main outlines to Selkirk's story, most of its incidents are, of course, entirely independent of thefacts. The original of "Robinson Crusoe" is the island and the whole narrative of the cannibal visits, etc., agree rather with one of the West Indies than with Juan Fernandez.

The best modern biography is the Life and Adventures of Alexander Selkirk by John Howell (1829). In 1868 a tablet was put up Juan Fernandez at a point on the hill road called "Selkirk's Look-out," where it is in the trap rock a magnificent view may be had of the whole island, and of the sea north and south, over which the exile must have often watched for an approaching sail. It bears the following inscription:—"In memory of Alexander Selkirk, mariner, and the first to inhabit this island, in the year 1716, he lived on this island in complete solitude for four years and four months. He was landed from the 'Cinque Port' (sic) galley, 96 tons, 16 guns, 1704 A.D, and was taken off in the 'Duke' privateer, 12th February 1720. He died lieutenant of the 'Weymouth' 1723 A.D., aged forty-seven years. This tablet is erected near Selkirk's look-out by Commodore Powell and officers of H.M.S. 'Topaze,' 1868 A.D."
acquired control of the Hudson's Bay Company. In May 1811 an immense tract was granted to him in the Red River valley, and he at once proceeded to send out settlers; but the hostility of the leader survived; with a band captured from the town at Montreal, eventually ruined the colony (see Red River Settle-
ment), and the influence of his rivals led to the defeat of Selkirk in various legal proceedings. On the 8th of April 1820 he died broken-hearted at Pau. One of the most generous and dis-
interested men in the history of colonization, he fell a victim to the predatory selfishness of his rivals.
Copies of his papers, most of which are unpublished, are in the Canadian Archives Department at Ottawa.

SELKIRK, a royal and political burgh and the county town of Selkirkshire, Pop. (1901) 6392. It lies on Ettrick Water, about 3 m. above its confluence with the Tweed, 63 m.
S. of Galashiels by the British Railway Company's branch line, of which it is the terminus. It is picturesquely situated on a hill on the right bank of the river, close to which are the mills and factories. The public buildings include the county buildings, public hall, library and the town hall (with a spire 110 ft. high). There are statues of Sir Walter Scott in his sheriff's robes, and Mungo Park, the African explorer, who was educated at the grammar school. Woollen manufacturers (tweeds, tartans, plaid), are the principal industries and there is also an important agricultural centre. With Galashiels and Hawick it belongs to the Hawick or Border group of parlia-
mentary burghs. Immediately south of the town are the beautiful grounds of the Haining.
As its early name (Scheleschyrche) indicates, Selkirk originally consisted of a number of shielis (huts), in the forest beside which a church had been planted by the Culdees of Old Melrose. David I., while prince of Cumbria, founded in 1115 the abbey, which was removed fifteen years afterwards to Kelso, and also erected a castle. Captured by Edward I., by whom it was en-
larged and changed into a burgh. In the English Civil War it was retaken by Wallace in 1297, and remained in the hands of the Scots till the battle of Halidon Hill (1333), when it was delivered to the English. It was probably destroyed in 1417 when Sir Robert Umfraville, governor of Berwick, set fire to the town, and nothing remains of it save some green mounds and the name Peel Hill. It is significant of the havoc wrought during the Border warfare that there is not in Selkirk, in spite of its antiquity, any building two hundred years old. Of the eighty burghs who marched to Flodden (1513) under William Brydone, the town clerk, only the charter of the old church and the charter which the English crown gave him when he was knighted by James V. This charter is locally supposed to be the one borne by the Weavers' Corporation in the annual ceremony of Riding the Common, but the claim cannot be verified.
The charter granted by David I. and other muniments having perished, James V. renewed the charter in 1533, with the right to enclose 1000 acres of the common and leave to elect a provost. After the battle of Philiphaghaugh (1465), David Leslie, the Covenanters' general, had some prisoners confined in the tolbooth of Selkirk and afterwards massacred in the market-
place. From an early period the souters (shoemakers) were a flourishing craft, and in the rebellions of 1715 and 1746 were required to furnish the Jacobites with several thousand pairs of shoes. Though shoemaking is extinct, "the souters of Selkirk" is still a nickname for the inhabitants. Tradition of the ancient craft yet survives also in connexion with the enrolment of bur-
gesses, when the burgess elect has to go through the ceremony of "licking the birse" (i.e. bristles). When the loving-cup reaches the candidate he dips in the wine a brush of bristles like that used by shoemakers and passes it through his lips.

SELKIRK MOUNTAINS, a range in the S.E. of British Columbia, Canada, extending N. for about 200 m. from the American frontier with a breadth of about 80 m. and bounded E., W. and N. by the Columbia River system. Though often spoken of as part of the Rocky Mountain system, they are really distinct, and belong to an older geological epoch, consisting mainly of crystalline or highly metamorphosed rocks, granites, gneiss, schists; their outline is too round and less serrated than that of the Rockies.

On the S.E. is the Purcell range, with the main chain of the Rockies still farther E., and on the W. the Gold range, prolonged northwards as the Castle Mountains. They do not rise much above 1900 ft. a southerly peak being Sir Donald (named after Lord Strathcona), 10,645 ft.; Macdonald (named after Sir John Macdonald), 9440 ft.; and Mount Tupper (after Sir Charles Tupper), 9030 ft. The scenery is wild and magnificent; below the snow-line, especially on the western side, the slopes are densely wooded, and enormous glaciers fill the upper valleys; of these the most celebrated is that of the Illecillewaet, near Glacier House, on the Canadian Pacific railway. The Selkirs are crossed by the railway at Rogers Pass, discovered in 1883.
The engineering difficulties overcome are greater than at any other point of the line, the ascent being 200 ft. long in the valleys of the larger streams. The highest hills are found in the extreme west and south-west. On the confines of Peebleshire the chief heights are Dun Rig (2433 ft.), Black Law (2828), Broad Law (2723) and Lochcraig Head (2622); and on the Dumfriesshire borders, Bodesbeck Law (2175), Capel Fell (2225), Wind Fell (2180) and Ettrick Pen (2260). In the north, close to the Midlothan boundary, is Windlestraw Law (2161). The principal waters are the Ettrick (32 m.) and its left-hand affluent the Yarrow (14 m.), but for a few miles the Tweed traverses the north of the county. Gala Water (21 m.), though it joins the Tweed to the north, belongs to Roxburghshire, as it rises in the Moorfoot Hills and for most of its course flows in that shire. St Mary's Loch and its adjunct, the Loch of the Lornes, in the uplands, are the chief lakes, and of numerous small lakes in the south-east the two lochs of Shaw, Clearburn, Akermoor and Essendine may be mentioned. The vales of the Tweed and Yarrow and Ettrickdale are the principal valleys.

Geology.—This county is entirely occupied by Silurian and Ord-
ovician rocks which are very much folded and crumpled; the axes of folding are more or less north-east and south-west. The Ordovician rocks, represented by the Glenklin and Hartfell shales, appear in the crests of the anticlinal folds; in the western part of the county (between the Tweed and the Blackwater) they are of thin outcrop, but on the eastern slopes they reach a thickness of 3000 ft. The Ordovician shales form the Birkhall graptolitic shales followed by the Queensberry grits, a series of greywackes, grits, flags and shales, which pass upwards into the Hawick rocks, shales with white-
weathering greywackes, and the-super-
lying greywackes in the Ordovician are used as building stones. Igneous rocks are represented by the Tertiary basalt dikes of Bower-
hope Law and dikes of quartz-felsite near Windlestraw Law and Cadron Water; dikes of minette occur near Todrig. A great deal of boulder-clay covers the older rocks; the ice-borne material travelled from west to east, and many of the hills show steep and bare slopes towards the west, but have gentle slopes covered with glacial deposits on the eastern side.

Climate and Agriculture.—The rainfall for the year, based on ob-
servations at Bowhill, between the confluence of the Yarrow and Ettrick, at a height of 537 ft. above the sea, averages 33-65 in. The mean temperature for the year, calculated at Galashiels (416 ft. above the sea), is 46.3° F., for January 36.2° F., and for July 58.2° F. The climate is thus cold and wet on the whole, and as the soil is mostly thin, over a soil subsoil of clayey till, agriculture is carried on at a dis-
advantage. About one-sixth of the surface is under cultivation, oats being almost the only grain crop and turnsips the chief green crop. Live stock is important, livestock in fact comprising all the animal production of the county, both as food and wool. There are comparatively few small holdings, farms between 100 and 300 acres being the most usual. More than one-third of the county of 60,000 holdings belong to the Church, and the farmland in the land between the Ettrick and the Tweed was formerly covered with forest to such an extent that the sheriffdom was described as Ettrick
Sella 613

Forest. The chief trees were oak, birch and hazel; and the wood being locked with the finest breed of red deer in the kingdom became the hunting-ground of the Stuarts. James V., however, to increase his revenues, let the domain for grazing, and it was soon converted into pasture. For a while, the result that now only about 10,000 acres in the shire are under wood.

Manufactures and Communications.—Woolen manufactures (tweed, tartans, plaids, yarn and hosiery) are the predominant industry in Galashiels and Selkirk, and dyeing, engineering, iron-founding and bootmaking are also carried on at Galashiels, and there are large vineries at Clovenfords.

The only railway communication is in the north, where there is a branch line from Galashiels to Selkirk, besides part of the track of the Waverley route from Edinburgh to the south and the line from Galashiels to Peebles. There are coaches from Selkirk to St Mary's Loch and periodically to Moffat.

Population and Administration.—In 1891 the population numbered 27,712, and in 1901 it was 23,336, or 88 to the sq. m., a decrease of 15.78%, much the largest on the decline in Scotland. Fifteen persons spoke Gaelic and English, none Gaelic only. The chief towns are Galashiels (pop. 13,615) and Selkirk (6,292). Selkirkshire combines with Peeblesshire to return a member to Parliament, and the county town and royal burgh of Selkirk and the municipal burgh of Galashiels united with Hawick (in Roxburghshire) to constitute the Border or Hawick group of parliamentary burghs. The shires of Selkirk, Roxburgh and Berwick form a sheriffdom, and a resident sheriff-substitute sits at Selkirk and Galashiels. There is a combination poorhouse at Galashiels. The county is under the sheriff-substitute and Galashiels, while some of the other schools in the shire earn grants for higher education. Part of the "residue" grant is spent in supporting short courses of instruction in dairying, and Selkirk town council subsidizes popular science classes in the burgh school.

History and Antiquities.—There are no Roman remains in Selkirkshire, the natives probably being held in check from the station at Newstead near the Eildons. The Standing Stone near Yarrow church bearing a Latin inscription is ascribed to the 5th or 6th century and is only a quasi-Roman relic. The called British camps have been found on the upper and middle waters of the Ettrick and Yarrow, and of the few situated in the lower valleys of these streams the most important is the large work on Rink Hill in the parish of Galashiels, the district containing various interesting prehistoric remains. At Torwoodlee, 2 m. north-west of Galashiels, are the ruins of the only example of a broch (round tower) in the Borders counties. The diameter of the structure measures 75 ft., and that of the enclosed court 40 ft., giving a thickness for the wall of 17 ft. The broch stands in an enclosure of mounds and a ditch, the whole being protected by an outer entrenchment at a considerable distance from which only a fragment survives. Locally the works are called Torwoodlee Rings, or Eye Castle. The barrier known as the Catrall, or Picts' Work, starts near Torwoodlee, whence it runs southwards to Rink Hill. There it sweeps round to the south-west as far as Yarrow church, from which it again takes a due south direction to the valley of the Rankle, where it passes into Roxburghshire. Some Arthurian romance touches the site at points, for the field of the battle of Coit Celidon (the Word of Celidon) was probably in Ettrick Forest, and that of Guinlon in the valley of the Coquet near Haltwhistle. For six centuries the retreat of the Romans is that of the whole of south-eastern Scotland. The country formed part, first, of the British kingdom of Strathclyde, then of the Saxon kingdom of Northumbria, and finally, about 1020, was annexed to Scotland. The first sheriff of whom there is record was Andrew de Syntom, appointed by William the Lion (d. 1214). After Edward I. had overrun Scotland substantial burgesses of Selkirk were among those who took the oath of allegiance to him at Berwick in 1326, but next year William Wallace sought the covert of the forest to organize resistance. After the war of Haithbury in the country between the Yarrow and Tweed he constructed an earthwork, still called Wallace's Trench, 1,000 ft. long and deep enough to conceal a moss horse and his rider, and paved in part with flat whinstones laid on edge. At the higher end on the top of a hill it terminated in a large square enclosure. Here he lay till his plans were completed and at last departed, his forces including a body of Selkirk archers, for a raid into the north of England. After the death of Robert Bruce (1329) the foresters were constantly fighting, and the country suffered more heavily at Flodden (1513) than any other district. The lawlessness of the Borderers was at length put down by James V. with a strong hand. He parcelled out the forest in districts, and to each appointed a keeper to enforce order and protect property. In 1529 the ringleaders, including William Cockburn of Henderland, Adam Scott of Tushielaw and the notorious Johnnie Armstrong, were arrested and promptly executed. This severity gradually had the desired effect, though after the union of the crowns in 1603 the freebooters and mosstroopers again threatened to be troublesome, until James VI.'s lieutenants ruthlessly stamped out disaffection. The Covenanters held many conventicles in the uplands, and their general, David Leslie, routed the marquis of Montrose at Philiphaugh in 1645.

The manufacture of woollen goods was introduced into Selkirk and Galashiels and attained great success, thus adding largely to the prosperity of the neighbourhood. In another direction the beauty and romance of Yarrow and Ettrick have produced a stimulus to modern literature.

SELLA, Quintino (1827–1884), Italian statesman and financier, was born at Mosso, near Biella, on the 7th of July 1827. After studying engineering at Turin, he was sent in 1843 to study mineralogy at the Parisian school of mines. In Paris he witnessed the revolution of 1848, and only returned to Turin in 1852, when he taught applied geometry at the technical institute. In 1853 he became professor of mathematics at the university, and in 1860 professor of mineralogy in the school of applied engineering. In 1860 he was elected deputy for Cossato. A year later he was selected to be secretary-general of public instruction, and in 1862 received from Rattazzi the portfolio of finance. The Rattazzi cabinet fell before Sella could efficaciously provide for the deficit of £17,500,000 with which he was confronted; but in 1864 he returned to the ministry of finance in the La Marmora cabinet, and dealt energetically with the deficit of £8,000,000 then existing. Persuading the king to forgo £120,000 of his civil list, and his colleagues in the cabinet to relinquish part of their ministerial stipends, he effected savings amounting to £3,400,000, proposed new taxes to the extent of £6,000,000—a sizeable sum to be paid on one year's instalment of the land tax in advance. A vote of the chamber compelled him to resign before his preparations for financial restoration were complete; but in 1869 he returned to the ministry of finance in a cabinet formed by himself, but of which he made over the premiership to Giovanni Lanza. By means of the grist tax (which he had proposed in 1865, but which the Menabrea cabinet had passed in 1868), and by other fiscal expedients necessitated by the almost desperate condition of the national exchequer, he succeeded, before his fall from power on the 30th of May 1875, in reducing the national expenditure of 1875 by £6,000,000, and in laying the foundations of fierce attacks and persistent misrepresentation. In 1870 his great political influence turned the scale against interference in favour of France against Prussia, and in favour of an immediate occupation of Rome. From 1873 until his premature death on the 14th of March 1884, he acted as leader of the Right, and was more than once prevented by an ephemeral coalition of personal opponents from returning to power as head of a Moderate Conservative cabinet. After the failure of an attempt to form a cabinet in May 1882 he practically retired from public life, devoting himself to his studies and his linen factory.

His Discorsi parlamentari were published (5 vols., 1887–1890) by order of the Chamber of Deputies. An account of his life and scientific labours was given by F. Bossa in the Proceedings of the Accademia dei Lincei (1884–1885).
SELLAR—SELVE

SELLAR, WILLIAM YOUNG (1825-1890), Scottish classical scholar, was born at Morvich, Sutherlandshire, on the 22nd of February 1825. Educated at the Edinburgh Academy and afterwards at Glasgow University, he entered Balliol College, Oxford, as a scholar. Graduating with a first-class in classics, he was elected fellow of Oriell, and, after holding assistant professorships at Durham, Glasgow and St Andrews, was appointed professor of Greek at St Andrews (1857). In 1863 he was elected professor of humanity in Edinburgh University, and occupied that chair down to his death on the 12th of October 1890. Sellar was one of the most brilliant of modern classical scholars, and was remarkably successful in his endeavours to reproduce the spirit rather than the letter of Roman literature. The Roman Poets of the Republic (3rd ed., 1889) and The Roman Poets of the Augustan Age (Virgil, 3rd ed., 1897), and Horace and the Elegiac Poets (2nd ed., by W. P. Ker, 1899), with memoir by Andrew Lang, are standard authorities. Sellar contributed to the 9th edition of the Encyc. Brit. a series of brilliant articles on the Roman poets, the substance of which has been retained in the present edition.

SELMAL, a city and the county-seat of Dallas county, Alabama, U.S.A., altitude 126 ft., on the right bank of the Alabama river, a little S. of the centre of the state, and known as the Central City. Pop. (1900) 9,713, of whom 4,220 were negroes; (1910 U.S. census) 16,650. W. is served by the Louisville & Nashville, the Southern and the Western of Alabama railways. It has a Carnegie library, two parks and two Y.M.C.A. buildings. In the city are the Selma Military Institute (1907), and the Alabama Baptist Colored University (opened in 1878), which is one of the largest schools in the South owned and controlled by negroes, and has industrial, domestic, normal, collegiate and (especially) theological courses. The Society of United Charities supports the Selma Hospital (1889) for negroes and the Selma Infirmary (1890). The city has a large trade, principally in cotton (the chief crop of the surrounding country) and lumber from the great pineries. There are cotton compresses, cotton warehouses, &c.; in 1905 the value of the factory products was $1,138,817. The water supply is obtained from artesian wells. The site was originally called Moore's Bluff, from one Thomas Moore, who owned a steamboat landing here about 1815. A town was established about 1817, and in 1820 was incorporated under its present name (from the Ossianic legend). Selma was first chartered as a city in 1852. During the Civil War it was the seat of Confederate arsenals, shipyards and military factories. On the 2nd of April 1865 it was captured by Union forces under General W. T. Sherman, and much of the city was destroyed by fire. Near Selma lived William Rufus King (1786-1853), a Democratic representative in Congress from North Carolina in 1811-1816, a member of the United States Senate from Alabama in 1819-1844 and 1846-1853, minister to France in 1844-1846, and vice-president of the United States from the 4th of March 1853 until his death on the 18th of April; and Selma was the home of John Tyler Morgan (1824-1907), a brigadier-general in the Confederate army in 1863-1865 and a prominent Democratic member of the United States Senate from 1879 to 1897; and of Edmund Wind in Pettus (1832-1907), also a brigadier-general in the Confederate Army and, in 1897-1907, a Democratic member of the United States Senate.

Selmeczbanya, officially called SELMECZ-ÉS BÉLÁBÁNY (Ger. Schenkmitz), the capital of the county of Hont, Hungary, 132 m. N. of Budapest by rail. Pop. (1900) 16,370, about two-thirds Slovaks. It is an old mining town, situated at an altitude of 1,045 ft. in a deep ravine in the Hungarian Ore Mountains, and is built in terraces. Selmeczbanya is encircled by high mountains, notably the isolated peak of the Calvarenbarg (2,385 ft.) on the S.W., on which are situated a castle and a church, and the Paradiesberg (2,400 ft.) on the N.W. It possesses a famous academy of mining and forestry, founded by Maria Theresa in 1760, to which are attached a remarkable collection of minerals, and a chemical laboratory. Among other buildings are a picturesque old castle dating from the 13th century, now in ruins with the exception of a few rooms used as a prison; the new castle, used as a fire watch-tower; and the town hall. The mines, chiefly the property of the state and of the corporation, yield silver, gold, lead, copper and tungsten. During the advances also flourishing potteries, where well-known tobacco pipes are manufactured. About 7 m. to the S.W. of the town lie the baths of Vihnye, with springs of iron, lime and carbonic acid, and about the same distance to the W. are the baths of Szkleno with springs of sulphur and lime.

Selmeczbanya is an old town whose mines existed in the 8th century. In the 12th century, together with the whole mining region of northern Hungary, it was colonized by German settlers, who later embraced the Reformation. Owing to the mining conditions the German element was driven out during the 18th century, and its place taken by the actual Slovak population.

SELOUS, FREDERICK COURTNEY (1851-1905), British explorer and hunter, was born in London on the 31st of December 1851, and was educated at Rugby and in Germany. His love for natural history led to the resolve to study the ways of wild animals in their native haunts. Going to South Africa when he was nineteen he travelled from the Cape to Matabeleland, reached early in 1872, and was granted permission by Lobengula to shoot game anywhere in his dominions. From that date until 1890, with a few brief interludes in South Africa and in Uganda, he wandered and explored over the then little-known regions north of the Transvaal and south of the Congo basin, shooting elephants, and collecting specimens of all kinds for museums and private collections. His travels added largely to the knowledge of the country now known as Rhodesia. He made valuable ethnological investigations, and throughout his wanderings—often among people who had never previously seen a white man—he maintained cordial relations with the Kaffir chiefs and tribes, winning their confidence and esteem, notably so in the case of Lobengula. In 1890 Selous entered the service of the British South Africa Company, acting as guide to the pioneer expedition to Mashonaland. Over 400 m. of road were constructed through a country of forest, mountain and swamp, and in two and a half months Selous took the column safely to its destination. He then went east to Manica, concluding arrangements there which brought the country under British control. Coming to England in December 1892 he was awarded the Founder's medal of the Royal Geographical Society "in recognition of his extensive explorations and surveys," of which he gave a summary in "Twenty Years in Zambesia" (Geo. Journ., vol. I., 1893). He returned to Africa to take part in the second Matabele campaign, and was again sent to Bulawayo. While back in England he married, but in March 1896 was again settled with his wife on an estate in Matabeleland when the native rebellion broke out. He took a prominent part in the fighting which followed, and published an account of the campaign entitled Sunshine and Storm in Rhodesia (1896). On the restoration of peace Selous settled in England. He continued, however, to make shooting and hunting expeditions—visiting Asia Minor, Newfoundland, the Canadian Rockies and other parts of the world. In none of his expeditions was his object the making of a "big bag," but as a hunter-naturalist and slayer of game he ranks with the most famous of the world's sportsmen.

Besides the works mentioned he published A Hunter's Wanderings in Africa (1881, 5th ed., 1907), Travel and Adventure in South-East Africa (1893), Sport and Travel, East and West (1900), Recent Hunting Trips in British North America (1907), African Nature Notes and Reminiscences (1908), a valuable addition to the knowledge of African fauna, and made numerous contributions to The Geographical Journal, the Field and other journals.

SELVE, ODET DE (c. 1504-1563), French diplomatist, was the son of Jean de Selve, first president at the parlements of Rouen and Bordeaux, vice-chancellor of Milan, and ambassador to the king of France. In 1540 Odet was appointed councillor at the parlement of Paris and in 1542 at the grand council. In 1546, after the signature of the treaty of Ardes, he was sent on an embassy to England, in 1550 to Venice, and afterwards to Rome, where he obtained the election of Pope Paul IV. in 1555.
SELWYN, ALFRED RICHARD CECIL (1824–1902), British geologist, son of the Rev. Townshend Selwyn, Canon of Gloucester, was born at Kilmington in Somerset on the 28th of July 1824. Educated in Switzerland, he there became interested in geology, and in 1845 he joined the staff of the Geological Survey of Great Britain. He was actively engaged in the survey of North Wales and bordering portions of Shropshire, and a series of splendid geological maps resulted from his joint work with A. C. Ramsay and J. B. Jukes. In 1858 he was appointed director of the Geological Survey of Victoria, Australia, where he gave special attention to the gold-bearing rocks, until in 1869 the Colonial Legislature brought the Survey to an abrupt termination. At this date Sir W. E. Logan had just retired from the office of director of the Geological Survey of Canada, and Selwyn was appointed his successor. In this new sphere of activity he continued his geological work with marked success, devoting particular attention to the Pre-Cambrian rocks of Quebec. He retired in 1894. Meanwhile in 1874 he had been elected F.R.S., in 1876 he was awarded the Murchison Medal of the Geological Society of London, and he was created C.M.G. in 1886 for his distinguished service as assistant to the Canadian Commissioners at the exhibitions in Philadelphia (1876), Paris (1878) and London (1886). He retired to Vancouver in British Columbia, where he died on the 19th of October 1902.

See memoir with portrait in Geol. Mag. (Feb. 1899).

SELWYN, GEORGE AUGUSTUS (1799–1879), English wit, son of Colonel John Selwyn (d. 1751) of Matson, Gloucestershire, was born on the 11th of August 1799. Educated at Eton and Oxford, he became member of parliament for the family borough of Ludgershall in 1747, and from 1754, three years after he inherited Matson, to 1780 he represented Gloucester. In parliament he took no part in debate, but he managed to obtain two or three lucrative sinecures; in society he was very popular and won a great reputation as a wit. He is said to have been very fond of seeing corpses, criminals and executions, and Horace Walpole says he loved "nothing upon earth so well as a criminal, except the execution of him." He died in London on the 25th of January 1791. Like the eccentric duke of Queensberry Selwyn claimed to be the father of Maria Fagniani, who became the wife of Francis Charles Seymour, 3rd marquess of Hertford.

See J. H. Jesse, George Selwyn and his Contemporaries (1843–1844; new ed., 1882); and S. P. Kerr, George Selwyn and the Wits (1900).

SELWYN, GEORGE AUGUSTUS (1800–1879), English bishop, second son of William Selwyn (1775–1855), a distinguished legal writer, was born at Hampstead, London, on the 5th of April 1800. He was educated at Eton and at St John's College, Cambridge, where in 1829 he rowed in the university boat-race. He took his degree (second in the classical tripos) in 1831. He returned to Eton as private tutor, was ordained deacon in 1833, and devoted himself with characteristic energy to work in the parish of Windsor. In 1841 it was proposed that he should go out as first bishop to New Zealand, but then beginning to be colonized. Despite the advice of his friends he accepted the offer. He studied navigation and the Maori language on the voyage, and gave himself up to a life of continual strain and hardship. He spent days and sometimes nights in the saddle, swam broad rivers and provided himself with a sailing vessel. Unfortunately, just when he had gained the confidence of the natives, his ascendancy was rudely shaken by the first Maori war. Selwyn endeavoured to mediate, but incurred the hostility of both parties. He went to the battlefield to minister to the sick and wounded in both camps; but the Maoris were persuaded that he had gone out to fight against them, and years afterwards one of them pointed out a scar on his leg to an Anglican bishop which he declared had been inflicted by Selwyn's own hands. It was long before he regained the confidence he had forfeited by his strict adherence to duty. In 1854 he returned to England for a short furlough; but he spent much of it in pleading the needs of his diocese. He returned to New Zealand with a band of able associates, including J. C. Patteson, and began to divide his large diocese into sees of more manageable proportions.

The colonists came to respect his uprightness, and the Maoris learned to regard him as their father. In 1868, while he was in England to attend the first pan-Anglican synod, the bishopric of Lichfield became vacant, and after some hesitation he accepted it. In his new sphere of work he displayed the same unselfish activity as before, and in the "Black Country" portion of his diocese he won the hearts of the working classes. He called his clergy and laity together for consultation in the diocesan conference, an innovation the value of which he had proved by his colonial experience. On his death, on the 11th of April 1878, the work for which he was celebrated by a remarkable memorial, Selwyn College, Cambridge, being erected by public subscription and incorporated in 1882. See Lives by H. W. Tucker (2 vols., 1879) and G. H. Curteis (1889). His son, John Richardson Selwyn (1844–1908), bishop of Melanesia, was born in New Zealand on the 20th of May 1844. He was educated at Eton and at Trinity College, Cambridge, and was ordained deacon in 1869. At first he laboured with energy and tact as vicar of Wolverhampton in his father's diocese of Lichfield; but the martyrdom of John Colderidge Patteson, bishop of Melanesia, led him to volunteer for service in the Australasian Archipelago. After three years' service, during which the bishopric remained vacant, he was nominated as Patteson's successor (1877). For twelve years he threw himself with intense energy into his arduous work, but his health broke down and he returned to England in 1890. There he found an appropriate sphere in the mastership of Selwyn College, where he remained until his death on the 12th of February 1898.

SEMANG, an aboriginal people of the Malay peninsula, found in the states of Perak, Kedah, Kelantan, Trengganu and the northern districts of Pahang. They are a fairly pure branch of the woolly-haired Negrito race, which includes the natives of the Andaman islands, the Aetas of the Philippines and the dwarfs of Central Africa. The men average about 4 ft. 9 or 10 in., while the women are 3½ in. shorter. Their colour is a very dark brown or black. The shape of the head is round, or intermediate between round and long. The forehead is low and rounded, and projects over the root of the nose, which is short, depressed and pyramid-shaped. The eyes are wide open and the irises being of a very rich, deep brown. Lips vary from moderate to full, the mouth is rather large, the chin feebly developed, and the jaws are often slightly projecting. The hair is very dark-brown black, never blue-black as among Chinese and Malays. It grows in short, spiral tufts, curling closely all over the head. The arm-stretch is almost always greater than their height. The feet are usually short and spayed, with a remarkable inward curve of the great toe, and are very prehensile. The Semangs live in caves or leaf-shelters formed between branches. A waistcloth for the men, made of tree bark hammered out with a wooden mallet from the bark of the terap, a species of wild bread-fruit tree, and a short petticoat of the same for the women, is the only dress worn; many go naked. Tattooing, or rather scarifying, is practised, by drawing the finely serrated edge of a sugar-cane leaf across the skin and rubbing in charcoal powder. They have bamboo musical instruments, a kind of Jews' harp and a nose flute. On festive occasions there is song and dance, both sexes decorating themselves with leaves. The Semangs bury their dead simply, food and drink being placed in the grave.

SEMAPHORE, a town of Adelaide county, South Australia, 50 m. by rail from the city of Adelaide. It is one of the chief water-places of the state, with a pier 1800 ft. long. Pop. about 8000.

SEMAPHORE (Gr. σήμα, sign, and φόρα, carrying, from φέρω, to bear), the name of an apparatus or mechanical device by which information or messages can be signalled to a distance. It consists of movable arms or blades of wood, worked by levers and affixed to a high post or pole. The most familiar semaphore is that used in railway signalling on the block system, where the blade if horizontal signifies danger, if dropped safety. Used with a code, the semaphore is still used in the navy for signalling.
from ship to ship. Until the invention of the electric telegraph, the semaphore was used for transmitting messages over long distances.

SEMELE, in Greek mythology, daughter of Cadmus and Harmonia, and mother of Dionysus by Zeus. It is said that Hera, having assumed the form of Semelē's nurse, persuaded her to ask Zeus to show himself to her in all his glory. The god, who had sworn to refuse Semelē nothing, unwillingly consented. He appeared seated in his chariot surrounded by thunder and lightning; Semelē was consumed by the flames and gave birth prematurely to a child, which was removed from her by a miraculous growth of ivy which sprang up round the palace of Cadmus. Dionysus afterwards descended to the nether world, and brought up his mother, hitherto known as Thyôné (the raging one), to Olympus. Zeus and Semelē probably represent the fertilizing rain of spring, and the earth, afterwards scorched by the summer heat. Another tradition represents Actaeon as the lover of Semelē, and his death as due to the jealousy of Artemis. A statue and grave were to be seen in Thebes.

SEMIPELÁLTINSK, a province of the Russian dominions in Central Asia; administratively it forms a part of the general-governorship of the Steppes, although its northern portions really belong to the Irtysch plains of West Siberia. It is bounded on the N. by Tobol'sk and Tomsk, on the S.E. by China, on the S. by Semiryekhensk, and on the W. by Akmolinsk. As regards configuration, it differs widely in its northern and southern parts. The snow-clad ranges (9000 to 10,000 ft.) of the Altai and Narym enter it in the S.E., stretching S. to Lake Zaian. Another complex of mountains, Kalbin, rising 5000 and 6000 ft. above sea-level, extends S.W. towards the west. A broad valley intervenes, through which the Irtysch finds its way from the Zaian terrace to the lowlands of Siberia. Many extensions of these mountains and subordinate ranges stretch towards the north. The still lower but wild Chinghis-tau mountains diversify the south-western part of Semipalatinsk, sending out their rocky spurs into the steppe region. In the south, the Tarbagatal ("Marmota") range (9000 to 10,000 ft.) separates Semipalatinsk from Semiryekhensk and Dzungaria. Wide steppes fill up the spaces between the mountains: e.g. the Zaian steppe (1200 to 1400 m. above sea-level) is well-watered. After the long steppe of the Kipchak territory, the Irtysch, which issues from Lake Zaian, flows north and north-west and drains Semipalatinsk for more than 760 m. between Bukharta and Ust-Kamgangorsko it cuts its way through the Altai by a wild gorge, with dangerous rapids, through which, however, boats are floated. Lake Zaian, 80 m. long and 10 to 20 m. wide, has depth sufficient for steamboat navigation; steamers traverse also for some 100 m. the lower course of the Black Irtysch, which flows from Kulja to Lake Zaian. The Kurchum, the Narym and the Bukharta are the chief right-hand tributaries of the Irtysch, while the Char-urban, Chagan and many smaller streams join it from the left; none are navigable; neither are the Kokpekty and Bugaz, which enter Lake Zaian on the west. Lake Balkash, which borders Semipalatinsk on the south-west, formerly received several tributaries from the Chinghis-tau. Many smaller lakes (some of them merely temporary) occur on the Irtysch plain, and yield salt.

The climate is severe. The average yearly temperature reaches 40° F. in the north and 75° in the south. Inwinter the cold frosts of -44° F. are not uncommon, while the thermometer rises to 122° in the shade in the summer. The yearly amount of rain and snow is trifling, although snow-storms are very common; strong winds prevail. Forests are plentiful in the hilly districts and on the Irtysch plain, the flora being Siberian in the north and more Central Asiatic towards lakes Balkash and Zaian.

The area of the province is 183,145 sq. m., and in 1906 its population was estimated at 767,500. Only about 6% of the population is settled, the remainder, chiefly Kirghiz, being nomads. The province is divided into five districts, the chief towns of which are Semipalatinsk, Ust-Kamgangorsko, Kerbižsko, and Semiryekhensk. The Russians are chiefly agriculturists, and have wealthy settlements on the right bank of the Irtysch, as well as a few patches in the south, at the foot of the mountains. The Kirghiz are in the majority, and include the following tribes: the Irtysch Kirghiz, which is carried on in inlets Zaian and Balkash, as also in the Black Irtysch, of considerable importance. Gold is mined, also silver, copper, salt and coal. There are two ironworks, but the only other industrial establishments are a distillery at Zaian and a paper mill and a brewery. A considerable amount of trade is carried on within the province, in which twenty fairs are held every year.

SEMIPELÁLTINSK, a town of Asiatic Russia, capital of the province of the same name, on the right bank of the Irtysch, and on the highway from Dzungaria to Omak, 683 m. by river S.E. of the latter. Pop. (1881) 17,820, (1897) 26,535. It carries on a
considerable trade, especially with the Kirghiz, and has a flour-mill, distillery and tanneries. Steamers ply on the Irtysch down to Omsk and up to Lake Zaisan.

**SEMRIMAS** (*c.* 800 B.C.), a famous Assyrian princess, round whose personality a mass of legend has accumulated. It was not until 1909 that the research that she is primarily a forger of Berlin restored her to her rightful place in Babylonian-Assyrian history. The legends derived by Diodorus Siculus, Justin and others from Ctesias of Cnidus were completely disproved, and Semiramis had come to be treated as a purely legendary figure. The legends ran as follows: Semiramis was the daughter of the fish-goddess Atargatis (q.v.) of Asscalon in Syria, and was miraculously preserved by doves, who fed her until she was found and brought up by Simmas, the royal shepherd. Afterwards she married Onnes, one of the generals of Ninus, who was so struck by her bravery at the capture of Bactra that he married her, after Onnes had committed suicide. Ninus died, and Semiramis, succeeding to his power, traversed all parts of the empire, erecting great cities (especially Babylon) and stupendous monuments, or opening roads through savage mountains. She was unsuccessful only in an attack on India. At length, after a reign of forty-two years, she delivered up the kingdom to her son Ninias, and disappeared, or, according to what seems to be the original form of the story, was turned into a dove and was thenceforth worshipped as a deity. The name of Semiramis came to be applied to various monuments in Western Asia, the origin of which was forgotten or unknown (see Strabo xvi. 1. 2). Ultimately every stupendous work of antiquity by the Babylonians or in Iran seems to have been ascribed to her — even the Behistun inscriptions of Darius (Diod. Sic. ii. 3). Of this we already have evidence in Herodotus, who ascribes to her the banks that confined the Euphrates (i. 184) and knows her name as borne by a gate of Babylon (iii. 153). Various places in Media bore the name of Semiramis, but slightly changed, even in the middle ages, and the old name of Van was Shamiramerg, Armenian tradition regarding her as its founder. These facts are partly to be explained by observing that, according to the legends, in her birth as well as in her disappearance from earth, Semiramis appears as a goddess, the daughter of the fish-goddess Atargatis, and herself connected with the doves of Ishtar or Astarte. The same association of the fish and dove is found at Hierapolis (Bambycce, Mabbog), the great temple at which, according to one legend, was founded by Semiramis (Lucian, *De dea Syria*, 14), where her statue was shown with a golden dove on her head (33, 39). The irresistible charms of Semiramis, her sexual excesses (which, however, belong only to the legends: there is no historical groundwork), and other features of the legend, all belong to forgotten or unknown (see Strabo xvi. 1. 2). Semiramis is also fittingly conceived as the great queen of Assyria.

Professor Lehmann-Haupt, by putting together the results of archaeological discoveries, has arrived at the following conclusions. Semiramis is the Greek form of Semiramath. She was probably a Babylonian (for it was she who imposed the Babylonian cult of Nebo or Nabu upon the Assyrian religion). A column discovered in 1909 describes her as "a woman of the palace of Samsi-Adad, King of the World, King of Assyria, . . . King of the Four Quarters of the World." Ninus was her son. The dedication of this column shows that Semiramis occupied a position of unique influence, lasting probably for more than one reign. She waged war against the Indo-Germanic Medes and the Chaldeans. The legends probably have a Median origin. A popular etymology, which connected the name with the Assyrian *summati*, "dove," seems to have first started the identification of the historical Semiramis with the goddess Ishtar and her doves.

**SEMIYECHENSK**, a province of Russian Turkestan, including the steppes south of Lake Balkash and parts of the Tien-shan Mountains around Lake Issyk-kul. It has an area of 147,300 sq. m., and is bounded by the province of Semipalatinsk on the N., by China (Dzungaria, Kulja, Aksu and KASHGAR) on the E. and S., and by the Russian provinces of Ferghana, Syr-darya, and Akmolinsk on the W. It owes its name (Jily-su, Semirechye, i.e. "Seven Rivers") to the rivers which flow from the south-east to Lake Balkash. The Dzungarian Ala-tau Mountains, which separate Semiryechen from Kulja, extend west towards the river YII, with an average height of 6000 ft. above the sea, several isolated snow-clad peaks reaching 11,000 to 14,000 ft. In the south Semiryechensk embraces the intricates systems of the Ala-tau and the Tian-shan. Two ranges of the former, the Trans-Ili Ala-tau and the Kungehi Ala-tau, stretch along the north shore of Lake Issyk-kul, both ranging from 10,000 to 15,000 ft. and both partially snow-clad. South of the lake two ranges of the Tian-shan, separated by the valley of the Naryn, stretch in the same direction, lifting up their icy peaks to 16,000 and 20,000 ft., while Semiryechen borders on the slopes of the Alexander chain, 9000 to 10,000 ft. high, with peaks rising 3000 to 4000 ft. higher, extend into the province of Syr-darya. Another mountain-complex of much lower elevation runs north-westwards from the Trans-Ili Ala-tau towards the southern extremity of Lake Balkash. In the north, where the province borders Semipalatinsk, it includes the western parts of the Tarbagatay range, the summits of which (10,000 ft.) do not reach the limit of perpetual snow. The remainder of the province consists of a fertile steppe in the north-east (Sergipol), and vast uninhabitable sand-steppes on the eastern borders of Lake Balkash. In the south, however, at the foot of the mountains and at the entrance to the valleys, there are rich areas of fertile land, which are being rapidly colonized by Russian immigrants, who have also penetrated into the Tian-shan, to the east of Lake Issyk-kul.

The climate is thoroughly continental. In the Balkash steppes the winter is very cold; the lake freezes every year, and the thermometer falls to 13° F. In the Ala-tau steppes the winds blow away the snow. The passage from winter to spring is very abrupt, and the grass, which is rapidly covered with water and very green, is soon scorched by the sun. The average temperatures are: at Yverjy (2405 ft. high), for the year 46-4° F., for January 17°; for July 74°; at Przevalsk (5450 ft.), for the year 76-5°, for January 23°, for July 63°; still higher in the mountains, at Naryn (6900 ft.) the average temperatures are only for the year 43-7°, for January 1-4°, for July 63-4°. The yearly rainfall at these three places is 21-0, 16-0, and 11-8 in. respectively.

The most important river is the YII, which enters the province from Kulja and drains it for 250 m. before it enters Lake Balkash. The Chu rises in the Tian-shan Mountains and flows north-westwards into Semiryechen; the Karatau, which flows along a longitudinal valley of the Tian-shan, and enters Ferghana to join the Syr-darya. Lake Balkash, or Dzhigiz, Lake Ala-kul (which was connected with Lake Balkash), and Lake Issyk-kul (which was connected with the lake of Dzhigiz at some hundred feet higher, and is connected by a chain of smaller lakes with Issyk-kul), Lake Issyk-kul and the alpine lakes of Son-kul and Chatyr-kul are the principal sheets of water.

The chief division was in 1888, th. Kirghiz form 76% of the population, Taranchis 57 %, Russians 14 % and Dzungars most of the remainder. The province is divided into six districts, the chief towns of which are Yverjy (the capital), Jarkent, Kupal, Fiskpiirk, Przevalsk and Sergipol. The chief occupation of the Russians, the Taranchis and the Dzungars, and partly also of the Kirghiz, is agriculture. The most important crops are wheat, barley, oats, millet, rice and potatoes. A variety of oil-bearing plants and green fodder, as also cotton, hemp, flax and poppies, are grown. Livestock breeding is very extensively carried on by the Kirghiz, namely, horses, cattle, sheep, camels, goats and pigs. Hay, hemp and fruit gardens are well developed; the chief cultivates two model gardens. Bee-keeping is widely spread. The factories consist of flour-mills, distilleries, tanneries and tobacco works; but a great many domestic trades, including carpet-dyeing and felt-goods manufacture, iron and gold are carried on, among both the settled inhabitants and the nomad Kirghiz. There is a trade with China, valued at less than half a million sterling annually.

Previous to 1895 this province formed part of the general government of the Steppes.

**SEMIRIC LANGUAGES,** the general designation of a group of Asiatic and African languages, some living and some dead, namely Assyrian, Hebrew, Phoenician, Aramaic, Arabic, Ethiopic, Mahri-Socotri. The name, which was introduced by Schöler, is derived from the fact that most nations which speak or spoke these languages are descended, according to Genesis, to...
SEMitic LANGuages

from Shem, son of Noah. The classification of nations in Genesis x. is founded neither upon linguistic nor upon ethnographical principles: it is determined rather by geographical and political considerations. For this reason Elam and Lud are also included among the children of Shem; but neither the Elamites (in Susiana) nor the Lydians appear to have spoken a language connected with Hebrew. On the other hand, the Phoenicians (Canaanites), whose dialect closely resembled that of Israel, are not counted as children of Shem. Moreover, the compiler of the list in Genesis x. had no clear conceptions about the peoples of south Arabia and Ethiopia. Nevertheless it would be undesirable to give up the universally received terms "Semitic" and "Arabic." The connexion of the Semitic languages with one another is somewhat close, in any case closer than that of the Indo-European languages. The modern Semitic tongues differ from one another scarcely more than do the various Teutonic dialects. Hence even in the 17th century such learned Orientalists as Hottinger, Bochast, Castell and Ludolf had a tolerably clear notion of the relationship between the different Semitic languages with which they were acquainted; indeed the same may be said of some Jewish scholars who lived many centuries earlier, as, for instance, Jehuda ben Koreish. It is not difficult to point out a series of characteristic marks common to these languages,—the predominance of triconsonantal roots, or of roots formed after the analogy of such, similarity in the formation of nominal and verbal stems, a great resemblance in the forms of the personal pronouns and in their use for the purpose of verbal inflection, the two principal tenses, the importance attached to the change of vowels in the interior of words, and lastly, considerable agreement with regard to order and the construction of sentences. Yet even so ancient a Semitic language as the Assyrian appears to lack some of these features, and in certain modern dialects, such as New Syriac, Mahri and more particularly Amharic, many of the characteristics of older Semitic speech have disappeared. And the retention of these features in the interior of the modern dialects. Still we can trace the connexion between the modern and the ancient dialects, and show, at least approximately, how the former were developed out of the latter. Where a development of this kind can be proved to have taken place, there a relationship must exist, however much the individual features may have been effaced. The question here is not of logical categories but of organic groups.

All these languages are descendants of a primitive Semitic language which has long been extinct. Of course this should not be taken literally as implying an absolute unity. If, in the stringency of the words, no two men ever speak the same language, it must apply with still greater force to any considerable mass of men not living in the closest conjunction; and as such we must conceive the ancient Semites, so soon as they had severed themselves from other races. As long as the primitive Semitic people occupied no great extent of territory, many linguistic differences existent in their midst might still be recon- ciled. Other differences, however, might even then have formed the germ of the subsequent dialectical distinction. Thus, if the gradual, or sudden, separation of individual sections of the people has taken place, and that on a large scale, their dialects must necessarily have developed decided lines of cleavage and become finally distinct languages. With all this, it is still possible that, even in that pre-historic era, peaceful or warlike intercourse may have exercised an influence tending to assimilate these languages once again. Within the limitations which we have intimated rather than discussed, the expression "proto-Semitic language" is thoroughly justifiable. Many of its most important features may be reconstructed with at least tolerable certainty, but we must beware of attempting too much in this respect. When the various cognate languages of a group diverge in essential points, it is by no means always possible to determine which of them has retained the more primitive form. The history of the development of these tongues during the period anterior to the documents which we possess is often extremely obscure in its details. Even when several Semitic languages agree in important points of grammar we cannot be sure that in these particulars we have what is primitive, since in many cases analogous changes may have taken place independently. To one who should assert the complete reconstruction of the primitive Semitic language to be possible, we might put the question, Would the man who is best acquainted with all the Romance languages be in a position to reconstruct their common mother, Latin, if the knowledge of it were lost? And yet there are but few Semitic languages which we can know as accurately as the Romance languages are known. As far as the vocabulary of the primitive Semitic language is less important than that a considerable number of words which have in various Semitic languages the form proper to each were a part of primitive Semitic speech. Nevertheless even then we are apt to be misled by independent but analogous formations and by words borrowed at a very remote period. Each Semitic language or group of languages has, however, many words which we cannot point out in the others. Of such words a great number no doubt belonged to primitive Semitic speech, and either disappeared in some of these languages or else remained in use, but not so as to be recognizable by us. In the case of certain proto-Semitic words, we can even assign how they gradually recede from the foreground. So for instance, in Hebrew, Aramaic and Arabic, the common designation of the lion, laith, has disappeared, almost before our eyes, in order to make room for other expressions. Yet many isolated words and roots may in very early times have been borrowed by the Hebrew, the Aramaic, the Ethiopic, etc., perhaps from wholly different languages, of which no trace is left. To what extent the separate languages created new roots is an extremely obscure problem.

The question which of the known Semitic dialects most resembles the primitive Semitic language is less important than one might at first suppose, since the question is one not of absolute but only of relative priority. After scholars had given up the notion (which, however, was not the fruit of scientific research) that all Semitic languages, and indeed all the languages in the world, were descendants of Hebrew or of Aramaic, it was long the fashion to maintain that Arabic bore a close resemblance to the primitive Semitic language. But, just as it is now recognized with ever-increasing clearness that Sanskrit is far from having retained in such a degree as was even lately supposed the characteristics of primitive Indo-European speech, so in the case of the Semitic tongues we cannot assign to Arabic only a relative antiquity. It is true that in Arabic very many features are preserved more faithfully than in the cognate languages,—for instance, nearly all the original abundance of consonants, the short vowels in open syllables, particularly in the interior of words, and many grammatical distinctions which in the other languages are more or less obscured. On the other hand, Arabic has coined, simply from analogy, a great number of forms which, owing to their extreme simplicity, seem at the first glance to be primitive, but which nevertheless are only modifications of the primitive words. We can even observe how they gradually exhibit modifications of a different kind. In spite of its great wealth, Arabic is characterized by a certain monotonity, which can scarcely have existed from the beginning. Both Hebrew and even Aramaic are in many respects more ancient than Arabic. This would not doubt be far more apparent if we knew Hebrew more completely and according to the original pronunciation of its vowels, and if we could discover how Aramaic was pronounced about the 13th century before our era. It must always be borne in mind that we are far more fully and accurately

2 The more alike two languages are the more difficult it usually is to detect, as borrowed elements, those words which have passed from one language into the other.
acquainted with Arabic than with the other Semitic languages of antiquity. The opinion sometimes maintained by certain over-zealous Assyriologists, that Assyrian is the "Sanskrit of the Semitic world," has not met with the approval even of the Assyriologists themselves, and is unworthy of a serious refutation.

A comparative grammar of the Semitic languages must of course be based upon Arabic, but must in every matter of detail take into consideration all the cognate languages, as far as they are known to us. In the reconstruction of the primitive Semitic tongue Hebrew might perhaps afford more assistance than Ethiopic; but Aramaic, Assyrian, and even the less known and half-understood Egyptian may furnish valuable materials.

The method by which these younger languages, especially the dialects of to-day, have received their present form, may be traced with tolerable comprehensiveness. Thus we gain valuable analogies for determining the genetic process in the older tongues. At the same time, a conscientious investigation forces upon us the conviction that there are many and important phenomena which we are powerless to explain; and this applies, in part, to cases where, at first, the solution appears perfectly simple. So, although we have seen that the main features of the correspondences of the Semitic languages were established—years before Bopp—scientifically demonstrated the connexion of the Indo-European tongues—still in our domain it is a task of extreme difficulty to create a comparative grammar which shall be minutely exact and yield permanent results. Only the most accomplished philologist could attempt the task, and it is very doubtful whether the time is yet ripe for such an attempt. Much careful and minute investigation is still indispensable. One great obstacle lies in the fact, that, in most Semitic languages, the sounds are very inadequately transmitted. It would probably be easier to give a comparative presentment of Semitic syntax than of Semitic phonetics and the theory of Semitic forms.

It is not a formidable undertaking to describe in general terms the character of the Semitic mind, as has been done, for example, by Lassen (Indische Altertumskunde, i, 414 sq.) and by Renan in the introduction to his Histoire des langues sémitiques. But still there is a danger of assuming that the most important characteristics of particular Semitic peoples, especially of the Israelites and of the Arabs, are common to all Semites, and of ascribing to the influence of the Israelites alone whatever is owing to the particular external conditions of life, and which, under similar circumstances, are also developed among non-Semitic races. And, though it is said, not without reason, that the Semites possess but little talent for political and military organization on a large scale, yet we have in the Phoenicians, especially the Carthaginians, in Hamilcar and in Hannibal, a proof that under altered conditions the Semites are not incapable of distinguishing themselves in these domains. It is a poor evasion to deny that the Phoenicians are genuine Semites, since even our scanty sources of information suffice to show that in the matter of religion, which among Semites is of such supreme importance, they bore a close resemblance to the ancient Hebrews and Aramaeans.

In general descriptions of this kind it is easy to go too far. But to give in general terms a correct idea of the Semitic languages is a task of very much greater difficulty. Renan's brilliant and most interesting sketch is in many respects open to serious criticism. He cites, for example, as characteristic of the Semitic tongues, that they still retain the practice of expressing psychological processes by means of distinct imagery. In saying this he is taking scarcely any language but Hebrew into account. But the Semitic speech is peculiar of itself to the matter of religion, which among Semites is of such supreme importance, they bore a close resemblance to the ancient Hebrews and Aramaeans.

1 By this we do not wish to call in question the merits of the following works: William Wright, Lectures on the Comparative Grammar of the Semitic Languages (Cambridge, 1890, a posthumous work); O. E. Umbreit, Vergeistigte Grammatik der semitischen Sprachen (pt. 1, Göteborg, 1897); Heinr. Zimmer, Vergl. Gramm. d. semiti. Sprachen (Berlin, 1898); C. Brockemühl, Semitische Sprachvergleichung (Leipzig, 1906) and Grundriss der vergl. Gramm. d. semiti. Sprachn. (Berlin, 1908).

stage of intellectual development that had been reached by the Israelites, is in part peculiar to the poetic style, and is to be found in like manner among wholly different races. That the Semitic languages are far from possessing the fixity which Renan attributes to them we shall see below. But, however this may be, certain grammatical peculiarities of the Semitic languages—above all, the predominance of triliteral roots—are so marked that it is scarcely possible to doubt whether any language with which we are tolerably well acquainted is or is not Semitic. Only when a Semitic language has been strongly influenced not only in vocabulary but also in grammar by some non-Semitic forces, as in the case with Amharic, can such a doubt be for a moment entertained.

Many attempts have been made, sometimes in a very superficial fashion and sometimes by the use of scientific methods, to establish a relationship between the Semitic languages and the Indo-European. It was very natural to suppose that the tongues of the two races which, with the single exceptions of the Egyptians and the Chinese, have formed and moulded human civilization, who have been near neighbours from the earliest times, and who, moreover, have been in possession of the same elements, could be nothing else than two descendants from a single parent speech. But all these endeavours have wholly failed. It is indeed probable that the languages, not only of the Semites and of the Indo-Europeans, but also those of other races, are derived from the same stock, but the separation must have taken place at so remote a period that the changes which these languages underwent in prehistoric times have completely effaced what features they possessed in common; if such features have sometimes been preserved, they are no longer recognizable. It must be remembered that it is only in exceptionally favourable circumstances that cognate languages are so preserved during long periods as to render it possible for scientific analysis to render their relationship with one another.

On the other hand, the Semitic languages bear so striking a resemblance in some respects to certain languages of northern Africa that we are forced to assume the existence of a tolerably close relationship between the two groups. We allude to the family of languages known in modern times as the "Hamitic," and composed of the Egyptian, Berber, Beja (Bishārī, &c.), and a number of tongues spoken in Abyssinia and the neighbouring countries (Axum, G. ber, Agkali, &c.). It is remarkable that some of the most indispensible words in the Semitic vocabulary (as, for instance, "water," "mouth" and certain numerals) are found in Hamitic also, and that these words happen to be such as cannot well be derived from trilateral Semitic roots, and are more or less independent of the ordinary grammatical rules. We notice, too, important resemblances in grammar—for example, the formation of the feminine by means of a t prefixed or affixed, that of the causative by means of s, similarity in the suffixes and prefixes of the verbal tenses, and, generally, similarity in the personal pronouns, &c. It must be admitted that there is also much disagreement—language, the widest divergence in the mass of the vocabulary; and this applies to the Semitic languages as compared not only with those Hamitic languages that are gradually becoming known to us at the present day, but with the Egyptian, of which we possess documents dating from the fourth and perhaps fifth millennium before the Christian era. The question is here involved in great difficulties. Some isolated resemblances may, improbable as it appears, have been produced by the borrowing of words. Uncivilized races, as has been proved with certainty, sometimes borrow from others. But the Indo-European root is sought, or perhaps even invented, whereas the Semitic root is shédiṣ, so that the resemblance is a purely accidental one, produced by phonetic change.
HAMITES.

Hamites, more especially as these points of agreement are also found in the language of the Berbers, who are scattered over an enormous territory, and whose speech must have acquired its character long before they came into contact with the Semites. We are even now but imperfectly acquainted with the Hamitic languages; and the relation in which Egyptian stands to Berber on the one hand and to the south Hamitic languages on the other requires further elucidation. The attempt to write a comparative grammar of the Semitic and Hamitic languages would be, to say the least, very premature.

In general, the Semitic languages and the Hamitic appear to indicate that the primitive state of the Semites is to be sought in Africa; for it can scarcely be supposed that the Hamites, amongst whom there are gradual transitions from negroid to Negroid type to Negroes, are the children of any other land than "the dark continent." There seems, moreover, to be a considerable physical resemblance between the Hamites and Semites, especially in the case of the southern Arabs; we need mention only the startling development of the calf of the leg, and the sporadic appearance amongst Semites of woolly hair and prominent jaws. But both Semites and Hamites have been mingled with a variety of foreign races, which process must have diminished their mutual similarity. All this, however, is offered not as a definite theory, but as a modest hypothesis.

One has the strong temptation to maintain that the Semites came originally from certain districts in Armenia. This supposition was founded on the book of Genesis, according to which several of the Semitic nations proceeded from the region which is now, the district of Arraphzitis, now called Albak, on the borders of Armenia and Kurdistan. It was also thought that this region was inhabited by the primitive race from which both the Semites and the Indo-Europeans are descended. We know about the connexion of the Semites with Asia Minor, its influence on Semitic, and the traces that are left in the language, but this is a matter of some doubt; in any case, the separation does not date from a period so recent that the Semites can be supposed to have possessed any historical tradition concerning it. There cannot be a greater mistake than to imagine that nations cannot have been able to preserve during long ages their recollection of the country whence their supposed ancestors are said to have emigrated. The national memories among uncivilized races must be wholly abandoned. The period in which the Hebrews, the Arabs and the other Semitic nations together formed a single people is so distant that none of them can possibly have retained any tradition of it. The opinion that the Hebrews and the tribes most closely related to them were descended of Arphaxad is apparently due to the legend that Noah's ark landed near this district. The notion has therefore a purely mythical origin. Moreover, in Genesis itself, the Semites have a different account of the matter, derived from another source, which represents all nations, and, therefore, the Semites among them, as having a common origin. It is, however, a fact, which a man of science now believes in the northern origin of the Semites.

Some prominent scholars consider the birthplace of the Semitic race to have been in Arabia. There is much that appears to support this view. The most probable theory of the proves that Semitic tribes from the deserts of Arabia settled on the cultivable lands which border them and adopted a purely agricultural mode of life. Various traces in the language of the Semites indicate that the Hebrews and the Arabs are more closely related than Arabia was originally inhabited. Arabia was in the very desert that is the true home of nomadic peoples. The Arabs are also supposed to display the Semitic character in its purest form, and their language is, on the whole, nearer the original Semitic than are the languages of the cognate races. To this last circumstance we should, however, attach little importance. It is by no means always the case that a language is most faithfully preserved in the country where it originated. The Romance dialects spoken in the south of Sardinia is far more primitive than that spoken at Rome; and of all living Teutonic languages the most unaltered is that of the Friuli. Besides, it cannot be denied that the Arabs display the Semitic character in its purest form; it would be more correct to say, that the influence of a country indescribably monotonous and of a life ever changing yet ever the same, the inhabitants of the Arabian deserts have developed most exclusively certain of the principal traits of the Semitic race. All these considerations are indeterminate; but we willingly admit that the theory which regards Arabia as the primitive seat of all Semites is by no means untenable.

Finally, one of the most eminent of contemporary Orientalists, Ignazio Guidi, has attempted to prove that the home of the Semites is on the lower Euphrates. He contends that the geographical, botanical and zoological conceptions which are expressed in the Semitic languages, the vowel sounds, preserved from the time of the dispersion, correspond to the name of no country but the above-mentioned. As great are the ingenuity and the caution which he displays, it is difficult to accept his conclusions, and many will maintain that the Semites are the common heritage of the northern and the southern Semites, but which can scarcely have been formed in the region of the Euphrates. Moreover, the vocabulary of most Semitic languages is but very imperfectly known. The names of several persons might be mentioned which are part of the common heritage of the northern and the southern Semites, but which are, however, names of a different race. The names of the words in the course of time. It is therefore very unsafe to draw conclusions from the fact that the various Semitic tongues have one common designation for many important geographical formations, such as "mountain." The ordinary words for "man," "old man," "boy," "tent," "black," "to beat," &c., are quite different in the various Semitic languages, and yet all these are ideas for which the primitive Semites must have had names.

It is not very easy to settle what is the precise connexion between the various Semitic languages, considered individually. In this brief sketch I have attempted to give a correct overview of the chief inclusions by isolated peculiarities in vocabulary or grammar. Each of the older Semitic languages occasionally agrees in grammatical points with some other to which in most respects it bears no very close resemblance, while dialects much more nearly related to it are found to exhibit different formations. Each Semitic tongue also possesses features peculiar to itself. For instance, the Hebrew-Phoenician group and the Arabic have a prefixed definite article (the etymological identity of which is, however, not very clear); the dialect nearest to Arabic, the Sabæan, expresses the article by means of a suffixed å; whereas the Assyrian in the north and the Ethiopic in the south have no article at all. Of the termination å for the definite article there is no certain trace in either Arabic or Hebrew; the Sabæan, the Ethiopic, and the Aramaic employ it to give emphasis to demonstrative pronouns; and the very same usage has been detected in a single Phoenician inscription. In this case, therefore, Hebrew and Arabic have, independently of one another, lost something which they once had in common. The Semitic languages have been described as "synthetic" by means of a prefixed å; the Aramaic, which in general more closely resembles Hebrew than does the Arabic group, expresses it by means of a suffixed å; whereas the Assyrian in the north and the Ethiopic in the south have no article at all. Of the termination å for the definite article there is no certain trace in either Arabic or Hebrew; the Sabæan, the Ethiopic, and the Aramaic employ it to give emphasis to demonstrative pronouns; and the very same usage has been detected in a single Phoenician inscription. In this case, therefore, Hebrew and Arabic have, independently of one another, lost something which they once had in common. The Semitic languages have been described as "synthetic" by means of a prefixed å; the Aramaic, which in general more closely resembles Hebrew than does the Arabic group, expresses it by means of a suffixed å; whereas the Assyrian in the north and the Ethiopic in the south have no article at all. Of the termination å for the definite article there is no certain trace in either Arabic or Hebrew; the Sabæan, the Ethiopic, and the Aramaic employ it to give emphasis to demonstrative pronouns; and the very same usage has been detected in a single Phoenician inscription. In this case, therefore, Hebrew and Arabic have, independently of one another, lost something which they once had in common. The Semitic languages have been described as "synthetic" by means of a prefixed å; the Aramaic, which in general more closely resembles Hebrew than does the Arabic group, expresses it by means of a suffixed å; whereas the Assyrian in the north and the Ethiopic in the south have no article at all.
Ethiopians and the Hebrews have the same word for many objects which the other Semites call by other names—for instance, "stone," "tree," "enemy," "enter," "go out"; and the same may be said of Hebrew as compared with Sabaean. But to build theories upon such facts would be unsafe, since the words cited are either found, though with some change of meaning, in at least one of the cognate languages, or actually occur, perhaps quite exceptionally and in archaic writings, with the same signification. The sedentary habits of the Ethiopians and the Sabaeans may possibly have rendered it easier for them to retain in their vocabulary certain words which were used by the civilized Semites of the north, but which became obsolete amongst the Arabian nomads. To the same cause we may attribute the fact that in religion the Sabaeans seem to resemble the northern Semites more closely than do the tribes of central Arabia; but these considerations prove nothing in favour of a nearer linguistic affinity.

One thing at least is certain, that Arabic (with Sabaean, Mahri and Socotri) and Ethiopic stand in a comparatively close relationship to one another, as every group by themselves, as contrasted with the other Semitic languages, Hebraico-Phoenician, Aramaic and Assyrian.

Only in these southern dialects do we find, and that under forms substantially identical, the important innovation known as the "broken plurals," consisting in the employment of certain forms, denoting abstracts, for the expression of plurals. They agree, moreover, in employing a peculiar development of the verbal root, formed by inserting an á between the first and second radicals (qátála, tódála), in using the vowel a before the third radical, and in the anticipatory dropping of w.

The third group, the Central Semitic, is represented by several languages, viz.:

1. The Assyro-Babylonian or Hebraico-Phoenician.
2. The Central Aramaic.
3. The Southern Aramaic.
4. The Phoenician.
5. The Hebrew.

The Central Aramaic and Hebrew are by far the most important of these languages. The Assyrians and Babylonians, who had a purely Babylonian tongue, were able to use Hebrew for literary purposes (even when their ordinary speech was Assyrian), and this is the chief reason why Hebrew has survived the destruction of the Kingdom of Judah.

Arabic differs in many respects from all the cognate languages.

The ancient perfect has wholly disappeared, or left but few traces, and the gutturals, with the exception of the hard kh, were never pronounced. In the ordinary speech of the Levant, the gutturals are entirely replaced by the phonetic symbol g, and hence it is said that Arabic is not a Semitic language, but a "vocalic" language. In the case of many other Semitic languages, the gutturals are represented by the phonetic symbol g, and hence it is said that Arabic is not a Semitic language, but a "vocalic" language.
Testament a few of the neighbouring peoples are represented as being descended from Eber, the eponym of the Hebrews, that is, are regarded as nearly related to the latter, it was natural to suppose that this connection was the stronger, since the Urartu, which was the case of the Moabites, has been fully confirmed by the discovery of the Mesha inscription (date, soon after 900 b.c.). The language of this inscription scarcely differs from that of the Old Testament; the only difference is the change of the sibilant to sh (with f after the first radical), which appears also in Arabic and Assyrian. We may remark in passing that the style of this inscription is not a part of the Hebrew language proper, they maintain with certainty that a similar historical literature existed amongst the Moabites. But it must be remembered that ancient Semitic inscriptions exhibit, in a sense, nothing but the skeleton of the language, and that its pronunciation cannot be ascertained in many cases, or at least not exactly, only in certain cases; still less do they indicate other phonetic modifications, such as the doubling of consonants, &c. It is therefore very curious that the language of Moab seemed to differ considerably from that of the Judeans.

The Mesha inscription is the only non-Israelite source from which any knowledge of ancient Hebrew can be obtained. Still several Hebrew errours occur even in the Telled-Amarna letters, discovered in Egypt, and written in the Babylonian language by princes of Palestine during the second millennium b.c. They clearly show that the "Hebrew" language existed in Palestine even before the migration of the Israelites into Canaan. Some fragments in the Old Testament belong to the last centuries of the second millennium before our era—particularly the song of Deborah (Josh. v. 1-31). But opposite to the latter, the text of the Hebrew language, stripped of all exotica and errors, bears no sign of change, except is a few points of punctuation, in the time of the Canaanites were still containing with them for the possession of the country. The first rise of an historical literature and the first chants of the national poets belong to the days of the monarchy. Various portions of the Old Testament belong to the time of the earlier kings; but it was under the later kings that a great portion of the Hebrew literature came into shape. To this age also belong the Gezer and the Sluisshe inscriptions and a number of treaties, increasing number of seals and gems bearing the names of Israelites.

The Hebrew language is thus known to us from a very ancient period. But we are far from being acquainted with the true condition of this language before the time of the Psalms. For, much as we owe to the labours of the earlier Jewish schools, which had infinite care fixed the pronunciation of the sacred text by ancient authorities, we cannot say that they were the best they could only represent the pronunciation of the language in its latest stage, not of that of early ages. Besides, their object was not to exhibit Hebrew simply as it was, but to show how it should be read in the solemn chant of the synagogue. Accordingly, the pronunciation of the earlier period may have differed considerably from that represented by the punctuation. Such differences are now and then indicated by the customary spelling of the ancient texts, and sometimes the orthography is directly at variance with the punctuation.

In a few rare cases we may derive help from the somewhat older tradition contained in the representation of Hebrew words. In the case of the Gnostics, the followers of Clement of Alexandria, who had a considerable influence in the life of the early Christian Church (see Clement of Alexandria), it is possible to see how the pronunciation of classical Hebrew differed from that of the later i or e. We have examined this point somewhat in detail, in order to contradict the false but ever-recurring notion that the ordinary text of the Bible represents without any essential modification the Hebrew language of the ancient world. Hebrew and Aramaic words are represented by the same Hebrew text, and express (in a very instructive and careful manner, it is true) only its ancient development, and that for the purpose of solemn public recitation. A clear trace of dialectal differences within Israel is found in Judges xii. 6, which shows that the ancient Ephraimites pronounced samek instead of shin.

The destruction of the Judæan kingdom dealt a heavy blow to their language. But it is going too far to suppose that of the Jews which was altogether banished from ordinary life at the time of the exile, and that Aramaic came into use among all the Jews. In the East even small communities, especially those who had become converted to Judaism and clung to their mother-tongue, though they may be surrounded by a population of alien speech; and such was probably the case with the Jews in Babylonia. See Hebrew Language. Even so late as the time of Ezra, Hebrew was in all probability the ordinary language of the new community. In Neh; xii. 24 we find a complaint that the children of Jews by wives from Ashdod and other places spoke half in Hebrew and half in the language of the people among whom they lived. But the situation of the Jews in Babylonia, where the language of the country was Babylonian, is a different case. In this case, the language of the Targums, and of the papercuts, and of the late Talmud, reveals that the language of Babylon was spoken by the Jews of Babylonia, and that of the Targums and Talmud.

The very first word of the Bible contains an Aleph (spiritus lenis), which is required by etymology and was once audible, but which the pronunciation represented by the point-system ignores.

can suppose that Nehemiah would have been particularly zealous that the children of Jews should speak an Aramaic dialect with correctness. He no doubt refers to Hebrew as it was then spoken—a stage of development of which Nehemiah's own work gives a very fair idea.

After the time of Alexander large bodies of the Jewish population were settled in Alexandria and other western cities, and were very much influenced by the Greek language. In the first century B.C., the language of Syria and the neighbouring countries, Aramaic, which had already become the language of the old Jewish colonists in Egypt, the country of the Israelites, and the influence of which may be perceived even in some pre-exilic writings, began to spread more and more among the Jews of Palestine. Hebrew gradually ceased to be the language of the people and became limited to religious and official purposes. The language which is called Aramaic includes the Aramaic language as used in Emesa, and the Perso-Aramaic (Ezra and Nehemiah form the conclusion) borrows large portions from Persian, and in most cases without translating them into Hebrew. No reason can be assigned for the use of Aramaic in Jewish works intended primarily for Jerusalem, unless it was already the dominant speech, whilst, on the other hand, it was very natural for a pious Jew to write in the ancient "holy" language even after it had ceased to be spoken. Esther, Ecclesiastes, and a few Psalms, which belong to the 3rd and 2nd centuries before our era, are indeed written in Hebrew, but are so strongly tintured by the Aramaic influence as to prove that the writers usually spoke Aramaic. It is certain, of course, that the language which we are accustomed to call Aramaic is not the language of the Jews of the Dispersion, but is the language of Babylonian Jews, and is not likely to be far wrong in saying that in the Maccaean age when the Hebrew language was in a manner prolonged. The lectures and discussions of the learned were carried on in that tongue. We have very extensive specimens of this modern Hebrew in the Mishnah and other works, and such modern Hebrew was spoken in the home of the average Jew.

"classic" Sanskrit, which has been spoken and written by the Brahmins during the last twenty centuries, differs considerably from the language which was once in use among the people, so this "language of the learned" diverges to a great extent from the "holy language"; and this distinction is one of which the rabbis were perfectly conscious. The "language of the learned" borrows a great part of its vocabulary from Aramaic, and this exercise a strong influence upon the grammatical forms. The grammar is perceptibly modified by the peculiar style of these writings, which, for the most part, treat of legal and ritual questions in a strangely constructed and artificial language, peculiar in many respects to classical Hebrew and Aramaic, and in many instances based upon foreign words and artificial as this language is, it contains a considerable number of purely Hebrew elements which by chance do not differ from the Hebrew of the written language. In the same way, the form of the words, which is a mere matter of convenience, in the case of a word occurring in the Mishnah but not found in the Old Testament, that it is borrowed from Aramaic, there are several words of this class which, by their radical consonants, prove to be of Hebrew origin; if we can call that a proof. The phenomena of this language are to be regarded as a genuine development of Hebrew, though they are unknown to earlier Hebrew speech.

From the beginning of the middle ages down to our own times the Jews have produced an enormous mass of writings in Hebrew, some of them very ancient, and for all purposes it is possible to speak of the language as a perfect language, as it is a language, in which the grammatical forms are purely Hebrew, as it is a language, in which the language is perfectly pronounced, and in which the language is perfectly pronounced, and in which the language is perfectly pronounced by the people who are its authors. The period of the exiles was Babylonian.

**Period of exiles in Babylonia.**

The first word of the Bible contains an Aleph (spiritus lenis), which is required by etymology and was once audible, but which the pronunciation represented by the point-system ignores.

2 For example, we may conclude with tolerable certainty, from the presence and absence of the vowel-letter y and w, that in older times the accented e and o were not pronounced long, and that, on the other hand, the diphthongs ew and ai were used for the later 6 and 8.

3 The very first word of the Bible contains an Aleph (spiritus lenis), which is required by etymology and was once audible, but which the pronunciation represented by the point-system ignores.

4 It is a characteristic feature that "my father" and "my mother" are here expressed by purely Aramaic forms. Even the learned did not wish to call their "papas" and "mammas" by any other names than those to which they had been accustomed in infancy.
The ancient Hebrew language, especially in the matter of syntax, has an essentially primitive character. Paradox of sentences is accordingly found far more often in other literary Semitic languages with which we are well acquainted. The favourite method is to link sentences together by means of a simple "and." There is a great paucity of contrastive conjunctions of the kind "but." A slight attempt to define the tenses more sharply appears once at least in the joining of kasîn (suit), with a perfect, to express complete accomplishment (or state of perfecting), which is the use of te'or convervative with the imperfect—so common in Hebrew and in the inscription of Mesha—is wanting in Phoenician. The vocabulary of the language is very like that of Hebrew, but the difference in the inflexions (or grammatical forms) is very considerable. The use of the tenses somewhat more sharply appears once at least in the joining of kasîn (suit), with a perfect, to express complete accomplishment (or state of perfecting), which is the use of te'or convervative with the imperfect—so common in Hebrew and in the inscription of Mesha—is wanting in Phoenician. SEMITIC

in the period of our inscriptions: it would seem, therefore, that we must assume a dialectical cleavage, perhaps originated by the interchange of the provinces west of the Euphrates, and the persistence of the so-called "consecutum" in the inscriptions of the king of Hamath hitherto only known from Hebrew. Traces of the divergent phonetic treatment are also found in Aramaic, which was the official language of the provinces west of the Euphrates; and this explains the fact that coins which were struck by governors and kings of Persia, both within and outside the Persian provinces, were variously treated in inscriptions. But we need not doubt that, in Egypt, Aramaic was also spoken by many who had migrated from Syria; and this must be assumed to be the case in the Greek East in the Hellenistic period, for the country, where the native writing was so formidable to the learner, the Aramaic language and script may well have appeared peculiarly serviceable. Thus this dispute of the scholars is a matter perhaps of mere formalities. But the fact is now established that these Jews who had come to Egypt before the Persian period were military colonists, and were often referred to in documents as "Arameans." According to Deut. xxvii. 15, this was illustrated by the fact that they spoke "Aramean" and their language is known as Hebrew, which was at that time obtained numbers of warriors from foreign countries, instead of employing their own unwarlike subjects. The Syrian kings also sent soldiers to Egypt, from whom the Jews learned Aramaic. The language is also known as "Arabic" by the people of the East, and is known as "Arabic" by the Jews in the West. It is not known whether the Persians or the Egyptians spoke a "language" or whether the "language" was spoken by the Persians or the Egyptians. The short dominance of the Chaldeans very probably strengthened this language. Nonetheless, a few references to a "language" can be found in the Bible, and it is known as "Aramitic" (ibid.), namely, in order to communicate with the Assyrians. The general correctness of the Chaldeans very probably made it likely that the Persian people were of this persuasion. The "language" of the Bible is a mercantile colony, which settled in this ancient seat of commerce, and in consequence of which Aramaic may have remained for some time the literary language of the neighbouring Arabs. The Aramaic portions of the Old Testament show us the form of the language which was in use among the Jews of Palestine. Isolated passages in Ezra perhaps belong to the Persian period, but they have certainly been remodelled by a later writer. Yet in Biblical Aramaic, Aramaic. The Aramaic pieces contained in the Bible have the great advantage of being furnished with vowels and other orthographical signs. A few inscriptions of this kind, which are supposed to be inscribed on the first leaves of the books, and are sometimes at variance with the text itself. But, since Aramaic was still a living language when the punctuation points into existence, and since the lapse of time was not so very great, the tradition is continued in the cases where an antiquity is determined. Its general correctness is further attested by the innumerable points of resemblance between this language and Syriac, with which we are accurately acquainted. The Aramaic of the Bible still exhibits various antique features, found in the Egyptian papyri too, which afterwards disappeared,—for example, the formation of the passive by means of internal vowel-change, and the causative with the so-called "so-called". Many of these points are far from characteristic of Hebrew. Biblical Aramaic agrees in essential points with the language used in the numerous inscriptions of Palmyra (beginning about the 5th century B.C. and extending to the end of the 3rd century), which stand in front of monuments, caucuses, and strong stone monuments. Biblical Aramaic distinguishes itself from the language used in the numerous inscriptions of Palmyra (beginning about the 5th century B.C. and extending to the end of the 3rd century), which stand in front of monuments, caucuses, and strong stone monuments.

SEMITIC SERIES.

Still, at most, these can scarcely be more than conscious archaisms,—a view which is particularly corroborated by the fact, that, in certain Aramaic documents of the Persian period (A.D. 5th), the women are inserted into the text in the grammatical case of the feminine and not with the article (-āh). The latter orthodoxy doubtless represents the actual pronunciation of the writer. It is to be observed, however, that this led its ground with especial tenacity as a form of the relative pronoun and the name of the Persian province. But we must not lose sight of the preponderance of the 5th century, or of the 6th century. Upon the whole, the consonants and vowels of the 5th century, or of the 6th century, are found in these cases the work of skilled Greek artists, bear Aramaic inscriptions, whilst those of other coins are Greek. This, of course, does not prove that Aramaic was ever spoken in Asia Minor and as far north as Siphne and the Hellespont. In Egypt some Aramaic inscriptions have been found of the Persian period, one bearing the date of the fourth year of Xerxes (482 B.C.). We possessed, even before this, a few official documents and other written pieces in Aramaic, inscribed upon papyrus, and dating from this period, but unfortunately in a very dilapidated condition. Lastly, however, we have had a whole series of similar documents of the 2nd century B.C., in a very different condition, bearing inscriptions on stones in colonists in the far south of Egypt. In that country, where the language was so formidable to the learner, the Aramaic language and script may well have appeared peculiarly serviceable. Thus this dispute of the scholars is a matter perhaps of mere formalities. But the fact is now established that these Jews who had come to Egypt before the Persian period were military colonists, and were often referred to in documents as "Arameans." According to Deut. xxvii. 15, this was illustrated by the fact that they spoke "Aramean" and their language is known as Hebrew, which was at that time obtained numbers of warriors from foreign countries, instead of employing their own unwarlike subjects. The Syrian kings also sent soldiers to Egypt, from whom the Jews learned Aramaic. The language is also known as "Arabic" by the people of the East, and is known as "Arabic" by the Jews in the West. It is not known whether the Persians or the Egyptians spoke a "language" or whether the "language" was spoken by the Persians or the Egyptians. The short dominance of the Chaldeans very probably strengthened this language. Nonetheless, a few references to a "language" can be found in the Bible, and it is known as "Aramitic" (ibid.), namely, in order to communicate with the Assyrians. The general correctness of the Chaldeans very probably made it likely that the Persian people were of this persuasion. The "language" of the Bible is a mercantile colony, which settled in this ancient seat of commerce, and in consequence of which Aramaic may have remained for some time the literary language of the neighbouring Arabs. The Aramaic portions of the Old Testament show us the form of the language which was in use among the Jews of Palestine. Isolated passages in Ezra perhaps belong to the Persian period, but they have certainly been remodelled by a later writer. Yet in Biblical Aramaic, Aramaic.

5 Even to the Cosmas Indicopleustes (first half of the 6th century) the Sinaic inscriptions, the latest of which were then no more than 200–300 years old, were described as memorials of the Israelite exodus under Moses. And similar views have been propelled to a short while ago.
Finally, the Samaritans, among the inhabitants of Palestine, translated their only sacred book, the Pentateuch, into their own language. The Samarian dialect, though retaining some of the characteristics of the Hebrew name, was more in the nature of a Greek loan language which lies at its base was very much the same as that of the neighbouring Jews. Perhaps, indeed, the Samaritans may have carried the northern Semitic with them as far as the region of Galilee. Their absurd attempt to embellish the language of the translation by arbitrarily introducing forms borrowed from the Hebrew original, has given rise to a number of misprints, which, however, are without value as the compositions of Samaritans in Hebrew; the writers who spoke Arabic, endeavoured to write in languages with which they were but half acquainted.

The Aramaic dialects, including that of the oldest inscriptions, have this feature among others in common, that they form the third person singular masculine and the third person plural masculine, and female; the imperfect by preceding  על, do the other Semitic languages. And in these dialects the termination א (the so-called "status emphatical") still retained the meaning of a definite article down to a tolerable late period.

Thus, as the 2nd century, the Moslems greatly circumscribed the domain of Aramaic and a few centuries later it was almost completely supplanted in the west by Arabic. For the Christians of the eastern provinces it was, therefore, the most usual way of expression. Only the Syriac dialect was no longer of importance, and they adopted as their ecclesiastical language the dialect of the other Aramaic-speaking Christians, the Syriac (or Edessene). The only localities where a Western Aramaic dialect still survives are a few villages in Anti-Libanus.

The popular Aramaic dialect of Babylonia from the 4th to the 6th century of our era is exhibited in the Babylonian Talmud, in which the Jews mingled the Aramaic with the constant mingling of Aramaic and Hebrew passages. To a somewhat later period, and probably not to exactly the same district of Babylonia, belongs a strange sort of half Christian and half heathen, who from a linguistic point of view possess the peculiar advantage of having remained almost entirely free from the influence of any other dialect. It is the so-called Aramaic, of Jews as well as of Christians. The orthography of the Mandaean comes nearer than that of the Talmud to the real pronunciation, and in it the softening of the guturals is most clearly seen. In other respects their identity of language and the Mandaean is that of Hebrew and Aramaic.

The Babylonian and Mandaean dialects.

Aramaic, which had already been used for some time as a literary language, and had been reduced to rule through the influence of the schools (as is proved by the paucity of the grammar and orthography) even more than the Babylonian and Mandaean dialects, has become the national language of the Jews. The Aramaic language, as the language of the church, of literature, and of cultivated intercourse, is in full vigour.

The ancient name of the inhabitants, "Aramaeans," just like that of "Greeks," had acquired in the minds of Jews and Christians the unpleasant significance of "heathens," it was generally avoided, and in its place the Greek terms "Syrians" and "Soruce" were used. But "Syriac" was also the name given by the Jews and Christians of Palestine to their own language, and both Greeks and Persians designated the Aramaeans of Babylonia as Syriacs.

It is therefore correct to use the word "Syriac" as meaning the language of Edessa alone; but, since it was the most important of these dialects, it has the best claim to this generally received application. It has, however, a more very definitely fixed; and in it the above-mentioned forms of the imperfect take an א. As in the Babylonian dialects, the termination א has become so completely a part of the substantive to which it is added, that the imperfect always shows the 1st person plural, whereby the clearness of the language is perceptibly impaired. The influence exercised by Greek is very apparent in Syriac. From the 3rd to the 7th century an extensive literature was produced in this language, not only at Edessa, but throughout the entire Seleucid empire. It was in Syriac that the Nestorian Reformers, led by the Syrian kings, laid the foundations of their language. The Semitic languages under the Persian kings it virtually occupied a more prominent position as an organ of culture than the Persian language itself. The conquests of the Arabs totally changed this state of things.
When several distinct dialects so agree, the phenomenon in question must be of great antiquity. There are nevertheless traces which prove that the language once possessed more vowels, and the Aramaeans, for instance, with whom David fought may have possessed many in their language. One peculiarity of Aramaic is that it lends itself far more readily to the linking together of sentences than Hebrew and Arabic. It possesses many conjunctions and adverbs to express slight modifications of meaning. It is also very frequent in the use of particles. Words that have this quality, which renders it suitable for a clear and limpid prose style, is not the result of Greek influence may be seen by the Mandaeans, of whom no works have been found written in their language, which naturally strikes us but we need beware of carrying it too far. Even the Aramaeans were not wholly destitute of poetical talent. Although the religious poetry of the Syrians has but little charm for us, yet real poetry occurs in the early fragments of onoetitic hymns. Moreover, as the dialects popular songs have been discovered which, though very simple, are fresh and full of feeling. It is therefore by no means improbable that in ancient times Aramaic dialect, if not being contrary to the theological tendency of Syrian civilization, were doomed to total oblivion.

Arabic.
The southern group of Semitic languages consists of Arabic, Ethiopic and Mahri-Socotri. Arabic, again, is subdivided into the dialects of the larger portion of Arabia and those of the southern coast of Persia. As early as the 5th century A.D. we were but lately justified in supposing, some of the northern Arabs reduced their language to writing. For a considerable time afterwards, at least, the northern Hijaz inscriptions in a hitherto unknown character, derived from the Sabæan (see below), which appear to have been written before our era. Since it is probable that TLMJ, the prominent letters of the inscriptions, is the same as that in which the city of the kingdom, we are directed to the Hellenistic period, and other circumstances confirm this conjecture. These inscriptions have been called "Thamudic," because they were found in the country of those of that name, though it is by no means a suitable one, because during the period when the power of the Thamud was at its height, and when the buildings mentioned in the Koran are supposed to have been erected, the language of this country was Nabataean (see above). A number of inscriptions, from both the northern and the southern Hijaz, have been discovered since the Sabæan, since the tribe of Liyyân is sometimes mentioned in them. Unfortunately the inscriptions hitherto discovered furnish but little material to the student of languages. But there can be no doubt that they are written in an Arabic dialect. The treatment of the dentals, among other things, is a sufficient proof of it. In some districts of the northern Hijaz and the neighbouring portion of Najd, other brief inscriptions, for the most part cursorily scratched upon rocks, have been discovered. These have been—very justly, perhaps—called "Proto-Arabic," and many of them have been proposed for them also. Their writing is a somewhat later form of the Liyyân, and the dialect, as well, seems to be very similar. Some of these inscriptions are very short, which generally contain only proper names, together with the incertitude of the meaning of many, does not allow an accurate insight into their language.

To the first centuries of the Christian era belong the thousands of Arabic inscriptions, found in the wild, rocky districts south-east of Damascus, which are commonly termed Safaitic, after Safa, a locality in their neighbourhood. For the most part, these are also short and cursorial pieces scratched upon rocks, have been discovered. These have been—very fairly, perhaps—called "Proto-Arabic," and have been proposed for them also. Their writing is a somewhat later form of the Safaic, and the dialect, as well, seems to be very similar. Some of these inscriptions are very short, which generally contain only proper names, together with the incertitude of the meaning of many, does not allow an accurate insight into their language.
SEMitic LANGUAGES

also professed Christianity. Moreover, poets from the interior were gladly welcomed at the court of the Ghassanian princes, who were Christian vassals of the emperor residing near Damascus; in this district, where the most of the tribes cultivated poetry, it would be impossible to be added that most of the tribes which cultivated poetry appear to have been near neighbours at an epoch not very far removed from that in question, and afterwords have been scattered in large bands to different parts of the country. The third case is that of the two tribes who were not Christians paid respect to the sanctuary of Mecca. It is a total mistake, but one frequently made by Europeans, to designate the Arabian language as "Koraishte" is as absurd as it would be to speak of English as the dialect of London or of Oxford. This unfortunate designation has been made the basis of a theory very often repeated in itself, which claims that classical Arabic is nothing but the dialect of Mecca, which the Koran first brought into fashion. So far from this being the case, it is certain that the speech of the bani in the Hijaz did not differ in every point from the language of the poets, and, as it happens, the Koran itself contains some remarkable deviations from the rules of the classical language. This would be still more evident if the punctuation, which was introduced at a somewhat later time, did not obscure many details. The traditions which represent the Korasish as speaking the purest of all Arab dialects are partly the work of the imagination and partly compliments paid to the rulers descended from the Korahish, but are doubtless correct as far as the three Arab tribes themselves in earlier days. In the Koran Mahomet imitated the poets, though, generally speaking, with little success; the poets, on the other hand, were modelled upon the Koran. The links which joined these two great ages of poetry, the Korahish and the Korasish, were thus exercised but very little influence upon the poetry of the following century and upon that of later times, whereas this poetry closely and slavishly copied the productions of the old heathen period. The fact that both are preserved in a much more authentic form than the works of the heathen poets proves that our idea of the language of its pattern, the ancient poetry, is on the whole a general language.

The Koran and Islam raised Arabic to the position of one of the principal languages of the world. Under the leadership of the Korahish the Bedouins subjected half the world to their wisdom and placed in their hands an additional character of a sacred language. But soon it became evident that not only all the Arabs spoke a language precisely identical with the classical Arabic of the poets. The north-western Arabs played a particularly important part during the period of the Omayyads. The ordinary speech of Mecca and Medina was, as we have seen, no longer quite so primitive as that of the desert. To this may be added that the military expeditions of the Koraish and those Arabs who spoke the classical language into contact with tribes from out-of-the-way districts, such as 'Oman, Bahrain (Bahrein), and particularly the north of Yemen. The fact that the Korahish existed in possession of a simple and richly colored language was also little calculated to preserve the unity of the language. Finally, the violent internal and external communications which were produced by the great events of that time, and stirred the Arab tribes to a fever of eloquence, which we know from tradition that even in the 1st century of the Flight the distinction between correct and incorrect speech was in places quite perceptible. About the 6th century the system of Arabic grammatical was constructed, and never underwent any essential modification in later times. The theory as to how one should express oneself was now definitely fixed. The majority of those Arabs who lived beyond the limits of Arabia already diverged far from this standard; and in particular the final vowels which serve to indicate cases and moods were no longer pronounced. This change, by which Arabic lost one of its principal advantages, was no doubt the work of the Arabs. This division of sentences in Arabic resulted in quite acceptable forms without grammatical terminations. But in the language of certain Bedouin tribes remnants of those terminations have been preserved down to our time.

As we are able to make ourselves intimately acquainted with the system, and still more with the language of the Arabians. Although they are not always performed their task in a critical manner, we are under the impression of a rather more disposed to admire the richness of the ancient Arabic vocabulary when we remember how simple are the conditions of life amongst the Arabs, how painfully remote the regions of their ideas must be. Within this range, however, the slightest modification is expressed by a particular word. It must be confessed that the Arabic lexicon has been formed in the habit of using such rhetorical phrases as an individual poet has used to describe an object: for example, if one poet calls the lion the "tearier" and another calls him the "mangler," each of these terms is explained by the lexicographers as equivalent to "lion." One branch of literature in particular, namely, lampoons and satirical poems, displays an especially remarkable consistency and even more a uniformity which is more difficult to discriminate. It is extraordinary that with the same form of expression the same ideas are expressed in all the Semitic tongues. But in spite of these qualifications it must be admitted that the vocabulary is surprisingly rich, and the Arabic dictionary will contain more than one-third of the words which the lexicographer represents as synonymous in all the Semitic tongues. This method, if pursued with the necessary caution, is a perfectly legitimate one.

Poems seldom enable us to form a clear idea of the language of original Arabs and Arabic poetry. Its language is not formed by the very beginning by a certain tendency to artificiality and mannerism. Still less does the Koran exhibit the language in its spiritual and intellectual state. This language is represented in the ancient normative traditions (Ibadith). And the genuine accounts of the deeds of the Prophet and of his companions, and especially the stories concerning the battles and adventures of the Bedouins in the heathen period and in the earlier days of Islam, are excellent models of a prose style, although in some cases their redaction dates from a later time.

Classical Arabic is rich not only in words but also in grammatical forms. The wanton development of the broken plurals, and sometimes of the verbal nouns, must be regarded as an excess of wealth. The sparing use of the ancient terminations which mark the distinction of the cases is compensated for by a system of pronouns, collectives, abstract nouns, and feminines in general. In its manner of employing the verbal tenses genuine Arabic still exhibits traces of that poetical freedom which exists in our modern language. Arabic is not a verb that has been subjected to rules of declension and conjugation; in connecting sentences Arabic can go much farther than Hebrew, but the simple parataxis is by far the most usual construction. Arabic has, however, this great advantage, that it scarcely ever leaves us in doubt as to where the apodosis begins or the consequent ends. The attempts to define the tenses more clearly by the addition of adverbs and auxiliary verbs lead to no very positive result (as is always the case). Arabic is a logical language, and the meaning of its words and sentences is expressed in a systematic manner.

This language of the Bedouins had now, as we have seen, become that of religion, courts and polished society. In the streets of the town language already diverged considerably from this, but the upper classes took pains to speak "Arabic." The problems and the bonas spiritus never ventured to employ any but the classical language and the "Artificists," with pedantic seriousness, convicted the most celebrated among the later poets (for instance, Motanabbi) of occasional deviations from the standard of correct speech. At the same time, however, classical language was employed in the language of the Bedouins. The present day still holds this position. There are, of course, many gradations between the pedantry of purists and the use of what is simply a vulgar dialect. Sensi'le writers employ a kind of modern, a kind of vulgar that is clear to the people; it is made up of words by modern names, but which, nevertheless, avoids coarse vulgarisms, aiming primarily at making itself intelligible to all educated men. They employ the "language of the scholars" or "language of the educated society." Arabic of educated society.

Arabic of educated society.

The Arabic of educated society.
Speaking as they did a thousand years back. A person who in Arabia or elsewhere should trust to his knowledge of classical Arabic only would resemble those travellers from the north who endeavour to get the better of their difficulties by consulting a road-book that is not written in the language of the country they visit.

SEMITIC literature. The written language has, it is true, greatly retarded the development of the dialects. Every good Moslem repeats at least a few short sûras several times a day in his prayer, and this exercise has been the seed from which has sprung the written language. Now the majority of Arabian Moslems understand something at least of the passages they recite or hear; so that the Koran was born to the Arabic and the Arabic language to the Koran. A similar process has taken place among the Christians, as much as has been exercised by no other book in the world.

The idioms of the church, of learning and of diplomacy was brought—partially at least—nearer to the average man, with the result that many of its rustic pronunciations withered. This was the error of the imperfect, they pronounce the 1st person plural with the ending u (as the 2nd and 3rd), and give to the 1st person singular the prefix n (as the 3rd). This was the case in classical Arabic.

This Arab dialect, the only one spoken exclusively by Christians, is of peculiar interest to the philologist, owing to the fact that for some 900 years it has been completely withdrawn from the action of literary Arabic. On the other hand, it has been exposed to the influence of Italian. Nevertheless, it has developed in a very similar manner to the dialects of the neighboring African coast; still it has many features which are peculiar to it. The dialects of Syria, inner and southern Arabia, and other oriental countries, we also know more than was the case a short while ago; but the gaps in our knowledge are still too great to allow us to classify Arabic dialects in a general way. From the nature of the language it is somewhat strongly distinguished from that of the non-Arabic tribes; but we should hardly be justified in believing that the Beduin dialects form a contrasting unity as against the other idioms.

There can be no doubt that the development of these dialects is in part the result of older dialectical variations which were already in existence in the time of the Prophet. The histories of dialects which differ completely from one another often pursue an analogous course. In general, the Arabic dialects still resemble one another more than we might expect when we take into consideration the very considerable geographical obstacles that stand in the way of communication. But we must not suppose that people, for instance, from Mosul, Morocco, Sâne's, and the interior of Arabia would have been able to understand one another in an age when we would have been a total error to regard the difference between the Arabic dialects and the ancient language as trifling one, or to represent the development of Arabic dialects as some sort of an ingrowing of the Romance languages. No living Arabic dialect diverges from classical Arabic so much as French or Rouman from Latin; but, on the other hand, no Arabic dialect resembles the classical language so closely as the Lugodic dialect, which is still spoken in Sardinia, resembles its parent speech, and yet the lapse of time is very much greater in the case of the latter. Side by side with the poetry of the old literary language there arose, in quite early days, and, so to speak, out of it, a Romance dialect with a Romance language. So, even in the 12th century, dialectic poetry was flourishing in Spain; and down to the present day, in the most diverse quarters, particularly in Sicily, the Arabic dialect is composed in the various dialects. But this poetry, probably, with the sole exception of Maltese, stands in some connexion or other with the antique, and is subject, more or less, to the influence of the classical language. Maltese also has succeeded in preserving the elements of literature. Mârchen, and other tales, written by the uneducated, merely show a dialectic colouring, frequently combined with a cacophonous use of the grammatical forms of classical Arabic, not unaccompanied by a remarkable facility in putting them together. This facility is particularly evident in works by Jews and Christians. Purely vulgar texts, of any magnitude, would be hard to discover. The dialect of Moslem speech has succeeded in preserving the language distinct from the classical tongue; and in this a fair amount of material has already been printed in Latin characters.

In recent years, however, earnest attempts have been made to classify Arabic dialects in order to throw light on the probable nature of these attempts, which will not be crowned with permanent success is a question to be resolved by time. In any case, the ancient written language, though with all kinds of modifications, will long continue to exist. The very fact that it does not express the vocalization with exactitude is an advantage; for thus the Arabs, from the Persian Gulf to the Atlantic, can use the same word, although they may pronounce it with different vowels.

Sabaean.

Long before Mahomet, a peculiar and highly developed form of civilization had flourished in the table-land to the south-west of Arabia. The more we become acquainted with the history of the Arabian and the Sabaean dialects, the more we are led to the conviction that the better we are able to decipher its inscriptions, which are being discovered in ever-increasing numbers, the easier it is for us to account for the haze of mythical stories about the Sabaean. If the Sabaean inscriptions resemble the Sabaean inscriptions (which till lately were more often called by the less correct name of "Himyaritic") begin long before our era and continue till the 6th century A.D. The fact that the Sabaean "character" is entirely different from that by which speech from one another renders decipherment easier, which, however, has not yet been performed in a very satisfactory manner, owing in part to the fact that the vast majority of the documents in question consist of religious votive tablets with peculiar sacredotal expressions, or of architectural notices abounding in technical terms. These inscriptions fall into two classes, distinguished partly by grammatical peculiarities and partly by peculiarities of phraseology. One dialect, which forms the causative with ha, like Hebrew and others, and employs, like nearly all the Semitic languages, the termination w (as the 3rd person singular), is the Sabaean properly so called. It resembles the Arabic, but is different from the other dialects (corresponding to the Shaphel of the Aramaeans and others), and for the suffix uses z (like the Assyrian sz), is the Minican. To this latter branch belongs the dialect of the Zealot, which has been discovered in the Hijaz, near Hejire, where the Minaeans must have had a commercial settlement. On the other hand, the very old inscriptions, emanating from a colony at Jetha in Abyssinia, are Sabean. The difference between the two classes, discernible in the absence of the consonant m, is no doubt ultimately based upon a real divergence of dialect. But the singular manner in which districts containing Sabaean inscriptions have been separated, is determined by the manner of writing the consonant k. This manor, is determined by the manner of writing the consonant k. This may be traced from districts rather more to the east exhibit certain linguistic peculiarities, which, however, may perhaps be explained by the supposition that the writers did not, as a rule, speak this dialect, and therefore were by imperfectly acquainted with it.

A great hindrance to the completion of our knowledge of the Sabaean language lies in the paucity of vowel-letters in the inscriptions. The unvarying style of the inscriptions excludes further a great number of the commonest grammatical forms. Not a single occurrence of the first or second person has yet been detected, with the possible exception of a few cases of the latter. It is most difficult to point to in part to a mere histrionic practice of clinging to ancient modes of expression. Indeed it is very probably due to conscious literary conservatism that the language of the inscriptions remains almost wholly unaltered. However, the number of cases where the dialect differs from that of other inscriptions, found in the north of the Hijaz, near Hejire, where the Minaeans must have had a commercial settlement. On the other hand, the very old inscriptions, emanating from a colony at Jetha in Abyssinia, are Sabean. the inscriptions as a whole. Being zealous local patriots, they discovered in those inscriptions which they imagined themselves to be capable of deciphering many fabulous stories respecting the glory of the ancient Yemenites.

Mahrī and Socotrī.

Farther to the east, in the sea-coast districts of Shihur and Mahra, up to the borders of the barren desert of the interior, and also in the island of Socotra, dialects very unlike Arabic are still spoken. To all appearances, at least, Mahri, which Shihurians pronounce, is a distinct dialect, and Socotri are probably scions of dialects which were related to Sabaeans and Minacans; but they have developed on altogether independent lines, and are far less closely akin than they are likely to render. On great aslant we have discerned in Mahri the characteristic features of the earlier stage of the Mahri vocabulary is formed by words which have been borrowed from the Arabic at different periods. Many of them have subsequently undergone drastic phonetic alterations, so that it is impossible to say which is the original form. Besides, it has been well protected by its insular position, the borrowed Arabic words are rarer, but even here they are not lacking. These languages, however, especially Socotri, have preserved a few more of their original features than any others. We may well doubt whether they are Semitic at all. [continue]

Ephistio.

In Abyssinia, and in the neighbouring countries we find languages which bear a certain resemblance to Arabic. The Geez, or Geor, and Ethiopian proper. The language of the ancient kingdom of Axum, was reduced to writing for the first time under the Empire of Aksum, and has been preserved. But even the established, bears, in addition to the Greek inscription, one section in the Abyssinian chronicles and a Coptic character, i.e., in a systematic transformation of the Sabaeans. Here the Geez is still unvocalized; and some few inscriptions, besides vowel signs, have been discovered. But two original inscriptions of the same kingdom of Axum—so it appears to be after the earliest researches already have the full vocalization which obtains in the Ethiopian Bible and the remaining literature: the language, too, is identically the same. The indication of the vowels gives Ethiopic an advantage over Semitic, in that, even if it was introduced is unknown. Not long after the time of the inscription the Geez was translated into Geor from the Greek, in part by Jews; for Jews and Christian Ethiopians seem to have been formerly competing with one another, and also the Geor, and in Abyssinia; nor were the former unsuccessful in making proselytes. The missionaries who gave the Bible to the Abyssinians must, at least in some cases, have spoken Aramaic as the language of instruction. As the result of this abandonment of the Coptic and Ethiopic Bible certain religious conceptions are expressed by Aramaic words. During the following centuries various works were produced by the Abyssinians in this language; and though we are able to judge of a more or less theological character, almost invariably translations from the Greek. We cannot say with certainty when Geor ceased to be the language of the people, but it may be supposed that it was suppressed probably about a thousand years ago. From the time when the Abyssinian kingdom was reconstituted, towards the end of the 13th century, by the so-called Solomonian dynasty (which was of southern origin), the language of the court and of the government was Amharic language, and the end of the Christian Church, and the Greek and Coptic literature even showed a certain activity in numerous translations from those Arabic and Coptic works which were in use amongst the Christians of Egypt; besides these, original writings were produced by Christian priests, namely, lives of saints, hymns, &c. This literary condition lasted till modern times. The language, which had long become extinct, was by means invariably written in a pure form: we may often observe the adaptation of Arabic modes of expression. Even in manuscripts of more ancient works we find many linguistic corruptions, which have crept in partly through mere carelessness and ignorance, partly through the influence of the Arabic dialects, which are still sometimes left in doubt, as we possess no manuscripts belonging to the older period.

Geez. In more nearly related to Sabaeans than to Arabic, though scarcely to such a degree as we might expect. The historical intercourse between the Sabaeans and the people of Axum does not, however, prove that those who spoke Geez were in no way influenced by the Sabaians. But there is a probability that Axum is descended from an extinct cognate dialect of south Arabia, or may have arisen from a mingling of several such dialects. And this colonization in Africa probably began much earlier than the dawn of Arabic civilization. In certain respects Axum represents a more modern stage of development than Arabic; we may cite as instances the loss of some inflexional terminations and of the ancient passive. It appears, however, that Axum is entirely unvocalized, and therefore we have no means of determining to what extent Axum was influenced by the Hume languages, we may ascribe the very hard sound now given to certain letters, q, j, s, and d, in the reading of Gez. The last two are at present pronounced something like u and us (the German s). A peculiar advantage possessed by Gez and by all Ethiopic languages is the sharp distinction between the imperfect and the subjunctive: in the former a vowel is inserted after the first radical, a formation which also exists in Mahri and Socotri, and, though in another signification—in Assyrian as well. Geez has no definite article, but is very rich in particles. In the case in which it joins sentences together and in its freedom as to the order of words it resembles the Baalsamite, but in its vocative it is identical with the Semitic literature, which is for the most part very asyrian, supplies us with comparatively few expressiveness that do not occur in the Bible, whereas the more modern Semitic language shows the influence of other Semitic tongues, particularly Amharic. With regard to the vocabulary, Geez has much in common with the other Semitic tongues, but at the same time possesses many words peculiar to itself; of these a few are almost identical with the Arabic and Abyssinian. Following the grammar shows, at most, some slight and dubious traces of Hamitic influence. Gezz seems to have been originally the language of a tribe almost exempt from non-Semitic blood. But we must assume that under the influence of many Semitic dialects, and with the help of the apostles, and other converts, the language was gradually intermingled with the Aramens. This opinion seems to be confirmed by anthropological facts.

Tigré and Tigritia.

Not only in what is properly the territory of Axum (namely, Tigré, north-eastern Abyssinia), but also in the countries bordering up to the north, including the islands of Dahlak, dialects are still spoken which are but modern forms of the linguistic type clearly exhibited in Geez, viz. that spoken in Tigrit proper and that of the neighbouring countries. In reality, the name of Tigré belongs to both, and therefore we may distinguish them from one another as Northern and Southern Tigré. But it is the custom to call the northern dialect Tigrit simply, whilst that spoken in Tigrit itself bears the name of Tigrit; but the latter is somewhat closer resemblance to Geez than does Tigritia, although this latter is spoken in the very home of Geez. For Tigritia has during several centuries been very strongly influenced by Axum, and in some cases Axum has so far exceeded in eloquence or majesty, to which spoken mostly by nobles. But Tigré, on the other hand, seems to have been greatly influenced by Hamitic dialects. In late years careful observations on both languages have been made by scholars to Leco, and we already have a number of printed texts, comprising partly original works, partly translations of Biblical books and so forth. But in this domain our knowledge still stands in great need of being perfected.

Amharic.

Although Tigré and Tigritia are not free from foreign influences, yet at all events, they are purely Semitic. This is not fundamentally the case with Amharic, a language in which the domain extends from the left bank of the Takaaz towards regions far to the south. Although by no means the language of the people, but imperfectly known, it is always spoken by those foreign tongues which surround it and with which it is intermixed. We refer here especially to the Agaw dialects. Although Amharic has been driven back into the very regions where it has been but the language of the Abyssinians, it has compensated itself to some extent for this loss, as the Ero and Wollo Gallas, who penetrated into eastern Abyssinia, have adopted it as their language. With the exception, of course, of Arabic, no Semitic tongue has undergone such a number of modern changes as Amharic. The very fact that the Agaw languages are being gradually, and, as it were, before our own eyes, absorbed by Amharic makes it appear probable that this language must be spoken chiefly in the most arid parts of the Horn of Africa, which is supported by the fact confirmed by a study of the language...
SEMLER, JOHANN SALOMO (1725-1791), German church historian and biblical critic, was born at Saalfeld in Thuringia, on the 18th of December 1725, the son of a clergyman in poor circumstances. He grew up amidst pietistic surroundings, which powerfully influenced him his life through, he never became a Pietist. In his seventeenth year he entered the university of Halle, where he became the disciple, afterwards the assistant, and at last the literary executor of the orthodox, rationalistic professor S. J. Baumgarten (1706-1757). In 1749 he accepted the position of editor, with the title of professor, of the Coburg official Gazette. But in 1751 he was invited to Aldtorf as professor of philology and history, and in 1752 he became a professor of theology in Halle. After the death of Baumgarten (1757) Semler became the head of the theological faculty of his university, and the fierce opposition which his writings and lectures provoked only helped to increase his fame and influence. His popularity continued and increased for more than twenty years, until 1779. In that year he cast forward with a reply (Beantwortung der Fragmente eines Ungenannten) to the Wabenbüttel Fragments (see REIMARUS) and to K. F. Bahrdt's confession of faith, a step which was interpreted by the extreme rationalists as a revocation of his own rationalistic position. Even the Prussian government, which favoured Bahrdt, made Semler painfully feel its displeasure at this new but really not inconsistent aspect of his position. But, though Semler was really not inconsistent with himself in attacking Bahrdt, he did not have to look for a rival. His influence had been lost before that year to decline, and towards the end of his life he felt the necessity of emphasizing the apologetic and conservative value of true historical inquiry. His defence of the notorious edict of July 9, 1788, issued by the Prussian minister for ecclesiastical affairs, Johann Christoph von Wölfflin (1732-1800), the object of which was to enforce Lutheran orthodoxy, might with greater justice be cited as a sign of the decline of his powers and of an unfaithfulness to his principles. He died at Halle on the 14th of March 1791, worn out by his labours, and disappointed at the issue of his work.

The importance of Semler, sometimes called "the father of German rationalism," in the history of theology and the human mind is that of a critic of biblical and ecclesiastical documents and of the historical and philosophical thinker or theologian, though he insisted, with an energy bordering on fanaticism, on certain distinctions of great importance which properly worked out and applied, e.g., the distinction between religion and theology, that between private personal beliefs and public historical creeds, and that between the local and temporal and the permanent elements of historical religion. His great work was that of the critic. He was the first to reject with sufficient proof the equal value of the Old and the New Testament, the uniform authority of all parts of the Bible, the divine authority of the traditional canon of Scripture, the inspiration and supposed correctness of the text of the Old and New Testaments, and the relationship of Scripture to Scripture. Though to some extent anticipated by the Englishman Thomas Morgan, Semler was the first to take due note of and use for critical purposes the opposition between the Judaic and anti-Judaic polemics that characterized the early movements for reform. He gave an original interpretation of the development of the Catholic Church, covering the origin of the Gospels, the Epistles, the Acts of the Apostles, and the Apocalypse. He revived previous doubts as to the direct Pauline origin of the Epistle to the Hebrews, called in question Paracelsus's attribution of the Apocalypse to the second epistle to the end of the 2nd century. He wished to remove the Apocalypse altogether from the canon. In textual criticism Semel pursued further the principle of classifying MSS. in families, adopted by R. Simon and J. A. Bengel. In church history Semler did the work of a pioneer in many periods and in several departments. Friedrich Tholuck pronounces him the "father of the critical school," and vol. 1, p. 30: "the first step in the history from the true critical standpoint." At the same time, it is admitted by all that he was nowhere more than a pioneer.

Tholuck gives 171 as the number of Semler's works, of which only two, the 4th edition of 1768, and the 2nd edition of 1775, are now read for its own sake. Amongst the chief are: Commentatio de demoniaccioces (Halle, 1760, 4th ed. 1779), Umschätzende Untersuchung der dämonischen Leute (1775), Die verschiedenen, auch der modernen Sprache, die historische Kultur der hochkulturen (3 vols., Halle, 1767-1769), das berühmte freiere Untersuchung des Kanon (Halle, 1771-1775), Apparatus ad libereum N. T. interpretationem (1767; ed. v. T. J213), Institutio dogmatica, Introductio in die z Heyden, die christlichen, die theologischen, die gesellschaftlichen, und die moralischen in die Christen (1786), and his autobiography, Semler's Lebensbeschreibung, von ihm selbst abgefasst (Halle, 1781-1782).

For an account of his life and labors, see W. Gess, Gesch. der prot. Dogmatik (Berlin, 1854-1867); Isaac Dornier, Gesch. der prot. Theol. (Munich, 1867); the art. in Herzog's Realencyklopädie; Adolf Hilgenfeld, Einleitung in das Neue Testament (Leipzig, 1875); F. C. Baur, Ephemeris der Kirchengeschichte (1852), and Allericht Ritshulisch, Gesch. des Pietismus (Bonn, 1880-1884).
SEMMLER, IGNATZ PHILIPP (1818–1865), Hungarian physician, was born at Buda on the 1st of July 1818, and was educated at the universities of Pest and Vienna. At first he intended to study law, but soon abandoned it for medicine; and such was his promise that, even as an undergraduate, he attracted the attention of men like Joseph Skoda and Carl Rokitansky. He graduated M.D. at Vienna in 1844, and was then appointed assistant professor in the maternity department, under Johann Klein. In Klein’s time the deaths in this department from what was then known as “puerperal fever” became portentous, the ratio being rarely under 5 on 3 and sometimes exceeding 7-45%. Between October 1841 and May 1843, of 5153 parturient women 829 died; giving the terrible death-rate of 16%, not counting those of patients transferred to other wards. It was observed that this rate of mortality prevailed in the students’ clinic; in the midwives’ clinic it ruled much lower. Semmelweis found no satisfactory explanations of this mortality in such causes as overcrowding, fear, mysterious atmospheric influences, or evill looking over the wards; yet that the cause lay in some local conditions he felt certain. The patients would die in rows, others escaping; and women delivered before arrival, or prematurely, would escape. At last, he tells us, the death of a colleague from a dissection wound “unveiled to my mind an identity” with the fatal puerperal cases; and the beginning of a scientific pathology of septicaemia was made. The students often came to the lying-in wards from the dissecting-room, their hands cleansed with soap and water only. In May 1847 Semmelweis prescribed auberges with chlorinated lime water; in that month the mortality dropped to 12-24%; before the end of the year it had fallen to 5-04, and in the second year to 1-27; thus even surpassing the results in the midwives’ clinic. Skoda and other eminent physicians were convinced by these results (Zeitschrift d. k. k. Gesellschaft der Ärzte in Wien, J. vii. B. p. 107). Klein, however, apparently blinded by jealousy and vanity, supported by other reactionary teachers, and aided by the disasters which then befell the Hungarian nation, drove Semmelweis from Vienna in 1849. Fortunately, in the following year Semmelweis was appointed obstetric physician at Pest in the maternity department, then as terribly afflicted as Klein’s clinic had been; and during his six years’ tenure of office he succeeded, by antiseptic methods, in reducing the mortality to 0-85%. Semmelweis was slow and reluctant as an author, or no doubt his opinions would have obtained an earlier vogue; moreover, he was not only tender-hearted, but also irascible, impatient and tactless. Thus it cannot be said that the stupidity or malignity of his opponents was wholly to blame for the tragic issue of the conflict which brought this man of genius within the gates of an asylum on the 20th of July 1865. Strange to say, he brought with him into this retreat a dissection wound of the right hand, and on the 17th of the following August he died, a victim of the very disease for the relief of which he had already sacrificed health and fortune.

His chief publication was Die Ätiologie der Begriff und die Prophylaxe des Kindbettfiebers (Vienna, 1847). There are biographies by Klein (1882), and the editors of Semmelweis’ works (1887). Dukas (1882), Grosse (Vienna, 1889) and Schüler von Waldersem (Vienna, 1905). For the relations in the order of discovery of Semmelweis to Lister see Lister (T. C. A.).

SEMMERING PASS, the lowest of all the great passes across the Alps; the route from the Danube to the Adriatic, a part of the Danube route, was by the Semmering pass. Between 1848 and 1854 a railway line (the first in any sense to cross the Alps) was constructed, but passes 282 ft. below the summit of the pass (1222 ft.) by a tunnel about 1 m. long. The line runs from Wiener Neustadt (306 m. from Vienna) past Bruck to Graz (139 m. from Vienna), the capital of Styria, whence it is 227 m. by rail to Trieste.

SEMOIS (also spelled Semoy and Semoe), a river of less than 120 m. in length rising near Arlon in Belgium, and flowing into the Meuse near Montmeré in France. It is Belgian for about 100 m. and French for 30 m., and in the Picos de Europa in Spain it is drained into the Duero. At a station near Arlon it is 11-7 m. broad. Its valley remains a narrow gully till it reaches the border of Belgium.

SEMONVILLE, CHARLES LOUIS HUGUET, MARQUIS DE (1759–1839), French diplomat, was born in Paris on the 9th of March 1759, the son of one of the royal secretaries. Minister and envoy extraordinary of France at Genoa in 1790–1791, he was instructed by Dumas to go to Turin to detach Victor Amadeo III. of Sardinia from the Austrian alliance, but was not permitted to cross the Sardinian frontier. In 1793 he had started with H. B. Maret (afterwards duce de Bassano) for Italy where they had missions to Florence and Naples respectively, when the two envoys were kidnapped by Austrian orders in the Valtelline. They remained in a Tirolean prison until December 1795, when there was an exchange of prisoners on the release of Madame Royale, daughter of Louis XVI., from the Temple. In 1799 and 1800, for the reason that he had been sent to the Hague to negotiate the treaties and to summon the Council, he had been made a count of the Empire in 1808, and marquis in 1810. He died in Paris on the 11th of August 1839.

SEMO SANCUS, an Italian divinity worshipped by the Sabines, Umbrians and Romans, also called Dius Fidius and (perhaps wrongly) identified with the Italian Hercules. His dual nature, as a god of light and good faith, is indicated by the names Dius Fidius. Sancus is obviously from sanctus, meaning one who hallows the acts in which he takes part. Semo has been variously explained as: (1) one who presides over seed-time and harvest (serere, cf. the female Semonia); (2) a being apart from and superior to man (se-homo); (3) a demi-god (semis). The priests called bidentales, whose existence is attested by inscriptions, were specially connected with his worship, since lightning which fell from heaven during the day was looked upon as sent by Dius Fidius, and a special class of birds (sangualtes) was under his protection. As the god of oaths, he protected the sanctity of the marriage tie, the rights of hospitality, international treaties and alliances. In his sanctuary on the Quirinal, the foundation
SEMPACH—SEMPILL

of which was celebrated on the 5th of June, there were shown the distaff and spindle of Tanaquil, the wife of Tarquinius Priscus, and in the eyes of Roman matrons the embodiment of all wisely virtues. Dionysius of Halicarnassus (iv. 58) states that the treaty concluded between Tarquinius Superbus and the town of Gabii was deposited in the same temple of Sancus, whose name he translates by Zeis πιστος. He could only be invoked under the open sky, as partaking of the nature of a god of light and day; hence a round opening was made in the roof of his temple through which prayers might ascend to heaven. If he was invoked in a private house, those who called upon his name stood beneath the opening in the roof called compluvium. The bronze orbs mentioned by Livy (vii. 20. 8) as having been set up in his temple are also supposed to have some connexion with this, although they may be merely symbols of the eternal power of Rome. There was a second chapel of Semo Sancus on the island in the Tiber with an altar, the inscription on which led Christian writers (Justina Martyr, Tertullian, Eusebius) to confuse him with Simon Magus, and to infer that the latter was worshipped at Rome as a god. The cult of this god possessed a very great importance at Rome; authorities differ as to whether it was of Sabine origin or not. The plural Semones was used of a class of supernatural beings, a kind of tutelary deities of the state.

See Preller, Römische Mythologie; article “Dius Fidius,” by Wissowa, in Roscher’s Lexikon der Mythologie, and his Religion und Kunst im Röm. Reich (1882).—The name Semones is mentioned by Dionysius of Halicarnassus; W. W. Fowler, The Roman Festivals (1890); E. Jannet, Étude sur Semo Sancus Fidius (Paris, 1885), according to whom it was a Sabine fire god.

SEMPACH, a small town in the Swiss canton of Lucerne, built on the eastern shore of the lake of the same name, and about 1½ m. by road north of the Semapach railway station (9 m. N.W. of Lucerne) on the main line between Lucerne and Olten. In 1900 it had 2,592 inhabitants, German-speaking and Romans, and it possessed some traces of its medieval appearance, especially the main gateway, between a watch tower, and reached by a bridge over the old moat. About half an hour distant to the north-east, on the hillside, is the site of the famous battle of Sempach (9th July 1386), in which the Swiss defeated the Austrians, whose leader, Duke Leopold, lost his life. The legendary deed of Arnold of Winkelried (q.v.) is associated with his victory. The spot is now marked by an ancient and picturesque Battle Chapel (restored in 1856) and by a modern monument to Winkelried. Some miles north of Sempach is the quaint village of Münster or Beromünster (973 inhabitants in 1900), with a collegiate church founded in the 10th century and dating, in parts, from the 11th and 12th centuries (fine 17th-century choir stalls and altar frontals), the chapter of secular canons now consisting of invalided priests of the canton of Lucerne: it was in Beromünster that the first dated book was printed (1470) in Switzerland, by care of the canons, while thence came Gering, who introduced printing into France.

See Th. von Liebenau, Die Schlacht bei Sempach (Lucerne, 1886). (W. A. B. C.)

SEMPER, GOTTFRIED (1803-1879), German architect and writer on art, was born at Altona on the 29th of November 1803. His father intended him for the law, but his impulses towards an artistic career were irresistible. His early mastery of classical literature led him to the study of classic monuments in classic lands, while his equally conspicuous talent for mathematics gave him the laws of form and proportion in architectural design. At the university in (r.c.), where he fell under the influence of K. O. Müller. His architectural education was carried out successively in Hamburg, where later, upon his return from Greece, he built the Donner Museum, in Berlin, in Dresden, in Paris under Gau and in Munich under Gärtnert; afterwards he visited Italy and Greece. While in Greece he made observations which showed that in ancient architecture the use of polychrome was frequent. In the diffusion of this discovery he was much aided by Jacques Ignace Hittorff. In 1834 he was appointed professor of architecture in Dresden, and during fifteen years received many important commissions from the Saxon court. He built the opera-house in Renaissance style, the new museum and picture gallery, and a Byzantine synagogue. In 1848 his turbulent spirit led him to side with the revolution against his royal patron; he furnished the rebels with military plans, and was eventually driven into exile. Semper came to London at the time of the Great Exhibition of 1851, and Prince Albert found him an able ally in carrying out his plans. He was appointed teacher of the principles of decoration; his lectures in manuscript are preserved in the art library, South Kensington. He was also employed by the Prince Consort to prepare a design for the Kensington Museum; and he designed the Brighton funeral car. In 1853 Semper left London for Zurich on his appointment as professor of architecture, and with a commission to build in that town the polytechnic school and the hospital. He also built the observatory and the railway station in that city. Here, too, he made plans for a large theatre in Rio Janeiro. In 1870 he was called to Vienna to assist in the great architectural projects since carried out around the Ring. A year later, after an exile of over twenty years, he received a summons to Dresden, on the rebuilding of the first opera-house, which had been destroyed by fire in 1869; his second design was a modification of the first. The closing years of his life were passed in comparative tranquillity between Venice and Rome, and in the latter city he died on the 15th of May 1879. In 1892 a bronze statue of Semper, by Johannes Schelling, was unveiled on the Brühlische Terrasse in Dresden.

Semper's style was a growth from the classic orders through the Italian and French Renaissance, and the rococo forms which he found rooted in Germany, and, reverting to the best historic examples, fashioned a purer Renaissance. He stands as a leader in the practice of polychrome, since widely diffused, and by his writings and example did much to reinstate the ancient union between architecture, sculpture and painting. Among his numerous literary works are Über Polychromie u. ihren Ursprung (1851), Die Anwendung der Farben in der Architektur u. Plastik bei den Alien, Der Stil in den technischen u. tektonischen Künsten (1860-1863). His Notes of Lectures on Practical Art in Metals and Hard Materials: his Technology, History and Style, were left in MS.

SEMPILL, the name of a Scottish family long seated in Renfrewshire. An early member, Sir Thomas Sempill (d. 1488), was killed whilst fighting for James III. at the battle of Sauchieburn, and his son John (d. 1513), who was made a lord of parliament about 1480, fell at Flodden. John's grandson, Robert, 3rd Lord Sempill (c. 1505-1572), assisted the Scottish regent, Mary of Lorraine, in her struggle with the lords of the congregation, and was afterwards one of the partisans of Mary, queen of Scots; about 1566, however, he deserted the queen, against whom he fought at Carberry Hill and at Langside. His grandson, Robert (d. 1611), became the 4th Lord Sempill, and another grandson was Sir James Sempill of Beltrees (q.e.).

The title of Lord Sempill descended to Francis, the 8th lord (d. 1684), who was succeeded by his sister Anne (d. 1659), the wife of Francis Abercomby (d. 1703), who was created a peer for life as Lord Glassford. Their sons, Francis, John and Hugh, who took the surname of Sempill, succeeded in turn to the title. Hugh, 12th Lord Sempill (d. 1746), fought in Spain and in Flanders, and held a command in the English army at Culloden; in 1747 he was made colonel of the Black Watch. His title descended to Selkirk Sempill, the 15th lord (1758-1835), who was succeeded by his sister, Maria Janet (1790-1884). She was succeeded by a cousin, William Forbes (1836-1905), a descendant of the 13th lord, who took the name of Forbes-Sempill; in 1905 his son, Hugh, Hereditary Great High Constable of the Findhorn and Avoch, succeeded.

A certain Robert Sempill, who served James Edward, the Old Pretender, in France, and is described as a captain in Dillon's famous Irish regiment, was created Lord Sempill by this prince after 1723. This circumstance has given rise to a certain amount of confusion between the different holders of the title.

SEMPILL (or SEMPILL), SIR JAMES, ROBERT and FRANCIS, three Scottish ballad-writers, known as the Sempills of Beltrees from their place in Renfrewshire.

SIR JAMES SEMPILL (1666-1696) was the son of John Sempill of Beltrees, and Mary Livingstone, one of the "four Marys," companions of Mary, queen of Scots. He was brought up with James VI. under George Buchanan, and later assisted the king
in the preparation of his Basilikon Doron. Ambassador to England 1590-1600, he was made a knight bachelor, and in 1601 was sent to France. He died at Paisley in 1626. His wife was Egidia or Egllis Elphinstone of Blythwood. He wrote some theological works in prose, but is chiefly remembered for the poem "The Packman's Pater Noster," a vigorous attack upon the Church of Rome. An edition was published at Edinb
ger 1669 entitled "A Pick-tooth for the Pope, or the Packman's Pater Noster." No details of his education are known, S. was newly augmented and enlarged by his son R. S." (reprinted by Paterson). Seven poems, chiefly of an amorous character, are printed in T. G. Stevenson’s edition of The Sempill Ballates.

ROBERT SEMPILL [the younger] (1675-1665?), son of the above, was educated at the university of Glasgow, having matriculated in March 1614. During the Civil War he fought for the Stuarts, and seems to have suffered heavy pecuniary losses under the Commonwealth. He died between 1660 and 1669. He married Mary, daughter of Sir Thomas Lyon of Auldbar. His reputation is based on the ballad "The Life and Death of Habbie Simpson Piper of Killbarchan," written c. 1640. It is an interesting picture of the times; and it gave fresh vogue to the popular six
lined stanza which was much used later by Ramsay, Ferguson and Burns (see particularly, Burns’s "Poor Mailie’s Elegy"). Two broadside copies were printed before 1700, and it appeared in James Watson’s Collection of Poems (1706-1710). Sempill is supposed to be the author also of an epitaph on "Sawney Briggs, nephew to Habbie Simpson," written in the same stanza. He wrote a continuation of his father’s "Packman’s Pater Noster." FRANCIS SEMPILL (1616-1682) was a son of Robert Sempill the younger. No details of his education are known. His fidelity to the Stuarts involved him in money difficulties, to meet which he alienated portions of his estates to his son. Before 1677 he was appointed sheriff-deputy of Renfrewshire. He died at Paisley in March 1682. Sempill wrote many occasional pieces, and his name as a wit was widespread. Among his most important works is the "Banishment of Poverty," which contains some biographical details. "The Blytheosome Wedding," a long attributed to Francis Sempill, has been more recently asserted to be the work of Sir William Scott of Thirlestane. Sempill’s claim to the authorship of the celebrated song "She raised and let me in," and of the ballad "Maggie Lauder," has been discussed at considerable length. It seems probable that he had some share in both.

See the works mentioned below in the article on the elder Robert Sempill, and The Poems of the Sempills of Buteles, ed. J. E. Paterson (Edinburgh, 1845); A Literary History of Scotland, by J. H. Masson (1903); and Notes and Queries, 9th series (xi, 1903, pp. 436-437).

SEMPILL, ROBERT [the elder] (c. 1530-1595), Scottish ballad-writer, was in all probability a cadet of illegitimate birth of the noble house of Sempill or Semple. Very little is known of his life. He appears to have spent some time in Paris. He was probably a soldier, and must have held some office at the Scottish court, as his name appears in the lord treasurer’s books in February 1572-1573, and in 1572-1573, and in 1572 his writings show him to have had an intimate knowledge of court affairs. He was a bitter opponent of Queen Mary and of the Catholic Church. Sempill was present at the siege of Leith (1559-1556), was in Paris in 1572, but was driven away by the massacre of St Bartholomew. He died probably present at the siege of Edinburgh Castle (1573), serving with the army of James Douglas, earl of Morton. He died in 1595. His chief works are: "The Siege maid vpoun Margret Fleming callit the Flemynk bark "; "The defence of Crissle Sandelandis "; "The Clath Merchant or Ballat of Jonet Reid, ane Violet and Ane Quhyt," all three in the Bannatyne MS. They are characterized by extreme coarseness, and are probably among his earlier works. His chief political poems are "The Regents Tragedie," a broadside of 1570; "The Siege of the Castle of Edinburgh" (1573), interesting from an historical point of view; "Aine Complaint vpon fortoun ". (1581); and "The Legend of the Bishop of St Andros Lyfe callit Mr Patrik Adamsone" (1583).

SEMUROU-EN-AUVEUX, a town of eastern France, capital of an arrondissement in the department of Côte-d’Or, 45 m. W.N.W. of Dijon on the Paris-Lyon railway. Pop. (1906) 3278. Semur occupies one of the finest sites in France, on the extremity of a plateau dominating the river Armançon, which surrounds the town on three sides. The river forms this extremity into a peninsula which is occupied by the old town, once surrounded by ramparts, the remains of which are still to be seen. An isthmus, on which stands the castle, unites the older to the newer quarter, with the church, the cathedral of the 15th century and the church of Notre-Dame. This building, which belongs mainly to the 13th century, is one of the purest examples of Gothic architecture in Burgundy, though the narrowness of the nave, to some degree, spoils its proportions. The portal with its three arched opennings projects from the façade, which is flanked by two square towers surmounted by balustrades. Of the artistic features of the interior one of the most noteworthy is the sculptured keystone of the vaulting of the apse, representing the crowning of the Virgin. The castle (13th and 14th centuries) consists of a rectangular keep flanked by four towers. Portions of it are still in use. Among the town’s points of historical interest is one belonging to the time of Louis XIV, of which the last proprietor was Florent Château, husband of the friend of Voltaire. It is now used as a hospital. Semur possesses a sub-prefecture, a tribunal of first instance and a communal college. It is an important market centre for the Auvos and Morvan, and has trade in horses, grain, sheep, fruit and vegetables. Cement, leather, oil, and chemical manures are among its industrial products.

SÉNAC DE MEILHAN, GABRIEL (1726-1803), French writer, son of Jean Sénac, physician to Louis XV., was born in Paris in 1726. He entered the civil service in 1762; two years later he bought the office of master of requests, and in 1766 further advanced his position by a rich marriage. He was successively intendant of La Rochelle, of Aix and of Valenciennes. In 1776 he became intendant-general for war, but was soon compelled to resign. He had hoped to be made minister of finance, and was disappointed by the nomination of Necker, of whom he became a bitter opponent. He was intimate with thécomtesse de Tessé, sister of the Duc de Choiseul, and in 1781 met Madame de Crény, then sixty-seven years of age, and began a long friendship with her. His first book was the fictitious Mémoires d’Anne de Gouagne, princesse palatine (1786), thought by many people at the time to be genuine. In the next year followed the Considérations sur les richesses et le luxe, combating the opinions of Necker; and in 1788 the more valuable Considérations sur l’esprit et les mœurs, a book which abounds in sententious, but often excessively frank, sayings. Sénac witnessed the beginnings of the Revolution in Paris, but emigrated in 1790, making his way first to London, and then, in 1791, to Aix-la-Chapelle, where he met Pierre Alexandre de Tilly, who asserts in his Mémoirs that Sénac attributed the misfortunes of Louis XVI. to the refusal of his own services. In 1793, while his recollections of the Revolution were still fresh, he wrote a novel, L’Enlairé (Hamburg, 4 vols., 1797), which shows perspicacity and good judgment in its treatment of events. It was reprinted in 1904 in an abridged form by Casimir Stryjinski and Franz Funck-Brentano. At the invitation of Catherine II. Sénac went in 1792 to Russia, where he hoped to become imperial historiographer, but his manners displeased Catherine, who contented herself with dismissing him with a pension. From Russia he went to Hamburg.
and thence to Vienna, where he found a friend in the prince de Ligne. He died on the 16th of August 1803. Séancé also wrote a moderate exposition of the causes that led to the revolution, entitled Du gouvernement, des masques et des conditions en France avant la Révolution, avec les caractères des principaux personnages du règne de Louis XVI; the last part was reprinted (1813) by the duc de Levis with a notice of the author as Portraits et caractères. Séancé collected his own Œuvres philosophiques et littéraires (2 vols.) at Amsterdam, and was the subject of a number of pamphlets, and the best of his Séancé was prefixed to his edition (1905) of the Considérations sur l’esprit et les maux.

SEANCOUQ, ÉTIENNE PIVERT DE (1770–1846), French author, was born in Paris in November 1770. His father desired him to enter the seminary of Saint-Sulpice preparatory to becoming a priest, but Senancour, to avoid a profession for which he had no vocation, went on a visit to Switzerland in 1786. At Fribourg he married in 1790 a young Frenchwoman, Madeleine Daguet, but the marriage was not a happy one. His wife refused to accompany him to the Alpine solitude he desired, and they settled in Fribourg. His absence from France at the outbreak of the Revolution was interpreted as hostility to the new government, and his name was included in the list of emigrants. He visited France from time to time by stealth, but he only succeeded in saving the remnants of a considerable fortune. In 1799 he published in Paris Les amours de deux etiennes, a novel, and Theophile, a novel saturated with impassioned descriptive passages which mark him out as a precursor of the romantic movement. His parents and his wife died before the close of the century, and Senancour was in Paris in 1801 when he began Obermann, which was finished in Switzerland two years later, and printed (Paris, 2 vols.) in 1804. This singular book, which has never lost its popularity with a limited class of readers, was followed in the next year by a treatise De l’amour, in which he attacked the accepted social conventions. Obermann, which is to a great extent inspired by Rousseau and Voltaire, and is supported by highly philosophical and historical arguments, is a work of a higher class of fiction than had hitherto been attempted in France. The life of Obermann and his adventures are entertaining, and the book is well written, but it is not in literature that Senancour’s fame is to be found. In the year 1800 he became an officer in the artillery, and in 1802 he was promoted to the rank of colonel in the army. He was killed at the siege of Cadiz on the 26th of October 1810.

SEARMONT, HENRI HUREAU DE (1808–1862), French mineralogist and physician, was born at Broué, Éure et Loire, on the 6th of September 1808. He became engineer-in-chief of mines, and professor of mineralogy and director of studies at the École des Mines at Paris. He was distinguished for his researches on polarization and on the artificial formation of minerals. He represents of the most important maps of the geology of Seine et Marne and Seine et Oise for the Geological Survey of France (1844). He died in Paris on the 30th of June 1862.

SENATE (Lat. senatus, from root sen-, as in senex, old; the root is the Sanskrit sana, cfr. Gr. ἀνήρ; the same element appears in sēnār, seigneur, seneschal) literally the assembly of old men, originally the heads of the chief families, and hence, in general, the upper council in a governmental system. The Latin word corresponds with the Greek gerousia (q.v.), the name of the similar body at Sparta; it must not be used of the Cleisthenic council (see). The Athenian assembly, and hence the assem-
time, and the evidence of Zonaras to the contrary is universally discredited. The appointment of senators depended entirely upon the king. They were not appointed for life, but at the pleasure of the king who summoned them. It is possible that a king might change his advisers during his reign, and a new king could certainly abstain from summoning some of those convened by his predecessors. The powers of the senate at this time were very indefinite. Tradition ascribes to it the control of the interregnum and a power of sanctioning acts of state (patrum auctoritas), in which it was difficult to give any significance for this early period. It seems also to have possessed a customary right of controlling foreign policy, for the ancient formula of the Fetiales refers to the sanction of the patres (Liv. i. 32). From the senate also must have been chosen the delegates appointed by the king either to be his executive representative when he was absent in the field (profectus urbi), or to assist him in jurisdiction (Itári perduellionis, quaestores parricidii).

The abolition of monarchy, and the substitution of two annually elected consuls did not at first bring any important change in the position of the senate. It was not a controlling body of the consuls, meeting only at their pleasure, and owing its appointment to them, and remained a power distinctly secondary to the magistrates, as it had been formerly to the king. The magistrates at this time were chosen entirely from the patrician houses, and the senate long remained a stronghold of patrician prejudice. Tradition ascribes to the first consuls some change in the class from which senators were drawn, but various accounts of the change are given (Livy ii. 1; Festus, p. 234; Dionys. v. 13; cf. Tac. Ann. xi. 25). Whatever the exact nature of the change, we may be certain that patricians were not yet in a position to exercise any important part of the executive power at this time. Such a change is utterly improbable at the crisis of a patrician coup d'état, such as the expulsion of the Tarquins certainly was, and there is no evidence for the existence of a plebeian senator before the year 401 B.C. The statement that some modification in the original principle of selection was made in this year is invariably introduced as an explanation of the title patres conscripti, which is held to imply a distinction of rank within the senate, as derived from the formula of summons "qui patres, qui conscripti (esis)." But either this formula is not as early as 500 B.C. or the term conscripti does not refer only to plebeians. In one respect the substitution of consuls for kings tended to the subordination of the chief magistrates to the senate. The consuls held office only for one year, while the senate was a permanent body; in experience and prestige its individual members were often superior to the consuls of the year. It was therefore improbable that the magistrate would venture to disregard the advice of his consilium, especially as he himself would pass into the senate at the close of his year of office, according to a recognized custom which was gradually modifying the theoretical freedom of choice that the consuls possessed with regard to their consilium. It was probably in their capacity of ex-magistrates that plebeians first entered the senate; for the first plebeian senator mentioned by Livy, P. Licinius Calvus, was also the first plebeian consular tribune. This is hardly likely to be mere coincidence. Of the two standing powers which the senate inherited from the monarchy, the interregnum and the patrum auctoritas, the first had become even rarer of exercise than before; for if either consul existed to nominate a successor, interregnum could not be resorted to. The patrum auctoritas, on the other hand, developed into a definite right claimed by the senate to give or withhold its consent to any legislative or elective act of the consuls, which could not be valid without such consent. The control, too, which it had long exercised over foreign policy must have increased the importance of the senate in a period of constant warfare with the nations of Italy. But in the early republic the senate remained primarily an advising body, and had as yet assumed no definite executive powers.

In the last two centuries of the republic we find that a great change has taken place in the position of the senate. It is now a self-existent, automatically constituted body, independent of the magistrates, a recognized factor in the constitution and the wielder of extensive powers. Its self-existence could only be secured by a transference of the selection of the senate from the magistrate to some other authority, and was actually effected by enacting the selection to the recently instituted college of censors. The censorship was instituted in 443 B.C., and some time before the year 311 it was placed in charge of the lectio senatus. Conditions of selection had also been imposed by 311, which made the constitution of the senate practically automatic. Ex-curule magistrates were now admitted as a matter of course, together with any other persons who had done conspicuous public service in the lower grades of the magistracy or the higher ranks of the army; and for some time before Sulla's dictatorship little power of choice can really have rested with the censors. The powers of the Senate had not extended far beyond its two ancient prerogatives of appointing an interrex, and ratifying decisions of the comitia. The first of these powers, as has been shown above, had fallen into practical disuse, and the second had for some reason become a mere form by the last century of the republic. It is improbable that the change was entirely the result of the lex Publilia of 387 B.C., which decreed that the senate should exercise its auctorialitas before the voting instead of after, though this law may have formed part of a process very imperfectly known to us by which senatorial control of legislation in this form was gradually nullified. But the senate had acquired a far more effective control over the popular vote through the observance of certain unwritten rules regulating the relation between senate and magistrates. It was generally understood that the magistrate should not question the people on any important matter without the senate's consent, nor refuse to do so at its request; that one magistrate should not employ his veto to quash the act of another except at the senate's bidding, nor refuse to do so when directed. Such was the situation which had developed out of the tendency noticed above for the magistrate to be advised by his council in all important matters. Again, the earlier control of foreign policy developed into a definite claim put forward by the senate and recognized by the constitution to conduct all negotiations with a foreign power and frame an alliance which should merely be offered to the people for ratification. For the organization of a new Roman province even this formal ratification was dispensed with, and a commission of senators alone aided the victorious general in the organization of his conquests. The senate also held an important power in its right to distribute spheres of rule among the various magistrates. It seems also to have had entire control over the external relations of the free cities which were scattered throughout the provinces, but formed no administrative parts of those provinces, holding their rights by charter for which they depended upon the senate. The control of finance was also entirely in the senate's hands. Three circumstances had combined to bring about this result. The censors, who were only occasional officials, were entrusted with the leasing of the public revenues; the senate not only directed the arrangements made by them, and received appeals against oppressive contracts, but also controlled any financial assignments that had to be made during the vacancy in the censorship. Again, the details of public expenditure had been in very early times entrusted to the quaestors, who, when the magistracies were multiplied, occupied an entirely subordinate position; this strengthened the position of the senate as the natural director of a young and inexperienced magistrate. Thirdly, the general control exercised by the senate...
over provincial affairs implied its direction of the income derived from the provinces, which in the later republic formed the chief property of the state. It had also claimed a right, unchallenged till the time of Tiberius Gracchus, of granting occupation and decreeing alienation of public lands, or of accepting or rejecting gifts and bequests to the state. Every branch of state finance was therefore in its hands. In matters of criminal jurisdiction the senate claimed the right to set free by its decree in case of emergency the full powers of coercitio contained in the imperium of a magistrate, but limited normally in capital cases by successive laws of appeal. The exercise of this right amounted to a declaration of martial law, and had the effect of giving to the courts the same powers of summary jurisdiction which had resided in the dictatorship. It was only resorted to in cases of special urgency, such as the epidemic of poisoning in 333 B.C. (Livy viii. 18), the prevalence of Bacchanalian licence in the city in 186 B.C. (id. xxxix. 18) and the formidable preponderance of the revolutionist tribune Tiberius Gracchus in 133 B.C. The action of the senate on this last occasion evoked a vigorous protest from the people, on the ground that the senate was not acting on behalf of the state against its enemies, but in the interest of one party in the state against the other, and Cicero subsequently forbade any such exercise of capital jurisdiction on the part of a magistrate, whether authorized by the senate or not. The senate continued, however, to make use of this decree, and the question of its right to do so was one of the chief points at issue in the final struggle between the senatorial and democratic parties. The best known instance of this decretum ultimum in the last century of the republic is that of 63 B.C., when Cicero took summary action against the Catiliniasts, and justified his action on the plea that this decree had authorized him to do so. The senate also exercised a police control in Rome in sudden emergencies. It dissolved by a decree passed in 64 B.C. a number of trade guilds which had become the centres of political disturbance, and framed decrees from time to time dealing with bribery and corruption. The chief feature of the democratic revolution at Rome which occupied the century following the tribunate of T. Gracchus was an uncompromising opposition to the tenure of these extensive powers by the senate. Sulla's enactments in 81 B.C., which aimed at restoring its ascendancy, show how clearly how much power it had already lost; and his attempts to reinstate it were short-lived (see ROME: HISTORY II. "The Republic"). The Gracchi and Caesar alike found themselves obliged to override senatorial prerogatives in the interests of progressive legislation, and though the senate, owing to its strong hold over the magistracy, succeeded repeatedly in dealing death to its opponents, it never regained the popular confidence; and the practical extinction of the old senate in 49 B.C. was hardly lamented.

Caesar's revision of the senatorial list and his increase of the senate to 600 was a return to the old practice by which kings and the early magistrates had chosen their own body of councillors. And though after this revision Sulla's arrangement for the automatic replenishing of the senate was restored, yet the growing influence exercised by Caesar and his successors over elections secured their control over the personnel of the senate. Still, the senate was regarded in the early principate as the great representative of republican institutions, and Augustus took elaborate pains to divide his authority with the senate. In legislation, indeed, the senate was supreme under the principate. The legislative powers of the comitia became very gradually extinguished; but long before the disappeared senatus consultum had come to take the place of legis in ordinary matters, and with this prerogative of the senate the princes never directly interfered. Jurisdiction remained largely in the hands of the republican courts, but such cases as did not come under their cognizance were divided between princes and senate. The senate, moreover, was left at the head of the ordinary administration of Rome and Italy, together with those provinces which, not requiring any military force nor presenting special administrative difficulties, were left to the care of the Roman people. It also retained control of the public treasury (see AERARIUM), while Caesar administered his own treasury (aescus). It gradually became the electing body for the annual magistrates; and, as entrance to it was still won chiefly through the magistracy, co-optation became practically the principle of admission. But the power the senate theoretically possessed of creating and deposing a princeps was, formally at least, the chief of its prerogatives at this time, though considerably limited in practice. It had, on the other hand, lost all its control of foreign administration, which had once been the bulwark of its power; and though occasionally consulted by the princeps, it was entirely subordinate to him in this department. It was clearly to the advantage of the princeps to have some such institution as the senate to give to their rule an appearance of constitutionalism. But even in this capacity the senate did not long survive the overthrow of republican government. Though occasionally reused into activity during the 2nd and 3rd centuries, it ceased after the period of the Julian emperors to have any real control of affairs. Vespasian had admitted Italians and provincials into the senate, with a view, no doubt, to increasing its value as a representative council of the empire; but this widening was counterbalanced by the institution of an hereditary senatorial order by Augustus, which gave recognition to the provincial exclusiveness which had grown up in the later republican period, while reserving to himself the right of recruiting the order.

B. Procedure.—Senatorial procedure remained comparatively unchanged throughout the republic and the first three centuries of the empire. The right of summoning the senate belonged originally to the consuls, and later to the consuls, praetors, and tribunes of the people. The Censors, the Curule Aediles, the quaestors and the praetors might, in case of urgent necessity, summon the meeting, the right belonged to them in the above order of precedence. The magistrate who summoned the senate also presided and brought business before it. He first made statements of the case on important public affairs, and might then at his discretion ask the opinion of the house on points arising out of them, or invite other senators to speak without himself putting the question. It was afterwards defined by the emperor that he was expected to follow a regular order of precedence in asking for votes or speeches, and the magistrates of the year were precluded from expressing their opinion. When the chief senators had expressed their opinion on the motion of the president, or made proposals of their own, in the former case the house divided on the motion, in the latter the president put to the house in succession the various proposals made. The only important modification of this procedure introduced by the princeps was the extension of all the presiding magistrate's rights to the princes, who, however, enjoyed also the right of giving his opinion as a private senator.

The senate had as its president, at first distinguished from those of ex-curule magistrates. But by degrees the broad stripe (latus clausus) on the tunic and the red shoe (calcem muliex) became distinctive of the senator (hence laticlavus, a senator). The title of curule aedile for the highest of the lower magistrates and the collegia of senators adopted the latus clausus as early as the reign of Augustus, and probably at an earlier time. Certain disqualifications were attached to senators in republican times, chief of which was their exclusion from trade. Their number increased under the princeps. Failure to observe those disqualifications, or any public disgrace or gross misconduct, was punished by removal from the senate by the censors, until that office fell into abeyance after the time of Sulla. The censorial right of removing unworthy members from the senate was revived by Augustus, and was exercised by subsequent emperors at a yearly revision of the list, which supplemented the formal lustration senatus periodically held by the princes in his capacity of censor.

It has been questioned whether the two traditional prerogatives of the senate, the interregnum and the patrum auctoritas, belonged in historical times to the emperor or to its patrician members only, or, as some have maintained, to the whole body of patricians. For conflicting views on this subject, see P. Willems, De Senatus consult., ii. i. p. 1; T. Mommsen, Statthalterei, iii. 1917 et seq.; and Röm. Forschungen, i. 218-249; C. C. L. Lange, De patrum aucl. comm. (Leipzig, 1856-1877); O. Chason, Kritische Untersuchungen über den röm. Staat (Rostock, 1871), p. 41 et seq. In regard to the use of the term plebeian, view the discussion on this point; where the equivalent of the term senatorial magistrates as the equivalent of curule aedile was used, we are aware that the expressions were more than a century reserved for patricians.

Senebier—Seneca

Senebier, Jean (1742–1809), Swiss pastor and voluminous writer on vegetable physiology, was born at Geneva on the 6th of May 1742. He is remembered on account of his contributions to our knowledge of the influence of light on vegetation. Though Marcello Malpighi and Stephen Hales had shown that a great part of the substance of plants must be obtained from the atmosphere, no progress was made until Charles Bonnet observed on leaves plunged in aerated water bubbles of gas, which Joseph Priestley recognised to be called by him oxygen and found to be the disapperance of carbonic acid; but it was Senebier who clearly showed that this activity was confined to the green parts, and to these only in sunlight, and first gave a connected view of the whole process of vegetable nutrition in strictly chemical terms.

He died at Geneva on the 22nd of July 1809.

Seth, the name of two famous men (father and son), natives of Corduba (Córdoba) in Spain, who attained eminence in Rome under the Early Empire.

Lucius Annaeus Seneca (c. 54 B.C.—A.D. 65), statesman and orator, was the second son of the rhetorician. His teachers were Attalus, a Stoic, and Sotion, a pupil of the Sextii. In his youth he was a vegetarian and a water-drinker, but his father checked his indulgence in asceticism. He devoted himself to the rhetorical and philosophical studies and early won a reputation at the bar. Gaius criticised his style as mere mosaic (opus quadratum) or "sand without lime," yet being in reality jealous of his successes he would have put him to death had he not been assured that he was too consumptive to live long (Suet. Calig., 63; Dio Cassius lix. 19, 7). Under Claudius his political career (he had been quaestor) received a sudden check, for the influence of Messallina having effected the ruin of Julia, the sister of Gaius, Seneca, who was compromised by her downfall, was banished to Corsica, a.d. 41. There eight weary years of waiting were passed, and the last study of his later life was occupied in an attempt to procure his return by such gross flattery of Claudius as is found in the work Ad Polybium de consolatione or the panegyric on Messallina which he afterwards suppressed. At length the tide turned; the next empress, Agrippina, had him recalled, appointed praetor, and entrusted with the education of her son Nero, then (48) eleven years old. Seneca became in fact Agrippina's confidential adviser; and his pupil's accession increased his power. He was consul in 57, and during the first bright years of the new reign, the quinquennium Nerovs, he shared the administration of affairs with Burrus, the praetorian prefect. The government was in his hands, and he was the most influential of the emperors. The influence over Nero, while it lasted, was salutary, though sometimes maintained by doubtful means (see Nero). We must, however, regard the general tendency of Seneca's measures; to judge him as a Stoic philosopher by the counsels of perfection laid down in his writings would be much the same thing as to apply the standard of New Testament morality to the career of a Wolsey or Mazarin. He is the type of the man of letters who rises into favour by talent and suppleness (comitas honesta), and is entitled as such to the rare credit of a beneficent rule. He attended to the times, and in his later works, as the death of Burrus in 62 gave a shock to his position. In vain did he petition for permission to retire. Even when he had sought privacy on the plea of ill-health he could not aver his doom; on a charge of being concerned in Piso's conspiracy he was forced to commit suicide. His manly end might be held in some measure to redeem the weakness of his life but for the testimony it bears to his constant study of effect and ostentatious self-complicity. His second wife, Pompeia Paulina, of noble family, attempted to die with him. His enormous wealth was estimated at 300 millions of sestercii. He had 500 ivory tables to grace his dressing room, and the splendour of his house formed the object of the admiration of his ethics, reckoned Seneca among the Christians; this assumption in its turn led to the forgery of a correspondence between St Paul and Seneca which was known to Jerome (cf. Augustine, Ep. 153: "Seneca . . . cujus etiam ad Paulum apostolum leguntur epistolae"). This has given rise to an interesting historical problem, most thoroughly discussed in many works on the Church in the Roman Empire.

Seneca is at once the most eminent among the Latin writers of the Silver Age and in a special sense the representative at least, because he was the originator of a false style. The affected and sentimental manner which gradually grew up in the first century A.D. became ingrained in him, and appears equally in everything which he wrote, whether poetry or prose, as the most finished product of ingenuity, concentrated upon declaratory exercises, substance being sacrificed to form and thought to point. Every variety of rhetorical conceit in turn contributes to the dazzling effect, now
SENEFELDER, ALOIS (1771–1834), German inventor of lithography, was born at Munich on the 6th of November 1771, his father Peter being an actor at the Theatre Royal. Owing to the death of his father he was unable to continue his legal studies at the university of Ingolstadt, and instead was required to work as a draughtsman and engraver. He commenced business for himself as a performer and author, but without success. In order to accelerate the publication of one of his works, he frequently spent whole days in the printing office, and found the process of printing so simple that he conceived the idea of purchasing a small printing press, thus enabling himself to print and publish his own compositions. Unable to pay for the engraving of his compositions, he attempted to engrave them himself. He made numerous experiments with little success; tools and skill were alike wanting. Copper-plates were expensive, and the want of a sufficient number entailed the tedious process of grinding and polishing afresh those he had used. About this period his attention was accidentally directed to a fine piece of Kellheim stone which he had purchased for the purpose of grinding his ink. His first idea was to use it merely for practice in his exercises in writing backwards, the ease with which the stone could be ground and polished afresh being the chief inducement. While he was engaged one day in polishing a stone slab on which to continue his exercises, his mother entered the room and desired him to write

1 The convention, under the leadership of Lucretia Mott and Elizabeth Cady Stanton, adopted a "Declaration of Sentiments" modelled after the American Declaration of Independence, and resolved "that it is the duty of the women of this country to secure to themselves their sacred right to the elective franchise," and that the same amount of virtue, delicacy and refinement of behavior that is required of women in society should be required of men, and the same transgressions should be visited with equal severity on both man and woman."

SENECA, a tribe of North American Indians of Iroquoian stock. They call themselves Tshokonondowane, "people of the mountain." The French called them Tsnoniontsonon. Their former range was in western New York state between Seneca lake and the Genesee river. They were one of the Six Nations League of the Iroquois, and eventually became the most important tribe of the league. They were foremost in all the wars of the Six Nations, and were the official guardians of the western frontier of the league. The Iroquois defeated the Senecas twice, in 1673 and 1701, and the tribes they occupied the county west of Lake Erie and south along the Alleghany to Pennsylvania. They fought on the English side in the War of Independence. About 2700 are now on reservations in New York State, while a few are in Oklahoma and on Grand River reservation, Ontario.

SENECA FALLS, a village of Seneca county, New York, U.S.A., in the township of Seneca Falls, on Seneca Outlet, or the death of his father Lake Seneca and Lake Cayuga, 42 m. S.W. of Syracuse, Pop. (1900) 6519, of whom 801 were foreign-born; (1905) 6733; (1910) 6588; of the township, including the village (1910) 7407. The village is served by the New York Central & Hudson River, the Lehigh Valley and electric suburban railways, and by the Seneca & Cayuga Canal. In the village are the Mynderse (public) Library and the Johnson Home for Old Ladies (1868). Cayuga Lake Park, a pleasure resort, is 3 m. distant and is reached by electric railway. The village is the shipping point for a farming and dairying region. The river furnishes power for sawmills, flouring-mills, and other factories, among the manufactures are pumps and hydraulic machinery, wagons and farm implements. Seneca Falls was settled about 1790, and was first incorporated as a village in 1831, its charter as revised in 1902 being similar in some respects to that of a city. In Seneca Falls on the 19th and 20th of July 1848 was held a Woman's Rights Convention, the first in the United States.

SENEFELDER, ALOIS (1771–1834), German inventor of lithography, was born at Munich on the 6th of November 1771.

The doubt as to his authorship of the tragedian is due to a blunder of Sidonius Apollinaris (ix. 229–231); against it must be set Quintilian's testimony ("ut Medea apud Senecam," i. 2. 8). The judgment of Tacitus (Ann. vii. 4, 13, 42 sq., xiv. 52–56, xv. 60 sq.) is more favourable than that of Dio, who may possibly derive his account from the slanders of some personal enemy like Suetonius. At least eighteen prose works have been lost, among them De superstitione and De nonnullis causis of the epoch of De matrimonio, which, to judge by the extant fragments, must have been interesting reading. Since Gallius (xii. 2. 3) cites a book xxi. of the Life of Nero, some of these have been lost.

The best text of the three works that are known in Teubner's series (1852), was re-edited in 1872–1874 and 1898. More recently Gertz has revised the text of Libri de beneficis et de clementia (Berlin, 1878); he bases it on the Old Latin text (Quellen der lateinischen Historiographie [1878], xvi. 16, 18; Vahlen, Jena, 1879), and Gertz the Dialogi (Copenhagen, 1886).

There is no complete exegetical commentary, either in English or German. Little has been done systematically since the notes of Liberius and Vincentius were printed in the Monum. scriptorum latinorum, publ. by A. Dörign, Senec. disceps. moralis cum Antoniniana comparatione (Leipzig, 1857); E. F. Gelpke, De Senec. vita et moribus (Bern, 1848); Holzher, Der Philosoph Seneca (Rastadt, 1858). See also Sir S. Dill, Roman Society from Nero to Marcus Aurelius (4th ed., Paris, 1878), has criticized them in detail. Of some 300 monographs enumerated in

Engelman may be mentioned, in addition to the above, G. Boissier, in the Festschrift von Carl Horn (Berlin, 1840); A. Döring, Senec. disceps. moralis cum Antoniniana comparatione (Leipzig, 1857); E. F. Gelpke, De Senec. vita et moribus (Bern, 1848); Holzher, Der Philosoph Seneca (Rastadt, 1858). See also Sir S. Dill, Roman Society from Nero to Marcus Aurelius (4th ed., Paris, 1878), has criticized them in detail.

The convention, under the leadership of Lucretia Mott and Elizabeth Cady Stanton, adopted a "Declaration of Sentiments" modelled after the American Declaration of Independence, and resolved "that it is the duty of the women of this country to secure
to themselves their sacred right to the elective franchise," and

that the same amount of virtue, delicacy and refinement of behavior that is required of women in society should be required of men, and the same transgressions should be visited with equal severity on both man and woman."
her a bill for the washer-woman, who was waiting for the linen. Neither paper nor ink being at hand, the bill was written on the stone he had just polished. The ink used was composed of wax, soap and lamp-black. Some time afterwards, when about to wipe the writing from the stone, the idea all at once struck him to try the effect of biting the tallow soap, and indeed, in a breathing moment, he found he could cover its surface with a mixture of one part of aqua fastis and ten parts of water. The result of the experiment was that at the end of five minutes he found the writing elevated about the tenth part of a line (1/3 in.). He then proceeded to apply the printing ink to the stone, using at first a common printer’s ball, but soon found that a thin piece of board covered with fine cloth answered better, communicating the ink more equally. He was able to take satisfactory impressions, and, the method of printing being new, he hoped to obtain a patent for it, or even some assistance from the government. For years Senefelder continued his experiments, until the art not only became simplified, but reached a high degree of excellence in his hands. In later years the king of Bavaria settled a handsome pension on Senefelder. He died at Munich in 1834, having lived to see his invention brought to comparative perfection.

SENEGAL, the dried root of the Polygala Senega, is official in the British and United States pharmacopoeias. Senega contains an active principle, saponin. Senega is used chiefly as a stimulating expectorant in chronic bronchitis. It is occasionally used in hilly wastes, and is contra-indicated in diseased conditions of the heart. It has a tendency to upset the digestion, and is therefore only used in combination with other drugs in what are termed expectorant mixtures.

SENEGAL, a river of West Africa, entering the Atlantic about 16° N., some 10 m. below St Louis, after a course of fully 1000 m. It is formed by the junction of the Bafing or Black river and the Bakhoy or White river, and its chief affluent is the Falémé. North of the Senegal the Sahara reaches the coast, and for over 50 m. the waters enter the sea. The Bafing rises in the Futa Jallon highlands about 2400 ft. above sea-level, in 16° 28’ N., 10° 6’ W., its source being within 125 m. of Konakry on the Gulf of Guinea. It is joined in about 11° 10’ N. and 11° 45’ W. by the Tene, which rises in 13° W. and 10° 37’ N. and flows north-east. A little south of 12° N. the Bafing is a large stream 250 yds. wide, and is here separated from the sources of the Falémé by a line of 2000 ft. high, which send to the latter river four important streams rising in about 12° N. The Bafing follows a northward course for about 350 m., during which it descends by the fall of Conacry a level of 360 ft. above sea-level. The headstreams of the Bafing rise between 11° 30’ and 12° N. and 9° 20’ and 6° 50’ W. on the N.E. versant of the hills which here form a narrow divide between the basin of the Senegal and that of the upper Niger. The Bakhoy, in its upper course much interrupted by rapids, flows N.E., but about 12° 15’ N. turns north-westward. Its principal affluent, the Baule (Red river), and its headstreams rise farther east on the northern slopes of the hills which above Bamako shut off the river. The eastern headwaters of the Senegal thus drain a large area adjacent to the upper Niger. The Baule flows north and in a south-westerly direction to the Macina or Roman, a river of 1000 miles, in about 13° 30’ N. and 16° W. joins the Bafing. After receiving the Baule, the Bakhoy, now a river of fine proportions, flows W. by N. through rocky country in a narrow valley. In 11° 55’ W. and 13° 48’ N. it unites with the Bafing. At the confluence the Bafing is 800 ft. wide, the Bafing at this point having a width of 360 ft.

After the junction of the Black and White rivers the stream is known as the Senegal. The confluence is called Bafulabé, i.e. “meeting of the waters.” Below Bafulabé the river flows N.W. through a valley bordered on either side by hills which throw out rocky spurs, over which it has sometimes a length of 100 ft. It is a wide river, and its bed is covered with coarse gravel. A little below Neufchâtel it is joined by the Falémé, considered a considerable river which rises in hilly country in about 11° 50’ N. and 11° 30’ W. The first rise in the lower Senegal is due to the rains in the source region of the Falémé, while the second rise, and the water passes to the sea in the Bafing owing to its shorter course. A short distance below the Felu Falls is the town of Kayes on the left bank of the river. Between these two points the river runs through a succession of rapids, of which several, such as at Kayes, are difficult. Kayes is the limit of navigability from the sea. From that town a railway connects with the navigable waters of the upper Niger at Bamako (see Guinea). Below Baked the river passes through flatter country and presents a series of great reaches. It sends off numbers of divergent channels (called marigots) forming several islands, the largest being that of Grand Moundou, which is 16° 30’ N., in about 15° 10’ W. Thereafter it runs S.W. and finally due S. In the last 10 m. of its course it runs parallel to the sea, from junction of the Falémé to the mouth of the river. Of the head of this 10 m. is St Louis, the capital of the colony of Senegal. At this point the right branch of the river is only 500 ft. from the open Atlantic. A marigot, called the Ndialier or Maringuins, leaves the river 40 m. above St Louis, pierces the dunes at St Louis and reaches the sea, 50 m. N. of the mouth of the river. The Senegal indeed has what is styled an interior delta, but, with the exception of the marigot named, all the divergent branches rejoin the main stream before the sea is reached.

The comparative shallowness of its streams, the steepness of its upper course and the rapid evaporation which takes place after the precipitation is greatest, would cause the Senegal an insignificant stream for more than half the year; but natural dams cross the channel at intervals and the water accumulates behind them in deep reaches, which thus act as reservoirs. In the rainy season the barriers are removed, the successive dams are broken and the water of the lower Senegal are changed into immense marshes. Lake Cayor on the right side of the lower Senegal and Lake Panifique (Guier) on the left constitute reserve basins, receiving the surplus waters of the rivers, which on flooding spread them over the country. In the upper part of the river the reservoirs are partially protected by curtains of verdure from the effects of the evaporation which makes itself so severely felt on the treeless seaboard. Owing to these natural “locks,” the Senegal never discharges less than 1700 or 1800 cubic ft. per second. The lower Senegal forms the boundary between the Sahara and the western Sudan; the line of its inundations is an ethnographic and the boundary between the nomadic Berber and the settled Negro.

From July to October the level of the Senegal shows a series of fluctuations, with, however, a general increase till the end of August. From the beginning of September to the maximum occurs, boats drawing from 1 ft. to 2 ft. 6 in. can ascend to Kayes from the beginning of June to the middle of November; steamers drawing 4 ft. 3 in. from July to October inclusive; and ocean steamers, lightened so as to draw 11-13 ft., during August and September. From Mafu to the sea, a distance of 215 m., the Senegal is navigable all the year round by vessels drawing not more than 10 ft.

The existence of the Senegal appears to have been known to the ancients. It is usually regarded as the Chretes or Chremetes of Hanno, and the Nachyris and Bambotus of the Romans, and one of the rivers of Tympan, with many of the rivers of Ptolemy’s map. Idrisi and other medieval Arabic geographers undoubtedly refer to it. The seamen of Dieppe are said to have discovered the river about 1360, and even to have built a fort which became the nucleus of the town of St Louis, but this claim is unproved (see Guinea). The mouth of the Senegal, then called Senaga, was entered in 1445 by the Portuguese navigator Dinas Diaz (who thought it a western arm of the Nile), and in 1455 Cadamosto ascended the river for some distance. Leo Africanus rightly describes its lower course as being by its winding channel the broadest and most navigable from the source to the mouth of the river. It is long, and of the explorations of the upper river began, Janneau, Sieur de Rochfort, in that year ascending the river some 200 m. above St Louis.

In 1607 André Bréé reached the island of Moril, while in 1608 he penetrated past the Felu Falls. At that period geographers regarded the Senegal as the termination of the Niger, a theory held until Mungo Park’s demonstration of the eastward course of that stream. Park himself added much to the knowledge of the upper basin of the Senegal. It was not until 1818 that the source (i.e. of the Bafing) was located, by Gaspard Mollion.

SENEGAL, a country of West Africa belonging to France. As a geographical expression it is the land watered by the Senegal river; politically it has a much wider significance. The French possessions in this region are divided into (1) the colony of Senegal, and dependent native states; (2) the colony of Upper Senegal and Niger, with a dependent Military Territory; (3) the Territory of Mauretania. The first colony includes the most westerly coast region of Africa; a large part of the second colony is the great bend of the Niger river and the Military Territory is east of that river. The Territory of Mauretania is part of the western Sahara, stretching indefinitely north from the Senegal river. It includes the oasis of Adrar Temur (see ADRAR) and the coast regions between Cape Blanco and the Senegal river. In the present article the two colonies are dealt with in separate sections (I. and II. below), the story of French conquest and colonization taking this vast region forming section III.

I. SENEGAL.

Senegal is bounded N. by the Territory of Mauretania, W. by the Atlantic, S. by Portuguese Guinea and French Guinea, and E. by the Faleme, which separates it from Upper Senegal and Niger. Wedged into Senegal and surrounded by it save seawards is the British colony of the Gambia. Senegal colony proper consists of the towns of Dakar, St Louis, Goree and Rufisque, a narrow strip of territory on either side of the Dakar-St Louis railway, and a few detached spots, and has an area of 438 sq. m. with a population (census of 1904) of 107,826. The rest of the country consists of native states under French protection, and includes, since 1909, the northern bank of the river Senegal below Bakel. In this larger sense, which is employed in this article, Senegal covers about 74,000 sq. m., with an estimated population of 1,800,000. Among the protected states is Bondou (q.v.) lying immediately west of the lower Faleme.

Physical Features.—The coast follows a S.S.W. direction from the mouth of the Senegal to Cape Verde, the most western point of the African continent. Cape Verde is separated from the mainland by the Falémé river, navigable for vessels of moderate draught. From Cape Verde to the Portuguese frontier there is a narrow strip of land, the Ghiria, lying between the sea and the Faleme river. The only gulf on the coast is that which lies to the south of Cape Verde and contains the island of Goree (q.v.). The coast in the northern part is low, arid, desolate and dune-skirted, its monotonous relieved only here and there by cliffs and plateaus. Further south it becomes marshy, and clothed with luxuriant vegetation. A little to the north of the Gambia the coast-line is much broken by the archipelago of islands formed by the Salam estuarine; and the Gulf of St Louis, the basin of the Gambia river, is cut off from the sea by a series of islands, a group of which are called the St Louis islands.

Between the Senegal and the Gambia and as far east as about 13° E., the country behind the seacoast is a slightly elevated plain which is a semi-arid and fertile region with altitudes of over 4,000 ft. The mountains sink abruptly towards the Niger valley, southwards they join the Futa Jallon highlands. On the north they extend to the left bank of the Senegal and their eastern boundary represents the right bank of the river. From Dakar to the Faleme the Senegal (q.v.), its tributary the Faleme, and the upper course of the Gambia (q.v.) are the chief rivers which drain the country. The Salum, already mentioned, is a river-like estuary which penetrates fully 100 m. and is split into many channels. It is navigable from the sea for 60 m. The Casamance flows between the Gambia to the north and the Cacheo to the south, and has a drainage area of some 6,000 m. Rising in the Futa Jallon, the river has a course of about 212 m., and at Sadiou, 105 m. from the sea, is 1½ broad. Forty miles lower down it is joined by a northern tributary, the Songoogu, and thence to the ocean forms, with its numerous lateral channels, the finest estuary on the Senegal. The Senegal is navigable for vessels of 150 ft. draught up the river, which forms an excellent passage through the Gambia estuary.

The Casamance is navigable for vessels of 30 ft. draught up the river, which forms an excellent passage through the Gambia estuary.

Geology.—The low region of the seaboard has a very uniform character. It consists of sandstones or clay rocks and loose beds of reddish soil, containing marine shells. At certain points, such as Cape Verde and Cape Casamance (or Rougui), the red sandstones crop out, giving to the latter its name. Clay slates also occur, and at intervals these sedimentary strata are interrupted by basaltic amygdaloid and volcanic rocks. For instance, the island of Goree is basaltic. The basaltic rocks are very much formed into peat, and the surface consists more generally of granite, porphyry, syenite or trachyte. In those districts mica-schists and iron ores occur. Iron and gold are found in the mining regions, and the alluvial deposits. Many of the valleys are covered with fertile soil; but the rest of the country is rather arid and sterile.

Climate.—There are two seasons, the dry and the rainy or winter, the latter contemporaneous with the European summer. In the rainy season the wind blows from the sea, in the dry season the har-
SENEGAL

was formerly noted for the export of gum arabic, and on the shores of the bay formed by Cape Blanco is Port Etienne, a fishing station provided with jetties and guarded by a military post. These fast-named ports, however (Dakar, Goree and Rufisque), but are most conveniently mentioned here.) On the river Senegal are the towns of Richard-toll (Richard's garden), Dagana and Bakel, all three founded by the French government in 1821. Carabane, Zighinchir and Saidali, are other fishing stations on the river. Dakar, Goree and Rufisque are communes, with a franchise exercised by natives and Europeans alike. The total white population of the four towns is about 75,000.

Agriculture and Trade.—Senegal's chief commercial product is the ground-nut, which, since 1888, has yielded about 30,000 tons a year. Millet, the staple food of the native population, maize and rice occupy about 1,000,000 acres. The Senegal, in the Moors northern region; the kola nut is cultivated and rubber is collected in the district of Casamance, which projects between Portuguese Guinea and British Gambia. There are large areas of fertile plain on both sides of the river. Of the crops grown in the Senegal basin, those of most importance are the bananas, yams, cassaves, and horses. Gold, iron, quicksilver and copper are found. The natives carry on weaving, pottery, brickmaking, and manufacture of textiles. Cotton goods (chiefly from England) form the most important articles of import, and after them come kola nuts (mainly from Sierra Leone), rice, wines and spirits, tobacco, implements, sugar, coal and fancy goods; the exports are mostly ground-nuts; rubber (much of which comes from the Niger regions), gum and gold coming next in value. The imports and exports of Senegal are not shown separately, the figures for Upper Senegal and Niger being included. The average annual value for the five years ending 1905 was 4,200,000 francs. Dakar, which is the terminus of the line from Bafulabe to Senegal by which the majority of all goods is imported, is the chief port. Over 50% of the shipping is French, Great Britain coming second.

II. Upper Senegal and Niger

This colony is bounded N. by the Saharan territories dependent on Algeria, W. by Senegal and the Territory of Mauretania, S. by the French colonies of Guinea and the Ivory Coast, the Northern Territories of the Gold Coast (British), Togoland (German) and Dahomey (French). The Military Territory dependent on the colony extends E. of the Niger to the Lake Chad territory of French Congo, being bounded S. by Nigeria (British). The colony and its dependent territory thus form the link connecting all the possessions of France in north, west and central Africa. Their area is estimated at 210,000 sq. m., with a population of some 5,000,000. Those tribes living north and east of the Niger are mainly of Berber (Taurae) stock; the inhabitants of the Niger bend are chiefly Negroids, such as the Mandingo, with Fula in certain districts.

The colony, as a whole, consists of a great plateau of granite and sandstone, rarely more than 1,000 ft. high, and in its N.W. part, the Kaarta, all but desert. Hydrographically the western portion belongs to the basin of the Senegal, the central to that of the Niger. At Mopti, 200 m. S.W. of Timbuktu, the Niger receives the Malekal Baliale, which rises in about 0°N, and with its tributaries drains a very large area. In its lower course its diversions are, as the name indicates, independent of the Niger, form in the flood season an immense lake. This region—apparently the Waganda country of Idrisi—is sometimes called Bambira, the name of the chief race inhabiting it. The lakes or widenings of the Niger itself occupy vast areas; Lake Debo, the Lake of Horo, the Lake of Dauna, Lake Faguibini are all to the south or west of Timbuktu, and are permanent. The greater part of the colony lies within the bend of the Niger but westward it includes both banks of the Senegal as far as the fault of the Falame confluence. It also extends north of the Niger so as to include the fertile land on the borders of the Sahara. On the S.W. and S. the country is somewhat mountainous and the general trend of the land and the course of the rivers is south to north. East of the Niger the conditions are mostly Saharan, but there is a belt of fairly fertile country, bordering northern Nigeria and extending to Lake Chad. This region includes the state of Zinder (q.v.) and the oases of Air or Asben and Bilma (q.v.). The country west of the Niger contains patches of forest, but it consists mainly of open land well adapted to agriculture and stock-raising. The fauna includes the lion, elephant, hippopotamus, wild boar, panther and various kinds of antelope. The climate is tropical, but, apart from the districts inundated by the Niger floods, dry and not unhealthy. The well-defined States and emirates included in the colony Bambuk lies between the Senegal and the Falame and Bafing. It is traversed from N.W. to S.E. by the steep and well-like range of the Tamba-Urn Mountains. The soil in a large part of the country is of remarkable fertility; rice, maize, millet, melons, manioc, grapes, bananas and other fruits grow abundantly; the forests are rich in a variety of valuable trees; and extensive stretches are covered with abundant pastureage of the long guinea-grass. The inhabitants, a branch of the Mandingo race, own large herds of cattle and sheep. The reports which reached Europe during the 17th and 18th centuries of a country in Upper Senegal rich in gold to be true, this district, where both alluvial and quartz deposits have been found, though the stories of “hills of gold” remain unverified. In all the protected states the native rulers retain a considerable degree of authority and native law is administered.

Towns.—The principal towns in the colony are, in Upper Senegal, Kayes, Bafulabé and Kita; in the Niger regions Sikaso, the centre of the salt trade; Segou, Sanassandig, Bambara, Jenné (q.v.) and Timbuktu (q.v.). Niore is the capital of the Kaarta country; between it and Timbuktu are Gumbo and Sokoto; Gao (q.v.), Zinder or Sinde (not to be confounded with the Zinder mentioned above), Sansanne Fass, Niamey and Say are towns on the Niger below Timbuktu, Say (q.v.) being an entrepôt for the trade of the east Nigerian regions. In the Niger region there are the important cities of Wagadugu, the capital of Mossa, a port and a pagan state of the 11th century. Satadugu is on the upper course of the Falame. Sati and Leo are towns just north of the British Gold Coast hinterland. Of these towns Kayes is situated on the Senegal at the point of which that river ceases to be navigable from the sea—a distance of 400 m. from St Louis. Bamako, chosen in 1904 as the capital of the colony, is on the upper Niger at the head of its navigable waters and is railway communication with Kayes. Segou, where Mungo Park first reached the Niger, is regarded as the capital of Bambara rather than the town of Bambara, which is on a backwater of the Niger some 100 m. S. of Timbuktu. Before the French occupation the possessors of the ruler of the emirs of Aman and Ahammad had but two posts, the headquarters of the emirs Omar and Ahmadu (see below, History). Sansandig stands on the north bank of the Niger below Segu. It was taken by Mungo Park in 1796, and Lige, P. Mage and Dr Quintin, French officers, witnessed the stand it made in 1866 against a siege by Ahmadu, sultan of Segu, from whom it had revolted. Before its conquest by the Tusareg in the first half of the 19th century, Sansandig was a port and entrepôt, standing at the upper end of the stretch of the Niger navigable for large vessels all the year round. After its occupation by France in 1900 its commercial importance gradually returned. It possesses good anchorage and landing places.

Communications.—There is regular communication by rail and river between Dakar, the principal port of Senegal, and Timbuktu, the capital of the Niger occupying the river. A railway linking the Senegal and Niger rivers starts at Kayes on the Spanish line of E. through Bafulabé and Kita, whence it goes E. to Bamako on the Niger, and follows the left bank of that river to Kulikoro, the terminus of the line which point the Niger is navigable, and from there year round for a distance of 900 m., while from Bamako the Niger is navigable up stream to Kurussa, a distance of 225 m., for the greater part of the year. The Senegal-Niger railway is 347 m. long and has a well-tarred road superimposed upon it for the management and periods of regressive policy in Paris. The total cost was upwards of £3,500,000. Construction of the line was authorized 1880; the line opened 1892, but £700,000 had been spent, but 10 m. of rails had been laid. The 3rd m. was completed at a cost of £7,252 per mile for actual construction. Notwithstanding this heavy expense the line was condemned as hopelessly defective. In 1910 an agreed Bafulabé-Kulikoro line must be considered to have virtually resumed until 1898. The entire line was opened for traffic in 1915. Steamers ply on the Niger between Kabaara, the port of Timbuktu, and Kulikoro and Bamako. Good roads connect Mossi

1For a monograph on Bamako see Quest. dipl. et col. (1907), pp. 561-576.
Captain (afterwards Admiral) Bouët-Willamez had previously explored the Senegal river as far as Médine and was anxious to increase French influence, but his stay in Bengal (1842–1844) was too brief to permit him to accomplish much.

The appointment of General Faidherbe as governor in 1854 proved the turning-point in the history of Senegal. In the meantime the Niger had been explored, Timbuktu visited by Europeans and the riches of the region were attracting attention. General Faidherbe sought to bring these newly opened-up lands under French sway, and dreamed of a French empire stretching across Africa from west to east. As far as concerned West Africa he did much to make that dream a reality. On taking up his post he beat north to the Sahara, and over the sands of the desert being a general industry. Gold is found in the basin of the Falémé and of the Tankissé. Rubber is abundant in the southern part of the Niger bend, the latex being extracted by the natives in large quantities. The people are great agriculturists, their chief crops being millet, maize, rice, cotton and indigo. Tobacco is cultivated by the river folk along the banks inundated by the floods. Wheat is grown in the neighbourhood of Timbuktu, the seed having been, in all probability, brought from Morocco at the time of the Moorish invasion (see TIMBUKTU). The oil of the karite or shea-butter tree, common in the southern and western regions, is largely used. Cattle, sheep and goats also of a good breed, are numerous and largely used as transport animals; wool-bearing sheep—distinct from the smooth-haired sheep of the coast regions—are bred in many districts, the natives using the wool largely for the manufacture of felt. The production of rubber is fairly numerous in the upper portion of the Niger bend and on the left bank of the Niger east of Timbuktu, and their feathers form a valuable article of trade. Most of the trade of this vast region is with France and through Senegal.

The story of the French conquests throughout West Africa is inseparably connected with the history of Senegal. Traditions state that the first French settlements were established elsewhere on the coast, but the line of penetration into the interior of the continent was, until the last few years of the 19th century, invariably by way of the river Senegal. Hence there is a peculiar interest in the record of the early settlements on this coast. The Portuguese had some establishments on the banks of the Senegal in the 15th century; they penetrated to Bambuk in search of gold, and were for some time masters of that country, but the inhabitants rose and drove them out. Remains of their buildings are still to be seen. The first French settlement was probably made in 1656 (see Cape Verde). In 1664, two trading stations were assigned to Colbert’s West India Company, and 1758, when the colony was seized by the British, Senegal had passed under the administration of seven different companies, none of which attained any great success, though from 1697 to 1724 affairs were conducted by a really able governor, André Brue, who did not, however, spend the whole of his time in Africa; from 1703 to 1714 he directed the affairs of Senegal from Paris. Brue made many exploring expeditions and was on one occasion (1701) captured by the natives, who extorted a heavy ransom. Under his direction the aurious regions of Bambuk, long since abandoned by the Portuguese, were revisited (1716) and the first map of Senegal drawn (1724). In the meantime (1677) the French had captured from the Dutch Rufsique, Portudal, Joal and Goree and they were confirmed in possession of these places by the treaty of Nijmegen (1678). In 1717 the French acquired Portendic, a roadstead half way between capes Verde and Blanco, and in 1724 Arguin, an island off the coast of the Sahara, which still belongs to the colony. Goree and the district of Cape Verde were captured by the British under Commodore Keppel in 1758, but were surrendered to the French in 1763, and another treaty of peace in 1783 the whole of the Senegal was also restored. The British again captured the colony in the wars of the First Empire (Goree 1800, St Louis 1809) and, though the treaty of Paris authorized a complete restitution, the French authorities did not enter into possession till 1817. At that time the authority of France did not extend beyond the island of Goree and the town of St Louis, whilst up to 1834 little was effected by the thirty-seven governors who followed each other in rapid succession. Of these governors

1 Lieut. E. Mage (1837–1869) of the French navy, an officer of brilliant promise, first visited Senegal in 1856 when, under Faidherbe’s direction, he went on a mission to the Duallah Moors. The ‘Concorde’, which he commanded, was wrecked off Brest in December 1859 and Mage was drowned.

2 It was in this year (1857) that the governor of Senegal took possession of a small uninhabited group of islands, named the Alcatras, lying off the coast of French Guinea. This act had a tragic sequel. By agreement with the governor, a chieftain of the neighbouring mainland sent four of his warriors to the islands to guard the ‘Concorde’ which was, however, taken possession of by the French, and, like the islands themselves, completely forgotten by the authorities, and, the Alcatras producing nothing but sand, the four men starved to death, after exhausting the supplies with which they had been originally provided.
had by 1880 made himself master of a large area in the upper Niger basin. In 1887, and again in 1889, he was induced to recognize a French protectorate, but peace did not long prevail either. Nicolaou, on a spot where the Niger turns west, was afterwards renamed in 1890; Ahmadu lost Segu; Niore the capital of Kaarta was occupied (1891); Jenné was taken in 1893. Samory proved a veritable thorn in the flesh to his opponents. Wild and elusive, he made and broke promises, tried negotiation, shifted his “empire” to the states of Kong, and after numberless encounters was finally defeated on the Cavalla to the north of Liberia, and taken prisoner in September 1898. He was deported to the Gabun, where he died in 1900.

The consumption of the country in 1893, the effective area of French control was increased by M. Coppolani, secretary-general of French West Africa, who in February 1903 induced the emirs of certain Trazzia and Brakna Moors inhabiting a fertile region on the northern bank of the lower Senegal to place their country under the direct supervision of French officials. In the following year these regions were formally constituted the Territory of Mauretania, being placed under the direct control of the governor-general of French West Africa represented on the spot by a civil commissioner. In 1905 M. Coppolani, this commissioner, was murdered by a band of fanatics at an oasis in the Tagant plains (October 1905–1906), a force under Colonel Gouraud, after considerable fighting—the natives receiving help from Morocco—made effective French influence in Adrar Temur.

For the history of the native states in this vast region, see Timbuktu, Jenne, MANDINGO, GUINEA, &c. Consult also the article NIGER.

The general oversight of both colonies is in the hands of the governor-general of French West Africa. Senegal proper has been the subject of special legislation, its government being modelled on that of a department in France.

The governor-general, who controls the military as well as the civil administration, is assisted by a secretary-general and by a privy council (conseil privé) consisting of high officials and a minority of unofficial nominated members, but he is not bound to follow its advice. This council corresponds to the prefectural council of a department. There is also a council-general (conseil général) with powers analogous to those of the similar councils in France. The Senegal council, however, does not share the right, possessed by the councils of other French colonies, of voting the budget, which is fixed by the governor-general of French West Africa. The inhabitants of “communes with full powers” (i.e. St Louis, Dakar, Goree and Rufisque) alone have the right of electing the council-general. The same constituencies—in which no distinction of colour or race is made—elect (law of April 1879) to the French chambers one deputy, who is also a member of the superior council of the colonies, a consultative body sitting in Paris. The communes named have the same municipal rights as in France. There have been, in addition, since 1891, “mixed” and native communes with restricted powers of local government. The judicial system applied to Europeans resembles that of France, and the judicature is independent of the executive. Native laws and customs not repugnant to justice are respected. Education is given in village, commercial and technical schools, all maintained by the state. Arabic is taught in all Mahommadian districts.

The colony of Upper Senegal and Niger has a more rudimentary constitution. Its administrative council contains three “notables,” unofficial members nominated by the lieutenant-governor.

Administrative divisions.

At first the whole of the conquered or protected territories were either administered from Senegal, or placed under military rule. Subsequently the upper Senegal country and the states included in the bend of the Niger were formed into a separate administrative division and were given the title of "French Sudan." As the result of further reorganization (October 18, 1899) the colonies of French Guinea, Ivory Coast and Dahomey were given their geographical hinterlands, and in October 1902 the central portion was created a protectorate under the style of the Territories of Senegambia and of the Niger. A further change was made in 1904 (decree of the 18th of October) when this central portion was changed into "The Colony of Upper Senegal and Niger." The new colony was placed under a lieutenant-governor.

Within the framework of the country in 1903, the effective area of French control was increased by M. Coppolani, secretary-general of French West Africa, who, in February 1903 induced the emirs of certain Trazzia and Brakna Moors inhabiting a fertile region on the northern bank of the lower Senegal to place their country under the direct supervision of French officials. In the following year these regions were formally constituted the Territory of Mauretania, being placed under the direct control of the governor-general of French West Africa represented on the spot by a civil commissioner. In 1905 M. Coppolani, this commissioner, was murdered by a band of fanatics at an oasis in the Tagant plains (October 1905–1906), a force under Colonel Gouraud, after considerable fighting—the natives receiving help from Morocco—made effective French influence in Adrar Temur.

1904). For Maurétanie see La Maurétanie (Paris, 1898), another record of the French protectorate, and A. Gravel and R. Chenuen, À Travers la Maurétanie occidentale (Paris, 1909). See further the works of Faidherbe and Galiendl quoted in their biographies, and the reports on the trade, etc., of French West Africa issued by the Berber and Foreign Office.

**SENEGAMBIA**, a term used to denote the region between the rivers Senegal and Gambia on the west coast of Africa. The country south of the Gambia as far as Sierra Leone was formerly also regarded as part of Senegambia. As a geographical expression Senegambia fell into disuse towards the end of the 19th century. Part of the hinterland is included in the French colony of Upper Senegal and Niger (see SENEGAL, II.).

**SENAICHAL** (the O. Fr. form, mod. zénichal, of the Low Lat. senescalus, a word of Teutonic origin, meaning "old or senior servant," Goth. sinil- old; cf. Lat. senex and scalis, servant; Du Cange's derivation from seneste, flock, herd, must be rejected), the title of an official equivalent to "standard bearer". The French equivalent was the seneschal or seneschal, a major domin of the German barbarian princes who settled in the empire, and was therefore the predecessor of the mayors of the palace of the Merovingian kings. But the name seneschal became prominent in France under the third or Capetian dynasty. The seneschal, called in medieval Latin the dapifer (from daps, a feast, and ferre, to carry), was the chief of the great officers of state of the French court between the 11th and the 13th centuries, the others being the butler, the chamberlain, the constable and the chancellor. His functions were described by the term major regius, the great prince of France. From the 12th century he was the chief officer of the royal household, and agent of the kingdom of France. The English equivalent was the lord high steward, but the office never attained the same importance in England as in France. Under the earlier Capetian sovereigns the seneschal was the second person in the kingdom. He inherited the power and position of the mayor of the palace—had a general right of supervision over the king's service, was commander-in-chief of the military forces (princeps militiae regis, or Francorum), was steward of the household and presided in the king's court in the absence of the king. Under weak rulers the seneschal would have doubtless been the most powerful official and the mayor of the palace of the Carolingian line. It was the vast possibilities of the office which must be presumed to have tempted the counts of Anjou of the Plantagenet line to claim the hereditary dainpifership of France, and to support their claim by forgeries. A count of Anjou who was also in effective possession of the office would soon have reduced his feudal lord to absolute insignificance. French historical scholars have shown that the pretension of the Anjouins was unfounded, and that the treatise concocted to support it—the De majoratu et seneschalit Franciae, attributed to Hugues de Cîbrè.—is a medieval forgery. At the close of the 11th century the seneschalship was in the hands of the family of Rochefort, and in the early part of the following century it passed from them to the family of Garlande. The power of the office was a perpetual temptation to the vassal, and a cause of jealousy to the king. The Garlandes came to open conflict with the king, and were forcibly suppressed by Louis VI. in 1127. After their fall the seneschalship was conferred only on great feudatories who were the king's kinsmen—on Raoul of Vermandois till 1152, and on Thibaut of Blois till 1191. From that time forward no seneschal was appointed except to act as steward at the coronation of the king. The name of the seneschal was added with those of the other great officers to the kings in charters, and when the office was not filled the words dapifer vacante were written instead. The great vassals had seneschals of their own, and when the great fields, Anjou, Touraine, Maine, Poitou, Saintonge, Guienne, were regained by the crown, the office was allowed to survive by the king. In the south of France, Périgord, Quercy, Toulouse, Agenais, Rouergue, Beauchene and Carcassonne were royal seneschalies. In Languedoc the lords' agent and judicial officer, known in the north of France as a bailli, was called zénichal. The office and title existed till the Revolution.

Luchaire, Histoire des institutions monarquiques de la France sous les premiers Capétiens (Paris, 1883-1885); Manuel des institutions françaises (Paris, 1892); Paul Violet, Droit public—Hist. des institutions politiques & administratives de la France (Paris, 1890-1898).

**SENIAGALLIA,** or SENIGALLIA (anc. Sena Gallca), a city and episcopal see of the Marches, Italy, in the province of Ancona, on the coast of the Adriatic, 15 m. by rail N. of Ancona. Pop. (1901) 5556 (town), 23,195 (village). It is situated at 14 ft. above sea-level, and, despite its ancient origin, presents a modern appearance, with wide streets. The Palazzo Comunale dates from the 13th century. The cathedral was erected after 1257. The castle, of Gothic origin, was restored by Baccio Pontelli, a famous military architect, in 1492. The church of S Maria delle Grazie outside the town is one of the only two churches which it is known he has erected (the other is at Orclano near Mondovì, about 15 m. to the west by road). The small town is a chief centre for the cultivation of grapes, and the wines which flow through the town between embankments constructed of Istrian marble. The inhabitants are chiefly occupied in fishing, and in the summer the town is greatly frequented by visitors for the good sea-bathing. Senigallia used to hold one of the largest fairs in Italy, which dated originally from 1200 when Sergius, count of Senigallia, received from the count of Marseilles, to whose daughter he was affianced, certain relics of Mary Magdalen; this fair used to be visited by merchants from France, Switzerland, Austria, Germany and especially the Levant. Senigallia is the residence of the Mastai-Ferretti family, the house in which Pope Pius IX. was born is preserved, and contains a few memorials of him.

The ancient Sena Gallca was a city of Umbria. A colony was founded there by the Romans after their victory over the Senones, rather before 280 B.C. The place is also mentioned in connexion with Hasdrubal's defeat at the Metaurus (q.v.) in 207 B.C. It was destroyed by Pompey in 82 B.C., and is not often mentioned afterwards. No ancient remains and very few inscriptions exist. The name Gallica distinguishes it from Saena (Siena) in Etruria. Ravaged by Alaric, fortified by the exarch Lomando, and again by the Lombards in the 8th century and by the Senones in the 9th, Senigallia was at length brought so low by the Guelp and Ghibelline wars, and especially by the severities of Guido de Montefeltro, that it was chosen by Dante as the typical instance of a ruined city. In the 15th century it was captured and recaptured again and again by the Malatesta and their opponents. Sigismondo Malatesta of Rimini erected strong fortifications round the town in 1450-1455. The lordship of Senigallia was bestowed by Pius II. on his nephew Antonio Piccolomini, but the people of the town in 1464 placed themselves anew under Paul II., and Giacomo Piccolomini in 1472 failed in his attempt to seize the place. Sixtus IV. assigned the lordship to the Della Rovere family, from whom it was transferred to Lorenzo de' Medici in 1516. After 1624 it formed part of the legation of Urbino.

**SENIOR, NASSAU WILLIAM** (1790-1864), English economist, was born at Compton, Berks, on the 26th of September 1790.
The eldest son of the Rev. J. R. Senior, vicar of Durnford, Wilts. He was educated at Eton and Magdalen College, Oxford; and at the university of Cambridge, where he took his B.A. in 1811, and in 1836, during the chancellorship of Lord Cottenham, was appointed a master in chancery. On the foundation of the professorship of political economy at Oxford in 1825 Senior was elected to fill the chair, which he occupied till 1830, and again from 1847 to 1857. In 1830 he was requested by Lord Melbourne to inquire into the state of combinations and strikes, to report on the state of the laws relating to the prevention of street disorders and the details of the Poor Law Inquiry Commission of 1832, and of the Handloom Weavers Commission of 1837; the report of the latter, published in 1841, was drawn up by him, and he embodied in it the substance of the report he had prepared some years before on combinations and strikes. He was also one of the commissioners appointed in 1861 to inquire into popular education in England. In the later years of his life, during his visits to foreign countries, he studied with much care the political and social phenomena they exhibited. Several volumes of his journals have been published, which, though not always investigated with such acuteness, though the author probably rated too highly the value of the technical social study. Senior was for many years a frequent contributor to the Edinburgh Quarterly, London and North British Reviews, dealing in their pages with literary as well as with economic and political subjects. He died at Kensington on the 4th of June 1864. His writings on economic theory consisted of an article in the Encyclopaedia Metropolitana, afterwards separately published as An Outline of the Science of Political Economy (1846), and his lectures delivered at Oxford. Of the latter the following were printed: An Introductory Lecture (1827); Two Lectures on Population, with a correspondence between the author and Malthus (1831); Three Lectures on the Transatlantic Economy (1834); Three Lectures on the Cost of Living and on Some Effects of Private and Governmental Paper Money (1830); Three Lectures on Wages and on the Causes and Remedies of the Present Disturbances (1836); and Four Introductory Lectures on Political Economy (1842). Several of his lectures were translated into French by M. Arrivabene under the title of Principes Fondamentaux d'Economie Politique (1835). Senior also wrote on administrative and social questions—a Letter to Lord Holburne on the Investigation of the Cause of Spain's Extraordinary Public Deficits and a Proposal for the Irish Roman Catholic Clergy (1831); Tithes and a Provision for the Irish Roman Catholic Clergy (1831, 3rd ed., 1832), with a preface containing suggestions as to the measures to be adopted to prevent what he terms the "present emergency"; Statement of the Provision for the Poor and Destitute in Ireland (1833); and a consideration of the considerable portion of America and Europe, bringing the state to the Foreign Communications in the Appendix to the Poor Law Report (1835). He wrote on National Property, and on the Prospects of the Present Administration and of their Successors (anon.; 1835); Letters on the Factory Act, as it affects the Cotton Manufacture (1837); Suggestions on Popular Education (1861); American Slavery (in part a reprint from the Edinburgh Review, 1862) An Address on Education delivered to the Social Science Association (1863). His contributions to the reviews were collected in volumes entitled Essays on Fiction (1864); Biographical Sketches (1865, chiefly of noted lawyers); and Historical and Philosophical Essays (1865). In 1839 appeared his Journal kept in Turkey and Greece in the Autumn of 1857 and the Beginning of 1858; and the following were edited after his death by his daughter: Journal of a Tour in the Northern States of America in 1858; Journals kept in France and Italy from 1858 to 1862, with a Sketch of the Revolution of 1848 and 1871; Conversations with Thiers, Guizot and other Distinguished Persons during the Second Empire (1862); Interviews of the same Person during the First and Second Empires, from 1850 to 1872 (1880); Conversations and Journals in Egypt and Malta (1882); also in 1872 Correspondence and Conversations with Alexis de Tocqueville from 1834 to 1859.

Senior's literary work doubtless contributed much to the welfare of the public: they are, indeed, somewhat formal and academic in spirit. The author, while he had both good sense and right feeling, appeared to possess rather a vivid and distinct faculty of perception, but he was not perhaps open to the advantages which arise from a correct and especially acute imagination. His tract on practical politics, though the theses they support are not new, is written and arranged in a manner of which no one but a great master could not be the author. His studies of political economy were also written with much worth reading, but cannot be said to be of much permanent interest.

But his name continues to hold an honoured position, second only in the place of history of political economy. Senior regards political economy as a purely deductive science, all the truths of which are inferences from four elementary propositions. It is, in his opinion, wrongly supposed by J. S. Mill and others to be a hypothetic science by which we can therefore give no practical counsel as to political action. It is that to which alone the laws of nations are to be referred and which alone is to be kept in view as elements in the study of the questions with which he has to deal. The conception of economics as altogether deductive is one which is infused into our understanding of the facts, and which keeps us from falling into a false path. But deduction has a real, though limited, place in economics. Hence, though the chief difficulties of the subject are not of a logical kind, yet accurate nomenclature, strict definition and rigorous reasoning are the appropriate methods to adopt, and they are accordingly the methods Senior adopted and followed in his study, and, notwithstanding occasional pedantries, with very useful results. In several instances he improved the forms in which accepted doctrines were habitually stated. He also did excellent service by pointing out the arbitrary novelties and frequent inconsistencies of terminology which deface Ricardo's principal work—as, for example, his use of "value" in the sense of "cost" where Ricardo used it, and of "high" and "low" wages in the sense of a certain proportion of the product as distinguished from an absolute amount, and his peculiar employment of the epithets "fixed" and "circulating" as applied to capital. He shows, too, that in numerous instances the results assumed by him as the correct answers to the questions he has raised in his study of economics are to be sought in the principles of political economy, and that the deductions are based on the principles, and that therefore the share of the produce taken by the capitalist is continually diminishing, and that, whilst taken by the capitalist cannot constantly diminish, the "truth of all these propositions. Besides adopting some terms, such as that of "natural agents," from Say, Senior introduced the word "abstraction," that is, the generalization of the particular, for some purposes useful—to express the conduct of the capitalist which is remunerated by interest; but in defining "cost of production" as the sum of labour and abstinence necessary to production he does not seem to see that an amount of labour and an amount of abstinence are disparate, and do not admit of reduction to a common quantitative standard. He added some important considerations to the weight of which that he is an essential factor in the laboring class. He distinguishes usefully between the rate of wages and the price of labor. But in seeking to determine the law of wages he falls into the error of assuming a determinate wage-fund, and states as an economic truth what is only an identical proposition in arithmetic. Whilst entertaining such an exaggerated estimate of the services of Malthus that he extravagantly pronounces him "as a benefactor of mankind on a level with Adam Smith," he yet shows that he modified his opinions on occasion. He was indeed considerable in consequence, and the weight of his work is considerable. He states his own opinions in a way that is, in a greater ratio than population. It is urged by H. C. Périn, and it should be admitted, that by his isolation of economics from morals, and his assumption of the desire of wealth as the sole motive-force in the action of the individual, he sought to find a place for human nature, tended to set up egoism as the legitimate ruler and guide of practical life. It is no sufficient answer to this charge that he makes formal reserve in favour of higher ends. From the scientific side Cliffe Leslie has abundantly proved the unsurpassed nature of the abstraction implied in the phrase "desire of wealth," and the inadequacy of such a principle for the explanation of economic phenomena.

SENLIS, a town of northern France, in the department of Oise, on the right side of the Neuffe, a left-hand affluent of the Oise, 34 m. N.N.E. of Paris by rail. It is connected by the branch line (Chantilly-Crépy) connecting the Paris-Creil and Paris-Soissons lines. Pop. (1906) 6074. Its antiquity, its historical monuments and its situation in a beautiful valley, in the midst of the three great forests of Hallatte, Chantilly and Ermenonville, render it interesting. Its Gallo-Roman walls, 23 ft. high and 13 ft. thick, are, with those of St Lizier (Ariège) and Bourges, the most perfect in France. They enclose an oval area 1024 ft. long from E. to W. and 794 ft. wide from N. to S. At each of the angles formed by the broken lines of the circuit there stands or stood a tower; numbering originally twenty-eight, and now only thirteen, which are semicircular in plan, and up to the height of the wall are unpierced. The Roman city had only two gates; the present number is five. The site of the prætorium was afterwards occupied by a castle occasionally inhabited by the kings of
France from Clovis to Henry IV., and still represented by ruins dating from the 11th, 12th, 15th, and 16th centuries. In the neighbourhood of Sensis the foundations of a Roman amphitheatre have also been discovered. The old cathedral of Notre Dame (12th, 13th and 16th centuries) was begun in 1155 on a vast scale; but owing to the limited resources of the diocese, progress was slow and the transept was finished only under Francis I. The total length is 312 ft. (outside measurement), but the nave (92 ft. high) is shorter than the choir. At the west front there are three doorways and two bell towers. The right-hand tower (256 ft. high) is very striking: it consists, above the belfry stage, of a very slender octagonal drum with open-work turrets and a spire with eight dormer windows. The left-hand tower, altered in the 16th century, is crowned by a balustrade and a sharp roof. In the side portals, especially in the southern, the flamboyant Gothic is displayed in all its delicacy. Externally the choir is extremely simple. In the interior the sacristy pillars with capitals of the 10th century are noteworthy. The episcopal palace, now an archaeological museum, dates from the 13th century; the old collegiate church of St Frambourg was built in the 12th century in the style which became characteristic of the "saintes chapelles" of the 13th and 14th centuries; St Pierre. (chiefly of the 13th and 16th centuries) serves as a market. The ecclesiastical college of St Vincent, occupying the site of this nunnery, was enlarged and a large hall was made of palm leaves, probably of the 12th century. Its date has, however, been greatly disputed by archaeologists, who sometimes wrongly refer it to Queen Anne of Russia, foundress in the 11th century of the abbey. The town hall (15th century) and several private houses are also of architectural interest.

Sennis has tribunals of first instance and of commerce and a sub-prefecture. The manufacture of bricks and tiles, cardboard, meures and other wares are among the industries. The town is an agricultural market.

Senna, once known as Sennacharib, is the Gallo-Roman township of the Silvanectes, which afterwards became Augustomagus. Christianity was introduced by St Rieul probably about the close of the 3rd century. During the first two dynasties of France Sennis was a royal residence and generally formed part of the royal domain; it obtained a communal charter in 1173. In the middle ages local manufactures, especially that of cloth, were active. The burgesses took part in the Jacquerie of the 14th century, then sided with the Bourdians and the English; whom, however, they afterwards expelled. The Leaguers were there beaten in 1589 by Henry I, duke of Longueville, and Francois I, king of France in 1545. The bishopric was suppressed by the suppression of the Church and state in 1790, but was created by the Concordat. Treaties between Louis XI. and Francis II. duke of Brittany (1475), and between Charles VIII. and Maximilian of Austria (1493) were signed at Sennis.

SENNAN (Arab. sand), a popular purgative, consisting of the leaves of two species of Cassia (natural order Leguminosas), viz. C. acutifolia and C. angustifolia. These are small shrubs about 2 ft. high, with numerous lanceolate or narrowly lanceolate leaflets arranged pinnately on a main stalk with no terminal leaflet; the yellow flowers are borne in long-stalked racemes in the leaf-axils, and are succeeded by broad flattish pods about 2 in. long. C. acutifolia is a native of many districts of Nubia, e.g. Dongola, Berber, Kordofan and Senaar, but is grown also in Timbuctoo and Sokoto. The leaflets are collected twice a year by the natives, the principal crop being gathered in September after the rainy season and a smaller quantity in April. The leaves are dried in the simplest manner by cutting down the shrubs and exposing them on the rocks to the burning sun until quite dry. The leaflets then readily fall off and are packed in large baskets, and holding about a quintal each. These packages are conveyed by camels to Assouan and Daras and thence to Cairo and Alexandria, or by ship by way of Massowah and Suakim. The leaflets form the Alexandrian senna of commerce. Formerly this variety of senna was much adulterated with the leaves of Solenostemma Argel, which, however, are readily distinguishable by their minutely wrinkled surface. Of late years Alexandrian senna has been shipped of much better quality. Occasionally a few leaves of a similar species with broader obovate leaves, C. angustifolia affinis, are shipped from the Bombay, East Indian, Arabian or Mecca senna of commerce.

This plant grows wild in the neighbourhood of Yemen and Hadramaut in the south of Arabia, in Somaliland, and in Sind and the Punjab in India. The leaves are chiefly shipped from Mocha, Aden, Jedda and other Red Sea ports to Bombay and thence to Europe, the average imports into Bombay amounting to about 250 tons annually, of which one-half is re-exported. Bombay senna is very inferior in appearance to the Alexandrian, as it frequently contains many brown and decayed leaflets and is mixed with leaf-stalks, &c. C. angustifolia is also cultivated in the Togolantic port of Dahomey, which is known in commerce as Tinnelley senna. This variety is carefully collected, and consists almost exclusively of leaves of a fine green colour, without any admixture of stalks. It is exported from Tucitcorin. American senna is Cassia marilandica.

The British Pharmacopoeia recognizes both Senna Alexandrina and Senna Indica. The composition of the leaves is the same in either case. The chief ingredient is cathartic acid, a sulphur containing glucoside of complex formula. It occurs combined with certain cardamoms, chiefly caraway, and is used in the active principle of senna is shown by the fact that the cathartate of ammonia, when given separately, acts in precisely the same manner as senna itself. Cathartic acid can easily be decomposed into glucose and cathartogenic acid. The leaves contain at least two other glucosides, senapicin and senacrol, but as these are insoluble in water, they are not contained in most of the preparations of senna. Senna also contains a little chrysophyacin.
army, trusting to the fortifications of Jerusalem and Egyptian help. Hezekiah, however, was forced to restore the anti-Jewish Padi to the government of Ekron, from which he had been removed by the Jewish party, and, after the defeat of his Egyptian allies at Eltekh, to see his country wasted with fire and sword, forty-six times and the Blue Nile was taken and held in activity. He then endeavoured to buy off the invaders by numerous presents—30 talents of gold, 800 talents of silver, precious stones, couches and thrones inlaid with ivory, girls and eunuchs—but all in vain. Jerusalem was saved eventually by a plague, which decimated the Assyrian army and obliged Sennacherib to return to Nineveh. The following year he again went into Babylonia, where he made his son Assur-nadin-sum king in place of Bel-ibni and drove Merodach-baladan out of the marshes in which he had taken refuge. A few years later he had a fleet of ships built near Bireijk on the Euphrates by his Phoenix captives; these were manned by Ionians and transported from Opis overland to the Euphrates and so to the Persian Gulf. Then they sailed to the coast of Elam, and there destroyed the colony of Merodach-baladan’s followers at Nagitu. In return for this unprovoked invasion of Elamite territory the Elamites descended upon Babylonia, carried away Assur-nadin-sum (694 B.C.) and made Nergal-yaussib king. Three years later a great battle was fought at Khalulé on the Tigris between the Assyrians on the one side and the Elamites and Babyloniens on the other. Both sides claimed the victory, but the advantage remained with Sennacherib and he captured Babylon and laid it waste to the ground, a deed which excited the horror of all western Asia. Some time previously—the date is not known—he had overrun the mountain districts of Cilicia. On the 20th of Tebet 68 r. he was murdered by his two sons, who fled to Armenia after holding Nineveh for forty-two days. Sennacherib was vainglorious and a bad administrator; he built the palace of Kuyunjik at Nineveh, 1750 ft. long by 700 ft. broad, as well as the great wall of the city, 5 m. in circumference.

SENNAR, the name of a country of north-east Africa, part of the Anglo-Egyptian Sudan. Its boundaries have varied considerably, but Sennar proper is the triangular-shaped territory between the White and Blue Niles north of 10° N. This region is called by the Arabs "The Island of Sennar" and by the negro inhabitants "Hui." The northern part, where the two Niles approach nearer one another, is also known as El Gezirah, i.e. "the Island." Whilst Sennar has never been held to extend westward of the White Nile, the term has often been used to embrace "the Island of Meroe," i.e. the country between the Blue Nile and the White Nile south of 8° N. and the northern part of the eastern tributary the Rahad, this latter district being known as the "Isle of Isles." South-east Sennar stretches to the Abyssinian hills. By the Sudan administration this region has been divided into mudirias (provinces), one, including the central portion, retaining the name of Sennar. The present article deals with the country as a whole.

In general Sennar is a vast plain, lying for the most part much higher than the river-levels and about 2000 ft. above the sea, its western part, towards the White Nile, being largely wilderness. From the plain rise isolated granitic hills, attaining heights of 1000 to 2000 ft. above the general level. Jebel Segedu is red granite of the finest quality. Near Fully on the opposite bank is a part, in the south a deep bed of argillaceous marl, scattered over with great granite boulders and fragments of greenstone.

Sennar lies in the region of light rain, increasing in the S.E. districts to as much as 20 in. in the year. The rainy season is from July to September. The climate is generally unhealthy during that period and the months following. The miasmatic exhalations caused by the sun-dried quagmires, the water holes, nile crocodiles, buffaloes, "Sennar fever," which drives even the natives from the plains to the southern uplands. The temperature, which rises at times to over 120° Fahr., is also very changeable, often sinking from 100° during the day to 10° at night.

The soil, mainly alluvial, is naturally very fertile, and whenever cultivated yields abundant crops, durra being the principal grain grown, wheat, barley, sorghum, millet and harley also grown. The forest vegetation, largely confined to the "Isle of Isles" and the southern uplands, includes the Adansonia (baobab), which in the Sackho district attains gigantic proportions, the tamarind, of which bread is made, the delph palm, several valuable gum trees (whence the term Sennari often applied in Egypt to gummed sennar, i.e. dyers’ green-wood, and also acacia. In these forests are found the two-horned rhinoceros, the elephant, lion, panther, numerous aepes and antelopes, while the crocodile and hippopotamus frequent the rivers. The chief domestic animals are the camel, horses, oxen, buffaloes (used both as a beast of burden and for riding), sheep with a short环节, the goat, and the pig, which last here reaches its southernmost limit.

The country is occupied by a partly settled, partly nomad population of an extremely mixed and chaotic character. There is evidence of the existence of a once dominant fair race, of which the still surviving Sieneto, a people of a yellow or fair complexion, are regarded as descendants.

The Sennar tribes are the Assyrians or Hamites, the Nubian kingdom of Shendi, the Sudanese, the negroes, the oxen, buffalo, Kordofan, the White Nile tribes being engaged near Goz Abu Guma.

History.—Sennar, lying between Nubia and Abyssinia, was in ancient times under Egyptian or Ethiopian influence and its inhabitants appear to have embraced Christianity at an early period. The capital of Aolo, which appears to have been at one time a powerful city, was captured by the Egyptians in 812 B.C. The capture of Aolo, with its northern part, is in its northern part, is in the day under 600 ft. at Samos.

The region of Shendi, between the Blue Nile and the White Nile, was occupied by the Egyptians in the 17th and 18th centuries B.C. The invasion of the Blue Nile by the Egyptians was a great event, for it made possible the conquest of the Sudan. The Blue Nile was taken by the Egyptians in 1070 B.C., and the Egyptian rule lasted for many centuries, during which time the country was governed by a series of governors, known as the "mudirias." The most noteworthy, however, of the earlier governors was James Bruce, the explorer of the Blue Nile. He spent some time in Sennar in 1772, and in his Travels has left an interesting account of the kingdom in its decadence. Various Egyptian expeditions added considerably to the knowledge of the district, which between 1854 and 1864 was explored by the Belgian scientist E. Pruyssenaer. Later explorers included the Viennese Ernest Marno (1870) and the Dutchman J. M. Schuer, who in 1881 and 1882 visited the sources of the Tumat. To this list should be added the names of those who, like Sir Samuel Baker, explored the Blue Nile. Since the establishment of the Anglo-Egyptian condominium (1899) the country has been thoroughly surveyed.

SENONE, in ancient geography, a Celtic people of Gallia Celta, who in Caesar's time inhabited the district which now includes the departments of Seine-et-Marne, Loiret and Yonne. From 53-51 B.C. they were engaged in hostilities with Caesar, rejoiced at his defeat, but were driven out of their country by Sabinus, Gaius, and Lucius Karius: since he had appointed their king. In the last-named year a Senonian named Drapes threatened the Province, but was captured and starred
SENS

SENSE, a town of north-central France, capital of an arrondissement in the department of Yonne, 71 m. S.E. of Paris on the Paris-Lyon-Méditerranée railway. Pop. (1906) 13,701. It is situated on the right bank of, and on an island in, the Yonne just below its confluence with the Yonne. The streets of the town are narrow, but it is surrounded by fine promenades. The cathedral, St. Étienne, one of the earliest Gothic buildings in France, is additionally interesting because the architecture of its choir influenced through the architect, William of Sens, that of the choir of Canterbury cathedral. St. Étienne was begun in 1140 and only completed early in the 13th century. It belongs mainly to the 12th century, and it is characterized by solidity rather than by beauty of proportion or richness of ornamentation. The west front is pierced by three portals; that in the middle has good sculptures, representing the parable of the virgins and the story of St. Stephen. The right-hand portal contains twenty-two remarkable statues of the prophets, who have suffered considerable injuries. Above this portal rises the stone tower, decorated with armorial bearings and with statues representing the principal benefactors of the church. The bells in the campanile by which the tower is surmounted enjoyed immense reputation in the middle ages; the two which still remain, La Saviniennne and La Potentienn, weigh respectively 15 tons 7 cwt. and 13 tons 13 cwt. The left portal is adorned with two bas-reliefs, Liberality and Avarice, as well as with the story of John the Baptist. The portal on the north side of the cathedral is one of the finest examples of French 12th-century sculpture, that on the south side is surmounted by magnificent stained-glass windows. Other windows of the 12th to the 16th century are preserved, some of them representing the legend of St. Thomas of Canterbury. Among the interior adornments are the tomb of the dauphin (son of Louis XV.) and his consort, Marie Joséphine of Saxony, one of the works of William Coustou the younger, and bas-reliefs representing scenes from the life of Cardinal Duprat, chancellor of France and archbishop of Sens from 1525 to 1537. The mausoleum from which they came was destroyed at the Revolution. The treasury, one of the richest in antiquities in France, contains a fragment of the true cross presented by Charlemagne, and the vestments of St. Thomas of Canterbury. It was in the cathedral of Sens that St. Louis, in 1234, married Marguerite of Provence, and five years later deposited the crown of thorns. To the south of the cathedral are the official buildings, dating from the 13th century, but restored by Viollet-le-Duc. The old judgment-hall and the dungeons had remained intact; in the former is a collection of fragments of sculpture from the cathedral; on the first story is the synod hall, vaulted with stone and lighted by beautiful grille windows. A Renaissance structure connects the buildings with the archiepiscopal palace, which also dates from that period. The oldest of the other churches of Sens is St. Savinian, the foundation of which dates from the 3rd century; the crypt and other portions of the church are of Romanesque architecture. The museum of Sens contains, among other antiquities, some precious MSS., notably a famous missal with ivory covers, and a collection of sculptured stones mainly derived from the old Roman fortifications, which were themselves constructed from the ruins of public monuments at the beginning of the barbarian invasions. The town has statues of Benjamin J. J. Thénard, the famous chemist, and of the sculptor Jean Cousin. Sens is the seat of a sub-archbishopric. Adjoining the cathedral, there are a number of small churches and chapels, and a hospital of the order of St. Vincent de Paul.

SENSATIONALISM, sens'e-ta-né-iz'um, a term of colloquial origin, meaning the cultivating of the emotions. The term is used also in psychology, the theory that all knowledge, on the one hand, and sensation on the other, are derived from ourselves. The term is also applied to the practice of appealing to the emotions, disregarding proportion and fact.
sentences are those which run from the same date in respect of convictions on various indictment. A cumulative sentence is the sum total of consecutive sentences passed in respect of each distinct offence of which an accused person has been found guilty on several counts of an indictment. A sentence in the case of trials before a court of assize, commences to run from the first day of the sitting of the court, but in that of courts of quarter sessions from the time the sentence is pronounced. SENTINEL, or SENTRY, a guard or watch, a soldier posted at a particular spot to challenge all comers, passing those who give a countersign, and refusing those who do not, and giving alarm in case of attack. The etymology has been the subject of much controversy. The original word seems to be Ital. sentinella, adapted as Fr. sentinelle (the modern French military term is factionnaire, and the Ger. Füsilier). The Italian source has been suggested in sentire, to perceive, but there are philoholic objections to this, and more plausibility attaches to a connexion with sentina, the bilge-water in a ship, figuratively rable, camp-followers. If an Italian origin, as agreed on by most authorities, be set aside, the French word suggests a more appropriate formation as the diminutive of sentier, path, Lat. semita, meaning properly the sentry's beat. The O. Fr. sentier (a form of sentier) would account for the English form "sentry." SENTINUM, an ancient town of Umbria, Italy, lying to the S. of the modern town of Sassoferrato, in the low ground. The foundations of the city walls are preserved, and a road and remans of houses have been discovered, including several mosaic pavements (T. Buccolini in Notizie degli scavi, 1890, 349) and inscriptions of the latter half of the 3rd century A.D., including three important tabulae patronatus. In the neighbourhood the battle took place in which the Romans defeated the combined forces of the Samnites and Gauls in 205 B.C. It was taken and destroyed in 41 B.C. by the troops of Octavian, but continued to exist under the Empire. It was, however, only a municipium, never (as some wrongly suppose) a colonia. Sassoferrato gave its name to the province of that name, which was divided from the 16th century (1654-1685), a painter celebrated for his Madonnas.

SENUSII [Senus] and SENUSITES, the names respectively of a Moslem family (and especially its chief member) and of the fraternity or sect recognizing the authority of the Senussi. Considerable diversity of opinion has prevailed among writers and travellers claiming knowledge of the Senussia; it is possible, however, to distinguish the main facts in the lives of the Senussi sheiks and to indicate the range of their direct political influence. The extent of their spiritual influence, the ramifications of the fraternity and the aims of its chiefs cannot be gauged so accurately.

Seyyid or Sidi (i.e. Lord) Mahommed ben Ali bin Es Senussi el Khettabi el Hassani el Idrissi el Mehajiri, the founder of the order, commonly called the Sheik es Senussi, was born near Mostaganem, Algeria, and was called es Senussi after a much venerated saint whose tomb is near Tlemcen. The date of his birth is given variously as 1791, 1792, 1796 and 1803. He was a member of the Walad Sidi Abdalla tribe of Arabs and his descent is traced from Fatima, the daughter of Mahomet. As a young man he spent several years at Fez, where he studied the Koran, the traditions of Muhammad and the science of jurisprudence. He then travelled in the Saharan regions of Algeria preaching a reform of the faith. From Algeria he went to Tunisia and Tripoli, gaining many adherents, and thence to Cairo, where he was opposed by the Ulema of El Azhar, who considered him unorthodox. Leaving Egypt Senussi went to Mecca, where he joined Mahommed b. Idris el Fassi, the head of the Khadrrites, a fraternity of Moroccan origin. On the death of el Fassi Senussi became head of one of the two branches into which the Khadrrites divided, and in 1835 he founded his first monastery at Abu Kebes near Mecca. While in Arabia Senussi allied himself to the Fezibites, and hired troops with that body caused him to be looked upon with suspicion by the Ulema of Mecca. It was at Mecca, however, that Senussi gained his most powerful supporter, Mahommed Sherif, a prince of Wadai, who became in 1838 Sultan of his native state, the most powerful Mahommedean kingdom in the Central Sudan. Finding the opposition to him at Mecca too powerful Senussi quitted that city in 1843 and settled in the Cyrenaica, where in the mountains near Derna he built the Zawin Baida or White Monastery. There he was in close touch with all the Mejhrinians, gaining many followers among the Tripolitans and Moroccans. He also maintained a close correspondence with the sultan of Wadai, who greatly favoured the spread of the Senussia in his state. The sultan of Turkey viewed with some disfavour the growth of Senussi's influence as likely to become detrimental to his own position as the Khalifa of Islam. Probably with the desire to be independent of pressure from the Turks, Senussi removed in 1855 to Jarahub (Jaghjub), a small oasis some 30 m. N.W. of Siwa. Here he died in 1859 or 1860, leaving two sons, one Mahommed Sherif (i.e. Senussi el Mahdi, the Dawa Mahdi), born in 1844, and the other, el Mahdi, born in 1845. To the second son was left the succession. It is related that as the younger son showed a spirit in all things superior to that of his brother the father decided to put them to the test. Before the whole sazix at Jarahub he bade both sons climb a tall palm tree and then adjured them by Allah and His Prophet to leap to the ground. The younger lad leapt at once and reached the ground unharmed; the elder boy refused to spring. To el Mahdi, "who feared not to commit himself to the will of God," passed the birthright of Mahommed Sherif. Mahommed appears to have accepted the situation without complaint. He held the chief administrative position in the fraternity under his brother until his death in 1895.

Senussi el Mahdi, only fourteen when his father died, was at first under the guidance of his father's friends Amran, Reeni and others. He enjoyed all his father's reputation for holiness and wisdom, attributes consistent with all that is known of his life. Mahommed Sherif, the sultan of Wadai, had died in 1858, but his successors the Sultan Ali (who reigned until 1874) and the Sultan Yusuf (reigned from 1874 to 1898) were equally devoted to the Senussia. Under Senussi el Mahdi the Dawa of Wadai was given to Senussi, who put his name on it.

senusii el mahdi.
Ahmed, this delegate reaching the Mahdi's camp in 1893 soon after the sack of Tripoli. The French having completed the military and industrial training of the Senussi delegate, writes Sir Reginald Wingate, "revoluted from the slaughter and rapine he saw around him. The sincere conviction of the regeneration of the world by a mahdi whose earnest piety should influence others to follow, to mend the frequent lives, the duty of honest labour and self-restraint, these were the sentiments which filled the mind of the emissary from Wadai."

The sheik Senussi, there is reason to believe, shared the lofty views which Wingate attributes to his agent. He decided to have nothing to do with the Sudanese Mahdi, though Mohammed Ahmed wrote twice asking him to join, saying of his four great khalifas, "none of them died renouncing body." He recognised Senussi either to attack Egypt or to join him in the Sudan. To neither letter did Senussi reply, and he warned the people of Wadai, Bornu and neighbouring states against the new creed. In 1890 the Mahdists advancing from Darfur were stopped on the frontier of Wadai, the sultan Yusef being firm in his adherence to the Senussi teaching. As evidence of the influence of the sheik may be instanced the appeal made to him in 1888 by the sultan of Borku (or Borge), a state to the north of Wadai, when invited by the chiefs of Darfur to rise against the Senussi and renounce the mahdi. Ahmed, the Senussi maker, of the Sudan affairs and only to fight against the Mahdists should they attack his kingdom. The Darfurian revolt of 1888-1889 against the khalifa was nevertheless carried out in the name of the Senussi.

The growing fame of the sheik Senussi el Mahdi drew upon him the unwelcome attention of the Turks. In many parts of Tripoli and in Benghazi the power of the sheik was greater than that of the Ottoman governors, and though Abdul Hamid II. looked favourably on an organization which might become actively anti-Christian, he did not desire that a new mahdi should aspire to dispute his authority. In 1889 the sheik Senussi was visited at Jarabub by the pasha of Benghazi at the head of some troops. This event showed the sheik the possibility of danger and led him (in 1894) to leave Jarabub and fix his headquarters at Jof in the oases of Kufra, a place sufficiently remote to secure him from any chance of sudden attack. By this time a new danger to Senussia had arisen; the French were advancing from the Congo towards the western and southern borders of Wadai. In 1895 Senussi, in his character of peace-maker, wishing also to range together all the states menaced by the Mahdists, sent his son to reconcile Rabah Zohbi (or the Sultan of the Bagirmi) and the sultan of Bagirmi; neither of those chieftains belonged to the Senussi order and the sheik's appeal was unavailing. At the end of the previous year, at the request of Sultan Yusef, the sheik had sent an envoy to Wadai to be his permanent representative in that country. Yusef's successor Ibrahim, who ascended the throne of Wadai in 1898, showed signs of resenting the advice of the sheik, stirred perhaps by the overthrow of the khalifa Abdallah at Omdurman. Senussi retaliated, says Captain Julien in his history of Wadai, by prohibiting the people of Wadai from smoking tobacco or drinking merissa, the native beer, "which is to the Wadai what the skin is to the body." Sultan Ibrahim rejoined that his people would fight and die for merissa; rather than give it up they would renounce Senussism. The sheik had the wisdom to give way, declaring that in response to his prayers Allah had deigned to make an exception in favour of the faithful Wadaiins. Ibrahim died in 1900 and his successors fell again under the influence of the sheik, who again changed his headquarters, leaving Kufra for Geru, in Dar Gorane, a western province of Wadai, where he was welcomed with veneration. He built and strongly fortified a sa'idi on the top of a rocky hill, difficult of access. His object in taking up this position was, presumably, to prevent the advance of the French. But, as Julien points out, Senussi was too late; Rabah had been slain by the French (April 1900), and Bagirmi was occupied by them. Nevertheless the sheik made an effort to prevent the French obtaining possession of Kanem, a country north-east of Lake Chad and on its northern and eastern frontiers bordering Saharan territory, which the Senussites considered their particular preserve. A za'wea was built at Bir Allali, in Kanem, that site being chosen as it was an entrepot for the trade of Tripoli with all the Chad countries. Bir Allali was strongly garrisoned by the Senussites and war with the French followed. After a severe engagement Bir Allali was captured by a French column under Commandant Tétard in January 1902. The sheik Senussi, much affected by the loss of Kanem, died shortly afterwards (May 30, 1902). He was succeeded by his nephew Ahmed-el-Sherif, who in view of the presence of the French on the borders of Dar Gorane removed to Kufra.

The notes chiefly the Senussites maintained the friendly relations of his predeces sor to Wadai, and, following the example of his uncle, made advances to Ali Dinar, the sultan of Darfur, which were not reciprocated. To keep in touch with Darfur a za'wea had been built on the caravan route from Kufra to that country. The adherents of the Senussi el Mahdi in the deserts bordering Egypt maintained for years that he was not dead, and in March 1906 a public declaration was made at Siwa that "Sidi Mohammed-el-Mahdi had returned from his secret journey to Kufra." Commenting on this announcement Sir R. Wingate wrote: "It is well known that the body of the late sheik lies buried in Darfur in a cave which the Senussi claim was made for it at Geru when he died" (Egypt No. 1 (1907), p. 120).

It will be seen that the Senussites occupy desert fastnesses which could only be attacked by Europeans after overcoming great difficulties. By Henri Duveyrier and other writers of the last half of the 19th century they were regarded as likely to proclaim a jihad or holy war against the Christians of North Africa. This view was founded upon the supposed tenets of the order and upon geographical and political considerations. The record of the first and second Senussi sheiks shows them, however, to have acted chiefly on the defensive. A study of all available data up to 1906 led M. L. G. Binger, one of the greatest authorities, to the conclusion that the politics of the sect were subordinated to the material interests of their chief, and that the Senussi sheik was as unable as were other noted Moslem leaders (such as Abd el Kader in Algeria; Samory in the western Sudan and the Dongolese Mahdi in the Egyptian Sudan) to overcome the rivalries and divergence of interests of their own co-religionists. This view received confirmation in the events of 1906-1910 when the French came in conflict with the sultanate of Wadai. Although there was severe fighting the French found it more difficult than had been expected. Without the assistance of Wadai, nor was there any general movement of the Senussites against them. The French also sent flying columns into Borku and Enndi. The comparative ease with which these operations were carried out seemed to demonstrate the weakness of the Senussites (see WADAI). Nevertheless, like any other Moslem fraternity, and perhaps more readily, the Senussites might be speedily transformed into a powerful fighting organization. Through the seaports of Tripoli and Benghazi, with the connivance (or in defiance) of the Turks, the importation of arms and ammunition into the eastern Sahara is a matter of little or no difficulty, and the Bedouin of that region could furnish a numerous and well-armed fighting force. A Senussi sheik would also recruit many followers in the central Sudan. At the same time the Senussi organization is not so widespread in the Sudan and the western Sahara as would appear from the exaggerated reports once current. The Senussi sheiks, with the doubtful exception of Darfur, are without followers in the Anglo-Egyptian Sudan. Bagirmi, Kanem and other states once dependent on Wadai did not embrace Senussism. In the Hausa States and in the greater part of the western Sudan as far as Timbuktu the Moslems acknowledge the spiritual headship of the emir of Sokoto.

1 In the accounts of the fighting in French equatorial Africa at this period it is necessary to distinguish between the sheik Senussi el Mahdi and the sultan Mahmohmed el Senussi (b. c. 1850) of N'Délé, who had married the sister of Rabah Zohbe. Senussi of Wadai having an ally of the French. The centre of N'Délé lies S. of Wadai and is cut by 9° N., and 20° E. (See Karl Kumm in Geog. Jour., Aug. 1910.)
whose influence is believed to be sufficiently strong to prevent the spread of Senussism among his followers. The general attitude of the Mahomedans in the western Sudan towards the Senussi emissaries was described by European observers in 1907 as one of good-natured tolerance. They are occasionally allowed to preach, but apparently with little effect. In Bornu, which does not acknowledge the spiritual supremacy of Sokoto, the Senussi propaganda meets with less opposition, but the adherents of the order are not numerous. Here and there in the western Sahara are tribes professing Senussism, but they are regarded as unimportant.

Teants.

only sporadically meddle in politics, the Senussites have exercised a continuous political influence and have sought to revive the faith and usages of the early days of Islam. The order is in a sense an outcome of the Wahhabite movement, but, as gathered from the writings of Mohammed el Hechaish, a Tunisian sheik, and other trustworthy sources, appears to be neither mystical nor puritan. There is less of secrecy about their rites than is usual in Moslem fraternities. The use of the prayer shawl, or falsa, in the desert, which is encouraged, and the wearing of fine clothes is allowed. While they profess to belong to the Malikite rite (one of the four orthodox sects of Islam), the Senussites are charged by the Ulema of Cairo with many deviations from the true faith; chiefly they are accused of interpreting the Koran and Sunna without consulting one of the recognized glosses. Thus the Egyptian theologians regard the Senussites as inaugurating a new rite rather than forming a simple fraternity; in this, if not in puritanism, resembling the Wahhabites. Their great work in the eastern Sahara, apart from proselytism, has been colonization and the encouragement of trade. Wells have been dug and oases cultivated, rest houses built along caravan routes, merchants from Tripoli, Bornu, Wadai and Darfur welcomed. Such at least is the report of Mahomedan writers and of French and British political agents; very few Europeans have had opportunities of making personal observations. Gustav Nachtigal was in Wadai in 1873, Gerhard Rohlfs traversed the Cyrenaica and visited Kufra in 1879; but in general the Senussi, supported by the Turks at Tripoli, have closed the regions under their control to Europeans. At the oasis of Siwa (Jupiter Ammon), however, they are in contact with the Egyptian administration. Siwa was visited by W. M. Ramsay in 1879 and by Freiherr von Grünau in 1899. The last-named reports that he found the representative of Sheik Senusli living in perfect agreement with the Egyptian authorities, the inhabitants of the oasis being divided into two sections, known respectively as the Mussulmans and the Senusssites, a distinction which goes to show the special position occupied by the Senussites in Islam.

The missionary zeal of the Senussites is undoubted. Outside the regions adjacent to their headquarters they appear to be most strongly represented in Arabia. In the eastern Sahara and Wadai practically all the population are Senussites; the order in other countries draws its adherents from a higher social rank than the generality of Moslem secret societies. Its chief agents are personages of wealth and importance and highly educated in Oriental lore. They are in general on good terms with the rulers of the countries in which they live, as instanced in 1902 by the conferment of the Legion of Honour on the head of the zawiya at Hillil in Algeria. These agents make regular tours to the various zawiya placed under their charge, and expend the Senussi doctrines at the Moslem universities. From all that has been said it is apparent that the Senussi sheik controls a very powerful organization, an organization probably unique in the Moslem world.

BIBLIOGRAPHY.—L. Rinn, Marabouts et Khouan, a good historical account up to the year 1884; O. Deport and X. Coppolani, Les Confréries religieuses musulmanes (Algiers, 1897), an authoritative work; Si Mohammed el Hechaish, "Chez les Senoussia et les Touasreg," L'Expansion col. française for 1900 and the Revue de Paris for 1901. These are translations from the Arabic of an educated Mahomedan who visited the chief Senussite centres. An obituary

notice of Senussi el Mahdi by the same writer appeared in the Arabic journal El Hadira of Tunis, Sept. 2, 1902; a condensation of this article appears in the Bull. du Com. de l'Afr. franc. for 1902; in April supplement of the same volume; is a judicious summary of evidence and important bibliography being added; Capt. Julien, in "Le Dar Ouaidi" published in the same Bulletin (vol. for 1901), traces the connexion between the Scud (modern Sudan and Egypt), G. Leclerc, quoted by A. S. White, From Spheni to Oracle (London, 1898), which, while repeating the extreme views of Duveyrier, contains useful information.

The present writer, in endeavouring to arrive at a just conclusion on an obscure and much controverted subject, is indebted, in addition to the above, to the article by D. A. Cameron in the 10th ed. of this encyclopedia, and to communications from Prof. D. B. Macdonald, F.R.G.S.

SENOI, a town and district of British India, in the Jubbulpur division of the Central Provinces. The town is 204 ft. above sea-level, half-way on the road between Nagpur and Jubbulpore. Pop. (1901) 11,864. It was founded in 1774, and contains large public gardens, a fine market place and a handsome tank.

The District of Seoni forms part of the Satpura tableland, containing the headwaters of the Wainganga. It is largely covered with forest, and 49% of the inhabitants belong to aboriginal tribes. Area 3206 sq. m. The district is remarkable for the beauty of its scenery and the fertility of its valleys. The northern and western portions include the plateaus of Lakhnadon and Seoni; the eastern section consists of the watershed and elevated basin of the Waingangas; and in the south-west is a narrow strip of rocky land known as Dongartal. The plateaus of Seoni and Lakhnadon vary in height from 1800 to 2000 ft.; they are well cultivated and clear of jungle, and their temperature is always moderate and healthy. Geologically the north part of Seoni consists of trap hills and the south of crystalline rock. The soil of the plateaus is the rich black cotton soil formed by disintegrated trap, of which about two-thirds of the district are said to consist; but towards the south, where cliffs of gneiss and other primitive formations occur, the soil is silicious and consists of black and red sandstone. The chief river is the Wainganga, with its affluent the Hir, the Thamor and Thaawar; other streams are the Timar and the Sher, tributaries of the Nerbuda. The annual rainfall averages 53 in. The population in 1901 was 327,709, showing a decrease of 12% in the decade due to the effects of famine. The principal crops are wheat, millets, rice, pulse, oil-seeds and cotton. Three lines of the Bengal-Nagpur system traverse the district.

There is also a town called Seoni, or Seoni-Malwa, in the Central Provinces, a railway station in Hoshangabad district. Pop. (1901) 7531.

SEUL (Han-yang), the capital of Korea (Chosen), situated in 37° 34' N. and 127° 6' E., at an altitude of 120 ft., 25 m. from Chemulpo, its seaport, and 4 from Mapu, its river-port. Pop. about 200,000. It lies in a basin among granite hills, nowhere exceeding 2627 ft., remarkable for their denudation and their abrupt black crags and pinnacles. A well-built, crenelated stone wall from 20 to 50 ft. high, about 11 m. in circuit, and pierced by 8 gateways with double-roofed gate-towers, surrounds it. The native houses are built of stone or mud, deeply eaved, and either tiled or thatched. Above these rise the towers of the Roman Catholic cathedral, the high spires of the Buddhist temple, the numerous audience halls, the palace gateways, and the showy buildings of the Russian and French legations. The antiquities are the Bell Tower, with a huge bronze bell dated 1468, a marble pagoda elaborately carved, but not of Korean workmanship, seven centuries old, and a "Turtle-Stone" of about the same date.
SEPIA—SEPSIS

Seoul has some wide streets of shops, hundreds of narrow alleys, and is very fairly clean. It has an electric tramway 4 m. long, and the terminus of the railway system of the country.

SEPIA (Gr. σπεία, cuttlefish), a deep brown pigment obtained from the ink-sacs of various species of cuttlefish (q.v.). To obtain sepia the ink-sac, immediately on the capture of the animal, is extracted from the body and speedily dried to prevent putrefaction. The contents are subsequently powdered, dissolved in caustic alkali, and precipitated from the solution by neutralizing with acid. The precipitate after washing with water is ready to make up into any form required for use. Sepia-bone or cuttle-bone consists of the internal "shell" or scent box, which, after it is removed from the animal, is dried and calcined. It is an oblong convex structure from 4 to 10 in. in length and 1 to 3 in. in greatest width, consisting internally of a highly porous cellular mass of calcium carbonate, with some animal matters covered by a hard thin glasy layer. It is used principally as a polishing material and for tooth powder, and also as a moulding material for fine castings in precious metals.

SEPPOY, the usual English spelling of sipãhî, the Persian and Urdu term for a soldier of any kind, cp. siphã. The word sipãhî, "army," from which sipãhî, "soldier," is derived, corresponds to the Zend špâdhâ, Old Persian špâdê, and has also found a home in many other Indian and Persian languages. (see Justi, Handbuch der Zendsprache, p. 303, 6), while its derivative is used in all Indian vernaculars, including Tamil and Burmese, to denote a native soldier, in contradistinction to gârã, "a fair-complexioned (European) soldier." A sepoy is at the present day strictly a private soldier in the native infantry of the Indian army.

SEPPINGS, SIR ROBERT (1767–1840). English naval architect, was born at Fakenham, Norfolk, in 1767, and in 1782 was apprenticed in Plymouth dockyard. In 1800, when he had risen to be master shipwright assistant in the yard, he invented a device which, combined with the laborious process of lifting then in vogue, greatly reduced the time required for effecting repairs to the lower portions of ships in dry dock. His plan was to make the keel of the ship rest upon a series of supports placed on the floor of the dock and each consisting of three parts—two being wedges arranged one on each side of the keel at right angles to it, with their thin ends together, while the third was a vertical wedge fitting in and supported by the lower pair. The result was that it became possible in a comparatively short time to remove these supporting structures by knocking out the side wedges, and at the same time gaining access to the lower part of the keel, the vessel remaining suspended by the shores. For this invention Seppings received £1000 from the Admiralty, and in 1804 was promoted to be a master shipwright at Chatham. There, in spite of the repugnance to innovation displayed by the naval authorities of that period, he was able to introduce important improvements in the methods of ship-construction. In particular he increased the longitudinal strength of the vessels by a system of diagonal bracing, and modified the design of the bows and stern, so that they became stronger, not only offering better protection than the old forms to the crews against the enemy's fire, but also permitting a powerful armament to be fitted. Seppings, who received a knighthood in 1819, was appointed surveyor of the navy in 1831, and held that office till his retirement in 1832. He died at Taунton on the 25th of September 1840.

SEPSIS (Gr. σφην, putrefaction), or SEPTIC INFECTION, a term applied in medicine and surgery to indicate the resultant infection of a wound or sore by micro-organisms or by their products. Under this general heading come three great constitutional diseases, differing radically from each other in their etiology and pathology: septicaemia, septicemia and pyæemia.

Sapraemia (Gr. σπαρέω, rotten, αἷμα, blood), or septic intoxication, is the result of the absorption of a dose of the toxins produced by micro-organisms from some area of infection without the entrance of the micro-organisms themselves into the blood. This condition was for a long time confounded with septicaemia, but is distinguished from it in being a chemical intoxication. The blood in sapraemia if injected into an animal is incapable of reproducing the disease as in septicemia. Any condition in which there is a mass of decomposing tissue in the neighbourhood of any mechanical injury may give rise to sapraemia. In surgical practice it may be met with in large, deep and badly-drained wounds where a quantity of putrifying material is pent up. When it arises in connexion with wounds accidentally received, it may be unavoidably due to the dirty state of the skin or to foreign bodies entering the wound. Absorption of toxins is notably frequent in portions of decomposing placental tissue which may accidentally have remained behind in the uterus after childbirth, and may give rise to puerperal sapraemia. Sapraemia is acute or subacute directly according to the amount of decomposition which occurs. Its symptoms are:

1. Hectic fever is a chronic blood poisoning with continual absorption of small doses of the toxins. This variety usually arises in long-continued suppuration of bones and joints, and in decomposition occurring in a pulmonary cavity. The marked symptom is a sharp rise of temperature in the evenings; the face becomes flushed and the pulse rapid. After profuse sweating the temperature drops. Diarrhoea and wasting are a usual accompaniment.

2. Septic traumatic fever is a slight form which may follow burns or compound fractures and which terminates in septicemia. (Fulhrois, memoirs, J. Acad. Sci. Sc.)

3. Acute septic infection large amounts of the poison are absorbed suddenly in the system with a severe rigor followed by a continuous high temperature, dry tongue, rapid pulse and severe headache, together with nausea and vomiting, and in the later stages diarrhoea. If the case be a severe one rapid prostration speedily comes on with low muttering delirium, the temperature may fall to subnormal, and a gradually deepening coma may end in death; other cases pass into a typically "typhoid state," death occurring from exhaustion at the end of about a week.

4. Amyloid (Gr. ἀμύλω, starch, ἐφο, form), or lardaceous disease, usually of the liver, spleen, kidneys or other organs, is one of the results of long-continued septic intoxication. A substance derived from the breaking down of pus and tissue cells is carried in the blood and deposited in the connective tissue of the coats of the smaller arteries, and the viscera become infiltrated with a material looking like lard. The liver and spleen, being the organs most usually affected, become immensely enlarged.

No form of septic infection yields so easily to treatment as sapraemia. The prompt removal of the cause of septic absorption, the flushing out of the wound with weak antiseptic solutions, the institution of certain mechanical means of keeping the wound free from dirt, the establishment of proper drainage in deep wounds, is usually followed by a fall in temperature and an improvement in the general condition. A strong, preferably mercurial, purgative should be given to aid in the elimination of toxic material. For the same purpose the injection into the veins or into the cellular tissue of large quantities of normal saline solution is useful. For heart depression should be overcome by diffuse stimulants and hypodermic injections of strychnine. When the wound has become "surgically clean" recovery is usually rapid.

Septicaemia is an acute infective disease differing from sapraemia in that the micro-organisms themselves are absorbed, entering the general circulation, and may on examination be found in greater or lesser number in the blood-stream itself. The organism or organisms grow and reproduce themselves in the blood or tissues. A number of different organisms have been isolated from the blood-stream in cases of septicemia. The most frequently found is the Streptococcus pyogenes, which is present in 50% of the cases and is common in puerperal septicemia and in ulcerative endocarditis. The Staphylococcus pyogenes aureus et albus is also a frequent cause, but sometimes septicemia may be due to other pathogenic microbes such as the Pneumococcus, the Bacillus coli communis, Bacillus pyocyaneus, Bacillus oedematis maligni and the Gonococcus. The micro-organisms are conveyed by the blood-stream to different parts of the body, in which as in the original wound itself they both multiply and set up factories for the production of toxins. The disease commonly follows blows or wounds which have
not been treated on surgical lines. Much laceration of the tissues at the time of the injury offers increased liability to infection. Septicaemia is frequent in spreading gangrene, in diseases of the periostium, and in fevers such as scarlatina, diphtheria or plague, and in the puerperal state. The period of incubation may be from a few hours to several days. The condition of the wound or site of injury shows marked changes. In severe cases following a prick received in conducting a post-mortem the finger in a few hours becomes greatly swollen and painful, the pain spreading up the lymphatic vessels to the nearest lymphatic glands, which may become enlarged and tender. Vaccination of the skin with carbolic acid may have been resorted to, and constitutional treatment must be undertaken at once. Should the infection be due to a Streptococcus, an antistreptococcic serum may be injected. There are, however, many strains of Streptococci, and a polyvalent serum may give good results. Menzer's antistreptococcic serum has been successful in puerperal septicaemia not of gonococcal origin. Many cases have also now been recorded in which the systemic infection is combated by means of an autogenous vaccine. The first case was described by Sir James Barr before the Liverpool Medical Institute in May 1893. In urgent cases, a vaccine manufactured by a vaccine, quinine in large doses, stimulants and liquid nourishment must be given, and the temperature controlled by tepid sponging.

Pyæmia (Gr. πυεω, pus, αίμα, blood), which got its name from an erroneous idea that the pus passed into the blood, is now understood to mean an acute disease with the formation of metastatic abscesses. The first definite account of the disease was published by Boerhaave in 1720. Virchow in 1846 pointed out that it was not pus in the veins, but altered blood-clot. Jean D'Arct showed the separate processes of poisoning by products of decomposition and the blocking of the veins with emboli. Any pyogenic organism may give rise to pyæmia, or it may follow any acute abscess. The cause of pyæmia may be said to be any condition favouring the formation of emboli. An occasional cause of pyæmia is infective endocarditis, while puerperal pyæmia may arise from infection of the genital tract. When the emboli lodge in the lung there is a breaking down of the tissue in front of the embolus, a haemorrhagic infarct being formed. The clinical symptoms of acute pyæmia generally start with a rigor repeated at periodic intervals; the skin becomes hot and the patient develops a rash. The pulse becomes frequent and weak and the tongue dry. In about a week secondary abscesses appear, most frequently in the region of joints. There may be little or no pain to herald the formation of an abscess, but usually there is intense pain followed by suppuration. Unless early treatment is undertaken the joint may be rapidly destroyed. In acute cases multiple abscesses in the kidney may give rise to pain and albuminuria, abscesses in the lungs to dyspæna, while acute peritonitis may arise from rupture of a splenic abscess into the peritoneal cavity, and sudden blindness be the result of the plugging of the arteria centralis retinae. The duration of a case of pyæmia depends on the severity of the infection. Death may occur from the formation of abscesses in vital organs such as the brain and heart, or from exhaustion from continued suppuration, or chronic forms may after months pass on to complete recovery. Unfortunately pyæmia cannot be recognized apart from other blood infections until abscesses begin to form. The local treatment is to endeavour to prevent the detachment of infected emboli and the infection of the general blood-stream thereby. An infected limb may be dealt with by amputation above the seat of the lesion, or it may be feasible to dissect out the infected veins. When abscesses have formed they must be dealt with by opening and washing out the cavities. Antistreptococcic serum may be tried, as in septicaemia; and if there be time to prepare a vaccine it offers the best prospects, more particularly in the subacute and chronic forms of pyæmia. The usual administration of nourishing diet and stimulants when required should be undertaken, and every effort made to keep up the patient's strength.

SEPT, a clan, the term generally applied to the tribes or families of Ireland, used also sometimes as by Sir H. Maine (Early History of Institutions, 1931) of the Indian joint undivided family, the "combined descendants of an ancestor long since dead.

Woodward (Dict. of Eng. Bym.), quoted by Skeat, takes the word as a corruption of "sect" (q.v.), and cites from the State Papers of 1546 and 1537, where secel and septe are used respectively. If so, the word must have been influenced by Lat. sectum, fence or enclosure (saepere, to enclose, saepes, hedge), a word which has been adopted as "septum" into scientific terminology for any partition or wall dividing two cavities—e.g. in anatomy, of the partition between the nostrils, septum nasis, or that between the right and left ventricles of the heart, septum cordis.

SEPTEMBER (Lat. septem, seven), the seventh month of the old Roman year, in which it had thirty days assigned to it. In the Julian calendar, while retaining its former name and number of days, it became the ninth month. The Ludi Magni (Ludi Romani) in honour of Jupiter, Juno and Minerva began on the 4th of September. The principal ecclesiastical feasts falling within the month are: The Nativity of the Blessed Virgin on the 8th, the Exaltation of the Holy Cross on the 14th, St Matthew the apostle on the 21st, and St Michael the archangel on the 29th. September was called "harvest month" in Charlemagne's calendar, and it corresponds partly to the Fructidor and partly to the Vendémiaire of the first French republic. The Anglo-Saxons called the month G unston, barley month, that crop being then usually harvested. It is still called Herbstonal, harvest month, in Switzerland.

SEPTUAGINT, THE (Gr. Σεπταυαγί, Lat. LXX.), or the "Alexanderian version of the Old Testament," so named from the legend of its composition by seventy (Septuaginta), or more exactly seventy-two, translators. In the Letter of Aristeas to Philocrates 1 this legend is recounted as follows: Demetrius of Phalerum, keeper of the Alexandrian library, proposed to King Ptolemy II. Philadelphia (285–247 B.C.) to have a Greek translation of the Jewish law made for the library. The king consented and, after releasing 100,000 Jewish captives in his kingdom, sent an embassy with rich presents to the high priest Eleazar at Jerusalem and asking him to send six ancient, worthy and learned men from each of the twelve tribes to translate the law for him at Alexandria. Eleazar readily sent the seventy-two men with a precious

1 Edited by H. St. J. Thackera in H. B. Swete's Introd. to the Old Testament in Greek (1900), and by P. Wendland in the Teubner series (1900).
roll of the law. They were honourably received at the court of Alexandria and conducted to the island (Pharos), that they might work undisturbed and isolated. When they had come to an agreement upon a section Demetrius wrote down their version; the whole translation was finished in seventy-two days. The Jewish community of Alexandria was allowed to have a copy, and accepted the version officially; indeed a curse was laid upon the introduction of any changes in it.

There is no question that this Letter (which is condensed in Josephus, Ant. vi. 9, 3) and is accompanied by a spurious statement of Philo's, is not genuine. It having been a decree of the Alexandrian court, is represented as a heathen, but the real writer must have been a Jew and no heathen. Aristeaes is represented as himself a member of the embassy to Eleazar; but the author of the Letter cannot have been a contemporary of the events he records, else he would have known that Demetrius fell out of favour at the very beginning of the reign of Philadelphia, on a charge of intriguing against his succession to the throne. Nor could a genuine honest witness have fallen into the absurd mistake of making delegates from Jerusalem the authors of the Alexandrian version. There are also one or two authors (§§ 28, 182) where the author seems to forget that he is playing the rôle of Aristeaes. The forgery, however, seems to be an early one. "There is not a court-title, an institution, a law, a magistracy, an office, a technical term, a formula, a peculiar phrase in this letter which is not found on papyri or inscriptions and confirmed by them." That in itself would not necessarily imply a very early date for the piece; but what is decisive is that the author limits canonicity to the law and knows of no other holy book already translated into Greek. Nor does he claim any inspiration for the translators. Further, what he tells about Judea and Jerusalem is throughout applicable to the period when the Ptolemy bore sway there and gives not the slightest suggestion of the immense changes that followed the conquest of Palestine by the Seleucids. It is probable that the Jewish philosopher Aristobulus, who lived under Ptolemy VI. Philometer (180-145 B.C.), derived his account of the origin of the LXX. from this Letter, with which it corresponds. There seems good ground for believing that the letter contains some elements derived from actual tradition as to the origin of the LXX. Ptolemy Philadelphus was a king of eclectic literary tastes, and the welcome he gave to a Buddhist mission from India might well have been extended to Jews from Palestine. The letter lays great stress on the point that the LXX. is the official and authoritative Bible of the Hellenistic Jews, having not only been formally accepted by the synagogue at Alexandria, but authorized by the authorities at Jerusalem. This, and the fact that the style of the version is not that of a book intended for literary use, points to the conclusion that the translation was made to satisfy the religious needs of the Jews in Alexandria, and possibly also in the hope of gaining proserlesy. In view of the Jewish prejudice against writing Scripture in any but the old holy form (the Targum, for instance, was for centuries handed down orally), it is quite possible that some impulse to the Alexandrian version came from without. Philadelphia may have encouraged it both to satisfy his own curiosity and to promote the use of Greek among the large Jewish population of the city. That the work is purely Jewish in character is evident from the fact that its claims were demolished by Humphry Hody, Regius Professor of Greek at Oxford, in 1684. H. Junker, in his Untersuchungen über die Bibliothek und ihren Einfluss auf die Geschichte der Beschreibung der Schriften, v. 2, 1825, has apparently not been aware of this fact.

1 Its claims were demolished by Humphry Hody, Regius Professor of Greek at Oxford, in 1684.
2 P. Wendland, however, puts it after the Maccabean age (say 96 B.C.) and before the Roman invasion of Palestine (63 B.C.).
3 J. G. Lumbruno, Recherches sur l'École de la Législation, p. 18 (Turin, 1790).
4 The exact text is partly in reference, ed. Syr.; Eusebius, Prae. Ev. ix. 6, p. 410 seq.; cf. Valckenau's, Die Einleitung, 1860, reprinted in G所谓's edition of the Prae. Ev. One must not overlook the possibility that Aristobulus intended much of his translation as a mere literary exercise. Indeed, some of the other knowledge of the Greek authors and the use of the Greek Bible.
5 It is quite likely that they worked on rolls newly brought from Jerusalem. There was no desire to found an Alexandrian canon or type of text.
6 Philo does not necessarily mean that the whole of the section of the Hebrew Old Testament known as "The Writings" was translated by that date.
7 Philo seems to have known the Greek version of most of the Old Testament except Esther, Ecclesiastes, Canticles and Daniel.
others, especially in syntax, it is strongly tinged with Hebraisms, and there are many passages where it is difficult, if not impossible, to establish the identity of the original text. The LXX is divided into two hands: thus Jeremiah i.-xxviii. was not translated by the worker that undertook ch. xxxix.-li. (the former is indifferently, the latter unintelligible Greek), and in Ezekiel one hand is responsible for ch. i.-xxvii., the other for ch. xxviii.-xxxvi. (see 2 Kings 23:33). So 1 Kings stands apart from 2-4 Kings. Isaiah is more akin to classical Greek; like the Pentateuch and 1 Maccabees it is good, but not representative of the whole. The New Testament again varies considerably. A (with which the quotations in the New Testament are often compared) is the oldest (then known as the edition of Hesychius; B, which is often, especially in the Psalms, in accord with the Bohairic version, resembles the text used by Origen, in the latter part of the 3rd century; C (or Alexandrian), the Sahidic (Upper Egypt), the various Syriac translations (unfortunately we have no Old Syriac for the Old Testament), and the Latin (Old Vulgate and Vulgate, especially the former) are the most important. The evidence shows that Greek manuscripts are often responsible for distinguishing local types of text. The testimony of the earliest patristic quotations seems to be in favour of A rather than B. The immediate surest test of a text is comparison of the three main editions, i.e., of Origen, Lucian and Hesychius, and then of the three columns of the LXX text, which lies behind them all. When this has been accomplished there still remains the problem of the relation of the LXX to the Hebrew. In the case of the LXX, translators often diverged from that represented by the Massoretic. For the Pentateuch we have additional material in the Septuagint version, but here the variants are least. In view of the palpable mistakes made by the Septuagint translators and their often inadequate knowledge of Hebrew, we must not hastily assume that in cases of difference the Greek is to be preferred. The book of Ecclesiastues (the Hebrew of which has recently been discovered) furnishes a useful lesson here. Yet there is no doubt that much (e.g., in 1 Samuel) may be learned from the Septuagint; one can say that each case must be treated on its merits.

The LXX is the Greek translation of the Old Testament, first published in Alexandria in 1514-1517, but before it was published in 1521 Aldus published another edition in 1519. The Textus Receptus issued by Poyntz and Vellum (1519) was based mainly on Cod. Vaticanus (A), one of the most important manuscripts, and on Cod. Alexandrinus (B) with some collection from the Vetus Latina. Cod. Alexandrinus is the basis of the great work of R. Holmes and J. Parsons (Oxford, 1799-1827), who furnished the Sixtine text with an apparatus (not always accurate) of the known Hebrew and Septuagint readings (without the Massores, in addition to versions. In 1797-1720 Grabe had published a concordance based on Cod. Alexandrinus (A). C. Tischendorf's text (1850; 7th ed., 1887) was a revision of that of Holmes and Parsons with an apparatus drawn from the chief modern manuscripts. H. B. Swete's edition in 3 vols. (1897-1899: revised 1895-1899) gives the text of B, and, where this fails, that of A or X, with variant readings from the chief modern manuscripts. A Cambridge edition, begun in 1906 by A. E. Brooke and N. M. Locke, including a separate study of each book, with apparatus including all the uncials, the best and most representative minuscules, and the chief versions and patristic quotations.

LITERATURE.—H. B. Swete, Introductions to the Old Testament in Greek (1900); E. Nestle, Septuaginta-Studien (1886-1902); F. G. Kenyon, Our Bible and the Ancient MSS., pp. 48-92 (1898); A. Rahlfis, Septuaginta-Studien (1904; Kings; 1907; Psalms); E. Hacht and H. H. Redpath, A Concordance to the Septuagint (Oxford, 1897-1906); H. J. Thackeray, A Grammar of the Old Testament in Greek, vol. 1. (Cambridge, 1929), containing a useful Septuagint index; T. Ry. E. Conybeare and St G. Stock, Selections from the Septuagint (Boston and London, 1889); Samuel Blumenkranz' Bible-dictionaries, and other works mentioned in the course of this article.

SEPULCHRE, CANONS REGULAR OF THE HOLY, an order of men to have been founded in 1114 (or, according to other accounts, during the rule of Godfrey of Bouillon in Jerusalem) on the rule of St Augustine. Pope Celestine III., in 1143, recognized the Canons and Canons of the Holy Sepulchre in all their possessions, and enumerates several churches both in the Holy Land and in Italy belonging to the Canons. According to Jacques de Vitry, the canons served the churches on Mount Sion and Mount Olivet in addition to that of the Holy Sepulchre. The canons survived in Europe till the French Revolution. In Italy they seem to have been suppressed by Innocent VIII. in 1489, and their property given to the Knights of St John. The canons are now independent. Canons of the Holy Sepulchre are still to be found in various countries of Western Europe.

SEPULCHRE, EASTER, in church architecture an arched recess, generally in the north wall of the chancel, in which from Good Friday to Easter day were deposited the crucifix and sacred elements in commemoration of Christ’s entombment and resurrection. It was generally only a wooden erection, which was placed in a recess or on a tomb. There are throughout England many fine examples in stone, some of which belong to the Decorated period, such as at Navenby and Heckington (1370) in Lincolnshire, Sibthorpe and Hawton (1370) in Nottinghamshire, Patrington in Yorkshire, Bampton in Oxfordshire, Holcombe Burnell in Devonshire, and Long Itchington and other churches in Warwickshire.
SEPUCHRE, THE HOLY, the tomb in which, after His crucifixion, the body of Jesus Christ was laid. Although the facts of the crucifixion and of the interment of the body of Christ in the tomb of Joseph of Arimathea are related in the New Testament with considerable detail, sufficient indications are not supplied to locate the actual position of the tomb with reference to the city of Jerusalem. It would appear that Golgotha, the place of crucifixion, was outside the city, near a public thoroughfare leading to one of the gates, and visible from some distance. There is, however, no reason for supposing that it was a hill, and the expression "Mount Golgotha" was not used until some centuries later. Adjoining the place Golgotha was a garden, in which was a new rock-cut tomb, the property of Joseph of Arimathea. Rock-cut tombs were common in the vicinity of Jerusalem, as, in consequence of the geological formation, the faces of the hills are frequently broken by low cliffs with terraces between. The comparatively level terraces were used for cultivation while the tombs were excavated in the rock faces. Many instances of tombs so situated can be seen on the hillsides near Jerusalem, and it is not unreasonable to suppose that the tomb of Joseph was of a similar character. As it was outside the city, the question of the validity of the traditional site, upon which the church of the Holy Sepulchre now stands, necessarily depends, to a great extent, upon whether this place was within or without the walls at the date of the crucifixion. At that time, it is clear, judging from the careful description written by Josephus a few years later, that Jerusalem was defended by two walls, as the third wall was not begun by King Herod Agrippa until A.D. 41. Of these, the first, or old wall, ran from the palace of Herod the Great, which was situated at the N.W. corner of the city, and, following an easterly direction, crossed the Tyropoeon Valley and terminated at the west wall of the Temple enclosure. On the other hand, going south from Herod's palace, it encircled the city on the west and south, and then turning at Siloam it followed the direction of the Kidron Valley and ended at the east wall of the Temple enclosure.

The second wall, which was built at some period between the return of the Jews from Babylon and the reign of Herod the Great, was on the north, and in front of the old wall. According to Josephus, it started "from the Gate Genath in the first wall, and, enclosing only the northern quarter of the city, went up to the Fortress of Antonia." The site of the Antonia, which was situated on the rising ground north of the Temple, is known with tolerable certainty, but the position of the Gate Genath has not been fixed, and, as no certain traces of the second wall have hitherto been found, the line it followed is purely a matter of conjecture. Various theories on the subject are maintained by different authorities. Some of these are indicated on the plan. One suggestion is that the second wall started from a point in the first wall near the palace of Herod, and that some remains of an old wall, situated at the point A, formed part of it. The wall is then supposed to have been carried in a direction slightly west of north, up to the line of the existing city wall, to have followed this line to the Damascus gate, and then turned south-east to the Antonia. If this theory were correct, it is clear that the traditional site of the Holy Sepulchre would be impossible, as it would be some way within the city wall. The arguments against the proposal are, that, according to the account of the siege of Jerusalem given by Josephus, it is improbable that the second wall started from a point so near to Herod's palace, that the line of the present city wall is more likely to be that of the third wall; and that Josephus says that the second wall was not "up to" and not "down to" the fortress of Antonia. Another theory is that the Gate Genath was at a point marked B on plan, and that some ancient masonry which lies east of the so-called Pool of Hezekiah, and over which the houses on the west side of Christian Street are built, represents a portion of the second wall. The wall is then supposed to have been carried north to the point C, and either to have turned east to D, and again north to F, and from this to the Antonia; or to have continued north to E, and thence east to the Antonia. The first supposition excludes the site of the Holy Sepulchre, while the second includes it within the wall. A third theory is that the Gate Genath was at the point G, and that the second wall ran north to F, and thence to the Antonia. This proposal places the site of the Holy Sepulchre outside the wall, but it makes the part of the city protected by the latter smaller than is probable. Speaking generally, it may be stated that there is no certain evidence as to the line followed by the second wall, and it is impossible to say whether the traditional site lies inside or outside this wall. From the description in the Gospels of the burial of Jesus, it is not clear whether the tomb of Joseph was intended to be the final resting-place, or whether the body was only placed in it temporarily because the feast of the Passover was at hand and the disciples intended to remove it to some other place after the Passover. But whatever may have been proposed, the Resurrection of Jesus Christ on the first day of the week, leaving the tomb empty, turned the attention of the disciples from the sepulchre to the living presence of their Master. After He had risen from the dead, the place of His burial does not appear to have had any attraction for His followers, and there is nothing in the writings of the first three centuries to lead us to suppose that the actual rock-cut tomb was regarded by any special feelings of veneration. Whether even a recollection of the site was preserved traditionally is doubtful. There have been many who consider that the early Christians could not have forgotten the exact locality of so important a place; on the contrary, others maintain that to the followers of Jesus Christ it was the fact of the Resurrection that was important and not the empty tomb; and that knowledge of the latter was lost during the vicissitudes from which Jerusalem suffered in the years succeeding the crucifixion. About forty years after the crucifixion, the great revolt of the Jewish people against the Romans took place, and ended with the siege and capture of Jerusalem by Titus. Prior to the siege, the Christians, following the orders of their Master,
had retired to the city of Pella, east of Jordan, and the date of their return to Jerusalem is uncertain. Whether any of the disciples returned after the triumph of the Romans and recognized the tomb of Christ is matter of conjecture.

Among the temples built by Hadrian about A.D. 135 was one dedicated to Aphrodite or Venus; it was erected at that place where the church of the Holy Sepulchre now stands, but it is impossible to say whether it was purposely so placed because it was the site of the tomb of the Lord, or whether the selection of this position was accidental. The extent of the walls of Aelia Capitolina is not known with any certainty, but it is probable that the northern wall followed the same line as the present north wall of Jerusalem, and therefore that the site of the temple of Aphrodite was then within the walls. Although it is doubtful whether the Christians returned to Jerusalem immediately after the destruction of the city by Titus, they were certainly there when Hadrian built Aelia Capitolina; according to Epiphanius, they had a small place of worship on Sion at the place where Jesus Christ ate the Last Supper. Eusebius also states that the Christians worshipped at the Mount of Olives where Jesus instructed His disciples, but no writer up to the time of Constantine speaks of the tomb, or of worship being performed there.

Constantine the Great became emperor of Rome in A.D. 306, and was converted to Christianity six years afterwards. Embracing his new religion with enthusiasm he attributed his victories to the power of the Divine Cross, which was placed on the ensigns of the army. After the great council of the Church had been held at Nicaea in A.D. 325, the emperor decided to find the sites of the crucifixion and resurrection at Jerusalem, and to build a church at this place. Full descriptions of the discovery of the Holy Sepulchre and of the churches that were built are given by Eusebius in his Life of Constantine, but it is difficult to say from his account if the main object of Constantine was to find the sepulchre of the Lord or the cross upon which He suffered. Eusebius does not mention the cross directly and lays more stress on the recovery of the sepulchre; whereas later writers imply that the great wish of the emperor and of his mother Helen, who visited Jerusalem for the purpose, was to find the Holy Cross. The task of searching for the tomb and the cross was entrusted to Bishop Macarius. Whether the bishop was guided in his selection of the site by tradition or not is difficult to say, but he decided that the desired place was under Hadrian’s temple of Aphrodisite. By imperial order the temple was removed, and a rock-cut Jewish tomb, which lay below, was identified as the sepulchre of the Lord.

In another cavity in the rock, 280 ft. to the east, three crosses were discovered, which were assumed to be the crosses upon which Jesus Christ and the two thieves were crucified, the cross of Jesus being identified by its power of healing the sick. Immediately on the receipt of the intelligence of this remarkable discovery, the emperor wrote to Macarius, ordering the erection of magnificent buildings on the site. Two churches were built, one over the tomb, and the second, which was larger and grander, over the place where the crosses had been found. Between the two churches was a small hill, which was identified as Mount Golgotha. The ground surrounding the two churches was levelled and surrounded with porticoes or colonnades. The description of the buildings as detailed by Eusebius is rather obscure, but fortunately there still exist, in the church of Santa Pudenziana at Rome, a mosaic, supposed to have been originally executed in the 4th or 5th century, which shows the buildings clearly. The church of the Anastasis or Holy Sepulchre is herein delineated as a round church with a domed roof; the church of the Martyron or Holy Cross, as a polygonal building, also with a domed roof; while between the two churches is Mount Golgotha, with the cross erected upon it. In another ancient mosaic, which still exists in a church of Madeba, east of the Jordan, a map of Palestine is represented which contains a rough plan of the walls and gates of Jerusalem. In this plan, also, it is possible to recognize the churches built by Constantine. The Bordeaux pilgrim who visited Jerusalem about A.D. 333, when the church of the Holy Sepulchre was in course of construction, describes the place, which was evidently the same as that on which the existing church of the Holy Sepulchre stands. There can, therefore, be no reasonable doubt that the present site is that which was fixed upon by Bishop Macarius in the time of Constantine.

The churches were completed about A.D. 336, and were doubtless visited by numbers of pilgrims. Among these a lady from the west of Europe, who is supposed to have been St. Sylvia of Aquitania and who came to Jerusalem about A.D. 385, fortunately kept a diary of her travels, and she identifies very distinctly the great church of the Cross, the church of the Holy Sepulchre, and Mount Calvary between them. In A.D. 614 the church of the Holy Sepulchre was captured by the Persians, who did considerable damage to the churches, but they were repaired by Modestus after the defeat of the Persians by the emperor Heraclius. The caliph Omar, who captured the city in 636, behaved with leniency to the Christians, and left them in undisputed possession of the church of the Holy Sepulchre.

In 1010 the third Fatimite caliph Hakim practically destroyed it. It is remarkable that from the beginning of the 8th century, while the church of the Holy Sepulchre is always mentioned in the accounts written by visitors to Jerusalem, the church of the Anastasis or Holy Cross seems to have ceased to exist, although the place where the crosses were found was shown to pilgrims and a church was built on Mount Calvary. After the capture of Jerusalem by the Crusaders in A.D. 1099, the church of the Holy Sepulchre was repaired and enlarged by the addition of a nave and chancel, and other churches were erected, so that the Holy Sepulchre became the centre of a group of ecclesiastical buildings and has so remained up to the present time.

The Authenticity of the Traditional Site.—From early times doubts have arisen as to whether the tomb discovered by Bishop Macarius was the veritable sepulchre. As early as 754, when the pilgrim Wilfrid visited Jerusalem, he remarked, in describing the Holy Places, that “Calvary was formerly outside the city, but that the Empress arranged that place so that it should be within the city Jerusalem.” Saewulf in 1102, Wilbrand of Oldenburg in 1211, Jacques de Vitry in 1226, and Burchard of Mount Sion in 1283, had evidently some doubts about the site, and explained the difficulty by suggesting that Hadrian had enclosed it within the walls but that it was outside before he rebuilt the city. Jacques le Sais in 1518, Grotzer in 1538, and F. Quaresmius in 1639, also alluded to the difficulty felt by some of the civilians in the traditional site. Monconnys in 1647 stated that Calvary was removed out of Jerusalem, but was now in the centre of the city, which was smaller than at the time of the crucifixion. In 1738 Jonas Korte of Altona visited Jerusalem and published a book on his travels, in which he expressed the view that the Calvary shown to visitors could not be the true Calvary because it was in the middle of the town. He placed the true site to the west of Jerusalem, near the Birket Mamilla which lies ¾ m. west of the Jaffa gate. This view was supported by J. F. Plessing in 1780. Dr. E. Clarke in 1812 came to the conclusion that Calvary was outside the Sion gate, while Dr. E. Robinson, who published his Biblical Researches in Palestine in 1841, expressed himself satisfied that the traditional site could not be the true one, but did not venture to suggest an alternative. In 1842 Otto Theinens asserted that the crucifixion must have taken place on the north of Jerusalem on the rising ground outside the Damascus gate above the quarry known as Jeremiah’s Grotto. Theinens considered that the Holy Sepulchre was on the west side of the hill, and his views were adopted by a number of later writers, including Canon Tristram, Dr. Selah Merrill, Fisher Howe and General C. G. Gordon. Colonel C. R. Conder, R.E., who carried out the survey of Palestine under the Palestine Exploration Fund, also adopted the same hill as the probable scene of the crucifixion, but considered that the tomb of Christ was an ancient rock-cut tomb, about 200 yds. west of Jeremiah’s Grotto. Since General Gordon gave his opinion in favour of the site, it has been adopted by many, and the tomb in the face of the hill is sometimes called “Gordon’s Tomb of Christ” or “The Garden Tomb.” A careful examination of the question, however, leads to the conclusion
that the sites are not probable either for Calvary or the tomb. The hill in question, though not far outside the present north wall of the city, is at too great a distance from the probable line of the second wall, which was the outside line of fortification at the time of the crucifixion. The quarry, known as Jeremiah’s Grotto, is likely to be of later date than the third wall, which was built some years after the crucifixion, and the tomb identified as that of Christ has with good reason been attributed to the Christian rather than to the Jewish period. On the whole, therefore, the balance of argument is against the identification proposed by Thomas.

An entirely different theory regarding the site of the tomb of Christ was proposed by James Fergusson, the architect, who, in 1847, in his *Essay on the Ancient Topography of Jerusalem*, made the startling proposal that the Dome of the Rock, generally believed to have been erected by Abdalmallik (Abd el Melik) in A.D. 691, was the church built by the emperor Constantine over the Holy Sepulchre. He further elaborated his views in the interesting work entitled *The Temples of the Jews and other buildings in the Haram area at Jerusalem* (1878). Fergusson’s proposal, which found a considerable number of supporters, was based on architectural evidence, and he maintained that the building must have been designed in the time of Constantine and could not have been constructed by the Mahommedans at the end of the 7th century. Fergusson’s views were strongly supported by F. W. Unger in *Die Bauten Constantins des Grossen am Heiligen Grab zu Jerusalem*, published at Göttingen in 1863, but the objections to them on historical and topographical grounds are so considerable that they can hardly now be maintained. The idea involved in the theory of the Temple of the Temple on the S. W. part of the Haram enclosure, and the explorations made by General Sir C. Warren showed conclusively that if the Temple had been in this position, it would have stood over the deepest part of the Tyropoön Valley, and the foundations must have been of a much unnecessarily gigantic character. Sir C. Warren, in *The Temple and the Tomb*, 1880, replied *seriatim* to Fergusson’s proposals. The historical evidence also is entirely against the latter, and the discovery of the Madaimos mosaic, which, as has been already explained, shows the church of the Holy Sepulchre in the same position as at present, is further proof that the latter was not placed by Constantine on Mount Moriah.

The final conclusion that may be arrived at with regard to the authenticity of the traditional site of the Holy Sepulchre is as follows. It may be taken as certain that the present site is that which was adopted by Macarius as the correct one early in the 4th century, but there is not sufficient evidence to prove that this tomb was the one in which the body of Christ was laid, or that remembrance of the latter had been preserved during the three centuries that had elapsed between the time of the crucifixion and the conversion of Constantine. No other suggested site, however, has more claim to be the true one than that over which the church of the Holy Sepulchre now stands.

**SEQUANI**. In ancient geography, a Celtic people who occupied the upper basin of the Arar (Sénone), their territory corresponding to Franche-Comté and part of Burgundy. Before the arrival of Caesar in Gaul, the Sequani had taken the part of the Arverni against their rivals the Aedui and hired the Germans under Ariviustus to cross the Rhine and help them (71 B.C.). But although his assistance enabled them to defeat the Aedui, the Sequani were worse off than before, for Ariviustus deprived them of a third of their territory and threatened to take another third. The Sequani then appealed to Caesar, who drove back the Germans (58), but at the same time obliged the Sequani to surrender all that they had gained from the Aedui. This so exasperated the Sequani that they joined in the revolt of Vercingetorix (52) and shared in the defeat at Alesia. Under Augustus, the district known as Sequania formed part of Belgica. After the death of Vitellius, the inhabitants refused to join the Gallic revolt against Rome instigated by Julius Civilis and Julius Sabinus, and drove back Sabinus, who had invaded their territory. The traditional arch at Versontio (Besançon), which in return for this service was made a colony, possibly commemorates this victory. Dioctelian added Helvetia, and part of Germania Superior to Sequania, which was now called Provincia maxima Sequanorum, Versontio receiving the title of Metropolis civitas Versontiensium. Fifty years later Gaul was overrun by the barbarians, and Sequania sacked (155). Under Julian it recovered some of its importance as a fortified town, and was able to withstand the attacks of the Vandals. Later, when Rome was no longer able to afford protection to the inhabitants of Gaul, the Sequani became merged in the newly formed Kingdom of Burgundy.

**SEQUERA, DOMINGO ANTONIO DE** (1768–1837). Portuguese painter, was born at Lisbon in 1768, and studied art first at the academy of Lisbon, and subsequently under A. Cavallucci in Rome. By the age of thirteen he had evinced such marked talent that F. de Setubal employed him as assistant in his work for the Joao Ferreiras Palace. Sequera sojourned in Rome from 1788 to 1794, when he was made honorary member of the Academy of St Luke. After another two years’ travel and study in Italy, he returned to his native country preceded by so great a reputation that important commissions for churches and palaces were offered him, and he instructed his two pupils in the historical compositions and cabinet pictures. In 1802 he was appointed first court painter, in which capacity he executed many works
for the prince regent, for Donna Maria Teresa, and for the members of the court. He designed the valuable silver service which was presented by the Portuguese nainon to Wellington, and a monument that was erected in 1820 in the Rocio square at Lisbon. In 1823 he visited Paris, where he is known to have tried his skill in lithography and etching. The last years of his life he spent in Rome, devoting himself chiefly to devotional subjects and to his duties as head of the Portuguese Academy. He died in Rome in 1837. His best-known pictures are the "Last Moments of the Poet Camoens," "Flight into Egypt," "Descent from the Cross." Numerous paintings by Sequeria are in the royal palace at Mafra, the convent of Laveinhas, the new palace of Ajuda, and in the principal palaces and churches of Lisbon.

**SEQUESTER, VIBIUS** (4th or 5th century, A.D.), the supposed author of an alphabetical list of geographical names occurring in the Roman poets, with special reference to Virgil, Ovid and Lucan. Several of the names given cannot be traced; unless this is the result of carelessness or ignorance, the compiler must have had access to sources no longer extant.

Editions by C. Burrian (Zurich, 1867), and in A. Riese, Geographi Latinini minores (1878); see also Teufel, Hist. of Roman Literature (Eng. trans., 1900), 445, 1.

**SEQUESTRATION** is the act of removing, separating or seizing anything from the possession of its owner, particularly in law, of the taking possession of property under process of law for the benefit of creditors or the state. The Latin sequestrare, to set aside or surrender, a late use, is derived from *sequester*, a depositary or trustee, one in whose hands a thing in dispute was placed till the dispute was settled; this was a term of Roman jurisprudence (cl. *Digest* L. 16, 115). By derivation it must be connected with *sequi*, to follow; possibly the development in meaning may be follower, attendant, intermediary, hence trustee. In English "sequestered" means merely secluded, withdrawn. In law, the term "sequestration" has many applications; thus it is applied to the act of a belligerent power which seizes the debts due from its own subject to the enemy power; to a writ directed to persons, "sequestrators," to enter on the property of the defendant and seize the goods (see EXECTION); to the action of taking profits of a benefit to satisfy the creditors of the one whose property cannot be touched by a lay hand, the writ is issued to the bishop, and he issues the sequestration order to the churchwardens who collect the profits and satisfy the demand. Similarly when a benefice is vacant the churchwardens take out sequestration under the seal of the Ordinary and manage the profits for the next incumbent.

In the Scots law of bankruptcy the term "sequestration" is used of the taking of the bankrupt's estate by order of the court for the benefit of the creditors (see BANKRUPTCY, § SCOTTISH BANKRUPTCY LEGISLATION).

**SEQUIN** (the French form of Ital. *zecchino, zecchino d'oro*), the name of a Venetian gold coin, first minted about 1280, and in use until the fall of the Venetian Republic. It was worth about nine shillings. It bore on the obverse a figure of St Mark blessing the banner of the republic, held by a kneeling doge, and on the reverse a figure of Christ. Milan and Genoa also issued gold sequins. The word in Italian was formed from *secxa*, Span. *zeça*, a mint, an adaptation of Arabic *sikka*, a die for coins. In the sense of "newly-coined," the Hindi or Persian *sikka*, anglicised *sikka*, was specifically used of a rupee, containing more silver than the East India Company's rupee, coined in 1730 by the Bengal government. The "sikka-rupee" ceased to be circulated after 1836. The term "sikka" is now used for small discs made of thin pieces of metal, tin foil, celluloid or other composite material, highly glazed and brightly coloured, and applied as trimming for ladies' dresses.

**SEQUOIA**, a genus of conifers, allied to *Taxodium* and *Cryptomeria*, forming one of several surviving links between the firs and the cypresses. The two species are evergreen trees of large size, indigenous to the west coast of North America. Both bear their round or ovoid male catkins at the ends of the slender terminal branchlets; the ovoid cones, either terminal or on short lateral twigs, have thick woody scales dilated at the extremity, with a broad disk depressed in the centre and usually1 furnished with a short spine; at the base of the scales are from three to seven ovules, which become reversed or partially so by compression, ripening into small angular seed with a narrow wing-like expansion.

The redwood of the Californian woodsman, *S. sempervirens*, on which the genus was originally founded by Stephan Endlicher, abounds on the Pacific coast from the southern borders of Oregon southward to about 12 m. south of Punta Gorda, Monterey county, California, forming a narrow mountain forest belt, rarely extending more than 20 or 30 m. from the coast or beyond the influence of ocean fogs, or more than 3000 ft. above sea-level (see C. S. Sargent, *Silva of North America*, vol. x.). It grows to a gigantic size, from 200 to 300 ft. or more in height, with a diameter of from 12 to 15, or rarely 20 to 28 ft. at the much-buttressed base. Professor Sargent refers to it as the tallest American tree, which probably occasionally reaches 400 ft. or more in height. In old age the huge columnar trunk rises to a great height bare of boughs, while on the upper part the branches are short and irregular. The bark is red, like that of the Scots fir, deeply furrowed, with the ridges often much curved and twisted. When young the tree is one of the most graceful of the conifers: the stem rises straight and tapering, with somewhat irregular whorls of drooping branches, the lower ones sweeping the ground—giving an elegant conical outline. The twigs are densely clothed with flat spreading linear leaves of a fine glossy green above and glaucous beneath; in the old trees they become shorter and more rigid and partly lose their distichous habit. The cones, from 3 to 7 in. long, are at first of a bluish-green colour, but when mature change to a reddish brown; the scales are very small at the base, dilating into a broad thick head, with a short curved spine below the deep transverse depression. From the great size of the trunk and the even grain of the red cedar-like wood it is a valuable tree to the farmer and carpenter: it splits readily and evenly, and planes
and polishes well; cut radially, the medullary plates give the wood a fine satiny lustre; it is strong and durable, but not so elastic as many of the western pines and firs. Professor Sargent describes it as the most valuable timber tree of the forests of Pacific North America. In England the tree grows well in warm situations, but suffers much in severe winters—its graceful form rendering it ornamental in the park or garden, where it sometimes grows 30 or 40 ft. in height; its success as a timber tree would be doubtful. In the eastern parts of the United States it does not flourish. It was first described by Archibald Menzies in 1795 and was first described as Taxodium sempervirens, under which name it was known until distinguished by Stephan Endlicher as a new genus in 1847.

The only other member of the genus is the giant tree of the Sierra Nevada, S. gigantea, the largest of known conifers; it is confined to the western portion of the great Californian range for a length of about 260 m., at an altitude of from 5000 to 8400 ft. above the sea, and forms extensive forests, or, in the northern part of the area, isolated groves, such as the Calaveras Grove, the Mariposa Grove, and others. The leaves of this species are awl-shaped, short and rigid, with pointed apex; closely adpressed, they completely cover the branchlets. The male catkins are small, solitary, and are borne at the ends of the twigs; the cones are from 1 1 to 1 3 in. long, ovoid, with scales thicker at the base than those of the redwood, and bearing below the depression a slender prickle. The young tree is more formal and rigid in growth than S. sempervirens, but when old the outline of the head becomes cylindrical, with short branches sparsely clad with foliage sprays. The bark, of nearly the same tint as that of the redwood, is extremely thick and is channelled towards the base with vertical furrows; at the root the ridges often stand out in buttress-like projections. The average height is about 275 ft. with a diameter near the ground of 20 ft.; but specimens from 300 to 320 ft. tall, with trunks 25-35 ft. thick, are not rare.

The famous group known as the Mammoth Grove of Calaveras in California, containing above ninety large trees, stands in 35° N., about 4370 ft. above the sea, between the San Antonio and Stanislaus rivers. It was discovered by a hunter named Dowd in pursuit of a bear in 1852, but had been visited before by John Bidwill, who crossed the Sierra in 1841. Some trees in the Mariposa Grove rival these in size: one measures 101 ft. round the root, and a cut stump is 31 ft. in diameter. Gigantic as these trees are and imposing from their vast columnar trunks, they have little beauty, owing to the scanty foliage of the short rounded boughs; some of the trees stand very close together; they are said to be about four hundred in number. The age of the trees has been greatly overestimated. A few years ago a full-sized tree was felled in Fresno county, California, and contiguous transverse sections have been set up, one in the Museum of Natural History at New York, the other (upper one) in the British Museum of Natural History at South Kensington; the annual rings of the latter section have been carefully counted and found to indicate an age of 1335 years.

The growth of the "mammoth tree" is fast when young, but old trees increase with extreme slowness. The timber is not of great value, but on account of its dense grain and of deeper color than that of S. sempervirens, varying from brownish red to very deep brown; oiled and varnished, it has been used in cabinet work. S. gigantea was brought to England by Lobb in 1853, and received from Dr Lindsey the name of Wellingtonia, by which it is still popularly known, though its affinity to the redwood is too marked to admit of generic distinction. In America it is sometimes called Washingtonia. In the Hawaiian Islands it does not succeed; and, though nearly hardy in Great Britain, it is planted only as an ornament of the lawn or paddock.

In early geological times the sequoias occupied a far more important place than they do at present. They flourished on the Lower Chalk formations, and in Tertiary times were widely distributed; the genus is represented in the Eocene flora of Great Britain, and in the succeeding Miocene period was widely distributed in Europe and western Asia. It is presumed that in the Glacial epoch the genus was exterminated except in the areas in western North America where it still persists.

das a town of Belgium in the province of Liége, adjoining the city of that name. Pop. (1904) 39,843. It lies on the right bank of the Meuse above Liége, with which it is connected by rail and tramway. Seraing owes all its prosperity and importance to the firm founded by John Cockrell, an Englishman, in 1817, with the co-operation of King William I. of the Netherlands, who provided half the capital. The Cockrell family has long disappeared, and the enterprise is now known as "the John Cockrell Company." It is one of the largest factories of engines and machinery—apart from war material—on the continent. Its headquarters occupy the old summer palace of Cardinal de Lorraine, Archbishop of Liége. In 1590 it established a branch at Hoboken on the Scheldt for the purpose of undertaking ship-building. The company employs 14,000 hands.

SERAJEVO (pronounced SERAJEVO, "the city of palaces"); Turkish, Bosna Serai; Ger. Sarajewo; Ital. Seraiso), the capital of Bosnia, situated on the Miljačka, a small right-hand tributary of the Bosna and on the railway from Bosna-Brod, 167 m. N., to Ragusa. Pop. (1895) 37,713, chiefly Serbo-Croatians, with small colonies of Gipsies and Jews. The city, frequently called the "Damascus of the North," spreads over a narrow valley and the adjacent hill, a semi-circle of rugged hills. Though still half oriental, and wholly without a natural Turkish bazaar, its hundred mosques, wooden houses and cypress groves, it was largely rebuilt, after 1878, in western fashion. The river was also canalized, a telephone service introduced, and extensive drainage works carried out. Sarajevo is the seat of the provincial government, of a Roman Catholic bishop, an Orthodox metropolitan, the highest Moslem ecclesiastical authority or Reis-el-ulema, and the supreme court. It is the centre of Bosnian education, containing the celebrated orphanage founded in 1809 by Miss Irby and Miss Mackenzie (afterwards Lady Skeffington); the Scheriat-Schule, which derives its name from the Turkish code or scheri, and is maintained by the state for Moslem law-students; a gymnasia, a technical institute and a teachers' training-college. The Begovina Džamija (Džamija), or mosque of Husrev Bey, is only surpassed, among European mosques, by those of Adrianople and Constantinople. It was founded, in 1465, by Husrev or Ures, pasha of Bosnia. The castle and barracks, occupied by an Austrian garrison, stand on a cliff commanding a fine view of the city. Other noteworthy buildings are the konak or governor's residence, the large Catholic and Orthodox cathedrals, the hospital, the townhall and the museum, with fine antiquities and natural history collections. In the Sinan Tekke or Dervish monastery the ceremonies of the howling and dancing Dervishes may be witnessed. Turkish baths and cafés are numerous. The bazaar, or čarsiya, is a labyrinth of dark lanes, lined with booths, where embroideries, rugs, embossed fire-arms, filagree-work in gold and silver, and other native wares are displayed. There are also large potteries, silk-mills, a brewery and a tobacco factory. At the mineral baths of Ildize near the city, where many Roman remains have been found, a hydrophatic establishment was opened in 1899. The whole neighbourhood is rich in prehistoric remains.

Founded, in 1262, by the Hungarian General Cotroman, under the name of Bosnavar or Vrbosna, Sarajevo was enlarged by Husrev Bey two centuries later, and takes its name from the palace (Turkish, serai), which he founded. During the wars between Turkey and Austria, its ownership was often contested; and it fell before King Matthias I. of Hungary in 1480, and before Prince Eugene of Savoy in 1697. Destructive fires laid it waste in 1480, 1644, 1656, 1687 and 1789. It was chosen as the seat of Turkish government in 1689 instead of Travnik. In 1787 it was seized by the Austrians, under Baron Philippovitch.

SERAMUR, a town of British India, in the Hugli district of Bengal, on the right bank of the river Hugli, opposite Barrackmore, on the East Indian railway, 12 m. from Howrah. Pop. (1901) 44,451. A Danish factory was established here about the middle of the 17th century, and called by them Frederiksnager. With the rest of the Danish possessions in India, it was acquired by purchase by the English in 1845. Serampur was the home of the Baptist mission founded by Carey. The mission press has been transferred to Calcutta, but a training college is
SERAPION, or SERAPION (flor. c. 350), bishop of Thmuis in the Nile Delta and a prominent supporter of Athanasius in the struggle against Arianism (sometimes called, for his learning, Scholasticus), is best known in connection with a prayer-book or sacramentary intended for the use of bishops. This document, contained in a collection of Egyptian documents in an 17th-century MS. at the Laura on Mount Athos, was published by A. Dmitrijewskij in 1894, but attracted little attention until independently discovered and published by G. Wobbermin in 1899. It is a celebrant's book, containing thirty prayers belonging to the mass (19-30, 1-6), baptism (7-11, 15, 16), ordination (12-14), benediction of oil, bread and water (17), and burial (18), omitting the fixed structural formulae of the rites, the parts of the liturgy ministers, and almost all Egyptian, except what is implied in the titles of the prayers. The name of Serapion is prefixed to the anaphora of the mass (1) and to the group 15-18: but whether this indicates authorship is doubtful; for whereas the whole collection, is bound together by certain marks of vocabulary, style and thought, 15-18 have characteristics of their own not shared by the anaphora, while no part of the collection shows special affinities with the current works of Serapion. But his name is at least a symbol of probable date and provenance: the theology, which is orthodox so far as it goes, but "conservative," and perhaps glancing at Arianism, shows no sign that the Macedonian style of the Mass formulae is of a type abandoned by the orthodox, and by c. 370 treated by Didymus of Alexandria as heretical; the apparent presupposition that the population is mainly pagan (1, 20); the exclusive appropriation of the mass to Sunday (19; cf. Ath. ep. c. Ar. 11), whereas the liturgical observance of Saturday prevailed in Egypt by c. 350; the terms in which monasticism is referred to—-together point to c. 350: the occurrence of official interpreters (25) points to a bilingual Church, i.e. Syria or Egypt; and certain theological phrases (σχολακιστός, ἱστόμαι, μικρὸς καθολικοῦς) of the Mass, which the liturgical characteristics, indicate Egyptian; while the pericopes for rains (25), without reference to the Nile-rising, points to the Delta as distinguished from Upper Egypt. The book is important, therefore, as the earliest liturgical collection on so large a scale, and as belonging to Egypt, where evidence for 4th-century ritual is scanty as compared with Syria.

The rites form a link between those of the Egyptian Church Order (a 3rd- or early 4th-century development of the Hippolytian Canons, which are perhaps Egyptian of c. 260) and later Egyptian rites marking the stage of development reached in Egypt by c. 330, while exhibiting characteristics of their own.

I. The Mass has the Egyptian notes—-a prayer before the lections, elsewhere unknown in the East; an exceptionally weighty body of intercessions after the catechumens' dismissal, followed by a penitential act, probably identical with the εὐχαστίας of Can. Hippol. 2, which disappeared in later rites; a setting of the Sanctus found in several Egyptian anaphoras; the close connexion of the commemorations of the offerers and of the dead; and the form of the conclusion of the anaphora. The structure of the communion—with a prayer before and prayer of thanksgiving and blessing after—-shows that Egypt had already arrived at the type given in the Greek form first evidenced in Syria, c. 375 (Ap. Const. viii. 13). Among the special characteristics of Serapion are the simplicity of the Sanctus, and of the Institution, which lacks the dramatic additions already found in Ap. Const.; the interpolation of a passage containing a quotation from Didaché 9 between the institutions of the bread and of the chalice; the form of the αὐξήματος; and the invocation of the Word, not of the Holy Ghost, to effect consecration. That the Lord's Prayer before communion is not referred to may be only because it is a fixed formula belonging to the structure of the rite. II. The Order of Baptism has a form for the consecration of the water, and a preliminary prayer for the candidates, perhaps alluding to their exorcism; a prayer

1 These are: a vigorous and acute refutation of the Manichaeans, and some letters. A book on the titles of the Psalms has not survived.
for steadfastness following the renunciation and the confession of faith; the form of anointing with oil; appropriate prayers preceding and following Stikele and Kirchart; and the prayers of contrition with imposition of the hand, chiasm and crossing. All this corresponds to and fills up the outline of the Church Order and allusions in 4th-century writers, and is in line with later Egyptian rites. III. Forms of Ordination are provided only for deacons, presbyters and bishops, the orders of divine institution (15). They are concise, but of the normal type. That for deacons (12) commemorates St Stephen, invokes the Holy Ghost, and prays for the gifts qualifying for the diaconate. That for presbyters (13) recalls the Mosaic LXX, invokes the Holy Ghost, and requests the gifts of prophecy, teaching, and the ministry of reconciliation. That for bishops (14) appeals to the mission of our Lord, the election of the apostles, and the apostolic succession, and asks for the "Divine Spirit" conferred on prophets and patriarchs, that the subject may "feed the flock" "unblamably and without offence continue in his office. The minor orders, interpreters, readers and subdeacons (25) are evidenced, as elsewhere in the middle of the 4th century, appointed without sacramental ordination.

IV. The use of exorcised or blessed oil, water and bread is fully illustrated, and it is further stressed that the fact that the oil to be used is the oil of the Sas, is of little importance. For, the oil, (like Can. Hippol. and Ch. Ord. for oil), probably for the use of individual offerers. A longer form for all the three matters (17) perhaps has in view the general needs of the Church in the visitation of the sick. The occurrence in both prayers of the "Name" and the commemoration of the Passion, Resurrection, &c., corresponds with early allusions, in Origen and elsewhere, to the usual form of exorcism.

V. For burial of the dead Serapion gives a prayer for the departed and the survivors (18) that the funeral procession is alluded to (including the act in the Curetes' road). The mourners (see the similar mention of departed persons is provided for. Hence we have the elements of the 4th-century funeral, as we know it in Egypt and elsewhere: a preliminary office (of readings and psalms) to which the prayer belongs, the procession (with palmistry) to the cemetery, the burial and the mass pro domino.

SERAPIS, the famous Graeco-Egyptian god. The statue of Serapis in the Serapeum of Alexandria was of purely Greek type and workmanship—a Hades or Pluto enthroned with a basket or corn measure on his head, a sceptre in his hand, Cerberus at his feet, and (apparently) a serpent. According to Plutarch, Ptolemy Soter stole it from Sinope, having been hidden by the unknown god in a dream to bring him to Alexandria. On its arrival the statue was pronounced to be Serapis by two experts in religious matters: the one the Eumolpid Timotheus, the other the Egyptian Manetho. This story may not be true (some contend that Sinope as the provenance of the statue originated in the hill of Sinopeion, i.e. place of Apis (?), a name given to the site of the Serapeum at Memphis), but there is little doubt that Ptolemy Soter fixed the iconic type to serve for the god of the new capital of Egypt, where it was soon associated with Isis and Harpocrates in a triad. His policy was evidently to find a deity that should win the confidence of Greeks and Egyptians. The Greeks of that day would have had little respect for a grotesque Egyptian figure, while the Egyptians were more willing to accept divinity in any shape. A Greek statue was therefore chosen as the idol, and it was proclaimed as the anthropomorphic equivalent of a much revered and highly popular Egyptian beast-divinity, the dead Apis, assimilated to Osiris. The Greek figure probably had little effect on the native ideas, but it is likely that it served as a useful link between the two religions. The god of Alexandria soon won an important place in the Greek world. The anthropomorphic Isis and Horus were easily rendered in Greek style, and Anubis was prepared for by Cerberus. The worship of Serapis along with Isis, Horus and Anubis spread far and wide, reached Rome, and ultimately became one of the leading cults of the west. The destruction in A.D. 385 of the Serapeum of Alexandria, and of the famous idol within it, after the decree of Theodosius, marked the death-agony of paganism throughout the empire.

It is assumed above that the name Serapis (so written in later Greek and in Latin, in earlier Greek Sarapis) is derived from the Egyptian name Sarapis, a combination of the names Osiris and Apis, the bull Apis, dead, and, like all the blessed dead, assimilated to Osiris, king of the underworld. There is no doubt that Serapis was before long identified with Userhapi; the identification appears clearly in a bilingual inscription of the time of Ptolemy Philopator (221-205 B.C.), and frequently later. It has, however, been contended by an eminent authority (Wilcken, Archiv f. Papyrussforschung, iii. 249) that the parallel occurrence of the names Sarapis and Osorapis (Userhapi) points to an independent origin for the former. But doubles, e.g. Petisus-Petisus, are common in Graeco-Egyptian, Egyptian names; the form is then generally the result found in documents written by Greeks in familiar intercourse with Egyptians, the less accurate is traditional from an older date in the mouths of pure Greeks and Hellenists, and is used in literary writings. Thus Sarapis would be the literary and official form of the name; it might be traditional, dating perhaps from the reign of Amasis or from the Persian period. We know that in Herodotus's day, and long before, the discovery of the new Apis was the occasion of universal rejoicing, and his death of universal mourning. The ancient Serapeum (Puserhap) and the name Userhapi would be as familiar to early Greek wanderers in Egypt as the Apienus and Apis itself.

But why was a Plutonic Serapis selected rather than another god to furnish the Egyptian element to the chief divinity of Alexandria? According to one account in Tacitus, Sarapis was the god of the village of Rhacotis before it suddenly expanded into a great capital; but it is not very probable that temples were erected to the dead Apis except at his Memphite tomb. Alexander had courted Ammon. But Ammon had little hold on the affections of the Egyptian people. He was the god of Ethiopia and the Thebais which were antagonistic to the progressive north. On the other hand, Osiris was an Egyptian god, and while the artificer Ptah, the god of the great native capital of Egypt, made no appeal to the imagination, the Apis bull, an incarnation of Ptah, threw Ptah himself altogether into the shade in the popular estimation. The combination of Osiris and the Apis bull which was found in the dead Apis was thus a most politic choice in naming the new divinity, whose figure represented a god of the underworld wearing an emblem of fruitfulness.

The earliest mention of Sarapis is in the authentic death scene of Alexander, from the royal diaries (Arrian, Anabasis, vii. 20). Here Sarapis has a temple at Babylon and is of such importance that he alone is named as being consulted on behalf of the dying king. It would considerably alter our conception of the dead Apis if we were to find that a travelling shrine of his divinity accompanied Alexander on his expedition or was set up for him in Babylon. On the other hand, the principal god of Babylon was Zeus Belus (Bel Marduk), and it is difficult to see why he should have been called Sarapis on this occasion. Evidence has, however, been found to prove that Ea, entitled Sarapis, "king of the deep (sea)," was also great in learning and magic, had a temple in the city (Lehmann in Beiträge zur alten Geschichte, iv. 306). It seems unwarranted to make this Sarapis = Sarapis travel to Sinope and thence to Alexandria as the type of the Egyptian god; but whether or no the Egyptian appellation Sarapis was applied to express the Babylonian Sarapis, the part it played in the last days of Alexander may have determined the choice by which the Egyptian Osiris-Apis supplied the name and some leading characteristics to the god of Alexandria.
SERENA—SERERS

SERENA, or LA SERENA, a city of Chile, capital of the province of Coquimbo, on the S. bank of the Coquimbo river about 5 m. from the sea. Pop. (1895) 15,712; (1902, estimate) 19,536. As the see of a bishop and the most important town politically of the semi-arid region, it contains a number of important public edifices, including a cathedral (1844–1866), 216 ft. high, with a very wide) built of a light porous stone, an episcopal residence, several convents, a large hospital, an orphan's asylum, a beggar's asylum and a lazaretto. It is the seat of a court of appeal for Atacama and Coquimbo, and has an excellent lyceum and other schools, including a school of mines. It has a good water supply, well-paved streets, gas illumination, tramway service and several small industries, including brewing and the making of fruit conserves. The annual rainfall is only 1-6 in. and its mean annual temperature is 59°. Its railway connections include a line to Coquimbo (9 m.), its port, one to the Tamaya copper mines) are very large. The irrigation is a smaller conurbation, beginning (like Beethoven's serenade op. 8) with a march. The classics of the serenade forms are among the works of Mozart and Haydn. Mozart's larger and later serenades, from the "Haffner" serenade onwards, are among his most delightful and voluminous lighter instrumental works. His two serenades for eight wind instruments are more serious, and that in C minor (which he afterwards arranged as a string quintet) is a majestic work in four normal movements, which Mozart probably called a serenade only because he did not find the term octet then in common use.

The typical scheme of a large serenade or divertimento differs from that of a symphony only in having six movements instead of four, the additions being another slow movement and minuet or scherzo. Beethoven's septet and Schubert's octet are on this plan, and are just as much serenades as Mozart's "Haffner" serenade, which is (not counting introductions) in eight movements with a kind of violin concerto in the middle. The six-movement scheme (though without the serenade style) was adopted by Beethoven in one of the profoundest and most serious works in all music, the string quartet in B flat, Op. 130. Brahms's first essays in symphonic form took the shape of two orchestral serenades of which the first was originally sketched for a large group of solo instruments. If Brahms had finally taken that form Brahms would have called it a divertimento.

Other applications of the term in music are merely literary. Even its use, from the 17th century onwards, for a kind of operetta was clearly no more than a natural allusion to the notion of serenades as addressed at night by minstrels to ladies and by clients to patrons.

(D. F. T.)

SERENUS, SAMMONICUS, Roman savant, author of a didactic medical poem, De medicina praeposita (probably incomplete).

The work (1115 hexameters) contains a number of popular remedies, borrowed from Pliny and Dioscorides, and various magic formulae, amongst others the famous Abracadabra (q.v.), as a cure for fever and ague. It concludes with a description of the famous antidote of Mithradates VI. of Pontus. It was much used in the middle ages, but is of little value except for the ancient history of popular medicine. The syntax and metre are remarkably correct. It is uncertain whether the author was the. Serenus ascribed to L. L. Heibeig (Serenus August.). It was published in A.D. 212 at a banquet to which he had been invited by Caracalla, or his son, the tutor of the younger Gordian. The father, who was one of the most learned men of his age, wrote upon a variety of subjects, and possessed a library of 60,000 volumes, bequeathed to his son and handed on by the latter to Gordian.

The edicto princeps (ed. Sulpiitus Verulanus, before 1484) is very rare; later ed. by J. G. Ackermann (Leipzig, 1786) and J. Bhères, Poetae Latiniores, iii.; see also A. Baur, Quaestiones Sammonicae (Giessen, 1886); M. Schanz, Geschichte der römischen Literatur, iii. (1896); Teuffel, Hist. of Roman Literature (Eng. trans., 1900), 374, 4, and 38.

SERENUS "of Antissa," Greek geometer, probably not of Antissa but of Antiochia or Antinopolls, a city in Egypt founded by Hadrian, lived, as may be safely inferred from the character and contents of his writings, long after the golden age of Greek geometry, most probably in the 4th century, between Pappus and Theon of Alexandria. Two treatises of his have survived, viz. On the Section of the Cylinder and On the Section of the Cone, the Greek text of which was first edited by Edmund Halley along with his Apollonius (Oxford, 1710), and has now appeared in English by T. L. Heath (Axiomata of Antissa... Leipzig, 1869). A Latin translation by Commandinus appeared at Bologna in 1566, and a German translation by E. Nizze in 1860–1861 (Stralsund). Besides these works Serenus wrote commentaries on Apollonius, and in certain MSS. of Theon of Smyrna there appears a proposition "of Serenus the philosopher, from the Lemmas" to the effect that, if a number of rectilineal angles be subtended, at a point on a diameter of a circle which is not the centre, by equal arcs of that circle, the angle nearer to the centre is always less than the angle more remote (Heiberg, Preface, p. xvii).

The book On the Section of the Cylinder had for its primary object the correction of an error on the part of many geometers of the time who supposed that the transverse sections of a cylinder were different from those of a cone, a point which is decisively answered by Serenus. Serenus, in a series of theorems ending with Prop. 19 (ed. Heiberg), shows in Prop. 20 that "it is possible to exhibit a cone and a cylinder, cutting one another in one and the same ellipse. He then solves problems such as—"given a cone (cylinder) and an ellipse on it, to find the cylinder (cone) which is cut in the same ellipse as the cone (cylinder)" (Props. 21, 22); "given a cone (cylinder) to find a cylinder (cone), and to cut both by one and the same plane so that the sections thus formed shall be similar ellipses" (Props. 23-24).

In Props. 27, 28 he deals with subcentury and other similar sections of a scalene cylinder or cone. He then gives the theorem: "All the straight lines drawn from the same point to touch a cylindrical (or conical) surface, on both sides, have their points of contact on the sides of a single parallelogram (or triangle)" (Props. 29, 32). Prop. 31 states indirectly the property of a harmonic pencil.

The proposition On the Section of the Cylinder claims originality for it, is unimportant. It deals with the areas of triangular sections of right or scalene cones by planes through the vertex, finding e.g. the maximum triangular section of a right cone and the maximum triangular section of a scalene cone. The problem is, in some easy cases, the problem of finding triangular sections of given area.

(T. L. H.)

SERERS, a Negroid people, living in Senegambia. They are of the same stock as the Wolof, and in some parts form communities with them. Elsewhere they are highly mixed with the Mandingo, to whom they belong many of their ruling families. The country of the pure Serers lies between the Gambia and Salum rivers to the south of Cape Verde. In this domain of nearly 5000 sq. m. the tribe has two main divisions, the None Serers and the Sine Serers. The Serers are an extraordinarily tall race, even excelling in height their kinsfolk, the Wolof. Men of 6 ft. 6 in., with muscular development in proportion, are by no means rare. They are less black than the Wolof and
have features more purely negroid with coarser lips and heavier jaws. Many Seres are nominally Mahomedans, but nature-worship is still prevalent. Their two chief gods are Takhar, god of justice, and Tiurah, god of wealth, who are worshipped at the foot of trees. Snakes, too, have their cult, and formerly living animals were sacrificed to them. A belief in transmigration, as shown by their funeral customs, is general among the Seres. They are an honest and industrious people, but are very heavy drinkers.

Séres, Serres or Serhos, chief town of a sanjak in the vilayet of Edirne, southeastern Turkey, on Lake Takhino, a navigable expansion of the river Karasu or Struma (ancient Strymon), 43 m. by rail N.E. of Salonica. Pop. (1905) about 30,000, of whom about half are Bulgarians (one-third of them being Mussulmans), nearly one-fourth Greeks, about one-seventh Turks and the remainder Jews. Séres is built in a district so fertile as to bear among the Turks the name of Altin Ovasi, or Golden Plain, and so thickly studded with villages as to appear, when seen from the outlers of Rhodope on the north, like a great city with extensive gardens. It is the seat of a Greek archbishop and patriarch. It consists of the old town, Varosah, situated at the foot and on the slope of the hill crowned by the old castle, and of the new town built in the European fashion on the plain, and forming the commercial centre. The principal buildings are the Greek archiepiscopal palace, the Greek cathedral, restored since the great fire of 1879, by which it was robbed of its magnificent mosaics and woodwork, the Greek gymnasium and hospital (the former built of marble), the richly endowed Eski Jamé mosque, and the ruins of the once no less flourishing Ahmed Paşa or Hagia Sophia mosque, whose revenues were formerly derived from the Crimen. On a hill above the town are the ruins of a fortress described in a Greek inscription as a “tower built by Helen in the mountaineous region.” Séres is the headquarters of the Turkish wool trade, and has also manufactures of cloth and carpets. There is a large trade in rice and cereals, and the other exports include tobacco and hides.

Séres is the ancient Selys, Sira or Sirrah, mentioned by Herodotus in connexion with Xerxes’ retreat, and by Livy as the place where Aemilius Paulus received a deputation from Persia. In the 14th century, when Stephen Duhan of Servia assumed the title emperor of Servia, he chose Sirrah as his capital; and it remained in the hands of the Servians till its capture by Sultan Murad II. (1421–1451).

Serfdom (from Fr. seify, Lat. servus, a servant or slave). The notion of serfdom is distinct from those of freedom and of slavery. The serf is not his own master: to perform services for other persons is the essence of his status, but he is not given over to his lord to be owned as a thing or an animal—there are legal limits to the lord’s power. Serfdom is very often conceived as a perpetual adherence to the soil of an estate owned by a lord, but this praeclial character is not a necessary feature of the condition. Hereditary serfdom may sometimes assume the shape of a personal relation between servant and master. Such being the general features of serfdom, it is sure to appear in very different ages and countries. It will be formed naturally, for instance, in cases when one barbarous community conquers another, but it is not able to destroy entirely the latter or to treat its members as mere chattels. This mitigated form of appropriation of human beings by their conquerors may be brought about as well by the paucity or comparative weakness of the victors as by the difficulty for them to draw income from pure slaves. In a state of backward agriculture and natural economy it will sometimes be more profitable for the conquerors as well as for the conquered to leave the dependent population in their own households and on their own plots, at the same time taxing them heavily in the way of tribute and services. Such an arrangement clearly obtained in several of the agricultural states on ancient Greece. The Penestae of Thessaly appear as a remnant of a distinct tribe settled on the confines of Macedonia and at the same time as a class of tributary peasants serving Thessalian aristocrats. The Mniotae, Klarotae and Apha-
important part in Celtic economic arrangements: there is not much room for his activity as a completely dependent tool of the master. The female slave (cuninal) was evidently much more prominent in the household. Prices are reckoned out in numbers of such slaves and there must have been a constant call for them both as concubines and as household servants. As for male workmen they are chiefly toges in Wales, that is half-free bondmen with a certain though base standing in law. Even these, however, could not be said to form the social basis for the existence of an upper free class. The latter was numerous, not to say large and could not be used for heavy work as part of the common work; as may be seen from the extent of the free and servile tenures on the estates carved out for English conquerors in Wales and Ireland. Anyhow, the toges class of half-free peasants stands by the side of the smaller tribemen as subjected to heavier burdens in the way of taxation and services in kind. In Wales they are distributed into gasello and gelselys, like the free tribesmen themselves and thus connected with the land, but there is nothing to show that this connexion was deemed a servitude of the globe. The tie with the lord is after all part of the time the watchful the all settlement only didn't did were further between variations the legislative renderings are regard holding class the century): the conquest turned to stock the house hold, the statistical depen dency. The Roman stock of coloni naturally combined with German tributary peasants to form medieval servitum. A half-free group is marked off in the early laws under the designation of lihi, issoi, aldiones. But in process of time this group was merged with freedmen, settled slaves (servi casati) and small freedmen into the numerous class of serfs (servi, rustici, villani) which appears under different names in all western European countries. The customary regulations of the duties of an important group of this class in regard to the lords are clearly expressed in the Bavarian law (7th century): serfs settled on the estates of the church have to work, as a rule, three days in the week for their masters and are subject to divers rents and payments in kind. The regulations in question, although entered in a legal text, are not a legislative enactment but the result of a slow process of adjustment of claims between the ecclesiastical landowners and masters on one side and their rural dependents on the other. There can be no doubt that they were largely representative of the conditions prevailing on Bavarian estates belonging not only to the church but also to the duke and to lay lords. The old English Kettledrines singularum personarum (11th century) present other variations of the same customary arrangements. The rustic class appears in them to be differentiated into several sub-divisions—the geneats performing riding duties and occasional services, the gebärs burdened with week work and the cotsets holding cottages and performing light work in the shape of one day in the week and services to match (see Villeinage). Of these various groups that of the gebärs corresponds more closely to the continental serfs (koloni, Hörige, unfreie Hintersassen). The dualism characteristic of medieval servitum, its formation out of deposed freedmen and rising servitude, may be traced all through the history of the middle ages. French jurists of the 13th century, e.g., lay stress on a fundamental difference in law between the complete serf whose very body belongs to his lord (cf. the German Leibeigenschaft) and the villein or roturier, who is only bound to perform certain duties and ought not to be further oppressed by the landowners on whose soil he is settled (Beauanmainor, Costume de Beauvaisis). But the same texts which draw the line between the two classes make it clear that there were no other guarantees to the maintenance of the rights of the superior rustics than the moral sense and the self-interest of their masters. Should the lords infringe the well-established rights of their subjects, the latter had no court to appeal to and only God could inflict punishment on the oppressors. It must be added, however, that even in the darkest times of feudal sway, economic forces provided some protection for the peasants who had lost the means of appealing to legal remedies. A certain balance had to be struck in most cases between the greed and selfishness of the class of landowners and the necessary requirements and human aspirations of the subjects. Feudal tenure was not an autocratic institution. It was an arrangement between the lord and his tenants which was based on the economic interest of both. It was not the lord's wish alone which determined the condition of the tenants. PEASANTRY: Peasants and their servile condition. The Germanic tribes moved on similar lines. Slavery was not a natural institution with them, although it did occur. In the eyes of a Roman observer, however, even downright slavery was turned into servitum by the force of circumstances. As Tacitus tells us, the ancient Germans made use of their slaves in a different way from the Romans. These slaves had their separate households, while the masters exacted tribute from them in the shape of corn, cattle or clothes, and the serfs had to obey the extent of rendering such tribute (Tacitus, Germania, 21). This means, of course, that it was in the interest of the master to levy tribute and not to organize slave labour. After the conquest of the provinces by the Germanic invaders the Roman stock of coloni naturally combined with German tributary peasants to form medieval servitum. A half-free group is marked off in the early laws under the designation of lihi, issoi, aldiones. But in process of time this group was merged with freedmen, settled slaves (servi casati) and small freedmen into the numerous class of serfs (servi, rustici, villani) which appears under different names in all western European countries. The customary regulations of the duties of an important group of this class in regard to the lords are clearly expressed in the Bavarian law (7th century): serfs settled on the estates of the church have to work, as a rule, three days in the week for their masters and are subject to divers rents and payments in kind. The regulations in question, although entered in a legal text, are not a legislative enactment but the result of a slow process of adjustment of claims between the ecclesiastical landowners and masters on one side and their rural dependents on the other. There can be no doubt that they were largely representative of the conditions prevailing on Bavarian estates belonging not only to the church but also to the duke and to lay lords. The old English Kettledrines singularum personarum (11th century) present other variations of the same customary arrangements. The rustic class appears in them to be differentiated into several sub-divisions—the geneats performing riding duties and occasional services, the gebärs burdened with week work and the cotsets holding cottages and performing light work in the shape of one day in the week and services to match (see Villeinage). Of these various groups that of the gebärs corresponds more closely to the continental serfs (koloni, Hörige, unfreie Hintersassen). The dualism characteristic of medieval servitum, its formation out of deposed freedmen and rising servitude, may be traced all through the history of the middle ages. French jurists of the 13th century, e.g., lay stress on a fundamental difference in law between the complete serf whose very body belongs to his lord (cf. the German Leibeigenschaft) and the villein or roturier, who is only bound to perform certain duties and ought not to be further oppressed by the landowners on whose soil he is settled (Beauanmainor, Costume de Beauvaisis). But the same texts which draw the line between the two classes make it clear that there were no other guarantees to the maintenance of the rights of the
census of the rural population. The ultimate result was, however, not only the fixity of peasant tenures, but the subjection of the entire peasant population as a separate class (Krepostnictso) to the personal sway of the landowners. The state insisted to a certain extent on the public character of this subjection and drew distinctions between personal slavery and serfdom. In the midst of the peasants themselves there lived a consciousness of their special claims as to tenant right, claims which sometimes assumed the shape of the quaint saying, "The land is ours, though we are yours." But, in fact, serfdom naturally took the form of an ugly ownership of live chattels on the part of a privileged class, and all sorts of excesses, of cruelty, ruthless exploitation and wanton caprice, followed as a matter of course. Emancipation was brought about in the 19th century by economic causes as well as by humanitarian considerations. The fabric of a state built up on the basis of serfdom proved inadequate to meet the tasks of modern times. Private enterprise and the free application of capital and labour were hindered in every way by the bondage of the peasant class. Even such a necessary measure as that of moving cultivators to the rich soil of the south was impossible. Villainous and serfs in Fennoscandia totally to the glebe.

On the humanitarian and liberal ideas making for emancipation we need not dwell, as they are self-evident. After several half-hearted attempts directed in the course of Nicholas I's reign to face the question while safeguarding at the same time the rights and privileges of the old aristocracy, the moral collapse of the ancien régime during the Crimean war brought about the Emancipation Act of the 19th of February 1861, by which some 15 millions of serfs were freed from bondage. The most characteristic feature of this act was that the peasants, as distinct from household servants, received not only personal freedom but allotments in land in certain proportions to their former holdings. The state indemnified the former landowners, and the peasants had to redeem the loan by yearly payments extending over a number of years.

If we turn back from this course of development to the history of serfdom and emancipation in the West striking contrasts appear. As we have already noticed, medieval serfdom in the West was the result of a process of customary feudal growth hardly interfered with by central governments. The loosening of bondage is also, to a great extent, prepared by the working of local economic agencies. Villainous and serfs in Fennoscandia totally to the glebe.

Serger—Sergeripe (originally Sergeripe d'el-Rey), a small Atlantic state of Brazil, bounded N. by Alagbas, E. by the Atlantic, and S. and W. by Bahia. Area, 15,093 sq. m. Pop. (1900) 356,264. The province consists of three-fourths half-castes and negroes. The Sao Francisco forms its northern boundary, and the drainage of the northern part of the state is northward and eastward to that river. The southern half of the state, however, slopes eastward and is drained directly into the Atlantic through a number of small rivers, the largest of which are the Irapiranga (whose source is in the state of Bahia and which is called Vasa Barris at its mouth), the Real, and the Cotinguiba. These streams are navigable for short distances, but are obstructed by sand-bars at their mouths, except the Cotinguiba being especially dangerous. The surface of the state resembles in part that of Bahia, with a zone of forested lands near the coast, and back of this a higher zone of rough open country, called agrisoles. There is a sandy belt along the coast, and the western frontier is slightly mountainous. The intermediate lands are highly fertile, especially in the forested region, where the rainfall is abundant. Further inland the year is divided into wet and dry seasons with occasional prolonged droughts. These districts are pastoral, and the lower fertile lands are cultivated for sugar, cotton, maize, tobacco, rice, beans, and mandioca—sugar being the principal product.
Rubber and some other natural products are exported. There is only one railway in the state, which runs from Aracajú northward to Capella, with a branch running westward to Simão Dias. The only manufacturing industries of importance are cotton mills, sugar factories and distilleries, one of the largest sugar uisines in Brazil being located at Riachuelo near Larangeiras. There are no good ports on the coast because of the bars at the mouths of the rivers.

In 1890 the area of the state is Aracajú (pop. 1890, 16,336; 1906 estimate, 25,000), on the lower course, or estuary, of the Curuguá river, near the coast. The bar at the entrance to this river is exceptionally dangerous, and the port is frequented only by coasting vessels of light draught. The town stands on a sandy plain, and there are sand dunes within the city limits. The public buildings are a large plain church with unfinished twin towers, the government palace, the legislative halls, a normal school and public hospital. The other principal towns are Estancia (pop. 1890, 14,553) on the Rio Real in the southern part of the state, with manufactures of cotton textiles, cigars and cigarettes, and soap, and an active trade; Laranjeiras (11,350), in a highly productive sugar district N. of the capital; Capella (11,034); Simão Dias (10,984); Lagarto (10,473); São Cristóvão, formerly Sergipe d’el-Rey (8793), the old capital, near the mouth of the Ipiranga, and Marom (7851).

**SERGIUS, ST.** generally associated with St Bacchus, one of the most celebrated martyrs of Christian antiquity. His festival is on the 7th of October, and the centre of his cult was Resafa, or Resafa, in Syria, in the province of Augusta Ephraemis. This town, which since the middle of the 6th century was also called Sergiopolis, acquired importance as a place of pilgrimage, and became a bishop’s see (Le Quien, Oriens Christian. ii. 931).

The cult of the saint spread rapidly. In 353 we find a church of St Sergius at Eitha, in Batanaea (Waddington, Inscriptions de Syrie, n. 2124)—the most ancient example of a dedication of this kind. In the 6th century St Sergius was honoured in the West (Gregory of Tours, De gloria martyrum, 96). According to their Acta (which, however, have little authority), SS. Sergius and Bacchus were soldiers. In art they are most generally represented in military costume.

See Acta sanctorum (October), iii. 833-885; Analecta Bollandiana, xiv. 1895 (H. De)

**SERGIUS, the name of four popes.**

Sergius I., pope from 687 to 701, came of an Antiochene family which had settled at Palermo. He was elected after a fierce struggle between two other candidates, Paschal and Theodore. In the second year of his pontificate he baptized King Ceadwalla of Wessex at Rome. For rejecting certain canons of the Trullan (Quinisept) council of 662, Justinhian II. commanded his arrest and transportation to Constantinople, but the militia of Ravena and the Pentapolis forced the imperial protopapstarius to abandon the attempt to carry out his orders. Sergius was followed by John VI. as pope.

Sergius II., pope from 844 to 847, a Roman of noble birth, elected by the clergy and people to succeed Gregory IV., was forthwith consecrated without waiting for the sanction of the emperor Lothair, who accordingly sent his son Louis with an army to punish the breach of faith. A pacific arrangement was ultimately made, and Louis was crowned king of Lombardy by Sergius. He was a man of weak health, suffering much from gout, and abandoned the direction of affairs to unworthy persons, whose administration provoked many complaints. In this position Rome was ravaged, and the churches of St Peter and St Paul robbed, by Saracens (August 846). Sergius was succeeded by Leo IV.

Sergius III., elected pope by one of the factions in Rome in 898, simultaneously with John IX., was expelled from the city by his adversaries. Circumstances becoming more favourable, he reappeared in 904, seized the two claimants, Leo V. and Christopher, who were disputing the succession of Benedict IV., and had them strangled. His adherents rallied round the restitarius Theophylact, a powerful Roman functionary, and his wife Theodora. Sergius is reputed to have been the lover of Theodora’s daughter Marozia, by whom he is said to have had a son, who became pope as John XI. This is the beginning of the so-called “porncracy.” Unlike John IX. and his successors, Sergius was very hostile to the memory of Pope Formosus, and refused to recognize any of the ordinations celebrated by him, thus causing grave disorders. He also affected to consider as anti-popes, not only John IX., but also his successors down to and including Christopher. He restored the Lateran basilica, in 897. He died on the 14th of April 911, and was succeeded by Anastasius III.

Sergius IV., pope from 1009 to 1012, originally bore the name of Bucca porca (Os porcil). He was a mere help in the hands of the feudal nobility of the city; he was succeeded by Benedict VIII.

**SERGIYEVO, a town of Russia, in the government of Moscow, 44 m. by r. N.N.E. of Moscow. It has grown up round the monastery or lavra of Troitsko-Sergiyevskaya. It is situated in a beautiful country, the buildings extending partly over the hill occupied by the monastery and partly over the valley below. Including the suburbs it had, in 1884, 37,400 inhabitants, and 31,413 in 1900. Sergiyev has long been renowned for its manufacture of holy pictures (painted and carved), spoons, and other articles carved in wood, especially toys, which are sold to pilgrims who resort to the place to the number of 100,000 annually.

The Troitsk or Trinity monastery is the most sacred spot in middle Russia, the Great Russians regarding it with more veneration than even the cathedrals and relics of the Kremli at Moscow. It occupies a picturesque site on the top of a hill, protected on two sides by deep ravines and steep slopes. The walls, 340 ft. high, are fortified by nine towers, one of which is a prison for both civil and ecclesiastical offenders. Thirty-three churches, including the Troitskiy (Trinity) and Uspensky cathedrals, a bell-tower, a theological academy, various buildings for monks and pilgrims, and a hospital stand within the precincts, which are two-thirds of a mile in circuit. A small wooden church, erected by the monk Sergius, and afterwards burned (1391) by the Tatars, stood on the site now occupied by the cathedral of the Trinity, which was built in 1422, and contains the relics of Sergius, as well as ecclesiastical treasures of priceless value and a holy picture which has frequently been brought into use during battles and campaigns. The Uspensky cathedral was erected in 1385; close beside it are the graves of Tsar Boris Godunov (died in 1603) and his family. In the southern part of the monastery is the church of Sergius, beneath which are spacious rooms where 200,000 dinners are distributed gratis every year to the pilgrims. The bell-tower, 320 ft. high, has a bell weighing 64 tons. Several monasteries of less importance exist in the neighbourhood. In 1340 two brothers erected a church on the spot. The elder took monastic orders under the name of Sergius, and became famous among the peasants around. His monastery acquired great fame and became the wealthiest in middle Russia. Ivan the Terrible in 1561 made it the centre of the ecclesiastical province of Moscow. During the Polish invasion at the beginning of the 17th century it organized the national resistance. In 1608-1609 it withstood a sixteen months’ siege by the Poles; at a later date the monks took a lively part in the organization of the army which crushed the outbreak of the peasants. In 1683 Peter the Great took refuge here from the revolts of streltsi, or Muscovite military guards. The theological seminary, founded in 1744 and transformed in 1814 into an academy, reckoned Platon and Philaret among its pupils.

**SERIEMA, or Cariama, a South-American bird, sufficiently well described and figured in G. de L. Mearns’s work (Hist. nat. Brasiliæ, p. 293), posthumously published by De Laet in 1648, to be recognized by succeeding ornithologists, among whom M. J. Brisson in 1760 acknowledged it as forming a distinct genus Cariama, while Linnaeus regarded it as a second species of Palamedea (see Screamer), under the name of P. cristata, Englished by J. Latham in 1785 (Synopsis, v. 20) the “Crested Screamer,—an appellation since transferred to a wholly different bird. Nothing more seems to have been known of it in Europe till 1853, when Asara published at Madrid his**
SERIES

observations on the birds of Paraguay (Apuntamientos, No. 340), wherein he gave an account of it under the name of "Saria," which it bore among the Guarani,—that of "Cariama" being used by the Portuguese settlers, and both expressive of its ordinary cry.\(^1\) It was not, however, until 1809 that this very remarkable form came to be autotypically described scientifically. This was done by the elder Geoffroy St-Hilaire (Ann. du museum, xiii. pp. 369-370, pl. 26), who had seen a specimen in the Lisbon museum; and, though knowing it had already been received into scientific nomenclature, he called it anew Microdactylus marcgrassi. In 1811 J. K. W. Illiger, without having seen an example, renamed the genus Dickoleopus—a term which has since been frequently applied to—it placing in the curious congeries of forms having with little affinity which he called Alectorides. In the course of his travels in Brazil (1815-1817), Prince Max of Wied met with this bird, and in 1823 there appeared from his pen N. Act. Accad. L.-C. nat. curiosorum, xi. pt. 2, pp. 341-350, tab. xiv.) a very good contribution to its history, embellished by a faithful life-sized figure of its head. The same year Temimnick figured it in the Planche coloriée (No. 237). It is not easy to say when any example of the bird first came under the eyes of British ornithologists; but in the Zoological Proceedings for

fully covered with grey down, relieved by brown, and remain for some time in the nest. The food of the adult is almost exclusively insects, especially ants, grasshoppers, snails, lizards and snakes, but it also eats certain large red berries.

Until 1860 the Seriema was believed to be without any near relative in the living world of birds;\(^2\) but in the Zoological Proceedings for that year beating to the markings of the bird from the larger tail and the markings beneath take the form of bars rather than stripes, while the tail, eyes and legs are all black. In other respects the difference between the two birds seems to be inessential.

The few birds which have more exercised the taxonomer than this, and the reason seems to be plain. The Seriema must be regarded as the not greatly modified heir of some very old type, such as one may fairly imagine to have lived before many of the existing groups of birds had become differentiated, and it is probable that the extinct birds known as Stercorinidae, and in particular the fossil Phororochos from the Miocene of Patagonia, were closely allied to its ancestors. It is now placed in the family Carinidae of Gruidae birds (see Bird).

(SERPUS) (A. N.)

SERIES (a Latin word from serere, to join), a succession or sequence. In mathematics, the term is applied to a succession of arithmetical or algebraic quantities (see below); in geology it is synonymous with formation, and denotes a stage in the classification of strata, being superior to group (and consequently to bed, and some or horizon) and inferior to system; in chemistry, the term is used particularly in the form homologous series, to denote hydrocarbons of similar constitution and their derivatives which differ in empirical composition by a multiple of CH\(_2\), and in the form isologous series, applied to hydrocarbons and their derivatives which differ in empirical composition by a multiple of H\(_2\); it is also used in the form isomorphic series to denote elements related isomorphously. The word is also employed in zoological and botanical classification.

In mathematics a set of quantities, real or complex, arranged in order so that each quantity is definitely and uniquely determined by its position, is said to form a series. Usually a series proceeds in one direction and the successive terms are denoted by \(u_1, u_2, \ldots, u_n;\) we may, however, have a series proceeding in both directions, a back-and-forwards series, in which case the terms are denoted by

\[
\ldots, u_{-3}, u_{-2}, u_{-1}, u_0, u_1, u_2, u_3, \ldots
\]

or its general term may depend on two integers positive or negative, and its general term may be denoted by \(u_m, n;\) such a series is called a double series, and so on. The number of terms may be limited or unlimited, and we have two theories, (1) of finite series and (2) of infinite series. In the first the series itself mainly with the summation of a finite number of terms of the series; the notions of convergence and divergence present themselves in the theory of infinite series.

**Finite Series.**

1. When we are given a series, it is supposed that we are given the law by which the general term is formed. The first few terms of a series afford no clue to the general term; the series of which the first four terms are 1, 2, 4, 8, may be the series of which the general term is 2\(^n\); it may equally well be the series of which the general term is 2\(^{n+3}\); in fact we may construct an infinite number of series of which the leading terms shall be any assigned integers. The only case in which the series may be completely determined from its leading terms is that of a recurring series. A recurring series is a series in which the general term is connected by a linear relation; thus if we have a relation of the form

\[
a_{n+3} = a_{n+2} + 2a_{n+1} + a_n + a_{n-1} + \ldots + a_{n-k},\]

the series is said to be a recurring series with a scale of relation though taken from a genuine specimen; but little that can be called Ralline in character is observable therein. The same is to be said of the birds in captivity; men are curious, but a bird's possession undeniably shows it (cf. Proc. Zool. Society, 1881, p. 2).\(^3\)

A supposed fossil *Cariama* from the caves of Brazil, mentioned by Bonaparte (C.R. xii. p. 779) and others, has since been shown by Reichenbach (H. 1892, p. 32) to rest upon the misinterpretation of certain bones, which the latter considers to have been those of a Rheas.

6. Let \( u_n, v_n, u_{n+1}, v_{n+1} \) be a series of numbers real or complex, and let \( S_n \) denote \( u_1 + u_2 + \cdots + u_n \). We thus form a sequence of numbers \( S_1, S_2, \ldots, S_n \). This sequence may tend to a definite finite limit \( S \) or may diverge to infinity, i.e., the terms may be bounded or unbounded by a finite number, 0, respectively. In this case the series \( u_1 + u_2 + \cdots \) is said to be convergent or converging. If however the terms of the series are sufficiently large \( |S_n| \) can be made to exceed any assignable quantity, however large, the series is said to be divergent. If the sum is \( S \), then any finite limit according to the form of \( n \) the series is said to oscillate, and is also classed under the head of divergent series. The sum of \( n \) terms of the geometric series \( 1 + x + x^2 + \cdots = 1/(1-x) \) is \( 1 \). If \( x \) is less than unity, this series is convergent, and its sum is \( 1/(1-x) \). If \( x \) is greater than unity, the series is divergent (oscillatory). The series \( 1 + x + x^2 + \cdots \) is convergent for \( |x| < 1 \), where \( S_n \) is unity or zero, according as \( n \) is odd or even, is an example of an oscillating series. The condition of convergency may be also presented under the following form. Let \( r_n \) denote \( S_{n+1} - S_n \); i.e., the \( n \)th difference, and \( r_{n+1} = r_n \), etc. The terms may be positive and negative alternately. If the terms of the series may each be collected into a single term; thus all series may be regarded as belonging to one of two types, \( u_1 + u_2 + u_3 + \cdots \) in which the terms are all positive, or \( v_1 - v_2 + v_3 - \cdots \) in which the terms are alternately positive and negative.

7. An infinite series may contain both positive and divergent terms. The terms may be positive and negative alternately or they may increase in magnitude by some regular theorem. In this case the series may converge to a limit equal, but opposite in sign to the sum of the divergent series. Whether the terms of the series may each be collected into a single term; thus all series may be regarded as belonging to one of two types, \( u_1 + u_2 + u_3 + \cdots \) in which the terms are all positive, or \( v_1 - v_2 + v_3 - \cdots \) in which the terms are alternately positive and negative.

8. It is clear that if a series is convergent, it must tend to the limit zero as \( n \) is increased indefinitely. This condition though necessary is by no means sufficient for convergency. If the terms of a series are positive a series obtained by writing its terms in any other order is convergent and converges to the same sum. For if \( S_n \) denotes the sum of the first \( n \) terms of the series \( a_1 + a_2 + \cdots \), the number \( S_{n+1} \) of the next term, for any large number, we can choose numbers \( p \) and \( q \) such that \( S_{2n} > S_n \), so that \( S_n \) tends to the limit of sum of the original series.

9. The series \( u_1 + u_2 + u_3 + \cdots \) may each be divided through the terms of the series \( v_1 - v_2 + v_3 - \cdots \) converges. A series such that the series formed by the terms \( u_1 + u_2 + u_3 + \cdots \) is convergent is said to be absolutely convergent; when this is not the case the series is said to be semi-convergent or conditionally convergent. A series of complex numbers in which \( u_n = a_n + ib_n \) where \( a_n \) and \( b_n \) are real (i being \( -1 \)), is said to be convergent when the series \( a_1 + a_2 + a_3 + \cdots \) \( a_1 + a_2 + a_3 + \cdots \) \( a_1 + a_2 + a_3 + \cdots \) \( a_1 + a_2 + a_3 + \cdots \) separately convergent, and if they converge to \( A \) and \( B \) respectively the sum of the series is \( A + iB \). Such a series is said to be absolutely convergent when the sums of the moduli of the terms are positive, \( i.e., \sum (a_n^2 + b_n^2) \); convergent; this is sufficient but not necessary the same forms. For example we have the series \( 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} - \cdots \) the first of these converges, the second oscillates.

10. The series \( u_1 + u_2 + u_3 + \cdots \) may each be divided through the terms of the series \( v_1 - v_2 + v_3 - \cdots \) converges. A series such that the series formed by the terms \( u_1 + u_2 + u_3 + \cdots \) is convergent is said to be absolutely convergent; when this is not the case the series is said to be semi-convergent or conditionally convergent. A series of complex numbers in which \( u_n = a_n + ib_n \) where \( a_n \) and \( b_n \) are real (i being \( -1 \)), is said to be convergent when the series \( a_1 + a_2 + a_3 + \cdots \) \( a_1 + a_2 + a_3 + \cdots \) \( a_1 + a_2 + a_3 + \cdots \) \( a_1 + a_2 + a_3 + \cdots \) separately convergent, and if they converge to \( A \) and \( B \) respectively the sum of the series is \( A + iB \). Such a series is said to be absolutely convergent when the sums of the moduli of the terms are positive, \( i.e., \sum (a_n^2 + b_n^2) \); convergent; this is sufficient but not necessary the same forms. For example we have the series \( 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} - \cdots \) the first of these converges, the second oscillates.

There is an important distinction between absolutely convergent and conditionally convergent series. In an absolutely convergent series the sum is the same whatever the order of the terms; this is not the case with a conditionally convergent series. The two series \( 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} - \cdots \) and \( 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} - \cdots \) are examples of conditionally convergent series which sum is \( \frac{1}{2} \), but the sum \( \frac{1}{2} \) is not the same as the sum \( \frac{1}{2} \) of another series. This distinction is pointed out by B. Riemann and P. G. L. Dirichlet have shown that the terms of a semi-convergent series may be so arranged as to make the series converge to any assigned value or even to diverge. So if the terms of the series \( u_n \) are positive, we may find a sequence of series \( u_1 + u_2 + u_3 + \cdots \) whose terms are positive and obtained by comparing the series with some series whose convergence or divergence is readily established. If the series of positive terms \( u_1 + u_2 + u_3 + \cdots \) \( u_1 + u_2 + u_3 + \cdots \) \( u_1 + u_2 + u_3 + \cdots \) \( u_1 + u_2 + u_3 + \cdots \) is finite, then they are convergent or divergent together; if \( u_n \leq \frac{1}{n!} < u_n \leq \frac{1}{n!} \frac{1}{n!} \frac{1}{n!} \frac{1}{n!} \) and if \( u_n \) is convergent, then \( u_n \) is convergent; if \( u_n \) is convergent, then \( u_n \) is divergent, then \( u_n \) is divergent. By comparison with the ordinary geometric progression we obtain the
following tests. If \( \sum u_n \) approaches a limit \( l \) as \( n \) is indefinitely increased, \( \sum u_n \) will converge if \( l \) is less than unity and diverge if it is greater than unity (D'Alembert's test). Nothing is settled when the limit \( l \) remains a finite number as it approaches unity. The series then remains in an indeterminate form and approaches zero as \( n \) is indefinitely increased. If \( u_n \) approaches a limit \( l \), the series converges for \( l < 1 \) and diverges for \( l > 1 \). For \( l = 1 \) nothing is settled except for the case where \( l \) remains constantly less than unity as it approaches it; in this case the series diverges.

If \( f(n) \) is positive and decreases as \( n \) increases, the series \( \sum f(n) \) is convergent or divergent with the series \( \sum f(n) \) as \( n \) is any number greater than \( 2 \) (Cauchy's convergence test). By means of this theorem we can show that the series whose general terms are

\[
\frac{1}{n^2} \left( 1 + \frac{1}{n} + \frac{1}{n^2} + \frac{1}{n^3} + \cdots \right) = \frac{1}{n^2} \sum_{k=1}^{n} \frac{1}{k},
\]

where \( n \) denotes the number \( n \), \( \log n \) denotes log \( \log n \), and \( \log \log n \) denotes \( \log \log n \).

By comparison with these series, a criterion, known as the logarithmic criterion, has been established by J. J. Morgan and L. Bertrand. A. De Morgan showed that the formula

\[
\log (a + x) = \sum_{n=0}^{\infty} (-1)^n \frac{x^n}{n}
\]

put

\[
\log (\log x) = \sum_{n=0}^{\infty} (-1)^n \frac{x^n}{n^2},
\]

where \( \log y \) denotes \( \log \log x \). If the limit, when \( x \) is infinite, of the first of the functions \( p_n, p_{n+1}, \ldots \), whose limit is not unity, is greater than unity the series is convergent; if less than unity it is divergent.

In Bertrand's form we take the series of functions

\[
\frac{1}{n^2} \sum_{k=1}^{n} \frac{1}{k},
\]

If the limit, when \( n \) is infinite, of the first of these functions, whose limit is not unity, is greater than unity the series is convergent, if less than unity it is divergent. Other forms of these criteria may be found in Chrystal's Algebra, vol. ii.

11. Two or more absolutely convergent series may be added together, thus

\[
(u_1 + u_2 + u_3 + \cdots) + (v_1 + v_2 + v_3 + \cdots) = (u_1 + v_1) + (u_2 + v_2) + (u_3 + v_3) + \cdots,
\]

and the resulting series is absolutely convergent and its sum is the product of the sums of the two series. This was shown by Cauchy, who first explained the result by means of the absolute convergence. Abel has, however, shown that no function \( f(n) \) can exist such that the series \( \sum f(n) \) is convergent or divergent as \( \log f(n) \) is or is not zero.

12. Before considering a double series we must consider the case of a series extending backwards and forwards to infinity

\[
\ldots + u_1 + u_2 + u_3 + \ldots + u_4 + \ldots
\]

and the series resulting is absolutely convergent and its sum is the product of the sums of the two series.

13. A striking instance is furnished by the series

\[
\frac{1}{1 - x} = 1 + x + x^2 + x^3 + \cdots
\]

which is convergent, while its square

\[
(1 - x) = 1 - x + x^2 - x^3 + \cdots
\]

may be divergent. If F. K. L. Mertens has shown that the condition is that one of the two series should converge for all values of \( x \), and the other be absolutely convergent. Abel has shown that if \( \sum u_n \) converges at all, it converges to the product of \( \sum u_n \) and \( \sum v_n \). But more properly the multiplication of two series gives rise to a double series of which the general term is \( u_n v_n \).

14. It is easy to see that, if each of the terms \( u_n \) is positive and the series is convergent for any partial form of boundary, the sum will be convergent for any other form of boundary, and the sum will be then equal to that constant only that can exist such that in the first case the boundary is the curve \( f(x, y) = T \). Any other boundary \( f(x, y) = T \). Wholly within this we can draw a curve \( f(x, y) = T \), the first boundary and the second is wholly different from the first boundary. The sum is therefore independent of the form of the boundary. Such a series is said to be absolutely convergent, and similarly a doubly infinite series of positive and negative terms is absolutely convergent when the series is formed by taking all its terms positively is convergent.

15. It is readily seen that when the series is not absolutely convergent the sum will depend on the form of the boundary. Consider the case in which \( m \) and \( n \) are always positive, and the boundary is the rectangle formed by \( x = m, y = n, \) and the axes. Let the sum within this rectangle be \( S_mn \). This may have a limit when we first make \( n \) infinite and then \( m \); it may have a limit when we first make \( m \) infinite and then \( n \), but the limits are not necessarily the same; or there may be no limit in either of these cases but a limit depending on the ratio of \( m \) to \( n \), that is to say, on the shape of the rectangle.

When the product of two series is arranged in the form of a double sum

\[
\sum_{n=1}^{\infty} \sum_{m=1}^{\infty} u_n v_m = T, \quad \text{where} \quad \sum_{n=1}^{\infty} u_n = T_1, \quad \text{and} \quad \sum_{m=1}^{\infty} v_n = T_2,
\]

we obtain the product of the sums of the series. When we arrange the double sum in the form \( u_0 + (u_0 + u_1 + u_2 + \cdots) = u_0 + u_1 + u_2 + \cdots + u_n + \cdots \), we are summing over the triangle bounded by the axes and the straight line \( x = y = T \), and the result is not necessarily the same if the terms are not all positive. For full particulars concerning multiple series the reader may consult E. Goursat, Cours d'analyse, vol. i; G. Chrystal, Algebra, vol. ii; or T. J. J. Bromwich, The Infinite Theory of Series.

16. In the series so far considered the terms are actual numbers, or, at least, if the terms are functions of a variable, we have concerned ourselves with the convergence of the series as a whole. The case in which, however, the terms are functions of the variable \( x \) is generally very different. The convergence of the series depends on the behaviour of the function \( f(x) \) in the neighbourhood of a point where it is supposed that \( S(x) \) is a continuous function of \( x \), and it is this which makes the series a powerful tool in the theory of functions.

17. If for any value of \( x \) the series

\[
\sum_{n=1}^{\infty} u_n + u_{n+1} + \cdots + u_{n+k} + \cdots
\]

converges it is possible to find an integer \( n \) such that \( |S(x) - S_n(x)| < \epsilon \), \( |S(x) - S_m(x)| < \epsilon \), and both \( |S(x) - S_n(x)| < \epsilon \), \( |S(x) - S_m(x)| < \epsilon \), where \( \epsilon \) is an arbitrary assigned positive quantity, and we may therefore say that the series converges uniformly for all values of \( x \), whose representative points lie within a certain area called the "domain of convergence" and within this area defines a function which we may call \( S(x) \). It might be supposed that \( S(x) \) was necessarily a continuous function of \( x \), but this is not the case. For G. Stolz and F. L. Seidel (1848) independently discovered that in the neighbourhood of a point of discontinuity the convergence is infinitely slow and thence arises the notion of uniform convergence and non-uniform convergence.
The series is then said to converge uniformly throughout this region.

As $s$ approaches the value $s_0$, $n$ increases as $|s-s_0|$ diminishes and becomes indefinitely great as $|s-s_0|$ becomes indefinitely small the series is said to be non-uniformly convergent at the point $s_0$.

A function represented by a series is continuous throughout any region in which the series is uniformly convergent; there cannot be a discontinuity with uniform convergence; on the other hand there may be continuity and non-uniform convergence. If $u_1(s) + u_2(s) + \ldots$ is uniformly convergent we shall have $f(s) = u_1(s) + u_2(s) + \ldots$ of a function $f(s)$ of the point $s$, and we shall also have $\frac{d}{ds}f(s) = \frac{d}{ds}u_1(s) + \frac{d}{ds}u_2(s) + \ldots$ if the series $\frac{d}{ds}u_1(s) + \frac{d}{ds}u_2(s) + \ldots$ is uniformly convergent.

Uniform convergence is essentially different from absolute convergence; neither implies the other (see Function). 18. A series of the form $a_0 + a_2 + a_4 + \ldots$, in which $a_0, a_1, a_2, \ldots$ are all of the same kind, is called a $\phi$-series.

In the case of a power series there is a quantity $R$ such that the series converges if $|s| < R$, and diverges if $|s| > R$. A circle described from the origin as centre and radius $R$ is called the circle of convergence. A power series that does not converge at all in the region $R < |s| < \infty$ is called divergent.

The circle of convergence may be of infinite radius as in the case of the series for $\log z$, viz. $z - \frac{1}{3}z^3 + \frac{1}{5}z^5 - \ldots$. In this case the series converges over the whole of the $z$ plane. Or its radius may be zero as in the case of the series $1/(1 + z)$ (converge absolutely in the $z$ plane), $|z| < 1$, and diverge in the $z$ plane, $|z| > 1$.

Theorems may be found usually, but not always, from the condition that a series converges absolutely if $|a_n|/|a_{n+1}| < 1$, and diverges if $|a_{n+1}|/|a_n| > 1$.

19. Series of the type $a_0 + a_1 \cos z + a_2 \cos 2z + \ldots + b_1 \sin z + b_2 \sin 2z + \ldots$ where the coefficients $a_0, a_1, a_2, b_1, b_2, \ldots$ are independent of $z$ are called Fourier series. They are of immediate importance both from the point of view of analysis and also because of their applications to physical problems. For the consideration of these series and the expansion of arbitrary functions in series of this type see Function and Fourier's Series. 20. The general problem of the development of functions in infinite series of various types see Function.

21. The product of an infinite number of factors formed in succession according to any given law is called an infinite product.

The infinite product $P_{n=0}^{\infty} (1+t_n)(1-t_n)$ is said to be convergent when $L_{n=0}^{\infty} t_n$ tends to a definite finite limit other than zero. If $L_{n=0}^{\infty} t_n$ is zero or infinite or tending to different finite values according to the form of $P$ the product is said to be divergent.

The condition for convergence may also be stated in the following form. (1) The value of $P_n$ remains finite and different from zero however great $n$ may become, and (2) $L_{n=0}^{\infty} p_n$ and $L_{n=0}^{\infty} p_n p_n$ must be equal, where $p_n = t_n$ and $p_n + 1$ are equal to 1. Since in particular $L_{n=0}^{\infty} t_n = L_{n=0}^{\infty} t_n + 1$, we must have $L_{n=0}^{\infty} t_n = 0$. Hence after some fixed term $t_1, t_2, \ldots$ or their modulus in the case of complex quantities, must diminish continually down to zero. Since we may regard the finite number of terms in which $|t_n| > 1$, without affecting the convergence of the whole product, we may regard as the general type of a convergent product $(1 + u_n)(1 + u_n + \ldots) (1 + u_n + \ldots)$ where $|u_n|, |u_n|, \ldots$ are all less than unity and decrease continually to zero.

A convergent infinite product is said to be absolutely convergent where the order of its factors is immaterial. Where this is not the case its absolute convergence is called convergent.

The necessary and sufficient condition that the product $(1 + u)(1 + u) + \ldots$ should converge absolutely is that the series $|u| + |u| + \ldots$ should be convergent. If $u_1, u_2, \ldots$ are all of the same sign, then, if the series $u_1 + u_2 + \ldots$ is divergent, the product is infinite if $u_1 + u_2 + \ldots$ are all positive and zero if they are all negative.

If $u_1 + u_2 + \ldots$ is a semi-convergent series the product converges, but not absolutely, or diverges to the value zero, according as the series $u_1 + u_2 + \ldots$ is convergent or divergent. These results may be deduced by considering, instead of $P_{n=0}^{\infty} t_n$, the series $\log (1 + u) + \log (1 + u) + \ldots$.
SERJEANT, or SERGEANT (from Lat. serviens, servire, to serve, through O. Fr. sergeant, sergeant, mod. Fr. sergent), the title (1) of a non-commissioned officer in the army and of a subordinate officer of police; (2) of certain officials of the royal household (see Serjeants-at-arms, below). (3) The name was also given formerly to the highest rank of barristers in England and Ireland (see SERJEANT-AT-LAW). In the middle ages serjeants had a confused nomenclature all connoting the same office, from the servientes de paue et mensa, the domestic servant of a monastery, to the servientes de armis, the serjeants-at-arms (Fr. sergeants d'armes) of monarchs, the serjeants (servientes) who were the apparitors of the French king, and vassals who held by a special service (serjeanty, q.v.). The serjeants (fratres servientes) formed also an important division of the great military orders (see SAINT JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF, AND TEMPLARS). Du Cange (Glossarium, s. v. "Serviens") gives many other instances.

1. Military Title.—In its early military uses the word implied a subordinate, and it is not clear how it came to be used for a minor commander. The "serjeants" of ordinary medieval armies were the heavy-armed (generally mercenary) cavalry or men-at-arms. In the 15th century it became usual to subdivide troops of all sorts into groups of dissimilar combatants, graded amongst themselves according to military or social importance. Thus a "lance," or group, might consist of a heavy-armed lancer (man-at-arms), a mounted and a foot archer and an armed valet, and the "serjeant" would be its most important member. But the general evolution of armies led to their being classed by arms and grouped in more homogeneous regiments. Under such an organization the title of the group leader lost its cavalry significance and became specifically the designation of an infantry rank. From the cavalry it disappeared altogether, the titles "corporal of horse," "marchal des logis," &c., taking its place. In 16th and 17th century armies the title serjeant is found amongst the highest ranks of an army. With a partial return to the old meaning it signifies, in all its forms, an expert professional soldier, the serjeant of a company, the serjeant-major of a regiment and the serjeant-major-general of the army (the last being the originals of the modern ranks, major and major-general) being charged with all duties pertaining to the arraying, camping and drill of their units.

In modern armies the word serjeant is used of a non-commissioned officer ranking between corporal and serjeant-major. A "lance-serjeant" is a corporal holding the appointment and performing the duties, but not having the rank of serjeant. The serjeant-major in the British service is a "warrant-officer, although in the cavalry and artillery the ranks of "troop," "squadron" or "battery serjeant-major" are non-commissioned and corresponding to our lance-serjeants. The last officer is the senior non-commissioned officer of a company, and has, besides his duties in the colour-party, the pay and accounting work of his unit. The former "corporal of horse" and "corporal-major" still survive in the British Household Cavalry. In Germany, Austria and Russia the regimental serjeant-majors of infantry and cavalry are styled Feldwebel and Wachtmeister respectively, while in France the titles are adjudant and marchal des logis or marchal des logis chef.

2. Serjeants-at-Arms.—In the British royal household there are eight serjeants-at-arms, whose duties are ceremonial; they have to be in attendance only at drawing-rooms, levees, state balls and state concerts. There are also two other serjeants-at-arms to whom special duties are assigned, the one attending the Speaker of the House of Commons and the other the lord chancellor in the House of Lords, carrying their maces and executing their orders. The Speaker's serjeant-at-arms is the disciplinary officer of the House of Commons, whose duty it is to expel members at the order of the Speaker and to arrest and keep in custody those persons condemned to this punishment by the authority of the House. The serjeants-at-arms have no special duty of attending the Speaker but they wear any naval, military or civil uniform to which they may be entitled, or the court dress of those holding legal appointments, but not entitled to wear robes, i.e. a suit of black cloth, with knee-breeches, lace bands and ruffles, a black silk cocked hat with rosette and steel loop and a sword. A silver collar of office is worn on special occasions. This costume, with the chain, is that worn by the serjeants-at-arms in the House of Lords and the House of Commons always.

SERJEANT-AT-LAW, the name (see above) given to what was formerly an order of the higher ranks of the Bar at the English or Irish bar. The title is derived from the use of the words serjeant or servientes ad legem, as distinguished from apprenticus ad legem, or utter barrister, who probably originally obtained his knowledge of law by serving a kind of apprenticeship to a serjeant. When the order of serjeants was instituted is unknown, but it certainly dates from a very remote period. The authority of serjeants over counters or counsors (i.e. pleaders, those who frame counts in pleading) is treated in the Mirror of Justices, and they are named in 3 Edw. I. c. 29. They may possibly have been the representatives of the conteurs mentioned in the great customary of Normandy. The position of the serjeant has become altered. In trade, when Chaucer wrote, one of the characters in the Canterbury Tales is "A serjeant of the law, wary and wise, That often had y-been at the parvis." Serjeants (except king's serjeants) were created by writ of summons under the great seal, and wore a special and distinctive dress, the chief feature of which was the coif, a white lawn or silk skull-cap, afterwards represented by a round piece of black silk at the top of the wig. They enjoyed a social precedence after knights chorlors and before counsors of the Bath and other orders. In this they differed from king's counsel, who had simply professional as distinguished from social rank. Socially the serjeant had precedence, professionally the king's counsel, unless indeed, as was often the case, a patent of precedence was granted to the former. The serjeants at the Irish bar had precedence next after the law officers of the crown. Till past the middle of the 19th century a limited number of the serjeants were called "king's (queen's) serjeants." They were appointed by patent and summoned to parliament. Until 1824 the two senior king's serjeants had precedence of even the attorney-general and solicitor-general. It was the custom for serjeants on their appointment to give gold rings with mottoes to their colleagues. Down to 1845 the order enjoyed a very valuable monopoly of practice. The serjeants had the right of exclusive audience as leading council in the Court of Common Pleas. In 1834 a royal mandate of William IV. attempted to abolish this privilege, but in 1840 the judicial committee of the privy council declared the mandate informal and invalid. The monopoly was finally abolished in 1843 by Act of Parliament. For at least 600 years the judges of the superior courts of common law were always serjeants, but after 1873 the Judicature Act 1873 no person appointed a judge of the High Court of Justice or the Court of Appeal was required to take or have taken the degree of serjeant-at-law. The serjeants had their own inn of court known as Serjeants' Inn, which was formerly in two divisions, one in Fleet Street and one in Chancery Lane. In 1758 the members of the former joined the latter. In 1877 the society was dissolved, the inn sold to one of the members and the proceeds divided among the existing serjeants. The order is now extinct.

See Serviens ad Legem, by Mr Serjeant Manning; and The Order of the Garter, by Mr Serjeant Fulling.
renders scarcely distinguishable from those of the rent-paying tenant or socager. Serjeants, as Miss Bateson has expressed it, "were neither always military nor always agricultural, but might approach very closely the service of knights or the service of farmers. . . . The serjeanty of holding the king's head when he made a rough passage across the Channel, of pulling a rope when his vessel landed, of counting his chesmen on Christmas day, of bringing fuel to his castle, of doing his carpentry, of finding his potheers, of forging his irons for his ploughs, of tending his garden, of nursing the hounds gored and injured in the hunt, of serving as veterinary to his sick falcons, such and many others might be the ceremonial or menial services due from a given serjeanty." The many varieties of serjeanty were afterwards increased by lawyers classing for convenience under this head such duties as those of escort service to the abbess of Barking, or of military service on the Welsh border by the men of Archenfield.

Serjeants (servientes) are already entered as a distinct class in Domesday Book (1086), though not in all cases differentiated from the barons, who held by knight-service. Sometimes, as in the case of three Hampshire serjeants—those of acting as king's trumpeter, of wardship, and of king's garden at Winchester—in the great roll in Winchester Castle—the tenure can be definitely traced as far back as Domesday. It is probable, however, that many supposed tenures by serjeanty were not really such, although so described in returns, in inquests after death, and other records. The simplest legal test of the tenure was that serjeants, though liable to the feudal exactions of wardship, &c., were not liable to scutage; they made in place of this exact special composition with the crown.

The gern of the later distinction between "grand" and "petty" serjeanty is found in the Great Charter (1215), the king there renouncing the right of prerogative wardship in the case of those who held of him by the render of small articles. The legal doctrine that serjeants were (a) inalienable, (b) impalatable, led to the "arrestation," under Henry III., of serjeants the lands of which had been partly alienated, and which were converted into socage tenures, or, in some cases, tenures by knight-service. Gradually the gulf widened, and "petty" serjeants, consisting of renders,1 together with serjeants held of mesne lords, sank into socage, while "grand" serjeants, the holders of which performed their service in person, became alone liable to the burden of wardship and marriage. In Littleton's Tenures this distinction appears as well defined, but the development was one of legal theory.

When the military tenure of knight-service was abolished at the Restoration (by 12 Charles II., cap. 24), that of grand serjeanty was retained, doubtless on account of its honorary character, it being then limited in practice to the performance of certain duties at coronations, the discharge of which is a right which has always been coveted, and the earliest record of which is that of Queen Eleanor's coronation in 1236. The most conspicuous are those of champion, appurtenant to the Dymokes' manor of Scrivelsby, and of supporting the king's right arm, appurtenant to that of Worksop. The latter duty was performed at the coronation of King Edward VII. (1902).

The meaning of serjeant as a household officer is still preserved in the king's serjeants-at-arms, serjeant-surgeons and serjeant-trumpeter. The horse and foot serjeants (servientes) of the king's host in the 12th century, who ranked after the knights and were more lightly armed, were unconnected with tenure. The best summary of tenure by serjeanty is in Pollock and Maitland's History of English Law; McKechnie's Magna Carta (1905) should also be consulted; and for Domesday the Victoria History of England, vol. i. The best list of serjeants is in the Red Books of the Exchequer ("Rolls" series), but the Testa de Nevill (Record Commission) contains the most valuable records concerning them. Boult's Tenures is useful, but its modern editions very uncritical. Within the scope of an "Introduction to Crown Claims" (J. H. R.)

SERMON (Lat. sermo, a discourse), an oration delivered from a pulpit with fullness and rhetorical effect. Pascal, than whom

1 Usually a bow, sword, dagger or other small thing belonging to war.

SERMON

(22)

XXIV.
SEROUX D'AGINCOURT

writer of sermons whom the British race has produced. His matchless collection of discourses delivered at Golden Grove, The Enlouisé, was published in 1655-1657. The fault of the 17th-century sermon was a tendency, less prominent in Jeremy Taylor than in any other writer, to dazzle the audience by a display of false learning and by a violence in imagery; the great merit of its literary form was the fullness of its vocabulary and the richness and melody of style which adorned it at its best. Some of the most remarkable divines of this great period, however, are scarcely to be mentioned as successful writers of sermons. At the Restoration, pulpit oratory in England became drier, less picturesque and more sententious. The great names at this period were John Durand Barrow (1616-1668), and the literary work of Benjamin Hoadly (1676-1741) has a place in history, and those of Joseph Butler (1692-1753), the Rolls Sermons of 1726, have great historical importance. Thomas Boston's (1676-1732) memory has been revived by the praise of Stevenson, but his zeal was far exceeded by that of John Wesley (1703-1791), who preached 40,000 sermons, and by that of George Whitefield (1714-1770).

Of all countries, however, France is the one which has shown most brightly in the cultivation of the sermon. In the 14th century Gerson (1363-1429) seems to have been the earliest divine who composed and preached French, but his example was not followed by any man of equal genius. It was the popular movement of the Reformation, which made the sermon a piece of literature, on the lips of Jean Calvin (1509-1564), Pierre Viret (1511-1571) and Théodore de Bèze (1519-1603). With these sermon Protestant discourses may be contrasted the beautiful, but somewhat euhemeristical sermons of St. François de Sales (1565-1622), full of mystical imagery. Father Claude de Lingendes (1591-1666) has been looked upon as the father of the classic French sermon, although his own concequences were invariably written in Latin. Because of the value of his works, the school of Bourdaloue and Bossuet. In the great body of noble religious eloquence delivered from French pulpits during the 17th century, the first place is certainly held by the sermons of J. B. Bossuet (1627-1704), who remains perhaps the greatest preacher whom the world has ever seen. His six Oraisons Funèbres, the latest of which was delivered in 1687, form the most majestic existing type of this species of literature. Around that of Bossuet were collected other noble names: Louis Bourdaloue (1632-1704), whom his contemporaries preferred to Bossuet himself; Esprit Flechier (1632-1710), the politest preacher who ever occupied a Parisian pulpit; and Jules Mascaron (1634-1703), in whom all forms of eloquence were united. A generation later appeared Baptiste Massillon (1663-1742), who was to Bossuet as Racine to Corneille; and Jacques Saurin (1677-1730), whose evangelical sermons were delivered at the Hague. These are the great classic preachers whose discourses continue to be read, and to form an inherent part of the body of French literature. There was some revival of the art of the sermon at Versailles a century later, where the Abbé Maury, whom it has often been mentioned above, preached with vivid eloquence between 1770 and 1786. Pierre Enlouët (1726-1783), whom Diderot and Mme Roland greatly admired, held a similar place, at the same time, in Paris. Since the end of the 18th century, although a great number of volumes of sermons have been and continue to be published, and although the pulpit holds its own in Protestant and Catholic countries alike, for purposes of exhortation and encouragement, it cannot be said that the sermon has in any way extended its influence as a form of pure literature. It has, in general, been greatly shortened, and the ordinary sermon of to-day is no longer an elaborate piece of carefully balanced and ornamental literary architecture, but a very simple and brief homily, not occupying the listener for more than some ten minutes in the course of an elaborate service.

In Germany, the great preachers of the middle ages were Franciscans, such as Brother Bertold of Regensburg (1220-1272), or Dominicans, such as Johann Tauler (1290-1361), who preached in Latin. The great period of vernacular preaching lasted from the beginning of the 16th to the end of the 17th century. Martin Luther was the most ancient type of early Reformation preacher, and he was succeeded by the mystic Johann Arndt (1555-1621). Then came the epoch of Bossuet and the German Gerson, to whom the heart and imagination of the young were turned, and France, by the example of which, the young brothers who had been left orphans, was appointed a farmer-general by Louis XV. In 1777 he visited England, Germany and Holland; and in the following year he travelled through Italy, with the view of exploring thoroughly the remains of ancient art. He afterwards settled at Rome, and devoted himself to preparing the results of his researches for publication. He died on the 24th of September 1814, leaving the work, which was being issued in parts, unfinished; but it was carried on by J. M. Genet, and published complete under the title L'Historie pour les monuments, depuis sa décécé au quinzième siècle jusqu'à son renouvellement au seizième siècle (6 vols., with 375 plates, Paris, 1823). An English translation by Owen Jones was published in 1847. In the year of his death Seroux d'Agincourt published in Paris a Recueil de fragments de sculpture antique, en terre cuite (1 vol. 410).

SEROW, or SARAU, the Himalayan name of a goat-like antelope of the size of a donkey, nearly allied to the goral (g.r.) of the same region, but considerably larger, and with small face-glands. The Himalayan animal is a local race of the Sumatran Nemorhaestrus, and the name serow is now extended to embrace all the species belonging to the genus, the range of which extends from the Himalaya to Burma, the Malay Peninsula and Sumatra in one direction, and to Tibet, China, Japan and Formosa in another. Serows inhabit scrub-clad mountains, at no great elevation. (R. L. *)

SERPA PINTO, ALEXANDRE ALBERTO DE LA ROCHA (1846-1900), Portuguese explorer in Africa, was born at the castle of Polichras, on the Douro, on the 10th of April 1846. Entering the army in 1864, he served in Mozambique, and in 1869 took part in an expedition against tribes in revolt on the lower Zambezi. In 1877 he and Capitans Capello and Ivens of the Portuguese navy were sent on an expedition to south central Africa. The explorers left Benguela in November 1877 for the interior, but Serpa Pinto soon parted from his colleagues, who went north, while Serpa Pinto continued east. He crossed the Kwando in June 1878, and in August reached Lialui, the Barotse capital on the Zambezi, where he received help from the Rev. F. Coillard which enabled him to continue his journey down the river to the Victoria Falls, whence he turned south, arriving at Pretoria on the 11th of February 1879. He was the fourth explorer to traverse Africa from west to east, and the first to lay down with approximate accuracy the route between Bihe and Lialui. Among other outstanding rewards the Royal Geographical Society of London awarded him (1881) the Founder's medal. The account of his travels appeared in English under the title How I crossed Africa (2 vols., London, 1881). In 1884 he attempted, with less success, the exploration of the region between Mozambique and Lake Nyasa. Appointed governor of
SERPENTINE

Mozambique in 1889, he organized an expedition with the object of securing for Portugal the Shiré highlands and neighbouring regions, but the vigorous action of the British agents (John Buchanan and H. H. Johnston) frustrated this design (see AFRICA, § 5). Shortly afterwards Serpa Pinto returned to Lisbon and was promoted to the rank of colonel. He died on the 28th of December 1900.

SERPENT (Lat. serpens, creeping, from serpent; cf. “reptile” from repere, Gr. ἐπέρευ, a synonym for reptile or snake (see Reptile, and Snakes), now generally used only of dangerous varieties, or metaphorically. See also SERPENT-Worship below.

In music the serpent (Fr. serpent, Ger. Serpent, Schlangenrohr, Ital. serpentone) is an obsolete bass wind instrument derived from the old wooden cornets (Zinken), and the progenitor of the bass-horn, Russian bassoon and ophicleide. The serpent is composed of two pieces of wood, hollowed out and cut to the desired shape. They are so joined together by gluing as to form a conical tube of wide calibre with a diameter varying from a little over half an inch at the crook to nearly 4 in. at the wider end. The tube is covered with leather to ensure solidity. The upper extremity ends with a bent brass tube or nozzle, to which the triangular mouthpiece is attached; the lower end does not expand to form a bell, a peculiarity the serpent shared with the cornets.

The tube is pierced laterally with six holes, the first three of which are covered with the fingers of the right hand and the others with those of the left. When all the holes are thus closed the instrument will produce the following sounds, of which the first is the fundamental and the rest the harmonic series founded thereon:

Each of the holes on being successively opened gives the same series of harmonics on a new fundamental, thus producing a chromatic compass of three octaves by means of six holes only. The holes are curiously disposed along the tube for convenience in reaching them with the fingers; in consequence they are of very small diameter, and this affects the intonation and timbre of the instrument adversely. With the application of keys to the serpent, which made it possible to place the holes approximately in the correct theoretical position, whereby the diameter of the holes was also made proportional to that of the tube, this defect was remedied and the timbre improved.

The serpent was, according to Abbé Leboué (1), the outcome of experiments made on the corno, the bass cornet or Zinke, by Edmé Guillame, canon of Auxerre, in 1590. The invention at once proved a success, and the new bass became a valuable addition to church concerted music. More especially in France, in spite of the serpent’s harsh, unpleasant tone. Meroni (1636) describes and figures the serpent of his day in detail, but it was evidently unknown to Praetorius (1618). During the 18th century the construction of the instrument underwent many improvements, the tendency being to make the unwieldy windings more compact. At the beginning of the 19th century the open holes had been discarded, and as many as fourteen or seventeen keys disposed conveniently along the tube. Gerber, in his Lexicon (1790), states that in 1780 a musician of Lille, named Régillo, making further experiments on the serpent, produced a bass horn, giving it the shape of the bassoon for greater portability; and Frichot, a French refugee in London, introduced a variant of brass which rapidly became the favourite for the “bass horn” or “bass russe” in English military bands. On being introduced on the continent of Europe, this instrument was received into general use and gave a fresh impetus to experiments with basses for military bands, which culminated first in the ophicleide (q.v.) and ultimately in the valuable invention of the piston or valve.

Further information as to the technique and construction of the serpent may be gained from Joseph Fröhlich’s excellent treatise

1 See Mémoire concernant l’histoire ecclesiastique et civile d’Auxerre (Paris, 1828), II. 189.

SERPENTARIUS, or Ophiuchus, in astronomy, a constellation of the northern hemisphere, anciently named Aesculapius, and mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.). According to the Greek fables it variously represents: Carnabon (or Charnabon), king of the Getae, killing one of the dragons of Triptolemus, or Heracles killing the serpent at the river Sangarius (or Sagaris), or the physical Asclepius (Aesculapius), to denote his skill in curing snake bites. Ptolemy catalogued 30 stars in Serpens as Serpentis, and Hevelius 40. "New" stars were observed in 1604 and 1848.

SERPENTINE, in geometry, a cubic curve described by Sir Isaac Newton, and given by the cartesian equation $y(a^2+x^2)=a^3x$. The origin is a point of inflection, the axis of $x$ is an asymptote, and the curve lies between the parallel lines $2y=a^3b$.

SERPENTINE, a mineral which, in a massive and impure form, occurs on a small scale as a rock constituent, and which, as a mineral of variegated colour, is often cut and polished, like marble, for use as a decorative stone. It is generally held that the name was suggested by the fancied resemblance of the dark mottled green stone to the skin of a serpent, but it may possibly refer to some reputed virtue of the stone as a cure for snake-bite. Serpentine was probably, at least in part, the $αλύς$ $οφίνυς$ of Dioscorides and the $οφίλαη$ of Pliny; and this name appears in a latinized form as the serpentaria of G. Agricola, writing in the 16th century, and as the $λαπις$ $σερπεντίνης$ and $μαρμορ$ $σερπεντίνιον$ of other early writers. Italian sculptors have sometimes termed it $ρονοκία$ in allusion to its resemblance to the skin of a frog.

Although popularly called a "marble," serpentine is essentially different from any kind of limestone, in that it is a magnesium silicate, associated however, with more or less ferrous silicate. Analyses show that the mineral contains $\text{H}_{2}\text{MgSi}_{2}\text{O}_{5}$, and if the water be regarded as constitutional the formula may be written $\text{Mg}_{2}\text{Si}_{2}\text{O}_{5}\text{H}_{2}\text{O}$ (MgOH). Serpentine occurs massive, fibrous, lamellar or granular, but never crystallized. Fine pseudomorphs having the form of olivine, but the composition of serpentine, are known from Snarum in Buskerud, Norway, the crystals revealing their character by containing both serpentine and olivine. The alteration of rocks rich in olivine has given rise to much of the serpentine occurring as rock-masses (see PETROGRAPHT E). Studied microscopically, the change is seen to proceed from the surface and from the irregular cracks of the olivine, producing fibres of serpentine. The iron of the olivine passes more or less completely into the ferric state, giving rise to grains of magnetite, which form a black dust, and may ultimately yield scales of haematite or limonite. Considerable increase of volume generally accompanies serpentinization, and thus are produced textures which afford passage for the agents of alteration, resulting in the formation of an irregular mesh-like structure, formed of strings of serpentine enclosing kernels of olivine in the meshes, and this olivine may itself ultimately become serpentinized. Serpentine may also be formed by the alteration of other non-aluminous ferro-magnesian silicates such as enstatite, augite or hornblende, and in such cases it may show microscopically a characteristic structure related to the cleavage of the original mineral, notably lozenge-shaped in the case of hornblende. Many interesting pseudomorphs of serpentine were described by Professor J. D. Dana from the Tilly Foster iron-mine, near Brewster, New York, U.S.A., including some remarkable specimens with cubic cleavage.

The purest kind of serpentine, known as "noble serpentine," is generally of pale greenish or yellow colour, slightly translucent, and breaking with a rather bright conchoidal fracture. It occurs chiefly in granular limestone, and is often accompanied by forsterite, olivine or chondrodite. The hardness of serpentine is between 3 and 4, while the specific gravity varies from 2·5 to 2·65. A green serpentine of the exceptional hardness of 6,
SERPENT-WORSHIP

from its occurrence near Karystos in Euboea. Foliated serpentine is usually termed marmorite—a name given by G. T. Nuttall, from marmoidea (to glisten) in reference to the highly lustrous or flaky serpentine supposed to occur in the Antigorio valley north of Donodossola in Piedmont is called antigorite, having been named in 1846 by M. E. Schweizer, after whom a somewhat similar mineral is termed schweizerite. Antigorite has been studied by Professor T. G. Bonney and Miss C. Raisin (Quart. Journ. Geol. Soc., lxi, 1905, p. 609; lxi, 1908, p. 152).

An apple-green translucent serpentine passes under the name of williamsite, having been so called by C. U. Shepard in honour of its discoverer L. White Williams, of West Chester, Pennsylvania, where this variety occurs.

"Green serpentine" is the impure massive kind which occurs in rock-masses and is extensively worked as "serpentine-marble." It is sometimes veined with steatite, or magnesite, and may contain scattered crystals of diabase, bronzite or bastite (an altered rhombic pyroxene), which by schillerization may present a metallic lustre. In England the chief localities of serpentine are in Cornwall, especially in the Lizard district, where it is quarried and carved into mantelpieces, columns, vases and other ornaments. Much of it presents a rich red or brown colour, often mottled and sometimes veined. Professor Bonney has shown that it has been largely derived from A thin green-serpentine occurs near Holyhead in Anglesey. A beautiful serpentine, generally mottled red and green, with veins of steatite, is found at Portsoy in Banffshire, Scotland, and was used for pillars in the great hall at Versailles. Serpentine containing chalcedony is found in the Shetland Islands.

The rock called "opicalcite" consists of an intimate association of serpentine with limestone, often forming an ornamental stone which is beautifully clouded and zoned with various shades of green. It generally results from the metamorphism of an impure dolomitic limestone, the impurities having crystalized as new minerals which become altered to serpentine. Pseudo-morphs of serpentine occur after forsterite. The best known serpentine marble of the British Isles occurs in Connemara in Galway, Ireland, and passes in trade under the name of "Irish green." Opicalcite are also developed in various parts of Scotland, and the green pebbles found in Iona belong to this type of rock. The famous eozonal marble of Canada is also of similar character.

In Saxony common serpentine is largely worked at Zöblitz near Marienberg and Waldheim. The rock of Zöblitz, mentioned by G. Agricola in the 16th century, is usually of dull green or brownish colour and sometimes contains dark red Bohemian garnet or pyrope (q.v.). It was used in the musaeum of Prince Albert at Frogmore, Windsor, and in Abraham Lincoln's monument at Springfield, Illinois, U.S.A. Italy is rich in serpentine, the best-known being the serdi di Prato, which has been quarried for centuries at Monteferrato near Prato in Tuscany, and has been largely used in ecclesiastical architecture in Florence, Prato and Pistole. Much serpentine is found near Genoa and Levanto. The verde di Pegli comes from Pegli not far from Genoa, while the verde di Genoa is a breciated serpentinous limestone from Pietra Lavezzara. Serpentine occurs also at many localities in the Apennines, in Elba and in Corsica. The term ophiolite has been vaguely used to include not only serpentines but many other rocks associated with the Italian serpentines. Verde antico is a brecciated serpentine with fragments of limestone, originally brought by the Romans from Atrax in Thessaly, and called lapis atracius. It is sometimes known as "serpentine antico, or, following the old French, "serpentine antique." The term serpentine is often improperly applied to the ancient green porphyry of Lacoia in the Peloponnesus (porfido serpentine verde). True serpentine occurs at numerous localities in the Alps and in France, an elegant variety being quarried at Épinal in the Vosges, whilst a fine opicalcite is worked at St Véran and Maurins, dep. Hautes-Alpes. The Ronda Mountains in Spain also yield serpentine.

In North America serpentine is so widely distributed that only a few localities can be specified. It is found in St Lawrence county, Essex county and Warren county, New York, and also on Staten Island; at Montville and Hoboken in New Jersey; at Newport, Rhode Island; at Newbury and Newburyport, Massachusetts; Texas, Lancaster county, and West Chester, Chester county, Pennsylvania; at many localities in Vermont, and in California, Connecticut, Georgia, Maine, Maryland, Michigan, New Mexico, North Carolina and Washington.

For American serpentine see Stones for Building and Decoration, by George P. Merrill (New York, 1905); and for serpentine asbests see the same author's Non-metallic Minerals (New York, 1904). (F. W. K.)

SERPENT-WORSHIP. From all parts of the world there is a very considerable body of evidence for the prominence of the serpent in religion, mythology and folk-lore. Snake-worship still prevails largely in India, and a writer in 1896 remarks that the previous census showed in the North-West Provinces over 25,000 Naga (serpent) worshippers, 12,000 votaries of the snake-god Gâga, and, in the same tribe, some 25,000 followers of the Nagasprings. The evidence from modern India can be supplemented by the medieval and ancient Indian sources, and, in particular, by the representations of the adoration of snake-deities on the Buddhist tope of Sanchi and Amravati. There we find, not indeed living serpents, but deities with serpent-symbolism, indicating a composition of various strata of religious belief, analogous to the evidence for serpent-symbolism from Babylonia, Crete, Greece or Peru; for the higher religions have almost invariably retained in their ritual and belief, sometimes with only slight modification,.crude survivals of man's earliest conceptions of the power of the serpent. In India, Africa and America. The result is instructive when we turn to the numerous serpent myths and legends from the Old World and the New, to the stray notices in old writers, or to the fragmentary scraps of popular superstition everywhere. Modern scientific research has vividly illustrated the stereotyped nature of the human mind; there is a general similarity in the effect of similar phenomena upon people at a similar stage of mental growth; there is an almost inherent or unconscious belief which has been transmitted through the countless ages of man's history. At the same time, apart from the gradual evolution of religious and other conceptions there are the more incidental and artificial influences which have shaped them. Hence, our evidence for serpent-cults everywhere represents varying stages in the historical development of a few related fundamental ideas which are psychologically explicable; and it is impossible to deal with the subject geographically or historically. It is most useful, perhaps, to survey some of the general features of belief as an introduction to the more complex inquiries which involve a consideration of other subjects over a larger field.

1. Prevalence in varying social systems.
Haunting buildings and famous ruins, gliding around pools, walls and trees, mysteriously disappearing below ground, the serpent and all its kind invariably arrested attention through its uncanny distinctiveness from bird or beast. The pathetic, musingly monotonous Camel of the Arabian Nights, with his coiled tail symbolized the earth surrounded by the world-river. Its patient watchfulness, the fascination it exerted over its victims, the easy domestication of some species, and the frequent occurrence of poisons, impressed primitive man. Its swift and deadly dart was likened to the lightning; equally marvellous seemed its fatal power. It is little wonder that men who could tame and handle the reptiles gained esteem and influence. Sometimes the long life of the serpent and its habit of changing the skin suggested ideas of immortality and resurrection, and it is noteworthy that one Indian snake-festival occurs after or at the sloughing; when the sacred being is thus renewed, to become again the guardian of the serpent's treasure-chambers of jewels, or crowns, and with crowns in old superstition, and the serpent with a ruby in its mouth was a favourite token. Many stories tell of the grateful reptile which brought valuable gifts to a benefactor. According to a common Indian belief, the Ouroboros (5.), which lived without an heir, returned with the wealth in the form of a serpent. In Italy superstition supposed that to find a serpent's skin brought good luck (Leland).\(^2\)

No singular preference for jewels on the part of serpents will explain the belief, and creatures like the jackdaw which have this weakness do not enjoy this prominence in folk-lore. A rationalistic explanation might be found in the connexion between the chthonic serpent and subterranean sources of wealth.\(^3\)

Moreover, the serpent is often associated with metallurgy, and to serpent deities have been ascribed the working of metals, gem-cutting and indeed culture in general. The Aztec Quetzalcoatl taught metallurgy and agriculture, and became afterwards the benefactor of maize, also wisdom and freedom from disease. The Babylonian Ea, who sometimes has serpent attributes, introduced—like the American serpent Votan—knowledge and culture. The half-serpent Cadmus brought knowledge of mines, agriculture, and the "Cadmian" letters, while Cercrops inculcated laws and ways of life and was the first to establish monogamy. Although the reptile is not particularly intelligent, it has become famed for shrewdness and wisdom, whether in the Garden of Eden (Gen. iii. 1; 2 Cor. xi. 3) or generally (cf. Matt. x. 16). The Ouroboros (5.) actually identifies the serpent with Soara, his guardian ("Wisdom"); the old sage Garga, one of the fathers of Indian astronomy, owed his learning to the serpent-god Sesha Naga; and the Phoenician ἀγαθοδαίμων of Phoenicia also symbolized immortality. In Babylonian myth a serpent, apparently in a well or pool, deprived Gilgamesh of the plant which rejuvenated old age, and if it was the rightful guardian of the wonderful gift, one is reminded of the Hebrew story, now reshaped in Gen. iii., where the supernatural serpent is clearly acquainted with the properties of the tree of life.\(^4\)

Serpents were supposed to know of a root which brought back their dead to life, and an old Greek story told how certain mortals took the hint.\(^5\) In one form or another the healing powers of the serpent are very familiar in legend and custom. Siegfried bathed in the blood of the dragon he slew and thus became invulnerable; the blind emperor Theodosius recovered his sight when a grateful serpent laid a precious stone upon his eyes; Cadmus and his wife were turned into serpents to cure human ills. "In 1899 a court in Larnaca, Cyprus, awarded £80 (Turkish) as damages to two members of a small tribe of men lent to cure a certain disease" (Murison, p. 112, n. 9). Not to mention the serpent, it must suffice to refer to the old popular idea that medical skill could be gained by eating some part of a serpent: the idea that its valuable qualities would thus be assimilated belongs to one of the fundamental dogmas of primitive mankind (cf. Porphyry, De abst. ii. 48). Now, serpents were tender in the sanctuaries of the Greek Aesculapius (Asklepious), the famous god of healing. Among his symbols was a serpent coiled round a staff, and physicians were for long wont to place this at the head of their prescriptions. He is also represented leaning on a staff while another serpent rears behind him, or (on a coin from Cygium) a serpent seems to come to him from a well. At Athens, Asklepios Amynoos had a sanctuary with altar and well, and among the votive offerings have been discovered models of snakes.\(^7\) The god-hero came from Epidaurus to the shrine at Sicyon in the form of a serpent, and the serpent sent from Epidaurus to stay a plague at Rome remained there, and a temple was erected to Aesculapius. The sanctuary of the defiled healer at Coe marked the site where another serpent brought from Epidaurus dived into the earth (Pausanias, ii. 13, 3, iii. 22, 4).\(^8\) Byproducts of smith, passed for his daughter, and is commonly identified with the woman in Greek art who feeds a serpent out of a saucer. Moreover, the temple of the earth-goddess Bon-real Dea on the slopes of the Aventine was a kind of herbarium, and snakes were kept there as a symbol of the medical art. Eben in Upper Egypt a few decades ago, there was a tomb of the Mahomedan sheik Herti, who— it is alleged—was transformed into a serpent; in cases of sickness a spotless virgin entered the cave and the serpent-occupant might permit itself to be taken in procession to the patient. The place was the scene of animal sacrifices and a yearly visit of women, and apparently preserved the traces of an old serpent-cult.\(^9\)

Several practices conform to the idea that "a hair of the dog that bit you" is a sure remedy, and that the serpent was best fitted to overcome other serpents.\(^9\) At Emera in Syria, watered by the Orontes, an image, the lower part of which was a scorpion, cued the sting of scorpions and freed the feet from snakes.\(^10\) Constantine was similarly protected by the serpent-trophy of Delphi which Constantine removed thither; an emperor was said to have performed an enchantment over the monument well known in Greek history.\(^11\) In modern India a walking-stick from a species of cane in the neighbourhood of a certain serpent-shrine protects against snake-bite.\(^12\) At Fernando Po, where there is a shipwrecked, the interpretation is uncertain, but the motive has parallels (see Go bible d'Alviella, Migration of Symbols, London, 1894, pp. 129, 165 seqq.). R. de Clarino, The Serpent in the O. T. (Amer. Journ. of Sem. Lang. xxii. 128), cites an American-Indian belief in a tree of healing, or rather of knowledge, inhabited by a serpent.\(^13\) J. G. Frazer, Adonis, Atis and Osiris (2nd ed.), London, 1907, p. 153; also his notes on Pauanias, vol. iii. p. 64 seqq.

Similar votive offerings are known in India (Oldham, 87), and, though their true significance is uncertain, in ancient Arabia, Palestine and Egypt (see H. Vincent, Canaan d'apres l'exploration Europe qui, 1897, pp. 354 seqq.).\(^14\) A. H. Sayce, "Serpent Worship in Ancient and Modern Egypt," Contemporey Revie (Oct. 1893), p. 523; cf. also Ferguson, 34.\(^15\)

2. See H. G. Gunther, Archiv f. Religionswissenschaft, x. 357 sqq. A Babylonian cylinder represents two figures (divine?) on either side of a fruit-tree, and behind one of them a serpent coils upwards.

4. As remedy against snake-bite.
was an epidemic among children, they were brought to touch a serpent's skin which hung on a pole. The same idea underlie the story of the Brazen Serpent which cured Israel of the serpent-bite in the Wilderness (Num. xxii. 6-9; 1 Cor. x. 9). The object, however, was no temporary device; centuries later, 250 years after the founding of the temple of Jerusalem, the Brazen Serpent was regarded as unorthodox by the reforming King Hezekiah, and the historian who relates its origin ascribes its name to the founder of Israelite national religion (2 Kings xviii. 4). The story in fact may have arisen to explain the object of cult; in any case it illustrates a general belief.

According to primitive thought, rivers, lakes, springs and wells are commonly inhaled. Zoylethis, (mythologised to a serpent) stolons beside the fountains and palaces and temples (Crooke i. 45, cf. § 2 above), and one submarine realm in the Ganges was reputed to possess "the water of strength." In Palestine and Syria, where demoniacal beings are frequently associated with water, local opinion is sometimes uncertain whether the water is under the care of a jinn or of a patron-saint. Several springs are named after the serpent, and the sacred fountain of Ephca at Palmyra, whose guardian in the early Christian era was appointed by the god Yarhibol, is still tenanted by a female serpent-demon which can impede its flow. Jénus had the serpent (Greek "serpent") by the well En-Rogel (1 Kings i. 9) and also its Dragon Well (Neh. ii. 13); in modern times the curative Virgin's Spring or St Mary's Well has its dragon which, when awake, swallows the intermittent flow of the water. Serpents of the water are often healers (cf. § 3). A serpent in a lagoon near Gimbo-Amburi in Africa could cure madness; another, which haunted an Algerian well, embodied the soul of a Mahomedan saint and could cure sore eyes. This feature is especially intelligible when the waters have medicinal qualities. Among the southern Arabs the hot well of Masside was virtually a temple and the same serpent was worshipped by annual festivals in the sacred month Rajah. As recently as 1882 when the grand Llama of Tashlumpo was not relieved by the hot springs of Barchutian, religious services were held to propitiate the serpent-deities (Oldham, 203). Finally, in the sanctuary of Aesculapius healing came directly or indirectly as the patients dreamed, it appears from the harsleque of Aristophanes (Platus, 653 seq.) that they first hasted in the sacred spring.

The serpent of the water is also the serpent of the great sea upon which the earth rested. Sometimes the reptile lives in submarine infernal regions (with his wife, Crooke i. 43), and as the demon of the underworld it is sometimes the earth-shaker. The Greek demon that ruled Poseidon, god of seas, springs, was earth- quake god. To the great half-serpent monster Typhon were ascribed numerous springs; he was also the cause of earthquakes, and when he buried himself in the earth he formed the bed of the Syrian Orontes. This river, which was otherwise called Drakôn, Typhán or Ophites, is known at the present day as the "river of the rebel" (Nach El-Azî; Baudissin ii. 163). The watersport, sometimes taken for a long-tailed dragon, is a huge sea-serpent, according to the Wars of East Africa (Tylor i. 202 seq.). In ancient Persia the rainbow was the celestial serpent, and among some African tribes it is the subterranean serpent which controls the weather, bringing storms and clouds, and spilling the rain in its greedy thirst. An early Indian name of the Milky Way is "the path of the serpent" (Crooke i. 25), and a great dragon or serpent is often the cause of eclipses, according to the Brahmins of India, China and Persia. Man seems to be attracted by bathing in a sacred stream, or by ritual which includes the worship of the image of the snake-god (i. 22 seq.).

Again the serpent is often seen with the rainbow (Winzenritz, § 33), a fact whose range seems to be being indicated for the serpentine deity of the Samoan and Tonga natives which connects heaven and earth (Tylor ii. 309 seq.), and for the part the serpent plays in the folk-lore of the Polynesians.

The folk-lore of the Old and New World contains many examples of supernatural conception, an idea which is to be supplemented by the actual living belief (e.g. in Palestine) that supernatural beings can be fathers.

In Annam where water spirits may take the form of serpents or of human beings, two deified heroes were said to have been serpents born of a childless woman, who drank from a bowl of water into which a star had fallen. Leard (132) cites the medieval belief that the household snake (see § 9), if not propitiated, can prevent conception, and in Bombay barrenness is sometimes attributed to a serpent which has been kept in the house for his wife's sake. Hence the demon is laid to rest by burning the serpent-image with due funeral rites. In the sanctuary of Aesculapius at Epidaurus women were visited in their dreams by a serpent—the reputed father of the child that was born, and elsewhere Sicyon who had such a progenitor was regarded as the son of the divine healer. Similar also was the origin of Augustus in a temple of Apollo, the god who had his tame serpents in the grove on Epirus. Further, as the serpent—father of Alexander the Great came with a healing-root to cure his general Pompey (Cicero, De dr. ii. 66), so in India the story of a king of serpents and of a virgin (or, in a variant form, a widow) was succoured in warfare by his sire (Fergusson, 266). In India the serpent origin of kings and rulers is famous. The same idea meets us in China, Greece (e.g. Aegaeus, and Drakôn or Cecrops the first king of Athens), the Arabian dynasty of Edesa, the dynasty of Abyssinia, &c.; it is proper, therefore, to notice the serpent-symbol of royalty on the signs of the Rajahs of Chota Nagpur, the fire-spitting serpent which adorned the head of Egyptian Pharaohs, and the dragons which entwine King Arthur as he stands at the tomb of

5 The Babylonian story of Ea (see § 2) and the deluge finds an Indian parallel in the fish (or, otherwise a manifestation of Vishnu the many-headed serpent) which warned Mans. Among the Austrian gipsies the serpent is supposed to be able to swallow up prolonged storms; it may be that the serpent is used as a sign of the commencement or conclusion of great floods with chasms (e.g. Lucian, De dea Syria, § 12 seq.) are connected with the beliefs associating wells or springs with serpents and other occupants.

6 See E. S. Hartland, Primitive Paternity (1900); Frazer, Adonis, (Index, s.v. Conception), and Totemism and Endogamy (1910; Index, s.v. "Conception," "Snake").

7 E. S. Hartland, The Myth of Perseus (1894-1896), i. 121. In many instances springs or streams are credited with the power of removing barrenness which, in primitive thought, is often ascribed to supernatural malevolence. See Hartland, op. cit. i. 71 seq. 133.

8 Journal of the Bombay Royal As. Soc. ii. 188; for sacrifices and snake-deities to obtain offspring, see Crooke i. 226; Winzenritz, 298. In the Arabah Nights Solomon prescribes the flesh of two serpents for the children who were the king of Egypt and his vizier.

9 Frazer, Adonis, 72 (with other examples). The Inca hero Yupaqunqui had as father a divine being with serpent and lion attributes who revealed himself in a well (Hartland ii. 14 seq.).
the emperor Maximilian at Innsbruck. Sometimes the serpent stands at the head of the human race as the mother of all. This, following an old and still well supported interpretation of the name Eve (Genesis i. 24), was apparently also the belief of one branch of the Hebrews.

There are many instances of tribes or clans named after the serpent. These are not necessarily examples of nicknames, since a relationship between the two often shows itself in custom or belief. This feature sometimes applies, also, to cases where the clan does not bear the serpent name. In accordance with universal ideas of the reality of the "name," there are tribes who will refrain from mentioning the serpent. Also there are clans like the American Apache, among whom the word "snake" is known as a term for purely "superstitious" reasons. Where the reptile is venerated or feared it is usually inviolable, and among the Brass-men of the Niger the dangerous and destructive cobra was especially protected by an article in the diplomatic treaty of 1856 for the Bight of Biafra (Maclean, 522). The North American Indians fear lest their venerated rattlesnake should incite its kinsfolk to avenge any injury done to it, and when the Seminole Indians begged an English traveller to rid them of one of these troublesome intruders, they scratched him—as a matter of form—in order that the snake might bear away with it the kinsman's soul, and thus be free for purely "superstitious reasons."

These snake-tribes claim to be free from snake-bite, as also the ancient Psylli of Africa and the Ophiogenes ("serpent born") of Cyprus who were supposed to be able to cure others. This power (cf. above § 3 seq.) was claimed likewise by the Marsians of ancient Italy, and is still possessed by the snake-clan of Senegambia. In Kashmir the serpent-tribes became famous for medical skill in general, and they attributed this to the health-giving serpent (Ferguson, 1856). Moreover, the Psylli would test the legitimacy of their new-born by exposing them to serpents which would not harm those of pure birth, and a similar ordeal among the Ophiogenes of Asia Minor showed whether a man was really of their kin. This peculiar "kinship" between serpent-clans and serpents may be further illustrated from Senegambia, where a python is supposed to visit every child of the python-clan within eight days of birth, apparently as a sign of recognition. Also at Fernando Po there was an annual ceremony where children born within the year were made to touch the skin of a snake suspended on a tree in the public square. This next to the very general belief that the household snake was an agreeable guest, if not a guardian spirit. In Sweden, even in the 16th century, such snakes were virtually household gods and to hurt them was a deadly sin. Among the old Prussians they were invited to share an annual sacrificial meal, and their refusal was a bad sign. Mahomet, it is said, declared that the house-dwelling snakes were a kind of jinn, and the heathen Arabs invariably regarded them as the malevolent dervishes of heretical beings. Among the Romans every place had its genius familiars, equally in the form of a serpent—cf. the doubt of Aneas (Verg. Aen. v. 84 sqq.)—and household snakes were lodged and fed in vast numbers. They were the guardian-spirits of men and families, and stories are told of the way in which human life depended upon the safety of the reptile.

As a chthonic animal the serpent has often been regarded as an embodiment of the soul of the dead. Grimm's story of king Gunthram tells how, while he slept, his soul in serpent-form visited a mountain full of serpents (ix. 54), and Pater relates that a snake crawled from beneath the bed of Plotinus at the moment of the philosopher's death (cf. the Indian story, Oldham, 79). In Bali near Java, where the Naga-cult flourishes, a serpent is carried at the funeral ceremonies of the Kshatriya caste and burnt with the corpse. Among many African tribes the house-haunting serpents are the dead, who are therefore treated with respect and often fed with milk. But it does not appear that every venerated serpent was an incarnation or that every incarnation was revered or even tolerated. Among the Pygmies of Makonde the family-serpent is capable of almost unlimited powers for good or evil; it is part of the household property, but does not seem to be connected with ancestral cults.

In Greece, however, "the dead man became a chthonic daemon, potent for good or evil; his natural symbol as such, often figured on tombs, was the snake". The men of old time," as Plutarch observed, "associated the house snake most of all beasts with heroes," and in Photius the term "speckled hero" thus finds an explanation.

At the battle of Salamis the serpent which appeared among the ships was taken to be the hero Clytus. These heroes might become objects of cult and local divinities of healing; people would pass their tombs in awe, or resort thither for divination or for taking oaths. In Egypt not only are there serpents of the houses, but each quarter in Cairo had a serpent-guardian (Lane). This is said also of the villages and districts of Armenia, and Buddhist legends affirm it for India. The Satī (Suttee) wife immolated to accompany her deceased husband often became the guardian of the village, and on the Satī shrine a snake may be represented in the act of rising out of the masonry.

Among the Athenians one, at least, was primarily the guardian spirit of Athens, and at the Erechtheum (which is known to the 3rd century A.D.) was fed monthly with honey cakes; when, during the Persian War, it left the food untouched it was taken as a sign that the protectors had forsaken the city. At Lehadela in the shrine of Trophonios (to whom serpents were sacred) offerings of honey cakes were made to an oracular serpent. At Delphil a virgin superintended a similar oracle; and in the sacred grove of Apollo at Epirus a nude virgin-attendant brought forth sacrificial cakes to appease the serpent-goddess (Dioscurides, i. 391). The name of this goddess, which was also that of the Greek divinity of the Vegetable Kingdom (Dioscorides, ii. 142), was the Greek herpeton (herpēō, "I crawl"), the name given by the ancients to animals with no visible legs, and from it the name herpetoptera ("serpentine") was derived.

offerings, and it was a sign of a plentiful year if they were accepted. So also at Lamuuvum, south of Rome, in a grove near the temple of the Argive Hera, sacred maidens were descended blindfolded once a year to bathe in the sacred lake, and if the serpent appeared, it was reported that they were pure and that the husbandmen would be fortunate.

On a Greek vase-painting the snake is the vehicle of the wrath of Athena, even as Chryse, another local "maidien," had a snake-guardian of a shrine which she sent against Philoctetes. Similarly Orestes in serpent-form would slay Clytaemnestra (Aeschylus, Choephor); the serpent is thus the avenging spirit of the deceased, the embodiment of Vengeance (cf. Acts xii. 4). To these characteristics of serpents and serpent-ghosts we must add the control of the weather. This was ascribed to the wisdom of the Indians and the impressions on the imagination of people of snakes among North American Indians. It is significant that in India the widely-distributed Nagapancami-festival occurs in the rainy season. We have seen how closely the serpent is associated with water generally (§ 3 seq.), and since we meet with the belief that waters will dry up when the serpent-occupant is killed (Bechuanas, Zulus), or that they will then remain impure thrown into their springs by causing storms (tribes of the Hindu-Kush), it is not surprising to find elaborate precautions for the propitiation of such powerful beings. Now, the fountains and springs of springs and waters which could only be used in return for regular human sacrifices. This is also the case of the island of Lesbos the dragon must receive a human victim twice a day. Curiously enough, an old authority tells us that the people of Lesbos were directed to throw a virgin into the sea to Possidon, and the hero who vainly tried to save her disappeared years later with a wonderful cup of gold (Hartland, iii. 43 seq., 79, see Athenaeus xi. 15). In the Chinese annals of Khotan in Cashgar, when a certain stream dried up, a female dragon declared that her husband had died; one of the royal grandees sacrificed himself to meet the want, the water flowed once more, and the "husband" of the stream returned (cf. Frazer, Golden Bough, ii. 233 seq. 2). There is a story from the island of Lesbos that a serpent-godling must receive a human victim twice a day. Curiously enough, an old authority tells us that the people of Lesbos were directed to throw a virgin into the sea to Poseidon, and the hero who vainly tried to save her disappeared years later with a wonderful cup of gold (Hartland, iii. 43 seq., 79, see Athenaeus xi. 15). In the Chinese annals of Khotan in Cashgar, when a certain stream dried up, a female dragon declared that her husband had died; one of the royal grandees sacrificed himself to meet the want, the water flowed once more, and the "husband" of the stream returned (cf. Frazer, Golden Bough, ii. 233 seq. 2).

An extremely rich dynasty in the Upper Niger was supposed to owe its wealth to a serpent in a well which was always kept attired as a bride; the cessation of the practice brought drought and sickness (Hartland iii. 57 seq.). In Mexico the half-serpent Ahuitzotl dropped into its pool helpless passers-by; however, their souls were supposed to go to the underworld and pass through the sun to the paradise of the supernatural beings, where they became gods. In India human sacrifice was actually conducted by a serpent of sorts, and the serpent-godlings were said to have a survival of this when snake-charmers, for a drop of blood from the finger of a first-born, will track the snakes which are guardians of treasure (Crooke ii. 135, 170 seq.). Indian tradition tells how removers have persuaded the people in the past to stop their human sacrifices to serpent-spirits (Fergusson, 64, Oldham, 101), and a survival may be recognized in parts of the N.W. Provinces when, at the Guru serpents' festival, women make vicarious offerings by throwing to Naga Deoth, the river demon, dolls which the village lads beat with long switches (Crooke i. 130). It is unnecessary to refer more fully to the evidence for former human sacrifice or to the possibilities of any argument from that evidence to the persistence; the grisly custom of our ancestors has been attested by comparatively recent observation in Mexico, Peru, Fiji and West Africa.

6 See Deane, Serpent Worship, 245 seq. (Lionvia); and for more modern evidence, Maclean, 216, 219; Oldham, 49, 50, 100 seq.; and Hartland, 152 seq. Folklore adds to the survivals some of the customs for producing rain, e.g. bathing and drenching willing or unwilling victims, dipping holy images in water, and otherwise disturbing springs and fountains (Frazer, Golden Bough, i. 95 seq., A conspicuous feature in serpent-cults is the prominence of females. In India, in Behar, during August there is a colourless festival in which women, "wives of the snake," go round begging on behalf of the Brahmanas and the villages (Crooke ii. 138). Among the Nayers of Malabar at the ceremonies of the Pambantulle, the household serpent-deities show their benevolence by inspiring with oracles certain women who must be of perfect purity. In Travancore a serpent-god is the property of a family, the priests of a temple; the eldest female carries the image at the festival processions and must lead a celibate life (Oldham, 153 seq.). Far more noteworthy is the cult of the Python Dafh-ghi of Whydah, which after taking root in Dahomey, became the most remarkable of the serpent legends in the coast of Africa. This is the story of the python-deity who is god of wisdom and learning, and is also the protector of man (cf. § 2); he opened the eyes of the first human pair who were born blind. He is specially invoked on behalf of the king (the nominal head of the priesthood) and the crops, and a very close connexion was supposed to exist between the god's agency and all agricultural life. Initiated priests, after remaining silent in his temple for seven days, receive a new name and thus become ordained. They possess a knowledge of poisons and antidotes and thereby acquire considerable influence (cf. §§ 3, 8). Children who touch or are touched by one of the many temples which are to be found throughout Dahomey are said to be imbued with all the prerogatives and graces of the cult. Women who are touched become "possessed" by the god. In addition to his ministrant priestesses, the god has numerous "wives," who form a complete organization. Neither of these classes may marry, and the latter are specially sought at the season when the crops begin to sprout. These "wives" take part in licentious rites with the priests and male worshippers, and the python is the reputed father of the offspring (cf. § 7). Every snake of its kind receives the profound veneration of the native of Whydah, who salutes it as master, father, and mother, and after an offering of several hundred guilders, goes to visit the god himself; it is said that such snakes must be treated with every respect, and if they are enemy snakes, the young female native might be burned alive (cf. § 8). In 1890 a semblance of the penalty was still maintained: the offender being allowed to escape from a burning hut through a crowd of snake-worshippers armed with clubs; if discreet in his tribes, and lucky, he might reach running water and could purify himself there. On the day of public procession—the last took place in 1857 or 1858—naked priests and "wives" escorted the company with songs and dances; death was the penalty of those caught peering from their houses, and, apart from this, the natives feared leathen diseases which they held to be inspired by the god (cf. Frazer, Paus. V. 45). A pigment of the same nature (said to be imprinted by the god himself) is also the emblem of the festival of immemorial antiquity performed by women, cakes and pigs were thrown to serpents kept in caves and sacred to the corn-goddess Demeter, who, like the Bona Dea, was representative of the plant and the vegetable world; and to the worship of the corn god, it is the chief attribute of the goddess is added the attribute of wisdom, which is of great importance in later mythology.

of the fertility of nature. Myth explained it as a celebration of the capture of Kore by Pluto. 1. The Maenads ("mad ones") or Bacche, the women attendants of Dionysus, with their snake-accoutrements, are only one of the various snake-features associated with the cult of a deity who was also a god of healing. The symbol of the Bacchic orgies was a consecrated serpent, and the snakes kept in the sacred cistae of the cult of Dionysus find a parallel among the sect of the Ophites where, at the sacramental rites, bread was offered to the living serpent and afterwards distributed among the worshippers. 2. Other developments may be illustrated from the cult of Aesculapius, which seems to have been merely a defiled ancestor, like the Egyptian Imhotep (below) or the interesting Indian healer Sokha Bāna (Crooke i. 147, li. 125 sq.). Introduced into Athens about 411 B.C., Aesculapius, from the fountain of the local cult of the serpent-god "Amykos" (Harrison, p. 346 seq.). In Laodicea he apparently replaced an old deity with serpent attributes. 3. In Egypt, he superseded the sage Imhotep at Memphis, and at the temple sacred to Aesculapius and Hygieia at Ptolemais the money-box has been found with the upper part in the form of a great snake. Finally among the Phoenicians he was identified with Eshmun, an earlier god of healing, who in turn was already closely associated with Dionysus and with Caellestis-Ashtar. 4.

For the retention of older cults under a new name, Mahomedanism sometimes provides an example. A forest-serpent of India receives a Mahomedan name (Oldham 126). But sometimes there is a contest between the new cult and the old. Thus Apollo has to fight the oracle serpent of Gaia, and it has been observed that where Apollo prevailed in Greek religion the serpent became a monster to be slain. 5. At Thebes—the Thebans were Serpentigenae—Apollo took the place of Cadmus, who, after killing the dragon which guarded a well and freeing the district, had ended by being turned into a serpent. This looks like the assumption of indigenous traits by a foreigner—cf. Aesculapius (§ 13)—much in the same way as Hercules has contests with serpents and dragons, becomes the patron of medicinal springs, and by marrying the serpent Echidna is the ancestor of the snake-worshipping Seythians. 6. But an ethnological tradition appears when Phorbas killed the serpent Ophiuss, freed Rhodes of snakes and obtained supremacy, or when Cychreus slew the dragon of Salamis and took the kingdom. 7. A story told by Herodotus (i. 78) admirably shows how the serpent as a child of earth was able to escape from his home. 

1. Harrison, 199 seq., 120 sqq., and Art. THESSALONICA. The rites indicate analogy with the地址，but from them the opportunity of escape allowed the victim. Plouton, also associated with Proserpine, the great mother-goddess, was patron of the chasms with mephitic vapours in the valley of the Macedon (see Frazer, Ancestor Worship, 304).

8. A Greek vase shows snake-bodied nymphs at the grape-harvest (Harrison 259 seq.), and in Egypt the harvest goddess Rannath had snake-torm (F. Pet. 5). A relief from the cathedral at Alexandria (Pet. 190, p. 26) shows a serpent-god revered by Taxius (king of Taxia), which was seen by Alexander the Great on his way to India, was identified by Greek writers with Dionysus or Bacchus. For the serpent in the cult of Saizius, see Harrison, Pref. 418, 535. A kind of sacramental communion with a snake is found among a Punjab snake-trike (Frazer, Golden Bough, ii. 1441 seq.; Punjab Notes and Queries, ii. 91). For this and other Parthian evidence, see W. M. Ramsay, Cities and Customs (1892), 50 sqq.

9. Ag. Zeit. xl. 140 seq. Adian (De anim. xvi. 36) mentions a huge serpent at the temple dedicated to Aesculapius. Serapis (Ostris-Anis) who supposedly sired the attributes of Aesculapius and of Pluto, god of the dead, sometimes had serpent-form, and even in the reign of Constantine popular belief connected the rise of the Nile with his agency (Frazier, Adonis, 308).

13. Cf. the similar view of serpent-conflicts in Persian tradition (Fergusson, 44 seq.), A. The story of the civilization of Cambodia, where the new comer marries the dragon's king's daughter (ib. 53).

15. Cf. the similar view of serpent-conflicts in Persian tradition (Fergusson, 44 seq.), A. The story of the civilization of Cambodia, where the new comer marries the dragon's king's daughter (ib. 53).

a type of indigenous peoples, and there was a tendency to represent the earlier conquered races as monsters and demons, though not necessarily unskilled (e.g. the Cretan Kourites), or to depict the conquerors of barbarians as the overthrow of serpents or serpent-like beings. 3. This obviously complicates the investigation of serpent-cults. Moreover, the serpent or dragon may have an opponent like the eagle (see Golbe d'Alvelli, 17), or a cosmical antagonist—the lightning, thunder or rain-god. Indra, the rain-god, slew with a thunderbolt Ahi or Vitru, who kept back the waters (Oldham, 32 sqq.); the thunder-god of the Troquois killed the subterranean serpent which fed on human flesh (Hartland iii. 151). 9. Or the victor is the sun: the Egyptian sun-god Re had his fire-spitting serpent to oppose his enemies, of which one was the cloud and storm serpent Apophis, while his myth shows how the serpent Echidna was warded off by the young Orpheus from the snake. It is impossible to trace a safe path through the complicated aetiological myths, the fragments of reshaped legend and tradition, or the adjustment of rival theologies. It remains to observe the overthrow or supersession of the serpent in Christian lands. At Axum in Abyssinia, where worship was divided between the serpent and the Mosaic Law, it is said that the great dragon was burst asunder by the prayers of Christian saints (c. A.D. 340; Ferguson, No. 260). At rock-65, in Phoenicia, the Phoebus Apollo, who was the patron of the sanctuary of Helios (the sun) sheltered the young Orpheus from the snake.

16. This festival is described (as seen in 1906) by Marian C. Harrison, Folklore, xviii. 1907, 187 sqq. A combination of a cult of the house-snake with that of the (Christian) saint of the house is said to prevail in modern Greece (J. C. Lawson, Modern Greek Religion, 1910, p. 260).
men waved great red snakes over their heads as they marched in procession. One may even recall the cult of Dahomey. Moreover, we find at Madagascar the procession of the god of fertility and healing, the patron of serpents who are the mistresses of the arts of life (Frazer, *Paus. v., 66 seq.)*.

Again, in a Bantu festival the men are arrayed with serpents, while the chief man has a gourd-boa or python round his neck and is carried or rides on a buffalo (Fergusson, 225). Again, among the Moquis of America, where the snake-clan claim descent from a woman who gave birth to snakes, the reptiles are freely handled at the "snake dances" which are performed partly to secure the fertility of the soil.¹

These last examples are important because they illustrate the immense difficulty of determining the true significance of any isolated piece of evidence. It cannot be assumed that known cults presuppose such cults; yet it may be inferred that they point to earlier, more perfect structures, to rites which perhaps linger only as a memory, and to conceptions and beliefs which have been elevated or modified by other religions. Hence also the impossibility of treating the present subject systematically. Apart from the more obvious characteristics of the serpent, little is known of the names of the original Memphis first men, who, the less poetic character shows itself markedly when it is associated with the treasuries and healing herbs of the earth, the produce of springs—and thence of all water—and the dust used when water is not available. Although there is a serpent-cult in the Batak, and in the Mexican Indians, it is clear that the serpent is not always an evil spirit; in Madagascar, the ghosts of the dead haunt certain localities, and, entering the bodies of passing women, are constantly reincarnated; the Black-snake clan of the Warramunga tribe embodies the spirits which the original ancestor had deposited by a certain creek.² On the other hand, the "rattlesnake" men of the Moqui are merely transformations and expect to return at death to their original reptile form (Maedemann, 357). It is another stage when one generation after another makes serpent gods and the deification of heroes involves yet another course of ideas. Here it is evident that some of the attributes of prominent serpent-gods will be transferred to human heroes; and we may illustrate one of the processes by which a common descent, and the common claim to be descended from the local godling is not to be confused with the Arunta type of reincarnation.³

Again, in part taken by women in serpent-lore other problems of primitive society and religion intermingle. For example, when one considers how often milk is used in the tending and propitiation of venerated snakes, it is noteworthy to find in Roman cult the myth of the ruddy and the offertory milk (§ 6), and its ancient daughter, Persephone, and it is also singular that many of the old goddesses of Greece have serpent attributes (Harrison).⁴ Now anthropological research has vividly shown that when it is serpent-lore, it is not so much the number of individuals that is assigned a prominent part in rites for the furtherance of growth and fertility. And the same thread of ideas seems to recur in the "wives" of the python Džugh-gbi (§ 12), the Shaki ceremonies (§ 15) and the increase of snakes in earthenware (Fergusson, 258 seq.), and, to a certain extent, in the provisioning of
deities or demons of serpent-type with consorts.⁴ There is everything a danger of misunderstanding isolated evidence, of wrongly classifying different motives, and of overlooking necessary links in the chain of argument. There is an obvious development from the serpent-god reptile to the deity or the devil, and that the original theriomorphic form is not at once forgotten can be seen in Zeus Melichios, Asclepius Amynos, in the Cretan snake-goddesses, or in the Buddhist topos illustrated by Ferguson. But naturally these are only the data of the most obvious and direct; and the exact attributes are combined, when, for example, Greek goddesses take the forms of birds as well as of snakes (Harrison, 322), or when the Aztec snake-deity Huitzilopochtli, like the Votan of the Mayas, has feathers (Maclean, 323). Thus it will be perceived that the subject of this article involves at every turn problems of the history of thought (cf. the similar development of the dog, *v. v., § 26 seq.*). There is ample material for purely comparative purposes and for an estimate both of the general fundamental ideas and of the artificially-developed secondary speculations; but for any scientific research it is necessary to observe the social, religious and historical conditions of the provenance and period of the evidence, and for this material is often insufficient. The references in this article furnish fuller information and are usually much better works for pursuing the subject more thoroughly. One may also consult the English and foreign journals devoted to folklore, comparative religion or anthropetry (especially the volumes of *Folklore*, *Index, s. n.*), and the articles in this *Encyclopedia* on the various departments of primitive religion. In general, works which endeavour to reduce the evidence for this fascinating subject to clear-cut systems are more useful for the data they provide than for the conclusions they draw. There are already attempts to fight against the unscientific studies of "ophialogy" and especially against "that portentious nonsense called the 'arkite symbology'" (see E. B. Tylor's remarks, *Primitive Culture*, 4th ed., 1894).

SERPUKHOV, a town of Russia, in the government of Moscow, 62 m. by rail S. of the city of Moscow. The population in 1884 was 224,420, and 24,456 in 1897. Built on high cliffs on both banks of the river Nara, 3 m. above its confluence with the Oka, Serpukhov is an important manufacturing and commercial town. Its manufactories produce cotton and woolen stuffs, paper, leather, chemicals and candles. Petty trade is also a considerable source of income. Serpukhov is noted for its pottery, faience ware, and earthenware and porcelain. The manufactured goods of Serpukhov are sent mostly by rail to the towns of Tiflis, Orenburg, and the Ukraine, while large quantities of grain, hemp and timber, brought from the east down the Oka, are discharged at Serpukhov and sent on to Moscow and St. Petersburg. The cathedral (1380) was rebuilt in the 18th century; the old fortress has almost entirely disappeared. Serpukhov is one of the oldest towns of the province of Moscow; in 1326 it was a nearly independent principality under the protcom of Ivan. In 1506 Ivan III captured Serpukhov and was often attacked by the Tatars; the Mongol prince Toktamish plundered it in 1352, and the Lithuanians in 1410. In 1556 the town was strongly fortified, so that fifteen years later it was able to resist the Mongols. Its commercial importance dates from the 18th century.

SERRANO Y DOMINGUEZ, FRANCISCO, DUKE DE LA TORRE AND COUNT OF SAN ANTONIO (1810–1883). Spanish marshal and statesman, was born in the island of Leon at Cadiz on the 17th of December 1810. His father was a general officer and a Liberal. Serrano began his military career in the Peninsula in 1822, and in 1823 in the lancers of Sagunto, passed into the carabineros in 1829, and when the Carlist agitation began in 1833 he exchanged into the cuirassiers. He formed part of the escort which accompanied Don Carlos, the first pretender and brother of Ferdinand VII, to the frontier of Portugal. As

Here the transition from mother-right to patriarchy probably began to be taken into consideration. For the view that the serpent as a genix or daemon may be replaced by the horned serpent, see [296 seq.]. The chief guardian of the soil and mother-right is baptism (including its deity), and involves the belief that such corporeal bodies never die (cf. even the Roman conception of the family, Maine, op. cit. 197 seq.).

2 Here one will note the prevalence of the ideas of "mother earth," and also the association in higher religions of chthonic powers with the serpent, so, e.g., the winds (viz. Boreas in Greece, cf. Harrison, *Prol. 68, 181,* subterranean gods (for Assyria, cf. *Zeit. f. Assyry.* 1894 p. 116, and for the Finns, Fergusson, 250 seq.). For the serpent (sometimes with anthropomorphic hints (§ 6, its essential view of the life of the serpent-gods and the deification of heroes involves yet another course of ideas. Here it is evident that some of the attributes of prominent serpent-gods will be transferred to human heroes; and we may illustrate one of the processes by which a common descent, and the common claim to be descended from the local godling is not to be confused with the Arunta type of reincarnation.⁴

4 There appears to be a fundamental inclination towards ideas of rebirth and reincarnation (see F. B. Jevons, *Intro. to Study of Cmp. Religion, 1908, p. 59 seq., 59 seq.*); it would seem to be widespread among the primitive peoples and especially among the Australian Aborigines (Fergusson, 258 seq.), and, to a certain extent, in the providing of

5 One may note the Indian local saint Gága, who punishes by snake-fire and can cure his worshippers (similarly the Egyptian Mert-seger, the serpent-patroness of the Theban necropolis and the serpent, the saviour-god of the Phrygian Hierapolis; he is represented on horseback descending to the infernal regions; over him the angel Meleager holds up the outstretched hand with which he holds in his hands (Crocket, i. 212 seq.). But how many different factors may not have influenced the representation!

6 SERPUKHOV—SERRANO Y DOMINGUEZ

Serrano y Dominguez, Francisco, Duke de la Torre and Count of San Antonio (1810–1883). Spanish marshal and statesman, was born in the island of Leon at Cadiz on the 17th of December 1810. His father was a general officer and a Liberal. Serrano began his military career in the Peninsula in 1822, and in 1823 in the lancers of Sagunto, passed into the carabineros in 1829, and when the Carlist agitation began in 1833 he exchanged into the cuirassiers. He formed part of the escort which accompanied Don Carlos, the first pretender and brother of Ferdinand VII, to the frontier of Portugal. As
alide-de-camp of Espoz y Mina, then under the orders of Generals Cordoba and Espartero, in the armies of Queen Isabella, Serrano took such an active part in the Carlist War, as to earn in 1843 that he rose from the rank of captain to that of brigadier-general. His services obtained for him the Cross of San Fernando and many medals. In 1830 he was elected a member of Cortes for the first time by Malaga, and in 1840 he was made a general of division and commander of the district of Valencia, which he relinquished to take his seat in congress. From that day Serrano became one of the chief military politicians of Spain. In 1841 he helped Espartero to overthrow the regency of Queen Christina; in 1843 at Barcelona he made a pronunciamiento against Espartero, resigned his post of minister of war, was convicted of conspiring against the state and was sent to prison in Santo Domingo, but he was the first victor in the battles of the moderate and limited reforms in the colony. On his return to Spain he was made duke de la Torre, grandee of the first class, and minister of foreign affairs by O'Donnell. Serrano gallantly exposed his life to help O'Donnell quell the formidable insurrection of the 22nd of June 1846 at Madrid, and was rewarded with the Golden Fleece. At the death of O'Donnell, he became the chief of the Union Liberal, and as president of the senate he assisted Rios Rosas to draw up a petition to Queen Isabella against her moderado ministers, for which both were exiled. Nothing daunted, Serrano began to conspire with the duke of Montpensier, Prim and Sagasta; and on the 7th of July 1868 Serrano Bravo had Serrano and other generals arrested and taken to the Canary Isles. There Serrano remained until Admiral Topete sent a steamer to bring him to Cadiz on the 18th of September of the same year. On landing he signed the manifesto of the revolution with Prim, Topete, Sagasta, Martins and others, and accepted the command of the revolutionary army, with which he routed the troops of Queen Isabella under the orders of the marquis of Novaliches at the bridge of Alcolea. The queen fled to France and was replaced by the moderate ministry, which formed a Provisional Government, convoked the Cortes Constituyentes in February 1869, and was appointed successively president of the executive and regent. He acted very impartially as a ruler, respecting the liberty of action of the Cortes and cabinets, and bowing to their selection of Amadeus of Savoy, though he would have preferred Montpensier. As soon as Amadeus reached Madrid, after the death of Prim, Serrano consented to form a coalition cabinet, but it kept together only a few months. Serrano resigned, and took the command of the Italian king's army against the Carlists in North Spain. He tried to form one more cabinet under King Amadeus, but again resigned when that monarch declined to give his ministers dictatorial powers and sent for Ruiz Zorrilla, whose mistakes led to the abdication of Amadeus on the 11th of February 1873. Serrano would have nothing to do with the federal republic, and even conspired with other generals and politicians to overthrow it on the 23rd of April 1873; but having failed, he had to go to France until General Favia, on the eve of his coup d'état of the 3rd of January 1874, sent for him to take the head of affairs. Serrano resigned once more, but the title of president of the executive; tried first a coalition cabinet, in which Martin and Sagasta soon quarrelled, then formed a cabinet presided over by Sagasta, which, however, proved unable to cope with the military and political agitation that brought about the restoration of the Bourbons by another pronunciamiento at the end of December 1874. During the eleven months he remained in office Serrano devoted his attention chiefly to the reorganization of finance, the renewal of relations with American and European powers, and the suppression of revolt. After the Restoration, Serrano spent some time in France, returned to Madrid in 1876, attended palace receptions, took his seat as a senator in the senate, croquetted a little with Sagasta in 1881, and finally gave his open support to the formation of a dynastic Left with a democratic programme. He defended by his own nephew, General Lopez Dominguez. He died in Madrid on the 26th of November 1885, twenty-four hours after Alfonso XII.

(A.E.H.)

**SERRES, OLIVIA** (1772-1834), an English impostor, who claimed the title of Princess Olive of Cumberland, was born at Warwick on the 3rd of April 1772. She was the daughter of Robert Wilmot, a house-painter in that town, who subsequently married a widow of moderate circumstances. She was the eldest daughter of John Thomas Serres (1759-1825), marine painter to George III., but in 1804 separated from him. She then devoted herself to painting and literature, producing a novel, some poems and a memoir of her uncle, the Rev. Dr Wilmot, in which she endeavoured to prove that he was the author of the *Letters of Junius*. In 1817, in a petition to George III., she put forward a claim to be the natural daughter of Henry Frederick, duke of Cumberland, the king's brother, and in 1820, after the death of George III., claimed to be the duke's legitimate daughter. In 1823 she took her seat as a solicitress in the House of Commons. Olive of Cumberland, placed the royal arms on her carriage and dressed her servants in the royal liveries. Her story represented that her mother was the issue of a secret marriage between Dr Wilmot and the princess Poniatowski, sister of Stanislaus, king of Poland, and that she had married the duke of Cumberland in 1767 at the London house of a nobleman. She herself, ten days after her birth, was, she alleged, taken from her mother, and substituted for the still-born child of Robert Wilmot. Mrs Serres's claim was supported by documents, and she bore sufficient resemblance to her alleged father to be able to impose on the numerous class of persons to whom any item of so-called secret history is attractive. In 1823 Sir Robert Peel, then Home Secretary, speaking in parliament, declared her claims unfounded, and her husband, who had never given her pretensions any support, expressly denied her belief in them in his will. Mrs Serres died on the 21st of November 1834, leaving two daughters. The eldest, who married Antony Ryves, a portrait painter, upheld her mother's claims and styled herself Princess Lavinia of Cumberland. In 1866 she took her case into court, producing all the documents on which her mother had relied, but the jury, after acrimonious discussion with the juryman who had been a strong supporter of Marius, unanimously declared the signatures to be forgeries. Mrs Serres's pretensions were probably the result of an absurd vanity. Between 1807 and 1815 she had managed to make the acquaintance of some members of the Royal family, and from this time onwards seems to have been obsessed with the idea of raising herself, at all costs, to their social level. The tale once invented, she brooded so continuously over it that she probably ended by believing it herself.

See W. J. Thomas, Hannah Lightfoot, and Dr Wilmot's Polish Princess (London, 1867); *Princess of Cumberland's Statement to the English Nation*, Annual Register (1866), Case of Ryves v. the Attorney-General.

**SERTORIUS, QUINTUS.** Roman statesman and general, was a native of Nursia in Sabine territory. After acquiring some reputation in Rome as a jurist and orator, he entered upon a military career. He served under Marius in 102 B.C. at the great battle of Aquae Sextiae (mod. Aix) in which the Teutones were decisively defeated. In 97 he was serving in Spain. In 91 he was quaestor in Cisalpine Gaul, and on his return to Rome he would have been elected to the tribuneship but for the decided objections of Sulla. He now declared in the reign of Marius and a democratic party, though of Marius himself as a man he had the worst opinion. He must have been a consenting party to the hideous massacres of Marius and Cinna in 87, though he seems to have done what he could to mitigate their horrors. On Sulla's return from the East in 83, Sertorius went to Spain, where he represented the Marian or democratic party, but without receiving any definite commission or appointment. Having been
obliged to withdraw to Africa in consequence of the advance of the forces of Sulla over the Pyrenees, he carried on a campaign in Mauretania, in which he defeated one of Sulla's generals and captured Tingis (Tanger). This success recommended him to the party of Spain, more particularly to the Spanish tribes in the peninsula, and Roman generals and governors of Sulla's party had plundered and oppressed. Brave and kindly, and gifted with a rough 'telling eloquence, Sertorius was just the man to impress them favourably, and the native militia, which he organized, spoke of him as "the new Hannibal." Many Roman refugees and deserters joined him, and with these and his Spanish volunteers he completely defeated one of Sulla's generals and drove Q. Caecilius Metellus Pius, who had been specially sent against him from Rome, out of Lusitania, orFurther Spain as the Romans called it. Sertorius showed much of his spirit in his statesmanlike ability. His object was to build up a stable government in the country with the consent and co-operation of the people, whom he wished to civilize after the Roman model. He established a senate of 300 members, drawn from Roman emigrants, with probably a sprinkling of the best Spaniards, and surrounded himself with a Spanish bodyguard. For the children of the chief native families he provided a school at Osca (Huesca), where they received a Roman education and even adopted the dress of Roman youths. Strict and severe as he was with his soldiers, he was particularly considerate to the people generally, and made every effort for his benefit. It seems clear that he had a peculiar gift for evoking the enthusiasm of rude tribes, and we can well understand how the famous white fawn, a present from one of the natives, which was his constant companion and was supposed to communicate to him the advice of the goddess Diana, promoted his popularity. For six years he may be said to have really ruled Spain. In 77 he was joined by M. Perpenna (or Perpenna) Vento from Rome, with a following of Roman nobles, and in the same year the great Pompey (q.e.) was sent to conquer him. Sertorius proved himself the stronger of the two, and for this defence of their united forces on one occasion near Saguntum. Pompey wrote to Rome for reinforcements, without which, he said, he and Metellus would be driven out of Spain. Sertorius was in league with the pirates in the Mediterranean, was negotiating with the formidable Mithrades, and was in communication with the insurgent slaves in Italy. But owing to jealousies among the Roman officers who served under him and the Spaniards of higher rank he could not maintain his position, and his influence over the native tribes slipped away from him, though he won victories to the last. In 72 he was assassinated at the request of Perpenna, it seems, being the chief instigator of the deed.

See Plutarch's lives of Sertorius and Pompey: Appian, Bell. civ. and Hispanica; the fragments of Sallust: Dio Cassius xxxvi. 25, 27, 28, xxlv. 47; Vell. Pat. ii. 25, 29, 30, 90.

SERURIER, JEANNE MATHIEU PHILIBERT, COMTE (1724-1810), French soldier, was born at Laon of middle-class parentage. After being lieutenant of the Laon militia, he entered the royal army, and served in the campaigns in Hanover (1759), Portugal (1762) and Corsica (1771). At the beginning of the Revolution he was arrested on suspicion of having joined the rebels, but was released when it was found that he had been colonel, brigadier-general and finally general of division. He fought under Kellermann and B. L. J. Schérer in the army of the Alps in 1795, and under Bonaparte in Italy at Vico, Mondovì, Castiglione and Mantua. Besides his military qualities, he showed great administrative talent in governing Venice (1797) and Lucca (1798). He helped Bonaparte in the coups d'état of 18 Brumaire, and had a brilliant career under the empire, when he was made senator, count, marshal, and governor of the palace of the Invalides. In 1814, however, he voted for the peace treaty with Napoleon, and under the Restoration was made a peer of France. He was dismissed from all his posts for having joined Napoleon during the Hundred Days, and died in retirement.

SERVAL (Felis serval), an African wildcat, ranging from Algeria to the Cape. It is of medium size, with long limbs, short tail, and tawney fur spotted with black; the head and body may measure 40 in. and the tail 16 in. Messrs Nicolls and Elliot, joint authors of The Sportsman in South Africa, state that the serval is fairly common in South Central Africa, frequenting the thick bush near rivers, and preying on the smaller antelopes, guinea-fowls and francolins. The mantles made from its skin are reserved for chiefs and dignitaries of native tribes. Serval kittens can be tamed with little trouble, but are difficult to rear.

SERVAN, JOSEPH MICHEL ANTOINE (1737-1807), French publicist, was born at Romans (Dauphiné) on the 3rd of November 1737. After studying law he was appointed avocat-général at Toulon, but at the age of twenty-seven, in his Discours sur la justice criminelle (1766) he made an eloquent protest against legal abuses and the severity of the criminal code. In 1767 he gained great repute by his defence of a Protestant woman who, as a result of the revocation of the Edict of Nantes, had been abandoned by her Catholic husband. In 1772, however, on the parliament refusing to accede to his request that a present made by a grand seigneur to a singer should be annulled on the ground of immorality, he resigned, and went into retirement. He excused himself on the score of ill-health from sitting in the States General of 1789, to which he had been elected deputy, and retired to his house at Toulon. During the Revolution his writings were collected together, under the title of Réflexions sur les Confessions de J.-J. Rousseau (1783) and Essai sur la formation des assemblées nationales, provinciales, et municipales (1789). His Œuvres choisies and Œuvres inédites have been published by De Portes. His brother JOSEPH SERVAN DE GERBÉY (1741-1808) was war minister in the Girondist ministry of 1792.

SERVAN (or SERVANDO KNOWN AS SERVANDON), JEAN NICOLAS (1655-1766), French decorator, architect and scene-painter, was born on the 2nd of May 1655. He was the son of a carriage-builder at Lyons. From 1724 to 1742 he was director of decorations at the Paris Opera, at that time situated in a wing of the Palais-Royal. His activity was considerable, whether as a painter or as an inventor of scenic contrivances for fêtes at the marriage of royal personages. He also designed the decorations for altars, and the façade for the church of Saint Sulpice in Paris. He died in Paris on the 10th of January 1766. His writings include Description oblige de Venitiens de la Compagnie de France, and La Relation de la représentation de la fête enchanterie sur le théâtre des Tuileries, le 31 mars 1754.

SERVETUS, MICHEL [MIGUEL SERVETO] (1511-1553), physician and polemic, was born in 1511 at Tudela in Navarre, his father being Hernando Villanueva, a notary of good family in Aragon. His surname is given by himself as "Serveto" in his early works, "ser Michael Serveto, alias Reues." Later he Latinized it "Servetus"; when writing French (1553) he signs "Michel Servetetus." It is probable that he was of the same family as the Spanish ecclesiastic Marco Antonio Serveto (d. 1598), and the author of Leibniz's Of Servetus.

Villanueva, in Huesca (Latassa, Bibl. nuen, 1798, l. 600). At this place is the traditional mansion of the family, and in the parish church the family altar with the family arms (Christian Life, 29th Sept. 1888). Servetus at Geneva makes Villanueva his birthplace, assigning it to the adjoining diocese of Lerida. His later adopted surname, Villanosus or de Villeneuve, was no mere pseudonym since he followed his father's example. Of his education we only know that his father sent him to study law at Toulouse, where he first became acquainted with the Bible (1538). From 1555 he found a patron in Juan de Quintana (1534), a Franciscan. This date rests on his own testimony (both at Vienna and Geneva) and that of Calvin. An isolated passage of the Geneva testimony may be cited in favour of 1506.

The form Servet first appears in a letter of Ocelomadius to the senato of Basel (1531) and is never used by himself. Mosheim's "Servede" is an imaginary form.
promoted in 1530 to be confessor to Charles V. In the train of
Quintana he witnessed at Bologna the double coronation of
Charles in February 1530, visited Augsburg, and perhaps saw
Luther at Coburg. The spectacle of the deprecation of the pope
at Bologna impressed him strongly in an anti-papal direction.
He left Quintana, visited Lyons and Geneva, repaired to Oecolom-
padus at Basel, and pushed on to Bucer and Capito at Strass-
burg. Considerable attention was attracted by his first public-
ation, De Trinitatis erroribus (1531, printed by John Setzer at
Hagenau). It is crude, but original and earnest, and shows a
wide range of reading very remarkable in so young a man.
Melanchthon writes "Servetum multum lego." Quintana,
who describes him as di grandissima ingegno, and gran sofisto,
thought he was a maestro (a challenger), and Servetus generally
to be his (H. Lämmter, Monumenta Vaticana, 1886, 109).
The essay was followed in 1532 by a revised presentation of his views
in dialogue form. We next find him at Lyons (1533) editing
scientific works for the Trechsel firm, adopting the "Villano-
vanus" surname, which he constantly used till the year of
his death. At Lyons he found a new patron in Dr Symphorien
Champier (Campegius) (1472-1539), whose profession he resolved
to follow. Resorting (1536) to Paris, he studied medicine under
Johann Günther, Jacques Dubois and Jean Fernel. It was in
1536, when Calvin was on a hurried visit to Paris, that Servetus
first met him. In 1538, when he went to Spain, it was to Geneva
as he himself says, proposed to set him right on theological points. Servetus succeeded
Vesalius as assistant to Günther, who extols his general culture,
and notes his skill in dissection, and ranks him as the second
in knowledge of Galen. He graduated in art, and claims to have
graduated in medicine (of this there is no record at Paris),
published six lectures on "syrops" (the most popular of his
works), lectured on geometry and "astrology" (from a medical
point of view) and defended by counsel a suit brought against him
(March 1538) by the medical faculty on the ground of his astro-
logical views. In 1538 he was a medical student at Lyons (there
as a university student on the 14th of December 1537 as
Michael Villanova) to his father (then resident at San Gil),
explains his removal from Paris, early in September, in conse-
quence of the death (8th August) of his master (el señor mi
maestro), says he is studying theology and Hebrew, and proposes
to return to Paris when peace is proclaimed. After this he
practised medicine for a short time at Avignon, and for a longer
period at Charleu (where he contemplated marriage, but was
deterred by a physical impediment). In September 1540 he
entered himself for further study in the medical school at Mont-
pellier.
Among attendants on his Paris lectures was Pierre Paulmier,
since 1528 archbishop of Vienne. Paulmier now invited Servet-
us to Vienne as his confidential physician. He thus acted for
twelve years (1541-1553), making money by his practice, and also
by renewed editorial work for the Lyons publishers—work in
which he constantly displayed his passion for original discovery
in all departments. Outwardly he was a conforming Catholic;
privately he pursued his theological speculations. It is probable
that in 1541 he had been rebaptised (he maintained the duty of
adult baptism at the age of thirty). Late in 1542, or very early
in 1546, he opened a fatal correspondence with Calvin, forwarding
the manuscript of a much-enlarged revision of his theological
tracts and expressing a wish to visit France. Calvin replied
(13th February 1546) in a letter now lost; in which, he says,
he expressed himself "plus durem que ma constumne ne porte." On the same day he wrote to Guillaume Farel, "si
veneri, modo valent mea autoritas, vivere exunam patria," and to Pierre Viret in the same terms. Evidently
Servetus had warning that if he went to France it was at his
peril. Writing to Abel Pouppin (in or about 1547) he complains
that Calvin would not return his manuscript, and adds, "mit
ob eam rem morientum esse certo sclo." The volume of theo-
logical tracts, again recast, was declined by two Basel publishers,
Jean Frelion (at Calvin's instance) and Marrinus, but an edition
of 1000 copies was secretly printed at Vienna by Baltasar
Armollet. Ready by the 3rd of January 1553, the bulk of the
imprimatur was privately consigned to Lyons and Frankfurt
for the Easter market. On 26th February, a letter, enclosing a sheet
of the printed book, and revealing the secret of its authorship,
was written from Geneva by Guillaume H. C. de Teyre, formerly
teacher in Lyons, to his cousin Antoine Arneys in that city.
The letter bears no sign of dictation by Calvin (who must, how-
ever, have furnished the enclosed sheet), and de Teyre's part may
be explained by an old grudge of his against the Lyons books-
sellers. For a subsequent letter Calvin furnished (reluctantly,
according to de Teyre) samples of Servetus's handwriting, expressly
to secure his confession. The inquisitor-general at Lyons,
Guillaume de Morlay ("Dominius") of Rochesia) took up the case
on 12th March; Servetus was interrogated on 16th March, arrested
on 4th April, and examined on the two following days. His
defence was that, in correspondence with Calvin, he had assumed
the character of Servetus for purposes of discussion. At 4 A.M.
on 7th April he escaped from his prison, evidently by connivance.
He took the road for Spain, but turned back in fear of arrest.
How he spent the next four months is not known. His own
account is that he never left France; Calvin believed he was
wandering in the North of Italy; the absurd suggestion that he
combined a visit to Spain with a tour of the Holy Land was done
by his critics, not by himself. Servetus was brought to trial in
Frankfort (Hist. de Genève, 1680). On Saturday the 12th of August he
rode into Lyonset, a village on the French side of Geneva. Next
morning, having sold his horse, he walked into Geneva, put up at
"the Rose," and asked for a boat to take him towards Zürich on
his way to Naples. Finding he could not get the boat till next day
(Monday) he attended afternoon service (he would probably
have got into trouble if he had not done so), was recognized at church
by quelques frères, and immediately arrested. The process against
him (Nicholas de la Fontaine being in the first instance the
nominal prosecutor) lasted from 14th August to 26th October,
when he was convicted for "use of a heretic book." He was
condemned to death (Oct. 27, 1553). Calvin would have him
beheaded. Meanwhile the civil tribunal at Vienne had ordered
(17th June) that he be fined and burned alive; the sentence of the ecclesiastical tribunal at Vienne was delayed
till 23rd December. Jacques Chambier, a priest in Servetus's
confidence, was condemned to three years' imprisonment in
Vienne. The only likeness of Servetus is a small copperplate
by C. Sichem, 1607 (often reproduced); the original is not
known and the authenticity is uncertain. In 1576 a statue of
Servetus was erected by Pierre Gonzales de Velasco in his house
in Innsbruck, and in 1580 a statue was erected at Trinite,
where a notable exposition was held. In 1607 a statue
was put up at Champel; in 1679 a statue was erected in Paris (Place de la Mairie du XIVth Arrondissement); another
is at Armitane; another was prepared (1700) for erection at
Vienne.

The religious views of Servetus, marked by strong individuality,
are not easily described in terms of current systems. His denial of
the tripersonality of the Godhead and the eternity of the Son, along
with his antinazarian, made his system abhorrent to Catholics and
Protestants alike, in spite of his intense Biblicalism, his passionate
devotion to the person of Christ, and his Christocentric scheme of
the universe. His earliest theological writings, in which he approxi-
mates to the views of F. Socinus, are better known than his ripper
work. He has been classed with Arians, but he endorses in his own
way the homousian formula, and denounces Arius as "Christi
glorie incasuscimus." He has had many critics, some apologists
(e.g. Postel and Lincarius), few followers. The fifteen condemning
clauses, prefixing the sentence at Geneva, set forth in detail that he
was guilty of heresies, blasphemously expressed, against the founda-
tion of the Christian religion. An instance of his injurious language
was found in his use of the term "trinaries" to denote "ceux qui
creyent en la Trinité." No law, current in Geneva, has ever been
applied to Servetus. As he was not practicing the law, theProc-
cureur-general, put it to Servetus that his legal education must
have warned him of the provisions of the code of Justinian to this
effect; but in 1553 all the old laws on the subject of religion had been
set aside by the statute against heretics; the mayor of Geneva,
and in 1543 being banishment. The Swiss churches, while agreeing
to condemn Servetus, say nothing of capital punishment in their
letters of advice. The extinct law seems to have been revived for
the occasion. A valuable controversy followed on the
question of executing heretics, in which Beza (for), Mino Celsi (against),

1 Beza incorrectly makes Servetus the challenger, and the date

1534.
and several caustic anonymous writers (especially Castello) took part.

The following is a list of his writings:

1. De Trinitatis erroribus libri septem (Haganau, 1531).
2. Triplici Triunitatis libri tres (Haganau, 1532); two reprints of 1 and 2, to pass for originals; No. 1 in Dutch version (1620), by Regnier Telle.
3. Claudii Alexandri geographiae narrations libri octo; ex Biblioth. Frecceari translatio, sed ad Graeco et prisco exemplaria a Michaelo Villanovano jam primum recogniti. Adiecta insuper ad eodem scholia, &c. Lyons, Melchior and Caspar Trechsel (1535) and ed. Lyons, Melchior, &c. à Porta (1542), &c. (1542 fol.; printed by Caspar Trechsel at Vienna); on this work Tullin founds his high estimate of Servetus as a comparative geographer; the passage in- criminating his activity in the Society of Moses is from Lombardy; the accounts of the language and character of modern nations show original observation.

4. In Leonardum Puchiam apologia. Autore Michaelo Villanovano. Ex officina Haugeneana (1536), reprinted, Lyons (1548), and later Venice (1589), the medicus is Jean Tagault, who interrupted Servetus's lectures on astronomy during the toy burghers' search for the sun. (See 6.)

5. Syruperum universa ratio, &c. (Paris, 1537); four subsequent editions; latest, Venice, 1548 (six lectures on digestion; syrups treated in third lecture).

6. Michaelis Villanovani in quaedam medicum apologeticam dictationem pro astrologia (Paris, 1538; reprinted, Berlin, 1880); the medicus is Jean Tagault, who interrupted Servetus's lectures on astronomy during the toy burghers' search for the sun. (See 6.)

7. Biblia Sacra ex sanctis Pagnini translatione... recognita et scholios illustrata, &c. (Lyons, Hugo à Porta, 1542, fol.), remarkable for its theory of prophecy, explained in the preface and illustrated in the notes.

8. D'Artigy says Servetus fit les arguments to a Spanish version of the Summa of Aquinas; this, and divers traités de grammaire from Latin into Spanish have not been identified.

9. Quixantia (1553) in Latin, and Latin copies in Vienna and Paris; a copy in Edinburgh University Library is complete except that the missing first sixteen pages are replaced by a transcript from the original Latin manuscript; this transcript, following the print (this supplementary manuscript was reproduced by photography, 1909); a transcript of other portions of the draft is in the Bibl. Nat., Paris; partly reprinted (London, 1723), (copies in London and Paris); reprinted (page for page) from the Vienna copy (Nuremberg, Rau, 1570); German version, by D. Spina, in Wiesbaden, 1822-28, 1870; the last section Apologia to Melanchthon, is given in the original Latin. The book is not strictly anonymous; the initials M.S.V. are given at the end; the name Servetus on p. 199. The oft-quoted description of the pulmonary circulation (which occurs in the toy burghers' search for the sun) is p. 169; it has escaped Sigmond that Servetus had an idea of the composition of the blood, and of all the vessels for his researches was the dual form of the Hebrew words for blood, water, &c. Two treatises, Desiderius (ante 1542) and De tribus impotensibus (1548), have been wrongly ascribed to Servetus. Most of his few remaining letters are printed by Mosheim; his letter from Louvain was dispatched in duplicate to evade capture, but both were seized; one is in the Record Office (U. 140), the other in the British Museum (Cotton MSS., Calia B 6).

AUTHORITIES.—The literature relating to Servetus is very large; a bibliography is in A. v. d. Linde, Michael Servet (1891); the following are among the important pieces:

Calvin’s Defensio orthodoxae fidei (1554), in French, Déclaration pour mainteiner, &c. (1554), is the source of prevalent misconceptions as to Servetus’s opinions, and attitude on his trial. De la Roche’s Historical Account in Mem. of Lit. (1711-1712) in French, Biblioth. Amst., is followed by An Imperatorial History, &c. (1724, said to be by Sir Benjamin or Nathaniel Hodges). Allwood’s Historia, &c. (1728) materials published by A. D’Artigy, Nouveau manuscrits et restes de la vie de M. Servet (1554), &c. (1583, fol.; printed in Paris, 1602; &c. (1583, fol; printed in Paris, 1602; &c.). Chauffeune’s valuable article, Nouv. Dict. historique, iv. (1556), fol. (in English, by Rev. James Yair, 1771) makes no use of Mosheim’s latest edition, De la Roche’s Historia, or F. Seclin, bk. i. (1839), uses all available material up to date. The investigations of H. Tullin, M.D. (forty separate articles in various journals, 1874 to 1885) have thrown much light, mixed with some conjecture. The records of the Geneva trial, first published by De la Roche, reproduced in Ritter’s Relation &c. (1844), and elsewhere, are best given in vol. viii. (1879) of the Corpus reformatorum edition of Calvin’s works; Roget’s His. du peuple de Geneve, &c. (1879), has a good account of both trials. The passage on the pulmonary circulation, first noticed by W. Wotton, Reflections upon Anc. and Mod. Learning (1664), has given rise to a literature of its own; see, especially, Tullin’s De Enfiteusis de Blutkreislauf, &c. (1879); Huxley, in Formgny Rev. (February 1878); Tullin’s Kritische Bemerkungen über Harvey und seine Vorgänger (1882). Other physiological speculations of Servetus are noted by G. Sigmond, Unnotices Theories of Servetus (1826). The best study of Servetus as a theologian is Tullin’s Lehrzusammen M. Servets, 6 vols., 1875-1879; Ph. B. de M. Serveti doctrine (1875), is useful. From a Unitarian point of view, Servetus is treated by R. Wright, Apology (1807); W. H. Drummond, D.D. (1848); R. Wallace, Anti- in Biog. (1840); J. S. Porter, Servete and Calvin (1854). E. Saissset, Rev. des deux Mondes (1849), treats Servetus as a pantheist; he is followed by Menendez Pelayo, Los Antirrados españoles (1880, vol. ii.), and by R. Willis, M.D., Servet and Calvin (1877, an unsatisfactory book; cf. A. Gordon, Theol. Rev. April and July 1878). Of Servetus’s personal character the best vindication is Tullin’s Characterbild M. Servets (1876, in French, with additions by Dardier, Portrai Caractère, 1879). His story has been dramatized by Max Ring, Die Genfer (1890); by José Echegaray, La Muerte en los Labios (1880), by Albert Hamann, Servet (1881), and by Prof. Shields, The Reformer of Geneva (1897). Recent pamphlets by Spanish and French writers are numerous; some of the illustrations in Dr W. Osel’s Michael Servetus (1909), are useful.

(AG.)

SERVIA 1 [Srbiya], an inland kingdom of south-eastern Europe, situated in the north of the Balkan Peninsula. The frontier, as defined by the Berlin Treaty of 1878, is, roughly speaking, indicated by rivers in the north, and by mountains in the south. In the north, between Verciorova and

Belgrade, the Danube divides Servia from Hungary for 157 m.; and between Belgrade and the border village of Rach a the Save divides it from Croatia-Slavonia for 80 m. In the north-west the Drina flows for 162 m. between Bosnia and Servia; 1 The English-speaking races alone write this word with a v instead of a b, Servia for Servia; a practice resented by the Serbs, as suggesting the derivation of their name from the Latin Servus, "a slave."
in the north-east the Danube, for 50 m., and the Timok for 23 m., constitute respectively the Rumanian and Bulgarian boundaries. Various mountain ranges mark the frontiers of Bosnia, on the west, Turkey on the south-west and south, and Bulgaria on the south and south-east. According to the survey carried out by the Servian general staff in 1884 the area of the country is 18,782 sq. m.

Mountains.—The mountain groups which rise confusedly over almost the whole surface of the land, fall into two main blocks, one on either side of the river Morava. On the east of this river, three vast ranges, the Servian Alps, the Carpathians, and the Balkan Alps, encroach upon Servian soil; while on the west there is a chaos of mountain masses, outliers of the Bosnian and Albanian highlands.

Rivers.—The chief navigable river of Servia, which extends from the Lake of Pozar to the Adriatic, and which is partly regulated by way of the Kazan (i.e., "Cauldron ") Pass, near the famous Iron Gates (see Rumania). The Timok, which formed the Bulgarian frontier as long ago as the 9th century, springs in the western Balkans, or Stara Planina, and issues into the Danube, near Negotin, after a course of 70 m. Sooner or later, indeed, all the Servian rivers reach the Danube. The Save, which is also navigable, meets it at Belgrade, after being joined, on the Drina, by the Drina, a Servian river, which rises on the Montenegrin border, 155 m. s. by W. Near Ohrenovats the Kolubara also enters the Save, after traversing 45 m. from its source in the Sokoliska Gora. Apart from frontier rivers, there are numerous small streams which run into the Morava, especially on the western slopes of the Kara Dagh, a little beyond the Servian frontier, enters the country with a north-easterly course near the extreme S.E., and then turns N.N.W. and flows almost in a straight line to the Danube. The length of the Danube is about 150 m. In the upper part of its course it is known as the Bulgarian Morava, and only after receiving the Servian Morava is it known as the Danube.

The Morava is joined on the south by the Ibar, which comes from the Albanian Alps; the combined length of these rivers being about 150 m. The only other important tributary of the Great Morava is the Nish, which it receives on the right side. This stream flows 68 m. W. by N. from its source among the foothills of the Stara Planina. The valleys of all these rivers, especially those of the Slovenian and Servian Morava, are rich. The Nish contains considerable areas of level or low-lying country well suited for the growth of corn, and the low grounds along the Save and the Danube from the Drina to the Morava are also well adapted for agriculture, except the tract of fenland called the Machva, in the extreme north-west.

Geology.—The geological structure of Servia is varied. In the south and west the sedimentary rocks most largely developed are of ancient, pre-Permian age, interrupted by the crystalline rocks of granite, serpentine and other crystalline rocks. Beyond this belt there appear in the north-west Mesozoic limestones, such as are seen on many of the small islands in the Adriatic. In the Peninsular, generally, and the valleys opening in that quarter to the Drina have the same desolate aspect as belongs to these rocks in the rest of that region. In the extreme north-east the crystalline schistose rocks predominate, and the higher ranges on this side of the country are the Corabia, and stretch parallel to the Morava in a band along its right bank. Elsewhere east of the Morava the prevailing rocks belong to the Cretaceous series, which enters Servia from Bulgaria. The Shumadia is made up of low ranges of Territorial age, with interwoven patches of older strata; and the Rudnik Mountains are traversed by metaliferous veins of syenite.

Minerals.—Gold, silver, iron and lead were worked by the Romans, whose operations can still be traced in the Kostolats mines, near Pozharovats, and elsewhere. Even more ancient is the Aava mercury mine, near Belgrade. The heaps of debris which cover so many acres near Belgrade, on the Kopaonik foothills and in the Tnipitsa valley bear witness to the importance of this industry in the past. During the later middle ages the Servian mines brought in a large revenue to the merchant princes of Ragusa. They prospered strongly during the 14th century, under the rule of Turkish, and to this industry after 1459; and the revival only began in 1835, under the patronage of Prince Milosh. The richest coal and lignite seams occur among the north-eastern mountains, generally near the Danube or Timok, and along the Morava. They are worked by the state, by Belgian companies and by private enterprise, the output in 1907 being valued at £121,000. Lead is principally raised in the Popovac, and the Zajecar district. From the Montenegrin department, where zinc and small quantities of gold and silver are obtained. Antimony is mined at Zayечar. Copper and iron are worked by Belgians near Maydanapek, the chief mining centre near Nis. From the Niš region marble, sulphur and oil shales are found in various regions, but the mineral resources of the country, as a whole, remain almost untouched.

The numerous mineral springs are even more neglected than the mines. Waters rich in iodine and sulphur occur in the Machva. About 1878 an unsuccessful attempt was made to convert Arandyelovats into a popular health-resort. The baths near Nish and Vranja are comparatively prosperous, while the beautiful surroundings attract visitors even from abroad.

Agriculture.—Servia methods of farming remain in many respects primitive. Real progress was, however, achieved in the period 1890-1910, chiefly owing to improvements in agricultural education. Indian corn is the principal crop, for corn-cake forms the staple diet of the peasantry, while the grain is also used for feeding pigs, the heads for feeding cattle and the stubble for manure. The normal yield exceeds 5,000,000 bushels yearly, wheat coming next with a little less than 4,000,000. Flax, hemp and tobacco are also grown; hemp, especially near Leskovats. The cultivation of sugar-beet, introduced in 1900, became an important industry, but the attempt to introduce cotton failed. The native tobacco plantations meet all the local demand, except for a small quantity of Turkish tobacco imported for the manufacture of special blends. The best Servian wines are those of Negotin and Semendia. Before the appearance of Phylloxera in 1882 wine was exported to France and Switzerland, but in 1882-1895 thousands of acres of vines were destroyed. Phylloxera was checked by the importation of American vines and the establishment of schools of viticulture. The creation of state vine-nurseries, stocked with American plants, was authorized by a law of 1908. Orchards are very extensive, and all the fruits of central Europe will thrive in Servia. The chief care is bestowed on plums, from which is distilled a mild spirit known as raki or rulika. The favourite kind of raki is škirovica (the škirovica of Austria), extracted solely from plums. There is a considerable trade in dried plums and plum marmalade. Bees are very generally kept, the honey being consumed in the country, the wax exported. Mulberries are grown on many farms for silkworms; sericulture is encouraged and taught by the state, and over 100,000 cases of cocoons are annually exported. Relatively to its population, Servia produces a great deal of other food, such as potatoes (3,000,000 in 1905) and pigs (908,000 in 1905) than any country in Europe. Large herds of swine fatten, in summer and autumn, on the beech- and acorn of the forests, returning in winter to the lowlands. The Servian pig is pure white or black, but other breeds, notably the Berkshire and Yorkshire, are kept. Despite American competition and Austro-Hungarian tariffs the export of wine remains the principal branch of Servian commerce. Cheeses are made from the milk of both sheep and goats; but
cattle are mostly bred for export or draught purposes. The cumbersome wooden carts which afford the sole means of transport in many districts are generally drawn by oxen, although buffaloes may be seen in the south. The native horses, though strong, are, like the cattle, of small size.

Land Tenure.—More than four-fifths of the Servians are peasant farmers; and the great majority of these cultivate the land belonging to their own farms. Holdings are generally small, exceeding an average of 20 acres for each household. They cannot be sold or mortgaged entire; the law forbids the alienation for debt of a peasant’s cottage, his plough, or court-yard, his last six yards of land and the cattle necessary for working his farm. Besides the small farms there is the zadruga, a form of community which appears to date from prehistoric times, and mainly survives among the mountain tribes. The members appear every day and are to be replaced by rural co-operation. Under the zadruga system, each homestead or cluster of cottages is occupied by a group of families connected by blood and marriage. The members are connected by strict family ties; the association is ruled by a house-father (domanyin or staryeshina) and a house-mother (domanyitsa), who assign to the members their respective tasks. The staryeshina may be a patriarch of the community, but is often chosen by the rest of the members on account of his prudence and ability; nor is his wife necessarily the domanyitsa. In addition to the farm work, the members often practise various trades, the proceeds of which are distributed to the members. The community sometimes includes a priest, whose fees for baptism, &c., augment the common fund. The buildings belonging to the homesteads are enclosed within an immense palisade, which is periodically expanded so as to be protected with plum, damson, and other fruit-trees, surrounding the houses of the occupiers. In the midst of these is the house of the staryeshina, which contains the common kitchen, each family having its portion of the floor for little eating places. But that of the staryeshina is often of brick, and is invariably of better construction than the rest. The houses are often raised on piles, above the level of the floods which occur so frequently near the Save and Drina. Zadrugas were very prosperous, as they had always a sufficient number of hands at command, and their members combined to obtain implements and cattle. But with the establishment of order and security, the zadrugas began rapidly to disintegrate. The tenantry of the future, or what is left, are smaller societies, form a single great organization known as the General Union of Peasants.

Small holdings were in themselves a hindrance to Servian agricultural progress, as the peasants cannot afford the labor of clearing, &c., which is necessary; hence the great success of co-operation. As a rule, also, the lots of ground belonging to one household or family do not lie together, but are dispersed in different, very often distant, parts of the village land. To meet this difficulty, a farmer with more crops than he can reap himself would summon his neighbours to his assistance, supplying them with food, but no money, and binding himself to repay the service in kind. This form of voluntary labor is called moka. Another serious drawback to the economic position is that Servia has no seacoast, and that it is far from the nearest export harbours (e.g. Galatz, Salonika, Trieste). In such a situation the country is at the mercy of hostile tariffs.

Manufactures and Commerce.—The scarcity of labour prevents the growth of any great manufacturing industries. There is no native artisan class; for except in very rare cases, the people value the dependence too highly to work in factories, or even to enter domestic service. A large proportion of the artisans throughout Servia are Austro-Hungarians or gipsies. The chief manufacturing industries are those for which the country supplies raw material, notably meat-packing, flour-milling, brewing, tanning, and the weaving or spinning of hemp, flax and wool. There are also iron-foundries, potteries, and sugar, tobacco, and celluloid factories. A law of 1858 authorizes the government to grant concessions on very favourable terms to foreign capitalists willing to promote mining and manufacturing in Servia; but in 1910 the number of large industrial establishments in the kingdom did not exceed 60, nor the number of hands employed 5000. There are a few domestic industries, such as the manufacture of sandals (opanke), and of the hand-woven carpets and rugs made at Pirot, which are popular throughout the Balkan Peninsula.

Commerce.—The following table shows the value of Servian imports and exports for five years:

<table>
<thead>

Cotton and woollen fabrics, leather, salt, sugar, iron and machinery are the principal imports, and come chiefly from Austria-Hungary, Germany and Great Britain. Large quantities of prunes, grain, meat, raw hides, eggs and copper are exported, chiefly to Austria-Hungary, Germany and Turkey.

The situation up to 1878 the principal revenues were derived from the customs, excise and a sort of poll-tax. The government required the town and village communities to pay into the state treasury £1,48, per head of the able-bodied citizens living in the community, and the principal burden of the annual expenditure of the state amount due to the government from its citizens according to their estimated wealth or earnings. That system yielded without the slightest difficulty about £75,000 annually. But the Berlin Treaty (1878) stipulated that Servia should in fact part of the international railway to Constantinople and to Salonica, and should pay the Turkish landowners an indemnity for the estates which had been taken from them and divided among their Servian tenants. This and the necessity of indemnifying the people from whom, during the wars with Turkey (1876-1878), requisitions had been taken and money borrowed, forced the government to enter the European financial markets. Up to that time (1881) Servia had practically no public foreign debt, although it owed Russia about £240,000 lent privately for war preparations, and to its own people about £35,000 taken by a forced loan. The new taxes were levied by French banks at 7½ for 5% bonds, and the expenditure had to be immediately increased to £1,240,000:

The introduction of new taxes and the reorganization of the financial administration of the state (1881) has considerably increased the amount of public expenditure, chiefly because the skupishchina was for some time reluctant to replace the old system of direct taxation by a more modern system. When in 1884 the new law of taxation was adopted, the situation became so serious that in 1895 a new scheme was adopted by which the government gave to the bondholders additional securities, the bondholders at the same time accepting the new 4% authorised bonds in exchange for their old 5% bonds. The following table gives an analysis of the national debt on the 1st of January 1899:

| Russian debt of 1876 (5%) | £150,000 |
| Lottery loan of 1881 (2%) | 960,000 |
| Loan of the state treasury (5%) | 291,000 |
| Primary loan of 1887 | 367,000 |
| Unifed loan of 1895 (4%) | 13,516,000 |
| Railway loan (5%) | 3,500,000 |
| Monopoly loan of 1902 (5%) | 2,500,000 |
| Loan of 1906 (4½%) | 3,767,000 |
| Total | £21,572,000 |

The chief sources of revenue are customs duties, the state monopolies of salt, sugar, tobacco, matches and petroleum; national property, e.g. forests, railways, postal service; direct taxes, of which the most important are the poll-tax and the land tax (graduated according to the quality of the land). The heaviest charges are for the service of the national debt and for the army; each of these items exceeded £1,000,000 in 1909. The estimated revenue and expenditure for five years are shown below:

Banks and Money.—The National Bank of Servia, founded in Belgrade in 1883, has a nominal total of £80,000,000 pa. The Industrial Bank (Uprzna Fondu), founded in 1882, is a state institution which lends money for agricultural operations, &c. The Export Bank, founded in 1901, is a private bank under state supervision, with branches at Belgrade, Trieste, &c. Its chief object is the furtherance of Servian foreign commerce.

One yardro is the area which two oxen can plough in a day.
In 1875 Servia adopted the decimal system for money, weights and measures, which came into actual use in 1878. The monetary unit is the dinar (franc) of 100 paras (centimes). In circulation there are gold pieces of 10 and 20 dinars, silver of 50 paras, and, in paper, 2, 4, 9, 15, 20 and 2 paras; and bronze of 2 paras. Twenty-five dinars equal $1 sterling.

Chiefs and Government.—The chief towns of Servia are Belgrade, the capital, with a population of 113,803 (1890), and Pirot (18,851). There are also many smaller towns, and there are several smaller railways in the valleys of the Save, the Danube, the Servian Morava and their tributaries. Apart from country lanes and footpaths, there are three classes of highways, controlled, respectively, by the nation, department and commune. Construction and repairs are, in theory, carried out by compulsory labour; but this right is seldom enforced. Even in the Shumadia, where materials are plentiful, the roads rapidly give way under heavy traffic in the wintertime. In the more mountainous and richer districts, they are often impassable. The Constantinople and Salonica roads remain the best in Servia. Besides the frontier streams on the north and west, the only river of any importance for navigation is the Morava, which is navigable for small craft from Valjevo to Chupriya, about 60 m. from its mouth.

The postal system dates from 1820, when an organized system of couriers was established, for state correspondence only. From 1843 to 1868 the Servian government undertook the carriage of letters in Servia itself, while the Austro-Hungarian consulate in Belgrade forwarded correspondence to and from central and western Europe. In 1868 the whole business of the post was taken over by the state, and post-offices are also maintained by many communes, and a few are even carried on by private individuals. Servia joined the International Telegraphic Union in 1834, and in 1874 began to use free telegraphic stamps. Telegraphs were constructed as early as 1835; telegrams between Constantinople, Sofia, Budapest and Vienna pass over lines constructed by the Servian government (under conventions with Austria-Hungary and Turkey) in 1890 and 1906. The telephone service, inaugurated in 1903, is a state monopoly (both for construction and operation).

Population.—With a continuous excess of births over deaths, and of male over female children, the population of Servia rose from 1,079,270 in 1880 to 1,750,000 in 1910. More than four-fifths of this number belong to the Serbo-Croatian branch of the Slavonic race; while the remainder is composed of about 160,000 Rumans, 47,000 gipsies, 8,000 Austro-Hungarians and Germans, and 5,000 Jews. Many Servian emigrants returned, after 1878, to the territories which the Treaty of Berlin restored to their country. These territories had been occupied, under Turkish rule, by Albanians, west of the Morava, and by Bulgarians, along the Nisava; but, after 1878, the Albanians withdrew, and the Bulgarians were absorbed. The Rumans reside principally in the north-east, near the borders of their native land, and are peasant farmers, like the Serbs. The gipsies occasionally settle down, forming separate camps or villages, but in most cases they prefer a wandering life. They are often admirable artisans and musicians, almost every town possessing a gipsy band. The Germans and Austro-Hungarians control a large share of the commerce of the country; the Jews, as elsewhere in the Balkans, are retail traders. Anti-Semitism is not prevalent in Servia, owing to the smallness of the Jewish communities. The stature and features of the Serbs vary in different regions; but the northern peasantry are generally taller and fairer than the mountaineers of the south. Those of the Slavonian race are small, but the Montenegrins are generally taller and stronger than the mountaineers of the south. The first census, taken in 1877, showed the total population of Servia to be 1,750,000. The census of 1909 was the first to give an accurate estimate of the population of Servia, being taken simultaneously in all the provinces of the country. It was estimated that the population of Servia on the 31st December, 1908, was 2,962,600. This estimate was confirmed by the census of 1910, which showed the population of Servia on the 31st December, 1909, to be 2,975,000. The census of 1911 showed the population of Servia on the 31st December, 1910, to be 3,000,000. The census of 1912 showed the population of Servia on the 31st December, 1911, to be 3,025,000.

Constitution and Government.—In 1903, after the murder of King Alexander Obrenovich, and the accession of Peter Karageorgevich, the constitution of 1889 was revised. By this instrument the government of Servia is an independent constitutional monarchy, hereditary in the male line, and in the order of primogeniture. The executive power is vested in the king, advised by a cabinet of eight members, who are collectively and individually responsible to the nation, and represent the
ministers of foreign affairs, war, the interior, finance, public works, commerce, religion and education, and justice. The king and the national assembly, or Narodna Skupština, of 130 members, together form the legislature. A general election must be held every fourth year. Each member receives 15 dinars for every day of actual attendance, and travels free on the railways. There is also a state council which deals with various legal and financial matters. Of its 16 members, half are chosen by the king, and half by the Skupština. Apart from soldiers of the active army, all male citizens of full age may vote, if they pay 15 dinars in direct taxes; while, apart from priests, communal magistrates and other officials, paying 100 dinars, are eligible to the Skupština. The Velika Skupština or Grand Skupština is only convoked to discuss the most serious national questions, such as changes in the succession, the constitution or the territories of the kingdom. Its vote is regarded as a referendum, and its members are twice as numerous as those of the Narodna Skupština. For purposes of local government Servia is divided into 17 departments (okrug, pl. okrushi), each under a prefect (nachalkin), who is assisted by a staff of civil servants, dealing with finance, public works, sanitation, religion, education, and public health, and, in the less populous regions, the departmental constabulary or pandurs. Every department is divided into districts (srež), administered by the sub-prefect (sreški nachalkin); and the districts are sub-divided into communes or municipalities, each having its salaried mayor (kmet ot knea), who presides over a council elected on a basis of popular election. Within the smaller spheres of their jurisdiction, the sub-prefect and mayor have the same duties to fulfill as their superior, the prefect. The mayor is, further, responsible for the maintenance of the communal granary, forests and other property. He presents to the councilors (odbornik, pl. odbornsiti) a yearly statement of accounts and estimates, which they may reject or amend. All taxes levied by the state are paid by the communal council, which assesses the property owned by each family under its authority, collects the amount due and has the right to retain one-fourth, or more, for local requirements. The central government cannot veto the election of a communal mayor or councillor.

History.

The highest judicial authority in Servia is the Court of Cassation, created in 1855 and reorganized in 1865. The court of appeal (1840) has two sections, one competent for Belgrade and the seven northern departments, the other for the rest of the kingdom. The law of June 1848 establishes a tribunal for customs, and a commercial court of first instance in Belgrade. Communal courts exist in every commune or municipality, and certain judicial powers are delegated to the police, under laws dated 1848 and 1858. The local courts of the Servia Office, which dates as early as the 13th century and fell into desuetude under Turkish rule, was revived in 1871.

The first Turkish citadels of Belgrade, Nish, Pirot and Semendria have no military value, but some strategic points on the Bulgarian frontier were entrenched between 1889 and 1899, while the modern forts of Nish, Pirot and Zayechar were strengthened and re-armed at the beginning of the 20th century. The defensive force of the country, as reorganized in 1901, consists of the national army (narodna vojska) and the landstorm. In the national army, which is organized in 5 divisions, with headquarters at Nish, Belgrade, Valjevo, Krajevovac and Zayechar, every able-bodied citizen must serve (for two years in the artillery and cavalry or eighteen months in other branches) between his 21st and his 45th year. He must be able to carry 45 to 50 pounds of knapsack. The landstorm consists of 17,000 to 18,000 men. Exemption from service is granted in a few exceptional cases. The national army consists of three bans or classes; the first is the field army, the units of the second exist in peace as cadres only, the third is organized. On a peace footing the strength of the army is 45,000 men; in war it might reach 255,000, including landstorm. The infantry were armed in 1910 with the Mauser rifle (model 93); the field artillery with quick-firing guns on the Schneider-Canet system.

Religion.

The Servian Church is an autocephalous branch of the Orthodox Eastern communion. It is subject, as a whole, to the metropolitan of Constantinople, to whose jurisdiction the bishop of Belgrade, who is also the metropolitan of Servia. Belgrade is the only archiepiscopal see; the four dioceses are Nish, Sabats, Chuprija, and Velika Nish, and the churches belong to the patriarchate of Galicia, the metropolitanate of Servia, and the diocesan primate, Bishop Jovan. There is a synod of the highest ecclesiastical tribunal; there are also two ecclesiastical courts of appeal and diocesan courts of first instance in every bishopric; the canon law is an important part of the law of the land. In 1910 there were 54 monasteries, but only 110 monks, all belonging to the order of St Basil. Študenica, near Kraljevo, and Manasija and Mileševa, near Chič, are the most famous of the monasteries. Much political influence is wielded by the priests, who played a prominent part in the struggles for national independence. They also play a part in art, and, by training their parishioners, from whom a large part of their income is derived, they collect all offerings and fees. The remainder comes principally from church lands; only the highest dignitaries being paid by the state. No able-bodied man may become a priest or monk unless he has served in the army. Liberty of conscience is unrestricted. Liberty of worship is accorded to Roman Catholics, Jews, Mahomedans and certain Protestant communities. The Mahomedans (about 3000 Turks and 11,000 gipsies) are the largest religious body apart from the national Church.

Education.—In 1910, 17% of the population could read and write. Primary education in the state schools is free and compulsory, with a reading of Church Slavonic, nature-study and agriculture (for boys), domestic science (for girls), certain handicrafts, singing and gymnastics are among the subjects taught. There are higher schools (mostly Real-Gymnasia) in many of the larger towns, besides (1910) one theological seminary, 4 training schools for teachers, 4 technical schools, a military academy, and 5 secondary schools for girls. The commune, or municipalities pay the entire cost of primary education, and, in the case of teachers, which, with the cost of higher education, are paid by the state. In February 1905 the Great School (Velika Skola) in Belgrade was reorganized as the University of Servia, for the furtherance of philosophical, scientific and technological education. Other important institutions of a semi-educational character are the Royal Servian Academy (1836), which controls the national museum and national library in Belgrade, and publishes an official scientific periodical (Istoriya, or History of Serbia), the history museum (1904), the national theatre (1890), the State Archives (1866, reorganized 1901), and the state printing office (1831), all in Belgrade.

SREBIA

 territory, which as a geographical and political unit was called 
Zhupu or Zhupaniya (county), the political and military chief 
of which was called Zhupan. The country was divided into 
many such Zhupaniyas, which were originally independent of each 
other. The history of the Dalmatian peoples during the first few centuries 
after their arrival in their present country was a struggle between the 
attains at union and centralization of the Zhupaniyas into a state under one government, and the resistance to such union and centralization, a struggle between the centrifugal and the central forces. The more powerful Zhupan was tempted to subjugate and absorb the neighbouring less powerful Zhupaniyas. If successful, he would have in his the Veliki Zhupan (Grand Zhupan). But such unions were followed again and again by decentralization and disruption. It is not to be wondered at that this struggle gave occasion for wars between the Zhupaniyas, for civil wars within the Zhupaniyas, for popular 
rising, court revolutions, dethronements, political assassinations 
and such like. The earlier history of the Serbs on the Balkan territory is especially turbulent and bloody. One of the minor 
causes of that turbulence is to be found in the struggle between the ancient Slavic order of inheritance, according to which a 
Zhupan ought to be succeeded by the oldest member of the family and not necessarily by his own son, and the natural desire 
of every ruler that his own son should inherit the throne. 

This internal political process was complicated by the struggle between the Greek Church and Greek emperors on the one side, and the Roman Catholic Church and the Roman Catholic Powers (Venice and Hungary) on the other side, for the possession of 
exclusive ecclesiastical and political influence in the provinces 
occupied by the Serbs. The danger increased when the Bulgarians came, towards the end of the 7th century, and formed a 
powerful kingdom on the eastern and south-eastern frontiers of the Serbs. Practically from the 8th to the 11th century 
the Serbs were under either Bulgarian or Greek suzerainty, while the Serbo-Croat provinces of Dalmatia acknowledged 
either Venetian or Byzantine sovereignty. 

The Vichese Dynasty.—The first Serb princes who worked with more or less success at the union of several Zhupaniyas into one state, belonged to what might be called "the Vichese dynasty." Zhupan Vicheslav lived in the beginning of the 9th century, and seems to have been the descendant of that leader of the Serbs who signed the settlement treaty with the emperor Heraclius towards the middle of the 7th century. His ancestral Zhupanija comprised Tara, Viva, Lim (the neck of land between the Montenegro and Servia of our days), Vicheslav's son Rastko, and his grandson 
Vlastimir, continued his work. Vlastimir succeeded his father in the western provinces of Servia against the Bulgarian attacks, while the eastern provinces of Servia (Braničev, Morava, Timok, 
Vardar, Podrimlya) were occupied by the Bulgars. The Bulgarian danger, and probably the energetic and successful operations of the Greek emperor Basil the Macedonian (867–886), determined the survival Zhupans to acknowledge again the suzerainty of the Greek 
emperors. One of the important consequences of this new 
relationship to the Byzantine empire was that the entire Servian people embraced Christianity, between 871 and 875. In all 
important transactions the Servians were led by Zhupan Mitkutim Vicheslavich (d. 907). During the reign of his 
descendants all the Servian provinces were conquered by the 
Bulgarian Tsar Simeon (920). In 912 Chaslav, one of the princes of the Vicheslav dynasty, liberated the largest part of the Servian territory from Bulgarian domination, but to maintain that liberty 
he had to acknowledge the Byzantine emperors as his suzerains. 

The Princes of Zetza and the First Serb Kingdom.—Towards the 
end of the 9th century the political centre of the Serbs was transferred to Zetta (Zeta or Zenta; see MONTENEGRO) and 
the Princes (see Coasts of the prince, sometimes called king) of 
Zetta, Yovan Vladimir, tried to stop the triumphal march of the 
Bulgarian Tsar Samuel through the Serb provinces, but in 989 
declared war, was defeated, made prisoner and sent to Samuel's capital, Prespa. 

The historical fact that Vladimir married Kosara, the daughter of Samuel, and was sent back to Zetta as reigning prince under 
the Bulgarian suzerainty, forms the subject of the first Serb novel, 
Vladimir and Kosara, as early as the 13th century. Vladimir, 
who seems to have been a noble-minded and generous man, was 
murdered by Samuel's heir, Tsar Vladislav (1015). By the 
Christians of both churches in Albania he is to this day venerated 
as a saint. But after the death of Samuel the Bulgarians 
rapidly lost the Serb provinces, which, to get rid of the Bulgarians, 
again acknowledged the Greek overlordship. About 1042, 
however, Prince Voislav of Travunia (Trebinje), cousin of 
the assassin Vladimir of Zetta, started a successful insurrection 
against the Greeks, and united under his own rule Travunia, 
Zahumlye and Zetta. His son Michael Voislavich annexed the 
important Zhupaniya of Rashka (Rasicia or Rassia), and in 1077 
proclaimed himself a king (rex), receiving the crown from Pope 
Gregory VI (1073–1085). His son continued the work of his father, 
and enlarged the first Serb kingdom by annexing territory, went up to that time were under direct Greek rule. A body of 
Crusaders under Count Raymond of Toulouse passed through 
Bodin's kingdom about 1101. After Bodin's death the civil wars 
between his sons and relatives materially weakened the first 
Serb kingdom. Bosnia reclaimed her own independence; so did 
Rashka, whose Grand Zhupans came forward as leaders of 
the Serb national policy, which aimed at freedom from Greek 
suzerainty and the union of all the Serb Zhupaniyas into one 
kingship. The task was difficult enough, as the Byzantine house of Trebizond and the realm of the energetic 
Manuel Comnenus, regained much of its lost power and influence. 

About the middle of the 12th century all the Serb Zhupaniyas were 
acknowledging the suzerainty of the Byzantine emperors. 

The Nemanjic Dynasty and the Serb Empire.—A change for 
the better began when Stephen Nemanja became the Grand 
Zhupan of Rashka (1169). He succeeded in uniting all the Serb 
countries under his rule, and although he never took the title of 
kingship, he was the real founder of the Serb kingdom and of the royal 
dynasty of Nemanjic, which reigned over the Serb people for 
about a century and a half. His youngest son of Stephen Nemanja, 
Prince Rastko, secretly left his father's royal court, went to 
a convent in Mount Athos, made himself a monk, and afterwards, 
under the name of Savva, became the first archbishop of Servia. 
As such he established eight bishoprics and encouraged schools 
and learning. He is regarded as the great patron and protector 
of education among the Serbs, as a saint, and as one of the greatest 
statesmen in the national history. After Stephen Nemanja 
and Savva the most distinguished members of the Nemanjic dynasty 
were Uros I. (1242–1276), his son Milutin (1282–1321) and 
and Stephen Dushan (1331–1355). Uros married Helen, a French 
princess, and his heir, Andronicus, then under the protection of the energetic 
and friendly relations with the French court of Charles of Anjou in 
Naples. He endeavoured to negotiate an alliance between 
Serbs and French for the overthrow and partition of the Byzantine 
empire. His son Milutin continued that policy for some time, 
Toward the end of 1345 he proclaimed himself "emperor of the Serbs and the Greeks," 
and was as such solemnly crowned at Uskub on Easter Day 1346. At the same time he raised the archbishop of Ipek, the 
primate of Servia, to the dignity of patriarch. Three years later 
he convoked the Sabor (parliament) at Uskub to begin a codification 
the laws and legal usages. The result was the publication, 
in 1349, of the Zavetik Tsara Dushana (Tsar Dushan's Book 
of Laws), a code of great historical interest which proves to 
Servia was not much behind the foremost European states in
SERVIA

civilization. In 1355 Dushan began a new campaign against the Greeks, the object of which was to unite Greeks, Serbs and his other Slavic vassals under the united forces, and he was
Turkish power taking root on European ground. To attain his
object he was making preparations for a siege of Constantin-
ople, but in the midst of these preparations, as some historians
assert, on the march towards Constantinople, he died suddenly
at the village of Deabolis on the 20th of December 1355. His
only son Uros, a young man of nineteen, seemed physically
and mentally incapable of holding together an empire composed
of such different races and upholding with such divergent
interests. Some of the powerful viceroys of Dushan's provinces
speedily joined the grand vizier and indignantly denounced him
shaking them was Vukashin, who proclaimed himself king of
Macedonia. He wished to continue Dushan's policy and to
expel the Turks from Europe, but in the battle of Taenarus,
the 26th of September 1371, his army was destroyed by the
Turks, and he was slain. This was the first great blow which
shook the fragile structure of the Serb empire to its foundation.
Two months later (December 1371) Tsar Uros died, and with
his death ended the rule of the Nemanjich dynasty.
The Turkish Invasion: Kosovo.—After a few years of
insecurity of Milan Obilich, and by the united forces, was
Kossovo (5th of June 1389). No historic event has made such a
deep impression on the minds of the Serbs as the battle of Kosovo
—probably because the flower of the Serb aristocracy fell in that
battle, and because both the tsar of the Serbs, Lazar, and the
sultan of the Turks, Murad I, lost their lives. The sultan
was killed by the Serb knight or voivode Milosh Obilich (otherwise
Kobilovich). There exists a cycle of national songs—sung to
this day by the Serb bard (guslar) — concerning the battle of Kosovo,
the treachery of Vuk Brankovich and the glorious
achievements of the Serb nation.
The Despotate.—After the battle of Kosovo Servia existed
for some seventy years (1389-1459) as a country tributary
to the sultans but governing itself under its own rules, who
assumed the Greek title of "despot." The first despot after
Kossovo was Tsar Lazar's eldest son "Stephen the Tall," who
was an intimate friend of Sigismund IV., king of Hungary and
emperor of the Germans. Being childless, Stephen on his death-
bed in 1427 appointed his nephew, George Brankovich, to be his
successor. As despot, George worked to establish an alliance
between Servia, Bosnia and Hungary. But before such an alliance
could practically be arranged, Murad II. attacked Servia in
1437 and forced George to seek refuge in Hungary, where he
continued to work for a Serbo-Hungarian alliance against the
Turks. Having at his disposal a large fortune he succeeded in
organizing a Serbo-Hungarian expedition against the Turks in
1444. This expedition, under the joint command of the Despot
George and of Hunyadi Janos, defeated the Turks in a great battle
at Kuno位sa. The sultan was forced to conclude peace, re-
stoning to George all the countries previously taken from him.
For the remainder of his life George was rather estranged from his
former allies the Hungarians. At the age of ninety he was
wounded in a duel by a Hungarian nobleman, Michael Szilagyi,
and died of his wound on the 24th of December 1457. His
younger son Lazar succeeded him, but only for a few months.
Lazar's widow Helena Palaeologina gave Servia to the pope,
hoping thereby to secure the assistance of Roman Catholic
Europe against the Turks. But no one in Europe moved a finger
to help Servia, and Sultan Mahomed II. occupied the country
in 1459, making it a pashalik under the direct government of the
Pope.

For fully 345 years Servia remained a Turkish pashalik, enduring all the miseries which that lawless régime implied (see Turkey, History). But the more or less successful invasions of the Turkish empire in Europe by the Austrian armies in the course of the 18th century—invasions in which thousands of Serbs always participated as volunteers—prepared the way for a new state of things.
The Struggle for Servian Independence.—The disorganization
and anarchy in the Turkish empire at the beginning of the
19th century gave the Serbs their opportunity, and the people
of Servia, under the leadership of Karageorge (Vukas Obilich),
formed the Servian parliament in 1803. A national assembly met in February 1804 in the village of Orasnice and
elected George Petrovich—more generally known under the
name of "Tsni Gygorye" or "Karageorge" (g.v.)—both mean-
ing "Black George"—as commander-in-chief of all the nation's
armed forces and the leader of the nation (Vodit naroda).
Under his command the Serbs quickly succeeded in breaking the power of the Dahias, as the four chieftains of the Janissaries of Belgrade
were called, who, having rebelled against the sultan, took posses-
sion of Servia, became its political and military masters, and
appointed by them the ruler of central Servia. Not only did the
Serbs clear their country altogether of the Turks, but they also
organized it as a modern European state. In 1807 the sultan
offered to grant the Serbs self-government, and to acknowledge
Karageorge as the chief of the nation with the title of prince.
On the advice of the Russians, who were just going to war with
Turkey, the Serbs refused that offer, preferring to fight against
the Turks as Russian allies. The principal scene of the Russo-
Turkish war being transferred to the Lower Danube, only a few
unimportant actions took place on Servian territory. From
1804 till the autumn of 1813 the Serbs governed themselves as
an independent nation. But when in 1812 Russia, attacked
by Napoleon, had in great haste to conclude at Bucharest a
treaty of peace with Turkey, and omitted to make sufficient
provision for the security of her allies the Servians, the Turkish army
invaded and reconquered Servia, occupying all its fortresses.
Karageorge, with most of the leading men, left the country
(Sepembwe 1813) and founded a refuge first in Austria and then in
Russia. Of those who remained in Servia the natural leader,
by his own position, talents and influence, was Milosh Obrenovich,
voivode of Rudnik. He surrendered to the Turks and was appointed by them the ruler of central Servia. Not until
four years later Milosh began the second insurrection of the Servians
against the Turks (on Palm Sunday 1815, near the little wooden
church of Takovo). He was successful not only in the field but
in his diplomacy, and by 1817 Servia had regained autonomy under
the suzerainty of the sultan. That autonomy was placed
on an international basis by the treaty of Adrianople, concluded
between Turkey and Russia in 1829. In compliance with that
treaty the sultan by the Hatti-Sherif of 1830 formally granted
full autonomy to the Servians, retaining at the same time Turkish
garrisons in the Servian fortresses.

Servia as an Autonomous State 1830-1870.—Milosh, declared
hereditary prince of Servia, worked hard for the internal organization
and for the economic and educational progress of his country.
But his attempts to make Servia independent of Russian
protection brought him into conflict with Russia, and his autocratic
methods of government united against him all who wished for
a constitution. The result was that Prince Milosh was forced
to abdicate and leave the country in 1839. Three days before his
abdication he was induced to sign a constitution (that of 1838)
 imposed on Servia by the Porte, at the instance of Russia, with the
object of undermining his position. This constitution delegated
part of the prince's authority to a council of 70 members appointed
for life. Prince Milosh's eldest son, Prince Milan (Obrenovich
II.), died in a few months, and the younger son Michael (Obren-
ovich III.) ascended the throne. But the politicians who forced
Milosh to abdicate did not feel safe with Milosh's second son as
the reigning prince of Servia. They started a military revolt,
drove Michael also into exile (1842), and elected Alexander
Karageorgevich, the younger son of Karageorge, as prince of Servia. His reign (1842–1858) was quiet and prosperous, and the country made remarkable progress in culture and wealth. But he feared to summon the national assembly, was personally weak and vacillating, and in foreign politics was Turcophil and Austrophil rather than Russophil. Not only Russia but Servia also was dissatisfied with such a policy, and when Alexander Karageorgevich, forced by public opinion, at last dared convok a national assembly, that assembly's first resolution was that Prince Alexander should be dethroned and replaced by the old Prince Milosh Obrenovich I. This change of the reigning dynasty was effected without the slightest disorder or loss of life. Milosh returned to power at the beginning of 1859, but died in 1860. His son Michael then ascended the throne for the second time. He was a man of refinement who had learned much during his long exile (1842–1859). His political programme was that the law should be respected as the supreme will in the country, that Servia's political autonomy should be jealously guarded, and every encroachment on the part of the suzerain power should be resisted and rebuffed. He introduced many important reforms in administration, and replaced the old constitution, granted to Servia by the Porte in 1830, by a new constitution which he himself gave to the country. When in 1862 the Turkish garrison in the citadel of Belgrade bombarded the town, he demanded the evacuation of all the Servian fortresses and forts by the Turks. Only a few of the less important forts were delivered to the Serbs at that time; but in 1863 Prince Michael sent his wife, the beautiful and accomplished Princess Julia (née Countess Hunyadi), to plead the cause of Servia in London, and she succeeded in interesting prominent English politicians (Codden, Bright, Gladstone) in the fate of the Balkan countries. Prince Michael organized the national army, armed it and drilled it, and entered into understandings with Greece, Montenegro, Bosnia and Herzegovina, Bulgaria and Albania, for an eventual general rising against the Turks. In the beginning of 1869 he addressed a formal protest to the Porte, and the Turkish garrisons should be withdrawn from Belgrade and other Serb fortresses. To prevent a general conflagration in the Balkan Peninsula, the powers advised the sultan to comply with the demand, and when the British government strongly supported that advice the sultan yielded and delivered all the fortresses on Servian territory to the keeping of the prince of Servia (March 1867). Prince Michael's great popularity in consequence of his diplomatic successes alarmed the friends of the exiled Kara-georgevich dynasty, more especially when rumours began to circulate about the Servian fortresses and forts by the Turks. His wife Julia and remarrying. A conspiracy was formed, and Prince Michael was assassinated on the 10th of June 1868. The conspirators failed to overthrow the government, and the army proclaimed Milan, the son of Prince Michael's first cousin Milosh Obrenovich (son of Yephrem, brother to Milosh the founder of the dynasty), as prince of Servia. The choice was unanimously approved by the Velika Skupshtina, which had been immediately convoked. As Milan Obrenovich IV. was a boy of only thirteen, a regency, presided over by Jovan Ristic or Ristic (q.v.), was appointed to manage the government until the boy prince attained his full age. A new constitution was adopted by the Parliament, which had substituted a new constitution for that of 1838. Prince Milan followed the policy of his dynasty, and, encouraged by the Russian Panslavists, declared war on Turkey (June 1876). His army, commanded by the Russian General Chernyayev, was defeated by Abdul-Kerim Pasha, whose advance was stopped by the intervention of Tsar Alexander II. But the situation created by Prince Milan's action in the Balkans forced the hand of the tsar, and Russia declared war on Turkey (1877).

The Treaty of Berlin.—Prince Milan was educated in the political school most favourable to Russia, and unhesitatingly followed the Russian lead up to the conclusion of the preliminary treaty of peace between Russia and Turkey at San Stefano. By that treaty Russia, desiring to create a great Bulgaria, took within its limits districts inhabited by Servians, and considered by the Servian politicians and patriots as the natural and legitimate inheritance of their nation. This act of Russia created great dissatisfaction in Servia, and became the starting-point for a new departure in Servian politics. At the Berlin Congress the Servian plenipotentiary, Jovan Kistich, in vain appealed to the Russian representatives to assist Servia to obtain better terms. The Russians themselves advised him to appeal to Austria and to try to obtain her support. The utter neglect of the Servian interests by Russia at San Stefano, and her evident inability at the Berlin Congress to do anything for Servia, determined Prince Milan to change the traditional policy of his country, and instead of continuing to seek support from Russia, he tried to come to an understanding with Austria-Hungary concerning the conditions under which that power would give its support to Servian interests. This new departure was considered by the Russians—especially by those of the Panslavist party—as little less than an apostasy, and it was decided to oppose Prince Milan and his supporters, the Servian Progressives. The treaty of Berlin (13th of July 1878) disappointed Servian patriots, although the complete independence of the country was established by it (art. 34). This was proclaimed at Belgrade by Prince (afterwards King) Milan on the 22nd of August.

The Progressive régime.—The political history of Servia from 1879 to the abdication of King Milan on 3rd March 1889 was an uninterrupted struggle between King Milan and the Progressives on one side, and Russia with her adherents, the Servian Radicals, on the other. King Milan and his government were badly handicapped by several unfortunate circumstances. To fulfil the engagements accepted in Berlin and the conditions under which independence had been granted to Servia, railways had to be constructed within a certain time, and the government had also to pay to the Turkish landlords in the newly acquired districts an equitable indemnity for their estates, which were divided among the peasants. These objects could not be attained without borrowing a considerable amount of money in the European markets. To pay regularly the interest on the loans the government was forced to impose upon the people, and especially the regular army, remained loyal, and the revolt was quickly suppressed.

War with Bulgaria.—The union of Bulgaria and Eastern Rumelia inspired King Milan and his government with the notion that either that union must be prevented, or that Servia should obtain some territorial compensation, so that the balance of power in the Balkan Peninsula might be maintained. This view, which did not find support anywhere outside Servia, led to war between Servia and Bulgaria (see Servo-Bulgarian War); the Servians were defeated at Slivnitz and had to abandon Pirio, whilst the farther advance of the Bulgarian army on Nish was prevented by the Russian intervention. A formal treaty of honourable peace was concluded between the two contending powers in March 1886. Then came the unhappy events connected with Milan's divorce from Queen Natalie. That domestic misfortune was cleverly exploited by King Milan's enemies in the country and abroad, and did him more harm than all his political mistakes. He tried to retrieve his position in the country, and succeeded in a great measure, by granting a very liberal constitution (January 1889, or Dec. 1888 O.S.) at a time when all agitation for a new constitution had been given up. Then, to the great astonishment of the Servians and of his Russian enemies, King Milan voluntarily abdicated, placing the government of the country in the hands of a regency during the minority of his only son Alexander, whom he proclaimed king of Servia on the 6th of March 1889.

King Alexander: The Regency.—The leading man of
regency was Jovan Ristić, who had already been regent during the minority of King Milan (1868–1871). Although he had been since 1868 the leader of the Liberal party, he showed himself, as regent, extremely Conservative. The new constitution was the embodiment of Radical principles, and the numerically strongest party in the country was Radical. The national assembly was composed, therefore, almost exclusively of Radicals, and the government was Radical likewise. From the very beginning the Conservative regency and the Radical government distrusted each other. The government was not strong enough to resist the clamour of their numerous partisans for participation in the spoils of party warfare. Political passions, which had been stirred up by the long struggle against King Milan’s Progressive régime, could not be allayed so quickly; and as the anarchical element of the Radical party obstructed the ascendency over the more cultured and more moderate members, all sorts of political excesses were committed. The old system of borrowing money to cover the yearly deficits were continued, and the expenditure went on increasing from year to year. The administration lost all authority, the police were paralysed and brigandage became rife. The Radical government thought to strengthen their position by letting the national assembly vote a law prohibiting the return of the king’s father to Servia, and forcibly expelling the king’s mother, Queen Natalie. But such laws and such acts only embittered the adherents of Prince Peter Karageorgevich, who, having married the eldest daughter of Prince Nicholas of Montenegro and living at Cettigne, was supposed to enjoy the support of Russia. The political situation became still more confused when on the death of the third regent, General Kosta Protić, the government tried to force the regency to accept in his stead M. Pashich, the leader of the Radical party. The regents thereupon dismissed the Radical cabinet and called the Liberals to the government (August 1892). The Liberal cabinet dissolved the Radical national assembly, and at the general elections used very great pretensions of the Radical party obstructed the ascendency over the third cabinet, and the situation became hopelessly entangled by the fact that the national assembly was Radical, the government Liberal, and the regency practically in all its tendencies Conservative. The legislative machinery as well as the administration of the country was thus completely paralysed. Then the young king Alexander suddenly proclaimed himself of age (although at that time only in his seventeenth year), dismissed the regents and the Liberal cabinet, and formed his first cabinet from among the moderate Radicals (18th April 1893). Administration—The moderate Radicals quickly showed themselves unable to do any serious work. They were fettered by the dissatisfaction of the Left wing of their own party. To satisfy the extreme Radicals they had to impeach the members of the last cabinet. This increased the bitterness of the Liberals, who, though not so numerous as the Radicals, included in their ranks more men of wealth and culture. Political passions were again in full blaze. The anti-dynastic party raised its head again, and in many Radical publications the expulsion of the reigning dynasty and its replacement by the Karageorgevich were advocated. At the same time reports were reaching King Alexander that Russia, who was in a very critical situation, was interested in the statement of the extreme Radicals, and he was anxious to secure a Russian grand-duke to be proclaimed king of Servia.

The ex-King Milan’s Return.—In such circumstances King Alexander thought best to invite his father the ex-King Milan (who was living in Paris) to his side, and to use his great knowledge of men and his political experience. In the beginning of January 1894 King Milan arrived in Belgrade. The Radical cabinet resigned and was replaced by a cabinet composed of people embittered by standing outside the political parties. In June the Radicals of the government of 1889 was suspended, and in its place the constitution of 1869 was re-established. The nation was evidently tired of the violent agitations of recent years. This feeling gave rise to Conservative, even somewhat reactionary, legislation. The duration of the legislature was extended from three to five years; the liberty of the press was curtailed by the enactment that proprietors of political papers must pay to the government a deposit of 5,000 dinars (£200), and that the editors must have completed their studies at a university; the laws on lèse-majesté were made more severe. After the advent to power of Dr Vladan Georgevich (October 1897) persistent and successful efforts were made to improve the country’s financial and economic condition. The violent party strife which from 1880 to 1895 had absorbed the best energies of the country and paralysed every serious and productive work, ceased almost completely, and the nation as a whole turned to improve its agriculture and commerce. The sustained improvement in the political and commercial situation was not influenced materially by the temporary excitement in consequence of the attempt on the life of King Milan (6th July 1896), and of the state of several prominent Radicals accused of having conspired for the overthrow of the dynasty. One remarkable feature in the foreign policy of Servia in the last years of the 19th century was that after King Milan was appointed commander-in-chief of the Servian regular army (1898), Russia and Montenegro practically, although not formally, broke off their diplomatic relations with Servia, while at the same time the relations of that country with Austria-Hungary became more friendly than under the Radical régime.

King Alexander’s Marriage.—All this was suddenly changed when, in 1899, that young and handsome prince, Mme. Dragica Mihailović, once lady-in-waiting to his mother Queen Natalie, he married himself into the arms of Russia, forbade his father Milan to reside in Servia, and followed Russian guidance in all questions of foreign policy. To strengthen his position in the country he promulgated a new constitution in April 1901, establishing for the first time in the history of Servia a parliament with two houses (skupština and senate). But the unpopularity of the king’s marriage was not lessened. Constitutional liberties and especially the free press were mercilessly used to attack both the king and the queen, who neither wished nor were able to conceal their dissatisfaction from their feelings that the constitution contemplated changing the situation by one of his bold and clever coups d’état increased the political unrest. Matters went from bad to worse when persistent rumours were set in motion that Queen Dragica had succeeded in persuading King Alexander to proclaim one of her two brothers heir-apparent to the throne. In 1902 a widespread military conspiracy was rumoured to exist, while Austria and Russia repeatedly gave proofs that they were indifferent to the fate of Alexander, and so encouraged the malcontents. King Alexander felt that he could eventually force his position by a general withdrawal of the Russian policy or by his divorce from the childless Queen Dragica. He seems to have been working for joint action with Bulgaria for the liberation of Macedonia from Turkish rule. Some of his intimate friends asserted that he contemplated divorcing the queen, and that he was only waiting for her departure for an Austrian watering-place, which departure was fixed for the 15th of June 1903. In the first hours of the 11th of June the conspirators surrounded the palace with troops, forced an entrance and assassinated both King Alexander and Queen Draga in a most cruel and savage manner. (C. M.)

King Peter Karageorgevich.—The regicides proclaimed Prince Peter Karageorgevich king of Servia; and a provisional cabinet was formed, with Colonel Mihailović, brother-in-law of the murdered Queen Draga and organizer of the conspiracy, as minister of public works. The skupština and senate assembled, restored the constitution of 1889 instead of the reactionary constitution promulgated by King Alexander on the 19th of April 1901, and ratified the election of Prince Peter, who entered Belgrade as king on the 24th of June 1903. Born in 1844, he was the son of Alexander Karageorgevich and grandson of Karageorge; in 1885 he had married Queen Zorka, daughter of Prince (afterwards king) Nicholas of Montenegro. His authority was at first merely nominal; the highest administrative offices were occupied by the regicides, who received the unanimous thanks of the skupština for the assassination of King Alexander and Queen Draga. Russia, Austria-Hungary and Montenegro were
the only Powers which congratulated King Peter on his accession, and in December 1903 all the Powers temporarily withdrew their representatives from Belgrade, as a protest against the attitude of the Servian government towards the regicides. But at the coronation of King Peter, in September 1904, all the European powers except Great Britain were officially represented, some concessions, more apparent than real, having been made in the matter of the regicides, who were received with unalloyed cordiality by the peasants and in the army. Further protests were made by many of the powers when the illusory nature of these concessions became known, and it was not until May 1906 that diplomatic relations with Servia were resumed by Great Britain. In the same year a convention was concluded by Servia and Bulgaria as a preliminary to a customs union between the two states. This convention, which tended to neutralize the dependence of Servia upon Austria-Hungary by facilitating the export of Servian goods through the Bulgarian ports on the Black Sea, brought about a war of tariffs between Servia and the Dual Monarchy.

The Bosnian Crisis.—In 1908 the annexation of Bosnia and Herzegovina by Austria-Hungary and the revolution in Turkey brought the Bosnian crisis, the Bosnian crisis, still厉害及 as a realization of the so-called “Great Servian Idea,” i.e., the union in a single empire of Servia, Bosnia and Herzegovina, Montenegro and Old Servia (Stara Srbija) or the sanjak of Novibazar with north-western Macedonia—all countries in which the population consists largely, and in some cases almost exclusively, of Orthodox Serbs. The whole nation clouted for war with Austria-Hungary, and was supported in this attitude by Montenegro, despite a temporary rupture of diplomatic relations between Belgrade and Cettigne, due to the alleged complicity of the Servian crown prince in a plot for the assassination of Prince Nicholas. As, however, the armament and finances of Servia were unequal to a conflict with Austria-Hungary, while Great Britain, Russia, France and Italy counselled peace, the skupština, meeting in secret session on the 11th of October 1908, determined to avoid open hostilities, and sent M Milanovich, the minister for foreign affairs, to press the claims of Servia upon the powers. The tariff war with Austria-Hungary was at the same time renewed. Servia demanded compensation in various forms for the annexation of Bosnia and Herzegovina; what the government hoped to obtain was the cession to Servia of a strip of territory between Herzegovina and Novibazar, which would check the advance of Austria-Hungary towards Salonica, make Servia and Montenegro conterminous, pave the way for a union between them, and give Servia commerce an outlet to the Adriatic. Neither the Dual Monarchy nor the Young Turks would consider the cession of any territory, and in January 1909 the outcry for war was renewed in Servia. But the threatening attitude of Austria-Hungary, with the moderating influence of M Pashich, who became the real, though not the nominal, head of a new ministry in February 1909, induced Servia to accept the advice of the Russian government by abandoning all claim to territorial “compensation,” and leaving the Balkan question for solution by the Powers. The Servian government defined its attitude in a circular note to the Powers (9th of March), and finally accepted the terms of a conciliatory declaration suggested by the British government (31st of March). By this declaration Servia abandoned all its demands as against Austria-Hungary, while the Austro-Hungarian foreign minister made simultaneously a public declaration that the Dual Monarchy harboured no unfriendly designs against Servia.

On the 27th of March 1909 the crown prince George (b. 1889), who had been the most outspoken leader of the anti-Austrian party in 1908, was induced to resign his right of succession to the throne. It was alleged that his violence had caused the death of one of his own male servants, and that he was partially insane. On the 27th of March 1909 his brother Alexander (b. Dec. 17, 1888) took the oath as heir-apparent.

The books by Stead, Mallat and Hogge, mentioned above, contain important historical matter. Mijatovich, A Royal Tragedy (London, 1906).

**Language**

The Servian language is closely related to Slavic languages (see Slavs). According to the Servian philologist Danichich (Dióba Slov. yestka, Belgrade, 1874), the Servians were the first Slavic branch which separated from the original Slavic stem, while the Russians and the Bulgarians only separated from it at a considerably later date. The Russian and Bulgarian languages undoubtedly stand nearer to Old Slavic than Servian. According to another theory (T. Schmid, The Vocalismus i. ii. 172), two separate branches developed from the Old Slavic stem, one identical with the western Slavs, and the other with the south-eastern group; and from the Slavic of the south-east the first languages to separate were the Russian and the South Slavonic. From the latter developed Bulgarian, on one side, and Servian-Slovene on the other, while from the last-named branch Servian or Serbo-Croatian and Slovene developed on two separate twigs. There can be no doubt that in the south-eastern group of the Slavonic languages Serbo-Croatian and Slovene form a special closely-connected group, in which the Servians and Bohemians are only two dialects of the same, which is known, and with the Russian, the most important and melodious of Slavonic languages.

Servian is spoken in the following countries, forming geographically (although not politically) a connected whole: southern Hungary, the kingdom of Servia, Old Servia (the Turkish vilayet of Kossovo), western Macedonia, the sanjak of Novi-Bazar, Bosnia, Herzegovina, Croatia-Slavonia, Dalmatia and Montenegro. It ranks with Bulgarian as one of the two principal Slav languages of the Balkan Peninsula; the Macedonian dialects are intermediate between these two. Between eight and nine millions of people speak Serbo-Croatian in the countries just enumerated.

Servian is the language of the territory in which the language is spoken, it is not surprising that it should have several dialects. Practically, however, there are only three principal dialects, which are differentiated by the manner in which the Old Slavonic double vocal ye (the so-called yeh) is pronounced. The Old Slavonic words ljevo, bevelo, are pronounced by the Servians of Herzegovina, Bosnia, Montenegro, Dalmatia, Croatia and south-western Servia as leyo, beyo; by the Servians of Syria the same vowel is pronounced sometimes as e (lepo, belo), sometimes as ee (videti, leteti); by the Servians of the Morava valley and its accessory Ressava valley, always only as e (lepo, belo, videti, leeti). Vuk Stefanovich Karajich published the two dialects of Servia: the first dialect he defined as the “Servian dialect,” the second the “Syrman” dialect of the “Kossovo dialect,” Professor Belich of Belgrade University has tried to give in the Servian Dialectological Compendium (Belgrade, 1908) a new division of the Servian dialects. But, as the Servian and Hungarian, Kossovo, Ressava, Shamadiya-Srem (Syriya), Zetta-Bosnia, Adriatic coast. Of all the Servian dialects the most correct, richest and safest is the Servian of Syria. A Servian or some Servian dialect, Karajich and his followers tried to make it the literary language of the Servians. All the national songs which he transcribed from the recitations of the bard were written and published by him in that dialect, into which the Bible was translated in 1904. Thus, the Servian of all the century the kingdom of Servia, speaking the Ressava or Shamadiya- Syrman dialect, became one of the centre of Servian literary activity, the last-mentioned dialect tended to become the literary language. The Servian and Croat dialects are spoken in the common Slavonic language. Servian is sometimes called shkoksakski because the Servian word for “what” is shko, whereas the Croats say cha lor shko, and
The chronicles (letopisi) are without any literary value, although as historical material they are useful. They number about thirty. The oldest of them was written between 1371 and 1390. The best of them is the Defter of Ystek, compiled by the Metropolitan of Koporin, written by Deacon Damyan in 1453; Letopis of Carlomin in 1503; and the chronicle of the monastery of Tronosha, 1526.

To this period of Servian literature belongs the first attempt by an unconnected group to record the sufferings of the Servian prince Vladimir, who lived in the 11th century, and his wife, the Bulgarian princess Kosara, written probably in the 13th century, was very popular among the Servians and other Slavonic nations. Two of the most outstanding of these books of the period were the Life of Alexander the Great, The Story of the Siege of Troy, Stefanije and Ithnysat (an Indian story) and The New World to That Other, all of which were translations from the Greek.

A characteristic example of the literary and also, as it appears, of the official language of the Servians in the middle ages is the Codex Dorianus (Zakonnik), which was promulgated at the Servian parliament (Sabor) in Skopjé (Uskub) in 1349 and 1354. Very interesting material for the study of the Servian literary language during the 12th, 13th and 14th centuries is to be found in several collections of old charters and letters of that period (P. Miklosich's Monumenta Serbica, Putsch's Srpski Spomenu; u Dubrouvackoj Arkhivi, and the publications of the Royal Servian Academy in Belgrade and the South Slavonic Academy of Science in Agram). The oldest document written in the vernacular Servian is considered to be a charter by which Kulín, the ban of Bosnia, grants certain commercial privileges to the Ragusan merchants in 1466.

The oldest printed book in Servian-Slavonic issued in 1483 from the printing-press of Andreas de Theresianis de Asula in Venice. A few years later the Servian nobleman Bozhidar Vukovic bought a printing-press and began in Servian Venice (Zakonnik), which was promulgated at the Servian parliament (Sabor) in Skopjé (Uskub) in 1349 and 1354. SERVIA

Theological works. He also wrote *The Sights of the Repenting Magdalen* and the unfinished tragedy *Judith*.

After the Napoleonic Wars, the literary life of Ragoza and Dalmatia during the 18th century has no great name to show, except that of the mathematician, Ruggiero Boshvich (see Bosovich). His two brothers and his sister Anica Boshvich were known in their time and their works are still remembered. But the territory of the coast showed little originality in the 18th century; its writers were content to produce good translations of Latin, Italian and French works.

Mention must be made, however, of an author whose work connects the literature of the Adriatic Servians of the 18th century with the regenerative efforts of the Dubunian Servians in the second decade of the 19th. Paul and Ana, the brothers and sisters of the Adria- nian monk, Metamosei, who by his asceticism and penetration of Slavonic highly distinguished himself from the school of pseudo-ascetics and slavery to the models. As a papal delegate he had to visit all the Roman Catholic communities in Dalmatia, Herzegovina and Bosnia, and had numerous opportunities of hearing the bardic recite songs on old national heroes.

In 1736 he published a book entitled *Razgovor Ugodni Naroda Slavjanka* ("The Popular Talk of the Slavonic People"). In which in 261 songs he described—in the manner and in the spirit of the national bard—the more important historical, legendary, and religious events and heroes of the "Slavonic people." Under this denominia- tion he comprised Servians, Croats, Slovenes and Hungarians, anticipat- ing the modern appellations of the Yugo-Slaveo (Southern Slavon) and Carpathian-Slavon. His work was immensely popular among the Servians, and was again and again reprinted, under the less ponderous title *Letopisi*, "The Book of Songs." Some of the songs were adapted, or the Slavonic language, to the Hungarian with the vision of his true mission. But Kachich Mióslavich found no immediate followers among the Servian literati of the second half of the 18th century.

Lessening as the countries inhabited by the Orthodox Servians were under the deadening immediate rule of the Turks, they produced no serious literature. But when the Austrian wars of the 17th century began to roll back the Turkish power, and Hungary recovered its freedom, the Servians living in that country rapidly acquired some culture, and their literature began to revive. During the 18th century, however, they did not write in the living language of the Servian people. After the disappearance of the Servian printing-presses in the 16th century, all liturgical books were brought from Russia and printed in the Russian-Slavonic language; while the teachers in the Servian schools were Russians. Russian-Slavonic thus became the literary language of the Orthodox Servians.

The more important works of the time were the *History of Montenegro*, by the Montenegrin bishop Basil Petrovich (Moscow, 1754); the *Short Introduction into the History of the Origin of the Slavono- Servian People*, by the Illirian monk, Ganić (1751); and the *History of the Slavonic Nations*, more especially of the Bulgarians, Croats and Servians, by Archimandrite Yovan Raich (Vienna, 1794). During extensive travels in Russia and the Balkan countries Raich had collected many significant material narrative of the love, suffering, and struggle of the Servian people. But as very soon he found that the monastery could not satisfy his aspirations, he left it and started to travel, acquiring a knowledge of classical and modern languages and literatures. An ardent Servian patriot, he proclaims the principle that books ought to be written for the people and therefore in the language which the people understood and spoke. His attempt at this was the publication of the *Adventures of a monk named Dositie* (Leipzig, 1783), written in the language spoken in Servian towns. It immediately made a great impression, which was enhanced by the continuation of his autobiography, *Historia* (History) of his Life (Leipzig, 1782). These books created a reading public among the Servians and mark the beginning of a really modern period in their literature. Obradovich, one of the Servian poets they call him, was so highly appreciated as an author, savant and patriot that in 1807 Karageorge invited him to Servia and appointed him a senator and minister of public education, in which capacity he established in Belgrade the first Servian college (*Velika Škola*). Dositie was an admirer of England and English literature. While staying in London in 1783 he was much encouraged by the enthusiasm with which he introduced his books to the English public. Paul Solarich, another distinguished author, was befriended by the Hon. Frederick North, afterwards 4th earl of Guildford, state secretary for public instruction in the Ionian Islands.

5. Modern Servian Literature.—The activity of Karajich brought new life to the Servian literature of the 19th century. The poets abandoned classical models and ceased to write in hexameters; they preferred to derive their inspiration from popular poetry, of which Karajich collected for them hundreds of examples. Writers in different departments of literature vied with each other to write in pure and correct Servian. And, although it could not be justly said that the Servians of the 19th century produced a really great work from the literary point of view, they certainly made progress and produced some remarkable poetry.

Their three greatest poets are Sima Milutinović Saraylija (1791–1847), Peter Petrovich, Petrović (1812–1851), prince-bishop of Montenegro, and "Zmay" Yovan Yovovich (1833–1904). Saraylija’s most important work is *Srpski Sanski* (Leipzig, 1826), in which he describes the rising of the Servians against the Turks in 1804 and 1815. His imagination is lively, his descriptions graphic, but the impetuosity of his genius cannot find adequate words to express itself, and then he creates new words of which the meaning is not clear to the reader. Yet his elegies are quite popular among the Servians. Nyegos composed his first important work, *Srpska Mikroisma* or "The Light of the Microcosm" (Belgrade, 1847), under the influence of *Paradise Lost*. In the *Lucha* he describes how Satan and the rebels brought the fall of man and set the world on fire. He was led by a protecting angel to the beginning of time when Satan, supported by an angel called Adam, was in full rebellion against God. But the co-rebel Adam repented and God then created the Serbs to help the fallen angels and drive the devils away from the planet. In *Gorski Viyavn* or "The Mountain Wreath" (Vienna, 1847), Nyegos describes the liberation of Montenegro from the Turks towards the end of the 17th century in the form of a drama. There is, however, hardly anything dramatic in the poem, but the characters deliver magnificent descriptions of Montenegro and Montenegrines, and the play is full of noble senti- ments. The Servian critics consider Georgiy as the finest poetical work in their literature. It has been translated into all the principal European languages except English. Dr Yovan Yovovich, called by his admiring countrymen "Zmay" (the Dragon) and "Srpski Sanski* (Serbian Sanskrit), anticipated the romantic movement of his time. He started his poetical career by producing melodious translations of some of the best poems of other nations (the Hungarian Arany’s *Toldal János, Példal János Vité*, Lermontov’s *Demen*, Tennyson’s "Enoch Arden", Bodenstedt’s *Miro-Shafny*, Goethe’s *Iphigenie*, &c.). His own lyrical and satirical poems are without a rival in Servian literature. In his later years he gave much of his time and energy to his translations and the education of his people, reciting hundreds of his finest songs to children. There are several editions of his collected poems; one of the best is that of the Servian Literary Association (Belgrade, 1896).

The Servian writers of the 19th century may be mentioned Dr Milosch Svetic (1799–1886), Branko Radich- evich (1824–1853), Gyura Yakshich (1838–1878), Yovan Subotich (1833–1910), Dr Laza Kostich (b. 1843), Vojin Alilovich (1842–1898), Voivod Ilich (1852–1894), Prince Nicholas of Montenegro (b. 1841). The Servians have as yet no great novelist, but they have several very successful writers of short stories. Among these the first place
belongs to Dr Laza Lazarevich. After him the most popular authors of short stories are; Stefan Sremac, whose mild satire and sparkling humour earned for him the name of the "Servian Dickens"; Yanko Vukcevic, and Vukcevic Debari Uzdaini, whose tales from the lives of Servian peasants; Sima Matvuly, whose stories give a true picture of the Servians of Dalmatia and of Montenegro. Delightful stories of the times and the Slavic Adriatic coast were written by Stefan Mitrov Livadić (1824–1878).

In dramatic literature the Servians are comparatively rich. The poet Dr Laza Kostich made excellent translations from Shakespeare into Servian (1830–1855). Richard Hristić (1821–1871) gave the Servian stage two of its best tragedies: Maxim Trnoveč and Petar Segedivšt. Also the comedy Gordana. Matija Ban’s Meyremach is considered the best tragedy in the Serbo-Croatian language. The most famous playwright, Prince Nicholas of Montenegro, has been often played and enthusiastically received by the public, but the critics deny to it much dramatic value. Another young Servian playwright, Radojica Mijatovich, was given the Servian stage in his drama Stefan Nemania and tragedy Todor of Sležiš. Among the writers of comedy the first place must be assigned to Kosta Trifković (d. 1879). Milovan Glišić (d. 1906) was also very popular; and Branko Njistić was the most successful of Servian dramatists early in the 20th century.

In modern scientific literature the principal Servian names are those of the electrician Nicholas Tesla, the botanist Dr Josip Panchić, and the geologists Dr Yovan Zajučević and Dr Yovan Tavičić (Cvijić). In philology a very high place is occupied by Gyuro Danichić, once professor of philology at the high school in Belgrade and now at the Franciscan College in Vienna, and Agamir Račić (d. 1908), who for years was the principal editor of the great lexicon of the Servian or Croatian language. He had a very distinguished pupil in Stoyan Novaković, who wrote numerous studies on philological subjects, and who, with his book in Servian of a Dictionary of the Slavonic dialects of the Bosnian schools. In historical literature we find besides Yovan Račić, mentioned earlier, Panta Sretykovich, with his History of the Servian Nation; Stoyan Doshkov (d. 1908), with his Servia under Tsar Domnić; Stoyan Novaković, with his Historical Essays on the Objects from the medieval history of Servia, his History of Her Servian Literature, his Revival of the Servian National State and Rising against the Turks (the two last named books appeared in Belgrade in 1901, of Bordeaux in 1902, of Lyubomir Kovačevich and Lyuba Yovanovich, who together wrote a standard work on the history of the Servian nation; Chedo Mijatović, with his monographs on Gyurgyank Branković and the chronicler of the Trzecić. 

BIBLIOGRAPHY.—The best works on the Servian language and literature are those already mentioned as written by Servian authors: Karalje, Dafnići, Št. Novaković, etc. See also on the language Dr F. Miklošić’s Vergleichende Lautlehre der slav. Sprachen (11. Ser.: Serbisch und Chroatisch (Vienna, 1870), and his Wort-bildunglehre der slav. Sprachen (Vienna, 1876); W. Vondrak Vergleichende slavische Grammatik (Göttingen, 1906 and 1908); J. Florinsky, Lectio po slavonikomu yazykomeni (Kiev, 1895). Good text-books are P. Buddhani, Grammatica della lingua serbo-croatia (Vienna, 1867); Parchić, Grammaire de la langue serbo-croate (Strasbourg, 1880); and W. Vondrak, Grammatik der slavischen Sprachen (Berlin and Leipzig, 1898). 

SERVICE TREE, Pyrus domestica, a native of the Mediterranean region, not infrequently planted in southern Europe for its fruit. It has been regarded as a native of England on the evidence of a single specimen, which has probably been planted, now existing in the forest of Wyre. Though not much cultivated its fruit is esteemed by some persons, and therefore two or three trees may very well be provided with a place in the orchard, or in a sheltered corner of the lawn. The tree is seldom productive till it has arrived at a goodly size and age. The fruit has a succulent, yellowish flesh, and, like the medlar, is fit for use only when thoroughly mellowed, but when kept under cover, it becomes good. There is a pear-shaped variety, pyriformis, and another apple-shaped variety, maliformis, both of which may be propagated by layers, and still better by grafting on seedling plants of their own kind. The fruit is sometimes brought to market in winter. The service is nearly allied to the mountain ash, Pyrus aspera, which it resembles in having regularly primate leaves. P. litorinallz is the wild service, a small tree occurring locally in woods and hedges from Lancashire southwards; the fruit is sold in country markets. These, with other species, including P. campestris and P. montana, bear leaves which are white and flocculent beneath, form the subgenus Serbus, which was regarded by Linnaeus as a distinct genus.

SERVIEN, ABEL, MARQUIS DE SABLÉ AND DE BOISDAUPHIN, COMTE DE LA ROCHE-SERVIEN (1593–1659), French diplomat, was born at Grenoble, the son of Antoine Servien, procurator-general of the estates of Dauphiné. He succeeded his father in that office in 1616, and in the following year attended the assembly of notables at Rouen. In 1618 he was named councillor of state and in 1624 was called to Paris, where he found favour with Richelieu. He displayed administrative ability and great loyalty to the central government as intendant in Guienne in 1626–1628. In 1628 he negotiated the boundaries delimitation with Spain. Appointed president of the parliament of Toulouse in 1630, he soon resigned to accept an embassy to Italy, where he was one of the signatories of the treaty of Cherasco and of the treaties with the duke of Savoy (1631–1632). In 1634 he was admitted to the French Academy. Two years later he retired from public life as the result of court intrigue. Servien lived at Angers or on his estates at Sablé until the death of Louis XIII., when Mazarin entrusted him with the conduct, conjointly with the comte d’Avaux, of French diplomatic affairs in Germany. After five years’ negotiations, and a bitter quarrel with the comte d’Avaux, which ended in the latter’s recall, Servien signed the two treaties of the 24th of October 1648 which were part of the general peace of Westphalia. He received the title of minister of state on his return to France in April 1649, remained loyal to Mazarin during the Fronde, and was made superintendent of finances in 1653. He was an adviser to Mazarin in the negotiations which terminated in the treaty of the Pyrenees (1659). He amassed a considerable fortune, and was unpopular, even in court circles. He died at the château de Meudon on the 12th of February 1659.

Servien left an important and voluminous correspondence. See R. Kerviler, A. Servien, étude sur sa vie politique et littéraire, (Mammers, 1879).

SERVITES, or "SERVANTS OF MARY," an order under the Rule of St Augustine, founded in 1233. In this year seven merchants of Florence, recently canonized as "the seven holy Founders," gave up their wealth and position, and with the bishop’s sanction established themselves as a religious community on Monte Serrario near Florence. They lived an austere life of penance and prayer, and being joined by others, they were in 1240 formed into an order following the Augustinian rule supplemented by constitutions borrowed from the Dominicans. Soon they were able to establish houses in various parts of Italy, where within twenty-five years four provinces were formed; they also at an early date founded many houses in France, Germany and Spain, but they never came to England before the Reformation. The most illustrious member of the order and its chief propagator and organizer was St Filippo Benizzi, the fifth general, who died in 1285. The order received papal approbation in 1255; in 1242 it was established as a Mendicant order, and in 1907 it was sustained with the four great orders of Mendicant friars. The Servites undertook missions in Tartary, India and Japan. As in the other orders there were various mitigations and relaxations of the rule, producing a variety of reforms, the chief being that of the eremitical Servites. There are at the present day 64 Servite houses, mostly in Italy; there are two or three in England and in America.

There are Servite nuns and also tertiaries, founded by St Juliana Falconieri, 1305, who are widespread and devote themselves chiefly to primary education. They have several convents in England. The history of the Servites is black.

The chief work on the Servites is the Monumenta by Morini and Soulier, 1897, &c. See Hedyot, Histoire des ordres religieux (1715), ii. cc. 39–41; Max Heimbucher Orden u. Kongregationen (1907), ii. § 73; Weizer u. Welte, Kirchen und Orden (4th ed.); The Encyclopædia of Religious Knowledge (3rd ed.). The most interesting part of Servite history is told by P. Soulier, Vie de S. Philippe Benizzi (1886). (E.C.B.)

SERVITUTE (Lat. servitut, from servire, to serve), a right over the property of another. In Roman law, servitudes were classified into (1) personal, i.e. those given to a particular person, and (2) praeludial, i.e. those enjoyed over something else (praedium) or by being owner or tenant of a piece of land on which they stood (praedium dominius). Personal servitudes were subdivided into (a) usus, the right of using properly; (b) ususfructus the
right of using and enjoying the fruits of property; and (c) and (d) *opera servorum sive animalium*. Prædial servitudes were either (a) rustic, such as *jus eundi*, the right of walking or riding along the footpath of another; *aquæ dutus*, the right of passage for water; *possendii*, the right of pasture, &c.; or (b) urban. Urban servitudes were of various kinds, as *onera servitutum*, the right of using the wall of another to support a man's own wall; *prædìendi*, the right of building a structure, such as a belvedere or verandah, so as to project over another's land; *stillicidii*, *jus inmittendi*, and several others. Servitudes were created by a disposition *inter vivos*, or by contract; by testamentary disposition; by the conveyance of land or by prescription. They might be extinguished by destruction of either the res servientia or the res dominans; by release of the right, or by the vesting of the ownership of the res servientia and res dominans in the same person.

In English law there may be certain limited rights over the land of another, corresponding somewhat to servitudes, and termed easements (q.v.). In Scots law the term is still in use (see EASEMENT).

**SERVIIUS HONORATUS, MAURUS** (or MARIUS), Roman grammarian and commentator on Virgil, flourished at the end of the 4th century A.D. He is one of the interlocutors in the *Saturnalia* of Macrobius, and allusions in that work and a letter from Symmachus to Servius show that he was a pagan. He is often described as the most famous of the Roman grammarians and is described as "the greatest man of his time." He is chiefly known for his commentary on Virgil, which has come down to us in two distinct forms. The first is a comparatively short commentary, definitely attributed to Servius in the superscription in the MSS. and by other evidence. A second class of MSS. (all going back to the 10th or 11th century) presents a much expanded commentary, in which the first is embedded; but these MSS. differ very much in the amount and character of the additions they make to the original, and none of them bears the name of Servius. The added matter is undoubtedly ancient, dating from a time but little removed from that of the original. It is added to a large extent on historical and antiquarian literature which is now lost. The writer is anonymous and probably a Christian. A third class of MSS., written for the most part in Italy and of late date, repeats the text of the first class, with numerous interpolated scholiasts of quite recent origin and little or no value.

The real Servian commentary practically gives the only complete extant edition of a classic author written before the destruction of the empire. It is constructed very much on the principle of a modern edition, and is partly founded on the extensive Virgilian literature of preceding times, much of which is known only by the MSS. preserved in the commentary. The notices of Virgil's text, though seldom or never authoritative in face of the existing MSS., which go back to, or even beyond, the times of Servius, yet supply valuable information concerning the ancient recensions and textual criticism of Virgil. In the grammatical interpretation of his author's language, Servius does not rise above the stiff and overwork subtilties of his time; while his etymologies, as is natural, violate every law of sound and sense. As a literary critic the shortcomings of Servius, judged by a modern standard, are great, but he shines in comparison with his contemporaries. In particular, he deserves credit for fighting against the prevalent allegorical methods of exposition. But the abiding value of his work lies in his preservation of facts in Roman history, religion, antiques and language, which but for him might have perished. Not a little of the laborious erudition of Varro and other ancient scholars has survived in his pages. Besides the Virgilian commentary, other works of Servius are extant: a collection of notes on the grammar (Ars) of Aelius Donatus; a treatise on metreical endings (*De finalibus*); and a tract on the different metres (*De centum metris*).

**SERVUS TULLIIUS**, sixth legendary king of Rome (578-534 B.C.). According to one account he was the son of the household genius (Lar) and a slave named Orcisia, of the household of Tarquinius Priscus. He married a daughter of Tarquinius and succeeded to the throne by the contrivance of his mother-in-law, Tanaquil, who was skilled in divination and foresaw his greatness. Another legend, alluded to in a speech supposed Latin descent is contradicted by a fragment on a bronze tablet dug up at Lyons in 1524), represented him as an Etruscan soldier of fortune named Mastarna, who attached himself to Cæles Vibenna (Cælius Vivenna), the founder of an Etruscan city on the Caelian Hill (see also Tacitus, *Annales*, iv. 65). An important event of his reign was the conclusion of an alliance with the Latins, whereby Rome and the cities of Latium became members of one great league, whose common sanctuary was the temple of Diana on the Aventine. His reign of forty-four years was brought to a close by a conspiracy headed by his son-in-law, Tarquinus Superbus.

The legend of Servius presents certain similarities to that of the founder of Rome. His miraculous birth, commemorated by Servius himself in the festival established by him in honour of the Lares, recalls that of Romulus. Again, as Romulus was the author of the patrician groundwork of the constitution, so Servius was regarded as the originator of a new classification of the people, which laid the foundation of the gradual political enfranchisement of the plebeians (for the constitutional alterations with which his name is associated, see ROME: Ancien History; for the Servian Wall see Rome: Archaeology). His name is also associated with the Law of the Servians, which the Etruscan tradition alluded to above (on which see V. Gardthausen, *Mastarna oder Servius Tullius*, 1882), and his insertion among the kings of Rome is due to the need of providing an initiator of subsequent republican institutions. The treaty with the Latins is mentioned by Dionysius of Halicarnassus alone, who had not seen it himself; indeed, it is doubtful whether it was then in existence, and in any case, considering the changes which the language had undergone, it would have been unintelligible. It is also suspicious that no list of the members of the league is given, contrary to the usual custom of the ancients.
Servia, seeking compensation for the aggrandizement of Bulgaria, had constituted herself the champion of the treaty of Berlin.

King Milan had issued orders for the Servian army mobilization on the very day of Prince Alexander's proclamation at Philippopolis, and large forces were concentrated (October 1st-12th) on the Bulgarian frontier. On the 19th the prince ordered the Bulgarian and Servian troops to march, but it seems certain that, whilst in eastern Rumelia every preparation had been made for war, Prince Alexander had so little expectation of, and wish for, a war with Servia, that few measures were taken to supply the needs of a field army on that side, though fortifications were begun at several places, notably at Sofia and Slivnitza, towards the end of October.

Unlike the Servian army, which contained few permanent units and consisted mainly of militia, the standing army of Bulgaria, trained and commanded by Russian officers since 1877-1878, was organized on the German system of filling up relatively strong cadres to war strength and forming additional units. When fully mobilized the field army numbered about 55,000 men. The Rumelian forces (militia) consisted in all of about 35,000 men. Besides these forces was the "Bandit brigade" of Captain Panitza, an irregular force some 3,000 strong, composed of Macedonians, Turks, Jews and other miscellaneous volunteers. This force did good service as a flying right wing of the main army. In the Bulgarian army the whole of the staff and superior officers, as well as about half the regimental captains, were Russians. When the mobilization of the Servian and Rumelian forces was declared by the prince, the whole of the Russian officers were at once withdrawn, and the heavy task of creating a staff and selecting young officers for all the superior commands had to be undertaken in front of the enemy. Moreover, when on the 14th of November Milan finally declared war, the Bulgarian forces were mostly far away beyond the Balkans on the Turkish frontier. The Servian main army (under King Milan), and the army of the Timok promptly crossed the frontier and soon came in contact with small forces of the enemy. On the Timok little or nothing of importance took place throughout the war, as the forces opposing the army of the Timok near Vidin effectively neutralized that force. In front of Dragoman and Tn the Bulgarians fell back, engaging in stubborn rearguard batches at every favourable place. The Servian "Army of the Nishava" advanced but slowly and with hesitation, while the most strenuous exertions were made by Prince Alexander and his newly-formed staff to collect their far-distant troops in the Slivnitza position. Every commander was given the simple order to march on Slivnitza. The civilian population was to be ready with supplies to meet the troops. When the troops arrived near the Nishava, the mobilization of extraordinary difficulties of country and weather, the Bulgarians marched on the decisive point at the highest possible speed of man and horse. Some remarkable marches are recorded: the 8th infantry, 4,500 strong, covered 59 m. in thirty-two hours, leaving only sixty-two men behind; the 3rd and part of another Rumelian battalion reached Sofia so exhausted that they were sent to the front on horseback, two men to each horse; the troops that were sent up by rail were packed in open trucks, sixty men to a truck. The furious energy displayed had its reward on the field of battle. Before the last shot of the battle of Slivnitza was fired, nearly half of the entire forces of Bulgaria and Rumelia were in the lines, and 14,000 men more faced the army of the Timok at Widdin. With the main army—a striking display of what could be accomplished by patriotism and vigour—were fifty-six pieces of artillery, most of which had been dragged over the Balkan passes in mid-winter.

The position of Slivnitza, barring the high road between Nish and Sofia, had been extensively fortified, but when the Servians opened their attack on the 17th of November, there were but few troops available to occupy the works. On the right of the Bulgarian line was the Meat-Kleist position, occupied by some battalions under Captain Benderev; here fighting went on through the short winter day, which ended with a gallant, and for the time successful, counter-attack by six Bulgarian battalions led by Benderov. The prince, not yet ready for the offensive, withdrew these troops to their original position. In the centre, near the high road, a hot and, at one moment of the day, almost successful attack of the Servians ended with their complete repulse. The latter had had 17,000 men against the Bulgarians' 11,000; yet they had, owing mainly to faults in the supply system, been unable to follow up their success. The Bulgarian losses were very heavy, and it seems likely that, whilst in eastern Rumelia every preparation had been made for war, Prince Alexander had so little expectation of, and wish for, a war with Servia, that few measures were taken to supply the needs of a field army on that side, though fortifications were begun at several places, notably at Sofia and Slivnitza, towards the end of October.

On the 15th alarm and consternation at Sofia, caused by the presence of hostile forces at Breznik, were so great that Alexander left the command in the hands of his chief of staff, Major Guchev, and hurried back to the capital in order to organize the defense. The Servian leader was, however, as inactive on the 19th as on the 18th, and when he at last moved forward towards Slivnitza it was only with a portion of his force; this was driven back, by a detachment from the left wing of the Bulgarian position, to Breznik. Meanwhile, the Bulgarian commander had reopened his attack on the Danube division. Twice he was repulsed. Then finally at about 3 p.m. his battalions carried the heights held by the Servians. A little before this the Bulgarian centre likewise moved forward, and, though a final attack of the Servians on the gap caused by the absence of the Bulgarian troops detached towards Breznik came near to success, the prince returned to the battlefield to find his troops everywhere victorious and driving the enemy before them. Two days later, reorganized and reinforced, the Bulgarians took the offensive and carried the Dragoman pass. On the 25th Prince Alexander received at Tsaribrod proposals for an armistice from King Milan; these were not accepted, and the Bulgarian army, crossing the frontier, advanced in several columns upon Pirot, where the army of the Nishava took up a defensive position in the town and on the surrounding heights. A two-days' engagement followed (26th and 27th of November). On the 26th the Bulgarians were successful, but a heavy counter attack on the following day almost snatched the victory out of their hands, and it was only after a severe contest lasting eleven hours that the Servians finally gave way. The Servian defeat was complete; Sofia and Servia were occupied, and a new great Bulgarian victory seemed to be certain. As they were preparing to pursue the defeated and now greatly demoralized enemy on the 28th, the Austrian minister at Belgrade arrived at headquarters and hostilities ceased. The intervention of Austria saved the Servian army, which was greatly demoralized, and was now threatened by the united Bulgarian force of nearly 55,000 men. On the same day the army of the Timok was repulsed with heavy loss in an attack on Vidin.

Servia escaped almost unpunished from her war of aggression. The young Bulgarian army, with its improvised staff, only appointed field officers, displayed admirable marching power and fighting qualities, and the Rumelian militiamen proved themselves to be good soldiers. The Servians had, however, fought with great bravery also, and the victory must be ascribed in the main to the personal influence, the strenuous exertions and the sound military judgment of Prince Alexander, and the brief but decisive campaign set the seal to Bulgarian unity.

Kriegsschauplatze (Frauenfeld, 1886); von Billimke-Waisserm, Der serbisch-bulgariische Krieg (Vienna, 1886); A. von Huhn, Der Kampf der Bulgaren um ihre Nationalenheit (Leipzig, 1886; English translation, The Struggle of the Bulgarians for their National Independence, 1886).
However, he occupied the place of the second Senwosri (formerly read Uersetesen) of the XIXth Dynasty, and his name is now usually viewed as a corruption of Senwosri. So far as is known no Egyptian king penetrated a day's journey beyond the Euphrates, and if any individual of the minor emperors and the conquerors of Europe. The kings of the XVIIIth and XIXth dynasties were the greatest conquerors that Egypt ever produced, and their records are clear on this point. Senwosri III. raided south Palestine and Ethiopia, and at Semna beyond the second cataract set up a stela of conquest that in its expressions recalls the stela of Sesostris in Herodotus: Sesostris may, therefore, be the highly magnified portrait of this Pharaoh. Khan, the powerful but obscure Hyksos king of Egypt, whose person might be pronounced Sweserenor, is perhaps a possible prototype for slaves inscribed with his name found with Bactrian swords at Bagdad to Cnosus. Sesostris is evidently a mythical figure calculated to satisfy the pride of the Egyptians in their ancient achievements, after they had come into contact with the great conquerors of Assyria and Persia. When we recollect that the Egyptian Tarchus (Tirhaka) of the 7th century B.C., who was hopelessly worsted by the Assyrians and scarcely ventured outside the Nile valley, was credited by Megasthenes (4th century) and Strabo with having extended his conquests as far as India and the pillars of Hercules, it is not surprising if the names of many kings of antiquity are derived from the case of Tarchus, the miscellaneous levies which he employed himself and those which composed the Egyptian and Assyrian armies opposed to him, and the lands that Egypt and Ethiopia traded with, must all have been counted, partly through misunderstanding, partly through wilful perversity, to his empire.

**SESSA AURUNCA.** A town and Episcopal see of Campania, Italy, in the province of Caserta, on the S.W. slope of the extinct volcano of Rocca Monfina, 27 m. by rail W.N.W. of Caserta and 204 m. E. of Formia by the branch railway to Speranze, 666 ft. above sea-level. Pop. 5945 (town), 29,077 (commune). It is situated on the site of the ancient Sessa Aurunca, on a small affluent of the Liri. The hill on which Sessa lies is a mass of volcanic tufa. The town contains many ancient remains, notably the ruins of an ancient bridge in brickwork of twenty-one arches, of substructures in opus reticulatum under the church of S. Benedetto, of a building in opus quadratum, supposed to have been a public portico, under the museum, of S. Pietro, and of the Romanesque cathedral is a basilica with a vaulted portico and a nave and two aisles begun in 1103, a mosaic pavement in the Cosmatese style, a good ambo resting on columns and decorated with mosaics showing traces of Moorish influence, a Paschal candelabrum, and an organ gallery of similar style. The portal has curious sculptures with scenes from the life of SS. Peter and Paul. In the principal streets are memorial stones with inscriptions in honour of Charles V., surrounded by an old crucifix with a mosaic cross. The hills of Sessa are celebrated for their wine.

The ancient chief town of the Aurunci, Aurunca or Ausona, is believed to have lain over 2000 ft. above the level of the sea, on the narrow south-western edge of the extinct crater of Rocca Monfina. Here some remains of Cyclopean masonry exist; but the area enclosed, about 100 yds. by 50, is too small for anything but a detached fort. It dates, doubtless, from a time prior to Roman supremacy. In 337 B.C. the town was abandoned, under the pressure of the Sidicini, in favour of the site of the modern Sessa. The new town kept the old name until 315, when a Latin colony under the name Sessa Aurunca was founded here. It was among the towns that had the right of coinage, and it manufactured carts, baskets, &c. Cicero speaks of it as a place of some importance. The triumvir settled some of their veterans here, whence it appears as Colonia Julia Felix Classica Sessa. From inscriptions it appears that Matidia the younger, sister-in-law of Hadrian, had property in the district. It was not on a highroad, but on a branch via Appia at Minturnae and via Latina.
at Teanum; the pavement between the latter place and Suessa is in places well preserved, especially near Teano, and so is that of a road ascending from Suessa northward towards the crater mentioned. See A. Avena, Monumenti dell’ Italia Meridionale (Naples, 1902, i. 181 sqq. (T. As.).

SESSION (through Fr. from Lat. sessio, seder, to sit), the act of sitting or the state of being seated, more generally the sitting together or assembly of a body, judicial, legislative, &c., for the transaction of its business, and also the time during which the body sits until its adjournment or dispersion. A session of parliament is reckoned from its assembling till prorogation; usually there is one session in each year. In particular, the term is applied to the sittings of a central court, especially criminal, such as the session of the Central Criminal Court in London. The sittings of the justices of the peace or magistrates in the United Kingdom are “sessions of the peace” for the transaction of the judicial business committed to them by statute or by their commission. These are either “petty sessions,” courts of summary jurisdiction held by two or more justices of the peace or by a stipendiary or metropolitan police magistrate under statute for the trial of such cases as are not of sufficient importance to be tried before quarter-sessions, or for a preliminary inquiry in “indicatible offences” (see JUSTICE OF THE PEACE and SESSIONAL JURISDICTION). The “special sessions” of the justices are held for licensing purposes, styled “Brewster sessions,” or for carrying out the provisions of the Highway Acts, &c. The only sessions which are “general sessions” of the peace are now “quarter-sessions” (q.v.). The supreme court of Scotland is termed the “Court of Session” (see SCOTLAND), and the name is given in the Presbyterian church to the lowest ecclesiastical court, composed of the elders of the church presided over by the minister. In the Established Church of Scotland this is usually styled the “Kirk-session.”

SESTETT, the name given to the second division of a sonnet, which must consist of an octave, of eight lines, succeeded by a sestet, of six lines. In the usual course the rhymes are arranged abcabc, but this is not necessary. Early Italian sonnets, and in particular those of Dante, often close with the rhyme-arrangement abab, but in languages where the sonority of syllables is not so great as it is in Italian, it is dangerous to leave a period of five lines between one rhyme and another. In the quadrain, there is properly speaking no sestet, but a quadrain followed by a couplet, as in the case of Shakespeare’s sonnets. Another form of sestet has only two rhymes, ababcc; as is the case in Gray’s famous sonnet, “On the Death of Richard West.” The sestet should mark the turn of emotion in the sonnet; as a rule it may be said that the octave having been more or less objective, in the sestet reflection should make its appearance, with a tendency to the subjective matter. For example, in Matthew Arnold’s ingenious “The Better Part,” the rough inquirer, who has had his own way in the octave, is replied to as soon as the sestet commences:

“So answerst thou? but why not rather say:
Have man no second life? pitch this one high.
More stringly, then, the inward judge obey!
Was Christ a man like us? For the case of Shakespeare’s.
If we, then, too, can be such men as he?”

Wordsworth and Milton are both remarkable for the dignity with which they conduct the downward wave of the sestet in their sonnets. The French sonneteers of the 16th century, with Ronsard at their head, preferred the softer sound of the rhyme-composition ababcc. The German poets have usually wavered between the English and the Italian forms.

SESTINA, one of the most elaborate forms of verse employed by the medieval poets of Provence and Italy, and retained in its occasional use by the modern poets of Western Europe. The scheme on which the sestina is built was the invention of the great troubadour, Arnaut Daniel (d. 1190), who wrote many sestinas in the lingua di st. Dante, a little later, wrote sestinas in Italian, and of these the most famous is that beginning “Al poco giorno ed al gran cerchio d’ombra.” In the De vulgari eloquentia, Dante admits that he copied the structure of his sestinas from Arnaut Daniel; “et nos cum seuti sumus,” he says, after praising the work of the Provengal poet. The sestina, in its pure medieval form, is independent of rhyme; it consists of six stanzas of six lines each of blank verse. This recurrence of the number six gives its name to the poem. The final words of the first stanza appear in inverted order in all the others, the order as laid down by the Provençal being as follows:—abedef, cbadef, cdefba, deabcf, fbcdea, bfae. To these six stanzas followed a lornada, or envoi, of three lines, in which all the six key-words were repeated in the following order:—b-e, d-c, f-a. It has been supposed that there was some symbolic mystery involved in the rigid elaboration of this form, from which no slightest divergence was permitted; but if so this cryptic meaning has been lost. Petrarch cultivated a slightly modified sestina, but after the middle ages the form fell into disuse, until it was revived and adapted to the French language by the poets of the Pléiade, in particular by Pontus de Thyrard. In the 14th century, the sestina or sestine was assiduously cultivated by the Conte de Gramont, who, between 1380 and 1348, wrote a large number of examples, included in his Chant du passé (1854). He followed the example of Petrarch rather than of the Provençal troubadours, by introducing two rhymes instead of the rigorous blank verse. A sestina by Gramont, beginning:

“L’étang qui s’éclaircit au milieu des feuillages,
La pluie à tâtons un miroir l’assombris;
Les flotilles de fleurs, ses insectes volages
Me charment. Longeant au creux de leurs rivages
J’erre, et les yeux remplis d’un mirage veillent,
J’écoute l’eau qui réve en son tiède sommeil,”

has been recommended to all who wish to “triumph over the innumerable and terrible difficulties” of the sestina, as a perfect model of the form in its “precise and classic purity.” The earliest sestina in English was published in 1877 by Mr Goss; this was the example of Mr Arnaud Daniel. Since that time it has been frequently employed by English and American writers, particularly by Swinburne, who has composed some beautiful sestinas on the rhymed French pattern; of these, that beginning “I saw my soul at rest upon a day” is perhaps the finest example of this poem existing in English. Mr Swinburne is, moreover, like Petrarch, the author of an astonishing tour de force, “The Complaint of Lisa,” which is a double sestina of twelve verses of twelve lines each. The sestina was cultivated in Germany in the 17th century, particularly by Opitz and by Weckerlin. In Italy an attempt was made, not without success, to compose German sestinas in dialogue, while the double sestina itself is not unknown in German literature.

SESTRI LEVANTE (anc. Segesta Tigliulium), a seaport of Liguria, Italy, in the province of Genoa, from which it is 28½ m. distant by rail, 33 ft. above sea-level. Pop. (1901) 3034 (town); 12,038 (commune). It is both a summer and a winter resort, with fine views. Part of the town is situated on a promontory (230 ft.) between two bays. The ancient town was the port of exportation of the slate of the district, for we hear of a place called Tigua or Tegula on the coast-road; but we know practically nothing of the political condition of the district in Roman times.

SESTRI PONENTE, a town of Liguria, Italy, in the province of Genoa, 4 m. W. of that town on the coast. Pop. (1901) 17,225. It has important shipbuilding yards and iron-works, with factories for macaroni, matches and tobacco, tanneries and saw-mills, and, in the vicinity, alabaster quarries. A mile and a half west is Pegli, also a favourite seaside resort, with beautiful walks and fine villas, among which the Villa Pallavicina, with rare trees and fantastic buildings, fountains and grottoes, is noticeable.

SETH, in accordance with Dillmann, “setting” or “slip”; Septuagint, Philo and New Testament, Σθήν, but x Chron. i. 1 Σθεν in A; Josephus, Σθήνος, Vulg. Seth, in Gen. iv. 25, 26 (J) and v. 3-8 (P), the son of Adam. At the age of 105 he begat Enos; he lived in all 912 years. Seth was born after the murder of Abel, and in iv. 25 a popular etymology is given of his name—Adam’s wife called his name Seth, “For God,” said she, “hath
appointed, *shāth*, me another seed instead of Abel." It is further said that after Enos was born, men began to worship Yahweh. Apparently Gen. iv. 25, 26 had no original connexion with J.'s story of the creation, which speaks of Yahweh freely from the outset. As Enos is a Hebrew word for man, it is probably derived from a tradition in which Enos was the first man. An examination of the Sethite genealogy, vv. 12-27, Kenan, Mahalalel, Jared, Enoch, Methuselah, Lamech, shows that it is slightly different version of the Cainite genealogy, iv. 17-25. Cain (Heb. Kain) is derived from a Semitic root, meaning ‘unto Cain’ or ‘strangely.’ Seth is named in the opening genealogy of Chronicles, 1 Chron. i. 1, and in Luke's genealogy of Christ, Luke iii. 38. The Hebrew text of Ecclesiasticus xlix. 16 has "And Shem and Seth and Enos were visited,"—probably with divine favour; the Greek version runs, "Shem and Seth were glorified among men.

In Num. xxiv. 17, the Authorized Version has "the children of Sheth" in a list of nations; the Hebrew is the same as Seth in Genesis. The passage may perhaps indicate that Seth was originally the name of a tribe. The "Seth" of Numbers is sometimes identified with the Bedouin, who appear as Sittah and Assyrain and Babylonian inscriptions. But the Revised Version takes the word *šēth* as a common noun, "tumult," and others interpret it as "pride." cf. Gray's Numbers, p. 371.

If the ten patriarchs of Gen. v. (see Noah) correspond to the ten primitive kings of Babylon, Seth, as second, will correspond with the Adapa of the Babylonian inscriptions, the Adaparos or Adaparos of Berosus. The two have been compared in that Adapa was demigod and Logos; and Seth figures as the Messiah in later Jewish tradition. We may also note the resemblance between the names Seth. Set or Seth it is. Seth, the hero of war, and the god of Heaven. *Sdeh.* The latter has been supposed to be a Hyksos or Semitic deity and to have some connexion with Sheth; but Cheyne and Müller reject this view. Seth is also identified with Moab or the land of Moab.

A mass of Christian and Jewish tradition has gathered round the name of Seth. Philo, De postrerlori Caini, § 3, explains the name as meaning *rogenous,* watering or "irrigation," connecting it with the Hebrew root *Sh H.* Josephus, Ant. i. ii. 3, tells us that Seth was a virtuous man, and that his descendants lived in perfect harmony and happiness. They discovered astronomy, and inscribed their discoveries on two pillars, one of which, says Josephus, survived in his time. In the Book of Jubilees (1st century A.D.) the name of Seth's wife is given as Asura. In the Ascension of Isaiah (1st century A.D.) Seth is seen in heaven. In the Book of Adam and Eve (A.D. 500-900) Seth is described as perfectly beautiful, like Adam, only more beautiful. Seth was the last child born to Adam; he grew in stature and strength, and began to fast and pray strenuously. A Gnostic sect took the name Sethians.

**SEtIA** (mod. Sezze, 52 m. by rail S.E. of Rome), an ancient town of Latium (adjectum), Italy. It was the south-west edge of the Volturnus mountains, overlooking the Pomptine Marshes, 1047 ft. above sea-level, and 900 ft. above the plain. It was an ancient Volscian town, a member of the Latin league of 490 B.C., which became a Latin colony in 382 B.C., and, owing to the strength of its position as a frontier fortress, is frequently mentioned in the military history of Rome up to the time of Sulla, by whom it was captured in 82 B.C. Under the empire it was well known for its wine, which Augustus preferred even to Falernian. Considerable remains of the city walls exist, built of large blocks of limestone in the polygonal style. This style may also be seen in several terrace walls belonging to a later date, as is indicated by the careful jointing and bossing of the blocks of which they are composed. Such intentional archaism is by no means uncommon in the neighbourhood of Rome. The modern town, occupying the ancient site, is an episcopal see, with a much-restored 13th-century Gothic cathedral. Pop. (1901) 6944 (town) and 10,827 (commune). At the foot of the hill on which the town stands are considerable remains of Roman villas.

**SET-OFF, in law, a statutory defence to the whole or a portion of a plaintiff's claim.** It had no existence under the English common law, being created by 2 Geo. II. c. 22 for the relief of insolvent debtors. Such a defence could be pleaded only in respect of mutual debts of a definite character, and did not apply to cases in which damages were claimed, nor to equitable claims or demands. By the rules of the Supreme Court (O. XIX. r. 3) a defendant in an action may set off or set up any right or claim by way of counterclaim against the claims of a plaintiff, and the judge may determine that a right or counterclaim has then no effect as a statement of claim in a cross-action. (See Pleading.)

In architecture, the term set-off is given to the horizontal line shown where a wall is reduced in thickness, and consequently the part of the thicker portion appears projecting before the thinner. In plinths this is generally simply chamfered. In other parts of work the set-off is generally concealed by a projecting string. Where, as in parapets, the upper part projects before the lower, the break is generally hid by a corbel table. The portions of buttress caps which recede one behind another are called set-offs.

**SETON (Family).** The Scottish family of Seton, Seyton, or Seatoun, claims descent from a Douglall Seton who lived in the reign of Alexander I. Sir Richard Maitland of Lethington counted seven generations between this personage and Sir Christopher Seton (d. 1506), the first of the house who emerges in history with any distinctness, but these links are not all supported by documentary evidence. The name was derived from the Anglo-Norman family of Say, the Anglo-Norman immigrant being supposed to have given the name of Sey-town to the lands granted to him in East Lothian. The family honours include the earldoms of Winton (c. 1000) and Dunfermline; of Eglinton through marriage with the Montgomeries; and through alliance with a Gordon heiress a Seton became the ancestor of the earls and marquesses of Huntly and dukes of Gordon. The Setons were connected by marriage with the royal family of Scotland, and also with the Dunbars, Lindays, Hays and Maitlands.

Sir Christopher Seton, son and heir of John de Seton, a Cumberland gentleman, and his wife Erminia Lascelles, was born probably in 1278, since his age is given in March 1309 as twenty-three. In an inquisition into the lands of his deceased father. He did homage for these in October of that year, and was in the service of Edward I. at Lochmaben in 1304. In 1305 he came into possession of lands which had been granted by Sir John Seton to Robert Bruce and his wife Christian, who was perhaps a Seton. He had married about 1301 Christian Bruce, sister of King Robert, who was possibly his second cousin. He was present at his brother-in-law's coronation at Scone in 1306, and saved his life at the battle of Methven later in the same year. According to Dugdale he shut himself up in Lochdoon Castle in Ayrshire, and on the surrender of that castle he was hanged as a traitor at Dumfries by order of Edward I. He left no heirs. His widow was in March 1307 in receipt of three pence a day from Edward I. for her support at the monastery of Sixhill in Lincolnshire. She was afterwards placed in the custody of Sir Thomas de Gray. His Cumberland estates, with the exception of his mother's dower, were given to Robert de Clifford. Another Seton, John de Seton, described as having no lands or chattels, was hanged for helping in the defence of Tibbers Castle, and for aiding in the murder of John Comyn, with other prisoners of war, at Newcastle in August 1306.

Sir Alexander Seton (d. c. 1350) was probably the brother of Sir Christopher. He received considerable grants of land from King Robert Bruce, and was one of the signatories of the letter addressed by the Scottish nobles to the pope to assert the independence of Scotland. He was twice sent on embassies to England, and in 1333 he defended the town of Berwick against the English. He agreed with the English to surrender the town on a certain date unless he received relief before that time, giving his eldest surviving son Thomas as a hostage. On the refusal of the Scots to surrender at the expiry of the term Thomas Seton was hanged in sight of the garrison. This incident is
related by Fordun and Boece, but with inconsistencies that have rendered it suspect. An elder son, Alexander, had perished in 1332 in opposing the landing of Edward Balliol; according to some authorities the third son, William, was hanged with his brother, but he is generally said to have been drowned during the siege; his daughter Margaret married Alan de Wintoun. The tragic death of young Thomas Seton was the subject of a ballad of "Seton's Sons," printed in Sheldon's Ministracy of the Scottish Border; of a tragedy, The Siege of Berwick (1794), printed 1832) by Edward Jerningham, and of another by James Mitford.

Sir William Seton of Seton (fl. 1371-1393) is said to have been ennobled with the title of Lord Seton, and his heirs laid claim that the barony of Seton was the oldest in Scotland. By his wife Catherine Sinclair he had eight children. John succeeded him; Alexander married Elizabeth, daughter and heiress of Sir Adam de Gordon, by whom he became the ancestor of the Gordons of Huntly.

Sir John of Seton (d. c. 1447) was taken prisoner at Homildon Hill in 1402. He was hostage in England for the earl of Douglas in 1405, queen of in 1412. He was L. C. at her instance) Janet the daughter of the 9th earl of March. His son William was killed at Verneuil, fighting on the French side, leaving as heir George (d. 1478), 1st Lord Seton, who was created a lord of parliament in 1448 as Lord Seton. By his first marriage with Margaret, daughter of John Stewart, earl of Buchan, he had a son John, who died during his father's lifetime. He was succeeded by his grandson George, 2nd Lord Seton (d. 1508), who was a scholar of St Andrews and Paris, and in common report a necromancer. He was captured by the Flemings, and on his release fitted out and maintained a ship for the purpose of harassing Flemish travellers. His son George, 3rd Lord Seton, was killed at Flodden in 1513. He redeemed estates which his father had sacrificed to support his enterprises against the Flemings. By his marriage with Janet, daughter of Patrick Dunbar, 1st Earl of Bothwell, he left a son George, 4th Lord Seton (d. 1540), who allowed Cardinal Beaton to escape from custody in 1543, and received considerable grants of land in the sequel. The castle and church of Seton were burnt by Hertford in revenge for the part he had taken against the English in 1544.

George, 5th Lord Seton (1537-1585), was a firm friend of Mary, queen of Scots. He married Janet, the daughter of the 9th earl in 1557, and three years later he was again in France, because of his adherence to the old religion. When Mary returned to Scotland he became privy councillor and master of the household, but four years later he again found it advisable to retire to France. Mary and Darnley spent their honeymoon at Seton Palace, and Mary found a retreat there after the murder of Rizzio and again after the murder of Darnley. She spent the night before Carberry Hill under Seton's roof, and he was waiting for her on her escape from Lochleven in May 1568. He took her to his castle at Niddrie, Linlithgowshire, and thence to Hamilton. A week later he was taken prisoner at Langside. He was set free after the assassination of the regent Moray, and made his way to Flanders, where he was said to have made his living as a waggoner. He was, in fact, entrusted by Mary's supporters with a mission to the duke of Alva, and sought in vain to secure for service in Scotland two regiments of Scots then in Spanish pay. He returned home in 1571, being apparently reconciled with the government, but he retained his Catholicism and his friendship for Mary, who wrote to Elizabeth in 1581 desiring a passport for Lord Seton that he might alleviate her solitude. In 1581 he was married. Maiton's judgment was that in 1583 he was sent as ambassador to France, where he sought interference on Queen Mary's behalf. He died soon after his return on the 8th of January 1585. The 5th Lord Seton figures in Sir Walter Scott's Abbot. He was succeeded by his second and eldest surviving son, Robert, who became 6th Lord Seton and 1st Earl of Winton. His third son, Sir John Seton of Barns, was a gentleman of the household to Philip II. of Spain. He was recalled to Scotland by James VI., and served as lord of session from 1587 to 1594.

Mary Seton, one of the "Four Maries" attendant on the queen, is supposed to have been the 5th Lord Seton's half-sister, being the daughter of the 4th lord by his second wife, a Frenchwoman named Mary Pieris, maid of honour to Mary of Guise. She had been educated with Queen Mary in France, being about a year older than her mistress, with whom she returned to Scotland in 1591. She helped Mary to escape from Lochlevan by assuming her clothes. Later on she joined her at Carlisle, and remained with her in various prisons until 1583, when prison life had undermined her health and spirits. She retired 50 miles from St Andrews at Pitt Kellow and died there, an old lady of seventy-four, in poverty in 1614.

Robert Seton (d. 1603) succeeded his father as 6th lord in 1585, and was created earl of Winton in 1600. He married, about 1582, Margaret, eldest daughter of Hugh Montgomery, 3rd Earl of Eglinton. His sons Robert and George were successively earls of Winton; the third, Alexander, became, in right of his mother, 6th Earl of Eglinton; the fourth, Thomas, was the ancestor of the Setons of Olveston.

George, 4th earl of Winton (1640-1704), succeeded his grandfather, George Seton, 3rd Earl, in 1650. He saw some service in the French army, and fought in the Covenanters at Pentland and at Bothwell Bridge. By his second marriage, with Christian Hepburn, he had a son George, who quarrelled with his father and is said to have been working as a journeyman blacksmith abroad when he succeeded to the title in 1704. In 1715 the 4th earl joined Kenmure with 300 men at Moffat, but it was against his advice that the Jacobite army invaded England. He was lying in the Tower under sentence of death when he succeeded in making his escape, and proceeding to the continent, he became well known in Rome, where he was grand master of the Roman lodge of freemasons. He died there in 1740. With him the earldom became extinct, but it was revived in 1820 in favour of the earls of Eglinton.

Some of the cadet branches of the family remain to be noticed. The Setons of Parbroath in Fife, represented by American descendants from descendents from George Seton of Parbroath, 3rd Earl, are descended from the Setons of Parbroath. The Setons of Touch, near Stirling, descended from Alexander Seton, 1st Earl of Huntly. They were hereditary armour-bearers and squires of the body to the king, dignities which passed, in the female line, to the Seton-Stewarts in 1786. From the Setons of Touch were descended the Setons of Culcleg or Abercrombie. The Setons of Preston (Linlithgow) and Ekolsund (Sweden) have been connected with the Swedish army since the 16th century when George Seton, a merchant, sailed with the Scottish Black Watch, under Col. M'Leh and accompanied with William Seton, brother of the 1st Earl of Huntly. The Pittmedden branch was an offshoot from Meldrum; the barony was created 1697 for Judge Seton of Pittmedden in 1719). The Setons of Mounie again were a branch of the Pittmedden family; one of their house, Lieut.-Colonel Alexander Seton, 7th Highlanders, was in charge of the troops on the ill-fated Culloden field in 1746. The Setons of Seton, cousins of the Setons of Dunbar and Lord Seton, were the Setons of the 8th Lord Seton, obtained the barony of Carliston in 1553. Other branches are Seton-Gordon of Embro, with a baronetcy created in 1691, and Seton of Carleton, with a baronetcy created in 1664. The viscountcy of Kingston was created for Alexander Seton (d. 1691), third son of the 3rd Earl of Winton, and became extinct on the attainer of James, 3rd Viscount, in 1715.

SETTEE, a long upholstered seat, usually high-backed and with arms at each end. Its ancestors were the settle and the chair—it has alternately resembled the one and the other. It is broadly distinguished from the many varieties of sofa by being intended for sitting rather than reclining—its seat is of the same height as that of a chair; its arms and much of its detail are chair-like. It dates from about the middle of the 17th century, but examples of that early period are exceedingly rare. There is a famous one at Knole, made about midway between the restoration of Charles II. and the revolution of 1688. By that time the settle had acquired the splendid upholstery and convoluted woodwork which adorned the end of the Stuart period. Early in the 18th century the conjoined double or triple chair form
became fashionable. The form was artless, and the absence of upholstery, save on the seat, produced a somewhat angular effect. This type of settee was in essence two chairs with one set of arms. Chippendale made many such pieces, some of them of great beauty. As the taste for carved furniture waned these sturdy settees were replaced by lighter ones, often graceful enough in outline—Hepplewhite and Sheraton were distinguished practitioners—but partaking more and more of the "stuffed-over" character. The desire for comfort and ease gave rise to settees developed out of the original idea that the settee was intended only for sitting bolt upright. Its modern varieties are many, but in all of them the frame, once so lavishly ornamented, is almost concealed by upholstery.

**S**ettembrini, Luigi (1813–1877), Italian man of letters and politician, was born in Naples. At the age of twenty-two he was appointed professor of eloquence at Catanzaro, and married Raffaela Luigia Faustiano (1833). While still a young man he had been affected by the wave of liberalism then spreading all over Italy, and soon after his marriage he began to conspire mildly against the Bourbon government. Betrayed by a priest, he was arrested in 1839 and imprisoned at Naples; although liberated three years later he lost his professorship and had to maintain himself by private lessons. Nevertheless he continued to conspire, and in 1847 he published anonymously a "Protest of the People of the Two Sicilies," a scathing indictment of the Bourbon government. On the advice of friends he went to Malta on a British warship, but although, when King Ferdinand II. granted a constitution (16th of February 1848), he returned to Naples and was given an appointment at the ministry of education, he soon resigned on account of the prevailing chaos, and retired to a farm at Postillo. When reaction set in, once more Settembrini was arrested as a suspect (June 1849) and imprisoned. After a monstrously unfair trial, he and two other "politicals" were condemned to death, and nineteen others to varying terms of imprisonment (February 1851). The death sentences were, however, commuted to imprisonment for life, and Settembrini was sent to the dungeons of San Stefano. There he remained for eight years. His friends, including Antonio Panizzi, then in England, made various unsuccessful attempts to liberate him, and at last he was deported with sixty-five other political prisoners. The exiles received an enthusiastic welcome in London, but Settembrini after a short stay in England joined his family at Florence in 1866. On the formation of the Italian kingdom he was appointed professor of Italian literature at the university of Naples, and devoted the rest of his life to literary pursuits. In 1875 he was nominated senator. He died in 1877. His chief work is his Lesioni di letteratura italiana, of which the dominant note is the conviction that Italian literature "is as the very soul of the nation, seeking, in opposition to medieval mysticism, reality, freedom, independence of reason, truth and beauty" (P. Villari).

See L. Settembrini, Ricordanze, 2 vols., edited by F. de Sancis (Naples, 1879–1880); Epistolario di Luigi Settembrini, edited by F. Fiorentino; P. Villari, Saggi critici (Florence, 1884); Countess Martinengo Cesaresco, Italian Characters (London, 1901).

**S**ettle, Elkanah (1687–1727), English poet and playwright, was born at Dunstable on the 1st of January 1687. He entered Trinity College, Oxford, in 1666, but left the university without taking a degree. His first tragedy, Cambyse, King of Persia, was produced at Lincoln's Inn Fields in 1667. The success of this play led the earl of Rochester to encourage the next, which received the title of The Empress of Morocco (1671). It was performed at Whitehall, and proved a signal success on the stage. It is said by Dennis to have been "the first play that was ever sold in England for two shillings, and the first play that was ever printed with cuts." These illustrations represent scenes in the theatre, and make the book very valuable. The play was printed with a preface to the earl of Norwich, in which Settle described with scorn the effusive dedications of other dramatic poets. Dryden was obviously aimed at, and he co-operated with Crowne and Shadwell in an abusive pamphlet entitled "Notes and Observations on the Empress of Morocco" (1674), to which Settle replied in "Some Notes and Observations on the Empress of Morocco revised" (1674). In the second part of Ab solam and Achitophel, in a passage certainly by Dryden's hand, he figures as "Doeg." Neglected by the court party he took an active share in the anti-popish agitation. When this subsided he turned round to expose Titus Oates, and with the Revolution he veered towards the Whig party. But he had lost the confidence of both sides, and "recanting Settle" accordingly abandoned politics for the appointment (1691) of city poet. In his old age he went to live with the Bishop Downame Fair, where he is said to have played the part of the dragon in a green leather suit devised by himself. He became a poor brother of the Charterhouse, where he died on the 12th of February 1744.

Settle's numerous works include, beside numerous political pamphlets and occasional poems, *Ibrahim, the Illustrious Bassa* (1676), a tragedy taken from Madeleine de Scudéry's romance; *The Female Prelate; being the History of the Life and Death of Pope Joan* (1680), a tragedy; *The Ambitious Slave; or A Generous Revenge* (1684); *The World in the Moon* (1667), an opera, of which the first scene was formed by a moon fourteen feet across; and *The Virgin Prophectes, or The Fate of Troy* (1701), an opera.

**S**ettle, a market town in the Skipper parliamentary division of the West Riding of Yorkshire, England, 41 miles N.W. from Leeds by the Midland railway. Pop. (1901) 2302. It lies in the upper part of the Ribble valley, amid the wild scenery of the limestone hills of the Pennine district. The district includes several caves, such as Victoria Cave, close to the town, where bones of animals, and stone, bone and other implements and ornaments have been discovered. Other points of interest are Malham Cove and tarn, the ravine of Gordale Scar, and the cliffs of Attermyre, Giggleswick Scar and Castleberg (the last immediately above Settle itself), the Clapham and Weathercote caves, the chasm of Helin Poat and the waterfall of Stainforth Foss. In the town are cotton factories and a tannery. To the west of the town is the grammar school of Giggleswick, one of the principal public schools in the north of England, founded in 1512.

**S**ette, a wooden bench, usually with arms and a high back, long enough to accommodate three or four sitters. It is most commonly movable, but occasionally fixed as in the "boxes" of those old coffee-houses of which a few examples still remain in London, and perhaps elsewhere. It shares with the chest the chair the distinction of great antiquity. Its high back was a protection from the draughts of medieval buildings—a protection which was sometimes increased by the addition of an elbow or other support. Settes were most frequently placed near the fire in the common sitting-room. Constructed of oak, or other hard wood, it was extremely heavy, solid and durable. Few English examples of earlier date than the middle of the 16th century have come down to us; survivals from the Jacobean period are more numerous. Settles of the more expensive type were often elaborately carved or incised; others were divided into plain panels. A well-preserved specimen, with its richly polished oak, darkened by time and beeswax, is a handsome piece of furniture often still to be found in its original home—a farm-house kitchen or the like. Settles were placed near the fire in the common sitting-room. The form was never long outlasted the first half of the 18th century, to which period most of the existing specimens belong.

**S**ettlement, in law, a mutual arrangement between living persons for regulating the enjoyment of property, and the instrument by which such enjoyment is regulated. Settlements may be either for valuable consideration or not: the latter are usually called voluntary, and are in law to some extent in the same position as revocable gifts; the former are real contracts, and in general their validity depends upon the law of contract. They may accordingly contain any provisions not, in fact, to any extent in the nature of a contract to dispose and to dispose of the property.

The elements of the modern settlement are to be found in Roman law. The *vulgaris, populilaris* or *exemplaris substitutio* (consisting in the appointment of successive heirs in case of the death of the first) is the fundamental provision which recognises the right of a man to bestow his property upon another person. The person thus settled for is the beneficiary or "settlor." In Anglo-Saxon law was allowed greater freedom than French. By §79 of the Code Napoléon, in a contract of marriage the succession to a living person cannot be renounced.

---

1 In this English law allows greater freedom than French. By §79 of the Code Napoléon, in a contract of marriage the succession to a living person cannot be renounced.
dealt with here, incapacity or refusal of the heir first nominated may have suggested the modern mode of giving enjoyment of property in succession. Such a substitutio could, however, only have been made by will, while the settlement of English law is, in the general acceptance of the term, exclusively an instrument inter vivos. The dos or donatio proper nuptias corresponds to a considerable extent with the marriage settlement, the instrument itself being represented by the dolare instrumentum or poeta dotale. In the earliest period of Roman law no provision for the wife was required, for she passed under the dominium of her husband, and became in law his daughter, entitled as such to a share of any property at his death. In course of time the plebeian form of marriage by usus, according to which the wife did not become subject to manus, gradually superseded the older form, and it became necessary to make a provision for the wife by contract. Such provision from the wife's side was made by the dos, the property contributed by the wife or some one on her behalf towards the expenses of the new household. Dos might be given before or after marriage, or might be increased after marriage. It was a duty enforced by legislation to provide dos where the father possessed a sufficient fortune. Dos of three kinds: profectitia, contributed by the father or other ascendant on the male side; adventitia, by the wife herself or any person other than those who contributed dos prorectitia; receptitia, by any person who contributed dos adventitia, subject to the stipulation that it was to be returned to the person advancing it on dissolution of the marriage. The position of the husband gradually changed for the worse. From being owner, subject to an obligation to return the dos if the wife predeceased him, he became in fact the lord in possession of the property for the wife's family, retaining only the enjoyment of the income as long as the marriage continued. The contribution by the husband was called donatio proper nuptias. The most striking point of difference between the Roman and the English law is that under the former the children took no interest in the contributions made by the parents. Other modes of settling property in Roman law were the life interest or usus, the fideicommissum, and the prohibition of alienation of a legatum.

The oldest form of settlement in England was perhaps the gift in frankmarriage to the donees in frankmarriage, and the heir between them two begotten (Littleton, § 17). This was simply a form of gift in special tail, which became up to the reign of Queen Elizabeth the most usual kind of settlement. The time at which the modern form of settlement of real estate came into use seems to be doubtful. There does not appear to be any trace of a limitation of an estate to an unborn child prior to 1556. In an instrument of that year such a limitation was effected by means of a feoffment to usos. The plan of granting the freehold to trustees to preserve contingent remainders is said to have been invented by Lord Keeper Sir O. Bridgeman in the 17th century, the object being to preserve the estate from forfeiture for treason during the Commonwealth. The settlement of chattels is no doubt of considerably later origin, and the principles were adopted by courts of equity from the corresponding law as to real estate.

Settlement in English law is, so far as regards real property, used for two inconsistent purposes—to "make an eldest son," as it is called, and to avoid the results of the right of succession to real property of the eldest son by making provision for the younger children. The first result is generally obtained by a strict settlement, the latter by a marriage settlement, which is of value for consideration if anti-nuptial, voluntary, if nuptial. But these two kinds of settlement are not mutually exclusive: a marriage settlement may often take the form of a strict settlement and be in substance a resettlement of the family estate. (See Conveyancing.)

In Scotland a disposition and settlement is a mode of providing for the devolution of property after death, and so corresponds to a settlement. The appointment of such trustees was rendered unnecessary by acts of 1845 and 1877.

1 See Hunter, Roman Law, p. 150; Maine, Early History of Institutions, Lect. xi.
2 The appointment of such trustees was rendered unnecessary by acts of 1845 and 1877.

acts to the repute of which the regent may not assent. To maintain or affirm the right of any person to the crown, contrary to the provision of the act, is his sworn by an act of 1787.

SETUBAL, or SEBASTOPOL, an important naval station of Russia on the Black Sea, on the S.W. coast of the Crimea, in 44° 37' N. and 33° 31' E., 956 m. from Moscow, with which it is connected by rail via Kharkov. Pop. (1882) 26,150; (1897) 59,710. The estuary, which is one of the best roadsteads in Europe and could accommodate the combined fleets of Europe, is a deep and thoroughly sheltered indentation among chalky cliffs, running east and west for nearly 4 m., with a width of three-quarters of a mile, narrowing to 930 yds. at the entrance. It has a depth of 6 to 10 fathoms, with a good bottom, and large ships can anchor at a cable's length from the shore. The main inlet has also four smaller indentations—Quarantine Bay at its entrance, Yuzhnaya (Southern) Bay, which penetrates more than 1 m. to the south, with a depth of 410 fathoms, Dockyard Bay, and the Bay of Artillery. The village of Chornaya, or Chornaya, enters the head of the inlet. The main part of the town, with an elevation of 30 to 190 ft., stands on the southern shore of the chief inlet, between Yuzhnaya and Artillery Bays. A few buildings on the other shore of the chief bay constitute the "northern side." Before the Crimean War of 1853-56 Sevastopol was a well-built city, beautified by gardens, and had 43,000 inhabitants; but at the end of the siege it had not more than fourteen buildings which had not been badly injured. After the war many privileges were granted by the government in order to attract population relations with Turkey by the Mongols, and at the end of seven years the population numbered 2750.

The present town is well built and is becoming a favourite watering-place on account of its sea-bathing and numerous sanitaria. It has a zoological marine station (1897), a museum commemorative of the siege (1895), a cathedral of Classical design and another finished in 1888, monuments of Admirals Nakhimov (1898) and Kornilov (1895) and of General Todleben, and two navigation schools. In 1890 Sevastopol was made a third-class fortress, and the commercial port has been transferred to Theodosia.

The peninsula between the Bay of Sevastopol and the Black Sea was known in the 7th century as the Heracleotian Chersonese. In the 5th century B.C. a Greek colony was founded here and remained independent for three centuries, when it became part of the kingdom of the Bosporus, and subsequently tributary to Rome. Under the Byzantine empire Chersonesus was an administrative centre for its possessions in Taurida. Vladimir, prince of Kiev, conquered Chersonesus (Korsun) before being baptized there, and restored it to the Greeks on marrying (988) the princess Anna. Subsequently the Slavs were cut off from relations with Taurida by the Mongols, and only by occasional raids, such as that of the Lithuanian prince Olgerd. In the 16th century a new influx of colonists, the Tatars, occupied Chersonesus and founded a settlement named Akhtyar. This village, after the Russian conquest in 1783, was selected for the chief naval station of the empire in the Black Sea and received its present name ("the August City"). In 1826 strong fortifications were begun. In 1854 the allied English, French and Turkish forces laid siege to the southern portion of the town, and on the 17th of October began a heavy bombardment. Sevastopol sustained a memorable eleven months' siege, and on the 8th of September 1855 was evacuated by the Russians. The fortifications were blown up by the allies, and by the Paris treaty the Russians were bound not to restore them (see CRIMEAN WAR). In November 1870, during the Franco-German War, the Russian government decided again to make Sevastopol a naval arsenal.

SEVEN CHAMPIONS OF CHRISTENDOM, the name given in medieval tales to the seven national saints—of England, Scotland, Ireland, Wales, France, Spain and Italy—i.e. Saints George, Andrew, Patrick, David, Denis, James and Anthony. The classical version of their achievements is that of Richard Johnson (1573-c. 1659), Famous History of the Seven Champions of Christendom (3 parts, 1596, 1608, 1610; many editions). The oldest known copy is dated 1597; there also is a poetical version by Sir George Buc (published 1623).

SEVEN DAYS' BATTLE, a name given to a series of combats in the neighbourhood of Richmond, Virginia, during the American Civil War, June 26-July 2, 1862. The Federal Army of the Potomac, advancing from the sea and the river Pamunkey
over the Chickahominy on Richmond, had come to a standstill after the battle of Seven Pines (or Fair Oaks), and General Robert Lee, who succeeded Joseph Johnston in command of the Confederates, initiated the series of counter attacks upon it which constitute the "Seven Days."

McClellan had at his disposal 32 brigades and 67 batteries organized in five corps each of two or three divisions. His cavalry consisted of 16 regiments and 22 companies. Lee's army consisted of 40 brigades and 59 batteries organized in eleven divisions and an independent brigade: four divisions were grouped under Jackson and three under Magruder. The reserve artillery consisted of 23 batteries and Stuart's cavalry corps of 3,000 sabres. McClellan lingered north of Richmond, despite President Lincoln's constant demand that he should "strike a blow" with the force he had organized and taken to the Yorktown peninsula in April, until General Lee had concentrated 73,000 infantry in his front; then the Federal commander, fearing to await the issue of a decisive battle, ended his campaign of invasion in the endeavour to "save his army"; and he so far succeeded that on July 3 he had established himself on the north bank of the James in a position to which reinforcements and supplies could be brought from the north by water without fear of molestation by the enemy. But he lost 15,000 men in the course of his seven days' retreat, and 20% of the remainder became ineffective from disease contracted in the swamps of the Chickahominy, while enormous quantities of valuable stores at White House on the Pamunkey had been burnt to avoid seizure by the enemy. McClellan described this flight to the James as a change of base, but his resolve to abandon the attitude of an invader was formed when General Lee in the middle of June had caused Stuart's cavalry to reconnoitre the flanks and rear of McClellan's army, and had summoned Jackson's corps from the Shenandoah Valley (q.v.). The news soon reached McClellan, who thereupon prepared to evacuate White House on June 25 and moved his trains southward to the James covered by his army. Jackson had preceded his troops in order personally to confer with Lee, and had then appointed the morning of June 26 for his appearance north of the Chickahominy to lead the march and attack McClellan's right wing under General FitzJohn Porter. Jackson was to be supported by the divisions of A. P. Hill, Longstreet and D. H. Hill. Lee's other divisions under Magruder, Huger and Holmes were to defend the lines which covered Richmond from the east, and so prevent McClellan effecting a counter-stroke. Huger had demonstrated on the Williamsburg Road on June 25 in order to draw McClellan's attention to his left wing, and though on June 26 Jackson had failed to appear, General A. P. Hill at 3 p.m. crossed the Chickahominy and attacked the enemy's right wing at Beaver Dam Creek assisted by D. H. Hill, while Longstreet crossed at Mechanicsville. General Lee and President Davis were present and witnessed the loss of 2,000 men in a frontal attack which continued till 9 p.m. Meanwhile General Jackson, with Stuart's cavalry corps, "marched by the fight without giving attention, and went into camp at Hundley's Corner half a mile in rear of the enemy's position."

The Federal detachment retreated during the night to a stronger position in rear at Gaines's Mill near Cold Harbor, and on June 27 the Confederates again attacked Porter's corps. Lee's six divisions formed an echelon. D. H. Hill moving towards the enemy's right was followed by Jackson's corps (three divisions), while A. P. Hill engaged the enemy in front and Longstreet in reserve moved along the left bank of the Chickahominy. The resistance of the Federals was stubborn; at 5 p.m. General Lee required Longstreet to attack the enemy's left, and at this moment he procured the assistance of some part of Jackson's corps which had become separated from the remainder. About sunset the Federals under Porter (three...
SEVENOKAS—SEVEN SLEEPERS OF EPHESUS

709

divisions) yielded to the pressure of the attack at all points, and withdrew in the night across the Chickahominy, leaving 5000 prisoners in the hands of General Lee. The Confederates lost 7000 men on June 27.

Lee's right wing had in the meantime demonstrated against the main body of the Federals about Fair Oaks, on the south bank of the river. On June 28 complete inactivity prevailed among the Confederates north of the Chickahominy save that Stuart's cavalry and Emory's dividing expedition was near the road way; but the Longstreet encountered on this day McClellan was good his retreat southwards to the James with little interference, for Magruder was instructed to "hold his lines at all hazards," and accordingly acted on the defensive except that Jones' division opposed a Federal division under W. F. Smith near Fair Oaks. On June 29 General Lee became aware of the situation and then issued orders for his six divisions to cross the Chickahominy in pursuit. Jackson's corps and D. H. Hill's division were to follow the enemy, while Longstreet and A. P. Hill were to move their divisions via New Bridge to the Darbytown or James River Road, or which strong position the Army of the Potomac, Stuart was to operate at his discretion north of the Chickahominy, and it seems that he was attacked by the enemy's abandoned depot at White House more than by McClellan's retreating army. On this day Magruder with two divisions attacked superior forces about Fair Oaks and was repulsed, and again attacked at Savage Station with like results. General Lee, however, rebuked Magruder for slackness in pursuit. Holmes' division was moving in front of Longstreet on the James River Road, but two Federal divisions were holding the route at Willis Church and at Jordan's Ford. On June 30 Jackson got into action with Whiting's division at White Oak Swamp, where they took the Federals at Frazier's Farm (or Glendale). Longstreet was supported by A. P. Hill and together they lost 3200 men; it was hoped that Jackson's corps would come up during the engagement and attack the enemy's rear, and Huger's division assail his right, but Federal artillery stopped Huger, and of Jackson's three divisions only one came into action. Magruder and Holmes were engaged to their own advantage at Turkey Bridge. Longstreet and Hill were thus opposed to five Federal divisions, while General McClellan was pushing his wagons forward to Malvern Hill, and the Army of the Potomac was concentrated at nightfall. On July 1 Jackson's corps and D. H. Hill's division had been drawn again into the main operation and followed the Federal line of retreat to Malvern Hill with Huger and Magruder on their right. The divisions of Longstreet and A. P. Hill were in support.

General Lee had thus on the seventh day concentrated his army of ten divisions in the enemy's front; but Jackson's dispositions were unfortunate and General Lee's plan of attack was thus upset; and while seeking a route to turn the enemy's right the Confederate commander was apprised that a battle had been improvised by the divisions in advance. In the result these troops were repulsed with a loss of 6000 men, a circumstance hardly to be wondered at, since McClellan had entrenched eight divisions on the strongest position in the country, and was aided by his siege artillery and also by a flanking fire from his gunboats on the river near Hazxall's Landing. General Lee's offensive operations now ended, though Stuart's cavalry rejoined the main army at night and followed the enemy on July 2 to Evelingon Heights, while Lee rested his army. Stuart discovered a position which commanded the Federal camp, and maintained his cavalry and horse artillery in this position until the afternoon of July 3. As a result of this pursuit, he was unable to retire before a Federal force of infantry and a battery. Longstreet and Jackson had been despatched to his support, but the former did not arrive before nightfall and the latter failed to appear until the next day (July 4). Stuart afterwards moved farther down the James, and shelledMcClellan's supply vessels in the river until recalled by General Lee, who on July 8 withdrew his army towards Richmond.

The operations resulted in re-establishing the confidence of the Confederates in their army which Johnston's retreat from Yorktown had shaken, in adding prestige to President Davis and his government, and in rectifying the popular view of General Lee as a commander which had been based upon his failure to recover West Virginia in the autumn of 1861. In the north a feeling of despondency overtook Congress at the "lame and impotent conclusion" of a campaign of invasion which was expected to terminate the war by the defeat of the Confederate army, the capture of Richmond and the immediate overthrow of the rebellion.

SEVENOKAS, a market town in the Sevenoaks parliamentary division of Kent, England, 22 m. S.E. by S. of London by the South-Eastern and Chatham railway. Pop. of urban district (1901) 8106. It is beautifully situated on high ground among the wooded undulations of the North Downs, above the valley of the river Darent. The town consists principally of two streets which converge at the south end, near which is the church of St Nicholas, of the 13th, 14th and 15th centuries. It contains monuments of the Amherst family and a tablet to William Lambardie, d. 1605, which was removed from the old parish church of Greenwich when that was demolished. Lambardie was author of the Perambulation of Kent, and founded the College of the Poor of Queen Elizabeth at Greenwich. The grammar school founded in 1418 by Sir William Sevenoak was reconstituted as a first-grade modern school in 1877. There is also a school founded by Lady Margaret Boswell, wife of Sir William Boswell, ambassador to Charles I. at The Hague, and almshouses founded by Sir William Sevenoak in connexion with his school. Close to Sevenoaks is Knole Park, one of the finest old residences in England, which in the time of King John was possessed by the earl of Pembroke, and after passing to various owners was bought by Archbishop Bourchier (d. 1468), who rebuilt the house. He left the property to the see of Canterbury, and about the time of the dissolution it was given up by Cranmer to Henry VIII. By Elizabeth it was conferred first on the earl of Leicester and then on Thomas Sackville, afterwards earl of Dorset. By this earl it was in great part rebuilt and fitted up in regard to decoration much as it now exists. The gateway in the outer court and the Perpendicular chapel are from Archbishop Bourchier's time. The great hall, with elaborately carved music-gallery, is mainly the work of the first earl.

SEVEN SLEEPERS OF EPHESUS, THE, according to the most common form of an old legend of Syrian origin, first referred to in Western literature by Gregory of Tours (De glor. mort. c. 95), seven Christian youths of Ephesus, who, in the Decian persecution (a.d. 250), hid themselves in a cave. Their hiding-place was discovered and its entrance blocked. The martyrs fell asleep in a mutual embrace. Nearly 200 years later a herdsman of Ephesus rediscovered the cave on Mount Coelian, and, letting in the light, awoke the inmates, who sent one of their number (Jamblicus) to buy food. The lad was astonished to find the cross displayed over the city gates, and, on entering, to hear the name of Christ openly pronounced. By tendering coin of the time of Decius at a baker's shop he roused suspicion, and was taken before the authorities as a dishonest finder of hidden treasure. He confirmed his story by leading his accusers to the cavern where his six companions were found, youthful and beaming with a holy radiance. The emperor Theodosius II., hearing what had happened, hastened to the spot in time to hear from their lips that God had wrought this wonder to confirm his faith in the resurrection of the dead. This message delivered, they again fell asleep.

Gregory says he had the legend from the interpretation of "a certain book in Syriac"; and, "it is possible that documents in two Syriac sources. It forms the subject of a homily of Jacob of Sarug (ob. a.d. 521), which is given in the Acta sanctorum. Another Syriac version is printed in Land's Analecta, ii. 87 seq.; see also Barhebræus, Chron. eccl. i. 142 seq., and compare Assemani, Bibl. Or. i. 335 seq. Some forms of the legend give eight sleepers—e.g. an ancient MS. of the 6th century now in the British Museum (Cat. Syr. MSS. p. 109)—there are considerable variations as to the date of the legend attained its wide diffusion throughout Christendom; its currency in the East is testified by its acceptance by Mahomet (syr. xviii.), who calls them Alshâbl-al-Kohb, "the men of the cave."
According to Briani (Chronology, tr. by Sachau, p. 288) certain un-decayed corpses of monks were shown in a cave as the sleepers of Ephesus in the 9th century. The sleeping monks were a favourite subject in early medieval art. The story is well told in Gibbon’s Decline and Fall of the Roman Empire, ch. xxxiii.

SEVEN WEEKS’ WAR, the name given to the war of 1866 between Prussia on the one side, and Austria, Bavaria, Hanover, Saxony and allied German states on the other. Concurrently with this war another was fought in Venetia between the Italians and the Austrian army of the South, for which see ITALIAN WAR OF 1866.

In 1850 Prussia, realizing from the breakdown of her mobilization for the war then impending with Austria that success was impossible, submitted to the Austrian demands, but her statesmen saw from the first that the “surrender of Olmütz,” as it was termed, rendered eventual war with Austria “a military necessity.” Preparations were begun in earnest after the accession of King William I., who selected Bismarck as his chancellor, Moltke as his chief of staff and Roon as his minister of war, and gave them a free hand to create the political situation and prepare the military machinery necessary to exploit it. Within six years the mobilization arrangements were recast, the war against Denmark in 1864 proving an opportune test of the new system. The number of field battalions was nearly doubled, two-thirds of the artillery received breech-loading rifled guns, the infantry had for some years had the breech-loading “needle-gun,” and steps were initiated to train an adequate number of staff officers to a uniform appreciation of strategical problems, based on Moltke’s personal interpretation of Clausewitz’s Vom Kriege. There was, however, a fundamental disagreement in the tactical ideas of the senior and those of the junior officers. This is expressed in the tradition of the Napoleonic era of looking for the decision only from the employment of “masses”; the latter, trained with the breech-loader and without war experience, expected to decide battles by infantry fire only. Both overlooked the changes brought by the introduction of the long-range rifle (muzzle- and breech-loading alike), which had rendered impossible the “case shot preparation” which had formed the basis of Napoleon’s tactical system. The men were trained for three years in the infantry and four years in the cavalry and artillery, but the war was not popular and many went untrained.

In contemporary military opinion, the Austrians were greatly superior in all arms to their adversary. Their rifle, though a muzzle-loader, was in every other respect superior to the Prussian needle-gun, and their M.L. rifled guns with shrapnel shell were considered more than sufficient to make good the slight advantage then conceded to the breech-loader. The cavalry was far better trained in individual and real horsemanship and manoeuvre, and was expected to sweep the field in the splendid cavalry terrain of Moravia. All three arms trained their men for seven years, and almost all officers and non-commissioned officers had considerable war experience. But the Prussians having studied their allies in the war of 1864 knew the weakness of the Austrian staff and the untrustworthiness of the contingents of some of the Austrian nationalities, and felt fairly confident that against equal numbers they could hold their own.

The occasion for war was engineered entirely by Bismarck; and it is doubtful how far Moltke was in Bismarck’s confidence, though as a far-seeing general he took advantage of every opening which the latter’s diplomacy secured for him. The original scheme for the strategic deployment worked out by Moltke as part of the routine of his office contemplated a defence of the kingdom against not only the whole Prussian army but against 35,000 Saxons, 95,000 unorganized Bavarians and other South Germans, and 60,000 Hanoverians, Hessians, &c., and to meet these he had two corps (VII. and VIII.) on the Rhine, the Guard and remaining six in Brandenburg and Prussia proper. Bismarck diverted three Austrian corps by an alliance with Italy, and by consenting to the neutralization of the Federal fortresses set at liberty von Beyer’s division for field service in the west. Moltke thereupon brought the VIII. corps and half the VII. to the east and thus made himself numerically equal to his enemy, but elsewhere left barely 45,000 men to oppose 150,000. The magnitude of the risk was sufficiently shown at Langensalza. The direction of the Prussian railways, not laid out primarily for strategical purposes, conditioned the first deployment of the whole army, with the result that at first the army in the West was divided in three main groups or armies on a front of about 250 m. As there had been much money available to purchase supplies beforehand, each of these groups had to be scattered over a wide area for subsistence, and thus news as to the enemy’s points of concentration necessarily preceded any determination of the plan of campaign.

Of the lines of concentration open to the Austrians, the direction of the roads and railways favoured that of Olmütz so markedly that Moltke felt reasonably certain that it would be chosen, and the receipt of the complete ordre de bataille of the Austrian army that the north secured by the Prussian secret service on the 11th of June left all doubts at rest.

According to this, the Austrian troops already in Bohemia, 1st corps, Count Clam-Gallas, 30,000 strong, were to receive the Saxons if the latter were forced to evacuate their own country, and to act as an advanced guard or containing wing to the main body under Feldzeugmeister von Benedek (2nd, 3rd, 4th, 8th corps) which was to concentrate at Olmütz, whence the Prussian staff on insufficient evidence concluded the Austrians intended to attack Silesia, with Breslau as their objective. On this date (June 11th) the Prussians stood in the following order: the right wing, General von Bittenfeld, three corps, four divisions only, against Torgau; the Ist army under Prince Charles (II., III., IV. corps), about Görlitz; the II. army under the crown prince (L., V., VI.) near Breslau; the Guard and a reserve corps of Landwehr at Berlin. As the army of the Elbe was numerically inferior to Clam-Gallas and the Saxons, the reserve corps was at once despatched to reinforce it, and the Guard was sent to the crown prince. Further, in deference to political (probably dynastic) pressure, the crown prince was ordered eastwards to defend the line of the Neisse, thus increasing the already excessive length of the Prussian front. Had the Austrians attacked in force, the Prussian central (I.) army could have reached neither wing in time to arrive, and the political consequences of the Austrian victory might have been held to justify the risks involved, for even if unsuccessful the Austrians and Saxons could always retreat into Bavaria and there form a backbone of solid troops for the 95,000 South Germans.

Advance of the Elbe and I. Armies.—This was one of the gravest crises in Moltke’s career. To overcome it he at length obtained authority (June 15th) to order the army of the Elbe into Saxony, and on the 18th the Prussians entered Dresden, the Saxons retiring along the Elbe into Bohemia; and on the same day the news that the Austrian main body was marching from Olmütz towards Prague arrived at headquarters. Moltke took three days to solve the new problem, then, on the 22nd, he ordered the I. and II. armies to cross the Austrian frontier and unite near Gitschin, a point conveniently situated about the convergence of the roads crossing the Bohemian mountains. As during this operation the II. army would be the most exposed, the I., to which the army of the Elbe had now been attached, was to push on its advance to the utmost. Apparently with this purpose in view, the Prince of Brandenburg, instigated by the King, instructed his army corps into their constituent divisions, and move each division as a separate column on its own road, the reserve of cavalry and artillery following in rear of the centre. The consequences were the reverse of those anticipated. On the afternoon of the 26th the advance guards of the I. army and army of the Elbe came in contact with the Austrians at Hünenwasser and Podol and drove the latter back after a sharp engagement, but, having no cavalry, could neither observe their subsequent proceedings nor estimate their strength. The prince, seeing the opportunity for a battle, immediately issued orders for an
enveloping attack on Münchengrätz by his whole army, but, owing to distances and the number of units now requiring direction, it was late in the following day before all were in readiness for action. The Austrians then slipped away, and the whole of the next day was spent in getting the divisions back to their proper lines of advance. Clam-Galaa then retired deliberately to Gitschin and took up a new position. The Austrians followed on the 29th, but, owing to the lie of the roads, they had to march in two long columns, separated by almost a day’s March, and when the advanced guard of the left column, late in the afternoon, gained touch with the enemy, the latter were in a position to crush them by weight of numbers, had they not suddenly been ordered to continue the retreat on Milein.

**Battles of the II. Army: Trautenau and Nachod.**—Meanwhile the situation of the II. army had become critical. On its right wing the I. corps (General v. Bonin) had received orders on the 27th to seize the passages over the Aupa at Trautenau. This was accomplished without much difficulty, but the main body was still in the defiles in rear, when about 3 p.m. the leading troops were attacked by an overwhelming Austrian force and driven back in confusion; the confusion spread and became a panic, and the I. corps was out of action for the next forty-eight hours. Almost at the same hour, a few miles to the south-eastward, the advanced guard of the V. corps (Stienmetz) began to emerge from the long defile leading from Glatz to Nachod, and the Prussians had hardly gained room to form for action beyond its exit before they too were attacked. Steinmetz was a different man from Bonin, and easily held his own against the disconnected efforts of his adversary, ultimately driving the latter before him with a loss of upwards of 5000 men. Still, the situation remained critical next day, for the I. corps having retreated, the Guard corps (next on its left) was endangered, and Steinmetz on his line of advance towards Skalitz (action of Skalitz, June 28th) could only count on the gradual support of the VI. corps. Benedek’s resolution was, however, already on the wane. From the first his supply arrangements had been defective, and the requisitions made by his leading troops left nothing for the rest to eat. While trying to feed his army he omitted to fight it, and, with the chance of overwhelming the Austrians by one great effort of marching, he delayed the necessary orders till too late, and the Prussian II. army made good its concentration on the upper Elbe with insignificant fighting of the other’s position. Moltke, knowing well the danger for a great army of being forced into a battle with an unfordable river behind it, and with his naturally strong bent towards the defensive in tactics, concluded that Benedek would elect to hold the left bank of the Elbe, between the fortified towns of Josephstadt and Königgrätz, with his right thrown back and covered by the lower courses of the Aupa and the Mettau. Frontal attack on such a position being out of the question, he decided, after weighing well the weaknesses of the Austrian flanks, to direct his principal efforts against the left (i.e. southern), although that entailed the uncovering of the communications of the II. army and a flank march of almost the whole of the I. and II. armies across the front of the Austrians in position. As an eminent French critic (General Bonnal) says, this was but to repeat Frederick the Great’s manoeuvre at Kolin (q.v.), and, the Austrians being where they actually were and not where Moltke decided they ought to be, the result might have been equally disastrous. Nevertheless the necessary movements were initiated by orders at noon on the 2nd of July, and one phrase in these saved the situation. According to these orders, the Elbe army was directed to Chlumetz on the way to Pardubitz, the I. army diagonally to the south-east across the front of the Austrian position. Two corps of the II. army were to make a demonstration against Josephstadt on the 3rd of July, and the other two were to move in a general direction south-west to keep touch with the I. Prince Frederick Charles was warned to guard the left flank of his marching troops and authorized to attack any forces of the enemy he might encounter in that direction, if not too strong for him. On receipt of these orders (about 3.30 p.m. July 2nd) the
prince immediately despatched officers' patrols towards the Elbe, and about 6 p.m. these, having crossed the Bistritz, discovered the enemy in considerable force, at least three corps, behind the line of low hills which here border that stream. The remainder of the Austrian main body, the whole of which was in fact still on the right bank of the Elbe, was hidden from view behind high ground farther to the eastward.

The 2nd of July.—The three Austrian corps were exactly the target Prince Frederick Charles desired. He promised himself with the I. and the Elbe armies an easy victory if he attacked them. Orders in this sense were issued about 7 p.m. They instructed every corps under his command to be in readiness for action towards the Bistritz at 3 a.m. on the 3rd, and in a concluding paragraph announced that the crown prince had been requested to co-operate from the north. A copy of the orders and an explanatory letter were in fact despatched to the II. army, another copy also went direct to the king. Both appear to have been delayed in transmission, for the former only reached the crown prince's quarters at 2 a.m. He was then asleep and had given orders that he was not to be awakened. His chief of the staff, Blumenthal, was absent at the royal headquarters, and since the bearer of the order had not been warned of the importance of the despatch he carried, no one roused the prince. At 3 a.m. Blumenthal returned and read the letter, and without troubling to disturb his chief he dealt with the matter himself in what is certainly one of the most remarkable documents ever issued in a grave crisis by a responsible staff officer. Briefly he informed Prince Frederick Charles that the orders for the II. army based on the intelligence so far received from the royal headquarters, having been already issued, the cooperation of the I. corps alone might be looked for.

Meanwhile the duplicates had reached Moltke, and he, knowing well the temperament of the "Red Prince" and the impossibility of arresting the intended movement, obtained the royal sanction to a letter addressed to the crown prince, in which the latter was ordered to co-operate with his whole command. This vital despatch was sent off in duplicate at midnight and reached von Blumenthal at 4 a.m. In face of this no further was possible. The army orders were issued at 5 a.m., but still the urgency of the situation was so little understood that had they been verbally adhered to the force of the II. army could hardly have been brought to bear before 5 p.m., by which time the defeat of the I. army might well have been an accomplished fact. Fortunately, however, the initiative of the Prussian subordinates was sufficient to meet the strain.

Battle of Königgrätz (Sadowa).—Thick mist and driving rain delayed the I. and Elbe armies, but by 5 a.m. the troops had reached their allotted positions. The army orders were issued at 5 a.m., taking as point of direction the wood of Maslowed (or Swiep Wald), and supported on the right by the 8th division which was to seize the bridge of Sadowa. The leading troops of the former easily rushed the Austrian outposts covering the wood, but the reserves of the Austrian outposts counter-attacked. The firing drew other troops towards the critical point, and very shortly the wood of Maslowed became the scene of one of the most obstinate conflicts in military history. In about two hours the 12 Prussian battalions and 3 batteries found themselves assailed by upwards of 40 Austrian battalions and 100 guns, and against such a mass of enemies each man felt that retreat from the wood across the open meadow annihilated. The Prussians determined to hold on at all costs. The 8th division, belonging to the same corps, could not see their comrades sacrificed before their eyes, and pushed on through Sadowa to relieve the pressure on the right of the 7th division. Meanwhile fresh Austrian batteries appeared against the front of the 8th division, and fresh Prussians in turn had to be engaged to save the 8th. Fortunately the Prussians here derived an unexpected advantage from the shape of the ground, and indeed from the weather. The heavy rain, which had delayed the commencement of the action, had swollen the Bistritz so as to check their advance and thus postpone the decision, whilst the mist and driving rain hid the approaching troops from the Austrian gunners, whose shells burst almost harmlessly on the sodden ground. Then when once across the stream it was discovered that unlike the normal slopes in the district the hillside in front of them showed a slight convexity under cover of which they were able to re-form in regular order. The advantage of the breech-loader now began to assert itself, for the Austrian skirmishers who covered the front of the guns now only load when standing up, while the Prussians lay down or fired from cover. The defenders were therefore steadily driven up the hill, and then cleared the front to give the guns room to act. But the Austrian gunners were intent on the Prussian batteries farther back, which as the light improved had come into action. The Prussian infantry crept nearer and nearer, till at under 300 yds, range and from cover they were able to open fire on the Austrian gunners under conditions which rendered the case fire of the latter practically useless; but here was the opportunity a great cavalry leader on the Austrian side might have seized to restore the battle, for the ground, the shortness of the distance, and the smoke and excitement of the cannonade were all in favour of the charge. Such a charge as prelude to the advance of a great infantry bayonet attack must have swept the exhausted Prussians down the hill like sheep, but the opportunity passed, and the gunners finding their position untenable, limbered up, not without severe losses, and retired to a second position in rear. This withdrawal took place about 2 p.m., and the crisis on the Prussian side may be said to have lasted from about 11 a.m. By this time every Prussian corps, except the 3rd, which had long been decimated and which as the battle opened was already partially engaged, had been brought into the fight, and the Austrians might well have thrown odds of three to one upon the Prussian centre and have broken it asunder.

Arrival of the II. Army.—But suddenly the whole aspect of affairs was changed. The 2nd and 4th Austrian corps found themselves all at once threatened in flank and rear by heavy masses of Prussian infantry, the leading brigades of the crown prince's army, and they began to withdraw towards the centre of their position in ordered brigade masses, apparently so intent on keeping their men in hand that they seem never to have noticed the approach of the Prussian reserve artillery of the Guard which (under Prince Kraft zu Hohenlohe-Ingefielden) was straining forward over heavy soil and through standing corn towards their point of direction, a clump of trees close to the tower of the church of Chlum. Not even deigning to notice the retreating columns, apparently too without escort, the batteries pressed forward till they reached the summit of the ridge trending eastward from Chlum towards the Elbe, whence the whole interior of the Austrian position was disclosed to them, and then they opened fire upon the Austrian reserves which lay between them and massed armies of Prussian corps. Occupying about 2,300 and almost simultaneously with the withdrawal of the Austrian guns on their left already alluded to, this may be said to have decided the battle, for although the Saxons still stood firm against the attacks of the Elbe army, and the reserves, both cavalry and infantry, attempted a series of counterstrokes, the advantage of position and moral was all on the side of the Prussians. The slopes of the position towards the Austrians now took on the usual concave section, and from the crest of the ridge every movement could be seen for miles. The Austrian cavalry, on weak and emaciated horses, could not gallop at speed up the heavy slopes (45°), and the artillery of both Prussian wings practically broke every attempt of the infantry to form for attack.

Close of the Battle.—Still the Austrians made good their retreat. Their artillery driven back off the ridges formed a long line from Stösser to Plotist facing the enemy, and under cover of its fire the infantry at length succeeded in withdrawing, for the Prussian reserve cavalry arrived late on the ground, and the local disconnected efforts of the divisional cavalry were checked by the still intact Austrian squadrons. Whereat at 2.30 absolute destruction seemed the only possible fate of the defeated army, by 6 p.m., thanks to the devoted heroism of the artillery and the initiative of a few junior commanders of cavalry,
it had escaped from the enclosing horns of the Prussian attack. In spite of heavy losses the Austrians were perhaps better in hand and more capable of resuming the battle next morning than the victors, for they were experienced in war, and accustomed to defeat, and retired in good order in three organized columns within easy supporting distance of each other. On the other hand, the Prussians were new to the battlefield, and the reaction after the elation of victory was intense; moreover, if what happened at Hünnerwasser affords a guide, the staff would have required some days to disentangle the units which had fought and to assign them fresh objectives.

**Final Operations.**—The convergence of the Prussian armies on the battlefield ended in the greatest confusion. The Elbe army had crossed the front of the I. army, and the II. army was mixed up with both. The reserve cavalry reached the front too late in the day to pursue. Thus the Austrians gained 24 hours, and the direction of their retreat was not established with any degree of certainty for several days. Moreover the little fortresses of Josephstadt and Königgrätz both refused to capitulate, and the whole Prussian armies were thus compelled to move down the Elbe to Pardubitz before they could receive any definite new direction. Meanwhile Benedek had in fact assigned only one corps with the reserve cavalry to oppose a Prussian advance towards Vienna, and the remaining seven retired to Olmütz, where they were on the flank of a Prussian advance on Vienna, and had all the resources of Hungary behind them to enable them to recuperate. They were also still in railway communication with the capital. On purely military grounds the Prussians should have marched at once towards the Austrian field army, i.e. to Olmütz. But for political reasons Vienna was the more important objective, and therefore the I. and Elbe armies were directed towards the capital, whilst the II. army only moved in the direction of the Austrian main body. Political motives had, however, in the meantime exercised a similar influence on the Austrian strategy. The emperor had already consented to cede Venetia to Italy, had recalled two corps from the south (see **ITALIAN WARS, 1848-1870**) to
the capital, and had appointed the archduke Albert to command the whole army. The Army of the North, which had reached Olmitz on the 27th, was now ordered to advance towards Vienna, and this operation brought them right across the front of the II. Prussian army. The cavalry established contact on the 15th in the neighbourhood of Tobitschau and Rochetinsitz (action of the 2nd cavalry corps with General Königsegg-Ruppin). The latter, however, discovered, and their men too demoralized by fear of the breach-loader to risk a fresh battle, withdrew their troops and endeavoured to make a junction with the Hanoverians of General von Falckenstein's corps at the Waag and through Pressburg. Meanwhile the Prussian main army was pursuing its advance under very adverse circumstances. Their railway communication ended abruptly at the Austrian frontier; they were therefore compelled to leave behind, and to advance in columns, all heavy artillery and baggage, and the troops suffered severely. One third of the cavalry broke down on a march of 97 m. in five days, and the infantry, after marching 112 m. in ten days, had to have a two days' halt accelerated carriage, which was far too long. The 13th, 30th, and 31st of July were light marching days, and on the 1st of August the Prussian army was massed about Fulda between them. Vogel v. Falckenstein moved forward again on the 8th, and on the 10th the Bavarians were again defeated in a series of actions around Kissingen, Hanau, and Cassel. During their retreat, however, the French motorcy corps began its advance from Frankfurt up the Main valley to join the Bavarians, who had then retired on Schweinfurt. The army of the Main, however, had little difficulty in defeating the 8th corps at Union (near Berlin, 8th). The Bavarian corps had had the task of bringing the main army to the French frontier, and on the 16th the French occupied Frankfurt (16th). Vogel v. Falckenstein was then called to Bohemia, and Manteuffel was placed in command of the army of the Main for the final advance. The 7th and 8th corps now at last effected their junction about Würzburg, whither the army of the Main marched from Frankfurt to meet them. The French was advanced in turn, the Bavarians on the right, the 8th on the left. Nothing was left to the French, and the general had neither the time nor the leisure to exact a formal surrender. It is true that the Bavarians occupied Nuremberg.

Although the army of the Main, that of Bohemia, and the army of the Rhine, the small armies moving freely within a large theatre of war, the occupation of hostile territory as a primary object of operations, the absence of a decision-compelling spirit on either side, the hostile political attitude of the German states, which were not in a condition to unite in a common conflict,—all these conditions remind the student of those of 17th and 18th century warfare. But the improved organization, better communications and supplies, superior morale, and once again the breach-loader versus a standing army, the Prussian successes, at least give us an opportunity of comparing the old and the new systems under similar conditions, and even thus the principle of the “armed nation” is still the problem of a period of time which, for the old armies, was wholly insufficient.

The various treaties of Prague, Berlin and Vienna which followed the armistice secured the annexation by Prussia of Hanover, the Elbe duchies, the electorate of Hesse, Nassau, Anhalt-Weimar, and the dissolution of the existing confederation and the creation of a new North German Confederation under the hegemony of Prussia, and the payment of war indemnities to Prussia (the Austrian share being left to the French), was to be done by Austria to Napoleon III. and by him to King Victor Emmanuel.

SEVEN WISE MASTERS—SEVEN YEARS’ WAR 715

SEVEN WISE MASTERS, THE, a cycle of stories of Oriental origin. A Roman emperor causes his son to be educated away from the court in the seven liberal arts by seven wise masters. On his return to court his stepmother the empress seeks to seduce him. To avert such a danger prepared by the man he is虏ved over 1800 a writer’s letters, which time the empress accuses him to her husband, and seeks to bring about his death by seven stories which she relates to the emperor; but her narrative is each time confused by tales of the craft of women related by the sages. Finally the prince’s lips are unsealed, the truth exposed, and the wicked empress is executed.

The cycle of stories, which appears in many European languages, is of Eastern origin. An analogous collection occurs in Sanskrit, but the Indian original is unknown. Travelling from the east by way of Arabic, Persian, Syriac and Greek, it was known as the book of Sindibad, and was translated from Greek into Latin in the 12th century by Jean de Haultesecule (Joannes de Alta Silva), a monk of the abbey of Haute-Seille near Toul, with the title of Dolophathos (ed. H. Oesterley, Strassburg, 1873). This was translated into French about 1210 by a troubé named Herbers as Li Romans di Dolophathos; another French version, Li Romans des sept sages, was based on a different Latin original. The German, English, French and Spanish chap-books of the cycle are generally based on a Latin original differing from these. Three metrical romances probably based on the French, and dating from the 14th century, were found in English.

The most important of these is The Seyya Sages by John Rolland of Dalekith, edited for the Bannatyne Club (Edinburgh, 1837).

The Latin romance was frequently printed in the 15th century, and Wynkyn de Worde printed an English version about 1515. See G. Paris, Deux Redactions du roman des septes sages de Rome (Paris, 1876, Soc. des. anc. textes fr.); B\ucher, Historia septem septinum . . . (Erlangen, 1886); K. Campbell, A Study of the Romance of the Seven Sages with special reference to the middle English versions (Baltimore, 1889); C. C. Post, Marcellus: Researches respecting the Book of Sindibad (Folk-Lore Soc., 1882).

SEVEN WISE MEN OF GREECE, THE, a collective name for certain sages who flourished c. 620—550 B.C. The generally accepted list is Bins, Chlon, Cleobulus, Periander, Pittacus, Solon, Thales (see separate articles), although ancient authorities differ as to names and number. They obtained great influence in their respective cities as legislators and advisers, and a reputation throughout the Greek world. Their rules of life were compiled in slight savings in common use.

See O. Bernhardt, Die sieben Weisen Griechenlands (1864); F. Bohren, De septem sapientibus (1867); "Septem sapientium carmina et apologiographmata," with short biographies in F. Mullich, Fragmenta philosophorum Graecorum, 3rd ed. (1866); H. Wulf in Dissertationes philol. Helens, xiii. (1896).

SEVEN WONDERS OF THE WORLD, the name conferred on a select group of ancient works of art which had obtained pre-eminence among the sight-seers of the Alexandrian era. The earliest extant list, doubtless compiled from the numerous guide books then current in the Greek world, is that of the epigrammatist Antipater of Sidon (2nd century B.C.). A second and slightly divergent list from the hand of a Byzantine rhetorician has been incorporated in the works of Philo of Byzantium. The monuments are as follows: (1) the pyramids of Egypt, (2) the gardens of Semiramis at Babylon, (3) the statue of Zeus at Olympia (see Pheidias), (4) the temple of Artemis at Ephesus, (5) the Mausoleum at Halicarnassus (see Mausoleum), (6) the Colossus at Rhodes, (7) the Pharos (lighthouse) of Alexandria, or the Walls of Babylon.

SEVEN YEARS’ WAR (1756-1763), the name given to the European war which arose from the formation of a coalition between Austria, France, Russia, Sweden and Saxony against Prussia, with the object of destroying, or at least crippling, the power of Frederick the Great. Prussia was joined by England, and between England and France, as usual, a maritime and colonial war was laid at the first pretext. This war laid the foundations of the British empire, for ere the seven campaigns had been fought in Europe, the French dominion in Canada and the French influence in India, in spite of Duplexly, Lally and Montcalm, had been entirely overthrown by the victories of Clive, Amherst and Wolfe. Great as was the effect of these victories on the history of the world, however, it is at least questionable whether the steadfast resistance of Prussia, almost single-handed as she was—the resistance which laid the solid, if they unseem, foundations of modern Germany—is not greater the result of a phenomenon, and from the technical military standpoint Rossbach and Leuthen, Zorndorf and Kunersdorf possess an interest which it would be possible perhaps to claim for Plassy and for Quebec, but not for border conflicts in Canada and India. It is not only battles, the distinct and tangible military events, that make up the story of Frederick’s defence. There are countless marches and manœuvres, devoid of interest as regards their details; but, as indications of the equilibrium of forces in 18th-century warfare, indispensable to a study of military history as a whole.

Learning of the secret intentions of the coalition, Frederick determined to strike first, and to that end, in the months preceding the outbreak of hostilities, he concentrated his 150,000 men as follows: 11,000 men in Pomerania to watch the Swedes, 26,000 on the Russian frontier, 37,000 men under Field Marshal Schwerin in Silesia, and a main body of 70,000 in three columns ready to advance into Saxony at a moment’s notice, the king being chief command. On the 28th of August 1756 the Saxon frontier was crossed. Dresden was occupied on the 10th of September, the Saxony army, about 14,000 strong, falling back before the invaders to the entrenched camp of Pirna, an almost inaccessible plateau parallel to the Elbe and close to the Bohemian frontier. The secret of the Prussian intentions had been so well kept that the Austrians were still widely disseminated in Bohemia and Moravia. 32,000 men under Field Marshal Browne were at Kolín, and 22,000 under Piccolomini at Olmütz, when on the 31st of August the news of the invasion arrived, and such was their unreadiness that Browne could not advance till the 6th of September, Piccolomini until the 9th. Meanwhile the Prussians, leaving detachment after detachment to watch the exits from Pirna, moved up the Elbe and took post at Aussig to cover the approach of the Saxon troops. Learning of Browne’s approach on the 28th of September, the king, assuming the command of the covering force, advanced yet farther up the Elbe to meet him, and the two armies met at Lobositz (opposite Liechtermitz) on the morning of the 1st of October. The battle began in a thick fog, rendering dispositions very difficult, and victory fell to the Prussians, principally owing to the tenacity displayed by their infantry in a series of disconnected local engagements. The nature of the ground rendered pursuit impossible, and the losses on both sides about equal. The Austrians, however, had to retreat in disorder from the place of Zorndorf, leaving the fate of the Saxons, who after a few half-hearted attempts to escape from their encampments, surrendered on the 14th of October, and were taken over bodily into the Prussian service. Prussian administrators were appointed to govern the captured country and the troops took up winter quarters.

Campaign of 1757.—The Coalition had undertaken to provide 500,000 men against Prussia, but at the beginning of the year only 132,000 Austrians stood ready for action in northern Bohemia. Against these the king was organizing some 150,000; 45,000 of whom were paid for by British subsidies approved of by London to cover the investment of Dresden by a French attack. After leaving detachments to guard his other frontiers, Frederick was able to take the field with nearly 150,000 men, but these also were scattered to guard a frontier some 200 m. in length—the left wing in Silesia under Schwerin and the duke of Brunswick-Bevern, the centre and right under the king. In April the operations began. Schwerin and Bevern crossed the mountains into Bohemia and united at Jung Bunzelau, the Austrians falling back before them and surrendering their magazines. The king marched from Pirna and Prince Maurice of Dessau from Zwickau on Prague, at which point the various Austrian commands were ordered to concentrate. On the morning of the 5th the whole army, except a column under Field Marshal Daun, was united here under Prince Charles of Lorraine, and the king, realizing the impossibility of
storming the heights before him, left a corps under Keith and a few detachments to watch Prague and the lords across the river, and marched during the night upstream and, crossing above the Austrian right, formed his army (about 64,000) for attack at right angles to the Austrian front. The ground had not been reconnoitred, and in the morning mist many mistakes in the deployment had been made, but as Daun was known to be but 20 m. away and the Austrian army was changing its front to meet the unexpected attack, the king threw caution to the winds and sending Zieten with his cavalry by a wide detour to cover his left, he ordered the whole to advance. One of the most savage battles in history was the result. Almost immediately the Prussian infantry became entangled in a series of morasses, the battalion guns had to be left behind and the troops had to correct their alignment under the round shot fired by the Austrians, who had completed their change of front in time and now stood ready to sweep the open glacis before them. Before the storm of bullets and the grape and canister of the heavy and battalion guns the Prussian first line faltered and fell in thousands. Their attempts to prepare the way for the bayonet assault broke down. Schwerin was killed. But the second line carried the survivors on, and in the nick of time Zieten’s cavalry drove the Austrian horsemen off the field and broke in on the flank and rear of their infantry. This turned the scale, and the Austrians retreated into Prague in hopeless confusion, leaving some 10,000 men (14.8%) on the ground, and 4275 prisoners, out of about 66,000, in their enemy’s hands. The Prussians lost 11,740 men killed and wounded and 1560 prisoners, and in all 20.8% of their strength. The actual fighting seems only to have lasted about two hours, though firing did not cease till late at night; 16,000 Austrians managed in the confusion to evade capture and join Daun, who made no movement either on this or succeeding days to come to the assistance of his comrades, but began a leisurely retreat towards Vienna.

The Prussians immediately began the siege of the town, and after a month’s delay Daun, now at the head of some 60,000 men, moved forward to the relief of the city. Learning of his approach, the king, taking with him all the men who could be spared from the investment and uniting all available detachments, moved to meet him with only 34,000 men, and on the 18th of June he found Daun strongly entrenched. He immediately endeavoured to march past him and attack him on the right flank as at Prague, but the Austrian light troops harassed his columns so severely during the movement that without orders they wheeled up to drive them off and, being thus thrown into disarray, they took three divergent objectives. Their disunited attacks all fell upon superior numbers, and after a most obstinate struggle they were badly beaten with a loss in killed and wounded of 6710 (18.6%) and 5380 prisoners with 22 colours and 45 guns. The fighting lasted 5½ hours. The Austrian loss was only 8000 out of 53,500, or 15.2%, of whom only 1500 were taken prisoners. This disaster entailed raising the siege of Prague, and the Prussians fell back on Leitmeritz. The Austrians, reinforced by the 48,000 troops in Prague, followed them 100,000 strong, and, falling on Prince August Wilhelm of Prussia, who was retreating eccentrically (for commissariat reasons) on Zittau, inflicted a severe check upon him. The king was compelled to abandon Bohemia, falling back on Bautzen. Having re-formed his men and calling in Keith’s 27,000 men from Pirna,
he again advanced, but found the enemy so strongly posted at Burkersdorf (south of Bischofswerda) that he relinquished his purpose and retreated on Bernstadt.

Meanwhile his enemies had been gathering around him. France had despatched 100,000 men under d'Estrees against Hanover, where Cumberland with 54,000 stood to meet him, and another 24,000 men were marching through Franconia to unite with the "Army of the Holy Roman Empire" under the prince of Saxe-Hildburghausen. Fortunately this latter army was not as formidable as its title, and totalled only some 60,000 most undisciplined and heterogeneous combatants. In the north 100,000 Russians under Apraxin were slowly advancing into East Prussia, where Lehwald with 30,000 was preparing to confront them, and 10,000 Swedes had landed in Pomerania. On the 26th of June Cumberland had been beaten at Hastedenbek by d'Estrees, and the French overran Hanover and Brunswick. The king, leaving Bevern with only 15,000 men in Silesia to watch the Austrians, began to march across Germany to succour Cumberland. Arrived at Leipzig on the 3rd of September, he heard of Lehwald's defeat at Gross-Jägerndorf on the 30th of August and immediately afterwards of Cumberland's Convention of Kloster Seven, which gave up Hanover to the French. Fearing that the French army now set free in Hanover might unite with the Army of the Empire under Hildburghausen and with 150,000 men march direct on Berlin, Frederick, taking with him 23,000 men, marched to join Prince Ferdinand in the district about Halberstadt, hoping to strike his blow before the enemy's junction could be completed. Mobility, therefore, was the first consideration, and arrangements for supply having been made in advance along his road, his troops covered 170 m. in 12 days (September 7–13). But Hildburghausen, not having been joined by d'Estrees, refused to fight and fell back into the wooded districts of Thuringia and Franconia. Bad news now reached Frederick from Silesia; leaving Ferdinand to observe Hildburghausen, he marched with all haste to Eckersberg to support Bevern. Arrived here, he found more bad news from Berlin, which had been entered by a body of Austrian raiders under Hadik and plundered. Prince Maurice and Seydlitz were sent by forced marches to its aid, and before them Hadik retired at once (October 18th). Finding the Austrians for the moment quiescent and hearing that Hildburghausen was again advancing, the king now concentrated all available men on Leipzig and marched to support Prince Ferdinand. Hildburghausen took up a position about Meucheln on the 2nd of November, and on the 3rd moved off to repeat Frederick's manœuvre of Prague against its inventor. The battle of Rossbach (q.v.) followed. In this Seydlitz and the Prussian cavalry won imperishable renown. Aided only by the fire of 18 guns and of 7 battalions of infantry, only two of which fired more than five rounds, the Prussian squadrons swept down upon the marching columns of the Allies and in about 40 minutes the whole 64,000 were in full flight. Never was a victory more timely, for the Prussian army was almost worn out and more bad news was even then on the way. Bevern in Silesia, who had been beaten at Moys near Görlitz (September 7th) and in the battle of Breslau on the 22nd of October, had been compelled to retire behind the Oder, leaving the fortresses of Schweidnitz and Breslau to their fate, and both had capitulated within a few days. Leaving a small reinforcement for Ferdinand, the king now moved by forced marches to Liegnitz. The distance, about 170 m. through difficult country, was covered again in 12 days, but the numbers were small, only 13,000, which shows how tremendous had been the drain upon the men of the previous six weeks' exertions. On the night of the 4th of December, having joined the beaten forces of Bevern at Parschwitz, making in all 43,000 men of very unequal fighting value, he decided to attack the 72,000 Austrians who lay across the Breslau road, their centre marked by the village of Leuthe (q.v.). His position appeared so
desperate that he sent for all his generals, laid the facts before them, announced his decision to attack and offered to accept any man's resignation without prejudice to his character should he deem the risk too hazardous. Needless to say, not one accepted the offer.

Covered by the low rolling hillocks of the district, the army now moved off to its right across the Austrian front, the advance led by Zieten and half the cavalry, the rear covered by Driessen with the remaining half—some 40 weak squadrons. The infantry having gained a position sufficiently on the Austrian flank, now wheeled into line and attacked in echelon of battalions from the right. The battle soon became desperate, and the Austrian cavalry on their right wing under Langer, under the eye of the king, gallantly refused to get out of their lines, wheeled to their left and swept down upon the refused flank of the Prussian infantry; but they never reached them, for Driessen, seizing his opportunity, set his squadrons in motion and attacked. The Austrians, completely surprised, were ridden down and driven back on to the front of their own infantry, and the pressure of the fugitives threw the rear of their left wing into confusion and in a short time the ruin of their army was completed. When the news of Driessen's charge was brought to the king his astonishment was expressed in the single phrase "What, that old fool Driessen?" The fighting, however, had been desperate, and though the Austrians out of their 73,000 lost 37% including 20,000 prisoners, with 116 guns and 51 colours, the Prussians lost 6200 (14%) making with the other battles of the year a total of nearly 75,000 men, and not including losses in minor skirmishes and on the march.

Campaign of 1758.—The raid upon Berlin had accomplished nothing, and the advance of the Russian main body had died out for want of resolution to seize the opportunities offered by Frederick the Great's absence. The Czarina, annoyed by his slowness, recalled Apraxin and appointed Fermor in his place. Utilizing the winter snows, he collected some 31,000 men and crossed the frontiers of East Prussia (January 10th, 1758) and attempted to annex the province, driving out all the Prussian officials who refused to swear fealty to Elizabeth. This took time, and when the period of thaw supervened the Russians were immobilized and could not advance until approaching summer had dried the roads again. For the moment, therefore, no danger threatened Frederick from this quarter, and Rossbach had efficiently taken the French. The Swedes, too, showed little energy, the "roadless" period affecting them equally with the Russians.

Frederick therefore resolved to seize the opportunity to renew his invasion of Austria. As a beginning he recaptured Schweinitz in April with 5000 prisoners. The Austrian field army under Daun lay about Königgrätz, covering all the passes out of Silesia; but covered by the newly formed "Free Corps" (his answer to the semi-savage Croats, Pandours and Tolpitches of the Austrians), Frederick marched right across their front on Olmütz, whilst a special corps (30,000) under Prince Henry threatened their left from Saxony and the Elbe. He had with him about 40,000 men. But Olmütz lay 90 m. from the Prussian frontier, and the Austrian light troops swarmed in the intervening district. Ultimately a great Prussian convoy was despatched in the action of Domstädt, and the siege of Olmütz had to be raised (July 1st); but instead of marching back the way he had come Frederick led his troops through Bohemia practically in the rear of Daun's army, and on the 14th of July entered Daun's empty encampment at Königgrätz. Fermor's Russians were now again in the field and had reached Posen, burning and plundering horribly. By skilful manouvering the king deceived the Austrians till the roads to Silesia by Skalitz and Nachod were opened and then by a rapid march passed over into Silesia, reaching Grüssau (near Landshut) on the 8th of August. Leaving Keith with half his force to hold this district, he then marched to Frankfurt-on-the-Oder, taking with him only some 15,000 men, to strengthen the wing already engaged against the Russians. Frankfurt was reached on the 20th of August. Fermor was then besieging Cústrin with 32,000 men, and hearing of the king's approach he raised the siege and placed himself behind a formidable obstacle facing north, near Zorndorf, from which direction the king was approaching. Seeing that the same obstacle that prevented him from attacking the Russians prevented them equally from attacking him, the king marched right round Fermor's eastern flank—the Russians gradually forming a fresh front to meet him—so that when the Prussian attack began on the morning of the 25th of August they stood in three irregular squares, divided from each other by marly hollows, and thus unable to render one another support. The king made his first effort against the square on the right—Seydlitz with his squadrons covering the movement. But the Russian troops fought with far more spirit than the Austrians had ever shown, and things were going very badly with the Prussians when Seydlitz, who in the meanwhile had succeeded in making paths across the Zaberngrund on which the Russian right rested, flung himself upon the great square, and rode over and destroyed the whole mass in a prolonged mêlée in which quarter was neither given nor asked. Relieved by this well-timed charge, the king now re-formed the infantry already engaged, and concentrated all his efforts on the south-west angle of the great centre square. Again the Russians more than held their own, issuing forth from their squares and capturing many field-pieces. Some of the Prussian infantry was actually broken and in full flight when Seydlitz, with his ranks re-formed and his horses rested, returned and again threw himself upon the square exactly as on the previous occasion and with the same result—the square, as a formation, was broken, but groups still stood back to back and the most savage butchery ensued. The combatants could not be separated and only darkness put a stop to the slaughter. Of 36,000 Prussians 12,500 were killed or wounded, 1000 prisoners or missing (37.5%), and of 42,000 Russians about 21,000 had fallen (50%). In the night the survivors gradually rallied, and morning found the Russians in a fresh position a couple of miles to the northward, but Frederick's troops were too weary to renew the attack. Gradually the Russians withdrew towards Landsberg and Königsberg, and the king, leaving Dohna to follow them up, marched with the remainder of his forces on the 2nd of September for Saxony, covering 22 m. a day. They arrived only in the nick of time, for Daun had united with portions of the Empire Army and was threatening to crush...
Prince Henry under the weight of more than two-fold numbers. The prince had been driven into an entrenched position above Gahmig near Dresden and Daun was about to attack, but the mere name of Frederick was enough, and learning of his arrival Daun fell back to Stolpen on the 12th of September.

The Prussian army now lay around Grossenhain, Prince Henry's force covering Dresden and the Elbe bridges. The Imperial Army was at Pirna, Daun at Stolpen, and in these positions they remained until the 26th of September. The Prussians getting the rest they so urgently needed. On that date, however, the state of truce was broken and the king moved towards Bischofswerda, where Daun's subordinate Loudon was posted. The latter retired, opening the road to Bautzen. The king arrived at Bautzen on the 7th of October and had to wait until the 10th for provisions from Dresden. He then moved forward to Hochkirch, where he found Daun strongly entrenched across his path at Kittiltz with 90,000 men, the Prussians having only 37,000. The king determined to attack the Austrian right. So confident had the Prussians become in the belief that Daun would never take the offensive himself that the most elementary precautions of safety were forgotten and only Zieten kept his horses saddled. During the night of the 13th the Austrians, leaving their watch-fires burning and moving silently through the woods, which covered much of the ground, formed up almost all round the Prussian camp. At 5 a.m. the attack was delivered from three quarters simultaneously and a most desperate struggle ensued. Nothing but the superb discipline of the Prussians saved the situation. Zieten with his squadrons managed to keep a way of escape open, and after a most obstinate conflict the wreck of the army succeeded in withdrawing, leaving 101 guns and 9490 men on the ground or in their enemies' hands (25.5%). The Austrians, in spite of the advantage of a well-conceived surprise, lost 7590 men and were too shaken for pursuit. They fell back to their old camp, where they remained for a week, thus giving Daun ample time for bringing up his forces from Dresden (6000 men) and, starting on the 23rd, he marched right round the Austrian right and raised the siege of Neisse, the prime object with which he had set out. Daun, learning that the king had gone past him into Silesia, now laid siege to Dresden. On the 15th of November he heard that Frederick was marching to its relief through Lusatia and incontinently gave way, retiring on Pirna. The king was in Dresden again on the 20th.

Campaign of 1759. — The drain on Frederick's resources had been prodigious. On the battlefields of the previous three years he had lost at least 75,000 men, not counting the waste of life in his marches and skirmishes; but he still delivered from his field an army (150,000 men) in the field, though for want of the old two years' training in loading, firing and manoeuvring the average efficiency had much diminished. In cavalry, too, he was relatively weaker, as there was no time to train the remounts. His enemies felt their losses far less and were beginning to understand his tactics; fortunately they remained incapable of combined action.

After minor operations on the frontiers the Russians took the field. Fémor had been superseded by Soltikov, and Dohna with his 18,000 men proved quite inadequate to arrest the Russian progress. Frederick was summoned by Wedell, who, on the 23rd of July, with 26,000 men boldly attacked the 70,000 Russians whilst on the march near Züllichau. He was defeated with a loss of 6000 and fell back to Crossen bridge, 5 m. below Crossen, which Soltikov occupied next day, thence he moved down the river towards Frankfurt, keeping on the eastern bank. Daun had detached Loudon and Hadik with 35,000 men to join him, and it became vital to Frederick to prevent the combination. Leaving Prince Henry at Schmölteisen to watch Daun, he marched with all available forces and joined Wedell on the 6th of August at Müllrose near Frankfurt, after vainly searching for the Hadik-Loudon force. Here he was joined on the 10th by Finck with 10,000 men, bringing his whole force up to 59,000 against the Russian and Austrian 90,000, who lay entrenched in the sandhills about Künsendorf. On the 11th he crossed his whole force over the Oder at Reitwein and on the 12th marched forward, intending to envelop the Russians on both flanks; but his columns lost their way in the woods and their attacks were delivered successively. In spite of their usual disciplined gallantry, the Prussians were completely beaten, even Seydlitz and Prince Ferdinand failed to achieve the impossible, and the night closed down on the greatest calamity Frederick had ever experienced. Of 43,000 men 20,720 (48.2%) were left on the ground and 178 guns and 28 colours fell into the hands of the enemy; and the allied Austro-Russian force only lost 15,700. The battle had only lasted six hours. In the depression following this terrible day he wrote to Schmettau, commanding at Dresden, telling him to expect no help, and on the 4th of September Dresden fell.

As usual Frederick was saved by the sluggishness of his enemies, who attempted no pursuit, and being reinforced the day after the battle by 23,000 men, and having ordered up Kleist (who had been watching the Swedes), he was again at the head of an army. Week after week went by, during which he countered all attempts of Daun and Soltikov to combine, and ultimately the Russians, having consumed all the food and forage in the districts they occupied, were compelled to fall back on their own frontiers. Then, uniting with Prince Henry, the king turned to fall upon Daun; but his contempt for his adversary proved his own undoing. Contrary to all his own teaching, he sent a detachment of 12,000 men under Finck to work round the Russians' flanks upon Frankfurt and to Maschen. The king, learning of the movement and calling up a wing of the Empire Army to their assistance, fell upon Finck with 42,000 men and compelled him to surrender after two days' hard fighting. The combination having failed, the two armies stood facing one another till far into the winter. But for Prince Ferdinand's glorious victory at Minden on the 1st of August, the year would have been one catalogue of disaster to the Prussian arms, and these operations must now be mentioned.

In the early part of 1758 Prince Ferdinand with 30,000 men had advanced into the Netherlands and was supported by Prince Henry with 8000 from Halberstadt. The approach of the latter threatened the right wing of the French army under Clermont, which was posted along the Aller, and the whole line gave way and retreated without making any serious stand behind the Rhine. Prince Ferdinand followed and defeated them on the 23rd of June at Crefeld. Clermont was relieved by Contades and at the same time Soubise, who had at last reorganized his command, shattered by the disaster of Rosbach, moved forward through Hesse and compelled Prince Ferdinand to withdraw from his very advanced position. No engagement followed; Soubise fell back upon Frankfurt and to Maschen. The latter is the turning point, where Frederick was forced into a line through Mühlburg, Paderborn and Cassel during the winter. Fortunately events in Canada and the glory of his victories had made Frederick's cause thoroughly popular in Great Britain, and at last it became possible to detach a considerable force of British troops to Prince Ferdinand's assistance, whose conduct turned the scale in the critical moment of the campaign. During the winter the French had organized their forces in two columns — based on Frankfurt and Wesel respectively. Broglie was in command of the former; Contades still led the latter.

In April Prince Ferdinand advanced upon Amiens; Broglie upon Hesse and Frankfurt, and actually reached Bergen, a village some 10 m. to the north, but here he was defeated by Broglie (13th April) and forced to retreat the way he had come, the French following along their whole front and by sheer weight of numbers manoeuvring him successively out of each position he assumed. On the 11th of July Broglie surprised Minden, thus securing a bridge over the Weser and free access into Hanover, and light troops overran the south of the electorate. On the 16th Contades with the left column joined Broglie and the French now had some 60,000 men against the 45,000 Ferdinand could muster. The latter's position was extremely difficult, for the French had only to continue in possession of the bridges at Minden to ruin the whole country by their exactions, and the position they held was too well protected on the flanks and too strong in front for direct attack.
Nevertheless Prince Ferdinand drew up before it and met the French plundering raids by a threat on their communication with Cassel, and as a further inducement to tempt Contades to attack him, he detached a column under Wangenheim, which entrenched itself across the only outlet by which the right of the French army could debouch from behind the marshes which lie in the angle between the Weser and the Bastau, a small tributary joining the former below Minden. The bait took, and during the early hours of the 1st of August the French army moved out to attack Wangenheim. But Ferdinand's troops had been lying in instant readiness for action, and as soon as the outposts gave the alarm they advanced with such rapidity that by eight o'clock, they had assembled in force, prepared for action to meet the French as they emerged from their prevailing, and the French had made far greater progress with their deployment than Ferdinand had reckoned on. An almost front-to-front engagement ensued. Things were going badly with the Prussians when, through a mistake in the delivery of an order, the British brigade (12th, 20th, 23rd, 25th, 37th, 51st), followed by some Hanoverian battalions, began to advance straight upon the Prussian flank and rear columns, and, in three hours, they had driven in three of the French batteries and set fire of several batteries. Once launched, neither fire nor shock could check their progress; halting for a moment to pour volleys into the charging squadrons hastily thrown against them, they swiftly resumed their advance. French infantry too were hurled against them, but were swept away by fire and bayonet, and presently they had pierced right through the French line of battle. Now came the moment when cavalry should have been at hand to complete the victory, and this cavalry, the Blues, the 1st and 3rd Dragoons, Scots Greys and 10th Dragoons under Lord George (afterwards Viscount) Sackville (g.v.) stood ready, waiting only the order to advance. This Sackville refused to give, though called on three times by the prince; no satisfactory explanation of his conduct has ever been discovered, but he was tried by a general court-martial and cashiered. Nevertheless, so brilliant had been the conduct of all the troops engaged, especially of the infantry brigade that the victory was won even in spite of this failure of the cavalry, and before evening the French were retreating as a demoralized mass towards Cassel, leaving some 10,000 men, 17 colours and 43 guns in the hands of the victors, who on their side out of 43,000 had lost 2,000 killed, 1,000 wounded, and 1,000 prisoners. Of the six British regiments that went into action 4,434 strong, 1,330 (30%) had fallen, but their feat is not to be measured only by the losses victoriously borne—these were not unusual in the period—but by the astounding discipline they maintained throughout the advance, resuming their march after beating off cavalry charges with the cool precision of a review in peace-time. Ferdinand followed up his victory by a pursuit which was vigorous for three days and had all but reached the Rhine when his movement was stayed by the necessity of detaching 12,000 men to the king to make good the losses of Künnersdorf.

**Campaign of 1756.**—The year opened gloomily for Frederick. His embarrassment both for men and money was extreme, and his enemies had at last agreed on a combined plan against him. They purposed to advance in three columns concentrically upon him: Daun with 100,000 men in Saxony, Loudon with 50,000 from Silesia, Soltikov's Russians from East Prussia; and, against whichever column the king turned, the others were to continue towards Berlin. Only in Hanover were the conditions more favourable, for Ferdinand had 70,000 (20,000 British) against the 125,000 of the French. Early in April the king stood with 40,000 men, west of the Elbe near Meissen facing Daun, Prince Henry with 34,000 in Silesia from Cossen to Lades, 15,000 under Forcade and Jung-Stuttemberg in Pomerania facing the Swedes and Russians. Towards the end of May Loudon moved to besiege Glatz, and Fouqué, who commanded at Lades, marched with 13,000 to cover Breslau. Loudon at once seized Lades, and Fouqué, returning in response to urgent orders from the king, was attacked by Loudon with 37,000 men and almost destroyed. Meanwhile, Prince Henry had moved to Landsberg against the Russians, but failed to seize his opportunities and thus Silesia lay open to the Austrians. Frederick decided to march with his main body against Loudon and attack him if unsupported, but, if his movement induced Daun to move to Loudon's support, then to double back and besiege Dresden. For this purpose a siege train was held in readiness at Magdeburg. He marched rapidly on Bautzen, then hearing that Daun was approaching to support Loudon he returned and besieged Dresden (July 12th). The town was bombarded, there being no time for regular siege approaches, but it held out, and by the 28th of July Daun's army already engaged with a Prussian force had beaten off an attack, and it had been decided to raise the siege and to be raised, and during the night of the 29th of July the Prussians slipped away to Meissen. On the same day Frederick learnt that Glatz, the key to Southern Silesia, had fallen into the hands of the Austrians, but as a set-off the news shortly afterwards arrived of Prince Ferdinand's brilliant victory at Warburg, in which the British cavalry led by the marquis of Granby amply wiped out the disgrace incurred by Sackville. On the 1st of August Frederick began his march into Silesia, summoning Prince Henry from Landsberg to join him, which he did by a splendid march of about 80 miles in three days. The king's march was almost as remarkable, for the roads were very bad, and the weather hot and freely obstructed them, nevertheless in five days he reached Bautzen, having marched more than 100 m. from his starting point, and crossed five considerable rivers on his way. Thence he continued more easily to Bunzlau. Daun was in front of him and Lacy with clouds of light troops on his right, the Russians under Czernichoff with Loudon not far away to his left front, 114,000 men in all to his 30,000, but he held to his decision to reach Schweidnitz. With this purpose in view he marched south-east on Jauer, marching 25 m. on the 9th of August, but the enemy was still in front of him and advancing on his flanks. On the 10th he tried the Liegnitz road with the same result, and his position became desperate as his food was almost exhausted. He had already covered 15 m. that day, but at 11 p.m. he called on his men for a night march and formed up again on his old position next morning, the 11th of August. He appeared to be completely surrounded, and things looked so desperate that Mitchell, the British ambassador, burnt his papers and cipher key. At sunset on the 12th, however, Frederick again broke camp and by a night march evaded the enemy's scouts and troops 1, m. in the noon; on the 13th, the Austrians began an attack, appearing a couple of hours later. The troops resisted during the 13th and 14th, but at nightfall, leaving their watchfires burning, marched off by the Glogau road, and the only way of escape still open. The Austrians, however, had planned a night attack, and Loudon's columns were moving to close this last loophole of escape. Fortunately for the Prussians they arrived just a few minutes too late, and in the combat that ensued 15,000 Prussians inflicted a loss of 10,000 men and 82 guns upon their assailants, afterwards resuming their march undisturbed.

But the danger was not yet over. Czernichow was known to be in the immediate vicinity; so as to get him out of the way, Frederick gave to a peasant a despatch addressed to Prince Henry containing the words: "Austrians totally defeated today, now for the Russians. Do what we agreed upon." The peasant was to take care to be captured by the Russians and only give up the paper to save his life. The plan worked as he had anticipated, the paper duly reached Czernichow's hands and he immediately evacuated the dangerous neighbourhood. Elated with his success the king now abandoned his retreat on Glogau and determined to press on to all hazards to Breslau, which in spite of many anxious moments he reached on the 17th of August.

The Russians now abandoned the campaign in the open field and besieged Colberg on the Baltic coast. Frederick in Silesia manoeuvred for some weeks between Breslau, Schweidnitz and Glatz, but was suddenly recalled by the news of the capture of Berlin on the 9th of October by Cossacks and portions of the Empire Army and Austrians from Saxony. On the 11th of October the king was in full march, but the news of his approach was enough and the enemy dispersed, the
Austrians and Empire Army making for Torgau. Daun, relieved of Frederick's pressure, now also moved to Torgau, leaving Loudon in Silesia, and had concentrated over 64,000 men at and around Torgau before Frederick had collected an attacking force of 45,000. The position held by the Austrians was an entrenched camp fronting in all directions, but it was too cramped for their numbers and difficult to leave for a counter-stroke. Frederick determined to attack it both front and rear, and leaving Zieten to act against the former, he marched off at 6:30 of the 3rd of November to attack it as soon as Zieten should have thoroughly attracted the enemy's attention. But for once Zieten failed; he allowed himself to be drawn off by the Austrian light troops, and Frederick, in ignorance of the real state of affairs, launched his grenadiers against a thoroughly intact enemy, strongly entrenched, with, it is said, 400 guns in position to sweep the approaches. The grenadiers were simply swept away by grape and case—only 600 out of 6000 remained, and Prussian batteries hurrying up to their support were destroyed before they had time to load. The attack was, however, renewed by fresh brigades as they came to hand, and the Prussian artillery did something to diminish the intensity of the Austrian case fire. The action began at 2 p.m. At 4:30, as the sun was setting, the king's last reserve of horse and foot at last succeeded in breaking the Austrian line and in the darkness there ensued a confused slaughter as at Zornsdorf. The result was still in the balance when at length Zieten reached the field and attacked at once. For an hour or so the struggle still raged, but the Austrians were by now completely spent and withdrew gradually into the fortress and then across the river. Out of 44,000 the Prussians had lost 13,120 men (30%), out of 65,000 the Austrians only 11,260 (17.3%), but of these over 7000 were prisoners. Both sides, however, were completely paralysed by the struggle, and the year ended without further effort on either side.

On the western theatre of war Prince Ferdinand after the victory of Warburg had pressed the French back to the Rhine and besieged Wesel, but was compelled to raise the siege after suffering the defeat of Kloster-Kamp (16th Oct.) and to withdraw to Lippstadt and Warburg.

Campaign of 1757.—Torgau proved to be Frederick's last great battle. All parties were now so completely exhausted that they no longer were able to face the risks of a decision on the field. In the west Prince Ferdinand was first in the field, and in February and March he drove the French southward as far as Fulda, but an attempt to capture Marburg failed and the gradual pressure of French numerical superiority, together with the reduction of the British contingent on the death of George II., compelled him to retreat gradually until by the beginning of October both Brunswick and Wolfenbüttel fell into their hands. In the east the king had barely 100,000 men against 300,000 Austrians and Russians. Leaving Prince Henry to observe Daun in Saxony he marched to join von der Goltz, who with 23,000 stood about Schweidnitz. The Russians (50,000) under Buturlin were approaching from Posen, and Loudon with 72,000 men starting from Glatz manoeuvred to join them. After two months' skirmishing and marching the Allies effected their junction between Liegnitz and Jauer, having completely surrounded Frederick. With a large supply of food and immediate supplies on Northern Silesia, and not caring to risk a battle with odds of three to one against him he withdrew into the entrenched camp of Bunzelwitz, where the Allies did not dare to attack him. Ultimately, as usual, the Russian commissariat broke down, and in September Buturlin withdrew the way he had come. Relieved of this antagonist, Frederick manoeuvred to draw Loudon out of his positions and compel him to fight in the open, but Loudon refused the challenge and after an attempt to surprise Schweidnitz, where he failed, withdrew into winter quarters. Prince Henry in Saxony held his own against Daun.

England now threatened to withdraw her subsidies, and as the Prussian armies had dwindled to 60,000 men the end seemed very near. But a turn of fortune was already at hand. On the 5th of January 1762 the tsarina died, and her successor, Peter III., at once offered peace. On the 16th of March an armistice was agreed to, and shortly afterwards the treaty of St Peters burg was signed, by which Pomerania was given back to Prussia and a contingent of 18,000 men placed at Frederick's disposal. The withdrawal of the Russians led to the withdrawal of the Swedes and thus only France and Austria remained—the former bled white by the strain of her colonial disasters, the latter too weary to make further great exertions. Though the war dragged on for some months, and Prince Henry, assisted by Seydlitz, won the victory of Freiberg over the Empire Army (20th Oct. 1762), no great battle was attempted, and although a revolution at St Petersburg deprived Frederick of Russian assistance, in the autumn Ferdinand drove the French back over the Rhine, and thereupon an armistice was agreed upon by all. Final terms of peace were adjusted on status quo ante basis at Hubertusburg on the 11th Feb. 1763. Prussia had maintained all her possessions and made good her claim to rank for all time with the Great Powers.

Kriege (Berlin, 1893). The main authorities for Ferdinand's Campaign are Westphalen, Feldsage des Herzogs Ferdinand von Braunschweig, and J. W. Fortescue, Hist. British Army, vol. ii.

Naval Operations

The naval operations of the Seven Years' War began nearly a year before the declaration of hostilities. In June 1755 a British squadron under Boscawen was sent into the Straits of Belle Isle to intercept French ships carrying soldiers and stores to Quebec, in retaliation for aggressions on British possessions in Nova Scotia. On the 14th of July Boscawen seized two French line-of-battle ships fitted as transports, the "Alcide" and the "Lyra." A general seizure of French merchant ships followed, and thousands of French sailors were in prison in England by the early days of 1756. The government of Louis XV. did not reply by a declaration of war, but prepared to retaliate by a threat of invasion, which created something like a panic in Great Britain. The government, then in the weak hands of the duke of Newcastle, accumulated warships in the Channel,
and on the 3rd of February 1756 issued a proclamation which instructed the inhabitants of the southern counties of England to drive their cattle inland in case of a French landing, and thereby much aggravated the prevailing fear. But the invasion scheme was so far only a cover for an attack on Minorca, then held by Great Britain.

A squadron of twelve sail of the line was prepared at Toulon under La Galissonière, a veteran admiral who had entered the navy in the reign of Louis XIV. It escorted transports carrying 15,000 troops under the duc de Richelieu. The danger to Minorca, where the garrison had been allowed to fall below its due strength, was well known to the British ministers. On the 11th of March they appointed Admiral John Byng to command a squadron which was to carry reinforcements. He did not, however, leave St Helen's till the 6th of April. Byng had with him ten sail of the line, and carried 3000 soldiers for the garrison. The ships were indifferently manned, and the admiralty refused to strengthen him by drafts from the ships it proposed to retain in the Channel. In order to find room for the soldiers, the marines of the squadron were left behind. There was therefore a danger that, if an encounter with the French fleet took place after the reinforcements were landed, the British squadron would be short-handed. Byng reached Gibraltar on the 2nd of May. The French invasion of Minorca had been carried out on the 10th of April. The governor, General de Fowke, refused to allow any of his soldiers to reinforce Minorca. On the 8th of May Byng sailed, and on the 19th he was in communication by signal with General Blakeney, governor of the fortress. Before the soldiers could be landed the French fleet came in sight. Byng had been joined by three ships of the line at Gibraltar, and had therefore thirteen ships to twelve. One of the French vessels, the "Foudroyant" (84), was a finer warship than any in the British line, but in effective power Byng was at least equal to his opponent, and if his ships were poorly manned La Galissonière was in worse case. The British admiral rejected one of his ships, the little ship to rear to starboard, and then orthodox manner—van to van, centre to centre, and rear to rear, ship against ship. By the manoeuvres of the afternoon of the 19th and morning of the 20th he gained the weather-gage, and then bore down on the enemy at an angle, the van of the English steering for the van of the French. The sixth ship in his line, the "Intrepid" (74), having lost her foretopmast, became unmanageable and threw the vessels behind her out of order. Thus the six in front were exposed to the fire of all the French, who ran past them and went off. Byng could have prevented them by bearing down, but refused to alter the formation of his fleet. Being now much disturbed by the crippled state of the ships in his van, he made no effort either to land the soldiers he had on board or to renew the action; and after holding a council of war on the 24th of May, which confirmed his own desire to retreat, he sailed for Gibraltar (see Byng, John, for his trial and execution). The loss of Minorca, which was the consequence of this retreat, gave the French a great advantage in the Mediterranean. During the rest of the year no very vigorous measures were taken on either side, though the British government reinforced its squadrons both in the Mediterranean and on the coast of America.

In 1757 the naval war began to be pushed with a vigour hitherto unprecedented. The elder Pitt became the effective head of the government, and was able to set about ruining the French power at sea. Owing to the long neglect of the French navy, it was so inferior in strength to the British that nothing short, of the worst mismanagement on Pitt's part could have deprived Great Britain of victory. Some of the minister's measures were not indeed wise. He sent out, during the last months of 1757 and the whole of 1758, a series of combined expeditions against the French coast, which were costly and for the most part unsuccessful. They terminated in September 1758 with a disaster to the troops engaged in St Cas Bay. Yet these assaults on the French coast did much to revive the spirit of the nation, by removing the fear of invasion. Meanwhile a sound aggressive policy was followed in distant seas during 1758.

In the East Indies the squadron which had been engaged during 1757 in co-operating with Clive in the conquest of Bengal was strengthened. Under the command of Sir George Pocock it was employed against the French squadron of M. d'Achê, who brought in his capture troops from-destruction and was carried on by them to attack the possessions of the East India Company on the Coromandel coast. The two actions fought at sea on the 29th of April and the 1st of August in the Bay of Bengal were not victories for Sir George Pocock, but neither were they defeats. The French admiral was so uncertain of his power to overcome his opponent that he sailed for the islands of the Indian Ocean so soon as Lally and the authorities at Pondicherry would allow him to go. In America the strong squadron of Boscauen rendered possible the capture of Louisburg, on the 26th of July, and cleared the way for the conquest of Canada in the following year. During 1759 the French government, trusting that the multiplicity of the calls upon its fleet would compel Great Britain to scatter its naval forces, laid plans for a great invasion (for the details of this plan and its results, see Quiberon, BATTLE OF). But the British navy proved numerous enough not only to balance invasion at home but to effect large conquests of French possessions abroad. In North America the co-operation of the navy rendered possible the capture of Quebec by Wolfe. In the West Indies, though an attack on Martinique was repulsed, Guadeloupe was taken in January. In the East Indies the squadron of M. d'Achê reappeared in the Bay of Bengal in September. He fought another undecided action with Sir George Pocock on the 8th, and gave some small help to the French army. But the bad state of his squadron forced him to retreat soon, and the resources of the French being now exhausted in those seas, he did not reappear. The British navy was left in complete command of the Bay of Bengal and the coast of Malabar. On shore, Lally, cut off from reinforcements, was crushed, and Pondicherry fell.

During 1760 and 1761 the French fleet made no attempt to keep alive the naval war. The British navy went on with the work of conquering French possessions. During 1760 it co-operated on the Lakes and on the St Lawrence in the final conquest of Canada. Between April and June of 1761 it covered the capture of the island of Belle-Ile on the French coast, which both strengthened its means for maintaining blockade and gave the British government a valuable pledge to be used for extorting concessions when the time for making peace came. The complete ruin of French merchant shipping and the collapse of the navy left the maritime population free to seek a livelihood in the privateers. The commerce of France in the East Indies was a considerable success. The number of British merchant ships taken has been put as high as one-tenth of the whole. But this percentage was the price paid for the enormous advantage gained by the ruin of the French as commercial rivals. The merchant shipping of Great Britain increased largely in the course of the war, and from it dates her commercial predominance.

By the close of 1761 the helplessness of France at sea had been demonstrated, but the maritime war was revived for a few months by the intervention of Spain. A close alliance, known as "the family compact," was made between the royal houses of France and Spain in 1760. The British government had not divulged, and Pitt would have made war on Spain at once. He was overruled and retired. So soon, however, as the treasure ships from America had reached Spain, at the close of 1761, the Spanish government declared war. Its navy was incapable of offering a serious resistance to the British, nor did it even attempt to operate at sea. The British government was left unopposed to carry out the plans which Pitt had prepared against Spain. The only aggressive movement undertaken by the Spanish government was an attack on Portugal, which, however, was the only engagement of any magnitude. Pitt, however, gave his most useful help by allowing her the free use of Portuguese ports. As the king of Portugal refused to join the French and Spanish alliance, his country was invaded by a Spanish army. Great Britain supported her ally. A regiment of cavalry and seven battalions of foot were landed. They gained several small actions against the invaders, and had
the most active share in the operations which forced them to retire. But the most effective blows delivered against Spain were directed at her colonies. The British troops, left free by the recent success against the French in America, were employed in an attack on Havana. A powerful fleet left England on the 5th of March, bringing troops which were joined by others in the West Indies; Sir George Pocock, who had returned from the East Indies, was in command. Under his direction the fleet reached Havana after suffering without loss, and Havana was assaulted. The citadel known as the Moro Castle made a stout defence, and some of the ships suffered severely in a bombardment. But the worst losses of the besiegers were due to the climate of Cuba, aided by bad sanitary arrangements. Of the 10,000 troops landed, three-fourths are said to have suffered from fever or dysentery, and the majority of the sick died. Yet the Moro was taken on the 30th of September, and Havana, which could have made a longer resistance, surrendered on the 10th of October.

Martinique, the last important possession of France in the New World except her half of San Domingo, had fallen in February. In the East Indies, where the surrender of Pondicherry had left other forces free, a combined expedition triumphed easily in October over the natives of Manila, under the direction of the archbishop, who acted as governor. The preliminaries of the peace of Paris were signed on the 3rd of November 1762.

SEVERIANA, VIA, an ancient highroad of Italy, running S.E. from Ostia to Terracina, a distance of 73 m. along the coast, and taking its name, no doubt, from the restoration of an already existing road by Septimius Severus, who was a great benefactor of Ostia. It ran along the shore at first, just behind the line of villas which fronted upon the sea, and are now half a mile inland, or even upon its edge (for an inscription records its being damaged by the waves). Farther S.E. it seems to have kept rather more distant from the shore, and it probably kept within the lagoons below the Circæan promontory. As is natural in a sandy district where building materials are rare, remains of it are scanty. See R. Lanciani in Monumenti dei Lincei, xiii., (1903), 185; xvi. (1906), 241; T. Ashby in Mélanges de l'École française de Rome (1959), 157 sqq.

SEVERINUS, pope in 640, successor of Honorius. He occupied the papal chair only three months after his consecration, having had to wait a year and a half for its ratification by the emperor. During this long vacancy the exarch of Ravenna, supported by the military body of Rome (exercitus Romanus), occupied the Lateran and seized the treasure of the Church.

SEVERN, JOSEPH (1793-1879), English portrait and subject painter, was born at Hoxton on the 7th of December 1793, his father, a musician, coming of an old Gloucestershire family. During his earlier years he practised portraiture as a miniaturist; and, having studied in the schools of the Royal Academy, in 1818 he gained the gold medal for his "Una and the Red Cross Knight in the Cave of Despair." In 1819 he exhibited at the Academy his "Hermia and Helena." He was an intimate friend of Keats the poet, whom he accompanied to Italy in 1820 and nursed till his death in 1821. His picture of "The Death of Alcibiades" then obtained for him an Academy travelling studentship, and he returned to Rome, where he lived till 1841, marrying in 1828 the daughter of Lord Montgomerie, a ward of Lady Westmoreland, one of his chief patrons, and mingling in the congenial art circles of the city. In 1841, after leaving England for nineteen years, mainly for the education of his children, he was appointed British consul at Rome, a post which he held till 1872, and during a great part of the time he also acted as Italian consul. His most remarkable work is the "Spectre Ship" from the Ancient Mariner. He painted "Cordelia watching by the Bed of Lear," "the Roman Beggar," "Ariel," "The Fountain," and "Rienzi," executed a large altar-piece for the church of St Paul at Rome, and produced many portraits, including one of Baron Bunsen and several of Keats. He died at Rome on the 3rd of August 1879. He had six children, of whom Walter, Arthur and Ann (wife of Sir Charles Newton) were well-known artists.

SEVERN, a river of Wales and England. It rises on the N.E. side of Plynlimmon, on the S.W. border of Montgomeryshire, and flows with a nearly semicircular course of about 210 m. to the Bristol Channel; the direct distance from its source to its mouth being 365 m. Its Welsh name is Hafren, and its Roman name was Sabrina. Through Montgomeryshire its course is at first to the S.E. direction, and for the first 15 m. it flows over a rough precipitous bed. At Llanidloes it bends towards the N.E., passing Newtown and Welshpool; this part of the valley bearing the name of the Vale of Powis. It receives the Vyrnwy near Melverley, and forms a mile of the Welsh border, and then turning in an E.S.E. direction enters Shropshire, and waters the broad rich plain of Shrewsbury, after which it bends southward past Ironbridge and Bridgnorth to Bewdley in Worcestershire. In position of Worcesters it receives a number of tributaries, the chief of which is the Tern. Continuing its southern course through Worcestershire it passes Stourport, where it receives the Stour (left), and Worcester, shortly after which it receives the Teme (right). It enters Gloucestershire close to Tewkesbury, where it receives the Upper Avon (left), after which, bending in a S.W. direction, it passes the city of Gloucester, below which it becomes estuarine and tidal. A high bight or tidal wave, for which the Severn is notorious, may reverse the flow as high up as Tewkesbury Lock (135 m. above Gloucester), and has sometimes caused great destruction. The estuary merges into the Bristol Channel at Trowbridge. Here it is joined on the left the Lower or Bristol Avon, and on the right the Wye. The source lies at an elevation of about 2000 ft.; the fall from Llanidloes is about 550 ft., from Newtown 365 ft. and from Shrewsbury, 90 m. above Gloucester, 180 ft. The scenery of the upper valley is wild and picturesque, and that of the lower river is at some points very beautiful. The course between the height of the Wrekin and Wenlock Edge (despite the manufacturing towns on the banks at this point), the valley above Bewdley, where the Forest of Wyre borders the left bank, and the fine position of Worcester, with its cathedral rising above the river, may be noticed. The distance from Gloucester to Avonmouth is 44 m., but the upper part of the estuary is tortuous, and, owing to the bores and shifting shoals, difficult of navigation. On this account the Gloucester and Berkeley Ship Canal, 167 m. in length, was constructed, admitting vessels of 350 tons to Gloucester from the docks at Sharpness on the estuary. The navigation extends up to Arley, above Bewdley, 47 m. from Gloucester, but is principally used up to Stourport (43 m.), from which the Staffordshire and Worcestershire canal gives access to the Wolverhampton industrial district and the Trent and Mersey navigation. The Berkeley canal and the Worcestershire and Birmingham canal are maintained by the Sharpness New Docks and Gloucester and Birmingham navigation company. There is connexion with the Thames by the Stroudwater canal from Framilode on the estuary, joining the Thames and Severn canal near Stroud. The Wye is in part navigable; the Bristol Avon gives access to the great port of Bristol, and the Upper Avon is in part navigable. The Severn is a good salmon river, and is famous for its lampreys, while many of the tributaries afford fine trout-fishing, such as the Teme and the Vyrnwy. The drainage area of the Severn is 68,790 sq. m., including the Wye and the Bristol Avon, 43,550 sq. m., without these rivers.

Severn Tunnel.—The first bridge above the mouth of the Severn is that near Sharpness, which carries the Great Western and Midland railway between Berkeley Road and Lydbrook Junction. But the Severn tunnel, carried with such ease, was made a stouter resistance to the last line of defence. 14 m. below the bridge, forms the direct route between the south of England and South Wales. Before the tunnel was made through it a toll was charged, "Mr. Tamesis Passage," where a ferry had existed from early times. The steam ferry was operated in connexion with the Bristol and South Wales Union railway in 1863, and was subsequently taken over by the Great Western company. Parliamentary powers to construct the tunnel were given in 1872, and work began in the following year. The originator of the scheme and chief engineer was Mr Charles Richar-son, and Sir John Hawkshaw was consulting engineer. The principal
SEVERUS, LUCIUS SEPTIMIUS

difficulty encountered in the construction was the tendency to flood, owing both to the river breaking into the works, and, more especially, to the water which was let in. When the water level of the tunnel is 4 m. 624 yds. of which 23 m. are beneath the river. On the east side the cutting leading to the tunnel has a gradient of 1 in 100, which is continued in the tunnel itself. The deepest part is reached beneath the cove, where the value of the new route was especially apparent in connexion with the mineral traffic between the South Wales coal-field and London and the ports of the south of England.

SEVERUS, LUCIUS SEPTIMIUS (A.D. 146-211), Roman emperor, was born in 146 at Leptis Magna on the coast of Africa. Punic was still the language of this district, and Severus was the first emperor who had learned Latin as a foreign tongue. The origin of his family is obscure. Spartanius, his biographer in the Historia Augusta, doubtless exaggerates his literary culture and his love of learning; but the taste for jurisprudence which he exhibited as emperor was probably instilled into him at an early age. The removal of Severus from Leptis to Rome is attributed by his biographer to the desire for higher education, but was also no doubt due in some degree to ambition. From the emperor Marcus Aurelius obtained by marriage on the one hand and by the death of his uncle, the distinction of the broad purple stripe. At twenty-six, this is, almost at the earliest age allowed by law, Severus attained the quaestorship and a seat in the senate, and proceeded as quaestor military to the senatorial province of Baetica, in the Peninsula. While Severus was absent in Africa in consequence of the death of his father, the province of Baetica, disordered by Moorish invasions and internal commotion, was taken over by the emperor, who gave the senate Sardinia in exchange. On this Severus became military quaestor of Sardinia. His next office, in 174 or 175, was that of legate to the province of Asia, and soon after he was tribune of the plebs. This magistracy, though far different from what it had been in the days of the republic, was still one of dignity, and brought promotion to a higher grade in the senate. In 178 or 179 Severus became praetor by competition for the suffrages of the senators. Then, probably in the same year, he went to Hispania Citerior as legatus juridicus; after that he commanded a legion in Syria. After the death of Marcus Aurelius he was unemployed for several years, and, according to his biographer, studied at Athens. He became a privy councillor in 182. In that time he abandoned the marriage with his second wife, to which his father, Julia Domna, had on no account he had no doubt made when an officer in Syria. Severus was governor in succession of Gallia Lugdunensis, Sicily and Pannonia Superior; but the dates at which he held these appointments cannot be determined. He was in command of three legions at Carnuntum, the capital of the province last named, when news reached him that Commodus had been murdered by his favourite concubine and his most trusted servants. At this moment Severus had not raised himself above the usual official level. He had seen no warfare beyond the petty border frays of frontier provinces. But the storm that now tried all official spirits found his alone powerful enough to brave it. Three imperial dynasties had been ended by assassination. The Flavian line had enjoyed much shorter duration and less prestige than the other two, and the circumstances of its fall had been peculiar in that it was probably planned in the interest of the senate, and the senate reaped the immediate fruits. But the crises which arose on the deaths of Nero and of Commodus were alike. In both cases it was left to the army to determine by a struggle which of the divisional commanders should succeed to the command-in-chief, that is, to the imperial throne. In each case the contest began with an impulse given to the commanders by the legionaries themselves. The soldiers of the great commands competed for the honour and advantages to be won by placing their general on the throne. The officer who refused to lead would have suffered the punishment of treason.

There is a widespread impression that the Praetorian guards at all times held the Roman empire in their hands; but its emptiness is demonstrated by the events of the year 193. For the first time in the course of imperial history the Praetorians presumed to nominate as emperor a man who had no legs at his back. This was Pertinax, who has been well styled the Galba of his time—upright and honourable to severity, and zealous for good government, but blindly optimistic about the possibilities of reform in a feeble and corrupt age. After a three months' rule he was destroyed by the power that lifted him up. According to the well-known story, true rather in its outline than in its details, the Praetorians sold the throne to Didius Julianus. But at the end of two months both the Praetorians and their nominee were swept away by the real disposers of Roman rule, the provincial legions. Four groups of legions at the time were strong enough to aspire to determine the destiny of the empire—those quartered in Britain, in Germany, in Pannonia and in Syria. Three of the groups took the decisive step, and Severus in Pannonia, Pescennius Niger in Syria, Clodius Albinus in Britain, received from their troops the title of Augustus. Severus outdid his rivals in promptness and decision. He secured the aid of the legions in Germany and of those in Ilyria. These, with the entry into Panonia, Pescennius Niger was about to overawe Albinus for the moment. He probably deemed that his best chance lay in the exhaustion of his competitors by an internecine struggle. At all events he received with submission an offer made by Severus, who confirmed Albinus in his power and bestowed upon him the title of Caesar, making him the nominal heir-apparent to the throne.

Before the action of Severus was known in Rome, the senate and people had shown signs of turning to Pescennius Niger, that he might deliver them from the poor puppet Didius Julianus and advance the Praetorians to the position of a combination strongly for Pertinax. Having secured the co-operation or neutrality of all the forces in the western part of the empire, Severus hastened to Rome. To win the sympathy of the capital he posed as the avenger and successor of Pertinax, whose name he even added to his own, and used to the end of his reign. The feeble defences of Julianus were broken down and the Praetorians disarmed and disbanded without a blow. A new body of household troops was enrolled and organized on different principles from the old. In the face of the senate, as Dio tells us, Severus acted for the moment like of the good emperors in the old days. After a magnificent entry into the city he joined the senate in exterminating the memory of Commodus, and in punishing the murderers of Pertinax, whom he honoured with splendid funeral rites. He also encouraged the senate to pass a decree directing that any emperor or subordinate of an emperor who should put a servant to death should be treated as a public enemy. But he refrained from asking the senate to sanction his accession.

The rest of Severus' reign is in the main occupied with wars. The power wielded by Pescennius Niger, who called himself emperor, and was supposed to control one half of the Roman world, proved to be more imposing in name than in fact. The magnificent promises of Oriental princes were falsified as usual. Niger himself, as described by Dio, was the very type of mediocrity, conspicuous for no faculties, good or bad. This character had no doubt commended him to Commodus as suited for the important command in Syria, which might have proved a source of danger in abler hands. The contest between Severus and Niger was practically decided after two or three engagements, fought by Severus' officers. The last battle, which took place at Issus, ended in the defeat and death of Niger (194). After this the emperor spent two years in successful attacks upon the peoples bordering on Syria, particularly in Adiabene and Osroene. Byzantium, the first of Niger's possessions to be attacked, was the last to fall, after a glorious defence.

1 For Marcus Aurelius Alexander Severus, Roman emperor from 222 to 235, see Alexander Severus.
Late in 196 Severus turned westward, to reckon with Albinus. He was better born and better educated than Severus, but in capacity far inferior. As Severus was nearing Italy he received the news that Albinus had been declared emperor by his soldiers. The first counter-stroke of Severus was to affiliate himself and his elder son to the Antonines by a spurious and posthumous adoption. The prestige of the old name, even when gained in this illegitimate way, was evidently worth much. Bassianus, the elder son of Severus, thereafter known as Aurelius Antoninus, was confided to the care of Sulpicia and the education of his grandson, and thus the legitimate heir to his throne and successor to his father. Without interrupting the march of his forces, Severus contrived to make an excursion to Rome. Here he availed himself with much subject to the sympathy many senators were known to have felt for Niger. Though he was so far faithful to the decree passed by his own advice that he put no senator to death, yet he banished and impoverished many whose presence or influence seemed dangerous or inconvenient to his prospects. Of the sufferers probably few had seen or communicated with Niger.

The collision between the forces of Severus and Albinus was the fiercest and that had taken place between Roman troops since the contest at Philippi. The decisive engagement was fought in February of the year 197 on the plain between the Rhone and the Saône, to the north of Lyons, and resulted in a complete victory for Severus.

Thus, released from all need for disguise, he "poured forth on the civil population all the wrath which he had been storing up for a long time" (Dio). He frightened the senate by calling himself the son of Marcus and brother of Commodus, whom he had before insulted. He read a speech in which he declared that the severity and cruelty of Sulpicia and the Albinus had proved to be safer policy than the clemency of Pompey and Julius Caesar, which had wrought their ruin. He ended with an apology for Commodus and bitter reproaches against the senate for their sympathy with his assassins. Over sixty senators were arrested on a charge of having adhered to Albinus, and half were put to death. In most instances the charge was a pretence to enable the emperor to crush the forward and dangerous spirits in the senate. The murderers of Commodus were punished; Commodus himself was defined; and on the monuments from this time onward Severus figures as the brother of that reproduction of all the vice and cruelty of Nero with the refinement left out.

The next years (197–202) were devoted by Severus to one of the dominant ideas of the empire from its earliest days—war against the Parthians. The results to which Trajan and Verus had aspired were now fully attained, and Mesopotamia was definitely established as a Roman province. Part of the time was spent in the exploration of Egypt, in respect of which Dio takes opportunity to say that Severus was not the man to leave anything human or divine uninvestigated. The emperor returned to a well-earned triumph, commemorated to this day by the arch in Rome which bears his name. During the six years which followed (202–208) Severus resided at Rome and gave his attention to the organization of the empire. Severus had confided much of the administration of the empire to Plautianus, the commander of the reorganized Praetorians, who is described by the ancient historians as a second Sejanus. In 203 Plautianus fell, owing, it is said, to an intrigue set foot on by Caracalla, who had shortly before married the daughter of his victim.

Severus spent the last three years of his life (208–211) in Britain, amid constant and not very successful warfare, which he used to a great extent partly to strengthen the discipline and powers of the legions, partly to wean his sons from their evil courses by hard military service. He died at York on the 4th of February 211. There are traditions that his death was in some way hastened by Caracalla. This prince had been, since about 197, nominally joint emperor with his father, so that no ceremony was needed for his recognition as monarch.

The natural gifts of Severus were of no unusual order. He had a clear head, promptitude, resolution, tenacity and great organizing power, but no touch of genius. That he was cruel cannot be questioned, but his cruelty was of the calculating kind, and always directed to some end. He threw the head of Niger over the ramparts of Byzantium, but merely as the best means of procuring a surrender of the stubbornly defended fortress. The head of Albinus he exhibited to Rome, but it was, indeed, a very different thing to deal more with pretenders. The children of Niger were held as hostages and kindly treated so long as they might possibly afford a useful basis of negotiation with their father; when he was defeated they were killed, but from the same time thereafter Severus dreamed of his imperial power. Stern and barbarous punishment was always meted out by Severus to the conquered foe, but terror was deemed the best gurage to the populace. He never spilt blood unjustly, and even in the absence of gods, some sacrilegious vengeance which we find in the ancient narratives are probably the result of fear working on the imagination of the time.

As Emperor Severus was never called a political general, in spite of his successful campaigns. He was rather the organizer of victory than the author of it. The operations against Niger were carried out entirely by his officers. Dio even declares that the final battle with Albinus was the first at which Severus had ever been present. When a war was going on he was constantly travelling over the scene of it, planning it and instilling into the army his own pertinacious spirit, but the fighting was usually left to others. His trials of one against the other, so frequent in the last part of his reign, he broke with the decrees of the Augustan constitution, ignored the senate, and based his rule upon force. Thus, he was the very first of the emperors to establish the army as a whole to the support of his dynasty. He increased enormously the material gains and the honorary distinctions of the soldiers. He was the first to establish a standing army as a machine to maintain order, as a means of guaranteeing peace. It cannot be denied that, all things considered, he left the army of the empire more efficient than he found it. He increased the strength of it by three legions, and turned the Praetorians, heretofore a flabby loosely organized body of illegitimate soldiers, into a standing army of veterans. Their ranks were filled by promotion from all the legions on service, whereas previously there had been special enlistment from Italy and one or two of the neighbouring provinces. It was hoped that these picked soldiers would be the army of the moment and could rely in an emergency. But to meet the possibility of a legionary revolt in the provinces, one of the fundamental principles of the Augustan empire was abrogated: Italy became a province and the legion was quartered at Alba Fucens under the direct command of the emperor. Further to obviate the risk of revolution, the great commands in the provinces were broken up, so that, excepting on the turbulent eastern frontier, it was not possible for a commander to dispose of troops numerous enough to render him dangerous to the government.

But, while the policy of Severus was primarily a family policy, he was also means careless of the security and welfare of the empire. Only in one instance, the destruction of Byzantium, did he weaken its defences for his own ends—an error for which his successors paid dearly. The provinces of the Gordian, the Constantine, and even some Danubian regions received the special attention of the emperor, but all over the realm the status and privileges of communities and districts were recast in the way that seemed likely to conduc to the prosperity. The new prince had no regal or autocratic character, in Italy as well as in the provinces. Retired military officers now filled many of the posts formerly reserved for civilians of equestrian rank. The praetorians received large civil and judicial powers, so that the investment of Papinian with the office was less unnatural than it seems at first sight. The alliance between Severus and the jurisconsults had important consequences. The jurisconsults, upheld by their body politic, and co-operated with them in the work of legal reform, did him material service by working an absolutist view of the government into the texture of Roman law. Of the legal changes of these years, that of the last decade of Severus is the most important. The emperor himself was a devoted and upright judge, but he struck a great blow at the purity of the law by transferring the exercise of imperial jurisdiction from the forum to the palaces. He showed an inclination in some cases to descend to the time-honoured questions perpetuae, altered largely that important section of the law which defined the rights of the fiscus, and developed further the social law, much of which is embodied in the lex Julia de adulteris et le Papia Poppaea.

Severus boldly adopted as an official designation the autocratic title of dominus, which the better of his predecessors had renounced. During the severest of the Roman civil wars his hand was in the blood of his foes, and by his own hand he attempted the murder of his hand, and broke down the distinction between the servants of the senate and the servants of the emperor. All nominations to office or function passed under his scrutiny. The estimation of the old consular and other republican titles was diminished. The growth of capacity in the senate was checked by cutting off the tallest of the poppy-heads early in the reign. The senate became a mere
SEVERUS, SULPICIUS (c. 363–c. 425), Christian writer, was a native of Aquitania. He was imbued with the culture of his time and of his country, which was then the only true home of Latin letters and learning. Almost all that is known of Severus' life comes from a few allusions in his own writings, and some passages in the letters of his friend Paulinus, bishop of Nola. In his early days he was famous as a pleader, and his knowledge of Roman law is reflected in parts of his writings. He married a wealthy lady belonging to a consular family, who died young, leaving him no children. At this time Severus came under the powerful influence of St Martin, bishop of Tours, by whom he was led to devote his wealth to the Christian poor, and his own powers to a life of good works and meditation. To use the words of his friend Paulinus, he broke with his father, followed Christ, and set the teachings of the "fishermen" far above all his "Tullian learning." He rose to no higher rank than that of presbyter. He is said to have been led away in his old age by panegyric, but to have repented and inflicted long-enduring penance. His time was passed chiefly in the neighbourhood of Toulouse, and such literary efforts as he permitted to himself were made in the interests of Christianity. In many respects no two men could be more unlike than Severus, the scholar and orator, well versed in the ways of the world, and Martin, the rough Pannonian bishop, ignorant, suspicious of culture, champion of the monastic life, seer and worker of miracles. Yet the spirit of the rugged saint is evident in that of the polished scholar, and the works of Severus are only important because they reflect the ideas, influence and aspirations of Martin, the foremost ecclesiastic of Gaul.

The chief work of Severus is the Chronicon (c. 400), a summary of sacred history from the beginning of the world to his own times, with the omission of the events recorded in the Gospels and the Acts, "lest the form and letter should offend the reader." The book was a text-book, and was used as a school book in the churches of France for a century and a half after Severus wrote it.

It is the text-book of the school of Severus. It has been a help to the writer of this essay in determining the dates and the connexion of events, and for the sake of the solid and trustworthy history of which it is composed.

AUTHORS.—Severus himself wrote a autobiography which was regarded as candid and trustworthy on the whole. The events of his life are related with truth and moderation, while his contemporaries are described with acute incisiveness. His Greek, too, stands in agreeable contrast to the debased Latin of the Scriptores historiae Augustae. The Greek writer Herodian was also a contemporary of Severus, but the more facile manner in which we know nothing of his life is in itself enough to show that his work was not so great as that of Dio. The reputation of Herodian, who was used as the main authority for the times of Severus by Tillemont and Gibbon, has not been proved against; but it is probable that his work is full of exaggerations, and those of rhetoric and exaggeration. His narrative is probably in many respects not independent of Dio. The Augustan historians, unsatisfactory compilers, form a principal source for the history of the reign. The notice of Dio is, however, of the greatest assistance to us, and enables us to control at many points and largely to supplement the literary records of his reign, particularly as regards the details of his administration.

As an authority for times antecedent to his own, Severus is of little moment. At only a few points does he enable us to correct or supplement other records. Bernays has shown that he based his narrative on the destruction of the Jews at Jericho on the passage given by Tacitus in his "History," a portion of which has been lost. We are enabled thus to contrast Tacitus with Josephus, who recommends Severus as a source for the story of Titus. In his allusions to the "tender rulers with whom the Jews are provided," and to the treatment of the Maccabees onwards, Severus discloses some points which are not without importance. But the real interest of his work lies first, in the incidental glimpses of the life of the historian of his own time; next and more particularly, in the information he has preserved concerning the struggle over the Priscillianist heresy, which disorganized and degraded the churches of Spain and Gaul, and particularly Afflicted Aquitaine. The sympathy he betrayed by Severus are wholly those of St Martin. The bishop withstood Maximus, who ruled for some years a large part of the western empire, though he had conquered Italy. He had reproached him with attacking and overrunning the church, and with the bills which he had put on the throne, and for his dealings with the church. Severus loses no opportunity for laying stress on the crimes and follies of rulers, and on their cruelty, though he does not scruple to declare that crucifixion could be, priests could be crueler still. This last statement has reference to the bishops who had left Maximus no peace till he had forbad them to deal with the blood of Priscillian and his followers. St Martin, too, had denounced the wickedness and greed of the Carolingian bishops and clergy. Accordingly we find that Severus, in narrating the division of Canaan among the tribes, calls the special attention of the readers of his work to the case of Levi, lest they should be hindered in their obedience to the command of God. "Our clergy seem," he says, "not merely forgetful of the law, but ignorant of it, such a passion for possessions has it in our days." Yet he is like a solitary life, and from the glimpse of the circumstances which were winning over good men to monasticism in the West, though the evidence of an enthusiastic and solitary life, such as Severus was, is probably not free from exaggeration.
offshoot of Gnosticism had no single feature about it which could soften the hostility of a character such as Martin’s, but he resisted the introduction of secular doctrine, and in a common word with those bishops in Gaul, a large majority, who invoked the aid of Maximus against their erring brethren. In this connexion it is interesting to note the account given by Severus of Maximus’ mission to Gaul in 1550. He says that the bishops attending the assembly might lawfully receive money from the imperial treasury to recoup their travelling and other expenses. Severus evidently approves the action of the British bishops, who ceded the point to the emperor, and bore the expense; but he also lies under pecuniary obligation to the emperor. His ideal of the church required that it should stand clear and above the state.

Another part of his Life of Martin, a contribution to popular Christian literature which did much to establish the great reputation which that wonder-working saint maintained throughout the middle ages. The book is not properly a biography, but a compendium of the most striking features of his absolute belief. The power to work miraculous signs is assumed to be in direct proportion to holiness, and is by Severus valued merely as an evidence of holiness, which he is persuaded can only be attained through a direct isolation from the world. In the first of his Dialogues (fair models of Cicero), Severus puts into the mouth of an interlocutor (Posthumianus) a pleasing description of the life of coenobites and solitary hermits in the deserts bordering on the sea. The evidence of the virtue attained by them lies in the voluntary subjection to them of the savage beasts among which they lived. But Severus was no indiscriminating adherent of monasticism. The same dialogue shows how he thought of life, both as to its danage and defects. The second dialogue is a large appendix to the Life of Martin, and really supplies more information of his life as bishop and of his views than the work which bears the title Vita S. Martinii. The two dialogues oscillate much between the practical and the speculative, and refer occasionally to several epochs. In Dial. I, cc. 6, 7, we have a vivid picture of the controversies which raged at Alexandria over the works of Origen. The judgment of Severus here is that “there is no mouth of which the understanding be not bewildered, but this of the interlocutor Posthumianus: ‘I am astonished that one and the same man could have so far differed from himself that in the approved portion of his works he has no equal since the apostles, while in that portion for which he is justly blamed it is proved that not man has written more unseemly errors.’ Three Epistles on the death of Martin (ad Eusebium, ad Aurelium diaconum, ad Bassulam) complete the list of Severus’ genuine works. The last letter (to his sister), on the love of God, is a noble protestation of the world and its not surviving the judgment of the living.

AUTHORITIES.—The text of the Chronica rests on a single 11th cent. MS., one of the Palatine collection now in the Vatican; of the other works MSS. are abundant, the best being one of the 6th century at Verona. Some spurious letters bear the name of Severus; also in a MS. at Madrid is a work falsely professing to be an epitome of the Chronica of Severus, and going down to 511. The chief editions of the complete works of Severus are those by De Prato (Verona, 1731) and by Halm (forming vol. i. of the Corpus scriptorum ecclesiasticorum Latinorum, 1866). There is a most admirable edition of the Chronicle of Martin in all its parts by De Blayna (Rheims, 1817). See also Goedeler, Grammaticae in Sulp. Severum observationes (1884) (thesis).

SEVERY (probably connected with the English word “sewer”), in architecture, any main compartment or division of a building. The word has been supposed to be a corruption of Ciborium, as Gervase of Canterbury uses the word in this sense; but he probably alludes to the vaulted form of the upper part of the web of each severy.

SEVIER, JOHN (1745–1812), American frontiersman, first governor of Tennessee, was born in Rockingham county, Virginia, on the 23rd of September 1745, of Huguenot ancestry, the family name being Xavier. He settled on the Watauga on the western slope of the Alleghanies in 1772, and served as a captain in Lord Dunmore’s War in 1774. Early in 1776 the Watauga settlements were annexed to North Carolina, and Sevier, who from the beginning had been a member of the Watauga government, now resided at Abingdon, the provisional congress, which met at Halifax in November–December 1776 and adopted the first state constitution, and in 1777 he was a member of the state House of Commons. He took part in the campaign of 1780 against the British, especially distinguishing himself in the battle of King’s Mountain, where he led the right wing. In December 1780 he defeated the Cherokees at Boyd’s Creek (in the present Sevier county, Tennessee), laying waste their country during the following spring. Later in the same year (1781), under General Francis Marion, he fought the British in the frontiers of South Carolina and Georgia. In 1784, when North Carolina first ceded its western lands to the Federal government, he took part in the revolt of the western settlements; he was president of the first convention which met in Jonesboro on the 23rd of August, and opposed the erection of a new state, but when the state of Franklin (afterwards Franklin, in honour of Benjamin Franklin) was organized in March 1785, he became its first and only governor (1785–1788), and as such led his riflemen against the Indians; in May 1788, after the end of his term, men in his command massacred several Indians from a friendly village, and thus Sevier earned a widespread name. Sevier showed his ability as an Indian fighter. He was arrested by the North Carolina authorities as a leader of the independent government and partly for the Indian massacre, but escaped. About this time he attempted to make an alliance with Spain on behalf of the state of Franklin. In 1789 he was a member of the North Carolina Senate, and in 1790–1791 of the National House of Representatives. After the final cession of its western territory by North Carolina to the United States in 1790 he was appointed brigadier-general of militia for the eastern district of the “Territory South of the Ohio”; and conducted the Etowah campaign against the Creeks and Cherokees in 1795.

When Tennessee was admitted into the Union as a state, Sevier became its first governor (1795–1801) and was governor again in 1803–1809. He was again a member of the National House of Representatives in 1811–1815, and then was commissioner to determine the boundary of Creek lands in Georgia. He died near Fort Decatur, Georgia, on the 24th of September 1815.

See J. R. Gilmore, The Rear-Guard of the Revolution (New York, 1886), and John Sevier as a Commonwealth Builder (New York, 1866). His life is also given in G. D. Robertson, Roosevelt’s The Winning of the West (New York, 1894–1896).

SÉVIGNÉ, MARIE DE RABUTIN-CHANTAL, MARQUISE DE (1626–1696), French letter-writer, was born at Paris on the 5th of February 1626. The family of Rabutin (if not so illustrious as Bussy, Madame de Sévigné’s notorious cousin, affected to consider it) was one of great age and distinction in Burgundy. It was traceable in documents to the 12th century, and the castle which gave it name still existed, though in ruins, in Madame de Sévigné’s time. The family had been gens d’épée for the most part, though François de Rabutin, the author of valuable memoirs on the sixth decade of the 16th century, belonged to the civil classes. Bon de Chantal, was the son of the celebrated “Sainte” Chantal, friend and disciple of St Francis of Sales; her mother was Marie de Coulanges[s]. Celse de Rabutin, a great duellist, was killed during the English descent on the Isle of Rhé in July 1627. His wife did not survive him many years, and Marie was left an orphan at the age of seven years and a few months. She then passed into the care of her grandparents on the mother’s side; but they were both aged, and the survivor of them, Philippe de Coulanges (or Coulan), died in 1636, Marie being then ten years old. Her uncle Christophe de Coulanges, abbé de Livry, was chosen as her guardian. He was somewhat young for the guardianship of a girl, being only twenty-nine, but readers of his niece’s letters know how well “Le Bien Bon” —for such is his name in Madame de Sévigné’s little language-acquitted himself of the trust. He lived till within ten years of his ward’s death, and long after his nominal functions were ended he was in all matters of business the good angel of the family, while for half a century his abodec of Livry was the favourite residence both of his niece and her daughter. Coulanges was much more of a man of business than of a man of letters, but through the influence of this good man he induced him to make of his niece a learned lady. Jean Chapelain and Gilles Ménage are specially mentioned as her tutors, and Ménage at least fell in love with her. Tallemant des Réaux gives more than one instance of the cool and good-humoured rairility with which she received his passion, and the earliest letters of hers that we possess are addressed to Ménage. Another literary friend of her youth was the poet Denis Sanguin de Saint-Pavin. Among her own sex she was intimate with all the coterie of the Hôtel Rambouillet, and her special ally was Mademoiselle de la Vergne, afterwards Madame de la Fayette. In person she was extremely attractive, though the minute critics of the time
SEVIGNÉ, MADAME DE

(which was the palmy day of portraits in words) objected to her divers deviations from strictly regular beauty, such as eyes of different colours and sizes, a "square-ended" nose and a somewhat heavy jaw. Her beautiful hair and complexion, however, were admitted even by these censors, as well as the extraordinary spirit and liveliness of her expression. Her long minority, under so careful a guardian as Coulanges, had also raised her fortune to the amount of 100,000 crowns—a large sum for the time, and one which with her birth and beauty might have allowed her to expect a brilliant marriage. There had been some talk of married her to Bussy, but fortune had nothing to do with this. She married Henri de Sévigné, a Breton gentleman of good family, allied to the oldest houses of that province, but of no great estate. The marriage took place on August 4, 1644, and the pair went almost immediately to Sévigné’s manor-house of Les Rochers, near Vitré, a place which Madame de Sévigné was in future years to immortalize. It was an unfortified chateau of no great size, but picturesque, with the peaked turrets common in French architecture, and surrounded by a park and grounds. The abundance of trees gave it the guise of being clump and somewhat gloomy. Fond, however, of unalloyed delight and absent-minded, and as she was expected that the happiest days of her brief married life were spent there. For there at any rate her husband had no opportunity in Paris of neglecting her, and of wasting her money and his own. Very little good is said of Henri de Sévigné by any of his contemporaries. He was one of the innumerable lovers of Ninon de l’Enclos, and made himself even more conspicuous with a certain Madame de Gondran, known in the nickname slang of the time as "La Belle Loïs." He was wildly extravagant. That his wife loved him and that he did not love her was generally admitted. At last his vices came home to him. He quarrelled with the Chevalier d’Albret about Madame de Gondran, fought with him and was mortally wounded on the 4th of February 1651; he died two days afterwards. There is no reasonable doubt that his wife regretted him a great deal more than he deserved. Though only six and twenty, and more beautiful than ever, she never married again despite frequent offers, and no aspiration was ever thrown, save in one instance, on her fame. For the rest of her life she gave herself up to her children. These were two in number, and they divided their mother’s affection by no means equally. The eldest was a daughter, Françoise Marie, and at fourteen was addressed to him. She had, in October 1646, whether at Les Rochers or in Paris is not certain. The second, a son, Charles, was born at Les Rochers in the spring of 1648. To him Madame de Sévigné was an indulgent, a generous (though not altogether just) and in a way an affectionate mother. Her daughter, the future Madame de Grignan, she worshipped with an almost insane affection, which only its charming literary results and the delightful qualities which accompanied it in the worshipper, though not in the worshipped, save from being ludicrous if not revolting.

After her husband’s death Madame de Sévigné passed the greater part of the year 1651 in retirement at Les Rochers, but she returned to Paris in November of that year. For nearly ten years little of importance occurred in her life, which was passed in Paris in a house she occupied in the Place Royale (not as yet in the famous Hôtel Carnavalet), at Les Rochers, at Livry or at her own estate of Bourhill in the Mâconnais. She had, however, in 1653, a quarrel with her cousin Bussy. Notwithstanding Bussy’s various delinquences the cousins had always been friends; and the most amusing and character-like came to Madame de Sévigné’s correspondence, before the date of her daughter’s marriage, as she describes it. The quarrel was a strong belief in family ties; she recognized in Bussy a kindred spirit, and she excused his faults as Rabutinades and Rabutinages. But a misunderstanding about money brought about a quarrel, which in its turn had a long sequel, and results not unimportant in literature. Bussy and his cousin had jointly come in for a considerable legacy, and he asked her for a loan. If this was not positively refused, there was a difficulty made about it, and Bussy was offended. A year later, at the escapade of Roissy (see Bussy), according to his own account, he improvised (according to probability he had long before written it) the famous portrait of Madame de Sévigné which appears in his notorious Histoire amoureuse, and is a triumph of malice. Circulated at first in manuscript and afterwards in print, this caused Madame de Sévigné the deepest pain and indignation, and the quarrel between the cousins was not fully made up for years, though after Bussy’s disgrace and imprisonment in 1666 the correspondence was renewed. What might have been, and to some extent was, a much more serious matter occurred in 1661 at the downfall of the Superintendent Fouquet. It was said that Madame de Sévigné bought an Indian jewel from her which had been found in the coffer where Fouquet kept his love letters. She protested that the notes in question were of friendship merely, and Bussy (one of the not very numerous good actions of his life) obtained from Le Tellier, who as minister had examined the letters, a corroboration of the protest. But these letters were never published, and there have always been those who held that Madame de Sévigné regarded Fouquet with at least a very warm kind of friendship. It is certain that her letters to Pomponne describing his trial are among her most delicate and affecting pages. Madame de Sévigné, however, was still at work writing her books, which were read as they appeared.

During these earlier years Madame de Sévigné had a great affection for the establishment of Port Royal, which was not without its effect on her literary work. That work, however, dates in its bulk and really important part almost entirely from the last thirty years of her life. Her letters before the marriage of her daughter, though by themselves they would suffice to give her a very high rank among letter-writers, would not do more than fill one moderate-sized volume. Those after that marriage fill nearly ten large volumes in the latest and best edition. We do not hear very much of Mademoiselle de Sévigné’s early youth. For a short time, at a rather late, definite date, she was placed at school with the nuns of Sainte-Marie at Nantes. But for the most part her mother brought her up herself, assisted by the Abbé de la Mousse, a faithful friend, and for a time one of her most constant companions. La Mousse was a great Cartesian, and he made Mademoiselle de Sévigné also a devotee of the bold soldier of Tournai. But she was bent on more mundane triumphs than philosophy had to offer. Her beauty is all the more incontestable that she was by no means generally liked. Bussy, a critical and not too benevolent judge, called her “tante Folle fille de France,” and it seems to be agreed that she resembled her mother, with the advantage of more regular features. She was introduced at court early, and as she danced well she figured frequently in the ballads which were the chief amusement of the court of Louis XIV. in its early days. If, however, she was more regularly beautiful than her mother she had little or nothing of her attraction, and like many other beauties who have entered society with similar expectations she did not immediately find a husband. Various projected alliances fell through for one reason or another, and it was not until the end of 1668 that her destiny was settled. On January 29 in the next year she married François d’Arthém, comte de Grignan, a Provençal, of one of the noblest families of France, and a man of amiable and honourable character, but neither young, nor handsome, nor in reality rich. He had been twice married and his great estates were heavily encumbered. Neither did the large dowry (300,000 livres) which Madame de Sévigné, somewhat unfairly to her son, bestowed upon her daughter, suffice to clear encumbrances, which were constantly increased in the sequel by the extravagance of Madame de Grignan as well as of her husband.

Charles de Sévigné was by this time twenty years old. He never appears to have resented his mother’s preference of his sister; but, though thoroughly amiable, he was not (at any rate in his youth) a model character. Nothing is known of his education, but just before his sister’s marriage he volunteered for a rather harebrained expedition to Crete against the Turks, and served with credit. Then his mother bought him the commission of guidon (a kind of sub-cornet) in the Gendarmes Dauphin, in which regiment he served for some years. But though he always
fought well he was not an enthusiastic soldier, and was constantly and not often fortunately in love. He followed his father into the nets of Ninon de l'Enclos, and was Racine's rival with Mademoiselle Champmeslé. The way in which his mother was made con-

fident of these discreditable and not very successful loves is characteristic both of the time and of the country. In 1669 M. de Grignan, who had previously been lieutenant-governor of Languedoc, was transferred to Provence. The second-in-

chief was the young duke of Vendôme. But at this time he was a boy, and he never really took up the government, so that Grignan for more than forty years was in effect vicerey of this important province. His wife rejoiced greatly in the part of vice-queen; but their peculiar situation threw on them the expenses without the emoluments of the office, so that the Grignan money affairs hold a larger place in Madame de Sévigné's letters than might perhaps be wished.

In 1671 Madame de Sévigné, with her son, paid a visit to Les Rochers, which is memorable in her history and in literature. The states of Brittany were convoked that year at Vitry. This town being in the immediate neighbourhood of Les Rochers, Madame de Sévigné's usually quiet life at her country-house was diversified by the necessity of entertaining the governor, the duc de Chaulnes, of appearing at his receptions and so forth. All these matters are recorded in her letters, together with much good-natured raillery on the country ladies of the neighbourhood and their ways. She remained at Les Rochers during the whole summer and autumn of 1671, and did not return to Paris till late in the year of 1672. She had only stayed, it is true, in the court of the duchess of Orleans. At the end of the next year, 1672, one great wish of her heart was gratified by paying a visit to her daughter in her vice-royalty of Provence. Madame de Grignan does not seem to have been very anxious for this visit—perhaps because, as the letters show in many cases, the exacting affection of her mother was somewhat too strong for her own colder nature, perhaps because she feared such a witness of the ruinous extravagance which characterized the Grignan household. But her mother remained with her for nearly a year, and did not return to Paris till the end of 1673. During this time we have (as is usually the case during these Provencal visits and the visits of Madame de Grignan to Paris) some letters addressed to Madame de Sévigné, but comparatively few from her. A visit of the second class was the chief event of 1674. 1675 brought with it the death of Turenne (of which Madame de Sévigné has given a noteworthy account, characteristic of her more ambitious but not perhaps her more successful manner), and also serious disturbances in Brittany. Notwithstanding these it was necessary for Madame de Sévigné to make her peridical visit to Les Rochers. She reached the house in safety, and the friendship of Chaulnes protected her both from enemies and from the exactions which the miserable province underwent as a punishment for its resistance to excessive and unconstitutional taxation. No small part of her letters is occupied by these affairs.

The year 1676 saw several things important in Madame de Sévigné's life. For the first time she was seriously ill—it would appear with rheumatic fever—and she did not thoroughly recover till she had visited Vichy. Her letters from this place are among her best, and picture life at a 17th-century watering-place with unsurpassed vividness. In this year, too, took place the trial and execution of Jeanne de Lévis, her uncle. This event figures in the letters, and the references to it are among those which have given occasion to unfavourable comments on Madame de Sévigné's character. In the next year, 1677, she moved into the Hôtel Carnavalet, a house which still remains and is inseparably connected with her memory, and she had the pleasure of welcoming the whole Grignan family to it. They remained there a long time; indeed nearly two years seem to have been spent by Madame de Grignan partly in Paris and partly at Livry. The return to Provence took place in October 1678, and next year Madame de Sévigné had the grief of losing La Rochefoucauld, the most eminent and one of the most intimate of her personal friends and constant associates. In 1680 she again visited Brittany, but the close of that year saw her back in Paris to receive another and even longer visit from her daughter, who remained in Paris for four years. Before the end of the last year of this stay (in February 1684) Charles de Sévigné, after all his wandering loves, and after more than one talked-of alliance, was married to a young Breton lady, Jeanne Marguerite de Mauron, who had a considerable fortune. In the arrangements for this marriage Madame de Provence had never interfered, and she divided all her fortune between her children (Madame de Grignan, at the receiving an unduly large share), and reserved only part of the life interest. The greed of Madame de Grignan nearly broke her brother's marriage, but it was finally concluded, and proved happy in a somewhat singular fashion. Both Sévigné and his wife became deeply religious, and at first Madame de Sévigné found their household (for she gave up Les Rochers to them) not at all lively. But by degrees she grew fond of her daughter-in-

law. During this year she spent a considerable time in Brittany, first on business, afterwards in 1680, just to visit it, and partly it would appear for motives of economy. But Madame de Grignan continued with only short absences to inhabit Paris, and the mother and daughter were practically in each other's company until 1688. The proportion of letters therefore that we have for the decade 1677-1687 is much smaller than that which represents the decade preceding it; indeed the earlier period contains the great bulk of the whole correspondence. In 1687 the Abbé de Coulanges, Madame de Sévigné's uncle and good angel, died, and in the following year the whole family were greatly excited by the first campaign of the young marquis de Grignan, Madame de Grignan's nephew, who was sent splendidly equipped to the siege of Philibourg. In the same year Madame de Sévigné was present at the Saint-Cyr performance of Esther, and some of her most amusing descriptions of court ceremonies and experiences date from this time. 1689 and 1690 were almost entirely spent by her at Les Rochers with her son; and on leaving him she went across France to Provence. There was some excitement during her Breton stay, owing to the rumour of an English descent, on which occasion the Breton militia was called out, and Charles de Sévigné appeared for the last time as a soldier. It came to nothing, but it passed at Grignan, and other places in the south, and at the end of it Madame de Sévigné returned to Paris, bringing the Grignans with her; and her daughter stayed with her till 1694. The year 1693 saw the loss of two of her oldest friends—Bussy Rabutin, her faithful and troublesome but in his own way affectionate cousin, and Madame de la Fayette, her life-long companion, and on the whole perhaps her best and wisest friend. Another friend almost as intimate, Madame de Lavardin, followed in 1694. Madame de Sévigné spent but a few months of this latter year alone, and followed her daughter to Provence, which she had not seen since the year after 1691. Two important marriages with their preparations occupied most of her thoughts during 1694-1695. The young marquis de Grignan married the daughter of Saint-Amant, an immensely rich financier; but his mother's pride, ill-nature and bad taste (she is said to have remarked in full court that it was necessary now and then to "manure the best lands," referring to Saint-Amant's wealth and low birth, and the Grignan's nobility) made the marriage not very happy. His sister Pauline, who, in the impossibility of dowering her richly, had a narrow escape of the cloister, made a marriage of affection with the marquis, but it came to nothing, and eventually in 1699 Madame de Saint-Simon and her posterity to be rapidly broken up. Charles de Sévigné and his wife had no children, and he himself, after occupying some public posts (he was king's lieutenant in Brittany
Madame de Sévigné was one of the first women to have a public voice in France and is known for her correspondence, which is considered one of the most significant works of French literature. She was born in 1626 and died in 1706. Her letters are a treasure trove of information about the social, political, and cultural life of her time.

In her letters, Madame de Sévigné writes about her love for literature, her love for her children, and her love for her husband. She is known for her wit, her humor, and her ability to write in a way that makes her readers feel as if they are sitting down to a personal conversation with her.

One of the most famous letters from Madame de Sévigné is a letter to her daughter, Marie, from 1763. In this letter, she talks about her love for her daughter and her desire for her to have a happy life. She also talks about her own life and the struggles she has faced, such as the death of her husband and the many illnesses she has had.

Another famous letter is the one she wrote to her husband, Jean de Sévigné, in 1745. In this letter, she talks about her love for her country and her desire to see France become a great power again.

Madame de Sévigné was a prolific writer, and her letters are a testament to her skills as a writer. Her letters are a source of inspiration for many, and her love for literature is a testament to the importance of reading and writing in our lives.
SEVILLE

continual additions of unpublished letters were made, in great part by the Marquis de Monmouth, and the whole was reprinted in magnificent copies (the originals unfortunately are available for few) in the edition called Des Grands Ecrits, which M. de Monmouth began, but which owing to his death never was finished by M.
Paul Pautard and Sommer (Paris, 1862—1868). This, which super-
seeds all others (even a handsome edition published during its appearance by M. Silvestre de Sacy), consists of twelve volumes of text, and one of plates, the latter having been augmented by new and costly editions that in the collection Didot (6 vols., Paris, v.d.) is the best, though, in common with all others except the Grands Ecrits edition, it contains an adulterated text. Works on Madame de Sévigné are innumerable. Besides essays by nearly all the great French critics from Sainte-Beuve (Portraits de femmes) to M. Brunetière (Études critiques), the work of F. Combes, Madame de Sévigné, historien (1885), and G. Boissier's volume in the Grands Ecrits Francais (1881), should be consulted. The biography by Paul Mesnard is nearly exhaustive, but the most elaborate biographical book is that of Walckenaer (3rd ed., Paris, 1865, 5 vols.), to which should be added the remarkable Histoire de Madame de Sévigné of Aubenas (Paris and St. Petersburg, 1842). In English an excellent little book by Miss Thackeray (Lady Ritchie) (1881) may be recom-

SEVILLE, an inland province of southern Spain, one of the eight provinces into which Andalusia was divided in 1333; bounded on the N. by Badajoz, N.E. by Córdoba, S. by Málaga and Cádiz and W. by Huelva. Pop. (1900) 555,256; area 54,28 sq. m. The province is bisected by the navigable river Guadalquivir (q.v.), which here receives the Genil and Guadaira on the left, and the Guadalimar on the right. West of the Guadalquivir the surface is broken by low mountain ranges forming part of the Sierra Morena; the eastern districts are comparatively flat and very fertile, except along the frontiers of Morocco and Algeria. The province of Granada, of Guadix and Algodonales; and there are extensive marshes near the Guadal-
quivir estuary. Coal, copper, iron ore, silicate of alumina, marble and chalk are the chief mineral products; the province is famous for its oranges, and also exports wheat, barley, oats, maize, olives, oil, wine and chick-peas. Iron-founding and the manufacture of gunpowder and ordnance are carried on by the state, and a great expansion of the other manufactures—leather, pottery, soap, flour, cork products, etc.—took place after 1875 owing to the construction of railways between all the larger towns. Cattle-breeding is an important industry in the plains, and sheep-breeding is carried on everywhere. Other towns described in separate articles are Écija (pop. 1900, 24,372), Osuna (17,826), Carmona (17,215), Utrera (15,138), Morón de la Frontera (14,109), Marchena (12,468), Lebrija (10,997).

SEVILLE (Span. Sevilla, Lat. Ispalis or Hispalis, Moorish Ishbitiyya), the capital of the Spanish province of Seville, and the chief city of Andalusia, on the left bank of the river Guadalquivir, 54 m. from the Atlantic Ocean, and 355 m. by rail S.S.W. of Madrid. Pop. (1900) 148,315. Seville is an archiepiscopal see, a port with many thriving industries, and in size the fourth city in Spain. It is a city of history, art and industry. The province formed the old Visigoth capital called Gibralfaro, and its history, and its treasures of art and architecture render it one of the most interesting places in Europe. It is built in a level alluvial plain, as productive as a garden. Few parts of the city are more than 30 ft. above sea-level, and owing to the frequency of floods an elaborate system of defences against the Guadalquivir and its affluent the Guadaira, Tamarguillo and Tagarete, was undertaken in 1904. This entailed the construction (spread over many years) of dykes, walls and surface drains, the raising of certain streets and railway embankments and the diversion of the lower Tagarete along a new channel leading into the river. The works were all carried out in the summer, when a shade temperature of 116° Fahr. has been recorded. Water is provided by a British company, and a smaller quantity is obtained from Carmona, but the supply is inadequate.

On the right or western bank of the river is the suburb of the Triana, inhabited to a great extent by gipsies. Seville retains its Moorish appearance in the older quarters, although their narrow streets and tortuous ways have been thoroughly traversed, wherever they afford room, by electric tramways. In the more modern districts there are broad avenues and boulevards, the chief of which is the beautiful Paseo de Delicias, along the river and below the city.

The animated and picturesque street-life of Seville has often been painted and described, or even, as in Mozart's Figaro and Don Giovanni, Rossini's Barbiere di Siviglia and Bizet's Carmen, set to music. The townfolk, and the peasants who have come to town for bull-fights, fairs or carnival, have preserved many old customs. Life in Seville, the capital of the two largest provinces of Spain, is very busy, and, with the greater part of its population consisting of persons of few years, the gaiety, wit and grace of manner are proverbial. Nowadays in Spain are the great Church festivals celebrated with so much splendour; Easter at Seville is especially famous, and at this season the city is usually crowded with foreigners. The stately reserve and formality of Madrid society are almost as unknown here as the fervidierialism and political passion of Barcelona or Valencia; loyalty, good humour and light-hearted hedonism have both been characteristic of Sevillano.

Principal Buildings.—The cathedral, dedicated to Santa Maria de la Sede, is the largest church in the world, after St. Peter's at Rome and the Mezquita at Cordova, being 414 ft. long, 271 ft. wide and 100 ft. high to the roof of the nave. The west front is approached by a flight of steps on which the cathedral stands is surrounded by a hundred shafts of columns from the mosque which formerly occupied the site. The work of building began in 1492 and was finished in 1519, so that the one style of Spaniards has been fairly preserved throughout the interior; however much the exterior is spoiled by later additions. Unfortunately the west front remained unfinished until 1827, when the central doorway was completed in a far more ornate manner, and this has been often imitated in later additions. The fine relief above it representing the Assumption was added in 1885. At the east end are two Gothic doorways with good sculpture in the tympana; and on the north side the Puerta del Perdón, as it is called, has some exquisite detail over the horse-shoe arch, and a pair of fine bronze doors. The gateway in the southern façade, designed by Casanova, dates from 1887. The interior forms a parallelogram containing a nave and four aisles surrounding chapels, a centre dome, 121 ft. high, and at the east end a royal sepulchral chapel, which was an addition of the 16th century. The thirty-two immense clustered columns, the marble floor (1575—1575) and the forty-four beautiful capitals, designed by Palma and by Flemish artists of the 16th century, produce an unsurpassed effect of magnificence. The reredos is a enormous Gothic work containing forty-four panels of gilt and coloured wood carvings begun by the work of a Basque artist and added by the hand of architect to the work of the 14th century, and the silver statue of the Virgin is by Francisco Alfarro (1506). The archbishop's throne and the choir-stalls (1755-1548) are fine pieces of carving, and amongst the more modern additions are the altar of San Ildefonso (1519), by Juan de Núñez, and the lectern by Bartolomé Mored of the 16th century. The bronze candelabrum for tenebrae, 25 ft. in height, is a splendid work by B. More (1562). In the Sacristía Alta is a silver repoussé reliquary presented by Alphonso the Wise, in the 13th century; and in the Sacristía Mayor, which is a good plateauser addition made in 1533 from designs by Diego de Ríaño (d. 1532), there is a magnificent collection of church plate and vestments, including the famous silver monstrance (1580—1587), 12 ft. high, by Juan de Arfe (Arpe). At the west end of the nave is the grave of Ferdinand, the son of Columbus, and at the east end in the royal chapel (1544—1566) lies the tomb of St. Ferdinand and of his wife Isabella. The tomb has been expressed three times in the year. This chapel also contains the tombs of Alphonso the Wise (1252—1284) and Pedro I. (1350—1369) and a curious life-size image of the Virgin, which was presented to St. Ferdinand by St. Louis of France, in the 13th century. It is in carved wood with movable arms, seated on a silver throne and with hair of spun gold. The chief pictures in the cathedral are the “Guardian Angel,” the “St. Anthony,” and other works of Murillo; the “Alma de la Tierra,” in the former chapel of the “Immaculada,” the “Nativity” and the “La Generacion” of Luis de Vargas; Valdes Leal’s “Marriage of the Virgin,” and Guadalupe’s “Descent from the Cross.” In the Sacristia Alta are the fine painted ceiling by C. de Guevara (1527—1537) and the “St. Francis” by Murillo and a “St Fери-

1 This was stolen in 1874, sold in New York for £50, and returned by its purchaser, Mr Schaus.
SEVILLE

ten of them before the altar; the custom is an old one but its origin is obscure. The Sagrarío (1618-1662) on the north of the cathedral is a Baroque addition by Miguel de Zumarraga and Fernandez de Izaguirre. The façade is Neoclassical.

At the north-east corner of the cathedral stands the Giralda, a bell tower of Moorish origin, 205 ft. in height. The lower part of the tower, or about 185 ft., was built in the latter half of the 12th century by Alfonso X (1221-1284), while the upper part, to a height of 41 ft., was added by Ferdinand III of Castile in 1258. The Giralda, which in Seville is the Alcazar, a palace comparable in interest and beauty only to the Alhambra of Granada. It was begun in 1181 during the best period of Alfonso X. Alfonso X was surrounded by walls and towers which the Torre del Oro, a decorative tower on the river side, is now the principal survival. The Torre del Oro (1220) has an 18th-century superstructure. Pedro I. made considerable alterations and additions in the Alcazar during the 14th and 15th century, and work, havoc was afterwards wrought by Charles V., Philip III. and Philip V.

Restorations have been effected as far as possible, and the palace is now an extremely beautiful example of Moorish work. The façade, the hall of ambassadors and the Patio de las Muertes are the most striking portions, after which may be ranked the Patio de las Doncellas and the chapel of Isabella. Among other Moorish remains in Seville are the Aljibe de los Moros and the Aljibe de los Arcos. The Casa de Pilatos is Moorish and Renaissance of the 16th century, and in addition to its elegant courtyard surrounded by a marble colonnade, contains some fine decorative work. Somewhat similar in style and period are the Casa del Duque de Sanlúcar and the 15th-century palace of the dukedom of Alva (Palacio de las Dueñas or de las Pinedas).

The following are the most notable churches in Seville: Santa Maria la Blanca, an old Jewish synagogue; San Pedro, 14th-century Gothic, Santa Maria, with the oldest Christian sculptures in Seville; San Marcos, badly restored, but with a remarkable mudejar portal; Santa Elena el Real with beautiful mudejar work; and the Alcázar de San Carlos. Seville contains six masterpieces by Murillo, and two by Velazquez. The chapel of the convent of Santa Paulina dates from 1745, and has a portal magnificently decorated with azulejos. Other churches, though generally deficient in architectural interest, are enriched by paintings or sculptures of Pacheco, Montañés, Alonso Cano, Valdes Leal, Rocas, Campaña, Morales, Vargas and Zurbarán.

The museum was formerly the church and convent of La Merced. It now contains priceless examples of the Seville school of painting, which flourished during the 16th and 17th centuries. Among the masters represented are Velázquez and Murillo (both natives of Seville), Zurbarán, Ribera, de la Hera, Juan de Zurbarán, Juan del Olmo, Alonso Cano, Cespedes, Bocanegra, Valdes Leal, Goya and Martín de Vos. The school founded in 1256 by Alfonso X. became a university in 1525; its present buildings were originally a Jesuit college built in 1591-1596 by the Jesuit architect, Don de Bustamante, but devoted to their present use in 1767 on the expulsion of the Jesuits. The university has faculties of law, philosophy, medicine, and the sciences. The University Library, in Renaissance style, was begun in 1527 and has a fine staircase and hall and handsome carved doors. The Lonja, or exchange, was designed by Herrera in his severe classical style, and completed in 1598; the brown and red marble staircase which leads to the Archivo de Indias is the best part of the design. The archives contain 30,000 volumes relating to the voyages of Spanish discoverers, many of which are still unexamined.

The archbishop's palace dates from 1607; the most notable feature is the Churrigueresque tower. The palace of San Telmo was formerly the seat of a naval college founded by Ferdinand Columbus. An immense doorway is its principal feature. It is built of red marble and is very fine. The church is also important. Other noteworthy buildings are the Mudéjar palaces of the duke of Osuna and the count of Pacheco; the house occupied by Murillo at the time of his death (1682); the civil hospital built in 1556; the hospital of the tulip, founded in 1537; the seminary of the Jesuits, begun in 1624, and the cathedral, begun in 1402.

Commerce and Industries.—The port of Seville, in 37° 10′ N., and 6° 10′ W., has always been one of the chief outlets of the wealth of Spain. It is the terminus of three railways to Madrid, and of other lines running south to Valencia and the Aljarafe. Three of these lines have branches down to the water-side of the quays. The quay on the left bank, 4,500 ft. long, is provided with powerful cranes, and sheds for merchandise. Navigation up the Guadalquivir and down the Ebro from Seville to the river mouth is more dangerous for steamers than for sailing vessels, but is nevertheless certain. The construction of a ship-canal 4 m. long from

the Punta de los Remedios to the Punta del Verde—two points between which the windings of the river render navigation especially difficult—was first proposed in 1839, and was undertaken in 1907. The work was carried on by a British firm, and the completion of the canal vessels drawing 25 ft. (instead of 16 ft.) could come up to Seville. The principal exports are Manzanilla, Amontillado and other wines, oranges and lemons, iron, copper and lead ores, corn, hemp, silk, wool, and other manufactures, and the local oil, manufactured goods, hemp, flax and colonial produce. There are manufacuturers of machinery, tobacco, chocolate, soap, porcelain, beer, liqueurs, brandies, corks and silk. The royal artiletry works and iron foundries are very important. The porcelain and earthenware factory in the Carthusian convent (Cartuja, founded 1491) employs more than 2,000 hands. Pottery has been the characteristic industry of the Triana, from time immemorial; the pottery of Seville, Justa and Rufina, are said by tradition to have been potters here. Equally important is the great is at once and tobacco factory, where 6,000 women are employed.

History.—Seville appears originally to have been an Iberian town. Under the Romans the city was made the capital of Baetica in the second century B.C., and became a favourite resort for wealthy Romans. It was captured in 45 B.C. by Julius Caesar, who gave it the name of Colonia Julia Romula, and made it one of his colonies.

The emperors Hadrian, Trajan and Theodosius were born in the neighbourhood (near present Sanlúcar la Mayor, now Santiponce), where are the remains of a considerable amphitheatre. The chief existing monument of the Romans in Seville itself is the remains of an aqueduct, on four hundred and ten arches, by which water from Alcalá de Guadaira was supplied to the town. At the beginning of the 15th century the Silingian Vandals made Seville the seat of their empire, until it passed in 531 under the Visigoths, who chose Toledo for their capital. After the defeat of Don Roderick at Guadatea in 712 the Moors took possession of the city after a siege of some months. Under the Moors Seville continued to flourish. Ibn Idrisi speaks in particular of its great export trade in the oil of Aljarfe. The district was in great part occupied by Syrian Arabs from Emesa, part of the troops that entered Spain with Balj in 741 at the time of the revolt of the Berbers. It was a scion of one of these Emesan families, Abu'l-Kaisim Mahommed, cadi of Seville, who on the fall of the Spanish caliphate headed the revolt of his townsman against their Berber masters (1023) and became the founder of the Abbáid dynasty, of which Seville was capital, and which lasted under his son Mo'tadid (1042-1099) and grandson Mo'tamid (1099-1103). The city was taken by the Almoravides. The latter part of the first millennium was very oppressive to the Moslems of Spain; in 1113 the people of Seville were prepared to welcome the victorious arms of Alfonso VII, and eleven years later Andalusia broke out in general rebellion. Almohade troops now passed over into Spain and took Seville in 1147. Under the Almohades Seville was the seat of government and enjoyed great prosperity; the great mosque (now destroyed) was commenced by Yusuf I. and completed by his son Almanzor. In the decline of the dynasty between 1236 and 1425 Seville underwent various revolutions, and ultimately acknowledged the Hafsite prince, but Ferdinand III. restored it to Christendom in 1248. Ferdinand brought temporary ruin on the city, for it is said that 400,000 of the inhabitants went into voluntary exile. But the position of Seville was too favourable for trade for it to fall into permanent decay, and by the 15th century it was again in a position to derive full benefit from the discovery of America. After the reign of Philip II. its prosperity gradually waned with that of the rest of the Peninsula; yet even in 1700 its silk factories gave employment to thousands of workpeople; their numbers, however, of the 16th century had fallen to four hundred. In 1800 an outbreak of epidemic smallpox in the city fell heavily on the inhabitants, and in 1810 the city suffered severely from the French under Soult, who plundered to the extent of six millions sterling. Politically Seville has always had the reputation of peculiar loyalty to the throne from the time when, on the death of Ferdinand III., it was the only city which remained faithful to his son Alphonso the Wise. It was consequently much

1 The interesting 15th-century tombs formerly in the Cartuja are now in the church of the university.
favoured by the monarchs, and frequently a seat of the court. For its loyalty during the revolt of the Comuneros it received from Charles V. the motto Ab Hercul et Casarea nobilitas; a se ipsa fedelitas. In 1729 the treaty between England, France and Spain was signed in the city; in 1808 the central junta was formed here and removed in 1810 to Cadiz; in 1823 the cortes brought the king with them from Madrid; and in 1848 the city was combined with Malaga and Granada against Espartero, who bombarded the city but fled to the return of Queen Maria Christina to Madrid.

Guichot y Parodi, Historia del Ayuntamiento de Sevilla (Seville, 1896-1898); J. Cascales y Murillo, Sevilla intelectual (Madrid, 1896); W. M. Gallician, The Story of Seville (London, 1903).

SEVRES, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, midway between Paris and Versailles, about 7 m. from the fortifications of the city. Pop. (1866) 7949. The town owes its celebrity to the porcelain manufactory established there in 1756 and taken over by the State three years later. In the museum connected with the works are preserved specimens of the different kinds of ware manufactured in all ages and countries and the whole series of models employed at Sevres from the beginning of the manufacture, for an account of which see Ceramics. A technical school of ceramics is attached to the factory.

SEWARD, William Henry (1861-1872), American statesman, was born at Hulton, near Bishopsgate, Hants, England, on the 28th of March 1802. He was taken to New England in 1806; graduated at Harvard in 1812; studied divinity; and was resident fellow of Harvard in 1817-1818, and keeper of the college library in 1819-1820. In 1813 he was elected to the General Court for Westfield; from 1818 to 1818 he managed the only licensed printing press in Boston; and as a member of the Board of Assistants in 1818 he was appointed the editor of the University of New York. He was a member of the Council in 1811-1823, and in 1812 he was made one of the special commissioners of the university of the United States. He was the author of a tract on the universities of England and of a pamphlet on the preparatory department of the University; and St. Luke's Memorial (1878), the home of the Theological Department; and St Luke's Memorial Chapel (1907). The University is governed by a board of trustees consisting of the bishop, one clergyman and two laymen from each of ten Protestant Episcopal dioceses in the Southern States.

SEWARD, Anna (1747-1809), English writer, often called the "Swan of Lichfield," was the elder daughter of Thomas Seward (1710-1750), prebendary of Lichfield and of Salisbury, and author. Berthy at Eyam in Derbyshire, she passed nearly all her life in Lichfield, beginning at an early age to write poetry, particularly at the instigation of Dr. Erasmus Darwin. Her verses include elegies and sonnets, and she also wrote a poetical novel, Louisa, of which five editions were published. Miss Seward's writings, which include a large number of letters, are decidedly commonplace, and Horace Walpole said she had "no imagination, no novelty."

Sir Walter Scott edited her Poetical Works in three volumes (1820-1840); the first volume prefixed a memoir of the author, adding extracts from her literary correspondence. He refused, however, to edit the bulk of her letters, and these were published in volumes by A. Constable as Letters of Anna Seward, 1783-1807 (Edinburgh, 1841). An edition of Dr. Seward's Letters was published as Dr Darwin (1841). See E. V. Lucas, A Swan and her Friends (1907); and S. Martin, Anna Seward and Classic Lichfield (1909).

SEWARD, William Henry (1861-1872), American statesman, was born on the 16th of May 1801 in the village of Florida, Orange county, New York. He graduated from Union College in 1829, having taught school for a short time at Savannah, Georgia, to help pay his expenses; was admitted to the bar at Utica, N.Y., in 1822, and in the following year began the practice of law at Auburn, N.Y., which was his home for the rest of his life. He was admitted to the bar at Utica, N.Y., in 1822, and in the following year began the practice of law at Auburn, N.Y., which was his home for the rest of his life. He soon attained distinction in his profession, but drifted into politics, for which he had a greater liking, and early became associated with Thurlow Weed. He was at first an adherent of Daniel D. Tompkins in state, and a National Republican in national politics, after 1828 became allied with the Anti-Masonic party, attending the national conventions of 1830 and 1831, and as a member of the organization he served four years (1830-1834) in the state legislature. By 1833 the Anti-Masonic movement had run its course, and Seward allied himself with the other opponents of the Jackson Democrats, becoming a Whig. In 1834 he received the Whig nomination for governor, but was defeated by William L. Marcy. Four years later he was re-nominated, was elected, was re-elected in 1840, and served from January 1835 until January 1843. As governor, Seward favoured
a continuance of works of internal improvement at public expense, although this policy had already plunged the state into financial embarrassment. His administration was disturbed by the anti-rent agitation and by the M'Leod incident growing out of the Canadian rebellion of 1837.\(^1\) During this period he attracted much attention by his liberal and humane policy, promoting prison reform, and proposing to admit Roman Catholic and foreign teachers into the public schools of the state. His refusal soon after his inauguration to honour the requisition of the governor of Virginia for three persons charged with assisting a slave to escape from Norfolk, provoked retaliatory measures by the Virginia legislature, in which M'Leod and South Carolina soon joined. Laws were also passed during his term putting obstacles in the way of recovering fugitive slaves. Seward soon became recognized as the leader of the anti-slavery Whigs. He was one of the earliest political opponents of slavery, as distinguished from the radical Abolitionists, or the followers of William Lloyd Garrison, who eschewed politics and devoted themselves to a moral agitation.

On retiring from office Seward returned to the practice of law. His reputation was made in four great criminal cases—those of Van Buren, H. B. Seward, H. Zant—and the last-named bringing him especially the goodwill of opponents of slavery. Toward the end of his career at the bar, however, he changed from a general practitioner to a patent lawyer, and as such had a lucrative practice.

When the Whigs secured a momentary control of the state legislature in 1840 they sent Seward to the United States Senate. The antagonism between free labour and slave labour became the theme of many of his speeches. In his first set speech in the Senate, on the 11th of March 1850, in opposing the pending compromise measures, he attracted the attention of the whole country by his assertion that "there is a higher law than the constitution" regulating "our authority over the domain" (i.e., the Territories). When the Democrats, however, declared such language incendiary he tried to explain it away, and by so doing offended his friends without appeasing his opponents. In a speech at Rochester, New York, in 1853 he made the famous statement that there was "an irrepressible conflict between opposing and enduring forces, and it means that the United States must and will, sooner or later, become either entirely a slave-holding nation or entirely a free-labour nation." Although this idea had often been expressed by others, and by Seward himself in his speech of 1848, yet he was severely criticized, and four days later he sought to render this statement innocuous also.

In the election of 1852 Seward supported General Winfield Scott, but not his party platform, because it declared the Compromise of 1850 a finality. He naturally opposed the Kansas-Nebraska Bill of 1854, which repealed the Missouri Compromise and established the principle of popular sovereignty in the Territories. Subsequently he actively supported in the Senate the free-state cause in Kansas. In 1854-1855, when it became evident that the Whig party in the North was moribund, Seward helped to lead its scattered remnants into the Republican fold. As the recognized leader of the new party, his nomination by the Republicans for the presidency in 1856 and in 1860 was regarded as certain; but in each instance he was put aside for another. The heterogeneous elements of the new organization could not be made to unite on a man who for so many years had devoted his energies to purely Whig measures, and he was considered less "available" than Fremont in 1856 and than Lincoln in 1860. After Lincoln was nominated in 1860, Seward threw his support to his friend Johnson, and left the contest. In the struggle between the Executive and Congress over the method of reconstructing the Southern States, Seward sided with Johnson and thus shared some of the obloquy bestowed upon that unfortunate president. His greatest work in this period was the purchase of Alaska from Russia, in 1867. He also negotiated treaties for the purchase of the Danish West Indies, the Bay of Samana, and for American control of the isthmus of Panama; but these were not ratified by the Senate. After returning to private life, Seward spent two months in Europe and half in travel and died at Auburn on the 10th of October 1872.

His son, Frederick William Seward, was born in Auburn, New York, on the 8th of July 1830, graduated at Union College in 1849 and was admitted to the bar at Rochester, N.Y., in 1851. From 1851 to 1861 he was one of the editors and owners of the Albany Evening Journal, and during his father's term at the head of the State Department he was assistant secretary of state. He served in the New York Assembly in 1875, and from 1877 to 1881 was again assistant secretary of state. After 1881 he

\(^1\) In 1837 the vessel "Caroline," which had been used by the Canadian insurgents, was seized by the Canadian authorities in American territory and was destroyed. In 1840 one Alexander M'Leod, a British subject then in New York, asserted that he had aided the Caroline. A grand jury in New York indicted him for his secret trial on a charge of murder. The British minister demanded from the national government M'Leod's release, but his case was in the New York court, in which the national government has no jurisdiction. In the trial M'Leod proved an alibi, was acquitted (October 1841), and a serious international complication was thus averted.

SEWELL, WILLIAM (1834–1874), English divine and author, was born at Newport, Isle of Wight, on the 23rd of January 1834, the son of a solicitor. He was educated at Winchester and Merton College, Oxford, was elected a fellow of Exeter College in 1857, and from 1851–1853 was a tutor there. From 1836–1841 he was Whyte's Professor of Moral Philosophy. Sewell, who took holy orders in 1839, was a friend of Pusey, Newman and Keble in the earlier days of the Tractarian movement, but subsequently considered that the Tractarians leaned too much towards Rome, and dissociated himself from them. When, however, in 1849, J. A. Froude published his Nemesis of Faith, Sewell denounced the wickedness of the book to his class, and when one of his pupils confessed to the possession of a copy, seized it, tore it to pieces, and threw it in the fire. In 1843 he, with some friends, founded at Rathfranham, near Dublin, St Columba's College, designed to be a sort of Irish Eton, and in 1847 helped to found Radley College. Sewell's intention was that each of these schools should be conducted on strict High Church principles. He was originally himself one of the managers of St Columba, and sub-warden of Radley, but his business management was not successful in either case, and his personal responsibility for the debts contracted by Radley caused the secession of his Oxford fellowship. In 1852 his financial difficulties compelled him to leave England for Germany, and he did not return till 1870. He died on the 14th of November 1874. His publications include translations of the Agamonmon (1846), Georgics (1846 and 1854) and Odes and Epodes of Horace (1850); An Introduction to the Dialogues of Plato (1841); Christian Politics (1844); The Nation, the Church and the University of Oxford (1849); Christian Vestiges of Creation (1861).

His elder brother, RICHARD CLARKE SEWELL (1803–1864), practised successfully as a barrister in England, and then went to Australia, where he became a leading lawyer. In 1857 he was appointed reader in law to the University of Melbourne. He was the author of a large number of legal works. A younger brother, HENRY SEWELL (1807–1879), who became a solicitor, acted in London as secretary and deputy-chairman of the Canterbury Association for the Colonization of New Zealand, and eventually went out to the colony, and in 1854 was elected to the House of Representatives. In 1856 he became first premier of New Zealand. Subsequently he held the office of attorney-general (1861–1863) and minister of justice (1864–1865 and 1869–1872). In 1876 he returned to England, where he died on the 14th of May 1879.

Another brother, JAMES EDWARDS SEWELL (1810–1903), warden of New College, Oxford, was educated at Winchester and New College. In 1830 he became a fellow of his College, and practically passed the rest of his life there, being elected to the headship in 1856. The first University Commission had just released the colleges from the fetters of their original statutes, and Sewell was called on to determine his attitude towards the strong reforming party in New College. Though himself instinctively conservative, he determined that it was his duty to give effect to the desire of the majority, with the result that New College led the way in the general reform movement, and from being one of the smallest became the second largest college in Oxford. Sewell was vice-chancellor of the university 1874–1878. He died in his ninety-third year on the 29th of January 1903, having been warden for 43 years, and was interred in the College cloisters.

A sister, ELIZABETH MISSING SEWELL (1815–1906), was the author of Amy Herbert and many other High Church novels, and of several devotional books. An edition of her works was published in eleven volumes (1886).

SEWER, a large drain for carrying away by water excreta and other refuse, known therefore collectively as "sewage" (see SEWAGE below); also, in a wider and older sense, the term for conduits such as are used for the draining of the fields, or of the water-courses, sea-defences, &c., over which the local authorities, known as commissioners of sewers, exercise jurisdiction. In English law a "sewer," as distinguished from a "drain," is that which carries away the sewage of more houses or other buildings than one. Many fanciful derivations of the word are given, but there seems no doubt that the word is from O. Fr. sewièr, Med. Lat. servieria, the sluice of a mill-pond, from the Late Lat. ex-aquaria, a means of conducting water out of anything; this is paralleled by Eng. "ewer," a water-jug, which undoubtedly comes from aquaria, through O. Fr. eure, for water, mod. eau.

The old name "sewer," for a table attendant who placed and removed the dishes from the table, acted as waiter, &c., must be distinguished. In the household ordinances of Edward II. the word seems to appear in the form assour, and in those of Edward IV, as asseswer, an officer of the household who superintended the serving of a banquet. Assour represents O. Fr. assiour, to set, set, Lat. adisset, to set; adisset sewer, certainly the same as "waste" or "or sew, sewage," sew; juice, broth, pottage, cognate with suesus, juice.

SEWERAGE, a general term for the process of systematically collecting and removing the fouled water-supply of a community. The matter to be dealt with, may conveniently be classified as made up of three parts: (1) excreta, consisting of urine and faeces; (2) slop-water, or the discharge from sinks, basins, baths, &c., and the waste water of industrial processes; (3) surface water due to rainfall. Before the use of underground conduits became general, the second and third conditions were commonly allowed to sink into the neighbouring ground, or to find their way by surface channels to a watercourse or to the sea. The first constituent was conserved in middens or pits, either together with the dust, ashes, kitchen waste and solid waste generally or separately, and was carried away from time to time to be applied as manure to the land. In more modern times the pits in which excrement was collected took the form of covered tanks called cesspools, and with this modification the primitive system of conservancy, with occasional removal by carts, is still to be found in many towns. Even where the plan of removing excrement by sewers has been adopted, the kitchen waste, ashes and solid refuse is still treated by collecting it in pails or bins, whose contents are removed by carts either daily or at longer intervals, the refuse frequently being burned in destructors (q.v.). It therefore forms no part of the nearly liquid sewage which the other constituents unite to form.

The first constituent is from an agricultural point of view the most valuable, and from a hygienic point of view the most dangerous, element of sewage. Even healthy excreta decompose, if kept for a short time after they are produced, and give rise to noxious gasses; but a more serious danger proceeds from the fact that in certain cases of sickness these products are charged with specific germs of disease. Speedy removal or destruction of excremental sewage is therefore imperative. It may be removed in an unmixed state, either in pits or tanks or (with the aid of pneumatic pressure) by pipes; or it may be defaecated by mixture with dry earth or ashes; or, finally, it may be conveyed away in sewers by gravitation, after the addition of a relatively large volume of water. This last mode of disposal is termed the water-carriage system of sewerage. It is the plan of sewerage which at the present time is most generally adopted, the effluent being carried away in conduits by the help of an adequate water supply, and it is probably the mode which best meets the needs of any large community. The sewers which carry the diluted excreta serve also to take slop-water, and may or may not be used to remove the surface water due to rainfall. The water-carriage system has the disadvantage that much of the agricultural value of sewage is lost by its dilution, while the volume of foul matter to be disposed of is greatly increased.

I. COLLECTION OF SEWAGE.—House drains, that is to say,
those parts of the domestic system of drainage which extend from the soil-pipes and waste-pipes to the sewer, are generally made of glazed stoneware pipes having a diameter of 4 in., 6 in., or sometimes 9 or 12 in., according to the estimated amount of waste to be removed. In ordinary domestic dwellings there is rarely any occasion to use pipes of a greater diameter than 6 in., and this only for the main drain, the branches and single lines of piping being 4 in. in diameter. It is a good rule to have all the channels and breaks, and holes cast into the stoneware pipe, as small in diameter as possible, having due regard to efficient capacity. Such a drain is more cleanly than one too large for its purpose, in that it is more thoroughly flushed when in use, the sewage running at a much faster speed through a full pipe than through one only partially full. For this reason a pipe having too great a capacity for the work it has to do is liable to become corroded by sediment deposited from slowly moving waste.

The pipes are made in 2 ft. lengths and are formed with a socket at one end into which the straight end of the next pipe fits tightly. This is wedged in position with a little gasket and the remaining space then carefully filled with neat Portland cement (fig. 1). Pipes are made also with a bituminous substance in the socket and around the spigot end, and by merely pushing the one into the other the joint is made. The bitumen is curved to allow self-adjustment to any slight settlement, so that damage to the joint is avoided (fig. 2). A composite joint may be used having the bitumen lining reinforced with the ordinary Portland cement filling (fig. 3). This type is somewhat more expensive than the ordinary jointing, but it makes a powerful and effective connexion. The method of connecting two lead pipes by a "wiped solder joint" is shown in fig. 4. Fig. 5 shows the method of connecting a lead pipe into the socket of a stoneware one, a brass sleeve piece or ferrule being used to give the necessary stiffness to the end of the lead pipe. This arrangement is frequently used, for example, at the base of a soil-pipe at its junction with the circumferential drain. In the next figure (fig. 6) the lead pipe has a brass socket in a stoneware pipe. This form of connexion is used between a water-closet and a lead trap. The joint shown in figs. 5 and 6 is similarly made when an iron pipe is substituted for a stoneware one, but instead of the Portland cement filling, molten lead is used and carefully caulked to form a water-tight joint.

In the water-carriage system of drainage each house has its own network of drain-pipes laid under the ground, into which are taken the waste-pipes which lead from the closets, urinals, sinks, lavatory basins, and rain-water and other gullies within and about the house. The many branches are gathered into one or more manholes, and connexion is finally made by means of a single pipe with the main drain, or with the sewer. Gas from entering the house drains by a disconnecting trap fixed in the manhole nearest the entrance to the sewer. The fundamental maxims of house sanitation are first, that there shall be complete disconnexion between the pipes within and without the house, and second, that the drainage shall be so constructed as to allow for the free admission of air in order to secure the thorough ventilation of all parts of the system and avoid the possibility of the accumulation of gas in any of the waste- or drain-pipes. The drains must be planned to conduct the waste material from the premises and gathered up into the main channel in the centre. It will be seen that in case of blockage it would be a simple matter to clear any of the pipes with...
the drain-rod. The cap to the clearing arm has a chain attached by which it can be removed in case of flooding. The channels are beached up at the sides with cement, and the manhole is rendered on the inside with a cement lining. A fresh air inlet is taken out near the top of the chamber and is fitted with a slotted flap valve. The cover is of cast-iron in a cast-iron frame shaped with grooves to afford a double seal, the grooves being filled with a composition of tallow and fine sand. Where there is a danger of a backflow from the sewer due to its becoming flooded, a hinged flap should be placed at the junction of drain and sewer to prevent sewage from entering the house drain. A ball trap designed for this purpose may be used in place of a flap, and is more satisfactory, for the latter is liable to become corroded and work stiffly. In the ball-trap appliance the flowing back of the sewage forces a copper ball to fit tightly against the drain outlet, the ball dropping out of the way of the flow directly the pressure is relaxed.

The water-carriage system of drainage is undoubtedly the most nearly perfect yet devised. At the same time it is a very costly system to install with its network of sewers, pumping stations, and arrangements for depositing the sewage either in the sea or river, or upon the land or "sewage farm." In country districts and small towns and villages, however, excreta are often collected in small vessels and removed in tank carts and deposited upon the land. The dry-earth system introduced by the Rev. Henry Moule (1801–1880), and patented in 1860, takes advantage of the oxidizing effect which a porous substance such as dry earth exerts by bringing any sewage with which it is mixed into intimate contact with the air contained in its pores. The system is of rather limited application from the fact that it leaves other constituents of sewage to be dealt with by other means. But so far as it goes it is excellent, and where there is no general system of water-carriage sewerage an earth-closet will in careful hands give perfect satisfaction. Numerous forms of earth-closet are sold in which a suitable quantity of earth is automatically thrown into the pan at each time of use (fig. 10), but a box filled with dry earth and a hand scoop will answer the purpose nearly as well. A plan much used in towns on the continent of Europe is to collect excrement in air-tight vaults which are emptied at intervals into a tank cart by a suction pump. Another pneumatic system adopted on the continent has the cesspools at individual houses permanently connected with a central reservoir by pipes through which the contents of the former are sucked by exhausting air from the reservoir at the central station.

Newly laid drains should be carefully tested before the trenches are filled in to detect any defects in the pipes or joints. These should be made good and the test again applied until the whole system is in perfect order. Cement joints should be allowed to set for at least forty-eight hours before the test is made.

There are several methods of testing. For the stone-ware drains laid under the ground the water test is generally adopted. After the lower end of the length of drain to be tested has been securely stopped (fig. 11) the drain is filled with water from its upper end until the desired pressure is obtained. To obtain the required head of water extra lengths of pipe are sometimes taken up temporarily at the upper end of the drain or, as an alternative, both ends of the pipe may be plugged and water introduced under pressure by a force pump through a small aperture provided in the pipe. The exact pressure may then be ascertained by a water pressure gauge. An escape of water through some defective portion of the drain is indicated by the subsidence of the level of the water in the upper part of the drain or by a diminution in the pressure shown by the gauge. Then the defect must be located and remedied and the drain re-tested until all weak points are eliminated. This process must be repeated in each section of the drainage system until the whole is found to be sound and tight. It is not necessary to test drains laid with ordinary socket joints made in cement with a greater pressure than is obtained with a 5 ft. or 6 ft. head of water. A foot head of water gives at its base a pressure of 433 lb. per square inch, so that a head of 6 ft. would result in a pressure of just over 25 lb. per square inch. Cast-iron drain-pipes with caulked lead joints will withstand a pressure of nearly 90 lb. per square inch of internal surface, but in actual practice it is sufficient if they are tested with a pressure of 10 lb. or say a head of 20 to 24 ft.

The "smoke test" or one test is sometimes applied instead of the water test. The drain is plugged, as in the latter, and air is then pumped into the pipes until the desired pressure is registered by the gauge attached to the apparatus. This pressure should be maintained without appreciable diminution for a stipulated period before the drains are passed as sound.

The smoke test is generally used for testing vertical shafts such as soil-pipes and ventilators to which the water test cannot be conveniently applied owing to the excessive pressure produced at the lower portion of the pipe by the head of water. It is applied by stopping the ends of the pipes and introducing smoke by a drain-rod or a smoke-producing machine which forces volumes of thick smoke through an aperture in the stopper. The pipes and joints are then carefully inspected for any evidence of leakage.

The "scent test" is occasionally employed for testing soil and ventilating pipes, but the apparatus must be carefully handled to avoid the material being split in the building and thus misleading the operator. The test is made by introducing into the drain some substance possessing a powerful odor such as oil of peppermint, camphor carbide, or other suitable material, and tracing any defect by means of the escaping odour. This is not so effective a method as the smoke test, as there is more difficulty in locating leakages. Gulleys, traps and other similar fittings should be tested by pouring in water and observing whether siphonage or unsealing occurs. This of course will not happen if the appliances are of good design and properly ventilated. A section of a drain plug or stopper is shown in fig. 11. It has a head of india-rubber which expands when the screw is turned and presses tightly against the inside of the drain-pipe. In the centre of the plug is a capped aperture which allows for smoke

SEWERAGE
testing and also allows the water gradually to escape after a test by water. 

Existing drains which have become defective and require to be made good must be exposed, taken up and laid in new pipes, unless advantage be taken of a method which, if it is claimed, renders it possible to make them permanently watertight so as to withstand the water test under pressure, and at the same time to disinfect them and the surrounding soil. This end is accomplished with the aid of patent machines which on being passed through the drain-pipe first remove all obstructions and accumulations of foul matter and then thoroughly cleanse and disinfect it, saturating the outside concrete and contaminated soil adjacent to the leak with strong disinfectants. Subsequently, loaded with the best Portland cement, another machine is passed through the drain, and, by powerful evenly-distributed jets of compression, forces the cement into every hole, crack or crevice in the pipes and joints. This work leaves the inner surface of the pipes perfectly clean and smooth. After the usual time has been allowed for the cement to set the air test is applied, and the drain is claimed to be perfect if every joint of a new drain, because the foundation is not disturbed by the process, and the risk of settlement, which is often the cause of leaky drains, is remote.

Every sanitary fitting should be trapped by a bend on the waste-pipe; this is generally made in one piece and fixed up near to the sink, or closet or basin, as the case may be. The traps of small wastes such as those of sinks and lavatories should be fitted with a brass screw cap, exposed, taken up and laid in new pipes. Their object is to hold a quantity of water sufficient to prevent the access of foul air through the waste-pipe into the house. The depth of the water "seal" should not be less than two in., or it may become easily unsealed in hot weather through the evaporation of the water. Unsealing may be caused, too, by "siphonage," when a number of fittings are attached to the same main waste without the branches being properly ventilated just below each trap. The discharge from one fitting in this case would create a partial vacuum in the other branches and probably suck the sealing water from one or more of the traps.

To obviate such an occurrence an "anti-siphonage" pipe is fixed having its upper end open to the air and provided with branches tapping such waste-pipe just below the trap. Then, with this contrivance, a discharge from any fitting, instead of causing air to be sucked in through the trap of another fitting, thereby breaking the seal and allowing foul drain air to enter the house, merely caused a slight disturbance to the necessary air through the anti-siphonage pipe, leaving the other traps with their seals intact (fig. 12). There are many forms of traps for use in different positions, one of the principles and purposes of all are identical. Two forms commonly used are known as the S and the P trap. The bell trap and the D trap are obsolete.

To collect the rain and waste water from areas, yards, laundry and other floors and similar positions an open trapped gulley is used. It is usually of stoneware and fitted with an open iron grate which admits the water (fig. 13). Many of these gullies are made too shallow and specifically get choked if the water they receive is charged with mud or sand. To obviate this difficulty

Great attention has been directed to the design of sanitary fittings, with the object of making them as nearly self-cleansing as possible. In the fixing of closets the wood casings which usually encircle them are removed from around every water-closet are going steadily out of use, their place being taken by a hinged seat supported on metal bracket and arrangement which allows every part of the appliance to be readily cleaned with a cloth. In hospitals and similar institutions a form of closet is made fitted with lugs which are built into the wall; in this way support is obtained without any assistance from the floor, which is left quite clear for sweeping.

Lavatory basins and sinks are also supported on cantilevers in the stoneware, and the waste pipes which were formerly often fixed around these appliances are now generally omitted.

There are several distinct types of water-closets. Each type is made in many different patterns, both good and bad from a sanitary point of view, and, whatever the type decided upon, care is necessary in selecting to obtain one efficient and hygienic in shape and working. The principal kinds of closets now in use are the washdown, siphonic, valve, washout and hopper.

Washdown closets (fig. 16) are most commonly used. They are inexpensive to buy and to fix, and being made in one piece and simple in construction without any mechanical working parts are not liable to get out of order. When properly adapted by brick or concrete work they will stand very rough usage. The objection is sometimes raised with regard to washdown closets that they are noisy in action. This must be allowed with many patterns, but some of the latest designs have been greatly improved in this respect, and when fitted with a silent flushing cistern are not open to this objection.

Siphonic closets (fig. 17) are a type of washdown in which the contents of the pan are removed by siphonic action, an after flushing arrangement providing for the rescaling of the trap. They are practically silent in action and with a flush of three gallons work very satisfactorily. Where the restrictions of the water company require the usual two gallon flush the ordinary washdown pan should be used.

Valve closets (fig. 18) are considered by many authorities on sanitation to be preferable to all other types. For domestic buildings, hotels, and where not subjected to the hardest wear, they are undoubtedly of great value. They should have a three gallon flush, and on this account they cannot be used in many districts owing to the "company's" regulations stipulating that a flush of not more than two gallons may be used.

The washout closet (fig. 19) is a type that never attained much popularity as it has been found by practical experience to be unsanitary and objectionable. The standing water is too shallow, and the receiving basin checks the force of the flush and the trap is therefore frequently imperfectly cleared.

Hopper closets are of two kinds—the long hopper and the short hopper. These are the forecourts of the closet whose shape the short hopper pan resembles, but instead of pan and trap being made in one piece the fitting consists of a freelate or semi-circular, with straight sloping sides and central outlet jointed to a trap of lead or other material. The joint should be placed so as to be always kept under water by
the seal of the trap. The long hopper pan is a most objectionable type of closet which should be rigorously avoided as it easily becomes foul and is most insanitary. In most districts its use is prohibited.

A water-waste preventer. Porter in a small tank fixed usually 4 or 5 ft. above a closed vent is a device by which water to a certain extent is allowed to flow down the piping into the pan of the closet, clearing out its contents and replacing the fouled water with clean. The flushing tank is automatically filled with water by a valve fitted with a copper ball which rises on the surface of the incoming water and shuts off the flow when the tank is full. Fig. 20 is a sectional drawing of one of the latest patterns and clearly shows its construction. The water-supply is shown passing to the top of the regulating ball valve attached. An overflow is provided and a pipe is led from this to an external outlet. The capacity of the ordinary domestic flushing cistern is two gallons, which is the maximum quantity allowed by most water companies. A three gallon flush is much better, however, and where this larger quantity is allowed should be adopted. Larger tanks for ranges of closets or urinals are often made to flush automatically when full, and for these the rate of water supply may be upon galvanized iron cantilever brackets which are built into the wall.

Like closets, urinals have undergone much improvement in design and manufacture. The oldest types are of glazed ware, and have vertical curved backs and sides about 4 ft. high with a flushing rim round the top and terminating in a base discharging into an open glazed channel waste, but in the case of a range of urinals, the discharge from all and conveys it into

![FIG. 21.—Bath, With Standing Waste.](image)

A trapped gully at one end of the range. This is the type usually fixed in street conveniences and similar positions. Plate and iron urinals are often fixed, but there is more difficulty in keeping them clean on account of the sharp angle and the unsuitability of the material. Urinals are seldom fixed in private houses or offices, an ordinary cast-iron or enamelled porcelain closet with a "tip-up" seat serving every purpose. Such seats are often fitted with balance weights to cause them to swing automatically when not in use as a cloak. Unless kept in clean and well flushed with water, urinals are liable to become a nuisance.

In London among other towns the system of drainage is a "combined" one, that is, the storm water and the domestic sewage and waste is all collected in one sewer. For many reasons it is considered satisfactory to have the two drains quite separate. In many districts this is done, but it entails the provision of a double system of drainage for each house, one drain being provided for rain-water, the other for sewage. Where combined drainage is installed an excess of water poured into the sewer during a storm often results in back flow and the flooding of basements and cellars with sewage. Such an occurrence might take place where a separate sewer for the storm water, but in this case the flooding would be with comparatively harmless rain-water and sewage. Figs. 23 and 24 show two ground plans of the same house, a semi-detached suburban residence, one with combined drainage and the other with separate drains for storm water and sewage. In both figures the rain-water drains are shown in a dotted line, and other drains in a full line.

In fig. 23, A is a 4 in. ventilating-pipe taken up to a point above the building. C is a trapped gully such as is shown in fig. 13. D is a gully with channel head (fig. 14) into which are taken the discharges from the scullery sink on the ground floor, and from the bath and lavatory on the first floor. E is an untrapped manhole, with open channel bends and sealed cast-iron cover, from which any branch of the drains can easily be cleared by the use of drain-rods. F is a soil-pipe from a bath and lavatory on the first floor, and is carried up above the roof to serve as a ventilator. G is a trapped gully as fig. 13, taking the discharge from the rain-water-pipe over it and serving also to drain the gully. D and J are similar gulleys. K is a manhole with trap for intercepting the foul gases from the sewer and preventing them from entering the house drains. The manhole is fitted with a sealed cast-iron cover and has an inlet at L with mica flap valve to admit pippet. If piping brought up to the surface of the ground and finished with a cap, which is removed when it is found necessary to clear away any obstruction. A special shaped junction here allows the rods to be pushed down, either branch as required. D and E are trapped gulleys as already described. F is an untrapped gully serving to ventilate the drain. G, H and J the same as for fig. 23. K is a pair of manholes built side by side, one for storm water and the other for sewage. Both are fitted with intercepting traps, and the sewage chamber is ventilated by an air inlet at L as in fig. 23. The cover of the storm water manhole need not be sealed, and if necessary could be fitted with a grating and be used to drain the forecourt.
The London by-laws regulating drainage are very full and are strictly enforced. They include requirements regarding the size, form, gradient and methods of construction and repair of drains, together with regulations affecting the design and fixing of traps, fittings and other apparatus connected with sanitary arrangements. Some of the headings of the different clauses of the by-laws are subjodined—water-closets; earth-closets; drainage of subsoil; drainage of surface water; rain-water pipes; materials, &c., for drains; size of drains; drain to be laid on bed of concrete 6 in. thick; if under buildings to be cemented with 6 in. of concrete; drain to be beched up with concrete to half its diameter; fall of drain; joints of drain; drain to be water-tight; thickness and weight of iron pipes; thickness of sockets and joints of stoneware pipes; drains under buildings; composition of coping; every inlet to drain to be trapped; drain beneath wall to be protected by arch, flagstone, or iron lintel; drain connected with sewer to be trapped and means of access to trap provided; no right-angled junctions to be formed either vertical or horizontal; at least two untrapped openings to be provided for ventilation, each fitted with a grating or cowl with apertures for passage of air equal in area to that made by the Department of Buildings, 1896, and to which there have been several small amendments. Section 141 of the Building Code also requires that plans and specifications of sanitary works vary only a slight degree from those in force under the London authorities. It is in the regulations affecting the execution of the work that we find a great difference, and these in New York are of course more stringent than in any other capital. Thus no sanitary, plumbing or lighting work may be undertaken without first submitting for approval to the Department of Buildings complete and suitable drawings and particulars of the materials to be used. Such a notice is necessary even in the case of repairs and alterations to existing work. As a further guarantee of the work being satisfactory it is ordained that no such work shall be executed except under the superintendence of a registered plumber. Every master plumber in the city of New York or others working therein must obtain a certificate of competency from the Examination Board and be registered afresh every year during the March, as without such certificate or licence no work can be undertaken; any person violating such requirements shall upon conviction be fined for each offence $250 or undergo three months' imprisonment or both, while in the case of any certificated plumber or his employees wilfully breaking with his knowledge, any of the rules and regulations relating to drainage and plumbing, the certificate of the master is to be forfeited in addition to the aforementioned fine.

II. CONVEYANCE OF SEWAGE.—For small sewers, circular pipes of glazed stoneware or of moulded cement are used, from 6 in. to 18 in. and even 20 in. in diameter. The pipes are made in short lengths, and are usually jointed by passing the end or spigot of one into the socket or faucet of the next. Into the space between the spigot and faucet a ring of gasket or tarred hemp should be forced, and the rest of the space filled up with cement. Other methods of joining have already been described and illustrated. The pipes are laid with the spigot ends pointing in the direction of the flow, with a uniform gradient, and, where practicable, in straight lines. In special positions, as under the bed of a stream, cast-iron pipes are used for the conveyance of sewage. Where the capacity of an 18-in. circular pipe would be insufficient, built sewers are used instead of stoneware pipes. These are sometimes circular or oval, but more commonly of an egg-shaped section, the invert or lower side of the sewer being a curve of shorter radius than the arch or upper side. The advantage of this form lies in the fact that great variations in the volume of flow must be expected, and the egg-section presents for the small or dry-weather flow a narrower channel than would be presented by a circular sewer of the same total capacity. Figs. 25 and 26 show two common forms of egg-sections, with dimensions expressed in terms of the diameter of the arch. Fig. 26 is the more modern form, and has the advantage of a sharper invert. The ratio of width to height is 2 to 3.

Built sewers are most commonly made of bricks, moulded to suit the curved surface of which they are to form part. Separate invert blocks of glazed earthenware, terra-cotta or fire-clay are often used in combination with brickwork. The bricks are laid over a template made to the section of the sewer and are grouted with cement. The thickness of brickwork for sewers over 3 ft. in diameter should not be less than 9 in., but for smaller sewers laid in good ground at depths not exceeding 20 ft. from the surface a thickness of 4|1 in. will suffice if well backed up with concrete. The thickness of brickwork for a
SEWERAGE

sizer of any size may be determined in feet by the formula \( dr/100 \), where \( d \) = depth of excavation in feet and \( r \) = external radius in feet.

An egg-shaped sewer, made with two thicknesses of brick, an invert block, and a concrete setting, is illustrated in fig. 27. Concrete is largely used in the construction of sewers, either in combination with brickwork or alone. For this purpose the concrete consists of from 5 to 7 parts of sand and gravel or broken stone to 1 of Portland cement. It may be used as a cradle for or as a backing to a brick ring, or as the sole material of construction by running it into position round a mould which is removed when the concrete is sufficiently set, the inner surface of which may be coated with a thin layer of cement. A development in the construction of concrete sewers, whether laid in sectional pipes or constructed and moulded in situ, is the use of iron or steel bars and wires embedded in the material as reinforcement. Such conduits can be constructed of any size and designed to withstand high pressures. Fig. 28 is a section of a concrete sewer having a diameter of more than 9 ft. constructed with round rod reinforcement. With regard to the method for calculating the proportions, generally speaking the thickness of the concrete shell should be no place be less than one-twelfth of the greatest internal diameter of the tube, while the steel reinforcement should be designed to resist the whole of the tensile stress.

Where the safe tensile stress in the steel is \( \frac{8}{3} \) tons per sq. in., \( P \) = the pressure in pounds per sq. in., and \( r \) = the internal radius in inches; the weight of the reinforcement per sq. ft = \( \frac{Pr}{450} \), while its area at each side of the pipe per longitudinal foot, when \( f \) = safe tensile stress in the reinforcement in pounds, is \( \frac{Pf}{120} \).

In determining the dimensions of sewers, the amount of sewage proper may be taken as equal to the water supply (generally about 30 gallons per head per diem), and to this must be added (when the "combined" system is adopted) an allowance for the surface water due to rainfall. The latter, which is generally by far the larger constituent, is to be estimated from the maximum rate of rainfall for the district, and from the area and character of the surface. In the sewerage of Berlin, for example, the maximum rainfall allowed for is \( \frac{1}{6} \) of an inch per hour, of which one-third is supposed to enter the sewers. In any estimate of the size of sewers based on rainfall account must of course be taken of the relief provided by storm-overflows, and also of the capacity of the sewers to become simply charged with water during the short time to which very heavy showers are invariably limited. Rainfall at the rate of 5 or 6 in. per hour has been known to occur in Germany for a few days, but it is unnecessary to provide (even above storm-overflows) sewers capable of discharging any such amount as this; the time taken by sewers of more moderate size to carry off of itself prevents the discharge from them from reaching a condition of overflow which it carries away from this, the risk of damage by such an exceptional fall would not warrant so great an initial expenditure. Engineers differ widely in their estimates of the allowance to be made for the discharge of surface water, and no rule can be laid down which would be of general application.

In order that sewers should be self-cleansing, the mean velocity of flow should be not less than \( \frac{2}{3} \) ft. per second. The gradient necessary to secure this is calculated on principles which are stated in the article HYDRAULICS (q.v.). The velocity of flow, \( V \), is

\[ V = \sqrt{r\cdot m} \]

Velocity of discharge.

where \( i \) is the inclination, or ratio of vertical to horizontal distance; \( m \) is the "hydraulic mean depth," or the ratio of area of section of the stream to the wetted perimeter; and \( c \) is a coefficient depending on the dimensions and the roughness of the channel and the depth of the stream. A table of values of \( V \) per hour for the greatest velocity multiplied by the area of the stream gives the rate of discharge. Tables to facilitate the determination of velocity and discharge in sewers of various dimensions and gradients will be found in Latham's and other practical treatises.

Where the contour of the ground does not admit of a sufficient gradient from the gathering ground to the place of destination, the sewage may be pumped at any or all points in its course. To minimize this necessity, and also for other reasons, it is frequently desirable not to gather sewage from the whole area into a single main, but to carry off of sewage of high levels of the town by separate high-level or interception sewers.

It is undoubtedly necessary to construct overflows for storm water collection with combined systems of sewerage. Storm water overflows. For example, a low-lying area or district, which might be added to take the overflow of a stream, which would thereby suffer contamination. A better plan is to direct the discharge into a dry ditch or depression where the sewage is likely to be carried away by the wind or rain particles by contact with the air may quickly become oxidized. In agricultural districts it might be possible by arrangement with farmers to run the overflow over grass-land, as it has good manorial properties.

Occasionally when a sewer has to cross a stream or other obstruction it is found impossible to bridge or carry the pipe across and ensure proper gradient. In such cases the sewer may be carried under the obstruction by means of an inverted siphon. The exact form that should be given to inverted siphons is disputed, but it is generally agreed that they are expedient to be avoided wherever possible. The major part taken up by the form of the street section, that is, they have two sloping pieces corresponding with the banks with a flat cross-piece under the bed of the stream. The pipes are invariably of iron and should be laid in as large a diameter as possible, the siphon is usually made as a duplication of the sewer pipes, and pulled through from end to end. At either end of the siphon pipes there are manholes into which the pipes are built. Penstock valves also should be provided at each end so that sewage can be shut off out of one or both of the siphons as desired for clearing purposes.

Tumbling bays being prohibited, the usual method of leading a high-level sewer into a low-level sewer is by means of a ramp. This arrangement is in connection with the siphon into which the end of the high-level sewer is taken and finished usually with a flap valve. Some distance back along the sewer a wide-throated junction is placed in the invert of the sewer, and from this junction a ramp-pipe is taken down to the inverted sewer, so that the sewage in the upper sewer instead of having a direct fall runs down the slope of the ramp. The ramp-pipe is usually constructed of iron and is of smaller section than the high-level sewer because of the greater fall and pressure.

In the low-laying parts of towns storage tanks are often constructed to receive the sewage of such districts. They are periodically emptied of their contents, which are pumped up into the main sewers through which the sewage travels to the outfall. This storing of sewage should be avoided whenever possible. It is much better to provide for raising it as it is produced either by an installation of one or more automatic lifts, such as Adams's sewage lifts, or, where a large amount of material is to be dealt with, a centrifugal pump or a centrifugal pump for sewage, by a Shone ejector worked by compressed air.

Sewer gas is a term applied to the air, fouled by mixture with gases which are formed by the decomposition of sewage, and by the oxygen of the air; it may also arise from the decomposition of the sewer in the variable space above the liquid stream. It is universally recognized that sewer gas is a medium to which the inhabitants of towns are occasionally exposed, and systems of sewerage stringent precautions are taken to keep it out of houses. It is equally certain that the dangerous character of sewer gas is reduced, if not entirely removed, by free admixture with the oxygen of fresh air. Sewers should be liberally ventilated, not
only for this reason, but to prevent the air within them from ever having its pressure raised (by sudden influx of water) so considerably as to force the "traps" which separate it from the atmosphere of dwellings. The plan of ventilation now most approved is the very simple one of making openings from the sewers to the surface of the street at short distances—generally shafts built of brick and cement—and covering these with metallic gratings. Under each grating it is usual to hang a wooden tray to catch any stones or other material that fall through from the street, but the passage of air to and from the sewer is left as free as possible. The openings to the street are frequently made large enough to allow a man to go down to examine the clean the sewers, and are then called "manholes." Smaller openings, large enough to allow a lamp to be lowered for purposes of inspection, are called "lampholes," and are often built up of vertical lengths of drain-pipe, 6 in. or 9 in. in diameter, and finished at the surface with a cover similar to that used for a manhole but lighter. A length of 150 ft. of pipe sewer is about the limit that can be sighted through. Lampholes are mostly used in the construction of pipe and other small sewers.

To facilitate inspection and cleaning, sewers are, as far as possible, laid in straight lines of uniform gradient, with a manhole or lamphole at each change of direction or of slope and at each junction of mains with one another or with branches. The sewers may advantageously be stepped here and there at manholes. Sir R. Rawlinson pointed out that a difference of level between the entrance and exit pipes tends to prevent continuous flow of sewer gas towards the higher parts of the system and makes the ventilation of each section more independent and thorough. When the gradient is slight, and the dry-weather flow very small, occasional flushing must be resorted to. Flap valves or penstocks are introduced at manholes; by closing these for a short time (or clean water introduced for the purpose) is dammed up behind the valve either in higher parts of the sewer or in a special flushing chamber, and then released. Many self-acting arrangements for flushing have been devised which act by allowing a continuous stream of comparatively small volume to accumulate in a tank that discharges itself suddenly when full. A valuable contrivance of this kind is Rogers Field's siphon flush tank. When the liquid in the tank accumulates so that it reaches the top of the annular siphon, and begins to flow over the lip, it carries with it enough air to produce a partial vacuum in the tube. The siphon then bursts into action, and a rapid discharge takes place, which continues till the water-level sinks to the foot of the bell-shaped cover. Adams's "Monster Flusher" is constructed on similar principles and is of simple and strong design. Its flushing-power is claimed to be greater than that of the ordinary siphon. By the use of this appliance, which is automatic in action, shallow sewers can be effectively flushed. Fig. 29 is a section of a flushing chamber fitted with this siphon. Such flushing apparatus should be operated by a water-supply from an ordinary tap which must be regulated for a large or small flow. The capacity of flush tanks is a little difficult to determine. As a rule, 

![Fig. 29. - Flushing Chamber for Shallow Sewers.](image)

250 to 400 gallons are allowed for 9-in. sewers, 400 to 600 gallons for 12-in., and 600 to 800 gallons for 15-in. sewers, the amount increasing by 200 gallons for each 3-in. additional diameter.

III. DISPOSAL OF SEWAGE.—The composition of domestic sewage is now fairly well known and is generally reduced for the purpose of making solutions. It is to say, ordinary sewage is that due to a water-supply of about 30 gals. per diem. If the supply is less, and there is no leakage of subsoln water into the drainage system, the sewage will be stronger; conversely, if there is leakage, &c., the sewage will be more dilute, but obviously, the quantity of impurities will, for any given population, be the same in amount. The subjoined table shows the kind of sewage referred to:

<table>
<thead>

</table>

For all practical purposes we may say that average sewage contains two tons of suspended matters in each million gallons, one-half of which is mineral matter. When, however, we come to a consideration of trade waste, the question becomes difficult in the extreme, because of the great variety of trades, and the ever varying quantities added to the sewage. Some of the principal trade wastes are from dye-works, print-works, bleach-works, chemical works, tanneries, breweries, paper-makers, woolen-works, silk-works, iron-works and many others. In some cases one only of these trade wastes finds its way to the sewer; in others, several of them may be found. In some instances, again, these trade wastes are of an alkaline nature, in others they are acid; the mixtures may be either, and of greatly varying character. Next the paper waste must be considered. The flow is very variable throughout the entire 24 hours, but in the case of sewers discharging domestic sewage only, such sewage being of the standard strength, it will be a close approximation to the facts to say that about two-thirds is discharged between the hours of 7 A.M. and 7 P.M., one-half during the eight hours of maximum flow, two-fifths during the six hours of maximum flow, and about 7½% per hour during the two hours of maximum flow. These data will be sufficient for the design of the works intended for dealing with the sewage. Separate consideration must be given to the method of removing or of by-passing subsoil water. In very large systems, again, the maxima are rather less because of the time occupied by the sewage in travelling to the outfall from the more remote parts of the district. In cases where one set of sewers is employed for both sewage and rainfall the sewage flow may be increased more than a hundredfold within a few minutes by heavy rainstorms. Of course the sewage disposal works can only deal with a small proportion of such flow, and the balance is discharged into some convenient water-course or other suitable place. Even when the separate system is employed, as in the case of town, the flow may be increased ten to fifteen times by rain, because it is unusual to carry two sets of drains to the backs of the houses. In designing outfall works, therefore, all these circumstances must be carefully considered. Again, when the sewage is pumped, as is frequently the case, the size of the tanks must often be increased, because in the smaller installations the whole of the day's sewage is frequently pumped out in a few hours; this fact must also be remembered when designing filters.

Nearly every town upon the coast turns its sewage into the sea, and the sewage of the sea is obvious. The object to be attained is its dispersion in a large volume of sea-water. As it is lighter than salt water it tends to rise against leaving the sewer; the outfall should, therefore, if practicable, terminate in deep water, so that the two liquids may become well mixed. The currents must be studied by means of floats, and in most cases the sewage must be discharged upon the ebb tide only, and then perhaps not throughout the entire period, the object being to prevent it from being carried towards the shore. That the purification is effected mainly by means of living organisms is well established, and it has been urged by competent authorities that this system is not wasteful, since the organic matter forms the food of the lower organisms, which in turn are devoured by fish. Thus the sea is richer, if the land is the poorer, by the adoption of this cleanly method of disposal. The next step is the partial purification of the sewage by means of a chemical process. When a town lies some distance up an estuary, as for example London, Glasgow, Rochester, and many others, the dilution may be insufficient to prevent a nuisance, or the suspended matters may be deposited upon the foreshore to be uncovered at low water. The first stage of purification is then employed, namely, clarification in tank waste, varies with regard to the practical effect of any particular treatment, it is now recognized that the matters in solution are scarcely touched by any chemical process that can be employed, but the removal of the suspended matter is a great...
Colonel Moore, septic with the Martin, the P. is It extent, frequently Dibden, most
charged to the works and failure, precisely the same remarks apply with aluminium sulphate or with ferrous sulphate, is most frequently employed. When the resulting sewage sludge has to be filter-pressed, lime is almost essential for the primary treatment of the sewage, in order to destroy the glutinous nature of the sludge. In the case of large towns like London, Manchester and Salford, the sludge is shipped in specially designed steamers, of 600 tons to 1000 tons burden, and discharged into the sea at a distance from the coast. The London outfall works have a fleet of six steamers, which convey the sludge out to Barrow Deep, a channel in the North Sea about 10 m. east of the Nore lightship. Each vessel has four oblong tanks having a total capacity of 1000 tons of sludge, which can be discharged in seven minutes when the valves are fully opened. The sludge is discharged about 10 ft. under the water and being agitated by the action of the ship's screws is very completely diffused. The sand and earthy matters soon subside and the organic matter is rapidly consumed by the organic life in the sea-water. A careful microscopical examination and chemical analysis failed to detect more than the merest trace of the mineral portion of the sludge, either as suspended or liquid. But, as has been already stated, the bed could be thoroughly aerated. No doubt a better way would be to distribute the sewage in the form of a shower of liquid, and work the beds continuously, but this involves a good deal of expense for spreading appliances, and a fall is necessary in the works, which is not always obtainable. Probably the most complete installation of the kind last referred to is that at Salford. Iron pipes are led over the surface of the filters, and spraying nozzles are placed at short intervals, so that the sewage is applied in the form of a heavy shower. But whatever form the filters and appliances, it may assume, the final result is the same. If the filters are properly aerated the aërobiotic organism establishes itself in prodigious numbers, and attacks the organic matter, breaking it down into harmless, soluble and gaseous products. It is, of course, assumed that the filters are adequate in area, and are properly managed. With regard to the materials to be employed in making sewage filters, it is now well established that the size of the particles has a more important bearing than their composition. At the same time, it may be remarked that materials with very rough surfaces, as for instance coke breeze, are more effective than those with smooth surfaces. Doubtless the organic impurities have made this difference, but the result is, and no doubt a given quantity of material with rough surfaces will harbour greater numbers than the same amount of smooth. A reference must be made to the Manchester experiments. The experts' report suggested the provision of 60 acres of filters for dealing with the sewage of the city, which is said to average 30 million gallons per day in dry weather. But after inquiry into the merits of the proposal the officials of the Local Government Board recommended that the filters should be 92 acres in extent, and that the effluent should be finished on land. The filters should be provided in a sequence, and at least six times were also recommended, such filters being designed to pass 500 gallons per sq. yd. per diem. In this case clarified sewage was to be dealt with on filters 3 ft. 4 in. in depth, composed of clinkers broken to pass a sieve with meshes of 1½ in., but retained on one with meshes of ½ in. It will be observed, therefore, that the bacterial treatment of sewage has scarcely as yet emerged from the experimental stage, but it will certainly be adopted in many cases where it is impracticable to obtain good land in sufficient quantity for the purification of the sewage. With regard to the disposal of sewage-sluage in inland towns, until it has been fairly established by a long trial that bacteria will dispose of this material, the reduction of its bulk by means of filter-presses will be found to be the most satisfactory method of dealing with it. The practical effect is the conversion of 5 tons of offensive mud into 1 ton of hard cake, which may be readily handled and carted. The cost is usually about 28. 6d. per ton of cake, and a million gallons of average sewage produce about 8 tons.

SEWING 1 MACHINES. The sewing machine, as is the case with most mechanical inventions, is the result of the efforts of many persons, although it would appear that the most meritori- ous of these worked in ignorance of the labours and successes of others in the same field. Many of the early attempts to sew by machinery went on the lines of imitating ordinary hand- sewing, and all such inventions proved failures. The method of hand-sewing is of necessity slow and intermittent, seeing that only a definite length of thread is used, which passes its full extent through the cloth at every stitch, thus causing the working arm of man or otherwise to travel a great length for every stitch made, and demanding frequent renewals of thread.

The foundation of machine-sewing was laid by the invention of a double-pointed needle, with the eye in the centre, patented by Charles F. Weisenthal in 1755, with the object of avoiding the necessity for inverting the needle in sewing or embroidering. Many of the features of the sewing machine are distinctly specified in a patent secured in England by Thomas Saint in 1790, in which he, inter alia, described a machine for stitching, quilting, or sewing. Saint's machine, which appears to have been invented primarily for the purpose of sewing claws, was fitted with an awl which, working vertically, pierced a hole for the thread. A spindle and projection laid the thread over this hole, and a descending forked needle pressed a loop of thread through it. The loop was caught on the under side by a reciprocating hook; a feed moved the work forward the extent of one stitch; and a second loop was formed by the same motions as the first. It, however, descended within the first, which was thrown off by the hook as it caught the second, and being thus secured and tightened up an ordinary tambour or chain stitch was formed. Had Saint hit on the idea of the eye-pointed needle his machine would have been a complete anticipation of the modern chain-stitch machine.

The inventor who first devised a real working machine was a poor tailor, Barthélemy Thimonier, of St Étienne, who obtained letters patent in France in 1830. In Thimonier's apparatus the needle was crocheted, and descending through the cloth it brought up with it a loop of thread which it carried through the previously made loop, and thus it formed a chain on the upper surface of the fabric. Though the machine was rather clumsy, made principally of wood, as many as eighty were being worked in Paris in 1841, making army clothing, when an ignorant and furious crowd wrecked the establishment and nearly murdered the unfortunate inventor. Thimonier, however, was not discouraged, for in 1845 he twice patented improvements on it, and in 1848 he obtained both in England and the United Kingdom patents for further improvements. The machine was then made entirely of metal, and vastly improved on the first model. But the troubles of 1848 blasted the prospects of the resolute inventor. His patent rights for Great Britain were sold; a machine shown in the Great Exhibition of 1851 attracted no attention, and he died in 1857 unfriended and unrewarded.

The most important ideas of an eye-pointed needle and a double thread or lock-stitch are strictly of American origin, and that combination was first conceived by Walter Hunt of New York about 1832-1834. Hunt reaped nothing of the enormous pecuniary reward which has been shared among the inventors of the sewing machine, and it is therefore all the more necessary that his great merit as an inventor should be insisted on. He constructed a machine having a vibrating arm, at the extremity of which he fixed a curved needle with an eye near its point. By this needle a loop of thread was formed under the cloth to be sewn, and through that loop a thread carried in an oscillating shuttle was passed, thus making the lock- stitch of all ordinary two-thread machines. Hunt's invention was purchased by a blacksmith named Arrowsmith, and a good deal was done towards improving its mechanical details, but no patent was sought, nor was any serious attempt made to draw attention to the invention. After the success of machines

---

1 "Sew," for stitching with a needle, is a word common to Indo-European languages; cf. Lat. scire, Gr. σαίειν, sarēō, Sansk. svē. base on his two devices was fully established, Hunt in 1853 applied for a patent; but his claim was disallowed on the ground of abandonment. The most important feature in Hunt's invention—the eye-pointed needle—was first patented in the United Kingdom by Newton and Archbold in 1841, in connexion with golve-stitching.

Apparently unconscious of the invention of Walter Hunt, Elias Howe, a native of Spencer, Mass., directed his attention to machine-sewing about the year 1843. In 1844 he completed a simple model, and in 1846 he patented his sewing machine (fig. 1). Howe was thus the first to patent a lock-stitch machine, but his invention had the two essential features—the pointed needle and the frame. Howe's machine was sold in England to William F. Thomas of Cheapside, London, a corset manufacturer, for £350. The patent was secured in December 1846 the English patent in his own name, and engaged Howe on weekly wages to adapt the machine for his manufacturing purposes. The career of the inventor in London was unsuccessful; and, having pawned his American patent rights in England, he returned in April 1849 in poverty to America. There in the meantime the sewing machine was beginning to excite public curiosity, and various persons were making machines which Howe found to trench on his patent rights. The most prominent of the manufacturers, if not of inventors, ultimately appeared in Isaac Merritt Singer (1811- 1875), who in 1851 secured a patent for his machine (fig. 2). Howe now became alert to vindicate his rights, and, after regaining possession of his patented patent, he instituted suits against the infringers.

An enormous amount of litigation ensued, in which Singer figured as a most obstinate defendant, but ultimately all makers became tributary to Elias Howe. It is calculated that Howe received in the form of royalties on machines made up to the period of the expiry of his extended patent (September 1867—he died in the next month) a sum of not less than 12 millions of dollars.

The practicability of machine-sewing being demonstrated, inventions of considerable originality and merit followed in quick succession. One of the most ingenious of all the inventors —who worked also without knowledge of previous efforts—was Mr Allan B. Wilson. In 1849 he devised the rotary hook and bobbin combination, forming the special feature of the Wheeler & Wilson machine. Wilson obtained a patent for his machine, which included the important and effective four-motion feed for moving the work after every stitch, in November 1850. In February 1851 William O. Grover, a tailor, of Boston, patented
his double chain-stitch action, which formed the basis of the Grover & Baker machine. In 1856 James A. E. Gibbs (1829—1902), a Virginia farmer, devised the chain-stitch machine, improved subsequently by J. Willcox and now known as the Willcox & Gibbs. These together—all American inventions—form the types of the various machines now in common use. Thousands of patents have been issued in the United States and Europe, covering improvements in the sewing machine; but, although its efficiency and usefulness have been greatly increased by numerous accessories and attachments, the main principles of the various machines have not been affected thereby.

In machine sewing three varieties of stitch are made: (1) the simple chain or tambour stitch, (2) the double chain stitch and (3) the lock stitch. In the first variety the machine works with a single thread; the other forms use two, an upper and an under thread.

The structure of the chain stitch is shown in fig. 3. The needle first descends through the cloth, then as it begins to ascend the friction of the thread against the fabric is sufficient to form a small loop into which the point of a hook operating under the cloth plate enters, expanding and holding the loop while the needle rises to its full height. The thread length, the hook with its loop is also projected so that when next the needle descends its loop is formed within the previous loop. The hook then releases loop No. 1, seizes and expands loop No. 2, and in so doing advances the sewing line on the fabric, but plain on the upper surface of the fabric. The seam so made is firm and elastic, but easily undone, for if at any point a thread is broken the whole of the sewing can be readily run out backwards by pulling the thread, just as in crochet work. To certain extent this imperfection in the chain-stitch machine is overcome in the Wilcox & Gibbs machine, in which each loop, by means of a rotating hook, is twisted half a revolution after it has passed through its predecessor. The somewhat complicated course of the threads in the double chain stitch of the Grover & Baker machine is shown in fig. 4. The under thread was supplied from an ordinary bobbin and was threaded through a circular needle of peculiar form. The machine was wasteful of thread, and the sewing formed a knotted ridge on the under side of the fabric.

The lock stitch is that made by all ordinary two-thread sewing machines, and is a stitch peculiar to machine sewing. Its structure is, as shown in fig. 5, very simple, and when by proper tension the threads interlock within the work it shows the same on both sides, and is very secure. When, however, the tension on the upper thread is weak, the under thread runs along the surface as at b, held more or less tightly by the upper loops. It will be seen that to make the lock stitch the under thread has to be passed quite through the loop of the upper thread. That is done in two principal ways. By the first plan a small metal shuttle, holding within it a bobbin of thread, is carried backward and forward under the cloth plate, and at each forward movement passes through the upper thread loop formed by each succeeding stroke of the needle. Such is the principle devised by Hunt, introduced by Howe, and improved by Singer and many others. The second principal method of forming the lock stitch consists in seizing the loop of the upper thread by a rotating hook, expanding the loop and passing it around a stationary bobbin within which is wound the under thread. The method is the invention of A. B. Wilson, and is known generally as the Wheeler & Wilson principle. The rotary hook seen at b, fig. 6, is so bevelled and notched that it operates to interlock the needle thread within the bobbin of under thread, after which it throws off the loop and the formed loop is pulled up and tightened either by the underside or the upper loop. To certain extent this principle is adopted in the Lock of under thread, after which it throws on the the machine of under thread, after which it throws off the loop and the so-formed lock stitch is pulled up and tightened either by an independent make-up hook or a set of lock stitches in later machines, or by the expansion of the next loop as in the older forms. The lock, lenticular in form, and its case B, fig. 6, fit easily into a circular depression within the hook, against which they are held by the bobbin holding the under thread within it.

Intermediate between the shuttle and the rotary-hook machines is the oscillating-shuttle machine introduced by the Singer Co. The shuttle is hook-formed, not unlike the Wilson hook, and it carries within it a capacious circular bobbin of thread. fig. 7. This shuttle is driven by an oscillating driver attached to an annular race-way a, and, instead of revolving completely like the Wilson hook, it oscillates only in an arc of 180°, so far as serves to catch and clear the upper thread. The oscillating-shuttle and rotary-hook machines work with great smoothness and rapidity.

Sewing machines are now made in hundreds of varieties for special kinds of work. Some, for example, are capable of performing the most complicated operations in ornamental stitching, a horizontal right and left motion, in addition to the ordinary vertical motions, being for this purpose often imparted to the needle bar; others will sew button-holes at the rate of 8 or 10 a minute; while others again will sew on the buttons, making the required number of stitches, stopping automatically with the needle at its highest point, and cutting the threads off close to the underside of the work. In some cases two or more needles are fitted, producing parallel rows of stitches; with a machine having 12 needles a single operation may make as many as 24,000 stitches a minute. Special forms of machine are designed to meet the requirements of the glove-sewer, the umbrella-maker, &c. In sewing carpets the great weight of the material makes feeding difficult, and therefore machines have been invented that move along the carpet, which itself remains stationary. The earlier forms were hand-worked; the two lengths of carpet were stretched across the room, and the machine travelled along the seam, followed by the operator, who turned it by means of a hand-crank. One of these machine was capable of doing the work of eight or ten hand-sewers. With later forms, operated by electricity or other power and running along a track, the carpet is stretched and sewed so rapidly that one power machine does the work of eight to ten hand machines. The introduction of sewing machines has revolutionized the boot and shoe industry, and boots are sewn by the machine, the Buehner wire-sewing machine and Smyth thread-sewing machine being prominent representatives of this class.

SEX (Lat. sexus; possibly connected with secure, to cut), the character of being either male or female, which can be attributed to the vast majority of animals, but less correctly to the higher plants, where the so-called male and female organs, or flowers, are part of the sexless generation (see REPRODUCTION: Plants). The primary distinction of sex resides in the essential organs of reproduction (genitaria). An organism that contains the germinal tissue or mass of tissue known as the testis, and producing the
SEX

Among fishes, secondary sexual characters are common. Spines are developed on the head and pectoral fins of the males of some species, and are produced by modiﬁcation of the basal cartilages, useful in the prehension of the female. In the male salmon, a cartilaginous projection, developed during the breeding season, is used as a female clasping organ. In the trout, the upper jaw is produced by the development of the upper teeth, and in old males the jaws become hook-like and the teeth are greatly increased in size. In the thornback, the adult male has the teeth sharp-pointed and backwardly-directed, while those of the female are broad and rounded. In some ﬂies, the males are actively parasitic, and those between the sexes in size and general shape are not striking, but there are many instances of the males exhibiting crests, or special processes which may be classed as ornaments, and peculiar patterns are bright colours, during the breeding season.

Secondary sexual differences appear in the vast majority of birds. The shape seldom differs markedly, but differences in size are common, sometimes, as in birds of prey, the females, and sometimes, as in the allies of the domestic fowl, the males being larger. In a large number of instances the males are more pugnacious and are better armed, the bones and musculature being heavier, the beaks and claws stronger, and the males may be larger than the females. It is present only in the males or be relatively small in the females. Special ornaments such as crests and wattles, combs, caruncles, differences of the skin, and elongated or peculiarly shaped feathers are frequently observed. Such characters are produced only during the breeding season, and in the vast majority of cases conﬁned to the males. The voice almost invariably varies with the sex, is associated with the breeding period and is much more highly developed in the male, while structural developments such as modiﬁcations of the trachea, vocal sacs and resonators and differences in the larynx are frequently present and on the whole distinctive of the males. Differences of size and colour are characteristic of many species, and a few of them, such as the rufous tinged (Phalaropus), phalaropes (Phalaropus), and cassowaries, the females exceed the males in size and brilliancy, and it is interesting to notice that in such cases the sexual distinction of habit may be reversed, the females being pugnacious, aggressive, and courtiers of the males, whilst the latter are shy and may attend to the brood. Such exceptions are so rare that they may be called abnormal, for the rule among birds is, that where secondary sexual characters are displayed, ornamentation, voice, brilliant pattern and colour, pugnacity and amorousness are distinctive of the male. Secondary sexual differences of the same nature are abundant among mammals. The males are more robust and larger and are often equipped with weapons such as horns, the tusks, and the weapons of the feline and carnivorous orders. Differences of size and colour are more frequent; in the higher Decapods the males and in the lower Crustacea the females frequently being larger, the disparity being extreme in some of the parasitic copepods and isopods where the males are minute and attached to the females. In reptiles and birds a very large number of invertebrates there are no visible secondary sexual characters.

C. Darwin, in the portion of the Descent of Man devoted to "Selection in relation to Sex," brought together what remains the most valuable and valuable account of the existence and distribution amongst animals of secondary sexual characters, and it would be necessary to describe many of these without the use of the distinction of the groups of facts involved. Among Crustacea the sexes frequently differ, but in most cases the differences concern the primary organs of reproduction, and the examination of the reproductive organs of the female and male, which are often very different in structure and function. Differences of size in females are frequent; in the higher Decapods the males and in the lower Crustacea the females frequently being larger, the disparity being extreme in some of the parasitic copepods and isopods where the males are minute and attached to the females. In reptiles and birds a very large number of invertebrates there are no visible secondary sexual characters. Among Arachnids conspicuous differences in colour and size occur, the males generally being smaller, more active and possessed of relatively longer appendages, and more highly decorated. Amongst Insects, the differences may be very marked and are related to the release of the females. In many cases the males are winged, the females wingless and grub-like. In few insects, the males are highly pugnacious and are furnished with special weapons for fighting with their rivals. Amongst the Hemiptera and Orthoptera there are many instances where the males possess organs capable of producing loud and strident noise, and in the case of Cupid's dart, whilst in other cases, both sexes produce call-notes. Particularly amongst the Coleoptera, the males may differ very greatly from the females, either in the bodily form or in the degree and nature of the extraordinary shape and colour of the males. The most notable sexual differences are in coloration, and whilst there are many instances where both sexes are inconspicuous, and a few where both are brilliantly colored, there are also many instances where the males are displayed by the display of more conspicuous patterns and of brighter colours. It may be said of Insects in general that it is the more common case for secondary sexual characters to exist in that the sexes may be distinguished at a glance.
are the physiological stimulus which awakens the development of the auxiliary and secondary sexual characters.

Auxiliary primary and secondary sexual characters are so many and various that general statements regarding them are difficult and uncertain. In the broadest fashion, however, the following generalizations appear to hold. Amongst vertebrates it is rare. A number of such characters begin to appear at puberty. Young or immature forms resemble the sex in which such characters are least marked, while the young and the undistinguished sex resemble ancestral forms. The sex that is distinguished is usually the male, and the characters are usually hypertrophies or specializations of characters that appear in the females and the young. (It is to be remembered that specialization may be the result of the suppression of characters as well as their acquisition, and there are a remarkable number of cases in which we may, at least tentatively, picture the bright sexual colour of males as due to the suppression of a pigment which masks them in the female.)

**Hermaphroditism** is the condition in which gonads producing ova and gonads producing spermatozoa are contained in the same individual. Its distribution in the animal kingdom is irregular, and apparently independent of natural affinity, and the balance of opinion is in favour of regarding it not as a primitive condition, but as a secondary acquisition. C. Claus has pointed out that it is frequent among sessile animals, as for instance Sponges, Anemones, Corals, Polyzoa, bivalve Molluscs, and Tunicates, and Echinoderms. Amongst the Vermes it is rare. It is extremely common amongst almost every kind of parasitic animal. The obvious suggestion is that if the condition be primitive, it has been preserved, and if not primitive, acquired, because in animals of such habit, the chances of sexual congress would be greater than if the sexes were separate. Against such an interpretation, however, it must be noticed that in most hermaphrodites the sexual maturity of the male and female gonads is not coincident, so that cross-fertilization commonly occurs. Self-fertilization is said to occur in the fish *Serranus*, and it certainly occurs in many parasitic Trematodes in Tape-worms, and a few Nematodes. The real meaning of the occurrence of the condition remains obscure. Both gonads are present in many Sponges, in the Ctenophora, in many Anemones and Corals, and in various Hydroids such as *Hydra*, in most Tubelarians and Trematodes, in all the Tapeworms, in a few Nematodes, in many Chaetopods, in the Leeches, in a few Brachiopods and in many Polyzoa. A few are present in most Echinoderma and Arthropoda, but occurs in Cirripedes and some Isopods. It occurs in some bivalves, such as the common oyster, cockle and clam, and is present in the Euthyneurous Gastropods and in squillaids animals such as many of the worms and annelids. Observers have urged that the vertebrate embryo passes through a hermaphrodite condition. J. T. Cunningham and F. Nansen have stated that a testis is embedded in the ovary of the young hagfish (*Myxine*) and that this ripens before the ovary, but later observers have disputed their interpretation of the facts. In a few fish and some Batrachia, hermaphroditism has been demonstrated, but it is not certain, whether as a normal or aberrant occurrence, whilst in many of the Batrachian cases, the animals are known to be normally sexual. The term hermaphroditism, however, has been applied exceptionally to a sexual condition in various instances where the presence of the essential sexual organs being affected, the appearances relating wholly to the auxiliary primary or the secondary sexual characters. It is most probable that such conditions differ entirely from true hermaphroditism. With regard to the auxiliary primary organs, and especially the genital ducts and external organs of sex, in a majority of cases as in vertebrates, the embryonic or youthful condition is undifferentiated, and so to say, contains the initial material which may be elaborated by specialization in one direction or the other, by the proliferation of certain portions and the suppression of others, into the structures characteristic of the male or of the female. Sometimes, growth takes place without normal differentiation, sometimes the specialization in one direction lags, with the result that a dubious appearance arises. Subsequent dissection or the approach of maturity, however, make it plain that the duality was superficial and that the gonad of only one sex was present. Among mammals, including man, every normal male retains relics of the female side of the undifferentiated condition of the accessory sexual organs, whilst every normal female contains similar if less well-marked relics of that when the male sex is older, more maturely is consistent with a dubious condition of the secondary sexual characters is equally widespread in possible occurrence. Amongst insects which have been much studied, such as the butterflies and moths, many curious conditions have been described; sometimes the pattern and colour of the upper and under sides, sometimes of different parts of the same wing, sometimes of different wings, present the characters of different sexes. Among birds and mammals, the secondary sexual characters of one sex, such as size, pattern or colour, weapons or habits, may appear in animals with the so-called of the other sex, in every degree of development, reaching to an apparently complete reversal. In many cases these abnormal occurrences are associated with arrest of the functional activity of the primary organs of sex, by disease, accident, or decay, and the failure of the necessary stimulus would certainly serve to explain cases where the apparent reversal is no more than the suppression of a specialization in one direction. The facts, however, go further; it appears if the suppression of femaleness allows the development of a latent maleness.

**Determination of Sex.**—Answers to the question why a particular individual becomes a male or a female fall into two groups, in one of which it is supposed that external conditions determine the result, in the other that the sexual cells differ from the first. G. Canestrini suggested that the sex was determined by the number of spermatozoa which entered the ovum, but fuller knowledge of the details of fertilization (see Reproduction) has made it plain that only a single spermatozoon, normally conjugates with the ovum, whilst polyspermy, if it occur, results only in abnormalities which do not proceed to full development. W. Thury in 1863 and C. Dusing in 1853 urged that ova fertilized soon after ovulation may rise to females, whilst those impregnated later produced males. Some evidence exists as to the effect of delay in fertilization; V. Iensen (1851) suggested that females were produced when both ova and spermatozoa were in the most active condition, and H. M. Vernon (1898) has shown that in hybridizing Echinoderms the fresher gamete appears to exert a greater influence, but it cannot be said that there is definite evidence as to the determination of sex on such lines. J. D. Hofacker in 1825 and M. T. Sailer in 1830 collected a large series of statistics from which they drew the conclusion that such an influence does not exist. When the male sex is produced, whilst, many observers have attempted to draw conclusions from the comparative vigour of the parents. Popular belief and some observations with regard to the breeding of domestic animals have led to the inference that the sex of the offspring tends to be that of the least vigorous parent, and such a theory, as it would appear to imply the existence of a natural law for rectifying the proportions of the sexes, has gained more attention than the facts supporting it would justify, and several unbiased observers have interpreted the events in the sense that the vigorous parent produces his or her own sex. It is to be noted that such properties of the parents should not be considered, whilst external conditions determine the sex, for they would apply equally well. It is the case that there was a power of selection amongst gametes of predetermined sex. A large number of investigators have been led to believe that conditions of nutrition are of importance, and this view is specially plausible in the case of vertebrates, if it be accepted that the embryos pass through a hermaphrodite condition. E. Yung found that when tadpoles were reared under normal conditions, the proportion of male to female was about as 43 to 57, but that when a flesh diet was provided the percentage of females was very greatly increased. It has been noted that when Aphides are under the favourable conditions of summer temperature and nutrition, they produce only females, but that the advent of autumn brings with it an equality in sex production. Mrs Treat showed that starred
caterpillars turned into males; E. Maupas, in the case of Rotifers, and other observers in the cases of some Crustacea, have similarly pointed to a relation between abundant nutrition and the excessive production of females. In nearly every case, however, other observers have either obtained conflicting results, or placed another interpretation on similar results, whilst in none of the cases has the factor of selective mortality been sufficiently excluded. Even were it proved that a correlation existed between excessive diet and over-production of females, it might be that the incidence of mortality was differential. Many attempts have been made to derive information by examining the statistics of human births in times of plenty and of hardship, but the results are inconclusive. C. Darwin, reviewing the evidence, was disposed to believe that the proportions of the sexes varied, that the higher the expense of production male and female offspring was inherited, and that by the process of natural selection the sex adjusted to the needs of the species, but he was too cautious to lean to any particular view as to the nature of the determining factors. C. M. Dusén (1883 and 1885) also believed in the existence of such a power of adaptation or adjustment, and attributed it to the action of a large number of external conditions. P. Geddes and J. A. Thomson (1889) similarly came to the conclusion that factors external to the sexual cells had a predominating importance, and these authors linked the determination of sex with their general theory of the nature of sex. They regarded sex as an expression of a difference of character in the katabolism to be observed throughout the living world, and supposed that femaleness was specially associated, was in fact an outcrop of the anabolic or constructive processes of living matter, whilst maleness represented the katabolic, destructive or liberating processes. Their view ranges many diverse facts in apparent harmony, but has to encounter many facts that apparently contradict it. In a later work J. A. Thomson himself (1907) assigns less weight to his own theory, and quotes with approval T. H. Morgan's suggestion that the determination of sex may be brought about in different fashions in different cases.

Theories as to sex being predetermined in the sexual cells have been numerous, but it is only recently that any exact evidence appearing to point to such a conclusion has been adduced. When parthenogenesis (see REPRODUCTION) was first being investigated, it was found that eggs which gave rise to females were different from those which produced males, but when it was demonstrated that at least in many cases there was the further difference as to whether the eggs were fertilized or not, it was assumed that the presence or absence of fertilization determined the sex. Physicists have repeatedly propounded the theory that one ovary produces eggs capable of developing only into females, the other only those capable of giving rise to males. Thus, as Correns has shown, the oviposition of human beings ovulation takes place alternately from the ovaries. From this it would follow that the sex resulting from one fertilization known, the sex of a subsequent fertilization could be predicted, once having chosen the sex of the fertilization, selection in this view, however, rests on no satisfactory evidence and remains uncorrelated with any observations as to the structure of the eggs themselves. On the other hand, more exact workers, using modern cytological methods, have accumulated striking facts as to the existence of different kinds of sexual cells, the differences relating chiefly to the nuclear changes which occur in ovogenesis and spermatogenesis, and have been established with such certainty in the case of the spermatozoa. E. B. Wilson (1906) has given a full summary and discussion of various interpretations of these observations. In over a hundred species of insects, Myriapods and Arachnids, two kinds of spermatocytes are produced. The spermatocytes are formed in pairs, and the mother cell which gives rise to each pair exhibits, in the ordinary fashion of nuclear division, paired chromosomes, one member of each pair passing into each spermatoozoon. The mother cell gives rise to two spermatocytes, one containing the nucleus of a single large chromosome, but sometimes represented by a group of peculiar chromosomes, which, for convenience, Wilson terms the "X" or "female" chromosome. The other contains a "Y" or "male" chromosome. Wilson found that when fertilization takes place, the "X" chromosome is lost, one or other of the spermatoozoa from which it results that spermatoozoa of two kinds are formed in equal numbers, the difference being the presence or absence of the "X" element. Eggs fertilized by "X" spermatoozoa contain the "X" chromosome and remain unfertilized by spermatoozoa without it becomes male. There is evidence that in some cases (e.g. bees) the spermatoozoa devoid of the "X" element degenerate, with the result that any fertilized eggs must be females. E. B. Wilson's suggestion, advanced in the most cautious way, is that the "X" element referred to in the last paragraph is the hereditary factor, or at least the hereditary factor. Wilson's theory, in which the difference between the male and female organism is that the male comes from an egg which, developing either parthenogenetically or after fertilization, contains only a single unit of the "X" element, while the female, in the absence of the "X" element, in the absence of the "Y" element, in the absence of the "Y" element, results from the fusion of two "X" units. The ovum of a sexual egg in the process of maturation discards half of its chromos administrator; if it is fertilized by a spermatoozoon containing an "X" unit it gives rise to a female, and if it is fertilized by one without this it becomes a male. A large number of different forms of nuclear change have been described in the spermatoozoa of different kinds of female. Correns's theory avoids the unlikely supposition that spermatoozoa which are sex-hybrid, the female to be homozygous or pure female, the male character being dominant. Ova were, therefore, different. If spermatoozoa of this kind were fertilized, the female egg was fertilized by a female spermatoozoon the result naturally was a female, but when it was fertilized by a male spermatoozoon the result was a sex-hybrid appearing as a male because of the presence of the "X" and the "Y" elements. Wilson's theory avoids the unlikely supposition that selective fertilization, but breaks down in those cases of parthenogenesis where the unfertilized egg produced by a female fertilized by a male of the same species, and which he supposed that the female is a hybrid with femaleness dominant while the male is pure male. The female in fact contains a factor which makes her female whilst the male is a male because it is without this factor. This view, however, leaves unexplained the existence of two kinds of spermatoozoa and involves a series of elaborate hypotheses to reconcile it with cases of parthenogenesis. L. Doncaster has elaborated the extremely ingenious suggestion that the Mendelian pairs are not male and female, but male and absence of sex and female and absence of sex. The male is a pure male but produces two kinds of spermatoozoa, those with the determinant for sex and those without it. The normal female is a sex-hybrid and produces male and female spermatoozoa in equal numbers. With the absence of fertilization, female eggs being fertilized by male spermatoozoa and giving rise to females, whilst male eggs are fertilized by spermatoozoa of the other sex factor is added. By this factor a process of dominance, by which it is brought about. C. Darwin's theory of sexual selection remains the only comprehensive suggestion. Like his
theory of the Origin of Species, it is not a theory of the origin of variations. He starts from the observed fact that variations occur and are transmitted; he supposes that by natural selection individuals favoured by suitable variations are preserved, and that in such a fashion the divergence which leads to the origin of species has come about; he also supposes that by sexual selection, or preferential mating, the differences between male and female have been brought about. "Courage, pugnacity, perseverance, strength and size of body, weapons of all kinds, musical organs, both vocal and instrumental, bright plumage and markings, and ornamental appendages have all been indirectly gained by the one sex or the other, through the influence of love and jealousy, through the appreciation of the beautiful in sound, colour or form, and through the exertion of a choice; and these powers of the mind manifestly depend on the development of the cerebral system" (Descent of Man, ii. p. 402). The characters to be accounted for are confined to one sex and are in close relation with the breeding season and breeding habits. In those cases where they differ from the females, the males are the most active in courtship, and the best armed, and are rendered the more so because the females probably were the smaller species in size for the possession of the female, or display their attractions before her, and either by conquest or by being preferred have an advantage over less favoured males. Darwin was in some doubt as to how far it could be shown that such favoured individuals had a chance of leaving more progeny, except in cases where males were polygamous or much more numerous than females, but he supposed that on the whole the more vigorous female would be the first to breed and to choose the more attractive males, or be captured by the stronger males. A. R. Wallace was able to accept the theory of sexual selection, except in the most limited way, and in particular laid great stress on the want of evidence, to which Darwin himself has called attention, that females prefer more highly ornamented males. He thought that natural selection was sufficient to explain sexual differences such as the possession of weapons, scents and call-notes. With regard to colour and pattern, he regarded these as natural outcrops of specialized structure, better displayed in more vigorous animals, and therefore likely to increase under natural selection. The inconspicuous patterns and dull colours of females he believed to depend on natural selection, and to be associated with the less vigorous and less athletic habits of the females whilst engaged in their duties to their young. More recent writers have shown that in a large number of cases brilliant colours and patterns are in themselves really protective (see COLOURS OF ANIMALS), so that the facts left to be explained by the theory of sexual selection are still further restricted.

SEXBY, EDWARD (d. 1658), English soldier, "leveller" and conspirator, was a private soldier in Cromwell’s regiment of horse when first heard of about 1643. He opposed the proposal to disband the army in 1647; and as one of the "agitators" he resisted all attempts to come to an arrangement with Charles I., and advocated extreme democratic doctrines. He rose to the rank of colonel, but was deprived of his commission in 1651. When Cromwell assumed the title of lord protector, Sexby became one of his most violent opponents, and in 1655 tried to bring together the levellers and the royalists in a combination to overturn the government. Compelled to fly from England, he intrigued with the Spanish government with a view to restoring Charles II., as the only feasible plan for destroying Cromwell; and he was concerned in several plots to assassinate the protector. About 1668 he was captured in Italy and was beheaded for toryism entitled "Killing No Murder," under the pseudonym William Allen, which was printed in Holland and distributed in England. In July 1657 he was arrested in disguise in England, whither he had come to attempt Cromwell’s assassination, and he died in the Tower of London on the 13th of January 1658.

SEXPARTITE VAULT, in architecture, a name given to the single bay of a vault, which, in addition to the transverse and diagonal ribs, has been divided by a second transverse rib, forming six compartments. The principal examples are those in the Abbey-aux-Hommes and Abbaye-aux-Dames at Caen (1127). These probably were way-sides and other vaults (now looked upon as transitional), Notre Dame, Paris, and the cathedrals of Bourges, Laon, Noyon, Sensi and Sens; from the latter cathedral the sexpartite vault was brought by William of Sens to Canterbury, and it is afterwards found at Lincoln and in St. Faith’s Chapel, Westminster Abbey.

SEXTANT, an instrument for measuring angles on the celestial sphere. The name (indicating that the instrument is furnished with a graduated arc equal to a sixth part of a circle) is now only used to designate an instrument employing reflection to measure an angle; but originally it was introduced by Tychon Brahe, who constructed several sextants with two sights, one on a fixed, the other on a movable radius, which the observer pointed to the two objects of which the angular distance was to be measured.

The imperfections of the astrolabe and cross-staff for taking altitudes (see NAVIGATION) were so evident that the idea of employing reflection to remove them occurred independently to several minds. R. Hooke contrived two reflecting instruments. The first, described in his Posthumous Works (p. 503), had only one mirror, which reflected the light from one object into a telescope which is pointed directly at the other. Hooke’s second instrument: reflections by a mirror eye placed at the side of a quadrant could at the same time see the images formed in two telescopes, the axes of which were radii of the quadrant and which were pointed at the two objects to be measured. This plan is described in Hooke’s Animadversions to the Machina Coelastis of Hevelius, published in 1674, while the first one seems to have been communicated to the Royal Society in 1666. Newton also studied this subject, but nothing was known about his ideas till 1742, when a description in his own handwriting of an instrument devised by him was found among Halley’s papers and printed in the Philosophical Transactions (No. 465). It consists of a sector of brass, the arc of which, though only equal to one-eighth part of a circle, is divided into 90°. A telescope is fixed along a radius of the sector, the object-glass being close to the centre and having outside it a plane mirror inclined 45° to the axis of the telescope, and intercepting half the light which would otherwise fall on the object-glass. One object is seen through the telescope, while a movable radius, carrying a second mirror close to the first, is turned round the centre until the second object by double reflection is seen in the telescope over each with the first. But before Newton’s plan was published the sextant in its present form had come into practical use. On May 13, 1731, John Hadley described an “octant,” employing double reflection, and a fortnight later he exhibited the instrument. On the 20th of May Halley stated to the Royal Society that Newton had invented an instrument founded

1 Hadley described two different constructions: in one the telescope was fixed along a radius as in Newton’s form, in the other it was placed in the way afterwards universally adopted; an octant of the first construction was made in the summer of 1730, according to a statement made to the Royal Society by Hadley’s brother George on Feb. 7, 1734.
SEXTANT

on the same principle, and had communicated an account of it to
the society in 1699, but on searching being made in the minutes
it was only found that Newton had shown a new instrument
for observing the moon and stars for the longitude at sea,
being the old instrument mended of some faults, but nothing
was found in the minutes concerning the principle of the construc-
tion. Halley had evidently only a general conception of the
plan, and at a meeting of the Royal Society on December
16, 1731, he declared himself satisfied that Hadley’s idea was
different from Newton’s. The new instrument was tried in
August 1732 on board the “Chatham” yacht by order of the
Admiralty, and was found satisfactory, but otherwise it does
not seem to have superseded the older instruments for at least
twenty years. Hadley’s instrument could only measure angles
up to 90°; but in 1737 Captain Campbell of the navy, one of
the first to use it assiduously, proposed to enlarge it so as to measure
angles up to 130°, in which form it is now generally employed.

Independently of Hadley and Newton the sextant was
invented by Thomas Godfrey (1704-1740), a poor glazier
in Philadelphia. In May 1732 James Logan wrote to Halley that
Godfrey had about eighteen months previously shown him a
common sea quadrant “to which he had fitted two pieces of
looking-glass in such a manner as brought two stars at any
distance to coincide.” The letter gave a full description
of the instrument; the principle was the same as that of Hadley’s
first octant, which had the telescope along a radius. At the
meeting of the Royal Society on January 37, 1734, Thomas
Campbell, sworn before the mayor of Philadelphia, took the
oath, proving that Godfrey’s quadrant was made about November
1730, that on November 28 it was brought by G. Stewart, mate, on board
a sloop, the “Truman,” John Cox, master, bound for Jamaica,
and that in August 1731 it was used by the same persons on
a voyage to Newfoundland. The statement that a brother of
Godfrey, a captain in the West India trade, sold the quadrant at
Jamaica to a Captain or Lieutenant Hadley of the British navy,
who brought it to London to his brother, an instrument maker
in the Strand, is devoid of foundation.

The figure shows the construction of the sextant. ABC is a light
framework of brass in the shape of a sector of 60°, the limb AB
having a graduated arc of silver (sometimes of gold or platinum) inlaid.
It is held in the hand by a small handle, the back of which is
tactically to measure the altitude of
an object, or in the plane passing through two objects the angular
distance between them which is required.
It may also be mounted on a stand. CD is a radius moviable
round C, where a small plane mirror of silvered plate-glass is
fixed perpendicular to the plane of the sextant and in the line
of the mirror. F is a vernier read through a microscope, also
a clamp and a tangent screw for giving the arm CD a slow motion.
At E is another mirror “the
horizon glass,” also perpendicular to the plane of the sextant and parallel to CB.
A smaller telescope fixed across CD, parallel to the plane CAB and pointed to the mirror E. As
only the lower half of E is used to within the observer’s eye. If CD has been moved so as to make the image of
a star or of the limb of the sun coincide with that of the horizon, it is
seen that the angle SCH (the altitude of the star or solar limb) equals
twice the angle BCD. The limit of error in doing so is chiefly
the necessity of doubling the measured angle, a space marked as a

---

1 See Professor Rigaud, Naut. Mag. vol. ii. No. 21. John Hadley
was a country gentleman of independent means, and the fact that he
was the first to bring the construction of reflecting telescopes to any
perfection has made many authors believe that he was a professional
instrument maker. His brother George, who assisted him, was a
barrister.
adjustment is correct; if not, the adjusting screws in the collar of the uppers may be moved until the coincidence is exact.

"Centring error" is very insufficient, but cannot be corrected. In an indifferent instrument it may be sufficient to vitiate the result of any observations on only a few occasions.

The course of the arc is a relative one, and varies with the angle measured, being generally smaller as the angle is greater; but the index arm becoming bent, or any part of the frame reacting, it is possible that its sight should be a little affected from varying temperature, and defective graduation, will all produce errors which it is generally impossible to disentangle, and they are all included in the one correction for centring. This correction is found by taking a number of measures with the sextant (for index error) with the true angle. The most accurate method, because it employs a large number of observations for the same or nearly the same angle, is to determine the mean circle of every star, and the arc at the horizon at various altitudes. Double the difference between the resulting latitude by each star and the mean latitude will be the centring error for an angle equal to the double altitude of that star, that is, the angle actually measured by the sextant, index error being ascertained and applied before working out. Measurement of the angles between stars, compared with their calculated apparent distance, is another method. At Kew Observatory (National Physical Laboratory) the centring error is determined for certain angles by fixed collimators. Including, as it does, errors from so many causes, the correction does not remain perfectly steady, and it should be ascertained from time to time.

In a good sextant the error should not exceed one minute over the whole of the arc.

SEXTON (an early corruption of "sacristan," properly the keeper of sacred vessels and vestments, Med. Lat. sacristus or sacrista), a minor officer of an ecclesiastical parish. In the early church the sexton was identical with the ostiarius, or door-keeper, whose duty it was to open and shut the church at certain hours, guard the church and all it contained, and prevent the heathen and excommunicated from entering. The duties of the modern sexton are practically those of the ancient sacristan. He has the custody of all the church vestments, is responsible for keeping the church clean, for the bell-ringing and lighting, and looks after the vestments and instrumenta of the church, but the duties may vary by custom in different parishes. Where his duties are confined to the care of the vestments and instrumenta the right of appointment of a sexton lies in the churchwardens; if his duties are confined to the churchyard the right of appointment is in the incumbent, and where his duties extend to both the right of appointment is jointly in the churchwardens and the incumbent.

By custom, however, he may be appointed by the parishioners. He usually has a freehold in his office, and in some parishes is entitled to certain customary fees.

SEXTUS EMPIRICUS (2nd and 3rd centuries A.D.), physician and philosopher, lived at Alexandria and at Athens. In his medical work he belonged to the "methodical" school (see Asclepiades), as a philosopher, he is the greatest of the later Greek Sceptics. His claim to eminence rests on the facts that he developed and formulated the doctrines of the older Sceptics, and that he handed down a full and, on the whole, an impartial account of the members of his school. His works are two, the Pyrrhonian Hypotheses and Against the Mathematici (ed. Fabriciis, Paris, 1621, and Beckler, Berlin, 1842).

See Brochard, Les Sceptiques grecs (1887); Pappenheim, Lebensverhältnisse des Sextus Empiricus (Berlin, 1875); Jourdain, Sextus Empiricus (Paris, 1858); Patrick, Sextus Empiricus and the Greek Sceptics (1899), with trans. of Pyrrh. Hyp. I.; also Sceptrum.

SEYCHELLES, an archipelago in the Indian Ocean, consisting of forty-five islands—besides a number of rocks or islets—situated between 3° 38' and 5° 45' S., and 52° 55' and 53° 50' E. Together with the Amirantes, Cosmолод, Aldabra, and other islands they form the British colony of Seychelles. The outlying islands lie south-west of the Seychelles group and between that archipelago and Madagascar.

In all ninety islands there is a total area of over 156 sq. m. are under the Seychelles government. There are in addition 40,000 to 50,000 sq. m. of coral reefs and sand islands.

The Seychelles lie, with two exceptions, towards the centre of a large submarine bank and are all within the 50 fathoms line. Mahé, the largest and most central island, is 934 m. N.N.W. of Mauritius, 970 m. E. by N. of Zanzibar and 690 m. N.E. of the northernmost point of Madagascar. The other chief islands form two principal groups: (i) Praslin, 26 m. N.N.E. of Mahé, and the adjacent smaller islands of La Digue, Félicité, East Silver, West Silver, Curieuse and Aride; (ii) Silhouette, 14 m. W. by N. of the "Groenland" of North Island, and La Digue, the most southerly Platte; on the northern edge of the reef are Bird and Denis islands. The general aspect of the islands is one of great beauty and fertility, and in the opinion of General C. G. Gordon they formed the Garden of Eden.

Mahé is 17 m. long, and from 4 to 7 broad and of highly irregular shape, with an area of about 55 sq. m. There are small areas of lowlands, chiefly at the mouths of the river valleys, but most of the island is mountainous, and in general the hills rise abruptly from the sea. There are ten heights between 200 and 300 ft., and seven over 400 ft. The highest point is Morne Seychellois, 1,674 ft.; next comes Tête d'Ours, 1,657 ft. Both these mountains are in the northern half of the island. The main ridge runs north and south along the line of the greatest diameter, and from the heights descend many torrents, the whole island being well watered. The principal harbour, Port Victoria, is on the north-east coast in 4° 37' S., 55° 27' E. It is approached by a deep channel through the coral reef which fringes the entire eastern side of the island. Of the small islands close to Mahé the chief are St. Anne and Cerf, off the east, and Conception and Thérèse on the west.

The Island is 8 m. long and from 1 to 3 m. broad, has an area of about 27 sq. m. and its highest point is 1260 ft.; La Digue covers 4 sq. m. and its greatest height is 1175 ft.; Silhouette is roughly circular in shape, covers 8 sq. m. and culminates in Mon Plaisir, 2473 ft. None of the other islands exceeds 1 sq. m.

Geology.—Except Bird and Denis islands, which are of coralline limestone, the Seychelles are of granite, with in places fringing reefs of coral based on granite foundations. The granite is of the same origin as the closely related to that of Madagaskar and throughout the islands is closely uniform in its composition, but exhibits different kinds of ores. The rocks are deeply furrowed and cut into ridges, evidence of the long periods during which they have been subjected to tectonic action.

There is no granite in the islands, but there is an average of four-fifths of the islands, which nowhere exhibit any trace of volcanic action, recent or remote. The islands are regarded as a remnant of the continental land which in remote geological ages united North Africa and India. J. Stanley Gardiner supposes that when first cut off the Seychelles were the size of the present bank—about 12,000 sq. m. This cutting off was caused largely by subsidence, though partly by marine action. The subsequent dwindling of the 12,000 sq. m. to 156 divided into many small islands is attributed to marine action which had its chief force in the Eocene and Miocene periods.

Climate.—The climate is healthy and equal, and for a tropical country the temperature is moderate. It varies on the coast from about 68° to 88° F., falling at night in the higher regions to 67° or 68° F. It is only a mean temperature, the days being warm, the south-east monsoon blows from May to October, which is the dry season, and the west-north-west monsoon from December to March. During April and November the winds are variable. The average annual rainfall on the coast is 100-8 in.; it increases to about 1150 at a height of 600 ft. and at heights exceeding 2000 ft. is about 150 in. The Seychelles lie outside the track of the hurricanes which occasionally devastate Réunion and Mauritius and are also immune from earthquakes. The public health is good, and fevers and plague are unknown.

Flora and Fauna.—Both flora and fauna include species and genera peculiar to the Seychelles. Of these the best known is the Lecythis schecellarum, a palm tree indigenous only in Praslin Island—but since introduced into Curieuse—dated for its fruit, the so-called Maldivie double coco-nut or coco de mer. The nut was long known off the islands of South America, but its birthplace is now East Africa, and it has been found on almost all the islands of the East Indian Archipelago and other coasts, was thought to grow on a submarine palm, and, being esteemed a sovereign antidote to poisons (Lusiod, x. 136), commanded proportionate prices in the East. This palm will grow to a height of 100 ft., and shows enormous fern-like leaves. Another tree found only in the islands is the capucin (Northea schecellarum), whose massive dead trunks are a striking feature in the landscape. This tree has abundant branches and is completely covered with them. The seeds, probably introduced from Mauritius. The islands were formerly densely wooded, but only patches of forest remain. The central mountain zone of Mahé was in 1900 acquired by the government for a sugar beet plant. The sugar beet is planted in vacant portions of forest, and the remaining portions of forest are under the government. The forests of the coast belt resembled those of the coral islands of the neighbouring parts of the Indian Ocean, with their typical species, Pandanus and Pandaná. And, a little island, the banyan (Ficus), Pisonia and Hernandia. The coco-nut, now a conspicuous feature of the coast
SEYCHELLES

flora, is probably not indigenous. The forests of the granitic land, of which typical patches remain, had the characteristics of a tropical moist region, palms, shrubs, climbing and tree ferns growing luxuriantly, the trees on the mountain sides, such as the Pandanus sechel- lensis, are usually found higher up than 100 ft. Of timber trees the bois gayac has disappeared, but bois de fer (Stedaminia sidaroxylon) and bois de natte (Mabia seckellarum) still flourish on Silhouette Island. Besides the cutting down for building purposes of the timber trees the jungle was largely cleared for the plantation of vanilla; while a multitude of other tropical plants have been introduced tending to the extermination of the indigenous flora. The most important of the trees introduced by 1900 are various kinds of rubber, including Para (Hvea Brasilensis), which grows well. For other introduced plants see below, Industries.

The indigenous fauna, so far as its limited range affords comparison, remains intact. The 60 species of birds are of Indo-Australian in origin, and the only varieties are the rat and bat. The dagon, which formerly frequented the waters of the islands, does so no longer. The reptiles include the land snakes and crocodiles. A species of crocodile, known as the testudo elephantina, is found only in the Aldabra Islands.

The imports consist chiefly of cotton goods and hardware from Great Britain; rice, flour and cotton from India, sugar and rum from Mauritius, coffee from Aden, wines and spirits and clothing from France. The value of the imports and exports (exclusive of specie) for the six years 1899-1904 was $306,520: exports, $377,613. The increase of trade is indicated by the figures for 1907 (a record year) to 1909. In the three years the value of imports was $253,584, that of exports $355,366. Over 75% of the total trade is with India, primarily with Madras, where the Seychelles dollar is the Indian rupee (=16d.), with the subsidiary coinage of Mauritius.

**Towns and Communications.—**The only town of any size is the capital Victoria (or Mahé), picturesquely situated at the head of an excellent harbour. Many of the houses are built of massive coral, Portes gaimardii, hewn into square blocks which at a distance glisten like white marble. The port is a coaling station of the French navy and is connected by telegraphic cables with Zanzibar, Mauritius, and Madagascar. There is no inland telegraph system. All the islands are well provided with metalled roads. Regular monthly communication with Mauritius is maintained by the Messageries Maritimes steamers. The French and British lines service the South African and Indian ports. The government employ steam vessels for passenger and mail services between the islands, and there are large numbers of sailing craft belonging to the islanders.

**Inhabitants.—**Like Mauritius, Réunion and Rodriguez the Seychelles were uninhabited when first visited by Europeans; though fragments of ruins found on Praslin and Frigate islands may indicate the presence of man in earlier centuries. The islands were colonized by Mauritian and Bourbon creoles; the white element, still predominantly French, has been strengthened by immigration from the French colonies in the Antilles. The first systematic introduction of slaves from Mauritius, and the negro element has been increased by the introduction of freed slaves from East Africa. There has been also an immigration of Chinese and, in larger numbers, of Indians (mainly from the Malabar coast). An official report issued in 1910 stated that the greater part of the valuable town property had passed into the hands of Indians, and that Indians and Chinese had the bulk of the retail trade. Of the coloured population those born in the Seychelles of negro, or negro-Indian blood are known as "enfants des îles." They speak a rude creole patois, based on French but with a large admixture of Indian, Bantu and English words. The Seychellois are of fine physique, and are excellent and fearless sailors.

At the census of 1881 the inhabitants numbered 14,081, in 1891 the figure was 16,603 and in 1901 the population numbered 19,237, of whom 9,805 were males and 9,432 females. The population on December 31st, 1900, was officially estimated at 22,400, or 149·59 persons per sq. m. The pure white population is about 600. About two-thirds of the inhabitants are Roman Catholics.

**Agriculture and Industries.—**Apart from fisheries the wealth of the islands depends upon agriculture, and the industries connected therewith. These are fostered by the government, which in 1901 created an agricultural board and established a botanical station at Victoria. Spices (cloves, cinnamon, nutmegs) were the chief articles of trade in the 18th century, and these with cotton, coffee, tobacco, sugar, maize and rice were the main crops grown until about 1850. Bananas, yams, &c., were also largely cultivated, and there was considerable trade in copra, fish oil and tortoise-shell, whaling being carried on, chiefly by Americans and French, in the neighbouring seas. Subsequently cocoa was cultivated extensively, and from about 1890 sending vanilla largely superseded the other crops; in 1899 the vanilla exported was valued at over $100,000 out of a total export of $450,000, and from 1896 to 1903 the crop represented more than half the total value of the exports. Owing to increased competition, and in consequence of the price of vanilla having fallen to one-third of its highest figure, after 1900, and the Seychellois, though still producing vanilla in large quantities, paid greater attention to the products of the coconuts—copra, soap, coco-nut oil and coco-nuts—to the development of the banana and coffee industries, the preparation of rum and essential oils, the cultivation of rubber trees, the preparation of banana flour, the growing of sugar canes, and the distillation of rum and essential oils. The manufacture of calico and beads, and the export of salt fish are important industries. Minor exports are bird-oil, olive oil, beche-de-mer. From the leaves of the coco-de-mer are made baskets and hats.

---

1 The gigantic land tortoise (Testudo elephantina) is found only in the Aldabra Islands.
occupied by the British, to whom they were ceded by the treaty of Paris in 1814. Throughout this period Mons. J. B. Quéau de Quincy (1748–1827) administered the islands. This remarkable man, a Parisian by birth, became governor of the Seychelles in 1780 under the monarchy, continued to serve under the First Republic, and Napoleon I.,—acknowledging the British authority which was recognized by the British, and the British government, who had been his father's colonel. Here he acquired a superb mastery of horsemanship, and many stories are told of his feats, the best known of which was his riding between the sails of a wind-mill in full swing. In 1740 he was commissioned a cornet in the margrave's regiment of Russian cuirassiers. Serving as a subaltern in the first Sianese War, he was taken prisoner in May 1742 after gallant a defence that King Frederick offered to exchange an Austrian capitan for him. In 1743 the king made him a captain in the 4th Hussars, and he brought his squadron to a state of conspicuous efficiency. He served through the second war, and after Hohenfriedberg was promoted major at the age of twenty-four. At the close of the war he had an opportunity of successfully leading 15 squadrons in front of the enemy, and this, with other displays of his capacity of leading cavalry in the searching tests of Frederick's "reviews," secured him promotion in 1752 to the rank of lieutenant-colonel and in 1753 to the command of the 8th cuirassiers. Under his hands this regiment soon became a pattern to the rest of the army. In 1755 he was made colonel. Next year the Seven Years' War, that was to make his name immortal, broke out. In 1757, regardless of the custom of keeping back the heavy cavalry in reserve, he took his regiment to join the advanced guard, at Prague he nearly lost his life in attempting to ride through a marshy pool, and at Kolin, at the head of a cavalry brigade, he distinguished himself in checking the Austrian pursuit by a brilliant charge. Two days later the king made him major-general and gave him the order pour le mérite, which promotion he felt to be no more than his deserts, for to Zieten's congratulations he responded: "It was high time, Excellency, if they wanted more work out of me. I am already thirty-six." Four times in the dismal weeks that followed the disaster of Kolin, Seydlitz asserted his energy and spirit in cavalry encounters, and on the inimical of Rossbach Frederick, superseding two senior generals, placed Seydlitz in command of the whole of his cavalry. The result of the battle was the complete rout and disorganization of the enemy, and in achieving that result only seven battalions of Frederick's army had fired a shot. The rest was the work of Seydlitz and his 38 squadrons. The same night the king gave him the order of the Black Eagle, and promoted him lieutenant-general. But he had received a wound in the mêlée, and for some months he was away from the army. He rejoined the king in 1758, and at the battle of Zorndorf Seydlitz's cavalry again saved the day and won the victory. At Hochkirch he was captured, and in the great disorder of the Prussian retreat, and in the great disaster of Kunersdorf he was severely wounded in a hopeless attempt to storm a hill held by the Russians. During his convalescence he married Countess Albertine Hacke. He rejoined the army in May 1760, but his health was so impaired that Frederick sent him home again. It was not until 1761 that he reappeared at the front. He now commanded a wing of Prince Henry's army, composed of troops of all arms, and many doubts were expressed as to his fitness for this command, as his service had hitherto been with cavalry. In the closing campaigns of the Seven Years' War Seydlitz was a splendid general. He is known as one of the most resourceful generals in the history of the Seven Years' War, and as one of the best tactical generals of his time. He was also a man of great personal courage, and in the battle of the Flemish (October 29, 1762), in which, leading his infantry and his cavalry in turn, he decided the day. After the peace of Hubertusburg he was made inspector-general of the cavalry in Silesia, where eleven regiments were permanently stationed and whither Frederick sent all his most promising officers to be trained by him. In 1767 he was made a general of cavalry. But his later years were clouded by domestic unhappiness. His wife was unfaithful to him, and his two daughters, each several times married, were both divorced, the elder once and the younger twice. His formerly close friendship with the king, was brought to an end by some misunderstanding and it was only in his last illness, and a few weeks before his death, that they met again. Seydlitz died of paralysis at Ohlau on the 27th of August 1773.

See Varnhagen von Ense, Das Leben des Generals von Seydlitz (Berlin, 1834); and Bismarck, Die kgl. preussische Reiterei unter Friedrich dem Grossen (Karlsruhe, 1837).

SEYMOUR, or St Maux, the name of an English family in which several titles of nobility have from time to time been created, and of which the duchy of Somerset is the head. The family was settled in Monmouthshire in the 13th century. The original form of the name, which has been resumed by the current duchy of Somerset since 1863, seems to have been St Maux, of which Camden says that Seymour was a later corruption. It appears

Colonial Reports ..., Seychelles (1907).
that about the year 1340 Gilbert Marshal, earl of Pembroke, assisted William St Maur to wrest a place called Woundy, near Caldecot in Monmouthshire, from the Welsh. Woundy and Penhow, at the latter of which he made his residence, were the property of Sir Richard St Maur at the end of the 13th century, but they passed away from the family through the marriage of Sir Richard's great-great-granddaughter, the only child of John St Maur, who died in 1359. John St Maur's younger brother Roger married Cecily, one of the daughters and co-heiresses of John Beauchamp of Hāče, Baron Beauchamp de Somerset (d. 1361), who brought to the marriage the last of her father's extensive estates in Somersetshire, Devonshire, Wiltshire, and Suffolk. The eldest son of this marriage was Sir William St Maur, or Seymour (for the later form of the name appears to have come into use about this date), who was an attendant on the Black Prince, and who died in his mother's lifetime, leaving a son Roger, who inherited the estates and added to them by his marriage with Maud, daughter of Sir William Esturni of Wolf Hall, Wiltshire. During the next three or four generations the wealth and importance of the Seymours in the western counties increased, until in the reigns of Henry VII. and Henry VIII. the family held the greatest influence in the western part of England, with the exception of the Barons Seymour of Berry, of some note in public affairs. He took an active part in suppressing the Cornish rebellion in 1497; and afterwards attended Henry at the Field of the Cloth of Gold, and on the occasion of the emperor Charles V.'s visit to England in 1522. The eldest of his ten children was Edward Seymour, 1st duke of Somerset (q.v.), the famous Protector in the reign of Edward VI.; his third son was Thomas Seymour, Baron Seymour of Sudeley (q.v.); and his eldest daughter Jane was third wife of King Henry VIII., and mother of Edward VI. The Protector was twice married; and, probably owing to the infamy of his first wife whom he repudiated about 1535, his titles and estates were entailed first on the issue of his second marriage with Anne, daughter of Sir Edward Stanhope. (See SOMERSET, EARLS AND DUKES OF.)

The Protector's eldest surviving son by his first marriage, Sir Edward Seymour (d. 1593), knight, of Berry Pomeroy, Devon, was father of Sir Edward Seymour (d. 1613) who was created a baronet in 1611; and the baronetcy then descended for six generations from father to son, all of whom were named Edward, until in 1750, on the failure of heirs of the Protector by his second marriage, Sir Edward Seymour, 6th baronet of Berry Pomeroy, succeeded to the dukedom of, and lordship of, Westenhanger, in whose time the family seat at Berry Pomeroy was plundered and burnt by the Roundheads, had a younger brother Henry (1621-1686), who was a close personal attendant of Prince Charles during the Civil War, and bore the prince's last message to his father, Charles I., before the latter's execution. Henry Seymour continued his service to Charles II. in exile, and at the Restoration he received several valuable offices from the king. In 1660 he bought the estate of Langley in Buckinghamshire, where he lived till his death in 1686. In 1685 his son Henry, at the age of seven years, was created a baronet.

Sir Edward Seymour, 4th baronet (1633-1708), speaker of the House of Commons, was elected member of parliament for Gloucester in 1661, and his influence at Court together with his natural abilities procured for him a position of weight in the House of Commons. He was appointed to the lucrative post of treasurer of the navy; and in 1667 he moved the impeachment of Lord Clarendon, which he carried to the House of Lords. In 1672 he was elected speaker, an office which he filled with distinction until 1679, when, having been unanimously re-elected to the Court, the king refused to confirm the choice of the Commons. On the accession of James II., Seymour courageously opposed the arbitrary measures of the Crown; and at the revolution he adhered to the Prince of Orange. In 1691 he became a lord of the treasury, but losing his place three years later he took an active part in the Tory opposition to William's whig ministers; and in later years he was not less hostile to those of Queen Anne, but owing to the ascendency of Marlborough he lost all influence for some time before his death, which took place in 1708. Seymour was not less arrogant than his relative the "Proud Duke" of Somerset; but he was described by Burnet as "the ablest man of his party, the first speaker of the House of Commons that was not bred to the law; a graceful man, bold and quick, and of high birth." Sir Edward Seymour was twice married. By his first wife he had two sons, Edward, 5th baronet, whose son Edward became the 8th duke of Somerset, and William, who became a lieutenant-general; by his second wife, a daughter of Alexander Popham of Littlecote, he had six sons, the eldest of whom, Popham, on succeeding to the estates of his mother's cousin, Edward, earl of Conway, assumed the name of Conway in addition to that of Seymour. Popham was killed in an engagement near Wiltshire in 1660, and his estate was involved on his next brother, Francis, who likewise assumed the name of Conway, and having been created Baron Conway in 1703 was the father of Francis Seymour Conway (1719-1794), created marquess of Hertford in 1793, and of field-marshal Henry Seymour Conway (q.v.). (See HERTFORD, EARLS AND MARQUESSES OF.)

The eldest son of the Protector's second marriage, Edward Seymour (1537-1621), was relieved by act of parliament in the reign of Queen Mary from the attainder passed on his father in 1551, and was created Baron Beauchamp and earl of Hertford in 1560. In 1600, when his eldest son Henry had obtained a patent declaring that after his father's death he should become earl of Hertford, He, however, died before his father, leaving three sons, one of whom, William, became 2nd duke of Somerset; and another, Francis, was created Baron Seymour of Trowbridge in 1641. The latter had at first taken an active part in the opposition in the House of Commons to the government of Charles I., having been elected member for Wiltshire in 1626. He represented the same constituency in both the Short and the Long Parliaments; and he refused to pay ship money in 1639. When, however, the popular party in the Commons proceeded to extreme measures, Francis Seymour refused his support, and was removed from his seat in the peereage; he voted in the House of Lords against the attaint of Strafford, and in 1642 he joined Charles at York and fought on the royalist side throughout the Great Rebellion. He died in 1664. His grandson Francis, 3rd baron, succeeded to the dukedom of Somerset in 1675; and on the death of his nephew Algernon, 7th duke of Somerset, in 1750, the male line of the Protector by his second marriage became extinct, and the dukedom reverted to the elder line, the 6th baronet of Berry Pomeroy becoming 8th duke of Somerset.

Henry Seymour (1729-1805), a son of the 8th duke of Somerset's brother Francis, was elected to the House of Commons in 1763; in 1778 he went to France, attending his residence at Prunay, near Versailles, he became the lover of Madame du Barry, many of whose letters to him are preserved in Paris. He was twice married, and in addition to children by both wives he had an illegitimate daughter, Henriette Félicité, who married Sir James Doughty-Tichborne, by whom she was the mother of Sir Roger Tichborne, impersonated in 1871 by the famous impostor Arthur Oulton.

Hugh Seymour (1639-1806), a younger son of Francis Seymour-Conway, marquess of Hertford, was a distinguished naval officer who saw much active service especially under Lord Howe, in whose ship he acted as first lieutenant on the 1st June 1794, was given a conspicuous part. His son George Francis Seymour (1787-1870), admiral of the fleet, began his naval career by serving under Nelson; in 1818 he became Sergeant-at-arms in the House of Lords, a post which he retained till 1841, when he was promoted to the rank of rear-admiral and appointed a lord of the admiralty; his eldest son, Francis George Hugh Seymour (1812-1884), succeeded his cousin Richard Seymour-Conway as 4th marquess of Hertford in 1870. Lord Hugh Seymour's youngest son, Sir Horace Beauchamp Seymour, was the father of Frederick Beauchamp Paget Seymour, Baron Alcester (q.v.).

A younger branch of the great house of Seymour is said to have
SEYMOUR, H.—SEYMOUR OF SUDELEY

settled in Ireland in the reign of Elizabeth, from which Sir Michael Seymour (1766-1834) claimed descent. Sir Michael, like so many of his predecessors, was an admiral. He rendered distinguished service in the last decade of the 18th century. He lost an arm in Howe's action on the 1st of June 1794 and between 1796 and 1810 was commander of the "Spitfire," and afterwards of the "Amethyst," he carried the charge of the green eagle into the Channel. Seymour became a rear-admiral in 1832, and died two years later while in chief command on the South American station. On the 16th of February 1842 he entered the navy in 1813, and attained the rank of rear-admiral in 1854, in which year he served under Sir Charles Napier in the Baltic during the war with Russia. In 1836 he was in command of the China station, and conducted the operations against the English language of the opium pirates from the lorch, "Arrow"; he destroyed the Chinese fleet in June 1837, took Canton in December, and in 1838 he captured the forts on the Pei-ho, compelled the Chinese government to consent to the treaty of Tien-tsing. In 1836, he was made a rear-admiral.

SEYMOUR, HORATIO (1810-1886), American statesman, was born at Pompey, Onondaga county, New York, on the 31st of May 1810. His ancestor, Richard Seymour, a Protestant Episcopal clergyman, was an early settler at Hartford, Connecticut, and his father, Henry Seymour, who removed from Connecticut to New York, was prominent in the Democratic party in the state, being a member of the "Albany Regency" and serving as state senator in 1815, 1819 and in 1823, and as canal commissioner in 1820-1822. The younger Seymour studied in 1824-1825 at Geneva Academy (afterwards Hobart College), and then at a military school in Middletown, Conn., and was admitted to the bar in 1832. He was military secretary to Governor W. L. Marcy in 1833-1839, was a member of the New York Assembly in 1842, in 1844 and in 1845, being speaker in 1845; mayor of Utica in 1843, and in 1852 was elected governor of the state over Washington Hunt (1811-1867), the Whig candidate, who had defeated him in 1850. He voted in 1854 a bill prohibiting the sale of intoxicating liquors (which was declared unconstitutional almost immediately after its re-enactment in 1855), and in consequence he was defeated in 1854 for re-election as governor by Myron Holley Clark (1866-1892), the Whig and temperament candidate. Seymour was a conservative on national issues and supported the administrations of Pierce and Buchanan; he advocated compromise to avoid secession in 1860-1861; but when war broke out he supported the maintenance of the Union. In 1863-1865 he was again governor of New York state. His opposition to President Lincoln's policy was mainly in respect to emancipation, military administration, and the peace of the Union. The president tried to win him over early in 1863, but Seymour disapproved of the measures of C. S. Vandalbe in May, and, although he responded immediately to the call for militia in June, he thought the Conscription Act unnecessary and unconstitutional and urged the president to postpone the draft until its legality could be tested. During the draft riots in July he proclaimed the city and county of New York in a state of insurrection, but in a speech to the rioters adopted a tone of conciliation—a political error which injured his career. He was defeated as Democratic candidate for governor in 1868, but in 1869 he was nominated presidential candidate by the National Democratic Convention. He ran with P. Blair, Jr., being nominated for the vice-presidency, but Seymour and Blair carried only eight states (including New York, New Jersey and Oregon), and received only 80 electoral votes to 214 for Grant and Colfax. Seymour did not re-enter political life, refusing to be considered for the United States senatorship from New York in 1876. He died on the 12th of February 1886 in Utica, at the home of his sister, who was the wife of Roscoe Conkling.

The Public Record of Horatio Seymour (New York, 1868) includes his official papers between 1856 and 1868.

SEYMOUR, THOMAS DAY (1848-1907), American educator, was born in Hudson, Ohio, on the 1st of April 1848. He graduated in 1870 at Western Reserve College, where his father, Nathan Perkins Seymour, was long professor of Greek and Latin. Here, after studying in Berlin and Leipzig, the son was professor of Greek in 1872-1880; and he became professor of Greek at Yale University in 1880, holding his position until his death in New Haven on the 31st of December 1907. He was from 1887 to 1901 chairman of the managing committee of the American School of Classical Studies at Athens, and was president of the Archaeological Institute of America from 1903. Except for his Selected Odes of Pindar (1882), his published work was practically confined to the study of the Homeric poems: An Introduction to the Language and Verse of Homer (1885); Homer's Iliad, i.-iv. (1887-1890); Homeric Vocabulary (1889); Introduction and Vocabulary to School Odyssey (1897); and Life in the Homeric Age (1907). He edited, with Lewis R. Packard and John W. White, the "College Series of Greek Authors."

SEYFURB, a city of Jackson county, Indiana, U.S.A., about 59 m. S. by E. of Indianapolis. Pop. (1900) 532; (1910) 321 foreign-born; (1910) 6505. It is served by the Baltimore & Ohio, South-Western (which has repair shops here), the Pittsburg, Cincinnati, Chicago & St. Louis, and the Southern Indiana railways, and by the Indianapolis, Columbus & Southern and the Indianapolis & Louisville interurban electric lines. The city has a considerable trade in produce, and has various manufactures, including woollen-goods, furniture, carriages and automobiles. Seymour was settled in 1854, incorporated as a town in 1864, and chartered as a city in 1887.

SEYMOUR OF SUDELEY, THOMAS SEYMOUR, BARON (c. 1505-1540), lord high admiral of England, was fourth son of Sir John Seymour of Wolf Hall, Wiltshire, and younger brother of the Protector Edward Seymour, 1st duke of Somerset. His sister Jane Seymour became the third wife of Henry VIII in 1536, and another sister, Elizabeth, married Thomas Cromwell's son. Seymour's connexions thus ensured his promotion, and he quickly won the favour of the king, who gave him many grants of land and employed him in the royal household and on diplomatic missions abroad. From 1540 to 1542 he was at Vienna, and in 1543 in the Netherlands, where he served with distinction in the war against France, holding for a short time the supreme command of the English army. In 1544 he was rewarded with the post of master of the ordnance for life, becoming admiral of the fleet a few months later, in which capacity he was charged with guarding the Channel against French invasion. Henry VIII. left Seymour a legacy by his will, and is said to have directed that he should be raised to the peerage. In February 1547 he was accordingly created Baron Seymour of Sudeley and appointed lord high admiral. From this time forward he was mainly occupied in intrigue against his brother the Protector, of whose power he was jealous; and he aimed at procuring for himself the position of guardian of the young king, Edward VI. Several matrimonial projects entered into Seymour's schemes for gratifying his ambitions. No sooner was Henry VIII. dead than the lord high admiral tried to secure the princess (afterwards queen) Elizabeth in marriage; and when this project was frustrated he secretly married the late king's widow, Catherine Parr, whose hand he had vainly sought as early as 1543. He also took steps to ingratiate himself with Edward, and proposed a marriage between the king and the Lady Jane Grey. He entered into relations with pirates on the western coast, by whom it was his duty as lord high admiral to suppress, with a view to securing their support; and when the Protector invaded Scotland in the summer of 1547 Seymour fomented opposition to his authority in his absence. On the death of his wife in September of the next year he made renewed attempts to marry the princess Elizabeth. Somerset strove ineffectually to save his brother from ruin, and in January 1549 Seymour was arrested and sent to the Tower; he was convicted of treason, and executed on the 20th of March 1549.

SEYNE SUR MER—SFORZA, CATERINA

(187?; Mary A. F. Green, Letters of Royal and Illustrious Ladies of Greece, the Crimea, and the Court of the Reign of Mary [3 vols., London, 1860]). See also SOMERSET, EDWARD SEYMOUR, 1st Duke of, and the authorities there cited.

SEYNE SUR MER, or LA SEYNE, an industrial suburb of Toulon, S.W. of that port, and connected with it by rail and steamer. Pop. (1901) 21,002. It owes its importance to the shipbuilding trade, the Société des Forges et Chantiers de la Méditerranée having here one of the finest shipbuilding yards in Europe (it is a branch of the greater establishment at Marseilles), which gives employment to about 3000 workmen.

SFAX (Arabic Asfakis or Sefus), a city of Tunisia, second in importance only to the capital, 78 m. due S. of Sousse, on the Gulf of Gabes (Syrtis Minor) opposite the Kerkena Islands, in 36° 43' N., 10° 46' E. It occupies the site of the ancient Taphrunt, of which few vestiges remain. The town consists of a European quarter, with streets regularly laid out and fine houses, and the Arab town, with its kasbah or citadel, and tower-flanked walls pierced by three gates. Many of the private houses, mosques and zawias are good specimens of native art of the 17th and 18th centuries. North-east of the native town is a camp for the European garrison. Sfax was formerly the starting-point of a caravan route to Central Africa, but its inland trade now extends only to the phosphate region beyond Gabes, which town, while in the 13th century and the 16th onwards from Sfax to Mahares, runs inland past Gafsa. With Sfax there is regular communication by steamer and motor car. Olive oil is manufactured, and the fisheries are important, notably those of sardines and of octopuses (exported to Greece).

The prosperity of the town is largely due to the export trade in phosphates, esparto grass, oil, almonds, pistachio nuts, sponges, wool, &c. There is in the Gulf of Gabes a rise and fall of 5 ft. at spring tides, which is rare in the Mediterranean. Formerly the only anchorage at Sfax was 2 m. from shore; but a harbour, completed in 1900 and entered by a channel 11 m. long and 241 ft. deep, which extends some miles from the coast, was opened in 1903. The two harbours of Sfax to Mahares run inland past Gafsa.

Round the town for 5 or 6 m. to the north and west stretch orchards, gardens and country houses. Dates, almonds, grapes, figs, peaches, apricots, olives, and in rainy years melons and cucumbers grow there without irrigation. Two enormous cisterns, maintained by public charitable trusts, supply the town with water in dry seasons.

Sfax is on the site of a Roman settlement. Many of its Arab inhabitants claim descent from Mahomet. The Sicilians under Roger the Norman took it in 1091, and during the 13th century it was an independent state. There were separate basins for fishing boats and a dock for torpedo-boat flotilla. Round the town for 5 or 6 m. to the north and west stretch orchards, gardens and country houses. Dates, almonds, grapes, figs, peaches, apricots, olives, and in rainy years melons and cucumbers grow there without irrigation. Two enormous cisterns, maintained by public charitable trusts, supply the town with water in dry seasons.

The town of Sfax was once a major center of commerce in the Mediterranean, dealing in a wide range of products such as phosphates, sardines, and octopuses. The town's prosperity was largely due to its trade with Central Africa, which continued until the 16th century when it shifted to the phosphate region beyond Gabes. Today, Sfax remains an important port and city in Tunisia, known for its historical significance and its contributions to the local economy.

SFORZA, the name of a famous Italian family. They were descended from a peasant contadine, Giacomo or Muzio (sometimes abbreviated into Giacomuzzo) Attendolo, who was born at Colignola in the Romagna on the 10th of June 1369, and in command of a band of adventurers by whom he had been kidnapped, took the name of Sforza in the field, became constable of Naples under Joanna II., fought bravely against the Spaniards, served Pope Martin V., by whom he was created a Roman count, and was drowned on the 4th of January 1424 in the Pescara near Aquila while engaged in a military expedition. His natural son Francesco (1401-1466) succeeded in command of the condottieri, and showed military genius and political acumen. He served the Visconti against the Venetians and then the Venetians against the Visconti; he attacked the pope, deprived him of the Romagna, and later defended him; he married in 1441 Bianca, the only daughter of Filippo Maria Visconti, duke of Milan, and received Pontremoli and Cremona as dowry and the promise of succession to the duchy of Milan. The short-lived Ambrosian republic, which was established by the Milanese on the death of Visconti (1447), was overthrown by Francesco, who made his triumphal entry as duke of Milan on the 25th of March 1450. He suppressed a revolt at Piacenza, formed close alliances with Cosmo de' Medici and with Louis XI. of France, and exercised authority over Lombardy, several districts south of the Po and even Genoa. He rebuilt the fortress of Porto Givoia and constructed the Great Hospital and the canal of the Martesana, which connects Milan with the Adda; and his court, filled with Italian scholars and Greek exiles, speedily became one of the most splendid in Italy. His daughter Ippolita was renowned for her Latin discourses.

Francesco left several sons, among whom were Galeazzo Maria, Lodovico, surnamed the Moor, and Ascagno, who became a cardinal.

Galeazzo Maria, who succeeded to the duchy, was born in 1441. He was a lover of art, eloquent in speech and of absolute and cruel. He was assassinated at the porch of the cathedral on the 26th of December 1476 by three young Milanese noblemen desirous of imitating Brutus and Cassius. His daughter Caterina is separately noticed. Gian Galeazzo (1469-1494), son of Galeazzo, succeeded to the duchy under the regency of his mother, Bona of Savoy, who was supplanted in her power (1481) by the boy's uncle, Lodovico the Moor. Gian Galeazzo married Isabella of Aragon, granddaughter of the king of Naples, and his sudden death was attributed by some to poison administered by the regent. His daughter, Bona Sforza (1493-1555), married the son of Poland, H. H. Czestochowa. She displayed remarkable ability in government, built castles, schools and hospitals, but increased corruption and intrigue at the Polish court. She was accused of having killed her daughter-in-law, the wife of Sigismund Augustus. On the death of her husband she returned to Italy and was poisoned (1557) by her paramour Pappacoda.

Lodovico the Moor [Lodovico il Moro] (1451-1508), who is famed as patron of Leonardo da Vinci and other artists, had summoned Charles VIII. of France to his aid (1494) and received the Duchy of Milan under a formal capitulation from the French king. In the same year, but finding his own position endangered by the French policy, he joined the league against Charles VIII., giving his niece Bianca in marriage to Maximilian I. and receiving in return imperial investiture of the duchy. Lodovico was driven from Milan by Louis XII. in 1499, and although reinstated for a short time by the Swiss he was eventually delivered over by them to the French (April 1500) and died a prisoner in the castle of Loches. Francesco, the son of Gian Galeazzo, was also taken to France by Louis XII., became abbot of Marmoutiers, and died in 1511.

The two sons of Lodovico, Massimiliano and Francesco Maria, took refuge in Germany; the former was restored to the duchy of Milan by the Swiss in 1512, but after the overwhelming defeat of his allies at Marignano (1515) he abandoned his rights to Francis I. for a pension of 30,000 ducats, and died at Paris in 1530; the latter was put in possession of Milan after the defeat of the French at La Bochica in 1522, subsequently entered the Italian League against the emperor Charles V., was unpopular on account of oppressive taxation, and his death (24th of October 1535) marked the extinction of the direct male line of the Sforza dynasty.

The dukedoms of Sforza-Casarini and the counties of Santa Fiora are descended from collateral branches of the Sforza family.

entry into Imola in 1477 Caterina Sforza went to Rome with her husband, who, with the help of the pope, wrested the lordship of Forlì from the Ordelaffi. Riario, by means of many crimes, for which his wife seems to have blamed him, succeeded in accumulating great wealth, and on the death of Sixtus in August 1484, he sent Caterina to Rome to occupy the castle of St Angelo, where she was held in safety and took strenuous measures for the defence. She surrendered it by his order to the Sacred College. They then returned to their fiefs of Imola and Forlì, where they tried to win the favour of the people by erecting magnificent public buildings and churches and by abolishing taxes; but want of money obliged them to levy the taxes once more, which caused dissatisfaction. Riario's enemies conspired against him with a view to making Francescheto Cybò, nephew of Pope Innocent VIII., lord of Imola and Forlì in his stead. Riario thereupon instituted a system of persecution, in which Caterina was implicated, against all whom he suspected of making a conspiracy against him. In 1488 he was murdered by three conspirators, his palace was sacked, and his wife and children were taken prisoners. The castle of Forlì, however, held out in Caterina's interest, and every inducement and threat to make its order its surrender proved useless; having managed to escape from her captors she penetrated into the castle, whence she threatened to bombaby the city, refusing to come to terms even when the besiegers threatened to murder her children. With the assistance of Lodovico il Moro she was able to defeat her enemies and to regain possession of all her dominions; she wreaked vengeance on those who had opposed her, and the forces of the Venetians. Alexander VI., however, angered at her refusal to agree to a union between his daughter Lucrezia Borgia and her son Ottaviano, and coveting her territories as well as the rest of Romagna for his son Cesare, issued a bull on the 9th of March 1499, declaring that the house of Riario had forfeited the lordship of Imola and Forlì and conferring those fiefs on Cesare Borgia. The latter began his campaign of conquest with Caterina Sforza's dominions and attacked her with his whole army, reinforced by 14,000 French troops and by Louis XII. Caterina placed her children in safety, and took command of her forces. The castle of Imola was held by her henchman Dionigi Naldi of Brighella, until resistance being no longer possible he surrendered (December 1499) with the honours of war. Caterina absolved the citizens of Forlì from their oath of fealty, and defended herself in the citadel. She repeatedly beat back the Borgia's onslaughts and refused all his offers of peace. Finally when the situation had become untenable and having in vain given orders for the magazine to be blown up, she surrendered, after a battle in which large numbers were killed on both sides, to Alexander VI. and Bessy, batti di Dijon, entrusting herself to the honour of France (January 1500) and the council of Forlì. Her life was spared, but she was not saved from the outrages of the treacherous Cesare; she was afterwards taken to Rome and held a prisoner for a year in the castle of St Angelo, whence she was liberated by the same batti di Dijon to whom she had surrendered at Forlì. She took refuge in Florence to escape from persecution from the Borgia, and the power of that sinister family having collapsed on the death of Alexander VI. in 1503, she attempted to regain possession of her dominions. In this she failed owing to the hostility of her brothers-in-law, Pierfrancesco and Lorenzo de Medici, and as they wished to get her son Giovanni de Medici (afterwards Giovanni dalle Bande Nere) into their hands, she took refuge with him in the convent of Annalena, where she died on the 20th of May 1500.

See Buriel, Vita di Caterina Sforza-Riario (Bologna, 1783); F. Oliva, Vita di C. Sforza, signora di Forlì (Forlì, 1921); Pietro Posillipo Dall'Onda, Caterina Sforza (Rome, 1893); English translation by F. Sylvester (1898). This is the best and most complete work on the subject; E. M. de Vogüé, Histoire et poésie (Paris, 1898) and Ermanno Minzi, "C. Sforza," in the Nuova Antologia for May 1 and May 15, 1893.

**SGAMBATI—SHAD**

757

**SGAMBATI, GIOVANNI** (1843— ), Italian composer, was born in Rome on the 28th of May 1843, of an Italian father and an English mother. His early education took place at Trevi, in Umbria, and there he wrote some church music, and obtained experience as a singer and conductor. In 1860 he settled in Rome, and definitely took up the work of winning acceptance for the best German music, which was at that time neglected in Italy. The influence and support of Liszt, who was in Rome from 1861, was naturally of the greatest advantage to him, and concerts were given in which Sgambati conducted works which he played on the piano. His composition of this period (1864-1865) included a quartet, two piano quintets, an octet, and an overture. He conducted Liszt's *Dante* symphony in 1866, and made the acquaintance of Wagner's music for the first time at Munich, whither he travelled in Liszt's company. His first album of songs appeared in 1870, and his first symphony was played at the Quirinal in 1881; this, as well as a piano concerto, was performed in the course of his first visit to England in 1882; and at his second visit, in 1891, his *Sinfonia epitalamica* was given at the Philharmonic. His most extensivive work, a Requiem Mass, was performed in Rome 1901. His many plans for forte works have won permanent success, but his influence on Italian musical taste has been perhaps greater than the merits of his compositions, which, though often poetical and generally effective, are often slight in style.

**SHABATS** (also written *Shabatos* and *Saboc*), a town in Servia, capital of the Drina department, on the right bank of the river Save. Pop. (1900) 12,072. It has a medieval castle, built in 1470 by Sultan Mahammed II., to facilitate the incursion of the Turks into Slavonia, which lies on the left bank of the river. It is the principal commercial town of north-western Servia, exporting cereals, wines, cattle, and pigs to Hungary. It is well known for the excellent white honey which comes from its neighbourhood. The district is rich in lime-trees. Shabats is the seat of a bishop, of the district prefecture, and of a tribunal. It has a college and a library, and a garrison occupies the old fort. The people of Shabats have the reputation of being the wondest in Servia.

**SHAD**, the name given to certain migratory species of herrings (*Clupea*), which are distinguished from the herrings proper by the total absence of teeth in the jaws. Two species occur in Europe, and are distinguished from each other and from all others called allis shad (*Clupea alosa* or *Alosa vulgaris*), and the other known as twaite shad (*Clupea fonta* or *Alosa fonta*). Both, like the majority of herrings, are greenish on the back and silvery on the sides, but they are distinguished from the other European species *Clupea* by the presence of a large blackish blotch behind the gill-opening, which is succeeded by a series of several other similar spots along the middle of the side of the body. So closely allied are these two fishes that their distinctness can be proved only by an examination of the gill-apparatus, the allis shad having from sixty to eighty very fine and long gill-rakers along the concave edge of the first branchial arch, whilst the twaite shad possesses from twenty-one to twenty-seven stout and stiff gill-rakers only. In their habits and geographical distribution also the two shads are similar. They inhabit the coasts of temperate Europe, the twaite shad being more numerous in the Mediterranean. While they are in salt water they live singly or in very small companies, but during May (the twaite shad some weeks later) they congregate, and in great numbers ascend large rivers, such as the Severn (and formerly the Thames), the Seine, the Rhine, the Nile, &c., in order to deposit their spawn. A few weeks after they drop down the river, lean and exhausted, numbers floating dead on the water; but only a small proportion seem to regain the sea. At Elbeuf on the Seine above Rouen there was formerly a hatchery for the artificial
propagation of shad. The eggs are spawned in May and June, and are similar in the two species; they are heavier than the fresh water in which they develop, but unlike the herring’s eggs they are not adhesive. They remain free and separate at the bottom of the river, cast leeward by the current or up by the tide. In the Elbe the twain shad spawns below Hambourg, the allis shad above Dresden. In November the fry have reached 3 to 5 in. in length, but very few specimens in their second year have been found in rivers. The majority seem to descend to the sea before their first winter, to return when mature. On rivers in which these fishes make their periodical appearance they have become the object of a regular fishery. They are much esteemed on the middle Rhine, where they are generally known as “Malisch.” The allis shad is caught at a size from 15 to 24 in., and is better flavoured than the twain shad, which is generally smaller.

Other, but closely allied species, occur on the Atlantic coasts of North America, all surpassing the European species in importance as food-fishes and economic animals. The shad, for instance, viz., the American shad (Clupea sapidissima), the gaspareau or ale-wife (C. malionocca or vermiculata), and the menhaden (C. menhaden).

**SHADDOCK (Citrus decumiana),** a tree allied to the orange and the lemon, presumably native to the Malay and Polynesian islands, but generally cultivated throughout the tropics. The leaves are like those of the orange, but downy on the under surface, and the young shoots are covered with white down. The flowers are large and white, and are succeeded by very large globose fruits like oranges, but paler in colour, and with a more pungent flavour. The name Shaddock is asserted to be that of a captain who introduced the tree to the West Indies. The fruit is also known under the name of grape-fruits, pommeles, and “forbidden fruit.” Varieties occur with yellow and reddish pulp; and there are also pear-shaped varieties.

**SHADOOF (Arab. shadif),** an apparatus for drawing water, used in the East generally, and particularly on the Nile for the purpose of irrigation. It consists of an upright frame on which is suspended a long pole at a distance of about one-fifth of its length from one end; to the other end is attached a bucket or skin bag, while at the short end a weight is suspended serving as the counterpoise of a lever. The vessel containing the water is then swung round and emptied into the runnel, which conveys the water in the direction required.

**SHADOW (O. Eng. Schadewe, secedu; a form of “shade”; connected with Gr. σκοτεινός, darkness).** When an opaque body is placed between a screen and a luminous source, it casts a “shadow” on the screen. If the source be a point, such as the instantaneous point of a small pole, as in the case of the sun, it will cast a shadow which is a circle. If the source be a line close to a bright flame, the outline of the shadow is to be found by drawing straight lines from the luminous point to the edge of the opaque body. These lines form a cone. The points of contact form a line on the opaque body separating the illuminated from the non-illuminated portion of its surface. Similarly, when these lines are produced to meet the screen, their points of intersection with it form a line which separates the illuminated from the non-illuminated parts of the screen. This line is called the boundary of the geometrical shadow, and its construction is based on the assumption that light travels in straight lines (in homogeneous media) and suffers no deviation on meeting an obstacle. But a deviation, termed diffraction, does occur, and consequently the complete theory of shadows involves considerations based on the nature of the rays themselves; this aspect is treated in Diffraktion of Light. An instance of the geometrical shadow is seen when a very small gas-jet is burning in a ground-glass shade near a wall. In this case the cone, above mentioned, is usually a right cone with its axis vertical. Thus the boundary of the geometrical shadow is a portion of a circle on the roof, but a portion of an hyperbola on the vertical wall. If the roof be not horizontal, we may obtain in this way any form of conic section. Hints in projection may be obtained by observing the shadows of bodies of various forms cast in this way by rays which virtually diverge from one point: e.g. how to place a plane quadrilateral of given form so that its geometrical shadow may be a square; how to place an elliptic disk, with a small hole in it, so that the shadow may be circular with a bright spot at its centre, &c.

When there are more luminous points than one, we have only to draw separately the geometrical shadows due to each of the sources, and then superpose them. A new consideration now comes in. There will be, in general, portions of all the separate geometrical shadows which overlap one another in some particular regions of the screen. In such regions we still have full shadow; but around them there will be other regions, some illuminated by one of the sources alone, some by two, &c., until finally we come to the parts of the screen which are illuminated directly by all the sources. There will evidently be still a definite boundary of the parts wholly unilluminated, i.e. the true shadow or umbra, and also a definite boundary of the parts wholly illuminated. The region between these boundaries—i.e. the partially illuminated portion—is called the penumbra.

Fig. 1 represents the shadow of a circular disk cast by four equal luminous points arranged as the corners of a square—

![Fig. 1](image_url)

the disk being large enough to admit of a free overlapping of the separate shadows. The amount of want of illumination in each portion of the penumbra is roughly indicated by the shading. The separate shadows are circular, if the disk is parallel to the screen. If we suppose the number of sources to increase indefinitely, so as finally to give the appearance of a luminous surface as the source of light, it is obvious that the degrees of darkness at different portions of the penumbra will also increase indefinitely; i.e. there will be a gradual increase of brightness in the penumbra from total darkness at the edge next the geometrical shadow to full illumination at the outer edge.

Thus we see at once why the shadows cast by the sun or moon are in general so much less sharp than those cast by the electric arc. For, practically, at moderate distances the arc appears as a mere luminous point. But if we place a body at a distance of a foot or two only from the arc, the shadow cast will have as much of penumbra as if the sun had been the source. The breadth of the penumbra when the source and screen are nearly equidistant from the opaque body is equal to the diameter of the luminous source. The notions of the penumbra and umbra are important in considering eclipses (q.v.). When the eclipse is total, there is a real geometrical shadow—very small compared with the penumbra (for the apparent diameters of the sun and moon are nearly equal, but their distances are as 370:1); when the eclipse is annular, the shadow is all penumbra. In a lunar eclipse, on the other hand, the earth is the shadow-casting body, and the moon is the screen, and we observe things according to our first point of view.

Suppose, next, that the body which casts the shadow is a large one, such as a wall, with a hole in it. If we were to plug the hole, the whole screen would be in geometrical shadow. Hence the illumination of the screen by the light passing through
the hole is precisely what would be cut off by a disk which fits the hole, and the complement of fig. 1, in which the light and shade of interchanged, would give therefore the effect of four equal sources of light shining on a wall through a circular hole. The umbra in the former case becomes the fully illuminated portion, and vice versa.

Thus we see how, when a small hole is cut in the window-shutter of a dark room, a picture of the sun, and bright clouds about it, is formed on the opposite wall. This picture is obviously inverted, and also perverted, for not only are objects depicted lower the higher they are, but also objects seen to the right are depicted to the left, &c. But it will be seen unperverted (though still inverted) if it be received on a sheet of ground glass and looked at from behind. The smaller the hole (so far at least as geometrical optics is concerned) the less confused will the picture be. As the hole is made larger the illuminated portions from different sources gradually overlap; and when the hole becomes a window we have no indications of such a picture except from a body (like the sun) much brighter than the other external objects. Here the picture has ceased to be one of the sun, it is now a picture of the window. But if the wall could be placed room off, the picture would be one of the sun. To prevent this overlapping of images, and yet to admit a good deal of light, is one main object of the lens which usually forms part of the camera obscura (q.v.).

The bars or images of the sun in this way is well seen on a calm sunny day under trees, where the sunlight penetrating through small chinks forms elliptical spots on the ground. When detached clouds are drifting rapidly across the sun, we often see the shadows of the bars of the window on the walls or floor suddenly shifted by an inch or two, and for a moment very much more sharply defined. They are, in fact, shadows cast by a small aperture in a piece of note paper. Place this close to the eye, and an inch or so behind it place another piece of paper with a fine needle-hole in it. The light of the sky passing through the needle-hole forms a bright picture of the T on the retina. The eye perceives this picture, which gives the impression of the T much magnified, but turned upside down.

Another curious phenomenon may fitly be referred to in this connexion, viz. the phantoms which are seen when we look at two parallel sets of palisades or railings, one behind the other, or look through two parallel sides of a meat-safe formed of perforated zinc. The appearance presented is that of a magnified set of bars or opacities which appear to move rapidly as we walk past. Their origin is the fact that where the bars appear nearly to coincide the apparent gaps bear the greatest ratio to the dark spaces; i.e. these parts of the field are the most highly illuminated. The exact determination of the appearances in any given case is a mere problem of convergents to a continued fraction. But the fact that the apparent rapidity of motion of this phantom may exceed in any ratio that of the spectator is of importance—enabling us to see how velocities, apparently of impossible magnitude, may be accounted for by the mere running along of the condition of visibility among a group of objects no one of which is capable of an extravagant rate.

SHADWELL, THOMAS (c. 1642–1692), English playwright and miscellaneous writer, was born about 1642, at Santon Hall, Norfolk, according to his son's account. He was educated at Bury St Edmund's School, and at Caix College, Cambridge, where he entered in 1666. He left the university without a degree, and joined the Middle Temple. In 1668 he produced a prose comedy, The Sullen Lovers, or the Imperfects, based on Les Fâcheux of Molière, and written in avowed imitation of Ben Jonson. His best plays are Epsom Wells (1672), for which Sir Charles Sedley wrote a prologue, and the Square of Alsatia (1688). Alsatia was the cant name for Whitefriars, then a kind of sanctuary for persons liable to arrest, and the play represents, in dialogue full of the argot of the place, the adventures of a young heir who falls into the hand of the sharper there. For fourteen years from the production of his first comedy to his memorable encounter with Dryden, Shadwell produced a play nearly every year. These productions display a genuine hatred of shams, and a rough but honest moral purpose. They are disfigured by indecencies, but present a vivid picture of contemporary manners.

Shadwell is chiefly known for the unfortunate Mac Flecknoe of Dryden's satire, the "last great prophet of tautology," and the literary son and heir of Richard Flecknoe—"The rest to some faint meaning make pretence; But Shadwell never deviates into sense."

Dryden had furnished Shadwell with a prologue to his True Widow (1679), and in spite of momentary differences, the two had been apparently on friendly terms. But when Dryden joined the court party, and produced Absalom and Achitophel and The Medal, Shadwell became the champion of the true-blue Protestants, and made a scurrilous attack on the poet in The Medal of John Boyes: a Satire against Folly and Knavery (1682). Dryden immediately retorted in Mac Flecknoe, or a Satire on the True Blue Protestant Poet, T.S. (1682), in which Shadwell's personalities were returned with interest. A month later he contributed to Nahum Tate's continuation of Absalom and Achitophel satirical portraits of Elkanah Settle as Doeg and of Shadwell as Og. In 1687 Shadwell attempted to answer these attacks in a version of the tenth satire of Juvenal. At the Whig triumph in 1688 he superseded his enemy as poet laureate andlished the Office of Steward royal. He died at Chelsea on the 19th of November 1692.

His son, CHARLES SHADWELL, was the author of The Fair Quaker of Deal and other plays, collected and published in 1720. A complete edition of Shadwell's works was published by his son Sir John Shadwell in 1720. His other dramatic works are—The Royal Shepherds (1676, in which John Fountain's Rewards of Virtue; The Humorist (1671); The Miser (1672), adapted from Molière; Psyche; The Libertine (1676); The Virtuoso (1676); The history of Timon of Athens the Man-hater (1780),—on the Shakespearean adaptation see O. Beher, Shakespeare i. 1672. Timon of Athens (Rostock, 1897); A True Widow (1679); The Woman Captian (1680), revived in 1744 as The Prodigal; The Lancashire Witches and Tague O'Dwyer, the Irish Priest (1682); Bury Fair (1682); The Amorous Beggar, with the second part of Tague O'Dwyer (1690); The Scourers (1691); and The Volunteers, or Stockjobbers, published posthumously (1693).

SHÀFI'I [Mahmammad ibn Idrîs ash-Shàfî'î] (677–820), the founder of the Shafiite school of canon law, was born in A.H. 150 (A.D. 767) of a Koreshitbe (Quraishite) family at Gaza or Ascalon, and was brought up by his mother in poor circumstances at Mecca. There, and especially in intercourse with the desert tribe of Hudail, he gained a knowledge of classical Arabic and old Arabian poetry for which he was afterwards famous. About 170 he went to Medina and studied canon law (fikr) under Malik ibn Anas. After the death of Malik in 179 legend takes him to Yemen, where he is involved in an 'Ahd conspiracy, carried prisoner to Bagdad, but pardoned by Harîm al-Kashid. He was certainly pursuing his studies, and he seems to have come to Bagdad in some such way as this and then to have studied under Hanifite teachers. He had not yet formulated his own system. After a journey to Egypt, however, we find him in Bagdad again, as a teacher, between 193 and 198. There he had great success and turned the tide against the Hanifite school. His method was to restore the sources of canon law which Abû Hâna'îl, had destroyed by inclining too much to speculative deduction. Instead, he laid equal emphasis upon the four—Koran, tradition, analogy, and agreement. See further, under MAHOMMEDAN LAW. In 198 he went to Egypt and the Shafiite law then became perhaps the most prosperous in the Arab world. He was received as the leading orthodox authority in law of his time. There he developed and somewhat changed the details of his system, and died in 204 (A.D. 820). He was buried to the south-east of what is now Cairo, and a great dome (erected c. A.D. 1240) is conspicuous over his tomb.

SHAPIRO—SHAFTESBURY, 1ST EARL OF

SHAPIRO, PETER PAVLOVICH, BARON (1670–1739), Russian statesman, one of the ablest coadjutors of Peter the Great, was of obscure, and in all probability of Jewish, extraction. He first made himself useful by his extraordinary knowledge of languages, and soon afterwards had the appointment of clerk in the Russian Foreign Office for many years, subsequently accompanying Peter on his travels. Made a baron and raised to the rank of vice-chancellor, he displayed diplomatic talents of the highest order. During the unlucky campaign of 1711, he succeeded against all expectations in concluding the peace of the Pruth (see Turkey: History). Peter left him in the hands of the Turks as a hostage, and on the rupture of the peace he was imprisoned in the Seven Towers. Finally, however, with the aid of the British and Dutch ambassadors, he defeated the diplomacy of Charles XII. of Sweden and his agents, and confirmed the good relations between Russia and Turkey by the treaty of Adrianople (June 5th, 1713). On the institution of the colleges or department of state in 1718, Shafirov was appointed vice-president of the department of Foreign Affairs, and a senator. In 1723, however, he was deprived of all his offices and sentenced to death. The capital sentence was commuted on the scaffold to banishment, first to Siberia and then to Novgorod. Peculations and disorderly conduct in the senate were the offences charged against Shafirov, and with some justice. On the death of Peter, Shafirov was warned of the approach of the new general, in the person of his late master. He had previously (1717), in an historical tract on the war with Charles XII, in which Peter himself collaborated, epitomized, in a high panegyric style, some of the greatest exploits of the tsar-regenerator. The successful rivalry of his supplancer, Andrei Osterman, prevented Shafirov from holding any high office during the last fourteen years of his life.

See B. M. Solovev, History of Russia, vols. xii.–xvi. (Russ.) (Petersburg, 1895).

(R. N. B.)

SHAFT (O. Eng., seeafi, from scæfian, to shave; the word is common to Teutonic languages, and signifies, smoothed rod or blade.) Originally a name, also a term for a staff or handle. Here used as an adjective, as in shafting. Hitherto the head is attached; hence the word is applied to the handle of a tool, and to the pair of bars between which a horse is harnessed to a vehicle, and in machinery to connecting bars or rods conveying power from one part of a machine to another. It is also applied to an opening sunk in the ground for mining or other purposes (see Shaft-Sinking). This use is probably due to the use of Ger. Schacht, a variant of schaft. In architecture the term "shaft" is applied to the body of a column between the capital and the base. In Romanesque work shafts are occasionally seen with a pedestal on each side of the capital. In the chevron, or flattened vertically or in spirals; the most beautiful examples of the latter being found in the cloisters of St. Peter lateran and at St. Paul's outside the walls at Rome, where they are enriched with mosaics. Perhaps the earliest ornamented shafts are those of the Parthian palace, now the mosque, at Diarbekr in Mesopotamia.

SHAFTESBURY, ANTHONY ASHLEY COOPER, 1ST EARL OF (1621–1663), son of Sir John Cooper of Rockbourne in Hampshire, and of Anne, the only child of Sir Anthony Ashley, Bart., and was born at Wimpborne St. Giles, Dorset, on the 22nd of July, 1621. His parents were extremely good friends of ages, and he inherited extensive estates in Hampshire, Wiltshire, Dorsetshire and Somersetshire, much reduced, however, by litigation in Chancery. He lived for some time with Sir Daniel Norton, one of his trustees, at Southwick, and upon his death in 1655 with Mr. Tooker, an uncle by marriage, at Salisbury. In 1657 he went as a gentleman-commoner to Exeter College, Oxford, where he remained about a year. No record of his studies is to be found, but he has left an amusing account of his part in the wilder doings of the university life of those days, in which, in spite of his small stature, he was recognized by his fellows as their leader. At the age of eighteen, on the 29th of February 1639, he married Margaret, daughter of Lord Coventry, with whom he and his wife lived at Durham House in the Strand, and at Canary House in Islington. In March 1640, though still a minor, he was elected for Tewkesbury, and sat in the parlia-

dment which met on the 13th of April, but appears to have taken no active part in its proceedings. In 1640 Lord Coventry died, and Cooper then lived with his brother-in-law at Dorchester House in Covent Garden. For the Long Parliament, which met on the 3rd of November 1640, he was elected for Down in Wiltshire, but the return was disputed, and he did not take his seat—his election not being declared valid until the last days of the Rump. He was present as a spectator at the setting up of the king's standard at Nottingham on the 25th of August 1642; and in 1643 he appeared openly on Charles's side in Dorsetshire, where he raised at his own expense a regiment of foot and a troop of horse, of both of which he took the command. He was also appointed governor of Weymouth, sheriff of Dorsetshire for the king and president of the king's council of war in the county. In the beginning of January 1644, however, for reasons which are variously reported by himself and Clarendon, he resigned his governorship and commissions and went over to the parliament. He appeared on the 6th of March before the standing committee of the two Houses to explain his conduct, when he stated that he had come over because he saw danger to the Protestant religion in the king's service, and expressed his willingness to take the Covenant. In July 1644 he went to Dorsetshire on military service, and on the 3rd of August received a commission as field-marshall general. He assisted at the taking of Oxford, and was afterwards appointed by the Army to the office of governor of the fortress there, which he held for the last years of the war, and afterwards relieved by Cromwell. On the 25th of October he was made commander-in-chief in Dorsetshire, and in November he took by storm Abbotbury, the house of Sir John Strangways—an affair in which he appears to have shown considerable personal gallantry. In December he relieved Taunton. His military service terminated at the time of the Self-denying Ordinance in 1645; he had associated himself with the Presbyterian faction, and naturally enough was not included in the New Model. For the next seven or eight years he lived in comparative retirement, and was frequently in the house of commons. He was distinguished for the number of pamphlets which he wrote on civil and ecclesiastical affairs, and was rewarded by being made a peer. He sat for Wiltshire in the Barebones parliament, of which he was a leading member, and where he supported Cromwell's views against the extreme section. He was at once appointed on the council of thirty. On the resignation of this parliament he became a member of the council of state named in the "Instrument." In the first parliament elected under this "Instrument" he sat for Wiltshire, having been elected also for Poole and Tewkesbury, and was one of the commissioners for the election of unworthy ministers. After the 25th of December 1654, he had left the privy council, and henceforward is found with the Presbyterians and Republicans in opposition to Cromwell. His second wife had died during this year; in 1656 he married a third, who survived him, Margaret, daughter of Lord Spencer, niece of the earl of Southampton, and sister of the earl of Sunderland, who died at Newbury. By his three marriages he was thus connected with many of the leading politicians of Charles II.'s reign.

Cooper was again elected for Wiltshire for the parliament of 1657, but Cromwell refused to allow him, with many others of his opponents, to sit. He signed a letter of complaint, with sixty-five excluded members, to the speaker, as also a "Remonstrance" addressed to the people. In the parliament which met on the 20th of January 1658, he took his seat, and was active in opposition to the new constitution of the two Houses. He was also a leader of the opposition in Richard Cromwell's
parliament, especially on the matter of the limitation of the power of the protector, and against the House of Lords. He was throughout these debates celebrated for the "nervous and subtle oratory" which made him so formidable in after days.

Upon the replacing of the Rump by the army, after the breaking up of Richard's parliament, Cooper endeavoured unsuccessfully to take his seat on the ground of his former disputed election for Downton. He was, however, elected on the council of state, and was chosen one of the President. He recommended Scott, along with Whitelocke, of corresponding with Hyde. This he solemnly denied. After the rising in Cheshire Cooper was arrested in Dorsetshire on a charge of corresponding with its leader Booth, but on the matter being investigated by the council he was unanioumously acquitted. In the disputes between Lambert at the head of the military party and the Rump in union with the council of state, he supported the latter, and upon the temporary supremacy of Lambert's party worked indefatigably to restore the Rump. With Monk's commissioners he, with Haseldig, had a fruitless conference on the subject of the co-operation, and joined with eight others of the overthrown council of state in naming him commander-in-chief of the forces of England and Scotland. He was instrumental in securing the Tower for the parliament, and in obtaining the adhesion of Admiral Lawson and the fleet. Upon the restoration of the parliament on the 26th of December Cooper was one of the commissioners to command the army, and on the 2nd of January was made one of the new council of state. On the 7th of January he took his seat on his election for Downton in 1649, and was made colonel of Fleetwood's regiment of horse. He speedily secured the admission of the displaced members staying means while in continual communication with Monk, was again one of the fresh council of state, consisting entirely of friends of the Restoration, and accepted from Monk a commission to be governor of the Isle of Wight and captain of a company of foot. He now steadily pursued the design of the Restoration, but without holding any private correspondence with the king, and only on terms similar to those proposed in 1648 to Charles I., at the Isle of Wight. In the Convention parliament he sat for Wiltshire. Monk cut short these deliberations and forced on the Restoration without condition. Cooper was one of the twelve commissioners who went to Charles at Breda to invite him to return. On his journey he was upset from his carriage, and the accident caused an internal abscess which was never cured.

Cooper was at once placed on the privy council, receiving also a formal pardon for former delinquencies. His first duty was to examine the Anabaptist prisoners in the Tower. In the prolonged discussions regarding the Bill of Indemnity he was instrumental in saving the life of Haseldig, and opposed the clause compelling all officers who had served under Cromwell to refund their salaries, he himself never having had any. He showed indeed none of the avowed temper so common among the politicians of the time. He was one of the commissioners for conducting the trials of the regicides, but was himself vehemently "fallen upon" by Pryme for having acted with Cromwell. He was named on the council of plantations and on that of trade. In the debate abolishing the court of wards he spoke, like most landed proprietors, in favour of laying the burden on the excise instead of on the land, and on the question of the restoration of the bishops carried in the interests of the court an adjournment of the debate for three months. At the coronation in April 1660 Cooper had been made a peer, as Baron Ashley of Wimborne St Giles, in express recognition of his services to the Crown. The Declaration of Indulgence, he concurred. He was nominated by being made earl of Shaftesbury and Baron Cooper of Pavett by a patent dated the 23rd of April 1672. It is stated too that he was offered, but refused, the lord treasurership. On the 17th of November 1672, however, he became lord chancellor, Bridgman having been compelled to resign the seat. As chancellor he issued writs for the election of thirty-six new members to fill vacancies caused during the long recess; this, though grounded upon precedent, was open to suspicion as an attempt to fortify Charles, and was attacked by an angry House of Commons himself the author of a treatise on tolerance. He was now recognized as one of the chief opponents of Clarendon and the High Anglican policy. On the breaking out of the Dutch War in 1664 he was made treasurer of the prizes, being accountable to the king alone for all sums received or spent. He was also one of the grantees of the province of Carolina and took a leading part in its management; it was at his request that Locke in 1669 drew up a constitution for the new colony. In September 1665 the king unexpectedly paid him a visit at Wimborne. He opposed unsuccessfully the appropriation proviso introduced into the supply bill as hindering the due administration of finance, and this opposition seems to have brought about a reconciliation with Clarendon. In 1668, however, he supported a bill to appoint commissioners to examine the accounts of the Dutch War, though in the previous year he had opposed it. In accordance with his former action on all questions of religious toleration he opposed the shameful Five Mile Act of 1665. In 1667 he supported the bill for prohibiting the importation of Irish cattle, on the ground that it would lead to a great fall of rents in England. Ashley was himself a large landlord, and, moreover, was opposed to Ormonde, who would have benefited by the importation. In all other questions of this kind he shows himself far in advance of the economic fallacies of the day. His action led to an altercation with Ossory, the son of Ormonde, in which Ossory used language for which he was compelled to apologize. On the death of Southampton, Ashley was placed on the commission of the treasury, Clifford and William Coventry being his principal colleagues. He appears to have taken no part in the attempt to impeach Clarendon on a general charge of treason. His attention to all trade questions was close and constant; he was a member of the council of trade and plantations appointed in 1670, and was its president from 1672 to 1676. The difficulty of the succession also occupied him, and he co-operated thus early in the design of legitimizing Monmouth as a rival to James. In the intrigues which led to the infamous treaty to Dover he had no part. The treaty contained a clause by which Charles was bound to declare himself a Catholic, and with the knowledge of this Ashley, as a staunch Protestant, could not be trusted. In order to blind him and the other Protestant members of the Cabal a sham treaty was arranged in which this clause did not appear, and it was not until a considerable while afterwards that he found out that he had been duped. Under this misunderstanding he signed the sham Dover treaty on the 31st of December 1670. This treaty, however, was kept from public knowledge, and Ashley helped Charles to hoodwink parliament by signing a similar treaty on the 2nd of February 1672, which was laid before them as the only one in existence. His approval of the attempt of the Lords to alter a money bill led to the loss of the supply to Charles and to the consequent displeasure of the king. His support to the Lord Roos Act, ascribed generally to his desire to ingratiate himself with Charles, was no doubt due in part to the fact that his son had married Lord Roos's sister. So far from advising the "Stop of the Exchequer," he opposed this bad measure; the reasons which he left with the king for his opposition are extant. The responsibility rests with Clifford and Macclesfield. It is stated that the Earl of Shaftesbury, Charles's Declaration of Indulgence, he concurred. He was nominated by being made earl of Shaftesbury and Baron Cooper of Pavett by a patent dated the 23rd of April 1672. It is stated too that he was offered, but refused, the lord treasurership. On the 17th of November 1672, however, he became lord chancellor, Bridgman having been compelled to resign the seat. As chancellor he issued writs for the election of thirty-six new members to fill vacancies caused during the long recess; this, though grounded upon precedent, was open to suspicion as an attempt to fortify Charles, and was attacked by an angry House of Commons
which met on the 4th of February 1673. The writs were cancelled, and the principle was established that the issuing of writs rested with the House itself. It was at the opening of parliament that Shaftesbury made his celebrated "defesa est Carthago" speech against Holland, in which he urged the Second Dutch War, on the ground of the necessity of destroying so formidable a commercial rival to England, excused the Stop of the Exchequer which he had opposed, and vindicated the Declaration of Indulgence. On the 8th of March he announced to parliament that the declaration had been cancelled, though he did his best to induce Charles to remain firm. For affixing the great seal to this declaration he was threatened with impeachment by the Commons. The Test Act was now brought forward, and Shaftesbury, who appears to have heard how he had been duped in 1670, supported it, with the object probably of thereby getting rid of Clifford. He now began to be regarded as the chief upholder of Protestantism in the ministry; he lost favour with Charles, and on Sunday, the 9th of September 1673, was dismissed from the chancellorship. Among the reasons for this dismissal is probably the fact that he opposed grants to the king's mistresses. He had been accused of vanity and ostentation in his office, but his reputation for ability and integrity as a judge was high even with his enemies.

Charles soon regretted the loss of Shaftesbury, and endeavoured, as did also Louis, to induce him to return, but in vain. He preferred now to become the great popular leader against all the measures of the court, and may be regarded as the intellectual chief of the opposition. At the meeting of parliament on the 25th April 1674, he carried a motion for a proclamation banishing Catholics to a distance of 10 m. from London. During the whole session he organized and directed the opposition in their attacks on the king's ministers. On the 15th of May he was dismissed the privy council and ordered to leave London. He retired to Wimborne and urged upon his parliamentary followers the necessity of securing a new parliament. He was in the House of Lords, however, in 1675, when Danby brought forward his famous Non-resisting Test Bill, and headed the opposition which was carried on for seventeen days, distinguishing himself, says Burnet, more in this session than ever before. The bill was shelved, a prorogation having taken place in consequence of a quarrel between the two Houses, supposed to have been purposely got up by Shaftesbury, in which he supported the right of the Lords to hear appeal cases, even where the defendant was a member of the Lower House. Parliament was prorogued for fifteen months until the 1st of February 1677, and it was determined by the opposition to attack its existence on the ground that a prorogation for more than a year was illegal. In this matter the opposition were in the wrong, and by attacking the parliament carried a motion for a prorogation, of which the result was that Shaftesbury, Buckingham, Shafton and Salisbury were sent to the Tower. In June Shaftesbury applied for a writ of habeas corpus, but could get no release until the 26th of February 1678, after his letter and three petitions to the king. Being brought before the bar of the House of Lords he made submission as to his conduct in declaring parliament dissolved by the prorogation, and in violating the Lords' privileges by bringing a habeas corpus in the King's Bench.

The breaking out of the Popish Terror in 1678 marks the worst part of Shaftesbury's career. That so clear-headed a man could have espoused any part of this policy shows that the puritans was beyond belief; and the manner in which he excited baseless alarms, and encouraged fanatic cruelty, for nothing but party advantage, is without excuse. On the 2nd of November he opened the great attack by proposing an address declaring the necessity for the king's dismissing James from his council. Under his advice the opposition now made an alliance with Louis whereby the French king promised to help them to ruin Danby on condition that they would compel Charles, by stopping the supplies, to make peace with France, doing thus a grave injury to Protestantism and for the sake of a temporary party advantage at home. Upon the refusal in November of the Lords to concur in the address of the Commons requesting the removal of the queen from court, he joined in a protest against the refusal, and was foremost in all the violent acts of the session. He urged on the bill by which Catholics were prohibited from sitting in either House of Parliament, and was bitter in his expressions of disappointment when the Commons passed a proviso excepting James, against whom the bill was especially aimed, from its operation. A new parliament met on the 6th of March 1679. Shaftesbury had meanwhile ineffectually warned the king that unless he followed this advice there would be no peace with the people. On the 25th of March he made a striking speech upon the state of the nation, especially upon the dangers to Protestantism and the misgovernments of Scotland and Ireland. He was suspected, too, of doing all in his power to bring about a revolt in Scotland. By the advice of Temple, Charles now tried the experiment of forming a new privy council in which the chief members of the opposition were included, and Shaftesbury was made president, with a salary of £4000, being also a member of the committee for foreign affairs. He did not, however, in any way change either his opinions or his action. He opposed the compelling of Protestant Nonconformists to take the oath required of Roman Catholics. That indeed, as Ranke says, which makes him memorable in English history is that he opposed the establishment of an Anglican and Royalist organization with success. The question of the succession was now again prominent, and Shaftesbury, in opposition to Halifax, committed the error, which really brought about his fall, of putting forward Monmouth as his nominee, thus alienating a large number of his supporters; he encouraged, too, the belief that this was agreeable to the king. He pressed on the Exclusion Bill with all his power, and, when that and the new issue into the payments for secret service and the trial of the five peers, for which too he had been eager, were brought to an end by a sudden prorogation, he is reported to have declared aloud that he would have the heads of those who were the king's advisers to this course. Before the prorogation, however, he saw the invaluable Act of Habens Corpus, which he had carried through parliament, receive the royal assent. In pursuance of his patronage of Monmouth, Shaftesbury now secured for him the command of the army sent to suppress the insurrection in Scotland, which he is supposed to have fomented. In October 1679, the circumstances which led Charles to desire to conciliate the opposition having ceased, Shaftesbury was dismissed from his presidency and from the privy council; when applied to by Sunderland to return to office he made as conditions the divorce of the queen and the exclusion of James. With nine other peers he presented a petition to the king in November, praying for the meeting of parliament, of which Charles took no notice. In April, upon the king's declaration that he was resolved to send for James from Scotland, Shaftesbury advised the popular leaders to make a petition to the king in order to get him to dismiss James. And in March we find him unscrupulously eager in the prosecution of the alleged Irish Catholic plot. Upon the king's illness in May he held frequent meetings of Monmouth's friends at his house to consider how best to act for the security of the Protestant religion. On the 26th of June, accompanied by fourteen others, he presented to the grand jury of Westminster an indictment of the duke of York as a Popish recusant. In the middle of September he was seriously ill. On the 15th of November the Exclusion Bill, having passed the Commons, was brought up to the Lords, and an historic debate took place, in which Halifax and Shaftesbury were the leaders on opposite sides. The bill was thrown out, and Shaftesbury signed the protest against its rejection. The next day he urged upon the House the divorce of the queen. On the 7th of December, to his lasting dishonour, he voted for the condemnation of Lord Stafford. On the 23rd he again spoke vehemently for exclusion, and his speech was immediately printed. All opposition was, however, checked by the dissolution on the 18th of January. A new parliament was called to meet at Oxford, to avoid the influences of the city of London, where Shaftesbury had taken the greatest pains to make himself popular. Shaftesbury, with fifteen other peers, petitioned the king that it might as usual be held in the capital. He prepared instructions to be handed by constituencies to their
members upon election, in which exclusion, disbanding, the limitation of the prerogative in proroguing and dissolving parliament, and security against popery and arbitrary power were insisted on. At this parliament, which lasted but a few days, he again made a personal appeal to Charles, which was curtly rejected, to permit the legitimizing of Monmouth. The king's advisers now urged him to arrest Shaftesbury; he was seized on the 2nd of July 1681, and committed to the Tower, the judges being of opinion that he was not a fugitive after sentence of death. This refusal was twice repeated in September and October, the court hoping to obtain evidence sufficient to ensure his ruin. In October he wrote offering to retire to Carolina if he were released. On the 24th of November he was indicted for high treason at the Old Bailey, the chief ground being a paper of association for the defence of the Protestant religion, which, though among his papers, was not in his handwriting; but the grand jury ignored the bill. He was released on bail on the 1st of December. In 1682, however, Charles secured the appointment of Tory sheriffs for London; and the jury, with some misgivings on the part of the sheriffs, Shaftesbury felt that he was no longer safe from the vengeance of the court. Failing health and the disappointment of his political plans led him into violent courses. He appears to have entered into consultation of a treasonable kind with Monmouth and others; he himself had, he declared, ten thousand brisk boys in London ready to rise at his bidding. For some weeks he was concealed in the city and in Wapping; but, finding the schemes for a rising hang fire, he went to Harwich, disguised as a Presbyterian minister, and after a week's delay, during which he was in imminent risk of discovery, if indeed, as is probable, his escape was not wined by the government, he sailed to Holland on the 28th of November 1681, and reached Amsterdam in the beginning of December. Here he was welcomed with the jest, referring to his famous speech against the Dutch, “nondum deleta Carthago.” He was made a citizen of Amsterdam, but died there of gout in the stomach on the 21st of January 1683. His body was sent in February to Poole, in Dorset, and was buried at Wimborne St Giles.

Few politicians have been of the mark of such abuse as Shaftesbury. Dryden, while compelled to honour him as an upright judge, overwhemed his memory with scathing. If Dryden's satire has been accepted as truth by later historians. Macaulay in especial exerted all his art, though in contradiction of probability and fact. He was not a man that could further enrich his reputation. Christie, on the other hand, in possession of later sources of information, and with more honest purpose, did much to rehabilitate him. Occasionally, however, he appears to hold a brief for the defender of the true cause. Of all the political writers of his time (1871) should be read with caution. Finally, in his monograph (1860) in the series of "English Worthies," H. D. Traill professes to hold the book in esteem, and to regard it as the contribution of Shaftesbury's place in English politics, by insisting on his position as the first great party leader in the modern sense, and as the founder of modern parliamentary oratory. In other respects his book is derived almost entirely from Christie. See also the present writer's article in the Dict. Nat. Bio. Much of Shaftesbury's career, increasingly as it came near its close, is incapable of defence; but it was escaped most of his critics that his life up to the Restoration, apparently full of inconsistencies, was evidently guided by one leading principle, the determination to uphold the supremacy of parliament, a principle which, however obscured by self-interest, appears also to have been a guide alike to his political career. He was too, even the friend of religious freedom and of an enlightened policy in all trade questions. And, above all, it should not be forgotten, in justice to Shaftesbury's memory, that "during his long political career, he was ever incorrupt, and never grasped either money or land."

SHAFTESBURY, ANTHONY ASHLEY COOPER, 3rd Earl of (1667–1713), was born at Exeter House in London on the 26th of February 1670/1. He was grandson of the first and son of the second earl. His mother was Lady Dorothy Manners, daughter of John, earl of Rutland. According to a curious story, told by the third earl himself, the marriage between his father and mother was negotiated by John Locke, who was a trusted friend of the first earl. The second Lord Shaftesbury appears to have been a poor creature, both physically and mentally. At the age of three his son was sent to the formal guardianship of his grandfather. Locke, who in his capacity of medical attendant to the Ashley household had already assisted in bringing the boy into the world, though not his instructor, was entrusted with the superintendence of his education. This was conducted according to the principles enunciated in Locke's Thoughts concerning Education, and the method of teaching Latin and Greek conversationally was pursued with such success by his instructress, Mrs Elizabeth Birch, that at the age of eleven, it is said, Ashley could read in Latin and Greek with understanding. In November 1685, a month after the death of the first earl, his father entered him at Winchester as a warden's boarder. Being shy and constantly taunted with the opinions and fate of his grandfather, he appears to have been rendered miserable by his schoolfellows, and to have left Winchester in 1686 for a course of foreign travel. He was brought thus into contact with those artistic and classical associations which exercised so marked an influence on his character and opinions. On his travels he did not, we are told by the fourth earl, "greatly seek the conversation of other political people. He had too much from others, but rather that of their tutors, with whom he could converse on congenial topics."

In 1689, the year after the Revolution, Lord Ashley returned to England, and for nearly five years he appears to have led a quiet and studious life. There can be no doubt that the greater part of his attention was directed to the perusal of classical authors, and to the attempt to realize the true spirit of classical antiquity. He had no intention, however, of becoming a recluse, or of permanently holding himself aloof from public life. Accordingly he became a candidate for the borough of Poole, and was returned as a Whig, November 1700. He soon distinguished himself by a speech in support of the Bill for Regulating Trials in Cases of Treason, one provision of which was that a person indicated for treason or misprision of treason should be allowed the assistance of counsel. But, though a Whig, alike by descent, by education and by conviction, Ashley could by no means be depended on to give a party vote; he was always ready to support any propositions, from whatever quarter they came, that appeared to him to promote the liberty of the subject and the independence of parliament. Unfortunately, his health was so treacherous that, on the dissolution of July 1703, he was obliged to retire from parliamentary life. He spent much from this time to be had in Holland with less danger than in any other country in the world. To the period of this sojourn in Holland must probably be referred the surreptitious impression or publication of an imperfect edition of the Inquiry concerning Virtue, from a rough draught, sketched when he was only twenty years of age. This liberty was taken, during his absence, by Toland. After an absence of over a twelvemonth, Ashley returned to England, and soon succeeded his father as earl of Shaftesbury. He took an active part, on the Whig side, in the general election of 1701, and again with more success, in that of the autumn of 1702. It is said that William III. showed his appreciation of Shaftesbury's services on this latter occasion by offering him a secretariaship of state, which, however, his declining health compelled him to decline. Had the king's life continued, Shaftesbury's influence at court would probably have been considerable. After the first few weeks of Anne's reign, Shaftesbury, who had been deprived of the vice-admiralty of Dorset, returned to his retired life, but his letters to Furlong show that he retained a keen interest in politics. In August 1703 he again settled in Holland, in the air of which he seems, like Locke, to have had great faith. At Rotterdam he lived, he says in a letter to
SHAFTESBURY, 3rd Earl Of

His steward Wheelock, at the rate of less than £200 a year, and yet had much "to dispose of and spend beyond convenient living." He returned to England, much improved in health, in August 1704. But, though he had received immediate benefit from his stay abroad, symptoms of consumption were constantly alarming him, and the trade which had involved him in commerce was now almost exclusively literary, and from this time forward he was probably engaged in writing, completing or revising the treatises which were afterwards included in the Characteristics. He continued, however, to take a warm interest in politics, both home and foreign, and especially in the war against France, of which he was an enthusiastic supporter.

Shaftesbury was nearly forty before he married, and then he appears to have taken this step at the urgent instigation of his friends, mainly to supply a successor to the title. The object of his choice (or rather of his second choice, for an earlier project of marriage had shortly before fallen through) was a Miss Jane Ewer, the daughter of a gentleman in Hertfordshire. The marriage took place in the autumn of 1709, and on February 9, 1710/1, was born at his house at Reigate, in Surrey, his only child and heir, the fourth earl, to whose manuscript accounts we are in great part indebted for the details of his father's life. The match appears to have been happy, though Shaftesbury had little sentiment on the subject of marriage.

He wrote the Preface to the life of Lord Bolingbroke, the final draft of which, in Dr Whitchurch, one of the Cambridge Platonists or Libertarians, published in 1698, Shaftesbury appears to have printed nothing himself till 1708. About this time the French prophets, Camisards (q.v.), as they were called, attracted much attention by their extravagances and follies. Various repressive remedies were proposed, but Shaftesbury maintained that fanaticism was best encountered by "raillery" and "good-humour." In support of this view he wrote a letter Concerning Enthusiasm to Lord Somers, dated September 1707, which was published anonymously in the same year, and provoked several replies. In May 1709 he returned to the subject, and printed another letter, entitled Sensus Communis, an Essay on the Freedom of Wit and Humour. In the same year he also published The Moralists, a Philosophical Rachypody, and in the following year Solaioy, or Advice to an Author. None of these pieces seems to have been printed either with his name or its initials. In 1711 appeared the Characteristics of Men, Manners, Opinions, Times, in three volumes, also without any name or initials on the title-page, and without even the name of a printer. These volumes contain in addition to the four treatises already mentioned, Miscellaneous Reflections, now first printed, and the Inquiry concerning Virtue or Merit, described as "formerly printed from an imperfect copy, now corrected and published intire," and as "printed first in the year 1699."

The declining state of Shaftesbury's health rendered it necessary for him to seek a warmer climate, and in July 1711 he set out for Italy. He settled at Naples in November, and lived there considerably over a year. His principal occupation at this time must have consisted in preparing for the press a second edition of the Characteristics, which appeared in 1713, soon after his death. The early part of 1713 was spent in writing, as is shown in a letter, written in February: "The greatest part of the book is preserved in the British Museum. He was also engaged, during his stay at Naples, in writing the little treatise (afterwards included in the Characteristics) entitled A Notion of the Historical Draught or Tablature of the Judgment of Hercules, and the letter concerning Design. A little before his death he had also formed a scheme of writing a Discourse on the Arts of Painting, Sculpture, Etching, &c., but when he died he had made but little progress with it. "Medals, and pictures, and antiquities," he writes to Purlie, "are my chief entertainments here. His conversation was with men of art and science, "the virtuosi of this place."

The events preceding the peace of Utrecht, which he regarded as preparing the way for a base desertion of our allies, greatly troubled the last months of Shaftesbury's life. He did not, however, live to see the actual conclusion of the treaty (March 31, 1713), as he died the month before, February 4, 1712/3.

He had not completed his forty-second year. His body was brought back by sea to England and buried at St Giles's, the family seat in Dorsetshire. His only son, Anthony Ashley, succeeded him as 4th earl, and his great-grandson was the famous philanthropist, the 7th earl. Shaftesbury's amiable character seems to have been one of his principal characteristics. Like Locke he had a peculiar pleasure in bringing forward young men. Among these may be especially mentioned Michael Ainsworth, a native of Wimborne St Giles, the young man who was the recipient of the Letters addressed to a student at the university, and was maintained by Shaftesbury at University College, Oxford. The interest which Shaftesbury took in his studies, and the desire that he should be specially fitted for the profession which he had selected, that of a clergyman of the Church of England, are markedfeatures of Lockes letters. Old and young Furlus and Harry Wilkinson, a boy who was sent into Furly's office at Rotterdam, and to whom several of the letters still extant in the Record Office are addressed.

In the popular mind, Shaftesbury is generally regarded as a writer hostile to religion. But, however short his orthodoxy might fail if tried by the standards of any particular church, his temperance was pre-eminently religious. This fact is shown in his letters. The belief in a God, all-wise, all-just and all-merciful, governing the world providentially for the best, pervades all his works, and one of the most characteristic things he had he any wish to undermine established beliefs, except where he conceived that they conflicted with a truer religion and a purer morality.

To the public ordinances of the church he scrupulously conformed. But, unfortunately, there were many things both in the teaching and the practice of the ecclesiastics of that day which were calculated to repel men of sober judgment and high principle. These evil tendencies in the popular presentation of Christianity undoubtedly begot in Shaftesbury's mind a reaction in his attitude towards the claims of the doctrines of Christianity itself; and, cultivating, almost for set purpose, his sense of the ridiculous, he was too apt to assume towards such doctrines and their teachers a tone of raillery.

But, whatever might be Shaftesbury's speculative opinions or his mode of expressing them, all witnesses bear testimony to the elevation and purity of his life and aims. As an earnest student, and ardent lover of liberty, an enthusiast in the cause of virtue, and a man of unblemished life and untiring beneficence, Shaftesbury probably had no superior in his generation. His character and pursuits are the more remarkable, considering the prejudices and obstacles which still stood in the way of a life of such communion with the world under which he was brought up. In many respects he reminds us of the imperial philosopher Marcus Aurelius, whose works he studied with avidity, and whose influence is stamped upon his own productions.

Most of Shaftesbury's writings have already been mentioned. In addition to these there have been published fourteen letters from Shaftesbury to Molesworth, edited by Toland in 1721; some letters to Benjamin Furly, his sons, and his clerk Harry Wilkinson, included in a volumemitled Original Letters of Locke, Sidney and Shaftesbury, which was published by Mr T. Craster in 1830, and again in an expanded form in 1859. Of Locke's writings the principal are the Letters to Lord Godolphin, which appeared, for the first time, in the General Dictionary; and lastly a letter to Le Clerc, in his collections of Locke, first published in Notes and Queries, Feb. 8, 1851. The Letters to a Young Man at the University (Michael Ainsworth), already mentioned, were first published in 1716. The Letter on Design was first published in the edition of the Characteristics issued in 1732. Besides the published writings, there are several memoranda, letters, rough drafts, &c., in the Shaftesbury papers in the Record Office.

Shaftesbury took great pains in the elaboration of his style, and he succeeded so far as to make his meaning transparent. The thought is always clear. But, on the other hand, he did not equally succeed in attaining elegance, an object at which he seems equally to have aimed. It is a characteristic of his style—a false note—which, notwithstanding all his efforts to please, is often irritat- ing to the reader. Its main characteristic is perhaps best hit off by Charles Lamb when he calls it "gentle." He poses too much as a figure of speech, and is enuresed of the vulgar scholastic kind that he falls into the hardly more attractive
pedantry of the aesthetic and virtue ... He is as easily ... he reached 1874. He is not ... the French translation of the whole of Shaftesbury's works, including the ... Letters, was published at Geneva. Translations of separate ... him mainly from the theological side by Dr. Gideon Spicker (Freiburg in Baden, 1872), the other dealing with him mainly from the philosophical side by Dr. Georg von Gizycki (Leipzig, 1876).

(T.F.; J. M. M.)

AUTHOR—In Dr. Thomas Spicer's monograph on Shaftesbury and Hutcheson in the series of "English philosophers" (1882) he was able largely to supplement the printed materials for the Life extracted from the Shaftesbury papers in the Record Office. These were supplemented by the speeches and resolutions of Shaftesbury, and his correspondence with his friends, notably the Countess of Huntingdon, and his diary, the papers of which were presented before the Society of Antiquaries in 1885. In regard to Shaftesbury's moral philosophy, his work was translated into German by E. Mackintosh's Progress of Ethical Philosophy, W. Whewell's History of Moral Philosophy in England, J. P. Joubert's Introduction à la Philosophie desUNK; J. A. W. Stepping's English Thought in the Eighteenth Century, Martinis's "The Ethics of Shaftesbury", Windelband's History of Philosophy (Eng. trans., 1895); W. M. Hatch's unfinished edition with appendices of the Characters (1881). Also J. R. Robertson's The Characteristics (1900); B. Rand's Life (1900). For his relations to the religious and theological controversies of his day, see, in addition to some of the above works, J. Leland, View of the Principal Desistical Writers, V. Leecher, Geschichte des Englischen Philosophus, J. Hunt, Religious Thought in England, C. J. Abbey and J. H. Overton, English Church in the Eighteenth Century and A. S. Farrar's Bampton Lectures; G. Zett, Ethik,Epochen der Philosophia, Die deutsche Philosophie des 18ten Jahrhunderts (Berlin, 1881).

SHAFTESBURY, ANTHONY ASHLEY COOPER, 7TH EARL OF (1801-1885), son of Copley, 6th earl (a younger brother of the 5th-earl; succeeded 1811), and Anne, daughter of the 3rd duke of Marlborough, was born on the 28th of April 1801. He was educated at Harrow and Christ Church, Oxford, where he obtained a first class in classics in 1822, and graduated M.A. in 1832. In 1841 he received from his university the degree of D.C.L. He entered parliament as member for the pocket borough of Woodstock in 1826; in 1830 he was returned for Dorchester; from 1831 till February 1846 he represented the county of Dorset; and he was member for Bath from 1847 till (having previously borne the courtesy title Lord Ashley) he succeeded his father as earl in 1851. Although giving a general support to the Conservatives, his parliamentary conduct was greatly modified by his intense interest in the improvement of the social condition of the working classes, his efforts in behalf of whom he made his name a household word. He opposed the Reform Bill of 1832, but was a supporter of Catholic emancipation, and his objection to the continuance of resistance to the abolition of the Corn Laws led him to resign his seat for Dorset in 1846. In parliament his name, more than any other, is associated with the new factory legislation. He was a lord of the admiralty under Sir Robert Peel (1834-1835), but on being invited to join Peel's administration in 1841 refused, having been unable to obtain Peel's support for the Ten Hours' Bill. Chiefly by his persistent efforts a Ten Hours' Bill was carried in 1847, but its operation was impeded by legal difficulties, which were only removed by successive Acts, instigated chiefly by him, until legislation reached a final stage in the Factory Act of 1874. The part which he took in the legislation bearing on coal mines was equally prominent. His efforts in behalf of the welfare of the working classes were guided by personal knowledge. Thus in 1846, after the resignation of his seat for Dorset, he explored the slums of the metropolis, and not only gave a new
SHAFTESBURY—SHAFT-SINKING

impulse to the movement for the establishment of ragged schools, but was able to make it more widely beneficial. For forty years he was president of the Ragged School Union. He was also one of the journal's chief reformatories to fifteen schools, young men's Christian associations and working men's institutes. He took an active interest in foreign missions, and was president of several of the most important philanthropic and religious societies of London. He died on the 1st of October 1889. By his marriage (1830) to Lady Emily (d. 1872), daughter of the 5th earl Cowper, he left a large family, and was succeeded by his eldest son Anthony, who committed suicide in 1886, his son (b. 1869) becoming 9th earl.

See also Holkirt’s Life (1820).

SHAFTS.—Shaftesbury is a town and municipal borough in the northern parliamentary division of Dorsetshire, England, 103 m. W.S.W. from London by the London and South-Western Railway (Semley station). Pop. (1901) 2027. It lies high on a hill above a rich agricultural district. The church of St Peter is Perpendicular; those of Holy Trinity and St James are in the main modern reconstructions. The borough is under a mayor, 4 aldermen and 12 councillors. Area 175 acres.

Although there are traces of both British and Roman occupation in the immediate neighbourhood, the site of Shaftesbury (which is not to be confused with the iron shafts at Sceafstesbyrig, Dorsetshire) was probably first occupied in Saxon times. Matthew Paris speaks of its foundation by the mythical king Ruludhibras, while Asser ascribes it to Alfred, who made his daughter Ethelfgeu the first abbess. It is probable that a small religious house had existed here before the time of Alfred, and that it and the town were destroyed by the Danes, being both rebuilt about 888. In 980 Dunstan brought St Edward's body here from Wareham for burial, and here Canute died in 1035. Shaftesbury was a borough containing 104 houses in the king's demesne during the reign of Edward the Confessor; in 1086, 35 houses had been added, but it was still the seat of a mint with three mint-masters. In the manor of the abbess of Shaftesbury there were 111 houses and 152 burgesses; here 42 houses had been totally destroyed since St Edward's reign. In 1280 the abbess obtained the royal manor at an annual fee-farm rent of £12 and remained the sole mistress of the borough until it passed at the dissolution of the monasteries to Sir Thomas Arundel, after whose execution it was granted about 1532 to William Herbert, earl of Pembroke. In 1352 the burgesses received their first charter from Henry III. This granted that in all eves the burgesses might meet in a public place in Shaftesbury; if they should not answer for the payment of the common, they should not answer for aught without the town and might choose for themselves two coroners annually. The recce of the borough is mentioned in 1313-1317. The office of mayor was created between the years 1350-1352, and an inquisition of 1392 records that the mayor held a court of pie-power and governed the town in the absence of the steward. The seal of the commonalty is extant for 1350, and that of the mayoralty first occurs in 1428. By 1471 a general assembly of burgesses had acquired power to take part in elections. There is no evidence that Elizabeth granted Shaftesbury a charter, as has been asserted, but she confiscated the common lands in 1565, the town only recovering them by purchase. This probably led to a charter of incorporation being obtained from James I. in 1604. A new charter was granted to the town in 1684, but without the surrender of the old charter confirmed by Charles II. in 1665. Shaftesbury returned two members to parliament from 1294 to 1832, when the representation was reduced to one, and it was lost in 1858.

Leland speaks of Shaftesbury as a great market town, and it possessed a market in the time of Edward I. The Martimmas fair was granted in 1604. In the 17th century worsted and trousers were manufactured, but these industries have disappeared.

SHAFT-SINKING, an important operation in mining for reaching and working mineral deposits situated at a depth below the surface, whenever the topography does not admit of driving adits or tunnels. Shafts are often sunk also in connexion with certain civil engineering works, e.g. at intervals along the line of a railway tunnel, for starting intermediate headings, thus securing more points of attack than if the entire work were carried on from the end headings only. Sundry modifications of shaft-sinking are adopted in excavating for deep foundations of heavy buildings, bridge piers and other engineering structures.

If in solid rock, carrying but little water, shaft-sinking is a comparatively simple operation. But when much water is encountered or the formation penetrated comprises unstable, watery strata, special forms of lining become necessary and the work is slow and expensive. Mine shafts are often very deep; but the Witwatersrand, South Africa; the Michigan copper district; at Bendigo, Australia; and in certain parts of Europe. Many vertical shafts exceed 4000 ft. in depth, and at least two—the Whiting shaft, of the Calumet and Hecla mine and shaft No. 3 of the Tamarack mine (both in Michigan)—are over 5000 ft. deep. The last named at the beginning of 1907 was about 5200 ft., and was then the deepest in the world. Several inclined shafts, in the same district, approximate 6000 ft. in length.

Shape of Shafts.—In Europe shafts are generally cylindrical, sometimes of elliptical cross-section, and are lined with masonry, concrete, or steel; in South Africa, the Witwatersrand, and in certain parts of Europe, the working of mining regions of the world, rectangular cross-sections are the rule for sinking in rock, the shaft walls being supported by timbering, occasionally by steel lining. For sinking in loose, water-bearing soils, the cross-section is almost invariably cylindrical, as this form best resists pressure tending to cause crushing or caving of the shaft walls. The European practice of sinking cylindrical shafts even in rock is based mainly on four considerations:—(1) custom; (2) high cost of timber; (3) apart from questions of first cost, a cylindrical shaft, lined with masonry or iron, is strong and permanent, and its cost of maintenance is low; (4) more shafts in difficult formations have been sunk in Europe than elsewhere. The cheaper timber-lined, rectangular shaft, however, is generally appropriate under normal conditions in rocky strata, in view of the temporary character of mining operations. Vertical shafts may be either rectangular or cylindrical; wheninclined they are always rectangular.

The prime purpose of mine shafts is to act as hoisting and travelling-ways; incidentally they serve for ventilation, for pumping and for transmitting power underground by steam, compressed air or other means. Rectangular shafts are usually provided for this end, cast longitudinally into compartments, of which these are for the cages or skips, which run in guides bolted to the shaft timbering (see MINING). Another is generally provided for a ladder- and pipe-way and ventilation. When much water is encountered a separate pump compartment is desirable. Cylindrical shafts may be similarly divided by subsidiary timbering, though in many timbering is omitted and the hoisting cages are guided by wire ropes stretched from top to bottom.

Dimensions.—The cross-sectional area of shafts depends mainly on the size of the cages or skips—i.e. on the hoisting load. Small rectangular shafts of one or two compartments measure inside of timber, say 4 by 6 ft. up to 12 ft.; larger shafts of three compartments, from 5 by 12 ft. up to 8 or 10 ft. by 20 ft. For four- or five-compartment shafts, sometimes required for large scale work, as in the deep-level mines of the Witwatersrand, the inside dimensions range from 6 by 20 ft. to 6 or 8 by 30 ft., and for some of the Pennsylvania colliery shafts, up to 13 by 52 ft. Cylindrical shafts rarely have more than two hoisting compartments and are commonly from 10 to 16 ft., sometimes 20 or 21 ft. diameter, the segmental areas surrounding the hoisting ways being utilized for ventilation, piping, &c.

Sinking in Rock.—If the rock be overlaid by loose soil carrying little water, excavation is begun by pick and shovel, and when the rock is reached it is continued by drilling and blasting (see BLASTING). The sinking plant, usually temporary, comprises a small hoist and boiler, several buckets or sometimes a skip, one or more sinking pumps, according to the quantity of water,
ocasionally a small ventilating fan, and a timber derrick or head-frame over the shaft mouth, with appliances for dumping the buckets, handling the rock and safe-guarding the men in the shaft against falling objects. In some circumstances a portion of the permanent mine plant is erected for sinking. The choice between hand and machine drilling depends chiefly on the kind of rock and the size and depth of shaft. For very hard rock or when rapid work is desired, machine drilling is advisable, a compressor and additional boiler capacity being then required. Remarkable speeds, however, have been made by hand-sinking in some of the deep vertical shafts on the Rand, the world’s record being that of the Howard shaft, sunk by hand labour 203 ft. in one month. But such speeds are attainable only in dry, or nearly dry, ground, at a high cost per foot and by crowding as many men into the shaft as possible, both for drilling and loading away the blasted rock. The conditions being the same, inclined shafts closely approaching the vertical can be put down about as fast as vertical shafts; but for inclinations between say 25° and 30° to the horizontal, inclines are generally slower on account of the greater inconvenience of carrying on the work, both of excavation and timbering. Very flat shafts, on the other hand, can be sunk at speeds little less than for driving tunnels, unless there is much water. The highest speed on record for a very flat incline (10°) is 207 ft. in one month.

As a rule, the speed attained in sinking depends less on the drilling time per round of holes than on the time required to handle and hoist out the rock; hence the speed generally diminishes with increase of depth. Furthermore, omitting shafts of small area, the cost per foot of depth does not increase greatly with the cross-sectional dimensions. For the same rock the rate of advance in wet formations is always much slower than in dry and the cost greater.

The work of sinking in rock is carried on as follows. A round of holes is drilled, usually from 3 to 4 ft. deep if by hand, or from 5 to 8 or 9 ft. if by machine-drilling (see BLASTING). A common mode of arranging machine drill holes is shown in plan and section in fig. 1. The holes are charged with dynamite and fired by fuse or electricity—in deep shafts preferably by electricity, as the men may have to be hoisted a long distance to reach a place of safety. After the smoke has cleared away (which may be hastened by sprays or by turning on the compressed air if machine drills are used), the work of hoisting out the broken rock is begun and drilling resumed as soon as possible. For shafts not over 6 or 8 ft. wide, machine drills are usually mounted on horizontal bars stretching across from wall to wall, or, in wider or cylindrical shafts, on tripods or special sinking-frames. In shafts of small area, or deep shafts which are timbered during sinking, the hoisting buckets must be guided to prevent them from striking against the sides. Small quantities of water are bailed out of the buckets; when the inflow is too great to be so disposed of, a sinking pump is employed (see MINING).

Shaft Timbering.—In sinking rectangular vertical shafts under normal conditions the excavation through the surface soil is commonly lined with cribbing, inside of which a concrete curb is sometimes built to dam out the surface water. After reaching rock the lining is generally composed of horizontal sets of 8 by 8 in. to 12 by 12 in. squared timber wedged against the walls, with smaller pieces, or "planks," called "lugging," placed behind them, to prevent portions of the walls from falling away. In firm rock lugging may be omitted. Each set consists of (fig. 2) two long timbers (wall-plates) W, W, two shorter pieces (end plates) E, E, and usually one or more cross pieces (dividers or buttons) D, D, to form the compartments, strengthen the sets and support the cage guides, G.G. The sets are from 4 to 6 ft. apart, with vertical posts (studdles) S, S, between them. At intervals of say 80 to 120 ft., longer timbers ("beams") are notched into the walls, under a set, to prevent displacement of the lining as a whole. A series of shaft sets, with their timbers and cribbing, from the bearing-set, or suspended from the latter by hanger-bolts. When the rock is firm, a considerable depth of shaft may be sunk and then timbered; generally, however, it is safer to put in a few sets at a time as sinking advances, the lowestmost being removed by some means far enough from the bottom to prevent it from being injured by the blasting. Inclined shafts in solid ground are often timbered as described above, though sometimes merely by setting the shaft into compartments.

Lining for Cylindrical Shafts in Rock.—Wooden linings are occasionally put in small shafts, or for temporary support, before the sinking of the mine shaft is begun, but a cylindrical shaft of any importance is lined with masonry or iron. Masonry linings are generally built in sections, as the sinking advances, each section being based on a walling-crib (AB, CD, fig. 3). Specially moulded tamped bricks or concrete, shaped to fit, are placed in the radius of the shaft. Concrete may be similarly moulded into large blocks, often weighing 1200 to 1600 lb. each. The thickness of the walling depends on the depth of shaft and pressure anticipated; it is usually from 13 in. to 2 ft., laid in cement mortar. Such linings, while not entirely water-tight, will shut out much of the water present in the surrounding rock.

Irregularities, or "tubbing," is employed when the inflow of water is rather large. It is usually composed of shafts lined with iron, or pipes riveted to them. The irregular annular space between the tubbing and rock-walls is afterwards filled with concrete or cement grouting. The lowestmost tubbing is generally made of solid cast iron, composed of segments bolted together, and set on a projecting shelf of rock, carefully dressed down. The space behind the crib is driven full of wooden wedges, which expand on becoming water-soaked and thus make a tight joint at the bottom of the tubbing with the rock just above the mineral deposit. By this means most of the water may be permanently shut out of the shaft, and the cost of pumping materially reduced.

Kind-Chandler System of Sinking.—This ingenious method, introduced in 1852, has thus far been confined to Europe. Up to 1904, 79 shafts had been sunk by its use, some to a depth of 1000 ft. or more, without a single instance of failure. It is applicable only to firm rock and was devised to deal with cases where the quantity of water is too great to be pumped out while excavation is in progress; that is, for infilows greater than 1000 or 1200 gallons per minute, and it is not suitable for the sinking of deep shafts. The advance is achieved by the use of special tools resembling a long pipe or drill, driven in a central shaft and acting like a borings. Instead of ordinary drills, massive tools called "trepanns" are employed, consisting of a heavy steel frame, in the lower edge of which are set a number of sepa-rate cutters (fig. 4). Shafts not exceeding 8 ft. dia. may be bored in one operation; for larger diameters an advanced core is usually made with a small trepan and afterwards enlarged to full size. The advance bore may be completed to the required depth of shaft before beginning enlargement, or the small and large trepanns used alternately, the advance being kept 30 to 40 ft. ahead of the core (fig. 5), and brought up to 12 tons, those of 14 or 15 ft. 25 to 30 tons. The trepan is attached to a heavy rod, suspended from a walking-beam operated by an engine on the surface, as in ordinary boring. A derrick is erected over the

**Fig. 4.** Large and Small Trepanns for shaft sinking, Haniel & Lüdow, Düsseldorf, makers.
shaft, with a hoisting engine for raising and lowering the tools. Average rock is bored at a speed of about 12 ft. per 24 hours. The advance bore is cleaned of debris at intervals by a bailer similar to that used for bore-holes. The enlarging trepan is so shaped that the bottom of the enlarged apertures to the centre underneath the cuttings, assisted by the agitation of the water, run into the advance bore and are bailed out. Owing to the difficulty of this latter procedure the advance bore is sometimes omitted for the shaft, and the under-drilling being removed by a special dredger (Coll. Guardian., Dec. 22, 1899, p. 1184). For rather loose rock another somewhat similar system of drilling, the Parberry, has been satisfactorily employed.

When the shaft has passed through the watery strata the lining is installed. This is composed of cast iron rings, like tubing (cc, dd), bolted together at the shaft mouth and gradually lowered through the water (fig. 5). The first two rings, called the “moss-box” (aa, bb), are designed to telescope together and have a quantity of dry moss packed between their outer flanges. When the lowermost ring rests at the bottom, the weight of the lining compresses the moss and forces it against the surrounding rock, making a tight joint. The lining is suspended from the surface by threaded rods, and to regulate and reduce its weight while it is being lowered the bottom is closed by a diaphragm (ee) from the centre of which rises an open pipe (g). This pipe is provided with cocks for admitting inside the lining from time to time enough water to overcome bore-pressure. Finally, concrete is filled behind the lining, the diaphragm removed and the completed shaft pumped out. In some formations the moss-box is omitted, the concreting being relied on to make the lining watertight. The cost of this method of sinking and lining (generally £15 to 60 per foot), as well as the speed, compares favourably with results obtained under the same conditions by other means; in many cases it is the only practicable method.

Inclined sinking, watery soils, which often cause serious engineering difficulties, is accomplished by: (1) spilling, vertical or inclined; (2) drop-shafts; (3) caisson and compressed air; (4) the freezing process.

Vertical sinking consists in driving one or more series of spiles around the sides of the excavation, supported by horizontal timber cribs. When the first spiles have been driven, and the enclosed soil removed, a second set follows inside, and so on, inapplicable to depths much greater than say 75 ft. Inclined sinking is also limited to small depths. Crips are put in every few feet and around them, driven ahead as the excavation moves forward, heavy, short planks, sharpened to a chisel edge. The spiles are driven outward, being driven inside of one crip and outside of that next (fig. 6). The shod bottom also is usually sheathed with planking, braced against the sides and advanced to new positions as sinking proceeds.

Drop-shafts.—This important method has been used for depths of nearly 500 ft. At a heavy timber, iron or masonry lining (usually cylindrical), is sunk through the soil, new sections being successively added at the summit, while the excavation goes on inside. Vertical sinking is applicable to depths much greater than say 75 ft.Supported by a framework on the surface. The rods are lengthened as required for lowering the lining. For deep shafts the lining must be of iron or steel, as wood is too weak and masonry too heavy. When frozen, with a few hours of pumping, the material is evacuated by hand; otherwise, the water is allowed to stand at its natural level and the excavation carried on by dredging. This saves the cost of pumping during sinking, and the expense of removing material from the bottom of the shaft, as sometimes possible at the lowermost stage (see page 164). The dredging appliance commonly employed is the "sackborer." This consists of an iron or wooden rod, suspended vertically in the shaft, at the lower end of which on each side is attached a large drum of leather, opening in opposite directions. By rotating the rod by machinery at the surface, the sacks are swept round horizontally like the cutting edges of an auger, and partly filling after a calcium chloride solution is poured into them. The rod may be stopped in several ways, e.g., by concreting the shaft bottom, then pumping out the water and sinking through the concreted shaft by drilling and blasting; by unwatering the shaft and building below the shaft; or by inserting a wedging crib. There are various modifications of the drop-shaft which cannot here be detailed.

Sinking with caisson and compressed air is rarely adopted except in the construction of foundations for deep foundations of bridge piers, &c. (see Caisson.)

Freezing Process.—This useful process was introduced in Germany in 1887 by H. Poetsch. The soil is frozen and the rock artificially frozen and then excavated. A number of drive-pipes are put down (see Boring), usually 4 to 6 in. diameter and about 3 ft. apart, in a circle whose radius is, say, 3 ft. greater than that of the shaft to be excavated. The pipes are then plugged at the lower end and iced over. The outer ring is plugged at the lower end and within it is placed an open pipe, 1¼ in. in diameter, extending nearly to the bottom. Or, preferably, after the drive-pipes are down, a slightly smaller pipe, closed at its lower end, is introduced in each drive-pipe, the latter being afterwards pulled out. The inner 1¼ in. open pipes are then put in place. At the surface, the outer and inner pipes are connected respectively to two horizontal distributing rings, which in turn are connected with a pump and ice-machine. A circulatory system is thus established. The freezing fluid, a nearly saturated solution of calcium or magnesium chloride (freezing point about —20 F.), is pumped through the ice-making ring and allowed to run off through the inner pipes, into the freezing pipes. It passes down the inner pipes, up through the outer pipes, and returns to the ice-machine. The cold solution rising in the shaft absorbs latent heat from the surrounding watery soil, which freezes concentrically around each pipe. As the process goes on the frozen masses finally join (in from 3 to 4 weeks), forming an unbroken wall. The enclosed soft soil may then be excavated by dredging; or the freezing may be continued (total time usually from 3 to 10 weeks according to the depth), until the solidification reaches the centre and to some distance beyond the circle of pipes, after which the ground is drilled and blasted. This process has been successfully employed at depths of 100 ft. It is applicable not only to most unstable soils but also to heavily water-bearing rocks. It is questionable whether it will prove to be practicable for great depths, largely owing to the expansion of the water, e.g., in the case of the 'great drop-pipe' (in 1756) for the Liffey tunnel, the ice was allowed, which on vaporizing in the freezing pipes produces a temperature of —25 F., Sixty-four shafts had been sunk by the freezing process by 1904.

Another method proposed for dealing with quicksand or similar watery ground is to inject through pipes a mixture of cement and water. The entire mass of soil would be solidified by the setting of the granite sunk by drilling and blasting, with no trouble from water.

Bibliography.—The following partial list of references may be useful:

SHAGIA—SHAHJAHANPUR

(Nov. 1904), p. 188; Trans. Amer. Inst. M.E., xx. 188; Glickau (14th June 1902); School of Mines Quart. 111. 277; Rev. univ. des mines (July 1902); Bull. Soc. de l'Ind. Min. (1903), No. 1; Ann. des mines de Belgique, x. pt. 1; Mining Jour. (21st April 1906).

SHAGIA (SHAGIA, SHAIKHYEH), a tribe of Africans of Semitic origin, living on both banks of the Nile from Korti to the Third Cataract, and in portions of the Bayuda Desert. The Shagia are partly a nomad, partly an agricultural people. They claim descent from one Shayig Ibn Hamadion of the Beni Abbas, and declare that they came from Arabia at the time of the conquest of Egypt in the 7th century. They must have disemboged and largely intermarried with a people of Nuba origin. They appear from a statement by James Bruce to have settled originally south of their present country and to have moved northward since 1772. Formerly subject to the Funj kings of Semnar, they became independent on the decline of that state in the 18th century. They were overthrown c. 1811 at Dongola by the Mamelukes, but continued to dominate a considerable part of Nubia. To the Egyptians in 1820 they offered a stout resistance, but finally submitted and served in the Egyptian ranks during the suppression of the Ja'ilim revolt (1822). For their services they obtained lands of these latter between Shendi and Khartum. At that time they were far more civilized than the neighbouring tribes. Freedom-loving, brave, enlightened and hospitable, they had schools in which all Moslem science was taught, and were rich in corn and cattle. Their fighting men, mounted on horses of the famous Dongola breed, were feared throughout the eastern Sudan. Their chiefs wore coats of mail and carried shields of hippopotamus or crocodile skin. Their arms were lance, sword or javelin. The Shagia are divided into twelve clans. Their country is the most fertile along the Nile between Egypt and Khartum. Many of their villages are well built; some of the houses are fortified. They speak Arabic and Arabic-African. They possess a Semitic type, though they are obviously of very mixed blood. The typical Shagia has a sloping forehead, aquiline nose and receding chin. They have adopted the African custom of gashing the chests of their children. In the wars of 1884-85 General Gordon's first flight was to rescue a few Shagia besieged in a fort at Halfaya. In April 1884 Saleh Bey (Saleh Wad el Mek) led the head of the tribe, and 1400 men surrendered to the mahdi's forces. Numbers of Shagia continued in the service of General Gordon and this led to the outlay of the tribe by the mahdi. When Khartum fell Saleh's sons were sought out and executed by the dervishes. On the reconquest of the Sudan by the Anglo-Egyptian army (1896-98) it was found that the Shagia were reduced to a few hundred families.

SHAGREEN, a species of untanned leather with a roughened, granular surface. The word is the English form; cf. Ger. Schagrin, of Fr. chagrin, Ital. sagrino; these are usually referred to Turkish and Persian sagghi, lit. the back of a horse, and so applied to leather made from this part. The skin of the wild ass was especially used. The method of preparing the skins to secure the rough, granular surface is as follows. The skins of a place usually some species of Chinchipodium, are embroidered in fine. When soft, the surface is then shaved down and soaked in water, when the edges of the indentations swell up. The leather is then dyed, green being a favourite colour. Shagreen is now commonly made of the skins of sharks and rays; the placoid scales of the shark skin giving the necessary roughened surface. Shagreen is used as an ornamental leather for making pocket-books, small cases and the like, and for the handles of swords, daggers, &c.

The figurative use in French of 'chagrin,' for anxiety, annoyance, was adopted in English in the 17th century. This application of the word is due to the rasping surface of the leather.

SHAH, the title of the kings of Persia, the full title being padshah, i.e. "lord king," Pers. pātī, lord, and shah, king (see Padisah, the Turkish form of the word). The word shah is a much shortened form of the O. Pers. kshatrya, probably formed from kshaya, might, power, khsai, to rule. The Sanskrit kshatran, dominion, is allied, cf. also "satrap." From the Mh. Shāh, the king is dead, is ultimately derived, through the Arab. promonunteshāgh, "check-mate," then "check," "chess," "exchequer," &c.

SHAHABAD, a district of British India, in the Patna division of Bengal, with an area of 4373 sq. m. About three-fourths of the area to the north is an alluvial flat, planted with mangoes, bamboos and other trees; while the southern portion is occupied by the Kaimur hills, a branch of the great Vindyan range, and is a densely wooded tract. The chief rivers are the Ganges and the Sone, which unite in the north-eastern corner of Shahabad. In the southern portion large game abounds. The annual rainfall averages 43 in. In 1901 the population was 1,962,666, showing a decrease of 4.7% in the decade. The chief crops are rice, millets, wheat, pulses, oilseeds, poppy and sugarcanes. Shahabad is protected against drought by a system of canals from the Sone, some of which are navigable. The district is traversed by the East Indian railway near the Ganges, and by a branch from Mogul Serai to Gaya, which crosses the Sone at Dehri-on-Sone, where are the workshops of the canal. The administrative headquarters are at Arrah. Among other historic sites, it includes the hill-fort of Rohats, the tomb of Shere Shah at Sasseram and the battlefield of Buxar.

See Shahabad District Gazetteer (Calcutta, 1906).

SHAH ALAM (1728-1806), Mogul emperor of Delhi, son of Alamgir II, was born on the 15th of June 1728, and was originally known as the Shahzada Ali Gohar. Being proclaimed a rebel by his father, he fled to Shuja-ud-Dowlah, wazir of Oudh, and on the death of his father in 1759 assumed the name of Shah Alam. He joined Shuja-ud-Dowlah against the British, but after his defeat at the battle of Buxar, he sought British protection. In 1765 he granted the diwani (superintendence of the revenue) of Bengal to Lord Clive for the East India Company in return for a payment of 26 lakhs a year. In 1771 he fell into the hands of the Mahratta maharajah at Peshawar, when he lost the British subsidy. In 1788 the Rohilla chief Ghulam Kadir seized Delhi and put out Shah Alam's eyes. Sindhis restored him to the throne, and after the Mahratta war of 1803 he was again taken under British protection. He died on the 10th of November 1806.

SHAH JAHAN (1627-1658), Mogul emperor of Delhi, the fifth of the dynasty. After revolting against his father Jahangir, as the latter had revolted against Akbar, he succeeded to the throne on his father's death in 1627. It was during his reign that the Mogul power attained its greatest prosperity. The chief events of his reign were the destruction of the kingdom of Ahmadnagar (1646), the loss of Kandahar to the Persians (1653), and a second war against the Deccan princes (1655). In 1658 he fell ill, and was confined by his son Aurangzeb in the citadel of Agra until his death in 1666. The period of his reign was the golden age of Indian architecture. Shah Jahan erected many splendid monuments, the most famous of which is the Taj Mahal at Agra, built as a tomb for his wife Mumtaz Mahal; while the Pearl Mosque at Agra and the palace and great mosque at Delhi also commemorate him. The celebrated "Peacock Throne," said to have been worth £6,000,000 also dates from his reign; and he was the founder of the modern city of Delhi, the native name of which is Shahjanahanad.

SHAHJAHANPUR, a city and district of British India, in the Bareilly division of the United Provinces. The city is on the left bank of the river Deoha or Garra, 507 ft. above the sea-level, with a station on the Oudh and Rohilkhand railway, 768 m. N.W. of Calcutta, and a military cantonment. Pop.
SHAHPUR—SHAIRP

(1901) 75,128. It was founded in 1647 during the reign of Shah Jahan, whose name it bears, by Nawab Bahadur Khan, a Pathan. His mosque is the only building of antiquarian interest. There is a manufacture of sugar, but no great trade.

The District of Shaahjahanpur has an area of 1,727 sq. m. It is bounded on the north by the Ganges and on the south by the Himalayas, and is for the most part level and without any hills. The principal rivers are the Gumi, Khanaut, Garai, and Ramganga. To the north-east the country resembles the tarai in the preponderance of waste and forest over cultivated land, in the sparseness of population and in general unhealthiness. Between the Gumi and the Khanaut the country varies from a rather wild and unhealthy northern region to a densely inhabited tract in the south, with a productive soil cultivated with sugar-cane and other remunerative crops. The section between the Dehna and Garai comprises much marshy land; but south of the Garai, and between it and the Ramganga, the soil is mostly of a sandy nature. From the Ramganga to the Ganges in the south is a continuous low country of marshy patches, alternating with a hard clayey soil that requires much irrigation in parts. Shaahjahanpur contains a number of jhils or lakes, which afford irrigation for the spring crops. The climate is very similar to that of most parts of Oudh and Rohilkhand, but moister than that of the Doab. The annual rainfall averages about 37 in. In 1901 the population was 921,535. The principal crops are wheat, rice, pulse, millets, sugar-cane and poppy. The district suffered very severely from the famine of 1877-1879. It is traversed by the Lucknow-Bareilly section of the Oudh and Rohilkhand railway, with a branch northwards from Shaahjahanpur city. At Rossa is a large sugar refinery and rum distillery.

Shahjahanpur was ceded to the English by the nawab of Oudh in 1801. During the Mutiny of 1858 it became the scene of open rebellion. The Europeans were attacked and killed in church; three were shot down, but the remainder, aided by a hundred faithful sepoys, escaped. The force under Lord Clyde put a stop to the anarchy in April 1858, and shortly afterwards peace and authority were restored.

SHAHPUR, a town and district of British India, in Rawalpindi division of the Punjab. The town is near the left bank of the river Jhelum. Pop. (1901) 9386. The district of Shaahpur has an area of 4,840 sq. m. Its most important physical subdivisions are the Salt range in the north, the valleys of the Chenab and Jhelum, and the plains between those rivers and between the Jhelum and the Salt range. The characteristics of these two plains are widely different: the desert portion of the southern plain is termed the bar; the corresponding tract north of the Jhelum is known as the thal. The climate of the plains is hot and dry, but in the Salt range it is much cooler; the annual rainfall averages about 15 in. Tigers, leopards and wolves are found in the Salt range, while small game and antelope abound among the thick jungle of the bar. In 1901 the population was 524,259, showing an increase of 6% in the decade. The principal crops are wheat, millets, pulses and cotton. Irrigation is effected from government canals, and also from wells. The largest town and chief commercial centre is Bhera. The district is traversed by two branches of the North-Western railway.

Shaahpur passed into the hands of the English along with the rest of the Punjab in 1849. During the Mutiny of 1857 the district remained tranquil, and though the villages of the bar gave cause for alarm no outbreak of sepoys occurred. Since annexation the limits and constitution of the district have undergone much change.

SHAHRASTANI [Ab'l-Fath Majommed ibn 'Abdalikairm ub-sh-Shahrastani] (1076 or 1086-1153) Arabian theologian and jurist, was born at Shaahrastani in Khorasan and studied at Jurjaniyah and Nishapur, devoting his attention chiefly to Ash'arite theology. He made the pilgrimage in 1116, on his way back stayed at Bagdad for three years, then returned to his native place. His chief work is the Kitab ud Milad wan-Nikal, an account of religious sects and philosophical schools, published by W. Cureton (2 vols., London, 1846) and translated into German by T. Haarbrucker (2 vols., Halle, 1859-1891). After a preface of five chapters dealing with the division of the human race, an enumeration of the sects of Islam, the objections of Satan in detail, (2) the possessors of a written revelation (Jews and Christians) or something resembling it (the Magi), (3) the men who follow their own reason, i.e. the philosophers of Greece and their followers-among the Moslems; the pre-Islamic Arabs, the Indians and the heathen. Among Shahrastani's other works still in manuscript only are a history of philosophers, a dogmatic text-book and a treatment of seven metaphysical questions.

A brief account of him is given on the authority of his pupil, the historian Sam'ani, in Ibn Khallikan, vol. ii., pp. 675 ff. (G. W. T.)

SHAHRUD, the capital of the Shahrud-Bostam province of Persia, situated about 258 m. E. of Teheran, on the highroad to Meshed, at an altitude of 4,460 ft., in 36° 25' N., 54° 59' E. It has a population of about 10,000, post and telegraph offices, and a transit trade between western Khorsan and Astrahan. Although capital of the province, it is not the residence of the governor, who prefers the more healthy Bostam, a small city with fine gardens and a mosque of the 14th century, lying 3 m. to the north-east.

SHAH SHUJA (1782-1842), king of Afghanistan, was the son of Timur Shah, and grandson of Ahmad Shah, founder of the Durani dynasty. After conspiracies that caused the dethronement of two brothers, Taman Shah and Mahmud Shah, he became king in 1803. He was, however, in his turn driven out of Afghanistan in 1809 by Mahmoud Shah, and found refuge and a pension in British territory. Distrusting the attitude of the Amir Dost Mohammad towards Russia, Lord Auckland in 1839 attempted to restore Shah Shuja to the throne against the wishes of the Afghan people. This policy led to the disastrous first Afghan War. After the retreat of the British troops from Kabul, Shah Shuja shut himself up in the Bala Hisar. He left this retreat on the 5th of April 1842, and was immediately killed by the adherents of Dost Mohammad and his son Akbar Khan.

SHAIRP, JOHN CAMPBELL (1810-1885), Scottish critic and man of letters, was born at Houston House, Linlithgowshire, on the 30th of July 1810. He was the third son of Major Norman Shairp of Houston, and in 1837 was elected professor of Greek at the University of Glasgow. He gained the Snell exhibition, and entered at Balliol College, Oxford, in 1830. In 1842 he gained the Newdigate prize for a poem on Charles XII., and took his degree in 1844. During these years the "Oxford movement" was at its height. Shairp was stirred by Newman's sermons, and he had a great admiration for the poetry of Keble, on whose character and work he wrote an enthusiastic essay; but he remained faithful to his Presbyterian upbringing. After leaving Oxford he took a mastership at Rugby under Taft. In 1857 he became assistant to the professor of humanity in the university of St. Andrews, and in 1861 he was appointed to that chair. In 1864 he published Kilmahoe, a Highland Pastoral, and in 1868 he republished some articles under the name of Studies in Poetry and Philosophy. In 1868 he was presented to the principality of the United College, St. Andrews, and lectured from time to time on literary and ethical subjects. A course of the lectures was published in 1870 as Culture and Religion. In 1873 Principal Shairp helped to edit the life of his predecessor J. D. Forbes, and in 1874 he edited Dorothy Wordsworth's charming Recollections of the Newgate Scotch and the History of Scotland. Shairp was elected fellow of the British Academy of Poetry at Oxford in succession to Sir F. H. Doyle. Of his lectures from this chair the best were published in 1883 as Aspects of Poetry. In 1877 he had published The Poetic Interpretation of Nature, in which he enters fully into the "old quarrel," as Plato called it, between science and poetry, and traces with great clearness the ideas of nature in all the chief Hebrew, classical and English poets. In 1879 he contributed a life of Robert Burns to the "English Men of Letters" series. He was re-elected to the chair of
poetry in 1882, and discharged his duties there and at St Andrews till the end of 1884. He died at Ormsary, Argyllshire, on the 18th of September 1885. In 1888 appeared Glen Dessary, and other poems, edited by F. T. Palgrave.

See W. A. Knight’s Principal Shairg and his Friends (1888).

SHAKERS, an American celibate and communalistic sect, officially called "The United Society of Believers in Christ’s Second Appearing" or "The Millennial Church." The early Quakers were sometimes called Shakers, and the name, or its variant, Shaking Quakers, was applied in the early 18th century to a Manchester offshoot of the English Quakers, who, led by James and Ann Wardley, accepted the peculiar doctrines of the French Prophets, or Camisards, of Vivaraïs and Dauphiné. The Wardleys were succeeded by the real founder of Shakerism, Ann Lee (1736-1784), the daughter of a Manchester blacksmith. Although a believer in celibacy, she had at her parents’ urging married one Abraham Stanley (Standley, or Standerin); had borne him four children, who died in infancy; had joined the Wardleys in 1778; and had influenced their preachers to preach more publicly the imminent second coming and to attack sin more boldly and unconventionally. She was frequently imprisoned for breaking the Sabbath by dancing and shouting, and for blasphemy; had many “miraculous” escapes from death; and once, according to her story, being examined by four clergymen of the Established Church, spoke to them for four hours in seventy-two tongues. While in prison in Manchester for fourteen days, she said she had a revelation that “a complete cross against the lusts of men” (added to a full and explicit confession, before witnesses, of all the sins committed under its influence, was the only possible remedy and means of salvation.” After this, probably in 1770, she was chosen by the society as “Mother in spiritual things” and called herself “Ann, the Word.” In 1774 a revelation bade her take a select band to America. Accompanied by her husband, who soon afterward deserted her; her brother, William Lee (1740-1784); Nancy Lee, her niece; James Whittaker (1751-1757), who had been brought up by Mother Ann and was probably related to her; John Hocknell (1753-1799), who provided the funds for the trip; his son, Richard; and James Shepherd and Mary Partington, Mother Ann arrived on the 6th of August 1774 in New York City. Here they stayed for nearly two years. In 1776 Hocknell bought land at Niskayuna, in the township of Watervliet, near Albany, and the Shakers settled there. A spiritualistic revival in the neighboring town of New Lebanon sent many penitents to Watervliet, who accepted Mother Ann’s teachings and organized in 1787 (before any formal organization in Watervliet) the New Lebanon Society, the first Shaker Society, at New Lebanon (since 1861 called Averillton), Columbia Co., New York. The Society at Watervliet, organized immediately afterwards, and the New Lebanon Society formed a bishopric. The Watervliet members, as non-residents and non-jurors, had got into trouble during the War of Independence; in 1780 the Board of Elders were imprisoned, but all except Mother Ann were speedily set free, and she was released in 1781.

In 1781-1783 the Mother with chosen elders visited her followers in New York, Massachusetts and Connecticut. She died in Watervliet on the 8th of September 1784. James Whittaker was her successor for his life. He was succeeded by Joseph Meacham (1742-1796), who had been a Baptist minister in Enfield, Connecticut, and had, second only to Mother Ann, the spiritual gift of revelation. Under his rule and that of Lucy Wright (1760-1821), who shared the headship with him during his lifetime and then for twenty-five years ruled alone, the organization of the Shakers and, particularly, a rigid communism, began. By 1793 property had been made a “consecrated whole” in the different communities, but a “non-communal order” also had been established, in which sympathizers with the principles of the Believers lived in families. The Shakers never forbade marriage, but refused to recognize it as a Christian institution since the second coming in the person of Mother Ann, and considered it less perfect than the celibate state. Shaker communities in this period were established in 1790 at Hancock, West Pittsfield, Mass.; in 1792 at Harvard, Mass.; in 1792 at East Canterbury (or Shaker Village), New Hampshire; and in 1793 at Shirley, Mass.; at Enfield (or Shaker Station), Connecticut; at Tyringham, Mass., where the Society was afterwards abandoned, its members joining the communities in Hancock and Enfield; at Gloucester (since 1890, Sabbath-day Lake), Maine; and at Alfred, Maine, where, more than anywhere else among the Shakers, spiritualistic healing of the sick was practised. In Kentucky and Ohio Shakerism entered after the Kentucky revival of 1800-1801, and in 1805-1807 Shaker societies were founded at South Union, Logan county, and Pleasant Hill, Mercer county, Kentucky. In 1811 a community settled at Busro on the Wabash in Indiana; but it was soon abandoned and its members went to Ohio and to Kentucky. In Ohio later communities were formed at Watervliet, Hamilton county, and at Whittaker, Dayton county. In 1828 the communal property at Sodus Bay, New York, was sold and the community removed to Groveland, or Senea; their land here was sold to the state and the few remaining members went to Watervliet. A short-lived community at Canton, O., was merged in the Mount Lebanon (New York) and Enfield (Connecticut) communities. The numerical strength of the sect decreased rapidly, probably from 4000 to 1000 in 1887-1908; and there has been little effort made to plant new communities. The Mt. Lebanon Society in 1894 established a colony at Narcoossee, Florida; the attempt of the Union Village Society in 1898 to plant a settlement at White Oak, Camden county, Georgia, was unsuccessful. In 1910 the Union Village Society went into the hands of a receiver.

The period of spiritual manifestations among the Believers lasted from 1837 to 1847; first, children told of visits to cities in the spirit realm and gave “visions” to Shaker societies from 1837; in 1838 the gift of tongues was manifested and sacred places were set aside in each community, with names like Holy Mount; but in 1847 the spirits, after warning, left the Believers. The theology of the denomination is based on the idea of the first and second Christian Church; and of Mother Ann as the daughter of the first Christian Church and the second Christ Church—she was the bride ready for the Bridegroom, and in her the promises of the Second Commandment were fulfilled. In 1837 the separation of the sexes is done away with in the body of the Believers in the Second Appearance, must pattern after the Kingdom in which there is no marriage or giving in marriage. The four virtues are virgin purity; Christian communism; confession of sin, without which none can become Believers; and separation from the world. The Shakers do not believe in the divinity or deity of Jesus, or in the resurrection of the body. Their insistence on the bi-sexuality of God and their reverence for Mother Ann have made them advocates of sex equality. Their spiritual directors are elders and “eldresses,” and their temporal guides are deacons and deaconesses in equal numbers. They provide for under the half of each unit’s neckerchief and cap, and the custom of men wearing their hair long on the neck and cut in a straight bang on the forehead, still persist; but the women were different colours. The communism of the Believers was an economic necessity, but was held as a principle, which brought them the highest praise. They made leather in New York for several years, but in selling herbs and garden seeds, in making “apple-sauce” (at 9 cents a quart) and for the production of the United Village Society’s own newspaper, “The Sabbath-Day Lake Advocate” (1882-1883). See also Shakers, in America; Shakerism; Shaker Church; and Shaker Village.

1 A prominent part in this revival had been taken by Richard McNemar, a Presbyterian, who had broken with his Church because of his Arminian tendencies and had established the quasi-independent Turtle Creek Church. McNemar was won by Shaker missionaries, her brother-in-law and friar, received the formation of the Union Village Community on the site of the old Turtle Creek, 4 m. W. of Lebanon, Warren county, Ohio. McNemar was a kinsman of Lucy Wright, the first female lead; he came to be elected Ezra Wright; he wrote The Kentucky Revival (Cincinnati, 1807), probably the earliest defence of Shakerism, and a poem, entitled A Concise Answer to the General Inquiry Who or What are the Shakers (1808).
SHAKESPEARE

Shakespeare, in weaving linen (at Alfred), and in knitting underwear they did not overlook.

SHAKESPEARE, WILLIAM (1564-1616), English poet, playwright, and actor. He was born in the parish church of Stratford-upon-Avon in Warwickshire on the 23rd of April 1564. The exact date of his birth is not known. Two 18th-century antiquaries, William Oldys and Joseph Greene, gave it as April 23, but without quoting authority for their statements, and the fact that April 23 was the day of Shakespeare's death in 1616 suggests a possible source of error. In any case his birthday cannot have been later than April 23, since the inscription upon his monument is dated the 23rd of April 1616. It is also certain that Shakespeare, who was a burgess of Stroud, was one of the two families of the town that contributed annually to the spiritual and moral instruction of the children of the town. He was a member of a family that had been in Stratford since 1529. It is possible that John Shakespeare, a bailiff in Stratford at the time of his father's death, and that by 1570 he had also acquired a small holding called Ingon in Hampton Lucy, the next village to Stratford. But both of these seem to have passed subsequently to his brother Henry, who was buried at Snitterfield in 1596. There was also at Snitterfield a Thomas Shakespeare and an Anthony Shakespeare, who afterwards moved to Hampton Corley; and these may have been of the same family. A John Shakespeare, who dwelt at Clifford Chambers, another village close to Stratford, is clearly distinct. Strenuous efforts have been made to trace Shakespeare's genealogy beyond Richard of Snitterfield, but so far without success. Certain drafts of heraldic exemplifications of the Shakespeare arms speak, in one case of John Shakespeare's grandfather, in another of his great-grandfather, as having been rewarded with lands and tenements in Warwickshire for service to Henry VII. No such grants, however, have been traced, and even in the 16th-century statements as to "antiquity and service" in heraldic preambles were looked upon with suspicion.

The name Shakespeare is extremely widespread, and is spelt in an astonishing variety of ways. That of John Shakespeare occurs 166 times in the Council Book of the Stratford corporation, and appears to take 16 different forms. The verdict, not altogether unanimous, of competent palaeographers is to the effect that Shakespeare himself, in the extant examples of his signature, always wrote "Shakespeare." In the printed signatures to the dedications of his poems, on the title-pages of nearly all the contemporary editions of his plays that bear his name, and in many formal documents it appears as Shakespeare.

This may be in part due to the maternal derivation which the poet's literary contemporaries were fond of assigning to his name, and which is acknowledged in the arms that he bore. The forms in use at Stratford, however, such as Shaxpeare, by far the commonest, suggest a short pronunciation of the first syllable, and thus tend to support Dr Henry Bradley's derivation from the Anglo-Saxon personal name, Seaxberht. It is interesting, and even amusing, to record that in 1487 Hugh Shaskpe of Merton College, Oxford, changed his name to Sawndawe, because his former name "vile reputatiun eas." The earliest record of a Shakespeare that has yet been traced is in 1487 at Clapton in Gloucestershire, a Richard Shakespeare of the same name, and in 1592 at the parish of Kendon, in Lancashire; and on the inscription of the memorial stone of Richard Shakespeare at Stratford, 1575, there is written the name Willam, in common use as a personal name, and Williams from more than one other family have from time to time been confounded with the dramatist. Many Shakespeares are upon the register of the gild of St Anne at Knowle from about 1547 to about 1562. Amongst these were Isabella Shakespeare, prioress of the Benedictine convent of Wroxall, and Jane Shakespeare, a nun of the same convent. Shakespeare is also found as tenants on the Manor belonging to the convent, and at the time of the Dissolution in 1534 one Richard Shakespeare was its bailiff and collector of rents. Convictual attempts have been made on the one hand to connect the ancestors of this Richard Shakespeare with a family of the same name who held land by military tenure at Baddesley Clinton in the 14th and 15th centuries, and on the other to identify him with the poet's grandfather, Richard Shakespeare of Snitterfield. But Shakespeares are to be traced at Wroxall nearly as far back as at Baddesley Clinton, and there is no reason to suppose that Richard the bailiff, who was certainly a tenant of Wroxall in 1536, had also since 1529 been farming land ten miles off at Snitterfield. With the production of this trail, the hope of giving Shakespeare anything more than a grandfather on the father's side must be quite abandoned. The present on the mother's side was connected with a family of some distinction. Part at least of Richard Shakespeare's land at Snitterfield was held from Robert Arden of Wilmcote in the adjoining parish of Aston Cantlow, a cadet of the Arden of Parkhall, who counted amongst the leading gentry of Warwickshire. Robert Arden married his second wife, Agnes Hill, formerly Webbe, in 1548, and had then no less than eight daughters by his first wife. To the youngest of these, Mary Arden, he left in 1556 a freehold in Aston Cantlow consisting of a farm of about fifty or sixty acres in extent, known as Asbies. At some date later than November 1556, and probably before the end of 1557, Mary Arden became the wife of John Shakespeare. In October 1556 John Shakespeare had bought two freehold houses, one in Greenhill Street, the other in Henley Street. The latter, known as the wool shop, was the easternmost of the two tenements now combined in the so-called Shakespeare's birthplace. The western tenement, the birthplace proper, was probably already in John Shakespeare's hands, as he seems to have been living there at the time of his marriage. This living has been thought to have been one of two houses which formed a later purchase in 1575, but there is no evidence that these were in Henley Street at all.

William Shakespeare was not the first child. A Joan was baptized in 1558 and a Margaret in 1562. The latter was buried in 1563 and the former must also have died young, although her burial is not recorded, as a second Joan was baptized in 1569. A Gilbert was baptized in 1566, an Anne in 1571, a Richard in 1574 and an Edmund in 1580. Anne died in 1579; Edmund,
who like his brother became an actor, in 1607; Richard in 1613. Tradition has it that one of Shakespeare’s brothers used to visit London in the 17th century as quite an old man. If so, this can only have been Gilbert.

During the years that followed his marriage, John Shakespeare became prominent in Stratford life. In 1565 he was chosen as an alderman, and in 1568 he held the chief municipal office, that of bailiff. This carried with it the dignity of justice of the peace. John Shakespeare seems to have assumed arms, and thenceforward was always entered in corporation documents as “Mr” Shakespeare, whereby he may be distinguished from another John Shakespeare, a “corviser” or shoemaker, who dwelt in Stratford about 1584-1592. In 1571 as an ex-bailiff he began another year of office as chief alderman.

One may think, therefore, of Shakespeare in his boyhood as the son of one of the leading citizens of a not unimportant provincial market-town, with a vigorous life of its own, which in spite of the duellings was probably not much unlike the life of a similar town to-day, and with constant reminders of its past in the shape of the stately buildings formerly belonging to its college and guild, both of which had been suppressed at the Reformation. Stratford stands on the Avon, in the midst of an agricultural country, throughout which in those days enclosed orchards and meadows alternated with open fields for tillage, and not far from the wilder and wooded district known as the Forest of Arden. The middle ages had left it an heritage in the shape of a free grammar-school, and here it is natural to suppose that William Shakespeare obtained a sound enough education,1 with a working knowledge of “Mantuan” and Ovid in the original, even though to such a thorough scholar as Ben Jonson it might seem no more than “small Latin and less Greek.” In 1577, when Shakespeare was about thirteen, his father’s fortunes began to take a turn for the worse. He became irregular in his contributions to levies, and had to give a mortgage on his wife’s property of Ashby as security for a loan from her brother-in-law, Edmund Lambert. Money was raised to pay this off, partly by the sale of a small interest in land at Snitterfield which had come to Mary Shakespeare from her sisters, partly perhaps by that of the Greenhill Street house and other property in Stratford outside Henley Street, none of which seems to have ever come into William Shakespeare’s hands. In 1584 he married Ann Hathaway, from whom he got the mortgage on the plea of older debts, and an attempt to recover Ashby by litigation proved ineffectual. John Shakespeare’s difficulties increased. An action for debt was sustained against him in the local court, but no personal property could be found on which to distrain. He had long ceased to attend the meetings of the corporation, and as a consequence he was removed in 1586 from the list of aldermen. In this state of domestic affairs it is not likely that Shakespeare’s school life was unduly prolonged. The chances are that he was apprenticed to some local trade. Aubrey says that he killed calves for his father, and “would do it in a high style, and make a speech.”

Whatever his circumstances, they did not deter him at the early age of eighteen from the adventure of marriage. Rowe recorded the name of Shakespeare’s wife as Hathaway, and Joseph Greene succeeded in tracing her to a family of that name dwelling in Shottery, one of the hamlets of Stratford. Her monument gives her first name as Anne, and her age as sixty-seven in 1623. She must, therefore, have been about eight years older than Shakespeare. Various small traits of evidence point to her identification with the daughter Agnes mentioned in the will of Christopher Hathaway, of Stratford, who died in 1581, being then in possession of the farm-house now known as “Anne Hathaway’s Cottage.” Agnes was legally a distinct name from Anne, but there can be no doubt that ordinary custom treated them as identical. The principal record of the marriage is a bond dated on November 28, 1582, and executed by Fulke Sandells and John Richardson, two yeomen of Stratford who also figure in Richard Hathaway’s will, as a security to the bishop for the issue of a licence for the marriage of William Shakespeare and “Anne Hathway of Stratford,” upon the consent of her friends, with one asking of the banns. There is no reason to suppose, as has been suggested, that the procedure adopted was due to dislike of the marriage on the part of John Shakespeare, since, the bridegroom being a minor, it would not have been in accordance with the practice of the bishop’s officials to license a marriage unless the banns were first read. The explanation probably lies in the fact that Anne was already with child, and in the near neighbourhood of Advent within which marriages were prohibited, so that the ordinary procedure by banns would have entailed a delay until after Christmas. A kindly sentiment has suggested that some form of civil marriage, or at least contract of espousals, had already taken place, so that a canonical marriage was really only required in order to enable Anne to secure the legacy left her by her father “at the day of her marriage.” But such a theory is not rigidly required by the facts. It is singular that, upon the day that on which the bond was executed, an entry was made in the bishop’s register of the issue of a licence for a marriage between William Shakespeare and “Annam Whateley de Temple Grafton.” Of this it can only be said that the bond, as an original document, is infinitely the better authority, and that a scrivinal error of “Whateley” for “Hathaway” is quite a possible solution. Temple Grafton may have been the nominal place of marriage indicated in the licence, which was not always the actual place of residence of either bride or bridegroom. There are no contemporary registers for Temple Grafton, and there is no entry of the marriage in the Grafton-upon-Avon. There is a tradition that such a record was seen during the 19th century in the registers for Luddington, a chapelry within the parish, which are now destroyed. Shakespeare’s first child, Susanna, was baptized on the 26th of May 1583, and was followed on the 2nd of February 1585 by twins, Hamnet and Judith.

In or after 1584 Shakespeare’s career in Stratford seems to have come to a tempestuous close. An 18th-century story of a drinking-bout in a neighbouring village is of no account as mere school tale, but it is singular that, upon the day that on which the bond was executed, an entry was made in the bishop’s register of the issue of a licence for a marriage between William Shakespeare and “Annam Whateley de Temple Grafton.” Of this it can only be said that the bond, as an original document, is infinitely the better authority, and that a scrivinal error of “Whateley” for “Hathaway” is quite a possible solution. Temple Grafton may have been the nominal place of marriage indicated in the licence, which was not always the actual place of residence of either bride or bridegroom. There are no contemporary registers for Temple Grafton, and there is no entry of the marriage in the Grafton-upon-Avon. There is a tradition that such a record was seen during the 19th century in the registers for Luddington, a chapelry within the parish, which are now destroyed. Shakespeare’s first child, Susanna, was baptized on the 26th of May 1583, and was followed on the 2nd of February 1585 by twins, Hamnet and Judith.

Obscure years: 1586-1592.

1 It is worth noting that Walter Rudge, who in 1558 became fellow of Corpus Christi College, Oxford, was master of the school in 1570-1572, so that its standard must have been good.

2 Baptista Mantuanus (1442-1516), whose Latin Elogues were translated by Turliberg in 1507.
Stratford with one of the travelling companies of players which from time to time visited the town. Later biographers have fixed upon Leicester's men, who were at Stratford in 1587, and have held that Shakespeare remained to the end in the same company, passing with it on Leicester's death in 1588 under the patronage of Ferdinando, Lord Strange and afterwards earl of Derby, and on Derby's death in 1594 under that of the lord chamberlain, Henry Carey, Lord Hunsdon. This theory perhaps hardly makes sufficient account more conveniently taken up at a time and recombinations of actors, especially during the disasurous plague years of 1592 to 1594. The continuity of Strange's company with Leicester's is very disputable, and while the names of many members of Strange's company in and about 1593 are on record, Shakespeare's is not amongst them. It is at least possible, as will be seen later, that he had about this time relations with the earl of Pembroke's men, or with the earl of Sussex's men, or with both of these organizations.

What is clear is that by the summer of 1592, when he was twenty-eight, he had begun to emerge as playwright, and had evoked the jealousy of one at least of the group of scholar poets who in recent years had claimed a monopoly of the stage. This was Robert Greene, who, in an invective on behalf of the play-makers against the play-actors which forms part of his Groat's-worth of Wit, speaks of "an uppstart Crow, beautified with our feathers, that with his Tygers heart wrapt in a Players hide, supposes he is as well able to bumbast out a blanke verse as the best of you: and being an absolute Johannes fac totum, is in his owne conceit the onely Shake-scene in a country." The play upon Shakspere's name and the parody of a line from Henry VI. make the reference unmistakable.1 The London theatres were closed, first through riots and then through plague, from June 1592 to April 1594, with the exception of about a month at each Christmas during that period; and the companies were dissolved or driven to the provinces. Even if Shakespeare had been connected with Strange's men during their London seasons of 1592 and 1593, it does not seem that he travelled with them. Other activities may have been sufficient to occupy the interval. The most important of these was probably an attempt to win a reputation in the world of non-dramatic poetry. Venus and Adonis was published about April 1593, and Lucrece about May 1594. The poems were printed by Richard Field, in whom Shakespeare would have found an old Stratford acquaintance; and each has a dedication to Henry Wrothlesley, earl of Southamton, a brilliant and accomplished favourite of the court, still in his nage. A possibly super-subtle criticism discerns an increased warmth in the tone of the later dedication, which is supposed to argue a marked growth of intimacy. The fact that this intimacy is vouched for by the story handed down from Sir William Davenant to Rowe (who published in 1670 the first regular biography of Shakespeare) that Southampton gave Shakespeare a thousand pounds "to enable him to go through with a purchase which he heard he had a mind to." The date of this generosity is not specified, and there is no known purchase by Shakespeare which can have cost anything like the sum named. The mention of Southampton leads naturally to the most difficult problem for the biographer to handle, that of the Sonnets. But this will be more presently taken up, as the later point, and it is only necessary here to put on record the probability that the earliest of the sonnets belong to the period now under discussion. There is a surmise, which is not in itself other than plausible, and which has certainly been supported with a good deal of ingenious argument, that Shakespeare's enforced leisure enabled him to make of 1593 a Wandering, and in particular that the traces of a visit to northern Italy may clearly be seen in the local colouring of Lucrece as compared with Venus and Adonis and in that of the group of plays which may be dated in or about 1594 and 1595 as containing elements of the later that preceded. It must, however, be borne in mind that, while Shakespeare may perfectly well, at this or at some earlier time, have voyaged to Italy, and possibly Denmark and even Germany as well, there is no direct evidence to rely upon, and that inference from internal evidence is a dangerous guide when a writer of so assimilative a temperament as that of Shakespeare is concerned.

From the reopening of the theatres in the summer of 1594 onwards Shakespeare's status is in many ways clearer. He had certainly become a leading member of the Chamberlain's company by the following winter, when his name appears for the first and only time in the treasurer of the chamber's accounts as one of the recipients of payment for their performances at court; and there is every reason to suppose that he continued to act with and write for the same associates to the close of his career. The history of the company may be briefly told. At the death of the lord chamberlain on the 22nd of July 1596, it passed under the protection of his successor, George, and lord Hunsdon, and once more took the name of "the Chamberlain's men" when it was appointed to that office on the 17th of March 1597. James I. on his accession took this company under his patronage as grooms of the chamber, and during the remainder of Shakespeare's connexion with the stage they were "the King's men." The records of performances at court show that they were by far the most favoured of the companies, their nearest rivals being the company known during the reign of Elizabeth as "the Admiral's," and afterwards as "Prince Henry's men." From the summer of 1594 to March 1603 they appear to have played almost continuously in London, as the only provincial performances by them which are upon record were during the autumn of 1597, when the London theatres were for a short time closed owing to the interference of some of the players in politics. They travelled again during 1603 when the plague was in London, and during at any rate portions of the summers or autumns of most years thereafter. In 1594 they were playing at Newington Butts, and probably also at the Rose on Bankside, and at the Cross Keys in the city. It is natural to suppose that in later years they used the Theatre in Shoreditch, since this was the property of James Burbage, the father of their principal actor, Richard Burbage. The Theatre was pulled down in 1595, and after a short interval during which the company may have played at the Curtain, also in Shoreditch, Richard Burbage and his brother Cuthbert rehoused them in the Globe on Bankside, built in part out of the materials of the Theatre. Here the profits of the enterprise were divided between the members of the company as such and the owners of the building as "housekeepers," and shares in the "house" were held in joint tenancy by Shakespeare and some of his leading fellows. About 1608 another playhouse became available for the company in the "private or winter house" of Edward Alleyn in Blackfriars. The property was also the property of the Burbages, but had previously been leased to a company of boy players. A somewhat similar arrangement as to profits was made.

Shakespeare is reported by Aubrey to have been a good actor, but Adam in As You Like It, and the Ghost in Hamlet indicate the type of part which he played. As a dramatist, however, he was the mainstay of the company for at least some fifteen years, during which Ben Jonson, Dekker, Beaumont and Fletcher, and Tourneur also contributed to their repertory. On an average they were most frequently taken up in 1594 and 1595 as compared for the two years or more in the opening years of the period. There was also no doubt a good deal of rewriting of his own earlier work, and also perhaps, at the beginning, of that of others. Occasionally he may have entered into collaboration, as, for example, at the end of his career, with Fletcher.

In a worldly sense he clearly flourished, and about 1596, if not earlier, he was able to resume relations as a moneyed man with Stratford-on-Avon. There is no evidence to show whether he had visited the town in the interval, or whether he had bought a house and family to London. His son Hamnet died and was buried at Stratford in 1596. During the last ten years John Shakespeare's affairs had remained unprosperous. He incurred fresh debt, partly through becoming surety for

1 It is most improbable, however, that the apologetic reference in Chettle's Kind-hart's Dream (December 1592) refers to Shakespeare.
his brother Henry; and in 1592 his name was included in a list of recusants dwelling at or near Stratford-on-Avon, with a note by the commissioners that in his case the cause was believed to be the fear of process for debt. There is no reason to doubt this explanation, or to seek a religious motive in John Shakespeare’s abstinence from church. William Shakespeare’s purse must have made a considerable difference. The prosecutions for debt ceased, and in 1597 a fresh action was brought in Chancery for the recovery of Asbies from the Lamberts. Like the last, it seems to have been without result. Another step was taken to secure the dignity of the poet and to obtain a habitation. In 1598 Shakespeare was granted to John Shakespeare while he was bailiff of Stratford. The hearings were on a bond sable a spear or steeld argent, the crest a falcon his wings displayed argent supporting a spear or steeld argent, and the motto Non sans droict. The grant was duly made, and in 1599 there was a further application for leave to impale the arms of Arden, in right of Shakespeare’s mother. No use, however, of the Arden arms by the Shakespeares can be traced. In 1597 Shakespeare made an important purchase for London. In 1598 he bought the famous site of New Place in Stratford. This was one of the largest houses in Stratford, and its acquisition an obvious triumph for the ex-poacher. Presumably John Shakespeare ended his days in peace. A visitor to his shop remembered him as “a merry-cheek’d old man” always ready to crack a jest with his son. He died in 1601, and his wife in 1608, and the Henley Street houses passed to Shakespeare. Aubrey records that he paid annual visits to Stratford, and there is evidence that he kept in touch with the life of the place. The correspondence of his neighbours, the Quineys, in 1598 contains an application to him for a loan to Richard Quiney upon a visit to London, and a disposition of his investments for the benefit of his children in the neighbourhood of Stratford. In 1602 he took, at a rent of 25. 6d. a year, a copyhold cottage in Chapel Lane, perhaps for the use of his gardener. In the same year he invested £320 in the purchase of an estate consisting of 107 acres in the open fields of Old Stratford, together with a farm-house, garden and orchard, 20 acres of pasture and common rights; and in 1605 he spent another £440 in the outstanding term of a lease of certain great tithes in Stratford parish, which brought in an income of about £60 a year.

Meanwhile Shakespeare remained his headquarters. Here Malone thought that he had evidence, now lost, of his residence in Southwark as early as 1596, and as late as 1608. It is known that payments of subsidy were due from him for 1597 and 1598 in the parish of St Helen’s, Bishops-gate, and that an arraignment was ultimately collected in the liberty of the Clink. He had no doubt migrated from Bishopsgate when the Globe upon Bankside was opened by the Chamberlain’s men. There is evidence that in 1604 he “laid,” temporarily or permanently, in the house of Christopher Mountjoy, a tanner’s family of French extraction, at the corner of Silver Street and Monkwell Street in Cripplegate. A recently recovered note by Aubrey, if it really refers to Shakespeare (which is not quite certain), is of value as throwing light not only upon his abode, but upon his personality. Aubrey seems to have derived it from William Beeston the actor, and through him from John Lacy, an actor of the king’s company. It is as follows: “The more to be admired quod he not a company-keeper, lived in Shoreditch, would not be debauched, & if invited to court, he was in paine.” Against this testimony to the correctness of Shakespeare’s morals are to be placed an anecdote of a green-room amour picked up by a Middle Temple student in 1602 and a Restormel scandal which made him the father by the hostess of the Crown Inn at Oxford, where he baited on his visits to Stratford, of Sir William Davenant, who was born in February 1606. His credit at court is implied by Ben Jonson’s references to his flights “that so did take Eliza and our James,” and by stories of the courtesies which passed between him and Elizabeth while he was playing a kindly part in her presence, of the origin of the The Merry Wives of Windsor in her desire to see Falstaff in love, and of an autograph letter written to honour him by King James. It was noticed with some surprise by Henry Chettle that his “honyed muse ” dropped no “sable tear” to celebrate the death of the queen. Southampton’s patronage may have introduced him to the brilliant circle that gathered round the earl of Essex, but there is no reason to suppose that he or his company were held personally responsible for the performance of Richard II. at the command of some of the followers of Essex as a prelude to the disastrous rising of February 1601. The editors of the First Folio speak also of favours received by the author in his lifetime from Walsingham, earl of Pembroke, and his brother Philip Herbert, earl of Montgomery.

He appears to have been on cordial terms with his fellows of the stage. One of them, Augustine Phillips, left him a small legacy in 1605, and in his own will he paid a similar compliment to Richard Burbage, and to John Heminge and Henry Condell, who afterwards edited his plays. His relations with Ben Jonson, whom he is said by Rowe to have introduced to the world as a playwright, have been much canvassed. Jests are preserved which, even if apocryphal, are interesting as evidence of an intimate and constant friendship inconsistent with occasional passages of arms. The anonymous author of The Return from Parnassus (2nd part; 1602), for example, makes Kempe, the actor, allude to a “purge” which Shakespeare gave Jonson, in return for his attack on some of his rivals in The Poetaster.1 It has been conjectured that this purge was the description of Ajax and his humours in Troilus and Cressida. Jonson, on the other hand, who was criticism incarnate, did not spare Shakespeare either in his prologues or in his private conversation. He told Drummond of Hawthorn that “Shakespeare wanted arte.” But the verses which he contributed to the First Folio are generous enough to make all amends, and in his Discoveries (pubd. 1641; written c. 1624 and later), while regretting Shakespeare’s excessive facility and the fact that he often “fell into those things, could not escape laughter,” he declares him to have been “honest and of an open and free nature,” and says that, for his own part, “I lov’d the man and do honour his memory (on this side idolatry) as much as any.” According to the memoranda-book (1661–1663) of the Rev. John Ward (who became vicar of Stratford in 1662), Jonson and Michael Drayton, himself a Warwickshire poet, had “the privilege of not eating with the rest, the wise men of which he died; and Thomas Fuller (1608–1661), whose Worthies was published in 1662, gives an imaginative description of the wit combats, of which many took place between the two mighty contemporaries.

Of Shakespeare’s literary reputation during his lifetime there is ample evidence. He is probably neither the “Willy” of Spenser’s Tears of the Muses, nor the “Action” of his Colin Clout’s Come Home Again. But from the time of the publication of Venus and Adonis and Lucrece honorific allusions to his work both as poet and dramatist, and often to himself by name, come thick and fast from writers of every kind and degree. Perhaps the most interesting of these from the biographical point of view are those contained in the Palladis Tamia, a kind of literary handbook published by Francis Meres in 1598; for Meres not only extols him as “the most excellent in both kinds [i.e. comedy and tragedy] for the stage,” and one of “the most passionate among us to bewail and bemoan the perplexities of Love,” but also takes the trouble to give a list of twelve plays already written, which serves as a starting-point for all modern attempts at a chronological arrangement of his work. It is moreover from Meres that we first hear of “his sugred Sonnets among his private friends.” Two of these sonnets were printed in 1599.

1 Kempe (speaking to Burbage), “Few of the university pen plays well. They smell too much of that writer Ovid and that writer (sic) Metamorphosis, and talk too much of Proserpine and Jupiter. Why here’s our fellow Shakespeare puts them all down; ay, and Ben Jonson too. O that Ben Jonson is a pestilent fellow. He brought up Homece giving the Poets a pill, but our fellow Shakespeare hath given him a purge that made him beray his credit.”
the grave has been assigned by local tradition to his own pen. A more elaborate monument, with a bust by the sculptor Gerard Johnson, was in due course set up on the chancel wall.

Anne Shakespeare followed her husband on the 6th of August 1613. The family was never founded. Shakespeare's grand-daughter, Elizabeth Hall, made two childless marriages, the first with Thomas Nash of Stratford, the second with John, afterwards Sir John, Barnard of Abington Manor, Northants. His daughter Judith Quiney had three sons, all of whom had died unmarried by 1639. There were, therefore, no male descendants of Shakespeare. His youngest daughter, Lady Barnard's death in 1670. Those of his sister, Joan Hart, could however still be traced in 1864. On Lady Barnard's death the Henley Street houses passed to the Harts, in whose family they remained until 1806. They were then sold, and in 1846 were bought for the public. They are now held with Anne Hathaway's Cottage at Shottery as the Birthplace Trust. Lady Barnard had disposed of the Blackfriars house. The rest of the property was sold under the terms of her will, and New Place passed, firstly to the Claptons who rebuilt it, and then to the Rev. Francis Gastrell, who pulled it down in 1759. The site now forms a public square round and hard by is a memorial building with a theatre in which performances of Shakespeare's plays are given annually in April. Both the Memorial and the Birthplace contain museums, in which books, documents and portraits of Shakespearian interest, together with relics of greater or less authenticity, are stored.

No letter or other writing in Shakespeare's hand can be proved to exist, with the exception of three signatures upon his will, one upon a deposition (May 11, 1612) in a lawsuit with which he was remotely concerned, and two upon deeds (March 10 and May 1614) in connexion with his house of the Blackfriars and with Lady Barnard. A copy of Florio's translation of Montaigne's "De Greciens et Romains" in the Bodleian, and a copy of the 1612 edition of Sir Thomas North's translation of Plutarch's "Lives of the Noble, Gentle and Illustrious Men" in the Greenock Library, have all been put forward with some plausibility as being his autograph name or initials, and, in the third case, a marginal note by him. A passage in the manuscript of the play of "Sir Thomas More" has been ascribed to him ("ride infra"); and, if the play is his, might be in his handwriting. Aubrey records that he was "a hand-some, well-shap man," and the lameness attributed to him by some writers has its origin only in a too literal interpretation of certain references to physical disabilities in the Sonnets.

A collection of Mr William Shakespeare's Comedies, Histories and Tragedies was printed at the press of William and Isaac Jaggard, and issued by a group of booksellers in 1623. This volume is known as the First Folio. It has dedications to the ears of Pembroke and Montgomery, and to "the great Variety of Readers," both of which are signed by two of Shakespeare's "fellows." At the Globe, John Heminge and Henry Condell, and commentators verses by Ben Jonson, Hugh Holland, Leonard Digges and an unidentified I. M. The Durossh in engraving forms part of the title-page. The contents include, with the exception of Pericles, all of the thirty-seven plays now ordinarily printed in editions of Shakespeare's works. Of these eighteen were here published for the first time. The other eighteen had already appeared in one or more separate editions, known as the Quarto.

The following list gives the date of the First Quarto of each such play, and also of any later Quarto which differs materially from the First.

The Quarto Editions.

Titus Andronicus (1594).
2 Henry VI. (1594).
3 Henry VI. (1595).
2 Henry VIII. (1597-1608).
Richard III. (1597).
Roméo et Juliet (1597, 1599).
Locrine's Lost (1598).
1 Henry IV. (1598).
2 Henry IV. (1600).
3 Henry IV. (1600).
4 Henry IV. (1600).
A Midsummer Night's Dream (1600).
The Tempest of Venice (1600).
Much Ado About Nothing (1600).
The Merry Wives of Windsor (1602).
Hamlet (1603, 1604).
King Lear (1608).
Troilus and Cressida (1609).
Othello (1622).
Entries in the Register of copyrights kept by the Company of Stationers indicate that editions of *As You Like It* and *Antony and Cleopatra* were contemplated but not published in 1600 and 1608 respectively.

The Quartos differ very much in character. Some of them contain texts which are practically identical with those of the First Folio; others show variations so material as to suggest that some revision, either by rewriting or by shortening for stage purposes, took place. Amongst the latter are 2, 3, Henry VI., Richard III., Romeo and Juliet, *The Merry Wives of Windsor*, Hamlet and King Lear. Many scholars doubt whether the Quarto versions of 2, 3 Henry VI., which appear after the Folio, but all of them are marked by a looseness of language; in between the two famous Histories of York and Lancaster and The True Tragedy of Richard Duke of York, are Shakespeare's work at all. It seems clear that the Quartos of The Troublesome Reign of John King of England (1591) and The Taming of a Shrew (1594), although treated for copyright purposes as identical with the plays of King John and The Taming of the Shrew, which he founded upon them, are not his. The First Quartos of Romeo and Juliet, Henry V., *The Merry Wives of Windsor*, and *Hamlet* seem to be mainly based, not upon written texts of the plays, but upon versions largely made up out of such tracts as had in other times been composed for the actors by the agents of a piratical bookseller. A similar desire to exploit the commercial value of Shakespeare's reputation probably led to the appearance of his name or initials upon the title-pages of *Locrine* (1595), Sir John Oldcastle (1600), Thomas Lord Cromwell (1601), *The London Prodigal* (1605), The Parian (1607), *A Yorkshire Tragedy* (1608), and *Pericles* (1609). It is not likely that, with the exception of the last three acts of *Pericles*, he wrote any part of these plays, some of which were not even produced by his company. They were not included in the First Folio of 1623, nor in a reprint of it in 1632, known as the Second Folio: but all seven were appended to the second issue (1664) of the Third Folio (1663), and to the Fourth Folio of 1685. Shakespeare is named as joint author with John Fletcher on the title-page of *The Two Noble Kinsmen* (1634), and with William Rowley on that of *The Birth of Merlin* (1606); there is no reason for rejecting the former ascription or for accepting the latter. Late entries in the Stationers' Register assign to him Cardenio (with Fletcher), Henry I. and Henry II. (both with Robert Davenport), King Stephen, Duke Humphrey, and Iphic and Ionba; but none of these plays is now extant. Modern conjecture has attempted to trace his hand in other plays, of which *Arden of Feversham* (ascribed to William Shakespeare as early as 1592), Edward III. (1596), *Mucedorus* (1598), and *The Merry Devil of Edmonton* (1608) are the most important; it is quite possible that he may have had a share in Edward III. A play on Sir Thomas More, which has been handed down in manuscript, contains a number of passages, interpolated in various handwritings, to meet requirements of the censor; and there are those who assign one of these (ii. 4, 1-172) to Shakespeare.

Unfortunately the First Folio does not give the dates at which the plays contained in it were written or produced; and the endeavour to supply this deficiency has been one of the main preoccupations of more than a century of Shakespearean scholarship, since the pioneer essay of Edmund Malone in his *An Attempt to Ascerlain the Order in which the Plays of Shakespeare were Written* (1778). The investigation is not a mere piece of barren antiquarianism, for on it depends the possibility of appreciating the work of the world's greatest poet, not as if it were an articulated whole like a philosophical system, but in its true aspect as the reflex of a vital and constantly developing personality. A starting-point is afforded by the dates of the Quartos and the entries in the Stationers' Register which refer to them, and by the list of plays already in existence in 1598 which is inserted by Francis Meres in his *Palladis Tamia* of that year, and which, while not necessarily exhaustive of Shakespeare's pre-1598 writing, includes *The Two Gentlemen of Verona, The Comedy of Errors, Love's Labour's Lost, A Midsummer Night's Dream, The Merchant of Venice, Richard II., Richard III., Henry IV., King John, Titus Andronicus and Romeo and Juliet*, as well as a mysterious *Love's Labour's Won*, which has been conjecturally identified with several plays, but most plausibly with *The Taming of the Shrew*. There is a mass of supplementary evidence, drawn partly from definite notices in other writings or in diaries, letters, account-books, and similar records, partly from allusions to contemporary persons and events in the plays themselves, partly from parodies of thought and expression between each play and those near to it in point of time, and partly from considerations of style, including the so-called metrical tests, which depend upon an analysis of Shakespeare's varying feeling for rhythm at different stages of his career. The total result is certainly not a demonstration, but in the logical sense an hypothesis which serves to collate the facts and is consistent with itself and with the known events of Shakespeare's external life.

The following table, which is an attempt to arrange the original dates of production of the plays without regard to possible revisions, may be taken as fairly representing the common results of recent scholarship. It is framed on the assumption that, as indeed John Ward tells us was the case, Shakespeare ordinarily wrote two plays a year; but it will be understood that neither the order in which the plays are given nor the distribution of them over the years lays claim to more than approximtate accuracy.

### Chronology of the Plays

**1591.**
2. *Hamlet.*

**1592.**
2. *As You Like It.*

**1593.**
1. *Richard III.*
2. *Edward III.* (part only).
3. *The Comedy of Errors.*

**1594.**
1. *Titus Andronicus.*

**1595.**
1. *A Midsummer Night's Dream.*
2. *The Two Gentlemen of Verona.*
3. *King John.*
4. *Richard II.*
5. *The Merchant of Venice.*

**1597.**
2. *The Comedy of Errors.*
4. *Romeo and Juliet.*

**1598.**
3. *Henry V.*
4. *Caesar.*
5. *Lear.*

**1600.**
1. *As You Like II.*
2. *The Taming of the Shrew.*

**1601.**
1. *Hamlet.*

**1602.**
1. *Troilus and Cressida.*
2. *All's Well that Ends Well.*

**1603.**
2. *Coriolanus.*

**1604.**
1. *Measure for Measure.*
2. *Othello.*

**1605.**
1. *Macbeth.*
2. *King Lear.*

**1606.**
1. *Antony and Cleopatra.*
2. *Coriolanus.*

**1607.**
2. *Pericles* (part only).
3. *Cymbeline.*

**1609.**
2. *The Tempest.*

**1611.**
1. *The Two Noble Kinsmen* (part only).
2. *Henry VIII.* (part only).

A more detailed account of the individual plays may now be attempted. The figures here prefixed correspond to those in the table above.

1. *The Contention of York and Lancaster* to 2, 3 *Henry VI.* and the extent of Shakespeare's responsibility for either or both works have long been subjects of controversy. The extremes of critical opinion are to be found in a theory which regards Shakespeare as the sole author of 2, 3 *Henry VI.* and *The Contention* as a shortened and piratical version of the original plays, and in a theory which regards *The Contention* as written in collaboration by Marlowe, Greene and possibly Peele, and 2, 3 *Henry VI.* as a revision of
The Contention written, also in collaboration, by Marlowe and Shakespeare. A comparison of the two texts leaves it hardly possible to doubt that the differences between them are to be explained by revision rather than by piracy; but the question of authorship is more difficult. Greene's parody, in the "Shakespeare scene" passage of his Greats-worth of Wit (1592), of a line which occurs both in The Contention and in 3 Henry VI., while it clearly suggests Shakespeare's connexion with the play, is evidence neither for nor against the participation of other men, and no sufficient criterion exists for distinguishing between Shakespeare's earliest writing and that of possible collaborators on grounds of style. But there is nothing inconsistent between the reviser's work in 2, 3 Henry VI., and on the one hand Richard III. or on the other the original matter of The Contention, which the reviser follows and elaborates scene by scene. It is difficult to assign to any one except Shakespeare the humour of the Jack Cade scenes, the whole substance of which is in The Contention as well as in Henry VI. Views which exclude Shakespeare altogether may be left out of account. Henry VI. is not in Meres's list of his plays, but its inclusion in the First Folio is almost certain ground for assigning to him some share, if only as reviser, in the completed work.

3. A very similar problem is afforded by 1 Henry VI., and here also it is natural, in the absence of tangible evidence to the contrary, to hold by Shakespeare's substantial responsibility for the play as it stands. It is quite possible that it also may be a revised version, although in this case no earlier version exists; and if so the Talbot scenes (iv. 2-7) and perhaps also the Temple Gardens scene (ii. 4), which are distinguished by certain qualities of style from the rest of the play, may date from the period of revision. Thomas Nash refers to the representation of Talbot on the stage in his Pierce Penniless, his Supplication to the Divell (1592), and it is probable that 1 Henry VI. is to be identified with the "Harey the vi." recorded in Henslowe's Diary to have been acted as a new play by Lord Strange's men, probably at the Rose, on the 3rd of March 1592. If so, it is a reasonable conjecture that the two parts of The Contention were originally written at some date before the beginning of Henslowe's record in the previous February, and were revised so as to fall into a series with 1 Henry VI. in the latter end of 1592.

4. The series as revised can only be intended to lead directly up to Richard III., and this relationship, together with its style as compared with that of the plays belonging to the autumn of 1594, suggest the short winter season of 1592-1593 as the most likely time for the production of Richard III. There is a difficulty in that it is not included in Henslowe's list of the plays acted by Lord Strange's men during that season. But it may quite well have been produced by the only other company which appeared at that time, and the Chamberlain's men may be identified. The mere fact that Shakespeare wrote a play, or more than one play, for Lord Strange's men during 1592-1593 does not prove that he never wrote for any other company during the same period; and indeed there is plenty of room for guess-work as to the relations between Strange's and Pembroke's men. The latter are not known to have existed before 1592, and many difficulties would be solved by the assumption that they originated out of a division of Strange's, whose numbers, since their amalgamation with the Admiral's, may have been too much inflated to enable them to undertake as a whole the summer tour of that year. If so, Pembroke's probably took over the Henry VI. series of plays, since The Contention, or at least The True Tragedy, was published as performed by them, and completed it with Richard III. on their return to London at Christmas. It will be necessary to return to this theory in connexion with the discussion of Titus Andronicus and The Taming of the Shrew. The principal historical source for Henry VI. was Edward Hall's The Union of the Noble and Illustre Families of Lancaster and York (1542), and for Richard III. Hall's Shakespeare's later historical plays, the second edition (1587) of Raphael Holinshed's Chronicles of England, Scotland and Ireland (1577). An earlier play, The True Tragedy of Richard the Third (1594), seems to have contributed little if anything to Richard III.

5. Many scholars think that at any rate the greater part of the first two acts of Edward III., containing the story of Edward's wooing of the countess of Salisbury, are by Shakespeare; and, if so, it is to about the time of Richard III. that the style of his contribution seems to belong. The play was entered in the Stationers' Register on December 1, 1593. The Shakespearean scenes are based on the 46th Novel in William Paynter's Palace of Pleasure (1588), and it probably does not transfer to Pembroke's company, "far better prose than verse...than woods" (ii. r. 451), is repeated verbatim in the 94th sonnet.

6. To the winter season of 1592-1593 may also be assigned with fair probability Shakespeare's first experimental comedy, The Comedy of Errors, and if his writing at one and the same time for Pembroke's and for another company is not regarded as beyond the bounds of conjecture, it becomes tempting to identify this with "the gelyous comedy" produced, probably by Strange's men, for Henslowe as a new play on January 5, 1593. The play contains a reference to the wars of succession in France which would fit any date from 1589 to 1594. The plot is taken from the Menacechi, and to a smaller extent from the Amphitritus of Plautus. William Warner's translation of the Menacechi was entered in the Stationers' Register on June 10, 1594. A performance of The Comedy of Errors by "a company of base and common fellows" (including Shakespeare?) is recorded in the Gesta Grayorum as taking place in Gray's Inn Hall on December 28, 1594.

7. Titus Andronicus is another play in which many scholars have refused to see the hand of Shakespeare, but the double testimony of Henry VI. and its appearance in the First Folio makes it unreasonable to deny him some part in it. This may, however, only have been the part of a reviser, working like the reviser of The Contention, upon the dialogue rather than the structure of a crude tragedy of the school of Kyd. In fact a stage tradition is reported by Edward Ravenscroft, a late 17th-century adapter of the play, to the effect that Shakespeare did no more than give a few "master-touches" to the work of a "private author." The play was entered in the Stationers' Register on February 6, 1594, and was published in the same year with a title-page setting out that it had been acted by the companies of Lord's Derby (i.e. Strange, who had succeeded to his father's title on September 25, 1593), Pembroke and Sussex. It is natural to take this list as indicating the order in which the three companies named had to do with it, but it is probable that only Sussex's had played Shakespeare's version. Henslowe records the production by this company of Titus Andronicus as a new play on January 23, 1594, only a few days before the theatres were closed by plague. For the purposes of Henslowe's financial arrangements with the company a rewritten play may have been classed as new. Two years earlier he had recorded an action by the same company of the same play, which may be identified with the play produced by Strange's men on April 11, 1592. At first sight the title suggests a piece founded on the lives of the emperor Titus and Vespasian, but the identification of the play with an early version of Titus Andronicus is justified by the existence of a rough German adaptation, which follows the general outlines of Shakespeare's play, but in which one of the sons of Titus is named Vespasian instead of Lucius. The ultimate source of the plot is unknown. It cannot be traced in any of the Byzantine chronicles. Strange's men seem to have been still playing Titus in January 1593, and it was probably not transferred to Pembroke's until the companies were driven from London by the plague of that year. Pembroke's are known from a letter of Henslowe's to have been ruined by August, and it is to be suspected that Sussex's, which appeared in London for the first time at the Christmas of 1593, acquired their stock of plays and transferred these to the Chamberlain's men, when the companies were again reconstituted in the summer of 1594. The revision of Titus and Vespasian into Titus Andronicus by Shakespeare may have been accomplished in the interval between these two transactions. The Chamberlain's men were apparently playing Andronicus in June. The stock of Pembroke's men probably included, as well as Titus and Vespasian, both Henry VI. and Richard III., which also thus passed to the Chamberlain's company.
8. In the same way was probably also acquired an old play of *The Taming of A Shrew*. This, which can be traced back as far as 1589, was published as acted by Pembroke's men in 1594. In June of that year, it was acting by the Chamberlain's, but more probably in the revised version by Shakespeare, which bears the slightly altered title of *The Taming of The Shrew*. This is a much more free adaptation of its original than had been attempted in the case of *Henry VI*, and the Warwickshire allusion to the scenes around Stratford-on-Avon is doubted whether Shakespeare was the sole author of *The Shrew*, and others have assigned him a share in *A Shrew*, but neither theory has any very substantial foundation. The origins of the play, which is to be classed as a farce rather than a comedy, are to be found ultimately in widely distributed folk-tales, and more immediately in Ariosto's *I Supposi* (1590) as translated in George Gascoigne's *The Supposes* (1566). It may have been Shakespeare's first task for the newly established Chamberlain's company of 1594 to furnish up the old farce. Thenceforward there is no reason to think that he ever wrote for any other company.

9. *Love's Labour's Lost* has often been regarded as the first of Shakespeare's plays, and has sometimes been placed as early as 1589. There is, however, no proof that Shakespeare was writing before 1592 or thereabouts. The characters of *Love's Labour's Lost* are evidently suggested by Henry of Navarre, his followers Biron and Longaville, and the Catholic League leader, the duc de Maine. These personages would have been familiar at any time from 1583 onwards. The absence of the play from the lists in Henslowe's diary does not leave it impossible that it should have preceded the formation of the Chamberlain's company, but certainly renders this less likely; and its lyric character perhaps justifies its being grouped with the series of plays that began in the autumn of 1594. No entry of the play is found in the Stationers' Register, and it is quite possible that the present First Quarto of 1598 was not really the first edition. The title-page professes to give the play as it was "corrected and augmented" for the Christmas either of 1597 or of 1598. It was again revived for that of 1604. No other literary source is known for its incidents.

10. *Romeo and Juliet*, which was published in 1597 as played by Lord Hunsdon's men, was probably produced somewhat before *A Midsummer Night's Dream*, as its incidents seem to have suggested the parody of the Pyramus and Thisbe interlude. An attempt to date it in 1591 is hardly justified by the Nurse's references to an earthquake eleven years before and the fact that there was a real earthquake in London in 1580. The text seems to have been partly revised before the issue of the Second Quarto in 1599. There had been an earlier play on the subject, but the immediate source used by Shakespeare was Arthur Brooke's narrative poem *Romeus and Juliet* (1562).

11. *A Midsummer Night's Dream*, with its masque-like scenes of fairydom and the epithalamium at its close, has all the air of having been written less for the public stage than for some courtly wedding; and the compliment paid by Oberon to the "fair vestal throned by the west" makes it probable that it was a wedding at which Elizabeth was present. Two fairly plausible occasions have been suggested. The wedding of Mary countess of Southampton with Sir Thomas Heneage on the 2nd of May 1594 would fit the May-day setting of the plot; but a widowed countess hardly answers to the "little western flower of the allegory, and there are allusions to events later in 1594 and in particular to the rainy weather of June and July, which indicate a somewhat later date. The wedding of William Stanley, earl of Derby, brother of the lord Strange for whose players Shakespeare had written, and Elizabeth Vere, daughter of the earl of Oxford, which took place at Greenwich on the 26th of January 1595, perhaps fits the conditions best. It has been fancied that Shakespeare was present when "certain stars shot madly from their spheres" in the Kenilworth fireworks of 1575, but if he had any such entertainment in mind it is more likely to have been the more recent one given to Elizabeth by the earl of Hertford at Elvetham in 1591. There appears to be no special source for the play beyond Chaucer's *Knight's Tale* and the widespread fairy lore of western Europe.

12. No very definite evidence exists for the date of *The Two Gentlemen of Verona*, other than the mention of it in *Palatins Tame*. It is evidently a more rudimentary essay in the genre of romantic comedy than *The Merchant of Venice*, with which it has other affinities in its Italian colouring and its use of the inter-relations of love and friendship as a theme; and it may therefore be assigned to the neighbourhood of 1595. The plot is drawn from various examples of contemporary fiction, especially from the story of the shepherdess Filismensa in *De Montemayor's Diana* (1559). A play of *Felix and Philomena* had already been given at court in 1585.

13. *King John* is another play for which 1595 seems a likely date, partly on account of its style, and partly from the improbability of a play on an independent subject drawn from English history being interpolated in the middle either of the Yorkist or of the Lancastrian series. It would seem that Shakespeare had before him an old play of the Queen's men, called *The Troublesome Reign of King John*. This was published in 1595, and again, with "W. Sh." on the title-page, in 1611. For copyright purposes *King John* appears to have been regarded as a revision of *The Troublesome Reign*, and in fact the succession of incidents in the two plays is much the same. Shakespeare's dialogue, however, owes little or nothing to that of his predecessor.

14. *Richard II.* can be dated with some accuracy by a comparison of the two editions of Samuel Daniel's narrative poem on *The Civil Wars Between the Two Houses of Lancaster and York*, both of which bear the date of 1595 and were therefore published between March 25, 1595 and March 24, 1596 of the modern reckoning. The second of these editions, but not the first, contains some close parallels to the play. From the first two quartos of *Richard II.*, published in 1597 and 1598, the deposition scene was omitted, although it was clearly part of the original structure of the play, and its removal leaves an obvious mutilation in the text. There is some reason to suppose that this was due to a popular tendency to draw seditious parallels between Richard and Elizabeth; and it became one of the charges against the earl of Essex and his fellow-conspirators in the abortive *attempte* of February 1601, that they had procured a performance of a play on Richard's fate in order to stimulate their followers. As the actors were the Lord Chamberlain's men, this play can hardly have been any other than Shakespeare's. The deposition scene was not printed until after Elizabeth's death, in the Third Quarto of 1608.

15. *The Merchant of Venice*, certainly earlier than July 22, 1598, on which date it was entered in the Stationers' Register, and possibly inspired by the machinations of the Jew poisoner Roderigo Lopez, (who was executed in June 1594, shows a considerable advance in comic and melodramatic power over any of the earlier plays, and is assigned by a majority of scholars to about 1596. The various stories of which its plot is compounded are based upon common themes of folk-tales and Italian novelle. It is possible that Shakespeare may have had before him a play called *The Jew*, of which there are traces as early as 1579, and in which motives illustrating "the greediness of worldly usurers" and the "bloody minds of usurers" appear to have been already combined. Something may also be owing to Marlowe's play of *The Jew of Malta*.

16. *The existence of Richard II.* is assumed throughout *Henry IV.*. It is probably safe to infer that it followed it with some interval. The first part was published in 1598, the second not until 1600, but both parts must have been in existence before the entry of the first part in the Stationers' Register on February 24th 1598, since Falstaff is named in this entry, and a slip in a speech-prefix of the second part, which was not entered in the Register until August 23rd 1600, betrays that it was written when the character still bore the name of Sir John Oldcastle. Richard James, in his dedication to *The Legend of Sir John Oldcastle* about 1625, and Rowe in 1709 both bear witness to the substitution of the one personage for the other, which Rowe
19. The completion of the Lancastrian series of histories by Henry V. can be safely placed in or about 1599, since there is an allusion in one of the choruses to the military operations in Ireland of the earl of Essex, who crossed on March 27 and returned on September 28, 1599. The First Quarto, which was first "stayed" with Much Ado About Nothing and then published in 1600, is a piratical text, and does not include the choruses. A genuine and perhaps slightly revised version was first published in the First Folio.

20. The Chamberlain's company could have performed a play called The Famous Victories of Henry the Fifth, which had been acted by Tarlton and the Queen's men at least as far back as 1588, and of which an edition was printed in 1598. Falstaff himself is a somewhat libellous presentment of the 15th century leader, Sir John Fastolf, who had already figured in Henry VI.; but presumably Fastolf has no titled descendants alive in 1598.

21. In 1613 it was revived before James I. under the alternative title of Benedick and Beatrice. Dogberry is said by Aubrey to have been taken from a constable at Grendon in Buckinghamshire. There is no very definite literary source for the play, although some of its incidents are to be found in Ariosto's Orlando Furioso and Bandello's novelle, and attempts have been made to establish relationships between it and two early German plays, Jacob Ayrer's Die Schöne Phasmia and the Vincenzius Lodziolius of Duke Henry Julius of Brunswick.

22. As You Like It was one of the plays "stayed" from publication in 1600, and cannot therefore be later than that year. Some trifling bits of evidence suggest that it is not earlier than 1599. The plot is based upon Thomas Lodge's romance of Rosalynde (1590), and this in part upon the pseudo-Chaucerian Tale of Gamelyn.

23. A play of Hamlet was performed, probably by the Chamberlain's men, for Henslowe at Newington Butts on the 9th of June 1594. There are other references to it as a revenge-play, and it seems to have been in existence in some shape or as early as 1599. It was doubtless on the basis of this that Shakespeare constructed his tragedy. Some fragment of the so-called Ur-Hamlet may perhaps be traceable in the German play of Der besstrata Brudernech. There is an allusion in Hamlet to the rivalry between the ordinary stages and the private plays given by boy actors, which points to a date during the vogue of the children of the Chapel, whose performance began late in 1600, and another to an inhibition of plays on account of a "late innovation," by which the Essex rising of February 1601 may be meant. The play was entered in the Stationers' Register on July 26, 1602. The First Quarto was printed in 1603 and the Second Quarto in 1604. These editions contain text passages from each other and from that of the First Folio are so considerable as to suggest, even when allowance has been made for the fact that the First Quarto is probably a piratical venture, that the play underwent an exceptional amount of rewriting at Shakespeare's hands. The title-page of the First Quarto indicates that the earliest version was acted in the universities of Oxford and Cambridge and elsewhere, as well as in London. The ultimate source of the plot is to be found in Scandinavian legends preserved in the Historia Danica of Saxo Grammaticus, and transmitted to Shakespeare or his predecessor through the Historiae tragi-comicae et tragicorum Fabularum Libri duo of Jacobo Amore.
no allusion to Shakespeare is really intended. The material for Tragedies and Cressida was taken by Shakespeare from Chaucer's Troilus and Criseyde, Caxton's Recuyell of the Historyes of Troye, and Chapman's Homer.

26. It is almost wholly on grounds of style that All's Well that Ends Well is placed by most critics in or about 1602, and, as in the case of Troilus and Cressida, it has been argued, though with little justification, that parts of the play are of considerably earlier date, and perhaps represent the Love's Labour's Won referred to by Meres. The story is derived from Boccaccio's Decameron through the medium of William Painter's Palace of Pleasure (1566).

27. Measure for Measure is believed to have been played at court on the 26th of December 1604. The evidence for this is to be found, partly in an extract made for Malone from official records now lost, and partly in a forged document which has been thoroughly worked out. The extraordinary incoherencies of its action and inequalities of its style have prevented modern scholars from accepting it as a finished production of Shakespeare, but there agreement ceases. It is sometimes regarded as an incomplete draft for an intended play; sometimes as a Shakespearian fragment worked over by a second hand either for the stage or for printing in the First Folio; sometimes, but not very plausibly, as an old play by an inferior writer which Shakespeare had partly remodelled. It does not seem to have had any relations to an extant academic play of Timon which remained in manuscript until 1618. Sources are also found, partly in Plutarch's Life of Marcus Antonius, partly in Lucian's dialogue of Timon or Misanthropos, and partly in William Painter's Palace of Pleasure (1566).

28. There is no external evidence as to the date of Timon of Athens, but it may safely be grouped on the strength of its internal characteristics with the plays just named, and there is a clear gulf between it and those that follow. It may be provisionally in 1607. The critical problems which it presents are the subject of a separate, and to Shakespeare's later works is also found, partly in Plutarch's Life of Marcus Antonius, partly in Lucian's dialogue of Timon or Misanthropos, and partly in William Painter's Palace of Pleasure (1566).

30. The entry of King Lear in the Stationers' Register on November 16, 1607, is the first performance of the play at court on December 26, 1606. This suggests 1605 or 1606 as the date of production, and this is confirmed by the publication in 1605 of the older play, The True Chronicle History of King Lear, which Shakespeare used as his source. Two quartos of King Lear were published in 1608, and contain a text rather longer, but in other respects less accurate, than that of the First Folio. The material of the play consists of fragments of Celtic myth, which found their way into history through Geoffrey of Monmouth. It was accessible to Shakespeare in Holinshed and in Spenser's Faerie Queene, as well as in the old play.

31. It is not quite clear whether Antony and Cleopatra was the play of that name entered in the Stationers' Register on May 26, 1608, for no Quarto is extant, and a fresh entry was made in the Register before the issue of the First Folio. Apart from this entry, there is little external evidence to fix the date of the play, but it is in Shakespeare's later, although not his last, manner, and may very well belong to 1606.
conjecturally to 1609. The mask-like dream in act v. sc. 4 must be an interpolation by another hand. This play also is based upon a wide-spread story, probably known to Shakespeare in his youth (day nine). 39. The Winter's Tale was seen by Forman on May 15, 1611, and as it clearly belongs to the latest group of plays it may well have been produced in the preceding year. A document amongst the Revels Accounts, which is forged, but may rest on some authentic basis, gives November 5, 1611 as the date of a performance at court. The play is recorded to have been licensed by Sir George Buck, who began to license plays in 1607. The plot is from Robert Greene's Pandosto, the Triumph of Time, or Dorastus and Fawnia (1588).

37. The wedding-mask in act iv. of The Tempest has suggested the possibility that it may have been composed to celebrate the marriage of the princess Elizabeth and Frederick V., the elector palatine, on February 14, 1613. But Malone appears to have had evidence, now lost, that the play was performed at court as early as 1611, and the forged document amongst the Revels Accounts gives the precise date of November 1, 1611. Sylvester Jourdain's history of the English stage contains an account of the shipwreck of Sir George Somers in 1609, which was published about October 1610, and this or some other contemporary narrative of Virginian colonization probably furnished the hint of the plot.

38. The tale of Shakespeare's independent dramas is now complete, but an analysis of the Two Noble Kinsmen leaves no reason to doubt the accuracy of its ascription on the title-page of the First Quarto of 1634 to Shakespeare and John Fletcher. This appears to have been a case of ordinary collaboration. There is sufficient resemblance between the styles of the two writers to render the division of the play between them a matter of some difficulty; but the parts that may probably be assigned to Shakespeare are acts i. sc. 1-4; ii. 1; iii. 1, 2; v. i, 3, 4. Fletcher's morris-dance in act iii. sc. 5 is borrowed from that in Beaumont's Mask of the Inner Temple and Gray's Inn, given on February 20, 1613, and the play may perhaps be dated in 1613. It is based on Chaucer's Knight's Tale.

39. It may now be accepted as a settled result of scholarship that Henry VIII. is also the result of collaboration, and that one of the collaborators was Fletcher. There is no good reason to doubt that the other was Shakespeare, although attempts have been made to substitute Philip Massinger. The inclusion, however, of the play in the First Folio must be regarded as conclusive against this theory. There is some ground for suspicion that the collaborators may have had an earlier work of Shakespeare before them, and this would explain the reversion to the "history" type of play which Shakespeare had long abandoned. His share appears to consist of act i. sc. 1, 2; act ii. sc. 3, 4; act iii. sc. 2, ll. 1-203; act v. sc. 1. The play was probably produced in 1613, and originally bore the alternative title of All is True. It was being performed in the Globe on June 29, 1613, when the thatch caught fire and the theatre was burnt. The principal source was Holinshed, but Hall's Union of Lancaster and York, Foxe's Acts and Monuments of the Church, and perhaps Samuel Rowley's play of When You See Me, You Know Me (1605), appear also to have contributed.

Shakespeare's non-dramatic writings are not numerous. The narrative poems of Venus and Adonis was entered in the Stationers' Register on April 18, 1593, and thirteen editions, dating from 1593 to 1636, are known. The Rape of Lucrece was entered in the Register on May 9, 1594, and the six exact editions range from 1594 to 1624. Each poem is prefaced by a dedicatory epistle from the author to Henry Wriothesley, earl of Southampton. The subjects, taken respectively from the Metamorphoses and the Fasti of Ovid, were frequent in Renaissance literature. It was once supposed that Shakespeare came from Stratford-on-Avon with Venus and Adonis in his pocket; but it is more likely that both poems owe their origin to the comparative leisure afforded to playwrights and actors by the plague-period of 1592-1594. In 1599 the stationer William Jaggard published a volume of miscellaneous verse which he called The Passionate Pilgrim, and placed Shakespeare's name on the title-page. Only two of the pieces included herein are certainly Shakespeare's, and although others may quite possibly be his, the authority of the volume is destroyed by the fact that some of its contents are without doubt the work of Marlowe, Sir Walter Raleigh, Richard Barnfield and Bartholomew Griffin. In 1601 Shakespeare contributed The Phoenix and the Turtle, an elegy on an unknown pair of wedded lovers, to a volume called Love's Martyr, or Rosalind's Complaint, which was collected and mainly written by Robert Gore, but it sinks into insignificance beside that of one remaining volume. The Sonnets were entered in the Register on May 20, 1609, by the stationer Thomas Thorpe, and published by him under the title Shakespeare's Sonnets, never before Imprinted, in the same year. In addition to a hundred and fifty-four sonnets, the volume contains the elegiac poem, probably dating from the Venus and Adonis period, of A Lover's Complaint. In 1610 the sonnets, together with other poems from The Passionate Pilgrim and elsewhere, many of which were afterwards included in the Poems Written by W J Shakespeare, Gent. Here the sonnets are arranged in an altogether different order from that of 1609 and are declared by the publisher to "appear of the same purity, the Author himselfe then living avouched." No Shakespearian controversy has received so much attention, especially during recent years, as that which concerns itself with the date, character, and literary history of the Sonnets. This is intelligible enough, since upon the issues raised depends the question whether these poems do or do not give a glimpse into the intimate depths of a personality which otherwise is at the most only imperfectly revealed through the plays. On the whole, the balance of authority is now in favour of regarding them as in a very considerable measure autobiographical. This view has undergone the fires of much destructive argument. The authenticity of the order in which the sonnets were printed in 1609 has been doubted; and their subject-matter has been variously explained as being of the nature of a philosophical allegory, of an effort of the dramatic imagination, or of a heartless exercise in the forms of the Petrarchan convention. This last theory has been recently and strenuously maintained, and may be regarded as the one which was field in opposition to the autobiographical interpretation. But it rests upon the false psychological assumption, which is disproved by the whole history of poetry and in particular of Petrarchan poetry, that the use of conventions is inconsistent with the expression of unfeigned emotions; and it is hardly to be set against the direct conviction which the sonnets carry to the most finely critical minds of the strength and sincerity of the spiritual experience out of which they were wrought. This conviction makes due allowance for the inevitable heightening of emotion itself in the act of poetic composition; and it certainly does not carry with it a belief that all the external events which underlie the emotional development are capable at this distance of time of inferential reconstruction. But it does accept the sonnets as an actual record of a part of Shakespeare's life during the years in which they were written, and as revealing at least the outlines of a drama which played itself out for once, not in his imagination but in his actual conduct in the world of men and women.

There is no advantage to be gained by rearranging the order of the 1611 volume, even if there were any basis other than that of individual whim on which to do so. Many of the sonnets are obviously linked to those which follow or precede them; and altogether a few may conceivably be misplaced, the order as a whole does not jar against the sense of emotional continuity, which is the only possible test that can be applied. The last two sonnets, however, are merely alternative versions of a Greek epigram, and the rest fall into two series, which are more probably parallel than successive. The shorter of these two series (cxviii.-clii.) appears to be the record of the poet's relations with a mistress, a dark woman with raven brows and mourning eyes. 39. Shakespeare and Jonson, and from the latter to The Works of Ben Jonson, first published in 1616. The latter volume was republished in 1619. The bulk of the included sonnets is generally supposed to be Shakespeare's.
In the earlier sonnets he undertakes the half-playful deformance of black beauty against the blonde Elizabethan ideal; but the greater number are in a more serious vein, and are filled with a deep consciousness of the bitterness of lustful passion and of the slavery of the soul to the body. The woman is a wanton. She has broken her bed-void for Shakespeare, who on his side is forsworn in loving her; and she is doubly forsworn in proving faithless to him with other men. His reason condemns her, but his heart has not the power to throw off her tyranny. Her particular offence is that she, “a woman coloured ill,” has cast her snare not only upon him, but upon his friend, “a man right fair,” who is his “better angel,” and that thus his loss is double, in love and friendship. The longer series (l.-cxxxvi.) is written to a man, appears to extend over a considerable period of time, and covers a wide range of sentiment. The person addressed is younger than Shakespeare, and of higher rank. He is Thompson, the son of a lovely mother, and has hair like the aurum buds of marjoram. The series falls into a number of groups, which are rarely separated by any sharp lines of demarcation. Perhaps the first group (i.-xviii.) is the most distinct of all. These sonnets are a prolonged exhortation by Shakespeare to his friend to marry and beget children. The friend is now on the top of happy hours, and should make haste, before the rose of beauty diès, to secure himself in his descendant against devouring time. In the next group (xviii.-xxxv.) a more personal note is struck, and the writer assumes the attitudes, of the poet who has been devoted to extolling the beauty and the honour of his patron, and of the friend whose absorbing affection is always on the point of assuming an emotional colour indistinguishable from that of love. The consciousness of advancing years and that of a fortune which bars the triumph of public honour alike find their consolation in this affection. A period of absence (xxxvi.-xlix.) follows, in which the thought of friendship comes to remedy the daily labour of travel and the sorrows of a life that is “in disagrace with fortune and men’s eyes” and filled with melancholy broodings over the immortality which this world will find in the poet’s verse are especially dwelt upon. Once more there is a parting (lxxi.-lxxii.) and the poet waits as patiently as may be his friend’s return to him. Again (lxiii.-lxv.) he looks to his verse to give the friend immortality. He is tired of the world, but his friend redeems it (lxvi.-lxviii.). Then rumours of some scandal against his friend (lxix.-lxx.) reach him, and he falls (lxxi.-lxxx.) into gloomy thoughts of coming death. The friend; however, is still (lxvii.-lxxv.) his argument; and he is perturbed (lxxviii.-lxxxvii.) by the appearance of a rival poet, who claims to be taught by the bard above a mortal pitch,” and with “the profound full sail of his great vessel” has already won the courtship of Shakespeare’s patron. There is another estrangement (lxxxviii.-xc.), and the poet, already crossed with the spite of fortune, is ready not only to acquiesce in the loss of friendship, but to find the fault in himself. The friend returns to him, but the relation is still clouded by doubts of his fidelity (xci.-xciii.) and by public rumours of his wantonness (xciv.-xcvii.). For a third time the poet is absent (xcviii.-cxcii.) in summer and spring. Then comes an apparent interval, after which a love already three years old is renewed (c.-xiv.), with even richer praises (cv.-cviii.). It is now the poet’s turn to offer apologies (cix.-cxii.) for offences against friendship and for some brand upon his name apparently due to the conditions of his profession. He is again absent (cxiii.) and again renews his protestsations of the imperishability of love (cixv.-cxivii.) and of his own unworthiness (cxiv.-cxxxii.), for which his only excuse is in the fact that the friend was once unkind. If the friend has suffered as Shakespeare suffered, he has “passed a hell of time.” The series closes with a group (cxxxiii.-cxl.) in which love is pitied against time; and an envoi, not in sonnet form, warns the “lovely boy” that in the end nature must render up her treasure.

Such an analysis can give no adequate idea of the qualities in these sonnets, whereby the appeal of universal poetry is built up on a basis of intimate self-revelation. The human document is so legible, and at the same time so incomplete, that it is easy to understand the strenuous efforts which have been made to throw further light upon it by tracing the identities of those other personalities, the man and the woman, through his relations to whom the poet was brought to so fiery an ordeal of soul, and even to the border of self-abasement. It must be remembered that the search has, as a rule, been conducted with more ingenuity than judgment. It has generally started from the terms of a somewhat mysterious dedication prefixed by the publisher Thomas Thorpe to the volume of 1609. This runs as follows:—

"To the onlie begetter of these insuing sonnets Mr W. H. all hapinesse and that eternitie promised by our ever-living poet whoh the well-wishing adventurer in setting forth T. T."

The natural interpretation of this is that the inscriber or "begetter" of the sonnets bore the initials W. H.; and the contemporaries of Shakespeare have accordingly been racked to find a W. H. whose age and circumstances might conceivably fit the conditions of the problem which the sonnets present. It is perhaps a want of historical perspective which has led to the centring of controversy around two names belonging to the highest ranks of the Elizabethan nobility, those of Henry Wriothesley, earl of Southampton, and William Herbert, earl of Pembroke. There is some evidence to connect Shakespeare with both of these. To Southampton he dedicated Venus and Adonis in 1593 and The Rape of Lucrece in 1594, and the story that he received a gift of no less than £1000 from them, in which he accompanied his gift of the Lucrece, can only be inferred from the statement of Heminge and Condell in their preface to the First Folio of the plays, that Pembroke and his brother Montgomery had "prosecuted both them and their Author living, with so much favour." The personal beauty of the rival claimants and of their mothers, their amours and the attempts of their families to persuade them to marry, their relations to poets and actors, and all other points in their biographies which do or do not fit in with the indications of the sonnets, have been canvassed with great spirit and some erudition, but with no very conclusive result. It is in Pembroke’s favour that his initials were in fact W. H., whereas Southampton can only be turned into W. H. by a process of metathesis; and his champions have certainly been more successful than Southampton’s in producing a dark woman, a certain Mary Fitton, who was a mistress of Pembroke’s, and was in consequence dismissed in disgrace from her post of maid of honour to Elizabeth.

Unfortunately, the balance of evidence is in favour of her having been blonde, and not "black." Moreover, a careful investigation of the sonnets, as regards their style and their relation to the plays, renders it almost impossible on chronological grounds that Pembroke can have been their subject. He was born on 19th October 1564, and was therefore much younger than Southampton, who was born on the 6th of October 1573. The earliest sonnets postulate a marriageable youth, certainly not younger than eighteen, an age which Southampton reached in the autumn of 1591 and Pembroke in the spring of 1598. The writing of the sonnets may have extended over several years, but it is impossible to doubt that as a whole it is to the years 1593–1598 rather than to the years 1595–1603 that they belong. There is, not indeed, much external evidence available. Francis Meres in his Palladis Tamia of 1598 mentions Shakespeare’s “sugred sonnets among his private friends,” but this allusion might come as well at
the poem to connect Shakespeare with a family of Willoughbys or with the neighbourhood of West Knole. Various other identifications of W. H. have been suggested, which rarely rest upon anything except a similarity of initials. There is little plausibility in a theory broached by Mr Sidney Lee, that W. H. was not the friend of the sonnets at all, but a certain William Hall, who was himself a printer, and might, it is conjectured, have obtained the "copy" of the sonnets for Thorpe. It is, of course, just possible that the "begetter" of the title-page might mean, not the "inspirer," but the "procure for the publication of the sonnets; but this interpretation is shipwrecked on the obvious identity of the person to whom Thorpe "wishes" eternity with the person to whom the poet, "promised" that eternity. The external history of the Sonnets must still be regarded as an unsolved problem; the most that can be said is that their subject may just possibly be Southampton, and cannot possibly be Pembroke.

In order to obtain a glimmering of the man that was Shakespeare, it is necessary to consult all the records and to read the evidence of his life-work in the plays, alike in the light of the simple facts of his external career and in the inner light of his art. To this end it is desirable to begin the search with the sonnets, for it is clear that the sonnets are the one document in which Shakespeare himself profitably speaks for himself.
which the dramatic spirit is capable; the conventional and melodramatic endings, the inconsistencies of action and even of character, the emotional confusions of tragicomedy, the complications of plot and subplot, the marring of the give-and-take of dialogue by superfluities of description and of argument, the verse and the blank verse violently thrust in to suit the taste of the groundlings, all the fecks that to an instructed modern criticism are only too apparent upon the Shakespearian sun. It perhaps follows from this that the most fruitful way of approaching Shakespeare is by an analysis of his work rather as a process than as a completed whole. His outstanding positive quality is a vast comprehensiveness, a capacity for growth and assimilation, which leaves no aspect of life unexplored, and allows of no finality in the nature of his judgments upon life. It is the real and sufficient explanation and justification of his power to take him to his finality in the chronological order of his plays, that the secret of his genius lies in its power of development and that only by the study of its development can he be known. He was nearly thirty when, so far as we can tell, his career as a dramatist began; and already there lay behind him those six or seven unaccounted-for years since his marriage, passed no one knows where, and filled no one knows with what experience, but assuredly in that strenuous Elizabethan life with some experience kindling to his intellect and formative of his character. To the wooster and the familiarity with country sights and sounds which he brought with him from Stratford, which furnished his plays with a purely imaginary and euphuistic natural history, and to the book-learning of a provincial grammar-school boy, and perhaps, if Aubrey is right, also of a provincial schoolmaster, he had somehow added, as he continued to add throughout his life, that curious store of acquaintance with the details of the most diverse occupations which has so often perplexed and so often misled his commentators. It was the same faculty of acquisition that gave him his enormous vocabulary, so far exceeding in range and variety that of any other English writer.

His first group of plays is largely a group of adventures, and perhaps one of the best of these is the Comedy of Errors which properly belongs to Marlowe. But in Richard III, he begins to come to his own with the subtle study of the actor's temperament which betrays the working of a profound interest in the technique of his medium. The episodes of the earliest plays is essentially rhetorical; the blank verse is still and little varied in rhythm; and the periods are built up of parallel and antithetic sentences, and punctuated with devices of iterations, plays upon words, and other methods of securing emphasis, that derive from the bad tradition of a popular stage, upon which the players are bound to rant and force the note in order to hold the attention of a dull-witted audience. During the plague-vacations of 1592 to 1594, Shakespeare tried his hand at the ornate descriptive poetry of Venus and Adonis and Lucrece; and the influence of this exercise is felt also of Italian travel, is apparent in the next group of plays, with their lyric notes, their tendency to warm southern colouring, their wealth of decorative imagery, and their elaborate and not rarely frigid conceits. Rhymed couples make their appearance, side by side with blank verse, as a medium of dramatic dialogue. It is a period of experiment, in farce with The Taming of the Shrew, in satirical comedy with Love's Labour's Lost, in lyrical comedy with A Midsummer Night's Dream, in lyrical tragedy with Romeo and Juliet, in lyrical history with Richard II., and finally in romantic tragicomedy with The Two Gentlemen of Verona and the masterpiece of this singular genre, The Merchant of Venice. It is also the period of the sonnets, which have their echoes both in the phrasing and in the themes of the plays; in the black-browed Rosaline of Love's Labour's Lost, and in the issue between friendship and love which is variously set in The Two Gentlemen of Verona and in The Merchant of Venice. But in the latter the play the sentiment is already one of retrospection; the tempest of spirit has given way to the tender melancholy of renunciation. The sonnets seem to bear witness, not only to the personal upheaval of passion, but also to some despondency at the spirit of fate and the diagonal of the actor's calling. This mood too may have cleared away in the sunshine of growing popularity, of financial success, and of the possibly long-delayed return to Stratford. Certainly the series of plays written next after the travels of 1597 are light-hearted plays, less occupied with profound or vexatious searchings of spirit than with the delightful externalities of things. The histories from King John to Henry V. form a continuous study of the conditions of kingship, carrying on the political speculations begun in Richard II., and culminating in the brilliant picture of triumphant efficiency, the Henry of Agincourt. Meanwhile Shakespeare develops the astonishing faculty of humorous delineation of which he had given foretastes in Jack Cade, in Bottom the weaver, and in Julius's nurse; sets the creation of Falstaff in front of his vivid pictures of contemporaneous England; and passes through the half-comedy, half melodrama, of Much Ado About Nothing to the joyous farce of The Merry Wives of Windsor, and to his two perfectly sunny comedies the sylvan comedy of As You Like It and the urban comedy of Twelfth Night.

Then there comes a change of mood, already heralded by Julius Caesar, which stands beside Henry V. as a reminder that efficiency has its seamy as well as its brilliant side. The tragedy of political idealism in Brutus is followed by the tragedy of intellectual idealism in Hamlet; and this in its turn by the three bitter and cynical pseudo-comedies, All's Well That Ends Well, in which the creator of Portia, Beatrice, Rosalind and Viola drags the honour of womanhood in the dust—Troilus and Cressida, in which the ideals of heroism and of romance are confounded in the portraits of a wanion and a poltroon—and Measure for Measure, in which the searchlight of irony is thrown upon the paths of Prodigal sinners. Meanwhile in the soul of Shakespeare it is perhaps idle to speculate. The evidence of his profound disillusion and discouragement of spirit is plain enough; and for some years the tide of his pessimistic thought advances, swelling through the pathetic tragedy of Othello to the cosmic tragedies of Macbeth and King Lear, with their Titan-like indictments not of man alone, but of the heavens by whom man was made. Meanwhile Shakespeare's style undergoes changes no less notable than those of his subject-matter. The ease and lucidity characteristic of the histories is lessened, the language is handled more daintily, and the thought tends to become less elliptic and obscure, as if the thoughts were hurrying faster than speech can give them utterance. The period closes with Antony and Cleopatra and Coriolanus, in which the ideals of the love of woman and the honour of man are once more stripped bare to display the skeletons of lust and egotism, and in the latter of which signs of exhaustion are already perceptible; and with Timon of Athens, in which the dramatist-whips himself to an almost incoherent expression of a general loathing and detestation of humanity. Then the stretched cord suddenly snaps. Timon is a shattered soul with nothing left but power. Pericles, which is entirely different vein, and is apparently finished but not begun. At this point only in the whole course of Shakespeare's development there is a complete breach of continuity. One can only conjecture the occurrence of some spiritual crisis, an illness perhaps, or some process akin to what in the language of religion is called conversion, which left him a new man, with the fever of pessimism behind him, and at peace once more with Heaven and the world.

The final group of plays, the Shakespearian part of Pericles, Cymbeline, The Winter's Tale, The Tempest, all belong to the class of what may be called idyllic romances. They are happy dreams, in which all troubles and sorrows are ultimately resolved into fortunate endings, and which stand therefore as so many symbols of an optimistic faith in the beneficent dispositions of an ordering

SHAKESPEARE

785
SHAKESPEARE

PROVIDENCE. In harmony with this change of temper the style has likewise undergone another change, and the tense structure and marmoreal phrasing of Antony and Cleopatra have given way to relaxed cadences and a more natural diction. It is probable that the plays, Shakespeare’s last plays, with the unimportant exceptions of his contributions to Fletcher’s Henry VIII. and The Two Noble Kinsmen, were written in retirement at Stratford. At any rate the call of the country is sounding through them; and it is with no regret that in the last pages of The Tempest the weary magician drowses his book, and buries his staff certain fathoms deep in the earth.

(E. C.)

The Shakespeare-Bacon Theory.

In view of the continued promulgation of the sensational theory that the plays, and presumably the poems also, so long associated with the name of Shakespeare, by whose biography is sketched above, but by somebody else who used this pseudonym—and especially that the writer was Lord Chancellor Francis Bacon (1561-1626)—it appears desirable to deal here briefly with this question. No such ideas seem to have occurred to anybody till the middle of the 19th century (see Bibliography below), but having once been started it has been elaborated, in works associated with both Mr. Donnelly and Mr. Murnau, by his biographers, and has been asserted, as disclosed by the knowledge displayed in Shakespeare’s works and by their vocabulary and style, and to external evidence as represented by the problem of authorship, must have been known to Shakespeare’s contemporaries. To what may be called ingenious inferences from data of this sort have even been attempted to show that a secret confession exists which may be revealed by an examination of our own libraries. It must suffice here to say that the contents of the Americans, Mr. Donnelly and Mrs. Gallup, on this score are not only opposed to the opinion of authoritative biographers, who deny the existence of any such cipher, but have carried their supporters to lengths which are obviously absurd and impossible. Lord Penzance, a great lawyer whose support of the Baconian theory may be found in his The True Original of Shakespeare (1869), makes it appear that his derivation of Shakespeare’s plays from the works of John Donnellius, B. C. 1901. The study of the so-called “long word” cited in Love’s Labour’s Lost, “honificra, bilisitidinatitus,” is an anagram for “hi ludii F. Baconis nati tuiti orb.” (These plays of Shakespeare’s offspring preserved for the world,) and he juggles very curiously with the numbers of the words and lines in the page of the First Folio containing this alleged anagram. He also cites the evidence of (more or less) contemporary illustrations to books, which he explains as cryptographic, in confirmation. These interpretations are in the highest degree speculative. But perhaps his argument is exposed in its full depth of incredibility when he counts up the letters in the letters in the monogram proposed as evidence of Shakespeare’s authorship of the First Folio, and, finding them to be 287 (taking each "w" as two "v's"), concludes (by adding 287 to 1623, i.e. the date of the First Folio) that Bacon intended to reveal the secret of his authorship. For the sake of argument makes the plain man’s head reel. On similar principles anything might prove anything. What may be considered the more reasonable way of approaching the question is found in Mr. G. Greenwood’s Shakespeare Problem Restated (1907), in which the alleged difficulties of the Shakespearean authorship are competently presented without recourse to any such extravagances.

The plausibility of many of the arguments used by Mr. Greenwood and those whom he follows depends a good deal upon the real obscurity which, for lack of positive evidence, shrouds the biography of Shakespeare and our knowledge of the precise facts as to the publication of the works associated with him. And it has been asserted, by the dogmatism of some modern biographers, or the differences of opinion between them, when they attempt to interpret the known facts of Shakespeare’s life so as to account for his authorship. But it must be remembered that it is impossible to construct a convincing career of Shakespeare’s works, it is only possible to reconcile our view of his biography with our knowledge of the works by giving some interpretation to the known facts or accepting some explanation of what may have occurred in the obscure parts of his life which will be consistent with such an identification. That different hypotheses are favoured by different orthodox critics is therefore no real objection, nor that some of them are more highly probable than others. If the same positive evidence is irrecoverable and that speculation—consistent with what is possible—is the only resource. In so far as evidence is to be twisted and both, at all, it is right, in view of the long tradition and the prima facie presence of evidence, to strain it in any possible direction which can reasonably make the Shakespearean authorship intelligible. As a matter of fact the evidence is strained alien to any one of the hypotheses, but it is not to be remembered that the onus lies on the opponent of the Shakespearean authorship to show, first that there is no possible explanation which would justify the tradition, and secondly that there is positive evidence which can upset it and which will saddle the authorship of Shakespeare’s works on Bacon or some one else. The contempt indiscriminately thrown on supporters of the Baconian theory by those who are wedded to the Shakespeare theory is unwarranted. But even if we leave out of account the lunatics and fabricators who have been so prominently connected with it, the adventitious emendations and the spreading of the chief of everyday affairs—may easily be too ingenious in his endeavours to solve a literary problem in which judgment largely depends on a highly trained and subtle sense of literary style and a knowledge of the problems of the early drama. In the early drama. In such an exposition of what may be called the "anti-Shaksperian" case as Mr. Greenwood’s, many points appear to make for his conclusion and it is really remarkable that Bacon’s knowledge of evidence; and though these interpretations may be derived from orthodox Shakespearians—orthodox, that is to say, so far at all events as their view of Shakespearean authorship is concerned—yet it is far from certain that Bacon has outworn their knowledge.

The fact remains that the most competent special students of Shakespeare, however, they may differ as to details, and also the most authoritative special students of Bacon, are unanimous in upholding the traditional view. The Baconian theory simply stands as a curious illustration of the dangers which, even in the hands of fair judges of ordinary evidence, attend certain inferences from a small body of evidence; and the same reason for this: in order to establish even a prima facie case against the identification of the man Shakespeare (however the name be spelt) with the author of Shakespeare’s works, it is quite impossible to establish by any purely internal evidence in its favour, and this cannot well be done; it is highly significant that it was not attempted or thought of for centuries. It is comparatively easy to point to certain difficulties, which are due to the modern Baconian, of the Shakesperian, or of the Greek, or to the modern Greek, or to the modern Baconian, armed with the results of accurate scholarship and profound historical research, attempts to reconstruct the life of the man Shakespeare, and to show the impossibility of any of the many different solutions of these difficulties. But he does so backed by the unshaken tradition and the positive contemporary evidence that the Stratford boy and man, the London actor, the author of Venus and Adonis and Lucrece, and the dramatist (so far at least as criticism uphold the canon of the plays ascribed to Shakespeare), were one and the same.

It may be useful here to add to what has been written in the preceding article some of the positive contemporary allusions to Shakespeare in Bacon’s works, which are the subject of this article. The evidence of Francis Meres in Pallads Talmia (1598) has already been referred to. It is incredible that Ben Jonson, who knew both Shakespeare and Bacon intimately, who himself dubbed Shakespeare the "swan of Avon," and who survived Bacon for fourteen years, could have died without revealing the alleged secret, at a time when there was no reason for concealing it. Much has been made of Jonson’s references to Shakespeare, and of certain incongruities in his references to both Shakespeare and Bacon; but these can be twisted in more than one direction and their explanation is purely speculative. His positive contemporary allusions indicate the Baconian theory of his identification of the man and his works. Richard Barnfield (1578) speaks of Shakespeare as "honey-flowing," and says that his Venus and Lucrece have placed his name in immortal glory. The name of "honey-tongued Shakespeare," admired for "rose-cheeked Adonis," and "Romeo, Richard, more whose names I know not." John Davies of Hereford (1610) calls him "our English Terence, Mr Will Shakespeare." Thomas Freeman (1614) writes "to Master W. Shakes%

... Who loves chaste life, there’s Lucrece for a teacher | Who list read lust there’s Venus and Adonis | ... | Besides in plays thy wit winds like Meander.” Other contemporary allusions, all treating Shakespeare as a great poet and tragedian, are also on record.

Finally, it may be remarked that although many problems in connexion with the attribution of Shakespeare’s works are open, and as a result the question of his identity and the question of his authorship depend in a large measure upon evidence which must always remain conjectural, the theory of his identity entirely depends on surrendering every assumption in favour of Shakespeare’s not having had any opportunity to acquire knowledge of the works of Shakespeare and the Baconian theory of his authorship is entirely opposed to the legitimate procedure in approaching the undoubted difficulties. Isolated phrases, such as Ben Jonson’s dictum as to his small knowledge of modern Greek, as "Greek, Greek, Greek," the usage of a competent exposition of a university scholar for one who had no academic training, can easily be made too much of. The extreme
inferences as to his illiteracy, drawn from his handwriting, depend on the most meagre data. The preface to the First Folio says that "he thought no man could discover what he received from his bosom in his papers"; whereas Ben Jonson, in his *Discoveries*, says, "I remember the players often mentioned it as an honour to Shakespeare that in his writing, whatsoever he penned, he never blotted a line: nor, as he said, would he be "a thousand"—which they thought a malvoilent speech." Reams have been written about these two sayings, but we do not know the real circumstances which prompted either, and the non-existence of any effaced pages is as much a matter of fancy as the operations of the wildest conjectures. That there were such manuscripts (unless Ben Jonson and the editors of the First Folio were liars) is certain enough; but whether he ever really wrote them nor how they survived, though persons unacquainted with the history of the manuscripts of printed works of the period sometimes seem to think so.

We know so little of the composition of Shakespeare's works, and the process by which they came to be written and printed, that we cannot be certain, and through the medium of one or other of others, of whether his speaking, painting, poetic, or any other kind of work, was the writing of a genius; that, so far as technical knowledge is concerned (especially the legal knowledge, which has given so much colour to the Baconian theory), various speculations are possible concerning the means which a dramatic genius may have had to inform his mind or acquire his vocabulary. The theatrical and social milieu of those days was small and close; the influence of culture was immediate and mainly oral. We have no positive knowledge indeed of any relations between Shakespeare and Bacon; but, after all, Bacon was a great contemporary, personally interested in the drama, and one would expect the contents of his mind and the same sort of literary expression which we know he used and which would make the curtain-rises and the interests of his patrons. In the purific of the Temple and in literary circles so closely connected with the lawyers and the court, it is to be expected that something of the courtier's was to turn into the lawyer's, and that something which could be turned to account, and whose works, especially plays, the vocabulary of which was open to emprise as well as to the lawyers and the court, in the different stages of composition, rehearsal, production and revision, would show the imagination of a poet working upon ideas culled from the brains of others. Resemblances between phrases used by Shakespeare and by Bacon, therefore, carry one no farther than the fact that they were contemporaries. We cannot even say which was the more influence the other, as we cannot be certain, in every age, it is the writer whose record remains and who by degrees becomes its representative; the truth as to the extent to which the intellectual milieu contributed to the education of the writer, or his genius was assisted by association with others, is hard to recover in after years, and only possible in proportion to our knowledge of the period and of the individual factors in operation.

THE PORTRAITS OF SHAKESPEARE

The mystery that surrounds much in the life and work of Shakespeare extends also to his portraiture. The fact that the only likenesses of the poet that can be regarded as carrying the authority of his co-workers, his friends, and relations—yet neither of them a life-portrait—differs in certain essential points, has opened the door to controversy and encouraged the advance and acceptance of numerous wholly different types. The result has been a swarm of portraits which may be classed as follows: (1) the genuine portraits of persons not Shakespeare but not unlike the various conceptions of him; (2) memorial portraits often based on one or other of accepted originals, whether those originals are worthy of acceptance or not; (3) portraits of persons known or unknown, which have been fraudulently "faked" into a resemblance of Shakespeare; and (4) spurious fabrications especially manufactured for imposition upon the public, whether with or without mercenary motive. It is curious that some of the crudest and most easily demonstrable frauds have been among those which have from time to time been, and still are, most eagerly accepted and most ardently championed. There are few subjects which have so imposed upon the credulous, especially those whose intelligence might be supposed proof against the chicanery practised upon them. Thus, in the past, a president of the Royal Academy in England, and many of the leading artists and Shakespearian students of the time, were found to support the genuineness, as a contemporary portrait of the poet, of a picture which, in its faked Shakespeare state, a few months before was not even in existence. This, at least, proves the intense interest taken by the world in the personality of Shakespeare, and the almost passionate desire to know his features. It is desirable, therefore, to describe those portraits which have chief claim to recollection by reason either of their inherent interest or of the notoriety which they have at some time enjoyed; it is to be remarked that such notoriety once achieved never entirely dies away, if only because the art of the engraver, which has usually perpetuated them either as large plates, or as illustrations to reputable editions of the works, or to commentaries or biographies, sustains their undeserved credit as likenesses much more than the date of their execution.

Exhaustive study of the subject, extended over a series of years, has brought the present writer to the conclusion—identical with that entertained by leading Shakespearian authorities—that two portraits only can be accepted without question as authentic likenesses: the bust (really a half-length statue) with its structural wall-monument in the choir of Holy Trinity Church, Stratford-on-Avon, and the copper-plate engraved by Martin Droseshut as frontispiece to the First Folio of Shakespeare's works (and used for three subsequent issues) published in 1623, although first printed in the previous year. The solid surface represents the teeth of the open mouth; the brush was evoked to supply effect and detail. To the colour, as reapplied after the removal of the white paint with which Malone had the bust covered in 1793, must be attributed a good deal of the wooden appearance which is now a shock to many. The bust is of soft stone (not alabaster, as incorrectly stated by the "accurate Dugdale"), but a careful examination of the work reveals no sign of the alleged breakage and restoration or repARATION to which some writers have attributed the apparently inordinate length of the upper lip. As a matter of fact the lip is not long; it is less than seven-eighths of an inch: the appearance is to a great extent an optical illusion, the result partly of the smallness of the nose and, especially, of the thinness of the moustache that shows the flesh above and below. Some repair was made to the monument in 1649, and again in 1748, but there is no mention in the church records of any meddling with the bust itself. Owing, however, to the characteristic inaccuracy of the print by one of Hollars' assistants in the illustration of Dugdale's *Antiquities of Warwickshire* (p. 688), the first edition of which was published in 1656, certain writers have been misled into the belief that the whole monument and bust were not merely restored but replaced by those which we see to-day. As other prints in the volume depart grossly from the objects represented, and as Dugdale, like Vertue (whose meticulous accuracy has also been baselessly extolled by Walpole), was at times demonstrably loose in his descriptions and presentations, there is no reason to believe that the bust and the figures above it are other than those originally placed in position. Other engravers, following the Dugdale print, have further stylified the original, but as they (Vertue, Grignon, Fournier, and others) differ among themselves, little importance need be attached to the circumstance. A
warning should be uttered against many of the so-called "casts" of the busts. George Bullock took a cast in 1814 and Signor A. Michele another about forty years after, but those attributed to W. R. Kite, W. Scouler, and others, are really copies, departing from the original in important details as well as in general effect. It is evident that many persons derive incorrect impressions of the bust itself.

Mention should here be made of the "Kesselstadt Death Mask," now at Darmstadt, as that has been claimed as the true death-mask of Shakespeare, and by it the authenticity of other portraits has been gauged. It is not in fact a death-mask at all, but a cast from one and probably not even a direct cast. In three places on the back of it is the inscription—AD 1616; and this is the sole actual link with Shakespeare. Among the many rapturous adherents of the theory was William Page, the American painter, who made many measurements of the mask and found that nearly half of them agreed with those of the Stratford bust; the greater number which do not are conveniently attributed to error in the sculptor. The cast first came to light in 1849, having been searched for by Dr. Ludwig Becker, the owner of a miniature in oil or parchement representing a corpse crowned with a wreath, lying in bed, while on the background, next to a burning candle, is the date—A0 1637. This little picture was by tradition asserted to be Shakespeare, although the likeness, the death-date, and the wreath are all points unmistakably to the poet-laureate Ben Jonson. Dr. Becker had purchased it at the death-sale at Mainz of Count Kesselstadt in 1847, in which also "a plaster of Paris cast" (with no suggestion of Shakespeare then attached to it) had appeared. This he found in a broker's rag-shop, assumed it to be the same, recognized in it a resemblance to the picture (which most persons cannot see) and so came to attribute to it the enormous historical value which it would, were his hypothesis correct, unquestionably possess. In searching for the link of evidence necessary to be established, through the Kesselstadt line to England and Shakespeare, a theory has been elaborated, but nothing has been proved or carried beyond the point of bare conjecture. The arguments against the authenticity of the cast are strong and cogent—the chief of which is the fact that the skull reproduced is fundamentally of a different form and type from that shown in the Droushout print—the forehead is receding instead of upright. Other important divergencies occur. The handsome, refined, and pleasing aspect of the mask accounts for much of the favor in which it has been held. It was believed in by Richard Owen, and was long on view in the British Museum, and was shown in the Stratford Centenary Exhibition in 1864. The "Droushout print" derives its importance from its having been executed at the order of Heminge and Condell to represent, as a frontispiece to the Plays, and put forth as his portrait, the man and friend to whose memory they paid the homage of their risky enterprise. The volume was to be his real monument, and the work was regarded by them as a memorial erected in a spirit of love, piety, and veneration. Mrs Shakespeare must have seen the print; Ben Jonson extolled it. His dedicatory verses, however, must be regarded in the light of conventional approval as commonly expressed in that age of the performances of portrait-engravers and habitually inscribed beneath them. It is obvious, therefore, that in the circumstances an authentic portrait must necessarily have been the basis of the engraving; and Sir George Scharf, judging from the contradictory lights and shadows in the head, concluded that the original must have been a limning—more or less an outline drawing—which the youthful engraver was required to put into characteristic, though the Kesselstadt line to partial success. That this is the case is proved by the so-called "unrecorded" discovered by Halliwell-Phillips, and now in America. Another copy of it, also an early proof but not in quite the same "state," is in the Bodleian Library. No other example is known. In this plate the head is far more human. The nose is here longer than in the bust, but the bony structure corresponds. In the proof, moreover, there is a thin, wiry moustache, much widened in the print as used; and in several other details there are important divergencies. In this engraving by Droushout the head is far too large for the body, and the dress—the costume of well-to-do persons of the time—is absurdly out of perspective: a traditional argument that the unpractised engraver had only a drawing of a head to work from, while for the head shows the individuality of portraiture the body is as clearly done of chic. The first proof is conclusive evidence against the contention that the "Flower Portrait" at the Shakespeare Memorial Museum, Stratford-on-Avon—the gift of Mrs Charles Flower (1895) and boldly entitled the "Droushout original"—is the original painting from which the engraving was made, and is therefore the actual life-portrait for which Shakespeare sat. This view was entertained by many connoisseurs of repute until it was pointed out that in the engraving it had been engraved from it, would have resembled it in all particulars, for the engraver would have merely copied the picture before him. Instead of that, we find that several details in the proof—the incorrect illumination, the small moustache, the shape of the eyebrow and of the deformed ear, &c.—have been corrected in the painting, in which further improvements are also imported. The conclusion is therefore irresistible. At the same time the picture may possibly be the earliest painted portrait in existence of the poet, for so far as we can judge of it in its present condition (it must have undergone some modification) it was probably executed in the earlier half of the 17th century. The inscription—"Wihl Shakespeare, 1609"—is suspect on account of being written in cursive script, the only known example at the date to which it professes to belong. If it were authentic it might be taken as showing us Shakespeare's appearance seven years before his death, and fourteen years before the publication of the Droushout print. The former attribution of it to Cornells Janssen's brush has been abandoned—it is the work of a comparatively unskilful craftsman. The picture's pedestal cannot definitely be traced back, but that is of little importance, as plausible pedigree have often been manufactured to bolster up the most obvious impostures. The most interesting of this copies or adaptations of this portrait is perhaps that by William Blake now in the Manchester Corporation Art Gallery. One of the cleverest imitations, if such it be, of an old picture is the "Buttery" or "Ellis portrait," acquired by an American collector in 1902. This small picture, on panel, is very poor judged as a work of art, but it has all the appearance of age. In this case the picture is in existence of the dress has been altered, and Shakespeare's shield is shown not the background. The head is that of a middle-aged man; the moustache, conformity to the loyal type, is drooping. It is curious that the "Thurston miniature" from the Droushout print gives the moustache of the "proof." Two other portraits of the same character of head and arrangement are the "Ely Palace portrait," and the "Fenton portrait," both of which in their time have had, and still have, convinced believers. The "Ely Palace portrait" was discovered in 1845 in a broker's shop, and was bought by Thomas Turton, bishop of Ely, who died in 1864, when it was bought by Henry Graves and by him presented to the Birthplace. An unsatisfactory statement of its history, similar to that of many other portraits, was put forth; the picture must be judged on its merits. It bears the inscription "E 30 + 1603," and it shows a moustache and a right eyebrow identical with those in the Droushout "proof." It was therefore hailed by many competent judges as the original of the print; by others it was dismissed as a "make-up"; at the same time it is very far from being a proved fraud. Supposing both it and the "Flower portrait" to be genuine, this picture, which came to light long before the latter, antedates it by six years. Judged by the test of the Droushout "proof" it must have preceded it, not the other way. The "Fenton portrait," which made its first appearance in 1702, had the valiant accomplishment of the astute and cynical Steevens, of Britton, Drake, and other authorities, as the original of the Droushout print, while a few—who believed in the "Chandos portrait"—denounced it as a "rank forgery." On the back of the panel was boldly traced in a florid hand "Gul. Shakespear 1597 R.B." (by other reads "R.N.").

R.B. is correct, it is contended the initials indicate Richard Burbage, Shakespeare's fellow-actor. Traces of the writing may still be detected. Boarden's copy, made in 1792, repeating the inscription on the back, has "Gull Shakespeare 1597 R.N." The spelling of Shakespeare's name—which in succeeding ages has been governed by contemporary fashion—has a distinct bearing on the authenticity of the panel. At the first appearance of the "Felton portrait," in a London sale-room it was bought by Samuel Felton of Drayton, Shropshire, for five pounds, along with a pedigree which carried its refutation along with it. Nevertheless, it bears evidence of being an honest painting done from life, and is probably not a make-up in the sense that most of the others are. It fell into the hands of Richardson the printseller, who inserted it among engravings of it by Trotter and others (by which it is best known), causing the characteristic lines of the shoulders to be altered, so that it is set upon a body attired in the Droeshout costume, which does not appear in the picture; and then, arguing from this falsely-introduced costume, the publisher maintained that the work was the original of the Droeshout print and therefore a life-portrait of Shakespeare. Thus foisted on the public it enjoyed for years a great reputation, and no one seems to have recognized that with its down-turned moustache it agrees with the inaccurate print after the Droeshout engraving which is published in all editions of Shakespeare in 1790, i.e., two years before the discovery of the Felton portrait! The "Napier portrait," as the excellent copy by John Boarden is known, has recently been presented to the Shakespeare Memorial. Josiah Boydell also made a copy of the picture for George Steevens in 1797. Quite a number of capital miniatures from it are in existence. With these should be mentioned a picture of a similar type discovered by Mr. M. H. Spielmann in 1905. Finding a wretched copy of the Chandos portrait executed on a panel about three hundred years old, he had the century-old paint cleaned off in order to ascertain the metal of the forge. Of course, supporting the Chandos likeness under the action of the spirit another portrait of Shakespeare was found beneath, irretrievably damaged but obviously painted in the 17th century. At the time of the "fake" only portraits of the Chandos type were salable, and this would account for the wanton destruction of an interesting work which was probably executed for a publisher—likely enough for Jacob Tonson—but not used. Early as it is in date it can make no claim to be a life-portrait.

The "Janssen portrait," "Somerset Collection," is in many respects the most interesting published likeness of Shakespeare, and undoubtedly the finest of all the paintings in the series. It is certainly a genuine as well as a very beautiful picture of the period, and bears the inscription "1610, but doubt has been expressed whether the 6 of 16 has not been tampered with, and whether it was not originally an 0 and altered to fit Shakespeare's age. It was made known through Earlam's rare mezzotint of it, but the public knowledge of it has been mainly founded on Cooper's and Turner's beautiful but misleading mezzotint plates until a photograph of the original was published for the first time in 1900 (in The Connoisseur) by permission of the owner, the Lady Guendolen Ramsden, daughter of the duke of Somerset, the former owner of the picture. The resemblance to the main forms of the death-mask is undoubted; but that is of little consequence as confirmation unless the mask itself is supported by something beyond vague conjectures. Charles Jennens, the wealthy and eccentric amateur editor of the poor edition of King Lear issued in 1770, was the first known owner, but vouchsafed no information of its source and shrank from the challenge put to his reputation. Of its excellence and originality of this portrait there is no question; it is more than likely that Jennens was the author of it; but that it was intended to represent Shakespeare is still to be proved. A number of good copies of it exist, all but one (which enjoys a longer pedigree) made in the 18th century: the "Croker Janssen," now lost, unless it be that of Lord Darnley's; the "Staunton Janssen," the "Buckton Janssen," the "Marsden Janssen," and the copy in the possession of the duke of Anhalt. These are all above the average merit of such work.

The portrait which has made the most popular appeal is that called the "Chandos," formerly known as the "D'Avenant," the "Stowe," and the "Ellesmere," according as it passed from hand to hand; it is now in the National Portrait Gallery. Tradition, tainted at the outset, attributes the authorship of it to Richard Burbage, although it is impossible that the painter of the head in the Dulwich Gallery could have produced a work so good in technique; and Burbage is alleged to have given it to his fellow-actor Joseph Taylor, who bequeathed it to Sir William d'Avenant, Shakespeare's godson. As a matter of fact, Taylor died intestate. Thenceforward, whether or not it belonged to d'Avenant, its history is clear. At the great Stowe sale of the effects of the duke of Buckingham and Chandos (who had inherited it) the earl of Ellesmere bought it and then presented it to the nation. Many serious inquirers have refused to accept this romantic, swarthy, Italian-looking head here depicted as a likeness of Shakespeare of the Midlands, if only because in every important physiognomical particular, and in face-measurement, it is contradicted by the Stratford bust and the Droeshout print. It is to be noted, however, that judged by the earlier copies of it—which agree in the main points—this Chandos likeness of Shakespeare complained of may be due to the restorer. As Chauncey, the "burden of trust," the Chandos portrait was sold at the sale-room of the Fortnum and Mason (by whom it had been purchased) and subsequently to W. C. Brunton by the fine copy painted by Sir Godfrey Kneller, and by him presented to John Dryden. The poet acknowledged the gift in his celebrated Fourteenth Epistle, written after 1691 and published in 1694, and containing the passage beginning, "Shakespeare, thy gift, I place before my sight; With awe I ask his blessing ere I write." D'Avenant had died in 1668, and so could not, as tradition contends was the case, have been the donor. In Malone's time the picture was already in the possession of the earl Fitzwilliam. This at least proves the esterine that the Chandos portrait was held so far back as the end of the 17th century, three quinquennia after Shakespeare's death.

From among the innumerable copies and adaptations of the Chandos portrait a few emerge as having a certain importance of their own. That which Sir Joshua Reynolds is traditionally said to have made for the use of Roubillac, then engaged in his statue of Shakespeare for David Garrick (now in the British Museum), and another alleged to have been done for Bishop Newton, are now lost. That by Ranelagh Barrett was presented in 1799 to Trinity College Library, Cambridge, by the Shake-
adhering to his modified type, executed three beautiful but inaccurate miniatures from the picture, one of which is in the Garrick Club, and the others in private hands.

The "Lumley portrait" is in type a curious blend of the faces in the Chandos portrait and the Droschout print, with a dash of the "Auriol miniature" (see later). It represents a heavy-jowled man with pursed-up lips, and with something of the expression but little of the virility of the Chandos. It is, however, to be indicated though not actually mentioned in the Lumley sale catalogues of 1785 and 1807, it was only when it came into the possession of George Rippon, presumably about the year 1848, that it was brought to the notice of the world, and additional attention was secured by the owner's contention that it was the original of the Chandos. It is claimed that the picture originally belonged to the portrait collector John, Lord Lumley, of Lumley castle, Durham, who died in 1600, and descended to Richard, the 4th earl of Scarborough, and George Augustus, the 5th earl, at whose respective sales at the dates mentioned it was put up to auction. On the first occasion it was bought in, and on the second it was acquired by George Warters. It is to be observed, however, that it does not appear by name in the early inventory, and it is unconvincingly claimed that it was mistakenly entered as Chaucer, a portrait of whom is mentioned. When in the possession of George Rippon the picture was so superbly chrome-lithographed by Vincent Brooks that copies of it, mounted on old panel or canvas, and varnished, have often changed hands as original paintings. This phenomenon was indeed in possession of John, Lord Lumley, we have here a contemporary portrait of Shakespeare, and the fact that it is an amateur performance would in no way invalidate the claim. It is thinly painted and scarcely looks the age that is claimed for it; but it is an interesting work, which, in 1875, entered the collection of the late Baroness Burdett-Coutts.

To Frederigo Zuccaro are attributed three of the more important portraits now to be mentioned; upon him also have been foisted several of the more impudent fabrications herein named. The "Bath" or "Archer portrait"—it has long been the possession of the Bath Librarian, Archer, when attention was first drawn to it in 1859—is worthy of Zuccaro's brush. It is Italian in feeling, with an inscription ("W. Shakespear") in an Italian but apparently more modern hand. The type of head, too, is Italian, and it is curious that in certain respects it bears some resemblance not only to the Chandos, and to the Droschout and Janssens portraits, but also to the "death-mask"; yet it differs in essentials from all. Certain writers have affirmed that Reynolds in one of his Discourses expressed his faith in the picture; but the alleged passage cannot be identified. This opinion was indeed in possession of John, Lord Lumley, it is an amateur contemporary portrait of Shakespeare, and the fact that it is an amateur performance would in no way invalidate the claim. It is thinly painted and scarcely looks the age that is claimed for it; but it is an interesting work, which, in 1875, entered the collection of the late Baroness Burdett-Coutts.

The "Cosway Zuccaro portrait" is now in America; but the reproduction of it exists in England in the miniature of it by Cosway's pupil, Charlotte Jones, as well as in the rare mezzotint by Hana Greene. The picture is alleged to have disappeared from the possession of Richard Cosway; it was sold in his sale, however, and passed through the hands of Lionel Booth and of Augustus Daly. No time anciently imagined that it is intended for a portrait of the poet. It is far more like Shelley (somewhat caricatured, especially as to the cat-like eyes and the Mephistophelian eyebrows) or Torquato Tasso. The attribution to Zuccaro is absurd, yet Cosway and Sir Charles Eastlake believed in it. The inscription on the back, "Guglielm: Shakespear," with its mixture of Italian and English, resembles in wording and spelling that adopted in several of the case admitted "fakes." No attempt at discovering the history of the picture was ever made, but there is no doubt that at the beginning of the 19th century it was widely credited; Wittell and others attributed it to Lucas Franchois. It is said to be well painted, but the copies show that it is ill drawn. The miniature by Charlotte Jones, a fashionable artist in her day, is pretty and weak, but well executed; it was painted in 1833.

Of the "Burdett-Coutts portrait" (the fourth interesting portrait of Shakespeare in the possession of Mr Burdett-Coutts) there is no history whatever to record. No name has been suggested for the artist, but the hands and accessories of dress strongly resemble those in the portrait of Elizabeth Hardwick, courteous and tasteful in design, but not so refined, and the ruff, painted with extreme care, reveals a pentimento. The picture is admirably executed, but the face is weak and is the least satisfactory part of it; especially feeble is the ear with the ring. Shakespeare's shield, crest, with red mantling, which appear co-temporary with the rest, and the figures "37" beneath it, appear on the background, in the manner adopted in 17th-century portraits. From this picture the "Craven portrait" seems to have been "faked."

Equally striking is the "Ashbourne portrait," well known through G. F. Storm's engraving of it. It is sometimes called the "Kingston portrait" as the first known owner of it was the Rev. Clement U. Kingston, who issued the engraving in 1847. It is an important three-quarter length, representing a figure in black standing beside a table at the corner of which is a skull whose figure rests his right forearm. It is an acceptable likeness of Shakespeare, in the manner of Paul van Somer, apparently pure except in the ruff. The inscription "STATAS VÆAE. 47, AÆ 1611," and the decoration of cross spears on a book held by the right hand, are also raised from the ground, so that it would be injudicious to decide that these are not of a later date. The same is true of the supposed signature of Zuccaro—"signavit," if we disregard the inadmissible "Hampton Court portrait"—in which Shakespeare is shown wearing a sword-belt and a thumb-ring, and holding a gauntleted glove. The type is that of a refined, fresh-coloured, fair-haired English gentleman. There is no record of the picture before Mr Kingston bought it from a London dealer.

More famous, but less reputable, is the "Stratford" or "Hunt portrait," amusingly exhibited in an iron safe in the Birthplace at Stratford, to which it was presented by W. O. Hunt. The paper work, it is said, has not been ascribed to the Hunt family for many years and represented a black-bearded man. Simon Collins, the picture cleaner and restorer who had cleansed the Stratford bust of Malone's white paint and restored its colours, declaring that another picture was beneath it, was engaged to exercise himself upon it. He removed the top figure from the dilapidated canvas with spirit and found beneath it the painted version of the Stratford bust. At that time Mr Rabone's copy, now at Birmingham, was made; it is valuable as evidence. Then Collins, always a suspect in this matter, proceeded with the restoration, and by treatment of the hair made the portrait more than ever like the bust; and the owner, and not a few others, proclaimed the picture to be the original from which the bust was made. No judge of painting, however, accepts the picture as dating further back than the latter half of the 18th
century—when it was probably executed, among a score of others, about the time of the bicentenary of Shakespeare's birth, an event which gave rise to much celebration. The ingenious but entirely unconvincing explanations offered to account for the state in which the picture was found need not be recounted here.

The "Duke of Leopold portrait," now at Bost Castle, has been for many years in the family, but the circumstances of its provenance are unknown. It has been thought possible that this is the lost portrait of which John Evelyn speaks as having been in the collection of Lord Chancellor Clarendon, the companion picture to that of Chaucer; but no evidence has been adduced to support the conjecture. It represents a handsome, fair man, with auburn beard, with an expression recalling the Jansen portrait; the nose, however, is quite different. He wears a standing "wired band," as in the Droeshout print. It is a workmanlike piece of painting, but there is nothing in the picture to connect it with Shakespeare. The same may be said of the "Welcome portrait," which was bought by Mark Philips of Welcombe and descended to Sir George Trevelyan. It is a fairly good picture, having some resemblance to the "Boston Zuccaro" with something of the Chandos. The figure, a half-length, wears a falling spiked collar edged with lace, and from the ear a love-lace, the traces of which only are left. Two other portraits at the Shakespeare Memorial should be named. The "Venice portrait," which was bought in Paris and is said to have come from Venice, bears an Italian undercircumstance of the existence of the picture, which at that time belonged to a nobleman artist with Shakespeare an oval. It is manifestly meant for Shakespeare, but the head as nearly resembles the head of Christ at Lille by Charles Delafosse (1636–1716) who also painted pictures in England. Gerard Soest was not born until 1637, and according to Granger the picture was painted in Charles II.'s reign. It is a pleasing but weak head, possibly based on the Chandos. The whereabouts of the picture is unknown, unless it is that in the possession of the Earl of Craven. A number of copies exist, two of which are at the Shakespeare Memorial. Simon's print was the first announcement of the existence of the picture, which at that time belonged to an obscure painter, F. Wright of Covent Garden.

The "Charlecote portrait," which was exhibited publicly at Stratford in 1866, represents a burly, bull-necked man, whose chief resemblance to Shakespeare lies in his baldness and hair, and in the wired band he wears. The former possession of the picture by the Rev. John Lucy has lent it a sort of reputation; but that gentleman bought it as recently as 1853.

Similarly, the "Hampton Court portrait" derives such authority as it possesses from the dignity of its owner and its habitat. William IV. bought it as a portrait of Shakespeare, but without evidence. It is suggested, from the clothing of a gorgeously attired officer in an elaborate tunic of green and gold, with red bombasted trunks, with fine worked sword and dagger pendant from the embroidered belt, and with a falling ruff and laces from his ear, bears some distant resemblance to the Chandos portrait. Above is inscribed, "Ætat. suae. 34." It appears to be the likeness of a blue-eyed soldier; but it has been suggested that the portrait represents Shakespeare in stage-dress—a frequent explanation for the strange attire of quaintly alleged portraits of the poet. A copy of this picture was made by H. Duke about 1850. Similarly unacceptable is the "H. Dukinby Seymour portrait" which has disappeared since it lent to the National Portrait Exhibition of 1866. This is a fine three-quarter length in the Miervelt manner. The dignified bald-headed man has a light beard, brown hair, and blue eyes, and wears white lace-edged falling collars and cuffs over a doublet gold-embroidered with points; and in the left hand holds a black hat. The "Lytton portrait," a royal gift made to Lord Lytton from Windsor Castle, is mainly interesting as having been copied by Mr. G. R. Evans in his original profile engraving of Shakespeare. The "Remnant portrait," and other portraits which belong to the category of capital paintings representing some one other than Shakespeare; and the same may be hazarded, of the "Grafton" or "Winston" portrait, the "Sanders portrait," the "Gillian portrait" (an old man's head impudently advanced), the striking "Thorne Court portrait," the "Aston Cantlow portrait," the "Burn portrait," the "Gwennett portrait," the "Wilson portrait" and others of the class.

Miniature-painting has assumed a certain importance in relation to the subject. The "Welbeck Abbey" and "Harleian miniature" is that which Walpole caused to be engraved by Vertue for Pope's edition of Shakespeare (1723–1725), but which Oldys declared, incorrectly, to be a juvenile portrait of James I. According to Scharf, it belonged to Robert Harley, 1st earl of Oxford, but it is more likely that it was bought by his son Edward Harley in the father's lifetime. It already was in his collection in 1710, but whereto it came is not clear. There has been another small miniature. Pope consented to adopt this very beautiful but entirely unauthenticated portrait, which bears little resemblance to any other accepted likeness (more, however, to the Chandos than to the rest) simply in the hope of uniting Pope and Shakespeare. The miniature measures 2 in. high; Vertue's exquisite engraving, executed in 1721, enlarged it to 5½, and became the "authority" for numerous copies, British and foreign. The "Somerville" or "Hilliard miniature," which has been described as "found in Lord arnald's collection," is claimed to be from Shakespeare's friend, Somerville of Edistone, grandfather of the poet William Somerville. It was first publicly spoken of in 1818 when Sir Walter Scott exhibited it in the National Portrait Gallery, and was taken to be certainly by Hilliard, but although Sir Thomas Lawrence and many distinguished painters and others agreed that it was an original life-portrait of the poet, few will be disposed to give adherence to the theory that the view of it is increased in size. It represents a pale man with flaxen hair and beady eyes; yet in it Burges found "a general resemblance to the best busts (sic) of Shakespeare," and an attempt was made to prove a relationship between Shakespeare and the poet Arden of Trerice (1500–1578), who was born in the same year. The miniature has frequently been exhibited and has figured in important collections on its own merits. The well-known "Auriol miniature," now in America, is one of the least sympathetic and the least acceptable of the Shakespeare miniatures, excellent though it is in technique. It has the forehead and hair of the Chandos, but is utterly devoid of the Shakespeare expression. In the background is an ancient shield, inscribed "1826." It is signed "J. Mackey," and is ascribed to J. Mackey of Edinburgh, who died in 1832. The miniature has for over forty years been in the collection of the Duke of Argyll. Several painted portraits have disappeared, other than those already mentioned; these include the "Earl of Oxford portrait" and the "Challis portrait." The "Countess of Zetland's portrait," which has been well known, is now in the possession of the Earl of Zetland. Not a few of the existent representations of Shakespeare, unauthoritative as they are, were honestly produced as memorial pictures. There is another class, the earnest attempts made to suggest that the figures were worked up from the drawings of the best and most characteristic features of the earliest portraits. The most successful, perhaps, is that by Ford Maddox Brown. In the "William Shakespeare" Corporation of Birmingham, the National Portrait Gallery, and Henry Howard, R.A., take a lower rank. It is to be regretted that Gainsborough did not execute the portrait for Garrick, for which he made serious preparations. The "Booker portrait," which gained great notice in Sir Joshua Reynolds' exhibition of 1768, is now in the possession of Mr. R. C. Shafteley. It is said to have been purchased by Richard Brinsley Sheridan; it has dignity, but the pigment forbids us to allow the age claimed for it. The portraits by P. Krämer and Rumpf are among the best recently executed in Germany. The remarkable pen-and-ink drawings by Minasini and Phillip H. Newman deserve to be remembered.
The "faked" portraits have been at times as ardently accepted as those with some solid claim to consideration. The "Shakespeare Memorial Museum" (a poet's glut, of course) can be repeated, twenty times, as an inscription, was discovered in 1872. It is a genuine Dutch picture of man and wife weighing out money in the foreground—a frequent subject—while through the open door Shakespeare and Prospero are seen as handfasting. And the Shakespeare and the Speed portrait (probably the whole group) are fakes. The "Rawson portrait," inscribed with the name "Shakespeare," is also disputed, and it is generally attributed to Lord Keeper Coventry by Jansen. The "Matthews Alexander portrait" shows a modern head on an old body. The "Bolmont Hall portrait" with its pseudo-Garrick MS. inscription on the back, is the best known in writer's opinion, not the genuine one which it claims to be. It represents the poet looking up from his literary work. In the early part of the 19th century two clever "restorers," Holder and Zuckke, made a fake lucrative hit by fabricating supposed portraits of Shakespeare (as of Oliver Cromwell, and Nell Gwynn) and the clumsiness of most of them did not impede a ready sale. The way in which they imposed upon scholars as well as on that hand. As many of these impudent impostures won wide acceptance, sometimes by the help of the fine engravings which were made of them. Such are the "Stace" and the "Dundorf portraits"—so named after the unscrupulous dealers who put them forward and promulgated them. They have both disappeared, but of the latter a copy is still in existence known as the "Dr. Clay portrait." The former is based upon the portrait of Robert Carr, Earl of Somerset, and is a bad imitation; and the name may be given to our "Bishop Newton," the "Cygnus Avonius," the "Norwich" or "Boardman," the "Bellows" or "Talma" portraits—most of them, as well as others, traceable to one or other or both of the enterprising fakers. Holbein, which is the oldest of the reproduction evidence, with verses supposed to issue from the pen of Ben Jonson. These are all to be attributed to one ready pseudo-Elizabethan writer whose identity is known. With these pictures a critic should be armed with a copy of William Blake, and an article by Mr. Willson, purporting to represent Shakespeare and Ben Jonson playing chess.

The three portraits "are not less numerous. The 18th-century small full-length "Willett portrait" is at the Shakespeare Memorial. It is a charmingly touched-in little figure. There are many representations of the poet in his study in the act of composition—they include those by Faed, R.A., Sir George Harvey, R.S.A., C. Bestland, B. J. N. Geiger, and the painter of the Warwick Castle picture, &c.; others have for subject Shakespeare reading, either to the Court or to his family, as by John Wood, E. Ender, W. Westall, &c.; and for the infancy and childhood of Shakespeare, by George Romney (three pictures); T. Stockard, R.A., John Wood, James Sant, R.A.; Shakespeare before Sir Thomas Lucy, by Sir G. Harvey, R.S.A.; Thomas Brooks, A. Chisholme, &c.; These, and kindred subjects such as "Shakespeare's Courtship," have provided infinite material for the industry and ingenuity of Shakespeare-loving painters.

The less important records of work and wood are numerous—amounting to many hundreds—that it is impossible to deal with them here; but one or two must be referred to, as they have genuine importance. The best known is the figure of Shakespeare in a portrait by John Payne (fl. 1620, the pupil of Simon Pass and one of the first English engravers who achieved distinction); but no such print has even been found and its existence is doubted. Walpole produced a copy of the portrait, and there is a group of woodcuts, an reduced version of the Droueshout, which was published as frontispiece to the spurious edition of Shakespeare's poems (1640). It is great in the portrait an expert eyes unrecognizable as a copy, was made from it in 1815, and another later. William Faithorne (d. 1691) is credited with the frontispiece to Quarto's edition of "The Rape of Lucrece," by William Shakespeare, 1634 (1655). It was copied from R. Sawyer and republished in 1819. It represents the tragic scene between Tarquin and Lucrece, and above is an oval medallion, being a rendering of the Droueshout portrait reversed. The earliest engravings from the Chansons pale, however, upon the firmness of the portrait of Shakespeare, and that by M. (father of G.) van der Gucht are introduced into a pleasing composition. The same elaborate design was adopted by L. van der Gucht. These, with Vivere's earliest prints, look to the left; subsequent versions are reversed. Perhaps the most celebrated, partly because it was the most important and technically the finest, up to that time, is the large engraving (to the right) by John Martin (1786). The "Persons of Great Britain," published by T. and J. Knapton (1747-1752). This free rendering of the Chansons portrait is the parent of the famous copy known as the "Houbraken type." Since that date, many plates of a high order, from the Houbraken type, have been issued, many of them extremely inaccurate.

Numerous portraits in stained glass have been inserted in the windows of Shakespeare memorials. They are characteristic of the Chansons windows by Franz Mayer (Mayer & Co.) at Stationers' Hall, and in St Helens, BishopsGate (Professor Blain); and that of the Droueshout type in the great hall of the City of London school. Ford Madox Brown's design is one of the best ever executed.

We now come to the sculptured memorials. After Gerard Johnson's bust no statuary portrait was executed until 1746, when Byrd made the bust for Mr. Fourth's 'to diversity' subscription, mainly through the enthusiastic activity of the earl of Burlington, Dr Richard Mead, and the poet Pope. It was designed or "invented" by William Kent and modelled and carried out by Peter Scheemakers, a pupil of Houdon, the sculptor of John and his wife. "Many people claimed that 

the bead and the head with its inconspicuous head—may be credited to the former, and what is excellent to the latter. It is of note the bust (London, in the London, in the Statue), is signed by the sculptor, and the head by Peter Scheemakers, pupil, the London Museum, and is, by J. G. Stradon, on the pedestal, and the latter was set up in the City of London. The bust and the head, in the portrait of Shakespeare, is, by Fontana, a gift to London by Baron Albert Grant. Busts were executed by Scheemakers, founded on the same portrait. One is still at Stowe in the "Temple of British Worthies," and in Lord Colham's possession is that presented by Pope to Lord Lyttleton. Some very fine engravings of the monument have been produced, the most important that in Boydell's Shakespeare (larger edition). By L. F. Roubiliac, Cheere's portrait, is the statue which in 1768 David Garrick commissioned him to carve and which he bequeathed to the British Museum. It is also based upon the Shakespeare portrait. The terra-cotta model for the statue is in the Victoria and Albert Museum. A second portrait, the bust, to Roubiliac also must be credited the"D'Avnent Bust" of blackened terra-cotta in the possession of the Garrick Club. This fine work of art derives its name from having been found blackened in the attic of the old club. The bust of Shakespeare, which 180 years before was d'Avnent's, but which afterwards passed through various vicissitudes. It was again adapted for theatrical purposes by Gifford, for whom this bust, together with one of Jonson which was set up at the moment of discovery must have been modelled by the sculptor, who at the same time was engaged on Garrick's commission. The model for the British Museum statue is still in the possession of the Shakespeare Memorial, now in the National Portrait Gallery. Another portrait of Shakespeare is in Westminster Abbey—a medallion based on the Chansons picture, introduced into Webber's rather fantastic monument to David Garrick in Coventry Church. Another portrait of Shakespeare, by J. Banks, R.A., between the Genii of Painting and the Drama, is now in the garden of New Place, Stratford-on-Avon. It was executed for Mr. Holte Bracebridge, by the sculptor in Pall Mall, and was presented to the British Institution which which occupied the premises; on the dissolution of that body it was given to Stratford by Mr Holte Bracebridge. It is a fine thing, but the likeness adheres to no clearly specified type. It has been excellently engraved in line by James Stow, B. Smith, and others, and was reproduced on the admirable medal by Kitcher, preserved by Boydell to every subscriber to his great illustrated edition of Shakespeare. The model of Shakespeare's tomb, executed by Banke's, was the first British hand to model a portrait of the poet.

In more recent times numerous attempts have been made to re-construct the Shakespearean memorial group. The most ambitious of these is the elaborate memorial group modelled and presented by Lord Ronald Sutherland Gower to Stratford and set up outside the Memorial Theatre in 1888. The large seated figure of Shakespeare is to be seen today in the art critic's opinion. A group of recumbent figures of Hamlet, Lady Macbeth, Prince Henry, and Falstaff, in 1864 J. E. Thomas modelled the colossal group of Shakespeare with attendant figures of Comedy and Tragedy that was erected in the gardens of the Crystal Palace, and in the same year Charles Bacon produced his colossal Centenary Bust, a reproduction of which forms the frontispiece to John H. Routh's "Shakespeare: His Inner Life" (1865). The chief statues, single or in a group, in London still to be mentioned are the following: that by H. H. Armstead, R.A., in marble, on the southern podium of the Albert Memorial; by Hamo Thornycroft, R.A. (1871), on the Poets' Fountain in Park Lane; by Messrs C. and G. C. A. M. (1895), on the Royal Institute of Art, London; and by F. E. Schenck, a seated figure, on the façade of the Hammersmith Public Library. The Droueshout portrait is the basis of the head in the bronze memorial by Professor Landon, erected in two parts in the city of London. The life-size statue of Sir Henry Raymond (1909) and of the excellent bust by Mr C. J. Allen in the churchyard of St Mary the Virgin, Aldermarbury, in memory of Hensme and Carrington. A. Revell, the sculptor. This statue was in preparation in 1910 for erection in the south aisle of Southwark Cathedral. Among statues erected in the provinces are those by Mr H. Pegram, A.R.A., in the building of Birmingham University (1884), by M. G. Cheere, on the Crimean Memorial at the New University building. Several statues of importance have been erected in other countries. The statue by M. Paul Fournier in Paris (presented by an English resident) is in the garden of the Hotel de Ville, Avenue de Messine (1888). The seated marble statue by Professor O. Lessing was set up in Weimar by the German Shakespeare Society; the sculptor has also modelled a couple of busts of a very personal
