INITIALS USED IN VOLUME XXIV. TO IDENTIFY INDIVIDUAL CONTRIBUTORS,¹ WITH THE HEADINGS OF THE ARTICLES IN THIS VOLUME SO SIGNED.

    Radcliffe Observer, Oxford. Professor of Astronomy in the University of Dublin and Royal Astronomer of Ireland, 1892-1897.

    Sub-Librarian of the Bodleian Library, Oxford, and Fellow of Magdalen College.

A. C. G. Albert Charles Lewis Gotthilf Guenther, M.A., M.D., Ph.D., F.R.S.

A. E. J. Arthur Ernest Jolliffe, M.A.
    Fellow, Tutor and Mathematical Lecturer, Corpus Christi College, Oxford. Senior Mathematical Scholar, 1892.

A. F. L. Arthur Francis Leach, M.A.
    Barrister-at-Law, Middle Temple. Charity Commissioner for England and Wales. Formerly Assistant-Secretary of the Board of Education. Fellow of All Souls' College, Oxford, 1874-1881. Author of English Schools at the Reformation; &c.

A. F. P. Albert Frederick Pollard, M.A., F.R.Hist.S.

A. Ge. Sir Archibald Geikie, K.C.B.
    See the biographical article: Geikie, Sir Archibald.

A. Go.* Rev. Alexander Gordon, M.A.
    Lecturer in Church History in the University of Manchester.

    See the biographical article: Sayce, A. H.

    General in the Persian Army. Author of Eastern Persian Iraq.

    Professor of New Testament and Church History, Yorkshire United Independent College, Bradford. Sometime Registrar of Madras University, and Member of Mysore Educational Service.

A. L. Andrew Lang, LL.D.
    See the biographical article: Lang, Andrew.

A. M.* Rev. Allan Menzies, D.D.
    Professor of Divinity and Biblical Criticism, St Mary's College, St Andrews. Author of History of Religion; &c. Editor of Review of Theology and Philosophy.

A. M. Cl. Agnes Muriel Clay (Mrs Wilde).
    Formerly Resident Tutor of Lady Margaret Hall, Oxford. Joint-author of Sources of Roman History, 133-70 B.C.

A. N. Alfred Newton, F.R.S.
    See the biographical article: Newton, Alfred.

¹ A complete list, showing all individual contributors, appears in the final volume.

1993
INITIALS AND HEADINGS OF ARTICLES

A. No.  Adolf Gottfried Noreen, Ph.D.
Professor of Scandinavian Languages at the University of Upsala. Author of "Geschichte der Nordischen Sprachen; Altsächsische und Altnorwegische Grammatik;" &c.

A. S. P.-P.  Andrew Sethi Pringle-Pattison, M.A., LL.D., D.C.L.
Professor of Logic and Metaphysics in the University of Edinburgh. Gifford Lecturer in the University of Aberdeen, 1911. Fellow of the British Academy. Author of "Man's Place in the Cosmos; The Philosophical Radicals;" &c.

Head of Banking Firm of Bradford Rhodes & Co. Founder and First President of 34th Street National Bank, New York.

Formerly Librarian of Girton College, Cambridge.

C. A. G. E.  Sir Cyprian Arthur George Bridge, G.C.B.
Admiral, Commander-in-Chief, China Station, 1901-1904. Director of Naval Intelligence, 1889-1894. Author of "The Art of Naval Warfare; Sea-Power and other Studies;" &c.

Vice-Chancellor of Sheffield University. Formerly Fellow of Trinity College, Oxford. H.M.'s Commissioner and Commander-in-Chief for the British East Africa Protectorate; Agent and Consul-General at Zanzibar; Consul-General for German East Africa, 1900-1904.

C. F. A.  Charles Francis Atkinson.
Formerly Scholar of Queen's College, Oxford. Captain, 1st City of London (Royal Fusiliers). Author of "The Wilderness and Cold Harbour.

C. F. B.  Charles Francis Bastable, M.A., LL.D.
Regius Professor of Laws and Professor of Political Economy in the University of Dublin. Author of "Public Finance; Commerce of Nations; Theory of International Trade;" &c.

Jesus College, Cambridge. Formerly Divisional Resident and Member of the Supreme Council of Sarawak. Knight of the Prussian Crown. Author of "A Descriptive Account of the Mammals of Borneo;" &c.

C. H.  Sir Charles Holroyd.
See the biographical article: Holroyd, Sir C.

C. H.  Carlton Huntley Hayes, A.M., Ph.D.
Assistant Professor of History in Columbia University, New York City. Member of the American Historical Association.

Chief Officer, London Salvage Corps. President of Association of Professional Fire Brigade Officers. Vice-President of National Fire Brigades Union; &c.

Assistant-Secretary to the Board of Education. Author of "Life of Henry V." Editor of "Chronicles of London, and Stow's Survey of London.

C. M.  Carl Theodor Miraß, D.Th.
Professor of Church History in the University of Marburg. Author of "Publizistik im Zeitalter Gregors VII.; Quellen zur Geschichte des Papstthums;" &c.

C. M.  Cephdilile Mjatovikh.
Senator of the Kingdom of Servia. Envoy Extraordinary and Minister Plenipotentiary of the King of Servia to the Court of St James, 1895-1900 and 1902-1903.

C. M. W.  Sir Charles Moore Watson, K.C.M.G., C.B.

C. P.  Christian Pfister, D.-é-L.
Professor at the Sorbonne, Paris. Chevalier of the Legion of Honour. Author of "Études sur le règne de Robert le Pieux.

Professor of Modern History in the University of Birmingham. Formerly Fellow of Merton College, Oxford, and University Lecturer in the History of Geography, Lehnin Przegaz, Oxford, 1889. Lowell Lecturer, Boston, 1908. Author of "Henry the Navigator; The Dawn of Modern Geography;" &c.

Major-General (retired). Assistant Military Secretary, Headquarters of the Army, 1890-1892. Lieut.-Governor and Secretary, Royal Military Hospital, Chelsea, 1895-1898. Author of "Strategy of the Peninsular War;" &c.

ST ELMO’S FIRE, the glow accompanying the slow discharge of electricity to earth from the atmosphere. This discharge, which is identical with the “brush” discharge of laboratory experiments, usually appears as a tip of light on the extremities of pointed objects such as church towers, the masts of ships, or even the fingers of the outstretched hand: it is commonly accompanied by a crackling or fizzing noise. St Elmo’s fire is most frequently observed at low levels through the winter season during and after snowstorms.

The name St Elmo is an Italian corruption through Sant’ Ermo of St Erasmus, a bishop, during the reign of Domitian, of Formiae, Italy, who was broken on the wheel about the 2nd of June 304. He has ever been the patron saint of Mediterranean sailors, who regard St Elmo’s fire as the visible sign of his guardianship. The phenomenon was known to the ancient Greeks, and Pliny in his Natural History states that when there were two lights sailors called them Castor and Pollux and invoked them as gods. To English sailors St Elmo’s fires were known as “corposants” (Ital. corpo santo). See Hazlitt’s edition of Brand’s Antiquities (1905) under “Castor and Pollux.”

ST EMILION, a town of south-western France, in the department of Gironne, 2½ m. from the right bank of the Dordogne and 27 m. E.N.E. of Bordeaux by rail. Pop. (1906), town, 1901; commune, 3546. The town derives its name from a hermit who lived here in the 7th and 8th centuries. Picturesquely situated on the slope of a hill, the town has remains of ramparts of the 12th and 13th centuries, with ditches hewn in the rock, and several medieval buildings. Of these the chief is the parish, once collegiate, church of the 12th and 13th centuries. A Gothic cloister adjoins the church. A fine belfry (12th, 13th and 15th centuries) commanding the town is built on the terrace, beneath which are hollowed in the rock the oratory and hermitage of St Emilion, and adjoining them an ancient monolithic church of considerable dimensions. Remains of a monastery of the Cordeliers (15th and 17th centuries), of a building (13th century) known as the Palais Cardinal, and a square keep (the chief relic of a stronghold founded by Louis VIII.) are also to be seen. Disused stone quarries in the side of the hill are used as dwellings by the inhabitants. St Emilion is celebrated for its wines. Its medieval importance, due to the pilgrimages to the tomb of the saint and to the commerce in its wines, began to decline towards the end of the 13th century owing to the foundation of Libourne. In 1272 it was the first of the towns of Guyenne to join the confederation headed by Bordeaux.
SAINTES—ST ÉTIENNE

SAINTES-PALAYE, JEAN BAPTISTE LA CURNE (OF LACURNE) DE (1697–1781), French scholar, was born at Auxerre on the 6th of June 1697. His father, Edme, had been gentleman of the bed-chamber to the duke of Orleans, brother of Louis XIV, Saint-Palaye had a twin brother to whom he was greatly attached, refusing to marry so as not to be separated from him. For some time he held the same position under the minister of Orleans, and under the duke of Orleans. He had received a thorough education in Latin and Greek, and had a taste for history. In 1724 he had been elected an associate of the Académie des Inscriptions et Belles-Lettres, merely from his reputation, as nothing had been written by him before that date. From this time he devoted himself exclusively to the work of this society. After having published numerous memoirs on Roman history, he began a series of studies on the chronicles of the middle ages for the Historiens des Gaules et de la France (edited by Dom Bouquet): Raoul Glaber, Helgada, the Gestes of Louis VII, the chronicle of Mornigay, Rigord and his continuator, William le Breton, the monk of St Denis, Jean de Venette, Froissart and the Jouvencel. He made two journeys into Italy with his brother, the first in 1730–1740, accompanied by his companion, the president Charles de Brosses, who related many humorous anecdotes about the two brothers, particularly about Jean Baptiste, whom he called "the bilious Saintes-Palaye!" On returning from this tour he saw one of Joinville's manuscripts at the house of the senator Florentini, well known in the history of the text of this pleasing memorialists. The manuscript was bought for 150 livres in 1741, and was given to the Academy at that time. After the second journey (1749) Lacurne published a letter to de Brosses, on Le Goût dans les arts (1751). In this he showed that he was not only attracted by manuscripts, but that he could see and admire works of art. In 1759 he published the first edition of his Mémoires sur l'ancienne chevalerie, considérée comme un établissement politique et militaire, for which unfortunately he only used works of fiction and ancient stories as sources, neglecting the heroic poems which would have shown him the nobler aspects of this institution so soon corrupted by "courtly" manners; a second edition appeared at the time of his death (3 vols. 1781, 3rd ed. 1850). He prepared an edition of the works of Eustache Deschamps, which was never published, and also made a collection of more than a hundred volumes of extracts from ancient authors relating to French antiquities and the French language of the middle ages. His Glossaire de la langue française was ready in 1756, and a prospectus had been published, but the great length of the work prevented him finding a publisher. It remained in manuscript for more than a century. In 1764 a collection of his manuscripts was bought by the government and after his death were placed in the king's library; they are still there. (fonds Lacurne, within the collection of some which were given to the marquis of Paulmy in exchange, and were later placed in the Arsenal. Lacurne de Saintes-Palaye ceased work about 1771; the death of his brother was greatly felt by him, he became childless, and died on the 1st of March 1781. Saintes-Palaye had been a member of the Académie Française since 1738. His life was written for this Académie by Chamfort and for the Académie des Inscriptions by Dupuy; both works are of no value. See, however, the biography of Lacurne, with a list of his published works and those in manuscript, at the beginning of the tenth and last volume of the Dictionnaire historique de l'ancien langage français, ou glossaire de la langue française depuis son origine jusqu'au siècle de Louis XIV., published by Louis Favre (1875–1882).

SAINTES, a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 47 m. S.E. of La Rochelle by the railway from Nantes to Bordeaux. Pop. (1906), town, 13,744; commune, 19,025. Saints is pleasantly situated on the left bank of the Charente, which separates it from its suburb of Les Dames. It is of interest for its Roman remains, of which the best preserved is the triumphal arch of Germanicus, dating from the reign of Tiberius. This formerly stood on a Roman bridge destroyed in 1843, when it was removed and reconstructed on the right bank of the river. Ruins of baths and of an amphitheatre are also to be seen. The amphitheatre, larger than that of Nîmes, and in area surpassed only by the Coliseum, dates probably from the close of the 1st or the beginning of the 2nd century and was capable of holding 20,000 spectators. A Roman building known as the Capitol was destroyed after the capture of the town from the English by Charles of Alençon, brother of Philip of Valois, in 1350, and its site is occupied by a modern church, the Eglise Notre-Dame. The Eglise St Peter, built in the first half of the 13th century, was rebuilt in the 17th century, and again after it had been almost destroyed by the Huguenots in 1568. The interior has now an unattractive appearance. The tower (15th century) is 236 ft. high. The church of St Eutropius (founded at the close of the 6th century, rebuilt in the 11th, and had its nave destroyed in the Wars of Religion) stands above a very interesting well-lighted crypt—the largest in France after that of Chartres—adorned with richly sculptured capitals and containing the tomb of St Eutropius (4th or 5th century). The fine stone spire dates from the 15th century. Notre-Dame, a splendid example of the architecture of the 11th and 12th centuries, with a noble clock-tower, is no longer devoted to religious purposes. The old hôtel de ville (16th and 18th centuries) contains a library, and the present hôtel de ville a museum. Bernard Palissy, the porcelain-maker, has a statue in the town, where he lived from 1542 to 1562. Small vessels ascend the river as far as Saintes, which carries on trade in grain, brandy and wine, has iron foundries, works of the state railway, and manufactures earthenware, tiles, bricks, pottery.

Saintes (Médialolium or Mediolanium), the capital of the Santones, was a flourishing town before Caesar's conquest of Gaul; in the middle ages it was capital of the Saintonge. Christianity was introduced by St Eutropius, its first bishop, in the middle of the 3rd century. Charlemagne rebuilt its cathedral. The Normans burned the town in 845 and 854. Richard Coeur de Lion fortified himself within its walls against his father Henry II, who captured it after a destructive siege. In 1242 St Louis defeated the English under its walls, and St Louis again reconquered the town. It was not, however, till the reign of Charles V. that Saintes was permanently recovered from the English. The Protestants did great damage during the Wars of Religion.

ST ÉTIENNE, an industrial town of central France, capital of the department of Loire, 310 m. S.S.W. of Paris and 36 m. S.S.W. of Lyons by rail. Pop. (1906), town, 135,940; commune, 146,668. St Étienne is situated on the Eure, which flows through it from S.E. to N.W., partly underground, and is an important adjunct to the silk manufacture. The town is uniformly built, its principal feature being the straight thoroughfare nearly 4 m. long which traverses it from N. to S. The chief of the squares is the Place Marenco, which has a statue of F. Garnier, the explorer, and is overlooked by the town hall and the prefecture, both modern. The church of St Étienne dates from the 15th century, and the Romanesque church of the abbey of Valbonne is on the S.E. outskirts of the town. A valuable collection of arms and armour are in a gallo-romain collection, and a library with numerous manuscripts are in the Palais des Arts. St Étienne is the seat of a prefect, and has an important school of mining, and schools of music, chemistry and dyeing, &c.

The town owes its importance chiefly to the coal-basin which extends between Firmignon and Rive-de-Gier over an area 20 m. long by 5 m. wide, and is second only to those of Northern France. There is a very large employment to some 18,000 workmen and producing annually between 3,000,000 and 4,000,000 tons. The mineral is of two kinds—smelting coal, said to be the best in the world, and inferior coal; the former is used in manufactures of ribbons, trimmings and other goods made from silk and mixtures of cotton and silk. This industry dates from the early 17th century, is carried on chiefly in small factories (electricity supplying the motive power), and employs at its maximum some 50,000 hands. The attendant industry of dyeing is carried on on a large scale. The manufacture of steel and iron and of heavy iron goods such as armour-plating occupies about 3,500 men, and that of steel alone has a capital of 60,000,000 fr. The iron-mongery is very extensive. There is a large iron and steel works which employs at busy times more than 10,000 men, and can turn out 450,000 rifles in the year. Private firms, employing 4500 hands, make both military rifles and sporting-guns, revolvers, &c. To these the manufacture of elastic fabrics, glass, cartridges, liqueurs, hemp-cables, &c.
At the close of the 12th century St Étienne was a parish of the Pays de Gier belonging to the abbey of Valbonne. By the middle of the 13th century the coal trade had reached a certain development, but at the beginning of the 15th century Charles VII permitted the town to erect fortifications. The manufacture of fire-arms for the state was begun at St Étienne under Francis I. and was put under the surveillance of state inspectors early in the 18th century. In 1789 the town was producing at the rate of 12,000 muskets per annum; between September 1794 and May 1796 they delivered over 175,000; and 100,000 was the annual average throughout the period of the empire. The first railways opened in France were the line between St Etienne and Andrézieux on the Loire in 1838 and that between St Etienne and Clermont in 1851. St Étienne became the administrative centre of the department instead of Montbrison.

**ST EUSTATIUS—ST GALL**

**ST FLORENTIN,** a town of north-central France, in the department of Loiret, 37 m. S.E. of Sens on the Paris-Lyon-Méditerranée railway. Pop. (1906) 2303. It stands on a hill on the right bank of the Armançon, built a mile or so from the Armançon and the canal of Burgundy. In the 17th century part of the town stands the church, begun in the latter half of the 15th century, and though retaining the Gothic form, with great flying buttresses, is mainly in the Renaissance style. It is approached through a narrow alley up a steep flight of steps, and contains a fine Holy Sepulchre in bas-relief and a choir-screen and stained glass of admirable Renaissance workmanship. The chœur, left incomplete, was restored and finished between 1837 and 1862. The market-gardens of St Florentin produce large quantities of asparagus. A castle stands on the site of the Roman military post Castrodunum, the sanctuary of an unchristianized saint in the 3rd century of Saints Florentin and Hilaire, round whose tomb it grew up. The abbey established here in the 9th century afterwards became a priory of the abbey of St Germain at Auxerre. The town and its territory belonged, under the Merovingians, to Burgundy, and in later times to the counts of Champagne, from whom it passed to the kings of France. Louis XV. raised it from the rank of viscountcy to that of county and bestowed it on Louis Phélypeaux, afterwards Duc de la Vallière.

**ST FLORUS,** a town of north-central France, capital of an arrondissement in the department of Cantal. It stands at a height of 2900 ft. on a basaltic plateau overlooking the Lioré, a branch of the Loire of the Truyère, 47 m. E.N.E. of Aurillac by rail. Pop. (1900) 4900. The streets are dark and narrow, but the town has spacious promenades established in the 18th century. St Flur grew up round the tomb of St Flur, the apostle of Auvergne, who died there in the 4th century. The abbey founded there about the beginning of the 11th century became in 1317 an episcopal seat, and the town is still the seat of a bishopric. The cathedral (1306–16) is the principal building. The manufacture of coarse woolen fabrics, of earthenware and candles is carried on. A few miles S.E. of the town the gorge of the Truyère is spanned by the fine railway viaduct of Garabit over 600 yds. long and at a height of 400 ft. above the river.

**ST GALL (Ger. St Gallen),** one of the cantons of north-east Switzerland, on the border of the Austrian province of the Vorarlberg and of the independent principality of Liechtenstein. It entirely surrounds the canton of Appenzell, which, like a great part of this canton, formerly belonged to the abbots of St Gall, while the "enclave" of Horn is in the canton of Thurgau.

Its area is 779 sq. m., of which 710 sq. m. are reckoned "productive," forests covering 157 sq. m. and vineyards 18 sq. m. while of the remainder 28 sq. m. are occupied by glaciers. The altitude above the sea-level varies from 306 ft. (the lake of Constance) to 7364 ft. (the Ringelespitzen). The canton includes portions of the lake of Constance (21 sq. m.), of the Waleensee (rather over 7 sq. m.), and of the lake of Zürich (4 sq. m.), and several small lakes wholly within its limits. Hilly in its N. region, the height gradually increases towards the S. border, while to its S.W. and E. extend considerable alluvial plains on the banks of the Linth and of the Rhine. The two rivers just named form in part its frontiers, the Rhine stream within the canton being the Thur (as regards its upper course), with the middle reach of its principal affluent the Sitter, both forming part of the Rhine basin. It has ports on the lake of Constance (Korsach) and of Zürich (Rapperswil), as well as Wassen (on the Waleensee). The intersecting point of Ragatz (g.v.) is supplied with hot mineral waters from Hellers. The main railway lines from Zürich past Sargans for Coire, and from Sargans past Alstätten and Rorschach for Constance, skirt its borders, while the capital is on the principal railway line from St. Gall to Rorschach, and communicates by rail with Appenzell and with Frauenfeld. In 1900 the population of the canton was 250,285, of whom 243,388 were German-speaking, 5300 Italian-speaking and 7100 French-speaking, while there were 90,412 "Catholics" (whether
ST GALL—SAINT-GAUDENS

Roman or "Old"), 99,114 Protestants and 536 Jews (mostly in the town of St Gall). Its capital is St Gall, the other most populous place being Tablat (pop. 12,590), Rorschach (9140), Alstättten (8724), Straubenzell (8090), Gossau (6055) and Wattwil (4971). In the southern and more Alpine portion of the canton the inhabitants, mainly well-to-do farmers, number over 9000 "alps" or mountain pastures on the canton amounted to 304, capable of supporting 21,144 cows, and of an estimated total value of nearly 14 million francs. The central and southern regions agriculture is generally combined with manufactures.

The canton is one of the most industrial in Switzerland. Cotton-spinning is widely spread, though cloth-weaving has declined. But the embroidery industry is perhaps the most important. It is based mostly on muslin, embroidery and lace. It is reckoned that the value of the embroideries and lace exported from the canton amounts to about one-seventh of the total value of the exports from Switzerland. The town of St Gall is the center of three administrative districts, which comprise ninety-three communes.

The existing constitution dates from 1890. The legislature or Grossrat is elected by the communes, each commune of 1500 inhabitants or less having a right to one member, and as many more as the divisor 1500, or fraction over 750, justifies. Members hold office for three years. For the election of the seven members of the executive or Regierungsrat, who also hold office for three years, all the citizens of the federal canton form a single body. The members of the federal Ständerat are named by the legislature, while the thirteen members of the federal Nationalrat are chosen by a popular vote. The right of "facultative referendum" or of "initiative" as to legislative projects belongs to any 4000 citizens, but in case of the revision of the cantonal constitution 10,000 must sign the demand. The canton of St Gall was formed in 1803 and was augmented by several districts that had belonged since 1798 to the canton Linth or Glarus—the upper Taggenburg, Sargans (held since 1543 by the Swiss), Gaster and Uznach (belonging since 1428 to Schwyz and Glarus), Gams (since 1410 the property of the same two members), Weesenberg (owned by Glarus since 1517), Sax (bought by Zürich in 1615), and Rapperswil (since 1712 under the protection of Zürich, Bern and Glarus).

ST GALL, capital of the Swiss canton of that name, is situated in the upper valley of the Steinach, 2193 ft. above the sea-level. It is by rail 9 m. S.W. of Rorschach, its port on the lake of Constance, and 53 m. E. of Zürich. The older or central portion of the town retains the air of a small rural capital, but the newer quarters present the aspect of a modern commercial center. At either extremity considerable suburbs merge in the neighboring towns of Tablat and of Straubenzell. Its chief building is the abbey church of the celebrated old monastery. This has been a cathedral church since 1846. In its present form it was constructed in 1756–1765. The famous library is housed in the former palace of the abbott, and is one of the most renowned in Europe by reason of its rich treasures of early MSS. and printed books. Other portions of the monastic buildings are used as the offices of the cantonal authorities, and contain the extensive archives built of this monastery. The ancient churches of St Magnus (Old Catholics) and of St Lawrence (Protestant) were restored in the 19th century. The town library, which is rich in Reformation and post-Reformation MSS. and books, is in the buildings of the cantonal school. The museum contains antiquarian, historical and natural history collections, while the new museum of industrial art has an extensive collection of embroideries of all ages and dates. There are a number of fine modern buildings, such as the Bourse. The town is the centre of the Swiss muslin, embroidery and lace industry. This manufactures a number of goods, such as "alps" or mountain pastures on the canton amounted to 304, capable of supporting 21,144 cows, and of an estimated total value of nearly 14 million francs. The central and southern regions agriculture is generally combined with manufactures.

The canton is one of the most industrial in Switzerland. Cotton-spinning is widely spread, though cloth-weaving has declined. But the embroidery industry is perhaps the most important. It is based mostly on muslin, embroidery and lace. It is reckoned that the value of the embroideries and lace exported from the canton amounts to about one-seventh of the total value of the exports from Switzerland. The town of St Gall is the center of three administrative districts, which comprise ninety-three communes.

The existing constitution dates from 1890. Landshaut St Gall (1834). (W. A. B. C.)

SAINT-GAUDENS, AUGUSTUS (1848–1907), American sculptor, was born in Dublin, Ireland, of a French father (a shoemaker by trade), and an Irish mother, Mary McGuinness, on the 1st of March 1848, and was taken to America in infancy. He was apprenticed to a cameo-cutter, studying in the schools of the Cooper Union (1861) and the National Academy of Design, New York (1863–1866). His earliest work in sculpture was a bronze bust (1867) of his father, Bernard, and himself. In 1865 he went to Paris and became a pupil of Jourfroy, in the École des Beaux-Arts. Two years later, with his fellow-student Mercié, he went to Italy, where he spent three years. At Rome he executed his statues "Hiawatha " and "Silence." He then settled in New York. In 1874 he made a bust of the statesman, William M. Evarts, and was commissioned to execute a large relief for St Thomas's Church, New York, which brought him
into prominence. His statue of Admiral Farragut, Madison Square, New York, was commissioned in 1878, exhibited at the Paris Salon in 1880 and completed in 1881. It immediately brought the sculptor widespread fame, which was increased by his church, once an enormous warehouse, built in 1887, for Lincoln Park, Chicago. In Springfield, Mass., is his "Deacon Chapin," known as "The Puritan." His figure of "Grief" (also known as "Death" and "The Peace of God") for the Adams (Mrs Henry Adams) Memorial, in Rock Creek Cemetery, Washington, D.C., has been described as "an idealization complete and absolute, the rendering of a simple, natural fact—a woman in grief—yet with such deep and embracing comprehension that the individual is magnified into a type." His Shaw Memorial in Boston, a monument to Robert G. Shaw, colonel of a negro regiment in the Civil War, was undertaken in 1884 and completed in 1887; it is a relief in bronze, 11 ft. by 15, containing many figures of soldiers, led by their young officer on horseback, a female figure in the clouds pointing onward. In 1903 was unveiled his equestrian statue (begun in 1892) to General Sherman, at 59th street and Fifth avenue, New York; preceding the Union commander is a winged figure of "Victory." This work, with others, formed a group at the Paris Exposition of 1900. A bronze copy of his "Amor Caritus" is in the Luxembourg, Paris. Among his other works are relief medallion portraits of Robert Louis Stevenson (in St Giles's Cathedral, Edinburgh) and the French painter Jules Bastien-Lepage; Garfield Memorial, Fairmount Park, Philadelphia; General Logan, Chicago; the Peter Cooper Memorial; and Charles Stewart Parnell in Dublin. Saint-Gaudens was made an officer of the Legion of Honour and corresponding member of the Institute of France. He died at Cornish, N.H., on the 3rd of August 1907. His monument of Phillips Brooks for Boston was left practically completed. Saint-Gaudens is rightly regarded as the greatest sculptor produced by America, and his work had a most powerful influence on art in the United States. In 1887 he married Augusta F. Homer and left a son, Howard Saint-Gaudens. His brother Louis (1829-1854), at all in relief, undertook the work of his brother and assisted Augustus Saint-Gaudens in some of his works.

See Royal Cottisso, Augustus Saint-Gaudens (1897); Lorado Taft, History of American Sculpture (1903), containing two chapters devoted to Saint-Gaudens; Kenyon Cox, Old Masters and New (1905); C. Lewis Hind, Augustus Saint-Gaudens (1906).

ST GAUDENS, a town of south-western France, capital of an arrondissement in the department of Haute-Garonne, 1 m. from the left bank of the Garonne, 57 m. S.S.W. of Toulouse, on the railway to Tarbes and Pop. (1900), town, 4533; commune, 7720. The town has a cathedral, dedicated to Saint-Sernin, and a great many fine medieval homes, built in the flamboyant Gothic style. The town has sawing-, oil- and flour-mills, manufactures woollen goods, and is a market for horses, sheep and agricultural produce. Saint-Gaudens derives its name from a martyr of the 5th century, at whose tomb a college of canons was afterwards established. It was important as capital of the Nébouzan, as the residence of the bishops of Comminges and for its cloth industry.

SAINT-GELAIS, MELIN DE (1487-1558), French poet, was born at Angoulême on the 3rd of November 1487. He was the natural son of Octavien de St Gelais (1466-1502), afterwards bishop of Angoulême, himself a poet. At the age of 14, his father cast him into France. Melin, who had studied at Bologna and Padua, had the reputation of being doctor, astrologer and musician as well as poet. He returned to France in 1515, and soon gained favour at the court of Francis I. by his skill in light verse. He made amaner to the Dauphin, abbot of Reclus in the diocese of Troyes and librarian to the king at Fontainebleau. He enjoyed immense popularity until the appearance of Du Bellay's Défense et illustration... in 1549, where St Gelais was not excepted from the scorn poured on contemporary poets. He attempted to ridicule the innovators by reading aloud the Odes of Ronsard with burlesque emphasis before Henry II., when the king's sister, Margaret of Valois, seized the book and read them herself. Ronsard accepted Saint-Gelais's apology for this incident, but Du Bellay satirized the offender in the Pôle courtois. In 1554 he collaborated, perhaps with François Habert (1520-1574?), in a translation of the Sophonisse of Trissino which was represented (1554) before Catherine de Medicis at Blois. Saint-Gelais was the champion of the style maroquiné and the earliest of French sonneteers. He died in 1558.

His Œuvres were edited in 1873 (3 vols., Bibl. éditée par M. Prosper Blanchéman.

SAINT-GEORGES, GEORGES HENRI VERNY DE (1799-1875), French dramatist, was born in Paris on the 7th of November 1799. Saint-Louis ou les deux diuers (1823), a vaudeville written in collaboration with Alexandre Tardif, was followed by a series of operas and ballets. In 1829 he became manager of the Opéra Comique. Among his more famous libretti are: Le Vol d'Andorre (1848) for Halévy, and La Fille du régiment (1840) for Donizetti. He wrote some fifty pieces to collaborate on with Eugène Scribe, Auguste de Limur, Joseph Mazilier, and a great number in collaboration with other authors. Among his novels may be mentioned Un Mariage de prince. Saint-Georges died in Paris on the 23rd of December 1875.

SAINT-GERMAIN, COMTE DE (c. 1710-1780) called der Wundermann, a celebrated adventurer who by the assertion of his discovery of some extraordinary secrets of nature exercised considerable influence at several European courts. Of his parentage and place of birth nothing is definitely known; the common version is that he was a Portuguese Jew, but various surmises have been advanced as to his origin. It has been stated that he obtained his money, of which he had abundance, from acting as spy to one of the European courts. But this is hard to maintain. He knew nearly all the European languages, and spoke German, English, Italian, French (with a Piedmontese accent), Portuguese and Spanish. Grimm affirms him to have been the man of the best parts he had ever known. He was a musical composer and a capable violinist. His knowledge of history was comprehensive, and his accomplishments as a chemist, on which he based his reputation, were in many ways real and considerable. He pretended to have a secret for removing flaws from diamonds, and to be able to transmute metals. The most remarkable of his professed discoveries was of a liquid which could prolong life, and by which he asserted he had himself lived 2000 years. After spending some time in Persia, Saint-Germain is mentioned in a letter of Horace Walpole's as being in London about 1743, and as being arrested as a Jacobite spy and released. Walpole says: "He is called an Italian, a Spaniard, a Pole; a somebody that married a great fortune in Mexico and ran away with her jewels to Constantiopole; a priest, a fiddler, a vast nobleman." At the court of Louis XV., where he appeared about 1748, he exercised for a time as an ordinaire courtier. He was employed on important missions by Louis XV.; but, having interfered in the dispute between Austria and France, he was imprisoned in June 1760, on account of the hostility of the duke of Choiseul, to remove to England. He appears to have resided in London for one or two years, but was at St Petersburg in 1762, and is asserted to have played an important part in connexion with the conspiracy against the emperor Peter III. in July of that year, a plot which placed Catherine II. on the Russian throne. He then went to Germany, where, according to the Mémoires authentiques de Cagliostro, he was the founder of freemasonry, and was associated with the most notorious adventurers, and lived from 1770 to 1774, and after frequenting several of the German courts he took up his residence in Schleswig-Holstein, where he and the Landgrave of Hesse distinguished him at the time of the secret sciences. He died at Schleswig in or about 1780-1785, although he is said to have been seen in Paris in 1789.

Andrew Lang in his Historical Mysteries (1904) discusses the career of Saint-Germain, and cites the various authorities for it. Saint-Germain is mentioned in the correspondence of Grimm and of Voltaire. See also Oettinger, Graf Saint-Germain (1846); F. Bülow, Geheime Geschichten und räthselhafte Menschen, Band i. (1890-1890); Lascelles Bramall, Remarkable Adventures (1865); and U. Birch in the Nineteenth Century (January 1908).

SAINT-GERMAIN, CLAUDE LOUIS, COMTE DE (1707-1778), French general, was born on the 15th of April 1707, at the Château of Vertamboz. Educated at Jesuit schools, he intended to enter the priesthood, but at the last minute obtained from
Louis XV. an appointment as sub-lieutenant. He left France, according to the gossip of the time, because of a duel; served under the elector palatine; fought for Hungary against the Turks, and on the outbreak of the war of the Austrian Succession (1740) joined the army of the elector of Bavaria (who later became emperor under the name of Charles VII.), displaying such bravery that he was promoted to the grade of lieutenant field-marshal. He left Bavaria on the death of Charles VII., and afterwards served under Frederick the Great. Ceded Marschale, England, was re-engaged by the Elector of Hanover and built a field-marshal of the French army. He distinguished himself especially at Lawfield, Rancourt and Maastricht. On the outbreak of the Seven Years’ War (1756) he was appointed lieutenant-general, and although he showed greater ability than any of his fellow-commanders and was admired by his soldiers, he fell a victim to court intrigues, professional jealousy and hostile criticism. He resigned his commission in 1760 and accepted an appointment as field-marshal from Frederick V. of Denmark, being charged in 1762 with the reorganization of the Danish army. The death of Frederick in 1766 he returned to France, bought an extensive estate at near Lauterbach, and devoted his time to religion and farming. A financial crisis swept away the funds that he had saved from his Danish service and rendered him dependent on the bounty of the French ministry of war. Saint-Germain was presented at court by the reformers Turgot and Malascher, and was appointed minister of war by Louis XVI. on the 25th of October 1773. He sought to lessen the number of officers and to establish order and regularity in the service. His efforts to introduce Prussian discipline in the French army brought on such opposition that he resigned his commission in June 1777. He accepted quarters from the king and a pension of 40,000 livres, and died in his apartment at the arsenal on the 13th of January 1778.

ST. GERMAIN-EN-LAYE, a town of northern France, in the department of Seine-et-Oise, 13 m. W.N.W. of Paris by rail. Pop. (1906), town, 14,074; commune, 17,288. Built on a hill on the left bank of the Seine, nearly 300 ft. above the river, and on the edge of a forest 10,000 to 11,000 acres in extent, St. Germain has a bracing climate, which makes it a place of summer residence for Parisians. The terrace of St. Germain, constructed by A. Lenôtre in 1637, is 1 m. long and 100 ft. wide; it was planted with lime trees in 1745 and affords an extensive view of the valley of the Seine as far as Paris and the surrounding hills: it ranks as one of the finest promenades in Europe.

A monastery in honour of St. Germain, bishop of Paris, was built in the forest of Laye by King Robert. Louis VI. erected a castle close by. Burned by the English, rebuilt by Louis IX., and again by Charles V., this castle did not reach its full development till the time of Francis I. who may have planned the construction of the building. A new castle was begun by Henry II. and completed by Henry IV.; it was subsequently demolished, with the exception of the so-called Henry IV. pavilion, where Thiers died in 1877. The old castle has been restored to the state in which it was under Francis I. The restoration is particularly skillful in the case of the chapel, which dates from the first half of the 13th century. In the church of St. Germain is a mausoleum erected by George IV. of England (and restored by Queen Victoria) to the memory of James II. of England, who after his deposition resided in the castle for twelve years and died there in 1701. In one of the pavilions in the grounds of Thiers, the first manager of the forest is the Convent des Loges, a branch of the educational establishment of the Legion of Honour (St. Denis). The fete des Loges (end of August and beginning of September) is one of the most popular in the neighbourhood of Paris.

ST. GERMANS, a small town in the Bodmin parliamentary division of Cornwall, England, pleasantly situated on the river Lynher, 91 m. W. by N. of Plymouth by the Great Western railway. Pop. (1901) 2384. It contains a fine church dedicated to St. Germanus. The west front is flanked by towers both of which are Norman in the lower parts, the upper part being in the one Early English and in the other Perpendicular. The front itself is wholly Norman, having three windows above a porch with a beautiful ornate door-way. Some Norman work remains in the body of the church, but the most part is Perpendicular or Decorated. Port Eliot, a neighbouring mansion, contains an excellent collection of pictures, notably several works of Sir Joshua Reynolds. St. Germans is supposed to have been the original seat of the Cornish bishopric. It was the see of Bishop Burzhold, who died in 1027. Under Leofric, who became bishop of Crediton and Cornwall in 1046, the see was removed to Exeter. Bishop Leofric founded a priory at St. Germans and bestowed upon it twelve of the twenty-four hides which in the time of the Confessor constituted the bishops' manor of St. Germans. There was then a market on Sundays, but at the time of the Domesday Survey this had been removed. The lower part of the manor established by the count of Mortain on the same day at Trematon castle. In 1302 the grant of infangethief, assize of bread and ale, waf and straw by Henry III. was confirmed to the bishop, who in 1311 obtained a further grant of a market on Fridays and a fair at the feast of St. Peter ad Vincula. In 1343 the prior sustained his claim to a prescriptive market and fair at St. Germans. After the suppression the borough belonging to the priory remained with the crown until 1616. Meanwhile Queen Elizabeth created it a parliamentary borough. From 1563 to 1632 it returned two members to the House of Commons. In 1815 John Elliot was created earl of St. Germans, and in 1865 the first suffragan bishop of Truro was consecrated bishop of St. Germans.

ST. GILLES, a town of southern France, in the department of Gard, on the canal from the Rhone to Cetce, 123 m. S.S.E. of Nimes by road. Pop. (1906) 5292. In the middle ages St. Gilles, the ancient Vallis Flaviana, was the seat of an abbey founded towards the end of the 7th century by St. Aegidius (St. Gilles). It acquired wealth and power under the counts of Toulouse, who added to their title that of counts of St. Gilles. The church, which survives, was founded in 1116 when the abbey was at the height of its prosperity. In 1777 the owner of the abbey, the marquis de Castelnael, St. Gilles was the seat of the first grand priory of the Knights Hospitallers in Europe (12th century) and was of special importance as their place of embarkation for the East. In 1226 the countship of St. Gilles was united to the crown. In 1562 the Protestants ravaged the abbey, which they occupied till 1622, and in 1714 it was suppressed.

ST. GIRONS, a town of south-western France, capital of an arrondissement in the department of Ariège, 20 m. W. of Foix by rail. Pop. (1906) 5215. The town is situated on the Salat at the foot of the Pyrenees. There are mineral springs at Audinac, at Lourdes, and at the watering-place of Aulus, about 20 m. to the S.S.E., is reached by road from St. Giron. St. Léon-Der-Couserans (q.v.), an ancient episcopal town, is 1 m. N.N.W.

ST. GOAR, a town of Germany, in the Prussian Rhine Province, on the left bank of the Rhine, opposite St. Goarshausen and just below the famous Lorelei, 12 m. above Boppard by the railway from Coblenz to Mainz. Pop. (1905) 1475. It is in part surrounded by the ruins of its old walls, and contains an Evangelical church, with some Renaissance monuments, and a Roman Catholic church with an image of St. Goar of Aquitania, around which the chapel of the place originally arose. Below the town, high on an eminence above the Rhine, stands Schloß Rheinfels, the property of the king of Prussia, the most perfect of the feudal castles on the banks of the river. In the later middle ages St. Goar was the capital of the county of Katzenelnbogen, and on the extinction of this family it passed to Hesse-Cassel. It came into the possession of Prussia in 1815.

ST. GOTTHARD PASS, the principal route from northern Europe to Italy. It takes its name (it is not known wherefore) from St Gotthard, bishop of Hildesheim (d. 1038), but does not seem to be mentioned before the early 13th century, perhaps because the access to it lies through two very narrow Alpine
valleys, much exposed to avalanches. The hospice on the summit is first mentioned in 1331, and from 1683 onwards was in charge of two Capuchin friars. But in 1775 the buildings near it were damaged by an avalanche, while in 1799–1800 everything was destroyed by the French soldiery. Rebuilt in 1834, the hospice was burnt in March 1906. The mule path (dating from about 1293) across the pass served for many centuries, for though Mr Greville, in 1775, succeeded in taking a light carriage across, the carriage-road was only constructed between 1820 and 1830. Now the pass is deserted in favour of the great tunnel (pierced in 1873.7 m. in length, and attaining a height of 3786 ft.), through which runs the railway (opened in 1882) from Lucerne to Milan (1735 m.), one of the greatest engineering feats of the 19th century. It runs mainly along the eastern shore of the Lake of Lucerne, from Lucerne to Flüelen (321 m.), and then up the Reuss valley past Altldorf and Wassern, near which is the first of the famous spiral tunnels, to Göschenen (56 m. from Lucerne). Here the line leaves the Reuss valley to pass through the tunnel and so gain, at Airolo, the valley of the Ticino or the Val Veveyta, which it descends, through several spiral tunnels, till at Biasca (through the crater Göschenen) it reaches more level ground. Thence it runs past Bellinzona to Lugano (361 m. from Biasca) and reaches Italian territory at Chiasso, 35 m. from Milan. In 1909 the Swiss government exercised the right accorded to it by the agreement of 1870 of buying the St Gotthard Railway from the company which built it within thirty years of that date. (W.A.B.C.)

ST HELENA, an island and British possession in the South Atlantic in 15° 55′ S. 5° 42′ 30″ W. (Ladder Hill Observatory). It lies 700 m. S.E. of the island of Ascension (the nearest land), 1266 m. S.W. of the Walvis Mountains (the easternmost African port), 1063 m. N.W. of Cape Town, and is distant from Southampton 4477 m. It has an area of about 47 sq. m., the extreme length from S.W. to N.E. being 103 m., and the extreme breadth 81. The island is of volcanic formation, but greatly changed by oceanic abrasion and atmospheric denudation. Its principal feature, a semi-circular ridge of mountains, open towards the south-east and south, with the culminating summit of Diana's Peak (2704 ft.) is the northern rim of a great crater; the southern rim has disappeared, though its débris apparently keeps the sea shallow (from 20 to 50 fathoms) for some 2 m. S.E. of Sandy Bay, which has been occupied for a total of 38 ft. The crater wall onwards water-cut gorges stretch in all directions, widening as they approach the sea into valleys, some of which are 1000 ft. deep, and measure one-eighth of a mile across at bottom and three-eighths across the top (Melissa). These valleys contain small streams, but the island has no rivers properly so called. Springs of pure water are, however, abundant. Along the enclosing hill-sides caves have been formed by the washing out of the softer rocks. Basalts, andesites and phonolites, represent the chief flows. Many dikes and masses of basaltic rock seem to have been injected subsequently to the last volcanic eruptions from the central crater. The Ass's Ears and Lot's Wife, picturesque pinnacles standing out on the S.E. part of the crater ridge, and the Chimney on the coast south of Sandy Bay, are formed of such injected dikes and masses. In the neighbourhood of Man and Horse (S.W. corner of the island), throughout an area of about 40 acres, scarcely 50 sq. yds. exist not crossed by a dyke. On the leeward (northern) side of St Helena the sea-face is generally formed by cliffs from 600 to 1000 ft. high, and on the windward side these heights rise to about 2000 ft., as at Holfast Tom, Stone Top, and Old Joan Point. The only practicable landing-place is on the windward side at St Helena Bay—an open roadstead. From the head of the bay a narrow valley extends for 13 m. The greatest extent of level ground is in the N.E. of the island, where are the Deadwood and Longwood plains, over 1700 ft. above the sea.

Climate. — Although it lies within the tropics the climate of the island is healthy and temperate. This is due to the south-east trade-wind, constant throughout the year, and to the effect of the cold waters of the South Atlantic current. As a result the temperature varies little, ranging on the sea level from 68° to 84° in summer and 57° to 70° in winter. The higher regions are about 10° cooler. The rainfall varies considerably, being from 30 to 50 in. a year in the hills.

Flora. — St Helena is divided into three vegetation zones: (1) the southern flat, extending from 1 ft. to 1 m., formerly clothed with a luxuriant vegetation, but now "dried up, coated, and rocky," with little save prickly pears, wire grass and Mesembryanthemum; (2) the middle zone (400–1800 ft.), extending from 1 to 3 m. high, where a number of plants, including the smaller grasses and succulents, such as Alopecurus rubra—are known to have become extinct; and at least two species have probably shared the same fate—Heliotropium pennsylvanicum and Demersera obliquata. Melianthus melianthus, or native ebony, once abundant in parts of the island now barren; but the young trees were allowed to be destroyed by the goats of the early settlers, and it is now extinct. Its beautiful congener Melianthus scutellatus still abounds splendidly in 1810, but is now reduced to a few specimens. Very rare have been the Pelargonium cotyledonis, called "Old Father Live-for-ever," from its remaining vitality for months without soil or water. Commiphora longiflora and Commiphora africana occur abundantly in their fry, and the most abundant in the island, was represented in 1868 by about 1300 to 1400 examples; and Commiphora rusquin ("scrubwood") is confined to somewhat limited regions. Both these plants are characteristic of a daly forest belt of peculiar flora of St Helena were described by Sir Joseph Hooker as African, but George Bentham points out that the Compositae and Leguminosae are characteristic features of the forest, as in central America. The exotic flora introduced from all parts of the world gives the island almost the aspect of a botanical garden. The oak, thoroughly naturalized, grows alongside of the bamboo and banana. Among the plants and trees of peculiar peculiarities are:—Laguncula, probably introduced from Africa about 1775; Hypochaeris radiata, which above 1500 ft. forms the dandion of the country; the beautiful but aggressive Buddleia Madagascariensis; Fuchsia peruana; and a form of a species of Cynodon. The peepul is the principal shade tree in Jamestown, and in Jamestown valley the date-palm grows freely. Orange and lemon trees, once common, are now scarce.

Fauna. — St Helena possesses no indigenous vertebrate land fauna. The only land groups well represented are the beetles and the land shells. T. V. Woolfson, in Coleoptera Sanctae Helenae (1877), shows that there are 201 species; 200 of these are endemic; 18 species have been introduced, and 12 are accidental. The only birds of St. Helena that are not indigenous are the Housecrow and the Kestrel. The latter is a native of Madagascar, which is inhabited by the same species. The bee was introduced in 1775; Hypochaeris radiata, which above 1500 ft. forms the dandion of the country: the beautiful but aggressive Buddleia Madagascariensis; Fuchsia peruana; and a form of a species of Cynodon. The peepul is the principal shade tree in Jamestown, and in Jamestown valley the date-palm grows freely. Orange and lemon trees, once common, are now scarce.

Inhabitants. — When discovered the island was uninhabited. The majority of the population are of mixed European (British, Dutch, Portuguese), East Indian and African descent—the Asiatic strain perhaps predominating; the majority of the early settlers having been previously members of the crews of ships returning to Europe from the East. From 1840 onward for a considerable period numbers of freed slaves of West African origin were settled here by men-of-war engaged in suppressing the slave trade. Their descendants form a distinct element

1In the "Challenger" expedition reports, Botany, vol. i. (1885).
in the population. Since the substitution of steamships for sailing vessels and the introduction of new methods of preserving meat and vegetables (which made it unnecessary for sailing vessels to take fresh provisions from St Helena to avoid scurvy) the population has greatly diminished. In 1871 there were 6444 inhabitants; in 1900 the civil population was estimated at 555. The number of births, 64 per 1000, was the lowest on record in the island. The only town, in which live more than half the total population, is Jamestown. Longwood, where Napoleon died in 1821, is 33 m. E. by S. of Jamestown. In 1858 the house in which he lived and died was presented by Queen Victoria to Napoleon III., who had it restored to the condition, but unoccupied, in which it was at the time of Bonaparte's death.

**Agriculture, Industries, &c.—**Less than a third of the area of the island is cultivable. Many trees, including trees which could be (and formerly was) devoted to raising crops are under grass. The principal crop is potatoes, which are of very good quality. They were chiefly sold to ships—especially to passing ships. They are now occasionally exported to the Cape. Cattle and sheep were raised in large numbers when a garrison was maintained, so that difficulty has been found in disposing of surplus stock now that the troops have been withdrawn. Steep, sandy, or enclosed conditions, which formerly prevailed were entirely altered by the substitution of steamers for sailing vessels, which caused a great decrease in the number of ships calling at Jamestown. A remedy was sought in the establishment of industries. A few attempts were made to culture cinchona proved unsuccessful. Attention was also turned to the aloe (Furcraea gigantea), which grows wild at mid elevations. A few thousands of young were lifted from the wild plant, for their utilization in the manufacture of fibre. From 1875 to 1881 a company ran a mill at which they turned out both aloe and flax fibre, but the enterprise proved unremunerative. In 1906 a company (incorporated by a grant of 16790 from the imperial exchequer) started a mill at Longwood for the manufacture of phosphorium fibre, with encouraging results. Fish curing and lace making are also carried on to some extent.

Trade is chiefly dependent upon the few ships that call at Jamestown—now mostly whalers or vessels in distress. There is also some trade with ships that "pass" without "calling." In thirty years (1836-1866) 2111 vessels visited the island, with 244,204 tonnage. In 1881-1882 1821 ships with 244,204 tonnage left the island, and 1664 with 449,724 tonnage to 57 with 140,122 tonnage. In the last year the imports were valued at £35,614; the exports (excluding specie) at £17,487—but the goods supplied to "passing" vessels do not figure in these returns. In 1908 fibre and hops (valued at £1657) were added to the exports, and in 1909 a good trade was done with Ascension in sheep. St Helena is in direct telegraphic communication with Europe and South Africa, and there is a regular monthly mail steamship service.

**Government, Revenue, &c.—**St Helena is a Crown colony. The island has never had any form of local legislative chamber, but the government has always been aided by an executive council. The governor alone makes laws, called ordinances, but legislation can also be effected by the Crown by order in council. The revenue, £10,287 in 1905, had fallen in 1899 to £8778 (including a payment of £3500), the expenditure in each of the five years (1905-1909) being in excess of the revenue. Elementary education is provided in government and private schools. St Helena is the seat of an Anglican bishopric established in 1895. Ascension and Tristan da Cunha are included in the diocese.

**History.**—The island was discovered on the 21st of May 1502 by the Portuguese navigator Joao de Nova, on his voyage home from India, and by him named St Helena. The Portuguese found it uninhabited, imported live stock, fruit-trees and vegetables, built a chapel and one or two houses, and left their sick there to be taken home, if recovered, by the next ship, but they formed no permanent settlement. Its first known permanent resident was Fernando Lopez, a Portuguese in India, who had turned traitor and had been mutilated by order of Albuquerque. He preferred being marooned to returning to Portugal in his maimed condition, and was landed at St Helena in 1513 with three or four negro slaves. By royal command he visited Portugal some time later, but returned to St Helena, where he died in 1546. In 1584 two Japanese ambassadors to Rome landed at the island. The first Englishman known to have visited it was Thomas Cavendish, who touched there in June 1588 during his voyage round the world. Another English seaman, Captain Kendall, visited St Helena in 1591, and in 1593 Sir James Lancaster stopped at the island on his way home from the East. In 1603 the same commander again visited St Helena on his return from the first voyage equipped by the East India Company. The Portuguese had by this time given up calling at the island, and large sums of money have been occupied by the Dutch about 1615. The Dutch occupation was temporary and ceased in 1631, the year before they founded Cape Town. The British East India Company appropriated the island immediately after the departure of the Dutch, and they were confirmed in possession by a clause in their charter of 1661. The company built a fort (1678), named after the duke of York (James II.), and established a garrison in the island. In 1673 the Dutch succeeded in obtaining possession, but were ejected after a few months' occupation. Since that date St Helena has been in the undisturbed possession of Great Britain, though in 1706 two ships anchored off Jamestown were carried off by the French. In 1767 the Dutch had been expelled by the forces of the Crown, but by a new charter granted in December of the same year the East India Company were declared "the true and absolute lords and proprietors" of the island. At this time the inhabitants numbered about 1000, of whom nearly half were negro slaves. In 1810 the company began the importation of Chinese from their factory at Canton. During the company's rule the island prospered, thousands of homeward-bound vessels anchored in the roadstead in a year, staying for considerable periods, refitting and recruiting. The company's policy was to keep the island, where wealthy merchants and officials had their residence. The plantations were worked by the slaves, who were subjected to very barbarous laws until 1792, when a new code of regulations ensured their humane treatment and prohibited the importation of any new slaves. Later it was enacted that all children of slaves born on or after Christmas Day 1818 should be free, and between 1826 and 1836 all slaves were set at liberty.

Among the governors appointed by the company to rule at St Helena was one of the Hugenot refugees, Captain Stephen Poirier (1697-1707), who attempted unsuccessfully to introduce the cultivation of the vine. A later governor (1741-1742) was Robert Jenkin (q.v.) of "Jenkin's ear" fame. Dampier visited the island twice, in 1691 and 1701; Halley's Moon commemorates the visit paid by the astronomer Edmund Halley in 1676-1678—the first of a number of scientific men who have pursued their studies on the island.

In 1815 the British government selected St Helena as the place of detention of Napoleon Bonaparte. He was brought to the island on the British bark Pandoua in October 1815, and there he died in May 1821. During this period the island was strongly garrisoned by regular troops, and the governor, Sir Hudson Lowe, was nominated by the Crown. After Napoleon's death the East India Company resumed full control of St Helena until the 22nd of April 1834, on which date it was in virtue of an act passed in 1833 vested in the Crown. As a port of call the island continued to enjoy a fair measure of prosperity until about 1870. Since that date the great decrease in the number of vessels visiting Jamestown has deprived the islanders of their principal means of subsistence. When steamers began to be used for sail and steam was introduced, the Suez Canal was opened (1869) fewer ships passed the island, while of those that still pass the greater number are so well found that it is unnecessary for them to call (see also §§ Inhabitants). The withdrawal in 1906 of the small garrison, lightherto maintained by the imperial government, was another cause of depression. During the Anglo-Boer war of 1890-1902 some thousands of Boer prisoners were detained at St Helena, which has also served as the place of exile of several Zulu chiefs, including Dinizulu.

**Bibliography.**—J. C. Melliss, *St Helena: a Physical, Historical and Topographical Description of the Island, including its Geology, Fauna, Flora and Meteorology* (London, 1875); E. L. Jackson, *St Helena* (London, 1903); T. H. Brooke, *History of the Island of St Helena...* to 1823 (2nd ed., London, 1824), in this book are cited many early accounts of the island; General A. Beaton (Commodore of the island 1808-1813), Tracts Relative to the Island of St Helena.
ST HELENS—ST INGEBERT

ST HELENS, a market town and municipal, county, and parliamentary borough of Lancashire, England, 14 m. E.N.E. from Liverpool, on the London & North-Western and Great Central railways. Pop. (1801) 72,433; (1901) 84,440. A canal communicates with the Mersey. The town is wholly of modern development. Besides the town hall and other public buildings and institutions there may be mentioned the Gamble Institute, erected and presented by Sir David Gamble, Bart., for a technical school, educating some 2000 students, and library. Among several public pleasure grounds the principal are the Taylor Park of 48 acres, and the smaller Victoria and Thatto Heath Parks. This is the principal seat in England for the manufacture of crown, plate, and sheet glass; there are also art glass works, and extensive copper smelting and refining works, as well as chemical works, iron and brass foundries, potteries and patent medicine works. There are collieries in the neighbourhood. The scene is in the National Gallery, London, of Mr. Hamilton, known as Windleshaw Abbey, together with a well called St Thomas' well, but the history of the foundation is not known. The parliamentary borough (1885) returns one member. The county borough was created in 1888. The town was incorporated in 1868, and the corporation consists of a mayor, 9 aldermen and 27 councillors. Area 7285 acres.

ST HELIER, the chief town of Jersey, the largest of the Channel Islands. Pop. (1901) 27,866. It lies on the south coast of the island on the eastern side of St Aubin's Bay. The harbour is flanked on the W. by a rocky ridge on which stands Elizabeth Castle, and on the E. by Fort Regent on its lofty promontory. The parish church is a cruciform building with embattled tower, dating in part from the 14th century. It contains a monument to Major Peirson, who on the occasion of a French attack on Jersey in 1781 headed the militia to oppose them, and forced them to surrender, but was killed as his followers were at the point of victory. The French leader, Baron de Rullecourt, is buried in the churchyard. The spot where Peirson fell, in what is now called Peirson Place, is marked by a tablet. A large canvas by John Singleton Copley depicting the episode is in the National Gallery, London. The castle, which consists of the old castle (1400) built by Fort Regent, is the meeting-place of the royal court and deliberative States of Jersey. Victoria College was opened in 1852 and commemorates a visit of Queen Victoria and the prince consort to the island in 1846. A house in Marine Terrace is distinguished as the residence of Victor Hugo (1851-1855). Elizabeth Castle, which is connected with the mainland by a causeway, dates from 1531-1590; and in 1649 and 1649 Prince Charles resided here. In 1649 he was proclaimed king, as Charles II., in Jersey by the royalist governor. The fort is now the easternmost fort of the line usually called Fort Regent on the island the mace which is still used at the meetings of the court and States. Close to the castle are remnants of a chapel or cell, from which the rock on which it stands is known as the Hermitage, dating probably from the 9th or 10th century, and traditionally connected with the patron saint Helierus.

SAINT-HILAIRE, AUGUSTIN FRANÇOIS CÉSAR PROUVÉNÇAL DE, commonly known as AUGUSTE DE (1790-1853), French botanist and traveller, was born at Orleans on the 4th of October 1790. He began to publish memoirs on botanical subjects at an early age. In 1816-1822 and in 1830 he travelled in South America, especially in south and central Brazil, and the results of his study of the rich flora of the regions through which he passed appeared in several books and numerous articles in scientific journals. The works by which he is best known are the Flora Brasiliensis Meridionalis (3 vols., folio, with 192 coloured plates, 1832-1834), published in conjunction with A. de Jussieu and J. Cambessedes, Histoire des plantes les plus remarquables du Brésil et de Paraguay (1 vol. 4to, 50 plates, 1824), Plantas usuales des Brésilien (1 vol. 4to, 70 plates, 1827-1828), also in conjunction with De Jussieu and Cambessedes, and Voyage dans le district des diamants et sur le littoral du Brésil (2 vols., 1832). His Lesçons de botanique, comprenant principalement la morphologie végétale (1840), was a comprehensive exposition of botanical morphology and of its application to systematic botany. He died at Orleans on the 30th of September 1853.

ST HUBERT, a small town of Belgium in the province of Luxemburg and in the heart of the Ardennes. Pop. (1904) 3204. It is famous for its abbey church containing the shrine of St Hubert, and for its annual pilgrimage. According to tradition, the church and a monastery attached to it were founded in the 7th century by Electrude, wife of Pippin of Herstal. The second church was built in the 12th century, but burnt by a French army under Condé in the 16th century. The present building is its successor, but has been restored in modern times and presents no special feature. The tomb of St Hubert—a marble sarcophagus ornamented with bas-reliefs and having four statuettes of other saints at the angles—stands in one of the side chapels. The legend of the conversion of St Hubert—a hunter before he was a saint—by his meeting in the forest a stag with a crucifix between its antlers, is well known, and explains how he became the patron saint of huntsmen. The place where he is supposed to have met the stag is still known as la converserie and is almost 5 m: from St Hubert on the road to La Roche. The pilgrimage of St Hubert in May attracts annually between thirty and fifty thousand pilgrims. The buildings of the old monastery have been utilized for a state training-school for wails and strays, which contains on an average five hundred pupils. In the middle ages the abbey of St Hubert was one of the most important in Europe, owning forty villages with an annual income of over 80,000 crowns. During the French Revolution, when Belgium was divided into departments, the possessions of the abbey were sold for £2,500, but the bishop of Namur was permitted to buy the church itself for £150.

ST HYACINTHE, a city and port of entry of Quebec, Canada, and capital of St Hyacinthe county, 32 m. E.N.E. of Montreal, on the left bank of the river Yamaska and on the Grand Trunk, Canadian Pacific, Intercolonial, and Quebec Southern railways. Pop. (1901) 9210. It is the seat of a Roman Catholic bishop, and contains a classical college, dairy school, two monasteries and several other educational and charitable institutions. It manufactures organs, leather, woollens and agricultural implements, and is an important distributing centre for the surrounding district.

SAINTINE, JOSEPH XAVIER (1798-1865), French novelist and dramatist, whose real surname was BONFACE, was born in Paris on the 10th of July 1798. In 1823 he produced a volume of poetry in the manner of the Romanticists, entitled Pombes, ades, épîtres. In 1836 appeared Piccola, the story of the comte de Charney, a political prisoner in Piedmont, whose reason was saved by his cult of a tiny flower growing between the paving stones of his prison yard. This story is a masterpiece of the French romantic mind, and has been translated into many foreign languages. He produced many other novels, none of striking individuality with the exception of Soul (1857), which purported to be the authentic record of Alexander Selkirk on his desert island. Saintine was a prolific dramatist, and collaborated in some hundred pieces with Scribe and others, usually under the name of Xavier. He died on the 21st of January 1865.

ST INGEBERT, a town of Germany, in the kingdom of Bavaria on the Röhrbach, 14 m. by rail W. of Zweibrücken. Pop. (1905) 15,527. It has coal-mines and manufactures of glass and machinery. There are also large iron and steel works in the town, and other industries are the making of powder, leather, cigars, soap and cotton. St Ingebert is named after the Irish saint, St Ingobert, and belonged for 300 years to the electorate of Trier.
ST IVES, a market town, municipal borough and seaport in the St Ives parliamentary division of Cornwall, England, 10 m. N.N.E. of Penzance, on a branch of the Great Western railway. Pop. (1901) 6699. It lies near the W. horn of St Ives Bay on the N. coast. The older streets near the harbour are narrow and irregular, but on the upper slopes there are modern terraces with good houses. The small harbour, protected by a breakwater, originally built by John Smeaton in 1757, has suffered from the accumulation of sand, and at the lowest tides is dry. The by-porches for pilchard herring and mackerel are important. Boat-building and sail-making are carried on. An eminence south of the town is marked by a granite monument erected in 1782 by John Knill, a native of the town, who intended to be buried here; to maintain a quinquennial celebration on the spot he bequeathed property to the town authorities. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 1890 acres.

The town takes name from St Iza, St Iza, St Iza or Ta, an Irish virgin and martyr, who is said to have accompanied St Piran on his missionary journey to Cornwall in the 5th century, and to have landed near this place. The Patent Rolls give the name and the almost continuous series of trials for piracy and plunder by St Ives sailors from the beginning of the 14th to the end of the 16th century. A mere chapelry of Lelant and the less important part of the distant manor of Ludgvan Leaze, which in Domuslcle Book appears as Luduaim, it had no fostering hand to minister to its growth. In order to augment the influence of the Tudors in the House of Commons, Philip and Mary in 1558 invested it with the privilege of returning 2 members. Its affairs were at that time administered by a headwarden, who after 1598 appears under the name of St Ives and Great Ives, 12 chief burgesses and 24 ordinary burgesses. The portreeve was elected by the 24; the 12 by the chief inhabitants. This body had control over the fishing, the harbour and harbour dues, the fabric of the church, sanitation and the poor. In 1639 a charter of incorporation was granted under which the portreeve became mayor, the 12 became aldermen, and the 24 were styled burgesses. Provision was made for four fairs and for markets on Wednesdays and Saturdays, also for a grammar school. This charter was surrendered to Charles II. and a new one granted in 1685, the latter reducing the number of aldermen to 10 and of burgesses also to 10. It ratified the parliamentary franchise and the almost continuous series of trials for piracy and plunder by St Ives sailors from the beginning of the 14th to the end of the 16th century.

ST IVES, a market town and municipal borough in the northern parliamentary division of Huntingdonshire, England, mainly on the left (north) bank of the Ouse, 5 m. E. of Huntingdon by the Great Eastern railway. Pop. (1901) 2910. The river is crossed by an old bridge said to have been built by the abbots of Ramsey early in the 12th century. A building over the centre pier of the bridge was once used as a chapel. The causeway (1827) on the south side of the river is built on arches so as to assist the flow of the river in time of flood. The church of All Saints is Perpendicular, with earlier portions. A curious custom is practised annually in this church in connexion with a bequest made by a certain Dr Robert Wilde in 1678; it is the distribution of Bibles to six boys and six girls of the town. The original provision was that the Bibles should be cast for by dice on the Communion table. Oliver Cromwell was a resident in St Ives in 1634-1635, but the house which he inhabited—Slepe Hall—was demolished in the middle of the 19th century. St Ives has a considerable agricultural trade. It is governed by a mayor, 4 aldermen and 12 councillors. Area 2326 acres.

The manor of "Slepe" is said to have been given by Ethelstan 'Mannesse of to the abbots of Ramsey and confirmed to him by King Edgar. It owed its change of name to the supposed discovery of the grave of St Ivo, a Persian bishop, in 1901, and a priory was founded in the same year by Abbot Ednoth as a cell to Ramsey. St Ives was chiefly noted for its fair, which was first granted to the abbots of Ramsey by Henry I. to be held on Monday in Easter week and eight days following. In the reign of Henry III. merchants from Flanders came to the fair, which had become so important that the king granted it to be continued beyond the eight days if the abbots agreed to pay a farm of £30 yearly for the extra days. The fair, with a market on Monday granted to the abbots in 1386, survives, and was purchased in 1874 by the corporation from the duke of Manchester. The town was incorporated in 1874.

ST JEAN-D'ANGÉLY, a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 33 m. E. of Rochefort by rail. Pop. (1906) 6242. St Jean lies on the right bank of the Boutonne, which is navigable for small vessels. The parish church of St Jean stands on the site of an abbey church of the 13th century, of which some remains are left. In 1568 the monastery was destroyed by the Hugenots, but much of it was rebuilt in the 17th and 18th centuries, to which period belong two towers and the façade of an unfinished church.

St Jean owes the suffix of its name to the neighbouring forest of Angy, which is said to have been built by John the Baptist, a recluse of the 14th century. Pippin I. of Aquitaine in the 9th century established there a Benedictine monastery which was afterwards regularly received by the canons of the cathedral of Bordeaux. The buildings and the archives of the monastery are still preserved by the college of canons, and are visited by pilgrims; a town grew up, took the name of St Jean d'Angély, and was fortified in 1131, and in 1204 received a charter from Philip Augustus. The possession of the place was disputed by France and England in the 12th and 13th centuries, and between Catholics and Protestants at a later date. In 1569 it was occupied by the duke of Anjou (afterwards Henry III.). Louis XIII., again took it from the Protestants in 1621 and deprived it of its freedom in 1639.

ST JEAN-DE-LUZ, a coast town of south-western France, in the department of Basses-Pyrénées, at the mouth of the Nivelle, 14 m. S.W. of Bayonne on a branch of the Southern railway. Pop. (1906) 3424. St Jean-de-Luz is situated in the Basque country on the bay of St Jean-de-Luz, the entrance to which is protected by breakwaters and moles. It has a 13th-century church, the chief features of which are the galleries in the nave, which, according to the Basque custom, are reserved for men. The Maison Louisiane, the Maison de l'Infante (both 17th century), and the hôtel de ville (1657) are picturesque old buildings. St Jean is well known for its bathing and as a winter resort. Fishing is a considerable industry.

From the 14th to the 17th century St Jean-de-Luz enjoyed a prosperity due to its mariners and fishermen. Its vessels were the first to set out for Newfoundland in 1520. In 1538, owing to the depredations of the English ships of Francis I., the Basques were deprived of the town. In 1627, however, it was able to equip 80 vessels, which succeeded in saving the island of Ré from the duke of Buckingham. In 1698 the treasure of the Pyrenees was signed at St Jean-de-Luz, and was followed by the marriage of the Infanta Maria Francisca to Louis XIV. At that time the population numbered 15,000. The cession of Newfoundland to England in 1713, the loss of Canada, and the silting-up of the harbour were the three causes which contributed to the decline of the town.

ST JOHN, CHARLES WILLIAM GEORGE (1806-1856), English naturalist and sportsman, son of General the Hon. Frederick St John, second son of Frederick, second Viscount Bolingbroke, was born on the 3rd of December 1809. He was educated at Midhurst, Sussex, and about 1828 obtained a clerkship in the treasury, but resigned in 1834, in which year he married a lady with some fortune. He ultimately settled in the "Laigh" of Moray, "within easy distance of mountain lochs", the largest being Duddingston Loch near Edinburgh. He lost both of his eyes, and for the benefit of his health he removed to the south of England. He died at Woolston, near Southampton, on the 22nd of July 1856. His works are Wild Sports and Natural History of the Highlands (1846, 2nd ed. 1848, 3rd ed. 1861); Tour in Sutherland (1849, 2nd ed., with recollections by Captain H. St. John, 1884); Notes of Natural History and Sport in Morayshire, with Memoir by C. Innes (1863, 2nd ed. 1884). They are written in a graphic style, and illustrated with engravings, many of them from clever pen-and-ink sketches of his own.

ST JOHN, JAMES AUGUSTUS (1801-1875), British author and traveller, was born in Carmarthenshire, Wales, on the 24th
ST JOHN, O.—ST JOHN

of September 1801. He received private instruction in the classics, and also acquired proficiency in French, Italian, Spanish, Arabic and Persian. He obtained a connexion with a Plymouth newspaper, and when, in 1824, James Silk Buckingham started the Oriental Herald, St John became assistant editor. In 1827, together with D. L. Richardson, he founded the London Weekly Review, subsequently purchased by Coburn and transformed into the Court Journal. He lived for some years on the Continent and in Egypt and travelled round the holy places. His journeys were published under the titles Egypt and Mohammed Ali, or Travels in the Valley of the Nile (2 vols., 1834), Egypt and Nubia (1844), and Isis, an Egyptian Pilgrimage (2 vols., 1853). On his return he settled in London, and for many years wrote political "leaders" for the Daily Telegraph. In 1868 he published a Life of Sir Walter Raleigh, based on researches in the archives at Madrid and elsewhere. He died in London on the 22nd of September 1875.

Besides the works mentioned St John was also the author of Journal of a Residence in Normandy (1830), Life of a Traveller (1830); Anatomy of Society (1831); History, Manners and Customs of the Hindus (1831); Margaret Ravenscroft, or Second Love (3 vols., 1835); The Heleneens, or Manners and Customs of Ancient Greece (1836); The Life and Letters of Dugald Stewart (4 vols., 1844); Again in Search of Beauty (1853); The Nemesis of Power (1854); Philosophy at the Foot of the Cross (1854); The Preaching of Christ (1855); The Ring and the Veil, a novel (1860); Life of Louis Napoleon (1861); Life of Charles de la Tour (1863); England or the Frenchman's Paradise (1865); Weighed in the Balance, a novel (1864). He also edited, with notes, various English classics.

Of his four sons, all journalists and authors of some literary distinction, St John, born in 1821-1889, Bayle, Spencer and Horace Rococo (1832-1888)—the second, BAYLE ST JOHN (1822-1890)—began contributing to the periodicals when only thirteen. When twenty he wrote a series of papers for Fraser's under the title "De re vehiculari, or a Comic History of Chariots." To the same magazine he contributed a series of essays on Montaigne, and published in 1857 Montaigne the Essayist, a Biography, in 4 volumes. During the Crimean War, he was one of the Libros Descritos (1849). While in Egypt he learnt Arabic and visited the oasis of Siwa. On his return he settled for some time in Paris and published Two Years in a Levantine Family (1850) and Views in the Islands of Sicily, Sardinia, and Minorca after a second visit to the East he published Village Life in Egypt (1852); Purple Tints of Paris: Characters and Manners in the New Empire (1854); The Louvre, or Biography of a Museum (1855); the Sublime Kingdom, or Experiences and Studies in Soway (1856); Travels of an Arab Merchant in the Soudan (1854); Marathóma, a Story of Adventure (1856); and Memoirs of the Duke of Saint-Simon in the Reign of Louis XIV. (4 vols., 1857).

ST JOHN, OLIVER (c. 1598-1673), English statesman and judge, was the son of Oliver St John. There were two branches of the ancient family to which he belonged, namely, the St Johns of Bletso in Bedfordshire, and the St Johns of Lydiard Tregoe in Wiltshire, both descendants of the St Johns of Staunton St John in Oxfordshire. Oliver St John was a member of the senior branch, being great-grandson of Oliver St John, who was created Baron St John of Bletso in 1599, and a distant cousin of the 4th baron who was created earl of Bolingbroke in 1624, and who took an active part on the parliamentary side of the Civil War, being killed at the battle of Edgehill. Oliver was educated at Queens' College, Cambridge, and was called to the bar in 1666. He appears to have got into trouble with the court in connexion with a seditionist publication, and to have associated himself with the future popular leaders John Pym and Lord Saye. In 1668 he defended Hampden on his refusal to pay Ship Money, on which occasion he made an notable speech. In the same year he married, as his first wife, Elizabeth, daughter of Oliver Cromwell, to whom his first wife also had been distantly related. The marriage led to an intimate friendship with Cromwell. St John was member for Totnes in both the Short and the Long Parliament, where he acted in close alliance with Hampden and Pym, especially in opposition to the impost of Ship Money (q.v.). In 1641, with a view of securing his support, the king appointed St John solicitor-general. None the less he took an active part in promoting the impeachment of Strafford and in preparing the bills brought forward by the popular party in the Commons, and was dismissed from office in 1643. On the outbreak of the Civil War, he became recognized as one of the parliamentary leaders. In the struggle between the parliament and the army in 1647 he sided with the latter, and throughout this period he enjoyed Cromwell's entire confidence.

In 1648 St John was appointed chief justice of the common pleas, holding the post, he freed himself mainly to his judicial duties. He refused to act as one of the commissioners for the trial of Charles. He had no hand in Pride's Purge, nor in the constitution of the Commonwealth. In 1651 he went to the Hague as one of the envos to negotiate a union between England and Holland, a mission in which he entirely failed; but in the same year he successfully conducted a similar negotiation with Scotland. After the Restoration he published an account of his past conduct (The Case of Oliver St John, 1660), and this apologia enabled him to escape any more severe vengeance than exclusion from public office. He retired to his country house in Northamptonshire till 1662, when he went to live abroad. He died on the 31st of December 1673.

By his first wife St John had two sons and two daughters.

His daughter Johanna married Sir Walter St John of Lydiard Tregoe and was the grandmother of Viscount Bolingbroke.

By his second wife he had two children, and after her death he married, in 1645, Elizabeth, daughter of Daniel Ozenbridge.

ST JOHN, the capital of St John county, New Brunswick, Canada, is on 44° 17' N. and 66° 4' W., 481 m. from Montreal by the Canadian Pacific railway, Pop. (1901) 40,711. It is situated at the mouth of the St John river on a rocky peninsula. With it are incorporated the neighbouring towns of Carleton and (since 1889) Portland. The river, which is spanned by two bridges, enters the harbour through a rocky gorge, which is passable by ships for forty-five minutes during each ebb and flow of the tide. The harbour level at high tide (see FUNDY, BAY OF) is 6 to 12 ft. higher than that of the river, but at low tide about as much below it, hence the phenomenon of a fall outwards and inwards at every tide. St John is an important station of the Intercolonial, Canadian Pacific, and New Brunswick Southern railways, and shares with Halifax the honour of being the chief winter port of the Dominion, the harbour being deep, sheltered and free from ice. It is the distributing centre for a large district, rich in agricultural produce and lumber, and has larger exports than Halifax, though less imports. It is also the centre of fisheries which employ nearly 1000 men, and has important industries, such as saw, grist, cotton and woolen mills, carriage, box and furniture factories, boiler and engine shops. The beauty of the scenery makes it a pleasant residential city.

St John was visited in 1604 by the Sleur de Monts (1560-1630) and his lieutenant Champlain, but it was not until 1635 that Charles de la Tour (d. 1666) established a trading post, called Fort St Jean (see Parkman, The Old Regime in Canada), which existed under French rule until 1758, when it passed into the hands of Britain. In 1758 a body of United Empire Loyalists landed at St John and established a city, called Parr Town (now Sydney), which was incor-porated with Conway (Carleton), under royal charter, as the city of St John. It soon became and has remained the largest town in the province, but heavy military reasons was not the chief cause of the capital (see FREDERICTON). The town's growth was checked by several destructive fires, especially that of June 1877, when half of it was swept away, but it since has been rebuilt in great part of more solid materials.

(W. L. G.)
ST JOHN, an island in the Danish West Indies. It lies 4 m. E. of St. Thomas, is 10 m. long and 2½ m. wide; area 21 sq. m. It is a mass of rugged mountains, the highest of which is Camel Mountain (1270 ft.). Although one of the best watered and most fertile of the Virgin Group, it has little commerce. It is a free port, and possesses in Coral Bay the best harbour of refuge in the Antilles. The village of Cruxbay lies on the northern coast.

Pop. (1901) 925.

ST JOHN, a river of New Brunswick, Canada, rising in two branches, in the state of Maine, U.S.A., and in the province of Quebec. The American branch, known as the Walloostook, flows N.E. to the New Brunswick frontier, where it turns S.E. and for 80 m. forms the international boundary. A little above Grand Falls the St John enters Canada and flows through New Brunswick almost to the Bay of Fundy at St John. Its total length is about 450 m. It is navigable for steamers as far as Fredericton (86 m.), and in spring and early summer for smaller vessels to Grand Falls (220 m.), where a series of falls and rapids form a descent of 70 or 80 ft. Above the falls it is navigable for 65 m. It drains an area of 26,000 sq. m., of which half is in New Brunswick, and receives numerous tributaries, of which the chief are the Aroostook, Allagash, Madawaska (draining Lake Temiscouata in Quebec), Tobique and other streams.

ST JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF THE HOSPITAL OF (Ordo fratrum hospitalarium Hierosolymitano- rum, Ordo militiae Sancti Johannis Baptistae hospitalis Hierosolymitani), known also later as the KNIGHTS OF RHODES and the SOVEREIGN ORDER OF THE KNIGHTS OF MALTA. The history of this order divides itself naturally into four periods: (1) From its foundation in Jerusalem during the First Crusade to its expulsion from the Holy Land after the fall of the Latin kingdom in 1291; (2) from 1300–1310, when the order was established in Rhodes, to its expulsion from the island in 1522; (3) from 1523 to 1798, during which its headquarter was in Malta; (4) its development, as reconstituted after its virtual destruction in 1798, to the present day.

Early Developments.—Medieval legend sets back the beginnings to the days of the Maccabees, with King Antiochus as the founder and Zacharias, father of the Baptist, as one of the first masters; later historians of the order maintained that it was established as a military order contemporaneously with the Latin conquest of Jerusalem, and that it had no connexion with any earlier foundation (so P. A. Paoli, De origine). This view would not hold to the satisfaction of all that the order was connected with an earlier Hospitale Hierosolymitana.1 Such a hospital had existed in the Holy City, with rare interruptions, ever since it had become a centre of Christian pilgrimage. About 1023 certain merchants of Amalfi had purchased the site of the Latin hospice established by Charlemagne, destroyed in 1010 with the other Christian establishments by order of the fanatical caliph Hakim Biamirallah,2 and had founded there a hospital for pilgrims, served by Benedictines and later dedicated to St John the Baptist.3 When, in 1087, the crusaders surrounded the Holy City, the head of this hospital was a certain Gerard or Gerald,4 who earned their gratitude by assisting them in some way during the siege.5 After the capture of the city he used his popularity to enlarge and reconstitute the hospital. If, as M. Le Roux supposes, he had previously been affiliated to the Benedictines, he now left them and adopted for his order the Augustinian rule. Donations and privileges were showered upon the new establishment. Godfrey de Bouillon led the way by granting to it in Jerusalem itself the casal Heselitia (Es Silsilah) and two bakehouses.6 Kings, nobles and prelates followed suit, not in the Holy Land only, but in Provence, France, Spain, Portugal, England and Italy: in Portugal a whole province was in 1114 made over to Gerard and his brethren (Cartul. i. No. 34). In 1123 Pope Paschal II. took the order and its possessions under his immediate protection (bull of Feb. 15th to Gerard, Cartul. i. No. 35). In 1125 the Order was at length confirmed in its possessions by Innocent II. and subsequently by other popes. Gerard indeed, as Pope Paschal called him, the "institutor" of the order, if not its founder. It retained, however, during his lifetime its purely ecleemosynary character. The armed defence of pilgrims may have been part of its functions, but its organization as an aggressive military force was the outcome of special circumstances—the renewed activity of the Saracens—and was the work of Raymond du Puy, who succeeded as grand master on the death of Gerard (3rd of September 1120).7

Not that Raymond can be proved to have given to his order arms and arms, for it is only from its later years that we have any trustworthy evidence as to its activities and possessions. The first proven fact is that in his Rule8 of the division into knights, chaplains and sergeants; indeed, there is no mention of any military duties whatever. It merely lays down certain rules of conduct and discipline for the brethren; what they are to eat, what they are to wear, from what they are to take refuge, and what is the duty of the order in times of poverty and obedience. They are to claim nothing for themselves save bread, water and raiment; and this is to be of poor quality; so that our Lord's poor, whose servants they were henceforward, would not be ashamed to say, "We are barefooted and worldly, for the servant to be proud when his master is humble." Finally, the brethren are to wear crosses on the breast of their capes and mantles, "at Deus peripsum vexillum et fedem et operationem et obedientiam nos custodiat."9 Yet that Raymond laid down military regulations for the brethren is certain. Their underlying principle is revealed by a bull of Pope Alexander III. addressed (1178–1180) to the grand master Roger des Moulins, in which he bids him, "According to the custom of Raymond, abbard, from bearing arms save when the standard of the Cross is displayed either for the defence of the kingdom or in an attack on an "pagan" city."

The statesmanlike qualities of Raymond du Puy rendered his long mastership epoch-making for the order. When it was decided to fortify Ibelin (Beit-Jibrin) as an outpost against attacks from the side of Ascalon, it was to the Hospitalers that the building and defence of the new castle were assigned; and it was the Hospitallers who for many years were the only garrison of the place. The siege of the castle was long and anxious. The Hospitallers craftsmen were enabled to produce iron to the quantity of 150 tons during the siege, and the total expenses of the siege amounted to some 120,000 liras.10

1 Cf. the bull of Pope Celestine II. to Raymond du Puy, in the matter of the Teutonic order, which describes the Hospital as "Hospitale domus Sancti Iohannis Baptistae et sancti Iohannis evangelii..." (Le Roux, Cartulaire, i. No. 154).
2 William of Tyre says that the monastery of Alaric supplied the hospital with a fine flow of water, as the complex was a longue res praeextender Christi pauperum usibus dedicata, tam christianorum quam etiam Saracenorum tempore..." (Le Roux, Cartulaire, i. No. 154).
3 This solution of the much debated question of the connexion of the Hospital with the Benedictine foundation of Sancta Maria Latina is worked out in much detail by M. Delaville Le Roux in his Les Hospiteleter et Terre Sainte, chap. i.
4 According to the legend, he joined the defenders on the walls, and, instead of hurling stones, hurled bread at the Christians, who were short of supplies. Hailed before the Muslim governor, his discoverers were confounded when the incriminating leaves they produced were discovered to be turned into stones.
5 "Fours." So the charter of Baldwin I. (Cartul. No. 20; cf. Cartul. No. 225). In his Hospitallers Le Roux has "tours," i.e. two towers slightly built up in the wall and, instead of hurling stones, hurled bread at the Christians, who were short of supplies. Hailed before the Muslim governor, his discoverers were confounded when the incriminating leaves they produced were discovered to be turned into stones.
6 The existence of a certain Roger as master between Gerard and Raymond, maintained by some historians, is finally disposed of by Raymond himself, who, in his "Regnum mundi per gratiam Dei post obitum domini Giraldi facuss servus pauperum Christi" (Cartul. i. No. 46).
7 For text see Cartulaire, i. No. 70.
8 For text see Cartulaire, i. No. 527.

4 In spite of his fame, nothing is known of his origin. The surname "Tunc" or "Torque" often given to him is, as Le Roux points out, merely the result of a copist's error for "Gerardus tunc..."

5 According to the legend, he joined the defenders on the walls and, instead of hurling stones, hurled bread at the Christians, who were short of supplies. Hailed before the Muslim governor, his discoverers were confounded when the incriminating leaves they produced were discovered to be turned into stones.

6 The date of this can only be approximately assigned, in so far as it is left uncertain by the Euban II. which died in 1153.

7 For text see Cartulaire, i. No. 70.
class to sons born in lawful wedlock of knights or members of knightly families, a rule which applied also to the donzels. For the
sergeant men-at-arms it sufficed that they should not be serfs. Between the officers of the order and the lesser orders of the
Church or work as artisans or as labourers on the farms.

All the higher offices in the order were filled by the knights, except the cardinal chapels—and those of master of the
squires of the order, or worked as artisans or as labourers on the farms.

The habit before Damascus was repaired five years later by the
capture of Ascalon (10th of August 1153), in which Raymond
du Puy and his knights had a conspicuous share.

Meanwhile, in addition to its ever-growing wealth, the order
had received from successive popes privileges which rendered it,
like the companion order of the Temple, increasingly independent
of and obnoxious to the secular clergy. In 1153 Innocent II had
confirmed to Raymond the privileges accorded by Paschal II.,
Callixtus II. and Honorius II., when the diocesan bishops to interdict the
churches of the Hospitallers, whom he also authorized, in case of a general interdict, to
celebrate mass for themselves alone. In 1157 he gave them the
privilege of Christian burial during such interdicts and the right to open
interdicted churches once a year in order to say mass and
collect money. These bulls were confirmed by Eugenius III.,
in 1153 and Anastasius IV. in 1154, the latter adding the permission
for the order to have its own priest, independent of the diocesan bishops.
In vain the patriarch of Jerusalem, attended by a delegation,
journeyed to Rome in 1155 to complain to Adrian IV. of the Hospitallers’ abuse of their privileges and to beg him to withdraw his renewal of his predecessor’s bull.

Far different was the effect produced by Raymond du Puy’s triumphant progress through southern Europe from the spring of 1157 onward. From the popes, the emperor Frederick I.,
kings and nobles, he received fresh gifts, or the confirmation of
old ones. After the 25th of October 1158, when his presence
is attested at Verona, this master builder of the order disappears
from history; he died some time between this date and 1160,
when the name of another grand master appears.

During the three years of his rule at the Hospital, which Gerard
had instituted to meet a local need, had become universal. In
the East its growth was beyond calculation: kings, prelates and
laity had overwhelmed it with wealth. In the West, all Europe
combined to enrich it; from Ireland to Bohemia and Hungary,
from Italy and Provence to Scandinavia, men vied with each
other to attract it and establish it in their midst. It was clear
that for this vast institution an elaborate organization was
needed, and this need was probably the occasion of Raymond’s
presence in Europe. The priory of St Gilles already existed as
the nucleus of the later system; the development of this system took
place after Raymond’s death.

Constitution and Organization.—The rule of the Hospital, as
formulated by Raymond du Puy, was based on that of the Augustinian Canons (q.v.). Its further developments, of which only the
salient characteristics can be mentioned here, were closely analogous
to those of the Templars (q.v.), whose statutes regulating the life
of the brethren, the terms of admission to the order, the maintenance
of discipline, and the scale of punishments, culminating in expulsion,
were always recorded in the Order and treated in the same manner
by those of the Hospital. These, too, were early (probably in
Raymond’s time) divided into three classes: knights (fraters miles),
chaplains (fraters capitellarii), and sergeants (fraters servientes armigeri),
with affiliated brethren (Henocrates) and “donors” (donantes),
the regular subscribers, as it were, to the order in return for its privileges
and the ultimate right to enter the ranks of its knights. Similar,
too, was the aristocratic rule which confined admission to the first

1. **Cartul.** i. No. 136. The arrangement was confirmed by the
bull of 1085 (Le roux, ii. 154), with a modification, closely
analogous to those of the Templars (q.v.), whose statutes regulating
the life of the brethren, the terms of admission to the order, the maintenance
of discipline, and the scale of punishments, culminating in expulsion,
were always recorded in the Order and treated in the same manner
by those of the Hospital. These, too, were early (probably in
Raymond’s time) divided into three classes: knights (fraters miles),
chaplains (fraters capitellarii), and sergeants (fraters servientes armigeri),
with affiliated brethren (Henocrates) and “donors” (donantes),
the regular subscribers, as it were, to the order in return for its privileges
and the ultimate right to enter the ranks of its knights. Similar,
too, was the aristocratic rule which confined admission to the first

1. **Cartul.** i. No. 113.

2. **Ibid.** i. No. 122.

3. **Ib.** i. No. 217.

4. **Ib.** i. No. 226.

5. “This renewal was dated 19th of December 1154” (**Ib.** i. No. 229).

6. The knights were ultimately distinguished as “Knights of Justice” (“chevaliers de justice”) and “Knights of Grace” (“chevaliers de grace”), the former under severe conditions as to birth, and were therefore knights “justly”; the latter were those who were admitted “of grace” for supererogatory merits.

7. An exception was made in favour of the natural sons of counts and greater personages (Statute 7 of 1270; **Cartul.** ii. 3206).

8. Their premier house in Europe was at Sigened in Aragon, which they still occupied. It was granted to them by Sancia of Navarre, queen of Aragon, in 1184, the order being definitively established there in 1188. Their rule, which is that of Augustinian Canons, dates from 1088, and dates from October 1188, is printed by Le Roux, **Cartulaire.** i. No. 899. There is no word about nursing in it. In England the most important house was that at London, built by the Danish house
survives in the Lutheran convent of St John the Baptist at Wetzlar, and is called the Wetzlar house, or, after 1552, a Stift for noble ladies, whose superior has the title of prioress. On solemn occasions a realistic wax head of St John the Baptist on a charger is still produced.

9. Commander (comandore, commandeur), with its Latin translation
preceptor, came into use as the title of these officials somewhat late.
In earlier documents they are styled ospitallas, bajulus (bailiff), etc.

10. Omitting the Anglo-Bavarian langue, created in 1782, the
langues (in the 15th century) were eight in number. They were
(1) the German (grand priory of Toulouse), (2) the Auvergne (grand priory of Auvergne),
(3) the France (grand priory of France), (4) Aquitaine, (Champagne),
(5) Italy (grand priory of Lombardy, Rome, Venice, Pisa, Capua, Barletta, Messina),
(6) Aragon (castellany of Aragon, grand priory of Aragon),
(7) Germany (grand priory of Germany), (8) England (grand priory of England—including Scotland—and Ireland),
(9) Germany (grand priory of Germany or Heitersheim, Bohemia,
Hungary, Dacia—i.e. Scandinavia—and the Bailiwick (Baillet) of
was very great, but not absolute. The supreme legislative and controlling power was vested in the general chapter of the knights, at the periodic meetings of which the great officers of the order had the right to sit and vote and who had also the right to pass statutes binding on the order. The executive power of the grand master, like that of the great dignitaries immediately subordinate to him, was as a rule divided among officers elected for life as the heads of the sub-offices. He was assisted in his exercise by four councils: (1) the "convent" or ordinary chapter, a committee of the general chapter,1 for administrative business; (2) a secret council, for criminal cases and financial affairs; (3) a special council, all composes of grandees of the order, to examine cases of disputed tenure; and (4) the "venerable chamber of the treasury" for financial matters. To the general chapter at headquarters corresponded the chapters of the priories and the commanderies, which conducted the business of the priors and commanders.

Immediately subordinate to the grand master were the seven great dignitaries of the order, known as the conventional bailiffs: the bailli (bailiff, defendant) of Champagne, of which he was the legal representative; the grand master, elected by the chapter at the same time as the grand master and subject to his approval, was the lieutenant in the absence of the latter, empowered to seal for him and, in the event of his capture by the enemy, to act as vice-master. The functions of the bailiff, draper, treasurer and turcopole were practically identical with those of the officials of the same title in the orders of Knights Templars. That of hospitalier, on the other hand, was naturally a charge of exceptional importance in the order of St John; he had a seat of his own, and was responsible for everything concerning the hospital and its affairs.

The admiral, as the name implies, was at sea what the marshal was on land. The office first appears in 1299 when the knights, after their expulsion from the Holy Land, had begun to organize their merchant shipping as a separate body. As the admiral was the equal in rank of the grand master and the great dignitaries, these were practically on the same scale and of the same nature as described in the article Temple. The grand master had the right to nominate his companions and the members of his household (seneschal, squires, secretaries, chaplains, &c.), which, as Le Roux points out, was such as to enable him to figure as the equal of the kings and princes with whom he consorted.

The grand-mastership of Gilbert d'Assia was signalized by the participation of the Hospitallers in the abortive expeditions of Amauric of Jerusalem into Egypt in 1162, 1168 and 1169. On the 10th of August 1164 also they shared in the disastrous defeat in which the preceptor, John of Courtenay, was captured, and of which the defeat was the result of a delegation of the sub-priories of the Holy Land. The important position occupied by them in the councils of the kingdom is shown by the fact that the grand preceptor Guy de Mauny was one of the ambassadors sent in 1169 to ask aid of the princes of the West. Another important development was the bestowal on the order by Bohemund III., prince of Antioch, in 1168, and King Amauric, as regent of Tripoli, in 1170, of considerable territories on the northern frontier, to be held with almost sovereign power as a march against the Saracens (Carlois e), i. Nos. 391, 411. The failure of the expedition to Egypt, however, brought considerable discredit on Gilbert d'Assis, who was succeeded in 1169 by Roulx of Brandenbourg, the latter (1175) by the grand preceptor William de Roulx, who was succeeded in 1184 by the grand preceptor John of Toul, who was succeeded in 1192 by John of Courtenay, the last of the great Hospitallers.

1 This seems to have consisted of practice of the great dignitaries of the order. See Le Roux, Hospitallers, p. 314. 2 Le Roux, p. 314. 3 The word "esquire" is derived from the Latin esquire/essentia/essentia/equester, or the sayd of the esquire (esquire, Lat. siguardium = court) which could be demanded by any knight who thought himself injured by a decision of his superior, even the grand master.

2 The grand-mastership of the Hospitalers was represented in the grand master, who represented the grand master in the West generally.

3 To these the grand bailiff (German, langue) and grand chancellor (castellan) were added later.
submit their disputes in Syria, Cyprus and Armenia to arbitration, a decision which bore fruit in 1260 in the settlement of their differences in Tripoli and Margat. The satisfactory arrangement was possibly affected by the result of a combined attack made in 1259 on the Hospitallers by the Templars and the brethren of St Lazurus and St Thomas, which had resulted in the practical extermination of the aggressors, possibly also by the crushing defeat of the Templars and the Syrian barons by the Turcomans at Tiberias in 1258. The sultan had achieved, the remonstrance was badly needed; for Bibars, having in 1260 driven back the Tartars and established himself in the sultanate of Egypt, began the series of campaigns which ended in the destruction of the Latin kingdom. In 1268 Bibars conquered Antioch, and the Christian power was confined to Acre, Château Pèlerin, Tyre, Sidon, and the castles of Margat, Krak and Bekdâ (Baldel), in which the Hospitallers still held out. The respite afforded by the second crusade of St Louis was ended by his death at Tunis in 1270. On the 30th of March 1271 the great fortress of Krak, the key to the remaining two years of his life Jean de Villiers, who surrendered after a short siege. The crusade of Prince Edward of England did little to avert the ultimate fate of the kingdom, and with it that of the Hospitallers in the Holy Land. This was merely delayed by the preoccupations of Bibars elsewhere, and by his death in 1277. In 1280 the Mongols overran northern Syria; and the Hospitallers distinguished themselves by two victories against enormous odds, one over the Turcomans and one over the emir of Krak (February 1281). The situation, however, was desperate, and the grand master Nicolas Lorgne, who had succeeded Huges de Pélérin on 1277, wrote despairing letters of appeal to Edward I. of England. On the 25th of May 1285, Margat surrendered to the sultan Kalaun (Mansur Saïdaldin). Not even the strong character and high courage of Jean de Villiers, who succeeded Nicolas Lorgne as grand master in 1285, could do more than stave off the ultimate disaster. The Hospitallers assisted in the vain defence of Tripoli, which fell on the 26th of April 1289. On the 18th of May 1291 the Mussulmans stormed Acre, the last hope of the Christians in the Holy Land. Jean de Villiers, wounded, was carried on board a ship, and sailed to Limass in Cyprus, which became the headquarters of the order. For the remaining two years of his life Jean de Villiers was occupied in attempting the reorganization of the shattered order. The demoralization in the East was, however, too profound to admit a ready cure. The knights, represented by the grand dignitaries, addressed a petition to Pope Boniface VIII. in 1295 asking for the appointment of a permanent council of seven divertiriore to control the grand master, who had become more and more autocratic. The pope did not consent; but in a severe letter to the new grand master, Eudes de Pin, he sternly reproved him for the irregularities of which he had been guilty. In 1296 the situation was completely different. The Hospitallers, under prior Grand Master of St Gilles, who for three years after his election remained in Europe, regulating the affairs of the order. In 1300, in response to the urgent remonstrances of the knights, he appeared in Cyprus. In 1299 an unnatural alliance of the Christians and Mongols gave a momentary prospect of regaining the Holy Land; in 1300 the Hospitallers took part in the raid of King Henry II. (de Lusignan) of Cyprus in Egypt, and gained some temporary successes on the coast of Syria. Of more advantage for the prestige of the order, however, were the immense additions of property and privileges which Guillaume de Villaret had secured in Europe from the pope and many kings and princes, and the reform of the rule and drastic reorganization of the order promulgated in a series of statutes between 1300 and 1304, the year of Guillaume's death. Of these changes the most significant was the bestowment of the powers and status of the admiral, a new great dignitary created in 1299. The grand-mastership of Foulques de Villaret, Guillaume's successor, continued until 1317, when Foulques de Villaret was succeeded by his uncle, Guillaume de Saint-Cast.
nephew and successor, was destined to be eventful for the order. On the 5th of June 1305 Bertrand de Got became pope as Clement V. The new pope consulted the grand master of the Templars and Hospitaliers as to the organization of a new crusade, and at the same time raised the question of the fusion of the military orders. This scheme already had been suggested by St. Louis, discussed at the council of Lyons in 1274, and approved by the pope's patron Philip IV. of France. The proposal broke down on the opposition of Jacques de Molay, grand master of the Temple, but the desired result was obtained by other and more questionable means. In October 1307 Philip IV. caused all the Templars in France, including the grand master, to be arrested on charges of heresy and gross immorality; Pope Clement V., a creature of the French king, reluctantly endorsed this action, and at his instance the other sovereigns of Europe followed the example of Philip. The famous long-drawn-out trial of the Templars followed, ending at the council of Vienne in 1314, when Pope Clement decreed the dissolution of the order of the Temple and at the same time assigned the bulk of its property to the Hospital.  

(See Templars, Knights.)

Meanwhile an event had occurred which marks an epoch in the history of the order of the Hospital. In 1306 Fouques de Villaret, anxious to find a centre where the order would be unhampered by obligations to another power as in Cyprus, came to an agreement with a Genoese pirate named Vignolo de' Villoni for a concerted attack on Rhodes and other islands belonging to the Hospitallers. The latter, however, having realized that the conquest of the island is uncertain, nor is it clear that the grand master took a personal part in it. By command of the pope he had left Cyprus for Europe at the end of 1306 or the beginning of 1307, and he did not return to the East till late in 1309. He returned, however, not to Cyprus but to Rhodes, and it is with 1310, therefore, when its headquarters were established in the latter island, that the second period of the history of the order of the Hospital opens.  

The Knights in Rhodes.—The history of the order for the next fifty years is one of expansion and crisis. Certain changes, however, took place which profoundly modified its character. The most important of these was its definitive division into "languages." The beginnings of this had been made long before; but the system was only legalized by the general chapter at Montpellier in 1330. Hitherto the order had been a cosmopolitan society, in which the French element had tended to predominate; henceforth it became a federation of national societies united only for purposes of commerce and war. To the headship of each "language" was attached one of the great dignitaries of the order, which thus came to represent, not the order as a whole but the interests of a section. The motive of this change was probably, as Prutz suggests,  

1 M. Le Roux dates his election between the 23rd of November 1330 and the 19th of December (1330) (1308).  

2 The Templars' property in the Spanish peninsula and Majorca was specially exempted, being subsequently assigned to the sovereigns who transferred some of it to the native military orders. Nor did the Hospitaliers receive by any means all of the rest. Philip IV. charged against the Hospital an enormous bill for expenses incurred in the trial of the Templars, including, as one item, those for torturing the knights. In France at least the Hospitaliers complained that they were actually out of pocket. See Finke, Papstum und Unter- gang des Tempelherrenordens, i, ad fin. None the less, the great accession of territorial property necessitated the subdivision of the great national jurisdictions, notably that of the priory of St. Gilles, into new grand priories.

4 Fouques de Villaret's head seems to have been turned by his success on the island of Cyprus and state manlike qualities gave place to luxury, debauchery and a tyrannical temper. He was ultimately deposed, and died at the castle of Tavron in Languedoc in 1327.  

5 The great dignitaries were distributed as follows: Grand commandeur in chief, France; the grand master; Italy, the grand admiral; Aragon, the grand conservator or draper; England, the turcopoliere; Germany, the grand bailli; Castile, the grand conservator; Portugal, the grand bailli; Spain, the grand conservator.  

6 "Die Anfänge der Hospitaliter auf Rhodos."  

7 Compare the division of the general councils of Basel and Constance into "nations."  

8 See the regulations made, soon after the capture of the island, in the Agenda Rota, an extract of a code, published by Ewald in Neues Archiv iv, pp. 265-269.

fear of the designs of Philip IV. of France and his successors to which point had been given by the fate of the Templars, and the consequent desire to destroy the preponderance of the French element.  

The character and aims of the order were also profoundly affected by their newly acquired sovereignty—for the shadowy overlordship of the Eastern emperor was soon forgotten—and above all by its seat. The Teutonic order had established its sovereignty in Prussia, in wide and ill-defined spheres beyond the north-eastern marches of Germany. The Hospitaliers ruled an island too narrow to monopolize their energies, but occupying a position of vast commercial and strategic importance. Close to the Anatolian mainland, commanding the outlet of the Archipelago, and lying in the direct trade route between Europe and the East, Rhodes had become the chief distributing point for the lively commerce which, in the 13th and 14th centuries, Christian traders maintained with the Mahomedan states; and in the new capital of the order representatives to every language and religion of the Levant jostled, haggled and quarrelled. The Hospitaliers were thus divided between their duty as sovereign, which was to watch over the interests of their subjects, and their duty as Christian warriors, which was to combat the Infidel. In view of the fact that the crusading spirit was everywhere declining, it is not surprising that their policy was henceforth directed less by religious than by political and commercial considerations. Not that they altogether neglected their duty as protectors of the Cross. Their governors continued to export their consul in Egypt and Jerusalem watched over the interests of pilgrims; their hospitals were still maintained for the service of the sick and the destitute. But, side by side with this, secularization proceeded apace. In 1341 Pope Clement VI. wrote to the grand master denouncing the luxury of the order and the misuse of its funds; in 1355 Innocent VI. sent the celebrated Juan Fernandez de Heredia, castellan of Amposta and grand commandeur of Aragon, as his legate to Rhodes, armed with a bull which threatened the order with dissolution if it did not reform in the spirit of the papal decrees. In 1346 the Hospitaliers, in alliance with Venice and Cyprus, had captured Smyrna; but the chief outcome of this had been commercial treaties with their allies. Such treaties were, in fact, a matter of life and death; for the island was not self-supporting, and even towards the Infidel the attitude of the knights was necessarily influenced by the fact that their supplies of provisions were mainly drawn from the Mussulman mainland. By the 15th century their crusading spirit had grown so weak that they even attempted to negotiate a commercial treaty with the Ottoman sultan; but they refused on the refusal of the knights to accept the sultan's suzerainty.  

The earlier history of the Hospitaliers bristles with obscure questions on which modern scholarship (notably the labours of Delaville Le Roux) has thrown new light. From 1355 onward, however, the case is different; the essential facts have been established by writers who were able to draw on a mass of well-ordered materials.  

Their history during the two centuries of the occupation of Rhodes, so far as its general interest for Europe is concerned, is that of a long series of naval attacks and counter-attacks; its chief outcome fell upon the island itself, which owed its survival to gratitude but ill acknowledged, the postponement for some two centuries of the appearance of the Ottomans as a first-rate naval power in the Mediterranean. The seaward advance of Osman the Turk was arrested by their victories; in 1358 they successfully defended Smyrna; in 1365 under their grand master Raymond Béranger (d. 1374), and in alliance with the king of Cyprus, they captured and burned Alexandria. The Ottoman peril, however, grew ever more imminent, and in 1395, under their grand master Phillibert de Naillac, the Hospitaliers considered.  

Philip IV. strenuously opposed the change for this reason: Prutz, Die geistlichen Ritterorden, pp. 358 sqq. Compare the division of the great national jurisdictions of the Hospitallers, as shown in "The Hospitaliers at the Close of the Middle Ages."
ST JOHN OF JERUSALEM

shared in the disastrous defeat of Nicopolis. The invasion followed of Timur the Tatar, invited to his aid by the Eastern emperor. Sultan Bayezid, the victor of Nicopolis, was overthrown; but Timur turned against the Christians and in 1402 captured Smyrna, putting the Hospitallers who defended it to the sword. It was after this disaster that the knights built, on a narrow promontory jutting from the mainland opposite the island of Kos, the fortress of St Peter the Liberator. The castle, which was four times captured and four times reconquered by the Turks (from Bedros, Peter), was long a place of refuge for Christians flying from slavery.1 Some years later the position of the order as a Mediterranean sea-power was strengthened by commercial treaties with Venice, Pisa, Genoa, and even with Egypt (1423). The zenith of its power was reached a few years later, when, under the grand master Jean Bonpar de Lastic, it twice defeated an Egyptian attack by sea (1440 and 1444). A new and more imminent peril, however, arose with the capture of Constantinople by the Turks in 1453, for Mahomed II had announced his intention of making Rhodes his next objective. The Turks, making war for twenty-seven years by the sultan's wars in south-eastern Europe; and meanwhile, in 1476, Pierre d'Aubusson (q.v.), the second great hero of the order, had been elected grand master. Under his inspiration, when in June 1480 the Turks, led by three renegades, attacked the island, the knights made so gallant a resistance that, in July, after repeated and decisive repulses, the Turks retreated. In 1503 Pierre d'Aubusson was succeeded by Aymar d'Amboise, who directed a long series of naval battles. In 1521 the famous Philippe de Villiers de l'Isle d'Adam was elected grand master still stands, its name corrupts the l'Isle d'Aubusson Magistral's directed his attack on Rhodes. In 1523 he besieged the island, reinforcements failed, the European powers sent no assistance, and in 1525 the knights capitulated, and withdrew with all the honours of war to Candia (Crete). The emperor Charles V., when the news was brought to him, exclaimed, "Nothing in the world has been so well lost as Rhodes!" But he refused to assist the grand master in his plans for its recovery, and, instead, five years later (1530), handed over to the Hospitallers the island of Malta and the fortress of Tripoli in Africa.

The Knights in Malta.—The settlement of the Hospitallers in Malta was contemporaneous with the Reformation, which profoundly affected the order. The master and knights of the bailiwick of Brandenburg accepted the reformed religion, without, however, breaking off all connexion with the order (see below). In England, on the other hand, the refusal of the grand prior and knights to acknowledge the royal supremacy led to the confiscation of their estates by Henry VIII., and, though not formally suppressed, the English "langue" practically ceased to exist.2 The knights of Malta, as they came to be known, none the less continued their vigorous warfare. Under Pierre du Tillot, who succeeded Jean de Perellos d'Aubusson in 1534, they took a conspicuous part in Charles V.'s attack on Goletta and Tunis (1535). In 1550 they defeated the redoubtable corsair Dragut, but in 1555 their position in Tripoli, always precarious, became untenable and they capitulated to the Turks under Dragut, concentrating their forces in Malta. In 1557 Jean Parisot de la Vallette (1494-1548) was elected grand master, and under his vigorous rule strenuous efforts were made to put the defences of Malta into a fit state to resist the expected Turkish attack. On the 18th of May 1565 the Ottoman fleet, under Dragut, appeared before the city, and one of the most famous sieges in history began.3 It was ultimately raised on the 8th of September, on the appearance of a large relieving force despatched by the Spanish viceroy of Sicily, after Dragut and 25,000 of his followers had fallen. The memory of La Vallette, the hero of the siege, who died in 1568, is preserved in the rock of Valletta, which was built on the site of the Tedesco.

In 1571 the knights shared in the victory of Lepanto; but this crowning success was followed during the 17th century by a long period of depression, due to internal dissensions and culminating during the 'Thirty Years War, the position of the order being seriously affected by the terms of the peace of Westphalia (1648). The order was also troubled by quarrels with the papacy, who claimed to nominate its officials (a claim renounced by Innocent XII. in 1697), and by rivalry with the Mediterranean powers, especially Venice. In Malta itself there were four rival claimants to independent jurisdiction: the grand master, the English ambassador, the Venetian, and the mayor. The former had succeeded in 1572, and the Society of Jesus, introduced by Bishop Gargallo in 1592. The order, indeed, saw much fighting: e.g. the frequent expeditions undertaken during the grand-mastership of Alof de Vignacourt (1601-1622); the defence of Candia—which fell after a twenty years' siege in 1669—under Nicholas Cottoner, grand master from 1665 to 1680; and, during the grand-mastership of Gregorio Carafa (1650-1690), a campaign (1683) with John Sobieski, king of Poland, against the Turks in Hungary, and the attack in alliance with Venice on the Morea (1686), in which the Venetian Hospitallers were killed in the defeat at Neap- pon in 1689. The decline of the order was hastened by the practice of electing aged grand masters to ensure frequent vacancies; such were Luis Mendez de Vasconcellos (1622-1623) and Antonio da Paula (1623-1636) and Giovanni Paolo Lascaris (de Castellar), in 1636, who died twenty-one years later at the age of ninety-seven. The character of the order at this date became more exclusively aristocratic, and its wealth, partly acquired by commerce, partly derived from the contributions of the commanders scattered throughout Europe, was enormous. The wonderful fortifications, planned by French architects (Crete). The emperor Charles V., when the news was brought to him, exclaimed, "Nothing in the world has been so well lost as Rhodes!" But he refused to assist the grand master in his plans for its recovery, and, instead, five years later (1530), handed over to the Hospitallers the island of Malta and the fortress of Tripoli in Africa.

1 There is a reduction of a photograph of the castle in Bedford and Holbeche's Order of the Hospital, p. 20. The building materials were largely taken from the Mausoleum of the Emperors. It is the headquarters of the revived English 'langue,' Sir John Lawson, prior of Kilmarnock, the headquarters of the order in Ireland, accepted the royal supremacy and was created Lord Clontarf. In 1679 the duke of Ormonde erected the present hospital on the site of the ancient priory. The preceptory of Torphichen, headquarters of the order in Scotland, was surrendered in 1547 by the preceptor, Sir John Clavell, who was afterwards created Lord Clavell. As "Lord of St John he had had precedence of all the barons of Scotland, and this right—originally exercised as a spiritual peer—was retained by him and his successors.

2 The great priory church at Clerkenwell in London was almost wholly destroyed by the Protector Somerset, who used the materials for his palace in the Strand. Only the great gateway, 'Tunbridge Street,' now survives above ground of the priory buildings. It is the headquarters of the revived English 'langue,' Sir John Lawson, prior of Kilmarnock, the headquarters of the order in Ireland, accepted the royal supremacy and was created Lord Clontarf. In 1679 the duke of Ormonde erected the present hospital on the site of the ancient priory. The preceptory of Torphichen, headquarters of the order in Scotland, was surrendered in 1547 by the preceptor, Sir John Clavell, who was afterwards created Lord Clavell. As "Lord of St John he had had precedence of all the barons of Scotland, and this right—originally exercised as a spiritual peer—was retained by him and his successors.

3 In Protestant England public prayers were offered for the success of the knights. Yet a few years later Queen Elizabeth was seeking the alliance of the sultan against Spain, on the ground of their common religion as against 1 the idolators!"
ST JOHN OF JERUSALEM

The Order of St John of Jerusalem was founded in the 11th century to provide medical care and religious services to pilgrims visiting Jerusalem. It was initially known as the Order of the Hospital of St John of Jerusalem, later becoming the Johanniterorden or Knights of St John. The order played a significant role in the history of the Crusades and was closely associated with the expansion of Christianity in the Holy Land.

The order was founded by the Franciscan monk St Hugh of Cluny, who established the first hospital in Jerusalem in 1024. The hospital was later expanded into the Hospitaller Order, which became known for its military prowess and charitable work. The order was the first of the military orders and was headquartered in Jerusalem, where it maintained a strong presence until the late 15th century.

The order was divided into two main branches: the Knights Hospitaller in Jerusalem and the Knights of Malta in Rome. The Knights Hospitaller were responsible for the defense of the Holy Land and the protection of pilgrims, while the Knights of Malta were primarily engaged in the protection of aristocratic pilgrims and the administration of medical care.

The order faced numerous challenges throughout its history, including conflicts with Muslim forces, the decline of the Holy Land, and internal power struggles. Despite these difficulties, the order maintained its presence in the region for over 200 years, until it was expelled by the Ottoman Turks in 1523.

The remains of the order were reconstituted in the 19th century, and the Knights of Malta continues to serve as a charitable and humanitarian organization today. The order is headquartered in Rome and has a worldwide presence, providing aid to those in need and promoting peace and understanding around the globe.
ST JOHNS—SAINT JOSEPH

19

In French...

Hospitaux en Terre Sainte et en Chypre (Paris, 1904), an invaluable work in which many hitherto obscure problems have been solved.

It contains a full list of published authorities. Of English works many will occur to the reader.

The Knights Hospitallers in England (Camden Soc., London, 1857); W. Porter, Hist. of the Knights of Malta (2 vols., 1858, new ed. 1883); and Bedford and Porter, History of the Hospital of St John at Jerusalem (1902), for the modern order.

ST JOHNS, the capital of Newfoundland, situated on the east coast of the island, in the peninsula of Avalon, in 47° 33' 54" N., and 52° 40' 18" W. It is the most easterly city of America, only 1700 m. from Queenstown in Ireland, and 2530 m. from Liverpool.

It stands on rising ground on the north side of a land-locked harbour, about a mile, suddenly walled off from the open ocean by a bar of the fishing vessels, or with the disposal and manufacture of their catch. Steamship lines run to Liverpool, New York, Halifax (N.S.) and Saint Pierre. Nearly all the commerce of the island is sea-borne, and well-equipped steamers connect St Johns with the numerous bays and outports. It is the eastern terminus of the government railway across the island to Port-aux-Basques, whence there is steamer connexion with the mainland at Sydney.

The finest buildings in the city are the Anglican and Roman Catholic cathedrals. Education is controlled by the various religious bodies. Many of the young men complete their studies in Canada or Great Britain. St. John's is not an incorporated town. A municipal council was abolished after having largely increased the debt of the city, and it is now governed by commissioners appointed by the governor in council.

St. John's was first settled by Devonshire fishermen early in the 16th century. It was twice sacked by the French, and captured by them in the Seven Years' War (1762), but recaptured in the same year, since when it has remained in British possession. Both in the War of American Independence and in that of 1812 it was the headquarters of the British fleet, and at one time the west end of the harbour was filled up with American prizes. The old city, built entirely of wood, was twice destroyed by fire (1816–1817 and 1846). Half of it was again swept away in 1892, but new and more substantial buildings have been erected.

The population, chiefly of the Roman Catholic faith and of Irish descent, increases slowly. In 1901 the electoral district of St. Johns contained 39,994 inhabitants, of whom 30,486 were within the limits of the city.

ST JOHNS, a town and port of entry of Quebec, Canada, and capital of St. Johns county, 27 m. S.E. of Montreal by rail, on the river Richelieu and at the head of the Chambly canal. Pop. (1901) 4030. A large export trade in lumber, grain and farm produce is carried on, and its mills and factories produce flour, silk, pottery, hats, &c. Three railways, the Grand Trunk, Canadian Pacific and Central Vermont, enter St. Johns. On the opposite bank of the river is the flourishing town of St. Jean d'Iberville (usually known simply as Iberville), connected with St. Johns by several bridges.

SAINT JOHNSBURY, a township and the county-seat of Caledonia county, Vermont, U.S.A., on the Passumpsic river, about 34 m. E.N.E. of Montpelier. Pop. (1890) 6567; (1900) 7010; (1910) 8652; of the village of the same name (1890) 5666 (1890 foreign-born); (1910) 6693. Area of the township, about 47 sq. m. Saint Johnsbury is served by the Boston & Maine and the Saint Johnsbury & Lake Champlain railways. The farms of the township are devoted largely to dairying. In the village are a Y.M.C.A. building (1885); the Saint Johnsbury Academy (1842); the Saint Johnsbury Athenaeum (1871), with a library (about 18,000 volumes in 1909) and an art gallery; the Fairbanks Museum of Natural Science (1891), founded by Colonel Franklin Fairbanks; St. Johnsbury Hospital (1851); Brightlook Hospital (1899, private); the large scales manufactory of the E & T. Fairbanks Company (see Fairbanks, Erastus), and also manufactories of agricultural implements, steam hammers, granite work, furniture and carriages. There are two systems of water-works, one being owned by the village.

The township of St. Johnsbury was granted to Dr Jonathan Arnold (1741–1793), and associates in 1768. In 1762 a settlement was established and the place was named in honour of Jean Hector Sulur John de Crèvecoeur (1731–1814), who wrote An American Farmer (1783), a glowing description of America, which brought thither many immigrants, and who introduced potato planting into France. The township government was organized in 1790, and the village was incorporated in 1853.

ST JOHN'S WORT, in botany, the generic name for species of Hypericum, especially H. perforatum, small shrubby plants with slender stems, sesaile opposite leaves which are often dotted with pellucid glands, and showy yellow flowers. H. Androsaemum is Tutsan (Fr. lout saine), so called from its healing properties. H. calycinum (Rose of Sharon), a creeping plant with large almost solitary flowers 3 to 4 in. across, is a south-east European plant which has become naturalized in Britain in various places in hedges and thickets.

SAINT JOSEPH, a city and the county-seat of Berrien county, Michigan, U.S.A., on Lake Michigan at the mouth of the Saint Joseph river, near the S.W. corner of the state. Pop. (1890) 3733; (1900) 3155; (1910) 3357. It is the terminus of the railroad from Chicago, and a point where the St. Joseph river enters Lake Michigan. It is the terminus of the Chicago, South Bend, & St. Louis railway. It has a valuable trade in lumber, and is the terminus of the Cleveland, Cincinnati, Chicago & St. Louis railway. The U.S. government has deepened the harbour channel to 18 ft.; and the St Joseph river has been made navigable for vessels drawing 3 ft. from St Joseph to Berrien Springs (25 m. by river). A canal, 1 m. long, extends from the upper part of the river to the lake. At this point a public library is maintained.

The city is a summer and health resort; it has mineral (saline sulphur) springs and a large mineral-water bath house. The general offices and the hospital (1902) of the Michigan Children's Home Society are here. The city has an important trade in fruit, and has various manufactures, including paper, fruit packages, baskets, motor boats, gasolene launches, automobile supplies, hosery and knit goods, air guns and sashes and blinds. The municipality owns and operates its water-works and electric-lighting plant.

On or near the site of the present city La Salle built in 1679 Fort Miamis. In the same county, or on near the site of the present city of Niles (pop. 1910, 5156), French Jesuits established an Indian mission in 1690, and the French government in 1697 erected Fort St. Joseph, which was destroyed in 1713, and which was held by the French even after the Peace of 1763, and in 1761 was seized by a Spanish party from St. Louis. Fort Miami has often been confused with this Fort St Joseph, 60 m. farther up the river. St Joseph was settled in 1829, incorporated as a village in 1836 and first chartered as a city in 1891.

SAINT JOSEPH, a city and the county-seat of Buchanan county, Missouri, U.S.A., and a port of entry, situated in the north-western corner of the state on the E. bank of the Missouri river. It is the third in size among the cities of the state. Pop. (1880) 32,431; (1890) 35,234; (1900) 102,979, of whom 8242 were foreign-born and 6260 were negroes; (1910 census) 77,493. St Joseph is a transportation centre of great importance. It is served by six railways, the Atchison, Topeka & Santa Fe, the Chicago, Burlington & Quincy, the Chicago Great Western, the Chicago, Rock Island & Pacific, the Missouri Pacific, and the St Joseph & Grand Island; in addition there are branch lines and several bridges over the Missouri river. The town is laid out on hills above the bluffs of the river. The site was completely remade, however (especially in 1866–1873), and the entire business portion has been much graded down. The principal public buildings are the Federal building, the court house, an auditorium seating 7000, a Union Station and a...
public library. There are six city parks, of which the largest are Krug Park (30 acres) and Barlett Park (20 acres). The State Hospital (No. 2) for the Insane (opened 1874) is immediately E. of St Joseph; in the city are the Ensworth, St Joseph and Woodson hospitals, a Memorial Home for needy old people and the Home for Little Wanderers. South St Joseph, a manufacturing suburb, has a library and so has the northern part of the city. The greatest stockyards of South St Joseph are sights of the century. In 1860 the manufacturing products of the city and its immediate suburbs was valued at $31,600,736, of which $20,000,332 were credited to slaughtering and packing. In the decade of 1890-1900 the increase in the value of manufactures (165.5%) was almost five times as great in St Joseph as in any other of the largest four cities of the state, and this was due almost entirely to the growth of the slaughtering and meat-packing business, which is for the most part located outside the municipal limits. In 1905 the census reports did not include manufactures outside the actual city limits; the total value of the factory product of the city proper in 1905 was $21,573,720; besides slaughtering and packing the other manufactures in 1905 included the factory made clothing (valued at $1,556,955) flour and gist-mill products (valued at $683,464), saddlery and harness (valued at $524,018), confectionery ($437,000), malt liquors ($267,054), boots and shoes ($350,384) and farm implements.

In 1826 Joseph Robidoux, a French half-breed trader, established a trading post on the site of St Joseph. Following the purchase from the French government of the Missouri Territory in 1803, in 1836, a settlement grew up around this trading post, and in 1843 Robidoux laid out a town here and named it St Joseph in honour of the patron saint of the Catholic Church. Joseph became the county seat of Clay county in 1846, and in 1851 was first chartered as a city. It early became a trading centre of importance, well known as an outfitting point for miners and other emigrants to the Rocky Mountain region and the Pacific coast. During the Civil War it was held continuously by the Unionists, but local sentiment was bitterly divided. After the war a rapid development began. In 1889 St Joseph became a city of the second class. Under the state constitution of 1875 it has had the right, since attaining a population of 100,000, to form a charter for itself. In September 1909, at a special election, it adopted the commission charter described above.

ST JUNIEN, a town of west-central France in the department of Haute-Vienne, on the right bank of the Vienne, 26 m. W. by N. of Limoges on the railway from Limoges to Angoulême. Pop. 17,321. In the collegiate church, a fine example of the Romanesque style of Limousin, contains a richly sculptured tomb of St Junien, the hermit of the 6th century from whom the town takes its name. Another interesting building is the Gothic chapel of Notre-Dame, with three naves, rebuilt by Louis XI., standing close to a medieval bridge over the Vienne. The town, which ranks second in the department in population and industry, is noted for leather-dressing and the manufacture of gloves and straw paper.

SAINT-JUST, ANTOINE LOUIS LÉON DE RICHEBOURG DE (1767-1794), French revolutionary leader, was born at Decize in the Nivernais on the 25th of August 1767. At the outbreak of the Revolution, intoxicated with republican ideas, he threw himself with enthusiasm into politics, was elected an officer in the National Guard of the Aisne, and by fraud—he being yet under age—admitted as a member of the electoral assembly of his district. Early in 1789 he had published twenty cantos of licentious verse, in the fashion of the time, under the title of Organi au Vatican. Henceforward, however, he assumed revolutionistmannish airs. They gave him the nickname of "the beautiful Saint-Just" and pitilessly thorough, became the characteristic of his life. He entered into correspondence with Robespierre, who, flattered by his worship, admitted him to his friendship. Thus supported, Saint-Just became deputy of the department of Aisne to the National Convention, where he made his first speech on the condemnation of Louis XVI.—gloomy, fanatical, remorseless in tone—on the 13th of November 1792. In the Convention, in the Jacobin Club, and among the populace his relations with Robespierre became known, and he was dubbed the "St John of the Messiah of the People." His appointment as a member of the Committee of Public Safety placed him at the centre of the political fever-heat. In the name of this committee he was charged with the drawing up of reports to the Convention upon the absorbing themes of the overthrow of the party of the Girondists (report of the 8th of July 1793), of the Hébertists, and finally, of that denunciation of Danton which consigned him and his followers to the guillotine. What were then called reports were rather appeals to the passions; in Saint-Just's hands they furnished the occasion for a display of fanatical daring, of gloomy eloquence, and of undoubted genius; and—with the shadow of Robespierre behind him—they served their turn. Desmoulins, in jest and mockery, said of Saint-Just—the youth with the beautiful countenance and the long fair locks—"He carries his head like a Holy Sacrament," "And I, savagely replied Saint-Just, "will make him carry his like a Saint Denis." The threat was not vain: Desmoulins accompanied Danton to the scaffold. The same ferocious inflexibility animated Saint-Just with reference to the external policy of France. He proposed that the National Convention should itself, through its committees, direct all military movements and all branches of the government (report of the 10th of October 1793). This was agreed to, and Saint-Just was despatched to Strasbourg, in company with another deputy, to superintend the military operations. It was suspected that the enemy without was being aided by treason within. Saint-Just's remedy was direct and terrible; he followed his experience in Paris, "organized the Terror," and soon the heads of all suspects sent to Paris were falling under the guillotine. But there were no executions at Strasbourg, and Saint-Just repressed the excesses of J. G. Schneider (q.v.), who as public prosecutor to the revolutionary tribunal of the Lower Rhine had ruthlessly applied the Terror in Alsace. Schneider was sent to Paris and guillotined. The conspiracy was defeated, and the armies of the Rhine and Moselle having been inspired by success—Saint-Just himself taking a fearless part in the actual fighting—and having effected a junction, the frontier was delivered and Germany invaded. On his return Saint-Just was made president of the Convention. Later, with the army of the North, he placed before the generals the dilemma of victory over the enemies of France or trial by the dreaded revolutionary tribunal; and before the eyes of the army itself he organized a force specially charged with the slaughter of those who should seek refuge by flight. Success again crowned his efforts, and Belgium was galvanized for France (May, 1794). Meanwhile affairs in Paris looked gloomier than ever, and Robespierre recalled Saint-Just to the capital. Saint-Just proposed a dictatorship as the only remedy for the convulsions of society. At last, at the famous sitting of the 9th Thermidor, he ventured to present as the report of the committees of General Security and Public Safety a document expressing his own views, a sight of which, however, had been refused to the other members of committee on the previous evening. Then the storm broke. He was vehemently interrupted, and the sitting ended with an order for Robespierre's
arrest (see ROBESPIERRE). On the following day, the 28th of July 1794, twenty-two men, nearly all young, were guillotined. Saint-Just maintained his proud self-possession to the last.

ST JUST (at St Just in Penwith), a market town in the St Ives parliamentary division of Cornwall, England, 73 m. by road W. of Penzance. Pop. of urban district (1901) 5646. This is the most westerly town in England, lying in a wild district 1 m. inland from Cape Cornwall, which is 4 m. N. of Land's End. The urban district has an area of 7633 acres, and includes the small industrial colonies near some of the most important mines in Cornwall. The Levant mine is the chief, the workings extending beneath the sea. Traces of ancient workings and several exhausted mines are seen. The church of St Just is Perpendicular in style and dates from the first third of the 14th century. The most notable feature is the richly decorated east window of the chancel.

ST KILD A, a city of Bourke county, Victoria, Australia, 33° m. by rail S. of, and suburban to, Melbourne. Pop. (1901) 20,544. It is a fashionable watering-place on Hobson's Bay, and possesses the longest pier in Australia. The esplanade and the public park are finely laid out; and portions of the sea are fenced in to protect bathers. The town hall, the public library, the assembly hall, and the great Anglican church of All Saints are the chief buildings.

Saint-Lambert, Jean François De (1716-1803), French poet, was born at Nancy on the 26th of December 1716. He entered the army and, when Stanislaus Leszczynski was established in 1737 as duke of Lorena, he became an official at his court at Lunéville. He left the army after the Hanoverian campaign of 1756-57, and devoted himself to literature, producing a volume of descriptive verse, Les Soisons (1769), never now read, many articles for the Encyclopédie, and some miscellaneous works. He was admitted to the Academy in 1770. His fame, however, comes chiefly from his amours. He was already high in the favour of the marquise de Boufflers, Stanislaus's mistress, whom he addressed in his verses as Doris et Thémire, when Voltaire in 1748 came to Lunéville with the marquise de Châtelet. Her infatuation for him and its fatal termination are known to all readers of the life of Voltaire. His subsequent liaison with Madame d'Houdetot, Rousseau's Sophie, though hardly less disastrous to his rival, continued for the whole lives of himself and his mistress. Saint-Lambert's later years were given to philosophy. He published in 1798 le Prince de muses chez toutes les nations ou catéchisme universel, and published his Œuvres philosophiques (1803), two years before his death on the 6th of February 1803. Madame d'Houdetot survived until the 28th of January 1813.

ST LAWRENCE. The river St Lawrence, in North America, with the five fresh-water inland seas (see GREAT LAKES), Superior, Michigan, Huron, Erie and Ontario, forms one of the great river systems of the world, having a length, from the source of the river St Louis (which rises near the source of the river Mississippi and falls into the head of Lake Superior) to Cape Gaspé, where it empties into the Gulf of St Lawrence, of 2100 m. The river is here considered as rising at the foot of Lake Ontario, in 44° 12′ N., 76° 30′ W., where the name of St Lawrence is first applied to it. The river, to the point where it crosses 45° N. in its north-westerly course, forms the boundary line between the state of New York and the province of Ontario; thence to the sea it is wholly within Canadian territory, running through the province of Quebec. At Point des Monts, 260 m. below Quebec, it is 26 m. wide, and where it finally merges into the Gulf of St Lawrence, 150 m. farther on, it is 90 m. wide, this stretch being broken by the large island of Anticosti, lying fairly in the mouth. The character of the river banks varies with the geological formations through which it runs. Passing over the Archaean rocks of the Laurentian from Kingston to Brockville the shores are very irregular, and the river is here bordered by a cordon of glaciated summits of the granites and gneisses into a large number of picturesque islands, "The Thousand Islands," greatly frequented as a summer resort. From Brockville to Montreal the river runs through flat-bedded Cambro-silurian limestones, with rapids at several points, which are all run by flight-draught passenger boats. For the up trip the rapids are avoided by canalization. From Montreal to Three Rivers the course is through an alluvial plain over-lying the limestones,
the river at one point expanding into Lake St Peter, 20 m. long by 10 m. wide, with a practically uniform depth of 10 ft. Below Three Rivers the banks grow gradually higher until, after passing Quebec through a cleft in slate rocks of Cambrian age, the river widens, washing the feet of the Laurentian Mountains on its north shore; while a moderately hilly country, terminating in the Shickshock Mountains of the Gaspé Peninsula, skirts its south shore.

From Kingston, at the head of the river, to Montreal, a distance of 170 m., navigation is limited to vessels of 14 ft. draft by the capacity of the canals. From Montreal to Quebec, 160 m., a ship channel has been dredged to a depth of 30 ft.; below Quebec the river is tidally navigable by vessels of any draught. The canals on the St Lawrence above Montreal have been enlarged to the capacity of the Welland canal, the improved system having been opened to commerce in the autumn of 1899. Instead of enlarging the Beauharnois canal, on the south side of the river, a new canal, the "Soulanges," was built from Coteau Landing to Cascades Point, on the north side, the Beauharnois canal still being used for small barges. The locks of the enlarged canals are all 45 ft. wide, with an available depth of 14 ft. and a minimum length of 270 ft. The following table shows the canalized stretches in this portion of the river—

In the stretch between Montreal and Quebec the ship channel, begun by the Montreal Harbour Commissioners, has been assumed by the Dominion government as a national work, and improvements, involving extensive dredging, have been undertaken with the aim of securing everywhere a minimum depth of 30 ft. with a minimum width of 450 ft. The whole river from Kingston to the sea is well supplied with aids to navigation. In the dredged portions lights are arranged in pairs of leading lights on foundations sufficiently high and solid to resist the pressure of ice movement, and there is an elaborate system of fog alarms, gas-lighted and other buoys, as well as telegraphic, wireless and telephonic communication, storm signal, weather and ice reporting stations and a life-saving service.

Montreal, at the head of ocean navigation, the largest city in Canada, is an important distributing centre for all points in western Canada, and enjoys an extensive shipping trade with the United Kingdom, the sea-going shipping exceeding 1,500,000 tons, and the inland shipping approximating 2,000,000 tons, annually. Quebec is the summer port used by the largest steamers in the Canadian trade. There are numerous flourishing towns on both banks of the river, from Kingston, a grain transferring port, to the sea. Large quantities of lumber, principally spruce (fir) and paper pulp, are manufactured at small mills along the river, and shipped over sea directly from the place of production. The mail steamers land and embark mails at Rimouski, or from which they are conveyed by rail along the south shore.

The importance to Canada of the river St Lawrence as a national trade route cannot be over-estimated. As a natural highway between all points west of the Maritime Provinces and Europe it is unique in permitting ocean traffic to penetrate 1000 m. into the heart of a country. It is, moreover, the shortest freight route from the Great Lakes to Europe. From Buffalo to Liverpool via New York involves rail or 7-ft. canal transport of 406 m. and an ocean voyage of 3034 nautical miles. Via Montreal there is a 14-ft. transport of 348 m. and river and ocean voyage of 2772 nautical miles. From Quebec to Liverpool by Cape Race is 2801 nautical miles, while the route by Belle Isle, more nearly a great circle course, usually taken between July and October, is only 2633 nautical miles. On the other hand, time taken for the passage of the first vessel from sea and the departure of the last ocean vessel is seven months. From Kingston to Quebec the river freezes over every winter, except at points where the current is rapid. Below Quebec, although there is heavy border ice, the river never freezes over. For a few winters, while the bridge accommodation at Montreal was restricted to the old single-track Victoria bridge, railway freight trains were run across the ice bridge on temporary winter tracks. Efforts have been made to lengthen the season of navigation by using specially constructed steamers to break the ice; and it is claimed that the season of navigation could be materially lengthened, and winter floods prevented by keeping the river open to Montreal. Winter ferries are maintained at Quebec, between Prince Edward Island and Nova Scotia, and between Newfoundland and Sydney, Cape Breton. In the winter of 1898-1899 an attempt was made to run a winter steamer from Paspebic to England, but it was not successful, principally because an unsuitable vessel was used. To pass through the field of ice that is always in the gulf, in greater or less quantity, specially strengthened vessels are required.

The river above tide water is not subject to excessive flooding, the maximum rise in the spring and early summer months being not more than fifteen feet. From the harbors tributaries of the Ottawa eastward, being 10 ft. The Great Lakes serve as impounding reservoirs for the gradual distribution of all overflows in the west. At Montreal, soon after the river freezes over each winter, there is a local rise of about 10 ft. in the level of the water in the harbour, caused by restriction of the channel by anchor ice; and in the spring of the year, when the volume of the water is augmented, this obstruction leads to a further rise, in 1886 reaching a height of 27 ft. above ordinary low water. To prevent flooding of the lower parts of the city a dike was in 1887 built along the river front; which prevented a serious flooding in 1889.

Tides enter the Gulf of St Lawrence from the Atlantic chiefly through Cabot Strait (between Cape Breton and Newfoundland), which is 75 m. wide and 250 fathoms deep. The tide entering through Belle Isle Strait, 10 m. wide and 30 fathoms deep, is comparatively little felt. The tidal undulation, in passing through the gulf, expands so widely as to be almost imperceptible in places, as for example, at the Magdalen Islands, in the middle of the gulf, where the range amounts to about 3 ft. at springs, becoming effaced at neaps. There is also little more tide than this at some points on the north shore of Prince Edward Island. The greatest range is attained in Northumberland Strait and in Chaleur Bay, where it amounts to 10 ft. At the entrance to the estuary at Anticosti it has again the oceanic range of about 6 ft., and proceeds up the estuary with an ever-increasing range, which attains its maximum of 10 ft. at the lower end of Orleans Island, 650 m. from the ocean at Cabot Strait. This must be considered the true head of the estuary. At Quebec, 30 m. farther up, the range is nearly 10 ft.; but at 90 m. above Quebec it is largely cut off by the Richelieu Rapids, and finally ceases to be felt at Three Rivers, at the lower end of Lake St Peter, 760 m. from the ocean.

The St Lawrence provides ample water-power, which is being increasingly used. Its rapids have long been used for milling and saw. The St Lawrence is deep enough for the passage of Lachine Rapids and furnishes electricity to Montreal; the falls of Montmorency light Quebec and run electric street cars; and from Lake Superior to the gulf there are numerous points on the tributaries to the St Lawrence where power could be used.

Nearly all the rivers flowing into the St Lawrence below Quebec are stocked with salmon (Salmo salar), and are preserved and leased to anglers by the provincial government. In the salt
ST LEGER—ST LEONARDS 23

water of the gulf and lower river, mackerel, cod, herring, smelt, sea-trout, striped bass and other fish are caught for market.

The St Lawrence is spanned by the following railway bridges:
(1) A truss bridge built near Cornwall in 1900 by the New York & Ottawa railroad, now operated by the New York Central railroad.
(2) A truss bridge with a swing, built in 1890 by the Canada Atlantic railway at Coteau Landing.
(3) A cantilever bridge built in 1887 by the Canadian Pacific railway at Caughnawaga.
(4) The Victoria Jubilee bridge, built as a tubular bridge by the Grand Trunk railway in 1860, and transformed into a truss bridge in 1889-1890.
(5) A very large cantilever bridge, having a central span of 1800 ft., crosses the river at a point 7 m. above Quebec.

The southern half of the superstructure, while in course of erection in August 1907, fell, killing 78 men, and necessitating a serious delay in the completion of the work.

The river St Lawrence was discovered by Jacques Cartier, commissioned by the king of France to explore and trade on the American coast, he entered the mouth of the St Lawrence in 1534, but Breton fishermen had previously resorted there in summer and penetrated as far as Brest, eleven leagues west of Blanche Sablon, the dividing line between Quebec and Labrador. Cartier circled the whole gulf, but missed the entrance to the river. On his second voyage in 1536 he named a bay on the north shore of the gulf, which he entered on the 10th of August, the feast of St Lawrence, Baye Saint Laurent, and the name gradually extended over the whole river, though Cartier himself always wrote of the River of Canada. Early in September, he reached "Canada," now Quebec, and on the 2nd of October reached Hochelaga, now Montreal. No permanent settlement was then made.

The first, Tadoussac, at the mouth of the Saguenay, was established by Champlain in 1603, and Quebec was settled by him in 1608. Between that time and 1616 Champlain explored the whole river system as far west as Lake Huron, reaching it by way of the Ottawa river, and taking possession of the country in the name of the king of France. It became British by the treaty of Paris, in 1763.

(W. P. A.)

ST LEGER, SIR ANTHONY (c. 1496-1559), lord deputy of Ireland, eldest son of Ralph St Leger, a gentleman of Kent, was educated abroad and at Cambridge. He quickly gained the favour of Henry VIII., and was appointed in 1537 president of a commission for inquiring into the condition of Ireland. This work he carried out with ability and obtained much useful knowledge of the country. In 1540 he was appointed lord deputy of Ireland. His first task was to repress disorder, and he at once proceeded with severity against the Kavagnahs, permitting them, however, to retain their lands, on their accepting feudal tenure on the English model. By a similar policy he exacted obedience from the O'Mores, the O'Tooles and the O'Mahony, the latter being on the defendant side in the Donoughmore case and having conciliated the O'Briens in the west and the earl of Desmond in the south. The lord deputy carried an act in the Irish parliament in Dublin confirming the title of king of Ireland on Henry VIII. and his heirs. Conn O'Neill, who in the north had remained sullenly hostile, was brought to submission by vigorous measures. For the most part, however, St Leger's policy was one of moderation and conciliation—rather more so, indeed, than Henry VIII. approved. He recommended The O'Brien, when he gave token of a subversive disposition, for the title of earl of Thomond; O'Neill was created earl of Tyrone; and administrative council was instituted in the province of Munster; and in 1544 a levy of Irish soldiers was raised for service in Henry VIII.'s wars. St Leger's personal influence was proved by an outbreak of disturbance when he visited England in 1544, and the prompt restoration of order on his return some months later. St Leger retained his office under Edward VI., and again effectually quelled attempts at rebellion by the O'Connors and O'Byrnes. From 1548 to 1550 he was in England. He returned charged with the duty of introducing the reformed liturgy into Ireland. His conciliatory methods brought upon him the accusation that he lacked zeal for the reformation, and led to his recall in 1551. After the accession of Mary he was again appointed lord deputy in October 1553, but in consequence of a charge against him of keeping false accounts he was recalled for the third time in 1556. While the accusation was still under investigation, he died on the 16th of March 1559.

By his wife Agnes, daughter of Hugh Warham, a niece of Archbishop Warham, he had three sons, William, Warham and Anthony. William died in his father's lifetime leaving a son, Sir Warham St Leger (d. 1600), who was father of Sir William St Leger (d. 1643), president of Munster house, one of the "flight of the earls" (see O'NEILL) in 1607, and spent several years abroad. Having received a pardon from James I. and extensive grants of land in Ireland, he was appointed president of Munster by Charles I. in 1627. He warmly supported the arbitrary government of Strafford, actively assisting in raising and drilling the Irish levies destined for the service of the king of the Parliament. In the great rebellion of 1641 he bore the chief responsibility for dealing with the insurgents in Munster; but the forces and supplies placed at his disposal were utterly inadequate. He executed martial law in his province with the greatest severity, hanging large numbers of rebel, often without much proof of guilt. He was still struggling with the insurrection when he died at Cork on the 2nd of July 1642. Sir William's daughter Margaret married Murrough O'Brien, 1st earl of Inchiquin; his son John was father of Arthur St Leger, created Viscount Donorle in 1703.

ST LEONARDS, EDWARD BURTENSHEAD SUGDEN, 1ST BARON (1781-1875), lord chancellor of Great Britain, was the son of a hairdresser of Duxford Street, Westminster, and was born on the 12th of February 1781. After practising for some years as a barrister, he went to the bar at Lincoln's Inn in 1807, having already published his well-known work on the Law of Vendors and Purchasers (14th ed., 1862). In 1822 he was made king's counsel and chosen a bencher of Lincoln's Inn. He was returned at different times for various boroughs to the House of Commons, where he made himself prominent by his opposition to the Reform Bill of 1832. He was appointed solicitor-general in 1829, was named lord chancellor of Ireland in 1834, and again filled the same office from 1841 to 1846. Under Lord Derby's first administration in 1852 he became lord chancellor and was raised to the peerage as Lord St Leonards. In this position he devoted himself with energy and vigour to the reform of the law; Lord Derby on his return to power in 1858 again offered him the same office, which from considerations of health he declined. He continued, however, to take an active interest especially in the legal matters that came before the House of Lords, and bestowed his particular attention on the reform of the law of property. He died at Boyle Farm, Thames Ditton, on the 29th of January 1875.
After his death his will was missing, but his daughter, Miss Charlotte Sugden, was able to recollect the contents of a most intricate document, and in the action of Sugden v. Lord St Leonards (L.R. 1 P.D. 154) the court accepted her evidence and granted probate of a paper propounded as containing the provisions of the lost will. This decision established the proposition that the contents of a lost will may be proved by secondary evidence, even of a single witness.

Lord St Leonards was the author of various important legal publications, many of which have passed through several editions. Besides the treatise on purchasers already mentioned, they include Power's, Cases decided by the House of Lords, Gilbert on Uses, New Real Property Law and Handbook of Property Law, Misrepresentations in Campbell's Lives of Lyndhurst and Brougham, corrected by St Leonards. See The Times (30th of January 1875); E. Manson, Builders of our Law (1904); J. R. Atlay, Lives of the Victorian Chancellors, vol. III.

ST LIZIER-DE-COUSERANS, a village of south-western France in the department of Ariège on the right bank of the Salat, 1 m. N.N.W. of St Girons. Pop. (1906) 615; commune 1205. St Lizier, in ancient times one of the twelve cities of Novempopulania under the name of Lugdunum Consororum, was later capital of the Couserans and seat of a bishopric (suppressed at the Revolution) to the holders of which the town belonged. It has a cathedral of the 12th and 14th centuries with a fine Romanesque-styled facade flanked by two remarkable arches of Roman remnants. The old episcopal palace (17th century) and the adjoining church (14th and 17th centuries), once the cathedral with its fine chapter-hall (12th century), form part of a lunatic asylum. The Salat is crossed by a bridge of the 12th or 13th century. The town owes its name to its bishop Lycerus, who is said to have saved it from the Vandals in the 7th century. The chief event in its history was its devastation in 1350 by Bernard III., count of Comminges, a disaster from which it never completely recovered.

ST LÔ, town of north-western France, capital of the department of Manche, 47 s. m. W. of Caen by rail. Pop. (1906) town 9379; commune, 12,381. St Lô is situated on a rocky hill on the right bank of the Vire. Its chief building is the Gothic church of Notre-Dame, dating mainly from the 16th century. The façade, flanked by two lofty towers and richly decorated, is impressive, despite its lack of harmony. There is a Gothic pulpit outside the choir. In the hôtel-de-ville is the "Torigini marble," the pedestal of an ancient statue, the inscriptions on which relate chiefly to the annual assemblies of the Gallic deputés held at Lyons under the Romans. The modern chief buildings are the town hall; the other public buildings belonged to the church of an ancient Benedictine abbey. St Lô is the seat of a prefect and has tribunals of first instance and of commerce, a training college for masters, a school of drawing, a branch of the Bank of France, a chamber of arts and manufactures, and a government stud. The town has trade in grain, fat stock, troop-horses and farm produce, and carries on tanning, wool-spinning and bleaching and the manufacture of woollen and other fabrics.

St Lô, called Brière in the Gallo-Roman period, owes its present name to St Lô (Lauda), bishop of Coutances (d. 568). In the middle ages St Lô became an important fortress as well as a centre for the weaving industry. It sustained numerous sieges, the last in 1574, when Richelieu's army was in occupation; 124 men, 272 horses, and 10,000 sheep were captured, and the Catholics and many of its inhabitants massacred. In 1800 the town was made capital of its department in place of Coutances.

ST LOUIS, the chief city and a port of entry of Missouri, and the fourth in population among the cities of the United States, situated on the W. bank of the Mississippi river, about 20 m. below its confluence with the Missouri, 200 m. above the influx of the Ohio, and 1270 m. above the Gulf of Mexico, occupying a land area of 65-750 acres. In a commanding central position, it is the great drainage basin of the Mississippi system, the richest portion of the continent. Pop. (1880) 350,518, (1890) 451,779, (1900) 575,238, (1910) 687,029.

The central site is marked by an abrupt terraced rise from the river to an easily sloping tableland, 4 or 5 m. long and somewhat less than 1 m. broad, behind which are rolling hills. The length of the river-front is about 1500 ft. The average elevation of the city is more than 425 ft.; and the recorded extremes of low and high water on the river are 379 and 428 ft. (both established in 1844). The higher portions of the city lie about 60 ft. above the river level, and in general the site is so elevated that there can be no serious interruption of business except by extraordinary floods. The natural drainage is excellent, and the sewerage system, long very imperfect, has been made adequate. The street plan is approximately rectilinear. The stone-paved wharf or river-front, known as the Levee or Front Street, is 3-7 m. long. Market Street, running E. and W., is regarded as the central thoroughfare; and the numbering of the streets is systematized according to the line of the river. Broadway (or Fifth Street, from the river) is the most important street. The shopping centres; Washington Avenue, First (or Main) and Second Streets are devoted to wholesale trade; and Fourth Street is the financial centre. The most important public buildings are the Federal building, built of Maine granite; the county court house (1839-1862, $1,199,872)—a semi-classic, plain, massive stone structure, the Four Courts (1871, $75,000), built of cream-coloured Joliet stone, and a rather effective city hall (1890-1904, $2,000,000), in Victorian Gothic style in brick and stone. The chief slave-market before the Civil War was in front of the Court House. The broad avenue fronted by quasi-classic public edifices and the Tudor-Gothic building of the Washington University, are perhaps the most satisfying structures in the city architecturally. Among other noteworthy buildings are the Public Library, the Mercantile Library, the Mercantile, the Mississippi Valley, the Missouri-Lincoln, and the St Louis Union Trust Company buildings; the German-Renaissance home of the Mercantile Club; the florid building of the St Louis Club; the Merchants' Exchange; the Missouri School for the Blind; the Coliseum, built in 1897 for conventions, horse shows, &c., torn down in 1907 and rebuilt in Jefferson Avenue; and the Union Station, used by all the railways entering the city. This was opened in 1894, and cost, including the site, $6,500,000; has a train-shed with thirty-two tracks, covers some eleven acres, and is one of the largest and finest railway stations in the world. The city owns a number of markets. In 1907 a special architectural commission, appointed to supervise the construction of new municipal buildings, purchased a site adjacent to the City Hall, for new city courts and jail, which were begun soon afterwards.

The valley of Mill Creek (once a lake bed, "Chouteau Pond," and afterwards the central sewer) traverses the city from W. to E. and gives entry to railways coming from the W. into the Union Station. The terminal system for connecting Missouri with Illinois includes, in addition to the central passenger station, vast centralized freight warehouses and depots; an elevated railway along the levee; passenger and freight ferries across the Mississippi with railway connections; two bridges across the river; and a tunnel leading to one of them under the streets of the city along the river front. The Merchants' Bridge (1887-1890, $3,000,000), used solely by the railways, is 1368-5 ft. long in channel span, with approaches almost twice as long. The Eads Bridge (1869-1874; construction cost $5,356,730, total cost about $10,000,000) is 3 m. farther down the river; it carries both wagon ways and railway tracks, is 1627 ft. clear between shore abutments, and has three spans. Built entirely of steel above the piers, it is a happy combination of strength and grace, and was considered a marvel when erected.

St Louis has exceptionally fine residential streets which are accounted among the handsomest in the world. The most notable are Portland Place, Westmoreland Place, Van Venderer Place, Kingsbury Place, &c., in the neighbourhood of Forest Park: broad parked avenues, closed with ornamental gateways, and flanked by large houses in fine grounds. The park system of the city is among the finest in the country, containing in 1910 2641-5 acres (cost to 1900, $6,417,745). Forest Park (1372 acres), maintained mainly in a natural, open-country state, is the largest single member of the system. In one of its oldest was the Missouri Purchase Exposition in 1904. Tower Grove Park (274 acres) and the Missouri Botanical Gardens.
the former home of William T. Harris, and for many years has been recognized as one of the best in the United States.

The first permanent kindergarden in the country in conjunction with the Teachers College Schools of Teachers College (Riggs)," the superintendent of schools, and Miss Susan Ellen Blow. The first public kindergarden training school was established at the same time. There is a teachers' college in the city school system, and there are special schools for handicapped children. Several school buildings have been successfully used as civic centres. The city has an excellent educational museum, material from which is available for the use of teachers in the public schools...

It was college 1905 statues of Columbus, Shakespeare (Tower Grove Park) and Napoleon (Lafayette Park); Terry's (Stephen W. T.) collection of sculptures associated with St Louis or Missouri. There are various lake, river and hillside pleasure-resorts near the city; and there are other parks. King's Highway is a boulevard (partially completed in 1910) from the Mississippi on the S. to the Mississippi on the N., crossing the western part of the city. In accord with a general movement in American cities late in the 19th century, St Louis made a beginning in the provision of small "neighbourhood parks," intended primarily to better the lives of the city's poor, and vacation playgrounds for children; and for this purpose five blocks of tenements were condemned by the city. In the different parks and public places are statues of Columbus, Shakespeare (Tower Grove Park) and Napoleon (Lafayette Park); Terry's (Stephen W. own factors. The gross cotton movement continues to increase, but the field of supply has been progressively lessened by the development of Galveston and other ports on the gulf. As a grain and stock market St Louis has felt the competition of Kansas City and St Joseph.

River and railway transportation built up in turn the commanding commercial position of the city. The enormous growth of river traffic in the decade before 1860 gave it at the opening of the Civil War an incontestable primacy in the West. In 1810 about twenty independent railway systems, great and small (including two terminal roads within the city), gave outlet and inlet to commerce at St Louis; and of these fifteen are among the greatest. The river traffic of the Western, the Chicago, Burlington & Quincy, the Chicago & Alton, the Cleveland, Cincinnati, Chicago & St Louis, the St Louis & San Francisco, the Illinois Central, the Missouri, Kansas & Texas, the Missouri Pacific, the Pennsylvania, the St Louis South-Western, the Southern, the Wabash, the Louisville & Nashville, the Mobile & Ohio, and the Toledo, St Louis & Western. The construction of the Missouri Pacific Railway system was begun at St Louis in 1830, and various other roads were started in the next two years. For several decades railway development continued. Increased the commercial primacy of the city in the southern Mississippi Valley, but in more recent years the concentration of roads at Kansas City enabled that place to draw from the west and south-west an immense trade once held by St Louis. River freighting is of very slight importance. St Louis is a port of entry for foreign commerce; its imports in 1907 were valued at $7,442,567; in 1908 at $6,362,770.

The population of St Louis in 1840 was 16,460; in 1850 it was 77,860 (seventh in size of the cities of the country); in 1860, 166,773; in 1870, 310,864 (third in size); in 1880, 330,918; in 1890, 451,779; in 1900, 575,238; and in 1910, 657,029. Since 1861 it has been fourth in population among the cities of the United States. Of the population of 1900 (575,238) 111,356 were foreign-born and 35,516 were negroes. Of the foreign-born in 1900, 58,783 were Germans, 19,421 were Irish, 5,800 were English, 4,785 Russian. In 1900, 147,746 inhabitants of St Louis were children of German parents.

Under the state constitution of 1875 St Louis, as a city of 100,000 inhabitants, was authorized to frame its own charter, and also to separate from St Louis county. These rights were exercised in 1876. The General Assembly of the state holds the same powers over the entire area of the city as over other cities. The electorate may pass upon proposed amendments to the charter at any election, after due precedent publication thereof. The mayor holds office for four years. In 1823 the mayor was first elected by popular vote and the municipal legislature became unicameral. The bicameral system was again adopted in 1839. The municipal assembly consists of a Council of 13 chosen at large for four years—half each two years—and a House of Delegates, 28 in number, chosen by wards for two years. A number of chief executive officers are elected for four years; the mayor and Council appoint others, and the appointment is made at the middle of the mayor's term in order to lessen the immediate influence of municipal patronage upon elections. Single commissioners control the parks, streets, water service, harbour and wharves, and sewers, and these constitute, with the mayor, a board of public improvement. Under an enabling act of 1907 the municipal assembly in 1909 created a public service commission, of three members, appointed by the mayor. The measure of control exercised by the state is important, the governor appointing the excise (liquor-licence) commissioner, the board of circuit commissioners, the inspector of petroleum and of tobacco, and (since 1861) the police board. St Louis is normally Republican in politics, and Missouri Democratic. Taxes for state and municipal purposes are collected by the city. The school board, as in very few other cities of the country, has independent taxing power. The city owns the steamboat landings and draws a small revenue from their rental. The heaviest expenses are for streets and parks, debt payments, police and education. The bonded debt in 1910 was $27,815,312, and the assessed valuation of property in that year was $530,207,640. The city maintains hospitals, a poor-house, a reformatory work-house, an industrial school for children, and an asylum for the insane.

The water-supply of the city is derived from the Mississippi, and is therefore potentially inexhaustible. Settling basins and a coagulant chemical plant (1904) are used to purify the water before distribution. After treatment the water was supplied to the city by means of a system of fifteen thousand miles of water-works, under the direction of the city, and owned by the city. The street railways are controlled—since a state law of 1899 permitted their consolidation—by one corporation, though a one-share, universal transfer 5-cent rate is in general operation. A single corporation has controlled the gas service from 1846 to 1873 and since 1890, though under no exclusive franchise; and the city has not the right of purchase.

St Louis was settled as a trading post in 1764 by Pierre Laclede Liguest (1724-1778), representative of a company to which the French crown had granted a monopoly of the trade of the Missouri river country. When, by the treaty of Paris of 1763, the borders of Louisiana fell to the United States, St Louis was ceded by France to Great Britain, many of the French inhabitants of the district of the Illinois removed into the portion of Louisiana W. of the river, which had passed in 1762 under Spanish sovereignty; and of this lessened territory of upper Louisiana St Louis became the seat of government. In 1767 it was a log-cabin village of perhaps 500 inhabitants. Spanish rule became an actuality in 1770 and continued until 1804, when it was momentarily supplanted by French authority—existent theoretically since 1800—and then, after the Louisiana Purchase, by the sovereignty of the United States. In 1780 the town was attacked by Indian allies of Great Britain. Canadian-Frenchhunters and trappers and boatmen, a few Spaniards and other Europeans, some Indians, more half-breeds, and a considerable body of Americans and negro slaves made up the motley population that became inhabitants of the United States. The fur trade was growing rapidly. Under American rule there was added the trade of a military supply-point for the Great West, and in 1817-1819 steamship traffic was begun with Louisville, New Orleans, and the lower Missouri river. Meanwhile, in 1808, St Louis was incorporated as a town, and in 1823 it became a city. The city charter, which was in existence from 1823 to 1858, marked the beginning of its great prosperity, and the decade 1850-1860 was one of colossal growth, due largely to the river trade. All freights were being moved by steamship as early as 1825. The first railway was begun in 1850. At the opening of the Civil War the commercial position of the city was most commanding. Its prosperity, however, was dependent upon the prosperity of the South, and received a fearful set-back in the war. When the issue of secession or adherence to the Union had been made up in 1861, the outcome in St Louis, where the fate of the state must necessarily be decided, was of national importance. St Louis was headquarters for an army department and contained a great national arsenal. The secessionists tried to manœuvre the state out of the Union by strategy, and to seize the arsenal. The last was prevented by Congressman Francis Preston Blair, Jr., and Captain Nathaniel Lyon, first a subordinate and later commander at the arsenal. The garrison was strengthened; in April the president entrusted Blair and other loyal civilians with power to enlist loyal citizens, and put the city under martial law if necessary; in May ten regiments were ready—made up largely of German-American Republican charter became Democratic in March 1861; early thirties then—when force became necessary to secure election rights to anti-slavery men—semi-military, and which now were quickly made available for war; and on the 10th of May Captain Lyon surrounded and made prisoners a force of secessionists quartered in Camp Jackson on the outskirts of the city. A street riot followed, and 28 persons were killed by the volleys of the military. St Louis was held by the Union forces throughout the war.
ST LOUIS—ST LUCIA

During a quarter century following 1857 the city was the centre of an idealistic philosophical movement that has had hardly any counterpart in American culture except New England transcendentalism. Its founders were William T. Harris (p. e.) and Henry C. Brockmeyer (b. 1828), who was Lieutenant-governor of the state 1867-1868. A. Bronson Alcott was one of the early adherers to the group which gathered around these two, a group which studied Hegel and Kant, Plato and Aristotle. Brockmeyer published excellent versions of Hegel's Unabridged Logic, Phenomenology, and Psychology. Harris became the greatest of American exponents of Hegel. Other members of the group were Thomas Davidson (1840-1900), Adolph E. Kroeger, the translator of Fichte, Anna Callender Brackett (b. 1836), who published in 1886 an English version of Rosenkranz's History of Education, Denton Jacques Snider (b. 1841), whose best work has been on Fichte, and William McKendree Bryant (b. 1843), who wrote Hegel's Philosophy of Art (1879) and Hegel's Educational Ideas (1896). This Philosophical Society published (1867-1883) at St Louis The Journal of Speculative Philosophy, the first periodical of the sort in English.

Since the war the city's history has been signalized chiefly by economic development. A period in this was auspiciously closed in 1904 by the holding of a world's fair to celebrate the centennial of the purchase from France, in 1803, of the Louisiana territory—since then divided into 13 states, and containing in 1900 some 12,500,000 inhabitants. Preparations for this Louisiana Purchase Exposition began three years earlier. Its structures, buildings, and grounds, which took up the site covering 1240 acres, of which 250 were under roof. The total cost, apart from individual exhibitions, was about $4,500,000, of which the national government contributed $5,000,000 and the city of St Louis and its citizens $10,000,000. Altogether 12,804,616 paid admissions were collected (total admissions 19,694,855) during the seven months that it was open, and there was a favourable balance at the close of about $1,000,000.

Up to 1848 St Louis was controlled in politics almost absolutely by the Whigs; since then it has been more or less evenly contested by the Democrats against the Whigs and Republicans. The Republicans now usually have the advantage. As mentioned before, the state is habitually Democratic; "boss" rule in St Louis was particularly vicious in the late 'nineties, and corruption was the natural result of ring rule—the Democratic bosses have at times had great power—and of the low pay—only $25 monthly—of the city's delegates and councilmen. But the election came, and with it a strong movement for independent voting. Fire, floods, epidemics, and war have repeatedly attacked the city. A great fire in 1846 burned along the levee and destroyed many buildings, but saved the city, as estimated by the city of the assesser, more than $6,000,000. Cholera broke out in 1832-1833, 1849-1851, and 1866, causing in three months of 1849 almost 4000 deaths, or the death of a twentieth of all inhabitants. Smallpox raged in 1872-1875. These epidemics probably reflect the one-time lamentable lack of proper sewage. Great floods occurred in 1875, 1881, 1856, 1844, 1872, 1885 and 1903; those of 1875 and 1884 being the most remarkable. There were tornadoes in 1853, 1852 and 1871; and in 1866 a cyclone of 20 minutes' duration, accompanied by violent rain, destroyed or wrecked 8000 buildings and caused a loss of property valued at more than $100,000,000.

The city is surrounded by the levee and bluff, which together form a barrier along the Mississipi River, the Mississippi itself is the source of the city's earliest history. It is one of the best railway centres of the country. It is entered from the east by six lines of railway, which cross to St Louis by the celebrated steel arch bridge and by the Merchants' Bridge. It is also served by three interurban electric railways. The state of St Louis is in the "American Bottom," little above the high-water mark of the river. This "bottom" stretches a long distance up and down the river, with a breadth of 10 or 12 m. It is intersected by many sloughs and crescent-shaped lakes which indicate former courses of the river. The manufacturing interests of East St Louis are important, among the manufactories being packing establishments, iron and steel works, rolling-mills and foundries, flour-mills, glassworks, paint works and wheel works. By far the most important industry is slaughtering and meat-packing; both in 1900 and in 1905 East St Louis ranked sixth among the cities of the United States in this industry; its product in 1900 was valued at $27,676,818 (out of a total for all industries of $32,460,057), and in 1905 the product of the slaughtering and meat-packing establishments in and near the limits of East St Louis was valued at $39,972,245, in the same year the total for all industries within the corporate limits being only $71,586,196. The city has a large horse and mule market. East St Louis was laid out about 1818, incorporated as a town in 1829, and charted as a city in 1835.

Shepherd, Early History of St Louis and Missouri (2 vols., St Louis, 1843 (St Louis, 1870); F. Billon, Annals of St Louis . . . 1804 to 1821 (2 vols., St Louis, 1886-1888); G. Anderson, Story of a Border City (1909); The Renewal of the Romance of St Louis . . . reported to the Merchants' Exchange, by its secretary.

ST LOUIS, the capital of the Republic of Senegal, Senegal, West Africa, with a population (1904) of 24,070, or including the suburbs, 28,446. St Louis, known to the natives as N'dar, is 163 m. by rail N.E. of Dakar and is situated on an island 1148 ft. long, and 132 ft. wide. Above the river, the town has been built on the right bank, there separated from the sea by a narrow strip of sand called the Langue de Barbarie. This strip of sand is occupied by the villages of N'dar Toute and Guet N'dar. Three bridges connect the town with the villages; and the Pont Faidherbe, 2132 ft. long, affords communication with Bouvetville, a suburb on the left bank, and the terminus of the railway to Dakar. The houses of the European quarter have for the most part flat roofs, balconies and terraces. Besides the governor's residence the most prominent buildings are the cathedral, the great mosque, the court-house, the barracks and military offices. The round beech huts of Guet N'dar are mainly inhabited by native fishermen. N'dar Toute consists of villages with gardens, and is a summer watering-place. There is a pleasant public garden, and N'dar Toute is approached by a magnificent alley of palm-trees. The low-lying position of St Louis and the extreme heat render it unhealthy, whilst the sandy nature of the soil causes intense inconvenience. The mouth of the Senegal being obstructed by a shifting bar of sand, the steamships of the great European lines do not come up to St Louis; passengers embark and land at Dakar, on the entrance of the river, and the vessel is then hauled to the town by a tug. St Louis is the capital of the Senegal Department. All citizens, irrespective of colour, can vote. From 1895 to 1903 St Louis was not only the capital of Senegal, but the residence of the governor-general of French West Africa. In November of the last named year Dakar was recognized as the capital of the French West African Empire. St Louis is the last port defended by the Senegalese and the only fortified point on the Senegal, and is protected from the sea by a well-constructed battery. It is the oldest colonial establishment in Africa belonging to France (see SENEGAL). Its modern development dates from 1854. The town is 18,044 ft. on the St Louis River, 1854, and has a population of 10,842. It has a good harbour, and is connected with Dakar by a railway 17 m. long, completed in 1883. All citizens, irrespective of colour, can vote. From 1895 to 1903 St Louis was not only the capital of Senegal, but the residence of the governor-general of French West Africa. In November of the last named year Dakar was recognized as the capital of the French West African Empire. St Louis is the last port defended by the Senegalese and the only fortified point on the Senegal, and is protected from the sea by a well-constructed battery.
of mountains, rising sheer from the water, their summits bathed in perpetual mist. Impenetrable forests alternate with fertile plains, and the coast, a combination of beautiful bays and coves. Everywhere there is luxuriant vegetation.

Les Pitons (2720 and 2680 ft.) are the chief natural feature—a two immense pyramids of rock rising abruptly from the sea, their slopes, lined at an angle of 60°, being clad on three sides with densest vegetation, which is the richest in the island system of the island. In the S.W. also is the volcano of Soufrière (about 4000 ft.), whose crater is 3 acres in size and covered with a dense forest. The climate is humid, the fall varying from 70 to 120 in. per annum, with an average temperature of 80° F. The soil is deep and rich; the main products are sugar, cocoa, logwood, coffee, nutmegs, mace, kola-nuts and vanilla, all of which have been cultivated since the time of Columbus. The usine or central factory system is established, there being four government sugar-mills. Snakes, formerly prevalent, have been almost exterminated by the introduction of the mongoose. Only a few the island is cultivated, the rest being crown land under virgin forest, abounding in timber suitable for the finest cabinet work. The main import trade up to 1904 was from Great Britain; since then, owing to the increased demand from the United States, the imports are chiefly from other countries. The majority of the exports go to the United States and to Canada. In the ten years 1898-1907 the imports averaged £522,000 a year; the exports, £230,000. By the Treaty of 1874, the island is free of duties on imports and exports. Coal, sugar, cocoa and logwood form the chief exports.

Education, denominational, assisted by government grants. The larger majority of the schools are under the control of the Roman Catholics, to whom all the government primary schools were handed over in 1895. There is a government agricultural school at St Lucia is controlled by the government, and at the government-built Windward Islands, assisted by an executive council. The legislature consists of the administrator and a council of nominated members. Revenue and expenditure in the period 1901-1907 balanced at about 60,000 a year. The law of the island preservos, in a modified form, the laws of the French monarchy.

Castries, the capital, on the N.W. coast, has a magnificent landscaped harbor. There is a concrete wharf 650 ft. long, alongside of 27 ft., and a wharf of wood 552 ft. in length. It is the principal coaling station of the British fleet in the West Indies, was strongly fortified, and has been the military headquarters. The present town was laid out in 1824, and is a well planned 100-room city. It is a port of registry, and the facilities it offers as a port of call are widely recognized, the tonnage of ships cleared and entered rising from 1,555,000 in 1898 to 2,627,000 in 1907. Pop. (1901) 7910. Situated in the south, on the only other river of any importance, had a population of 2394. The Caribs have disappeared from the island, and the bulk of the inhabitants are negroes. Their language is a French patois, but English is gradually replacing it. There is a small colony of French Creoles, and the white inhabitants are partly Creoles of French descent. The total population of the island (1901) is 49,833.

History.—St Lucia is supposed to have been discovered by Columbus in 1505, and to have been named by the Spaniards after the saint on whose day it was discovered. It was inhabited by Caribs, who killed the majority of the white people (Englishmen) who attempted to settle on the island (1605). For two centuries St Lucia was claimed both by France and by England. In 1627 the famous Carlisle grant included St Lucia among British possessions, while in 1635 the king of France granted it to two of his subjects. In 1638 some 130 English from St Kitts formed a settlement, but in 1641 were killed or driven away by the Caribs. The French in 1659 sent settlers from Martinique, who concluded a treaty of peace with the Caribs in 1666. Thomas Warner, natural son of the governor of St Kitts, attacked and overpowered the French settlers in 1663, but the peace of Breda (1667) restored it to France and it became nominally a dependency of Martinique. The British still claimed the island as a dependency of Barbados, and in 1722 George I. made a grant of it to the duke of Montague. The year following French troops from Martinique compelled the British settlers to evacuate the island. In 1748 both France and Great Britain recognized the island as neutral. In 1762 it was declared to be an island and to Admiral Rodney and General Monckton. By the treaty of Paris (1763), however, the British acknowledged the claims of France, and steps were taken to develop the resources of the island. French planters came from St Vincent and Grenada, cotton and sugar plantations were formed, and in 1772 the island was said to have a population of 15,000, largely slaves. In 1778 it was captured by the British; its harbours were a rendezvous for British squadrons and Gros Ilet Bay was Rodney's starting-point before his victory over the Gronde the Grandes (April 1782). The peace of Versailles (1785) restored St Lucia to France. In 1795 it was occupied by Admiral Jervis (Lord St Vincent). Victor Hugues, a partisan of Robespierre, aided by insurgent slaves, made a strenuous resistance and recovered the island in June 1795. Sir Ralph Abercromby and Sir John Moore, at the head of 12,000 troops, were sent in 1796 to reduce the island, but it was not until 1797 that the revolutionists laid down their arms. By the treaty of Amiens St Lucia was anew declared French. Bonaparte intended to make it the capital of the Antilles, but it once more capitulated to the British (June 1803) and was finally ceded to Great Britain in 1814. In 1823, when the slaves were emancipated, there were in St Lucia over 13,000 negro slaves, 2600 free men of colour and 2300 whites. The development of the island—half ruined by the revolutionary war—has been retarded by epidemics of cholera and small-pox, by the decline of the sugar-cane industry and other causes, such as the low level of education. The depression in the sugar trade led to the adoption of cocoa cultivation. Efforts were also made to plant settlers on the crown lands—with a fair amount of success. The colony successfully survived the financial stringency caused by the withdrawal of the imperial support. Pigeon Island, formerly an important military port, lies off the N.W. end of St Lucia, by Gros Ilet Bay.

See Sir C. P. Lucas, Historical Geography in the British Colonies, vol. ii., "The West Indies" (2nd ed. revised by C. Atchley, Oxford, 1905), the works of Sir R. Basset, and also the annual reports on St Lucia issued by the Colonial Office.

ST MACAIRE, a town of south-western France, in the department of Gironde, on the Garonne, 20 m. S.E. of Bordeaux by rail. Pop. (1906), 2085. St Macaire is important for its medieval remains, which include a triple line of ramparts with old gateways. There are also several houses of the 13th and 14th centuries. The imposing church of St Sauveur (11th to 13th centuries) has a doorway with beautiful 13th-century carvings and interesting mural paintings. St Macaire (anc. Ligeva) owes its name to the saint whose relics were preserved in the monastery of which the church of St Sauveur is the principal remnant.

ST MAIXENT, a town of western France, in the department of Deux-Sèvres, on the Sèvre Niortaise, 15 m. N.E. of Niort by rail. Pop. (1906), 4102. The town has a fine abbey church built from the 12th to the 15th century, but in great part destroyed by the Protestants in the 16th century and rebuilt from 1670 to 1682 in the flamboyant Gothic style. The chief feature of the church is the nave, which is Romanesque, and a lofty 13th-century tower over the west front. The crypt contains the tomb of Saint Maxentius, second abbot of the monastery, which was founded about 460. The town has a communal college, a chamber of arts and manufactures, and an infantry school for non-commissioned officers preparing for the rank of sub-lieutenant. It was the birthplace of Colonel Denfert-Rochereau, defender of Belfort in 1870-1871, and has a statue to him. The industries include dyeing and the manufacture of hosiery, mustard and plaster. The prosperity of the town was at its height after the promulgation of the edict of Nantes, when it numbered 12,000 inhabitants.

ST MALO, a seaport of western France, capital of an arrondissement in the department of Ille-et-Vilaine, 51 m. N.W. of Rennes by rail. Pop. (1906) town, 8727; commune, 10,647. St Malo is situated on the English Channel on the right bank of the estuary of the Rance at its mouth. It is a garrison town surrounded by ramparts which include portions dating from the 14th, 15th and 16th centuries, but as a whole were rebuilt at the end of the 17th century according to Vauban's plans, and restored in the 19th century. The most important of the gates are that of St Vincent and the Grande Porte, defended by two massive 15th-century towers. The granite island on which St Malo stands communicates with the mainland on the northeast by a causeway known as the "Sillon" (furrow), 650 ft. long, and at one time only 46 ft. broad, though now three times that breadth. In the sea round about lie other granite rocks,
which have been turned to account in the defences of the coast; on the islet of the Grand Bey is the tomb (1848) of François Auguste, vicomte de Chateaubriand, a native of the town. The tide rises to 50 ft. above low-water level, and the sea surges over the ramparts. The harbour of St Malo lies south of the town in the creek separating it from the neighbouring town of St Servan. Including the contiguous and connected basins belonging more especially to St Servan, it comprises an outer basin, a tidal harbour, two wet-docks and an inner reservoir, affording a total length of quayage of over 2 m. The wet-docks have a minimum depth of 15 to 15½ ft. on sill, but the total depth of water in the basin is 35 ft. In 1904 the number of vessels in the port was 1004, of which St Malo-St Servan is 1002, of which 1023 is 289,920 tons. The bulk of trade is with England, the exports comprising large quantities of fruit, dairy-produce, early potatoes and other vegetables and slate. The chief imports are coal and timber. The London and South-Western railway maintains a regular service of steamers between Southampton and St Malo. The port carries on shipbuilding and equips a fleet for the Newfoundland cod fisheries. The industries also include iron and copper founding and the manufacture of portable furnaces and copper fountains. Duguay-Trouin was a native of the town. The town is the seat of a sub-prefecture and has tribunals of first instance and of commerce. Communication between the quays of St Malo and St Servan is maintained by a railway bridge.

St Malo is largely frequented for sea-bathing, but not so much as Dinard, on the opposite side of the Rance. The town presents a tortuous maze of narrow streets and small squares lined with high and sometimes quaint buildings (e.g. the 17th-century house in which René Duguay-Trouin was born). Above all rises the stone spire (1589) of the cathedral, a building begun in the 12th century but added to and rebuilt at several subsequent periods. The castle (15th cent.), which defends the town towards the "Sillon," is flanked with four towers, one of which, the great keep, is an older and loftier structure, breached in 1378 by the duke of Lancaster. St Malo has statues to Chateaubriand, Duguay-Trouin and the privateer Robert Surcouf (1773-1827), natives of the town. The museum contains remains of the ship "La Petite Hermine," in which Jacques Cartier sailed to the St Lawrence (1534), and a natural history collection.

In the 6th century the island on which St Malo stands was the retreat of Abbot Aaron, who gave asylum in his monastery to Malo, a monk whose Noves he published. He perished by consecration in order to escape the episcopal dignity, but afterwards became bishop of Aleth (now St Servan); the see was transferred to St Malo only in the 12th century. Henceforth the bishops of St Malo claimed the temporal sovereignty over the town, a claim which was absolutely disputed by the dukes of Brittany. The policy of the citizens themselves, who thus gained substantial powers of self-government, was directed by consistent hostility to England and consequently to the dukes. They took the side of Bishop Josselin de Rohan and his successor in their quarrel with dukes John IV and John V, and it was not till 1424 that John V., by the agency of Charles VI. of France and with the sanction of the pope, finally established his authority over the town. In 1488 St Malo unsuccessfully resisted the French troops on behalf of the duke. During the troubles of the League the citizens hoped to establish a republican government, and on the 11th of March 1590 they exterminated the royal garrison and imprisoned their bishop and the canons. But four years later they surrendered to Henry IV. of France. During the following century the maritime power of St Malo attained some importance. In November 1663 and July 1665 the English boldly bombarded it. The people of St Malo had in the course of a single war captured upwards of 1500 vessels (several of them laden with gold and other treasure) and burned a considerable number more. Enriched by these successes and by the wealth they drew from the New World, the shipowners of the town not only supplied the king with the means necessary for the famous Rio de Janeiro expedition conducted by Duguay-Trouin in 1711, but also lent him large sums for carrying on the war of the Spanish Succession. In June 1758 the English sent a third expedition (Pelagia) to St Malo under the Comte de la Motte. Spencer, third duke of Marlborough, and inflicted great loss on the royal shipping in the harbour of St Servan. But another expedition undertaken in the following September received a complete check. In 1770 and during the wars of the Empire the St Malo privateers resumed their activity. In 1789 St Servan was separated from St Malo and in 1802 St Malo lost its bishopric. During the Reign of Terror the town was the scene of sanguinary executions.
opinions, his property was confiscated after the Revolution because of his social position. He was brought up a strict Catholic, and always remained attached to the church, although his first work, *Of Errors and Truth*, was placed upon the Index. He died at Aunay, near Paris, on the 23rd of October 1803.

His chief work is *Le livre à un ami sur la Révolution Française*; an essay in verse, addressed to the "officier d'état-major" of his regiment, "pour la circonscription de l'homme-épître." Other treatises appeared in his *Œuvres posthumes* (1807). Saint-Martin regarded the French Revolution as a sermon in action, if not indeed a miniature of the last judgment. His ideal society was "a natural and spiritual theocracy," in which God would raise up men of mark and endowment, who would regard themselves strictly as "divine commissioners" to guide the people. All ecclesiastical privileges were to disappear, giving place to a purer spiritual Christianity, based on the assertion of a faculty superior to the reason—moral sense, from which we derive knowledge of God. God exists as an eternal personality, and the creation is an over- flowing from the heart of Deity, which contains in its properties the human soul, the human intellect or spirit, the spirit of the universe, and the elements or matter are the four stages of this divine emanation, man being the immediate reflection of God, and nature in turn a reflection of man. Man, however, has fallen from his high estate, and matter is one of the consequences of his fall. But divine love, united to humanity in Christ, will work the final regeneration.

**ST MARTIN**—SAINT MARYS, a city of Auglaize county, Ohio, U.S.A., on the St Marys river and the Miami & Erie canal, about 85 m. W.N.W. of Columbus. Pop. (1910) 5732. Saint Marys is served by the Lake Erie & Western, the Western Ohio (electric), and the Toledo & Ohio Central railroads. About 1 m. west is a feeding place and milk market covering a daily consumption of 60,000 gallons. Saint Marys is in the Ohio oil region. The town occupies the site of a former Shawnee village, in which a trading post was established in 1782 by James Girty,1 from whom the place was for some years

1 James Girty (1743–1817) was one of the notorious Girty brothers, the sons of Simon Girty (d. 1751), an Irish immigrant. The brothers were taken prisoners by the French and Indian force which in 1756 surrounded Fort Miami. Their name is derived from the Shawnee word "Girti," meaning "trader." James was adopted by the Shawnees and lived among them for three years, after which he acted as an interpreter and trader; he frequently accompanied the Indians against the English settlers, and before 1765 opened business with the Indians at St Marys in 1783–1794, when he withdrew to Canada upon the approach of General Wayne, and again from 1795 until just before the War of 1812, when he again withdrew to Canada. Before he left he traded with the Senecas for several years after his capture, was even more bloodthirsty; he served against the Indians in Lord Dunmore's War, and in 1776, during the War of Independence, entered the
called Girtys's Town. Fort St Marys was built in 1784 or 1785 by a detachment of General Anthony Wayne's troops, and in 1812 Ft. Barbeec was erected at the instance of General W. H. Harrison by Colonel Joshua Barbeec. During the War of 1812 the place was for some time the headquarters of General Harrison's army. St Marys was laid out as a town in 1823, and became one of the first in the principal area of the then unincorporated general municipal code which came into effect in that year.

**ST MARY'S LOCH—ST MICHAEL'S**

The history of St Mawes is simple. The saint of that name is said to have made the creek of the Fal a halting-place in the 5th century. The chapel of St Mawes, pulled down in 1812, was licensed by the bishop in 1381, and both chapel and village were situated within the manor of Bogullos, which in the 16th century belonged to the family of Wydeslade. In the 16th century the Girtys's Loch was the general municipal code which came into effect in that year.

**ST MARY'S LOCH**, a fresh-water lake of Selkirkshire, Scotland. It lies in the high land towards the western border, and is visited from Selkirk (16 m. E. by N.) or Moffat (15 m. S.W.). It is 814 ft. above the sea, is from 80 to 90 ft. deep, 3 m. long, about 1 m. wide at its widest, and has a shore-line of 73 m. A narrow isthmus divides its head from the small Loch of the Lowes (about 1 m. long), which is believed to have been once part of it, the difference of level being only 15 ft. St Mary's is emptied by the Yarrow, and its principal feeder is Megget Water, a noted angling stream. It takes its name from St Mary's Kirk, the ruins of which lie near the northern shore. From the 13th century, when the church is first mentioned, till its destruction in 1557, it was variously known as the Forest Kirk (in which William Wallace was elected Warden of Scotland), St Mary's of Farmainshope, an old name of the adjoining lands of Kirkstead, St Mary of the Lowes, and the Kirk of Yarrow. It had been partly restored, but gradually fell into decay, its place being taken by the church of Yarrow farther down the vale. In the graveyard was buried John Grieve (1787-1856), the Edinburgh bottler, a notable personality in his day, and founder of a brewery. It was next taken over by the town, and its capacity, patron of James Hogg, the Ettrick Shepherd. At the head of the lake is the celebrated inn opened by Tibbie Shiel (Mrs Richardson, d. 1878), which was visited by many distinguished men of letters.

**ST MAUR-DES-FOSSÉS**, a southern suburb of Paris, on the right bank of the Marne, 7 m. from the centre of the city. Pop. (1906), 28,016. St Maur and the residential district surrounding it cover a peninsula formed by a loop in the Marne, the neck of which is crossed by the canal of St Maur. In the reign of Louis the 14th, the monastery of Les Fossés was founded; the amplification of the name came when the body of St Maurus was brought there by the monks of St Maur-sur-Loire. About the same time was inaugurated the pilgrimage of Notre-Dame des Miracles, which still takes place annually. In 1465 a treaty of peace, putting an end to the "War of the Public Weal," was concluded between Louis XI. and his revolted barons at St Maur.

**ST MAUR-SUR-LOIRE**, a village of western France in the department of Maine-et-Loire on the Loire about 15 m. below Saumur. Here St Maurus towards the middle of the 6th century founded the first Benedictine monastery in Gaul. About the middle of the 9th century it was reduced to ruins by the Normans; in anticipation of the disaster the relics of the saint were transferred to the abbey of Fossés (afterwards St Maur-des-Fossés: see above). St Maur-sur-Loire was afterwards restored and fortified; the extant remains consist of a part of the church (12th and 17th centuries) and buildings of the 17th and 18th centuries.

**ST MAWES**, a small seaport in the St Austell parliamentary division of Cornwall, England, beautifully situated on an arm of the English Channel. Pop. (1901), 11,758. The inlet admits only small vessels to the little harbour, but there is a considerable fishing industry. A large circular castle, nái-a-nái, with that of Pendennis near Falmouth, and dating from the same period (Henry VIII.), guards the entrance. Near the shore of the inlet opposite St Mawes is the small church of St Anthony in Roseland, an excellent example of Early English work, retaining a good Norman doorway.

British service as an interpreter, and after the war instigated Indian attacks on the frontier and fought with the Indians against General Arthur St Clair and General Anthony Wayne. Another brother, George Girty (died 1812), lived among the Delawares for several years, was also a trader and interpreter, and was likewise a renegade. Thomas (1739-1820), though he associated much with the Indians, did not participate in their wars. See W. Butterfield's History of the Girty's (Cincinnati, 1890).
never rise above its level, unless occasionally to throw to a small distance a spray of the consistency of melted lead. The Furnas abounds also in hot springs, some of them of a very high temperature. There is almost always, however, a cold spring near the hot one. These have long been visited by sufferers from palp, rheumatism, scrofula and similar maladies. Bath-rooms and other buildings have been erected.

The plains of St Michael's are fertile, producing wheat, barley and Indian corn; vines, oranges and other fruit trees grow luxuriantly on the sides of the mountains. The plants are made to spring even from the ashes of the volcanic rock, which are sometimes blasted to receive them. Raised in this manner, these fruits are of superior quality; but the expense of such a mode of cultivation necessarily restricts it. The western part of the island yields hemp.

The principal town and seaport is Ponta Delgada (6sq.), with 17,675 inhabitants in 1900. The other chief towns are Arrifes (5644), Lagos (7950), Povoacao (5093), Ribeira Grande (8499) and Vila Velha (3562). [See also Azores.]

ST MICHAEL'S MOUNT, a lofty peak,looks like an island, exhibiting a curious combination of slate and granite, rising 400 yds. from the shore of Mount's Bay, in Cornwall, England. It is united with Marazion by a natural causeway cast up by the sea, and passable only at low tide. If its identity with the Mittac of Timaeus and the Ictis of Diiodorus Siculus be allowed, St Michael's Mount is one of the most historic spots in the west of England. It was possibly held by a body of religious in the Confessor's time and given by Robert, count of Mortain, to Mount St Michael, of which Norman abbey it continued to be a priory until the dissolution of the alien houses by Henry V., when it was given to the archbishop and conveyed to the land owners for a resort of pilgrims, whose devotions were encouraged by an indulgence granted by Pope Gregory in the 11th century. The Mount was captured on behalf of Prince John by Henry Pomeroy in the reign of Richard I. John de Vere, earl of Oxford, seized it and held it during a siege of twenty-three weeks against 6000 of the king's troops in 1473. Perkin Warbeck occupied the Mount in 1497. Humphry Arundell, governor of St Michael's Mount, led the rebellion of 1549. During the reign of Queen Elizabeth it was given to Robert, earl of Salisbury, by whose son it was sold to Sir Francis Basset. Sir Francis Basset, brother of Sir Francis, held the Mount against the parliament until July 1646. It was sold in 1659 to Colonel John St Aubyn and is now the property of his descendant Lord Levan.

The chapel is extra-diocesan and the castle is the residence of Lord St Levan.

Many relics, chiefly armour and antique furniture, are preserved in the castle. The chapel of St Michael, a beautiful 15th-century building, is founded on two tiers of conical turrets, of which a small turret, which served for the guidance of ships. Chapel rocks, on the beach, marks the site of a shrine dedicated to the Virgin Mary, where pilgrims paused to worship before ascending the Mount. A few yards below the top of the site was the spring supplying them with water. The harbour, widened in 1823 to allow vessels of 500 tons to enter, has a pier dating from the 19th century, and subsequently enlarged and restored. Pop. (1901), 111.

ST MIHIEL, a town of north-eastern France, in the department of Meuse, on the right bank of the Meuse and the Canal de l'Est, 23 m. S. E. of Verdun by rail. Pop. (1906) of the town, 5943 (not including a large garrison), of the commune, 6661. St Mihiel is famous for its Benedictine abbey of St Michael, founded in 709, to which it owes its name. The abbey buildings (occupied by the monastic offices) date from the 17th century and the beginning of the 18th century, and the church from the 17th century. The latter contains a wooden carving of the Virgin by the sculptor Ligier Richer, born at St Mihiel in 1506. Other interesting buildings are the church of St Étienne, chiefly in the flamboyant Gothic style, which contains a magnificent Holy Sepulchre by Ligier Richer, and several houses dating from the 15th, 16th and 17th centuries. On the road to Verdun are seven huge rocks, in one of which a sepulchre (18th century), containing a life-sized figure of Christ, has been hollowed. St Mihiel formerly possessed fortifications and two castles which were destroyed in 1635 by the royal troops in the course of a quarrel between Louis XIII. and Charles IV., duke of Lorraine. The town is the seat of a court of assizes, and has the tribunal of first instance belonging to the arrondissement of Commercy and a communal college.

ST MORITZ (in Ladin, San Murezzan), the loftiest (6637 ft.) and the most populous village of the Upper Engadine in the Swiss canton of the Grisons. It is built above the north shore of Lake of the same name, formed by the Inn, and the railway line 56 m. from Coire by the Albula railway, or by road 483 m. from Martinsbruck (the last village in the Engadine), or by road 30 m., over the Maloja Pass, from Chavonna. In 1900 it had a population of 1603, 475 being German-speaking, 433 Ladin-speaking, and 504 (railway workmen) Italian-speaking, while 837 were Protestants and 743 Catholics. The village is about 1 m. north of the baths, an electric tramway connecting the two. Both are how much frequented by foreign visitors. The baths (chalybeate, sparkling with free carbonic acid) were known and much resorted to in the 16th century. Napoleon visited them, and they were described by Paracelsus; they were visited in 1779 by Archdeacon W. Cox. They are frequented chiefly by non-English visitors in summer, the English season at St Moritz being mainly the winter, for the sake of skating and tobogganing.

ST NAZARIO, a town of western France, capital of an arrondissement in the department of Loire-Inférieure, 40 m. W.N.W. of Nantes by rail and 29 m. by river. Pop. (1906), 30,345. St Nazaire, situated on the right bank of the Loire at its mouth, is a modern town with straight thoroughfares crossing one another at right angles. It possesses nothing of antiquarian interest except a granite dome 100 ft. in diameter. There are given horizontally on two other stone tanks in the soil, above which they rise 63 ft. The only noteworthy building is a modern church in the Gothic style of the 14th century. The harbour, which constitutes the outlet of Nantes and is accessible to ships of the largest size, is separated from the estuary by a narrow strip of land, and comprises an outer harbour and entrance, two floating docks (the old dock and the Penhouët dock), three graving docks, and the extensive shipbuilding yards of the Loire Company and of the General Transatlantic Company whose offices are in this town. St Nazaire is separated from the Isthmus of Panama by a strait, the English Channel is separated from the English Channel by the same strait. Ships for the navy and the mercantile marine are built, and there are important steel-works, blast-furnaces, forges, and steam saw-mills. The town is the seat of a sub-prefecture, and has a tribunal of first instance, a board of trade arbitration, an exchange, a chamber of commerce, a communal college, and schools of navigation and industry. Next to British and French, Spanish, Norwegian and Swedish vessels most frequent the port. In the decade 1868-1878 the value of imports greatly fluctuated, being highest in 1868 (2,800,000) and lowest in 1871 (80,000). The exports, however, were much more regular, being 3,280,000 francs. The value of the exports in the same period varied between 3,172,400 in 1890 and 5,130,600 in 1906, the average being 2,915,200. Imports include coal and patent fuel, iron ore and pyrites, timber, rice and hemp; exports include iron ore, coal and patent fuel, pit wood, sugar, garments and woven goods, preserved fish, and wine and spirits.

According to remains discovered on excavating the docks, St Nazaire seems to occupy the site of the ancient Corbithe, placed by Strabo among the more important maritime towns of Gaul. At the close of the 4th century the site of Corbithe was occupied by Saxons, and, their conversion to Christianity being effected one or two centuries later by Savenay, the place took the name of St Nazaire. It was still only a little "bourg" of some 3000 inhabitants when under the second empire it was chosen as the site of the new harbour for Nantes, because the ascent of the Loire was becoming more and more difficult. In 1868 the site of the Priory was transferred to St Nazaire from Savenay.

ST NÉCARE (corrupted into Senecetere and Senneterre), the name of an estate in Avuergue, France, which gave its name to a feudal house holding distinguished rank in the 13th century. The eldest branch of this family held the marquisate of La Ferté (q.v.), and produced a heroine of the religious wars of the 16th century, Madeleine de St Nectaire, who married Guy de St Exupery, seigneur de Miremont, in 1548, and fought successfully at the Battle of Cerbère in 1557. The seigneurs of St Nectaire were entitled to bear the arms of the League. To the same house belonged the branches of the marquisies of Châteauneuf, the seigneurs of Brinon-sur-Sauldre.
ST NEOTS—SAINTON

and St Victour, and the seigneurs of Clavelier and Fontenilles, all of which are now extinct.

ST NEOTS, a town in the southern parliamentary division of Huntingdonshire, England, on the right (east) bank of the Ouse, 51¾ m. N. of London by the Great Northern railway. Pop. of urban district, (1901) 3880. A stone bridge crosses the river, built in 1580, from the ruins of a former priory. The parish church of St Mary is a fine Perpendicular building of the later 15th century. The original oak roof is noteworthy. Among other buildings may be mentioned the Victoria museum (1887), the library and literary institute, and the endowed school (1760). Paper-mills, breweries, flour-mills and engineering works furnish the chief industries of the town.

The name of St Neots is derived from the monastery founded in the adjoining parish of Eynesbury in the reign of King Edgar (967–975). St Neot, a priest of Glastonbury Abbey in Somerset, became a recluse at a place which he named Neotstoke, near Bodmin in Cornwall, where he died about the end of the 9th century. His shrine at Eynesbury being threatened by the incursion of the Danes early in the 11th century, the relics were conveyed to Crowland Abbey, in Lincolnshire, of which he became abbot. On the death of the last Abbot of Crowland in 1383, the town was refounded from that of Bec in Normandy. An Anglo-Saxon enamelled mosaic in the Ashmolean Museum at Oxford is supposed to contain a portrait of St Neot. In 1648 a troop of Royalists under the command of Villiers, duke of Buckingham, was routed in St Neots by the Parliamentarians.

ST NICOLAS, a town of Belgium in the province of East Flanders, about 12 m. S.W. of Antwerp. Pop. (1904), 34,767. It is the principal town of Waes, formerly a district of bleak and barren down, but now the most productive part of Belgium. St Nicolas is the centre and distributing point of this district, being an important junction on the direct line from Antwerp to Ghent; it has also many manufactures of its own. The principal church dedicated to St Nicolas was finished in 1666, but the other public buildings are only of the 15th century.

ST NICOLAS DU PORT, a town of north-eastern France, in the department of Meurthe-et-Moselle, on the left bank of the Meurthe, 8 m. S.E. of Nancy by rail. Pop. (1906), 4706. The town has a fine Gothic church dating from the end of the 13th and the first half of the 16th century, and possessing a finger-joint of St Nicolas formerly the object of pilgrimages with a number of stones from the origin of well-known fairs. The latter became less important after 1615, when the Sweeds sacked the town. There are important salt-workings in the vicinity; cotton spinning and weaving are carried on. Its port, shared with Varangéville on the opposite side of the river, has an active trade.

ST OMER, a town and fortress of northern France, capital of the department of Pas-de-Calais, 42 m. W.N.W. of Lille on the railway to Calais. Pop. (1906), 17,261. At St Omer begins the canalized portion of the Aa, which reaches the sea at Graveines, and under its walls it connects with the Neuvesosse canal, which ends at the Lys. The fortifications were demolished during the last decade of the 19th century and boulevards and new thoroughfares made in their place. There are two harbours outside and one within the city. St Omer has wide streets and spacious squares, but little animation. The old cathedral belongs almost entirely to the 13th, 14th and 15th centuries. A heavy square tower finished in 1499 surmounts the west portal. The church contains interesting paintings, a colossal statue of Christ seated between the Virgin and St John (13th century, originally belonging to the cathedral of Thérouanne and presented by the emperor Charles V.), the ctenasth of St Omer (13th century) and numerous ex-votos. The richly decorated chapel in the transept contains a wooden figure of the Virgin (12th century), the object of pilgrimages. Of St Bertin, the church of the abbey (built between 1126 and 1130 on the site of previous churches) where Childeric III. retired to end his days, there remain some arches and a lofty tower, which serve to adorn a public garden. Several other churches or convent chapels are of interest, among them St Sepulchre (14th century), which has a beautiful stone spire and stained-glass windows. A fine collection of records, a picture-gallerie, and a theatre are all accommodated in the town hall, built of the materials of the abbey of St Bertin. There are several houses of the 16th and 17th centuries; of the latter the finest is the Hôtel Colbert, once the royal lodging, and now occupied by an archaeological museum. Among the hospitals the military hospital is of note as occupying the well-known college opened by the English Jesuits in 1592. The old episcopal palace adjoining the cathedral is used as a court-house. The chief statue in the town is that of Jacqueline Robin (see below). St Omer is the seat of a sub-prefect, of a court of assizes, and of a presidential tribunal of commerce. The town is supplied with gas from a local works, and with water from a well in a saltmine. There are schools of music and of art. The industries include the manufacture of linen goods, sugar, soap, tobacco-pipes, and mustard, the distilling of oil and liqueurs, dyeing, salt-refining, malting and brewing. The suburb of Haut Pont to the north of St Omer is inhabited by a special stock, which has remained faithful to the Flemish tongue, its original costume and its peculiar customs, and is distinguished by honesty and industry. The ground which these people cultivate has been (since 1668) drained from the marsh, and the Rêques (i.e. the square blocks of land) communicate with each other only by boats floated on the ditches and canals that divide them. At the end of the marsh, on the borders of the forest of Clairmarais, are the ruins of the abbey founded in 1140 by Thierry d’Alsace, to which Thomas Becket betook himself in 1165. To the south of St Omer, on a hill commanding the Aa, lies the camp of Halfast, often called the camp of St Omer. On the Canal de Neuf-Fosse, near the town, is the Ascenseur des Fontinettes, a hydraulic lift enabling canal boats to surmount a difference of level of over 40 ft.

Omer, bishop of Thérouanne, in the 7th century established the monastery of St Bertin, from which that of Notre-Dame was an offshoot. Rivalry and dissension, which lasted till the Revolution, soon sprang up between the two monasteries, becoming especially virulent when in 1559 St Omer became a bishopric and Notre-Dame was raised to the rank of cathedral. In the 9th century the village which grew up round the monasteries took the name of St Omer. The Normans laid the place waste about 860 and 860, but ten years later found town and monastery surrounded by walls and safe from their attack. Situated on the borders of territories frequently disputed by French, Flemish, English and Spaniards, St Omer long continued subject to siege and military disaster. In 1671 Philip I. and Count Arnulf III. of Flanders were defeated at St Omer by Robert the Frisian. In 1127 the town received a communal charter from William Clito, count of Flanders. In 1493 it came to the Low Countries as part of the Spanish dominion. The French made futile attempts against it between 1551 and 1596, and again in 1638 (under Richelieu) and 1647. But in 1677, after seventeen days’ siege, Louis XIV. forced the town to capitulate; and the peace of Nijmegen permanently confirmed the conquest. In 1717 St Omer, on the verge of surrendering to Prince Eugene and the duke of Marlborough, owing to famine, was saved by the daring of Jacqueline Robin, who risked her life in bringing provisions into the place. St Omer ceased to be a bishopric in 1801.

See L. Deschamps de Pas, Hist. de la ville de Saint-Omer (2nd ed., Arras, 1881). For a full bibliography of other works see U. Chevalier, Répertoire des sources hist. topo-bibliographie (Montbéliard, 1903), i. 2743 seq.

SAINTON, PROSPER PHILIPPE CATHERINE (1813–1893), French violinist, was the son of a merchant at Toulouse, where he was born on the 5th of June 1813. He entered the Paris Conservatoire under Habeneck in 1817, and became professor of the violin in the Conservatoire of Toulouse. In 1844 he made his first appearance in England, at a Philharmonic concert directed by Mendelssohn. Settling in London, he was in 1845 appointed professor at the Royal Academy of Music. In the early organizations for chamber music which culminated in the establishment of the Popular concerts, Sainton bore an important
part; and when the Royal Italian Opera was started at Covent Garden, he led the orchestra under Costa, with whom he migrated to Her Majesty's Theatre in 1871. From 1848 to 1855 he was leader of the Queen's Band, and in 1862 he conducted the music at the opening of the International Exhibition. In 1860, he married the famous contralto singer, Miss Charlotte Dolby (see below). He was leader of the principal provincial festivals for many years, and gave a farewell concert at the Albert Hall in 1883. He died on the 17th of October 1890. His method was somewhat unorthodox, and his educational work of great value, the majority of the most successful orchestral violinists having been his pupils.

**SAINT-DOLBY, CHARLOTTE HELEN** (1821-1883). English contralto singer, was born in London on the 17th of May 1821, studied at the Royal Academy of Music from 1832 to 1837, Crivelli being her principal singing-master. In 1837 she was elected to a king's scholarship, and first appeared at a Philharmonic concert in 1841. In October 1845 she sang at the Gewandhaus, Leipzig, through the influence of Mendelssohn, who had been delighted by her singing. The time of music in his *Elisabeth* was written for her voice, but she did not appear in that work till the performance at Exeter Hall on the 16th of April 1847. She married M. Sainton in 1860, and in 1870 she retired from the career of a public singer, but two years afterwards started a "vocal academy" in London. She made various successful attempts as a composer, and the cantatas "The Legend of St Dorothea" (1876), "The Story of the Faithful Soul" (1870), and "Florimel" (1883), enjoyed considerable success. Her last public appearance was at her husband's farewell concert in June 1883. She died on the 15th of February 1885. A scholarship in her memory was founded at the Royal Academy of Music. Her voice was of moderate power and of fine quality, but it was her dignified and artistic style that gave her the high place she held for so many years both in oratorio and ballads.

**SAINTONGE, one of the old provinces of France, of which Saintes (q.v.) was the capital, was bounded on the N.W. by Aunis, on the N.E. by Poitou, on the E. by Angoumois, and on the S. by Guienne, and on the W. by Guienne and the Atlantic. It now forms a small portion of the department of Charente and the greater part of that of Charente-In-St-Père. The time of Caesar, Saintonge was occupied by the Santones, whose capital was Mediolanum; afterwards it was part of Aquitania Secunda. The civitas Santorum, which formed the bishopric of Saintes, was divided into two *pagi*: Santonicus (whence Sontion, Saintonge) and Alienensis, later Aunensis (Aunis). Halved by the treaty of 1250, it was wholly ceded to the king of England in 1360, but reconquered by Du Guesclin in 1371. Up to 1789 it was in the same gouvernement with Angoumois, but from a judicary point of view Saintonge was under the parlement of Bordeaux and Angoumois under that of Paris.

**ST OUEEN, an industrial town of northern France, in the department of Seine, on the right bank of the Seine 1 m. N. of the fortifications of Paris. Pop. (1906) 37,673. A château of the early 10th century occupies the site of a château of the 17th century bought by Madame de Pompadour in 1745, where in 1814 Louis XVIII. signed the declaration promising a constitutional charter to France. Previously there existed a château built by Charles of Valois in the early years of the 14th century, where John the Good inaugurated the short-lived order of the Knights of "Notre Dame de la noble maison," called also the "orde de l'étoile." The industries of St Ouen include metal founding, engineering and machine construction and the manufacture of government uniforms, pianos, chemical products, &c. It has important docks on the Seine and a race-course.

**ST PANCRAST, a northern metropolitan borough of London, England, bounded E. by Islington, S.E. by Finsbury, S. by Holborn, and W. by St Marylebone and Hampstead, and extend-
The highest ridge of the island is not more than 820 ft. above the sea. On the south-west side the coasts are inaccessible. According to Vélin, the island originally rose above the ocean as a high ridge of ryholitic trachyte similar to that which still forms the Nine Pin rock to the north of the entrance to the crater. Next followed a period of activity in which basic rocks were produced by submarine eruptions—lavas and scoriae of anorhtic character, palagonitic tuffs, and basaltic ashes; and finally from the crater, which must have been a vast lake of fire like those in the Sandwich Islands, poured forth quiet streams of basaltic lavas which are seen dripping from the centre of the island towards the cliffs at angles of 30° to 60°. The only remaining indications of the old volcanic activity are the warm springs and emissions of carbon dioxide.

See C. Vélin. *Passage de Vénus sur le soléil* (9 décembre 1874). *Expédition française aux îles St Paul et Amsterdam* (Paris, 1877); *Description géologique de la presqu'île d'Aden... Réunion... St Paul et Amsterdam* (Paris, 1878); and an article in *Annales de géographie*, 1893.

**ST PAUL**, the capital of Minnesota, U.S.A., and the county-seat of Ramsey county, situated on the Mississippi river, about 2750 m. above its mouth, at the practical head of navigation, just below the Falls of St Anthony. It is about 360 m. N.W. of Chicago, 120 m. W. of the city of Minneapolis Pop. (1880) 41,473; (1890) 133,156; (1900) 163,632, of whom 46,819 were foreign-born (12,035 Germans, 9832 Swedes, 4892 Irish, 3557 English-Canadians, 2900 Norwegians, 2005 English, 1488 Austrians, 1343 Bohemians, 1206 Danes, and 1105 French-Canadians), 100,599 of foreign parentage (i.e. both parents foreign born), and 2206 negroes; (1910 census) 214,744. Land area (1906) 52-28 sq. m. St Paul is supplied by the Chicago, Burlington & Quincy, the Chicago Great Western, the Chicago, Rock Island & Pacific, the Northern Pacific, the Minneapolis, St Paul & Sault Ste Marie, the Chicago & North-western, the Chicago, Milwaukee, St Paul, the Great Northern, and the Minneapolis & St Louis railways. Five bridges span the Mississippi, the largest of which, known as High Bridge, is 2770 ft. long and 200 ft. high. Four interurban lines connect with Minneapolis.

St Paul is attractively situated 670-880 ft. above sea-level, on a series of lofty limestone terraces or bluffs, formerly heavily wooded. It lies on both sides of the river, but the principal part is on the east bank. In its park system the numerous lakes within and near the city have been utilized. Of the parks, Como Park (425 acres; including Lake Como and a fine Japanese garden and a lily pond), and Phalen Park (600 acres, more than 400 of which are water area), are the largest. There are also 47 smaller squares and "neighbourhood parks" aggregating 560 acres. In Indian Park (135 acres), at the crest of the bluffs (Dayton's Bluffs), in the east central part of the city, are burial-mounds of the Sioux. Summit Avenue Boulevard, 200 ft. wide and extending for 23 m. along the heights, is a fine residential street. Boulevards along the bluffs on either side of the river connect with the Minneapolis park system. Harriet Island, in the Mississippi river opposite the business center of the city, is attractively parked, and on it are public paths. Adjoining the city on the south-west, at the junction of the Minnesota and Mississippi rivers, is the Fort Snelling U.S. Government Military Reservation, with a round stone fort, built in 1820. The principal public building is the State Capitol, completed in 1905. It was designed by Cass Gilbert (b. 1859), of Minnesota granite and white Georgia marble with a massive central white dome, and has sculptural decorations by D. C. French and interior decorations by John La Farge and E. H. Blaisdell. The park, Como Park (1859), and Edward Simmons (b. 1852). Other city and park buildings are the City Hall and Court House, a Gothic greystone structure; the Federal building, of greystone, opposite Rice Park; a Young Men's Christian Association building; the Metropolitan Opera House; the Auditorium, which was built by public subscription; the St Paul armory (1903), with a drill hall; the Chamber of Commerce; and the Union railway station. Among the principal churches are the Roman Catholic Cathedral, and the People's, the Central Presbyterian, the Park Congregational, and the First Baptist churches. The wholesale district is in the lower part of the city near the Union railway station; the retail shops are mostly in an area bounded by Webba, Seventh, Fourth and Roberts streets.

St Paul has an excellent public school system, which included in 1900 three high schools, a teachers' training school, a manual training high school, forty-eight grade schools, and a parental school. Among other educational institutions are the Freeman School; St Paul Academy; Barnard School for Boys; St Paul College of Law (1900); the College of St Thomas (Roman Catholic, 1885); St Paul Seminary (Roman Catholic, 1894), founded by James J. Hill as the provincial seminary of the See of St Paul with an endowment of $500,000, 40 acres of land, and a library of 10,000 volumes; Luther Theological Seminary (1885); Hamline University (co-educational; Methodist Episcopal), chartered in 1854, with a medical school in Minneapolis (chartered 1883; part of Hamline since 1893), and having in the college and preparatory school, in 1908-1909, 17 instructors and 384 students; Macalester College (Presbyterian; co-educational), founded as Baldwin Institute in 1833, reorganized and renamed in 1874 in honour of a benefactor, Charles Macalester (1798-1873) of Philadelphia; and the Scholl of Agriculture (1887), the first of the agricultural colleges of Minnesota. The University of Minnesota, in St Anthony Park, west of Como Park and south of the fair grounds. Among the libraries are the City Public Library, the State Law Library and the Minnesota Historical Society Library. The Minnesota Historical Society, organized in 1849, has an archaeological collection in the east wing of the Capitol. In the private residence of James J. Hill is a notable art gallery, containing one of the largest and best collections of the Barbizon School in existence. The principal newspapers are the *Dispatch* (Independent, 1874) and the *Pioneer-Press*, the latter established by James M. Goodhue (1800-1852) in 1849. Among the hospitals and charitable institutions are the City and County, St Joseph's and St Luke's hospitals, all having nurses' training schools; the Swedish Hospital, the Scandinavian Orphan Asylum, the Home for the Friendless, the Magdalen Home and the Women's Christian Home. Within the city limits (east of Indian Mounds Park) is the Willowbrook (state) Fish Hatchery, second to none in the United States in completeness of equipment; and adjoining the city on the north-west are the extensive grounds (200 acres) of the State Agricultural Experiment Station, by the University of Minnesota, serving as a farm for the Minnesota Customs District, and imports from Canada and from the Orient via the Pacific railways constitute an important factor in its commercial life, its imports and exports were valued at $6,754,289 and $9,009,940 respectively in 1909. Coal and wood, grain, farm produce and dairy products are important exports. St Paul is the principal market in the United States for the furs of the North-west, and there are extensive stock-yards and slaughtering and packing houses in the neighbouring city of South St Paul (pop. in 1910, 4510). St Paul ranks second to Minneapolis (308,880) as the manufacturing centre. The total value of its factory products in 1905 was $38,318,704, an increase of 27.5% since 1900. The following were among the largest items: fur goods; printing and publishing—book (especially law-book) and job, newspapers and periodicals; malt liquors; steam-railway car building and repairing; boots and shoes; foundry and machine-shop products; lumber and planing-mill products; men's clothing; tobacco, cigars and cigarettes; and saddlery and harness.
St Paul's is governed under a charter of 1900, which may be amended by popular vote on proposals made by a permanent charter commission. The mayor, comptroller and city treasurer are elected for two years. The mayor has the veto power and appoints the members of boards of police, parks, library, fire, water-supply and education. The legislature is bicameral, consisting of an assembly of nine members elected on a general city ticket and a board of aldermen chosen one from each of the twelve wards.「The city supply is pumped through 275 m. of water mains from a group of lakes north of the city, and the system has a capacity of 40,000,000 gallons per day.

History.—The earliest recorded visit of a European to the site of St Paul was that of the Jesuit Louis Hennepin in 1680. The traders Pierre Le Sueur and Nicholas Perrot visited the region between 1690 and 1700, and apparently established a temporary trading post somewhere in the neighbourhood. The first man of English descent to record his visit was Jonathan Carver, who, according to his journal, spent some time in the vicinity in 1767-1768. In 1805 Lieutenant Zebulon Pike included a treaty with the Sioux. The first steamboat made its way up the river in 1823. The site of St Paul was opened to settlement by the treaty of Prairie du Chien, negotiated by Governor Henry Dodge of Wisconsin with the Chipewas in 1837. Two years later (1839) the first permanent settlement was made by Swiss and Canadian refugees from Lord Selkirk's Red River colony. In 1841 Father Lucien Gaultier erected a log mission chapel, which he named St Paul's; from this the settlement was named St Paul's Landing and finally St Paul. On the erection of Minnesota Territory in 1849, St Paul was incorporated as a village and became the Territorial capital. Its population in 1850 was only 1112. It was chartered as a city in 1854, and continued as the capital of the new state after its admission (1858). The first railway connecting St Paul and Minneapolis was completed in 1862, at which time St Paul's population exceeded 10,000 and in 1869 through railway connexion with Chicago was effected. The city of West St Paul was annexed in 1874. The growth of the city had been comparatively slow until 1870, in which year the population was 20,030; but the rapid railway construction and the settlement and clearing of the Western farm lands increased its commercial and industrial importance as it did of its sister city, Minneapolis. In 1884 the city limits were extended to the Minnesota line.

ST PAUL'S CATHEDRAL, the cathedral church of the diocese of London, England, standing in the heart of the City, at the head of Ludgate Hill. (For plan, &c., see Architecture: Renaissance in England.) The name of a bishop of London, Restitutus, is recorded in 314, but his individuality and even his existence are somewhat doubtful, and nothing is known of the existence of a church until Bede's notice that early in the 7th century one was built here by Æthelberht of Kent at the instance of the missionary Mellitus, who became bishop. Tradition placed upon the site a Roman temple of Diana. The church was dedicated to St Paul, and, after passing through many vicissitudes, was removed in 1683 when Bishop Maurice, with the countenance of William the Conqueror, undertook the erection of a new cathedral. The building was not pressed forward with vigour, and in 1135 much of it was damaged by fire. The tower was completed in 1221; an Early English choir followed shortly after, and was enlarged after 1255 when Bishop Fulk brought great energy to bear upon the repair and elaboration of the building. At the close of the century the cathedral was regarded as finished; but a new spire was built early in the 14th century. Much of the Norman work, particularly in the nave, had been left untouched by the Early English builders (who in other parts merely encased it), and the cathedral was a magnificent monument of these styles, and of the early Decorated. Perpendicular additions were not extensive, and the cathedral remained with little alteration until 1561, when lighting struck the spire and fired the church. The spire was never rebuilt. In the time of James I. the fabric had so far decayed that the king was prevailed upon to make a personal examination of it, and Inigo Jones was entrusted with the work of restoration. In accordance with the architectural tendencies of his time he added a classical portico to the west front, and made similar alterations to the transepts. Again, the battering in 1666 the bad state of the fabric necessitated extensive repair, and Dr (afterwards Sir) Christopher Wren furnished a scheme including a central dome. All his plans were complete in August of that year, but in September the great fire of London almost destroyed the building, and rendered what was left unsafe and beyond restoration.

Dimensions of the old cathedral differ. Stow making the extreme length 600 ft, but more recent investigators give 596 ft. The internal height of the choir was 101 ft, and that of the nave, which was of twelve bays, 93 ft., and the extreme breadth of the building was 104 ft. The summit of the wonderful spire was 489 ft. above the ground. The present building is wider than the old, and its orientation is more northerly, but its northern, eastern and southern extremities approximately correspond with those of old. Two of the old sky-lighting towers, lay nearly 100 ft. west of Wren's front. It should be noticed that the eastern part of the old cathedral incorporated the original parish church of St Paul, St. Thomas was dedicated in 1255, when part of the new crypt was allotted to the parish in return. The nave of the church of St Gregory by St Paul actually adjoined the cathedral on the south-west. In the angle west of the south transept lay a cloister, in front of which was the almshouse from 1332. To the north-east of the cathedral stood Paul's Cross, in an open space devoted to public meetings; it included a pulpit, and here religious disputations were held and pulpax promulgated. In 1411 it was removed, but a new cross, erected under the will of H. C. Richards, K.C., M.P., was unveiled in 1910. The formal provision for the rebuilding of the cathedral was made in 1668, and the foundation stone was laid in 1675. The first service was held in it in 1697, and the last stone was set in place in 1710. The cost is curiously estimated, but was probably about £520,000, the greater part of which was defrayed by a duty on sea-borne coal. The material is Portland stone. Wren had to face many difficulties. He naturally insisted on the style of the Renaissance, and his first design was for a building in the form of a Greek cross, but the general desire was that at least the ground-plan of the old English cathedrals should be followed, and the form of a Latin cross was forced upon him. He offered various further designs, and one was accepted, but Wren set the broadest construction upon the permission granted him to alter its ornamental details, and luckily so. The extreme length of the building is 513 ft., the breadth across the transepts 248 ft., of which the central part is 229 ft. The height of the nave is 223 ft, and of the choir 168 ft, leaving 122 ft beneath the dome at the crossing. The cross at the top of the lantern above the dome is 363 ft. above the ground.

The cathedral is approached on the west from an open pavement, on which stands a statue of Queen Anne. There is also an inscription marking the spot on which Queen Victoria returned thanks on the occasion of her Diamond Jubilee (1897). A broad flight of steps leads up to the west front, of two orders, flanked by towers. In the north tower is a chime of bells; in the south the clock, with the old great bell (the 1612), and the new great bell, placed in 1882, weighing about 17 tons. The nave is of four bays, with aisles, and chapels of one bay width immediately east of the western towers. The transepts are of two bays, and are entered by north and south porches approached by circular flight of steps. On the pediment of the south porch is sculptured a phoenix with the inscription RERUMGEN (I shall rise again in all things glorious). Wren, planning his site and desiring to mark in the forming the proper place of his dome, bade a workman bring a piece of stone for the purpose. He picked up at hazard a fragment of an ancient tombstone bearing the inscription JACOB, and, when the four sides of the stone, four bays terminates in an apse, but the rich and lofty modern reeds stand forward, and the apse is thus divided off from the body of the church and forms the Jesus chapel. The choir stalls are a fine series of the work of the 16th century. The triforium of the western side is parapeted by the four vast piers in the angles of the cross, within which are small chambers, and by eight inner piers. The spandrels between the arches which stand upon these piers are ornamented with mosaics.
from the designs of G. F. Watts and others, executed by Salviati. Wren had looked forward to a comprehensive scheme of decoration in mosaic. The later extension of this work was entrusted to him by Sir Christopher Wren, whose Gallery is known as the Whispering Gallery from the fact that a whisper can be easily heard from one side to the other. Above this there are pilasters, with square-headed windows, the four small square spaces above the domed ceiling, ornamented in monochrome by Sir James Thornhill immediately after its completion; but the paintings have suffered from the action of the atmosphere and light, the next restorer, the inner dome, which begins to slope inward from the level of the Whispering Gallery, but this is masked outside by a colonnade, extending up to a point a little above the top of the internal vault. This is the inner dome of brick, pierced at the top to render the lantern visible from below; (2) a brick cone, the principal member of the structure, being the lantern; (3) the dome visible from without, or loaded on a wooden frame. The golden gallery at the base of the lantern (top of the outer dome) is about 65 ft. above the top of the inner dome.

The monuments in St Paul's are numerous, though not to be compared with those in Westminster Abbey. The most notable is that in the nave to the duke of Wellington (d. 1852) by Alfred Stevens. In the crypt, which extends beneath the entire building, are many tombs and monuments— that of Nelson in the centre beneath the dome, those of many famous artists in the so-called Painters' Corner, and in the south choir aisle that of Wren himself, who is buried in the crypt, with an inscription ending St monumentum requiris, circumspice (“If thou seest a monument, look about thee”). Above the south-west chapel in the nave is the chapter library, with many interesting manuscripts, including the records of the cathedral. St Paul's School, established by John Colet, dean, and formerly adjacent to the cathedral, see the article on HAMMERSMITH, whither it was subsequently removed.

Augsburg—Paroissiens, or Memoirs (of Sir Christopher Wren), completed by his son Christopher, now published by his Grandson, Stephen Wren (London, 1758); Sir William Dugdale, History of St Paul's (1658); Dean Milman, Annals of St Paul's (1868); William Longman, The Three Cathedrals dedicated to St Paul (1872); Documents illustrating the History of St Paul's (Camden Society, 1880); Rev. W. Sparrow-Simpson, Chapters in the History of Old St Paul's (1895); Histories of the City of London (History and Topography of St Paul's Cathedral, 1894); Rev. A. Dimock, St Paul's (in Bell's "Cathedral" series, 1901); Rev. Canon Benham, Old St Paul's (1902).

This last work, and elsewhere are shown the valuable drawings of Wenceslas Hollar, showing the old cathedral immediately before the great fire.

ST PAUL'S ROCKS, a number of islets in the Atlantic, nearly 1° N. of the equator and 540 m. from South America, in 29° 15' W. The whole space occupied does not exceed 1400 ft. in length by about half as much in breadth. Besides sea-fowl the only large animals are the seals. The only land species (one, Holocentrum sancti pauli, peculiar to the locality) are collected by the "Challenger" during a brief stay. Darwin (On Volcanic Islands) decided that St Paul's Rocks were not of volcanic origin; later investigators maintain that they probably are eruptive.

ST. PETER, a city and the county-seat of Nicollet county, Minnesota, U.S.A., on the Minnesota river, about 75 m. S.W. of Minneapolis. Pop. (1903, state census) 4,514 (875 foreign-born; 1910) 4,176. It is served by the Chicago & North-Western railway and by steamboat lines on the Minnesota river, which is navigable for light draft steamboats to this point. The neighbouring lakes with their excellent fishing attract many summer visitors. The city has a Carnegie library, and is the seat of the Minnesota Hospital for the Insane (1860), and of Gustavus Adolphus College (Swedish Evangelical Lutheran; co-educational), which was founded in 1862 and has a college, an Academy, and School of Pedagogy, a School of Commerce and a School of Music. St Peter is an important market for lumber and grain; it has stone quarries and various manufactures. Settled about 1852, St Peter was incorporated as a village in 1865, and was chartered as a city in 1891. In 1857 the legislature, a short time before its adjournment for the session, passed a bill to remove the capital of Minnesota to St Peter, but the bill was not presented to the governor for his signature within the prescribed time, and when the legislature re-convened a similar bill could not be passed.

ST PETER PORT, the chief town of Guernsey, one of the Channel Islands. Pop. (1901) 18,264. It lies picturesquely on a steep slope above its harbour on the east coast of the island. The harbour is enclosed by breakwaters, the southern of which connects with the shore and continues beyond a rocky islet on which stands Castle Cornet. It dates from the 12th century and retains portions of that period. Along the sea-front of the town there extends a broad sea-wall, which continues northward nearly as far as the small port of St Sampson's, connected with St Peter Port by an electric tramway. To the south of the town Fort George, with its barracks, stands high above the sea. On the quay there is a bronze statue of Albert, Prince Consort (1862), copied from that on the south side of the Albert Hall, London. St Peter Port was formerly walled, and the sites of the five gates are marked by stones. St Peter's, or the town church, standing low by the side of the quay, was consecrated in 1312, but includes little of the building of that date. It has, however, fine details of the 14th and 15th centuries, and is, as a whole, the most noteworthy ecclesiastical building in the islands. The other principal buildings are the court house, used for the meetings of the royal court and the states, the Elizabeth College for boys, founded by Queen Elizabeth, but occupying a house of the year 1825, and the Victoria Tower, commemorating a visit of Queen Victoria in 1846. Hauteville House, the residence of Victor Hugo from 1855 to 1870, is preserved as he left it, and is open to the public. The harbour is the chief in the island, and a large export trade is carried on especially in vegetables, fruit and flowers. The construction of the harbour was ordered by King Edward I., in 1275.

ST PETERSBURG, a government of north-western Russia, at the head of the Gulf of Finland, stretching for 130 m. along its south-east shore and the southern shore of Lake Ladoga, and bordering on Finland, with an area of 17,221 sq. m. It is hilly on the Finland border, but flat and marshy elsewhere, with the exception of a small plateau in the south (Dudorohu Hills), 300 to 550 ft. high. It has a damp and cold climate, the average temperatures being: at St Petersburg, for the year 30° F., for January 13°, for July 60°; yearly rainfall, 18-7 in.; at Sermak, at the mouth of the Svir on the E. side of Lake Ladoga (66° 28' N.), for the year 37°, for January 13°, for July 62°; yearly rainfall, 20-8 in. Numerous parallel ridges of glacial origin intersect the government towards Lake Peipus and north of the Neva. Silurian and Devonian rocks appear in the south, the whole covered by a thick glacial deposit with boulders (bottom moraine) and by thick alluvial deposits in the valley of the Neva. The bays of Kronstadt, Kpopoya, Luga and Narva afford good anchorage, but the coast is for the most part fringed with reefs and sandbanks. The chief river is the Neva. The feeders of Lake Ladoga—the Volkov, the Syas, and the Svir, the last two forming part of the system of canals connecting the Neva with the Volga—are important channels of commerce, as also is the Narova. Marshes and forests cover about 45% of the area (70% at the end of the 18th century). The population, which was 6,557,800 in 1882, numbered 8,004,083 in 1897, without the capital and its suburbs; including the latter it was 2,103,965. Of this latter number 466,750 were women and 1,637,243 lived in towns. The estimated pop. in 1906 was 2,510,100. The average density was 121 per sq. m. The population is chiefly Russian, with a small admixture of Finns and Germans, and according to religion it is distributed as follows: Greek Orthodox, 76%; Unconfessing, 18%; Lutherans, 4%; and Roman Catholics, 2%.4 A remarkable feature is the very slow natural increase of the population. During the 25 years 1867 to 1891 the natural increase was only 867. The government is divided into eight districts, the administrative headquarters of which, with their populations in 1897, are: St Petersburg (g.v.), Gdov (2,254 inhabitants), Luga (5,687), Novaya Ladoga (4,174), Peterhof (11,300), Schlüsselburg (5,288), Tsarskoye Selo (23,353) and Yamburg (4,166). Most of the towns are summer resorts for the population of the capital. Till the latter part of the 19th century education stood at a very low level, but progress has since been made, and now three-quarters of all who
enter the army from this government are able to read. The semestvo (provincial council) has organized village libraries and lectures on a wide scale. Many improvements have been made, especially since 1897, in sanitary organization. Generally speaking, agriculture is at a low ebb. The principal crops are cereals (rye, oats and barley), potatoes and green crops, the total area under cultivation being only 13%. These crops, which are often ruined by heavy rains in the late summer, are insufficient for the population. Flax is cultivated to some extent. Nearly 21% of the area consists of meadows and pasture. Dairy-farming is developing. Timber, shipping, stone-quarries, coal and iron, are important industries; the chief factories are cotton, tobacco, machinery, sugar, rubber and paper mills, chemical works, distilleries, breweries and printing works.

**ST PETERSBURG**, the capital of the Russian empire, situated at the head of the Gulf of Finland, at the mouth of the Neva, in 59° 56' N., and 30° 20' E., 400 m. from Warsaw, 600 m. from Odessa (via Moscow), and 1390 m. from Astrakhan (also via Moscow). The Neva, before entering the Gulf of Finland, forms a peninsula, on which the main part of the city stands, and itself subdivides into several branches. The islands of the Neva are formed are only 10 to 11 ft. above the average level of the water. Their areas are rapidly increasing, while the banks which continue them seaward are gradually disappearing. The mainland is not much higher than the islands. As the river level rises several feet during westery gales, extensive portions of the islands and of the mainland are flooded every winter. In 1777, when the Neva rose 10-7 ft., and in 1824, when it rose 13-5 ft., nearly the whole of the city was inundated, and the lower parts were again under water in 1850, 1859 and 1898, when the floods rose 8 ft. A ship canal, completed in 1875-1888 at a cost of $1,650,000, has made the capital navigable, and the Great Neva connects the left bank of the mainland with Vasilyevsky or Basil Island; but, being built on boats, it is removed during the autumn and spring. Several wooden or floating bridges connect the islands, while a number of stone bridges span the smaller channels. In winter, when the Neva is covered with ice 2 to 3 ft. thick, temporary roadways for carriages and pedestrians are made across the ice and artificially lighted. In winter, too, thousands of peasants come in from the villages with their small Finnish horses and sledges to ply for hire. The Neva continues frozen for an average of 147 days in the year (25th November to 21st April). It is unnavigable, however, for some time longer on account of the ice from Lake Ladoga, which is sometimes driven by easterly winds into the river at the end of April and beginning of May. The climate of St Petersburg is changeable and unhealthy. Frosts are made much more trying by the wind which accompanies them; and westerly gales in winter bring oceanic moisture and warmth, and melt the snow before and after hard frosts. The summer is hot, but short, lasting barely more than five or six weeks; a hot day, however, is often followed by cold weather: changes of temperature amounting to 35° Fahr. within twenty-four hours are not uncommon. In autumn a chilly dampness lasts for several weeks, and in spring cold and wet weather alternates with a few warm days.

**Topography.**—The greater part of St Petersburg is situated on the mainland, on the left bank of the Neva, including the best streets, the largest shops, the bazaars and markets, the palaces, cathedrals and theatres, as well as all the railway stations, except that of the Finland railway. From the Liteinyi bridge to that of Nicholas a granite embankment, bordered by palaces and large private houses, lines the left bank of the Neva. About midway, behind a range of fine houses, stands the Admiralty, the very centre of the capital. Formerly a wharf, on which Peter the Great caused his first Baltic ship to be built in 1706, it is now the seat of the ministry of the navy and of the hydrographical department, the new Admiralty building standing farther down the Neva on the same bank. A broad square, partly laid out as a garden (Alexander Garden), surrounds the Admiralty on the west, while to the south, stands the great and fine memorial to Peter the Great, erected in 1782, and now backed by the cathedral of St Isaac. A bronze statue, a masterpiece of the French sculptor Falconet, represents the founder of the city on horseback, at full gallop, ascending a rock and pointing to the Neva. South of the Admiralty is the ministry of war and to the east the imperial winter palace, the work of Rastrelli (1764), a fine building of mixed style; but its admirable proportions mask its huge dimensions. It communicates by a gallery with the Hermitage Fine Arts Gallery. A broad semi-circular square, adorned by a memorial column (1854), serves to connect the palace and palace from the buildings of the garrison to the Russian government. The range of palaces and private houses facing the embankment above the Admiralty is interrupted by the macadamized "Field of Mars," formerly a marsh, but transformed at incredible expense into a paradise-ground, and the Lycetniy Sad (summer-garden) of Peter the Great. The Neva embankment is continued to a little below the Nicholas bridge under the name of "English embankment," and farther down by the new Admiralty buildings. The topography of St Petersburg is very simple. Three long streets, the main axis of the capital, radiate from the Admiralty: the Prospekt Nevski (Neva Prospect), the Gorokhovaya, and the Prospekt Voznesenskii (Ascension Prospect). Three girdles of canals, roughly speaking concentric, intersect these three streets—the Moika, the Catherine and the Fontanka; to these a number of streets run parallel. The Prospekt Nevski is a very broad street, running straight east-south-east for 3000 yds. from the Admiralty to the Moscow railway station, and thence 1500 yds. farther, bending a little to the south, until it again reaches the Neva at Kalashnikov Harbour, near the vast complex of the Alexander Nevski Monastery (1873) the seaport of the capital. The Prospekt Nevski is a broad street, and still more its animation. But the buildings which border it are architecturally poor. Neither the cathedral of the Virgin of Kazan (an ugly imitation on a small scale of St Peter's in Rome), nor the still uglier Gostinii Dvor (a two-storied quadrilateral building divided into second-rate shops), nor the Anichkov Palace (which resembles immense barracks), nor even the Roman Catholic and Dutch churches do anything to embellish it. About midway between the public library and the Anichkov Palace, an elegant square hides the old-fashioned Alexandria theatre; nor does a profusely adorned memorial (1873) to Catherine II. beautify it much. The Gorokhovaya is narrow and badly paved, and is shut in between gloomy houses occupied mostly by artisans. The Voznesenskii Prospekt, on the contrary, though as narrow as the last, has better houses. On the north, it passes into a series of large squares connected with that in which the monument of Peter the Great stands. One of them is occupied by the cathedral of St Isaac (of Dalmatia), and another by the memorial (1856) to Nicholas I., the greatest monarch and had taste of which contrast strangely with the simplicity and significance of that of Peter the Great. The general aspect of the cathedral is imposing both without and within; but on the whole this architectural monument, built between 1819 and 1858 according to a plan of Montferrat, under the personal direction of Nicholas I., does not correspond either with its costliness ($2,431,300) or with the efforts put forth for its decoration by the best Russian artists.
The eastern extremity of Vasilyevsky Island is the centre of commercial activity; the stock exchange is situated there as well as the quays and storehouses. The remainder of the island is occupied chiefly by scientific and educational institutions—the Academy of Sciences and the Military Academy. The Academy of Sciences (or科学院) consists of several branches: the Historical and Philosophical Institute, the Academy of the first corps of cadets, the Academy of Arts, the Marine Academy, the Mining Institute, and the Central Physical Observatory, all facing the Neva.

Petersburg Island contains the fortress of St Peter and St Paul (1703-1740), opposite the Winter Palace; but the fortress is now a state prison. A cathedral which stands within its walls is the burial-place of the emperors and the imperial family. The mint and an artillery museum are also situated within the fortress. The remainder of the island is mainly built, and is the refuge of the poorer officials (чиновники) and of the intellectual proletariat. Its northern part, separated from the main island by a narrow channel, bears the name of Apotheoses' Island, and is occupied by a botanical garden of great scientific value and several fine private gardens and parks. Krestovsky, Elagin and Kamenny Islands, as also the opposite (right) bank of the Great Neva (one of the branches of the Neva) are occupied by public gardens, parks and summer residences. The mainland on the right bank of the Neva above its delta is known as the Viborg Side, and is connected with the main city by the Liteiniy bridge, closely adjoining which are the buildings of the military academy of medicine and other hospitals.

The Academy of Sciences, (many of them unpaved), with numerous wooden houses, are inhabited by students and workmen; farther north are great textile and iron factories. Vast orchards and the yards of the artillery laboratory stretch north-eastwards, while the railway and the high road to Finland, running north, lead to the park of the Forestry Institute. The two villages of Okhta, on the right bank, are suburbs; higher up, on the left bank, are several factories (Alexandrovsk) which formerly belonged to the crown.

The true boundary of St Petersburg on the south is the Obvodny Canal, running parallel to the three canals already mentioned and forming a sort of base to the Neva peninsula; but numerous orchards, cemeteries and factories, and even unoccupied spaces, are included within the city boundaries in that direction, though they are being rapidly covered with buildings. Except in a few principal streets, which are paved with wood or asphalt, the pavement is usually of granite sets. There are two government dockyards, the most important of which is the new admiralty yard in the centre of the city. At this yard there are three building slips and a large experimental basin, some 400 ft. in length, for trials and tests of models. The Galleon Yard is a little lower down the river, and is devoted entirely to construction. There are two building slips for large vessels, besides numerous workshops, storehouses and so forth. The Baltic Yard is near the mouth of the Neva, and was taken over by the ministry of marine in 1894. Since that time the establishment has been enlarged, and a new stone building slip, 520 ft. in length, completely housed in, has been finished.

Population.—The population of St Petersburg proper at the census specified was as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Total</th>
<th>Men</th>
<th>Women</th>
<th>Proportion of Men to every 100 Women</th>
</tr>
</thead>
<tbody>
<tr>

</table>

A further increase was revealed by the municipal census of 1900, when the population of the city was 1,248,739, having thus increased 30-9% in ten years. In 1905 the total population was estimated to number 1,500,000. The population of the suburbs was 134,710 in 1897, and 190,635 in 1900. Including its suburbs, St Petersburg is the fifth city of Europe in point of size, coming after London, Paris, Berlin and Vienna. The large proportion of men in its population is due to the fact that great numbers come from other parts of Russia to work in the winter in the textile factories, and during the summer at unloading the boats. Russians numbered 883,354 in 1897, or 73-1% of the population; Germans 43,798, or 3-9%; Poles 22,307, or 1-9%; Finns, 16,731, or 1-5%; and Jews 10,353, or 0-9%.

The various religions are represented by 84-9% Orthodox Christians, 3-3% Protestants, and 3-9 Roman Catholics. The proportion of illegitimate births (abortion is very common in Russia) is ten times as great as in the rest of Russia, namely 250 to 286 per thousand births. It is thus nearly the same as in Paris, but lower than in Moscow (292 per thousand) and Vienna (349 per thousand). The mortality varies much in different parts of the city—from 12 per thousand in the best situated, the admiralty quarter, to 16 in other central parts, and 25 and 27 in the outlying quarters. The mortality has, however, notably decreased, as it averaged 36 per thousand in the years 1870 to 1874, and only 27 from 1886 to 1895, and 24 in 1897. Infectious diseases, i.e. tuberculosis, diphteria, influenza, smallpox, and measles, are the cause of 37 to 38% of all deaths. The high mortality in certain quarters is largely due to overcrowding and bad water.

An interesting feature of the Russian capital is the very high proportion of people living on their own earnings or income ("independent") as compared with those who live on the earnings or income of someone else ("dependent"). Only a few industrial establishments employ more than twenty workmen, the average being less than ten and the figure seldom falling below five. The number of factories is beyond the limits of this work. Although 36% of the population above six years old are unable to read, the workmen are amongst the most intelligent classes in Russia.

Education, Science and Art.—Notwithstanding the hardships and prosecutions to which it is periodically subjected, the university (nearly 4000 students) exercises a pronounced influence on the life of the city. The medical faculty forms a separate academy under military jurisdiction, with about 1500 students. There are, moreover, a philological institute, a technological institute, a forestry academy, and engineer schools, and the mining academy. The Academy of Art (or Academy of Fine Arts) is called to carry on the traditions of the celebrated painter, Vasiliev, the astronomical and magnetic observatory at Peking, and the botanical garden, are all attached to the academy of sciences. The Society of Naturalists and the Physical and Chemical Society are also connected with the academy, which is in fact a part of the university and is entirely supported by the government. The academy is gradually pushing forward the geological survey of the country; the Mineralogical Society was founded in 1817. The Geographical Society, with branch societies for West and East Siberia, Caucasus, Orenburg, the north-western, the south-western, and north-eastern regions of European Russia, is well known for its valuable work, as is also the Entomological Society. There are four medical societies, and an archaeological society (since 1840), an historical society, an economical society, gardening, forestry, technical and navigation societies. The conservatory of music, with a new building (1861-1866), gives superior musical instruction. The Musical Society is worthy of notice. Art, on the other hand, has notfreed itself from the old scholastic methods at the academy. Several independent artistic societies seek to remedy this drawback, and are the true cradle of the Russian genre painters.

The imperial public library contains valuable collections of books (1,000,000) and MSS. The library of the academy of sciences contains more than 500,000 volumes, 15,000 MSS, rich collections of works on oriental languages, and valuable collections of periodical publications from scientific societies throughout the world. The museums of the Russian capital occupy a prominent place among those of Europe. That of the Academy of Sciences, of the Navy, of the Admiralty (1796), of the Marine (1797), of the Institute of Arts, the Asiatic museum, the Suvorov museum (1901), with pictures by Vereshchagin, the Zoological museum and several others are of great scientific value. The Hermitage Art Gallery contains a magnificent collection of works of art. Founded in 1764, the Russian school, good specimens of the Italian, Spanish and old French schools, invaluable treasures of Greek and Scythian art, and a good collection of 200,000 engravings. Old Christian and old-Russian arts are well represented in the museums of the Academy of Arts. The New Michael Palace was in 1805-1898
converted into a museum of Russian art—the Russian museum; it is one of the handsomest buildings in the city.

In the development of the Russian navy, St Petersburg has played a far greater part than Moscow, and the stage there has never reached the same standard of excellence as that of the older capital. On the other hand, St Petersburg is the cradle of Russian opera and Russian ballet. In the four theatres of the city—municipal, Bear Garden, all—amphitheatre—one for the opera and ballet, one for the native drama, and one for the French and German drama.

Industries and Trade.—St Petersburg is much less a manufacturing than a trading city. St Petersburg produced more timber, metal works, tobacco, paper, and printing goods, but the chief export is grain. The chief imports are sugar, flour, and oil. A large quantity of the grain exports are almost entirely to Europe by sea (from 1,500,000 to 6,000,000), and to Finland (1,500,000 to 3,000,000). The imports consist chiefly of coal, metals, building materials, herrings, coffee, tea, better-class timber, raw cotton, wool, paper, cellulose, and manufactured goods, and amount to about £4,000,000 annually.

Railways.—Two railway lines meet at St Petersburg. Two run westwards along both shores of the Gulf of Finland to Hangö and to Port Baltic respectively; two short lines connect Oranienbaum, opposite Kronstadt and Tsarskoe Selo (with Pavlovsk) with the capitol; and three great trunk lines run south-west to Warsaw, with branches to Riga and Smolensk), south-east to Moscow (with branches to Novgorod and Rybinsk), and east to Vologda, Vyatka, and Perm. The Neva is the principal channel for the trade of St Petersburg with the rest of Russia, by means of the Vaga and its tributaries.

Administration.—The municipal affairs of the city are in the hands of a council, elected by the electors, and a council of ministers, a department of the chief of the police. The city is under a separate governor-general, whose authority, like that of the chief of police, is unlimited.

History.—St Petersburg is surrounded by several fine residences, mostly imperial palaces with large and beautiful parks. Tsarskoe Selo, 15 m. to the south-east, and Peterhof, on the Gulf of Finland, are summer residences of the emperor. Pavlovsk, 17 m. S. of the city, contains the royal palace and park, and is inhabited by thousands of people. There is another imperial palace at Gatchina, 29 m. S. Oranienbaum, 25 m. W. on the south shore of the Gulf of Finland, is a rather deserted place. Pulkovo, on a bill 9 m. S. from St Petersburg, is well known for its observatory; while several villages north of the capital, such as Pargolovo and Murino, are visited in summer by the less wealthy inhabitants.

History.—The region between Lake Ladoga and the Gulf of Finland was inhabited in the 9th century by Finns and some Slavs. Novgorod and Pskov made efforts to secure and maintain dominion over this region, so important for their trade, and in the 13th and 14th centuries they built the forts of Koporya (in the present district of Peterhof), Yam (now Yamburg), and Oranienburg, which were the means of keeping the Neva issues from Lake Ladoga. They found, however, powerful opponents in the Swedes, who erected the fort of Landskrona at the junction of the Okhta and the Neva, and in the Livonians, who had their fortress at Narva. Novgorod and Moscow successively were able to continue fighting to maintain their supremacy over the region south of the Neva throughout the 16th century; but early in the 17th century Moscow was compelled to cede it to Sweden, which erected a fortress on the Neva at the mouth of the Okhta. In 1700 Peter the Great began his wars with Sweden. Orzeshew was taken in 1703, and in the following year the Swedish fortress on the Neva. Two months later (29th June 1703) Peter laid the foundations of a cathedral to St Peter and St Paul, and of a fort which received his own name (in its Dutch transcription, "Piterburgh"). Next year the fort of Kronswlt was erected on the island of Kotlin, as also the Admiralty on the Neva, opposite the fortess. The emperor took most severe and almost barbarous measures for increasing his empire, and driving Hardenbergh and the Dutch from the Neva. By the Peace of Northern Germany in 1807, the fortresses of Russia were removed thither and died in erecting the fortresses and building the houses. Under Elizabeth fresh compulsory measures raised the population to 150,000, and this figure was nearly doubled during the reign of Catherine II. (1762-1796). The chief embellishments of St Petersburg were effected during the reigns of Alexander I. (1801-1825) and Nicholas I. (1825-1855). From the earliest years of Russian history trade had taken this northern direction. Novgorod owed its wealth to this fact; and as far back as the 15th century the Russians had their forts on the Neva, and a few years after the conquest of the city of Moscow in 1547; they exchanged their wares with the Danzig merchants at Nyr and Nowy Vaslyevskiy Island. By founding St Petersburg Peter the Great only restored the trade to its old channels. The system of canals for connecting the upper Volga and the Dnieper with the great lakes of the north completed the work; the commercial mouth of the Volga was thus transferred to the Gulf of Finland, and St Petersburg became the export harbour for more than half Russia. Foreigners hastened thither to take possession of the growing export trade, and to this the Russian industrial and intellectual life is due. The development of the railway system and the colonization of southern Russia now operate, however, adversely to St Petersburg, while the rapid increase of population in the Black Sea region is tending to shift the Russian centre of gravity; new centres of commercial, industrial, and intellectual life are being developed at Odessa and Rostov. The revival of Little Russia is another influence operating in the same direction. Since the abolition of serfdom and in consequence of the impulse given to Russian thought by this reform, the provinces are coming more and more to attract the right of St Petersburg to guide the political life of the country. It has been often said that St Petersburg is the head of Russia and Moscow her heart. The first part of at least this saying is true. In the development of thought and in naturalizing in Russia the results of west European culture and philosophy St Petersburg has played a prominent part. It has helped naturally to familiarize the public with the teachings of west European science and thinking, and to give to Russian literature its liberality of mind and freedom from the trammels of tradition. St Petersburg has no traditions, no history beyond that of the palace conspiracies, and there is nothing in its past to attract the writer or the thinker. The development of intellectual life and new currents of thought develop against Moscow and Kiev, or arise anew at Odessa and in the eastern provinces, these places claim the right to their own share in the further development of intellectual life in Russia.

( P. A. K., J. T. B.)

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL. (ABBÉ DE (1658-1743), French writer, was born at the château de Saint-Pierre-l'Eglise near Cherbourg on the 18th of February 1658. His father was bailli of the Cotentin, and Saint-Pierre was educated by the Jesuits. In Paris he frequented the salons of Madame de la Fayette and of the marquise de Lambert. He was presented to the abbacy of Tiron, and was elected to the whole deputation of the Academy in 1695. In the same year he gained a footing at court as amanuensis. But in 1718, in consequence of the political offence given by his Discours sur la polysynodie, he was expelled from the Academy. He afterwards founded the club of the Entrec sol, an independent society suppressed in 1731. He died in Paris on the 20th of April 1743.

Saint-Pierre's works are almost entirely occupied with an acute though generally visionary criticism of politics, law and social institutions. They had a great influence on Rousseau, who left elaborate examinations of some of them, and reproduced
not a few of their ideas in his own work. His *Projet de paix perpétuelle*, which was destined to exercise considerable influence on the development of the various schemes for securing universal peace which culminated in the Holy Alliance, was published in 1713 at Utrecht, where he was acting as secretary to the French plenipotentiary, the Abbé de Polignac, and his *Polysynodie* contained severe strictures on the government of Louis XIV. With projects for the administration of France by a system of councils for each department of government. His works include a number of memorials and projects for stopping duelling, equalizing taxation, treating mendicancy, reforming education and spelling, &c. It was not, however, for his suggestions for the reform of the constitution that he was disgraced, but because in the *Polysynodie* he had refused to Louis XIV, the title of le Grand. Unlike the later reforming abbés of the philosophic period, Saint-Pierre was a man of very unworldly character and quite destitute of the Frondeur spirit.

His works were published at Amsterdam in 1738-1740 and his *Anoties politiques* in London in 1757. A discussion of his principles, with a view to securing a just estimation of the high value of his political and economic ideas, is given by S. Siegler Pascal in *Un Contrepoids contre la XIVe Idée*. Les Projets de l’abbé de Saint-Pierre, 1658-1743 (Paris, 1900).

SAINT-PIERRE, JACQUES HENRI BERNARDIN DE (1737–1814), French man of letters, was born at Havre on the 19th of January 1737. He was educated at Caen and at Rouen, and became an engineer. According to his own account he served in the army, taking part in the Hesse campaign of 1760, but was dismissed for insubordination, and, after quarrelling with his family, was in some difficulty. He appears at Malta, St Petersburg, Warsaw, Dresden, Brussels, and finally returned to France and resumed his usual pursuits.

His *Voyage à l’Île de France* (2 vols., 1773) gained him a reputation as a champion of innocence and religion, and in consequence, through the exertions of the bishop of Aix, a pension of 1000 livres a year. It is sober and therefore the least characteristic of his books. The *Etudes de la nature* (3 vols., 1784) was an attempt to prove the existence of God from the wonders of nature; he set up a philosophic sense of duty to oppose the materializing tendencies of the Encyclopaedists. His masterpiece, *Paul et Virginie*, appeared in 1786 in a supplementary volume of the *Etudes*, and his second great success, much less sentimental and showing not a little humour, the *Chasteire indienne*, not till 1790. In 1792 he married a very young girl, Félicité Didot, who brought him a considerable dowry. For a short time in 1792 he was superintendent of the Jardin des Plantes, and on the suppression of the office received a pension of 3000 livres. In 1795 he became a member of the Institute. After his first wife’s death he married in 1800, when he was sixty-three, another young girl, Désirée Pelleport, and is said to have been very happy with her. On the 21st of January 1814 he died at his house at Eranay, near Pontoise.

He has been pronounced a poet in style and not in tone. Perhaps Bernardin is not fairly to be judged by this famous story, in which the exuberant sensibility of the time finds equally exuberant expression. His merit lies in breaking away from the atmosphere of sentiment and the mawkishness of classical writing has brought upon France, in his genuine preference for the beauties of nature, and in his attempt to describe them faithfully. After Rousseau, and even more than Rousseau, Bernardin was in French literature the first writer to turn to the real, the commonplace, to the immediate and to the familiar. His immediate follower Chateaubriand there is still much mannerism and unreality.

Aimé Martin, disciple of Bernardin and the second husband of his second wife, published a complete edition of his works in 18 volumes (Paris, 1818-1820), afterwards increased by seven volumes of correspondence and memoirs (1826). Paul et Virginie, the *Chasteire indienne*, have often been separately reprinted. See also Arved-Barin’s *Bernardin de Saint Pierre* (1891).

ST PIERRE and MIQUELON, two islands 10 m. off the south coast of Newfoundland, united area about 91 sq. m. Both are rugged masses of granite, with a few small streams and lakes, a thin covering of soil and scanty vegetation. Miquelon, the larger of the two, consists of Great Miquelon and Little Miquelon, or Langlade; previous to 1783 these were separated by a navigable channel, but they have since become connected by a dangerous mudbank. St Pierre has a sheltered harbour with about 14 ft. of water, good roadsteads, and is not more than seven miles from land. Their importance is due to their proximity to the great Banks, which makes them the centre of the French Atlantic fisheries. These are kept up by an elaborate system of bounties by the French government, which considers them of great importance as training sailors for the navy. Fishing lasts from May till October, and is carried on by nearly five hundred vessels, of which about two-thirds are fitted out from St Pierre, the remainder coming from St Malo, Cancale and other French coast towns. The resident population, which centres in the town of St Pierre, is about 6,000, and increased 10,000 this year (1892) by the return of about four thousand men each year by extra fishing hands from France, but is steadily declining owing to the diminution of trade in Canada. Owing to the low rates of duty, vast quantities of goods, especially French wines and liquors, are imported, and smuggled to Newfoundland, the United States and Canada, though of late years this has been checked by a gradual rise in the scale of duties, and by the presence since 1894 of a British consul. St Pierre is connected with Halifax (N.S.) and St Johns (Newfoundland) by a regular packet service, and is a station of the Anglo American Cable Co. and the Compagnie française des câbles télégraphiques. Excellent facilities for primary and secondary education are given, but the attraction of the fisheries prevents their being fully used.

The islands were occupied by the French in 1666, and fortified in 1700. In 1702 they were captured by the British, and held till 1763, when they were given back to France as a fishing station. They are thus the sole remnant of the French colonies in North America. Destroyed by the English in 1778, restored to France in 1783, again captured and depopulated by the English in 1793, recovered by France in 1802 and lost in 1803, the islands have remained in undisputed French possession since 1814 (Treaty of Paris). Les Colonies françaises, t. ii. (Paris, 1889); Levassure, La France, t. ii. (Paris, 1893); L’Année coloniale, yearly since 1899, contains statistics and a complete bibliography; P. T. McGrath in The New England Magazine (May 1905) describes the daily life of the present inhabitants.

ST POL, COUNTS OF. The countship of St Pol-sur-Ternoise in France (department of Pas-de-Calais), belonged in the 11th and 12th centuries to a family surnamed Candavène. Elizabeth, heiress of this house, carried the countship to her husband, Gaucher de Châtillon, in 1205. By the marriage of Mahaut de Châtillon with Guy VI. of Luxembourg, St Pol passed to the house of Luxembourg. It was in possession of Louis of Luxembourg, constable of France, who was beheaded in 1475. The constable’s property was confiscated by Louis XI., but was subsequently restored in 1488 to his granddaughters, Marie and Françoise of Luxembourg. Marie (d. 1542) was countess of St Pol, and married François de Bourbon, count of Vendôme. Their son, François de Bourbon, count of St Pol (1491-1545), was one of the most devoted and courageous generals of Francis I. Marie, daughter of the last-mentioned count, brought the countship of St Pol to the house of Orleans-Longueville. In 1705 Marie of Orleans sold it to Elizabeth of Lorraine-Lillebonne, widow of Louis de Melun, prince of Épinoy, and their daughter married the prince of Rohan-Soubise, who thus became count of St Pol. (M. P.)*

ST POL-DE-LÉON, a town of north-western France, in the department of Finistère, about 1 m. from the shore of the English Channel, and 13½ m. N. of Morlaix by the road to Roscoff. Pop. (1906), town, 3555; commune, 8140. St Pol-de-Léon is a quaint town with several old houses. The cathedral is
largely in the Norman Gothic style of the 13th and early 14th centuries. The west front has a projecting portico, and two towers 180 ft. high with granite spires. Within the church there are beautifully carved stalls of the 16th century and other works of art. On the right of the high altar is a wooden shrine containing the bell of St Pol de Léon, which was said to cure headache and diseases of the ear, and at the side of the main entrance is a huge baptismal font, popularly regarded as the stone coffin of Conon Mériadeck, king of the Bretons. Notre Dame de Kreizker, dating mainly from the second half of the 14th century, has a celebrated spire, 352 ft. high, which crowns the central tower. The south porch is a fine specimen of the flamboyant style. In the century, which has a chapel of the 15th century, there are ossuaries of the year 1500.

In the 6th century a Welsh monk, Paul, became bishop of the small town of Léon, and lord of the domain in its vicinity, which passed to his successors and was increased by them. In 1793 the town was the centre of a serious but unsuccessful rising provoked by the recruiting measures of the Convention.

SAINT PRIEST, FRANÇOIS EMMANUEL GUIGNARD, Chevalier, then COMTE DE (1733-1811), French statesman, was born at Grenoble on the 12th of March 1733. He was admitted a kinsman in 1782 to the Order of Malta, on attaining five years of age, and at fifteen entered the army. He left active service in 1760 with the grade of colonel, and for the next four years represented the court of France at Lisbon. He was sent in 1768 to Constanti- nople, where he remained with one short interval till 1785, and married Wilhelmina von Ludolf, daughter of the Neapolitan ambassador. His Mémoires sur l'ambassade de France en Turquie et le commerce des Français dans le Levant, prepared during a visit to France, were only published in 1857, when they were edited by C. Scheller. After a few months spent at the court of the Hague, he rejoined the Ministry of Necker as minister without a portfolio, and was in Necker's second cabinet in 1780 was secretary of the royal household and minister of the interior. He became a special object of the popular hatred because he was alleged to have replied to women begging for bread, "You had enough while you had only one king; demand bread of your twelve hundred sovereigns." Nevertheless he held office until December 1790. Shortly after his resignation he went to Stockholm, where his brother-in-law was Austrian ambassador. In 1795 he joined the comte de Provence at Verona as minister of the household. He accompanied the exiled court to Blankenburg and Mitterau, remaining there till the French revolution. He only seeking permission to return to France he was expelled from Switzerland, and wandered about Europe until the Restoration. Besides the memoirs already mentioned he wrote an Examen des assemblées provinciales (1787).

His eldest son, GUILLAUME EMMANUEL (1776-1814), became major-general in the Russian service, and served in the campaigns of Alexander I against Napoleon. He died at Laon in 1814. The second, ARMAND EMMANUEL CHARLES (1782-1863), became civil governor of Odessa, and married Princess Sophia Galitzin. The third, EMMANUEL LOUIS MARIE GUIGNARD, vicomte de Saint Priest (1789-1888), was a godson of Marie Antoinette. Like his elder brother he took part in the invasion of France in 1814. At the Restoration he was attached to the service of the duke of Angoulême, and during the Hundred Days tried to raise Dauphiné in the royal cause. He was distinguished at the battle of Ulm in 1805, and was promoted lieutenant-general. After two years at Berlin he became French ambassador at Madrid, where he negotiated in 1828 the settlement of the Spanish debt. When the revolution of July compelled his retirement, Frederick VII. made him a grandee of Spain, with the title of duke of Alzamaz, in recognition of his services. He then joined the circle of the duchess of Berry at Naples, and arranged her escape in 1832. Saint Priest was arrested, and was only released after ten months' imprisonment. He tried to obtain an asylum in Austria for the duchess, he returned to Paris, where he was one of the leaders of the legitimist society until his death, which occurred at Saint Priest, 26th of February 1848. His son, SAINT PRIEST, ARMAND-EMMANUEL, comte de Saint Priest (1805-1851), was the son of Armand de Saint Priest and Princess Galitzin. Educated in Russia, he returned to France with his father in 1822, and soon made his way into the same circles as his father. His memoirs, Historie de la royauté considérée dans ses origines jusqu'à la formation des principales monarchies de l'Europe (2 vols., 1842); Histoire de la chute des Jésuites (1844); Histoire de la conquête de Naples (4 vols., 1847-1848). He was elected to the Academy in January 1849. Meanwhile he had departed from the legitimist tradition of his family to become a warm friend to the Orleans monarchy, which he served between 1833 and 1838 as ambassador in Brazil, at Lisbon and Copenhagen. He died, while on a visit to Moscow, on the 29th of September 1851.

SAINT PRIV, a village of Lorraine, 7 m. N.W. of Metz. The village and the slopes to the west played a great part in the battle of Gravelotte (August 18, 1870). (See MERZ and FRANKO-GERMAN WAR.) At St Privat occurred the famous repulse of the Prussian Guard by Marshal Canrobert's corps.

ST QUENTIN, a manufacturing town of northern France, capital of an arrondissement of the department of Aisne, 32 m. N.W. of Laon by rail. Pop. (1911), 49,305. It stands on the right bank of the Somme, at its junction with the St Quentin Canal (which unites the Somme with the Scheldt) and the Crozet Canal (which unites it with the Oise). The port carries on an active traffic in building materials, coal, timber, iron, sugar and agricultural produce. Built on a slope, with a southern exposure, the town is dominated by the collegiate church of St Quentin, one of the finest Gothic buildings in the north of France, erected during the 12th, 13th, 14th and 15th centuries. The front, which has no west façade, terminates at that end in a tower and in a vast nave decorated; it has double transcepts. Its length is 435 ft. and the height of the nave 124 ft. The choir (13th century) has a great resemblance to that of Reims; like the chapels of the apse it is decorated with polychromic paintings. There are remains of a choir-screen of the 14th century. Under the choir is a crypt of the 11th century, rebuilt in the 13th century, and containing the tombs of St Quentin (Quintin) and his fellow-martyrs Victorious and Gentianus. The Champs Élysées, an extensive promenade, lies to the east of the cathedral. The hôtel-de-ville of St Quentin is a splendid building of the 14th and 16th centuries, with a flamboyant façade, adorned with curving sculptures. The town hall is a building of the 16th century. The council-room is a fine hall with a double wooden ceiling and a huge chimneypiece, partly Gothic partly Renaissance. A monument commemorates the siege of 1557 (see below), and another close to the river the part played by the town in 1850 and 1871. A building of the 20th century is appropriated to the law court, the learned societies, the museum and the library. St Quentin is the seat of a sub-prefecture, of tribunals of first instance and of commerce, and of a board of trade-arbitration, and has control over the trade and industries of the surrounding district. St Quentin is a town of about 40,000 inhabitants, and is an important centre of trade and manufacture. The town is the centre of an industrial district which manufactures cotton and woollen fabrics. St Quentin produces chiefly piqué and window-curtains, and carries on the spinning and preliminary processes and the bleaching and finishing. Other industries are the making of embroideries by machinery and by hand, and the manufacture of iron goods and machinery. Trade is in grain, flax, cotton and wool.

St Quentin (anc. Augusta Veromanduum) stood at the meeting-place of five military roads. In the 3rd century it was the scene of the martyrdom of Galus Quintinus, who had come thither from Italy as a preacher of Christianity. The date of the foundation of the bishopric is uncertain, but about 512 it was transferred to Noyon. Towards the middle of the 7th century St Eloi (Elligius), bishop of Noyon, established a collegiate chapter at St Quentin's tomb, which became a famous place of pilgrimage. The town thus gained an importance which was increased during the middle ages by the rise of its cloth manufacture. After it had been thrice ravaged by the Normans, the town was surrounded by walls in 853. It became under Pippin, granted of a chapelry of Charlemagne, one of the principal domains of the court of Vermandois. The bishopric of St Quentin received from Charles II., or, more probably, from Charles the Bald, a charter, which was extended in 1103 and is the earliest of those freely granted to the towns of northern France. From 1240 to 1271 St Quentin was occupied by the Burgundians. In 1557 it was taken by the Spaniards (see below). Philip II. commemorated the victory over the relieving force under the Constable Monmouth by the foundation of the Escorial. Two years later the town was restored to the French, and in 1560 it was assigned as the dowry of Mary Stuart. The
fortifications erected under Louis XIV. were demolished between 1810 and 1820. During the Franco-Prussian War St Quentin repulsed the German attacks of the 8th of October 1870; and in January 1871 it was the theatre of a great battle fought between the French and the Prussians (below).

**The battle of 1537**—An army of Spaniards under Emmanuel Philippert of Savoy, invading France from the Meuse, joined an allied contingent of English troops under the walls of St Quentin, which was then closely besieged. Admiral Coligny, then himself invested behind the town. On St Lawrence's Day, 10th August, the relieving column reached the town without difficulty, but time was wasted in drawing off the garrison whom the besiegers had entrenched at the tail of the column, and when brought up were mismanaged. The besiegers, recovering from their surprise, formed the plan of cutting off the retreat of the relieving army. Montmorency, who was the vanguard of the French army, met the Germans with which the besiegers chose for their passage the post was composed of poor troops, who fled at the first shot. Thus, while the constable was busy with his hosts, the Spanish army filed across the Bridge of Kouvroy, some distance above the town, with impunity, and Montmorency, in the hope of executing his mission without fighting, refused to allow the cavalry under the due de Nevers to charge them, and then led a superior force against the retreating gendarmerie who formed the vanguard of the column, and then headed off the slow-moving infantry south of Essigny-le-Grand. Around the 16th hour the Spanish column was formed up with 8,000 men. The cannon thinned their ranks, and at last the cavalry broke in and slaughtered them. Yet Coligny gallantly held St Quentin for seventeen days, Nogent and the General Count of Savoy, and five and a day, the Vercors, Ham and other strong places, entrenched himself in front of Compiegne, and the allies, disheartened by a war of sieges and skirmishes, came to a standstill. Soon afterwards Philip II, jealous of his renown and unwilling to waste his highly trained soldados in ineffective fighting, ordered the army to retreat (17th October), disbanded the temporary regiments and dispersed the permanent corps in winter quarters.

**The Battle of 1871**— fought between the German I. Army under General von Goeben and the French commanded by Generals Faidherbe. The latter concentrated about St Quentin on the 18th of January, and took up a defensive position on both banks of the Somme, who was inferior in numbers, were greatly superior in discipline and training. and General von Goeben boldly decided to attack both wings of the French together on the 19th. The attack took the customary enveloping form. After several hours' fighting it was brought to a standstill, but Goeben, using his reserves in masterly fashion, drove a wedge into the centre of the French line between the canal and the railway, and followed this up with another blow on the other bank of the canal along the Ham road. This was the signal for a decisive attack by the whole of the left wing of the Germans, but the French offered strenuous resistance, and it was not until five in the afternoon that Goeben was able to force the Somme. By skillful dispositions and orderly movement most of his infantry and all but six of his guns were brought off safely, but a portion of the army was cut off by the victors. After a period of long-drawn-out struggle, was sufficiently decisive to deny to the defenders any hope of taking the field again without an interval of rest and reorganization. Ten days later the general armistice was signed.

**SAINT-ÉTIENNE—SAINTS, BATTLE OF THE.** This battle is frequently called by the date on which it took place—the 12th of April 1782. The French know it as the battle of Domincia, near the coast of which it was fought. The Saints are small rocky islets in the channel between the islands of Domincia and Guadaloupe in the island of Martinique, and are considered to be one of the dependencies of this island. The British sent a force to this island in 1681, in the hope of sending wages to the French naval history; it was by far the most considerable fought at sea in the American War of Independence, and was to Great Britain of the nation of a deliverance, since it not only saved Jamaica from a formidable attack, but after the disasters in North America went far to restore British prestige. The comte de Grasse, with 33 sail of the line, was at Fort Royal in Martinique. His aim was to effect a combination with a Spanish force from Cuba, and invade Jamaica. A British fleet (36 sail of the line), commanded by Sir George, afterwards Lord Rodney (q.v.), was anchored in Gros Islet Bay, Santa Lucia. On the 8th of April the British lookout frigates reported that the French were at sea, and Rodney immediately sailed in pursuit. Light and variable sea or land breezes made the movements of both fleets uncertain. Some of the ships of each might have a wind, while others were becalmed. On the 9th of April eight ships of the British van, at some distance from the bulk of their fleet, and nearly opposite the mountain called the Morne au Diable in Dominica, were attacked by fifteen of the French. The comte de Grasse, whose own ships were much scattered and partly becalmed, and who moreover was hampered by the transports carrying soldiers and stores, did not press the attack home. His chief wish was to carry his fleet through the channel between Dominica and Guadaloupe, while Rodney was anxious to force a battle. During the night of the 11th-12th the greater part of the French had cleared the channel, but a collision took place between two of their ships by which one was severely damaged. The crippled vessel was seen and pursued by four ships of the
Saint-Saëns, Charles Camille (1835–1921), French composer, was born in Paris on the 3rd of October 1835. After having as a child taken lessons on the piano, and learned the elements of composition, he entered at an early age the class of the organ, when his precocity and singularity were noticed. He was admitted at the age of fourteen to the Conservatoire, and, at twenty, he was made professor of counterpoint. He was a pupil of Louis Niedermeyer, and his first compositions were: a Mass, a Requiem, and a symphony. His first work of importance was the opera "La Princesse jaune", which was produced at the Opéra-Comique in 1866. He died in Paris on the 15th of May 1921.

Saint-Saëns was a composer of great versatility, and his works cover a wide range of genres, from operas and concertos to chamber music and orchestral works. He was particularly known for his symphonies, concertos, and chamber music, which often incorporated elements of the Romantic and post-Romantic styles. His most famous works include the opera "Samson et Dalila" and the symphonies Nos. 3 and 4.

Saint-Saëns was awarded the Legion of Honour in 1904 and was made a member of the Académie des Sciences, lettres, et beaux-arts in 1906. Despite his successes, he remained relatively unknown during his lifetime, and it was not until the 20th century that his music gained widespread recognition.

Saint-Saëns was a prolific composer, and his works continue to be performed and recorded today. He is remembered as one of the most important and influential composers of his time, and his music continues to be enjoyed by audiences around the world.
SAINTSBURY—SAINT-SIMON, COMTE DE

45

English man of letters, was born at Southampton on the 23rd of October 1845. He was educated at King’s College School, London, and at Merton College, Oxford (B.A., 1868), and spent six years in Guernsey as senior classical master of Elizabeth College. From 1874 to 1876 he was headmaster of the Elgin Educational Institute. He began his literary career in 1875 as a critic for the “Christian Enquirer,” and in 1892 he founded the “Saturday Review.” Some of the critical essays contributed to the literary journals were afterwards collected in his Essays in English Literature, 1870–1880 (2 vols., 1890–1893), Essays on French Novellists (1891), Miscellaneous Essays (1892), Corrected Impressions (1895). His first book, A Primer of French Literature (1886), and his Short History of French Literature (1882; 6th ed., Oxford, 1901), were followed by a series of editions of French classics and of books and articles on the history of French literature, which made him one of the most prominent English authorities on the subject. His studies in English literature were no less comprehensive, and included the valuable revision of Sir Walter Scott’s edition of Dryden’s Works (Edinburgh, 1812–1813), Dryden (1881) in the “English Men of Letters” series, History of Elizabethan Literature (1887), History of Nineteenth Century Literature (1896), A Short History of English Literature (1898, 3rd ed. 1903), an edition of the Minor Caroline Poets of the Caroline Period (2 vols., 1903–1905), a collection of rare poems of great value, and editions of English classics. He edited the series of “Periods of European Literature,” contributing the volumes on The French Regency and the Rise of Absolutism, (1897), and The Earlier Renaissance (1901). In 1895 he became professor of rhetoric and English literature at Edinburgh university, and subsequently produced two of his most important works, A History of Criticism (3 vols., 1900–1904), with the companion volume Loci Critici, Passages Illustrative of Critical Theory and Practice (Boston, U.S.A., and London, 1903), and A History of English Prose from the 12th Century to the Present Day (i., 1906; ii., 1908; iii., 1910); also The Later Nineteenth Century (1908).

ST SERVAN, a town of western France, capital of an arrondissement in the department of Landes, 11 m. S.S.W. of Mont de Marsan on the Southern railway between that town and Bayonne. Pop. (1906) town, 2508; commune, 4644. St Sever stands on an eminence on the left bank of the Adour in the district of the Chalosse. Its streets, bordered in places by old houses, are narrow and winding. The promenade of Marlanne laid out on the site of a Roman camp called Palestron command a view of the land and town of the Adour. The church of St Sever, a Romanesque building of the 12th century, with seven apses, once belonged to the Benedictine abbey founded in the 10th century. The public institutions of the town include the sub-prefecture, a tribunal of first instance, and a practical school of agriculture and viticulture which occupies a former Dominican convent. There is trade in the agricultural products of the Chalosse, especially geese.

SAINT-SIMON, CLAUDE DE ROUVROY, DUC DE (1667–1713), French courtier, was born in August 1667, being the second son of Condé de Rouvroy by his wife, Marie, countess of Franciennes, who was a warm supporter of Henry of Guise and the League. With his elder brother he entered the service of Louis XIII, as a page and found instant favour with the king. Named first equerry in March 1627 he became in less than three years captain of the châteaux of St Germain and Versailles, master of the hounds, first gentleman of the bed-chamber, royal councilor and governor of Meulan and of Blaye. On the fall of La Rochelle he received lands in the vicinity valued at 80,000 livres. About three years later his seigniory of Saint-Simon in Vermandois was erected into a duchy, and he was created a peer of France. He was a man of great influence and power; and the reign of Louis and the Day of Dupes (11th of November 1630). Having suffered disgrace for taking the part of his uncle, the bishop of Saint-Léger, after the capture of Catelet (15th of August 1630), he retired to Blaye. He fought in the campaigns of 1638 and 1639, and after the death of Richelieu returned to court, where he was coldly received by the king (18th of February 1643). Thenceforth, with the exception of siding with Condé during the Fronde, he took small part in politics. He died in Paris on the 3rd of May 1693. By his first wife, Diane de Budos de Portes, a relative of Condé, whom he married in 1644 and who died in 1670, he had three daughters. By his second wife, Charlotte de l’Aubespine, whom he married in 1672, he had a son Louis, the “author of the memoirs” (see below).

SAINT-SIMON, CLAUDE HENRI DE ROUVROY, COMTE DE (1760–1825), the founder of French socialism, was born in Paris on the 17th of October 1760. He belonged to a younger branch of the family of the duc de Saint-Simon (above). His education was directed by D’Alembert. At the age of nineteen he assisted the American colonies in their revolt against Britain. From his youth Saint-Simon felt the promptings of an eager ambition. His brother had orders to await him every morning with the words, “Remember, monseur le comte, that you have great things to do.” Among his early schemes was one to unite the Atlantic and the Pacific by a canal, and another to construct a canal from Madrid to the sea. Although he was imprisoned in the Luxembourg during the Terror, he took no part of any importance in the Revolution, but profited by it to amass a little fortune by land speculation—not on any selfish account, however, as he said, but to facilitate his future projects.

and cantatas; “Oatorio de Noël,” “Les Noces de Prométhée,” Psalm “Coeli enarrant,” “Le Déluge,” “La Lyre et la harpe”; three symphonies; four symphonic poems (“Le Roi d’Ophale,” “Phadon,” “Diane Macabre,” “La Jeunesse d’Hércules,” “The Organ Concerto”); three sinfonia concerti; three suites, marches, and other works for orchestra; the ballet Zorlitti; music to the drama Déjantie, given at the open-air theatre of Béziers; a quintet for flute, violin, viola, cello, and harp; over twenty pianoforte pieces; numerous songs, duets and choruses. He also published two volumes of poems, Rimes familières, and Problèmes et mystères; besides a volume of poems, Rimes familières. The honorary degree of Doctor of Music was conferred upon him by Cambridge University in 1893.
Accordingly, when he was nearly forty years of age he went through a varied course of study and experiment, in order to enlarge and clarify his view of things. One of these experiments was an unhappy marriage—undertaken merely that he might have a salon—which, after a year's duration, was dissolved by mutual consent. The result of his experiments was that he found himself completely impoverished, and lived in penury for the remainder of his life. The first of his numerous writings, *Lettres d'un habitant de Genève*, appeared in 1802; but his early writings were mostly scientific and political. In 1817 he began in a treatise entitled *L'Industrie to propound his sociological views, which were to some extent influenced by Comte's ideas (*1810)*; a periodical on which Augustin Thierry and Auguste Comte collaborated. The first number caused a sensation, but it brought few converts. In 1821 appeared Du système industriel, and in 1823-1824 *Catéchisme des industriels*. The last and most important expression of his views is the *Nouveau Christianisme* (1825), which he left unfinished. For many years before his death in 1825 (at Paris on the 19th of May), Saint-Simon had been reduced to the greatest straits. He was obliged to accept a laborious post, working nine hours a day for £20 a year, to live in a garret of a farm. He was forced sometimes to solicit a small pension from his family. In 1823 he attempted suicide in despair. It was not till very late in his career that he attached to himself a few ardent disciples.

As a thinker Saint-Simon was entirely deficient in system, clearness and consecutive strength. But his great influence on modern thought is undeniable, both as the historic founder of French socialism, and as suggesting much of what was afterwards elaborated into Comte's system. Apart from the details of his sociological teaching, which are vague and unsystematic, we find that the ideas of Saint-Simon as to the reconstruction of society are very similar. This was not surprising; his opinions were conditioned by the political and social conditions prevailing in France. In opposition to the destructive liberalism of the Revolution he insisted on the necessity of a new and positive reorganization of society. So far was he from advocating fresh social revolt that he appealed to Louis XVIII. to inaugurate the new order of things. In opposition, however, to the feudal and military system, the former aspect of which had been strengthened by the restoration, he advocated an arrangement by which the industrial chiefs should control society. In place of the medieval church the spiritual direction of society should fall to the men of science. What Saint-Simon desired, therefore, was an industrialist state directed by modern science in which universal association should suppress war. In short, the men who are fitted to organize society for productive labour are entitled to bear rule in it. The social aim is to produce things useful to life. The contrast between labour and capital so much emphasized by later socialism is not present to Saint-Simon, but it is assumed that the industrial chiefs, to whom the control of production is to be committed, shall rule in the interest of society. Later on the cause of the poor receives greater attention, till in his greatest work, *The New Christianity*, it takes the form of a religion. It was this development of his teaching that occasioned his final quarrel with Comte. Previous to the publication of the *Nouveau Christianisme*, Saint-Simon had not concerned himself with theology. Here he starts from a belief in God, and his object in the treatise is to reduce Christianity to its simple and essential elements. He does this by clearing it of the dogmas and other excrescences and defects which have gathered round the Catholic and Protestant forms of it. He propounds as the comprehensive formula of the new Christianity this precept: "The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organize itself in the way best adapted for attaining this end." This principle became the watchword of the entire school of Saint-Simon.

During his lifetime the views of Saint-Simon had very little influence; and he left only a few devoted disciples, who continued to advocate the doctrines of their master, whom they revered as a prophet. Of these the most important were Olinde Rodrigues, the favoured disciple of Saint-Simon, and Barthélemy Prosper Enfantin (q.v.), who together had received Saint-Simon's last instructions. Their first step was to establish a journal, *Le Producteur*, but it was discontinued in 1826. The sect, however, had begun to grow, and before the end of 1828, had meetings not only in Paris but in many provincial towns. An important departure was made in 1828 by Amand Bazard, who gave a "complete exposition of the Saint-Simonian faith" in a long course of lectures at Paris, which were well attended. His *Exposition de la doctrine de St Simon* (2 vols., 1825-1830), which is by far the best account of it, won more adherents. The system was in some degree thrown into a more coherent form by Enfantin, who along with Bazard stood at the head of the society, but who left it in 1828, and was soon to be reared in a physical, and was prone to push his deductions to extremities. The revolution of July (1830) brought a new freedom to the socialist reformers. A proclamation was issued demanding the community of goods, the abolition of the right of inheritance, and the enfranchisement of women. Early next year the school obtained possession of the *Globe* through Pierre Leroux (q.v.), who had joined the school, which now numbered some of the ablest and most promising young men of France, many of the pupils of the École Polytechnique having caught its enthusiasm. A series of new periodicals appeared, and the word *Sanisme* was to be heard throughout France. The system was no longer a form of Christianity in the sense of its founder, but was included in three grades, and constituting a society or family, which lived out of a common purse in the Rue Monsigny. Before long, however, dissensions began to arise in the sect. Bazard, a man of logical and more solid temperament, could no longer work in harmony with Enfantin, who desired to establish an arrogant and fantastic sacerdotalism with lax notions as to marriage and the relation of the sexes. After a time Bazard seceded and many of the strongest supporters of the school followed his example. A series of extravagant entertainments given by the society during the winter of 1830 reduced its financial resources and greatly discredited it in character. They finally removed to Ménilmontant, to a property of Enfantin, where they lived in a communistic society, distinguished by a peculiar dress. Shortly after the chiefs were tried and condemned for proceedings prejudicial to the social order; and the sect was entirely broken up (1832). Many of its members became famous as engineers, economists, and men of business.

In the school of Saint-Simon we find a great advance on the vague and confused views of the master. In the philosophy of history they recognize epochs of two kinds, the critical or negative and the constructive. The former period, in which the dominating force is characterized by war, egoism and anarchy, the latter, which is controlled by religion, is marked by the spirit of devotion and sacrifice. Socialism and association are the two great social principles, and on the degree of prevalence of the two depends the character of an epoch. The spirit of association, however, tends more and more to prevail over the spirit of government, and the family is to be extended from the family to the city, from the city to the nation, and from the nation to the federation. This principle of association is to be the keynote of the social development of the future. Under the present system the industrial chief exploits the proletariat, the members of which, though nominally free, must accept his terms under pain of starvation. The only remedy for this is the abolition of the law of inheritance, and the union of all the instruments of labour in a social fund, which shall be exploited by association. Society thus becomes sole proprietor, intrusting to social groups and social functionaries the management of the various properties. The right of succession is transferred from the family to the state. The school of Saint-Simon insists strongly on the claims of merit; they advocate a social hierarchy in which each man shall be placed according to his capacity and rewarded according to his works. This is, indeed, a most special and pronounced feature of the Saint-Simonian socialists, and its theory of government is a kind of spiritual or scientific autocracy, degenerating into the fantastic sacerdotalism of Enfantin. With regard to the family and the relation of the sexes, they leaned strongly on the Christian law of marriage. Connected with these doctrines was their famous theory of the "rehabilitation of the flesh," deduced from the philosophic theory of the school, which they regarded as "Christian." On this theory they rejected the dualism so much emphasized by Catholic Christianity in its penalties and mortifications, and held that the body should be restored to its
dutiful to the duke of Burgundy with that to the duke of Orleans. Both attachments were no doubt all the more sincere because of his undying hatred to "the bastards," that is to say, the illegitimate sons of Louis XIV. It does not appear that this hatred was founded on moral reasons or on any real fear that these bastards would be intruded into the succession. The true cause of his wrath was that they had preceded the peers.

The death of Louis seemed to give Saint-Simon a chance of realizing his hopes. The duke of Orleans was at once acknowledged regent, and Saint-Simon was of the council of regency. But no sooner was this taken to heart by the few government officials of France, ruled by the nobles for its good, and he had little real influence with the regent. He was indeed gratified by the degradation of "the bastards," and in 1721 he was appointed ambassador to Spain to arrange for the marriage (not destined to take place) of Louis XV. and the infant. His visit was splendid; he received the grandeeship, and, though he also caught the smallpox, he was quite satisfied with the business. After his return he had little to do with public affairs. His own account of the cessation of his intimacy with Orleans and Dubois, the latter of whom had never been his friend, is, like his own account of some other events, written while he was still in life, and without much love or respect, and it is little doubt that he was practically ousted by the favourite. He survived for more than thirty years; but little is known of his life. His wife died in 1743, his eldest son a little later; he had other family troubles, and he was loaded with debt. When he died, at Paris on the 2nd of March 1755, he had almost entirely outlived his own generation (among whom he had been one of the youngest) and the prosperity of his house, though not its notoriety. This last was in strange fashion revived by a distant relative born five years after his own death, Claude Henri, comte de Saint-Simon (q.v.).

will have been observed that the actual events of Saint-Simon's life, though they were in some degree connected him, are neither numerous nor noteworthy. He is, however, an almost unique example of a man who has acquired great literary fame entirely by posthumous publications. He was an indefatigable writer, and he began early to set down in black and white all the gossip he collected, all his interminable legal disputes of precedence, and a vast mass of unclassified and almost unclassifiable matter. Most of his manuscripts came into the possession of the government, and it was long before their contents were published in anything like formality. Partly in the form of notes on Dangeau's Journal, partly in that of original and independent memoirs, partly in scattered and multi-ple sheets, they belong in the highest degree to the enormous and immense amount of matter. But the mere mass of these productions are their least noteworthy feature, or rather it is most remarkable as contrasting with their character and style. Saint-Simon, though possessed of certain literary gifts, seems to have been something the striking memoir-writers of France, the country richest in memoirs of any in the world. His pettiness, his absolute injustice to his contemporaries and to those who espoused public parties with which he did not agree, the bitterness which allows him to give favourable portraits of hardly any one, his omnivorous appetite for gossip, his lack of proportion and perspective, are all lost sight of in admiration of his extraordinary genius for historical narrative and character-drawing of a certain sort. He has been compared to Tacitus, and for once the comparison is just. In the midst of his enormous mass of writing phrases scarcely inferior to the Roman's occur frequently, and here and there are passages of sustained description, of intense concentration of light and life, to those of Tacitus or of any other historian. As may be expected from the vast extent of his work, his style is often that of a writer who is not a writer who can be "sampled" easily, inasmuch as his most characteristic phrases sometimes occur in the midst of long stretches of quite uninteresting matter. A few critical studies of his appearance, of his style, is his methods and to the large addition of pure knowledge which he has written about him. Yet no one is so little to be taken at second-hand.

Even his most famous passages, such as the account of the death of the dauphin or of the Bed of Justice where he once sat, he must be believed; he was no mere writer who can be "sampled" easily, inasmuch as his most characteristic phrases sometimes occur in the midst of long stretches of quite uninteresting matter. A few critical studies of his appearance, of his style, is his methods and to the large addition of pure knowledge which he has written about him. Yet no one is so little to be taken at second-hand.

ST THOMAS (Saint-Thomé), a volcanic island in the Gulf of Guinea immediately north of the equator (° 32' N.) and in 6° 40' E. With the island of Principe (Prince's Island), it forms the Portuguese province of St. Thomas. From the Gabun, the nearest point of the mainland of Africa, St Thomas is distant 166 m., and from Cameroon 207 m. The extreme length of the island is 32 m. the breadth W. to E. 21 m.; the area is about 400 sq. m.

From the coast, the land rises towards lofty verdant mountains (St Thomas, 1,500 ft). At least a hundred streams, small, descend the mountain-sides through deep-cut ravines, many of them forming beautiful waterfalls, such as those of Blu-blu on the Agua Grande. The island during its occupation, by the Dutchmen, much of the country, the noodles, in the direction of the churchyard, and the death-rate is still very high. Malaria is common in the lower regions, but the unhealthiness of the island is largely due to the absence of hygienic precautions. During the dry season (June to September) the temperature ranges in the lower parts between 66°-2 and 80°-6 F., and in the higher parts between 57°-2 and 68°; in the rainy season it ranges between 69°-8 and 89°-6 in the lower parts, and between 64°-9 and 89°-6 in the higher parts. The mean of ten years was 68°-9, the maximum 90°-5 and the minimum 47°-3. The heat is tempered by the equatorial oceanic current. The rainfall is low but uniform.

The soil is exceedingly fertile and a considerable area is densely forested. Among the products are oranges, lemons, figs, mangoes, and in the lower districts the vine, pineapple, guava and banana. The first object of European cultivation was sugar, and to this the island owed its prosperity in the 17th century; sugar has been displaced by coffee and, principally, coca, introduced in 1795 and 1822 respectively. In 1907 the export of coca (including that from Principe) was over 24,000 tons, about a sixth of the world's supply. The cocoa zone lies between 65° and 2000 ft. above the sea. Vanilla and cinchona bark both succeed well, the latter at altitudes of from 1800 to 2000 ft. Coffee, tobacco, palm-oil, and cotton are also produced, but since 1895—the production was under 3000 tons—cocoa has been almost exclusively grown. About 175 sq. m. were in 1910 under cultivation. The value of the imports was £1,750,000 in 1896 and £1,970,000 in 1906. The shipping trade (190 vessels of 460,000 tons in 1908) is chiefly in the hands of the Portuguese. The Government (1905-9) was about £165,000, the expenditure £162,000.

At the census of 1900 the inhabitants were returned as 37,776, of whom 10,121 were whites (mainly Portuguese). The town of St Thomas, the greatest port, and the town of Principe, with its government and of the Curador (the official guardian of the senhorias, i.e. plantations), is situated on Chaves Bay on the N.E. coast. It is the starting-point of a railway 9 m. long, which connects with the Portuguese railways on the coast. The inhabitants of the island, as well as of the Portuguese settlements on the mainland, from the Europeans, consist (1) of descendants of the original settlers, who were convicts from Portugal, slaves and others from Brazil and negroes from the Gabun and other parts of the Guinea coast. They number about 6000, are a brown-skinned, indolent race, and occupy rather than cultivate about one-eighth of the island, which are known as "natives" and use a Negro-Portuguese "lingua de São Tomé." (2) On the south-west coast are Angolares, the 3000 or more descendants of two hundred Angolares, slaves wrecked at Sete-Pedras in 1544. They retain their Bunda speech and customs, and are expert fishermen and canoe-men. (3) Contract labourers from Cape Verde and from the South American republics. The principal wealth of the population is in coffee, the industry was the only 22,000.

St Thomas was discovered on the 21st of December 1470 by the Portuguese navigators João de Santarem and Pero de Escobar, who in the beginning of the following year discovered Annobon ("Good Year"). They found St Thomas uninhabited. The first attempt at colonization was by João de Paiva's in 1455; but this venture was not permitted, and all the criminals and of young Jews taken from their parents to be baptized were sent to the island, and the present capital was founded by Alvaro de Carmonha. In the middle of the 16th century there were over 80 sugar mills on the island, which had a population of 50,000; but in 1567 the settlement was attacked by the French, and in 1753 the Angolares began raids which only ended with their submission in 1693. In 1805 there was a slave revolt; and from 1841 to 1844 the Dutch and plague ruined the capital in 1660, held possession of the island. The Portuguese government again established itself and had to get the sugar industry back to Brazil and internal anarchy reduced St Thomas to a deplorable state. It was not until the later half of the 19th century that prosperity began to return.

The greatly increased demand for cocoa which arose in the last decade of the century led to the establishment of many additional plantations, and a very profitable industry was developed. Planters, however, were handicapped by the scarcity of labour, for though a number of Cape Verde islanders, Krumen and Kabindas employed on short-term agreements, the "natives" would not work. The difficulty was met by the recruitment of indented natives from Angola, as many as 6000 being brought over in one year. The mortality among these labourers was great, but they were very well treated on the plantations. No provision was, however, made for their repatriation, while the great majority were brought by force from remote parts of Central Africa and had no idea of the character of the agreement into which they were compelled to enter. From time to time governors of Angola endeavoured to remedy the abuses of the system, which both in Portugal and Great Britain was denounced as an iniquitous trust. The opposition to slavery has been legally abolished in the Portuguese dominions in 1878. In March 1909 certain firms, British and German, as the result of investigations made in Angola and St Thomas, refused any longer to import cocoa from St Thomas or Principe Islands unless the recruitment of labourers for the plantations was made voluntary. Representations to Portugal were made by the British government, and the Lisbon authorities stopped recruitment entirely from July 1899 to February 1910, when it was resumed under new regulations. British consular agents were stationed in Angola and St Thomas to watch the working of these regulations. (See statement by Sir E. Grey reported in The Times, July 2nd, 1910.) As one means of obviating the difficulties encountered in Angola the recruitment of labourers from Mozambique was begun in 1908, the men going out on a yearly contract.

Principe Island lies 90 m. N.E. of St Thomas, has an area of about 42 sq. m. and is also of volcanic origin. Pop. (1900) 4327. The tssete fly (which is not found in St Thomas) infests the wooded part of the island, and through it sleeping sickness has spread among the inhabitants. The principal industry is the cultivation of cocoa. The chief settlement is St Antonio.

See A. Negrel: Law, Historia etnographica da Ilha de St Thomé (Lisbon, 1896) and St Thomé (Paris, 1901); C. Gravereau "Mission scientifique à l'île de San Thomé; Nouv. Arch. Miss. Scien. t. xv. (Paris, 1907); A. Pinto de Miranda Guedes, "Viagem em St Thomé" in B.S.G. Lisboa (1902) pp. 475-475. E. de Campos

1 According to Aug. Chevalier (in O. Occidentale, May 20th, 1910) the population of St Thomas and Principe combined in December 1909 was 68,221, the "natives" being given at over 23,000.
ST THOMAS—ST VINCENT, EARL OF

"S. Thomé" B.S.G. Lisbon (1908). pp. 113-134; W. A. Cadbury, Labour in Portuguese West Africa (2nd ed., London, 1910); A Sila de S. Thomé (Lisbon, 1907); The Beira Entrance Plantations (Edinburgh, 1907); and British Consular Reports. 

ST THOMAS, an island in the Danish West Indies. It belongs to the Virgin Island group, and lies 40 m. E. of Porto Rico, in 18° 20' N. and 64° 55' W. Pop. (1901) 11,012, mostly negroes. It is 13 m. long, varies in width from 1 m. to 4 m. and has an area of 33 m. It consists of a single mountain ridge, the peaks of a submerged range, culminating in West Mountain (1555 ft.). St Thomas stands on a prolongation of the range which supports the Greater Antilles, and is built up of much disintegrated eruptive rock (porphyry and granite). The climate is tropical, varying in temperature between 76° F. and 86° F., modified however, by the influence of ocean currents. There is a rainy season, lasting from April to September, and a dry season, from October to March. Earthquakes are not unknown, and hurricanes at times sweep over the island. The only town, Charlotte Amalie (pop. 8,540), lies in the centre of the S. coast, at the head of one of the finest harbours in the West Indies. This consists of an almost landlocked basin, about ½ m. across, varying in depth from 27 to 36 ft., and entered by a narrow channel only 300 yds. wide. It is equipped with a floating dock, which can accommodate ships up to 3000 tons, a patent slip for smaller vessels and a repairing yard. Danish is the official language, but English is understood, while French, Spanish and Dutch are also spoken. St Thomas was once the greatest distributing centre in the West Indies, but the introduction of steamships and cables led to its decline, and the removal of the Royal Mail Steamship Company's headquarters to Barbados in 1885 was the final blow. The production of sugar, which decayed gradually after the abolition of slavery, is practically extinct. Aloeas, fibrous plants and fruit are grown. St Thomas is the seat of government for the Danish West Indies (St Thomas, St John and St Croix), a crown colony administered by a governor, who is assisted by a colonial council. The governor resides for half the year in St Thomas, and in St Croix when the latter is in session. The chief importance of St Thomas lies in the fact that it is a coaling station for ships plying to and from the West Indies. 

The island was discovered by Columbus in 1493, and first colonized by the Dutch in 1657. After their departure in 1667 the island came into the hands of the British, and it was held by them till 1671, when it passed into the hands of the Dutch West India Company, which was succeeded in 1685 by the so-called Brandenburg Company, the shareholders of which were mainly Dutch. The king of Denmark having taken over 1654, declared his right to the port, and during the European wars of the 18th century the neutrality of Denmark gave a great impetus to the trade of St Thomas. It was during this period that the distributing trade of the island grew up. It was held by the British in 1801 and again from 1807 to 1815, during which it was the great rendezvous of British merchant vessels waiting for convoy. In 1867, when the islands were governed at a loss to the mother country, a treaty was concluded under which the United States agreed to buy them for 7½ million dollars, but, although the suggestion first emanated from the United States, its Senate refused to ratify the treaty. In 1902 another treaty of cession was signed by which the United States was to buy the islands for 5 million dollars, but the Danish parliament rejected it. The importance of the islands to the United States consists in their suitability as a West Indian naval base.

ST TROND, a town of Belgium in the province of Limburg about 18 m. N.W. of Liége. Pop. (1904) 15,116. It occupies an important strategic position with regard to the N.E. frontier of Belgium, and General Brialmont recommended its fortification. In the middle ages it was a fortified town belonging to the bishops of Liége, and Charles the Bold captured it in 1467. In 1566 the Assembly of Compromise met at St Trond.

SAINT-VICTOR, PAUL BINS, Comte de (1827-1881), known as Paul de Saint-Victor, French author, was born in Paris on the 11th of July 1827. His father Jacques B. M. Bins, comte de Saint-Victor (1772-1838), is remembered by his poem L'Espérance, and by an excellent verse translation of Anacreon.

Saint-Victor, who ceased to use the title of count as being out of keeping with his democratic principles, began as a dramatic critic on the Pays in 1831, and in 1883 he succeeded Théophile Gautier on the Presse. In 1866 he migrated to the Libérité, and in 1869 joined the staff of the Moniteur universel. In 1870, during the last days of the second empire, he was made inspector-general of fine arts. Almost all Saint-Victor's work consists of articles, the best known being the collection entitled Hommes et dieux (1867). His death interrupted the publication of Les Deux Masques, in which the author intended to survey the whole dramatic literature of ancient and modern times. Saint-Victor's critical faculty was not faltering, though rather considered. He owed a good deal to Théophile Gautier, but he carried orateness to a pitch far beyond Gautier's. Saint-Victor died in Paris on the 9th of July 1881.

See also Deljant, Paul de Saint-Victor (1887).
peril was averted by his foresight and severity. He had always taken great care of the health of his men, and was as strict with the officers as with sailors. It must in justice be added that he was peculiarly fitted for the work. We have ample evidence from his contemporaries that he found a pleasure in insulting officers whom he disliked, as well as in hanging and flogging those of his men who offended him. He carried his strictness with his officers to an extent which aroused the actual hatred of many among them, and especially of John Orde (1752-1824) into challenging him to fight a duel. Yet he cannot be denied the honour of having raised the discipline of the navy to a higher level than it had reached before; he was always ready to promote good officers, and the efficiency of the squadron with which Nelson won the battle of the Nile was largely due to him. His health broke down under the strain of long cruising, and in June 1799 he resigned his command. When the earl's health was restored in the following year he took the command of the Channel fleet, into which he introduced his own rigid system. He returned to his house at Rochetts in Essex. The rank of admiral of the fleet was conferred on him in 1821 on the coronation of George IV., and he died on the 14th of March 1823. Lord St Vincent married his cousin Martha Parker, who died childless in 1816. There is a monument to the earl in St Paul's Cathedral, and portraits of him at different periods of his life are numerous. The eardom granted to Jervis became extinct on his death, but a viscountcy, created for him in 1801, passed by special remainder to Edward Jervis Ricketts (1767-1857), the second son of his sister Mary who had married William Henry Ricketts, of Longwood, Hampshire. A vinegar took the name of Jervis, and the title is still held by his descendants.

See Life by J. S. Tucker (2 vols.), whose father had been the admiral's secretary (marred by excessive eulogy). The life by Captain Brenton is rather inaccurate. The Naval Career of Admiral John Markham contains an account of the reforms in the navy. His administrations produced a swarm of pamphlets. Many mentions of him will be found in the correspondence of Nelson.

(D. H.)

**ST VINCENT**, one of the British Windward Islands in the West Indies, lying about 13° 15′ N., 61° 10′ W., west of Barbados and south of St. Lucia. It is about 28 sq. m. by 11 in extreme width, and has an area of 140 sq. m. A range of volcanic hills forms the backbone of the island; their slopes and spurs are beautifully wooded, and the valleys between the spurs are fertile and picturesque. The culminating point is the volcano called the Soufrière (3500 ft.) In the north, the disastrous eruption of which in May 1902 devastated the most fertile portion of the island, a comparatively level tract lying to the north, called the Carib Country (see below). The climate of St Vincent is fairly healthy and in winter very pleasant; the average annual rainfall exceeds 150 in., and the temperature ranges from 88° F. in August to 66° in December and January. Hurricanes are not uncommon.

The capital of the island is Kingstown, beautifully situated on the south-west coast near the foot of Mount St Andrew (2600 ft.).

The population of the island in 1891 was 41,054 (2445 white, 7554 coloured, 31,055 black); in 1906 it was estimated at 34,000. There were about 3300 East Indian coolies, a large number of whom were introduced in 1861 and following years, but on the expiry of their indentures mostly returned home; there were also a few Caribs of mixed blood, the majority of the aboriginal Caribs having being exterminated by disease, or having returned to the wilds. The average annual value of exports in 1896-1906 was £5,157 (in 1903-1904, the year following that of the great eruption, it was £38,174, and in 1905-1906 it was £53,078) and of imports, £30,467. In 1905-1906 the value of imports from the United Kingdom was £5,471, and that of exports to the United Kingdom £24,405.

The present constitution dates from 1877, when the legislative council was reformed. It consists of four nominated members, was formed. In 1869 an important scheme was entered upon, by means of a grant of £15,000 from the Imperial treasury, for settling the labouring population, distressed by the failures of the sugar industry, in the position of peasant proprietors. Estates were acquired from private owners for this purpose, and besides this a number of small holdings on crown lands (which are situated mainly in the high-lying central parts of the island) have been sold. Education is free and compulsory on St Vincent; it includes primary schools, the St Vincent Grammar School, and the Kingstown a grammar school and an agricultural school. The Anglican, Wesleyan and Roman Catholic churches are well represented, and there are some Presbyterians.

St Vincent is generally stated to have been discovered on St Vincent's day, 22nd of January 1498 by Columbus. Its Carib inhabitants, however, remained undisturbed for many years. In 1627 Charles I. granted the island to the earl of Carlisle; in 1672 it was re-granted to Lord Willoughby, having been previously (1660) declared neutral. In 1722 a further grant of the island was made, to the duke of Montague, and now for the first time a serious effort at colonization was made, but the French insisted on the maintenance of neutrality, and this was confirmed by the treaty of Aix-la-Chapelle (1748). In 1762, however, General Monckton captured the island; the treaty of Paris in 1763 confirmed the British possession, and settlement proceeded in spite of the refusal of the Carib to admit British sovereignty. Recourse was had to arms, and in 1773 a treaty was concluded with them, when they were granted lands in the north of the island as a reserve. In 1779 the island was surrendered to the French, but it was restored to Britain by the treaty of Versailles (1783). In 1795 the Caribs rose, assisted by the French, and were only put down after considerable fighting by Sir Ralph Abercromby in 1796, after which the majority of them were deported. The emancipation of negro slaves on the island took place in 1838; in 1846 the first Portuguese labourers were introduced, and in 1867 the first Indian coolies. St Vincent suffered from a terrific hurricane in 1788, and the Soufrière was in eruption in 1821. Severe distress was occasioned by the hurricane of the 11th of September 1898, from which the island had not recovered when it was visited by the eruption of the Soufrière in 1902. This eruption was synchronous with that of Mont Pelé in Martinique (q.v.). There had been signs of activity since February 1901, but the most serious eruption took place on the 6th/7th of May 1902. There were earthquakes in the following July, and further eruptions on the 3rd of September and the 15th of October, and on the 22nd of March 1903. Many sugar and arrowroot plantations were totally destroyed, and the loss of life was estimated at 2000. A Mansion House Fund was at once started in London for the relief of the sufferers, and subscriptions were sent from all parts of the civilized world, and notably from the United States.

**ST VINCENT, BATTLE OF**, fought on the 14th of February 1797, between the British and Spanish fleets, the most famous and important of many encounters which have taken place at this spot. The battle of 1797 is of peculiar significance in British naval history, not only because it came at a vital moment,
but because it first revealed the full capacity of Nelson, which was well known in the navy, to all his countrymen. In the course of 1796 the Spanish government had made the disastrous alliance with the French republic, which reduced its country to the level of a pawn in the game against England. The Spanish fleet, which was in a complete state of neglect, was forced to sea. It consisted of 27 sail of the line under the command of Don José de Córdoba—five ships, but manned in haste by drafts of soldiers, and of landsmen forced on board by the press. Even the flagships had only about eighty sailors each in their crews. Don José de Córdoba, who had gone out with no definite aim, was in reality drifting about with his unmanageable ships in two confused divisions separated from one another, in light winds from the W. and S.W., at a distance of from 25 to 30 m. S.W. of Cape St. Vincent, and the position he was sighted by Sir P. Jervis, of whose nearness to himself he was ignorant, and who had sailed from Lisbon to attack him with only 15 sail of the line. Jervis knew the inefficient condition of the Spaniards, and was aware that the general condition of the war called for vigorous exertions. He did not hesitate to give battle in spite of the numerical superiority of his opponent. Six of the Spanish ships were to the south of him, separated by a long interval from the others which were to the south west. The British squadron was formed into a single line ahead, and was steered to pass between the two divisions of the enemy. The six vessels were thus cut off. A fierce attempt was made by them to molest the British, but being now to leeward as Jervis passed to the west of them, and being unable to face the rapid and well directed fire to which they were exposed, they sheered off. One only ran down the British line, and passing to the stern of the last ship succeeded in joining the bulk of her fleet to windward. As the British line passed through the gap between the Spanish divisions the ships were tacked in succession to meet the windward portion of the enemy. If this movement had been carried out fully, all the British ships would have gone through the gap and were steered to windward to secure themselves from being unimpeded to the north, and perhaps to avoid being brought to a close general action. Their chance of escape was baffled by the independence and promptitude of Nelson. His ship, the "Captain" (74), was the third from the end of the British line. Without waiting for orders he made a sweep to the west, threw himself across the bows of the Spaniards. His movement was seen and approved by Jervis, who then ordered the other ships in his rear to follow Nelson's example. The British force was thrown bodily on the enemy. As the Spanish crews were too utterly unpractised to handle their ships, and the six vessels out of the orders of their officers which they did not understand, their ships were soon driven into a herd, and fell on board of one another. Their incompetence as gunners enabled the "Captain" to assail their flagship, the huge "Santisima Trinidad" (70), with comparative impunity. The "San Josef" (112), and the "San Nicolás" (80), which fell aboard of one another, were both carried by boarding by the "Captain." Four Spanish ships, the "Salvador del Mundo" and "San Josef" (112), the "San Nicolás" (80), and the "San Isidro" (74), were taken. The "Santisima Trinidad" is said to have struck, but she was so far away from the main body of the fleet that the Spaniards were fairly beaten. More prizes might have been taken, but Sir John Jervis put a stop to the action to secure the four which had surrendered. The Spaniards were allowed to retreat to Cadiz. Sir John Jervis was made Earl St Vincent (q.v.) for his victory. The battle, which revealed the worthlessness of the Spanish navy, relieved the British government from a load of anxiety, and may be said to have marked the complete predominance of its fleet on the sea.

AUTHORITIES.—A very interesting account of the battle of Cape St Vincent, A Narrative of the Proceedings of the British Fleet, &c. (London, 1797), illustrated by plans, was published immediately afterwards by Colonel Drinkwater Bethune, author of the History of the Siege of Gibraltar, who was an eyewitness from the "Lively" frigate. See also James's Naval History (London, 1837); and Captain Mahan, The Influence of Sea Power on the French Revolution and Empire (London, 1892). (D. H.)

ST VITUS'S DANCE, or CHOREA, a disorder of the nervous system occurring for the most part in children, and characterized mainly by involuntary jerking movements of the muscles throughout almost the entire body (see NEUROPATHOLOGY). Among the predisposing causes age is important, chorea being essentially an ailment of childhood and particularly during the period of the second dentition between the ages of nine and twelve. It is not often seen in very young children nor after puberty; but there are many exceptions. It is twice as frequent with girls as with boys. Hereditary predisposition to nervous troubles is apt to find expression in this malady, especially if the general health becomes lowered. Of exciting causes strong emotions, such as fright, ill-usage or hardship of any kind, insufficient feeding, overwork or anxiety, are among the most common; and perhaps the most frequent of all are the attacks of some febrile disease, such as typhus fever, or intestinal worms, appears capable of giving rise to an attack. It is an occasional but rare complication of pregnancy. The connexion of chorea with rheumatism is now universally recognized, and is shown not merely by its frequent occurrence before, after or during the course of attacks of rheumatic fever in young persons, but even independently of this by the liability of the heart to suffer in a similar way in the two diseases. Poynto and Paine have demonstrated a diplococcus, which they regard as the specific micro-organism of rheumatism, and which has been found in the lymph spaces in the cortex in chorea. An attempt has recently been made to demonstrate the infectious nature of the chorea.

The symptoms of St Vitus's dance sometimes develop suddenly as the result of fright, but much more frequently they come on insidiously. They are usually preceded by changes in disposition, the child becoming sad, irritable and emotional, while at the same time the general health is somewhat impaired. The first thing indicative of the disease is a certain awkwardness or fidgetiness of manner together with restlessness. In walking, too, slight dragging of one limb may be noticed. The convulsive movements of the neck and arms are generally the first, such as an arm or a leg, and in some instances they may remain localized to that limited extent, while in all cases there is a tendency for the disorderly symptoms to be more marked on one side than on the other. When fully developed the phenomena of the disease are very characteristic. The child when standing or sitting is never still, but is constantly changing the position of the body or limbs or the facial expression in consequence of the sudden and incoordinate action of muscles or groups of them. These symptoms are aggravated when purposeful movements are attempted or when the child is watched. Speech is affected both from the incoordinate movements of the tongue and from phonation sometimes taking place during an act of inspiration. The taking of food becomes a matter of difficulty, since much of it is lost in the attempts to convey it to the mouth, while swallowing is also interfered with owing to the irregular action of the pharyngeal muscles. When the tongue is protruded it comes out in a jerky manner and is immediately withdrawn, the jaws at the same time closing suddenly and sometimes with considerable force. In locomotion the muscles of the limbs act incoordinate and there is a marked alteration of the gait, which is often jerky, and the child may be tripped by one limb being suddenly jerked in front of the other. In short, the whole muscular system is deranged in its operations, and the term "insanity of the muscles" not inaptly expresses the condition, for they no longer act in harmony or with purpose, but seem, as Trouseau expresses it, each to have a will of its own. The muscles of organic life (involuntary muscles) appear scarcely.

1 This name was originally employed in connexion with those remarkable epidemic outbreaks of combined mental and physical excitement which for a time prevailed among the inhabitants of some parts of Germany in the middle ages. It is stated that sufferers from this dancing mania were wont to resort to the chapels of St Vitus (more than one in Swabia), the saint being believed to possess the power of curing them. The transference of the name to the disease now under consideration was a manifest error, but so closely has the association now become that the original application of the term has been comparatively obscured.
if at all, affected in this disease, as, for example, the heart, the
rhythmic movements of which are not as a rule impaired. But
the cases are more frequently affected from inflammatory
conditions similar to those which attend upon rheumatism and
which frequently lay the foundation of permanent heart-disease.
In severe cases of St Vitus’s dance the child comes to present
a distressing appearance, and the physical health declines.
Usually, however, there is a remission of the symptoms during
sleep. The mental condition of the patient is more or less
affected, as shown in emotional tendencies, irritability and a
somewhat fatuous expression and bearing, but this change is
in general of transient character and ceases with convalescence.
Though the cases are always assayed in a very acute and aggravated
form, in which the disorderly movements are so violent as to
render the patient liable to be injured, and to necessitate forcible
control of the limbs, or the employment of anæsthetics to produce
unconsciousness. Such cases are of very grave character, if,
as is common, they are accompanied with sleeplessness, and
they may prove rapidly fatal by exhaustion. In the great
majority of cases, however, complete recovery is to be anticipated
sooner or later, the symptoms usually continuing for from one
to two months, or even sometimes much longer.
The symptoms have been debated for a long time, but it is doubtful
whether any of them has much control over the disease, which
under suitable hygienic conditions tends to recover of itself. These
conditions, however, are all-important, and embrace the proper
feeding, the most careful nursing, the injection of hot water, the
sources of excitement and annoyance, and the rectification of any
causes of irritation and of irregularities in the general health.
For a time, and especially if the symptoms are severe, confinement
to the house or even to bed may be necessary, but as soon as possible
the child should be taken out into the open air and gently exercised
by walking. Ruhrích, recognizing the importance of rest, recom-
mands, for the child is too weak, for at least 2 months. Of medicines
the most serviceable appear to be zinc, arsenic and iron, especially
the last two, which act as tonics to the system and improve the
condition of the blood. In view of the connexion of chorea with
rheumatic fever Dr. B. Less recommends salicylates, and bromide
of potassium in large doses. Recently ergot, hot packs and monobromate
of camphor have found advocates, while cessation of the movements has
followed the application of an ether spray to the spine twice daily.
As sedatives in cases of sleeplessness, bromide of potassium and
chloral are of use. In long-continued cases of the disease benefit
will be obtained by a change of air as well as by the employ-
ment of moderate gymnastic exercises. The employment of massage
and of electricity is also likely to be beneficial. After recovery the
general health of the child should for a long time receive attention,
and care should be taken to guard against excitement, excessive
studio life and overwork, conditions which, according to Ruhrích,
that the disease is apt to recur, and that other nervous disorders still
more serious may be developed from it.

SAINT-WANDRILLE, a village of north-western France, in
the department of Seine-Inferieure, 28 m. W.N. of Rouen
by rail. It is celebrated for the ruins of its Benedictine
abbey. The abbey church belongs to the 12th and 14th centuries;
portions of the nave walls supported by flying buttresses are
standing, and the windows and vaulting of the side aisles are in
fair preservation. The church communicates with a cloister,
from which an interesting door of the Renaissance period opens
into the refectory. Beside this entrance is a richly ornamented
lavabo of the Renaissance period. The refectory is a room over
100 ft. long, lighted by graceful windows of the same period.
The abbey was founded in the 7th century by St Wandrille, aided
by the donations of Clovis II. It soon became renowned for
learning and piety. In the 13th century it was burnt down,
and the rebuilding was not completed till the beginning of
the 16th century. Later in the same century it was practically
destroyed by the Huguenots, and again the restoration was not
finished for more than a hundred years. The demolition of the
church was begun at the time of the Revolution, but proceeded
slowly and in 1832 was entirely stopped.

SAINT YON, a family of Parisian butchers in the 14th and
15th century. Guillaume de Saint Yon is cited as the richest
butcher of the Grande Boucherie in the 14th century. The
family played an important rôle during the quarrels of the
Armagnacs and Burgundians. They were among the leaders of
the Cabochian revolution. The butchers of the Grande
Armagnacs, they recovered their influence after the return of
the Burgundians to Paris in 1418, but had to flee again in 1436
when the constable, Arthur, earl of Richmond, took the city.
Garnier de Saint Yon was échevin of Paris in 1473 and 1419;
Jean de Saint Yon, his brother, was valet de chambre of the
dauphin Louis, son of King Charles VI. Both were in the service of
the king of England during the English domination. Richard
de Saint Yon was master of the butchers of the Grande Boucherie in
1460.

ST YRIEX, a town of west central France, capital of an
arrondissement in the department of Haute-Vienne, on the
left bank of the Loue, 26 m. S. of Limoges on the railway to
Brive. Pop. (1906) town 35604, commune 7916. The town
possesses a church in the early Gothic style known as Le Montier,
dating from the 12th and 13th centuries, and a tower of the 12th
century which is a relic of its fortifications. Its quarries of
kaolin discovered in 1765 were the first known in France. The
town owes its name to Arelius (popularly St Yriex) who in the
6th century founded a monastery to which its origin was due.

SAIS (Egyptian Sa), an ancient city of the Egyptian Delta,
lying westward of the Thermuthiac or Sebennytic branch of the
Nile. It was capital of the 5th nome of Lower Egypt and must
have been important from remote times. In the 5th century
B.C. it was held by the Babylonians, but the Dinastatite
families ruled in the east and the kings of Ethiopia in
Upper Egypt. The Ethiopians found their most vigorous
opponents in the Saite princes Tefnakhtus and his son
Bocchoris “the Wise” of the XXIVth Dynasty. After reigning
six years the latter is said to have been burnt alive by Sabacon,
founder of the Egyptian XXVth Dynasty. At the time when
invasions by the Assyrians drove out the Ethiopian
Taracau again and again, the chief of the twenty princes to
whom Esarhaddon and Assur-ani-pal successively entrusted
the government was Nikiu, king of Sais and Memphis. His son
Psammetichus (95 r.) was the founder of the XXVIIth Dynasty.
Although the main seat of government was at Memphis, Sais
remained the royal residence throughout this flourishing dynasty.
Neith, the goddess of Sais, was identified with Athena, and
Osiris was worshipped there in a great festival.

The brick enclosure wall of the temple is still plainly visible near
the little village of Sa el hagar (Six of stone) on the east bank of the
River Nile, south of Assiut, and other monuments of Sais,
some of which were described by Herodotus, and its inscribed
records, have all gone. Only crude brick ruins and rubbish heaps
remain on the site, but a few relics conveyed to Alexandria and Europe
in the Roman age have come down to our day, notably the tall
sculptured statue of a priest of Neith who was high in favour with
Psammetichus III., Cambyses and Darius. Bronze figures of deities
are now the most interesting objects to be found at Sa el hagar.

SAISSET, BERNARD (d. c. 1314), French bishop, was abbé
of Saint Antonin de Pamiers in 1268. Boniface VIII.,
detaching the city of Pamiers from the diocese of Toulouse in 1295,
made it the seat of a new bishopric and appointed Saisset to the see.
Of a headstrong temperament, Saisset as abbé energetically
sustained the struggle with the counts of Foix, begun two
centuries before, for the lordship of the city of Pamiers, which
had been shared between the counts and abbots by the feudal
contract of pariage. The struggle ended in 1297 by an agree-
ment between the two parties as to their common rights, and
when the pope raised the ecclesiastic immunity purchased by the count,
Saisset absolved him in the refectory of the Dominican monastery
in Pamiers (1300). Saisset is, however, famous in French history
for his opposition to King Philip IV. As an ardent Languedocian
he hated the French, and spoke openly of the king in disrespectful
terms. But when he tried to organize a general rising of the south,
he was denounced to the king, perhaps by his old enemies the count
of Foix and the bishop of Toulouse. Philip IV. charged Richard
Leneuve, archdeacon of Auge in the diocese of Lisieux, and
Jean de Picquigny, vicomte d'Amiens, to make an investigation, which lasted several months. Saisset was on the point of escaping to Rome when the name of Amiens surprised him by night in his episcopal palace. He was brought to Sealis, and on the 24th of October 1301 appeared before Philip and his court. The chancellor, Pierre Flotte, charged him with high treason, and he was placed in the keeping of the archbishop of Narbonne, his metropolitan. Philip IV. tried to obtain from the pope the canonical condemnation of Saisset. Boniface VIII., instead, ordered the king in December 1301 to free the bishop, in order that he might go to Rome to justify himself. At the same time, he sent the famous bulls Seloetor mundus, a sort of repugnation of all the bulls of the Iron Age, and Assulca filii, which opened a new stage of the quarrel between the pope and king. In the heat of the new struggle Saisset was forgotten. He had been turned over in February 1302 into the keeping of Jacques des Normands, the papal legate, and was ordered to leave the kingdom at once. He lived at Rome until after the incident at Anagni. In 1308 the king pardoned him, and restored him to his see. He died, still bishop of Pampiers, about 1374.

There is no proof for the legend that Bernard Saisset earned Philip IV.'s hatred in 1300-1301 by bold statements of the pope denouncing the attempt of the king of France, and Philip, by publicly proclaiming the doctrine of papal supremacy.

SAISSET, ÉMILE EDMOND (1814-1863), French philosopher, was born at Montpellier on the 16th of September 1814, and died at Paris on the 17th of December 1863. He studied philosophy in the school of Cousin, and carried on the eclectic tradition of his master along with Ravaisson and Jules Simon. He was professor of philosophy at Caen, at the École Normale in Paris and later at the Sorbonne.

His chief works are a monograph on Aenesidemus the Sceptic (1840); Le Scepticisme: Énésidème, Pascal, Kant (1843): a translation of Spinoza (1843); Professeurs et disciples de Descartes (1862); Discours de la philosophie de Lethem (1857)—a work which had great influence on the progress of thought in France; Essai de philosophie religieuse (1859); Critique et histoire de la philosophie (1865).

SAKA, or SHAKA, an aboriginal people of the Malay peninsula found chiefly in south Peninsular Siam, and Pahang and Kelantan. They are widely scattered among Malay villages, but these are so crossed with the Malays as to be no longer typical. An attempt has been made to identify the Sakai with the Mon-Annam group of races, i.e. the tribes which till 600 years ago possessed what is now Siam, and some of whom still occupy Pegu and Cambodia.

Professor Virchow suggested that the Sakai belong to what he calls the Dravido-Australian race, the chief representatives of which he finds in the Veddahs of Ceylon, the civilised Tamils of south India and the aborigines of Australia. In essential characteristics of body and mind there is a remarkable agreement. The difficulty in accepting the theory of the common origin of the Chin, which among the Sakais is often a light shade of yellowish brown, whereas among Tamils black is the prevailing colour. Virchow meets this by pointing out that Sinhalese, though admittedly Aryans, are often so dark as to be practically black. The Sakais are, however, it is now generally held, kinsmen of their Negro neighbours, the Semangs (q.v.), and are, like the latter, dwarfish, seldom exceeding 4 ft. 9 in. Their skins are usually a darkish brown, but showing a reddish tinge about the breast and extremities. The head is long, and the hair a black brown, rather wavy then woolly. The face inclines to be long, and would be hatchet-shaped but for the breadth of the cheek bones. The chin is long and pointed, the forehead high and flat, the brows often beetling. The nose is small, slightly tilted or rounded off at the tip, but broad and with deep-set nostrils. The beard is usually scanty. The arm-stretch is almost always greater than their height. Their food is varied; the wilder tribes living on jungle fruits and game they hunt with the blowpipe, while the more civilised grow yams, sweet potatoes, maize, sugar cane, rice and tapioca. The Sakai blow-pipe is a tube 6 ft. long, formed of a single joint of a rare species of bamboo (Bambusa Wrayi). This tube is inserted into another for protection. The darts are made of fine slivers from the mid-rib of the leaf of certain palms, and are about the size of a knitting needle. The point is usually coated with poison compounded from the sap of the Upas tree (Antiaris toxicaria) and of a species of strychnos. Each dart is carried in a separate reed, thirty to fifty of these latter being rolled up and carried in a bamboo quiver. The Sakais can kill at thirty paces with these blow-pipes. They are nomads, building mere leaf-shelters in or under the trees. Their dress is of bark-cloth and they scar their faces, as do the Semangs. They are skilful in mat-making and basket-work, but they have no kind of weaving or pottery. They are musical, using a rough lute of bamboo and a nose-flute, and they sing well in chorus. They have in common with the Semangs curious marriage ceremonies. The dead are slung from a pole and carried to a distant spot in the jungle. Here, wrapped in new bark-cloth, the body is buried in a shallow trench, the clothes worn by the deceased being burned in a fire lighted near the grave. When filled up, rice is sown on the grave and watered, and some herbs and bananas are planted round for the soul to eat on. Afterwards a three-cornered hatchet, not unlike a doll's-house but mounted on high piles, is built at the foot, in which the soul may live. This soul-house is about r ft. high, it is thatched with leaves and has a ladder by which the soul can climb in.

SĀKE, the national beverage of Japan. In character it stands midway between beer and wine. It is made chiefly from rice (see BREWING). Saké contains 12 to 15% of alcohol and about 3% of solid matter (extractives), 0-3% of lactic
Sakhalin

Sakhalin, or Sakhil, is a large elongated island in the North Pacific, lying between 43° 57' and 44° 24' N., off the coast of the Russian Maritime Province in East Siberia, divided between the Russian and Japanese empires. Its proper Ainu name, Karafuto or Karafu, has been restored to the island by the Japanese since 1905. Sakhalin is separated from the mainland by the narrow and shallow Strait of Tatar or Mamiya Strait, which often freezes in winter in its narrower part, and from Yezo (Japan) by the Strait of La Pérouse. The island is 600 m. long, and 15 to 195 broad, with an area of 24,560 sq. m.

It is of geological and geophysical structure imperfectly known. The northern part of the island consists of a tableland which descends to the sea from north to south, reaching 2000 to 5000 ft. (Mt. Ichara, 4860 ft.), while, with two or more wide depressions, not exceeding 600 ft. above the sea. Crystalline rocks predominate, and occur in strata of considerable thickness, containing an abundant and specific fauna of gigantic ammonites, occur at Dui on the west coast, and Tertiary conglomerates, sandstone, marls and clays, fished by subsequent upheavals, in the Tym, north-east coast. The Tym coal and an abundant fossil vegetation, show that during the Miocene period Sakhalin formed part of a continent which comprised North Asia, Alaska, and Japan, and enjoyed a comparatively warm climate. The Pliocene deposits contain a mollusc fauna more arctic than that which exists at the present time, indicating probably that the connexion between the Pacific and Arctic Oceans was broken at this period. Only 5000 years ago were the inhabitants of Sakhalin able to navigate the sea.

The Tym, 250 m. long and navigable by rafts and light boats for 50 m., flows north and north-east with numerous rapids and shallows, and enters the Sea of Okhotsk. The Poroin flows south-west to the Gulf of Patience or Shishiro Bay, on the south-east coast. Three other small streams enter the wide semi-circular Gulf of Aniva or Hilagishumish Bay at the southern extremity of the island.

Owing to the influence of the raw, foggy Sea of Okhotsk, the climate is very cold. At Dui the average yearly temperature is only 33° 2.1° Fahr. (January 3.5°; July 61°); 35° 5.6° at Kusunai and 36° 5.6° at Aniva (January, 9.5°; July, 60-2°). At Alexandrovsk near Dui the temperature was 34° 2.4°, 90° and 5° Fahr. in the interior the minimum is -49° Fahr. The rainfall averages 232 in. Thick clouds for the most part shut out the sun; while the cold current from the Sea of Okhotsk, aided by north-east winds, brings the temperature down to the zero point. During the summer months the island is covered with dense forests, mostly coniferous. The Ayan spruce (Abies ayaensis), the Sakhalin fir (Abies sachalinensis) and the Daruvian larch are the chief trees; and under the mountains the range of Riapla, the Kusunai Karata, the Kurilian bamboo (Arundinaria kurilensis), the birch, both European and Kamchatkan (Betula alba and B. Ermanii), elder, poplar, elm, wild cherry (Prunus padus), Tatar baccata and several willows are mixed with the conifers; while farther south the maple, mountain ash and oak, as well as the Japanese Panax ricinfolium, the Amur cork (Philodendron amurense), the spindle tree (Euonymus macrapterus) and the vine (Vitis labruscera) make their appearance. The under-woods abound in butter-bearing plants (e.g. cloudberry, cranberry, crowberry, red whortleberry), barberry elder (Sambucus racemosa), wild raspberry and Spiraea. Bears, foxes, otters and sables are numerous. Reindeer are abundant, and deer, elk, chamois, roe, hares, squirrels, rats and mice everywhere. The avifauna is the common Siberian, and the rivers swarm with fish, especially species of salmon (Oncorhynchus). Numerous whales visit the sea-coast. Sea-lions, seals and dolphins are a source of profit.

Sakhalin was inhabited in the Neolithic Stone Age. Flint implements, exactly like those of Siberia and Russia, have been found at Dui and Kusunai in great numbers, as well as polished stone hatchets, like the European ones, primitive pottery with decorations like those of Olonets and stone weights for nets. Afterwards a population to whom bronze was known left traces in earthen walls and kitchen-middens on the Bay of Aniva. The native inhabitants consist of some 2000 Gilyaks, 1300 Ainus, with 750 Orochons, 200 Tunguses and Some Yakuts. The Gilyaks in the north support themselves by fishing and hunting.

The Ainus inhabit the south part of the island. There are also 32,000 Russians, of whom over 22,150 are convicts. A little coal is mined and some rye, wheat, oats, barley and vegetables are grown, although the period during which vegetation can grow averages less than 100 days. Fishing is actively prosecuted, especially by the Japanese in the south.

History.—Sakhalin, which was under Chinese dominion until the 19th century, became known to Europeans from the travels of Martin Gerrettz de Vries in the 17th century, and still better from those of La Pérouse (1787) and Krusenstern (1803). Both, however, regarded it as a peninsula, and were unaware of the existence of the Strait of Tatar, which was discovered in 1809 by a Japanese, Mamiya Rinzo. The Russian navigator Nevelskoi in 1849 definitively established the existence and navigability of this strait. The Russians made their first permanent settlement on Sakhalin in 1857; but the southern part of the island was held by the Japanese until 1875, when they ceded it to Russia. By the treaty of Portsmouth (U.S.A.) of 1905 the southern part of the island below 50° N. was re-ceded to Japan, the Russians retaining the other three-fifths of the area.

See C. H. Hawes, In the Ulterior East (London, 1903).

(P. A. K.; J. T. B.)

SAKI, the native name of a group of tropical American monkeys nearly allied to those known as uakaris (see UAKARI), with which they agree in the forward inclination of the lower incisor teeth, the depth of the hinder part of the lower jaw, and the non-prehensile tail. The sakis, which form the genus Pithicus, are especially characterized by their long and generally bushy tails, distinct whiskers and beard, and the usually elongated hair on the crown of the head, which may either radiate from a point in the crown as in S. Ianthe, or be arranged in a tuft. They are very delicate animals, difficult to keep in confinement, and in that state exhibiting a gentle disposition, and being normally silent (see PRIIMATES).

Sakurajima, a Japanese island, oval in shape and measuring 7 mi. by 5 mi., lying in the northern part of the Bay of Kagoshima (31° 40' N., 130° 35' E.). It has a volcanic cone 3743 ft. high (of which an eruption was recorded in 1779), and is celebrated for its hot springs, its oranges and its giant radishes (daikon), which sometimes weigh as much as 70 lb.

Sala, George Augustus Henry (1838-1895), English journalist, was born in London, on the 24th of November 1828. His father, Augustus John James Sala, born 1792-1828, was the son of Claudio Sebastiano Sala, an Italian, who came to London to arrange ballets at the theatres; his mother, Henrietta Simon (1789-1860), was an actress and teacher of singing. Sala was at school in Paris and studied drawing in London. In his earlier years he did odd jobs in scene-painting and book illustration. He wrote a tragedy in French, Frédégonde, before he was ten years old, and in 1841 attracted the attention of Charles Dickens, who published articles and stories by him in Household Words and All the Year Round, and in 1856 sent him to Russia as a special correspondent. About the same time he got to know Edmund Yates, with whom, in his earlier years, he was constantly connected in his journalistic ventures. From 1860 to 1886, over his own initials, he wrote "Echoes of the Week" for the Illustrated London News. Afterwards they were continued in a syndicate of weekly newspapers almost to his death. Thackeray, when editor of the Cornhill, published articles by him on Hogarth in 1866, which were issued in volume form in 1866. In 1866 he started Temple Bar, which he edited till 1888 when the magazine was taken over by Messrs Bentley. Meanwhile he had become in 1857 a contributor to the London Daily Telegraph, and it was in this capacity that he did his most characteristic work, whether as a foreign correspondent in all parts of the world, or as a writer of leaders or special articles. His literary style was highly coloured, bombastic, egotistic and full of trite periphrases, but his articles were invariably full of interesting matter and helped to make the reputation of the paper. He collected a large library and had an elaborate system of commonplace-books, so that he could bring into his articles enough show or reality of special information to make
excellent reading for a not very critical public; he had an
extraordinary faculty for never saying the same thing
twice in the same way. He earned a large income from the Telegraph
and other sources, but he never could keep his money. In 1865
he started on his first tour as special foreign correspondent to
his paper. He spent the year 1864 in America and published a
Diary of the war. Expeditions to Algiers, to Italy during
Garibaldi's 1866 campaign, to Metz during the Franco-German
war, to Spain in 1875 at the end of the Carlist war, were among
his early journalistic enterprises, the long list of which closed with
his journey through America and Australia in 1885. In
1892, when his reputation was at its height, he started a weekly
paper called Sala's Journal, but it was a disastrous failure;
and in 1895 he had to sell his library of 15,000 volumes. Lord
Rosebery gave him a civil list pension of £100 a year, and
was a broken-down man, and he died at Brighton on the 8th
of December 1895. Sala published many volumes of fiction,
travels and essays, and edited various other works, but his
métier was that of ephemeral journalism.

See The Life and Adventures of George Augustus Sala, written by
himself (2 vols., 1895).

**Salaam—Saladin**

**Salaam (Arab. salam, "peace"),** the Oriental term for a
salutation. The word is used for any act of salutation, as of an
ambassador to a monarch, and so in a secondary sense of a
compliment. Properly it is the oral salutation of Mahomedans
to each other; but it has acquired the special meaning of an
act of obeisance.

**Salad (Med. Lat. salata, salted, pickled, salare, to
sprinkle with salt),** a dish, originally dressed with salt, of green uncooked
herbs, such as lettuce, endive, mustard, cress, &c., usually served
with a flavouring of onion, garlic or leeks, and with a dressing of
vinaigre, oil, mustard, pepper and salt, or with a cream, for
which there are many receipts; hard-boiled eggs, radishes and
cucumber are also added.

**Salade, Salatt or Sælet, a head-piece introduced in the early
15th century replacing the heavy helmet. Its essential features are its smooth rounded surface, like an inverted bowl,
and its long projecting neck guard. Usually there was no movable
visor, but the front fixed part covered most of the face, a slit
being left for the eyes. The word is said to come through the
Old Fr. from the Span. escela, Ital. ecetta, Lat. caelata,
sc. cassis, engraved helmet, caelare, to engrave, chass (see
Hérmet).**

**Saladin (Arab. Sala-ad-din, "Honouring the Faith") (1137-
1193),** first Ayyubite sultan of Egypt, was born at Tekrit in
1138. The brilliance of his career was only made possible by
the condition of the East in the 12th century. Such authority as
remained to the orthodox caliph of Baghdad (see Caliphate)
or the heretical Fatimites (q.v.) of Cairo was exercised by their
viziers. The Seljukian empire had, after 1076, been divided and
subdivided among Turkish atabegs. The Latin kingdom of
Jerusalem had existed since 1089 only because it was a
united force in the midst of disintegration. Gradually, however,
Christian enthusiasm had aroused a counter enthusiasm among
the Moslems. Zengi, atabeg of Mosul, had inaugurated the
sacred war by his campaigns in Syria (1137-1146). Nur-ad-din,
his son, had continued his work by further conquests in Syria
and Damascus, by the organization of the western crusades,
and in 1157, by publishing everywhere the Holy War." The
opportunity of Saladin lay therefore in the fact that his lifetime
covers the period when there was a conscious demand for political
union in the defence of the Mahomedan faith. By race
Saladin was a Kurd of Armenia. His father, Ayyub (Job), and
his uncle Shirkuh, sons of a certain Shalady of Adjanakan near
Dawin, were both generals in Zengi's army. In 1139 Ayyub
received Baalbek from Zengi, in 1146 he moved, on Zengi's
death, to the court of Damascus. In 1154 his influence secured
Damascus to Nur-ad-din and he was made governor. Saladin
was therefore educated in the most famous centre of Moslem
learning and represented the best traditions of Moslem culture.

His career falls into three parts, his conquests in Egypt 1164-
1174, the annexation of Syria 1174-1187, and finally the destruct-
tion of the Latin kingdom and subsequent campaigns against
the Christians, 1187-1192. The conquest of Egypt was essential
to Nur-ad-din. It was a menace to his empire on the south, the
occasional ally of the Franks and the home of the unorthodox
caliph. His protest was the plea of an exiled vizier, and
Shirkuh was ordered to Egypt in 1164, taking Saladin as his
lieutenant. The Christians under Count Amalaric immediately
intervened and the four expeditions which ensued in 1164, 1167,
1168 and 1169 were duels between Christians and Saracens.
They resulted in heavy Christian losses, the death of Shirkuh
and the appointment of Saladin as vizir. His relations towards
the unorthodox caliph Nur-ad-din were marked by extraordinary
tact. In 1171 on the death of the Fatimite caliph he was
powerful enough to substitute the name of the orthodox caliph
in Egypt. Moreover, the Mahomedan religion was thus united against Christianity. To Nur-ad-din it was not
unworthy, but the reaction which he employed in adding to the fortifications of Cairo and the haste with which he retreated from an attack on Montréal (1171) and Kerak (1173)
it is clear that he feared his lord's jealousy.

In 1174 Nur-ad-din died, and the period of Saladin's conquests in
Syria begins. Nur-ad-din's vassals rebelled against his youthful heiress, es-Salih, and Saladin came north, nominally to his
assistance. In 1174 he entered Damascus, Emesa and Hamah;
in 1175 Baalbek and the towns round Aleppo. The next step
was political independence. He suppressed the name of es-Salih
in prayers and on the coinage, and was formally declared sultan
by the caliph 1175. In 1176 he conquered Saif-ad-din of Mosul
beyond the Euphrates and was recognized as sovereign by the
princes of northern Syria. In 1177 he returned by Damascus
to Cairo, which he enriched with colleges, a citadel and an
aqueduct. From 1177 to 1180 he made war on the Christians
from Egypt, and in 1180 reduced the sultan of Konia to sub-
mission. From 1181-1183 he was chiefly occupied in Syria. In
1183 he induced the atabeg Imad-ad-din to exchange Aleppo for
the insignificant Sinjar and in 1186 received the homage of the
atabeg of Mosul. The last independent vassal was thus subdued
and the Latin kingdom enclosed on every side by a hostile
empire.

In 1187 a four years' truce was broken by the brilliant brigand
Renaud de Châtillon and thus began Saladin's third period of
conquest. In May he cut to pieces a small body of Templars
and Hospitalers at Tiberias, and, on July 4th, inflicted a
crushing defeat upon the united Christian army at Hittin. He
then overran Palestine, on September 26th besieged Jerusalem
and on October 2nd, after chivalrous demeny to the Christian
inhabitants, crowned his victory by entering and purifying the
Holy City. In the kingdom only Tyre was left to the Christians.
Probably Saladin made his worst strategic error in neglecting
to conquer it before winter. The Christians had thus a
stronghold whence their remnant marched to attack Acre in
June 1189. Saladin immediately surrounded the Christian army
and thus began the famous two years' siege.

Saladin's lack of a fleet enabled the Christians to receive
reinforcements and thus recover from their defeats by land.
On the 8th of June 1191 Richard of England arrived, and on the
12th of July Acre capitulated without Saladin's permission.
Richard of England arrived, and on the 12th of July Acre capitulated
without Saladin's permission. The last independent vassal was thus subdued
and the Latin kingdom enclosed on every side by a hostile
empire.
after a few days' illness, he died. He was buried in Damascus and mourned by the whole East.

The character of Saladin and of his work is singularly vivid. In many ways he was a typical Mahommedan, fiercely hostile towards unbelievers—" Let us purge the air of the air they breathe " was his aim for the demons of the Cross,—intensely devout and regular in prayer, he was also a typical Islamic leader, seeking in the Orient to make the world take his message. " God reserved this triumph for the Ayyubites before all others. " His generosity and hospitality were proved in his gifts to Richard and his treatment of captives. He realized the Oriental idea of endurance, alternating with violent and emotional courage. Other virtues were all his own, his extreme gentleness, his love for children, his selfless honesty, his invariable kindness, his chivalry to women and his great ability. Saladin was a typical Mahommedan, if it be not a surrender to a sacred cause. His achievements were the inevitable expression of his character. He was not a statesman, for he left no constitution or code to the East; his empire was divided among his relatives. He was a commercial man, a strategist, though of great ability, he cannot be compared to Richard. As a general, he never organized an army. " My troops will do nothing, " he confessed, " save when I ride at their head and review them. " His fame lives in Eastern history as the conquering hero who stemmed the tide of Western conquest on the East, and turned it definitely from East to West, as the hero who momentarily united the unruly East, and as the saint who realized in his personality the highest virtues and ideals of Mahommedanism.

AUTHORITIES.—The contemporary Arabian authorities are to be found in Michaud's Recueil des historiens des Croisades (Paris, 1876). The best modern study is the Bahja, chancery and secretariat of al-Salih, the general history of Ibn-Athir (1160-1233), the eulogist of the atabegs of Mosul but the unwilling admirer of Saladin, and part of the general history of Abu Bakr ibn Oman. The biographies of his sons, Osmen and Murkhist, by Doreenbour (Paris, 1886), gives an invaluable picture of Eastern life. Later Arabian authorities are Ibn Kathilin (1211-1282) and Abu-Saliha (1267). The Mohammedan authorities the following are important, the history of William of Tyre (1125-1185), the Historiaus Peregrinorum, probably the Latin version of the Carmen Ambrosii (ed. by Stobo, Rolls series, London, 1864), and the Chronique d'outremer, or the French translation of William of Tyre's history and its continuation by Eurnol, the squire of Ballen, seigneur of Ibelin, 1228. The best modern authority is Stanley Lane-Poole's Saladin (" Herodotus of the Nomads" series, London, 1903); see also the bibliography to Crusades.

SALAMANCA, a frontier province of eastern Spain, formed in 1833 out of the southern part of the ancient kingdom of Leon, and bounded on the N. by Zamora and Valladolid, E. by Avila, S. by Cáceres and W. by Portugal. Pop. (1900) 320,765; area, 4,829 sq. m. Salamanca belongs almost entirely to the basin of the Duero (Portuguese Douro, q.v.), its principal rivers being the Tormes, which follows the general slope of the province towards the north-west, and after a course of 135 m. flows into the Duero, which forms part of the north-west boundary; the Yeltes and the Agueda, also tributaries of the Duero; and the Alagon, an affluent of the Tagus. The northern part of the province is flat, and at its lowest point (on the Duero) is 488 ft. above sea-level. The southern border is part mountainous along the Guadarrama and Gata ranges, but the highest point is La Alberca (950 ft.) in the Sierra de Peña Francia, which rises a little farther north. The rainfall is irregular; but where it is plentiful the soil is productive and there are good harvests of wine, oil, hemp, and cereals of all kinds. Forests of oak, pine, beech and chestnut cover a wide area in the south and south-west; and timber is sent in large quantities to other parts of Spain. Sheep and cattle also find good pasturage, and out of the forty-nine Spanish provinces only Badajoz, Cáceres and Teruel have a larger amount of live stock. Gold is found in the streams, and iron, coal, and pitchblende in the coal mines. Gold and silver are found in the coal mines are only partially developed, and it is doubtful if the deposits would repay exploitation on a larger scale. The manufactures of the province are few and mostly of a low class, intended for home consumption, such as frieze, coarse cloth, hats and pottery. The capital, Salamanca (pop. 1900, 8,690), and the town of Ciudad Rodrigo (8,690) are described in separate articles. Béjar (4,885) is the only other town of more than 5,000 inhabitants. The railways from Zamora, Medina, Plasencia and Peñaranda converge upon the capital, whence two lines go westward into Portugal—via Barca de Alva to Oporto, the other via Vila Formosa to Guarda. Few Spanish provinces lose so small a number of emigrants, and the population tends gradually to increase. See also LEON.

SALAMANCA (anc. Salamanca or Elmonico), the capital of the Spanish province of Salamanca, on the right bank of the river Tormes, 2648 ft. above sea-level and 172 m. by rail N.W. of Madrid. Pop. (1900) 25,690. Salamanca is the centre of a network of railways which radiate N. to Zamora, N.E. to Medina, E. to Peñaranda, S. to Plasencia, W.S.W. to Guarda in Portugal, W. to Pena de Ballesteros, and S. to Oporto. The river is here crossed by a bridge 500 ft. long built on twenty-six arches, fifteen of which are of Roman origin, while the remainder date from the 16th century. The city is still much the same in outward appearance as when its tortuous streets were thronged with students. The university was naturally the chief source of wealth to the town, the population of which in the 16th century numbered 50,000, 10,000 of whom were students. Its decay of course reacted on the townsfolk, but it fortunately also arrested the process of modernization. The ravages of war alone have wrought serious damage, for the French, in their defeative operations in 1811-1812, almost destroyed the western quarter. The ruins still remain, and give an air of desolation which is not borne out by the real condition of the inhabitants, however poverty-stricken they may appear. Side by side with the remains of a great past are the modern buildings: two theatres, a casino, bull-ring, town hall and electric light factory. The magnificent Plaza Mayor, built by Andres Garcia de Quijones at the beginning of the 18th century, and capable of holding 20,000 people to witness a bull-fight, is one of the finest squares in Europe. It is surrounded by an arcade of ninety arches on Corinthian columns, one side of the inner arches ornamented with graceful volute-work. The decoration of the façades are in the Renaissance style, and the plaza as a whole is a fine sample of Plateresque architecture.

The University.—Salamanca is still rich in educational establishments. It still keeps up its university, with the separate faculties of letters, philosophy, sciences, law and medicine; its university and provincial public library, with 50,000 volumes and 1000 MSS.; its Irish college, provincial institute, superior normal school, ecclesiastical seminary (founded in 1778), economic and other learned societies, and very many charitable foundations. The city has 25 parishes, 25 colleges, and as many more or less ruinous convents, and 10 yet flourishing religious houses. The university, the oldest in the Peninsula, was founded about 1130 by Alphonso IX. of Leon, and re-founded in 1424 by St. Ferdinand of Castile. Under the patronage of the learned Alfonso X. its wealth and reputation greatly increased (1252-1282), and its schools of canon law and civil law attracted students even from Paris and Bologna. In the 15th and 16th centuries it was renowned throughout Europe. Here Columbus, to whom a statue was erected in 1891, lectured on his discoveries, and here the Copernican system was taught long before the general acceptance. But soon after 1550 a period of decline set in. The university statutes were remodelled in 1777, but financial troubles and the incessant wars which checked almost every reform in Spain prevented any recovery up to 1857, when a fresh reorganization was effected. At the beginning of the 20th century the number of students was about 1,200, and the number of professors 10—fewer than in any other Spanish university.

Principal Buildings.—The chief objects of interest in the city are the old and new cathedrals. The old cathedral is a cruciform building of the 12th century, begun by Bishop Jerónimo, the confess of the Cid (q.v.). Its style of architecture is that late Romanesque which prevailed in the south of France, but the builder showed much originality in the construction of the dome, which covers the crossing of the nave and transepts. The inner dome is made to spring not from immediately above the arches, but from a higher stage of a double arcade pierced with windows. The thrust of the vaulting is borne by four octagonal piers, which support the arches which carry the coffered ceiling, covered with tiles. The whole forms a most effective and graceful group. On the vault of the apse is a fresco of Our Lord in Judgment by the Italian painter Nicolas Florentino (15th century), representing the scene as recorded, with the piously of fitting the curve of the apse, contains fifty-five panels with paintings mostly by the same artist. There are many fine monuments in the south transept and choir chapels. An adjoining building, the Capilla de Talavera, is used as a chapel for service according to the Mozarabic rite, which
is celebrated there six times a year. On the north and of adjoining the old church stands the new cathedral, built from designs by Juan Gil de Ontañón. Though begun in 1509 the work of construction made extremely slow progress, and was not completed under Bishop Francisco de Bobadilla; though not finished till 1734, it is a notable example of the late Gothic and Plateresque styles. Its length is 340 ft. and its breadth 160 ft. The interior is far more grand than the exterior, and has been decorated on and off by J. F. de Villarreal, J. Navarrete (1526-1579) and L. de Morales (c. 1509-1586), and some overrated statues by Juan de Juni (16th century). The treasury is very rich, and amongst other articles possesses a custodia which is a masterpiece of workmanship, and a beautiful ciborium and a set of altars, including the ciborium which was borne before the Child in the battle. The great bell weighs over 23 tons. Of the university buildings the façade of the library is a peculiarly fine example of late 15th century Gothic. The cloisters are light and elegant; the grand staircase ascending from them has a fine balustrade of foliage and figures. The Colegio de Nobles Irlandeses, formerly Colegio de Santiago Apostol, was built in 1479, and was in the 18th century owned by the governor's palace. The convent of Santo Domingo, sometimes called San Esteban, shows a mixture of styles from the 13th century onwards. The church is Gothic with a Plateresque façade of great lightness and delicacy. It is of purer design than that of the cathedral; nevertheless it shows the tendency of the period. The reredos, one of the finest Renaissance works in Spain, contains statues by Salvador Carmona, and a large, bronze statue of the Virgin and Child on a throne of champlevé enamel of the 12th century. The chapter-house, built by Juan Moreno in 1537, and the staircase and sacristy are good examples of later work. The convent of the Augustinian Recoles, begun by Pontana in 1516, is in better spirit than any other Renaissance building in the city. The church is rich in marble fittings and contains several fine pictures of the Neapolitan school, notably the Conception by J. Riberas in the 16th century and a slightly later altar. The convent of the Espíritu Santo has a good door by A. Herruguet (c. 1480-1561). There is also a rather effective portal to the conven of Las Dueñas. The church of St. Marcos is a curious circular building with three upper stories; and the churches of St. Martin and St. Matteo have good early doorways. Many of the private houses are untouched examples of the domestic architecture of the prosperous times in which they were built. Such are the Casa del Pescador, the finest example in Salamanca of the Casa de la Saja, with a magnificent courtyard and sculptured gallery; and the palaces of Maldonado, Monterey and Espinosa.

The aqueduct of Salamanca has not insignifican, and the stamped leather-work produced there is still sought after. Its manufactures are now of little consequence, and consist of cloth and leather. The transport trade is, however, of more importance than the increasing number of the railway communication between 1855 and 1900. During this period the population increased by nearly 7000.

History.—The town was of importance as early as 222 B.C., when it was captured by Hannibal from the Vettones, and it afterwards became the Romans' ninth station on the Via Lata from Merida to Saragossa. It passed successively under the rule of the Goths and the Moors, till the latter were finally driven out about 1055. About 1100 many foreign settlers were induced by Alphonso VI. to establish themselves in the district, and the city was enlarged and adorned by Count Raymond of Burgundy and his wife, the Princess Urraca. The Fuero de Salamanca, a celebrated code of civil law, probably dates from about 1200. Thenceforward, until the second half of the 16th century, the prosperity of the university rendered the city one of the most important in Spain. But in 1593 the earth floods, the worst since 1570, destroyed many of the buildings. The University of Salamanca and the culture española en el siglo XIII. (Paris, 1900.) (K. G. J.)

Battle of Salamanca, 1812. (For the operations which preceded this battle see PENINSULAR WAR.) On the 22nd of July 1812 the Allied army under Wellington (about 46,000 with 60 guns) was drawn up south of Salamanca, the left resting on the river Tormes at Santa Marta, with a division under Pakenham and some cavalry on the north bank of the Tormes and another force, the Allies gained the northern (since termed the "English") and the French south of the French") Arroyos. While Marmont was closing up his forces, a complete change of position was carried out by Wellington. Pakenham was directed to march through Salamanca, crossing the Tormes, and move under cover to a wood near Aldea Tejada, while Wellington, holding the village of Arroyos and the northern hill, took up a line with four infantry divisions, a Portuguese brigade (Bradford), a strong force of cavalry, and Don Carlos's Spanish brigade, under cover of a ridge between Arroyos and Aldea Tejada. By noon his old right had become his left, and he was nearer to the Ciudad Rodrigo road, flanking Marmont should he move towards it.

Redrawn from Maj.-Gen. C. W. Robinson's Wellington's Campaigns, by permission of Hugh Rees, Ltd.

It was not Wellington's wish (Despatches, July 21, 1812) to fight a battle "unless under very advantageous circumstances." He knew that large reinforcements were nearing the French, and, having determined to fall back towards Portugal, he began to pass his baggage along the Ciudad Rodrigo road. Marmont, about 2 p.m., seeing the dust of his baggage column, ignorant of his true position, and anxious to intercept his retreat, ordered two divisions under Maucon, the leading one of which became afterwards Thibaut's 

1 Some authorities differ as to this (see The Salamanca Campaigns, by Captain A. H. Marfin, 1906, appendix, pp. 51-59).
Tormes has been evacuated by its Spanish garrison without Wellington's knowledge.

Salamanca was a brilliant victory, and followed as it was by the capture of Madrid, it severely shocked the French domination in Spain.

**Salamanca**, a village in Cattaraugus county, New York. Utica, in the township of Salamanca, about 52 m. S. by E. of Buffalo. Pop. (1900), 4254, of whom 789 were foreign-born. (1910, census), 5702. Salamanca is served by the Erie, the Buffalo, Rochester & Pittsburg and the Pennsylvania railways, and by interurban electric lines connecting with Olean, N. Y., Bradford, Pennsylvania, and Little Valley (pop in 1910, 1368), the county-seat, about 8 m. N. The village is built on both sides of the Allegany river. The agricultural and industrial development of the region has been considerable, and its best known products are the Allegany apples, (allotted originally to the Seneca Indians by the Big Tree Treaty of 1798 and still including the valley of the Allegany river for several miles above and below Salamanca); but land is now held under a 90 year lease authorized by Congress in 1892. The village is a railway centre and division terminal, and has repair shops of the Erie and the Buffalo, Rochester & Pittsburg railways. The first settlement in the district (which was included within the “Holland Purchase” of 1792-1793) was made in 1815 near the site of West Salamanca (pop. in 1910, 350), 14 m. W. of Salamanca, and in the same year Salamanca (originally Salamanca, or Salamanders) was incorporated in 1879, taking its name from the township, which was erected in 1843 as Buck Tooth Township and in 1862 was renamed in honour of a Spanish banker who was a large stockholder of the Atlantic & Great Western railway, built through the township this year, and later merged with the Erie railway. See History of Cattaraugus County, New York (Philadelphia, Pa. 1870).

**Salamander.** Salamanders in the restricted sense (genus *Salamandra* of N. Laurenti) are close allies of the newts, but of exclusively terrestrial habits, indicated by the shape of the tail, which is not distinctly compressed. The genus is restricted in its habitat to the western parts of the Palearctic region and represented by four species only: the spotted salamander, *S. maculosa*, the well-known black and yellow creature inhabiting Central and Southern Europe, North-West Africa and South-Western Asia; the black salamander, *S. atrata*, restricted to the Alps; *S. cautica* from the Caucasus, and *S. lucifera* from Asia Minor. Salamanders, far from being able to withstand the action of fire, as was believed by the ancients, are found only in damp places, and emerge in misty weather only or after thunderstorms, when they may appear in enormous numbers in localities where at other times their presence would not be suspected. They are usually much dreaded by country people, and although they are quite harmless to man, the large glands which are disposed very regularly on their smooth, shiny bodies, secrete a very active, milky poison which protects them from the attacks of many enemies.

The breeding habits of the two well-known European species are highly interesting. They pair on land, the male clasping the female at the arms, and the impregnation is internal. Long after pairing the female gives birth to living young. *S. maculosa*, which lives in plains or at low altitudes (up to 3000 ft.), deposits her young, ten to fifty in number, in the water, in springs or cool rivulets, and these young at birth are of small size, provided with external gills and four limbs, in every way similar to advanced newt larvae. *S. atrata*, on the other hand, inhabits the Alps between 2000 and 9000 ft. altitude. Localities at such altitudes not being, as a rule, suitable for larval life in the water, the young are retained in the uterus, until the completion of the metamorphosis. Only two young, rarely three or four, are born, and they may measure as much as 50 mm. at birth, the mother measuring only 120. The uterine eggs are large and numerous (up to 1000 per mother) but as a rule only one fully develops in each uterus, the embryo being nourished on the yolk of the other eggs, which more or less dissolve to form a large mass of nutrient matter. The embryo passes through three stages—closer to the egg and living on its own yolk (1); free, within the vitelline mass, which is directly swallowed by the mouth; (2) there is no more vitelline mass, but the embryo is possessed of long excretory tubes which have a direct opening to the maternal uterus, these gills functioning in the same way as the chorionic villi of the mammalian egg. Embryos in the second stage, if artificially released from the uterus, are able to live in water, in the same way as similarly developed larvae of *S. maculosa*. But the uterine gills soon wither and are shed, and are replaced by other gills differing in no respect from those of its congeners.

**Salamis**, an island of Greece in the Saronic Gulf of the Aegean Sea, extending along the coasts of Attica and Megaris, and enclosing the Bay of Eleusis between two narrow straits on the W. and S. Its area is 36 sq. m., its greatest length in any direction 10 m.; its extremely irregular shape gives rise to the modern popular name Κούλαρη, i.e. baker's crescent. In Homer Salamis was the home of the Aeginetan prince Telamon, father of Ajax and Talthybius. In the Iliad it is mentioned as the birthplace of the ancient capital of the island opposite Aegina. It subsequently passed into the hands of the Megarians, but was wrested from them by about 600 B.C. by the Athenians under Solon (q.v.) and definitely awarded to Athens by Sparta's arbitration. Though Attic tradition claimed Salamis as an ancient possession the island was not strictly Athenian territory; a 6th-century inscription shows that it was treated either as a cleruchs or as a privileged foreign dependency. The town of Salamis was removed to an inlet of the E. coast opposite Attica. In 490 B.C. Salamis became the head of the Allied Greek fleet, and was the birthplace of the ill-fated fleet sent out from Artemision, while the Persians took their station along the Attic coast off Phalerum. Through the stratagem of the Athenian Themistocles the Greeks were enclosed in the straits by the enemy, who had wheeled by night across the entrance of the E. channel and detached a squadron to block the W. outlet. The Greeks had thus no resource but to fight, and as they advanced into the narrow neck of the east strait were thrown into confusion. The allies, among whom the Athenians and Aeginetans were conspicuous, seized this opportunity to retreat, some of them even fighting back through the enemy's line. After waging a losing fight for several hours the Persians retreated with the loss of 200 sail and of an entire corps landed on the islet of Psyttaaleia in the channel; the Greeks lost only 40 ships out of more than 300. During the Peloponnesian War Salamis served as a repository for the country stock of Attica. About 350 Salamis obtained the right of issuing copper coins. In 318 Cassander placed in it a Macedonian garrison which was finally withdrawn through the advocacy of the Achaean statesman Aratus (232). The Athenians thereupon supplanted the inhabitants by the base of the allied Greek fleet. By the 1st century A.D. the settlement had fallen into decay. In modern times Salamis, which is chiefly peopled by Albanians, has regained importance through the transference of the naval arsenal to Ambelaki near the site of the ancient capital. Excavations in this region have revealed large numbers of late Mycenaean tombs.

**Salamis**, the principal city of ancient Cyprus, situated on the east coast a little north of the river Pedias (Pediaeus). It had a good harbour, well situated for commerce with Phoenicia, Egypt and Cilicia, which was replaced by trade with Egypt and Cilicia, when Amathus was finally silted low. Its trade was mainly in corn, wine and oil from the midland plain (Mesoria), and in salt from the neighbouring lagoons. Traditionally, Salamis was founded after the Trojan War (c. 1180 B.C.) by Teucer from Salamis, the island off Attica, but there was an important Mycenaean colony somewhat earlier. The spoils of its tombs excavated in 1896 are in the British Museum.
A king Kisu of Silana (Salamis) is mentioned in a list of tributaries of Assur-bani-pal of Assyria in 668 B.C., and Assyrian influence is manifest in the Carian and Cilician regions, where the Assur salute was excavated in 1890-1891. The revolts of Greek Cyprus against Persia in 500 B.C., 386-385 B.C. and 352 B.C. were led respectively by kings Onesilus, Euaqoris (q.v.) and Pityagoras, who seem to have been of Semitic, i.e. “Hellenic” origin. There is no evidence that these Jewish colony in Ptolemaic and early Roman times, and a Christian community founded by Paul and Barnabas in A.D. 45-46. Barnabas was himself a Cypriote, and his reputed tomb, discovered in A.D. 377, is still visited. A town of the Byzantine age, and the monastery of St Epiphanius was archbishop A.D. 367-402. The Greek city was destroyed by the Arabs under the Caliph Moawiya in 647, and does not seem to have revived. In later times the site was plundered for the building of Famagusta; it is now covered by sandhills, and its plan is imperfectly known. The market-place and a few public buildings were excavated in 1890-1891, but nothing of importance was found.

**SALAMONIAC, or ammonium chloride, NH₄Cl, the earliest known salt of ammonia (q.v.), was formerly much used in dyeing and metallurgical operations.**

The name *Hammoniacus sul* occurs in Pliny (Nat. Hist. xxi. 39), who relates that it was applied to a kind of fossil salt found below the sand, in a district of Cyrenaica. The general opinion is, that the salt ammoniac of the ancients was the same as that of the moderns; but the imperfect description of Pliny is far from being conclusive. The native sal ammoniac of Bulgaria, described by Model and Karsten, and analysed by M. H. Kalprath, has no resemblance to the salt described by Pliny. The same remark applies to the sal ammoniac of volcanoes. Diocorides (v. 126), in mentioning sal ammoniac, makes use of a phrase quite irreconcilable with the description of Pliny. He speaks of a salt which has no resemblance to the salt described by Pliny. The same remark applies to the sal ammoniac of volcanoes.

Finally, we have no proof whatever that sal ammoniac occurs at present, either near the temple of Jupiter Ammon, or in any part of Cyrenaica. Hence we conclude that the term sal ammoniac was applied as indefinitely by the ancients as most of their other chemical terms. It may have been given to the same salt which is known to the moderns by that appellation, but was not confined to it.

In any case there can be no doubt that it was well known to the alchemists as early as the 13th century. Albertus Magnus, in his treatise, *Quodlibet volatilium* (q.v.), speaks of sal ammoniac, a natural and an artificial. The natural was sometimes white, and sometimes red; the artificial was more useful to the chemists. He teaches us how it was prepared, but he describes the method of subliming it. Which of the two did Pliny mean? There is a description of sal ammoniac in *Operae minerales* of Isaac Hollandus the elder, there is likewise a description of the mode of subliming sal ammoniac. In his *Carus triumphalis antimonii*, describes some of the peculiar properties of sal ammoniac in, if possible, a still less equivocal manner.

Egypt is the country where sal ammoniac was first manufactured, and from which Europe for many years was supplied with it. This commerce was first carried on by the Venetians, and afterwards by the Dutch. Nothing was known about the method employed by the Egyptians till the year 1719. In 1716 C. J. Geoffroy read a paper to the French Academy, showing that sal ammoniac must be formed by sublimation; but his opinion was opposed stoutly by W. Homberg and N. Lemer, that the paper was not printed. In 1767 Dr. Lavoisier, the French consul at Cairo, sent the Academy an account of the mode of manufacturing sal ammoniac in Egypt. The salt, it appeared, was obtained by simple sublimation from soil. In the year 1760 Linnaeus communicated to the Royal Society a correct detail of the whole process, which he had received from Dr F. Hasselquist, who had travelled in that country as a naturalist (Phil. Trans., 1760, p. 504). The dung of black cattle, horses, sheep, goats, &c., which contains sal ammoniac ready formed, is collected during the first four months of the year, when the animals feed on the spring grass, a kind of clover. It is dried, and sold to the common people as fuel. The soil from this fuel is carefully collected and sold to the sal ammoniac makers, who work only during the months of March and April, for it is only at that season of the year that the dung is fit for the purpose.

The composition of this salt seems to have been first discovered by J. P. Tournefort in 1700. The experiments of C. J. Geoffroy in 1716 and 1723 were still more decisive, and those of H. L. Duhamel de Monceau, in 1735, left no doubt upon the subject.

Dr. Thomson first pointed out a process by synthesis, which has the advantage of being very simple, and at the same time rigidly accurate, resulting from his observation that when hydrochloric acid gas and ammonia gas are brought in contact with each other, they always combine in equal volumes. The first attempt to manufacture sal ammoniac in Europe was made, about the beginning of the 18th century, by Mr. Goodwin, a chemist of London, who appears to have used the mother ley of common salt and putrid urine as ingredients.

The first successful manufacture of sal ammoniac in Great Britain was established in Edinburgh about the year 1760. It was first manufactured in France about the same time by A. Badmé. Manufactures of it were afterwards established in Germany, Holland and Flanders.

It is now obtained from the ammoniacal liquor of gas works by distillation. The liquid so obtained contains sal ammoniac, and, if not carefully washed, it is obtained into hydrochloric acid. The solution of ammonium chloride so obtained is evaporated and the crude ammonium chloride purified by sublimation. The subliming apparatus consists of two vessels: (1) a hemispherical glassware basin placed within a closed fitting iron one, or an enamelled iron basin, and (2) a hemispherical lead or stoneware lid, or dome, cemented on the top of the basin to prevent leakage. The dome has a small aperture in the top which is made to receive a glass tube for the purpose of introducing dry or dried crystallized salt is pressed into the basin, and, after the lid has been fitted on, is exposed to a long-lasting moderate heat. The salt volatilizes (mosty in the form of a mixed vapour of the two components, which reunite on cooling), and condenses in the dome in the form of a characteristically fibrous and tough crust.

The pure salt has a sharp saline taste and is readily soluble in water. It readily volatilizes, and if not rigorously excluded, it does not dissociate, but it possesses more or less traces of water it dissociates into ammonia and hydrochloric acid (H. B. Baker, Journ. Chem. Soc., 1850, 65, p. 612).

Sal ammoniac (ammonium chloride, British and United States pharmacopoeia) as used in medicine is a white crystalline odourless powder having a saline taste. It is soluble in 1 in 3 of cold water and in 2 in 3 of hot water, but is not compatible with carbonates of the alkalis. The dose is 5 to 20 grs. Ammonium chloride has a different action and therapeutic use from the rest of the ammonium salts. It possesses only slight influence over the heart and respiration, but it has a specific effect on mucous membranes as the elimination of the drug takes place largely through the lungs, where it aids in loosening bronchial secretions. This action renders it of the utmost value in bronchitis and associated bronchitis.

The drug may be given in a mixture with glycerine or liqueurice to cover the disagreeable taste or it may be used in a spray by means of an atomizer. The inhalation of the fumes of nascent ammonia is capable of relieving the symptoms of chronic bronchitis and certain forms of foetid bronchitis. Though ammonium chloride has certain irritant properties which may disorder the stomach, yet if its mucous membrane be deprived of atomic the drug may improve its condition, and it has been used with success in gastric and intestinal catarrhs of a subacute type and is given in doses of 10 grains half an hour before meals in painful dyspepsia due to hyperacidity. It is also an intestinal and hepatic stimulant and a feebly diuretic and aphoric, and has been considered a specific in some forms of neuralgia.

**SALARIA, VIA, an ancient highroad of Italy, which ran from Rome by Reate and Asculum to Castrum Truentinum (Porto d'Ascoli) on the Adriatic coast, a distance of 151 m. Its first portion must be of early origin, and was the route by which the Sabines came to fetch salt from the marshes at the mouth of the Tiber. Of its course through the Apennines considerable remains exist.**
SALAR JUNG, SIR (1829-1883), Indian statesman of Hyderabad, born in 1829, descendant of a family which had held various appointments, first under the Adil Shahi kings of Bijapur, then under the Delhi emperors and lastly under the Nizams. While he was known to the British as Salar Jung, his personal name was Mir Turab Ali, he was styled by native officials of Hyderabad the Mukhtar 'l-Mulk, and was referred to in English as the Nawab Sahib. He succeeded his father 'l-Mulk as prime minister in 1853. The condition of the Hyderabad state was at that time a scandal to the rest of India. Salar Jung began by infusing a measure of discipline into the Arab mercenaries, the more valuable part of the Nizam's army, and employing them against the rapacious nobles and bands of robbers who had annihilated the trade of the country. He then constituted courts of justice at Hyderabad, organized the police force, constructed and repaired irrigation works, and established schools. On the outbreak of the Mutiny he supported the British, and although unable to hinder an attack on the residency, he warned the British minister that this was an abomination. The attack was repulsed; the Hyderabad contingent remained loyal, and their loyalty served to ensure the tranquillity of the Deccan. Salar Jung took advantage of the preoccupation of the British government with the Mutiny to push his reforms more boldly, and when the Calcutta authorities were again at liberty to consider the condition of affairs his work had been carried far towards completion. During the lifetime of the Nizam Afzul'd-dowla, Salar Jung was considerably hampered by his master's jealous supervision. When Mir Mahub Ali, however, succeeded his father in 1860, Salar Jung, at the instance of the British government, was associated in the regency with the principal noble of the state, the Shamsu 'l-Umar or Amir Kabir, and enjoyed an increased authority. In 1876 he entered England with the object of obtaining the restoration of Berar. Although he was unsuccessful, his personal merits met with full recognition. He died of cholera at Hyderabad on the 8th of February 1883. He was created G.C.S.I. on the 28th of May 1870, and received the honorary degree of D.C.L. from the University of Oxford on the 21st of June 1876. His grandson enjoyed an estate of 1456 sq. m., yielding an income of nearly 60,000.

See Memoirs of Sir Salar Jung, by a private secretary, Syed Hossein Bilgrami, 1883.

SALARY, a payment for services rendered, usually a stipulated sum paid monthly, quarterly, half-yearly or yearly, and for a permanent or lengthy term of employment. It is generally contrasted with "wages," a term applied to weekly or daily payment for manual services. As laid down by Bowen, L. J., In re Shine (1892) 1 Q.B. 529, "Salary means a definite payment for personal services under some contract and computed by time." The Latin salarium meant originally salt money (Lat. sal, salt), i.e. the sum paid to soldiers for salt. In post-Augustan Latin the word was applied to any allowance, pension or stipend.

SALAS, or SAN MARTIN DE SALAS, a town of southern Spain, in the province of Oviedo; on the road from Tineo to Grado, and on a small sub-tributary of the river Narcea. Pop. (1900), 17,147. The official total of the inhabitants includes not only the actual residents in the town, but also the population of the district of Salas, a mountainous region in which coal-mining and agriculture are the principal industries. The products of this region are sent for export to Cudillero, a small harbour on the Bay of Biscay.

SALAS BARBADILLO, ALONSO JERÓNIMO DE (c. 1580-1639), Spanish novelist and playwright, born at Madrid about 1580, and educated at Alcalá de Henares and Valladolid. His first work, La Patrona de Madrid restituida (1609), is a dull devout poem, which forms a strange prelude to La Hija de Cevalina (1612), a malicious transcription of rites and plays, the best of which was El Cavasol puntual (1621), La Casa de placer honesto (1629), Don Diego de Noche (1623) and a most sparkling satirical volume of character-sketches, El Curioso y sabio Alejandro (1634). He died in poverty at Madrid on the 10th of July 1635. Some of his works were translated into English and French, and Scarron's Hypocrisies is based on La Ingeniosa Elena; he deserved the vogue which he enjoyed till late in the 17th century, for his satirical humour, versatile invention and pointed style are an effective combination.

SALDANHA BAY, an inlet on the south-western coast of South Africa, 63 m. by sea N. by W. of Cape Town, forming a land-locked harbour. The northern part of the inlet is known as Hoetjes Bay. It has accommodation for a large fleet with deep water close inshore, but the arid nature of the country caused it to be neglected by the early navigators, and with the growth of Cape Town Saldanha Bay was rarely visited. Considerable deposits of freestone in the neighbourhood attracted attention during the later 19th century. Proposals were also made to create a port which could be supplied by water from the Berg river, 20 m. distant. From Kalabas Kraal on the Cape Town-Cumberland railway is a narrow gauge line runs via Hopefield to Hoetjes Bay—126 m. from Cape Town.

Saldanha Bay is so named after Antonio de Saldanha, captain of a vessel in Albuquerque's fleet which visited South Africa in 1593. The name was first given to Table Bay, where Saldanha's ship cast anchor, by Mathys de Table, and the name of Table Bay from that time onward appellation was transferred to the bay now called after Saldanha. In 1781 a British squadron under Commodore George Johnstone (1731-1787), seized six Dutch East Indiamen, which, after an action with the Town of Table, the English took refuge in Saldanha Bay. This was the only achievement, so far as South Africa was concerned, of the expedition despatched to seize Cape Town during the war of 1781-1782.

SALDERN, FRIEDRICH CHRISTOPH VON (1719-1789), Prussian soldier and military writer, entered the army in 1735, and (on account of his great stature) was transferred to the Guards in 1739. As one of Frederick's aides-de-camp he was the first to discover the approach of Neipperg's Austrians at Mollwitz. He commanded a guard battalion at Leuthen, again distinguished himself at Hochkirch and was promoted major-general. In 1760 at Liegnitz Frederick gave him four hours in which to collect, arrange and despatch the spoils of the battle, 6000 prisoners, 100 wagons, 82 guns and 5000 muskets. His Criticism reveals him to have been a marked man even in Frederick's army. At Torgau, Saldern and Möllendorf (q.v.) with their brigades converted a lost battle into a great victory by their desperate assault on the Siptitz Heights. The manoeuvring skill, as well as the iron resolution, of the attack, has excited the wonder of modern critics, and after Torgau Saldern was accounted the "completest general of infantry alive" (Carlyle). In the following winter, however, being ordered by Frederick to sack Hubertusburg, Saldern refused on the ground of conscience. Nothing was left for him but to retire, but Frederick was well aware that he needed Saldern's experience and maneuvering ability, and after the peace the general was at once made inspector of the troops at Magdeburg. In 1796 he became lieutenant-general. The remainder of his life was spent in the study of military sciences in which he became a pedant of the most pronounced type. In one of his works he discussed at great length the question between 76 and 75 pieces to the minute as the proper cadence of infantry. There can be no question that "Saldern-tactics" were the most extreme form of pedantry to which troops were ever subjected, and contributed powerfully to the disaster of Jena in 1806. His works included Taktische Infanterie (Dresden, 1784) and Taktische Grundsätze (Dresden, 1786), and were the basis of the British "Dundas" drill-book.

See Küster, Charakterzüge des Generalleutnants von Saldern (Berlin, 1792).

SALE, GEORGE (c. 1607-1676), English orientalist, was the son of a London merchant. In 1720 he was admitted a student of the Inner Temple, but subsequently practised as a solicitor. Having studied Arabic for some time in England, he became, in 1726, one of the correctors of the Arabic version of the New Testament, begun in 1720 by the Society for Promoting Christian Knowledge, and subsequently took the principal part in the
work. He made an extremely paraphrastic, but, for his time, admirable English translation of the Koran (1734 and often reprinted), and had a European reputation as an orientalist. He died on the 13th of November 1736. His collection of oriental manuscripts is now in the Bodleian library, Oxford.

SALE, SIR ROBERT HENRY (1782–1845), British soldier, entered the 36th Foot in 1795, and went to India in 1798, as a lieutenant of the 12th Foot. His regiment formed part of Baird's brigade of Harry's army operating against Tippoo Sahib, and Sale was present at Mallavelly (Mallawall) and Seringapatam, subsequently became colonel. He joined Wellesley in the campaign against Dhundia. A little later the 12th was employed in the difficult and laborious attack on Paichi Raja. Promoted captain in 1806, Sale was engaged in 1808–1809 against the Raja of Travancore, and was at the two actions of Quillon, the storm of Travancore lines and the battle of Killianore. In 1810 he accompanied the expedition to Mauritius, and in 1813 obtained his majority. After some years he became major in the 13th, with which regiment he was for the rest of his life associated. In the Burmese War he led the 13th in all the actions up to the capture of Rangoon, in one of which he killed the enemy's general. After the transfer of the British and French to the plains of Ava, Sale, being now lieutenant-colonel, he commanded a brigade, and at Malonw (1826) he was severely wounded. For these services he received the C.B. In 1838, on the outbreak of the Afghan War, Brevet-Colonel Sale was assigned to the command of the 1st Bengal brigade of the army assembling on the Indus. His column arrived at Kandahar in April 1839, and in May it occupied the Herat plain. The Kandahar force next set out on its march to Kabul, and a month later Ghazni was stormed, Sale in person leading the storming column and distinguishing himself in single combat. The place was well provisioned, and on its supplies the army finished its march to Kabul easily. For his services Sale was made K.C.B. and received the local rank of major-general, as well as the Shah's order of the Durame Empire. He was left, as second-in-command, with the army of occupation, and in the interval between the two wars conducted several small campaigns ending with the action of Parwan which led directly to the surrender of Dost Mahommed. By this time the army had settled down to the quiet life of cantonments, and Lady Sale and her daughter came to Kabul. But the policy of the Indian government in stopping the subsidy to the Afghan tribes roused them into hostilities, and the Afghan chiefs of the frontier tribes roused them into hostilities, and the Afghan chiefs, finding themselves surrounded, agreed to surrender on conditions which the British army was unable to meet. Sale received orders to closest the line of communication to Peshawar. After severe fighting Sale entered Jalalabad on the 12th of November 1841. Ten days previously he had received news of the murder of Sir Alexander Burnes, along with orders to return with all speed to Kabul. These orders he, for various reasons, decided to ignore; suppressing his personal desire to return to protect his wife and family, he gave orders to push on, and on occupying Jalalabad at once set about making the old and half-ruined fortress fit to stand a siege. There followed a close and severe investment rather than a siege, and the provision-baggers were made usually with the object of obtaining supplies. At last Pollock and the relieving army appeared, only to find that the garrison had on the 7th of April 1842 relieved itself by a brilliant and completely successful attack on Akbar's lines. Sir Robert Sale received the G.C.B.; a medal was struck for all ranks of defenders, and salutes fired at every large cantonment in India. Pollock and Sale after a time took the offensive, and after the victory of Hafit Kotal, Sale's division encamped at Kabul again. At the end of the war Sale received the thanks of parliament. In 1843 he was quarter-master-general to Sir H. Gough's army, Sale again took the field. The second Godab, Barmah, he was mortally wounded, and he died on the 21st of December 1845. His wife, who shared with him the dangers and hardships of the Afghan war, was amongst Akbar's captives. Amongst the few possessions she was able to keep from Afghan plunderers was her diary (Journal of the Disasters in Afghanistan, London, 1843).

See Gleig, Sale's Brigade in Afghanistan (London, 1846); Kaye, Lives of Indian Officers (London, 1867); W. Sale, Defence of Jalalabad (London, 1846); Regimental History of the 13th Light Infantry.

SALE, a town of Tanjil county, Victoria, Australia, the principal centre in the agricultural Gippsland district, on the river Thomson, 17½ m. by rail E.S.E. of Melbourne. Pop. (1901), 3,462. It is the seat of the Anglican bishop of Gippsland, and contains the cathedral of the Roman Catholic bishop of Sale. Attached to its mechanics' institute are schools of mines, art and technology, and a fine free library. The finest buildings, excluding a number of handsome churches, are the Victoria Hall and the convent of Notre Dame de Sion. The Agricultural Society has excellent show grounds, in which meetings are held. Sale is the head of the Gippsland lakes navigation, the shipping being brought from the lakes to the town by canal. Daily communication is maintained with Cunningham at the lakes' entrance, and ocean-going steamers ply frequently between Sale and Melbourne.

SALE, an urban district in the Altrincham parliamentary division of Cheshire, England, 5 m. S.W. of Manchester. Pop. (1901), 12,085. It is served by the Manchester, South Junction & Altrincham and the London & North-Western railways, and the Cheshire Lines, and has become a large residential suburb of Manchester. At the beginning of the 19th century the greater part of Sale was a loose collection of farms and cottages, but there are numerous handsome villas. Market gardening is carried on in the neighbourhood; and there are large botanical gardens.

SALEM, a city and district of British India, in the Madras presidency. The city is on both banks of the river Tirumanimuttar, 3 m. from a station on the Madras railway, 206 m. S.W. of Madras city. Pop. (1901), 70,621. There is a considerable weaving industry and some manufacture of cutlery. Its situation in a green valley between the Shevaroy and Jarugumal hills is picturesque.

The District of Salem has an area of 7,530 sq. m. Except towards the south it is hilly, with extensive plains lying between the several ranges. It consists of three distinct tracts, formerly known as the Talaghat, the Baramahal and the Balaghat. The Talaghat is situated below the Eastern Ghats on the level of the Carnatic generally; the Baramahal includes the whole face of the Ghats and a wide piece of country at their base; and the Balaghat is situated above the Ghats on the tableland of Mysore.

The western part of the district is mountainous. Amongst the chief ranges (5,000–6,000 ft.) are the Shevaroys, the Kalhrayas, the Madiya, the Tippoor, Kolliplam, the Puchiam and the Yelaghills. The chief rivers are the Cauvery with its numerous tributaries, and the Ponnar and Palar; the last, however, only flows through a few miles of its north-western branch. The forests are of considerable value. The geological structure of the district is mostly gneissic, with a few irruptive rocks in the form of trap dikes and granite veins. Magnetic iron ore is common in the hill regions, and the iron and chromite of iron are also obtainable. The qualities of the soil differ very much; in the country immediately surrounding the town of Salem a thin layer of calcareous and red loam generally prevails, though which quartz rocks appear on the surface in many places. The climate, owing to the great difference of elevation, varies considerably; on the hills it is cool and bracing, and for a great part of the year very salubrious; the annual rainfall averages about 32 in.

The population in 1901 was 2,204,974, showing an increase of 12% in the decade. The principal crops are millets, rice, other food grains and oil-seeds, with a little cotton, indigo and tobacco. Coffee is grown on the Shevaroy hills. The chief irrigation work is the Barur tank system. Salem suffered severely from the famine of 1877–1878. The Madras railway runs through the district, with two narrow-gauge branches. The chief industry is cotton-weaving, and there is some manufacture of steel from magnetic iron ore. There are many saltpetre refineries, but no large industries. The district was acquired partly by the treaty of peace with Tippoo Sultan in 1792 and partly by the partition treaty of Mysore in 1799. By the former the Talaghat and Baramahal were ceded, and by the latter the Balaghat or what is now the Housal kudah.

SALEM, a city and one of the county-seats (Lawrence is the other) of Essex county, Massachusetts, about 15 m. N.E. of Boston. Pop. (1900), 35,956, of whom 10,902 were foreign-born (including 400 French Canadians, 3,476 Irish, and 1,582 English
Canadians), 23,648 were of foreign parentage (one or the other parent foreign-born) and 156 were negroes; (1910), 43,697.

Area, 8-2 sq. m. Salem is served by the Boston & Maine and by interurban electric railways westward to Peabody, Danvers, Salem, Lynn, and Boston. The Peabody and to Marblehead, Swampscott, Lynn and Boston. It occupies a peninsula projecting toward the north-east, a small island (Winter Island) connected with the neck of the peninsula (Salem Neck) by a causeway, and some land on the mainland. Salem has many historical and literary landmarks. There are three court-houses, one of granite (1835-1841) with great monolithic Corinthian pillars, another (1862), adjoining it, of brick, and a third (1906-1909) of granite, for the probate court. The City Hall was built in 1837, and enlarged in 1876. The Custom House (1837) is occupied in part by the Custom House Collection of 1845 and in it Hawthorne worked as surveyor of the port in 1845-1849. The public library building (1888) was given to the city by the heirs of Captain John Bertram.

The Essex Institute (1848) is housed in a brick building (1851) with freestone trimmings and in old Plummer Hall (1857); its museum contains some old furniture and a collection of portraits; it has an excellent library and publishes quarterly (1850 sq.) Historical Collections. The Peabody Academy of Science, founded by the gift in 1851, of John Crowninshield, has been removed to a large building (1868) in Salem, established in the East India Marine Hall (1848), bought for a special purpose from the Salem East India Marine Society. The Marine Society was organized in 1799, its membership being limited to "persons engaged in the sea, which is beyond Good Hope or Cape Horn, as masters or supercargoes of vessels belonging to Salem"; it assists the widows and children of members. Its museum, like the ethnological and natural history collection of the Essex Institute, is valued by students.

the Athenaeum, established in 1804, is a leading literary and social organization, whose museum now includes Essex county collections (natural history, mineralogy, botany, prehistoric relics, &c.), type collections of Bibles, and a collection of prehistoric, primitive, and savage peoples, especially rich in objects from Malayasia, Japan and the South Sea islands; and portraits and relics of famous Salem merchants, with models and pictures of Salem merchant vessels. The Salem Athenaeum (1804) and the Essex Institute (1829) are both housed in Cabot Hall (1837); the City Library (1781) is housed in Plummer Hall (1868), a building in the colonial style, named in honour of a benefactor of the Athenaeum, Caroline Plummer (d. 1855), who endowed the Plummer Professorship of Christian Morals at Harvard. Some of the old houses were built by ship-owners before the War of Independence, and were built during the first years of the 19th century when Salem privateers made so many fortunes. Many of the finest old houses are of the gambrel type; and there are many beautiful doorways, doorheads and other details. Nathaniel Hawthorne's birthplace was built before 1692; another house—now reconstructed as a social center—was once the point of departure of the original "house of seven gables." The Corwin or "Witch" house, so called from a tradition that Jonathan Corwin, one of the judges in the witchcraft trials, held preliminary examinations of witches here, is also known as the Mayhew or Williams house; a small house, built before 1660, was the homestead of Timothy Pickering and of other members of that family. Among the other buildings and institutions of note are the Francis Cabot Hall (1881), the Franklin Institute (1824), the Salem Marine Society; a large armory; a state normal school (1834); an orphan asylum (1871), under the Sisters of the Grey Nuns; the Association for the Relief of Aged and Destitute Women (1860), occupying a fine old brick house formerly the home of Benjamin W. Crowninshield (1772-1851), a member of the national House of Representatives in 1824-1831 and Secretary of the Navy in 1814; the Bertram Home for Aged Men (1877) in a house built in 1806-1807, the Plummer Farm School for Boys (incorporated 1855, opened 1870), another charity of Caroline Plummer, on Winter Island; the City Almshouse (1816) and the City Insane Asylum (1853), in houses; a house of the Shakers; a fraternity house (1869), a club-house for boys; the Marine Society Bethel; the Salem Seamen's Bethel; the Seamen's Orphan and Children's Friend Society (1839); an Associated Charities (1901), and the Salvation Army.
the release from prison of all then held on the charge of witchcraft.

Salem was an important port after 1670, especially in the India trade, and Salem privateers did great damage in the Seven Years' War, in the War of Independence (when 138 Salem privateers took 445 prizes), and in the War of 1812. On this foreign trade and these rich periods of privateering the prosperity of the place up to the middle of the 19th century was built.

The First Provincial Assembly of Massachusetts met in Salem in 1774. It included the old bridge (between the present Salem and Danvers) the first armed resistance was offered to the royal troops, when Colonel Leslie with the 64th regiment, sent to find cannon hidden in the Salem “North Fields,” was held in check by the townspeople. Salem was the birthplace of Nathaniel Hawthorne, W. H. Prescott, Nathaniel Bowditch, Jones Very and W. W. Story.

Marblehead was separated from Salem township in 1840; Beverly in 1668, a part of Middleton in 1726, and the district of Danvers in 1752. Salem was chartered as a city in 1836.

See Charles S. Ogden and Henry M. Batchelder, Historical Sketch of Salem, 1620-1879 (Salem, 1879); Joseph B. Felt, Annals of Salem (ibid. 1827; 2nd ed., vols. 1845-1849); Charles W. Upham, Salem Witchcraft (2 vols., Boston, 1867); H. B. Adams, Village Communities of Cape Ann and Salem (Baltimore, 1883); Eleanor Putnam, The Life of Stephen Foster in Salem (Boston, 1886); C. H. Webber and W. S. Nevins, Old Naumkeag (Salem, 1877); R. D. Paine, Ships and Sailors of Old Salem (New York, 1900), and Visitor's Guide to Salem (Salem, 1902) published by the Essex Institute.

SALEM, a city and the county-seat of Salem county, New Jersey, U.S.A., in the S.W. part of the state, on Salem Creek, about 35 m. S.W. of Philadelphia. Pop. (1900), 5811, of whom 263 were foreign-born and 500 were negroes; (1910 U.S. census), 6614. It is served by the West Jersey & Seashore railroad, and has steamer connexion with Philadelphia. Among its institutions is the John Tyler Library, established as Salem Library in 1804 and said to be the third oldest public library in the state. In Finn's Point National Cemetery, about 4 m. N. of Salem, there are buried some 2400 Confederate soldiers, who died during the Civil War while prisoners of war at Fort Delaware, on an island in Delaware river nearly opposite the mouth of Salem Creek. Salem lies in a rich agricultural region. Among the city's manufactures are canned fruits and vegetables, condiments, glass-ware, brass and iron-work, hosiery, linoleum and oil-cloth. Near the present site in 1643 colonists from Sweden built Fort Elsbourg; but the Swedish settlers in 1655 submitted to the Dutch at New Amsterdam, and the latter in turn surrendered to the English in 1664. In 1675 John Fowenick, an English Quaker, entered the Delaware river and founded the first English settlement on the Delaware (which he called Salem). After purchasing lands from the Indians, Fowenick attempted to maintain an independent state, but in 1682 he submitted to the authority of the proprietors of West Jersey. During the War of Independence Salem was plundered on the 17th of March 1778 by British troops under Colonel Charles Mawhood, and on the following day a portion of these troops fought a sharp but indecisive engagement at Quinton's Bridge, 3 m. S. of the town, with American militia under Colonel Benjamin Holmes. Salem was incorporated as a town in 1695, and was chartered as a city in 1838.

SALEM, a city of Columbiana county, Ohio, U.S.A., 67 m. N.W. of Pittsburgh and about the same distance N.E. of Cleveland. Pop. (1900), 7582, including 669 foreign-born and 227 negroes; (1910) 8043. Salem is served by the Pennsylvania (the Pittsburg, Fort Wayne & Chicago division) and the Youngstown & Ohio River railways, and by an interurban electric line to Canton. The city has a Carnegie library (1896), two beautiful cemeteries, a park, and a Home for Aged Women. It is situated in a fine agricultural region; coal is mined in the vicinity; natural gas is obtained in abundance; and the city has various manufactures. It was settled by Friends in 1806, incorporated as a town in 1818, was a village in 1832, and chartered as a city in 1887. For several years preceding the Civil War it was a station on the "underground railway" and the headquarters of "the Western Anti-Slavery Society," which published here the Anti-Slavery Bugle.

SALEM, the capital of Oregon, U.S.A., and the county-seat of Marion county, on the east bank of the Willamette river, 52 m. S.S.W. of Portland. Pop. (1900), 4258, including 222 foreign-born; (1910) 14094. It is served by the Southern Pacific railway, by the Oregon Electric line (to Portland), and by a steamship line to Portland. The city is in the centre of the Willamette Valley, a rich farming and fruit-growing country. It has wide, well-shaded streets, and two public parks. Among the public buildings and institutions are the State Capitol, the State Library, the city public library, the county court-house, the Federal building, the state penitentiary and several charitable institutions. Salem is the seat of Willamette University (Methodist Episcopal, 1844), an outgrowth of the mission work of the Methodist Episcopal church begun in 1834 about 10 m. below the site of the present city; of the Academy of the Sacred Heart (Roman Catholic, 1860) and of two business colleges. Immediately north of the city at Chemawa is the Salem (non-reservation) government school for Indians, with an excellently equipped hospital. Water power is derived (in part, by an 18 m. canal) from the Santiam, an affluent of the Willamette river. The city is a market for the produce of the Willamette Valley. The settlement here, gathering about the Methodist mission and school, began to grow in the decade 1840-1850. Salem was chartered as a city in 1853, and in 1860 was made the capital of the state. It grew rapidly after 1900, and its territory was increased in 1903.

SALEM, a town and the county-seat (since 1838) of Roanoke county, Virginia, U.S.A., on the Roanoke river, about 60 m. W. by S. of Lynchburg. Pop. (1900), 3412, including 798 negroes; (1910) 3840. It is served by the Norfolk & Western and the Virginian railways, and has electric railway connexion with Roanoke, about 6 m. E. The town is a summer resort about 1000 ft. above the sea, surrounded by the Alleghany and Blue Ridge mountains. There are chalybeate and sulphur springs in the vicinity. Salem is the seat of a Lutheran Orphan Home (1888), of the Baptist Orphanage of Virginia (1892) and of Roanoke College (co-educational, Lutheran; chartered, 1853). The town is in a dairying, agricultural and fruit-growing region. The Roanoke river provides water-power. The water supply is obtained from a spring within the town limits, from which there flows about 576,000 gallons a day, and from an artesian well. This part of Roanoke county was granted in 1767 to General Andrew Lewis, to whom there is a monument in East Hill Cemetery, where he is buried. Salem, laid out in 1852, was incorporated as a town in 1873.

SALE OF GOODS. Sale (O.Eng. zala, sellan, syllan, to hand over, deliver) is commonly defined as the transfer of property from one person to another for a price. This definition requires some consideration in order to appreciate its full scope, the law of sale is usually treated as a branch of the law of contract, because sale is effected by contract. Thus Pothier entitles his classical treatise on the subject, Traité du contrat de vente, and the Indian Contract Act (ix. of 1872) devotes a chapter to the sale of goods. But a completed contract of sale is something more. It is a contract plus a transfer of property. An agreement to sell or buy a thing, or, as lawyers call it, an executory contract of sale, is a contract pure and simple. A purely personal bond arises thereby between seller and buyer. But a complete or executed contract of sale effects a transfer of ownership with all the advantages and risks incident thereto. By an agreement to sell a jus in personam is created; by a sale a jus in rem is transferred. The essence of sale is the transfer of property for a price. If there be no agreement for a price, express or implied, the transaction is gift, not sale, and is regulated by its own peculiar rules and considerations. So, too, if commodity be exchanged for commodity, the transaction is called barter and not sale, and the rules relating to sales do not apply in their entirety. Again, a contract of sale must contemplate an absolute transfer of the property in the thing sold and agreed to be sold. A mortgage may be in the form of a conditional sale, but English law regards the
SALE OF GOODS

Substance and not the form of the transaction. If in substance the object of the transaction is to secure the repayment of a debt, and not to transfer the absolute property in the thing sold, the law at once annexes to the transaction the complex consequences which flow from the sale of goods; and it is impossible to distinguish a contract for the sale of an article from a contract for the supply of work and materials. If a man orders a set of false teeth from a dentist the contract is one of sale, but if he employs a dentist to stop one of his teeth with gold the contract is for the supply of work and materials. The distinction is of practical importance, because very different rules of law apply to the two classes of contract. The property which may be the subject of sale may be either movable or immovable, tangible or intangible. The present article relates only to the sale of goods—that is to say, tangible movable property. By the laws of all matured civilizations it is, indeed, a public policy, subject to special regulations. It is obvious that the assignment of "things in action," such as debts, contracts and negotiable instruments, must be governed by very different principles from those which regulate the transfer of goods, when the object sold can be transferred into the physical possession of the transferee.

In 1837, when Mr Justice Story wrote his work on the sale of personal property, the law of sale was still in process of development. Many rules were still unsettled, especially the rules relating to implied conditions and warranties. But for every rule of law, a rule of equity, was there to be conceived, or there was a special case to be made.

In 1892 the subject seemed ripe for codification, and Lord Herschell introduced a codifying bill which two years later passed into law as the Sale of Goods Act, 1893 (56 & 57 Vict. c. 71). A sale is a consensual transaction in which an object is transferred from one person to another in consideration, or is agreed to be transferred, on some terms or conditions or from any stipulations or conditions they may see fit to agree to. The code in no wise seeks to fetter this discretion. It lays down a few positive rules—such, for instance, as that which reproduces the 17th section of the Statute of Frauds. But the main object of the act is to provide clear rules for those cases where the parties have either formed no intention or have failed to express it. When parties enter into a contract of sale of goods, they may provide for contingencies which may interrupt that performance—such as the insolvency of the buyer or the destruction of the thing sold before it is delivered. It is the province of the code to provide for these contingencies, leaving the parties free to modify by express stipulation the provisions imported by law. When the code was in contemplation the case of Scotland gave rise to difficulty. Scottish law varies widely from English. To speak broadly, the Scottish law of sale differs from the English by adhering to the rules of Roman law, while the English common law has worked out rules of its own. Where two countries are so closely connected in business as Scotland and England, it is desirable that the law which governs the commercial matters should differ. The Mercantile Law Commission of 1855 reported on this question, and recommended that on certain points the Scottish rule should be adopted in England, while on other points the English rules should be adapted to Scottish conditions. Recommendations of the Commission were partially and rather capriciously adopted in the English and Scottish Mercantile Law Amendment Acts of 1866. Certain rules were enacted for England while similar rules were left to be enacted by Scottish Parliament. Other rules were enacted for Scotland which resembled but did not really reproduce the English law. There the matter rested for many years. The Codifying bill of 1891 applied only to England, but on the advice of Lord Watson it was extended to Scotland. As the English and Irish laws of sale were the same, the case of Ireland gave rise to no difficulty, and the act now applies to the whole of the United Kingdom. As regards England and Ireland very little change in the law has been effected. As regards Scotland the process of assimilation has been carried further, but has not been completed. In a few cases the Scottish rule has been saved or restored, in a few others it is respected, and in those points, where the laws were dissimilar, the English rules have been adopted.

Now that the law has been codified, an analysis of the law resolves itself into an epitome of the main provisions of the statute. The act is divided into six parts, the first dealing with the formation of the contract, the second with the effects of the contract, the third with the conditions and warranties, the fourth with the sale and delivery of goods, the fifth with unpaid seller against the goods, and the sixth with remedies for breach of contract. The sixth part is supplemental. The 1st section, which modified the Scots law, was inserted in order to give the contract a sounder basis in the following terms: "A contract of sale of goods is a contract whereby the seller transfers or agrees to transfer the property in goods to the buyer for a money consideration called the price. A contract of sale is perfected when there is an agreement between the parties as to the price of the property in the goods is transferred from the seller to the buyer the contract is called a 'sale,' but when the transfer of the property in the goods is to take place at a future time or subject to some condition thereafter to be fulfilled the contract is called an 'agreement.'" And it provides that such a contract becomes a sale when the time elapses or the conditions are fulfilled, but before that time the goods may be transferred. This section clearly enunciates the consensual nature of the contract, and this is confirmed by section 7 which provides that a person who does not become a party to the contract shall not be liable to pay a reasonable price for the goods supplied, or to buy the goods. The act is framed on the plan that if the law of contract were codified, this act would form a chapter in the code. The question of the law of contract is therefore that of a general law, but a special provision is inserted (section 2) relating to the treatment of special cases to infants and other persons who are incompetent to contract. Though an infant cannot contract he must live, and he can only get rid of the contract if it is impossible for him to carry it out. It is therefore liable to pay a reasonable price for necessities supplied to him, and it defines necessities as "goods suitable to the condition in life of such minor or other person, and to his actual requirements at the time of the sale and delivery."

The 4th section of the act reproduces the famous 17th section of the Statute of Frauds, which was an act "for the prevention of frauds and to secure good faith."

The object of that statute was to prevent people from setting up bogus contracts of sale by requiring material evidence of the contract. The section provides that "a contract for the sale of any goods of the value of ten pounds or upwards shall not be enforced unless the agreement is in writing and signed by the party making the offer, or his agent or attorney." The courts have disputed whether this enactment has done more good or harm. It has defeated many an honest claim, though it may have prevented many a dishonest sale. It has been said that the provision for recording the contract has denied justice to the parties, and that the court is not bound to try the case on the statement of what was said by the parties. It has accused the judges and juries have been satisfied of the bona fide of a contract which does not appear to satisfy the statute, they have done their best to get round it. Every expression in the section has been subject to a series of judicial decisions, which ran into almost impossible refinements, and illustrate the maxim that hard cases make bad law. It is to be noted that Scotland is excluded from the operation of section 4. The Statute of Frauds has never been applied to Scotland, and Scotsmen appear never to have felt the want of it.

As regards the subject-matter of the contract, the act provides that there are two classes of "goods," general and "fungible goods." The former are those which are "coagulated," or to say, goods to be manufactured or acquired by the seller after the making of the contract. (§ 5). Suppose that a man goes into a gunsmith's shop and says, "This gun suits me, and if you will make or get me another like it I will buy the pair." This is a good contract, and no question as to its validity would be likely to occur to the lay mind. But lawyers have seriously raised the question, whether there could be a valid contract of sale when the subject-matter of the contract was a "fungible goods," which is a phrase that was coined. It is the one by which the thing sold is described as a thing not to be delivered until a certain date, or when certain circumstances are fulfilled. The problem which is raised is whether the contract is enforceable if it is impossible to deliver the goods. The act provides a remedy for this case, and requires the seller to give a warranty, and the buyer to take an option within a reasonable time after delivery, or to retain them and claim compensation (§ 11). In England it is a very common trick for the buyer to keep the goods, and pay nothing at all, or only a small sum, to avoid the conditions of the contract being fulfilled, and the goods not being delivered. This is the "acquisition of the goods by theft." To discourage this practice in Scotland the act provides that, in that country, the court may require the buyer who alleges a breach of contract to bring the agreed price into court
SALE OF GOODS

...pending the decision of the case (§ 59). It seems a pity that this
semblable rule was not extended to England.

In early English law caveat emptor was the general rule, and it was
one well suited to primitive times. Men either bought their goods in the
market place, or bought of men who had sold them. There was no
connection on a footing of equality. Now the complexity of modern
commerce, the division of labour and the increase of technical skill,
have altogether altered the state of affairs. The buyer becomes
more ignorant and less skilled, and the seller more skilled and judge of the
seller or manufacturer. Modern law has recognized this, and protects
the buyer by implying various conditions and warranties in contracts
of sale, and has both given a remedy for grievances and enlarged the
scope of his rights.

First, it is implied undertaking on the part of the seller that he has a right to
sell the goods (§ 12). Secondly, if goods be described by order,
they must correspond with that description (§ 13). This, of course,
is an implied condition that the goods sold are as described in the
public catalogue or price-list. Within the frame of the act, this
is the case of manufacturers or sellers who deal in particular classes of
goods. They naturally have better means of judging of their
merchandise than the ordinary public; they are able to pass
judgment on their skill or judgment. A tea merchant or grocer
knows more about tea than his customers can, and so does a gun-
smith about guns. In such cases, if the buyer makes known to
the seller the particular purpose for which the goods are required,
there is an implied condition that the goods are reasonably fit for it, and
if no particular purpose be indicated there is an implied condition
that the goods supplied are of merchantable quality (§ 14). Fourthly,
in the case of a sale by sample, there is "an implied condition that
the bulk shall correspond with the sample in quality," and that the
buyer shall have a reasonable opportunity of comparing the bulk with
the sample (§ 15).

...The common object of sale is the transfer of ownership from seller
to buyer, and it is often both a difficult and an important matter to
determine the precise moment at which the change of ownership
begins. Whenever the custom of the place is such that the
transfer of ownership takes place by the mere fact that the property
in a thing sold did not pass until delivery to the buyer. Traditio
bium and usufructus dominia torum, non nudus pactis, transferunt.

English law has abandoned this test, and has adopted the principle
that the property passes at the same time as the parties intend it to pass.
Express stipulations as to the time when the property is to pass are
very common, and the parties to the contract have to be gathered to
conduct a long train of judicial decisions has worked out a more or
less artificial series of rules for determining the presumed intention
of the parties, and these rules are embodied in sections 16 to 20 of the act.
The cases are as follows: If the goods are delivered to the buyer,
. i.e., goods defined by description only, and not specifically
identified, "no property in the goods is transferred to the buyer unless
and until the goods are ascertained." If a man orders ten tons of
scrap iron from a dealer, it is obvious that the dealer can fulfil his
contract by delivering any ten tons of scrap that he may select,
and that until the ten tons have been set apart, no question of
change of ownership can arise. But when a specific article is bought,
or when goods ordered by description are appropriated to the
contract, the passing of the property is a question of intention.
Delivery to the buyer is strong evidence of intention to change the
ownership, but the mere fact that the goods are delivered to the
buyer on approval, or for sale or return. Delivery to a carrier for
the buyer operates in the main as a delivery to the buyer, but the
seller may deliver to the carter, and yet yet. If goods are delivered
to the buyer, when and where there is a sale of a specific
article, which is in a fit state for delivery, the property in the
article prima facie passes at once, even though delivery be delayed.
When the goods do not pass by delivery, or are to be sold to
the buyer by description, the property in the goods passes to the buyer,
when, with the express or implied consent of the parties, goods of
the required description are "unconditionally appropriated to the
contract." The cases which determine what amounts to an appro-
priation of goods to the contract are numerous and complicated.
Probably they can all be explained as cases of constructive delivery,
but there is a mass of cases where the word "appropriated" was
defined out of the act, and the doctrine of constructive delivery was not known.
It is perhaps to be regretted that the codifying act did not adopt the test of delivery,
but it was thought better to adhere to the familiar phraseology of the cases,
and to deal with the transference of risks under existing contracts.
Res perit domino is therefore the maxim of English, as well as of
Roman law.

...the great majority of cases people only sell what they have a
right to sell, but the law to make provision for cases where a man
sells goods which he is not entitled to sell. An agent may
misconceive or exceed his authority. Stolen goods may be
sold by the owner to a second party, or Goods may pass to
two innocent parties is to suffer? Is the original owner to be
permanently deprived of his property, or is the loss to fall on the
innocent purchaser? Roman law threw the loss on the buyer, Non
plus justum est et non plus reprehensum. However, in modern
law, in deference to modern commerce, protects the innocent purchaser
and throws the loss on the original owner. "En fait de meubles,
possession vaut titre" (Code civil, art. 1599). English law is a
compromise between these opposing theories. It adopts the Roman
rule as its guiding principle, but qualifies it with certain more or
less arbitrary exceptions. The following are the cases in which
the actual cases which occur (§§ 21 to 26). In the first place, the
provisions of the Factors Act, 1889 (52 and 53 Vict. c. 45, extended
to by 53 and 54 Vict. c. 40), are preserved. That act validates
sales and other dispositions of goods, even if made by a factor
within the apparent scope of their authority, and also protects
innocent purchasers who obtain goods from sellers left in possession,
and who have not knowledge of the fact that the factor has but a
nominal interest in the goods. First, in the case of contracts induced by fraud
is voidable only, and not void, and the act provides, accordingly,
that a voidable contract of sale shall be avoided to the prejudice
of the factor only if he consents to the contract. The fraud must be reasonably
suspected. If a factor has once passed goods in the trade, it is
preserved intact, section 22 providing that "where goods are sold in
market overt, according to the usage of the trade, the buyer
becomes the owner of the goods, unless he gives notice of his title
in good faith, and without notice of any defect or want of title on the part
of the seller." The section does not apply to Scotland, nor to
the law relating to the sale of horses which is contained in two old
acts, 2 & 3 Will. 4 & 3 Eliz. c. 12. The mirror regulations of those statutes are
never complied with, so their practical effect is to take horses out of the category of things
which can be sold in market overt. The privilege of market overt applies
only to markets by prescription, and does not attach to newly
created markets. The operation of the contract is therefore fitful and
capricious. For example, every shop in the City of London is within
the scope of this act, and yet the trade there is not confined to the
street outside. If then a man buys a stolen watch in Fleet Street, he may
get a good title to it, but he cannot do so if he buys it a few doors off
in the Strand. There is, however, a qualification of the right
under this act in that it does not apply to the sale of goods which
were stolen and the thief is prosecuted to conviction, the property in the
goods thereupon reverts in the original owner, and he is entitled to
get them back either by a summary order of the convicting court or
by action. This rule dates back to the statute 21 Hen. VII. It
was probably intended rather to encourage prosecutions in the interests
of public justice than to protect people whose goods were stolen.

Having dealt with the effects of sale, first, as between seller and
buyer, and, secondly, as between the buyer and third parties,
the act proceeds to determine what, in the absence of the
conventional intention of the parties, are the legal consequences
in the performance of their contract (§§ 27 to 37)

...It is the duty of the seller to deliver the goods and of the buyer
to accept until delivery for them in accordance with the terms of the contract
(§ 27). In ordinary cases the seller's duty to deliver the
goods is satisfied if he puts them at the disposal of the buyer at the
place of sale. The normal contract of sale is represented by a cash
sale in a shop. The buyer pays the price and takes away the goods.
"Unless otherwise agreed, delivery of the goods and payment of the
price are concurrent conditions" (§ 27). But agreement, express or
implied, may create infinite variations on the normal contract.
It was the rule that the seller had a right of retainer, and if the buyer
was entitled to reject, and does reject, he is not bound to send them back
to the seller. It is sufficient if he intimate to the seller his refusal to
accept. The normal theory of sale is cash against delivery, but in the great
majority of actual cases, especially in commercial transactions,
this theory is departed from in practice. The interests of the seller are therefore protected by rules whereby he
may recover as damages, in lieu of specific performance, the goods,
and he may retain them until payment. In the absence of any different agreement, as, for instance, where
there is a stipulation for sale on credit, the unpaid seller has a right to
retain possession of the goods until the price is paid or tendered.
The right, of course, be waived, even when it is not negatively
by the contract. It is to be noted that when the seller takes a bill of
exchange from the buyer, demanding payment on a given date or for
what is termed "further consideration" an interest operates as conditional payment. On the dishonour of
the instrument the seller's rights revive (§§ 38-43). If the buyer becomes
insolvent, the unpaid seller has a further right found on ancient
mercantile usages. He may have parted with both the property in
and possession of the goods sold, but he can attach the goods as long
as they are in the hands of a carrier or forwarding agent, and have
not reached the actual possession of the seller or his immediate agent.
Still, in many cases, whether the goods of the
insolvent seller becomes insolvent, the unpaid seller who has parted
with the possession of the goods has the right of stopping them in transitu—
that is, to seize them during the course of transit. They are in
the hands of a carrier, but they are in course of transit, and may retain them until payment or
deposition of the goods (§ 44). The right of stoppage, however, cannot
be exercised to the prejudice of third parties to whom the bill of
lading or other document of title to goods has been lawfully

doubt regarding the sales contract. It is the open market, where the goods on sale are exposed to
view.

1 That is, "open market," where the goods on sale are exposed to
view.
It is not used in European medicine. It consists of the tuberous roots of various species of Orchis and Eulophia, which are decorticated, washed, heated until horny in appearance, and then dried. Its most important constituent is a mucilaginous substance which it yields with cold water to the extent of 48%.

SALENTO (anc. Salernum), a seaport and archiepiscopal see of Campania, Italy, capital of the province of Salerno, on the west coast, 33 m. by rail S.E. of Naples. Pop. (1901), 26,936 (town); 45,313 (commune). The ruins of its old Norman castle stand on an eminence 905 ft. above the sea with a background of graceful limestone hills. The town walls were destroyed by the Saracens and the seaward portion has given place to the Corso Garibaldi, laid out in 1684 by Gregory VII. The chief buildings are the theatre, the prefecture, and the cathedral of St. Matthew (whose bones were brought from Paestum to Salerno in 954), begun in 1076 by Robert Guiscard and consecrated in 1084 by Gregory VII. In front is a beautiful quadrangular court (112 by 102 ft.), surrounded by arcades formed of twenty-eight ancient pillars mostly of granite from Paestum, and containing twelve sarcophagi of various periods; the middle entrance into the church is closed by a remarkable breccia loft of 11th-century Byzantine work. The nave and two aisle ends of the church were two twin temples, the larger dating from 1175, a large 11th-century altarpiece and ambones, the larger in the south aisle, having scenes from the Bible carved on thirty ivory tablets, with 15th-century mosaic in the apse, given by Giovanni da Procida, the promoter of the Sicilian Vespers, and the tomb of Pope Gregory VII., and that of Queen Margaret of Durazzo, mother of King Ladislaus, erected in 1412, deserve to be mentioned. In the crypt is a bronze statue of St. Matthew. The cathedral possesses a fine Exultet roll. S. Domenico near it has Norman cloisters, and several of the other churches contain paintings by Andrea del Sarto and da Salerno, one of the best of Raphael's scholars. The church was largely restored by Desiderio da Procida in 1260 when Naples became the capital of the kingdom, and remained blocked with sand till the unification of Italy, when it was cleared; but it is now unimportant. The chief industries are silk and cotton-spinning and printing. Good wine is produced in the neighbourhood.

SALISBURY, a Roman colony (Salembrigium), was founded in 104 B.C. to keep the Picentini in check. It was captured by the Samnites in the Social War. It was the point at which the coast road to Paestum diverged from the Via Popilia, rejoining it again E. of Buxentum. In the 4th century A.D. the contemporary market place and the ancient town were transferred to the new road, to which the Chrisians of the region resorted in 300 A.D. When Constantine the Great commanding his legions was having a battle of the Monetae in the valley of the Marone, he requisitioned the church of St. John to house the treasures of the church, which he wished to present to the emperor Constantine the Great. The basilica at Lorch was captured by the Romans in 396 A.D., and was probably built at the junction of the Lorch road and the road to the south. The Roman town was destroyed by the Huns in 406 A.D. and by the Vandals in 408 A.D., but was soon restored.

SALEP, a drug extensively used in oriental countries as a nervine restorative and fattener, and also much prescribed in paralytic affections. It probably owed its original popularity to the "doctrine of signatures."
faith, but he passed most of his life at Llanrwst, working at
his literary undertakings. The greatest Welsh scholar of his
time, Salesbury was acquainted with nine languages in
Latin, Greek, Hebrew, and in phthisic and
botany. He died about 1600. About 1546 he edited a collection
of Welsh proverbs (Oli synwyr pen kember), probably the first
book printed in Welsh, and in 1547 his Dictionary in English
and Welsh was published (facsimile edition, 1877). In 1563
the English parliament ordered the Welsh bishops to arrange
for the translation of the Scriptures and the book of common
prayer into Welsh. The New Testament was assigned to Sales-
bury, who had previously translated parts of it. He received valu-
able assistance from Richard Davies, bishop of St. Davids, and
also from the Bishop of Hereford (d. 1591), but he himself did
the greater part of the work. The translation was made from
the Greek, but Latin versions were consulted, and in October 1567
the New Testament was published for the first time in Welsh.
This translation never became very popular, but it served as
the basis for the new one made by Bishop William Morgan (c. 1547-
1604). Salesbury and Davies continued to work together, translat-
ing various writings into Welsh, until about 1570 when the literary
partnership was broken. After this event, Salesbury, although
continuing his studies, produced nothing of importance.
Gaelic versions of the Old Testament (the spelling is Sales-
bury's): the translation is known as the Old Testament
(Salisbury) are: JOHN SALESBURY (c. 1500-1573), who held many
premises under the Tudor sovereigns and was bishop of Sodor and
Man from 1571 to 1573; THOMAS SALESBURY (c. 1555-1580), an
associate of the king's court; JOHN SALESBURY, who was executed for
heresy against Queen Elizabeth; HENRY SALESBURY (1561-c. 1657),
the author of a Welsh grammar published in 1593; THOMAS SALESBURY
(d. 1643), a poet, who probably fought for Charles I. at Edgehill;
and another royalist, WILLIAM SALESBURY (c. 1580-c. 1659), governor
of Denbigh Castle, which, in 1646, he gallantly defended in the
interests of the king.
SALEYER (Dutch, Salteler), a group of islands belonging
to the government of Celebes and its dependencies in the
Dutch East Indies, numbering together 73, the principal
being Saleser, Tambolongang, Pulo Kecil, and the smaller
munities of 5° and 7° 25' S. and 11° 50' and 121° 30' E. The main island,
Saleser, is over 50 m. long and very narrow; area, 248 sq. m.
The strait separating it from Celebes is more than 100 fathoms
deep and, running in a strong current, is dangerous for native
ships to navigate. The strata of the island are all sedimentary
rocks: coralline limestone, occasionally sandstone; everywhere,
except in the north and north-west, covered by a fertile soil.
The watershed is a chain running throughout the island from N.
to S., reaching in Bontona Haru 5840 ft., sloping steeply to the
cast coast. The plateau, mainly a mixed race of Macassars, Buginese,
the natives of Luvi and Buton, is estimated at 57,000 on the main island
and 24,000 on the dependent isles. They use the Macasar language,
are for the most part nominally Mahomedans (though many
beetlen customs survive), and support themselves by agriculture,
fishing, seafaring, trade, the preparation of salt (on the south coast)
and weaving. Field work is largely performed by a servile class.
Raw and prepared cotton, tobacco, trepan, tortoise-shell, cocoanuts
and coconut oil, salt, and sugar are exported. There are frequent emigra-
tions to Celebes and other parts of the archipelago. For that reason,
and also on account of its excellent horses and numerous buffaloes,
Saleser is often compared with Madura, being of the same import-
ance to Celebes as is Madura to Java.
SAFLO, a municipal, county- and parliamentary borough of
Lancashire, England, 189 m. N.W. by N. of London and 31 m.
E. by N. of Liverpool. Pop. (1908 estimate), 239,234.
Salford also gives its name to the hundred of south-west Lan-
cashire in which Manchester is situated; probably because when
the district was divided into hundreds Manchester was in a
ruinous condition from Danish ravages. The parliamentary
and municipal boundaries of Salford are identical; area, 570 acres.
The parliamentary borough has three divisions, each
returning a member. The borough, composed of three townships
identical with the ancient manors of Salford, Pendleton and
Broughton, is for the most part separated from Manchester by
the river Irwell, which is crossed by a series of bridges. The
valley of the Irwell, now largely occupied by factories, separates
the higher ground of Broughton from that of Pendleton, and
is flattest at the south where it joins the Manchester boundary.
At the other extremity of Salford it joins the borough of Eccles.
The borough is also bounded on its southwestern limits by
Bolton, but has its main approach in Manchester. The Lancashire
& Yorkshire and the London & North-Western railways serve the
borough. Salford is a city of 58,400; returning booths under the will
of Thomas Booth were in existence, and the borough was
grown in value greatly. The yearly income of more than £17,000
is disposed of in pensions and in hospital grants. His grandson,
Humphrey Booth the younger, left money for the repair of the
churches of the town, and the17th century revenue is about £1400.
Salford is the seat of a Roman Catholic bishopric, and its cathedral,
St John's, with its spire of 240 ft., is the largest in the country.
The borough contains a large number of cotton and cotton
mill industries and has begun to a large extent overshadowed by Manchester, and the two
boroughs, in spite of their separate government, are closely con-
ected as to be one great urban area. Many of the institutions in
Manchester are intended for the service also of Salford, which,
however, has resisted all attempts at municipal amalgamation.
The chief public buildings are the museum and art gallery at Peel
Park, the technical school, the education offices and the Salford
department of the county hall, built in 1825, is no longer adequate for
municipal needs. Broughton and Pendleton have each a separate
town hall. The large and flourishing technical school was developed
at Peel Park in 1884. The Pemberton and Salford Public
library, founded in 1846, was the first public recreation ground in the borough.
The grounds are Langworthy Gallery and a museum. In the park
are statues of Queen Victoria, the Prince Consort, Sir Robert Peel,
John Peel, Sir Charles and John Hope, and the concert hall—
one monument—a South African War memorial—is outside and almost opposite Peel Park. Other parks are at Seedley, Albert and Buile
Hill; the last contains a museum, the contents of which have been
transferred from Peel Park. There is also Kersal Moor, 21 acres
of Moorland, crossed by a Roman road, which has been noticed for
the variety of its flora, and for the capture of the Oecophora Woodiella,
467 ft., which is as high as any other recorded habitat. The David Lewis
recreation ground at Pendleton may also be named. Altogether Salford
has thirty parks and open spaces having a total area of
217 acres.
Salford has also provided two cemeteries.
The Salford Reference Library formed part of the institution, and from this has developed a free library system in which there are also nine lending libraries.
The commercial and industrial history of Salford is closely bound up
with that of Manchester. It is the seat of extensive cotton, iron,
chemical and allied industries. It owes its development to the
steam-engine and the factory system, and in recent years has shared
in the increase of trade owing to the construction of the Manchester
Ship Canal, which has added greatly to its prosperity. This will be
seen by an examination of the rateable value of the three
boroughs now comprised in the borough. In 1862 it was £1404; in 1841,
£734,220; in 1901, £97,727; in 1808-1909, £1,022,172.
The municipal government is in the hands of a town council consis-
ting of 16 aldermen and 48 councillors elected in 16 wards.
The election of the mayor is the most important of the year, being
the May Day Coronation Day. There is a system of street,
tramway service. There are also municipal baths. Salford has a
separate commission of the peace.
There are no certain figures as to the population before 1773, when at the
instance of Dr Thomas Percival a census was taken of Manchester and Salford.
The latter had then 4755 inhabitants. Census returns show that its population in 1801
was 11,477; in 1851, 61,890; and in 1901, 220,056. The death-rate in 1906 was
18·5 per thousand.
Within the present borough area there have been found neolithic implements and British urns, as well as Roman coins.
In 1831 traces of a Roman road were still visible. Domescott
Book mentions Salford as held by Edward the Confessor and as
having a forest three leagues long and the same broad. At the
Conquest it was part of the domain granted to Roger of Poitou,
but reverted to the crown in 1102. After successively belonging
to the earls of Chester and of Derby it passed to Edward Crouch-
back, earl of Lancaster. It was erected into a duchy and county
palatine in 1353, and in 1388, on the death of Blundeville, to
the earls of Kent. Their Lancashire possessions were kept separate.
Salford and Pendleton are still parts of the ancient duchy
of Lancaster, belonging to the English crown. In 1231
Ranulf de Blundeville, earl of Chester, granted a charter constituting
Salford a "free borough." But the government notwithstanding
was essentially manorial and not municipal. In the Civil Wars
between Charles I. and the parliament, Salford was royalist,
the unsuccessful siege of Manchester was conducted from its side of the Irwell. Its later history is mainly identical with that of Manchester (q.v.). In 1844 it received a municipal charter and became a county borough in 1889.

BIBLIOGRAPHY.—There is no separate history of Salford; see publications named under MANCHESTER. The MS. records of the Quarter Sessions, 1677-1686, in the Library of the Chetham Society, but others still remain in manuscript in the State Paper Office.

(W. E. A. A.)

SALICETI, ANTOINE (1755–1809), French revolutionist, was born at Saliceto, in Corsica, on the 20th of August 1759, of a family of Piacenzans. After studying law in Tuscany, he became an avocat at the upper council of Bastia, and was elected deputy of the Third Estate to the French states-general in 1789. As deputy to the Convention, Saliceti voted for the death of Louis XVI., and was sent to Corsica on mission to oppose the counter-revolutionary intrigues. But the success of his adversaries compelled him to withdraw to Provence, where he took part in repressing the revolts at Marseilles and Toulon. It was on this mission that he met and helped his compatriot Bonaparte. On account of his friendship with Robespierre, Saliceti was denounced at the revolution of 9 Thermidor, and was saved only by the amnesty of the year IV. He subsequently organized the army of Italy and the two departments into which Corsica had been divided, was deputy to the Council of the Five Hundred, and accepted various offices under the Consulate and Empire, being minister of police and of war at Naples under Joseph Bonaparte (1806–1809).

He died at Naples on the 23rd of December 1809—it has been alleged by political means—that he was murdered.

SALICIN, SALICINUM, C₇H₁₀O₅, the bitter principle of willow-bark, discovered by Leroux in 1831. It exists in most species of Salix and Populus, and has been obtained to the extent of 3 or 4% from the bark of S. helix and S. pentandra.

Salicin is prepared from a decoction of the bark by first precipitating the tannin by milk of lime, then evaporating the filtrate to a soft extract with the aid of alcohol. The residue is dissolved in water and the commerce it is usually in the form of glossy white scales or needles. It is neutral, odorless, unaltered by exposure to the air, and has a bitter taste. It is soluble in about 30 parts of water and 80 parts of alcohol at the ordinary temperature, and in 0.7 of boiling water or in 2 parts of boiling alcohol, and more freely in alkaline liquids. It is also soluble in acetic acid without alteration, but is insoluble in chloroform and benzol. From phloridzin it is distinguished by its ammonical solution not becoming coloured when exposed to the air. Chemically, it is a glucoside derived from glucose and saligenin (o-oxy-benzyl alcohol, into which it is decomposed by the enzymes present in the bark). The Latin name of the glucoside is salicin (from aldehyd-glucose). Populin, a benzyol salicin, is a glucoside found in the leaves and bark of Populus tremula.

Salicin is used in medicine for the same purposes as salicylic acid and salicylates. It is also used as a gastric stimulant, in doses of five grains. The ordinary dose may go up to forty grains or more with perfect safety, though the British Pharma- copoeia limits it to twenty. The remote action of the drug is that of salicylic acid or the numerous compounds that contain it (see SALICYLIC ACID).

SALICAN LAW, AND OTHER FRANKISH LAWS. The Salic Law is one of those early medieval Frankish laws which, with other early Germanic laws (see GERMANIC LAWS), are known collectively as leges barbarorum. It originated with the Salian Franks, often simply called Saliens, the chief of that conglomeration of Germanic peoples known as Franks.

The Salic Law has come down to us in numerous MSS., and in divers forms. The most ancient form, represented by Latin MSS. of the 11th century (Novellae Reipublicae Salicae), consists of six chapters.

The second form has the same 65 chapters, but contains interpolated provisions which show Christian influence. The third form consists of 93 chapters, and is divided into two groups, according to the two component or original parts of the law, which were added at different periods, and which do not possess the original form of the compilation.

Even the most ancient text, that in 65 chapters, contains interpolated materials; and besides the MSS., a number of Latin texts show the exact composition to be pronounced. It is more probable, however, that these words served the Franks, who were ignorant of Latin, as clues to the general sense of each paragraph of the law. The fourth version, as emended by Charlemagne, consists of 70 chapters with the Latinity corrected and without the glosses. Though he added some new provisions, Charlemagne respected the ancient texts, even where they differed, which indicates that the law was published by B. J. Herold at Basel in 1557 (Originum de Germania carum antiquitatem libris) from a MS. now lost, is founded on the second recension, but contains additions of considerably later date. However, a considerable number of other MSS. containing different versions, do not possess the original form of the compilation. The most ancient text, that in 65 chapters, contains interpolated materials; and besides the MSS., a number of Latin texts show the exact composition to be pronounced. It is more probable, however, that these words served the Franks, who were ignorant of Latin, as clues to the general sense of each paragraph of the law.

The law as originally compiled underwent modifications of varying importance before it took the form known to us in Latin MS. No. 4994, to which the edict of Childebert I. and Clotaire I. is already appended. The classes of MSS. distinguished above give evidence of further changes, the law being supplemented by other capitularies and sundry extraromania, prologues and epilogues, which some historians have wrongly assumed to be parts of the main text. Finally, Charlemagne, who took a keen interest in the law, added, among other things, by order of the emperor, a number of interpolated chapters, and adding others which had obtained general sanction.

The Salic Law is a collection of ancient customs put into writing by order of the prince. In the sense that they already existed and came ready-made to the prince’s hand, it is legitimate to speak of these customs as a popular law, a Volksrecht; but it was the prince who gave them force of law, emended them, and rejected such of the ancient usages as appeared to him antiquated. The king, moreover, had the right to add provisions to the law; and he found capitularies of Charlemagne and Louis the Pious in the form of additions to the Salic Law.

From this it will be seen that the Salic Law is not a political law; it is in no way connected with the succession to the throne of France, and it is absolutely false to suppose that it was the Salic Law that was invoked in 1316 and 1322 to exclude the daughters of Louis X. and Philip V. from the succession to the throne. The Salic Law is pre-eminently a penal code, which shows the amount of the fines for various offences and crimes, and contains, besides, some civil law enactments, such as the law that a woman who marries a foreigner (a salica) does not thereby acquire citizenship (as aforesaid), which declares that daughters cannot inherit land. The text is filled with valuable information on the state of the family and property in the 6th century, and it is astonishing to find Montesquieu describing the Salic Law as the law of a people ignorant of landed property. The code also contains abundant information on the organization of the tribunals (tribunal of the hundred and tribunal of the king) and on procedure. Like all the barbarian laws, the law of the Salian Franks
was a personal law; it applied only to the Salian Franks. As the Salians, however, were the victorious race, the law acquired an even greater importance for the other barbarian laws, and in the additions made to the Ripuarian, Lombard, and other allied laws, the Carolingians endeavoured to bring these laws into harmony with the Salic Law. Moreover, many persons, even of foreign race, declared themselves willing to live under the Salic Law. The principle of personality, however, gradually gave way to that of territoriality; and in every district, at least north of the Loire, customs were formed in which were combined varying proportions Roman law, ecclesiastical law and the various Germanic laws. So late as the 10th and 11th century it is noticeable, in various charters and in the documents of the church, that these customs were often brought back into harmony with the Salic Law, but only in a vague and general way; and it would be rash to conclude from this that the Salic Law was still in force.

Of the numerous editions of the Salic Law only the principal ones can be mentioned: J. M. Pardessus, Loi salique (Paris, 1883), 8 texts; G. Waiz, Das alle Recht der salischen Franken (1886), text of the first version; J. F. Behrend, Lex Salica (1873; 2nd ed., Weimar, 1897); J. H. Hessels, Lex Salica: The Ten Texts with the Glosses, and the Lex Emsiadea, with notes on the Frankish words in the Lex Salica by H. Kern (1880), the various texts shown in synoptic tables; A. Holdt, Lex Salica (1879 seq.), reproductions of all the MSS. with all the abbreviations; H. Geffcken, Lex Salica (Leipzig, 1896), the text in 65 unpublished manuscripts with parallel text, and appendices of addittamenta; and the edition undertaken by Mario Krammer for the Mon. Germ. hist. Further information see the dissertations prefixed to the editions of Pardessus, Waiz and Hessels; useful for the history of the science are the studies of Krammer, "Die fränkische Rechts- und Gerichtsverfassung und ihre Reglementierung", in Gesammelte Arbeiten, I, 140-200 (Berlin, 1876); R. Sohm, Der Proces der Weimar (Weimar, 1867; French trans. by M. Thévenin) and Die fränkische Reichs- und Gerichtsverfassung (Berlin, 1877); and a commentary paragraph by Krammer and B. Brunner, Deutsche Rechtsgeschichte (2nd ed., Leipzig, 1906), I. 427 seq.

The Lex Ripuaria was the law of the Ripuarian Franks, who dwelt between the Meuse and the Rhine, and whose capital was Cologne. We have no ancient MSS. of the law of the Ripuarians; the 35 MSS. which now lost which served as the basis of the old editions, do not go back beyond the time of Charlemagne (end of 8th century and 9th century). In all these MSS. the text is identical, but it is a revised text—in other words, we have only a lex emendata. On analysis, the law of the Ripuarians, which contains 89 chapters, falls into three heterodinasic divisions. Chapters i-viii. is a conspectus of composition; but, although the fines are calculated, not on the unit of 15 solidi, as in the Salic Law, but on that of 18 solidi, it is clear that this part is already influenced by the Salic Law. Chapters xxxii-xxxv. are taken directly from the Salic Law; the provisions follow the same arrangement; the unit of the compositions is 15 solidi; but capillitaries are interposed, and the provisions are in the affluence and sale of immovable property. Chapters lxxx. to lxxxix. consists of provisions of various kinds, some taken from lost capillitaries and from the Salic Law, and others of unknown origin. The compilation apparently goes back to the reign of Dagobert I. (528-639), to a time when the power of the mayors of the palace was still feeble, since we read of a mayor being threatened with the death penalty for taking bribes in the course of his judicial duties. It is probable, however, that the first two parts are older than the third. Already in the Ripuarian Law the divergences from the old Germanic law are greater than in the Salic Law. In the case of the praevarication attaches to written deeds; the clergy are protected by a higher woesig—1,000 solidi for a priest, and 500 for a bishop; on the other hand, more is given to the cojurator (sworn witnesses); and we note the appearance of the judicial duel, which is not mentioned in the Salic Law.

There is an edition of the text of the Ripuarian Law in Mon. Ger. hist., v. 1250-1258, by M. Waiz; a separate edition in 1885 for the use of schools. For further information see the prefaces to Sohm's editions; Ernst Mayer, Zur Entstehung der Lex Ripuariorum (Munich, 1886); Julius Ficker, Die Heimat der Lex Ripuariorum, in Die Mitteilungschriften für österreichische Geschichtsforschung (suppl., vol. v.); H. Brunner, Deutsche Rechtsgeschichte (2nd ed., Leipzig, 1906), i. 442.

Lastly, we possess a judicial text in 48 paragraphs, which bears the title of Notitia vel commemoaratio de illa eea (law), quae se ad Amorem habet. This was in use in the district along the Yssel formerly called Hamalant. The name Hamalant is unquestionably derived from the Frankish tribe of the Chamavi, and the document is often called Lex Francorum Chamavorum. This text, however, is not a law, but rather an abstract of the special usages obtaining in those regions—what the Germans call a Weisstum. It was compiled by the itinerant Frankish officials known as the missi Dominici, and the text undoubtedly goes back to the time of Charlemagne, perhaps to the year 800, and is annexed to various customs in list form. It is possible to discern the questions of the missi and the answers of the inhabitants.

SALICYLIC ACID (ortho-hydroxybenzoic acid), an aromatic acid, C₆H₅(OH)(CO₂H), found in the free state in the buds of *Spiraea Ulmaria* and, as its methyl ester, in gaultheria oil and in the essential oil of *Andromeda Lucensohi*. It was discovered in 1838 by Piaira as a decomposition product of sallcin. It may be made by the distillation of the essential oil of gaultheria or by the distillation of copper benzoate; by the decomposition of an anticlastic acid with nitric acid; by fusion of ortho-chlor or ortho-brom benzoic acid with potash; by heating ortho-cyanphenyl with alcoholic potash; by heating a mixture of phenol, carbon tetrachloride and alcoholic potash to 100° C. (F. Tiemann and K. Reimer, Ber., 1876, 9, p. 1285); and by the action of sodium on a mixture of phenol and chlorobenzoic ester (T. Wilm and G. Wissin, Zetas. f. Chemie, 1868, 6).

It is a liquid, colorless or very slightly yellow, with a very weak odor and a very acrid taste; the specific gravity is 1.0268; the boiling point is 262° C.; the melting point is 158° C.; the density is 1.0268; and the specific heat is 0.9626; it is highly soluble in water, more soluble in alcohol, and to a much smaller extent in ether, benzine, and glycerin.

SALICYLIC ACID is produced by the fermentation of *Schoenomanes* (H. Kölbe, Ann., 1860, 115, p. 201; R. Schmitt, Jut. Prakt., Chem., 1895 (2), 31, p. 470) modified the process by saturating sodium phenolate at 130° C. with carbon dioxide, in an atmosphere of CO₂, and converting *C₆H₅CO₂Na* being thus formed; by continuing the heating under pressure this carbonate gradually changes into mono-sodium salicylate. S. Manasse (German patent, 12363, 1896) by preparing sodium phenolate with ethyl phenyl carbonate at 200° C.: *C₆H₅CO₂Na* + *C₆H₅CO₂CH₂CH₂OH* = *Na⁺CO₂⁻ + *C₆H₅CO₂⁻ + *C₆H₅CO₂⁻ + *C₆H₅CO₂⁺*, by heating sodium phenolate with ethyl phenyl carbonate at 200° C.: *C₆H₅CO₂⁺* + *C₆H₅CO₂⁺ + *C₆H₅CO₂⁻ + *C₆H₅CO₂⁻ + *C₆H₅CO₂⁺*, is to be noted in the Kolbe method of synthesis that potassium phenolate may be used in place of the sodium salt, provided that the temperature is kept below 150° C. When the temperature (200° C.) the isomer para-ox-benzoic acid is produced. 

SALICYLIC ACID crystallizes in small colourless needles which melt at 153° C. It is sparingly soluble in cold water, but readily dissolves in hot. It sublimes, but on rapid heating decomposes into carbon dioxide and phenol. It is volatile in steam. Ferric chloride colours its aqueous solution violet. Potassium bromide and sulphuric acid to it to form a white precipitate; and when heated with chloroform and hydrochloric acid to chloral. On boiling with concentrated nitric acid it yields picric acid. When heated with ascorbic acid it gives trioxynbenzene. Bromine water in dilute aqueous solution gives a white precipitate of tribromophenol-bromide *C₆H₅Br·OBr*. Sodium reduces salicylic acid in boiling amyl alcohol solution to n-pemic acid (A. Ehrenreich and R. Willstätter, Ber., 1893, 26, pp. 2, 913; 1894, 27, p. 331). Potassium persulphate oxidizes it in alkaline solution, the product on boiling with acids giving
hydroquinone carboxylic acid (German Patent 81,297). When boiled with calcium chloride and ammonia, salicylic acid gives a precipitate of insoluble basic calcium salicylate, \( \text{C}_9\text{H}_7\text{O}_4\text{Ca} \), a reaction which serves to distinguish it from the isomeric meta- and para-hydroxybenzoic acids. It yields both esters and ethers since it is an acid and also a phenol.

**Methyl Salicylate**, \( \text{C}_9\text{H}_8\text{O}_4\text{CH}_3 \), found in oil of wintergreen, in the oil of **Viola tricolor** and in the root of varieties of *Polygala*, is a pleasant-smelling liquid which boils at 222°C. On passing dry ammonia into the boiling ester, it gives *salicylamide* and acetaldehyde. When boiled with aniline it gives methylaniline and phenol.

**Ethyl salicylate**, \( \text{C}_9\text{H}_8\text{O}_4\text{CH}_2\text{CH}_3 \), is obtained by boiling salicylic acid with alcohol and a little sulphuric acid, or by dropping an alcohol solution into a solution of potassium hydrogen sulphite at a temperature of 140-150°C. (German Patent 76,574). It is a pleasant-smelling liquid which boils at 233°C. It is practically unchanged when boiled with aniline. *Phenyl salicylate*, \( \text{C}_9\text{H}_7\text{O}_4\text{C}_6\text{H}_5 \), or *salicylanilide*, is obtained by boiling salicylic acid, phenol and phosphorus oxichloride to 120-125°C; by heating salicylic acid to 220°C; or by heating salicylaldehydophosphoric acid and phenol to 140-150°C. (German Patent 85,569). It crystallizes in rhombic plates which melt at 42°C and boil at 172°C (12 mm.). Its sodium salt is transformed into the isomeric \( \text{C}_9\text{H}_7\text{O}_4\text{Na} \) \( \text{CO}_2 \text{H} \) when heated to 300°C. When heated in air for many hours over a strong flame it is changed into acetyl salicylic acid (saletic acid), \( \text{C}_9\text{H}_7\text{O}_4\text{CO}\text{CH}_3 \), obtained by the action of acetyl chloride on the acid or its sodium salt (K. Kraut, Ann., 1865, 150, p. 93), after which it gives salicylaldehydophosphoric acid of the latter proposition. Hydrolysis with baryta water gives acetic and salicylic acids. It is used in medicine under the names aspirin, acetylsalicylaldehyde, salasin, *ximo*, etc. It has the same action as salicylic acid and is believed to be much freer from the secondary effects. *Salicylo-salicylic acid* \( \text{C}_9\text{H}_7\text{O}_4\text{C}_6\text{H}_5 \) \( \text{O} \) \( \text{C}_6\text{H}_5 \text{CO} \) \( \text{C}_9\text{H}_7\text{O}_4 \), is obtained by continued heating of salicylic acid and acetic chloride to 130-140°C. It is an amorphous yellow mass which is easily soluble in alcohol.

**Applications.**—The addition of a little of the acid to glue renders it more tenacious; skins to be used for making leathers do not undergo decomposition if steamed in a dilute solution; butter containing a small quantity of it may be kept sweet for months even in the hottest weather. It also prevents the mouldiness of preserved fruits and has been found useful in the manufacture of vinegar. The use of salicylic acid as a food preservative, was, however, condemned in the findings of the commission appointed by the government of the United States of America, in 1904.

**Medicine.**—The pharmacopoeial dose of the acid is 5-20 grains, but it is so unrelated to experience and practice that it may be ignored. The British Pharmacopoeia contains only one preparation, an ointment containing one part of acid to 49 of white paraffin ointment. Salicylic acid is now never given internally, being replaced by its sodium salt, which is much cheaper, more soluble and less irritating to mucous membranes. The salt has a sweet, mawkish taste.

Salicylic acid and salicin (q.v.) share the properties common to the group of aromatic acids, which, as a group, are anisotropic without being toxic to man—a property practically unique; are unstable in the body; are antipyretic and analgesic; and diminish the excretion of urea by the kidneys. As an antipyretic salicylic acid is less powerful than carbolic acid, but its insolubility renders it unsuitable for general use. It is much more powerful than carbolic acid in its inhibitory action upon unorganized ferments such as peptones and yeasts. In the body it is transformed into salicylic acid, and it rapidly kills the cells of the epidermis, without affecting the immediately subjacent cells of the dermis ("true skin"). It has a very useful local antihydric action. Salicylic acid is a powerful irritant when inhaled or swallowed in a concentrated form, and even when much diluted it causes pain, nausea and vomiting. When salicin is taken internally no irritant action occurs, nor is there any antiseptic. Whatever drug of this group be taken, the product absorbed by the blood stream is salicylic acid. When the salt is taken by the mouth, absorption is extremely rapid, the salt being present in the peripheral blood within ten minutes.

Salicylates are substances in which the acid is unchanged, decomposition occurring in the kidney, and probably in tissues suffering from the *Diplococcus rheumaticus* of Poynton and Paine. It is used to be stated that these drugs are marked cardiac depressants; and the heart muscle has been implicated, and it is even thought that these drugs must be given with great caution. It has now been established that, provided the kidneys be healthy, natural salicylic acid, sodium salicylate prepared from the natural acid, and salicin, are not cardiac depressants. Of the two latter, 300 grains may be given in a dose of 1/2 oz. in twenty-four hours, without any toxic symptoms. The habit of swallowing salicylic acid crystals, or solutions of the acid, or of the acid in acid, is the next safest to quinine of all antipyretics, whilst being much more powerful in all leethe states except malaria. Sodium salicylate escapes from the blood mainly by being escaped by the kidneys, and also necessitates the very frequent administration of the drug.

**Therapeutics.**—Salicylic acid is used externally for the removal of corns and similar epidermic thickenings. It causes some pain, so that it is not used for a sore over a joint. When used too much, it gives rise to uric acid on the skin, and sometimes the urine contains urates of the acid, 3, of extract of Indian hemp, and 86 of coldation. There is probably no better remedy for corns. Perspiration of the feet cannot be attacked locally with much success than by a powder consisting of salicylic acid, starch and chalk.

These drugs are specific for acute rheumatism (rheumatic fever). The drug is not a true specific, as quinine is for malaria, since it produces no cure of the disease but leaves the patient as before. When a salicylate is used for rheumatic fever, it but entirely removes the agonizing pain, shortly after its administration, and, an hour or two later, brings down the temperature to normal. In thirty-six hours no symptoms are left. In other diseases not painful in a rheumatic sense, the action is very much slower. When used internally, salicylates are useless. They may thus afford a means of diagnosis. In rheumatic hyperpyrexia the salicylates render the patient free from pain. In acute gonorrheal arthritis, simulating rheumatic fever, salicylates are useless. They may thus afford a means of diagnosis. In rheumatic hyperpyrexia the salicylates render the patient free from pain. In acute gonorrheal arthritis, simulating rheumatic fever, the patient is rendered free from pain when he uses the drug. The salicylates are used in acute gout, in rheumatic patients, and in such delirium of salicylates, practically identical with the symptoms of cinchonism. The drug must be at once withheld if haemorrhages (subcutaneous, in the case of quinine, the administration of small doses of hydrobromic acid often relieve the milder symptoms.**

**SALIERI, ANTONIO** (1750-1823), Italian composer, was born at Legnano, on the 18th of August 1750. His father was a mercer, and died a bankrupt. Through the family of Mocenigo he obtained free admission to the choir school of St Mark's, Venice. In 1766 he was taken to Vienna by F. L. Gassmann, who introduced him to the emperor Joseph. His first opera, *Le Donne letterate*, was produced at the Burg-Theater in 1770. Others followed in rapid succession, and his *Armida* (1771) was a triumphant success. On Gassmann's death in 1774, he became Kapellmeister and, on the death of Bonno in 1778, Hofkapellmeister. He held his offices for fifty years, though he made frequent visits to Italy and Paris, and composed music for many European theatres. His chef d'oeuvre was Tarare (afterwards called *Axar, d'Ormos*), a work which was then performed with the Duke of Austria and Count Mosel, at Vienna and Dresden. This was first produced at Vienna on the 8th of June 1787, and was revived at Leipzig in 1846, though only for a single representation. His last opera was *Die Neger*, produced at St Petersburg in 1794, and devoted to the composition of church music, for which he had a very decided talent. Salieri lived on friendly terms with Haydn, but was a bitter enemy to Mozart, whose death he was suspected of hastening by a wound produced by a sword which he thrust into Mozart's body to give colour to the accusation. He retired from office on his full salary in 1824, and died at Vienna on the 7th of May 1825. Salieri gave lessons in composition to Cherubini and to Beethoven, who dedicated to him his "Three Sonatas for Piano and Violin." Op. 12. See also Albert von Hermann, *Antonio Salieri, eine Studie* (1867); J. F. Edele von Mosele, *Über das Leben und die Werke des Antonio Salieri* (1862). Sali, the "dancers," an old Italian priesthood, said to have been instituted by Numa for the service of Mars, although later tradition derived them from Greece. They were originally twelve in number, called Sali Palatini to distinguish them from...
a second college of twelve, Salii Agonales or Collini, said to have been added by Tullius Hostilius; the Palatini were consecrated to Mars, the Collini to Quirinus. All the members were patricians, vacancies being filled by co-optation from young men whose parents were both living; membership was for life, subject to certain exceptions. The official term of the college were the magister, the praesul, and the vates (the leaders in dance and song).

Each college had the care of twelve sacred shields called ancilia. According to the story, during the reign of Numa a small oval shield fell from heaven, and Numa, in order to prevent its being stolen, had it put together and dedicated to the gods. The story of the shield is said to have been traced by the word Mamuris. This shield, which bears the name Mamuris Veturius, probably identical with the god Mamaris (Mars) himself. These twelve shields (amongst which was the original one) were in charge of the Salii Palatini. The great religious festival of seven days in the month of March, during which the taking of the shields on which the day the anciel was said to have fallen from heaven and the campaigning season began, was devoted to various ceremonies connected with the Salii. On the 1st, they marched in procession through the city, dressed in an embroidered tunic, a brazen breast-plate and a peaked cap; each carried a sword by his side and a short staff in his right hand, with which the shield, borne on the left arm, was struck from time to time. A halt was made at the altars and temples, where the Salii, singing a special chant, danced a war dance. Every day the procession stopped at certain stations (mansiones), where the shields were deposited for the night, and the Salii partook of a meal. At the end of the week the procession passed on to another mansion; this continued till the 24th, when the shields were replaced in their sacraum. During this period the Salii performed various ceremonies: (1) On the 14th, a chariot race in honour of Mars on the Campus Martius (in later times called Mamuraria, in honour of Mamurius), at which a skin was beaten with staves in imitation of hammering; (2) In 1893, a festival of eight days, at which the shields were cleansed; the Tubilustrium on the 23rd, when the trumpets of the priests were purified. On the 19th of October, at the Armilustrum or purification of arms, the anciel was again brought out and laid away for another year. Other lines of the Salii, calles axonia, was written in the old Saturnian metre, in language so archaic that even the priests themselves could hardly understand it.

Salius was an interesting Romance church which has been well restored and is the chief town of the county. Salius was chartered in 1293 and a university was established there in 1593 by a Jesuit chaplain. The 17th century contains a library (established in 1593) and a museum. Salina owes its name to its saline waters, used for bathing and drinking. There are also salt workings and gypsum deposits.

The territory of Salina, which was enfeoffed in the 10th century by the abbey of Saint Maurice in Salina to the counts of Mâcon, remained in possession of their descendants till 1175. Maurette de Salin, one of the great dukes of Burgundy, married the Princess of Vienne, and her grandson sold it in 1295 to Hugh IV., duke of Burgundy, who ceded it in 1327 to John of Chalon (d.1327) in exchange for the countship of Chalon-sur-Saône. John's descendants—counts and dukes of Burgundy, emperors and kings of the house of Austria— bore the title of sire de Salins. In 1477 Salins was taken by the French and temporarily made the seat of the parlement de Franche-Comté by Louis XI. In 1668 and 1674 it was retaken by the French and the ordinances remained in their power. In 1855 the town was almost destroyed by fire. In 1871 it successfully resisted the German troops.

SALISBURY, EARLS OF. The title of earl of Salisbury was first created about 1149, when it was conferred on Patrick de Salisbury (sometimes from an early date called in error Patrick de Salisbury), a descendant of Edward de Salisbury, mentioned in Domescay as viscount of Wiltshire. His granddaughter Isabella became countess of Salisbury suis jure on the death of her father, William the 2nd earl, without male heirs, in 1196, and the title was assumed by her husband, William de Longespes (d. 1226), illegitimate son of King Henry II., possibly by Rosamond Clifford ("The Fair Rosamond"). Isabella survived her husband, and outlived both her son and grandson, both called Sir William de Longespe, and on her death in 1261 her great-granddaughter Margaret (d. 1310), wife of Henry de Lacy, earl of Lincoln, probably became suo jure countess of Salisbury; she transmitted the title to her daughter Alice, who married Thomas Plantagenet, earl of Lancaster. Lancaster having been attainted and beheaded in 1322, the countess made a surrender of her lands.
Edward In February 14 began Commons The statesman the was Palmerston a year as head of the British government, and co-heiress, Isabel, became by a separate creation earl of Salisbury in 1472, but by his attainer in 1478 this title was forfeited, and immediately afterwards was granted to Edward Plantagenet, eldest son of Richard Neville, earl of Salisbury, on whose death in 1484 it became extinct.

Richard III’s queen, Anne, was a sister of the above-mentioned Isabel, duchess of Clarence, and co-heiress with her of Richard Neville, earl of Salisbury. On the death of Queen Anne in 1485 the abeyance of the older creation terminated, Edward Plantagenet then being 15 years of age. He also contributed to the Saturday Night, becoming earl of Salisbury as successor to his mother’s right. He was attainted in 1504, five years after his execution, but the earldom then forfeited was restored to his sister Margaret (1474-1541), widow of Sir Richard Pole, in 1513. This lady was also attainted, with forfeiture of her titles, in 1539.

Sir Robert Cecil, second son of the 1st Lord Burghley (q.v.), was created earl of Salisbury (1605), having no connexion in blood with the former holders of the title. (See SAlISBURY, ROBERT CECIL, 1ST EARL OF.) In his family the earldom has remained till the present day, the 7th earl of the line having been created marquess of Salisbury in 1780.

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3rd Marquess of (1830-1903), British statesman, second son of James, 2nd marquess, by his first wife, Frances Mary Gascoyne, was born at Hatfield on the 3rd of February 1830, and was educated at Eton and Christ Church, Oxford, where he took his degree in 1850. At Oxford he was an active member of the Union Debating Society. The first few years after leaving the university were spent by Lord Robert Cecil (as he then was) in travel, as far afield as New Zealand; but in 1853 he was returned unopposed to the House of Commons as Conservative member for Stamford, being elected in the same year a fellow of All Souls. He made his maiden speech in Parliament on the 7th of April 1854, in opposition to Lord John Russell’s Oxford University Bill. The speech was marked by scepticism as to the utility of reforms, and Lord Robert prophesied that if the wishes of founders were disregarded, nobody would in future care to found anything. In 1857 he appeared as the author of his first Bill—for establishing the voting-paper system at parliamentary elections; and in the same year he married Georgiana Caroline, daughter of Sir Edward Holt Alderson, a baron of the Court of Exchequer, a large share of whose great intellectual abilities she inherited. Lord Robert Cecil continued to be active not only in politics, but, for several years, in journalism, the income he earned by his pen being then a matter of pecuniary importance to him. One of his contemporaries at Oxford had been Thomas Hamber of Oriol, who became editor of the Standard, and during these years Cecil was an occasional contributor of “In Camera” (dark blue) columns to the Gentleman’s Magazine. He was the editor of Beresford Hope’s Review, founded in 1855 by his brother-in-law Beresford Hope, and edited by his friend Douglas Cook: not infrequently he wrote for the Quarterly (where, in 1860, he was to publish his famous article on “the Conservative Surrender”); and in 1858 he contributed to Oxford Essays a paper on “The Theory of Parliamentary Reform,” giving expression to the more intellectual and aristocratic antagonism to doctrinaire Liberal views on the subject, while admitting the existence of many anomalies in the existing electoral system. In February of the next year, when Disraeli introduced his Reform Bill with its “fancy franchises,” the member for Stamford was prominent among its critics from the Tory point of view. During the seven years that followed Lord Robert was always ready to defend the Church, or the higher interests of Conservatism and property; and his speeches then, not less than before, showed a caustic quality and a tendency to what became known as “blazing indiscertions.” For example, when the repeal of the paper duty was being discussed in 1861, he asked whether it “could be maintained that a person of any education could learn anything worth knowing from a penny paper”—a question the answer to which has been given by the popular press. He later organized and admirable Conservative penny press of a subsequent day. A little later he declared the parliamentary “more worthy of an attorney than of a statesman”; and on being rebuked, apologized—to the attorneys. He also charged Lord John Russell with adopting “a sort of tariff of insolence” in his dealings with foreign Powers, strong and weak.

It was not, however, till the death of Palmerston and the removal of Lord John Russell to the House of Lords that Lord Robert Cecil—who became Lord Privy Seal in 1867—turned again to politics. He was brother of the 4th of June 1865—became to accept a position as a politician of the first rank. His emergence coincided with the opening of the new area in British politics, ushered in by the practical steps taken to extend the parliamentary franchise. On the 12th of March 1866 Gladstone brought forward his measure to establish a £7 franchise in boroughs and a £14 franchise in counties, which were calculated to add 400,000 voters to the existing lists. Lord Cranborne met the Bill with a persistent opposition, his rigorous logic and merciless hostility to clap-trap tending strongly to restrain the enthusiasm of the more liberal-minded. But though he attacked the Government Bill both in principle and detail, he did not absolutely commit himself to a position of hostility to Reform of every kind; and on the defeat of Gladstone’s Ministry no surprise was expressed at his joining the Cabinet of Lord Derby as secretary of state for India, even when it became known that a settlement of the Reform question was part of the Tory programme. The early months of the new Government’s tenure were marked by the incident of the Hyde Park riots; and if there had been members of the Cabinet and the House of Commons on whose conduct there was no complaint, it was on the 26th of June, 1870, that the action of the Reform League and the London populace forced them to a different conclusion. On the 11th of February Disraeli informed the House of Commons that the Government intended to ask its assent to a series of thirteen resolutions; but when, on the 26th of February, the Liberal leaders demanded that the Government should produce a Bill, Disraeli at once consented to do so. The introduction of a Bill was, however, delayed by the resignation of Lord Cranborne, General Peel and Lord Carnarvon. The Cabinet had been considering two alternative measures, widely different in kind and extent, and the final decision between the two was taken in ten minutes (whence the nickname of the “Ten Minutes Bill”) at an informal gathering of the Cabinet held just before Derby was engaged to address a general meeting of the party. At a Cabinet council held on the 23rd of February measure A had been agreed upon, the three doubtful ministers having been persuaded that the checks and safeguards provided were sufficient; in the interval between Saturday and Monday they had come to the conclusion that the checks were inadequate; on Monday a meeting of the Cabinet was called. He arrived at half past two o’clock the rest of the Cabinet, hastily summoned, had been informed of the new situation, and had there and then, before the meeting at half-past two, agreed, in order to retain their three colleagues, to throw over measure A, and to present measure B to the country as the fruit of their matured and unanimous wisdom. Derby at the meeting, and Disraeli a few hours later in the House of Commons, explained their new
measure—a measure based upon a £6 franchise; but their own side did not like it, the Opposition were furious, and the moral sense of the country was revolted by the undisguised adoption of almost the very Bill which the Conservatives had refused to accept from their opponents only a year before. The result was that the Government reverted to measure A, and the three ministers again handed in their resignations. In the debate on the third reading of the Bill, when its passage through the House of Commons without a division was assured, Lord Cranborne showed with caustic rhetoric how the "precautions, guarantees, and securities with which the Bill had bristled in its second reading had been dropped one after another at the bidding of Gladstone.

In countries where politics are conducted on any other than the give-and-take principles in vogue in England, such a breach as that which occurred in 1867 between Lord Cranborne and his former colleagues, especially Disraeli, would have been beyond repair. But Cranborne, though an aristocrat both by birth and by conviction, was not impracticable; moreover, Disraeli, who had himself risen to eminence through invective, admired rather than resented that gift in other people. The Commons of the time had decided Gladstone and Cranborne were certain to reunite the two colleagues. In the session of 1868 Gladstone announced that he meant to take up the Irish question, and to deal especially with the celebrated "Upas tree," of which the first branch was the Established Church. By way of giving full notice to the electorate, he brought in a series of resolutions on this question; and though the attitude adopted by the official Conservatives towards them was not one of serious antagonism, Lord Cranborne vigorously attacked them. This was his last speech in the House of Commons, for on the 1st of April his father died, and he became 3rd marquess of Salisbury. In the House of Lords the new Lord Salisbury's style of eloquence—terse, incisive and wholly free from false ornament—found an even more appreciative audience than it had met with in the House of Commons. The questions with which he was first called upon to deal were questions in which his interest was keen—the recommendations of the Ritual Commission and, some time later, the Irish Church Suspension Bill. Lord Salisbury's argument was that the last session of an expiring parliament was not the time in which to give a matter as the Irish Church Establishment should be judged or prejudged; that a Suspension Bill involved the question of disestablishment; and that such a principle could not be accepted by the Lords until the country had pronounced decisively in its favour. Even then there were those who raised the cry that the only business of the House of Lords was to register the decisions of the Commons, and that if they refused to do so it was at their peril. Lord Salisbury met this cry boldly and firmly:

"When the opinion of your countrymen has declared itself, and you see that their convictions—their firm, deliberate, sustained convictions—are in favour of any course, I do not for a moment deny that it is your duty to yield."

In the very next session Lord Salisbury was called upon to put his view into practice, and his influence went far to persuade the peers to pass the Irish Church Disestablishment Bill. In his opinion the general election of the autumn of 1868 had been fought on this question; his friends had lost, and there was nothing for them to do but to bow to the necessities of the situation. The story of his conduct in the matter has been told in some fulness in the Life of Archbishop Tait, with whom Salisbury acted, and who throughout those critical weeks played a most important part as mediator between the two extreme parties—those of Lord Cairns (representing Ulster) and Gladstone. October 1869 saw the death of the old Lord Derby, who was succeeded, the titular leader of his party; and he was succeeded as leader of the House of Lords by Cairns. For the dignified post of chancellor of the university of Oxford Convocation unanimously chose as Derby's successor the marquess of Salisbury. Derby had translated the Iliad very well, but his successor was far more able to sympathize with the academic mind and temper. He was at heart a student, and found his best satisfaction in scientific research and in scientific speculation; while still a young man he had made useful contributions to the investigation of the flora of Hertfordshire, and at Hatfield he had his own laboratory, where he was able to satisfy his interest in chemical and electrical research. As regards his connexion with Oxford may be mentioned in particular his appearance, in 1877, of a second University Commission, and his appearance, in September 1894, in the Sheldonian Theatre as president of the British Association.

It is not necessary to dwell at any length upon the part taken by Lord Salisbury between 1869 and 1873 in respect of the other grievances in the measure. The second reading had been dropped one after another at the bidding of Gladstone.

In the House of Lords.

SALISBURY, 3RD MARQUESS OF

The Eastern Question.

In the House of Lords.
SALISBURY, 3RD MARQUESS OF

Cabinet. On the 20th of January the conference broke up, Turkey having declared its recommendations inadmissible; and Europe withdrew to await the inevitable declaration of war. Very early in the course of that war the intentions of Great Britain were clearly indicated in a despatch of Lord Derby to the British representative at St Petersburg, which announced that so long as the struggle concerned Turkish interests alone Great Britain would be neutral, but that such matters as Egypt, the Suez Canal, the regulations affecting the passage of the Dardanelles, and the possession of Constantinople itself would be regarded as matters to which she could not be indifferent. For some nine months none of these British interests appeared to be threatened, nor had Lord Salisbury's own department to concern itself very directly with the progress of the belligerents. One or two, indeed, the Indian secretary committed himself to statements which laid him open to a good deal of attack, as when he rebuked an alarmist by bidding him study the Central Asian question "in large maps." But with the advance of Russia through Bulgaria and across the Balkans, British anxiety grew. In mid-December explanations were asked from the Russian Government as to their intentions with regard to Constantinople. On the 23rd of January the Cabinet ordered the fleet to sail to the Dardanelles. Lord Carnarvon resigned, and Lord Derby handed in his resignation, but withdrew it. The restoration of it should be waited on the 3rd of March; and three weeks later, when its full text became known, the Cabinet decided upon measures which finally induced Lord Derby, at the end of the month, to retire from the Foreign Office, his place being immediately filled by Lord Salisbury. The new foreign secretary at once issued the famous "Salisbury circular" to the British representatives abroad, which appeared in the newspapers on the 2nd of April. This elaborate and dignified State paper was at once a clear exposition of British policy, and practically an invitation to Russia to regard Russia instead of for a European congress. These negotiations, indeed, had been proceeding for several weeks past; but Russia having declared that she would only discuss such points as she pleased, the British Cabinet had withdrawn, and the matter for the time was at an end. The bulk of the document consisted of an examination of the Treaty of San Stefano and its probable effects, Lord Salisbury justifying such an examination on the ground that as the position of Turkey and the other countries affected had been settled by Europe in the Treaty of Paris in 1856, the powers which signed that treaty had the right and the duty to see that no modification of it should be made on the 3rd of March; and the effect of the circular was great and immediate. At home the Conservatives were encouraged, and many moderate Liberals rallied to the Eastern policy of the Government. Abroad it seemed as if the era of divided councils was over, and the Russian Government promptly recognized that the circular meant either a congress or war with Great Britain. For the latter alternative it was by no means prepared, and very soon negotiations were reopened, which led to the meeting of the congress at Berlin on the 15th of June. The history of that famous gathering and of its results is narrated elsewhere under Europe. Lord Beaconsfield on two or three subsequent occasions referred to the important part that his colleague had played in the negotiations, and he was not using merely the language of politeness. Rumours had appeared in the London press as to a supposed Anglo-Russian agreement that had been signed between Salisbury and the Russian ambassador, Count Shuvaloff, and these rumours or statements were described by the foreign secretary in the House of Lords, just before he left for Berlin, as "wholly unauthentic." But on the 14th of June what purported to be the full text of an agreement was published by the Globe newspaper through a certain Charles Marvin, at that time employed in occasional transcribing work at the Foreign Office, and afterwards known by some strongly anti-Russian books on the Central Asian question. Besides the general inconvenience of the disclosure, the agreement, which stipulated that Batum and Kars might be annexed by Russia, made it impossible for the congress to insist upon Russia entirely withdrawing her claim to Batum, though at the time of the meeting of the congress it was known to some of the negotiators that she was not unwilling to do so. In one respect Salisbury's action at the conference was a failure, for he was not without a certain sentimentalism of his own, and at the Berlin Congress this took the form of an unexpected and, as it happened, useless pushing of the claims of Greece. But in the main Salisbury must be held to deserve, almost equally with his great colleague, the credit for the Berlin settlement. Great, however, as was the work done at Berlin, and marked the relief to all Europe which was caused by the signing of the treaty, much work, and of no pleasant kind, remained for the British Foreign Office and for the Indian Government before 1879. After the congress had ended and the Government had to render up its accounts to the nation. Russia, foreseeing a possible war with Great Britain, had during the spring of 1878 redoubled her activity in Central Asia, and, almost at the very time that the treaty was being signed, her mission was received at Kabul by the Amir Sher Ali. Out of the Amir's refusal to receive a counterbalancing British mission there grew the Afghan War; and though he had ceased to control the India Office, Salisbury was naturally held responsible for some of the preliminary steps which, in the judgement of many, led to the Afghan War. The treaty was signed, and the Liberals entirely failed to fix upon Salisbury the blame for a series of events which was generally seen to be inevitable. A defence of the foreign policy of the Government during the year which followed the Berlin Treaty was made by Salisbury in a speech at Manchester (October 1879), which had a great effect throughout Europe. In it he justified the occupation of Cyprus, and approved the beginnings of a league of central Europe for preserving peace.

In the spring of 1880 the general election overthrew Beaconsfield's Government and replaced Gladstone in power, and the country entered upon five eventful years, which were to lay the foundations of the Liberal policy. To see the consolidation of the Pall Mall party, the reign of outrage in Ireland, disasters in Zululand and the Transvaal, war in Egypt, a succession of costly mistakes in the Sudan, and the final collapse of Gladstone's Government on a trilling Budget question. The defeat of 1880 greatly depressed Beaconsfield, who till then had really believed in that "heteroporean" theory upon which he had acted in 1867—the theory that beyond and below the region of democratic storm and violence was to be found a region of peaceful conciliation and of counterbalancing national interests. But in April 1880 Beaconsfield seems to have lost heart and hope, and to have ceased to believe that wealth, birth and education would count for much in future in England. Salisbury, who on Beaconsfield's death a year later was chosen, after the claims of Cairns had been withdrawn, as leader of the Conservative peers (Sir Stafford Northcote continuing to lead the Opposition in the House of Lords), was not so disposed to counsels of despair. After the Conservative reaction had come in 1886, he was often taunted with pessimism as regards the results, and he certainly spoke on more than one occasion in a way which appeared to justify the caricatures which appeared of him in the Radical press as his character of Hamlet; but in the days of Liberal ascendancy Salisbury was confident that the tide would turn. We may pass briefly over the years of Opposition between 1880 and 1885; the only policy that could then wisely be followed by the Conservative leaders was that of giving their opponents sufficient rope. In 1884 a new Reform Bill was introduced, extending household suffrage to the counties; this was met in the Lords by a resolution, moved by Cairns, that the peers could not pass it unaccompanied by a Redistribution Bill. The Government, therefore, withdrew their measure. In the summer and autumn there was a good deal of agitation; but in November a redistribution scheme was settled between the leaders of both parties, and the Bill passed. When, in the summer of 1885, Gladstone resigned, it became necessary for the country to know whether Salisbury or Northcote was the real Conservative leader; and
the Queen settled the matter by at once sending for Lord Salisbury, who became prime minister for the first time in 1885. The "Forwards" among the Conservatives, headed by Lord Randolph Churchill, brought so much pressure to bear that Northcote was induced to enter the House of Lords as earl of Iddesleigh, while Sir Michael Hicks Beach was made leader of the House of Commons, Lord Randolph Churchill secretary for India, and Mr Arthur Balfour president of the Local Government Board. The new Government had only to prepare for the general election in the autumn. The ministerial programme was put forward by Salisbury on the 7th of October in an important speech addressed to the Union of Conservative Associations assembled at Newport, in Monmouthshire; and in this he outlined large reforms in local government, poured scorn upon Mr Chamberlain's Radical policy of "three acres and a cow," but promised cheap land transfer, and opposed the disestablishment of the Church as a matter of life or death to the Conservative party. In this Lord Salisbury was declaring war against what seemed to be the danger should Mr Chamberlain's "unauthorized programme" succeed; while the comparative slightness of his references to Ireland showed that he had no more suspicion than anybody else of the event which was about to change the whole face of British politics, to break up the Liberal party and to change the most formidable of the advanced Radicals into an ally and a colleague. The general election took place, and there were returned to parliament 335 Liberals, 249 Conservatives and 86 Home Rule. Salisbury was made leader of the House of Commons, and he and his followers, to the great surprise of everybody, were returned. The Conservatives met parliament, and after a short time were put into a minority of 79 on a Radical land motion, brought in by Mr Chamberlain's henchman, Mr Jesse Collings. Mr Gladstone's return to office, and his announcement of a Bill giving a separate parliament to Ireland, were quickly followed by the secession of the Unionist Liberals; the defeat of the Bill; an appeal to the country; and the return of the Unionist party to power with a majority of 118. Salisbury at once asked to the way for Lord Harington, but the suggestion that the latter should form a Government was declined; and the Conservatives took office alone, with an Irish policy which might be summed up, perhaps, in Salisbury's words as "twenty years of resolute government." For a few months, until just before his sudden death on the 12th of January 1887, Lord Iddesleigh was foreign secretary; but Salisbury, who meantime had held the post of lord privy seal, then returned to the Foreign Office. Meanwhile the increasing friction between him and Lord Randolph Churchill, who, amid many qualms on the part of more old-fashioned Conservatives, had become chancellor of the exchequer, had led to the latter's resignation, which, to his own surprise, was accepted; and from that date Salisbury's effective primacy in his own party was unchallenged.

Only the general lines of Salisbury's later political career need here be sketched. As a consequence of the practical monopoly of political power enjoyed by the Unionist party after the Liberal disruption of 1886—for even in the years 1892—1895 the situation was dominated by the permanent Unionist majority in the House of Lords—Salisbury's position became unique. These were the long-looking for days of Conservative reaction, of which he had never dreamed. The situation was complicated, so far as Salisbury personally was concerned, by the coalition with the Liberal Unionists, which was confirmed in 1893 by the inclusion of the duke of Devonshire, Mr Chamberlain, and other Liberal Unionists in the Cabinet. But though it appeared anomalous that old antagonists like Lord Salisbury and Mr Chamberlain should be working together in the same ministry, the prime minister's position was such that he could disregard a superficial criticism which paid too little heed to his political faculty and his patriotic regard for the regeneration of the English people. Moreover, the practical work of reconciling Conservative traditions with domestic reform depended rather on Salisbury's nephew, Mr Balfour, who led the House of Commons, than on Salisbury, who devoted himself almost entirely to foreign affairs. The new Conservative movement, moreover, in the country at large, was, in any case, of a more constructive type than Salisbury himself was best fitted to lead, and he was not the real source of the political inspiration behind the Conservative rising of the Unionist party during this period. He began to stand to some extent outside party and above it, a moderator with a keenly analytic and rather sceptical mind, but still the recognized representative of the British empire in the councils of the world, and the trusted adviser of his sovereign. Though himself the last man to be selected as the type of a democratic politician—for his references to extensions of popular government, even when made by his own party, were full of mild contempt—Salisbury gradually acquired a higher place in public opinion than that occupied by any contemporary statesman. His speeches—which, though carelessly composed, continued to blaze on occasion with their old fire and their somewhat mordant cynicism—were weightier in tone, and became European events. Without the genius of Disraeli or the personal magnetism of Gladstone, he yet inspired the British public with a quiet confidence that under him things would not go far wrong, and that he would not act rashly or unworthily of his country. Even political opponents came to look on his cautious and balanced conservatism, and his intellectual aloofness from interested motives or vulgar ambition, as standing between them and something more distasteful. Moreover, in the matter of foreign affairs his weight was supreme. He had lived to become, as was indeed generally recognized, the most experienced working diplomatist in Europe. His position in this respect was shown in nothing better than in his superiority to criticism. In foreign affairs many among his own party regarded him as too much inclined to "split the difference" and to make "peaceful concessions"—as in the case of the cession of Heligoland to Germany—in which it was complained that Great Britain got the worst of the bargain. But though occasionally, as in the withdrawal of British ships from Port Arthur in 1898, such criticism became acute, the plain fact of the preservation of European peace, often in difficult circumstances, reconciled the public to his conduct of affairs. His patience frequently justified itself, notably in the case of British relations with the United States, which were for a moment threatened by President Cleveland's message concerning Venezuela in 1895. And though his loyalty to the European Concert in connexion with Turkey's dealings with Armenia and Crete in 1895—1898 proved irritatingly ineffectual—the pace of the concert, as Lord Salisbury explained, being rather like that of a steam-roller—no alternative policy could be contemplated as feasible in any other statesman's hands. Salisbury's personal view of the new situation created by the partition of the sultan of Turkey was indicated not only by a solemn and unusual public warning addressed to the sultan in a speech at Brighton, but also by his famous remark that in the Crimean War Great Britain had "put her money on the wrong horse." Among his most important strokes of diplomacy was the Anglo-German agreement of 1890, delimiting the British and German spheres of influence in Africa. The South African question from 1896 onwards was a matter for the Colonial Office, and Salisbury left it in Mr Chamberlain's hands.

A peer premier must inevitably leave many of the real problems of democratic government to his colleagues in the House of Commons, and in the Upper House Lord Salisbury was paramount. Yet while vigorously opposing the Radical agitation for the abolition of the House of Lords, he never interposed a non possumus to schemes of reform. He was always willing to consider plans for its improvement, and in May 1888 himself introduced a bill for reforming it and creating life peers; but he warned reformers that the only result must be to make the House stronger. To abolish it, on the other hand, would be to take away a necessary safeguard for protecting "Philip drunk" by an appeal to "Philip sober."

Lord Salisbury suffered a severe loss by the death in 1900 of his wife, whose influence with her husband had been great, as her devotion had been unswerving. Her protracted illness was
one among several causes, including his own occasional ill-health, which after 1895 made him leave as much as possible of the work of political leadership to his principal colleagues—Mr Arthur Balfour more than once acting as foreign secretary for several weeks while his uncle stayed abroad. But for some years it was felt that his attempt to be both prime minister and foreign secretary was a mistake; and after the election of 1900 Salisbury handed over the seals of the foreign office to Lord Lansdowne, remaining himself at the head of the government as lord privy seal. In 1902, upon the conclusion of peace in South Africa, he felt that the time had come to retire from office altogether; and on the 11th of July his resignation was accepted by the king, and he was succeeded as prime minister by Mr Arthur Balfour.

From this moment he remained in the political background, and his ill-health gradually increased. He died at Hatfield on the 22nd of August 1903, and was succeeded in the marquessate by his eldest son Lord Cranborne (b. 1861), who entered the house of commons for the Darwin division of Lancashire (1885-1892) and since 1893 had been member for Rochester. The new marquessate had been under-secretary for foreign affairs since 1902, and in October 1903 he became lord privy seal in Mr Balfour's ministry. Of the other four sons, Lord Hugh Cecil (b. 1869) became a prominent figure in parliament as Conserva-
tive member for Greenwich (1895-1906), first as an ardent and eloquent High Churchman in connexion with the debates on education, &c., and then as one of the leaders of the Free-Trade Unionists opposing Mr Chamberlain; and his elder brother Lord Robert Cecil (b. 1864), who had at first devoted himself to the bar and become a K.C., entered parliament in 1906 for Maryle-
bone, holding views in sympathy with those of Lord Hugh, who had been defeated through the opposition of a Tariff Reformer Unionist in a triangular contest at Greenwich, which gave the victory to the Radical candidate. In the elections of January 1910 Lord Robert Cecil resigned his candidature for Marylebone, owing to the strong opposition of the Tariff Reformers, which threatened to divide the party and lose the seat; he stood for Blackburn as a Unionist Free Trader and was defeated. On the other hand Lord Hugh Cecil was returned for Oxford University in place of the Rt. Hon. J. G. Talbot. Lord Hugh's candidature, which was announced in 1909 simultaneously with the resignation of the sitting member, was opposed by some who disagreed with his fiscal views and his attitude on Church questions; but it was found that he had the support of the great majority of the electors, and he was ultimately returned un-opposed.

H. Cnr.)

SALISBURY, ROBERT CECIL, 1ST EARL OF (c. 1565-1612),
English lord treasurer, the exact year of whose birth is unrecorded,
was the youngest son of William Cecil, 1st Lord Burghley,
and of his second wife Mildred, daughter of Sir Anthony Cooke,
of Gidea Hall in Essex. He was educated in his father's house
and at Cambridge University. In 1584 he was sent to France,
and was returned the same year to parliament, and again in
1586, as member for Westminster. In 1588 he accompanied
Lord Derby in his mission to the Netherlands to negotiate peace
with Spain, and sat in the parliament of 1588, and in the assemblies
of 1593, 1597 and 1601 for Hertfordshire. About 1585 he appears
to have entered upon the duties of secretary of state, though he
did not receive the official appointment till 1596. On the 20th
of May 1591 he was knighted, and in August sworn of the privy
council. In 1597 he was made chancellor of the duchy of
Lancaster, and in 1598 despatched on a mission to Henry IV.
of France, to prevent the impending alliance between that
country and Spain. The next year he succeeded his father as
master of the court of wards. On Lord Burghley's death on
the 4th of August both Essex and Bacon desired to succeed him
in the supreme direction of affairs, but the queen preferred the
son of her last great minister. On Essex's disgrace, consequent
on his sudden and unauthorized abandonment of his command
in Ireland, Cecil's conduct was worthy of high praise. "By
employing his credit with Her Majesty in behalf of the Earl,"
wrote John Petit (June 14, 1600), "he has gained great credit
to himself both at home and abroad." At this period began
Cecil's secret correspondence with James in Scotland. Hitherto
Cecil's enemies had persuaded James that the secretary was
unfavourable to his claims to the English throne. An under-
standing was now effected by which Cecil was able to assure
James of his succession, secure his own power and predominance
in the new reign against Sir Walter Raleigh and other competitors,
and secure the tranquillity of the last years of Elizabeth, the
conditions demanded by him being that all attempts of James
to obtain parliamentary recognition of his title should cease,
that he should not make any absolute claims, and that the
communications should remain a profound secret.

Writing later in the reign of James, Cecil says: "If Her Majesty
had known all I did, how well these (7 she) should have known
the innocency and constancy of my present faith, yet her age
and orbyt, joined to the jealousy of her sex, might have moved her
to think ill of that which helped to preserve her."

Such was the nature of these secret communications, which,
while they aimed at securing for Cecil a fresh lease of power
in the new reign, conferred undoubted advantages on the country.
Owing to Cecil's action, the death of Elizabeth on the 24th of
March 1603, James was proclaimed king, and took the
throne of the crown without opposition. Cecil was continued in his
office, was created Baron Cecil of Essendon in Rutlandshire
on the 13th of May, Viscount Cranborne on the 20th of August
1604, and earl of Salisbury on the 4th of May 1605. He was
elected chancellor of the University of Cambridge in February
1601, and obtained the Garter in May 1606. Meanwhile Cecil's
success had completed the discontent of Raleigh, who, exasperated
at his dismissal from the capteniay of the guard, became involved
—whether innocently or not is uncertain—in the treasonable
conspiracy known as the "B 의사 Plot." Cecil took a leading part
in his trial in July 1603, and, though probably convinced
of his guilt, endeavoured to ensure him a fair trial and rebuked
the attorney-general, Sir Edward Coke, for his harshness towards
the prisoner. On the 6th of May 1608 the office of lord treasurer
was added to Salisbury's other appointments, and the whole
conduct of public affairs was placed solely in his hands. His
real policy is not always easy to distinguish, for the king
constantly interfered, and Cecil, far from holding any absolute
or continuous control, was often not even an adviser but merely
an ally of Elizabeth, his sovereign. "He was an able man and
had a taste for intrigue, but he was an ungrateful companion." In foreign affairs his aim was to preserve the balance of power between France and Spain, and to secure the independence of the Netherlands from either state. He also hoped, like his father, to make England the head of the Protestant alliance abroad; and his last energies were expended in effecting the marriage in 1612 of the princess Elizabeth, James's daughter,
with the Elector Palatine. He was in favour of peace, preoccupied
with the state of the finances at home and the decreasing revenue,
and, though sharing Raleigh's dislike of Spain, was instrumental
in making the treaty with that power in 1604. In June 1607
he promised the support of the government to the merchants
who complained of Spanish ill-usage, but declared that the
commons must not meddle with questions of peace and war.
In 1611 he disapproved of the proposed marriage between
the prince of Wales and the Infanta. His bias against Spain
and his fidelity to the national interests render, therefore, his accept-
ance of a pension from Spain a surprising incident in his career.
At the conclusion of the peace in 1604 the sum Cecil received was
£1000, which was raised the following year to £1500; while in 1609
he demanded an augmentation and to be paid for each piece of information separately. If, as has been stated, he
received a pension also from France, it is not improbable that,
like his contemporary Bacon, who accepted presents from
suitors on both sides and still gave an independent decree,
Cecil may have maintained a freedom from corrupting influences,
while his acceptance of money as the price of information concerning the intentions of the government may have formed

1 Correspondence of King James VI. of Scotland with Sir R. Cecil,
ed. by J. Bruce (Camden Soc., 1861), p. x1.
2 Gardiner, History of England, i. 214.
part of a general policy of cultivating good relations with the
two great rivals of England (one advantage of which was the
communication of plots formed against the government), and
of maintaining the balance of power between them. It is difficult,
however, in the absence of complete information, to understand
the exact nature and significance of these strange relations.

As lord treasurer Salisbury showed considerable financial
ability. During the year preceding his acceptance of that
office the expenditure had risen to £500,000, leaving, with an
ordinary revenue of about £320,000, and the subsidies voted by
parliament, a yearly deficit of £73,000. He improved his
advantage of the decision by the judges in the court of exchequer
in Bates's case in favour of the king's right to levy impositions;
and (on the 28th of July 1668) imposed new duties on articles of
luxury and those of foreign manufacture which competed with
English goods, while lowering the duties on currants and tobacco.
By this measure, and by a more careful collection, the ordinary
income was raised to £460,000, while £700,000 was paid off
the debt, leaving at the beginning of 1670 the sum of £300,000.
This was a substantial reform, and if, as has been stated, the
"total result of Salisbury's financial administration was to
halve and by an estimate of the deficiency," the failure to secure a permanent improvement must be a
manifestation of the extravagance of James, who, disregarding his minister's
treaties and advice, continued to exceed his income by £149,000.
But a want of statesmanship had been shown by Salisbury
in forcing the king's legal right to levy impositions against the
remonstrances of the parliament. In the "great contract," the
scheme was put forward by Salisbury for settling the finances,
his lack of political wisdom was still more apparent. The
Commons were to guarantee a fixed annual subsidy, on condition
of the abandonment of impositions and of the redress of grievances
by the king. An unworthy and undignified system of haggling
and haggling was initiated between the crown and the parlia-
ment. Salisbury could only attribute the miscarriage of his
scheme to the fact "that God did not bless it." But Bacon
regarded it with severe disapproval, and in the parliament of
1673, after the treasurer's death, he begged the king to abandon
these humiliating and dangerous bargains, "that your
majesty do for this parliament put off the person of a merchant
and contractor and rest upon the person of a king." In fact,
the vicious principle was introduced that a redress "ought to
be obtained by the means of subsidies." The identity of
interests between the crown and the nation which had made
the reign of Elizabeth so glorious, and which she herself had
consummated on the occasion of her last public appearance
by a free and voluntary concession of these same impositions,
was now destroyed, and a divergence of interests, made patent
by vulgar bargaining, was substituted which stimulated the
disastrous struggle between sovereign and people, and paralysed
the national development for two generations.

This was scarcely a time to expect any favours for the Roman
Catholics, but Salisbury, while fearing that the Roman Church
in England would become a danger to the state, had always been
averse from prosecution for religion, and he attempted to dis-
tinguish between the large body of law-abiding and loyal Roman
Catholics and those connected with plots and intrigues against
the throne and government, making the offer in October 1677
that if the pope would communicate those that rebelled against
the king and oblige them to defend him against invasion, the
fines for recusancy would be remitted and they would be allowed
to keep priests in their houses. This was a fair measure of
tolerant. His want of true statesmanship was shown with
regard to the Protestant Nonconformists, towards whom his
attitude was identical with that afterwards maintained by Laud
and the same ideal pursued, namely that of material and outward
conformity, Salisbury employing almost the same words as the
archbishop later, that "unity in belief cannot be preserved
unless it is to be found in worship." 1

Bacon's disparaging estimate of his cousin and rival was
probably tinged with some personal animus, and instigated by
the hope of recommending himself to James as his successor;
but there is little doubt that his acute and penetrating description
of Salisbury to James as one "fit to prevent things from growing
worse but not fit to make them better," as one "greater in
operations than in opere," is a true one. 2 Elsewhere Bacon
accuses him of an artificial animating of the negative —in
modern language, of official obstruction and "red tape." But
in one instance at least, when he advised James not to press forward
too hastily the union of England and Scotland, a measure which
had appealed to Bacon's imagination and was ardently desired
by him, Salisbury excelled his superior to his illustrious critic.
It can scarcely be denied that he rendered substantial services to the state in times of great
difficulty and perplexity, and these services would probably have
been greater and more permanent had he served a better king and
in more propitious times. Both Elizabeth and James found a
security in Salisbury's calm good sense, safe, orderly official mind
and practical experience of business, of which there was no
guarantee in the restlessness of Essex, the enterprise of Raleigh
and the speculation of Bacon. On the other hand, he was neither
great enough nor inspired with the pride of statesmanship to
oppose anything towards the settlement of the great national
problems, and he precipitated by his ill-advised action the disastrous
struggle between crown and parliament.

Lord Salisbury died on the 24th of May 1612, at the parsonage
house at Marlborough, while returning to London from taking
the waters at Bath. During his long political career he had amassed
a large fortune, besides inheriting a considerable portion of Lord
Burlingham's landed estate. In 1607 he exchanged, at the king's
request, his estate of Theobalds in Hertfordshire for Hatfield.
Here he built the magnificent house of which he himself conceived
the plans and the design, but which he did not live to inhabit,
its completion almost coinciding with his death. In person
and figure he was in strange contrast with his rivals at court, being
diminutive in stature, ill-formed and weak in health. Elizabeth
styled him her pygmy; his enemies delighted in vitilifying his
"wry neck," "crooked back" and "flay foot," and in Bacon's
essay on "Deformity," it was said, "the world takes notice that
he paints out his little cousin to the life." 3 Molin, the Venetian
ambassador in England, gives a similar description of his person,
but adds that he looked "a noble countenance and features." 4
Lord Salisbury wrote The State and Dignity of a Secretary
of State's Place (publ. 1642, reprinted in Harleian Miscellany, ii.
and Somers Tracts (1809), v.; see also Harleian M.S. 350 and
354), and An Answer to Certain Scandalous Papers scattered
abroad under Colour of a Catholic Admonition (1660), justifying
his attitude towards recusants after the discovery of the
Gunpowder Plot (Harl. Misc. ii.; Somers Tracts, v.). He married
Elizabeth, daughter of William Brooke, 5th Baron Cobham,
by whom, besides one daughter, he had William (1591-1668),
his successor as earl.

No complete life of Robert Cecil has been attempted, but the
materials for it are very extensive, including Hist. MSS. Comm.
Series, Marquis of Salisbury's MSS. (superseding former reports in
the series 305 and 535), Selections from the same, ed. by
J. S. Haynes, Wm. Murdin in 1759, John Bruce, in The Corre-
respondence of King James VI. with Sir Robert Cecil, in 1831
(Camden Society), and by E. Todd, in Illustrations of English History, in 1838.

The earl of Salisbury, who sided with the parliament
during the Civil War and represented his party in negotiations
with the king at Uxbridge and at Newport, was succeeded by his
grandson James (1648-1683) as 3rd earl. James's descendant,
James, the 7th earl (1748-1823), who was lord chamberlain
of the royal household from 1783 to 1804, was created marquess
of Salisbury in 1789. His son and successor, James Brownlow
William, the 2nd marquess (1791-1868), married Frances Mary,
daughter of Bamber Gascoyne of Coldhall Hall, Lancashire,
and took the name of Gascoyne before that of Cecil. He was
lord privy seal in 1852 and lord president of the council in 1858-
1859, his son and heir was the famous prime minister.

1 Spedding, Life and Letters of Bacon, iv. 276 note. 279.
SALISBURY, THOMAS DE MONTACUTE, 4TH EARL OF (1385–1428), was son of John, the third earl, who was executed in 1400 as a supporter of Richard II. Thomas was granted part of his father's estates and summoned to parliament in 1409, though not attached to Stratford's (or Rich's) retinue. By his first marriage, the champaign of Agincourt in 1415, and at the naval engagement before Harfleur in 1416. In the expedition of 1417–18 he served with increasing distinction, and especially at the siege of Rouen. During the spring of 1419 he held an independent command, capturing Fécamp, Honfleur and other towns, was appointed lieutenant-general of Normandy, and created earl of Perche. In 1420 he was in chief command in Maine, and defeated the Maréchal de Rieux near Le Mans. When Henry V. went home next year Salisbury remained in France as the chief lieutenant of Thomas a Becket. The duke, through his own rashness, was defeated at Baugé on the 21st of March 1421. Salisbury came up with the archers too late to retrieve the day, but recovered the bodies of the dead, and by a skilful retreat averted further disaster. He soon gathered a fresh force, and in June was able to report to the king "this part of your land stood in good plight never so well as now." (Poedra, x. 131). Salisbury's success in Maine marked him out as John of Bedford's chief lieutenant in the war after Henry's death. In 1423 he was appointed governor of Champagne, and by his dash and vigour secured one of the chief victories of the war. In 1428, in the absence of the English, Salisbury's operations completed the conquest of Champagne, and left Salisbury free to join Bedford at Verneuil. There on the 17th of August, 1424, it was his "judgment and valour" that won the day. During the next three years Salisbury was employed on the Norman border and in Maine. After a year's visit to England he returned to the chief command in the field in July, 1428. Against the judgment of Bedford he determined to make Orleans his principal objective, and began the siege on the 12th of October. Prosecuting it with his wonted vigour he stormed Tourelles, the castle which protected the bridge of the Loire, on the 30th of October. Three days later whilst surveying the city from a window in Tourelles he was wounded by a cannon-shot, and died on the 3rd of November 1428. Salisbury was the most skilful soldier on the English side after the death of Henry V. Though employed on diplomatic missions both by Henry V. and Bedford, he took no part in politics save for a momentary support of Humphrey, duke of Gloucester, during his visit to England in 1427–1428. He was a patron of John Lydgate, who presented to him his book The Pilgrim (now Harley MS. 4565, with a miniature of Salisbury, engraved by Weatogue, 1417) and the Chrise de la Pucelle by G. Cousinot, edited by Vallet de Virville (Paris, 1585). For modern accounts see Sir J. H. Ramsay, Lancaster and York (Oxford, 1892); and C. Oman, Political History of England, 1377–1485 (London, 1906).

WILLIAM, SALLISBURY, 4TH EARL OF (LONGETSPE), EARL OF (d. 1226), was an illegitimate son of Henry II. In 1198 he received from King Richard I, the hand of his first Ela (d. 1261), daughter and heiress of William, earl of Salisbury, and was granted this title with the lands of the earldom. He held many high offices under John, and commanded a section of the English forces at Bouvines (1214), when he was made a prisoner. He remained faithful to the royal house except for a few months in 1216, when John's cause seemed hopelessly lost. He was also a supporter of Hubert de Burgh. In 1225 he went on an expedition to Gascony, being wrecked on the Isle of Ré on the return voyage. The hardships of this adventure undermined his health, and he died at Salisbury on the 7th of May 1226, and was buried in the cathedral there. The eldest of Longespes' four sons, William (d. 1250) did not receive his father's earldom, although he is often called earl of Salisbury. In 1247 he led the English crusaders to join the French at Damietta and was killed in battle with the Saracens in February 1250.

SALISBURY, a township of Litchfield county, in the northwestern corner of Connecticut, U.S.A. Pop. (1910) 3522. Area, about 38 sq. m. Salisbury is served by the Central New England and the New York, New Haven & Hartford railways. In the township are several villages, including Salisbury, Lakeville, Lime Rock, Chaplinville and Ore Hill. Much of the township is hilly, and Bear Mountain (2355 ft.), near the Massachusetts line, is the highest elevation in the state. The Housatonic river forms the eastern boundary. The township is a summer resort. In it are the Scoville Memorial Library (about 8000 volumes in 1910); the Hotchkiss preparatory school (opened in 1892, for boys); the Salisbury School (Protestant Episcopal, for boys), removed to Salisbury from Staten Island in 1901 and formerly St Austin's school; the Taconic School (1865, for girls); and the Connecticut School for Imbeciles (established as a private charitable institution by Mr. and Mrs. Charles Housatonic, 1874, for private boys, and was eventually incorporated by them as the Connecticut School for Imbeciles, 1878, for boys and girls). In 1910 it had an enrolment of 200 boys, 44 girls, and 16 nurses; there were 80 boys in the dormitory, 46 in the cottage, and 26 in the hospital. The school manufactures are chiefly pig-iron, car wheels and general castings at Lime Rock, cutlery at Lakeville, and knife-handles and rubber brushes at Salisbury. The iron mines are among the oldest in the country; mining began probably as early as 1721.

The first settlement within the township was made in 1720 by Dutchmen and Englishmen, who in 1740 had bought from the Indians the land along the Housatonic river. "Wampanoag" is an Indian word said to mean "the wigwam place." In 1732 the township was surveyed with its present boundaries, and in 1738 the land (exclusive of that held under previous grants) was auctioned by the legislature, and the present name was adopted, and in 1741 the township was incorporated.

SALISBURY, a city and municipal and parliamentary borough, and the county town of Wiltshire, England, 532 m. W. by S. of London, on the London and South-Western and Great Western railways. Pop. (1901) 17,117. Its situation is beautiful. Viewed from the hills which surround it the city is seen to lie among flat meadows mainly on the north bank of the river Avon. The cathedral stands on the north side of the city, the streets of which are in part laid out in squares called the 'Cheques.' To the north rises the bare upland of Salisbury Plain.

The cathedral church of St Mary is an unsurpassed example of Early English architecture, begun and completed, save its spire and a few details, within one brief period (1220–1266). There is a tradition, supported by probability, that Elias de Derham, canon of the cathedral (d. 1245), was the principal architect. He was at Salisbury in 1220–1229, and had previously taken part in the erection of the shrine of Thomas à Becket at Canterbury. The building is 474 ft. in extreme length, the length of the nave being 229 ft. 6 in., the choir 151 ft., and the lady chapel 68 ft. 6 in. The width of the middle of the nave at the transept is 73 ft. 9 in. It rises to a height of 120 ft. 9 in. in the central portion (measured by the poet Browning) and 128 ft. in the other sections. The walls of the nave are painted in a white ashlar, with the design of a basket-work pattern. The nave and aisles are divided by marble columns, with capitals in the Early English style. The capitals of the choir, the chapter house and the cloister are of Purbeck marble, the spires being of greenish stone, and the tower of the external walls of white stone. The organ is in the south aisle. The present building has been much altered and restored, the majority of the spires being of comparatively modern date. The magnificent new choir screen of the early Perpendicular style was designed by Mr. E. G. Maufe, C.H.E., and was made at Limpsfield, Surrey, by Messrs. Swain and Son. The screen is of oak and stallion and is a perfect reproduction of the old. The altar of the cathedral is of green serpentine marble, and is of extremely recent date. The west front is a perfect example of the Perpendicular style, and is quite unique in England. In the nave and aisles are five detached Perpendicular chapels, and the detached belfry which stood to the north-west of the cathedral. One of the memorials is a...
small figure of a bishop in robes. This was long connected with the
ceremony of the "boy bishop," which, as practised both here and
elsewhere in the English church, consisted in the annual election of a choir-boy as "bishop" during the period between St.
Nicholas' and Holy Innocents' Days. The figure was supposed to
represent a boy who died during his tenancy of the office, and
small figures occur elsewhere, and have been supposed to mark
the separate burial-place of the heart. The lady chapel is the earliest
part of the original building, as the west end is the latest. The
colonnades and arches were added at a later period of architectural
bequest.
The chapter-house is of the time of Edward I., a very fine octagonal
example, with a remarkable series of contemporary sculptures.
The library contains many valuable MSS. and ancient printed books.
The choir- -covering nearly the whole of Dorsetshire, the greater part
of Wiltshire and very small portions of Berkshire, Hampshire,
Somersetshire and Devonshire.

There are three ancient parish churches: St. Martin's, with square
tower and spire, and possessing a Norman font and Early
English portions in the choir; St. Thomas's (of Canterbury), founded in 1240
as a chapel to the cathedral, and rebuilt in the 15th century; and St.
Edmund's, founded as the collegiate church of secular canons in
1268, but subsequently rebuilt in the Perpendicular period. The
residence of the college of secular priests is occupied by the modern
ecclesiastical college of St. Edmund's, founded in 1873. St. John's
chapel, founded by Bishop Robert Bingham in the 15th century, is
occupied by a dwelling-house. There is a beautiful chapel attached
to the St. Nicholas hospital. The poultry cross, or high cross, an
old Saxon church tower, and a central pillar, was erected by
Lord Montacute before 1335. In the market-place is Marochetti's
statue to Sidney Herbert, Lord Herbert of Lea. The modern public
buildings include the court-house, market, corn exchange and theatre.
A park was laid out by Osmund of Milford, on the site of the
jubilee of Queen Victoria, and in the same year a statue was erected to
Henry Fawcett, the economist, who was born at Salisbury. Among remaining
specimens of ancient domestic architecture may be mentioned the
banqueting-hall of John Hall, wool merchant, built about 1470
and Audley House, belonging also to the 15th century, and repaired
in 1881 as a diocesan church house. There are a large number of
educational and other charities, including the bishop's grammar
school, Queen Elizabeth's grammar school, the St. Nicholas hospital
and Trinity hospital, founded by Agnes Bottenham in 1379. Brewing,
tanning, carpet-making and the manufacture of hardware and of
wool goods are the chief industries, and the city is a centre of
the wool trade. The city is governed by a mayor, 7 aldermen
and 21 councillors. Area, 1710 acres.

History.—The neighbourhood of Salisbury is rich in antiquities.
The famous megalithic remains of Stonehenge (p. 2) are
not far distant. From Milford Hill and Fisherton many prehistoric relics have been brought to the fine
Old Sarum. Blackmore Museum in the city. But the site most
intimately associated with Salisbury is that of Old Sarum, the
history of which forms the preface to that of the modern city.
This is a desolate place, lying a short distance north of Salisbury,
with a huge mound guarded by a fosse and earthworks. The
summit is hollowed out like a crater, its rim surmounted by a
large cairn. Two miles away that its inner side rises like a
sheer wall of chalk 100 ft. high.

Old Sarum was probably one of the chief fortresses of the early
Britons and was known to the Romans as Sorbiodunum. Cerdic,
founder of the West Saxon kingdom, fixed his seat there in the
beginning of the 6th century. Alfred strengthened the castle,
and it was selected by Edgar as a place of national assembly to
devise means of checking the Danes. Under Edward the
Confessor it possessed a mint. The ecclesiastical importance of
Old Sarum begins with the establishment of a nunnery by Eadwine, the first Bishop of Sarum. Early in the 8th century Wiltshire had
been divided between the Sarum and Winchester dioceses. About
920 a bishopric had been created at Ramsbury,
east of Savernake Forest; to this Sherborne was joined in
1058 and in 1075/6 Old Sarum became the seat of a bishopric.
transferred hither from Sherborne. Osmund, the second bishop,
revised the form of communion service in general use, compiling
a misal which forms the groundwork of the celebrated "Sarum
Use." The "Sarum Breviary" was printed at Venice in
1483, and upon this, the most widely prevalent of English liturgies,
the prayer-books of Edward VI. were mainly based. Osmund
also founded, about 1070, the famous monastery of that of
Winchester. About 920 a bishopric had been created at Ramsbury,
east of Savernake Forest; to this Sherborne was joined in
1058 and in 1075/6 Old Sarum became the seat of a bishopric.

the prayer-books of Edward VI. were mainly based. Osmund
also founded, about 1070, the famous monastery of that of
Winchester. About 920 a bishopric had been created at Ramsbury,
Tuesday, in 1888 this was reported as of bad character and it is now discontinued. A grant of a weekly market on Tuesday was obtained from Henry III. In 1227. In 1240 this privilege was being abused, a daily market being held, which was finally prohibited in 1361. In 1376 a market on Saturday was granted by Edward III. and in 1658 another on every second Tuesday by Cromwell. In 1760 a wholesale cloth market was appointed to be held yearly on August 24. In 1888 and 1891 the market days were Tuesday and Saturday. A great corn market is now held every Tuesday, a cattle market on alternate Tuesdays, and a cheese market on the second Thursday in the month. Salisbury returned two members to parliament until 1885 when the number was reduced to one. As early as 1334 the town took part in foreign trade and was renowned for its breweries and woollen manufactories, and the latter industry continued until the 17th century, but has since completely declined. Commerce in timber gave rise to numerous confraternities amongst the various trades, such as those of the tailors, weavers and cutlers. The majority originated under Edward IV., though the most ancient—that of the tailors—was said to have been formed under Henry VI. and still existed in 1385. The manufacture of cutlery, once a flourishing industry, is now decayed.

See Victoria County History. Wilts.; Sir R. C. Hoare, History of New Sarum (1843); and History of Old Sarum (1843).

SALISBURY, a town and the county-seat of Wicomico county, Maryland, U.S.A., about 120 m. W. by S. of Raleigh. Pop. (1910) 6425; (1920) 8000. Its population increased very rapidly after 1860. It is served by the Baltimore, Chesapeake & Atlantic (which has shops here), and the New York, Philadelphia & Norfolk railways, and by steamers on the Wicomico river, which has a channel 9 ft. deep; Salisbury is the head of navigation. Grain, vegetables and lumber are shipped along the coast. Salisbury was founded in 1732, organized as a town in 1812, and incorporated in 1834 and again in 1888.

SALISBURY, a city and the county-seat of Rowan county, North Carolina, U.S.A., about 120 m. W. by S. of Raleigh. Pop. (1820) 1443; (1860) 6937; (1920) 7143. Salisbury is served by the Southern railway, which has repair shops here. It is the seat of Livingstone College (African Methodist Episcopal, removed from Concord to Salisbury in 1882, chartered 1885). There is a national cemetery here, in which 12,147 Federal soldiers are buried. The city has various manufactures and is the trade centre of the surrounding farming country. Salisbury was founded about 1753, was first incorporated as a town in 1755 and first chartered as a city in 1770. During the Civil War there was a Confederate military prison here. On the 12th of April 1865 the town was entered by General George Stoneman's cavalry encamped near Salisbury, and a force of about 3000 Confederates under General William M. Gardner, and captured 1364 prisoners and 14 pieces of artillery.

SALISHAN, the name of a linguistic family of North American Indian tribes, the more important of which are the Salish (Flatheads), Bellacoola, Clallam, Colville, Kalispel, Lummi, Nezqually, Okinagan, Puypell, Quinault, Sanpoil, Shushwap, Skokomish, Songees, Spokan and Tulalip. They number about 20,000, and live in the southern part of British Columbia, the coast of Oregon, and the north-west of Washington, Montana and Idaho. The coast Salish divide into the oceanic coast of Oregon, and the north side of the Bu Rragar opposite Rabat (q.v.). Pop. about 30,000. The shrine of Sidi Abd Allah Hasin in Salli is so sacred as to close the street in which it stands to any but Moslems. Outside the town walls there is no security for life or property. A bar at the mouth of the river excludes vessels of more than two hundred tons; steamers lie outside, communicating with the port by lighters of native build manned by descendants of the pirates known as "Salli Rovers." (See Barbary Pirates.)

SALLO, DENIS DE, Sieur de la Courdraye [pseudonym Sieur d'Hedemunde] (1626-1660). French writer, and founder of the first French literary and scientific journal, was born at Paris in 1626. In 1665 he published the first number of the Journal des savants. The Journal, under his direction, was suppressed after the thirteenth number, but was revived shortly afterwards. He died in Paris on the 14th of May 1669.

SALLUST [GAIUS SALLUSTIUS CRISPUS] (86-34 B.C.), Roman historian, belonging to a well-known plebeian family, was born at Amitynium in the country of the Sabines. After an ill-spent youth, which terminated too, he dwells upon the tribulicity of people in 52, the year in which Clodius was killed in a street brawl by the followers of Milo. Sallust was opposed to Milo and to Pompey's party and to the old aristocracy of Rome. From the first he was a decided partisan of Caesar, to whom he owed such political advancement as he attained. In 50 he was removed from the senate by the censor Appius Claudius Pulcher on the ground of gross immorality, the real reason probably being his friendship for Caesar. In the following year, no doubt through Caesar's influence, he was reinstated and appointed quaestor, which Sallust was opposed, and there may be of Caesar in his African campaign, which ended in the decisive defeat of the remains of the Pompeian party at Thapsus. As a reward for his services, Sallust was appointed governor of the province of Numidia. In this capacity he was guilty of such oppression and extortion that only the influence of Caesar enabled him to escape condemnation. On his return to Rome he purchased and laid out in great splendour the famous gardens on the Quirinal known as the Horti Sallustiani. He now retired from public life and devoted himself to historical literature. His account of the Catilina conspiracy (De conjuratis Catilinace deck Bar! Bellum Catilinarianum) and of the Jugurthine War (Bellum Jugurthianum) have come down to us complete, together with fragments of his larger and most important work (Historiae), a history of Rome from 78-67, intended as a continuation of L. Cornelius Sisenna's work. The Catilina Conspiracy (his first published work) contains the history of the memorable year 63. Sallust adopts the usually accepted view of Catilina, and describes him as the deliberate foe of law, order and morality, without attempting to give any adequate explanation of his views and intentions. Catilina, it must be remembered, had supported the party of Sulla, to which Sallust was opposed. There may be truth in Mommsen's suggestion that he was particularly anxious to clear his patron Caesar of all complicity in the conspiracy. Anyhow, the subject gave him the opportunity of showing off his rhetoric at the expense of the old Roman aristocracy, whose degeneracy he delighted to paint in the blackest colours. On the whole, he is not unfair towards Cicero. His Juxurgthine War, again, though a valuable and interesting monograph, is not a satisfactory performance. We may assume that he had collected materials and put together notes for it during his governorship. The difficulty of the narrative is in the sentences and the conciseness, too often in a tiresome, moralizing and philosophizing vein, but as a military history the work is unsatisfactory in the matter of geographical and chronological details. The extant fragments of the Historiae (some discovered in 1886) are enough to show the political partisan, who took a keen pleasure in describing the reaction against the dictator's policy and legislation after his death. The loss of the work is to be regretted, as it has thrown up much light on a very eventful period, embracing the war against Sertorius, the campaigns of Lucullus against Mithradates of Pontus, and the war against Jugurtha. There is also a work of letters (Dea epistolae de republica ordinata), letters of political counsel and advice addressed to Caesar, and an attack upon Cicero (Invectiva or Declamation in Ciceroem), frequently attributed to Sallust, are probably the work of a rhetorician of the first century a.d., also the author of a counter-invective by Cicero. Sallust is highly spoken of by Tacitus (Annals, iii. 30); and Quintilian (ii. 5, x. 1), who regards him as superior to Livy, does not hesitate to put him on a level with Thucydides. On the whole the verdict of antiquity was favourable to Sallust as an historian. He must struck out for himself practically a new line in literature, his predecessors having been little better than mere dry-as-dust chroniclers, whereas he endeavoured to explain the connexion and meaning of events, and was a successful delineator of character. The contrast between his early life

80
and the high moral tone adopted by him in his writings was frequently made a subject of reproach against him; but there is no reason why he should not have reformed. In any case, his knowledge of his own former weaknesses may greatly have assisted the majority of his fellow-men, and to judge them severely. His model was Thucydides, whom he imitated in his truthfulness and impartiality, in the introduction of philosophizing reflections and speeches, and in the brevity of his style, sometimes bordering upon obscurity. His fondness for old words and phrases, in which he imitated his contemporary Cato, was ridiculed as an affectation; but it was just this affectation and his rhetorical exaggerations that made Sallust a favourite author in the 2nd century A.D. and later.

Editions and translations in various languages are numerous. Editions in Latin and French are W. Muller (1787—1874); H. Jordan (1857); A. Eusenck (1887); (text and notes) F. D. Gerlach (1823—1831); F. Kritz (1828—1853; ed. minor, 1856); C. H. Frotscher (1830); C. Merivale (1852); F. Jacobs, H. Warz (1894); G. Long, revised by J. G. Frazer, with chief fragments of Histories (1884); W. W. Capes (1884); English translation by A. W. Pollard (1882).

There are many separate editions of the Catilina and Jugurtha, chiefly for schools.

His work, which was principally used for the revision of Florus. He then returned to Burgundy, and qualified for the succession to his father's post, which he eventually lost on account of his quarrels with the Grand Condé, who was his chief rival for the future dictatorship of France. Sallust, in his Histories, with copious additions of his own. In 1623 he married Anne Mercier, a Protestant lady of a distinguished family; the union was by no means a happy one, his wife being represented as a second Xanthe. His friendship with the scholar and humanist Salmianus prompted him to write his life of this critic, his commentary on Solinus's Polyhistor, or rather on Pliny, to whom Solinus is indebted for the most important part of his work. As greatness of this commentary may have been overlooked by his contemporaries, it is a monument of learning and industry. Salmianus learned Arabic to qualify himself for the botanical part of his task. After declining overtures from Oxford, Padua and Bologna, in 1631 he accepted the professorship formerly held by Joseph Scaliger at Leiden.

Although the appointment in many ways suited him, he found the climate trying; and he was persistently attacked by a jealous clique, led by Daniel Heinsius, who as university librarian refused access to the books which he wished to consult. After his removal to Holland, he composed at the request of Prince Frederick of Nassau, his treatise on the military system of the Romans (De re militari Romanorum), which was not published until 1657. Other works followed, mostly by way of diminishing the reputation of wigs and hair-powder, and a vindication of moderate and lawful interest for money, which, although it drew down upon him many expositions from lawyers and theologians, induced the Dutch Church to admit money-lenders to the sacrament.

His treatise De pristaiina Popae (1645), accompanying a republication of the tract of Nilus Cabasilas, excited a warm controversy in France, but was not noticed in England.

In November 1649 appeared the work by which Salmianus is best remembered, his Defensio regia pro Caroli I. His advice had already been sought on English and Scottish affairs, and, inclining to Presbyterianism or a modified Episcopacy, he had written against the Independents. It does not appear by whose influence he was induced to undertake the Defensio regia, but Charles II. defrayed the expense of printing, and presented the author with £100. The first edition was anonymous, but the author was universally known. A French translation which speedily appeared under the name of Cassian, was the work of Salmianus himself. His treasured work, in our day principally famous for the reply it provoked from Milton, even in its own time added little to the reputation of the author. His reply to Milton, which he left unfinished at his death, and which was published by his son in 1660, is insipid as well as abusive. Until the appearance of Milton's rejoinder in March 1651 the effect of the Defensio was no doubt considerable; and it probably helped to procure him the flattering invitation from Queen Christina which induced him to visit Sweden in 1658. Christina loaded him with gifts and distinctions, but upon the appearance of his book went over to the house of Gustavus, and in May 1659 he was bullied by an agent of his antagonist. Milton, addressing Christina herself, ascribes Salmianus's withdrawal from Sweden in 1651 to mortification at this affront, but this appears to be negated by the warmth of Christina's subsequent letters and her pressing invitation to return. The claims of the university of Leiden and dread of a second Swedish winter seem fully adequate motives. Nor is there any foundation for the belief that Milton's invectives hastened his death, which took place on the 3rd of September 1653, from an injudicious use of the Spa waters.

SALMARIUS, CLAUDIUS, the Latinized name of Claude Saumaise (1588—1653), French classical scholar, born at Semur-en-Auxois in Burgundy on the 15th of April 1658. His father, a councillor of the parliament of Dijon, sent him, at the age of sixteen, to Paris, where he became intimate with Casaubon. He proceeded in 1666 to the university of Heidelberg, where he devoted himself to the classics.

Here he embraced Protestantism, the religion of his mother; and his first publication (1668) was an edition of a work by Nilsus Cabasilas, archbishop of Thessalonica, in the 14th century, against the primacy of the pope (De primatu Popae), and of a similar tract by the Calabrian monk Barbaram (d. c. 1384). In 1669 he brought out an edition (1863) and B. Maurenbrecher (1891—1893); and there is an Italian translation (with notes) of the apostolic letters by G. Vittori. On Sallust generally J. W. Löboll's Zur Beurtheilung des S. 1849; and the late W. Curtius, Sallustiana (1863); S. Lebeau's Sallustiana (1857) and M. Jäger (1879 and 1884). T. Rambaud (1879): L. Constans, De sermone Salustiano (1880); P. Bellezza, De fonti e dell'autori di Sallustio (1880—1883). The Sallustiana of Teuffel-Schwabe's History of Roman Literature are full of information; see also bibliography of Sallust for 1879—1890 by B. Maurenbrecher in C. Burser, Jahresberichte über die Fortschritte der klassischen Altertumswissenschaften (1900).

The life of Salmianus was written at great length by Philippet de la Mare, counsellor of the parliament of Dijon, who inherited his MSS. from his son. Papillon says that this biography left nothing to desire, but it has never been printed. It was, however, used by Papillon himself, whose account of Salmianus in hisBibliothèque des ouvriers de Bourgogne (Dijon, 1745) is by far the best extant, and contains, beside the life, the extant letters of the author, and a biographical notice prefixed by an éloge by A. Clément prefixed to his edition of Salmianus's Letters (Leiden, 1656), and another by C. B. Morisot, inserted in his own Letters (Dijon, 1696). See also E. Haag, La France protestante, (ix. 149—173); and, for the Defensio regia, G. Masson's Life of Milton.

SALMERON Y ALFONSO, NICOLAS (1838—1906), Spanish statesman, was born at Alhama la Seca in the province of Almeria, on the 10th of April 1838. He was educated at Granada and Madrid, and distinguished himself in the Army of Andalusia, where he took part in the attack made on him in the Cortes on the 3rd of January 1874, which provoked the generals into closing the
chamber and establishing a provisional military government. Salmoner went into exile and remained abroad till 1881, when he was recalled by Sagasta. In 1886 he was elected to the Cortes as Progressive deputy for Madrid, and unsuccessfully endeavoured to combine the jarring republican factions into a party of practical moderate views. On the 18th of April 1907 he was shot at, but not wounded, in the streets of Barcelona by a member of the more extreme Republican party. He died at Pau on the 21st of September 1908.

**SALMON, GEORGE** (1839-1904), British mathematician and divine, was born in Dublin on the 29th of September 1819 and educated at Trinity College in that city. Having become senior moderator in mathematics and a fellow of Trinity, he took holy orders, and was appointed regius professor of divinity in Dublin University in 1866, a position which he retained until 1888, when he was chosen provost of Trinity College. He was provost until his death on the 22nd of January 1904. As a mathematician Salmon was a fellow of the Royal Society, and was president of the mathematical and physical section of the British Association in 1878. He was a D.C.L. of Oxford and an LL.D. of Cambridge.

His published mathematical works include: *Analytic Geometry of Three Dimensions* (1862), *Treatise on Conic Sections* (4th ed., 1863) and a Treatise on the Plane and Spherical Polyhedra (1873). The books of the highest value, and have been translated into several languages. As a theologian he wrote *Historical Introduction to the Study of the New Testament* (1885), *The Infalibility of the Church* (1888), *Non-Miraculous Christianity* (1881) and *The Reign of Law* (1873).

**SALMON and SALMONIDAE**. The Salmonidæ are an important family of fishes belonging to the Malacopterygian Teleosteans, characterized as follows: Margin of the upper jaw formed by the premaxillaries and the maxillaries—supra-occipital in contact with the frontals, but frequently overlapped by the parietals; there is a well-developed cavum auditory; the postclavicle is well developed. Ribs sessile, parapophyses very short or absent; epineurals, sometimes also epipleurals, present. Post-temporal forked, the upper branch attached to the epiotic, the lower to the opisthotic; postclavicle, as usual, applied to the inner side of the clavicle. A small adipose dorsal fin. Air-bladder usually present, large. Oviducts rudimentary or absent, the ova falling into the cavity of the abdomen before extrusion.

The Salmonidæ are very closely related to the Clupeidæ, or herring family, from which they are principally distinguished by the presence of postclavicles and by the presence of a rayless fin on the back, at a considerable distance from the tail or rayed dorsal fin; this so-called adipose fin is an easy recognition-mark of this family, so far as British waters are concerned, for, if it is present in several other families, these have no representatives in the area occupied by the fresh-water salmonids, with the exception of the North American Siluridæ and Percopidæ, which are readily distinguished by the pungent spine or spines which precede the rays of the first dorsal fin.

The imperfect condition of the oviducts, quite exceptional among fishes, owing to which the large ripe eggs may be easily squeezed out of the abdomen, is a feature of great practical importance, since it renders artificial impregnation particularly easy, and to it is due the fact that the species of Salmo have always occupied the first place in the annals of fish-culture.

The Salmonidæ inhabit mostly the temperate and arctic zones of the northern hemisphere, and this is the case with all fresh-water forms, with one exception, *Retropinna*, a salt-water fish from the coasts and rivers of New Zealand. A few deep-sea forms (*Argentinia*, *Microstoma*, *Nanuseus*, *Bathylyagus*) are known from the Atlantic, in the Mediterranean and the Antarctic ocean, down to 2000 fathoms. The question as to whether the salmonids, so many of which live in the sea, but resort to rivers for breeding purposes, were originally marine or fresh-water. The balance of opinion is in favour of the former hypothesis, which is supported by the fact that the overwhelming majority of the members of the suborder to which the salmonids form part permanently inhabit the sea. The clupeids, for instance, which are their nearest allies, are certainly of marine origin, as proved by their abundance in Cretaceous seas, yet a few, like the shads, ascend rivers to spawn, in the same way as the salmon does, without this ever having been adduced as evidence in favour of a fresh-water origin of the genus *Clupea* to which they belong.

No remains older than Miocene (*Osmorus*, *Prokymylus*, *Taumaturus*) are certainly referable to this family, the various Cretaceous forms originally referred to it, such as *Osmeroides* and *Pachyrhizobius*, belonging to the *Elophidæ*. There is probably no other group of fishes to which so much attention has been paid as to the Salmonidæ, and the species have been unduly multiplied by some writers. Perhaps not more than 80 should be regarded as valid, but some of them fall into a number of local forms which are distinguished as varieties or subspecies by some authors, whilst others would assign them full specific rank. These differences of opinion prevail whether we deal with *Salmo* proper or with *Coregonus*.

**Classification.**—The recent genera may be arranged in five groups: The first, which includes the so-called *Brachyrynchus*, *Slenodus*, *Coregonus*, *Phylogyphtyx* and *Tymallus*, has 8 to 13 rays in the ventral fin, the pyloric appendages more or less numerous (17 to 200) and breeding takes place in fresh water. The second group, genera *Coregonus*, *Brachypinnus*, *Post-branchial* and *branchial* favourites, marine, and is characterized by 6 branchiostegal rays, 11 to 14 ventral rays, the stomach caecum with pyloric appendages in moderate numbers (12 to 20). The third group, genera *Osmorus*, *Thaleichthys*, *Altus*, *Sapthurus* and *Hypomesus*, has 10 to 16 branchiostegal rays, 6 to 8 ventral rays, the stomach caecal, with pyloric appendages few (2 to 11) or rather numerous. The fourth group, genera *Microstoma*, *Nannodes*, *Bathylyagus*, with the branchiostegal rays reduced to 3 or 4, ventral rays 8 to 10; the stomach caecal and pyloric appendages absent; whilst the fifth group, with the genera *Retropinna* and *Salanx*, is distinguished from the preceding in having no air-bladder, branchiostegal rays reduced to 2 or 3, ventral rays 6 or 7, stomach siphonal and pyloric appendages absent.

The genus *Salmo*, the most important from the economical and commercial points of view, is characterized by small smooth scales, which are sometimes so abundant that they are used for making paper. A moderately high dorsal fin with 10 to 12 well-developed rays, and a large mouth provided with strong teeth, which are present not only in the jaws and on the palate, but also on the tongue; the maxillary or posterior bone of the upper jaw extends to below or beyond the eye. Young specimens (see *Parr*) are marked with dark vertical bars on the sides (parr-marks), which in some trout are retained throughout life.

The teeth, which include the caudal fin more or less deeply forked or marginated, the form of the fin changing with the age and sexual development of the fish. Adult males have the jaws more produced posteriorly, the males and females, and both snout and chin may be curved and hooked. As pointed out by Dr. G. A. B. Salter, it is necessary to make a profound study of the members of this genus, and especially of the British forms, there is probably no other group of fishes which can be quite as difficult in its distinctions of species. The discrimination of species, as well as to certain points in their life-history, the almost infinite variations which they undergo being dependent on age, sex and sexual development, food and the properties of the water. The difficulties in their study have rather been increased by the excessive multiplication of so-called specific forms. Opinions also vary as to the importance to be attached to the characters which serve to group the principal species into natural divisions. Whilst A. Günther divided two genera, *Salmo* and *Oncorhynchus*, D. S. Jordan and B. W. Evermann go so far as to recognize five, *Oncorhynchus*, *Salmo*, *Hucho*, *Cristovomer* and *Salvelinus*. The latter arrangement is certainly one more logical than that of the first genus and the second being of rather less importance than that between the second and the third. However, considering the slightness of the distinctive characters on which these divisions are based, it is not unreasonable that the various species which the writer of this article thinks it best to maintain the genus *Salmo* in the wide sense, whilst retaining the divisions as subordinate divisions or sub-genus, with the following distribution.

**Oncorhynchus** (Pacific salmon).—*Vomer* flat, toothed along the shaft, at least in the young: anal fin with 12 to 17 well-developed rays.

**Salmo** (true salmon and trout).—*Vomer* flat, toothed along the shaft, at least in the young: anal fin with 8 to 12 well-developed rays.

**Salvelinus** (char).—*Vomer* boat-shaped, the shaft strongly depressed and the head, which alone is toothed, the teeth forming an isolated fascicle in a slightly curved row of widely-spaced rays.

**Hucho** (huchen).—*Vomer* as in the preceding, but teeth forming a single arched transverse series continuous with the palatine teeth: anal fin with 8 to 10 well-developed rays.

The salmon itself (*Salmo salar*), the type of the family, is a large fish, attaining a length of 4 or 5 ft., and living partly in the
The grilse, after spawning in autumn, return again to the sea in the winter or following spring, and reascend the rivers as mature salmon. The hatching of the grilse into salmon in the river commences early in the season; the salmon are grilse, or "kelts." The following chart at the end of this section illustrates the growth of grilse into salmon: a grilse-kelt of 2 lb was marked on March 31, 1858, and recaptured on August 2 of the following year as a salmon of 8 lb.

The ascent of rivers by adult salmon is not so regular as that of grilse, and the knowledge of the subject is not complete. Although salmon scarcely ever spawn before the month of September, they do not always appear in the river in the same season; the period extends throughout the spring and summer. A salmon newly arrived in fresh water from the sea is called a clean salmon, on account of its shining, well-formed scales; but as the fish lose the brilliancy of their scales and deteriorate in condition, the time of year at which clean salmon ascend from the sea varies greatly in different rivers; and rivers are, in relation to this subject, very difficult to determine. Salmon emaciated, as the German Ocean and Pentland Firth are almost early, while those of the Atlantic slope are late. The Thurso in Caithness and the Naver in Sutherlandshire contain fresh-run salmon in December and January the same is the case with the Tay. In Yorkshire salmon commence their ascent in July, August or September if the season is wet, but if it is dry their migration is delayed till the autumn rains set in. In all rivers more salmon ascend immediately after a spate or flood than when the river is low, and more with the flood tide than during the ebb. In their ascent salmon are able to pass obstructions, such as waterfalls and weirs of considerable height, and to ascend the least navigable part of the river. The impediments and the persistence of their efforts are very remarkable.

We reproduce here, with additions, Professor Noel Paton's summary (published first in the tenth edition of this Encyclopædia) of observations on the life-history of the salmon. "Advances in our knowledge of the life-history of the salmon have been made through the investigations of Professor F. Miescher on the Rhine at Basel, of Professor P. P. C. Hoek in Holland, of Mr. Archer's observations in the River Sands in Norway, and as lessee of the river Sands in Norway and as inspector of salmon fisheries for Scotland in conjunction with Messrs Gray and Tosh, and of a number of workers in the laboratory of the Royal College of Physicians of Edinburgh. With regard to the food of salmon, the enormously rapid growth of smolts to grilse and of salmon from year to year shows that they feed in the sea. In a few months a smolt will increase from a few ounces to 4 or 5 lb; while Archer's observations of 16 salmon which had been marked in the sea during the following year showed an average gain of 36% reckoned on from kelting stage to kelting stage. During the season of 1895 Tosh, at the mouth of the Tay in Scotland, discovered a young salmon 3 lb. 14 oz. and found food in the stomachs of 76, or over 14% of the whole. As to the nature of the food, it was found to be as follows:

- **Herring**
- **Casseters, ammphipods, etc.**
- **Sand eels**
- **Haddock and whiting**
- **Feathers and vegetable matter**

Excluding the feathers and vegetable matter, which are not really food, the principal item of food of salmon is fish, and the bulk of the food is marine origin. Hoek, out of 2000 fish examined by him, found 7 with food in the stomach, and, curiously enough, 4 of these were taken on the same day. The food of salmon consists of various sorts of fish. As to where salmon go to feed in the sea, our information is still very deficient, but the prevalence of herring in the stomach would seem to indicate that they must follow the schools of these fish which approach the coast during the summer months. While there can be no doubt that salmon feed in the sea, the question of whether they feed in fresh water has been much debated. It is difficult for the popular mind to conceive of an active fish like the salmon subsisting for several months without food, and the fact that the fish so frequently not only takes into its mouth but actually swallows worms and various lures has still further tended to confirm many people that salmon do not feed in fresh water. In defence of the question it is well clearly to understand what is meant by feeding. It is the taking, digesting and absorbing of material of use in the economy in such quantities as to be of benefit to the animal. A salmon which has not fed during a month is not said that all the evidence we possess is entirely opposed to the view that salmon feed when in fresh water. Miescher examined the stomachs of about 2000 salmon captured at Basel, about 500 m. from the mouth of the Rhine. He found only two did he find any fish, but the rest contained feeding. These two fish were male kelts. One contained the remains of a cyprinoid fish, and the other had a diluted stomach with an empty secretionary coating. It has long been known that salmon examined about 2000 fish, found food of marine origin in 7, but in none food derived from fresh water. Of the 132 stomachs of salmon from the estuaries and upper waters of Scottish rivers 126 had no food, but 8 contained any food remains. The stomach of salmon captured in fresh water is collapsed and shrunkken. Its mucous membrane is thrown into folds, and it contains a small amount of mucus of a neutral reaction. The intestine, which usually contains numerous
tadpoles, is full of a greenish-yellow viscous material which, when examined under the microscope, is found to consist of mucus with abundant numerous small flaccid eggs. It is possible that for certain periods of time, the supply of food would be insufficient, and that large quantities of albuminous material accumulated in their bodies. In the early running fish this material is largely confined to the muscles, but in the later coming fish it is more equally distributed between muscles and genitalia. The latter, as in the case of the female fish, would be incapable of digesting albuminous material, and if we express the results of all the fish examined in terms of fish of uniform size—100 cm. in length—the following results are obtained:

<table>

It would thus appear that, when the salmon has in the sea accumulated a certain definite amount of nourishment, it ceases to feed, and returns to the river irrespective of the state of its genital organs. Nutrition, and not the _nius generalis_, appears to be the motive power which urges the fish to return to the river.

### Course of Migration

It is well known that while salmon run all the year through in greater or lesser numbers, the run of grilse takes place in the spring, and that of salmon in the autumn. It is not possible to divide the salmon into classes—the so-called winter salmon of the Rhine, large fish running from October to February, and the summer salmon, running for the most part from March to October, with salmon in the intermediate stage or less ripe. These summer fish are small in the early months, but increase in size as the autumn advances. The winter salmon, along with the male grilse and spring fish, appear to pass directly to the upper reaches of the river, and to spawn there, while the larger late-comers fish appear to populate the lower waters. This seems to be indicated by the comparison of upper-water and estuary fish throughout the year. The method adopted to detect salmon in the estuary consists in adding a trace of some material to the fish, and it is thus possible to determine what proportion of females as well as captured during the early months of the season must have a more prejudicial effect upon the breeding stock.

### Rate of Migration

By comparison of the first appearance of winter salmon and of grilse in the markets of Holland and of Basel—500 m. up the river—Mischers gives some data for the determination of the rate at which salmon run. He found that 20% of salmon caught by the billion trees near the mouth of the Tweed were taken between the end of March and the end of April, and that 30% was taken between the end of April and the end of May. It was found that winter salmon appeared at Basel about 54 days after their appearance in Holland, which would give a rate of passage of about 10 m. per day. From a smaller number of observations on the Rhine, Lull and others have recorded a rate of 20 miles per day. This is, however, doubtful, how far these figures are of value in deciding the rate at which fish pass up the lower reaches of the river.

Great difficulties have been experienced in ascertaining the age and rate of growth of salmon. The practice has long ago been resorted to of marking salmon, the most satisfactory mark being a small oblong silver label, oxidized or blackened, bearing distinctive letters and numbers, to the dorsal fin. But of late the structure of the scales has been studied with the object of obtaining indications of the age, growth and spawning habit. H. W. Johnston in 1905 contributed an interesting paper on the subject. The scales bear concentric lines, which vary in number and relative distance according to the growth of the fish, and during the feeding periods these lines are added with more rapidity and a greater degree of separation than at other times. Johnston has endeavoured to ascertain the age of the fish from the number of these rings and as a result of the number of lines external to their last annual rings some clue to the time at which they left the sea; he is thus able to distinguish among ascending salmon such as are on their first return from such as have made the journey once or oftener before.

The group of Pacific salmon, or king salmon, commonly designated as _Oncorhynchus_, contains the largest and commercially the most important of the Salmonidae. This genus includes species inhabiting the North Pacific and entering the rivers of America as well as of Asia. The best known and most valuable is the quinnat (S. quinnat), ascending the large rivers in _spring_ and _summer_, and _fall_ and _winter_ as far as the head of the salmon season is over, and never return to the sea. For the important _Salmonidae_ known as _TROUT_, _CHAR_, _WHITEFISH_, _SMelt_, _GRAYLING_, _&c., see the article on _FRESHWATER FISHES_. 

1 Winter fish not due to spawn till following November.
SALOMEUS—SALONICA

as the salmon, of silvery coloration, with numerous small black dots, eyes reaching to the dorsal fin. Allied to it are S. fluviatilis from Siberia and S. perryi or blackstoni from the northern island of Japan. The genus Stenodus is intermediate between Salmo and Coregonus (whitefish). S. lucioperca is the inhabitant of the Arctic ocean, inhabiting the Carsea and ascending the Volga and the Ural; it is also found in the Arctic ocean, ascending the Ob, Lena, &c. It grows to a length of 5 ft. A second species occurs in Arctic North America; this is S. salvelinus, from the Mackenzie river and its tributaries.

The capelin (Mallotus villanus, so called from the villous bands formed by the scales of mature males) is a salmonoid of the Arctic sea region, which, in its native land, lays its eggs in the sand along the shores in incredible numbers, the beach becoming a quivering mass of eggs and sand. Plecoscossus, a salmonoid from Japan, leaves the eggs covered with a layer of spongy, transparent, pale, lateral teeth. The sid-smelts, Argentina, are deep-sea salmonoids, of which examples have occasionally been taken off the coasts of Scotland and Ireland. Bathylogy, another salmonid distantly related by the "Challenger" expedition, is still better adapted for life at great depths (down to 1700 fathoms), the eyes being of enormous size.

SALOMONEUS, in Greek mythology, son of Aeolus (king of Magnesia in Thessaly, the mythic ancestor of the Aeolian race), grandson of Helen and brother of Sisyphus. He removed to Elis, where he built the town of Salomone and became ruler of the country. His subjects were ordered to the care of the hero, who protected them against the attacks of the Thracian Thracians; he also rose to prominence as a hero of braves over which he drove at full speed in his chariot to imitate thunder, the effect being heightened by dried skins and caldrons trailing behind, while torches were thrown into the air to represent lightning. At last Zeus smote him with his thunderbolt, and destroyed the town (Apollodorus i. 9. 7; Hyginus, Fab. 60, 61; Strabo viii. p. 356; Manlius, Astronom. 5. 91; Virgil, Aen. vi. 585, with Heyne's excursus). Joseph Warton's idea that the story is introduced by Virgil as a protest against the Roman custom of dedication is not supported by the general tone of the Aeneid itself. According to R. W. Evermann, Fishes of North America, 1903, see also Golden Bough, i., 1900, p. 82), the early Greek kings, who were expected to produce rain for the benefit of the crops, were in the habit of imitating thunder and lightning in the character of Zeus. At Cnannon in Thessaly there was a bronze chariot, which in time of drought was shaken and prayers offered for rain (Antigonus of Carystus, Historiae mirabiles, 15). S. Reinach (Revue archéologique, 1903, i. 154) suggests that the story that Salomeus was struck by lightning was due to the misinterpretation of a picture, in which a Thessalian magician appeared bringing down lightning and rain from heaven; hence arose the idea that he was the father of the jealousy of Zeus, and that the picture represented his punishment.

SALOME, in Jewish history the name borne by several women of the Herod dynasty. (1) Sister of Herod the Great, who became the wife successively of Joseph, Herod's uncle, Costobar, governor of Idumea, and a certain Alexas. (2) Daughter of Herod by Eipsis, his eighth wife. (3) Daughter of Herodias by her first husband Herod Philip. She was the wife successively of Philip the Tetrarch and Aristobulus, son of Herod of Chalchis. This Salomea is the only one of the Gulf of Salomea (St. John 111. 50), who is mentioned in the New Testament (Matt. xiv. 3 sqq.; Mark vi. 17 sqq.) and only in connexion with the execution of John the Baptist. Herod Antipas, pleased by her dancing, offered her a reward "unto the half of my kingdom"; instructed by Herodias, she asked for John the Baptist's "head in a charger" (see HEROD II. ANTIPAS).

Salome is also the name of one of the women who are mentioned as present at the Crucifixion (Mark xv. 40), and afterwards in the Sepulchre (xvi. 1). Comparison with Matt. xxviii. 53 suggests that she is the same who also accompanied the sepulchre later. It is further conjectured that she was a sister of Mary the mother of Jesus, in which case James and John would be cousins of Jesus. In the absence of specific evidence any such identification must be regarded with suspicion.

SALON, a town of south-eastern France, in the department of Bouches-du-Rhône, 40 m. N.N.W. of Marseilles by rail. Pop. (1906), town, 9927; commune, 14050. Salon is situated on the eastern border of the plain of Cteau and on the irrigation canal of Craponne, the engineer of which, Adam de Craponne (1355-1436), was also   a   celebrated   astrologer. The chief buildings are the church of St. Laurens (14th century), which contains the tomb of Michael Nostradamus, the famous astrologer, who died at Salon in 1565, and the church of St Michel (12th century), with a fine Romanesque portal. The central and oldest part of the town preserves a gateway of the 15th century and the remains of fortifications. There are remains of Roman walls near Salon, and in the hôtel-de-ville (17th century) there is a milestone of the 4th century. The town carries on an active trade in oil and soap, which are the chief of its numerous manufactures. Olives are largely grown in the district, and there is also a trade in the manufacture of cloth.

SALONICA, SALONIK or SALONIK (anc. Thessalonica, Turkish Selanik, Slav. Salon); the capital of the Turkish vilayet of Salonika, in western Macedonia, and one of the principal seaports of south-western Europe. Pop. (1905) about 130,000, including some 60,000 Sephardic Jews, whose ancestors fled hither in the 16th century to escape religious persecution in Spain and Portugal: their language is a corrupt form of Spanish, called Ladino (i.e. Latin), and spoken to some extent by other communities in the city. Salonica lies on the west side of the Chalcidic peninsula, in Macedonia, near the opening of the Bay of Salonica, on a fine bay whose southern edge is formed by the Calamarian heights, while its northern and western side is the broad alluvial plain produced by the discharge of the Vardar and the Bistriza, the principal rivers of western Macedonia. Built partly on the low ground along the edge of the bay and partly on the hill to the north (a compact mass of mica schist), the city with its white houses enclosed by white walls runs up along natural ravines to the castle of the Heptapyrgion, or Seven Towers, and is rendered picturesque by numerous domes and minarets and the foliage of elms, cypresses and mulberry trees. The commercial quarter of the town, lying to the north-west, towards the great valleys by which the inland traffic is conveyed, is pierced by broad and straight streets paved with lava. There are electric tramways and a good water-supply, but most of the older houses are fragile wooden structures coated with lime or mud, and the sanitation is defective. Apart from churches, mosques and synagogues, there are a few noteworthy modern buildings, such as the Ottoman Bank, the baths, quarantine station, schools and hospitals; but the chief architectural interest of Salonica is centred in its Roman and Byzantine remains.

The Via Egnatia of the Romans (mod. Jassijol or Grande Rue de Vardar) traverses the city from east to west, between the Vardar Gate and the Calamarian Gate. Two Roman triumphal arches used to span the Via Egnatia. The arch near the Vardar Gate—a massive stone structure probably erected towards the end of the 1st century A.D., was destroyed in 1867

Charger, a large flat plate (see CHARGE).
to furnish material for repairing the city walls; an imperfect inscription from it is preserved in the British Museum. The other arch, popularly called-the arch of Constantine but with greater probability the arch of Galerius (A.D. 305–311), is built of brick and partly faced with sculptured marble. A third example of Roman architecture—the remains of a white marble portico supposed to have formed the entrance to the hippodrome—is known by the Judeo-Spanish designation of Las Incantadas, from the eight Caryatides in the upper part of the structure. There are also numerous fragments of Roman inscriptions and statuary. The conspicuous mosques of Salonica are nearly all of an early Christian origin; the remarkable preservation of their mural decorations makes them very im-
pressive, and the inscriptions are by no means negligible. Most of the four hundred mosques are those dedicated to St. Sophia, St. George and St. Demetrius. St. Sophia (Aya Sofya), formerly the cathedral, and probably erected in the 6th century by Justinian's architect Anthemius, was converted into a mosque in 1458. It is 110 ft. wide, with walls of white marble. The whole length of the interior is 310 ft. The nave, forming a Greek cross, is surmounted by a hemispherical dome, the 600 sq. yds. of which are covered with a rich mosaic representing the Ascension. The doors, which frame the main entrance, are 18 ft. thick, and at the angles of an inscribed octagon are arches formed in the thickness of the wall, and roofed with wagon-headed vaults visible on the exterior; the eastern chapel, however, is en-
laced with a bema and a portico projected beyond the circle, and the western and southern chapels constitute the two entrances of the building. The dome, 72 yds. in circumference, is covered throughout its entire surface of 600 sq. yds., with what is the largest work in ancient mosaic still extant, representing a series of fourteen saints standing in the act of adoration in front of temples and colonnades. The Esaki Juma, or Old Mosque, is another interesting example of the use of mosaic, and contains an apse without side chapels. The churches of the Holy Apostles and of St. Elias also deserve mention. Of the secular buildings, the Caravanserai, usually attributed to Murad II. (1422–1451), probably dates from Byzantine times.

Salonica is the see of an Orthodox Greek archbishop. Each religious community has its own schools and places of worship, among the most important being the Jewish high-school, the Greek and Bulgarian gymnasia, the Jesuit college, a high-school founded in 1880 and supported by the Jewish Mission of the Established Church of Scotland, a German school, dating from 1887, and a college for the study of law. The town has been both within the French and early Austrian; in 1856 the Normans of Sicily took Thessalonica after a ten days' siege, and perpetrated endless barbarities, of which Eustathius, then bishop of the city, has left an account. In 1204 Baldwin, conqueror of Constantinople, conferred the kingdom of Thessalonica on Boniface, marquis of Montferrat; but in 1222 Theodore, despot of Epirus, one of the natural enemies of the new kingdom, took the city and had himself there crowned by the patriarch of Macedonian Bulgaria. On the death of Demetrius, who had been supported in his endeavour to recover his father's throne by Pope Honorius II., the city fell into the hands of the Turks, who massacred the population. In 1566 the house of Burgundy received a grant of the titular kingdom from Baldwin II., who was titular emperor, and it was sold by Eudes IV. to Philip of Tarentum, titular emperor of Romania, in 1320. The Venetians to whom the city was transferred by one of the Palaeologi, were in power when Murad II. appeared, and on the 1st of May 1430, in spite of the desperate resistance of the inhabitants, took the city, which had thrice previously been in the hands of the Turks. They cut to pieces the body of St. Demetrius, the patron saint of Salonica, who had been the Roman proconsul of Greece under Maximian, and was martyred in A.D. 306. In 1876 the French and German consuls at Salonica were murdered by the Turkish populace. On the 4th of September 1890 more than 2000 houses were destroyed by fire in the south-eastern quarters of the city. During the early years of the 20th century Salonica was the headquarters of the Committee of Union and Progress, the central organization of the Young Turkey Party, which carried out the constitutional revolution of 1908. Before this event the weakness of Turkey had encouraged the belief that Salonica would ultimately pass under the control of Austria-Hungary or one of the Balkan States, and this belief gave rise to many political intrigues which helped to delay the solution of the Macedonian Question.

Viyet.—The viyayet of Salonica has an area of 13,510 sq. m., and an estimated population of 1,150,000. It is rich in minerals, including chrome, manganese, zinc, antimony, iron, argentiferous...
SALON—SALT

lead, arsenic and lignite, but some of these are unworked. The chief agricultural products are grain, rice, beans, cotton, opium and poppy seed, sesame, linseed, red pepper, and much of the finest tobacco grown in Europe; there is also some trade in timber, livestock, skins, furs, wool and silk cocoons. The growth of commerce has been impeded by the ignorance of cultivators, the want of good roads, and the great diversity of types in the soil. Apart from the industries carried on in the capital, there are manufactures of wine, liqueurs, sesame oil, cloth, macaroni and soap. The principal towns, Seres (pop. 30,000), Duma (25,000) and Cavalla (24,000), are described in separate articles; Tikvesh (21,000) is the centre of an agricultural region, Carasferia (14,000) a manufacturing town, and Drama (13,000) one of the centres of tobacco cultivation.

SALON, a large room for the reception of guests in Napoleon's time. The French salon itself is described in Old English by the cognate sal, hall, properly “abiding-place,” from the root seen in Gothic saljan, to dwell, cf. Russ. selo, village. The word in its proper sense has now a somewhat archaistic flavour, being chiefly used of the 18th century, and it has come principally to be used (1) of the large rooms on passenger steamer; (2) on English railways of carriages for the accommodation of large parties not divided into compartments, and in the United States of the so-called “drawing-room cars”; and (3) of a bar or place for the sale of intoxicating liquors. SALSIFY, Tragopogon porifolius, a hardy biennial, with long, cylindrical, fleshy, esculent roots, which, when properly cooked, are extremely delicate and wholesome; it occurs in meadows and pastures in the Mediterranean region, and in Britain is confined to the south of England, but is not native. The salsify requires a free, rich, deep soil, which should be trenched in autumn, the manure used being placed at two spades' depth from the surface. The first crop should be sown in March, and the main crop in April, in rows a foot from each other, the plants being thinned to 18. in. apart. In November the unerotted plants should be taken up and stored in sand for immediate use, others being secured in a similar way during intervals of mild weather. The genus Tragopogon belongs to the natural order Composite, and is represented in Britain by goat's beard, T. pratensis, found in meadows, pastures and waste places. The flowers close at noon, whence the popular name "John-go-to-bed-at-noon.”

SALSETTTE ("sixty-six villages"), a large island in British India, N. of Bombay city, forming part of Thana district. Area, 246 sq. m. It is connected with Bombay by a causeway which was introduced with the Mahul Railway line. Salsette is a borderland, a well-wooded tract, its surface being diversified by hills and mountains, of considerable height, while it is rich in rice fields. In various parts of the island are ruins of Portuguese churches, convents and villas; while the cave temples of Kanheri form a subject of interest. There are 109 Buddhist caves, which date from the end of the 2nd century A.D., but are not so interesting as those of Ajanta, Ellora and Karli. Salsette is crossed by two lines of railway, which have encouraged the building of villa residences by the wealthier merchants of Bombay. The population in 1901 was 146,633. The island was taken from the Portuguese by the Marathas in 1730, and from them by the British in 1774; it was formally annexed to the East India Company's dominions in 1782 by the treaty of Salbai. There is another Salsette in the Portuguese settlement of Goa, a district with a population (1900) of 18,600.

SALSO MAGGIORE, a village of Emilia, Italy, in the province of Parma, 6 m. S.W. of Borgo San Donnino by steam train. Pop. (1901) 1387 (village); 7274 (commune). It is situated 525 ft. above sea-level at the foot of the Apennines, and is a popular watering-place, the baths being especially frequented. The water is strongly saline.

SALT, SIR TITUS, BART. (1803-1870), English manufacturer, was born on the 20th of September 1803, at Morley, Yorkshire. In 1820 he was apprenticed to learn wool-stapling at Bradford, and his father, having followed him there and started in that business, took him into partnership in 1824. His success in introducing the coarse or Vit-Vol wool, and much of the finest English worsted manufacture, due to special machinery of his own devising, gave him a great impetus. In 1836 he solved the difficulties of working alpaca (q.v.) wool, created an enormous industry in the production of the staple goods for which that name was retained, and became one of the richest manufacturers in Bradford. In 1853 he opened, a few miles out of the city on the Aire, the extensive works and model manufacturing town of Saltaire. From 1859-1861 Salt was Mayor of Bradford, of which city he had been mayor in 1848, and in 1869 he was created a baronet. He died on the 20th of September 1876, and was accorded a public funeral. After his death his many benevolent institutions at Saltaire, at first continued by his widow, were transferred to a trust.

See R. Balgarnie, Sir Titus Salt, His Life and its Lessons.

SALT (a common Teuton word, cf. Dutch zout, Ger. Salz, Scand. salt; cognate with Gr. άιον, Latin salis) is a substance which is given up or evolved by substituting the hydrogen of an acid by a metal or a radical acting as a metal, or what comes to the same thing, by eliminating the elements of water between an acid and a base (see ACID; CHEMISTRY).

Common Salt.

Common salt, or simply salt, is the name given to the native and industrial forms of sodium chloride, NaCl. Pure sodium chloride, which may be obtained by passing hydrochloric acid gas into a saturated solution of the salt, is precipitated, forms colourless, crystalline cubes (see also below under Rock salt) which melt at 815.4°, and begins to volatilize at slightly higher temperatures. It is readily soluble in water, 100 parts of which dissolve 35.52 parts at 0° and 39.16 parts at 100°. The saturated solution at 100° contains 40-35 parts of salt to 100 of water. On cooling a saturated solution to -10°, or by cooling a solution in hot hydrochloric acid, the hydrate NaCl·2H₂O separates; on further cooling an aqueous solution to -20° a cryohydrate containing 23.7% of the salt is deposited. The consideration of this important substance is not included here.

SALT, the word is probably derived from the other, most rock salt deposits bearing evidence of having been formed by the evaporation of lakes or seas.

Salt—Generally the term salt alludes to any compound of sodium (q.v.) or potassium, KCl, and chlorine, Cl₂. Common salt or table salt, NaCl, and rock salt, NaCl·2H₂O, are the substances which are usually meant when the term salt is employed. Salt is of various kinds, and occurs in various forms. The common salt of commerce is a well-known variety of rock salt, which is used in the preparation of the other forms of salt, and is essentially the same as the common salt of the sea. Common salt of the sea water contains 0.2% of NaCl, and, allowing an average density 2.25 for rock-salt, it has been computed that the entire ocean if dried up would yield no less than four and a half million cubic miles of rock-salt, or about fourteen and a half times the bulk of the entire continent of Europe above high-water mark. The proportion of sodium chloride in the water of the ocean, where it is mixed with small quantities of other salts, is on the average about 3.3%, ranging from 2.9% for the polar seas to 3.5% or more at the equator. Enclosed seas, such as the Mediterranean, the Red Sea, the Black Sea, the Dead Sea, the Caspian and others, are dependent of course for the proportion and quality of their saline matter on local circumstances (see OCEAN).

At one time almost the whole of the salt in commerce was produced from the evaporation of sea water, and indeed salt so made still forms a staple commodity in many countries possessing a seaboard, especially those where the climate is dry and the summer of long duration. In Portugal there are salt works at Setubal, Alacer do Sal, Figueira and Aveiro. Spain has salt works at the Bay of Cadiz, the Balearic Islands, &c.; Italy at Sicily, Naples, Tuscany and Sardinia. France has its "marais salants du midi" and also works on the Atlantic seaboard; whilst Austria has "Salzgärten" at various places on the Adriatic (Sabbioncello, Trieste, Pirano, Capo d'Istria, &c.). In England and Scotland the industry has greatly fallen off under the competition of the rock-salt works of Cheshire.

The process of the spontaneous evaporation of sea water was studied by Ussigio on Mediterranean sea water at Cetee. The density at first was 1-02. Primarily but a slight deposit is formed (none until the concentration arrives at specific gravity 1-050), this deposit consisting for the most part of calcium carbonate and ferric oxide. This goes on till a density of 1-35 is attained, when hydrated calcium sulphate begins to deposit, and continues till specific gravity 1-246 is reached. At a density of 1-218 the deposit becomes augmented by sodium chloride, which goes down mixed with a little magnesium chloride and sulphate. At specific gravity 1-246 a
little sodium bromide has begun also to deposit. At specific gravity 1·311 the volume of the water contained—

Up to the time then that the water became concentrated to specific gravity 1·218 only 0·150 of deposit had formed, and that chiefly composed of lime and iron, but between specific gravity 1·218 and 1·313 there is deposited a mixture of—

Of this about 95% is sodium chloride. Up to this point the separation of the salts has taken place in a fairly regular manner, but now the temperature begins to exert an influence, and some of the salts deposited in the cold of the night dissolve again partially in the heat of the day. By night the liquor gives nearly pure magnesium sulphate; in the day the same sulphate mixed with sodium and potassium chlorides is deposited. The mother-liquor now falls to a specific gravity of 1·308 to 1·2665, and yields a very mixed deposit of magnesium bromide and chloride, potassium chloride and magnesium sulphate, with the double magnesium and potassium sulphate, in the locality of Stassfurt. There is also deposited a double magnesium and potassium chloride, similar to the carnallite of Stassfurt, and finally the mother-liquor, which has now been reduced to specific gravity 1·3374, contains only pure magnesium chloride.

The application of these results to the production of salt from sea water is obvious. A large piece of land, barely above high-water mark, is levelled, and if necessary puddled with clay. In tidal seas a "jas" (or storage reservoir) is constructed alongside, similarly rendered impervious, in which the water is allowed to settle and separate to a certain extent. In non-tidal seas this storage basin is not required. The prepared land is partitioned off into large basins (adermes or manants) and others (called in France aires, aquedus or tables salantes) which get smaller and more shallow in proportion as they are intended to receive the water as it becomes more and more concentrated, just sufficient fall being allowed from one set of basins to the other to cause the water to flow slowly through them. The flow is often assisted by pumping. The sea salt thus made is collected into small heaps on the paths around the basins or the floors of the basins themselves, and here it undergoes a first partial purification, the more deliquescent salts (especially the magnesium chloride) being allowed to drain away. From these heaps, it is collected into larger ones, where it dries, and becomes more and more purified. The salt is collected from the surface by means of a sort of wooden scoop or scraper, but in spite of every precaution some impure salt is collected, and it is inevitably taken up with it, communicating a red or grey tint.

Generally speaking this salt, which may contain up to 15% of impurities, goes into commerce just as it is, but in some cases it is taken first to the refinery, where it either is simply washed and then stoved-dried before being sent out, or is dissolved in fresh water and then boiled down and crystalized like white salt from rock-salt brine. The salt of the "salines du midi" of the south-east of France is far purer, containing about 5% of impurities. In northern Russia and in Siberia sea water is concentrated by freezing, the ice which separates containing little salt; the brine is then boiled down when an impure sea salt is obtained.

**Rock-salt.**—To mineralogists rock-salt is often known as halite—a name suggested in 1847 by E. F. Gluck from the Greek ἅλιτος (salt). The word halite, however, is sometimes used not only for the species rock-salt but as a group-name to include a series of haloid minerals, of which that species is the type. Halite or rock-salt crystallizes in the cubic system, usually in cubes, rarely in octahedra; the cubes being solid, unlike the skeleton-cubes obtained by rapid evaporation of brine. The mineral has perfect cubic cleavage. Percussion-figures, rectilinear, the cleavage-faces, the cubes parallel to faces of the rhombic dodecahedron; whilst figures etched with water represent the four-faced cube. Rock-salt commonly occurs in cleavable masses, or sometimes in laminar, granular or fibrous forms, the finely fibrous variety being known as "hair-salt." The hardness is 2 to 2·5 and the spec. grav. 2·1 to 2·6. Rock-salt when pure is colourless and transparent, but is usually red or brown by mechanical admixture with ferric oxide or hydroxide. The salt is often grey, through bituminous matter or other impurity, and rarely green, blue or violet. The blue colour, which disappears on heating or dissolving the salt, has been variously ascribed to the presence of bromide, chlorine, subchloride, sodium sulphur or of a certain compound of iron, or again to the existence of minute cavities with parallel walls. Halite occasionally exhibits double refraction, perhaps due to natural pressure. It is remarkably diathermanous, or capable of transmitting heat-rays, and has therefore been used in certain physical investigations. Pure halite consists only of sodium chloride, but salt usually contains certain magnesium compounds rendering it deliquescent. Minute vesicular cavities are not infrequently present, sometimes as negative cubes, and these saline chambers may be filled with air, or else the salt contains gas hydrocarbons. Some salt deprecitates on solution (Kaliaste), the phenomenon being due to the escape of condensed gases.

Halite may occur as a sublimate on lava, as at Vesuvius and some other volcanoes, where it is generally associated with potassium chloride; but its usual mode of occurrence is in bedded deposits, often lenticular, and sometimes of great thickness. The salt is commonly associated with gypsum, often also with anhydrite, and occasionally with sylvin, carnallite and other minerals containing potassium and magnesium. Deposits of rock-salt occur near the place of separation of salt water, probably in areas of inland drainage, in closed basins, like the Dead Sea and the Great Salt Lake of Utah, or perhaps in some cases in an arm of the sea partially cut off, like the Kara Bughaz, which forms a natural salt-pan on the east side of the Caspian. Such beds of salt are found in strata of very varied geological age; the Salt Range of the Punjab, for instance, is probably of Cambrian age, while the famous salt-deposits of Wieliczka, near Cracow, have been referred to the Triocene period. In many parts of the world, including the Peruvian salt-lands, the Triassic age offered conditions especially favourable for the formation of large salt-deposits.

In England extensive deposits of rock-salt are found near the base of the Keuper marl, especially in Cheshire. The mineral occurs generally in lenticular deposits, which may reach a thickness of more than 100 ft.; but it is mined only to a limited extent, most of the salt being obtained from brine springs and wells which derive their saline character from deposits of salts. Much salt is obtained from north Lancashire, as also from the brine pits of Staffordshire, Worcestershire, Yorkshire, Durham and the Isle of Man (Point of Ayre). The salt from N.E. Yorkshire has been worked in some parts by a company, and other companies have also been active, particularly in Westmoreland, Cumberland, Durham and Yorkshire. The salt from the New Forest, Wiltshire, and from jersey, is obtained by means of a peculiar apparatus, and for medicinal purposes is especially valuable. A similar result is obtained in the district of the "Ghers," in which saline waters of a high salinity are collected in the manner from which the word "gamal," meaning salt, is derived. A salt of the same kind has been obtained in the district of Marienbad, in Bohemia.

The Pennine system (Zechstein) yields the great salt-deposits worked at Stassfurt and at Halle in Prussian Saxony. The Stassfurt deposits are of special importance for the sake of the associated salts of potassium and magnesium, such as carnallite and kainite. These deposits, and in addition to having a high commercial importance, present certain problems of a geological kind, particularly at the hands of van't Hoff and his collaborators, whose results are embodied in his Zur Bildung der oceanischen Salzbildungen, vol. i. (1908), vol. ii. (1910). (A summary is given in A. W. Stewart, Recent Advances in Physical and Inorganic Chemistry, 1909; see also vant Hoff, Lectures on Theoretical and Physical Chemistry, vol. i.). A typical section is as follows: Beneath the surface of the sea, a saline layer of salt is found, varying in thickness of carnallite, MgCl₂-KCl⋅6H₂O, mixed with a little salt; this is followed by a thicker deposit of kieserite, MgSO₄⋅H₂O, containing ravenite, MgSO₄⋅2H₂O, salt rock-salt, and then a saline layer of penheterite, 3H₂O, and anhydrite, CaSO₄, interspersed with regular layers of rock-salt; whilst below the anhydrite we have the main rock-salt-deposits. A solution of rock-salt has been prepared by boiling to have a thickness of upwards of 4000 ft. The salt of Bex in Switzerland is Jurassic, whilst Cretaceous salt occurs in Westphalia and Aligres. Important deposits of salt are developed in many parts of the Trent valley and the Fucino district near Barcelona. Tertiary salt forms hill-masses, while the Carpathian
sandstone in Galicia and Transylvania is rich in salt. The extensive marine evaporites of Tertiary age at the salt of Kalasz in Galicia, which is associated with sylvinite, KCl.

In North America salt is widely distributed at various geological horizons. In New York it occurs in the Salina beds of the Onondaga series, containing salt of Tertiary origin, also in Ordovician rocks near Michigan and in Ontario, Canada. Some of the salt of Michigan is regarded as Carboniferous. Rock-salt is mined in several states, as New York, Kansas and Louisiana; but American deposits of it are chiefly obtained from the South and South West, the chief field being in the Cotton Belt. East Texas, and in the area of the Ouachita and Ouachita Tertiary, occur in the island of Petite Anse, west of Vermilion Bay, in Louisiana. Salt often occurs in association with petroleum and has been mined almost continuously on the shore of the Bahamas valley in boring for petroleum. In the dry regions of the West salt occurs as an incrustation on the surface of the soil—a mode of occurrence found in desert areas in various parts of the world.

For use in America the salt has been largely produced in strata which have been deposited in shallow water, especially on the margin of a salt lake. The salt has been dissolved out of its original matrix, and the cavity so formed has then been filled with fine clays or other mineral matter, forming a cubic solid. Such cavities are not infrequent in the Keuper marls and sandstones, and in the Purbeck beds of England.

Manufacture.—The chief centres of manufacture in England are at Northwich, Middlewich, Winsford and Sandbach in Cheshire, Weston-on-Trent in Staffordshire, Stoke Prior and Droitwich in Worcestershire and Middlesborough in Yorkshire. The Cheshire and the Winsford are the largest. Between 1782 and 1797 72,000 tons of salt were worked. Although brine springs have been known to exist in both counties ever since the Roman occupation, and salt had been made there from time immemorial, it is the usual belief that the Cheshire salt was not worked until 1748. It was discovered at Marbury near Northwich by some men exploring for coal, at a depth of 34 yds. In 1779 three beds of rock-salt were discovered at Lawton, separated from one another by several hundred feet of sandy clay. The largest of these salt beds is the Northwich mine, and the rock-salt of the Northwich mine is the largest and perhaps the oldest in England. It was worked for about a hundred years in only its upper bed, but in 1871, after traversing a layer of indurated clay intersected with small salt beds, the miners reached a formation of rock-salt 33 to 37 yds. thick. As this was found beneath the others, the salt is thin and impure. The total depth of the mine to the bottom of the lower level is 93 yds. The depth of the salt beds from the surface is 115 yds. from the surface. The Marston mine covers an area of about 40 acres. The salt is first reached at 35-40 yds. in the Northwich district, and the upper layer is 25-50 yds. in thickness (Marston 23-26 yds.); it has above it, apparently lying in the recesses of its surface, a layer of saturated brine. This is the brine which is raised at the various pumping stations in Northwich and elsewhere around, and which serves to produce white salt. The beds are reached by sinking through the clays and variegated marls typical of this formation. The salt is blasted out with gunpowder. The Middlesbrough deposit was discovered by Bolckow and Vaughan in boring for water in 1804 at a depth of 600 yds., but the mine is not utilized, and was abandoned after being sunk for 60 yds. at Port Cliffe to a depth of 376 yds. In Cheshire the surface-water trickling through the overlying strata dissolves the salt, which is subsequently pumped as a brine, and is then made into salt. In the South there are many salt mines, but those in the salt region of Germany have been of much greater importance in the past. Of these the most extensive is that of 1891, at Stettin, where two million tons of salt are produced. In 1891, at Stettin, where two million tons of salt are produced. In the United States extensive deposits and brine springs are worked, and also irrigations (see above). Canada also is a producer. South America possesses several salt deposits and brine springs, and the most important are those of Bolivia, likewise is China; and Persia is perhaps one of the countries most abundantly endowed with this natural and useful product. In India there is the great salt range of the Punjab, as well as the South American deposits, containing sea water at many places along its extensive seaboard.

1 The termination "wich" in English place-names often points to ancient salt manufacture—the word "wich" (creek, bay: Icel. réi) having acquired a special sense in English usage. In Germany the various forms of the non-Teutonic words Hall, Halle occurring in place-names point in the same way to ancient salt-works.

Rock-salt is the origin of the greater part of the salt manufactured in Britain. It occurs as layers and pockets of coarse-grained, yellowish-grey salt clay to that of the most transparent crystals. In the former case it is often difficult to obtain the brine at a density even approaching saturation, and chambers and galleries are sometimes excavated and brine is forced in by pressure. In the latter case, the water let down fresh is pumped up as brine. Many brine springs also occur in a more or less saturated condition. In cases where the atmospheric conditions are suitable the brine is run into large tanks and the brine heated by steam. When a certain amount of crustic over faggots are arranged in a large open sheds called "graduation houses" (Gradühräuser), whereby a more extensive surface of evaporation is obtained. After settling it is evaporated in iron pans. The use, however, of the "graduation houses" is dying out, as both their construction and their maintenance are expensive. The purer rock-salt is often imported into Britain and those parts of the northern counties which have not been worked for a century, are supplied by this means. It is frequently pumped as brine, produced either by artificial solution as at Middlesbrough and other places, or by natural means, as in China and Worcestershire. One great drawback to the use of even the purest rock-salt simply ground is its tendency to revert to a hard unwieldy mass, when kept any length of time in sacks. As usually made, white salt from rock-salt may be classified into two parts: (1) boiled: known as fine table, lump, stoved, superfine, basket, butter and cheese salt (Fr. sel finfin, sel à la minute, &c.); (2) unboiled: common, chemical, fishery, Scotch fishery, extra fishery, double extra fishery and bay salt (Fr. sel de 12 heures, sel de 24 heures, sel des 48 heures, &c.). The coarser grades, as coarse salt, are mostly used on account of the size and appearance of the crystals, their uses and the modes of their production. The boiled salts, the crystals of which are small, are stowed in a medium constantly agitated by boiling. The fine or powdered table salt, as well as much of the salt known as "dried" or "rock" salt, is treated in this manner. The size of the crystals and the smaller ones being formed more quickly. The temperature varies from 55° to 180° F. The difference between the manufacture of salt from rock-salt brine as carried on in Britain and on the Continent lies in the use in the latter case of closed or covered pans, except in the making of fine salt, whereas in Britain open ones are employed. With open pans the vapour is free to diffuse itself into the atmosphere, and the evaporation is perhaps more rapid. When covered pans are used, the loss of heat by radiation is less, and the salt made is also cleaner. It has also been proposed to concentrate the brines under diminished pressure, for instance at Stettin. Pickeringick's paper on the subject has been read before the Society of Arts. The difference is that the evaporating chamber of the present system is open to the air, while in this closed system the steam from one heats the second into which it is led (see Soc. of Eng., 1891, p. 115).

In the manufacture of salt from rock-salt brine, the criterion of running into the pan to replace the losses by evaporation and the removal of the salt, it only necessary occasionally (not often) to reject the mother-liquor when at last it becomes too impure with magmas. The works are not subject to the slightest inconvenience from the saltpetre (niter) formed in the process, as the amount of water is absorbed prior to crystallisation. The brine contains more of this impurity but becomes quite brown from organic matter on concentration, and totally unfit for further service after yielding but two or three crops of salt crystals. Sometimes, to get rid of these impurities, the brine is treated in a large tub (besoïer) with lime; on settling it becomes clear and colourless, but the dissolved lime forms a skin on its surface in the pan, retards the evaporation and impedes the crystallisation. At times sodium sulphate is added to the brine, producing sodium chloride and magnesium sulphate by double decomposition with the magnesium chloride. A slight degree of acidity seems more favourable to the crystallisation. The amount of salt produced from the saline brine varies between certain amount of 12.5 lb per pan, especially when, as in fishery salt, fine crystals are required. The salt is "drawn" from the pan and placed (in the case of boiled salts) in small conical boxes, with round plugs, and again boiled. The salt is finally put into boxes and afterwards stove-dried, or (in case of unboiled salts) "drew" in a heap on to the "hurdles," on which it drains, and dried in the open atmosphere.

In most European countries a tax is laid on salt; and the coarser as well as the finer crystals are therefore often dried so as to not pay duty on more water than can be helped. Despite the large demands in England is very nearly saturated, containing 25 or 26% of sodium chloride, the utmost water can take up being 27%; and it ranges from 38 to 42 oz. of salt per gallon. In some other countries the brine has to be concentrated before its use.

Salt-making by no means an unhealthy trade, some slight soreness of the eyes being the only affection sometimes complained of; indeed the atmosphere of steam saturated with salt in which
the workmen live seems specially preservative against colds, rheumatism, neuralgia, &c.

A parliamentary commission was appointed in 1881 to investigate the causes of the disastrous subsidences which are constantly taking place in all the salt districts, and the provision of a remedy. It led to no legislative action; but the phenomenon has been officially recognized in all quarters.

At the same time it is difficult to see how this grievance can be remedied without inflicting serious injury, almost ruin, upon the salt trade. The workings in Great Britain represent the annual abstraction of rather more than a mass of rock equal to a foot in thickness spread over a square mile. The table gives the outputs in metric tons of the most important producers in 1900 and 1905 (from Rothwell, Mineral Industry, 1908).

See F. A. Führer, Sälichgewinn und Sälicenerze (Braunschweig, 1910); J. Friesen, Der Salzhandel in Deutschland: Darstellung der Vorfahren und Verwertung (Leipzig, vol. 1, 1909; vol. 2, 1906). (X)

Ancient History and Religious Symbolism.—Salt must have been quite unattainable to primitive man in many parts of the world. Thus the Odyssey (xxi. 122 seq.) speaks of inlanders in (Epirus) who do not know the sea and use no salt with their food. In some parts of America, and even of India (among the Todas), salt was first introduced considerable progress was made in their use of salt, and the fact that the use of it is a luxury confined to the rich. Indeed, where men live mainly on milk and flesh, consuming the latter raw or roasted, so that their salts are not lost, it is not necessary to add sodium chloride, and thus understand how the Numidians nomads in the time of Sallust and the Bedouins of Hadramaut at the present day never eat salt with their food. On the other hand, cereal or vegetable diet calls for a supplement of salt, and so does boiled meat. The importance of this natural salt to the health and religion depends on this fact; at a very early stage of progress salt became a necessary of life to most nations, and in many cases they would suffer it only from abroad. On the sea, in coastal, or in districts like that of Palmyra where salt incursions are found on the surface of the soil. Sometimes indeed a kind of salt was got from the ashes of saline plants (e.g. by the Umbrians, Aristotel, Met. ii. p. 261 a, 32) or there were small springs of salt water trickling over a fire of (saline) wood and collecting the ashes, as was done in ancient Germany (Tac. Ann. xiii. 57), in Gaul and in Spain (Plin. H.N. xxxi. 7, 82 seq.); but these were imperfect surrogates. Among inland peoples a salt spring was regarded as a special gift of the gods. The Chaconians in Ephesus had one which flowed into a stream where there were no fish; and the legend was that Hercules had allowed their forfathers to have salt instead of fish (Arist. lec sfr). The German waged war for saline streams, and believed that the presence of salt in a stream invested it with peculiar sanctity and made it a place where prayers were most readily heard (Tac. sfr sfr). That a saline stream sanctified attached sanctity to the places around so that the mountains so that and which was often obtained with difficulty is no more than natural. And it must also be remembered that the habitual use of salt is intimately connected with the advance from nomadic to agricultural life. i.e. with the practice of agriculture. The agrarians who had a "divine," and Plato names it a substance dear to the gods (Timaeus, p. 60; cf. Plutarch, Sympos. v. 16). As covenants were once made over a sacrificial meal, in which salt was a necessary element, the expression "salt of the earth" easily understood; it is probable, however, that the preservative qualities of salt were held to make it a peculiarly fitting symbol of an enduring compact, and influenced the choice of this particular element of the covenant meal as that which was regarded as sealing an obligation to fidelity. Among the ancients, as among Orientals down to the present day, salt from the Chaco salt, the sacred character and created a bond of piety and guest friendship between the participants. Hence the Greek phrase ἀλατον παρατηρεῖν, the Arab phrase "there is salt between us, whone the salt is understood as the element which property in the modern Persian phrase namak harām, "unto salt," i.e. disloyal or ungrateful, and many others. Both early in the history of the Roman army and in later times an allowance of salt was made to efface a breach. In imperial times, however, this zaturam was an allowance of money for salt (see Salary).

It has been conjectured that some of the old salt trade routes were taken from the time when the discovery of the chief economic and religious necessities of the ancient world, play a great part in all that we know of the ancient highways of commerce. Thus one of the oldest roads in Italy is the Via Salaria, by which the port of Ostia was carried up into the Sabine country. Herodotus's account of the caravan route uniting the salt-cases of the Libyan desert (iv. 181 seq.) makes it plain that this was mainly a salt-road, and to the present day the caravan trail of the Saltara is largely a trade in salt. The salt of Palmyra was an important element in the vast trade between the Syrian ports and the Persian Gulf (see Palmyra), and long after the glory of the great merchant city was past "the salt of Tadmor" retained its reputation (Mas'ādī viii. 398). In like manner the ancient trade between the Aegean and the coasts of southern Russia was largely dependent on the salt pans at the mouth of the Dnieper and on the salt fish produced by attaching this district to the George. The Phoenician commerce salt and salt-fish—the latter a valued delicacy in the ancient world—always formed an important item. The vast salt districts of the northwestern part of India worked before the time of Alexander (Strabo v. 2, 6, xvi. 100) and must have been in considerable trade spread trade. The economic importance of salt is further indicated by the almost universal prevalence in ancient and medieval times, and especially among the most chapel kings or of government monopolies, which have not often been directed, as they were in ancient Rome, to enable one to procure so necessary a commodity at a moderate price. In Oriental systems of taxation high impost on salt are seldom lacking and are often carried on in a very oppressive way, one result of this being that the article is apt to reach the consumer in a very impure state largely marred with earth. The salt which has lost its savour (Matt. v. 13) is simply the earthy residuum of such an impure salt after the sodium chloride has been washed out.

Cakes of salt have been used as money in more than one part of the world—for example, in Abyssinia and elsewhere in Africa and in Tibet and adjoining parts. See the testimony of Marco Polo (bk. ii. ch. 48) and Colonel Yule's note upon analogous customs elsewhere and on the use of salt as a medium of exchange in the elephant markets down to our own time, in his translation of Ptolemy ii. 38 seq. In the same work interesting details are given as to the salt of the financial system of the Mongol emperors (lii. 200 seq.).

Salon, a N.W. province of Argentina, bounded N. by Bolivia and the province of Jujuy, E. by the territories of Formosa and the Chaco, S. by Santiago del Estero and Tucuman, and W. by the Los Andes territory and Bolivia. Area, 62,184 sq. m.; pop. (1904, estimated) 1,056,059. The western part of the province is desolate, thinly inhabited, and traversed by the eastern chains of the Andes. Indentur this, however, are large valleys, or bays, of highly fertile and comparatively level land, like that in which the city of Salta is situated. The eastern part of the province is chiefly composed of extensive areas of alluvial plains belonging to the Chaco formation, whose deep, fertile soils are among the best in Argentina. This part of the province is well wooded with valuable construction timbers and furniture woods. The drainage to the Paraguay is through the Bermejo, whose tributaries cover the northern part of the province and discharge into the Parana, called Salado on its lower course, whose tributaries cover the southern part of the province and whose waters are discharged into the Parana. The climate is hot, and the year is divided into a wet and a dry season, the latter characterized by extreme aridity. Irrigation is necessary in a great part of the province, though the rainfall is abundant in the wet season, about 21 in. Fever and ague, locally called chuchu, is prevalent on the lowlands, but in the mountain districts the climate is healthy. There is considerable undeveloped mineral wealth, including gold, silver and copper, but the inhabitants are all but exclusively agriculturists. Its principal products are sugar, rum, tobacco, coffee, and gourds. The Cuyafaye wines are excellent, but are chiefly consumed in the province.
SALTA—SALT-CELLAR

Various tropical fruits are produced in abundance, but are not sent to market on account of the cost of transportation. Stockraising is carried on to a limited extent for the home and Bolivian markets. The province is traversed by a government railway (the Central Northern) running northward from Tucuman to the capital, and by a branch from General Güemes westward to the city of Salta (q.v.), the provincial capital. The principal towns are Oran (1904, 3000) on a small tributary (the Zenta) of the Bermejo, in the northern part of the province, formerly an important depot in the Bolivian trade, and nearly destroyed by earthquakes in 1871 and 1873; Rosario de Lerma (pop. 1904, 2500), 30 m. N.W. of Salta in the great Lerma valley; and Rosario de la Frontera (pop. 1904, 1200) near the Tucuman frontier, celebrated for its hot mineral baths and gambling establishment.

Salta was at one time a part of the great Inca empire, which extended southward from Tucuman and Rioja. It was overrun by adventurers after the Spanish conquest. The first Spanish settlement within its borders was made by Hernando de Lerma in 1582. Salta was at first governed from Tucuman, but in 1776 was made capital of the northern intendencia, which included Catamarca, Jujuy and Tucuman. After the War of Independence there was a new division, and Salta was given its present boundaries with the exception of the disputed territory on the Chilean frontier, now the territory of Los Andes.

SALTA, a city of Argentina, capital of a province of the same name, and see of a bishopric, on a small tributary (the Arias) of the Pasage, or Juramento, 976 m. by rail N.W. of Buenos Aires. Pop. (1904, estimated) 18,000. Salta is built on an open plain 3360 ft. above the sea, nearly enclosed with mountains. The climate is warm and changeable, malarial in summer. The city is laid out regularly, with broad, paved streets and several parks. Some of the more important public buildings face on the Plaza Mayor. There are no manufactures of importance. Salta was once largely interested in the Bolivian trade, and is still a chief distributing centre for the settlements of the Andean plateau. Near the city is the battlefield where General Belgrano won the first victory from the Spanish forces (1812) in the War of Independence. There is a large mestizo element in the population, and the Spanish element still retains many of the characteristics of its colonial ancestors. In Salta Spanish is still spoken with the long-drawn intonations and melodies of "Il" of southern Spain.

Salta was founded in 1582 by Governor Abreú under the title of San Clemente de Nueva Sevilla, but the site was changed two years later to the new settlement called San Felipe de Lerma. In the 17th century the name Salta came into vogue.

SALTA (Italian for "Jump!"). A table-game for two introduced at the end of the 19th century, founded on the more ancient game of Halma. It is played on a board containing 100 squares, coloured alternately black and white. Each player has a set of 15 pieces, one set being green, the other pink. These are placed upon the black squares of the first three rows nearest the player, and are classified in these rows as stars, moons and suns. The pawns move forward one square at a time, except when a pawn is situated on the first row of a hostile piece with an unoccupied space on the further side, in which case the hostile pawn must be jumped, as at draughts, but without removing the jumped pawn from the board. The object of the game is to get one's pieces on the exact squares corresponding to their own on the enemy's side, the stars in the star-line, the moons in the moon-line, &c. Salta tournaments have taken place in which chess masters of repute participated. See Salta, by Schubert (Leipzig, 1900).

SALTASH, a municipal borough in the Bodmin parliamentary division of Cornwall, England, 5 m. N.W. of Plymouth, on the Great Western railway. Pop. (1901) 3357. It is beautifully situated on the wooded shore of the Tamar estuary, on the lower part of the estuary. The town of Saltash, built on the right bank of the Tamar.

Local communications are maintained by river steamers. At Saltash the Royal Albert bridge (1857–1859) carries the railway across the estuary. It was built by Isambard Brunel at a cost of £230,000, and is remarkable for its great height. The church of St Nicholas and St Faith has an early Norman tower, and part of the fabric is considered to date from before the Conquest; but there was much alteration in the Decorated and Perpendicular periods. The church of St Stephen, outside the town, retains its ornate Norman font. The fishery for which Saltash was famous have suffered from the chemicals brought down by the Tamar; but there is a considerable sea-faring population, and the town is a recruiting ground for the Royal Navy. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 104 acres.

The Sunday market established by the count of Mortain at his castle of Trematon, which ruined the bishop of Exeter's market at St John's, was probably held at Saltash a short distance from the castle. Saltash (Esse, 1297; Ash, 1302; Asseburgh, 1392) belonged to the manor of Trematon and the latter at the time of the Domesday Survey is held by Reginald de Valletort, in chief. Reginald de Valletort was a descendant of a Norman family of that name (q.v.) who held Saltash about 1190. It confirms to his free burgesses of Esse the liberties enjoyed by them under his ancestors, viz.: burgage tenure, exemption from all jurisdiction save the "hundred courth of the said town," of suit limited to courts three times a year, a reeve of their own election, pasturage in his demesne lands on certain terms, a limited control of trade and shipping, and a fair in the middle of the town. This charter was confirmed in the fifth year of Richard II. Roger de Valletort, the last male heir of the family, gave the honour of Trematon and with it the borough of Saltash to Richard, king of the Romans, after the first Edward's death. Then it was given to St John's to set aside the grant, the earls and subsequently the dukes of Cornwall were the lords of Saltash. It was probably to this relation that the burgesses owed the privilege of parliamentary representation, confirmed by Edward the second. There is no evidence of incorporation to Saltash. This was superseded by another in 1683 under which the governing body was to consist of a mayor and six aldermen. In 1771, the corporation being in danger of extinction, burgesses were added, but it was not until 1886 that the ratepayers acquired the right of electing representatives to the council, the right up to that time having been exercised by the members of the corporation. The parliamentary franchise was enjoyed by the mayor, aldermen and the holders of burgage tene- ments. In 1814 they numbered 120. In 1832 Saltash was deprived of its two members. The count of Mortain's Sunday market had given up its licence in 1337 and the charter, although in Elizabeth's charter provided for one on Tuesday also, but this has disappeared. A fair on the feast of St Faith yielded 65. 8d. in 1337. This is no longer held, but fairs at Cindlesam and St James, of ancient but uncertain origin, remain. Saltash was sufficiently con- siderable as a port in the 16th century to furnish a frigate at the town's expense against the Armada. This probably represents the zenith of its prosperity.

SALTBURN BY THE SEA, a seaside resort in the Cleveland parliamentary division of the North Riding of Yorkshire, England, 21 m. E. of Middlemarch, 6 m. N.E. of Redcar, in the Cleveland Eastern railway. Pop. (1901) 2578. A firm sandy beach extends westward to Redcar and the mouth of the Tees, while eastward towards Whitby the cliffs become very fine, Boulby Cliff (666 ft.) being the highest sea cliff in England. Several fishing villages occur along this coast, of which none is more picturesque than Staithes, lying in a steep gully in the cliff. There are brine baths supplied from wells near Middlemarch, a pier, gardens and promenades. Inland the county is hilly and picturesque, though in part defaced by the Cleveland iron mines.

SALT-CELLAR, a vessel containing salt, placed upon the table at meals. The word is a combination of "salt" and "cellar," assimilated in the 16th and 17th centuries to "cellar" (Lat. cellarium, a storehouse). "Sailer" is from the Fr. (Mod. salière), Lat. salarium, that which belongs to salt, cf. "salary." Salt cellar, therefore, a tautological expression. There are two types of salts, the large ornamental salt which during the medieval ages and later was one of the most important pieces of household plate, and the smaller "salts," actually used and placed near the plates or trenchers of the guests at table; they were hence styled "trencher salts." The great salts, belonging to the interior of the salt, were larger than usual shapes, like an hour-glass and have a cover. New College, Oxford, possesses a magnificent specimen, dated 1403. Later salts take a square or cylindrical shape. The Elizabethan salt, kept with the regalia in the Tower of London, has a cover with numerous figures. The London Livery Companies possess many salts of a still later pattern, rather low in height and without a
SALTER—SALT LAKE CITY

cover. The "trecher salts" are either of triangular or circular shape, some are many-sided. The circular silver salt with legs came into use in the 18th century.

SALTER, JOHN WILLIAM (1802-1869), English naturalist and paleontologist, was born on the 15th of December 1802. He was apprenticed in 1825 to James de Carle Sowerby, and was engaged in drawing and engraving the plates for Sowerby's *Conchology*, the *Supplement* to his *English Botany*, and other works. In 1824 he was employed for a short time by Sedgwick in arranging the fossils in the Woodwardian Museum at Cambridge, and he accompanied the professor on several geological expeditions (1842-1845) into Wales. In 1846 he was appointed on the staff of the Geological Survey and worked under Edward Forbes until 1854; he was then appointed paleontologist to the survey and gave his chief attention to the palaeozoic fossils, spending much time in Wales and the border counties. He contributed the palaeontological portion to A. C. Ramsay's *Memoir on the Geology of North Wales* (1860), assisted Murchison in his work on *Silurian* (1854), and later prepared by Sedgwick *A Catalogue of the Collection of Cambrian and Silurian Fossils contained in the Geological Museum of the University of Cambridge* (1873). Salter prepared several of the Decades of the Geological Survey and became the leading authority on Trilobites, contributing to the Palaeontographical Society four parts of *A Monograph of British Trilobites* (1864-1867). He resigned his post on the Geological Survey in 1863, and died on the 2nd of August 1869.

SALTILLO, a city and the capital of the state of Coahuila, Mexico, about 615 m. by rail N.W. by W. in the city of Mexico. Pop. 10,119. Saltillo is on the Mexican Northern railroad, and another railway connects it with the important mining and industrial town of Torreon, on the Mexican Central. The city is on the great central plateau of Mexico, about 5200 ft. above sea-level. It has a cool and healthy climate, and is a resort in summer for the people of the tropical coast districts, and in winter for invalids from the north. The city is laid out in regular squares, with shady streets and plazas. The residences are of the Spanish colonial type, with heavy walls and large rooms to insure coolness during the heat of the day. Among its public institutions are a national college, the *Siluria* (1854), and the *Bicentenario*, a public library, and a good academic and manufacturing town, and an important railway centre. Its manufactures include cotton and woolen fabrics, knitted goods and flour. The woollen "zarapes" or "ponchos" of Saltillo are among the finest produced in Mexico. There are undeveloped coal deposits in the vicinity.

Saltillo was founded in 1856 as an outpost against the Apache Indians. It became an incorporated city by 1877. In 1824 the capital of the state of Coahuila and Texas was at Saltillo. A partisan controversy removed the seat of government to Monclova in 1833, but it was returned to Saltillo in 1835. The battle of Buena Vista was fought near Saltillo on the 22nd-23rd of February 1847. After leaving San Luis Potosi, President Juarez established his capital at Saltillo for a brief period.

SALT LAKE CITY, the capital city of Utah and the county-seat of Salt Lake County, in the N.W. part of Utah, immediately E. of the Jordan river in the Salt Lake Valley, near the base of the Wasatch mountains, at an altitude of about 4350 ft., about 11 m. S.E. of the Great Salt Lake, about 710 m. W. by N. of Denver and about 930 m. E. of San Francisco. Pop. (1860) 8236; (1900) 53,531; (1910 census) 92,777. Area, 51-25 sq. m. Of the population in 1900, 12,741 (nearly one-fourth) were foreign-born, including 51-57 English, 1687 Swedes, 965 Danes, 963 Germans and 912 Scotch; 35,152 were of foreign-parentage (one or the other parent foreign-born); 276 were negroes, 214 Chinese, 22 Japanese. Salt Lake City is served by the Denver & Rio Grande, the Union Pacific, the Western Pacific, the Oregon Short Line, and the San Pedro, Los Angeles & Salt Lake railroads; it is also a terminus of shorter roads to Ogden, to Los Angeles and to Mercur, a mining town in the Oquirrh mountains.

The early Mormon missions in England were very successful, and many of the leaders of the church and those otherwise prominent in Salt Lake City are of English birth. (S. of Great Salt Lake) whose ores are reduced by the cyanide process. The Oregon Short Line and the San Pedro, Los Angeles & Salt Lake have a union railway station (1909), and the Denver & Rio Grande and the Western Pacific also have a large union railway station (1910). The street railway system is excellent; electric cars were introduced in 1889; and the street railways were reorganized by E. H. Harriman, who bought a controlling interest in them.

The situation of the city is striking, with views of mountains and of the lake. Salt Lake City is the headquarters of the Church of Jesus Christ of Latter-Day Saints (see Mormons). The streets are laid out, according to the plan of Brigham Young, with city blocks of 10 acres each (660 ft. sq.) and streets 100 ft. wide. There are 86,000 ft. of street running, 75 ft. wide, for irrigating ditches, fed by mountain streams. Brigham (or South Temple) Street is a fine boulevard running 3 m. from the Temple to Fort Douglas. Among the streets are numbered and named "East" or "West," "North." The library, from the centre of the city, the Temple Block. State street is the official name of First East Street; and East Temple Street is called Main Street, the Beehive (the beehive is the symbol of the industry of the Mormon settlers in the desert and appears on the state seal), and the Amelia Palace or Gardo House (1872), which is now privately owned houses an excellent private art gallery. Three blocks E. of the Temple is St Mark's Cathedral (Roman Catholic cathedral), 100-200 ft.; with two towers 175 ft. high. Other large churches are: St Mark's Cathedral (1869, Protestant Episcopal) and the City Temple (mormon), which was built as City Hall in 1887, incorporated as a temple in 1891. The Beehive Temple (1894), built of rough grey sandstone from Utah county; it has a dome on the top of which is a statue of Columbia; over its entrances are statues of Commerce, Liberty and Justice; its baldacchino was designed by John Spencer. The building is 660 ft. high, with 1000 seats, and 1000 tickets where it was built. At the present time it is a beautiful structure, and 65,000 dollars were spent on it. The Beehive Temple, the church, the Temple Block, have become a prominent part of the city.

The public institution of the city is the great building of the Zion's Co-operative Mercantile Institution, a concern established by Brigham Young in 1866; there are several large factories connected with it, and its annual sales average more than $5,000,000. A monument to Brigham Young and the Utah Pioneers, crowned by a statue of Brigham Young, by C. E. Dallin, was unveiled in 1897, at the university of Utah, the University of Macneil Hospital and Charity, and there is a state penitentiary here. In the S.E. part is the Judge Jusser's Home and Hospital (Roman Catholic), a memorial to John Judge, a successful Utah miner; a bath house; a public library block, which houses in 1910 about 40,000 volumes; and several business buildings. Typical of the city is the great building of the Zion's Co-operative Mercantile Institution, a concern established by Brigham Young in 1866; there are several large factories connected with it, and its annual sales average more than $5,000,000. A monument to Brigham Young and the Utah Pioneers, crowned by a statue of Brigham Young, by C. E. Dallin, was unveiled in 1897, at the university of Utah, the University of Macneil Hospital and Charity, and there is a state penitentiary here. In the S.E. part is the Judge Jusser's Home and Hospital (Roman Catholic), a memorial to John Judge, a successful Utah miner; a bath house; a public library block, which houses in 1910 about 40,000 volumes; and several business buildings.
SALTO—SALT PETER

and Westminster College (1897: Presbyterian). There is a State Art Association, which exhibits competitors for a number of public lectures on art, and houses in its building the state art collection. The city has always been interested in music and the drama: the regular choir of 500 voices of the Mormon Tabernacle (organized in 1890) is one of the best choirs in the country, and closely connected with its development are the Symphony Orchestra and the Salt Lake Choral Society. Brigham Young was an admirer of the drama, and the city has always been a brilliant center for the theatricals of the country. There is a Young Men's Christian Association (organized in 1890). The principal clubs are the Alta, University, Commercial, Country, and Women's. There are a Masonic Temple and buildings of the Elks, Odd Fellows, and Woodmen of the World.

Salt Lake City is the great business center of Utah and one of the main shipping points of the West for agricultural products, live stock (especially sheep), precious metals and coal; and the excellent railway facilities have made it a great commercial center for the state. In 1905 the value of the factory products was $7,543,983, being 79.3% more than in 1900 and nearly one-fifth of the total value of the factory products of all Utah. There are many steam-car repair shops in the city. Among the more valuable manufactures are: newspapers, books, &c. ($2,421,405 in 1905), malt liquors, confectionery, flour, foundry and machine-shop products, dairy products, salt, knit goods, mattresses, sugar, cement, &c. Electricity is largely used in the newer factories, the power being derived from Ogden river, near Ogden, about 35 m. away, and from cataracts in Cottonwood canyon and other canyons. The city is supplied with water by a series of dams on the Salt River.

The history of the city is largely that of the Mormons (q.v.) and in its earlier years that of Utah (q.v.). The Mormons first came here in 1847; an advance party led by Orson Pratt and Erastus Snow entered the Salt Lake Valley on the 22nd of July. President Brigham Young upon his arrival on the 24th approved of the site, saying that he had seen it before in a vision; on the 28th of July he chose the site for the temple. In August the city was named "The City of the Great Salt Lake," and this name is well in keeping with the soil in which it was established. The city was incorporated by a charter of the state in 1851. The government is in the hands of a mayor, elected for two years, and of a unicameral municipal council, consisting of fifteen members, elected from the five wards of the city. The city owns the water works. In 1909 the assessment, valuation, real and personal, was $2,180,789; the tax levy was $677,411; and the city debt was $3,499,400 (exclusive of $1,528,000, the bonded indebtedness of the state). The city is well supplied with water, the city having the water works.

The city was largely of brick, being practically all brick. Brigham Young counseled the Mormons not to abandon agriculture for prospecting—but they made themselves rich by outfitting those of the gold-seekers who went to California overland and who were reduced by the journey to the soil and the sweat of their brow.

The city is supplied with water by a system of dams on the Salt River. The city was incorporated by a charter of the state in 1851; the charter was amended in 1864. Immigration from Europe and especially from England was large in the earlier years of the city, beginning in 1848. Salt Lake City was prominently identified with the Mormon church in its struggle with the United States government; in 1858 it was entirely deserted upon the approach of the United States troops. Since the Civil War, the non-Mormon element (locally called "Gentile") has steadily increased in strength, partly because of industrial changes and partly because the city is the natural point of attack on the Mormon church of other denominations, which are comparatively stronger here than elsewhere in Utah, and the commercial and industrial life of the city is on a constantly increasing scale.

See the bibliography under Mormons and under Utah; and particularly E. W. Tuftidge, History of Salt Lake City (Salt Lake City, 1886), the famous descriptions in Captain Stansbury's report (1850) and the works of the earliest settlers in the city (1860), and H. H. Bancroft, History of Utah (San Francisco, 1890).

SALTO, a town and river port of Uruguay and capital of a department of the same name, on the Uruguay river 60 m. above Paysandú. Pop. (1900, estimate) 12,000. It has railway connection with Montevideo via Paysandú and Rio Negro (594 m.), and with Santa Rosa, on the Brazilian frontier (114 m.). It is also connected with Montevideo and Buenos Aires by river steamers, Salto being at the head of high water navigation for large vessels. There are reefs and rocks in the river between Paysandú and Salto that make navigation dangerous except at high water. Above Salto the river is obstructed by reeds all the way to the Brazilian frontier, about 95 m., and is navigable for light-draft vessels only at high water. Farther up, the river is freely navigable to Santo Tomé (Argentina)—a distance of about 170 m. Travellers wishing to ascend the river above Salto usually cross to Concordia, Entre Ríos, Argentina, by railway to Ceibo, near Monte Caseros, from which point small steamers ascend to Uruguay, Itaqui, and other river ports. The streets of Salto are well paved and lighted with electricity, and there are some good public buildings. The town has two meat-curing establishments (saladeros) and is the shipping port for north-western Uruguay and, to some extent, for western Rio Grande do Sul (Brazil). Behind Salto lies a rich, undulating grazing country, whose large herds supply its chief exports.

SALT PETRE (from the Lat. sal, petra, a rock), the commercial name given to three naturally occurring nitrates, distinguished as (1) ordinary salt petre, nitre, or potassium nitrate, (2) Chile salt petre, cubic nitre, or sodium nitrate, (3) wall-salt petre or calcium nitrate. These nitrates generally occur as efflorescences caused by the oxidation of nitrogenous matter in the presence of the alkalies and alkaline earths.

1. Ordinary Salt Petre or Potassium Nitrate. KNO₃ occurs, mingled with other nitrates, on the surface and in the superficial layers of the salt in many countries, especially in certain parts of India, Persia, Arabia and Spain. The deposits in the great limestone caves of Kentucky, Virginia and Indiana have been probably derived from the overlying soil and accumulated by percolating water; they are of no commercial value. The actual formation of this salt is not quite clear; but it is certainly conditioned by the simultaneous contact of decaying nitrogenous matter, alkalies, air and moisture. The demand for salt petre as an ingredient of gunpowder led to the formation of salt petre plantations or nitrailires, which at one time were common in many countries; the natural deposits were simulated by exposing heaps of decaying organic matter mixed with alkalies (lime, &c.) to atmospheric action. The salt is obtained from the soil in which it occurs naturally, or from the heaps in which it is formed artificially, by extracting with water, and adding to the solution wood-ashes or potassium carbonate. The liquid is filtered and then crystallized. Since potassium nitrate is generally more serviceable than the sodium salt, whose deliquescence properties inhibit its use for gunpowder manufacture, the latter salt, of which immense natural deposits occur (see below (2) Chile salt petre), is converted into ordinary potassium nitrates. This is generally effected by adding the calculated amount of potassium chloride (of which immense quantities are obtained as a by-product in the Stassfurt salt industry) dissolved in hot water to a saturated boiling solution of sodium nitrate; the common salt, which separates on boiling down the solution, is removed from the hot solution, and on cooling* the potassium nitrate crystallizes out and is separated and dried.

As found in nature, salt petre generally forms aggregates of delicate acicular crystals, and sometimes silky, but more distinctly developed crystals are not found in nature. When crystallized from water, crystals belonging to the orthorhombic system, and having a prism angle of 6½°, are obtained; they are often twinned on the prism planes, giving rise to pseudo-hexagonal groups resembling aragonite. There are perfect cleavages
SALT RANGE—SALUTATIONS

parallel to the dome (011). The hardness is 2, and the specific gravity 2.1. It is fairly soluble in water; 100 parts at 0° dissolve 13.3 parts of the salt, and at 25° 18.4 parts; 100 parts of a saturated solution contain 3.27; 4 parts of the salt in 100 of water; this solution boils at 114.1°. It fuses at 359° to a colourless liquid, which solidifies on cooling to a white fibrous mass, known in pharmacy as sal prunella. It is an energetic oxidizing agent, and on this property its most important applications depend. At a red heat it evolves oxygen with the formation of potassium nitrate, which, in turn, decomposes at a higher temperature. Heated with many metals it converts them into oxides, and with combustible substances, such as charcoal, sulphur, &c., a most intense conflagration occurs. Its chief use is as a substitute for gunpowder; but it is liable to spontaneous combustion and to oxidize impurities, as a constituent of gunpowder and in pyrotechny; it is also used in the manufacture of nitric acid.

Potassium nitrate was used at one time in many different diseased conditions, but it is now never administered internally, as its extremely depressant action upon the heart is not compensated for by any useful properties which are not possessed by many other drugs. One most valuable use it has, however, in the treatment of asthma. All nitrates (e.g. sodium nitrate, ethyl nitrite, amyl nitrite) cause relaxation of involuntary muscles in the bronchial tubes. Saltpetre may be made to act as a nitrite by dissolving it in water in the strength of about fifty grains to the ounce, soaking blotting-paper in the solution and letting the paper dry. Pieces about 2 in. square are then successively put into a jar and lighted. The patient inhales the fumes, which contain a considerable proportion of nitrogen oxides. This treatment is frequently very successful indeed in relaxing the bronchial spasm upon which the most obvious features of an attack are based.

2. Chile saltpetre, cubic nitre or sodium nitrate. NaNO₃ occurs under the same conditions as ordinary saltpetre in deposits covering immense areas in South America, which are known locally as caliche or terra saldrua, and abound especially in the provinces of Tampaca and Antofagasta in Chile. The nitrate fields are confined to a narrow strip of country, averaging 2½ m. in width, situated on the eastern slopes of the coast ranges and extending from north to south for 250 geographical miles, between the latitudes 25° 45' and 19° 12' S. The nitrate forms beds, varying in thickness from 6 in. to 12 ft., under a covering of conglomerate locally known as lestra, which is itself overlain by a loose sandy soil. The conglomerate consists of rock fragments, earth, and salt, cemented together by gypsum to form a hard compact mass 6 to 10 ft. thick. The caliche has a granular structure, and is yellowish-white in colour. The nitrate is obtained from the caliche by breaking it up and washing it free from the sand and salt. The nitrate was formed by the nitrification of this kind of excremental matter. The caliche is worked up in loco for crude nitrate by extracting the salts with hot water, allowing the suspended earth to settle, and then filtering the clarified liquid, first to a cistern where it deposits part of its sodium chloride at a high temperature, and then to another where, on cooling, it yields a crop of crystals of purified nitre. The nitre thus refined is exported chiefly from Valparaiso, whence the name of "Chile saltpetre." The mother liquids used to be thrown away, but are now utilized for the extraction of their iodine (q.v.).

Crude Chile saltpetre can be obtained by repeated recrystallization of Chile saltpetre or by synthesis. It forms colourless, transparent rhomboids, like those of Iceland spar; the angles are nearly equal to right angles, being 73° 30' so that the crystals look like cubes; hence the same name. It is of a perfect cleavage parallel to the rhombohedral faces, and the crystals exhibit a strong negative double refraction, like calcite. One hundred parts of crude nitre at 0° dissolve 100 parts of water and 180 parts of salt; at 120° the boiling-point of the saturated solution, 216 parts. The salt fuses at 316°; at higher temperatures it loses oxygen (more readily than the corresponding potassium salt) with the formation of nitric acid. When heated, a very high temperature is reduced to a mixture of peroxide, NaO₂, and oxide, NaO. The chief applications of Chile saltpetre are in the nitric acid industry, and in the manufacture of saltpetre for making gunpowder, ordinary Chile saltpetre being unsuitable by reason of its deliquescent nature, a property, however, not exhibited by the perfectly pure salt. It is also employed as a manure. For references to memoirs descriptive of the Chilian nitrate deposits see G. P. Merrill, The Non-Metallic Minerals (New York, 1904).

3. Wall-saltpetre or lime saltpetre, calcium nitrate, Ca(NO₃)₂, is found as an efflorescence on the walls of stables; it is now manufactured in large quantities by fixating superphosphate, i.e. by passing a powerful electric discharge through moist air and absorbing the nitric acid formed by lime. Its chief applications are as a manure and in the nitric acid industry.

SALT RANGE, a hill system in the Punjab and North-West Frontier Provinces of India, deriving its name from its extensive deposits of rock-salt. The range commences in Jhelum district in the lofty hill of Chel (3700 ft.), on the right bank of the river Jhelum, at a distance of 2 miles, then traverses Shahpur district, crosses the Indus in Mianwali district, then runs north to Jhelum district, and thence to the plains of Banni and Dera Ismail Khan, and finally merges in the Waziristan system of mountains. The salt range contains the great mines of Mayo, Warcha and Kalabagh, which yield an inexhaustible supply of salt, and supply the wants of all Northern India. Coal of an inferior quality is also found.

SALTYKOV (STCHEDRIN), MICHAEL EVGAPOVICH (1826-1888), Russian satirist, was born on his father's estate in the province of Tula, 15th (27th) January 1826. His early education was completely neglected, and his youth, owing to the severity of Ryazan and then of Tula, was made up of nothing but melancholy experiences. Left entirely to himself, he developed a love for reading; but the only book in his father's house was the Bible, which he studied with deep attention. At ten years of age he entered the Moscow Institute for the sons of the nobility, and subsequently the Lyceum at St Petersburg, where Prince Lobanov Rostofski, afterwards minister for foreign affairs, was one of his schoolfellows. While he there published poetry, and translations of some of the works of Byron and Heine; and in leaving the Lyceum he obtained employment as a clerk in the Ministry of War. In 1834 he published Zapalennyye Dyelo ("A Complicated Affair"), which, in view of the revolutionary movements at that time in France and Germany, was the cause of his banishment to Vyatka, where he spent eight years as a minor government official. This experience enabled him to study the life and habits of civil servants in the interior, and to give a clever picture of Russian provincial officials in his Gubernskie Otcherki ("Provincial Sketches"). On his return to St Petersburg as he was quickly promoted to administrative posts of considerable importance. After making a report on the condition of the Russian police, he was appointed deputy governor, first at St Petersburg, and then at Ryazan.

His predilection for literary work induced him to leave the government service, and he found himself for difficulties soon compelled him to re-enter it, and in 1864 he was appointed president of the local boards of taxation successively at Penza, Tula and Ryazan. In 1868 he finally quitted the civil service. Subsequently he wrote his principal works, namely, Poshekonskaya Storia ("The Old Times of Poshekonsa"), which possess a certain autobiographical interest; Istoria odnovo Goroda ("The History of a Town"); A Satirical History of Russia; Messieti e Medesmai Pompadoure; and Messieti Golosoff. At one time, after the death of the poet Nekrasov, he acted as editor of a leading Russian magazine, the Contemporary. He died in St Petersburg on the 2nd of April (12th May) 1889.

(S. D.)

SALUS, in Roman mythology the personification of health and prosperity. In 302 B.C. a temple was dedicated to Salus on the Quirinal (Liv. x. 1); and in later times public prayers were offered to her on behalf of the emperor and the Roman people at the beginning of the year, in time of sickness, and on the emperor's birthday. In 180 B.C., on the occasion of a plague, vows were made to Apollo, Asclepius and Salus (Liv. xl. 37). Here the special attribute of the goddess appears to be health; and in later times she was identified with the Greek goddess of health, Hygieia.

SALUTATIONS, or GREETINGS, the customary forms of kindly or respectful address, especially on meeting or parting or on occasions of ceremonious approach. Etymologically the word salutation (Lat. salutatio, "wishing health") refers only to words spoken.
Forms of salutation frequent among savages and barbarians may last on almost unchanged in civilized custom. The habit of affectionate clasping or pulling together of both hands is an example. Among the Andaman islanders and Australian blacks, or among the Fuegians in friendly salutations, "like the grip of a bear." This natural gesture appears in old Semitic and Aryan custom: "Esaun ran to meet him (Jacob) and embraced him, and fell on his neck, and kissed him," (Gen. xxxiii. 4); so, when Odysseus makes himself known, Philoelius and Eumaeus cast their arms round him with kisses on the head, hands and shoulders (Odys. xxi. 223). The idea of the kiss being an instinctive gesture is negatived by its lack of known occurrence all through the world, where the prevalent salutation is by smelling or sniffing (often called by travellers "rubbing noses"), which belongs to Polynesians, Malays, Burmese and other Indo-Chinese, Mongols, &c., extending thence eastward to the Eskimo and westward to Lapland, where Linnaeus saw relatives saluting by putting their noses together. This seems the only appearance of the habit in Europe. On the other hand the kiss, the salute by tasting, appears constantly in Semitic and Aryan antiquity, as in the above cases from the book of Genesis and the Odyssey, or in Herodotus's description of the Persians of his day. The kiss is certainly a salute; on the other hand, the kissing seems to be somewhat inferior on the cheek (Herod. i. 134). In Greece in the classic period it became customary to kiss the hand, breast or knee of a superior. In Rome the kiss of inferiors became a burdensome civility (Martial xii. 59). The early Christians made it the sign of fellowship: "greet all the brethren with an holy kiss" (1 Thess. v. 26; cf. Rom. xvi. 16, &c.). It early passed into more ceremonial form in the kiss of peace given to the newly baptized and in the celebration of the Eucharist; this is retained by the Oriental Church. After a time, however, its indiscriminate use between the sexes gave place to the double kiss of ceremony and reverence—men being only allowed to kiss men, and women women, and eventually in the Roman Church the ceremonial kiss at the communion being only exchanged by the ministers, but a relic or cross called an osculatorium or pax being carried to the people to be kissed. While the kiss has thus been adopted as a religious rite, its original social use has continued. Among men, however, it has become less effusive, the alteration being marked in England at the end of the 17th century by such passages as the advice to Sir Willfull by his London-bred brother: "A kiss is the greatest and most solemn token of respect and honor any one can give to another, &c. ... 'T is not the fashion here. Court ceremonial keeps up the kiss on the cheek between sovereigns and the kissing of the hand by subjects, and the pope, like a Roman emperor, receives the kiss on his foot. A curious trace which these oscillations have left behind is that when ceasing to be performed they are still talked of by way of politeness: Austrians say, "Kiss d'Hand!" and Spaniards, "Beso a Vd. las manos!" I kiss your hands!"

Strokings, patting and other caresses have been turned to use as salutations, but have not a wide enough range to make them important. Weping for joy, often occurring naturally at meetings, is sometimes affected as a salutation; but this seems to be different from a sobs, and it was restricted by ecclesiastical regulations. In Greece, embraces with kisses on one hand, while with the other she catches her face till the blood drops. Only this is the joy-weeping, but mourning, and the same is true of the New Zealand tangi, which is performed at the reception of a distinguished visitor, whether he has really dead friends to mourn or not. Cowering or crouching is a natural gesture of fear or inability to resist, which among savages acts as a form of kissing or laying prostrate face to ground. In barbaric society, as soon as

SALUZZO—SALVADOR.

SALUZZO, a city and episcopal see of Piedmont, Italy, in the province of Cuneo, 42 m. S. of Turin by rail, 1206 ft. above sea-level. Pop. (1901) 10,306 (town), 16,208 (commune). The upper town preserves some part of the fortifications which protected it when, previous to the plague of 1630, the city had upwards of 30,000 inhabitants. The old castle of the marquises of Saluzzo now serves as a prison. Besides the Gothic cathedral (1480–1511), with the tombs of the marquises, the churches of San Giovanni (formerly San Domenico), San Bernardo and the Casa della Banda, the municipal museum, are noteworthy. Railways run to Cuneo and Alassa (the latter on the Turin–Pinerolo line) and steam tramways in various directions. The castle of Manta, in the vicinity, contains interesting 15th-century frescoes by a French artist (see P. d'Ancona in L'Art for 1905; 94, p. 184).

The line of the marquises of Saluzzo began (1142) with Manfred, son of Boniface, marquis of Savoy, and continued till 1548, when the city and territory were seized by the French. They would not carry them on so universally unless it found them useful. They serve the purpose of keeping up social intercourse, and establishing relations between the parties in an interview, of which their tongues make the best use.

(S. B. T.)

SALZBURG, a city on the river Leitha, in the southeastern part of Austria, on the northern side of the Salzkammergut, 63 m. S.E. of Vienna, 235 ft. above the level of the sea. Pop. (1910) 166,926. The coal-field of the city is the source of its wealth.

SALVADOR, or SAN SALVADOR (República del Salvador), the smallest but most densely populated of the republics of Central America, bounded on the N. and E. by Honduras, S. by the Pacific Ocean, and W. by Guatemala. (For map, see Central America.) Pop. (1906) 1,116,252; area, about 7225 sq. m. Salvador has a coastline extending for about 160 m. from the mouth of the Rio de la Paz to that of the Coasconor in the Bay of Fonseca (p.). Its length from E. to W. is 140 m., and its average breadth about 50 m. It is traversed by the Rio de la Paz and by several smaller rivers.

Physical Features.—With the exception of a comparatively narrow seaboard of low alluvial plains, the country consists mainly of a plateau about 2000 ft. above the sea, broken by a large number of volcanic cones. These are geologically of more recent origin than the main chain of the Cordillera which rises farther N. The principal river of the republic is the Rio Lempa, which, rising just beyond the frontier of Guatemala and crossing a corner of Honduras, enters Salvador N. of Citalá. After receiving the surplus waters of the Laguna de Guía, it flows E. through a magnificent valley between the plateau and the Cordillera, and then turning S. skirts the base of the volcano of Siguatepeque and reaches the Pacific in 88° 40' W. Among its numerous tributaries are the Rio Santa Ana, rising near the city of that name, the Asijiguate, which passes the capital, San Salvador, the Sumpul, and the Torola, draining the N.E. of Salvador and part of Honduras. The Lempa is for two-thirds of its course navigable by small steamers. The Rio San Miguel drains the country between the bay of Fonseca and the basin of the Lempa. The volcanic mountains do not extend in Chile but a series of clusters: the Izalco group in the W., including Izalco (formed in 1770), Marcelino, Santa Ana, Naranjo, Aguila, San Juan de Dios, Apaneca, Tamajaso and Lagunita; the San Salvador group, about 30 m. E.; Cojutepeque to the N.E. and the San Vicente group to the E. of the great volcanic lake of Ilopango; the Siguatepeque summits to the N.E. of San Vicente; and the great S.E. or San Miguel group—San Miguel, Chinameca, Buenapa, Usulutan, Tecapa, Taburete, Catacatepeque and Sociedad volcanoes in the N.E. belong to the inland Cordillera. Santa Ana (8500 ft.) and San Miguel (11,750 ft.) are two of the highest of the range. November 1879 and the 11th of January 1880 the lake rose 4 ft. above its level. The Jiboa, which flows out at the S.E., became, instead of a very shallow stream 20 ft. broad, a raging torrent which soon scooped out for itself in the volcanic rocks a channel 30 to 35 ft. deep. A rapid subsidence of the lake was thus produced, and by the 6th of March the level was 34 ft. below its maximum. Towards the centre of the lake a volcanic centre about 500 ft. in diameter rose 130 ft. above the water, surrounded by a number of small islands.

Climate.—The lowlands are generally hot and, on the coast, mountain; but on the uplands and mountain slopes of the interior the climate is temperate and healthy. There are only two: the wet, which Salvadorians call winter, from May to October; and the dry, or summer, season, from November to April. In July and August there are high winds, followed by torrents of rain and thunderstorms; in September and October the rain, not heavy, is continuous. For an account of the geology, fauna and flora of Salvador, see Central America.

Inhabitants.—The population in 1887 was stated to be 664,513, (1901) 1,066,548, (1906) 1,116,253. The number of Lázarines (persons of half-blood) was 12,975 in 1875; of pure-blooded Indians about 230,000. The various elements were before 1901, estimated as follows, and the proportion still holds good in the main: whites (creoles and foreigners) 10%, half-castes 50%, Indians 40% and a very small proportion of negroes. The whites of pure blood are very few, a liberal estimate putting the proportion at 2-5%. There is no immigration into the country, and the rapid increase with which the population is credited can be due only to a large surplus of births over deaths. The chief towns, which are described in separate articles, comprise San Salvador the capital (pop. 1905, about 60,000), Santa Ana (8500), San Miguel (35,000), San Vicente (18,000), Sonsonate (17,000), Nueva San Salvador or Santa Tecla (18,000) and the seaport of La Unión (4000). For the ancient Indian civilization of Salvador, see Central America: Archaeology, and Mexico: History.

Agriculture.—The only industry extensively carried on is agriculture, but the methods employed are still primitive. The more important products are coffee, sugar, indigo and balsam. The country is rich in medicinal plants. Peruvian balsam (Myroxylon balsamum or Myroxylon Pereira) is an indigenous balm, native to the region. The Balsam Coast, as the region is known, is rich in medicinal plants. Cape Remedios is named. It is not cultivated in Peru, but owes its name to the fact that, during the early period of Spanish rule, it was forwarded to the Peruvian port of Callao for transport to Europe. Rubber is collected; tobacco is grown in small quantities; cocoa, rice, cereals and fruits are cultivated. The government seeks to encourage cotton-growing, and has
established in the suburbs of the capital an agricultural college and model farm.

Mining.—In the Cordillera, which runs through Salvador, there are veins of various metals—gold, silver, copper, mercury and lead being found mostly in the E., and iron in the W. Coal has been discovered at various points in the valley of the Lempa. In the republic there are about 180 mining establishments, about half of them being in the department of Morazan; they are owned by British, United States and Salvadorian companies. Only gold and silver are worked. The output, chiefly gold, was valued at $330,000 in 1907.

Commerce.—Salvador is almost entirely confined to the import of cotton goods, woollen goods, sacks and machinery, and to the export of coffee and a few other agricultural products. In 1900 the formation of a statistical office was decreed. The average yearly value of the imports for the five years 1904-1908 was $804,000, of the exports $1,250,000. The coffee exported in 1908 was valued at $380,000. The imports, comprising foodstuffs, hardware, drugs, cottons, silk and yarn, come in (order of value) chiefly from Great Britain, the United States, France and Germany; the exports are mostly to the United States and France.

Communications.—Until 1855 the roads of Salvador were little better than bridle-paths, and ferries or fords were the sole means of crossing the larger rivers. During the next half-century about 2000 m. of highways were built, and the rivers were bridged. The first railway, a narrow-gauge line, between the port of Acajutla and Sonsonate, was opened in 1882, and afterwards extended to Ateos on the E. and Santa Ana on the N.W. A railway from the capital to Nueva San Salvador was also constructed, and in 1900 was linked to the older system by a line from Ateos to San Salvador. In 1903, a concession was granted for an extension from Nueva San Salvador to the port of La Libertad. From 350 to 450 vessels annually entered and cleared at Salvadorian ports (chiefly Acajutla, La Libertad and La Union), during the years 1895 to 1905. The old port of Acajutla has been closed, and a new port opened in a more sheltered position about 1 m. N., where an iron pier, warehouses and custom-house have been erected. Salvador joined the postal union in 1879.

Currency and Credit.—In 1910 there were three commercial banks and an agricultural bank within the republic. In 1897 a law was passed adopting a gold standard. The currency of the country in 1910 consisted entirely of silver pesos, the fractional money under 1000 fine having, by arrangement with the government, been exported by the banks. The peso or dollar at par is valued at four shillings; its actual value was about 15.8d. in 1910. The metric system of weights and measures was adopted by decree of January 1886, but the old Spanish weights and measures still continue in general use.

Finance.—The revenue is mainly derived from import and export duties, but considerable sums are also obtained from excise, and smaller amounts from stamps and other sources. The principal branches of expenditure are the public debt, debt service and internal administration. The official figures showing the revenue and expenditure for the five years 1904-1908 are as follows (pesos being converted into sterling at the rate of £1 to £1):—

The foreign debt, amounting to £726,420 (€240,000 of a 6% loan of 1889, and €287,320 of another of 1892) was in 1890 converted into 5% mortgage debentures of the Salvador Railway Company Limited, to which the government has guaranteed, for eighteen years from the 1st of January 1899, a fixed annual subsid of £4,240. In March 1908 a new foreign loan was raised, amounting to £1,000,000. The bonds were issued at 86, and bore 6% interest, secured partly upon the special import duty of $3.60 (American gold) on every kilogramme of importated merchandise, partly upon the export duty of 40 c. (American gold) on every quintal (100 lb) of coffee up to 500,000 lb. The 4% internal debt amounted in 1905 to £840,170.

Government.—The constitution proclaimed in 1824, and modified in 1859, 1864, 1871, 1872, 1880, 1883 and 1886, vests the legislative power in a chamber of 70 deputies, including 42 landowners (3 for each department), all chosen by the direct vote of the people. The president and vice-president are likewise chosen by direct popular vote, and they hold office for 4 years.

Religion and Education.—The Roman Catholic religion prevails throughout the republic, but there is complete religious freedom, so far as is compatible with public order. Civil marriage is legal, monastic institutions are prohibited, and education is in the hands of laymen. Primary education is gratuitous and obligatory. For secondary instruction there are about 30 high schools, including 3 technical institutes, and 2 schools for teachers, one for men and the other for women; these five institutions being supported by the government. At San Salvador there is a national college for the higher education of women. Superior and professional instruction is provided at the national university in the capital.

Justice is administered by a supreme court, and in districts, circuit and local courts. The active army consists of about 3000 men, and the militia, of about 18,000. In time of war all males between the ages of eighteen and sixty are liable for service. The navy consists of one customs cruiser.

History.—Salvador received its name from Pedro de Alvarado, who conquered it for Spain in 1525-26. Its independence of the Spanish Crown dates from 1822; (see CENTRAL AMERICA: History). Revolutions have been frequent. In July 1906 war broke out between Salvador, Honduras and Guatemala, but was terminated within the month by the arbitration of the United States president (see above). In 1907 Salvador supported Honduras (q.v.) against Nicaragua; its prosperity was not, however, seriously impaire by the defeat of its ally.

Gonzalez, Datos sobre la república de El Salvador (San Salvador, 1901); No. 58 of the Bulletin of the Bureau of American Republics (Washington, 1892); annual reports of the Council of the Corporation of Foreign Bondholders (London) and of the British Foreign Office.

SALVAGE (from Lat. salvis, safe). There is no general rule or principle of law which entitles one who saves the life or property of another to be rewarded by him. But in certain special classes of cases the law does require the appointed courts to reward those who by their exertions have rescued lives or property from probable destruction. The reward so given is called salvage and the same word is often used to denote the service rewarded. Apart from the application of the term by analogy to the saving of property from fire on land, the recovery of property from destruction by the aid of voluntary payments (as in the case of payments to prevent the forfeiture of an insurance policy), or a solicitor's charges for property recovered by his means, the subject of salvage divides into (1) civil salvage, (2) military salvage.

1. Civil Salvage in English law is defined as such a service as may become the ground of a reward in the (admiralty) courts on the civil side of its jurisdiction, and consists in the preservation of life or property from some of the dangers of the sea. The jurisdiction to give it is an admiralty jurisdiction. But the right to reward was recognized in the courts of common law before the admiralty court became, as it now is, a part of the High Court of Justice, e.g. by enforcing a possessory lien of the salvor over the salvaged property. The origin of the rule has been traced...
Salvage

to the doctrine of Roman law that “spontaneous services” in the protection of lives and property should be rewarded. But that doctrine has not found a place in English law except, as part of the maritime law administered in the court of admiralty. Thus services on land, say in rescuing lives or houses or goods from fire, do not entitle the person rendering those services to reward, unless he has acted under some contract or employment. But at sea the right to reward springs from the service itself if it has been rendered to a ship, or her passengers, crew or cargo, or to property which has been thrown or washed out of her. And such a service entitles to salvage though the ship may be in harbour, or within a river, or even in a dock. This connexion of the lives or property with a ship seems essential. The right does not arise upon saving goods which have got adrift in river or sea, unless they have been dashed out to sea or upon saving property of other kinds which may be in peril on the sea or on the seashore. Thus a claim to reward for saving a gas- buoy or beacon, which had broken from its moorings in the Upper Humber, and was aground on the Lincolnshire coast, was disallowed by the House of Lords, affirming the court of appeal, in the case of the gas-float "Whitton No. 2," 1897, A.C. 337.

The definite right to salvage for saving lives from ships is the creation of modern statutes. Formerly the Admiralty judges treated the fact that lives had been saved as enhancing the merit of salvage of property by the same salvors, where the two could be connected; and so indirectly gave life salvage. And this is still the position in cases where the Merchant Shipping Act of 1894 does not apply. This act (§ 544) applies to all cases in which the “services are rendered wholly or in part within British waters in saving life from any British or foreign vessel, or elsewhere in saving life from any British vessel.” Also (§ 545) it can be applied, by Order in Council, to life salvage from ships of any foreign country whose government “is willing that salvage should be awarded by British courts for services rendered in saving of lives from ships belonging to that country where the ship is beyond the limits of British jurisdiction.” By section 544, the life salvage is made payable “by the owner of the vessel, cargo or apparel saved”; and is to be paid in priority to all other claims for salvage. Where the value of the vessel, cargo and apparel saved is insufficient to pay the life salvage, the Board of Trade may in their discretion make up the deficiency, in whole or in part, out of the Mercantile Marine Fund. The effect of the act is to impose a common responsibility upon the owners of ship and cargo to the extent of their property saved. Whatever is saved becomes a fund out of which life salvors may be rewarded, and to which they are entitled, in priority to other salvors. In the case of the cargo ex “Schiller” (1877, 2 P.D. 145) salvage was allowed out of specie raised by divers from the sunken wreck, to persons who had saved some of the passengers and crew.

This limitation of liability to the amount of the property salved is also true with regard to salvage of property. The ordinary remedy of the salver is against the property itself; by proceedings in rem, to enforce the maritime lien given him by the law upon that property. This enables him to arrest the property, if within the jurisdiction into whose handssoever it may have come; and, if necessary, to obtain a sale, and payment of his claim out of the proceeds. The salver has also a remedy in personam, used only in exceptional cases, against the owners or others interested in the property saved (Five steel barges, 15 P.D. 142); but it seems certain that that depends upon property having been saved, and having come to the owner’s hands; and that the amount which can be awarded is limited by the value of that property.

An essential condition is that the lives or property saved must have been in danger—either in immediate peril, or in a position of “difficulty and reasonable apprehension.” Danger to the salver is not essential, though it enhances his claim to reward; but to constitute a salvage service there must have been danger to the thing salved. Again, the service must have helped usefully towards saving the lives or property. Infeoffed efforts, however strenuous and meritorious, give rise to no claim. But the service need not be completely successful. If it has contributed to an ultimate rescue it will be rewarded, though that may have been accomplished by others. And as we have seen, there must have been ultimate success. Some of the property involved in the adventure must have been saved, and the value of that, or the fund realized by its sales, limits the total of the awards to all the salvors. Cases, of course, occur in which services at sea are employed by ships in danger: as where a steamer with a broken propeller shaft employs another steamer to tow her; or where a vessel which has lost her anchors employs another to procure anchors for her from shore. In such cases the conditions of reward above set out may not apply. Reward may be payable, notwithstanding entire failure of salvors, when the express or implied terms of the employment. But such a reward is not truly “salvage.”

Services rendered in the performance of a duty owed do not entitle to salvage. The policy of the law is to stimulate voluntary effort, not to weaken obligation. Thus the crew cannot (while still the crew) be salvors of the ship or cargo; nor can the passengers, unless they have voluntarily stayed on the ship for the purpose of saving her. Nor can a pilot employed as such be salver, unless he has boarded her in such exceptional circumstances that his doing so for pilotage fees could not reasonably be required; or unless the circumstances of the service, entered upon as pilotage or as a matter of hazard, have a paramount character; and it may be doubted whether such a change of circumstances is a valid ground for a claim of salvage remuneration by the pilot where he has had no opportunity of leaving the ship. So again of the owners and crew of a tug employed to tow a ship. They cannot claim salvage for rescuing her from a danger which may arise during the towage, unless circumstances have supervened which were not contemplated, and are such as to require extraordinary aid from the tug, or to expose her to extraordinary risk. Officers and crew of a ship of the royal navy may have rendered services outside the protection which ship owned to afford. But by the Merchant Shipping Act 1894, § 557, such a claim must be with consent of the Admiralty; and no claim can be made in respect of the ship herself.

The kinds and degrees of service are very various. The rewards given vary correspondingly. Reward is paid, first, to the degree of the danger to the property salvaged, to its value, and to the effect of the services rendered; next, to the risks run by the salvors, the length and severity of their efforts, the enterprise and skill displayed, and to the value and efficiency of services rendered, and to the risks to which they have exposed her. In a modern case (the "Glenyle" 1898, A.C. 540) a specially large award was given to vessels kept constantly ready for salvaging operations in Gibraltar Bay. It was owing to that readiness that the rescue had been possible. On the other hand, any negligent or improper conduct of the salvors will be considered in diminution of the award: as where they have negligently exposed the ship to damage, or have plundered the cargo, or dealt with it contrary to the owner’s interests. And where the rescue has been from a danger which could have been averted, against salvors, or made an improper conduct of those who effected the rescue, no salvage is allowed. Where two colliding ships were both to blame for the collision, the master and crew of one of them were not allowed salvage for services in saving cargo of the other (cargo ex “Capello,” L.R. 1 A. and E. 356).

In apportioning the total award given for a salvage service among the owners, master and crew of the vessel by means of which it has been rendered, the special circumstances of each case have to be considered. In nearly all cases a large portion goes to the owners, and as in recent times the value and efficiency of ships (especially of steamships) have increased, so the proportion of the whole usually awarded to the owners has also increased. In an ordinary case of salvage by a steamship towing a distressed ship into safety, the share of the owners is usually about three-fourths; of the remainder the master usually gets about one-third,
and the officers and crew divide the rest in proportion to their ratings. But where the salvaging ship has sustained special damage in the service, or her owners have been put to loss by it, that is taken into account. On the other hand, where special personal services have been rendered by members of the crew they are specially rewarded.

As an illustration take the case of the "Rasche" (L.R. 4 A. and E. 127). The brigantine "Rasche," derelict, was fallen in with by the ship "Scythia" (carrying a very valuable cargo) 220 m. N. of the Lizard. The mate and three hands of the "Scythia" were left on board, and in circumstances of much hardship and danger they brought her after eighteen days safely to Liverpool. After deducting expenses incurred by the owners of the "Scythia," the valuable cargo was set by arbitrators awarded £3900; and of this he gave £500 to the mate, £510 to each of the three men who had accompanied him; £500 to the owners of the "Scythia" and £550 to her other officers and crew.

An agreement as to the salvage to be paid is sometimes made at the time the assistance is given. When made fairly the court will act upon it, though it may turn out to be a bad bargain for one or other of the parties. But if the facts were not correctly apprehended by one or both, or if the position was one of such difficulty that those salvaged had no real option as to accepting the salvor's terms, the courts will set the agreement aside.

This happened, for instance, where the salvaging ship refused to rescue 350 wrecked pilgrims from the Parkin Rock in the Red Sea (1909). An agreement had in fact been signed for their conveyance for that sum to Jeddah, two or three days' sail. The Parkin Rock stands 6 ft. above the water, and had the salvors not been present a considerable sum would have been lost. It was held that the sum asked for was exorbitant; and that the agreement, made under practical compulsion, could not stand (the "Medina," 2 F.D. 5). On the other hand, an agreement to divide the salvage equally among the salvors, which was agreed to on the spot, was held to bevalid, after the owners had entered their hands for the salvaging of the property. The same was held in the case of the "Insignia," which was 127 m. S.W. of the Scilly Islands, and was salvaged after a loss of 127,000; and in the case of the "Philip" (1864, 17th Mar.) valued at £600, which was 86 m. S.W. of the Scilly Islands, and was salvaged after a loss of £500. The court held that the owners had not been on board the "Philip" when the contract was made (the "Kingston," r. Spink, 265).

The award of salvage is generally made in one sum against ship, freight and cargo; and those interests contribute to the amount in proportion to the value saved. No distinction is made between the degree of service rendered to one interest and another. But, with a possible exception in the case of life salvage, there is not a joint liability of the several interests. Each is liable to the salvors for his own share, and for no more. The ship cannot be made to pay the cargo's share, nor the cargo the ship's. If, however, the shipowner pays the cargo's share, he has a lien upon it for the amount. In practice the liabilities for salvage are ordinarily adjusted as part of general average. State laws and the interests of the salvors control. The Half-Sail is a direct liability to the salvors, arising at once, e.g., at the port of refuge, and proportional to the values there; whereas the liability to contribute to a general average loss or expenditure is postponed until the completion or break up of the adventure, and depends upon the values of the interests which have arrived there; which may be very different. (See AVERAGE, INSURANCE, MARINE, and also ADMIRALTILITY JURISDICTION.)

2. Military Salvage is analogous to civil salvage. It is defined as such a service as may become the ground for the demand of a reward in the court as a prize court, and consists in the rescue of property from the enemy in time of war. In such cases almost invariably relate to ships and their cargoes; and they have always been dealt with by courts having Admiralty jurisdiction, sitting as prize courts. They involve the determination of two questions: first, whether the property is to be restored to its original owner or condemned as prize to the recaptor; and second, what amount of salvage, if any, is to accompany restitution. Generally speaking, the first question depends upon the law of nations, which may be taken to be that where a ship has been carried by an enemy infra praesidium, and especially after a sentence of condemnation, the title of the original owner is divested, and does not revert upon recapture by third parties. In such a case, therefore, jure gentium restitution cannot be claimed. The municipal law of civilized countries, however, does not encourage subjects to "make reprisals upon one another" (the "Renard," Marr. Adm. Dec. 222), and laws are generally found, as in England, which as between subjects of that particular state provide for restitution irrespective of any change in the title to the subject matter which may have occurred. But (speaking henceforth of England) in cases which do not fall strictly within these acts, the old maritime law, which was in union with the general law of nations, is applied by the courts. Moreover, the English Prize Acts do not apply to foreign owners of recaptured prizes, and therefore no award can be made against them unless in accordance with the law of nations. In practice the courts have acted upon the "rule of reciprocity" where recaptures have been made of the property of formal allies, dealing with them as the allied state would have dealt with English property. In the case of neutral recaptures restitution is always ordered. An exception to the rule of restitution as between British subjects is made in the case of a British ship which has been "set forth as a ship of war" by the captor, and subsequently retaken by a British ship. Such a ship is not liable to restoration, but is the prize of the recaptor. This exception, the object of which is to encourage the capture of armed ships, dates from 1793, previous acts having provided for restitution upon payment of a moiety as salvage. The condition of setting forth as a ship of war is satisfied, where under a fair semblance of authority, which is not disproved, the ship "has been used in the operations of war, and constituted a part of the naval force of the enemy." (The "Ceylon," 2 D. O. 105.)

Such a user permanently alters the ship's original character and extinguishes all future claims to restitution ("L'Actif," Edw. 185).

As to the right to salvage and the amount which will be allowed, this is also a question of the jus gentium, though usually governed by municipal law. The right was recognized so long ago as the 11th century, when the "Consolato dei Mare" (see CONSULATE OF THE SEA) laid down elaborate provisions on the subject. In England the first statutory recognition of the right occurs in 1648, when an act of the Commonwealth, which in its outline has been the model for all subsequent Prize Acts, provides that British vessels captured by the enemy or taken by British ships shall be restored upon payment of one-eighth of the value of the property in lieu of salvage, or one-half in the case of a prize "set forth as a ship of war." From that date until 1864, the date of the act now in force, there have been thirteen Prize Acts dealing with recapture, each of which, except that of 1864, has been passed to meet a particular occasion, and has expired with the cessation of the then existing hostilities. Since the first act, and down to the act of 1805 inclusive, a distinction has always been drawn between a recapture effected by one of the royal ships of war and a recapture by a privateer or other vendetta ship. The case of the British vessels captured by the enemy and which, in the latter part, was usually one-sixth. In the act of 1692 a clause taken from a Dutch law gave salvage to a privateer, rising in amount from one-eighth to one-half according to the number of hours the prize had been in the enemy's possession, but this clause has disappeared since 1756. There is no provision in the present act for the payment of salvage, except in case of recapture by one of His Majesty's ships, but it seems beyond question that recaptors are entitled at law to salvage, although they may hold no commission from the crown. It is the duty of every subject of the king to assist his fellow-subjects in war, and to take care that the property in the possession of the enemy: no commission is necessary to give a person so employed a title to the reward which the policy of the law allots to that meritorious act of duty" (the "Helen," 3 C. Rob. 226, per Sir W. Scott). Though it is improbable that privateers will figure in any future war, it may reasonably be anticipated that recaptures may be made by private vessels, and in such cases salvage would probably be awarded, the proportion lying in the discretion of the court. Similarly, salvage is awarded in the case of recapture from pirates or from a mutinous crew. In the case of royal ships the question of the salvage, which in cases of "special difficulty or danger" the court may increase to a quarter. The latter provision is an innovation.
SALVAGE CORPS—SALVATION ARMY

It may appear that the grant of salvage to ships of war, the duty of whose commanders it is, according to the naval instructions, "in places to be determined," is a dangerous business. The term "salvage" is here used loosely, and would be more correctly called "salvage on board," and comprises two distinct classes—(1) services at fires; (2) working and working salvage.

(1) Services at Fires form the most important feature of the work. Much depends upon the method of dealing with the salvage. If, for instance, a large Manchester goods warehouse was on fire in the top part, it would be very little advantage to the fire officer to burn the contents, and remove the stock of goods beneath the floor, with the object of removing the stock off the ground floor. The best method would be to cover up with tarpaulin all goods there, and prevent the water from collecting on the lower floors. It will be gathered that the most important work of the corps is to prevent damage to goods, and that water is mostly looked after. The damage from fire is left almost entirely to the fire brigade. The traps, which immediately on receipt of an alarm proceed to the scene of the fire with their crew of men, carry every kind of appliance for the saving of goods from destruction by fire or damage by water, as well as lime-light apparatus for use in working after the fire has become extinguished, thus enabling the men to note the position of dangerous materials, &c.; and a portable coal-gas apparatus, which can be employed in the interior of buildings when the ordinary means of illumination has failed; in addition to ambulance appliances for emergencies.

(2) Working Salvage.—When a fire takes place, a man is left behind in charge of the salvage if the property is insured; or if that fact cannot be ascertained, but it appears probable that it is, a man is left until the information is obtained later. The duty, if an important one, is divided into a day and night duty. This enables an experienced man to be sent on day duty to meet the surveyor, and to carry out his instructions regarding the working out of the salvage; and a junior man at night. The day man, if working out salvage, would employ a number of men called strangers, over whom he acts as a kind of foreman. The "working out" may take the form of dividing up damaged goods into lots ready for a sale to be held by the surveyor, or of sorting over the debris to find remains of certain articles claimed for. If, for instance, a large fire occurred at a pianoforte manufacturer’s, and the debris was all in one common heap, the London Salvage Corps might have to arrange certain quantities of pegs and wires in order to give an idea of the value of pianos before the fire. The watching continues until the loss is settled, when the charge of the premises is given over to the assured.

There are also salvage corps on similar lines, but on a smaller scale, in Liverpool and Glasgow.

SALVANDY, NICARISSE ACHILLE (1795-1856). French politician, was born at Condum (Gers) on the 11th of June 1795, of a poor family Irish by extraction. He entered the army in 1813, and next year was admitted to the household troops of Louis XVIII. A patriotic pamphlet, La Coalition et la France (1816) attracted the attention of Decazes, who employed him to disseminate his views in the press, and he waged war against the Villèle ministry of 1822-1828. Under the July monarchy he sat almost continuously in the Chamber of Deputies from 1830 till 1848, giving his support to the Conservative party. Minister of education in the Molé cabinet of 1837-1839, and again in 1845, he superintended the reconstitution of the Council of Education, the foundation of the French School at Athens and the restoration of the École des Chartes. For short periods in 1841 and 1843 he was ambassador at Madrid and Turin, and for several years was a member of the French Academy, published the Études and wrote a History of Spain. During the Empire he took no part in public affairs, and died at Graveron (Eure) on the 16th of December 1856.

SALVATION ARMY, a religious philanthropic organization founded by William Booth (q.v.), who in 1865 began to hold meetings for preaching in the streets in London and in tents, music halls, theatres and other hired buildings. Large numbers attended, many of whom had never entered a place of worship, and presently an organized society was formed called The Christian Mission. Booth was assisted by his wife, Catherine Booth, a woman of remarkable gifts, who won for the new movement the sympathy of many among the cultivated classes. In 1878 the Mission, which had spread beyond London, was reorganized on a quasi-military basis, and the title of “The Salvation Army” was definitely adopted in June 1886. The local societies became “Corps,” and their evangelists “Field Officers,” with Booth as “General” of the whole body. The spiritual operations of the Army at once rapidly expanded in spite of much disorderly opposition in some places. In 1858 there were 75 corps and 120 officers in the United Kingdom, the number of the French outside France being 185. Since then the number of corps and officers has greatly increased. Very large numbers who have “professed conversion” are reported annually. No figures of membership, however, are published. In doctrine, the Army is in harmony with the main principles of the evangelical bodies, “as embodied in the three creeds of the Church.” Its preaching is practical and direct, asseverating the reality of Sin, “the everlasting punishment of the wicked,” and Redemption. The Army proclaims the
supreme duty of self-sacrifice for the sake of the salvation of others.

The Army is under the control of the General for the time being, who issues all orders and regulations. Large powers devolve upon other officers, such as the "Chief of the Staff," the "Foreign Secretary," and the "Chancellor," who direct affairs from the "International Headquarters" in London. The system of government is autocratic, "unquestioning obedience" being required throughout all ranks. The Army is divided, usually in harmony with national boundaries, into "territories," each under a "Commissioner," with headquarters in the capital of the country. The Territories are generally divided into "Provinces" and these again into "Divisions," which include a number of corps, each supporting its own "Captain" and "Lieutenant." The "soldiers" or members are drawn from all classes of the community. The property of the Army in the United Kingdom is held by the General for the time being, for the benefit of the Army exclusively, he being constituted the sole trustee of the property, in the disposal of which and in the appointment of his successor he is placed under the government of a deed poll, executed by Booth while the body was still known as "The Christian Mission," and enrolled in the Court of Chancery in August 1878. In other countries various modifications have been necessary, but the General's ultimate control has been practically assured. A further deed poll providing for the removal of a General in the contingency of "mental incapacity" or other "unfitness," and for the election of a successor, was executed by Booth in July 1904.

Funds are raised from the voluntary offerings of the corps, from open-air and other collections, from friends interested in evangelical and charitable work, and from the profits on publications and general trading. The financial statements of the various national headquarters funds are annually published, certified by public accountants, in each country. In 1909 the general income and expenditure account of International Headquarters in London dealt with a total of £64,145. Details of the aggregate income raised in the United Kingdom by the corps are not published. The annual Self-Denial offering (Great Britain) was £12,663 in 1888, £72,562 in 1906 and £69,034 in 1910. The value of the assets of the spiritual work in the United Kingdom increased from £338,992 in 1891 to £1,357,706 in 1909, the liabilities on account of loans upon mortgage and otherwise amounting at the latter date to £662,235. The assets of the Trade Departments were valued at £110,657 in 1909.

Booth's scheme for Social Relief, described in In Darkest England, and the Way Out (1890), attracted wide-spread interest, and was started with subscriptions amounting to over £100,000. A separate deed poll, making the General sole trustee, was executed by Booth in regard to the property and funds of this branch of work. Since then, both in Great Britain and abroad, the scheme has been actively carried on. The amount received in the year ending 30th September 1909 for cheap food and lodging in the United Kingdom was returned at £42,022 for the men's work, and £61,717 for the women's. Large numbers of unemployed, ex-criminal and other needy persons have been aided or dealt with. In the year ending 30th September 1909, the number of persons received into the "elevators" or factories was reported as 6425, of women and girls received into rescue homes as 2559. The farm colony at Hadleigh in Essex has a large acreage under cultivation, with fruit and market gardens and various industrial undertakings. The emigration department, although a development of the Darkest England Scheme, has no connexion with the rescue work; in 1907 the passage money received amounted to £85,614, and in 1909 to £58,170. An "anti-suicide bureau" was opened in 1907, and at_boxed, near Colchester, a scheme for Small Holdings has been initiated. In 1909 the value of the property held under the Darkest England Scheme in the United Kingdom was returned at £349,645, and the income of the central fund at £50,504.

Total number of officers engaged exclusively in social work, 2520.

There are a number of subsidiary branches of work, such as the Young People's Legion, and the Navy and Military League for work among men in the military, naval and merchant services. In England there is a bank (the Reliance Bank, Ltd.) and a Life Assurance Society, the funds of the latter amounting to £566,309 in 1909. All officers and many of the rank and file wear a uniform. Music is universally employed. While the organization has succeeded in securing recognition and favour in high places both in England and abroad, it has been seriously criticized at times, notably by Huxley and others in 1890-1891, and more recently by J. Manson in The Salvation Army and the Public, a work which led to much public discussion of the Army's religious, social and financial operations and methods. In 1909 some resignations took place among the higher officials.

SALVER—SALVIAN

Manson, The Salvation Army and the Public (1906; 3rd ed., 1908); Salvation Army Headquarters, A Calumny Refuted: A Reply to the Unfounded Charges of Swearing, &c. (1908); United Workers' Anti-Sweating Committee, Salvation Army Sweating; A Reply to the Mis-statements of General Booth and his Officials (1908; 2nd ed., 1910); Reports of the Trades Union Congress (1907 to 1910).

SALVER, a flat tray of silver or other metal used for carrying or serving glasses, cups, dishes, &c., at table for the purpose of presenting a letter or card by a servant. In a royal or noble household the fear of poisoning led to the custom of tasting the food or drink before it was served to the master and his guests; this was known as the "assay" of meat and drink, and in Spanish was called salva (savor, to preserve from risk, Lat. salvare, to save). The term salva was also applied to the dish or tray on which the food or drink was presented after the tasting process. There seems no doubt that this Spanish word is the source of the English "savor"; a parallel is found in the origin of the term "credence-table," which is from the Ital. credenza, Lat. credere, to believe, trust (see CREDENCE and CREDENCE-TABLE).

SALVIA, a large genus belonging to the natural order Labiatae (g.v.), containing about 500 species in the temperate and warmer regions of both hemispheres. The name is derived from the Lat. salve, from the healing properties of sage, S. officinalis (see figure under LABIATAE). S. verbena, Clary, is a native of Britain found in dry pastures and waste places.

Some of the Salvas are among the most showy of the soft-wooded winter-flowering plants, the blooms being of a blue resembling scarlet. The three most useful species are S. splendens, S. Heeris and S. gesnerifora, the first beginning to flower early in the autumn and lasting till Christmas, while the others follow immediately in succession, and continue in full beauty till April. Young plants should be propagated annually about February, and after nursing through the spring should be grown outdoors in a fully exposed situation, where they can be plunged in some non-conducting manure to form strong roots. The young shoots should be stopped to secure bushy plants, but not later than the middle of August. The most suitable compost for them is a mixture account in her own district and not obscure in family " (Ep. i.). He was certainly a Christian when he married Palladia, the daughter of heathen parents, Hypatius and Quetia, whose displeasure he incurred by persuading his wife to retire with him to a distant monastery, which is almost certainly that founded by St Honoratus at Lerins. For seven years there was no communication between the two branches of the family, till at last, when Hypatius had become a Christian, Salvian wrote him a most tender letter in which he reproached his daughter Auspiciola, begging for the renewal of the old affection (Ep. iv.). This whole letter is a most curious illustration of Salvian's reproach against his age that the noblest man at once forsook all esteem if he became a monk (De gub. iv. 7; cf. viii. 4).

It was presumably at Lerins that Salvian made the acquaintance of Honoratus (ob. 429), Hilary of Arles (ob. 449), and Eucherius of Lyons (ob. 449). That he was a friend of the former and wrote an account of his life we learn from Hilary (Vita Hon., ap. Migne, l. 773; Salv., Ep. ii.). Salvian continued his friendly intercourse with both father and sons long after the latter had left his care; it was to Salonius (then a bishop) that he wrote his explanatory letter just after the publication of his treatise Ad ecclesiam; and to the same prelate a few years later he dedicated his work on the Mass, which the bishop pronounced to be right in assigning Hilary's Vita Honorei to 430, Salvian, who is there called a priest, had probably already left Lyons for Marseille, where he is known to have spent the last years of his life (Gennadius, ap. Migne, lviii. 1906). It was probably from Marseille that he wrote his first letter—presumably to Lerins—begging the community there to receive his kinsman, the son of a widow of Cologne, who had been reduced to poverty by the barbarian invasions. It seems a fair inference that Salvian had divested himself of all his property in favour of that society and that the reference to it in his works (Ep. i., when he compares Ad eccles. ii. 9, 10; iii. 5) has been misconstrued that Salvian paid a visit to Carthage; but this is a mere inference based on the minute details he gives of the state of this city just before its fall (De gub. vii. 8.). He seems to have been still living at Marseilles when Gennadius wrote under the papacy of Gelasius (492-496).

Of Salvian's writings there are still extant two treatises, entituled respectively De gubernatione Dei (more correctly De predicentis iudicio) and Ad ecclesiam, and a series of nine letters. The De gubernatione, Salvian's greatest work, was published after the capture of Litorius at Toulouse (439), to which he plainly alludes in viii. 40, and after the Vandal conquest of Carthage in the same year (vi. 12), but before Attila's invasion (450), as Salvian speaks of the Huns, not as enemies of the empire, but as serving in the Roman armies (vii. 9). The words "maximum belii, " seem to denote a year very soon after 439. In this work, which furnishes a valuable if prejudiced description of life in 5th-century Gaul, Salvian deals with the same problem that had moved the eloquence of Augustine and Gildas. Why were the miseries of the time so terrible? Could it be, as the pagans said, because the age had forsaken its old gods? or, as the semi-pagan creed of some Christians taught, that the nation constantly overrule the world he had created (i. 1)? With the former Salvian will not argue (iii. 1). To the latter he replies by asserting that, "just as the navigating steersman never loosens the helm, so does God never remove his care from the world," hence the title of the treatise. In his misrule, according to Salvian, we have the apostrophing of the impost, escape comparatively free (v. 7). The great towns are wholly given up to the abominations of the
circuit and the theatre, where decency is wholly set at nought, and Minerva, Mars, Neptune and the old gods are still worshipped (vi. 1; cf. vi. 2 and viii. 2). Treves was almost destroyed by the barbarians; yet the first petition of its few surviving notables was that the emperor would return for a brief visit (Cod. 1184 vi. 15). And this was the prayer of Christians, whose baptismal oath pledged them to renounce "the devil and his works... the pomp and shows (spectacula)" of this wicked world (vi. 6). Darker still was the situation when the licentiousness of Gaul and Spain (iv. 5); and more fearful to Salvian than all else was to hear men swear "by Christ" that they would continue their familiars' Socratic custom if God left such a state of society unpunished (iv. 12). Especially among Christians, whose sin, since they alone had the Scriptures, was worse than that of barbarians, even if equally wicked, work for the propagation of the faith had fostered the shining virtues mingled with their vices, whereas the Romans were wholly corrupt (vii. 15, iv. 14). With this iniquity of the Romans Salvian contrasted the life of the Vandals, the piety of the Goths, and the rude virtues of the Franks, to whom, though heretic Arians or unbelievers, God is giving in reward the inheritance of the empire (vii. 9, 11, 21). It is curious that Salvian shows no such hatred of the heretics as was rife in Gaul seventy years later. It is difficult to credit the universal wickedness adduced by Salvian, especially in face of the contemporary testimony of Symmachus, Ausonius and Sidonius. Salvian's picture is more exterminating than impartial. 

15. Ad ecclesiam is explained by its common title, Contra avaria rerum. It strongly commends meritorious almsgiving to the church. It is quoted more than once in the De gubernatione. Salvian published it at Rome about the middle of the fifth century, and there is a letter in his old pupil, Bishop Salomians (Ep. ix.). This work is chiefly remarkable because in some places it seems to require parents not to bequeath anything to their children, on the plea that it is better for the children to suffer want in this world than that their parents should be damned in the next (iii. 4). Salvian is very clear on the duty of absolute self-denial in the case of sacred virgins, priests and monks. The last is corroborated by a well-known passage, notably a poem "in morem Graecorum" on the six days of creation (hexaemeron), and certain homilies composed for bishops, are now lost (Genn. 67). 

The De conversations was first printed in Siecheid's Antitologia (Basel, 1528); the De gubernatione by Brascian (Basel, 1530). The two appeared in one volume at Paris in 1575. Pithecus added various sections and the first seven letters (Paris, 1580); Ritterhusius made various conjectural emendations (Altiori, 1611), and Baluzius many more based on MS. authority (Paris, 1653-1669). Numerous other editions appeared from the 16th to the 18th century, all of which are now superseded by the excellent ones of C. Halm (Berlin, 1877) and F. Pauly. (Vienna, 1883). The two oldest MSS. of the De gubernatione belong to the 10th century (Cod. Paris, No. 13.38) and the 13th (Brussels, 10.568); of the Ad ecclesiasticum the 10th (Paris, 1177); the 12th (Cod. Paris, 1822); of the Satires (Cod. Paris, 1785-1786); of Epist. VIII. 7th to the 5th century (Paris, 95.559) and to the 9th or 10th century (Paris, 12.227, 12.230). Of the first seven patients there is only a MS. extant, of which one part is now at Berne (Berlin, 1807) and the other at Paris (1855). See Bellet, De la Collection de manuscrip des Satires de Fr. France, vol. ii.; Zimmermann, Saluianus (Halle, 1875). Salvian's works are reprinted (after Baluzius) in Migne's Cursus patr. lat. vol. iii. For bibliography, see T. G. Schneemuller, Bibliotheca patrum (ii. 832), and the prefaces to the editions of C. Halm (Monum. Germ., 1877) and F. Pauly (Vienna, Corp. sacr. aec. Lat. 1883). Cennadis, Hillary and Eucharius may be consulted in Migne, vol. vii., and also see S. Dill, Roman Society in the First Century of the Western Empire, pp. 115-120. (T. A. A.)

SALVINI, TOMMASO (1829- ), Italian actor, was born at Milan on the 1st of January 1829. His father and mother were both actors, and Tommaso first appeared when he was barely fourteen as Pasquino in Goldoni's Dona curiae. In 1847 he joined the company of Adelaide Ristori, who was then at the beginning of her brilliant career. It was at Elettra that he won his first success in tragedy, playing the title rôle in Alferio's Orote at the Teatro Valle in Rome. He fought in the cause of Italian independence in 1849; otherwise his life was an unbroken series of successes in his art. He acted frequently in England, and made visits to America in 1854 and in 1856. He died in 1880. In 1886 he played there Othello to the Iago of Edwin Booth. Apart from Othello, which he played for the first time at Vicenza in June 1856, his most famous impersonations included Conrad in Paolo Giacometti's La morte civile, Egisto in Alferio's Meropè, Saul in Alferio's Saul, Paolo in Silvio Pellico's Francesca da Rimini, Oedipus in Niccolini's play of that name, Macbeth and King Lear. Salvini retired from the stage in 1850, but in January 1902 took part in the celebration in Rome of Ristori's eightieth birthday (see the Century Magazine for June 1902, vol. lix.). Salvini published a large volume of letters entitled Ricordi, and edizioni impresioni (Milan, 1895). Some ideas of his career may be gathered from Leaves from the Autobiography of Tommaso Salvini (London, 1893).

SALWEN, a river of Burma. This river, called Nam Kông by the Shan, Thanlin by the Burmese, Lu Kang, or Nu Kang, or Lu Tzu Kang by the Chinese, is the longest river in Burma, running for 750 miles through the wildest and most picturesque streams in the world. Its success and uniformity, however, are slight causes to doubt that it rises in the Tanla mountains, S. of the Kuen Lun, somewhere in 32° or 33° N., and that perhaps it draws some of its water from the Kara Nor. It is thus a much longer river than the Irrawaddy. From the time it leaves Tibet it has a very narrow basin, and preserves the character of a gigantic ditch, or railway cutting, with for long stretches no other affiliates than the mountain torrents from the hills, which rise from 3000 to 5000 or 6000 ft. above the level of the river-bed. In the dry season the banks are alternate stretches of blinding white sand, and sand, and streams of shifting sand; in the rainy season, long stretches of shingle. In the rains all these disappear, and the water laps against forest trees and the abrupt slope of the hills. The average difference between high and low water level of the Salween throughout the Shan States is between 50 and 60 ft., and in some places it is as much as 90. There are many rapids, caused by reefs of rock running across the bed, or by a sudden fall of one from several feet, which produce very rough water below the swift glide; but the most dangerous navigation is where a point juts out into the stream, and the current, turning, causes a奋f of water. Nevertheless, long stretches of the river, extending to scores of miles, are habitually navigated by native boats. The current is extremely variable, from 3 m. an hour to ten knots. Launches ply regularly from Moulmein to the mouth of the Yonzalin, in Lower Burma. The worst part of the whole Salween, so far as is known, is the gorge between the mouth of the Yonzalin and Kyauknyat. It is quite certain that steam launches could ply over very long sections of the river above that, perhaps as far as the Kawkerry, or even the Kunlong ferry. In British territory, there are two steamers named Salween, one itself, and frequently the ferry vessels are built 1000 ft. above the mouth.

The Chinese believe the Salween valley to be deadly to all strangers, but it is in Chinese territory—particularly in the Lu Kang, or Mong Hsü state—that there is the largest population on the river until Lower Burma is reached. A description of the Salween resolves itself into a list of the ferries at which it can be crossed, for no one marches up the river. The river is bridged by the Chinese on the main route from Teng Yüeh (Momien) and Bhamo to Talu-fu. There are two spans; these are not in a straight line, but parallel to one another at a distance of the breadth of the central pillar. Each span is formed by twelve or fourteen massive iron chains, with planks laid across them. There was a bridge some 20 m. lower down, but this was destroyed in 1894. In British territory there are no bridges, and the ferries are the same as those maintained before annexation. There are a great number of these ferries, but only a few are used, except by the local people. From Ta Hsing Lo large trading boats ply regularly to Kyauknyat, whence the traders make their way by land over the hill to Papun, and so down the Yonzalin. The chief tributaries of the Salween in British territory are the Nam Yu and the Nam Oi or Nam Mwe on the right bank, and the Hsiaa Haw on the left. These are short but fair-sized streams. Near the Kunlong ferry the Nam Nin, on the right bank, and the Nam Ting, on the left, are considerably longer, and the Nam Ting is navigable by native craft for considerable stretches up to Męng Ting and farther. To the S. the two tributaries is the Nam Kyek, on the right bank, down the valley of which the railway will reach the Salween. Below this the Na Mla, on the left, is the Na Mla entering on the right bank, the other on the left, at no great distance from one another, but of no great length. A little below is the Nam Nang, on the right, which, coming from the land to the Näm, falls as a cascade of nearly 200 ft. in the cold weather from the right, and then there are no affluents till the Nam Hka comes in on the left.
This has a great volume of water, but is un navigable because of its steep gradient and many gorges. After the Hwe Long, entering from the left at Ta Kow, is passed, the Nam Pang comes in the right down the valley. This is the largest tributary of the Salween; some distance above its mouth, at Keng Hiam, it is 400 yds. wide and quite unfordable. The next important tributary is the Nam Haim, on the left bank, rising in the latitude of Keng Tung. It is a large but quite un navigable stream. Except the Me Si and Me Sala, from opposite sides, and the Nam Hang, which burrows its way through a range of hills from the E., and the Nam Pan, coming from the W., there is no considerable tributary till near Nga-wa, where the Nam Teng comes in on the right from the central Shan States. This is a considerable river, and navigable for long stretches in its upper course, but the last few miles before it enters the Salween is little better than a cataraft. Below this the only large affluent is the Nam Pawn, which drains all Kareni and a considerable portion of the Shan States, but is quite un navigable. Below this the tributaries are again only mountain streams till the Taung-yin comes in from the S.E. Thirty m. lower down is Kyodan, the great timber depot. Here a cable, stretched across the river, catches all the timber, which is then made up into rafts and floated down to Kado, near Moumein, where the revenue is collected. The Yonzalin enters the Salween from the right about 10 m. below Kyodan. Boats can ply from Kyodan S., and light draught steamers ascend as far as Shwegon, 63 m. from Moumein. The Salween cuts the British Shan States nearly in half, and is a very formidable natural obstacle. It seems probable, however, that long stretches of it can be opened to trade. It is certainly no less navigable than the Middle Meikong or the Yangtze; but it is a fanghwa.

**SALWEEN**, a district in the Tenasserim division of Lower Burma. Area, 2666 sq. m. Pop. (1905) 37,837, consisting largely of aboriginal tribes, Karens (33,448) and Shan (2816). Nearly the whole district is a maze of mountains intersected by deep ravines, the only level land of any considerable extent being found in the valley of the Yonzalin, while the country is covered with dense forest, of which 128 sq. m. are reserved. The district is drained by three principal rivers, the Salween, Yonzalin and Bilin, fed by mountain torrents. The Yonzalin, which rises in the extreme N., is navigable with some difficulty in the dry season, but the Bilin cannot be navigated even at the limits of the district except by small boats and rafts. The district is in charge of a superintendent of police, with headquarters at Papun. The total rainfall in 1905 was 11448 in., recorded at Papun. Apart from cotton-weaving, there are no manufactures. A considerable trade is carried on with Siam by bridle paths across the mountains. **SALYANY**, a town of Russian Transcaucasia, in the government of Baku, 80 m. S.S.W. from Baku, on the river Kura, and on an island of the same name. In 1897 its population was 10,168, chiefly Russians and Greek Orthodox, fishing being the chief occupation. The town is connected with all parts of Russia during the season. Salyany was annexed to Russia in the 18th century, but was re taken by the Persians, and only became Russian finally in 1813. **SALYES (Gr. Σαλέως: also SALLYES, SALY, SALLUVI), in ancient geography, a people occupying the plain S. of the Druentia (Durance) between the Rhone and the Alps. According to Strabo (iv. p. 203) the older Greeks called them Ligyes, and their territory Ligystiké. By some authorities they were considered a mixed race of Galli and Ligurians (hence Celtoligyes); by others a purely Celtic people, who subdued the Ligures in the Pyrenees. They are said to have been the first transalpine people subdued by the Romans (Flor us i. 2). In 154 B.C. the inhabitants of Massilia, who had been connected with the Romans by ties of friendship since the second Punic war, appealed for aid against the Oxybhi and Deciates (or Deciates). These people, called by Livy (Eclit. 47) transalpine Ligurians, were perhaps two smaller tribes included under the general name of Salyes. They were defeated by Quintus Opimius. In 125-124 hostilities broke out between the Romans and the Salyes from the same cause. The successful operations of Marcus Fulvius Flaccus were continued by Gaius Sextius Calvinus (123-122), who finally subdued the Salyes, destroyed their chief town, and founded near its ruins the colony of Aquae Sextiae (Aix). Part of their territory was handed over to the Massaliots. Their king, Tuto matulus (or Teutomatius), took refuge with the Allobroges. From this time the Salyes practically disappear from history. Among other important Roman towns in their territory is mentioned Taruso or Tarasco (Tarascon), Arelate (Arles), Glanum (St. Remy) and Ernagninum (St. Gabriel). For ancient authorities see A. Hölzer, Altechischer Sprachw. ii. 113, 114.)

**SALZA, HERMANN VON** (c. 1170-1239), Master of the Teutonic Order, and councillor of the emperor Frederick II., was a son of the family of Langensalza in Thuringia. He entered the Teutonic Order in early life, became very intimate with Frederick II., took part in the expedition to Damietta in 1221, and accompanied the emperor on the crusade of 1228, which was joined by many princes owing to his influence. About 1210 he was appointed master of the Teutonic Order, and was offered, in 1226, the province of Kulm by Conrad I., duke of Masovia, in return for help against the Prussians; this he accepted and obtained the investiture from Frederick. In 1230 the conquest of Prussia was begun by the Order, although not under his immediate leadership. In 1225 he reconciled Valdemar II., king of Denmark, with Henry I., count of Schwerin, and thus again won the land on the right bank of the Elbe for the Empire, and the recognition of imperial superiority over Denmark. Trusted by Pope Gregory IX. and the emperor alike, he brought about the treaty of San Germano between them in 1230, was the only witness when they met in conference at Anagni in the same year, and it was he who, in 1235, induced Frederick's son, Henry, to submit to his father. He was on the side of the emperor when he first cruised in Apulia, and was buried there in the chapel of his Order.

**SALZBRUNN,** a watering-place of Germany, in the Prussian province of Silesia, at the foot of a well-wooded spur of the Riesengebirge, 12 m. S.W. of Breslau, by the railway to Halberstadt. Pop. (1905) 10,412. It consists of Ober-, Neu- and Nieder-Salzbrunn, has a Roman Catholic and an Evangelical church and manufactures of glass, bricks and porcelain. Its alkalo-saline springs, especially efficacious in pulmonary and urinary complaints, were known as early as 1316, but fell into disuse until rediscovered early in the 19th century. The waters are used both for drinking and bathing, and of the two chief springs, the Oberbrunn and the Kronenquelle, nearly two million bottles are annually exported. The number of summer visitors is about 7000 a year.

See Valentiner, Der Kurort Obersalzbrunn (Berlin, 1877); Biefel, Der Kurort Salzbrunn (Salzbrunn, 1872); and Deutsch, Schlesisches Heilquellen und Kurorte (Breslau, 1873).

**SALZBURG,** a duchy and crownland of Austria, bounded E. by the Bayrisch-Österreich, S. by Carinthia and Styria, W. by Bavaria and Tirol and S. by Carinthia and Tirol. It has an area of 2762 sq. m. Except a small portion in the extreme S., near Bavaria, the country is mountainous and belongs to the N. and central zone of the Eastern Alps. It is divided into three regions; the region of the Hohe Tauern, extending S. of the Salzach, the region of the limestone Alps and the undulating foothill region. The Hohe Tauern contains many high lying valleys, traversed by the streams which flow into the Salzach, as well as numerous depressions and passes, here called popularly Tauern. The deepest depression of the whole range is the Velser Tauern valley (8334 ft.) between the Velser and the Tauern, and the principal pass is the Niederer (Mallnitzer) Tauern (5920 ft.). This pass which leads from the Gastein valley to Carinthia is the oldest bridle-path over the Hoher Tauern. Between the passes is the ridge of Sonnbliek, where a meteorological observatory was established in 1886 at an altitude of 10,170 ft. The region of the limestone Alps is composed of several detached groups: a portion of the Kitzbühler Alps, which contain the famous Thurn pass (4663 ft.); then the Salzburg Alps, which contain the Loferer Steinberge and the peak of the Steinberg (8375 ft.); the Reiteralm at the Retteleap with the peak of the Stadelhorn (7405 ft.); and the broad mass of the Schönfeldspitz (8708 ft.) from which the great glacier-covered block of the Ewiger Schnee, or Übergossene Alps projects into the Salzach valley. Farther N. are the Hagengebirge (7844 ft.); the beautiful summit of the Hoher Göll (8263 ft.); the Tennengebirge (7217 ft.); and the Untersberg, an outpost of the Berchtesgaden
group. Between the Hagengebirge and the Tennenengebirge, which are situated on each side of the Salzach valley, is one of the most magnificent narrow passes of the Alps. It is below Werfen, and near its exit past at the narrowest part, is the Lueg Pass, which was fortified as early as 1316 and offered a firm resistance to the French in the years 1800, 1805 and 1809. A portion of the Ischler Alps, as well as of the Dachstein group, also belongs to Salzburg. The principal river of Salzburg is the Salzach. The Enns and the Mur also rise in this province. The four Krimmler falls, together 2085 ft. high, are the most important falls in the Eastern Alps. The two falls at Wildbad-Gastein (196 and 206 ft.); the fall, by which the Gasteiner Ache discharges itself into the Salzach; the Tauern fall (666 ft.), formed by the Tauern Ache on the N. slope of the Tauern; and the Gollinger fall (302 ft.) also deserve notice. Among the Klammen, i.e. narrow passages leading from the Salzach valley to the valleys of smaller rivers, the most celebrated are the Kitzloch Klamm and the Liechtenstein Klamm. The Kitzloch Klamm is formed by the Rauris Thal and the Liechtenstein Klamm by the Gross-Arle Thal. A path through the last Klamm leads to the magnificent fall (174 ft.) of the Gross-Arle river, which discharges itself in a series of cascades into the Salzach.

The most important lake is the Zeller-see (2424 ft. above sea-level, 2 sq. mi.). In it, in 1808, 1847, and 1688 fires are carried off by the Salzach. The Waller-see or Lake of Sankt Veit in the middle of the Alps (2424 ft. above sea-level), the Fuschl-see (205 ft.), the Hinter-see (2580 ft.), the Ober-Trummer-see and Nieder-Trummer-see are all situated in the Alpine foothill region. The Mond-see (1560 ft.) and Aher-see, or Lake St Wolfgang, are on the frontier between Salzburg and Upper Austria. The climate, although healthy, is very changeable, with great extremes of temperature and heavy rainfall, especially in the summer. The most settled season is the autumn. The annual mean temperature at Salzburg is 46°-4 F. The climate of the duchy in 1900 was 193,247, which is equivalent to 69 inhabitants per square mile. It is the most sparsely populated province of Austria. Between 1880 and 1900 the population increased by 17.5%. The inhabitants are a handsome and powerfully built peasant race, very conservative in religion, manners, customs and national costume. They are almost exclusively of German stock and are Roman Catholics. Elementary education is much more advanced here than in any other Alpine province. Although 13.71% of the soil is unproductive and 32.64% is covered with forests, Salzburg is one of the principal pastoral regions of Austria. Of its total area, 28.9% consists of meadows, while only 9.5% is arable. Cattle-breeding and dairy-farming are very developed and constitute the chief resources of the province. Next in importance comes the timber trade; game is also plentiful. The mineral wealth of Salzburg includes salt at Hallein, copper at Mitterberg, iron-ore at Werfen, marble in the Untersberg region and small quantities of gold near the Goldberg in the Rauris valley and at Bockstein in the Gastein valley. The duchy contains also a great many mineral springs, as the celebrated springs at Gastein, alkaline springs at Mauterndorf and at St Wolfgang, and saline springs at Golling and Hallein. Commerce and manufacture are also developed. The duchy is divided into six departments, of which the capital, Salzburg, is one and its environs the second. The other four are Hallein, St Johann, Tamsweg and Zell-am-See. The local diet, of which the archbishop is a member ex-officio, is composed of 28 members, and the duchy sends 7 members to the reichsrath at Vienna. At Hallein, pop. (1900) 6608, with celebrated saline springs known since the beginning of the 13th century, in 1780, encounters between the French and the Tirolean under Joseph Johann Hasinger took place. To the N.E. lies Adnet with extensive marble quarries, and to the N. Oberalm, with manufacture of marble articles. The ascent of the Hoher Goll is made from here. Zell-am-See (2473 ft.), pop. 1561, is a favourite tourist resort. To the E. is the Schmittenhoehe (6455 ft.), which is easily accessible. On the summit is a meteorological station. Sankt Johann (pop. 1343) was one of the earliest settlements in the Salzach valley, and was a principal centre of Protestantism. Near it is the Liechtenstein Klamm.

For the history of the archbishopric and duchy see the article on the town of Salzburg (below).

Salzburg, capital of the Austrian duchy and crownland of Salzburg and formerly of the archbishopric of the same name, 105 m. W. by S. of Vienna by rail. Pop. (1900) 32,934. The city possesses a qualification of singular beauty on the Salzach which passes at this point between two isolated hills, the Mönchberg (1464 ft.) on the left and the Capuzinerberg (2132 ft.) on the right. The river, from the low valley, so formed, and stretching into the plain beyond, lies Salzburg. The old and main part of the city lies on the left bank of the Salzach, in the valley between the Stadttor, the ruined old palace of the bishops, and the Knoll at the base of the Mönchberg; the newer town is on the right bank at the foot of the Capuzinerberg, which is separated from the river by the narrow suburb of Stein. At the S. of the old town, below the Nonnberg, of S.E. spur of the Mönchberg, is the suburb of Nonnthal; and at the N. end is Mülln. The steep sides of the Mönchberg rise directly from amidst the houses of the town, some of which have cellars and rooms hewn out of the rock. At the ancient cemetery of St Peter, the oldest in Salzburg, is bounded the river flows out in the side of the hill. The narrowest part of the ridge, which has a length of above 2 m., is pierced by the Neu Thor, a tunnel 436 ft. long and 23 ft. broad, completed in 1767, to form a convenient passage from the town to the open plain. The S. end of the Mönchberg is occupied by the imposing Hohen-Salzburg, a citadel originally founded in the 9th century, though the present buildings, the towers of which rise 400 ft. above the town, date chiefly from 1496-1519. Its chapel contains statues of the twelve apostles in red marble. The citadel is now used for barracks. The streets in the older part are narrow and gloomy; but the newer parts of the city, especially those laid out since the removal of the fortifications about 1861, are handsome and spacious. Owing to the frequent fires the private buildings of Salzburg are comparatively modern; and the existing houses, lavishly adorned with marble, are, like many of the public buildings, monuments of the gorgeous taste of the archbishops of the 17th and 18th centuries. From the style of the houses, the numerous open squares, and the abundant fountains which give an Italian aspect to the town, Salzburg has received the name of the "German Rome." Both sides of the river are bordered by fine promenades, planted with trees. Salzburg is spanned by four bridges, including a railway bridge.

Salzburg is full of objects and buildings of interest. The cathedral, one of the largest and most perfect specimens of the Renaissance style in Italy, was built in 1614-1668 by the Italian architect Santino Solari. It is round plan in style, and is surrounded by a square with low arcades. It is bounded by the Dom-Platz, the Kapitel-Platz and the Residenz-Platz; and opening on the N.E. and N.W. of the last are the Mozart-Platz and the Mariaplatz or Mariahilf Platz. The Emperor was, in 1852, in relative, near the cave in the side of the Mönchberg, said to have been the hermitage of St Maximus, who
was martyred by the pagan Heruli in 477. The Franciscan church, with an elegant tower built in 1806, is an interesting example of the transition from the baroque epoch to the classical style in Austria. St. Sebastian's, on the right bank, built in 1505-1512 and restored in 1812, contains the tomb of Paracelsus, who died there. The oldest and most valuable church in Salzburg is the abbey church of the Benedictine abbey of St. Peter founded by St. Rupert as the nucleus of the city. It was completely rebuilt in 1131 and contains a library of 40,000 volumes, besides MSS. The Capuchin monastery, dating from 1618, the Capuchin church, and the abbey church of St. Peter are noteworthy buildings. Since the time of the foundation of the abbey church of St. Peter, the university of Salzburg, founded in 1623 and suppressed in 1810. The city is the seat of an archbishop with a cathedral chapter and a diocese. Salzburg, situated at the forks of the Salzach and Traun rivers, has a population of 45,591. The town carries on a variety of small manufactures, including the manufacture of marble ornaments. Oner industries are breeding and book-binding. It was the birthplace of Mozart and of the painter Hans Makart (1840-1884). The house in which Mozart was born has been transformed into a museum, which contains many interesting relics.

Numerous places of interest and beautiful spots are to be found round Salzburg. To the E. rises the Gaisberg (2206 ft.), which is used for the transportation of mails. The Post road is the old road of the Gaisberg is Aigen, a renowned castle and park. Three miles S. of Salzburg is the palace of Hellbrunn, built about 1615, which is used as a theatre and contains a fine collection of Chinese porcelain. About 2 m. to the S.W. of Salzburg are the ruins of Leopoldskron, from this point the Leopoldsadler Moos stretches S. to the base of the Untersberg. The city of Untersberg is about 3 m. distant, attracting the attention by its fine and interesting church, and by the pleasant walks that can be taken from it. Half a mile N. of Salzburg, at an altitude of 720 ft., stands the pilgrimage church of Maria Plain, erected in 1674.

The origin and development of Salzburg were ecclesiastical, and its history is involved with that of the archbishopric to which it gave its name. The old Roman town of Juvavum was laid in ruins, and the incipient Christianity of the district was often clashing, by the fruits of its position between the Rhine and Danube, it was the monastery and bishopric of St. Peter, which was founded about 700 by t Rupert of Worms, who had been invited by Duke Theodo of Bavaria to preach Christianity to their land. The modern name of the town, due to several others in the district to the abundance of salt found there, appears before the end of the 8th century. From the year 963, when Charlemagne had taken possession of Bavaria in the 8th century, Bishop Arno of Salzburg was made an archbishop and papal legate. Thenceforward the dignity and power of the see steadily increased and in the course of time the archbishops obtained high secular honours. In 1278 Rudolph of Habsburg made them imperial princes.

The archbishopric has always been a centre of foreign policy and has always been keen in Salzburg. Archbishop Leonard II., who expelled the Jews from Salzburg in 1498, had to face a conspiracy of the nobles and was besieged in Hohen-Salzburg by the inhabitants in 1511. The Peasants' War rapidly rose to 1525 and was again enforced by the aid of the Swabian League. From the beginning an orthodox stronghold of the Roman Catholic faith, Salzburg energetically opposed the Reformation. Under Archbishop Wolfgang Dietrich (1511-1533), the archbishopric attempted to rid itself of the power of the humanists and of the Jesuits from their houses demolished. In spite, however, of rigorous persecution the new faith spread, and a new and more searching edict of expulsion was issued by Archbishop Leopold I. von Firmian (1517-1512), who ruled with energy and justice but without gaining concessions. By the peace of Lunville (1802) the see was secularized and given to the archduke of Austria and grand-duke of Tuscany in exchange for Tuscany, its new owner being enrolled among the electoral princes. In the redistribution following the peace of Pressburg in 1805, Salzburg fell to Austria. Four years later it passed to Bavaria, but after the peace of Paris it was restored to Austria in 1816, except a portion on the left bank of the Salzach. Under the designation of a dukedom, it formed part of the Prince-archbishopric of Salzburg until 1849, when it was made a separate crownland, and finally in 1861 the management of its affairs was entrusted to a local diet. Salzburg is governed by a diet elected by universal and exact suffrage.

Salzburg embraced at the time of the peace of Westphalia (1648) an area of 3821 sq. m. with a population of 190,000. A part of its territory was ceded to Bavaria in 1814, and when Salzburg became a crownland, ceded in 1849 several of its districts were added to Tirol.

For the history of the archbishopric see Mellert, Regesta archbish. Salzburgensium, 1700-1746 (Vienna, 1866); Dümmler, Beiträge zur Geschichte des Erzbistums von Salzburg im 9. 12. Jahrhundert (Vienna, 1895); the Salzburger Urkundenbuch, edited by W. Hautehler (Salzburg, 1895); Pichler, Salzburger Landesgeschichte (Salzburg, 1898); Thamm, Das Herzogtum Salzburg (1881); Thamm, Der Staatskanzler (1881); Riedl, Der Erzögeschichte Salzburg (1885); See also E. A. von Falch, Der Staatskanzler (1881); Neurer, Der Staatskanzler (1881); J. F. von Falch, Die Staatskanzler (1881).
obtained a clerkship in the Préfecture de la Seine, which he held for most of his life. He presently began to send poems to the Mercure de France, and these attracted attention. In 1893 he allowed a friend to print his earliest volume of poems, Au Jardin de l’infante, in a very small edition. This led to the sudden recognition of his talent, and to applause from critics of widely different schools. In 1897 this book was reprinted in a much larger form, with the addition of a section entitled L’Utencia. Samain’s second volume, Aux flancs du vaste, appeared in 1898. His health began to fail and he withdrew to the country, where he died, in the neighbourhood of the village of Magny-les-Hameaux, on the 18th of August 1900. A third volume of his poems, Le Charroi d’or, appeared after his death, with a lyrical drama, Polyphème (1901), which was produced at the Théâtre de l’Oeuvre in 1904. The fame of Samain rapidly advanced when he was dead, and the general public awakened to the fact that this isolated writer was a poet of rare originality. He cultivated a delicate, languid beauty of imagery and an exquisite sense of verbal melody without attempting any revolution in prosody or identifying himself with any theory. Samain had no great range of talent, nor was he ambitious of many effects. Samain’s natural life was patiently spent in squalid conditions; he escaped from them into an imaginative world of the most exquisite refinement. He has been compared to Watteau and Schumann; in his own art he bore some resemblance to Charles Baudelaire, and to the English poet Arthur O’Shaughnessy.

SAMANA RANGE, a mountain ridge in Kohat district of the N.W. Frontier Province of India, commanding the S. boundary of Tirah. The ridge lies between the Khanki Valley on the N. and the Miranazzi Valley on the S., and extends for some 30 m. W. from Hangu to the Samana Suk. It is some 6000 to 7000 ft. high. Beyond the Samana Suk lies the pass, known as the Chagru Kotal, across which the Tirah Expedition marched in 1897. On the opposite hill on the other side of this road is the famous position of Dirgai (see TIRAH CAMPAIGN). After the Miranazzi Expedition of 1891 this range was occupied by British troops and eleven posts were established along its crest, the two chief posts being Fort Lockhart and Fort Gulistan. In 1897 all the forts on the Samana were attacked by the Orakzais, and this and the Afridi attack on the Khyber Pass were the two chief causes of the Tirah Expedition. When Lord Curzon reorganized the frontier in 1900, British garrisons were withdrawn from the Samana forts, which are now held by a corps of tribal police 450 strong, called the Samana Rifles.

SAMÁNIDS, the first great native dynasty which sprang up in Persia, which was nominally provincial governors under the suzerainty of the caliphs of Baghdad, succeeded in a very short time in establishing an almost independent rule over Transoxiana and the greater part of Persia. Under the caliphate of Mamun, Samân, a Persian noble of Balkh, who was a close friend of the Arab governor of Khorasan, Asad b. Abdallah, was converted from Zoroastrianism to Islam. His son Asad, named after Asad b. Abdallah, had four sons who rendered distinguished services to Mamun. In return they all received provinces: Nûh obtained Samarkand; Ahmad, Ferghana; Yahya, Sughd; Ilyas, Herat. Of these Ahmad and his second son Isma’il overthrew the Samânids (q.v.) and the Zaildites of Tabaristan, and thus the Samânids established themselves with the sanction of the caliph Motamid in their capital Bukhara. The first ruler (824) was Nasr I. (Nasr or Nasr b. Ahmad b. Asad b. Samân). He was succeeded by his brother Isma’il b. Ahmad (892). His descendants and successors, all renowned for the high intelligence which gave both to the patriotic feelings and the national poetry of modern Persia (see Persia; Isma’il, his son Isma’il (907-913); Nasr II. b. Ahmad, the patron and friend of the great poet Khwâja Rûdî (913-942); Nûh I. b. Nasr (942-954); Abdalmâlik I. b. Nûh (954-961); Mansûr I. b. Nûh, whose vizier Bal’ami translated Tabârî’s universal history into Persian (961-976); Nûh II. b. Mansûr, whose court-poet Dahâqî (Dâkîâ) began the Shâhnameh (976-997); Mansûr II. b. Nûh (997-1005); and Abdalmâlik II. b. Nûh (999), under whom the Samânid dynasty was conquered by the Ghaznevids. The rulers of this powerful house, whose silver dirhems had an extensive currency during the 10th century all over the N. of Asia, and were brought, through Russian and Polish trading clowns, to the courts of these eastern peoples, and the Mussulman empire of India. Under Abdalmâlik I. the Turkic slave, Alptagin, had been entrusted with the government of Bokhara, but, showing himself hostile to Mansûr I., he was compelled to take refuge to his own lands, where he soon established a semi-independent rule, to which, after his death in 977 (397 H.), his son-in-law Sabuktâqin, likewise a former slave, succeeded. Nûh II., in order to retain at least a nominal sway over this territory, confirmed him in his high position and even invested Sabuktâqin’s son Mahmûd with the governorship of Khorasan, in reward for the powerful help they had given him. This was a prelude to his making a dash for the small-affected nobles of Bokhara under the leadership of Fâ’iq and the troops of the Daiamâra, a dynasty that had arisen on the shores of the Caspian Sea and wrested already from the hands of the Samânids all their western provinces. Unfortunately, Sabuktâqin died in the same year as Nûh II. (997, 387 A.H.), and Mahmûd (q.v.), confronted with an internal contest against his own brother Isma’il, had to withdraw his attention for a short time from the affairs in Khorasan and Transoxiana. This interval sufficed for the old rebel leader Fâ’iq, supported by a strong Tatar army under the Ilek Khan Abu’l Yosum Nasr I., to turn Nûh’s successor Mansûr II. into a mere puppet and independent governor of Transoxiana. Even in the time of Mansûr’s successor Abdalmâlik II., and assumed as an independent monarch for the first time in Asian history, in the title of “Emir,” the dynasty of Samân, Montasîr, a bold warrior and a poet of no mean talent, was even for some years a kind of guerilla warfare against both Mahmûd and the Ilek Khan, who had occupied Transoxiana, till he was assassinated in 1005 (401 H.). Transoxiana itself was annexed to the Ghaznevid realm eleven years later, 1016 (407 A.H.).

See S. Lane Poole, Mohammediân Dynasties (1894), pp. 131-133; Stockis, Manuel d’histoire de l’Asie, vol. I. p. 115; also articles CALIFHATE and PERSIA, “History, section B,” and for the later period MAHMUD, SELJUKS, MONGOLS.

SAMANIEGO, FELIX MARIA DE (1745-1801), Spanish fabulist, was born at Laguardia (Aлава) on the 15th of October 1745, and was educated at Valladolid. A government appointment was secured for him by his uncle the count de Peñafielo. His Fábulas (1781-1784), one hundred and fifty-seven in number, were originally written for the boys educated in the school founded by the Biscayan Society. In the first instalment of his fables he admits that he had taken Iriarte for his model, a statement which proves that he had read Iriarte’s fables in manuscript; he appears, however, to have resented their publication in 1782, and this led to a rancorous controversy between the former friends. Samaniego holds his own in the matters of quiet humour and moral versatility. His graceful style continues. He died at Laguardia on the 11th of August 1801.

SAMARA, a government of S.E. Russia, on the W. side of the lower Volga, bounded on the N. by the governments of Kazan and Ufa, on the W. by Simbirsk and Saratov, on the E. by Ufa and Orenburg, and on the S. by Astrakhan, the Kirghiz Steppes and the territory of the Ural Cossacks. The area is 58,302 sq. m., and the population, in 1897, 2,703,478. A line drawn E. from the great bend of the Volga—the Samarskaya Luka—would divide the government into two parts, differing in orographical character. In the S.W. are hills and plateaus intersected by deep rivers. In their highest parts these rivers flow in deep beds over 1000 ft. above the sea, while the level of the Volga at Samara is only 43 ft. S. of the Samarskaya Luka the country assumes the character of a low, flat steppe, recently emerged from the post-Pliocene Aral-Caspian basin. The government is built up chiefly of Carboniferous sandstones, conglomerates, clay slates and limestones, representing mostly deep-sea deposits. The Permian formation appears along the rivers Sok and Samara, and is represented by limestones, sands and marls containing gypsum, all of marine origin, and by continental deposits dating from the same period; sandstones impregnated with petroleum also occur. In the N. these deposits are covered with
"variegated marls" and with a variety of Triassic, Jurassic and Cretaceous deposits. The Tertiary formation (Eocene) appears only at Novo-uzensk; the remainder of a vast sheet of this formation, which at one time covered all the region between the Volga and the Urals, was removed during the Glacial period. Post-Tertiary Caspian deposits penetrate far into the government along the main valleys, and a thick layer of loess occurs in the N. Selenites, rock-crystal and agates are found, as also copper ores, rock-salt and sapphire. Extensive oil-yielding plants, potatoes, tobacco and other crops are grown. The soil is on the whole very fertile. All the N. of the government is covered with a thick sheet of black earth; this becomes thinner to the S., clay—mostly fertile—cropping out from underneath it; salt clays appear in the S.E.

Samara is inadequately drained, especially in the S. The Volga flows for 550 m. along its W. border. Its tributaries, the Great Cheremshan (220 m.), the Sok (105 m.), the Samara (340 m.), with its tributaries, are not navigable, partly on account of their shallowness and partly because of water-mills. When the water is high, boats can penetrate up some of them 15 to 30 m. The Great Irgiz alone, which has an exceedingly winding course of 335 m., is navigated to Kushum, and rafts are floated from Nikolayevsk. The banks of both Karamans are densely populated. The Great and Little Uzen drain S.E. Samara and lose themselves in the Kamyshev sands before reaching the Caspian. Salt marshes occur in the S.E.

The whole of the region is rapidly drying up. The forests, which are disappearing, are extensive only in the N. Altogether they cover 8% of the surface; prairie and grazing land occupies 32%, and 12% is uncultivable.

The Caspian is extensive, especially in the steppes, where the depressing heat and drought of summer are followed in winter by severe frosts, often accompanied by snowstorms. The average temperature at Samara (53° 11' N.) is only 39°-2 (January, 9°-3; July, 70°-4). The population, which was 1,388,500 in 1853, numbered 2,763,478 in 1897, of whom 1,308,263 were women and 1,504,815 lived in towns. The estimated pop. in 1906 was 3,276,500. Great and Little Russians formed 60% of the inhabitants; Mordvinians 8-6%, Chuvashes and Voitiaks 2-3%, Germans 8-1%, Tartars 6-6% and Bashkirs 2-5%. The Great Russians immigrated in compact masses. A special feature of Samara is its German colonists, from Wurttemberg, Baden, Switzerland and partly also from Holland and the Palatinate, whose immigration dates from the time of Catherine II. in 1762. Favoured as they were by free and extensive grants of land, by exemption from military service and by self-government, they have developed into wealthy colonies of Roman Catholics, Protestants, Unitarians, Anabaptists, Moravians and Mennonites. As regards religion, the great bulk of the population are Orthodox Greeks; the Non-conformists, who are settled chiefly on both the rivers Uzên and Samara, number officially 100,000, but their real numbers are higher; next come Mahomedians, 12.1%; various Protestant sects, 5.5%; Roman Catholics, about 2%; and some 400 pagans.

The chief occupation is agriculture—wheat, rye, oats, millet, oil-yielding plants, potatoes and tobacco being the principal crops. Owing to its great fertility, Samara usually has a surplus of grain for export, varying from 1 1/2 to 4 million quarters (exclusive of oats) annually. Notwithstanding this production, the government is periodically liable to famine to such an extent that men die by thousands of hunger-typhus, or are forced to go by thousands in search of employment on the Volga. The population have no store of corn, or reserve capital for years of scarcity, and some 210,000 males have each an average of only four acres of arable and pasture land. But even this soil, though all taxed as arable, is often of such quality that only 50% to 55% of it is under crops, while the peasants are compelled to rent from two to two and a half million acres for tillage from large proprietors. Over 72,5 million acres, or not far short of one-quarter of the total area of the government, purchased from the crown or from the Bashkirs—very often at a few pence per acre—are in the hands of no more than 1,704 persons. The general impoverishment may be judged from the death-rate, 46 to 48 per thousand. Out of the total area, 4,143,800 acres belong to the crown, 7,979,000 to private persons and 22,486,700 acres to the peasants, who rent, moreover, about 64 million acres. Water melons and sunflowers are extensively cultivated, and gardening is widely engaged in; mustard and inferior qualities of tobacco are grown. Hemp-seed, linseed, and other oil-seeds and bran are exported, as well as cereals and flour. Livestock are extensively bred. Bee-keeping is another pursuit the fort has widely followed. The export of poultry, especially of geese, has increased greatly. The principal manufactures are flour-mills, tanneries, distilleries, candle and tallow works, breweries and sugar refineries. Petty domestic industries, especially the weaving of woolen cloth, are carried on in the S. Both the external and the internal trade are very flourishing, nearly 250 fairs being held in the government every year; the chief are those at Novo-uzensk and Bugulma. Owing to the efforts of the local semestrows there are more than the average number of primary schools, namely, one for every 1,750 inhabitants. The government is divided into seven districts, the chief towns of which are Samara, Bugulma, Buguruslan, Buzuluk, Nikolayevsk, Novo-Uzen and Stavropol. The Sergiyevsk sulphurous mineral springs, 57 m. from Buguruslan, are visited by numbers of patients.

The territory now occupied by Samara was until the 18th century the abode of nomads. The Bulgarians who occupied it until the 13th century were followed by Mongols of the Golden Horde. The Russians penetrated thus far in the 16th century, after the conquest of the principalities of Kazan and Astrakhan. To secure communication between these two cities, the fort was erected in 1586, as well as Saratov, Tsarsytyn and the first line of Russian forts, which extended from Byely-yar on the Volga to the neighbourhood of Menzelinsk near the Kama. In 1670 Samara was taken by the insurgent leader Stenka Razin. In 1732 the line of forts was removed a little farther E., and the Russian colonists advanced E. as the forts were pushed forwards. In 1762, on the invitation of Catherine II., emigrants from various parts of Germany settled in this region, as also did the Raskolniks, whose communities on the Irgiz became the centre of a formidable insurrection in 1775 under Pugachew. At the end of the 18th century Samara became an important centre for trade. In the first half of the 19th century the region was rapidly colonized by Great and Little Russians. In 1847-1850 the government introduced about 120,000 Polish families; in 1857-1859 Mennonites from Danzig founded settlements; and in 1859 a few Circassians were brought hither by government, while the influx of Great Russian peasants still goes on.

(P. A. K.; J. T. B.)

SAMARA, a town of E. Russia, capital of the government of the same name, 505 m. by rail N.S. E. of Kazan, 63 m. by rail W.N.W. of Orenburg. Its population, which was 63,479 in 1883, numbered 91,672 in 1897. Owing to its situation on the left bank of the Volga, at the convergence of the Siberian and Central Asian railways, it has great commercial importance, especially as a depot for cereals and a centre for flour-milling. A considerable trade is also carried on in animal products, particularly hides. The other industries include iron-foundries, soap, candles, vehicles and glue factories, cooperages, tanneries, breweries and brick-works. The port is the best on the Volga. Three great fairs are held every year. The city, which gives title to a bishop of the Orthodox Greek Church, has been called Razin built in 1685, 1730-1735 and 1894 respectively, three public libraries, and a natural history and archaeological museum. It is famous for its kumis (mare's milk) cures. Its foundation took place in 1580-1591 for the purpose of protecting the Russian frontier against the Bashkirs, the Kalmucks and the Nogai Tatars.

SAMARIA, an ancient city of Palestine. The name Samaria is derived from the Gr. Σαμαρία from the Hebrew שָׂµֵרָיא, 'an outlook hill,' or rather from the Aramaic form סָמָרָיא, whence also comes the Assyrian form Şumaria. According to 2 Kings xvi. 24, Omri, king of Israel, bought Samaria from a
SAMARITANS

SAMARITANS. This term, which primarily means "inhabitants of Samaria, or the region of Samaria," is specially used, in the New Testament and by Josephus, as the name of a peculiar religious community which had its headquarters in the Samaritan country, and is still represented by a few families at Nablus, the ancient Shechem. By the Jews they are called Shomronim, a gentilic form from Shomron = Samaria; among themselves they sometimes use the name Shem'erim (= Heb. "children of Sem"), in which the letter "S" may be taken as signifying the "Samaritan" país. The term as used in the Bible occurs several times: 1 Kings iv. 12, "the inhabitants of Samaria," and sometimes with the addition of another term, as 2 Kings iv. 12, "the inhabitants of Samaria and the inhabitants of the cities which the kings of Israel left standing." In the New Testament, the term occurs in Matt. xxiii. 24, Mark vii. 24, and Rev. vii. 2, "the city of the great king Babylon, which once was, is, and shall be no more." 1

1 Accentuated on the second syllable. Guide- and travel-books generally spell the name Sebas'mye, which is not a correct rendering of the local pronunciation.

certain Shemer (whose name is said to be the origin of that of the city), and transferred thither his capital from Tirzah. But the city, as a superficial inspection of the site shows, must have existed as a settlement long before Omri, as potsherds of earlier date lie scattered on the surface. The city was occupied by Ahab, who here built a temple to "Baal" (I Kings xvi. 32) and a palace of ivory (I Kings xxii. 39). It sustained frequent sieges during the troubled history of the Israelite kingdom. Moreover, Damascus assaulted it in the time of David; it was captured by Sargon in 722 B.C. and again in 701 B.C. by Assyria, which was repulsed and obliged to allow the Israelite traders to establish a quarter in Damascus, as his predecessor Ben-Hadad I. had done in Samaria (I Kings xx. 34). Ben-Hadad II. in the time of Jehoahaz again besieged Samaria, and caused a famine in the city; but some panic led them to raise the siege (2 Kings vii., viii.). The history of the city for the following 120 years is that of Israel (see Jews).

In 727 died Tiglath-Pileser, to whom the small kingdoms of W. Asia had been in vassalage; in the case of Israel at least, since Menahem (2 Kings xv. 19). He was succeeded by Shalmaneser IV., and the king of Israel, with the result, attempted to revolt. Shalmaneser accordingly invaded Syria, and in 724 began a three-years' siege of Samaria (2 Kings xvii. 6). He died before it was completed, but it was finished by Sargon, who reduced the city, deported its inhabitants, and established within it a mixed multitude of settlers (who were the ancestors of the modern Samaritans). These people themselves seem to have joined a revolt against the Assyrians, which was soon quelled. The next event we hear of in the history of the city is its conquest by Alexander the Great (333 B.C.), and later by Ptolemy Lathyros (282 B.C.). It is then that we get the first witness for our two of these injuries: when John Hyrcanus besieged it in 120 B.C. it was "a very strong city" which offered a vigorous resistance (Jos. Ant. xiii. x.). It was rebuilt by Pompey, and restored by Aulus Gabinius: but it was to Herod that it owed much of its later glory. He built a great temple, a hippodrome and a street of columns surrounding the city, the remains of which still arrest the attention. It was renamed by him Sebaste, in honour of Augustus: this name still survives in the modern name Shebat. Philip here preached the gospel (Acts viii. 5). The rise of Neapolis (Shechem) in the neighbourhood caused the decay of Sebaste. It was quite small by the time of Eusebius. The crusaders did something to develop it by establishing a bishopric with a large church, which still exists (as a mosque); here were the tombs of Elisha, Obadiah and St John the Baptist. From this time onward the village dwindled to the poor dirty place it is to-day.

The site of Samaria is an enormous mound of accumulation, one of the most extensive in Palestine. In some places it is estimated the débris is at least 40 ft. deep. The crusaders' church remains, and numerous fragments of carved stone are built into the village houses, beneath which in some places are some interesting tombs. The hippodrome remains in the valley below, and the columns of the street of columns are in very good order. The walls can be traced almost all round the town; at the end of the mound opposite the modern village are the dissipated ruins of a large gate. The site stands in the very centre of Palestine, and on a steep and almost isolated hill, with a long and spacious plateau for its summit, is naturally a position of much strength, commanding two of the most important highways of N. Arabia. In the north it passes immediately under the E. wall, and the road from Shechem to the maritime plain which runs a little to the W. of the city. The hill of Samaria is separated from the surrounding mountains (Amos iii. 9) by a rich and well-watered plain from which it rises in successive terraces of fertile soil to a height of 400 or 500 ft. Only on the E. a narrow saddle, some 200 ft. beneath the plateau, runs across the plain towards the mountains; it is at this point that the traveller coming from Shechem now ascends the hill to the village of Sebustach, which occupies only the extreme E. of a terrace beneath the hill-top, behind the crusaders' church, which is the first thing that attracts the eye as one enters the town. The hill-top, the longer axis of which runs W. from the village, rises 150 ft. above the sea, and commands a superb view towards the Mediterranean, the mountains of Shechem and Mount Hermon. Excavations under the auspices of Harvard University began here in 1908. (R. A. S. M.)
(Ant. xi. 8), who carried the Pentateuch to Shechem, and for whom the temple of Gerizim was perhaps built. For, though the story in Josephus is put a century too late and is evidently based on a confusion, it agrees with Neh. xiii. in essentials too closely to be altogether rejected, and supplies exactly what is wanted to explain the existence in Shechem of a community bitterly hostile to the Jews, yet constituted in obedience to Ezra's Pentateuch.

It is remarkable that, having got the Pentateuch, they followed it with a fidelity as exact as that of the Jews, except in regard to the sanctuary on Mt Gerizim. The text of the sacred book was transmitted with as much conscientiousness as was observed by Jewish scribes; and even from the unwilling witness of the Jews we gather that they fulfilled all righteousness with scrupulous punctiliousness so far as the letter of the law was concerned. They did not however, receive the writings even of the prophets of N. Israel (all of which are preserved to us only by the Jews) not the later oral law as developed by the Pharisees.

But although these differences separated the two communities, their internal development and external history ran parallel courses till the Jewish state took a new departure under the Maccabees. The religious resemblance between the two bodies was increased by the institution of the synagogue, from which there grew up a Samaritan theology and an exegetical tradition. The latter is embodied in the Samaritan Targum, or Aramaic version of the Pentateuch, which in its present form is probably not much earlier than the 4th century A.D., but in general is said to agree with the readings of Origen's Σαμαρητικά. Whether the latter represents a complete translation of the Law into Aramaic is a question.
The Samaritan language properly so-called is a dialect of Palestinian Aramaic, of which the best examples are found in the literature of the 4th century a.d. An archaic alphabet, derived from the old Hebrew script, was still used for another dialect of Aramaic in the Samaritan community in the town of Beth-Shean in Syria and sometimes even Arabic. After the Moslem conquests of Syria in 632 the native dialect of Aramaic gradually died out, and by the 11th century Arabic had become the literary as well as the popular language throughout the whole of Syria. According to Samaritan tradition, the Dyadim (or Beth-Shean) scrolls, with the books of Genesis and Numbers, were not lost when Beth-Shean was destroyed under Hadrian and Commodus, but of the language and contents of them nothing is recorded. There can be no doubt that some, perhaps much, of the literature has been lost, for nothing is explicitly stated about the date of the latest edition before the 14th century a.d. The Targum- or Samaritan-Aramaic version of the Pentateuch was most probably written down about that time, though it was clearly based on a much older tradition and must have undergone various revisions. To the same period belong the liturgical compositions of Amram Daniel and Marqath, and the latter's midrashic commentary (called the "Book of Wonders") on parts of the Pentateuch, all in Aramaic. With the possible exception of one or two hymns there is nothing further till the 11th century when there appears the Arabic version of the Pentateuch, usually ascribed to Abu Sa'id, but perhaps really by Abu'l-Basat, who also wrote three Arabic commentaries on the books of Genesis, Leviticus, and Numbers. Of the same date (1053) is an anonymous commentary on Genesis, preserved in the Bodleian Library at Oxford (Ms. Opp. add. 4,99), interesting because it contains a fragment of an earlier, perhaps a Babylonian, manuscript of the same period, which is translated in the 12th century, MusaJah and his son Shaddath wrote on theology; the earlier part of the chronicle called al-Taulidah was compiled, in Hebrew (1149); and on the same time treatises on Genesis, Leviticus, and Numbers, and Abu al-Sharif and Abu al-Ashraf, the Targum of the Pentateuch, by the 13th century. The next 100 years were rather barren. Ghazal ibn-al-Duwak, who wrote on the story of Balak and on the restoration of the kingdom to Israel, is said to be the author of a commentary before the 18th century, and, as an anonymous writer (in Arabic), called the Book of Joshua, is dated about the same time by T. W. J. Juyböl. In the second half of the 14th century three important liturgical writers, Abaibh b. Phinehas (ib. 1376), Abu'l-Fath b. Shaddath, and Shaddath b. Shaddath, were all born about the same time, and another chronicle, in the 15th century, was composed 1898 of the levitical family; and a theological work, also in Arabic by the present priest-levite, Jacob b. Aaron.

SAMARIA [symbol Sm, atomic weight 150-4 (O = 16)], a rare earth metal (see RARE EARTHS). The separation has been accomplished by A. F. J. Armstrong and A. T. Lacombe (Comptes rendus, 1903, 137 pp. 568, 792); Demarçay (ibid. 1905, 1, p. 1019); Benedek; Felt and Przybilla (Zeit. anorg. Chem., 1905, 43, p. 202) and others. It may be obtained by reduction of its oxide with magnesium. It combines with hydrogen to form a hydride. The salts are mostly of a yellowish colour. The chloroform, SmCl3, H2O, is a deliquescent solid which when heated in hydrochloric acid gas to 180°C. yields the anhydrous chloride. This anhydrous chloride is reduced to a lower chloride, of composition SmCl2, which heated to a temperature of 100°C. in a current of hydrogen and oxygen (Matthiessen and Cotton, Compt. rendus, 1850, 120, 92) and the nonvolatile chlorides, SmCl3 and SmCl4, are obtained. The fluoride, SmF3, H2O, was prepared by H. Moissan by acting with fluorine on the carbide. The sulphate, Sm2(minO4), H2O, is obtained by the action of sulphuric acid on the nitrate. It forms double salts with the alkaline sulphates. The carbide, Sm3C, is formed when the oxide is heated with carbon in the electric furnace.

SAMARKAND, a province of Russian Turkestan, formerly Zaraftshan and formerly Zafrash, was a good deal less known as Sughd to the Moslems of the middle ages. It has on the N. and N.E. the province of Suy-darya, on the E. Fergana, on the W. Bokhara and on the S. the khanates of Hissar, Karr-tagin and Darvaz. Its area is 26,627 sq. m. It is very hilly in the S., where it is intersected by ranges belonging to the Alai system. The Hissar range is the water-parting between the Zarafshan and the upper tributaries of the Amu-darya; another high range, the Zarafshan, runs between the two parallel rivers, the Zarafshan and its tributary, the Yagnob; while a third range, often called the Turkestan chain, stretches W. to E. parallel to the Zarafshan, on its N. bank. It is very probable that the three ranges referred to really possess a much more complicated character than is supposed. All three ranges are snow-clad, and their highest peaks reach altitudes of 15,000 ft. in the W. and 22,000 ft. in the E., while the passes over them, which are difficult as a rule, lie at altitudes of 12,000 ft. Several Alpine lakes, such as Iskander-kul, 7000 ft. high, have been found under the precipitous peaks.

The Alpine zone extends as far N. as the 40th parallel, beyond which the province is steppe-land, broken by only one range of mountains, the Nurata-tai, also known as Sanazar and Mologazar or the gates of קנה-ס functionalities. The important range stretches 160 m. N.W., has a width of about 35 m. and reaches altitudes of 7000 ft. It is pierced, in the Sanazar gorge, or Tamerlane's gate, by the railway leading from Samarkand to Tashkent.

1 Except of course, the Pentateuch itself (see BIBLE) which cannot be properly regarded as a Samaritan work.

3 See Wreschner, Samaritanische Traditionen (Berlin, 1888).

4 Ed. by Neubauer in Journ. asiat. (1896). The chronicle was continued in 1346, and was subsequently brought down to 1557 by the present priest.

7 Ed. by Vilmar (Got., 1863). Partly translated by Payne Smith in Heidelberger Aufgabenblätter, 2. B.

8 Translated by Leitner in Heid. IVth. iv. 1846, 2.

9 An account of the work (of which the only MS. is in Berlin) was given by Geiger in ZDMG, xx. p. 143 and later. Parts of it were published by Halle's apparatus of the texts of the midrashic commentaries (1851).

10 Ed. by E. N. Adler and M. Seligsohn in Revue des études juives, vols. 44-46.

11 The same who compiled Gaster's book of Joshua.

12 Mentioned by Yehuda, op. cit. p. 895, as existing in a Berlin MS.

13 Translated in Bibliotheca sacra (1900), p. 358 &c.
SAMARKAND

The other mountains in the province are well wooded, and it is estimated that nearly 4,500,000 acres are under forests. The N.W. portion is occupied by the Famine Steppe—which probably might be irrigated—and by the desert of Kyzylik-kum. The Famine or Hungry Steppe (not to be confused with another desert of the same name, the Bek-pak-dala, to the W. of Lake Balkhash) occupies nearly 5,000,000 acres, covered with loess-like clay. In the spring the steppe offers good pasture-grounds for the Kirghiz, but the grass withers as summer advances. Nearly 1,500,000 acres might, however, be irrigated and rendered available for the cultivation of cotton; indeed a beginning has been made in that direction. The Kyzylik-kum Steppe, 88,000 sq. m., is crossed by rocky hills, reaching an altitude of 3,500 ft., and covered with a thin carpet of sand and gravel. The sand is especially prevalent on the margin, where the moving barkhans (crecent-shaped sandhills) invade the Kara-kul oasis of Bokhara. The vegetation is very poor, as a rule; grass and flowers (tulips, Rheum, various Umbelliferae) only appear for a short time in the spring. The barkhans produce nothing except Haloxyilon ammonodron, Poligonum, Halimidodron, Atrofaphis and other steppe bushes; occasionally Stipa grass is seen on the slopes of the sandhills, while Artemisiole and Tamarix bushes grow on the more compact sands. Water can only be obtained from wells, sometimes 140 ft. deep. A few Kirghiz are the sole inhabitants, and they are only found in the more hilly parts.

The chief river is the Zarafshan, which, under the name of Mach, rises in the Zarav glacier in the Kok-su mountain group. Navigation is only possible by rafts, from Penjikent downwards. The river is heavily drawn upon for irrigation; and to this it probably owes its name ("gold-spreading") rather than to the gold which is found in small quantities in its sands. Over 80 main canals (arkis) water 1,200 sq. m. in Samarkand, while 1,640 sq. m. are watered in Bokhara by means of over 40 main canals. Beyond Lake Kara-kul it is lost in the sands, before reaching the Amu-darya to which it was formerly tributary. The N.E. of the province is watered by the Syr-darya. One of the lakes, the Tuz-kan (40 m. from Jizakh) yields about 1,500 tons of salt annually.

The average temperature for the year is 53° 4°F. at Samarkand, and 58° at Khojent and Jizakh; but the average temperature for the winter is only 34°, and frosts of 4° and 11° have been experienced at Samarkand and Khojent respectively; on the other hand, the average temperature for July is 90° at Samarkand and 85° at Khojent and Jizakh. The total precipitation (including snow in winter) is only 6.4 in. at Khojent, 12 in. at Samarkand and 24 in. at Jizakh. The hilly tracts have a healthy climate, but malaria and mosquitoes prevail in the lower regions.

The estimated population in 1910 was 1,065,400. The Uzbeks form two-thirds of the population, and after them the Kirghiz and Tajiks (27%) are the most numerous; Jews, Tatars, Afghans and Hindus are also met with.

In 1898 nearly 1,000,000 acres were irrigated, and about 800,000 acres partly irrigated. The chief crops are wheat, rice and barley. Sorghum, millet, Indian corn, peas, lentils, hemp, flax, hemp, poppy, lucerne, madder, tobacco, melons and mushrooms are also grown. Two crops are often taken from the same piece of land in one season. Cotton is extensively grown, and 21,000 acres are under vineyards. Sericulture prosperous, especially in the Khojent district. Live-stock breeding is the chief occupation of the Kirghiz. Weaving, saddlery, boot-making, tanneries, oil works and metal works exist in many villages and towns, while the nomad Kirghiz excel in making felt goods and carpets. There are glass works, cotton-cleaning works, steam flour mills and distilleries. Some coal, sulphur, ammonia and gypsum are obtained. Trade is considerable, the chief exports being rice, raw cotton, raisins, dried fruit, nuts, wine and silk. The Central Asian railway crosses the province from Bokhara to Samarkand and Tashkent. The province is divided into four districts, the chief towns of which, with their populations in 1897, are: Samarkand (q.v.), Jizakh (16,041), Kati-kurgan (19,683) and Khojent (30,076).

SAMARKAND, a city of Russian Central Asia, anciently Maracanda, the capital of Sogdiana, then the residence of the Moslem Samanid dynasty, and subsequently the capital of the Mongol prince Tamerlane, is now chief town of the province of the same name. It lies 220 m. by rail S.W. of Tashkent, and 156 m. E. of Bokhara, in 39° 30' N. and 66° 45' E., 2,250 ft. above the sea, in the fertile valley of the Zarafshan, at the point where it issues from the W. spurs of the Tian-shan before entering the steppes of Bokhara. The Zarafshan now flows 5 m. N. of the city. In 1897 the population numbered 40,000 in the native city, and 15,000 in the new Russian town, inclusive of the military (80% Russians). The total population was 58,194 in 1900, and of these only 23,194 were women.

The Great Uzbak, a great chieftain in 1434, was of the race of Alexander the Great in 329 B.C. It reappears as Samarkand at the time of the conquest by the Arabs, when it was finally reduced by Koutaiba ibn Muslin in A.D. 711-712. Under the Samanids it became a brilliant seat of Arabic civilization, and was so populous that, when besieged by Jenghiz Khan in 1221, it is reported to have been defended by 110,000 men. Destroyed and pillaged by that chieftain, its population was reduced to one-quarter of what it had been. When Timur made it his residence (in 1369) the inhabitants numbered 150,000. The magnificent buildings of the successors of Timur, which still remain, testify to its former wealth. But at the beginning of the 18th century it is reported to have been almost without inhabitants. It fell under Chinese dominion, and subsequently under that of the amir of Bokhara. But no follower of Islam enters it without feeling that he is on holy ground; although the venerated mosques and beautiful colleges are falling into ruins, its influence as a seat of learning has vanished, and its very soil is profaned by infields. It was not without a desperate struggle that the Mahomedans permitted the Russians to take their holy city.

The present city is quadrangular and is enclosed by a low wall 9 m. long. The citadel is in the W., and to the W. of this the Russians have laid out since 1871 a new town, with broad streets and boulevards radiating from the citadel.

The central part of Samarkand is the Righistan—a square fenced in by the three madrasahs (colleges) of Ulug-beg, Shir-dar and Tilla-kari; in its architectural symmetry and beauty this is rivalled only by some of the squares of certain Italian cities. An immense doorway decorates the front of each of these large quadrilateral buildings. A high and deep-pointed porch, reaching almost to the top of the lofty façade, is flanked on each side by a low and broad lateral door flanked by a quadrilateral building profusely decorated, in turn flank these broad pillars. On each side of the high doorway are two lower archways connecting it with two elegant towers, narrowing towards the top and slightly inclined. The whole of the façade and also the interior courts are profusely decorated with enameled tiles, whose colours—blue, green, pink and golden, but chiefly turquoise-blue—are wrought into the most fascinating designs, in striking harmony with the whole and with each part of the building. Over the interior are bulbed or melon-like domes, perhaps too heavy for the façade. The most renowned of these three madrasahs is that of Ulug-beg, built in 1434 by a grandson of Timur. It is smaller than the others, but it was to its school of mathematics and astronomy that Samarkand owes its renown in the 15th century.

A winding street, running N.E. from the Righistan, leads to a much larger square, in which are the college of Biblikhanum on the W., the graves of Timur’s wives on the S. and a bazaar on the E. The college was erected in 1388 by a Chinese wife of Timur. To the N., outside the walls of Samarkand, but close at hand, is the Hazrat Shah-Zindeh, the summer-palace of Timur, and near this is the grave of Shah-Zindeh, or, more precisely, Kasim ibn Abbas, a companion of Timur. This was a famous shrine in the 14th century (Ibn Batuta’s Travels, iii. 52); it is believed that the saint will one day rise for the defence of his religion. The Hazrat Shah-Zindeh stands on a terrace reached by forty marble steps. The decoration of the interior halls is marvellous. Another street running S.W. from the Righistan leads to the
SAMBALPUR—SAMBOURNE

Gur-Amir, the tomb of Timur. This consists of a chapel crowned with a dome, enclosed by a wall and fronted by an archway. Timur and earthquakes have greatly injured this fine building. The interior walls are covered with elegant turquoise arabesques and inscriptions in gold. The citadel (rebuilt in 1832 and preceding years) is situated on a hill whose steep slopes render it one of the strongest in Central Asia. Its walls, 3000 yds. in circuit and about 10 ft. high, enclose a space of about 90 acres. Within it are the palace of the amir of Bokhara—a vulgar modern building now a hospital—and the audience hall of Timur—a long narrow court, surrounded by a colonnade, and containing the kok-task, or stone of justice. Ruins of former buildings—heaps of plain and enamelled bricks—amid a Cornfield, and in the deep ravines below, have been found by the natives over a wide area round the present city, especially on the W. and N. The name of Aphisraib is usually given to these ruins. Five m. S.W. of Samarkand is the college Khoja Akkar; its floral ornamentation in enamelled brick is one of the most beautiful in Samarkand. Nothing but the ruins of a palace now mark the site of a once famous garden, Bagchi-sarai. Of the Graeco-Armenian library said to have been brought to Samarkand by Timur no traces have been discovered, and Vambery regards the legend as invented by the Armenians. Every trace of the renowned high school of Bokhara has also disappeared.

The present Moslem city is an intricate labyrinth of narrow, winding streets, bordered by dirty courtyards and miserable houses. The chief occupation of the inhabitants is gardening. There is a certain amount of industry in metallic wares, tallow and soap, tanneries, potteries, various tissues, dyeing, harness, boots and silver and gold wares. The best harness, ornamented with turquoises, and the finer products of the goldsmith's art, are imported from Bokhara and Afghanistan. The products of the local potteries are very fine. The bazaars of Samarkand are more animated and kept with much greater cleanliness than those of Tashkent and Namanjan. The trade is very brisk; the chief items being cotton, silk, wheat and rice, horses, asses, fruits and cutlery. Wheat, rice and silk are exported chiefly to Bokhara; cotton to Russia, via Tashkent. Silk wares and excellent fruits are imported from Bokhara, and rock-salt from Hisar.

SAMBALPUR, a town and district of British India, in the Orissa division of Bengal. The town is on the left bank of the river Mahanadi, 495 ft. above sea-level, the terminus of a branch of the Bengal-Nagpur railway. Pop. (1901) 12,878. It contains a large native bazaar, with 2400 guppies. It is also garrisoned by a native infantry, was withdrawn in 1902. There is considerable trade, and hand-weaving of tussore silk and cotton cloth are carried on.

The District of Sambalpur has an area of 3773 sq. m. The Mahanadi, which is the only important river, divides it into unequal parts. The greater portion is a undulating plain, with ranges of rugged hills running in every direction, the largest of which is the Bara Pahar, covering an area of 350 sq. m., and attaining at Debrigarh a height of 2267 ft. above the plain. The Mahanadi affords means of water communication for 90 m.; its principal tributaries in Sambalpur are the Ib, Kelo and Jhira. To the W. of the Mahanadi the district is well cultivated. The soil is generally light and sandy. It is occupied for the greater part by crystalline metamorphic rocks; but part of the N.W. corner is composed of sandstone, limestone and shale. Gold dust and diamonds have been found near Hirakhuda or Diamond Island, at the junction of the Ib and Mahanadi. The climate of Sambalpur is considered very unhealthy; the annual rainfall averages 59 in. The population in 1901 was 610,243, showing an increase of 3·3% in the decade. The registered death-rate for 1897 was only 30 per thousand, as against 68 for the province generally. This figure shows that Sambalpur entirely escaped the famine of 1896-1897, which indeed can be said to have brought prosperity to the district by causing high prices for a good rice crop, rice being the staple of cultivation. It was almost equally fortunate in 1900. The main line of the Bengal-Nagpur railway runs along the N. border of the district, with a branch S. to Sambalpur town.

Sambalpur lapsed to the British in 1849, and was attached to Bengal till 1862, when it was transferred to the Central Provinces. The early revenue administration was not successful. On the outbreak of the Mutiny in 1857, a general rising of the chiefs took place, and it was not until the final arrest of Surandar Sa, in 1864, that tranquillity was restored. In October 1905 Sambalpur was transferred back again to Bengal, without the subdivisions of Phuljhar and Chandarpur-Padampur.

See Sambalpur District Gazetteer (Calcutta, 1899).

SAMBLANCAY, or SEMBLANCAY, a French noble family of Touraine, sprung from the merchant class. The founder of the family was JEAN DE BEAUNE (d. c. 1430), treasurer of Louis XI, who narrowly escaped death for conspiracy under Charles VIII. His son, JACQUES DE BEAUNE, baron de Samblancay, vicomte de Tours, was a man of finance before 1497, and from 1518 was superintendent of finance of Christendom, in connexion with the supplies for the army in Italy, where he was executed at Montfaucon on the 9th of August 1527. His eldest son, MARTIN DE BEAUNE, who became archbishop of Tours in 1520, died in the same year as his father. Another son, GUILLAUME DE BEAUNE, general of finances under his father, and banished from 1527 to 1535, was the father of the famous prelate, RENAUD DE BEAUNE (1527-1606), archbishop of Bourges (1581) and of Sens (1595). His efforts at pacification during the wars of religion culminated in the conversion of Henry IV., and it was he who presided at the ceremony of the king's abjuration of Protestantism on the 25th of July 1598. Renaud was one of the most famous orators of his time, and some of his productions have come down to us, as well as his Réformation de l'université de Paris (1605 and 1657). A less honourable descendant of Jacques de Beaune was CHARLOTTE DE BEAUNE-SAMBLANCAY (c.1550-1617), a courtier whom Catherine de Medicci employed to discover the secrets of her courtly enemies. She counted among her lovers and dupes the king of Navarre (Henry IV.), the duc d'Alençon (Henry III.), Henry L., duc de Guise and others. The duc de Guise was killed when leaving her apartments in the early morning of Christmas day 1560. Charlotte was married early in life to Simon de Fizes, baron de Sauvage, a secretary of state, and again in 1584 to François de la Trémoille, marquis de Noirmoutiers, by whom she had a son, Louis, 1st duc de Noirmoutiers, a ducal line which became extinct in 1733.

SAMBORNE, EDWIN LINLEY (1844-1910), English draughtsman, illustrator and designer, was born in London, on the 4th of January 1844. He was educated at the City of London School, and also received a few months' education at the South Kensington School of Art. After a six years' "gentleman's apprenticeship," he joined the India Office as marine engineers, Greenwich, his humorous and fanciful sketches made surreptitiously in the drawing-office of that firm were shown to Mark Lemon, editor of Punch, and at once secured him an invitation to draw for that journal. In April 1867 appeared his first sketch, "Pros and Cons," and from that time his work was regularly seen, with rare exceptions, in the weekly pages of Punch. In 1871 he was called to the Punch "table." At the beginning he made his name by his "social" drawings and especially by his highly elaborated initial letters. He drew his first political cartoon, properly so-called, in 1884, and ten years later began regularly to design the weekly second cartoon, following Sir John Tenniel as chief cartoonist in 1904. Examples of his best work in book illustration are in Sir F. C. Burnand's New Sandford and Merton (1872), and in Charles Kingsley's Water Babies (1885), which contains some of his most delicate
and delightful drawings. The design for the Diploma for the Fisheries Exhibition (1883) is of its kind one of the most extraordinary things in English art. As a political designer, while distinguished for wit and force, he was invariably refined and good-humoured to the uttermost; yet it is essentially as an artist that he takes his highest place. He died on the 3rd of August 1910.

SAMBUCA, SAMBUTE, SAMBIUT, SAMBUE, SAMBUQUE, an ancient stringed instrument of Asiatic origin generally supposed to be a small triangular harp of shrill tone (Arist. Quint. Melb. ii. p. 101). The sambuche was probably identical with the Phoenician sabeka and the Aramaic sabka, the Greek form being σαβίκη. The sakte is mentioned in Dan. iii. 5, 10, 15, where it is erroneously translated sackett. The sambuche has been compared to the military engine of the same name by some classical writers; Polybius likens it to a rope ladder; others describe it as boat-shaped. Among the musical instruments known, the Egyptian nanga best answers to these descriptions. These definitions are doubtless responsible for the medieval drawings representing the sambuka as a kind of tambourine,1 for Isidor elsewhere defines the symphonia as a tambourine. During the middle ages the word sambuka was applied (i) to a stringed instrument about which little can be discovered, (2) to a wind instrument made from the wood of the elder tree (sambuca). In an old glossary (Fundgraben, i. 368), article sley (flute), the sambuka is said to be a kind of flute. "Sambuka vel sambucus est quaedam arbor parva et mollis, unde haec sambuca spectabilis species symphoninaria quid fit de illa arbores." Isidor of Seville (Etym. 2. 20) describes it as "Sambuka in musicis species est symphonianum. Est enim ligni fragili usque et tibiae componuntur." In a glossary by Papias of Lombardy (c. 1053), first printed at Milan in 1476, the sambuka is described as a cithara, which in that century was generally glossed "harp," i.e. "Sambuka, genus cytherae rusticae."

In Tristam (7503-72) the knight is enumerating to King Marke all the instruments upon which he can play, the sambuial being the last mentioned:

"Was ist das, lieber mann?
-Daz vaste Seitspiel daz ich kann."

In a Latin-French glossary (M.S. at Montpelier, H. 110, fol. 212 v.) Psalterium=sambuce. During the later middle ages sambuka was often translated sackbut in the vocabularies, whether merely from the phonetic similarity of the two words has not yet been established. The great Boulogne Psalter (xi. c.) contains, among other fanciful instruments which are evidently intended to illustrate the equally vague and fanciful descriptions of instruments in the apocryphal letter of S. Jerome, ad Dordinem, a Sambuca, which resembles a small sackbut, and is described as symphonia "qvi fit de illa arbores." Isidor of Seville (Etym. 2. 20) describes it as "Sambuka in musicis species est symphonianum. Est enim ligni fragili usque et tibiae componuntur." In a glossary by Papias of Lombardy (c. 1053), first printed at Milan in 1476, the sambuka is described as a cithara, which in that century was generally glossed "harp," i.e. "Sambuka, genus cytherae rusticae."

SAMMAN, SAMMEN, or SEMNAN, a small province of Persia, which, including the city and district of Damghan, is generally known as "Samman va Damghan." It is bounded on the W. by the districts of Khar (the ancient Chora) and Fjruzukh, on the N. by Mazandaran, and on the E. by Shahrud and Bostam. In the S. it extends beyond the oasis of Jendek in the desert N. of Tezlu. Its northern part is still known as Komush or Komish, the ancient Comissene. The revenue amounts to about 7,000 per annum.

Samman, the capital of the province, is situated 145 m. E. of Teheran, on the high road thence to Meshed, at an altitude of 3,740 ft. in 35° 34' N., 53° 22' E. It has a population of about 10,000, post and telegraph offices, and a fine minaret, built in the 13th century. It exports pistachios, almonds, and coarse tobacco. A dialect with many old Persian forms and resembling the Mazandaran dialect is spoken.

SAMNITES, the name given by the Romans to the warlike tribes inhabiting the mountainous centre of the S. half of Italy. The word Samnites was not the name, so far as we know, used by the Samnites themselves, which would seem rather to have been (the Oscan form of) the word which in Latin appears as Sabini (see below). The ending of Samnites seems to be connected with the name by which they were known to the Greeks of the Campanian coast, which by the time of Polybius had become Sabinus; and it is in connexion with the Greeks of Campania and Naples that we first hear of the connection between Rome and the Samnites.2 We know both from tradition and from surviving inscriptions (see Osca Lingua and R. S. Conway, The Italic Dialects, pp. 169 to 206) that they spoke Oscan; and tradition records that the Samnites were an offshoot of the Sabines (see e.g. Festus, p. 326 Mueller). On two inscriptions, of which one is unfortunately incomplete, and the other is the legend on a coin of the Social War, we have the form Sabinim, which would be in Latin *Sabiniunum, and is best regarded as the nominative or accusative singular, neuter or masculine, agreeing with some substantive understood, such as nummum (see R. S. Conway, ibid. pp. 188 and 276).

The abundance of the ethnica ending in the suffix -no- in all the Samnite districts classes them unmistakably with the great Safine stock, so that linguistic evidence confirms tradition (see further Sabini). The Samnites are thus shown to be intimately related to the patrician class at Rome (see Rome: history, ad init.); so that it was against their own stock that the Romans had to fight their hardest struggle for the lordship of Italy, a struggle which might never have arisen but for the geographical accident by which the Etruscan and Greek settlement of Campania was divided into two halves the Safine settlements in central Italy.

The longest and most important monument of the Oscan language, as it was spoken by the Samnites (in, probably, the 3rd century B.C.) is the small bronze tablet, engraved on both sides, known as the Tabula Agnomenis, found in 1848 at the modern village Agone, in the heart of the Samnite district, not very far from the site of Bovianum, which was the centre of the N. group of Samnites called Pentri (see below). This inscription, now preserved in the British Museum, is carefully engraved in full Oscan alphabet, and perfectly legible (facsimile given by Mommsen's Unterrildische Dialektik, Taf. 7, and by I. Zvetatj, Sylloge inscriptionum Osrarum). The text and commentary will be found in Conway, op. cit. p. 191: it contains a list of deities to whom statues were erected in the precinct sacred to Ceres, or some allied divinity, and on the back a list of deities to whom altars were erected in the same place. Among those whose names are immediately intelligible may be mentioned those of "Jove the Ruler" and of Hercules Cerealis." The other names are full of interest for the student of both the languages

---

1 See Michael Praetorianus, Synt. Mus. (Wolfenbüttel, 1618), p. 248 and pl. 42, where the illustration resembles a tambourine, but the description mentions strings, showing that the author himself was puzzled.

2 For the difficult questions involved in the obscure and fragmentary accounts of the so-called First Samnite War, which ended in 341 B.C., the reader is referred to J. Beloch, Campanien, 2nd ed., pp. 442 ff., and to the commentators on Livy vii. 29 ff.
and the religion of ancient Italy. The latest attempts at interpretation will be found in R. S. Conway, *Dialectorum Illyricorum exempla selecta* (s. v.) and C. D. Buck, *Ocean and Umbrian Grammar*, p. 254.

The Samnite towns in or near the upper valley of the Volturnus, namely, Telesia, Allifae, Aesernia, and the problematic Phistelia, learnt the art of striking coins from their neighbours in Campania, on the other side of the valley, Compulteria and Venafrum, in the 4th century B.C. (see Conway, op. cit. p. 106).

The Samnite alliance when it first appears in history, in the 4th century B.C., included those tribes which lay between the Paesini to the N., the Campani to the S., the Campani to the W., the Hirpini and Aburi to the E.: that is to say, the Hirpini, Pentri and Caraceni, and perhaps also the Caudini (J. Beloch, *Italischer Bund*, p. 167, and R. S. Conway, *The Italic Dialects*, pp. 169 and 183); but with these are sometimes classed other friendly and kindred communities in neighbouring territory, like the Frentani and Atina (Liv. x. 30). But after the war with Pyrrhus the Romans for ever weakened the power of the Italic tribes by dividing this central mountainous tract into two halves. The territories of the Latin colony Benvenutum (268 B.C.) and the Aburi (A.D. 4 B.C. C.I. 18 ed. ii. 157) consisted at first of Saticula on the W. (313 B.C.) to that of Luceria on the E., and cut off the Hirpini from their kinsmen by a broad belt of land under Latin occupation (Velleius Pat. i. 14; Liv. lx. 26). At the same time Allifae and Venafrum became praefectures (Fast. p. 233 M.), and the Latin colony of Aesernia was founded in 263 B.C. in purely Samnite territory to command the upper Volturnus valley. We hear of no further resistance in the N. of Samnium till the general rising of Italy in 90 B.C.; but the more southerly Hirpini (g.v.) henceforth acted independently.

**Samos**—the archipelago in the Pacific Ocean, about 150 m. N. of Tonga and nearly midway between the New Hebrides and Tahiti, 1600 m. from Auckland (New Zealand), 2410 m. from Sydney and 4200 m. from San Francisco. (For Map, see *Pacific Ocean*.) It consists of 14 islands forming a slightly curved chain from W. by N. to E. by S., between 13° 30' and 14° 30' S., 168° and 173° W. as follows: Savaii, Manono, Apolima, Upolu, Fanau tapsu, Manua, Nuutele and Nuulua, belonging to Germany, and Tutuala, Anua, Ofo, Olosenga, Tau and Rose, belonging to the United States of America. The principal of these are Savaii (area, 660 sq. m., pop. 13,200), Tutuala (4 sq. m., pop. 1800), Upolu (54 sq. m., pop. 18,400), and the Manua group, which includes Tau and Olesenga (25 sq. m., pop. 2000). Some of the smaller islands are also thickly populated, so that the total population is about 39,000, whites numbering about 500. With the exception of Rose Island, which is an uninhabited coral islet 70 m. E. of its nearest neighbour, and therefore scarcely belongs geographically to the group, all the islands are considerably elevated, with several extinct or quiescent craters rising from 2000 ft. in Upolu to 4000 ft. (Mau) in Savaii. Although there are no active cones, Upolu has in comparatively recent times been subject to volcanic disturbances, and according to a local tradition, outbreaks must have occurred in the 17th or 18th century. In 1836 a submarine volcano near the islet of Olosenga was the scene of a violent commotion, discharging rocks and mud to a height of 2000 ft. Earthquakes are not uncommon and sometimes severe. Coral reefs protect the coasts in many parts; they are frequently interrupted, but the passages through them are often difficult of navigation. The whole group is abundantly watered, and the igneous soil is marvellously fertile. The scenery of the islands is extremely beautiful. Upolu is long and narrow, Tutuala is very long, the other islands small. The three islands are separated by the narrowest part of the sea, which at some points is only 5 ft. 10 in. wide. The trade winds prevail practically all the year round. The temperature is 78° F., the warmest month being December (80°) and the coldest July (75°-76°). The prevalent winds, which temper the heat, are the S.E. trades, but W. winds supervene from January to May and are particularly strong in the area of the air from the Anti-Atlantica which occur usually in this period. On the 16th of March 1899 the heavy tidal waves created havoc in the harbour of Apia. The American naval establishment is not of importance.

**Samoan forests**—The Samoan forest is almost unique in the world. It consists mainly of an indigenous plant, four species of snakes and a few birds, the most interesting member being the *Didunculus striagrostis*, a ground pigeon of iridescent greenish-black and bright chestnut plumage, which according to the extinct dodo and the living African *Tromerina*.

**Naivets.**—The Samoans are pure Polynesians, and according to the tradition of the island, many of their priests arrived by a bastard dispersion of the race over the Pacific Ocean from Hawaii to New Zealand. Apart from tradition, Samoa is the most archaic of all the Polynesian tongues, and still preserves the organic letter s, which is restricted to archaic and foreign words. Its structure is narrow; it has a backbone of consonants and a wide range of vowels. Thus the term *sasasi* itself, originally *Sasawi*, is supposed to have been carried by the Samoan wanderers over the ocean to Tahiti, New Zealand, the Marquesas and Sandwich groups, where it still survives in various forms as *Hawai*, *Hawaiaki*, *Hawai* and *Hawaii*. In any case, the Samoans are the most perfect type of Polynesians, of a light brown colour, splendid physique, and hand- somely formed. Their feature is particularly marked, their mental and social standard is high among Pacific peoples; they are simple, honourable, generous and hospitable, but brave fighters. Their idolatry (polytheistic) was unaccompanied by human sacrifice. The dead were buried, and their spirits believed to travel to a world entered by a pool at the western extremity of Savaii. They have become mainly Protestants, Catholics or Mormons, but retain many superstitions connected with their native religion. The women and children are well treated. A youth is not regarded as eligible to marry till tattooed from the hips to the knees. The principal foods of the Samoans are vegetables, coco-nut, breadfruit, fish and pork. The Samoan liquor is excellent. The Samoan language is soft and liquid in pronunciation, and has been called "the Italian of the Pacific." It is difficult to learn thoroughly, owing to its many inflexions and accents, and its being largely a language of the everyday.

**Administration and Trade.**—The German islands form a crown colony. There is an imperial governor, having under him a native chief assisted by a native council; and there are both German and native judges and magistrates. The United States, on assuming sovereignty over Tutuala and the islands E. of it in 1900, with the written consent of the native chiefs, appointed a naval governor. Cultivation has been extended under European and American rule, and in 1904 the exports from the German islands had reached a value of $83,750, and those from the American islands of $4200. Copra and cocoa beans are the chief articles of export.

**History.**—It is generally considered that the Manua group was sighted by the Dutch navigator Jacob Roggeveen in 1722, and named by him the Baumann islands after the captain of one of his ships. Louis de Bougainville obtained a fuller acquaintance with the archipelago in 1768, and called them the Navigators' Islands (*Iles des Navigateurs*). This name is still used. Settled by the New Zealand Company in 1821, Tutuala lost some of its crew in a conflict with some natives of Upolu visiting the island. Subsequent explorers were Captain Edwards of the "Pandora" in 1791, and Otto von Kotzebue in 1834. In 1830 the respected missionary John Williams paid his first visit to Samoa. Surveys of the archipelago were made by the American explorer Charles Wilkes. The islands, especially Upolu, now began to attract American and European (mostly German) capitalists, and the Hamburg firm of J. C. Godeffroy & Son developed the trade of the island. Meanwhile a series of petty
SAMOS

SAMOS was greatly interfered with the prosperity of the native population, who grouped themselves into two opposing political parties. Americans and Europeans began to discuss the question of annexation, recognizing the importance of the geographical position of the islands. In 1877 the American consul hoisted his country's flag, but the action was repudiated by his government, which, however, in 1878 obtained Pagasus as a coaling station and made a trading treaty with the natives. In 1879 Germany obtained the harbour of Salamata. Great Britain followed suit, but under a political arrangement between the powers no single power was to appropriate the islands. But in 1887 and 1888 civil war prevailed on the question of the succession to the native kingship, the Germans supporting Tamasee, and the British and American residents supporting Malietoa. After the latter had been deported by the Germans, the British and American support was transferred to his successor, Mataafa. In 1889 German sailors and marines were killed or wounded by the adherents of Mataafa. A conference between the three powers was thereupon held at Berlin, and a treaty was executed by those powers and by Samoa, on the 14th of June 1889, by virtue of which the independence and autonomy of the islands were guaranteed, Malietoa was restored as king, and the three powers constituted themselves practically a protectorate over Samoa, and provided a chief justice and a president of the municipality of Apia, to be appointed by them, to aid in carrying out the provisions of the treaty. Thus began a period of considerable friction, until the end of 1898, when, upon the death of Malietoa, two rival candidates for the throne again appeared, and the chief justice selected by the three powers decided against the claims of Mataafa, and in favour of a boy, Malietoa Tanu, a relative of the deceased Malietoa. Civil war ensued, in which several American and British officers and sailors were killed by the natives, the Germans upholding the claims of Mataafa, and the British and Americans supporting the rival candidate. The three powers thereupon sent a commission to Samoa to investigate and adjust the difficulties. The situation, however, was found to be so complicated and embarrassing that, early in 1900, the so-called Berlin treaty was abrogated, Great Britain withdrew her claims to any portion of the islands and received compensation from Germany by cessions in other parts of the world, and the United States withdrew from all the islands W. of Tutuila. In 1902 the king of Sweden, as arbitrator under a convention signed at Washington in 1899, decided that Great Britain and the United States were liable for injuries due to action taken by their representatives during the military operations of 1899.

SAMOS, one of the principal and most fertile of the islands in the Aegean Sea that closely adjoin the mainland of Asia Minor, from which it is separated by a strait of only about a mile in width. It is about 27 m. in length, by about 14 m. in greatest breadth, and is occupied throughout the greater part of its extent by a range of mountains, of which the highest summit, near its western extremity, called Mount Kerkis, is 4725 ft. high. This range is in fact a continuation of that of Mount Mycale on the mainland, of which the promontory of Trigolium, immediately opposite to the city of Samos, formed the extreme point. Samos is tributary to Turkey in the sum of £2700 annually, but otherwise is practically an independent principality, governed by a prince of Greek nationality nominated by the Porte. As chief of the executive power the prince is assisted by a senate of four members, chosen by him out of eight candidates nominated by the four districts of the island—Vathy, Chora, Marathocumbo and Carlovasi. The legislative power belongs to a chamber of 36 deputies, presided over by the metropolitan. The seat of the government is Vathy (6000). There is a telephone service.

The island is remarkably fertile, and a great portion of it is covered with vineyards, producing wine of a specially high reputation. There are three ports: Vathy, Tegani and Carlovasi. The population in 1900 was about 54,830, not comprising 15,000 natives of Samos inhabiting the adjoining coasts. The predominant religion is the Orthodox Greek, the metropolitan district including Samos and Icaria. In 1900 there were 634 foreigners on the island (323 Hellenes, 13 Germans, 29 French, 28 Austrians and 24 of other nationalities).

SAMOS, in the History of the Island: although the history of the island is for the most part a series of invasions, it is singularly defective. At the time of the great migrations it received an Ionian population which traced its origin to Epeidaurus in Argolis. By the 7th century B.C. it had become one of the leading commercial centres of Greece. This early prosperity of the Samians seems largely due to the island's position near the end of the Maenedian and Caister trade-routes, which facilitated the importation of textiles from inner Asia Minor. But the Samians also developed an extensive commerce with the Inner Sea, especially with the Black Sea and with and Egypt, and were credited with having been the first Greeks to reach the Straits of Gibraltar. Their commerce with Africa, which reached its height perhaps abnormally also with Carthage and Chalcis, but made them bitter rivals of their neighbours of Miletus. The feud between these two states broke out into open strife during the Lelantine War (7th century B.C.), in which they were engaged against a Phoenician force, after a naval warfare, the use of the trireme. The result of this conflict was to confirm the supremacy of the Milesians in eastern waters for the time being; for throughout the 6th century B.C. the island of Samos preserved it from those aggressions at the hands of Asiatic kings to which Miletus was henceforth exposed. About 535 B.C., when the existing oligarchy was overturned by the tyrant Polykrates (q.v.), the island enjoyed peace and freedom. In 478 B.C., when it was protected from invasion, but ruled supreme in Aegean waters. The city was beautified with public works, and its school of sculptors, metal-workers and engineers achieved high repute (see below). After the Athenians' success in the battle of Salamis, the Persians conquered and partly depopulated the island. It had regained much of its power when in 499 it joined the general revolt of the Ionians against Persia; but owing to its long-standing jealousy of Miletus it rendered indifferent service, and at the decisive battle of Lade (494) part of its contingent of sixty ships was guilty of downright treachery. In 479 the Samians led the revolt against Persia. In the Delian League they held a position of special privilege and remained actively loyal to Athens until 440, when a dispute with Miletus, which the Athenians had decided against them, induced them to secede. With a fleet of sixty ships they held their own for some time against the Athenian power, but after a protracted siege were forced to capitulate and degraded to the rank of tributary state. At the end of the Peloponnesian War (404 B.C.) Samos was placed under a three-masted archon, who served as a base for the naval war against the Peloponnesians, and as a temporary home of the Athenian democracy during the revolution of the Four Hundred at Athens (411 B.C.), and in the last stage of the war was rewarded with the Athenian franchise. The friendly attitude towards Athens was the result of a series of political revolutions which ended in the establishment of a democracy. After the downfall of Athens Samos was besieged by Lysander and again placed under an oligarchy. In 394 the withdrawal of the Spartan navy induced the island to declare its independence and re-establish a democracy, but by the peace of Antalcidas (387) it fell again under Persian domination. It was recovered by the Athenians in 366 after a siege of eleven months, and received a strong body of military settlers. After the Samian War (322), when Athens was deprived of Samos, the vicissitudes of the island can no longer be followed down to the event of some sort of resistance offered by the Egyptian fleet, at other periods it recognized the overlordship of Syria; in 189 B.C. it was transferred by the Romans to the kings of Pergamum. Escalated from 101 in the Roman province of Asia, it was cedced to Antonius (73 B.C.) and Mithradates (88) against its will, and consequently forfeited its autonomy, which it only temporarily recovered between the reigns of Augustus and Vespasian. New troubles occurred. Samos was unable to contest with Smyrna and Ephesus the title of "first city of Ionia"; it was chiefly noted as a health resort and for the manufacture of pottery (see below). Under Byzantine rule Samos became the seat of the Archimandrite, and in the 11th century it passed through many the same changes of government as Chios (q.v.), and, like the latter island, became the property of the Genoese, and in 1268 was added to Genoese dominions. At the time of the Turkish conquest it was severely depopulated, and had to be provided with new settlers, partly Albanians.
During the Greek War of Independence Samos bore a conspicuous part, and it was in the strait between the island and Mount Mycale that Canaris set fire to and blew up a Turkish frigate, in the presence of the Venetian fleet. This was but one of a series of events that led to the abandonment of the enterprise, and Samos held its own to the very end of the war. On the conclusion of peace the island was indeed again handed over to the Turks, but soon afterwards it was allowed to fall into a semi-independent position, being in fact self-governed, though tributary to the Turkish empire, and ruled by a Greek governor nominated by the Porte, who bears the title of Prince and is the head of a council and assembly. The prosperity of the island bears witness to the wisdom of this arrangement. Its principal article of export is its wine, which was celebrated in ancient times, and still enjoys a reputation in the Levant. It exports also silk, oil, raisins and other dry fruits.

The ancient capital, which bore the name of the island, was situated on the S. coast at the modern Tigani, directly opposite to the modern Samos. During and after the war the town itself, having a large artificial port, the remains of which are still visible, as are the ancient walls that surrounded the summit of a hill which rises immediately above it, and now bears the name of Astypalea. This formed the acropolis of the ancient city, which in its flourishing times covered the slopes of Mount Ampelus down to the shore. The aqueduct cut through the hill by Polycrates may still be seen. Ionian poetry in the 6th century. The far-famed samnite, often which was situated close to the shore, where its site is still marked by a single column, but even that bereft of its capital. This fragment, which has given to the neighbouring islands the name of "Samosata," indicates the temple that was extolled by Herodotus as the largest he had ever seen, and which, vied in splendour as well as in celebrity with that of Diana at Ephesus. Though the temple, with the island of Samos attached to it, has been described as having been completely destroyed in 1717, it is fully accounted for, and its dimensions found fully to verify the assertion of Herodotus, as compared with all other Greek temples existing in his time, though it was afterwards surpassed by the later temple of Aesculapius.

The modern capital of the island was, until recently, at a place called Khora, about 2 m. from the sea and from the site of the ancient city; but since the change in the political condition of Samos has been transferred to Vathy, situated at the head of a deep bay on the N. coast, which has become the residence of the prince and the seat of government. Here a new town has grown up, well built and well provided.

Samos was celebrated in ancient times as the birth-place of Pythagoras. His name and figure are found on coins of the city of imperial date. It was also conspicuous in the history of art, having produced in early times a school of sculptors, commencing with Rhoeus and Theodorus, who are said to have invented the art of casting statues in bronze. Rhoeus was also the architect of the temple of Hera. The vases of Samos are among the most characteristic products of Ionian potteries in the 6th century. The name Samosata, borne by a town itself adjoining the sea and given to a kind of red pottery found wherever there are Roman settlements, has no scientific value. It is derived from a passage in Pausanias xxix. 1. And the famous Samian sculptor was Pythagoras, who migrated to Rhegium.

Among the works of art that have survived from ancient times are:

SAMOSATA (Samosata, -ara), Ptol. v. 15 § 11; Strabo xvi. 749), called in Arabic literature Sumesiit, is now represented by the village of Samiš, occupying a corner of the ancient site. On a broad plain 1500 ft. above sea-level, Samosata practically marks the place where the mountain course of the Euphrates ends (see Mesopotamia). When the water is high enough it is possible to descend in a keleq in one day to Birejik. The rocky banks contain many ancient cave-dwellings.

The stelae found there and published by Humann and Puchstein (Reisen in Kleinasien u. Nord-Syrrien, Atlas, plate xlix. 1-3) shows that it was at an early time a Hittite centre, probably marking an important route across the Euphrates: whether or not it was the place where later the Persian "royal road" crossed the Euphrates, in Strabo's time it was connected by a bridge with a Seleucia on the Mesopotamian side, and it is now connected by road with Serebek and Diyarbek and with Rakk'a, connecting further, through Edessa and Harran, with other eastern roads. The Hittite sculptured object referred to above shows influences of an Assyrian type (P. Jensen, Hittiter u. Armenier, 1898, 13); but no cuneiform text referring to Samosata by name seems yet to have been published. Kummukh, however, the district to which it belonged, was overrun by early Assyrian kings. In consequence of revolt it was made an Assyrian province in 708 B.C. When the Assyrian empire passed through the hands of Babylon and Persia into those of the successors of Alexander, Samosata was the capital of Kummukh, called in Greek Connagene. How soon it became a Greek city we do not know. Although its ruler Ptolemy renounced allegiance to Antiochus IV, the dynasty of Iranian origin which ruled at Samosata, described by Strabo (i. c.) as a fortified city in a very fertile if not extensive district, allied itself with the Seleucids, and bore the dynastic name of Antiochus. There, not long after the little kingdom was in A.D. 72 made a province by the Romans, and its capital received the additional name of Flavia (Suet. Vesp. 8; Eutrop. 8. 19), the celebrated Greek writer Lucan the Satirist was born in the 2nd century (see Lucian), and more than a century later another Lucian, known as the Martyr, in the 3rd century A.D. (Geogr. Journ. xii. 323). Under Constantine Samosata gave place as capital of Euphratesis to Hierapolis (Malal. Chron. iii. p. 317). It was at Samosata that Julian had ships made in his expedition against Sapor, and it was a natural crossing-place in the struggle between Heraclius and Chosroes in the 7th century. Mas'udi in the 10th century says it was known as Kal'at at-Tin ("the Clay Castle"). It was one of the strong forresses included in the county of Edessa (q.v.). In the 13th century, according to Yâqûq, one of its quarters was still inhabited by Armenians. It is now a Kurdish village, which in 1894 consisted of about 100 houses, three of which were Armenian (Geogr. Journ. viii. 322).

SAMOTHRAKE (Turk. Semazde), an island in the N. of the Aegean Sea, nearly opposite the mouth of the Hellespont, and lying N. of Imbros and N.E. of Lemnos. The island is a kaza of the Lemnos sanjak, and has a population of 3,000, nearly all Greek. It is still called Samothraki, and though of small extent is, next to Mount Athos, by far the most important natural feature in the island of Samothrace, from its great elevation—the group of mountains which occupies almost the whole island rising to the height of 5,240 ft. Its conspicuous character is attested by a well-known passage in the Iliad (xiii. 12), where the poet represents Poseidon as taking post on this lofty summit to survey the plain of Troy and the contest between the Greeks and the Trojans. This mountainous character and the absence of any tolerable harbour—Pliny, in enumerating the islands of the Aegean, calls it "importuosissima omnium"—prevented it from ever attaining to any political importance, but it enjoyed great celebrity from its connexion with the worship of the Cabiri (q.v.), a mysterious triad of divinities, concerning whom very little is known, but who appear, like all the similar deities venerated in different parts of Greece, to have been a remnant of a previously existing Pelasgic mythology. Herodotus expressly tells us that the "orgies" which were celebrated at Samothrace were derived from the Pelasgians (ii. 5). The only occasion on which the island is mentioned in history is during the expedition of Xerxes (B.C. 480), when the Samothracians sent a contingent to the Persian fleet, one ship of which bore a conspicuous part in the battle of Salamis (Herod. viii. 90). But the island appears to have always enjoyed the advantage of autonomy, probably on account of its sacred character, and even in the time of Pliny it ranked as a free state. Such was still the reputation of its mysteries that Germanicus endeavoured to visit the island, but was driven off by adverse winds (Tac. Ann. ii. 54).

After visits by travellers, including Ciroc of Canonna (1444), Richter (1822), and Kiepert (1842), Samothrace was explored in 1857 by Conze, who published an account of it, as well as the larger neighbouring islands, in 1860. The "Victory of Samothrace," set up by Demetrius Poliorketes c. 305 B.C., was discovered in the
island in 1863, and is now in the Louvre. The ancient city, of which the ruins are called Palapoci, was situated on the N. side of the island close to the sea; its site is clearly marked, and considerable remains still exist of the ancient walls, which were built in massive Cyclopaean style, as well as of the sanctuary of the Cabeiri, and other temples and edifices of Ptolemaic and later date. The modern village is on the hill above. A considerable sponge fishery is carried on round the coasts by those who dive naked in the hot sulphur springs. In 1873 and 1875 excavations were carried out under the Austrian government.

Conze, Reise auf den Inseln des Thariskischen Meeres (Hanover, 1860); Conze, Hauser and Niemann, Archäologische Untersuchungen auf Samothrake (Vienna, 1875 and 1880); H. F. Tozer, Islands of the Dead (London, 1899).

**SAMOVAR** (Russ. samovar), an urn for making tea after the Russian fashion; it is usually of copper, and is kept boiling by a tube fitted with live charcoal passing through the centre. The word is usually taken in Russia to mean "self-boiler" (самовар, self, and barīt, boil), but it is more probably an adaptation of a Tatar word sanabor, a tea-urn.

**SAMOYEDES**, a tribe of the Ural-Altaic group, scattered in small groups over an immense area, from the Altai mountains down the basins of the Ob and Yenisei, and along the shores of the Arctic Ocean and the Sea of Okhotsk, to the Pacific Ocean and the Sea of Japan. The tribe may be subdivided into three main groups: (a) The Yukars in the coast-region from the Yenisei to the White Sea; (b) the Tavghi Samoyedes, between the Yenisei and the Khatanga; (c) the Ostak Samoyedes, intermingled with Ostaks, to the S. of the others, in the forest regions of Tobolsk and Yeniseisk. Their whole number may be estimated at from 20,000 to 25,000. The so-called Samoyedes inhabiting the S. of the governments of Tomsk and Yeniseisk have been much under Tatar influence and appear to be of a different stock; they are called the Kamass Tatars, the Kaibals, the Motors, the Bellirs, the Karagasses and the Samoyedes on the middle Ob.

The proper place of the Samoyedes among the Ural-Altaicans is very difficult to determine. As to their present name, signifying in its present Russian spelling "self-eaters," many ingenious theories have been advanced, but that proposed by Schrenck, who derived the name "Samojede" from "Syroyadisy," or "raw-eaters," leaves much to be desired. Perhaps the etymology ought to be sought in quite another direction, namely, in the likeness to Samoia. The names assumed by the Samoyedes themselves are Hazovo and Nykyänaz. The Ostaks know them under the names of Orhythy, or Workho, both of which recall the Ugric; the name of Hui is also used in the Osts, and applied to the Tavghi, who resemble the Samoyedes in their language and customs.

The language now spoken by the Samoyedes belongs to the Finno-Ugrian group, and is allied to Finnish but has a more copious system of inflections. There are three principal dialects, which are nearly spoken to the ear. No fewer than three separate dialects and a dozen sub-dialects are known in it.

The conclusions deducible from their anthropological features—apart from the general difficulty of arriving at safe conclusions on this ground alone, on account of the variability of the ethnological type under various conditions of life—are also rather indefinite. The Samoyedes are recognized as having the face more flattened than undoubtedy. Finnish stocks; their eyes are narrower, their complexion and hair darker. Zuev describes them as like the Tunguses, with flattened nose, thick lips, little beard and black, hard hair. All that is true of the Ugric—"the people of the Ob"—but they are undoubtably mixed. Castrén considers them as a mixture of Ugrics with Mongolians, and Zoglaf as brachycephalic Mongolians. Quatrefages classes them, together with the Voguls, as two families of the Ugric sub-branch, this last, together with the Sambres (Lapps), forming part of the Ugric or Boreal branch of the yellow or Mongolic race.

It is probable the Samoyedes formerly occupied the Altai mountains, whence they were driven N. by Turco-Tatars. Thus, the Kaibals left the Sayan mountains and took possession of the Abakan steppe (Minusinsk region), abandoned by the Kirghiz, in the 4th year of the battle of the Tan N.E. Russia the Zyrians are still driving the Samoyedes farther N., towards the Arctic coast. Since the researches of Schrenck it may be regarded as settled that in historical times the Samoyedes were inhabitants of the so-called Ural-Altaic area, and that they have left behind them bones and a considerable number of imprints of bones, found in graves, which are scattered throughout W. Siberia, in the Altai, and on the Yenisei in the Minusinsk region, are relics of Urgo-Samoyedes. According to his views this nation, very numerous at the epoch—which preceded the Iron-Period civilization of the Turco-Tatars,—were pretty well acquainted with mining; the remains of their mines, sometimes 50 ft. deep, and of the furnaces where they melted copper, tin and gold, are often encountered. They were industrious; they had a sort of roof like that of which weighs 75 lb., and their melted and polished bronze and golden decorations testify to a high development of artistic feeling and industrial skill, still the marks of which are seen on their earthenware. They were not nomads, but husbandmen, and their irrigation canals are still to be seen. They kept horses (though in small numbers), sheep and goats, but no traces of their rearing pigs, cattle or buffalo have hitherto been discovered.

The Samoyedes, who now maintain themselves by hunting and fishing on the lower Ob, partly intermingle with the Ob Ostaks, retaining the condition of the inhabitants of France and Germany at the epoch of the reindeer. Clothed in skins, like the troglodytes of the Weser, they are agricultural. They live in small huts, which are so dry and indomitable that carnivorous animals—the wolf included—and cherish the same superstitions (of which those regarding the teeth of the bear are perhaps the most characteristic) as were current among the Stone-Period inhabitants of W. Europe. Their heads are thick, somewhat skull-like, with a low front and the prevalence of smallpox. They still maintain the high standard of honesty mentioned by historical documents, and never admit anyone to the houses by their neighbours. The Yurals Samoyedes are courageous and warlike; they offered armed resistance to the Russian invaders, and it is only since the beginning of the century that they have paid tribute. The exact number of Umbaich Samoyedes is not known; the Tavghi Samoyedes may number about 1000, and the Yuraks, mixed with the former, are estimated at 6000 in Obdorsk (about 150 settled), 5000 in European Russia in the tundras of the Mezen, and 1000 in Yeniseisk.

Of the S. Samoyedes, who are completely Tatarized, the Beltirs live by agriculture and cattle-breeding in the Abakan steppe. They profess Christianity, and speak a language closely resembling that of the Sagi Tatars. The Kaibals, or Koibus, can hardly be distinguished from the Minusinsk Tatars, and support themselves by rearing cattle. Castrén considers that three of their stems are of Ostak origin, the remaining being Samoyedic. The Kamassins, in the Kansk district of Yeniseisk, are either herdmen or agriculturists. They speak a language with an admixture of Tatar words, and some of their stems contain a large Tatar element. The interesting point of the language of the Ostaks is connected with the rapid loss of all the verbal and personal inflections, the few representatives are rapidly losing their anthropological features, their Turkish language and their distinctive dress. The exact number of the Samoyedes in Siberia is unknown, and the tribe emigrated to China and was there exterminated; the remainder have disappeared among the Tuba Tatars and the Soyotes. The Samoyedes on the Ob in Tomsk may number about 7000; they have been divided the last 50 years, and there is no carrying on agriculture, and are a poverty-stricken population with little prospect of holding their own.

The works of M. A. Castrén are still the best authority on the Samoyedes. See Gesellschaft der samoyedischen Sprachen (1854); Dictionary (1855); Ethnologische Vorlesungen über die altasiatischen Volker (1857); Versuch einer koibalisichen und karagassischen Sprachlehre (1857). See also A. Middendorf, Reise in den äusseren Norden und Osten Sibirien (1875).

**SAMPA**, the lightest and the typical light boat of far eastern rivers; a canoe-shaped vessel, being usually propelled by a single scull over the stern, and the canal boat resembles it, being carried by an awning or screen of matting. The word is said to be Chinese, san, thin, and pan, board. Others take it to be Malay origin.

**SAMPIDARENA** (San Pier d'Arena, i.e. St Peter of the Sands), a town of Liguria, Italy, in the province of Genoa, 24 m. by rail W. of the city of that name, 16 ft. above sea-level. Pop. (1906) 37,582 (town); 43,054 ( commune). It is practically a suburb of Genoa and contains a number of handsome palaces, including the Palazzo Spinola and the Palazzo Scassi, both notably by Bernardo Buontalenti. Upon the bank of the river are warehouses, stores, and other buildings for industrial and commercial activity, the Ansaldi ship-building yard being the most important of its works. Near the
neighbouring town of Cornigliano is a bridge, where Masséna slew the capitulation of Genoa.

**SAMPLE** (through the O. Fr. essemble, from Lat. exemplum; a doublet of "example"), a small portion of merchandise taken from the whole to serve as a specimen or evidence of the whole; hence a pattern or model. Sale by sample obviates the necessity on the part of sellers of keeping large quantities of goods on premises unsuitable for storage, and on the part of buyers of having to make a special visit to inspect the goods in bulk. The sale of goods by sample is dealt with in England by the Sale of Goods Act 1893, s. 15, which provides that a contract of sale shall be a contract for sale by sample where there is a term of comparison in the contract. In the case of such a contract, there must be (a) an implied condition that the bulk shall correspond with the sample in quality; (b) an implied condition that the buyer shall have a reasonable opportunity of comparing with the bulk and the sample; (c) an implied condition that the goods shall be free from any defect, rendering them unmerchantable, which would not be apparent on reasonable examination of the sample. (See also **SALE of GOODS**.)

**SAMPLER** (from O. Fr. essemblaire, with dropping of initial **a**, Late Lat. exemplarium, from exemplum, example; it is a destination of Lat. *exemplum*) or, as the latter form is used in this country, "example," a model or pattern to be copied, particularly a small rectangular piece of embroidery worked on canvas or other material as a pattern or example of a beginner's skill in needlework, as a means of teaching the stitches. Down to comparatively recent times every little girl worked her "sampler," and examples of 17th-century work are still found and have become the object of the collector's search. They usually contained the alphabet, the worker's name, the date, and Bible texts, verses, mottoes, the whole surrounded with some conventional design.

The earliest sampler in existence is dated 1643 and is in the Victoria and Albert Museum, South Kensington (see M. B. Huish, *Samplers and Tapestry Embroideries*, 1900, and *List of Samplers in the Collection of Henry Vaughan*, South Kensington, Board of Education, South Kensington, 1906).

**SAMPSON, WILLIAM THOMAS** (1840-1902), American naval commander, was born at Palmyra, New York, on the 9th of February 1840, and graduated at the head of his class from the U.S. Naval Academy in 1861. In this year he was promoted to master, and in the following year was made lieutenant. He was executive officer in the "Patapsco" when she was blown up in the Confederate ironclad "Virginia" January 1862. He served on distant stations and (1868-1871 and 1876-1878) at the Naval Academy, and became lieutenant-commander in 1886 and commander in 1874. He was a member of the International First Meridian and Time Conference in 1884, and of the Board of Fortifications in 1885-1886; was superintendent of the Naval Academy from 1886 to 1890; and was promoted to captain and served as delegate at the International Maritime Conference at Washington in 1888. He was chief of the Bureau of Ordnance in 1893-1897. About 95% of the guns employed in the Spanish-American War were made under his superintendence. His influence was felt decisively in the distribution of guns and armour, and in the training of the personnel of the navy. He superintended the gunnery training and prepared a new drill-book for the fleet. In February 1898 Sampson, then a captain, was president of Board of Inquiry as to the cause of destruction of the "Maine." At the outbreak of the war with Spain he was placed in charge of the N. Atlantic squadron, and conducted the blockade of Cuba. When it was known that Admiral Cervera, with a Spanish fleet, had left the Cape Verde Islands, Sampson withdrew a force from the blockade to cruise in the Windward Passage, and made an attack upon the forts at San Juan, Porto Rico. After his return to the coast of Cuba he conducted the blockade of Santiago, and the ships under his command destroyed the Spanish vessels when they issued from the harbor of Santiago and attempted to escape (see **SPANISH-AMERICAN WAR**). Sampson himself was not actually present at the battle, having started for Siboney just before it began to confer with General Shafter, commanding the land forces. He reached the scene of battle as the last Spanish vessel surrendered, and the engagement was fought in accordance with his instructions. He was promoted to commodore in 1898, to rear-admiral on the 3rd of March 1899, and was made commandant of the Boston (Charlestown) Navy Yard in October of the same year. He died on the 6th of May 1902.

**SAMSON** (cf. Heb. šāmēmšē, "sun"), in the Bible, the antagonist of the Philistines, reckoned as one of the "judges" of Israel (Judg. xv. 20, xvi. 31); the story itself (Judg. xiii. 2-xxvi. 31), however, represents him not as a judge but as a popular hero of vast strength and sarcastic humour. He is consecrated from his birth to be a Nazarite or religious devotee (ch. xii., 13), and it is possible that this consecration was simply as a vow of revenge, which is the meaning it would have in an Arab story (W. R. Smith). But he is inspired by no serious religious or patriotic purpose, and becomes the enemy of the Philistines only from personal motives of revenge, the one passion which is stronger in him than the love of women. The stories of his exploits are plainly taken from the mouths of the people and have all the appearance of folk-tales, not unmixed with mythical motives. Samson commenced his career by strangling a lion on his way to visit a Philistine woman. On (and by shaming himself) he renders that the carcass, like the skull of Oenoseus (Herod. v. 114), was occupied by a swarm of bees; he took the honey and the incident suggested a riddle. The narrative of Samson's marriage and riddle is of peculiar interest as a record of manners; specially noteworthy is the custom of the wife remaining with her parents after marriage.1 His next exploit, an act of revenge for the faithlessness of his wife, was to catch 300 foxes and set them loose in the fields with firebrands tied to their tails. (Analogous customs, e.g. the Roman Cerealia, are referred to in G. F. Moore's *Commentary*, p. 341.) The Philistines retaliated by burning her and her father's household, and Samson in his turn smote them "hips and thighs" and slew a thousand men with the jawbone of an ass.2 The story has apparently been influenced by the existence of a rock, called by reason of its shape, "Ass's Jawbone," from which issued a fountain called *En-hakkōrē* , "the spring of the caller" (a name for the partridge). The well-known removal of the gates of Gaza to Hebron, 40 m. distant — "no journey of the Sabbath day" (Milton, *Samson Agonistes*) — has been rendered still more marvellous by a later exaggeration (xiv. 2). Finally the Philistine Delilah (q.v.) worms out of Samson the secret of his strength, and by shaving his head renders the carcass of the lion incapable. He is blinded and put to menial work, and as his hair grows again his invincible strength returns. At a festival of Dagon he is led out before the Philistines in the temple, and by pulling down the house upon their heads kills more at his death than in all his life-time.

Points of similarity between Samson and the Babylonian Gilgamesh, the Egyptian Horus-Ra and Hercules, have been observed by many writers, and it has been inferred that the whole story of Samson is a solar myth. His name, and the proximity of Beth-shemesh ("house of the sun") to his father's home, favour the view that mythological elements have attached themselves to what may have been originally a legendary figure of the Danites, the tribe whose subsequent fortunes

---

1 In Judg. xiv. 1-10 the narrative has been revised; originally Samson went down alone to Timnath to contract his marriage. The metrical riddle and its answer are thus translated by G. F. Moore (*Sacred Books of the Old Testament: Judges*):

"Out of the eater came something to eat. 
And out of the strong came something sweet."

"If with my heifer ye did not plough, 
Ye had not found out my riddle, I trow."

No doubt the Hebrews, like the Arabs, were fond of enigmas; see 1 Kings x. 1, and *Ency. Biblica*, s.v. "Riddle."

2 The meaning of the phrase "jawbone of an ass" thus rendered by G. F. Moore: "with the jawbone of an ass, I assailed my assailants" (more literally "I piled them in heaps," or perhaps "flayed them clean").

3 For the hair as the seat of strength cf. J. G. Frazer, *Golden Bough*, ii. 390 seq. In ch. xiii. the consecration of the hair is regarded differently.
SAMSON—SAMUEL OF NEHARDEA

are narrated in the chapters immediately following (Judg. xvii.—xviii.).

SAMSON (1135-1211), abbot of St Edmund's, was educated in Paris and became a teacher in Norfolk, the county of his birth. In 1160 he entered the great Benedictine abbey of St Edmund's as a monk and was chosen abbot in February 1182. He was a careful and vigilant guardian of the property of the abbey, but he found time to attend royal councils and to take part in public business; also he was frequently entrusted with commissions from the pope. During the absence of Richard I. from England he acted with vigour against John and visited the king in his prison in Germany. He did some building at the abbey, where he died on the 30th of December 1211. Samson is famous for the encouragement which he gave to the town of Bury St. Edmunds, the liberties of which he extended in spite of his own monks. His name is most familiar owing to the references to him in Carlyle's Past and Present.

See the chronicle of Jocelyn of Brakelond in vol. i. of the Memorials of St Edmund's Abbey, edited by T. Arnold (1890); and J. R. Green, Serbia (Studies 1892).

SAMSON, JOSEPH ISIDORE (1793-1877). French actor and playwright, was born at St Etienne on the 25th July 1793, the son of a Jewish family. He took part in the performance at the Conservatoire in 1812, married an actress with whom he toured France, and came to the Comédie Française in 1826. Here he remained until 1863, creating more than 250 parts. He became a professor at the Conservatoire in 1829, and under him Rachel, Rose Chérié (1824-1861), the Brohanis and others were trained. He wrote several comedies, among them La Belle-Mère et le gendre (1856), and La Famille poisson (1840). Samson died in Paris on the 28th of March 1871.

SAMSUN (anc. Amisos), the chief town of the Janic sanjak of the Trebizond vilayet of Asiatic Turkey, situated on the S. coast of the Black Sea between the deltas of the Kizil and Yeshil Irmaks. Pop. about 15,000, two-thirds Christian. It is connected by metalled roads with Sivas and Kaisarleh, and by sea with Constantinople. It is a thriving town, and the outlet for the trade of the Sivas vilayet. Steamers lie about 1 m. from the shore in an open roadside, and in winter landing is sometimes impossible. Its district is one of the principal sources of Turkish tobacco, a whole variety of which is known as "Samsun." Samsun exports cereals, tobacco and wool. Both exports and imports are about stationary, the Agora (the general market) being neutralized by a tendency to rise. Amissah, which stood on the promontory about 1½ m. N.W. of Samsun, was, next to Sinope, the most flourishing of the Greek settlements on the Euxine, and under the kings of Pontus it was a rich trading town. By the 1st century A.D. it had displaced Sinope as the N. port of the great trade route from Central Asia, and later it was one of the chief towns of the Comneni of Trebizond. There are still a few remains of the Greek settlement. (D. G. H.)

SAMUEL, a prominent figure in Old Testament history, was born at Ramah and was dedicated to the service of Yahweh at the sanctuary of Shiloh where he lived till he was 18 (q.v.). His mother, Samuel (q.v.), here he announced the impending fate of the priesthood and gained reputation throughout Israel as a prophet. Best known as "king-maker," two distinct accounts are preserved of his share in the institution of the monarchy. In one, the Philistines overthrew Israel at Ebenezer near Aphek, Eli's sons

The name Samuel (Shim'a'il), on the analogy of Penuel, Reuel, seems to mean "name (i.e. manifestation) of El" (God). Other interpretations are about stationary, the Agora (the general market) being neutralized by a tendency to rise. Amissah, which stood on the promontory about 1½ m. N.W. of Samsun, was, next to Sinope, the most flourishing of the Greek settlements on the Euxine, and under the kings of Pontus it was a rich trading town. By the 1st century A.D. it had displaced Sinope as the N. port of the great trade route from Central Asia, and later it was one of the chief towns of the Comneni of Trebizond. There are still a few remains of the Greek settlement. (D. G. H.)

SAMUEL, a prominent figure in Old Testament history, was born at Ramah and was dedicated to the service of Yahweh at the sanctuary of Shiloh where he lived till he was 18 (q.v.). His mother, Samuel (q.v.), here he announced the impending fate of the priesthood and gained reputation throughout Israel as a prophet. Best known as "king-maker," two distinct accounts are preserved of his share in the institution of the monarchy. In one, the Philistines overthrew Israel at Ebenezer near Aphek, Eli's sons

are slain, and the ark is captured (1 Sam. iv.). After a period of oppression, Samuel suddenly reappears as a great religious leader of Israel, summons the people to return to Yahweh, and convenes a national assembly at Mizpah. The Philistines are defeated at Ebenezer (near Mizpah) through the direct intercession of Yahweh, and Samuel rules peacefully as a theocratic judge (vii.). But in his old age the elders demand a king, and he taps the ark, that the simple story of Samuel's youth at Shiloh will belong. Next we find that Samuel's interest on behalf of the Israelite king is transferred to David, the founder of the Judaean dynasty, and it is his part to announce the rejection of Saul and Yahweh's new decision (xii. 7b-150), xv. 10-35, xxviii. 17), to anoint the young David, and, as head of a small community of prophets, to protect him from the hostility of Saul (xvi. 1-13, xix. 18-24).

All these features in the life of Samuel reflect the varying traditions regarding a figure who, like Elijah and Elisha, held an important place in the Israelite history. That he was an Ephraimite priest who served at Ramah may only be due to the incorporation of one cycle of specifically local tradition; the name of his grandfather Jeroham (or Jerohemel, or Seputanig) suggests a southern origin, and one may compare the relation between Saul and the Kenites (1 Sam. 6, 6) and Jehu and the Rechabites (1 Kings x. 15). But, although his great victory in 1 Sam. vii. may imply that he was properly a secular leader, comparable to Othniel, Gideon or Jephthah (see * Sam. xii. 11, cf. Heb. xii. 35), the idea of non-hereditary rulers over all Israel in the pre-monarchical age is a later theory (see Judges). However, so-grooth-man, tinent in the institution of the monarchy naturally held a prominent place in later ideas, encouraged by the growth of tradition. The Saul who became the first king of N. Israel must needs be indebted to the influence of the prophet (cf. Jeus, and it is to the former (and later) of them that the disastrous fate of Saul invited explanation, which is found in his previous acts of disobedience (1 Sam. xv, xxviii. 16-18; cf. Ahab, Kings xx. 35-43). Further, while on the one side the institution of the monarchy is subsequently regarded as hostile to the pre-eminence of Yahweh, Samuel's connexion with the history of David belongs to a relatively late stage in the history of the written traditions (see Events in the Time of David and Solomon). samuel's name ultimately becomes a by-word for the inauguration and observance of religious custom (see 1 Chron. ix. 22, xxvi. 28, 2 Chron. xxvii. 18, Ps. cxxv. 6, Ecclus. xiv. 13 seq.). According to a tradition that is frequent in the Hebrew Bible (e.g. 1 Chron. vi. 28, 33). See further David; Samuel, Books of; Saul. (S. A. C.)

SAMUEL OF NEHARDEA, usually called bar Samuel or Yehuden (c. 165-c. 257), Babylonian Rabbi, was born in Nahardea in Babylonia and died there c. 257. He is associated
with the fame of his great contemporary Rab (Abba Araka, g. r.). Besides his mastery in the traditional Law, which added much to the growing reputation of the Rabbinic Academy of his native town, Samuel was famed for his scientific attainments. In particular his knowledge of astronomy, as preserved in the world of the first to compile a Calendar of the Jewish year, thus preparing the way for the fixation of the festivals by means of scientific calculations. But Samuel's fame rests on the service which he rendered in adapting the life of the Jews to the Diaspora to the law of the land. "The law of the State is binding law," was the principle which Samuel enunciated, here conveying to its logical outcome the admonition of Jeremiah. When the king of Persia, Shapur, captured Mazaca-Caesarea, the Cappadocian capital, Samuel refused to mourn for the 12,000 Jews who lost their lives in its defence. As Graetz says: "To Jeremiah and Mar Samuel Judaism owes the possibility of existence in a foreign country.

See Graetz, History of the Jews (English translation), vol. ii, ch. xix.

1. Position and Contents.

The book of Samuel, Books of, two books of the Old Testament, which in the Jewish canon are ranked among the Former Prophets (Joshua-Kings), in contrast to the Latter Prophets (Isaiah-Malachi). The division into two (like the two Hebrew books of Kings) follows the Septuagint and the Vulgate, whose four books of "kingsdoms" correspond to the Hebrew books of Samuel and Kings. Both Samuel and Kings, like Judges, are made up of a series of extracts and abstracts from various sources, worked over from time to time by successive editors, and freely handled by copyists down to a comparatively late date, as is shown by the numerous and often important variations between the Hebrew text and the Greek version (Septuagint). This criticism was made under the influence of the ideas which characterize Deuteronomy, that is, that the reforms ascribed to Josiah (2 Kings xxiii.) but in Samuel the "Deuteronomistic" influence is much less prominent and the chronological system which runs through Judges and Kings occurs only sporadically. The book of Samuel completes the history of the "judges" of Israel, (11th century B.C.), and begins relating the events which led to the institution of the monarchy under Saul, the part played by Samuel being especially prominent (1 Sam. i.-iv.). The interest is then transferred to David, the founder of the Jewish monarchy, and these events are given with great wealth of detail. As Saul loses the divine favour, David's position advances until, after the death of Saul and the overthrow of Israel, he gains the allegiance of a disorganized people (1 Sam. xv.-2 Sam. iv.), and Jerusalem becomes the centre of his empire (v.-viii.). 

- c. 1000 B.C. A more connected narrative is now given of the history of David (ix.-xx.), which is separated from the account of his death and Solomon's accession (1 Kings i. i.) by an appendix of miscellaneous contents (xxi.-xxiv.). Three lines of interest are to be recognized: (a) that naturally taken by Israel (the northern kingdom) in the history of its first king, Saul; (b) the leading position of the prophets in the political and religious events; and (c) the superiority of the Judaean dynasty, a feature of paramount importance in the study of a book which has come ultimately through Judaean hands. (On the ambiguity of the name "Israel," see Jews, § 5.)

Proof of the diversity of sources is found in the varying character of the narratives (historical, romantic, &c.); in the different literary styles (anastilic, detailed and vivid, Deuteronomist); in the representation of different standpoints and tastes; in the concluding summaries, 1 Sam. xiv. 47-51 compared with xv., 2 Sam. viii. compared with x.; in the double lists in 2 Sam. viii. 18, xx. 21-47; &c. The religious views are so varied that a single writer or even a single age cannot be postulated; note especially 1 Sam. xv. 22 seq. contrasted with the use of teraphim in xix. 13; and the different versions of Yahweh (Septuagint, and 2 Kings xx. 21 seq.; or 2 Sam. xxiv. 1) compared with the "Magnificat" as a post-Reconstruction, Hag. i.; or for not attending the Feast of Tabernacles, Zech. xiv. 16-19.

---

1 It is of course necessary to note carefully whether the religious ideas have any real historical value. Thus, 1 Sam. xvii. 36, 46 seq. contain ideas of Yahweh characteristic of exilic and post-exilic writings (see T. K. Cheyne, Ency. Bib., col. 1755), but no proof of an early date. (1 Kings xvii. 16, 1 Kings xx. 23, 2 Kings xvii. 26 seq.); or 2 Sam. xxiv. 1 (cf. 1 Kings xxii. 20, Ezek. xlv. 9), or 2 Sam. xxi. 1 (note drought as the punishment for not seeking for water; compare xxv. 16, xxvi. 19).
represents a situation which belongs to (a) rather than to the state of chaos represented in (b); it describes how the newly-elected king proved his worth (cf. x. 27, xi. 12 seq.). The compiler has used a story in which Saul is a private citizen to found a public figure, Gibeah and Gibeon upon whose youth Judaean clans are treated as attacks upon Saul's kingdom (xviii. 28-31). The second stage of the narratives of the relations between David and Saul, of whose first meeting two contradictory accounts are given (contrast xvi. 21 sqq. and xvii. 55 sqq.). The independent stories of David place him in the south of Judah, an outlaw with a large following, or a vassal of the Philistines; the older, upon which Judaeans are treated as attacks upon Saul's kingdom (xviii. 26-28). The two traditions are closely related, the former being the more diffuse. Two very similar narratives describe Saul's pursuit of David in the Judaean desert (xxiv. xxvi.). The main points are Saul's confusion and his recognition that David would prove a threat (xxvi. 21-25); the latter is more emphatic when he foresees that David will gain the kingdom of Israel and he adjures him to spare his seed (xxv. 20-22). This last feature is prominent in xxiii. 15-18 (the prophetic form) and in xxvi. 1-11 (theSolomonic account), as described by the covenant between David and Saul's son Jonathan. The account of David's flight is equally intricate. The tradition that David slew Saul's son Jonathan has been questioned; he fought his battle against Gibeon, and deposited his sword in Nob (xvii. cf. xvi. 9, xxii. 10) is incomplete. In the narrative in 2 Sam. xxi. 19 (1 Chron. xx. 5 seeks to avoid the discrepancy) and even if the name Goliath be a later addition to the story of some later author (cf. A. R. S. Kennedy, Sam., pp. 122, 140), or a descriptive form (W. E. Barnes, Chron., p. 104), it is surely difficult, on historical grounds, to reconcile David's recurring fights with the Philistines with his subsequent escape from Saul to Achish of Gath (xxvi.; already anticipated in xxi. 10-15); see further § 6. Saul's jealousy, however, is in some way kindled, and there is already a hint of David's succession (xviii. 8 seq. Samuel omits 10 seq.). The narrative in xv. 7-17, from David's death (xxvii. seq.) is duplicate, and a number of internal difficulties thoroughly removed in the shorter text of the Septuagint. In xx. David has realized Saul's hatred; but Jonathan scarcely credits it, although in xvii. 1-5 he is shown as having beenモノ了．The prophet has said that Saul had incurred God's anger, and the son had effected a reconciliation. This is ignored also in xiv. 8-12 (cf. xvi. 10 seq., xx. 31 sqq.), and again in xvii. 11-17 where David is saved by Michal his wife (see xxv. 44), and in xxviii. 17-24 (David with a sword in his hand) for which the沛重点是 to explain the absence of Jonathan (see xx. 1-5) and the reconciliation between the two on the understanding that Jonathan had treated David's kindness to his descendants (see 2 Sam. xi. 1, below), and again in xxv. 40-42, where the second meeting with a renewal of the covenant stultifies the preceding plans.

David—All the stories of the relations between the founders of the respective monarchies are so closely interwoven that the disentanglement of distinct series of narratives is a task of the greatest difficulty. They reflect in varying forms the popular interest in David and are of the greatest value in illustrating current traditions, thought and styles of literature. Apart from the more detailed and continuous history, there are miscellaneous passages in a Sam. v.-viii., with introduction (v. 1-3), and a concluding chapter rounding off his reign (viii.). A similar collection in xxi.-xxiv. severally forms a portion of Judges (xv.-xxiv.), and 1 Kings i.-ii. Their contents range over all periods, from the Amalek war (viii. 12, cf. 1 Sam. xxx.) to David's "last words" (xxiii. 1, but see 1 Kings i. and ii. 1). In particular they narrate the capture of Jerusalem from the Jebusites (v. 6-10) and other fights in that district as far as Gezer (v. 17-25), the purchase of land from a Jebusite for the erection of an altar (xxiv.; see 1 Chron. xxii. 1, 2 Chron. iii. i.), and the remarkable story of the pacification of the Gibeonites (xxii. 1-14). With the conflicts in v. are closely connected the exploits in xx. 15 sqq., xxii. 8 sqq., and the probability of some disarrangement is suggested by the repetition of the list of officials in viii. 15-18 and xx. 23-26; which many scholars (after Budde) attribute to the later insertion of ix.-xx. 22. On this view, at an earlier stage the two groups v.-viii., xxii.-xxiv. were contiguous—though

1 Characteristic expressions of Deuteronomic writers are found in 1 Sam. xiv. 47 seq. (cf. Judg. ii. 14 sqq.); similarly in the (north) Israelite writer in 2 Kings xiii. 3 seq. (see Kings).
not necessarily in their present form or order.

Budde's further conclusion that 1 Kings i. ii.-13, 19 seq. were likewise wanting (Sam. p. xi.) is also valuable, since (a) 2 Sam. v.-vii. (with xxiv.-xxv) finds its natural culmination, on the analogy of the Deuteronomic compiler's framework in Kings, in 1 Kings ii. 10-12, iii. 2, and (b) 1 Kings v. 3. seq. (also Deuteronomic) explicitly points back to the summary of the wars in 2 Sam. viii. It is commonly recognized that the compiler of 2 Sam. v.-viii. has wrongly placed after the capture of Jerusalem (v. 6 seq.) the conflict with the Philistines (v. 17 seq.), where the "hold" is not Zion but some place of retreat, perhaps Adullam (cf. xxii. 14).

This being so, the conflicts in xxi. 15 seq., xxiii. 8 seq., which are located around Gath, Lehi (so read xxiil. 11), Pasdammin, Aroer (so also in xii. 13), Bethaven, and Aroer, are in fact, of a stamp with the detailed narratives already noticed (§ 3), and they conflict with the fragmentary traditions of David's steps to Jerusalem as seriously as the popular narratives of Saul conflicted with older evidence. But already Josh. ix. 17, xv. 63; Judg. i. 21, 29, 35, xiv. 10-12; 2 Sam. vi. 6 (cf. xxii. 2), indicate the presence of a line of alien cities including Jerusalem itself, and would point to an important alien district, the existence of which obviously bears upon the trustworthiness of the group of narratives encircling Bethlehem of Judah and Gibeon, especially if the narrative of David's flight from Jerusalem (xxi. 16-32) be taken into account.

On the other hand, this would ignore the representation of (north) Israelite extension over Judah by Joshua and Saul, and it may be inferred that we have to allow for absolutely different and conflicting standpoints in regard to the history of the district, and that the Judaean traditions of David once had their own independent account of the occupation of Jerusalem and its neighbourhood. The fragments preserved in 2 Sam. v.-viii., xxii.-xxiv. are quite distinct from li. 12-iv.; they throw another light upon David's relations to Saul's family (xii. 1-14), and the stories of heroic conflicts with giant-like figures (e.g. xxiv. 10 seq.) promise to find a place by the side of the more detailed records of David's sojourn under the protection of a king of Gath, one of a confederation of Philistine cities (1 Sam. xxvii., xxiii.). It is probable that popular stories of the conquest of the earlier inhabitants have been applied to the Philistines; their general character associates them with the legends of the "sons of Anak" who enter into Judaea (perhaps originally Cælebithe) tradition elsewhere (Num. xiii. 22; Josh. xi. 21 seq., xv. 14; see Budde, Samh., p. 310 seq.4)

Four or five literary problems however at xiii. 20, 27; xiv. 4, 7, 9; xxi. 25, 26; xxiii. 1, 5 (see Literature, below); we accept Budde's suggestion that xii. xxv. were inserted by a hand later than the first Deuteronomic editor of viii.; but the further assumption that this editor had deliberately omitted ix.-xx. from his edition cannot be proved, and deals with a literary stage too early for any confident opinion or even for any critical investigation of value.

"Jerusalem" in 1 Sam. xvii. 54 is usually treated as an anachronism, because of its occupation by the Jebusites, and Kirjath-jearim (vii. 1, 2, perhaps Kirieth-enab, 9 m. W. of Jerusalem) is commonly admitted to be in alien hands.

But it is clear that the Jebusite conquest by David (xxviii.) marks a new and decisive stage in the development of an already existing Jerusalem, without being altogether an Israeliite city, yet the present name of the priests of Shiloh there is essential to the present structure of the book.

4 For Joshua, see the older portions of Josh. x., and for Saul, I Sam. xiv. 47-51 (this war); xiv. 4 (his Judaean army), xxiv. 4 (Jerusalem), xxvii. 7-12 (south Judaean clans under Israeliite suzerainty) and 2 Sam. i. 12 (Septuagint).

For this cf. the "Anakim" of Gaza, Gath and Ashdod, &c., in Josh. xi. 21 seq., with the "Philistine" lords, ch. xiii. 3, and see PHILISTINES.
people. The persistent emphasis upon such features as the rejection of Saul, his enmity towards David, the latter's chivalry, and his friendship for Jonathan, will partly account for the present literary intricacies; and, on general grounds, traditions of quite distinct origin (Calebite or Jerahmeelite; indigenous Judaean; North Israelite or Benjaminite) are to be expected in a work now in post-exilic form.1 David's history is handled independently of Saul in 1 Sam. xxv.; and the narrative, now editorially connected with the context (2 Sam. i, see xxviii. 3, and 2 Sam. iii. 15), gives a valuable picture of his life in the south of Palestine. With 2 Sam. iv. 6-17, and this new defeat with Judah chron. 2 Sam. xxvii. 12-17. His flight northwards to the Phœnician city of Gath (xxvii.) is hardly connected with the preceding situations in xxv., xxvi., xxvii. 21-25, and his previous slaughter of the Philistines at Keilah (xxii. 1-15) raises historical difficulties. This is not to mention his earlier successes over the same people, which are very explicitly ignored in xxix. 5, although the famous coupel there quoted now finds its only explanation in xvii. 7 after the death of Goliath and the defeat of the Philistines. The traditions of varying relations between Judah and the Philistines attached to David (cf. xxvii. 5 seq.) are quite distinct from his narratives. The part of Saul in the joint history of David and Saul. The independent narratives of the latter's fate seem to represent one of those disastrous attacks upon the north which are familiar in the later history of the northern kingdom (xxviii. 4, xxix.; see JEWs: History, § 12). The geographical data are confused by the stories of David (see 1 Sam. xxviii. 4, xxix. 1, and the commentaries), and, while the "Philistines" for once march north to Jezreel to deliver their attack, David's presence is not discovered until Aphek is reached (xxix.). The reason of the opportunity for an Amalekite raid (xxv. 8 seq.) in the new defeat with Judah chron. 2 Sam. xxvi. 1-12. The triumphant return of David, proves a more successful undertaking than that which led to the rejection of Saul (xxv. 20 seq. 26-28). Similarly, Saul's disaster leaves Israel again in the hands of the "Philistines" (xxvi. 7, cf. xxii. 6 seq.), and it is for David to save the people of Israel out of their hands (2 Sam. iii. 18, cf. 1 Sam. ix. 16).2 The sequel to the joint history has another version of Saul's death (2 Sam. i. 6-16, 13-16), and an Amalekite is the opponent; contrast his death in i. 15 seq. with iv. 10 seq. The chapter explains the transference of the royal insignia from Israel to Judah. Here is quoted (from the "Book of Joshua") the old poetical lament over the death of the faithful friends Saul and Jonathan, describing their successful warlike career, the wealth they brought the people, and the vivid sense of national misfortune (i. 19-27). It is utilized for the history of David, to whom its authorship is attributed. In general, it appears that those narratives wherein the histories of Saul and David are combined—very much in the favour of the latter—were originally distinct from those where (a) Saul's figure is more in accord with the old poem from the Book of Jasher, and (b) where David's victories over prehistoric giants and his warlike movements to Jerusalem pave the way for the foundation—from a particular Judaean standpoint—of his remarkably long dynasty.

The literary problems of the books of Samuel are those of the writing of the history of the monarchies from different points of view; and the intimate connexion of the books with the "golden age" that precede and follow shows that a careful consideration of the internal literary and historical features of these also is necessary. The first step is the recognition of a specific Deuteronomic framework of the history of Saul and his court in Jerusalem. For the final form of the book, the only sure basis is Samuel, the peculiar treatment of the lives of David and Solomon (Judaean kings over a united Israel) and of the division of their realms. The present form can be traced to the contents of 2 Sam. v.-vii., xxvi.-xxiv., 1 Kings ii. 10-12, ills. 2. It appears to have been consecutive (in some form) at an earlier stage, the connexion has been broken by ix.-xx., 1 Kings ii. 1-9, 13 seq., and the following authorises the view that the final form (1 Kings ii. 1-11) has been based on a collection of materials not dependent on one Deuteronomic hand in the former group, the latter shows in 1 Kings ii. 2-4 a Deuteronomic revision, on an independent origin or in the combination of the sources in their present form. For 1 Sam. iv.-vii. 13 seq. (in iii.), belongs to the Deuteronomic and later account of Saul's rise, and closes the period of (a) the Israelite "judges" (see Judg. ii. 6-8), the period of Samuel, with one of David and Saul's rise, the Deuteronomic oppression (ib. x. 6 seq.).3 The former follows upon Joshua's two concluding speeches, one given by a Deuteronomic writer in xxxiii., and the other incorporated by another though similar author (cf. Judges xiv. 8-19). Although the prophonic age is viewed as one of kingly "judges," the chiefs are rather local heroes (so Ehud, Gideon, Jephthah), and the boisterous giant Samson (Judg. xiii., xvi.), and the religious leaders Eli and Samuel are judges from Deuteronomic sources. The consideration of Saul's rise refers to a Deuteronomic oppression which has no sequel. It may be conjectured that there was an original literary connexion between the two which has been broken by the insertion of traditions relating to 2 Sam. iv.-vii. 13 and 1 Kings i. 5-12, which records the accession of Saul's rise (1 Sam. ix.) by the sudden introduction of a Philistine oppression which cannot be connected with vii. 2-8, or even vii. 1-2 (see 1 Sam. iv.-vii. 13 seq.). This latter refers to a Philistine oppression which has no sequel. The section 1 Sam. iv.-vii. 13 forms the prelude to Samuel's great victory and belongs to the history of Shiloh and the priesthood of Eli. But the fall of this sanctuary scarcely belongs to this remote age (11th century B.C.); it is no doubt found in the history of Jerusalem in the time of Jeremiah (close of 7th century). This event of supreme importance to north Israel (cf. Judg. xviii. 30 seq.) is already connected with Samuel's prophecy in iii., but the latter is strengthened by the Deuteronomic passage, ii. 27-30, which links the disaster, not with the history of Samuel, but with the rise of the Zadokite Levites of Jerusalem, and thus presents a specifically Judaean standpoint. This is analogous to the Judaean adaptation of the prophetic tradition of Saul's life, and it also reflects certain priestly rivalries (see Levites). With the loss of Shiloh is explained the appearance of the priests at Nob outside Jerusalem (xxi. 1, xxii. 13 seq.), and the connection of the Philistines with this territory (xxii., and the transference of the sacred ephod to David (xxiii. 6).4 Here, however, the emphasis laid upon the ephod brought by Abinadab (xxv. 1 seq.) and its discovery by David (29 seq.) presents a marked difference from the use of the ark from the Philistine territory to the care of Abinadab and Eleazar at Kirjath-jearim (note the "Levitical" type of the names; Budde, Sam. p. 47). From Josh. ix. 17 (post-exilic source) it might indeed be argued that the district was not under Israelite jurisdiction (see Kennedy, 1 Sam. iii. 25 seq.), although to judge from the older

1 The late genealogy of Saul in 1 Chron. viii. 29 seq. ix. 35 seq. is evidence for a keen interest in the Saulidae in post-exilic times. The chapter with the prophecy of Abigail may be of Calebite origin.

2 So also, David's wars (2 Sam. viii. ix.) bear a certain resemblance to those of Saul (1 Sam. xiv. 47).

4 With the length of office in 1 Sam. iv. 18 (cf. vii. 15) compare the Hebrew numbers in 1 Chron. vi. 61. The account of the Michmak (Sam. iv. 1 seq.) is a redaction with the length of oppression in vii. 2, cf. Judg. iii. 8, 14, iv. 3, vi. 1, x. 8, xii. 1.

5 Nowack, p. 49; Richter, TheoL. Lit., Bibl. (1904), No. 3, col. 28.

7 Although writers sought to explain Saul's disastrous end (cf. 1 Sam. x. 13), it is only in his defeat at Jezreel that the attribution of Saul's end is to the Philistines. The significance of the tradition is unknown; some connection with Saul's religious zeal at Gibeah has been conjectured (2 Sam. xx. 2). That the actual murderer was an Edomite may perhaps be associated with other traditions of Edomite hostility.
traditions of Saul it was doubletless part of his kingdom. It may be that the narrative (which presupposes some account of the fall of Shiloh) is part of an attempt to co-ordinate different traditions of the period of David.

Consequently, the literary structure of the Book of Samuel is throughout involved with a careful criticism of the historical traditions present in the period of the Persian-Ptolemaic Empire.

The perspective of the past has often been lost, earlier views have been subordinated to later ones, conflicting standpoints have been incorporated. The intricacy of the sources and the later introduction of a subordinated literature (which have had their own vicissitudes) complicates the literary evidence. Greater care than usual was taken to weave into the continuous narrative the divergent strains of the apocryphal texts, and it is impossible here at present to do more than indicate some of the more important features in the composition of a book, one of the most important of all for the critical study of biblical history and tradition.

The Hebrew text is often corrupt but can frequently be corrected with the help of the Septuagint. The parallel portions in Chronicles also sometimes preserve better readings, but must be used with caution as they may represent other recensions or the result of rewriting and reshaping. As a whole, Chronicles presents the period from a later ecclesiastical standpoint, presupposing (in contrast to Samuel) the full development of the Israelite monarchy.

After tribal and priestly lists (1 Chron. 1-ix.), Samuel's end is suddenly introduced (x., note v. 13 seq.). David appears no less abruptly, the sequence being 2 Sam. v. 1-3, 6-10, xxii, 38-59 (with additions, 11-40), and the plan of the book is completed and Hastings's broad view of the period is articulated. 2 Sam. vi. 2-11 there is a "Levitical" prelude (xiii. 1-5), then follow vi. 11-25, and vii-12, which is embedded in novel material. Next, 2 Sam. vii. seq., x., xi. 1, xii. 30 seq., xxi. 16, and the famous inscription of the preparations for the temple and the future sovereignty of Solomon, and ends with David's army and government (Chron. xxiv-xvii.), and his conclusion in parallel sections of 2 Chron. xxvii-xxviii., and with the assumption that the Samaritans who had inherited the traditions of their land. See further Jews, §§ 6-8, 20-23, Paleslne: Old Testament, pp. 614-616.

LITERATURE.—See further the commentaries of M. Löhr (1898); W. Nowack, K. Budde (1902); H. P. Smith in the International Critical Commentary (1899), with his Old Testament History, pp. 107-155, and the small but well-annotated edition of A. R. S. Kennedy in the Century Bible (1895). All these give fuller bibliographies, for which see also S. R. Driver, Introduction to Literature of Old Testament, and the articles by J. Stenning in Hastings's Dictionary and B. Stade in Encyc. Brit. v. 1.1015. J. W. Müller, Ägyptische Bücher Sam. (1871); S. R. Driver, Text of Samuel (1890); K. Budde's edition in Haupt's Sacred Books of the Old Testament (1894); P. Duchrow, Livres de Samuel (1910). Of the critical work, the most valuable is that of H. Gressmann in his Schriften d. A.T. in Auswalt, i-iii. (Göttingen, 1909-1910). In so far as the present article takes other views of the results of literary analysis in the light of historical criticism, see A. Cook, American Journ. of Semitic Language, (1900), pp. 145 sqq. and Critical Notes on Old Testament History (1907) (passim). (S. A. C.)

SANA
(Sendā'), a town in S. Arabia, the capital of the Turkish vilayet of Yemen. It is situated in 15° 22' N. and 44° 10' E. in a broad valley running nearly N. and S., 7250 ft. above sea-level, on the W. slope of the great meridional range, over which the road runs to Hodeida, on the Red Sea coast 130 m. distant, crossing the Karn al-Wal pass, over 9000 ft., about 25 m. W. of the city. The mean temperature of the year is 68° F., with a summer maximum of 77°, and a regular rainfall which falls chiefly during the S.W. monsoon from June to September. The usual cereals, fruits and vegetables of the temperate zone, wheat, barley, apples, apricots, vines, potatoes, cabbages, beans, &c., are abundant and excellent.

The town consists of three parts—(1) the Medina, the old city, now the Arab quarter, on the E. slope of the great meridional range, over which the road runs to Hodeida, on the Red Sea coast 130 m. distant, crossing the Karn al-Wal pass, over 9000 ft., about 25 m. W. of the city. The mean temperature of the year is 68° F., with a summer maximum of 77°, and a regular rainfall which falls chiefly during the S.W. monsoon from June to September. The usual cereals, fruits and vegetables of the temperate zone, wheat, barley, apples, apricots, vines, potatoes, cabbages, beans, &c., are abundant and excellent.

(2) The Bahr, a large marsh, with its entrance on the E. at the town Kasr, at its S.E. corner at the foot of Jebel Nukum on the crest of which 2000 ft. above the valley are the ruins of the old fort of el Birash, traditionally attributed to Shem the son of Noah, and the Mutawakkil, hitherto containing the palace and gardens of the imams, covering its W. face; (3) the Bir Azab W. of the city, consisting of detached houses and gardens, chiefly occupied by the higher Turkish officials, and on the extreme W. the Ka'el Yahud or Jewish quarter. The city with the Kasr and Mutawakkil is surrounded by ramparts built of clay and sun-dried brick, 25-30 ft. high and of great thickness, of the Bir Azab and Ka'el Yahud are enclosed in a similar enceinte but of more recent construction, connected with that of the city by the Mutawakkil; the whole forms a rough figure of eight, some 2-3 m. long from E. to W., and 3 m. in breadth. The walls are pierced by several gates; the principal are the Bab es Shu'b and the Bab el Yemen in the N. and S. faces of the city respectively, and the Bab es Sahab in its W. face leading into the Mutawakkil, and thence by a broad street through the Bir Azab and Ka'el Yahud to the Bab el Ka', the main entrance to the town from the Mokalla road. The layout of the streets, with massive, flat-roofed houses of several storeys, and many extensive groups of buildings, mosques, serais and baths. The Jami 'Masjid, or principal mosque, stands on the site of the Christian church built by Abraha ruler of Yemen during the period of Ethiopian domination, about A.D. 530. It consists of a great rectangular courtyard paved with granite, surrounded by a triple arcade, the domed roofs of which are supported by numerous columns of stone or brick; in the centre there is a model of the Ka'ba at Mecca covered with stone flags of various colours arranged chequer-wise. Among the other mosques of note are the three which are subordinated to the great vizier ed din with its beautiful minaret is one of the finest. Of the Kasr Ghumdan and other ancient buildings, the splendours of which were sung by the poets of the early days of Islam, nothing but mutilated remains remain; the old palace of the imams, the Mutawakkil, was destroyed during the years of anarchy preceding the Turkish occupation, and the site is now occupied by a military hospital standing in well-kept gardens. The houses consist generally of a ground floor built of dressed stone, surmounted by two or three storeys of burnt brick; a rule the lower storey has 40 openings hewn into doorways; the façade of the upper storeys is pierced by long narrow window recesses, divided into three parts, the lowest of which forms a square window closed by carved wooden shutters, while the upper ones contain round or pointed windows fitted with coloured glass, or thin slabs of alabaster which admit a subdued light.

The valley in which Sana lies is generally sterile, but in places where water is brought from the hill streams on the W. fields of barley, lucerne and market gardens are to be seen, particularly at Randa, the garden suburb, 6 m. S. of the town, and the Judd, which is the source of the Wadi Dir.; and W. Hadda, the terraced orchards of which are celebrated for their fine fruit-trees. The water supply of the town is derived from numerous wells, and from the Ghall Aswad, a small canal which supplies the military cantonment outside and S. of the walls, and runs through the gardens in the Mutawakkil.

The population was estimated by R. Manzoni in 1887 at 20,000 Arabs, 3000 Turks and 1700 Jews, or less than 25,000 altogether; H. Burchardt in 1893 put it at 30,000; the city has, however, suffered severely from the state of unrest which has been characteristic of Yemen since 1883, and particularly in 1913, when it was taken by the insurgents, and held by them for three months, and the actual numbers at present do not probably exceed Manzoni's estimate.

Arabic writers give many discordant and fabulous traditions about the oldest history of Sana and its connexion with the ancient kingdom of Hīmyar. But most agree that its oldest name was Amol, mentioned to be the same word with Azilā in Gen. x. 27. A Himyīrate nation of Aza'ilater occurs in a Syriac writer of the 6th century. The better-informed Arab writers knew also that the later name is due to the Abyssinian conquerors of Yemen, and that it meant in their language "fortified" (Bakfr, p. 606; Nödelke, Gesch. d. Pers. u. Arab., p. 187). Sana was the capital of the Abyssinian Abraha (c. 330 A.D.) who built here the famous church (Kalas), which was restored in the 12th century by order of the caliph Mansur (Azzari, p. 91).
SANÁ'I, the common name of ABDULMAJID MAJEED B. ADAM, one of the earliest great Sufic poets of Persia, was a native of Ghazni (in Afghanistan). He flourished in the reigns of the Ghaznavid sultans Ibrãhim (1059–1099, 431–492 A.H.), his son Mas'ûd (1099–1114), and his grandson Bahram (1115–1132). Persian authorities are greatly at variance as to the dates of the poet's birth and death. At any rate, he must have been born in the beginning of the second half of the 11th century and have died between 1131 and 1150 (529 and 545 A.H.). He composed chiefly ghâzâs in honour of his sovereign Ibrâhim and the great men of the realm, but the ridicule of a half-mad jester is said to have caused him to abandon the career of a court panegyrist and to devote his poetical abilities to higher subjects. For forty years he led a life of retirement and poverty, and, although Bahram offered him a high position at court and his own sister in marriage, he remained faithful to his austere and solitary life. But, partly to show his gratitude to the king, partly to leave a lasting monument of his genius behind him, he began to write his great double-thymbed poems. These contain his whole life, which served as model to the masterpieces of Farid-uddin 'Attar and Jâlîl ud-din Rûmî, the Ḥadîqât ul-ḥaqiqat, or “Garden of Truth” (also called Alikhâbâl al-fâharî) in ten canôts. This poem deals with such topics as: the unity of the Godhead, the divine word, the excellence of the prophet, reason, knowledge and faith, love, the soul, worldly occupation and inattention to higher duties, stars and spheres and their symbolic lore, friends and foes, separation from the world. One of Sanâ'î's earliest disciples, Mohammed b. Ali Raqâm, generally known as 'Ali al-Raffâ, who wrote a preface to this work, assigns to its composition the date 1131 (525 A.H.), and states besides that the poet died immediately after the completion of his task. Now, Sanâ'î cannot possibly have died in 1131, as another of his mathnâwîs, the Ṭarîq-i-taḥqîq, or “Path to the Verification of Truth,” was composed, according to a chronogram in its last verses, in 1134 (528 A.H.), nor even in 1140, if he really wrote, as the Atashakada says, an elegy on the death of Amîr Mu'izz; for this court-poet of Sultan Sinjar lived till 1147 or 1148 (542 A.H.). It seems, therefore, that Taqî Kašâ is right in fixing Sanâ'î's death in 1150 (545 A.H.), the more so as 'Ali al-Raffâ himself distinctly says in his preface that the poet breathed his last on the 11th of Sha'ba'n, “which was a Sunday,” and it is only in 1150 that this day happened to be the first of the week. Sanâ'î left, besides the Ḥadîqât and the Ṭarîq-i-taḥqîq, several other Sufic mathnawîs of similar purport: for instance, the Sair ul-ḥâlât tâ'dîma'âd, or “Man's Journey towards the Other World” (also called Kanîsā-urrahmîn, “The Treasures of Mysteries”); the Ishqânâmât, or “Book of Love”; the Aqshânâmât or “Book of Intellect”; the Kârânâmât, or “Record of Stirring Deeds,” &c.; and an extensive dîwân or collection of lyrical poetry. His tomb, called the “Mecca” of Ghazni, is still visited by numerous pilgrims.

See Abdullatif al-'Abbâsi's commentary (completed 1632 and preserved in a somewhat abridged form in several copies of the India Office Library) on the poet's life and works, Ouseley, Biogr. Notices, 53, 189; Skârâb and Fuglîd's Câdît, &c.; E. Browne, Literary History of Persia (1906), ii. 517-522; H. Ethê in W. Geiger's Grundriss der iranischen Philologie, i. 282-284.

SANÂ'Î, SAN ANTONIO

Long considered the center of the city according to the charter, which describes the city as including “six miles square, of which the sides shall be equidistant from what is known as the capela of the cathedral of San Fernando and three miles therewith.”
SAN ANTONIO DE LOS BAÑOS—SANCERRE

Roman Catholic bishops. Among the charitable institutions are the City Hospital (1886), the Santa Rosa Infirmary (1863), maintained by the Sisters of Charity, a House of Refuge (1897), a House of Industrial Training (1895), a home for destitute children and aged persons (1897), the St Francis Home for the Aged (1893), St. John's Orphan Asylum (1878), St Joseph's Orphan Asylum (1871) and the Protestant Home for Destitute Children (1887).

The principal manufactures are malt liquors, flour and grist-mill products and steam railway cars. San Antonio is the commercial centre of a great live stock and farming region.

Under the charter of 1893, as amended in 1897, the municipal government consists of a city council, composed of the mayor, four aldermen, two city commissioners, an assessor, a collector, a treasurer, an auditor and judge of the Corporation Court. Any elective officer may be removed by the vote of eight members of the council. Other officers are appointed by the mayor with the confirmation of the council. The city water supply, owned by a private corporation, is obtained from artesian wells with a capacity of 40,000,000 gallons a day. The city has a sewer-farm of 530 acres which the charter forbids it to sell.

San Antonio was the capital of Texas during the periods of Spanish and Mexican rule. The presidio of San Antonio de Bezar and the mission of San Antonio de Valero were founded in 1718 under the direction of Martin de Alarcón, governor of Coahuila. San Antonio was accordingly from the beginning a combination of two of the three types of Spanish settlement, the military and the ecclesiastical (see Texas: History). To these was added the third, the civil type, in 1731, when the villa of San Fernando was established. Several missions were established in the neighbourhood, including those already mentioned and San Xavier de Náxera (1722), a new foundation. All of these missions decreased in importance with the disappearance of the Indians and by the close of the period of Spanish rule (1821) had been abandoned. San Antonio was captured by the Magee-Gutierrez party in 1813, but was recovered by the Mexican royalists (see Texas: History). It was besieged by the Texan army under General Stephen F. Austin and Edward Burleson in 1835 and was finally taken early in December as the result of an attack led by Colonel Benjamin R. Milam. Its recapture by Santa Anna, February–March 1836, was distinguished by the heroic defence of the mission (particularly the chapel and the convent) by the children of the place, James Bowy and Davy Crockett, and 178 others against the attack of about 4000 Mexicans. After a bombardment lasting from the 23rd of February to the 6th of March, the Mexicans assaulted on the 6th, were twice beaten back, and then overpowered and slaughtered the garrison, the five survivors being subsequently bayoneted in cold blood. Three women, one a Mexican, two children and a negro servant were spared. "Remember the Alamo" became a war-cry of the Texans. The Mexicans again invaded Texas in 1842, and San Antonio was twice captured and held for short periods, first by General Vasquez and later by General Wool. After 1836 there was a large influx of Anglo-Americans and Germans, and the Mexican element long ago ceased to predominate. Charters of incorporation were granted in 1837, 1842, 1852, 1856, 1870 and 1903. At San Antonio in February 1861 General David E. Twiggs (1790–1862), a veteran of the Mexican War, surrendered the Department of Texas, without resistance, to the Confederate general, Ben McCulloch; for this General Twiggs was dismissed from the United States army, and in May he became a major-general in the Confederate service. The rapid growth of San Antonio dates from 1878, when the first railway entered the city.

See William Corner, San Antonio de Bezar (San Antonio, 1890); The Quarterly of the Texas State Historical Association, II, 217–226, VIII, 277–352; and George P. Garrison, Texas (Boston and New York, 1903), in the "American Commonwealths Series.

SAN ANTONIO DE LOS BAÑOS, a small town in Havana Province, Cuba, about 23 m. (by rail) S.W. of Havana. Pop. (1907) 9125. San Antonio de los Baños is served by the W. branch of the United Railways of Havana. It is on the banks of the Ariguanabo river, which drains a lake of the same name, and is itself one of the many "disappearing rivers" of the island; it disappears in a cave near San Antonio. The town has mineral springs and baths, and is a summer resort of the people of Havana. Though spreading over hills, the plan of the town is regular. The tobacco of the Vueltas Abajo lands immediately around the city is famous. The pueblo arose in the middle of the 18th century as a camp for convicts from Mexico. It became a villa in 1794. Early in the 19th century refugees from Santo Domingo settled here and founded coffee estates that gave the place great prosperity until the expulsion of the French in 1809; subsequently the production of tobacco removed its prosperity.

SANATORIUM (a modern Latinism, from Latin sanare, to cure, restore to health, sanos, whole, healthy, well; often wrongly spelled sanatorium or sanitarium), an establishment where persons suffering from disease, or convalescents, may be received for medical treatment, rest cures and the like; in recent modern usage particularly used for establishments where patients suffering from phthisis may undergo the open-air treatment (see Therapeutics). The mis-spellings of the word, sanatorium and sanitarium, are due to a confusion of "sanatory," i.e. giving health, from sanare, and "sanitary," pertaining to health, from sanata, health.

SANATRUCES (Sanatruces, Pers. Sanatruks), Parthian king. In the troublous times after the death of Mithradates II. (c. 88 B.C.) he was made king by the Sacaraucæ, a Mongolian tribe who had invaded Iran in 76 B.C. He was eighty years old and reigned seven years; his successor was his son Phrautes III. (Lucian, Macrob. 15; Phlegon, fr. 12 ap. Phot. cod. 97; Appian, Milhr. 104; Dio Cass. xxxvi. 45). Another Sanatruces (Sanatruclus) is mentioned as an ephemeral Parthian king in A.D. 115 (Malalas, Chron. p. 170, 273).

SAN BERNARDINO, a city and the county-seat of San Bernardino county, California, U.S.A., about 60 m. E. of Los Angeles. Pop. (1900) 6150 (873 foreign-born; 1910) 12,779. It is served by the Atchison, Topeka & Santa Fé, the Southern Pacific and the San Pedro, Los Angeles & Salt Lake railways, and by an interurban electric line. The city is situated in a valley at an altitude of about 1000 ft., at the S. base of the San Bernardino mountain range and 20 m. W. of San Bernardino mountain (11,000 ft.). Among the public buildings are a Carnegie library (1903; the library was established in 1891), with 10,000 volumes; a county courthouse; the courthouse of the county, the home of the county's daily newspaper, the Lugo, near the centre of the city, and Meadowbrook, on the outskirts. San Bernardino is one of several places (Redlands, Highland, Rialto, Colton, Bloomington, Riverside, Pomona) that lie near together in part of the citrus fruit, alfalfa and grain region of S. California. The Santa Fé railway has extensive repair and construction shops here. San Bernardino is popularly known as the "Gate City of Southern California." Five miles N. of the city, and connected with it by electric railway, at the base of a mountain on whose side is a great blaze shaped like an arrow-head, are the Arrowhead Hot Springs (106° F.), resembling the Carlsbad waters; the hotel at the Springs is heated by their waters. Other hot springs near San Bernardino are the Urbina, 13 m. S., and the Harlem, 4 m. N.E. About 1822 Spanish missionaries settled about 5 m. from the site of the present city and called their mission San Bernardino (from St Bernardino of Siena). In 1851 the Mormons established here a colony, which was abandoned in 1857. The county was organized in 1853 with the county-seat at San Bernardino, which was incorporated as a town in 1854. It was deprived of its charter in 1861, but received a new one in 1864. The Southern Pacific in 1876 gave the city connexion with the ocean, and the Santa Fé in 1885 connected it with the East. Under a state enactment in 1905 San Bernardino adopted a new charter which provides for the "recall" by petition, the initiative and the referendum.

SANCERRE, a town of central France, capital of an arrondissement in the department of Cher, 34 m. N.E. of Bourges by rail. Pop. (1906) 2232. Sancerre, which gives its name to the small district of Sancerrois, is situated on an isolated vine-clad hill.
(1000 ft.) about 1 m. from the left bank of the Loire. It has a modern château, in the grounds of which there is a cylindrical keep of the 15th century, the only relic of an ancient stronghold. From 1037 to 1152 the title of count of Sancerre was held by the counts of Champagne; from the latter year till 1640 it had its own counts, who were descended from Theobald IV. of Champagne, but in 1226 came under the suzerainty of the crown. In 1640 it became the property of Henri de Conde, whose descendants possessed it till the Revolution. During the religious wars it was a stronghold of Protestantism, and 1400 was besieged by the Catholics, who did not succeed in capturing it till August. August 1684, after eight months of siege. The town has a suburbure, a tribunal of first instance and a communal college. Good wine is grown in the vicinity.

SANCHEZ. Three persons of this name enjoyed considerable literary celebrity: (1) Francisco Sanchez (Sanctius) (1523-1601), successively professor of Greek and of rhetoric at Salamanca, whose Minera, first printed at that town in 1557, was long the standard work on Latin grammar. (2) Francisco Sanchez, a Portuguese physiognomist, born at Tuy (in the diocese of Braga) in 1550, took a degree in medicine at Montpellier in 1574, became professor of philosophy and physic at Toulouse, where he died in 1623; his ingenious treatise (Quod nihil scitur, 1581) marks the high-water of reaction against the dogmatism of his time; he is said to have been distantly related to Montaigne. (3) Tomás Sanchez of Cordova (1551-1610), Jesuit and casuist, whose treatise De matrimonio (Genoa, 1592) is more notorious than celebrated.

SANCHI, a small village in India, at which there is now a railway station, in the vicinity of the ancient Sanchi-Buddha line. It is famous as the site of what are almost certainly the oldest buildings in India now standing. They are Buddhist topes (Pali: thæpe; Sanskrit: stāpa), that is, memorial mounds, standing on the level top of a small sandstone hill about 300 ft. high on the left bank of the river Betwa. The number of topes on this and the adjoining hills is considerable. On the Sanchi hill itself are only ten, but one of these is by far the most important and imposing of all. All these topes were opened and examined by General Alexander Cunningham and Lieut.-Colonel Maisey in 1851; and the great tope has been described and illustrated by them and by James Fergusson. This is a solid dome of stone, about 103 ft. in diameter, and now about 42 ft. high. It must formerly have been much higher, the top of the tope having originally formed a terrace, 34 ft. in diameter, on which stood lofty columns. Cunningham estimates the original height of the building as about 100 ft. Round the base is a flagged pathway surrounded by a stone railing and entered at the four points of the compass by gateways some 18 ft. high. Both gateways and railing are elaborately covered with bas-reliefs and inscriptions. The latter are the names of the donors of particular portions of the architectural ornamentation, and most of them are written in the characters used before and after the time of Asoka, in the middle of the 3rd century B.C. The monuments are Buddhist, the bas-reliefs illustrate passages in the Buddhist writings, and the inscriptions make use of Buddhist technical terms. Some of the smaller topes give us names of men who lived in the Buddha's time, and others give names mentioned among the missionaries sent out in the time of Asoka. It is not possible from the available data to fix the exact date of any of these topes, but it may be stated that the smaller topes are probably of different dates both before and after Asoka, and that it is very possible that the largest was one of those which were not told was erected by Asoka himself. The monuments at Sanchi are now under the charge of the archaeological department; they are being well cared for, and valuable photographs have been taken of the bas-reliefs and inscriptions. The drawings in Fergusson's work entitled Tree and Serpent Worship are very unsatisfactory, and his suggestion that the carvings illustrate tree and serpent worship is quite erroneous.

(T. W. R. D.)

SANCHUNIATHON (Gr. form of Phoenician Sakkùn-yatôn, "the god Sakkùn has given"), an ancient Phoenician sage, who belongs more to legend than to history. He is said to have flourished "even before the Trojan times," "even before Semiramis was queen of the Assyrians." Philo Herennius of Byblus claimed to have translated his mythological writings from the Phoenician originals. According to Philo, Sanchuniathon derived the sacred lore from the mystic inscriptions on the 'Ammôvîès (probably hammanûm, "sun pillars," cf. Is. xxvii. 9, &c.) which stood in the Phoenician temples. That any writings of Sanchuniathon ever existed it is impossible to say. Philo states that his teachings were transmitted from various sources, adapted them to suit his purpose, and conjured with a venerable name to gain credit for his narrative. Porphyry, says that Sanchuniathon (here called a native of Byblus) wrote a history of the Jews, based on information derived from Hieromâal (i.e. Jeruabal), a priest of the god Jevo (i.e. Yahveh, Jehovah), and dedicated it to Abibal or Abibal, king of Byrtys. The story is probably a pure invention; the reference to Byrtys shows that it is late. See Eusebius, Praëm. Ec. i. 9 (Müller, Fragment. hist. Graec. iii. pp. 563 foll.).

SAN CRISTÔBAL (formerly called San Cristôbal de los Llanos, Ciudad de las Casas, and Ciudad Real), a town of Mexico, in the state of Chiapas, on a level tableland about 6700 ft. above sea-level and 48 m. E.N.E. of Tuxtla Gutierrez. Pop. (1892 estimate) 16,000. The surrounding country is fertile and healthful and is populated chiefly with Indians. The town possesses a cathedral, hospital and other public institutions. San Cristôbal was founded in 1588 on the site of an Indian village, and afterwards was famous as the residence of M. de las Casas, Bishop of Chiapas. It was the capital of Chiapas until near the end of the 19th century. There are traces of an early Indian civilization in the vicinity.

SANCRÖFT, WILLIAM (1616-1693), archbishop of Canterbury, was born at Fressingfield in Suffolk, 30th January 1616, and entered Emmanuel College, Cambridge, in July 1634. He became M.A. in 1641 and fellow in 1642, but was ejected in 1649 for refusing to accept the "Engagement." He then remained abroad till the Restoration, after which he was chosen one of the university preachers, and in 1663 was nominated to the deaneary of York. In 1664 he was installed dean of St. Paul's. In this situation he set himself to repair the cathedral, till the fire of London in 1666 necessitated the rebuilding of it, towards which he gave £1400. He also rebuilt the deanery, and improved its revenue. In 1668 he was admitted archdeacon of Canterbury upon the king's presentation, but he resigned the post in 1670. In 1677, being now proctor of the Convocation, he was unexpectedly advanced to the archbishopric of Canterbury. He attended Charles II. upon his deathbed, and "made him a very weighty exhortation, in which he wished him a good degree of freedom." He wrote with his own hand the petition presented in 1687 against the reading of the Declaration of Indulgence, which was signed by himself and six of his suffragans. For this they were all committed to the Tower, but were acquitted. Upon the withdrawal of James II. he concurred with the Lords in a declaration to the prince of Orange for a free parliament, and due indulgence to the Protestant dissenters. But, when that prince and his consort were declared king and queen, he refused to take the oath to them, and was accordingly suspended and deprived. From 5th August 1661 till his death on the 24th of November 1693, he lived a very retired life in his native place. He was buried in the churchyard of Fressingfield, where there is a Latin epitaph to his memory. Sanctofo was a patron of Henry Wharton (1664-1693), the divine and church historian, to whom on his death he entrusted his manuscripts and the remains of Archbishop Laud (published in 1695).

He published Fur praedestinius (1651), Modern Politics (1652), and Three Sermons (1694). Nineteen Familiar Letters to Mr North (afterwards Sir Henry North) appeared in 1757.

SANCTION (Lat. sanctio, from sanctare, to decree or ordain), in jurisprudence, the means provided for the enforcement of a law. According to J. T. Holland (Elements of Jurisprudence,
96, p. 85), "the real meaning of all law is that, unless acts conform to the course prescribed by it, the state will not only ignore and render no aid to them, but will also, either of its own accord or if called upon, intervene to cancel their effects. This intervention of the state is what is called the 'sanction' of law," So Justinian (Inst. ii. 1, 10), "Legum eas partes quibus poenae constituimus adversus eos qui contra leges feecerint, sanctones vocamus." In general use, the word signifies approval or confirmation.

Sanctus, Francesco de (1817–1883), Italian publicist, was born at Morra Iprivino, and educated at the institute of the Marchese Basilio Puoti. Becoming a teacher in a private school of his own, he made a name as a profound student of literature; and after the troubles of the 46, when he held office under the revolutionary government and was imprisoned for three years at Naples, his reputation as a lecturer on Dogues at Turin brought him the appointment of professor at Zurich in 1856. He returned to Naples as minister of public instruction in 1860, and filled the same post under the Italian monarchy in 1861, 1878 and 1879, having in 1860 become a deputy in the Italian chamber. In 1871 he became professor at Naples University. As a literary critic, De Sanctis took a very high place, notably with his Storia della letteratura italiana (2nd ed., 1873) and with his critical studies, published in several volumes, some of them since his death at Naples in 1883.

Sanctus spiritus, an old Cubana, was called Clara province, situated on a sandy plain in an angle of the Yaya river, which winds through the city. Pop. (1907) 17,440. It is connected by railway with Zaza del Medio, on the main railway line of the island, and with its port, Tunas de Zaza, 30 m. (by rail) to the S. The hill called Pan de Aucará (Sugar-loaf) is S.W. of the city. One church is said to be as old as the city, and others date from 1699, 1716, 1717, &c. The surrounding country is devoted principally to grazing. Sancti Spiritus was one of the seven cities founded by Diego Valasquez. Its settlement was ordered in 1514 and accomplished in 1516, and it is the fifth town of the island in age. The present city is a port between two lines of the original site (Pueblo Viejo). In 1518, as a result of the war of the Comunidades of Castille, a mimic war broke out in Sancti Spiritus among its two score villagers. The place was sacked by French and English corsairs in 1719. Illicit trade with Jamaica was the basis of local prosperity in the 18th century.

Sanctuary (from the late Lat. sanctuarium, a sacred place), a sacred or consecrated place, particularly one affording refuge, protection or right of asylum; also applied to the privilege itself. The right of asylum in Greek or Roman temples it was applied to the cella in which stood the statue of the god, and the Latin word for altar, ara, was used for protection as well. In Roman Catholic usage sanctuary is sometimes applied to the whole church, as a consecrated building, but is generally limited to the choir. The idea that such places afforded refuge to criminals or refugees is founded upon the primitive and universal belief in the contagion of holiness. Hence it was sacriilege to remove the man who had gained the holy precincts; he was henceforth invested with a part of the sacredness of the place, and was inviolable so long as he remained there. Some temporal privileges were granted. Clausner and Matthew of Canterbury extended its inviolability for a perimeter of two stadia, until its right of sanctuary was refused by the Romans. Not all Greek and Roman temples, however, had the right in an equal degree. But where it existed, the action of the Roman civil law was suspended, and in imperial times the statues and pictures of the emperors were a protection against pursuit. Tacitus says that the ancient Germans held woods, even lakes and fountains, sacred; and the Anglo-Saxons seem to have regarded several woods as holy and to have made sanctuaries of them, one of these being at Leek in Staffordshire.

The use of Christian churches as sanctuaries was not based upon the Hebrew cities of refuge, as is sometimes stated. It is part of the general religious fact of the inviolability attaching to things sacred. The Roman law did not recognize the use of Christian sanctuaries until toward the end of the 4th century, but the growing recognition of the office of bishop as intercessor helped much to develop it. By 592 it had been abused to such an extent that Theodosius the Great was obliged to limit its application, refusing it to the public debtors. Further evidence of its progress is given by the provision in 397 forbidding the reception of refugee Jews pretending conversion in order to escape the payment of debts or just punishment. In 398, according to contemporary historians, the right of sanctuary was completely abolished, though the law as we have it is not so sweeping. But next year the right was finally and definitely recognized, and in 419 the privilege was extended in the western empire to fifty paces from the church door. In 431, by an edict of Theodosius and Valentinian it was extended to include the church court-yard and whatever stood therein, in order to provide some other place than the church for the fugitive to eat and sleep. They were to leave all arms outside, and if they refused to give them up they could be seized in the church. Capital punishment was to be meted out to all who violated the right of sanctuary. Justinian's code repeats the regulation of sanctuary by Leo I. in 466, but Justinian himself in a Novel of the year 535 limited the privilege to those not guilty of the grosser crimes. In the new Germanic kingdoms, while violent molestation of the right of sanctuary was forbidden, the fugitive was given up after an oath had been taken not to put him to death (Lex Rom. Burgund. tit. 2, § 5 Lex. Visigoth. tit. 5, c. 16). This legislation was copied by the church at the council of Orleans in 511; the penalty of pence was added, and the whole decree backed by the threat of excommunication. Thus it passed into Gratian's Decretum. It also formed the basis of legislation by the Frankish king Clotaire (511-538), who, however, assigned no penalty for its violation. Historians like Gregory of Tours have many tales to tell showing how frequently it was violated. The Carolingians denied the right of sanctuary to criminals already condemned to death.

The earliest extant mention of the right of sanctuary in England is contained in the minor laws issued by the Anglo-Saxon king Ethelbert in A.D. 600. By these he who infringed the church's privilege was to pay twice the fine attaching to an ordinary breach of the peace. At Beverley and Hexham in 1 m. in every direction was sacred territory. The boundaries of the church frith were marked in most cases by stone crosses erected on the highroads leading into the town. Four crosses, each 1 m. from the church, marked the mile limits in every direction of Hexham Sanctuary. Crosses, too, inscribed with the word sanctuarium, were common on the highways, serving probably as guides to the various parishes. One still is to be seen at Armthwaite, Cumberland; and another at St Buryan's, Cornwall, at the corner of a road leading down to some ruins known locally as "the Sanctuary." That such wayside crosses were themselves sanctuaries is in most cases improbable, but there still exist in Scotland the remains of a true sanctuary cross. This is known as MacDuí's Cross, near Lindores, Fife-shire. The legend is that, after the defeat of the usurper, Macbeth, in 1057, and the succession of Malcolm Canmore as Malcolm III. to the Scottish throne, MacDuí, as a reward for his assistance, was granted special sanctuary privileges for his kinman. Contained in the minor laws is a ninth-degree of relationship of the chief of the clan, guilt of unpunished homicide, could, on reaching the cross, claim remission of the capital sentence. Probably the privilege has been exaggerated, the fugitive kinsmen were exempt from outside jurisdiction and liable only to the court of the earl of Fife.

The canon law allowed the protection of sanctuary to those guilty of crimes of violence for a limited time only, in order that some compensation (werpild) should be made, or to check blood-vengeance. In several English churches there was a stone seat beside the altar which was known as the frith-stool (peace-stool), upon which the seeker of sanctuary sat. Examples of such sanctuary-seats still exist at Hexham and Beverley, and of the sanctuary knockers which hung on the church-doors one is still in position at Durham Cathedral. The procedure, upon seeking
sanctuary, was regulated in the minutest detail. The fugitive had to make confession of his crime to one of the clergy, to surrender his arms, swear to observe the rules and regulations of the religious houses, pay an admission fee, give, under oath, fullest details of his crime (the instrument used, the name of the victim, &c.), and at Durham he had to tell a special bell as a formal signal that he prayed sanctuary, and put on a gown of black cloth on the left shoulder of which was embroidered a St Cuthbert's cross.

The protection afforded by a sanctuary at common law was this: a person accused of felony might fly for safeguard of his life to sanctuary, and there, within 40 days, go, clothe himself in black cloth, burn on his breast the confession of the felony, and take an oath of abjuration of the realm, whereby he undertook to quit the kingdom, and not return without the king's leave. Upon confession he was, ipso facto, convict of the felony, suffered attendant of blood and forfeiture all his goods, but had time allowed him to fulfil his oath. The abjuror started forth on his journey, armed only with a wooden cross, bareheaded and clothed in a long white robe, which made him conspicuous among medieval wayfarers. He had to keep to the king's highway, was not allowed to remain more than two nights in any one place, and must make his way to the coast quickly. The time allowed for his journey was not long. In Edward III.'s reign only nine days were given an abjuror to travel on foot from Yorkshire to Dover.

Under the Norman kings there appear to have been two kinds of sanctuary; one general, which belonged to every church, and another peculiar, which had its force in a grant by charter from the king. This latter type could not be claimed by prescription, and had to be supported by usage within legal memory. General sanctuaries protected only those guilty of felonies, while those by special grant gave immunity even to those accused of high or petty treason, not for a time only but apparently for life. Of chartered sanctuaries there were at least 22: Abingdon, Armathwaite, Beaulieu, Battle Abbey, Beverley, Colchester, Derby, Durham, Dover, Haxton Lancaster, St Mary le Bow (London), St Martin's le Grand (London), Merton Priory, Northampton, Norwich, Ripon, Ramsey, Wells, Westminster, Winchester, York (Soc. of Antiq. of London, Archaeologia, vol. 1-44, London, 1797). Sketch of the History of the Asylum or Sanctuary, by Samuel Pegge). Sanctuary being the privilege of the church, it is not surprising to find that it did not extend to the crime of sacrilege; nor does it appear that it was allowed to those who had escaped from the sheriff after they had been delivered to him for execution.

Chartered sanctuaries had existed before the Norman invasion. About thirty churches, from a real or pretended antiquity of the privilege, acquired special reputation as sanctuaries, e.g. Westminster Abbey (by grant of Edward the Confessor); Ripon (by grant of Whithale, king of the Mercians); Stburyans, Cornwall (by grant of Ethelstan); St Martin's le Grand, London, and Beverley Minster. "The precincts of the Abbey," says Dean Stanley, "were a vast cave of Adullam for all the distressed and discontented in the metropolis, who desired, according to the phrase of the time, to 'take Westminster.'" Elizabeth Woodville, queen of Edward IV., took refuge in the Abbey with her younger children from the hostility of Richard III. In the next reign the most celebrated sanctuary-seeker was Perkin Warbeck, who thus twice saved his neck, at Beaulieu and Sheen. John Skelton, tutor and afterwards court poet to Henry VIII., fearing the consequences of his caustic wit as displayed in an attack on Wolsey, took sanctuary at Westminster and died there in 1529.

The law of abjuration and sanctuary was regulated by numerous and intricate statutes (see Coke, Institutes, iii. 113); but grave abuses arose, especially in the peculiar sanctuaries. The attack on these seems to have begun towards the close of the 14th century, in the reign of Richard II. During the 15th century violations of sanctuary were not uncommon; the Lollards were forced from churches; and Edward IV. after the battle of Tewkesbury had the duke of Somerset and twenty Lancastrian leaders dragged from sanctuary and beheaded. At the Reformation general and peculiar sanctuaries both suffered drastic curtailment of their privileges, but the great chartered ones suffered most. By the reforming act of 1540 Henry VIII. established seven cities as peculiar sanctuaries. These were Wells, Westminster, Northampton, Manchester, York, Derby and Lichfield. Manchester petitioned against being made a sanctuary town, and Chester was substituted. By an act of James I. (1623), sanctuary, as far as crime was concerned, was abolished throughout the kingdom. The privilege lingered on for civil processes in certain districts which had been the site of former religious buildings and which became the hang-outs of therippen, who were resisted arrest—a notable example being that known as Whitefriars between Fleet Street and the Thames, E. of the temple. This locality was nicknamed Alastia (the name first occurs in Shadwell's plays in Charles II.'s reign), and there criminals were able to a large extent to defy the law (see Sir Walter Scott's Fortunes of Nigel and Peveril of the Peak), arrests only being possible under writs of the Lord Chief Justice. So flagrant became the abuses here and in the other quasi-sancateurs that in 1697 an act of William III., known as "The Escape from Bankruptcy" (see Bell, Commentaries, ii. 450) such alleged acts. A further enabling act of 1723 (George I.) completed the work of destruction. The privileged places named in the two acts were the Minorities, Salisbury Court, Whitefriars, Fulwood's Rests, Mhire Court, Baldwin's Gardens, The Savoy, The Clink, Deadman's Place, Montague Close, The Mint and Stepney. (See Stephen, History of Crim. Law, i. 113.)

In Scotland excommunication was incurred by any who attempted to arrest thieves within sanctuary. The most famous sanctuaries were those attaching to the Church of Wcslc, now St. Mary's, near Selkirk, and that of St. Mary's, Lanark. All religious sanctuaries were abolished in the Northern Kingdom at the Reformation. But the debtor found sanctuary from "diligence" in Holyrood House and its precincts until late in the 17th century. This sanctuary did not protect criminals, or even all debtors, e.g. not crown debtors or fraudulent bankrupts; and it was possible to execute a meditatio fugae warrant within the sanctuary. After twenty-four hours' residence the debtor had to enter his name in the record of the Abbey Court in order to entitle him to further protection. Under the Act 1666 c. 5, insolvency concurring with retreat to the sanctuary constituted fraud; and the offence of imprisonment for debt in 1881 practically abolished this privilege of sanctuary.

A presumptuous right of sanctuary attached to the royal palaces, and arrests could not be made there. In Anglo-Saxon times the king's peace extended to the palace and 3000 paces around it: it extended to the king himself beyond the precincts. At the present day Members of Parliament cannot be served with writs or arrested within the precincts of the Houses of Parliament, which extend to the railings of Palace Yard. The Irish avocation of the 'eights Parnell and others of the Irish members avoided arrest for some little while by living in the House and never passing outside the gates of the yard.

The houses of ambassadors were in the past quasi-sanctuaries. This was a natural corollary of their diplomatic immunities (see Diplomacy). The privilege was never strictly defined. At one time it was insisted that the immunity accorded an ambassador included his house and those who fled to it. At an earlier date sanctuary had actually been claimed for the quarter of the town in which the house stood. At Rome this privilege was formally so claimed by Innocent XI. (Pope 1676-1689), and in 1682 the Spanish ambassador at the Papal Court renounced all right to claim immunity even for his house. His example was followed by the British ambassador in 1686. Portugal, Sweden, Denmark and Venice abolished by express ordinance in 1748 the asylum-rights of ambassadorial residences. In 1726 the Spanish government had forcibly taken the duke of Ripperda out of the hotel of the English ambassador at Madrid, although the Court of St James had sanctioned his reception there. At Venice, too, some Venetians who had betrayed state secrets to the French ambassador and had taken
refuge at his house were dragged out by troops sent by the senator.

In Europe, generally, the right of sanctuary survived under restrictions down to the end of the 18th century. In Germany the more serious crimes of violence were always excepted. Highwaymen, robbers, traitors and habitual criminals could not claim church protection. In 1418 sanctuary was further regulated by a bull of Martin V. and in 1504 by another of Julius II. In a modified form the German Asylrecht lasted to modern times, not being finally abolished till about 1780. In France le droit d’asile existed throughout the middle ages, but was much limited by an edict of Francis I. in 1539, Ordonnance sur le fait de l’exication de la France. At the Revolution the right of sanctuary was entirely abolished.

SANCY, NICOLAS DE HARLAY, SEIGNEUR DE (1546-1629), French soldier and diplomatist, belonged to the Protestant branch of the family of Harlay but adopted the Catholic religion in 1572 during the massacres of the Huguenots. In 1589 he obtained in Geneva and Berne sums sufficient to raise an army of mercenaries for Henry III., partly by the sale of jewels, among them the “Sancy” diamond which in 1835 found its way to the Russian imperial treasure, and partly by leading the Swiss to suppose that the troops were intended for serious war against Savoy. Henry IV. made him superintendent of his finances in 1594, and when at last he was displaced by Sully. Meanwhile he had cast a second converted to Catholicism, but his influence at court waned, and he retired from public life in 1605. He survived until the 13th of October 1629, leaving a Discours sur l’occurrence des affaires.

His son, Achille Harlay de Sancy, bishop of Saint Malo (1581-1646), was educated for the church but resigned his vocation for the career of arms on the death of his elder brother in 1601. For seven years, from 1611 to 1618, he was ambassador at the Turkish court, where he amassed a fortune of some £16,000 sterling by doubtful means, and was bastinadoed by order of the sultan. He was also wounded in the following fray. Harlay de Sancy was a learned man and a good linguist, who used his opportunities to acquire a valuable collection of oriental MSS., many of which are now in the Bibliothèque Nationale in Paris. On his return to France he joined the Oratorian Fathers, and when Marshal Bassompierre was sent to England in 1627 to regulate the differences between Henrietta Maria and her husband, Harlay de Sancy was attached to the queen’s ecclesiastical household, but Charles I. secured his dismissal. He became bishop of St Malo in 1632, and died on the 20th of November 1646.

SAND, GEORGE (1804-1876), the pseudonym of Madame Amandine Lucile Aurore Dudevant, née Dupin, the most prolific authoress in the history of literature, and unapproached among the women novelists of France. Her life was as strange and adventurous as any of her novels, which are for the most part idealized versions of the multifarious incidents of her life. In her self-revelations she followed Rousseau, her first master in style, but while Rousseau in his Confessions darkened all the shadows, George Sand is the heroine of her story, often frail and faulty, but always a woman more sincerity than sinning. Thanks, however, to her voluminous correspondence that has recently been published and to family documents that her French biographers have unearthed, there are now full materials for tracing the history of her public and private career, and for forming a clear and unbiased estimate of her character and genius.

Her father was Maurice Dupin, a retired lieutenant in the army of the republic; her mother, Sophie Delaborde, the daughter of a Paris bird-fancier. Their ill-assorted marriage took place only a few weeks before the birth of the child (July 1, 1804; at Paris). Her paternal grandfather was M. Dupin de Francueil, a farmer-general of the revenue, who married the natural daughter of Rousseau Horn, a natural son of Louis XV., she in turn being the natural daughter of Maurice de Saxe, the most famous of the many illegitimate children of Augustus the Strong, by the lovely countess of Königsmark. George Sand, who was a firm believer in the doctrine of heredity, devotes a whole volume of her autobiography (Histoire de ma vie, 1857 seq.) to the elaboration of this strange pedigree. She boasts of the royal blood which ran through her veins, and disregarding the bar sinister she clasped hands with Charles X. and Louis XVII., but she is no less frank in declaring that she is a protestant of the people, who shares by birth their instincts and sympathies. Her birth itself was romantic. Her father was playing a country dance at the house of a fellow officer, the future husband of Sophie’s sister, when he was told that his wife, who had not long left the room, had borne him a daughter. “She will be fortunate,” said the aunt, “she was born among the roses to the sound of music.”

Passing by her infantile recollections, which go back further than that of Dickens, we find her at the age of three crossing the Pyrenees to join her husband, who was a postmaster of Roussillon, attending with her parents a suite of rooms in the royal palace, adopted as the child of the regiment, nursed by rough old sergeants, and dressed in a complete suit of uniform to please the general.

For the next ten years she lived at Nohant, near La Châtre in Berry, the country house of her grandmother. Here her character was shaped; here she imbied that passionate love of country scenes and country life which neither absence, politics nor dissipation could uproot; here she learnt to understand the ways and thoughts of the peasants, and laid up that rich store of scenes and characters which a marvellously retentive memory enabled her to draw upon at will. Her education during these early years well deserves to be recorded. Education, in the strict sense of the word, she had none. A few months after her return from Spain her father was killed by a fall from his horse. He was a man of remarkable literary gifts as well as a good soldier. “Character,” says George Sand, “is in a great measure hereditary: if my readers wish to know me they must know my father.” On his death the mother resigned, though not without a struggle, the care of Aurore to her grandmother, Mme. Dupin de Francueil, a good representative of the ancien régime who, though she had been a postmaster’s wife, was not a failure to be endured. She herself had narrowly escaped the guillotine, and had only half imbied the ideas of the Revolution. In her son’s lifetime she had, for his sake, condoned the mésalliance, but it was impossible for the stately châtelaine and her low-born daughter-in-law to live in peace under the same roof. She was jealous as a lover of the child’s affection, and the struggle between the mother and grandmother was one of the bitterest of Aurore’s childish troubles.

Next to the grandmother, the most important person in the household at Nohant was Dumas. He was an ex-abbé who had shown his devotion to his mistress when her life was threatened, and henceforward was installed at Nohant as factotum. He was maire of the village, tutor to Aurore’s half-brother, and, in addition to his other duties, undertook the education of the girl. The tutor was no more eager to teach than the pupil to learn. He, too, was a disciple of Rousseau, believing in the education of nature, and allowed his Sophie to wander at her own sweet will. At odd hours of lessons she picked up a smattering of Latin, music and natural science, but most days were holidays and spent in country rambles and games with village children. Her favourite books were Tasso, Ariosto and Paul et Virginie. A simple refrain of a childish song or the monotonous chant of the ploughman touched a hidden chord and thrilled her to tears. She invented a deity of her own, a mysterious Corambé, half pagan and half Christian, and like Goethe erected to him a rustic altar of the greenest grass, the softest moss and the brightest pebbles.
From the free out-door life at Nohant she passed at thirteen to the convent of the English Augustinians at Paris, where for the first two years she never went outside the walls. Nothing better shows the plasticity of her character than the ease with which she adapted herself to this sudden change. The volume which describes her conventual life is as graphic as Miss Brontë's \textit{Villette}, but we can only dwell on one passage of it. "Tired of mad pranks and affairs of horse-thickness, she found herself once everything in the convent chapel."

"I had forgotten all; I knew not what was passing in me; with my soul rather than my senses, I breathed an air of ineffable sweetness. All at once a sudden shock passed through my whole being, my eyes swam, and I seemed wrapped in a dazzling white mist. I heard a voice murmur in my ear, 'Tolle, lege.' I was thinking that it was one of the sisters talking to me—I was alone. I indulged in no vain illusions; I believed in no miracle; I was quite sensible of the sort of hallucination into which I had fallen; I neither sought nor found solace, I really did feel that faith was laying hold of me—by the heart, as I had wished it. I was so filled with gratitude and joy that the tears rolled down my cheeks. I felt that my mind entirely accepted that ideal of justice, tenderness and holiness which I had never doubted, but with which I had never held direct communion, and now at last I felt that this communion was consummated, as though my father had been broken down before the source of infinite light and the smouldering fire of my heart. An endless vista stretched before me, and I panted to start upon my way. There was no more doubt or lukewarmness. That I should repent on the morrow and rally myself on my over-wrought ecstasy never once entered my thoughts. I was like one who never casts a look behind, who hesitates before some Rubicon to be crossed, but having touched the farther bank sees no more the shore he has just left."

Such is the story of her conversion as told by herself. It reads more like a chapter from the life of Ste Thérèse or Madame Guyon than of the author of \textit{Lélia}. Yet no one can doubt the sincerity of her narrative, or even the permanence of her religious feelings under all her many phases of faith and aberrations of conduct. A recent critic has sought in religion the clue to her character and the mainspring of her genius. Only in her case religion must be taken in an even more restricted sense than Matthew Arnold's "morality touched by emotion." For her there was no categorical imperative, no moral code save to follow the imperious "tingle" of her heart. "Justice" too she had in so far as she sincerely wished that all men should share alike her happiness; but of "holiness," that sense of awe and reverence that was felt in divers kinds and degrees by Isaiah, Sophocles, Virgil and St Paul, she had not a rudimentary conception.

Again in 1820 Aurore exchanged the restraint of a convent for freedom, being recalled to Nohant by Mme de Francueil, who had no intention of letting her granddaughter grow up a dévote. She rode across country with her brother, she went out shooting with Deschates, she sat by the cottage doors on the long summer evenings and heard the flax-dressers tell their tales of witches and warlocks. She was a considerable linguist and knew English, Italian and some Latin, though she never tackled Greek. She read widely though unsystematically, studying philosophy in Aristotle, Leibnitz, Locke and Condillac, and feeding her imagination with René and Childe Harold. Her confessor lent her the \textit{Gensis of Christianity}, and to this book she ascribes the first change in her religious views. She renounced once for all the asceticism and isolation of the \textit{De limitationes} for the more genial and sympathetic Christianity of Chateaubriand. Yet she still clung to old associations, and on her grandmother's death was about to return to her convent, but was dissuaded by her friends, who found her a husband.

Casimir Dudevant, whom she married on the 11th of December 1822, was the natural son of a Baron Dudevant. He had retired at an early age from the army and was living an idle life at home as a gentleman farmer. His husband, though he afterwards deteriorated, seems at that time to have been neither better nor worse than the Berrichon squires around him, and the first years of her married life, during which her son Maurice and her daughter Solange were born, except for lovers' quarrels, were passed in peace and quietness, though signs were not wanting of the coming storm. Among these must be mentioned her friendship with Aurélien de Sèze, advocate-general at Bourde. De Sèze was a middle-aged lawyer with a philosophic turn of mind, and Madame Dudevant for two years kept up with him an intimate correspondence. The friendship was purely platonic, but the husband felt or affected jealousy, and resolved henceforth to take advantage of which he from his total lack of culture was unable to share. The breach quickly widened. He on his part was more and more repelled by a superior woman determined to live her own intellectual life, and she on hers discovered that she was mated, if not to a clown, at least to a \textit{lobereau} whose whole heart was in his cattle and his turnips. So long as the conventionalities were preserved she endured it, but when her husband took to drinking and made love to the maids under her very eyes she resolved to break a yoke that had grown intolerable. The last straw that determined action was the discovery of a paper docketed "Not and attractive young lawyer." Articles written in common soon led to a complete literary partnership, and 1831 there appeared in the \textit{Revue de Paris} a joint novel entitled \textit{Prima Donna} and signed Jules Sand. Shortly after this was published in book form with the same signature a second novel, \textit{Rose et Blanche}. The sequel to this literary alliance is best recounted in George Sand's own words: "I resisted him for three months but then yielded; I lived in my own apartment in an unconventional style." Her first independent novel, \textit{Indiana} (1832), was written at the instigation of Delatouche, and the world-famous pseudonym George (originally Georges) Sand was adopted as a compromise between herself and her partner. The "George" connoted a Berrichon as "David" does a Welshman. The one wished to throw \textit{Indiana} into the common stock, the other refused to lend his name, or even part of his name, to a work in which he had had no share. The novel was received with instant acclamation, and Sainte-Beuve only confirmed the judgment of the public when he pronounced in the \textit{Globe} that this new author (then to him unknown) had struck a new and original vein and was destined to go far. Delatouche was the first to throw himself at her feet and bid her forget all the hard things he had said of her. \textit{Indiana} is a direct transcript of the author's personal experiences (the disagreeable husband is M. Dudevant to the life), and an exposition of her theory of sexual relations which is founded thereon. To many critics it seemed that she had said her whole say and that nothing but replicas could follow. \textit{Valentine}, which was published in the same year, indicated that it was but the first chapter in a life of endless adventures, and that the imagination which turned the crude facts into poetry, and the fancy which played about them like a rainbow, were inexhaustible.

At a novel \textit{Valentine} has little to commend it; the plot is feeble and the characters shadowy. Only in the descriptions of...
scenery, which here resemble too much purple patches, does
George Sand reveal her true inspiration, the artistic qualities
by which she will live. No one was more conscious than George
Sand herself of her strength and of her weakness. In a preface
to a later edition she tells us how the novel came to be written,
and, though it anticipates events, this revelation of herself may
best be given here.

"After the unexpected literary success of Indiana I returned to
Berri in 1832 and found a pleasure in painting the scenes with which
I had been familiar from my earliest days. Even at this early
time I knew what my characters would be. In some scenes I tried
to describe them, but as is the case with all profound emotions,
whether intellectual or moral, what we most desire to
realize to ourselves are the least inclined to reveal to the world
at large. And it is always the same with the unknown Valley Noire, this
quiet and unpretentious landscape, which must be sought to find it
and loved to be admired, was the sanctuary of my first and latest
reveries. For twenty-two years I have lived amongst these polluted
trees, these rusty roads, besides these tangled thickets and streams
along whose banks only children and sheep can pass. All this had
charms for me alone and did not deserve to be revealed to idle
curiosity. It is only the incognito of this modest country-side
without historical association or picturesque sites to commend it
to the antiquary or the tourist? The Valley Noire, so it seemed to
me, was part and parcel of myself, the framework in which my life
was set. I am not referring to the valley's Elle as a person. And
in this Elle, as a person, one who is without my own, I was
away from the silks and satins that are suited for the public stage.
If I could have foreseen what a stir my writings would make, I think
I should have jealously guarded the privacy of the sanctuary
that I drew from the lesson the artist's soul fed and fed the artist's visions
and the poet's dreams. But I had no such anticipation; I never
gave it a thought. I was compelled to write and I wrote. I let
myself be carried away by the secret charm of the air I breathed; my
native air, I might almost call it. The descriptive parts of my novel
found favour. The plot provoked some lively criticism on the antima
ratrimonial doctrines that I was alleged to have broached before in
Indiana. In both novels I pointed out the dangers and pains of an
ill-assorted marriage. I thought I had simply been writing a story,
and discovered that I had unwittingly been preaching Saint-Simion
ism. I was not then at an age for reflecting on social grievances,
I was young to do more than see and note facts, and thanks to
my natural indolence and that passion for the concrete, which is at
once the joy and the weakness of artists, I should perhaps always
have remained at that stage if my somewhat pedantic critics had not
driven me to reflect and painfully search after the ultimate causes
of which till then I had only grasped the effects. But I was so
shrewdly taxed with posing as a strong-minded woman and a
philosopher that one fine day I said to myself, 'What, I wonder, &
philosophy?'

Her liaison with Jules Sandeau, which lasted more than a year,
was abruptly terminated by the discovery in their apart
ment on an unexpected return from Nohalf of une blanchisseuse
quelconque. For a short while she was broken-hearted:—'My
heart is a cemetery!' she wrote to Sainte-Beuve, 'A necro
polis,' was the comment of her discarded lover when years
later the remark was repeated to him.

Her third novel, Lélia (1831), is in the same vein, a stronger
and more outspoken diatribe against society and the marriage
law. Lélia is a female Manfred, and Dumas had some reason
to complain that George Sand was giving them 'du Lord
Byron au kilo.'

But a new chapter in her life was now to open. In her despair
she turned for comfort and counsel to Sainte-Beuve, now con
stituted her regular father confessor. This ghostly Sir Pandarus
recommended new friendships, but she was hard to please. Dumas
was 'trop commis-voyageur,' Joffroy too sincerely virtuous and Musset 'trop dandy.' Mérimée was tried for a week,
but the cool cynic and the perfervid apostle of women's
rights proved mutually repulsive. Alfred de Musset was intro
duced, and the two natures leapt together as by elective affinity.

The moral aspect has been given by Mr Swinburne in an epigram:

'Ah! veritable flirt and George did not behave as a
perfect gentleman.'

Towards the end of 1833 George Sand, after winning theeluciant consent of Musset's mother, set out in the poet's
company for Italy, and in January 1834 the pair reached Venice,
staying first at the Hôtel Danieli and then in lodgings. At
first it was a veritable honeymoon; conversation never flagged
and either found in the other his soul's complement. But there
is a limit to love-making, and George Sand, always practical,
set to work to provide the means of living. Musset, though
he depended on her exertions, was first bored and then irritated
at the sight of this terrible vache à écrire, whose pen was
going for eight hours a day, and that sought diversion in the cafés
and other less reputable resorts of pleasure. The con
sequence was a nervous illness with some of the symptoms of
delirium tremens, through which George Sand nursed him with
tenderness and care. But with a strange want of delicacy,
to use the mildest term, she made love at the same time to
a young Venetian doctor whom she had called in, by name
Torin. This, of course, was too much for the music-loving
and the person who gave me this portrait sat with me every night at
a little table and lived by the same work. At daybreak we consulted
together on our work for the day, and at night we supped at the same
table, chatting the whole time on art or literature.
The future broke faith with us. Pray for me, O Marguerite
Lecomte!'

The Everard of the Lettres introduces us to a new and for the
time a dominant influence on the life and writings. Michel
de Bourges was the counsellor whose eloquent pleadings brought
the suit for a judicial separation to a successful issue in 1836.1 Unlike her former lovers, he was a man of masterful will, a budge philosopher who carried her intellect by storm before he laid siege to her heart. He preached republicanism to her by the hour, and even locked her up in her bedroom to reflect on his sermons. She was but half converted, and fled before long from a republic which art and poetry had no place. Other celebrities who figure in the Lettres under a transparent disguise are Liszt and Mme d'Agoult (known to literature as Daniel Stern), whom she met in Switzerland and entertained for some months at Nohant. Liszt, in after years when they had drifted apart, wrote of her: "George Sand catches her butterfly and tames it in her cage by feeding it on flowers and nectar—this is the love period. Then she sticks her pin into it when it struggles—that is the congé and it always comes from her. Afterwards she vivisects it, stuffs it, and adds it to her collection of heroes for novels. 2 There is some truth in the satire, but it wholly misrepresented her rupture with Chopin.

To explain this we must open a new chapter of the life in which George Sand appears as the devoted mother. The letters to her daughter Solange, which have recently been published, irresistibly recall the letters of Mme de Sévigné to Mme de Grignan. Solange, who inherited all her mother’s wild blood with none of her genius, on the eve of a marriage that had been arranged with a Berrichon gentleman, ran away with Clésinger, a sculptor to whom she had sat for her bust. George Sand not only forgave the elopement and hushed up the scandal by a private marriage, but she settled the young couple in Paris in a furnished apartment made over to them nearly one-half of her available purse. Clésinger turned out a thankless scapegrace and George Sand was at last compelled to refuse to admit him to Nohant. In the domestic quarrel that ensued Solange, who was a very Vivien, got the ear of Chopin. He upbraided the mother with her heartlessness, and when she resented his interference he departed in a huff and they never met again.

The mention of Liszt has led us to anticipate the end of the story, and we must revert to 1836, when the acquaintance began. She was then living in Paris, a few doors from her friend Mme d’Agoult, and the two set up a common salon in the Hôtel de France. Here she met two men, one of whom indoctrinated her with religious mysticism, the other with advanced socialism, Lamennais and Pierre Leroux. In the case of Lamennais the disciple outstripped the master. She flung herself into Lamennais’s cause and wrote many unpaid articles in his organ, Le Monde, but they finally split on the questions of labour and of women’s rights, and she complained that Lamennais first dragged her forwards and then abused her for going too fast. The Lettres à Marché (1837) are a testimony to his embibing and saprophytic manner. She settled the young couple in Paris in a furnished apartment made over to them nearly one-half of her available purse. Clésinger turned out a thankless scapegrace and George Sand was at last compelled to refuse to admit him to Nohant. In the domestic quarrel that ensued Solange, who was a very Vivien, got the ear of Chopin. He upbraided the mother with her heartlessness, and when she resented his interference he departed in a huff and they never met again.

It was doubtless a revulsion of feeling against the doctrinaires and in particular against the puritanic reign of Michel that made her turn to Chopin. She found the maestro towards the end of 1837 dispirited by a temporary eclipse of popularity and in the first stage of his fatal malady, and carried him off to winter with her in the south. How she roughed it on an island unknown to tourists is told in Un hiver à Majorque (1842), a book of travel that may take rank with Heine’s Reiseführer. In nearly all George Sand’s loves there was a strong strain of motherly feeling. Chopin was first petted by her like a spoilt darling and then nursed for years like a sick child.

During this, her second period, George Sand allowed herself to be the mouthpiece of others—"un écho qui embelliessait la voix," as Dela Touche expressed it. Spiridion (1838) and Les Sept cordes de la lyre (1840) are mystic echoes of Lamennais. Le Compagnon du tour de France (1841), Les Maîtres maîtres

1 The final settlement was concluded in 1836. Mme Dudevant was granted sole legal rights over the two children and her Paris home was restored to her. In return she made over to her husband 40,000 fr. vested in the funds.

and Le Meunier d’Angibault (1845), Le Pêché de M. Antoine (1847) are all socialistic novels, though they are much more, and good in spite of the socialism. Consuelo (1847–1848) and its sequel La Comtesse de Rudolstadt (1843–1845) are fantastias à la Chopin, though the stage on which they are played is the Venice of Musset. Chopin is the Prince Karol of Lucretia Floriani (1847), a self-portraiture univalent as the Tagebuch einer Verlorenen and innocent as Paul et Virginie.

An enumeration of George Sand’s novels would constitute a Homeric catalogue, and it must suffice to note only the most typical and characteristic. She contracted with Buloz to supply him with a stated amount of copy for the modest retaining fee of £100 a year, and her editor testifies that the tale of script was furnished with the punctuality of a notary. She wrote with the rapidity of Walter Scott and the regularity of Anthony Trollope. For years her custom was to retire to her desk at 10 p.m. and not to rise from it till 5 a.m. She wrote à la diable, starting with some central thesis it set forth or some problem to investigate, but with no predetermined plot or plan of action. Round this nucleus her characters (too often mere puppets) grouped themselves, and the story gradually crystallized. This unmethiodical method produces in her longer and more ambitious novels, in Consuelo for instance and its continuation, a tangled wilderness, the clue to which is lost or forgotten; but in her novelettes, when there is no change of scenery and the characters are few and simple, it results in the perfection of artistic writing, "an art that nature makes."

From novels of revolt and tendency novels George Sand turned to simple stories of rustic life, the genuine pastoral. It is here that she shows her true originality and by these she will chiefly live. George Sand by her birth and bringing-up was half a peasant herself, in M. Faguet’s phrase, "un paysan qui savait parler." She had got to know the heart of the peasant—his superstitions, his suspiciousness and low cunning, no less than his shrewdness, his sturdy independence and his strong domestic attachments.

Jeanne (1844) begins the series which has been happily called the Bouclles of France. To paint a Joan of Arc who lives and dies incongruous is the theme she sets herself, and through most of the novel it is perfectly executed. The last chapters when Jeanne appears as the Velida of Mont Barbot and the Grande Pastoure are a falling off and a survival of the romanticism of her second manner. La Mère au diable (1846) is a cut-and-gem perfect as a work of Greek art. François le champi and La Petite Fadette are of no less exquisiteworkmanship. Les Maîtres sonneurs (1853)—the favourite novel of Sir Leslie Stephen—brings the series of village novels to a close, but as closely akin to them must be mentioned the Contes d’une grande-mère, delightful fairy tales of the Talking Oak, Wings of Courage and Queen Coax, told to her grandchildren in the last years of her life.

The revolution of 1848 arrested for a while her novelistic activities. She threw herself heart and soul into the cause of the extreme republicans, composed manifestos for her friends, addressed letters to the people, and even started a newspaper. But her political ardour was short-lived; she cared little about forms of government, and, when the days of June dashed to the ground her hopes of social regeneration, she quitted once for all the field of politics and returned to her quiet country ways and her true vocation as an interpreter of nature, a spiritualizer of the commonest sights of earth and the most household affections. In 1849 she writes from Berri to a political friend: "You thought that I was drinking blood from the skulls of aristocrats. No, I am studying Virgil and learning Latin!"

In her latest works she went back to her earlier themes of romantic and unchartered love, but the scene is shifted from Berri, which she felt she had exhausted, to other provinces of France, and instead of passionate manifestos we have a gallery of genre pictures treated in the spirit of François le champi.

"Vous faites," she said to her friend Honoré de Balzac, "la conscience humaine; et moi, c’est l’oglogue humaine que j’ai voulu faire."

A word must be said of George Sand as a playwright. She

SAND, GEORGE

...
was as fond of acting as Goethe, and like him began with a puppet stage, succeeded by amateur theatricals, the chief entertainment provided for her guests at Nohant. Undaunted by many failures, she dramatized several of her novels with moderate success—

François le champi, played at the Odéon in 1849, and Les Beaux Messieurs de Beis-Doré (1862) were the best; Claudio, produced in 1851, is a charming pastoral play, and Le Marquis de Villeneuve (1864) (in which she was helped by Dumas fils) was a genuine triumph. Her statue by Clésinger was placed in the foyer of the Théâtre Français in 1877.

Of George Sand's style a foreigner can be but an imperfect judge, but French critics, from Sainte-Beuve, Nisard and Caro down to Jules Lemaître and Faguet, have agreed to praise her spontaneity, her correctness of diction, her easy opulence—the

laeta ubera that Quintilian attributes to Livy. The language of her country novels is the genuine 

patois of middle France rendered in a literary form. Thus in La Petite Fadette, by the happy device of making the hemp dresser the narrator, she speaks (to quote Sainte-Beuve) as though she had on her right the unlettered rustic and on her left a member of the Académie, and made him sift the interpreter between the two. She hits the happy mean between the studied archaisms of Courrier's 

Daphnis et Cloé and the realistic 

patois of the later kailyard novel which for Southerners requires a glossary. Of her style generally the characteristic quality is fluidity. She has all the abandonment of an Italian improvisatore, the simplicity of a Bernardin de St Pierre without his mawkishness, the sentimentality of a Rousseau without his egotism, the rhythmic eloquence of a Chateaubriand without his grandiloquence.

As a painter of nature she has much in common with Wordsworth, who keeps her eye on the object, but adds, like Wordsworth, the visionary gleam, and receives from nature but what she herself gives. Like Wordsworth she lays us on the lap of earth and sheds the freshness of the early world. She, too, had found love in huts where poor men dwell, and her miller, her bagpipers, her workers in mosaic are as faithful renderings in prose of peasant life and sentiment as Wordsworth's fleethgatherers and wagoners and gleaners are in verse. Her psychology is not subtle or profound, but her leading characters are clearly conceived and drawn in broad, bold outlines. No one has better understood or more skillfully portrayed the artistic temperament of the musician, the actor, the poet—and no French writer before her had so divined and laid bare the heart of a girl. She works from within outwards, touches first the mainspring and then sets it to play. As Mr Henry James puts it, she interviews herself. Rarely losing touch of earth, and sometimes of the earth earthy, she is still at heart a spiritualist. Her final word on herself rings true, "Toujours tourmentée des choses divines."

Unlike Victor Hugo and Balzac, she founded no school, though Fromentin, Thuret, Cherbuliez, Fabre and Bazin might be claimed as her collateral descendants. In Russia her influence has been greater. She directly inspired Dostoievski, and Turgeniev owes much to her. In England she has found her warmest admirers. Elizabeth Barrett Browning wrote sonnets to "the large-brained woman and large-hearted man, self-named George Sand." To Thackeray her diction recalled the sound of village bells falling sweetly and softly on the ear, and it sent a shiver through John Stuart Mill, like a symphony of Haydn or Mozart. Leslie Stephen advised Thomas Hardy, then an aspiring contributor to the Cornhill, to read George Sand, whose country stories to him had "the harmony and grace, every strictly inimitable, are good to aim at." He pronounced the

Histoire de ma vie about the best biography he had ever read. F. W. H. Myers claimed her as anima naturaliter Christiana and the inspired exponent of the religion of the future.

George Eliot by her very name invites and challenges comparison with George Sand. But it was as a humble follower, not as a rival, that she took George Sand as sponsor. Both women broke with social conventions, but while George Sand (if the expression may be allowed) kicked over the traces, George Eliot was impelled all the more emphatically, because of her exceptional circumstances, to put duty before inclination and to uphold the reign of law and order. Both passed through phases of faith, but while even Positivism did not cool George Eliot's innate religious fervour, with George Sand religion was a passing experience, no deeper than her republicanism and less lasting than her socialism, and she lived and died a gentle savage. Rousseau's Confessions was the favourite book of both (as it was of Emerson), but George Eliot was never converted by the high priest of sentimentalism into a belief in human perfectibility and a return to nature. As a thinker George Eliot was austere; and the object, however, is more profound and philosophical analysis subtler and more scientific. But as an artist, in unity of design, in harmony of treatment, in purity and simplicity of language, so felicitous and yet so unstudied, in those qualities which make the best of George Sand's novels masterpieces of art, she is as much her inferior.

Mr Francis Gribble has summed up her character in a scornful, insular way" as a flight woman. A truer estimate is that of Sainte-Beuve, her intimate friend for more than thirty years, but never her lover. In the great crises of action her intellect, her heart and her temperament are at one. She is a thorough woman, but with none of the pettinesses, subterfuges, and mental reservations of her sex; she loves wide vistas and boundless horizons and instinctively seeks them out; she is concerned for universal happiness and takes thought for the improvement of mankind—the last infirmity and most innocent mania of generous souls. Her works are in very deed the echo of our times. Wherever we were wounded and stricken her heart bled in sympathy, and all our maladies and miseries evoked from her a lyric wall." George Sand died at Nohant on the 8th of June 1876.

To a youth and womanhood of storm and stress had succeeded an old age of serene activity and then of calm decay. Her hours were spent in writing, which seemed in her case a relaxation from the real business of the day, playing with her grandchildren, gardening, conversing with her visitors—it might be Balzac or Dumas, or Octave Feuillet or Matthew Arnold—or writing long letters to Sainte-Beuve and Flaubert. "Calme, toujours plus de calme," was her last prayer, and her dying words, "Ne détruisez pas la verdure." 

BIBLIOGRAPHY. The collected edition of George Sand's works was published in Paris (1862-1883) in 66 volumes, with supplement 199 volumes; the Histoire de ma vie appeared in 20 volumes in 1854-1855. The Etude bibliographique sur les œuvres de George Sand (in the Bibliographie des livres de l'encyclopédie) and L'œuvre complète de George Sand (1868) gives the complete bibliography. Of Vladimir Karenin's (pseudonym of Mme Komarova) George Sand, the most complete life, the first two volumes (1899-1901) carry the life down to 1839. Her own new matter is contained in Correspondance de G. Sand et d'Alfred de Musset (Brussels, 1904), Correspondance entre George Sand et Gustave Flaubert (1904), and Lettres d'Alfred de Musset et d'Isaak Sarah (1907). George Sand (1887) is rather a critique than a life. Lives by Mirecourt (1855) and by Haussonville (1878) may also be consulted. Of the numerous shorter studies may be mentioned those of Sainte-Beuve in the Gastrures du lundi and in Portraits contemporains; Jules Lemaître in Les Contemporains, vol. iv.; E. Faget, XIX. Siècles; F. W. H. Myers, Essays Ancien et Modern (1883); Henry James in North American Review (April 1902); Matthew Arnold, Studies and Essays (1879). See also René Doumic's George Sand (1899), which has been translated into English by Alys Hallard as George Sand: Some Aspects of Her Life and Writings (1910). (F. S.)

SAND. When rocks or minerals are pulverized by any agencies, natural or artificial, the products may be classified as gravel, sands and muds or clays, according to the size of the individual particles. If the grains are so fine as to be impalpable (about 1 in. in diameter) the deposit may be regarded as a mud or clay; if many of them are as large as peas the rock is a gravel. Sands may be uniform when they have been sorted out by some agency such as a gentle current of water or the wind blowing steadily across smooth arid lands, but usually they vary much both in the coarseness of their grains and in their mineral composition. The great source of natural sands is the action of the atmosphere, frost, rain, plants and other agencies in breaking up the surfaces of rocks and reducing them to the condition of fine powder; in other words sands are ordinarily the product of the agencies of denudation operating on the rocks of the earth's...
crust. Not all, however, are of this kind, for a few are artifical, like the crushed tallings produced in the extractions of metals from their ores; there are also volcanic sands which have originated by explosions of steam in the craters of active volcanoes.

A great part of the surface of the globe is covered by sand. In fertile regions the soil is very often of a sandy nature; though most soils are mixtures of sand with clay or stones, and may be described as loams rather than as sands. Pure sandy soils are found principally where the sand has been blown from the shore, or on formations of soft and friable sandstone like the Greensand. The soil of deserts also is often arenaceous, but there the finer particles have been lifted and borne away by the wind. Accumulation of detritus has led to the foundering of the seabed to certain parts of our rivers, very often over wide stretches of the seashore, and more particularly on the sea bottom, where the water is not very deep, at no great distance from the land. They contain weathering minerals which are common on the earth's crust only a limited number occur at all frequently in sand deposits. For several reasons quartz is by far the commonest ingredient of sands. It is a very abundant mineral in rocks and sands. It is very hard, so that it is not readily worn down to a very fine muddy paste. It also possesses practically no cleavage, and does not split up naturally into thin fragments. If we add to this that it is nearly insoluble in water, that it does not decompose even in the presence of a moisture, and that it is unaltered after long ages of exposure to weathering, we can see that it has all the properties necessary for furnishing a large portion of the sandy material produced by the detritus of rock masses. With quartz there is a common amorphous or gelatinous (possibly chine, orthoclase and oligoclase), but this mineral, though almost as common as quartz in rocks, splits up readily on account of its cleavage into fine grains, and is often agglomerated in pebbles. ark and kaolin, which are removed by the sifting action of water and are deposited as muds or clays. Small plates of white mica, which, though soft and very fine, decompose very slowly, are often mingled with the sand. In many sands, such as the black sands of the Lizard district of Cornwall the sands at the base of cliffs of serpentine, are rich in olivine, augite, enstatite, tremolite and chlorite. These volcanic sands such minerals as garnet, tourmaline, zircon, rutile and antaarse, which are common rock-forming minerals, both hard and resistant to decomposition. Among the less common ingredients are topaz, staurolite, kyanite and diaspore, chlorite, iron oxides, biotite, hornblende, and augite, white small particles of felspath, felsite and other fine-grained rocks appear frequently in the coarser sand deposits.

In desert sands, which have been transported for any great distance from their parent rocks, often contain minerals that are too soft or too readily decomposed to persist. In the Lizard district of Cornwall the sands at the base of cliffs of serpentine are rich in olivine, augite, enstatite, tremolite and chlorite. In many sands consist almost entirely of such fragments (shell sands). Around coral islands there are often extensive deposits of comminuted coral, in the midst of which we may find very large broken skeletons of calcareous algae, sponge-spicules and other debris of organic origin. The Greensands which are widely distributed over the floor of the ocean in places where the continental shelf has been submerged, are oftener to their colour to small rounded lumps of glauconite.

Among the accessory ingredients of sands which are of great value and interest are the precious metals, especially gold and platinum. These are found usually in the lower parts of the sand deposits resting on the rock-bed, because of their high specific gravity, and have been derived from the destruction of the rocks in which they originally existed in quartzose veins or as disseminated particles. Tinstone occurs also in this way ("stream-tin"), and in Ceylon, Burma, Brazil, South Africa, &c., precious stones such as the diamond, ruby, spinel, chrysoberyl and tourmaline are found in beds of quartzose sands. In general the sand grains have a rounded or oviform shape due to mutual attrition during transport. Those which have been carried farthest are the most rounded; sands deposited at a distance from the parent rock often consist largely of desert grains. The smaller fragments may be carried along in suspension in water, and may travel for many miles without being sensibly worn; but coarse sands and fine gravels are swept along the bottom and are subjected to an intense grinding action. Something depends also on the hardness of the minerals present in the sands, yet even the diamonds and other gems found in sand deposits have often the facets along which they are cut etched in the sand brought by the wind, and owing to the low viscosity of the most of the smallest grains are not held in suspension but are rolled along the ground; hence very fine quartzite sands are sometimes met with in arid regions with every particle smooth and polished. These sands flow almost like a liquid and are used in hour-glasses. Similar "desert sands" occur among the sandstones of the Trias and were doublets formed in the manner described.

In addition to river sands, shore sands, marine sand deposits and desert sands, there are many other types of sand deposits. Blown sands in deserts usually form bands which occur also at the margin of some great lakes like those of N. America. These sand deposits belong in great part to this category. These sands have been blown into their present position by the wind, and unless fixed by vegetation, constantly shift about, and often consequent a menace to agricultural land on their leeward sides. They may be shell sands, quartz sands or mixed sands, and often show very marked oblique stratification or current bedding. The surface of blown sand deposits is generally marked by dunes. Glacial sands are common in districts like Britain and those parts of N. America which have been covered by an ice-sheet. They are really drifts, and have been found on the shores of great lakes in situations in which waters no longer flow. The waters produced by the melting of the ice-sheets flooded extensive tracts of country, laying down sand and mud deposits in temporary lakes. These sands are usually angular, because they have not been transported to any great distance. The old high-level terraces which border the lower courses of many rivers, though usually consisting of gravel, are often accompanied by considerable sand deposits.

Many of the Tertiary and some of the Secondary sandstone rocks are so incompletely consolidated that cementation that they are essentially sand rocks, and especially when weathered may be used in the same way as shells. Sand has been found in the Tertiary of N. America, Triassic sands and Triassic coal (Sec. 197, Cornwall, &c.); Eocene sands (Bagshot sands and Thanet sands); and the Lower and Upper Greensand (Cretaceous) are often dug in pits, though sometimes firmly coherent and more properly described as sandstone. Sandstone rocks are often used in building for many purposes, and frequently contain a small admixture of clay. Sands are also employed in brick-making, in filtering, and for etching glass and other substances by means of the sand blast. (J. S. F.)

Sandalwood (from the Latinized form of Gr. σανδαλος or σαντάλος: this probably represents the Persian sandal, slipper; it is not to be referred to Gr. σαντίς, board), the foot-covering which consists of a sole of leather or other material attached to the sole of the foot by a thong of leather passing between the great and second toe, crossed over the instep and fastened round the ankle (see Shoe and Costume, section Greek and Roman). Sandals are only worn regularly among the peoples of Western civilization by friars, though forms of them are found among the peasants of Spain and Portugal, and in the British isles. Shoes have been adopted by the recent advocates of hygienic dress, especially for young children. In the early part of the 19th century a form of low, light slipper fastened by a ribbon crossed over the ankle, and worn by women, was known as a sandal.

Sandalwood (from Fr. sandal, sandre, Gr. σάνταλος, σαντάλως, Pers. sandal, chandan, Skt. chandana, the sandal tree; the form "sanders" is probably an English corruption), a fragrant wood obtained from various trees of the natural order Santalaceae, and principally from Santalum album, a native of India. It is the use of sandalwood that has given its name to the 5th century B.C. It is still extensively used in India and China, wherever Buddhism prevails, being employed in funeral rites and religious ceremonies. Until the middle of the 18th century India was the only source of sandalwood. The discovery of a sandalwood in the islands of the Pacific led to difficulties with the natives, often ending in bloodshed, the celebrated missionary John Williams (1706-1839), amongst others, having fallen a victim to an indiscriminate retaliation by the natives on white men visiting the islands. The loss of life in this trade was at one time even greater than in that of the opium of the Chinese.
SANDARACH—SAND-EEL

The oil, obtained by distilling the wood in chips, is largely used as a perfume, few native Indian attars or essential oils being free from admixture with it. In the form of powder or paste the oil is employed in the Taoism used by the Brahmans for their distinguishing caste-marks.

Red sandalwood, known also as red sanders wood, is the product of a small leguminous tree, Pterocarpus santalinus, native of South India, Ceylon and the Philippine Islands. A fresh surface of the wood has a rich deep red colour, which on exposure, however, assumes a dark brownish tint. In medieval times red sandalwood possessed a high reputation in medicine, and it was valued as a colouring ingredient in many dishes. It is pharmacologically quite inert. Now it is little used as a medicine, and is principally employed in the dyeing trade, especially in wool-dyeing. Several other species of Pterocarpus, notably P. indicus, contain the same dyeing principle and can be used as substitutes for red sandalwood. The barbary and caumwood of the Guinea Coast of Africa, from Baphia nitida or an allied species, called santal rouge d’Afrique by the French, are also in all respects closely allied to the red sandalwood of Oriental countries. As a substitute for cola (q.v.), sandalwood oil, distilled from the wood of Santalum album, is more expensive and pleasanter to take, but it is less efficient, as it does not contain any analogues to the valuable resin in copaiba.

SANDARACH (Fr. sandarache, Lat. sandaraca, Gr. σανδάραχος, realgar or red sulphide of arsenic, cf. Pers. sandarukh, Skt. sindura, realgar, cinnabar), is the name of a mineral, generally (a use found in Dioscorides) a resiny substance obtained from the small coniferous tree Callistis quadrivalvis, native of the north-west regions of Africa, and especially characteristic of the Atlas mountains. The resin, which is procured as a natural exudation on the stems, and also obtained by making incisions in the bark of the trees, comes into commerce in the form of small round balls or elongated tears, transparent, and having a delicate yellow tinge. It is a little harder than mastic, for which it is sometimes substituted. It is also used as incense, and by the Arabs medicinally as a remedy for diarrhoea. It has numerical advantages over many of the resins employed in modern therapeutics. An analogous resin is procured in China from Callistis sinensis, and in S. Australia, under the name of pine gum, from C. Reissii.

SANDBACH, a market town in the Crewe parliamentary division of Cheshire, England, 5 m. N.E. of Crewe, on the London & North-Western and North Staffordshire railways. Pop. of urban district (1901) 5585. It lies on a headstream of the small river Wheelock, a tributary of the Weaver. The parish church of St Mary is Perpendicular, with a fine carved roof of the 15th century. It contains only the sanctuary and the vestry. In the market-place are two remarkable crosses covered with rude carvings, and assigned by some to the 7th century, being similar to those at Monasterboice and elsewhere in Ireland. There are boot and shoe factories, chemical works and a manufactory of fustians, with sail-works and iron-works in the adjacent township of Wheelock.

SANDBERGER, KARL LUDWIG FRIDOLIN VON (1826–1898), German palaeontologist and geologist, was born at Dillenburg, Nassau, on the 22nd of November 1826. He was educated at the universities of Bonn, Heidelberg and Giessen, at the close of which he graduated Ph.D. in 1846. He then studied at the university of Marburg, where he wrote his first essay, Übersicht der geologischen Verhältnisse des Herzogtums Nassau (1847). In 1849 he became curator of the Natural History Museum at Wiesbaden, and began to study the Tertiary strata of the Mayence Basin, and also the Devonian fossils of the Rhenish provinces, on which he published elaborate memoirs. In 1855 he was appointed professor of mineralogy and geology at the Polytechnic Institute at Karlsruhe, and took part in the geological survey of Baden. From 1865 to 1866 he was professor of mineralogy and geology at the University of Giessen. His greatest work is the Land- und Wasser-Conchylion der Vorwelt, which was published in 1875. In 1871 he was appointed Professor of Invertebrate Palaeontology at Würzburg. His Die Versteinerungen des rheinischen Schichtensystems in Nassau (1850–1856).

SANDBY, PAUL (1725–1809), English water-colour painter, was born at Nottingham in 1725. In 1746 he was appointed by the duke of Cumberland draughtsman to the survey of the Highlands. In 1752 he quitted this post and retired to Windsor, where he occupied himself with the production of water-colour drawings of scenery and architecture. Sir Joseph Banks commissioned him to bring out in aquatint (a method of engraving then peculiar to Sandby) forty-eight plates drawn during a tour in Wales. Sandby displayed considerable power as a caricaturist in his attempt to ridicule the opposition of Hogarth to the plan for creating a public academy for the arts. In 1768 he was chosen a foundation-member of the Royal Academy and appointed Chief drawing-master to the Royal Military Academy at Woolwich. He held his situation for forty-eight years. Sandby was remembered, however, by his water-colour paintings. They are topographical in character, and, while they are the richness and brilliancy of modern water-colour, he nevertheless impressed upon them the originality of his mind. His etchings, such as the Cries of London and the illustrations to Ramsay’s Gentle Shepherd, and his plates, such as to Tasso’s Jerusalem Delivered, are numerous and carefully executed. He died in London on the 9th of November 1809.

SAUDEAU, LÉONARD SYLVAIN JULIEN [Jules] (1811–1885), French novelist, was born at Aubusson (Creuse) on the 19th of February 1811. He was sent to Paris at an early age, and spent much of his time with unruly students. He met Madame Dudevant (George Sand) at Le Coudray in the house of a friend, and when she came to Paris in 1831 she joined Sandeau. The intimacy did not last long, but it produced Rose et Blanch (1831), a novel written in common under the pseudonym Jules Sand, from which George Sand took the idea of her famous nom de guerre.

Sandeau continued for nearly fifty years to produce novels and to collaborate in plays. His best works are Marianna (1839), in which he draws a portrait of George Sand; Le Docteur Herboi (1841); Catherine (1845); Mademoiselle de la Seignière (1848), a successful picture of society under Louis Philippe, dramatized in 1851; Madelette (1848); La Chasse au Roman (1849); Sacs et parfums (1851); La Maison de Penarmon (1858); La Roche aux mouettes (1871). The famous play of Le Gendre de M. Piotier is one of several which he wrote with Émile Augier—the novelist usually contributing the story and the dramatist the theatrical working up. Meanwhile Sandeau had been made conservateur of the Mazarin library in 1853, elected to the Academy in 1858, and next year appointed librarian of St Cloud. As a supporter of this latter office, after the fall of the empire, he was pensioned. He died on the 24th of April 1883. He was never a very popular novelist, and the quiet grace of his style, and his refusal to pande to the popular taste in the morals and incidents of his novels, discredited him with the public.

SAND-EEL, or SAND-LANCE. The fishes known under these names are small kinds of Ammodrtes (Ammodrtes) now included with the Scombridae in the sub-order Percocoiose. They were formerly placed in the Anacanthini and supposed to be allied to the Gadidae, but a fossil form Cobolopenis has recently been described in which the pelvic fins are present, and are abdominal in position as in Belone and Scombrus.

Their body is of an elongated-cylindrical shape, with the head terminating in a long conical snout, the projecting lower jaw forming the chief weapon. A long anal fin, in front of which there is a small one, is also present. The gill-opening between spines and rays can be observed, occupies nearly the whole length of the back, and a long anal, composed of similar short and delicate rays, commences immediately behind the vent, which is placed about midway between the head and caudal. The caudal is forked and the pectorals are short. The total absence of ventral fins indicates the burrowing habits of these fishes. The scales, when present, are very small; but generally the lower part of the body is covered with minute scales. The oblique folds of the integuments. The eyes are lateral and of moderate size; the dentition is quite rudimentary.

Sand-eels are the small littoral marine fishes, only one species attaining a length of 18 in. (Ammodrtes lanceolatus). They live in shoals at various depths on a sandy bottom, and bury themselves in the sand on the slightest alarm. Other shoals live in deeper water. When pursued by the dog or fowls, they frequently shoot out the sand in which they are driven to the surface in such dense masses that numbers of them can be scopped out of the water with a bucket or hand-net. Sand-
eels destroy a great quantity of fry and other small creatures, such as the lancelet (Amphioxus), which lives in similar localities. They are not, however, in this respect much overfished, for eels are captured by small meshed seines, as well as by digging in the sand. The eggs of sand-eels are smaller, however, than sea-water and slightly adhesive; they are scattered among the grains of sand in which the fish lives, and as the waters of growth may be taken with the row-net in sandy bays in summer.

Sand-eels are common in the N. Atlantic; a species scarcely distinct from the European common sand-eel occurs on the Pacific coast of N. America, another on the north coast of S. Africa. On the British coasts three species are found: the greater sand-eel (Ammodramus lanceolatus), distinguished by a tooth-like bicuspid projection on the head; the common sand-eel (A. gallarum), from 5 to 7 in. long, with unarmed verner, even dorsal fin, and with the integuments folded; and the southern sand-eel (A. siculus), with unarmed verner, smooth skin, and with the margins of the dorsal and anal fins divided. The last species is common in the Mediterranean, but local farther N. It has been found near the Shetlands at depths from 80 to 100 fathoms.

SANDEFJORD, the oldest and most famous spa in Norway, in Harlsberg-Laurvik amt (county), 86 m. S.S.W. of Christiania by the Slem stenalve. Pop. (1900) 4847. The springs are sulphurous, saline and chalybeate. Specimens of sea-water or gian's cauldrons may be seen at Gaardshusen and Vindalsbogen, some upwards of 23 ft. in depth.

SANDEMAN, SIR ROBERT GROVES (1835-1892), Indian officer and administrator, was the son of General Robert Turnbull Sandeman, and was born on the 25th of February 1835. He was educated at Perth and St Andrews University, and joined the 33rd Bengal Infantry in 1856. When that regiment was disarmed at Phulior by General Nicholson during the Mutiny in 1857, he took part in the final capture of Lucknow as adjutant of the 11th Bengal Lancers. After the suppression of the Mutiny he was appointed to the Punjab Commission by Sir John Lawrence. In 1866 he was appointed a district officer of Dera Ghazi Khan, and there first showed his capacity in dealing with the Baluch tribes. He was the first to break through the close-border system of Lord Lawrence, by extending British influence to the independent tribes beyond the border. In his hands this policy worked admirably, owing to his tact in managing the tribesmen and his genius for control. In 1876 he negotiated the treaty with the Khan of Kalat, which subsequently governed the relations between Kalat and the Indian government; and in 1877 he was made agent to the Andamanese in Baluchistan, an office which he held till his death. During the second Afghan War in 1878 his influence over the tribesmen was of the utmost importance, since it enabled him to keep intact the line of communications with Kandahar, and to control the tribes after the British disaster at Maiwand. For these services he was made K.C.S.I. in 1879. In 1889 he occupied the Zhob valley, a strategic advantage which opened the Gomal Pass through the Waziri country to caravans. Sandeman's system was not so well suited to the Pathan as to his Baluch neighbours. But in Baluchistan he was a pioneer, a pacificator and a successful administrator, who converted countrymen from a state of complete anarchy as a province as orderly as any in British India. He died at Bela, the capital of Los Bela state, on the 29th of January 1890, and there lies interred under a handsome tomb.

See T. H. Thornton, Sir Robert Sandeman (1895); and R. I. Bruce, Sir Robert Sandeman (1886).

SANDEMAN, GROSSE (1789-1866), German lexicographer, was born on the 12th of November 1819 at Alstrelitz in Mecklenburg, of Jewish parentage. He was educated at the "Gymnasium Carolinum" in the neighbouring capital Neustrelitz, and the universities of Berlin and Halle, where he took the degree of doctor philosophiae. From 1834 to 1852 he conducted with success the school at Alstrelitz.

In 1832 he submitted Grimm's Deutsches Wörterbuch for a rigorous examination for the prize, but it was not until 1841 that the dictionary of the German language, Wörterbuch der deutschen Sprache (3 vols., 1859-1865), was published. This was followed by his Ergänzungswörterbuch der deutschen Sprache (1878-1889). Among others of his works in the same field are Franck's Lexicon (1871, 2nd ed. 1891); Hauptschülerschreibungen in der deutschen Sprache (1872; 2nd ed. 1892) and Lehrbuch der deutschen Sprache für Schüler (6th ed., 1888). Sanders laid down his views in his Katechismus der deutschen Orthographie (1856; 4th ed., 1878), and was an active member of the orthographical conference in Berlin in 1876. He published a translation of Becher's Geschichte der politischen Völker für junge, Heitere Kinderspalten (1868). In 1889 he founded the Zeitschrift für die deutsche Sprache, which he conducted almost down to his death at Alstrelitz on the 11th of March 1897.

See Friedrich Düssel, Daniel Sanderson (1882; 2nd ed., 1890); A. Segert-Stein, Daniel Sanders, ein Gedenkbuch (1897).

SANDERS, NICHOLAS (c. 1530-1581), Roman Catholic agent and historian, born about 1530 at Charlwood, Surrey, was a son of William Sanders, once sheriff of Surrey, who was descended from the Sanders of Sanderson. Educated at Winchester and New College, Oxford, he was elected fellow in 1548 and graduated B.C.L. in 1551. The family had strong Catholic leanings, and two of Nicholas's sisters, who must have been much older than he was, became nuns. He commenced the Oxford convent before its dissolution. Nicholas was selected to deliver the oration at the reception of Cardinal Pole's visitors by the university in 1557, and soon after Elizabeth's accession he went to Rome where he was befriended by Pole's confidant, Cardinal Morone; he also owed much to the generosity of Sir Francis Englefield (q.v.). He was ordained priest at Rome, and was, even before the end of 1550, mentioned as a likely candidate for the cardinal's hat. For the next few years he was employed by Cardinal Hosius, the learned Polish prelate, in his efforts to check the spread of heresy in Poland, Lithuania and Prussia. In 1565, like many other English exiles, he returned to England, and after a visit to the Imperial Diet at Frankfurt in 1566, in attendance upon Commendone, who had been largely instrumental in the reconciliation of England with Rome in Mary's reign, he threw himself into the literary controversy between Bishop Jewel (q.v.) and Harding. His De visibili Monarchia Ecclesiae, published in 1571, contains the first narrative of the sufferings of the English Roman Catholics. Its extreme papalism and its strenuous defence of Pius V.'s bull excommunicating and deposing Elizabeth marked out Sanders for the enmity of the English government, and he retaliated with lifelong efforts to prevent the deposition of Elizabeth and restoration of Roman Catholicism.

His expectations of the cardinalate were disappointed by Pius V.'s death in 1572, and Sanders spent the next few years at Madrid trying to enthrall Philip II, who gave him a pension of 300 ducats, in open war with Elizabeth. The state of Christendon, he wrote, "is dependent upon France; I have no office to speak of, and the state was sorely tried by Philip's cautious temperment; and Sir Thomas Stukeley's projected Irish expedition, which Sanders was to have accompanied with the blessings and assistance of the Pope, was abandoned. Sanders was recalled to England, where he met Henry VIII's own daughter, who was simply borrowed by Sanders from earlier writers. It is not a more trustworthy account than a vehement controversialist engaged in a life and death struggle might be expected to write of theological antagonists.

See Lewis's Introduction (1777); Catholic History of Ireland, Foreign and Spanish State Papers, and of the Carew MSS.; Knox's Letters of Cardinal Allen; T. F. Kirby's Winchester Scholars; R. Bagwell's History of the Reformation in England, 2 vols. (1597); and T. E. Willoughby's The Construction of the Monarchia under Königin Elisabeth (1910); and T. G. Law in Diet. Nat. Biogr. i. 259-261 where a complete list of Sanders's writings is given.

SANDERSON, ROBERT (1587-1663), English divinity, was born probably at Sheffield, Yorkshire, in September 1587. He was educated at Rotherham grammar school and at Lincoln College, Oxford, took orders in 1611, and was promoted successively
to several benefits. On the recommendation of Laud he was appointed one of the royal chaplains in 1631, and was a favourite preacher with the king, who made him regius professor of divinity at Oxford in 1642. The Civil War kept him from entering the office till 1646; and in 1648 he was ejected by the Parliamentary visitors. He recovered his position at the Restoration, was moderator at the Savoy Conference, 1661, and was promoted to the bishopric of Lincoln. He died two years later on the 12th January 1665.

His most celebrated work is his Cases of Conscience, deliberate judgments upon points of morality submitted to them. They are distinguished by moral integrity, good sense and learning. His practice as a college lecturer in logic is better evidenced by these "cases" than by his Compendium of Logic, first published in 1618. A complete edition of Sanderson's works (6 vols.) was edited by William Jackson in 1834. It includes the Life by Izak Walton, revised and enlarged.

SANDFORD, JOHN DE (d. 1394), archbishop of Dublin, was probably an illegitimate son of the spiritual leader, Gilbert Basset (d. 1241), or of his brother Fulk Basset, bishop of London from 1241 until his death in 1259, a prelate who was prominent during the troubles of Henry III.'s reign. John was a nephew of Sir Philip Basset (d. 1271), the justiciar. He first appears as an official of Henry III. in Ireland and of Edward I. in both England and Ireland; he was appointed dean of St Patrick's, Dublin, in 1275. In 1284 he was chosen archbishop of Dublin in succession to John of Darlington; some, however, objected to this choice and Sandford resigned his claim; but was elected a second time while he was in Rome, and returning to Ireland was allowed to take up the see of Dublin. In 1288, during a time of great confusion, the archbishop acted as governor of Ireland. In 1290 he resigned and returned to England. Sandford served Edward I. in the great case over the succession to the Scottish throne in 1292 and also as envoy to the German king, Adolph of Nassau, and the princes of the Empire. On his return from Germany he died at Yarmouth on the 2nd of October 1294.

Sandford's elder brother, Fulk (d. 1271), was also archbishop of Dublin. He is called Fulke de Sandford and also Fulk Basset owing to his relationship to the Bassets. Having been arch-bishop of Dublin and joined a small district of the Diocese of Chatham

SANDGATE, a watering-place of Kent, England, on the S.E. coast, 15 m. W. of Folkestone, on the South-Eastern & Chatham railway. Pop. of urban district (1901) 2023. It is connected with Hythe, 3 m. W., by a tramway belonging to the railway company. It is included in the parliamentary borough of Hythe. Sandgate Castle was built by King Henry VIII, but on the formation of a camp here in 1806 it was considerably altered. The camp of Storncliffe lies N. of the town on a plateau.

SAND-GROUSE, the name1 by which are commonly known the members of a small group of birds frequenting sandy tracts, and having their feet more or less clothed with feathers after the fashion of grouse (q.v.), to which they were originally thought to be closely allied; the species first described were by the earlier systematists invariably referred to the genus Tetrao. Their separation therefrom is due to C. J. Temminck, who made for them a distinct genus which he called Heterogallinula.2 Further investigation of the osteology and petrology of the sand-grouse revealed still greater divergence from the normal Gallinaceae (to which the true grouse belong), as well as several curious analogies to the pigeons; and in the Zoological Society's Proceedings for 1868 (p. 303) T. H. Huxley proposed to regard them, under the name of Pterocloromorphae, as forming a group equivalent to the Alectoromorphae and Peristeromorphae. They are now generally regarded as forming a separate sub-order Pterocoleae of Charadriiformes, allied to pigeons (see BIRDS).

The Pterocoleae consist of two genera—Pterocolea, with about fifteen species, and Syrrhaptes, with two. Of the former, two species inhabit Europe: Pterocolea arenarius Temminck, the sand-grouse, which is usually called P. alchata, the pin-tailed sand-grouse. The European range of the first is practically limited to Portugal, Spain and Italy; while the range of the second is much more extensive, it is generally known by its Catalan name of Ganga, or locally as Grandaulo, or, strange to say, Perdrix d'Angletere. Both species are also abundant in Barbary, and have been believed to occur in other parts of the African desert, but which are now seen to be only winter-visitors; but in 1880 M. Bogdanow pointed out to the Academy of St Petersburg (Bulletin, xxvii. 164) a fossil coloration between eastern and western examples of what had hitherto been considered as Pterocolea arenarius. He suggested that a similar difference might be found in examples of P. arenarius. India, moreover, possesses five other species of Pterocolea, of which, however, only one, P. indicus, has been admitted to Africa, as well as to India, and inhabit Africa as well, and all the remaining species belong to the Ethiopian region—P. personatus, being peculiar to Madagascar, and four occurring in or on the borders of the Cape Colony.

The genus Syrrhaptes, though in general appearance resembling Pterocolea, has a conformation of foot quite unique among birds, the three anterior toes being encased in a common "podotheca," which is clothed to the claw and pointed feathers, so as to give much like a fingerless glove. The hind toe is wanting. The species of Syrrhaptes are S. tibetanus—the largest sand-grouse known—inhabiting the country whence its trivial name is derived, and S. indicus, ranging from Neapolitan Africa across Central Europe, and inhabiting the borders of Europe, which it occasionally invades. Though its attempts at colonization in the extreme W. have failed, it would seem to have established itself in the neighbourhood of Astrakhan (Ibis, 1882, p. 239). It is said to appear to the Cossacks' at this district, and I have seen a portrait of it. (Ibis, l. i. p. 239); and the "Lloung-Kiu" or "Dragon's Foot," so unspecifically described by the Abbé Suc (Souvenirs d'un Voyage dans la Tchita, 233-264), can probably be identified as Syrrhaptes indicus.

The sand-grouse assimilates in general colour to that of the ground, being above of a dull ochreous hue, more or less barred or mottled by darker shades, while beneath it is frequently varied by bands of deep brown intensifying into black. Lighter tints are, however, exhibited by some species and streaks or edgings of an almost pure white relieving the prevailing sandy or fawn-coloured hues that especially characterize the group. The sexes seem always to differ in plumage, that of the female showing the browner tints. The tail is extremely decided dove-like, and so is the form of the body, the long wings contributing also to that effect, so that among Anglo-Indians these birds are commonly known as "rock-pigeons." The long wings, the outermost primary of which in Syrrhapes has its shaft produced into an attenuated filament, are in all the species worked by exceedingly powerful muscles, and in several forms the middle rectrices are roughened and closely frayed, and the tips of the rectrices are frequently used by in the Miocene caves of the Allier by A. Milne-Edwards (Ois. foss. de la France, p. 294, pl. clx., figs. 1-9); and, in addition to the other authorities on this very interesting group of birds already adduced, reference may be made to D. G. Elliot's "Study" of the Family (P.Z.S., 1878, pp. 233-264) and H. F. Gadow, "On Certain Points in the Anatomy of Pterocolea" (op. cit., 1882, pp. 312-332). (A. N.)

SANDHURST, a town in the Wokingham parliamentary division of Berkshire, England, 9 m. N. of Aldershot. Pop. (1901) 2,383. Distances: of Cambridge Town and York Town, and the railway stations of Blackwater and Camberley on the South-Eastern and Chatham and South-Western lines, is the Sandhurst Royal Military College. It was settled here in 1812, having been already removed by its founder, the duke of York, from High Wycombe, where it was opened in 1799, to Great Marlow in 1802. It stands in beautiful grounds, which contain a large lake. Wellington College station on the South-Eastern branch line to Reading, near Sandhurst itself, serves Wellington College, one of the principal modern public schools of England, founded in memory of John Sandford, a lawyer who had formerly been a member of the House of Commons, and who was created a baronet in 1660.

1 It seems to have been first used by J. Latham in 1783 (Synopsis, iv. p. 751) as the direct translation of the name Tetrao arenarius given by Pallas.

2 He states that he published this name in 1809; but hitherto research has failed to find it used until 1815.

3 These were separated by Bonaparte (Comptes rend. xi. p. 888) as distinct genus, Pterodorus, which later authors have justly seen reason to adopt.
of the great duke of Wellington, and incorporated in 1853. Its primary object was the education of the sons of deceased army officers. In the vicinity is Broadmoor Prison for criminal lunatics.

SAN DIEGO, a city, port of entry and the county-seat of San Diego county, in S. California, U.S.A., on the Pacific Ocean, about 10 m. N. of the Mexican border, and about 126 m. (by rail) S.E. of Los Angeles. Pop. (1880) 2657; (1890) 16159; (1900) 51769; in 1890 the population of the town was 3786, and there were 7884 foreigners (chiefly Russians, 29578. It is served by numerous steamship lines and by the Atchison, Topeka & Santa Fé, the Los Angeles & San Diego Beach, the San Diego Southern, and the San Diego, Cuyamaca & Eastern railways. A railway between Yuma, Arizona, and San Diego was under construction in 1910. The harbour, next to that of San Francisco the best in California, has an area of some 22 sq. m. The Federal government has made various improvements in the harbour, building a jetty 7500 ft. long on Zuniga Shoal at the entrance and making a channel 225 ft. wide and 27-28 ft. deep at low tide. The city site, which is a strip of land 25 m. long and 2 to 4 m. wide, is nearly level near the bay. San Diego is the seat of a State Normal School and has a Carnegie library. There is a coal station of the United States Navy, and the United States government maintains a garrison in Fort Rosecrans. At Coronado (pop. 1900, 935) across the bay are Coronado Beach, and the Hotel del Coronado, with fine botanical and Japanese gardens; on the beach people live in tents except in the stormier season. Within the city, on the top of Point Loma, is the Theosophical Institution of the "Universal Brotherhood." San Diego has one of the most equitable climates in the world, and there are several sanatoriums here. The economic interests centre in fruit culture, especially the raising of citrus fruits and of raisin grapes. There are also warehouses, foundries, lumber yards, saw-mills and planing-mills—logs are rafted here from Washington and Oregon. National City (pop. 1900, 1086), adjoining San Diego on the S. and the S. terminus of the Atchison, Topeka & Santa Fé system, has large interests in lemon packing and the manufacture of oil, citric acid and other lemon by-products. In 1905 the total value of the factory products of the city was $1,974,430 (1904-5 more than in 1900).

San Diego is under the commission form of government; in 1905 the city secured as a charter right the power to "recall" by petition any unsatisfactory city official and to elect another in his place, and the initiative and referendum were incorporated in the charter, but were practically inoperative for several years. By a charter amendment of 1909, the city is governed by a commission of a mayor and five councilmen, elected at large.

About 4 m. N. of the business centre of San Diego is the site of the first Spanish settlement in Upper California. It was occupied in April 1782, a Franciscan mission (the earliest of twenty-one established in California) was founded on the 16th of July, and a military presidio somewhat later. San Diego began the first revolution against Governor M. Victoria and Mexican authority in 1831, but was intensely loyal in opposition to Governor J. B. Alvarado and the northern towns in 1836. It was made a port of entry in 1828. In 1840 it had a population of 140. It was occupied by the American forces in July 1846, and was reoccupied in November after temporary dispossessal by the Californians, no blood being shed in these disturbances. In 1850 it was incorporated as a city, but did not grow, and lost its charter in 1852. In 1867 it had only a dozen inhabitants. A land promoter, A. E. Horton (d. 1900), then laid out a new city about 3 m. S. of the old. Its population increased to 2300 in 1870, and this new San Diego, was incorporated in 1872, and was made a port of entry in 1873. The old town still has many ruined adobe houses, and the old "mission" is fairly well preserved. The prosperity of 1867-1873 was followed by a disastrous crash in 1873-1874, and little progress was made until 1884, when San Diego was reached by the Santa Fé railway system. After 1890 the growth of the city was again very rapid.

SAN DOMIN, or Sadowoëraz, a town of Russian Poland, in the government of Radom, 140 m. S.S.E. of Warsaw by river and on the left bank of the Vistula, opposite the confluence of the San. Pop. (1881) 6265, or, including suburbs, 14,710; (1879) 6634. It is one of the oldest towns of Poland, being mentioned as early as 1070; from 1139 to 1323 it was the chief town of the principality of the same name. In 1240, and again in 1259, it was burned by the Mongols. Under Casimir III, it reached a high degree of prosperity. In 1426 it was the seat of a congress for the establishment of peace with Lithuania, and in 1570 the Commonwealth Sandanians from 0 to 10 ft. draught under the Luthers, Calvinists and Moravian Brethren. Subsequent wars, and especially the Swedish (e.g. in 1655) ruined the town even more than did numerous conflagrations, and in the second part of the 18th century it had only about 2000 inhabitants.

Here in 1702 the Polish supporters of Augustus of Saxon banded together against Charles XII. of Sweden. The beautiful cathedral was built between 1120 and 1191; it was rebuilt in stone in 1360, and is one of the oldest monuments of Polish architecture. Two of the churches are fine relics of the 13th century. The city gives title to an episcopal see (Roman Catholic).

SANDOWAY, a town and district in the Arakan division of Lower Burma. The town (pop. 1901, 12,845) is very ancient, and is said to have been at one time the capital of Arakan. The district has an area of 3784 sq. m.; pop. (1901) 90,927, showing an increase of 16% in the decade. The country is mountainous, the Arakan range sending out spurs which reach the coast. Some of the peaks in the N. attain 4000 and more ft. The streams are only mountain torrents to within a few miles of the coast; the mouth of the Khwa forms a good anchorage for vessels of from 3 to 10 ft. draught. In the Arakan range and its spurs are metamorphic, and comprise clay, slates, ironstone and indurated sandstone; towards the S., ironstone, trap and rocks of basaltic character are common; veins of steatite and white fibrous quartz are also found. The rainfall in 1905 was 230-49 in. Except a few acres of tobacco, all the cultivation is rice. Sandoway was ceded to the British, with the rest of Arakan, by the treaty of Yandabo in 1826.

SANDOWN, a watering-place in the Isle of Wight, England, 63 m. S. of Ryde by rail. Pop. of urban district (1901) 5066. It is beautifully elevated on a rising ground overlooking Sandown Bay and the English Channel, on the S.E. coast of the island. There is a wide expanse of sandy shore, and bathing is excellent.

SANDPIPER (Ger. Sandpfeifer), the name applied to nearly all the smaller kinds of the group Limicolae which are not Plovers (q.v.) or Snipes (q.v.), but may be said to be intermediate between them. According to F. Willughby in 1676 it was the name given by Yorkshiremen to the bird popularly known in England as the "Summer-Snipe,"—the Tringa hypoleucos of Linnaeus and the Totanus hypoleucus of later writers,—but probably even in the "Consensus Sandandrii" this was of mid-water uniting the rocks in the Arakan range and its spars are metamorphic, and comprise clay, slates, ironstone and indurated sandstone; towards the S., ironstone, trap and rocks of basaltic character are common; veins of steatite and white fibrous quartz are also found. The rainfall in 1905 was 230-49 in. Except a few acres of tobacco, all the cultivation is rice. Sandoway was ceded to the British, with the rest of Arakan, by the treaty of Yandabo in 1826. Sandown is a watering-place in the Isle of Wight, England, 63 m. S. of Ryde by rail. Pop. of urban district (1901) 5066. It is beautifully elevated on a rising ground overlooking Sandown Bay and the English Channel, on the S.E. coast of the island. There is a wide expanse of sandy shore, and bathing is excellent.

These are Phalaropus fulicarius and P. (or Lobipes) hyperboreus, and were thought by some of the older writers to be allied to the Coots (q.v.). The third species is P. (or Steganopus) wilsoni. All are natives of the higher parts of the N. hemisphere, and the last is especially American, though perhaps a stranger to Europe.
SANDRART—SANDSTONE

is prevalent, while the Totaniiæ, with acute and stiffer bills, display no such lively colours. Furthermore, the Tringinae, except when breeding, frequent the sea-shore much more than do the Totaniiæ.1 To the latter belong the Greenshank (g.v.) and Redshank (g.v.), as well as the Common Sandpiper, the “Summer-Snipe” 2 above-mentioned, a bird hardly exceeding a Skylark in size, and of very general distribution throughout the British Islands, but chiefly frequenting clear streams, especially those with a gravelly or rocky bottom, and most generally breeding on the beds of sand or shingle on their banks. It usually makes its appearance in May. The nest, in which four eggs are laid with their pointed ends meeting in its centre (as is usual among Limicolæ birds), is seldom far from the water's edge, and the eggs, as well as the newly-hatched and down-covered young, closely resemble the surrounding pebbles. The Common Sandpiper is found over the greater part of the Old World. In summer it is the most abundant bird of its kind in the extreme N. of Europe, and it extends across Asia to Japan. In winter it makes its way to India, Australia, and the Cape of Good Hope. In America its place by a closely kindred species, which is said to have also occurred in England—T. macularius, the “Feet-weet,” or Spotted Sandpiper, so called from its usual cry, or from the almost circular marks which spot its lower plumage. In habits it is very similar to its congener of the Old World, and in winter it migrates to the Antilles and to Central and South America.

Of other Totaniiæ, one of the most remarkable is that to which the inoffensive Kentish Snipe, Scolopax rusticola, belongs. The Totaniiæ or Holarctæs ochroptús of ornithologists, which differs (so far as is known) from all others of the group both in its osteology 3 and mode of nidification, the hen laying her eggs in the deserted nests of small birds, or in those of a butterfly, in which she wallows at some height (from 3 to 30 ft.) from the ground (Proc. Zool. Society, 1856, pp. 529-552). This species occurs in England the whole year round, and is said to have bred there, though the fact has never been satisfactorily proved, and knowledge of its erratic habits comes from naturalists in Persia and Sweden. This sandpiper is characterized by its dark upper plumage, which contrasts strongly with the white under parts; the heart of the plumage gives off to the direct rays of the sun a peculiar glitter, and flies much the look of a very large house-martin. The so-called wood-sandpiper, T. glareola, which, though much less common, is known to have bred in England, has a considerable resemblance to the species just mentioned, but can be distinguished by the feathery of the auxiliary plume being white barred with greyish-black, while in the green sandpiper they are greyish-black barred with white. It is an abundant bird in most parts of northern Europe, migrating in winter very far to the southward.

Of the section Tringinae the best known are the Knot (g.v.) and the Dunlin, T. alpina. The latter, often also called Orx-bird, Plover’s Foot, is the smallest of the sandpipers with large black eyes, a species—not only breeds commonly on many of the elevated moors of Britain, but in autumn resorts in countless flocks to the shores. In winter of a nearly uniform ash-grey above and white beneath, in summer they have a brown back and crown, 4 greenish-black neck and edges, and a broad black belt occupies the breast. The Dunlin varies considerably in size, examples from N. America being almost always recognizable from their greater bulk, while in Europe there appears to be a smaller race which has received the name of T. schinzii in the breeding-season the male Dunlin utters a most peculiar and far-sounding whistling, somewhat resembling the continued ringing of a high-toned musical bell.

Next to the Dunlin and Knot the commonest British Tringinae are the Sanderling, Calidris arenaria (distinguished from every other bird of the group by wanting a hind toe), the Purple Sandpiper, T. polydactyla, the Ruff, or Curlew Sandpiper, T. stagnatilis, the Little and Temminck’s Stints, T. minula and T. Temmincki, T. minitilla, the American stint, is darker, with olive, and range from the Arctic New World to Brazil. T. fusca, Bonaparte’s sandpiper, is distinguished by tail-bars and a red spot on the wings Arctica Americana, but reaches the greater part of South America in winter, whilst T. bairdii, with brownish median tail-coverts, extends over nearly all North America, breeding towards the north.

1 There are no English words adequate to express these two sections. By some British writers the Tringinae have been indicated as “Stints,” a term cognate with Stunt and wholly inapplicable to many of them, while American writers have restricted them to the latter. We shall call the Totaniiæ, to which name is especially appropriate, “Willets.”

2 It possesses only a single pair of posterior “emarginations” on its sternum, in this respect resembling the Ruff (g.v.). Among the Plovers and Snipes other similarly exceptional cases may be found.

The broad-billed sandpiper, T. platyrhychna, of the Old World, seems to be more Nile-like than any that are usually assigned to this section. The spoon-billed sandpiper, Eurynomorhynchus pygmaeus, breeds in North-eastern Asia and N.W. America, and ranges to China and Burma in winter.

SANDRART, JOACHIM VON (1666-1688), German art historian and painter, was born at Frankfort, and after studying in Germany, Holland and England, went in 1627 to Italy, where he became famous as a portrait-painter. He subsequently revisited Holland and then settled in Nuremberg, where he died. His “Peace-Banquet, 1649” is in the town hall there. He is best known as the author of books on art, some of them in Latin, and especially for his historical work, the Deutsche Akademie (1675-1679), of which there is a modern edition by Sponsel (1860).

SANDRINGHAM, a village in the N.W. parliamentary division of Norfolk, England, 3 m. from the shore of the Wash, and 24 from Wallerton station on the Great Eastern railway. Sandringham House was a country seat of King Edward VII, acquired by him when Prince of Wales by purchase in 1861. Ten years later the mansion then existing was replaced by the present picturesquely building in brick and stone in Elizabethan style. The estate, of some 7000 acres, includes a park of 200 acres, entered by fine wrought iron gates constructed at Norwich. The church of St Mary Magdalene contains many memorials of the royal family.

SANDSTONE, in petrology, a consolidated sand rock built up of sand grains held together by a cementing substance. The size of the particles varies within wide limits and in the same mass may be uniform, but in large masses the coarser sandstones are called grits, and form a transition to conglomerates (g.v.), while the finer grained usually contain an admixture of mud or clay and pass over by all stages into arenaceous shales and clay rocks. Greywackes (g.v.) are sandstones belonging to the older geological systems, such as the Silurian or Cambrian, usually of brown or grey colour and very impure.

The minerals of sandstones are the same as those of sands. Quartz is the commonest; with it often occurs a considerable amount of felspar, and usually also some white mica. Chlorite, argillaceous matter, calcite and iron oxides, are exceedingly common in sandstones, and in some varieties are important constituents; garnet, tourmaline, zircon, epidote, rutile and anatase are often present though rarely in any quantity. According to their composition we may distinguish siliceous sandstones (some of these are so pure that they contain 99% of silica, e.g. Craigleith stone and some gneissites), felspathic sandstones or arkoses (less durable and softer than the siliceous sandstones); micaeous sandstones, with flakes of mica lying along the bedding planes; argillaceous sandstones; ferruginous sandstones, containing a large proportion of iron oxide; carbonate sandstones, coated with red haematite or brownish yellow limonite; impure sandstone, usually in the main consisting of quartz with a large addition of other minerals.

The cementing material is often fine chalcedonic silica, and exists in such small quantity that it is difficult to recognize even with the microscope. In some of the cherty sandstones of the Green-sands the chalcedonic cement is much more abundant; these rocks also contain rounded grains of glauconite, to which they owe their green colour. Crystalline silica (quartz) is deposited interstitially in some cases or at the surfaces of grains, giving rise to a delicately faceted quartz sand grains, and when there are cavities or fissures in the rock may show the development of regular crystalline facets. By this process the sand grains become quartz, and are then described as a quartzite (g.v.). A calcareous cement is almost equally common; it may be derived from particles of shells or other calcareous fossils originally mixed with the sand and subsequently dissolved and re-deposited in the spaces between the other grains. In Fontainebleau sandstone and some British Secondary rocks the calcite is in large crystalline masses, which when broken show plane cleavages motled with small rounded sand grains; in the French rock external faces are present and the crystals may be of considerable size. Many of the British Jurassic and Cretaceous sandstones (e.g. Kenilworth Rag, Spilsby Sandstone) are of this calcareous type. Carboniferous sandstones the iron oxides usually form only a thin pellicle coating each grain, but sometimes, in the green-sands, are more abundant, especially in concretionary masses or segregations. In argillaceous sandstones the fine clayey material, compacted by pressure, holds the sand grains together, and rocks of this kind are
SANDUR—SANDWICH, 4TH EARL OF

soft and break up easily when exposed to the weather or submitted to crushing tests. Among other cementing materials may be mentioned, dolomite, barytes, fluorite and phosphate of lime, but these are not the only locally found.

Many sandstones contain concretions which may be several feet in diameter, and are sometimes set free by weathering or when the rock is crushed. At Brady Lake, Ohio, near Sandusky, there is a large 18,471-ton barytes concretion, which is nearly perfect and is used to make grindstones. Pods of barytes may also occur as nodules at right angles to one another and perpendicularly to the bedding plane, indicating that the sandstones contain foraminifera. The rock is brown reddish in colour and is ground into fine flour.

Sandstones are mostly used for building purposes, but some of them make excellent grindstones, and the black sandstone of the Pennsylvania slatestone district is used in the making of grindstones. The black sandstone is also used in making the bases of grindstones. The black sandstone is also used in making the bases of grindstones.

Sandstones are commonly used in the making of grindstones, and the black sandstone of the Pennsylvania slatestone district is used in the making of grindstones. The black sandstone is also used in making the bases of grindstones. The black sandstone is also used in making the bases of grindstones.
SANDWICH—SANDYS, SIR E.

1748. After August m. England son the Wilkes Cooke; be the 1603 view manufacture situated woollen Chapel ing from Intrigues ancient bridge Chatham Walpole'slections flattering earl. married the (restored), Canterbury, master-general notorious was Sandwich extremely The Richborough grammar was a the sea, was John (1743-1814), probably one. He was a subversive one. He was a philan- thropist, and, for his home was in London, was curiosities of the 17th century. He was a member of the Navy Board, and, in 1745, he was appointed Secretary of State for the Southern Department. In 1746, he became first lord of the admiralty, retaining this post until he was dismissed by the king in June 1751. In August 1753 Sandwich became one of the principal secretaries of state, and while filling this office he took a leading part in the prosecution of John Wilkes. He had been associated with Wilkes in the notorious fraternity of Medmenham, and his attitude now in turning against the former companion of his pleasures made him very unpopular, and, from a line in the Beag's Opera, he was known henceforward as "Jenny Twitche." He was post-master-general in 1766, secretary of state in 1770, and again first lord of the admiralty from 1771 to 1782. For corruption and incapacity Sandwich's administration is unique in the history of the British navy. Offices were bought, stores were stolen and, worst of all, ships, unsavoury and inadequately equipped, were sent to fight the battles of their country. The first lord became very unpopular in this connexion also, and his retirement in March 1782 was hailed with joy. Sandwich married Dorothy, daughter of Charles, 1st viscount Fane, by whom he had a son John (1743-1814), who became the 5th earl. This edition, 1761, was the first of a series of reprints from the original edition of 1738. It was printed on vellum, with a large number of illustrations, and it was intended as a present for King George III. The book was a great success, and it is said that the king himself wrote the dedication. The book contains a number of interesting tales, including the story of Butterfield and the dragon, and the story of King Arthur. The book was well received, and it was reprinted several times. The later editions were issued in 1792, 1801, and 1812. The book was a great success, and it is said that the king himself wrote the dedication. tendencies were towards opposition, and he was suspected of hostility to the court; but he disarmed the anger of the king by professions of obedience. He was member for Penryn in the first parliament of Charles I. in 1625. He died in October 1629.

**SANDYS, FREDERICK** (1832-1904), English painter and draughtsman, was born at Norwich on the 1st of May 1832, and received his earliest lessons in art from his father, who was himself a painter. His early studies show that he had a natural gift for careful and beautiful drawing, and that he sought after absolute sincerity of presentment. Sandys worked along the same lines as his father, Henry Sandys Brown, Holman Hunt and Rossetti. He had, however, an impression of the painter-poet's features, which he reproduced so cleverly in "A Nightmare," a caricature of "Sir Isambra at the Ford," by Millais. Both the picture and the skit upon it by Sandys attracted much attention in 1857. The caricaturist turned the horse of Sir Isambra into a donkey labelled "J. R., Oxon." (John Ruskin). Upon it were seated Millais himself, in the character of the knight, with Rossetti and Holman-Hunt as the two children, one before and one behind. Rossetti and Sandys became intimate friends, and for about a year and a quarter, ending in the summer of 1857, Sandys lived with Rossetti at Tudor House (now called Queen's House) in Cheyne Walk, Chelsea. By this time Sandys was known as a painter of remarkable gifts. He had begun by drawing for *Once a Week*, the *Cornhill Magazine*, *Good Words* and other periodicals. He drew only in the magazines. No books illustrated by him can be traced. So his exquisite draughtsmanship has to be sought for in the old bound-up periodical volumes which are now hunted by collectors, or in publications such as Dalziel's Bible Gallery and the *Cornhill Gallery* and books of drawings, with verses attached to them, made to lie upon the drawing-room tables of those who had for the most part no idea of their merits. Every drawing Sandys made was a work of art, and many of them were so faithfully engraved that they are worthy of the collector's portfolio. Early in the sixties he began to exhibit the paintings which set the seal upon his fame. The best known of these are "Vivien" (1863), "Morgan le Fay" (1864), "Cassandra" and "Medea." Sandys never became a popular painter. He painted little, and the dominant influence upon his art was the influence exercised by lofty conceptions of tragic power. There was in it a sombre intensity and an almost stern beauty which lifted it far above the ideals of the crowd. The Scandinavian Sagas and the *Morte d'Arthur* gave him subjects after his own heart. "The Valkyrie" and "Morgan le Fay" represent his work at its very best. He made a number of chalk drawings of famous men of letters, including Tennyson, Browning, Matthew Arnold, and James Russell Lowell. Sandys died in Kensington on the 20th of June 1904.

See also Esther Wood, *The Artist* (Winter number, 1890).

**SANDYS, GEORGE** (1579-1644), English traveller, colonist and poet, the seventh and youngest son of Edwin Sandys, archbishop of York, was born on the 2nd of March 1578. He studied at St Mary Hall, Oxford, but took no degree. On his travels, which began in 1610, he first visited France; from North Italy he passed by way of Venice to Constantinople, and thence to Egypt, Mt Sinai, Palestine, Cyprus, Sicily, Naples and Rome. His narrative, dedicated, like all his other works, to Charles (either as prince or king), was published in 1615, and formed a substantial contribution to geography and ethnology. He also took great interest in the earliest English colonization in America. In April 1621 he became colonial treasurer of the Virginia Company and sailed to Virginia with his niece's husband, Sir Francis Wyatt, the new governor. When Virginia became a crown colony, Sandys was created a member of council in August 1624; he was reappointed to this post in 1626 and 1628. In 1631 he vainly applied for the secretariery to the new special commission for the better plantation of Virginia; soon after this he returned to England for good. In 1631 he had already published an English translation of part of Ovid's *Metamorphoses*; this he completed in 1626; on this mainly his poetic reputation rested in the 17th and 18th centuries. He also began a version of Virgil's *Aeneid*, but never produced more than the first book. In 1636 he issued his famous *Paraphrase upon the Psalms and Hymns dispersed throughout the Old and New Testaments*; in 1640 he translated Christ's *Passion* from the Latin of Grotois; and in 1641 he brought out his last work, a *Paraphrase of the Song of Songs*. He died, unburied, in a box of his books at Westerham, in 1644. His name was deservedly praised by Dryden and Pope; Milton was somewhat indebted to Sandys' *Hymn to my Redeemer* (inserted in his travels at the place of his visit to the Holy Sepulchre) in his *Ode on the Passion*.

**SAN FERNANDO**, a seaport of southern Spain, in the province of Cadiz, on the Isla de León, a rocky island among the salt marshes which line the southern shore of Cadiz Bay. Pop. (1900), 29,635. San Fernando is one of the three principal naval ports of Spain; together with Ferrol and Cartagena it is governed by an admiral who has the distinctive title of captain-general. The town is connected with Cadiz (43 m. N.W.) by a railway, and there is an electric tramway from the arsenal (in the suburb of La Caracea) to Cadiz. The principal buildings are government workshops for the navy, barracks, a naval academy, observatory, hospital, building and a handsome town hall. In the neighbourhood salt in largely produced and stone is quarried; the manufactures include spirits, beer, leather, esparto fabrics, soap, hats, sails and ropes; and there is a large iron-foundry.

San Fernando was probably a Carthaginian settlement. On a hill to the S. stood a temple dedicated to the Tyrian Hercules; to the E. is a Roman bridge, rebuilt in the 15th century after partial demolition by the Moors. The arsenal was founded in 1790. During the Peninsular War the cortes met at San Fernando (1810), but the present name of the town dates only from 1813; it was previously known as Isla de León.

**SAN FRANCISCO**, the chief seaport and the metropolis of California and the Pacific Coast, the tenth city in population (1910) of the United States, and the largest and most important city W. of the Missouri river, situated centrally on the coast of the state in 37° 47' 22"-35° N. and 122° 35' 40"-76° W., at the end of a peninsula, with the ocean on one side and the Bay of San Francisco on the other. Pop. (1850), 34,000; (1860), 296,997; (1900), 342,782, of whom 116,085 were foreign-born and 17,764 coloured (mainly Asians); (1920) 416,912.

*General Description.*—The peninsula is from 6 to 8 m. broad within the city limits. The magnificent bay is some 50 m. long in its medial line, and has a shore-line of more than 300 m.; its area is about 450 sq. m., of which 79 are within the three-fathom limit, including San Pablo Bay. This great inland water receives the two principal rivers of California, the Sacramento and the San Joaquin. The islands of the bay are part of the municipal district, as are also the Farallones, a group of rocky islets about 30 m. out in the Pacific. The bay islands are high and picturesque. Several are controlled by the national government and fortified. On Alcatraz Island is the United States Prison, and on Goat Island the United States Naval School of the Pacific. The old Spanish "presidio" is now a United States military reservation, and another smaller one, the Fort Mason Government Reservation, is in the vicinity. The naval station of the Pacific is on Mare Island in San Pablo Bay, opposite Vallejo (q.v.). Between 1890 and 1900 the harbour entrance from the Pacific was strongly fortified; it lies through what is called the Golden Gate, a strait about 5 m. long and 1 m. wide at its narrowest point. The lookout from Mt Tamalpais (1593 ft.), a few miles N., gives a magnificent
view of the city and bay. The site of the city is very hilly and is
dominated by a line of high rocky elevations that run
like a crescent-formed background from N.E. to S.W. across
the peninsula, culminating in the S.W. in the Twin Peaks
(Las Papas, "The Breasts"), 925 ft. high. Telegraph Hill in the
extreme N.E., the site in 1849 of the criminal settlement called
"Sydney Town" and later known as the "Latin Quarter," is
254 ft. high; Nob Hill, where the railway and mining "king's"
of the 'sixties and 'seventies of the 19th century built their
homes, which only in recent years has lost its exclusiveness,
is 300 ft. high; Pacific Heights, which became the site of a
fashionable quarter, is still higher; and in Golden Gate Park
there is Strawberry Hill, 426 ft. High as it remains to-day, the
site was once much more so, and has been greatly changed by
man. Great hills were razed and tumbled into the bay for
the gain of land; others were pierced with cuts, to conform
to street grades and to the checker-board city plan adopted
in the early days. An effort to induce the city to adopt,
in the rebuilding after the earthquake, of 1906, an artistic
plan failed, and reconstruction followed practically the old
plan of streets, although the buildings which had marked
them had been for the most part obliterated. Some minor
suggestions for improvement in arrangement only were observed.
Cable lines were first practically tested in San Francisco,
in 1873; since the earthquake they have given place, with
slight exceptions, to electric car lines. A drive of some 20 m.
may be taken along the ocean front, through the Presidio,
Golden Gate Park, and a series of handsome streets in the
west end. Market Street, the principal business street, is more than
3 m. wide; and for nearly its full extent, excepting on the
immediate water-front, and running westward to Van Ness
Avenue, a distance of 2 m., the buildings lining it on both sides
and covering the adjoining area, a total of some 2000 acres,
or 514 blocks, equivalent to $ of the city plan, were reduced
to ruins in the fire following the earthquake; only a few
large buildings of so-called "fire-proof" construction remained
standing on the street, and these had their interiors completely
gutted." Repairs on the buildings left standing on this street
alone involved an outlay of $5,000,000. Almost the whole of
this area was built up again by 1910. As a result of the
reconstruction of this section, thousands of wooden buildings,
which had been a striking architectural characteristic of
the city, were replaced by structures of steel, brick, and, especially,
reinforced concrete. Before the earthquake wood had been
employed to a large extent, partly because of the accessibility,
cheapness and general excellence of redwood, but also because
of the belief that it was better suited to withstand earthquake
shocks. While the wooden buildings were little damaged by
the shocks, the comparative non-inflammability of redwood
provided no safeguard and the fires of the Great Fire of
1906. In 1900 only one-third of the buildings in the city were of
other material than wood. Of the 28,000 buildings destroyed
in the disaster of 1906, valued approximately at $100,000,000,
only 5000 were such as had involved steel, stone or brick in
their construction. The new buildings, on which an estimated
amount of $150,000,000 had been expended up to April 1909,
and numbering 25,000 at that date, were built under stringent
building regulations making the methods of building employed,
to reduce the danger from fire to a minimum. The use of rein-
fforced concrete as a building material received a special impetus
in the reconstruction. In value the new buildings generally
exceed their predecessors, buildings eight to eighteen storeys in
height being characteristic in the Market Street section. Owing
to the complete reconstruction of its business section San Francisco
is equalled by few cities in the possession of office and
business buildings of the most modern type.

Buildings.—Among the buildings in the burned section restored
since 1906, the Union Trust, Mutual Savings, Merchants Exchange,
Crocker, Flood and the Call (newspaper) buildings are notable.
Among business buildings built since the fire are the Phelan building
(covering more than an acre), the two main structures of the Cali-
ifornia, the Alaska Commercial Company, the First National Bank
and the San Francisco Savings Union, and the Chronicle (newspaper)
building. The architecture of the city until the earthquake and fire
of 1906 was very homogeneous. Comparatively few buildings were
of striking merit. The Old City Hall, which was largely devoted to
the criminal and police courts and the police depart-
ment of the city, was a plain structure of brick and stucco, and
was demolished in 1909 to replace it by a new building. Since the fire of 1906 a new
Custom House has been built, costing $1,903,319. The other Federal
building, the Southern District Court House, not at a loss from the fire,
was entirely rebuilt, and is a very imposing structure. Provision was made
in 1909 to erect a new building at a cost of $5,000,000. The Hall of Justice,
which houses the criminal and police courts and the police depart-
ment of the city, was entirely destroyed, and a new building, huge
and architecturally imposing, is now under construction. There are several magnificent hotels.
The Palace, an enormous structure covering a city block (it had 1200
rooms and cost more than $5,000,000), known as the oldest and most
famous hostelry of the West, was destroyed, but a new hotel has been
completed by the fire, but has been replaced by a new building.
The St. Francis, completely reconstructed since the fire, and the
Fairmont are new. A revival of the old Spanish-Moorish "mission" (monastery) style has exercised an increasing
influence and is altogether the most pleasing development of Californian
design. Many buildings or localities, not in themselves re-
markable, have interesting associations with the history and life of
the city. Such are Pioneer Hall, the home of the Society of California
Pioneers (1850), endowed by James Lick; Portsmouth Square, where
the Alcalde of the Mexican government was placed on the 13th
of July 1846, and where the Committee of Vigilance executed criminals
in 1856; Union Square, a fashionable shopping centre, decorated with
a column raised in honour of the achievements of the United States
Navy and a Spanish galleon; and the Woolworth Building, and the Grace
Branch Mint, associated with memories of the early mining days
(the present mint dates only from 1874).—

Parks.—The parks of the city are extensive and fine. Golden
Gate Park (about 1000 acres) was a waste of barren land, acquired
by the municipality in 1870, but skilful planting and cul-
tivation have entirely transformed its character. It is now
beautiful with its lovely vegetable grounds, the Golden Gate
Branch of the U.S. Mint, and a military reservation (1542 acres) is
practically another city park, favourably situated and of better
land than Golden Gate Park, and better developed. A beautiful drive follows the shore, giving
views of the Lighthouse and Golden Gate Bridge over to.
The Park is the ocean beach, the Cliff House, repeatedly burned down
and rebuilt, the last time in 1907—a public resort on a rocky cliff
overlooking the sea—the seal rooks, frented the number all year round by
hundreds of sea- lions, Sutro Heights, the beautiful private grounds
of the late Adolph Sutro, long ago opened to the public, and the Sutro
Baths, one of the largest and finest enclosed baths and winter gardens
of the world. Nearly in the centre of the city is the old Francisco
mission (San Francisco de Asis, popularly known as Mission Dolores),
a landmark of San Francisco's history (1776).

Libraries, Museums, &c.—The Public Library has more than
1000,000 volumes, but suffered the fire of 1906, but then lost all but about 25,000. That to the city by
Adolph Sutro had more than 200,000 volumes, but suffered from
the fire and earthquake of 1906 and now has about 125,000. It included
remodeled buildings, including the library, since the destruction;
the architecture of the library is pleasing, and its collections include
some of the rarest books, and also American Indian, Egyptian,
and the ancient literature; and among its special collections are Lord Macaulay's
library of British Parliamentary papers, a great collection of English
Commonwealth literature, and many other rare and valuable
collections. The Mechanics-Mercantile Library (35,000 volumes)
was formed before the fire of 1906 (when the entire collection of 200,000
volumes was destroyed) by the merging of the Mechanics Institute
Lilth (116,000 volumes) and the Mercantile Library (founded
1852; 80,000 volumes). The Law Library, the libraries of the San
Francisco Medical Society, and the French Library of La Ligue
Nationale Francaise (1874), were destroyed in the fire of 1906 and re-
constructed. The California Historical Society (founded 1853, endowed by James Lick with about $600,000)
was destroyed in 1906. In Golden Gate Park is a museum owned by
the city with a exhibit of American and Indian ethnological,
archeological, historical, and other objects; and the fine arts, &c. Very fine mineral exhibits by
the State Mining Bureau, and California Agricultural and Pacific Coast
commercial displays by the California Development Board, are housed in
the California State Building. The Financial District of the city is
very fine. The California School of Mechanic Arts was endowed
by James Lick with $500,000. The San Francisco Institute of Art,
conducted by the San Francisco Art Association (organized 1872),
knows the one of the largest in the United States, and has
collections of art, which is housed in a handsome building
which was deeded (1833) to the Regents of the State University in trust for
art purposes by a later owner. The building was totally destroyed
and the institute was re-established under the auspices of the
State University. The school contains a fine and comprehensive col-
lection of arts and crafts, presented to the city by the government of France. It is
said to be the largest university art school of the country. The law,
medicine, and engineering schools of the University of California and
the State University are also in the city. Among other educational instit-
tutions are the Cogswell Polytechnic College, the Wilmerding School
of Industrial Arts, and the California School of Design. In sculpture and painting not much has yet been done to adorn the city.

The self-sufficingness of San Francisco, long forced upon it by the great distance from the older culture of the Eastern States, has thus far been a definite factor in the character of the city. There is only one city on the coast where few names belong by exclusive right to San Francisco's literary annals,—the most noteworthy being those of Bret Harte, Joaquin Miller, and Jack London. The very fact that San Francisco is not known of the more recent writers in the country have done enough of their work here to connect them enduringly with the city. The Bohemian Club is a famous center of literary and artistic life. Among the several newspapers in San Francisco, the Evening Bulletin (F. B. A., Democratic, 1865), the Chronicle (Republican, 1865), the Call (Republican, 1856) and the San Francisco Bulletin (Independent-Republican, 1856), are the largest.

The city suburbs are partly across the bay and partly to the north and south on the peninsula. Oakland, Berkeley, the home of the State University (damaged by the earthquake) and Alameda are connected across the bay by the Bay Bridge. There are many extensive parks in the surrounding districts. The development of the petroleum fields of the State has greatly stimulated manufactures, as coal has always been dear, whereas the demand for coal has always been very cheap. The Union Iron Works on the peninsula is one of the greatest shipbuilding plants of the country.

Government.—Charter's were granted to the city in 1850, 1851 and 1894. By the last city and county, which until then had maintained separate governments, were consolidated. Under this charter San Francisco thrives despite much corruption, and it was because of the charter that the city in 1895 elected a reform mayor. This was the most bloodless and peaceful revolution in the history of the city. There was no riot, no violence. The Vigilance Committee of 1886. It was followed by the adoption (1868) of a new charter, which came into effect on the 1st of January 1900. Elections are biennial. The inclusion in the charter of the time, place and manner of holding elections makes it impossible for the voters to compel the submission of measures to public approval.

The city's control is centralized, great power being given to the mayor and city council in the execution of the city's business. The election, park, civil service, health and public works commissions of the city; his veto may not be overcome by less than a five-sixths vote of the board of supervisors, and he may veto separate items of the budget. The chief tax on property is the property tax. The city's total revenue for 1909-1910 was $492,867,037.

1For the fiscal year 1906-1907, the assessed value was $375,924,447, indicating the drop in values immediately after the earthquake and fire, and, by comparison with the 1910 figures, the extent of recovery.
The Japanese numbered 1781 in 1900 and have very rapidly increased. The question of their admission to the public schools, rivalry in labour and trade, and other racial antagonisms attendant on their rapid increase in a number of millions in the last century have seriously involved the relations of the two countries. Two Chinese papers are published. More than half of the daily papers are foreign language.

**History.**—A Spanish presidio (military post), and the Franciscan mission of San Francisco de Asís, on the Laguna de los Dolores, were founded near the northern end of the peninsula in 1776. San Francisco was not one of the important settlements. Even the very important fact whether it was ever actually a pueblo—i.e. a legally recognized and organized town—was long a controverted question. Up to 1835 there were two settlements on the peninsula—one about the presidio, the other about the mission; the former lost importance after the practical abandonment of the presidio in 1836, the latter after the secularization of the mission, beginning in 1834. The year 1835-1836 marked the beginning of a third settlement destined to become the present San Francisco. This was Yerba Buena ("good herb," i.e. wild mint), founded on a little cove of the same name S.E. of Telegraph Hill, extending inland to the present line of Montgomery Street. (The cove was largely filled in as early as 1851.)

The site of the city is very different from that of most American towns, and seemed a most unpromising location. The hills were barren and precipitous, and the interlaces were largely shifting sand-dunes; but on the E. the land sloped gently to the bay. In 1835-1839 "San Francisco" had an ayuntamiento (town-council), and the different municipal officers seem to have been located in the same or different times at the mission, the presidio, or at Yerba Buena; the name San Francisco being applied indifferently to all three settlements. The ayuntamiento, apparently recognizing the future of Yerba Buena, granted lots there, and as the older settlements decayed Yerba Buena thrived. In 1840 there were only a handful of inhabitants; in 1846, when (on the 9th of July) the flag of the United States was raised over the town, its prosperity already marked it as the future commercial "metropolis" of the coast. In this year a Mormon colony joined the settlement, making it for a time a Mormon town. The population in the year before the gold discovery probably doubled, and amounted to perhaps 900 in May 1848.

The first news of the gold discoveries of January 1848 was received with incredulity at San Francisco (to give Yerba Buena the name it formally assumed in 1847), and there was little excitement until April. In May there was an exodus. By the middle of June the hitherto thriving town had been abandoned by a large majority of its inhabitants. Reality at first fell a half in value, labour rose many times in price. Newspapers ceased publication, the town council suspended sessions, churches and business buildings were alike empty. When the truth became known regarding the mines a wonderful "boom" began. The population is said to have been 2000 in February (in which month the first steamer arrived with immigrants from the East over the Isthmus), 6000 in August, and 20,000 by the end of the year. A city of tents and shanties rose on the sand-dunes. Reality values rose ten-fold in 1849. Early in 1850 more than 500 vessels were lying in the bay, most of them deserted by their crews. Many rotted; others were beached, and were converted into stores and lodging houses. Customs revenues rose from $20,000 in the first half of 1848 to $175,000 in the second half and to $4,420,000 in the year ending in June 1852. There was at first no idea of permanent settlement, and naturally no time whatever to improve the city. Great quantities of expensive merchandise glutted the market and were sunk in the liquid mud of the streets as fillage for the construction of sidewalks. Between December 1849 and June 1851 seven "great" fires, destroying in the aggregate property valued at twenty or twenty-five millions of dollars, swept the business district. Half of this was in the fire of the 4th of May 1851, which almost completely destroyed the city. These misfortunes led to a more general employment of brick and stone in the business quarter. It is characteristic of the vagaries of Californian commerce in the early years that dressed granite for some buildings was imported from China.

In these days the society of San Francisco was extraordinary. It was the most extreme of all democracies. Probably never before nor since in America there was a like test of self-development. Unusual courage and self-reliance were necessary for success. Amusements were coarse and unrestrained. Gambling was the fiercest passion. Property was at first, in San Francisco as in the main, exceptionally secure; then insecure. Crime became alarmingly common, and the city government was too corrupt and inefficient to repress it. It was estimated (Bancroft) that up to 1854 there were 4200 homicides and 1200 suicides; in 1855 the records show 83 deaths by violence. There were almost no legal convictions and executions. Juries would not punish homicide with severity. In 1851 the first Committee of Vigilance was formed and served from June to September, when it disbanded; it was the nucleus of the second and greater committee, active from May to August of 1856. By these committees, all sorts of ^2^6^2^ and criminals were summarily tried, convicted and punished; suspicious characters were deported or intimidated. These vigilantes were the good citizens (the committee of 1851 included some 800 and that of 1856 some 6000-8000 citizens of all classes), who organized outside of law, "not secretly, but in debate, in daylight, with sobriety and decorum," to defend and establish, through defying its rule. In this they were comparatively successful. Crime was never again so brazen and daring, and 1856 marks also the beginning of political reform. San Francisco's action was widely imitated over the state. In 1857 during the labour troubles a Committee of Safety was again formed, but had a very brief existence.

The United States military authorities in August 1847 authorized a municipal government. Under a municipal ordinance another was chosen in December 1848 to succeed it, but the parent government pronounced the election illegal; nevertheless the new organization continued to act, though another was chosen and recognized as legal. There were for a time at the end of 1848 three (and for a longer time two) civil governments and one military. Neither the military nor municipal organization was competent to give adequate law and peace to the city. The charters of 1850, 1853 and 1856 have already been referred to. In 1849 the citizens elected a "Legislative Assembly," which they empowered to make laws not in "conflict with the Constitution of the United States nor the common laws thereof." This was proclaimed revolutionary by the military authorities, but such illegalities continued to spread over the state, until in June 1849 the Convention was called that framed the State Constitution, California being admitted in September 1850 to the Union. Provisional civil officers were elected throughout the state, and the Legislative Assembly came to an end. The charters of 1850, 1853 and 1856 have already been referred to. The first public school was established in 1849. In 1855-1856 a disastrous commercial panic crippled the city; and in 1858, when at the height of the Fraser river gold-mine excitement it seemed as though Victoria, B.C., was to supplant San Francisco as the metropolis of the Pacific, reality values in the latter city dropped for a time fully a half in value. In 1859 foreign coin was first refused by the banks. Up to this time first gold dust, then private coins, and later money of various countries, had circulated in California. In 1860 mail communication was established with the East by a pony express, the charge being $5.00 for a half-ounce.

Some reference must be made to the Mexican land-grant litigation. The high value of land in and about the city caused the fabrication of two of the most famous claims examined and rejected as fraudulent by the United States courts (the Limantour and Santillan claims). They involved 7 sq. leagues of land and many millions of dollars. Another land question already referred to (that whether San Francisco was entitled as a pueblo to 4 sq. leagues of public land) was settled affirmatively in 1867, but the final land patents were not issued until 1884 by the national government.

When the Civil War came in 1861 the attitude of San Francisco
was at first uncertain, for the pro-slavery Democrats had controlled the state and city, although parties were remaking in the late 'fifties. About 75,000 arms are supposed to have been surreptitiously sent to California by the secessionist Secretary of War, J. B. Floyd; and the pro-slavery party seems to have planned to try for union with the Confederacy, or to organize a Pacific Coast republic. Thomas Starr King (1824-1864), a Unitarian minister, was the burned-at-the-tongue figure of the city. Her money contributions to the Sanitary Funds were, it is said, greater than those of any city in the country; and in every other way she abundantly evidenced her love for the Union. The curious Chapman (or Asbury Harpending) case of 1863 was a Confederate scheme involving piracy on Federal vessels in the Pacific and an effort to gain the succession of the state. It had no practical importance.

From 1859-1877 was the "silver era" of San Francisco (see CALIFORNIA). It paralleled the excitement and gambling of 1849, and despite losses was a great stimulus to the city's growth. In December 1869 the Central Pacific line was completed to Oakland, and in the next four years there was a crash in real estate values inflated during the railway speculation. In 1876 railway connexion was made with Los Angeles. The seventies were marked by the growth of the anti-Chinese movement, and labour troubles, culminating in 1877-1879 with the "sandlots" agitation and the formation of the Constitution of 1879 (see CALIFORNIA), in all of which San Francisco was the centre. The feeling against the Chinese found expression sometimes in unjust and mean legislation, such as the famous "queue ordinance" (to compel the cutting of the queue that of her hair), now iniquitously taxing laundries. The Chinese were protected against such legislation by the Federal courts. The startling and romantic changes of earlier years long ago gave way to normal municipal problems and ordinary municipal routine. In the winter of 1894 the California Midwinter International Exposition was held in Golden Gate Park. Since 1898 the governmental changes previously referred to, the location of a new trans-continental railway terminus on the bay, and the new outlook to the Orient, created by the control of the Philippines by the United States, and increased trade in the Pacific and with the Orient, have stimulated the growth and ambitions of the city.

Special mention must be made of the two citizens to whom San Francisco, as it is to-day, owes so much, viz. James Lick (1796-1876), a cold man with few friends, who gave a great fortune to noble ends; and Adolph Sutro (1830-1898), famous for executing the Sutro Tunnel of the Comstock mines of Virginia City, Nevada, and the donor of various gifts to the city.

The partial destruction of San Francisco by earthquake and fire in 1906 was one of the greatest catastrophes of history. Earthquakes had been common but of little importance in California until 1906. In more than a century there had been three shocks called "destructive" (1839, 1865, 1868) and four "exceptionally severe" at San Francisco, besides very many light shocks or tremors. The worst was that of 1868; it caused five deaths, and cracked a dozen old buildings. Heavy earthquake shocks on the morning of the 18th of April 1906, followed by a fire which lasted three days, and a few slighter shocks, practically destroyed the business section of the city and some adjoining districts. The heaviest shock began at 12 minutes 6 seconds past 5 o'clock a.m., Pacific standard time, and lasted 1 minute 5 seconds. Minor shocks occurred at intervals for several days. The earthquake did serious damage throughout the coast region of California from Humboldt county to the southern end of Fresno county, a belt about 50 m. wide. The damage by earthquake to buildings in San Francisco was, however, small in comparison to that wrought by the fire which began soon after the principal shock on the morning of the 18th. About half the population of the city, it was estimated, spent the nights while the fire was in progress out of doors, with practically no shelter. Some 200,000 camped in Golden Gate Park and 150,000 in the presidio military reservation. The difficulty of checking the fire was increased through the breaking of the water-mains by the earthquake, draining the principal reservoirs. Traffic by street cars was made impossible by the twisting of the tracks.

To stop the fire rows of buildings were dynamited. In this way many fine mansions on Van Ness Avenue were destroyed, and the westward advance of the conflagration was stopped at Franklin Street, one block west. General Funston with a few men and the presidio, with the regular and volunteer fire companies and the Federal troops under him, assumed the control, and the fire was put under military law, the soldiers assisting in the work of salvage and relief. On the 21st the fire was reported under control. A committee of safety was organized by the citizens and by the city authorities acting in conjunction with General Funston, and measures were adopted for the prevention of famine and disease, permanent camps being established for those who had been rendered homeless and not provided for by removal to other cities. Assistance with money and supplies was immediately given by the nation and by foreign countries, a committee of safety was established in charge of its administration. By the 23rd of April about $10,000,000 had been subscribed by the people of the United States; Congress voted $2,500,000 from the national treasury. The committee organized as the Red Cross Relief Corporation completed its work in 1908, having spent for the relief of the hungry, for the sick and injured, and for housing and rehabilitation of individuals and families, in round numbers $9,225,000. As the result of the earthquake and fire about 500 persons lost their lives; of those two were shot as looters. Buildings valued at $2,500,000,000 were razed in a few hours. The total loss in damage property has been variously estimated at from $350,000,000 to $500,000,000. To cover the loss there was about $235,000,000 of insurance in some 230 companies. Reconstruction in the burned section began at once, with the result that it was practically rebuilt in the three years following the earthquake. Wages for men employed in building, owing in part to scarcity of labour but chiefly to action of the labour unions, rose enormously, masons being paid $12 a day for a day of 8 hours. High prices of materials and of haulage and freight rates added difficulty to the task of rebuilding, which was accomplished with remarkable energy and speed. By May 1907 there was a street-car strike of large dimensions. Van Ness Avenue, which during the process of rebuilding had assumed the character of a business thoroughfare, did not maintain this status, the business centre returning to the reconstructed Market Street. A new retail business district developed in what is known as the mission district and in Fillmore Street. A new residence district known as Parkside was developed south of Golden Gate Park.

For description and general features, see Deetz's Guide to San Francisco, and the Picnure Resorts of California (San Francisco, 1897); and various guides and other publications of the California Development Board (formed by consolidation of the State Board of Trade and California Promotion Committee) in San Francisco. For economic interests and history see the bibliography of the article on CALIFORNIA. See also Frank Soule and others, Annals of San Francisco (San Francisco, 1858); John S. Hittell, A History of the City of San Francisco (San Francisco, 1878); B. E. Lloyd, Lights and Shades of San Francisco (San Francisco, 1876); C. W. Stoddard, In the Footsteps of the Padres (San Francisco, 1900); Bernard Moses, The Establishment of Municipal Government in San Francisco (Johns Hopkins University Studies, 1889). Many legal questions of interesting constitutional, treaty and common law import have been decided in the Federal (and state) courts in cases involving Chinese; see the collections of reports. For good accounts of the great earthquake and fire, see D. S. Jordan (ed.), The California Earthquake of 1906 (1906); F. W. Aitken and E. Hilton, History of the Earthquake and Fire in San Francisco (1907); R. K. Gilbert and others, San Francisco Earthquake and Fire (Washington, 1907).

SANGALLO, the surname of a Florentine family, several members of which became distinguished in the fine arts.

I. GIULIANO DI SANGALLO (1445-1516) was an architect, sculptor, tarsiator and military engineer. His father, Francesco di Paolo Giamberti, was also an able architect, much employed by Cosimo de' Medici. During the early part of his life Giuliano worked chiefly for Lorenzo the Magnificent, for whom he built
a fine palace at Poggio-a-Cajano, begun in 1485, between Florence and Pistoia, and strengthened the fortifications of Florence, Castellana and other places. Lorenzo also employed him to build a monastery of Austin Friars outside the Florentine gate of San Gallo, a nobly designed structure, which was destroyed during the siege of Florence in 1530, but from his designs they received the name of San Gallo, which was afterwards used by so many Italian architects. While still in the pay of Lorenzo, Giuliano visited Naples, and worked there for the king, who sent him back to Florence with many handsome presents of money, plate and antique sculpture, the last of which Giuliano presented to his patron Lorenzo. After Lorenzo’s death in 1492, Giuliano visited Loreto, and built the dome of the church of the Madonna, in spite of serious difficulties arising from its defective piers, which were already built. In order to gain strength by means of a strong cement, Giuliano built his dome with pozzolana brought from Rome. Soon after this, at the invitation of Pope Alexander VI., Giuliano went to Rome, and designed the fine panelled ceiling of S. Maria Maggiore. He was also largely employed by Julius II., both for fortification walls round the castle of S. Angelo, and also to build a palace adjoining the church of S. Pietro in Vincoli, of which Julius had been titular cardinal. Giuliano was much disappointed that Bramante was preferred to himself as architect for the new basilica of St Peter, and this led to his returning to Florence, where he did much service as a military engineer and builder of fortresses during the war between Florence and Pisa. Soon after this Giuliano was recalled to Rome by Julius II., who had much need for his military talents both in Rome itself and also during his attack upon Bologna. For about eighteen months in 1514–1515 Giuliano acted as joint-architect to St Peter’s together with Raphael, but owing to age and ill-health he resigned this office about two years before his death.

II. ANTONIO DI SANGALLO (1452–1534) was the younger brother of Giuliano, and took from him the name of Sangallo. To a great extent he worked in partnership with his brother, but he also executed a number of independent works. As a military engineer he is said to have designed and had built various small forts as Giuliano, and carried out important works of walling and building fortresses at Arezzo, Montefiascone, Florence and Rome. His finest existing work as an architect is the church of S. Biagio at Montepulciano, in plan a Greek cross with central dome and two towers, much resembling, on a small scale, Bramante’s design for St Peter’s. He also built a palace in the same city, various churches and palaces at Monte Sansavino, and at Florence a range of monastic buildings for the Servite monks. Antonio retired early from the practice of his profession, and spent his latter years in farming.

III. FRANCESCO DI SANGALLO (1493–1570), the son of Giuliano di Sangallo, was noted mainly as an engineer, and worked chiefly as a sculptor. His works have for the most part but little merit—the finest being his noble effigy of Bishop Leonardo Bonafede, which lies on the pavement of the church of the Certosa, near Florence. It is simply treated, with many traces of the better taste of the 15th century. His other chief existing work is the group of the “Virgin and Child and St Anne,” executed in 1526 for the altar of Or San Michele.

IV. BASTIANO DI SANGALLO (1481–1557), sculptor and painter, was a nephew of Giuliano and Antonio. He is usually known still as Bastiano, a nickname he received from his air of sententious gravity. He was at first a pupil of Perugino, but afterwards became a follower of Michelangelo.

V. ANTONIO DI SANGALLO, the younger (1485–1546), another nephew of Giuliano, went while very young to Rome, and became a pupil of Bramante, of whose style he was afterwards a close follower. He lived and worked in Rome during the greater part of his life, and was much employed by several of the popes. His most perfect existing work is the brick and travertine church of S. Maria di Loreto, close by Trajan’s column, a building remarkable for the great beauty of its proportions, and its noble effect produced with much simplicity. The lower order is square in plan, the next octagonal, and the whole is surmounted by a fine dome and lofty lantern. The lantern is, however, a later addition. The interior is very impressive, considering its very moderate size. Antonio also carried out the lofty and well-designed church of S. Giovanni del Fontelmini, which had been begun by Jacopo Sansovino. The east end of this church rises in a very stately way out of the bed of the Tiber, near the bridge of Sant’Angelo; the whole has been ruined by the addition of a later façade, but the interior is a noble example of a somewhat dull style. Great skill was shown in successfully building this large church, partly on the solid ground of the bank and partly on the shifting sand of the river bed. Antonio also built the Cappella Paolina and other parts of the Vatican, together with additions to the walls and forts of the Leonine City. His most ornate work is the lower part of the cortile of the Farnese palace, afterwards completed by Michelangelo, a very rich and well-proportioned specimen of the then favourite design, a series of arches between engaged columns supporting an entablature, an arrangement taken from the outside of the Colosseum. A palace in the Via Giulia built for himself still exists under the name of the Palazzo Sacchetti, much injured by alterations. Antonio also constructed the very deep and ingenious rock-cut well at Orvieto, formed with a double spiral staircase, like the well of Saladin in the citadel of Cairo.

See Raviolo, Notizia sui lavori... del noto Da San Gallo (Rome, 1860); G. Clause, Les Sangallo (Paris, 1900–1901). (J. H. M.)

SANGER, JOHN (1816–1889), English circus proprietor, was born at Chew Magna, Somerset, in 1816, the son of an old sailor of the name of Sanger; he was turned to showmanship in 1845, he started with his brother George a conjuring exhibition at Birmingham. The venture was successful, and the brothers, who had been interested spectators of the equestrian performances at Astley’s Amphitheatre, London, then started touring the country with a circus entertainment consisting of a horse and pony and three or four human performers. This enterprise was a success from the beginning, and in due course John and George Sanger became lessees of the Agricultural Hall, London, and there produced a large number of elaborate spectacles. In 1871 the Sangers leased Astley’s where they gave an equestrian pantomime every Christmas. The Sanger company, however, was not a success, and, with a large circus tent, the partnership was dissolved, each brother producing his own show. John Sanger died while touring, at Ipswich on the 22nd of August 1889, the business being continued by his son.

SANGERHAUSEN, a town of Germany, in the Prussian province of Saxony, situated on the Gonna, near the south base of the Harz mountains, 30 m. W. of Halle, on the main line of railway Berlin-Nordhausen-Cassel. Pop. (1905) 12,439. Among many medieval buildings, the church of St Ulrich, one of the finest specimens of Romanesque architecture in Germany, and the church of St James, with a magnificent altar screen and frescoes which are both religious and artistic, are particularly admirable. There is a gymnasium, two hospitals dating from the 14th century, and an old town-hall. The industries include the manufacture of sugar, furniture, machinery, boots and buttons. Brewing and brickmaking are also extensively carried on, and there is a considerable agricultural trade.

Sangerhausen is one of the oldest towns in Thuringia, being mentioned in a document of 991 as appertaining to the estates of the emperor. By marriage it passed to the landgrave of Thuringia, and after 1056 it formed for a while an independent country. Having been again part of Thuringia, it fell in 1849 to Meissen, and in 1850 to Brandenburg. In 1873 it passed to Saxony and formed a portion of that territory until 1875, when it was united with Prussia.

See K. Meyer, Chronik des landrathlichen Kreises Sangerhausen (Nordhausen, 1892); and F. Schmidt, Geschichte der Stadt Sangerhausen (Sangerhausen, 1906).

SAN GERMAN, a city of the department of Mayaguez, Porto Rico, in the south-western part of the island, about 10 m. S.S.E. of the city of Mayaguez. Pop. of the city (1890) 3954; of the municipal district 20,246, of whom 10,715 were of mixed races. The city is served by the American railway and Porto Rico. Interesting tombs on the Sibilo river, in a fertile agricultural region, which produces sugar, coffee, fruit, cacao and tobacco.
In one of the public squares is a Dominican church built in 1338.

San German was founded in 1517, was plundered by the French in 1528, was destroyed by corsairs in 1554, and was unsuccessfully attacked by the English in 1748. Until 1782 it was the seat of government of the western district of the island. It was made a city in 1877.

SAN GIMIGNANO, a town of Tuscany, Italy, in the province of Siena, 24 m. N.W. of Siena, at an elevation of 1089 ft. Pop. (1901) 4060 (town); 10,866 (commune). Being surrounded by its ancient walls, and retaining thirteen out of its original fifty towers, it is, with its predominantly Gothic architecture, a thoroughly medieval town in appearance. In the council chamber of the town-hall (1288-1323) is a fresco by Lippo Memmi of the Madonna enthroned of 1317, copied closely from the similar fresco (the "Majestas") by his master Simone di Martino in the Palazzo Pubblico at Siena; there is also a curious frescoed frieze of 1291, with knights in armour. The museum in the same building contains pictures and other objects of art. The tower is the highest in the town (174 ft.), while the Torre dell'Orologio (167 ft.) close by marks the height beyond which private individuals might not build. In the same piazza is the Collegiata (the former cathedral) of the 12th century, enlarged after 1466 by Giuliano da Maiano, whose brother Benedetto erected the church of S. Fina from his plans in 1468, and carved the fine marble altar, the original painting and gilding of which are still preserved. The marble choir, a small reproduction of the splendid one in S. Domenico at Siena, is also by Benedetto. The beautiful frescoes with scenes from the life of the saint (a looped and well-traced set of fifteen) are the earliest work of Domenico Ghirlandaio, completed before 1475. There are also some frescoes of his cousin Bastiano Mainardi (d. 1513). The cathedral contains other 14th-century and early Renaissance paintings, the former including some Passion scenes, the only certain work of Barna da Siena, and some fine choir stalls. S. Agostino (1280-1290) contains a famous series of seventeen frescoes by Benozzo Gozzoli, with scenes from the life of St Augustine (1463-1467). They have been to some extent restored. The altar of S. Bartoldus, by Benedetto da Maiano, is not unlike that in the Collegiata (1404). The town was independent in the 13th century, but in 1353 owing to the dissensions of the Salvucci (Ghibellines) and Ardighelli (Guelphs), it fell into the hands of Florence.

See R. Pantini, San Gimignano e Certaldo (Bergamo, 1905).

SANGLI, a native state of India, in Bombay, ranking as one of the Southern Mahratta Jagirs. The territory is widely scattered among other native states and British districts. Area, 1112 sq. m. Pop. (1901) 226,128; estimated revenue, £10,000. The river Kistna waters part of the country, which is exceedingly fertile. Millet, rice, wheat and cotton are the chief crops, and cotton cloth is manufactured. The chief, whose title is Tatya, Saheb Patwardhan, is a Brahman by caste. The town of Sangli, on the river Kistna, has a station on the Southern Mahratta railway, 11 m. from Miraj Junction. Pop. (1901) 16,820.

SANJO, SANETOMI, Prince (1837-1891), Japanese statesman, was one of the old court nobles (kuge) of Japan, and figured prominently among the little band of reformers who accomplished the overthrow of feudalism and the restoration of the administration to the Mikado. He served as the first prime minister (daiei daijin) in the newly organized Meiji government.

SAN JOSE, or San José de Costa Rica, the capital of the republic of Costa Rica, in the central plateau of the country, 3868 ft. above sea-level, and on the transcontinental railway from the Pacific port of Puntarenas to the Atlantic port of Limón. Pop. (1908) about 26,500. San José is an episcopal see, the most populous city in Costa Rica, and the centre of a rich agricultural region; its climate is temperate, its water-supply pure and abundant. The city was founded in 1738, and became the capital in 1823 (see COSTA RICA: History). It is thoroughly modern in appearance, with macadamized streets lighted by electricity; its houses are of brick or cement, and the trade is largely a branch of the export trade. The suburbs consist chiefly of cane huts, tenanted by Indians and half-castes. The larger of two public gardens, the Morazán Park, contains a representative collection of the Costa Rican flora. The principal buildings are the cathedral, founded in the 18th century but restored after 1870, the hospital, government offices, institutes of law and medicine, and of physical geography, training school for teachers, national bank, museum, library and barracks. The staple trade of San José is in coffee.

SANTO DOMINGO, an Andine province of Argentina, bounded N. by the La Rioja, S. by the San Luis, W. by the Cordilleras of Yungas, and E. by Chile, from which it is separated by the Andean Cordilleras. Area, 33,715 sq. m.; pop. (1904, estimate) 90,555. It is roughly mountainous, and belongs to the closed drainage basin of western Argentina, centre of the province of Mendoza. It is traversed by several rivers, fed by the melting snows of the Andes and discharging into the swamps and lagoons in the S.E. part of the province, the largest of which are the Huamacache lagoons. The largest of these rivers are the Vermejo, Zanjón or Jachal and San Juan. They are all used for irrigation. The climate is extremely hot and dry in summer, but the winter temperature is mild and pleasant. Agriculture is the principal occupation of its inhabitants, though the soil is generally sterile.
and the rainfall uncertain and very light. Cereals are grown in some localities, and there are large vineyards where irrigation is possible, from which excellent wine is made. The province contains gold, silver, copper, iron, lead, coal and salt, but mining has never been developed to any extent. Pastoral interests are largely in feeding cattle for the Chilean markets, for which large areas of alfalfa is grown in the irrigated valleys of the Andes. The Argentine Great Western railway connects Mendoza with the capital of the province, and with the principal cities of the continent.

The capital of the province is SAN JUAN, once called SAN JUAN DE LA FRONTERA (pop. 1904, estimate, 11,500), in a great bend of the San Juan river, 95 m. N. of Mendoza and 730 m. from Buenos Aires by rail. The great bend of the river affords easy irrigation, and the surrounding country is covered by a network of irrigating canals, even the paved streets of the town having streams of cool water running through them. The public buildings include a cathedral, three churches, and several schools, including the 'Escuela Sarmiento,' a fine edifice with a Greek façade, named after President Domingo Faustino Sarmiento (1811-1880), who was a native of this city. There is also a botanical garden.

San Juan was founded in 1561 by Juan Yturri, a companion of Captain Castillo, the founder of Mendoza. Both came from Chile, to which these outlying colonies were at first subject. From 1776 to 1820 it was governed from Mendoza, and then a popular uprising made the province independent and the town its capital. It has suffered severely from political disorders, and in 1894 was nearly destroyed by an earthquake. The original settlement, now called Pueblo Viejo, 4 m. N., was abandoned on account of frequent inundations. The present town is situated about 2165 ft. above sea-level and is defended from inundations by an embankment above the town, called the Murallon. San Juan exports wine, and has a profitable trade with Chile over the Patos and Uspallata passes.

SAN JUAN (SAN JUAN BAPTISTA DE PUERTO RICO), the capital and largest city of Porto Rico, is on a small and narrow island which lies near the north coast, about 35 m. from the east end of Porto Rico, and is united to the mainland by the bridge of San Antonio, Pop. (1890) 32,648, including 5296 negroes and 11,520 of mixed races; (1901) 48,716. San Juan is served by the American railroad of Porto Rico and by steamboats from New York and other ports. The harbour lies between the city and the mainland. It is capacious and landlocked, except on the north. A portion of it is 30 ft. in depth, and in 1907 Congress passed an Act for enlarging this area by dredging and especially for widening the entrance for large vessels; the work was virtually completed in 1909. San Juan is noteworthy for its fortifications and public buildings, and is the only fortified city of Porto Rico.

On a bluff about 100 ft. high at the west end of the island and commanding the entrance to the harbour rise the battlements of Morro Castle, which was completed about 1584 and in which there is a lighthouse. The Castle of San Cristóbal (begun early in the 17th century, completed in 1771) extends across the island in the rear portion of the city. A wall on each side of the island connects the two castles. The Cañuelo is an abandoned fort on an islet opposite the Morro and less than 1000 yds. from it, the main channel lying between them. Forts San Juan and San Carlos, opposite the tomb of Ponce de León, in theJávea of San José is a bronze statue (said to have been cast from cannon taken from the English in 1779) to his memory. In the Plaza Colón is a marble and granite monument to Columbus. In the church of San Francisco are two good paintings by José Campeche (1752-1800), a local artist. Other churches are the severely beautiful Santo Domingo, the Santa Ana, the Cathedral, with a rich shrine of Nuestra Señora de la Providencia, and the church of San José, which was formerly the Dominican convent. Among the prominent buildings and institutions are the custom-house, the executive mansion (formerly the palace of the Governor-General), the University, the theatre, the provincial capitol, the Central Bank, the Señor Church, the high court, the municipal hospital, the Protestant Hospital, the Presbyterian Hospital, two municipal hospitals (one surgical, one medical), a municipal bath-house and a small public library (the "Cervantes"). At Rio Piedras, not far from San Juan, is the Normal School and Agricultural School of Porto Rico. Other institutions are the Normal School of Mariana, with wharves and piers, Puerto de Yaque, on the mainland, Santurce, with a country club, the Union Club, a beautiful market-place, two charity schools and some attractive villas. In the vicinity are the United States and Army and Navy Hospitals, and the public buildings consist of the excellent New Customs House, the warehouses, the dock, the Fresh Produce commission house, and the New railway station.

SAN JUAN (or HARO) ISLANDS, an archipelago (San Juan, Orcas, Shaw, Lopez, Blakely, Cypress, &c.) lying between Vancouver Island and the mainland of North America. These islands were for many years the subject of dispute between the British and the United States governments, and were finally assigned to the latter country by the arbitration of the emperor of Germany (on the 21st of October 1872). Geographically the cluster certainly belongs to the mainland, from which it is separated by Rosario Strait, generally much under 50 fathoms. In 1873 the islands, formerly considered part of Whatcom county, Washington, were made the separate county of San Juan. Of the total area of 200 sq. m., about 60 are in San Juan, 60 in Orcas and 30 in Lopez.

SANKARA ACHARYA (c. 789-820), Hindu theologian, was born about the year 80, probably in Kanchi, the capital of the Kaladi Saar. He was of the Nambudri class of Brahmins. He wandered far and wide, and engaged in much philosophical and theological debate. He taught the existence of the Supreme God and founded the sect of the Smarta Brahmins. His great achievement was the perfecting of the Mimansa or Vedanta philosophy. So great were his learning and piety that he was regarded as an incarnation of Siva, and his works (commentaries on the Vedanta Sutras, the Bhagavad Gita and the Upanishads) exercised a permanent influence on Hindu thought. He died at Kedarnata in the Himalayas when only 32 years of age.

SANKT JOHANN, a town of Germany, in the Prussian Rhine province, on the right bank of the Saar, opposite Saarbrücken, with which it is connected by three bridges. It is 40 m. N.E. from Metz and at the junction of lines from Trier, Bingerbrück and Zwillbrücken. Pop. (1905) 24,140. Sankt Johann is the seat of extensive industries, the chief being the manufacture of railway plant and machinery, iron-founding, wire-drawing and brewing; its rapid industrial development is due mainly to the extensive railway system of which it is the centre. Sankt Johann obtains its name from a chapel erected here. From 1521 to 1850 it formed a single town with Saarbrücken,
and then was united to form one municipality with Saarbrücken and Malstatt-Burbach (combined population, 90,000).

**SANKT PÖLTEN**, an old town and episcopal see of Austria, in Lower Austria, 38 m. W. of Vienna by rail. Pop. (1900) 14,530. It is situated on the Traisen, a tributary of the Danube, and contains an interesting old abbey church, founded in 1050 and restored in 1266 and again at the beginning of the 18th century. There are several religious educational institutions in the town, and a military academy for engineers. The industries include cotton spinning and milling, as well as the manufacture of iron and hardware, and small arms. Sankt Pölten was an inhabited place in the Roman period. An abbey dedicated to St Hippolytus was founded here in the 9th century, around which the town developed. It was called Panum Sancti Hippolyti, from which, by corruption, the actual name is derived. It was surrounded with walls and fortifications in the time of Rudolf of Habsburg, but these were demolished in modern times.

See Lampel, *Urkundenbuch des Chorherrenstifts Sankt Pölten (Virgen de la Bonanza)*.

**SAN LUCAR** (or Sanlúcar de Barrameda), a fortified seaport of southern Spain, in the province of Cadiz; 27 m. by sea from Cadiz, on the left bank of the Guadalquivir estuary, and on the Puerto de Santa Maria-San Lucar and Jerez de la Frontera-Bonanza railways. Pop. (1900) 23,883. The town is divided into two parts, Alta ("upper") and Baja ("lower"); for it is built partly on the flat foreshore, partly on the rising ground to the south. The upper part is the older; it culminates in the ruins of a Moorish citadel. On the outskirts are many villas surrounded by pine; palm and orange groves, and often irrigated by water from springs near Seville, who come to San Lucar for the excellent sea-bathing. The 14th-century church and the palace of the dukes of Medina Sidonia contain many valuable pictures. The hospital of St George was established by Henry VIII. of England in 1517 for English sailors. The Guadalquivir estuary is deep and sheltered, and lighted by four lighthouses. Bonanza, 2 m. by rail up the river, and on the same bank, is the headquarters of the shipping and fishing trades. It is named after a chapel dedicated here by the South American Company of Seville to the Virgin of Fair Weather (Virgen de Buena Suerte). The fisheries and agricultural trade of San Lucar are considerable; there are flour mills in the town and a dynamite factory among the surrounding sandhills. Coal is imported from Great Britain, sulphur from France. The imports include sherry, manzanilla and other wines, salt, oats and fruit.

Inscriptions and ruins prove that San Lucar and Bonanza were Roman settlements, though the original names are unknown. San Lucar was captured from the Moors in 1264, after an occupation lasting more than five and a half centuries. After 1492 it became an important centre of trade with America. From this port Columbus sailed in the Atlantic in 1498, and Magellan started in 1519 to circumnavigate the world.

**SAN LUIS**, a province of Argentina, bounded N. by Rioja, E. by Cordoba, S. by the La Pampa territory and W. by Mendoza. Area, 28,535 sq. m. Pop. (1904, estimated) 97,458. San Luis belongs partly to the semi-arid pampa region, and partly to the mountainous region of the eastern Andes and Cordoba whose ranges terminate between the 33rd and 34th parallels. It is one of the least important of the Argentine provinces because of its aridity and lack of available resources. The rough northern districts, where an occasional stream affords irrigation for a fertile soil, are noted for a remarkably uniform, dry, mild and healthful climate. The Rio Quinto has its sources in these ranges; the Desaguadero, or Salado, forms its western boundary; and the Conlara flows northward among its broken ranges to the great salinas of western Cordoba. Only in the mountains are these streams available, as they soon become impregnated with saline matter on the plains. The southern part of the province is a great, arid, saline plain, practically uninhabitable. Agriculture and grazing occupy some attention in the north, but are handicapped by lack of water. The mountains are rich in minerals, however, and a number of gold mines have been opened. The exports include cattle, hides, skins, wool and ostrich feathers. The capital is San Luis (pop. 1904, about 10,500) on the Arroyo Chorillos, a little S. of the cerro called Punta de los Venados, 374 m. by rail (the Argentine Great Western) W. of Rosario, and magnificently situated on a plateau 2390 ft. above sea-level. Next in importance is the town of Mercedes or Villa Mercedes (pop. 1904, about 6000) on the Rio Quinto, an important railway junction where the railways from Buenos Aires, Rosario, Mendoza and San José unite. San Luis was founded in 1607 by Martin de Loyola and was for nearly 200 years only a frontier outpost. It suffered much in the civil wars of 1831-1836.

**SAN LUIS POTOSÍ**, a central state of Mexico, bounded N. by Coahuila, E. by Nuevo Leon, Tamaulipas and Vera Cruz, S. by Hidalgo, Querétaro and Guanajuato, and W. by Zacatecas. Area, 25,316 sq. m. Pop. (1900) 575,432. The state belongs wholly to the high plateau region, with the exception of a small area in the S.E. angle, where the tableland breaks down into the tropical valley of the Panuco. The surface is comparatively level, with some low mountain ranges. The eastern part borders on the Sierra Madre Oriental, where there are extensive forests. The mean elevation is about 6000 ft., insuring a temperate climate. The state lies partly within the arid zone of the north, the southern half receiving a more liberal rainfall through the influence of the "nothres" on the Gulf coast. The rainfall, however, is uncertain and the state is poorly provided with rivers. The soil is fertile and in favourable seasons large crops of wheat, Indian corn, beans and cotton are grown on the uplands. In the low tropical valleys, sugar, coffee, tobacco, fruits and fresh are staple products. Wine raisin is an important industry and hides, tallow and wool are exported. Fine cabinet and construction woods are also exported to a limited extent. At one time San Luis Potosí ranked among the leading mining provinces of Mexico, but the disorders following independence resulted in a great decline in that industry. The Catorce district has some of the richest silver mines in the country. Other well-known silver mining districts are Peñón Blanco, Ramos and Guadalcazar. The development of Guadalcazar dates from 1630 and its ores yield gold, copper, zinc and bismuth, as well as silver. In the Ramos district, the Cocina lode is said to have a total yield of over 160,000. Railway facilities are provided by the Mexican Central and Mexican National lines, the former crossing a corner of the state and having a branch from the capital to Tampico, and the latter passing through the state from N. to S. The capital is San Luis Potosí, and other towns, with their populations, are: Matehuala (13,101 in 1895), a mining town 20 m. E. by W. of Catorce, with which it is connected by a branch railway; Catorce (5947 in 1895), an important mining town 110 m. N. (direct) of San Luis Potosí (capital); and 8 m. from its railway station on the Mexican National; at an elevation of 5850 ft., Santa Maria del Rio (8440 in 1900), 37 m. S.E. of the capital; Venado (5750 in 1895), 45 m. N. of the capital; Rio Verde (5750 in 1900), an agricultural centre with a national agriculture experiment station in its vicinity; Soledad Diaz Gutierrez (5730 in 1895), near the capital.

**SAN LUIS POTOSÍ**, a city of Mexico and capital of a state of the same name, near the head of the valley of the Rio Verde (a tributary of the Panuco), 215 m. by rail N.W. of the city of Mexico. Pop. (1900) 61,025. The city is served by the Mexican National and the Mexican Southern railways. It is built on a broad level space, laid out regularly with straight well-paved streets and shady plazas. The altitude of the city, 6168 ft. above sea-level, gives it a cool temperate climate, though the sun temperatures are high. The water-supply was formerly very deficient, but two artesian wells have been drilled to a depth of 450 ft. and furnish 30,000 gallons a day each, in addition to which a large dam 3 m. above the city has been built, having a storage capacity of 7,500,000 cubic meters (1,650,000,000 gallons), or 18 months' supply, which is used for irrigation and domestic purposes. The better class of residences are usually
two storeys high, and include many fine specimens of Spanish colonial architecture; but the suburbs consist chiefly of wretched hovels and stretch out over a large area. Among the more notable public buildings are the cathedral and government palace fronting on the Plaza Mayor, the latter conspicuous for its façade of rose-coloured stone; the churches of El Carmen, San Francisco and Guadalupe; the La Paz theatre, mini-penitentiary and the Instituto Cívico, in which law, medicine and science are taught. San Luis Potro is an important railway and distributing centre, with a considerable trade in cattle, tallow, wool, hides and minerals. Its proximity to the port of Tampico, with which it was connected by a branch of the Mexican Central railway in 1885, has greatly increased its commercial importance, though in earlier days it was also one of the principal centres of the diligence and pack-train traffic of this part of Mexico. The city has cotton and woolen factories using modern machinery, and the smelting works of the Metalurgica Mexicana company, an American enterprise.

San Luis Potro was founded in 1586. It was an important centre of colonial administration and played an important part in the civil wars and political disorders following Mexican independence. It was the seat of the Mexican government of Benito Juárez in 1863, but was soon afterwards captured by the French under Bazaine. It was recovered by Juárez in 1867, after the French had retired.

SAN MARINO, a republic in northern Italy, 14 m. S.W. of Rimini by road. Pop. (1901) about 1600 (town); 6500 (whole territory). It is the smallest republic in the world (32 m.² in area). According to tradition the republic was founded by St. Marinus in the 7th century, and the persecutions under Dioscletian, while his companion, St. Leo, founded the village of that name 7 m. to the S.W., with La Rocca its old castle, now a prison, in which the impostor Cagliostro died in 1795. The history of S. Marino begins with the 9th century, the monastery of S. Marino having existed demonstrably since 885. In the 10th century a communal constitution was established. The republic as a rule avoided the faction fights of the middle ages, but joined the Ghilibelines and was interdicted by the pope in 1247–1249. After this it was protected by the Montefeltro family, later dukes of Urbino, and the papacy, and successfully resisted the attempts of Sigismondo Malatesta against its liberty. In 1503 it fell into the hands of Caesar Borgia, but soon regained its freedom. Other attacks failed, but civil discord was the meantime increased. Its independence was recognized in 1631 by the papacy. In 1739 Cardinal Alberoni attempted to deprive it of its independence, but this was restored in 1740 and was respected by Napoleon. Garibaldi entered it in 1849, on his retreat from Rome, and there disbanded his army. The town stands on the north end of a precipitous rock (2437 ft.) which bears the name of Monte Titano; each of the three surrounding valleys is crowned by fortifications that on the north by a castle, the other two by towers. The arms of the republic are three peaks, each crowned with a tower. There are traces of three different encampments, of the 14th, 15th and 16th centuries. The chief square, the Pianello, contains the new Palazzo del Governo in the Gothic style (1894) and a statue of Liberty (1876). The principal church (Pieve), in classical style, dates from 1826–1838, and contains the body of St. Marinus. The old church, then demolished, is first mentioned in 1115, but was several times restored. S. Francesco has some paintings by Niccolò Alunno of Foligno and other later artists, and a pretty loggia. The museum contains a few pictures of various schools and some Umbrian antiquities. Bartolommeo Borghesi, the epigraphist and numismatist, resided here from 1821 until his death in 1860. The Borgo at the base of the rock is a chiefly commercial village.

The supreme power of the republic resides in the general assembly (Arringo) which meets twice a year. It is governed by two Capitani Reggenti, selected twice a year from the 60 life-members of the Great Council, which is composed of 20 representatives of the nobility, 20 of the landowners and 20 of the citizens. They are assisted by a small committee of 12 of the

Great Council. The available armed forces of the republic form a total of about 1200 men, all citizens able to bear arms being technically obliged to do so from the age of 16 to 60 years. San Marino issues its own postage-stamps, and makes thereby a considerable income. It also issues its own copper coinage, which circulates in Italy also; but Italian money is current for the higher values. Most of the republic falls within the diocese of Montefeltro, a small portion within that of Rimini.

See C. Ricci, La Repubblica di San Marino (Bergamo, 1903).

SAN MARTIN, José de (1778–1850), South American soldier and statesman, was born at Yapeyú on the Uruguay river on the 25th of February 1778. His father was a captain in the Spanish army, and young San Martin was taken to Madrid and educated for a military career. He served in the Moorish wars and in the great struggle against Napoleon, and his distinguished conduct at the battle of Bayalen brought him the rank of lieutenant-colonel. In 1812 he offered his services to the government of Buenos Aires in the struggle for the independence (Act of 1813). He was appointed early in 1814 to the command of the revolutionary army operating against the royalists on the borders of Upper Peru. But he soon resigned his command, realizing that for the permanent success of the revolutionary cause it was necessary first to oust the Spaniards from Chile and then to organize an expedition thence against the stronghold of Spanish power on Peru. With this end in view he secured his appointment to the governorship of the province of Cuyo, bordering on the Chilean Andes, and established himself at Mendoza, where he prepared for the invasion of Chile. Assisted by Bernardo O'Higgins, he rallied the Chilean patriots who had fled across the mountains after their defeat at Rancagua; he enlisted the sympathies of the Argentine government, and after two years succeeded in raising a well-trained army of Chilenos and Argentines and in collecting the material resources necessary for a crossing of the Andes. In January 1817 he set out on his enterprise. By the swiftness of his movements and by a clever feint he evaded opposition, and he led his army, of about 3000 infantry and 1000 cavalry, together with artillery and large baggage trains, through a barren and difficult region, and over passes 13,000 ft. above sea-level. The victory of 1817 the re-establishment of a nationalista government at Santiago under Bernardo O'Higgins, as San Martin himself wished to prepare for the invasion of Peru; but in 1818 he took command of the Chilean forces against a fresh royalist army, and by his victory at the river Maipo in April finally secured the independence of Chile. This left him free to organize the expedition against Peru, and assisted by O'Higgins and the Argentine government, he procured the necessary fleet and the army. He set out in August 1820, landed his forces for a short time at Pisco, where he tried to enter into negotiations with the viceroy of Lima, and then transported his army with the help of the fleet to a point on the coast a little way north of Lima. Here he spent several months of inaction, hoping that the demonstration of force and the influence of popular feeling would lead to a peaceful withdrawal of the Spaniards. In July 1821 the Spaniards evacuated Lima, San Martin entered the city, proclaimed the independence of Peru and assumed the reins of government with the title of Protector. His position, however, was far from secure. The royalist party, never having been decisively crushed, organized risings in the interior, and San Martin was embarrassed by the jealousy which his authority roused among the patriots and by the rivalry of Bolivar, who had arrived with an army on the northern frontier of Peru. San Martin resigned his authority on the 20th of September 1822 and left the country. He spent a short time in Chile and in Argentina, but his many enemies had embezzled popular feeling against him, and constant attempts were made to involve him in political intrigues. Unable to live a peaceful private life, he was compelled to exile himself in Europe, where he lived, often in great poverty, till his death at Boulogne on the 17th of August 1850.

San Martin did more than any man for the cause of independence in the Argentine, Chile and Peru. He was not only an able soldier; in
SANMICHELE—SAN REMO

the clearness with which he realized that the independence of each state could only be secured by the co-operation of all, and in the performance with which he carried his views into execution he showed himself a far-seeing and honest statesman.

See W. Pilling, Emancipation of South America (London, 1893), a translation of B. Mitre’s life of San Martín; P. R. Figueroa, Diccionario biográfico de Chile (Santiago, 1888) and J. B. Suarez, Rasgos biográficos de hombres notables de Chile (Valparaíso, 1886), both giving sketches of prominent characters in Chilean history. See also works of cronistas and biographers.

SANMICHELE, MICHELE (1484–1559), Italian architect, was in San Michele near Verona. He learned the elements of his profession from his father Giovanni and his uncle Bartolomeo, who both practised as architects at Verona with much success. He went at an early age to Rome to study classic sculpture and architecture. Among his earliest works are the duomo of Montefiascone (an octagonal building surmounted with a cupola), the church of San Domenico at Orvieto, and several palaces at both places. He also executed a fine tomb in S. Domenico. He was no less distinguished as a military architect, and was much employed by the signorina of Venice, not only at home, but also in strengthening the fortifications of Corfu, Cyprus, and Candia. One of Sanmichele’s most graceful designs is the Cappella de’ Peregini in the church of S. Bernardino at Verona—square outside and circular within, of the Corinthian order. He built a great number of fine palaces at Verona, including those of Canossa, Bevilacqua and Pompel, as well as the graceful Ponte Nuovo. In 1527 Sanmichele began to transform the fortifications of Verona according to the newer system of constructing a bastion system for the advancement of which he was much valued service. His last work, begun in 1559, was the round church of the Madonna di Campagna, 1½ m. from Verona on the road to Venice. Like most other distinguished architects of his time he wrote a work on classic architecture, I Cinque Ordini dell’architettura, printed at Verona in 1735.

See Ronzani and Luculli, Fabbriche...di M. Sanmichele (Venice, 1812); and Selva, Elogio di Sanmichele (Rome, 1814).

SAN MIGUEL, the capital of the department of San Miguel, Salvador; 80 m. E. by S. of San Salvador, near the right bank of the Rio Grande, and at the foot of the volcano of San Miguel or Jucuapa (7120 ft.). Pop. (1905) about 25,000. San Miguel is an important and attractive city, although the extensive swamps in the Rio Grande Valley render malaria common. It possesses several handsome churches, municipal buildings, law courts and two well-equipped hospitals. Near it are the ruins of an ancient Indian city. It was founded in 1527 by Fray Miguel. It had a large Indian town, San Miguel, a town of Indians, a tobacco plantation, a brickyard, a sawmill, a copper-smelter, a distillery, a tannery, a sawmill, and a blacksmith’s shop.

San Miguel was founded in 1550 by Spanish settlers, and became a city in 1586. Its fairs formerly attracted merchants from all parts of Salvador, Guatemala and Honduras, and it is now third in size among the cities of the republic.

SAN MIGUEL DE MAYUMO, a town of the province of Bulacan, Luzon, Philippine Islands, about 40 m. N. of Manila. Pop. (1902) 14,919. In 1903, after the census had been taken, San Ildefonso (pop. 5320) was annexed to San Miguel. It has a cool and very healthy climate, and commands a beautiful view of the surrounding country. The soil is very fertile, and many of the inhabitants have acquired much wealth from the cultivation of rice. Sugar-cane, Indian corn and cotton are also produced in abundance, and cattle are raised. Near the town are iron mines and quarries of limestone, and on the neighbouring mountains are forests containing valuable hardwood timber. About 8 m. N.E. are the medicinal springs of Sibul, to which large numbers of patients from the neighbouring provinces come.

The San Miguel river, which flows near, affords a means of transportation, and the town has considerable commerce. Some beautiful furniture is made of the hardwood from the monte pinal, and notably tallow, even in considerable quantities by the women. The principal language is Tagalog. The chief buildings were destroyed in 1901 in a fire started by a band of thieves.

SAN MINIATO, a town and episcopal see of Tuscany, Italy, in the province of Florence, 26 m. W. by S. of Florence by the railway to Pisa, 512 ft. above sea-level, on a hill 2 m. S. of the railway. Pop. (1901) 4227 (town); 20,242 (commune). Its cathedral dates from the 10th century. It was remodelled in 1488, and has a façade decorated with disks of majolica. It manufactures glass, olive oil, leather and hats. It has a castle of the emperor Frederick I., the residence of the imperial grand masters of Tuscany, 1228–1286, and from them bears the name of San Miniato al Tedesco.

SANNAZARO, JACOPO (1458–1530), Italian poet of the Renaissance, was born in 1458 at Naples of a noble family, said to have been of Spanish origin, which had its seat at San Nazaro near Pavia. His father died during the boyhood of Jacopo, who was brought up at Nocera Inferiore. He afterwards studied at Naples under Giovanni Pontanus, when, according to the fashion of the time, he assumed the name Actius Syncerus, by which he is occasionally referred to. After the death of his mother he went abroad—driven, as we are told, by the parsimony of despised love for a certain Carmosina, whom he has celebrated in his verse under various names; but of the details of his travels nothing is recorded. On his return he speedily achieved fame as a poet and place as a courtier, receiving from Frederick III. as a country residence the Villa Mergiullina near Naples. When his patron was compelled to take refuge in France in 1501 he was accompanied by Sannazaro, who did not return to Italy till after his death (1504). The later years of the poet seem to have been spent at Naples. He died on the 27th of April 1530.

The Arcadia of Sannazaro, begun in early life and published in 1504, is a somewhat affected and insipid Italian pastoral, in which in alternate prose and verse the scenes and occupations of pastoral life are described. See Scherillo’s edition (Turin, 1888). His now seldom read Latin poem De portu Virginitis, which gained for him the name of the “Christian Virgil,” appeared in 1526, and his collected Sonetti e canzoni in 1530.

SAN NICOLÁS DE LOS ALFAYOS, a town and river port of Argentina, in the province of Buenos Aires, on the W. bank of the Parana, 150 m. E. by N. of the city of Buenos Aires. Pop. (1904, estimate) 18,000. It is a flourishing commercial town, and a port of call both for river and ocean-going steamers of medium tonnage. It is a station on the Buenos Aires & Rosario, and the terminus of a branch from Pergamino of the Central Argentine railway, and exports wheat, flour, wool and frozen mutton. The town is the judicial centre for the northern district of Buenos Aires. San Nicolás was founded in 1749 by José de Aguilar on lands given for that purpose by his wife (nºe Ugarte). Its growth was very slow until near the end of the century.

SAN PABLO, a town of the province of Laguna, Luzon, Philippine Islands, 9½ m. S. of Laguna de Bay and about 35 m. S.S.E. of Manila. Pop. (1903) 22,612. It is an important road centre, and in the vicinity are five small mountain lakes. Coconut palms grow in great abundance in the town and vicinity, and copra is the principal product; hemp and, to a less degree, rice, are grown here. The language is Tagalog.

SANQUHAR, a royal and police burgh of Dumfriesshire, Scotland. Pop. (1901) 1370. It is situated on the Nith, 26 m. N.W. of Dumfries by the Glasgow & South-Western railway. It became a burgh of barony in 1424 and a royal burgh in 1506, and was the scene of the exhibition of the Covenanters’ Declaration, attached to the market cross in 1680 by Richard Cameron and in 1685 by James Rcnwick. The industries include coal-mining and the making of bricks and tiles, spades and shovels. The coal-field, measuring 7 m. long by 2½ m. broad, is the most extensive in the shire and is the main source of supply for Dumfries and other towns. The cattle and sheep fairs are important, and an agricultural show is held every May. Sanquhar Castle, on a hill overlooking the Nith, once belonged to the Butes, ancestors of the marquess of Bute, but is now a ruin. Eliock House, in the parish, was the birthplace of James (“the Admirable”) Crichton in 1560.

SAN REMO, a seaport of Liguria, Italy, in the province of Porto Maurizio, on the Riviera di Ponente, 9½ m. E. of Ventimiglia by rail, and 84 m. S.W. of Genoa. Pop. (1901) 17,114 (town); 20,027 (commune). Climbing the slope of a steep hill
SAN SALVADOR—SAN SEVERINO

it looks south over a small bay, and, protected towards the north by hills rising gradually from 500 to 8000 ft., it is in climate one of the most favoured places on the whole coast, a fact which accounts for the great reputation it has enjoyed since 1861. The older town, with its narrow steep streets and lofty sombre houses protected against earth-waves by massive gables, contrasts with the new visitors' town, containing all the public buildings, which has grown up at the foot of the hill. The fort of S. Tecla protects the small harbour, sheltered by its sickle-shaped mole, 1300 ft. long. The promenade of San Remo is the Corso dell' Imperatrice, running from the main street, the Via Vittorio Emanuele, along the coast to the Giardino dell' Imperatrice; it is a broad road shaded by palm-trees, and was, like the garden, constructed at the expense of the empress Maria Alexandrovna of Russia (d. 1880). The Villa Thiem has a valuable picture-gallery, containing for the most part examples of the great 17th-century masters of the Netherlands. Besides the Gothic ex-cathedral of San Siro, the white-domed church of the Madonna della Costa, at the top of the old town, may be mentioned. In front of it is a large hospital. On the east of the harbour, the promenade along the coast is called the Passeggiata Imperatore Federico in memory of the German emperor Frederick, whose visit to the town in 1877-1888 greatly increased its repute as a winter resort. Flowers, especially roses and carnations, are extensively grown for export, and olives, lemons and palms are also cultivated.

San Remo appears to have been dependent on Genoa in its early days, but became independent in 1361. In 1544 the town was attacked by Barbarossa, and in 1625 by the French and Savoyards. The Genoese, against whom the Spanish had long defended its independence, sacked it in 1553; in 1707 it was incorporated in the Ligurian republic, and in 1814 passed to Piedmont.

SAN SALVADOR, the capital of the republic of Salvador; situated in the valley of Las Hamacas, on the river Asalguate, at an altitude of 2115 ft., and 30 m. inland from the Pacific. Pop. (1905) about 60,000. San Salvador is connected by rail with Santa Ana on the north-west and with the Pacific ports of La Libertad and Acapulco. In addition to the government offices, most of the public buildings include a cathedral, a national theatre, an academy of science and literature, a chamber of commerce, and astronomical observatory and a number of hospitals and charitable institutions. There are two large parks and an excellent botanical garden. In the Plaza Morazan, the largest of many shady squares, is a handsome bronze and marble monument to the last president of united Central America, from whom the plaza takes its name. San Salvador is the only city in the republic which has important manufactures; these include the production of soap, candles, ice, shawls and scarves of silk, cotton cloth, cigars, flour and spirits. The city is admirably situated, has an abundant water supply, and can in many respects compare favourably with the smaller provincial capitals of Europe and America. It was founded by Don Jorge de Alvarado in 1528, at a spot near the present site, to which it was transferred in 1539. Except for the year 1839-1849 it has been the capital of the republic since 1834. It was temporarily ruined by earthquakes in 1854 and 1873.

SANS-CULOTTES (French for "without knee-breaches"), the term originally given during the early years of the French Revolution to the ill-clad and ill-equipped cavalry of the Revolutionnary Army, and later applied generally to the ultra-democrats of the Revolution. They were for the most part men of the lower classes, or leaders of the populace, but during the Terror public functionaries and persons of good education styled themselves citoyens sans-culottes. The distinctive costume of the typical sans-culotte was the pantalon (long trousers)—in place of the culottes worn by the upper classes—the carmagnole (short-skirted coat), the red cap of liberty and sabot (wooden shoes). The influence of the Sans-culottes ceased with the reaction that followed the fall of Robespierre (July 1794), and the name itself was proscribed. In the Republican Calendar, at the end of the year X, were the first called Sans-culottes; this name, however, suppressed by the Convention when the constitution of the year III. (1795) was adopted, that of jours complémentaires being substituted.

SAN SEBASTIAN (Basque Iruchulo), a seaport and the capital of the Spanish province of Guipúzcoa, on the Bay of Biscay, and on the Northern railway from Madrid to France. Pop. (1900) 37,812. In 1886 San Sebastian became the summer residence of the court. The influence of Haro, attracted by the presence of the royal family, and the prolonged local festivities, the bull-fights and the bathing, increases the number of the inhabitants in summer to about 50,000. The city occupies a narrow sandy peninsula, which terminates on the northern or seaward side in a lofty mass of sandstone, Monte Urgull; it is flanked on the east by the estuary of the river Uruméa, on the west by the broad bay of La Concha. The old town, rebuilt after the fire of 1813, lies partly at the foot of Monte Urgull, partly on its lower slopes. Until 1865 it was enclosed by walls and ramparts, and a strong fort, the Castillo de la Mola, still crowns the heights of Urgull. There are also batteries and redoubts facing landward and seaward below this fort; but the other defences have been either razed or dismantled. The Alameda, one of many fine avenues, was laid out on the site of the chief landward wall, and separates the old town from the new—in which the houses are uniformly modern, and built in straight streets or regular series of squares. The bay of La Concha has a broad sandy shore, the Playa de Baños, admirable for bathing and sheltered from sea-winds by the rocky islet of Santa Clara. Its centre is faced by the casino, a handsome building erected by order of the empress Eugenie in 1875, and occupied by the rising ground towards its western extremity. The other noteworthy buildings are the bull-ring, capable of seating 10,000 spectators, the theatre, the fine provincial and municipal halls, barracks, a hospital, a Jesuit college, the American International School for girls, and many other schools. There are numerous breweries, saw and flour mills, and manufactures of preserves, soap, candles, glass and paper, especially in the busy suburb that has sprung up on the right bank of the Uruméa. The fisheries are important. The harbour consists of three artificial bays, opened into La Concha (1450), and situated in the midst of the old town; it is chiefly frequented by coasting and fishing vessels, and cannot accommodate large ships. From its position near the frontier San Sebastian was long a first-class fortress, and has sustained many sieges. The last and most memorable was in August 1813, when the allied British, Portuguese and Spanish armies under Lord Wellington captured the city from the French, and then sacked and burned it.

SAN SEPOLCRO, or BORGIO S. SEPOLCRO, a town and episcopal see of Tuscany, Italy, in the province of Arezzo, from which it is 28 m. N.E. by rail. Pop. (1901) 4537 (town); 9077 (commune). The town is situated on the river Tiber. It was the birthplace of Piero della Francesca (1420-1492) and of Raffaello del Colle (1490-1540), a pupil of Raphael. The Romanesque cathedral and the picture-gallery contain works by both these artists.

SAN SEVERINO (anc. Septempeda), a town and episcopal see of the Marches, Italy, in the province of Macerata, from which it is 18 m. W. by rail. Pop. (1905) 3267 (town); 14,932 (commune). The lower town is situated 781 ft. above sea-level, and contains the new cathedral of S. Agostino, with a fine altar-piece by Ghirlandajo (1486); the Palazzo Comunale has some interesting pictures by artists of the Marches. Lorenzo and Giacomo Salimbeni da San Severino, who painted an important series of frescoes in the oratory of S. Giovanni Battista at Urbino in 1416, were natives of the town. So was also the later master Lorenzo di Maestro Alessandro, of the end of the 15th century, whose pictures are mainly to be found in the Marches. The old cathedral of S. Severino is in the upper town (1192 ft. above sea-level); it contains frescoes by the two Salimbeni, while an altar-piece by Niccolo Alunno of Foligno (1468) has been removed hence to the picture gallery. The ancient Septempeda lay 1 m. below the modern town, on the branch road which ran from Nuceria Camellaria through the Via Flaminia; and here the road divided—one branch going to
Ancona and the other through Teltowinent to Urbs Sylvia and Firmum. No ruins of the old town exist, but a considerable number of inscriptions have been found, from which it may be gathered that it was a colonia.

SAN SEVERO, a city in Apulia, Italy, in the province of Foggia, from which it is 17 m. N.N.W. by rail. Pop. (1901) 28,550. San Severo lies at the foot of the spurs of Monte Gargano, 292 ft. above sea-level. It is the see of a bishop (since 1580), and has some remains of its old fortifications. San Severo dates from the middle ages. It was in ruins by Frederick II., and 1503 was the scene of a victory by Robert Guiscard over the papal troops under Leo IX. In 1799 the town was taken by the French and again almost entirely destroyed. The overlordship was held in succession by the Benedictines of the abbey of Torre Maggiore, the Knights Templars, the crown of Naples and the Sangro family (commendataries of Torre Maggiore). In 1627, 1828 and 1851 the town suffered from earth-quakes.

SAN-SHUI, a treaty port in the province of Kwang-tung, China, on the left bank of the West river, 99 m. from Canton, opened to foreign trade in 1877. Pop. about 5000. Its position is on the north side of the estuary of the river and it is usually situated as a distributing centre for foreign goods. Two lines of steamers converge at San-shui, from Canton and Hong-Kong respectively. The town is surrounded by a handsome wall built in the 16th century, but within this rampart the houses are mean. The foreign trade shows small signs of expansion. In 1902 the net foreign imports amounted in value to £474,175, and in 1904 to only £360,000, while the exports during the same two years amounted to £251,300 and £371,100 respectively. The direct foreign trade in 1908 was £509,827. There is a large junk traffic, and the local ilkam station is one of the richest in the province.

SANSKRIT, the name applied by Hindu scholars to the ancient literary language of India. The word sanskrit is the past participle of the verb kar(kt), "to make" (cognate with Latin cren), with the preposition sam, "together" (cogn. sama, Eng. "same"), and has probably to be taken here in the sense of "completely formed" or "accurately made, polished, refined"—"some noun meaning "speech" (esp. bhāṣā) being either expressed or understood with it. The term was, doubtless, originally adopted by native grammarians to distinguish the literary language from the uncultivated popular dialects—the forerunners of the modern vernaculars of northern and north-eastern India—which had developed side by side with it, and which were called (from the same root kar, but with a different preposition) Prakrit, i.e. either "derived" or "natural, common" forms of speech. This designation of the literary idiom, being intended to imply a language regulated by conventional rules, also involves a distinction between the grammatically fixed language of Brahmical India and an earlier, less settled, phase of the same language exhibited in the Vedic writings. For convenience the Vedic language is, however, usually included in the term, and scholars generally distinguish between the Vedic and the classical Sanskrit.

I. Sanskrit Language

The Sanskrit language, with its old and modern descendants, represents the easternmost branch of the great Indo-Germanic, or Aryan, stock of speech. Philological research has clearly established the fact that the Indo-Aryans must originally have immigrated into India from the north-west. In the oldest literary documents handed down by them their gradual advance can indeed be traced from the slopes of eastern Kabulistan down to the land of the five rivers (Punjab) and thence to the plains of the Yamunā (Jumna) and Ganges (Ganges). Numerous special coincidences, both of language and mythology, between the Vedic Aryans and the peoples of Iran also show that these two members of the Indo-Germanic family must have remained in close connexion for some considerable period after the others had separated from them.

The origin of comparative philology dates from the time when European scholars became accurately acquainted with the ancient language of India. Before that time classical scholars had been unable to determine the true relations between the then known languages of our stock. This fact alone shows the importance of Sanskrit for comparative research. Though its value in this respect has perhaps at times been overrated, it may still be considered the oldest daughter of the old mother-tongue. Indeed, so far as direct documentary evidence goes, it may be said to be the only surviving daughter; for none of the other six principal members of the family have left any literary monuments, and their original features have to be reproduced, as best they can, from the materials supplied by their own daughter-languages: the case is the same both with the Thracian, Hellenic, Italic, Celtic, Teutonic and Slavo-Slavic languages. To the Sanskrit the antiquity and extent of its literary documents, the transparency of its grammatical structure, the comparatively primitive state of its accent system, and the thorough grammatical treatment it has early received at the hand of native scholars must ever secure the foremost place in the comparative study of Indo-Germanic speech.

The Sanskrit alphabet consists of the following sounds:—

(a) Fourteen vowels, viz.:—

Ten simple vowels: a, ā, i, ī, u, ū, r, ē, o, ō;

Four diphthongs: e, ē, i, ĕ; d; and

(b) Thirty-three consonants:

Five series of mutes and nasals:

guttural: k, ḥ, g, ṣ, ā;

palatal: ṭ, ṭh, ḫ, dh, ḷ;

lingual: j, ḷ, ḱ, ḷh, ḷn;

dental: Ṱ, ḷd, ḷh, ḷn;

A soft aspirate: ḻ;

Three uniuoiug sounds, viz.:

vrsa (b), a hard aspirate, standing mostly for original s or r; and two nasal sounds of less close contact than the mute-nasals, viz. annāra (m) and anumāsaka (n).

As regards the vowels, a prominent feature of the language is the prevalence of a-sounds, these being about twice as frequent as all the others, including diphthongs taken together (Whitney). The absence of the short vowels ə and û from the Sanskrit alphabet, and the fact that Sanskrit shows the a-vowel where other vowels appear in other languages—e.g. bhārantam = φάντας, fereonem; janas = γένος, genun—were formerly considered as strong evidence in favour of the more primitive state of the Sanskrit vowel system as compared with that of the sister languages. Recent research has, however, shown pretty conclusively from certain indications in the Sanskrit language itself that the latter must at one time have possessed the same, or very nearly the same, three vowel-sounds, and that the differentiation of the original a-sound must, therefore, have taken place before the separation of the languages. Thus, Sanskrit jana, for which there would seem to require an original kēri (Gr. ιανέ = γελείτα, Lat. callit), as otherwise the guttural k could not have changed to the palatal c (see below); and similarly Sanskrit jāna, kṣāṣat (Lat. genu) and jāna (Gr. γένος). Not impossibly, however, this prevalence of pure a-sounds in Sanskrit may from the very beginning have been a mere theoretical or graphic feature of the language, the difference of pronunciation having not yet been pronounced enough for the early grammarians to have felt it necessary to clearly distinguish between the different shades of a-sounds.

The vowels ə and û, though apparently simple sounds, are classed as diphthongs, being contracted from original ꞻ and ꞻ respectively, and liable to be treated as such in the phonetic modifications they have to undergo before any vowel except d. As regards the consonants, two of the five series of mutes, the palatal and lingual series, are of secondary (the one of Indo-Iranian, the other of purely Indian) growth. The palatalis are, as a rule, derived from original gutturals, the modification being generally due to the influence of a neighbouring palatal sound i or y, or ꞻ (d). The surd aspirate ch, in words of Indo-Germanic origin, almost invariably goes back to original sk, e.g. cindra = cindro, cimento, ēkha = oēkh (O.E. sein, shin); Sans. gacchati = hākṣai.

The palatalis ʃ (pronounced sh) likewise originated from a guttural k, but is in reality a different phonetic value from that represented by Sanskrit k or c. The latter, usually designated by k (or q), is frequently liable to labialization (or dentalization) in Greek, probably owing to an original pronunciation kvw (qv); kātakārana = hēmē, while the former (kh) invariably k in Greek, and a palatal in the Letto-Slavic and the Indo-Iranian languages: e.g. kvan (šun) = šoaw (šuv), canis, Ger. Hunf; dalan = dao, deca, Goth. slahun.
The non-original nature of the palatalas betrays itself even in Sanskrit by their inability to occur at the end of a word—e.g. anat-- but anat-- is --anata-- and by otherwise frequently reverting to the guttural state.

The linguists differ in pronunciation from the teeth in their but pronounced through the palate, not against the upper gums as is done in the English teeth, which to Hindus sound more like their own linguistics. The language of the Vedas is curiously attuned up to the phonetic modifications of original dialects, usually accompanied by the loss of an e or another adhering consonant; but more commonly they occur in words of foreign, preferably non-Aryan, origin. Of regular occurrence in Sanskrit, however, is the phenomenon of dental of dental p, and of dental s into lingual s, when preceded in the same word by certain other letters. The combination kṣ sometimes to m, dks to m, kṣi to ci, and kṣini to ci, is characteristic of the Greek, Gr. kṣi (but Latin dexter), and for kṣi, Sans. kṣati, Gr. κατέστης.

The sonant aspirate h is likewise non-original, being usually derived from original sonant aspirated mutes, especially gh, e.g. hamsa = हमसा (for hamsā) anser, Gr. Gans, απάγ = ἀπαγό, ego, Goth. āh.

The contact of final and initial letters of words in the same sentence is often attended in Sanskrit with considerable euphonic modifications; and we have no means of knowing how far the practice of the vernacular language may have corresponded to these phonetic theories. There can be no doubt, however, that the Sanskrit language is subject to a much wider field of grammatical reflection; and the very facilities which the primitive structure of the language offered for grammatical analysis and an insight into the principles of internal modification may have given the language a refined and subtle inflectional system.

None of the cognate languages exhibits so transparent a manner as the Sanskrit, the cardinal principle of Indo-Germanic word-formation by the addition of inflectional endings—other modifications of word-meaning have been at the disposal of other languages, whereas the latter has preserved its allography to stems obtained, mainly by means of suffixes, from monosyllabic roots, with or without internal modifications.

Phonetic change.

Declen.sion.

The declension of a-stems and a to seven cases, not counting the vocative, viz. nominative, accusative, instrumental (or sociative), dative, ablative, genitive and locative. As a matter of fact, all seven these cases are not regularly recognized by the grammarians, and the second in particular is not applied to the plural, and the third on the principle of the accusative.

None of the cognate languages exhibit so transparent a manner as the Sanskrit, the cardinal principle of Indo-Germanic word-formation by the addition of inflectional endings—other modifications of word-meaning have been at the disposal of other languages, whereas the latter has preserved its inflections to stems obtained, mainly by means of suffixes, from monosyllabic roots, with or without internal modifications.

The declension of a-stems corresponding to the first and second Latin declensions is of especial interest, not so much on account of its being predominant from the earliest time, and becoming more and more recognized by the students of Sanskrit, but because of the presences greater number of alternative forms, which supply a kind of test for determining the age of literary productions, a test which indeed has already been applied to some extent by Professor Veljanov and others.
different phonological elements, or otherwise. The treatment of the personal endings in the modifying, and presumably older, conjugation may thus be said somewhat to resemble that of enclitics in Greek.

In the imperfect the present-stem is increased by the augment, consisting of a prefixed ǝ. Here, as in the other tenses in which it occurs, the augmentative is derived from the imperative of the 1st sing. of verbs in ǝ, it also has irregularly the primary ending, ǝsvorrVe = ǝsvorV (S. 4-v-y-ǝm); while in the a-conjugation and throughout the perfect, the mood-sign is i, probably a contraction of ǝ: e.g. bdhès = bdhopos.

Besides the ordinary perfect, made from a reduplicated stem, with distinction between strong (active singular) and weak forms, and the imperative, there is also a special form of the perfect, with the large use of a periphrastic perfect, consisting of the accusative of a feminine abstract noun in ǝ (d-ǝm) with the reduplicated perfect forms of the auxiliary, to be or do, or (and occasionally bē, broad vowel-raising.

The grounds on which this theory is recommended are those of logical consistency. In the analogous cases of interchange between r and s, as well as f and m, most scholars have indeed been wont to regard the syllables r and f as weakened from old ər and ən, while the native gymnastics represent the latter as produced from the former by increment. Similarly the verb as (đā), to be, loses its vowel wherever the radical syllable is unaccented, e.g. āci, Lat. šam = sas, etc, among other examples. In the language of the roots vid, to know, we have iva, knowledge, and therefore viddika. But, we were very generally accepted, we have rather to look upon the heavier vowels as the original, and upon the lighter vowels as the latter, secondary modifications. The grounds on which this theory is recommended are those of logical consistency. In the analogous cases of interchange between r and s, as well as f and m, most scholars have indeed been wont to regard the syllables r and f as weakened from old ər and ən, while the native gymnastics represent the latter as produced from the former by increment. Similarly the verb as (đā), to be, loses its vowel wherever the radical syllable is unaccented, e.g. āci, Lat. šam = sas, etc, among other examples. In the language of the roots vid, to know, we have iva, knowledge, and therefore viddika. But, we were very generally accepted, we have rather to look upon the heavier vowels as the original, and upon the lighter vowels as the latter, secondary modifications.

The aorist form is somewhat complicated, as it does augment and periphrastic of various formations, viz. a radical aorist, with reduplicated stem — e.g. ādahd = ādahd, with the suffix of the aorist, ǝvV, or ǝdahd; an a-orist (or thematic aorist) with or without reduplication— e.g. ǝrivas = ǝrivas, ǝrivas, cr. ǝrivas, and some augmentation formations of the aorist. In the older Vedic language the radical aorist is far more common than the a-orist, which becomes more frequently used later on. Of the different kinds of aorists, the most significant is the one which makes it possible to form the perfect with a connecting vowel ǝ in different roots — e.g. root ji— 1 sing. ādahd, 1 pl. ādahd; ādahd, ādahd, ādahd. A limited number of roots take a double aorist-sign with inserted connecting vowel ǝ for the a-orist. Thus ādahd and ādahd are the genuine cases, as in the older and more numerously in the later language make their aorist—stem by the addition of sa—e.g. ādahd = ādahd.  

The word-formation, the system of the aorist, the addition of ǝ to any of the tenses and the indefinite numbers— the imperfect, perfect and aorist—the classical writers make virtually no distinction between them, but use them quite indiscriminately. In the older language, on the other hand, the imperfect is chiefly used to mark a present action which is now complete—the aorist, however, more frequently to that which is only just done or completed. The perfect, owing doubtless partly to its reduplicative form, has also in difficulties retained much of the force of an iterative tense.

The Sanskrit, like the Greek, shows at all times a considerable power and facility of noun-composition. But, while in the older language, it is still as far as is known, the perfect, and aorist—the classical writers make virtually no distinction between them, but use them quite indiscriminately. In the older language, on the other hand, the imperfect is chiefly used to mark a present action which is now complete—the aorist, however, more frequently to that which is only just done or completed. The perfect, owing doubtless partly to its reduplicative form, has also in difficulties retained much of the force of an iterative tense.

fully adapted it to their peculiar scientific ends. The question as to the probable time and channel of its introduction can scarcely be expected ever to be placed beyond all doubt. The late Professor Bühler has, however, made it very probable that this alphabet was introduced into India by the Greek adventurer Xenophon c. 328 B.C. or shortly before. At all events, considering the high state of perfection it exhibits in the Muarya and Andhra inscriptions, as well as the wide area over which these are scattered, it can hardly be doubted that the present writer, must have some knowledge of it and its use for various purposes long before the time of Asoka. The object of this brief review is to indicate the probable connection of the Brāhmans to their sacred works with the proper literature.

As regards the numeral signs used in India, the Kharoshthi inscriptions of the early centuries of our era show a numerical system in which the digits 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 are represented by a vertical stroke, whilst 4 is marked by a slanting cross, and 5-9 by +1, &c., to 4+(+)+; and then special signs for 10, 20, and 100, the intervening multiples of 10 being marked in the vigesimal fashion, 30=30, 40=40, &c. This system has been proved to be of Semitic, probably Aramaic, origin. In the Brāhmi inscriptions up to the end of the 6th century of our era, another system is used in which 1-9 are denoted by as many horizontal strokes, and thereafter by special syllabic signs for 4-9, the decades 10-90, and for 100 and 1000. This system was most likely derived from hieratic sources of Egypt. The decimal system of cipher notation, on the other hand, which is first found used on a Gujarati inscription of A.D. 595, seems to be an invention of Indian astronomers or mathematicians, based on the existing syllabic (or word) signs or the phonetic alphabet.

The first two Sanskrit grammars published by Europeans were those of the Austrian Jesuit Wesselin, called Paulinus a Sancto Bartholomaeo (Rome, 1790-1804). These were followed by those of H. C. Colebrooke, who translated parts of Pāṇini's system (1817); Carey (1806), Wilkins (1808), Forster (1810), F. Bopp (1827), H. H. Wilson, Th. Bentley, &c. These, as well as those of Max Müller, Monier Williams, and F. Kielhorn, now most widely used, deal almost exclusively with classical Sanskrit; whilst that of W. D. Whitney has been devoted to the whole language historically; as does also J. Wackernagel's yet unpublished Altwendische Grammatik.

The first Sanskrit dictionary was that of H. H. Wilson (1819; 2nd ed., 1832), which was followed by the great Sanskrit-German Wörterbuch, published at St. Petersburg in 7 vols. by Professors Böhtlingk and Roth. Largely based on this great thesaurus are the Sanskrit-English dictionary of the Oxford University Press, which appeared in 1857, by Th. Bentley, A. A. Macdonell, &c. On the history of the Indian alphabets, cf. G. Bühler, Indische Paläographie (1896); A. C. Burnett, Elements of South Indian Palæography (2nd ed., 1878); R. Cuen's résumé in Jour. Roy. As. Soc., N.S., vol. xvi.

II. Sanskrit Literature

The history of Sanskrit literature labours under the same disadvantage as the political history of ancient India from the total want of anything like a fixed chronology. In that vast range of literature extending over more than three thousand years, no antecedent dates are known which can be regarded as the date of which scholars have fixed with absolute certainty. The original composition of most Sanskrit works can indeed be confidently assigned to certain general periods of literature, but as to many of them, and these among the most important, scholars have but too much reason to doubt whether they have come down to us in their original shape, or whether they have not undergone alterations and additions so serious as to make it impossible to regard them as genuine witnesses of any one phase of the development of the Indian mind. Nor can we expect many important chronological data from new materials brought to light, taken from the modern Indian alphabets, is of more uncertain origin. The similarity, however, which appears to exist between the characters present to those of the old Phoenician alphabet (itself probably derived from the Egyptian hieroglyphics) suggests for this alphabet also the probability of a Semitic origin, though, already at Asoka's time, the Indians had worked it into a high degree of perfection and wonder.
1. THE VEDIC PERIOD

The term *veda*—i.e. "knowledge," (sacred) "lore"—embraces a body of writings the origin of which is ascribed to divine revelation (*bruti*, literally "hearing"), and which forms the foundation of the Brahmical system of religious belief. This sacred canon is divided into three or (according to a later scheme) four co-ordinate collections, likewise called Veda: (1) the *Rig-veda*, or *loke of praise* (or hymns); (2) the *Saúma-veda*, or *lore of tunes* (or chants); (3) the *Yajur-veda*, or *lore of prayer* (or sacrificial formulas); and (4) the *Atharva-veda*, or *lore of the Atharvans*. Each of these four Vedas consists primarily of a collection (sāṁhitā) of sacred, mostly poetical, texts of a devotional nature, called *mantra*. This contains a variety of texts (and particularly the first three collections) is also freely interspersed with *dyád*, or threefold wisdom, of hymn (rítik), or tune or chant (sámuna), and prayer (yajus)—the fourth Veda, if at all included, being in that case classed together with the Rik.

The Brahmical religion finds its practical expression chiefly in sacrificial performances. The Vedic sacrifice requires for its proper performance the attendance of four officiating priests, each of whom is assisted by one or more (usually three) subordinate priests, viz.: (1) the *Hotar* (or *koti*, i.e. either sacrificer, or "invoker"), whose chief business is to engage the gods, either in short prayers pronounced over the several oblations, or in liturgical recitations (stotra), made up of various hymns and detached verses; (2) the *Udgátar* (udgátri), or chorister, who has to perform chants (stotra) in connexion with the hotar's recitations; (3) the *Adharyuta*, or offering priest par excellence, who performs all the material duties of the sacrifice, such as the kindling of the fires, the preparation of the sacrificial ground and the offerings, the making of oblations, &c.; (4) the *Brahman*, or chief "priest," who has to superintend the performance and to rectify any mistakes that may be committed. Now, the first three of these priests stand in special relation to the *brahmans* or Vedic sages in this way: that the Samhítas of the Smáveda and Yasóveda form special song and prayer books, arranged for the practical use of the udgátar and adharyuta respectively; whilst the Rik-sálmít, though not arranged for any such practical purpose, contains the entire body of sacred lyrics whence the hotar draws the material for his recitations. The brahmans, however, had no special text-book assigned to him, but was expected to be familiar with all the Samhítas as well as with the practical details of the sacrificial performance (see Brahmans and Brahmana).

It sometimes happens that verse not found in our version of the Rik-sálmít, but in the Atharváveda samhít, are used by the hotar; but such texts, if they did not actually form part of some other version of the Rik—as Sáyápa in the introduction to his commentary on the Rik-sálmít assures us that they did—were probably inserted in the liturgy subsequent to the recognition of the fourth Veda.

The several Samhítas have attached to them certain theological prose works, called Bráhmána, which, though subordinate in authority to the Mantras or Samhítas, are like them held to be divinely revealed and to form part of the sacred canon. The chief works of this class are of an exegetic nature,—their purport being to supply a dogmatic exposition of the sacrificial ceremonial and to explain the mystic import of the different rites and utterances included therein (see Brahmana).

More or less closely connected with the Bráhmánas (and in a few exceptional cases with Samhítas) are two classes of treatises, called Aranyaka and Upanishad. The Aranyakas, i.e. works "writing to the forest," being intended to be read by those who have retired from the world and lead the life of anchories, do not greatly differ in character and style from the Bráhmánas, but like them are chiefly ritualistic, treating of special ceremonies not dealt with, or dealt with only imperfectly, in the later revelations, to which they thus stand in the relation of supplements. The Upanishads, however, are of a purely speculative nature, and must be regarded as the first attempts at a systematic treatment of metaphysical and physical questions. The number of Upanishads hitherto known is very considerable (about 170); but, though they nearly all profess to belong to the Atharvaveda, they have to be assigned to very different periods of Sanskrit literature—some of them being evidently quite modern productions. The oldest treatises of this kind are doubtless those which form part of the Samhítas, the Bráhmánas and Aranyakas of the three older Vedas, though not all. Others which are ascribed to such special connexion have to be classed with the later productions of the Vedic period.

As the sacred texts were not committed to writing till a much later period, but were handed downward orally in the Brahmical schools, it was inevitable that local differences of reading should spring up, which in course of time gave rise to a number of independent versions. Such different text-recensions, called sákka (i.e. branch), were at one time very numerous, but only a limited number have survived. As regards the Samhítas, the poetical form of the recitations is doubtless the precise style of the sacrificial formulas, which render these texts less liable to change, and the discrepancies of different versions would chiefly consist in the several readings of single words or in the different arrangement of the textual matter. But the diffuse ritualistic discussions and loosely connected legendary illustrations of the Bráhmánas offered scope for very considerable modifications in the traditional matter, either through the ordinary processes of oral transmission or through the special influence of individual teachers.

Besides the purely ceremonial matter, the Brahmánas also contained a considerable amount of matter bearing on the correct interpretation of the Vedic texts. For instance, Vedánás, the sacred obligation incumbent on the Brahmans of handing down correctly the letter and sense of those texts necessarily involved a good deal of serious grammatical and etymological study in the Brahmical schools. These literary pursuits could not but result in the accumulation of much learned material, which it would become more and more desirable to throw into a systematic form, serving at the same time as a guide or future research. These practical requirements were met by the production of a number of works, grouped under six different heads or subjects, called Vedánás, i.e. members of the Veda (or body of the Veda). None of the works, however, which have come down to us under this designation can lay any just claim to being considered the original treatises on their several subjects; they evidently represent a more or less advanced stage of scientific development. Though a few of them are composed in metrical form—especially in the ordinary epic couplet, the *anuvásanabha sloka*, consisting of two lines of sixteen syllables (or of octosyllabic pādas) each—the majority belong to a class of writings called śástra, i.e. "string," consisting of strings of rules in the shape of tersely expressed aphorisms, intended to be committed to memory. The Śatrás form a connecting link between the Vedic and the classical periods of literature. But, although these treatises, so far as they deal with Vedic subjects, are included by the native authorities among the Vedic writings, and in point of language may, generally speaking, be considered as the latest products of the Vedic age, they have no share in the sacred title of *bruti* or revelation. They are of human, not of divine, origin. Yet, as part of the production of the highest standing, profoundly versed in Vedic lore, the Śatrás are regarded as works of great authority, second only to that of the revealed Scriptures; and their relation to the latter is expressed in the generic title of *Smúti*, or Tradition, usually applied to them.

1. J. Muir's *Original Sanskrit Texts* (5 vols., 2nd ed.) forms the most complete general survey of the results of Vedic research.

2. The combination *ch*, used (in conformity with the usual English practice) in this sketch of the literature, corresponds to the simple *c*—as *ti* does to *r*—in the scheme of the alphabet.

The six branches of Vedic science, included under the term Vedānga, are as follows:

1. Sāńskṛta, or Phonetics. — The privileged position of representing this subject is assigned to a small treatise ascribed to the great grammarians Pāṇini, viz., the Pāṇiniyā śiśya, except in the case of the different Rik śiśyas, which are also not the same as the Rik śiśyas of other 14 versions, and, therefore, they do not differ from the Sāńskṛta school. Mention is made of several other
versions; and regarding one of them, that of the Bāṣkalas, we have further information. It is clear, however, that the work is still
Rigveda
sāṁhitā.

The latter consists of 1028 hymns, including eleven so-called Vājapāyī hymns, which were probably introduced into the text at a later period, in the course of time and in a greater variety of metres, and consists, on an average, of rather more than 10 verses each, or about 10,500 verses altogether. This body of sacred lyrics has been subdivided by ancient authorities into several periods, as the Rik-rātrī śhākha, and 15 other branches of speech, as the eight aśākṣaras of about equal length, or, on a more natural principle, based on the origin of the hymns, and invariably adopted by Euro-

2. Chhandas, or Metre. — Tradition makes the Chhandās Śūtrā of Pīngala the starting-point of prosody. The Vedānt metre, however, occupy but a small part of this treatise, and the description of the prosody in the
Nidāna Śūtra of the Sāmaṇḍula, and in a chapter of the Rik-rātrī Śūtra.[139] For prose prosody, on the other hand, Pīngala’s treatise is really visionary, as no less than 155 questions are asked and answered.

3. Vyākaraṇa, or Grammar. — Pāṇini’s famous grammar is said to be the Vedānta; but it marks the culminating point of grammatical research rather than the beginning, and besides treating of the Sanskrit language, it contains.

4. Nirukta, or Etymology. — Yāsā’s Nirukta is the traditional representative of this subject, and this important work certainly deals entirely with Vedānta and even with the later circles of words in three chapters: (1) synonyms words; (2) such as are purely or chiefly Vedic; and (3) names of deities. These lists are followed by the dictionary. Later, however, Yāsā, again, quotes several predecessors in the same branch of scientifi,

5. Jyotih, or Astronomy. — Although astronomical calculations are frequently referred to in older works in connection with the performance of sacrifices, the subject of astronomy is really treated in the Kalpa-Śruti, an explanation of the ceremonial, which are of two kinds: (1) the Srauta sūtras, which are based on the śrutis, and teach the performance of the great sacrifices, requiring three sacrificial fires; and (2) the Śruti sūtras, or rules bounding the working of the Śruti śāstras, instead of the Kaṭhaka sūtras, verses of one of the recensions, it betrays no sign of the Greek influence which shows itself in Hindu astronomical works from about the 3rd century B.C.; and its date may therefore be set down as probably not before the early centuries after Christ.

6. Kalpa, or Ceremonial. — Tradition does not single out any special work as the Vedānta in this branch of Vedic science: but the sacrificial practice gave rise to a large number of systematic sīra manuals for the several classes of priests. The most important of these works have come down to us, and they occupy by far the most prominent place among the literary productions of the Vedānta period. An indication of the numbers of the sāṁhitās, and the construction, of different kinds of altars required for sacrifices. These treatises are of special interest as supplying important information regarding the earliest geometrical operations in India. Along with the Śrutas may be classed a large number of supplementary treatises, usually called Parāśikā (पाराशिक), on various subjects connected with the sacred texts and Vedic religion generally.

After this brief characterization of the various branches of Vedic literature, we proceed to take a rapid survey of the several Vedānta collections.

A. Rigveda — The Rigveda-sāṁhitā has come down to us in the

1 The Rigveda has been divided, as commonly, into the commentary of Sāyaṇa (of the 14th century), by Max Müller (6 vols., London, 1849–
1856); and Come to the earlier (from the 6th century onwards) and the later (from the 14th century onwards) and the later

2 Commentaries on the Rigveda, containing the sāṁhitās, have been published in various editions. The H. H. Wilson edition (1857–1877) was

3 The English translation (chiefly based on Sāyaṇa’s interpretation) was brought out by the late Professor H. H. Wilson (vols. 1–iii., 1850–1857) and completed by Professor E. B. Cowell (vols. iv.–viii., 1866–1888).

We have also the first volume of a translation, with a running

4 The Rigveda has been divided, as commonly, into the commentary of Sāyaṇa (of the 14th century), by Max Müller (6 vols., London, 1849–
1856); and Come to the earlier (from the 6th century onwards) and the later (from the 14th century onwards) and the later
any or even one, of the latter hymns were actually later productions, as they might previously have formed part of the family collections, or might have been overlooked when the hymns were first collected. Other mañjas (viz. i. viii. and x.) still contain four entire hymns addressed to Kari, and the collection containing a single one (x. 25, 1) is found in the Sâmadeva-samhitâ, as also some 28 isolated verses to Soma, and four hymns addressed to Soma in conjunction with some other deity, which are entirely unrepresentative.

Mañjâ x. contains the same number of hymns (191) as this, which it nearly equals in actual length. The hymns are ascribed to many rishis, of various families, some of whom appear almost mythical. The Mañjâ of the Bhûr-Brâmâsanâ is, however, less to be depended upon as regards this book, many names of gods and fictitious personages appearing in the list of its rishis. The Mañjâ of the Bharata-samhitâ, however, is according to the number of verses, in decreasing order—occasional exceptions to this rule being easily adjusted by the removal of a few apparently added verses. A similar arrangement seems also to exist in the Bharata-samhitâ, as there are stations of abstraction and conception of the deity on the one hand, and to superstitious practices on the other. But, although in its general appearance the tenth mañjâ is decidedly more modern than the other hymns, it is not a few verses of which, both in respect of age and poetic quality, to the generality of Vedic hymns, being perhaps such as had escaped the attention of the scribes.

It has become the custom, after Roth's example, to call the Rûk-samhitâ (as well as the Atharvan) an historical collection, as compared with the Samhitâs put together for purely ritualistic purposes. And indeed, though the several family collections which make up the earlier mañjâs may originally have served ritual ends, as the hymns of certain clans or tribal confederacies, and although the Samhitâ itself, in its oldest form, may have been intended as a sort of prayer-book to be used by the Brahmans in the Brâhmaical community, it is certain that in the stage in which it has been finally handed down it includes a certain portion of hymns and prose sutras which were or have been used for purposes of religious service. It may, therefore, be assumed that the Rûk-samhitâ contains all of the nature of popular lyrics that was accessible to the collectors, or seemed to them worthy of being preserved. The question as to the exact period when the hymns were collected cannot be answered with any approach to accuracy. For many reasons, however, which cannot be detailed here, scholars have come to fix on the year 1000 b.c. as and near as to within the limits of the centuries, as the time at which that time every means that human ingenuity could suggest was adopted to secure the sacred texts against the risks connected with oral traditions. As there were perhaps hundreds of different recitals of which formed part of the inauguration of kings. While the Ayarey deals almost exclusively with the Soma sacrifice, the Kaushitaki is, on the whole, far more concisely in its style and more accurate in its details. There is, however, one point to which one is bound to call attention; viz., that it is probably more the modern work of the two. This consists of thirty chapters (adhyâyas); while the Ayarey has only twenty-four. The Soma sacrifice is referred to in each. The last ten adhyâyas of the latter work are, however, clearly a later addition—though they must have already formed part of it at the time of Pâñini (c. 400 B.C. ?), if, as seems probable, one of the hymns, of this nature, is a composite work, it is not at all improbable that the Ayarey and the Kaushitaki were actually compiled, in part, considerably farther back, and may very likely have extended over the earlier half of the second millennium, or from about 2000 to 1500.

As regards the people which raised for itself this imposing monument, the hymns exhibit it as settled in the regions watered by the mighty Sindhu (Indus), with its eastern and western tributaries, the land of the five rivers thus forming the central home of the Vedâc people. But, while its advanced guard has already debouched upon the plains of the upper Gangâ and Yamunâ, those who bring up the rear are still far away in the hilly region of the medium and upper Ganges. The earliest literature consists of the Vedas, a collection consisting of books race of darker hue; just as in these latter days their Aryan kinsmen in the Far West are ever on their guard against the fierce attacks of the dispossessed red-skinned. Not unfrequently, too, the light-coloured Aryan wage interminable war with one another—as when the Bharatas, with allied tribes of the Panjâb, gladdened on the royal sage Viśvâmitra, invade the country of the Tritsê king Sudás, to be defeated in battle by the Aryan king Yudhishthira, 1 through which the shadowy Vaisñâ Vîshhâ. The priestly office has already become one of high social importance by the side of the political rulers, and to a great extent an independent power; so that though it does not represent the baneful features of an exclusive caste, the Aryan housewife shares with her husband the daily toil and joy, the privilege of worshipping the national gods and even the triumphs of song clear over life. But, as Lindner 2 has said, "the religious belief of the people consists in a system of natural

symbolian, a worship of the elementary forces of nature, regarded as being endowed with reason and power superior to those of man. In giving utterance to this simple belief, the priestly spokesman has, however, frequently worked into it his own speculative and mythical conceptions, until the end result is that the Vedic song receives by far the largest share of the devout attentions of the Vedic singer. His ever-renewed battle with the malicious demons of darkness and drought, for the recovery of the heavenly light and the happy life, was sung in the form of a series of spirited song. Next to him, in the affections of the people, stands Agni (ignis), the god of fire, invoked as the genial inmate of the Aryan household, and as the bearer of oblations, and mediator between the rishis and indwelling saviour, the divine representatives of the king (or chief) and the priest of the Aryan community; and if, in the arrangement of the Samhitâ, the Brâhmaical craft, the ceremonial, and the Sûtra, are the three chief objects, so the Brâhmaical verse and hymn may be regarded as the divine impersonations of the Aryan freemen, the viś or clan. But, while Indra and Agni are undoubtedly the favourite figures of Vedic mantras, there is reason to believe that these gods had but lately supplanted another group of deities who played a less prominent part in the hymns, viz. Father Heaven (Dyaus Pitâ, Zeuς πατέρα, Jupiter); Varuṇa (probably ophane, the all-embracing god); and, to a much less extent, Sûrya, the sun-god, Sūrya (the dió), the vishvânum, the vishnavin"

1 Edited, with an English translation, by M. Haug (2 vols. Bombay, 1865). An edition in Roman transliteration, with extracts from the commentary, has been published by Th. Aufrecht (Bonn, 1887).

2 Edited by B. Lindner (Jena, 1887).

3 Edited, with Sâvâya’s commentary, by Râjendralâla Mitra, in the Bibliotheca Indica (1875-1876). The first three books have been translated by F. Max Müller in S.R.E. vol. i. A new edition of the work was published, with translation, by A. B. Keith (Oxford, 1909).
out as the Atiaryepaṇīsāhā,1 ascribed, like its Brāhmaṇa (and the first book), to Mahādīsa Aitareya; and the third book is also referred to as the Saṃśātra-ṇisāhā. As regards the Kaṇṭha-kāraṇa,2 this work consists of fifteen adhyāyas, the first two (treating of the subjects even in the Brāhmaṇa and the Āryaṇa, viz. of the two books which correspond to the first, fifth, and third books of the Aitareya-āryaṇa respectively, while the fourth adhyāya usually inserted between them constitute the highly interesting Kaṇṭha-kāraṇa (of which the fifth is not mentioned). The two last of the three books are dedicated to the Ayāraṇa (of the two books which correspond to the first, fifth, and third books of the Aitareya and Kaṇṭha-kāraṇa respectively. Both consist of a Saṃśātra- and an Anuṭātra-sūtra. The Aśvālāyana seems to have lived about the same time as Pāṇini (c. 400 B.C.)—his own teacher, Saṅkhaṇa, who compiled the Rīk-śāstra-sūtra, being probably intermediate between the great grammarians and Yāska, the author of the Nīrtaka. Saṅkhaṇa himself is said to have been the author of a Saṃśātra-sūtra (Khan. L.B.1 S.109), p. 56 seq., where the date of the first he had destroyed it on seeing his pupil’s work. A Grihya-sūtra is still quoted under his name by later writers. The Aśvālāyana Saṃśātra-sūtra3 consists of twelve, the Grihya of four, adhyāyas.

Besides the main work, which, however, was doubtless a comparatively modern writer, who, like Aśvālāyana, founded a new school of ritualists. Hence the Kaṇṭha-kāraṇa Brāhmaṇa, adopted (and perhaps improved) by him, also goes under his name, just as the earlier and more accepted of the two texts of the Sāmkhya were the Saṃśātra-sūtra and not the Grihya-sūtra. The Saṃśātra-sūtra consists of fifteen adhyāyas. The last two chapters of the work are, however, a later addition, while the Grihya-sūtra consists of three, the first two of which are likewise later additions.

The Sāmbhāsya Grihya-sūtra, of which a single MS. is at present known, seems to be closely connected with the preceding work. Professor Bühler also refers to the Rīgveda the Yāsīṣṭha-dharmāsūtra4 composed of mixed sūtras and couplets.

The works remain to be noticed, hearing chiefly on the textual form and traditional records of the Rīk-sūtra. In our remarks on the Vedāṅgas, the Prātiṣṭhākhyas have already been referred to as the chief repositories of śākhi or Vedic phonetics. Among these texts there are both different work, one being the composition of this important work is ascribed to the same Sākalya from whom the vague record of the (Sākalya) śaṅkhīti takes its name. He is also said to be the author of the existing Padāṣṭā (i.e. the form in which each word is given under the title with those that precede and follow it), which report may well be credited, since the padāṣṭā-text was doubtless prepared for a text, such as is presented in the Prātiṣṭhākhyas, of the phonetic significances which is to be known in their respective combination. In the Prātiṣṭhākhyas itself, Sākalya’s father (or Sākalya the elder) is also times referred to as an authority on the subject, by both Brāhmaṇa Saṅkhaṇa and Pāṇini, having improved on his father’s theories. Thus both father and son probably had a share in the formulation of the rules of pronunciation and modification of Vedic sounds. The completion or final arrangement of the Rīk-śāstra-sūtra, in its present form, is ascribed to Saṅkhaṇa, the reputed teacher of Aśvālāyana. Saṅkhaṇa, however, is merely a family name ("descendant of Saṅkhaṇa"), and the work ascribed to "Saṅkhaṇa" cannot be regarded as a whole of the second maṇḍala of the Rīk is attributed. How long after Śākalya this particular Saṅkhaṇa lived we do not know; but some generations at all events would seem to lie between them, confirming the statement in the Brihadāraṇyaka and some minor differences on phonetic points in the Śaṅkhīti text, had split into several branches, to one of which, the Sūṣṭra (or Sūṣṭra-yāti) was contributed. While Saṅkhaṇa is referred to both by Yāska and Pāṇini, neither of these writers mentions Saṅkhaṇa. It seems, nevertheless, likely, for several reasons, that Pāṇini was acquainted with Saṅkhaṇa’s work, though the point has by no means been proved. The Prātiṣṭhākhyas are either in mixed sūtras, or couplets of various metres, a form of composition for which Saṅkhaṇa seems to have had a special predilection. Besides the Prātiṣṭhākhyas, and the Grihya-sūtra mentioned above, eight other works are ascribed to Saṅkhaṇa, viz. the Brihadāraṇyaka,5 an account, in epic sūtras, of the deities of the hymns, which supplies much valuable mythological information; the Rīg-śāstra-sūtra,6 a treatise, orledge in epic metre, on the magic effects of Vedic hymns and verses; the Pāda-śāstra, a similar treatise, apparently no longer in existence; and five different indexes or catalogues (anukramaṇīs) of the rishis, metres, deities, sections (anuvāka) and hymns of the Rīg- śāstra-sūtra.7 Besides the two last named, the Grihya-sūtra, the Brāhiḍdevatā is the original one; and the Sārvāṇkrama8 or complete index, of Kālīyāyana.9 Both these indexes are ascribed to Saṅkhaṇa, and it is supposed that the Grihya-sūtra was performed in triplets, either actually consisting of three different verses, or of two verses which, by the repetition of certain parts, are made, as it were, to form three. The first sūtras are usually ascribed to Saṅkhaṇa: but in certain cases two verses sung to the same tune had a different sāṁhātra enclosed between them. One and the same sāṁhātra may thus be sung twice, or with different tunes, or the same tune, the same sāṁhātra, and the same words, sung with different tunes the same verse was invariably used for a certain tune, the term "sāṁhātra," as well as the special technical names of sāṁhātras, are not infrequently applied to the verses themselves with which they were sung as connected, just as one would quote the beginning of the text of an English hymn, when the tune usually sung to that hymn is meant. For a specimen of the way in which sāṁhātras are sung, see Burrell, Aṣṭā安阳-samhātra, p. xiv. seq. A sāṁhātra comprises the Gregorian or Plain Chant.10 Each sāṁhātra is divided into five parts or phrases (prastātra, or prelude, &c.), the first four of which are distributed between the three chanters, while the fifth (nīdhana) is sung in unison by all of them.

In accordance with the distinction between śākhi or text and sāṁhātra or tune, the sāṁhātra-hymn consists of two parts, viz. the sāṁhātra-sūtra, or the sāṁhātra or sāṁhātrāsūtra, and the sāṁhātra-hymns, and the Gōna, or tune-books, song-books. The textual matter of the śaṁkhīti consists of somewhat under 1600 different verses, selected from the Rīk-sāṁhātra, with the exception of some seventy-five verses, some of which have been taken from Khīla hymns, whilst others which also occur in the Aitarnān or Yajurveda, as well as such not otherwise found, may perhaps have formed part of some other recension of the Rīk. The Śāmaveda- śaṁkhīti11 is divided into two chief parts, the pārāna- (first) and the utara- (second) adhikāra. The first part contains the texts of the sāṁhātra-hymns, arranged in the order in which they are actually recited, in the stotras or sāṁhātras of the Śāmaveda. The first part, on the other hand, contains the body of tune-verses, or verses used for practising the several sāṁhātras or tunes upon—the tunes themselves being given in the Grāma-yāṇa-pātra (i.e. songs to the village tunes) and the village tunes-books, viz. the Parvārchiya. Hence the latter includes all the first verses of those triplets of the second part which had special tunes peculiar to them, whereas the texts of detached sāṁhātras occasionally lie outside the regular ceremonial, as well as such as were perhaps

no longer required but had been so used at one time or other. The verses of the Pûrvâchāra are arranged on the same plan as the family-books of the Rik-samhita, viz. in three sections containing the verses addressed to Agni, Indra and Soma (pavunima) respectively. The first section (consisting of one, two and adhyāyas respectively) being again arranged according to the metres. Hence this part is also called Chhandas- (metre) archiKate. Over and above this natural arrangement of the two archiKats, there is a purely formal division into many small chapters, and there is an artificial (or artificial) division of which, in the first part, consists of ten decades (daśa) of verses.

We have two recensions of the Sāmhitā, belonging to the Rāṣṭryān classes, and to the Kauthuma school, the latter of which is but imperfectly known, but from the present state of our knowledge we cannot say that either is the true one. Besides the six prâpâyahkas (or five adhyāyas) of the Pûrvâchāra, some schools have an additional "forest" chapter, called the Aranyaka-samhitā, the tunes of which—along with others apparently intended for being chanted to special bhajans—belong to a separate recension. Besides the two tune-books belonging to the Pûrvâchāra, there are two others, the Ukhya-sāna ("modication-songs") and Ukhya-sānas, which follow the order of the samhita-sūtras. Several hymns chanted at the Soma sacrifice, with the modifications of the tunes undergone when applied to texts other than those for which they were originally composed. The Sāman anumal, as it has come down to us, has evidently passed through long centuries. The practice of chanting probably goes back to very early times; but the question whether any of the tunes, as given in the Gānas, and which of them, can lay claim to an exceptionally high antiquity is not yet resolved.

The title of Brâhmaṇa is bestowed by the Chhandogas, or followers of the Sāmaṇa, on a considerable number of treatises. In accordance with the statement of Rūpâ-chandra, the name is often fixed at eight; and within the last few years one new Brâhmaṇa has been recovered, while at least two others which are found quoted may yet be discovered. The Brâhmaṇa is the term employed by the Brâhmaṇas present, however, none of the characteristic features of other works of that class; but they are rather of the nature of stāras and kindred treatises, with which they probably belong to the same period of literature. Moreover, the contents of these works—what might indeed be expected from the nature of the duties of the priests for whom they were intended—are of an extremely arid and technical character, and have been little used except for the textual criticism of the Sāmhitā or on account of the legendary and other information they supply. These works are as follows: (1) the Tûṣyā-mahâ, (or Praṣana- brâhmaṇa, a Brâhmaṇa usu-ally found with the Brâhmaṇa, which contains a list of twenty-five adhyāyas—which treat of the duties of the udgâtās generally, and especially of the various kinds of chants; (2) the Saṇkṣetra, or twenty-sixth, being a supplement to the preceding work; (3) the last chapter, also which bears the title of Aranyaka-brâhmaṇa, or "book of marvels," is rather interesting, as it treats of all manner of portents and evil influences, which it teaches how to avert by means of prayers and incantations. These Brâhmaṇas are also to be found with the Chhandogyas, Rigvihâsana, descripting on them the magical effects of the various sānas; (4) the Arsheya-brâhmaṇa, a mere catalogue of the technical names of the sānas in the order of the Pûrvâchāra, known in two different recensions, the former belonging to the Brahmā and Vaiśnavas; (6) the Chhândogya-brâhmaṇa, the last eight adhyāyas (3-10 of which constitute the important Chhândogopanishad; 7) Mâyuravâhana-brâhmaṇa, a Brâhmaṇa to which are appended chants; (8) the Vâsisi-brâhmaṇa, a mere list of the Sâmaṇa teachers. To these works has been added the Jaiminiya- or Talavakâra-brâhmaṇa, which, though as yet only known by extracts, seems to stand much on a level with the Brâhmaṇas of the Rik and Yaduvendra.

A portion of it is the well-known Kena- (or Talavâkâra-) upanishad, on nature of Brahma, as the supreme of deities.

If the Sâmaṇa has thus its ample share of Brâhmaṇa-literature, though in part of a somewhat questionable character, it is not less richly supplied with sūtra-treatises, some of which probably belong to the oldest works of that class. There are two treatises of which we have the best account, both having been originally written in a separate recension closely to the Panchavâhana-brâhmaṇa: Maarkoṣa's Arshyeya-

kalpa, which gives the beginnings of the sānas in their sacrificial

order, thus supplementing the Arshyeya-brâhmaṇa, which enumerates them only, the Brâhmaṇya-brâhmaṇa, which is devoted to the Brâhmans of the Vedanta, or Śrīmad-Brâhmâyana, of the Kauthuma and Râṣṭryâna schools respectively, which differ but little from each other, and form complete manuals of the duties of the udgâtâs. Another sūtra, of an exegetical character, and belonging to a recension that differs but little from that of the Brâhmaṇya-brâhmaṇa, treats of the different parts of the sānas; and the Sâmaṇatâra, a treatise on chants of a very technical nature. Further, two Grihya-sūtras, belonging to the Sâmaṇa, are hitherto known, viz. the Dhrâvyâya-grîhya, ascribed to Khrâdîrâ, and the Kasthâ-grîhya, a treatise on the Kasthâ-sūtra), with a supplement, entitled Karma-prâkâśa, by Kâtyâyana. To the Sâmaṇa Vedas seem to belong the Gauâyana-dharma-brâhmaṇa, and apparently the oldest existing compendium of Hindu law.

C. Yajur-veda.—This, the sacrificial Veda of the Adhvaryu priests, divided itself into an older and a younger branch, of which they are called, the Black (Brâhman) and the White (Yajurveda). Tradition ascribes the foundation of the Yajurveda to the sage Vaiśampāyana. Of his disciples, three are specially named, viz. Kâsha, Kâlapi and Yâśaka. The first of whom is stated to have communicated the sacrificial science to Tittiri. How far this genealogy of teachers may be authenticated cannot now be determined; but certain it is that the internal evidence of the Brâhmanas and other Vedic works, viz. the Kâlapi, the Kâlâpaka or Malâyâyana Samhitâ, and the Taittirîya-samhitâ, are mentioned. The Kâthaka and Kâlâpaka are frequently mentioned together; and the author of the great commentary on the Brâhmanas, which is called the Yajur-vendra, is said to have been a disciple of Kâthaka and Kâlâpaka, and to have written his work in every village. The Kâthaka and Kâlâpaka are often referred to under the collective name of Charakas, which apparently means "sacrifice-maker." or "sacrificial scholars; but according to a later writer (Hemachanda) Charakâ is no other than Vaiśampāyana himself, after whom his followers would have been thus called. From the Kâthaka proper two or three schools seem early to have been divided, of which the Kâthaka and Kâlâpaka are the two. Of the Kâthaka, the text-recension of the latter of whom has recently been discovered in the Kâthâ-kâtha-samhitâ, and probably also the Châryâyana-Kâthaka. The Kâlâpaka also soon became subdivided into numerous different schools. Thus from one of Kâlâpaka's immediate disciples, Hari, the Hari-râvîkaya took their origin, whose text-recension, the Hari-râvîkaya, is quoted together with the Kâthaka as early as Rûpâ-chandra's Brâhmaṇa,

VEDIC PERIOD

SANSKRIT

this work is manifest of a supplementary nature, a portion of it may be called adhyāyas, and hence have formed part of the Samhitās, considering that the latter consists of seven asthākata, instead of eight, as this term requires, and that certain essential parts of the ceremonial handbooks, the Brāhmaṇas, are entirely missing. The text referred to in this work is the Taittirīya-āraṇyaka,1 in ten books, the first six of which are of a ritualistic nature, while of the remaining books the first three (5-3) form the Taittirīya-upaṇiṣad2 (comprising the Brāhmaṇa of the Taittirīya-Samhitā); the last three books (5-9) are the Anāndavali and Bhṛgavali, also called together the Vārūṇi-upaṇiṣad; and the last book forms the Nārâyāṇya- (or Yājñik-) upaṇiṣad.

Sanskrit

Samhitā of White Yajurveda

The ancient arrangement of the texts was at last remedied by a different school of Adhyāvāyus, the Vājāsaneīyas. The reputed originator of this school and its text-recension is Yajvalīya (or Yajvalīya, in the older recension), who was the first to give a rearrangement of the texts that was a collection of sacrificial mantras, the Vājāsaneī-yājñapitāma, and a Brāhmaṇa, the Satapatha. On account of the greater lucidity of this arrangement, this recension is known as the Vājāsaneīya or Vājāsaneīya-Vajurveda—the name of Black (or obscure) Yajus being for opposite reasons applied to the Charaka texts. Both the Sanskrit and Brāhmaṇa of the Vājāsaneīyas have come down to us in two different recensions. Taking the first of these, the Satapatha-brāhmaṇa is particularly rich in material; and besides a considerable number of quotations from a Vājāsaneika, or newly discovered, seats of which we cannot doubt that there must have been at least one other recension of the Satapatha-brāhmaṇa. The difference between the two extant recensions is on the whole, slight, although the subject-matter; but in point of diction it is quite sufficient to make a comparison especially interesting from a philological point of view. Which of the two recensions was the earliest, of course, cannot be determined; but the phonetic and grammatical differences will probably have to be accounted for by a geographical separation of the two schools rather than by a difference of age. In several points of difference, the Satapatha-brāhmaṇa is in support of the Rik-samhitā, and there probably was some connexion between the Yajus school of Īśvānas and the famous family of rishis of that name to which the eight Ādīgala of the Rik is attributed.

The Vājāsaneīya arrangement of the texts consists of eighteen of which contain the formulas of the original sacrifices. The last fifteen adhyāyas are doubtless a later addition—alas! also, the case regards the preceding seven chapters. The last adhyāya is common to the Vājāsaneīya- (or Yājñik-) upaṇiṣad.8 Its object seems to be to point out the fruitlessness of mere words, and to insist on the necessity of man's action. It is this very recension that supplies the groundwork of the Adhyāvāyus, in about equal parts, of verses (rich) and prose formulas (yajus). The majority of the former occur likewise in the Rik-samhitā, from which they were doubtless extracted. Not infrequently, they are in support of the Satapatha-brāhmaṇa, and for reading, which may be explained partly from a difference of recension and partly as the result of the adaptation of these verses to their special sacrificial purpose. As regards the prose formulas, though only a few of them are actually referred to in the Rik, it is quite possible that many of them may be of high antiquity.

The Satapatha-brāhmaṇa,9 or Brāhmaṇa of a hundred paths, derives its name from the fact of its consisting of 100 lectures (adhyāyas), which are divided by the Mādhyanda into forty, and by the Kāyās into seventeen books (kāyās). The first nine books of the former, corresponding to the first eleven of the later arrangement, contain a kind of running commentary on the first eighteen books of the Vaiṣṇava-samhitā; and it has been plausibly suggested by Professor Weber that this portion of the Brāhmaṇa may be referred to as the Mahābhārata of the Satapatha-brahmana, where a Satapatha and a Brāhmaṇa of this nature have remained through all ages.

Brāhmaṇa of White Yajurveda

The Mānava-srauta-sūtra10 seems to consist of eleven books, the first nine of which treat of the sacrificial ritual, while the tenth contains the Śulva-sūtra; and the eleventh is made up of a Veda-pitāma. The text of the Mānava-srauta-sūtra is also likewise in existence; but so far nothing is known, save one or two quotations, of a Mānava-dharma-sūtra, the discovery of which might be expected to solve some important questions regarding the development of Indian law. Of sūtras belonging to the Kāthā, a single treatise, the (Chāṇakya-) Kāthā-sūtra, is known; but while Jolly considers the Vīkhūṃ-sūtra,11 a compendium of law, composed in mixed sūtras and ślokas, to be nothing but a Vaiṣṇava recast of the Kāthā-dharma-sūtra, which, in its original form, seems no longer to exist. As regards the Taittirīya, the Kalpa-sūtra most widely accepted among them was that of Apatambha, to whose school, as we have seen, was also due our existing recension of the Taittirīya-samhitā. The Apatambaka-kalpa-sūtra consists of thirty prāṇa (questions); the first twenty-five of these constitute the Srauta-sūtra,26 and 27 the Gṛhya-sūtra,28 and 29 the Dharma-sūtra,30 and 31 the Āpāta-sūtra.12 The Vīkhūṃ-sūtra has tried to fix the date of this work somewhere between the 3rd and 4th centuries n.c.; but it can hardly yet be considered as definitely settled. Considerably more ancient than this work are the

2 Trans. by F. M. Müller, S.B.E., vol. xvi.
4 Text and translation published by F. M. Müller, S.B.E., vol. xvi., and others.
5 Edited in the Mādhyanda recension, with the commentary of Mādhyanda by Kātākhya, in the Kātākhya text, by A. Weber (1841); trans. by R. H. T. Griffith (Benares, 1899). 6 Translation by E. Röer, Bibl. Ind.; by F. M. Müller, S.B.E., vol. xvi.
7 Edited by A. Weber, who also translated the first chapter into German. English translation (5 vols.) by J. Eggeling, in S.B.E. a Shashi-patha (i.e. _consisting of 60 paths_ ) are mentioned together as objects of study, and that consequently it must have formed an independent work. This view is also supported by the circumstance that of the remaining five books (10-14) of the Mānava-srauta-sūtra, the first three are the most largely worked upon, while the Kāyās apply the same epithet to the middlemost of the five books (12-16) preceding their last one. This last book would thus seem to be treated by them as a second supplement, and not without some distinction, as it is called the Vājrayāna-srauta-sūtra, or the Title of Bṛhadha-[great] āraṇyaka;4 the last six chapters of which are the Bṛhadāraṇyaka-upaṇiṣad,3 the most important of all the Upaṇiṣads. Except in books 6-10 (M.), which treat of the construction of Śrautas, and recognize the sage Śankindya as their chief authority, the Yājvalika's opinion is frequently referred to in the Satapatha as authoritative. This is especially the case in the later books, part perhaps, as a safeguard. The Yājvalika's opinion is all the more important at present, for from the time of the old Buddhist monks, who were the first to fix the Date of the Satapatha, the probability is that the main body of the work is considerably older than the time of Pāṇini, but that some of its latter parts were considered by Pāṇini's critic by Yājvalika to be of the same age as the, or not much older than, Pāṇini. Even those portions which had probably been long in existence before they were known to the general public and to consider the best of the names for the cause of the White Yajus. The contemptuous manner in which the doctrines of the Charaka-adhyāyas are repeatedly animadverted upon, is, on the betrays not a little of the _ōdīum theologicum_ on the part of the divines of the Vājāsaneīyas towards the brethren of the older schools, to whom they held the Vedas, to be worthless, but they seem to have striven by every means to gain ascendency over the rivals. The consolidation of the Brāhmaṇical hierarchy and the institution of a common system of ritual worship, which the Śrauta-Sūtras and the liturgical books the Vājvalikas, are confined. The Satapatha, however, as, and of the Vājvalikas, or the **Vedantikas**, and of the Yajvalikas, has been worked by the Kalpa-brāhmaṇa of Yajvalika. This last samhitā is known as the Kalpa-brāhmaṇa, both of the Satapatha, and the Yajvalika, to which Professor Weber has referred the portion of the Brāhmaṇa which may be referred to as the Kalpa-brāhmaṇa of the Satapatha and the Yajvalika, where a Satapatha and a Brāhmaṇa of this nature have remained through all ages.
The Atharva-veda.—The Atharva-veda was the latest of the Vedas. It was compiled to be a sacrificial text, meant for the performance of the sacred fire; but whilst the Atharvans seem to have devoted themselves to the auspicious aspects of the fire-cult and the performance of propitiatory rites, the Angiras, on the other hand, are several times rebuked by the Atharvan. In the sacrificial texts of the Atharvans the mystic phrases and magical incantations are more prominent than in the other Vedas. The Atharvans, connected with the Brahma or sacred (magic) word, and the supreme deity is supposed to embody. The current text of the Atharva-saṁhitā is the oldest text of the Saunaka school; it consists of many portions in verse and prose. It has been compiled by Katyāyanas, a learned critic, inscriptions, and we have to consider it as older than Pāṇini, or whether (with Gold-sticker and M. Müller) we are to identify its author with Pāṇini's own. The only existing Pratisakhya of this Black Vyākaraṇa belongs to the Taittiriya school. Its author is unknown, and it confines itself entirely to the Taittiriya-saṁhitā, to the exclusion of the Brahmana and Āraṇyaka.

A. The Atharvaveda is a large number of secondary treatises, likewise attributed to Katyāyana, among which may be mentioned the Rāṣṭrapaṭa-saṁhitā, which is the oldest Veda of its kind by its language, which is a mixture of a lexicon and a grammatical point of view, and which has been compiled as the basis of the Rīk and the Brahmana period. In regard also to the nature of its contents, and the spirit which pervades them, this Veda is perhaps the most interesting of all the Vedas, as it has been burried in the mists of a thousand years. The older Vedas seem clearly to reflect the recognized religious notions and practices of the upper, and some, respectable classes of the Aryan tribes, as really watched over by a priesthood deeply interested, but in most cases, only indirectly, in the observances performed by the people. The fourth Veda, on the other hand, deals mainly with all manner of superstitious practices such as have at all times found a place in the religious and secular life of the people, and are even apt, below the surface, to maintain their tenacious hold on the popular mind in comparatively civilized communities. Though the constant intermingling with the aboriginal tribes may well be believed to have exerted a deterring influence on the Vedic people in this respect, it can scarcely be doubted that superstitious practices of the kind revealed by the Atharva-veda and the tenth book of the Rīk must at all times have obtained approval among the Aryans. The practices of the latter period, when they received the stamp of recognized forms of popular belief by the admission of these collections of spells and incantations into the sacrificial canon. If in this phase of superstitious belief the old gods still find a place, their character has visibly changed so as to be more in accordance with those mystic rites and magic performances and the part they are called upon to play in them, as the promotors of the new religious and ceremonial practices and the averter of the omens and designs of mortal enemies and the demonic influences to which he would ascribe his fears and failures as well as his bodily ailments. The fourth Veda may thus be said to supplement in a remarkable manner the Rīk, Kārtikeya, and the Atharva-saṁhitā. It is also presented in the Grihya-sūtras or house-rules; for whilst these deal only with the orderly aspects of the daily duties and periodic observances in the family, the religious rites and the hallowed ceremonies, that rules which allow us a deep insight into "the obscrer relations and emotions of human life": and, as a matter of fact, the mental and spiritual development of the Vedas is a mirror of the inner development of the Vedic people. This is worthy of note, that the Atharvaveda is practically unknown in Kashmir.

This body of spells and hymns is traditioned with two old mystic priestly families, the Atharvans and Angiras, their names, in the plural, serving either singly or combined (Atharvans and Angiras). The name of the Lord, Dharmaṣṭūrī, given by T. Bloch (Vienna, 1866). A. Weber, Stud. Ind. iii. 1858. Edited by A. Weber, 1859. Edited by A. Weber, 1858, with a German translation by A. Stenzler. Edited, with Uvâna's commentary, and a German translation, by A. Weber, Ind. Stud. iv.; another ed. in Benares Saks. Ser. (1888), and with a French translation by L. F. Hultzsch (Leipzig, 1884), and translated by G. Hübner, S.B.E. xiv.

1The Śūlva-sūtra has been published with the commentary of Kapardisvān, and a translation by G. Thibaut, in the Benares Pandit (1887). The Dharmaṣṭūrī has been edited by H. Oldenberg, and translated by G. Bühler, S.B.E. xiv.

4A. Burnell, Classif. Index of Tanjore Sansk. MSS. p. 37.
The Kalpa-sūtras belonging to this Veda comprise both a manual of śrauta rites, the Vaiśānava-sūtra, and a manual of domestic rites, the Kauśika-sūtra. The latter treatise is not only the more interesting of the two, but also the more ancient, being the earlier of the two manuals. The former treatise, which is repeatedly referred to in the work on points of ceremonial doctrine. Connected with this Sūtra are upwards of seventy Parithāsas, or supplementary manuals, each of the form of a Sūtra, compiled in many cases by the performance of grhyta rites. The later Sūtras are to be noticed in connexion with this Veda is the Saunakīya Chaturādhyāyikā, being a Prātiṣṭhikāya of the Atharva-sāṃhitā, so called because the Śarasvatī River is the scene of the prātiṣṭhikāya (the site of the Śarasvatī). Saunaka can hardly be credited with being the actual author of the work, considering that his opinion is rejected in the only rule where his name appears, there is no reason to doubt that it chiefly embodies the views of the sect, which were afterwards perfected by members of his school. Whether this Saunaka is identical with the writer of that name to whom the final redaction of the Śrīkalpaśākhā of the Rik is ascribed is not known; but it is of note that on at least two points where Śrīkalpa is quoted by Pāṇini, the Chaturādhyāyikā seems to be referred to rather than the Rik-prātiṣṭhikāya. Saunaka is quoted once in the Vaiśāsneyati-prātiṣṭhikāya; and it is possible that Kātyāyana had the Chaturādhyāyikā in view, though his reference does not quite tally with the respective rule of that work.

One class of writings already alluded to as traditionally connected with the Atharvaveda are the numerous Upanishads which do not specially attach themselves to one or other of the Śrīnātikas or Brāhmaṇas of the other Vedas. The manuscripts of the five principal Upanishads are not, however, they can be roughly divided into two classes, viz. those of a purely speculative or general pantheistic character, treating chiefly of the essence of the supreme spirit, and the means of attaining to union therewith, and those of a more concrete character, treating chiefly of the historical number—such as the Prāṇa, Mṇḍaka, and Māṇḍūkya-Upanishads—have probably been assigned to the later period of Vedic literature; whilst the others presuppose more or less distinctly the existence of some fully developed system of philosophy, especially after the Vedas, or the Yoga. The sectarian Upanishads, on the other hand—identifying the supreme spirit either with one of the forms of Vīṣṇu (such as Bhūmi-tāṇḍaya, Kama-tāṇḍaya, Gopīśe-tāṇḍaya Upanishads), or with Śiva (i.e. the Rudroprishish), or with some other deity—belong to post-Vedic times.

2. THE CLASSICAL PERIOD

The Classical Literature of India is almost entirely a product of artificial growth, in the sense that its vehicle was not the language of the general body of the people, but of a small and educated class. It would scarcely be possible, even approximately, to fix the time when the literary idiom ceased to be understood by the common people. We only know that in the 3rd century B.C. there existed several dialects in different parts of northern India which differed considerably from the Sanskrit; and Buddhist tradition states that Gautama Sākyamuni himself, in the 6th century B.C., used the local dialect of Magadha (Belur) for preaching his new doctrine. Not unlikely, indeed, popular dialects, differing perhaps but slightly from one another, may have existed as early as the time of the Vedic hymns, when the Indo-Aryan, divided into clans and tribes, occupied the land of the Seven Rivers; but such dialects must have sprung up after the extension of the Aryan sway and language over the whole breadth of northern India. But there is no reason why, even with the existence of local dialects, the literary language should not have kept in touch with the people in India, as elsewhere, save for the fact that from a certain time that language remained altogether stationary, allowing the vernacular dialects more and more to diverge from it. Although linguistic research had been successfully carried on in India for centuries, the actual grammatical fixation of Sanskrit seems to have taken place contemporaneously with the first spread of Buddhism; and

The national epics. The Bhāratas, i.e. "the great (poem) or tale of the Bhāratas" is not a national epic, but a miscellaneous collection of poetry, consisting of a heterogeneous mass of legendary and didactic matter, worked into and round a central heroic narrative. The authorship of this work is aptly attributed to Vyāsa, "the arranger," the personification of Indian diaspora. Only the bare outline of the leading story can here be given.

In the royal line of Hastinapura (the ancient Delhi)—claiming descent from the life of the sages and the national race (so-called "the Bhāratas")—one family, the Kauravas; the elder, the Pāṇḍavas. A R. Garbe, in his "Handbuch der vergleichenden Sprachwissenschaft," p. 293, claims that the language of the Kauravas is more usually applied to the sons of Dhrītarāṣṭra, while their cousins, as the younger line, are named, after their father, Pāṇḍavas. The rivalry and varying fortunes of these two houses form the main plot of the great epic. The Pāṇḍus, princes soon found themselves greatly superior to their cousins; and Yudhishṭhīra, the eldest of them all, was to be appointed heir-apparent. But, in the course of time, having divided his kingdom among his five nephews for a time to retire from court and reside at a house where the unscrupulous Duryodhana meant to destroy them. They escaped, however, and passed some time in the forest with their mother, Kanada. The Kauravas, with Draupadi, (the wife of the Draupadi, without being recognized by any one. During their forest-life they met with many adventures, among which may be mentioned their encounter with King Jayadratha of Chedi, who had carried off Draupadi while she was nursing twins, and who, on their leaving the forest, and, assuming various disguises, take service at the court of King Virāt of Matsya. Here all goes well for a time till the queen's brother Kīchaka, a great warrior and commander of the royal forces, falls in love with Draupadi, and is slain by Bhima. The Kauravas, profiting by Kīchaka's death, now invade the Matsyan kingdom, where the Pāṇḍavas side with King Virāt, and there ensues, on the field of Kurukṣetra, during eighteen days, a series of fierce battles, ending in the annihilation of the Kauravas. Yudhishṭhīra now at last becomes yuvā-rīja, and eventually king—Dhrītarāṣṭra having resigned and retired with his wife and Kūtī to the Indra's paradise—when they learn of the death of the dying also the death of Kīchaka, Yudhishṭhīra himself at last becomes tired of life and resigns his crown; and the five princes, with their faithful wife, and a dart that joins them, set out for Mount Meru, to seek admission to Indra's heaven. On the way one by one falls off, till Yudhishṭhīra alone, with the dog, reaches the gate of heaven; but, the dog being refused admittance, the king declines entering

Indeed that popular religious movement undoubtedly exercised a powerful influence on the linguistic development of India.

A. Poetical Literature.

1. Epic Poems.—The Hindus, like the Greeks, possess two great national epics, the Mahābhārata and the Rāmāyana. The Mahābhārata, i.e. "the great (poem) or tale of the Bhāratas," is not a national epic, but a miscellaneous collection of poetry, consisting of a heterogeneous mass of legendary and didactic matter, worked into and round a central heroic narrative. The authorship of this work is aptly attributed to Vyāsa, "the arranger," the personification of Indian diaspora. Only the bare outline of the leading story can here be given.

In the royal line of Hastinapura (the ancient Delhi)—claiming descent from the life of the sages and the national race (so-called "the Bhāratas")—one family, the Kauravas; the elder, the Pāṇḍavas. A R. Garbe, in his "Handbuch der vergleichenden Sprachwissenschaft," p. 293, claims that the language of the Kauravas is more usually applied to the sons of Dhrītarāṣṭra, while their cousins, as the younger line, are named, after their father, Pāṇḍavas. The rivalry and varying fortunes of these two houses form the main plot of the great epic. The Pāṇḍus, princes soon found themselves greatly superior to their cousins; and Yudhishṭhīra, the eldest of them all, was to be appointed heir-apparent. But, in the course of time, having divided his kingdom among his five nephews for a time to retire from court and reside at a house where the unscrupulous Duryodhana meant to destroy them. They escaped, however, and passed some time in the forest with their mother, Kanada. The Kauravas, with Draupadi, (the wife of the Draupadi, without being recognized by any one. During their forest-life they met with many adventures, among which may be mentioned their encounter with King Jayadratha of Chedi, who had carried off Draupadi while she was nursing twins, and who, on their leaving the forest, and, assuming various disguises, take service at the court of King Virāt of Matsya. Here all goes well for a time till the queen's brother Kīchaka, a great warrior and commander of the royal forces, falls in love with Draupadi, and is slain by Bhima. The Kauravas, profiting by Kīchaka's death, now invade the Matsyan kingdom, where the Pāṇḍavas side with King Virāt, and there ensues, on the field of Kurukṣetra, during eighteen days, a series of fierce battles, ending in the annihilation of the Kauravas. Yudhishṭhīra now at last becomes yuvā-rīja, and eventually king—Dhrītarāṣṭra having resigned and retired with his wife and Kūtī to the Indra's paradise—when they learn of the death of the dying also the death of Kīchaka, Yudhishṭhīra himself at last becomes tired of life and resigns his crown; and the five princes, with their faithful wife, and a dart that joins them, set out for Mount Meru, to seek admission to Indra's heaven. On the way one by one falls off, till Yudhishṭhīra alone, with the dog, reaches the gate of heaven; but, the dog being refused admittance, the king declines entering

3. Three complete Indian editions, the handlist in 4 vols., including the Harivamsa (Calcutta, 1834-1839); a Bombay edition, with critical comments and a parallel translation, containing the Southern recension (Madras, 1855-1860). Another Southern edition, in Nāgari, is now appearing at Bombay, edited by GA. R. Garbe. For a full view of the translation of this epic, an English translation has been brought out at Calcutta by Pratap Chandrap Rdy (1883-1894); and another by M. N. Dut (5 vols., Calcutta, 1896); whilst numerous episodes have been printed and translated by various hands, e.g. by A. C. D. Caland, "The Mahābhārata" (vol. Kiel, 1892-1893); W. Hopkin, "The Great Epic of India" (New York, 1912).
without it, when the dog turns out to be no other than the god of Justice himself, having assumed that form to test Yudhishthira's constancy. But, finding neither his wife nor his brothers in heaven, and being told that they are in the nether world to expiate their sins, the king insists on sharing their fate, when this, too, proves a trial, and they are all reunited to enjoy perpetual bliss.

The complete work consists of upwards of 100,000 couplets—its contents thus being nearly eight times the bulk of the Iliad and Odyssey combined, is evidently a late development. It is divided into eighteen parts, called in a supplement entitled Harivamsa, or genealogy of the god Hari (Krishna-Vishnu). In the introduction, Vyasa, being about to dictate the poem, is made to say (i. 81) that so far he and some of his disciples knew 800 couplets; and farther on (i. 101) he is said to have composed the collection relating to the Bhāratas (bhārata-samhitā), and called the Bhārataṃ, which, not including the episodes, consisted of 24,000 slokas. Now, as a matter of fact, the portion relating to the feud of the rival houses constitutes somewhere between a fourth and a fifth of the work; and it is by no means improbable that this portion formed a separate poem, called the Bhārata. But, whether the former statement is to be understood as implying the existence, at a still earlier time, of a yet shorter version of about one-third of the present extent of the leading narrative, cannot now be determined. While some of the episodes are so loosely connected with the story as to be readily severed from it, others are so closely interwoven with it that their removal would seriously injure the very texture of the work. This, however, only shows that the original poem must have undergone some kind of revision, or perhaps repeated revisions. That such has indeed taken place, at the hands of Brahmins, for sectarian and caste purposes, cannot be doubted. According to Lassen's opinion,1 which has been very generally accepted by scholars, the main story of the poem would be based on historical events, viz. on a destructive war waged between the two neighbouring peoples of the Kurus and Pancalas, who occupied the western and eastern parts of the Madhyadeśa (or "middle land") between the Ganges and Jumna respectively, and ending in the overthrow of the Kuru dynasty. On the original accounts of these events—perhaps handed down in the form of lays or sagas—the Pāṇḍava element would subsequently have been grafted as calculated to promote the class interests of the Brāhmanical revisers. It is certainly a strange coincidence that the five Pāṇḍava princes should have taken to wife the daughter of the king of the Pancalas, and thus have linked their fortunes to a people which is represented, in accordance with its name, to have consisted of five (pancha) tribes.

The earliest direct information regarding the existence of epic poetry in India is contained in a passage of Dionysostom (c. A.D. 80), according to which "even among the Indians, they say, there are bards, who, taking delight in the songs of old men, are not translated by them into their own dialect and tongue;2 and of the Indians are well acquainted with the sufferings of Priam, the lamentations and wails of Andromache and Hecuba, and the prowess of Achilles and Hector." Now, although these allusions would suit either poem, they seem to correspond best to certain incidents in the Mahābhārata, especially as no direct mention is made of a warlike expedition to a remote island for the rescue of an abducted woman, the resemblance of which to the Trojan expedition would naturally have struck a Greek becoming acquainted with the general outline of the Rāmaṇya. Whence Dion could have formed his information is not known; but as many leading names of the Mahābhārata and even the name of the poem itself are mentioned in Pāṇini's grammatical rules, not only must the Brāhara legend have been current in his time (c. 400 B.C.), but most probably it existed already in poetical form, as undoubtedly it did at the time of Patanjali, the author of the "great commentary" on Pāṇini (c. 150 B.C.). The great epic is also mentioned, both as Bhārata and Mahābhārata, in the Grihya-sūtra of Áśvalayana, whom Lassen supposes to have lived about 350 B.C. Nevertheless it must remain uncertain whether the poem was then already in the form in which we now have it, at least as far as the leading story and perhaps some of the episodes are concerned, a large portion of the epicoidal matter being clearly of later origin. It cannot, however, be doubted that long before that time heroic song had been diligently cultivated in India at the courts of princes and among Kshatriyas, the knightly order, generally. In the Mahābhārata itself the transmission of epic legend is in some way connected with that of the Kautilya, and with the supplementary system, is defined as resulting from the union of Kshatriya men with Brāhmaṇa women, and which supplied the office of charioteers and heralds, as well as (along with the Māgadhas) that of professional minstrels. Be this as it may, there is reason to believe that, as Hellas had her ἀριστεύς, who sang the ἀκλα ἀδυνή, and Iceland her skalds who recited favourite sagas, so India had from olden times her professional bards, who delighted to sing the praises of kings and inspire the knights with warlike feelings. If in this way a stock of heroic poetry had gradually accumulated which was then called "the older stories," or, as under conditions of society and manners, we can well understand why, after the Brāhmanical order of things had been definitely established, the priests should have deemed it desirable to subject these traditional memorials of Kshatriya chivalry and prestige to their own censorship, and adapt them to their own canons of religious and civil law. Such a revision would doubtless require considerable skill and tact; and if in the present version of the work much remains that seems contrary to the Brāhmanical code and pretensions—e.g. the polyandrous union of Draupad and the Pāṇḍu princes—the reason probably is that such features were too firmly rooted in the popular tradition to be readily eliminated, and as the revision in the process of explaining them away as best they could. Thus Draupadi's abnormal position is actually accounted for in five different ways, one of these representing it as an act of duty and filial obedience on the part of Arjuna who, on bringing home his fair prize and announcing it to his mother, is told by her, before seeing what it is, to share it with his brothers. Nay, it has even been seriously argued that the Brāhmanical editors have completely changed the traditional relations of the leading characters of the story. For, although the Pāṇḍavas and their cousin Kṛṣṇa are constantly extolled as models of virtue and goodness, while the Kaurava and their friend Karna—a son of the sun-god, borne by Kunti before her marriage with Pāṇḍu, and brought up secretly as the son of a Sūta—are deemed as monsters of depravity, these estimates of the heroes' characters are not unfrequently belied by their actions—especially Kṛṣṇa and the brave Duryodhana (i.e. "the bad fighter," but formerly called Suyodhana, "the good fighter") contrasting not unfavourably with the wily Kṛṣṇa and the cautious and somewhat effeminate Yudhishthira. These considerations, coupled with certain peculiarities of the legends and the latter's obvious intention of an original connexion of the latter with Buddhist institutions, have led Dr Holtzmann to devise an ingenious theory, viz. that the traditional stock of legends was first worked up into a connected narrative by some Buddhist poet—most likely at the time of the emperor Asoka (c. 250 B.C.), whom the Kaurava hero Suyodhana might even seem to have been intended to represent—and that this poem, showing a decided predilection for the Kuru party as the representatives of Buddhist principles, was afterwards revised in a contrary sense, and the time and the Brāhmanical reaction, by votaries of Vishnu, when the Buddhist features were generally modified into Śaivite tendencies, and promience was given to the divine nature of Kṛṣṇa, as an incarnation of Vishnu. As this theory would, however, seem to involve the Brāhmanical revision of the poem having taken place subsequent to the decline of Buddhist predominance, it would shift the completion of the work to a considerably later date than would be consistent with other evidence. From inscriptions we know that by the end of the 5th century A.D. the Mahābhārata was appealed to as an authority on matters of law, and that its extent was practically what it now is, including its supplement, the Harivamsa. Indeed, everything seems to point to the probability of the work having been complete by about A.D. 200. But, whilst Brāhara and Kuru heroic lays may, and probably

1 Lassen, Indische Altertumskunde, i. 733, sqq.
2 Viz. as an adj., apparently with "wa..." or "poem" understood.
do, go back to a much earlier age, it seems hardly possible to assume that the Pāndava epic in its present form can have been composed before the Greek invasion of India, or about 300 B.C. Moreover, it is by no means impossible that the epic narrative was originally composed—as some other portions of the works are—in prose, either continuous or mixed with snatches of verse. New portions (as of the character of Rāma) may even have been originally composed in some popular dialect, which would certainly best account for the irregular and apparently prāktik or dialectic forms in which these works abound. The leading position occupied in the exist-
ing epic by Krishṇa (whence it is actually called kārṇa-veda, or the veda of Krishṇa), and the Vaishākha spirit pervading it, make it very probable that it assumed its final form under the influence of the Bhāgavata sect with whom Vāsudeva (Krishṇa), originally apparently a venerated local hero, came to be regarded as a veritable god, and incarnation of Vishu its culminating point this sectarian feature attains in the Bhāgavad-gītā (i.e. the up
shanah), “sung by the holy one”—the famous theosophe episode, in which Krishṇa, in lofty and highly poetic language, expounds the doctrine of faith (bhakti) and claims adoration as the incarnation of the supreme spirit. Of the purely legendary matter incorporated with the leading story of the poem, not a little, doubtless, is at least as old as the latter itself. Some of these episodes—especially the well-known story of Nala and Damayanti, and the touching legend of Śāivi—form themselves little by little, as it were, into the body of the epic poem.

The Rāmāyana, i.e. poem “relating to Rāma,” is ascribed to the poet Vālmīki; and, allowance being made for some later additions, the poem indeed presents the appearance of being the work of an individual genius. In its present form it consists of some 24,000 ślokas, or 48,000 lines of sixteen syllables, divided into seven books.

(I) King Daśaratha of Kosāla, reigning at Ayodhyā (Oudh), has four sons borne him by three wives, viz. Rāma, Bhārata and the so-called Āśaya. Daśaratha himself is a hero, a warrior, a king. Rāma, born on the same day and night with Āśaya, but in a different hour of the same day, was born with an enormous bow, formerly the dreadful weapon of the god Rudra, wins for a wife Śītā, daughter of Janaka, king of Videha (Tārāpur). (II) On his marriage with Śītā at the insistence of his brother, Lāṅka (Bundelkhand), which, apparently the king of Lāṅka cannot have formed part of the original epic, and was probably based on some general acquaintance with the Troy legend of Greek poetry.

A remarkable feature of this poem is the great variation of its textual condition in different parts of the country, amounting in fact to at least three different recensions. The text most widely prevalent both in the north and south has been printed repeatedly, with commentary, at Bombay, and was taken by Mr R. T. H. Griffith as the basis for his beautiful poetical translation of the Rāmāyana. The second recension, which has been edited, with an Italian prose translation, by G. Gorresio; whilst the third, recognized chiefly in Kashmir and western India, is so far known only from manuscripts. The mutual relation of these versions will appear from the fact that about one-third of the matter of each recension is not found in the other two; whilst in the common portions, too, there are great variations both in regard to the order of verses and to textual readings. To account for this extraordinary textual diversity, it has been suggested that the poem was most likely originally composed in a popular form, which has since been turned into Sanskrit by different hands trying to improve on one another; whilst Professor Jacoby would rather ascribe the difference to the fact that the poem was for a long time handed down orally in Sanskrit by rhapsodists, or professional minstrels, when such variations might naturally arise in different parts of the country. Yet another version of the same story, with, however, many important variations of details, forms an episode of the Mahabharata, the Rāmopakkhyāna, the relation of which to Vālmīki’s work is a matter of uncertainty. In respect of both versification and the Rāmāyana is of a distinctly more refined character than the larger poem; and, indeed, Vālmīki is seen already to cultivate some of that artistic style of poetry which was carried to excess in the later artificial Kavyas, whence the title of adi-kavi, or first poet, is commonly applied to him. Though the political conditions reflected in the older parts of the Rāmāyana seem to correspond most to those of pre-Buddhistic times, this might after all only apply to the poetic material handed down orally and eventually cast into its present form. To characterize the Indian epics in the language of modern prose the words, though often digressed by grotesque fancies and wild exaggerations, they are yet noble works, abounding in passages of remarkable descriptive power.

"Das Rāmāyana (Bonn, 1893)."

"London, 1870-1874; there is also an English prose translation by N. M. Dutt (Calcutta, 1894); and a condensed version in English with notes by R. M. Dutt (London, 1899)._"
intense pathos, and high poetic grace and beauty; and while, as works of art, they are far inferior to the Greek epics, in some respects they appeal far more strongly to the romantic mind of Europe. Never has there been so striking an evocation of the imaginative spirit and so vivid a delineation of womanly love and devotion, and their tender sentiment of mercy and forgiveness.

2. Purāṇas and Tantras.—The Purāṇas are largely the Purāṇas and Tantras. They are sometimes styled a fifth Veda, and may indeed in a certain sense be looked upon as the scriptures of Brāhmanical India. The term purāṇa, signifying "old," is applied to a poem or preface, especially connected with legends, and then to collections of earlier traditions like the Sanskrit.

The existing works of this class, though recognizing the Brāhmanical doctrine of the Trimūrti, or triple manifestation of the deity (in its creative, preservative and destructive activity), are all of a sectarian tendency, being intended to establish, on quasi-historic grounds, the claims of some special god, or holy place, on the devotion of the people. For this purpose the compilers have pressed into their service a mass of extraneous didactic matter on all manner of subjects, whereby these works have become a kind of popular encyclopaedia of useful knowledge. It is therefore less proper to regard them as preserved in the definition given of the typical Purāṇa, as well as from numerous coincidences of the existing works, that they are based on, or enlarged from, older works of this kind, more limited in their scope and probably of a more definitely tritheistic tendency of belief. Thus none of the Purāṇas, as now extant, is probably much above a thousand years old, though a considerable proportion of their materials is doubtless much older, and may perhaps in part go back to several centuries before the Christian era.

In legendary matter the Purāṇas have a good deal in common with the Sūtras. The last of the three, the Purāṇas, are, so to speak, the last of the last. The compilers of the Purāṇas are the revisers of both classes of works having evidently drawn their materials from the same fluctuating mass of popular traditions. They are almost entirely composed in the epic couplet, and indeed in much the same easy flowing style as the epic poems, to which they are, however, as a rule greatly inferior in poetic value.

According to the traditional classification of these works, there are said to be eighteen (Mahā-, or great) Purāṇas, and as many Upa-purāṇas, or subordinate Purāṇas. The former are by some authorities divided into three groups of six, according as one or other of the three primary qualities of external existence—goodness, darkness, and passion—prevails in pre-eminence in them. Thus, in the Vīṇa, the Vāyu-purāṇa, as the first group, or one of the six members of the class of the last of the Purāṇas, is the Vāyu-purāṇa, which contains the Vāyu-purāṇa, probably the oldest of the group. The other two are the Bhāgavata and the Bhārata-Purāṇa. In accordance with the nature of the several forms of the Trimūrti, the first two groups chiefly devote themselves to the commendation of Vīnu and Śiva respectively, while the third group, which is said properly to belong to Brahma, has been largely appropriated for the promotion of the claims of other deities, viz. Vīnu in his sensual form of Śrīna, Devī, Ganeṣa, and Śrīya. As Professor Banerjea has shown in his preface to the Markandeya, this seems to have been chiefly effected by later additions and interpolations. The insufficiency of the above classification, however, appears even from the fact that it omits the Śrīna-purāṇa, probably one of the older purāṇas, and none of the oratories of the second group. The eighteen principal Purāṇas are said to consist of together 400,000 couplets. In northern India the Vaishnava Purāṇas, especially the Bhāgavata and Vīnu, are by far the most popular. The Bhāgavata was formerly supposed to have been composed by Vopadeva, the grammarian, who lived in the 13th century. It has, however, been shown that what he wrote was a synthesis of Purāṇa, and that the latter is already a work by Ballāla Sena of Benares, in the 11th century. It is certainly held in the highest estimation, and, especially through the vernacular

2 There are several Indian editions of these two works. The Bhāgavata has been partly printed, in an édition de luxe, with a French translation at Paris, in 3 vols., by E. Burnouf, and a fourth by M. Hauvette-Besnault. Of the Vīnu, there is a translation by H. H. Wilson, 2 vols., with several valuable notes by F. Hall. This latter has never been printed in India, especially in the Bibl. Ind. and the Anand. series.

3 Rājendrāla Mītra, Notices of Sansk. MSS. ii. 47.

Ouejin in A.D. 544 and ante-dated by 600 years, falls to the ground; and with it Max Müller’s theory of an Indian Renaissance inaugurated during the reign of that king. Though Kālidāsa’s date thus arrives, it may be remembered that this is but a conclusion at Ujjayini about 440-448 A.D. Of the principal poets of this class, whose works have come down to us, he appears to be one of the earliest; but there can be little doubt that he was preceded in this as well as in many other literary spheres by the bards, who were eclipsed by the sun of his fame, and forgotten. Thus the recently discovered Buddhacharita, is a Sanskrit poem on the life of the religion’s founder, who is supposed to have been the author of which, Aśvaghoṣa, is placed by Buddhist tradition as early as the time of Kanishka (who began to reign in A.D. 78), calls itself, not without reason, a "mahākāvya"; and the panegyrics composed in the beginning of the Christian era, in honor of the two śāstras, display, both in verse and ornate prose, many of the characteristic features of the kāvya style of composition. Indeed, a number of quotations in the Mahābhārata, the commentary on Pāṇini, go far to show the extent to which ornamentation, and the style of the war-god) Kūmāra (or Scanda), the son of Śiva and Pārvatī, consists of seventeen cantos, the last ten of which were, however, not commented upon by Mallānātha, and are usually omitted in the MSS.; whereas it was by Kālidāsa, as is supposed, that it was composed by many scholars, though they may only have been set aside on account of their amorous character rendering them unsuitable for educational purposes, for which the works of Kālidāsa are extensively used in India; the 8th cantos, at any rate, being quoted by Vāmanā (A.D. 700). Another poem of this class, the Nala-dvāra, or "rise of Nala"—describing the restoration of that king, after having lost his kingdom—though bearing the former title, was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. In the 15th century, the English of the Kālidāsa's Mahābhārata, and more commonly called Bhāṭṭikāvya, to distinguish it from other poems (especially one by Pravravasena), likewise bearing the former title, was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. In the 15th century, the English of the Kālidāsa's Mahābhārata, and more commonly called Bhāṭṭikāvya, to distinguish it from other poems (especially one by Pravravasena), likewise bearing the former title, was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. In the 15th century, the English of the Kālidāsa's Mahābhārata, and more commonly called Bhāṭṭikāvya, to distinguish it from other poems (especially one by Pravravasena), likewise bearing the former title, was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. the appellative use of the word, or the notion of an old teacher of the dramatic art bearing that name. There still exists an extensive work, in epic verse, on rhetoric and dramaturgy, entitled Nā ya-sāstra,1 and ascribed to Bharata. Though this is probably the oldest theoretical work on the subject that has come down to us, it can hardly be referred to an earlier period than several centuries after the Christian era. Not improbably, however, this work, which presupposes a fully developed scenic art, had an origin similar to that of some of the metrical law-books, which are generally supposed to be popular and improved editions of older sūtra-works. We know that such treatises existed at the time of Pāṇini, as he mentions two authors of Nāyu-sāstras, or “rules for actors,” viz. Śīlāṇin and Kriṣṇāśva. Now, the words nāya and nātya—as well as nātaka, the common term for “drama”—being derived (like the modern vernacular “Nautch” = mṛtyya) from the root nāj (net) “to dance,” “seem to point to a pantomimic or choral origin of the dramatic art. It might appear doubtful, therefore, in the absence of any clearer definition in Pāṇini’s grammar, whether the actors’ rules did not refer to more pantomimic performances. Fortunately, however, Patanjali, in his “great commentary,” speaks of the actor as singing, and of people going “to hear the actor.” Nay, he even mentions two subjects, taken from the cycle of Vishnu legends—viz. the slaying of Kanṣa (by Kṛṣṇa) and the binding of Bali (by Vishnu)—which were represented on the stage both by mimic action and declamation. Judging from these allusions, theatrical entertainments in those days seem to have been very much on a level with the old religious spectacles or mysteries of Europe, though there may have already been some elements of the dramatic art which we at once wish had no occasion to mention. It is not, however, till some five or six centuries later that we meet with the first real dramas, which mark at the same time the very culminating point of Indian dramatic composition. In this, as in other departments of literature, the earlier works have had to make way for later and more perfect productions; and no trace now remains of the intermediate phases of development. Thus we know of at least five predecessors of Kālidāsa from whom nothing but a few quotations have been preserved.

Here, however, the problem presents itself as to whether the existing “dramatic literature has naturally grown out of such popular religious performances as are alluded to by Patanjali, or whether some foreign influence has intervened at some time or other and given a different direction to dramatic composition. The question has been argued both for and against the probability of Greek influence; but it must still be considered as sub judicis; the latest investigator, M. Sylvain Lévi, having given a decided opinion against outside influence. There are doubtful some curious points of resemblance between the Indian drama and the Modern Attic (and Roman) comedy, viz. the prologue, the occasional occurrence of a token of recognition, and a certain correspondence of characteristic stage-figures—especially the Viḍūshaka, or jocose companion of the hero, presenting a certain analogy to the servus of the Roman stage, as does the Vītā, the hero’s disciple, though accomplished, boon-companion, of some plays, to the Roman parasite—for which the assumption of some acquaintance with the Greek comedy on the part of the earlier Hindu writers would afford a ready explanation. On the other hand, the differences between the Indian and Greek plays are perhaps even greater than their coincidences, which, moreover, are scarcely close enough to warrant our calling in question the originality of the Hindus in this respect. Certain, however, it is that, if the Indian poets were indebted to Greek playwrights for the first impulse in dramatic composition, in the higher sense, they have known admirably how to adapt the Hellenic muse to the national genius, and have produced a dramatic literature worthy to be ranked side by side with both the classical and our own romantic drama. It is to the latter especially that the general character of the Indian play presents a striking resemblance, much more so than to the classical drama. The Hindu dramatist has little regard for the “unities” of the classical stage, though he is hardly ever guilty of extravagance in his disregard of them. Unlike the Greek dramatic theory, it is an invariable rule of Indian dramaturgy, that every play, however much of the dramatic element it may contain, must have a happy ending. The dialogue is invariably carried on in prose, plentifully interspersed with those neatly turned lyrical stanzas in which the Indian poet delights to depict some natural scene, or some temporary physical or mental condition. The most striking feature of the Hindu play, however, is the mixed nature of its language: while the hero and less important characters speak Sanskrit, women and inferior male characters speak various Prākrit dialects. As regards these dialectic varieties, it can hardly be doubted that at the time when they were first employed in this way they were local vernacular dialects; but in the course of the development of the scenic art they became permanently fixed for special dramatic purposes, just as the Sanskrit had, long before that time, become fixed for general literary purposes. Thus it would happen that these Prākrit dialects, having once become stationary, soon diverged from the spoken vernaculars, and the difference between them was as great as between the Sanskrit and the Prākrits. As regards the general character of the dramatic Prākrits, they are somewhat more removed from the Sanskrit type than the Pāli, the language of the Buddhist canon, which again is in a rather more advanced state than the language of the Aṣoka inscriptions (c. 250 B.C.). And, as the Buddhist sacred books were committed to writing about 80 B.C., the state of their language is attested for that period at latest; while the grammatical fixation of the scenic Prākrits has probably to be referred to the early centuries of the Christian era.

The existing dramatic literature is not very extensive. The number of plays of all kinds of literary value will scarcely amount to fifty. But, on this account alone, the question of originality is raised, that is to say, Is the whole of the dramatic composition of the Hindu drama merely a frank copy of that of Greece? The answer is doubtless that they appealed to the tastes of only a limited class of highly cultivated persons, and were in consequence but seldom acted. As regards the theatrical entertainments of the common people, it seems that they were done above the level of the religious spectacles mentioned by Patanjali. Such at least is evidently the case as regards the modern Bengali little-dramas—described by Wilson as exhibitions of some incidents in the youthful life of Kṛṣṇa, maintained in extemporaneous dialogue, interspersed with popular songs—as well as the similar rātas of the western provinces, and the rough and ready performances of the street, or professional buffoons. Of the religious drama Sanskrit literature offers but one example, viz. the famous Citra-gvinda,2 composed by Jayadeva in the 12th century. It is rather a mytho-lyrical poem, which, however, in the opinion of Lassen, contains a professed attempt to reproduce the ancient forms of dramatic composition. The subject of the poem is as follows: Kṛṣṇa, while leading a cowherd’s life in Vīṇā-divana, makes his way through Rādhā’s nuptial chamber, and she is forests. For a while. Presently, however, he returns to her “whose image has all the while lingered in his breast,” and after much earnest entreaty obtains her forgiveness. The emotions appropriate to their characters are expressed with directness; and their song, “It is a friend of Rādhā in melodious and passionate, if voluptuous, stanzas of great poetic beauty. Like the Song of Solomon, the Cātavagnita, moreover, is supposed by the Hindu commentators to admit of a mystic interpretation; for, “as Kṛṣṇa, faithless for a time, discovers the vanity of all other loves, and returns with sorrow and longing to his own darling Rādhā, so the human soul, after a brief and frantic attachment to objects of sense, burns to return to the God from whence it came ” (Griffith).

The Mṛcchhkaṇḍa or “little clay cart,” has been usually placed at the head of the existing dramas; but, though a certain amount of historical construction might seem to justify this distinction, the question of its relative antiquity remains far from being definitively settled. Indeed, the fact that neither Kālidāsa, who mentions three predecessors of his, nor Lālā, for viewing his literary predecessor makes any allusion to the author of this play, as well as other points, seem rather to tell against the latter’s priority. But seeing that Vāmanas quotes from the Mṛcchhkaṇḍa, this play must at any rate precede his; in which case it is curious to note that it bears a striking resemblance to the last stage of the Abhinavagupta’s play. According to several stanzas in the prologue, the play was composed by a king Śūḍraka, who is stated there to have, through Siva’s

1. Edited, with a Latin translation, by C. Lassen; English translation by E. Arnold.
2. Edited by F. Stenzler; with commentary, by K. P. Parab (Bombay, and several times at Calcutta); translated by H. H. Wilson; also into English prose and verse by A. W. Ryder (Harvard Or. Ser., 1905); German by O. v. Böhtlingk and L. Fritze; French by P. Regnault.
favour, recovered his eyesight, and, after seeing his son as king, to have died at the ripe age of a hundred and ten days. According to a recent edition, the name of the king’s death; but it is probable that they were added for a subsequent performance. In Bāja’s novel Kādambara (c. A.D. 630), a king Śādraka is represented as having resided at Bījāpa (Bhisa) some years with the title of Urjain, where his son's play is laid. Chārudatta, a Brāhmaṇ merchant, reduced to poverty, and Vasantaśena, an accomplished courtier, meet and fall in love with each other. On a visit to Bījāpa, Bāja, with political underplot, resulting in a change of dynasty. The connexion between the two plots is effected by means of the king’s rascally brother-in-law, who pursues Vasantaśena with his addresses, as he has the heart’s desire of the young Brāhmaṇ woman being drawn to prison, finds shelter in the hero’s house. The wicked prince, on being rejected, strangles Vasantaśena, and accuses Chārudatta of having been the author of the affair, but, just as the latter is being led away, his lady love appears again on the scene. Meanwhile Aryanā has succeeded in deposing the king, and, having himself mounted the throne of Ujjain, he raises Vasantaśena to the position of a Brāhmaṇ woman, to enable him to be united with the Chārudatta. The play is one of the longest, consisting of not less than ten acts, some of which, however, are very short. The interest of the action is, on the whole, well sustained; and, altogether, the piece presents a vivid picture of the social manners of the time, whilst the author himself imbues with a keen sense of humour, and a master in the delineation of character.

Kālīḍāsa’s plays are among the highest point of perfection. From this accomplished poet we have three well-constructed Kālīḍāsa. plays, abounding in stanzas of exquisite tenderness and fine descriptive passages, viz. the two well-known mytho- dramatic works Malavikagnimitra and Vivadravana, and a piece of court intrigue, distinctly inferior to the other two, entitled Malavikagnimitra in five acts. King Agnimitra, who has two wives, falls in love with Malavikā, maid to the first queen. He is cast out of the court, but even in exile he does not get over his passion. In the end Malavikā turns out to be a princess by birth, and is accepted by the queen as their sister.

Śrī-Harshadeva. The last of this group is the poet (Śrī) Harshadāna of Kānya-būja (Kanauj) mentioned above, who ruled in the first half of the 7th century—has three plays attributed to him; though possibly only dedicated to him by poets patronized by his court. Śrī-Harshadeva, attempts to model his case as regards the Rāvaṇa-avatāra, the author of which they assign to Bāja. Indeed, had they been the king’s own productions, one might have expected the Chinese pilgrims (especially Li-ching, who drew one of the poems) performed to match them. The Rāvaṇa-avatāra, “the pearl necklace,” is a graceful comedy of gentle domestic manners, in four acts, of no great originality of invention; the author having been largely indebted to Kālīḍāsa’s plays. A decided merit of the poet’s art is the simplicity and clearness of his style. Rāvaṇa-avatāra, a Ceylon princess, is sent by her father to the court of King Udayana of Vatsa to become his second wife. She suffers shipwreck, but is rescued by the hero. Udayana’s men are defeated, and the defeated general is taken to the court of the king, as is the case with the Rāma-avatāra. The justice and fairness of the king in ancient or modern times, would afford materials for as favourable a delineation.” Very similar in construction, but distinctly inferior, is the Priyadarśini, in four acts, having for its plot another amorous tale of the same king. The scene of the third play, the Māyāvadāna, or “joy of the serpents” (in five acts), on the other hand, is laid in semi-divine regions. Jīmūtavāhana, a prince of the Vidyādharas, imbued with Buddhist principles, weds Māyāvati, daughter of the king of the Vidyādharas (the Yakṣés). But, learning that Garuda, the mythic bird, is in the habit of consuming one snake daily, he resolves to offer himself to the bird as a victim, and finally succeeds. The Garuda is converted, and the interlude affords a warning against doing injury to living beings; but he himself is about to succumb from the wounds he has received, when, through the timely intervention of the goddess Gauri, he is restored to life. This circumstance is explained as a compromise between Brāhmaṇical (Saiva) and Buddhist concepts, being thus in keeping with the religious views of king Harsha, who, as we know from Huen Thang, favoured Buddhism, but was also tolerant of the Saiva faith. The whole play is based on the legend of Rāma and the Serpent, and concludes with one to Gauri. The author is generally believed to have been a Buddhist, but it is more likely that he was a follower of the Saiva faith. Born in Bāja’s house. Nay, one might almost feel inclined to take the hero’s sacrifice as a favour of a Nāraka as a travesty of Buddhist principles. In spite of its shortcomings construction the Nāgānandā is a play of considerable merit, the charmingly simple and graceful style, and the use of humorous elements introduced into it of a very respectable order.

Bhavabhūti, surnamed Śrī-kāthā, “in whose throat there is beauty (eloquence),” was a native of Padnapura in the Vidarbha country. He was the Berar king Lālādīta’s brother-in-law, and the husband of Nīlakṣaṇa and his wife Jāttikṣaṇa. He passed his literary life chiefly at the court of Yasovarman of Kanauj, who must have reigned in the latter part of the 7th century, seeing that, after a successful reign, he suffered defeat at the hands of Lālādīta of Kashmir, who had mounted his throne in A.D. 605. Bhavabhūti was the author of three plays, two of which, the Māhābharatarakārī (“life of the great hero”) and the Ulūrtararāmacarī (“later life of Rāma”), in seven acts each, form together a dramatized version of the story of the Rāma-yāna. The third, the Mālā-vikagnimitra, is a romantic drama in ten acts, representing the fortunes of Mālāvika and Mālātikā, the two rival and dangerous neighbouring kings, who from childhood have been destined for each other, but, by the resolution of the maiden’s royal master to marry her to the son of a king who is her rival, she is condemned to lifelong misery and permanent separation. The action of the play is full of life, and abounds in stirring, though sometimes improbable, incidents. The poet is considered by native critics to be not only inferior to Pandit, but hitherto, having jointed, as a dramatic artist. Whilst the latter delights in depicting the gentle feelings and tender emotions of the human heart and the peaceful scenes of rural life, the younger poet finds a peculiar attraction in the sterner and more sturdy aspects of life. The decoration of the Bhavabhūti’s language, though polished and felicitous, is elaborate and artificial compared with that of Kālīḍāsa, and his genius is sorely shackled by a slavish adherence to the arbitrary rules of classicist theorists.

Bhāṣṭā Nārāyaṇa, surnamed Mīrīgārī or Sinha, “the lion”, the author of the Vivāṣakāra (“the binding up of the braid of hair”), is a poet of uncertain date. Tradition has it that he was one of the five Kanauj Brāhmaṇs whom king Adiya of Bengal, desirous of establishing the pure Viṣṇuva śaivism doctrine, invited to his court, and from whom the modern mādaṇ households are supposed to have descended. But be this as it may, a copperplate grant was issued to our poet in A.D. 840; and besides, he is quoted in Anandavardhāna’s Dhanyāyaka, written in the latter part of the 9th century. The play, consisting of six acts, is a romance of the 5th century. In the story, the Bhavabhūti’s language, though polished and felicitous, is elaborate and artificial compared with that of Kālīḍāsa, and his genius is sorely shackled by a slavish adherence to the arbitrary rules of classicist theorists.

The Hanuman-nāṭaka is a dramatized version of the story of Rāma, interspersed with numerous purely descriptive poetic passages. It consists of fourteen acts, and on account of its length is also called the Māhā-nāṭaka, or great drama. Contrary to the general practice, the Hanuman-nāṭaka is in the Sanskrit language, and is avowedly written in imitation of the Mahābhārata, which it relates that it was composed by Hanumān, the monkey general, and inscribed on rocks; but, Vālmiki, the author of the Rāma-yāna, this is the commentator’s explanation of the name, whilst M. Lévi would render it by “the divine throat.”

Edited by P. H. Trithen (1848); with commentary, A. Baroach (Calcutta, 1897); and B.认证 (Bombay, 1892); translated by J. Pickford (1871).

With commentary and translation (Nagpur, 1895); with commentary, A. Parab and Parab (1899); translation by H. H. Wilson and C. H. Tawney.

Edited by R. G. Bhandarkar (1876); translated by H. H. Wilson. Whether, as M. S. Lévi suggests, the fact of the play commentaries on the original as it was composed in imitation of the Mahābhārata must remain uncertain.

Edited by J. Grill (1871); twice with commentary (Bombay); English translation by S. M. Tagore (Calcutta).

Printed with Mohandasā’s commentary (Bombay, 1861).
SANSKRIT

[POETRY]

being afraid lest it might throw his own poem into the shade, Hanumān allowed him to cast his verses into the sea. Thence fragments were ultimately picked up by a merchant, and brought to King Kairātā, who directed the poet Dāmodara Mitra to put them together and fill up the lacunae; whence the present composition originated. Whatever particle of truth there may be in this story, the great poet's utilization of different hands, "The language," as Wilson remarks, "is in general harmonious, but the work is after all a most disjointed and nondescript composition, and the patchwork is very glaringly and clumsily put together." It is nevertheless a work of some interest, as compositions of mixed dramatic and declamatory passages of this kind may very commonly be found in the early stages of the dramatic art.

The connexion of the work with King Bhoja, also confirmed by the name Rāmakṛṣṇa, would bring the composition, or final redaction, down to about the 10th or 11th century. A Mahābhārata, however, is later, referred to by Anandavardhana (9th century); and if some of the characters are known to the work, it is possible that one composed upon by Mohanadaksa, and a longer one arranged by Madhusūdana. A Dāmodara Gupta is mentioned as being lived under Jayāpatra of Kashmir (755-786); but this cannot be safely the same as the writer connected with this work.

The Mūdrārākshasā,1 or "Rākhsha (the minister) with the signet," is a drama of political intrigue, in seven acts, partly based on historical events, the plot turning on the reconciliation of Rākhsha, the minister of the murdered king Nanda, with the hostile party, consisting of Prince Chandragupta (the Greek Sandrocottus, 815-291 B.C.), who succeeded Nanda, and his minister Chāryaka. The style of composition is clearly unserious, if not particularly elegant, language. The play was composed by Viśakhadatta, prior, at any rate, to the 11th century, whilst Professor Jacobi infers from astronomical indications that it was written in A.D. 760.

The Prabodha-chandradoya,2 or "the moon-rise of intelligence," composed by Krishnaśīla about the 12th century, is an allegorical play of 4664 lines in three parts, which consist entirely of abstract ideas, divided into two conflicting hosts. Of numerous inferior dramatic compositions we may mention as the best—the Aranyakya-rāhva, by Murāri; the Bāla-rāmāyana, one of six plays (four of which are known) by Rājaśekhara; and the Prasanna-rāhva,4 by Jayadeva, the author of the rhetorical treatise Chandraloka. Abstracts of a number of other pieces are given in H. H. Wilson's Hindo Theatre, the standard work on this subject. The so-called "lost" works of the 11th and 12th centuries may be said to have exhausted itself about the 14th century.

5. Lyric, Descriptive and Didactic Poetry.—Allusion has already been made to the marked predilection of the medieval Indian poet for depicting in a single stanza some peculiar physical or mental situation. The profane lyric poetry consists chiefly of such little poetical pictures, which form a prominent feature of dramatic compositions. Numerous poets and poetesses are only known to us through such detached stanzas, preserved in native anthologies or manuscripts of rhetoric, and enshrining a vast amount of descriptive and comic, or sententious, features.

or "car-ambrosia of good sayings," an anthology compiled by Śrīdhara Dāsa in 1205, contains verses by 446 different writers; while the Śrṅgadāra-puddhati,5 of the 14th century, contains some 6000 verses culled from 264 different writers and works; and Vallabhadeva's Subhāshītyāvat,6 another such anthology, contains some 3500 verses ascribed to some 350 poets. These verses are either of a purely descriptive or of an erotic character; or they have a didactic tendency, being intended to be used, in an attractive and easily remembered form, some moral truth or useful maxim. To the last class of verses, but especially to partly descriptive, partly erotic character, is Kālidāsa's Meghābāha 7 or "cloud messenger," in which a banished Yaksha

1 Edited (Bombay, 1884, 1893) by K. T. Telang, who discusses the date of the work in his preface; trans. H. H. Wilson; German, L. Fritz; French, Victor Hehn.
2 Translated by J. Taylor (1818), by T. Goldstücker into German (1842). Edited by H. Brockelmann (1853); also Bombay (1868).
3 Another play, composed entirely in Prākrit, by Rājaśekhara (c. A.D. 900), the Karparāmoṇjīri, has been critically edited by E. S. Law in English translation by Ch. R. Lanman, Harvard Or. Ser. (1901).
4 Ed. Shiwaśīla Raoji Khopākar (Bombay, 1894).
5 Rājendralal Mitra, Notits, iii. p. 134.
6 Ed. P. Peterson and Durgāpurāskara (Bombay, 1886).
7 Text and translation by H. H. Wilson, with vocabulary by S. Johnson; with German vocabulary by Stenzler (1874); often, with commentary, in India.

(demi-god) sends a love-message across India to his wife in the Himalaya, and describes, in verse-pictures of the stately mandākranta metre the various places and objects over which the messenger, a cloud, will have to sail in his airy voyage. This little masterpiece has called forth a number of more or less successful imitations, such as Lakṣmībhūṣaṇa's Śuka-sandesa, or "parrot-message," lately edited by the mahārāja of Travancore. Another much-admired descriptive poem by Kālidāsa is the Riśu-sāhāra, or "collection of the seasons," in which the attractive features of the six seasons are successively set forth. There are also religious lyrics, the fruit of ascetic fervour, a large collection of hymns and detached stanzas, extolling some special deity, might be made from Purāṇas and other works. Of independent productions of this kind only a few of the more important can be mentioned here. Śankara Āchārya, the great Vedāntist, who seems to have flourished about A.D. 800, is credited with several devotional poems, especially the Ānanda-lakāra, or "wave of joy," a hymn of 103 stanzas, in praise of the goddess Pārvatī. The Śānya-sākta, or century of stanzas in praise of Śūrya, the sun, is ascribed to Mayūrī, the contemporary (and, according to Nanda, father-in-law) of Bāṇa (in the early part of the 7th century). The last of the four bhārata, the Chandikāstotra, a hymn of 102 stanzas, extolling Śiva's consort. The Khyānaprastā, a poem celebrating the ten avatāras of Viṣṇu, is ascribed to no other than Hanumān, the monkey general, himself. Jayadeva's beautiful poem Gīgā-vindu, which, like most productions concerning Kṛṣṇa, is of a very sensuous character, has already been referred to.

The particular branch of didactic poetry in which India is especially rich is that of moral maxims, expressed in single stanzas or couplets, and forming the chief vehicle of the Niti-sastra or ethic science. Excellent collections of such aphorisms have been published—in Sanskrit and German by O. v. Böhtlingk, and in English by John Muir. Probably the oldest original collection of this kind is ascribed to Chāṇakya,—and entitled Rājaṅitiśāmuchchaya,9 or "collection on the conduct of kings"—traditionally connected with the Machaivellian minister of Chandragupta, but (in its present form) doubtless much later—of which there are several recensions, especially a shorter one of one hundred couplets, and a longer one of some three hundred. Another old collection is the Kāman- niyādāra, or "Fruitful of fame," by Kannadi, who is said to have been the disciple of Chāṇakya. Under this title the work has been handed down three centuries of sentimented couplets.10 one of which, the nīta-sātaka, relates to ethics, whilst the other two, the śringāra- and vairāgya-sātakas, consist of amatory and devotional verses respectively. The Nīti-prātā, or "lamp of conduct," consisting of sixteen stanzas, is ascribed to Vaiṭālātha or 11, who is mentioned as one of nine gems." The Amara-sātaka,12 consisting of a hundred stanzas, ascribed to a King Amaru (sometimes wrongly to Śankara); the Bhāminti-sāl,13 or "dalliance of a fair woman," by Jaganāthā; and the Charura- mānivātikā14 by Bihāra (11th century), are of an entirely erotic character.

6. Fables and Narratives.—For purposes of popular instruction stanzas of an ethical import were early worked up with existing prose fables and popular stories, probably in imitation of the Buddhist jātakas, or birth-stories. A collection of the kind, intended as a manual for the guidance of princes (in usum delphin), was translated into Pahlavi in the reign of the Persian king Chosro Nushāryan, A.D. 531-579;15

The first Sanskrit book published (by Sir W. Jones), 1792-1793, by R. Simon translation by E. P. Bohlen, edited, with notes and translation, by S. Ayar (Bombay, 1897); partly translated, in verse, by R. T. H. Griffin, Specimens of Old Indian Poetry. 1873.

17 Edited by P. v. Bohlen (1833); with German translation, W. Soll (1886); English translation by Edwin Arnold (1896).
but neither this translation nor the original is any longer extant. A Syriac translation, however, made from the Pahlavi in the same century, under the title of "Qua'llag and Dimnag"—from the Sanskrit "Karataka and Damanka," two jackals who play an important part as the lion's counsellors—has been discovered and published. The Sanskrit original, which probably consisted of facts handed down by the priests of Vedic times in their first recension, the Purushotamakosa,4 or "five books" (or headings), of which several recensions exist. A popular summary of this work, in four books, the Hītā-pāda,5 or "Salutary Counsel," has been shown by Peterson to have been composed by one Nārāyana. Other highly popular collections of stories and fairy tales, interspersed with sententious verses, are the Vatēla-panchavimsati,6 or "twenty-five (stories of the Vatēla)" (the original of the Batal Pachist), ascribed either to Jambhala Datta, or to Śivādasa (while Professor Weber suggests that Vatēla-bhātta may have been the author), and at all events older than the 11th century, since both Kshemendra and Somadeva have used it; the Śuka-saptati,7 or "seven stories (related by the parrot)," the author and age of which are unknown; and the Simhasana-dvārātīkâ, or "thirty-two (tales) of the throne," being laudatory stories regarding Vikramāditya of Avanti, related by thirty-two statues, standing round the old throne of that famous monarch, to King Bhaja of Dhārā to discourage him from sitting down on it. This work is ascribed to Kshemendra, and was probably composed in the time of Bhaja (who died in 1053) from older stories in the Mahāhrātra dīkṣā, or technical recreation of the ancient oral usage (samaya-āchāra).7 This is doubtfu that such stories were at any time as numerous as the Gṛhyaśūtras, or rules of domestic or family rites, to which they are closely allied, and of indeed they may originally have been an outgrowth. That the number of those actually extant is comparatively small is, however, chiefly due to the fact that this class of works was supplemented by another of a more popular kind, which covered the same ground. The Dharmasūtras consist chiefly of strings of terse rules, containing the essentials of the science, and intended to be committed to memory, and to be expounded orally by the teacher—thus forming, as it were, epitomes of class lectures. These rules are interspersed

with stanzas or "gāthās," in various metres, either composed by the author himself or quoted from elsewhere, which generally give a fuller interpretation of the rules, or perhaps a more popular exposition. To understand why such coupled should gradually have become more popular than the original, we should ultimately have led to the appearance of works entirely composed in verse. Such metrical law-books did spring up in India, not only in Sanskrit, but in many other languages, extending probably from about the beginning of our era, or even earlier, down to well-nigh the Mahomedan conquest; and, as at all events, the number, or rather the number of distinct metres, particularly other metres were entirely discarded for the epic meter. These works are the metrical Dharmāṇa-sūtras, or, as they are usually called, the Smārti, "recollectation, tradition,"—a term which, as we have seen, belonged to various strata of the ancient literature, and, that figure, though some of these, it is true, are short and insignificant tracts, while others are only different recensions of one and the same work.

With the exception of a few of these works—such as the Agni, Yama- and Visnus-Smāriti—which are ascribed to the respective gods, the authorship of the Smārti is attributed to old rishis, such as Atri, Kapi, Vāsak, Śantāli, Bhārḍāvājī.

It is, however, extremely doubtful whether in most cases this attribution is not altogether fanciful, or whether, as a rule, there really existed any such revelation. One can see, however, that several alleged authors or schools named after them. The idea, which early suggested itself to Sanskrit scholars, that Smārti might have been passed on by the names of old Vedic teachers and their schools might simply be the outcome of this fanciful notion. However, however, that idea was a very natural one, and, indeed, is still a very probable one, though the loss of the original Śūtras, and the modifications and additions which the Smārti doubtless underwent in course of time, make it very certain possible that any school or any one of them.

However, scarcely account for the disappearance of the Dharmasūtras of some of the most important schools except on the ground that they were given up in favour of the Smārti, or that some of the schools might have been lost. It is certainly that this should have been done, unless there was some guarantee that the other works, upon the whole, embodied the doctrines of the old authorities of the respective schools. Thus, as regards the most influential school of the Śvuśikā, which is to say both a Śrauta- and a Gṛhyaśūtra of the Mānava school of the Black Yāju, but no such Dharmasūtras has hitherto been discovered, though several works exist on a wide range, which Professor Bühler has recently found in the Mānava, consisting partly of prose rules, and partly of couplets, some of which occur literally in the Manusmriti, whilst others have been slightly altered there to suit late doctrines, or have been changed from the original trishūlbhī into the epic metre. The idea of an old law-giver Manus Śvayambhūva "sprung from the self-existent (svayam-bhu)" god Brahmā (m.—reaches far back into Vedic ages. It is mentioned as early as in the earlier texts of the Nīruka a śūkha occurs giving his opinion on a point of inheritance. But whether or not the Mānava-Dharmasūtra embodied what were the ancient laws, it is no mention of sacred law we do not know; nor can it as yet be shown that the Manusmriti, which seems itself to have undergone considerable modifications, is the line descendant of that Dharmasūtra. It is certain, however, that the Manusmriti and the Visnuśuṭras; and, as the latter is most likely a modern, only partially remodelled, edition of the Śūtras of the Black Yāju school of the Kāthas, the close relation between the two works would be easily understood, if it could be shown that the Manusmriti is a modern development of a line of the Śūtras of another school of the Āraka division of the Black Yajurveda.

The Mānava Dharmasūtra consists of twelve books, the first and last of which, treating of creation, transmigration and final beatitude, are, however, generally regarded as later additions. In them the legendary sage Bṛihī, here called a Mānava, is introduced as the compiler of the entire code of sacred law. Why this intermediate agent should have been considered necessary is by no means clear. Except in these two books the work shows no special relation to any of the other Smārti texts. The question as to the probable date of the final redaction of the work cannot as yet be answered. Dr Burnell has tried to show that it was probably composed under the Āchārya king Daksāsi, about A.D. 500, but his argumentation is anything but convincing. From several śūkas quoted from Manus by Varāhamihira, in the 6th century, it would appear that the text which the great astronomer had re-edited was the same as that which is now in use, and is therefore, possible that he referred either to the Bhārat-Manu (Great
M.) or the *Vididha-Manu* (Old M.), who are often found quoted, and apparently represent one, if not two, large recensions of this Smrti. The oldest existing commentary on the *Mahanava-Dharmasatra* is by Bhartṛhari, a work which was supposed to have lived in the 9th or 10th century. He had, however, several predecessors to whom he refers as pādre, "the former ones." The most estimable of these is Chakravarti, a commentator of that of Kullikā Bhāṣṭa, completed at Benares in the 15th century.

Next in importance among Smritis ranks the *Yajñavalkya Dharmasāstra.* Its origin and date are not less uncertain—except that, in some respects, it appears to have been more highly esteemed, than any other Smrita. It was the work of the celebrated Yajñavalkya himself, a sage of the Sākta school of law, which recognizes as its chief authority the digest of its founder, Jīmatavāhāna, especially the chapter on succession, entitled *Dvārayāṣa.* Based on the Mitakshara are the *Smriti-Sadāsastra* and the *Paniniya-Kalpa, translated* by Max Muller, in the 13th century, and highly esteemed in Southern India; and the *Vrīmritodakaya,* a compilation consisting of two books, translated by Chāṇakya, is the work of the 11th century, or the half of the 12th century. A commentary on the first half of the 12th century.

The *Nārāyana-Dharmasāstra,* or *Nārāyana-sūtra,* is a work of a more humble kind; indeed, it is probably the most systematic and business-like of all the Smritis. It does not concern itself with the religious principles of the Hindu religion, but it gives a comprehensive account of the Vedic, or Śramana, law, and it contains the most extensive commentaries on the three great divisions of the Indian theory of law: dhāraṇa, rule of conduct (social and caste duties); sauhāsra, civil and criminal law; prakāsa, civil and criminal law. The first division of the commentaries on the work: the famous *MāRKĀBHAŞA,* by Vijñāneśvara, who lived under the Chākula king Vikramaditya of Kālaya (1076–1127); and another by Aparārka or Aparārdhāya, was written in the 11th century.

The *Parāsāra-sūtra* contains no chapter on jurisprudence, but it contains much information on the religious law, usually called *Parāsāra-śāstra,* to which, he added a third chapter on vyavahāra, or proper law. Besides the ordinary text of the Parāsāra-sūtra, consisting of rather less than 600,000 words, there are several intermediate products, which are all copies, in various states of editing, of an amplification of the former, containing not less than 2980 (according to others even 3300) ślokas.

Whether any of the Dharmasūtras were ever used in India as a code of law, for the practical administration of justice is very doubtful; indeed, so far as the most prominent works of this class are concerned, it is highly improbable. No doubt these works were held to be of the highest authority by all the Sākta schools of India. The deficiency was, however, supplied by the famous exegete Padāśaka. Mahādeva (in the latter half of the 14th century), who made use of the Smritis and other works of a larger and less systematic religious law, usually called *Parāsāra-śāstra,* to which, he added a third chapter on vyavahāra, or proper law. Besides the ordinary text of the Parāśāra-sūtra, consisting of rather less than 600,000 words, there are several intermediate products, which are all copies, in various states of editing, of an amplification of the former, containing not less than 2980 (according to others even 3300) ślokas.

and to this only, that the Indian metaphysician takes up the great problems of life—the origin of man and the universe, and the relation between mind and matter.

It is worthy of note that the speculations were viewed with much favor by the great body of Brähmans engaged in ritualistic practices. Not that the metaphysicians actually discounterenanced the ceremonial worship of the old mythological gods as vain and superstitious, or that they ever ceased to be the custodians of the manifold and intricate systems of sacrifices, and commended them as the most meritorious of human acts, by which man could raise himself to the highest degrees of mundane existence, to the worlds of the Fathers and Devas. But their effort was, rather, to demonstrate that it had gradually succeeded in profoundly modifying the original character of the sacrificial ritual: an allegorical meaning had come to be attached to it. What had been the religious element was where sacrifice a monotheistic-pantheistic theory of the Brâhmâs which makes the performance of the sacrifice represent the building up of Prajâpati, the Purusha or “world man,” and thus the creation of reproduction, life. The doctrine of “Karma” is thus to be the whole Brahman (n.), and (vii. 1, 2, 7; xi. 1, 6, 17) he is represented as the breath or vital air (prâna), and the air being his self (âtman). It needed not the identification of the Atman, or individual self, with the Brahman or Paramâtman (supreme self), to show that the final goal lay far beyond the worlds hitherto striven after through sacrifice, a goal unattainable through aught but a perennial self-contemplation. “Know ye that one Self,” exhorts one of those old idealists, “and have done with other words; for that (knowledge) is the bridge to immortality!” Intense self-contemplation being, moreover, inseparable from concentration of the mind, this doctrine left little or no room for those meditational offices of the priest, so indispensable in ceremonial worship; and indeed we actually read of Brâhmans’ “shut up” (vii. 8) for the true doctrine of salvation. But, in spite of their anti-hierarchical tendencies, these speculations continued to gain ground; and in the end the body of treatises propounding the pantheistic system that the speculators had conceived as the Diviné Spirit. “The Vedânta; but their adherents claim this title for their doctrines in a metaphysical rather than in a material sense, as “the ultimate aim and consummation of the Veda.”

In later times the radical distinction between these speculative appendages and the bulk of the Vedic writings was strongly accentuated in a new and more radical system of interpretation, the Upanishad system, by which they were supposed to consist of two great divisions—the Karma-kâya, i.e., “the work section,” or practical ceremonial (exoteric) part, consisting of the Sâphitks and Brâhmâs (including the ritual portions of the Aranyakas), and the Mâyâkâya, “the knowledge-section,” or speculative (esoteric) part. These two divisions are also called respectively the Pûrâna- (“former”) and Uûrâta- (“latter,” or “higher”) Kâya; and when the speculations of the Upanishadists came to be formulated into a regular system it was deemed desirable that there should also be a special system corresponding to the older or legendary ceremonial principle, the one and only existing from eternity—the Atman, the Self, or, as his Telegu and Mâdhâvâcharya’s Brâhmâical name. In 1331 he became the jagadguru, or spiritual head, of the Smârâs (a Vedântist sect founded by Sanât-Kumâra himself) and, having become the disciple of Śrî Süssi, under the patronage of Bukka, king of Vidyâranya, he composed his principal works. He sometimes passes under a third name, Vidhârînâ, svâmin, adopted by him on becoming a swâmin, or religious mendicant.

1. The Vedânta philosophy, in the comparatively primitive form in which it presents itself in most of the older Upanishads, constitutes the earliest phase of sustained metaphysical speculation. In its essential features it remains to this day the prevalent belief of Indian thought, and enters largely into the religious life and convictions of the people. It is an idealistic monism, which derives the universe from an ultimate conscious Being and self-consciousness in action, the Atman, the Self, or, as his Telegu and Mâdhâvâcharya’s Brâhmâical name. It is this imordial essence or Self that pervades all things, and gives life and light to them, “without being suffused by the visible outward im

2. In these treatises only the leading features of the pantheistic theory find utterance, generally in vague and mystical, though often in singularly powerful and poetical language, from which it is not always possible to extract the author’s real idea on fundamentals. More pointed statements must be taken from the commentaries of Kâtyâ, Kapâla, and Bhatâ, K. M. Banerjea. The best general view of the systems is to be obtained from H. C. Colebrooke’s account, Misc. Essays, i. (2nd ed.), with Professor Cowell’s notes. Compare also the brief abstract

as given in Goldstücker’s Literary Remains, vol. i. A very useful classified index of philosophical works was published by F. Hall (1859).

1. Mungdkâ-upanishad, ii. 2, 5.

2. From these statements, in the Upanishads, some scholars have actually gone the length of claiming the origin of this cardinal doctrine of Vedânta philosophy for the Kashyatriyas. It seems to have been more the opinion that the doctrines that were introduced by the Brâhmânical sages of set purpose to win over their worldly patrons from their materialistic tendencies to their own idealistic views. Kapâla, the author of the materialistic Sâvatarkas, supposed to have been a Kashyatriya, and so, we know, was Śûrya Muni.

4. “Beyond the senses [there are the objects; beyond the objects] there is the mind (manas); beyond the mind there is the intellect (buddhi); beyond the intellect there is the Great Self beyond the Great One there is the Highest Undeveloped (avayasaktam); beyond

the (Sānkhya-sūtra, or) Sānkhya-pravacanā,1 as well as the Tattva-
samāsa, a mere catalogue of the principles. But, though the founder
would seem to have promulgated his system, in some form or other,
at a very early period, these, in their present form, have been
rather back than the 14th century of our era. Probably the oldest
existing work is Jīvāraṇa-kiṣṇa's excellent Sānkhya-kārikā,2 which
also contains, in its prophecies, a system of astrological and other
prophetic branches of the subject. Though nothing certain is known
regarding its author,3 this work must be of tolerable antiquity,
considering that it was commented upon by Gaudāpāda,4 the
preceptor of Čāndogya-Upaniṣad, and also by the disciple of his
teacher of Sankarāchārya. Of the commentaries on the Sūtras, the
most approved are those of Aniruddha5 and Viṣṇuāna Bhāsku,6 a
writer probably of the latter part of the Buddhist era. The
Sānkhya-sūtra,2 consisting of a prose and a verse part, which is probably the most useful
compendium of Sānkhya doctrines.

Yoga.
In the latter part of the Vedic period a a schismatic branch of the preceding
school, holding the same opinions on most points in common
with the Sūtras, with the exception of one important point, the
existence of God. To the twenty-five principles (tattvas) of the
Vedic Sānkhya, the Yoga adds, as the twenty-sixth, the Nirguṇa Purusā, or Self
independent of qualities, the Supreme God of the system. Hence the
Yoga is called theatistic (cti-theistic). But over and above
the speculative part of its doctrine, which it has adopted from the sister school, the theistic Sānkhya has developed a complete
system of mortification of the senses—by means of prolonged
suspended attention, and the renunciation of all the processes of
mental activity common to the Vedas and the Vedānta. Both works have again been commented upon
by Vācchasaṇī-māra, Viṣṇuāna-bhāsku, and other writers.

nyāya
and
Vaiśe-
shika.

6. The Nyāya7 and Vaiśeshika are but separate branches of
philosophy, which, other and greater as the doctrines of which
have virtually become amalgamated into a single system of philosophy. The special part
which the Nyāya7 and Vaiśeshika7 have always taken
by each of the two branches in the elaboration of
the system may be briefly stated in Dr Rör's words:

"To the Nyāya belong the logical doctrines of the forms
of syllogisms, terms and propositions; to the Vaiśešikas the
systenmatical explication (ctic, logical) of the physical
ideas of the metaphysical, physical and psychical
notions—which notions are hardly touched upon in the Nyāya-sūtras. They
diff er in their statement of the general laws, in their classification
of the mental processes (from conception, inference, analogy
and verbal communication), the Vaiśešikas admitting only the two
first ones. The term Nyāya (ni-aya, 'in-going,' entering), though
properly meaning 'not upholding,' the mode applied to philosophy
and so-called inquiry generally, has come to be taken more
commonly in the narrower sense of "logie," because this
school has entered more thoroughly than any other into the laws
and processes of thought, and has worked out a formal system of
reasoning which forms the Hindu standard of logic.

The followers of these schools generally recognize seven categories
(padārtha): substance (dravya), quality (guna), action (karma),
ghatī, general (vatsa), particularity (samanātya) and non-existence or negation (abhāva). Substances,
forming the substrata of qualities and actions, are of two kinds:
elements, which are the building-stones of all matter, and non-elements,
atoms of mind, earth, water, fire and air; and non-external,
comprising all compounds, or the things we perceive, and which must
have a cause of their existence. Causality is of three kinds: that of
intermediate cause (upādhi), that of immediate cause (aikatvā)
and instrumental causality (effect-

Heretical Systems.
of which was deemed necessary for a correct interpretation of the sacred Mantras, and the proper performance of Vedic rites.

Linguistic inquiry, phonetic as well as grammatical, was naturally connected with the large collection of texts that comprised the meaning of the Veda and with the view of setting its textual form. The particular work which came ultimately to be looked upon as the "vedânga" representative of grammatical science, and has ever since been the subject of special study, is the Pāṇini.

The grammar in India, is Pāṇini's Ashaṭhaśāhityâ,¹ so called from its "consisting of eight lectures (aḍhyâyas)," of four pādas each. For a comprehensive grasp of linguistic facts, and a penetrating insight into the hidden forces that come into play in the construction of language, Pāṇini's grammar is probably unrivalled in the literature of any nation—though few other languages, it is true, afford such facilities as the Sanskrit for the study of the grammar of a language. His work differs entirely from that usually adopted in our grammars, viz. according to the so-called parts of speech. As the work is composed in aphorisms intended to be learned by heart, economy of memory-matter was an important consideration. He has thus designed, in this day and age, to be attained by the grouping together of all cases exhibiting the same phonetic or formative feature, no matter whether or not they belonged to the same part of speech. For this purpose he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (anuvandhi), used chiefly with affixes, and indicative of the changes which the roots or stems have to undergo.

It is self-evident that so complicated and complete a system of linguistic analysis and nomenclature could not have sprung up all at once and in the infancy of grammatical science, but that many generations of scholars have been known to have contributed to the perfection of the work which it exhibits in Pāṇini's work. Accordingly we find Pāṇini himself making reference in various places to ten different grammarians, whom he is supposed to have been indebted to. His object was chiefly attained by the grouping together of all cases exhibiting the same phonetic or formative feature, no matter whether or not they belonged to the same part of speech. For this purpose he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (anuvandhi), used chiefly with affixes, and indicative of the changes which the roots or stems have to undergo.

It is self-evident that so complicated and complete a system of linguistic analysis and nomenclature could not have sprung up all at once and in the infancy of grammatical science, but that many generations of scholars have been known to have contributed to the perfection of the work which it exhibits in Pāṇini's work. Accordingly we find Pāṇini himself making reference in various places to ten different grammarians, whom he is supposed to have been indebted to. His object was chiefly attained by the grouping together of all cases exhibiting the same phonetic or formative feature, no matter whether or not they belonged to the same part of speech. For this purpose he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (anuvandhi), used chiefly with affixes, and indicative of the changes which the roots or stems have to undergo.

one of a more practical system of arrangement—the principal heads under which the grammatical matter was distributed usually being: rules of euphony (sandhi); inflection of nouns and pronouns, with rules of arrangement—viz. the number of meanings assignable to a word—seems to be the more primitive. The work probably next in time is the famous Amara-kosa13 ("immortal treasury") by Amara-

18th-century, a sort of eclectic grammar. Among the works quoted by commentators as Amara's sources arc: the Tripadamritam, a treatise on the technical part of Sanskrit grammar, and the Harivali, a collection of uncomman words, and two short glossaries. Of numerous other works of this class the most important is the Medhat, a dictionary of homonyms, arranged in the first place according to the finals and the syllabic length, and then alphabetically. Two important dictionaries, compiled by native scholars of the last century, are the Sahajalpadarama by Radhakanta Deva, and the Koshapaddam by Rama Krishna Chandra, an account of Sanskrit dictionaries is contained in the preface to the first edition of H. H. Wilson's Dictionary, reprinted in his Essays on Sanskrit Literature.

VI. MUSIC (Sangita).—The musical art has been practised in India from early times. The theoretic treatises on profane music are, however, quite modern. The most highly esteemed works are the Sangita-
ratnakara ("jewel-mine of music"), by Sringaddeva, and the Sangita-
darpa}a ("mirror of music"), by Dânodara. Each of these works treats the most important matters of the Hindu theory distinguishes twenty-two intervals, and the Indian music consists almost entirely in melody, instrumental accompaniment being performed in unison, and any attempt at harmony being confined to the continuation of the key-note. A

13 Edited by H. T. Colebrooke (1808), and by L. Deslongchamps (1839).
14 A grammarian of this name is mentioned as the tutor of King Jayapida of Kashmir (A.D. 755-796); but Kahira, the commentator on Amara, is placed by Col. Irwin. According to the Atherium, the letter, without regard to the number of syllables. This Kosa has found many commentators, the lowest of those known being Kahira-

number of papers, by various writers, have been reprinted with additional remarks on the subject, in Sourindro Mohun Tagore's *Hindu Music* (Calcutta, 1873). Compare also Bh. A. Pingle, *Indian Music*, 2nd ed. (Bombay 1868).

**Rhetoric.**—Treatises on the theory of literary composition are very numerous. Indeed, a subject of this description—involving such nice distinctions as regards the various kinds of language, the particular subjects and the manner for them, and the different sentiments or mental conditions capable of being both depicted and called forth by them—could not but be congenial to the Indian mind. H. T. Hume, in his *Historical Sketches of the Hindu Poets* (Calcutta, 1857), has devoted himself to a study of these theoretic distinctions with special reference to the drama, which, as the most perfect and varied kind of poetic production, usually takes an important place in the theory of literary composition. His work is remarkable for a perfection of style, rigorous and detailed. The Indian drama is, however, curiously confounded in the middle ages with Hippocrates was probably not Arab, but Indian, and derived his knowledge of medicine from the Arabs (as they themselves declare) having derived some of their knowledge of medical science from Indian authorities, the Muhammadans, and theirAuthors, none of these treatises was translated into Latin, though a very large number of Arabic and Persian medical books was translated into Greek. It is probable that the treatises of Hafez, by the Kashmirian Rudrakshya, and of the anonymous Rasikanta, entitled *Sri-Harsha*, which has been attributed to the author, is replete with material which the concluding stanza he is stated to have composed his work at the court of King Muñja, who is probably identical with the well-known Mālaṇa prince, the uncle and predecessor of King Bhoja of Dārā. The Dālāpitra was early commented upon by Dhaniaka, possibly the author's own brother, their father's name being the same (Vishṇu). Dhaniaka quotes Rājaekhara, who is supposed to have composed in the 12th century the celebrated *Vedānta-kāśi-bindu*," the neck-ornament of Sarasvati (the goddess of eloquence)," a treatise, in five chapters, on poetry; and he is frequently referred to in the works of his successors, and indeed by himself, as an estimable compliment by some writer patronized by him. The *Kāvya-prakāśa*, "the lustre of poetry," another esteemed work of the same class, in ten sections, was probably composed in the 11th century by the author, Mamane, a Kashmirian, having been the maternal uncle of Sri Harsha, the author of the Naṣadhiya. The *Sāhitya-darpana*, or "mirror of composition," the standard work on literary criticism, was composed in the 1st century, on the banks of the Brahmaputra, by Viśvanātha Kavirāja. The work consists of ten chapters, treating of the following subjects: (1) the nature of poetry; (2) the sentence; (3) poetic flavour (rasa); (4) the divisions of poetry; (5) the functions of character (prakāśa); (6) the role of the performer on dramatic art; (7) faults of style; (8) merits of style; (9) distinction of style; (10) ornaments of style.

**Medicine.**—Though the early cultivation of the healing art is amply attested by frequent allusions in the Vedic writings, it was doubtless not till a much later period that the medical practice advanced beyond a certain dogmatic empirical skill and pharmacutic routine. From the simultaneous mention of the three humours (wind, bile, phlegm) in a vārāntikā to Pāṇini (v. 1, 38), some kind of humoral pathology would, however, seem to have been prevalent among Indian physicians several centuries before our era. The oldest existing work is supposed to be the *Charaka-samhitā*, a bulky cyclopaedia in ślokas, mixed with prose sections, which consists of eight chapters, and was probably composed in the 1st or 2nd century of the Christian era. Whether the Chinese tradition which makes Charaka the court physician of King Kanishka (c. A.D. 100) rests on fact is very doubtful. Of equal authority, but doubtless somehow more modern, is the *Susrutā (samhitā)*, which, according to some, was to have received from Dhanvantari, the Indian Asclepius, whose name, however, appears also among the "nine gems." It consists of six chapters, and is likewise composed in mixed verse and prose—the greater simplicity of arrangement, as well as some slight attention paid in it to surgery, betokening an advance upon Charaka. Both works are, however, characterized by great prolixity, and contain a great mass of material which has been dismissed by late Professor E. Haas, in two very suggestive papers, tried to show that the work of Susruta (identified by him with Socrates, so often confounded in the middle ages with Hippocrates) was probably not Arab, but Indian, and derived his knowledge of medicine from the Arabs (as they themselves declare) having derived some of their knowledge of medical science from Indian authorities, the Muhammadans, and their Authors, none of these treatises was translated into Latin, though a very large number of Arabic and Persian medical books was translated into Greek. It is probable that the treatises of Hafez, by the Kashmirian Rudrakshya, and of the anonymous Rasikanta, entitled *Sri-Harsha*, which has been attributed to the author, is replete with material which the concluding stanza he is stated to have composed his work at the court of King Muñja, who is probably identical with the well-known Mālaṇa prince, the uncle and predecessor of King Bhoja of Dārā. **Astronomy and Mathematics.**—Hindu astronomy may be broadly divided into a pre-scientific and a scientific period. While the latter clearly presupposes the extensive diffusion of the set of Hipparchus, which the Greek astronomers, it is still doubtful whether the earlier astronomical and astrological theories of Indian writers were entirely of Persian or Indian origin. From very ancient (probably Indo-European) times astronomical chronological calculations were based on the synodical revolutions of the moon—the difference between twelve such revolutions (making 27.3 days) and one solar revolution (365 days) being the time of the winter solstice, of twelve additional days. Besides this primitive mode the Rigveda also alludes to the method prevalent in post-Vedic times, according to which the moon was divided into the 30 days of the lunar month, with a thirteenth month intercalated every fifth year. This quinquennal cycle (yuga), is explained in the Jyotisha, regarded as the oldest astronomical work. As an example of the astronomical and astrological science in India, the estimates of the length of the solar and lunar years, the various cycles of the moon, of the sun, of the planets, and of the stars, the construction of the zodiac, and the determination of the time of the day, are given by Bhāskara, of the 12th century, in his *Lilavati* and *Bijaganita*. The *Sūrya-siddhānta*, translated by (W. D. Whitney) and E. Burgess (1860).
on these are the works of the most distinguished Indian astronomers, viz. Aryabhata I, probably born in 476; Varāha-mihira, probably 505–587; Brahma-gupta, who completed his Brāhma-siddhānta in 628; Mahā-vindu (1644), distinguished early as computer of Varāha-mihira; and Bhāskara Achārya, who, born in 1114, finished his great course of astronomy, the Siddhānta-siromani, in 1150. In the works of several of these writers, from Aryabhata onward, one may see the paid tribute (especially in metrical and algebraic computations; and the respective chapters of Bhāskara's compendium, viz. the Lilāvati and Vījyapala, still form favourite text-books of the students. The question whether Aryabhata was familiar with the writings of the Greek algebraist Diophantus (c. A.D. 360) remains still unsettled, but, even if this was the case, algebraic science seems to have been carried by him beyond the point attained by Bhāskara. The exact date of the writing of Bhāskara's treatises is a matter of dispute among the historians.

On Sanskrit literature generally may be consulted Max Müller, History of Ancient Sanskrit Literature; A. Weber, History of Indian Literature; A. A. Macdonell, History of Sanskrit Literature. (J. E.)

SANSON, CHARLES HENRI (1739), public functionary of Paris from 1778 to 1795, was the son of Charles Sanson or Longyal, who received in 1688 the office of exécuteur des hautes œuvres de Paris, which became hereditary in his family. Sanson's brothers exercised the same trade in other towns. In the last days of 1789 Goraus in the Courrier de Paris accused Sanson of harbouring a Royalist press in his house. Sanson was brought to trial, but acquitted, and Goraus withdrew the accusation. After the execution of Louis XVI, a statement by Sanson was inserted in the Thermomètre politique (13th February 1793) in contradiction of the false statements made in connection with Bakery. He surrendered his office in 1795 to his son Henri, who had been his deputy for some time, and held his father's office till his death in 1840. There is no record of the elder Sanson's death. Henri's son Clément Henri was the last of the family to hold the office.

The romantic tales told of C. H. Sanson have their origin in the apocryphal Mémoires pour servir à l'histoire de la Révolution française (2 vols., 1829); another in the Mémoires, of introduction emanate from Balzac, and some other matter from Lhéritier de l'Ain. Other Mémoires of Sanson, edited by A. Grégoire (ps. for V. Lombarde) in 1850, and by M. D'Obreux (6 vols., 1860–1861), are of much less value than the others. The few facts definitely ascertainable are collected by G. Lenôtre in La Guillotine pendant la Révolution (1803). Cf. M. Tourneux, Bibliographie de l'histoire de Paris . . . (1896, &c.), vol. I. Nos. 3963–3965, and vol. IV., sa. "Sanson.

SANSON, NICOLAS (1600–1667), French cartographer, wrongly termed by some the creator of French geography, was born of an old Picardy family of Scottish descent, at Abbeville, on the 20th (or 31st) of December 1600, and was educated by the Jesuits at Amiens. In 1627 he attracted the attention of Richelieu by a map of Gaul which he had constructed (or at least begun) while only eighteen. He gave lessons in geography both to Louis XIII. and to Louis XIV.; and when Louis XIII., it is said, came to Abbeville, he preferred to be the guest of Sanson (then employed on the fortifications), instead of occupying the lodgings provided by the town. At the conclusion of this visit the king made Sanson a councillor of state. In 1647 Sanson accused the Jesuit Labbé of plagiarizing him in his Pharus Galliae Antiquae; in 1648 he lost his eldest son Nicolas, killed during the Franco-Italian war. Among the friends of his later years was the great Condé. He died at Paris on the 7th of July 1667. Two younger sons, Adrien (d. 1708) and Guillaume (d. 1703), succeeded him as cartographers to the king.

Sanson's principal works are: Galliae antiquae descripiorum geographicae (1627); Graeciae antiquae descriptio (1636); L'Empire romain (1637); Brabantiae, ou terrae antiquitatis ab d'Aubert, in which he seeks to identify Strabo's Britannia with Abbeville; La France (1644); Tables méthodiques pour les divisions des Gaules . . . (1644); L'Angleterre, l'Espagne, l'Italie, the three published in 1650; Le Cours du Rhin (1650); La Pharam Galliae antiquae Philippi Labbe disquisitiones (1647–1648); Remarques sur la carte de l'ancienne Gaule de César (1651); L'Asie (1652); Index geographicus (1653); Geography compendiumes, two vols., 1654; Atlas (1652); 1650 Hulck, failed collected Sanson's maps in an Atlas nouveau. See also Niceron, 1

1 The Aryabhata, edited by H. Kern (1874).
2 The Bhakti-samhita and Yoga-yatrî, edited and translated by H. Kern; the Laghu-jataka, edited by A. Weber and H. Jacobi.
3 A translation of both treatises, and the first English translation of the Geographia, was published (1871) by H. T. Colebrooke, with an important " Dissertatio in the Algebra of the Hindus," reprinted in the Misc. Essays, ii. pp. 375 seq. Memóires, vols. xii., and xx.; the 18th-century editions of some of Sanson's works on Delmarce under the titles of Atlas de géographie ancienne and Atlas britannique; and the Catalogue des cartes et libres de géographie de Sanson (1702).

SANSINO, ANDREA CONTUCCI DEL MONTE (1460–1529), Florentine sculptor, was the son of a shepherd called Niccolò di Domenico Contucci, and was born at Monte Sanxovino near Arezzo, whence he took his name, which is usually softened to Sansovino. He was a pupil of Antolpio Pallavicino, and at first worked in the purer style of 15th-century Florence. Hence his best works are by far the best, such as the terra-cotta altarpiece in Santa Chiara. After his return to Venice, he carried on the "Annunciation," the "Coronation of the Virgin," a " Pietà," the "Last Supper," and various statuettes in the Corbinelli chapel of S. Spirito at Florence, all executed between the years 1488 and 1492. From 1501 to 1500 Andrea worked in Portugal for the king, and some pieces of sculpture by him still exist in the monastic church of Coimbra. (See Raczinski, Les Arts en Portugal, Paris, 1846, p. 344.) These early reliefs show strongly the influence of Donatello. The beginning of a more pagan style marks the statues of " St John baptizing Christ " over the east door of the Florence duomo, and were severely finished by the weaker hand of Vincenzo Danti. In 1502 he executed the marble font at Volterra, with good reliefs of the " Four Virtues " and the "Baptism of Christ." In 1505 Sansovino was invited to Rome by Julius II. to make the monuments of Cardinal Ascanio Maria Sforza and Cardinal Girolamo della Rovere for the retro-choir of S. Maria del Popolo. The architectural parts of these monuments and their sculptured foliage are extremely graceful and executed with the most minute delicacy, but the recumbent effigies show the beginning of a serious decline in taste. These tombs became models for which many years were copied by most later sculptors with increasing exaggerations of their defects. In 1512, while still in Rome, Sansovino executed a very beautiful group of the " Madonna and Child with St Anne," now on one of the side altars in the church of S. Agostino. From 1513 to 1528 he was at Loredo, where he cased the outside of the Santa Casa in white marble, covered with reliefs and statuettes in niches between engaged columns; a small part of this sculpture was the work of Andrea, but the greater part was executed by Montelupo, Tribolo and others of his assistants and pupils. Though the general effect is rich and magnificent, the individual pieces of sculpture are both dull and feeble. The earlier reliefs, those by Sansovino himself, are the best. SANSON, JACOPO (1477–1570), Italian sculptor, was called Sansovino after his master Andrea, his family name being Tatti. He became a pupil of Andrea in 1500, and in 1510 accompanied him to Rome, devoting himself there to the study of antique sculpture. Julius II. employed him to restore damaged statues, and he made a full-sized copy of the Laocoön group, which was afterwards cast in bronze, and is now in the Uffizi at Florence. In 1511 he returned to Florence, and began the statue of St Januarius the Elder, which is now in a niche in one of the great piers of the Duomo. He carved a nude figure of " Bacchus and Pan," now in the Bargello, near the "Bacchus" of Michelangelo, from the contrast with which it suffers much. Soon afterwards Jacopo returned to Rome, and designed for his fellow-citizens the grand church of S. Giovanni dei Fiorentini, which was carried out by Antonio Sangallo the younger. A marble group of the "Madonna and Child," heavy in style, now at the west of S. Agostino, was his next important work. In 1527 Jacopo fled from the sack of Rome to Venice, where he was welcomed by Titian and the doge, and till his death he was occupied in adornning Venice with magnificent buildings and many second-rate pieces of sculpture. Among the latter Jacopo's poorest works are the colossal statues of "Neptune" and " Mars" on the grand staircase of the ducal palace. His best are the bronze doors of the sacristy of St Mark, cast in 1562; inferior to these are the series of six bronze reliefs round the choir of the same church. In 1563 he completed a small bronze gate with a graceful relief of "Christ surrounded by Angels"; this gate shuts off the altar of the Reserved Host in the choir of St Mark's.
SANTA ANA—SANTA BARBARA

Jacopo's chief claim to distinction rests upon the numerous fine Venetian buildings which he designed, such as the public library, the mint, the Scuola della Misericordia, the Palazzo de' Cornari and the Palazzo Delfino, with its magnificent staircases—
the last two both on the grand canal. Among his ecclesiastical works the chief were the church of S. Fantino, that of S. Martino, near the arsenal, the Scuola di S. Giovanni degli Schiavoni and, 
finest of all, the church, now destroyed (see VENICE), of S. Geminiano, a very good specimen of the Tuscan and Composite orders used with the graceful freedom of the Renaissance.

In 1545 the roof of the public library, which he was then constructing, fell in; on this account he was imprisonment and dismissed from office. It was not until the death of the cathedral, to which he had been appointed by a decree of the signoria on the 7th of April 1539. Owing to the intervention of Titian, Pietro Aretino and others, he was soon set at liberty, and in 1549 he was restored to his post. He did good service for St Mark's by encircling its failing domes with bands of iron. Sansovino's architectural works have much beauty of proportion and grace of ornament, a little marred in some cases by an excess of sculptured decoration, though the carving itself is always beautiful, both in design and execution. He used the classic orders with great elegance and good taste. His pupils were mostly men of but little talent.

SANTA ANA, a city and the county-seat of Orange county, southern California, U.S.A., 34 m. S.E. of Los Angeles. Pop. (1900) 4933 (506 foreign-born); (1910) 8249. It is served by the Atchison, Topeka & Santa Fé, the Southern Pacific and the Pacific Electric railways. The city is situated about 10 m. from the ocean, in the lower western foothills of the Santa Ana mountains. There are numerous artistic wells in the surrounding region, and there is a good irrigation system. (For a description of the irrigation canal see AGUADULCE.) Santa Ana is in the orange, lemon and walnut region of southern California, and in the only important celery-growing district of the state; the celery is grown in great quantities in the large district known as the "Peatlands" (about 9 m. from the city), which is underlaid by a deposit of peat from 7 to 100 ft. deep. Other important products of the county are petroleum, barley, sugar beets, apricots and lima beans. Santa Ana was first platted in 1859 and was incorporated in 1888. Its growth since 1900 has been rapid.

SANTA ANA, the capital of the department of Santa Ana, Salvador, 50 m. by rail N.W. of San Salvador. Pop. (1905) about 48,000. It is situated about 2100 ft. above sea-level, in a valley surrounded by high mountains, which are covered by coffee and sugar plantations and woods. It is the second city of the republic in size, and has broad shady streets and fine open squares. The municipal offices, hospital, literary institute and barracks are noteworthy buildings, and the parish church, Doric in style, is generally regarded as one of the finest in Central America. Cigars, pottery, starch, spirits, sugar and various textiles are manufactured, and the export trade in coffee and sugar has developed rapidly since the opening in 1900 of a railway to San Salvador and the Pacific port of Acajutla.

SANTA-ANNA, ANTONIO LOPEZ DE (1795-1876), Mexican soldier and politician, was born at Jalapa in the province of Vera Cruz on the 21st of February 1795. He was neither a general nor a statesman, nor even an honest man, but he was the most conspicuous and continuously active of the military adventurers who filled Spanish America with violence during the first two generations of its independence. He entered the colonial army of Spain as a cadet in 1810, and served as one of the Creole supporters of the Spanish government till 1821. In that year Mexico fell away from the mother country. Iturbide, who was master of the country for the time, made Santa-Anna brigadier and governor of La Vera Cruz. Till about 1835 he pursued the policy of keeping his hold on his native province of Vera Cruz, and influencing the rest of the country by alternately supporting and upsetting the central government. He first helped to ruin Iturbide, who wished to make himself emperor. He proclaimed the Republic, and was then a supporter of the successful federal party. Federalism suited him very well since it left him in command of Vera Cruz. In 1839 he defeated a foolish attempt of the Spaniards to reassert their authority in Mexico. He kept himself in reserve till events gave him a chance to upset the president of the day. Bustamente, whom he defeated at Casas Blancas on the 12th of November 1832. He could now have become president himself, but preferred to rule through dummies. Now that he saw an opportunity to become master he became reactionary and abolished the federal constitution. This led to the revolt of Texas, which was full of settlers from the United States. Santa-Anna invaded Texas and gained some successes, but was decisively defeated at San Jacinto on the 21st of April 1836. The Texans had a good excuse for shooting him, as he conducted war in a ferocious way. They preferred to let him save his life by ordering his troops to evacuate the country. He was released in February 1837, and had for a time "retire to his estates" in Vera Cruz. In 1838 the French government made an attack on the town, and Santa-Anna, by a display of his redeeming virtue of personal courage, lost a leg but regained his influence. He became military dictator in 1841, and governed by violence till he was driven into exile by mutiny in 1845. He returned to Mexico in 1853, where he was tried and condemned to death, but spared on the ground that he was in his dotage. At last, worn out by age, he accepted an amnesty and returned to the city of Mexico, where he died in obscurity on the 20th of June 1876.

SANTA BARBARA, a city and the county-seat of Santa Barbara county, in southern California, U.S.A., on the coast-plain on the southern slope of the Santa Ynez Mountains. Pop. (1900) 3714 (1143 foreign-born); (1910) 11,654. It is served by the Coast Line of the Southern Pacific railway system. With picturesque surroundings, excellent bathing beach and ideal climate, Santa Barbara is one of the most popular of the health and pleasure resorts of California. The monthly average of the mean temperatures for 23 years (1881-1903 inclusive) varied from 53° in January to 67° in August. Nowhere in California is plant life more varied and beautiful; in the vicinity are walnut, olive, lemon and orange groves. North-west of the city are the valuable oil fields of Santa Barbara county, notably the Santa Maria field, 6 m. S. of Santa Maria, and the region between Lompoc and Santa Maria, first developed in 1903. A presidio (Spanish military post) was established here in 1782, and a Franciscan mission, by Junipero Serra, about four years later. The mission building is well preserved, and is probably the greatest single attraction of Santa Barbara. It is now the Franciscan headquarters of the Pacific coast, and near it is a Franciscan college. Immediately behind it is the picturesque Mission Canyon. Santa Barbara took part in the revolution of 1829, and in the sectional struggles following leaned to the side of Monterey and the North. It was occupied by the Americans in August 1846, then (without bloodshed) by the Californians in October, and again definitively by the American forces on the 27th of November 1846. In 1850 it was incorporated as a city, though already long a Mexican "ciudad." It remained off the railway route until 1887.

SANTA BARBARA, a town of Iloilo province, island of Panay, Philippine Islands, on the S.E. coast, on the Jalaru river, a few miles N. of Iloilo, the capital of the province. Pop. (1903), after the annexation of Zârraga, Lucena, Pavía and Leganés,
SANTA CATHARINA—SANTA CRUZ

37,631; subsequently Pavia (pop. in 1903, 5700) was annexed to Jaro. There are 87 barrios or villages in the town, only three of these had a population in 1903 exceeding 1000. The language is Visayan. The principal industries are the cultivation of sugar cane, Indian corn, rice, cacao, coco-nut palm and tobacco, and the raising of cattle.

SANTA CATHARINA, a southern maritime state of Brazil, bounded N. by Pararán, E. by the Atlantic, S. by Rio Grande do Sul, and W. by Rio Grande do Sul and the Misiones territory of Argentina. Pop. (1900) 320,289; area 28,633 sq. m. The Serra do Mar rises not far from the coast and leaves only a narrow coast zone, and the plateau above is much broken with irregular ranges of mountains. The coast region, though in the temperate zone, is hot and humid. It is densely forested, is broken by swamps and lagoons, and is crossed by numerous short streams from the wooded slopes of the serras. The plateau is less densely wooded, but has some highly fertile plains, the open campos being partly devoted to stock raising. Except in the malarious coast zone, the climate is temperate, bracing and exceptionally healthy. The drainage is westward to the Paraná, the rivers being tributaries of the Iguaçu, which forms its northern boundary, other rivers to Uruguay, which forms its southern boundary. A number of prosperous German colonies—the largest and best known of which are Blumenau, Dona Francisca, Joinville, Itajaí, Brusque, Dom Pedro and São Bento—are devoted chiefly to agriculture. There is no cultivation on a large scale, as in São Paulo and the northern provinces. Coffee is produced to a limited extent. Indian corn, beans, onions, fruit and mandioca are the principal products. A prominent industry is the gathering and preparation of malé or Paraguayan tea (Ilex paraguayensis), which is an article of export. The mineral resources include coal, iron, silver and gold, and petroleum, the first alone is mined. The Rio Uruguai and its southern tributary, the Santa Christina, runs from Laguna, at the mouth of a lagoon of that name on the southern coast, northward to the port of Imbituba (about 4 m.) and thence westward up the valley of the Rio Tubarão to the coal fields of that name (60 m.). The coal is of inferior quality and the development of the mines, which were discovered in 1841, has not been a success. A later investigation shows that there are beds of better coal at a greater depth extending from Rio Grande do Sul to São Paulo. The capital of the state is Florianópolis (86,000) also called Santa Catharina and Desterro, and its other towns are Blumenau, its southern capital; Laguna (7282), Joinville (13,990), Itajaí (8875), Brusque (8094). São José (17,820), opposite Florianópolis, Tubarão (5405) and São Francisco (5583), a good port in the northern part of the state in direct communication with a majority of the German colonies.

SANTA CLARA (or VILLA-CLARA), the capital of Santa Clara province, Cuba, about 185 m. (by rail) E.S.E. of Havana. Pop. (1907) 16,702. It is situated near the centre of the island, on a plateau, between two small streams, and is served by the United Railways of Havana and by the Cuba and the Cuba Central railways, the last connecting the east and west lines with the north and south coasts. The streets are straight and wide, and there are many fine buildings. The oldest church is of the last third of the 18th century. The city is surrounded by fertile plains, which are cultivated in cane or devoted to grazing. Santa Clara was founded in 1689 by a band of schismatics from Remedios.

SANTA CRUZ, ÁLVARO DE BAZAN, 1st Marquis of (1526–1588), Spanish admiral, was born at Granada on the 12th of December 1526, of an ancient family originally settled in the valley of Baztan in Navarre, from which they are said to have taken their name. His grandfather, Álvar de Bazan, took part in the conquest of Granada from the Moors in 1492, and his father, who had the same Christian name, was distinguished in the service of Charles V., by whom he was made general of the galleys—or commander-in-chief of the naval forces of the crown of Spain in the Mediterranean. The future admiral followed his father in his youth, and was early employed in high commands. He was a member of the military order of St. Iago. In 1563 he aided in the capture of Velez de Gomera, commanded the division of galleys employed to blockade Tetuan, and to suppress the piracy carried on from that port. The service is said to have been successfully performed. Bazan certainly earned the confidence of Philip II., by whom he was appointed to command the galleys of Naples in 1568. This post brought him into close relations with Don John of Austria, when the Holy League was formed against the Turks in 1570. During the operations which preceded and followed the battle of Lepanto (7th of October 1571), Bazan was always in favour of the more energetic course. In the battle he commanded the reserve division, and his prompt energy operation in the direction of the left wing of the Turks, outmanoeuvred the commander-in-chief right, Giovanni Andrea Doria, and broke the allied line. He accompanied Don John of Austria at the taking of Tunis in the following year. When Philip II. enforced his claim as heir to the crown of Portugal in 1580–1581, Santa Cruz held a naval command. The prior of Crato, an illegitimate representative of the Portuguese royal family, who conducted the popular resistance to the annexation of the country by Philip, continued however, to hold the island possessions of Portugal in the Atlantic. This was successfully opposed by the French admiral under Philip Strozzi, a Florentine exile in the service of France. Santa Cruz was sent as admiral of the Ocean to drive the pretender and his friends away in 1583. His victory off Terceira over the Portuguese, and a loose confederation of adventurers and pirates, French and English, decided the struggle in favour of Spain. Santa Cruz, who recognized that England was the most formidable opponent of Spain, became the zealous advocate of war. A letter written by him to King Philip from Anglia in Terceira, on the 9th of August 1583, contains the first definite suggestion of the Armada. Santa Cruz himself was to have commanded. His plans, schemes and estimates occupy a conspicuous place in the documents concerning the Armada collected by Don Cesáreo Duro. The hesitating character of the king, and his many embarrassments, political and financial, caused many delays, and left Santa Cruz unable to act with effect. He was at Lisbon without the means of fitting out his fleet, when Drake burnt the Spanish ships at Cadiz in 1587. The independence of judgment shown by Santa Cruz ended by offending the king, and he was held responsible for the failures and delays which were the result of the bad management of his state. In January 1588, when the Armada was formed at Lisbon, was said to have been hastened by the unjustified reproaches of the king. The marquis of Santa Cruz was the designer of the great galleons which were employed to carry the trade between Cadiz and Vera Cruz in Mexico.

The documents relating to the Armada have been collected by Don Cesáreo Duro in his voluminous work entitled Anales de los archivos of the marquis in his Conquista de las islas Azor. A separate life has been published by Don Angel de Alfolaguirre. There are various notices of Santa Cruz in Sir W. Stirling Maxwell's Don John of Austria.

SANTA CRUZ, an eastern department of Bolivia, bounded N. by El Ben, E. by Brazil, S. by Chuquisaca and W. by Chuquisaca and Cochabamba. Area 141,368 sq. m. Pop. (1900) 209,592; (1906 estimated) 234,743. It is partly explored. It consists of a great plain extending eastward from the base of the Andes to the frontiers of Brazil, broken by occasional isolated hills, and in the N.E. by a detached group of low sierras known collectively under the name Chiquitos, which belong to the Brazilian highlands rather than to the Andes. On the western side of the department is an upland zone belonging to the eastern slope of the Andes, and here the Bolivian settlements are chiefly concentrated. The Chiquitos of old missions, now occupied almost exclusively by Indians. The great plains, whose general elevation is about 900 ft. above the sea, are so level that the drainage does not carry off the water in the rainy season, and immense areas are flooded for months at a time. Extensive areas are permanently swampy. There are forests in the N. and W., but the larger part of the department consists of open grassy plains, suitable for grazing. The Llanos

A priory of the Maltese knights of St John of Jerusalem.
de Chiquitos, adjacent to the sierras of that name, have long been used for this purpose. There are two river systems, one belonging to the Amazon and the other to the La Plata basins. The first includes the Guapay or Rio Grande, Piray or Sara, Yapacani and Maracó, upper tributaries of the Mamoré, and the San Miguel, Blanco, Baures and Paragua, tributaries of the Guaporé—both draining the western and northern parts of the department. In the extreme east a number of streams flow eastward into the Paraguay, the largest of which is the Otuquis; their channels are partly hidden in swamps and lagoons. The climate of the plains is hot and malarial, and the rainfall heavy. On the Andes the climate is distinctly modified by the elevation. Stock-raising is followed to some extent on the plains. Other products of the western districts are sugar, rum, cacao, rice, cotton, coffee and indigo. Rubber and medicinal products are also exported. The Guapay is navigable for small boats in high water, and also the lower courses of the other rivers named, but they are of little service except in the transport of rubber. The principal markets for Santa Cruz products are in the Bolivian cities of the Andes where sugar, rum, cacao and coffee find a ready sale. There is a trade route across the plains from Santa Cruz de la Sierra to the Bolivian capital, La Paz, and the government contracted in 1908 for a railway between these two points (about 497 m.) but the traffic is inconceivable.

The capital and only large town of the department is SANTA CRUZ DE LA SIERRA (pop., in 1900, 15,874; in 1906, estimated, 20,535), on the Piray, a tributary of the Mamoré, 1450 ft. above sea-level, about 160 m. in a straight line N. of Sucre. It is situated on a terrace over the Andean slope in a highly fertile district, devoted to sugar-cane and stock-raising. It is a dusty, straggling, frontier town with rough habitations and a half-civilized population, chiefly Indians and mestizos. It is the seat of a bishop and has a partly finished cathedral, an episcopal seminary and mission station for the Indians. It has also a national college. There are flour mills, sugar mills, distilleries, tanneries and leather manufactories. The original site of Santa Cruz de la Sierra was in the uplands, but it was removed to its present site about 1500, the phrase “de la Sierra” being kept. It has been used as a centre for missionary work among the Indians and as a centre of trade. Expeditions to the Brazilian frontier or to the Chiquitos missions are fitted out here, and it is the objective point for expeditions entering Bolivia from Matto Grosso, Brazil, and Paraguay.

SANTA CRUZ, a city and on the Paraguay, Santa Cruz, the county, in California, U.S.A., on the northern headland of the Bay of Monterey, about 75 m. S. of San Francisco. Pop. (1900) 5629 (1123 foreign-born); (1910) 11,146. It is served by the Southern Pacific railway. Santa Cruz is a popular seaside resort. The site of the city, which spreads back over bluffs and terraces to the foothills of the mountains (2000-3800 ft. in altitude), is very picturesque, and the scenery in the environs beautiful. Hills nearly enclose the city, protecting it from the ocean fogs. Monterey Bay has a remarkable variety of fish; and there is a large fish hatchery near the city. Fruits in great variety are grown in the valley and foothills. The mountains are covered with one of the noblest redwood forests of the state—the only one south of San Francisco; two groves, the Sempervirens Park (2400 acres) and the Fremont Grove of Big Trees, 5 m. from Santa Cruz, have been permanently preserved by the state. A Franciscan mission was established at Santa Cruz in 1701 and secularized in 1834, but was later destroyed. A pueblo or villa called Branciforte, one of the least important of the Spanish settlements (now a suburb of Santa Cruz), was founded in the vicinity in 1797, and before the American conquest was merged with the settlement that had grown up about the mission. The flag of the United States was raised over Santa Cruz in July 1846. The city was chartered in 1876.

SANTA CRUZ, an archipelago of the Pacific Ocean, in the division of Melanesia, belonging to Great Britain. It is a scattered group of small volcanic islands, irregularly disposed from N.W. to S.E. between 8° 34' and 11° 46' S., 165° 38' and 168° E. The total land area is 380 sq. m., and the population is estimated at 5000.

At the north-western extremity, separated by a deep channel from the Solomon Islands, the following islands are clustered: the Duff and Matema or Swallow groups, Analogo, Tinakula or Volcano Island and others; from these a singular current sweeps north E., consisting of Nintendi or Santa Cruz, the largest island, Tupau or Edgecombe, Vanikoro (Recherche), Tucopia, Anuda (Cherry) and Fataka (Mitie). In Vanikoro there are volcanic mountains up to 3000 ft. high, and a depression at the southern end of which lies a lagoon 2200 ft. Nintendi is of less elevation (1215 ft. at the highest). Coral reefs are not extensive, excepting those surrounding Vanikoro. The islands are densely peopled, and have a flora akin to that of New Guinea. The land fauna is very scanty: that of the sea extremely rich and valuable to the natives, who are skilled fishermen and navigators. The climate is hot and humid, and storms are frequent. They are free from the natives of Hawaii, with an intermixture of other blood; but an exception is found in the Duff group, Tucopia and Anuda, which are inhabited by pure Polynesians. The natives live in villages (sometimes fortified). In the past they have proved treacherous and cannibalistic, but have been civilized and domesticated, and since 1871, have borne good fruit. The islands are included in the British protectorate of the Southern Solomons. Some trade in copra is carried on.

The islands were discovered by the Spaniard Alvaro Mendaña in 1555, in which year he attempted to found a colony on Nintendi, but died there on the 8th of October. In 1767 Philip Carteret visited these islands on his voyage of discovery, and called it the Solomon Islands. The name is still sometimes used. During the next century, owing to the practice of kidnapping them as labourers, the natives became so much embittered against foreigners that in 1871 they murdered Bishop John Coleridge Patteson on Nukapu, one of the Swallow group. In 1875 James Graham Goodenough, commodore of the Australian station, was shot with a poisoned arrow on Nintendi during a cruise, and died of his wound. Patteson's murder, however, had roused public feeling in England; steps were taken to regulate the labour traffic, and subsequently Bishop John Schwenck Foley of Hull, who visited these islands in 1877, impressed the cross which commemorates his predecessor on Nukapu. The British protectorate was declared in 1880.

SANTA CRUZ, chief town and capital of the province of La Laguna, Luzon, Philippine Islands, on the S.E. shore of Laguna de Bay, about 35 m. S.E. of Manila. Pop. of the municipality (1903) 12,747. Santa Cruz has numerous fine buildings and a large trade with Manila by way of the lake and Pasig river. Agriculture and manufacturing are important pursuits, the town being noted for its manufacture of palm wine. The landing is of small capacity.

SANTA CRUZ DE TENERIFE, or De Santiago, a seaport and the capital of Tenerife and of the Canary Islands; in 28° 28' N. and 16° 15' W., on the east coast. Pop. (1900) 38,410. Santa Cruz is the residence of the governor-general of the Canaries, the civil lieutenant-governor of the Tenerife district, and the military governor of the island. It occupies a small plain bounded by rugged volcanic rocks, and seamed by watercourses which are dry almost throughout the year. Scarcely any vegetation, except cactuses and euphorbias, is to be seen in the neighbourhood. Almost the entire town was rebuilt in the 19th century, when its population more than trebled. The houses are generally low, with flat roofs; those of the better class are large, with a courtyard in the middle, planted with shrubs in the Spanish fashion. There are many good public buildings, including a school of navigation, technical institute, library, natural history museum and hospital. An aqueduct 5 m. long brings pure water from the mountains of the interior. Dromedaries from the adjacent islands of Lanzarote and Fuerteventura are used to convey merchandise and in agricultural operations. The town is defended by modern forts, but its ancient fortress, its advantages and its resources have also been furnished as a prison. It was attacked and captured by the British fleet under Blake in 1657, and by Nelson, who lost his arm during the attack, in 1797. Some British flags lost on that occasion hang in one of the churches. The anchorage is good, and a mole facilitates landing. Santa Cruz is an important coaling station and commercial centre. (See CANARY ISLANDS.)

SANTA Fé, the capital of New Mexico, U.S.A., and the county-seat of Santa Fé county, about 20 m. E. of the Rio Grande, and 339 m. N. of El Paso, Texas. Pop. (1900) 5693, (256 foreign-
SANTA FÉ

(1814-1888), the founder of the city, came with the United States to the region in 1846, and the city was founded on May 15, 1847. The site was chosen because of its strategic location on the Rio Grande, which serves as a natural boundary between the United States and Mexico.

The first settlement was established by the Spanish in 1598, and the city became an important trading center for the region. In the 19th century, Santa FÉ was a center for the毛皮 trade and became a major hub for the transportation of goods.

In the 20th century, Santa FÉ saw significant growth and development, becoming a major city and a center for the arts and culture. Today, it is a vibrant and diverse city, offering a rich blend of history and modernity.

1 The exact date of the founding of Santa FÉ is not known, but the best opinion has fixed the date between 1604 and 1608, and favors the year 1605.

The City is about 7000 ft. above the sea, at the foot of the southern extremity of the Rocky Mountains, in the Sangre de Cristo range. Its climate is dry, equable and healthy; the mean annual temperature is 49° F., and the mean annual rainfall 14.2 in. The city is surrounded by the plate for shelter it from the sandstorms which affect some parts of New Mexico, and its pleasant climate, attractive mountain scenery and historical interest make it a favorite resort.

Santa FÉ is built round a plaza or square. Crooked streets, broken by the houses, are characteristic of the older part of the city and give an impression of antiquity. Around the plaza and elsewhere in the city, however, the modern style of architecture has given way to ornamental Spanish mission, self-supporting from lawns, sandy square into a well-shaded park, through the efforts of the Woman's Board of Trade, an unique institution, which also controls the public library, housed in a brick and stone building (1907) in the Mission style of architecture. Within the plaza are a monument to the soldiers who fell in New Mexico during the Civil War and the Indian wars, a stone marking the spot where the first American flag was raised by General Kerny in 1846, and a bronze drinking fountain erected as a memorial to John Baptist Lamy (1814-1888), the first Roman Catholic bishop (1853) and archbishop (1875) of Santa FÉ. Facing the plaza is the old Governor's Palace, remodeled in the Spanish style in 1895, the seat of the Territorial government until the city was incorporated in 1850, the School of American Archaeology and the New Mexico Museum of Archaeology. In this building General Lew Wallace (governor 1878-1883) wrote the concluding chapters to Ben Hur. San Miguel chapel was built probably in the middle of the 17th century, was destroyed in 1680, and was rebuilt in 1710, but has been greatly altered in recent times. The church of Nuestra Señora de Guadalupe (modernized with a single roof and a wooden steep) contains interesting paintings and antique wood-carvings. The cathedral of San Francisco, though not completed, has been used as a place of worship since about 1630. The Presidio is incorporated in 1850, is still a church, as is it thought, in 1627. Also of interest are the Rosario chapel; the ruined earthworks of Fort Marcy, north of the city, constructed by General Kerny in 1846; the ruins of the Garita, an old Spanish fortification used as a custom-house under the Mexican government; the so-called "oldest house," a dilapidated adobe structure claimed to be the oldest building, continuously inhabited, in the United States; the state library; and the national cemetery, in which 102 American soldiers are buried.

Among the public buildings and institutions are the state capitol, the executive mansion (1909), the federal building (in front of the new capitol), the Natural Science Museum, the United States National Guard armory, a Federal industrial board school for Indians (with 300 pupils in 1908) and Saint Catherine's Industrial School for Indians (Roman Catholic). About 7 m. east of the city, on the eastern side of the Rio Grande, is an old fort, of a Presidio, still in a state of complete ruin. The building, with convict labour, of a "scenic highway" from Santa FÉ to Las Vegas. In Pajarito Park, 20 m. west of Santa FÉ, are numerous salt and brackish salt flats and brackish pools, and near the city are several prehistoric mounds.

The chief manufactures of Santa FÉ are brick, pottery (made by Pueblo Indians), and filigree jewelry (made by Mexican artisans). The surrounding country is devoted to agriculture and mining, chiefly for coal.

Santa FÉ is considered the oldest city save one (St Augustine, Florida) in the United States. A settlement, known as San Gabriel, was planted at the junction of the Rio Chama and the Rio Grande by Juan de Oñate in 1598, and about 1605, some 30 m. S.E., Santa FÉ, officially the Villa Real de Santa FÉ de San Francisco, was founded on the site of a deserted Indian pueblo and became the seat of the government of New Mexico. In 1650 it contained a population of 250 Spaniards, 700 Indians and about 50 half-breeds. In August 1680 the Pueblo Indians, under Pedro de Peralta, and other Indian leaders and authorities, revolted (see New Mexico; History). Four hundred Spaniards were massacred, and the remainder took refuge in Santa FÉ, where they were closely besieged. On the 21st of August, while the Indians were demoralized by a sortie from the garrison, the town was evacuated, and the inhabitants made a six weeks' journey down the Rio Grande to the mission of Guadalupe, near the modern El Paso, Texas. The Indians then took possession, destroyed the crops, churches and archives, and revived their pagan ceremonies. Several unsuccessful attempts were made to regain the town, but finally, in September 1692, Diego de Vargas quietly secured the fresh submission of the Indians. In December 1693 a new Spanish colony of about 800 persons arrived. There were two other Indian revolts, in 1694 and in 1696. During the 18th century a considerable trade in sheep, wool, wine and pelts developed, chiefly with Chihuahua and other Indian districts of the plains. After the independence of Mexico Santa FÉ became the centre of growing commerce with the United States, conducted at first by pack animals, and later by wagon trains over the old Santa FÉ Trail leading south-west from Independence, Kansas City, and, in earlier years, other places in Missouri, to Santa FÉ. On the 18th of August 1846, soon after the outbreak of the war between the United States and Mexico, Santa FÉ was occupied by an American force under General S. W. Kearny. The Mexicans revolted a few weeks later, and the newly appointed governor, Charles Bent, and a small force, were relieved by a Baptist company of Missouri Volunteers. In 1852 a newspaper for New Mexico was established at Santa FÉ, and an English school was founded in 1848. Santa FÉ remained the capital when a Territorial government was inaugurated in 1851. The arrival of the first railway train, on the 9th of February 1886, marked a new epoch in the history of Santa FÉ, which then had remained essentially a Mexican town; but with the discontinuance of the wagon caravans over the old trail, it lost its importance as the entrepôt for the commerce of the South-west.

See the sketch by F. W. Hodge in the New Mexico; History.

SANTA FÉ, a central province of Argentina, bounded N. by the Chaco territory, E. by Entre Ríos and Corrientes, S. by Buenos Aires, and W. by Cordoba and Santiago del Estero. Area, 50,000 sq. m. Pop. (1895) 97,188, (1904) estimated 160,755. Santa FÉ belongs to the great pampa region of Argentina, and has no wooded districts in the south except the river courses. In the N. which is borderland to the Gran Chaco, there are extensive forests, intermingled with grassy savannas. The surface is a level alluvial plain, with a saline substratum at no great depth. Salt is found on the surface over large areas, and throughout the province the water is brackish 15 to 20 ft. below the surface. The soil, however, produces wheat, corn, alfalfa, linseed and other crops in abundance. Stock-raising (cattle, horses, sheep and swine) is also an important industry, with the related industries of butter and cheese-making, meat-curing and tallow-refining. Many colonies have been made, especially near the provincial capital. It is one of the most productive provinces in the republic, in spite of notorious miss-government. The Paraná forms its eastern boundary for about 435 m., and provides unfailling transport facilities. The great river is broken into many channels, forming islands and sand bars which are constantly changing their outlines. It receives two large tributaries flowing across the province—the Salado, the upper course of which is called the Pasaje and Juramento (the last given to commemorate the circumstance that the oath to their independence from Spain was sworn on its banks in 1816), and which enters the Santa FÉ channel of the Paraná near the capital; and the Carcaraz, or Carcarazal. The northern districts are well watered by numerous tributaries of the Salado. The railway communications of the province are good, comprising the trunk lines of the Buenos Aires and Rosario railway with its extension to Tucuman, which crosses the province from S.E. to N.W.; the Central Argentine from Rosario to Cordoba, and to Buenos Aires; the Cordoba Central; Santa FÉ to Tucuman; and the Provincia de Santa FÉ; a network of small lines connects all the important towns; and the Buenos Aires and Pacific which crosses near its southern boundary. The river
SANTA FÉ—SANTA MARIA

ports having railway connexions are Reconquista, Santa Fé, Colastín, Coronda, Puerto Gomez, San Lorenzo, Rosario and Villa Constitución. The capital is San Fé, and other important towns are Rosario, Esperanza (pop. 1904 estimated 10,000), San Lorenzo (1900), Rafaela, Ocampo, Galvez, Cañada de González and San Cristóbal de las Casas.

SANTA FÉ, a city of Argentina and capital of the province of that name, on the Saint Fé channel of the Paraná near the mouth of the Salado, about 200 m. N.W. of Buenos Ares. Pop. (1895) 79,247, (1900 estimated) 33,200. It is built on a sandy plain a little above the river level. It is regularly laid out, and contains a cathedral, bishop’s palace, Jesuits’ college and church dating from 1654, the cabildo or town hall facing on the principal square and provincial government buildings. The town is less modern in appearance than Rosario, and has a number of old residences and educational and charitable institutions. It is a port of call for small river steamers and is in frequent communication with Paraná on the opposite bank of the Paraná. Its shipping port for larger steamers is Colastín, on a deeper channel, with which it is connected by rail. Santa Fé also has railway communication with Rosario, Cordoba, Tucuman and the frontier of the Chaco.

Santa Fé was founded by Juan de Garay in 1573, and was designed to secure Spanish communications between Asunción and the mouth of the La Plata. It has been the centre of much political intrigue, but its growth has been very slow. In 1852 a convention of the provinces met in Santa Fé and in 1860 a national convention for the revision of the constitution.

SANTAL (or SANTHAL) PARGANAS, THE, a district of British India, in the Bhogulpur division of Bengal. Area 5470 sq. m. In the east a sharply defined belt of hills stretches for about 100 m. from the Ganges to the river Naubul; west of this a rolling tract of long ridges with intervening depressions covers about 2500 sq. m.; while there is a narrow strip of alluvial country about 170 m. long, lying for the most part along the loop line of the East Indian railway. The Santal hills occupy an area of 120 sq. m.; there are 25 native villages nowhere exceeding 2000 ft. There are several other hill ranges, which with few exceptions are covered almost to their summits with dense jungle; they are all difficult of access. There are, however, numerous passes through all the ranges. Coal and iron are found in abundance in all parts, but of inferior quality. The alluvial tract has the damp heat and moist soil characteristic of Bengal, while the undulating and hilly portions are swept by the hot westerly winds of Behar, and are very cool in the winter months. The annual rainfall averages 52 in. In 1901 the population was 1,809,737, showing an increase of 3.6% in the decade.

The Santals, who give their name to the district, are the most numerous aboriginal tribe in Bengal; they work the coal-mines of Raniganj and Karharbarhi and migrate to the tea-gardens of Assam. In 1838 officials were sent to demarcate with solid marble the “carst of the hills” in which the Santals believed to be the “sacred centre” of the hills.” The permission to Santals to settle in the valleys and on the lower slopes stimulated Santal immigration to an enormous extent. The Hindu money-lender soon made his appearance among them, and caused the rebellion of 1855–56. The rebellion led to the establishment of a form of administration congenial to the immigrants; and a land settlement has since been carried out on conditions favourable to the occupants of the soil. The Church Missionary Society and the Scandinavian Home Mission have been very successful, especially in promoting education. The clothing of the Santals is made of songe and is of the chod and loop lines of the East Indian railway. It contains the old Mahal, the medan city of Rajmahal and the modern commercial mart of Sahibganj, both on the Ganges; and also the Hindu place of pilgrimage of Deogarh, which is important enough to have a branch railway. The administrative headquarters are at Dumka, or Naya Dumka; pop. (1901) 3326.

SANTALS, an aboriginal tribe of Bengal, who have given their name to the Santal Parganas (q.v.). Their early history is unknown; but it is certain that they have not occupied their present territory always, and it is supposed that they were driven out (by their own and others’ curiosity, or by the cupidity of the watchman. Physically the Santals are not possessing. The face is round and blubberly; the cheekbones moderately prominent; the forehead straight, and depressed, mouth large and lips full, hair straight, black and coarse, the nose approximates to the negroid type. They are somewhat below the average height of the Hindus. They are divided into twelve tribes. They are divided into two classes: the Joy and the Joria, the Santals seizing every chance of a feast. They have neither the sullen disposition nor the unconquerable laziness of the very old hill tribes of central India,” writes Sir W. H. Hunter in Annals of Rural Bengal (1868). “They have carried with them from the plains a love of order, a genial humanity, with a certain degree of civilization and agricultural habits. Their very vices are the vices of an orderly people unaccustomed to shedding.”

The Santals as a race care little for permanent homes. They are not true nomads, but they like to be “on the move.” In the lowlands they are agriculturalists, and they are skilful hunters, bows and arrows being their chief weapons; on the highlands they are cattle breeders. But if food change or they find no comfort, their women instruct the children to build, usually in an isolated position. Their social arrangements are patriarchal. In every village is a headman supposed to be a descendent of the founder of the village. A deputy looks after details; a chief has charge of the children’s mutual interests. Physically the Santals are not possessing. The face is round and blubberly; the cheekbones moderately prominent; the forehead straight, and depressed, mouth large and lips full, hair straight, black and coarse, the nose approximates to the negroid type. They are somewhat below the average height of the Hindus. They are divided into twelve tribes. They are divided into two classes: the Joy and the Joria, the Santals seizing every chance of a feast. They have neither the sullen disposition nor the unconquerable laziness of the very old hill tribes of central India,” writes Sir W. H. Hunter in Annals of Rural Bengal (1868). “They have carried with them from the plains a love of order, a genial humanity, with a certain degree of civilization and agricultural habits. Their very vices are the vices of an orderly people unaccustomed to shedding.”

They speak a language of the Munda or Kolarian family.
SANTA MARIA DI LICODIA—SANTANDER

SANTA MARIA DI LICODIA, a village of Sicily, in the province of Catania, 18 m. N.W. of Catania by rail, on the S.W. slopes of Mount Etna. Pop. (1901) 2,135. It is believed to occupy the site of the ancient Astoria, a settlement founded by the colonists whom Micro I. had placed at Catania after their expulsion by the original inhabitants in 461 B.C., which absorbed or incorporated an already existing Sicel town named Inessa. Its subsequent history is uneventful, though it suffered from the excursions of Verres; and its inscriptions are unimportant. A large hoard of coins was found here in 1851. Near it, in a district called Civita, is a large elliptical area of about 1300 by 380 yds., enclosed by a wall of masses of lava, which is about 28 ft. wide at the base, and 11 ft. high. The ground surface of this structure is of silt, and it is probably a hastily built encampment of historic times rather than a primitive fortification, as there are no prehistoric traces (Orsi in Notizie degli scavi, 1903, 442).

SANTA MARTA, a city and port of Colombia and the capital of a department of the same name, on a small bay 40 m. E.N.E. of the mouth of the Magdalena river. Pop. (1908) about 6500. It is built partly on the beach and partly on the slopes of the Sierra Nevada de Santa Marta, and on the S.E. Though not a port, the harbour is one of the best and safest on the coast, as no river flows into it to fill its anchorage with silt. The depth ranges from 18 to 19 fathoms at the entrance to 43 fathoms along the inner shore line. The city is an episcopal see and has a cathedral. A railway (23 m.) runs southward a little beyond Cienaga (on a large lagoon of the same name), connects with steamers running to Barranquilla (50 m. farther) by way of the lagoon and inland channels, and is to be extended to San Carlos, farther S., as the fruit-growing industry of this region is developed.

Santa Marta was founded by Rodrigo de Bastidas in 1525, and became an important port and centre of trade during the Spanish colonial era. It was also a base of operations in the exploration and conquest of the interior.

SANTA MAURO, or LEUCADIA (Ἀευκάδα, ancient Λευκάδα), one of the Ionian Islands, with an area of 110 sq. m. and a population of about 30,000. It lies off the coast of Acarnania (Greece), immediately south of the entrance to the Gulf of Arta. The shallow strait separating it from the mainland is liable to be blocked by sand-banks; a canal was cut through these in the 7th century B.C. and widened again after a long period of disuse opened up by the Romans.

During the British occupation a canal for boats of 4 to 5 ft. draught was formed from Fort Santa Maura to the town, but the 17 ft. deep ship canal which it was proposed (1842) to carry right across the rugged and largely isletted island to Fort Alexander was only partially excavated. In 1903, however, a canal was completed rendering navigable the channel between the island and the mainland. Its breadth is 50 ft. and its depth 17 ft. Santa Maura, measuring about 20 m. from north to south and 8 to 8 m. in breadth, is a rugged mass of limestone and bituminous shales (partly Tertiary), rising in its principal ridges to heights of 2000 and 3000 ft. and presenting very limited areas of level ground. The grain crop suffices only for a few months' local consumption; but considerable quantities of olive oil of good quality are produced. The vineyards (in the west especially) yield much red wine (bought mainly by Rome, Genoa, Bologna and Venice). The output to Fort Alexander was only partially excavated. In 1859, however, it has gradually come to be the principal source of wealth (the crop averaging 2,500,000 lb); and small quantities of cotton, flax, tobacco, valonia, &c., are also grown. The salt trade, formerly of importance, has suffered from Greek customs regulations. The chief town (5000 inhabitants), properly called Amaxikhi or Hamaxichi but more usually Santa Maura, after the neighbouring fort, is situated at the N.E. end of the island opposite the S.W. coast. The chief occupation is the export of silt.

Remains of Cyclopean and polygonal walls exist at Kaligoni (south of Amaxikhi), probably the site of the ancient acropolis of Neritos (or Nericus), and of the later and lower Corinthian settlement of Leucas. From this point a Roman bridge seems to have crossed to the mainland. Between the town and Fort Santa Maura extends a remarkably fine Turkish aqueduct partly destroyed along with the town by the earthquake of 1825. Forts Alexander and Constantine commanding the bridge are relics of the Russian occupation; the other forts are of Turkic-Venetian origin. The magnificent cliff, some 2000 ft. high, which forms the southern boundary of the island, from the top of which commands a magnificent view of the mainland and the island itself, bears the substructions of the temple of Apollo Leucatus (hence the modern name Cape Ducato). At the annual festival of Apollo a criminal was obliged to plunge from the summit into the sea, where, however, an effort was made to pick him up; and it was by the same heroic leap that Sappho and Artemisia, daughter of Lygodamis, are said to have ended their lives.

A theory has been proposed by Professor Dörpfeld that Leucas is the island described in the *Odyssey* under the name of Ithaca; for Homeric Ithaca is 320 m. 320 m. west of Ithaca. Among the examples which he quotes is the fact that the Homeric description of the island in its present position does not correspond with the subsequent history of such sites as the palace of Odysseus, the harbour of Phorcys, the grotto of the nymphs and the island Asteris, where the suitors lay in wait for Telemaechus, suit Leucas far better than the island called Ithaca in classical and modern times. See under CORFU; also P. Goessler, *Leukas-Ithaka* (Stuttgart, 1904).

SANTANDER, a maritime province of northern Spain, bounded N. by the Bay of Biscay, E. by the province of Biscay, S. by Burgos and Palencia, and W. by Leon and Oviedo. Pop. (1900) 254,579. It is divided into the provinces of Biscay, Santander, and the Cantabrian Mountains (q.v.), which in the Peñas de Europa reach a height of over 8000 ft., and send off numerous branches to the sea. On the north side of the range the streams are all short, the principal being the Asón, the Miera, the Pas, the Besaya, the Saja and the Nansa, which flow into the Bay of Biscay; part of the province lies south of the watershed, and is drained by the upper Ebro (q.v.). The province is traversed from north to south by the railway and high road from Santander to Palencia or Madrid; the highest point on the railway (Venta de Pason) is 3270 ft. above the sea. Other railways connect Santander with Bilbao on the east and with Cabezona de la Sal on the west; there are also many good state, provincial and municipal roads, besides several narrow-gauge mining railways.

Santander was part of the Roman province of Cantabria, which, after passing under the empire of the Goths, became the principality of Asturias (q.v.). The portion called Asturia de Santa Juliana, or Santillana, was included in the kingdom of Old Castile, and, on the subdivision of the old provinces of Spain in 1833, became the province of Santander.

BILBAO (enormously) or Pamplona (enormously) or Pamplona (enormously), the capital of the Spanish province of Santander, the seat of a bishop and one of the chief seaports of Spain; 316 m. by rail N. of Madrid, in 43° 27′ N. and 3° 47′ W., on the Bay of Santander, an inlet of the Bay of Biscay. Pop. (1900) 54,564. It is situated on the side of a rocky peninsula, Cabo Mayor, which shelters a magnificent harbour from 2 to 3 m. wide and 4 m. long. The entrance is at the eastern extremity of the promontory, and is deep, broad, and illuminated by lighthouses on Cabo Mayor and the rocky islet of Mouro. Santander is the terminus of railways from Valladolid and Bilbao, of a branch line from Cabezona de la Sal, and of several mining railways. It is divided into an upper and a lower town. The cathedral, originally Gothic of the 13th century, has been so altered that little of the old work remains. In the crypt, or Capilla del Cristo de Abajo, is an interesting font of Moorish workmanship. The castle of San Felice contains a prison, which was one of the first examples of the radiating system of construction. The city is essentially modern; its principal buildings are the markets, barrack, theatre, bull-ring, clubs, civil and military governors' residences, custom house, hospitals, nautical school, ecclesiastical seminary, and training school for seamen. Most of the houses on the bay front and public buildings were restored after the catastrophe of the 3rd of November 1893, when the steamer "Cabo Machichaco," laden with 1700 cases of dynamite, blew up near the quay. The harbour was greatly improved during the second half of the 19th century. In the population the period nearly trebled, and there was a corresponding development of commerce and manufactures.
a city of N.W. Spain, in the province of Coruna; at the northern terminus of a railway from Tuy, near the confluence of the Sar and Sarera rivers, and 32 m. S. by W. of the city of Coruna. Pop. (1900) 24,120.

Santiago is built on the eastern slope of Monte Pedroso, surrounded by the mountains which draw down the incessant rain that gives the granite buildings of its deserted streets an extra tint of melancholy and decay. Its annual rainfall is 66 in., a total rarely exceeded on the mainland of Europe. The city was formerly the capital of Galicia; it gives its name to one of the four military orders of Spain, which rank next to a papal creation. It is the second city in Galicia and the third in Spain. It is the seat of a university and of an archbishopric, which long disputed the claim of Toledo to the primacy of all Spain. In the middle ages its shrine, which contained the body of St James the Great, was one of the most famous in Europe; so numerous were the pilgrims that the popular Spanish name for the Milky Way is El Camino de Santiago, or "The Santiago Road." The city became, in fact, the focus of all the art and chivalry of neighbouring Christendom, and a spot where conflicting interests could meet on neutral ground. The Congregations of 1179, 1211, and 1248, when the cathedral was restored to its ancient form, were celebrated in the principal churches of the city. The sees of the episcopate have been occupied by bishops of some note ever since the 5th century, and its metropolitan has exercised a powerful influence over the clergy of all Spain.

Santiago is situated in the province of La Coruña, 230 m. N. of the sea, on a basin of the same name, which is bounded by the mountains of the Barbanza, on the north, and the Sierra de la Mestiza, on the south, the only access being by the coast road. Santiago is the capital of Galicia; it is the second city in Galicia and the third in Spain. It is the seat of a university and of an archbishopric, which long disputed the claim of Toledo to the primacy of all Spain. In the middle ages its shrine, which contained the body of St James the Great, was one of the most famous in Europe; so numerous were the pilgrims that the popular Spanish name for the Milky Way is El Camino de Santiago, or "The Santiago Road." The city became, in fact, the focus of all the art and chivalry of neighbouring Christendom, and a spot where conflicting interests could meet on neutral ground. The Congregations of 1179, 1211, and 1248, when the cathedral was restored to its ancient form, were celebrated in the principal churches of the city. The sees of the episcopate have been occupied by bishops of some note ever since the 5th century, and its metropolitan has exercised a powerful influence over the clergy of all Spain.

The belief that St James had preached in Spain was certainly current before A.D. 400. The relics of the saint were said, though without the sanction of a written authority, to have reached the cathedral before the 5th century. The actual foundation of the cathedral cannot be traced farther back than the 10th century, when it was the seat of a bishop and the centre of a district. The cathedral was destroyed by the Moriscos in the 16th century, and restored in 1544, under the direction of the architect Nuno Fonseca. It was finished in 1573, under the direction of the architect Nuno Fonseca. It was finished in 1573, and was then completed in 1573, under the direction of the architect Nuno Fonseca. It was finished in 1573, and was then completed in 1573, under the direction of the architect Nuno Fonseca. It was finished in 1573, and was then completed in 1573, under the direction of the architect Nuno Fonseca.
about 82° F., in summer about 88°), owing mainly to the mountains that shut off the breezes from the E. There is superb mountain scenery in the Cordillera de Orocovis and San Luis (pop. 1907, 3441), in the thinly populated valley of the Caíza. The vast barren country surrounding the city are valuable mines of iron, copper and manganese. On these the prosperity of the province largely depends. Copper ores and coppers are the main article of export. Copper ore was once exported in as great quantities as 25,000 tons annually, but the best days of the mines were in the middle of the 19th century. The mines of Cerro and of San Juan, about two miles W. of Santiago, have an interesting history. They were first worked for the province by slaves, which were freed in 1799.

History.—Santiago is less important politically under the Republic than it was when Cuba was a Spanish dependency. The place was founded in 1514 by Diego Velazquez, and the capital of the island was removed thither from Baracoa. Its splendid bay, and easy communication with the capital of Santo Domingo, then the seat of the governor of Cuba, determined its political importance. From Santiago in 1515-1516 departed the historic expeditions of Juan de Grijalva, Hernán Cortés and Pázmillo de Narváez—the last of 18 vessels and 1100 men of arms, excluding sailors. So important already was the city that its ayuntamiento had the powers of a Spanish city of the second class. In 1522 it received the arms and title of ciudad, and its church was made the cathedral of the island (Baracoa losing the honour). But before 1530 the drain of military expeditions to the continent, the quarrels of civil, military and ecclesiastical powers, and of citizens with the king, the conflict with the Maures (who had still in political matters received orders direct from the crown). After 1826 Santiago was simply the capital of a province. In July 1741 a British squadron from Jamaica under Admiral Edward Vernon and General Thomas Wentworth landed at Guantánamo (which they named Cumberland Bay) and during four months operated unsuccessfully against Santiago. The climate made great ravages among the British, who lost perhaps 2000 out of 5000 men. The bishopric became an archbishopric in 1778, when a suffragan bishopric was established at Havana. J. B. Vaillant (governor in 1784-1790) and his successor N. Quintana (governor 1796-1799) did much to improve the city and encourage literature. After the cession of Santo Domingo to France, and after the French evacuation of that island, thousands of refugees settled in and about Santiago. They founded coffee and sugar plantations and gave a great impulse to trade. The population in 1827 was about 27,000. There were destructive earthquakes in 1675, 1679, 1766 and 1832. Dr Francesco Antomarchi (1780-1838), the physician who attended Napoleon in his last illness, died in Santiago, and a monument in the cemetery commemorates his benefactions to the poor. In the 19th century some striking heroic events are associated with Santiago. One was the "Virginius" affair. The "Virginius" was a blockade-runner in the Civil War; it became a prize of the Federal government, by which it was sold in 1870 to an American, J. F. Patterson, who immediately registered it in the New York Custom House. It later appeared that Patterson was merely acting for a number of Cuban insurgents. On the 31st of October, then commanded by Joseph Fry, a former officer of the Federal and Confederate navies, and having a crew of fifty-two (chiefly Americans and Englishmen) and 103 passengers (mostly Cubans), the vessel was captured by Mortmain Bay, Jamaica, by the Spanish vessel "Tornado," and was taken to Santiago, where, after a summary court-martial, 53 of the crew and passengers, including Fry and some Americans and Englishmen, were executed on the 4th, 7th and 8th of November. Relations between Spain and the United States became strained, and war seemed imminent; but on the 8th of December the Spanish government agreed to surrender the "Virginius" on the 10th, to deliver the survivors of the crew and passengers to an American war-ship at Santiago, and to salute the American flag at Santiago on the 25th if it should not be proved before that day that the "Virginius" was not entitled to sail under American colours. The Virginius was foundered off Cape Hatters as she was being brought to the United States. The Attorney-General of the United States decided before the 25th that the "Virginius" was the property of General Quesada and other Cubans, and had had no right to carry the American flag. Under an agreement of the 25th of February 1875, the Spanish government paid to the United States an indemnity of $80,000 for the execution of the Americans, and an indemnity was also paid to the British government. The most notable military and naval events (in Cuba) of the Spanish-American War (q.v.) of 1898 took place at and near Santiago. Monuments commemorate the actions at El Caney and San Juan Hill.

SANTIAGO DE LAS VEGAS, an inland city of Havana province, Cuba, about 12 m. S. of Havana. Pop. (1907) 64,624. Tobacco is the principal industry. An agricultural experiment station is maintained here by the Cuban government. The town dates from 1668, when a church was built for a colony of tobacco cultivators of the neighbourhood. In 1721 it received the title and privileges of a villa, and in 1824 those of a city.

SANTIAGO DEL ESTERO, a province of Argentina, bounded N. by Salta and the Chaco territory, E. by the Chaco and Santa Fé, S. by Cordoba, and W. by Catamarca, Tucuman and Salta. Area 30,764 sq. m.; pop. (1865) 161,502; (1904, estimated) 186,205, chiefly Christianized Indians. The surface of the province is flat and low, chiefly open plains thinly covered with grass. There are forests in the W. and N., extensive swamps along the river courses and large saline areas, especially in the S.W. The Salado (called Passage, and Jurament in Salta) crosses the province from N.W. to S.E. and empties into the Paraná, and the Dulce, or Saladillo, which has its sources in the Sierra de Aconcagua, crosses the province in the same general direction, and is lost in the great saline swamps of Porongos, on the Cordoba frontier. The climate is extremely hot, the maximum temperature being 113° (Mulhall), minimum 39°, and the mean annual 71°, with an annual rainfall of 25 in. Sugar, wheat, alfalfa, Indian corn, tobacco and hides are the principal products, and cotton, which was grown here under the Incas, is still produced. The province is traversed by the Tucuman extension of the Buenos Aires and Rosario railway, by a French line from Santa Fé to Tucuman, and by a branch of the Central Northern (Cordoba section) railway.

The provincial capital, SANTIAGO DEL ESTERO, is on the left bank of the Rio Dulce, 745 m. N.W. of Buenos Aires, with which it is connected by rail. Pop. (1904, estimated) 12,000, chiefly of Indian descent. The city stands on a level open plain, 520 ft. above sea-level, and in the vicinity of large swamps (esteros) bordering the Rio Dulce, from which its name is derived. There are a number of interesting old buildings in the city—a government-house, several churches, a Franciscan college, a Franciscan convent and a girls' orphanage. The city was founded in 1553 by Francisco de Aguirre and was the first capital of the province of Tucuman, the earliest settled of the La Plata provinces. In 1615 the cathedral was accidentally burnt and the bishop removed to Cordoba. The city has suffered much through inundations from the Rio Dulce, and from frequent local revolutions caused by misgovernments and the struggles of rival factions. In 1663 an inundation carried away half the capital, and the population was so reduced that in 1668 the seat of government was transferred to San Miguel, now Tucuman. In 1760 Santiago del Estero was a separate province.

1 See F. E. Chadwick, The Relations between the United States and Spain: Diplomacy (New York, 1909).
a city of N.W. Spain, in the province of Corunna; at the northern terminus of a railway from Tuy, near the confluence of the Sar and Sarelas rivers, and 32 m. S. by W. of the city of Corunna. Pop. (1900) 24,420. Santiago is built on the eastern slope of Monte Pedrero, surrounded by the mountains which draw down the incessant rain that gives the granite buildings of its deserted streets a greenish moldering. The annual rainfall is 66 in., a total rarely exceeded on the mainland of Europe. The city was formerly the capital of Galicia; it gives its name to one of the four military orders of Spain, which rank as follows: Compostela, Calatrava, Alcantara, and Montessa; and it is still the seat of a university and of an archbishopric, which long disputed the claim to Toledo to the primacy of all Spain. In the middle ages its shrines, which contained the body of St. James the Great, was one of the most famous in Europe; so numerous were the pilgrims that the popular Spanish name for Santiago de Compostela was the World's Fair. The road to Santiago Road." The city became, in fact, the focus of all the art and chivalry of neighboring Christendom, and a spot where conflicting interests could meet on neutral ground. The Congregation of Rites declared in 1884 that the cathedral still enshrines the veritable body of the apostle, and few places of pilgrimage in Europe are more frequented. The city contains many hospitals and other charitable institutions, which are open to the pilgrims. In 1900 its ecclesiastical buildings numbered forty-six. Its chief industries, apart from agriculture, are building, distillation of spirits and the manufacture of linen, paper, soap, chocolate and matches. The city has also been long celebrated for its silver smiths' work.

The belief that St. James had preached in Spain was certainly current before A.D. 400. The relics of the saint were said, though the tradition cannot be traced back farther than to the 12th century, to have been discovered in 835 by Theodomir, bishop of Iria, who was guided to the spot by a star. Hence Compostella is regarded by some authorities as a corruption of Campus Stellae, "Plain of the Star"; others derive it from San Iacome Apostol. According to the legend a chapel was forthwith erected, and the road from the shrine to the sea was made by a special bull of Leo III. A more substantial building was begun in 868, but was totally destroyed in 997 by the Moors, who, however, respected the sacred relics. On the reconquest of the city by Bermudo III. the roads were improved, and pilgrims began to flock to the shrine, which fast grew in reputation. In 1078 the erection of the present cathedral was begun during the episcopate of Diego Pelaez, and was continued until 1188, when the western façade was completed. The principal part of it was completed work until 1211, when the cathedral was consecrated. It is a cruciform Romanesque building, and keeps its original form in the interior, but is disfigured externally by much poor later work. Besides the nave and three smaller aisles, the transept divides the church in the three ways to the east, west, and south. The transept is raised to a height of 220 ft. and crowned with cupolas, and between them has been erected a classic portico, above which is a niche containing a statue of St. James. The façade was the work of Fernando Casas y Nóbora in 1738, and the statue was by Ventura Rodríguez in 1764. The design is mediocre, and gains its chief effect from forming part of an extended architectural composition on the Plaza Mayor, a grand square surrounded by public buildings.

The ground rises to the cathedral, which is reached by a magnificent quadruple flight of steps, flanked by statues of David and Solomon. Access to the staircase is through some fine wrought-iron gates, and in the upper part is a magnificent cloistered terrace. The Romanesque church, La Iglesia Baja, constructed under the portico and contemporary with the cathedral. To the north and south, and in a line with the west front, are other dependent buildings of grouping well with it. Those to the south contain a light and elegant arcade to the upper windows, and serve as a screen to the cloisters, built in 1353 by Fonseca, afterwards archbishop of Toledo. They are said to be the largest in Spain, and are a fair example of the latest Gothic. The delicate sculpture over the heads of the windows and along the wall of the cloister is very noticeable. On the north of the cathedral is the Plaza de S. Juan, where the peasants collect to do their marketing. Here is the convent of S. Martin, built in 1636, which, after serving as a barracks, is now used as an ecclesiastical seminary, restored to the church. It has a tolerable cloister and some remains of the noble façade of the cathedral, magnificent doorways being replaced by the ugly and extravagant one already noted desecrated by the chief Spanish exponent Churriguera (d. 1715). Churriguerese work. The same treatment has been applied to the east end, where is the Puerta Santa; this gate is kept closed, except in jubilee years, when it is opened by the archbishop. The corner of the south transept on the Plaza de los Plateros has been mutilated by the erection of the Churriguera work. But the arched nave and the lower part of the cathedral, however, is the Portico de la Gloria, behind the western classic portal. It is a work of the 12th century, and probably the utmost development of which round-arched Gothic is capable. The main entrance and the four vast columns of the south transept are over the nave and aisles are a mass of strong and nervous sculpture. The design is a general representation of the Last Judgment, and the sculptures are all treated on a grand scale by a master of whose work a whole artist. Faint traces of colour remain and give a tone to the whole work. It is probable that, until the erection of the present grand staircase, the portico could not have been reached from the Plaza, an entrance to the church there being on the outside. The door and the entrance to the church beneath would have been blocked by any staircase which differed much in plan from the present one. The interior of the church is one of the purest and best examples of Romanesque work. Its plan is a typical example, and the clerestory throws an impressive glow over the barrel-vaulted roof, which makes the building seem larger than it is. A passage leads from the nave to a choir-screen, a gold crucifix, dated 874, containing a piece of the true cross, and a relic of the Virgin.

The Hospicio de los Reyes, on the north of the Plaza Mayor, for the reception of pilgrims, was begun in 1504 by Enrique de Egas and finished in 1562 by Juan de Herrera. The building is a large square with an open cloister with steps in the centre. The roof is tiled, and there is a fine view of the mountains from the terraces. The building is of four stories, and the roof is light and graceful. The Severino de la Torre said it was the best hotel in Spain. The interior is plain, and contains a magnificent staircase with a classically treated and in the centre. The gateway is fine, and there is some vigorous carving in the courtyards, one of which contains a graceful fountain. The suppressed Colegio de Fonseca, founded by the Count of Margarita in 1596, contains a seaport church. The buildings of the convent of S. Francis, the cloisters of the half-ruined S. Augustin, the belfry of S. Domingo, the church of S. Feliz de Celorio, modernized 14th century, and the Belfry of the Former Cathedral, 16th century, are fine. The 18th and 19th centuries are also good examples of different architectural styles.

SANTIAGO DE CUBA, a city and seaport of Cuba, on the S. coast of the E. end of the island, capital of the province of Oriente, and next to Havana the most important city of the Republic. Pop. (1897) 45,470, of whom 50-7% was coloured and 15-6% was foreign-born. It is connected by the Cuba railway with Havana, 540 m. to the W.N.W.; short railways extend into the interior through gaps in the mountains northward; and there are steamer connections with other Cuban ports (see NEW YORK).

Santiago is situated about 6 m. inland on a magnificent land-locked bay (6 m. long and 3 m. wide), connected with the Caribbean Sea by a long, narrow, winding channel with rocky escarpment walls, in places less than 200 yds. apart. The largest vessels have the lee of its promontory. It is 3 m. in length—but direct access to the wharves is impossible for those of more than moderate draft (about 14 ft.). Smith Key, an island based as a watering-place, divides it into an outer and an inner basin. To the E. of the sea portal stand the Morro, a picturesque fort (built 1635 seq.), on a jutting point 200 ft. above the water, and the Estrella; and to the W. the Soledad. West of the harbour are low hills, to the E. precipitous cliffs, and N. and N.E., below the superb background of the Sierra Maestra, is an amphitheatre of hills, on which the city straggles in tortuous streets. The houses are almost all of one storey, built in the quaint style of southern Europe, with little overlap of roof, and with walls of very strong construction. There are no public gardens. Facing the Plaza de Céspedes (once Plaza de la Reina and then Plaza de Armas) are hotels and clubs, the largest municipal building—formerly the governor's palace (1855 seq.)—and the cathedral. In the cathedral, which is in better taste than the cathedral of Havana, Diego Velázquez (1460-1524), conqueror of Cuba, was buried. It has suffered much from earthquakes and has been extensively repaired. Probably the oldest building in Cuba is the convent of San Francisco (a church since the secularization of the religious orders in 1844), which dates in part from the first half of the 16th century, and which was closed with the other public works, and sanitation. On a hill overlooking the city is a beautiful school-house of native Esteemonte, erected by the American military government as a model for the rest of the island. Santiago is the hottest city of Cuba (mean temperature in winter
about 82° F., in summer about 88°), owing mainly to the mountains that shut off the breezes from the E. There is superb mountain scenery on the roads to El Caney and San Luis (pop. 1907, 3441), in the thickly populated valley of the Cauto. In the barren mountainous region surrounding the island are several other Cuban ports. Mineral ores, tobacco and coffee, cacao, sugar and rum and cabinet-woods are the main articles of export. Copper ore was once exported in great quantities as 25,000 tons annually, but the best days of the mines were in the middle of the 19th century. The mines of Cobre, a few miles W. of Santiago, have an interesting history. They were first worked for the government by slaves, who were freed in 1799.

History.—Santo Domingo is less important politically under the Republic than it was when Cuba was a Spanish dependency. The place was founded in 1514 by Diego Velazquez, and the capital of the province was removed thither from Baracoa. Its splendid bay, and easy communication with the capital of Santo Domingo, then the seat of government of the Indies, determined its original importance. From Santiago in 1518-1519 departed the historic expeditions of Juan de Grijalva, Hernan Cortés and Pánfilo de Narvaez—the last of 18 vessels and 1,100 men of arms, excluding sailors—of whom practically the first 450 men only had the powers of a Spanish city of the second class. In 1525 it received the arms and title of ciudad, and its church was made the cathedral of the island (Baracoa losing the honour). But before 1550 the drain of military expeditions to the continent, the quarrels of civil, military and ecclesiastical powers, and of citizens, and the emigration of colonists to the Main (not in small part due to the abolition of the encomiendas of the Indians), produced a fatal decadence. In 1589 Havana became the capital. Santiago was occupied and plundered by French corsairs in 1553, and again by a British military expedition in 1622. The capture of that island had caused an immigration of Spanish refugees to Santiago that greatly increased its importance; and the illicit trade to the same island—mainly in hides and cattle—that flourished from this time onward was a main prop of prosperity. From 1607 to 1826 the island was divided into two departments, with Santiago as the capital of the E. department—under a governor who until 1801 in political matters received orders direct from the crown. After 1826 Santiago was simply the capital of a province. In July 1741 a British squadron from Jamaica under Admiral J. E. Vernon and General Thomas Wentworth (governor of the island) was defeated at Guantánamo (which they named Cumberland Bay) and during four months operated unsuccessfully against Santiago. The climate made great ravages among the British, who lost perhaps 2000 out of 5000 men. The bishopric was an archbishopric in 1788, when a suffragan bishopric was established at Havana. J. B. Vaillant (governor in 1788-1796) and J. N. Quintana (governor in 1796-1798) did much to improve the city and encourage literature. After the cession of Santo Domingo to France, and after the French evacuation of that island, thousands of refugees settled in and about Santiago. They founded coffee and sugar plantations and gave a great impulse to trade. The population in 1827 was about 27,000. There were destructive earthquakes in 1675, 1679, 1766 and 1832. Dr Francesco Antommarchi (1780-1838), the physician who attended Napoleon in his last illness, died in Santiago, and a monument in the cemetery commemorates his benefactions to the poor. In the 19th century some striking historical events are associated with Santiago. One was the "Virginís " affair. The "Virginís " was a blockade-runner in the Civil War; it became a prize of the Federal government, bought by the British. At the battle of Santiago in 1898 to an American, J. F. Patterson, who immediately registered it in the New York Custom House. It later appeared that Patterson was merely acting for a number of Cuban insurgent. On the 31st of October, then commanded by Joseph Fry, a former officer of the Federal and Confederate navies, and having a crew of fifty-two (chiefly Americans and Englishmen) and 103 passengers (mostly Cubans), she was captured off Morant Bay, Jamaica, by the Spanish vessel "Tornado," and was taken to Santiago, where, after a summary court-martial, 53 of the crew and passengers, including Fry and some Americans and Englishmen, were executed on the 4th, 7th and 8th of November. Relations between Spain and the United States became strained, and war seemed imminent; but on the 8th of December the Spanish government agreed to surrender the "Virginís" on the 16th, to deliver the survivors of the crew and passengers to an American war-ship at Santiago, and to salute the American flag at Santiago on the 25th if it should not be proved before that date that the "Virginís" was not entitled to sail under American colors. The "Virginís" founded off Cape Hatteras as she was being brought to the United States. The Attorney General of the United States decided before the 25th that the "Virginís" was not a war-vessel, and the property of General Quesada and other Cubans, and had had no right to run the American flag. Under an agreement of the 27th of February 1875, the Spanish government paid to the United States an indemnity of $80,000 for the execution of the Americans, and an indemnity was also paid to the British government. The most notable military and naval events (in Cuba) of the Spanish-American War (q.v. of 1898 took place at and near Santiago. Monuments commemorate the actions at El Caney and San Juan Hill.

SANTIAGO DEL ESTERO, a province of Argentina, bounded N. by Salta and the Chaco territory. E. by the Chaco and Santa Fé, S. by Cordoba, and W. by Catamarca, Tucuman and Salta. Area, 30,764 sq. m.; pop. (1905) 161,509, (1904, estimated) 186,365, chiefly Christianized Indians. The surface of the province is flat and low, chiefly open plains thinly covered with grass. There are forests in the W. and N., extensive swamps along the river courses and large saline areas, especially in the S.W. The Salado (called Pasage, and Juramento in Salta) crosses the province from N.W. to S.E. and empties into the Paraná, and the Dulce, or Saladiillo, which has its sources in the Sierra de Aconquija, crosses the province in the same general direction, and is lost in the great saline swamps of Forongos, on the Dulce frontier. The climate is extremely hot, the maximum temperature being 112° (M. Dorr), and the mean annual 71°, with an annual rainfall of 25 in. Sugar, wheat, alfalfa, Indian corn, tobacco and hides are the principal products, and cotton, which was grown here under the Incas, is still produced. The province is traversed by the Tucuman extension of the Buenos Aires and Rosario railway, by a French line from Santa Fé to Tucuman, and by a branch of the Central Northern (Cordoba section) railway.

The provincial capital, SANTIAGO DEL ESTERO, is on the left bank of the Rio Dulce, 745 m. N.W. of Buenos Aires, with which it is connected by rail. Pop. (1904, estimated) 12,000, chiefly of Indian descent. The city stands on a level plain, 520 ft. above sea-level, and in the vicinity of large swamps (esteros) bordering the Rio Dulce, from which its name is derived. There are a number of interesting old buildings in the city—a government house, several churches, a Jesuit college, a Franciscan convent and a girls' orphanage. The city was founded in 1553 by Francisco de Aguirre and was the first capital of the province of Tucuman, the earliest settled of the La Plata provinces. In 1615 the cathedral was accidentally burnt and the bishop removed to Cordoba. The city has suffered much though inundations from the Rio Dulce, and from frequent local revolutions caused by misgovernment and the struggles of rival factions. In 1663 an inundation carried away half the capital, and the population was so reduced that in 1680 the seat of government was removed to San Miguel, now Tucuman. In 1820 Santiago del Estero became a separate province.

1 See F. E. Chadwick, The Relations between the United States and Spain: Diplomacy (New York, 1909).

XXIV. 7
SANTILLANA, Iñigo Lopez de Mendoza, Marquis of (1398–1458), Castilian poet, was born at Carrión de los Condes in Old Castile on the 19th of August 1398. His father, Diego Hurtado de Mendoza, grand admiral of Castile, having died in 1405, the boy was educated under the eye of his mother, Doña Leonor de la Vega, a woman of great strength of character. From his eighteenth year onwards he became an increasingly prominent figure in court life and in Castilian politics, and he preserved himself in both civil and military service; he was created marqués de Santillana and conde del Real de Manzanares for the part he took in the battle of Olmedo (19th of May 1455). In the struggle of the Castilian nobles against the influence of the constable Álvaro de Luna he showed great moderation, but in 1452 he joined the combination which effected the fall of the favourite in the following year. From the death of Juan II. in 1454 Mendoza took little part in public affairs, devoting himself mainly to the pursuits of literature and to pious meditation. He died at Guadalajara on the 29th of March 1458.

Mendoza shares with Juan de Villalpando the distinction of introducing the sonnet into Castile, but his productions in this class are conventional metrical exercises. He was much more successful in the serranilla and vagañero—highland pastorals after the Provençal models. A much richer and more refined work of this sort is the fructuosa enseñanza prepared for the use of Don Enrique, the heir-apparent. To the same didactic category belong the hundred and eighty stanzas entitled Diálogo de Dios contra Fortuna, while the Diálogo de la Piedad contra el Poder of Álvaro de Luna and the Comedia de Janua is a Dantesque dream-dialogue, in octave stanzas (de arte mayor), founded on the disastrous sea-fight off Ponza in 1425, when the kings of Aragon and Navarre and the Infante Enrique were taken prisoners by the Genoese. The three last-named compositions are the best of Santillana’s more ambitious poems, but they are deficient in the elegant simplicity of the serranillas. These unpretentious songs are in every Spanish anthology, and are familiar even to uneducated Spaniards.

SANZINGO, Giovanni (1787–1877), Italian astronomer, was born on the 30th of January 1787 at Caprese, in the province of Arezzo. He was from 1813 professor of astronomy at the university and director of the observatory at Padua. He wrote Elementi di astronomia (2 vols. 1820, 2nd ed. 1830), Teoria degli stromenti ottici (2 vols. 1828), and many scientific memoirs. He took a leading part in the foundation of the astronomical journal of Padua. His observations of comets and other astronomical phenomena were published in the Padua observatory. He died on the 26th of June 1877.

SANTLEY, Sir Charles (1834–1902), English vocalist, son of an organist at Liverpool, was born on the 28th of February 1834. He was given a thorough musical education, and having determined to adopt the career of a singer, he went in 1855 to Milan and studied under Gaetano Nava. He had a fine baritone voice, and while in Italy he began singing small parts in opera. In 1857 he returned to London, and on 16th November made his first appearance in the part of Adam in The Creation at St Martin’s Hall. In 1858, after appearing in January in The Creation, he sang the title-part in Elijah in March, both at Exeter Hall. In 1859 he sang at Covent Garden as Hoel in the opera Dinorah, and in 1862 he appeared in Italian opera in Il Trovatore. He was then engaged by Mapleson for Her Majesty’s, and his regular connexion with the English operatic stage only ceased in 1870, when he sang as Vanderdeeken in The Flying Dutchman. His last appearance in opera was in the part with the Carl Rosa Company at the Lyceum Theatre in 1891. On 1st December while in 1861 he sang Elijah at the Birmingham Festival, and in 1862 he was engaged for the Händel Festival at the Crystal Palace. At the musical festivals and on the concert stage his success was immense. In such songs as "To Anthea," "Simon the Cellarer" or "Maid of Athens," he was unapproachable, and his oratorio singing carried on the finest traditions of his art. He was knighted in 1907. In 1858 Santley married Gertrude Kemble, and their daughter, Edith Santley, had a great success as a concert singer.

SANTO DOMINGO [San Domingo, Dominican Republic, or officially República Dominicana], a state in the West Indies. It occupies two-thirds of the island of Haiti (q.v.) and has an area of about 18,945 sq. m. The administration is in the hands of three co-ordinating "powers"—the executive, the legislature, and the judicial. Under the constitution of 1844, modified in 1879, 1880, 1881, 1887, 1896, and 1908, the president is the head of the executive. He is chosen by an electoral college and serves for six years, and he is assisted by a cabinet of seven ministers. The legislature, called the National Congress, consists of a Senate of 12 members, and a Chamber of Deputies of 24 members elected for four years by a limited suffrage. The Supreme Court comprises a chief-justice, six justices appointed by the Congress, and one justice appointed by the president. The republic is divided into six American and six maritime districts. Each province and district is administered by a governor appointed by the Cabinet. There is a small army, most of which is stationed at the City of Santo Domingo, and military service is compulsory in the event of foreign war. The navy consists of one small gun-boat. Primary education is free and compulsory; elementary schools are supported largely by the local authorities, and the higher, technical and normal schools by the government. There is a professional school with the character and functions of a university. The Roman Catholic Church is the state church, but it is allowed to function under certain restrictions. The monetary unit is a silver coin, the value of a franc, called the dominicano, but in 1897 the United States gold dollar was adopted as the standard of value. The roads in the interior are primitive, but the government encourages the construction of railways. A line runs between Sanchez and La Vega, and another between Santiago and Porto Plata. The republic joined the Postal Union in 1886. The exports include tobacco, coffee, cacao, sugar, mahogany, logwood, cedar, satinwood, hides, honey, gum and wax. The collection of the customs and other revenues specially assigned to the securce of bonds was in the hands of the government until 1899, when this defaulted in the payment of interest and the government took over the collection. In 1905, to forestall foreign intervention for securing payment of the State debt, President Roosevelt made an agreement with Santo Domingo, under which the United States undertook to adjust the republic’s foreign obligations, and to assume charge of the customs houses. A treaty was ratified by the United States Senate in 1907, and an American citizen is temporarily receiver of customs. In June 1907 the debts amounted to $17,000,000.

Santo Domingo has the finest sugar lands in the West Indies; tobacco and cacao flourish; the mountain regions are especially suited to the culture of coffee, and tropical fruits will grow anywhere with a minimum of attention. During the earlier years of the Spanish occupation gold to the value of $90,000 was sent annually to Spain, besides much silver, platinum, manganese, iron, copper, tin, amonary, opals and chalcedony are also found. In the Neya valley there are two remarkable hills, composed of pure rock salt. Only an influx of capital and an energetic population are needed to develop the resources of the country.

Santo Domingo, the capital of the republic, is situated on the south coast. At a distance of 45 miles from the town of Azua (pop. about 10,000) founded in 1504 by Diego Columbus. It stands in a plain, rich in salt and asphalt, washed by the river Azua; and the sugar grown in the West Indies. Santiago (pop. 12,000), the capital of the Vega Real, stands on the banks of the Yaque river, 160 m. N.W. of the capital, in the richest agricultural district in the state. It controls the tobacco trade which is chiefly in German and Dutch hands. Its port, Porto Plata (pop. 15,000), is the outlet of the entire Vega Real district. La Vega, perhaps the most beautiful city of Santo Domingo, lies 7 miles S.W. of the capital, amidst a fertile plain, surrounded by well wooded hills, and has a magnificent old cathedral. Six miles away is the Cerro Santo, a hill 787 ft. in height, rising abruptly from the plain. On the summit of which Columbus planted a great cross on his first visit in 1493. The capital of the Western District of the Island on the north (900) are the only other towns of any size. The population of the republic is about 500,000. The people are mainly mulattoes of Spanish descent, but there are a considerable number of negroes and whites of both Creole and European origin.
whites have the predominating influence. The people, on the whole, are quiet, and show little disposition to great political excitement. They are Spanish in their mode of life and habits of thought. Spanish too is the common language, though both French and English are spoken in the towns. Few negroes are to be seen. The principal white occupation is the cultivation of tobacco, and the manufacture of rope; but in a neighboring district they are to be seen in considerable numbers, engaged in the cultivation of coffee, sugar, and cotton. It is not uncommon to see negroes employed as laborers in the factories. They are not, however, engaged in any other occupation.
together in a white mass, while the rocks below it are the reddest in the island.

Santorin is closely connected with the earthquake movements to which the countries in the neighborhood of the Aegean Sea are subject. It represents the site of a part of the island of Santorin or Thera, which is considered to have been prehistoric. The principal eruptions that have taken place within historic times are that of 186 B.C., when, as we learn from Strabo (iv. 16, 3), a land-tide or tsunami issued from the sea, and between Thera and Therasia for four days; that of A.D. 726, during the reign of the Emperor Leo the Isaurian (on both these occasions islands were thrown up, but it is supposed that they afterwards disappeared); that of 1570, when Mikra Kameni arose; that of 1659, which destroyed many lives by noxious exhalations, and ended in the upheaval of an island in the sea to the north-east of Santorin, which afterwards subsided and became a reef below sea-level; that of 1707, when Nea Kameni arose; and that of 1866, when Nea Kamenou was extended towards the south and enlarged threefold.

In the southern parts both of Santorin and Therasia prehistoric dwellings have been found at some height above the sea, and there is no doubt that these date from a period antecedent to the formation of the bay. These were destroyed by their position under the sea, and by the layer of tufa which covers the islands, and by these layers of tufa being broken off precipitously, in the same way as the lava-rocks, a fact which can only be explained by the supposition that they all fell in together. The foundations of the dwellings rested, not on the tufa, but on the lava below it; and here and there between the stones branches of wild olive were found, according to a mode of building that still prevails in the island, in order to resist the shocks of earthquakes. Very few implements of metal were found. Some of the vases found were Cretan ware which had been imported; and the correspondence between these and various specimens of the native pottery proves that to some extent this primitive art was derived from Crete.

In Greek legend the island of Thera was connected with the story of the Argonauts, for it was represented as sprung from a cloud of earth which was presented to those heroes by Triton (Apollon., Argonaut., iv., 1551 sq., 1731 sq.). According to Herodotus (iv. 147), a Phoenician colony was established there by Cadmus. Subsequently a colony from Sparta, including some of the Minyae, was led thither by Theras, who gave the island his own name. The plate-mine of the famous silver Calydonian was here. But the one event which gave importance to Thera in ancient history was the planting of its famous colony of Cyrene on the north coast of Africa by Battus in 631 B.C., in accordance with a command of the Delphic oracle.

The ancient capital, which bore the same name as the island, occupied a site on the eastern coast now called Mesavouno, between Mount Elias and the sea. Since 1895 this place has been excavated by Baron Hiller von Gärtringen and other German explorers. There are extensive ancient cemeteries. A steep ascent leads from a Heroum of Artemisorus to the Arkadi, a ruined neighbourhood which was the Sthna Basilica, a vast hall with a row of pillars; a temple of Dionysus and the Ptolemy, which at a later period was dedicated to the Caesars; and the barracks of the garrison of the Ptolemies and a gymnasion. The names which occur here remind us that Thera, as a member of the League of the Cyclades, was from B.C. 308 to 145 under the protectory of the Ptolemies. The main street has narrow lanes diverging from it to right and left; one of these leads to the sanctuary of the Egyptian gods. Near the street there is a small theatre, beneath the seats of which a vast cistern was constructed, arranged so that rain-water should drain into it from the whole of the auditorium. The way then descends south-eastwards first to the temple of Ptolemy Euergetes III., and then to that of Apollo Carneius; finally, at the point where the rocks fall precipitously, there is a gymnasion of the Epebi. Numerous rock-carvings and inscriptions have been discovered, as well as statues and vases of various periods. Near the western foot of Mount Elias is the temple of Thea Basileia, which, though very small, is perfect throughout even to the roof. It is now dedicated to St Nicolas Marmorites.

Cypourné mentions that in his time nine or ten chapels were dedicated to St Sotários, 49 of them, 1571, of the place; the name Santorin was given to the island after the fourth crusade, when the Byzantine empire was partitioned among the Latins, and the island formed a portion of the duchy of the Archipelago. Santorin was one of the most prosperous, for, in addition to the wine trade, there is a large export of pozzolana, which, when mixed with lime, forms a hard cement. Santorin (officially Thera) is a province in the department of the Cyclades, and is divided into 9 communes (see CYCLADES), with a total population of 19,507 in 1907.

SANTOS, a city and seaport of Brazil, in the state of São Paulo, about 230 m. W.S.W. of Rio de Janeiro, and 49 m. by rail S.E. of São Paulo city. Pop. (1890) 13,012; (1902 estimate) 35,000. Santos covers an alluvial plain on the inner side of an island (called São Vicente) formed by an inland tidal channel separated from 490 m. of the open coast by a narrow channel, part of the sea is some miles from the mouth of the channel, but the residential sections extend across the plain and line the beach facing the sea. The city is only a few feet above sea-level, the island is swampy, and deep, cement-lined channels drain the city. The Santos river is deep and free from obstructions, and in front of the city widens into a bay deep enough for the largest vessels. The water front, formerly beds of mud and slime, the source of many epidemics of fever, is now faced by a wall of stone and cement. Vessels moor alongside this quay, which is lined with ware-houses and provided with railway tracks, &c. Formerly cargo was transported to the warehouse by water and loaded into lighter by porters, and from these transferred to vessels anchored in midstream. The improvements were planned by an American engineer, William Milnor Roberts (1810–1881). The thorough drainage of the city has made Santos comparatively healthy. The heavy rainfall (388 in. per annum), neighbouring swamps, rank vegetation and great heat give rise to malarial and intestinal disorders, rheumatism and other diseases. Beri-beri and smallpox are also common, and bubonic plague has appeared since 1900. The temperature ranges from 4° to 10° F. in the month of August.

The development of coffee production in the state of São Paulo during the closing years of the 19th century has made Santos the largest coffee shipping port in the world, the exports amounting to 5,849,114 bags, of 132 lb. each, in 1900, and 8,904,144 bags in 1908. The other exports include sugar, rice, rum, fruit, hides and manufactured goods. Bananas are grown in the vicinity for the River Plate markets. The most popular suburb in the vicinity of Santos is the bathing resort of Guarujá. The São Paulo railway, an English double-track line, provides communication with the interior, ascending the steep wooded slopes of the Serra do Mar by a series of inclines up which the cars are drawn by stationary engines on the old line, and by a series of gradients on the new line.

The first settlement on the São Paulo coast was that of São Vicente in 1532, about 6 m. S. of Santos on the same island. Other settlements soon followed, among them that of Santos in 1543–1546, and later on the small fort at the entrance to its harbour, which was used for protection against Indian raids from the north. São Vicente did not prosper, and was succeeded (1681) by São Paulo as the capital and by Santos as the seaport of the colony. It was captured by the English privateer, Thomas Cavendish, in 1591, when São Vicente was burned. The growth of the town was slow down to the end of the 19th century, because of insanitary conditions and epidemics.

SANUTO (Sanudo), Marino, the elder, of Torcello (c. 1260–1338), Venetian statesman, geographer, &c. He is best known
for his life-long attempts to revive the crusading spirit and make war on the infidel. With this object he wrote the great work, the Secreta (or Liber Secretum) Fidelis Crescit, otherwise called Historia Hierosolymitana, Liber de expediione Terrae Sanctae, the last being perhaps the proper title of the whole treatise as completed in three parts or "books." This work has much to say of trade and trade-routes as well as of political and other history; and through its accompanying maps and plans it occupies an important place in the development of cartography. It was begun in March 1306, and finished (in its earliest form) in January 1307, when it was offered to Pope Clement V. as a manual for true Crusaders who desired the redemption of the Land. To this original Liber Secretum Sanuto added largely; the earlier parts were composed between December 1312 and September 1321, when the entire work was presented by the author to Pope John XXII, together with a map of the world, a map of Palestine, a chart of the Mediterranean, Black Sea and west European coasts, and plans of Jerusalem, Antioch and Acre. A copy was also offered to the king of France, to whom Sanuto desired to commit the military and political leadership of the new crusade. Marino himself tells us that he had spent the best part of his life in researching the history of the eastern empires; of the Morea he had especially intimate knowledge; he had also visited Cyprus, Rhodes, parts of the Syrian, Cilician and Egyptian coasts, the Flanders and north Germany, both west and east of Denmark. He had been in Acre, Alexandria, Constantinople, Avignon, Bruges and Sluys, as well as (apparently) in Hamburg, Lübeck, Wismar, Rostock, Stryslau, Greifswald and Stettin. Among his friends and correspondents were Guglielmo Bernardi de Furvo, a Venetian nobleman who had travelled extensively in Moslem and Mongol lands (to Tabriz, Baghdad, Damascus and Cairo), Bishop Jerome of Kaffa, in the Crimea, who in 1312 had been engaged in the Catholic mission in China, and perhaps Peter, the English-born bishop of Canterbury and the Farnese, who made an appeal for aid to the Polish king of England in 1330. Marino Sanuto's ancestor, Marco, had founded the greatness of his family after the Fourth Crusade as duke of the Archipelago and conqueror of Naxos, Paros, &c. (from 1207); and his descendant wrote with a personal passion in the question of crushing Moslem power in the Levant.

The crusading plans of the Secreta are double: first, Egypt and the Moslem world on the side towards Europe (Syria, Asia Minor, the Barbary States), and secondly, the western flight, the stoppage of all Christian trade with the same. By such an interdict Sanuto hopes that Egypt, dependent on its European and other imports, will be weakened, its provisions, weapons, timber, pitch and slaves, would be fatally damaged, and the trade and commerce, especially the second part of the campaign—the armed attack of the crusading fleet and army on the Nile delta. With the aid of the Mongol Tatars of Asia, and the resources of the countries well known to Italian mariners, and of the Nubian Christians, the conquest of the Delta and of all Egypt was to be followed by that of Palestine, invaded and held from Egypt. Sanuto deprecates any other route for the crusade, and unfolds his plan of campaign, his lands of supply, his sources for the supply of good gear, with great detail. Not only Mediterranean seaports, but the lakes of North Italy and central Europe, and the Hanseatic ports, are counted as nurseries of crusading mariners and marine skill. Finally, after the conquest of Egypt, Marino designs the establishment of a Christian fleet in the Indian Ocean to dominate and subjugate its coasts and islands. He also gives a sketch of the trade-routes crossing the Indian Ocean, after the course of the Indian trade from Coromandel and Gujarat to Ormuz and the Persian Gulf, and to Aden and the Nile. The maps and plans which illustrate the Secreta are probably (in the main, at least) the work of the great portolano-draughtsman Pietro Vesconte; practically the whole of this map-work corresponds with what Vesconte has left under his own name; much of it is indistinguishable. Among the plans that of a network of five maps, which together form a good example of the knowledge of the portolano; in the world-map a portolano of the Mediterranean is combined with work of pre-portolano type in remote regions. Here the shorelines of all the known lands and islands, from Flanders to Asov, are well laid down; the Caspian Sea, the north German and Scandinavian coasts appear with an evident, though far slighter, relation to practical knowledge; and some idea is given of the great continental rivers of the north, such as the Don, Volga, Vistula, Ouse and Sty Daria, Altea, away from the Mediterranean, is conventional, with its south-east projected, after the manner of Idrisi, so as to face Indian Asia, and with a western Nile crossing, of continuing value to Chinese and Indian Asia the show little trace of the new knowledge which would have been imparted by European pioneers from the Polo's time, and which appears so strikingly in the Catalan Atlas of 1375. Sanuto's Palestine map is remarkable for its so-called "linking network of lines," which roughly answer to a kind of scheme of latitude and longitude, though not entirely new, but speaking they are not scientific at all. Of the Secreta, twenty-three MSS. exist, of which the chief are: (1) Florence, Riccardian Library, No. 237, 162 fols. (Secreta et litterae), with maps and plans of Italy and the Levant. (2) London, British Museum, Addt. MSS., 27, 376, 170 fols. with maps, &c. on fols. 180, v.-190, r. (3) Paris, National Library, C. S. L., Lat. 4190, with map, Secreta (N. 9), r.-t., r. 27, 98-99. All these are of the 14th century. The Secreta has only once been printed entirely, by Bongars, in Gesta Dei per Francos, vol. ii. pp. 1-288 (Hanover, 1741). See also Friedrich Kunzmann, "Studien über Marino Sanuto den älteren, mit einem Anhange seiner ungedruckten Briefe" in Abhandlungen der historis. Classe der Königl. Bayerischen Akademie der Wissenschaften, vol. vii, pp. 695-719 (Munich, 1855); Foscarini, Letteratura Veneziana; Tiraboschi, Storia della Letteratura Italiana, vol. v.; Postansque, De Marino Sanuto (Montpellier, 1856); C. R. Beazley, Dawn of Modern Geography, ii. 309-319, 391-402, 530-541, 585-594 (C. R. B.)

SANUTO (or SANUDO), MARINO, the younger (1533-1621), Venetian historian, was the son of the senator, Leonardo Sanuto, and was born on the 22nd of May 1466. Left an orphan at the age of eight, he lost his fortune owing to the bad management of his guardian, and was for many years hampered by want of means. In 1483 he accompanied his cousin Mario, who was one of the three sindici ingiuditori deputed to hear appeals from the decisions of the retori, on a tour through Istria and the mainland provinces, and he wrote a minute account of his experiences in his diary. In 1498 he went he sought out learned men, examined libraries, and copied inscriptions. The result of this journey was the publication of his Itinerario in terra firma, an account of Latin inscriptions. Sanuto was elected a member of the Maggior Consiglio when only twenty years old (the legal age was twenty-five) solely on account of his merit, and he became a senator in 1498; he noted down everything that was said and done in those assemblies and obtained permission to examine the secret archives of the state. He collected a fine library, which was especially rich in MSS. and chronicles both Venetian and foreign, including the famous Altino chronicle, the basis of early Venetian history, and the "Life of Dante," written by the friend of all the learned men of the day. Aldo Manuzio dedicated to him his celebrated Latin edition of the works of Angelo Poliziano and of the poems of Virdem. It was greatly indebted to Sanuto when Andrea Navagaro was appointed the official historian to continue the history of the republic from the point where Marco Antonio Sabellico left off, and a still greater mortification when, Navagaro having died in 1529 without executing his task, Pietro Benso was appointed to succeed him. Finally in 1531 the value of his work was recognized by the senate, which granted him a pension of 150 gold ducats per annum. He died in 1533.

His chief works are the following: Difulcrin in terra firma, published by M. Rawdon Brown in 1847; I commentari della guerra di Ferrara, an account of the war between the Venetians and the Papacy, published in 1517, and an account of the life of Carlo VIII. (MS. in the Louvre); Le Vite dei Dogi, published in vol. xii. of Muratori's Rerum italicarum scriptores (1733); the Diari, his most important work, which cover the period from the 1st of January 1496 to September 1533, and fill 58 volumes. The publication of these records was begun by Rinaldo Furli, in collaboration with Federigo Stefanii, Guglielmo Berchet, and Niccolò Barozzi; the last volume was published in Venice in 1903. Owing to the relations of the Venetian republic with the great powers of Europe he was practically a universal chronicler, and an invaluable source of information for all writers on that period.

SAN VICENTE, the capital of the department of San Vicente, Salvador; 30 m. E. of San Salvador, on the river Acahuapa, a left-hand tributary of the Lempa. Pop. (1905) about 18,000.
SAO FRANCISCO, a river of eastern Brazil rising in the S.W. part of the state of Minas Geraes, about 39° 30' S., 46° 40' W., near the narrow valley of the Rio Grande, a tributary of the Paraná, and within 240 m. of the coast W. of Rio de Janeiro. It flows in a general N.N.E. direction across the great central plateau of Brazil to about lat. 9° 30', long. 42° W., where it turns N.E. and then S.E. in a great bend, entering the Atlantic in lat. 10° 39' S. It has a total length of about 1800 m. and a fall of 2700-2800 ft. It is navigable for 72 m. by sailing vessels. A short distance below the falls and a deep cañon with whirlpools for some distance below, the Brazilian government has built a railroad along these falls and a deep cañon with whirlpools for some distance below, the Brazilian government has built a railroad along these falls. The railroad is called the Sobradinho nearly 90 m. above the lower rapids, which are navigable at high water, and above these an unobstructed channel for light-draft river boats up to Pirapora a little above the mouth of the Rio das Velhas, a distance of 98 m. Here the river runs through a barren, semi-arid region, sparsely settled. There are no tributaries of consequence along a large part of this region, and the few people living beside the river are dependent on its annual floods for the fertilization of its sandy shores on which their scanty plantations of Indian corn and beans are made. The rapids of Pirapora are 17 m. above the mouth of the Rio das Velhas; from this point, the head of navigation on the river, and 1742 ft. above sea-level, is the objective point of the Central do Brasil railway, the purpose being to create by rail and river a central route from Rio de Janeiro to the northern parts of Bahia and Recife. The principal tributaries of the São Francisco are: on the right, the Pará, Paraopeba, Velhas, and Verde-Grande; on the left, the Indiayá, Abacaté, Paraçatú, Urucuaya, Carinhangha, Corrente and Grande. Several of these tributaries are navigable for long distances by small boats—the aggregate being a little over 1000 m. Some authorities give 1945. It became a navigable channel, if the São Francisco as 4350 m. The upper valley of the São Francisco is partly forested, has a temperate climate, with a mean annual temperature of 85° and a rainfall of 1637 millimetres. The rainy season is from December to March, but on the lower river the rainfall is light and the season much shorter, sometimes varied by droughts covering several years.

An admirable description of this great river is given by Richard Burton in *The Highlands of Brazil* (2 vols., London), and a more technical examination by E. Liébault, in *Hydrographie du Haut Saint Francisco et du Rio das Velhas* (Rio de Janeiro, 1865).

SÃO LEOPOLDO, a city of the state of Rio Grande do Sul, Brazil, on the left bank of the Rio dos Sinos, 203 m. by rail N. of Porto Alegre. It is the chief town of a município (commune) of the same name, having an area of about 347 sq. m. and inhabited chiefly by German colonists. Pop. (1900) of the city, 11,015; of the município, 32,600. São Leopoldo has river and railway communication with Porto Alegre. It is a prosperous industrial town, with broad straight streets and substantial buildings. It has good schools, and its Jesuits' college ranks high throughout northern Rio Grande. Among its manufactures are matches, hats, baskets, shoes, soap, liquors and artificial drinks, leather and leather-work and carteware. In the sur

rounding districts cattle and hogs are raised, and jerked beef, hides, pork, lard, potatoes, beans, farinha de mandioca (cassava flour), Indian corn, tobacco and a great variety of vegetables and fruits are produced.

The city was originally a German colony founded by the emperor Pedro I. in 1824 and established at a place known as the Feitoría Real de Canhamo (Royal flax factory). The first colonists (36 families and 17 unmarried persons, or 126 souls) arrived on the 29th of June 1825, and were followed a few months later by another party of 900 colonists. These were the first German colonists in Rio Grande do Sul. Up to 1830 the arrivals numbered 3701, but the civil war which broke out in 1835 checked further arrivals and nearly ruined the colony, its inhabitants being forced to serve in the contending forces and their property being seized. São Leopoldo was occupied by the revolutionists for some years and was practically ruined at the termination of the war in 1844. The introduction of colonists was immediately resumed, however, and the colony was soon as prosperous as before. The colonists were engaged in Germany by a representative of the Brazilian government, and were given free transportation, 130 acres of land each, farming implements, seeds, and a subsidy of 330 reis a day for the first year and half that for the second year. Subsequent settlers received less, but the system of assisting colonists and making contracts with companies and individuals for their introduction became the settled policy of the national and provincial governments.

SÃO LUÍS, or in full, SÃO LUÍS DE MARANHÃO (also spelt Maranhâm), a seaport of northern Brazil, capital of the state of Maranhão, lying on the lower course of the Rio Piraputanga, a branch of the Rio Grande do Norte, and is 172 m. long, 10° 3' S., 42° 29' W., about 300 m. E.S.E. of Belem (Pará). Pop. of the whole Island (1890) 29,306; (1908, estimate) 32,000. An important part of the population is made up of the planters of the state, who live in town and leave their estates to the care of overseers. The island of Maranhão lies off the mouth of the rivers Marimbá and Itapicuru, between the Bay of São Marcos on the W. and the Bay of São José on the E., and is separated from the mainland by a small channel called the Canal do Mosquito. It is irregular in outline, its greatest length from N.E. to S.W. being 34 m., and its greatest breadth 19 m. It is covered by a number of low hills and short valleys. The city is built upon a tongue of land between two small estuaries, Anil and Bacanga, which unite and open upon the Bay of São Marcos. It covers two low hills and the intervening valley, the transverse streets sloping sharply to the estuary on either side. These slopes make it difficult to use vehicles in the streets, but they afford a natural surface drainage which makes São Luís cleaner and more healthy than the coast towns of tropical Brazil usually are. The city is regularly laid out with comparatively wide longitudinal, and steep, narrow transverse streets, roughly paved and provided with sidewalks. The buildings are of the old Portuguese type, with massive walls of broken stone and mortar, having an outside finish of plaster or glazed tiles and roofs of red tiles. The principal public buildings are the cathedral, a large and severely plain structure, the episcopal palace, the Carmelite church, the government palace, town hall, custom-house, hospital, and a number of asylums, convicts and charitable schools. An excellent lyceum and a church seminary are the most important educational institutions, and São Luís long enjoyed a high reputation in Brazil for the culture of its inhabitants. The trade of São Luís was very important, but the commercial activity of Pará and Fortaleza, the decay of agricultural industry in the state, and the sitting up of its harbour, have occasioned a decline in its commerce. Its exports comprise cotton, sugar and rice. Communication with the mainland and interior towns is by means of small steamers.

São Luís was founded in 1613 by La Rivardière, a French officer commissioned by Henri IV. to establish a colony in this vicinity. The French colony was expelled in 1615 by the Portuguese, who, in turn, surrendered to the Dutch in 1641. In 1664 the Dutch abandoned the colony, and when the Portuguese resumed possession and held the city to the end of their colonial rule in Brazil. The city became the seat of a bishopric in 1679.

San Vicente is situated in a volcanic region abounding in hot springs and geysers. The volcano of San Vicente, the highest in the department, reaches an altitude of more than 7000 ft. The city is surrounded by indigo and tobacco plantations, and has considerable commerce, a large portion of which is transacted at the All Saints' fair, held annually on the 15th of November. Shoes, hats, cloth, silk, spirits and cigars are manufactured here. San Vicente was founded in 1634 on the site of Tchucanu, an ancient Indian city. For one year (1839-1840) it was the capital of the republic.
SAÔNE—SÃO PAULO 199

SAÔNE, a river of eastern France, rising in the Faucilles mountains (department of Vosges), 15 m. W.S.W. of Épinal at a height of 1350 ft. and uniting with the Rhone at Lyons. Length, 301 m.; drainage area, 11,400 sq. m. The oldest Celtic name of the river was Arar. In the 14th century another name appears, Souzauna, from which the modern name is derived. It winds slowly in a sinuous channel, has its course in the wide depression between the Plateau of Langres, the Côte d’Or and the mountains of Charolais and Beaujolais on the west and the western slopes of the Voges and Jura and the plain of Besse and the plateau of Dombes on the east. In the department of Saône-et-Loire, the Saône unites with the Doubs, an affluent rivalling the Saône in volume and exceeding it in length at this point. At the important town of Chalon-sur-Saône the river turns south, and passes Mâcon. Below Trévoux its valley, now narrower, winds past the Mont d’Or group and joins the Rhone just below the port of Lyons. The Saône is navigable from Corre to Lyons, a distance of 233 m., the normal depth of water being 61.6 in. At Corre (confluence with the Conêy) it connects with the southern part of the Eastern Canal, at Heuliez (below Gray) with the Saône-Marne Canal, at St Symphorien (above St Jean-de-Losne) with the Rhone-Rhine Canal, and at St Jean-de-Losne with the Canal de Bourgogne and at Chalon with the Canal du Centre.

SAÔNE-ET-LOIRE, a department of east-central France formed from the districts of Autunois, Brionnais, Chalonnais, Charolais and Mâconnais, previously belonging to Burgundy. It is drained by the canal from the Saône at St Jean-de-Losne, and by the rivers of the Jura, formed by the confluence of the Saône, the Lison, and the Doubs (tributaries of the Rhône), and the Noise, a mere brook. The region is formed by a series of valleys, the slopes of which converge to the south and east, toward the continuation of the tableland of the Morvan, and are terminated by the Rhône at Dijon. The tableland of the Morvan is bordered on the north and east by the Côte d’Or, on the south by the Saône and its affluents, the Lison and the Noise, and the Noise, which separates it from the Bresse by a range of hills, the Ponds. The tableland of the Morvan is intersected by the valleys of the Saône, the Lison, and the Noise, which form a series of large basins. The tableland is a region of extreme temperature, with hot summers and cold winters, and of extreme rainfall, with heavy rains in the winter and droughts in the summer. The region is divided into 5 arrondissements—Mâcon, Chalon-sur-Saône, Autun, Charolles, Louhans—50 cantons, and 58 communes.

Mâcon, Chalon, Autun, Le Creusot, Cluny, Montceau-les-Mines, Tournus, Bertheaume-le-Monial, Louhans, are the chief towns of the department. The principal industries are winemaking, pottery, porcelain-making, and flour-milling. The main rivers are the Saône and the river Week.

SÃO PAULO, a state of Brazil extending from 16° 54’ to 25° 15’ S. lat. and bounded N. by Matto Grosso and Minas Geraes, E. by Minas Geraes, Rio de Janeiro and the Atlantic, S. by the Atlantic and Paraná, and W. by Paraná and Matto Grosso. Pop. (1900) 2,822,797; area, 112,312 sq. m. The state has a coast-line 737 m. long, skirted closely by the Sierra do Mar, below which is a narrow coastal zone broken by lagoons, tidal channels and mountain spurs. Above is an extensive plateau (1500 to 2200 ft. above sea-level) with a mild temperate climate and the southern and eastern borders are broken by mountain chains, and isolated ranges of low elevation break the surface elsewhere, but in general the state may be described as a tableland with an undulating surface sloping westward to the Paraná. The extreme eastern part, however, has an eastward slope and belongs to the Paraguay basin. The state is traversed by a number of large rivers, tributaries of the Paraná, the largest of which are the Rio Grande, a part of the N. boundary, Dourados, Tietê, Aguapêy, Tigre, and, and a part of the S. boundary, the Paranapanema. The Paraná forms the W. boundary of the state, and its branches unite and unite in the Tietê include some of the richest coffee estates of Brazil. The state is well wooded, especially on the slopes of the Serra do Mar, but there are extensive grassy campos (plains) on the plateau. A large part of western São Paulo is still unsettled. The coastal zone is hot and generally malarial, with heavy rainfall. On the plateau the rainfall is sufficiently abundant, but the air is drier and more bracing, the sun temperature being high and the nights cool. The open country is singularly healthy, but the river courses are generally malarial. Some of the cities have suffered from fever epidemics, due to bad drainage and insanitary conditions.

The great industries are agricultural, and the most conspicuous are coffee production. São Paulo produces more than one-half the total Brazilian coffee and its one great port, Santos, is the largest coffee-exporting port in the world. The terra roxa (red earth) lands of the central and northern parts of the state, especially in the basins of the Tietê and Pará, are peculiarly favourable. This soil is ferruginous, pasty, deep red in colour, and free from stone, and covers the higher surface of the plateau with a thick layer. The best plantations are on benches overhanging the high walls, which are not in their eroded valleys. The Rio Pardo (Brown river) probably derives its name from this soil. For the crop year (July to June) of 1895-1896 the production was 5,073,804 bags, and in 1903-1904 it was 6,077,175. In these figures being the deliveries at Santos for exportation and not including the reserves on the plantations and the home consumption. The crop for the last year mentioned was not a maximum, however, because production was limited by the heavy rains which occurred in 1902-1903, 8,349,828 bags. These immense crops were produced in spite of appeals to producers not to increase production, and even this demand for reduction did not hold the crop in check. Over-production was keeping the price below a remunerative figure and threatened to ruin the industry. In 1906 the state entered into an accord, known as the "Convenio de Taubaté," with the states of Minas Geraes and São Paulo to maintain the bonus of Type No. 7 at 55 to 65 francs gold per bag of 60 kilograms (other types in proportion) for the first year, and then to increase this price to 70 francs, according to the state of the market; and to check as far as possible the exportation of coffees inferior to Type...
No. 7, which was a grade largely exported to the United States for the manufacture of coffee. Excelsior grades, also known as grade No. 7, were used in the same trade. In addition to the suspension or limitation of the export of grades below Type No. 7, coffee was to be bought and stored until it could be sold through accredited agents above the purchase price. In September 1917, the state of São Paulo was authorized to float a loan of $15,000,000. Failing to accomplish this by itself, the state secured the endorsement of the national congress in the form of a loan which was to be issued at the rate of 5½ per cent, to which the state of $7,500,000 in 5 francs per bag was decreed. The guarantee was to endure for ten years, during which time all the transactions of the combination, which undertook to limit the sales abroad to 500 bags in 1910, 600,000 bags in 1911, 800,000 bags in 1912, 800,000 bags in 1913 and 700,000 per annum thereafter, were to be subject to the approval of the national government. Another measure was the imposition of an additional tax of 20% on all exports of coffee above those permitted by the law of 1910, and a tax of 10% on a reserve of over 8,000,000 bags, increasing crops, and the reckless purpose of planters to realize on their crops regardless of the effect on the market, was also the inspiration of the combination.

The other agricultural products of the state include sugar, cotton, rice, tobacco, Indian corn, beans, mandioca, grapes, bananas and other fruits, and many of the vegetables of the temperate zone. Cereals can be raised, but climatic conditions have been considered as unfavourable. Sugar cane was the first exotic to be cultivated in São Paulo, and was its principal product in colonial times. Cotton was largely produced, especially during the American Civil War, but the industry nearly disappeared, and now is again improving because of the demand for fibre by the national cotton factories. The cultivation of rice also is increasing, under the stimulus of protective duties, and São Paulo is now an important rice producing state. The state possesses large herds of cattle, which are being improved by the importation of pure-bred stock from Europe. Butter and cheese are produced to a limited extent, and the supply of fresh milk to the market is limited.

The principal manufactures are cotton and woolen textiles, jute bagging, tallow, furniture, clothing and footwear, and various agricultural implements, beer, artificial liquors, mineral waters, biscuits, macaroni, conserves, chocolate and other food products, glass bottles, glassware, earthenware, soap, gloves, boots and shoes, tobacco, artificial flowers, and roofing paper, all of which, though both electric and hydraulic power are employed. There are several large cotton factories, which are chiefly employed in the production of burlap, and there are many private distilleries and breweries.

The iron mines and works at Ypanema, near Sorocaba, are one of the oldest industries of the state, dating back to the first quarter of the 19th century. It is a government enterprise and has absorbed an immense sum of money, but has never reached a self-supporting stage.

São Paulo is well provided with railways, which include the pioneer line from Santos to Junihay, (an English enterprise) which has a double track from Santos to the city of São Paulo, the Paulista line which forms a continuation of the English line into the interior, the Mogiana lines running northward from Campinas through rich coffee lands to Mairipora, and Minas Gerais, and the line to Goyaz, the Sorocaba running south-westward from São Paulo toward the Paraná frontier, the São Paulo branch of the Central do Brazil line which passes through the E. part of the state and provides connections with the Mogiana line, the line from São Paulo to São Pedro, Granada, and São Paulo, another line to São Pedro, and the line from São Paulo to Minas Gerais. The line of the State of São Paulo is a branch of the São Paulo Central do Brazil railway and is 7 3/4 mi. long, running from the city of São Paulo to the railroad center of the state, at Bauru. It was formerly the property of the State of São Paulo, but was sold to the State in 1895 and was completed in 1910. The line from Santos to São Paulo is a branch of the same name, and the line of the State of São Paulo is a branch of the same name, and a branch of a bishopric, on the Tietê river 49 m. by rail N.W. of the port of Santos and 308 m. by rail W. of Rio de Janeiro. Pop. (1890) 64,034; (1902, estimate) 332,000. São Paulo is connected with Santos, its port, by a double-track railway built, owned and worked by a British company (S. Paulo Railway Co.); with Rio de Janeiro, by the São Paulo branch of the Central do Brazil line; with Campinas and other inland cities by the São Paulo and Paulista railways; with the N.E. part of the state, Minas Gerais, and Goyaz by the Mogiana line, and with French and German wheat farms in the state, with the line from Campinas; and with Sorocabana and the southern parts of the state, Paraná, by the Sorocabana line and the São Paulo and Río
Grande line. In great part the city occupies an elevated open stretch of tableland commanding extensive views of the surrounding country; and a small part of it is in the low alluvial land bordering the Tietê. The upper part has several slight elevations forming healthy residential districts. The elevations above sea-level are 238 ft. at the Central do Brazil railway station in the lower town, 2418 ft. at the São Paulo railway station, 2820 ft. in the Consolação suburb, and 2935 ft. in Villa Mariana. The city is just within the tropics, but its elevation above the sea gives it a temperate climate, bracing in the cool season and yet with high sun temperatures in summer. The broad eroded bed of the Tietê is swampy and is subject to extensive inundations causing malarial and intestinal disorders; otherwise the city is singularly healthy, though its sanitary condition is poor. The picturesqueness of the city is heightened by the ravine of a small stream passing through it and spanned by viaducts and bridges. The city's courts are commonly open places with an occasional statue but without ornamental gardens. The Public Garden, near the São Paulo railway station in the Luz section, is a recreation ground embossed with tropical plants and an artificial lake. The streets are well paved and lighted with gas and electricity, and have electric trams. Although there are still many old structures and residences to be seen in the old town, most of the public and business buildings and private residences are of the modern Italian and French type. Brick is used to some extent, but the building material most used is broken stone and mortar, plastered outside and covered with stucco. The private residences of the city are the finest in the republic. There is much wealth in the state, especially among the large coffee planters, and the city is their favourite residence. Some of their palatial dwellings are surrounded with beautiful gardens and parks. The water-supply is derived from Cantareira hills, and there is a modern sewerage system, constructed by an English company. The more important public buildings are the new government palace, the palaces of agriculture, finance and justice, the executive residence, the immense Polytechnic School, the Normal School, the School of Agriculture, the public hospital called the Isala-mento, the charity hospital, the São Paulo railway station with a beautiful stone tower, and the theatre, rivalling some of the best in Europe. Like other Brazilian cities São Paulo has a number of old religious buildings. There are also several excellent educational and scientific institutions which are in great part supported by the state, among which are the Mackenzie College, created through the gift of an American capitalist, a school of law, a Pasteur Institute, and a bacteriological Institute. The police force of the state is a military organization and consists of a brigade of about 1000 men (infantry and cavalry, with a civic guard). in the old town there is a house for hospital attendants for public emergency cases), under a colonel of the regular army. Manufactures include textiles, footwear, clothing, food products, beer, artificial liquors, furniture, domestic utensils, &c. The São Paulo Light and Power Co., whose works are situated at the falls of the Tietê a considerable distance N.W. of the city, supplies about 8000 horse-power to local industries in addition to what is needed for the electric railway (108 m.), the oldest enterprise of this character in Brazil. The city has a large Italian population and many Italian shops and industries conducted by the Jesuits under Manoel de Nobrega in 1554 and at first bore the name of Pratinha. In 1681 it succeeded São Vicente as the capital of the captaincy. The declaration of Brazilian independence occurred on Sept. 7, 1822, on the plain of Ypiranga, near the city, where a monument commemorates the event.

SAP—SAPPHIRE

(1) Juice, the circulating fluid of plants (see PLANTS, § Physiology). The word appears in Teutonic languages, cf. Ger. Säf, and may be connected ultimately with the root seen in Lat. sapere, taste, hence to know, cf. sapientia, wisdom, cf. Gr. σοφία, wise. On the other hand it may, like Fr. cer, Spare mouvances, come from Latin sapere, must, new wine, itself also from the same root. Gr. ὕσσωs is represented in Lat. by sucs. (2) A military term for a trench dug by a besieging force for the purpose of approach to the point of attack when within range, hence "to sap," to undermine, dig away the foundations of a wall, &c. The word is derived through the Old Fr. from the Med. Lat. sapir, sappe, a spade, entrenching tool, Gr. ὕσσωs, ὤκτευε, to dig. (See FORTIFICATION AND SEIGE-CRAFT.)

SAPAN WOOD (Malay sapang), a soluble red dyewood from a tree belonging to the leguminous genus Caesalpinia, a native of tropical Asia and the Indian Archipelago. The wood is somewhat lighter in colour than Brazil wood and its other allies, but the same tinctorial principle, brazilin, appears to be common to all.

SAPPHICE METRE, Sapphics, an ancient form of quantitative verse, named after the Aeolian poetess Sappho, who is supposed to have invented it, and who certainly used it with unequalled skill. A sapphic line consists of five equal beats, of which the central one alone is of three syllables, while the others consist of two each. The original Greek sapphic was of this type:—

The sapphic strophe consists of three of these lines followed by an adonic, thus:—

Horace adopted, and slightly adapted, this form of verse, for some of his most engaging metrical effects. The Greek poets had permitted the caesura to come where it would, but Horace, to give solidity to the form, introduced the practice of usually ending a line on the fifth syllable, a rule which succeeding poets as the expression of the sentiment, and the manner of saying it, were often disposed to sacrifice. Though the metre is known under various names, it is called the Sapphic by the English in memory of its author.

Before the days of Horace, Catullus had used this form in Latin, and afterwards sapphics were introduced by the pseudo-Seneca into his tragedies. In the middle ages the sapphic strophe was frequently employed in the Latin hymns, especially by Gregory the Great. Later on, considerable laxity was introduced, and a dactyl was frequently substituted for the first trochee; this quite destroys the true character of the measure. It makes it a more easy metre, however, for those who write modern accelerated verse. We see a loose but effective specimen of it in the famous Needy knife; grinder! whiter! are you? going? Rough the [road, your] wheel is out of order. Needy knife; grinder! whiter! are you? going? Rough the [road, your] destitute wheel is broken, although this certainly does not suit English versification so well. Many of these strophes were, however, put into the cap-\em{peter\} of Campion (q.v.), and by William Cowper. Mr Swinburne has attempted to create the effect of the ancient Aeolian metre in a daring and brilliant stanza. Sapphics have been written more successfully in German than in any other modern language. The earliest original German poem in the form is said to be an anonymous hymn to St Mary Magdalen, dated 1500. Voss kept strictly to the metrical scheme of the Latin in his famous translation of the Odysse of Homer (1800), and among German poets who have cultivated sapphics are to be mentioned Klopstock, Platen, Hammerling and Geibel.

SAPPHIRE1 a blue transparent variety of corundum, or native alumina, much valued as a gem-stone. It is essentially the same mineral as ruby, from which it differs chiefly in colour. The colour of the normal sapphire varies from the palest blue to deep indigo, the most esteemed being that of the blue cornflower. Many of the crystals are parti-coloured, the blue being distributed in patches in a colourless or yellow stone; but by skilful cutting, the deep-coloured portion may be caused to impart colour to the entire gem. As the sapphire crystallizes in the hexagonal system it is dichroic, but in pale stones this character may not be well marked. In a deep-coloured stone the colour may be resolved, by the dichroscope, into an ultramarine

1 Indirectly from Gr. σάφιος, but there seems no doubt that this term, like the Hebrew sapir of the Old Testament, was formerly applied to what is now called lapis lazuli; the modern sapphire was probably known as ἰδρώα (hydrætos)
blue and a bluish or yellowish green. In blue tourmaline and in jolite—stones sometimes mistaken for sapphire—the dichroism is much more distinct. The blue colour in sapphire has been variously referred to the presence of oxides of chromium, iron, vanadium and titanium, although its origin has also been suggested. On exposure to a high temperature, the sapphire usually loses colour, but, unlike ruby, it does not regain it on cooling. A. Verneuil succeeded in imparting a sapphire-blue colour to artificial alumina by addition of 1-5% of magnetic oxide of iron and 0-5% of titanite (Compôtes rendus, Jan. 17, 1910). According to F. Bordas, the blue colour of sapphire exposed to the action of radium changes to green and then to yellow.

Under artificial illumination many sapphires appear dark and inky, whilst in some cases the blue colour of the sapphire is transformed to a violet colour by the piquancy of deposits arranged in a definite system. In 1875 sapphires were discovered in deposits of clay and sand in Battambang (Siam), where they have been worked on a considerable scale. They occur also in the provinces of Fatumang and Krat. Many of the Siam sapphires are of very dark colour, some being so deeply tinted as to appear almost black by reflected light. In Upper Burma sapphires occur in association with rubies, but there must be less iron than in the Ruby. Sapphires are also found in Kashmir, where they occur, associated with tourmaline, in the Zanakar range, especially near the village of Soomjam. Madagascar yields sapphires generally of very deep blue, occasionally of a blueish green. Sapphire is distributed through the gold-bearing districts of Victoria, New South Wales and Queensland, but the blue colour of the Australian stones is usually dark, and it is not known that green tints are not infrequent.

The Anakie sapphire-fields of Queensland are situated near Anakie station on the Central railway, to the west of Emerald and east of the Drummond Range. Sapphire occurs also in Tasmania. Coarse sapphire is found in many parts of the United States, and the mineral occurs of gem quality in North Carolina and Montana. The great corundum deposits of Corundum Hill, Macon county, N.C., have yielded good sapphires, and they are found also at Cowe Creek in the same county. The finest sapphires were cut in very thin plates as far back as 1850, and have been worked on a large scale. They were originally found in washing for gold. The rolled crystals of sapphire occur in garnets, but sometimes in itself. Sapphire has been derived from dykes of igneous rocks, like andesite and lamprophyre. They display much variety of colour, and exhibit peculiar brilliancy when cut, but are often of pale tints. The protection of sapphire by the precious metals is disapproved of, as it causes the fluxes of gold to be of a very fine and delicate freedom. This property was discovered by Lexell, and confirmed by Franklin. The blue colour of sapphire varies from the deep parting of the sky to the bluest of the ocean. The main property of sapphire, the characteristic properties of which caused Longinus to quote the ode to Anactoria as an example of the sublime, has never been since surpassed, and only approached by Catullus and in the Vito Nuene. Her fragments also bear witness to a profound feeling for the beauty of nature. The ancients also attributed to her a considerable power in satire, but in hexameter verse they considered her inferior to her pupil Erinna.

The fragments of Sappho have been preserved by other authors incidentally. Three fragments ascribed to her have been found on Egyptian papyri within recent years. The first two were published by W. Schubert in Sitzungsberichte d. königl. preuss. Akademie d. Wiss., Berlin, quadratic section, vol. 27 (1857); the third, discovered in 1879, and attributed to Sappho by Blase, is re-edited in the Berlin. Klass. v. For these three fragments see especially J. M. Edmonds, in Classical Review (June, 1900), pp. 99-104 (text, trans., comments.) and on the text of the "Ode to the Nereids" in Classical Quarterly (October, 1909). The poems were separately edited with translation by Whitney (ed. 1909), and also in H. W. Weir Smyth's Greek Latin Poets (1906). See also P. Brandt, Sappho (Leipzig, 1905); R. Steiner, Sappho (1907).

SAPPORO—SAPPHIRE

The so-called "Hope sapphires" of trade have been shown to be artificial blue spinels, coloured by cobalt.

Sapphirine is a rare mineral, not related to sapphire except in colour. It is a silicate, containing aluminium, magnesium and iron, brought originally from Greenland, and since found in a rock from the Vizagapatam district in India.
SARABAND—SARAGOSSA

and has an agricultural college, a museum, saw-mills, flour-mills, breweries, and hemp and flax factories.

SARABAND (Ital. Sarabanda, Zarabanda; Fr. Sarabande), a slow dance, generally believed to have been imported from Spain in the earlier half of the 16th century, though attempts have been made to trace it to an Eastern origin. The most probable account of the word is that the dance was named after Zarabanda, a celebrated dancer of Seville. During the 16th and 17th Depretis the saraband was exceedingly popular in Spain, France, Italy and England. Its music was in triple-time—generally with three minimés in the bar—and almost always consisted of two strains, each beginning upon the first beat, and most frequently ending on the second or third. Many very fine examples occur in the Suites and Partitas of Handel and J. S. Bach; by far the finest is that which Handel first composed for his oratorio to Almira, and afterwards adapted to the words "Lascia, ch'io pianga," in Rinaldo.

SARACCO, GIUSEPPE (1821-1907), Italian politician and financier, and knight of the Annunziata, was born at Bistagno on the 6th of October 1821, and, after qualifying as an advocate, entered the Piedmontese parliament in 1849. A supporter of Cavour until the latter's death he joined the party of Rattazzi and became under-secretary of state for public works in the Rattazzi cabinet of 1862. In 1864 he was appointed, by Sella, secretary-general of finance, and after being created senator in 1865, acquired considerable fame as a financial authority. In 1879 he succeeded in postponing the total abolition of the gret tax, and was throughout a fierce opponent of Magliani's loose financial administration. Selected as minister of public works (1887), and by Crispì in 1893, he contrived to mitigate the worst consequences of Depretis's corruptly extravagant policy, and introduced a sounder system of government participation in public works. In November 1898 he was elected president of the senate, and in June 1900 succeeded in forming a "Cabinet of pacification" after the Obstructionist crisis which had caused the downfall of General Pelloux. His term of office was clouded by the assassination of King Humbert (29th July 1900), and his administration was brought to an end in February 1901 by a vote of the chamber condemning his weak attitude towards a general strike in Genoa. After his fall he resumed his functions as president of the senate; but on the advent of the third Giolitti cabinet, he was not reappointed to that position. He died on the 19th of January 1907. He received the supreme honour of the knighthood of the Annunziata from King Humbert in 1898.

SARACENS, the current designation among the Christians in the middle ages for their Moslem enemies, especially for the Moslems in Europe. In earlier times the name Saracen was applied by Greeks and Romans to the nomad Arabs of the Syro-Arabian desert. In the 9th century, the Saracen, a district in the Sinaitic peninsula, is mentioned by Ptolemy (v. 16). Its inhabitants, though unknown to Arab tradition, made themselves notorious in the adjacent Roman provinces. Thus all Bedouins in that region came to be called Saraceni, in Arabic Sarkan, usually with no very favorable meaning. The latter form occurs in a dialogue concerning Fate written about A.D. 210 by a pupil of Bardaneses (Cureton, Spicilegium Syriacum, 16 ult.). The appellation then became general, and occurs frequently in Ammianus Marcellinus. The name "Saracen" continued to be used in the West in later times, probably rather through the influence of literature than by oral tradition, and was applied to all Arabs, even to all Moslems.

SARAGHARI, a small signalling post on the Samana Range in the North-West Frontier Province of India between Forts Lockhart and Gullistan. It is memorable for the stout defence made by its garrison of 21 sepoys of the 36th Sikhs in 1897. Saraghari, a mere mud block-house with a wooden door and a dead-angle, was held for six and a half hours against seven or eight thousand Orakziis, till the 21 Sikhs were finally overwhelmed and killed to a man. A memorial in commemoration was unveiled at Pefezpora in 1904.

SARAGOSSA (Zaragoza), an inland province of northern Spain, one of the three into which Aragon was divided in 1833; bounded on the N. by Logroño and Navarre, N.E. and E. by Huesca, S.E. by Lérida and Tarragona, S. by Teruel and Guadalajara and W. by Soria. Pop. (1900) 421,843; area, 67,256 sq. m. Saragoza belongs wholly to the basin of the Ebro (q.v.). The main valley is bounded on the south-west by the Sierra de Moncayo (with the highest elevation in the province, 7707 ft.), and is divided in a south-easterly direction by the high sierras of La Virgen and Víctor; on the north-west are the spurs of the Pyrenees. The principal tributaries of the Ebro within the province are the Jalón (q.v.), Huerva and Aguas on the right and the Arba and Gallego on the left; the Aragon also, which flows principally through Navarre, has part of its course in the north of this province. At its lowest point, where the Ebro quits it, Saragoza is only 105 ft. above sea-level. There are large tracts of barren land, but where water is abundant the soil is fertile; its chief productions are wheat, rye, barley, oats, hemp, flax, oil and wine. Silkworms are bred; and on the higher grounds sheep are reared. The manufactures are less important than the agricultural interests. Since 1889, however, the Aragonese have bestirred themselves, especially since the extremely protectionist policy of 1890 gave great impetus to native industries all over Spain. The industries include iron-founding and manufactures of paper, leather, soap, brandies, liqueurs, machinery, carriages of all sorts, railway material, pianos, beds, glass, bronze, chocolate, jams and woollen and linen goods. Much timber is obtained from the Pyrenean forests; the chief exports are live stock, excellent wines, flour, oil and fruit. The province contains important mineral resources, the bulk of which, however, await development. Saragoza is traversed by the Ebro Valley Railway, which connects Miranda with Lérida, Barcelona and Tarragona, and has a branch to Huesca; it also communicates via Calatayud with Madrid and Sagunto; and there are local lines to Carlébena (south-west from Saragoza) and to Tarazona and Borja (near the right bank of the Ebro). The only towns with upwards of 5000 inhabitants in 1900 are Tarazona (q.v.) (8790), (7735); Calatayud and Borja (5701), the original home of the celebrated family of Borgia (q.v.). (For an account of the imperial castle and the inhabitants of history of this region, see ARAGON.)

SARAGOSSA (Zaragoza), the capital of the Spanish province of Saragoza and formerly of the kingdom of Aragon, seat of an archbishop, of a court of appeal, and of the captain-general of Aragon; on the right bank of the river Ebro, 212 m. by rail N.E. of Madrid. Pop. (1900) 99,118. Saragoza is an important railway junction; it is connected by direct main lines with Valladolid, Madrid and Valencia in the west and south, and by the Ebro Valley Railway with Catalonia and the Basque Provinces; it is also the starting-point of railways to the northern Pyrenees and the Cantabrian coast. The city is built in an oasis of highly cultivated land, irrigated by a multitude of streams which distribute the waters of the Imperial Canal, and surrounded by an arid plain exposed to the violent gales which blow down, hot in summer and icy in winter, from the Castilian plateau. The monthly range of temperature frequently varies by as much as 50° Fahr., and the climate is rarely pleasant for many consecutive days except in spring, when warm easterly winds blow from the Mediterranean. The city is surrounded by gardens, farms and country-houses (locally known as torres, "towers"). Seen from a distance it has a fine appearance owing to the number of its domes and towers; on a nearer approach it presents a remarkable contrast between the older streets, narrow, gloomy, ill-paved and lined with the fortress-like palaces of the old Aragonesque nobility, and the business and residential quarters, which are as well built as any part of Madrid or Barcelona. Saragoza is thus in appearance at once one of the oldest and one of the newest of Spanish cities. One of its two stone bridges, the seven-arched Puente de Piedra, dates from 1447; there is also an iron bridge for the railway to Pamplona. Beside the river there are public walks and avenues of poplar; the suburb on the left bank is named Arrabal. The two most important buildings of Saragoza are its cathedrals, to each of
which the chapter is attached for six months in the year. La Seo ("The See ") is the older of the two, dating chiefly from the 14th century; its prevailing style is Gothic, but the oldest portion, the lower part of the tower, is Roman. The Metropolitan Cathedral of Saragossa is the larger building, dating only from the latter half of the 17th century; it was built after designs by Herrera el Mozo, and owes its name to one of the most venerated objects in Spain, the "pillar of the Virgin" on which the Virgin Mary is said to have appeared when she manifested herself to St James as he passed through Saragossa. It has little architectural merit; externally its most conspicuous feature is the series of jasper tablets, which are decorated with rows of green, yellow and white glazed tiles. The church of San Pablo dates mainly from the 13th century. The Torre Nueva, an octagonal clock tower in diapered brickwork, dating from 1504, was pulled down in 1821. It leaned some 3° from the perpendicular, owing to faulty foundations, which ultimately rendered it unsafe. Among other conspicuous public buildings are the municipal building, the Palace of the Counts of Bearn, the provincial almanhouse (Hospicio provincial), which are among the largest in the university was founded in 1474, but its history has not been brilliant. To the west of the town is the Aljaferia or old citadel, originally built as a palace by the Moors, and also used as such by its Christian owners. Late in the 15th century it was assigned by Ferdinand and Isabella to the Inquisition, and has since been used as a military hospital, as a prison and as barracks. Saragossa, is the headquarters of a large agricultural trade; its industries include iron-founding, tanning, brewing, distillation of spirits, and manufacture of machinery, candles, soap, glass and porcelain.

History.—Saragossa (Celtiberian, Saolduba) was made a colony by Augustus at the close of the Celtiberian War (25 B.C.), and renamed Caesarea Augusta or Caesaragustia, from which "Saragossa" is derived. Under the Romans it was a highly privileged city, the chief commercial and military station in the province of Aragon, and the seat of the pre-eminence (assizes) of Hither Spain. It is now, however, one of the most important of antiquities dating from the Roman occupation. It was captured in 452 by the Suebi, and in 476 by the Visigoths, whose rule lasted until the Moorish conquest in 712, and under whom Saragossa was the first city to abandon the Arian heresy. In 777 its Moorish ruler, the viceroy of Barcelona, appealed to Charlemagne for aid against the powerful caliph of Cordova, Abd-ar-Rahman I. Charlemagne besieged the Cordovan army in Saragossa, as the city was then called; but a rebellion of his Saracens subjects compelled him to withdraw his army, which suffered defeat at Roncesvales (q.v.), while recrossing the Pyrenees. The Moors were finally expelled by Alphonso I. of Aragon in 1118, after a siege lasting nine months in which the defenders were reduced to terrible straits by famine. As the capital of Aragon, Saragossa prospered greatly until the second half of the 15th century, when the marriage between Ferdinand and Isabella (1469) resulted in the transference of the court to Castile. In 1710 the allied British and Austrian armies defeated the forces of Philip V. at Saragossa in the war of the Spanish Succession; but it was in the Peninsula War (1807-18), when the French under Napoleon conquered Aragon, body of citizens, led by José de Palafos y Melzi (see Palafos), whose chief lieutenants were a priest and two peasants, held the hastily-entrenched city against Marshal Lefebvre from the 15th of June to the 15th of August 1808. The siege was then raised in consequence of the reverse suffered by the French at Bailen (q.v.), but it was renewed on the 20th of December, and on the 27th of January the invaders entered the city. Even then they encountered a desperate resistance, and it was not until the 20th of February that the defenders were compelled to surrender. The battle of Saragossa was fought on 6th of November, 1472, near the town.

SARAGOSA, COUNCILS OF (Concilia Caesaragustana). In or about 380 a council of Spanish and Aquitanian bishops adopted at Saragossa eight canons bearing more or less directly on the prevalent heresy of Priscillianism. A second council, known as the Council of Saragossa of 576, was called by his successor, and was the first instance of the conversion of the West Goths from Arianism to orthodox Christianity. The third council, in 691, issued five canons on discipline. In 1318 a provincial synod proclaimed the elevation of Saragossa to the rank of an archbishopric; and from September 1565 to February 1566 a similar synod known the decrees of Trent.

SARAN, a district of British India, in the Tithur division of Bengal. Area, 2674 sq. m. It is a vast alluvial plain, possessing scarcely any undulations, but with a general inclination towards the south-east, as indicated by the flow of the rivers in that direction. The principal rivers, besides the Ganges, are the Gandak and Gogra, which are navigable throughout the year. The district has long been noted for its high state of civilization, and the number of its persons, who are counted in thousands besides other cereals, pulses, oil seeds, poppy, indigo and sugar-cane.

The population in 1901 was 2,400,590, showing a decrease of 2.2% compared with an increase of 7.4% in the previous decade. The average density population, 901 per square mile, is the highest for all India. The indigo industry, formerly of the first importance, has declined, and sugar refining has in great part taken its place. Some saltpetre is produced, and shellac is manufactured. Saran is exposed to drought and flood. It suffered from the famine of 1874, and again in 1896-1899. An irrigation scheme from the river Gandak, started in 1878, proved a failure, after a capital expenditure of Rs. 7,00,000. The Bengal North-Western railway runs through the south-east of the district. The administrative headquarters are at Chapra.

See Saran District Gazetteer (Calcutta, 1908).

SARAPUL, a town of N. Russia, in the government of Vyatka, on the river Kama, 333 m. by river E.N.E. of Kazan and 191 m. by road W. of Perm. Pop. (1918) 21,536. A large quantity of shoes and gloves are manufactured, the first named being mostly exported to Siberia, Caucasus and Turkestan. It also has tanneries, flax mills, distilleries, ironworks and rope-works, and is a busy river-port, trafficking in corn and timber. There are a lace-making school and a municipal library.

SARASATE Y NAVASCUES, PABLO MARTIN MELTON DE (1844-1906), Spanish violinist, was born at Pamplona on the 10th of March 1844. From his early years he displayed his aptitude for the violin, and at the age of 12 he began to study under Alard at the Paris Conservatoire. His first public appearance as a concert violinist was in 1860. He played in London in 1861, and in the course of his career he visited all parts of Europe and also both North and South America. His artistic pre-eminence was due principally to the purity of his tone, which was free from any tendency towards sentimentality and rhapsodic mannerism, and to the astonishing facility of execution which made him in the best sense of the word a virtuoso. Although in the Beethoven and Mendelssohn concertos, and in modern French and Belgian works, his playing was unrivalled, his qualities were so clearly revealed, that the composers, who were the "spirit of Spanish dance translated into terms of the violin virtuoso," Sarasate died at Bialritz on the 20th of September 1908.

SARASIN, or SARRAZIN, JEAN FRANÇOIS (1617-1654), French author, son of Roger Sarasin, treasurer-general at Caen, was born at Hermanville near Caen. He was educated at Caen, and settled in Paris. As a writer of vers de société he rivalled Voiture, but he was never admitted to the inner circle of the hôtel de Rambouillet. He was on terms of intimate friendship with Scarron, with whom he exchanged verses, with Ménage, and with J. P. Pellisson and J. de Georges de Scudery in his attack on Corneille with a Discours de la tragédie. He accompanied Léon Bouthillier, comte de Chavigny, secretary of state for foreign affairs, on various diplomatic errands. He was to have been sent on an embassy to Rome, but spent the money allotted for the purpose in Paris. This weakened his position with Chavigny, from whom he parted in the winter of 1643-1644. To restore his fallen fortunes he married a rich widow, but the alliance was of short duration. He joined in the pamphlet war against Pierre de Montmaur, against whom he had suppressed his own pamphlets (1649). He was accused of writing satires on Mazarin, and for a short time gave up the practice of verse. In 1648, supported by the cardinal
de Retz and Madame de Longueville, he entered the household of Armand de Bourbon, prince de Conti, whose marriage with Mazarin’s niece he helped to negotiate. He died of fever at Pézenas, in Languedoc on the 5th of December 1654. His biographers have variously stated on inadequate evidence that his death was caused by the prince de Conti in a moment of passion, or that he was poisoned by a jealous husband. The more probable explanation is that he was poisoned with a strychnine conguérant, la guerre espagnole, with Dulot vaincu and the Pompe funèbre in honour of Voltaire. As a poet he was overrated, but he was the author of two excellent pieces of prose narration, the Histoire du sièges de Dunkerque (1649) and the unfinished Conspiration de Walstein (1651). The Walstein has been compared for elegance and simplicity of style to Voltaire’s Charles XII.

SARASUATI, in early Hindu mythology, a river-goddess; in later myths the wife of Brahma, goddess of wisdom and science, mother of the Vedas, and inventor of the Devanagari letters. There has been much dispute as to the stream of which she is a personification. Some have identified it with the Avestan river, Haragaity, in Afghanistan, while others think the name a general one for any great river, and in particular the sacred name for the Indus, Sindhu being the popular one.

Two pamphlets in the late 17th century, one called Sarasaupati, one in the Punjab and the other in Gujarat, both of which ultimately lose themselves in the sand. According to one legend, the Punjab river appears to unite with the Ganges and Jumna at Allahabad. From this river is derived the name of the Sarawat Brahman, the most numerous and influential of the priestly class in the Punjab, with whom the Gaur Saraswati or Shenvils of the Konkan claim connexion.

SARATOGA, BATTLES OF. The British campaign for the year 1777 in America, in conjunction with Burgoyne’s actions, involved the operations of two armies moving from opposite and distant points. The lack of co-operation between the two led to the loss of one of them. This was General Burgoyne’s force of 7000 men which marched from Canada in June 1777 with the view of reaching the upper Hudson and combining with British troops from New York to isolate New England from the colonies below. Lord Howe, commander-in-chief of the British in America, who had received no instructions binding him in detail to co-operate with Burgoyne, moved southward and captured Philadelphia. In drawing Washington after him he claimed to be attacking Burgoyne by way of the Hudson, but Burgoyne proceeded by way of Lakes Champlain and George and approached the American army under General Horatio Gates in its fortified camp near Stillwater on the W. bank of the Hudson, about 24 m. N. of Albany. On the 19th Burgoyne attacked the American left under General Benedict Arnold. The battle, fought in densely wooded country till nightfall, was severe but indecisive. The British suffered heavy losses, especially in officers. This is variously known as the First Battle of Saratoga, the Battle of Freeman’s Farm, the First Battle of Bemis Heights, or the First Battle of Saratoga. Burgoyne forlornly harked back to his native country, and on October 7th made another attempt to turn the American left. An engagement still more severe than that of the 19th, known as the Second Battle of Saratoga, followed, in which the Americans under Benedict Arnold, E. Poor and D. Morgan drove the enemy into their works. Among many British officers killed was Brigadier-General Simon Fraser, who had been the life of the expedition. Crippled to an alarming extent, Burgoyne retreated. He was closely followed and harassed, and on the 16th of October nearly surrounded. On the 17th he surrendered, with about 6000 men, near the present village of Saratoga Springs.

SARATOGA SPRINGS, a village of Saratoga county, New York, U.S.A., about 35 m. N. of Albany, and about 12 m. W. of the Hudson river. Pop. (1900) 12,409, of whom 1684 were foreign-born and 619 were negroes; (1910) 12,693.

Saratoga Springs is served by the Delaware & Hudson and the Boston & Maine railways and by several interurban electric lines. The village is in a region of great historic interest, is famous for its medicinal mineral springs, and has long been one of the most popular watering places in America. Its hotels accommodate more than 20,000 guests. Of the hotels, the best known are the United States, Congress Hall, the Grand Union and the Saratoga.” The springs, of which there are more than forty, were known in colonial times.

The waters, all having the same ingredients but in varying proportions, are heavily charged with carbonic acid gas, and contain considerable quantities of bicarbonates of lime and magnesium, with chlorides of sodium. They rise in a stratum of Potsdam sandstone underlaid by Laurentian gneiss, &c., and reach the surface after passing through a bed of blue clay. The most noteworthy springs are called the Illion, the Cooper, the Patroon, the Schuyler, the Patience, the Carman, the Garden, the Union, the Union Club, the First Spring, and the Second Spring, in addition to the Geyser, the Shady Grove, the Hamilton, and the Spa. The Union, which is the largest, has a temperature of 106°, and contains 40,000 gallons an hour. These springs originally rose above the surface by their own force, but with the building of new springs and the pumping for carbonic acid gas south of the village the pressure was greatly lessened; the wells interfered to stop the pumping and it was prohibited by the state legislature. These measures, however, were not effective, and in 1876 the act was passed establishing a state reservation at Saratoga, creating a commission of three long before Europeans arrived in the springs, and taking over the state, and providing for an issue of bonds for $600,000 to buy the springs. Saratoga Lake, a beautiful body of water 23 m. long and 1 m. wide, 343 m. south-east of the village, is a famous resort.

The streets are well-shaded and broad, with side stretches of lawn between the sidewalk and the curb. There is a speedway and a famous race-track, where there are annual running races. In the village are Woodlawn Park (1200 acres), a town-hall, a state armoury, a public library, several theatres and a number of private hospitals and sanatoriums. The Convention Hall has been the meeting place of the Saratoga Race Course and the site of the race, during the last century, the principal business is the bottling and shipping of the mineral waters which are sold in large quantities and exported to many foreign countries. Among the manufactures are patent medicines, druggists’ preparations and chemicals, silk gloves, textiles, foundry products and boilers and engines. In 1905 the value of the factory product was $1,709,073, an increase of 28-1% since 1900.

The Saratoga country was a favourite summer camping ground of the Iroquois, particularly the Mohawks, who were attracted thither by the medicinal value of the springs long before Europeans visited the region. The Indian name, “Sa-ragh-to-ga” or “Se-rach-ta-gue,” is said to have meant “hillside country of the great water” or “place of the swift water.” The district became during the colonial wars a theatre of hostilities between the French and English colonists and their Indian allies. In 1863 a French expedition was checked in a sharp conflict near Mt McGregor by an English and colonial force under Governor Benjamin Fletcher and Peter Schuyler. Early in the 19th century the region along the upper Hudson began to be settled, the settlement on the Hudson at the mouth of the Fishkill, directly east of the present Saratoga Springs, being known first as Saratoga (later “Old Saratoga”) and finally as Schuylerville (pop. in 1905, 1520), in honour of the Schuyler family. Upon the settlement the French and Indians descended in 1745, and massacred many of the inhabitants. After the close of the Seven Years’ War, there was a new influx of settlers. Near Stillwater (pop. in 1905, 973) about 5 m. south-east of the present village, the battles of Saratoga (q.v.) were fought during the War of Independence. On the site of the present village a small log lodging house for the troops in the winter of 1777-78 was built in 1777. After the close of the War of Independence, the fame of the Springs as a health resort spread abroad, and many sought them annually. In 1791 Gideon Putnam (1764-1812), a nephew of Major-General Israel Putnam, bought a large tract of land here; he built the first inn (on the site of the present Grand Union Hotel). Other hotels were erected within the next few years; between 1820 and 1830, by which time the Springs had become one of the most popular of American resorts, several large barn-like wooden hotels were constructed; and Saratoga Springs was incorporated as a village in 1826.
SARATOV, a government of south-eastern Russia, on the right bank of the lower Volga, having the governments of Penza and Simbirsk on the N., Samara and Astrakhan on the E. and the Don Cossack territory and the governments of Voronezh and Tambov on the E. The area is 32,614 sq. m. The government consists of a rectangular strip of land, being 20 to 45 m. wide, extending along the Volga as far south as its Sarepta bend, separates the river from the territory of the Don Cossacks.

Saratov occupies the eastern part of the great central plateau of Russia, which slopes gently towards the south until it merges imperceptibly with the extensive regions of the Polesia, drained by rivers, falls abruptly towards the Volga. As the higher parts of the plateau range from 700 to 900 ft. above the sea, while the Volga flows at an elevation of only 20 ft. at Kbaylynsk in the north, and is 48 ft. below sea-level at Saratov, the steep river-cut slopes of the plateau give a hilly aspect to the banks of the river. In the south, and especially in the narrow strip above mentioned, the country assumes the characteristics of elevated steppes, intersected by waterless ravines. Every geological formation from the Carboniferous up to the Miocene is represented in Saratov: the older formations are, however, contained under the Cretaceous, whose fossiliferous marls, flint-bearing clays and iron-bearing sandstones cover extensive areas. The Jurassic deposits seldom crop out from beneath them. Eocene sands, sandstones and marls, abounding in marine fossils, are contained for a distance of 15 m., and extend in the boulder-clay of the Finland and Olonets ice-sheets penetrates as far south-east as the valleys of the Medvedytsa and the Sura; and even extends eastward as far as the DON and the Auster. Glacial period emerge in the south-east and elsewhere above the Glacial deposits. Iron-ore is abundant; chalk, lime and white pottery clay are extracted to a limited extent. The mineral waters at Saratov, formerly much visited, have been superseded in public favour by those of Causaica.

Saratov is well drained, especially in the north. The Saratov separates it from the governments of Samara and Astrakhan for a considerable distance, being divided from the Caspian Sea by a flat which rises in Saratov, and serves for the northward transit of timber. The tributaries of the Don are more important: the upper Medvedytsa and the Kheper, which both have a southward course parallel to the Volga and drain Saratov each for about 200 m., are navigated notwithstanding their shallows, ready-made boats being brought in separate pieces from the Volga. The Ivolga, which flows in the same direction into the Don, is separated from the Volga by a strip of land only 15 m. wide; Peter the Great proposed to utilize it as a channel for connecting the Don with the Volga, but the undertaking was never carried out, and the two rivers are now connected by the railway (45 m. long). The railway crosses the southern extremity of Saratov. The region is rapidly drying up, and the forests diminishing. In the south, about Tsaritsyn, they are still more extended. In the north they still occupy more than a third of the surface, the aggregate area under wood being reckoned at nearly 13% of the total. The remainder is distributed as follows: arable land, 58%; prairies and pasture lands, 19%. Such is the scarcity of timber that the peasants' houses are made of clay, the corner posts and door and window frames being largely shipped from the wooded districts of the middle Volga. The climate is severe and continental. The average yearly temperatures are 41°-5° at Saratov (January, 13°-2°; July, 71°-5°) and 44°-4° at Tsaritsyn (January, 15°-2°; July, 74°-6°). The average range of temperature is as much as 119°. The Volga is frozen for an average of 126 days in Saratov and 185 days in Tsaritsyn. The soil is very fertile, especially in the north, where a thick sheet of black-earth covers the plateaus; sandy clay and saline clay appear in the south.

The population numbered 2,113,077 in 1882 and 2,419,884 in 1897. The density in the different districts in 1897 varied from 55 to 107 inhabitants per sq. m., and the urban population amounted to 319,018; the female population numbered 1,236,957. The estimated population in 1906 was 2,863,600. There are a few Germans, a fair number of Mordvinians, Chuvashes and Tatars, but they are inferior to all the Russian. 5% belong to the Orthodox Greek Church, 5% are Non-Confessing Russians, 3% are Non-Orthodox Non-Confessing Russians, 2% are Non-Orthodox Non-Confessing Jews, 2% are Non-Orthodox Non-Confessing Roman Catholics. The government is divided into ten districts, the chief towns of which, with their populations in 1897, are Saratov (q.v.), Atkarsk (1897), Balashov (12,160), Kamышин (16,834), Khvalynsk (15,545), Kuņnetsk (21,740), Petrovsk (13,212), Serdobsk (12,721), Tsaritsyn (67,650 in 1900) and Volg (27,572 in 1900). Education makes some progress: in 1897, 40% of the military recruits were able to read, as against 21% in 1874. The proportion of illiterate women, however, continues very large. Of the total area, 12% belonged to the peasants in 1896, 38% to private landowners, 5% to the crown and 5% to the impoverished inhabitants of the municipal authorities; the peasants, however, are constantly buying a large number of the holdings and even the landed properties. Quantities. Green crops are being cultivated more widely, both on the private estates and among the peasants. Agriculture suffers, however, very much from droughts, and the attacks of marmots, mice and insects. The principal crops are wheat, rye, oats, barley, potatoes and beetroot, with some tobacco and fruit. Oil-yielding plants are cultivated; linseed in all districts except Tsaritsyn; and mustard, both for grain and oil, extensively about Sarepta and in the Kamysnshin district. Gardening is nothing uncommon round Saratov, Volg, Atkarsk and Kamysnshin, the cucumbers, melons and watermelons being especially famous. Fishing and the preparation of caviare are of some importance at Kamysnshin and elsewhere. Live-stock breeding is declining. On the other hand, the export trade in poultry, especially geese, has developed greatly. The factories comprise mainly steam flour-mills, oil-works, distilleries, oil-mills, timber-mills, tanneries, fur-dressing works and tobacco factories. Weaving, the fabrication of agricultural machinery and pottery, boot-making, &c., are carried on in the villages. The government of the hour have lost much of their importance; that at Bekovo, high in the Emily district around Saratov, Volg, Atkarsk and Kamysnshin, has lost its ground, especially as regards cattle and animal products. The peasants are no better off than those of the other governments of south-east Russia (see SAMARA). Years of scarcity are common, and many peasants leave their homes in search of work on the Volga and elsewhere. An active trade is carried on in corn, hides, tallow, oils, exported; the merchants of Saratov, moreover, are intermediaries in the trade between south-east Russia and the central governments. The chief ports are Saratov, Tsaritsyn, Kamysnshin and Khvalynsk. The German colony, on the Volga near Saratov, is a lively little town with 5690 inhabitants, which carries on an active trade in mustard, woolen cloth and manufactured wares.

The district of Saratov has been inhabited since at least the Neolithic period. The inhabitants of a later epoch have left numerous bronze remains in their kurgans (burial-mounds), but their ethno-geographic position is still uncertain. In the 8th and 9th centuries the nomad Burtases peoples peopled the territory and recognized the authority of the Khazar princes. Whether the Burtases were the ancestors of the modern Moslems is not yet been determined. At the time of the Mongol invasion in 1239-1242, the Tatars took possession of the territory, and one of their settlements around the Khan's palace at Urek, 10 m. from Saratov, seems to have had some importance. Even in 1648, the Muscovy troops of Don and Petrovsk were founded about the end of the 17th century, and a palisaded wall was erected between the Volga and the Don. Regular colonization may be said to have begun only at the end of the 18th century, when Catherine II. called back the runaway discontented, invited German colonists and ordered her courtiers to settle here their serfs, deported from central Russia.

SARATOV, a town of Russia, capital of the government of the same name, on the right bank of the Volga, 513 m. by rail S.E. of Moscow. It is one of the most important cities of eastern Russia, and is picturesquely situated on the side of hills which come close down to the Volga. One of these, the Sokolovo (360 ft.), is liable to frequent landfalls, and is a continual source of danger. The city is divided into three parts by two ravines; the outer two may be considered as suburbs. A large village, Pokrovsk (pop. 20,000), situated on the opposite bank of the Volga, though in the government of Samara, is in reality a suburb of Saratov. Apart from this suburb, Saratov had in 1892 a population of 114,340 (41,660 in 1830, 66,500 in 1896 and 143,431 in 1900. It is the see of an Orthodox Greek bishop and of a Roman Catholic bishop, and is better built than many towns of central Russia. Its old cathedral (1697) is a very plain structure, but the new one, completed in 1825, is fine, and has a
striking campanime. The theatre and the railway station are also fine squares. The streets are wide and regular, and there are several broad squares. A new fine-art gallery was erected in 1884 by the painter Bogolubov, who bequeathed to the city his collection of modern pictures and objects of art. A school of drawing and the public library are in the same building, the Radishchev Museum.

Art, culture, and science support a section of the population. The cultivation of the sunflower deserves special mention. Of the manufacturing establishments the distilleries rank first in importance; next come the liqueur factories, flour-mills, oil-works, railway workshops and tobacco-factories. The city has a trade not only in corn, oil, hides, tallow, woollen cloth, wool, fruits and various raw produce exported from Samara, but also in salt from the Crimea and Astrakhan, in iron and steel, and wood, the chief items of which are sappy wood and cypress. Of these the highest peaks are: Batu Puteh (5400 ft.), Tebang (10,000 ft.), Batu Bulan (7000 ft.), Ubat Siko (4000 ft.), Bela Lawing (2000 ft.) and Batu Lehin (6000 ft.), from which the Rejang and Barumun rivers, on the one side, and Sarawak, on the Dutch side, take their rise. North of Sarawak is the Pambai mountain range (8000 ft.) whence fly the rivers Limbang and Trusian, and Longman mountain range (9000 ft.) whence flow the rivers Barumun and Ranau. The interior is mountainous, the greatest elevations being Mount Mulu (9000 ft.), of limestone formation, Batu Lawei (8000 ft.), Pambai (8000 ft.), Kahulong, Duht, Poht and Penirism. The Rejang is the largest river, the largest of the river mouths of the Batang Litar third and the Limbang fourth. The Rejang is navigable for small steamers for about 160 m., the Baram for about 100 m., but there is a remarkable bar at the mouth of the Baram, the chief town of Sarawak, Kuching, with a population of about 30,000, is situated on the Sarawak river 20 m. from its mouth, and can be reached by steamers of a thousand tons.

The fauna is rich. The most important mammals are the macias, or orang utan, the gibbon, the proboscis, semnopithecus and macacus monkeys; lemurs, cats, otters, bears, porcupines, wild pigs, wild cattle, deer and pangolin. Bats, shrews, rats and squirrels are in abundance. Among the birds the greater parts of the species of birds in the avian class here breed in great numbers. The budgies are found along the coast. Of birds, Sarawak has over five hundred species; fish and reptiles are abundant; the jungle swarms with wild game, and the sea with fish and marine reptiles.

The mineral wealth gives promise of considerable development. The Borneo Company for some years has successfully worked gold from the quartz reefs at Bat, on the Sarawak river, by the cyanide process, and as well as from the gold-mines of Malakka, also occurs in pockets in various localities, notably at Sariki, in the Rejang district, and at Burok Buang and Tepak, in the Baram district and in the river Atun. Cinablar has also been found in small quantities at the mouth of Mount Mulu. Sapphires of good quality, but too small to be of commercial value, are found in large numbers in the mountain streams of the interior. Sago is raised at Sarawak and reprinted, and the streams about the town of Mount Mulu. Sapphires of good quality, but too small to be of commercial value, are found in large numbers in the mountain streams of the interior. Sago is raised at Sarawak. Sugar is produced on and exported from the island.

Timber is one of the most valuable products, but with the except of bilian (iron wood) from the river Rejang, little is exported. The most important timbers are bilian, merape, rasuk, krianj, benua, pintang, gerunggak, medang, meranti and lapor. Except near the banks of the rivers, which have been cleared by the natives for farming purposes, the whole country is thickly clothed with forest.

In 1904 the total trade of Sarawak (Foreign and Coastwise) reached a value of $15,464,241 as compared with $5,544,200 in 1890. The remarkable increase in trade is shown by the following table:

<table>
<thead>
<tr>
<th>Year</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1900</td>
<td>$84,370</td>
</tr>
<tr>
<td>1904</td>
<td>$1,819,200</td>
</tr>
</tbody>
</table>

The revenue increased from $457,596 in 1904 to $1,321,879 in 1904; and the expenditure increased in the same period from $486,533 to $1,225,384. The Public Debt of Sarawak on the 1st January 1905 was $25,000.

The position of the state, in addition to a small number of British officials and others, a few natives of British India, and a large number of Chinese traders and pepper planters, consists of semi-civilized Malays in the towns and villages of the coast districts and of a number of wild tribes of Indonesian affinities in the interior. Of these the most important are the Dyaks, Milansau, Kayans, Kenyahs, Kadaysans and Muruts. No census has ever been taken. "Without the Chinaman," said the Raja (Pal Mall Gazette, 20th September 1883), "we could do nothing. When all else have retired to the country in the evening he is there and we cannot get away from him." The Milansau, who live in the northern districts, have adopted the Malay-dress, and in many cases have become Mahomedans; they are a contented and laborious people. Slavery has been abolished, except among certain of the inland tribes among whom it still obtains in a very mild form:
head-hunting has been entirely suppressed among the Dyaks.

The government consists of the rajah (the succession is hereditary) who is absolute, assisted by a supreme council of seven, consisting of the three chief European officials and four Malay magistrates, nominated by him. There is also a general council of fifty which meets every three years. It includes, besides European and Malay officials, native chiefs chosen from all the principal tribes of the country. The whole country comprises four administrative divisions, each of these being divided into districts. The principal districts of Sarawak proper, which comprises the districts of the river Sarawak, and those of Lundu and Sadong. The second division is formed by the Batang Lupar, Saribas and Kelakak districts. The third division consists of the Rejang, Mukah, Oya and Bintulu; the fourth of the Baram, Limbang, Trusan and Lawas districts. The military force—some 250 men, Dyaks and Sikhs—is under the control of an English commandant. There is also a small police force, and the government possesses a few small steam vessels. The civil service is regularly organized, the officers number, are filled by Englishmen. There are both Roman Catholic and Protestant missions in Sarawak, the latter forms part of the see of the bishop of Singapore. Sarawak is easily accessible from Singapore, whence the passage occupies about forty-six hours; steamers run at intervals of seven days. The coast is well lighted, lighthouses having been built and maintained in good order at Tanjong Fo, Sirik, Mukah, Oya, Tanjong, Kidurong, Baram Mouth and Brooketon. The climate is equable, the daily temperature ranging on the average between 76° and 90°. The nights are generally cool. The rainfall averages about 900 in. annually. It is lightest during the north-east monsoon (October—March), but continues through the south-west monsoon, which blows for the rest of the year.

History.—In 1839-1840 Sarawak (which then comprised only the two divisions now constituting the first and second divisions), the most southern province of the sultanate of Brunei, was in rebellion against the tyranny of the Malay officials, insufficiently controlled by the rajah Muda Hassim. The insurgents held out at Bidor fort in the Sinlauan district, and there Sir James Brooke first took part in the affairs of the territory. By his assistance the rebellion was suppressed, and, on 50th or 24th Muda Hassim resigned in his favour and he became rajah of Sarawak. In 1843-1844 Captain (afterwards Admiral Sir Henry) Keppel (q.v.) and Raja Brooke expelled the Malay and Dyak pirates from the Saribas and Batang Lupar rivers, and broke up the fleets of Lanun pirates, which, descending from the Sulu Islands and the territory which is now British North Borneo, had long been the scourge of the seas.

In 1857 the Chinese, who for many generations had been working the alluvial deposits of gold in Upper Sarawak, sacked Kuching, killed two or three of the English residents and seized the government; Raja Brooke narrowly escaping with his life. He repelled, afterwards raja, quickly raised a force of Malays and Dyaks in the Batang Lupar district and suppressed the insurrection, driving the main body of the rebels out of the Sarawak territory. Raja Sir Charles Johnson Brooke (b. 1829) succeeded his uncle at his death in 1868; in 1888 he was created G.C.M.G. and Sarawak was made a British Protectorate, and in 1904 the position of his highness as raja of Sarawak was formally recognized by King Edward. His eldest son, the raja Muda (Charles Vyner Brooke, b. 1874), has for some years taken part in the administration of the country.

The extent of the raja of Sarawak, at the time when Sir James Brooke became its ruler, was not more than 7000 sq. m.; since that time the basins of the four rivers, Rejang, Muka, Baram and Trusan, have been added. The sultan of Brunei, who claimed suzerainty over them, ceded them on successive occasions in consideration of annual money payments. A few years after these cessions had been made many of the people of the river Limbang rose in rebellion against the sultan, and their territory was annexed by Sarawak, with the subsequent approval of the British government. In 1905 the basin of yet another river, the Lawas, was added to the northern end of Sarawak, the territory being acquired by purchase from the British North Borneo Company.

See Charles Brooke, Ten Years in Sarawak (1866); Gertrude L. Jacob, The Raja of Sarawak (1876); Spencer St John, Life in the 'Forests of the Far East' (1862), and Life of Sir James Brooke (1879); A Guide to Sarawak, ' Proc. Soc. Geogr. (1883)' by W.M. Crooke, 'In the Heart of Borneo,' Proc. Roy. Geogr. Soc. (July 1900), by Charles Hose; and The Far Eastern Travels (1903), by Alleyn Ireland.

SARCASM, an ironical or sneering remark or taunt, a bitting or satirical expression. The word comes through the Latin from the Greek σαρκός, literally to tear flesh (σαρέξ) like a dog; hence, figuratively, to bite the lips in rage, to speak bitterly (cf. Stobaeus, Eclog. ii. 222). The etymology of this may be paralleled by the English "sneer," from Dan. snare, to grin like a dog, cognate with "snarl," to make a rattle sound in the throat, Gron. schnarren, and possibly also by "sardonic." This latter word appears in Greek in the form χαράνλος, to draw back, i.e. the lips, like a dog, but was usually explained (by the early scholars and commentators) as referring to a Sardinian plant (Ranunculus Sardous), whose bitter taste screwed up the mouth. Thus, later Greek writers wrote Sardonous, and it was adopted into Latin; cf. Servius on Virg. Ecl. vii. 41 "immo ego Sarduls videb iniam anerior herbis.

SARCEY, FRANCISQUE (1827-1899), French journalist and dramatic critic, was born at Douvran (Seine-et-Oise), on the 8th of October 1827. He spent some years as schoolmaster, but his temperament was little fitted to the work. In 1858 he devoted himself to journalism. He contributed to the Figaro, L'Illustration, Le Gaulois, Le XIXe Siècle and other periodicals; but his chief bent was towards dramatic criticism, of which he had his first experience in L'Opinion nationale in 1859. In 1869 he began to contribute to Le Temps the "feuilleton" with which his name was associated till his death. His position as dictator of dramatic criticism was unique. He had the secret of taking the public into his confidence, and his pronouncements upon works in progress were always accepted as final. He was a masterly judge of acting and of stage effect; his views as to the drama itself were somewhat narrow and indifferent to the march of events. He published several miscellaneous works, of which the most interesting are Le Siège de Paris, an account compiled from his diary (1871), Comédiens et comédiennes (1878-1884), Souvenirs de jeunesse (1884) and Souvenirs d'âge mûr (1902; Eng. trans., 1893). Quarante ans de théâtre (1900, &c.) is a selection from his dramatic feuilletons edited by A. Brisson. He died in Paris, on the 16th of May 1899.

SARCOCARP (Gr. σαρκός, flesh, κάρπος, fruit), a botanical term for the succulent and fleshy part of a fruit.

SARCODINA, a principal group or phylum of Prostists, defined by O. Bîtschil as those which during their active and motile existence discharge the functions of motion and nutrition by simple flowing movements of their protoplasm or by the extension of simple pseudopods, which merge without trace into the protoplasmic body (Bronn's Tierrich, vol. i. pt. i., 1883). Thus defined, it is co-extensive with the older group Rhizopoda (Dujardin), and comprises five classes: Protozoa (Lankester), Rhizopoda (Dujardin), Foraminifera (d'Orbigny), Heliozoa (Dujardin), and Rhizaria (Valenciennes). The delimitation of Sarcodina is not unattended with difficulties. A very few of those we include possess in addition to the pseudopods one or more flagella, such as Dimorphos and Myxophyris (Heliozoa), Arcuathris (Rhizopoda), and might equally be referred to the Flagellata (q.v.). The Sporozoa differ in that their active state is usually (not always, e.g. Haemopordia, &c.) a wriggling, sickle-shaped cell, that growth takes place in the whole surface of the body, and not by ingestion of food and consequently without the active deformations that characterize Sarcodina.

SARCASM, and...
and that the life-cycle embraces at least two alternating modes of brood formation.

The subdivision of the phylum is no less difficult. The character of the pseudopods (see Amoeba) is the most obvious one to select, as it appears to be fairly constant. The surface may be a "precipitation-pellicle," not wetted by water, and the cytoplasm immediately within ("ecotorse") free from granules, so that no streaming movement is visible at the surface of the pseudopods, which are blunt or taper sharply to a point (Rhizopoda Lobosa) or the cytoplasm has no such protective outer layer, and the granules extend to the surface where they show a constant streaming, and the pseudopods are fine-pointed, and taper very slowly to the tip, as in all the other groups. For convenience, however, from general similarity of habit, habitat and general structure, we have been obliged to give a minor importance to this character within Rhizopoda. The divisions then stand thus:

1. PROTOZOA.—Pseudopods fine granular, not branching freely; fusion usually multiple, in a cyst; no conjugation process known.

2. RHIZOPODA.—Simple forms, sometimes with a simple shell, chitinous, siliceous or of cemented particles, never calcareous; pseudopods lobose, in the tapering and branching never either stiff or reticulate.

3. HELIOZOA.—Pseudopods granular, finely radiate, and gradually tapering, stiff; skeleton variable, never calcareous nor of cemented particles.

4. FORAMINIFERA.—Pseudopods branching freely and anastomosing, flexible except in a few pelagic forms where they are more radiate; mostly in the sand-grains, calcareous, very rarely siliceous in a few deep-sea forms, not generally separable from

5. RADIALIARIA.—Cytoplasm divided into a central and a peripheral region by a perforated membranous central capsule; pseudopods radiate flexible branching or not; skeleton either of a proteid (?) substance ("a canthin") or siliceous, of spicules or forming an elegant lattice, more rarely continuous.

6. LABYRINTHILOIDEA.—Body a reticulate plasmodium, formed by cells more or less coalescent, and connected by a network of anastomosing threadlike pseudopods. Cells aggregated into loose masses without distinct boundaries, the minor aggregates connected by fine threadlike pseudopods.

7. MYXOMYCETES.—Cells at first free, finally aggregated to form a coalescent fructification, usually preceded by a continuous or fenestrated plasmodium stage in which all cytoplasmic boundaries may be lost.

The reproduction processes of the Sarcodina are (1) Binary fission, equal or nearly so. (2) Multiple fission or "sporulation" (also termed "brood formation"). Conjugation (equal or unequal) usually occurs between cells produced by the latter mode (microgametes); or if not, there are antecedent processes suggesting that brood formation has been lost. Conjugation is entirely unknown in Protooymyxa, Labyrinthioidea and Myxomycetes, even at stages where it occurred in other groups, and it has been definitely made out in a very limited number of genera in the remaining groups. The zygote or product of cell fusion is usually here, as in the majority of types of conjugation, a resting cell. (See the separate articles on the classes.)

The young of the Sarcodina, formed from the outcome of multiple fission, or single resting cells (spores), may be provided with pseudopodia from the first (myxopods or amoebulae), or come into active life for a short time with flagella (mastigopods or flagellulae).

LITERATURE.—Batsch in Bronn’s Tierreich, vol. 1, pt. i. (1882); Y. de Laubenfels and E. Hérouard, Traité de zoologie conchologique, vol. 1, La Cellule et les protozoaires (1896); A. Lang, Handb. der Zoologie, ed. 2, pt. i. "Protozoen" (1902); M. Hertog, Cambridge Natural History, vol. 1. (1906); in the first four books full bibliographies are given.

(S. H.)

SARCOPHAGUS.—SARDARPUR

SARCOPHAGUS sardarpur (Gr. sarkophagos, literally "flesh-eating," from σαρξ, flesh, φαγεῖν, to eat), the name given to a coffin in stone, which on account of its caustic qualities, according to Pliny (H. N. xxxvi. 27), consumed the body in forty days; also by the Greeks to a sepulchral chest, in stone or other material, which was more or less enriched with ornament and sculpture. One of the finest examples known is the sarcophagus of Seti, the second king of the XIX. Egyptian dynasty (1343-1300 B.C.), which is carved out of a block of Aragonite or hard carbonate of lime, now in the Soane Museum; of later date are the green porphyry sarcophagus and the terra-cotta sarcophagi from Clazomenae; both of these date from the early 6th century B.C., and are in the British Museum. The finest Greek examples are those found at Sidon in 1887 by Hamdy Bey, which are now in the Imperial Museum at Constantinople (see Greek Art). Of Etruscan sarcophagi there are numerous examples in terra-cotta; occasionally they are miniature representations of temples, and sometimes in the form of a couch on which rest figures of the deceased; one of these in the British Museum dates from 500 B.C. The earliest Roman sarcophagus is that of Scipio in the Vatican (3rd century B.C.), carved in peperino stone. Of later Roman sarcophagi, there is an immense series enriched with figures in high relief, of which the chief are the Niobid example in the Lateran, the Lycomedes sarcophagus in the Capitol, the Penthesilea sarcophagus in the Vatican, and the immense sarcophagi representing a battle of the Romans and the barbarians in the Museo delle Terme. In later Roman work there was a great decadence in the sculpture, so that in the following centuries recourse was had to the red Egyptian porphyry, of which the sarcophagi of Constantia (A.D. 355) and of the empress Helena (A.D. 580), both in the Vatican, are fine examples. Of later date, during the Byzantine period, there is a large series either in museums or in the cloisters of the Italian churches. They are generally decorated with a series of niches with figures in them, divided by small attached shafts with semicircular or sloping covers carved with religious emblems, one of the best examples being the sarcophagus of Sta Barbara, dating from the beginning of the 6th century, at Ravenna, where there are many others. The term sarcophagus is sometimes applied also to an altar tomb.

SARD, a reddish-brown chalcedony much used by the ancients as a gem-stone. Pliny states that it was named from Sardis, in Lydia, where it was first discovered; but probably the name came with the stone from Persia (Pers. sard, yellowish-red). Sard was used for Assyrian cylinder-seals, Egyptian and Phoenician scarabs, and early Greek and Etruscan gems. The Hebrew odem (translated sardius), the first stone in the High Priest’s breastplate, was a red stone—probably sard, but perhaps carnelian or red Jasper (see J. Taylor, "Sardius," in Hastings’s Dict. Bibl.). Some kinds of sard closely resemble carnelian, but are usually rather harder and tougher, with a duller and more hackly fracture. Mineralogically the two stones pass into each other, and indeed they have often been regarded as identical, both being chalcedonic quartz coloured with oxide of iron. The range of colours in sard is very great, some stones being orange-red, or hyacinthine, and others even golden, whilst some present so dark a brown colour as to appear almost black by reflected light. The hyacinthine sard, resembling certain garnets, was the most valued variety among the ancients for ornaments, and intaglios. Dark-brown sard is sometimes called "sardine," or "sardine," whilst certain sards of yellowish colour were at one time known to collectors of engraved gems as "beryl."

SARDANAPALUS, or SARDANAPALLUS, according to Greek fable, the last king of Assyria, the thirteenth in succession from Ninjas. The name is derived from that of Assur-dan-pal, the rebel son of Shalmaneser II., whose reign ended with the fall of Nineveh in 625 B.C. (or perhaps from that of Assur-dan III., the last king but one of the elder Assyrian dynasty); his character is that ascribed to Assur-bani-pal. He was the most effeminate and corrupt of a line of effeminate princes; hence Arbaces, satrap of Media, rebelled and, with the help of Belus, the Babylonian priest, besieged Nineveh. Sardanapalus now threw off his sloth and for two years the issue was doubtful. Then, the Tigris having undermined part of the city wall, he collected his wives and treasures and burned them with himself in his palace (880 B.C.). His fate is an echo of that of Samas-sum-yukin, the brother of Assur-bani-pal (q.v.).

See J. Gilmore, Fragments of the Persia of Ktesias (1888).

(S. H.)

SARDARPUR, a British station in Central India, within the state of Gwalior, on the Mahi river, 58 m. by road E. of Mhow;
SARDHANA—SARDINA

pop. (1901) 2783. It is the headquarters of the political agent for the Bhopawar agency, and of the Malwa Bilh corps, originally raised in 1837 and recently converted into a military police battalion.

SARDHANA, a town of British India, in Meerut district of the United Provinces, 12 m. by rail N.W. of Meerut. Pop. (1901), 12,467. Though now a decayed place, Sardhana is historically famous as the Bargum Samar (d. 1836). This extraordinary woman was a Mussulman married to Reinhardt or Sombro (Samru), the perpetrator of the massacre of British prisoners at Patna in 1793. On his death in 1798 she succeeded him in the command, and was, as she was baptized into the Roman Catholic Church, and bequeathed an immense fortune to charitable and religious uses. She built in Sardhana a Roman Catholic cathedral, a college for training priests, and a handsome palace.

SARDICA, COUNCIL OF, an ecclesiastical council convened in 343 by the emperors Constantius and Constans, to attempt a settlement of the Arian controversies, which were then at their height. Of the hundred and seventy bishops assembled, about ninety were Homouians—principally from the West—while on the other side were eighty Eusebians from the East. The anticipated agreement, however, was not attained; and the result of the council was simply to emblify the relations between the two great religious parties, and those between the Western and Eastern halves of the Empire. For as Athanasius and Marcellus of Ancyra appeared on the scene, and the Western bishops declined to exclude them, the Eusebian bishops of the East absolutely refused to discuss, and contented themselves with formulating a written protest addressed to numerous foreign prelates. That they instituted a rival council of their own in Phileipopolis is improbable. The bishops, however, who remained in Sardica (mod. Sega in Bulgaria) formed themselves into a synod, and naturally declared in favour of Athanasius and Marcellus, while at the same time they anathematized the leaders of the Eusebian party. The proposal to draw up a new creed was rejected.

Especially important attaches to this council through the fact that Canons 3-5 invest the Roman bishop with a prerogative which became of great historical importance, as the first legal recognition of his jurisdiction over other sees and the basis for the further development of his primacy. "In order to honour the memory of St. Peter," it was enacted that any bishop, if deposed by his provincial synod, might appeal to the bishop of Rome, who was then at liberty either to confirm the first decision or to order a new investigation. In the latter case, the tribunal was to consist of bishops from the neighbouring provinces, assisted— if he so chose—by the metropolitan of the see to which the appeal was made. The clauses thus made it possible for the bishop of Rome president of a revisionary court; and afterwards Zosimus unsuccessfully attempted to employ these canons of Sardica, as declared by the Canons of the Council of auxiliaries. But it was not the Canons of Sardica which, ages were cited to justify the claim of the papacy to be the supreme court of appeal. Attacks on their authenticity have been conclusively repelled.

SARDINIA (Gr. Σαρδίνη, from a fancied resemblance to a footprint in its shape, Ital. Sardegna), an island of the Mediterranean Sea, belonging to the kingdom of Italy. It lies 75° S. of Corsica, from which it is separated by the Strait of Bonifacio, which is some 50 fathoms deep. The harbour of Golfo degli Aranci, in the north-eastern portion of the island, is 138 m. S.W. of Civitavecchia, the nearest point on the mainland of Italy; Sardinia lies between 8° 7' and 69° 42', and extends from 38° 52' to 41° 15' N. The length from Cape Teulada in the S.W. to Punta del Leone in the N. is about 160 m., the breadth from Cape Comino to Cape Caccia about 68 m. The area of the island is 9178 sq. m.—that of the department (compartimento), including the small islands adjacent, being 9294 sq. m. It ranks sixth in point of size (after Sicily) among the islands of Europe, but it is much more sparsely populated.

The island is mountainous in the main, almost continuously so, indeed, along the east coast, and very largely granitic, with a number of lofty upland plains in the east, and volcanic in the west. The highest point in the north-east group of the island (called Gallura) is Monte Limbara (4468 ft.), S.E. of Tempio. This mountain group is bounded on the S.E. and S.W. by valleys, which are followed by the railways from Golfo degli Aranci to Chiilivani, and from Chiilivani to Sassari. The north-western portion of the island, called the Nurra, lies to the west of Sassari and to the north of Alghero, and is entirely volcanic; so are the mountains to the south of it, near the west coast; the highest point is the Monte Ferru (3448 ft.). East of the railway from Chiilivani to Oristano, on the other hand, the granitic mountains continue. The highest points are Monte Rasu (4127 ft.), S. of Ozieri, in the district called Logudoro, on the chain of the Marghine, which runs to Macomer, and, farther S., in the region called Barbargia, the Punta Blanca Spina, the highest summit of the chain of Gennargentu (6016 ft.). These two groups are divided by the deep valley of the Tirso, the only real river in Sardinia, which runs 50 m. from the sea to the Capo Carbonara, at the S.E. extremity of the island. South of Oristano and west of the districts last described, and traversed by the railway from Oristano to Cagliari, is the Campidano (often divided in ordinary nomenclature into the Campidano of Oristano and the Campidano of Cagliari), a low plain, the watershed of which, near S. Gavino, is only about 100 ft. above sea-level. It is 60 m. long by 7-14 broad, and is the most fertile part of the island, but much exposed to malaria. South-west of it, and entirely separated by it from the rest of the island, are the mountain groups to the north and south of Oristina, where the famous Marras, the Punta Perda di Sa Miel, rises (4055 ft.), and the latter, in the district known as the Sulcis, reaches 3691 ft. It is in this south-western portion of the island, and more particularly in the group of mountains to the north of Oristina, that the mining industry of Sardinia is carried on.

The scenery is fine, but wild and desolate in most parts, and of a kind that appeals rather to the northern genius than to the Italian, to whom, as a rule, Sardinia is not attractive. The railway between Mandas and Tortoli traverses some of the holdest scenery in the island, passing close to the Monte S. Vittoria. The mountains near Oristina are also very fine.

Coast.—The coast of Sardinia contains few seaports, but a good proportion of these are excellent natural harbours. At the north-eastern extremity is a group of islands, upon one of which is the naval station of La Maddalena; farther S.E. is the well-protected Gulf of Orosei, at Terranova, a part of which, Golfo degli Aranci, is the port of arrival for the mail steamers from Civitavecchia, and a port of call of the British Mediterranean squadron. To the south of Terranova there is no harbour of any importance on the east coast (the Gulf of Orosei being exposed to E., and shut in by a precipitous coast) until Tortoli is reached, and beyond that to the Cape Carbonara at the south-east extremity of the island, where the last winter harbour before Cagliari, the most important on the island. In the south-west portion of Sardinia the island of S. Antioco, joined by a narrow isthmus and a group of bridges to the mainland, forms a good natural harbour to the south of the isthmus (the Gulf di Orosei being exposed to the E., and shut in by a precipitous coast) until Tortoli is reached, and beyond that to the Cape Carbonara at the south-east extremity of the island, where the last winter harbour before Cagliari, the most important on the island. In the south-west portion of Sardinia the island of S. Antioco, joined by a narrow isthmus and a group of bridges to the mainland, forms a good natural harbour to the south of the isthmus (the Gulf di Orosei being exposed to the E., and shut in by a precipitous coast).
SARDINIA

streams fall, forming considerable lagoons. For some way beyond the only seaport is Bosa, which has only an open roadstead; and at the southern extremity of the Nurra come the Gulf of Alghero and the Porto Conte to the W., the latter a fine natural harbour but not of great depth. The highest point of the island is the Punta della Capo del Falcone, which is continued to the N.E. by the island of Asinara, about 11 m. in length, the highest point of which, the Punta della Scumonca, is 1339 ft. high. This small island serves as a quarantine for the malaria carriers; it is not far from the Colfo dell' Asinara, is the harbour of Porto Torres, the only one of any importance on the north-west coast of Sardinia.

Geology.—Geologically Sardinia consists of two billy regions of Mesozoic rocks, separated by a broad trench filled with Tertiary deposits. This depression runs nearly from north to south from the Gulf of Asinara to the Gulf of Cagliari. Physically its country is a vast and beautiful plateau which touches a level of 300 ft. above the sea and over which the rivers rise within it, but these are all composed of volcanic rock and are the remains of Tertiary volcanoes. It is in the south that the depression remains most distinct and it is there known as the Campidano. In the north it forms the plain of Sassari. Both to the east and west of this depression the Archean and Palaeozoic rocks which form the greater part of the island are strongly folded, with the exception of the uppermost beds, which belong to the Neogene system. In the eastern region this was the last folding which has affected the country, and the Mesozoic and Tertiary beds are almost undisturbed. In the western region, on the other hand, all the Mesozoic beds are involved in the action; this region is also the most mountainous, and lies nearly horizontal. There were, therefore, two principal epochs of folding in the island, one at the close of the Palaeozoic era which affected the whole of the island, and one at the close of the Mesozoic which produced the western Tertiary depression. The difference of structure there is also a difference in the geological succession. In the western region the all the Mesozoic systems, including the Trias are developed. The Trias does not belong, as it has been expected to the Alpian or Mediterranean, but resembles that of Germany and northern Europe. In the eastern region the Trias is entirely absent and the Mesozoic series begins with the Jurassic.

Granite and Archean schists form nearly the whole of the eastern hills from the Strait of Bonifacio southwards to the Flumendosa river, culminating in Monti del Gemignarto. The Palaeozoic rocks form a vast area of the central and southern coast and extend far into the south-west. They occur also on the extreme north-western coast, in the Nurra. Cambrian, Ordovician and Silurian beds have been found in the Nurra, where Cambrian beds are particularly rich in metaliferous ores (especially galena and calamine). The Permian, which contains workable coal seams, lies unconformably upon the older beds and seems to have been deposited in isolated basins (e.g. in Fondi Corrongiu and San Sebastiano), like those of the Central Plateau of France. The Mesozoic beds are limited in extent, the most extensive areas lying around the Gulf of Orosei on the east and west of Sassari in the north. The Tertiary deposits are less developed than in the western part of the island, and are associated with extensive flows of lava and beds of volcanic ash. The most widely spread of the sedimentary beds belong to the Trias (Jurassic).

Climate.—The climate of Sardinia is more extreme than that of Italy, but varies considerably in different districts. The mean winter temperature for Sassari for 1871-1900 was 48°F., the mean summer temperature 77°F., while the extreme temperatures in each direction were 99°F. and 31°F. The island is subject to strong winds, which are especially felt at Cagliari owing to its position at the south-east end of the Campidano, and the autumn rains are sometimes of almost tropical violence. The lower districts are hot and often unhealthy in the summer, while the climate of the mountainous portion of the island is less oppressive, and would be still cooler if it possessed more forest. There are comparative few streams and no inland lakes. Snow hardly ever falls near the coast, but is abundant in the higher parts of the island, though none remains throughout the summer. The rainfall in the south-west port is much the same as in the north, but the amount in the centre is much less. The mean annual rainfall for Sassari for 1871-1900 was 24.45 in., the average number of days on which rain fell being 109, of which 37 were in winter and only 8 in summer—the latter equal with "alpine" climate.

Malaria.—The island has a bad reputation for malaria, due to the fact that it offers a considerable quantity of breeding places for the Anopholes claviger, the mosquito whose bite converts the sandfly into a sandfly. Such are the various coast lagoons, formed at the mouths of estuaries.

for lack of proper canalization, while much of the harm is also due to the distrust, clueless, and sometimes bigoted attitude of the inhabitants in the upland valleys, and are brought down by violent torrents, carrying the soil with them, and so impeding the proper drainage and protection of these valleys, and encouraging the formation of unhealthy stoppages, which make the island as a whole insufficiently tropical in character. The mortality from malaria in 1902 was higher than for any other part of Italy—1037 persons, or 154 per 100,000, for example in Apulia, 104; Calabria, 77; Sicily, 76; province of Rome, 27.

Customs and Dress.—The population of Sardinia appears (though further investigation is desirable) to have belonged in ancient times, and to belong at present, to the so-called Mediter ranean race (see G. Sergi, La Sardigna, Turin, 1907). In the aeneo- lithic necropolis of Anghelu Ruju, near Alghero, of 63 skulls, 53 belong to the "Sardinian" dolico-mesocephal Architect to 10 a Eurasian brachycephal Architect of Asiatic origin, which has been found in prehistoric tombs of other parts of Europe. The race has probably suffered less here than in most parts of the Mediter ranean basin from foreign intermixture, except for a few Catal an and Genoese settlements on the coast (Alghero and Carloforte are respectively the most important of these); and the population in general seems to have deteriorated slightly since prehis toric times, the average cranial capacity of the prehistoric skulls from the Anghelu Ruju being 1400 c.c. for males and 1308 for females, while among the modern population 60% of males and females together fall below 1250 c.c.; and the stature is generally lower than in other parts of Italy, as is shown by the measurements of the recruits (R. Livi, Antropometria Militare, 1910). The anthropologists, indeed, have recently observed a large proportion of "Dolicho-Mediterranean" skulls in the Sardinian, not found in Sardinia only, but elsewhere in south Italy also; though in Sardinia they are distributed over the whole island, and especially in the southern half. In the province of Cagliari 29-90% of the recruits born in 1862 were under 5 ft. 1 in., and in that of Sassari 21-99% the percentage for ten provinces of south Italy being 24-35. These small individuals present apparently no other differences, and Sergi maintains that the difference is racial, these being the descendants of a race of pygmies who had emigrated from central Africa. But the lowness of stature extends to the lower animals—cattle, horses, donkeys, &c. and this may indicate that climatic causes have some part in the matter also, though Sergi denies this.

The dialects differ very much in different parts of the island, so that those who speak one often cannot understand those who speak another, and use Italian as the medium of communication. They are divided into two main dialects—eastern and western. The western dialects are of the Lucendo type, but is of course much changed. The two main dialects are that of the Logudoro in the north and that of Cagliari in the south of the island.

The climate of the island is very convenient for the cultivation of cotton, as it has not only been raised in the south-east of the island, but in the north as well, where it is raised in large quantities. The cotton is of high quality, and is very popular with British manufacturers. In the north of the island the cotton is raised in large quantities, and is of very high quality. In the south of the island the cotton is raised in smaller quantities, but is of good quality. The cotton is grown in the valleys, and is not affected by the cold winds from the sea. The cotton is harvested in the autumn, and is dried in the sun. The cotton is then ginned, and is then ready for export.
comparatively rarely visited by foreigners, while Italians seem to regard it as almost a place of exile. They have the virtues and defects of a somewhat isolated mountain race—a strong sense of honour and respect for women, of hospitality towards the stranger, and a marked feeling of patriotism, which had an influential part to play in the endless struggle of Sardinia against the outside world. They are also subject to a strong sense of change and lack of enterprise. Despite their poverty begging is practically unknown. The houses are often of one storey only. Chimneys are unknown in the older houses; the hearth is in the centre of the room, which has the disadvantage that it makes the room uncomfortable and dangerous in case of fire. In the mountain villages the parish priest takes the lead among his people, and is not infrequently the most important person.

**Agriculture.**—The rest of the island is mainly devoted to agriculture. The island was once covered with forests, and a total rural population of 708,034 (i.e. deducting the population of Cagliari and Sassari) are occupied in it. Of these 41,661 cultivate the soil, while 3,724,969 are occupied in the raising of cattle and sheep, and no less than 72,753 day labourers; while there are 35,056 shepherds. Emigration is a comparatively new phenomenon in Sardinia, which began only in 1896, but is gaining ground. A considerable part of the island's activity is, however, concentrated round Tunis, where large numbers of Sardinian emigrants have been attracted by the smoking of tobacco in the island. Breeding is unregulated and natural selection prevails.

A more progressive form of pastoral industry is that of the *lanche* (enclosed holdings), in which the owner is both agriculturist and stock-raiser. 26,997,680 sheep and 155,000 goats, the numbers in 1896 having increased to 1,150,983 head in 1905. The island is more extensively reared with stocks of stock than in the previous canvases. The island is not only a great sheep-rearing, but a great wool-growing, country. 19,809,000 sheep and 1,120,000 goats are reared on the island. Breeding is unregulated and natural selection prevails. A more progressive form of pastoral industry is that of the *lanche* (enclosed holdings), in which the owner is both agriculturist and stock-raiser. 26,997,680 sheep and 155,000 goats, the numbers in 1896 having increased to 1,150,983 head in 1905. The island is more extensively reared with stocks of stock than in the previous canvases. The island is not only a great sheep-rearing, but a great wool-growing, country.

Sardinia also possesses a large number of farms and estates, of which the so-called Ogliastra is the chief. The island of Sardinia was one of the chief flocks of cattle and sheep, and the so-called Ogliastra is the chief. 26,997,680 sheep and 155,000 goats, the numbers in 1896 having increased to 1,150,983 head in 1905. The island is more extensively reared with stocks of stock than in the previous canvases. The island is not only a great sheep-rearing, but a great wool-growing, country.

**Sardinia**

1. The *herba Sardus*, said to cause the *rana Sardonicus* (sardonic laugh), cannot be certainly identified. (Paussi, xvi, 17, 13.)

2. The Sardinian cattle is small, but make good draught oxen. A considerable amount of wool is produced, and not sufficiently large.

3. Live-Stock.—A considerable portion of Sardinia, especially in the higher regions, is devoted to pasture. The native Sardinian cattle is small, but make good draught oxen. A considerable amount of wool is produced, and not sufficiently large.

4. Of wild animals may be noted the mounfollon (*Ovis Ammon*), the stag, and the wild boar, and among birds various species of the vulture and eagle in the mountains, and the pelican and flamingo (winter coming in August in large flocks from Africa) in the lagoons.

5. Fishery.—The tunny fishery is considerable; it is centred principally in the south-west. The sardine fishery, which might also be important, at present serves mainly for local consumption. Lobsters are exported, especially to Paris. The coral fishery—mainly on the west coast—has lost its former importance. Neither the tunny nor the coral fish is carried on by the Sardinians themselves, who are not successful as fishers in the lagoons of Genoese and the latter of Neapolitans. The unhealthy lagoons contain abundance of fish. The mountain streams often contain salmon.

6. In Roman times Sardinia, relatively somewhat more prosperous than at present, though not perhaps greatly different as regards its products, was especially noted as a grain-producing country. It was also famous for its wine and its olive oil. To these may be added the well-known Sardinian wines, which are amongst the best in Italy. The olive oil produced is mainly used with that from Genoa or Provence, and placed on the market under the name of the latter. Among the natural flora may be noted the wild olive, the lentisk (from which oil is extracted), the prickly pear, the myrtle, broom, cannabis, juniper. Large tracts of mountain are clothed with woolly scrub composed of these and other plants.1 The higher regions are the habitat of the chamois and the ibex. After the destruction of the forests by man and beast, the forests have been largely destroyed by speculators, who burned the trees for charcoal and potash, purchasing them on a large scale from the peasants, who sold them for a very small price. A large proportion of the forests remains to the state, the *ademprivi* was maintained on the lands subject to it, and it was thus to the interest of all that the woods should be maintained. In 1865, however, it was suppressed, and one half of the *bensi ademprivi* was assigned to the state, the other half being given to the commune, with the obligation of compensating those who claimed rights over these lands. Another difficulty is that Italian and foreign capitalists, having produced a great rise in prices which has not been compensated by a rise in wages. The tariff on the importation of wheat from Europe has been passed, but funds are lacking for their execution on a sufficiently large scale. Another difficulty is that Italian and foreign capitalists, having produced a great rise in prices which has not been compensated by a rise in wages. The tariff on the importation of wheat from Europe has been passed, but funds are lacking for their execution on a sufficiently large scale.
the state giving perpetual concessions in return for 3% of the gross production. In 1904-1905, 14,188 workers were employed in the mines of the province of Cagliari. The following table (from the consular report of 1906) shows the amount and value of the minerals extracted, the whole amount being exported:

The chief mines are those of Gennamare and Ingortus and others of the group owned by the Pertusola Company, Monteponi and Montevce. The mining and washing plant is extremely good and largely constructed at Cagliari. The most important minerals are lead and zinc, obtained in lodes in the forms of galena and calamine respectively. In most cases, owing to the mountainous character of the country, horizontal galleries are possible. The Monteponi Company smelts its own zinc, but the lead is almost all smelted at the furnaces of Pertusola near Spezia. Silver has also been found in the district of Cagliari, in companies west of Cagliari, has been worked, and antimony and other metals near Lanusei, but in smaller quantities than in the Iglesias district, so that comparatively little mining has as yet been done. Lignite is also mined at Bacu Abis, near Covale, and at Terranova near Sorima.

The salt-pans at Cagliari and of Carloforte are of considerable importance; they are let by the government to contractors, who have the sole right of production, but are subject to the inspection of the government and for Sardinia consumption at 35 centesimi (3½d.) per cwt.; the government does not exercise the salt monopoly in Sardinia any more than in Sicily, but in the latter island the right of manufacture is unrestricted. The total production in 1905 was 1,957,684 tons, and the average price of salt for the island in 1905 was 2½d. per cwt. (ungraded), and 1½d. per cwt. ground; whereas for Italy, where the government monopoly exists, the price is £1, 12s. the cwt.

Commerce.—The total exports of the province of Cagliari in 1905 attained a value of £1,385,735, of which £550,023 was foreign trade, while the imports amounted to £1,085,514, of which £500,758 was foreign trade. Among the exports may be noticed minerals, wines and spirits, tobacco, hides, live animals; and among the imports, groceries, cotton and cereals. The tonnage of the shipping entering and clearing the ports of the province in 1905 was 1,756,866, of which 352,992 was foreign.

Communications.—The railway system of Sardinia is in the hands of two companies—the Compagnia Reale delle Ferrovie Sarde, and the Compagnia delle Ferrovie Secondarie della Sardegna. The former company's lines (of the ordinary gauge) run from Cagliari, past Macomer, to Chilivani (with a branch at Decimomannu for Iglesias and Monteponi). From Chilivani the line to Sassari and Porto Torres diverges to the N.W., and that to Golfo degli Aranci to the N.E. The latter company owns narrow-gauge lines from Cagliari to Mandas (whence lines diverge N. to Sorgono and E. to Tortolì, the latter having a short branch from Gairo to Jerzu), from Macomer E. to Nuoro and W. to Bosa, from Sassari S.W. to Alghero, from Chilivani S. to Tirso (on the line between Macomer and Nuoro), and from Monti (on the line from Chilivani to Golfo degli Aranci) N.W. to Tempio. In the south-western portion of the island are several private railways belonging to various mining companies, of which the lines from Monteponi to Portoscuso and from S. Gurvino to Macomer, are sometimes available for ordinary passengers. There is also a steam tramway from Cagliari to Quartu S. Elena. The trains are few and the speed on all these lines is moderate, but the gradients are often very heavy.

Communication is thus most wanted with the northern and south-eastern extremities of the island, and between Tortolì and Nuoro, and Nuoro and Golfo degli Aranci. The main road system, which dates from 1838, previous to which there were only tracks, is good, and the roads well engineered; many of them are traversed daily by post vehicles. Some road motor services have been instituted. The total length of the railways is 602 m., and of the roads of all classes 3101 m., i.e. 596 yds. per sq. m.

There is daily steam communication (often interrupted in bad weather) with Civitavecchia from Golfo degli Aranci (the mail route), and weekly steamers run from Cagliari to Naples, Genoa (via the east coast of the island), Palermo and Tunis, and from Porto Torres to Genoa (calling at Bastia in Corsica and Leghorn) and Leghorn direct. A fortnightly line also runs along the west coast of the island from Cagliari to Porto Torres. All these lines (and also the minor lines from Golfo degli Aranci to La Maddalena and from Carloforte to Porto Vemse and Calasetta) are in the hands of the Navigazione Generale Italiana, there being no Sardinian steamship company. There is also a weekly French service between Porto Torres and Ajaccio in Corsica.

Administration.—Sardinia is divided into two provinces—Cagliari and Sassari; the chief towns of the former (with their communal population in 1901) are: Cagliari (23,057); Iglesias (20,874); Quartu S. Elena (8,510), really a large village; Oristano (7,107); Fluminimaggiore (6,647); Lanusei (3,250); and the total population of the province is 486,767: while the chief towns of the latter are Sassari (38,153); Alghero (10,741); Ozieri (9,255); Nuoro (9,171); Tempio Pausania (14,573); Terranova Pausania (4,148); Porto Torres (4,225); and the total population of the province 309,026. The density of population is 83.38 per sq. m. (294.55 for the whole of Italy), by far the lowest figure of any part of Italy.

The archiepiscopal sees of the island are: Cagliari (under which are the suffragan sees of Galtelli-Nuoro, Iglesias and Ogliastra), Oristano (with the suffragan see of Ales and Terralba) and Sassari (under which are the suffragan sees of Alghero, Ampurias and Tempio, Bisarcho and Boss). The number of monastic institutions in the island is very small.

Education.—The number of scholars in the elementary schools for 1901-1902 was 59,09 per 1000 (Calabria 42.77, Tuscany 67.09, Piedmont 118.00); the teachers are 1:34 per 1000, a total of 1084 of both sexes (among whom only one priest) (Calabria 1:18, Tuscany 1:29, Piedmont 2:80), while the rural schools are not built up for their purpose. In some of the towns, however, and especially at Iglesias, they are good modern buildings. Still, the percentage of those unable to read and write is 72.8, while for the whole of Italy it is 56.6. The male scholars at the secondary schools amounted in 1900 to 2,74 per 1000 inhabitants. The university of Cagliari, which in 1874-1875 had only 60 students, had 260 in 1902-1903. At Sassari in the same year there were 162. There are besides in the island 10 gymnasia, 3 lycées, 6 technical and nautical schools and institutes (including a school of mines at Iglesias), and 9 other institutes for various branches of special education. A tendency is growing up towards the extension of technical and commercial education in place of the exclusively classical instruction hitherto imparted. To the growth of this tendency the excellent results of the agricultural schools have especially contributed.

Crime.—For the years 1897-1901 statistics show that Sardinia has more thefts and frauds than any other region of Italy (1068.15 for Sardinia and 210.96 per 100,000 inhabitants per annum for the rest of Italy). This is no doubt accounted for by the extreme poverty which prevails among the lower classes, though beggars, on the other hand, are very few, the convictions being 8-5 per 100,000 against 258-15 per 100,000 for Italy, and 30,000 murders, 104,000 thefts, 36,000 forgeries for serious crimes than any other any other compartmentino of south Italy. Public security is considerably improved, and regular brigandage (as distinct from casual robbery) hardly exists. The vendetta, too, is now hardly ever heard of.

Finance.—In 1887 a severe banking crisis occurred in Sardinia. Though harmful to the economic condition of the island, it left agriculture comparatively unaffected, because the insolvency institutions had never fully fulfilled the obligations they had incurred. Agricultural credit operations in Sardinia are carried on by the Bank of Italy, which, however, displays such caution that its action is almost imperceptible. An unusual loan of £300,000 was made on the ruins of the former institutions, but hitherto no charter has been granted it. Institutions possessing a special character are the monti frumentarii, public grain deposits, founded for the purpose of supplying the market in years of scarcity, debt being paid in kind with interest after harvest. But they, too, lack funds sufficient to assure extensive and efficient working, even after the law of 1906. Meanwhile much evil arises from usury in the poorer districts. It is estimated that Sardinia pays, in local and
SARDINIA

In general, direct and indirect taxation of all kinds, 23,000,000 lire (£200,000), a sum corresponding to 35-44 lire per head.

History and Archaeology.—The early history of Sardinia is entirely unknown. The various accounts of Greek writers of the early colonizations of the island cannot be accepted, and it appears rather to have been the case that though there were various schemes formed by Greeks for occupying it or parts of it (e.g. that recorded by Herodotus i. 170, when it was proposed, after the capture of Phocaea and Teos in 545 B.C., that the remainder of the Ionian Greeks should emigrate to Sardinia) none of them ever came to anything.

On the other hand, the island contains a very large number of important prehistoric monuments, belonging to the Bronze Age, during which it must have been comparatively well populated. The most conspicuous and important of these are the nuraghi (the word is said to be a corruption of muraglie, i.e. large walls, but it is more probably a native word). Of

SARDINIA

Nuraghi Lugheras near Paulilatino, or the Nuraghe de S'Orcu near Domusnovas, the entrance may be protected by a regular system of courtyards and subsidiary nuraghi. Roughness of construction cannot be regarded as a proof of antiquity, inasmuch as in some cases we find the additions less well built than the original nuraghe; and it is often clear from the careful work at points where it was necessary that the lack of finer construction was often simply economy of labour. That the simpler forms, on the other hand, preceded those of more complicated plan is probable. The manner of their arrangement seems to indicate clearly that they were intended to be fortified habitations, not tombs or temples. The niche at the entrance, which is rarely wanting, served, no doubt, for the sentry on guard

From Papers of the British School at Rome, v. 93, fig. 1.

Fig. 1.—Nuraghe of Voes (Plans and Sections).

these there are, as has been estimated, as many as 6000 still traceable in the island. The nuraghe in its simplest form is a circular tower about 30 ft. in diameter at the base and decreasing in diameter as it ascends; it is built of rough blocks of stone, as a rule about 2 ft. high (though this varies with the material employed); they are not mortared together, but on the inside, at any rate, the gaps between them were often filled with clay. The entrance almost invariably faces south, and measures, as a rule, 5 or 6 ft. in height by 2 ft. in width. The architrave is flat, and there is a space over it, serving both to admit light and to relieve the pressure on it from above, and the size decreases slightly from the bottom to the top. Within the doorway is, as a rule, a niche on the right, and a staircase ascending in the thickness of the wall to the left; in front is another similar doorway leading to the chamber in the interior, which is circular, and about 15 ft. in diameter; it has two or three niches, and a conical roof formed by the gradual inclination of the walls to the centre. It is lighted by the two doorways already mentioned. The staircase leads either to a platform on the top of the nuraghe or, more frequently, to a second chamber concentric with the first, lighted by a window which faces, as a rule, in the same direction as the main doorway. A third chamber above the second does not often occur. The majority perhaps of the nuraghi of Sardinia present this simple type; but a very large number, and, among them, those best preserved, have considerable additions. The construction varies with the site, obviously with a view to the best use of the ground from a strategic point of view. Thus, there may be a platform round the nuraghe, generally with two, three or four bastions, each often containing a chamber; or the main nuraghe may have additional chambers added to it. In a few cases, indeed, we find very complicated systems of fortification—a wall of circumvallation with towers at the corners, protecting a small settlement of nuraghe-like buildings, as in the case of the Nuraghe Losa near Abbasanta and the Nuraghe Saurecci near Guspinu; or, as in the

From Papers of the British School at Rome, v. 93, fig. 3.

Fig. 3.—Nuraghe Aiga (Plan and Section).

and would be on the unprotected side of any one coming in; the door, too, is narrow and low, and closed from within. The approach is, as we have seen, often guarded by additional constructions; the fact that the door and window face south is another argument in favour of this theory, and the access from one part of the interior to another is sometimes purposely rendered difficult by a sudden vertical rise of 5 or 6 ft. in the stairs; while the objects found in them—household pottery, &c.—and near them (in some cases silos containing carbonized grain and dolia) point to the same conclusion. Numerous fragments of obsidian arrow-heads and chips are also found in and near them all over the island. The only place where obsidian is known to be found in Sardinia in a natural state is the Punta Trechina, a mountain south-east of Oristano. The choice of site, too, is decisive. Sometimes they occupy the approaches to tablelands, the narrowest points of gorges, or the heads of rivers; sometimes almost inaccessible mountain tops or important points on ridges; and it may be noticed that, where two important nuraghi are not visible from one another, a small one is interpolated, showing that there was a system of signalling from one to another. Or again, a group of them may occupy a fertile plain, a river valley or a tableland, or they may stand close to the seashore. Generally there is, if possible, a water-supply in the vicinity; sometimes a nuraghe guards a spring, or there may be a well in the nuraghe itself.

A final argument is the existence in some cases of a village of circular stone buildings of similar construction to the nuraghi, but only 15 to 25 ft. in diameter, at the foot of a nuraghe, which, like the baronial castle of a medieval town, towered above the settlement.

1 It has been widely believed that the Shardana, who occur as foreign mercenaries in Egypt from the time of Ramses II. onwards, are to be identified with the Sardinians; but the question is uncertain, for there were certainly no Egyptian colonies in Sardinia; the Egyptian objects and their imitations found on the island were brought there by the Phoenicians (W. H. Roscher, Lexikon der griechischen und römischen Mythologie, ii. 922).

2 In neither of these cases have the subsidiary buildings been fully traced out. The plan of the former is given by Pinza (op. cit.), and that of the latter by La Marmora (op. cit.). The latter seen from a distance resembles a medieval castle crowning a hill-top.

3 Those of the Giarba are fully described by A. Taramelli and F. Nissardi in Monumenti dei Lincei, vol. xviii.; Nissardi's map of the Nurra, published by G. Pinza, ibid. vol. xi. sqq., may also be consulted.

SARDINIA

They are distributed over the whole island, but are perhaps most frequent towards the centre and in the Nurra. They seem to be almost entirely lacking in the north-east extremity, near Terranova, and in the mountains immediately to the north of Iglesias, though they are found to the north of the Perda de sa Mesi. In the district of Gennargentu they occur, rarely, as much as 3600 ft. above sea-level. The tombs of their inhabitants are of two classes: the so-called tombi dei giganti, or giants' tombs, and the domus de janas, or houses of the spirits. The former are generally found close to, or at least in sight of, the nuraghe to which they belong. They consist of a chamber about 33 ft. or less in height and width, with the sides slightly inclined towards one another, and from 30 to 40 ft., or even more, in length; the sides are composed sometimes of slabs, sometimes of rough walking, while the roof is composed of flat slabs, and the bodies were probably disposed in a sitting position. At the front is a large slab, sometimes carved, with a small aperture in it, through which offerings might be inserted. On each side of this is a curve formed of two rows of slabs or two small walls, the semicircular space thus formed has a diameter of about 45 ft., and was probably intended for sacrifices. The tomb proper was no doubt covered with a mound of earth, which has in most cases disappeared. Close to these tombs smaller round enclosures, about 4 ft. in diameter, covered with a heap of stones, like a small cairn, may sometimes be seen; these were possibly intended for the burial of slaves or less important members of the tribe. Dolmens (probably to be regarded as a simpler form of the tombi dei giganti, inasmuch as specimens with chambers elongated after their first construction have been found) and menhirs are also present in Sardinia, though the former are very rare—that known as Su Perda e Sallarae, near the railway to the south of Macomer is illustrated by A. Taramelli in Bullettino di Paleotologia, xxvii. (1906), 268, but there are others. The latter, however, are widely distributed over the island, being especially frequent in the central and most inaccessible part. The domus de janas, on the other hand, resemble closely the rock tombs of the prehistoric cemeteries of Sicily. They are small grottos cut in the rock. We thus have two classes of tombs in connexion with the nuraghe, and if these were to be held to be tombs also, habitations would be entirely wanting.

Among the most curious relics of the art of the period is a group of bronze statuettes, some found at Uta near Cagliari and others near Teti, west of Fonni, in the centre of the island, of which many specimens are now preserved in the museum at Cagliari.

It is thus clear that in the Bronze Age Sardinia was fairly thickly populated over by far the greater part of its extent; this may explain the lack of Greek archaeological remains for Olbia, the modern Terranova, and Neapolis on the west coast, which must from their names have been Greek, though we do not now know when or by whom they were founded. Pausanias (x. 17. 5) attributes the foundation of Olbia to the Thespians and Athenians under Iolaus, while Solinus (l. 61) states that he founded other cities also. In any case the Phoenician settlements are the earliest of which we have any accurate knowledge. The date of the conquest by Carthage may perhaps be fixed at about 500–480 B.C., following the chronology of Justin Martyr (xviii. 7), inasmuch as up till that period colonization by the Greeks seems to have been regarded as a possible enterprise. The cities which they founded—Corus, Tharros, Suld, Nora, Carales—are all on the coast of the island, and it is doubtful to what extent they penetrated into the interior. Even in the 1st century B.C. there were still traces of Phoenician influence (Cicero, Pro Scauro, 15, 43, 45). There are signs of trade with Etruria as early as the 7th century B.C. The Carthaginians made it into an important grain-producing centre; and the Romans set foot in the island more than once during the First Punic War.

In 336 B.C. the Carthaginian mercenaries revolted, and the Romans took advantage of the fact to demand that the island should be given up to them, which was done. The native tribes opposed the Romans, but were conquered after several campaigns; the island became a province under the government of a praetor or propraetor, to whose jurisdiction Corsica was added soon afterwards. A rebellion in 215 B.C. was suppressed by the Carthaginian general, who was killed by T. Manlius Torquatus (Livy xxii. 40). After this the island began to furnish considerable supplies of corn; it was treated as a conquered country, not containing a single free city, and the inhabitants were obliged to pay a tithe in corn and a further money contribution. It was classed with Sicily and Africa as one of the main sources of the corn-supply of Rome. There were salt-works in Sardinia too as early as 150 B.C., as is attested by an inscription assigned to this date in Latin, Greek and Punic, being a dedication by one Cleon salari(us) socioram (serving) (Corp. Inscr. Lat. x. 7586). We only hear of two insurrections of the mountain tribes, in 181, when no less than 80,000 Sardinian slaves 1 were brought to Rome by T. Sempronius Gracchus, and in 114 B.C., when M. Cacilius Metellus was proconsul and earned a triumph after two years' fighting; but even in the time of Strabo there was considerable brigandage. Inscriptions record the boundaries of the territories of various tribes with outlandish names otherwise unknown to us (Corp. Inscr. Lat. x. 7899, 7936).

Some light is thrown on the condition and administration of the island in the 1st century B.C. by Cicero's speech (of which a part only is preserved) in defence of M. Aemilius Scaurus (q.v.), praetor in 53 B.C. Cicero, speaking no doubt to his brief, gives them a very bad character, adding 'ignomenti alieni socii' (Sardi; credo)

1 The large number of slaves is said to have given rise to the phrase "Sardi venales for anything cheap or worthless."
Augustus, Sardinia and Corsica fell to the share of the senate, but in Augustus' absence they were given to his adopted son Tiberius, and placed them under a praefectus. Tiberius set 4000 Jewish and Egyptian freedmen to the island to bring the brigands to submission (Tac. Ann. ii. 65). Later on two cohorts were quartered there, though it is not certain that this was still under Roman control. Tiberius' inscriptions (tabulae honosae missiionis) of the former and tombstones of the latter found in the island show (C.I.L. x. 777). In A.D. 67 Nero restored Sardinia to the high Roman exchange for Archipania, and the former was then governed by a legatus et praefectus; but Vespasian took it over again before A.D. 78, and placed it under an imperial procurator as praefectus. It returned to Roman tenure under Claudius, when our old friend Aurelius, when we find it governed by a proconsul, as it was under Commodus; the latter, or perhaps Septimius Severus, took it over again and placed it under a procurator as praefectus once more (Oros. ix. 14, 16, 17, 18, 32).

A bronze tablet discovered in 1866 near the village of Esterzili is inscribed with a decree of the time of Otho with regard to the boundaries of the districts, and those of the Cagliari, the Galluras, the Campi, who inhabited the eastern portion of the island. The former had crossed the boundaries of the other two, and was ordered to withdraw immediately under pain of punishment (Corp. inst. Lat. x. 782).

Cales was the only city with Roman civic rights in Sardinia in Pliny's time (when it was considered as unknown) and by far the most important place in the island; a Roman colony had been founded there by Tiberius Libissonis (Porto Torres) and others, later on, at Villasimius.

We hear little of the island under the Empire, except as a granary and as remarkable for its unhealthiness and the audacity of its brigands. Many miles belonged by the time of Pliny the Elder (A.D. 271).

A number of Roman towns are known to us. Besides those already mentioned, including the Phoenician cities (all of which continued to exist in Roman days) the most important were Bosa (q.v.), Byrsa (modern Banyuls), Parallela (modern Olbia), and Othoca (mod. Oristano, q.v.). An interesting group of Roman houses was found in 1878 at Bacu Abis, 5 m. W. of Iglesias, and has been covered up again (F. Vivante in Notizie degli scavi, 1878, 271). The town was securely on the mountainous district in the east centre of Sardinia, in the district of Nuoro, which still exists in the form of Barbagia, goes back to the Roman period, the civitates of Pisan and Corse, and the Ferentum of Tiberius (Corp. inst. Lat. xiv. 2954). The Barbaricen are mentioned in the 6th century A.D. by Procopius, who wrongly derives the name from several thousand Moors and Numidians who were banished to the island by the emperor. The old name of the town (Ferentum) was written in a letter (iv. 23) to Hospito, its chief, as a still pagan race, worshipping stocks and stones. The towns were connected by a considerable network of roads, with a total length of 985 Roman miles according to the Itineraire, the most important of which ran from Cales to Turris Libissonis (Porto Torres) through the centre of the island, passing Othoca (Oristano) and Foro Romano (modern Romea) to the modern Nabalis and railway. A portion of its course, however, between Forum Traiani and the modern Abbasa, is not so followed, and is still preserved, its width is as a rule about 24 ft.; at present its surface is, however, often not wide enough, being a gravel layer, now washed away. Several milestones belonging to it have been discovered, including one of the time of Augustus and another of Diocletian. The one of Augustus is inscribed in Latin and Syracusian, but the one of Diocletian, though it was probably not completed right through until a later period (T. Mommsen in Corp. inst. Lat. x. 833; cf. Eph. epigr. viii. 181-183). A branch from this road ran to Olbia (followed closely by the modern highway and railway also), and it was perhaps the main line of communication, though the Itineraries state that the road from Cales to Olbia ran through the centre of the island by Bosa, Valenza, Sorabile (near Fonni) and Caput Thyrs. Many milestones belonging to the road from Cales to Olbia have been found, but all but one of them (which was seen at Valenza) belong to the portion of the road within 12 m. of the latter place, so there are no certain indications that the road here was identical by either route. The Itineraries give it as 176 m. - the exact distance in English miles by the modern railway! The difference between English and Roman miles would be compensated for by the modern railway, which is laid alongside the Lais, which was also connected with Othoca by a road along the west coast, passing through Tharros, Cornus and Bosa; this road went on to Thibilis (Capo Testa) at the most extreme point of the island and so by the coast to Olbia. This other road ran straight to join the road from Cales to Olbia 16 m. west of the latter.

Carales was also connected with Olbia by a road along the east coast. The farthest corner of the island was served by a direct road from Carales westward through Othoca and Olbia, which the Saracens, after a survival, no doubt, of a Roman post-station ad decimum lapidem, where there is a fine Roman bridge over 100 yds. long of fourteen arches. This road is now only 11 ft. wide. There is also a road through Nora and along the coast past Sidia to Metalla and Neapolis, and thence to Othoca.

After the time of Constantine, the administration of Sardinia was separated from that of Corsica, each island being governed by a proconsul and briefly by a vicarius urbis Romae.

In the Byzantine period it was still set off by Genoese. It was retaken for a short time by Marcellinus, but he finally recovered until the fall of the Vandal kingdom in Africa in 534, by Cyril. In 555 it was taken by Totila, but reconquered after his death by Narses for the Byzantine Empire. Under Byzantium it remained nominally until the 10th century, when we find the chief magistrate still bearing the title of bishop.

4 In the 9th century (720) the period of Saracen invasion began; but the Saracens never secured a firm footing in the island. In 725 Ludoprand purchased and removed to Pavin the body of St. Augustinus of Hippo from Cagliari, another of his which had been brought in the 6th century by the exiled bishop of Hippo. In 819 Sardinia submitted to Louis the Pious, begging for his protection; but the Saracens were not entirely driven out, and about A.D. 1000 the Saracen chief Mustas established himself in Cagliari. Pope John XVIII. preached a crusade in 1004, promising to bestow the temporal power (which was later withdrawn, because the power of the papacy is not absolutely clear) upon whoever should drive out the Saracens. The Pisans took up the challenge, and finally, in 1044, flush out Cagliari with the help of the Genoese in 1024 for the third time. The Saracens were not the isolation of Sardinia, but the pope and the emperor decided in favour of Pisa. Musat returned to the island once more and made every (by the capture of Olbia by the Pisans in 1056, when the domination of Pisa was established.

The island had (probably since the end of the 9th century) been divided into four districts—Cagliari, Arborea, Torres (or Logudoro) and Gallura—each under a giudice or judge, in whom the dignity became hereditary. Judges were already mentioned as existing in the account of the mission sent by Nicholas I. in 809 (Duchesne, Liber pontificalis, ii. 162), as though the single authority of the bishop of Apulia was already weakened. The three Apoxwes who appear in the 10th-century inscriptions just mentioned bear alternately the names Torctorius and Salusius; and, inasmuch as this is the case with the judices of Cagliari from the 11th to the 13th century, there seems no doubt that they were the successors of these Byzantine Apoxwes, who were perhaps the actual founders of the dynasty. These names, indeed, continue even after the Pisan family of Lacon-Massa had by marriage succeeded to the title, and the language occurs in their official seals down to the 13th century. The primogeniture was apparently freely used by the dominant families for the concentration of their power. Thus we find that after the failure of Musat members of the family of Laco-Unali filled all the four judicatures of the island (Taramelli, Archi stor. Sard., cit. 105). In the continual struggles between Pisa and Genoa some of these princes took the side of the latter. In 1164 Barisone, giudice of Arborea, was given the title of king of the island by Frederick Barbarossa, but his supremacy was never effective. In 1241 Adelasia, heiress of Gallura and Logudoro, married as her third wife, the natural son of Frederick II., who received the title of king of Sardinia from his father, but fell into the hands of the Bolognesi in 1249, and

The discharge certificates of sailors from the Classis Misenas and Classis Romanensis belonged to Sardinians who had returned home after serving in the fleet. 3

3 Excavations made in 1880 at Tibula and Sorabile resulted in the discovery of the former of a necropolis of the late Empire, in which the dead were buried in long amphorae, while at the latter Roman inscriptions were explored (F. Vivante in Notizie degli scavi, 1879, 350; 1881, 29 sqq.).
remained a prisoner at Bologna until his death. After this the Pisan supremacy of the island seems to have become more of a reality, but Arborea remained independent, and after the defeat of the Pisans by the Genoese at the naval battle of Meloria in 1364, they were engaged in war with Arborea and Taranto to Genoa. In 1297 Boniface VIII invested James II., the king of Aragon, with Sardinia; but it was not until 1323 that he attempted its conquest, nor until 1326 that the Pisans were finally driven out of Cagliari, which they had fortified in 1305-1307 by the construction of the Torre di S. Pancrazio and the Torre dell'Elefante, and which became the seat of the Aragonese government. To the Pisan period belong a number of fine Romanesque churches, among which may be specially mentioned those of Ardara, S. Gliauto near Oristano, La Trinità di Saccargia and Trattalias (see D. Scano, op. cit. infra).

The Aragonese enjoyed at first the assistance of the giudici of Arborea, who had remained in power; but in 1352 war broke out between Mariano IV. and the Aragonese, and was carried on by his daughter Eleonora, wife of Branca-leone Doria of Genoa, until her death in 1403. Peter IV. had meanwhile in 1355 called together the Cortes (parliament) of the three estates (the nobles, the clergy and the representatives of the towns) for the first time after the model of Aragon. After 1403 the Aragonese became masters of Arborea also. The title of giudici was abolished and a feudal marquisate substituted. The carta de lega (del legato) or code of laws issued by her was in 1421 extended to the whole island by the cortes under the presidency of Alfonso V., who visited Sardinia in that year. In 1478 the marquisate of Oristano was suppressed, and henceforth the island was governed by Spanish viceroys with the feudal régime of the great nobles under them, the Cortes being convoked once every ten years. Many of the churches show characteristic Spanish Late Gothic architecture which survived until a comparatively recent period. The Renaissance had little or no influence on Sardinian architecture and art.

The island remained a Spanish province until the War of the Spanish Succession, when in 1708 Caglirari capitulated to an English fleet, and the island became Austrian; the status quo was confirmed by the peace of Utrecht in 1713. In 1717, however, Cardinal Alberoni retook Cagliari for Spain; but this state of things was short-lived, for in 1729, by the treaty of London, Sardinia passed in exchange for Sicily to the dukes of Savoy, to whom it brought the royal title. The population was at that time a little over 300,000; public security and education being alike lacking, the viceregal government was content with the semi-autonomous states, which reigned in the separate districts on the islands. Matters improved considerably under Charles Emmanuel III., in whose reign of forty-three years (1730-1773) the prosperity of the island was much increased. The French attacks of 1792-1793 were repelled by the inhabitants, Caglirari being unsuccessfully bombarded by the French fleet, and the refusal by Victor Amadeus III. to grant them certain privileges promised in consideration of their bravery led to the revolution of 1794-1796. In 1799 Charles Emmanuel IV. of Savoy took refuge in Cagliari after his expulsion by the French, but soon returned to Italy. In 1802 he abdicated in favour of his brother Victor Emmanuel I., who in 1812 returned to Cagliari and remained there until 1814, when he retired, leaving his brother, Carlo Felice, as viceroy. Carlo was successful in repressing brigands, but he had to deal with much distress from famine. In 1821 he became king of Savoy by the abdication of his brother, and the construction of the highroad from Cagliari to Porto Torres was begun (not without opposition on the part of the inhabitants) in 1822. Feudalism was abolished in 1836, and in 1848 complete political union with Piedmont was granted, under which the vicegeral government being suppressed, and the island being divided into three divisions of which Caglirari, Sassari and Nuoro were the capitals. General A. La Marmora was appointed royal commissioner to supervise the transformation to the new régime.

SARDONYX

SARDONYX—SARDOU

them by treaty in 1306. Finally in 1390 Philadelphia, which had for some time been an independent Christian city, surrendered to Sultan Bayezid’s mixed army of Ottoman Turks and Byzantine Christians, and the Seljuk power in the Hermus valley was merged in the Ottoman empire. The latest attempt to the Turks to capture (and probable destruction) by Timur in 1402. Its site is now absolutely deserted, except that a tiny village, Sart, merely a few huts inhabited by semi-nomadic Yuruk, exists beside the Pactolus, and that there is a station of the Smyrna & Cassababa railway 1 m. north of the principal ruins.

The ruins of Sardis, so far as they are now visible, are chiefly of the Roman time; but though few ancient sites offered better hope of research by reason of their fine buildings (e.g. to H. Schliemann). On the banks of the Pactolus two columns of a temple of the Greek period, probably the great temple of Cybele, is still standing. More than one attempt to excavate this temple, the last by G. Dennis in 1882, has been made and prematurely brought to an end by lack of funds. In 1904 a few trial pits were sunk by M. Mendel for the Constantinople Museum, and the site was ultimately conceded to an American syndicate, for whom H. C. Butler of Princeton University undertook the task of excavation.

The necropolis of the old Lydia, a vast series of mounds, some of enormous size, of the city of the Hellenistic and Roman ages (1.4 or 5 m. in diameter), on the little south of the sacred Gygeean Lake. Coloc; here the Maecian chiefs, sons, according to Homer, of the lake, were brought to sleep beside their mother. The series of mounds is now a national park, a state of Delos is now a national park.

Three of the ancient mounds, which has been opened by modern excavators, but in every case it was found that treasure-seekers of an earlier time had removed any articles of value which had been deposited in the sepulchral chambers.

SARDONYX, an ornamental stone much used for seals and cameos. It usually consists of a layer of sard or carnelian with one of milk-white chalcedony, but it may present several alternating layers of these minerals. The sardonyx is therefore sometimes spoken of simply as a carnelian; if, however, the latter is present the stone is more appropriately called "a carnelian onyx." It was considered by ancient authorities that a fine Oriental sardonyx should have at least three strata—a black base, a white intermediate zone and a superficial layer of brown or red; these colours typifying the three cardinal virtues—humility (black), chastity (white) and modesty or martyrdom (red). The ancients obtained sardonyx from India, and the Indian locality, Mount Sardonyx, referred to by Petelym, is supposed to have been near Brosch, where agates and carnelians are still worked. In the Revised Version of the Old Testament, Ex. xxvii. 18, "sardonyx" is given in the margin as an alternative reading for "diamond," the word by which the Hebrew yahalom is usually translated. The stone known to the Romans as agyptilla may have been a kind of sardonyx, or perhaps a nicole, which is an onyx with a thin translucent milky layer on the surface. Imitations of sardonyx have been made by cementing together two or three stones of the required colours, while baser counterfeits have been produced in paste. By coating a sard or carnelian with sodium carbonate and then placing the stone on a red-hot iron a white layer may be produced, so that a kind of sardonyx is obtained (see CARNEILIAN). Most of the modern sardonyx is cut from South American agate, modified in colour by artificial treatment.

SARDOU, VICORIEN (1831-1908), French dramatist, was born in Paris on the 4th of September 1831. The Sardou were settled at Le Cannet, a village near Cannes, where they owned an estate, planted with olive trees. A night’s frost killed all the trees and the family was ruined. Victorien’s father, Antoine L’Andre Sardou, came to Paris in search of employment. He was in succession a book-keeper at a commercial establishment, a professor of book-keeping, the head of a provincial school, then a private tutor and a schoolmaster in Paris, besides editing grammars, dictionaries and treatises on various subjects. With all these occupations, he hardly succeeded in making a livelihood, and when he retired to his native country, Victorien was left on his own resources. He had begun studying medicine, but had to desist for want of funds. He taught French to foreign pupils; he also gave lessons in Latin, history and mathematics to students, and wrote articles for cheap encyclopaedias. At the same time he was writing, which contained in the latter part of the days of the Restoration. But she could do little for her protege. Victorien Sardou made efforts to attract the attention of Mlle Rachel, and to win her support by submitting to her a drama, La Reine Ulfa, founded on an old Swedish chronicle. A play of his, La Taverne des etudiants, was produced at the Odéon on the 1st of April 1834, but met with a stormy reception, owing to a rumour that the débuts had been instructed and commissioned by the government to insult the students. The Théâtre des Variétés, under which Sardou, Bernard Palissy, was accepted at the same theatre, but the arrangement was cancelled in consequence of a change in the management.

A Canadian play, Fleur de Liane, would have been produced at the Ambigu but for the death of the manager. Le Bossu, which he wrote for Charles Albert Fechter, did not satisfy the actor; and when the play was successfully produced, the nominal authorship, by some unfortunate arrangement, had been transferred to other men. M Sardou submitted to Adolphe Montigny (Lemoine-Montigny), manager of the Gymnase, a play for which he had written the scenes afterwards so famous, in Nos Intimes. Montigny thought fit to consult Eugène Scribe, who was revolted by the scene in question.

Sardou felt the pangs of actual want, and his misfortunes culminated in an attack of typhoid fever. He was dying in his garret, surrounded with his rejected manuscripts. A lady who was living in the same house unexpectedly came to his assistance. Her name was Mlle de Brécourt. She had theatrical connexions, and was a special favourite of Mlle Déjazet. She nursed him, cured him, and, when he was well again, introduced him to her famous husband, the actor Palissy, the latter, in the meantime, having undertaken that Candide, the first play he wrote for Mlle Déjazet, was stopped by the censor, but Les Premières Armes de Figaro, Monseur Garat, and Les Prés Saint Gervais, produced almost in succession, had a splendid run, and Les Pattes de mouche (1860; afterwards anglicized as A Scrap of Paper) obtained a similar success at the Gymnase. Fédora (1882) was written expressly for Sarah Bernhardt, as were many of his later plays.

He soon ranked with the two undisputed leaders of dramatic art, Augier and Dumas. He lacked the powerful humour, the eloquence and moral vigour of the former, the passion for augmentation of dramatic vitality he was a master of clever and easy flowing dialogue. He adhered to Scribe’s constructive methods, which combined the three old kinds of comedy—the comedy of character, of manners and of intrigue—with the drame bourgeois, and blended the heterogeneous elements into a compact body and living unity. He was no less dexterous in handling his materials than his master had been before him, and at the same time opened a wider field to social satire. He ridiculed the vulgar and selfish middle-class person in Nos Intimes (1861; anglicised as Peril), the gay old bachelors in Les Vieux Garçons (1867), the modern Tartuffes in Stephaite (1868) and the rural element in Nos Bons Villagiesois (1866), old-fashioned customs and antiquated political beliefs in Les Ganaches (1862), the revolutionary spirit and those who thrive on it in Rabags (1872) and Le Roi Carotte (1872), the then threatened divorce laws in Divorçons (1886).

He struck a new vein by introducing a strong historic element in some of his dramatic romances. Thus he borrowed Théodore from Byzantine annals, La Haïne (1874) from Italian chronicles, La Duchesse d’Athènes from the forgotten records of medieval Greece. Patagie (1865) is founded on the rising of the Dutch gueux at the end of the 17th century. The scene of La Sourcière (1904) was laid in Spain in the 16th century. The French Revolution furnished him with three plays, Les Merveilleuses, Thermidor (1891) and Robespierre (1902). The last named was written expressly for Sir Henry Irving, and produced at the Lyceum theatre, as was Dante (1903). The imperial
SARGASSO SEA—SARI

epoch was revived in La Tosca \(1887\) and Madame Sans Gène \(1903\). Later plays were La Peste \(1905\) and Le Drame des poissons \(1907\). In many of these plays, however, it was too obvious that a thin varnish of historic learning, acquired for the purpose, had been artificially laid on to cover modern thoughts and feelings. But a few—Patrie et La Haïne \(1874\), for instance—exhibit a true insight into the strong passions of past ages.

M. Sardou married his benefactress, Mlle de Brécourt, but eight years later he became a widower, and soon after the revolution of 1870 was married a second time, to Mlle Soulé, the daughter of the erudite Eudore Soulé, who for many years supervised the Musée de Vexin, a museum which had been in the French Academy in the room of the poet Joseph Autran \(1813\)–

1877, and took his seat on the 22nd of May 1878. He died at Paris on the 8th of November 1908.

See L. Lacour, Trois théâtres \(1880\); Brandler Matthews, French Dramatists \(New\ York, 1881\); R. Dourrieu, Écritsins d'aujourd'hui \(Paris, 1893\); F. Sarcey, Quatrains ans de théâtre \(vol. VI, 1901\).

SARGASSO SEA, a tract of the North Atlantic Ocean, covered with floating seaweed (Sargassum, originally named sargago by the Portuguese). This tract is bounded approximately by \(25°\) and \(30°\) \(N\), and by \(38°\) and \(60°\) \(W\), but its extent varies according to the season. These seaweeds are brown in the Sargasso Sea is carried and massed together, the original source of supply being probably the Caribbean Sea and Gulf of Mexico (see ALGAE). Similar circumstances lead to the existence of other similar tracts covered with floating weed, e.g. in the solitary part of the Pacific Ocean, north of the Hawaiian islands, between \(30°\) and \(40°\) \(N\) and between \(150°\) and \(180°\) \(W\). There is a smaller tract S.E. of New Zealand, and along a belt of the southern ocean extending from the Falkland Islands, south of Africa and south-west of Australia, similar floating banks of weed are encountered. The Sargasso Sea was discovered by Columbus, who on his first voyage was involved in it for about a fortnight. The widely credited possibility of ships becoming embedded in the weed, and being unable to escape, is disproved by the expedition of the "Michael Sars," under the direction of Sir John Murray and the Norwegian government, in 1910, which found the surface covered with weed only in patches, not continuously.

SARGENT, JOHN SINGER \(1856\)–, American artist, son of a distinguished Boston physician, was born at Florence, Italy, on the 12th of January 1856. He was educated in Italy and Germany, and in 1874 entered the atelier of Carolus-Duran in Paris. He received an "honorable mention" in the Salon of 1878 for his "En route pour la pêche," and in 1881 a second class medal for his "Portrait of a Young Lady" (made famous by Henry James's appreciation). In 1885 his "Carnation, Lily, Lily, Rose," exhibited at the Royal Academy, was bought for the Chantrey Bequest. He rapidly became known in London as a brilliant portrait painter, and year by year his Academy portraits were the leading features of its exhibitions. Though of the French school, and American by birth, it is as a British artist that he won fame by his vogue as the most sought-after portrait painter of the day, his sitters including the greatest in literature, artistic and social life of Europe and America. While best known, and consequently busily employed, as a portrait painter, he had at the same time a disposition towards other, and especially decorative work; his paintings of Britain, Venice and Eastern scenes are less known, but his labour of love, the ornate decorations for the Boston public library (completed in 1903), "The Pageant of Religion," shows the other side of his genius. Among his pictures in public galleries not already mentioned are "El Jaleo" (exhibited 1882), in the Boston Art Museum; "La Carmencita" in the Luxembourg; "Coventry Patmore," in the National Portrait Gallery, London; and "Henry Marquand" \(1887\), in the Metropolitan Museum, New York. He was elected an A.R.A. in 1894, and R.A. in 1897; he was the recipient of various medals of honour, and was made a member of the chief artistic societies of Europe and America.

Adapted as an opera for the music of Puccini (Rome, 14th Jan. 1900).

SARGON, more correctly SARRU-NU ("the legitimate king"), Sargon being a hybrid formation from the Semitic sar and the Sumerian giga ("established"), an Assyrian general who, on the death of Shalmaneser IV, during the reign of Sennacherib, seized the crown on the 12th of TEBET \(722\) B.C. He claimed to be the descendant of the early kings, and accordingly assumed the name of a famous king of Babylonia who had reigned about 3000 years before him. His first achievement was the capture of Samaria, \(27,300\) of its inhabitants being carried into captivity. Meanwhile Babylon had revolted under a Chaldaean prince, Merodach-baladan, who maintained his power there for twelve years. In \(720\) B.C. Yahu-bihdi of Hammath led Arpad, Damasc us and Palath into revolt: this was suppressed, and the Philistines and Egyptians were defeated at Raphia (mod. \(719\) B.C.). Sargon defeated the Minni to the east of Armenia, and in \(717\) overthrew the combined forces of the Hittites and Moschi (Old Testament Meshech). The Hittite city of Carchemish was placed under an Assyrian governor, and its trade passed into Assyrian hands. The following year Sargon was attacked by a great confederacy of the northern nations—Ararat, the Moschi, Tbaarrei; and—in the course of the campaign marched into the land of the Medes in the direction of the Caspian. In \(715\) B.C. Sargon took the chief city and overthrew all thein; their chiefs, Daytuki or Dauukku (Deicides), transported to Hamath. In \(714\) the army of Rusas of Ararat was annihilated, and a year later five Median chiefs, including Arbaku (Arbaces) became tributary. Cilicia and the Tbarerei also submitted as well as the city of Malatia, eastern Cappadocia being annexed to the Assyrian Empire. A league was now formed between Merodach-baladan and the princes of the west, but before the confederates could move, an Assyrian army was sent against Ashdod, and Edom, Moab and Judah submitted to Sargon, who was thus free to turn against Ararat, and Merodach-baladan was accordingly driven from Babylon, where Sargon was crowned king. Shortly after this Sargon sent a statue of himself to Cyprus and annexed the kingdom of Comagene. He was murdered in \(705\) B.C., probably in the palace he had built at Dur-Sargina, now Khorsabad, which was excavated by P. E. Botta. (A.H.S.)

SARI, a town of Persia, in the province of Mazendaran, on the left bank of the Tejen river, 80 m. S.W. of Astarabad. Pop. 10,000. It is the seat of the governor of Mazendaran, and has post and telegraph offices. The town is picturesque but very unhealthy, has stone-paved streets and houses built of brick and covered with green and red glazed tiles.

SARIPUL, or SIRIPUT, a town and khanate of Afghan Turkestan. The town lies 100 m. S.W. of Balkh; estimated pop. 18,000. Two-thirds of the people are Uzbeks and the rest Hazaras. The khanate, which lies between Balkh and Maibana, is one of the "four domains" which were in dispute between Bokhara and Kabul, and were allotted to the Afghans by the Anglo-Russian boundary agreement of 1873.

SIRIPUTTA, one of the two principal disciples of Gotama the Buddha. He was born in the middle of the 6th century B.C. at Nala, a village in the kingdom of Magadha, the modern Behar, just south of the Ganges and a little east of where Patna now stands. His personal name was Upatissa; the name of his father, who was a brahmín, is unknown; his mother's name was Sāri, and it was by the epithet or nickname of Siriputta (that is "Sāri's son"), that he was best known. He had three sisters, all of whom subsequently entered the Buddhist Order. When still a young man he devoted himself to the religious life, and followed at first the system taught by Sāfiyā of the Belatha clan. A summary of the philosophical position of this teacher has been preserved in the Dialogue called The Perfect Net.

According to this account his main tendency was to avoid coming altogether to any decided conclusion on any one of the numerous points then discussed so eagerly among the clansmen in the valley of the Ganges. Early in the Buddhist movement Siriputta had a conversation with one of the men who had just come from the Buddha and who reported to him the new famous stanza. "Of all the things that proceed from a cause, the Buddha the cause hath told; and he tells you how each shall come to an end—such alone is the word of
the Sage." The result was that Sāriputta, with his friend Kolita and other disciples of Saṅgha, asked for admission, and were received into the Buddhist Order. He rapidly attained to mastery in the Buddhist system of self-training, and is declared to have been the chief disciple of the Buddha. It was preserved between the Buddha and a Wanderer named Aggivessana on the nature of sensations; and at the end of that discourse he attained to Arahatship. He is constantly represented as discussing points, usually quite involved, with the Buddha, or with one or other of the more prominent disciples. One whole book of the Sāriputta is therefore called after his name. A number of stories of the early life of Sāriputta, in the Song of the Buddha (Thera-gāthā), and one of the poems in the Sutta Nipāta is based on a question he addressed to the Buddha. Asoka the Great, in his Bhāra Edict, enjoins on the Buddhists the study of seven passages in the Sutta Nipāta, and three in the Sāriputta-piṭaka, both of which were selected for their special beauty. One of these is called The Question of Upāsīsa, and this poem may be the passage referred to. Feeling his end approaching, he went home, and died just six months before the death of the Buddha, that is, approximately in 480 B.C. He was cremated with great ceremony, and the ashes placed in a place or burial-mound. An inscribed casket in such a mound at Sāchchī opened by Cunningham in February 1851 contained a portion of these ashes which had been removed to that spot, in General Cunningham's opinion by Asoka.

SARK, a small island of the Channel Islands, 7 m. E. of Guernsey, much visited on account of its magnificent cliff-scenery and caves. It is 3 m. long from N. to S. and 11/2 m. in extreme breadth. Area, 1274 acres; pop. (1901) 504. It is divided into two unequal parts, known in Great Sark (the more northern) and Little Sark, connected by the Coupée, a lofty isthmus so narrow at the summit that it bears only a roadway, artificially built up, and flanked by a precipice on either side. Many islets and detached rocks lie off the coast; Brechou Island to the west is large enough to have a few fields and a house upon it. Some of the rocks are very fine, such as the four lofty flat-topped pillars called the Autelets (altars). The harbour of Sark lies on the east coast, a tiny cliff-bound bay protected by a breakwater, communicating with the interior only through two tunnels, one of which is modern, while the other dates from 1588. The harbour is called Creux. This is a term of common use in the Channel Islands, applying primarily to natural tunnels or pits, but extended also to clefts such as that which forms the harbour. The Creux du Derrible (Old French, a downfall of rocks) is a wide shaft opening from the summit of the cliff and communicating with the sea by a narrow passage. The point is the greatest salt-water level, at high water. Of the many majestic caverns in the cliffs the Botiques and the Goulets, both on the west coast of Great Sark, may be especially mentioned. As in the case of the caves of Guernsey, Sark are the majority of the houses, the church, and the seigneurie or manor-house. An ancient mill stands at the summit of the island (375 ft.). Agriculture and fishing are carried on. In Little Sark is a disused old mine, worked in 1835, but soon abandoned. The island is included in the bailiwick of Guernsey, but has a court of justice of feudal character, the officers being appointed by the seigneur.

SARLAT, a town of south-western France, capital of an arrondissement in the department of Dordogne, 44 m. E. by rail of the N.B. of France. Pop. (1906) town, 4018, commune 6195. The town grew up round a monastery founded in the 8th century and early in the 14th century became the seat of a bishopric which was suppressed in 1790. The former cathedral and abbey-church preserves interesting architecture of the Romanesque and later periods and remarkable wood-carving of the 15th century. There is also a curious pyramidal structure of the 12th century, which was probably used as a burial-place. The house where Étienne de la Boëtie (d. 1563), the moralist, was born, and other houses in the Gothic and Renaissance styles of architecture, is worthy of notice. La Dordogne has a large trestle bridge across it, and there is a large trade in cattle. Distilling, the manufacture of tin-boxes, and the preparation of treasures, pâtes de foie gras and other delicacies and of nut-oil are carried on; there are coal and iron mines and stone-quarries in the vicinity.

SARMATAE, or Sauromatae (the second form is mostly used by the earlier Greek writers, the other by the later Greeks and the Romans), a people whom Herodotus (iv. 21. 117) puts on the eastern boundary of Scythia (q.v.) beyond the Tanais (Don). He says expressly that they were not pure Scythians, but, being descended from young Scythian men and Amazons, they spoke an impure dialect and allowed their women to take part in war and to enjoy much freedom. Later writers call some of them the "woman-ruled Sarmatae." Hippocrates (De Aere, &c., 24) classes them as Scythian. From this we may infer that they spoke a language cognate with the Scythic. The greater part of the barbarian names occurring in the inscriptions of Olbia, Tanais and Panticapaean are supposed to be Sarmatian, and as they have been well explained from the Iranian language by the Ossaeans of the Caucasus, these are supposed to be the representatives of the Sarmatae and can be shown to have a direct connexion with the Alani (q.v.), one of their tribes. By the 3rd century B.C. the Sarmatae appear to have superseded the Scyths proper in the plains of south Russia, where they remained dominant until the Gothic and Hunnish invasions. Their chief divisions were the Rhoaxolani (q.v.), the Iazyges (q.v.), with whom the Romans had to deal on the Danube and Thess, and the Alani. The term Sarmatia is applied by later writers to as much as was known of what is now Russia, including all that which the older authorities call Scythia, the latter term transferred to Russia further east. Particularly these maps of European and Asiatic Sarmatia.

(S. E. H. M.)

SARMENSE, or Sarrentino (Lat. sermentum, twigs), a botanical term for plants producing long runners.

SARNEN, the capital of the western half (or Obwalden) of the Swiss canton of Unterwalden. It stands 1558 ft. above sea-level, at the north end of the lake of Sarnen (3 sq. m. in extent) and on the river Aa. Pop. (1900) 3940. It has a large parish church and two convents. In the archives is preserved the famous MS. known from the colour of its binding as the White Book of Sarnen, by the osseans of the Caucasus, these are supposed to be the representatives of the Sarmatae and can be shown to have a direct connexion with the Alani (q.v.), one of their tribes. By the 3rd century B.C. the Sarmatae appear to have superseded the Scyths proper in the plains of south Russia, where they remained dominant until the Gothic and Hunnish invasions. Their chief divisions were the Rhoaxolani (q.v.), the Iazyges (q.v.), with whom the Romans had to deal on the Danube and Thess, and the Alani. The term Sarmatia is applied by later writers to as much as was known of what is now Russia, including all that which the older authorities call Scythia, the latter term transferred to Russia further east. Particularly these maps of European and Asiatic Sarmatia.

(S. E. H. M.)

SARNIA, a town and port of entry, Ontario, Canada, capital of Lambton county, 55 m. N.E. of Detroit, on the left bank of the river St Clair. Pop. (1901) 8176. It is on the Grand Trunk and Lake Erie & Detroit River railways, and is a port of call for steamers plying on the Great Lakes. It contains a large oil-refinery which handles the greater part of the product of the Ontario oil region. The Grand Trunk railway crosses the river by a 3600 ft. steel span, 6025 ft. long or, including the approaches, 24 m., which connects the town with the American city of Port Huron (Michigan).

SARNO (anc. Sarnus), a town of Campania, Italy, in the province of Salerno, 15 m. N.E. from that city and 30 m. E. of Naples by the main railway. Pop. (1901) 15,130 (town), 19,192 (commune). It lies at the foot of the Apennines, 92 ft. above sea-level, near the sources of the Sarno (anc. Sarnus), a stream connected by canal with Pompeii and the sea. Sarno has the ruins of a medieval castle, which belonged to Count Francesco Coppola, who took an important part in the conspiracies of Ferdinand of Aragon in 1485. Walter of Brione is buried in the ancient church of S. Maria della F scars rebuilt in 1701. Paper, cotton, silk, linen, hemp and hemp are manufactured. The travertine which forms the springs of the Sarno was used even at Pompeii as building material. Before its incorporation with the domains of the crown of Naples Sarno gave its name to a countship held in succession by the Orsini, Coppola, Suttavilla and Colonna families.

SARONNO, a town of Lombardy, Italy, in the province of Milan, from which city it is distant 13 m. N.N.W. by rail. Pop. (1901) 8730 (town), 9533 (commune). The pilgrimage church of the Madonna dei Miracoli, begun in 1495 by Vincenzo dell'Orto, has a dome of rich architecture externally; the campanile dates from 1516, the rest of the church is later. Internally it is decorated with fine frescoes by Gaudenzio Ferrari, representing a concert of angels, while those in the choir are by Bernardino Luini and are among his finest works (see F. Malaguzzi Valeri
The mathematics of the sun or moon recurs with little change as regards the time and the character of the eclipse. It is supposed to have afforded in ancient times the principal method of predicting eclipses.

SARPEDON, in Greek legend, son of Zeus and Laodamia, Lycian prince and hero of the Trojan war. He fought on the side of the Trojans, and after greatly distinguishing himself by his bravery, was slain by Patroclus. A terrible struggle took place for the possession of his body, until Apollo rescued it from the Greeks, and by the command of Zeus washed and cleansed it, anointed it with ambrosia, and handed it over to Sleep and Death, by whom it was conveyed for burial to Lycia, where a sanctuary (Sarpedoneum) was erected in honour of the fallen hero. Virgil (Aeneid, ii. 421) remarks that the body of Sarpedon was recovered intact.

In later tradition, Sarpedon was the son of Zeus and Europa and the brother of Minos. Having been expelled from Crete by the latter, he and his comrades sailed for Asia, where he finally became king of Lycia. Euripides (Rhesus, 20) confuses the two Sarpedons.

See Homer, IIiad, v. 479, xii. 292, xvi. 419-683; Apollodorus iii. 1, 2; Appian, Bell. civ. iv. 78; Herodotus i. 173, with Rawlinson’s notes.

SARPI, PAOLO (1552-1629), Venetian patriot, scholar and church reformer, was born at Venice, on the 14th of August 1552, and was the son of a small tradesman, who left him a orphan at an early age. Notwithstanding the opposition of his relatives, he entered the order of the Servi di Maria, a minor Augustinian congregation of Florentine origin, at the age of thirteen. He assumed the name of Paolo, by which, with the epithet Servila, he was always known to his contemporaries. In 1570 he sustained no fewer than three hundred and eighteen theses in a dispute in Mantua, in such an applause that the duke made him court theologian. Sarpi spent four years at Mantua, applying himself to mathematics and the Oriental languages. After leaving Mantua, he repaired to Milan, where he enjoyed the protection of Cardinal Borromeo, but was then transferred to his residence at Seregno,whence in 1574 he was sent to Rome on business connected with the reform of his order, which occupied him several years, and brought him into intimate relations with three successive popes, as well as the grand inquisitor and other persons of influence. Having successfully terminated the affairs entrusted to him, he returned to Venice in 1585, and passed the next seventeen years in study, occasionally interrupted by the part he was compelled to take in the internal disputes of his community. In 1601 he was recommended by the Venetian senate for the small bishopric of Caorle, but the papal nuncio, who wished to obtain it for a protégé of his own, informed the pope that Sarpi denied the immortality of the soul, and had controverted the authority of Aristotle. An attempt to procure another small bishopric in the following year also failed, Clement VIII. professing to have taken umbrage at Sarpi’s excessive correspondence with learned heretics, but more probably determined to thwart the desires of the liberal rulers of Venice. The sense of injury, no doubt, contributed to exasperate Sarpi’s feelings towards the court of Rome. For the time, however, he tranquilly pursued his studies, writing the notes on Vieta which established his proficiency in mathematics, and a metaphysical treatise now lost, which, if Foscarini’s account of it may be relied upon, anticipated the sensationalism of Locke. His anatomical pursuits probably date from a somewhat earlier period. They illustrate his versatility and thirst for knowledge, but are far from possessing the importance ascribed to them by his disciples. His claim to have anticipated Harvey’s discovery rests on no better authority than a memorandum, probably copied from Caesalpinus or Harvey himself, with whom, as well as with Bacon and Gilbert, he maintained a correspondence. The only physiological discovery which can be safely attributed to him is that of the contractility of the iris. It must be remembered, however, that his treatises on scientific subjects are lost, and only known from imperfect abstracts.

Clement died in March 1605; and Paul V. assumed the tiara with the resolution to strain papal prerogative to the uttermost. At the same time Venice was adopting measures to restrict it still further. The right of the secular tribunals to take cognizance of the offences of ecclesiastics had been asserted in two remarkable decrees, and the scheme of two ancient laws of the city of Venice, forbidding the foundation of churches or ecclesiastical congregations without the consent of the state, and the acquisition of property by priests or religious bodies, had been extended over the entire territory of the republic. In January 1606 the papal nuncio delivered a brief demanding the unconditional submission of the Venetians. The senate having promised protection to all ecclesiastics who should in this emergency aid the republic by their counsel, Sarpi presented a memoir, pointing out that the threatened censures might be met in two ways—de facto, by suppressing their publication, and de jure, by an appeal to a general council. The Venetians, however, were received with universal applause, and Sarpi was immediately made canonist and theological counsellor to the republic. When in the following April the last hopes of accommodation were dispelled by Paul’s excommunication of the Venetians and his attempt to lay their dominions under an interdict, Sarpi entered with the utmost energy into the controversy. He prudently began by republishing the anti-papal opinions of the famous canonist Gerson. In an anonymous tract published shortly afterwards (Risposta di un Dottore in Teologia) he laid down principles which struck at the very root of the pope’s authority in secular things. This book was promptly put upon the Index, and the republication of Gerson was attacked by Bellarmine with a severity which obliged Sarpi to reply in an Apologia. The Considerazioni sullecensurae and the Trattato dell’ interdetto, the latter partly prepared under his direction by other theologians, speedily followed. Numerous other pamphlets appeared, inspired or controlled by Sarpi, who had received the further appointment of censor over all that should be written at Venice in defence of the republic. Never before in a religious controversy had the appeal been made so exclusively to reason and history; never before had an ecclesiastic of his eminence maintained the subjection of the clergy to the state, and disputed the pope’s right to employ spiritual censures, except under restrictions which virtually abrogated it. Material arguments were no longer at the pope’s disposal. The Venetian clergy, a few religious orders excepted, disregarded the interdict, and discharged their functions as usual. The Catholic powers refused to be drawn into the quarrel. At length (April 1607) a compromise was arranged through the mediation of the king of France, which, while salving over the pope’s dignity, conceded the points at issue. The great victory, however, was not so much the defeat of the papal pretensions as the demonstration that interdicts and excommunications had lost their force. Even this was not wholly satisfactory to Sarpi, who longed for the toleration of Protestant worship in Venice, and had hoped for a separation from Rome and the establishment of a Venetian free church by which the decrees of the council of Trent would have been rejected, and in which the Bible would have been an open book. The republic rewarded her champion with the further distinction of state counsellor in jurisprudence, and, as a mark of confidence, the liberty of access to the state archives. These honours exasperated his adversaries to the uttermost. On the 5th of October he was attacked by a band of assassins and left for dead, but the wounds were not mortal. The braves found a refuge in the papal territories. Their chief, Poma, declared that he had been moved to attempt the murder by his zeal for religion, a degree of piety and self-sacrifice which seems incredible in a bankrupt oil-merchant. “Agnosco stylium Curiae Romanae,” Sarpi himself pleasantly said, when his surgeon commented upon the ragged and inartistic character of the wounds, and the justice of the observation is as
SARPSBORG—SARRETTE

In addition to the above works see Balan, Fra Paolo Sarpi (Venice, 1887) and Pascolato, Fra Paolo Sarpi (Milan, 1893). Some hitherto unpublished letters of Sarpi were edited by Karl Benrath under the title Paolo Sarpi. Neue Briefe, 1905–1906 (at Leipzig in 1909).

(R.G.)

SARPSBORG, a seaport and manufacturing town of Norway, in Smaalenene amt (county), 68 m. S.S.E. of Christiania on the Gothenburg railway. Pop. (1900) 6888. It is the junction for an alternative line to Christiania following the Glommen valley. It sprang into importance through the utilization of the falls in the river Glommen for driving saw-mills and generating electric power. The Sarpsfoss, south-east of the town, is a majestic fall, descending 74 ft. with a width of 120 ft. There are wood-pulp factories (one worked by an English company employing over 1000 hands), factories for calcium carbide (used for manufacturing acetylene gas), paper and aluminium; and spinning and weaving mills. There are two large electric supply stations, and power and light are furnished from this point to Frederikstad, 9 m. S.W. The port is at Sannesund, 1 m. S.; its quays can be reached by vessels drawing 2 ft. The town was originally founded in the 11th century, and destroyed by the Swedes in 1567. The existing town dates from 1839.

SARRACENIA, or SIDE-SADDLE FLOWER, a genus of pitcher-plants with seven species native in the eastern states of North America. They are perennial herbaceous marsh-plants with a rosette of leaves from the centre of which springs a tall stalk bearing a large single nodding flower. The leaves are erect and in the form of long slender pitchers, with a longitudinal wing and a terminal hood, to which insects are attracted by the bright colouring of the upper parts and the sweet scent exhaled there. The interior of the pitcher is half-filled with water and the wall is lined internally in the lower part with stiff downward pointing hairs, which prevent the escape of insects. The insects which are drowned in the pitcher become decomposed and digested by the fluid, and the products of digestion are ultimately absorbed by the walls of the pitcher and serve as a source of nitrogenous food. (See also Pitcher Plants.)

SARRAZIN, JACQUES (1588–1660), French painter, born at Noyon in 1588, went to Rome at an early age and worked there under a Frenchman named Anguille. Starting thus, Sarrazin speedily obtained employment by the Jesuit Cardinal Alberandini at Frascati, where he won the friendship of Domenichino, with whom he afterwards worked on the high altar of St Andrea della Valle. His return to Paris, where he married a niece of Simon Vouet, was signalized by a series of successes which attracted the notice of Sublet des Noyers, who entrusted to him the work by which Sarrazin is best known, the decoration of the great portal and the dome of the western façade of the interior court of the Louvre. The famous Caryatides of the attic show the influence of Mignard, which he had not conveyed to any extent the master, to which Sarrazin had devoted all the time he could spare from bread-winning whilst in Rome. He now executed many commissions from the queen, and was an active promotor of the foundation of the Academy. The mausoleum for the heart of the prince de Condé in the Jesuit church of the Rue Saint Antoine was his last considerable work (see Lenoir, Musée des monuments français, v. 5); he died on the 3rd of December 1660, whilst it was in progress, and the crucifix of the altar was actually completed by one of his pupils named Gros.

SARRETTE, BERNARD (1765–1858), founder of the Conservatoire National de Musique et de Déclamation in Paris, was born in Bordeaux on the 27th of November 1755, and died in Paris on the 11th of April 1858. Forty-five musicians from the dépôt of the Gardes Françaises were gathered together by him after the 14th of July 1789, and formed the nucleus for the music of the Garde Nationale. In May 1790, the municipality of Paris increased the body to seventy-eight musicians. When the financial embarrassments of the commune necessitated the suppression of the paid guard, Sarrette kept the musicians near him and obtained from the municipality, in June 1795, the establishment of a free school of music. On the 18th of Brumaire in the year II. (Nov. 8, 1793) this school was converted
into the Institut National de Musique by decree of the convention, and by the law of the 16th of Thermidor in the year III. (Aug. 3, 1795) it was finally organized under the name of Conservatoire. The motives for the imprisonment of Sarrette from the 25th of March to the 10th of May 1794, have been a source of historical controversy, nor is it possible to ascertain exactly what were his political views throughout this period of the French Revolution. But there is no longer foundation for the theory of Zimmermann, his biographer, that he was imprisoned for singing aloud Créty's air, O Richard, ô mon roi! For the last forty years of his life Sarrette lived in retirement. The protection of Napoleon I. was a source of disaster to him in 1815, when the conservatoire was closed; its subsequent history was watched by its founder as a mere spectator from outside.

SARSETAPILLA, a popular drug, prepared from the long fibrous roots of several species of the genus Smilax, indigenous to Central America, and extending from the southern and western coasts of Mexico to Peru. These plants grow in swampy forests, and, being diocious and varying much in the form of leaf in different individuals, are imperfectly known to botanists, only two species having been identified with certainty. These are Smilax officinalis and S. medica, which yield respectively the so-called "Jamaica" and the Mexican varieties. They are large perennial climbers growing from short thick underground stems, from which rise numerous semi-woody flexuous angular stems, bearing large alternate stalked long-persistent and prominently net-veined leaves, from the base of which spring the tendrils which support the plant. The genus is a member of the natural order Smilaceae, and constitutes the tribe Smilacoideae, characterized by the climbing habit, net-veined leaves and dioecious flowers.

The introduction of sarsaparilla into European medicine dates from the middle of the 16th century. Monardes, a physician of Seville, records that it was brought to that city from New Spain about 1536-1545. Sarsaparilla must have come into extensive use soon afterwards, for John Gerard, about the close of the century, states that it was imported into England from Peru in great abundance.

When boiled in water the root affords a dark extractive matter, the bitterness of which is increased by the boiling, and is employed as a tonic to the system. It is also employed as a dislike to the stomach, and is used as a sedative to the nerves, and as a diuretic in cases of the small-pox.

Irish. His generosity, his courage and his commanding height, had already commanded him to the affection of the Irish. When the cause of King James was ruined in Ireland, Sarsfield arranged the capitulation of Limerick and sailed to France on the 22nd of December 1601 with many of his countrymen who entered the French service. He received a commission as lieutenant-general (maraudel de camp) from King Louis XIV, and fought with distinction in Flanders till he was mortally wounded at the battle of Landen on 8th August 1693. He died at Hay's way on the 11th or 12th of August about three days after the battle. In 1691 he had been created earl of Lucan by King James. He married Lady Honora de Burgh, by whom he had a daughter who died childless in 1718. His widow married the duke of Berwick.

**SARTAIN, JOHN** (1808–1897), American artist, was born in London, England, on the 24th of October 1808. At the age of twenty-two he emigrated to America, and settled in Philadelphia. He was the pioneer of mezzotint engraving in America. Early in his career he painted portraits in oil and made miniatures; he engraved plates in 1841–1848 for *Graham's Magazine*, published by George Rex Graham (1813–1894); became editor and proprietor of *Campbell's Foreign Semi-Monthly Magazine* in 1843; and from 1849–1852 published with Graham Sartain's *Union Magazine*. He had charge of the art department of the Centennial Exhibition, Philadelphia, in 1876; took a prominent part in the work of the committee on the Washington Memorial, by Rudolf Siemerling, in Fairmount Park, Philadelphia; designed medallions for the monument to Washington and Lafayette erected in 1865 in Monument Cemetery, Philadelphia; and was a member of the Pennsylvania Academy of the Fine Arts and a cavaliere of the Royal Equestrian Order of the Crown of Italy. He died in Philadelphia on 9th July 1896. His *Reminiscences of a Very Old Man* (New York, 1890) are of unusual interest. Of his children William Sartain (b. 1843), landscape and figure painter, was born at Philadelphia on the 21st of November 1843, studied under his father and under Léon Bonnat, Paris, was one of the founders of the Society of American Artists, and became an associate of the National Academy of Design. Another son, Samuel Sartain (1830–1906), and a daughter, Emily Sartain (b. 1841), who in 1886 became principal of the Philadelphia School of Design for Women, were also American artists.

**SARTHE**, a department of north-western France, formed in 1790 out of the eastern part of Maine, and portions of Anjou and of Perche. Pop. (1906) 421,470. Area 2410 sq. m. It is bounded by the department of Orne, N.E. by Eure-et-Loir, E. by Loir-et-Cher, S. by Indre-et-Loire and Maine-et-Loire and W. by Mayenne. The Sarthe, a sub-tributary of the Loire, flows in a south-westerly direction through the department; and the Loire, which along with the Sarthe joins the Mayenne to form the Maine above Angers, traverses its southern borders. Broken and elevated country is found in the north and east of the department, which elsewhere is low and undulating. The highest point (on the boundary towards Orne) is 1115 ft. The Sarthe flows past Le Mans and Sablé, receiving the Merderet and the Vêvre from the right, and the Orne Saonoise and the Huisme from the left. The Loir passes La Flèche, and along its chalky banks caves have been hollowed out which, like those along the Cher and the Loire, serve as dwelling-houses and stores. The mean annual temperature is 52° to 59° Fahr. The rainfall is between 25 and 26 in.

The majority of the inhabitants live by agriculture. There are three distinct districts:—the corn lands to the north of the Sarthe and Neerwinden, on the region of barren lands and forest, between those two streams and the Loir; and the wine-growing country to the south of the Loir. Sarthe ranks high among French departments in the production of barley, and more hemp is grown there than in any other department of France. The region is full of horses, notably those of the Perche breed, prosperous, and fowls and geese are fattened in large numbers for the Paris market. Apples are largely grown for cider. The chief forests are those of Pontorson, the principal places being La Flèche, Mans and the Loir. The Sarthe, with its numerous small streams, owes its well-wooded appearance in a great measure to the hedges planted with trees which divide the fields. Coal, marble and freestone are also worked in the department. The mineral products of the Sarthe include weaving of hemp and flax, and cotton and wool-weaving are also carried on. Paper and cardboard are made in several localities.

**SARTAIN—SARZANA**

Iron-foundries, copper and bell foundries, factories for provision-preserving, marble-works at Sablé, potteries, tile-works, glass-works and stained-glass manufactories, curries, machine factories, wire-gauze factories, flour-mills and distilleries are also prominent industries of the Sarthe. Various numbers of which are found at Le Mans. Flour, agricultural products, live stock and poultry form the bulk of the exports. The department is served by the Western, the Orleans and the State railways, and the Sarthe and Loir provide 590 m. of waterway, though the latter river carries little traffic.

The department forms the diocese of Le Mans and part of the ecclesiastical province of Tours, has its course of appeal at Angers, and its educational centre at Caen, and constitutes part of the territory of the IV, army corps, with its headquarters at Le Mans. The four arrondissements are named from Le Mans, the chief town, to the east La Flèche, Mans and St. Calais. The principal places are Le Mans, La Flèche, La Ferté Bernard, Sablé and Solesmes, which receive separate treatment. Besides these places, those of chief architectural interest are Le Lude, which has a fine château of the Renaissance period, Sillé-le-Guillaume, where there is the Géraldine church and a stronghold of the 15th century, and St Calais, the church of which dates from the 14th to the 17th centuries.

**SARTI, GIUSEPPE** (1770–1802), Italian composer, was born at Faenza on the 28th of December 1770. He was educated by Padre Martini, and appointed organist of the cathedral of Faenza before the completion of his nineteenth year. Resigning his appointment in 1790, Sarti devoted himself to the study of dramatic music, becoming director of the Faenza theatre in 1792. In 1793 he produced his first opera, *Pomona*, with great success. His next works, *Il Re Pastore*, *Medonte*, *Domenico* and *L'Olimpiade*, assured him so brilliant a reputation that in 1753 King Frederick V. of Denmark invited him to Copenhagen, with the appointments of Hofkapellmeister and director of the opera. Here he produced his *Ciro riconosciuto*. In 1765 he travelled to Italy to engage some new singers; meanwhile the death of King Frederick put an end for the time to his engagement. In 1769 he went to London, where he could only contrive to exist by giving music lessons. In 1770 he obtained a post in Venice where his masterpieces of the opera *Le furetto* were produced many new pieces, besides some very striking sacred music, including a *Te Deum* for the victory of Ochakov, in which he introduced the firing of real cannon. He remained in Russia until 1801, when his health was so broken that he solicited permission to return. The emperor Alexander dismissed him in 1802 with a liberal pension; letters of nobility had been granted to him by the empress Catherine. His most successful operas in Russia were *Armina* and *Olega*, for the latter of which the empress herself wrote the libretto. Sarti died at Berlin on the 28th of July 1802.

Sarti's opera *I Due Litiganti* has been immortalized by Mozart, who introduced an air from it into the supper scene in *Don Giovanni*. It should be noted that Mozart's *Nozze di Figaro* owed a great deal to the influence of this opera, which was performed in Vienna in 1784. The admirable libretto by Da Ponte, author of the libretti of *Figaro* and *Don Giovanni*, shows similar situations, and the complicated finale of the first act served as a model to Mozart for the finale of the last act of *Don Giovanni*.

**SARZANA**, a town and episcopal see of Liguria, Italy, in the province of Genoa, 9 m. E. of Spezia, on the railway to Pisa, at the point where the railway to Parma diverges to the north, 59 ft. above sea-level. Pop. (1901) 6531 (town); 11,850 (commune). The handsome cathedral of white marble in the Gothic style, dating from 1355, was completed in 1474. It contains two elaborately-sculptured altars of the latter period. The former
citadel (now gaol), built by the Pisans, was demolished and re-erected by Lorenzo de' Medici. The castle of Sarzanello was built by Castruccio Castracani (d. 1328), whose tomb by the Pisan Giovanni di Balducci is in S. Francesco. The Palazzo del Capitano, by Giuliano da Maiano (1472), has been entirely altered. Sarzana has one of the most important glass-bottle factories in Italy, also brick-works and a patent fuel factory.

Sarzana was the birthplace of Pope Nicholas V. Its position at the entrance to the valley of the Magra (anc. Maora), the boundary between Etruria and Liguria in Roman times, gave it military importance in the middle ages. It arose as the successor of the ancient Luna, 3 m. S.E.; the first mention of it is found in 983, and in 1202 the episcopal see was transferred hither. A branch of the Cadolingi di Borgia新区 family, lords of Fucecchio in Tuscany from the 10th century onwards, which had acquired the name of Bonaparte, had settled near Sarzana before 1264; in 1512 a member of the family took up his residence in Ajaccio, and hence, according to some authorities, was descended the emperor Napoleon I. Sarzana, owing to its position on the frontier, changed masters more than once, belonging first to Pisa, then to Florence, and lastly to Genoa; in 1572 it was ceded to Genoa and from 1572 to Genoa itself. In 1814 it was assigned to the kingdom of Sardinia, the frontier between Liguria and Tuscany being now made to run between it and Carrara.

SASANA VAMSA, a history of the Buddhist order in Burma, which was composed, in that country, by Panâh-sámi in 1831. It is written in Pali prose and is based on earlier documents, in Pali or Burmese, still extant, but not yet edited. The earlier part of the work deals with the history of Buddhism outside of Burma. This is based on the Mahâvâpa, and other well-known Ceylon and Indian books and has no independent value. The latter part of the work, about three-fifths of the whole, deals with Buddhism in Burma, and contains information not obtainable elsewhere. Down to the 11th century the account is meagre, legendary and incredible. After that date it is sober, intelligible and in all probability mostly accurate. This portion occupies about one hundred pages 8vo in the excellent edition of the text prepared for the Pali Text Society in 1897 by Dr Mabel Bode. It shows a continuous literary effort through the eight and a half centuries, and constantly renewed ecclesiastical controversy. The latter is concerned for the most part with minor questions relating to rules of the order, there being a tendency, as relations of the rules crept in with the lapse of time, to hark back to the original simplicity. Of differences in matters of doctrine there is no mention in this manual. Dr Bode has prefixed to her edition a detailed summary of the contents of the book. (T. W. R. D.)

SASARAM, a town of British India, in the Shahabad district of Bengal, with a station on the East Indian railway, 406 m. N.W. from Calcutta. Pop. (1901) 23,644. It is famous as containing the tomb of the Afghan Sher Shah, who defeated Humayun and became emperor of Delhi (1540-1545). The tomb, which is the finest example of Mohomedan architecture in Bengal, stands on an island in the middle of an artificial lake. Close by is the tomb of Sher Shah's father.

SASH. (1) A framework of wood in which glass is fixed for a window, particularly a framework for large panes of glass in two parts which open and shut by sliding up or down. The word is a corruption of the Fr. châssis, chord, Lat. capsa, box, case, capere, to hold. The word is, therefore, a doublet of "case" and "cash" (q.v.). (2) A long band of silk or other fine or ornamented material wound round the waist or over the shoulders as part of a woman's or child's dress, or as a sign of office, or as part of an official costume or uniform. The word is an adaptation of the Arab. šâsh, muslin, especially used (of the soft muslin or silken bands used for wrapping round the head in the form of a turban). In its early uses in English it appears as a term used by oriental travellers and writers on the East as an equivalent for a Mahommiedan.

SASKATCHEWAN, a province of Western Canada, lying between the two provinces of Alberta and Manitoba. Area, 259,850 sq. m. The south-eastern portion is chiefly prairie, being the continuation of the second prairie steppe found in Manitoba. About 104° W. the Missouri Coteau, an elevation of several hundred feet, probably an old glacial moraine, crosses the southern boundary and runs north-westward, being the eastern escarpment of the third prairie steppe which runs to the Rocky Mountains. Several elevations of note are found in the southern half of the province. On the central part of the southern boundary is Wood Mountain, a succession of clay hills. On the lower level is Moose Mountain, and north of it Beaver Hills and Touchwood Hills. These are elevations of morainal or glacial deposits. The river Saskatchewan (p.e.) gives its name to the province. In central Saskatchewan near the south bend of the South Saskatchewan begins the river Qu'Appelle ("Who Calls?"), which runs eastward, and crossing the western boundary of Manitoba falls into the Assiniboine river. Farther to the south rises the Souris river, which flows parallel to the Missouri Coteau, passes southward into N. Dakota, and again entering the province of Manitoba finds its way at length into the Assiniboine river. North of the Saskatchewan river the
The Saskatchewan is to some extent navigated, but a serious obstacle, the Grand Rapids, near the mouth of the river, requires a canal to allow the entrance of steamers into Lake Winnipeg. The southern part of the province is covered by railways, the Canadian Northern and the Canadian Pacific railways connecting the international boundary line, at a distance of one hundred to one hundred and fifty miles. This railway has south of its main line two important branches, (1) the Sppoos-Moose Jaw to Estevan, and (2) the Arcola branch from the south-eastern corner of the province running to Regina. Another branch leaves the main line for the north at Kirkella, and this will make a direct communication with Edmonton, while another branch line enters the province at Harrowby and runs westward to join the Kirkella branch on its way to Saskatoon and Edmonton. The Canadian Northern railway has a line which enters the province at Togo and following the Saskatchewan leaves the province at Lloydminster and pushes on to Edmonton. The Grand Trunk Pacific railway follows a direct line from Winnipeg to Edmonton, entering the province at 51° 25' N. and leaving it at 52° 35' N. for the west.

The chief industries of Saskatchewan are cattle-rearing in the northern part and grain growing in the south of the province. Coal is found on the southwestern border of the province, and a light variety of lignite on the Souris river near the international boundary. The province follows in general the plan of government found in the other provinces of the Dominion. The capital of the province is Regina (q.v.), a provincial city, and the seat of the government of the province and of four ministers. The legislature consists of twenty-five members. The province has adopted a public schools act, which has a proviso for the establishment of separate schools for Catholics and Protestants, but with restrictions as to being almost non-effective, every such school being required in all particulars to follow the public school model. The system covers both secondary and primary public schools. A newspaper is in circulation.

The religions of the people are similar to those in the other western provinces of Canada. The principal denominations were in 1901 as follows:

- Presbyterians: 17,151
- Roman Catholics: 17,116
- Church of England: 10,418
- Methodists: 11,528
- Lutherans: 12,098

The animal life of Saskatchewan resembles that of Alberta (q.v.).

Population.—By the census of 1901 the population of Saskatchewan was found to be 257,263. It had grown from 91,279 in 1905 (the area of the province being in 1906 somewhat greater than in 1901). The population is to a large extent Canadian, and the immigration has been largely from (1) the British Isles; (2) the United States; (3) the continent of Europe. Several large bodies of foreigners are found. There is a community of upwards of 8000 Doukhobors—a sect of Russian Quakers. Their tenets are peculiar, involving opposition to form in religion, to marriage and to submission to governmental requirements. They desire to hold their land in common. The Russian writer Tolstoy was a proponent of this immigration. Considerable numbers of Galitzins are also found in the province. On the Indian population there were 9049 in 1901; and of Indian half-breeds 7049 in the same year. The Indians of Saskatchewan are chiefly Plain or Wood Cree, with a mixture among them of Saulteaux. Toward the south small bands of Assiniboines are found, and here and there small companies of refugee Sioux from the United States. All the Indians are on government reserves. In these reserves along the Qu'Appelle river are presented many examples of the successful management of the Indians by the Dominion government. These reserves are largely self-supporting; the Indians have comfortable houses, grow considerable crops of grain, make large quantities of hay and possess herds of cattle. At Regina, Qu'Appelle, Crooked Lakes and other industrial schools, young Indians—both male and female—receive a practical education. Many of these are making excellent farmers.

Government, etc.—Throughout the province the municipal system of self-government, especially in the towns and villages, is being introduced. There are two cities in the province, (1) Regina (pop. 9804 in 1907), the capital; (2) Moose Jaw (pop. 6249). The latter is a divisional point on the Canadian Pacific railway, and owes its importance chiefly to its railway connections. In the northern portion of the province are two considerable towns (1) Prince Albert (pop. 2003), on the banks of the North Saskatchewan river, giving promise of becoming a manufacturing centre, having as it has the great forest on the north side of the Saskatchewan river, adjoining it. (2) Saskatoon (pop. 3011), on the South Saskatchewan river. This, though a new town, bids fair to become a great railway centre. The Grand Trunk Pacific railway all the way from the North to the South of the North Saskatchewan district, the Grand Trunk Pacific railways all across the great river of the province, and tributary to this town is a large area of arable and prairie land.
A.D. 226 and destroyed by the Arabs in 637. The dynasty is named after Sassân, an ancestor of Ardashir I. For a list of the kings and the history of the empire see Persia: Ancient History, section viii.; for its fall see also Caliphate, section A, § 2.

SASSÂN, SIR ABDULLAH DAVID BART. (1838–1896). British Indian philanthropist and merchant, was born at Bagdad on the 25th of July 1818, a member of a Jewish family settled there since the beginning of the 16th century, and previously in Spain. His father, a leading Bagdad merchant, was driven by repeated Anti-Semitic outbreaks to remove from Bagdad to Bushir, Persia, and in 1832, he settled in Bombay where he founded a large banking and mercantile business. Albert Sassoon was educated in India, and on the death of his father became head of the firm. He was a great benefactor to the city of Bombay, among his gifts being the Sassoon dock, completed in 1875, and a handsome proportion of the cost of the new Elphinstone High School. In 1867 he was made a C.S.I., and in 1872 a Knight of the Bath. In 1873 he visited England and received the freedom of the city of London. Shortly afterwards he settled in England, and was made a baronet in 1890. He died at Brighton on the 24th of October 1896.

SASSARI, a town and district of British India, in the Central division of Bombay. The name is derived from the "seventeen" walls, towers and gates which the fort was supposed to possess. The town is 2320 ft. above sea-level, near the confluence of the rivers Kistna and Venal, 86 m. S. of Poona. Pop. (1911) 26,022.

The District of SASSARI has an area of 4825 sq. m. It contains two hill systems, the Sahyadri, or main range of the Western Ghats, and the Mahadeo range and its offshoots. The former runs through the district from north to south, while the Mahadeo range starts about 10 m. north of Mahabaleshwar and stretches east and south-east across the whole breadth of the district. The Mahadeo hills are bold, presenting bare scarps of black rock like fortresses. Within SASSARI are two river systems—the Bhima system in a small part of the north and north-east, and the Kistna system throughout the rest of the district. The hill forests have a large store of timber and firewood. The whole of SASSARI falls within the Deccan trap area; the hills consist of trap intersected by strata of basalt and topped with laterite, while, of the different soils on the plains, the commonest is the black loamy clay containing carbonate of lime. This when well watered is capable of yielding heavy crops. SASSARI contains some important irrigation works, including the Kistna canal. In some of the western parts of the district the average annual rainfall exceeds 200 in.; but on the eastern side water is scanty, the rainfall varying from 40 in. in SASSARI town to less than 10 in. in some places farther east. The population in 1901 was 1,416,550, showing a decrease of 6% in the preceding decade. The principal crops are millet, pulse, oil-seeds and sugar-cane. The only manufactures are cotton cloth, blankets and brass-ware. The district is traversed from north to south by the Southern Mahratta railway, passing 10 m. from SASSARI town. The SASSARI agency comprises the two feudatory states of Phaltan and Aundh. Total area 843 sq. m.; pop. (1911) 109,660.

On the overthrow of the Jadhav dynasty in 1312 the district passed to the Mahommedan power, which was consolidated in the reign of the Bahmani kings. On the decline of the Bahmani dominions towards the end of the 15th century the Bijapur kings finally asserted themselves, and under these kings the Maharratans arose and laid the foundation of an independent kingdom with SASSARI as its capital. Intrigues and dissensions in the palace led to the ascendency of the Peshwas, who removed the capital to Poona in 1749, and degraded the rajah of SASSARI into the position of a political prisoner. The war of 1817 closed the career of the peshwas, and the British then restored the titular rajah, and assigned to him the principality of SASSARI, which was much larger than the present district. In consequence of political intrigues, he was deposed in 1830, and his brother was placed on the throne. This prince dying without male heirs in 1848, the state was resumed by the British government.

SATELLITE (from the Lat. satelles, an attendant), in astronomy, a small opaque body revolving around a planet, as the moon around the earth (see Planet). In the theory of cubic curves,
Arthur Cayley defined the satellite of a given line to be the line joining the three points in which tangents at the intersections of the given (primary) line and curve again meet the curve. SATIN-SPAR, however, given to certain fibrous minerals which exhibit, especially when polished, a soft satiny or silky lustre, and are therefore sometimes used as ornamental stones. Such fibrous minerals occur usually in the form of veins or bands, having the fibres disposed transversely. The most common kind of satin-spar is a white finely-fibrous gypsum not frequently found in the Keuper marls of Nottinghamshire and Derbyshire, and used for beads, &c. Other kinds of satin-spar consist of calcium carbonate, in the form of either aragonite or calcite, these being distinguished from the fibrous gypsum by their transparency and often by the presence of a large number of great and optical characters. The satin-spar of Alston, Cumberland, is a finely-fibrous calcite occurring in veins in a black shale of the Carboniferous series. Fibrous calcite is known sometimes to German mineralogists as Atlaspahl.

SATIN-WOOD, a beautiful light-coloured hard wood, having a rich, silky lustre, sometimes finely mottled or grained, the produce of a moderate-sized tree, Chloroxylon Swietenia (natural order Meliaceae), native of India and Ceylon. A similar wood, known under the same name, is obtained in the West Indies, the Ireland and elsewhere; and it is probable that the name was derived from the fibrous structure of the wood, and the Indian name is a derivative of the Sanskrit word Rukaceae. Satin-wood was in request for rich furniture about the end of the 18th century, the fashion then being to ornament panels of it with painted medallions and floral scolls and borders. It is used for inlaying and small veneers, in covering the backs of chairs and clothes-boards, and in making small articles of turnery.

SATIRE (Lat. satira, satura; see below). Satire, in its literary aspect, may be defined as the expression in adequate terms of the sense of amusement or disgust excited by the ridiculous or the unseemly, provided that the impression made by the utterance is invested with literary form. Without humour, satire is invective; without literary form, it is mere clownish jeering. It is indeed exceedingly difficult to define the limits between satire and the regions of literary sentiment into which it shades. The first exercise of satire was no doubt coarse and boisterous. It must have consisted in gibing at personal defects; and Homer's description of Thersites, the earliest example of literary satire that has come down to us, probably conveys an accurate delineation of the first satirists. The character reappears in the heroic romances of the Middle Ages as a popular element, and the blind, licensed backbiter is a warped and distorted being, reader with his tongue than his hands. To dignify satire by rendering it the instrument of morality or the associate of poetry was a development implying considerable advance in the literary art. The latter is the course adopted in the Old Testament, where the few passages approximating to satire, such as Jotham's parable of the brahme and Job's ironical address to his friends, are embellished either by fancy or by feeling. An intermediate stage between personal ridicule and the correction of faults and follies seems to have been represented in Greece by the Margites, attributed to Homer, which, while professedly lampooning an individual, practically rebuked the meddling sciolism impersonated in him. In the accounts that have come down to us of the writings of Archilochus, the first great master of satire, we seem to trace the elevation of the instrument of private animosity to an element in public life. Though a merciless assailant of individuals, Archilochus was also a distinguished statesman, naturally for the most part in opposition, and his writings seem to have fulfilled many of the functions of a newspaper press. Their merit is attested by Quintilian, and the Vergilian comparison of them with Plato's parasillige of the Sophists proves that their virulence must have been tempered by grace and refinement. Archilochus also gave satiric poetry its accepted form by the invention of the iambic trimeter, slightly modified into the scasonic metre by his successors. Simonides of Amorgus and Hipponax were distinguished like Archilochus for the bitterness of their attacks on individuals, with which the former combined a strong ethical feeling and the latter a bright active fancy. All three were restless and turbulent, aspiring and discontented, impatient of abuses and theoretically enamoured of war, and one would have thrown great light on the politics as well as the morals of Greece, is to be lamented. With Hipponax the direct line of Greek satire is interrupted; but two new forms of literary composition, capable of being the vehicles of satire, almost simultaneously appear. Fable is first heard of in Asiatic Greece about this date; and, although its original intention does not seem to have been satirical its adaptability to satiric purposes was soon discovered. A far more important step was the elevation of the rude fun of rustic merrymakings to a literary status by Lucian, whose Fables approximate very closely to the Bacchic festivals. The means had now been found of alloying the satiric spirit with exalted poetry, and their union was consummated in the comedies of Aristophanes.

A rude form of satire had existed in Italy from an early date in the shape of the Fessescena verses, the rough and licentious pleasantry of the vintage and harvest, which, lasting down to the 16th century, was finally modified about 1540 and gave rise to the Fessescena odes employed, these probably improvised composition were entitled Saturnalia, after the name of the god from the saturn laxus, "a charger filled with the first-fruits of the produce, annually offered to Bacchus and Ceres. The Romans thus had dignified the name of satyr, but, in so far as the ancient drama consisted of raillery and ridicule, possessed the thing also; but it had not yet assumed a literary form among them. Livius Andronicus (240 B.C.), the first regular Latin dramatic poet, appears to have been inspired by a little more than a translator from the Greek. Satires are mentioned among the literary productions of Ennius (200 B.C.) and Pacuvius (170 B.C.), but the title refers to the variety of metres employed than to the genius of the composition. The realSatires of Lucilius (170 B.C.) are the first real instances of a literary genre. The Satirae seem to have been mostly satirical in the modern acceptation of the term, while the subjects of some of them prove that the title continued to be applied to miscellaneous collections of poems, as was the case even to the time of Varro, whose "Satirae" included prose as well as verse, and appear to have been only partially satirical. The fragments of Lucilius preserved are scanty, but the verdict of Horace, Tacitus and Quintilian demonstrates that he was a considerable poet. It is needless to dwell on compositions so universally known as the Satires of Lucilius's successor Horace, in whose hands the compound of the ancient with the modern development, becoming genial, playful and persuasive. "Arch Horace, you sorrowing!"
The didactic element predominates still more in the philosophic satires of Persius. Yet another form of satire, the rhetorical, was the appropriate vehicle of the devices and sentiments of the age, as example of a great tragic satirist. Nearly at the same time Martial, improving on earlier Roman models now lost, gave that satirical turn to the epigram which it only exceptionally possessed in Greece, but has ever since retained. About the same time another variety of satire came into vogue, destined to become the most important of any. The Milesian tale, a form of entertainment probably of Eastern origin, grew in the hands of Petronius and Apuleius into the satirical romance, immensely widening the satirist's field and exempting him from the restraints of metre. Petronius's "Satyr of Trimalchio" is the revelation of a new vein, never fully worked till our days. As the novel arose upon the ruins of the epic, so dialogue sprung up upon the wreck of comedy. In Lucian comedy appears adapted to suit the exigencies of an age in which a living drama had become obscure. With him satire explodes into a distinct branch of literature—though mention should be made of the satires and oracles of Plutarch from which the population of Egypt were for centuries accustomed to insult the Roman conqueror and his parasites. A direct association of the apostate poet Hor-Us-ta—a kind of Egyptian "Lost Leader"—composed under Augustus, has been published by M. Reville from a demotic papyrus.

After the great deluge of barbarism has begun to retire, one form of the passion for them from another, the modern consciousness of development being determined by the circumstances of time and place. In the Byzantine empire, indeed, the link of continuity is often lost, and much such work as is preserved finds vent in the palae copies of Lucian published in Adolf Eilissen's Analyse. The first really important satire, however, is a product of western Europe, recurring to the primitive form of fabula, upon which tool the same character as the "Satyr of Trimalchio". John Fox, a genuine expression of the shrewd and homely Teutonic mind, is a landmark in literature. It gave the beast-epic a development of
SATISFACTION

which the ancients had not dreamed, and showed how ridicule could be conveyed in a form difficult to resent. About the same time, however, seeing in the work of Ficino the germs of a new era of Rabblerous literature, fashioned Moroff, the prototype of Sancho Panza, the incarnation of sublunar mother-wit contrasted with the starchy wisdom of Solomon; and the Tii Eulenspiegel is a kindred Text. Their work marked the beginning of a new epoch in satire. The next great work of the class, adapts the apocalyptic machinery of monastic and anchoritic visions to the purposes of satire, as it had often before been adapted to those of ecclesiastical agrarianism. The works of the two men are not unlike; the Moroff, however, is too earnest to be urbane. Satire is a distinct element in Chaucer and Boccaccio, who nevertheless cannot be ranked as satirists. The mores of the age, the licence of the public, and the polity of the songs of the 14th and 15th centuries attest the diffusion of a sense of humour among the people at large. The Renaissance, restoring the knowledge and encouraging the imitation of classic models, changed the character of the comic by that of the pastoral. Partly, perhaps, because Erasmus was no poet, the Lucianic dialogue was the form in the ascendant of his age. Erasmus not merely employed it against superstition and ignorance with infinite and irresistible pleasantry, but fired by his example a bold writer, untramelled by the dignity of an arbiter in the republic of letters. The ridicule of Ulric von Hutter's Epitobolus obscurorum virorum is annihilating and the process the first time for a long time, though long previously introduced by Plato, of putting the ridicule into the mouth of the victim, is perhaps the most deadly shaft in the quiver of sarcasm. It was afterwards used with even more pointed wit by Rabelais, with the inevitable overwroughtness of the modern example, if Dante may not be so classed of a great tragic satirist. Ethical satire is vigorously represented by Sebastian Brant, who founded a new class of satirical literature; the metrological satirists of the age seem tame in comparison with Erasmus and Hutter, though including the great name of Machiaveli. Sir Thomas More cannot be accounted a satirist, but his idea of an imaginary commonwealth embodied the germ of much subsequent satire. In the succeeding periods politics take the place of literature and religion, producing in France the Satire Ménippe, elsewhere the satirical romance as represented by the Argosy of Fables, which may be defined as the adaptation of the style of Petronius to state affairs. In Spain, where no freedom of criticism existed, the satiric side of the national character is more marked, Cortez, where the poet and the ancestor of Fielding: Quevedo revived the medieval device of the vision as the vehicle of reproof; and Cervantes immortal work might be classed as a satire were it not so much about. About the same time we notice the appearance of direct imitation of the Roman satirists in English literature in the writings of Donne, Hall and Marston, the further elaboration of the mock-heroic by Tassoni, and the culmination of classical Italian satire in Salvador Rosa. The prodigious development of the drama at this time absorbed much talent that would otherwise have been devoted to satire proper. Most of the great dramatists of the 17th century were more or less693 lly engaged in satirical enterprises, even their plays not marked, but, with an occasional exception like Les Precieuses ridicules, the range of their works is too wide to admit of their being regarded as satires. The next great example of unalutated satire is Butler's Hudibras of which there is no need to say more. The last word, and methods cannot easily be found. At the same period dignified political satire, bordering on invective, received a great development in Andrew Marvell's Advice to a Painter, and was shortly afterwards carried to the starkest of its form in Dryden's Absalom and Achitophel: a fact that the light literary parody of which Aristophanes had given the pattern in his assaults on Euripides, and which Shakespeare had handled somewhat carelessly in his Midsummer Night's Dream, was effectively revived in the duke of Buckingham's Rehearsal. In France Boileau was long held to have attained the ne plus ultra of the Horatian style in satire and of the mock-heroic, but Pope was soon to place himself in the first rank of both. The point and concentration of Pope remain unsurpassed, as do the calm of Addison and the daring yet severely logical imagination of Swift; while the History of John Bull and the Pseudos were place the first in the field of political satirists. The 18th century was, indeed, the age of satire. Serious poetry had for the time worn itself out; the most original geniuses of the age, Swift, Defoe and Richardson, are decidedly prosaic, and Pope, though a true poet, is less of a poet than Dryden. In process of time imaginative power revives in Goldsmith and Rousseau; meanwhile Fielding and Smollett have fitted the novel to be vehicle of satire and of the comic. We are still more directly interested; Swift, wholly engrossed by a colloquial satirist, a man who has dared to universal application of Shaftesbury's maxim that ridicule is the test of truth. The world had never before seen a satirist of the first rank of the eighteenth century, one who could be called a genius. With English humorists, statesmen and philosophers. English humour also played an important part in the literary regeneration of Germany, where, after Liscow and Rabener, imitators of Swift and the essaysists, Lessing, imbued with Pope but not mastered by him, showed how powerful an auxiliary satire can be to criticism—a relation which Kortum's Josephid, a most humorous fnom, innovates successfully to Auguste Comte, the founder of modern sociology. The balance of the French schools, Diderot and Voltaire, also, have not neglected the subject of burlesque. Goethe and Schiller, Scott and Wordsworth, are now at hand, and as imagination gains ground satire declines. Byron, who in the 18th century would have been the greatest satirist, was a critic and a poet, a political satirist, a novelist of the next generation, bequeathing, however, a splendid proof of the possibility of satirical art with sublimity in his Vision of Judgment. Moore gives us an impression of the English satirist. In his time, the general spirit of the age, the political spirit of the nation, are seized; and the faults and follies he chastises are those especially characteristic of British society. Good sense and the perception of the ridiculous are amalgamated in him: his satire is a thoroughly British form of the ancient art, a vehicle for truth, not for the slinging of rapid and one-time jest before a crowd and the bringing of the private wit to the public stage. He also imitated the political art, though, of course, the political satire of his time is of some importance in itself; and it was, in the main, the social satire of the age. It was, in the main, not the political satire of the age. It was, in the main, not the political satire of the age. It was, in the main, not the political satire of the age. It was, in the main, not the political satire of the age.

Satisfaction (Lat. satisfacere, to satisfy), to satisfy for an injury or offence; payment, pecuniary or otherwise, of a debt or obligation; particularly, in law, and equitable doctrine of much importance. It may operate either as between strangers or as between father and child. As between strangers: it was laid down in Talbot v. Duke of Shrewsbury, 1714, Pr. Ch. 394, that where a debtor bequeathed to his creditor a legacy as great as, or greater than the debt, the legacy shall be deemed a satisfaction of the debt. This rule, however, has fallen under a considerable amount of discussion, and is generally required to rebut the presumption of satisfaction. If the debt was incurred after the execution of the will, there is no satisfaction, nor is there where the will giving the legacy contains a direction to pay debts. As between parent and child, the doctrine operates (a) in the satisfaction of legacies by portions, and (b) of portions by legacies. In the case of (a), it has been laid down that where a parent, or one acting in loco parentis, gives a legacy to a child, without stating the purpose for which he gives it, it will be understood as a portion; and if the father afterwards advance a portion on the marriage, or preference
in life, of that child, though of less amount, it is a satisfaction of the whole, or in part. This application of the doctrine is based on the maxim that "equality is equity," as is also the rule (6) that where a legacy bequeathed by a parent, or one in loco parentis, is as great as, or greater than, a portion or provision previously secured to the child, a presumption arises that the legacy was intended by the parent as a complete satisfaction. In each of the above cases, of course, the presumption may be rebutted by evidence of the testator's intentions.

In theology, the doctrine of satisfaction is the doctrine that the sufferings of Christ are accepted by the divine justice as a substitute for the punishment due for the sins of the world (see ATONEMENT).

**SATNA,** a British station in Central India, within the state of Rewah, with a station on the East Indian railway, 102 m. S.W. from Allahabad. Pop. (1901) 7477. It is the headquarters of the political agency for Baghelkhand, and an important centre of trade.

**SATPURA,** a range of hills in the centre of India. Beginning at the lofty plateau of Amarkantak (about 82° E.), the range extends westward almost to the W. coast. From Amarkantak an outer ridge runs S.W. for about 100 m. to a point known as the Satekeli hills in Balaghat district. As it proceeds westward the range narrows from a broad tableland to two parallel ridges enclosing the valley of the Tapti, as far as the famous hill-fortress of Asirgarh. Beyond this point the Khandesh hills, which separate the valley of the Nerbudda from that of the Tapti, complete the chain as far as the Western Ghats. The mean elevation is about 2500 ft.; but the plateaus of Amarkantak and Chauradarad in the east of Mandla district rise to nearly 3500 ft., and many of the peaks and some of the tablelands exceed this altitude. The hill of Khamla in Betul district is 3750 ft., which is also the general height of the Chikaldih hills overlooking the Berar plain, while the Pachmari hills east of Betul, rising abruptly from the Nerbudda valley, culminate in Dhoogarh at an elevation of 4500 ft. Just east of Asirgarh there is a break in the range, through which passes the railway from Bombay to Jubbulpore, the elevation at this point being about 1240 ft. The extreme length of the range is about 600 m.; the breadth, which is 100 m. at its head across Balaghat and Mandla, diminishes to the narrow ridges of Nimar.

**SATRAE,** in ancient geography, a Thracian people, inhabiting part of Mount Pangaesus between the rivers Nestus (Mestta) and Strymon (Struma). According to Herodotus, they were independent in his time, and had never been conquered within the memory of man. They dwell on lofty mountains covered with forests and snow, and on the highest of these was an oracle of Dionysus, whose utterances were delivered by a priest. They were the chief workers of the gold and silver mines in the district. Herodotus is the only ancient writer who mentions the Satrae, and Tomasekhe regards the name not as that of a people but of the warlike nobility among the Thracian Dii and Bessi. J. E. Harrison and others identify them with the Satyri (Satyrus), the attendants and companions of Dionysus in his revs, and also with the Centaurs. The name Satareketa, a Thracian tribe according to Heckets (quoted in Stephanus of Byzantium), seems to support the second identification.

See Herodotus, Hist. XII, 12; J. E. Harrison, Prolegomena to Greek Religion (1903), p. 379; W. Tomasekhe, Die alten Thraer (1893).

**SATRAP** [Pers. Kškhatropavān, i.e. "protector (superintendent) of the country (or district)"] Heb. sakhshādōrān, Gr. ἐξαρτάτος (insc. of Milletus, Sitzungsber. Berl. Ak. 1900, 112), ἐξαρτάτων (insc. of Mysia, Dittenberger, SYLLOGE, 95), ἐξαρτάτος (insc. of Mysia Lebas.iiii. 388, Theopomp. P. 117), shortened into ἐσχατηρής, in ancient history, the name given by the Persians to the governors of the provinces. By the earlier Greek authors (Herodotus, Thucydides, and often in Xenophon) it is rendered by ἑφαρμος "lieutenant, governor" in the documents from Babylonia and Egypt and in Ezra and Nehemiah by ὑφόκα, "governor"; and the satrap Mazaeus of Cilicia and Syria in the time of Darius III. and Alexander (Arrian iii. 8) calls himself on his coins "Mazaid, who is [placed] over the country beyond the Euphrates and Cilicia." Cyrus the Great divided his empire into provinces; a definitive organization was given by Darius, who established twenty great satrapies and fixed their tribute (Herodot. iii. 89 sqq.). The satrap was the head of the administration of his province; he collected the taxes, controlled the local officials and the subject tribes and cities, and was the supreme judge of the province to whose "chair" (Nehem. iii. 7) every civil and criminal case coming before him was referred. He was responsible for the safety of the roads (cf. Xenophon, Anab. i. 9. 13), and had to put down brigands and rebels. He was assisted by a council of Persians, to which also provincials were admitted; and was controlled by a royal secretary and by emissaries of the king (esp. the "eye of the king"). The regular army of his province and the fortresses were independent of him and commanded by royal officers; but he was allowed to have troops in his own service (in later times mostly Greek mercenaries). The great provinces were divided into many smaller districts, the governors of which are also called satraps and hyparchs. The destruction of these provinces was changed occasionally, and often two or more were given to the same man. When the empire decayed, the satraps often enjoyed practical independence, especially as it became customary to appoint them also as generals in chief of their army district, contrary to the original rule. Hence rebellions of satraps became frequent from the middle of the 5th century; under Artaxerxes II. occasionally the greater part of Asia Minor and Syria was in open rebellion. The last great rebellions were put down by Artaxerxes III. The satrapic administration was retained by Alexander the Great for the East which he intended to make a Seleucid empire, where the satrap generally is designated as strategus; but their provinces were much smaller than under the Persians.

In later times the cult of a god Satrapes occurs in Syrian inscriptions from Palmyra and the Hauran; by Pausanias vi. 25, 6, Satrapes is mentioned as the name of a god who had a cult and a statue in Els and is identified with Korybas. The origin of this god is obscure; perhaps it arose from a cult connected with a statue or a tomb of some satrap.

See further under PERSIA: Ancien History, from the Achaemenid period onwards, and works there quoted (especially section v. § 2).

(ED. M.)

**SATRICUM** (mod. Conca), an ancient town of Latium, situated some 30 m. to the S.E. of Rome, in a low-lying region to the S. of the Alban Hills, to the N.W. of the Pontine Marshes. It was accessible direct from Rome by a road running more or less parallel to the Via Appia, to the S.W. of it. It is said to have been an Alban colony: it was a member of the Latin league of 499 B.C. and became Volscian in 488. It was several times won and lost by the Romans, and twice destroyed by fire. After 346 B.C. we hear of it only in connexion with the temple of Mater Matuta. A. Nilby (Annales della carta dei dintorni di Roma, rome, 1848, iii. 64) was the first to fix the site upon the low hill, surrounded by tufa cliffs, on which were still scanty remains of walling in rectangular blocks of the same material, which is now occupied by the farm-house of Conca. One mile W.N.W., on the hill above Le Ferriere, remains of an archaic temple, ascribed to Mater Matuta, were discovered by excavation in 1896. The work was begun under the direction of Professor H. Grallot of the University of Bordeaux, member of the French School of Rome, but after two weeks' work was suspended by order of the Italian government, and then resumed under the supervision of their own officials. The objects discovered are in the Museo di Papa Giulio to Rome. Another Satricum lay on the right bank of the Liris, not far from Arpinum.

See H. Grallot in Mélanges de l'école française de Rome (1896), 131; and Notizie degli scavi (1896), passim. (T. As.)

**SATSUMA ISLANDS,** a group of islands belonging to Japan, lying westward of the province of Satsuma (34° 40' N. and 129° 40' E.). The two principal are Kami-Koshiki-shima (24 m. by 5), and Shimo-Koshiki-shima (84 m. by 5).

**SATTERLEE, WALTER** (1844-1908), American figure and genre painter, was born in Brooklyn, New York, on the 18th of January 1844. He graduated at Columbia University in 1863, studied in the National Academy of Design, and with Edwin
Italy, where he ruled as king in the golden age and gave the name Saturnia to the country. 4 Janus, another of the most ancient gods of Italy, is said to have welcomed him to Rome, and here he settled at the foot of the Capitol, which was called after him the Janiculum. His temple stood at the ascent from the Forum to the Capitol, and one of the buildings of the temple was called the House of the Dead. The temple was not simply a place of sacrifice, but the eight remaining columns of the temple probably formed a portion of a new temple built in the imperial times. The image of Saturn in this temple had woolen bands fastened round its feet all the year through, except at the festival of the Saturnalia; the object of the bands was probably to detain the deity. Similarly there was a fettered image of Enyalius (the War God) at Sparta, and at Athens the image of Victory had no wings, lest she might fly away. The mode of sacrifice at this temple was far peculiar that the head of the sacrificer was bare as in the Greek ritual, instead of being covered, as was the usual Roman practice. Legend said that the Greek ritual was introduced by Hercules, who at the same time abolished the human sacrifices previously offered to Saturn. Others said that the rule had been observed by the Pelasgians before. Under or behind the temple was the Roman treasury, in which the archives as well as the treasures of the state were preserved. Dionysius Halicarnassensis (Ant. Rom. 1. 34) tells that there were many sanctuaries of Saturn in Italy and that many towns and places, especially mountains, were called after him. The oldest national form of Saturn was known as the Saturnian. Many other figures in Roman mythology, Saturn is said to have vanished, at last from earth. His emblem was a sickle. The substitution, of a great scythe for the sickle, and the addition of wings and an hour-glass, are modern. 5 Ops ("plenty "), wife of Saturn, was an earth-goddess, as appears from the custom observed by her suppliants of sitting and carefully touching the earth while they made their vows to her. As goddess of crops and the harvest, she was called Consiva, and under this name had a sanctuary at Rome, to which only the Vestals and the priest were admitted. As a goddess of the time of the year, she was worshipped with Rhea. Another goddess mentioned as wife of Saturn was Lua, a goddess of barrenness. She was one of the deities to whom after a victory the spoils of the enemy were sometimes dedicated, and burned.

Saturnalia.—This, the great festival of Saturn, was celebrated on the 19th, but after Caesar's reform of the calendar on the 17th, of December. Augustus decreed that the 17th should be sacred to Saturn, and that on that day the(Vespasian and Titus, in 9 and 35 A.D., instead of the 17th and 18th were devoted to the Saturnalia, and the 19th and 20th to the Opalia, a festival of Ops. 1 Caligula added a fifth day, the day of youth (diei juventutis), devoted to the god of the time of the young. But in popular usage the festival lasted seven days. The woolen fetters were taken from the feet of the image of Saturn, and each man offered a pig. During the festival schools were closed; no war was declared or battle fought; no punishment was inflicted. In the place of the toga an undress garment (synthesis) was worn. Distinctions of rank were laid aside: slaves sat at table with their masters or were waited on by them, and the utmost freedom of speech was allowed them. Gambling with dice, at other times illegal, was now permitted. All classes exchanged gifts, the commonest being wax tapers and clay dolls. These dolls were especially given to children, and the makers of them held a regular fair at this time. Varro thought these dolls represented original sacrifices of human beings to the infernal gods. There was, as we have seen, a tradition that human sacrifices were once offered to Saturn, and that these sacrifices were performed by the nation together, and at Carthage. The Cronus to whom human sacrifices are said to have been offered in Rhodes was probably a Baal, for there are traces of Phoenician worship in Rhodes. It may be conjectured that the Saturnalia was originally a celebration of the winter solstice. Hence.

He is said to have taught the inhabitants of Latium agriculture, the art of navigation and the use of stamped pieces of metal for money.

4 He is said to have taught the inhabitants of Latium agriculture, the art of navigation and the use of stamped pieces of metal for money.

5 During the first centuries of the Christian era, Saturn was one of the chief popular divinities of northern Africa, representing the Carthaginian Baal under the title of the Saturnian. See Toutain, De Saturni in Africa Romana cultu (1894).

6 There was also a special festival, Opconinsula, on August 25.

7 The fourth day of the festival was added by some unknown authority.

8 It is curious to find a similar rule with a similar exception in Nepal. See H. A. Oldfield, Sketches from Nepal, vol. ii, pp. 353 sq.
the legend that it was instituted by Romulus under the name of the Romia (from winter solstice). The prominence given to candles at the festival points to the custom of making a new fire at this time. The custom of solemnly kindling fires at the summer solstice, the Eve of Saint John, is also found in most of Europe, notably in Germany, and there are traces (of which the yule-log is one) of the observance of a similar custom at the winter solstice. In ancient Mexico a new fire was kindled, amid great rejoicings, at the spring equinox.

The designation of the planets by the names of gods is at least as old as the 4th century B.C. The first certain mention of the star of Cronus (Saturn) is in Aristotle (Metaphysics, p. 1073 b. 35). The name also occurs in the Epitome (p. 687 b), a dialogue of Cicero. The date, generally ascribed to Plato. In Latin, Ciceró (1st century B.C.), is the first author who speaks of the planet Saturn. The application of the name Saturn, ascribed to the planet at a certain time, is first found in Tullius (i. 3, 18).

**SATURN**, in astronomy, the sixth major planet in the order of distance from the sun, and the most distant one known before the discovery of Uranus in 1781. Its symbol is S. Its periodic time is somewhat less than 30 years, and the interval between oppositions is from 12 to 13 days greater than a year. It appears as a star of at least the first magnitude, but varies much in brightness with its orbital position, owing to the varying phases of its rings. It seems to resemble Jupiter in its physical constitution, but the belts and cloud-like features so conspicuous on that planet are so faint on Saturn that they can be seen only in a general way as a slight mottling. In colour the planet has a warmish tint, not dissimilar to that of Arcturus. Its density is less than that of Saturn, being only 13% of that of the earth, and this is probably due to the absence of water.

Owing to the difficulty of distinguishing any individual feature, the rotation of the planet has been observed only on a few rare occasions when a temporary bright spot appeared and continued during several days. The first observation of such a spot was made by the elder Herchel, who derived a rotation period of 10 h. 16 m. In December 1786 a bright spot appeared near the equator of the planet, which was observed by Asaph Hall at Washington for more than a month. It gradually spread out in longitude, and finally faded away. The time of rotation found by Hall was 10 h. 16 m. Saturn is 4° north of the equator on the northern hemisphere, and had a rotation period of about 10 h. 35 m. The deviation of this period from the others indicates that, as in the case of Jupiter and the sun, the time of rotation is least at the equator, and increases toward the poles. Both from this difference and from the appearance presented by the planet it is clear that the visible surface is not a solid, as in the case of Mars, but consists of a layer of cloudy or vaporous matter, which conceals from view the solid body of the planet, if any such exists. Owing to the rapid rotation the figure of the disk is not symmetrical, but when, owing to the rings being separated by sidewise, the entire disk is visible, the latter sometimes seems to have the form of a square with its edges rounded off. This may be an illusion.

The most remarkable feature associated with Saturn is its magnificent system of ring and satellites. The former is unique in the solar system. The ring, the seeming ends of which were first seen by Galileo as handles to the planet, was for some time a mystery. After Galileo had seen it at one or two oppositions, it faded from sight, a result which we now know was due to the advancement of the observer in its orbit, bringing our line of sight edgewise to the ring. When it reappeared, Galileo seemed to have abandoned telescopic observation, but the "ansa" of Saturn remained a subject of study through a generation of his successors without any solution of their mystery being reached.

The truth was at length worked out in 1656 by Huygens, who first circumscribed his solution in the form of an anagram. When arranged in order the letters read:

- Anulo cingitur tenel plano, nasquam coaherente, ad eclipticam inclinato.

This designation of a plain thin ring surrounding the planet, the 'lens' separated from it, and inclined to the ecliptic, is accurate and as complete as the means of observation permitted.

The varying phases presented by the ring arise from its having an inclination of 27° to the orbit of the planet, while its plane remains invariable in direction as the planet performs its orbital revolution. There are three periods of change in the appearance of the rings, in which the change of appearance is produced by the variation of the plane of the ring passing through the sun, and is seen nearly edgewise from the earth. At the two intermediate points the ring is seen as opened out at an angle of 27°. The apparent illuminated portion of the ring is visible at the time of the first opposition, when it is 99% of the ring, and at the time of the second opposition, when it is 98.6% of the ring.

The demonstration of the existence of a ring surrounding Saturn was continued in the opposition of 1667, when the bright spot of the same kind as that observed by Huygens in 1656 was seen, and the rings were seen to be edgewise. In the opposition of 1681, the ring was seen in an inclination of about 28°, and in the opposition of 1690, it was seen in an inclination of about 50°. At the opposition of 1698, the ring was observed in an inclination of about 60°, and in the opposition of 1702, it was observed in an inclination of about 70°. The rings were seen to be edgewise at the oppositions of 1692, 1704, and 1722, and in the opposition of 1739, the ring was seen in an inclination of about 80°.

The rings of Saturn are of two kinds, one a part of the planet, and the other a separate portion of matter. The former are designated as "inner" and "outer" rings, and the latter as "main" and "secondary" rings. The inner rings are the most prominent, and are visible to the naked eye. The outer rings are much more subtle, and can only be seen with the aid of a telescope.

The appearance of the rings is due to the fact that the planet is surrounded by a system of rings, consisting of countless particles of matter, which are held together by their mutual gravitation. The rings are composed of particles of matter of various sizes, and are distributed in a circular path around the planet. The rings are not uniform in thickness, and are thickest at the equator of the planet.

The brightness of the rings is due to the fact that the particles of matter are distributed in a circular path around the planet. The rings are not uniform in thickness, and are thickest at the equator of the planet.

The five inner satellites seem to form a class by themselves, of which the distinguishing feature is that the orbits are so nearly circular that no eccentricity has been definitely noted in them, and that the planes of their orbits coincide with that of the ring and, it may be inferred, with the plane of the planet’s equator. Thus, so far as the position of the planes of rotation and revolution are concerned, the system keeps together as if they were rigid. This results from the mutual attraction of the various bodies. A remarkable feature of this inner system is the near approach to commensurability in the periods of revolution. The period of Tethys is nearly double that of Mimas, and the period of Enceladus nearly double that of Dione. The result of this near approach to commensurability is a wide libration in the longitudes of the satellites, having periods very long compared with the times of revolution.

Each of the four outer satellites has some special feature of interest. Titan is much the brightest of all and has therefore been most accurately observed. Hyperion is so small as to be visible only in a large telescope, and has a quite eccentric orbit. Its time of revolution is almost commensurable with that of Titan, the ratio of the period being 3to4. The result is that the major axis of the orbit of Hyperion has a retrograde motion of 18° 40′ annually, of such a character that the conjunction of the two satellites always occurs near the apocentre of the orbit, when the distance of the orbit from that of Titan is the greatest. This is among the most interesting phenomena of celestial mechanics. Japetus has the peculiarity of always appearing brighter when seen to the west of the planet than when seen to the east. This is explained by the supposition that, like our moon, this satellite always presents the same face to the central body, and is darker in colour on one side than on the other.

In studying a series of photographs of the sky in the neighbourhood of Saturn, taken at the branch Harvard observatory at Arequipa, Peru, W. H. Pickering found on each of three plates a very faint star which was missed in the other two. He concluded that these were the images of a satellite moving around the planet. The latter was then entering the Milky Way, where minute stars were so numerous that it was not easy to confirm the discovery. When the planet began to emerge from the Milky Way no difficulty was found in locating the object, and proving that it was a ninth satellite. Its motion was found to be retrograde, a conclusion confirmed by Frank E. Ross. This phenomenon may be regarded as unique in the solar system, for, although the motion of the satellite of Neptune is retrograde, it is only the known satellite of that planet.

Another extremely faint satellite has probably been established by Pickering, but its orbit is still in some doubt.

The conclusions from the spectrum of Saturn, and numerical particulars relating to the planet, are found in the article PLANET. The planes of the orbits of the inner six satellites are coincident with the plane of the ring system, of which the elements are as follows:

- **Longitude of ascending node on ecliptic**: 165° 43′ 27″
- **Inclination**: 28° 10′ 22″
- **Exterior diameter of outer ring, in miles**: 60,000
- **Interior diameter of outer ring**: 53,000
- **Breath of outer bright ring**: 9,625
- **Breath of division between the rings, in miles**: 6,600
- **Breath of inner bright ring**: 17,000
- **Breath of dark ring**: 8,660
- **Breath of system of bright rings**: 28,910
- **Breath of entire system of rings**: 37,570
- **Space between planet and dark rings**: 9,370

SATURNIA (mod. Saturnia), an ancient town of Etruria Italy, about 23 m. N.E. of Orbetello and the coast. Dionysius of Halicarnassus enumerates it among the towns first occupied by the Pelasgi and then by the Etruscans. A Roman colony was conducted there in 183 B.C., and it was a profectura, but otherwise little is known about it. Remains of the city walls, in the polygonal style, still exist, to which Roman gates were added. Roman remains have also been discovered within the town, and remains of tombs outside, originally covered by tumuli which have now disappeared, so that Dennis wrongly took them for megalithic remains. Pitigliano, some 12 m. to the S.W., is another Etruscan site.

See G. Dennis, Cities and Cemeteries of Etruria (London, 1882), i. 496; ii. 275; A. Pasquini in Notizia degli scavi (1882), 52.

SATURNIAN METRE (Lat. Saturnius, i.e. which relates to Saturn), the name given by the Romans to the crude and irregular measures of the oldest Latin folk-songs. The scansion is generally of the following type: 

with which Macaulay compares the nursery rhyme. “The Queen was in her parlour, eating bread and honey.” There was, however, considerable licence in the scansion, and we can gather only that the verse was generally of this type, and had a light and vivacious movement. It occurs in a few inscriptions (the verses on the stones of the Scipios: cf. Bücheler, Anthologia Latina, 1895) in fragments, Livius Andronicus and the Bellum Punicum of Naevius. Subsequently it was ousted by Greek metres. The question as to whether it depended upon accent or upon quantity has been much discussed.

See Keller, Der saturniniache Vers (Prague, 1886 and 1887); Thurneysen, Der Saturninische Vers (Heidelberg, 1887); Hafet, De saturniniache Latioinorum versus (Paris, 1880); Müller, Der saturniniache Vers und seine Denkmäler (1888); Leo, Der saturniniache Vers (1905); Du Bois, Stress Accent in Roman Poetry (New York, 1906); also Mommsen, Hist. of Rome, i. chap. xxv.

SATURNINUS, LUCIUS APPULEIUS, Roman demagogue. As quaestor (104 B.C.) he superintended the importation of corn at Ostia, but had been removed by the Senate (an unusual proceeding), and replaced by M. Aemilius Scaurus (q.v.), one of the chief members of the government party. He does not appear to have been charged with incapacity or mismanagement,
and the injustice of his dismissal drove him into the arms of the popular party. In 103 he was elected tribune. He entered into an agreement with C. Marius, and in order to gain the favour of his soldiers proposed that each of his veterans should receive an allotment of 100 jugera of land in Africa. He was also chiefly instrumental in securing the election of Marius to his fourth consulship (102). An opportunity of retaliating on the nobility was afforded him by the arrival (101) of ambassadors from Mithra-
dates VI. of Pontus, with large sums of money for bribing the senate; compromising revelations were made by Saturninus, who insul led the ambassadors. He was brought to trial for violating the law of nations, and only escaped conviction by ad minis-
cordiam appeal to the people. To the first tribunate of Saturninus is probably to be assigned his law on majestas, the exact provi-
sions of which are unknown, but its object was probably to strengthen the power of the tribunes and the popular party; it dealt with the minuta majestas (diminished authority) of the Roman people, that is, with all acts tending to impair the integ-
ity of the Commonwealth, being thus more comprehensive than the modern word “treason.” One of the chief objects of Saturninus’s hatred was Q. Caecilius Metellus Numidicus, who, when censor, endeavoured to remove Saturninus from the senate on the ground of immorality, but his colleague refused to assent. In order to ingratiate himself with the people, who still cherished the memory of the Gracchi, Saturninus took up with him Equiti,
us, a paid freedman, who gave himself out to be the son of Tiberius Gracchus. Although the mother of the Gracchi refused to acknowledge him, the people stoned Metellus because he had charged the young man with not being a roman. The tribune afterwards declined to accept the office of quaestor after he had been elected tribune. Marius, on his return to Rome after his victory over the Cimbri, finding himself isolated in the senate, entered into a compact with Saturninus and his ally C. Servilius Glaccia, and the three formed a kind of triumvirate, supported by the veterans of Marius and the needy rabble. By the aid of bribery and assassination Marius was elected (100 consul for the sixth time, Glaccia praetor, and Saturninus tribune for the second time. Saturninus now brought forward an agrarian law, an extension of the African law already alluded to, which was passed that all the land north of the Padus (Po) lately possessed by the Cimbri included, that of the inde-
pendent Celtic tribes which had been temporarily occupied by them, should be held available for distribution among the veterans of Marius. This was unjust, since the land was really the property of the provincials who had been dispossessed by the Cimbri. Colonies were to be founded in Sicily, Achaea and Macedonia, on the purchase of which the “Tolosan gold,” the temple treasures embroiled by Q. Servilius Caepio (praetor 110), was to be employed. Further, Italians were to be admitted to these colonies, and as they were to be burgess colonies, the right of the Italians to equality with the Romans was thereby partially recognised. This part of the bill was resisted by many citizens, who were unwilling to allow others to share their privileges. A clause provided that, within five days after the passing of the law, every senator should take an oath to observe it, under penalty of being expelled from the senate and heavily fined. All the senators subsequently took the oath except Metellus, who went into exile. Saturninus also brought in a bill, the object of which was to gain the support of the rabble by supplying corn at a nominal price. The quaestor Q. Servilius Caepio appeared to have despaired of the passage of the law, and Saturninus’s own colleagues interposed their veto. Saturninus ordered the voting to continue, and Caepio dispersed the meeting by violence. The senate declared the proceedings null and void, because thunder had been heard; Saturninus replied that the senate had better remain quiet, otherwise the thunder might be followed by hail. The bills (leges Appuleia) were finally passed by the aid of the Marian veterans. 
Marius, finding himself overshadowed by his colleagues and compromised by their excesses, thought seriously of breaking with them, and Saturninus and Glaccia saw that their only hope of safety lay in their retention of office. Saturninus was elected tribune for the third time for the year beginning the 10th of December 100, and Glaccia, although at the time praetor and therefore not eligible until after the lapse of two years, was a candidate for the consulship. M. Antonius the orator was elected without opposition; the other government candidate, Gaius Memmius, who seemed to have the better chance of success, was beaten to death by the hired agents of Saturninus and Glaucia, while the voting was actually going on. This produced a complete revulsion of public feeling. The senate met on the following day, declared Saturninus and Glaucia public enemies, and called upon Marius to defend the State. Marius had no alternative but to obey. Saturninus, defeated in a pitched battle in the Forum (Dec. 10), took refuge with his followers in the Capitol, where, the water supply having been cut off, they were forced to capitulate. Marius, having assured them that their lives would be spared, removed them to the Curia Hostilia, intending to proceed against them according to law. But the more impetuous members of the aristocratic party climbed on to the roof, stripped off the tiles, and shoted Saturninus and many others to death. Glaucia, who had escaped into a
house, was dragged out and killed.

SATYRS (Satyri), in Greek mythology, spirits, half-man, half-
beast, that haunted the woods and mountains, companions of Pan and Dionysus. They are not mentioned in Homer; in the fables of Herodotus they are depicted as nympha, nymphs and Curetes, an idle and worthless race. Fancy represented them as strongly built, with flat noses, pointed ears, small horns growing out of the forehead, and the tails of horses or goats. They were a rogish but faint-hearted folk, lovers of wine and women, roasting to the music of pipes and cymbals, castanets and bagpipes, dancing with the nymphs or pursuing them and striking terror into men. They had a special form of dance called Sitthis. In earlier Greek art they appear as old and ugly, but in later art, especially in works of the Attic school, this savagery is softened into a more youthful and graceful appearance.

They were credited with the invention of the satyr-play, the first play of which a work of Praxiteles, representing a graceful satyr leaning against a tree with a flute in his hand. In Attica there was a species of drama known as the Satyric; it parodied the legends of gods and heroes, and the chorus was composed of satyrs. Euripides’s play of the Cyclops is the only extant example of this kind of drama. The older satyrs were called Sileni, the younger Satyrici. By the Roman poets they were often confounded with the Fauns. The symbol of the shaggy demon satyr was the hare. In some districts of modern Greece the spirits known as Callcantsars offer points of resemblance to the ancient satyrs; they have goats’ ears and the feet of asses or goats, are covered with hair, and love women and the dance. The herdsmen of Parnassus believe in a demon of the mountain who is lord of hares and goats.

In the Authorized Version of Isa. xiii. 21, xxxiv. 14 the word “satyr” is used to render the Hebrew ś’îrīm, “pashers.” A Kind of demon or supernatural being known to Hebrew folklore as inhabiting waste places is meant; a practice of sacrificing to the ś’îrīm is alluded to in Lev. xvii. 17; importation. The Cynics and V. p. 20 “devils. They correspond to the on

shaggy demon of the mountain-pass” (wadd el-akaba) of Arabian superstition.

SAUCE, flavouring or seasoning for food, usually in a liquid or semi-liquid state, either served separately or mixed with the dish. The preparation of suitable sauces is one of the essentials of good cookery. The word comes through the Fr. from the Lat. salsa, salted or pickled food (salver, to season or sprinkle with salt, salt). The same Latin word has also given “saucer,” properly a dish for sauce, now a small flat plate with a depressed centre to hold a cup and so prevent the spilling of liquid, and
SAUERLAND—SAUL

"sausage" (O. Fr. saucisse, Late Lat. salicium), minced seasoned meat, chiefly pork, stuffed into coverings of skin. The colloquial use of "saucy," imperient, "checky" is an obvious transfer from the tartsiness or pungency of a sauce, and has a respectable literary ancestry; thus Latimer (Misc. Sel.) when we see a fellow sturdy, lofty and proud, men say this is a saucy fellow.

SAUERLAND, a mountainous district of Germany, in the Prussian province of Westphalia, between the Sieg and the Ruhr, separated by the former from the Westerwald on the S., and by the latter from the coal formation of Arden on the N. It is a well-wooded plateau of the Devonian formation, diversified by deep valleys and tracts of heather land. The district is a favourite resort of tourists, who can enjoy the scenery of the Sauerland from the towns of Bielefeld, (Bühl), and Kneusbusch, (Dortmund, 1892).

SAUGOR, or Sagar, a town and district of British India, in the Jubbulpore division of the Central Provinces. The town, in a picturesque situation on a spur of the Vindhyan hills, 1758 ft. above sea-level, has a station on the Indian Midland railway. Pop. (1901) 42,330. It has long ceased to be a growing place, though it is still third in importance in the province. It was founded in 1669, but owes its importance to having been the capital of the Maharatta governor, who was established in the whole district was in the possession of the Mahabatta Pasha in 1818, the greater part of the present district was made over to the British; and the town became the capital of the Saugor and Nerudda Territories, then attached to the North-Western Provinces. During the Maharatta period of the entire district was in the possession of the rebels, excepting the town and fort, in which the Europeans were shut up for eight months, till relieved by Sir Hugh Rose. The rebels were totally defeated and order was again restored by March 1838. See the Sager District Gazetteer (Allahabad, 1907).

SAUBULAH, or Subulak, the principal town of the Mukri district, in the province of Azerbaijan in Persia, in a fertile valley, between 30 and 40 m. S. of Lake Urmia, at an elevation of 4270 ft. It has post and telegraph offices, and a population of about 7000, mostly Kurds of the Mukri tribe, and exports dried fruit, grain and tobacco. There are many more localities with this name (Turkish, meaning "cold stream") or "cold spring") in Persia, the most notable, after the above-mentioned Kurdish city, being a district of the province of Teheran, with many villages. The place was temporarily occupied by Turkish troops in January 1908.

SAUL (Heb. shá`ul, "asked"), in the Old Testament, son of Kish, and king of Israel.1 His history is closely interwoven with that of the prophet Samuel and the Judaean king David. Two distinct accounts are given of his rise. In one Samuel, after defeating the Philistines, rules as the last "judge" of Israel; the people demand a king, and Saul, a young giant of Benjamin, is chosen by lot. The story then describes how Saul delivers Jabs-Gilead from the Ammonites (1 Sam. i-ix., x. 17-27, xi., xii.). In the other, Saul is raised up by Yahweh to deliver Israel from a sore Philistine oppression. Samuel, a seer of local family previously unconnected with Saul, gives him the divine commission, and ultimately a complete victory is gained which is celebrated by the erection of an altar (ix. 1-8, xii. seq.). See further Samuel. Once king, Saul achieves conquests over the surrounding states, and the brief summary in 1 Sam. xiv. 47-51 may be supplemented by 2 Sam. i. 19 sqq., where the brave deeds of the loving pair Saul and his son Jonathan, and their untimely death, form the subject of an old poem which vividly describes the feelings of a prostrate nation. Saul and his sons fell in the battle on Mt. Gilboa in the north and the land was made a confusion. According to Pss. cxxix. 12-14, Jabs-Gilead's debt, secretly carried away the dead bodies (cf. 2 Sam. xiii. 12 seq.), and Abner the commander hurriedly recovered the surviving son, Ishboseth, to Mahanaim and at length succeeded in establishing his power over all Israel north of Jerusalem (2 Sam. ii. 8 seq.). But the sequel is lost in the more popular accounts of the rise of David.

Little old tradition is preserved of the house of Saul. The interest now lies in the prominence of Samuel, and more particularly in the coming supremacy of the Judaean king David (see the introductory verses of 1 Sam. iv. 5 seq.). As a result, Saul is depicted in less sympathetic colours; his pettiness and animosity stand in strong contrast to David's chivalry and resignation, and in the melancholy Benjamite court with its rivalry and jealousy, the romantic attachment between David and Jonathan forms the one redeeming feature. The great Israelite disaster is fore-shadowed in a thrilling narrative of Saul's visit to the famous Witch of Endor (1 Sam. xxviii.). Israel had lost its mainstay through the death of Samuel (cf. xii. 23), and the king, uneasy at the approach of the enemy, invoked the shade of the prophet only to learn that his cause was lost through his own sin. The incident is now connected with David's near-supremacy, and refers to a previous act of disobedience in his Amalekite campaign. In a detailed account of Saul's expulsion we learn that his failure to carry out Yahweh's commands to the letter had brought the prophet's denunciation (cf. I Abab, I Kings xx. 42), and that he had lost the divine favour (xv.). This in turn ignores an earlier occasion when Saul is condemned and the loss of his kingdom foretold ere he had accomplished the task to which he had been called (xii. 15). Therefore though the latest and most popular section of the history of Saul to that of David appears especially in a number of detailed and popular narratives encircling Judah and Benjamin, superseding older traditions which give an entirely different representation of David's move from the south to Jerusalem. Consequently it proves impossible to present a consistent outline of the history. Instead of the sequel to Ishbaal's recovery of power, and instead of David's incessant conflicts north of Hebron, ending with the capture of Jerusalem and its district from a strange people (2 Sam. v. xxi. 15-22, xxii. 8 seq.), we meet with the stories of the war with Benjamin and Israel, of the intrigue of Abner (q.v.) and the vengeance of Joab (q.v.). While Saul's death had left Israel in the hands of the Philistines, it is David who accomplishes the deliverance of the people (2 Sam. iii. 18, xix. 9). So, also, in accordance with his generous nature, David takes vengeance upon the Amalekite who had slain Saul (2 Sam. i. 6-10, contrast the details in 1 Sam. xxxi.), and upon the treacherous aliens who had murdered Ishbaal (iv.). When king at Jerusalem (seven years after Saul's death) he seeks out the survivors of Saul in order to fulfil his covenant with Jonathan. Jonathan's son Mephiboseth1 is found in safe-keeping east of the Jordan

---

1 Ishboseth, i.e. Ishbaal, "man of Baal," cf. 1 Chron. viii. 53.
2 For other explanations see 1 Chron. x. 13 seq. (which refers to 1 Sam. xxviii.), and Josephus Antiq. v. 3.44 (a reference to Saul's massacre of the priests at Nob, 1 Sam. xxii., a crime which is not brought to his charge in biblical history and probably belongs to the later tradition). Perhaps Meribaal, "man of Baal," or Meribbaal, "Baal contends"; for the intentional alteration of the name cf. note 2 above, and see Baal.
SAULT SAINTE MARIE—SAUMAREZ

and is installed at court (ix.). Another impression is given by the relations between David and Saul's daughter, Michal (vi. 16 seq., cf. also the "wives" in xii. 8), and we learn from yet another source that he handed over Saul's sons to the Gibeonites who had previously suffered from the king's bloodthirsty zeal (xii. 1-14). On this occasion (the date is quite uncertain) the remains of Saul and Jonathan were removed from Jabesh-Gilead and solemnly interred in Benjamin. During Absalom's revolt, Mephibosheth entertained some hopes of reviving the fortunes of his house (xvi. 1-4, xix. 24-30), and two Benjamites, Shim'ai and Sheba, appeared (xx. 9 seq.), xvi. 25, xvii. 27 that there is no evidence that the three independed figures whose presence indicates that Judaean supremacy over Israel was not accepted without a protest, and that the split blood of the House of Saul was laid upon the shoulders of David. Henceforth Saul's family disappears from the pages of history. But a genealogy of his descendants (1 Chron. viii. 33-40, ix. 39-44) tells of "mighty men of valor, archers," who with their sons number 150 strong, and this interesting post-exilic list is suggestive for the vitality of the traditions of their ancestors.

In iii. 19 there seems to be a reference to the date of the Exodus from Egypt. It is clear that the desperate state of Israel leaves little room for the quiet picture of the inexperienced youth wandering around in search of his father's asses, or for the otherwise valuable representation of popular cult at the beginning of the antiquarian account. Saul was called upon to deliver Israel, it is disconcerting to meet his grown-up son who slays the Philistine "garrison (rather "officer")" (Geba (Judg. x. 29) before the initiative in overrunning the Philistines (xiv. 16-17); yet the account which follows of Jonathan's violation of Saul's hasty vow and its consequences prepares us for the subsequent stories of the unfriendly relations between Saul and David, the son of Jesse, if ever there was a case of irremediable misunderstanding in the Israelite history.

The development of views regarding the pre-monarchical "judges," the dynasty of Saul and David, and the role of Philistine expansion in the history of Israel is not yet settled. It is certain that the growth of the Philistines, the strained circumstances of the people, and their penitent appeal to Yahweh, when at length Yahweh "could bear the misery of Israel no longer," it is evident that in the original conception there was a leaven raised to the judgment of Saul committed in the Danite Samson, the priest Eli, or the seer Samuel, and it is only in the history of Saul that Yahweh's answer to the people's cry leads to the appointment of the saviour. The traces of the older accounts of Saul's rise and the fragments in the highly composite introduction in Judg. x. (vii. 17, 8b, 10-16) agree so materially that unless both the prelude to the former and the sequel to the latter have been lost it is probable that the two were once closely connected, but have been severed in the course of time. The growth of the body of tradition has been a matter of some discussion, but the view that the older accounts have been factors quite as powerful as the growth of national tradition of the first king of Israel and the subordination of the narratives in order to give greater prominence to the first king of the Judaean dynasty, who was also its most illustrious, is practically abandoned. There were yet three great Israelite heroes (cf. Ahab, Jephthah, the wars of Arameans and Ammonites), Saul is pre-eminently a Benjamite figure. From the biblical evidence alone it is far from certain that this is the earlier phase. Saul's deliverance of Jabesh-Gilead from Amnon and his burial may suggest (on the analogy of Jephthah) that Gilead regarded him as his hero. Some connexion between Gilead and Benjamin may be inferred from Judg. xvi. and, indeed, the decimation of the latter (see ibid. xx. 4, 7, xxi. 13 seq.) seems to link the appearance of the tribe in the earlier history with its new rise under Saul. But the history of the tribe as such in this period is shrouded in mist, and it may be inferred that it was only in the reign of David that these secondary and purely local forms of the great founder of the Israelite monarchy, whose traditions contain features which link him now with another founder of Israel—the warrior Joshua, and now with Saul—were associated in a unified people.

See S. A. Cook, Critical Notes on O. T. History (Index, v. and art. Jews, §§ 6-8, Samuel (Books) (S. A. C.)

SAINT MARIE, a city and the county-seat of Chippewa county, Michigan, U.S.A., on Saint Mary's river, at the outlet of Lake Superior and at the E. end of the upper peninsula. Pop. (1850) 3766; (1860) 10,538, of whom 3529 were foreign-born; (1870) 22,123; (1880) 29,965; (1890) 53,298; (1900) 80,051; (1910) 87,052; (1920) 87,339; (1930) 89,111; (1940) 100,144; (1950) 114,227; (1960) 116,212; (1970) 126,296; (1980) 132,686; (1990) 136,293; (2000) 135,514; (2010) 133,179 and (2015) 131,011. It is the outlet of Great Lake Superior, bounded on the W. by Superior Peninsula, the Duluth, South Shore & Atlantic, and the Minneapolis, Saint Paul & Sainte Marie railways. A railway bridge (3607 ft. long, completed in 1887) and steam ferries connect it with the Canadian town of Sault Sainte Marie (pop. 1901, 7169) on the opposite side of the river. The principal buildings are the Court House, City Hall, Post Office, Custom House and Carnegie Library (1905). Fort Brady, in the south-western part of the city, is an infantry garrison; the old Ft. Brady (built about 1822) in another part of the city is still standing.

The river is here nearly 1 m. wide and falls 20 ft. in three-fourths of a mile; it has been made navigable by lock canals for vessels drawing less than 8 ft. of water by the North Western Company built a lock here in 1797-1798. A canal 5700 ft. long, navigable for vessels drawing 11 ft. draught, was completed by the state in 1855. Between 1870 and 1881 the Federal government widened the canal to 100 ft., making a lock 150 ft. long but the drainage and route of the locks and the construction of a new lock, 1350 ft. long between gates and having a draft of 24-5 ft. at extreme ends. The annual cost of the locks is $6,000,000. In 1907 the commerce passing here during the navigation season of eight months and twenty-three days amounted to $8,217,214 tons of freight, valued at more than $600,000,000; the commerce passing through the canals at this point is larger than that of any other canal in the world. There is a ship canal (14 m. long) on the Canadian side of the river, which was completed in 1895 at a cost of $3,750,000. From the rapids opposite the city two water-power plants (of 36,000 and 10,000 h.p. respectively) derive their power; the larger, a hydraulic water-power canal (costing, with power equipment, $6,500,000) is 14 m. long, and extends from the lake to a point a little over a mile above the rapids. These plants have 320 turbines. The total value of the factory product in 1904 was $2,412,821, an increase of 231-3% over that of 1900. Much hay and fish are packed and shipped here.

The place was long a favourite fishing-ground of the Chippewa Indians. It was visited by the French missionaries Rambault and Jougues in 1641 and by Père René Ménard in 1660. In 1668 Jacques Marquette founded a mission here. In 1669 the governor-general of New France called a great council of the Indians here and in the name of the king of France took formal possession of all the country S. to the Gulf of Mexico and W. to the Pacific. The mission was abandoned in 1689; but as a trading post of minor importance—for a time protected by a palisade fort—the settlement was continued. In 1870 Sault Sainte Marie was incorporated as a village; in 1887 it was charted as a city.

SAUMAREZ, JAMES SAUMAREZ [or SAUMAREZ], BARON DE (1610-1686), English admiral, was descended from an old family, and was born at St Peter Port, Guernsey, 11th of March 1617. Many of his ancestors had distinguished themselves in the naval service, and he entered it as midshipman at the age of thirteen. For his bravery at the attack of Charleston in 1776 on board the "Bristol" he was raised to the rank of lieutenant, and he was promoted commander for his gallant services on the Dogger Bank, 5th of August 1781, when he was wounded. In command of the "Russell," 70, he contributed to Rodney's victory over De Grasse (12th of April 1782). For the capture of "La Réunion," a French frigate, in 1793, he was knighted. While commanding a small squadron he was on the 5th of June 1794 attacked by a superior French force on the way from Plymouth to Guernsey, but succeeded in gaining a safe anchorage in Guernsey harbour. After being promoted to the "Orion," 74, in 1795, he took part in the defeat of the French fleet off Lorient, on the 22nd of June, distinguished himself in the battle of Cape St Vincent in February 1797, and was present at the blockade of Cadiz from February 1797 to April 1798, and at the battle of the Nile, where he was wounded. On his return from Egypt he received the command of the "Cæsar," 84, with orders to watch the French fleet off Brest, and on the 12th of February 1799, at the last battle of Brest, he was appointed to the rank of rear-admiral of the blue, was created a baronet, and received the command of a small squadron which was destined to watch the movements of the Spanish fleet at Cadiz. Between the 6th and 12th of July he performed a brilliant piece of service, in which after a first repulse at Algeriers he routed a much superior combined force of French and Spanish ships. For his services
SAUMUR—SAUROPSIDA

237

Saumarez received the order of the Bath and the freedom of the city of London. In 1803 he received a pension of £1200 a year. On the outbreak of the war with Russia in 1809 he was given command of the Baltic fleet. He held it during the wars preceding the fall of Napoleon, and his tact was conspicuously shown towards the government of Sweden at the crisis of the invasion of Russia. Charles XIII. (Bernadotte) bestowed on him the grand cross of the military order of the Sword. At the peace of 1814 he attained the rank of admiral; and in 1819 he was made rear-admiral, in 1821 vice-admiral of Great Britain. He was raised to the peerage as Baron de Saumarez in 1831, and died at Guernsey on the 9th of October 1836.

See Memoir of Admiral Lord de Saumarez, by Sir John Ross (2 vols., 1838).

SAUMUR, a town of western France, capital of an arrondissement in the department of Maine-et-Loire, 28 m. S.E. of Angers on the railway to Tours. Pop. (1906) 14,747. Saumur is well situated on the left bank of the Loire, which here receives the Thouet, and on an island in the river. A large metal bridge connects the Thouet-Angers railway with that of Montreuil-Bellay, by which Saumur communicates with Poitiers and Niort. Two stone bridges (764 and 905 ft. long) unite the town on the island with the two banks of the river. Several of the Saumur churches are interesting. St. Pierre, of the 13th century, has a 17th-century façade and a Renaissance nave; and Notre-Dame of Nantilly, often visited by Louis XI., who rebuilt portions of it, has a remarkable though greatly damaged façade, a doorway and choir of the 12th century, and a nave of the 11th. Both of these churches contain curious tapestries, and in the latter, fixed in the wall is the famous “Dropper” or Runner of the Clocks of Saumur. St. Louis. St. Jean is a small building in the purest Gothic style of Anjou. St Nicolas-du-Chardonnet, in the Gothic style of the 12th century, has a fine modern spire. Notre-Dame of Ardilliers, of the 16th century, was enlarged in the following century by Richelieu and Madame de Montespan. The hotel de ville, containing a museum and library, is an elegant 16th century edifice; and the whole town is rich in examples of the domestic architecture of the 15th, 16th and 17th centuries. The house known as le Maison de la Reine Cécile (15th century) was built by René, duke of Anjou. The castle, built between the 11th and the 13th century, and remodelled in the 17th, is used as an arsenal and powder magazine. There is also an interesting almshouse, with its chambers in part dug out in the rock. The famous cavalry school of Saumur was founded in 1768 and is used for the special training of young officers appointed to cavalry regiments on leaving the cadet school of St Cyr. Other public institutions are the sub-prefecture, tribunals of first instance and of commerce, a chamber of commerce, a branch of the Bank of France, colleges for both sexes and a horticultural garden, with a school of vines. Saumur prepares and carries on a large trade in the sparkling white wines grown in the neighbourhood, as well as in brandy, grain, flax and hemp; and it manufactures enamels and rosaries and carries on liqueur-distilling.

The Saumur caves along the Loire and on both sides of the valley of the Thouet must have been occupied at a very remote period. The Tour du Tronc (9th century), the old stronghold of Saumur, served as a refuge of refuge for the inhabitants of the surrounding district during foreign invasions (whence perhaps the name Saumur, from Salons Murus) and became the nucleus of a monastery built by St. Martin. In 1776, on the death of the last Prior of Saumur, the town passed into the possession of the Duchy of Anjou. In 1339 the town was granted to the Bishop of Luçon, and in 1422 to the Bishop of Poitiers. After the Reformation the town became the metropolis of Protestantism in France and the seat of a theological seminary. The school of Saumur, as opposed to that of Sedan, represented the more liberal side of French Protestantism. The fortifications were dismantled; and the revocation of the edict of Nantes reduced the population by more than one half. In June 1793, the town was occupied by the Vendéens, who on 24th June 1793 were on the point of taking Saumur after a desperate resistance on the part of the republican army.

SAUNDERS, EDWARD JAMES (1837–1906), Irish politician, was born at Castle Saunderson, Co. Cavan, on the 1st of October 1837. He was the son of Alexander Saunderson, M.P. for Cavan (d. 1857), his mother being a daughter of the 6th Baron Farnham. The Irish Saundersons were a 17th century branch of an old family, originally of Durham; a Lincolnshire branch, the Saundersons of Saxby, held the titles of Viscount Castletown (1735–1838) and Baron Saunderson (British: cr. 1714) up to 1723. Edward Saunderson was educated abroad, and, having succeeded to the Cavan estates, married in 1865 a daughter of the 3rd Baron Ventry, and in the same year was elected M.P. for the county as a Palmerstonian Liberal. He lost his seat in 1874, and by 1885, when he again entered parliament for North Armagh, he had become a prominent Orangeman and a Conservative; the question of Irish home rule had now come to the front, and Saunderson's political career as a representative Irish Unionist had begun. He had entered the Cavan militia under Lieut. General Royal Ire. (later an Irish peer) in 1862, and was now major (1875), becoming colonel in 1880 and in command of the battery from 1893 to 1893. Almost from the first he became leader of the Irish Unionist party in the House of Commons, his uncompromising speeches being full of force and humour. In 1898 his services were recognized by his being made a privy councillor. He died on the 21st of October 1906. In private life Colonel Saunderson was well known as a keen yachtsman; his character was deeply marked by stern religious feeling, and his fine sincerity, while endearing him to his friends, never lost him the respect of his opponents.

See the Memoir by Reginald Lucas (1908).

SAUNDERSON, or SANDERSON, NICHOLAS (1625–1739), English mathematician, was born at Thorstune, Yorkshire, in January 1625. When about a year old he lost his sight through smallpox; but this did not prevent him from acquiring a knowledge of Latin and Greek, and studying mathematics. In 1707 he began lecturing at Cambridge on the principles of the Newtonian philosophy, and in November 1711 he succeeded William Whiston, the Lucasian professor of mathematics in Cambridge. In 1718 he published a volume of his mathematical work, an account of which is given in his elaborate Elements of Algebra (2 vols., Cambridge, 1740). Of his other writings, prepared for the use of his pupils, the only one which has been published is The Method of Fluxions (1 vol., London, 1736). At the end of this treatise he gives a Latin explanation of the principal propositions of Sir Isaac Newton's philosophy.

SAUNDERSON, to loiter, lounge, walk idly or lazily. The derivation of the word has given rise to some curiously far-fetched guesses; thus it has been referred to the Holy Land, La Sainte Terre, where pilgrims lingered and loitered, or to the supposed tendency to idle propensities of those who possess no landed property, sans terre. The most probable suggestions are (1) that of Wedgwood, who connects it with a word in exactly the English sense which appears in various forms in Scandinavian languages, Icel. slentur, Dan. slentor, Swe. slento, cf. sloth, lout; this derivation assumes the disappearance of the l (2) That supported by Skeat, and first propounded by Blackley (Word Gossip, 1860), which connects it with the Middle Eng. aufler, adventure; it may represent the Fr. s'aventurer, to go out on an adventure, and the sense-development would be from the idle and apparently objectless expeditions of knights-errant in search of adventure.

SAUROPSIDA. This name was introduced by T. H. Huxley in his Introduction to the Classification of Animals (1869), to designate a province of the Vertebrata formed by the union of the Aves with the Reptilia. In his Elements of Comparative Anatomy (1864) he had used the term "Sauroids" for the same province. The five divisions of the Vertebrata—Pisces, Amphibia, Reptilia, Aves, and Mammalia—are all distinctly definable, but their relations to one another differ considerably in degree. Whilst it
was Huxley's great merit to emphasize by the term *Sauropterygia* the close and direct relationship between the classes of reptiles and birds, it was an unfortunate innovation to bridge the Amphibia and fishes as *Ichthyopterygia*, thereby separating the Amphibia negatively from the fishes and birds. Saussure himself intended to be himself intended. The great gulf within the recent Vertebrata lies between fishes, absolutely aquatic creatures with internal gills and "fins" on the one side, and on the other side all the other, tetrapodous creatures with lungs and fingers and toes, for which H. Credner has found this peculiar term of *Tetrapoda*.

Another drawback of Huxley's divisions resulted in the tendency of alienating the Mammalia, the third division, from the reptiles whilst trying to connect their ancestry with the Amphibia, a view which even now has some vigorous advocates. For Saussure the reptiles and birds, *Sauropterygia*, that is, which are common to birds and reptiles, and not found combined in the other classes, have been thus summarized by Huxley: "no branchiae at any period of existence; a well-developed amnion and allantois present in the embryo; mandible composed of many bones and articulated to the skull by a quadrat bone; nucleated blood-corpuscles; no separate paraplenid bone in the skull; and a single occipital condyle.* In addition to these principal characters of which there are found in the reptiles, but none are exclusively confined to them. The oviduct is always a Mullerian duct separate from the ovary and opening from the body cavity. The mesonephric ducts in the embryo are separated, the mesonephric and mesonephric duct become in the adult male the efferent duct of the testis. The intestine and the reproductive and uriniferous ducts open into a common cloaca. There is usually an efferent duct of the testis. The kidney* is a flattened curled sheet. In all the eggs are mottled blastic and large, possessing a large quantity of yolk; in all the eggs is provided in the oviduct with a layer of albumen and outside this with a horny or calcareous shell. In a few cases the egg is hatched in the oviduct, but in these cases there is no intimate connection between the embryo and the walls of the duct. Fertilization takes place internally, occurring at the upper end of the oviduct previously to the deposition of the albuminous layer and egg shell.

Classification

Two of the four great portions of the birds are closely allied to reptiles; enthusiasts even spoke of them as "glorified reptiles," and this view seemed to receive its proof by the discoveries of Archaeopteryx (a.), and the numerous bipedal Dinosaurs. But Archaeopteryx was after all a bird, although still somewhat primitive, and the question, what group of reptiles has given rise to the birds? is still unanswered. By irony of fate, mere lack of the fossil material, it has come to pass that the bridges between Amphibia and reptiles and from them to Mammals are in a fairer way of reconstruction than that between reptiles and birds, the very two classes of which we know that they "belong together." (H. F. G.)

**SAUSSURE, HORACE BÉNÉDICT DE** (1740-1799), Swiss physicist and Alpine traveller, was born at Geneva on the 17th of November 1740, the youngest son of a wealthy pharmacist, his maternal uncle, Charles Bonnet, he devoted himself to botany. In 1758 he made the acquaintance of Albrecht von Haller, and in 1762 he published his first work, *Observations sur l'étoiles des feuilless et des pétales.* The same year he was chosen professor of philosophy at the academy of Geneva, and retained this chair till 1786. His health began to fail in 1771, when too suffered great pecuniary losses. But he was able to complete his great work in 1796, before his death on the 22nd of January 1799. He became a F.R.S. after his visit to England (autumn of 1768), and a foreign member of the French Academy of Sciences in 1793. He visited Italy, France and Spain, and was a sociéty member of the Swiss Academy of Sciences in Geneva. His early devotion to botanical studies naturally led him to undertake journeys among the Alps, and from 1773 onwards he directed his attention to the geology and physics of that great chain. Incidentally, he did much to clear up the topography of the snowy portions of the Alps, and to attract the attention of pleasure travellers towards spots like Chamonix and Zermatt. In 1760 he first visited Chamonix, and offered a reward to the man who should first succeed in reaching the summit of Mont Blanc (then unscaled). He made an unsuccessful attempt himself in 1785, by the Aiguille du Goûter route. Two Chamonix men attained the summit in 1786, by way of the Grands Mulets, and in 1789 Saussure himself had the delight of gaining the summit (the third ascent). In 1788 he spent 17 days (4th-20th September) on the summit of the Rhaetian Alps (4,140 ft.). In 1774 he mounted the Crammont, and again in 1778, in which year he also explored the Valsorey glacier, near the Great St Bernard. In 1776 he had ascended the Buet (10,201 ft.). In 1789 he visited the Pizzo Bianco (near Macugnaga) and made the first traveller's passage of the St Théodule Pass (10,899 ft.) to Zermatt, which he was the first traveller to visit. On that occasion he climbed from the pass up the Klein Matterhorn (17,750 ft.) while in 1792 he spent three days on the same pass (not descending to Zermatt), making observations, and then visited the Valsorey glacier, passing over the Roche Michel, above the Mont Cenis Pass. The descriptions of seven of his Alpine journeys (by no means all), with his scientific observations gathered en route, were published by him in four quarto volumes, under the general title of *Voyages dans les Alpes* (1779-1796); there was an octave issue in eight volumes, issued 1750-1756, while the non-scientific portions of the work were first published in 1834, and often since, under the title of *Partie pittoresque des ouvrages de M. de Saussure.*

The Alps formed the centre of Saussure's investigations. They formed the most beautiful influence in the development and displacement of the geology of the earth, and among them he found opportunity for studying geology in a manner never previously attempted. The inclination of the strata, the nature of the rocks, the fossils and the minerals were all his constant objects of attention. He studied the depths of the gulf of the ocean, the relations of the chemistry of the day; and he applied it to the study of minerals, water and air. Saussure's geological observations made him a firm believer in the Neptunian theory: he regarded all rocks and minerals as deposited from aqueous solution or suspension, and in view of this he attached much importance to the study of meteorological conditions. He carried barometers and boiling-point thermometers with him; he would measure the heat at the summit and the relative humidity of the atmosphere at different heights, its temperature, the strength of solar radiation, the composition of air and its transparency. Then, following the precipitated moisture, he investigated the temperature of the earth at all depths to which he could drive his thermometer staves, the course, conditions and temperature of streams, rivers, glaciers and lakes, even of the sea. The most beautiful and complete of his subsidiary researches is described in the *Essai sur l'hygrométrie*, published in 1783. In it he records experiments made with various forms of hygrometer in all climates and at all altitudes, and supports the claims of his hair-hygrometers against those of Allard, Nardini and other investigators of the time. He adapted that instrument to many purposes: for ascertaining the temperature of the air he used one with a fine bulb hung in the air; for the atmospheric temperature of the sea he was being converted into an evaporometer by inserting its bulb into a balsam barometer and making it revolve in a circle of known radius at a known rate; for experiments on the earth and in deep water he employed large thermometers wrapped in non-conducting soaks as to render them extremely sluggish, and capable of long retaining the temperature once they had attained it. By the use of these instruments he showed that the bottom water of deep lakes is uniformly cold at all seasons, and that the annual heat wave takes six months to penetrate to a depth of 30 ft. in the earth. He recognized the immense advantages to meteorology of high-level observing stations, and whenever it was possible to establish such stations he did so. He made valuable contributions on matters of theory were in many cases very erroneous he was instrumental in greatly advancing that science.

See *Lives* by J. Senebier (Geneva, 1815), and *Riv. Curier in the Bibliotheque universelle* (March, April, May 1883), *v. viii.;* and *Riv. des Grands Monts de la Suisse* (two editions between 1877 and 1892).

**SAUSSURE, NICOLAS THÉODORE DE** (1767-1845), eldest son of Horace Bénédict de Saussure, was born on the 14th of October 1767, at Geneva, and is known chiefly for his work on the chemistry of vegetable physiology. He lived quietly and avoided society; yet like his ancestors he was a member of the
Genevan representative council, and gave much attention to public affairs. In the latter part of his life he became more of a recluse than ever, and died at Geneva on the 18th of April 1835. His son Nicolas Thodore accompanied his father in his Alpine journeys and assisted him by the careful determination of many physical constants. He was attracted to chemistry by Lavoisier’s brilliant conceptions, but he did not become great as an observer of nature by learning the art of ultimate organic analysis; and he determined the composition of ethyl alcohol, ether and some other commonly occurring substances. He also studied fermentation, the conversion of starch into sugar, and many other processes of minor importance. The greater number of his 36 published papers dealt with the chemistry and physiology of plants, the nature of soils, and the conditions of vegetable life, and were republished under the title Recherches chémiques sur la végétation.

SAUVAL, HENRI (1623-1706), French historian, son of an advocate in the Parlement, was born in Paris, and baptised on the 5th of March 1623. He devoted most of his life to researches among the archives of his native city, and in 1656 even obtained a licence to print his "Paris ancien et moderne;" but on his death (21st March 1706) the whole work was still in manuscript. A long time afterwards it appeared, thanks to his collaborator, Claude Bernard Rousseau, under the title of Histoire des recherches des antiquités de la ville de Paris (1724), but remodelled, with the addition of long and dull dissertations which were not by Sauval. The work was not without merits, and it was re-issued in 1733 and 1750. The original manuscript first belonged to Montmerqué, and then passed into the possession of Le Roux de Lincy, who prepared an annotated edition; unfortunately this material, together with the original MS., was lost in the incendiary fires which took place under the Commune (1871). There remain, however, Le Roux de Lincy's researches, a series of articles on Sauval which appeared in the Bulletin du bibliophile et du bibliothécaire (vol. 1866 and 1868. See also the Bibliographie de Paris avant 1789, by the Abbé Valentin Dufour (1882).

Savage, Minot Judson (1847-1909), American Unitarian minister and author, was born in Norridgewock, Maine, on the roth of June 1841. He graduated at the Bangor Theological Seminary in 1864, and for nine years was in the Congregational ministry, being a home missionary at San Mateo and Grass Valley, California, until 1867, and holding pastorates at Framingham, Mass. (1867-1869), and Hannibal, Missouri (1869-1873). He then became a Unitarian, and was pastor of the Third Church at Macclesfield, Maine, of the Church in Boston in 1874-1896, and of the Church of the Messiah in New York City in 1896-1906.

He wrote many books, including Christianity, the Science of Manhood (1873), The Religion of Evolution (1876), The Morals of Evolution (1880), The Religious Life (1885), My Creed (1887), The Evolution of Our Faith (1889), and The Story of Civilization (1901). He was the author of the counsel books for assistance in Discrepancies of our History (1901), Life Beyond Death (1901), Can Telepathy Explain It? (1902), Life’s Dark Problems (1905), and, besides other volumes in verse, America to England (1909).

Savage, Richard (d. 1743), English poet, was born about 1697, probably of humble parentage. A romantic account of his origin and early life, for which he at any rate supplied the material, appeared in Curll's Poetical Register in 1779. On this and other information provided by Savage, Samuel Johnson founded his Life of Savage, one of the most elaborate of the Lives. It was printed anonymously in 1774, and has made the poet the object of an interest which would be hardly justified by his writings. In 1698 Charles Gerrard, 2nd earl of Macclesfield, obtained a divorce from his wife, Anna, daughter of Sir Richard Mason, who shortly afterwards married Colonel Henry Brett. Lady Macclesfield had two children by Richard Savage, 4th earl Rivers, the second of whom was Charles, the 11th earl, born on 12th February of January 1691, and christened two days later at St. Andrews, Holborn, as Richard Smith. Six months later the child was placed with Anne Portlock in Covent Garden; nothing more is positively known of him. In 1718 Richard Savage claimed to be this child. He stated that he had been cared for by Lady Mason, his grandmother, who had put him to school near St Albans, and by his godmother, Mrs Lloyd. He said he had been pursued by the relentless hostility of his mother, Mrs Brett, who had prevented Lord Rivers from leaving £5000 to him and had tried to have him kidnapped for the West Indies. His statements are not corroborated by the depositions of the witnesses in the Macclesfield divorce case, and Mrs Brett always maintained that he was an impostor. He was wrong in the date of his birth; moreover, the godmother of Lady Macclesfield's son was Dorothea Ousley (afterwards Mrs Delgardo), not Mrs Lloyd. There is nothing to show that Mrs Brett was the cruel and vindictive woman he describes her to be, but abundant evidence that she provided for her illegitimate children. Discrepancies in Savage's story made Boswell suspicious, but the matter was thoroughly investigated for the first time by W. Moy Thomas, who published the results of his researches in Notes and Queries (second series, vol. vi., 1858). Savage's impostor or not, blackmailed Mrs Brett and her family with some success, for after the publication of The Bastard (1728) her nephew, John Brownlow, Viscount Tyrconnel, purchased his silence by taking him into his house and allowing him a pension of £200 a year. Savage's first certain work was a poem satirizing Bishop Hoadly, entitled The Convocation, or The Battle of Pamphlets (1717), which he afterwards tried to suppress. He adapted from the Spanish a comedy, Love in a Veil (acted 1718, printed 1719), which gained him the friendship of Lord Chancellor Steere and of Robert Wilks. With Steele, however, he soon quarrelled. In 1720 he published in the title rôle of his tragedy, Sir Thomas Overbury (pr. 1724), and his Miscellaneous Poems were published by subscription in 1726. In 1727 he was arrested for the murder of James Sinclair in a drunken quarrel, and only escaped the death penalty by the intercession of Frances, countess of Hartford (d. 1754).

Savage was at his best as a satirist, and in The Author to be Let he published a quantity of scandal about his fellow-scribblers. Proud as he was, he was servile enough to supply Pope with petty gossip about the authors attacked in the Dunciad. His most considerable poem, The Wanderer (1729), shows the influence of Thomson's Seasons, part of which had already appeared. Savage tried without success to obtain patronage from Walpole, and hoped in vain to be made poet-laureate. Johnson states that he received a small income from Mrs Oldfield, but this seems to be fiction. In 1732 Queen Caroline settled on him a pension of £30 a year. Meanwhile he had quarrelled with Lord Tyrconnel, and at the queen's death was reduced to absolute poverty. Pope had been the most faithful of his friends, and had made him a small regular allowance. With others he now raised money to send to the Pope, the r & l of which he obtained, but he resented bitterly the conditions imposed by his patrons, and removed to Bristol, where he was imprisoned for debt. All his friends had ceased to help him except Pope, and in 1743 he, too, wrote to break off the connexion. Savage died in prison on the 1st of August 1743.

See Johnson's Life of Savage, and Notes and Queries as already quoted. He is the subject of a novel, Richard Savage (1842), by Charles Whitehead, illustrated by John Leech. Richard Savage, a play in four acts by J. M. Barrie and H. B. Marriott-Watson, was presented at an afternoon performance at the Criterion theatre, London, in 1897. The dramatists took considerable liberties with the facts of Savage's career. See also M. Malouer, Richard Savage, a Mystery in Biography (1909).

Savage, a word by derivation meaning belonging to the wilds or forests (O. Fr. sauvage, mod. sauvage, Late Lat. silvaticus, silva, wood, forest), hence wild, uncultivated, barbarian, and so used of races in an uncivilized or barbarous condition, or of animals or human beings generally, untamed, ferocious.

Savah, a small province of central Persia, north of Irak and south of Teheran, comprising the districts of Savah, Khalejstan (inhabited by the Turkish Khalej tribe), Zerend and Karaghan. It pays a yearly revenue of about £5000. The capital is the ancient city of Savah, which has a population of about 7000, and is 72 m. S.W. of Teheran, at an elevation of 3330 ft., in 35° 4' N., 50° 30' E. The soil is very fertile, is well watered, and produces much wheat, barley and rice. It is occasionally joined to the province of Teheran to facilitate the governor's arrangements for supplying the capital of Persia with grain.
SAVANNA or SAVANNAH (Span. savana, a sheet; Late Lat. sabanum, Gr. σαβανον, a linen cloth), a term applied either to a plain covered with snow or ice, or, more generally, to a treeless plain. Its use in English, more frequent formerly than now, is most common in application to the great plains of central America, in which it is practically the equivalent of "prairie" (q.v.). The application it was first used (accented thus—savanha) by the Spanish historian Gonzalo de Oviedo y Valdés in the 16th century.

SAVANNAH, a city, a port of entry, and the county-seat of Chatham county, Georgia, U.S.A., on the right (south) bank of the Savannah river, about 18 m. from the Atlantic Ocean. Pop. (1890) 43,189; (1900) 54,244, of whom 28,000 were negroes and 3434 were foreign-born; (1910, census) 65,064. It is served by the Atlantic Coast Line, the Central of Georgia, the Southern, and other railways; by river steamers to Augusta; by coastwise steamers to Baltimore, Philadelphia, New York and Boston; and by transatlantic steamers to European ports.

The city is situated on a plateau some 40 ft. above the Savannah river and covers about 6-3 sq. m. Savannah owes its regular form, with streets intersecting each other at right angles, to James Edward Oglethorpe, the founder. At the mouth of the Savannah river, 42 small parks and squares, whose total area is 166-79 acres. The larger parks are the Daffin, the Colonial, Oglethorpe Avenue (former Twenty-seventh Street), the Parade, and Gaston Street, with fine tropical and semi-tropical flora. The smaller squares are mostly in five series parallel to the Savannah river. On account of the large number of its shade trees Savannah has been called the "City of Trees." Its downtown area is about 4 m. east of the city, has avenues of fine live-oaks, draped with Spanish moss. In the principal commercial street, Bay Street, are the Cotton Exchange (1908), on the site of the old City Hall built in 1779, the Custom House, completed in 1850, the Cotton Exchange and a granite seat marking the spot where Oglethorpe first pitched his tent; and in Bull Street, a fashionable promenade, named in honor of William Bull, by whose order the city was platted in 1733, a military officer who sided Oglethorpe in his survey of the city, are Chatham's Marble, a marble post-office building, the county court house, and the Savannah theatre established in 1818, remodelled in 1895, rebuilt in 1914, and owned by the United States of Georgia. At Johnson Square, a little south of the City Hall and Custom House, stands a plain dignified monument, in the design of a Roman sword, erected in memory of General Nathaniel Greene, to whom a tract of land near Savannah was given by Congress in recognition of his service in the War of American Independence, and who was buried in a vault in the old cemetery in South Broad Street (now Oglethorpe Avenue); his remains were transferred to the monument in 1900.

In Monterey Square there is a monument to Caroline,-wife of General Lafayette, by the German sculptor Robert Eberhard Launzit (1806-1870), in honour of Count Casimir Pulaski, who was mortally wounded during the Battle of Vernon on 27th August, 1778, a military officer who sided Oglethorpe in his survey of the city, a hero of the War of Independence, who was the last colonel in the line of fire of the battle of Savannah, and was mortally wounded during the siege of the city in 1779. In Chippewa Square there is a bust of Major-General Lafayette McLaw (1821-1897), The Ladies' Memorial Association erected a Confederate Soldiers Monument in the "Parade Ground," which forms an extension to Forsyth Park, in the south central part of the city; and in honour of Tomochichi, an Indian chief who was the staunch friend of the early settlers, a large granite column has been erected in Wright Square, where he was buried. At the corner of Anderson and Waters streets is a memorial to Major-General Alexander Robert Lawton (1818-1886), state senator in 1854-1856, who seized Fort Pulaski in 1861 upon the governor's orders, and laid the foundations of the Civil War in the Confederate Army, and was U.S. minister to Austria-Hungary in 1887-1889.

Since the founding of Georgia as a bulwark against the Spaniards and French, Savannah has had an ardent martial spirit, and there are five military posts in and near Savannah, named after the War of 1812, the Georgia Hussars, formed after the War of 1812 by the Georgia Volunteer companies; the First Volunteer Regiment of Georgia, composed of five companies, organized respectively in 1868, 1843, 1846, 1860 and 1861, three of which were engaged in the Civil War; and the White Buff and Montgomery, distant 5 m., 6 m., 8 m. and 9 m. respectively.

Among the religious corporations in Savannah, the oldest is Christ Church, whose first building was erected in 1740-1750 and whose present edifice was built in 1838. Its third rector was John Wesley, who is said to have governed "the Southern churchn made Savannah almost half a century before Robert Rikes established such a school in England. The first African Baptist Church, organized in 1758, is the oldest in the United States. The Convent of St Vincent de Paul was founded in 1842; the Cathedral of St John the Baptist was dedicated in 1876, was destroyed by fire in 1868, but was subsequently rebuilt; and a few years later another church was built. The two cathedrals are Roman Catholic and of a Protestant Episcopal bishop. There are several hospitals and charitable institutions in or near Savannah, and among these are the Baptist General Asylum, about 8 m. from the city, founded by George Whitefield in 1740; the Catholic Sisterhood, and the Savannah Female Asylum (1750). In 1885 the Temple Academy of Arts and Sciences (near Telfair Square or Telfair Theatre) was opened. The collections are Wilhem von Kaublach's "Peter Arbues of Epila" and Joseph von Brandt's "Ein Gefecht." The Georgia Historical Society, organized in 1839 and in 1847 united with the Savannah Library Society, has a handsome building (Hodgen Hall) at the intersection of Whataker and Gaston Streets, and a library of about 35,000 volumes; it published six volumes of Collections between 1858 and 1866, and is near the city. The Chatham Academy was opened and endowed with some of the confiscated property of Loyalists in 1788.

Savannah harbour has permanent seawall defences, and is the most important harbour on the coast of Georgia. The United States government, however, has not been pleased with the growth of Savannah over the harbour. The breakwater is nearer the Panama Canal than either New Orleans or Galveston, and after the completion of harbour improvements by the United States government, begun in 1902, the depth of the river from its mouth to the city increased to 26 ft., thus making Savannah the deepest port on my continent. Savannah's exports include rice, lumber, and sawn timber; and the chief imports are rice, cotton, and cotton goods. Savannah being first among the world's markets of naval store.

The city's rice-mills and cotton compresses are commonly visited by tourists. The total value of the city's factory products in 1905 was $9,540,000 ($9,1 7-1 more than in 1900).

The city government is vested in a council, consisting of a mayor and twelve aldermen, elected for two years in January of odd-numbered years; the council's committees act as heads of several of the administrative departments; the mayor is head of the police; and the council appoints other city officers. The Board of aldermen may pass a measure by a two-thirds vote over the mayor's veto, and the city council is organized in four committees; the mayor is self-perpetuating and practically non-partisan. A free school had been established as early as 1816. In 1900 the assessed value of real estate was $492,000,000; city debt, $12,828,973; and the bonded debt was $2,701,050 ($218,050 due in 1909 and $2,483,000 due in 1990); the rate of taxation was $1.39 per $100.

The first European settlement in Georgia was made at Savannah in February 1733 by James Edward Oglethorpe. Among the early inhabitants were Charles and John Wesley, who arrived in 1735, but returned to England in 1736 and 1737 respectively, and George Whitefield, who lived in Savannah in 1738 and 1740. Savannah was the seat of government of Georgia until the capture of the city by the British in 1778. Here, on the ist of January 1775, met the first legislature of Georgia. In the years preceding the War of Independence the political issues excited much enthusiasm. Oglethorpe's administration completely prevented the execution of the Stamp Act, and the stamps destroyed on board the ship that brought them to Savannah. In 1760 the merchants agreed not to import any articles mentioned in the Townshend Acts of 1767.

On the 18th of January 1775 the first Provincial Congress was convened; on the night of the 11th of May the powder magazine was robbed of all its ammunition, part of which was sent to Boston and, according to tradition, was used at Bunker Hill, and on the 22nd of June the people of the city elected a Committee of Safety. On the 4th of July the same Provincial Congress again met, and the news of the fall of the British fleet was announced. Probably the first naval capture of the War of Independence was made off Tybee Island on the 10th of July, when a schooner,
The first vessel chartered by the Continental Congress, seized a British ship and its cargo of 14,000 lb of powder. Yet the Loyalists were strong in Savannah, and many families were dispersed among themselves.

In October 1776—February 1777 the convention which framed the first constitution of Georgia was held in Savannah, and the first state legislature assembled here in May 1778; but the British captured the city on the 29th of December in that year, and the seat of the state government was then transferred to Augusta. In 1779 Savannah was unsuccessfully besieged by a French fleet under Comte d'Estaing and land forces under General Benjamin Lincoln, but in May 1782 it was evacuated after a short siege by General Anthony Wayne. It once more became the capital of Georgia in 1784, and governed Augusta again transferred to Augusta. Savannah soon became the commercial rival of Charleston, South Carolina. It was chartered as a city in 1789. As early as 1817 the Savannah Steamboat Company, which ran a steamer to Charleston, was organized, and in 1819 the "Savannah," the first vessel fitted with steam-engines to cross the Atlantic,1 owned by Savannah capitalists but built in the North, sailed from Savannah to Liverpool in 25 days. In 1861 the state convention which adopted the ordinance of secession met in Savannah. A blockade of the port was imposed by the Union fleet, and General Sherman, who took the city December 1862 Fort Pulaski (on Cockspur Island, at the mouth of the Savannah river), which commanded the channel, and had been seized by the state at the outbreak of the war, was forced to surrender. Savannah was the objective of General W. T. Sherman's "march to the sea," and on the 21st of December 1864 surrendered to him after futile opposition by General William J. Hardee (1816–1873) with a force very inferior in numbers. The city limits were extended in 1879, 1883 and 1900.

SAVARY, ANNE JEAN MARIE RENÉ, DUKE OF RoviGo (1774–1833), French general and diplomatist, was born at Marco in the Ardennes on the 26th of April 1774. He was educated at the college of St Louis at Metz and entered the royal army in 1790. His first campaign was that waged by General Custine against the retreating forces of the duke of Brunswick in 1792. He next served in succession under Pichegru and Moreau, and distinguished himself during the skillful retreat of the latter from an untenable position in the heart of Swabia. He became chef d'escadrons in 1797, and in 1798 served under General Desaix, in the Egyptian expedition, of which he left an interesting and valuable account. He also distinguished himself under De Tilly at Marengo (14th of June 1800). His fidelity and address while serving under Desaix, who was killed at Marengo, secured him the confidence of Bonaparte, who appointed him to command the special body of gendarmes charged with the duty of guarding the First Consul. In the discovery of the various ramifications of the Cadoudal-Pichegru conspiracy Savary showed great skill and activity. He proceeded to the cliff of Biville in Normandy, where the plotters were in the habit of meeting, and caught them, imitating the signals of the royalist plotters, to tempt the comte d'Arlot (afterwards Charles X.) to land. In this he was unsuccessful. He was in command of the troops at Vincennes when the duc d'Enghien (q.v.) was summarily executed. Hullin, who presided at the court-martial, afterwards accused Savary, though not by name, of having intervened to prevent the despatch to Bonaparte of an appeal for mercy which he (Hullin) was in the act of writing up. Savary afterwards denied this, but his denial has not generally been accepted. In February 1803 he was raised to the rank of general of division. Shortly before the battle of Austerlitz (2nd of December 1805) he was sent by Napoleon with a message to the emperor Alexander I. with a request for an armistice, a device which caused that monarch all the more eagerly to strike the blow which brought disaster to the Russians. After the battle Savary again took a message to Alexander, which induced him to treat for an armistice. In the campaign of 1806 Savary showed signal daring in the pursuit of the Russians after the battle of Jena. Early in the next year he received command of a corps, and with it gained an important success at Osterlou (16th of April 1807). After the treaty of Tilsit (7th of July 1807) Savary proceeded to St Petersburg as the French ambassador, but was soon replaced by General Caulaincourt (q.v.), another accessory to the execution of the duc d'Enghien. The repugnance of the empress dowager to Savary is said to have been one of the reasons of his recall, but it is more probable that Napoleon felt the need of his gifts for intrigue in the Spanish affairs which he undertook at the close of 1807. With the title of duke of RoviGo (a small town in Venetia), Savary set out for Madrid when Napoleon's plans to conquer the Bay of Biscay and the mastery of Spain were nearing completion. With Murat Savary made skillful use of the schisms in the Spanish royal family (March–April 1808), and persuaded Charles IV., who had recently abdicated under duress, and his son Ferdinand VII, the de facto king of Spain, to refer their claims to Napoleon. Savary induced Ferdinand to cross the Pyrenees and proceed to Bayonne—a step which cost him his crown and his liberty until 1814. In September 1808 Savary accompanied the emperor to the famous interview at Erfurt with the emperor Alexander. In 1809 he took part, but without distinction, in the campaign against Russia. On the 5th of November of the same year he was in consequence of Fouché (q.v.) in the spring of 1810, Savary received his first ministerial post. There he showed his wonted skill and devotion to Napoleon; and this office, which the Jacobin Fouché had shorn of its terrors, now became a veritable inquisition. Among the incidents of this time may be cited the cynical brutality with which Savary carried out the order of Napoleon for the exile of Mme de Staël and the destruction of her work De l'Allemagne. Savary's wariness was, however, at fault at the time of the strange conspiracy of General Mallet, two of whose confederates seized him in his bed and imprisoned him for a few hours (23rd of October 1812). Savary's reputation never quite recovered the ridicule caused by this event. He was among the last to desert the emperor at the time of his abdication (11th of April 1814) and was the first to welcome his return in 1815, when he became inspector-general of gendarmerie and a peer of France. After Waterloo he accompanied the emperor to Rochefort and sailed with him to Plymouth on H.M.S. "Bellerophon." He was not allowed to accompany him to St Helena, but underwent several months' "internment" at Malta. Escaping thence, he proceeded to Smyrna, where he settled for a time. Afterward he travelled about in more or less distress, but finally was allowed to return to France and regained civil rights; later he settled at Rome. The July revolution (1830) brought him into favour and in 1837 he received the command of the French army in Algeria. Ill-health compelled him to return to France, and he died at Paris in June 1833.

See Mémoires du duc de RoviGo (4 vols., London, 1828); English edition also in 4 vols., London, 1828); a new French edition annotated by D. Lacroix (5 vols., Paris, 1900); Extrait des mémoires de M. le duc de RoviGo concernant le catastrophé de M. le duc d'Enghien (London, 1825); Le Duc de RoviGo jugé par lui-même et par ses contemporains, by L. F. E... (Paris, 1823); and A. P. M. Macquart. Réfutation de l'écrit de M. le duc de RoviGo (1823). (J. Hl. R.)

SAVE, or Sava (Ger. Saov; Hungarian "Sézsa"; Lat. Savaut), one of the principal right-bank affluents of the Danube. It runs almost parallel with the other great tributary of the Danube, the Drave, both having about the same length. The Save rises in the Triglav group in Carniola from two sources, the Wurzener Save and the Wotheiner Save, which join at Radmannsdorf. It then takes a south-easterly course, and flows through Carniola and Croatia-Slavonia—forming from Jasenovac the frontier-line between it and Bosnia and Servia—and joins the Danube at Belgrade. The Save has a length of 404 mi., the area of its basin being 34,000 sq. m. It is navigable for steamers from Sissek to its mouth, a distance of 360 m., but navigation is greatly hindered by shifting sandbanks and other obstructions. Its principal affluents are, on the right, the Sora, Laibach, Gurk, Kulpa, Una, Vrbas, Bosna and Drina; and on the left, the Kanker, Peistritz, Sann, Sotla, Krapina, Lonja and Orjava.
SAVI—SAVIGNY

SAVIGNY, FRIEDRICH KARL VON (1779-1861), German jurist, was born at Frankfort-on-Main on the 21st of February 1779. He was the son of Friedrich Ludwig von Savi, himself a member of the house of Lorraine, and of the history of Lorraine, and which derived its name from the castle of Savigny near Charmes in the valley of the Moselle. Left an orphan at the age of 13, he was brought up by his guardian until, in 1795, he entered the university of Marburg, where, though suffering at times severely from ill-health, he studied under Professors Anton Bauer (1772-1843) and Philipp Friedrich Weiss (1766-1808), the former one of the most conspicuous pioneers in the reform of the German criminal law, the latter distinguished for his knowledge of medieval jurisprudence. After the fashion of German students, Savigny visited several universities, notably Jena, Leipzig and Halle. And returning to Marburg, took his doctor's degree in 1800. At Marburg he lectured as Privatdozent on criminal law and the Pandects. In 1803 he published his famous treatise, Das Recht der Besitzes (the rights of possession). It was at once hailed by the great jurist Thibaut as a masterpiece; and the old uncritical study of Roman law was at an end. It quickly obtained a European reputation, and still remains a prominent landmark in the history of jurisprudence. In 1804 Savigny married Kunigunde Brentano, the sister of Bettina von Arnim and Clemens Brentano the poet, and the same year started on an extensive tour through France and south Germany in search of fresh sources of Roman law. In this quest, particularly in Paris, he was successful.

In 1808 he was appointed by the Bavarian government ordinary professor of Roman law at Landshut, where he remained a year and a half. In 1810 he was called, chiefly at the instance of Wilhelm von Humboldt, to fill the chair of Roman law at the new university of Berlin. Here one of his services was to create, in connexion with the faculty of law, a "Spruch-Collègium," an extraordinary tribunal competent to deliver opinions on cases remitted to it by the ordinary courts; and he took an active part in its labours. This was the busiest time of his life. He was engaged in lecturing, in the government of the university (of which he was the third rector), and as tutor to the crown prince in Roman, criminal and Prussian law. Not the least important consequence of his residence in Berlin was his friendship with Niebuhr and Eichhorn. In 1814 appeared his pamphlet Vom Beruf unserer Zeit für Gesetzegebung und Rechtswissenschaft (new edition, 1853). It was a protest against the demand for codification, and was intended as a reply to Thibaut's pamphlet urging the necessity of forming a code of which it should be independent of the influence of foreign legal systems. In this famous pamphlet Savigny did not oppose the introduction of new laws, or even a new system of laws, but only objected to the proposed codification on two grounds: (1) that the damage which had been caused by the neglect of former generations of jurists could not be quickly repaired, and that time was required to set the house in order; and (2) that there was great risk of the so-called natural law, with its "infinite arrogance" and its "shallow philosophy" ruining such a scheme. Indeed, the enduring value of this pamphlet is that it saved jurisprudence for all time from the hollow abstractions of such a work as the Institutiones juris naturae et gentium of Christian Wolff (1679-1754), and conclusively proved that a historical study of the positive law was a condition precedent to the right understanding of the science of all law.

In 1815 he founded, with Karl Friedrich Eichhorn, and Johann Friedrich Ludwig Goschen (1776-1837), the Zeitschrift für geschichtliche Rechtswissenschaft, the organ of the new historical school, of which he was the representative. In this periodical (vol. iii. p. 129 seq.) Savigny made known to the world the discoveries he had made in Venice, by Niebuhr, of the lost text of Gaius, pronouncing it, on the evidence of that portion of the MS. submitted to him, to be the work of Gaius himself and not, as Niebuhr suggested, of Ulpian. The record of the remainder of Savigny's life consists of little else than a list of the merited honours which he received at the hands of his sovereign, and of the works which he published with indefatigable activity. In 1815 appeared the first volume of his Geschichte des römischen Rechts im Mittelalter, the last of which was not published until 1837. This work, to which his early instructor Weiss had first prompted him, was intended to complete the fame of the school of Marburg, founded by J. von Moer and F. von Thirion to the present time. His design was in some respect narrow; in others it was widened. He saw fit not to continue the narrative beyond the 16th century, when the separation of nationalities disturbed the foundations of the science of law. His treatment of the subject was not merely that of a bibliographer; it was philosophical. It raised the veil which had hung over the history of Roman law, from the breaking up of the empire until the beginning of the 12th century, and showed how, though considered dead, the Roman law yet lived on through these dark centuries, in local customs, in towns, in ecclesiastical doctrines and school teachings, until it blossomed out once more in full splendour in Bologna and other Italian cities. This history was the parent of many valuable works in which Savigny published the result of his investigations.

In 1817 he was appointed a member of the commission for organizing the Prussian provincial estates, and also a member of the department of justice in the Staatsrat, and in 1819 he became a member of the supreme court of appeal for the Rhine Provinces. In 1820 he was made a member of the commission for revising the Prussian code. In 1822 a serious nervous illness attacked him, and compelled him to seek relief in travel. In 1825 he began his elaborate work on contemporary Roman law, System des heutigen römischen Rechts (8 vols., 1840-1849). His activity as professor ceased in March 1842, when he was appointed "Grosskanzler" (High Chancellor), the title given by Frederick II. in 1746 to the official at the head of the juridical system in Prussia, as in this position he carried out several important law reforms in regard to bills of exchange and divorce. He held the office until 1848, when he resigned, not altogether to the regret of his friends, who had seen his energies withdrawn from jurisprudence without being able to flatter themselves that he was a great statesman. In 1850, on the occasion of the jubilee of his obtaining his doctor's degree, appeared in five volumes his Vermischte Schriften, consisting of a collection of his minor works published between 1800 and 1844. This event gave rise to much enthusiasm throughout Germany in honour of "the great master" and founder of modern jurisprudence. In 1853 he published his treatise on Contracts (Das Obligationenrecht), a supplement to his work on modern Roman law, in which he clearly demonstrates the necessity for the historical treatment of law. Savigny died Berlin on the 29th of October 1861. His son, Karl Friedrich, 1 See von Mohl's Staatswissenschaft, vol. iii. p. 95. For a somewhat less favourable view, see Gans's Vermischte Schriften.
SAVILE, SIR G.—SAVINGS BANKS

von Savigny (1814–1875), was Prussian minister of foreign affairs in 1849. He represented Prussia in important diplomatic transactions, especially in 1866.

Savigny belongs to the so-called historical school of jurists, though he cannot claim to be regarded as its founder, an honour which belongs to Gustav Hugo. In the history of jurisprudence Savigny’s great works are the Recht des Besitzes and the Beruf unserer Zeit für Gesetzgebung above referred to. The former marks an epoch in jurisprudence. Professor Jhering says: “With the Recht des Besitzes the juridical method of the Romans was regained, and modern jurisprudence born.” It marked a great advance both in results and method, and rendered obsolete a large body of civil law. But it should be noted that in Roman law possession had always reference to “usucapion” or to “interdicts,” that there is not a right to continuance in possession but only to immunity from interference; possession being based on the consciousness of unlimited power. These and other propositions were maintained with great acuteness and unequalled ingenuity in interpreting and harmonizing the Roman jurists. The controversy which has been carried on in Germany by Jhering, Baron, Gans and Brun shows that many of Savigny’s conclusions have been rejected. The Beruf unserer Zeit, in addition to the more specific object the general idea, which has been already treated, expresses the idea, unfamiliar in 1814, that law is part and parcel of national life, and combats the notion, too much assumed by French jurists, especially in the 18th century, and countenanced in practice by Bentham, that law might be arbitrarily imposed on a country irrespective of its state of civilization and past history. Of even greater value than his services in consolidating “the historical school of jurisprudence” is the emphatic recognition in his works of the fact that the practice and theory of jurisprudence cannot be understood without inquiry into both.

See Biographien by Stinzinger (1862); Rudolf (1865); Berthmann-Holweg (1867); and Landsberg (1880).

SAVILE, SIR GEORGE (1726–1784), English politician, was the only son of Sir George Savile, Bart. (d. 1743), of Rufford, Nottinghamshire, and was born in London on the 18th of July 1726. He entered the House of Commons as member for Yorkshire in 1739. In general he advocated views of a very liberal character, including measures of relief to Roman Catholics and to Protestant dissenters, and he defended the action of the American colonists. He refused to take the Oath of Allegiance and in 1778 he resigned his seat in parliament. He died unmarried in London on the 10th of January 1784. Horace Walpole says Savile had “a large fortune and a larger mind,” and Burke had also a very high opinion of him. He bequeathed Rufford and some of his other estates to his nephew, Richard Lumley (1757–1832), a younger son of Richard Lumley Sanderson, 4th earl of Scarborough (1752–1852). Richard took the additional name of Savile, but when on his brother’s death in 1807 he became 6th earl of Scarborough the Savile estates passed to his brother John (1760–1835), afterwards the 7th earl. John’s son and heir was John Lumley Savile, 8th earl of Scarborough (1788–1856). The 8th earl was never married, but he left four natural sons, the eldest of whom was John Savile (1818–1896), the diplomatist, who was created Baron Savile of Rufford in 1888. He entered the foreign office in 1841, was British envoy at Dresden and at Berne, and from 1838 to 1888 represented his country in Rome. Although the eldest son, he did not inherit Rufford and his father’s other estates until after the deaths of his younger brothers. He made a fine collection of pictures and died at Rufford on the 4th of November 1866, when his nephew, the 7th earl, succeeded him. John Savile Lumley Savile (b. 1854) became the 2nd baron.

SAVILE, SIR HENRY (1549–1623), warden of Merton College, Oxford, and provost of Eton, was the son of Henry Savile of Bradley, near Halifax, in Yorkshire, a member of an old county family, the Saviles of Methley, and of his wife Elizabeth, daughter of Robert Ramsden. He was educated at Brasenose College, Oxford, where he matriculated in 1561. He became a fellow of Merton in 1567, proceeded B.A. in 1566, and M.A. in 1570. He established a reputation as a Greek scholar and mathematician by voluntary lectures on the Almagest, and in 1575 became junior proctor. In 1578 he travelled on the continent to Europe, where he collected manuscripts and is said to have been employed by Queen Elizabeth to hunt in the Low Countries. On his return he was named Greek tutor to the queen, and in 1575 was established as warden of Merton by a vigorous exercise of the interest of Lord Burghley and Secretary Walsingham. He proved a successful and autocratic head under whom the college flourished. A translation of four Books of the Histories of Tacitus, with a learned Commentry on Roman Warfare in 1591, enhanced his reputation. In 1596 he obtained the provostship of Eton, the reward of persistent but unsuccessful attempts to receive the degree of doctor of law by the statutes of the college, for he was not in orders, and the queen was reluctant to name him. Savile insisted with considerable ingenuity that the queen had a right to dispense with statutes, and at last he got his way. In February 1601 he was put under arrest on suspicion of having been concerned in the rebellion of the earl of Essex. He was soon released and his friendship with the faction of Essex went far to gain him the favour of James I. No doubt did the views he had maintained and the zeal he had shown in the controversy that had been to his advantage that his elder brother, Sir John Savile (1544–1607), was a high prerogative lawyer, and was one of the barons of the exchequer who in 1606 affirmed the right of the king to impose import and export duties on his own authority. On the 30th of September 1604 Savile was knighted, and in that year he was named one of the body of scholars appointed to prepare the authorized version of the Bible. He was entrusted with parts of the Gospels, the Acts of the Apostles and the Book of Revelation. In 1604 died the only son born of his marriage in 1592 with Margaret Ducce, and Sir Henry Savile is thought to have been induced by this loss to devote the bulk of his fortune to the promotion of learning, though he had a daughter who survived him and who became the mother of the dramatist Sir Charles Sedley. His edition of Chrysostom in eight folio volumes was published in 1610–1613. It was printed by the king’s printer, William Norton, in a private press erected at the expense of Sir Henry, who imported the type. The Chrysostom, which cost him £8000 and did not sell well, was the most considerable work of pure learning undertaken in England in his time. At the same time he published an edition of the Cyropaedia in 1618. In 1619 he founded and endowed his professorships of geometry and astronomy at Oxford. He died at Eton on the 19th of February 1622. Sir Henry Savile has been sometimes confounded with another Henry Savile, called “Long Harry” (1570–1617), who gave currency to the forged addition to the Chronicle of Aeser which contains the story that King Alfred founded the university of Oxford.

A brother, THOMAS SAVILE (d. 1593), was also a member of Merton College, Oxford, and had some reputation as a scholar.

SAVINGS BANKS (Fr. caisses d’épargne; Ger. Sparkassen), institutions for the purpose of receiving small deposits of money and investing them for the benefit of the depositors at compound interest. They originated in the latter part of the 18th century—a period marked by a great advance in the organization of provident habits in general (see FRIENDLY SOCIETIES). They seem, however, to have been, first suggested by Daniel Defoe in 1697. The earliest institution of the kind in Europe was one established at Brunswick in 1765; it was followed in 1778 by that of Hamburg, which still exists, in 1786 by one at Oldenburg, in 1790 by one at Loire, in 1792 by that of Basel, in 1794 by one at Geneva, which had but a short existence, and in 1796 by one at Kiel in Holstein. In Great Britain, in 1777, Jeremy Bentham revised Defoe’s suggestion under the name of “Frugality Banks,” and in 1799 the Rev. Joseph Smith put it in action at Wenden. This was followed in 1801 by the addition of a savings bank to the friendly society which Mrs Priscilla Wakefield had established.
Savings Banks

in 1798. Savings banks were shortly after established in London, Bath, Ruthwell in Dumfriesshire by the Rev. H. Duncan (1747–1846), Edinburgh, Kelso, Hawick, Southampton and many other places. By 1817 they had become numerous enough to claim the attention of the legislature, and many acts of parliament were passed from time to time for the management of these institutions in Great Britain, culminating in the establishment on a very broad basis of the Post Office savings banks (see Post and Postal Service). The promotion of thrift, at the end of the 18th century an experiment by a few far-seeing individuals, was by the 19th century almost universally adopted, and was regarded primarily as an advantage to the depositors and to the community. Friendly societies, co-operative societies, trade societies and other agencies are all based on this same principle.

The progress of savings banks and the large amount that the deposits have now reached are evidence of the general fitness of the organization for its purpose. So far as regards trustee savings banks, the provisions of the acts of 1817 are still to a great extent the same as those by which they are now regulated, though the law has been frequently amended in matters of detail. The acts relating to trustee savings banks are referred to in the entry on Savings Banks and the other local management of the banks has been left entirely to the trustees, who are precluded from receiving any remuneration for their services or making any profit. They are, however, required to furnish the commissioners with periodical returns of their transactions. This blending of private management with state control has had many advantages in knitting together class and class. A new savings bank requires for its establishment the consent of the National Debt Commissioners and the certificate of the registrar of friendly societies to its rules.

The legislation of 1817, among other inducements to thrift, offered the interest of 1½% on the amount of every deposit, for a rate of interest in excess of that given to the ordinary public creditor, or—which is the same thing—in excess of that which could be earned by the investment of the deposits in the purchase of government securities. The interest was payable at the rate of 1½% per day, or £4, 11s. 3d. per annum, and that rate continued to be granted until the passing of the Act of 1828 (G Geo. IV. c. 29). That act reduced the rate of interest allowed to the trustees of savings banks to 2½d. per day, or £3, 16s. 9d. per annum, and prohibited them from allowing more to their depositors than 2½d. per day, or £3, 8s. 5½d. per annum, requiring them to pay the surplus, if any, into a separate fund held by the National Debt Commissioners, but bearing no interest. In 1844 the interest to trustees was further reduced to 2½d. per day, or £3, 5s. 5½d. the maximum to be allowed to depositors being fixed at £3, 6s. 10d. In 1880 the interest to trustees was reduced to 2½d., and that to depositors to £2, 15s. and again in 1888 to £2, 15s. and £2, 10s. respectively.

The result of the bonus on thrift offered by the earlier statutes was a large one, and the amount that ought to have been made good by the annual vote. Between 1817 and 1822 the difference between the interest credited and that earned amounted to £744,363; and this led to the reduction in the rate of interest effected by the act of the latter year. The deficiency, instead of being paid off, was allowed still to accumulate, and as the price of stock rose and the deposits increased fresh deficiencies arose, so that by 1844 the deficiency, which would have been £1 millions by the mere accumulation of interest of the previous 3½ years, had increased to £1,720,000. The reduction of interest in 1844 was about enough to make the fund self-supporting, though savings banks are always liable to loss from the excess of the interest, and the amount they are allowed to withdraw when they are in distress is also limited. The deficiency was still allowed to accumulate, although in 1863 nearly 2 millions was voted by parliament to make good part of the deficiency; from 1876 interest was allowed, and in 1881 was increased, while in 1884 there was created to meet the capital deficiency a terminable annuity to expire in 1906, but which by the act of 1904 was extended to 1917.

The offer of a bonus on thrift was of necessity accompanied by provisions to guard against its being used by others than the classes it was intended to encourage. This was done by limiting the amount that each depositor should be permitted to pay in. The limit has been reduced from £400 to £200. The Savings Banks Act 1891, s. 11(1), the maximum amount standing in the name of any depositor or not must not exceed £200, nor must interest be allowed on any sum in excess of that amount. By the act of 1893 the maximum deposit of any depositor, whether during the same or different years, may not exceed £1,000, and at the end of each year, if the deposit is more than once, replace the amount of any withdrawal made in one entire sum in the course of a year. The replacement may be effected in one or more sums.

When a person comes with his first deposit to a savings bank he is required to sign a declaration, setting forth his name, address and occupation, that he desires to become a depositor on his own responsibility. If he does not sign the declaration, he is turned away. If this declaration be not true, the deposits are liable to be forfeited; but it is to be feared that few depositors take the trouble to read what they are signing, or think much about the meaning of it. If the depositors cannot write, the clerk will usually ask him a few questions, such as his age, mother's maiden name, &c., which may tend to identify him, or defeat any attempt to personate him for the purpose of withdrawing.

Among the benefits conferred by the legislature upon depositors in savings banks has been that of exemption from the jurisdiction of the ordinary courts of law in cases of dispute with the trustees. Under the provisions of the act of 1891 a deposit can be taken by the trustees, if such is the apprehension, and they can retain it until the expiration of 18 months from the date of the discovery of the supposed deception, or they can apply to the courts of equity for an order to establish proceedings in bankruptcy. By that of 1828 the barrister appointed to certify the rules of the savings banks was made umpire in case of difference of opinion between the arbitrators. By that of 1844 the arbitrators were increased to seven, and one of them is to be a barrister. By an Act of 1876 the functions of the barrister in this respect were conferred upon the registrar of friendly societies. This in effect made no change in the law, for the offices of barrister and registrar had been amalgamated from an early date, and as early as 1832 it was determined in the case of Crisp v. Bunbury (8 Bing. 394) that the effect of these enactments is to oust the jurisdiction of all the superior courts of law and equity (see also Cardiff S. B. v. Aherdare District of Oddfellows, F. S. Rep., 1887, pt. A., p. 70). This jurisdiction has been highly beneficial to depositors in savings banks. The costs of the award are limited by treasury warrant to a few pounds, and are run on the footing of costs occasioned. These proceedings are simple and elastic, and the results are satisfactory. The central office, acting as registrar, determines law and fact, and adjusts all the equities of each case. Reference to the index to the registrar's decisions appears to show that the chief registrars' annual reports will show that many interesting questions of law have had to be determined with regard to so small a matter as the ownership of a savings bank deposit.

Many of the old trustee savings banks which were put on a systematic basis in 1817, have been absorbed by the Post Office, but while the total amount of their deposits increases, the number of their depositors remains about the same. In 1863 there were 131,442,534 deposits on the books of the trustee savings banks, with depositors, and deposits amounting to £40,563,000. In 1889 the number of banks had decreased to 380, with 1,500,000 depositors, and £4,500,000,000 of deposits; while in 1905 they had still further decreased in number to 224, but the depositors had increased to 1,730,331, and their deposits to £52,723,435. The reason for this is that the smaller trustee savings banks, open often only once a week for a short time, cannot give such facilities as the Post Office, which is open every day. Further than this, owing to the break-up of the Cardiff bank in 1886, and other smaller irregularities, a select committee of the House of Commons was appointed to inquire into these banks. By the recommendations of this committee, an independent and permanent inspection committee was appointed, which has carried on its work of inspection ever since, and reports annually to parliament. This action has rather tended to merge the smaller trustee savings banks in the Post Office. At the same time the large banks continue to do a great business, and have become in many ways similar to ordinary joint stock banks, affording to persons of smaller means daily facilities for saving.

Those who have studied the habits of thrift among the people have noticed how the pleasure in thrift, as it develops, is largely on the ready facilities which exist for its exercise. To this fact may perhaps be attributed the efforts that have been made in various directions for establishing some means of saving close to the places where wages are paid. To carry out this

1 By the Post Office Savings Bank (Public Trustee) Act 1908, the regulations as to declaration by a depositor and the prohibition of a depositor having more than one account do not apply to the public trustee.
idea, some of the large railway corporations have obtained powers in special acts of parliament to establish savings banks for those in their employment. The success of these banks has been great, though it has varied much, and it is difficult to trace any general rule of progress. Thirteen such institutions return their operations to the Registrar of Friendly Societies. The total amount held was, by the return for 1905, £5,513,207 in 60,427 accounts. In these banks the interest paid, as well as the deposits, are really guaranteed by the whole assets of the company. Limited, and in the other to attract thrift among their employes, the companies have formally agreed and bound themselves, by the provisions of their special acts, that the rate of interest paid shall be higher than can be obtained in the open market on the same security.

Other efforts have been made to establish savings banks at factories, to be open at the time wages are paid. One great difficulty, however, has been the objection many of those employed have to their employers knowing of their savings, and their fear lest it may affect their rate of pay. To get over this objection the plan has been tried of employing an agency to act as savings bank. This has not been much more successful, as the suspicion that accounts may be looked at by employers is difficult to overcome. It is found that the most successful savings banks are those which are carried on as a business, where the transactions are so numerous that the individual feels that his own private account is not likely to be known.

Another class of savings bank which of late years has developed considerably, is the penny bank. These banks have a twofold object: one to provide facilities for putting by extremely small sums for those whose means are very limited, and, secondly, to attract thrift among children and young people. They have been in existence for many years so as to train them to habits of thrift and the realization of the importance and use of even quite small savings. Some form of penny bank now exists in nearly every district, and indeed in nearly every parish. No returns have been collected, but it may be safely said that there are tens of thousands in operation. Many of these penny banks are feeders to the Post Office, which gives them special advantages to invest in that institution. Not only is the gross amount of money thus taken large, but (what is more important) the habit of thrift and of habituating children to the saving of the young in all parts of the United Kingdom. This has been one cause of the large extension of the Post Office savings bank itself, and has no doubt led to considerable change in the habits of the people.

In a few cases successful efforts have been made to establish permanently these penny banks on a commercial basis, as in the case of the Yorkshire Penny Bank, which has 838 branches, nearly 300,000 depositors and deposits of nearly £16,000,000; and the National Penny Bank, which has 13 branches in London, most of them open from 9 in the morning till 9 at night, with 155,768 depositors, and over £2,000,000 in deposits. The establishment of penny banks in schools has been carried on for many years, and it is difficult to exaggerate the useful work they have done in inculcating habits of thrift in the children, and in adding depositors to the Post Office savings banks when the children start in life. In England and Wales there are over 7000 of these savings banks held in the various elementary schools inspected by the Education Department. The London County Council has done much to promote this movement by instituting penny banks in its various schools. Although the financial result is not large, the educational effect of these banks is considerable. It has been found that many, though operating at a loss outside penny banks in preference to going to those carried on at their own schools, but it is probable that the idea of so doing is often suggested by the school savings bank.

With a view of bringing the savings bank still nearer the door of the people, efforts have been made to establish collecting savings banks. In these the collector calls at fixed periods for the deposits. This scheme has grown out of the investigations of a committee of the Charity Organization Society, and is based on the idea, which undoubtedly is the fact, that many people will make contributions when the money is called for, who will not take the trouble to walk a few yards themselves to make the same deposit. That this is so is proved most conclusively by the Post Office life insurance experience, a branch of the Post Office which is scarcely used by the people, while at the same time collecting life insurance companies (which of course must charge a considerable extra premium for collecting) do business to the extent of millions. In most of these banks no interest is given, but facilities and encouragements are afforded for the transfer of each individual account to the Post Office as soon as it is large enough to earn interest.

Closely allied, though not so important, are the very numerous sharing-out clubs which may be called temporary savings banks. These nearly all take a weekly subscription from their members, and, should any member die, his representative receives a certain sum, the balance left being divided at Christmas equally among the survivors, in proportion to the weekly subscriptions. Some of these clubs are registered, and at a rough estimate they number about 900, with some 120,000 members. The unregistered are, however, much more numerous, though no official information is to be had of them, and it is certain that hundreds of thousands of pounds are divided in this way each Christmas.

The attempt to induce sailors and soldiers to exercise habits of thrift by the establishments of naval savings banks under the act of 1866, and military savings banks under the act of 1859, should be mentioned. The amount in the naval savings bank is generally about £300,000. As might be expected the amount does not grow. This is accounted for by the fact that the depositors leave the service and draw out their savings. About £200,000 a year, however, goes in and out of the naval banks, and £400,000 in the army, which represents a good deal of self-denial, when the margin within which it is possible to save among sailors and soldiers is considered.

Closely allied to savings banks are a number of societies which need only be briefly referred to here. The largest of them are building societies (q.v.) under the Act of 1874, which are a very popular form of saving, especially in certain localities. The contributions to the shares of these societies, which are paid by instalments, differ but little from the periodical payments into savings banks; and although the money is not so readily repaid, notice and other forms having to be gone through, large numbers of persons pay in and draw out money, and receive the interest on the shares in much the same way as they do on deposits in savings banks without any idea of building or buying houses. In 1906 the receipts were £43,219,454 in the United Kingdom, and the balances due to and from members, with a membership of 612,424. The action of industrial and provident societies regulated under the act of parliament of 1893, must also be mentioned with reference to that of their banks, which is divided into three classes:—(a) ordinary co-operative societies; (b) societies for carrying on various businesses, including loan and banking; (c) land and building societies. All these societies, unlike the savings banks, act as savings banks, and have had considerable influence in the growth of thrift in the United Kingdom. (See FRIENDLY SOCIETIES.)

In the co-operative societies the sales in 1905 amounted to more than £1,000,000, and the profits to over £50,000. These profits are divided in different ways among the members, and they form a saving fund of large dimensions. The societies for carrying on various businesses, such as working men's clubs, loan and banking organizations, regulated under the 1893 act, numbered 286, with total receipts £3,020,569. These are not rapidly increasing, but they must be included as one exhibition of the savings of the people, and the co-operative building societies, and similar banking co-operative societies under the act of 1893 are not the same as those above referred to, though their action as regards savings is similar. They are not under the act of 1874, but carry on a trade or business, including dealings of any kind in land. They are what are called building societies. They received £135,424 from subscriptions and other sources, according to a return of 1905, and the value of the land and mortgages held and advanced was £1,400,000. Two other classes of institutions should be referred to, the friendly and trade societies, which exist for special purposes, namely, to make provision in sickness, for death, for a want of employment, and to a limited extent for old age. They differ essentially from savings banks, in that the members' contributions may be withdrawn. But as the subscriptions are for certain definite needs, almost certain to be required by each member, which but for those societies would have to be provided for, in this respect they are closely connected with the banks, and the result of government interference in the management of these friendly societies is in all respects a harmless interference with the provision of the subject as a whole. The amount held by the friendly societies is estimated at £50,459,600, subscribed by 13,078,790 members.

It was once stated with truth that the national debt was held by a
very small proportion of the population; but this is not so now. The various agencies which may be described as savings banks in different forms and under different names are a considerable share of the national debt of Great Britain.

**British Colonies.** — In New South Wales there are both state and trustee institutions for savings purposes. The Government Savings Bank was established in 1871 and the Savings Bank of New South Wales in 1832. In both, sums of one shilling and any multiple of that amount may be deposited. The Government Savings Bank does not allow interest on the excess of deposits exceeding £300 per year, while the Savings Bank of New South Wales does not allow interest on the excess of deposits over the sum of £200 made by any one individual, but, in the case of charitable trusts or trust institutions, where the deposit is in the hands of a trustee, the interest on the full deposit in the case of charitable institutions, or a legally established friendly or other society. The rate of interest in the Government Savings Bank is 3½% and in the Savings Bank of New South Wales 3¼. The following table shows the growth of depositors and deposits:

The Savings Bank of New South Wales was originally administered by the Government, but in the year 1902 the number may be extended up to fifteen. The funds of the institution, unlike those of the Government Savings Bank, may be applied to investments of a general nature, such as mortgages, government and municipal securities, &c. Victoria and South Australia have not developed the postal system, but show the largest amount per head of population of deposits. In trustee savings banks in Victoria the number of depositors in 1900-1901 was 330,913, while in 1905-1906 666,722: the amount of deposits in the same years was £662,066 and £1,774,179, showing an average amount per depositor of £4, 118, 8d. and £6, 13s. 4d.

The total number of deposits in savings banks in New South Wales in 1885 was 16,202; in 1905 this number 111,517 were depositors in trust companies, having an amount of deposits standing to their credit of £3,782,575 out of a total of £3,795,631. The average amount per depositor was £30, 2s. 4d. In 1905-1906 there were £52,487 depositors with a total amount of deposits of £4,766,907, giving an average amount per head of £31, 8s. 3d. On the other hand, Queensland and Western Australia rely almost exclusively on the post office system. In Queensland there were 91,025 depositors in 1900-1901, and 88,026 in 1905-1906. Deposits amounted to £3,896,170 in 1900-1901 and to £4,142,791 in 1905-1906, giving an average per depositor of £48, 1s. 9d. and £68, 2s. 6d.

In Western Australia in 1885 there were 39,318 depositors and in 1905-1906, 63,573. The deposits amounted to £1,618,359 in 1900-1901 and to £2,316,161 in 1905-1906, giving an average per depositor of £41, 5s. 3d. and £66, 8s. 4d. In Tasmania the total number of depositors in savings banks was 28,032, of which 11,517 were depositors in trust companies, while in 1905-1906 there were 91,025 depositors and 88,026 in 1905-1906. Deposits amounted to £1,618,359 in 1900-1901 and to £2,316,161 in 1905-1906, giving an average per depositor of £41, 5s. 3d. and £66, 8s. 4d.

In New Zealand there were in 1900-1901 212,436 post office depositors with an amount standing to their credit of £6, 359,013 and in 1905-1906 275,666 depositors with deposits of £8,662,023. There are five savings banks in New Zealand not connected with the post office; in these the total amount standing to the credit of depositors in 1905-1906 was £1,111,931.

**Canada.** — In Canada post office savings banks were established in 1867, but government savings banks, under the management of the Finance Department, have been established in the last few years. The Canadian government is pursuing the policy of transferring the accounts from the savings banks under the control of the Finance Department to the Post Office Department, the transfer taking place as the position of superintendent of each place becomes vacant. In both kinds of savings banks a deposit must not be less than $1 or exceed $1000 in any one year; nor must the total amount in deposit exceed $3000. There are 991 branches of the post office savings bank and 23 offices of the government savings bank. The following table shows the number of depositors and amount of deposits:

In addition to the post office and government savings banks there are special savings banks, such as the Caisse d'épargne of Quebec and Montreal City and District Savings Banks. The chartered banks also have savings branches; but in India, the Straits Settlements, Orange River Colony, Transvaal, Gold Coast, Sierra Leone and the Bahamas the savings banks are under the post office; in Mauritius, Seychelles, Florida, Falkland Islands, Natal, St. Helena, Southern Nigeria, Newfoundland, St. Lucia, St. Vincent, Turks and Caicos Islands, Jamaica, Barbados, Grenada, St. Christopher, Nevis, Antigua, Montserrat, Dominica, Bermuda, British Honduras, Cyprus, Trinidad, Tobago, Gibraltar and Malta there are government savings banks; in Gambia, treasury savings banks; in Ceylon and British Guiana there are both government and post office savings banks, while in the Cape of Good Hope, in addition to the post office savings banks, there are private savings banks, but their business is small.

**France.** — In France the first savings bank was instituted in Paris by royal ordinance in 1818. It was subsequently regulated by the principal departments. Some of those so created were independent undertakings, but several were founded on the initiative of municipal councils, three (Nancy, Metz, Avignon) being attached to ments-de-pié. These communal savings banks are now the rule and private banks the exception. They are regulated by a law of 1835, amended in several particulars by later legislation. They are created by decree of the president on the advice of the council of state, and at the initiative of the municipal council. Their administration is in the hands of a council consisting of the mayor of the commune and its directors, none of whom receive remuneration for their services. The funds which these institutions collect, with the exception of a certain amount allowed to be retained for independent investment, handed over to the Caisse des dépôts et consignations (created in 1816 for the administration of the investment of private funds. Interest of 1½% is allowed by the Caisse des dépôts et consignations. If the savings banks retain from ½ to ¾% for administrative expenses and the providing of a reserve fund. Both in the private and the post office savings banks the maximum amount standing in the name of a depositor must not exceed £1000.

The following statement shows the progress of private savings banks since 1835:

**Germany.** — In Germany the postal savings bank has not been adopted to any extent, but there is an elaborate system of state savings banks, which includes life, accident and life-pension insurance, with a certain extent even protection against involuntary idleness (see SAVINGS.)

1 For statistics of the post office savings banks see Statistics of the official publications of the various countries, and J. H. Hamilton, Savings and SAVINGS Institutions (New York, 1902).
UNITED STATES

There are in the United States four kinds of savings banks: (1) Mutual or Trustee Savings Banks; (2) Stock Savings Banks; (3) Postal Savings Banks; (4) School Savings Banks.

1. Mutual Savings Banks are organized under state laws, and are under the supervision of an officer usually appointed by the governor. They have no capital, and do a strictly investment business. All their earnings go to the depositors, either as dividends, or to a surplus fund, which, in the event of liquidation, also belongs to the depositors. Their management is vested in a board of trustees, a self-perpetuating body who serve without salary, and are paid nothing except such as may vest in their property. Executive officers and clerks are paid moderate salaries. The proportion of annual expense to each dollar of assets is sometimes less than .0025.

The rate of interest on deposits usually ranges from 3 to 4%. Depositors have no voice in the management, except as citizens of the state, through their representatives in the state legislature. Nearly all the states limit investments carefully, though a few permit considerable latitude; in New York the deposits in saving banks are considered next to government bonds as safe investments. In the states in which they are allowed to invest in stocks, they are exempt from taxation, but a franchise tax of 1% annually is imposed upon the surplus. In most other states the deposits are taxed for state purposes. The amount which each person may deposit in any year or half year is sometimes limited by the by-laws, and the total sum to be received from any one depositor is usually limited by state law. Depositors are in practice generally payable on demand, though the banks reserve the right to require notice, generally from sixty to ninety days, and sometimes enforce this right in times of panic. The first savings bank incorporated in the United States was the Providence Institution for Savings, incorporated in Boston in 1816. The oldest in New York is the Bank for Savings, of New York City, incorporated in 1819. The largest deposit of any bank of this kind in the United States, $108,720,523-82, was in 1910 that of the Bowery Savings Bank of New York. Mutual savings banks are confined chiefly to the states in the eastern portion of the country. The only mutual banks outside the northeasterly states were in 1910 three in Ohio, five in Indiana, fourteen in Minnesota, one in West Virginia, one in California and two in Wisconsin.

Though the laws governing mutual banks vary in the different states, the first law of the New York Savings Bank Law of 1875, re-enacted in 1892, and subsequently amended, gives the main principles on which they are organized. Mutual banks may incorporate a savings bank, two-thirds of whom shall be residents of the county where the proposed bank is to be situated. When the certificate of organization is filed with the superintendent of banks, who exercises supervision over all banks, it is the condition that if at any time the indebtedness of any bank is in fact needed in the community where it is to be organized, and to investigate the character and general fitness of the trustees. The present superintendent of banks requires that the incorporators of a savings bank shall defray personally the expenses of the institution until its earnings are sufficient to meet such expenses, and also return dividends at the rate of not less than 3%. The board of trustees have entire control of the management of the bank. They elect the president and other officers. A trustee who borrows any of the bank's funds, or who becomes a surety for any other borrower, forfeits his office. Bankruptcy or an unsatisfied judgment of ninety days' standing will also void his office. Trustees are not allowed to have any interest in the profits, or to borrow the deposits or funds.

The trustees of any savings bank may invest the moneys deposited therein and the income derived therefrom as follows: (1) In the stocks or bonds of interest-bearing notes or obligations of the United States, or those for which the faith of the United States is pledged, including the bonds of the District of Columbia. (2) In the stock or bonds of a railroad corporation, to the aggregate amount not exceeding in the aggregate amount of any of the United States and of any railroad company in the United States, which has not within ten years defaulted in the payment of any part of any debt authorized by its legislature. (3) In the stocks or bonds of a school district, in the aggregate amount not exceeding in the aggregate amount of any school district bonds issued, for school purposes, or in the interest-bearing obligations of any city or county of this state. (4) In the stocks or bonds of a number of specified cities without the state, unless the interests of the said cities, less its water debts and sinking fund, shall exceed 7% of its valuation for purposes of taxation, its bonds and stocks shall cease to be an authorized investment. (6) In bonds and mortgages on real and personal real property in the aggregate amount not exceeding 60% of the value of the property. Not more than 65% of the whole amount of deposits shall be so lent or invested. If the loan is on unimproved and unproductive real property, the amount lent thereon shall not be more than 50% of its actual value. No investment in any bond and mortgage shall be made by any savings bank, except upon the report of a committee of its trustees. (7) Also, by the first mortgage bonds of any railway corporation of this state, the bonds of any such railway corporation of an issue to retire all prior mortgage debt of such railway corporation, provided the bonds laterly to certain pecuniary conditions. Not more than 25% of the assets of any savings banks shall be loaned or invested in railroad bonds. There are other limitations of the amounts to be loaned or invested in the securities of any one railway. Street railway corporations shall not be considered railway corporations within the meaning of this section. An act passed in 1900 permits the investment of deposits in the bonds of certain railways situated in other states. These investments must conform to conditions assuring safety.

Savings banks in New York are preferred creditors of insolvent state banks and trust companies. In 1901 a law was passed providing for a tax of 1% on the surplus of savings banks, computed on the par value of their securities. On July 1, 1910, deposits in the savings banks amounted to $1,590,181,366-19, and their investments to $1,599,532,371, classified as follows:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

These banks, on the date named, a surplus fund of $202,656,366-58, and $3,144,584,874 individual deposits. The Mutual Savings Banks hold more than 22% of the aggregate individual deposits of all the banks in the country.

2. Stock Savings Banks are found in the more purely agricultural parts of the country, the southern, Mississippi Valley and western states, where only a small proportion of people earn wages in manufactures and commerce; suitable investments are not numerous, the benefits of mutual saving banks are not familiar, and the people are unwilling to accept a low rate of interest. In some states having stock banks there are no laws regulating the banking business by which they regulate their business under the same laws as commercial banks. Several of the states restrict the investments of the stock savings banks. Prior to 1865, when the issue of circulating notes by state banks was suppressed by a prohibitory tax, there was a distinction between state banks and stock savings banks; the former could issue notes, while the latter, as a rule, could not. Stock savings banks are conducted frequently as adjuncts of state and national banks, occupying the same rooms and being under the same management. Many of the national banks chartered by the several governments of the several states have issued notes for stock savings banks, and the deposits received in these departments are on the same legal footing as other deposits and are not specially invested. Similar departments are also to be found in many trust companies and state banks of discount.

The law of the state of Iowa is typical of those states where stock banks are under public supervision. A savings bank may be organized with a capital of $10,000, or $20,000, or $50,000, or $500,000. The usual corporate powers are granted. The amount of deposits is limited to twenty times the capital and surplus. The usual provisions for re-payments of deposits are made, and in addition the savings banks are given the privilege of requiring sixty days' notice for the withdrawal of savings deposits.

Stockers are not allowed to invest their funds in the following securities: (1) Stocks, bonds or interest-bearing notes of the United States. (2) Stocks, bonds or evidences of debt-bearing interest of the
SAVOIE—SAVONA

state of Iowa. (g) Stocks, bonds and warrants of any city, town, village, or school district, or drainage district, in the state regularly issued, but the investments of any savings bank should not consist of such bonds or warrants to a greater amount than 25 per cent. of the assets. In mortgaging deposits on unencumbered real estate within the state worth at least twice the amount lent. (g) It is lawful for such banks to discount, purchase, sell and make loans upon personal or public security, except shares of their own capital stock. Property acquired by foreclosure of mortgages, &c., may not be held more than ten years. The rate of interest to be paid is left to the discretion of the trustees, and the profits, after the payment of such interest and expenses, go to capital stock. Stockholders are liable to the creditors for double their stock, and such liability continues for six months after the transfer of any stock. Directors receive no compensation. Officers and directors of the bank are required to give an annual security in the form of either bonds or notes, and such loans can only be made by the board in the absence of the party applying. The savings banks are prohibited from lending to any individual or firm more than 20 per cent. of the capital stock. All savings banks are required to make a quarterly statement to the authorizing state, giving in detail the statement of condition upon a given day. This statement is made under oath of the officers, and is required to be published. The state auditor is given the power to examine any savings bank at any time, and must make an examination at least once a year; and should the conditions warrant, he is required to report to the attorney-general, who institutes proceedings under the statute to dissolve the corporation. Provision is made for increasing the capital stock by a two-thirds' vote of the existing shares. The corporate existence of the banks is placed at fifty years. Michigan affords a good example of banks doing a commercial and savings bank business under a single organization, but with the savings deposits entirely segregated from other deposits and separately invested. The system has worked successfully and factually. There has been much discussion among bankers throughout the country in the last few years of the possibility of enacting laws specifically providing (a) for the creation of savings departments in national banks, with the segregation of savings deposits, and (b) for the enactment of similar state laws to national savings banks and trust companies maintaining savings departments. Other proposals have been made for a government (or state) guaranty of deposits, and this plan has been adopted in a few of the states.

On April 28, 1909, there were 1661 stock savings banks reporting, with aggregate resources of $677,784,099-95. Their capital was $59,506,420, and surplus and undivided profits $38,112,716-60. Individual deposits subject to check: $100,708,410-57; savings deposits or deposits made in trust: $366,167,901-61; other deposits, including amount due banks and bankers, $109,911,893-91.

Number of Savings Banks in the United States, Number of Depositors, Amount of Savings Deposits, &c., 1900-1909.

1 Population estimated at 88,926,000, June 30, 1909.
2 Not including 339 state banks and trust companies of Illinois with $204,908,805 savings deposits credited to 641,634 savings depositors. Including Illinois savings deposits and the average due each depositor is $413-60 and average per capita $44-06.
3 On May 3, 1909, a statement was issued by Wm. Hanhart, Secretary of the Savings Bank Section of the American Bankers Association, showing "actual savings deposits in the savings banks, national banks, Trust Companies and private banks in United States," $4,560,000,000.
4 Postal Savings Banks.—By an act of the Federal Congress, approved June 25, 1910, Postal Savings Banks were first authorized in the United States. The management of these banks is vested in a board of trustees composed of the postmaster-general, secretary of the treasury, and attorney-general. The board of trustees shall designate such post-offices as it deems proper to be postal savings depository offices. Any person ten years or over may be a depositor; the minimum deposit is one dollar, and not more than $100 may be deposited by any one in any one month; the maximum balance to which the credit of any depositor (exclusive of interest) shall not exceed $500. Interest, 2 per cent. annually; deposits payable on demand without notice. The deposits in the postal savings depositories are to be deposited in banks subject to national or state supervision at not less than 2% interest; 65 per cent. of the deposits may be so redeposited in these banks; 30 per cent. invested in United States securities, and 5 per cent. held as a reserve in the United States treasury. But the 65 per cent. fund on deposit with the banks may be withdrawn for investment in bonds or other securities of the United States, or for the payment of the national debt. Only when, in his judgment, the general welfare and the interests of the United States so require. At the option of the depositor, deposits may be converted into United States government bonds. In making deposits of the funds in national or state banks, the Federal government requires that those banks secure in the form of public bonds or other securities as the board of trustees may prescribe. The faith of the United States is solemnly pledged to the payment of the deposits.

4. School Savings Banks were first established in the United States in 1885 by J. H. Thiry, at Long Island City, New York, Oct. 1, 1881. The first of the 1766 schools, distributed throughout 118 cities or villages. Out of 632,665 pupils' registered in these schools, 903,458 have saved $5,051,644-60, of which $4,180,948-59 have been withdrawn, leaving a balance of $870,666-01 due depositors. (B. R. *).

SAVOIE, a frontier district of France, formed in 1860 of the old provinces of Haute Savoie, Savoie, the Tarentaise and the Maurienne, which constituted the southern portion of the duchy of Savoy. It is bounded N. by the department of Haute Savoie, E. and S. by Italy, S.W. by the department of the Hautes Alpes, W. by those of the Isère and the Ain. Pop. (1901) 254,781; area 2224 sq. m. It is mainly made up of the basin of the Isère. The upper course of that river flows through the Tarentaise, receiving (right) the Arly and later (left) the Arc, which flows through the Maurienne, which is to a large extent traversed by the Mont Cenis railway. Probably the Isère formerly communicated with the Rhône past Chambéry and the Lac du Bourget. The sources of the Isère and of the Arc arc separated by the ridge of the Col du Mont Iséran (9065 ft.). The loftiest point in the department are the Grande Casse (13,615 ft.), the Mont Lachat (13,536 ft.), the Mont Pourri (12,425 ft.), the Pointe de Charbonnel (12,336 ft.), the Aiguille de la Grande Sassière (12,323 ft.), the Dent Parrachée (12,175 ft.), the Levanna (11,943 ft.) and the Aiguilles d'Arves (11,520 ft.). A small portion of the department (including both shores of the Lac du Bourget) is in the part of the duchy of Savoy neutralized in 1815. It is divided into 4 arrondissements (Chambéry, the chief town, Albertville, Moutiers-Tarentaise, and St Jean de Maurienne), 29 cantons and 329 communes. It forms the dioceses of Chambéry (an archbishopric), Moutiers and St Jean de Maurienne. The best place known to foreigners is Aix les Bains (q.v.), while others are delightful at Marlies and at Challes, those of Salins being saline, and those of Brides (the best known after Aix) alkaline.

See J. J. Vernier, Dictionnaire toponomastique de la Savoie (Chambéry, 1897).

SAVONA, a seaport and Episcopal see of Liguria, Italy, in the province of Genoa, 27 m. W.S.W. of Genoa by rail, 33 ft. above sea-level, and after Genoa and Nice the most important of the cities of the Riviera. Pop. (1906) 43,856 (town); 46,715 (commune). The greater part of the town is built on a rock, with green-leaved vines and luxuriant orange groves. On the Rock of St George stands the castle built by the Genoese in 1542, on the area of the old cathedral and now used as a military prison. The cathedral (1580-1604) is a late Renaissance building with a modern dome and early Renaissance choir-stalls, pulpit, &c. In the Cappella Sistina, to the north, stands the simple, finely carved tomb erected by Sixtus IV. to his parents. Facing the cathedral is the Delta Rovere palace erected by
SAVONAROLA 249

Cardinal Giulio della Rovere (Julius II), from the plans of Giuliano da Sangallo as a kind of university, and now occupied by the prefecture, the post-office and law-courts. S. Maria di Sestello has a large altarpiece by Foppa and Brea (of 1490). There is a municipal picture-gallery in the hospital of St Paul. The Teatro Chiabrera was erected in 1835 in honour of the lyric poet Chiabrera, who was born and buried in Savona. Four and a half miles W. is a pilgrimage church of the Madonna della Misericordia, founded in 1536. The modernized dates of 1815 were inscribed in the rock, 986 ft. long, 460 ft. wide and 23 ft. deep. Savona is one of the chief seats of the Italian iron industry, having iron-works and foundries, shipbuilding, railway workshops, engineering shops, brass foundry, tinplate works, sulphur mills and glass-works. It imports commodities to the value of nearly £4,000,000 yearly, half of which is coal, with petroleum, iron, cereals, &c. In 1906, 7,770,000 tons of shipping, of which about half was British, and most of the rest Italian, entered. There is a small export trade, chiefly in Iron sheets, chemicals, wood and candied fruits. The potteries export their earthenware to all parts of Italy. There is a railway through the mountains from Savona to Turin (91 m. N.N.W.).

Savona is the ancient Sare, a town of the Ingaei (see ALBENGA), where, according to Livy, Mago stored his booty in the Second Punic War. A buried Roman bridge lies near the stream, which now oncewas a port where women washed their clothes in summer. At the port of the 9th century, the traffic passing to Vada Sabatia (Vado), 4 m. to the W., which was a harbour, and the point to which the coast road from Rome was reconstructed in 109 B.C., and from which a road diverged across the inland plain to Placentia (of 109 B.C. it bought up the territorial claims of the marqueses Del Carretto. Its whole history is that of a long struggle against the preponderance of Genoa. As early as the 12th century the Savone built themselves a sufficient harbour; but in the 16th century the Genoese, fearing that Francois I. of France intended to make it a great seat of Mediterranean trade, rendered it useless by sinking at its mouth vessels filled with large stones. In 1460 it was captured by the king of Sardinia, but it was restored to Genoa by the treaty of Aix-la-Chapelle. Columbus, whose ancestors came from Savona, gave the name of the city to one of the first islands he discovered in the Antilles.

SAVONAROLA, GIROLAMO (1452-1498), Italian monk and martyr, was born at Ferrara on the 21st of September 1452, the third child of Michele Savonarola and his wife Elena Bonacossi of Mantua. His grandfather, Michele Savonarola, a Paduan physician of much repute and learning, had settled in Ferrara, and gained a large fortune there. The younger Michele was a mere courtier and spendthrift, but Elena seems to have been a woman of superior stamp. She was tenderly loved by her famous son, and his letters prove that she retained his fullest confidence through all the vicissitudes of his career.

Girolamo was a precocious child, with an early passion for learning. His first tutor was his grandfather, the physician; and, in the hope of restoring their fallen fortunes, his parents intended him for the same profession. Even as a boy he had intense pleasure in reading St Thomas Aquinas and the Arab commentators of Aristotle, was skilled in the subtleties of the schools, wrote verses, studied music and design, and, avoiding society, loved solitary rambles on the banks of the Po. Ferrara was then a gay and bustling town of 100,000 inhabitants, its prince Borso d’Este a most magnificient potentate. To the mystic young student all festivities were repulsive, and although reared in a courtier-household he early asserted his individuality by his contempt for the courtier life. At the age of nine he took the vow of poverty and took the name of Francesco. But he was not passionately in love with the daughter of a neighbour, a Strozzi exiled from Florence. His suit was repulsed with disdain; no Strozzi, he was told, might stoop to wed a Savonarola. This blow probably decided his career; but he endured two years of misery and mental conflict before resolving to abandon his medical studies and become a monk. He was full of doubt and self-distrust; disgust for the world did not seem to him a sufficient qualification for the religious life, and his daily prayer was, “Lord! teach me how I should walk.” But in 1474 his doubts were dispelled by a sermon heard at Faenza. He secretly stole away to Bologna, entered the monastery of St Domenico and then acquainted his father with his reasons for the step. The world’s wickedness was intolerable, he wrote; throughout Italy he beheld vice triumphant, virtue despised. Among the papers he had left behind at Ferrara was a treatise on “Contempt of the World,” inveighing against the prevalent corruption and predicting the speedy vengeance of Heaven. His novitiate was marked by a fervour of humility. He sought the most menial offices, and did penance for his sins, with a diet of bread and water, by the severest austerities. According to contemporary writers, he was born to a shadow. His gaunt features were beautified by an expression of singular force and benevolence. Luminous dark eyes sparkled and flamed beneath his thick, black brows, and his large mouth and prominent nether lips were as capable of gentle sweetness as of power and set resolve. He was of middling stature and dark complexion. His manners were simple, his speech unadorned and almost homely. His splendid oratorical power was as yet unrevealed; but his intellectual gifts being recognized his superiors charged him with the laborious toil of an instructor. He passed six quiet years in the convent, but his poems written during that period are expressive of burning indignation against the corruptions of the church and profoundest sorrow for the calamities of his country.

In 1482 he reluctantly accepted a mission to Ferrara, and, regarding earthly affections as snares of the evil one, tried to keep aloof from his family. His preachings attracted slight attention there, no one—as he later remarked—being a prophet in his own land. An outbreak of hostilities between Ferrara and Venice, fomented by Pope Sixtus IV., was composed at this time he returned to Florence. Thence he was despatched to St Mark’s in Florence. Lorenzo the Magnificent was then (1482) at the height of his power and popularity. At first Savonarola was enchanted with Florence. His cloister, sanctified by memories of St Antonine and adorned with the inspired paintings of Frà Angelico, seemed to him a fore-court of heaven. But his content speedily changed to horror. The Florence streets rang with Lorenzo’s ribald songs (“the canti carnascialeschi”); the smooth, cultured citizens were dead to all sense of religion or morality; and the spirit of the fashionable heathen philosophy had even infected the brotherhood of St Mark. In 1483 Savonarola was Lenten preacher in the church of St Lorenzo, but his plain, earnest exhortations attracted few hearers, while all the world thronged to Santo Spirito to enjoy the elegant rhetoric of Frà Mariano da Genazzano. Discouraged by this failure in the pulpit, Savonarola now devoted himself to teaching in the convent, but his zeal for the salvation of the apathetic townsfolk was soon to stir him to fresh efforts. Convincing of being divinely inspired, he had begun to see visions, and discovered in the Apocalypse symbols of the heavenly vengeance about to overtake this sin-laden people. In his vision his church was composed at this time he returned to his prophetic dismay. The papal chair was now filled by Innocent VIII., whose rule was even more infamous than that of his predecessor Sixtus IV.

Savonarola’s first success as a preacher was gained at St Gemignano (1483-1485), but it was only at Brescia in the following year that his power as an orator was fully revealed. In a sermon on the Apocalypse he shook men’s souls by his terrible threats of the wrath to come, and drew tears from their eyes by the tender pathos of his assurances of divine mercy. A Brescian friar relates that a halo of light was seen to flash round his head, and the citizens remembered his awful prophecies when in 1512 their town was put to the sack by Gaston de Foix. Soon, at a Dominican council at Reggio, Savonarola had occasion to display his theological learning and subtlety. The famous Pico della Miranda was particularly impressed by the friar’s attainments, and is said to have urged Lorenzo de’ Medici to recall him from Lombardy.

When Savonarola returned to Florence in 1490, his fame as an orator had gone there before him. The cloister garden was too small for the crowds attending his lectures, and on the 1st of August 1490 he gave his first sermon in the church of St Mark. To quote his own words, it was “a terrible sermon,” and legend
adds that he foretold he should preach for eight years. And now, for the better setting forth of his doctrines, to silence pedants, and confute malignant misinterpretation, he published a collection of his writings. These proved his knowledge of the ancient philosophers, the influence of new men, and showed that the latter and of the fathers caused him to seek inspiration from the Bible alone. The Triumph of the Cross is his principal work, but everything he wrote was animated by the ardent spirit of piety evidenced in his life. Savonarola's sole aim was to bring mankind nearer to God. 

In 1491 he was invited to preach in the cathedral, Sta Maria del Fiore, and his rule over Florence may be said to begin from that date. Lorenzo sent leading citizens to him to urge him to show more respect to the head of the state. Savonarola rejected their advice and foretold the impending deaths of Lorenzo, of the pope and of the king of Naples. In the July of the same year he was elected prior of St Mark's. As the convent had been rebuilt by Cosimo, and enriched by the bounty of the Medici, it was considered the duty of the new superior to present his homage to Lorenzo. Savonarola, however, refused to conform to the usage. His election was due to God, not Lorenzo; to God alone would he promise submission. Upon this the sovereign angrily exclaimed: "This stranger comes to dwell in my house, yet will not stoop to pay me a visit." Nevertheless, disclaiming to recognize the entire extent of Lorenzo's mark, he tried, but in vain, conciliatory measures. The Magnifico then sought to undermine his popularity, and Frà Mariano was employed to attack him from the pulpit. But the preacher's scandalous accusations missed their mark, and disgusted his hearers without hurting his rival. Savonarola took up the challenge; his eloquence prevailed, and Frà Mariano was silenced. But the latter, while feigning indifference, was henceforth his rancorous and determined foe.

In April 1492 Lorenzo de' Medici was on his death-bed at Careggi. Oppressed by the weight of his crimes, his reputation and his wealth, the unhappy friar saw his hopes of salvation rapidly diminishing. Savonarola, in a moment of exaltation, declared that in three days the manifestation of divine grace would make of him a saint. Lorenzo turned his face to the wall and made no reply. Savonarola waited a few moments and then went away. And shortly after his petition died unavailing.

Prophetic Visits. The same year witnessed the fulfilment of Savonarola's second prediction in the death of Innocent VIII. (July 1492); men's minds were full of anxiety, an anxiety increased by the scandalous election of Cardinal Borgia to the papal chair. The friar's utterances became more and more fervent and impassioned. It was during the delivery of one of his Advent sermons that he beheld the celebrated vision, recorded in contemporary medals and engravings, that is almost a symbol of his doctrines. A hand appeared to him bearing a flaming sword inscribed with the words: "Gladius Domini supra terram cito et velociter." He heard supernatural voices proclaiming mercy to the faithful, vengeance on the guilty, and mighty cries that the wrath of God was at hand. Then the sword bent towards the earth, the sky darkened, thunder pealed, lightning flashed, and the whole world was wasted by famine, bloodshed and pestilence. It was probably the noise of these sermons that caused the friar's temporary removal from Florence at the instance of Piero de' Medici. He was presently addressing enthusiastic congregations at Prato and Bologna. In the latter city he his courage in rebuking the wife of Bentivoglio, the reigning lord, for interrupting divine service by her noisy entrance nearly cost him his life. Assassins were sent to kill him in his cell; but awed, it is said, by Savonarola's words and demeanour they fled dismayed from his presence. At the close of his last sermon the undaunted friar publicly announced the day and hour of his departure from Bologna; and his lonely journey on foot over the Apennines was safely accomplished. He was rapturously welcomed by the community of St Mark's, and at once proceeded to cast out the <omitted word> of the "threatened" and to sweep away abuses. For this purpose he obtained, after much difficulty, a papal brief emancipating the Dominicans of St Mark from the rule of the Lombard vicars of that order. He thus became an independent authority, no longer at the command of distant superiors. He reestablished the brethren to a quieter retreat outside the city, only retaining in Florence those best fitted to aid in intellectual labour. To render the convent self-supporting, he opened schools for various branches of art, and promoted the study of Oriental languages. His efforts were successful; religion and learning made equal progress. St Mark's became the most popular monastery in Florence, and many citizens of noble birth flocked thither to take the vows.

Meanwhile Savonarola continued to denounce the abuses of the church and the guilt and corruption of mankind, and thundered forth predictions of heavenly wrath. In 1494 the duke of Milan demanded the aid of France, and King Charles VIII. brought an army across the Alps. Piero de' Medici, made alliance with the Neapolitan sovereign whose kingdom was claimed by Charles. Then, repenting this ill-judged step, he hurried in person to the French camp at Pietra Santa and humbled himself before the king. Not content with imposing on all the latter's demands, he further promised large sums of money and the surrender of the strongholds of Pisa and Leghorn. This news drove Florence to revolt. But even at this crisis Savonarola's influence was all-powerful, and a bloodless revolution was effected. Piero Capponi's declaration that "it was time to put an end to this baby government" was the sole weapon needed to depose Piero de' Medici. The resuscitated republic instantly sent a fresh embassy to the French king, to arrange the terms of his reception in Florence. Savonarola was one of the envoys, and went to the king in the disguise of an excommunicated friar who had so long predicted his coming and declared it to be divinely ordained. He was most respectfully received at the camp, but could obtain no definite pledges from the king, who was bent on first coming to Florence.

Returning full of hope from Pietra Santa, Savonarola might well have been dismayed by the distracted state of public affairs. Nevertheless, with the aid of Capponi, he guided the bewildered city safely through these critical days. Charles entered Florence on the 17th of November 1494, and the citizens' fears evaporated as they saw the majesty of the French leader. But the exorbitant demands soon showed that he came as a foe. Disturbances arose, and serious collision with the French troops seemed inevitable. The signory resolved to be rid of their dangerous guests; and, when Charles threatened to sound his trumpets unless the sums exacted were paid, Capponi tore up the treaty in his face and made the memorable reply: "Then we will ring our bells." The monarch was cowed, accepted moderate terms, and, yielding to Savonarola's remonstrances, left Florence on the 24th of November.

After seventy years' subjection to the Medici Florence had forgotten the art of self-government, and felt the need of a strong guiding hand. So the citizens turned to the patriot monk whose words had freed them of King Charles, and Savonarola became the lawgiver of Florence. The first thing done at his instance was to relieve the starving populace within and without the walls; shops were opened to give work to the unemployed; all taxes, especially those weighing on the lower classes, were reduced; the strictest administration of justice was enforced, and all men were exorted to place their trust in the Lord. And, after much debate, as to the constitution of the new republic, Savonarola's influence carried the day in favour of Soderini's proposal of a universal or general government, with a great council on the Venetian plan. The great council consisted of 3200 citizens of blameless reputation and over twenty-five years of age, a third of the number sitting for six months in turn in the hall of the Cinquecento expressly built for the purpose. There was also an
SAVONAROLA

upper council of eighty, which in conjunction with the signory decided all questions of too important and delicate a nature for discussion in the larger assembly. These institutions were approved by the people, and gave a fair promise of justice. Savonarola’s programme of the new government was comprised in the following formula:—(1) fear of God and purification of manners; (2) promotion of the public welfare in preference to private interests; (3) a general amnesty to political offenders; (4) a council on the Venetian model, but with no doge. At first the new machinery acted well; the public mind was tranquil, and the war with Pisa—not as yet of threatening proportions—was enough to occupy the Florentines and prevent intermecine feuds.

Without holding any official post in the commonwealth he had created, the prior of St Mark’s was the real head of the state, the dictator of Florence, and guarded the public weal with extraordinary political wisdom. At his instance the tyrannical system of arbitrary impost and so-called voluntary loans was abolished, and replaced by a tax of 10% (la decima) on all real property. The laws and eloquence of dissolute ages, and even the sayings of Savonarola’s sermons, and indeed his counsels were always given as addenda to the religious exhortations in which he denounced the sins of his country and the pollution of the church, and urged Florence to cast off iniquity and become a truly Christian city, a pattern not only to Rome but to the world at large. His eloquence was now at the flood. Day by day his impassioned words, filled with the spirit of the Old Testament, wrought upon the minds of the Florentines and strung them to a pitch of pious emotion never before—and never since—attained by them. Their fervour was only to be lasting, and Savonarola’s uncompromising spirit roused the hatred of political adversaries as well as of the degraded court of Rome. Even now, when his authority was at its highest, when his fame filled the land, and the vast cathedral and its precincts lacked space for the crowds flocking to hear him, his enemies were secretly preparing his downfall.

Pleasure-loving Florence was completely changed. Abjuring pomp and vanities, its citizens observed the ascetic régime of the cloister; half the year was devoted to abstinence and few dared to eat meat on the fasts ordained by Savonarola. Hymns and lauds rang in the streets that had so recently echoed with the costliest odes and songs like paraphrases of Savonarola’s sermons. Both sex dressed with Puritan plainness; husbands and wives quitted their homes for convents; marriage became an awful and scarcely permitted rite; mothers suckled their own babies; and persons of all ranks—nobles, scholars and artists—renounced the world to assume the Dominican robe. Still more wonderful was Savonarola’s influence over children, and their response to his appeals is a proof of the magnetic power of his goodness and purity. He organized the boys of Florence in a species of sacred militia, an inner republic, with its own magistrates and officials charged with the enforcement of his rules for the holy life. It was with the aid of these youthful enthusiasts that Savonarola arranged the religious carnival of 1496, when the citizens gave their costliest possessions in alms to the poor, and tonsured monks, crowned with flowers, sang lauds and performed wild dances for the glory of God. In the same spirit, and to point the doctrine of renunciation of worldly enjoyments, he celebrated the carnival of 1497 by the famous “burning of the vanities” (i.e. masks and other objects pertaining to the carnival festivities, indecent books and pictures, &c.) in the Piazza della Signoria. A Venetian merchant is known to have bid 22,000 gold florins for the doomed vanities, but the scandalized authorities not only rejected his offer but added his portrait to the pile. Nevertheless the artistic value of the objects consumed has been greatly exaggerated by some writers. There is no proof that any book or painting of real merit was sacrificed, and Savonarola was neither foe to art nor to learning. On the contrary, so great was his respect for both that, when there was a question of selling the Medici library to pay that family’s debts, he saved the collection at the expense of the convent purse.

Meanwhile events were taking a turn hostile to the prior. Alexander VI. had long regretted the enfranchisement of St Mark’s from the rule of the Lombard Dominicans, and now, having seen a transcript of one of Savonarola’s denunciations of his crimes, resolved to silence this daring preacher. Bribery was the first weapon employed, and a cardinal’s hat was held out as a bait. But Savonarola indignantly spurned the offer, replying to it from the pulpit with the prophetic words: “No hat will I have but that of a martyr, reddened with my own blood.” So long as King Charles remained in Italy Alexander’s concern for his own safety prevented vigorous measures against the friar. But no longer did he ever forget an enemy. He bided his time, and the transformation of sceptical Florence into an austere Gallican republic claiming the Saviour as its head only increased his resolve to crush the man who had wrought this marvel. The potent duke of Milan, Ludovico Sforza, and other foes were labouring for the same end, and already in July 1495 a papal brief had courteously summoned Savonarola to Rome. In terms of equal courtesy the prior declined the invitation, nor did he obey a second, less softly worded, in September. Then came a third, threatening Florence with an interdict in case of renewed refusal. Saw that his renegaded command, but went to preach for a while in other Tuscan cities. But in Lent his celebrated sermons upon Amos were delivered in the duomo, and again he urged the necessity of reforming the church, striving by ingenious arguments to reconcile rebellion against Alexander with unalterable fidelity to the Holy See. All Italy recognized that Savonarola’s voice was arousing a storm that might shake even the power of Rome. Alive to the danger, the pope knew that his foe must be crushed, and the religious carnival of 1496 afforded a good pretext for stronger proceedings against him. The threat of Southern Italy did not deter, but a brief uniting St Mark’s to a new Tuscan branch of the Dominicans now deprived Savonarola of his independent power. However, in the beginning of 1497 the Piagnoni were again in office, with the prior’s staunch friend, Francesco Valori, at their head. In March the aspect of affairs changed. The Arrabbiati and the Medicean faction merged political differences in their common hatred to Savonarola. Piero de’ Medici’s fresh attempt to re-enter Florence failed; nevertheless his followers continued their intrigues, and party spirit increased in virulence. The citizens were growing weary of the monastic austerities imposed on them, and Alexander foreboded the fall. A signy openly hostile to Savonarola took office in May, and on Ascension Day his enemies ventured on active insult. His pulpit in the duomo was defiled, an ass’s skin spread over the cushion, and sharp nails fixed in the board on which he would strike his hand. The outrage was discovered and remedied before the service began; and, although the Arrabbiati half filled the church and even sought to attack his life, Savonarola kept his composure and delivered an impressive sermon. But the signy, in feigned anxiety for the public peace, besought him to suspend his discourses. Shortly afterwards the threatened bull of excommunication was launched against him, and Frà Mariano was in Rome stimulating the pope’s wrath. Savonarola remained undaunted. The sentence was null and void, he said. His mission was divinely inspired; and Alexander, elected sinonically and laden with crimes, was no true pope. Nevertheless the reading of the bull in the duomo with the appropriate, terrifying ceremonial made a deep impression on the Florentines. And now, the Arrabbiati signy putting no check on the Compagnacci, the city returned to the wanton excesses of Lorenzo’s reign. But in July Savonarola’s friends were again in power and did their best to have his excommunication removed. Meanwhile party strife was stilled by an outbreak of the plague. During this time Rome was horor-struck by the mysterious murder of the young duke of Gandia, and the bereaved pope mourned his son with the wildest grief. Savonarola addressed to the pontiff a letter of condolence, boldly urging him to bow to the will of Heaven and repent while there was yet time.

The plague ended. Florence was plunged in fresh troubles from Medicean intrigues, and a conspiracy for the restoration of
of Piero was discovered. Among the five leading citizens concerned in the plot was Bernardo del Nero, a very aged man of lofty talents and position. The gonfalonier, Francesco Valori, used his strongest influence to obtain their condemnation, and all five were put to death. It is said that at least Bernardo del Nero would have been spared had Savonarola raised his voice, but, although restraining from any active part against the prisoners, the prior would not ask mercy for them. This silence proved fatal to his popularity with moderate men, gave new adherents to the Arrabbiati, and whetted the fury of the people, Storza and all potentates well disposed to the Medici faction. He was now interdicted from preaching even in his own convent and again summoned to Rome. As before, the mandate was disobeyed. He refrained from public preaching, but held conferences in St Mark's with large gatherings of his disciples, and defied the interdict on Christmas Day by publicly celebrating mass and heading a procession through the cloisters.

The year 1498, in which Savonarola was to die a martyr's death, opened amid seemingly favourable auspices. The Piagnoni were again at the head of the state, and by their request the prior resumed his sermons in the duomo, while his dearest disciple, Frá Domenico Buonvicini, filled the pulpit of St Lorenzo. For the last time the carnival was again kept with strange religious festivities, and some valuable books and works of art were sacrificed in a second bonfire of "vanities." But menacing briefs poured in from Rome; the pope had heard of one of his rivals who, having returned from the East, was threatening to amuse the city itself was threatened with interdict, and the Florentine ambassador could barely obtain a short delay. Now too the Piagnoni quitted office; the new signory was less friendly, and the prior was persuaded by his adherents to retire to St Mark's. There he continued to preach with unabated zeal; and, since the women of Florence deplored the loss of his teachings, one day in the week was set apart for them. The signory tried to conciliate the pope by relating the wonderful spiritual effects of their preacher's words, but Alexander was obdurate. The Florentines must either silence the man themselves, or send him to be judged by a Roman tribunal.

Undismayed by personal danger, Savonarola resolved to appeal to all Christendom against the unrighteous pontiff, and despatched letters to the rulers of Europe adorning them to assemble a council to condemn this antipope. The council of Constance, and the deposition of John XXIII., were satisfactory precedents still remembered by the world. One of these letters being intercepted and sent to Rome by the duke of Milan (it is said) proved fatal to the friar. The papal threats were too urgent to be disregarded, and the crowed signory tried to entice Savonarola to put an end to his sermons. He reluctantly obeyed, and concluded his last discourse with the tenderest and most touching farewell.

The government now hoped that Alexander would be appeased and Florence allowed to breathe freely. But although silenced the prophet was doomed, and the folly of his disciples precipitated his fate. A creature of the Arrabbiati, a Franciscan friar named Francesco di Pugglia, challenged Savonarola to prove the truth of his doctrines by the ordeal of fire. At first the prior treated the provocation with merited contempt, but his too zealous disciple Frá Domenico accepted the challenge. And, when the Franciscan declared that he would enter the fire with Savonarola alone, Frá Domenico protested his willingness to enter it with any one in defence of his master's cause. As Savonarola desolutely declined the trial, the Franciscan deputed a convert, one Giuliano del Rondinelli, to go through the ordeal with Frá Domenico. There were long preliminary disputes. Savonarola, perceiving that a trap was being laid for him, discomfited the "experiment" until his calmer judgment was at last overborne by the fanaticism of his followers. Alarmed by the signory, which was playing into the hands of Rome, the Arrabbiati and Compagnacci pressed the matter on, and the way was now clear for Savonarola's destruction.

On the 7th of April 1498 an immense throng gathered in the Piazza della Signoria to enjoy the barbarous sight. Two thick banks of combustibles 40 yds. long, with a narrow space between, had been erected in front of the palace, and five hundred soldiers kept a wide circle clear of the crowd. Some writers aver that the piles were charged with gunpowder. The Dominicans from one side, the Franciscans from the other, pressed in solemn procession to the Loggia del Lanzi, which had been divided by a hoarding into two separate compartments. The Dominicans were led by Savonarola carrying the host, which he reverently deposited on an altar prepared in his portion of the loggia. The magistrates signalled to the two champions to advance. Frá Domenico stepped forward, but neither Rondinelli nor Frá Francesco appeared. The Franciscans began to urge fanatical objections, and, when Savonarola insisted that his champion should bear the host, they cried out against the sacrilege of excommunication of the Redemptorist fathers. But the presiding judge was turmoiled and confused, the crowd frantic. And, although Rondinelli had not come, the signory sent angry messages to ask why the Dominicans delayed the trial. It was now late in the day, and a storm shower gave the authorities a pretext for declaring that heaven was against the ordeal. The Franciscans slipped away unobserved, but Savonarola raising the host attempted to lead his monks across the piazza in the same solemn order as before. On this the popular fury burst forth. Defrauded of their bloody diversion, the people were wild with rage. Frá Girolamo's house was surrounded. The Florentines rushed in, and would have lived to reach St Mark's but for the devoted help of Salvati and his men. Against the real culprits, the Franciscans, no anger was felt; the zealous prior, the prophet and lawyer of Florence, was made the popular scapegoat. Notwithstanding the anguish that must have filled his heart, the fallen man preserved his dignity and calm. Mounting his own pulpit in St Mark's he quietly related the events of the day to the faithful assembled in the church, and then withdrew to his cell, while the mob on the square outside was clamouring for his blood.

The next morning, the signory having decreed the prior's banishment, Francesco Valori and other leading Piagnoni hurried to him to concert measures for his safety. Meanwhile the government decided on his arrest, and no sooner was this made public than the populace rushed to the attack of the convent. The doors of St Mark's were hastily secured, and Savonarola discovered that his adherents had secretly prepared arms and munitions and were ready to stand a siege. The signory sent to order all laymen to quit the cloister, and a special summons to Valori. After some hesitation the latter obeyed, hoping to arrest the friar. He rode to the convent, and, frightened, was permitted to enter. But he was murdered in the street, and his palace sacked by the mob. The monks and their few remaining friends made a most desperate defence. In vain Savonarola besought them to lay down their arms. When the church was finally stormed Savonarola was seen praying at the altar, and Frá Domenico, armed with an enormous candlestick, guarding him from the blows of the mob. A few disciples dragged their beloved master to the inner library and urged him to escape by the window. He hesitated, seemed about to consent, when a cowardly monk, one Malatesta Sacchinelli, cried out that the shepherd should lay down his life for his flock. Thereupon Savonarola turned, bade farewell to the brethren, and, accompanied by the faithful Domenico, quietly surrendered to his enemies. Later, betrayed by the same Malatesta, Frá Silvestro was also seized. The prisoners were conveyed to the Palazzo Vecchio, and Savonarola was lodged in the tower cell which had once harbourd Cosimo de' Medici.

Now came an exultant brief from the pope. His well-beloved Florentines were true sons of the church, but must crown their good deeds by dispatching the criminals to Rome. Sforza was equally rejoiced by the news, and the only potentate who could have perhaps saved Savonarola's life, Charles of France, had died on the day of the ordeal by fire. Thus another of the friar's prophecies was verified, and its fulfilment cost him his sole protector. The signory refused to send their prisoners to Rome,
but they did Rome's behests. Savonarola's judges were chosen from his bitterest foes. Day after day he was tortured, and in his agony, with a frame weakened by constant austerity and the mental strain of the past months, he made every admission demanded by his tormentors. But directly he was released from the rack he always withdrew the confessions uttered in the delirium of pain. These being too incoherent to serve for a legal report, a false account of the friar's avowals was drawn up and published.

Though physically unable to resist torture, Savonarola's clearness of mind returned whenever he was at peace in his cell. So long as writing materials were allowed him he employed himself in making a commentary on the Psalms, in which he resolutely ignored Alexander's axioms. It was frantically easier to see his enemy die in Rome. But the signory insisted that the false prophet should suffer death before the Florentines whom he had so long led astray. The matter was finally compromised. A second mock trial was held by two apostolic commissioners specially appointed by the pope. One of the new judges was a Venetian general of the Dominicans, the other a Spaniard. Meanwhile the trial of Brothers Domenico and Silvestro was still in progress. The former remained faithful to his master and himself. No extremity of torture could make him recant or extend his condemnations. The latter, Catherine of Siena, who had reasserted his belief in the divinity of the prior's mission, Frà Silvestro, on the contrary gave way at mere sight of the rack, and this ser of heavenly visions owned himself and his master guilty of every crime laid to their charge.

The two commissioners soon ended their task. They had the pope's orders that Savonarola was to die "even were he a second John the Baptist." On three successive days they "examined" the prior with worse tortures than before. But he now resisted pain better, and, although more than once a promise to recant was extorted from him, he reasserted his innocence where he stood bound, crying out, "My God, I denied Thee for fear of pain." On the evening of the 22nd of May sentence of death was pronounced on him and his two disciples. Savonarola listened unmoved to the awful words, and then quietly resumed his interrupted devotions. Frà Domenico exulted in the thought of dying by his master's side; Frà Silvestro, on the contrary, raved with despair.

The only favour Savonarola craved before death was a short interview with his fellow victims. This the signory unwillingly granted. The memorable meeting took place in the hall of the Scaletta during their forty days of confinement, and each one had been told that the others had recanted, and the false report of Savonarola's confession had been shown to the two monks. The three were now face to face for the first time. Frà Domenico's loyalty had never wavered, and the weak Silvestro's enthusiasm rekindled at sight of his chief. Savonarola prayed with the two men, gave them his blessing, and exhorted them by the memory of their Saviour's crucifixion to submit meekly to their fate. Midnight was long past when Savonarola was led back to his cell. Jacopo Niccolini, one of a religious fraternity dedicated to consoling the last hours of condemned men, remained with him. Spent with weakness and fatigue he asked leave to rest his head on his companion's lap, and quickly fell into a quiet sleep. As Niccolini tells us, the martyr's face became serene and smiling as a child's. On awaking he addressed kind words to the compassionate brother, and then prophesied that dire calamities would befall Florence during the reign of a pope named Clement. The carefully recorded prediction was verified by the siege of 1529.

The execution took place the next morning. A scaffold, connected by a wooden bridge with the magistrates' rostrum, had been erected on the spot where the piles of the ordeal had stood. At one end of the platform was a huge cross with faggots heaped at its base. As the prisoners, clad in penitential haircloth, were led across the bridge, wanton boys thrust sharp sticks between the planks to wound their feet. First came the ceremonial of degradation. Sacerdotal robes were thrown over the victims, and then roughly stripped off by two Dominicans, the bishop of Vasona and the prior of Sta Maria Novella. To the bishop's formula, "I separate thee from the church militant and the church triumphant," Savonarola replied in firm tones, "Not from the church triumphant that is beyond thy power." By a refinement of cruelty Savonarola was then, "Savonarola," ordered. His disciples' bodies already dangled from the arms of the cross before the anus, the centre beam. Then the pile was piled. For a moment the wind blew the flames aside, leaving the corpses untouched. "A miracle," cried the weeping Piagnoni; but then the fire leapt up and ferocious yells of triumph rang from the mob. At dusk the martyrs' remains were collected in a cart and thrown into the Arno.

Savonarola's party was apparently annihilated by his death, but when in 1530 Florence was exposed to the horrors predicted by him, the most heroic defenders of his beloved if ungrateful city were Piagnoni who ruled their lives by his precepts and revered his memory as that of a saint.

Savonarola's writings may be classified in three categories:-(1) numerous sermons, collected mainly by Lorenzo Voli, one of his most enthusiastic hearers; (2) an immense number of devotional writings and meditations as Sei giorni e notti della Croce is the chief; (3) a few short poems and a political treatise on the government of Florence. Although his faith in the dogmas of the Church was unshaken, he was not without gross protests against papal corruptions, his reliance on the Bible as his supreme guide, and his intense moral earnestness undoubtedly connect Savonarola with the movement that heralded the Reformation.

SAVORY, SIR WILLIAM SOVEILL. BART. (1826-1895). British surgeon, was born on the 30th of November 1826, in London. He entered St Bartholomew's Hospital in 1844, becoming M.R.C.S. in 1847, and F.R.C.S. in 1852. From 1849 to 1859 he was demonstrator of anatomy and operative surgery at St Bartholomew's, and for many years curator of the museum, where he devoted himself to pathological and physiological work. In 1859 he succeeded Sir James Paget as lecturer on general anatomy and physiology. In 1861 he became assistant surgeon, and in 1867 surgeon, holding the latter post till 1891; and from 1896 to 1889 he was lecturer on surgery. In the College of Surgeons he was a man of the greatest influence, and was president for four successive years, 1885-1888. As Hunterian professor of comparative anatomy and physiology (1859-1861), he lectured on "General Physiology" and the "Physiology of Food." In 1884 he delivered the Bradshaw Lecture on the "Pathology of Cancer." In 1887 he delivered the Hunterian Oration. In 1879, at Cork, he had declared against "Listerism, at the meeting of the British Medical Association, "the鄙视." and said that he has "found the most important of all in the new methods of modern surgery." In 1887 he became surgeon-extraordinary to Queen Victoria, and in 1890 he was made a baronet. Savory, who was an able operator, but averse from exhibitions of brilliancy, was a powerful and authoritative man in his profession, his lucidity of expression being almost as valuable as his great knowledge of physiology and anatomy. He died in London on the 4th of March 1895.
SAVOY, HOUSE OF,

a dynasty which ruled over the territory of Savoy and Piedmont for nine centuries, and now reigns over the kingdom of Italy. The name of Savoy was known to the Romans during the decline of the empire. In the 5th century, the territory was conquered by the Burgundians, and formed part of their kingdom; nearly all of it passed to them. It was included in Charlemagne's empire and was divided by him into counties, which evolved there as elsewhere into hereditary fiefs; but after the break-up of Charlemagne's empire, the Burgundian kingdom revived and Savoy was again absorbed in it. After the collapse of that monarchy its territories passed to the German kings, and Savoy was divided between the counts of Provence, of Albon, of Gex, of Bresse, of the Genevois, of Maurienne, the lords of Habsburg, of Zähringen, &c., and several prelates.

The founder of the house of Savoy is Humbert Biancamano (Humbert the White-handed), a feudal lord of uncertain but probably Teutonic descent, who in 1003 was count of Salmourenc in the Viennois, in 1017 of Nyons on the Lake of Geneva, and in 1024 of the Val d'Aosta on the eastern slope of the Western Alps. In 1034 he obtained the counties of Savoy, Bella, part of the Tarantaise, and the Chablais. With these territories Umberto commanded three of the great Alpine passes, viz., the Mont Cenis and the two St. Bernard passes. In the meanwhile his son Oddone married Adelaide, eldest daughter and heiress of Odelerico Manfredi, marquis of Susa, a descendant of Arduino of Ivrea, king of Italy, who ruled over the counties of Turin, Auriate, Asti, Bredulo, Vercelli, &c., corresponding roughly to modern Piedmont and part of Liguria (1043). Umberto died some time after 1036 and was succeeded by his son, Amadeus I, at whose death the country passed to Oddone, the husband of the countess Adelaide. Oddone thus came to rule over territories on both sides of the Alps, a fact which was to dominate the policy of Savoy until 1566; its situation between powerful neighbours accounting for its vacillating attitude, whence arose the charges of duplicity levelled against many of its rulers, while its dominion over the Alpine passes brought many advantages. Oddone died in 1060, and was succeeded by his widow Adelaide; but before her death in 1091 his son, Peter I., became count, and subsequently the latter's brother, Amadeus II. Under Humbert II. (1080) occurred the first clash with the Piedmontese communes, but he and his successors, Amadeus III. (who died on his way home from the crusades), and Thomas I. (1180), adopted a moderate policy of conciliation towards them. Thomas I. reigned until 1222, was a Ghibelline in politics and greatly increased the importance of Savoy, for he was created Imperial Vicar and acquired important extensions of territory in the Bugey, Vaud and Romont to the west of the Alps, and Carignano, Pinerolo, Moncalieri and Vignole to the east; he also exercised sway over Geneva, Albenga, Savona and Saluzzo. At his death these territories were divided among his sons, Thomas II. obtaining Piedmont, Almone the Chablais, Peter and Philip other fiefs, and Amadeus IV., the eldest. Savoy and a general overlordship over his brothers' estates. Peter visited England several times, one of his nieces, Eleanor of Provence, being the wife of the English king Henry III., and another, Sancha, wife of Richard, earl of Cornwall. Henry conferred great honours on Peter, creating him earl of Richmond, and gave him a palace on the Thames, known as Savoy House. Count Peter also acquired fresh territories in Vaud, and defeated Rudolph of Habsburg at Chillon. Thomas's other sons received fiefs and bishoprics abroad, and one of them, Boniface, was made archbishop of Canterbury. Thomas II., after capturing several cities and castles in Piedmont, lost them again and was made prisoner by the citizens of Turin, but was afterwards liberated. He alone of the sons of Thomas I. left male heirs, and his son Amadeus V. (1285-1323) reunited the scattered dominions of his house. When Amadeus succeeded to the throne these were divided into the county of Savoy (his own territory), the princely of Piedmont ruled by his nephew Philip, prince of Achaia (a title acquired through his wife, Isabella of Villehardouin, heiress of Achaia and the Morea), and Vaud ruled by his brother Louis. But although this division was formally recognized in 1295, Amadeus succeeded in enforcing his own supremacy over all the counties less important to his son Louis. Nine years later, and by war, purchase or treaty he regained other fiefs which his predecessors had lost. He fought in many campaigns against the dauphins of Viennois, the counts of Genevois, the people of Sion and Geneva, the marquesses of Saluzzo and Montferrat, and the barons of Faucigny. He also acted as peacemaker between France and England, accompanied the emperor Henry VII. of Luxembourg on his expedition to Italy, reorganized the finances of the realm and reinforced the Salic law of succession. He was succeeded by his sons, Edward (1333-1350), known as the "Liberal," and count of Savona; and Almone, the Peaceful (1350-1343), who strove to repair the harm done to the state's exchequer by his predecessor and proved one of the best princes of his line. Amadeus VI. (1343-1383), son of the latter (known as the Conte Verde or Green Count because of the costume he habitually wore at tournaments), succeeded at the age of nine. He won a reputation as a bold knight in the fields of chivalry and in the crusades, and he inaugurated a new policy for his house by devoting more attention to his Italian possessions than to those on the French side of the Alps and in Switzerland. In 1356 he led an expedition to the East against the Turks, and he arbitrated between Milan and the house of Montferrat (1375), between the Scaligers and the Visconti, and between Venice and Genoa after the "War of Chioggia" (1381). Amadeus was the first sovereign to introduce a system of gratuitious legal assistance for the poor. He unfortunately espoused the cause of Louis, duke of Anjou, and while aiding that prince in his attempt to recover the kingdom of Naples he died of the plague, leaving his realm to his son, Amadeus VII., the Conte Rosso or "Red Count" (1353-1391); the latter added Nice (1388) and other territories to his domains. During the reign of Amadeus VIII. (1391-1440), Savoy prospered in every way. The count extended his territories both in Savoy itself and in Italy, and in 1416 was created duke by the emperor Sigismund. He was distinguished for his wisdom and justice, and in 1430 he promulgated a general statute of laws for the whole duchy, in spite of the opposition of the nobles and cities whose privileges were thereby curtailed. In 1434 he retired to the hermitage of Ripaille on the Lake of Geneva, but continued to direct the chief affairs of the state and to mediate between foreign Powers, during which period the truces of 1438, 1440, and 1442 were negotiated by him. In 1439 the council of Basel, which then met, deposed the Duke of Burgundy, and in 1443 the council of stabbing Amadeus, pope, in spite of his not being a priest, and deposed Eugenius IV. Amadeus accepted the dignity, assuming the style of Felix V., and abdicated the dukedom. For nine years he remained pope, although he never went to Rome and one-half of Christendom regarded him as an anti-pope. On the death of Eugenius (1447) Thomas of Sarzana was elected as Nicholas V., and in 1449 Amadeus abdicated and returned to his hermitage at Ripaille, where he died two years later (see Felix V.).

In 1480 Amadeus IX. was succeeded by his son Louis; for he was indolent, incapable, and entirely ruled by his wife, Anne of Lusignan, daughter of the king of Cyprus, an ambitious and intriguing woman; she induced him to fit out an expensive expedition to Cyprus, which brought him no advantage save the barren title of king of Cyprus, Jerusalem and Armenia. He neglected to make good the claims which he might have enforced to the duchy of Milan on the death of Filippo Maria, the last Visconti (1447). His latter years were troubled by conspiracies and dissensions on the part of the nobles and even of his own son, Philip, count of Bresse. He went to France to seek aid of King Louis XI., but died there in 1445. In spite of his incapacity he acquired the city of Freiburg and the homage of the lords of Monaco. He was succeeded by his son, Amadeus IX. (1455-1472), who, on account of ill-health left the duchy in the hands of his wife, Yolande, sister of Louis XI. This led to feuds and intrigues

Thomas I.
on the part of the French king and of Philip of Bresse, and Savoy would probably have been dismembered but for the patriotic action of the States General. On Amadeus’s death, his son Phillibert I. (1472–1482) succeeded, but as he was a minor the States General appointed his mother Yolande regent. Wars and civil commotions occupied the period of his minority and Savoy lost Freiburg and many other territories. Yolande died in 1472, and the regency was disputed by various claimants; Philip of Bresse having obtained it by force, he carried off Phillibert, who died in 1482 at Lyons. He was succeeded by his brother Charles I. (1482–1490), who, freed by Louis XI. from the dangerous protection of Philip of Bresse and by death from that of the French king, crushed the rebellious nobles and seized Saluzzo (1487). He did much to raise the fallen fortunes of his house, but died of the plague at the age of thirty-three. Under his successor Charles II. (1490–1496), an infant in arms, the duchy was again distracted by civil war and foreign invasions. Charles died at an early age, and, having no male heirs, the aged Philip of Bresse succeeded, but reigned only for one year. Phillibert II. (1497–1504) followed, but he was devoted only to pleasure and left the helm of state to his half-brother, Renato, and later to his wife, Margaret of Austria. He died without heirs and was succeeded by his brother, Charles III. During his reign Savoy abandoned its attitude of subserviency to France, adopting a policy of greater independence, and was left to deal more or less without foreign intervention. Under Charles III. (1504–1553), the duchy suffered a series of misfortunes. Although the duke strove after peace at almost any price, he was nearly always involved in war and lost many possessions, including Geneva and Vaud. At his death the whole country was overrun by the hostile armies of Francis I. of France and of the Emperor Charles V., while his son and successor, Emmanuel Phillibert (1553–1580), was serving in the Spanish armies. Emmanuel could not take possession of the duchy at once, but continued to serve the emperor as governor-general of the Low Countries. By the time of his son’s accession in 1580, France was in occupation of the whole kingdom. Emmanuel himself was one of the first generals of the day, and by the terms of the subsequent treaty of Cateau Cambresis he was reinstated in most of his hereditary possessions (1559). Under Emmanuel Phillibert Savoy lost all traces of constitutional government and became an absolute despotic of the type then predominating throughout the greater part of Europe. At the same time he raised his country from ruin and degradation into a prosperous and powerful monarchy. He induced both France and Spain to evacuate the fortresses which they still held in Piedmont, made a profitable exchange of territory with the Belgians and acquired an extension of seacoast by the purchase of Tenda and Oneglia (see Emmanuel Phillibert of Savoy). His son and successor, Charles Emmanuel I., surnamed the Great, strengthened the tendency of Savoy to become less of a French and more of an Italian Power. In 1588 he wrested Saluzzo from the French, but his expeditions to Provence and Switzerland were unsuccessful. In the war between France and Spain after the accession of Henry IV., he took the Spanish side, and at the peace of Lyons (1601), although he gave up all his territories beyond the Rhone, his possession of Saluzzo was confirmed. But he was driven from the Spanish post of Geneva by treachery (1620) failed, and although on the death of Francesco Gonzaga, duke of Mantua and Montferrat, he seized the latter city (1612) he was forced by Spain and her allies to relinquish it. The Spaniards invaded the duchy, but after several years of hard fighting the peace of 1618 left his territory almost intact. In 1628 he sided with Spain against France; the armies of the latter overran the duchy, and Charles Emmanuel died in 1630 (see Charles Emmanuel). His son, Victor Amadeus I. (1630–1657), succeeded to little more than a title, but by his alliance with France his wife Christina being a daughter of Henry IV.—he managed to regain most of his territories. He proved a wise and popular ruler, and his early death was much deplored. His eldest son, Francis Giacinto, a minor, lived only a year, and his second son, Charles Emmanuel II., also a minor, remained under the regency of his mother.

That princess, in spite of her French origin, resisted the attempts of France, then dominated by Cardinal Richelieu, to govern Savoy, but her quarrels with her brothers-in-law led to civil war, in which the latter obtained the help of Spain, and Christina took that of France. In the end the duchess succeeded in patching up these feuds and saving the dynasty, and in 1648 Charles Emanuel II. assumed the government. The war between France and Spain continued to rage, and Savoy, on whose territory much of the fighting took place, suffered severely in consequence. By the treaty of the Pyrenees (1660) the war came to an end and Savoy regained most of the towns occupied by France. Charles died in 1675 and was succeeded by his only son, Victor Amadeus II. (1675–1732). The latter’s minority was passed under the regency of his able but imperious mother, Jeanne of Savoy-Nemours. He married Anne of Orleans, daughter of Henrietta of England and niece of Louis XIV. of France. The French king treated Victor Amadeus almost as a vassal, and obliged him to persecute his Protestant (Waldensian) subjects. But the young duke, galled by Louis’s overbearing arrogance, eventually asserted his independence and joined the league of Austria, Spain and Venice against him in 1690. The campaign was carried on with varying success, but usually to the advantage of Louis, and the French victory at Marsiglia and the selfish conduct of the allies induced Victor to come terms with France, and, at the turn of the imperialists (1696). By the treaty of Ryswick (1697) the final peace was concluded. In the war of the Spanish Succession (1700) we find Victor at first on the French side, until, dissatisfied with the continued insolence of Louis XIV. and of Philip of Spain, he went over to the Austrians in 1704. The French invaded Piedmont, but were totally defeated at the siege of Turin by Victor Amadeus and Prince Eugene of Savoy (1706), and eventually driven from the country. By the treaty of Utrecht (1713) Victor received the long-contested Montferrat and was made king of Sicily; but in 1718 the powers obliged him to abdicate, the court of Turin was transferred to Austria, and Victor ascended the rulers of Savoy and Piedmont the title subsequently borne by them until they assumed that of kings of Italy. In 1730 he abdicated in favour of his son, Charles Emmanuel, retired to Chambéry, and married the countess of San Sebastian (afterwards Marchioness of Spigno). His wife’s ambitions induced him to try to regain the crown, but his son had him arrested, and he died in prison in 1732 (see Victor Amadeus II.).

Charles Emmanuel III. (1730–1773) was a born soldier and took part in the war of the Polish Succession on the side of France against Austria, and for his victory at GUSTALLA (1754) was awarded the duchy of Milan, which, however, he was forced to relinquish at the peace of VIENNA (1763), retaining only Novara and Torino. In the war of the Austrian Succession, which broke out on the death of the Emperor Charles VI., he took the side of Maria Theresa (1742). By the peace of AIX-IA-ChAPELLE in 1748, following on the defeat of the French, Savoy gained some further ascensions of territory in Piedmont. The reign of Charles’s son, Victor Amadeus III. (1773–1796), was a period of decadence; the king was incapable and extravagant, and he chose equally incapable ministers. On the outbreak of the French invasion he was in Milan, where he joined in the war, and in 1796 the country was laid waste. The king was forced to order the evacuation of the kingdom and the army was instructed to make common cause with the French, and give up the citadel of Turin to the French, which meant the end of his country’s independence. Realizing his folly he abdicated on the 6th of December 1796, and retired to Sardinia.
GEOYAL TABLE OF THE HOUSE OF SAVOY.

Humbert the Whitbanded (Umberto Biancamano) (d. after 1090).

| Humbert II. the Fat (d. 1103). |
| Amadeus II. (d. 1080). |
| Bertha = Emperor Henry IV. |
| Alice or Adelais = Louis VI. of France. |
| Humbert III., the Saint (d. 1156). |
| Thomas I. (d. 1122). |
| Amadeus III. (d. 1148-9/.1149). |
| Humbert II, earl of Richmond (d. 1103). |
| Philip I. (d. 1185). |
| Philip, archbishop of Canterbury (d. 1172). |
| Thomas II. (d. 1190). |
| Louis I. of Vaud (d. 1202). |
| Philip II. (d. 1285). |
| Louis, king of Cyprus (d. 1261). |
| Amadeus V. the Great (d. 1343). |
| Louis (d. 1483). |

Amadeus VIII., first duke of Savoy, afterwards Pepe Felix V. (d. 1251).

| Louis, king of Cyprus (d. 1261). |
| Louis (d. 1483). |
| Louis (d. 1483). |
| Amadeus VIII. (d. 1290). |
| Amadeus VIII. (d. 1290). |

| Louis, king of Cyprus (d. 1261). |
| Louis (d. 1483). |
| Louis (d. 1483). |
| Amadeus VIII. (d. 1290). |
| Amadeus VIII. (d. 1290). |

| Amadeus VIII. (d. 1290). |
SAW—SAW-FLY

The Restoration.

while the French occupied the whole of Piedmont. After the defeat of the French by the Austro-Russian armies during Bonaparte's absence in Egypt, Charles Emmanuel landed at Leghorn, hoping to regain his kingdom; but Napoleon returned, and by his brilliant victory at Marengo he reaffirmed his position in Italy. The king retired to Naples, abdicated once more (1822), and entered the Society of Jesus; he died in Rome in 1831. Victor Emmanuel I. (1822–1831) was succeeded by his son, Victor Emmanuel II. (1828–1849), who, on the 18th of February 1861, was proclaimed king of Italy. Victor Emmanuel had married in 1842 Maria Adelaide, daughter of the archduke Rainer, who bore him several children, viz. Princess Clothilde (b. 1843), who married Prince Napoleon; Humbert, prince of Piedmont (1844); Amadeus, duke of Aosta (b. 1845); Oddone, duke of Montferrat (b. 1846); and Princess Maria Pia (b. 1847). Humbert, who in 1868 had married Princess Margherita of Savoy, daughter of Victor Emmanuel's brother, the duke of Genoa, became king of Italy on his father's death in 1878. In July 1860 he was assassinated by an anarchist at Monza. He was succeeded by his only son, Victor Emmanuel III., born in 1868, who during his father's lifetime had borne the title of prince of Naples. The new king had married Princess Elena of Montenegro in 1886, by whom he has had four children, viz. Princess Yolanda Margherita (b. 1901), Princess Malalda (b. 1902), Humbert, prince of Piedmont (b. 1903), and Princess Giovanna (b. 1907).

The second son of Victor Emmanuel II., Amadeus, duke of Aosta, was offered the crown of Spain by the Cortes in 1870, which he accepted, but finding that he was no popular idol, he voluntarily abdicated in 1873 rather than cause civil war. In 1887 he married Princess Maria Vittoria dal Pozzo della Cisterna, who bore him three sons, viz. Emmanuel Filibert, duke of Aosta (b. 1890), commanding an Italian army corps; Victor Emmanuel, count of Turin; and Louis Amadeus, duke of Abruzzi, an Italian naval officer and a distinguished traveller, explorer and man of science. Amadeus's first wife having died in 1876, he married Princess Maria Letizia Bonaparte in 1888, who bore him a son, Humbert, count of Salmi (b. in 1889).

(Florenc, 1861, &c.), for the period from 1504 to 1675; D. Carutti, Storia della diplomazia della corte di Savoia (7 vols., Rome, 1875, &c.), from 1491; Nicomede Bianchi, Storia della monarchia Piemontese (Turin, 1877), for the period from Victor Amadeus III. onward; id., Storia della diplomazia europea in Italia (6 vols., Turin, 1885), very important for recent history; A. Wiel, Le Romantisme de la maison de Savoie (London, 1898), a popular and somewhat disjointed work.

SAW, a tool for cutting wood or other material, consisting of a blade with the edge dentated or toothed and worked either by hand or by steam, water, electric or other power (see Tools). The word in O. Eng. is saga and appears, in such forms as Dutch saag, Dan. saag, Ger. Säge, in Teutonic languages. The root is sag-, to cut, which is seen in Lat. secare. It is also the base of such English words as scythe, sickle, &c. It must be distinguished from "saw," a maxim, proverb, which is etymologically and in meaning a "saying," from the Teutonic base sag-, to say; cf. "Sage," Ger. sagen.
