SAWANTWARI, or Savantwadi, a native state of Bombay, India. Area, 925 sq. m. Pop. (1901) 217,732, showing an increase of 13½% during the preceding decade. The surface is broken and rugged, interspersed with densely-wooded hills; in the valleys are gardens and groves of cocoa-nut and betel-nut palms. Sawantwari has no considerable rivers; the chief streams are the Karli on the north and the Terakhel on the south, both navigable for small craft. The climate is humid and relaxing, with an average annual rainfall of 150 in. The estimated revenue is £28,000. The chief, whose title is sar desai, is a Maharatta of the Bhonsla family, who traces his descent to the 16th century. There are special manufactures of ornaments carved out of bison-horn, painted and inlaid lacquer-work, and gold and silver embroidery. The town of Sawantwari, or Vadi, is picturesquely situated on the bank of a large lake, 17 m. E. of the seaport of Vengurla. Pop. (1901) 10,213.

Before the establishment of Portuguese power Sawantwari was the highway of a great traffic between the coast and the Interior; but during the 16th and 17th centuries trade suffered much from the rivalry of the Portuguese, and in the disturbances of the 18th century it almost entirely disappeared. In consequence of piracy, the whole coast-line (including the port of Vengurla) was ceded to the British in 1812.

SAW-FLY, the name given to the members of a well-known subdivision (Symphyta) of the Hymenoptera characterized by possessing a sessile abdomen which hides the base of the posterior legs. The antennae vary in their structure and in the number of their joints. Two of the processes of the ovipositor are modified to form saws, which when at rest lie in a sheath formed of two other processes which are modified into protective structures or valves. The larvae are usually caterpillars, but may be distinguished from the caterpillars of Lepidoptera (moths and butterflies) by the greater number of their abdominal pro-legs; usually 6 to 8 pairs are present. When alarmed they roll themselves up in a spiral fashion; then discharge a thin fluid from lateral pores situated above the spiracles. The fly (magnified, with lines to left showing natural females place size), caterpillars, pupa and pupa-case, their eggs in small incisions made by means of their saws in the soft parts of leaves. Usually one egg is placed in each silt. Some species merely attach their eggs in strings to the exterior of the leaves. With each incision a drop of fluid is usually excreted, which serves to excite a flow of sap to the wounded part. The egg is said to absorb this sap, and so to increase in size. One genus (Nematus) alone forms gall cells. These occur in the young leaves of the willow, a tree which the true gall-flies do not attack. Nematus ventricosus resembles the bees and wasps in the fact that the parthenogenetic ova produce only males; as a rule in the animal kingdom the absence of fertilization results in the production of females.

The injury which the saw-flies inflict upon crops or young trees is almost entirely brought about by the voracious habits of the larvae. They possess well-developed mouth-appendages, by means of which they gnaw their way out of the leaf in which they have been hatched, and then eat it. In this way the turnip saw-fly (Athalia spinorum), not to be confused with the turnip "fly," a beetle (Phyllistleta nemorum), attacks the leaves of the turnup, often completely consuming the leafage of acres at a time. The pine saw-fly (Lophyris pini) causes great damage to plantations of young Scotch firs, devouring the buds, the leaves and even the bark of the young shoots. Other species infest currant and gooseberry bushes, consuming the soft parts of the leaves, and leaving only the tough veins. The only remedy in most cases is to collect and kill the larvae when they first appear or to spray the plants with some arsenical wash. The best known family of saw-flies is that of the Tenodredinidae, most of whose caterpillars feed on leaves. The larvae of other families—the Cepheidae and Striciidae—are internal feeders, boring in succulent...
or woody stems, and their limbs are in an extremely reduced condition.

Sawrey, William (d. 1401), English Lollard, was a priest at Lynn who was summoned before the bishop of Norwich for heresy in 1399. He does not appear at this time to have been seriously punished, and at the beginning of 1401 he is found in London, where his preaching against the war was listened to with the notice of the ecclesiastical authorities. The statute De haeresiaco comburendo had just been introduced for the purpose of stamping out heresy, but it had not become law when Sawrey was summoned to St Paul's and was charged with denying transubstantiation, with refusing to adore the cross except as a symbol, and with six other heresies. He defended himself ably against Archbishop Thomas Arundel, but in February he was condemned and was degraded from the priesthood. Being the first Lollard to be put to death was burned at St Paul's Cross in March 1401.

Sawyer, Sir Robert (1633-1692), English lawyer, a younger son of Sir Edmund Sawyer, auditor of the city of London, was educated at Magdalene College, Cambridge, where he distinguished himself in classical learning, being the first Craven Scholar in 1648. He acquired a good practice at the bar, and in 1673 he was elected to the House of Commons, where for a short time in 1678 he was speaker. He inclined to the side of the court in politics, but was a strong opponent of concession to the Roman Catholics, and was one of the draftsmen of the Exclusion Bill. About the same time he began to appear as counsel in important state trials; he prosecuted Sir George Villiers and Sir William Temple in the Popish plot in 1679; in 1681, having been in that year appointed attorney-general, he appeared for the crown in the prosecutions of Stephen College and Lord Shaftesbury; in the following year in the proceedings against the charter of the city of London; and in 1683 against Lord Russell and Algernon Sidney for complicity in the Rye House plot; and he conducted the case against Titus Oates for perjury in 1685. Although James II. retained him as attorney-general, he proved himself by no means a compliant instrument of the royal prerogative; he advised the king against the legality of the dispensing power, and objected to signing the patents appointing Roman Catholics to office from which they were excluded by law. He was dismissed as the attorney-general in 1687, and in the following year he appeared as leading counsel for the defence of the seven bishops, whose acquittal he secured. On the flight of James II., Sawyer maintained that the throne had thereby been abdicated, and took a prominent part in the debates on the constitutional questions then brought to the front. Owing to an attack upon him in 1690 in relation to his conduct in the case of Sir Thomas Armstrong in 1684, Sawyer was expelled from the House of Commons but two years later returned to the House of Commons, and the Cambridge University shortly afterwards. He died on the 30th of July 1692. Sawyer's only daughter married Thomas Herbert, 8th earl of Pembroke.

Sax, Antoine Joseph, known as ADELOPH (1814-1894), maker of musical instruments, was born at Dinant in Belgium on the 6th of November 1814 and died in Paris in 1894. In 1835 he perfected a bass clarinet superior to any that had preceded it. He came to Paris in 1842 and succeeded in interesting many eminent men, including Bertioz and Halévy. He set up a workshop in the Rue St Georges and studied acoustics, discovering a new principle in the manufacture of wind instruments, viz. that it is the proportions given to a column of air vibrating in a sonorous tube, and these alone, that determine the character of the timbre produced: the material of the walls of the tube is not of the slightest importance so long as it offers enough resistance. Together with his genius for mechanical invention Sax seems to have combined a knowledge of advertising, and his name was often prefixed to successful types of instrument for the invention of which he was not primarily responsible. In 1845 he patented his saxhorn and a family of cylinder instruments called saxotrombas. On the 22nd of June 1846 he registered the saxophone. He also effected various improvements in piston instruments, of which the most important was the substitution of a single ascending piston for a number of descending ones.

See J. P. Corretta, Histoire d'un inventeur (1860); C. Pillard, Les Inventions Sax (1886).

Saxe, John Godfrey (1816—1887), American poet, was born at Highgate, Vermont, on the 2nd of June 1816. He graduated at Middlebury College in 1839, and was admitted to the bar at St Albans, Vermont, in 1843. From 1850 to 1856 he edited the Burlington (Vermont) Sentinel, in 1859 and in 1860 was the candidate of the Democratic party for governor of Vermont, in 1860 removed to New York, and after 1872 edited the Evening Journal at Albany, New York, where he died on the 31st of March 1887. He was best known as a writer of humorous verse and a lecturer. His travesties and satires found many readers or listeners, and some of his love lyrics and other poems combine sparkle with real feeling. His "Rhyme of the Rain," "The Proud Miss McBride," "I'm Growing Old" and "Treasures in Heaven" were once very popular. Among his published collections are Humorous and Satirical Poems (1850), The Times, The Telegraph, and other Poems (1865), and Leisure Day Rhymes (1895).

Saxe, Maurice, Comte de (1666—1750), marshal of France, was the natural son of Augustus II. of Saxony and the countess Augusta, Königsmark, his mistress, and the richest man in Rye House plot; and, returning to the camp of the allies in the beginning of 1710, he displayed a courage so impetuous as to call forth from Eugène the friendly admonition not to confound rashness with valour. He next served under Peter the Great against the Swedes. After receiving in 1711 formal recognition from his father, with the rank of count, he accompanied him to Pomerania, and in 1712 he took part in the siege of Stralsund. In manhood he bore a strong resemblance to his father, both in person and character. His grasp was so brilliant that it would have been difficult for the count to find any fissures in the king's account from which the last energy and endurance were scarcely subdued by the illnesses resulting from his many excesses. In 1714 a marriage was arranged between him and one of the richest of his father's subjects, Johanna Victoria, Countess von Loeben, but he dissipated her fortune so rapidly that he was soon heavily in debt, and, having given her more serious grounds of complaint against him, he consented to an annulment of the marriage in 1721. Meantime, after serving in a campaign against the Turks in 1717, he had in 1719 gone to Paris to study mathematics, and in 1720 obtained a commission as maréchal de camp. In 1725 negotiations were entered into for his election as duke of Coucy, at the instance of the duchess Anna Ivanovna, who offered him her hand. He was chosen duke in 1726, but declining marriage with the duchess found it impossible to resist her opposition to his claims, although, with the assistance of £30,000 lent him by the French actress Adrienne Lecouvreur, whose story forms the subject of Scribe and Legouvé's tragedy, he raised a force by which he maintained his authority till 1727, when he withdrew and took up his residence in Paris. On the outbreak of the war in 1734 he served under Marshal Berwick, and in 1735 at Philippsburg was appointed colonel and given the command of the defences of the town and of the nearby castle, but was obliged to evacuate the last by the Austrians in May 1736. In the Austrian Succession War in 1741, he took command of a division of the army sent to invade Austria, and
on the 19th November surprised Prague during the night, and took it by assault before the garrison were aware of the presence of an enemy, a coup de main which made him famous throughout Europe. After capturing the strong fortress of Eger on the 19th April 1742, he received leave of absence, and went to Russia to push his claims on the duchy of Courland, but obtaining no success he returned to his command. His exploits had been the sole redeeming feature in an unsuccessful campaign, and on 20th March 1743 his merits were recognized by his promotion to be Field-Marshal. From that time onwards he became one of the first generals of the age. In 1744 he was chosen to command the expedition to England in behalf of the Pretender, which assembled at Dunkirk but did not proceed farther. After its abortive issue he received an independent command in the Netherlands, and by dexterous manoeuvring succeeded in continually harassing the superior forces of the enemy without risking a decisive battle. In the following year he besieged Tournaï and inflicted a severe defeat on the relieving army of the duke of Cumberland at Fontenoy (q.v.), a battle of which the issue was due entirely to his constancy and cool leadership. During the battle he was unable on account of dropsy to sit on horseback except for a few minutes, and was carried about in a wicker chariot. In recognition of his brilliant achievement the king conferred on him the castle of Chambord for life, and in April 1746 he was naturalized as a French subject. Thenceforward to the end of the war he continued to command in the Netherlands, always with success. Besides Fontenoy he added Rocouz (1746) and Lawfeldt or Val (1747) to the list of French victories, and it was under his orders that Marshal Lwendorf captured Bergen-op-Zoom. He himself won the last success of the war in capturing Maestricht in 1748.

In 1747 the title formerly held by Turenne, "Marshal general of the King's camps and armies," was revived for him. But on the 30th of November 1750 he died at Chambord "of a putrid fever." In 1748 there had been born to him a daughter, one of several illegitimate children, whose great-granddaughter was George Sand.

Saxe was the author of a remarkable work on the art of war, Mes Rêveries, which though described by Carlyle as "a strange military farrago, dictated, as I should think, under opium,” is in fact a classic. It was published posthumously in 1757 (ed. Paris, 1872). His Lettres et mémoires choisis appeared in 1794. His letters to his sister, the princess of Holstein, preserved at Strassburg, were destroyed on the destruction of that place in 1870; thirty copies had, however, been printed from the original. Many previous errors in former biographies were corrected and additional information supplied in Carl von Weber's Moritz, Graf von Sachsen, Marshall von der Werfft, nach einer Abhandlung, Saale (ed. Leipzig, 1863) and A. de La Chappelle's Maurice de Saxe, étude historique d'après les documents des archives de Dresde (1865) and C. F. Vitzthum's Maurice de Saxe (1869). See also the military histories of the period, especially Carlyle's Frederick the Great.

SAXE-ALtenburg (Ger. Sachsen-Altenburg), a duchy in Thuringia, forming an independent member of the German Empire and consisting of two detached and almost equal parts, separated from each other by a portion of Reuss, and bounded on the S. and W. by the grand duchy of Saxe-Weimar-Eisenach, on the N. by Prussia, and on the E. by the kingdom of Saxony. There are in addition twelve small exclaves. The total area is 511 sq. m., of which 254 are in the east, or Altenburg, division, and 257 in the west, or Saal-Eisenberg, division. The eastern district, traversed by the most westerly offshoots of the Erzgebirge and watered by the Pleisse and its tributaries, forms an undulating and fertile region, containing some of the richest agricultural soil in Germany. The western district, through which the Saale flows, is rendered hilly by the foothills of the Thuringian Forest, and in some measure makes up its fine woods for its comparatively poor soil. The mineral wealth of Saxe-Altenburg is scanty; lignite, the chief mineral, is worked mainly in the eastern district. Nearly 60% of the entire duchy is occupied by arable land, and about 26% by forests, mainly consisting of conifers. Oats, rye, wheat and potatoes are the chief crops. Cattle-raising and horse-breeding are of considerable importance. About 35% of the population are supported by agriculture. The manufactures of the duchy are varied, though none is of first-rate importance; woollen goods, gloves, hats, porcelain and earthenware, bricks, sewing-machines, paper, musical instruments, sausages and wooden articles are the chief products. Trade in these, and in horses, cattle and agricultural produce, is brisk. The chief seats of trade and manufacture are Altenburg the capital, Ronneburg, Schmolln, Gössnitz and Meuselwitz in the Altenburg division; and Eisenberg, Roda and Kahla in the Saal-Eisenburg division. Besides these there are the towns of Lucka, Orlamünde and Russdorf. The duchy is bounded by the Saale and the river Eibenstock and contains several inhabited districts in the Thuringian states. The population in 1905 was 206,608, of whom 206,511 were Protestants and 5449 Roman Catholics. In the west division the population is wholly Teutonic, but in the east there is a strong Wendish or Slavonic element, still to be traced in the peculiar manners and costume of the country-people, though these are gradually disappearing. The Altenburg peasants are industrious and prosperous; they are said to be avaricious, but to love pleasure, and to gamble for high stakes, especially at the card game of Skat (q.v.), which is a native offshoot of the game of Tric-Trac. Their holdings are rarely divided, and a common custom is the inheritance of landed property by the youngest son. They are decreasing in numbers.

Saxe-Altenburg is a limited hereditary monarchy, its constitution resting on a law of 1831, subsequently modified. The diet consists of 32 members, elected for 3 years, of whom 9 are returned by the highest taxpayers, 11 by the towns and 12 by the country districts. The franchise is enjoyed by all males over 25 years of age who pay taxes. The duke has considerable powers of initiative and veto. The executive is divided into four departments, justice, finance, the interior, and foreign and ecclesiastical affairs. The revenue consists of agricultural, industrial, trading, railway, and expropriation, with a total of about £230,000 each. There was a public debt in 1909 of £44,370. Saxe-Altenburg has one vote in the Reichstag and one in the Bundesrat (federal council).

History.—The district now forming the duchy of Saxe-Altenburg came into the possession of the margrave of Meissen about 1329, and later with Meissen formed part of the electorate of Saxony. On the division of the lands of the Wettins in 1485 it was assigned to the Albertine branch of the family, but in 1534 it passed by arrangement to the Ernestine branch. In 1669 Saxe-Altenburg was made into a separate duchy, but are only lasted until 1764, when the ruling family became extinct and the greater part of its lands was inherited by the duke of Saxe-Gotha. In 1825 the family ruling the duchy of Saxe-Gotha-Altenburg became extinct and another division of the Saxon lands was made. Frederick (d. 1834) exchanged the duchy of Saxe-Hildburghausen, which he had ruled since 1788, for Saxe-Altenburg, and was the founder of the present reigning house. In answer to popular demands a constitution was granted to Saxe-Altenburg in 1831, and greater concessions were extorted by the more threatening disturbances of 1848. In November of this year Duke Joseph abdicated and was succeeded by his brother George. Under George's son Ernest (1826-1908), who became duke in 1853, a period of reaction began and the result was that the constitution was made less liberal. In 1874 a long dispute over the public domains was settled, two-thirds of these being assigned to the duke in lieu of a civil list. In 1898 Ernest was succeeded by his nephew Ernest (b. 1871).

Löhe, Altenburgsca (Altenburg, 1878).

SAXE-COBURG-GOTHA (Ger. Sachsen-Coburg-Gotha), a sovereign duchy of Germany, in Thuringia, and a constituent member of the German Empire, consisting of the two formerly separate duchies of Coburg and Gotha, which lie at a distance of 14 m. from each other, and of eight small scattered exclaves, the most northerly of which is 70 m. from the most southerly. The total area is 764 sq. m., of which about 224 are in Coburg and 540 in Gotha. The duchy of Coburg is bounded on the S.E., S., and S.W. by Bavaria, and on the other sides by Saxe-
Meiningen, which, with part of Prussia, separates it from Gotha. The considerable exclave of Königberg in Bavaria, 10 m. south, belongs to Coburg. Lying on the south slope of the Thuringian Forest, and in the Franconian plain, the duchy of Coburg is undulating and fertile district. Roe (its highest point is in the Senichshöhe (1716 ft.) near Mirdorf. Its streams, the chief of which are the Itz, Biberach, Steinhach and Rodach, all find their way into the Main. The duchy of Gotha, more than twice the size of Coburg, stretches from the southern borders of Prussia along the northern slopes of the Thuringian Forest, the highest summits of which (Der grosse Beerberg, 3325 ft.; Schneekopf, 3710 ft.; and Inselsberg, 2937 ft.) rise within its borders. The more open and level district on the north is spoken of as the "open country" (das Land) in contrast to the wooded hills of the forest (der Wald). The Cera, Horsel, Unstrut and other streams of this duchy flow to the Werra, or to the Saale. The climate is that of the other central states of Germany, temperate in the valleys and plains and somewhat inclement in the hilly regions.

*Industries and Population.—* In both duchies the chief industry is agriculture, which employs about 30% of the entire population. According to the returns for 1905, about 50% of the area was occupied by arable land, 10% by meadow-land and pasture and 30% by forest. In the same year the chief crops were oats, barley; rye, wheat, potatoes, and hay. A small quantity of hemp and locally managed by ephories, twelve members of the united duchy is represented in the imperial diet. The members of the separate diets and meeting at Coburg and Gotha alternately, exercises authority. The members are elected for four years. The Coburg diet consists of eleven members and the Gotha diet of nineteen. The franchise is extended to all male taxpayers of twenty-five years of age and upwards. The franchise has special departments for each duchy, but is under a common president. There is a sub-department for the control of ecclesiastical affairs, which are locally managed by ephories, twelve members of the united duchy is represented in the imperial diet. SAXE-MEININGEN

(Ger. Sachsen-Meiningen), a duchy in Thuringia, forming an independent member of the German
empire and consisting chiefly of an irregular crescent-shaped territory, which, with an average breadth of 10 m., stretches for over 100 m. along the south-west slope of the Thuringian Forest. The convex side rests upon the duchy of Coburg and is in part bounded by Bavaria, while the concave side, turned towards the north, contains portions of four other Thuringian states and Prussia between its horns, which are 46 m. apart. The districts of Kranichfeld, 15 m. N.W., and Kamburg, 22 m. N. of the eastern horn, together with a number of smaller scattered exclaves, comprise 74 of the 935 sq. m. belonging to the duchy. The surface on the whole is hilly and is partly occupied by offshoots of the Thuringian Forest; the highest summits are found in the central part of the duchy, while the chief river rises in the Hoburg and the Blesberg 2835 ft. The chief streams are the Werra, which traverses the south and east of the duchy, and various tributaries of the Main and the Saale, so that Saxe-Meiningen belongs to the basins of the three great rivers Weser, Rhine and Elbe.

The soil is not very productive, although agriculture flourishes in the valleys and on the level ground; grain has to be imported to meet the demand. Only 41% of the total area is devoted to agriculture, while meadow-land and pasture occupy 11%. The chief grain crops are oats, rye and barley; and the most important of the principal towns, Hildburghausen, the Werra district, hogs and flux are also raised. The Werra valley and the other fertile valleys produce large quantities of fruit. The raising of cattle, pigs and sheep is a fairly important branch of industry throughout the duchy; horses are bred in Kamburg. The extensive and valuable forests, of which 75% consist of coniferous trees, occupy 42% of the entire area. About 42% of the forests belong to the state and about 33% to public bodies and institutions, leaving only 25% for private owners. The mineral wealth of the duchy is not inconsiderable. Iron, coal and salt, and the chief products, copper and cobalt may be added. There are salt-works at Salzungen and Neusulza, the former the most important in Thuringia; and the mineral water of Friedrichshall is well known. The manufacturing industry of Saxe-Meiningen is active, especially in the districts of Sonneberg, Gräfenthal and Saalfeld. Iron goods of various kinds, glass and pottery, school plates, pencils and marbles are produced; the abundant timber fosters the manufacture of all kinds of wooden articles, especially toys; and the textile industry and the manufacture of leather goods, paper mâché and sewing-machines are also carried on.

The capital of the duchy is Meiningen; the other principal towns are Salzungen, Hildburghausen, Eisleben, Sonneberg, Saalfeld, Pößneck and Kamburg. In 1905 the population was 268,916, of whom 30% live in communities of more than 1000. As in the other Saxon duchies the population is almost exclusively Protestant; in 1905, 262,243 belonged to the Lutheran confession, 4845 were Roman Catholics and 1256 Jews.

Saxe-Meiningen is a limited monarchy, its constitution testing on a law of 1829, subsequently modified. The diet, elected for six years, consists of 24 members, of whom 4 are elected by the largest landowners, 4 by those who pay tax on incomes of £150 or more, and 16 by the other electors. The franchise is enjoyed by all domiciled males over twenty-five years of age who pay taxes. The government is carried on by a ministry of five, with departments for the ducal house and foreign affairs, home affairs, justice, education and public worship and finance. The revenue, £190,000, of which is drawn from the state domains, stands at about £480,000 a year. The expenditure, including a civil list of £20,000, stands at £445,000. In 1909 the state had a debt of £302,170. Saxe-Meiningen has one vote in the General Federal council (Bundesrat) and sends two members to the Reichstag.

History.—The duchy of Saxe-Meiningen, or more correctly Saxe-Meiningen-Hildburghausen, was founded in 1681 by Bernard, the third son of Ernest the Pious, duke of Saxe-Gotha, and consisted originally of the western part of the present duchy, the district around Meiningen. Bernard was succeeded in 1706 by his three sons, Ernest Louis, Frederick William and Anton Ulrich, but after 1746 the only survivor was the youngest, Anton Ulrich, who resigned alone from this date until his death in 1783. By this time the duchy had increased considerably in extent, but petty wars with the other Saxon princes combined with the extravagance of the court and the desolation caused by the Seven Years’ War to plunge it into distress and bankruptcy. A happier time, however, was experienced under Charlotte Amalie, Anton’s widow, who ruled as regent for her sons, Charles (d. 1785) and George (d. 1806). Under the latter prince the country prospered greatly, and having introduced the principle of primogeniture, he died and was succeeded by his infant son, Bernard Ernest Freund (1800–1882), whose mother, Eleonora Maria Caroline, Countess of Meiningen, founded in 1680 by Ernest, the sixth son of Ernest the Pious, the duchy of Saxe-Saalfeld, founded by John Ernest, the seventh son of Ernest the Pious, which had been united with Saxe-Coburg in 1735; and the districts of Themar, Kranichfeld and Kamburg. In 1823 Bernard had granted a liberal constitution to his duchy, but these additions made further changes inevitable and a new constitution was granted in 1829. Saxe-Meiningen had entered the confederation of the Rhine in 1807, but had joined the allies in 1813 and became a member of the German confederation in 1815. In 1866, unlike the other Saxon duchies, Saxe-Meiningen remained neutral, and the war with Prussia; at once the land was occupied by Prussian troops, and in September 1866 Duke Bernard abdicated and was succeeded by his son George (b. 1826), who immediately made peace with Prussia and joined the North German Confederation, his land becoming a member of the new German empire in 1871. In 1871 the dispute which had been carried on since 1832 between the duke and the diet about the rights of each to the state domains was settled by a compromise, each party receiving a share of the revenues. The heir-apparent Prince Bernard (b. 1852) has no sons, so by a law of 1866 the state was settled upon the sons of his half-brother Prince Frederick (b. 1861).

SAXE-WEIMAR-EISENACH (Ger. Sachsen-Weimar-Eisenach), a grand duchy of Germany and a sovereign and constituent state of the German empire. It is the largest of the Thuringian states, and consists of the three chief detached districts of Weimar, Eisenach and Neustadt, and the sixty-five scattered exclave, of which Alstadt, Oldisleben and Ilmenau belonging to Weimar, and Ostheim belonging to Eisenach, are the chief. The first and last named of these exclave are 70 m. apart; and the most easterly of the other exclave is 100 m. from the most westerly. The total area of the grand-duchy is 1397 sq. m., of which 678 are in Weimar, 465 in Eisenach and 254 in Neustadt. The population in 1905 was 388,005 (189,422 males and 198,573 females), on an average 271 to the square mile, of whom the greatest bulk are Lutherans, the Roman Catholics only number about 12,000, and Jews and those of other confessions about 9000 in all. Of the population about 47% live in towns or communes exceeding 2000 inhabitants and about 53% are rural.

The district of Weimar, which is at once the largest division and the geographical and historical kernel of the grand-duchy, is a roughly circular territory, situated on the plateau to the
north-east of the Thuringian Forest. It is bounded on the N. and E. by Prussia, and on the S. and W. by Schwarzburg and detached portions of Saxe-Altenburg, and lies 23 m. east of the nearest part of Eisenach, and 7 m. north-west of the nearest part of Neustadt. The exclaves of Allstedt and Oldleisnien lie in Prussian territory 10 m. to the north and north-west respectively; Ilmenau as far to the south-west. The surface is undulating and destitute of any striking natural features, although the valleys of the Saale and Ilm are picturesque. The Kieselhahn (1825 ft.) and the Thuringberg (2621 ft.) rise in Ilmenau; but the Goethe-Kalm (1824 ft.) farther beyond the River Ilm to the extreme south, is the highest point in the main part of Weimar. The Saale flows through the east of the district and is joined by the Ilm, the Elster and the Unstrut. The chief towns are Weimar, the capital, on the Ilm; Jena, with the common university of the Thuringian states, on the Saale; Apolda, the "Manchester of Weimar," to the east; and Ilmenau, lying among the hills on the edge of the Thuringian Forest to the S.W. of Weimar.

Eisenach, the second district in size, and the first in point of natural beauty, stretches in a narrow strip from south to south on the extreme western boundary of Thuringia, and includes parts of the church lands of Fulda, of Hesse and of the former countship of Henneberg. It is bounded on the N. and W. by Prussia, on the S. by Bavaria (which also surrounds the exclave of Osheim) and on the E. by Saxe-Meiningen and Saxe-Gotha. The north is occupied by the rounded hills of the Thuringian Forest, while the Rhön mountains extend into the southern part. The chief summits of the former group, which is more remarkable for its fine forests and picturesque scenery than for its height, are the Gross-Kahl (1355 ft.), the north-western termination of the system, Otterwald (2103 ft.), the Wachstein (1900 ft.) and the Ringberg (2200 ft.). The chief river is the Werra, which flows across the centre of the district from east to west, and then bending suddenly northwards, re-enters from Prussia, and traverses the north-eastern parts in an irregular course. Its chief tributaries in Eisenach are the Höseld and the Ütler. Eisenach is the only town of importance in this division of the grand-duchy.

Neustadt, the third of the larger divisions, is distinguished neither by picturesque scenery nor historical interest. It forms an oblong territory, about 15 m. long by 16 b. wide, and belongs rather to the hilly district of the Vogtland than to Thuringia. It is bounded on the N. by the Reuss (junior line) and Saxe-Altenburg, on the W. by Saxe-Meiningen and a Prussian exclave, on the S. by the two Reuss principalities and on the E. by the kingdom of Saxony. The Kesselberg (1310 ft.), near the town of Neustadt, is the chief eminence. This district lies in the basin of the Saale, its chief streams being the White (Weiße) Elster, the Weida and the Orla. Neustadt, Auma and Weida are the principal towns.

Agriculture forms the chief occupation of the inhabitants in all parts of the district, though in Eisenach and around Ilmenau a large proportion of the area is covered with forests. According to the returns for 1900 about 55% of the entire area was occupied by arable land, 26% by forest and 9% by pasture and meadow-land. Only about 5% was unproductive soil or moorland. In 1900 the chief crops were oats, barley, rye, wheat, potatoes, hay, beet (for sugar), maize, especially at Ilmenau. The optical instruments of Jena and the scientific institutions of Ilmenau are well known. Leather, paper, glass, cork and tobacco are among the less prominent manufactures. There are numerous breweries in the district. The volume of trade is not very great, although a large part of the manufactured articles are exported all over Europe, and in some cases to other continents as well.

Constitution.—Saxe-Weimar-Eisenach is a limited hereditary monarchy, and was the first state in Germany to receive a liberal constitution. This was granted in 1816 by Charles Augustus, the patrician Goethe, and was revised in 1837 and again in 1906. The diet consists of one chamber only; three fifths of the members, of whom five are chosen by owners of land worth at least £50 a year, five by those who derive a similar income from other sources, five by the university of Jena and other public bodies, and twenty-three by the rest of the inhabitants. The deputies are elected for six years. The franchise is enjoyed by all domiciled citizens over twenty-one years of age. The government is carried on by a ministry of three, holding the portfolios of finance; of home and foreign affairs; and of religion, education and justice, with which is combined the ducal household. The duchy is represented by two votes in the Bundesrat and by two members in the Reichstag.

The Saxe-Weimar family is the oldest branch of the Ernestine line, and hence of the whole Saxon house. By a treaty with Prussia in 1867, which afterwards became the model for similar treaties between Prussia and other Thuringian states, the troops of the grand-duchy were incorporated with the Prussian army.

The budget is voted by the chamber for a period of three years. That from 1906 to 1910 estimated an annual income of £15,000,000 and a similar annual expenditure. A large income is derived from the state forests. The public debt amounted to £145,000 in 1908, but it is annually secured by real estate and invested funds. Justice is administered by two high courts (Landesgerichte), at Weimar and Eisenach respectively; the district of Neustadt falling under the jurisdiction of the Landesgericht at Gera; while the supreme court of appeal for the four Saxon dukedoms, Schwarzburg-Rudolstadt and Reuss, together with portions of Prussia, is the Oberlandesgericht at Jena.

History.—In early times Weimar with the surrounding district belonged to the counts of Thalma, and from the end of the 10th century until 1067 it was the seat of the counts of Weimar. In the 14th century it passed to the elector of Saxony, falling at the partition of 1485 to the Ernestine branch of the Wettin family. Although John Frederick the Magnanimous was deprived of the electorate in 1547 by his sons retained Weimar; and one of them, John William (d. 1573), may be regarded as the founder of the present ruling house, but it was not until 1641 that Saxe-Weimar emerged into an independent historical position. In this year, having just inherited Coburg and the line of the three brothers, William, Albert and Ernest founded the third princely house of Saxe-Weimar, with Saxe-Gotha. Eisenach fell to Saxe-Weimar in 1644, and although the enlarged principality of Saxe-Weimar-Eisenach was temporarily split up into the lines Saxe-Weimar, Saxe-Eisenach and Saxe-Jena, it was again united under Ernest Augustus, who began to reign in 1728, and the adoption of the principle of primogeniture about this time secured it against further divisions. Ernest Augustus II., who succeeded in 1748, died in 1758, and his young widow, Anna Amelia, was appointed regent of the country and guardian of her infant son Charles Alexander. The reign of this prince, who assumed the government in 1775, is the most brilliant epoch in the history of Saxe-Weimar. An intelligent patron of literature and art, he attracted to his court the leading scholars in Germany; Goethe, Schiller and Herder were members of this illustrious band, and the little state, hitherto obscure, attracted the eyes of all Europe.

The war between France and Prussia in 1806 was fraught with danger to the existence of the principality, and after the battle of Jena it was mainly the skillful conduct of the duchess Louise, the wife of Charles Augustus, that dissuaded Napoleon...

1 See Goethe's famous lines, Epigramme (35):

klein ist unter den Fürsten Germaniens reich der mein; Kurz und schmal ist mein Land, mächtig nur, was er vermag. Aber so wende nach innen, so wende nach aussen die Kräfte fieder: da wär e's ein Fest, Deutscher mit Deutschen zu sein."

2 Saxe-Gotha's famous lines, Epigramme (35):
from removing her husband from his place as a reigning prince. In 1807 Saxe-Weimar-Eisenach entered the Confederation of the Rhine and in the subsequent campaigns it suffered greatly. The Congress of Vienna in 1815 added about 660 sq. m. to its area and gave its ruler the title of grand-duke. Just after the conclusion of peace Charles Augustus gave a liberal constitution to his land, freedom of the press was also granted, but after the festival of the Warthurg on the 18th of October 1817 this was seriously curtailed. The next grand-duke, Charles Frederick, who succeeded in 1828, continued his father’s work, but his reforms were not thorough enough nor rapid enough to avert disturbances in 1848, when power was given to a popular ministry and numerous reforms were carried through. Reaction set in under Charles Alexander, who became grand-duke in 1853, and the union of the crown lands and the state lands was undone, although both remained under the same public management. In 1866 the grand-duchy joined Prussia against Austria, although its troops were then garrisoning towns in the interests of the latter power; afterwards it entered the North German Confederation and the new German empire. Charles Alexander died in January 1901 and was succeeded by his grandson William Ernest (b. 1876).

See C. Kronfeld, Landeskunde des Grossherzogtums Sachsen-Weimar-Eisenach (Weimar, 1878–1879); and the official Staats- handbuch für das Grossherzogtum Sachsen (Weimar, 1904).

SAXHORN, the generic name of a family of brass wind instruments (named horns but valve-bugles) with cup-shaped mouthpieces, invented by Adolphe Sax and in use chiefly in French and Belgian military bands and in small wind-bands. The saxhorns came into being in 1843, when Sax applied a modification of the valve system invented in Germany in 1815 to the keyed bugle. The saxhorn consists of a conical tube of a calibre greater than that of French horn and trumpet, but smaller than that of the tubas or bombardons, and capable therefore of producing by overblowing the members of the harmonic series from the 2nd to the 8th, in common with the cornets, bugles, valve-trumpets and the Wagner tubas. The saxhorns are furnished with three valves, by means of which the compass is rendered chromatic, and which act as in other valve instruments, lowering the pitch of the instrument when depressed, respectively 1 tone, a semitone and 1½ tones; and further, when used in combination, 2 tones, 2½ tones and 3 tones. The Flügelhorns, the euphonium, the bombard and the tubas are sometimes erroneously classed as saxhorns. The difference between saxhorns and bombardons or tubas consists in the calibre of the bore, in which the latter is sufficiently wide in proportion to the length to produce the fundamental note of the harmonic series an octave below the lowest note of the saxhorns. The consequence of this structural difference is important, for whereas the tube of the tubas is theoretically of the same length as an open organ pipe of the same pitch, the saxhorns require a tube twice that length to produce the same scale. For instance, a euphonium sounding 8 ft. C only needs a tube 8 ft. long, whereas the corresponding bass saxhorn requires one 16 ft. long. In Germany these structural differences have given rise to a classification of brass wind instruments as single valves or half-instruments (Grosse or Halbe), according to whether the whole or only the half of the length of tubing is of practical use. The members of the saxhorn family are the small saxhorn in E₃, the soprano in B₄, the alto in E₅, the tenor in B₅, the bass in B₆ (an octave lower), the low bass in E₆, the contra-bass in B₇, three octaves below the soprano. All the saxhorns are treated as transposing instruments. A similar family, constructed with rotary valves and conical tubes of larger calibre than the saxhorns, but having the same harmonic scale, is known in Germany as Flügelhorn. (K. S.)

1 See Dr Emil Schafhautl’s article on musical instruments in sect. iv. of Bericht der Beurteilungscommission bei der allg. deutschen Industrieausstellung, 1854 (Munich, 1855), pp. 160–170.

SAXIFRAGACEAE, in botany, a small natural order of Dicotyledons belonging to the sub-class Polypetalea and containing 27 genera with about 350 species distributed through the Arctic and north temperate zone, often alpine. It is repre-
has a very similar distribution. The North American genus *Heuchera* has sometimes sapelike flowers. *Aster* has 6 species in temperate Asia and north-eastern North America; *A. japonica* is commonly grown in the spring as a pot-plant, and often misnamed *Spiraea*.

The order is frequently much extended to include other groups of genera differing in habit and more or less in the general conformation from those to which the order is here confined, and which are therefore regarded as forming one of several tribes. Among these is the order *Bignoniaceae*; the single genus peculiar to it is the gooseberry (*R. Grossularia*) and currants of gardens. These are shrubs with racemes of flowers which have only one whorl of stamens (isosomos), an inferior unilocular ovary with two parietal placentae, and fruit a berry. Another is the Hydrangeaceae, to which belong *Hydrangea* (qv.), *Deutzia* and *Philadelphus*, all well-known garden plants; *P. coronarius* is the so-called Syringa or mock-orange. There are shrubs or trees with simple generic leaves, 5-merous flowers with epigynous stamens and a 3- to 5-locular ovary. *Escallonia*, which represents a small group of genera with leathery gland-dotted leaves, is also often included.

**SAXIFRAGE** (Saxifraga), a genus of plants which gives its name to the order of which it is a member. There are nearly 200 species distributed in the temperate and arctic parts of the northern hemisphere, frequently at considerable heights on the mountains, and also found on the Andes. They are mostly herbs with perennial rootstocks and less than 6 cm in stature. The flowers are white to greenish, sometimes striped. The arrangement of the flowers is various, as also are the size and colour of the flowers themselves. They have a flat or more or less cup-shaped receptacle, from the margin of which spring five sepals, five petals and ten (or rarely five) stamens. The pistil is often partly adherent to the receptacle, and is divided above into two styles; the ovules are numerous, attached to axile placentas; and the seed-vessel is capsular. Fifteen species are in cultivation, including the *Bergenia* or *Megasas* with their large fleshy leaves and copious panicles of rosy or pink flowers, the numerous alpine species, such as *S. pyramidalis*, *S. cotyledon*, &c., with tall panicles studded with white flowers, and many others, most of them adapted for rockwork.

**SAXO GRAMMATICO** (c. 1350–c. 1265), Danish historian and author, the son of his father and grandfather having served under Valdemar I, king of Denmark (d. 1185). Brought up for the clerical profession, Saxo entered the service of Archbishop Absalon about 1180, and remained in that capacity until the death of Absalon in 1201. It was at the archbishop's instigation that he began, about 1185, to write the history of the Danish Christian kings from the time of Sweyn Estridson (d. 1076), but later Absalon prevailed on him to write also the history of the earlier heathen times, and to combine both into a great work, *Gesta Danorum*, or *Historia Danica*. The archbishop died before the work was finished, and therefore the preface, written about 1208, dedicates the work to his successor Archbishop Andreas, and to King Valdemar II. Nothing else is known about Saxo's life and person; a chronicle of 1265 calls him "mirae et urbanae eloquentiae clerici"; and an epitome of his work from about 1340 describes him as "egregius grammaticus, origine Sialandicus." That he was a native of Zealand is probably correct, inasmuch as, whereas he often criticizes the Jutlanders and the Scandians, he frequently praises the Zealanders. The surname of "Grammaticus" is probably of later origin, since the act of composition of the history preceded the revival of the title of "provost of Rökilde," given him in the 16th century, is also probably incorrect, the historian being confounded with an older contemporary, the provost of the same name. Saxo, from his apprenticeship as the archbishop's secretary, had acquired a brilliant but somewhat euphemitic Latin style, and wrote fine Latin verses, but otherwise he does not seem to have had any very great learning or extensive reading. His models of style were Valerius Maximus, Justin and Martianus Capella, especially the last. Occasionally he mentions Bede, Dudo of St Quentin and Paulus Diaconus, but he does not seem to have studied them or any other historical works thoroughly. His sources are partly Danish traditions and songs, partly the statements of Archbishop Absalon, partly the accounts of Icelanders and, lastly, some few earlier sources, lists of Danish kings and short chronicles, which furnished him with some reliable chronological facts. He considered traditions as history, and therefore made it his chief business to recount and arrange these, and his work is a loosely connected series of biographies of Danish kings and heroes.

The first nine books of the *Gesta Danorum* comprise traditions of kings and heroes of the historical time up to about 950. Here Saxo's style is mostly simple, and his history is in frequent use by modern writers, especially Fredriksen's about Amleth (Hamlet) and Fenge, about Hrolfr Kraki, Hadding, the giant Starkather, Harald Hildetann and Ragnar Lodbrok. In this earlier history Saxo has also embodied myths of national gods who in tradition had become Danish kings, for instance, Balder and Hother, and of foreign heroes, likewise incorporated in Danish history, as the Gothic Jarunnrik (A.S. Eormenre), the Anglian Vermund (A.S. Gärmund) and Uffe (A.S. Offa), the German Hedin and Hild, and others. Frequently the narrative is interrupted by translations of poems, which Saxo has used as authentic sources, although they were written only a few generations older than himself. In the later books (x–xxvi) of his work he follows to a greater extent historical accounts, and the more he approaches his own time the fuller and the more trustworthy his relation becomes; especially brilliant is his treatment of the history of King Valdemar and of Absalon. But his patriotism often makes him partial to his countrymen, and his want of critical sense often blinds him to the historical truth.

Saxo's work was widely read during the middle ages, and several extracts of it were made for smaller chronicles. It was published for the first time, from a MS. afterwards lost, in Paris, 1534, by the Danish humanist Christians Pedersen; this edition was reprinted at Basel, 1534, and at Frankfort, 1576. Of later editions may be mentioned that of Stephen Stephunius (Séro, 1644), the second volume of which contains the little-known, but valuable, *Stephanii notae ubiores in histioriam Dannicum Saxonis Grammatici*, and which was reproduced, though without the notes, by C. A. Klotz (Leipzig, 1771); and that of P. E. Müller completed by J. M. Velschow (Copenhagen, 1839–1858). The last complete edition is that of Alfred Holder (Strassburg, 1886), which is based mainly on the text of the 19th century and the last MSS. of Cuxhaven, 1882, and also adds much historical material for the period after this. There are also many MSS. and printed versions of *Saxo*.

There are Danish translations by A. G. Vedel (Copenhagen, 1575, and again 1851), and by F. Winkel-Horn (1806–1808). There is an English translation by O. Elton and F. Y. Powell (London, 1894).

SAXONS, a Teutonic people mentioned for the first time by Ptolemy about the middle of the 2nd century. At that time they are said to have inhabited the neck of the Cimbrian peninsula, by which we have probably to understand the modern province of Schleswig, together with three islands lying off its western coast. We next hear of them in connexion with piratical expeditions in the North Sea about the year 266. These raids became more frequent during the 4th century, and at the beginning of the 5th century the part of the north-east coast of Britain which is known as *litera Saxonica*, owing either to their liability to the attacks of the Saxons or, as some think, to the establishment of Saxon colonies there. During the same period the Saxons appear to have conquered a considerable portion of north-west Germany. According to their own traditions they landed at Hadel in the neighbourhood of Cuxhaven and seized the surrounding districts from the Thuringians. It is clear that by the middle of the 4th century they had advanced
westwards into the basin of the Yssel, from whence they drove the Frankish Salii into Batavia. In the following centuries we find them in possession of the whole of the basin of the Ems, except the coast district, while that of the Weser with all its tributaries belonged to them as far south as the Diemel, where they bordered on the Hessian Franks, the ancient Chatti. The conquest of the Borcuturii who dwelt between the Lippe and the Ruhr marks the extent of their progress towards the south-west. This took place shortly before the end of the 1st century B.C. The Rhine tribes remained, after frequent warfare with the Franks and on several occasions had to submit to their supremacy, notably after their defeat by Clothaire I. in 553. No thorough conquest was, however, carried out until the time of Charlemagne, who, between the years 772 and 785, annexed the whole region as far as the Elbe, destroying in 772 the Irmisul, their great sanctuary, near Marsberg on the Diemel. Up to this time they had remained entirely heathen. In the 8th century and later we find the Saxons divided into three geographical districts known as Westphalai (a name preserved in Westphalia), Angrarri and Ostalde, each of which had in several respects special customs of its own. The Saxons were ruled by a number of independent princes, but it is said that they had a national council which met annually at a place called Marklo on the Weser. At the beginning of the following century Charles also conquered the Saxons known as Nordalbingi in western Holstein, a district which had perhaps been occupied by a southward movement from the original home of the tribe.

It is doubtful how far the Saxons who invaded Britain were really distinct from the Anglii, for all their affinities both in language and custom are with the latter and not with the Saxons (Old Saxons) of the continent. During the 6th century we hear also of Saxon settlements on the coasts of Gaul. The most important were those at the mouth of the Loire founded in the time of Childeric, Clovis's father, and at Bayeux, in a district which remained in their possession until towards the close of the 6th century. From the 6th century onwards, however, we hear practically nothing of the Saxons as a seafaring people. Almost all the southern coast of the North Sea had now come into the possession of the Frisians, and one can hardly help concluding that most of the maritime Saxons had either voluntarily or by conquest become incorporated in that kingdom.

W. de Hase; Hallstatt, 'Itin. regal.'; Ammianus Marcellinus, Translatio S. Alexandri; Huchbald, Vita S. Lebini; Widukind. Res Gestae Saxonicæ, i. 1 ff. (F. G. M. B.)

SAXONY, a kingdom of Germany, ranking among the constituent states of the empire, fifth in area, third in population and first in industrial population, bounded on the S. by the E. and N., the W. by Bavaria and the Thuringian states and on the W.-N. and E. by Prussia. Its frontiers have a circuit of 760 m. and, with the exception of the two small exclaves of Ziegleheim in Saxo-Altenburg and Liebschitz on the border of the principality of Reuss, it forms a compact whole of a triangular shape, its base extending from N.E. to S.W., and its apex pointing N.W. Its greatest length is 130 m.; its greatest breadth 93 m., and the total area is 5787 sq. m. Except in the south, towards Bohemia, where the Erzgebirge forms at once the limit of the kingdom and of the empire, the boundaries are entirely political.

Physical Features.—Saxony belongs almost entirely to the central mountain region of Germany, only the districts along the north and east border and around Leipzig descending into the great north-European plain. The average elevation of the country, however, is not great, and the whole region is drained by numerous small rivers. The chief mountain range is the Erzgebirge, stretching for 90 m. along the south border, and reaching in the Fichtelbergs (3979 ft. and 3853 ft.) and the Erzgebirge the highest points of Saxony. The southernmost part of Saxony is more or less occupied by the ramifications and subsidiary groups of one range, one of which is known from its position as the Central Saxony chain, and another lower group still further south as the Choritz group. The south-east angle of Saxony is occupied by the mountains of Upper Lusatia (highest summit 2660 ft.), which form the link between the Erzgebirge and Riesengebirge in the great Sudetic chain. North-west from this group, and along both banks of the Elbe, which divides it from the Erzgebirge,
where the manufacture of linen was at one time a flourishing
domestic industry. Saxony owes its unusual wealth in fruit partly to the care
of the land, which has been enriched without fruit seeds for distribution among the peasants and farmers. Enormous quantities of cherries, plums and apples are annually
borne by the trees round Leipzic, Dresden and Colditz. The cultiva-
tion of the vine, however, is comparatively new. The introduction of the
early one-half commercial varieties has been fostered by the state near Freiberg, where and the next, lead growing, on the lea
fostered where. Excellent vintages are found in the districts round Bautzen and Chemnitz. Paper is made chiefly in the west of the kingdom, but
does not keep pace with the demand. Machinery of all kinds is pro-
duced, from the sewing-machines of Dresden to the steam-locomotives
and vessels of Schwerin. The factories of Saxony are among the
most extensive of printing-presses in that city. In 1902-1903 Saxony contained
601 active breweries and 572 distilleries. The smelting and refining
of the ore of which the metal ores is also an important industry, by the
mining companies, which is estimated at 266 million pounds annually.

Saxony — Saxony is a constitutional monarchy and a member of the German empire, with four votes in the Bundesrat (federal council) and twenty-three in the Reichstag (imperial diet). The constitution rests on a law promulgated on the 4th of September 1831, and subsequently amended. The crown is hereditary in the Albertine line of the house of Wettin, with restoration to the Ernestine line, of which the duke of Saxo-Weimar is now the head. The king enjoys a civil list of 3,674,927 marks or about £185,000, while the appanages of the crown, including the payments to the other members of the royal house, amount to £59,544 more.

The legislature (Ständeversammlung) is bicameral—the constitution provides for co-ordinate chambers being finally settled by a law of 1868 amending the enactment of 1831. The first chamber consists of the adult princes of the blood, two representatives of the Lutheran and one of the Roman Catholic Church, a representative of Leipzig (appointed by the town) and two of the towns. In addition to these six, there is a proprietor of the mediated domains, two of Ständesherrschaften, one of those of four estates in fee, the superintendent at Leipzig, a deputy of the collegiate institution at Wurzen, 12 deputies elected by owners of noble estates, ten landed proprietors and five other members nominated by the king and the burgomasters of eight towns. The second chamber consists of 43 members from the towns and 48 from the country, elected for six years. All male citizens twenty-five years old and upwards who pay 3 marks per annum in taxes have the
suffrage; and all above thirty years of age who pay 30 marks in annual taxes are eligible as members of the lower house. With the exception of those nominated by the crown, who are elected by the first chamber, the members of the diet are entitled to an allowance for their daily expenses, as well as their travelling expenses. The executive consists of a responsible ministry (Gesamtministerium, comprising the chancellor, the minister of war, public worship and education, and foreign affairs. The minister of the royal household does not belong to the cabinet. The constitution provides for the formation of a kind of privy council (Staaterrat), consisting of the cabinet ministers and other members appointed by the king.

For administrative purposes Saxony is divided into five Kreishaupt-
mannschaften, or governmental departments, subdivided into
twenty-seven Amtshauptmannschaften. The cities of Dresden, Leipzig, Chemnitz, Plauen and Zwickau, form departments by themselves. The supreme court of law for both civil and criminal cases is the Oberlandessgericht at Dresden, subordinate to which are seven other courts in the other principal towns. The German imperial code was adopted by Saxony in 1879. Leipzig is the seat of the Reichskammergericht, the court of appeal for the German empire.

The Saxony army is modelled on that of Prussia. It forms the XLI. and XIX. army corps in the imperial German army, with head-
quarters at Dresden and Leipzig respectively.

Four-fifths of the inhabitants of Saxony are Protestants; about 12,500 are Jews, and about 4.7%, including the royal family, are
Roman Catholics. The Evangelical-Lutheran, or State, church has as its head the minister de evangelycis so long as the king is Roman Catholic, though, in the event of the death of the crown prince, his representative becomes the minister at Dresden. Its representative assembly consisting of 35 clergymen and 42 laymen is called a synod (Synode). The Reformed Church (French) is represented by the minister de prédication of the Lutheran Catholic Church has enjoyed the patronage of the reigning family since 1697, though it was only the peace of Posen in 1806 which placed it on a level with the Lutherans. By the peace of Prague, 1866, Saxony was converted to the Roman Catholic faith, and the church was made in favour of the Roman Catholics of that region, who are ecclesiastically in the jurisdiction of the cathedral chapter of St Peter at Bautzen, the dean of which has ex-officio a seat in the first chamber.
of the diat. The other districts are managed by an apostolic vicar at Dresden, under the direction of the minister of public worship. Two nunneries in Lusatia are the only conventual establishments in Saxony, and no others may be founded. Among the smaller religious sects the Pietists are the most numerous at Halle, but the most interesting is perhaps the independent religious confession.

Education.—Saxony is one of the most highly educated countries in Europe, and its foundations of schools and universities were among the earliest in Germany. Of the four universities founded by the Saxon electors at Leipzig, Jena, Wittenberg, later transferred to Halle, and Erfurt, now extinct, only the first is included in the present kingdom of Saxony. The endowed schools (Fürstenschulen) at Meissen and Grimma have long enjoyed a high reputation. There are over 4000 schools and education is compulsory in the public schools. On account of their teaching programs and the textile industries being especially fostered by numerous schools of weaving, embroidery and lace-making; but the mining academy at Freiberg and the school of forestry at Tharandt are probably the most widely known. The conservatory of music at Leipzig enjoys a world-wide reputation; not less the art collections at Dresden.

Finance.—The Saxon financial period embraces a space of two years. For 1908-1909 the ordinary budget showed an income of 1,175,382,833, balanced by the expenditure. The chief sources of income are taxes, state railways and public forests and domains. The chief expenditure was on the interest and sinking fund of the national debt. The national debt, incurred almost wholly in making and buying railways and telegraphs, and carrying out other public works, amounted to 748,648,000 in 1909.

See the annual Jahrbuch für Statistik des Königreichs Sachsen (Dresden); P. E. Richter, Literatur des Landes und Volkskunde des Königreichs Sachsen (Dresden, 1903); Zemminich, Landeskunde des Königreichs Sachsen (Leipzig, 1902); and Polz, Geologie des Königreichs Sachsen (Leipzig, 1904).

History.—The name of Saxony has been borne by two distinct blocks of territory. The first was the district in the north-west of Germany, inhabited originally by the Saxons, which became a duchy and attained its greatest size and prosperity under Henry the Lion in the 12th century. In 1180 it was broken up, and the name of Saxony disappeared from the greater part of it, remaining only with the districts around Lauenburg and Wittenberg. Five centuries later Lauenburg was incorporated with Hanover, and Wittenberg is the nucleus of modern Saxony, the name being thus transferred from the west to the east of Germany. In 1433 Meissen and Thuringia were united with Sax-Wittenberg under Frederick of Meissen, and gradually the name of Saxony spread over all the lands ruled by this prince and his descendants. Saxony and Saxony-Lauenburg were the principal land-holding fiefs of the Hohenzollerns, and the Saale on the east, the Elbe on the north and the Rhine on the west, with a fluctuating boundary on the south. During the 8th century it was inhabited by the Saxons (g.v.), and about this time was first called Saxonia, and afterwards Saxony.

For many years the Saxons had been troublesome to the Franks, their neighbours to the east and south, and the intermittent campaigns undertaken against them by Charles Martel and Pipin the Short had scarcely impaired their independence. This struggle was renewed by Charlemagne in 772, and a warfare of thirty-two years' duration was marked by the readiness of the Saxons to take advantage of the difficulties of Charles in other parts of Europe, and by the missionary character which the Frankish king imparted to the war. The subjugation of the Saxons, who were divided into four main branches, was rendered more difficult by the absence of any common ruler, and of a central power answerable for the allegiance of the separate tribes. Einhard, the friend and biographer of Charles, sums up this struggle as follows:—"It is hard to say how often the Saxons, conquered and humbled, submitted to the king, promised to fulfill his commands, delivered over the required hostages without delay, received the officials sent to them, and were often rendered so tame and pliable that they gave up the service of their heathen gods and agreed to accept Christianity. But just as quickly as they showed themselves ready to do this, did they also always break their promises, so that one could not really say which of these two courses may truly have been easier to them, and from the beginning of the war scarcely a year passed without bringing such change of mind."

In 772 the war was decided upon, and Charles marched from Worms into the land of the Engrians or Angrians. The frontier fortress of Eresburg which stood on the site of the modern Marburg was taken, the Irminisul was destroyed, and the treasures of gold and silver were seized. The Irminisul was a wooden pillar erected to represent the world-sustaining ash Yggdrasil, and was the centre of the worship of the whole Saxon people. Having received hostages Charles left the country; but in 774 while he was in Italy the Saxons retook Eresburg, and crossing the frontier attacked the church of St Boniface at Fritzlar and ravaged the land of the Franks. The king retaliated by sending troops of cavalry to devastate Saxony, and declared that any Saxon who remained in the land was an adherent of Christianity. In pursuance of this resolve he marched against them early in 775, captured the fortress of Sigiburg on the Ruhr, regained and rebuilt Eresburg and left Frankish garrisons in the land. The Engrians, together with the Eastphalians and the Westphalians who dwelt on either side of them, made a formal submission and many of them were baptized; but about the same time some Frankish troops met with a serious reverse at Lübecke near Minden. Charles thereupon again took the field, and after ravaging Saxony returned home under the impression that the king had been defeated. In 776, however, the Saxons were again in arms and retook Eresburg; but they failed to capture Sigiburg, and showed themselves penitent when the king appeared among them. Saxony was regarrisoned, a new fortress named Carlsburg was erected on the banks of the Lippe, and terms of peace were arranged. In 777 Charles held an assembly at Paderborn, henceforth his headquarters during this war, which was attended by most of the Saxon chiefs. Hostages were given, oaths of fealty renewed, while many accepted Christianity, and the rudiments of an ecclesiastical system were established. The peace did not last long. A certain Widukind, or Wittekind, who had doubtless taken part in the earlier struggle, returned from exile in Denmark, and under his leadership the Saxony revolt broke out afresh in 778. The valley of the Rhine from Coblenz to Deutz was ravaged, and the advance of winter prevented Charles from sending more than a flying column to drive back the Saxons. But in 779 he renewed the attack, and after an important Frankish victory at Bocholt the Westphalians again did homage. The civil and ecclesiastical organization of the country was improved, and in 782 the king held an assembly at the source of the Lippe and took further measures to extend the Frankish power into the Saxon lands. But although the Saxons were again in arms, they were, however, given to Saxon chiefs to administer, and it was probably on this occasion that the capitulatio de partibus Saxoniae was issued. This capitulary ordered the celebration of baptism and other Christian rites and ceremonies in addition to the payment of tithes, and forbade the observance of pagan customs on pain of death.

This attack on the religion and property of the Saxons aroused intense indignation, and provoked the rising of 783 which marks the beginning of the second period of the war. The work of devastation was renewed, the priests were driven out, and on the Sünelt mountains near Minden, the Frankish forces were almost annihilated. Charles collected a large army, and by his orders 4500 men who had surrendered were beheaded at Verden. This act made the Saxons more furious than ever, but in 783 Charles inflicted two defeats upon them at Detmold and on the river Hase, and ravaged their territory from the Weser to the Elbe. This work was continued during the following year by the king and his eldest son Charles, and the Christmas of 784 was spent by the royal family at Eresburg, whence Charles directed various plundering expeditions. The work of conversion was renewed, and an important event took place in 785 when Widukind, assured of his personal safety, surrendered and was baptized at Attigny together with many of his companions. Saxony at last seemed to be subdued, and Saxon warriors took service in the Frankish armies. But in 792 some Frankish troops were killed at the mouth of the Elbe, and a similar disaster in the following year was the signal for a renewal of the ravages with great violence, when churches were destroyed, priests killed, or driven away, and many of the people returned to
heathenism. These events compelled Charles to leave the Avar war and return to Saxony in 794; and until 799 each year had its Saxony campaign. At the same time in 794, as a fresh experiment in policy, every third man was transported; while the king was assisted in his work of conquest by the Abotrites who inhabited a district east of the Elbe. The resistance Charles met with was not serious, and these expeditions took the form of plundering, raids. Oaths and hostages were exacted; and many Saxony youths were educated in the land of the Franks as Christians, and sent back into Saxony to spread Christianity and Frankish influence. The southern part of the country was now only tranquil, and the later campaigns were directed mainly against the Nordalbingians, the branch of the Saxons living north of the Elbe, who suffered a severe reverse near Bornhöved in 798. Further transporting were carried out, and in 797 Charles issued another capitulary which mitigated the severe provisions of the capitulary of 782; and about 802 the Saxoun law was committed to writing. The Nordalbingians were still restless, and it is recorded that their land was devastated in 802. Two years later a fnal campaign was undertaken, when a large number of these people were transported into the country, and their places were occupied by Huns and Franks.

The conversion of the Saxons to Christianity, which during this time had been steadily progressing, was now completed in the reign of the emperor Louis I., the Pious, who, however, took very little interest in this part of his empire. Bishoprics were founded at Bremen, Münster, Verden, Minden, Paderborn, Osnabrück, Hildesheim and Hamburg, and one founded at Seligen- stadt was removed to Halberstadt. Some of these bishoprics were under the authority of the archiepiscopal see of Cologne, others under that of Mainz, and this arrangement was unaltered when in 834 Hamburg was raised to an archbishopric. In 843 the bishopric of Bremen was united with Hamburg, but the authority of this archbishopric extended mainly over the districts north and east of the Elbe. The abbey of Corvey, where rested the bones of St Vitus, the patron saint of Saxony, soon became a centre of learning for the country, and the Saxons undertook with the eagerness of converts the conversion of their heathen neighbours. After a period of tranquillity a reaction set in against Frankish influences, and in 840 the freemen and villeins separated themselves from the nobles, formed a league, or stüllings, and obtained a promise from the emperor Lothair I. that he would restore their ancient constitution. This rising, which was probably caused by the exaction of tithes and the oppression of Frankish officials, aimed also at restoring the heathen religion, and was put down in 842 by king Louis the German, who claimed authority over this part of the Carolingian empire.

The influences of civilization and the settlement of Frankish colonists in various parts of Saxony facilitated its incorporation with the Carolingian empire, with which its history is for some time identified. By the treaty of Verdun in 843 Saxony fell to Louis the German, but he paid little attention to the northern part of his kingdom which was harassed by the Normans and the Slavs. About 850, however, he appointed a margrave to defend the Limner Saxoniae, a narrow strip of land on the eastern frontier, and this office was given to one Liudolf who had large estates in Saxony, and who was probably descended from an Engrian noble named Bruno. Liudolf, who is sometimes called Duke of the East Saxons," carried on a vigorous warfare against the Slavs and extended his influence over other parts of Saxony. He died in 866, and was succeeded by his son Bruno, who was killed fighting the Normans in 880. Liudolf's second son, Otto the Illustrious, was seated as margrave, and his son Conrad I., and on the death of Burkhard, margrave of Thurgingia, in 908, obtained authority over that country also. He made himself practically independent in Saxony, played an important part in the affairs of the Empire, and is said to have refused the German throne in 911. He died in 912 and was succeeded by his son Henry I., the Fowler. Between this prince and Conrad I., who wished to curb the increasing power of the Saxony duke, a quarrel took place; but Henry not only retained his hold over Saxony and Thuringia, but on Conrad's death in 919 was elected German king. He extended the Saxon frontier almost to the Oder, improved the Saxon forces by training and equipment, established new marks, and erected forts on the frontiers for which he provided regular garrisons. Towns were walled, where it was decreed markets and assemblies should be held, churches and monasteries were founded, civilization was extended and learning encouraged. Henry's son, Otto the Great, was crowned emperor in 962, and his descendants held this dignity until the death of the emperor Otto III. in 1002. Otto retained Saxony in his own hands for a time, though in 938 he had some difficulty in suppressing a revolt led by his half-brother Thianmar. The Empire was driven by his domestic policy of Henry the Fowler was continued, the Saxons becoming a centre of learning visited by Italian scholars, and in 968 an archbishopric was founded at Magdeburg for the lands east of the Elbe. In 960 Otto gave to a trusted relative Hermann, afterwards called Billung, certain duties and privileges on the eastern frontier, and from time to time appointed him as his representative in Saxony. Hermann gradually extended his authority, and when he died in 973 was followed by his son Bernard I., who was undoubtedly duke of Saxony in 986. When Henry II. was attacked by his brother Henry the Quarrelsome near the Saxons at Merseburg, and on promising to observe their laws and pay a large sum for the sacred lance, thus entrusting Saxony to his care. Bernard was succeeded by his son Bernard II., who took up a hostile attitude towards the German kings, Conrad II. and Henry III. His son and successor Ordluf, who became duke in 1059, carried on a long and obstinate struggle with Adalbert, archbishop of Bremen, who was compelled to cede one-third of his possessions to Ordluf's son Magnus in 1066. The emperor Henry III. sought to win the allegiance of the Saxons by residing among them, and built a fortress at Goslar and the Harzburg; and the emperor Henry IV. also spent much time in Saxony.

In 1070 Otto of Nordheim, duke of Bavaria, who held large estates in this country, being accused of a plot to murder Henry, was placed under the ban, his possessions were declared forfeited and his estates plundered. Otto, in alliance with Magnus, won considerable support in Saxony, but after some fighting both submitted and were imprisoned; and Magnus was still in confinement when on his father's death in 1072 he became titular duke of Saxony. As he refused to give up his duchy he was kept in prison, while Henry confiscated the estates of powerful nobles. Magnus, however, was short-lived, as the peasants employed in pursuance of its terms in demolishing the forts, desecrated the churches and violated the ducale tombs. Henry, having obtained help from the princes of the Rhineland, attacked and defeated the Saxons at Hohen- burg near Langenalza, rebuilt the forts, and pardoned Otto, whom he appointed administrator of the country. The Saxons, however, were not quite subdued: risings took place from time to time, and the opponents of Henry IV. found considerable support in Saxony. During the century which followed the death of Henry, the Saxons had been in constant warfare with the Slavs, but although the emperors had often taken the field, the Saxons had been driven back to the Elbe, which was at this time their eastern boundary. In 1106 Magnus died, and the German king Henry V. bestowed the duchy upon Lothair, count of Supplinburg, whose wife Richenza inherited the Saxoun estates of her grandfather Otto of Nordheim, on the death of her brother Otto in 1116. Lothair quickly made himself independent, defeated Henry at Welfesholz in 1115, and prosecuted the war against the Slavs with vigour. In 1125 he became German...
king, and in 1357 gave Saxony to Henry the Proud, duke of Bavaria, who had married his daughter Gertrude, and whose mother Wulfhild was a daughter of Magnus Billung. The succeeding German king Conrad III., refused to allow Henry to hold two duchies, and gave Saxony to Albert the Bear, marquavate of Brandenburg, who like his rival was a grandson of Magnus Billung. Albert’s attempts to obtain possession failed, and after Henry’s death in 1319 he formally renounced Saxony in favour of Henry’s son, Henry the Lion (q.v.). The new duke improved its internal condition, increased its political importance, and pushed its eastern frontier towards the Oder. In 1180, however, he was placed under the imperial ban and Saxony was broken up. Henry retained Brunswick and Luneburg; Westphalia, as the western portion of the duchy was called, was given to Philip, archbishop of Cologne, and a large part of the land was divided among nine bishops and a number of counts who thus became immediate vassals of the emperor. The title ducal of Saxony was given to Bernard, the sixth son of Albert the Bear, together with the small territories of Lauenburg and Wittenberg, which were thus the only portions of the former duchy which now bore the name of Saxony. Bernard, whose paternal grandmother, Eilicke, was a daughter of Magnus Billung, took a prominent part in German affairs, but lost Lauenburg which was seized by Waldemar II., king of Denmark. Dying in 1218, Bernard was succeeded in Wittenberg by his younger son Albert I., in Lauenburg after the defeat of Waldemar at Bornhöved in 1227. Albert died in 1250, and soon after his death his two sons divided his territories, when the elder son John took Lauenburg which was sometimes called lower Saxony, and the younger, Albert II., took Wittenberg or upper Saxony. Both retained the ducal title and claimed the electoral privilege, a claim which the Lauenburg line refused to abandon when it was awarded to the Wittenberg line by the Golden Bull of 1356.

Saxe-Lauenburg was governed by John until his death in 1351. In 1346 he divided his dominions among his three sons John II., Albert III., and Eric I. As Albert had no sons the duchy was soon divided into two parts, until on the death of duke Eric III., a grandson of John II., in 1401, it was reunited by Eric IV., a grandson of Eric I. When Eric IV. died in 1412 he was succeeded by his son Eric V., who made strenuous but vain efforts to obtain the electoral duchy of Saxe-Wittenberg, which fell vacant on the death of the elector Albert III. in 1422. Eric died in 1436 and was followed by his brother Bernard IV., whose claim to exercise the electoral vote was quashed by the electors in 1438; and who was succeeded by his son John IV. in 1453. The next duke, John V., Magnus I., spent much time in struggles with the archbishop of Bremen and the bishop of Ratzeburg; he also assisted the progress of the Reformation in Lauenburg. Magnus, who was formally invested with the duchy by the emperor Charles V. in 1530, was the first duke to abandon the claim to the electoral privilege. After his death in 1543 his son Francis I. reigned for the succeeding twenty-eight years, and his grandsons, Magnus II. and Francis II., until 1619. Francis, who did something to improve the administration of his duchy, was succeeded in turn by his two sons and his two grandsons; but of these the younger of his grandsons, in 1689 the family became extinct.

Several claimants to Saxe-Lauenburg thereupon appeared, the most prominent of whom were George William, duke of Lüneburg-Celle, and John George III., elector of Saxony. George William based his claim upon a treaty of mutual succession made in 1360 between his ancestor Magnus II., duke of Brunswick, and the reigning dukes of Saxe-Lauenburg. John George had a double claim. Duke Magnus I. had promised that in case of the extinction of his family Lauenburg should pass to the family of Wettin, an arrangement which had been confirmed by the emperor Maximilian I. in 1507. Secondly, John George himself had concluded a similar treaty with Julius Francis in 1671. In 1689 the elector received the homage of the people of Lauenburg. George William, however, took Ratzeburg, and held it against the troops of a third claimant, Christian V., king of Denmakr; and in 1702 he bought off the claim of John George, his successor being invested with the duchy in 1728. Since that date its history has been identified with that of Hanover (?..).

In Saxe-Wittenberg Albert II. was succeeded in 1298 by his son Rudolph I., who in 1314 gave his vote to Frederick, duke of Austria, in the disputed election for the German throne between that prince and Louis of Bavaria, afterwards the emperor Louis IV.; and when the latter ignored his claims on the marquavate of Brandenburg Rudolph shared in the attempt to depose him, and to elect Charles of Luxemburg, afterwards the emperor Charles IV., as German king. Rudolph was followed in 1356 by his son Rudolph II., who had fought at the battle of Crécy; and who in turn was succeeded in 1370 by his half-brother a Wenceslaus. This prince succeeded after some hesitation in temporising obtaining the duchy of Lüneburg for his house; he took part in the election of Wenceslaus as German king in 1376; and was followed in 1388 by his eldest son Rudolph III. Lavish expenditure during the progress of the council of Constance reduced Rudolph to poverty, and on the death in 1422 of his brother Albert III., who succeeded him in 1410, this branch of the Ascanian family became extinct.

A new era in the history of Saxony dates from 1423, the year when the emperor Sigismund bestowed the vacant electoral duchy of Saxe-Wittenberg upon Frederick, marquavate of Meissen. Frederick was a member of the family of Wettin, which since his day has played a prominent part in the history of Europe, and he owed his new dignity to the money and other assistance which he had given to the emperor during the Hussite war. The new and more honourable title of elector of Saxony now superseded his other titles, and the name Saxony gradually spread over his other possessions, which included Meissen and Thuringia as well as Saxe-Wittenberg, and thus the earlier history of the electorate and kingdom of Saxony is the early history of the mark of Meissen, the name of which now lingers only in the customary term of the electoral Saxony.

Frederick’s new position as elector, combined with his personal qualities to make him one of the most powerful princes in Germany, and had the principle of primogeniture been established in his country, Saxony and not Prussia might have been the leading power to-day in the German empire. He died in 1428, just before his lands were ravaged by the Hussites in 1429 and 1430. The division of his territory between his two sons, the elector Frederick II. and William, occasioned a destructive internecine war, a kind of strife which had many precedents in the earlier history of Meissen and Thuringia. It was in 1455 during this war that the knight Kunz von Kaufungen carried into execution his daring plan of stealing the two sons of the elector Frederick, Ernest and Albert, but he was only momentarily successful, the princes soon escaping from his hands. These two sons succeeded to their father’s possessions in 1464, and for twenty years ruled together peaceably. The land prospered rapidly during this respite from the horrors of war. Encouraged by an improved coinage, trade made great advances, and other benefits also accrued from the discovery of silver on the Schneeberg. Several of the important ecclesiastical pricinicipalities of North Germany were about this time held by members of the Saxon ruling house, and the external influence of the electorate corresponded to its internal prosperity. But matters were not allowed to continue thus. The childless death of their uncle William in 1482 brought Thuringia to the two princes, and Albert insisted on a division of their common possessions.

The important partition of Leipzig accordingly took place in 1495, and resulted in the foundation of the two main lines of the Saxon house. The lands were never again united. Ernest, the elder brother, obtained Saxe-Wittenberg with the electoral dignity, Thuringia and the Saxon Vogtland; while Albert received Meissen, Osterland being divided between them. Something was still held in common, and the division was probably made intricate to render war difficult and dangerous. The elector Ernest was succeeded in 1486 by his son, Frederick the Wise, one of the most illustrious princes in German history.
Under him Saxony was perhaps the most influential state in the Empire, and became the cradle of the Reformation. He died in 1525 while the Peasants’ War was desolating his land, and was succeeded by his brother John, who was an enthusiastic supporter of the reformed faith and who shared with Philip, landgrave of Hesse, the leadership of the league of Schmalkalden. John’s son and successor, John Frederick the Magnanimous, who became elector in 1532, might with equal propriety have been summed the Unfortunate. He took part in the war of the league of Schmalkalden, but in 1547 he was captured at Mühlberg by the emperor Charles V. and was forced to sign the capitulation of Wittenberg. This deed transferred the electoral title and a large part of the electoral lands from the Ernestine to the Albertine branch of the house, whose astute representative, Maurice, had taken the imperial side during the war. Only a few scattered territories were reserved for John Frederick’s son, although these were increased by the treaty of Naumburg in 1554, and on them were founded the Ernestine dukedoms of Saxe-Gotha, Saxe-Weimar, Saxe-Coburg, Saxe-Meiningen and Saxe-Altenburg. For the second time in the history of the Saxon electorate the younger line secured the higher dignity, for the Wittenberg line was junior to the Launenburg line. The Albertine line is now the royal line of Saxony.

Maurice, who became elector of Saxony in consequence of the capitulation of Wittenberg, was a grandson of Albert, the founder of his line. His predecessors in ruling Albertine Saxony had been his father, Henry, who only reigned for two years, and securing his heir the latter, the last of the Roman Saxon electors, had vainly tried to stem the tide of the Reformation in his dominions; Henry, on the other hand, was an equally devoted Protestant. Maurice, who succeeded his father in 1544, was also a Protestant, but he did not allow his religious faith to blind him to his political interests. His ruling motive was ambition to increase both his own power and the importance of his country. He refused to join the other Protestant princes in the league of Schmalkalden, but made a secret treaty with Charles V. Then suddenly invading the Ernestine lands while the elector John Frederick was campaigning against the imperialists on the Danube, he forced that prince to return hastily to Saxony and thus weakened the forces opposed to the emperor. Although compelled to retreat, his fidelity to Charles V. was rewarded, as we have already seen, by the capitulation of Wittenberg. All the lands torn from John Frederick were not, however, assigned to Maurice; he was forced to acknowledge the sovereignty of Bohemia over the Vogtland and the Silesian duchy of Sagan. Moreover, Roman Catholic priests were reinstated in the bishoprics of Meissen, Merseburg and Naumburg-Zella. Recognizing now as Protestant prince that the most powerful alliance for securing his new possessions was not with the emperor, but with the other Protestant princes, Maurice began to withdraw from the former and to conciliate the latter. In 1552, suddenly marching against Charles of Janssbruck, he drove him to flight and then extorted from him the religious peace of Passau. Thus at the close of his life he came to be regarded as the champion of German national and religious freedom.

Amid the distractions of outward affairs, Maurice had not neglected the internal interests of Saxony. To its educational advantages, already conspicuous, he added the three Fürsten- schulen at Pforta, Grimma and Meissen, and for administrative purposes, especially for the collection of taxes, he divided the country into the four circles of the Electorate, Thuringia, Meissen and Leipzig. During his reign coal-mining began in Saxony. In another direction over two hundred religious houses were suppressed, the funds being partly applied to educational purposes. The country had four universities, those of Leipzig, Wittenberg, Jena and Erfurt; books began to increase rapidly, and, by virtue of Luther’s translation of the Bible, the Saxon dialect became the ruling dialect of Germany. Augustus I., brother and successor of Maurice, was one of the best domestic rulers that Saxony ever had. He increased the area of the country by the “circles” of Neustädt and the Vogtland, and by parts of Henneberg and the silver-yielding Mansfeld, and he devoted his long reign to the development of its resources. He visited all parts of the country himself, and personally encouraged agriculture; he introduced a more economical mode of mining and smelting silver; he favoured the importation of finer breeds of sheep and cattle; and he brought foreign weavers from abroad to teach the Saxons. Under him lace-making began on the Erzgebirge, and cloth-making flourished at Zwickau. With all his virility and moderation, Augustus was an intolerant Lutheran, and used very severe means to extirpate the Calvinists; in his electorate he is said to have expelled 111 Calvinist preachers in a single month. Under his son Christian I., who succeeded in 1586, the chief power was wielded by the chancellor Nikolaus Crell (q.v.), who strongly favoured Calvinism; but, when Christian II. came to the throne in 1591, Crell was sacrificed to the Lutheran nobles. The duke of Saxe-Weimar was made regent, and continued the persecution of crypto-Calvinism. Christian II. was succeeded in 1611 by his brother John George I., under whom the country was devastated by the Thirty Years’ War. John George was an amiable but weak prince, totally unfitted to direct the fortunes of a nation in time of danger. He refused the proffered crown of Bohemia, and, when the Bohemian Protestants elected a Calvinist prince, he assisted the emperor against them with men and money. The edict of restitution, however, in 1629, opened his eyes to the emperor’s projects, and he joined Gustavus Adolphus. Saxony now became the theatre of war. The first battle on Saxony soil was fought in 1631, on the road to the Rhine, for the flight of the Saxons. Wallenstein entered Saxony in 1633, and his lieutenants plundered, burned and murdered through the length and breadth of the land. After the death of Gustavus Adolphus at the battle of Lützen, not far from Leipzig, in 1632, the elector, who was at heart an imperialist, detached himself from the Swedish alliance, and in 1635 concluded the peace of Prague with the emperor. By this peace he was confirmed in the possession of Upper and Lower Lusatia, a district of 180 sq. m. and half a million inhabitants, which had already been pledged to him as a reward for his services against the Bohemians.

Saxony had now to suffer from the Swedes a repetition of the devastations of Wallenstein. No other country in Germany was so scourged by this terrible war. Immense tracts were rendered desolate, and whole villages vanished from the map; in eight years the population sank from three to one and a half millions. When the war was ended by the peace of Westphalia in 1648, Saxony found that its influence had begun to decline in Germany. Its alliance with the Catholic party deprived it of its place at the head of the Protestant German states, which was now taken by Brandenburg. The Swedes made the decline of the electorate even more inevitable by detaching from it the three dukedoms of Saxe-Weissenfels, Saxe-Merseburg and Saxe-Zeitz as appanages for his younger sons. By 1746, however, these lines were all extinct, and their possessions had returned to the main line. Saxe-Neustadt was a short-lived branch from Saxe-Zeitz, extinct in 1714. The next three electors, who each bore the name of John George, had uneventful reigns. The first made some efforts to heal the wounds of his country; the second wasted the lives of his people in foreign wars against the Turks; and the last was the last Protestant elector of Saxony. John George IV. was succeeded in 1694 by his brother Frederick Augustus I., or Augustus the Strong. This prince was elected king of Poland as Augustus II. in 1697, but any weight which the royal title might have given him in the Empire was more than counterbalanced by the fact that he became a Roman Catholic in order to qualify for the new dignity. The connexion with Poland was disastrous for Saxony. In order to defray the expenses of his wars with Charles XII. Augustus pawned and sold large districts of Saxon territory, while he drained the resources of both men and money. For a year before the peace of Altranstadt, it was the fate of Saxony to give up the crown of Poland. Saxony was occupied by a Swedish army, which had to be supported at an immense expense.
The wars and extravagance of the elector-king, who regained the Polish crown in 1709, are said to have cost Saxony a hundred million thalers. From this reign dates the privy council (Geheimes Kabinet), which lasted till 1830. The castle privileges of the estates (Stände) were increased by Augustus, a fact which tended to alienate him from other German states. To withstand their power, Johann Friedrich Böttger made his famous discovery in 1710, and the manufacture of porcelain was begun at Meissen, and in this reign the Moravian Brethren made their settlement at Herrnhut. Frederick Augustus II., who succeeded his father in the electorate in 1733, and was afterwards elected to the throne of Poland as Augustus III., was an indolent prince, wholly under the influence of Count Heinrich von Brühl (q.v.). Under his ill-omened auspices Saxony sided with Prussia in the First Silesian War, and with Austria in the other two. It gained nothing by the first, lost much in the second, and in the third, the Seven Years' War (1756-1763), suffered renewed miseries. The country was deserted by its king and his minister, who retired to Poland. By the end of the war it had lost 90,000 men and a hundred million thalers; its coinage was debased and its trade ruined; and the whole country was in a state of frantic disorder. The elector died seven months after his return from Poland; Brühl died twenty-three days later. The connexion with Poland was now at an end. The elector's son and successor, Frederick Christian, survived his father only two months, dying also in 1763, leaving a son, Frederick Augustus III., a boy of ten. By the king's uncle, was appointed guardian, and he set himself to the work of healing the wounds of the country. The foundation of the famous school of mining at Freiberg, and the improvement of the Saxony breed of sheep by the importation of merino sheep from Spain, were due to his care. Frederick assumed the government in 1768, and in his long and eventful reign, which saw the electorate elevated to the dignity of a kingdom, though deprived of more than half its area, he won the surname of the Just. As he was the first king of Saxony, he is usually styled Frederick Augustus I. The first ten years of his active reign passed in peace and quiet; agriculture, manufactures and industries were fostered, economical reforms instituted, and the heavy public debt of forty million thalers was steadily reduced. In 1770 torture was abolished. When the Bavarian succession fell open in 1777, Frederick Augustus joined Prussia in protesting against the absorption of Bavaria by Austria, and Saxony troops took part in the bloodless “potato-war.” The elector commuted his claims in right of his mother, the Bavarian princess Maria Antonia, for six million florins, which he spent chiefly in redeeming Saxony territory that had been pawned. He was invested in 1775 as prince-elector of Saxony, and became in 1785, the Elector of Saxony, and in 1786, the Grand Elector. His title was elevated in 1806 to that of king of Saxony, and he entered the Confederation of the Rhine as an independent sovereign, promising a contingent of 20,000 men to Napoleon.

No change followed in the internal affairs of the new kingdom, except that Roman Catholics were admitted to equal privileges with Protestants. Its foreign policy was dictated by the will of Napoleon, of whose irresistibility the king was too easily convinced. In 1807 his submission was rewarded with the duchy of Warsaw (to which Cracow and part of Galicia were added in 1809), and the title of Czarottus, though he had to surrender some of his former territory to the new kingdom of Westphalia. The king of Saxony's faith in Napoleon was shaken by the disasters of the Russian campaign, in which 21,000 Saxony troops had shared; when, however, the allies invaded Saxony in the spring of 1813, he refused to declare against Napoleon and fled to Prague, though he withdrew his contingent from the French army. Whatever misgivings he may have had were, however, removed by Napoleon's victory at Lützen (May 2, 1813), and the Saxon king and the Saxony army were once more at the disposal of the French. After the battle of Bautzen, Napoleon's headquarters were successively at Dresden and Leipzig. During the battle of Leipzig in October 1813, the popular Saxony feeling was displayed by the desertion of the Saxony troops to the side of the allies. Frederick was taken prisoner in Leipzig, and the government of his kingdom was assumed for a year by the Russians. Saxony was now regarded as a conquered country. Nothing but Austria's vehement desire to keep a powerful neighbour at a distance from her boundaries preserved it from being completely annexed by the Prussians, who had succeeded the Russians in the government. At the conclusion of Viena in 1815, the king of Prussia annexed the whole kingdom was supported by Russia, and opposed by Austria, France and Great Britain, the question all but leading to a complete break-up of the alliance (see VIEENA, CONGRESS OF). As it was, the congress assigned the northern portion, consisting of 7,800 sq. m., with 864,404 inhabitants, to Prussia, leaving 5,790 sq. m., with a population of 1,182,744, to Frederick, who was permitted to retain his royal title. On the 8th of June 1815 King Frederick joined the new German Confederation.

From the partition in 1815 to the war of 1866 the history of Saxony is mainly a narrative of the slow growth of constitutionalism and popular liberty within its borders. Its existence as a more or less independent kingdom was supported by Russia, and opposed by Austria, France and Great Britain, the question all but leading to a complete break-up of the alliance (see VIEENA, CONGRESS OF). As it was, the congress assigned the northern portion, consisting of 7,800 sq. m., with 864,404 inhabitants, to Prussia, leaving 5,790 sq. m., with a population of 1,182,744, to Frederick, who was permitted to retain his royal title. On the 8th of June 1815 King Frederick joined the new German Confederation.

From the partition in 1815 to the war of 1866 the history of Saxony is mainly a narrative of the slow growth of constitutionalism and popular liberty within its borders. Its existence as a more or less independent kingdom was supported by Russia, and opposed by Austria, France and Great Britain, the question all but leading to a complete break-up of the alliance (see VIEENA, CONGRESS OF). As it was, the congress assigned the northern portion, consisting of 7,800 sq. m., with 864,404 inhabitants, to Prussia, leaving 5,790 sq. m., with a population of 1,182,744, to Frederick, who was permitted to retain his royal title. On the 8th of June 1815 King Frederick joined the new German Confederation.
While Saxony's political liberty was thus enlarged, its commerce and credit were stimulated by its adhesion to the Prussian Zollverein and by the construction of railways. Antony had died in 1856, and Frederick Augustus II. became sole king. Growing interest in politics produced dissatisfaction with the compromise of 1831, and the Liberal opposition grew in numbers and influence. The burning questions were the publicity of legal proceedings and the freedom of the press; and on these the government sustained its first crushing defeat in the lower chamber in 1842. In 1843 Lindenau was forced by the action of the aristocratic party to resign, and was replaced by Julius Traugotte von Königritz (1792-1860), a statesman of reactionary views. This increased the opposition of the Liberal middle classes to the government. Religious considerations arising out of the attitude of the government towards the "German Catholics," and a new constitution for the Protestant Church, began to mingle with purely political questions, and Prince John, as the supposed head of the Jesuit party, was insulted at a review of the communal guards at Leipzig in 1845. The military rashly interfered, and several innocent spectators were shot. The bitterness which this occurrence provoked was intensified by a political reaction which was initiated about the same time under Königritz. Warned by the sympathy excited in Saxony by the revolutionary events at Paris in 1848, the king dismissed his reactionary ministry, and a Liberal Cabinet took its place in March 1848. The disputed points were now conceded to the country. The privileges of the nobles were curtailed; the administration of justice was put on a better footing; the press was unshackled; publicity in legal proceedings was granted; trial by jury was introduced for some special cases; and the German Catholics were recognized. The feudal character of the first chamber was abolished, and its members were made mainly elective from among the highest tax-payers, while an almost universal suffrage was introduced for the second chamber. The franchise was established in accordance with the franchise law under this reform bill was that the king should accept the German constitution elaborated by the Frankfort parliament. Frederick, alleging the danger of acting without the concurrence of Prussia, refused, and dissolved the diet. A public demonstration at Dresden in favour of the Frankfort constitution was prohibited as illegal on the 2nd of May 1849. This at once awoke the popular fury. The mob seized the town and barricaded the streets; Dresden was almost destitute of troops; and the king fled to the Königstein. The rebels then proceeded to appoint a provisional government, consisting of Tischiner, Heubner and Todt, though the true leader of the insurrection was the Russian Bakunin. Meanwhile Prussian troops had arrived to aid the government, and after two days' fierce street fighting the rising was quelled. The bond with Prussia now became closer, and Frederick entered with Prussia and Hanover into the temporary "alliance of the three kings." He was not sincere, however, in desiring to exclude Austria, and in 1850 accepted the invitation of that power to send deputies to the restored federal diet at Frankfort. The first chamber immediately protested against this step, and refused to consider the question of a pressing loan. The king retorted by dissolving the diet and summoning the old estates abolished in 1838. When a quorum, with some difficulty, was obtained, another period of retrograde legislation set in. The king himself was carried away with the reactionary current, and the people remained for the time indifferent. Beust became minister for both home and foreign affairs in 1852, and under his guidance the policy of Saxony became more and more hostile to Prussia and friendly to Austria.

The son and successor of the king, by a fall from his carriage in Tirol in 1854, left the throne to his brother John, a learned and accomplished prince, whose name is known in German literature as a translator and annotator of Dante. His brother's ministers kept their portfolios, but their views gradually became somewhat liberalized with the spirit of the times. Beust, however, still retained his federalistic and philo-Austrian views. When war was declared between Prussia and Austria in 1866, Saxony declined the former's offer of neutrality, and, when a Prussian force crossed the border, the Saxon army under the king and the crown prince joined the Austrians in Bohemia. The entire kingdom, with the solitary exception of the Königstein, was occupied by the Prussians. On the accession of Prince John Saxony lost no territory, but had to pay a war indemnity of ten million thalers, and was compelled to enter the North German Confederation.

During the peace negotiations Beust had resigned and entered the Austrian service, and on the 15th of November the king in his speech from the throne announced his intention of being faithful to the new Confederation as he had been to the old. On the 7th of February 1867 a military convention was signed with Prussia, which, while leaving to Saxony a certain control in matters of administration, placed the army under the king of Prussia; from the 1st of July it formed the XII. army corps of the North German Confederation under the command of Crown-Prince Albert. The postal and telegraph systems were also placed under the control of Prussia, and the representation of the Saxon crown at foreign courts was merged in that of the Confederation. A new electoral law of the same year reformed the Saxon diet by abolishing the old distinction between the various "estates" and lowering the qualification for the franchise; the result was a Liberal majority in the Lower House and a period of civil and ecclesiastical reform. John was succeeded in 1873 by his elder son Albert (1832-1902) who had added to his military reputation during the war of 1870. Under this prince the course of politics in Saxony presented little of general interest, except perhaps the spread of the doctrines of Social Democracy, which was especially remarkable in Saxony. The number of Social Democratic delegates in a diet of 80 members rose from 3 in 1885 to 14 in 1895. So alarming did the growth appear, that the other parties combined, and on the 28th of March 1896 a new electoral law was passed, introducing a franchise and electoral law, in which the representation of each class was divided by the amount paid in direct taxation. This resulted in 1901 in the complete elimination of the Socialists from the diet. On the 7th of June 1902 King Albert died, and was succeeded by his brother as King George. The most conspicuous event of his reign was the flight in December 1902 of the crown-princess Louise with a M. Giron, who had been French tutor to her children, which resulted in a grave scandal and a divorce. More important, however, was the extraordinary situation created by the electoral law of 1866. This law had in effect secured the misrepresentation of the mass of the people in the diet, the representation of the country population at the expense of that of the towns, of the interests of agriculture as opposed to those of industry. A widespread agitation was the outcome, and the temper of the people, of what became known as the "Red Kingdom," was displayed in the elections of 1903 to the German imperial parliament, when, under the system of universal suffrage, of 23 members returned 22 were Social Democrats. This led to proposals for a slight modification in the franchise for the Saxon diet (1904), which were not accepted. In the elections of 1906, however, only 8 of the Social Democrats succeeded in retaining their seats. In 1907 the government announced their intention of modifying the electoral system in Saxony by the adding of representation for certain professions to that of the three classes of the electorate. This was, however, far from satisfying the parties of the extreme Left, and the strength of Social Democracy in Saxony was even more strikingly displayed in 1909 when, in spite of plural voting, under a complicated franchise, 25 Socialist members were returned to the Saxon diet.

King George died on the 15th of October 1913 and was succeeded by his son as King Frederick Augustus III.

The Saxon Duchies.—The political history of the parts of Saxony left by the capitulation of Wittenberg to the Ernestine line, which occupy the region now generally styled Thüringen (Thuringen), is mainly a recital of partitions, reunions, redictions and fresh combinations in a territory that was always variously divided. The principle of primogeniture was not introduced until the end of the 17th century, so that the Protestant Saxony dynasty, instead of
building up a single compact kingdom for itself, has split into four petty duchies, of no political influence whatever. In 1547 the ex- 
lector John Frederick the Magnanimous was allowed to retain 
Weimar, Jena, Eisenach, Gotha, Hesse-Hanau and Saalfeld. 
Altenburg and the southern territories which had been added to the 
treaty of Naumburg in 1534, and other additions were made from 
other sources. John Frederick, who had retained and transmitted 
to his descendants the title of duke of Saxony, forbade his sons 
to divide or sell these possessions but his wishes were respected only until 
after the death of his eldest son in 1565. The two survivors then 
-founded separate jurisdictions at Weimar and Coburg, though arrange-
ments for a common government were made in 1558. Saxe-Coburg gave off the branch Saxe-Eisenach; and in 1603 Saxe-
Weimar gave off Saxe-Altenburg, the elder Weimar line ending and 
the younger beginning with the latter date. By 1638 Weimar had absorbed both Coburg and Eisenach; Altenburg remained independent until 1739; when John, duke of Saxe-Weimar, who died in 1605, is regarded as the 
common ancestor of the present Ernestine lines. In 1640 his three 
-surviving sons ruled the dukedoms of Weimar, Eisenach and Gotha. 
Eisenach fell in 1644 and Altenburg in 1672, thus leaving the dukes of 
Saxe-Weimar and Saxe-Gotha to become the ancestors of the 
modern ruling houses. Saxe-Weimar was still repeatedly divided; 
in 1668 a Saxe-Markssuhl appears, and about 1672 a new Saxe-Eisenach. All these, however, were extinct by 1741, 
and their possessions returned to the main line, which had adopted 
the principle of primogeniture in 1719. 
Saxony was now divided; and the climax was 
reached about 1680, when Gotha, Coburg, Meiningen, Romhold, Eisenberg, Hildburghausen and Saalfeld were each the capital of a 
duchy. By the beginning of 1825 only the three of these and Hildburghausen remain, the others having been 
divided after much quarrelling. In that year the Gotha line expired and a general redistribution of the lands of the "Nexus Gothanus," 
which had comprised all of Saxony until 1789, was decided on in 
November 1826. The duke of Hildburghausen gave up his lands 
entirely for Altenburg and became duke of Saxe-Altenburg; the 
duke of Coburg exchanged Saalfeld for Gotha and became duke of 
Saxe-Coburg-Gotha; and the duke of Saxe-Meiningen received 
Hildburghausen, Saalfeld and some other territories, and added 
Hildburghausen to his title. The existing duchies are separately 
noticed.

The chief authority for the early history of Saxony is Widukind, 
whose Res gestae Saxoniae is printed, together with the works of 
other chroniclers, in the Monumenta Germaniae historic a, Scriptores 
Magdeburgenses. The history of Saxony was written by the von 
Königreichs Sachsen, new ed. by F. Thalhe (1867-1873); Sturmhöhl, Geschicht der sächsischen Lande und ihrer Herrscher (Chemnitz, 
1857-1868); and Tutzschmann, Atlas zur Geschichte der sächsischen 
Länder (Leipzig, 1852). Collections which may be consulted are: 
Codex diplomaticus Saxoniae regiae (Leipzig, 1862-1879); the Archiv für 
die sächsiche Geschichte, edited by K. von Weber (Leipzig, 1862-
1879); and the Bibliothek der sächsischen Geschichte und Landeskunde 
von G. Buchholz (Leipzig, 1893). See also Germany: Biblio-
graphy, and the articles on the various dukes, electors and kings of 
Saxony.

SAXONY (Circa Provincia Sachsen), one of the central provinces 
of the kingdom of Prussia, consists mainly of what was formerly 
the electorate part of the kingdom of Saxony, which was ceded to 
Prussia in 1815, but also comprises part of the duchy of Magde-
burg and other districts, the connexion of which with Prussia 
is of earlier date. The area of the province is 9751 sq. m. It is 
bounded W. by Hesse-Nassau, Hanover and Brunswick, N. by 
Hanover and Brandenburg, E. by Brandenburg and Silesia, and 
S. by the kingdom of Saxony and the small Thuringian states. 
It is, however, very irregular in form, entirely surrounding parts 
of Brunswick and the Thuringian states, and itself possessing 
several exclaves, whereas the northern portion is almost severed from 
the southern by the duchy of Anhalt.

The major part belongs to the great North-German plain, but the 
western and south-western districts include parts of the Harz, with 
the Brocken, its highest summit, and the Thuringian Forest. About 
ten-ninth of Prussian Saxony belongs to the basin of the Elbe, the 
chief feeders of which within the province are the Saale, which 
tributary the Unstrut, and the Mulde, but a small district on the 
west drains into the Weser.

Saxony is on the whole the most fertile province of Prussia and 
gives a good yield of rye and barley. The beetroot, however, has 
not the nature of its soil is very unequal. The best crop-produ-
cing districts lie near the base of the Harz Mountains, such as the " 
Magdeburger Börde" (between Magdeburg and the Saale) and the 
"Gotland Börde" (beneath Halle). The sandy plains of Saxony are 
the sandy plains of the Altmark, in the north part of the province, 
yield but a scanty return.

Of the agricultural land, about 90 per cent. is occupied by arable land, 8 percent by meadows and pastures and 21 percent by forests. Wheat and rye are exported in considerable quantities. The beetroot for sugar is grown chiefly in 
the district to the north of the Harz, as far as the Ohre, and on 
the banks of the Saale; and the amount of sugar produced is nearly as 
much as that of all the rest of Prussia together. Flax, hops and oil-
seeds are also cultivated, and large quantities of excellent fruit are 
grown in the district to the west of the Harz and in the valleys of the Unstrut and 
the Saale. The market-gardening of Erfurt and Quedlinburg is well 
known throughout Germany. The province is comparatively poor in 
timber; though there are some fine forests in the Harz and other hilly 
districts, the state has been less concerned with success in the timber 
trade, and more goats are met with here than in any other part of Prussia.

The principal underground wealth of Prussian Saxony consists of 
its own and its brown coal, of both of which it possesses larger stores than any other part of the German empire. The chief rock-salt 
mines and brine springs are at Stassfurt, Schönbeck and Halle. 
The brown coal region extends from Oschersleben by Kalbe to 
Wittenberg, and is comprised entirely in the district of Bitterfeld 
and Wittenberg. Prussian Saxony also possesses three-
fortis of the wealth of Germany in copper. The copper mines 
are found chiefly in the Harz district. The other mineral resources 
include fever (the third of the total German yield), pit-coal, pyrites, 
slate, plaster of Paris, sulphur, alabaster and several varieties of 
good building-stone. Numerous mineral springs occur in the Harz. 
In addition to the production of sugar the most important 
industries are the manufacture of cloth, leather, iron and reed wares, 
chiefly at Erfurt, Suhl and Sömmerda; spirits at Nordhausen, 
chemicals at Stassfurt and Schönbeck, and starch. Beer is also 
brewed extensively. Slate is manufactured by (of the great waterway of 
the Elbe as well as by a complete system of railways. The chief 
articles are wool, grain, sugar, salt, lignite and the manifold 
manufactured products named above.

The population of the province of Saxony in 1905 was 9,979,221, 
an average of 305 persons to the square mile; they were almost 
equally divided between urban population and rural. There were 
2,739,008 Protestants, 230,860 Roman Catholics and 875,298 Jews. 
The bulk of the inhabitants are of unmixed German stock, but many of those in the east part have Wendish blood 
in their veins.

Prussian Saxony is divided into the three government 
districts of Magdeburg, Merseburg and Erfurt. The principal 
towns are Magdeburg, Halle, Erfurt, Halberstadt, Nordhausen, 
Mühlhausen, Aschersleben, Weissenfels and Zehlitz. Magdeburg 
is the headquarters of an army corps. The provincial chambers 
meet at Merseburg. The province sends twenty members to the 
Reichstag and thirty-eight to the Prussian Abgeordnetenhaus 
(house of representatives). Magdeburg is the seat of an 
Evangelical consistory; the Roman Catholics belong to the 
diocese of Paderborn. The university of Halle holds a high rank among 
German seats of learning.

See the Handbuch der Provinz Sachsen (Magdeburg, 1900); and 
Jacobs, Geschichte der in der preussischen Provinz Sachsen vereinigten 
Gebiete (Gotha, 1884).

SAXOPHONE (Ger. Saxophon, Ital. sassofono), a modern 
hybrid musical instrument invented by Adolphe Sax, having 
the clarinet mouthpiece with single reed applied to a conical 
bronze tube. In general appearance the saxophone resembles the 
bass clarinet, but the tube of the latter is cylindrical and of wood; 
both instruments are doubled up near the bell, which is shaped 
somewhat like the flower of the glockina. The mouthpiece in 
both is fixed to a serpentine tube at right angles to the main 
tube. On the saxophone, owing to its conical bore, the produc-
tion of harmonics in this tube is impossible. The saxophone 
resembles that of the oboe. The reed mouthpiece in combination 
with a conical tube allows the performer to give the ordinary 
harmonic series unbroken, which means in practice that the 
 octave or second member of the harmonic series is first overblown 
when the pressure of the breath and the tension of the lips on 
the reed are proportionally increased. The saxophone is there-
fore one of the class known as octave instruments. The funda-
mental note given out by the tube when the lateral holes are 
closed is that of an open organ pipe of the same length, whereas 
the main note, when the clarinet mouthpiece is combined 
with a cylindrical bore, the tube behaves as though it were 
closed at one end, and its notes are an octave lower in pitch. 
Hence the bass clarinet to give the same note as a bass saxophone 
would need to be only half as long. The closed pipe, moreover, 
can only overblow the uneven numbers of the harmonic series, 
and therefore first gives the 12th instead of the octave, which
necessitates an entirely different arrangement of holes and keys and a different scheme of fingering.

The bore of the saxophone is large, and there are from 18 to 20 keys covering holes of large diameter to produce the fundamental scale. The first 15 semitones are obtained by opening successive keys, the rest of the compass by means of octave keys enabling the performer to sound the harmonic octave of the fundamental scale. The compass of the various saxophones extends over 2 octaves and a fifth with chromatic intervals, being limited to one octave less than the clarinet. The complete family consists of five members.

The treble clef is used in notation, and all saxophones are transposing instruments, the music being written in a higher key, according to the difference in pitch between the fundamental note of the instrument and the standard C of the notation. The keys given above are of the orchestral saxophones; the instruments used in military bands are a tone lower. The quality of tone of this family of instruments is inferior to that of the clarinets and has affinities with that of the harmonium.

According to Bertioz it has vague analogies with the timbre of 'cello, clarinet and cor anglais, with, however, a brazen tinge. To a clockmaker of Lisieux named Desfontenelles, who made a clarinet with a conical bore and an upturned bell in 1807, is due the combination of single reed mouthpiece with a conical tube. In 1840 Adolphe Sax, in trying to produce a clarinet that would overblow an octave like the flute and oboe, invented the saxophone, which at once leapt into popularity in France and Belgium, where the alto, tenor and baryton have superseded the bassoon in all the military bands. Many modern French composers, Meyerbeer, Massenet, Ambroise Thomas and others, have scored for it in their operas. Kastner introduced it into the orchestra in Paris in 1844 in Le Dernier Roi de Jude. The saxophone has been adopted in England at the Royal Military School of Music at Kneller Hall.

SAY, JEAN BAPTISTE (1757-1832), French economist, was born at Lyons on the 5th of January 1757. His father, Jean Étienne Say, was of a Protestant family which had originally belonged to Nîmes, but had removed to Geneva for some time in consequence of the revocation of the edict of Nantes. Young Say was intended to follow a commercial career, and was sent, with his brother Horace, to England, and lived first at Croydon, in the house of a merchant, to whom he acted as clerk, and afterwards in London, where he was in the service of another employer. When, on the death of the latter, he returned to France, he was employed in the office of a life assurance company directed by E. Clavière, afterwards known in politics. Clavière called his attention to the Wealth of Nations, and the study of that work revealed to him his vocation. His first literary attempt was a pamphlet on the liberty of the press, published in 1780. He worked under Mirabeau on the Courrier de Provence. In 1792 he took part as a volunteer in the campaign of Champagne; in 1793 he assumed, in conformity with the Revolutionary fashion, the pre-name of Aticus, and became secretary to Clavière, then finance minister. He married in 1793 Mlle Deloche, daughter of a former avocat au conseil; the young pair were greatly straitened in means in consequence of the depredation of the assignats. From 1794 to 1800 Say edited a periodical entitled La Décade philosophique, littéraire, et politique, in which he expounded the doctrines of Adam Smith. He had by this time established his reputation as a publicist, and, when the consular government was established in the year VIII (1799), he was selected as one of the hundred members of the tribunate, and resigned, in consequence, the direction of the Décade. He published in 1808 Obie, ou essai sur les moyens de réformer les mœurs d'une nation.

In 1803 appeared his principal work, the Traité d'économie politique. In 1804, having shown his unwillingness to sacrifice his convictions for the purpose of furthering the designs of Napoleon, he was removed from the office of tribune, being at the same time nominated to a lucrative professorship. Moreover, he thought it his duty to resign. He then turned to industrial pursuits, and, having made himself acquainted with the processes of the cotton manufacture, founded at Auchy, in the Pas de Calais, a spinning-mill which employed four or five hundred persons, principally women and children. He devoted his leisure to the improvement of his economic treatise, which had for some time been out of print, but which the censorship did not permit him to republish; and in 1814 he availed himself (to use his own words) of the same of liberty arising from the entrance of the allied powers into France to obtain a second edition of the work, dedicated to the emperor Alexander, who had professed himself his pupil. In the same year the French government sent him to study the economic condition of Great Britain. The results of his observations during his journey through England and Scotland appeared in a tract De l'Angleterre et des Anglais; and his conversations with distinguished men in those countries contributed to greater correctness in the exposition of principles in the third edition of the Traité, which appeared in 1817. A chair of industrial economy was founded for him in 1819 at the Conservatoire des Arts et Métiers. In 1831 he was made professor of political economy at the Collège de France. He published in 1828-1830 his Cours complet d'économie politique pratique, which is in the main an expansion of the Traité, with practical applications. In his later years he became subject to attacks of nervous apoplexy. He lost his wife in January 1830; and from that time his health constantly declined. When the revolution of that year broke out, he was named a member of the council-general of the department of the Seine, but found it necessary to resign. He died at Paris on the 10th of November 1832.

Say was essentially a propagandist, not an originator. His great service to mankind lay in the fact that he disseminated throughout Europe by means of the French language, and popularized by his own style, the economic doctrines of Adam Smith. It is true that his French panegyrist (and he is the only one from censure on this score) are unjust in their estimate of Smith as an expositor and extol too highly the merits of Say. On the side of the philosophy of science his observations are usually commonplace or superficial. Thus he accepts the shallow dictum of Condillac that toute science se réduit à une langue bien faite. He recognizes political economy and statistics as alike sciences, and represents the distinction between them as having never been made before him, though he quotes what Smith had said of political arithmetic. While deserving the praise of honesty, sincerity and independence, he is inferior to his predecessor in breadth of view, on moral and political questions. In his general conception of human affairs there is a tendency to regard too exclusively the material side of things, which made him pre-eminently the economist of the French liberal bourgeoisie. He is inspired with the dislike and jealousy of governments so often felt and expressed by thinkers formed in the social atmosphere of the 18th century. Soldiers are for him not merely unproductive labourers, as Smith called them; they are rather "destructive labourers." Taxes are uncompensated payments; they may be described as of the nature of robbery.

Say is considered to have brought out the importance of capital as a factor in production greater than that of the English economists, who unduly emphasized labour. The special division of objects the most commonly mentioned as due to him are—(1) that of "immaterial products," and (2) what is called his "théorie des débouchés." Observe that M. Say is the first to recognize the distinction between productive and unproductive labour, he maintains that, production consisting in the creation or addition of a utility, all useful labour is productive and none of it, and that he thus led to recognize immaterial products, whose characteristic quality is that they are consumed immediately and are incapable of accumulation; under this head are to be ranged the services rendered either by a person, a capital or a portion of
SAY, LéON

land, as, e.g., the advantages derived from medical attendance, or from a hired house or from a beautiful view. But in working out the consequences of this view Say is not free from obscurities and inconsistencies. His theory of international commerce is based on the assumption that the value of commodities is proportional to their cost of production, the number, or rather value, of other commodities produced with which it could be purchased. Another proposition on which Say insists is that every value is consumed and is created only to be consumed. Value is, he maintains, accumulated in the course or, as often happens, by the very act of consumption; hence his distinction between reproductive and unproductive consumption. We find in him other corrections or new points of view not previously accepted, and some useful suggestions for the improvement of nomenclature.

Say's writings occupy vols. ix.-xii. of Guillaumin's Collection des principaux économistes. Among them are, in addition to those already mentioned, Cécéchisme d'économie politique (1815); Petit Volume contenant quelques opéreus des hommes et de la société, lettres à Mathias sur différents sujets d'économie politique (1820); des principes de l'économie politique (1831). A volume of Mélanges et correspondance was published posthumously by Charles Comte, author of the Traité de législation, who was his son-in-law. To this volume was added an edition or his works' Cécéchisme politique, which Say published in 1853 without Storch's authorisation, with notes embodying a "critique amère et virulente," a proceeding which Storch justly resented.

Cécéchisme d'économie politique which appeared during the life of the author was the 5th (1826); the 6th, with the author's final corrections, was edited by the eldest son, Horace Émile Say, himself known as an economist, in 1845. The work was translated into English from the 4th edition of the French by R. Prinsep (1821), into German by Ludwig Heinrich von Jakob (1807) and by C. Ed. Morstadt (1818 and 1830), and, as Say himself informs us, into Spanish by José Queypo. The Cours d'économie politique pratique, from which Morstadt had given extracts, was translated into German by Max Stirner (1845). The Cécéchisme and the Petit Volume have also been translated into several European languages. An English translation of the Cécéchisme politique was made by E. Clément in 1852, and a French translation by Lamartine and the Pamphleteer (1821). See also Jean Baptiste Say, by A. Liessie (Paris, 1901).

SAY, [JEAN BAPTISTE] LéON (1826-1896), French statesman and economist, was born in Paris on the 6th of June 1826. The family was a most remarkable one. His grandfather Jean Baptiste Say (q.v.) was a well-known economist. His brother Louis Auguste Say (1774-1840), director of a sugar refinery at Nantes, wrote several books against his theories. His son Horace Émile Say (1794-1860), the father of Léon Say, was educated at Genova, and had travelled in America before establishing himself in business in Paris, where he became president of the Chamber of Commerce in 1838. His careful investigations into the condition of industry at Paris gained for him a seat in the Academy of political and moral sciences, 1837.

Léon Say thus inherited zeal for economic studies, of which he gave proof by publishing at the age of twenty-two a brief Histoire de la caisse d'épargne. He was at first destined for the law, next entered a bank, and finally obtained a post in the administration of the Chemin de fer du Nord. Meanwhile he became a regular contributor to the Journal des débats, where he established his reputation by a series of brilliant attacks on the financial administration of the prefect of the Seine, Haussmann. He displayed talent for interesting popular audiences in economic questions. His sympathies, like those of his family, were with Britain, and his admiration for Adam Smith. He was, indeed, the hereditary defender of free-trade principles in France. He had, moreover, an intimate acquaintance with the English language and institutions, and translated into French Goschen's Theory of Foreign Exchanges. He was one of the pioneers of the co-operative movement in France. Elected to the Assembly of 1871 by the departments of Seine and Seine-et-Oise, he adopted the former, and took his seat among the Moderate Liberals, to whose principles he adhered throughout his life. He was immediately chosen as reporter of the commission on the state of the national finances, and in this capacity prepared two elaborate statements. Thiers, though opposing their publication on grounds of public expediency, was much struck by the ability displayed in them, and on the 5th of June appointed Say prefect of the Seine. The fall of the empire, the siege of Paris, and the Commune had reduced the administration of the capital to chaos, and the task of reconstruction severely tried the new prefect's power of organization. This was, however, a gift with which he was pre-eminently endowed; said a prophetess of the day, "et il est de plus, il est un vrai père de l'État, et il est le premier ministre—un ministre de la finance—a remarkable tribute to his abilities from Thiers, who himself held strongly protectionist views.

In all other respects Say regarded himself as the disciple of Thiers, who, in his last public utterance, designated Say as one of the younger men who would carry on his work. He fell from office with Thiers on the 24th of May 1873, and was elected president of the Left Centre group, as whose candidate he unsuccessfully contested the presidency of the Chamber with Buffet. In spite of their divergence of views, he consented, at the urgent request of President MacMahon, to take office in March 1875 in the buffet Cabinet; but the reactionary policy of the premier led to a dispute between him and Say both in the press and in the constituencies, and brought about Buffet's resignation.

Say continued to hold the ministry of finance under Dufaure and Jules Simon, and again in the Dufaure ministry of December 1877, and its successor, the Waddington ministry, till December 1879. During this long period, in which he was practically the autocratic ruler of the French finances, he had first to complete the payment of the war indemnity—an operation which, thanks largely to his consummate knowledge of foreign exchanges, was effected long before the prescribed time. He was, at a later date, assistant to M. Fradin, who had been minister of finance, in the Thiers ministry, 1881, and was appointed minister of finance by Thiers on the 12th of February 1885, which he held till May 1886, when he was dismissed by Thiers, and again on the 12th of May 1889, when his ministry was dissolved. Say was, however, re-appointed minister on the 28th of October 1890. His able administration of the finances was not without its defects, but it was with some hesitation that his successors succeeded in overhauling his department.
SAY, a town on the right bank of the river Niger in 13° 4' N. and 2° 30' E., in the French colony of Upper Senegal and Niger. In the agreement of 1890 between Great Britain and France for the delimitation of their respective spheres of influence in West Africa, Say was taken as the western end of an imaginary line which ran eastward to Barrua on Lake Chad. To the north the "light soil" of the Sahara—a phrase used by Lord Salisbury in explaining the nature of the position in the House of Lords—was recognized as French; to the south the Sokoto empire (northern Nigeria) fell to Great Britain. By the convention of 1898 Say, however, and a considerable tract of territory south and east of the town were ceded to France. (See AfRICA, § 5.)

SAYAD, a descendant of Ali, the son-in-law of Mahomet, by Fatima, Mahomet's daughter. Many of the Pathan tribes in the North-West Frontier Province of India, such as the Bangash of Kohat and the Mishwans of the Hazara border, claim Sayad origin. The 20th century conquest of the Pathans to Islam were called Sayads if they came from the west, and Sheikhs if they came from the east; hence doubtless many false claims to Sayad origin. In Afghanistan the Sayads have much of the commerce in their hands, as their holy character allows them to pass unharmed where other Pathans would be murdered. The Sayads gave a short-lived dynasty to India, which reigned at Delhi during the first half of the 15th century. Their name again figures in Indian history at the break up of the Mogul empire, when two Sayad brothers created and dethroned emperors at their will (1714-1720). In 1903 the total number of Sayads in all India was returned at 1,339,734. They include many well-known and influential families. The first Mahomedan appointed to the Council of India and the first appointed to the Privy Council were both Sayads.

SAYAN MOUNTAINS, a range of Asia, forming the eastern continuation of the Salkhughem or Altai range, stretching from 83° E. to 106° E. Geographically they are the North-ridge-order of the plateau of N.W. Mongolia, and separate that region from Siberia. The geology is imperfectly known. While the general elevation is 7000 to 9000 ft., the individual peaks, consisting largely of granites and metamorphic slates, reach altitudes of 10,000 ft. and 11,450 ft., e.g. in Munko Sardykh; while the principal passes lie 6000 to 7500 ft. above the sea, e.g. Mustagh 7480 ft., Mongol 6950 ft., Tenghuy 7480 ft. and Obo-sarym 6100 ft. In 92° E. the system is pierced by the Bel-kem or upper Yenisel, and in 106°, at its eastern extremity, it terminates above the depression of the Selenga-Orkhon valley. From the Mongolian plateau the ascent is on the whole gentle, but from the plains of Siberia it is much steeper, despite the fact that the range is masked by a broad belt of subsidiary ranges of an Alpine character, e.g. the Usinsk, Oya, Tunka, Kitoi and Byelaya ranges. Between the breach of the Yenisel and the Kosso-gol (lake) in 100° 30' E. the system bears also the name of Yerghik-taiga. The flora is on the whole poor, although the higher regions carry good forests of larch, pitch pine, cedar, birch and alder, with rhododendrons and species of Berberis and Ribes. Lichens and mosses cover many of the boulders that are scattered over the upper slopes.

SAY BROOK, a township of Middlesex county, Connecticut, U.S.A., at the mouth and on the W. bank of the Connecticut river, about 100 m. N.E.N. of New York City and about 40 m. S. of Hartford. Pop. (1900) 1634; (1910) 1907. The post office of the township is named Deep River. Mainly confined to Saybrook Point, jutting out into the river, is the town of Old Saybrook (pop. in 1910, 1510), separated from the township of Saybrook in 1752, but actually the mother colony; its post village is called Saybrook. It is served by the New York, New Haven & Hartford railway, the Valley branch of which here separates from the Shore Line branch. It is a beautiful place, with several old buildings, notably the Hart mansion built about 1783 by Captain Elisha Hart, whose seven daughters here entertained Washington Irving, J. R. Drake and Fitz-Greene Halleck. Com. Isaac Hull and his nephew Joseph Bartine Hull married two of the daughters, and the younger of these in 1824 left the house to the township of Old Saybrook, which refused the gift. Fenwick (pop. in 1910, 34), the smallest borough in the state, is a part of Old Saybrook township, in which there are summer residences. The first settlement was made on Saybrook Point late in 1635 by John Winthrop, commissioned governor for one year by the company of which the principal shareholders were the earl of Say and Sele, the Groose, Sir Richard Saltonstall, John Pym and John Hampden, and which was founded from the earl of Warwick. The English settlers forestalled the Dutch, who attempted to land here in November. A palisade was built across the narrowest part of the neck of the point by Lyon Gardiner, who built a fort (burned in 1647) and planned a settlement, to which for a time it was thought Lord Saye and Sele, Lord Brooke, John Hampden, Oliver Cromwell, and other independents would immigrate. Gardiner called the place Saybrook from the names of its principal proprietors. He had purchased the control in 1610 from the Groose and others by George Fenwick (d. 1617), whose wife, called Lady Fenwick (she was the widow of Sir John Botetel), died here in 1646, and who in 1644 sold 1 to Connecticut the proprietors' rights.

In 1646 the First Church of Christ was organized; a church building was erected in 1647, and in 1680-1681 another, in which in September 1708, at the call of the General Assembly, met a Congregationalist convention of 150 ministers which reaffirmed the Savoy Articles which reformed the Savoyards who reasserted the profession of Faith and the Heads of Agreement adopted in England in 1691 by Congregationalists and Presbyterians, and drew up the New Covenant. The form of government was explained by the modification of harmony and order, the regular introduction of candidates into the ministry and the establishment of associations and consociations, the latter being tribunals with final and appellate jurisdiction. This establishment was approved by the General Assembly, and the churches organized under it were declared to be established by law. This establishment continued in full force until 1784. A granite boulder (1901) marks the site of the first home of Yale University, established here in 1701 as the Collegiate School of Connecticut; until 1716 when it was removed to New Haven, most of the school's commencements were held here and all its exercises after 1707-1708, before which time most of the actual teaching was done in Killingworth. In 1783 Clinton, Connecticut. Saybrook was the home of David Bushnell (1742-1824), who devised in 1776 a submarine torpedo and a tortoise-shaped diving boat, the "American Turtle," which were successful against the British in the War of American Independence.

The original township of Saybrook contained the present townships of Old Saybrook, Westbrook (1840), Essex (1854), taken from Old Saybrook, Saybrook, Saybrook Center (1871), and portions of the rivers, parts of the present Lyme (1865), Old Lyme (1855, from Lyme), and East Lyme (1839, from Lyme and Waterford).

SAYCE, ARCHIBALD HENRY (1846-1907), British Orientalist, was born at Shirehampton on the 25th of September 1846, son of the Rev. H. S. Sayce, vicar of Caldicot. He was educated at Bath, and at Queen's College, Oxford, of which he became fellow in 1869. In 1891 he was elected professor of Assyriology at Oxford. He threw his whole energies into the study of biblical and other Oriental subjects, and though his conclusions have in a number of cases been considerably modified (e.g. in chronology and translocation) by the work of other scholars (see, e.g. BABYLONIA and ASSYRIA) it is impossible to overestimate his services to Oriental scholarship. He travelled widely in the East and continued in later life annual trips up the Nile. An interesting example of the importance of his pioneer work is the fact that there has been a strong tendency to revert to the views which he advanced on the question of the Hittites in his early Oxford lectures. He was a member of the Old Testament Revision Company in 1874-1884; deputy professor of comparative philology in Oxford 1876-1890; Hibbert Lecturer 1887; Gifford Lecturer 1900-1902.

1 The sale was probably illegal as it was never confirmed; and it does not appear that the earl of Warwick had ever title to the land as such. The correction by the General Assembly of a previous conjectural explanation of the history of the Warwick patent see Forrest Morgan, "The Solution of an Old Historic Mystery," in the Magazine of History for July, August, September and October 1899.
Of his numerous publications the following are of special importance—Assyrian Grammar for Comparative Purposes (1872); Principles of Comparative Philology (1874); Babylonian Literature (1877); Introduction to the Language (1879); Monuments of the Hittites (1881); Herodotus i.–iii. (1883); Ancient Empires of the East (1884); Introduction to Ezra, Nehemiah and Esther (1885); A Road in the River; or Nineveh and Babylon (1887); The Hittites (1889); Races of the Old Testament (1891); Higher Criticism and the Verdict of the Monuments (1894); Patriarchal Palestine (1895); The Egypt of the Hebrews and Herodotus (1895); Eastern History before the Christian Era (1896); The Hieroglyphic Cartoons (1897); The Oriental Nations (1898); Babylonians and Assyrians (1900); Egyptian and Babylonian Religion (1903); Archaeology of the Cuneiform Inscription (1907). He also contributed important articles to the 9th, 10th and 11th editions of the Encyclopaedia Britannica and edited a number of Oriental works.

**SAYE, WILLIAM FIENNES, 1st Viscount (1582–1662),** was the only son of Richard Fiennes, 7th Baron Saye and Sele, and was descended from James Fiennes, Lord Saye and Sele, who was lord chamberlain and lord treasurer under Henry VI. and was beheaded by the rebels under Jack Cade on the 4th of July 1450. Born on the 26th of May 1582 Fiennes, like many of his family, was educated at New College, Oxford, and was appointed to his father's barony in 1613, and in parliament opposed the policy of James I., undergoing a brief imprisonment for objecting to a benevolence in 1662; and he showed great animus towards Lord Bacon. In 1624, owing probably to his temporary friendship with the duke of Buckingham, he was advanced to the rank of a viscount, but notwithstanding this he remained during the early parliaments of Charles I. champion of the popular cause, and was in Clarendon's words "the oracle of those who were called Puritans in the worst sense, and steered all their counsels and proceedings in support of his own opinions, in helping to colonize Providence Island, and in interesting himself in other and similar enterprises in America. Although Saye resisted the levy of ship-money, he accompanied Charles on his march against the Scots in 1639; but, with only one other peer, he refused to take the oath binding him to fight for the king to "the utmost of my power and hazard of my life." Then Charles I. sought to win his favour by making him a privy councillor and master of the court of wards. When the Civil War broke out, however, Saye was on the committee of safety, was made lord-lieutenant of Gloucestershire, Oxfordshire and Cheshire, and raising a regiment occupied Oxford. He was a member of the committee of both kingdoms; was mainly responsible for passing the self-denying ordinance through the House of Lords; and in 1647 stood up for the army in its struggle with the parliament. In 1648, both at the treaty of Newport and elsewhere, Saye was anxious that Charles should come to terms, and he retired into private life after the execution of the king, becoming a privy councillor again upon the restoration of Charles II. He died at his residence, Broughton Castle near Banbury, on the 14th of April 1662. On several occasions Saye outwitted the advisers of Charles II. by his strict compliance with legal forms. He was a thorough aristocrat, and his ideas for the government of America included the establishment of an hereditary aristocracy. His eldest son James (c. 1603–1674) succeeded him as 2nd viscount; other sons were the parliamentarians Nathaniel Fiennes (q.v.) and John Fiennes. The viscountcy of Saye and Sele became extinct in 1781, and the barony is now held by the descendants of John Twisleton (d. 1682) and his wife Elizabeth (d. 1674), a daughter of the 2nd viscount. Saybrook (q.v.) in Connecticut is named after Viscount Saye and Lord Brooke.

**Sayer (or Sayers), JAMES (1748–1823), English caricaturist, was a native of Yarmouth, and son of a merchant captain. He began as clerk in an attorney's office, and was for a time a member of the borough council. In 1780 the death of his father put him in possession of a small fortune, and he came to London. As a political caricaturist he was a supporter of William Pitt. His plate of "Carlo Khan's triumphal entry into Leadenhall Street" was allowed by C. J. Fox, against whom it was directed, to have damaged him severely in public opinion. Indeed Sayer was always at his best when attacking Fox, whose strongly marked features he rendered with remarkable power, and always so as to make them convey expressions of defiant impudence or of anger. Pitt, who showed no wish to help literature or art in any other case, provided Sayer with a place as marshal of the Exchequer court. He died in Curzon Street, Mayfair, on the 20th of April 1833. Sayer's "Carlo Khan" has been frequently reproduced. But he can only be judged with confidence after examining the collection in the British Museum, or other public libraries. His drawings, more originally with pencil on oiled paper, were etched for him by the Bretherton's. They were then sold in collections of the size of a large volume. Sayer was a friend of Thomas Rowlandson and Mr. Gillray, and his work has a more substantial value than either, and nearer the truth.**

**Sayers, Tom (1826–1865),** English pugilist, was born at Brighton on the 25th of May 1826. By trade a bricklayer, he began his career as a prize fighter in 1840 and won battle after battle, his single defeat being at the hands of Nat Langham in October 1853. In 1857 he gained the championship. His fight with the American, John C. Heenan, the Benicia Boy, a much longer fight than Langham's, is perhaps the most famous in the history of the English prize ring. It took place at Farnborough on the 17th of April 1860 and lasted two hours and six minutes, thirty-seven rounds being fought. After Sayer's right arm had been injured the crowd pressed into the ring and the fight was declared a draw. £500 was raised by public subscription for Sayers, who withdrew from the ring and died on the 8th of November 1865. The champion was 3 ft. 8½ in. in height and his fighting weight was under 11 stone. An account of the fight between Sayers and Heenan is given by Frederick Locker-Lampson in My Confessions (1856).

**Sayre, a borough of Bradford county, Pennsylvania, U.S.A., on the North Branch of the Susquehanna river, about 95 m. (by rail) N.N.W. of Wilkes-Barre, and just S. of the New York state boundary. Pop. (1900) 5243 (337 foreign-born); (1910) 6426. Sayre is served by the main line and by a branch of the Lehigh Valley railway, and is connected by electric railway with Waverly, New York, and with the adjacent borough of Athens, Pennsylvania (pop. in 1910, 3769), which manufactures furniture, carriages and wagons. Sayre, Athens, South Waverly and Waverly form virtually one industrial community. But its industrial importance is due primarily to the locomotive and car shops of the Lehigh Valley railway. It was named in honour of Robert Heysham Sayre (1824–1907), long chief engineer of this railway. Sayre was settled in 1880 and was incorporated as a borough in 1891.**

**Sayyid Ahmad Khan, Sir (1817–1878), Mahommmedan educationist and reformer, was born at Delhi, India, in 1817. He belonged to a family which had come to India with the Mahommmedan conquest, and had held important offices under the Mogul emperors. Although his imperfect acquaintance with English prevented his attainment of higher office than that of a judge of a small cause court, he earned the title of the recognized leader of the Mahommmedan community. To the British he rendered loyal service, and when the mutiny reached Bijnor in Rohilkand in May 1857 the British residents owed their lives to his courage and tact. His faithfulness to his religion was pronounced, and in 1876 he defended the cause of Islam in A Series of Essays on Mahommed, written in London. He can only be judged with confidence after examining the Mahommmedans and their rulers, and to rouse his co-religionists to a sense of the benefits of modern education. The task was no light one; for during the first half of the 19th century the Mahommmedans had kept themselves aloof from English education, and therefore from taking their proper part in the British administration, being content to study Persian and Arabic in their own mosques. Sayyid Ahmad set himself to alter their resolution. He established a translation society, which became the Scientific Society of Aligarh. He wrote letters from England to draw the hearts of the East to the West. In 1873 he founded...**
the Mahommedan Anglo-Oriental College at Aligarh, and raised funds for the buildings of which Lord Lytton laid the foundation-stone. He stimulated a similar movement elsewhere, and among other cities Karachi, Bombay and Hyderabad caught the infection of his spirit. Thus he effected a revolution in the titles of the Madrassas towards modern education. He was made K.C.S.I., and became a member of the legislative councils of India and Allahabad, and of the education commission. He died at Aligarh on the 2nd of March 1898.

SBEITLA (anc. Sufetula), a ruined city of Tunisia, 60 m. S.W. of Kairawan. Long buried beneath the sand, this is the most perfect of the early examples of the Roman cities in the cities. It stands at the foot of a hill by a river, here perennial, but at a short distance beyond lost in the sands. The chief ruin is a rectangular walled enclosure, 238 ft. by 198 ft., known as the Hieron, having three small and one large entrance. The great gateway is a fine monumental arch in fair preservation, with an inscription to Antoninus Pius. Facing the arch, within the Hieron, their rear walls forming one side of the enclosure, are three temples, connected with one another by arches, and forming one design. The length of the entire façade is 170 ft. The characteristic of the central temple, which is of the Composite order, is 44 ft. long; those of the side temples, in the Corinthian style, are smaller. The walls of the middle temple are ornamented with engaged columns; those of the other buildings with pilasters. The porticos have fallen, and their broken monolithic columns, with fragments of cornices and other masonry, lie piled within the enclosure, which is still partly paved. (In 1901 a violent storm further damaged the temples and forced the gateway out of the perpendicular.) The other ruins include a triumphal arch of Constantine, a still serviceable bridge and a square keep or tower of late date.

The early history of Sufetula is preserved only in certain inscriptions. Under Antoninus and Marcus Aurelius it appears to have been a flourishing city, the district, now desolate, being then very fertile and covered with forests of olives. It was partly rebuilt during the Byzantine occupation and became a centre of Christianity. At the time of the Arab invasion it was the capital of the exarch Gregorius, and outside its walls the battle was fought in which he was slain; his daughter, who is said by the Arab historians to have fought by the side of her father, became the wife of one of the Arab leaders. The invaders besieged, captured and sacked Sufetula, and it is not afterwards mentioned in history. It was not until the close of the 10th century that the ruins were thoroughly examined by French savants.

SCABBARD, the sheath of a sword. The early forms of the word are scabbard in the Plautus, scæbærum in the Horace, scæburt, scaburt or scabuer. The termination is certainly from the Teutonic bergen, to protect, as seen in “hauberk,” “hawberk” (i.e. halsberg), literally a protection for the neck and shoulders, hence the “long tunic of mail” of the 17th century (see Arms and Armour). The first part is doubtful; Skeat takes it as representing the O. Fr. escâle, mod. écaille, shell. Ger. Schale; the word would therefore mean an outer sheath or shell that covers or protects.

SCABBLING, or SCAPPING, in building, the process of reducing a stone to a rough square by the axe or hammer; in Kent the confusion with scabbarding calls this knobbling (see Masonry).

SCABIES, or ITCH, a skin disease due to an animal parasite, the Sarcoptes scabei (see Mite), which burrows under the epidermis at any part of the body, but hardly ever in the face or scalp of adults; it usually begins at the clefts of the fingers, where its presence may be inferred from several scattered pimples, which will probably have been torn at their summits by the scratching of the patient, or have been otherwise converted into vesicles or pustules. The remedy is soap and water, and sulphur ointment.

SCEAEVOLA, the name of a famous family of ancient Rome, the most important members of which were:

1. Gaits Mucius Sceaevola, a legendary hero, who volunteered to assassinate Lars Porsena when he was besieging Rome. Making his way through the enemy’s lines to the royal tent, but not knowing Porsena by sight, he slew his secretary by mistake. Before the royal tribunal Mucius declared that he was one of 500 noble youths who had sworn to take the king’s life, and that he had been chosen by lot to make the attempt first. Thwarted with death or torture, Mucius thrust his right hand into the fire blazing upon an altar, and held it there until it was consumed. The king, deeply impressed and dreading a further attempt upon his life, ordered Mucius to be liberated, made peace with the Romans and withdrew his forces. Mucius was rewarded with a grant of land beyond the Tiber, known as the "Mucia Prata" in the time of Dionysius of Halicarnassus, and received the name of Sceaevola ("left-handed"). Dionysius says nothing of the incident of the fire, under which stand the words of Mucius to his complicity and the name of the fire-robbers in an ambuscade. The story is presumably an attempt to explain the name Sceaevola, coloured by national and family vanity (Livy lii. 12; Dion. Halic. v. 27-30). The Mucius of the legend is described as a patrician; the following were undoubtedly plebeians.

2. Publius Mucius Sceaevola, Roman orator and jurist, consul 133 B.C. during the time of the Gracchan disturbances. He was not opposed to moderate reforms, and refused to use violence against Tiberius Gracchus, although called upon in the senate "to protect the state and put down the tyrant." He opposed murder of the satirist Lucullus (Persius i. 115, Juvenal i. 154). In 130 he succeeded his brother Mucianus as pontifex maximus. During his tenure of office he published a digest in 80 books of the official annals kept by himself and his predecessors, which were afterwards discontinued as unnecessary, their place being taken by the works of private annalists. He was chiefly distinguished for his knowledge of law, which he held to be indispensable to a successful pontifex. Cicero frequently mentions him as a lawyer of repute, and he was a member of the jurists whose works were used in the compilation of the Digest. He was also a famous player at ball and the game called Duodecim Scripta; after he had lost a game, he was able to recall the moves and throws in their order. 3. See A. H. J. Greenidge, History of Rome.

3. Quintus Mucius Sceaevola, son of (2), usually called "Pontifex Maximus," to distinguish him from (3), consul in 95 B.C. with his friend L. Licinius Crassus the orator. He and his colleague brought forward the lex Licinia Mucia de civibus regendis, whereby any non-burgesses who was convicted of having usurped the rights of citizenship was to be expelled from Rome, and the memory of the Greeks of Asia set aside a day for the celebration of festivities and games called Mucia. He was subsequently appointed Pontifex Maximus, and, in accordance with a custom that had prevailed since the first plebeian appointment to that office (about 150 years before), was always ready to give gratuitous legal advice. His aedileship was thronged, and even the chief men of the state and such distinguished orators as Servius Sulpicius consulted him. He kept a firm hand over the priestly colleges and insisted upon the strict observance of definite regulations, although he was by no means bigoted in his views. He held that there were no tyrants of religion, philosophical and traditional. The senate and was to be preferred for the sake of the unreasonable multitude, who ought to be taught to set a higher

1 Some authorities hold that Quintillian (Inst. Orat. xi. 2, 38) refers to Sceaevola (3).
Quintus Mucius Scaevola (c. 159–88 B.C., uncle of (3), from whom he is distinguished by the appellation of “Augur,” He was instructed in law by his father, and in philosophy by the famous Stoic Panætius of Rhodes. In 121 he was governor of Asia. Accused of extortion on his return, he defended himself and, though no orator, secured his acquittal by his legal knowledge and common sense. In 117 he was consul. He did not take a prominent part in the Senate, but his brief, unpolished remarks sometimes made a great impression. He was a great friend of Cicero, and lived in an apartment near him. He gave advice to Scaevola to Cicero and Atticus. He had a high appreciation of Marius, and when Sulla assembled the senate, to obtain it a declaration that Marius was the enemy of his country, Scaevola refused his assent. He married Lelia (the daughter of Gaius Lelius, the friend of the younger Scipio), by whom he had a son and two daughters, one of whom became the wife of Licinius Crassus the orator. Scaevola is one of the interlocutors in Cicero’s De oratore, De amicitia and De republica.

For the legal importance of the Scaevolae, see A. Schneider, Die drei Scaevola Ciceres (Munich, 1879), with full references to ancient and modern authorities.

SCAFFEL (pronounced and sometimes written Scaw Fell), a mountain of Cumberland, England, in the Lake District. The name is specially applied to the southern portion (3162 ft. in height) of a certain range or mass, but Scafell Pike, separated from Scafell by the steep narrow ridge of Mickledore, is the highest point in England (3210 ft.). The ridge continues N.E. to Great End (3204 ft.), which falls abruptly to a flat terrace, on which are the settlements of Scafell and Seathwaite. It is a well known and popular ascent, the path between Sty Head Pass (3600 ft.) and Esk Hause (2900 ft.) being well defined. The ascent may be made from either end of the ridge, by a path of grass and heather, the ridge being of moderate height and easily traversed, the descent being more difficult. The range thus defined may be termed the Scafell mass. North-west from the Pike the lesser height of Lingmell (2649 ft.) is thrown out like a bastion, and the steep flank of the range, scored with the deep gully of Piers Gill, sweeps down to the head of Wasdale. On the east an even steeper wall, with splendid crags, falls to Easdale. Above Mickledore ridge Scafell rises nearly sheer, the rock scored with bold crests; here are some of the ascents most in favour with the mountaineers. Some of the other ascents of the Scafell are among the utmost; and the mountain has been the scene of several accidents.

SCAFFOLD, SCAFFOLDING (from the O. Fr. escaufl, originally escafoi, modern échafaud, a corruption of the Italian or Spanish catafalco, a platform, especially a canopy over a bier, a catafalque; this word is composed of O. Span. cataer, O. Ital. catar, to view, Lat. capere, to watch, observe, and balco, balcony), properly a platform or stage, particularly one of a temporary character erected for viewing or displaying some spectacle, and hence applied to the raised structure on which the execution of a criminal or condemned person is carried out. (See Capital Punishment, etc.) The word “scaffold” or “scaffolding” is used in a technical sense of an obstruction formed in a blast furnace by the fitting together of lumps which form a comparatively solid skeleton mass inside the furnace, preventing the charge from descending properly. The most general modern application of the word, however, is, in building, to the temporary structure of platforms erected or suspended at convenient heights to afford workmen easy access to their work. Such scaffolds may be divided into four principal classes—bricklayers’ scaffolds, masons’ scaffolds, gantres and derrick towers or staging. The first two are constructed with upright and horizontal poles lashed together. Gantres and derricks are built of squared timber, and the different members are connected by iron bolts and dogs.

The bricklayers’ scaffold is constructed of standards, ledgers and putlogs, and the connections are made with lashings of rope, though wire ropes or chains are sometimes used. The standards are a series of upright fir poles 30 to 50 ft. in length, either (1) sunk about 2 ft. into the ground, (2) fixed in barrels filled with earth lightly rammed, or (3) placed upon a “sole plate” of timber with a square formed of small fillets of wood round the base to prevent movement. The standards are placed 6 to 9 ft. apart, and about 5 ft. away from the building. At every 5 ft. ledgers are tied to the standards to support the putlogs, which in turn support the platform of planks. The ledgers are poles lashed horizontally to the standards; upon these, putlogs, usually of birch wood 3 in. square in section, are laid about 3 or 4 ft. apart, with one end resting on the ledger and the other in a recess in the wall. The outer end should be lashed to the ledger. Boards are then laid upon these putlogs parallel with the face of the wall. Two thicknesses of boards are used, the inner one being made about the thickness of the scaffold erected in an exposed position or is more than 30 ft. high, it should be stiffened by cross braces of poles running diagonally across the face of the structure and firmly lashed to all the main timbers touched. Ties should also be taken back from the face of the scaffold through apertures in the walls of the building and firmly secured. These ties should be connected with every fourth standard and start at a height between 20 and 30 ft. from the ground. Instead of, or in addition to, these ties light shires may be taken from the face of the scaffold outward to the building, and as the work is carried up the boarding and many of the putlogs are removed, the scaffold is supported by the two putlogs, however, being left tied to the lower ledgers to stiffen the scaffold. In the case of thick walls a scaffold is required inside as well as outside the building, and when this is the case the two structures are tied together and stiffened by short connecting poles through the window and door openings.

The mason requires an independent scaffold. He cannot rest the inner ends of his putlogs in the wall as the bricklayer does, for this would disfigure the stonework, so he erects another and parallel framework of standards and ledgers. They are placed between the inner and outer poles. These are made of fir, or other hardwood and are connected with one to support the other. The two portions are tied together with cross braces, and the whole of the timbering is made capable of taking heavier weights than are required in the case of the bricklayer.

Scaffolding poles are of Northern pine obtained chiefly from the Baltic ports. They consist of small trees up to 30 to 40 ft. long and of not more than 9 in. in diameter. They are sold with the bark on, but this should be removed before use. Materials. Such material forms the standards and ledgers. The putlogs are usually made from fir poles of moderate strength and about 4 ft. long. In order to have the fibres uncurt they should be split, not sawn. Scaffolding boards are made in 8-to-12 ft. lengths, 7 or 9 in. wide, and 14 in. or 2 in. thick. They should be of yellow deal, but they are more often cut from spruce. The corners are cut off and the ends bound with stout hoop-iron to prevent splitting. The cords used for lashing are made of jute and hemp fibre. The best and strongest cords are those of white Manila hemp. The fibres for scaffold cords are made by bonding them together for a few inches before being made up into rope. The ropes generally used by the scaffolders are either "shroud lad," having three strands of fibres wound tightly around a core, or "three strands" and only one shroud. Erection. Erection of scaffolding demands nerve and physical strength, as well as skill and discretion. The timbers near the ground are fixed by hand labour alone; the higher poles are raised by the use of hoists. The putlogs, rods, and battens are driven between the pole and the rope. They should be of oak or other hard wood, about 12 in. long and semicircular in cross section, and should taper off from one end to the other. Practically the only tool used by the scaffold is his hatchet, made with a
hammer-head for driving spikes and wedges; the wooden handle he often uses as a lever to tighten knots and cords. Scaffolds should not be too heavily loaded, and the weight of materials should be distributed as much as possible. This applies especially to bricklayers' scaffolds, for heavy concentrated loads, even if not sufficient to cause the scaffold to fail, tend to injure the brickwork.

In Scotland and the north of England much work is done from inside by means of platforms of boards placed upon the floor joists. When the work gets so advanced that it cannot be reached from the floor, treeties and platforms are used. For executing special external features, such as stone carving or plaster moulding, a scaffold will be thrown out on cantilevers projecting through openings in the wall and tied down inside the building. The materials are usually hoisted by derrick cranes.

"Gantry" is the term applied to a staging of squared timber used for the easy transmission of heavy material. The name, however, come to be used generally for strong stagings of squared timber whether used for moving loads or not.

Taking the general meaning of the term, gantries may be divided into three classes: (1) Gantries supporting a traveller; (2) Travelling gantries, in which the whole stage moves along rails placed on the ground; (3) Elevated platforms which serve as a base upon which to erect pole scaffolding.

A gantry to support a traveller (fig. 1) consists of two sets of framing placed at a convenient distance apart, say 8 ft. or more, and standing independently of each other. These frames consist of standards or uprights standing upon a sleeper or sill resting in a continuous line upon the ground. The tops of the standards are levelled to receive the head or runner. Struts are taken from cleats fixed at a convenient point in the sides of the standards, and meet in pairs under the middle of the head; sometimes a straining-piece is introduced between them. Struts are also taken outwards from the uprights and bedded on foot-blocks or bolted to small piles driven into the ground. The space between the two frames must be kept free from struts and ties of any description so as to leave a free passage for the material while being lifted and moved. The different members are connected by iron dogs and bolts; dogs are used wherever possible, as they form a strong connexion and do not spoil the wood for other purposes as bolt-holes do. They should be placed on both sides of the timbers to be connected. The size of the timbers varies according to the height of the structure and the weight intended to be carried. The standards may be from 6 to 12 in. squared in section, and the heads and sills are of similar size; the struts and braces are usually somewhat smaller.

The traveller consists usually of two wood girders trussed with iron rods and mounted on flanged wheels so as to run along the rails fixed to the head-piece. Along each girder also, a rail is provided upon which moves the hoisting gear; this is worked either by hand or steam power. The ends of the rails are turned up to form a stop for the traveller or crab.

A travelling gantry (fig. 2) runs along rails placed on the ground, and consists of two strong trusses braced and bolted together and supporting the two trussed girders which take the crab-winch. The latter is mounted on wheels, and by simple gearing is caused to run along the rails fixed on the upper side of the girders. This is a most useful form of gantry, and requires a very small amount of timber for its construction. The travelling frame is, however, very heavy, and such an apparatus is usually fitted with a steam winch, the power from which, besides lifting the materials, can also be applied to move the traveller. Gantry built on this principle have been used successfully in building or repairing lofty and wide-spanned steel or other roofs. After the collapse of the steel "bow-string" roof of Charing Cross station (London) in December 1905, huge travelling gantries running along rails laid upon the station platforms were employed, and these provided an efficient and economical means of access to the damaged portions; as section by section the work was removed the gantries were shifted along to the next bay. These gantries were 60 ft. in height. One, used to strip and remove the coverings of the roof, was 32 ft. deep, weighed 200 tons and moved upon 24 steel flanged wheels; the other, 40 ft. deep and with 32 wheels, weighed 250 tons and was used to take down the structural steel work of the roof. Four cranes were erected upon the staging to lower the material as it was removed. The amount of timber used in these gantries was 24,000 cubic ft.

In the erection of the Williamsburg Bridge over the East river, New York, for which 19,000 tons of steel were used, " framed timber falsework " was built up of squared timber to a height of 100 ft. and 90 ft. wide at the top. The span was 555 ft. The timbering was in three storeys or stages, and each " bent " had 8 vertical and 4 battening posts. The bents were 20 ft. apart and were connected...
at the top by 10 lines of 12-in. by 14-in. stringers, and the lower
strings were 8 by 10 in. and 6 by 12 in. The vertical standards or posts rested on sills, and under each
one also at its base was a timber foundation 4 ft. square. Two
travelling gantry towers, 22 ft. by 25 ft. and 40 ft. high, mounted on
double-flanged wheels, ran on rails which were laid on the top of the framework and
were connected by pulleys for raising the materials
necessary for the bridge. Beside the cranes they carried cars with
the timber and baulks, water tanks, and air compressor and
apparatus for the pneumatic riveting hammers.

"Elevated platforms" are generally used in conducting building
operations in towns where the importance of the traffic renders it
necessary to keep the footway clear. They consist of two sets of
standards, sill and head, one set being erected close to the building
and the other about 8 or 10 ft. away. These stages are formed of
square timber, framed and braced in a similar manner to gantries
designed to support a traveller, but, instead of external shores or
braces the uprights are braced across to each other, care being taken
to fix the braces at such a height as to allow free passage beneath
them. Joints are placed across from.

Derrick "gantries" or "towers" (fig. 3) are skeleton towers of
timber erected in a central position on a site to support
a platform at such a height as to enable an electric
Derrick

or steam power derrick crane placed upon it to clear
the highest portions of the building. The crane
revolves upon a base through nearly three parts of the circum-
ference of a circle, and in addition to this the jib of the crane is
able of an "up and down" motion which enables it to
command any spot within a radius of three-quarters of the length
of the crane. For a single crane, a derrick tower with three legs
built, and the crane is placed over one of these, stayed back to
the other two and then counterbalanced by heavy weights.
Each leg is usually from 6 ft. to 10 ft. square on plan, the "king"
leg (that is, the leg supporting the crane) being larger than the
"queen" legs. The three legs are placed from 20 to 30 ft. apart
in the form of an equilateral or isosceles triangle. When two
were used, as is the case when important operations are to
be conducted over the entire area of a circle, a four-legged square
derrick tower is constructed, and a crane is set upon a platform
over the centres of one and the other ground plan on which
the jib is proposed to erect the towers must be well chosen for its solidity
and often requires to be well rammed. The foundation usually
consists of a platform of 9-in. by 3-in. deals under each leg. The
corner posts may be of three 9-in. by 3-in. deals bolted together,
but those for the king leg may advantageously be larger.
They are connected at every 8 or 10 ft. of their height by means
of cross pieces or transoms from 9 by 3 in. to 9 by 6 in. in size,
and each bay thus formed is filled in on all four sides with diagonal
bracing of the same or slightly smaller timber. Up the centre
of the king leg, from the bottom to the top, is carried an extra
standard of timber to take the weight of the crane. The crane
is raised by a balk of whole timber, 12 or 14 in. square, or may consist of
deals bolted together up to 16 in. square. This central standard must
be well braced and struttered from the four corners to prevent any
tendency to bending.

When the towers have reached the desired height the king leg is
connected to each of the queen legs by a "trussing girders," the two
queen legs may be connected with each other either by a similar
trussing girders or by a single balk of timber which can be supported
by struts if the span is considerable. For the connecting girders a
balk of timber reaching from king to queen legs is placed over each of
the two topmost transoms, which may be from 4 to 8 ft. apart, the
depth of the top bays often being modified to the required depth of
the connecting beams. Upright struts are fixed at intervals of about 5 ft.
in the two bays, which are also connected by long iron or wood
bolts and cross braces filled into each bay. The top bays project
6 or 10 ft. beyond the king leg and form the support for a working
platform at the heads. Struts are thrown out from the sides of the leg
to support the ends of the balks. Upon the platform are laid two
"sleepers" of balk timber extending from beneath the bed of the
crane and passing over the centre of each queen leg. The "mast,"
a vertical member composed of either of a single timber or two pieces
strutted and braced, is erected upon the revolving crane bed, and the
"jib," which is similar in construction to the mast, is attached to
the base of the latter by a pivoted hinge. The jib is raised and
lowered by a rope fixed near the end of the jib and running to the
engine by way of a pulley wheel at the top of the mast. The rope or
chain used for lifting the materials passes over a pulley at the end
of the jib and thence to the winch over a pulley at the top of the
mast.

In the operation of lifting it is obvious that a great strain is
put upon the mast and a considerable overturning force is
exerted by the leverage of the weight lifted at the end of the jib. To counter-
balance this, two timber "stays" or "guys" are taken from the
mast head, one to the centre of each queen leg, and there secured.
From these points two heavy chains are taken down the centre of

FIG. 3.
the ballast necessary for the crane tower the weight of the engine should be considered. Access to the platform is obtained by ladders fixed either inside or outside one of the queen legs. Together with the exception of the boards forming the working platform, which are usually spiked down, the timbers of a tower gantry should all be connected by screw bolts and nuts.

Swinging scaffolds are useful for executing light repairs to a building. Perhaps the simplest form of swinging scaffold is the "ladder boat," so called from its being chiefly used for the painting or examination of the sides of ships, but it is dangerous to work from and a light wind will cause it to swing to and fro, and owing to the extremely awkward position occupied by the workman there is difficulty in doing good work from it. A better, safer and more comfortable arrangement, the "painter's boat" (fig. 4), is suspended by blocks and falls from two cantilever "jibs" fixed in the upper part of the building. The positions of the jibs are altered as required. The ends of the suspension ropes are fastened securely to the cradle, and by altering their length the workmen can adjust it to the proper height for working. These boats are usually constructed with a framework of iron and fitted with edge boards and guard rails all round. Like the "boatswain's boat" they swing considerably in the wind.

An improved form of cradle has been patented which is swung on block runners working along a tight wire cable stretched between two jibs. Block tackle is used to raise or lower the cradle, and horizontal movement also is obtained by light guy lines working over pulleys at the jibs and secured to the tops of the suspension ropes. All adjustments can be made from the cradle with perfect safety. The guy lines steady the boat to some extent and prevent it from swinging in the wind.

Tall chimney shafts may be erected by internal scaffolding only, or by a combination of external and internal staging. The latter method is often adopted when the lower part of the shaft is designed with ornamental brickwork, string courses, panels, &c., and it is important that this work should be carefully finished. An external scaffold is therefore carried up until plain work not more than 2 or 3 bricks thick is reached, when the remainder can be completed by "overhand work" from an internal scaffold. The offsets made in the brickwork on the inside are used to support the timbering. For the repair of tall chimneys, light ladders are erected one above the other by a steeplejack and his assistants, each being lashed to the one below it and secured to the brickwork by dog-hooks driven in the joints. When the top of the chimney is reached balk timbers are raised by pulleys and laid across the top. From these are swung cradles from which the defective work is made good. If the work be weather-demand a more stable scaffold, a light but strong framework of putlogs held together with iron bolts is fixed on each side of the shaft with iron holldasts, and a platform of boards is laid upon them. For circular chimneys pieces of timber cut to a curve to fit the brickwork are clamped with iron to the putlogs to prevent them from bending when the bolts connecting the two frames are screwed up.

In England, the Factory and Workshop Act of 1901 empowers the secretary of state to make regulations respecting any dangerous "machinery, plant, process, or description of manual labour." No regulations affecting the building trade have been made, however, but a memorandum was issued in 1902 by the Home Office with the following suggestions for the prevention of scaffold accidents:

1. All working platforms above the height of 10 ft., taken from the adjacent ground level, should, before employment takes place thereon, be provided throughout their entire length, on the outside and at the ends.

2. A guard rail fixed at a height of 3 ft. 6 in. above the scaffold boards. Openings may be left for workmen to land from the ladders and for the landing of materials;

3. With boards fixed so that their bottom edges are resting on which the scaffold boards. The boards should rise above the working platform not less than 7 ins. Openings may be left for the landing of the workmen from the ladders.

4. All "horns" or similar means of communication between different portions of a scaffold or building should be not less than 18 in. wide. If composed of two or more boards they should be fastened together in such a manner as to prevent unequal sagging. The ends of boards forming the back of a girder should be be supported at each end by a putlog, and should not project more than 6 in. beyond it unless lapped by another board, which should rest upon the same putlog and rarily upon putlogs other than those upon which the supported board rests.

5. In places where the scaffold has been sublet to a contractor, the employer shall satisfy himself, before allowing work to proceed thereon, that the foregoing suggestions have been complied with, and that the material used in the construction of the scaffold is sound.

J. F. Hurst, Tredgold's Carpenter; A. G. H. Thatcher, Scaffolding.

SCALA NUOVA (Turk. Kush-Adaasi), also known as New Ephesus, a well-protected harbour on the west coast of Asia Minor in the vilayet of Aidin, opposite Samos. The site of the ancient Marathesium is close by on the S. It is connected with the railway station of Ayassoluk by a diligence service. Before the opening of the Smyrna-Aidin railway its roadstead was frequented by vessels trading with the Anatolian coast, and it has often been proposed to connect it with the railway system by a branch line, and thus enable it to compete with Smyrna. In the absence of this the town is rapidly on the decline. The population is not over 7000. The trade is of merely local interest.

(D. G. H.)

SCALD, an ancient Scandinavian bard who recited or sang at feasts compositions in honour of chiefs and famous men and their deeds. This word represents the Icel. skald, Dan. skald, Swed. skjold, the regular term for a poet. Authorities differ as to its derivation. It seems certain that the word was originally derogatory in sense; some connect it with skilda, a pole, on which libels were cut. Others, e.g. Skeat, refer it to Swed. skalla, Icel. skylla, to make a loud noise or clatter, and take the original sense to have been a "loud talker." This would link the word with "scold," to rail at, find fault with, which is formed from Dutch schold, past tense of schelten, cf. Ger. schelten, in the same sense.

Of different origin is the verb "scald," to burn or injure the skin or flesh by hot liquid or steam (see Burns and Scales); also to cleanse an object, or to remove hair, bristles, feathers &c., from an animal, by exposure to moist heat, such as boiling water, steam, &c. This word is derived from the O. Fr. escaldar, eschaunder, mod. echouard, Lat. escalare, to wash with hot water (calidus, calidus, hot).

SCALE (1) A small thin flake, plate or shell. The word in O. Eng. is seale, so bean-seale, the husk or pod of a bean; cognate forms are found in Ger. Schale, O.H.G. Schale, from which is Fr. escale, modern scale, is borrowed. The ultimate root is seen in the closely allied "shell," and also in skull, scalp, shalke and skill, and means to peel off, separate, divide. The word is used specifically (1) in botany, of the rudimentary flake-like leaf forming the covering of the leaf-buds of deciduous trees and of the bracts of the cone in conifers; (2) in zoology, of the flat, hard structures of the epidermis or exoskeleton in fishes, reptiles. Thus in ichthyology the various types of scales are classed as cycloid (Gr. κυκλος, circle), where the growth is in layers, equally from the anterior and posterior edges; ctenoid (Gr. κτενος, comb), where the posterior edge is notched; ganoid (Gr. γανος, shining), with a hard enamelled surface and usually rhomboidal in shape, and placoid (Gr. πλακος, tablet), as in the ossified papillae of the cutis of the shark. In reptiles the term is applied to the structures which form the covering of the true reptiles, snakes and lizards. In entomology the downy covering
of the wings of lepidoptera consists of minute scales, really modifications of hairs, covered with fine lines, giving the bright colours. Another form in O, Eng. scale is found glossing the Lat. lanx, flat bowl or dish, and is thus used of the dishes or cups of a balance (bilans), the instrument itself being also called "scales."

2. Properly a ladder, flight of steps, now only used in the derived "escal" (scaling"") ladder." The word is derived from the Lat. scala (originally scaldare, from scando to climb). There are many transferred senses of the word, e.g. the distinguishing marks for purposes of measurement on a rule or other measuring instrument; hence a graduated measure or a system of proportional measurement or numeration, and particularly, in music, a series of tones at definite standard intervals (see Harmony, Musical Notation).

SCALE INSECT, a name given to insects belonging to the family Coccidae of the homopterous division of the Hemiptera and deriving their name from the formation by the females of a wax secretion which often hardens into a protective scale beneath which the insects live. The males, substance is also secreted by some members of the family. The females are always wingless, but are provided with antennae, legs and well-developed mouth-parts. In some cases these organs are retained, in some they are lost in the encysted condition. The males, on the contrary, although sometimes wingless, are, as a rule, provided with a pair of forewings and greatly reduced hindwings; their antennae and legs are longer than in the other sex, but the mouth-parts are reduced and functionless (see Economic Entomology).

SCALIGER, the Latinized name of the great Della Scala family (see Verona). It has also been borne by two scholars of extraordinary eminence.

1. Julius Caesar Scaliger (1484-1558), so distinguished by his learning and talents that, according to A. de Thou, no one of the ancients could be placed above him and the age in which he lived could not show his equal, was, according to his own account, a scion of the house of La Scala, for a hundred and fifty years princes of Verona, and was born in 1484 at the castle of La Rocca on the Lago de Garda. At the age of twelve this kinsman the emperor Maximilian placed him among his pages. He remained for seventeen years in the service of the emperor, distinguishing himself as a soldier and as a captain. But he was unmindful neither of letters, in which he had the most eminent scholars of the day as his instructors, nor of art, which he studied with considerable success under Albrecht Dürer. In 1512 at the battle of Ravenna, where his father and elder brother were killed, he displayed prodigies of valour, and received the highest honours of chivalry from his imperial cousin, who conferred upon him with his own hands the spurs, the collar and the eagle of gold. But this was the only reward he obtained. He left the service of Maximilian, and after a brief employment by another kinsman, the duke of Ferrara, he decided to quit the military life, and in 1514 entered as a student at the university of Bologna. He determined to take holy orders, in the expectation that he would become cardinal, and then pope, when he would wrest from the Venetians his principality of Verona, of which the republic had despoiled his ancestors. But, though he soon gave up this design, he remained at the university until 1519. The next six years he passed at the castle of Vico Nuovo, in Piedmont, as a guest of the family of La Rovère, at first dividing his time between military expeditions in the summer, and study, chiefly of medicine and natural history. In the winter, until an attack of rheumatic gout brought his military career to a close, Henceforth his life was wholly devoted to study. In 1525 he accompanied M. A. de la Rovère, bishop of Agen, to that city as his physician. Such is the outline of his own account of his early life. It was not until some time after his death that the enemies of his son first alleged that he was not of the family of La Scala, but was the son of Benedetto Bordone, an illuminator or school-master of Verona; that he was educated at Padua, where he took the degree of M.D.; and that his story of his life and adventures before arriving at Agen was a tissue of fables. It certainly is supported by no other evidence than his own statements, some of which are inconsistent with well-ascertained facts (see below ad fin.).

The remaining thirty-two years of his life were passed almost wholly at Agen, in the full light of contemporary history. They were without adventure, almost without incident, but it was in them that he achieved so much distinction that at his death in 1558 he had the highest scientific and literary reputation of any man in France. A few days after his arrival at Agen he fell in love with a charming orphan of thirteen, Andiette de Roques Lobejac. Her friends objected to her marriage with an unknown adventurer, but in 1528 he had obtained so much success as a physician that the objections of her family were overcome, and at forty-five he married Andiette, who was then sixteen. The marriage proved a complete success; it was followed by twenty-nine years of almost uninterrupted happiness, and by the birth of fifteen children.

A charge of heresy in 1538, of which he was acquitted by his friendly judges, one of whom was his friend Arnaud Le Ferron, a master of science, was caused in part to write a second oration, more violent, more abusive, with more self-glorification, but with less real regard than the first. The orations were followed by a prodigious quantity of Latin verse, which appeared in successive volumes in 1533, 1534, 1539, 1546 and 1547; of these, a friendly critic, Mark Pattison, is obliged to approve the judgment of Huet, who says, "par ses poésies brutes et informes Scaliger a dés-honoré le Parnasse"; yet their numerous editions show that they commended themselves not only to his contemporaries, but to succeeding scholars. A brief tract on comic metres (De comici dimensionibus) and a work De causis linguæ Latinae—the earliest Latin grammar on scientific principles and following these, scientific—were his only other purely literary works published in his lifetime. His Poëtica appeared in 1561 after his death. With many paradoxes, with many criticisms which are below contempt, and many indelent displays of personal animosity especially in his reference to Étiéenne Dolet, over whose death he gloated with brutal malignity—it yet contains acute criticism, and showed for the first time what such a treatise ought to be, and how it ought to be written.

But it is as a philosopher and a man of science that J. C. Scaliger ought to be judged. Classical studies he regarded as an agreeable relaxation from severer pursuits. Whatever the truth or fable of the first forty years of his life, he had certainly been a close and accurate observer, and had made himself acquainted with many curious and little-known phenomena, which he had stored up in a most tenacious memory. His scientific writings are all in the form of commentaries, and it was not until his seventieth year that (with the exception of a brief tract on the De insomniis of Hippocrates) he felt that any of them were sufficiently complete to be given to the world. In 1536 he printed his Dialogue on the De plantis attributed to Aristotle, and in 1546 his Exercitationes on the work of Jerome Cardan, De subtilitate. His other scientific works, Commentaries on Theophrastus' De causis plantarum and Aristotle's History of Animals, he left in a more or less unfinished state, and they were not printed until after his death. They are all marked by arrogant dogmatism, violence of language, a constant tendency to self-glorification, strangely combined with extensive real knowledge, with acute reasoning, with an observation of facts and details almost unparalleled. But he is only the naturalist of his own time. That he anticipated in any manner the inductive philosophy cannot be contended; his botanical studies did not lead him, like his contemporary Konrad von Geson, to any idea of
natural system of classification, and he rejected with the utmost arrogance and violence of language the discoveries of Copernicus. In metaphysics and in natural history Aristotle was a law to him, and in medicine Galen, but he was not a slave to the text or the details of either. He has thoroughly mastered their principles, and is able to see when his masters are not true to themselves. He corrects Aristotle by himself. He is in that stage of learning when the attempt is made to harmonize the written word with the actual facts of nature, and the result is that his works have no real scientific value. Their interest is only historical. His Exercitationes upon the De subtilitate duorum naturalium (1555) is the book by which Scaliger is best known as a philosopher. Its numerous editions bear witness to its popularity, and until the final fall of Aristotle's physics it continued a popular textbook. We are astonished at the encyclopaedic wealth of knowledge which the Exercitationes display, at the vigour of the author's style, at the accuracy of his observations, but are obliged to agree with G. Naudé that he has committed more faults than he has discovered in Cardan, and with Charles Nisard that his object seems to be to deny all that Cardan affirms and to affirm all that Cardan denies. Yet Leibniz and Sir William Hamilton consider him as the best modern exponent of the physics and metaphysics of Aristotle. He died at Agen on the 21st of October 1558.

2. JOSEPH JUSTUS SCALIGER (1540-1609), the greatest scholar of modern times, was the tenth child and third son of Julius Caesar Scaliger and Andiètte de Roques Lobetak. Born at Agen in 1540, he was sent when twelve years of age, with two younger brothers, to the college of Guienne at Bordeaux, then under the direction of Jean Gelida. An outbreak of the plague in 1555 caused the boys to return home, and for the next few years Joseph was his father's constant companion and amanuensis. The composition of Latin verse was the chief amusement of Julius in his later years, and he daily dictated to his son from eighty to a hundred lines, and sometimes more. Joseph was also required each day to write a Latin theme or declamation, though in other respects he seems to have been left to his own devices. But the companionship of his father was worth more to Joseph than any mere instruction. He learned from him to be not a mere scholar, but something more—an acute observer, never losing sight of the actual world, and aiming not so much at correcting texts as at laying the foundation of a science of historical criticism.

After his father's death, he spent four years at the university of Paris, where he began the study of Greek under Turnebus. But after two months he found he was not in a position to profit by the lectures of the greatest Greek scholar of the time. He determined to teach himself. He read Homer in twenty-one days, and then went through all the other Greek poets, orators and historians, forming a grammar for himself as he went along. From Greek, at the suggestion of G. Postel, he proceeded to attack Hebrew, and then Arabic; of both he acquired a respectable knowledge, though not the critical mastery which he possessed in Latin and Greek. The name of Jean Dorat then stood as high as that of Turnebus as a Greek scholar, and far higher as a professor. As a teacher he was able not only to impart knowledge, but to kindle enthusiasm. It was to Dorat that Scaliger owed the home which he found for the next thirty years of his life. In 1563 the professor recommended him to Louis de Chastaigner, the young lord of La Roche Pozay, as a companion in his travels. A close friendship sprang up between the two young men, which remained unbroken till the death of Louis in 1593. The travellers first went to Rome. Here they found Marc Antoine Muretus, who, when at Bordeaux and Toulouse, had been a great favourite and occasional visitor of Julius Caesar at Agen. Muretus soon recognized Scaliger's merits, and introduced him to all the men that were worth knowing. After visiting a large part of Italy, the travellers passed to England and Scotland, taking as it would seem La Roche Pozay on their way, for Scaliger's preface to his first book, the Conjectae in Varronem, is dated there in December 1564. Scaliger formed an unfavourable opinion of the English. Their inhuman disposition, and inhospitable treatment of foreigners, especially impressed him. He was also disappointed in finding few Greek manuscripts and few learned men. It was not until a much later period that he became intimate with Richard Thompson and other Englishmen. In the course of his travels he had become a Protestant. On his return to France he spent three years with the Chastaigners, accompanying them to their different châteaux in Poitou, as the calls of the civil war required. In 1570 he accepted the invitation of Cujas, and proceeded to Valence to study jurisprudence under the greatest living jurist. Here he remained three years, preparing scholars possessed—learnt by the library of Cujas, which filled no fewer than seven or eight rooms and included five hundred manuscripts.

The massacre of St Bartholomew—occurring as he was about to accompany the bishop of Valence on an embassy to Poland—induced him with other Huguenots to retire to Geneva, where he was received with open arms, and was appointed a professor in the academy. He lectured on the Organum of Aristotle and the De finibus of Cicero with much satisfaction to the students but with little to himself. He hated lecturing, and was bored with the importunities of the fanatical preachers; and in 1574 returned to France, and made his home for the rest of his years with Chastaigner. Of his life during this period we have interesting details and notices in the Lettres françaises intiédées de Joseph Scaliger, edited by M Tamizy de Larroque (Agen, 1881). Constantly moving through Poitou and the Limousin, as the exigencies of the civil war required, occasionally taking his turn as a guard, at least on one occasion trailing a pike on an expedition against the Leaguers, with no access to libraries, and frequently separated even from his own books, his life during this period seems most unsuited to study. He had, however, what so few contemporaries possessed—leisure and freedom from pecuniary cares. It was during this period of his life that he composed and published the books which showed that with him a new school of historical criticism had arisen.

His editions of the Catalaucta (1575), of Festus (1575), of Catullus, Tibullus and Propertius (1577), are the work of a man who not only writes books of instruction for learners, but is determined himself to discover the real meaning and force of his author. He was the first to lay down and apply sound rules of criticism and emendation, and to change textual criticism from a series of haphazard guesses into a "rational procedure subject to fixed laws" (Patton). But these works, while proving Scaliger's right to the foremost place among his contemporaries as Latin scholar and critic, did not go beyond mere scholarship. It was reserved for his edition of Manilius (1579), and his De emendatione temporum (1583), to revolutionize all the received ideas of ancient chronology—to show that ancient history is not confined to that of the Greeks and Romans, but also comprises that of the Persians, the Babylonians and the Egyptians, hitherto neglected as absolutely worthless, and that of the Jews, hitherto treated as a thing apart, and that the historical narratives and fragments of each of these, and their several systems of chronology, must be critically compared, if any true and general conclusions are to be reached. It is this which places Scaliger on so immeasurably higher an eminence than any of his contemporaries. Yet, while the scholars of his time admitted his pre-eminenue, neither they nor those who immediately followed seem to have appreciated his real merit, but to have considered his emendatory criticism, and his skill in Greek, as constituting his claim to special greatness. His commentary on Manilius is really a treatise on the astronomy of the ancients, and it forms an introduction to the De emendatione temporum, in which he examines by the light of modern and Copernican science the ancient system as applied to epochs, calendars and computations of time, showing upon what principles they were based.

In the remaining twenty-four years of his life he at once corrected and enlarged the basis which he had laid in the De emendatione. With incredible patience, sometimes with a happy audacity of conjecture which itself is almost genius, he succeeded in reconstructing the lost Chronicle of Eusebius—one of the most precious remains of antiquity, and of the highest value for ancient chronology. This he printed in 1606 in his
Thesaurus temporum, in which he collected, restored and arranged several chronological relia extant in Greek or Latin. When in 1590 Lipsius retired from Leiden, the university and its protectors, the states-general of Holland and the prince of Orange, resolved to obtain Scaliger as his successor. He declined their offer. He hated courtiers, and their wiles, sometimes his friends who erroneously believed that with the success of Henry IV. learning would flourish, and Protestantism be no bar to advancement. The invitation was renewed in the most flattering manner a year later. Scaliger would not be required to lecture. The university only wished for his presence. He would be in all respects the master of his time. This offer Scaliger provisionally accepted. About the middle of 1593 he started for Holland, where he passed the remaining thirteen years of his life, never returning to France. His reception at Leiden was that of esteem. A handsome income was assured to him. He was treated with the highest consideration. His rank as a prince of Verona was recognized. Placed midway between The Hague and Amsterdam, he was able to obtain, besides the learned circle of Leiden, the advantages of the best society of both these capitals. For Scaliger no hermit buried among his books; he was fond of social intercourse and was himself a good talker.

For the first seven years of his residence at Leiden his reputation was at its highest point. His literary dictatorship was unquestioned. From his throne at Leiden he ruled the learned world; a word from him could make or mar a rising reputation; and he was surrounded by young men eager to listen to and profit by his conversation. He encouraged Grotius when only a youth of sixteen to edit Capella; the early death of the younger Douza he wept as that of a beloved son; Daniel Heinsius, from being his favourite pupil, became his most intimate friend. But Scaliger had made numerous enemies. He hated ignorance, but he hated still more half-learning, and most of all dishonesty in argument or in quotation. Himself the soul of honour and truthfulness, he had no tolerance for the disingenuous arguments and the mingled facts of those who wrote to support a theory or to defend an unsound cause. His punging satire were soon carried to the persons of whom they were uttered, and his pen was not less bitter than his tongue. He resembles his father in his arrogant tone towards those whom he despises and those whom he hates, and he despises and hates all who differ from him. He is conscious of his power, and not always sufficiently cautious or sufficiently gentle in its exercise. Nor was he always right. He trusted much to his memory, which was occasionally treacherous. His emendations, if frequently happy, were sometimes absurd. In laying the foundations of a science of ancient chronology he fell sometimes into the most ridiculous absurdities; even upon absurd hypotheses, frequently upon an imperfect induction of facts. Sometimes he misunderstood the astronomical science of the ancients, sometimes that of Copernicus and Tycho Brahe. And he was no mathematician. But his enemies were not merely those whose errors he had exposed and whose hostility he had excited by the violence of his language. The results of his system of historical criticism had been adverse to the Catholic controversialists and to the authenticity of many of the documents upon which they had been accustomed to rely. The Jesuits, who aspired to be the source of all scholarship and criticism, perceived that the writings and authority of Scaliger were the most formidable barrier to their claims. It was the day of conversions. Muretus in the latter part of his life professed the strictest orthodoxy; J. Lipsius had been reconciled to the Church of Rome; Casaubon was supposed to be wavering; but Scaliger was known to be hopeless, and as long as his supremacy was unquestioned the Protestants had the victory in learning and scholarship. A determined attempt must be made, if not to answer his criticisms, or to disprove his statements, yet to attack him as a man, and to destroy his reputation. This was no easy task, for his moral character was absolutely spotless.

After several scurrilous attacks by the Jesuit party, in which coarseness and violence were more conspicuous than ability, in 1607 a new and more successful attempt was made. Scaliger's weak point was his pride. In 1594, in an evil hour for his happiness and his reputation, he published his Epistola de vetustate et splendore gentis Scaligerae et J. C. Scaligeri vita. In 1607 Gaspari Scippios, then in the service of the Jesuits, whom he afterwards so bitterly libelled, published his Scaliger Hypotheseis ("The Supposititious Scaliger"), a quarto volume of more than four hundred pages, written with consummate ability, in an admirable and incisive style, with the entire disregard for truth which Scippios always displayed, and with all the power of his accomplished sarcasm. Every piece of scandal which could be raked together respecting Scaliger or his family is to be found there. The author professes to point out five hundred lies in the Epistola de vetustate et splendore Scaligeri, but the main argument of the book is to show the falsity of his pretensions to be of the family of La Scala, and of the narrative of his father's early life. "No stronger proof," says Mark Pattison, "can be given of the impressions produced by this powerful philippic, dedicated to the defamation of an individual, than that it has been the source from which the biography of Scaliger, as it now stands in our biographical collections, has mainly flowed."

To Scaliger the blow was crushing. Whatever the case as to Julius, Joseph had undoubtedly believed himself a prince of Verona, and in his Epistola he put forth with the most perfect good faith, and without inquiry, all that he had heard from his father. He immediately wrote a reply to Scippios, entitled the Confutatio, which, though not entirely successful, was written with unusual moderation and good taste, the only reason had not the success which its author wished and even expected. In the opinion of the highest authority, Mark Pattison, "as a refutation of Scippios it is most complete;" but there are certainly grounds for dissenting, though with diffidence, from this judgment. Scaliger undoubtedly shows that Scippios committed more blunders than he corrected, that his book literally bristles with pure lies and baseless calumnies; but he does not succeed in adding a single proof either of his father's descent from the La Scala family, or of any single event narrated as having happened to himself or any member of this family prior to his arrival at Agen. Nor does he ever attempt a refutation of the crucial point, which Scippios had proved, as far as a negative can be proved—namely, that William, the last prince of Verona, had no son Nicholas, the alleged grandfather of Julius, nor indeed any son who could have been such grandfather. But whether complete or not, the Confutatio had no success; the attack of the Jesuits was successful, far more so than they could possibly have hoped. Scippios was wont to boast that his book had killed Scaliger. It certainly embittered the few remaining months of his life, and it is improbable that the vanity which may have shorted his days. The Confutatio was his last work. Five months after it appeared, "on the 21st of January 1609, at four in the morning, he fell asleep in Heinsius's arms. The aspiring spirit ascended before the Infinite. The most richly stored intellect which had ever spent itself in acquiring knowledge was in the presence of the Omniscient" (Pattison).

Of Joseph Scaliger the only biography in any way adequate is that of Jacob Bernays (Berlin, 1855). It was reviewed by Mark Pattison. The life of Joseph Scaliger is narrated both by himself, in the Essays, i. (1886), 132-195. Pattison had made many manuscript collections for a life of Joseph Scaliger on a much more extensive scale, which he left unfinished. Writing the above article, Professor Christie had access to and made much use of these MSS., which include a life of Julius Caesar Scaliger. The fragments of the life of Joseph Scaliger have been printed in the Essays, i. 196-243. For the life of the father, Joseph Scaliger, the student, the son, those subsequently published. In 1830 the President of Maussac, the Scaligeriana, and his own writings, which are full of autobiographical matter, are the chief authorities. M. de Bonneville's Life of Lafcadio, Président sur l'Ile de Lacroix Ceux de Lescade (Agen, 1860) and M. Magen's Documents sur la famille de Scaliger (Agen, 1873) add important details for the lives of both father and son. The lives by Charles Nisard—that of Julius in Les Gladiateurs de la république des lettres, and that of Joseph in
SCALP—SCALPING

Le Triunvirat littéraire au seizième siècle—are equally unworthy of their author and their subjects. Julius is simply held up to ridicule, while the life of Joseph is almost wholly based on the book of Scipio and the Scipicannes. A complete list of the works of Joseph will be found in his life by Bernays. See also J. E. Sandsy's, History of Classical Scholarship, ii. (1908), 199-204. (R. C. C.; J. E. S.)

SCALP (O. Dutch schelpe, a shell), in anatomy, the whole covering of the top of the head from the skin to the bone. Five layers are recognized in the scalp, and these, from without inward, are: (1) skin, (2) superficial fascia, (3) aponeurosis or epicranium, (4) lymph space, (5) peristeum or pericranium.

The skin of the scalp is thick and remarkable for the large number of hair follicles contained in it. The superficial fascia consists of dense bundles of fibrous tissue which pass from the skin to the third layer or aponeurosis and bind the two structures together so closely that when one of them is moved the other must needs be moved too. The fibrous bundles are separated by pulp of fat, and it is in this second layer that the vessels and nerves of the scalp are found. Here, as elsewhere, the vessels are arteries, veins and lymphatics, and the arteries are specially remarkable, firstly, for their tortuosity, which is an adaptation to so movable a part; secondly, for their anastomosing across the middle line with their fellows of the opposite side, an arrangement which is not usual in the body; and, thirdly, for the fact that, when cut, their ends are held open by the dense fibrous tissue already spoken of, so that bleeding is more free in the scalp than it is from arteries of the same size elsewhere in the body.

The veins do not follow the twists of the arteries but run a straight course; for this reason there is often a considerable distance between an artery and its companion vein. Accompanying the veins are the larger lymphatic vessels, though there are no lymphatic glands actually in the scalp. From the forehead region the lymphatics accompany the facial vein down the side of the face and usually reach their first gland in the submaxillary region, so that in the case of a poisoned wound of the forehead sympathetic swelling or suppuration would take place below the jaw. From the region of the temple the lymphatics drain into a small gland lying just in front of the ear, while those from the region behind the ear drain into some glands lying close to the mastoid process. In the occipital region a small gland (or glands) is found at the edge of the scalp close to the point at which the occipital artery reaches it, that is to say about a third of the distance from the external occipital protuberance to the tip of the mastoid process (see SKULL).

The nerve supply of the scalp in its anterior part is from the fifth cranial or trigeminal nerve (see NERVES, CRANIAL); in the forehead region the supratrochlear and supraorbital branches come out of the first two from the division of the ophthalmic nerve, while from the fifth, while farther back, in the anterior part of the temporal region, the temporal branch of the second or maxillary division of the same nerve is found. Farther back still, in front of the ear, is the area of the auriculo-temporal nerve, a branch of the third or mandibular division of the fifth cranial.

Behind the ear the scalp is supplied with sensation by two branches of the cervical plexus of nerves, the great auricular and the small occipital (see NERVES, SPINAL), while behind these, and reaching as far as the mid line posteriorly, the great occipital, derived from the posterior primary division of the second cervical nerve, is distributed. Sometimes the posterior primary division of the third cervical nerve reaches the scalp still nearer the middle line behind.

The second layer of the scalp or epicranium is formed by the two fleshy bellies of the occipito-frontalis muscle and the flattened tendon or aponeurosis between them. Of these two bellies the anterior (frontalis) is the larger, and, when it acts, throws the skin of the forehead into those transverse puckers which are characteristic of a puffed frame of mind. The much smaller (occipitalis or posterior) belly usually merely fixes the aponeurosis of the frontalis to act, though some people have the power of alternately contracting the two muscles and so wagging their scalps backward and forward as monkeys do. Both fleshy bellies of the occipito-frontalis are innervated by the seventh or facial nerve which supplies all the muscles of expression.

Deep to the occipito-frontalis and its aponeurosis or epicranium is the fourth layer, which consists of very lax areolar tissue constituting what is now known in anatomy as a lymph space. The length and laxity of this tissue allow great freedom of movement to the more superficial layers, and it is this layer which is torn through when a Red Indian scalps his foe. So lax is the integument and connective tissue that at times even bits of brain are torn off with the scalp. The areolar tissue is distributed throughout its whole area, and, owing to the absence of tension as well as of nerves, very little pain accompanies any such effusion.

The fifth and deepest layer of the scalp is the pericranium or the external peristeum of the skull bones. This, until the sutures of the skull close in middle life, is continuous with the dura mater which forms the internal peristeum, and for this reason any subperiostal effusion is localized to the area of the skull bone over which it happens to lie. Moreover, any suppurative process may extend through the sutures to the meninges of the brain.

Surgery of the Scalp.—In connexion with the treatment of surgical and other wounds of the scalp, it used to be thought that it was dangerous to treat them by suturing, because of the risk of the spread of septic organisms. Although it is recognized that wounds, however, that these two conditions are dependent upon the presence of septic micro-organisms, the surgeon deals with the scalp as with other parts of the body, cleansing the surface before performing an operation, and using antiseptic practices. The open incision is therefore made in position and secured by stitches.

As the result of septic infection by an accidental wound, abscess is likely to form beneath the scalp, and if it is left to increase in size may become large and may demand operation. Sometimes the abscess lies on the parietal region, and, therefore, as it is thought that matter is forming beneath the scalp, an incision should be made down to the bone, and provision taken for insuring free drainage.

Nerves of the scalp are best treated by electrolysis or by removal by dissection. If they are supplied by large blood-vessels, each artery should be under-pinned or tied before the removal by dissection is undertaken.

Sebaceous cysts of the scalp should be removed by incision under the ether-spray whilst they are still small, the whole of the cyst-wall being torn out, for unless the cyst is entirely removed, the recurrence is likely to be found. If the sebaceous cyst should cause a thinning of the overlying skin and, effecting its own discharge, may become the source of chronic suppuration. In some cases the chronic abscess of a sebaceous cyst becomes the starting-point of a malignant disease.

SCALPING, the custom of removing the skin of the skull, with hair attached. Though generally associated with the North American Indians, the practice has been common in Europe, Asia and Africa. The underlying idea, as of similar mutilations of those slain in battle, is the warrior's wish to preserve a portable proof or trophy of his prowess. Scalping was the usual form of mutilation from the earliest times. Herodotus (iv. 64) describes the practice among the Scythians. The Abbé Emmanuel H. D. Domenenw (Seven Years' Residence in the Great Desert of North America, ch. 39) quotes the descubre of the ancient Germans, the capillos et cutum detrahare of the code of the Visigoths, and the swords of Flandroald, to prove that the Anglo-Saxons and the Franks still scalped about A.D. 870. In Africa it was, and doubtless is, as prevalent as are all barbarous mutilations.

Among the North American Indians scalping was always in the nature of a rite. It was common to those tribes east of the Rocky Mountains, in the south-west and upper Columbia; but unknown apparently among the Eskimo, along the north-west coast, and on the Pacific coast west of the Cascade range and the Sierras, except among some few Californian tribes, or here and there in Mexico and southward. Properly the scalp could only be taken after a fair fight; in more recent times, there seems to have been no such restriction. To facilitate the operation the braves wore long ear-locks or scalping-tufts, as an
implied challenge. These locks were braided with bright ribbons or ornamented with a feather. After the successful warrior’s return the scalp or scalps captured were dried, mounted, and consecrated by a solemn dance. Some tribes hung the scalps to their bridle, others to their shirt, while some ornamented with it the image of their legging. This practice was sometimes adopted by the whites in their wars with the Redskins, and bounties have been offered for scalps several times in American history.

SCAMILLI IMPARES (‘unequal steps,’ Fr. escabeaux ingâles; Ger. Schuststege), in architecture, a term quoted by Vitruvius when referring to the rise given to the stylobate in the front and sides of a Greek temple. His explanation is not clear; he states (III. 4) that, if set out level, the stylobate would have an appearance of being sunk in the centre, so that it is necessary that there should be an addition by means of small steps (scamilli impares). In book v. chap. 9, he again refers to the addition on the stylobate. The interpretation of his meaning by Penrose and other authorities is generally assumed to be the addition which it was necessary to leave on the lower frust of the Doric column, or on the lower portion of the base of the Ionic column, so as to give them a proper bearing on the curved surface of the stylobate; when levelling ground, however, it is sometimes the custom to fix at intervals small bricks or tiles which are piled up, long before the problem of beading the columns on the curve had arisen.

SCAMMONY, a plant, Convolvulus scammonia (Gr. σκαμμωνία), native to the countries of the eastern part of the Mediterranean basin; it grows in bushy waste places, from Syria in the south to the Crimea in the north, its range extending westward to the Greek islands, but not to northern Africa or Italy. It is a twining perennial, bearing flowers like those of Convolvulus arvensis, and having irregularly arrow-shaped leaves and a thick fleshy root. The dried juice, 'virgin scammony,' obtained by incision of the living root, has been used in medicine until the 18th century, but the variable quality of the drug has led to the employment of scammoniae resina, which is obtained from the dried root by digestion with alcohol.

The active principle is the glucoside scammonia or jalapin, C14H14O6. The dose of scammonium is 5 to 10 grains, of scammonia resina 1 to 5 grains. Like certain other resins, scammony is inert until it has passed from the stomach into the duodenum, where it meets the bile, a chemical reaction occurring between it and the taurocholate and glycocholate of sodium, whereby it is converted into a powerful purgative. Its action is essentially that of a hydrogogue, and is exercised upon practically the entire length of the alimentary canal. The drug is not a cholagogue, nor does it markedly affect the muscular coat of the bowel, but it causes a great increase of secretion from the intestinal glands. It acts in about four hours. In large doses it is, of course, a violent gastro-intestinal irritant. In consonance with the statement that scammony acts only after contact with the bile, is the fact that hypodermic or intravenous injection of the drug produces no purgation, or indeed any other result. The drug frequently kills both the round and flat worms, especially the former, and is therefore an anthelmintic. It is not largely used, but is very effective in the treatment of severe constipation, especially in children.

SCAMP, an idle, worthless rascal; in earlier (18th cent.) usage especially applied as a cant term for a highway robber, a foot-pad, later of one who incurs debts and debets without paying them. The word appears to be derived from a shortened form of scamper," to run away, decamp, to move quickly or nimbly; which is generally taken to be a military slang word in allusion to the manner in which the juice exudes from the incised root. Adapted from Dutch schampen, to escape; O.Fr. escamper; Ital. scampare; Lat. ex, out, of, campus, field of battle, hence a vagabond deserter. This word must be distinguished from "scamp," to do work in a hasty, careless manner, which is apparently a variant of "skimp," "skimpy," and is to be referred to the root seen in O. Nor. skammar, short; Eng. "scant."

SCANDAL, disgrace, discredit, shame, caused by the report or knowledge of wrongdoing, hence defamation or gossip, especially malicious or idle; or such action as causes public offence or disrepute. (For the law relating to scandal, more generally termed "defamation" see Libel and Slander.) The Greek word ἀκαθάρτω, stumbling-block, cause of offence or temptation, is used in the Septuagint and the New Testament. Classical Greek had the word ἀκαθάρτηθαι only, properly the spring of a baited trap; the origin probably being the root seen in Latin scamere, to climb, get up. While the Latin scamur was given such direct derivatives as Spanish and Portuguese escandal, Dutch schandaal, Eng. "scandal," &c., it is also the source of the synonymous "slander," Middle Eng. sclandre, O.Fr. esclandre, escondire.

A particular form of defamation was scandalam magnatum, "slander of great men," words, that is, spoken defaming a peer specifically. The modern French expression is scandale des rois, for such defamation under the statutes of 3 Edw. I. c. 34, 2 Rich. II. c. 5, and 12 Rich. II. c. 11 whereby damages could be recovered, whenever it appeared in cases where no action would lie, if the defamation were of an ordinary subject, and that without proof of special damage. These statutes, though long obsolete, were only abolished in 1887 (Statute Law Revision Act).

SCANDERBEG, or ISKENDER BEY (1403-1457), also known also as "the Dragon of Albania," the national hero of the Albanians, was the son of John (Giovanni) Castriota, lord of Kroia and of the Mirdite country in northern Albania, and of a Servian princess named Valsava. His actual name was George (Giorgio) Castriota, and he came of the line of Iskender Bey (Prince Alexander) was given to him by the Turkish sultan as a decoration. His life was one of the Great. In 1423, when Murad II. invaded Epirus, George Castriota, with his three brothers, was handed over as a hostage to the Turks and sent to be trained in the service of the seraglio. His brilliant qualities of mind and body at once gained him the favour of the sultan; he became a Mussulman, was promoted to high military command and, though barely nineteen years of age, to the government of a sanjak. He remained in the Ottoman service for twenty years, dissembling his resentment when, on the death of his father, his principalcy was annexed and his brothers imprisoned. In 1443, however, his opportunity came with Janos Hunyadi’s victory at Nish. He seized Kroia by stratagem, proclaimed himself a Christian, and gathered the wild Albanian clansmen about him. In the inaccessible fastnesses of Albania he maintained a guerilla warfare against the Turks during nearly twenty-five years, easily routing the armies sent against him, and is said to have slain three thousand Turks with his own hand. In 1461 Murad’s successor Mahomed II. acknowledged him by a temporary truce as lord of Albania and Epirus. He died in 1467 at Alessio, and his tomb was long the object of a superstitious veneration on the part of the Turks.

Scanderbeg’s resistance to the Turks was a valuable asset to the cause of Christianity, but the union which he had maintained in Albania did not survive him. He was succeeded in Kroia by his son, Giovanni Castriota, who in 1474 sold the principality to the Venetians, by whom four years later it was re-sold to the Turks.

See Georgs T. Petzovitch, Scander-beg (Georgs Castriota): Essai de leur vie et de leur rôle (Paris, 1896); Jeffes, Sur le Scander-beg écrits en langues française, anglaise, allemande, latine, italienne, &c. (Paris, 1881); Pisko, Skanderbeg, historische Studie (Vienna, 1893).

SCANDINAVIAN CIVILIZATION. The date of man’s first appearance in Scandinavia is still an open question. But for all practical purposes Scandinavian archaeology only begins with the Neolithic or Later Stone Age, since the country must have been covered with ice during the preceding period, the Palaeolithic or Early Stone Age. When the Scandinavian part of Europe were already inhabited. Thus the expressions Earlier and Later Stone Age in Scandinavian archaeology merely refer to subdivisions.
of the Neolithic Period. Men have left traces of their occupation of Denmark from the time when fires were still the prevailing trees in that country, and a few tools of elk and reindeer horn appear to belong to an even earlier period. Sweden and Norway were probably not inhabited until later, though it seems that a few rock-carvings and other relics of a freshwater lake. The dates assigned to this period vary greatly: S. Müller suggests before 3000 B.C., while O. Montelius places it at 8000 years before our era. Besides the elk- and reindeer-horn tools mentioned above, a few rough flint implements seem to be the earliest traces of man in Scandinavia. In Norway and Sweden these are only found in the extreme south. The fjökkemisödinger or skaldynger, variously called in English kitchen-middens, refuse-heaps, or shell-mounds, are characteristic of Denmark in the next period. In these we find remains of primitively shellfishes, consisting chiefly of oyster, mussel and other shells, and the bones of various fish, birds and animals, including deer, wild boar, seals, wolves and aurochs. It appears that the race which left these relics must have lived by hunting and fishing, and that they were probably semi-nomadic. They were evidently unacquainted with agriculture and had no domestic animals other than the dog. These refuse heaps are almost always found by the sea-shore or close to a lake. Some of them extend over an area of as much as 700 yds. by 20 yds. width, but their depth is usually not more than 3 to 10 ft. There are frequent traces of fire and hearth places, so that we may conclude that the inhabitants of both Austria and Denmark lived by hunting and fishing. The flint implements consist of flakes or knives, awls and axes of various kinds, all made by a process of rough chipping. These are supplemented by articles of bone, horn and clay, including arrow or spear points, axes of horn, and bone combs. Earthenware vessels must have been much used, but only fragments have been found, made, of course, without the use of the wheel. Rare attempts at decoration consist of a few cuts or impressions round the top. The only ornaments found are the pierced teeth of animals and shells. In Norway and Sweden implements similar to those of the Danish shell-mounds have been found, but usually without the organic remains, except at Viste, near Stavanger, excavated in 1907. The first Swedish shell-mound was discovered in the north of Bohuslän in 1905, and is of a later type than the Danish. The remains at Nösvet in the Christiania fjord show traces of a considerable population. Ground slate implements are found scattered along the coasts of Norway and Sweden, and are attributed to a nomadic people, whose artistic culture persisted much longer in these countries than in the much earlier flint civilization of the Kitchen-middens in Denmark. To this race that the mound at Jutland appears to have been thickly inhabited during the Later Stone Age. In Sweden the southernmost part, Skåne and Bohuslän, were probably the first to be inhabited: and then Västergötland and Dal. Skåne has yielded more than three-fourths of all the Later Stone Age objects found in Sweden. Norway is not, as might be supposed from the absence of graves, entirely deficient in the objects of this period, but they are comparatively few in number, though quite on a par in technique with those of Sweden. As already indicated, the greatest concentrations of burial were, however, found in a mound near the Baltic sea coast. The Later Stone Age is the method of disposing of the dead. The dead of the former period, it is assumed, were placed in simple graves in the earth, while characteristic of the latter period are the megalithic graves found in profusion in Denmark and Sweden.

The earliest form, and that most common in Denmark, is the four-sided dolmen, formed by four or six large upright stones on which rests a huge rock, the whole probably partly of filling fires in the grave chambers. The chambers are often full of remains up to within a foot of the roof, and in some cases parts of as many as a hundred skeletons have been found.

In the mounds surrounding the tombs animal bones and shells are frequently found, indicating feasts and sacrifices. It is variously supposed, but as in many of the graves in Sweden, had at some time been considered as places for sacrifice, to judge by the saucerlike hollows constantly found on the upper side of the covering stones. The finds of tools, weapons, ornaments and pottery contribute greatly to our knowledge of the period, but probably the best specimens were not placed in graves, as we find the finest work elsewhere. The pottery is of good material and form, though still made without the aid of the potter's wheel. The indentations of the pattern are frequently filled in with a white chalklike substance. Many of the vessels are rounded at the bottom, and perforated or handles show that they are meant to hang. The vessels were not used much, but it is only by a fortunate chance that wooden vessels and a wooden spoon have been preserved to us in Denmark. It is probable that wool was used as well as skins for clothing, but if so it must be supposed that the spinning and weaving implements were of too perishable a material to have come down to us. Awls are constantly found, but not needles. Bone pins were used for fastening the clothes. The ornaments were chiefly pierced teeth of various wild animals, and objects of amber and bone, many of them in the form of aurochs. Some of the finds are characteristic of the Northern Stone Age, and show how much weight was laid on ornamental appearance, since wooden handles would have been equally effective and far less troublesome to make. The battle-axes are of many forms, perfectly symmetrical and beautifully ground and polished. Those of other stone than flint have holes bored through them for the shaft. Wooden shafts were usually attached at right angles to the flint axes. Of these the latter, once a central axe is the most characteristic. The distribution of flint implements reveals a considerable trading activity, as flint-bearing areas only occur in certain parts of Denmark and in Skåne. Furthermore, it must have been distributed over the whole of Southern Sweden through the channels of commerce. Considerable commercial activity must also have prevailed between the Scandinavians and their southern neighbours.
SCANDINAVIAN CIVILIZATION

PLATE I.

1. STONE AXE. Later Stone Age, Sweden.

2. WOMEN'S ORNAMENTS. Early Bronze Age.

3. BELT ORNAMENT. Latter part of earlier Bronze Age.

4. SUN CHARIOT. Older Bronze Age, Denmark.

5. SWORD. Second period of earlier Bronze Age.

6. TOP OF A SMALL BRONZE CASKET. Latter part of earlier Bronze Age.

7. FIBULA. Earlier and later forms, Bronze Age, Norway.

8. BRONZE KNIVES OR RAZORS. Later Bronze Age, earlier and later forms.

9. PART OF A ROCK CARVING, showing man ploughing.

10. PART OF A ROCK CARVING. Sweden, Later Bronze Age.

11. ROCK CARVINGS. Sweden, Later Bronze Age.

12. BRONZE CLASP. Later Bronze Age, Norway.

Fig. 1 from O. Montelius, Civilisation of Sweden; Figs. 2-6, 10, 11 from S. Müller, Vor Altertum und Ursprünge Europa; Figs. 7, 8, 12 from G. Gustafson, Norges Oldtid.
PLATE II.  SCANDINAVIAN CIVILIZATION

1. BRONZE TRUMPET. Denmark, Later Bronze Age.

2. BRONZE HANGING VESSEL. Later Bronze Age.

3. TORQUE. Denmark, Later Bronze Age.

4. FIBULA. Roman Period.

5. FIBULÆ. Period of National Migrations, Denmark.

6. IRON PINS. Pre-Roman Period, Denmark.

7. GOLD COLLAR. First period of Later Iron Age.

8. BROOCH. Post-Roman Period, Denmark.

9. BROOCH SET WITH GARNETS. Post-Roman Period, Denmark.

11. BRONZE PLATE FOR A BELT, showing Animal Figures. Post-Roman Period.

12. GOLD BRACTEATE, "barbarian" imitation of a Roman Coin. First period of Later Iron Age, Sweden.

Figs. 1, 3-6, 8, 9, 11 from S. Müller, Vor Oldtid; Figs. 2, 7, 12 from O. Montelius, Cir. Sweden; Fig. 10 from G. Gustafson, Norges Oldtid.
Traces of dwelling-houses with hearth-places show that the usual form was a round or slightly oval hut, constructed of wattles, plastered inside and out with clay. The floor was usually partly or entirely paved.

The Bronze Age.—Towards the close of the Later Stone Age a few objects of copper are found in the North. Copper is, however, soon superseded by bronze, which was probably imported ready alloyed into Scandinavia, though the special Scandinavian forms, as well as a large number of moulds, conclusively prove that the casting of the metal was done in the North. It is supposed that the Bronze Age, which can be divided into two main periods, began in Scandinavia about 2000-1750 B.C. The earliest implements are clearly copies of the Stone Age work, betraying the ignorance of the makers as to the adaptability of the new material. Some bronze axes are exactly the shape of stone axes, but gradually we see the blade grow wider, the neck narrower, the outer sides of the haft turn back over the wooden shaft, which is still cleft, and finally before the end of the earlier period we have the "socadoax" which has disappeared and the wooden shaft is fixed in a cylinder of bronze, with a metal loop at the side through which the fastening passed. The unsocketed celt has also undergone modifications. By the end of the earlier period swords have been evolved from daggers, and brooches and clasps, besides beautiful vases and hanging vessels, are made of the metal. Gold is also known and used. Fine linear decoration, usually in spirals or zig-zags, is applied. The forms are extremely artistic, and the technique higher than in almost any other European country. Perhaps the most magnificent relic of this earlier period is the bronze "sun-mark" from Trelleborg in Seeland. The disk supposed to represent the sun is overlaid with gold and beautifully decorated with spiral designs. The later period is clearly marked off from the earlier by the method of disposing of the dead, since in the earlier period the dead were still buried unburned, often in stone cists or oak coffins, while in the later period cremation was practised, and the remains placed in small stone or wooden boxes, or in plain earthenware urns. Some of these urns are clearly imitations of the house of the period, and show that it was still round in form. The graves are covered by a cairn or mound. "Miniature weapons," so often found in the urns, but the objects placed in or beside the urn reveal little care in their selection: it is obvious that a few gifts were deposited with the dead, rather than the complete outfit of necessaries which are found in earlier periods. During this period decoration becomes more complicated: the spirals are often fringed with tangential lines, and the ends of knives, rings, etc., are frequently rolled up into spiral volutes. Bands of wavy lines are a common form of ornament. Amber and a dark-brown resinous matter are often interlaced. Ornaments show a tendency to exaggeration of size, as is seen in the massive neck and arm-rings, the brooches, pins and clasps.

We are fortunate in knowing more about the Scandinavian Bronze Age than the mere remains, plentiful though they are, could tell us. In some parts of Sweden and Norway rude carvings on bare granite rocks, executed in a stiff and conventional style, have been identified as belonging to this period, and from these, in combination with the finds, we can deduce a considerable fund of information. Horses were used for riding, driving and ploughing. From the great wealth of ironwork, we may infer that the women were fashioning the women's clothing but for some unique finds in Denmark, where the oak coffins of the earlier period have preserved hair and clothing for over 3000 years. The clothes were a tunic and a long coat, a man consisted of a thick glossy cap, replaced by a helmet in time of war, a woollen tunic which left the shoulders bare, a cloak and leather shoes fastened on by strips of cloth crossed up the ankle. A buckle on the belt, pins for the cloak, and one brooch were his only ornaments. From the small bronze knife and the tweezers found in men's graves it has been deduced that shaving was usual, and that a combed instrument also found in the graves is regarded as evidence for tatting. The hair was usually long and straight. A curiously clumsily-cut bodice with sleeves to the elbow, and a long skirt gathered round the waist by a belt with a large ornament in front. A heavy necklace, two bracelets and a dagger appear to have been usual. The people were tall and had light hair. With regard to the distribution of Bronze Age finds, it may be said that Gotland, Scania and the South German districts were fertile lands, where agriculture had been started early, while in Norway the mass of finds are in the Christiania and the Stavanger districts. A notable feature of the period is the number of finds made in bogs. Many were clearly buried for safe keeping, but others are usually explained as votive offerings.

Iron Age.—The approximate date for the first beginnings of this period in the North is still a matter of controversy; Montelius placing it at about 500 B.C., while Sophus Müller, of Denmark, would put it at least a century and a half later. It has been divided into four main subdivisions, of which the first, lasting till about the beginning of our era, is usually called the Pre-Roman Period. The beginnings of this age are most clearly traced on the island of Bornholm, where cemeteries are found containing from 10 to 1000 graves. These graves, called Brandplätter, are closely similar to the common variatory graves on the Continent, and consist of burnt bones embedded in charcoal and black mould. In this are found iron brooches (of the safety-pin type), buckles and a few fragments of pottery. More typically Northern cemeteries show small mounds covering each grave, in which an urn contains the burnt bones. These graves also yield but few remains, and the wealth of objects from this period come from bog and field finds, as for instance some magnificent chariots, overlaid with decorated bronze plates, from a bog near Ringkjøbing, Denmark. Ornaments were usually of massive bronze or occasionally of iron, and gold seems to have been comparatively scarce. This period, therefore, is the Iron Age of Europe. All but the very beginning of the period shows the influence of the La-Tène (g.r.) civilization. The succeeding Roman period begins in the 1st century A.D. and extends, according to Swedish and Norwegian archaeologists, to about 400. In Denmark the latter half of the period is termed that of "National Migrations." A number of Roman objects are found—coins, glass and bronze vessels, &c. From the fact that Skåne, Bornholm, Öland and Gotland are the chief finding-places, it appears that most of the objects must have been brought, through war or trade, from the south-east, by way of the trade-route along the Vistula. Gotland alone has yielded nearly four thousand Roman coins, while Bornholm equals the whole of the rest of Denmark with 500, and Norway has only yielded three. A certain number of Roman objects seem, however, to have reached Denmark from the Rhine Provinces. The graves show a variety new to Scandinavia: in some parts cremation continues to be practised, in other localities, notably in Jutland and Seeland, inhumation reappears. Characteristic of both forms of burial is the practice of placing a number of vessels containing food and drink in the grave. Weapons are seldom found, however, but a considerable number of iron helmets, by such finds as that at Thorshöj in Schleswig and Vimose in Fünen, the latter yielding no less than 3500 objects to the National Museum. These are the debris of great battlefields from about the 4th century, and it is usually supposed that the victors dedicated the spoils to some god, as everything was left almost untouched.

From this ample evidence we learn that the spear or lance was the most common weapon, and after that the sword, used now for thrusting, but also for chopping. Shields were made of wood, and leather and iron were used for protection. The shield is sometimes surmounted by a covering of hide, and the latter is often covered with gold. The shield is generally long and of a semicircular or ovoid shape. It is often simply fibbed, frequently with silver, which is now much used. Coats of mail are found. Helmets and shields are extraordinarily thin, almost flimsy, possibly in imitation of the inferior Roman goods of the period, possibly in the case of the shields, at any rate, because they were only intended to protect from arrows or spears flung from a distance, or because dependence was placed on the strength of the divided state of central Europe. The latter is supported by the number of coins and other fragments of harbour prove the use of harbours in the Iron Age.

A similar find at Nydam in Schleswig yielded two of the oldest boats that have come down to us: one of oak, 75 ft. long, built for 28 persons, the other of pine. The timber is often fixed with iron nails, but some early boats from Norway and Sweden show a more primitive method of attaching the timbers with fastenings of basketwork.}

On the deserted battlefields, the more usual type of votive offering is found, such as the silver cauldron from Gudestrup, or the two magnificent gold horns, one more than 2 ft. in length, discovered at Gallehus in Schleswig. Further indications of religious
customs are afforded by a curious find, in Jutland, where between 20 and 30 earthenware vessels each contained a slaughtered lamb. With these were found remains of rude altars.

Of domestic arts, weaving and dyeing seem to have been carried to a high degree of perfection. The art of pottery has also advanced, especially in Jutland, where we find a multiplicity of forms, with decoration in bands of slanting lines. It was during this period that the Scandinavians acquired the runic alphabet from the southern Germanic tribes. The inscriptions do not appear till later. Inscriptions from this period, cut into stone monuments, are found in Norway and Sweden.

The next period (the first of the Later Stone Age), called in Denmark the Post-Roman, and in Sweden and Norway the "Iron Age" and "Viking Age" respectively, is from A.D. 400 to about 700. In Denmark these centuries are very obscure, owing to the fact that the graves there are usually difficult to find, being without mounds and unfinished with goods. Bornholm, where inhumation is greatly on the increase, is again the chief centre for grave-finds. Some few graves contain the personal equipment of the dead: sword, spear, axe, shield, knife, and whetstone, and occasionally the skeletons of horse and dog. The vessels for food and drink are no longer found. At Old Upsala, Vendel and Ulluno, all in Upland, great interest attaches to grave-finds. The most noteworthy among these is a grave of a hunter, the 19th century, that is, is not uncommon. The so-called ship-graves are fairly frequent in Sweden, and even in Finland, but only one grave containing remains of a boat has so far been found in Denmark. The details of the earlier Swedish ship-graves are somewhat obscure for us because the ship and all its contents have been burnt, but we can see that in these the dead man sits at the stern, as if about to set forth on a journey, while in later graves of the Viking Period, both burnt and unburnt, the corpse seems to have been laid on a bed in a chamber built amidships for the purpose. All the larger ship-graves are remarkable for the large number of animal-bones found, including those of horses, oxen, pigs, sheep and fowls.

The gold ornaments of the period are its chief glory: indeed the wealth of gold, especially in Sweden, has suggested the title "Golden Age" for these centuries. The favourite ornaments of the period were the so-called bracteates, worn as pendants, and imitated from Roman coins, but often stamped on one side only and decorated in the Northern style. Magnificent brooches of engraved or filigree work, some with a plate at the hinge end at right angles to the pin, others oval, often representing an animal seen from above, are among the finest productions of the time. The decoration of conventionalized animal forms is a marked feature, and, though characteristic of all the Germanic races at this time, in the case of the Scandinavians, as is inevitable in the Northern climate, their limbs become more and more attenuated and snake-like, or, on the other hand, when engraved, show less and less connexion with each other, but the limbs and the animal's body are still retained. Even though there is a certain barbaric absence of restraint in design.

In the Viking Age, from about 800 to the introduction of Christianity in the 10th and 11th centuries, Norway, hitherto the poorest in antiquities, springs into prominence. A wealth of objects is found in the graves, and especially in some of the larger ship-graves, such as those of Gokstad, Tune, Myklebostad and Oseberg (also in the Norwegian ship-grave at Grox, Britanny). Fortunately a number of these ships are unburnt, and in view of the importance of seafaring in the Viking Age, it is worth noting that a mast with square sail of wooden material is common. One ten-oared vessel from this period is of exactly the same build as those used to this day in the district where it was excavated. The number of shield-bosses is often found in the vessels, and it is clear that shields were hung round the bulwarks exactly as Icelandic sources describe. The prow and stern-post are often beautifully carved. Sometimes the remains of as many as 12 horses are found in one of these graves, besides those of a number of dogs. The presence of anvils, pincers and other tools, as well as weapons and ornaments, is noteworthy, indicating the extent to which the working capacity of the art of craftsmanship was developed among chiefs, as indeed is known from literary sources. During this period, moreover, iron ore was extracted, smelted and worked in Scandinavia. The weapons found are swords, knives, sickles, battle-axes, spears and arrows. The sword is two-edged, with a wooden hilt often beautifully decorated with silver. The axe is very broad-bladed, and evidently of great importance, being too often the only weapon found in graves. Helmets and coats of mail are not found in Norway, but are comparatively common in Sweden.

We owe much of our knowledge of this period to the unburnt burials which were fortunately usual. In Denmark grave-chambers of wood, such as those at Jellinge, stand nearest to the ship-graves. In Sweden the great number of graves surrounding the ancient town of Birka, which was founded in the 8th century, have been excavated. Birch or oak coffins were used. Sometimes a round, oblong or triangular howe raised over them. A feature of the period are the tall, rudely-hewn basta-stones, set up over graves containing burnt bones, or sometimes merely to the memory of the dead. The remains of the sarcophagus are often enclosed in an upright slab of stone, or in the shape of a circle, or in the shape of a ship, with pointed bow and stern. It is noticeable that the graves are often in close proximity to the modern farms. In some places, for instance in Magesund, there is a boat or ship, as in the case of one of the finest ship-graves, that at Oseberg. Women's graves often contain splendid ornaments, though gold and silver are rare in grave-finds, and the large oval- or trefoil-shaped ingots found are usually of bronze, while in other finds silver ornaments are common. Silver is also characteristic of this period as gold of the silver find, Demark alone yielding no less than 25 important silver finds, some of them consisting of necklaces of very fine filigree work, or of dexterously woven silver wires. The style of decoration is the same as the preceding period, but bolder, less refined and often heavier. Ornaments are often set with garnets. The influence of Irish art is discernible, as in the spirals which terminate the limbs of the animal forms, and in the frequent interlacing designs; and we are not surprised to find a number of objects of Irish manufacture in Viking graves in Denmark. On the other hand, the Carolingian and Carlingian models appear to have served for certain grotesque forms, such as dragons, winged lions, &c. Sweden shows the same development, though with a different aim, for whom, while with the eastern Baltic countries, and with the Scandinavian kingdom of Novgorod. "Cufic" coins, struck in Persia and Turkestan, are found together with those of Germany and England. It is clear that the trade and the commercial importance that it is still the richest treasure-ground in this respect, even for English coins. Evidence for the eastern communications of Sweden is afforded by Runic inscriptions, some of which state that the chief whom the stone comes from belonged to a potent family in Persia or Turkestan. The later, entirely Northern alphabet is now common all over Scandinavia. The stones, especially the later Swedish ones, are often carved in imitation of the Rhodian and animal style, but examples of ornaments such as the adventures of Sigurd Fafniskane, depicted on a stone from Sodermannland. The houses of this period were usually built of wood, and consisted, as we know from literary evidence, of a large hall with various outbuildings. The descriptions in Icelandic sagas of tapestry hangings are borne out by the discovery of traces of hangings in grave-chambers, especially those at Jellinge in Denmark. Some fragments of cloth, showing designs in various colours, testify to the importance of weaving in the period. The remains of humbler dwellings have been found, some of them resembling a type of cottage still to be seen in southern Sweden, built of wattle, plastered inside and out. The remains of great earthworks, many of them standing to this day, such as the famous Danevirke, stretching right across Schleswig, the work of Queen Thyra, who lies in one of the greatest barrows, are mentioned.

SCANDINAVIAN LANGUAGES. By this expression we understand
the closely allied languages which are and have been
spoken by the Teutonic population in Scandinavia,
and by the inhabitants of the countries that have been
wholly or partially peopled from it. The territory of these
languages embraces: Sweden, except the most northerly part
(chiefly Lapland and inland parts of Vesterbotten, where Finnish
and Lappish exclusively or chiefly prevail); certain islands and
districts on the west coast of northern Finland, as well as
Åland; a small tract on the coast of Estonia, where Finnish
is spoken, as it is also to some extent in the Estonian islands of
Dagö, Nargö, Nukküi, Odenholm, Ormöö and Räög; Gammal-
svensksby ("Galsvenskby") in southern Russia (government of
Kherson), a village colonized from Dagö; the Livonian island of
Runö, where Swedish is spoken, as it formerly was on the
islands of Kynö, Mamö, Moon and Ösel; Norway, except
certain regions, especially in the northern part of the country,
peopled by Finns and Lapps (mainly in the diocese of Tromsö);
Denmark, including the Faeroes; Iceland and Greenland, where,
however, Danish is only spoken by the Danish or Danish-
originated population; the northern half of Schleswig; and, finally,
several Scandinavian colonies in the United States of North America
(especially in Minnesota and Illinois). Scandinavian dialects
have besides been spoken for varying periods in the following places:
Norwegian in certain parts of Ireland (A.D. 800–1250)
and northern Scotland, in the Isle of Man (800–1450), the Hebrides
(800–1400), the Shetland Islands (800–1800) and the Orkneys
(800–1800); Danish in the whole of Schleswig, in the north-
eastern part of England (the Danelagh, q.v., 875–1175), and in
Normandy (900–1300, or a little longer); Swedish in Russia
(862–1300, or a little longer).\(^2\) Icelandic in Greenland (985–
about 1450).

At what epoch the Teutonic population settled in Scandinavia
we cannot as yet even approximately decide. It is quite certain,
however, that it already existed there before the
Christian era—most probably as early as the beginning
of the so-called Later Stone Age (3000 B.C., but see SCANDINAVIAN
CIVILIZATION), if not still earlier. If this view be correct, the
Scandinavian languages have had an existence of seven thousand
years, say, at least. But it is only in recent times that the beginning of the
Christian era that we can get any information concerning the language of
the old Scandinavians, which seems by that time not only to have
spread over Denmark and great parts of southern and middle Sweden and of Norway, but also to have
reached Finland (at least Nyland) and Estonia. In
spite of its extension over this considerable geographical area, the language appears to have been fairly homog-
eneous throughout the whole territory. Consequently, it may
be regarded as a uniform language, the mother of the younger
Scandinavian tongues, and accordingly has been named the
primitive Scandinavian (urnordisk) language. The oldest sources
of our knowledge of this tongue are the words which were
borrowed during the first centuries of the Christian era by the
Lapps from the inhabitants of central Sweden and Norway, and by
the Finns from their neighbours in Finland and Estonia
(partly, it is true, also from their Gothic neighbours in Russia
and the Baltic provinces), and which have been preserved in
Finnish and Lappish down to our own days.\(^3\) These borrowed
words, denoting chiefly utensils belonging to a fairly advanced stage of culture, amount to several hundreds, with a phonetic
form of a very simple stamp; as Finn. torm (O. Swed. "torn")
(Ger. "fert"), tar; airo (O. Swed. "ar"), oar; kansa (O.H.G. "kans")

The Primitive
Scandinavian
language.

The most essential point of correspondence between the Gothic and
Scandinavian branches is the insertion in certain cases of *g* before *w*
and *ug* in Gothic word-stems, as in Finn. *ugga* (O.H.G. "ugga")

---

4 See the plate in G. Stephenson's Handbuck of Old Northern Runic
Monuments (1884), and S. Bugge's Norges Indschrifter med adlige
Ranner I. (1891–1903).

5 For the interpretations we are principally indebted to Prof. S.
Bugge's ingenious investigations, who, in 1865 satisfactorily succeeded
in the only the inscription of the golden horn, and by this means
found a fixed starting-point for further researches. A short review
of their most important results is given by A. Noreen, Alltalandische
Grammatik (3rd ed., 1903), appendix.
SCANDINAVIAN LANGUAGES

trigge. However, even in the primitive Scandinavian age the difference between Gothic and Scandinavian is more clearly marked than the resemblance; thus, for example—just to hint only at some of the oldest and most essential differences—Goth. nom. sing. ending -s corresponds, or primitive Scandinavian—i.e. ending -i, which according to Scand. krogpiinn, shrunken; avokia, W. Scand. ekka, widow; bauti, W. Scand. but, he bound; (q) in E. Scand. the dative of the definite plural ends in -unim instead of W. Scand. -onom, as in handummin, homonomun, (to) the hands; (g) in E. Scand. the simplification of the verbal inflectional endings is far further advanced, and the passive ends in -s(s) for -skk, as in kallas(s), W. Scand. kalask, to be called. In several of these points, and indeed generally speaking, the Western Scandinavian languages have preserved the more primitive forms, while the Eastern Scandinavian, in the course of the centuries, has assimilated more and more to the runic inscriptions, dating from a period before the beginning of the literature, as well as in many modern Eastern Scandinavian dialects. For, having regard to the Scandinavian dialects generally, we must adopt quite a different classification from that indicated by the dialects which are the subject of the literature. We now pass on to review the latter and their history.

I. ICELANDIC. In ancient times Icelandic was by far the most important of the Scandinavian languages, in form as well as in literature. To avoid ambiguity, the language before the Reformata (about 1250) is often called Old Icelandic.

1. Old Icelandic was spoken not only in Iceland, but also in Greenland and the Faroe Islands, where the descendants of the early colonists lived for a lengthened period. Our knowledge of its character is almost exclusively derived from the remarkably voluminous literature, dating from the first half of the 13th century, and written in the Latin alphabet, adapted to the special requirements of this language. No traces are found of any older runic literature. Indeed, Old Icelandic possesses only very few runic inscriptions, which give no authentic information from a philological point of view. The oldest, the inscriptions on the church door of Valpjonstæur, and that of a tombstone at Hjarðarholt, date from the beginning of the 13th century, and they are written in runes read from right to left, and nearly all in the Latin alphabet, some of which are as old as the last half of the 12th century. A small fragment (Cod. AM. 237, fol.) of a Book of Homilies (of which a short specimen is given below) is considered the oldest of all. About contemporary with this is the oldest part of an inventory entitled Reykhjollits mældagí. From the end of the 12th century we possess a fragment (Cod. Reg. old. sig. 1812) of the only existing Old Icelandic glossary, and from the first years of the 13th century the Stockholm Book of Homilies (Cod. Holm. 15, 410), which provides a philological point of view is of the greatest importance, chiefly on account of its very accurate orthography, which is especially important to philologists. This first fragment is written in the Latin alphabet, apparently in the Gothic way, and the Old Icelandic script is partly based upon a lost work of the first grammarian of Iceland, Póródur Ránasteinari (who flourished at the beginning of the 12th century), partly and chiefly upon Priscian and Donatus.1

1 A complete catalogue of the literature edited hitherto is given by Th. Mühls, Catalogus Librorum Islandicorum et Norwegicorum Antiquiorum Mediae (1856), and Verzeichnis der alltäglichen und wissenschaftlichen älteren Isländischen Schriften (vol. 1 to 1855). Cf. Iceland.

2 An account of the oldest Icelandic manuscripts (to about 1250) is given by J. Haffner in the Göt. Gelehr. Mitt., 1881, and The MS. of the Old Icelandic Script, a study (with the cooperation of the Annals Regii (Cod. Reg. 2087) from the beginning of the 14th century, orthographically of great value; the rich manuscript collections of manuscripts and of the A. the Anew. Min. of which is written with Haukur Eriandsson's (d. 1334) own hand; and, above all, three short essays, in which some Icelanders have tried to write a grammatical and orthographical treatise on their own mother-tongue, all three appearing as an appendix to the manuscripts of the Prose Edda. The oldest and most important of these essays (preserved in the Cod. Worm. from the last half of the 14th century) is by an unknown author of about 1140, the second (the oldest known manuscript of which is preserved in the Cod. Ups., c. 1300) is by an unknown author of about 1250; the third (the oldest manuscript in Cod. AM. 748, 406.) of the beginning of the 13th century is by an unknown author. The old author of the first two (Cod. Ups. 1250 and 1230) is based partly upon the lost work of the first grammarian of Iceland, Póródur Ránasteinari (who flourished at the beginning of the 12th century), partly and chiefly upon Priscian and Donatus.4

3 Among the manuscript collections of manuscripts and of the Alt. Min. iv of which is written with Haukur Eriandsson's (d. 1334) own hand; and
The oldest form of the Icelandic language is, however, not preserved in the above-mentioned earliest manuscripts of the later half of the 12th century, which are written in Old Norse. One of the earliest texts from the 13th century, which contain poems by the oldest Icelandic poets, such as the renowned Egill Skallagrímsson (about 950) and the unknown Óláfr Efremsson (about 1050), and is the oldest written record of the language. The metrical form has been the means of preserving a good deal of the ancient language. But, as already remarked, during the 10th and 11th centuries this dialect differs but little from Norwegian, though in the 12th this is no longer the case.

We may here contrast a specimen of the above-mentioned earliest Icelandic manuscript with an almost contemporary Norwegian one. (The following was dictated by G. A. F. Munch.)

Norw.—En jet ur vitanda, at all ma andlega merkia oc fylla oc jet or til kirkio bunings eja bionost barf at haua, ef vei lium svra hreinaleg at vter sem verðir at kallace göps mustere.

Engl.—And that is to be known that all that is needed for the decoration of the church or the service may, spiritually, be found and imagined within us, if we live so cleanly that we are worthy to be called God’s temple.

Apart from the fact that the language is, generally speaking, archaic, we find that the dialects on both sides have a number of characteristics of Icelandic as opposed to Norwegian, viz. the more complete vowel assimilation (pionost, pionost; cf. also, e.g. lecl, knar, nage, ng, ngj, etc.) and an inflection before r (hreinaleg, rainleg), l and n. Other differences, some of which are common to this period, others a little later, are—(1) in lecl; lengthening of a, o, u before if, ig, ik, im and ip (as in lecl. kldrfr, norm. kldrfr); diphthongs a:u before ng and nk; lecl. dr and ey for older i and y (as in lecl. dýma, dýra, Norm. and oldest lecl. dýma, to deem, hýgra, to hear); (2) lecl. termination of 2nd plur. of verbs in -ð (or -i), but Norm. in -r (as lecl. fórð, fordr, norm. fórð, dórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, fórð, för

NORWEGIAN OR NORSE.

The Old Norwegian language

the Reformation) was not, like the modern language, confined to Norway and the Faeroes, but was, as already
and
stated, for some time spoken in parts of Ireland
the north of Scotland, the Isle of Man, the Hebrides,
Shetland and Orkney (in the last two groups of islands it con(till

tinued to survive down to the end of the i8th century), and
also in certain parts of western Sweden as at present denned
(Bohuslan, Sarna in Dalarna, Jamtland and Harjedalen).
Our knowledge of it is due only in a small measure to runic infew in number (about 150),
scriptions, for these are comparatively
and of trifling importance from a philological point of view, especially
as they almost wholly belong to the period between 1050 and 1350,'
and consequently are contemporary with or at least not much earlier
than the earliest literature. The most important are the detailed one
of Karlevi on Oland, wherein a Norwegian poet (towards 1000) in
"
"
metre celebrates a Danish chief buried there,
drottkuaett
so-called
and that of Froso in Jamtland, which (about 1050) mentions the
The whole literature preserved is
christianizing of the province.
written in the Latin alphabet. The earliest manuscripts are not much
later than the oldest Old Icelandic ones, and of the greatest interest.

On the whole,

however, the earliest Norwegian literature is in quality
as well as in quantity incomparably inferior to the Icelandic. It
amounts merely to about a score of different works, and of these but
few are of any literary value. A small fragment (Cod. AM. 655. 410,
Fragm. ix., A, B, c), a collection of legends, no doubt written a little
before 1200, is regarded as the earliest extant manuscript. From the
very beginning of the I3th century we have the Norwegian Book of
Homilies (Cod. AM. 619, 410) and several fragments of law-books
and the older EiSsivabingslaw). Of
(e.g. the older Gulafringslaw
later manuscripts the so-called legendary Olafssaga (Cod. Delag. 8,
The chief manuscript
foL). from about 1250, deserves mention.
(Cod. AM. 243 B., fol.) of the principal work in Old Norwegian
literature, the Speculum regale or Konungsskuggsid (" Mirror for
Kings,") is again a little later. The masses of charters which
occurring throughout the whole middle age of Norway from the
beginning of the I3th century afford much information, especiajly
concerning the dialectical differences of the language, are likewise
of great philological importance.
As in Old Icelandic so in Old Norwegian we do not find the most

already been stated that the language at this epoch differed
so little from other Scandinavian dialects that it could scarcely yet
be called by a distinctive name, and also that, as Icelandic separated
itself from the Norwegian mother-tongue (about 900), the difference
between the two languages was at first infinitely small as far, of
From the I3th
course, as the literary language is concerned.
century, however, they exhibit more marked differences; for, while
Icelandic develops to a great extent independently, Norwegian, owing
to geographical and political circumstances, is considerably influenced by the Eastern Scandinavian languages. The most important
differences between Icelandic and Norwegian at the epoch of the
'

MSS. (about 1200) have already been noted. The tendency in
Norwegian to reduce the use of the so-called u-Umlaut has already
been mentioned. On the other hand, there appears in Norwegian in

oldest

the IJth century another kind of vowel-assimilation, almost unto Icelandic, the vowel in terminations being in some degree
influenced by the vowel of the preceding syllable. Thus, for instance,
we find in some manuscripts (as the above-mentioned legendary
followed in
Olafisaga) that the vowels e, o, $ and long a, tt are
terminations by e, o; i, u, y, and short a, ce, on the other hand, by
as in btfner, prayers, honor, women; but tiCir, times, tungur,
i, u
tongues. The same fact occurs in certain Old Swedish manuscripts.
When Norway had been united later with Sweden under one crown
'1319) we meet pure Suecisms in the Norwegian literary language.
_n addition to this, the I4th century exhibits several differences
\
from the old language: rl, rn are sometimes assimilated into //,
nn as kail (elder karl), man, konn (korn), corn, prestanner (prestas hyrftir (hirSir),
arnir), the priests; i passes into y before r, I
shepherd, lykyl (lykill), key; final -r after a consonant is changed
as hester
into -or, -er, -ir, -or, -ur or -<zr, sometimes only -a, -e, -a,
(hestr), horse, btfker (btfkr), books, the names \wlleifcer (\>orleifr),
GuKl(eifai (GuSleifr). About the beginning of the Ijjth century initial
kv occurs for old hv (not, however, in pronouns, which take kv only in

are substituted for p, t and k as in the local names Nabfi (earlier
Napa), Tvedce sogn (fyveita sokn); -a in terminations passes into
as h&re (hfiyra) to hear, sfighe (sfikia), to seek; single Danish
-e
words are introduced as iek (ek), I, se (sid), to see; spfirge (spyria),
to ask,-&c. Towards the end of the middle ages the Danish influence
shows an immense increase, which marks the gradual decline of
Norwegian literature, until at last Norwegian as a literary language is
completely supplanted by Danish. During the I5th century Norway
has hardly any literature except charters, and as early as the end of
that century by far the greatest number of these are written in almost
In the l6th century, again, charters written in
pure Danish.
Norwegian occur only as rare exceptions, and from the Reformation
onward, when the Bible and the old laws were translated into Danish,
not into Norwegian, Danish was not only the undisputed literary
language of Norway, but also the colloquial language of dwellers in
towns and of those who had learned to read.
Dialectical differences, as above hinted, occur in great number
in the Norwegian charters of the I3th, I4th and 15th centuries.
Especially marked is the difference between the language

hand, as characteristics of the western dialects may be noted the
following: final -r after a consonant passes into -ur, -or, or -ir,
as velur (velr), winter, rettur (rettr), right, aftor (aftr), again;
-er
as sytla (sysla), charge; hw is changed into kw
si passes into U
also in pronouns as kuer (huerr), who. kuassu (huersu), how.
This splitting of the language into dialects seems to have continued
to gain ground, probably with greater rapidity as a Norwegian
literary language no longer existed. Thus it is very likely that the

present dialectical division was in all essentials accomplished about
the year 1600; for, judging from the first work on Norwegian
2
the S0ndfjord (Western Norway) dialect at least
dialectology,
possessed at that time most of its present features. A little clogcalendar of the year 1644 seems to prove the same regarding the
Valders (Southern Norway) dialect. How far the Old Norwegian
dialects on the Faeroes, in Ireland and Scotland, on the Scottish
islands, and on the Isle of Man differed from the mother-tongue it
is impossible to decide, on account of the few remnants of these
dialects which exist apart from local names, viz. some charters
(from the beginning of the 1 5th century onward) from the Faeroes,
Shetland and the Orkneys, and a few runic inscriptions from the
Orkneys 1(thirty in number), and the Isle of Man (about thirty in
These runic inscriptions, however, on account of their
number).
imperfect orthography, throw but little light on the subject. Of the
Orkney dialect we know at least that initial hi, hn, hr still preserved
h in the I3th century that is, at least two hundred years longer

than in Norway.

Old Norwegian grammar has hitherto always been taken up in
connexion with Old Icelandic, and confined to notes and appendices

works on Icelandic grammar. A systematic fl

Scandinavian Languages

Old Swedish, during its earliest pre-literary period (800-1225), retains quite as original a character as contemporary Old Icelandic. The first part of the inscription of the Röksteone running thus:

AFT UAMUP STAFTA RUNAK BAR / I UARIN FAJPA FAJP AFP FOTAIK SUNUP,1

and probably pronounced:

aft Wämöö standa runak jáar; en Uarinn fádi fálik aft fejgíjí sunup.

I would, no doubt, have had a somewhat different form in contemporary Icelandic, except the last word, which would probably have had the less original form sun. The formal changes of the Swedish language during this period are, generally speaking, such as appear about the same time in all the Germanic branches, the great -bi into common r (the Rök-steone runar, later runar, runes; this appears earliest after dental consonants, later after an accented vowel), and the change of ą into á (in the 10th century räfte, later rafri; raised); or they are, at least, common to it with Norwegian—as the dropping of b before l, n and r (in the 10th century brutm, younger, ryp, carin), and the changing of nasal vowels (the long ones latter) in non-nasalized words. This change is altogether different during what we may call the classical period of Old Swedish (1225-1375), the time of the later runic inscriptions and the oldest literature. During this period the language is already distinctly separated from the (literary) Icelandic-Norwegian (though not very much from Danish). The words of the Older Västgötalaw—

FALDER KLOCKE NIDER I HOJOFU MANNI, BOTTI SOPCN MACHURN JIRIM, RUUNAB AK TALKH JIRIM,2

would be in contemporary Icelandic be—

fell klukka niðr í hófuðu mauni, bæti sókn mrgókn jirin, en hann fær bana af.

These few words exhibit two of the most important of the following innovations in Swedish: á is inserted between ll (nn) and a following r (as b between l and n, r, and between m and n, t as hambrur, icl. hamnr, hammers, sampl, icl. samli, together with); an auxiliary vowel is inserted between final r and a preceding consonant (as the change of r into ā (nearly r) in the case of which we find as early as the 12th century); h has passed into á (as knm, icl. kné, knees); ia into ia, as in Eastern Norwegian (as biario, icl. biario, heart); ia into ār after, and a consonant (as bil, icl. bí, a), as in the forms of the three persons singular of verbs have assimilated (except in the so-called strong preterite); the 2nd person plural ends in -ir or -ir, -ur. The transition to the 14th century is marked by important changes—short y, e, passed into o in many positions (as dyw for dyo, door, &c.); there appeared a so-called law of vowel balance, according to which the vowels i and u are always found in terminations after a short root syllable, and a, e, o, u in terminations after a long root syllable; there was a remarkable reform, developing at the same time to a "riksrík," a uniform language, common to a certain degree to the whole country. The chief characteristics of this later Old Swedish (1375-1596) are the following: the long á has passed into ã (that is, an open o), and iə (except before k, rdh, rt) into iː (as sís, see, lake), g and k (sk) before palatal vowels are softened into dj and tj (sj); k and t in unaccented syllables often pass into gh, dh (as Swartbo for Swarbo, Sverd, Skr. Skalle, for Skalle, and a, the initials he-; kin), the, and (a little later) en, a, come into use; the dual pronouns vanish; the relative or, that, is changed with sumi; the present passive is formed with the -i ending (as gangand, gangand), a historical passive. A little later the following changes appear:—a short vowel is inserted before a single consonant, first when the consonant belongs to the same syllable (as hat, hate), afterwards also when it belongs to another syllable (as lidhe, liehe; a second short vowel is inserted between i or n and a preceding consonant (as gætsi, gable, sken, desert); short t often passes into e (as leca, to live); ih passes into i; a new conjugation is formed which has no infinitive termination (as pota, potte, to dwell, dwelle). Owing to the political and commercial state of the country the language at this period is deluged with borrowed words of Latin, whereas the number of the great number of verbs in -ir (e.g. handlra, to handle)

1 In memory of Wämdö these runes stand; and Warinn, his father, wrote them in memory of his son (by destiny) condemned to death.

2 If the bell fall down on anybody's head, the parish pays a fine of three marks should he die from it.
2. Modern Swedish.—The first complete translation of the Bible, edited in 1541 by the brothers Olaus and Laurentius Petri, and generally called the Bible of Gustavus I, may be regarded as the most important achievement in religious and political circumstances. It is not until the middle of the 17th century that Swedish literature adequately exemplifies the language, for at that period literature first began to be cultivated as a fine art, and its principal representatives were the poets as Stiernheim and Arvid Hjelm, who were not slow to use the first to study it as a means of expression and to develop its resources. Amongst the authors of the 18th century we have the expression of the individuality and the form of the prose style of that epoch; while of the end of the century Kellgren and Bellman are the most noteworthy examples, representing the higher and the more familiar style of poetry respectively. The language of the 19th century, on account of their enormous circulation, have had a greater influence than those of any other authors. As to the language itself the earliest Modern Swedish texts, as Gustavus I's Bible, differ considerably from the latest Old Swedish ones. We find a decided tendency to externate the plural endings, but the result gives less uniformity of forms. At the same time there appear several traces of a later state of the language: all genitives (singular and plural) end in -s, which in earlier times was the proper ending of the humorous Latin and of the Germanic; and it is the life of Christ in a series of pictures and words; on the other hand a literature has been preserved consisting of a runic calendar from 1328, the law of the island (the oldest manuscript is from about 1325); and of the church is distinguished from the Old Swedish of the mainland especially by the following characteristics:—the old diphthongs are preserved (e.g. var, and), the personal pronouns pluperfect tense, and the genitive singular of feminines in -s ends in -sr for -ur (as kirur, of the church). Owing to the entire absence of documentary evidence it is impossible to determine how far the dialects of the Baltic, which no doubt had a separate individuality, differed from the mother-tongue.

The first to pay attention to the study of Old Swedish was the Swedish savant J. Bureeus (d. 1652), who by several works (from 1599 onwards) called attention to and excited a lively interest in the runic monograms, and, by his edition (1654) of the excellent Old Swedish work Um Styrise Fighte (Acrid pitcher) which is a real attempt in modern times at a grammatical treatment of any Old Germanic language. The study of runes was very popular in the 17th century; M. Celsius (d. 1679) deciphered the "staffless" runes and the "tusked" runes, and the former, who also had knowledge of Old Swedish texts, published, by J. Göransson as Bastio (1750). During the 18th century, again, Old Swedish was almost completely neglected; but in the 19th century the study of runes was well represented by the collection (Runurkunder, 1833) of the Swede Liljeqren (d. 1837) and by the Norwegian S. Bugge's ingenious interpretation and grammatical treatment of some of the most remarkable inscriptions, especially that of Rök. Old Swedish literature has also been made the object of grammatical researches. A first outline of a history of the Swedish language is to be found in the work of N. M. Peterson (1830), and a good account of the grammatical development of Swedish in the swenskans och Formornskans språkbyggnad (1869); but Old Swedish grammar was never treated as an independent branch of science until the appearance of J. E. Rydqvist's grundläggande (1881), in which the language was dealt with from the 8th to the 16th century, while later work was published by K. Hyltén-Carls- son under the title språk i Sverige: Utomlandsfödd, talent, charmant, charming, &c. In the 19th century, especially about the middle of it, we again meet with conscious and earnest efforts to make the language fit for a new function in the formation of new words and in the adoption of words from the old language (ii, diligence, mäla, to speak, fisking, battle-array, &c.), and from the dialects (kliga, to gaze, flis, flake, skrabbig, bad, &c.). Consequently the present vocabulary differs to a very great extent from that of the literature of the 17th century. As for the sounds and grammatical forms, on the other hand, comparatively few changes have taken place during the last two centuries. In the 19th century, however, comparatively few changes have taken place during the last two centuries. In the 19th century, however, comparatively few changes have taken place during the last two centuries. In the 19th century, however, comparatively few changes have taken place during the last two centuries. In the 19th century, however, comparatively few changes have taken place during the last two centuries. In the 19th century, however, comparatively few changes have taken place during the last two centuries.
SCANDINAVIAN LANGUAGES

The study of Modern Swedish dates from Sweden's
Dialects.

The form of the language.

d, n, s, and i), while the singular of the verbs is gradually supplanting
the plural.

The Modern and the Old, as the word is usually understood, namely during all periods of the Swedish language, is the
throwing back of the principal accent to the beginning of the word in cases where previously it stood nearer the end, a tendency that is characteristic of modern Swedish and especially of Swedish. In the primitive Scandinavian age the accent was removed in most simple words; the originally accented syllable, however, preserved a musically high pitch and stress. Thus, around the 13th century, the one, with unaccented final syllable, as in Icel. strígr (Gr. οριζειν, thou goest, the comparative bein (cf. Gr. ὑπάρχω from -άρχειν), better, the other, within the words), was changed to the short, pret. plural. hano (Svens. bubdhus), we bade, part., pret. inten (Svens. bhinda), bitten. The same change afterwards took place in those compound words that had the principal accent on the second element, so that the original separation of the Swedish grammatical structure brought into conformity with the former accentuation. At the present day it is quite exceptionally (and chiefly in borrowed words of later date) that the principal accent in Swedish is on any other syllable than the first, as in lek, lekken, body, leken, to bless.

The scientific study of Modern Swedish dates from Sweden's

1684, three centuries before the Reformation. As these</((
SCANDINAVIA—SCANTLING

The first Modern Danish grammar is by E. Pontoppidan, 1668, but in Latin; the first in Danish is by the famous Peder Søv, 1669. The early works of J. Pedersen (‘Skriftet’), J. F. Hesselman (‘Accentueret og rasiønerret grammatica’, 1747) possess great merit, and are of especial importance as regards accent and syntax. The earlier part of the 19th century gave us Kask’s grammar (1841). As a matter of fact, a vocabulary of Danish existed; the most detailed is by K. Mikkelsen (1894). The vocabulary of the 16th and 17th centuries is collected in Kalkar’s Ordbog, mentioned above, and in the 18th century by the well-known Vorstevnerns Dictionaire of Vidskernes Selskab (1793-1805), and in C. M. Holbech’s Dansk Ordbog (2nd ed., 1859); that of our days in B. T. Dahl’s and H. Hammer’s Dansk Ordbog for folket (1903 seq.).

Dano-Norwegian. Though Danish was the language of the literary and educated classes of Norway and remained so for three hundred years, although it cannot be denied that many Norwegian authors even during this period adhered to it, it has been supplanted by Norwegian, a language differing from Danish in its vocabulary, having adopted very many Norwegian provincial words (more than 7000), less in its inflections, but to a very great extent in its pronunciation. The most striking differences exist in the following points: Norwegian c, e, and palatal vowels answer Norwegian fj, jr (point-trill, not back-trill as in Danish) is assimilated in some way with following l (d), h, m, and j into so-called supradental sounds; both the primitive Scandinavian accentuations are preserved; and Norwegian has a musical point of view, in opposition to the monotonous Danish. There are several other characteristics, nearly all of which are points of correspondence with Swedish.

Dano-Norwegian is in our days grammar for two dialects, Norwegian and Danish.

Norwegian—Norwegian.

Language. Old Norwegian, the eminent philologist J. Aaen (d. 1896) was led to undertake the bold project of con

struing the literature of this period, but the material is vast, and the task is in part already accomplished by his pupil H. A. Heggard (e.g. Etymologisk Ordbog, 1903, 1906).

Form of the language. The middle of the 19th century, however, far more advanced pretensions were urged to an independent Norwegian language. By the study of the Modern Norwegian dialects and their mother language, Old Norwegian, the eminent philologist J. Aaen (d. 1896) was led to undertake the bold project of con

struing the literature of this period, but the material is vast, and the task is in part already accomplished by his pupil H. A. Heggard (e.g. Etymologisk Ordbog, 1903, 1906).

The local names of Norway are treated in the large work Norske grammatik, by O. Rygh (1897 seq.).

SCANDINAVIAN DIALECTS. As above remarked, the Scandinavian dialects are not grouped, so far as their relationship is concerned, as might be expected judging from the literary languages. The modern Norwegian dialects are the Faeroe, each of which constitutes a separate group, the remainder may be thus classified:

1. West Norwegian Dialects—spoken on the western coast of Norway between Bergen and Molde.

2. North Scandinavian—the remaining Norwegian and the Swedish dialects of Uppland, Västmanland, Dalarna, Norrland, Finland and Russia.

3. The dialects on the island of Gotland.

4. Middle Swedish—spoken in the rest of Sweden, except the southernmost parts (No. 3).

5. The dialects spoken in the greater part of Småland and Halland, the whole of Skåne, Blekinge and Denmark, and the Danish-speaking part of Schleswig.

This group is distinctly divided into three smaller groups—the dialects of southern Sweden (with the island of Bornholm), of the Danish islands and of Jutland (and Schleswig).

The study of the modern Scandinavian dialects has been very unevenly prosecuted. Hardly anything has been done towards the investigation of the Icelandic dialects, while those of the Faeroes have been studied chiefly by V. U. Hammershaim, J. Jakobsen, and O. E. Pedersen. The Faeroes have been admirably treated by J. H. Christensen. The common language of the Faeroes has been examined, first by Aaen, whose works give a general account of them; then by J. Storm, who has displayed an unwearying activity, especially in the field of folk songs. The best account published is to which Aasen had paid but scant attention; in our own days by H. Ross and A. B. Larsen. For the study of Danish dialects there has been nothing. Moberg’s Dialect-Lexicon of 1841 is very deficient. The Scandinavian dialects have been thoroughly treated by H. Hof (1854), K. J. Lyngby (1858) and others. H. F. Filberg’s great dictionary (1886 seq.) of the dialect of Jutland is in every respect an excellent work. A dialect map on a large scale, and containing the whole of Denmark, is by H. Lind. Møller and J. A. Kristensen. Finally, several dialect monographs by P. K. Thorsen may be mentioned as being especially valuable. A phonetic alphabet for the purpose of dialectal investigations is worked out by J. Jessper and published in the journal Dania, vol. l. (1890). There is, however, no country in which the dialects have been and are studied with greater zeal and more fruitful results than in Sweden during the last hundred and fifty years. Archbishop E. Bengelius the younger (d. 1743) made collections of dialect words, and on his work is based the dialectical dictionary of 1746. An excellent work considering its age is C. Molberg’s Veströgödics (1772), and the Dialekstavlingar of J. B. Feilberg (1876) complete, the dialects of Gotland and Dalarna) are given by the famous dialects of Upsala, Lund and Helsing-}

SCAPHOPODA

The phylum Scaphopoda includes marine species, typically known as tusk shells, characterized by their elongated, cylindrical shells. This class is divided into three orders: Phylum Scaphopoda, with the species known for their use in medical applications, and Mollusca, which includes gastropods, bivalves, and cephalopods.

SCAPOLITE

After Kowalewsky, in Lancaster’s Treatise on Zoology. 

Fig. 3.—Larva of Dentalium, aged one and a half days; ventral aspect. 

I. Foot. 
II. Anterior. 
III. Mantle. 
IV. Habitat forming a sort of test. 

Siphonodentalia. 

Fam. 2. Siphonodentidae. 

Foot extended distally into a symmetrical disk with a crenate edge or simple and Vermiform without well-developed lateral processes; shell often contracted towards the anterior aperture. Siphonodontidens: foot ending in a medium disk without a median appendage. Calamodes. Plesiolum: terminal disk of foot with a median appendage. Enaliodes. Coelom. 

Beiträge zur Anatomie und Histologie von Dentalium, Jenaische Zeitschr. xxxviii. (1904); Paul Pelseneer, Mollusca, Lancaster’s Treatise on Zoology, pt. v. (1906). (J. T. C.) 

SCAPOLITE (Gr. σκαπόλης, rod, λίθος, stone), a group of rock-forming minerals composed of aluminium, calcium and sodium silicate with chlorine. The variations in composition of the different members of the group may be expressed by the isomorphous mixture of the molecules CaAlSiO₄ and NaAlSiO₄Cl, which are referred to as the meionite (Me) and marialite (Ma) molecules respectively, since they predominate in these two end-members of the series. Werneckeite, Scapolite (M₆M₆₄ to Me₆Ma₆₄) and Marialite (Me₆Ma₆₄ to Me₆Ma₆₄) are intermediate members. The tetragonal crystals are hedral with parallel faces (like scheelite), and usually have the form of square columns, sometimes of considerable size. There are distinct cleavages parallel to the prism-faces. Crystals are usually white or greyish-white and opaque, though meionite is found as colourless glassy crystals in the ejected limestone blocks of Monte Somma, Vesuvius. The hardness is 5-6, which is the specific gravity varies with the chemical composition between 2-74 (meionite) and 2-56 (marialite). The scapolites are especially liable to alteration by weathering processes, with the development of mica, kaolin, &c., and this is the cause of the usual opacity of the crystals. Owing to this alteration, and to the variations in composition, numerous varieties have been distinguished by special names. Scapolite is commonly a mineral of metamorphic origin, occurring usually in crystalline limestones, but also with pyroxene in schists and gneisses. The long slender prisms abundant in the crystalline limestones and schists in the Pyrenees are known as "dipyr" or "couzeiranite." Large crystals of common scapolite (wernerrite) are found in the apatite deposits in the neighbourhood of Bamle near Brevik in Norway, and have resulted from the alteration of the plagioclase felspar of a gabbro. (L. J. S.) 

Scapolite Rocks.

According to their genesis the scapolite rocks fall naturally into four groups.

1. The scapolite limestones and contact rocks. As silicates rich in lime, it is to be expected that these minerals will be found where impure limestones have been metamorphosed by contact with an igneous magma. Even meionite (the variety richest in soda) occurs in this association, being principally obtained in small crystals lining cavities in ejected blocks of crystalline limestone at the contact of scapolite with granite in Germany. Scapolite and meionite are far more common at the contacts of limestone with intrusive masses. The minerals which accompany them are calcite, epidote, vesuvianite, garnet, wollastonite, dolomite, and epidote. They are colourless, flesh-coloured, grey or greenish; occasionally they are nearly black from the presence of very small enclosures of graphic material. They are not in very perfect crystals, though sometimes incomplete. Crystals of the volcanic or intrusive series are visible; the tectonic cleavage, strong double refraction and uniaxial interference figure distinguish them readily from other minerals. Commonly they weather to micaceous aggregates, and are often hard to distinguish. Scapolite is rare and has been replaced by calcite. Scapolite occurs in a great number of places, both in the limestones and in the calcareous shales which accompany them. In some of these rocks large crystals of scapolite occur, as octagonal prisms with imperfect terminations. In others the mineral is found in small irregular grains. It is sometimes clear, but often crowded with minute enclaves, such as diopside and biotite. The scapolite is not a black variety well known, filled with minute graphic enclosures, often exceedingly small and rendering the mineral almost transparent. The scapolite, however, is a more satisfactory replacement to this kind of scapolite. Apparently the presence of chlorine in small quantities, which may often be detected in limestones, to some extent determines the formation of the mineral. Many instances of scapolitization have been described from the ophites (diabases) of the Pyrenees. In the unaltered state these are ophtic and consist of pyroxene enclosing lath-shaped plagioclase felspar; the pyroxene is often changed to scapolite, and the felspar is replaced by scapolite the new mineral is fresh and clear, enclosing often small grains of hornblende. Extensive recrystallisation often goes on, and the ultimate product is a mixture of scapolite with some hornblende, the assemblage resembling the scapolitized ophites of the Pyrenees. It has been suggested that the conversion of their original felspar (for there can be no doubt that they were once gabbros, consisting of plagioclase and pyroxene) into scapolite is due to the percolation of chloride solutions along lines of weakness, or planes of solubility, filling cavities etched in the substance of the mineral. Subsequently the chlorides were absorbed, and fari facies are found in scapolite. In some of these gabbros there are veins of a chloride-bearing apatite, which must have been deposited by gases or fluids ascending from below. This suggests that a pneumatolytic process has been at work, similar to that by which, around intrusions of granite, veins rich in tourmaline have been
“May thy name endure and a son be born thee.” Such are of the New Kingdom or later. Names and titles of officials appear, most commonly in the Middle Kingdom.

Historically the most valuable class is of those which bear royal arms, ranging from Cheops of the IIVth dynasty to the end of the XXVIth dynasty. Certain great kings are commemorated on scarabs of periods long subsequent to them. Thus Cheops (Khufu) may appear on an example of the latest Pharaonic age, and Tethmosis III. is found at all times after the XVIIIth dynasty. But as a rule the royal names are of contemporary workmanship, and the differences of style and pattern make it possible to group unknown kings with those who are known historically. Typically, the name of the Workmen in the Alaska Museum has been preserved, particularly from collections of scarab-seals. Scarab-shaped seals are traceable as far back as about the VIth dynasty. They became abundant under the XIIth and continued until almost the end of the native rule. As seals they took the place of the earlier cylinders. Considering the life-history of the scarabaeus and its meaning as a hieroglyph, it may well be that the scarab impressing the clay had a specific significance; however that may be, the oval form was well adapted for seal-stones and for the bezels of finger rings. In this situation the scarabs were treated with a cold in gold goss around the edge. Rings of stone, glass or metal, with engraved bezels of the same material, and eventually Greek gems rings, gradually displaced them.

A series of exceptionally large scarabs was engraved in the reign of Amenophis III., c. 1450 B.C., all being inscribed with his name together with that of Queen Tia and her parentage. At present five varieties are known. The simplest commemorates his queen and the north and south limits of his empire; another dated in the first year, a great battle of wild cattle; the third, the arrival of the princess Gulshipsa of Mittanni in the tenth year; the fourth, (many specimens), the number of lions slain by the king down to his tenth year; the last, the cutting of the lake of Zaruhe in the eleventh year. Egyptian scarabs were carried by trade to most of the islands and all of the eastern Mediterranean, and to Mesopotamia. The Greeks, especially in their Egyptian colony of Naukratis (q.v.),imitated them in soft paste. The finest Etruscan gems of the 6th and 5th centuries B.C. are in the form of scarabs, perhaps suggested by the Egyptian. The forgers of antiques have carried on a brisk trade in scarabs for more than a century.

See F. E. Newberry, Scarab (London, 1906); also art. Gem, esp. c. har-late-scarabaeoid gems. (F. L. G.)

SCARAMOUCHE, properly a buffoon, used later colloquially for a ne'er-do-well. The name was that of a stock character in 17th-century Italian farce, Scaramuccia (i.e. literally "skirmish"), who, attired usually in a black Spanish dress, burlesquing a "don," was beaten by Harlequin for his boasting and cowardice. The part was played in London in 1673 by a well-known Italian actor, Tiberio Fiurilli, and became popular. There are many instances of the use of the word in the New English Dictionary.

SCARBOROUGH, a municipal and parliamentary borough and fashionable seaside resort in the North Riding of Yorkshire, England, 231 m. N. of London, on the North-Eastern railway. Pop. (1891) 33,776; (1901) 38,161. From the bold and picturesque coast, afinger-ridge peninsula (285 ft.) projects, separating North Bay from South Bay, and the modern extension of the town fringes both of these. The peninsula is crowned by a 12th-century castle, though this naturally strong position was probably occupied earlier. There is a moat (Castle Dyke) on the landward side, and a wall with towers also protects the castle in this direction. The keep, a lofty ruined tower, is of Norman date. The peninsula is much exposed to encroachment by the sea. In 1190 the plateau forming the castle yard was stated by William of Newburgh to be 60 acres in extent; it is now about 17. The list of the governors of the castle covers the period from the 13th to 1832. Near the landward side of the dike is the church of St. Mary, finely situated, occupying the site of a Cistercian monastery of 1198. It is transitional Norman and Early English, with later additions. The choir was occupied by the Roundheads during the Commonwealth, and was wrecked by the castle guns. The tower fell later, and was in part rebuilt in the 17th century.

The development of Scarborough as a watering-place dates from the discovery in 1626 by Mrs Farren, a resident of mineral...
springs. These springs, of which there are two, occur near
the shore of the South Bay, and a handsome Spa House in
pleasant gardens contains them. The south spring is aperient,
while the north or chalybeate spring is more tonic in its properties.
They are still in use, though of less importance than formerly in comparison with the other
attractions of the town. The sea-bathing is very good, both
bays having a sandy foreshore. Well-plantcd gardens fringe
the steep slope down to the North Bay, in which there is a
promenade pier; the South Cliff is similarly adorned. It is
approached by a broad avenue, its use having been abandoned to
the enjoyment of which lies a pleasant park. The southern part
of the town is the more fashionable portion. The principal
buildings of entertainment are the aquarium (also used as
a concert hall); the museum, a rotunda in Doric style, containing
excellent antiquarian and natural history collections; two
theatres, and the assembly rooms attaching to the Spa House.
The promenades and drives are extensive, and there is an in-
clined tramway leading from summit to foot of the South Cliff.
A great marine drive, 4200 ft. long, was opened in 1908.
The neighbouring country is exceedingly picturesque, with
highly picturesque houses, and well-kept villages. The
hydrography of the district is remarkable, the Derwent, which
flows S.W. to the Ouse and so to the Humber, having one of
its sources near Scarborough within 2 m. of the sea. The climate
is healthy and temperate; average temperature, 50° F. in
July, and in January, 37°.

The chief buildings of Scarborough apart from those already
considered are the town hall, market hall and public hall,
several modern churches and chapels, and charitable and
benevolent institutions. The harbour, enclosed by piers and
divided into two basins, lies on the south side of the mouth of
the River Esk, the chief river of the town. It is dry at low tide,
but is accessible at spring tides to vessels of 15 ft. draught. It
is largely used by fishing
boats. The parliamentary borough, falling within the
Whitby division of the county, returned two members until 1885,
and since that date. The town is governed by a mayor,
6 aldermen
and 18 councillors. Area, 2373 acres.

Although there is no mention of Scarborough (Scarbode, Escarde-
bur, Scardeburg, Scardeburg, Scaribur, Scarbyburgh, in the Domes-
day Survey the remains of Roman roads leading to the town indicate
that it was in early times a place of importance. The castle was
built during the 12th century by William le Gros, earl of Albemarle,
who gave a large area of land to the See of York in exchange for
the castle, which had been captured by the Danes in 1066. Henry II.
added greatly to its strength. From this time it was in the
hands of a line of distinguished nobles appointed by the king.
Scarborough is a borough by prescription. Its first charter of
1181 granted it town privileges, but the town was not elevated to
the rank of a county town until 1833, when Henry III.
confirmed with various alterations and extensions by most of
the succeeding monarchs. Henry III. in 1253 granted that a court
of pleas should be held at Scarborough by the justices who went to
hold common pleas at York; he also gave the corporation a gild
merchant. Edward II. caused the town to be taken away from
the burgesses "for certain causes," but it was restored to them by
Edward III. in 1337. The charter of Edward I. in 1314
confirmed and confirmed the privileges of the borough. Richard III.
by his charter of 1485 appointed that the town should be governed by
a mayor, sheriff and twelve aldermen, and also granted amongst other
extensive privileges the freedom to hold fairs and two markets a week.
The town should be a county of itself. On the death of Richard III.
the charter took no effect, and the corporation returned to its
ancient mode of government. In 1664 a mayor, 12 aldermen
and 31 common councillors were nominated as governors. Scarborough
returned two members to parliament from 1295 to 1885. It is
said that Henry II. held a market here which he granted to the burgesses,
but of this there is no mention. A subsidy roll of 1393 lists
53 Henry III., granted a yearly fair lasting from the Assumption of
St Mary to the following Michaelmas. This fair was originally held
on the sands. Jet was formerly an important manufacture.

Thomas Hickey, History of Scarborough (1832); J. B. Baker, History of Scarborough (London, 1882).

SCARF, a narrow wrap for the neck or shoulders; the term
is a wide one, ranging from a light band of silk, muslin or other
material worn by women as a decorative part of their costume
to a warm knitted muffler of wool to protect the throat from
cold. The O. Eng. scarf meant a piece or fragment of any-
thing, and is to be referred ultimately to the root skar-, to cut;
seen in Dutch skerf, shred, Ger. Scherbe, potsherd, "scrap," a
piece or fragment; "scrip," a piece of leather, hence a pouch
or wallet. The particular meanings in English are to be referred
to Fr. escharpe, pilgrim’s wallet, also scarf. The ecclesiastical
"scarf" was originally a loose wrap or muffler (bend) to be worn
round the neck out of doors. In the English Church, in
post-Reformation times, the minister wore over the surplice the
"scarf," which was a broad band of black silk with fringed
ends arranged like the stole round the neck, but falling nearly
straight down the back. Its use was removed entirely by that
of the stole (p.p.), with which it has sometimes been wrongly
confused.

Ultimately from the same root, but directly adapted from the
Scandinavian, cf. Swed. skarf, joint, is the use of the word
"scarf," in carpentry and joinery, for a joint by which two
timbers are fastened together longitudinally so as to form a
continuous piece (see JOINERY).

SCARLETTI, ALESSANDRO (1659-1725), Italian musical
composer, was born in Sicily, either at Trapani or Palermo, in
1659. He was generally known as "Paolo Alessandri" or "Paolo
Alessandro" in Rome, and there is reason to suppose that he had some
connection with northern Italy, since his early works show the
influence of Stradella and Legrenzi. The production at Rome of
his opera GlE Equisoci nell amor (1709) gained him the
protection of Queen Christina of Sweden, and he became her
Maestro di Cappella. In February 1683 he became Maestro
di Cappella to the viceroy of Naples, through the intrigues of
his sister, an opera singer, who was the mistress of an influential
noble in that city. Here he produced a long series of operas,
remarkable chiefly for their fluency, as well as for the
harmonic and dramatic invention. In 1702 he moved to Naples and did not return until the
Spanish domination had been superseded by that of the
Austrians. In the interval he enjoyed the patronage of
Ferdinand III. of Tuscany, for whose private theatre near
Florence he composed operas, and of Cardinal Ottoboni, who
made him his Maestro di Cappella, and procured him a similar
post at the church of S Maria Maggiore in Rome (1703).
After visiting Venice and Urbino in 1707, he took up his duties at
Naples again in 1708, and remained there until 1717. By this
time Naples seems to have become tired of his music; the
Romans, however, and others down to Carafa of the
Cappella in Rome who that he produced some of his finest operas
(Tedemaco, 1718; Marco Attilio Regolo, 1719; Griselda, 1721),
as well as some noble specimens of church music, including
a mass for chorus and orchestra, composed in honour of St
Cecilia for Cardinal Acquaviva in 1721. His last work on a
large scale appears to have been the unfinished serenata for
the marriage of the prince of Stigliano (1723); he died at Naples
on the 24th of October 1725.

Scarlatti's music forms the most important link between the
tentative "new music" of the 17th century and the classical school
of the 18th, which culminated in Mozart. His early operas (GlE Equisoci nel sembraente (1679); L'Honest' negli amor (1680);
Pompeo (1683), containing the well-known airs "O cesso di
fanda" and "Togligetemi la vita amor," and others down to
about 1685) retain the older cadences in their recitatives, and a
considerable variety of neatly constructed forms in their charming
little arias, accompanied sometimes by the string quartet, treated
with careful elaboration, sometimes by the harpsichord alone.
By 1686 he had definitely established the "Italian overture" form
(second edition of Dal male ti bene), and had abandoned the ground
bass and the binary air in two stanzas in favour of the ternary or
da capo type of air. His best operas of this period are La Rosaura
(1690, printed by the Gesellschaft für Musikforschung), and Pirro e
Demetrio (1694), in which occur the songs "Rugiade e desolore,"
or "Tiranno, e perderei il cor mio (La mia vita e deh far
decempi)," influenced partly perhaps by the style of Bononcini
and probably more by the taste of the viceroyal court, his opera
becomes more conventional and common in method; while the
scoring is hard and crude, yet not without brilliancy (Eraclea, 1700),
the oboes and trumpets being frequently used, and
the violins often playing in unison. The operas composed for
Ferdinand de Medici are lost; they would probably have had
a more favourable idea of his style, his correspondence with
the prince showing that they were composed with a very sincere
sense of inspiration. Mitridate Eupatore, composed for Venice in
1707,
SCARLET—SCARLET FEVER

SCARLET, a vivid, bright red colour, somewhat inclined to orange. The word appears in most European languages; cf. Ger. Scharlach, Swed. skarlatan, Ital. scarlatto, &c.; the English form is an adaptation of the O. Fr. escarlate, mod. écarlate. The origin of these is to be found in the Persian sogan, meaning "broad-cloth." There are various forms, sagulat, sagülat, sagüé; this cloth was chiefly used for dresses, flags, large tents and trappings; hence the word is applied to its colour, and hence its name was applied to the colour.

SCARLET FEVER, or SCARLATINA, names applied indifferently to an acute infectious disease, characterized by high fever, accompanied with sore throat and a diffuse red rash upon the skin (see PARASITIC DISEASES). This fever appears to have been first accurately described by Sydenham in 1766, before which period it had evidently been confounded with smallpox and measles. Klein in 1885 isolated a streptococcus which he termed the streptococcus scarlatineae. The scarlatina is the chief habitat of the organism, though it has been found both by Klein and other observers in the discharges from the ears of scarlet fever patients. Mervyn Gordon also isolated from cases the streptococcus conglomeratus. It is possible that septic cases of scarlet fever are the result of a mixed infection.

The serum of patients has been found to contain agglutins to streptococci from cases of erysipelas, septicemia and puerperal fever, as well as to the streptococci scarlatineae. F. B. Mallory in 1904 published his discovery of "protozoonlike" bodies in the cells of the epidermis. Other pathological findings have not succeeded in failing to find them in the living. The contagion of scarlet fever takes place from a previous case either by the skin during the early stages of the disease or by the nasal or aural discharges of a patient. It may be conveyed by any article of clothing or furniture, or by any person that has been in contact with a scarlet fever patient. Infectivity may also take place through a contaminated milk supply, as in the Marylebone epidemic, 1885. Klein here found disorder in cows which he considers analogous to scarlatina and communicable to man.

The period of incubation in scarlet fever may be as short as one or two days, but in most instances it is probably less than a week. The invasion of this fever is generally sudden and sharp, consisting in rigor, vomiting and sore throat, together with a rapid rise of temperature and increase in the pulse. Occasionally, especially in young children, the attack is ushered in by convulsions. These premonitory symptoms usually continue for about twenty-four hours, when the characteristic eruption makes its appearance. It is the general rule that about the second day the redness, when once it appears all over the body, although it is not distinctly marked on the face. This rash consists of minute thickly-set red spots, which coalesce to form a general diffuse redness, in appearance not unlike that produced by a prostration of the skin. In some instances the redness is accompanied with small vesicles containing fluid. In ordinary cases the rash comes out completely in about two days, and it is then said to have "taken." In some cases the eruption is usually gone. The severity of a case is in some degree measured by the copiousness and brilliancy of the rash, except in the malignant varieties, where there may be little or no eruption. The tongue, which at first was furred, becomes about the fourth or fifth day denuded of its epithelium and acquires the peculiar "strawberry" appearance characteristic of this fever. The interior of the throat is red and somewhat swollen, especially the uvula, soft palate and tonsils, and a considerable amount of secretion exudes from the inflamed surface. There is also tenderness and slight swelling of the glands under the jaw. In favourable cases the fever departs with the appearance of the rash, but in many instances the rash proceeds to the commencement of the process of "desquamation" or peeling of the cuticle, which first shows itself about the neck, and proceeds slowly over the whole surface of the body. Where the skin is thin the desquamation is in the form of fine branny scales; but where it is thicker, as about the hands and feet, it comes off in large pieces, which sometimes assume the form of casts of the fingers or toes. The duration of this process is variable, but it is rarely complete before the third week, and is not infrequently gone on for several weeks beyond that period. It is during this stage that complications are apt to appear.

Scarlet fever shows itself in certain well-marked varieties, of which the following are the chief—

1. **Scarlatina Simplex** is the most common form in which this symptom occurs, and both Latin and English names, and the condition usually runs a favourable course. In some rare instances it would seem that the evidences of the disease are so slight, as regards both fever and rash, that they escape observation and only become known by the
patient subsequently suffering from some of the complications associated with it. In such cases the name latent scarlet fever (scarlatina) is properly applicable.

2. Septic Scarlatina or Scarlatina Anginosus is a more severe form of the fever, particularly as regards the throat symptoms. The rash may be well marked or not, but it is often slow in developing and in some instances may be entirely absent. The tongue is thickened and covered with a thick white coating, the uvula and soft palate being swollen and ulcerated, or having upon them membranous patches not unlike those of diphtheria, while exudations, which become tinged in the course of the disease with a slight yellowish or greenish tinge, and not unfrequently become the seat of abscesses. There is difficulty in opening the mouth; an acrid discharge exudes from the nostrils and excoriates the lips; and the countenance is pale and wax-like. The edges of the teeth are also affected, and the gradual development of the symptoms of acute septicemia, with sweating, albuminuria, delirium and septic rigor.

3. Toxic or ataxic scarlatina (scarlatina maligna). In this form the general symptoms are similar to those of the acute form, and the patient may even die therewith before the typical symptoms of the disease have had time to manifest themselves.

The typically malignant forms are those in which the attack sets in with great violence and the patient sinks from the very first. In such instances the rash either does not come out at all or is of the slightest amount and of livid rather than scarlet appearance, while the throat symptoms are often not prominent. A further example of a malignant form is occasionally observed in cases where the rash, which had previously been well developed, suddenly recedes, and consequently the fever persists, with the death of the patient from septicemia.

The complications and effects of scarlet fever are amongst its most important features in this disease, although their occurrence is exceptional. The most common and serious of these is inflammation of the membranes of the ears (otitis media). This disease is frequently associated with the infection of the ears in the scarlet fever, but is specially apt to appear in the convalescence, when desquamation is in progress. Its onset is sometimes announced by a return of feverish symptoms, accompanied with vomiting and pain in the joints; but in a large number of instances it occurs without these, and comes on insidiously. One of the most prominent symptoms is slight swelling of the face, particularly of the eyelids, which is rarely absent. If the eyelids are arranged in the form of pouches, the presence of a liquid containing blood, epithelium, &c., testifies to a condition of acute inflammation of the kidney (glomerular and tubal nephritis). Occasionally this condition does not wholly pass off, and consequently lai the death from the direct effect of the disease.

Muco-purulent minnorrhoea and also rheumatism are others of the more common complications or results of scarlet fever, while suppuration of the ears is due to the extension of the inflammatory process from the throat along the Eustachian tube into the middle ear. This not unfrequently leads to permanent ear-discharge, with deafness from the disease attacking the inner ear and temporal bone, a condition implying a degree of rick pulling and internal derangement that is fatal. The lungs, heart, kidneys, placenta, vulva, and the lymphatic glands in the breasts, neck, axilla, jaws, heart, lungs, pleura, &c., occasionally arise in connexion with scarlet fever, but they are of less common occurrence than those previously mentioned.

In the treatment of scarlet fever, one of the first requirements is the isolation of the case, with the view of preventing the spread of the disease. In the convalescence, with the view of preventing the treatment of an acute form of the disease. In the convalescence, with the view of preventing the treatment of an acute form of the disease.

As to general management during the progress of the fever, in favourable cases little is required beyond careful nursing and feeding. The diet all through the fever and convalescence should be of light character, consisting mainly of milk food. Soups and broths should be avoided as far as possible, as they increase the frequency of nephritis. During the febrile stage a useful drink may be made by a weak solution of chlorate of potash in water (1 drachm to the pint), and of this the patient may partake freely. This solution should be persisted in every day, according to a weak solution, and sucking ice often relieves local discomfort. Should the lymphatic glands be enlarged and tender, they should be&&.

If we now consider the sites of the other considerations, we may see that the patient had conceived the idea of the Roman comique, the first part of which was printed in 1641. In 1645 was performed the comedy of Jodelet, ou le maître valet, the name of which was derived from the actor who took the principal part. Jodelet was the first of many French plays in which the humour depends on the valet who takes the part of master, an idea that Scarlott borrowed from the Spanish. After a short visit to Le Mans in 1646, he returned to Paris, and worked hard for the bookseller Quinet, calling his works his "marquisat de Quinet." He had
also a pension from Fouquet, and one from the queen, which was withdrawn because he was suspected of Frondent sentiments. When Mazarin received the dedication of Typhon coldly, Scarron changed it to a burlesque on the minister. In 1651 he definitely took the side of the Fronda in a Mazarinade, a violent pamphlet. He now had no resources but his "marquisat."

In his early years he had been something of a libertine. In 1649 a penniless lady of good family, Céleste Palaisseau, kept his house in the Rue d'Enfer, and tried to reform the gay company which assembled there. But in 1652, sixteen years after he had been discovered among the ranks of the Sabran, the barefoot girl without beauty and no fortune, Françoise d'Aubigné, after-wards famous as Madame de Maintenon (q.v.), Scarron had long been able to endure life only by the aid of constant doses of opium, and he died on the 6th of October 1666.

Scarron's work is very abundant and very unequal. The piece most famous in his own day, his Virgile transiis (1648-1653), is now thought a somewhat ignoble waste of singular powers for burlesque. But the Roman comique (1654-1657) is a work of the merit of which is denied by no competent judge. Unfinished, and a little desultory, this history of a troop of strolling actors is almost the first French novel, in point of date, which shows real power of painting manners and character, and is singularly vivid. It is in the style of the Spanish picaresque romance, and furnished Théophile Gautier with the word of which he speaks of the spirit of Don Quixote. Scarron also wrote some shorter novels: La Précéadre insuline, which inspired Sedaine's Gageure impropre; Les Hypocrites, to which the English translation is the origin of the word hypocrite. Of his playe Jodelle (1648) and Don Japhet d'Arménie (1653) are the better.

The most complete edition of his works is by La Martinière, 1737 (10 vols., Amsterdam). The Roman comique and the Enéide imitée were over 500 years later restored by Alphonse de Gérando. In 112 he was one of the contemporary notices of Scarron, which contained in the Historiettes of Tallemant des Réaux is the most accurate. The most important modern works on the subject are Scarron et le genre burlesque by Paul Scarron, and the French translation by J. J. Jussierand in English, prefixed to his edition of The Comical Romance and other tales by Paul Scarron, done into English by Tom Brown of Shifnal, John Roberts, and John Scauro, published in 1837, while the edition of A. d'Aubigné d'après documents nouveaux (1894) by A. de Boislaire is the best.

SCAP, the wild-fowler's ordinary abbreviation of SCAP-DUCK, meaning a duck so called "because she feeds upon Scap, i.e. broken shell-fish," as may be seen in F. Willughby's Ornithology (p. 365); but it would be more proper to say that the name comes from the "mussel-scaps," or "mussel-scalsps," the beds of rock or sand on which mussels are aggregated. It is the Anas marila of Linnaeus and Fulgula marila of modern systematic writers. At the same time he has a third around the coasts of most parts of the northern hemisphere, repairing inland in spring for the purpose of reproduction, though so far as is positively known hardly but in northern districts, as Iceland, Lapland, Siberia, and the fur-countries of America. The scap-duck has considerable likeness to the pochard (q.v.), both in habits and appearance; but it much more generally affects salt-water, and the head of the male is black, glossed with green; hence the name of "Black-head," by which it is commonly known in North America, where, however, a second species or race, smaller than the ordinary one, is also found, the Fuligula affinis. The female scap-duck can be readily distinguished from the dun-female pochard by her broad white face.

SCAURUS, MARCUS AEMILIUS (c. 165-88 B.C.), Roman statesman, was a member of a great patrician family which had sunk into obscurity. His father had been a coal-dealer, and he himself had thought of becoming a money-changer, but finally decided in favour of a political career. Having served in the army in Spain and Sardinia, he became curule aedile, praetor and (after an unsuccessful attempt in 117) consul in 115. During his consilium he celebrated a triumph for his father, who was a very abundant land around the coasts of most parts of the commission senters to Africa to arrange the dispute between Jugurtha and Adherbal. When a special committee was appointed to examine the charges of venality in their dealings with Jugurtha brought against the Roman representatives, Scaurus, who was equally guilty with the rest, was especially active in promoting the establishment of the committee, and even managed to get himself put at the head of it. He thus saved himself, but his intercession on behalf of the other offenders was of no avail. In 109 Scaurus was censor, and constructed the Via Aemilia and restored the Mulvian bridge. In 104 he superseded Saturninus (q.v.) in the management of the corn supply at Ostia.

During all his life Scaurus was a firm adherent of the moderate aristocratical party, which frequently involved him in quarrels with theardeur and the orators. The Venalities of Dionysius of Hanno, for instance, caused him much trouble. Though not a great orator, his speeches were weighty and impressive. His wife was Caecilia Metella, who after his death married Quintus Sulla. His daughter Aemilia was the wife of Manius Claudius Glabrio, and subsequently of Pompey, the triumvir.

See Sallust, Jugurtha; Orelli's Onomastikon Tullianum; Asconius, in Scaurus; Aurelius Victor, De viris illustribus, 72; A. H. J. Grote, History of Greece, 1. 296; and M. G. Bloch, Mélanges d'histoire ancienne, i. (1906).

MARCUS AEMILIUS SCAURUS, his son, served during the third Mithradatic War (74-61 B.C.) as quaestor to Pompey, by whom he was sent to Judaea to settle the quarrel between Hyrcanus and Aristobulus. Scaurus decided in favour of the latter, who was able to offer more money. On his arrival in Syria, Pompey reversed the decision, but, ignoring the charge of bribery brought against Scaurus, left him in command of the district. An incidental campaign against Aretas, king of the Nabataeans, was ended by the capture of the town of Shihab, and the payment of 30,000 talents by Aretas to secure his possessions. This agreement is represented on coins of Scaurus—Aretas kneeling by the side of a camel, and holding out an olive branch in an attitude of supplication. As curule aedile in 58, Scaurus celebrated the public games on a scale of magnificence never seen before. Animals, hitherto unknown to the Romans, were exhibited in the circus, and an artificial lake (euxiprus) was made for the reception of crocodiles and hippopotamuses. One of the greatest curiosities was a huge skeleton brought from Joppa, said to be that of the monster to which Andromeda had been exposed. A wooden theatre was erected on the occasion, capable of holding 80,000 spectators.

In 56 Scaurus was praetor, and in the following year governor of Sardinia. On his return to Rome (54) he was accused of extortion in his province. Cicero and five others (amongst them the famous Q. Hortensius) undertook his defence, and, although there was no doubt of his guilt, he was acquitted. During the same year, however (according to some, two years later, under Pompey's new law), Scaurus was condemned on a charge of illegal practices when a candidate for the consulship. He went into exile, and nothing further is heard of him.

SCAURUS, QUINTUS TERENTIUS, Latin grammerian, flourished during the reign of Hadrian (Aulus Gellius xi. 13). He was the author of an Ars grammatica and commentaries on Plautus, Virgil's Aeneid and probably Horace. Under his name two fragments are extant—the longer from his work on orthography (De orthographia), the shorter (chiefly on the use of prepositions) from another grammatical work.

SCAVENGER, now one who cleans the streets, removes refuse, generally a workman employed by the local public health authority (see Public Health). The name is properly "scaverger" or "scaverger" (the n being intrusive as in "passenger" and "messageer"), an official who was concerned with the receipt of custom duties and the inspection (scavage) of imported goods. The "scavagers" are found with such officials of the City of London as almoners, beadle, &c., in the Liber Almoniarius, which contains the Aemilia Gildk Calderons Londonensis, ed. Riley). These officials seem to have been charged also with the cleaning of the streets, and the name superseded the older raker or for those who performed this duty. Skeat takes "scavage" to be a Low French corruption of "showage," spelled variously as scawage, sceage, &c., and, therefore, to be derived from "show," to exhibit for inspection.

1 The view that he was consul again in 108 is disproved by Bloch (see biblio).
SCAVENGER'S DAUGHTER—SCEPTICISM

SCAVENGER'S DAUGHTER (corruption of Skevington's or Skeffington's Daughter), an instrument of torture in use during the 16th century in England. It was invented by Sir W. Skevington, lieutenant of the Tower in the reign of Henry VIII. It consisted of a wide iron hoop which by means of screws was tightened round the victim's body until the blood was forced from the nose and ears, and sometimes even from the hands and feet.

SCENE (Fr. scène, Lat. scena, Gr. σκηνή, a tent or booth, a stage or scene), a word of which the various applications, figurative or otherwise, are derived from its original meaning of the stage or platform in the Greek or Roman theatre together with the structure that formed the background. Thus "scene" was formerly used, as "stage" is to-day, of the actor's profession or of dramatic art; and of the actual performance or representation on the stage, still surviving in such phrases as "the scene opens" or "closes." It is also applied, actually and figuratively, to the place where the action of a play or any series of events take place, and so of any episode or situation in a novel or other narrative or description of events; from this the transition to an excited or violent exhibition of feeling between two or more persons is easy.

Of the specific applications of the word to the drama the main examples are (1) to a division of the play, marked by the fall of the curtain, the "scene" being a subdivision of an act," where the play is thus divided, or where there are no acts, of the divisions themselves; (2) to the material which forms the view of the place where the acts of the play are supposed to be performed, used in the painted cloths, slides and other apparatus, known as the "scenery," a word which has thus been transferred to a view generally, the appearance of the feature of a natural landscape. Allied words are "scena," used only in music, and "scenical," signifying a dramatic system of accompaniment, forming part of an opera or as an individual composition; and "scenario," a full outline of a play or opera, giving details of the acts, scenes, actors, situations, stage-business, &c.

SCENT, an odour or smell, particularly a fragrant liquid distilled from flowers, &c., used as a perfume (see Perfumery). The word should be properly spelled "sent," and is derived from the Mid. Eng. verb senden, to scent, to perceive by the sense of smell, Fr. sentir, Lat. sentire, to perceive by the sense. The intrusive c appears in the 17th century, and is paralleled by the same in "scythe" for sythe. For the physical causes of the sensation caused by a scent see Smell, and for the anatomy of the organs concerned see Olfactory System.

SCEPTICISM (σεπτικός, I consider, reflect, hesitate, doubt), a term signifying etymologically a state of doubt or indecision in the face of mutually conflicting statements. It is implied, moreover, that this doubt is not merely a stage in the road to true knowledge, but rather the last result of investigation, the conclusion that truth or real knowledge is unattainable by man, and that critical systems, the intrusion of the senses, and the appliance of the sense of smell are, as it were, the food of scepticism. Accordingly, we find that sceptical thought did not make its appearance till a succession of mutually inconsistent theories as to the nature of the real had suggested the possibility that they might all alike be false.

The Sophists. The Sophistic epoch of Greek philosophy was, in great part, such a negative reaction against the self-confident assertion of the nature-philosophies of the preceding age. Though scepticism as a definite school may be said to date only from the time of Pyrrho (q.v.) of Elis, the main currents of Sophistic thought were sceptical in the wider sense of that term. The Sophists (q.v.) were the first in Greece to dissolve knowledge into individual and momentary opinion (Protagoras), or dialectically to deny the possibility of knowledge (Gorgias). In these two examples we see how the weapons forged by the dogmatic philosophers, to assist in the establishment of their own theses are sceptically turned against philosophy in general. As every attempt to rationalize nature implies a certain process of criticism and interpretation to which the data of sense are subjected, and in which they are, as it were, transcended, the antithesis of reason and sense is formulated early in the history of the Sophists. The Sophists do not reject it as absolute, but they impose the imprecation of the veracity of the senses in the interest of the rational truth proclaimed by the philosophers in question. Among the pre-Socratic nature-philosophers of Greece, Heraclitus and the Eleatics are the chief representatives of this polemic. The diametrical opposition of the grounds on which the veracity of the senses is impugned by the two philosophies (see Heraclitus, Parmenides, Eleatic School) was in itself suggestive of sceptical reflection. Moreover, the arguments by which Heraclitus supported this theory of the unverifiability of his propositions, was employed by Protagoras to undermine the possibility of objective truth, by dissolving all knowledge into the momentary sensation or persuasion of the individual. The idea of an objective flux, or law of change constituting the reality of things, is abandoned, and subjective points of sense alone remain—which is tantamount to eliminating the real from human knowledge.

Still more unequivocal was the sceptical nihilism expressed by Gorgias (q.v.)—(1) nothing exists; (2) if anything existed, it would be beyond our knowledge; (3) it would be impossible to communicate. His arguments were drawn from the dialectic which the Eleatics had directed against the existence of the phenomenal world. But they are no longer used as indubitable proofs of the non-existence of the phenomena, but are the obiter dicta given by most of the Sophists to rhetoric, their cultivation of a subjective readiness as the essential equipment for life, their substitution of persuasion for conviction, all mark the sceptical undertone of their teaching. This attitude of indifference to real knowledge passed in the younger and less reputable generation into a corroding moral scepticism which recognized no good but pleasure and no right but might.

The scientific impulse communicated by Socrates was sufficient to drive scepticism into the background during the great age of Greek philosophy (i.e. the hundred years preceding Aristotle). But the Megarian school (q.v.) was indeed in some cases closely related to sceptical results. The school had been considered with some truth to form a connecting link with the later scepticism, just as the contemporary Cynicism and Cyrenaicism may be held to be imperfect preludes to Stoicism and Epicureanism. The extreme nominalism of some of the Cynics also, who denied the possibility of any but identical judgments, must be similarly regarded as a solvent of knowledge. But with these insignificant exceptions it holds true that, after the sceptical wave marked by the Sophists, the happiness or satisfaction of life was to be found in activity and the observance of the Socratic impulse in Aristotle.

Scepticism, as a distinct school, begins with Pyrrho of Elis, who maintained that knowledge of things is impossible and that we must assume an attitude of reserve (ἐρωτευόμενος). The Pyrrhonists were certainly sufficient to extend their distrust even to their own principle of doubt. They thus attempted to make their scepticism universal, and escape the reproach of basing it upon a fresh dogmatism. Mental imperturbability (άραξαρξ) was the result to be attained by cultivating such a tranquil state of mind. The happiness or satisfaction of life was the end which dominated this scepticism as well as the contemporary systems of Stoicism and Epicureanism, and all three philosophies place it in tranquillity or self-centred indifference. It is men's opinions or unwarranted judgments about things, say the sceptics, which betray them into desire, and painful effort and disappointment. From all this a man is delivered who abides from judging one state to be preferable to another. But, as complete inactivity would have been synonymous with death, it appears to have been admitted that the sceptic, while retaining his consciousness of the complete uncertainty enveloping every step, might follow custom in the ordinary affairs of life.

The scepticism of the New Academy (more strictly of the Middle Academy, under Arcesilaus and Carneades) differed very little from that of the Pyrrhonists. The differences
asserted by later writers are not borne out on investigation. But the attitude maintained by the Academicians was chiefly that of a negative criticism of the views of others, in particular of the somewhat crude and imperious dogmatism of the Stoics. They also, in the absence of certainty, allowed a large scope to probability as a motive to action, and defended their doctrine on this point with greater care and skill. The whole position was stated with more urbanity and culture, and was supported, by Carneades in particular, by argumentation at once more copious and more acute. It seems also true that the Academicians were less overborne than the Pyrrhonians by the practical issue of their doubts (imperturbability); their interest was more purely intellectual, and they had something of the old delight in mental exertion for its own sake (see ARCESILAS, CARNEADES, Aenesidemus, AGRIPP and SEXTUS EMPRICUS).

Both Zeller and Hegel remark upon the difference between the calm of ancient scepticism and the perturbed state of mind evinced by many modern sceptics. Universal doubt was the instrument which the sceptics of antiquity recommended for the attainment of complete peace of mind. By the moderns, on the other hand, doubt is adopted, and the objection is made that it is not only impractical but painful. Even Hume, in various passages of his Treatise, speaks of himself as recovering cheerfulness and mental tone only by forgetfulness of his own arguments. His state of universal doubt he describes as a "malady" or as "philosophical melancholy and delirium." The difference might easily be interpreted either as a sign of sentimental weakness on the part of the moderns or as a proof of the limitation of the ancient sceptics which rendered them more easily satisfied in the absence of truth. It seems to prove, at all events, that the ancient sceptics were more thoroughly convinced than their modern successors of the reasonableness of their own attitude.

It may be doubted whether the thoroughgoing philosophical scepticism of antiquity has any exact parallel in modern times, with the single exception possibly of Hume's Treatise on Human Nature. It is true we find many thinkers who deny the competency of reason when it ventures in any way beyond the sphere of experience, and such men are not uncommonly called sceptics. This is the sense in which Kant often uses the term, and the usage is adopted by others—for example, in the following definition from Ueberweg's History of Philosophy: "The principle of principle for the most part, a state of doubt with regard to the validity of all judgments respecting that which lies beyond the range of experience." The last characteristic, however, is not enough to constitute scepticism in the ancient sense. Scepticism, to be complete, must hold that even within experience we do not rationally conclude but are irrationally induced to believe. "In all the incidents of life," as Hume puts it, "we ought still to preserve our scepticism. If we believe that fire warms, or water refreshes, "it only because it costs us too much pains to think otherwise" (Treatise, bk. i. iv. 7). This tone, which fairly represents the attitude of ancient sceptics, is rare among the moderns, at least among those who are professed philosophers. It is more easily matched in the unscientific utterances of a man of the world like Montaigne.

2. One form of scepticism, however, may be claimed as an exclusively modern growth, namely, philosophical scepticism in the interests of theological faith. These sceptics are primarily Apologists. Their scepticism is simply a means to the attainment of a further end. They find that the dogmas of their church have often been attacked in the name of reason, and it may be that some of the objections urged have proved hard to rebut. Accordingly, in an access of practical rage, as it were, they turn upon reason to rend her. They endeavour to show that she is in contradiction with herself, even on matters non-theological. Thus the "imbecility" of reason becomes their warrant for the reception by another organ—i.e., faith—of that to which reason had raised objections. The Greeks had no temptation to divide man in two in this fashion. Their scepticism was an end in itself. But this line of argument was latent in Christian thought from the time when St. Paul spoke of the "foolishness" of preaching. So Tertullian: "Crucifixus est Dei filius; non pudet, quia pudendum est. Et mortuus est Dei filius; prorsus credibile est, quia ineptum est. Et sepultus resurrexit; certum est, quia impossibile est." But, as Christianity became firmly established, Christian writers became more tolerant of speculation, and laboured to reduce the doctrines of the church to a rational system. This was the long task essayed by Scholasticism; and, though the great Schoolmen of the 13th century refrained from attempting to rationalize such doctrines as the Trinity and the Incarnation, they were far from considering them as essentially opposed to reason. It was not till the Enlightenment towards the close of the middle ages that a sense of conflict between reason and revelation became widely prevalent and took shape in the essentially sceptical theory of the twofold nature of truth. Philosophical truth, as deduced from the teaching of Aristotle, it was said, directly contradicts the teaching of the church, which determines truth in theology; but the contradiction leaves the authority of the latter unimpaired in its own sphere. It is difficult to believe that this doctrine was ever put forward sincerely; in the most of the cases, perhaps, it was only a prelude to that intolerance by which they sought to cover their heterodoxy and evade its consequences. Rightly divining as much, the church condemned the doctrine as early as 1276. Nevertheless, it was openly professed during the period of the break up of Scholastic Aristotelianism (see POMPONAZZI).

The typical and by far the greatest example of the Christian sceptic is Pascal (1623-1662). The form of the Pensées forbids the attempt to evolve from their detached utterances a completely coherent system. For, though he declares at times "Le pyrrhonisme est le vrai," "Se moquer de la philosophie c'est vraiment philosopher," or, again, "Humiliez-vous, raison impuissante, taisez-vous, nature imbécile," other passages might be quoted in which he avers the refusal of reason within its own sphere. But what he everywhere emphatically denies is the possibility of reaching by the unassisted reason a satisfactory theory of things. Man is a hopeless enigma to himself, till he sees himself in the light of revelation as a fallen creature. The fall alone explains at once the nobleness and the meaness of humanity; Jesus Christ is the only solution in which the baffled reason can rest. These are the two points on which he insists. Faustus, if ever he could be made, was, in the judgment upon the mysteries of the faith, reason is unable to solve its own contradictions without aid from a higher source. In a somewhat similar fashion, Lamennais (in the first stage of his speculations, represented by the Essai sur l'indifférence en matière religieuse, 1817-1821) endeavoured to destroy all rational certitude in order to establish the principle of authority; and the same profound distrust of the power of the natural reason to arrive at truth is exemplified (though the allegation has been denied by the author) in Cardinal Newman. In a different direction and on a larger scale, Hamilton's philosophy of the conditioned may be quoted as an example of the same religious scepticism (see HAMILTON, SIR WILLIAM). The theological application and development of Hamilton's arguments in Mansel's Bampton Lectures On the Limits of Religious Thought marked a still more determined attack, in the interests of theology, upon the competency of reason.

Passing from this particular vein of sceptical or semi-sceptical thought, we find, as we should expect, that the downfall of Scholasticism and the conflict of philosophical theories and the religious confessions which ensued, gave a decided impetus to sceptical reflection. One of the earliest instances of this spirit is afforded by the book of Agrippa of Nettesheim (1487-1535). De incertitudine et vanitate scientiarum. This turn of thought is not confined, however, to Christian thinkers. In the late 17th century, e.g., in his Taháfat al-Filázhá ("The Collapse of the Philosophers") is the advocate of complete philosophical scepticism in the interests of orthodox Mahometanism—an orthodoxy which passed, however, in his own case into a species of mysticism. He did his work of destruction so thoroughly that Arabian philosophy died out after his time in the land of its birth.
Scepticism

Sceptical reflection rather than systematic scepticism is what meets us in the treatise of La Motte (1653). Kantian analysis, though the elaborate presentation of sceptical and relativistic arguments in his "Apologie de Raimond-Sebon" (Essai, ii. 12), and the emblem he recommends—a balance with the legend, "Que scez-vous?"—might allow us to adduce his native state of helplessness and inertia, he doubtedly his own habitual frame of mind is better represented in his celebrated saying—"How soft and healthful a pillower are ignorance and insensibility, . . . for a well-ordered head." More inclined that Montaigne than Protagoras, in his reflection, his friend Pierre Charron (1541-1603), who in his book De la sagesse systematized in somewhat scholastic fashion the train of thought which we find in the Exeget. François Sanchex (1652-1653), professor of medicine and philosophy in Toulouse, combated the Aristotelianism of the schools with much bitterness, and was the author of a book with the title Quod nihil situr. Of more or less isolated thinkers may be mentioned François de la Mothe le Vayer (1688-1762), whose Cinq Dialogues appeared after his death under the pseudonym of Orosius Tubero; Samuel Sorbière (1615-1670), who translated into Latin Pyrrhoneus, Ctenius Empiricus; Simon Foucher (1644-1696), canon of Dijon, who wrote a De l'Academic, and combated Descartes and Malebranche from a sceptical standpoint. The work of Hieronymus Hynthal of Prague (1617-1686) and Pierre Antoine Regis Dijon, called Censura scientiarum, or typho non sanx, was written in the interests of revelation. This is still more the case with the bitter polemic of Daniel Huet (1621-1671), Censura philosophiae Cartesianae, and his later work, Traite de l'idole. The first work of Joseph Glanvill (q.v.), which is set forth in his two works The Vanity of Dogmatizing (1662) and Scepticus scientiae (1666), has more interest for Englishmen than for sceptics. It is celebrated than any of the above was Pierre Bayle (1647-1706), whose sceptical inclination more in his keen negative criticism of all systems and doctrines which came before him as literary historian than in any theoretic views of his own as to the possibility of knowledge. Bayle also parodied the opposition between reason and revelation; but the argument in his hands is a double-edged weapon, and when he extols the merits of subsatisfaction his sincerity is at least questionable.

3. Hume is the most illustrious and indeed the typical sceptic of modern times. His scepticism is sometimes placed, as we have seen it is, by Kant, in his distrust of our ability and right to pass beyond the empirical sphere. But it is essential to the sceptical position that reason be dethroned within experience as well as beyond it, and this is undoubtedly the result at which Hume finally arrives. The Treatise is a reductio ad absurdum of the principles of Lockianism, inasmuch as these principles, when consistently applied, leave the structure of experience entirely "loosened" (to use Hume's own expression), or cemented together only by the irrational force of custom. Hume, if consistent, and he really rises from his thoroughly empiricist standpoint, with "sceptical" ideas left in by the senses, he never advances beyond these "distinct existences." Each of them exists on its own account; it is what it is, but it contains no reference to anything beyond itself. The very notion of objectivity and truth therefore disappears. Hume's analysis of the conceptions of a permanent world and a permanent self reduces us to the sensationalistic relativism of Pyrrhonas. He expressly puts this forward in various passages as the conclusion to which reason conducts us. The fact that the conclusion is in "direct and total opposition" to the assumptions of the senses is a fresh justification of philosophical scepticism. For, indeed, scepticism regarded to the senses is considered in the Inquiry to be sufficiently justified by the fact that they lead us to suppose "an external universe which depends not on our perception," whereas "this universal and primary opinion of all men is soon destroyed by the slightest philosophy." Scepticism with regard to reason, on the other hand, depends on an insight into the irrational character of the relation which we chiefly employ, viz. that of cause and effect. It is not a real relation in objects, but rather a mere attribute of the mind, suggested by frequent repetition or custom. This point of view is applied in the following words: All real connexion or relation, therefore, and with it all possibility of an objective system, disappears; it is, in fact, excluded by Hume ab initio, for "the mind never perceives any real connexion among distinct existences." Belief, however, just because it rests, has as been said, on custom and the influence of the imagination, survives such demonstrations. "Nature," as Hume delights to reiterate, "is always too strong for principle." "Nature, by an absolute and uncontrollable necessity, has determined us to judge as well as to believe; and this true philosopher, therefore, is not the Pyrrhonist, trying to maintain an impossible equilibrium or suspense of judgment, but the Academic, yielding gracefully to the impressions or maxims which he finds, as matter of fact, to have most sway over himself.

The system of Kant, or rather that part of his system expounded in the Critique of Pure Reason, though expressly distinguished by its author from scepticism, has been included by many writers in their survey of sceptical theories. The difference between Kant, with his system of pure scepticism, and any of the thinkers we have passed in review is obvious; and his limitation of reason to the sphere of experience suggests itself in the title of agnostic or positivist rather than that of sceptic. Yet, if we go a little deeper, there is substantial justification for the view which treats agnosticism of the Kantian type as essentially sceptical in its foundations and in its results. For criticism not only limits our knowledge to a certain sphere, but denies that our knowledge within that sphere is real; we know things as they actually are, but only as they appear to us. But this doctrine of relativity really involves a condemnation of our knowledge (and of all knowledge), that it is false to realize an impossible and self-contradictory ideal. The man who impeaches the knowing faculties because of the fact of relation which they involve is pursuing the phantom of an apprehension which, as Lotze expresses it, does not apprehend things, but is itself things; he is desiring not to know but to be the things themselves. If this dream or prejudice be exploded, then the scepticism originating in it—and a large proportion of the sceptical thought does so originate—loses its raison d'être. The prejudice, however, which meets us in Kant, is in a somewhat different form, the same prejudice which is found in the tropes of antiquity—what Lotze calls the "inaudible relation of the word of ideas to a foreign world of objects." For, as he rightly points out, whether we suppose idealism or realism to be true, in neither case do the things themselves pass into our knowledge. No standpoint is possible from which we could compare the world of knowledge with such an independent world of things, in order to judge of the conformity of the one to the other. To ask an abstract doubt "whether all things may not be quite other than they really are" involves the rejection of our thought they necessarily appear is a scepticism which, though admittedly irreparable, is as certainly groundless. No arguments can be brought against it, simply because the scepticism rests on nothing more than the empty possibility of doubting. This holds true, even if we admit the "independent" existence of such a world of things. But the independence of things may with much greater reason be regarded as itself a fiction or prejudice. The real "objective" to which our thoughts must show conformity is not a world of things in themselves, but the system of this world (if it has one) which scepticism is deprived of its persistent argument if it is seen that, while clear individual experiences are to be judged by their coherence with the context of experience in general, experience as a whole does not admit of being judged by reference to anything beyond itself.

To the attack upon the possibility of demonstration, inasmuch as every proof requires itself a fresh proof, it may quite fairly be retorted that the contradiction really lies in the demand

---

* Much the same conclusion is reached in what is perhaps the ablest English exposition of pure philinological scepticism since Hume—A. J. Balfour's Defence of Philosophical Doubt (1879). It may be as well to add that the sceptical side of Kantianism is mainly confined to the Critique of Pure Reason; but this side of Kantian thought has been most widely influential. The remarks above would not apply to the coherent system of Idealism which may be evolved from Kant's writings, and which many would consider alone to deserve the name of Kantianism or Criticism.
for proof of the self-evident, on which all proof must ultimately depend. It is of course always possible that in any particular case we may be deceived; we may be assuming as self-evidently true what is in reality not so. But such incidental lapses are found to correct themselves by the consequences in which they involve us, and they have no power to shake our trust in the general validity of reason. It may, however, be granted that the possibility of lapse throws us open to the objections, ingenious or disingenuous, of the sceptic; and we must remain exposed to them so long as we deal with our first principles as to many isolated axioms or intuitions. But the process of self-correction referred to points to another proof—the only ultimately satisfactory proof of which first principles admit. Their evidence lies in their mutual interdependence and in the coherence of the system which they jointly constitute.

Of a scepticism which professes to doubt the validity of every reasoning process and every operation of all our faculties it is, of course, as impossible as it would be absurd to offer any refutation. This absolute scepticism, indeed, can hardly be regarded as more than an empiric position which they would indicate is not one which has ever existed. In any case, such scepticism is at all times sufficiently refuted by the imperishable and justifiable trust of reason in itself. The real function of scepticism in the history of philosophy is relative to the dogmatism which it criticizes. And, as a matter of fact, it has been seen that many so-called sceptics were rather critics of the effect systems which they found cumbering the ground than actual doubters of the possibility of knowledge in general. And even when a thinker puts forward his doubts as absolute, his scepticism is as bound to regard it in the same light. The progress of thought may show it to be, in truth, relative, as when the nerve of Hume’s scepticism is shown to be his thoroughgoing empiricism, or when the scepticism of the Critique of Pure Reason is traced to the unwarrantable assumption of things-in-themselves. When the assumptions on which it rests are proved to be baseless, the particular scepticism is also overcome. In like manner, the apparent antinomies on which such a scepticism builds will be found to resolve themselves for a system based on a deeper insight into the nature of things. The serious thinker will always repeat the words of Kant that, in itself, scepticism is “not a permanent resting-place for human reason.” Its justification is relative, and its function transitory.

AUTHORITIES.—Ancient scepticism is fully treated in the relative parts of Zeller’s Philosophie der Griechen. See also works quoted in the following pages.

SCEPTRE. A rod or staff has always been regarded as a token of authority. Among the early Greeks the sceptre (σκέπτωρ) was a long staff used by aged men (II. xviii. 416, Herod. 1. 160), and came to be used by judges, military leaders, priests and others. It is represented on painted vases as a long staff tipped with a metal ornament, and is borne by some of the gods. Among the Etruscans, however, it was a staff with a cross, and was used by kings and upper orders of the priesthood, and many representations of such sceptres occur on the walls of the painted tombs of Etruria. The British Museum, the Vatican and the Louvre possess Etruscan sceptres of gold, most elaborately and minutely ornamented. The Roman sceptre was probably derived from the Etruscan. Under the Republic an ivory sceptre (sceptrum dornseum) was a mark of consulary rank. It was also used by victorious generals who received the title of imperator, and it may be said to survive in the marshal’s baton. Under the empire the sceptrum Augusti was specially used by the emperors, and was often of ivory tipped with a golden eagle. It is frequently shown on medallions of the later empire, which have on the obverse a half-length figure of the emperor, holding in one hand the sceptrum Augusti, and in the other the orb surmounted by a small figure of Victory.

With the advent of Christianity the sceptre was often tipped with a cross, and thus it continued to the middle ages the finials on the top of the sceptre varied considerably. In England from a very early period two sceptres have been concurrently used, and from the time of Richard II. they have been consecrated with a cross and a dove respectively. In France the royal sceptre was tipped with a fleur de lys, and the other, known as the main de justice, had an open hand of benediction on the top. Sometimes the sceptre was designed on a small scale as were the sceptres of the emperors, viz. on royal seals, as on the great seal of Edward III., where the king, enthroned, bears such a sceptre, but it was an unusual form; and it is of interest to note that one of the sceptres of Scotland, preserved in Edinburgh Castle, has such a hand above the orb. The sceptres of St. Andrew and St James in it. This sceptre was, it is believed, made in France about 1536, for James V. Great seals usually represent the sovereign enthroned, holding a sceptre (often the second in dignity) in the right hand, and the orb and cross in the left. Harold is so depicted on the Bayeux tapestry.

The earliest coronation form of the 9th century mentions a sceptre (sceptrum), and a staff (bacillum). In the so-called coronation form of Ethelred II. a sceptre (sceptrum), and a rod (virga) are named, and this is also the case with a coronation form of the 12th century. In a contemporary account of Richard I.’s coronation the royal sceptre is described as having a gold cross, and the gold rod (virga) with a gold dove on top, are mentioned for the first time. About 1450 Sporley, a monk of Westminster, compiled a list of the relics there. Among these he described the sceptre of St. Edward the Confessor, and left by him for the coronations of his successors. A golden sceptre, a wooden staff and an iron rod are named. These survived till the Commonwealth, and are minutely described in the Register of the regalia drawn up in 1649, when everything was destroyed.

For the coronation of Charles II. new sceptres were made, and though slightly altered, are still in use. They are a sceptre with a cross and orb, and the Edwardian cross, or sceptre, or staff with a cross of gold on the top called St Edward’s staff. To these, two sceptres for the queen, one with a cross, and the other a gold staff, have been subsequently added.

See Cyril Davenson, The English Regalia (London, 1875); Lechard Wickham-Legg, English Coronation Records; The Ancestor, Nos. 1 and 2 (1902); Menin, The Form, Etc., of Coronations (English translation, 1797).

SCÉVE, MAURICE (c. 1500-1564), French poet, was born at Lyons, where his father practised law. Besides following his father’s profession he was a painter, architect, musician and poet. He was the centre of the Lyonnais coterie that elaborated the theory of spiritual love, derived partly from Plato and partly from Petrarch, which was enunciated in Antoine Heroët’s Parfaite Ame.

Scève’s chief works are Délle, objet de plus hailli vertu (1544); two elegoes, Arion (1536) and La Sausaye (1547); and Le Microscope, a poem in 350 lines, written in 1545. The Délle consists of 450 divinities and about 50 other poems in praise of his mistress. These poems, now little read, were even in Scève’s own day so obscure that his enthusiastic admirer Étienne Dolet confesses he could not understand them. Scève was a musician as well as a poet, and cared very much for the musical value of the words he used. In this and in his erudition he forms a link between the school of Marot and the Pléiade. Délle (an anagram for l’âme) set the fashion of a series of poems addressed to a mistress real or imaginary, followed by Ronsard in Cassandra and by Du Bellay in Ôïsile, the Lyonnese school of which Scève was the leader included many of the leading names of that school and movement. See Jeanne Gaillarde—placed by Marot on an equality with Christine de Pisan—Pernette du Guillet, Clémence de Bourges and the poet’s sisters, Claudine and Sibylle Scève. Scève died in 1564. See also LABI, LOUISA.

SCHACK, ADOLF FRIEDRICH, GRAF von (1815-1864), German poet and historian of literature, was born at Brüswitz near Schwerin on the 2nd of August 1815. Having studied jurisprudence (1834-1838) at the universities of Bonn, Heidelberg and Berlin, he entered the Mecklenburg State service and was subsequently attached to the “Kammergericht” in Berlin. Tiring of official work, he resigned his appointment, and after travelling in Italy, Egypt and Spain, was attached to the court.
of the grand duke of Oldenburg, whom he accompanied on a journey to the East. On his return he entered the Oldenburg government service, and in 1849 was sent as envoy to Berlin. In 1852 he retired from his diplomatic post, resided for a while on his estates in Mecklenburg and then travelled in Spain, where he studied Moorish history. In 1855, he settled at Munich, where he was made member of the academy of sciences, and here collected a splendid gallery of pictures, containing masterpieces of German, French, Schwinté, Schinkel, Böcklin, Lenbach, &c. and which, though bequeathed by him to the Emperor William II., still remains at Munich and is one of the noted galleries in that city.

He died at Rome on the 14th of April 1894.

Schack was a most productive author; he wrote lyric poems (Gedichte, 1807, 6th ed. 1888); novels in verse, Durch alle Wetter (1813), 3rd ed. (1854); Geschichten von Edelgängern der Eisenbahn (1817); the tragedies Die Pianer (1872) and Wolfsburg und Der Johanniter (1887); and the political comedies, Der Kasserboke and Cacana (1873).

In 1845-1846, he published Geschichte der dramatischen Literatur und Kunst in Spanien (3 vols. 1845-1846, 2nd ed. 1854), Poesie und Kunst der Araber in Spanien und Sicilien (1865, 2nd ed. 1877), which are valuable contributions to literary history. He also produced some excellent translations, e.g. Spanisches Theater (1845); Heldensagen des Freuds (1851) and Stimmen vom Ganger (1857, 2nd ed. 1877). He also compiled the catalogue and history of his own picture gallery, Meine Gemälde und andere Kunstdenkmäler (1864), and published his Werke, were published in six volumes (1883, 3rd ed. in 10 vols. 1897-1899). Nachgelassene Dichtungen were edited by G. Winkler (1890). In 1851, his Nachfahren, Ein kurzer text zur Geschichte der Ausfischungen (3 vols. 1887, 3rd ed. 1894). Cf. further the accounts of Schack by F. W. Rogge (1883), E. Zabel (1884), E. Brenning (1885), W. J. Maassen (from the Dutch, 1889), and also L. Schadow, a distinguished name in the annals of German art.

I. JOHANN GOTTFRIED SCHADOW (1764-1850), sculptor, was born and died in Berlin, where his father was a poor tailor. His first teacher was an inferior sculptor, Tassaert, patronized by Frederick the Great; the master offered his daughter in marriage, but the pupil preferred to elope with a girl to Vienna, and the father-in-law not only condoned the offence but furnished money wherewith to visit Italy. Three years' study and R., he published Geschichte der dramatischen Literatur und Kunst in Spanien (3 vols. 1845-1846, 2nd ed. 1854), Poesie und Kunst der Araber in Spanien und Sicilien (1865, 2nd ed. 1877), which are valuable contributions to literary history. He also produced some excellent translations, e.g. Spanisches Theater (1845); Heldensagen des Freuds (1851) and Stimmen vom Ganger (1857, 2nd ed. 1877). He also compiled the catalogue and history of his own picture gallery, Meine Gemälde und andere Kunstdenkmäler (1864), and published his Werke, were published in six volumes (1883, 3rd ed. in 10 vols. 1897-1899). Nachgelassene Dichtungen were edited by G. Winkler (1890). In 1851, his Nachfahren, Ein kurzer text zur Geschichte der Ausfischungen (3 vols. 1887, 3rd ed. 1894). Cf. further the accounts of Schack by F. W. Rogge (1883), E. Zabel (1884), E. Brenning (1885), W. J. Maassen (from the Dutch, 1889), and also L. Schadow, a distinguished name in the annals of German art.

II. His eldest son, RUDOLPH SCHADOW (1786-1822), sculptor, was born in Rome, and had his father at Berlin for his first master. In 1810 he went to Rome and received kindly help from Canova and Thorvaldsen. His talents were versatile; his first independent work was a figure of Paris, and it had for its companion a spinning girl.

Embracing the Roman Catholic faith, he produced statues of John the Baptist and of the Virgin and Child. In England he became known by bas-reliefs executed for the duke of Devonshire and for the marquis of Lansdowne. His last composition, commissioned by the Duke of Devonshire, the life-sized figure of Achilles with the Body of Penthesilea; the model, universally admired for its antique character and the largeness of its style, had not been carried out in marble when in 1822 the artist died in Rome.

III. FRIEDRICH WILHELM SCHADOW (1789-1862), painter, was the second son of Johann Gottfried Schadow. In 1805-1807, he was in his uncle brother Rudolph to Rome. He became one of the leaders among the German pre-Raphaelites. Following the example of Overbeck and others, he joined the Roman Catholic Church, and held that an artist must believe and live out the truths he essays to paint. The sequel showed that Schadow was qualified to shine less as a painter than as a teacher and director.

The Prussian consul, General Bartholdi, befriended his young countryman, and invited him to give his first paintings a room in his house on the Pincian Hill. The artists engaged were Schadow, Cornelius, Overbeck and Veit; the subject selected was the story of Joseph and his brethren, and two scenes, the Bloody Coat and Joseph in Prison, fell to the lot of each. Schadow had in 1819 appointed professor in the Berlin Academy, and his ability and thorough training gained devoted disciples. To this period belong his Ein treuer Freund and Christus am Ölberg. In 1826 the professor was made a member of the Düsseldorf Academy. The high and sacred art matured in Rome Schadow transplanted to Düsseldorf; he re-organized the Academy, which in a few years grew famous as a village of northern Hungary, where his father was a Protestant clergyman. His first production was a volume of poems in Czech entitled The Muse of Tatra with a Slavonic Lyric (Levoca, 1814). In 1815 he began a course of study at the university of Jena, and while there translated into Czech the Clouds of Aristophanes and the Maria Stuart of Schiller. In 1817 he removed to Prague and joined the literary circle of which Dobrovsky, Jungmann and Hanka were members. From 1829 to 1833 he was master of the head school at Neusatz in the south of Hungary. There he studied Servian literature and antiquities and acquired many rare books and manuscripts, and published a collection of Servian folk-songs in collaboration with Kollar and others (1832-1827). In 1826 his Geschichte der slawischen Sprache und Literatur nach allen Mandurten appeared at Budapest (2nd ed., 1860). This book was the first attempt to give anything like a systematic account of the Slavonic languages as a whole. In 1833 he returned to Prague, where he spent the remainder of his life. There he published his Serbische Leserkörner oder historisch-kritisiche Beleuchtung der Serbischen Mundart, and in 1837 his great work Slawische Sprachen und Literaturen. "The Slavonic "languages" have been translated into Polish, Russian and German; a second edition (1863) was edited by J. Jireček. In 1840 he published in conjunction with Palacký Die ältesten Denkmäler der böhmischen Sprache. In 1837 poverty compelled him to accept the unofficial office of censor of Czech publications, which he abandoned in 1847 on becoming custodian of the Prague public library. In 1842 he published his Slovácký Národopis, in which he sought to give a complete account of Slavonic ethnology. He was also for some time conductor of the "Slovo", a "society for the advancement of all Slavonic "literatures" (-poukry) for the culture of Slavic "literature". In 1848 he was made professor of Slavonic philology in the university of Prague, but resigned in 1849. He was then made keeper of the university library. In 1857 he published Glagolitische Fragmente in collaboration with Hůber; but in the same year, as a result of overwork, ill health and family anxieties, he became insane. He was nevertheless continued in his appointment until his death. His collection of Slavonic books, Sebrání spisů, were published at Prague. 1862-1865; his Geschichte der südslawischen Literatur was edited by Jireček in 3 vols. (1864-1865).
SCHAFF—SCHAFFHAUSEN

SCHAFF, PHILIP (1810-1893), American theologian and church historian, was born in Chur, Switzerland, on the 1st of January 1810. He was educated at the gymnasium of Stuttgart, and at the universities of Tübingen, Halle and Berlin, where he was successively influenced by Baur and Schmid, by Tholuck and Julius Müller, by Strauss and, above all, Neander. In 1842 he was Privatdozent in the university of Berlin, and in 1843 he was called to become professor of church history and Biblical literature in the German Reformed Theological Seminary of Mercersburg, Pennsylvania, then the only seminary of that church in America. On his appointment he wrote an address in English, and also Pusey and other Tractarians. His inaugural address on The Principle of Protestantism, delivered in German at Reading, Pennsylvania, in 1844, and published in German with an English version by J. W. Nevin (q.v.), by his Neander-like view that Romanism and Protestantism were only stages in the divinely appointed development of the Christian Church, aroused fierce opposition in the Reformed Church and Schaff was characterized as "Puseyistic" and "semi-papistical"; in 1845 he was tried for heresy and found not guilty by the Synod. Opposition to him soon died out within his own denomination, but more active opposition was raised against his polemic champion, Nevin, and it had its source more in the Dutch (than in the German) Reformed Church, and even there was confined more to the New Brunswick school (i.e. the churchmen of the Dutch Reformed Theological Seminary in New Brunswick, New Jersey) and its English and Scottish members,—as late as 1856 J. J. Janeeway of New Brunswick published his Antidote to the Poison of Popery in the Writings and Conduct of Professors Nevin and Schaff. Schaff's broad views strongly influenced the German Reformed Church, through his teaching at Mercersburg, through his championship of English in German Reformed churches and schools in America, through his hymnal (1850), through his labours as chairman of the committee which prepared a new liturgy, and by his edition (1863) of the Heidelberg Catechism. His History of the Apostolic Church (in German, 1851; in English, 1853) and his History of the Christian Church (7 vols., 1853-1890), opened a new period in American study of ecclesiastical history. After 1864 his home was in New York City, where he was until 1890 secretary of the New York Sabbath Committee (which fought the "continental Sunday"), and was corresponding secretary of the American Evangelical Alliance, of which he was in 1866 a founder. In 1867 he opened the first German Sunday School in Stuttgart. In 1868-1867 he lectured on church history at Andover, and after 1869 taught at the Union Theological Seminary—as instructor in church history in 1869-1870, and professor of theological cyclopædia and Christian symbolism in 1870-1875, of Hebrew and cognate languages in 1873-1874, of sacred literature in 1874-1887, and of church history in 1887-1893. The English Bible Revision Committee in 1870 requested him to form a co-operating American Committee, of which he became president in 1871. He died in New York City on the 20th of October 1893. Working with the Evangelical Alliance and the Chicago (1893) World's Parliament of Religions, and in Germany, through the monthly Kirchenfreund, he strove earnestly to promote Christian unity and union; and it was his hope that the pope would abandon the doctrine of infallibility and undertake the reunion of Christianity. He recognized that he was a "mediator between German and Anglo-American theology and Christianity"; his theology was broad rather than definite, though he sharply disented from Nevin's mystical doctrine of the union in the eucharist of the believer with Christ's glorified body as well as his glorified soul. He edited (1864-1880) the American translation and revision of Lange's Bibelwerk, the great Schaff-Herzog Encyclopædia of Religious Knowledge (1884, 3rd ed. 1891); the first seven volumes of the Nicene and Post-Nicene Church Fathers in English (1886-1894); and the International Illustrated Commentary on the New Testament (4 vols., 1879-1883) and the International Revision Commentary (5 vols. 1881-1884), as far as the Epistle to Romans. His Bibliotheca symbolorum ecclesiae universalis: the Credos of Christendom (3 vols. 1877, 6th ed. 1893) was a pioneer work in English in the field of symbolics. His History of the Christian Church, already mentioned, resembled Neander's work, though less biographical, and was pictorial rather than philosophical. He wrote, besides, biographies, catechisms and hymnals for children, manuals of religious verse, lectures and essays on Dante, &c.

His son, DAVID SCHLEY SCHAFF (1852- ), was professor of church history in Lane Theological Seminary in 1870-1903, and after 1903 in Western Theological Seminary at Allegheny, Pa. He wrote a Commentary on the Book of Acts (1882) and a Life of the Prophet Isaiah (1882).

SCHAFFHAUSEN (Fr. Schaffhouse), the most northerly of the Swiss cantons, and the only one wholly (excepting the small hamlet of Burg, a suburb of Stein) north of the Rhine. It is divided into three detached portions by the grand-duchy of Baden, which surrounds it on all sides save that of the Rhine, which separates it from the cantons of Thurgau and of Zürich: by far the largest part is the region near the chief town, Schaffhausen, while to the south is the small isolated district of Rüdlingen and Buchberg (purchased in 1590), and to the east the more extensive tract around the old town of Stein on the Rhine (ceded by Zürich in 1798). With the Rhine Schaffhausen are two "enclaves," belonging politically to Baden—the village of Büssingen (just east of the chief town) and the farm of Veranahof, near Büttenhardt. The total area of the canton is 113.5 sq. m., of which 108.4 sq. m. are classed as "productive" (forests covering 46 sq. m., and vineyards 4 sq. m.). The main portion of the canton consists of the gently inclined plateau of the Randen (its highest point, 8300 ft., is at its north edge) that slopes towards the Rhine, and is intersected by several short gorges, separated by rounded ridges. The Rhine is navigable for several miles above Stein, and the town is on a two miles wide island, the most important city in the league of the Rhine, with a population of 41,454, of whom 40,290 were German-speaking, while 34,046 were Protestants, 7403 Romanists and 22 Jews. The inhabitants are devoted chiefly to agriculture (particularly fodder stuffs and wheat), but there are also cotton mills, silk weaving, linen, and lace factories. There are tile factories in the Reith region (N.E. of the capital). The canton is divided into six administrative districts, which comprise thirty-six communes. The cantonal constitution dates in its main features from 1787. The legislature or Grossrat is composed of members elected for four years in the proportion of one to every 500 (or fraction over 250) of the population, but only communes with more than 250 inhabitants form separate electoral circles, the smaller being united for electoral purposes with their greater neighbours. The executive or Regerungsrat of five members is also elected for four years by a popular vote, as are the two members of the Federal Nationalrat. One thousand citizens have the right of "initiative," as to legislative projects and important financial matters as well as to the revision of the cantonal constitution. Since 1893 the "obligatory referendum" for all legislative projects has been prevailing, as well as a curious institution (formerly existing in several cantons) by which the legislature can consult the people on certain questions involving principles and not merely fully drafted legislative projects. The taxes are very small, while the property of the canton is the most considerable in Switzerland, so that from a financial point of view Schaffhausen is the most favoured in the country, and till recently it had no public debt. The numerous forests are well managed and bring in much money.

The canton arose from acquisitions made at various dates from 1461 to 1798 by the town, which at the time of the Reforma- tion obtained possession of the outlying estates of the ecclesiastical foundations then suppressed. The most interesting spot in the canton is the little town of Stein, with its Benedictine monastery (1055-1326), now a sort of medieval museum, and the castle of Hohenklingen towering above it. (W. A. B. C.)
SCHAFFHAUSEN—SCHANDAU

SCHAFFHAUSEN, the capital of the Swiss canton of that name, situated entirely (for its suburb, Feuerthalen, is in the canton of Zürich) on rising ground above the right bank of the Rhine. Its streets are narrow (save in the modern quarters), while it is dominated by the fortress of Unnong (wrongly called Munoth). It is by rail 31 m. W. of Constance and 59 m. W. of Basel. It is a city of contrasts, medieval architecture of the true Swabian type and modern manufactures mingling curiously together. Its fortunes in London and from the old houses, though few have preserved traces of the frescoes which formerly adorned their external walls. The chief ancient building in the town is the Münster (now Protestant) of All Saints, formerly a Benedictine monastery. It was consecrated in 1052, and is a good specimen of the "sternest and plainest Romanesque, finished with a single side tower near the east end, that is architecturally connected both with Italian chapels and the so-called Anglo-Saxon towns of England" (E. A. Freeman). Close to it is the celebrated 13th-century bell that suggested Schall's name to his instrument maker. Imthurneum, and houses a theatre, a picture gallery, concert rooms and the school of music. There are a number of factories in the town, while at Neuhausen, its suburb, are aluminium works, railway rolling stock works and a manufactory of playing cards and railway tickets. Industrial development has been furthered by the hydraulic works for the utilization of the forces in the Rhine; founded 1865-1866 by H. Moser (1805-1874), a wealthy citizen, these are now the property of the town and since 1900 are worked by electricity. In 1900 the town had 15,275 inhabitants (14,684 German-speaking), while there were 11,144 Protestants and 4,085 Roman Catholics and 21 Jews.

The spot is first mentioned in 1045, "Villa Schafthausen," while in 1050 we hear of the "ford" there across the Rhine. Hence it is probable that the name "Schafthausen" is derived from scoepha, a skiff, as here goods coming from Constance were disembarked in consequence of the falls of the Rhine a little below. Some writers, however, prefer the derivation from Schaf (a sheep), as a ram (now a sheep) formed the ancient arms of the town, derived from those of its founders, the counts of Nellenburg. About 1050 those counts founded here the Benedictine monastery of All Saints, which henceforth became the chief church of the town. Perhaps as early as 1100, certainly in 1208, it was an imperial free city, while the first seal dates from 1253. The powers of the abbot were gradually limited and in 1277 the emperor Rudolf gave the town a charter of liberties. It ran considerable risk of becoming a part of the private estates of the Habsburgs, as the emperor Louis of Bavaria pledged it in 1330 to that family, which held it till Duke Frederick with Empty Pockets was placed under the ban of the empire in 1475, its freedom being finally purchased in 1418, while from 1411 the trade guilds ruled the town. But it was much harassed by the neighbouring Austrian nobles, so that in 1454 it made an alliance with six of the Swiss confederates (Uri and Unterwalden coming in in 1476), by whom it was received as an "ally," being finally admitted a full member in 1501. The Reformaition was adopted in 1524, finally in 1529. The town suffered much in the Thirty Years' War from the passage of Swedish and Bavarian troops. It was not till the early 19th century that the arrested industrial development of the town took a fresh start.

AUTHORITIES.—F. L. Baumann, Das Kloster Allerheiligen in Schaffhausen (vol.iii.of the "Quellen z. Schweizer Geschichte") (Bazel, 1881); Beiträge z. vaterländische Geschichte (5 parts, 1863-1884); E. Im-Thurn, Der Kanton Schaffhausen (St Gall and Bern, 1849); A. Pfaff, Das Staatsrecht d. alten Eidgenossenschaft (Schaffhausen, 1870) (pp. 89-97 contain a history of Schaffhausen). In 1901 there appeared at Schaffhausen two elaborate historical "Festschriften," one for the canton and one for the town, while in 1906-1907 there were published at Schaffhausen two parts (from 1892 and 1910) of an official Urkundenregister für den Kanton Schaffhausen.

SCHAFFELE, ALBERT EBEBARD FRIEDRICH (1831-1903), German statesman and political economist, was born at Nürtlingen in Württemberg on the 24th of February 1831, and in 1848 became a student at the university of Tübingen. From 1850 to 1860 he was attached to the editorial staff of the Schwäbische Merkur in Stuttgart, and in the latter year accepted a call to the chair of political economy at Tübingen. From 1862 to 1864 Schaffe was a member of the Württemberg diet, and in 1868 he received a mandate to the German Zollparlament. This year he was appointed professor of political science at the university of Vienna, and in 1871 he entered the cabinet of Karl Siegmund Graf von Hohenwart as minister of commerce for Austria. But the government fell in the same year, and Schaffe withdrew to Stuttgart, where he took up his residence, devoting himself entirely to literary work. He died at Stuttgart on the 25th of December 1903. Among his numerous writings must be mentioned Das Gesellschaftliche System der menschlichen Wirtschaft (new ed., 1873); Die Nationalökonomische Theorie der ausschliessenden Absatzverhältnisse (1867); Bau und Leben des sozialen Körpers (2nd ed. 1886); Ein Votum gegen den neuen Zolltarif (Tübingen, 1901); Die agrarische Gefahr (Berlin, 1902); Gesammelte Aufsätze (1885-1887). From 1892 to 1901 Schaffe was the sole editor of the Zeitschrift for die gesamte Staatswissenschaft.

See Biermann, Schaffe und der Agrarismus (Bonn, 1902) and his autobiography, Aus meinem Leben (Berlin, 1905).

SCHALCKEN, GODFRIED (1643-1706), Dutch genre and portrait painter, was born at Dort in 1643, and studied under Hoogstraten, and afterwards under Gerhard Douw, whose works his earlier genre-pictures very closely resemble. He visited England and painted several portraits, of which the half-length of William III., now in the Museum, Amsterdam, is a good example. In this work he shows an effect of candle-light, which he also introduced—frequently with fine effect—in many of his subject-pictures. These may be studied in the collections at Buckingham Palace, the Louvre, Vienna and Dresden. His Scriptural subjects are of very indifferent merit. He died at The Hague in 1706.

SCHALL, JOHANN ADAM VON (1591-1666), Jesuit missionary in China, born of noble parents in Cologne. At the age of twenty he joined the Society of Jesus, and in 1628 went out to China. Apart from successful missionary work, he became the trusted counsellor of the emperor, was created a mandarin, and held an important post in connexion with the mathematical school. His position enabled him to procure from the emperor permission for the Jesuits to build churches and to preach throughout the country. Proceylon's to the number of 106,000 are said to have been obtained within fourteen years. The emperor, however, died in 1661, and Schall's circumstances at once changed. He was imprisoned and condemned to death. The sentence was not carried out, but he died after his release owing to the privations he had endured. A collection of his MS. remains was deposited in the Vatican Library.

There are a number of Germany, in the kingdom of Saxony, situated on the right bank of the Elbe, at the mouth of the little valley of the Kirnitsch. It is 4 m. from the Bohemian frontier, 20 m. S.E. of Dresden on the railway to Bodenbach, and has a branch to Niederneukirch, which is carried from the railway station lying on the right bank across the Elbe by an iron bridge. Pop. (1905) 3373. Schandau has an Evangelical parish church, a hydrophatic establishment and a school of river navigation. The position of Schandau in the heart of the romantic "Saxon Switzerland" has made it a place of importance, and thousands of tourists make it their headquarters in summer. For their accommodation numerous hotels and villas have been
erected. The chief manufactures of the town are artificial flowers and furniture.

See Schäfer, Führer durch Schandau und seine Umgebung (Dresden, 1907).

SCHANDORPH [or Skamrup], SOPHUS CHRISTIAN FREDERICK (1836–1901), Danish poet and novelist, was born at Ringsted in Zealand on the 8th of May 1836. In 1855 he entered the university of Copenhagen. In 1862 he published his first volume of poetry, written in the romantic style and giving a little indication of the ultimate direction that his talent was to take. Other books followed, but his gifts first found full expression in a volume of rustic tales entitled Fra Provinser (1876), in which he described provincial character and life with much frankness of detail and a great deal of wit. In 1878 his novel, Uden Midtpunkt ("Without a Centre"), recast later in dramatic form, attracted great attention by its exposure of contemporary failings. Among the more famous of his later novels are: Thomas Friis' Historie (2 vols., 1881), Det gamle Apotheke ("The Old Apothecary") (1855) and Helga (1900); but his last years was too occupied with his v. and direction of short sketches. He published his own Recollections (Oplevelser) in 1889. He died after a long illness at Frederiksborg on New Year's Day 1901.

See an article by V. Möller in C. F. Bricka's Dansk Biografisk Lexikon (vol. xv., 1901).

SCHARF, SIR GEORGE (1820–1893), British art critic, was born in London on the 16th of December 1820, the son of George Scharf, a Bavarian miniature painter who settled in England in 1816 and died in 1860. He studied in the schools of the Royal Academy. In 1842 he accompanied Sir Charles Fellowes to Asia Minor, and in 1843 acted as draughtsman to a government expedition to the same country. After his return he devoted himself with great industry and success to the illustration of books relating to art and antiquity, of which the best known are Macaulay's Lays of Ancient Rome (1847); Milman's Horace, (1849) Kugler's Handbook of Italian Painting (1851); and Dr Smith's classical dictionaries. He also engaged largely in lecturing and teaching, and took part in the formation of the Greek, Roman and Pompeian courts at the Crystal Palace. He acted as art secretary to the great Manchester Art Treasures Exhibition of 1857, and in 1853 exchanged, in the capacity of a government art inspector, his services as an art critic for those of draughtsman to the newly founded National Portrait Gallery. The remainder of his life was given to the care of that institution. Scharf acquired an unrivalled knowledge of all matters relating to historic portraiture, and was the author of many learned essays on the subject. In 1885, in recognition of his services to the Portrait Gallery, he was made C.B., and on his resignation, early in 1895, K.C.B. and a trustee of the Gallery. He died on the 19th of April of the same year.

SCHRANNHORST, GERHARD JOHANN DAVID VON (1755–1813), Prussian general, was born at Bordenuk near Hanover, of a farmer stock, on the 28th of November 1755. He succeeded in educating himself and in securing admission to the military academy of Wilhelmstein, and in 1778 received a commission in the Hanoverian service. He employed the intervals of regimental duty in further self-education and literary work. In 1783 he was transferred to the artillery and appointed to the new artillery school in Hanover. He had already founded a military journal which under various names endured till 1803, and in 1788 he designed, and in part published, a Handbuch für Offiziers in den anwendbaren Thesen der Kriegswissenschaften. He also published in 1792 his Militärische Taschenbuch für den Gebrauch im Felde. The income he derived from his writings was his chief means of support, for he was still a lieutenant, and though the farm of Bordenuk produced a small sum annually he had a wife (Claara Schmalz, sister of Theodor Schmalz, first director of Berlin University) and family to maintain. His first campaign was that of 1793 in the Netherlands, in which he served under the duke of York with distinction. In 1794 he took part in the defence of Menin and commemorated the escape of the garrison in his Vertheidigung der Stadt Menin (Hanover, 1803), which, next to his paper Die Ursachen des Glücks der Franzosen im Revolutionskrieg, is his best-known work. Shortly after this he was promoted major and employed on the staff of the Hanoverian contingent.

In 1795, after the peace of Basel, he returned to Hanover. He was by now so well known to the armies of the various allied states that from several of them he received invitations to transfer his services. This in the end led to his engaging himself to the king of Prussia, who gave him a patent of nobility, the rank of lieutenant-colonel and a pay more than twice as large as that he had received in Hanover (1801). He was employed, almost as a matter of course, in important instructional work at the War Academy of Berlin, where he had Clausewitz (q.v.) as one of his pupils, and he was the founder of the Berlin Military Society. In the mobilizations and precautionary measures that marked the years 1804 and 1805, and in the war of 1806 that was the natural consequence, Scharnhorst was chief of the general staff (lieutenant-quartmaster) of the duke of Brunswick, received a slight wound at Auerstädt and distinguished himself by his stern resolution during the retreat of the Prussian army. He was appointed aide-de-camp to the king, and in the last stages of the disastrous campaign, was taken prisoner with him at the capitulation of Ratisbon, and, being shortly exchanged, bore a prominent and almost decisive part in the leading of L'Estocq's Prussian corps which served with the Russians. For his services at Eylau, he received the order for the merit.

It was now evident that Scharnhorst was more than a brilliant staff officer. Educated in the traditions of the Seven Years' War, he had by degrees, as his experience widened, divested his mind of antiquated forms of war, and it had been borne in upon him by his reading of the "Artillerie" and "Artillerie" of the "nationale" forces that a single decisive battle, fought by a general who had himself directed and fought the battles alone responded to the political and strategic situation created by the French Revolution. The steps by which he converted the professional long-service army of Prussia, wrecked at Jena, into the national army as we know it to-day, based on universal service, were slow and laboured. He was promoted major-general a few days after the peace of Tilsit, and placed as the head of a reform commission, to which were appointed the best of the younger officers such as Gneisenau, Grolman and Boyen. Stein himself became a member of the commission and secured Scharnhorst free access to the king by causing him to be appointed aide-de-camp-general. But Napoleon's suspicions were quickly aroused, and the king had repeatedly to suspend or cancel the reforms recommended. In 1809 the war between France and Austria roused premature hopes in the patriots' party, which the conqueror did not fail to note. By direct application to Napoleon, Scharnhorst evaded the decree of the 26th of September 1810, whereby all foreigners were to leave the Prussian service forthwith, but when in 1811–1812 Prussia was forced into an alliance with France against Russia and despatched an auxiliary army to serve under Napoleon's orders, Scharnhorst left Berlin on unlimited leave of absence. In retirement he wrote and published a work on fireworks, Über die Wirkung des Feuerwerks (1813). But the retreat from Moscow at last soundest the call to arms for the new national army of Prussia. Scharnhorst was recalled to the king's headquarters, and after refusing a higher post was made chief of staff to Blücher, in whose vigour, energy and influence with the young soldiers he had complete confidence. The first battle Lützen or Gross-Görschen was a defeat, but a very different defeat from those which Napoleon had hitherto been accustomed to inflict. In it Scharnhorst received a wound in the foot, not in itself grave, but soon made mortal by the fatigues of the retreat to Dresden, and he succumbed to it on the 8th of June at Prague, whither he had been sent to negotiate with Schwarzenberg and Radetzky for the armed intervention of Austria. Shortly before his death he had been promoted to the rank of lieutenant-general. Frederick William III. erected a statue in memory of him, by Rauch, in Berlin.

SCHAUMBURG-LIPPE—SCHEELE

work in two volumes); also Max Jänicke, 
"Gesch. der Kriegswissenschaften, Schiffsverkehr und die Durchführung der allgemeinen Wehrpflicht" (1892); A. von Holleben, Der Früh- 
jahresfeldzug, 1813 (1905); and F. N. Maude, The Leipzig Campaign (1908).

SCHAUMBURG-LIPPE, a principality forming part of the 
German Empire, consisting of the western half of the old countship of 
Schaumburg, and surrounded by Westphalia, Harover and the 
Prussian part of Schäumburg. Area, 131 sq. m. Its northern 
extremity is occupied by a lake named the Steinruher Meer. The 
southern part is hilly (Wesergebirge), but the remainder consists of 
a fertile plain. Besides husbandry, the inhabitants practise 
sparrow-spinning and linen-weaving, and the coal-mines of the 
Bückeburg, on the south-eastern boundary, are important. 
The capital is Bückeburg, and Stadthagen is the only other town. 
Under the constitution of 1868 there is a legislative diet of 15 
members, so elected by the towns and rural districts and 1 each 
by the nobility, clergy and educated classes, the remaining 2 
nominated by the prince. Schaumburg-Lippe sends one member to 
the Bundesrat (federal council) and one deputy to the 
reichstag. The annual revenue and expenditure amount each to 
about £41,000.

SCHEDULE, originally a written or printed list of names or 
items, or a leaf of paper or parchment, a label or ticket, especially when attached to another 
document, as explaining or adding to its contents, hence any 
additional detailed statement such as cannot conveniently 
be embodied in the main statement. The word occurs first 
(14th century) as cedule, or sedule, representing the Fr. 
cedule (mod. cédule, cf. Ital. cedola, Gen. Zettel, &c.), which is derived from 
Late Lat. sedula or schedula, dim. of sedula, a written strip 
of parchment (late Gr. σενδερη), probably from σενδιρε, to cleave, 
cf. σκινδαλα, a shingle. The original pronunciation in English was 
sedule, the modern pronunciation is schedule; American usage 
has gone back to the original Latin or Greek, and adopts 
the latter.

SCHEELE, KARL WILHELM (1742-1786), Swedish chemist, 
was born at Stralsund, the capital of Pomerania, which then 
belonged to Sweden, on the 10th of December 1742. He 
was apprenticed to an apothecary in Gothen-
burg, with whom he stayed for eight years. His spare time 
and great part of his nights were devoted to the experimental ex-
amination of the different bodies which he dealt with, and 
the study of the standard works on chemistry. He thus acquired 
a large store of knowledge and great practical skill in manipula-
tive dexterity. In 1765 he removed to Malmö, and in 1768 to 
Stockholm. While there he wrote an account of his experiments 
with cream of tartar, from which he had isolated tartaric acid, 
and sent it to T. O. Bergman, the leading chemist in Sweden. 
Bergman somehow neglected it, and this caused for a time a reluctance on 
Scheele's part to become acquainted with that savant, but the 
paper, through the instrumentality of Anders Johann 
Retzius (1742-1821), was ultimately communicated to the 
Academy of Sciences at Stockholm. He left Stockholm in 1770 
and took up his residence at Upsala, where through the agency 
of Johann Gottlieb Gahn (1745-1818), assessor of mines at Falun, 
he acquired a personal acquaintance of Bergman. A friendship, 
of mutual advantage, soon sprang up between the two men, and 
has been said that Scheele was Bergman's greatest discovery.

In 1775, the year in which he was elected into the Stockholm 
Academy of Sciences, he left Stockholm for Köpenick, a small 
place on Lake Malar, where he became provisor and subsequently 
proprieter of a pharmacy. The business, however, was not what 
he had been led to expect, and it took him several years to put it 
on a sound footing. Yet in spite of his business cares he found 
time for an extraordinary amount of original research, and every 
year he published two or three papers, most of which contained 
some discovery or observation of importance. His unremitting 
work, it is said, especially at night, exposing him to cold and 
draughts, induced a rheumatic attack which brought about his 
death. He had intended, as soon as his circumstances permitted 
him, to marry the widow of his predecessor, but his illness 
increased so rapidly that it was only on his death-bed, on the 19th 
of May 1786, that he carried out his design. Two days later he 
died, leaving his wife what property he had acquired.

Scheele's power as an experimentalist in stoicheiometry has seldom if 
ever been surpassed, and his accuracy is most remarkable when 
his primitive apparatus, his want of assistance, his place of 
residence, and the undeveloped state of chemical and physical 
science in his time, are all taken into account. Research was 
at once his occupation and his relaxation, and his natural endow-
ments were cultivated by unceasing practice and unwearyed 
attention. Study of his original papers shows that his 
discoveries were not made at haphazard, but were the outcome of 
experiments carefully planned to verify inferences already 
drawn, and so to reach the simplest and most direct manner. He left nothing in doubt if 
experiment would decide it, and he evidently did not consider 
that he had fully investigated any compound until he could both 
unmake and remake it. His record as a discoverer of new subst-
ances is probably unequalled. The analysis of manganese 
dioxide in 1774 led him to the discovery of chlorine and baryta; 
to the description of various salts of manganese itself, including 
The manganates and permanganates, and to the explanation of its 
action in colouring and decolourizing glass. In 1775 he investigated 
arsenic acid and its reactions, discovering arseniuretted hydrogen 
and "Scheele's green", and he was the first to prepare the 
process which on a large scale he published in 1778. Papers published 
in 1776 were concerned with quartz, alum and clay and with 
the analysis of calculus vesicae from which for the first time he obtained 
uric acid. In 1778 he proposed a new method of making calomel 
and powder of algaroth, and he got molybdic acid from mineral 
molybdaena nitens which he carefully distinguished from ordinary molybdina (plumbago or black lead of commerce). In the follow-
ing year he showed that plumbago consists essentially of carbon, 
and he published a record of estimations of the proportions of 
oxides in the atmosphere, which he had obtained by passing 
air through a tube of red-hot iron, before Cavendish. In 1780 he 
proved that the acidity of sour milk is due to what was after-
wards called lactic acid; and by boiling milk sugar with nitric 
acid he obtained mucic acid. His next discovery, in 1781, was 
the composition of the mineral tungsten, since called scheelleite 
(cadmium tungstate), from which he obtained tungstic acid. In 
1782 he published some experiments on the formation of sulfur, 
and in 1783 examined the properties of glycercine, which he had 
discovered seven years before. About the same time he showed 
by a wonderful series of experiments that the colouring matter 
of "Scheele's green" copper arsenite in a process for preparing 
the precursor of a substance of the nature of an acid, to which the name 
of prussic acid was ultimately given; and he described the com-
position, properties and compounds of this body, and even 
ascertained its smell and taste, quite unaware of its poisonous 
character. In the last years of his life he returned to the vegetable 
acids, and investigated citric, malic, oxalic and gallic acids. His 
only book, on Air and Fire, was published in 1777, but was 
written some years before. The manuscript was in the hands 
of the printers in 1775, and most of the experimental work for 
it was done before 1773. Although it starts from the erroneous 
idea that the physical phenomena of fire, in the strictest sense, it contains much matter of 
permanent value. One of the chief observations recorded in it is that 
the atmosphere is composed of two gases—one which supports 
combustion and the other which prevents it. The former, "fire-air," or oxygen, he prepared from "acid of nitre," from saltpetre, from black oxide of manganese, from oxide of mercury and other substances, and there is little doubt but that he obtained it independently a considerable time before Priestley. 
Incidentally in 1777 Scheele prepared sulphuretted hydrogen, 
and noted the chemical action of light on silver compounds and 
other substances.

A list of Scheele's papers is given in Poggendorff's "Biographisch-
Literarisches Handwörterbuch" (Leipzig, 1863). They were 
collected and published in French as "Mémoires de chimie" (Paris, 1785-1788); 
in English as "Chemical Essays," by Thomas Beddoes (London, 1788-1793); 
in Latin as "Opuscula," translated by Schäfer, edited by Heibsen 
(Leipzig, 1788-1786); and in German as "Sämmtliche Werke," edited
by Hernbstadt (Berlin, 1793). The treatise on Air and Fire appeared in German, Leipzig and Upsala in 1777, and again in 1782; in English, by J. R. Forster (London, 1780); and in French, by Dietrich (Paris, 1781).

Scheelite, a mineral consisting of calcium tungstate, CaWO₄. It was early known as "tungsten" (meaning in Swedish, "heavy stone"), and is the mineral in which K. W. Scheele discovered tungstic acid, hence the name scheelite. Well-developed crystals are not infrequent; they usually have the form of acute tetragonal bipyramids (P in fig.); sometimes other pyramid-faces are present, and these (g and h) being developed on only one side of P indicate the parallel-faced hemihedrim of the crystals. Compact and granular masses also occur. The colour is usually yellowish white or brownish, the crystals sometimes transparent to translucent; the lustre vitreous to adamantine. The hardness is 4½, the specific gravity 6·0. Molybdenum is usually present, replacing an equivalent amount of tungsten; and in a green variety known as "cupro-scheelite" part of the calcium is replaced by copper.

Scheelite usually occurs with topaz, fluor, apatite, wolframate, &c., in thin-bearing veins; and is sometimes found in association with gold. Fine crystals have been obtained from Caldbec Fellis in Cumberland, Zinnwald and Elbogen in Bohemia, Guttannen in Switzerland, the Riesengebirge in Silesia, Dragon mountains in Arizona and elsewhere. At Trumbull in Connecticut and Kimpus-san in Japan large crystals of scheelite completely covered with yellowish wealth have been found: those from Japan have been called "reinite."

Scheemakers, Peter (1661-1770), Flemish sculptor, was born in Antwerp, and learnt his art from his father and from Delvaux. After visiting Denmark and walking thence to Rome for purposes of study, he returned on foot to the port of embarcation for England, but stayed in London but a short while. From 1728 to 1735 he again sojourned in Rome and then settled in England, where he remained from 1735 to 1770, returning in the latter year to his native city where he died a few months afterwards. He worked for a time with Francis Bird, the pupil of Grinling Gibbons. Fifteen of his works—monuments, figures and busts—are in Westminster; and, with the master Delvaux, the "Hug Chamberlen" (d. 1728, and therefore perhaps produced during his first visit to London) and "Catherine, duchess of Buckinghamshire." He is best, though not most creditably, known to fame by his monument to Kent the blame for the errors of taste therein displayed must not be laid to Scheemakers' account. In addition to these may be mentioned the monuments to Admiral Sir Charles Wager, Vice-Admiral Watson, Lieut.-General Percy Kirk, George Lord Viscount Howe, General Monck, and Sir Henry Belasyse. His busts of John Dryden (1720) and Dr Richard Mead (1754), also in the Abbey, are among the best of his smaller works. The most important of his monuments elsewhere, as mentioned by Walpole, are those to the 1st and 2nd dukes of Ancaster at Edenhall, Lincolnshire; Lord Chancellor Hardwicke at Wimpole, Cambridgeshire; the duke of Kent, his wives and daughters, at Fletton, Bedfordshire; the earl of Shelburne, at Wycombe, Bucks; and the figure on the sarcophagus to Montague Sherrard Drake, at Amersham. Although less esteemed by modern artists than Rysbrack and Roubilac, Scheemakers was a very popular and widely-employed sculptor in his day, whose influence was considerable; he was the master of Nollekens, and left a son, Thomas Scheemakers, who produced a considerable amount of work, and exhibited in the Royal Academy from 1782 to 1804. See Walpole's Anecdotes of Painting, vol. 3 (ed. 1876), and Dictionary of National Biography.

Schefer, Leopold (1784-1862), German poet and novelist, was born at Muskau in Lower Lusatia on the 30th of July 1784, and educated at the gymnasium of Bautzen. In 1813, he was appointed manager of the estates of Prince Pückler-Muskau (q.v.). The prince, recognizing the literary abilities of the young man, encouraged his early poetical efforts and gave him the means to travel. After visiting England, Italy, Greece and Turkey, Schefer returned in 1820 to Muskau, where he lived in easy circumstances and with abundant leisure for his literary pursuits, until his death on the 16th of February 1862. Schefer wrote a large number of poems, of which appeared in several series, Novellen (5 vols., 1825-1829); Neue Novellen (4 vols., 1831-1835); Laabecker (2 vols., 1833), Kleine Romane (6 vols., 1836-1837). The historical novel Die Grünen Ulföld (2 vols., 1834), and the piquant satire, Die Sibylle von Mantua (1852), were published separately. But Schefer is less known for his novels which are lacking in plastic power and creative imagination, than for a volume of charming poems, Laienbrevier (1834-1835). These, owing to their warmth of feeling and fascinating descriptions of the beauties of nature, at once established his fame as a poet. This vein, in close imitation of his friend the poet Richard Georg Spiller, was employed by the pseudonym Max Waldauf (1822-1855), he followed in later years with the poems Vignelen (1843), Der Weltpriester (1846), and Hausrenden (1860). His Hafis in Hellas (Hamburg, 1853) and Koran der Liebe (Hamburg, 1855) contain with their glowing descriptions of the East, original poetry of a high order. A selection of Schefer's works, Ausgewählte Werke, in 12 vols., was published in 1845 (2nd ed., 1857). See J. Schmidt, Geschichte der deutschen Litteratur (2nd ed., vol. i.), L. von der Mühlen, VON Schefer (1864); and L. Geiger in Dichter und Denker (1896).

Scheffel, Joseph Viktor von (1856-1886), German poet and novelist, was born at Karlsruhe on the 16th of February 1856. His father, a retired major in the Baden army, was a civil engineer and member of the commission for regulating the course of the Rhine; his mother, née Josephine Kredrer, the daughter of a prosperous tradesman at Oberndorf on the Neckar, was a woman of great intellectual powers and of a romantic disposition. Young Scheffel was educated at the lyceum at Karlsruhe and afterwards (1853-1854) at the universities of Munich, Heidelberg and Berlin. After passing the state examination, or "Examen," for the judicial service, he graduated doctor juris and for four years (1855-1859) held an official position at Säckingen. Here he wrote his poem Der Trompeter von Säckingen (1855), a romantic and humorous tale which immediately gained extraordinary popularity. It has reached more than 250 editions. Scheffel next undertook a journey to Italy. Returning home in 1859 he found his parents more than ever anxious that he should continue his legal career. But in 1854, defective eyesight incapacitated him; he quit the government service and took up his residence at Heidelberg, with the intention of preparing himself for a post on the teaching staff of the university. His studies were, however, interrupted by eye-disease, and in search of health he proceeded to Switzerland and took up his abode on the Lake of Constance, and elaborated the plan of his famous historical romance Ekkhard (1857); (Eng. trans. by S. Delffs, Leipzig, 1872). The first ideas for this work he got from the Monumenta Germaniae. It gained popularity hardly inferior to that of Der Trompeter von Säckingen. In 1901 it had reached the 179th edition. Scheffel next returned to Heidelberg, and published Gaudeamus, Lieder aus dem Engeren und Weiten (1868), a collection of joyous and humorous songs, the matter for which is taken partly from German legends, partly from historical subjects. In these songs, the author shows himself the light-hearted student, a friend of wit and song; and their success is unexampled in German literature and encouraged numerous imitators. For two years (1857-1859) Scheffel was custodian of the library of Prince Egon von Fürstenberg at Donaueschingen, but giving up his appointment in 1859, visited Joseph Freiherr von Lasseburg, at Meersburg on the Lake of Constance, stayed for a while with the grand duke Charles Alexander of Saxe-Weimar at the Wartburg in Thuringia, then settling at Karlsruhe, he married in 1864 Caroline von Malzen, and, in 1872, retired to his villa Seehalde near Radolitzell
Scheffer—Scheffer

on the lower lake of Constance. On the occasion of his jubilee (1876), which was celebrated all over Germany, he was granted a patent of hereditary nobility by the grand duke of Baden. He died at Karlsruhe on the 9th of April 1886.

His works, which have been already mentioned, are Frau Aventiure. Literally translated, Heinrich von Offlerdingsen Zeit (1863); Juniipcrus, Geschichte eines Kreuzfahrers (1866); Berghauser. Waldeinsamkeit (1880); Der Heim von Sieier (1883); and Huguenod, eine alte Geschichte (1884). Volumes of Briefe (1892) and Briefe (1898) were published posthumously. Scheffel’s Gesamteme Werke have been published in six volumes (1907).

Scheffel was joined by Joseph von Scheffel (1819); J. Prola, Scheffels Leben und Dichten (1887); L. von Kobell, Scheffel and seine Frau (1901); E. Boerschel, J. von Scheffel and Emma Heim (1906).

Scheffer, Ary (1795–1838), French painter of Dutch extraction, was born at Dort on the 10th of February 1795. After the early death of his father, a poor painter, Ary was taken to Paris and placed in the studio of Guérin by his mother, a woman of great energy and character. The moment at which Scheffer left Guérin coincided with the movement of the Romantic period. He had little sympathy with the directions given to it by either of its most conspicuous representatives, Sigalon, Delacroix or Géricault, and made various tentative efforts—"Gaston de Foix" (1824), "Sullot Women" (1827)—before he found his own path. Immediately after the exhibition of the last-named work he turned to Byron and Goethe, selecting from Faust a long series of subjects which had an extraordinary vogue. Of these, we may mention "Margaret at her Wheel"; "Faust Doubting"; "Margaret at the Sabbath"; "Margaret Leaving Church"; the "Garden Walk"; and, lastly, perhaps the most popular of all, "Margaret at the Well." The two "Mignons" appeared in 1836; and "Francesca da Rimini," which is one of the whole Scheffer’s best work, belongs to the same period. He now turned to religious subjects: "Christus Consolator" (1836) was followed by "Christus Remunerator," "The Shepherds Led by the Star" (1837), "The Magi Laying Down their Crowns," "Christ in the Garden of Olives," "Christ bearing his Cross," "Christ Interred" (1845), "St Augustine and Monica" (1846), after which he ceased to exhibit, but shut up in his studio, continued to produce much which was first seen by the outer world after his death, which took place at Argenteuil on the 15th of June 1838.

At the posthumous exhibition of his works there figured the "Sorrows of the Earth," and the "Angel Announcing the Resurrection," which he had left unfinished. Amongst his numerous portraits those of La Fayette, Béranger, Lamartine and Marie Amélie were the most noteworthy. His reputation, much shaken by this posthumous exhibition, was further undermined by the sale of the Paturier Gallery, which contained many of his most celebrated achievements; the charm and facility of their composition was replaced by an undermannered style, much overemphasized by their poor and earthy colour and vapid sentiment. Scheffer, who married the widow of General Baudrand, was only made commander of the Legion of Honour in 1848—that is, after he had wholly withdrawn from the Salon. His brother Henri, born at the Hague on the 27th of September 1798, was also a fertile painter.

See Vitet’s notice (1861) prefixed to Birmingham’s publication of writings of A. Scheffer; Etex, Ary Scheffer; Mrs Grote, Life of A. Scheffer (1860).

Schenk, Jean De (c. 1555–1635), Seigneur de Saumazées, French poet, was born about 1555 near Verdun of a Calvinist family. He studied at the university of Paris and then joined Turenne’s army in Holland, where he gained rapid advancement. He was the author of a tragedy, Tyr et Siden, ou les funestes amours de Belcar et Mélanie, published in 1658 under the anagram-name Daniel d’Ancheres, and reprinted with numerous changes in 1668 under the author’s own name. In defiance of all the rules the action proceeds alternately at Tyre, where Belcar, prince of Siden, is a prisoner, and at Siden where Léonte, prince of Tyre, is a prisoner and pursues his gallant adventures. The play, which was divided into two days and ten acts, had a complicated plot and contained 5000 lines. It required an immense stage on which the two towns should be represented, with a field between, where the contests should take place. It is noteworthy as an attempt to introduce the liberty of the Spanish and English drama into France, thus anticipating the romantic revolt of the 19th century. It has been suggested that Schenck was directly acquainted with Shakespearean drama, but of this there is no direct proof, although he appears to have spent some time in England, and to have seen James L. Tyr et Siden is reprinted in the 8th volume of the Ancien Théatre français. Schenck was also the author of a Stuarteide (1611), and of Les Sept Excellents Travaux de la pérennité de Saint Pierre (1636). He pursued his military career to the end of his life, dying at Saumazées in 1655 from wounds received in the German campaign of Louis d’Épernon, Cardinal de la Valette.

See Ch. Asselineau, Jean de Schenckl (Paris, 1854).

Scheldt (Fr. Escaut, Flem. Schelde), a river rising near Catcel in France, entering Belgium near Bleharies in Hainaut, and flowing past Tournai, Oudenaarde, Ghent and Termonde, till it reaches Antwerp. Some distance below Antwerp, in front of the island Beveland, where the river divides into two channels, respectively north and south of the island, both banks belong to Holland. Of the two channels named, the southern, which reaches the sea at Flushing, is the more important and is used for ocean commerce. The Scheldt has a length of 250 m., of which, by a skilful arrangement of locks, not less than 207 m. are navigable. The principal tributaries are the Lys and the Dender. By the treaty of Munster in 1648 the Dutch obtained the right to navigation on the Scheldt, and they clung tenaciously to it for over two centuries. In 1839, by the Act of Union of the kingdom of the Netherlands, Holland gave definite form to this right by fixing the toll, and by obtaining the assent of the powers to the arrangement which fettered the trade of Antwerp. In 1863, after long negotiations Belgium bought up this right—each of the powers interested in the trade contributing its quota—and the navigation of the Scheldt was then declared free.

Scheler, Jean Auguste Ulric (1816–1890), Belgian philologist, was born at Ebnat, Switzerland, in 1819. His father, a German, was chaplain to King Leopold I. of Belgium, and Jean Scheler, after studying at Bonn and Munich, became King’s librarian and professor at the Brussels Free University. His investigations in Romance philology earned him a wide reputation. He died atIxelles, Belgium, in 1890.

The most important of his numerous philological works are:

- Mémoire sur la conjuration française considérée sous le rapport du droit public (Brussels, 1847), Dictionnaire éymologique du langage de la frankh (Paris, 1848), and a monograph Sur le séjour de l’apôtre saint Pierre à Rome (Brussels, 1849), which was translated into German and English.

- Schelling, Friedrich Wilhelm Joseph von (1775–1854). German philosopher, was born on the 27th of January 1775 at Leonberg, a small town in Württemberg. He was educated at the cloister school of Bebenhausen, near Tübingen, where his father, an able Orientalist, was chaplain and professor, and where Schelling, the theological seminary at Tübingen, where he was specially allowed to enter when he was three years under the prescribed age. Among his (elder) contemporaries were Hegel and Hölderlin. In 1792 he graduated in the philosophical faculty. In 1793 he contributed to Paulus’s Memorabilien a paper "Über Mythus, historische Sagen, und Philosophere der ältesten Welt"; and in 1795 his thesis for his theological degree was De Mancione Paulinorum epistolorum emendatore. Meanwhile a much more important influence had begun to operate on him, arising out of his study of Kant and Fichte. The Review of Aeneidem and the tractate On the Notion of Wissenschaftskre found in his mind a fruitful soil. With characteristic zeal and inquisitiveness Schelling had no sooner grasped the leading ideas of Fichte’s amended form of the critical philosophy than he put together his impressions of it in Über die Möglichkeit
a form der Philosophie überhaupt (1794). There was nothing original in the treatment, but it showed such power of appreciating new ideas of the Fichtean method that it was hailed with cordial recognition by Fichte himself, and gave the author immediately a place in popular estimation as in the foremost rank of existing philosophical writers. The more elaborate work, *Vom Ich als Princip der Philosophie*, oder über das Unbedingte im menschlichen Wissen (1795), which, still remaining within the limits of the Fichtean idealism, however, exhibits unmistakable traces of a tendency to give the Fichtean method a more objective application, and to amalgamate with it Spinoza's more realistic view of things.

After two years as tutor to two youths of noble family, Schelling was called as extraordinary professor of philosophy to Jena in midsummer 1798. He had already contributed articles and reviews to the *Journal* of Fichte and Niethammer, and had thrown himself with all his native impetuosity into the study of physical and medical science. From 1796 date the *Briebe über Dogmatismus und Kriticismus*, an admirably written critique of the ultimate issues of the Kantian system; from 1797 the essay entitled *Neue Deduction des Naturrechts*, which to some extent anticipated Fichte's treatment in the *Grundlage des Naturrechts*, published in 1798, but not before Schelling's essay was vaguely contemplated by both. August's death in 1800 (due partly to Schelling's rash confidence in his medical knowledge) drew Schelling and Caroline together, and Schelling having removed to Berlin, a divorce was, apparently with his consent, arranged. On the 2nd of June 1803 Schelling and Caroline were married, and with the marriage Schelling's life at Jena came to an end. It was full time, for Schelling's undoubtedly overweening self-confidence had involved him in a series of disputes and quarrels at Jena, the details of which are important only as illustrations of the evil qualities in Schelling's nature which deface much of his philosophical work.

From September 1803 until April 1806 Schelling was professor at the new university of Würzburg. This period was marked by considerable changes in his views and by the final breach on the one hand with Fichte and on the other hand with Hegel. In Würzburg Schelling had many enemies. He embroiled himself with his colleagues and also with the government. In Munich, to which he removed in 1806, he found a quiet residence. A position as state official, at first as associate of the academy of sciences and secretary of the academy of arts, afterwards as secretary of the philosophical section of the academy of sciences, gave him ease and leisure. Without resigning his official position he lectured for a short time at Stuttgart, and during seven years at Erlangen (1820–1827). In 1809 Caroline died, and three years later Schelling married one of her closest friends, Pauline Götter, in whom he found a faithful companion.

During the long stay at Munich (1806–1841) Schelling's literary activity seemed gradually to come to a standstill. The "Aphorisms on Naturphilosophie" contained in the *Jahrbücher der Medicin als Wissenschaft* (1808–1808) are for the most part extracts from the Würzburg lectures; and the Denkmal der Schrift von den göttlichen Dingen des Herrn Jacobi was drawn forth by the special incident of Jacobi's work. The only writing of significance is the "Philosophische Untersuchungen über das Wesen der menschlichen Freiheit," which appeared in *Philosophische Schriften*, vol. i. (1809), and which carries out, with increased success as to form, the aim of the previous work, *Philosophie und Religion*. In 1815 appeared the tract *Über die Geistheilen zu Samothrake*, ostensibly a portion of a great work, *Die Weltalter*, frequently announced as ready for publication, of which no great part was ever written. Probably it was the overpowering strength and influence of the Hegelian system that constrained Schelling to so long a silence, for it was only in 1834, after the death of Hegel, that, in a preface to a translation by H. Beckers of a work by Cousin, he gave public utterance to the antagonism in which he stood to the Hegelian system. Some of the extracts of the essays on the history of philosophy (Stimmt. Werke, x. 124-125) of 1822 express the same in a pointed fashion, and Schelling had already begun the treatment of mythology and religion which in his view constituted the true positive complement to the negative of logical or speculative philosophy. Public attention was powerfully attracted by these vague hints of a new system which promised something more positive, as regards religion in particular, than the apparent results of Hegel's teaching. For the appearance of the critical writings of Strauss, Feuerbach and Bauer, and the evident dissolution in the Hegelian school itself had alienated the sympathy of many from the then dominant philosophy. In Berlin particularly, the headquarters of the Hegelians, the desire found expression to obtain officially from Schelling a treatment of the new system which he was understood to have in reserve. The realization of the desire did not come about till 1841, when the appointment of Schelling as Prussian privy councillor and member of the Berlin Academy, gave him the right, a right he was requested to exercise, to deliver lectures in the university. The opening lecture of his course was listened to by a large and appreciative audience. The enmity of his old foe, F. T. F. Fr. Paulus, sharpened by Schelling's apparent success, led to the surreptitious publication of a verbal report of the lectures on the philosophy of revelation, and, as Schelling did not succeed in obtaining legal condemnation and suppression of this piracy, he in 1845 ceased the delivery of any public courses.

No authentic information as to the nature of the new positive philosophy was obtained till after his death (at Bad Rogaz, on the 20th of August 1854), when his sons began the issue of his collected writings with the four volumes of Berlin lectures: vol. i. Introduction to the Philosophy of Mythology (1856); ii. Philosophy of Mythology (1857); iii. and iv. Philosophy of Revelation (1858).

Philosophy.—Whatever judgment one may form of the total worth of Schelling as a philosopher, his place in the history of that important movement called generally German philosophy is unmistakable and assured. It happened to him, as he himself claimed, to turn a page in the history of thought, and one cannot ignore the actual advance upon his predecessor achieved by him or the brilliant fertility of the genius by which that achievement was accomplished. On the other hand he nowhere succeeds in attaining to a complete scientific system. His philosophical writings are the successive manifestations of a restless, highly expansive spirit, striving unsuccessfully after a solution of its own problems. Such unity as they possess is a unity of tendency and endavour; in some respects the final form they assumed is the least satisfactory. Hence it has come about that Schelling remains for the philosophic student both a source of historical value in the development of thought, and that his works have for the most part ceased now to have more than historic interest.

1 The reviews of current philosophical literature were afterwards collected, and edited under the title "Abhandlungen zur Erläuterung des Idealismus der Wissenschaftslehre" in Schelling's *Philosophische Schriften*, vol. i. (1809).
philosophizing with the very nature of the thinker and with the inherent nature of thought. In his early writings, for example, more particularly those making up Naturphilosophie, one finds in painful abundance the evidences of hastily acquired knowledge, impatience of the hard labor, of the labor of discovery. It is the possessor of genius, and desire instantaneously to present even in crudest fashion the newest idea that had dimly been involved in his ardent and impetuous desires. It is not possible to altogether separate the Schellingian philosophy from the Hegelian philosophy; and if we claim for him perfect disinterestedness of view we must accuse him of deficient insight.

Nothing could be more striking than the forms and the forms of some other system Thus Fichte, Spinoza, Jakob Boehme and the Mystics, and finally, the great Greek thinkers with their Neoplatonic, Gnostic, and Scholastic commentators, give respectively colouring to the ideas of Schelling. Schelling does not derive his own view the turning points seem to have been—(1) the transition from Fichte’s method to the more objective conception of nature—the individuality of the subject, (2) the definition and organization of that which implicitly, as Schelling states, is involved in the idea of Naturphilosophie, viz. the thought of the identical, indifferent, absolute substratum of both nature and spirit, the advance to Identitätsphilosophie (3) the opposition of concept and positive philosophy, an opposition which is the theme of the Berlin lectures, though its germs may be traced back to 1804. Only what falls under the first and second of the divisions so indicated can be said to have effectively divided a fundamental philosophy: only so much constitutes Schelling’s philosophy proper.

1. Naturphilosophie.—The Fichteian method had striven to exhibit the nature of spiritual activity as an immanent unity of subjective and objective consciousness. The fundamental features of knowledge, whether as activity or as sum of apprehended fact, and of conduct had been deduced as elements necessary in the attainment of self-consciousness. Fichtean idealism therefore at once stood out negatively, as abolishing the dogmatic conception of the two real worlds, subject and object, by whose interaction cognition and practice arise, and as denuding the critical idea which retained with dangerous caution too much of the formalism of the older rationalism. Schelling, on the other hand, was disposed to identify too closely the ultimate ground of the universe of rational conception with the finite, individual spirit, and on the other hand to endanger the reality of the world of nature by regarding it too much as not merely a creation, but as a mere possibility of the finite thought, existed, in the existence of the finite thinking mind. It was almost a natural consequence that Fichte never succeeded in forming in his system the aesthetic view of nature to which the Kritik of Judgment had pointed as an essential component in any complete system. Schelling set Fichte’s position Schelling started. From Fichte he derived the form of a comprehensive philosophy consisting in the formal method to which for the most part he continued true. The earliest writings tended gradually towards the first important advance. Nature must not be conceived as merely abstract limit to an ideal, an absolute principle of mind, as it is by Fichte. It must be that and more than that. It must have reality for itself, a reality which stands in no conflict with its ideal character, a reality the inner structure of which is Ideal, a reality the root and spring of which is spirit. Nature as the sum of that which is objective, intelligence as the complex of all the activities making up self-consciousness, appear thus as equally real, as alike exhibiting ideal structure, as parallel with one another. The philosophy of nature and transcendental philosophy are the two complementary portions of philosophy as a whole.

With this new conception Schelling made his hurried rush to Naturphilosophie, and with the aid of Kant and of fragmentary knowledge of contemporary scientific movements, threw off in quick succession the Ideen, the Weltensche, and the Erster Entwurf als Metaphysik der Art der Seele. Schelling had the aid of modern science. His efforts after a construction of nature reality are bad in themselves, and gave rise to wearisome and useless physical speculation. Yet it would be unjust to ignore the many brilliant and sometimes valuable thoughts. But let us glance over the writings on Naturphilosophie—thoughts to which Schelling himself is but too frequently untrue. Regarded merely as a criticism of its premises, this interpretation proceeds, these writings have still importance and may have proved more and more they been untainted by the tendency hasty, ill-considered, a priori anticipations of nature.

Its manifoldness is not then to be taken as excluding its fundamental unity; the divisions which our ordinary perception and thought introduce into it have not absolute validity, but are to be regarded as the formal and partial outlines of the system for the good of the system; the many-sidedness of forces which is the inner aspect, the soul of nature. This we are in a position to apprehend and constructively to exhibit to ourselves in its inner form, if not in its full range, for it is the same spirit, though unconscious, of which we become aware and conscious. It is the realization of spirit. Nor is the variety of its forms imposed upon it from without; there is neither external (S.V. iii). In a full and lucid statement of Naturphilosophie is that given by K. Fischer in his Gesch. d. n. Phil., vi, 435-692.

1. The briefest and best account in Schelling himself of Naturphilosophie is that contained in the Einleitung zu dem Ersten Entwurf als Metaphysik der Art der Seele, and to this act, to make of it something more than empty sameness; it was necessary, in the second place, to clear up in some way the relation in which the reality or apparent actuality of nature and spirit...
stood to the ultimate real. Schelling had already (in the System der ges. Phil.) begun to endeavour after an amalgamation of the Spinozistic conception of substance with the Platonic view of an ideal realm, and to find therein the means of enriching the barrenness of the systems of Descartes, Leibnitz, and the like. It is evident that, in the realm of ideas, this latter absorbs all being, and that it is a tendency of his historical method to show this and to bring it to the fore; but, if the world of being is the absolute, and the finitude of man is the character of this absolution in the minds of men, this world and this character are not identical, and the latter is not the same as the former. Hence Schelling was led to the further statements that not in the rational conception of God is an explanation of existence to be found, nay, this is a mere external form or abstraction of the not-abstract, i.e., not the real—that God is to be conceived as act, as will, as something over and above the rational conception of the divine. Hence the stress laid on will as the realizing factor, in opposition to aview through which Schelling conveys and V. Hartmann, and on the ground of which he has been recognized by the latter as the reconciler of idealism and realism. Further, the position of negative, i.e., mere rational philosophy, and positive, of which the content is the real evolution of the divine as it has taken place in fact and in history, and as it is recorded in the varied mythologies and religions of mankind. The exposition of the latter, or its possible insight, is the exposition of either as it appears in the volumes of Berlin lectures.

Schelling's works were collected and published by his sons, in 6 vols., Berlin 1847. The codification of his philosophical doctrine can be found in Theorie der Möglichkeit, besonderer Form der Philosophie überhaupt (Tuebingen, 1794); Ideen zu einer Philosophie der Natur (Leipzig, 1797, ed. 1803); Von der Weltseele (Hamburg, 1798, 3rd ed. 1809); Erster Entwurf eines Systems der Naturphilosophie (Jena, 1799); Einleitung zu seinem Entwurf der Naturphilosophie (ib. 1799); System des transzendentalen Idealismus (Tubingen, 1800); Bruno, oder über das göttliche und natürliche Prinzip der Dinge (Berlin, 1802, ed. 1843); Vorlesungen über die Methode des akademischen Studiums (Tuebingen, 1803, ed. Braun, 1897); Uber das Verhältniss der bildenden Kunst zu der Natur (Munich, 1807); Uber die Goethes von Sammlkarte (Stuttgart, 1812). His Munich lectures were published by A. Dries (Liber amabilis: eine rühmliche Werke in der Philosophie, 3 vols., Aus Schelling's Leben in Briefen (3 vols., 1869-1870), in which a biographic sketch of the philosopher's early life is given by his sons. N. Tranlitz, Schelling: Briefe, welche mit seinen Werken und Leben sich verbinden, ein (1871). Of his other works is Klaiber, Helldrin, Hegel, u. Schelling in ihren schwäbischen Jugendjahren (1877). The biography in Kuno Fischer's Gesch. der neueren Philosophie, vol. vii. (3rd ed., 1902) is complete and admirable. See further Schelling als Persönlichkeit, Briefe, Reden, Aufsätze, ed. Otto Braun (1906), who also wrote Schellings geistliche Wandelungen in den Jahren 1800-1810 (1906); Rosenkranz, Schellings (1843); L. Noack, Schelling und die Philosophie der Romantik (2 vols., 1869); G. C. Frantz, Schellings positive Philosophie (3 vols., 1879-1880); Watson, Schellings Transcendental Idealism (1882); Groos, Die reine Vernunftwissenschaft, Systematische Darstellung von Schelling's Philosophie (1883); and G. Mele, Schellings Geschicht der Philosophie (2 vols., 1890). The Einfluss der Schellings auf die Entwicklung des Schleierschmers System (1909).

SCHELLING, CAROLINE (1763-1800), one of the most intellectual German women of her age, was born at Göttingen on 11 May 1763, daughter of Prof. Carl Michael Schelling. She married, in 1784, the state medical officer, one Böhmer, in Clausthal in the Harz, and after his death, in 1788, returned to Göttingen. Here she entered into close relations to the poet Gottfried August Bürger and the critic of the Romantic school, August Wilhelm Schlegel. In 1791 she took up her residence in Mainz, joined the famous society of the Clubbists (Klubblitzen), and suffered a short period of imprison-
a greater degree of freedom, especially commercial freedom, than had been possible on the Manor. The land was purchased from the Mohawks. To each of the fifteen original proprietors, except Van Cortland, who received a double portion, was assigned a village lot 200 ft. sq., a tract of bottom-land for farming purposes, a strip of woodland, and common pasture rights. Many of the early settlers were well-to-do and brought their slaves with them, and for many years the settlement was reputed the richest in the colony. It received a serious set-back in 1690, when on the 9th of February a force of French and Indians surprised and burned the village, massacred sixty of the inhabitants and carried thirty-two of the women and children captive. The village was not rebuilt in the present year, and a military post was established. About 1700 there was a considerable influx of English settlers. In 1745 the French and Indians again descended on the region and killed many of the inhabitants of the outlying settlement at Beekendael, 3 m. N.W. of Schenectady. Schenectady became a chartered borough in 1765 and a city in 1798. The first newspaper, the Gazette, was established in 1799. For some years after the completion of the Erie Canal, Schenectady, which had formerly been an important depot of the Mohawk river boat trade to the westward, suffered a decline in population and importance. With the abandonment of its terminus, the Mohawk & Hudson opening to Albany in September 1831 and the Saratoga & Schenectady in July 1832; the original station of the Mohawk & Hudson is still standing. It was not, however, until its new manufacturing era began, about 1880, that Schenectady's modern growth and prosperity began.

SCHENKEL, DANIEL (1813-1888), Swiss Protestant theologian, was born at Dägerlen in the canton of Zürich on the 21st of December 1813. After studying at Basel and Göttingen, he was successively pastor at Schaffhausen (1841), professor of theology at Basel (1849); and at Heidelberg professor of theology (1851), director of the seminary and university preacher. At first inclined to conservatism, he afterwards became an exponent of the mediating theology (Vermittlungstheologie), and ultimately a liberal theologian and advanced critic. Associating himself with the "German Protestant Union" (Deutsche Protestantien-verein), he defended the community's claim to autonomy, the cessation of railways in the suburbs, and the church and the rights of the laity. From 1852 to 1859 he edited the Allgemeine Kirchenzeitung, and from 1861 to 1872 the Allgemeine Kirchliche Zeitsschrift, which he had founded in 1859. In 1867, with a view to popularizing the researches and results of the Liberal school, he undertook the editorship of a Bibel-Lexicon (5 vols., 1869-1872), a work which was so much in advance of its time that it is still useful. In his Das Wesen des Protestantismus aus den Quellen des Reformationseides abgeleitet (3 vols. 1846-1851, 2nd ed. 1862), he declares that Protestantism is a principle which is always living and active, and not something which was realized once and for all in the past. He contends that the task of his age was to struggle against the Catholic principle which had infected Protestant theology and the church. In his Christliche Dogmasik (2 vols., 1838-1859) he argues that the record of revelation is human and was historically conditioned: it can never be absolutely perfect; and that inspiration, though originating directly with God, is continued through human instrumentality. His Charakterbild Jesu (1864, 4th ed. 1873; Engl. trans. from 3rd ed., 1869), which appeared almost simultaneously with D. Strauss's Leben Jesu, met with fierce opposition. The work is considered too subjective and fanciful, the great fault of the author being that he lacks the impartiality of objective historical insight. Yet, as Pfeiderer says, the work "is full of a passionate enthusiasm for the character of Jesus." The author rejects all the miracles except those of healing, and these he explains psychologically. His main purpose was to modernize and reinterpret Christianity; he says in the preface to the third edition of the book: "I have written it solely in the service of evangelical truth, to win to the truth those especially who have been most unhappily alienated from the church and its interests, in a great measure through the fault of a reactionary party, blinded by hierarchical aims." Schenkel died on the 18th of May 1885.

Other works—Friedrich Schleiermacher, Ein Lebens- und Charakterbild (1868); Christentum und Kirche (2 vols., 1867-1872); Die Schule in der neuen Zeit, (2 vols., 1865-1866); Das Christusbild des Glaubens dargestellt (1877); and Das Christusbild der Apostolischen und apostolischen Zeit (1879). See Herzog-Hauck, Realencyklopädie, Otto Pfeiderer, Development of Theology (1900); and F. Lichtenberger, History of German Theology (1886).

SCHERER, EDMOND HENRI ADOLPHE (1815-1889), French theologian, critic and politician, was born in Paris on the 8th of April 1815. After a course of legal studies he spent several years in theological study at Strassburg, where he graduated doctor in theology in 1843, and was ordained. In 1843 he was appointed to a professorship in the École Évangélique at Geneva, but the development of his opinions in favour of the Liberal movement in Protestant theology led to his resigning the post six years later. He founded the Anti-Jésuite, afterwards the Réformation au XIXe siècle, in which he advocated the separation of the Church from the State; but he gradually abandoned the Protestant doctrine. It is thought he became a pronounced Hegelian. Eventually he settled in Paris, where he at once attracted attention by brilliant literary criticisms, at first chiefly on great foreign writers, contributed to the Revue des deux mondes. He was elected municipal councillor at Versailles in 1870, deputy to the National Assembly for the department of Seine-et-Oise in 1871 and senator in 1875. He supported the Republican party. Towards the end of his life he devoted himself mainly to literary and general criticism, and was for many years one of the ablest critics to Le Temps. He was a frequent visitor to England, and took a lively interest in English politics and literature. He died at Versailles on the 16th of March 1880.

His chief works are: Dogmatique de l'Église réformée (1843), De l'État actuel de l'Église réformée en France (1844), Esquisse d'une histoire de l'Église moderne (1861, 2nd ed. 1866), Alexandre Vinet (1853), Lettres à Mon curé (1852), Etudes critiques sur la littérature contemporaine (1863-1889), Etudes critiques de littérature (1876), Diderot (1880), La Démocratie et la France (1883), Etudes sur la littérature au XVIIIe siecle (1891).

A memoir of him, by V. C. O. Gréard, appeared in 1890. See also an article by Professor E. Dowden in the Fortnightly Review (April 1889).

SCHERER, WILHELM (1841-1886), German philologist and historian of literature, was born at Schönborn in Lower Austria on the 26th of April 1841. He was educated at the academic gymnasium at Vienna and afterwards at the university, where he was the favourite pupil of the distinguished Germanist, Karl Viktor Müllenhoff (1818-1884). Having taken the degree of doctor philologicae, he became Privatdozent for German language and literature in 1864. In 1868 he was appointed ordinary professor, and in 1872 received a call in a like capacity to Strassburg, and in 1877 to Berlin, where in 1884 he was made member of the Academy of Sciences. He died at Berlin on the 6th of August 1886.

Scherer's literary activity falls into three categories: in Vienna he was the philologist, at Strassburg the professor of literature and in Berlin his author. His earliest work was a biography of the great philologist Jakob Grimm (1864, 2nd ed. 1883); he next, in conjunction with his former teacher Müllenhoff, published Denkmäler deutscher Poesie und Prosa aus dem 8. bis 12. Jahrhundert (1864, 3rd ed. 1892). His first great work was, however, Zur Geschichte der deutschen Sprache (Berlin, 1868; 3rd ed., 1890), a history of the German language with special reference to phonetic laws. He contributed the section on Alsatian literature to O. Lorenz's Geschichte des Elsasses (1871, 3rd ed. 1880). Other important works are: Geschichte der deutschen Literatur vom ersten bis zum 17. Jahrhundert (1874-1875); Geschichte der deutschen Dichtung im 11. und 12. Jahrhunderte (1875); and Vorüber- und Aufsätze zur Geschichte des geistigen Lebens in Deutschland und Österreich (1874). Scherer's best known work is his history of German literature, Geschichte der deutschen Literatur (Berlin, 1883; 10th ed., 1905; English translation by Mrs. F. C. Conybeare, 1883; new ed. 1966). This work is distinguished by the clearness with which details are caught and connected, and comprehensive survey of German literature from the beginning to the death of Goethe. Besides many other philological treatises, Scherer wrote largely on Goethe (Aus Goethes Freizeit,
The distinguished Brahms's mastery between 1895 and 1897)

SCHERR, Johannes (1817-1880), German man of letters and novelist, was born at Hohenrechberg in the kingdom of Württemberg on the 3rd of October 1817. After studying philosophy and history at the university of Tübingen (1837-1840), he became a pupil of the school conducted by his brother Thomas in Winterthur. In 1843 he removed to Stuttgart, and, entering the political arena with a pamphlet Württemberg im Jahre 1843, was elected in 1848 a member of the Württemberg House of Deputies; became leader of the democratic party in south Germany and, in consequence of his agitation for parliamentary reform in 1849, was obliged to take refuge in Switzerland to avoid arrest. Condemned in contumacia to fifteen years' hard labour, he established himself in Zurich as Privadozent in 1859, but removed in 1852 to Wintertur. In 1866 he was appointed professor of history and Helvetic literature in the Polytechnic in Winterthur, in which city he died on the 21st of November 1886.

Scherr was a voluminous writer in the field of historical investigation into the civilization, literature, and manners and customs of his country. His works have largely a political bias, but are characterized by an absence of any cleavage between exposition and careful research. Numberless among his books are the following: Geschichte der deutschen Kultur und Stüte (1852-1853, new ed. 1867); Schiller und seine Zeit (1859, new ed. 1870); Geschichte der deutschen Geschichte (1860, 4th ed. 1869); Geschichte der deutschen Musik (1860, 4th ed. 1880); Geschichte der englischen Literatur (1854, 2nd ed. 1853); Bücher, seine Zeit und sein Leben (1862, 4th ed. 1887). Scherr also wrote the humorous Sommertagebuch des vierten Dr. Gastroseptik, Jerimich Saurerhammer (1873); as a novelist he published the historical novels, Schiller (1856), and Michel, Geschichte eines Deutschen unserer Zeit (1858) which have passed through several editions.

With the exception of some of his stories (Novellenbuch, 10 vols. 1872-1877) Scherr's works have not appeared in a collected edition.

SCHERZO (Italian for "a joke"), in music, the name given to a quick movement evolved from the minuet and used in the position thereof in the sonata form. The term is occasionally applied otherwise, as a mere character name. Haydn first used it for a middle movement quicker than a minuet, in the comparatively early set of six quartets, Op. 74, and the three quartets Op. 77, as a joke. Mozart used it for a similar purpose, as well as for a coda to the last movement of his Jupiter Symphony. Scherzo is the French word for a round, as contrasted with the Russian quadrilles.

He never used the term again, though his later minuets, especially those in the Salomon symphonies, and the last completed quartets (Op. 77), are in a very rapid tempo and on a larger scale than any of the earlier scherzos of Beethoven. Haydn wished to see the minuet made more worthy of its position in large sonata works; but he did not live to appreciate (though he might possibly have heard) the great scherzos of his pupil Beethoven, which brought the element of the sublime into what may be generally termed the dance movement of the sonata style.

With rare exceptions Beethoven not only retained the dance character in lively middle movements, but accentuated it to the utmost in terms of what we have elsewhere called "dramatic" as distinguished from "decorative" music. He took those features of minuet form and style which most contrast the minuet with the larger and more highly organized movements, and he devised a form that emphasized them as they have never been emphasized before or since. The distinctive external feature in the minuet and trio is the combination of melodic binary forms with an exact division of minuet and trio themes. In the sonata admitting of so purely decorative a symmetry, the form of Beethoven's typical scherzo purposely exaggerates this feature. Mozart had frequently enriched minuets by giving them two or even three trios, with the minuet da capo after each. Beethoven does not do this; for, the general structure and texture of his scherzos being more continuous and highly organized, the variety of themes thereby produced would tend to give the form an elaborate rondo character which would not have differentiated it sufficiently from finales. But after Beethoven's mature scherzo has run through the stages of scherzo, trio and scherzo da capo, it goes through the same trio and da capo again; and perhaps even tries to do so a third time, as if it could not find a way out, and is then playfully and abruptly stopped.

This form lends itself to high-spirited humour, and differentiates the scherzo from the more highly organized movements by dramatically emphasizing its formal and decorative side. But Beethoven's Scherzo (Op. 33) where its "round-and-round" effect is realized with a mastery which alone suffices to dispose of Thayer's belief that these bagatelles are in their finished form, to Beethoven's boyhood.1 As a rule Beethoven did not find the piano forte a favourable instrument for his characteristic scherzo style; and his only other typical examples for piano forte are the second movements of the sonatas Op. 9, 10 and 11, a number of which is the trio repeated, and the fifth of the Six Bagatelles Op. 126.

The scherzo of the Eroica symphony is too long for Beethoven to allow it to go twice round; and that of the 9th symphony is so enormous that the main body of the scherzo is like a complete first movement of a sonata, from which it differs only in its comparative uniformity of texture and its incessant onrush, which not even the startling measured pause and the changes from 4-bar to 3-bar rhythm can really interrupt. Beethoven directs as many repetitions of its sub-sections as possible, and his coda consists of a most impressive attempt to begin the trio again, dramatically cut short. The scherzo of the Eroica and the scherzo of his 5th symphony are exceptions.

The scherzo of the 3rd symphony was originally meant to go twice round; but in its fifth edition, where it was not composed in the space of thirty years after Beethoven's death, was due simply to traces of the difference between the prima volta and seconda volta being left in the score.

Beethoven also used other types of quick middle movement in the place of the scherzo. In one case, that of the second allegretto of the E flat trio (Op. 70, No. 2), the round-and-round form is developed to the utmost in an almost humorous type, which thirty years after Beethoven's death, were due simply to traces of the difference between the prima volta and seconda volta being left in the score.

Modern custom uses the name of scherzo as a mere technical term for quick middle movements, and in this sense we may speak of the second movement of Beethoven's F major string quartet (Op. 59, No. 1) as a unique example; it being a very highly developed application of binary form with the utmost humour and unexpectedness of detail and style. It is possible that this gigantic movement, occurring in a work which was an especial favourite of Mendelssohn's, may have been the inspiring source of the Mendelssohnian scherzo of Liszt's A flat trio of 1853. But the scherzo of the E minor symphony, though not composed in the space of thirty years after Beethoven's death, is due simply to traces of the difference between the prima volta and seconda volta being left in the score.

Of Brahms's scherzos there are many distinct types. His largest, such as that of the trio Op. 8, are greatly influenced by Beethoven; but there are several great quick movements in the usual form which are not called scherzos, and are as far from being jokes as is the third movement of Beethoven's F minor quartet. The third movement of Brahms's fourth symphony is perhaps the most gigantic scherzo since Beethoven's time. It lasts hardly seven minutes, but is a fully developed blend of rondo and first-movement forms, with a coda containing one of the greatest climaxes in symphonic and operatic history. It was introduced as a new type of scherzo, independent of the sonata, but still in the quick triple time (one beat in a bar) which is Beethoven's typical scherzo rhythm. Chopin's form is traceable.

1 The autograph date, 1783, tallies neither with the handwriting nor with the style, but it may well refer to the raw material. Beethoven sometimes kept back his ideas for thirty years before executing them.
to the classical of scherzo and trio, and the style is dramatically
capricious and romantic, but far too impressive to suggest
humour. The same may be said of many classical scherzos,
though Beethoven uses the title only where the humorous
character of the movement lies on the surface. Even then
Beethoven's only mature instances of the title (except in the
form of scherando as a mark of expression) are those of the
Eroica symphony, the B flat trio Op. 97 and the B flat sonata
Op. 106. It is, however, correct to call any energetic move-
ment a scherzo when it occupies the position thereof in a sonata
scheme.

SCHETKY, JOHN CHRISTIAN (1778-1874), Scotch marine
painter, descended from an old Transylvanian family, was born
in Edinburgh on the 11th of August 1778. He studied art under
Alexander Nasmyth, and after having travelled on the continent
he settled in Oxford, and taught for six years as a drawing-
master. In 1808 he obtained a post in the military college,
Great Marlow, and three years later he was appointed professor
of drawing in the naval college, Portsmouth, where he had ample
opportunities for the study of his favourite marine subjects.
From 1836 to 1835 he held a similar professorship in the military
college, Addiscombe. To the Royal Academy exhibitions he
correspondingly contributed several works. He died in London on
the 9th of January 1874. A memoir by his daughter was published in 1877.

His younger brother, JOHN ALEXANDER SCHETKY (1785-1824),
studied medicine in Edinburgh university and drawing in the
Trustees' Academy. As a military surgeon he served with
distinction under Lord Beresford in Portugal. He contributed
excellent works to the exhibitions of the Royal Academy and
of the Water-Colour Society, and executed some of the illustra-
tions in Sir W. Scott's Provincial Antiquities. He died at Cape
Castle on the 5th of September 1824, when preparing to
follow Mungo Park's route of exploration.

SCHEUCHZER, JOHANN JAKOB (1672-1733), Swiss savant,
was born at Zurich on the 2nd of August 1672. The son of the
senior town physician (or Archiater) of Zurich, he received his
education in that place, and in 1692 went to the university of
Altdorf near Nuremberg, being intended for the medical profession.
Early in 1694 he took his degree of doctor in medicine at the
university of Utrecht, and then returned to Altdorf to complete
his mathematical studies. He went back to Zurich in 1696,
and was made junior town physician (or Poliater), with the
promise of the professorship of mathematics; this he obtained
in 1710, being promoted to the chair of physics, with the office
of senior town physician, in January 1733, a few months before
his death on the 23rd of June.

His published works (apart from numerous articles) were estimated
at thirty-four in number. His historical writings are mostly still
in MS, and many of his mathematical and physical writings are
lost; while his works on medicine and natural history are almost all
to his scientific observations (all branches) or to his journeys, in
the course of which he collected materials for these scientific works.
In the former category are his Beschreibung der Naturgeschichte
des N. Orients, and his Miscellanea physica, 1700, the second with the Swiss
writings on the Swiss mountains (summing up all that
was then known about them, and serving as a link between Sinler's
work of 1709 and Gruner's of 1766), the second with the Swiss rivers,
lakes and mineral baths, and the third with Swiss meteorology and
geology. Scheuchzer's works, as issued in 1740 and in 1752, formed
(with Tschudi's Chronicum Helveticum) one of the chief sources for
Schiller's play of Wilhelm Tell (1804). In 1704 Scheuchzer was
elected a F.R.S.; he published many scientific notes and papers in
the Philosophical Transactions for 1706-1707, 1709 and 1727-1728.
His published scientific catalogues include the Synopsis generum
(1704-1705), which was published in London in 1708, and dedicated to
the Royal Society, while the plates illustrating it were executed at
the expense of the various learned societies, including the president,
Sir Isaac Newton (whose form imprimatur is on the title-page).

SCHIAPARELLI, GIOVANNI VIRGINIO (1835-1910), Italian
astronomer and senator of the kingdom of Italy, was born on
the 14th of March 1835 at Savigliano in Piedmont. He entered
Turin university in 1859, and graduated in 1854. Two years
later he went to Berlin to study astronomy under Encke, and
in 1859 was appointed assistant observer at Pulkova, a post
which he resigned in 1860 for a similar one at Brema, Milan.
On the death of Francesco Carlini (b. 1793) in 1862, Schiaparelli
succeeded to the directorship, a position which he held until
1903. He died at Milan on the 4th of July 1910.

Schiaparelli's most striking work was the discovery of the
asteroid Asperia in 1861—but he had also considerable
mathematical gifts, as is shown in his treatment of orbital
motions, published in 1864, and in other papers. His great contribution
to astronomy are his studies of the Perseids and the Leonid
comets. In 1885 he published an important work on the
stellar system, which was largely amplified in his Le Stelle cadenti (1873) and
in his Norme per le osservazioni dellevette cadenti dei bolidi (1896) gained for him
the Lalande prize of the Academy of Sciences, Paris, in 1868, and the
pulvinar medal of the Royal Astronomical Society in 1872. He next worked on the
double stars, but his results have only been partially published. This labour was
in
SCHIAVONE, the Italian name of the basket-hilted sword of the 17th century, resembling what is erroneously called the "claymore" of modern Highland regiments. The "schiavone" was the sword of the Slavonic guards (Schiavonetti) of the doges of Venice, whence the name has been derived. He also produced a "Mater Dolorosa" after Vandyck, and Michelangelo's cartoon of the "Sight of the Soldiers on the Banks of the Arno." From 1803 to 1808 he was engaged in etching Blake's designs to Blair's Grave, which, with a portrait of the artist engraved by Schiavonetti after T. Phillips, R.A., were published in 1808. The etching of Stothard's "Canterbury Pilgrims" was one of his latest works, and on his death on the 7th of June 1810 the plate was taken up by his brother Niccolo, and finally completed by James Heath.

SCHILL, FERDINAND (1814-1869), German engineer and shipbuilder, was born at Elbing, where his father was asmith and ironworker, on the 30th of January 1814. He studied engineering at Berlin and then in England, and returning to Elbing in 1837 started works of his own, which from small beginnings eventually developed into an establishment employing some 8000 men. He began by making steam engines, hydraulic presses and industrial machinery, and, by concerning himself with canal work and river or coast improvement, came to the designing and construction of dredgers, in which he was the principal (1847), and contributed largely to the art.

His "Boatschiff" in 1855, was the first screw-rudder vessel constructed in Germany. Schichau began to specialize in building torpedo-boats and destroyers (at first for the Russian government); at an early date, he also had the honor of the cooperation of Carl H. Ziese, who married his daughter. Ziese introduced compound engines into the first vessels built by Schichau for the German navy, the gun-boat "Habicht" and "Möwe," launched in 1859, and also designed in 1881 the first triple-expansion machinery constructed on the continent, supplying these engines to the torpedo-boats built by Schichau for the German navy in 1884, the first of some 160 that by the year 1900 were provided for Germany out of the Elbing yards. torpedo-boats were also built for China, Austria and Italy. Meanwhile Elbing had become insufficient for the increased output demanded. In 1880 Schichau established a floating dock and repairing shops at Pillau, and soon afterwards by agreement that with the government, started a large shipbuilding yard at Danzig, for the purpose of constructing the largest ships of war and for the mercantile marine. He died on the 2nd of January 1886; but Ziese carried on the work, and not only made the Danzig yard the chief cradle of the new German fleet, rivalling the finest English establishments, but also largely developed the equipment at Elbing. These great works have made the name of their originator to rank with that of Krupp.

SCHIEDAM, a town and river port of Holland, in the province of South Holland, on the Schie, near its confluence with the Maas, and a junction station 3 m. by rail and steam tramway W. of Rotterdam. Pop. (1905) 29,227. The public buildings of interest are the Grooto of Janskork, the old Roman Catholic church, the synagogue, the town-hall, the exchange, the concert-hall and a ruined castle. Schiedam is famous as the seat of a great gin manufacture, which, carried on in more than three hundred distilleries, gives employment besides to malt-factories, cooperages and cork-cutting establishments, and supplies grain refuse enough to feed about 30,000 pigs, as well as sufficient yeast to form an important article of export. Other industries include shipbuilding, glass-blowing and the manufacture of stearine candles.

SCHIEFNER, FRANZ ANTON (1817-1870), Russian linguist, was born at Reval, in Russia, on the 18th of July 1817. His father was a merchant who had emigrated from Bohemia. He was admitted first at the Reval grammar school, matriculated at St Petersburg as a law student in 1836, and subsequently devoted himself at Berlin, from 1840 to 1842, exclusively to Eastern languages. On his return to St Petersburg in 1843 he was employed in teaching the classics in the First Grammar School, and soon afterwards received a post in the Imperial Academy, where in 1852 the cultivation of the Tibetan language and literature was assigned to him as his special function. Simultaneously he held from 1860 to 1873 the professorship of classical languages in the Roman Catholic theological seminary. And in 1874 till his death he was an election from member of the Imperial Academy. He visited England three times for purposes of research—in 1861, 1867 and 1878. He died on the 16th of November 1879.

Schiefler made his mark in literary research in three directions. First, he contributed to the Memoirs and Bulletin of the St Petersburg Academy, and brought out independently a number of valuable research papers. He also devoted much time to the composition of larger publications on the language and literature of Tibet. He possessed also a remarkable acquaintance with Mongolian, and when death overtook him had just finished a revision of the New Testament in that language with which the British and Foreign Bible Society had entrusted him. Further, he was one of the greatest authorities on the philology and ethnology of the Finnish tribes. He edited and translated the great Finnish epic Kalevala; he arranged, completed and brought out in twelve volumes the literary remains of Alexander Castrén, bearing on the languages of the Samoyedic tribes, the Koibal, Karagass, Tungusian, Buryat, Orestiak and Kottic tongues, and prepared several valuable papers on Finnish mythology for the Imperial Academy. In the third place, he made himself the exponent of investigations into the languages of the Caucasus, which his lucid analyses placed within reach of European philologists. Thus he gave a full analysis of the Tush language, and in quick succession, from Baron P. Usär's investigations, comprehensive papers on the Awar, Ude, Abkhasian, Tchetchen, Kási-Kümük, Hútkinan and Kúrian languages. He also mastered Ossetic, and in 1874 till his death he was an election from member of the Imperial Academy, several of them accompanied by the original text.

SCHILL, FERDINAND BAPTISTA VON (1776-1809), Prussian soldier, was born in Saxony. Entering the Prussian cavalry at the age of twelve, he was still a subaltern of dragoons when he was wounded at the battle of Auerstädt. From that field he escaped to Kolberg, where he played a very prominent part in the celebrated siege of 1807, as the commander of a volunteer force of all arms. After the peace of Tilsit he was promoted major and given the command of a hussar regiment formed from his Kolberg men. In 1809 the political situation in France appeared to Schill to favour an attempt to liberate his country from the French domination. Leading out his regiment from Berlin under pretext of manoeuvres, he raised the standard of revolt, and, joined by many officers and a company of light infantry, marched for the Elbe. At the village of Dodendorf (5th of May 1809) he had a brush with the Magdeburg garrison, but was soon driven northwards, where he hoped to find British support. The king of Prussia's proclamations prevented the patriots from receiving any appreciable assistance, and with little hope than his original force Schill was surrounded by 2500 Danish and Dutch soldiers in the neighbourhood of Wandsbek. He escaped by hard fighting (action of Damgarten, 24th of May) to Stralsund, and attempted to put the crumbling fortifications in order. The Danes and Dutch soon hemmed him in, and by sheer numbers overwhelmed the defenders (May 31). Schill himself was killed. Some parties escaped to Prussia, where the officers were tried by court-martial, cashiered and imprisoned. A few escaped to Swinemünde, but the rest were either killed or taken. Handled over to the French, the soldiers were sent to the galleys, and the eleven officers shot at Wesel on the 16th.
of September. The body of Schill was buried at Stralsund, his head sent to Leiden, where it remained until 1837. Monuments were erected at Brunswick, Stralsund and Wesel, and the 1st Silesian Leib-Hussars have borne Schill's name since 1880.

See Haken, Ferdinand von Schill (Leipzig, 1824); Bärsch, Ferdinand von Schill's Zug und Tod (Leipzig, 1860), and F. von Schill, ein Charakterbild (Stuttgart, 1860); Petrich, Pommer'sche Lebensbilder, vol. ii. (Stettin, 1884); Francke, Aus Stralsunds Frankensiszeit (1890).

Schiller, Johann Christoph Friedrich von (1759-1805), German poet, dramatist and philosopher, was born at Marbach on the Neckar, on the 10th of November 1759. His grandfather, Johann Schiller, a wine merchant in Marbach, had settled, near Wabingen; his father, Johann Kaspar (1732-1799), was an army-surgeon, who had settled in Marbach and married the daughter of an innkeeper, Elisabeth Dorothea Kodweis (1732-1805). In 1773 Schiller's father again took service in the army and ultimately rose to the rank of captain. The vicesituates of his profession entailed a constant change of residence; but at Lorch and at Ludwigsburg, where the family was settled for longer periods, the child was able to receive a regular education. In 1773 the duke Karl Eugen of Württemberg claimed young Schiller as a pupil of his military school at the "Solitude" near Ludwigsburg. In 1776, during his school holidays, he was obliged to devote himself to law. On the removal of the school in 1775 to Stuttgart, he was, however, allowed to exchange this subject for the more congenial study of medicine. The strict military discipline of the school lay heavily on Schiller, and intensified the spirit of rebellion, which, nurtured on Rousseau and the writers of the Sturm und Drang, burst out in the young poet's first tragedy; but such a school-life had for a poet of Schiller's temperament advantages which he might not have known had he followed his own inclinations; and it afforded him glimpses of court life invaluable for his later work as a dramatist. In 1776 some specimens of Schiller's lyric poetry had appeared in a magazine, and in 1777-1778 he completed his drama, Die Räuber, which was read surreptitiously to an admiring circle of schoolmates. In 1780 he left the academy qualified to practise as a surgeon, and was at once appointed by the duke to an ill-paid post as doctor to a regiment garrisoned in Stuttgart. His discontent found vent in the passionate, unbalanced lyrics of this period. Meanwhile Die Räuber, which Schiller had been obliged to publish at his own expense, appeared in 1781 and made an impression on his contemporaries hardly less deep than Goethe's Götz von Berlichingen, eight years before.

The strength of this remarkable tragedy lay, not in its inflated tone or exaggerated characterization—the restricted horizon of Schiller's school-life had given him little opportunity of knowing men and women—but in the sure dramatic instinct with which it is constructed and the directness with which it gives voice to the most poignant ideas of the time. In this respect, Schiller's Räuber is one of the most vital German dramas of the 18th century. In January 1782 it was performed in the Court and National Theatre of Mannheim, Schiller himself having stolen secretly away from Stuttgart in order to be present. The success encouraged him to begin a new tragedy, Die Verschwörung des Fiesco zu Genova, and he edited a lyric Anthologie auf das Jahr 1782, to which he was himself the chief contributor. A second surreptitious visit to Mannheim came, however, to the ears of the duke, who was also irritated by a complaint from Switzerland about an uncompromising reference to Graubünden in Die Räuber. He had Schiller put under a fortnight's arrest, and forbade him to write any more "comedies" or to hold intercourse with any one outside of Württemberg. Schiller, embittered enough by the ungenial conditions of his Stuttgart life, resolved on flight, and took advantage of some court festivities in September 1782 to put his plan into execution. He hoped in the first instance for material support from the theatre in Mannheim, and its intendant, W. H. von Dalberg; but nothing but rebuffs and disappointments were in store for him. He did not even feel secure against extradition in Mannheim, and after several weeks spent mainly in the village of Ogersheim, where his third drama, Luisi Millerin, or, as it was subsequently renamed, Kabale und Liebe, was in great part written, he found a refuge at Bauerbach in Thruringia, in the house of Frau von Wolzogen, the mother of one of his former schoolmates. Here Luise Millerin was finished and Don Carlos begun. In July 1783 Schiller received a definite appointment for a year as "theatre poet" in Mannheim, and here both Fiesco and Kabale und Liebe were performed in 1784. Neither play is as spontaneous or inspired as Die Räuber had been; but both mark a steady advance in characterization and in the technical art of the playwright. Kabale und Liebe, especially, is an admirable example of that "tragedy of common life" which had been introduced into Germany from England and which bulked large in Schiller's and Goethe's drama of the 18th century. In this drama Schiller's powers as a realistic portrait painter and of conditions familiar to him are seen to best advantage. Although Schiller failed to win an established position in Mannheim, he added to his literary reputation by his address on "Die Schaubühne als eine moralische Anstalt betrachtet" (1784), and by the publication of the beginning of Don Carlos (in blank verse) in his journal, Die rheinische Thalia (1785). He had also the opportunity of reading the first act of the new tragedy before the duke of Weimar at Darmstadt in December 1784, and as a sign of favour, the duke conferred upon him the title of "Rat".

In April 1788 Schiller, whose position in Mannheim had long before become hopeless, accepted a call from some unknown friends—C. G. Körner, L. F. Huber, and their fiancées Minna and Dom Stock—with whom he had corresponded, to pay a visit to Leipzig. He spent a happy summer mainly at Gohlis, near Leipzig, his jugant being reflected in the Gieße an die Freiheit (published in September of the same year he followed his new friend Körner to Dresden. As Körner's guest in Dresden and at Loschwitz on the bank of the Elbe, he read the drama Don Carlos, which was the dramatic tale, Der Verbrecher aus Infamie (later entitled Der Verbrecher aus verlorener Ehre, 1786) and the unfinished novel, Der Geisterseher (1786). The Rheinische Thalia was continued as the Thalia (1786-1791; in 1792, and in 1803 and 1805) and Don Carlos appeared as a kind of "review" of most of his writings at this time. Körner's interest in philosophy also induced Schiller to turn his attention to such studies, the first results of which he published in the Rhinische Bauernfreude (1796). Don Carlos, meanwhile, appeared in book form in 1797, and added to Schiller's reputation as a poet. In adopting verse instead of prose as a medium of expression, Schiller showed that he was prepared to challenge comparison with the great dramatic poets of other times and other lands; but in seeking a model for this higher type of tragedy he unfortunately turned rather to the classic theatre of France than to the English drama which Lessing, a little known friend of Schiller's, had been the first to translate. The unwieldiness of the plot and its inconsistencies show, too, that Schiller had not yet mastered the new form of drama; but Don Carlos at least provides Schiller with an opportunity of expressing ideas of politics and intellectual freedom with which the disciples of Rousseau, he, in warm sympathy.

A new chapter in Schiller's life opened with his visit to Weimar in July 1788. Goethe, the poet, the philosopher, who was absent from Weimar; but the poet was kindly received by Herder and Wieland, by the duchess Amalie and other court notabilities. The chief attraction for Schiller was, however, Frau von Kalb with whom he had been passionately in love in Mannheim; but not very long afterwards he made the acquaintance at Rudolstadt of the family von Lengefeld, the younger daughter of which subsequently became his wife. Meanwhile the preparation for Don Carlos had interested Schiller in history, and in 1788 he published the first volume of his chief historical work, Geschichte des Abfalls der vereinigten Niederlande von der spanischen Regierung, a book which at once gained for him the respect which, among the historians of the 18th century, it obtained for him, on the recommendation of Goethe, a professorship in the university of Jena, and in November 1790 he delivered his inaugural lecture, Was heisset und zu welchem Ende stehe die Geschichte? In 1792 he married Charlotte von Lengefeld. Schiller's other historical writings comprise a Sammlung historischer Memoires, which he began to publish in 1793; a 3-volume work, from 1791-1797. The latter work is more perfunctory in execution and written for a wider public than his first history, but the narrative is dramatic and vivid, the portraiture is sympathetic, and the general views are historically realistic. Its influence by the light of the rationalistic optimism of the later 18th century.

Before, however, the History of the Thirty Years' War was finished, Schiller had turned from history to philosophy. A year after his marriage he had written a satire on the effects of which he was never completely to recover; financial cares followed, which were relieved unexpectedly by the generosity of the
hereditary prince of Holstein-Augustenburg and his minister, Graf Schimmelpenninck, who conferred upon him a pension of 1000 florins to enable him to devote himself to the study of philosophy. In the summer of 1790 he had lectured in Jena on the aesthetics of tragedy, and in the following year he studied carefully the new stage in the history of aesthetic theory, Über Anmut und Würde, published in 1793, which had just appeared and appealed powerfully to Schiller's mind. The influence of these studies is to be seen in the essays Über den Grund unseres Vergnügens an tragischen Gegenständen and über die Würde des Gefühls, (1792), as well as in his correspondence with his friend Körner. Here Schiller arrives at his definition of beauty, as Freiheit in der Erscheinung, which, although it failed to remove Kant's difficulty that beauty was essentially a subjective conception, marked the beginning of a new stage in the history of aesthetic theory. Über Anmut und Würde, published in 1793, was a further contribution to the elucidation and widening of Kant's theories; and it is the first attempt at aesthetic theory of which (1795), Schiller proceeded to apply his new standpoint to the problems of social and individual life. These remarkable essays were published in Die Horen, a new journal, founded in 1794, which was the immediate occasion for that intimate friendship with Goethe which dominated the remainder of Schiller's life. The two poets had first met in 1788, but at that time Goethe, fresh from Italy, felt little inclination towards the author of the turbulent dramas Die Räuber, Kabale und Liebe and Don Carlo. By degrees, however, Schiller's historical publications, and, in a higher degree, the magnificent poems, Die Göter Griechenlands (1788) and Die Kunst und ihr Stand, published in 1798, secured for the younger poet invited Goethe to become a collaborator in the Horen, the latter responded with alacrity. In a very few weeks the two had become friends. In the meantime a holiday in Schiller's Wirtemberg during the height of the French war, and the immediate outcome of the new friendship was Schiller's admirable essays, published in the Horen (1795-1796) and collected in 1800 under the title Über naive und sentimentale Dichtung. Schiller applied his aesthetic theories to this branch of art which was most peculiarly his own, the art of poetry; it is an attempt to classify literature in accordance with an a priori philosophic theory of "ancient," "modern," "classical" and "romantic," of "naive," and "sentimental," and it sprang from the need Schiller himself felt of justifying his own "sentimental" and "modern" genius with the "naive" and "classical" tranquility of Goethe's. While Schiller arrived at his definition of beauty, it was the function of his life to lay claim to finality, it is, on the whole, the most concise statement we possess of the literary theory which lay behind the classical literature of the period.

For Schiller himself this was the bridge that led back from philosophy to poetry. Under Goethe's stimulus he won fresh laurels in that domain of philosophical lyric which he had opened with Die Künstler; and in Das Ideal und das Leben, Die Macht des Gesangses, Würde der Frauen, and Der Spaziergang, he produced masterpieces of reflective poetry which have not their equal in German literature. These poems appeared in the Musenalmanach, a new publication which Schiller began in 1796, the Horen, which had never met with the success it merited, coming to an end in 1797. In the Musenalmanach were also published the first fragments of Wallenstein (1797), and in the succeeding numbers of the journal Schiller and Goethe, in which the two friends avenged themselves on the cavalier critics who were not in sympathy with them. The Almanach of the following year, 1798, was even more noteworthy, for it contained a number of Schiller's most popular ballads, "Der Ring des Polykrates," "Der Handschuh," "Ritter Toggenburg," "Der Taucher," "Die Kraniche des Ibykus" and "Der Gang nach dem Eisenhammer," "Der Kampf mit dem Drachen" following in 1799, and "Das Lied von der Glocke in 1800. As a ballad poet, Schiller's position has been less high than as a dramatist; the bold and simple outline, the terse expression, the heavy rhythm, which appealed directly to the popular mind, which did not let itself be disturbed by the often artificial and rhetorical tone into which the poet falls. But the supreme importance of the last period of Schiller's life lay in the series of master-dramas which he gave to the world between 1799 and 1804. Just as Don Carlos had led him to the study of Dutch history, so now his occupation with the history of the Thirty Years' War supplied him with the theme of his trilogy of Wallenstein (1798-1799). The plan of Wallenstein was of long standing, and it was only towards the end, when Schiller was impelled by a conviction that he must say within five acts, that he decided to divide it into three parts, a descriptive prologue, Wallenstein's Lager, and the two dramas Die Piccolomini and Wallenstein Tod. Without entirely break-

with the pseudo-classic method he had adopted in Don Carlos —the two lovers, Max Piccolomini and Thelka, are an obvious concession to the tradition of the French theatre—Wallenstein shows how much Schiller's art had benefited by his study of Greek tragedy; the fostering of his hero is a masterly application
peculiar force to the German empire, especially in periods of political despondency. But since the re-establishment of the German empire in 1871 there has been, at least in intellectual circles, a certain waning of his popularity, the Germans of to-day realizing that Goethe's influence was the result of the achievements of the nation. In point of fact, Schiller's genius lacks that universality which characterizes Goethe's; as a dramatist, a philosopher, an historian, and a lyric poet, he was the exponent of ideas which belong rather to the Europe of the period before the French Revolution than to our time; we look to his high principles of moral conduct, his noble idealism and optimism, rather as the ideal of an age that has passed away than as the expression of the more material ambitions of the modern world.

The first edition of Schiller's Sämtliche Werke appeared in 1812–1813, and has been followed by numerous editions, the latest being that of C. G. Körner. Of the countless subsequent editions mention need only be made here of the historisch-britische Ausgabe by K. Goedeke and others (19 vols., 1867–1876), the edition published by Hennel and edited by K. Boxberger and W. von Maltzahn (16 vols., 1868–1874); that in Kärscher's Deutsche Nationalliteratur, vols. 118–129 (1882–1890), edited by R. Boxberger and A. Birlinger; and the latest Complete edition (Säkulare Ausgabe), edited by May Hellen and others (17 vols., 1904–1905). A critical edition of Schiller's Briefe was published by P. Jonas (7 vols.) in 1892–1896; the chief collections of his correspondence are: Briefwechsel zwischen Schiller und Goethe (1824–1850, published in 1893); Briefwechsel zwischen Schiller und W. von Humboldt (1830, edited by F. Muncker, 1893); Schiller Briefe mit Körner (1847, edited by L. Maier); Schiller Briefe und Dokumente (1892, edited by W. Vögel, 1897); Briefwechsel zwischen Schiller und Cotta, ed. by W. Vögel (1879, 3 vols.).

The chief biographies of Schiller are the following: T. Carlyle, Life of Friedrich Schiller (1824, German translation with an introduction by Goethe, 1876); Goethe, Gedichte (1830, 5th ed., 1876, cheap reprint, 1884); K. Hofmeister, Schillers Leben (1838–1842); G. Schwab, Schillers Leben (1840, 2nd ed. 1844); E. Pallaske, Schillers Leben und Werken (1858–1864, 3th ed. 1894); E. Schwab, Schillers Leben (1875, new ed. 1888); H. Düntzer, Schillers Leben (1881); J. Sime, Schiller (1882); R. Weltreich, F. Schiller (vol. i., 1890); O. Brahm, Schillers Werke, vols. 1–2, (1888–1892); J. Minor, Schillers Leben und Werke, ed. by W. Böhme, 1895; E. Müller, Regesten zu Schillers Leben und Werken (1900); A. Kontz, Les drame de la jeunesse de Schiller (1890); E. Kühnemann, Kant und Schiller (1897); E. Kühnemann, Friedrich Schiller (1898); E. Schiller, Schillers Dramen: Beiträge zu ihrem Verständnis (2 vols., 1888–1891; 2nd ed. 1898); K. Werder, Vorlesungen über Schillers Werke (1889); A. Küster, Schiller als Dramatiker (1891); L. Bölling, Schillers Meister (1883); K. Fischer, Schiller-Schriften (1891–1892); J. W. Braun, Schiller im Urteile seiner Zeitgenossen (3 vols., 1882); J. G. Robertson, Schiller after a Century (1905). (J. G. R.)

SCHILTBERGER, JOHANN or HANS (1581–1448?), German traveller and writer, was born of a noble family in 1581 (probably in Holten near Lobolf, half way between Munich and Freising, on what was then a property of his family. In 1394 he joined the suite of Lienhart Richartinger, and went off to fight under Sigismund, king of Hungary (afterwards emperor), against the Turks on the Hungarian frontier. At the battle of Nicopolis (Sept. 28th, 1396) he was wounded and taken prisoner; when he had recovered the use of his feet, Sultan Bayezid I. (Ildertin) took him into his service as a runner (1396–1402). He seems to have since accompanied Ottoman troops to certain parts of Asa Minor and to Egypt. On Bayezid's overthrow in 1402, and his flight to Syria, he served in the service of Bayezid's conqueror Timur: he now appears to have followed Themülin to Samarkand, and perhaps also to Armenia and Georgia. After Timur's death (February 17th, 1405) his German runner first became a slave of Shah Rukh, the ablest of Timur's sons; then of Miran Shah, a brother of Shah Rukh; then of Abu Bekr, a son of Miran Shah, whose camp roamed up and down Armenia. He next accompanied Chereke, a Tatar prince living in Abu Bekr's horde, on an excursion to Siberia, of which name Schiltberger gives us the first clear mention in west European literature. He also probably followed his new master to the land of the Red Bulgarians of the middle Volga, answering to the modern Kazan and its neighbourhood. Wanderings in the steppe lands of south-east Russia; visits to Sarai, the old capital of the Kipshak Khanate on the lower Volga and to Azov or Tana, still a trading centre for Venetian and Genoese merchants; a fresh change of servitude on Chereke's ruin; travels in the Crimea, Circassia, Akhkhia and Mingrelia; and finally escape (from the neighbourhood of Batum) followed. Arriving at Constantinople, he there lay hid for a time; he then returned to his Bavarian home (1427) by way of Kilia, Akkerman, Chersones, and finally Varna. He there in 1432 became a chamberlain of Duke Albert III., probably receiving this appointment in the first instance before the duke's accession in 1438.

Schiltberger's Reisebuch contains not only a record of his own experiences and a sketch of various chapters of contemporary Eastern history, but also an account of countries and their manners and customs, especially those whom he was first visited. First come the lands "this side" of Danube, where he had travelled; next follow those between the Danube and the sea, which he saw for the first time in 1429; then the Turkic dominions in Asia; last come the more distant regions of Schiltberger's world, from Trebizond to Russia and from Egypt to India. In this regional geography the descriptions of Brusa, of Constantinople, and the Black Sea, are particularly full. The Tatars around the Caspian, and the habits of their peoples (especially the Red Tartars); of Siberia; of the Crimea with its great Genoese fortress of Feodosia (where Schiltberger spent the winter); of Egypt and Arabia, are particularly worth notice. His allusions to the Islamic missions still persisting in Armenia and in other regions beyond the Euxine, and to (non-Roman?) Christian communities in Asia Minor, and to the history of the steppes are also marked. Schiltberger is perhaps the first writer of Western Christendom to give the true burial place of Mahomet at Medin: his sketches of Islam and of Eastern Christendom, with all their shortcomings, are valuable for the student of the early Middle Ages. He was among the authors who contributed to fix Prester John, at the close of the middle ages, in Abyssinia. His work, however, contains many inaccuracies; thus in reckoning the years of his service both with Bayezid and with Timur he unaccountably multiplies by two. His account of Timur and his campaigns is misty, often incorrect, and sometimes fabulous; nor can von Hammer's parallel between Marco Polo and Schiltberger be sustained without large reservations.

Four MSS. of the Reisebuch exist: (1) at Donaueschingen in the Fürstenberg Library, No. 481; (2) at Heidelberg, University Library, 216; (3) at Nürnberg, City Library, 34; (4) at St Gall, in the Bibliotheca Imperialis. The first edition was printed in 1625. The work was first edited at Augsburg, about 1460; four other editions appeared in the 15th century, and six in the 16th; in the 17th century it went through several editions. (Odess, 1666, with Russian commentary, in the Records of the Imperial University of New Russia, vol. i., and V. Langmantel's (Tiibingen, 1888); Hans Schiltbergers Reisebuch, in the 17th volume of the Bibliothek des literarischen Vereins in Stuttgart). Bruun (London, 1879); von Hammer, "Berechtigung d. orientalischen Namen Schiltberger," in Denkschriften d. Königl. Akad. d. Wissenschaften (vol. ix., Munich, 1823–1824); R. Röhrich, Bibliotheca geographica Palaeasitana (Berlin, 1890, pp. 103–104); C. R. Beazley, Dawn of Modern Geography, iii. 356-378, 594. (C. B. R.)

SCHIMMEL, HENDRIK JAN (1825–1887), Dutch poet and novelist, was born on the 30th of June 1825, at 'S Graveland, in the province of North Holland, where his father was a notary and the burgomaster. From 1836 to 1842 Schimmel served in his father's office, and upon his death he was taken into the office of the agent of the Dutch Treasury in Amsterdam, exchanging in 1849 for a post with the Dutch Trading Company there. In 1863 he became a director of the Amsterdam Credit Bank. His works number many, but he was first of all a writer of historical dramas in blank verse and one of the regenerators of the Dutch stage that his literary position was made. His finest production was Strenuuse (1868), which was preceded by Napoleon Bonaparte (1851) and Juffrouw Serklaas ("Mrs Serklaas," 1857). Among his other dramatic works may be mentioned Joan Wouters (a drama, 1847), Twice
Tudors ("Two Tudors," 1847), Goudelbald (1848), Schuld en Boete ("Guilt and Retribution," a drama, 1852), Het Kind van Staat ("The State Child," a dramatic fragment, 1859); Zege na Strijd ("Struggle and Triumph," a drama, 1878). Schimmel's renderings of Casimir de la Vigne's Louis XI., Gebel's Sophonte, and Ponson's Louvre are alike in their Neo-Neoclassical style. His novels are distinguished by their vigorous style and able characterization. The earlier, better-known ones betray the writer's English proclivities. The plots of Mary Hollis (1860, 3 vols., English translation, London 1872, under the title of "Mary Hollis, a Romance of the Days of Charles II. and William, Prince of Orange," 3 vols.) and of Mylady Carlisle (1864, 4 vols.) are laid in England, whereas those of his Sireign Semyens (1875, 3 vols.), a powerful picture of the terrible year 1762, and of De Kaptein van de Lijffsarde (1888, 3 vols., English translation, London 1889, under the title of "The Lifeguardman," 1 vol.), a continuation of "Master Semyens," are almost entirely centred in Holland. He had many points of style and manner in common with Madame Bosboom-Toussaint, though both remained highly original in their treatment. Both finally reverted to essentially national subjects.

To the earlier romances of Schimmel belong: Bonaparte en syn Lyf ("Bonaparte and his Time," 1853), De Eerste Dag eens Nieuwen Lyf ("The First Day of a New Life," 2 vols., 1853), Sproken en Vertellingen ("Legends and Tales," 1853), Een Haagse Joffer ("A Hague Dam," 1859), De Horizons sterren ("The Signs of the Stars") (1860). Schimmel was an early collaborator of Potgieter on the Gids staff. His dramatic works appeared in a collected edition in 1855-1856 at Amsterdam (3 vols.), followed by a complete and popular issue of his novels (Schiedam, 1892). Schinkel, Karl Friedrich (1781-1841), German architect and painter, and professor in the academy of fine arts at Berlin from 1820, was born at Neuruppin, in Brandenburg, on the 13th of March 1781. He was a pupil of Friedrich Gilly, the continuation of whose work he undertook when his master died (1805). He went to Italy, returning to Berlin in 1805. The Napoleonic wars interfered seriously with his work as architect, so that he took up landscape painting, displaying a talent for the romantic delineation of natural scenery. In 1810 he drew a plan for the mausoleum of Queen Louise and in 1819 a brilliant sketch for the Berlin cathedral in Gothic style. From 1808 to 1814 he painted a number of dioramas for Gropins. From 1815 he devoted much time to scene painting, examples of his work being still in use in the royal theatres of Germany. Schinkel's principal buildings are in Berlin and its neighbourhood. His merits are, however, best shown in his plans for the transformation of the ancient Acropolis into a royal palace, for the erection of the Orlando Palace in the Crimea and for a monument to Frederick the Great. These and other designs may be studied in his Sammlung architektonischen Entwürfe (1820-1837, 3rd ed. 1857-1868) and his Werke der höheren Baukunst (1845-1846, new ed. 1874). See the biographies by Kuugler, Bötticher, Quast, H. Grimm, Wagen, Woertz, Ziller, Pech, Dohme, and vol. xxviii. of the Künstler- und monumenten project, by Ziller (Leipzig, 1807).

Schirmer, Friedrich Wilhelm (1802-1866), German landscape artist, was born in Berlin. As a youth he painted flowers in the royal porcelain factory; afterwards he became a pupil of F. W. Schadow in the Berlin Academy, but his art owed most to Italy. He went to Italy in 1827; his sojourn extended over three years; he became a disciple of his countryman Joseph Koch, who built historic landscape on the Poussins, and it is to him that Schirmer is indebted. In 1830 Schirmer established himself in Berlin in a studio with scholars from 1839 to 1865; he was professor of landscape in the academy. Schirmer's place in the history of art is distinctive: his sketches in Italy were more than transcripts of the spots; he studied nature with the painter's eye when he painted historic landscapes. On the completion of the Berlin Museum of Antiquities he had the opportunity of studying the works of the ancient landscape artists. Schirmer was the first to devote himself to the study of the manorial landscape; he reveals in his studies the poet's instinct for atmosphere. His pictures appeal to the mind by the ideal they embody, by beauty of form, harmony of line, significance of light and colour. In this constructed landscape German critics discover "motivic," "inner meaning," "the subjective," "the ideal." And Schirmer thus formed a school.

Schirmer, Johann Wilhelm (1809-1863), German landscape painter, was born at Jülich in Rhenish Prussia. This artist, a namesake of F. W. Schirmer, had a similar aim and career. He was first a student, and subsequently became a professor in the academy at Düsseldorf. In 1854 he was made director of the art school at Carlsruhe, where he died. He travelled and sketched in Italy, and aimed at historic landscape after the manner of the Poussins. His Biblical landscapes with figures are held in good esteem.

Schism, a division, especially used of a formal separation from a church or religious body, a sect, or church formed by such separation. The Greek schisma, as a clef isolation, from schízein, to cleave, is used in the New Testament of an actual rent in a garment (Matt. ix. 16) and also several times of divisions or differences of opinion as to the teaching and message of Christ (John vii. 43) or of dissension in the church (1 Cor. xi. 18).

In the early Christian Church, as defined by the Fathers, and later, the offence of "schism" is distinguished from that of "heresy"; it refers not to differences of belief or doctrine, but to the promotion, or the state, of divisions of organisation, and to the formation of bodies separate from the true church, or to dissension and separations due to disputes over matters of discipline or authority (compare "schismatic" in a similar sense). The dispute which led to the separation of the Latin and Greek Churches is known as the "Great Schism," and the division over the election to the Papacy of Urban VI. and Clement VII. as the "Great Schism of the West" (1378-1417) (see PAPACY and CHURCH HISTORY).

Schists (Gr. σχίτω, to split), in petrology, metamorphic rocks which have a fissile character. In all of them there is at least one mineral which crystallizes in platy forms (e.g. mica, talc, chlorite, haematite), or in long blades or fibres (anthophyllite, tremolite, actinolite, tournamite), and when these have a well-marked parallelism in definite bands or folia, the rock will break far more easily along the bands than across them. The platy minerals have also a perfect cleavage parallel to their flat surfaces, while the fibrous species often have two or more cleavages following their long axes; hence a schistose rock may split not only by separation of the mineral plates from one another but also by cleavage of the parallel minerals through their substance.

Schists in the common acceptance of that term are really highly crystalline rocks; fissile slates, shales or sandstones, in which the original sedimentary structures are little modified by recrystallization, are not included in this group by English petrologists, though the French schistes and the German Schiefer are used to designate also rocks of these types. The difference between schists and gneisses is mainly that the latter have less highly developed foliation; they also, as a rule, are more coarse grained, and contain far more quartz and felspar, two minerals which rarely assume platy or acicular forms, and hence do not lead to the production of a fissile character in the rocks in which they are important constituents. Schists, as a rule, are found in regions composed mainly of metamorphic rocks, such as the Scottish Highlands, the Rhenish Prussia, Saxony, Scandinavia, the Highlands of Scotland and north-west of Ireland. They are typical products of "regional" metamorphism, and are in nearly all cases older than the fossiliferous sedimentary rocks. Transitions between schists and normal igneous or sedimentary rocks are often found. The Silurian mica-schists of Bergen in Norway are fossiliferous; in the Alps it is believed that even Mesozoic rocks pass laterally into mica-schists and calc-schists. These changes are regarded as having been produced by the operation of heat, pressure and folding. It is often taught that gneisses are the further stages of the crystallization of schists and belong to a deeper zone where the pressures and the temperatures were greater. Igneous rocks also lead into schists (e.g. serpentine into talc-schist, dolerite into hornblende-schist) by the same agencies.
There are two great groups of schists, viz. those derived from sedimentary and those derived from igneous rocks, or, as they have been called, the "paraschists" and "orthoschists," respectively. Most metamorphic rocks, and includes some of the commonest metamorphic rocks. In the paraschists, though fossils are exceedingly rare, sedimentary structures such as bedding and the outer ridges of sandstones may sometimes be preserved. The foliation is often parallel to the bedding, but may cross it obliquely or at right angles; or the bedding may be folded and contorted while the foliation maintains a nearly uniform orientation. When the foliation is undulate or sinuous the rocks are said to be crumpled, and have wavy splitting surfaces instead of nearly plane ones. The development of foliation in shaly rocks is undoubtedly closely akin to the "shearing" or "slaggage" phenomena in clays which have been deformed by hard pressure. The orthoschists or paraschists have three great subdivisions, the mica-schists and chlorite-schists (which correspond in a general way to shales or clay rocks) the calc-schists (imurelites, or the rock limestones), and the gneiss-schists and gneisses (gneisses, or quartz-schists). In the mica-schists of this group biotite or muscovite may be the principal mineral and often both are present in varying proportions; the mica has developed from the argillaceous matter of the original rock; in addition there is always quartz and sometimes talc (albite or oligoclase). A large number of minerals may occur as accessories, e.g. garnet, tourmaline, staurolite, andalusite, actinolite, chloritoid or ottreille, epidote, prehnite, can be identified and when the minerals present are indicated by the name given the rock, e.g. staurolite-mica-schist. The phyllites (g.v.) form a middle term between this group and the slates; they consist usually of quartz, which is often crystalline and exhibits the foliation, with the fine schistosity of the mica-schists. These rocks which contain andalusite and staurolite are sometimes found in such associations as to show that they are due to contact action by intrusive igneous masses. The foliation of igneous rocks, such as granites, hornblendes or fine lavas which have been metamorphosed. Many of them contain large octahedra of magnetite. Others are probably sedimentary rocks, especially those of the so-called "tectonic" or "tectonized" varieties that are usually argillaceous limestones in which a large development of biotite or phlogopite has occasioned foliation. Often they contain quartz and felspar, sometimes pyroxene, amphibole, garnet, or epidote, but not all of them on schistose rocks. The quartz-schists consist of quartz and white mica, and are intimately related to quartzites. Many of them have been originally micaceous or felspathic sandstones. We may mention also graphitic schists (g.v.), which are usually black and graphitic, or altered types of carbonaceous schists, and haematite-schists which may represent beds of ironstone. The orthoschists are white mica-schists produced by the shearing of acid rocks, such as felsite and porphyry. Some of the "porphyro" which have grains of quartz and felspar in a finely schistose micaceous matrix are intermediate between porphyries and mica-schists of this group. Still more numerous are orthoschists of hornblende (hornblende-schists) consisting of green hornblende with often felspar, quartz and felspar (also rutile, garnet, epidote or zoisite, biotite and iron oxides). These are modified forms of basalt and diorite. Every transition can be found between perfectly normal philitic dolerites and typical hornblende-schists, and occasionally the same dike or sill will provide specimens of all the various dolerites and diorites, or schists and metamorphosed gabbros; others have developed from dikes or sills of lamprophyre. Under extreme crushing these basic rocks may be converted into dark biotite-schists, or greenish chlorite-schists in 1850 (Gedeken, and another schistosity in nearly all cases the representatives of the ultra-basic igneous rocks such as peridotite in regions of high metamorphism. Talc-schists are of the same category. They are soft and lustrous, with a peculiarly smooth feel, and though often confounded with mica-schists may be distinguished by their richness in magnesia; many of them contain tremolite or actinolite; others have residual grains of olivine or augite; and also a number of gneisses found in the uppermost metamorphic types and the perfectly metamorphic schists. Occasionally serpentines become sheared without yielding talcose minerals; they are then known as serpentine-schist and antigorite-schist, the latter being tough, dark-green rocks, more or less transparent.

SCHLAGINTWET, the name of five German scientific explorers or students of foreign countries. They were brothers, and were named HERMANN (1826-1882, who became known as Hermann von Schlagintweit Sakünlinski), ADOLF (1829-1857), Eduard (1831-1866), Robert (1833-1885), and Emil (1835-1904). Hermann was born at Munich on the 15th of May 1826. His first scientific labours were studies in the Alps, carried on between 1845 and 1848 in association with his brother Adolf (born at Munich on the 9th of January 1826). The publication of the "Untersuchungen über die physikalischen Geographie der Alpen" in 1850 (Leipzig) founded the scientific reputation of the two brothers, and their reputation was increased by subsequent investigations in the same field, in which Robert (born at Munich on the 27th of October 1837) also took part. Soon after the publication of the "Untersuchungen über die physikalischen Geographie der Alpen" (Leipzig, 1854), the three brothers received, on the recommendation of Alexander von Humboldt, a commission from the East India Company to travel for scientific purposes in their territory, and more particularly to make observations on the geological and magnetic altitudes of the Himalayas. During 1854-1857 they travelled, sometimes in company, sometimes separately, in the Deccan and in the region of the Himalayas, prosecuting their investigations beyond the frontiers of the company's territory into the region of the Karakorum and Kuen-lun mountains. Hermann and Robert were the first Europeans who crossed the Kuen-lun, and in honour of that achievement the former had the title or surname of Sakünlinski bestowed upon him (in 1864). Robert returned to Europe early in 1857; Hermann, after a visit to Nepal, joined him on his homeward journey; but Adolf, who remained to prosecute his explorations in Central Asia, was put to death by the amir of Kashgar on the 26th of August. Hermann and Robert published in four volumes the Results of a Scientific Mission to India and High Asia (Leipzig, 1860-1866). They had, moreover, made extensive ethnographical and natural history collections. Hermann spent the last years of his life chiefly in literary and scientific activity, partly at Munich, partly at the castle of Jägerburg near Forchheim. He died at Munich on the 19th of January 1882. Robert was appointed professor of geography at Giessen in 1863. He paid several visits to America, which furnished him with a wealth of ethnographical and topographical data. His best works are "Die Mineralien" (1870), "Die Monomorien" (1874), "Die Pränien" (1876), &c., all published at Cologne. He died at Giessen on the 6th of June 1885. Eduard, born on the 23rd of March 1831, killed in battle at Kissingen in 1866, made himself known by an account of the Spanish expedition to Morocco in 1839-1860. Emil, born on the 7th of July 1835, served several learned works relating to India and Tibet. He died on the 29th of October 1904.

SCHLA, (Czech, Slane), a town of Bohemia, 37 m. N.W. of Prague by rail. Pop. (1900) 4497, mostly Czech. The most notable churches are St. Gotthard (14th century, remodelled in 1782) St Mary, attached to the Priest college (1655-1658), the chapel of St Lawrence (13th century) and the church of the Holy Trinity belonging to the Franciscan friary (1653). There are extensive coal-fields and important iron, metal and machine industries, together with the manufacture of chemicals and corn-milling.

SCHLAGGENBAD, a watering-place of Germany, in the Prussian province of Hesse-Nassau, pleasantly situated in a deep and well-wooded valley of the Taunus range, 6 m. N.W. of Wiesbaden, 43 m. S. of Langenschwalbach, and 5 m. E. of Eltville on the Rhine, with which it is connected by a steam tramway. Its eight thermal springs are mostly used for bathing, and are efficacious in nervous complaints and feminine disorders. There is a handsome kursaal connected with the principal bathing establishment. Permanent population (1905) 400, while the number of visitors numbers about 250,000 annually.

SCHLEGEL, AUGUST WILHELM VON (1767-1845), German poet, translator, and critic, was born on the 8th of September, 1767, at Hanover, where his father, Johann Adolf Schlegel (1721-1795), was a Lutheran minister. He was educated at the Hanover gymnasium and at the university of Göttingen. Having spent some years as a tutor in the house of a banker at
Amsterdam, he went to Jena, where, in 1766, he married Karoline, the widow of the physician Böhmer (see Schelling, Karolinen) and in 1768 was appointed extraordinary professor. Here he began his translation of Shakespeare, which was ultimately completed, under the superintendence of Ludwig Tieck, by Tieck's daughter Dorothea and Graf W. H. Baudissin. This rendering is one of the best poetical translations in German, or indeed in any language. At Jena Schlegel contributed to Schiller's periodicals the Horen and the Musenalmanach; and with his brother Friedrich he conducted the Athenaenau, the organ of the Romantic school. He also published a volume of poems, and carried on a rather bitter controversy with Kotzebue. At this time many other Germans were moving to Berlin in order to be enabled to withstand the severity and coldness of the French school. He and his brother, though they were freemen of Sanskrit, had not in their possession the knowledge of the Greek, which in their judgment was necessary for the translation of the classics. Their acquaintance and freshness of their ideas, and commanded respect as the leaders of the new Romantic criticism. A volume of their joint essays appeared in 1801 under the title Charakteristiken und Kritiken. In 1802 Schlegel went to Berlin, where he delivered lectures on art and literature; and in the following year he published Ion, a tragedy in Euripidean style, which gave rise to a suggestive discussion on the principles of dramatic poetry. This was followed by Spanisches Theater (2 vols., 1803-1809), in which he presented admirable translations of five of Calderon's plays. In 1807 his two brothers, and Madame de Staël, who owed to him many of the ideas which she embodied in her work, De l'Allemagne. In 1813 he acted as secretary of the crown prince of Sweden, through whose influence the right of his family to noble rank was revived. Schlegel was made a professor of literature at the university of Bonn in 1818, and during the remainder of his life occupied himself chiefly with oriental studies, although he continued to lecture on art and literature, and in 1828 he issued two volumes of critical writings (Kritische Schriften). In 1823-1830 he published the journal Indische Bibliothek (5 vols.) and edited the periodicals Die Räumya (1829) and Die Räumya (1829) the Räumya. These works mark the beginning of Sanskrit scholarship in Germany. After the death of Madame de Staël Schlegel married (1818) a daughter of Professor Paulus of Heidelberg; but this union was dissolved in 1821. He died at Bonn on the 12th of May 1845. As an original poet Schlegel is unimportant, but as a poetical translator he has rarely been excelled, and in criticism he put into practice the Romantic principle that a critic's first duty is not to judge from the standpoint of superiority, but to understand and to characterize a work of art.

In 1846-1847 Schlegel's Sämtliche Werke were issued in twelve volumes by E. Böcking. There are also editions by the same editor of his Œuvres écrites en français (3 vols., 1846), and of his Opuscula Latina scripta (1848). Schlegel's Shakespeare translations have been often published; an edition of 1811-1812 was revised with Schlegel's MSS. by M. Bernays. See M. Bernays, Zur Entstehungs geschichte des Schlegel'schen Shakespeare (1872); R. Genée, Schlegel and Shakespeare (1903). Schlegel's Berlin lectures of 1801-1804 were reprinted from MS. notes by J. Minier (1884). A selection of the writings of both A. W. and Friedrich Schlegel, edited by O. F. Watzol, will be found in Künzler's Deutsche Nationalliteratur, 143 (1892), and especially R. Haym, Schlegel, and the article in the Allg. deutsiche Biographie by F. Muncker.

SCHLEGEL, JOHANN ELIAS (1719-1749), German critic and dramatic poet, was born at Meissen on the 28th of January 1719. He was educated at Schulpforta and at the university of Leipzig, where he studied law. In 1743 he became private secretary to his relative, von Spener, the Saxon ambassador at the Danish court. Afterwards he was made professor extraordinary at the academy of Serce, where he died on the 13th of August 1749. Schlegel was a contributor to the Bremer Beiträge and for some time, while he was living in Denmark, edited a weekly periodical, Der Freund. With his dramatic as well as with his critical writings he did much to prepare the way for Lessing, by whom his genius was warmly appreciated. He wrote two lively and well-constructed comedies, Der Triumph der guten Frauen and Die stumme Schönheit, the former in prose, the latter in alexandrines. Hermann and Canut (in alexandrines) are generally considered his best tragedies.

His works were edited (in 5 vols., 1761-1770) by his brother, J. H. Schlegel (1774-1780), who had a considerable reputation as a writer on Danish history. Another brother, J. Adolf Schlegel (1721-1793), an eminent preacher, and author of some volumes of poems, was the father of August Wilhelm and Friedrich von Schlegel. J. E. Schlegel's Asher's Sherry (a dramaturgical work) was first edited by J. von Antoniewicz (1887), and a selection of his plays by F. Muncker in Bremer Beiträge, vol. ii. (Kürschners Deutsche Nationalliteratur, vol. xlvii., 1899). See, besides the biography by his brother in the edition of his works, E. Wolff, Johann Elias Schlegel (1886); and J. Rentsch, Johann Elias Schlegel als Trauerspielschiller (1890).

SCHLEGEL, KARL WILHELM FRIEDRICH VON (1727-1829), German poet, critic and scholar, was the younger brother of August Wilhelm von Schlegel. He was born at Hanover on Christmas Day, 1727. His first education was at the school of his brother in Leipzig, but ultimately devoted himself entirely to literary studies. He published in 1797 the important book Die Griechen und Römer, which was followed by the suggestive Geschichte der Poesie der Griechen und Römer (1798). At Jena, where he lectured as a Privatdozent at the university, he contributed to the Athenaenau the aphorisms and essays in which the principles of the Romantic school are most definitely stated. Here also he wrote Lucinde (1799), an unfinished romance, which is interesting as an attempt to transfer to practical ethics the Romantic demand for complete individual freedom, and Alarosc, a tragedy (1829) in which, without much success, he attempted to introduce romantic and classical elements. In 1802 he went to Paris, where he edited the review Europa (1803), lectured on philosophy and carried on Oriental studies, some results of which he embodied in an epoch-making book, Uber die Sprache und Weisheit der Indier (1805). In the same year in which this work appeared, he and his wife Dorothea (1763-1839), a daughter of Moses Mendelssohn, joined the Roman Catholic Church, and from this time he became more and more opposed to the principles of political and religious freedom. He went to Vienna and in 1807 was appointed to the chair of classical poetry, which he held at the headquarters of the archduke Charles. At a later period he was counsellor of legation in the Austrian embassy at the Frankfort diet, but in 1818 he returned to Vienna. Meanwhile he had published his collected Gedichte (1809) and two series of lectures, Uber die neuere Geschichte (1811) and Geschichte der alten und neuen Literatur (1815). After his return to Vienna from Frankfort he edited Concordia (1820-1823), and began the issue of his Sämtliche Werke. He also delivered lectures, which were re-published in his Philosophie des Lebens (1828) and in his Philosophie der Geschichte (1829). He died on the 11th of January 1829 at Dresden. A permanent place in the history of German literature belongs to Friedrich Schlegel and his brother August Wilhelm as the critical leaders of the Romantic school, which derived from them most of its governing ideas as to the characteristics of the middle ages, and as to the methods of literary expression. Of the two brothers, Friedrich was unquestionably the more original genius. He was the real founder of the Romantic school; to him more than to any other member of the school we owe the revolutionizing and germinating ideas which influenced so profoundly the development of German literature for a century and a half.
SCHLEICHER—SCHLEIERMACHER

SCHLEICHER, August (1831–1868). German philologist, was born in Coburg on the 19th of February 1831, the son of a medical practitioner. He attended (1832–1836) the gymnasium at Coburg. In the autumn of 1840 he entered the university of Leipzig as a student of theology, but exchanged Leipzig in the spring of 1841 for Tübingen. Here he remained two years, and under the influence of the famous orientalist Ewald, relinquished the study of theology for that of languages. Proceeding to the university of Bonn in 1843, he took his doctor's degree in 1846 and established himself as Privatdozent for comparative philology.

In 1850 he was appointed extraordinary professor of Slavonic philology at Prussia. Schleicher in 1853 was advanced as ordinary professor to the chair of German and comparative philology and Sanskrit. While at Prague he commenced the study of Slavonic languages, and with the assistance of the Vienna academy of sciences undertook in 1852 a journey of scientific research into Prussian Lithuania, the fruits of which were the first scientific examination and description of the character of the Lithuanian language. In 1857 he became professor of philology at Jena, where he lived and worked until his death on the 6th of December 1868. Next to Franz Bopp (q.v.), the founder of the science of language, no German savant left a more enduring stamp of his personality upon this science than did Schleicher.

His first scientific work, *Zur vergleichenden Sprachgeschichte* (1848), was followed by *Die Sprachen Europas* (1850); but the book by which he is best known in *Kompendium der vergleichenden Grammatik der indogermanischen Sprachen* (2 pts., 1861, 1863; 4th ed., 1876), and a supplementary volume, *Indogermanische Christenstammtie* (1864). Among his minor writings are: *Zur Morphologie der Sprache* (in the *Memoires de l'academeie de St. Petersbourg*, 1856); *Die Dargetische Theorie und die Sprachwissenschaft* (1863, new ed. 1873); *Über die Bedeutung der Sprache für die Naturgeschichte des Menschen* (1865); while in the department of Slavonic and Lithuanian languages particularly, he may be mentioned for his *Die Litauischen sprachen* (1852); *Hdbuch der italischen Sprache* (with grammar, reader and glossary, 1856–1857). Besides Lithuanian legends he published an edition of Christian Donaleis' *Lithauische Dichtungen* (1865).

See S. Lefmann, *August Schleicher* (1870) and *Zeitschrift für vergleichende Sprachforschung*, vol. xvii.

SCHLEIDEN, MATTHIAS JAKOB (1804–1881), German botanist, was born at Hamburg on the 5th of April 1804. He studied law at Heidelberg and practised as an advocate in Hamburg till 1831, but not succeeding he studied botany and medicine at Göttingen and Berlin, and in 1839 graduated at Jena, where he was appointed extraordinary professor of botany, becoming honorary professor in 1840 and ordinary professor in 1850. In 1863 he was called to Dorpat, but resigned the following year and returned to Germany, where he lived as a private teacher. He died at Frankfort-on-Main on the 23rd of June 1881. His title to remembrance is twofold. Uniting the labours of two centuries of workers in vegetable histology, he proved that a nucleated cell is the only original constituent of the plant embryo, and that the development of all vegetable tissues must be referred to such cells, thus preparing the way for the epoch-making cell theory of Theodor Schwann (q.v.); and his *Geschichte der Zelltheorie* (1842; 14th ed. 1873) through several editions, did much to make the significance of the purely systematic Linnean school, whose accumulations he was accustomed irreverently to describe as "hay." Despite a certain inability to criticize and verify his own hypotheses, he gave, both by his speculative activity and by the introduction of improved technical methods, so vivid an impetus to the younger botanists of his time as to have earned from Anton de Bary the title of reformer of scientific botany. His botanical labours practically ceased after 1850, when he entered on various philosophical and historical studies.

SCHLEIERMACHER, FRIEDRICH DANIEL ERNST (1768–1834), theologian and philosopher, was the son of a Prussian army chaplain of the Reformed confession, and was born on the 21st of November 1768 at Breslau. He was educated in a Moravian school at Niesky in upper Lusatia, and at Barby near Halle. Moravian theology, however, soon ceased to satisfy him, and his doubts rapidly took definite shape. Reluctantly his father gave him permission to leave Barby for the university of Halle, which had already (1787) abandoned Pietism and adopted the rationalist spirit of Wolf and Seemler (see Rationalism). As a student he pursued an indistinguishable course of reading and neglected to his permanent loss the study of the Old Testament and the Oriental languages. But he frequented the lectures of Seemler and of J. A. Eberhard, acquiring from the former the principles of an independent criticism of the New Testament and from the latter his love of Plato and Aristotle. At the same time he studied with great earnestness the writings of Kant and Jacobi. He acquired thus early his characteristic habit of forming his opinions by the process of patiently examining and weighing the positions of all thinkers and parties. But with the receptivity peculiar to the eclectic school he gained much from the struggle with a profoundly original thinker. While yet a student he began to apply ideas gathered from the Greek philosophers in a reconstruction of Kant's system. At the completion of his three years' course at Halle he was for two years private tutor in the family of Count Dohna-Schlobitten, developing in a cultivated and aristocratic household his deep love of family and social life. In 1796 he became chaplain to the Charité Hospital in Berlin. Having no scope for the development of his powers as a preacher, he sought mental and spiritual satisfaction in the cultivated society of Berlin, and profound philosophical studies. This was the period in which he constantly developed the central lines of his philosophical and religious system. It was the period, too, when he made himself widely acquainted with art, literature, science and general culture. He was at that time profoundly affected by German Romanticism, as represented by his friend Friedrich Schlegel. Of this his *Confidential Letters on Schlegel's Lucinde (Vertrauten Briefe über Schlegel's "Lucinde," 1801; ed. 1833; by Jonas Fränkel, 1897; R. Frank, 1907), as well as his perilous relation to Eleonore Grunow, the wife of a Berlin clergyman, are personal illustrations. Though his ultimate dedication to the position he had gained must have left a profound and abiding influence upon his personality, it showed him much of the inner truth of human feeling and emotion, and enriched his imagination and life with ideals ancient and modern, which gave elevation, depth and colour to all his thought. Meantime he studied Spinoza and Plato, and was profoundly influenced by both, though he was never a Spinozist; he made Kant more and more his master, though he departed on fundamental points from him, and finally remodelled his philosophy; with some of Jacobi's positions he was in sympathy, and from Fichte and Schelling he accepted ideas, which in their place in his system, however, received another value and import. The literary fruit of this period of intense fermentation and of rapid development was his "epoch-making" book, *Reden über die Religion* (1799; ed. Göttingen, 1906), and his "new year's gift" to the new century, the *Monologen* (1800; ed. 1902). In the first book he vindicated for religion an eternal place amongst the divine mysteries of human nature, distinguished it from all current caricatures of it and allied phenomena, and described the perennial forms of its manifestation and life in man and society, giving them by the programme of his subsequent theological system. In the *Monologen* he threw out his ethical manifesto, in which he proclaimed his ideas as to the freedom and independence of the spirit, and as to the relation of the mind to the world of sense and imperfect social organizations, and sketched his ideal of the future of the individual and society.

From 1802 to 1804, Schleiermacher was pastor in the little Pomeranian town of Stolpe. These years were full of literary
work, as well as rich in personal and moral progress. He relieved Friedrich Schlegel entirely of his nominal responsibility for the translation of Plato, which they had together undertaken (vols. 1–5, 1830; 2nd ed., 1835–1861; full ed., 1838; and ed., 1855–1863). At the same time another work, Grundzüge einer Kritik der bisherigen Sittenlehre (1830; 2nd ed. 1834), the first of his strictly critical and philosophical productions, occupied him. This work is a severe criticism of all previous moral systems, especially those of Kant and Fichte, Plato's and Spinoza's finding most favour; its leading principles are that the tests of the soundness of a moral system are the completeness of its view of the laws and ends of human life as a whole and the harmonious arrangement of its subject-matter under one fundamental principle. The most complete of Friedrich Schleiermacher's works, and indeed the only one released exclusively critical and negative, the book announces clearly the division and scope of moral science which Schleiermacher subsequently adopted, attaching prime importance to a "Güterlehre," or doctrine of the ends to be obtained by moral action. But the obscurity of the style of the book as well as its almost purely negative results proved fatal to its immediate success. In 1804 Schleiermacher removed as university preacher and professor of theology to Halle, where he remained until 1807, and where he quickly obtained a reputation as professor and preacher, and exercised a liberal and enlightened influence on his students, by the change of his being athiest, Spinozist and Pietist. In this period he wrote his dialogue the Weih- nachtsfeier (1806; 4th ed. 1850), a charming production, which holds a place midway between his Reden and his great dogmatic work, Der christliche Glaube, and presents in the persons of its speakers phases of his growing appreciation of Christianity as well as the conflicting elements of the theology of the period. After the battle of Jena he returned to Berlin (1807), was soon appointed pastor of the Trinity Church there, and the next year married the widow of his friend Willich. At the foundation of the Berlinerschule (1810), in which he himself was so influential, and which was, in a sense, the spiritual successor of the house of his being atheist, Spinozist and Pietist, he was thus placed in a position suited to his powers and in domestic and social surroundings adapted to meet the wants of his rich nature. At the same time he approved himself in the pulpit and elsewhere as a large-hearted and fearless patriot in that time of national calamity and humiliation, acquiring a name and place in his country's annals with Arnlt, Fichte, Stein and Scharnhorst. He took a prominent part too in the reorganization of the Prussian church in 1817. His energy and influence found expression in the union of the Lutheran and Reformed divisions of German Protestantism. The twenty-four years of his professional career in Berlin were opened with his short but important outline of theological study (Kurse Dorststellung des theologischen Studiums, 1811; 2nd ed. 1830), in which he sought to do for theology what he had done for religion in his Reden. While he preached every Sunday, he also gradually took up in his lectures in the university almost every branch of theology and philosophy—New Testament exegesis, introduction to and interpretation of the New Testament, ethics (both philosophic and Christian), dogmatic and practical theology, church history, history of philosophy, psychology, dialectics (logic and metaphysics), politics, pedagogy and aesthetics. His own materials for these lectures and his students' notes and reports of them are the only form in which the larger proportion of his works exist—a circumstance which has greatly increased the difficulty of getting a clear and harmonious view of fundamental portions of his philosophical and ethical system, while it has effectually deterred all but the most courageous and patient students from reading these posthumous collections. As a preacher he produced a powerful effect, yet not at all by the force of his-oratorical gifts, his intellectual strength, his devotional spirit and the philosophical breadth and unity of his thought. In politics he was an earnest friend of liberty and progress, and in the period of reaction which followed the overthrow of Napoleon he was charged by the Prussian government with "demagogic agitation" in conjunction with the great patriot Arnlt. At the same time he prepared for the press his chief theological work Der christliche Glaube nach den Grundsätzen der evangelischen Kirche (1821–1822; 2nd ed., greatly altered, 1830–1831; 6th ed., 1884). The fundamental principle of this classical work is that a religious feeling, the sense of absolute dependence on God as communicated by Jesus Christ through the church, and not the creeds or the letter of Scripture or the rationalistic understanding, is the source and law of dogmatic theology. The work is therefore simply a description of the facts of religious feeling, or of the inner life of the soul in its relations to God, and these inward facts are looked at in the various stages of their development and presented in their systematic connexion. The aim of the work was to reform Protestant theology by means of a Christian and ethical philosophy. Though the religion of the anthropomorphized Deity is "a failure, a monstrosity, a misrepresentation of the unreason and superficiality of both supernaturalism and rationalism, and to deliver religion and theology from a relation of dependence on perpetually changing systems of philosophy. Though the work added to the reputation of its author, it naturally aroused the increased opposition of the theological schools it was intended to overthrow, and at the same time Schleiermacher's defence of the right of the church to frame its own liturgy in opposition to the arbitrary dictation of the monarch or his ministers brought upon him fresh troubles. He felt himself to be the victim of his own success, and though his lecture-room continued to be largely attended, he prosecuted his translation of Plato and prepared a new and greatly altered edition of his Christliche Glaube, anticipating the latter in two letters to his friend Lüke (in the Studien und Kritiken, 1829), in which he defended with a masterly hand his theological position generally and his book in particular against opponents on the right and the left. The same year he lost his only son—a blow which, he said, "drove the nails into his own coffin." But he continued to defend his theological position against Hengstenberg's party on the one hand and the rationalists and romantics on the other, and his books added to the subscription to the ancient creeds and the imposition of a new rationalistic formulary. In the midst of such labours, and enjoying still full bodily and mental vigour, he was carried off after a few days' illness by inflammation of the lungs, on the 12th of February 1834.

Philosophical System.—A great antithesis lies at the basis of all thought and life—that of the real and the ideal, of organism, or sense, and intellect. But the antithesis is not absolute, for in life and thought both elements—intellectual and organismic—exist. The antithesis of life and thought would be impossible. In the actual world the antithesis appears as reason and nature, in each of which, however, there is a combination of its two elements—the ideal and the real—wherein, through a certain historical development, the predominance of one is more or less accompanied by a decrease in the other. At the basis of nature lies universal reason as its organizing principle, and when reason becomes a conscious power in man it finds itself in conflict as well as in harmony with the unity of the intellectual and physical and end of human thought and action is the gradual reduction of the realm and the power of this antithesis in the individual, the race and the world. Though the antithesis is real and deep, the human mind cannot admit its absolute nature: we are compelled to suppose a transcendental reality or entity in which the real and the ideal, being and thought, subject and object, are one. Consciousness itself involves the union of the antithetic elements, and prior to moral, action nature is found organized and reason manifested or symbolized therein. We are ourselves proofs of the unity of the real and the ideal, of thought and being, for we are both, our self-consciousness supplying the expression of the fact. As we have in ourselves an instance of the identity of thought and being, we must suppose a universal identity of the ideal and real behind the antithesis which constitutes the world. This supposition is the basis of all knowledge, for knowledge becomes knowledge only when it corresponds to being. The supposition may be called a belief, but it is so only in the sense in which belief appears in the religious department, where it is the ultimate ground of position and action. It is, without the conviction of the correspondence of thought and reality action would be fruitless and in the end impossible. It is above all the substance of religious feeling, which is the immediate consciousness of the unity of the world, the absolute and the absolute behind the infinite multiplicity of contrasts; indeed, it is the religious conviction of the unity which is the best guarantee of the truth of the oppositions of philosophy. It is "the religious antithesis of the contradiction of the intellectual and physical and end of human thought and action in "God" which is to overcome the scepticism of the critical philosophy. But, though
this unity must be laid down as the basis of knowledge, it is absolute and transcendental. In contrast with the "world," as the totality of things, the ego is only a part of the world, the real as manifold, and the spirit as one, find their uniting base, by its very nature is unphenomenal, indefinable and inconceivable. The idea is outside the boundary of thought, though its necessary positing of its "chance," and God with the absolute, is transcendent, but in God they are one, and therefore the world must not be identified with Him. The world and God are distinct, but correlative, and neither can be conceived without the other. The world without God would be chaotic, and God without the world nothing but "phantasm." But though God is transcendent and unknowable He is immanent in the world. In self-consciousness God is present as the basis of the unity of our nature in every transition from an act, e.g., of the mind, to the осуществление, to the presentation of the "ego" is the unity of the real and the ideal, God is in him. He also is in life, inasmuch as in everything the totality of the world and its transcendental basis is presupposed by virtue of their being and correlation. The unity of our personal life amidst the multiplicity of its functions is the symbol of God's immanence in the world, though we may not conceive of the Absolute as a person. The idea of the world as the totalizing of being of the transcendental idea of God, only of regulative value; it is transcendent, as we never do more than make approaches to a knowledge of the sum of beings absolute and transcendent terminus a quo and the other the transcendental terminus a quo and the transcendental idea of God, but though the world cannot be exhaustively known it can be known very extensively, and though the positive idea of God must always remain absolutely unknowable, it is capable of being understood as a contradiction of the postulate of the Absolute. Thus the pantheistic and the theistic conceptions of God as the supreme power, as the first cause, as a person, are alike unallowable, since they all bring God within the sphere of antithesis and preclude His absolute unity. On the other hand, the world can be known as the realm of antithesis, and it is the correlative of God. Though He may not be known, the sum of beings absolute and transcendent terminus a quo of the absolute and transcendental idea of God, only regulative, is the idea of absolute causality as symbolized in it may be taken as the approximate expression of the contents of the religious consciousness. The unbroken connexion of cause and effect throughout the world, we can think and act as God is in us, and in us only in ourselves and in the world. He is completely immanent in the universe. It is impossible that His causality should have any other sphere than the world, which is the totality of being. No God without a world, and no world without God. "The omnipotence is quantitatively represented by the sum of the forces of nature, and qualitatively distinguished from them only as the unity of infinite causality from the multiplication of its finite phenomena. Throughout the world—not excepting the realm of mind—absolute necessity prevails. As a whole the world is as good and perfect as it could possibly be, and everything in it, as occupying its necessary place in the system of the world, is also good, evil being only the necessary limitation of individual being.

Schleiermacher's psychology takes as its basis the phenomenal dualism of the ego and the non-ego, and regards the life of man as the relation of these two. The soul is an individual consciousness, a finite destination. The dualism is therefore not absolute, and, though present in man's own constitution as composed of body and soul, it is nowhere more clearly distinct as a distinct self. The ego soul—the conjunction of both constitutes it; our "organization" or sense nature has its intellectual element, and our "intellect" its organic element. There is no such thing as a "pure mind" or "pure body." The one general function of the ego, thought, becomes in relation to the non-ego either receptive or spontaneous action, and in both forms of action its organic, or sense, and its intellectual energies co-operate; and in relation to man, nature and the universe the ego gradually finds its true individuality by becoming an interconnection of every extension of consciousness being higher life." The specific functions of the ego, as determined by the relative predominance of the organic energies, are (subjective) and (objective) functions of the intellect. The former fall into the two classes of feelings (subjective) and perceptions (objective); the latter, according as the receptive or the spontaneous element predominates, into cognition and volition. Cognition is the object and in volition it is the purpose of thought: in the first case we receive (in our fashion) the object of thought into ourselves; in the latter we plant it out into the world. Both cognition and volition are functions of the ego as self-consciousness, or as the manifestation of the non-ego. This self-consciousness is the third special form of consciousness—which also called feeling and immediate knowledge. In it we cognize our own inner life as affected by the non-ego, but we cognize nothing as necessary or necessary as opposed to necessary expresses simply the fact that the mind can propose to itself ends, though a man cannot alter his own nature. In contrast to Kant and Fechter and modern moral philosophers
Schleiermacher reintroduced and assigned pre-eminent importance to the doctrine of the *summa bonum*, or highest good. It repre-
sents the highest good of the individual, and Schleiermacher's
approach is to define the highest good in terms of the essential
fundamental idea of the individual, and the natural right to feel
the natural goodness of the individual. The highest good of the
individual is the self-consciousness of the individual, and the
highest goodness of the individual is the quality of the individual
as a moral agent. Schleiermacher's foundation of the individual
is the natural goodness of the individual, and the natural right
to feel the natural goodness of the individual. The highest good
of the individual is the self-consciousness of the individual, and
the highest goodness of the individual is the quality of the
individual as a moral agent.

Schleiermacher says that the highest good of the
individual is the self-consciousness of the individual, and the
highest goodness of the individual is the quality of the
individual as a moral agent. Schleiermacher's foundation of the
individual is the natural goodness of the individual, and the natural
right to feel the natural goodness of the individual. The highest
good of the individual is the self-consciousness of the individual,
and the highest goodness of the individual is the quality of the
individual as a moral agent.

Schleiermacher says that the highest good of the
individual is the self-consciousness of the individual, and the
highest goodness of the individual is the quality of the
individual as a moral agent. Schleiermacher's foundation of the
individual is the natural goodness of the individual, and the natural
right to feel the natural goodness of the individual. The highest
good of the individual is the self-consciousness of the individual,
and the highest goodness of the individual is the quality of the
individual as a moral agent.

Schleiermacher says that the highest good of the
individual is the self-consciousness of the individual, and the
highest goodness of the individual is the quality of the
individual as a moral agent. Schleiermacher's foundation of the
individual is the natural goodness of the individual, and the natural
right to feel the natural goodness of the individual. The highest
good of the individual is the self-consciousness of the individual,
and the highest goodness of the individual is the quality of the
individual as a moral agent.
affords access to small vessels only. Fishing, tanning, flour-milling and brewing are the chief industries.

Schleswig (ancient forms Slesitorp, Slesisaw, i.e. the town or bay of the Slia or Schel) is a town of very remote origin, and seems to have been a trading place of considerable importance as early as the 9th century. It served as a medium of commercial intercourse between the North Sea and the Baltic, and as far as the extent of the southern German rivers. The first Christian church in this district was built here by Hildegarde (d. 775), and it became the seat of a bishop about a century later. The town, which obtained civic rights in 1200, also became the seat of the dukes of Schleswig, but its commerce gradually dwindled owing to the rivalry of Lübeck, the numerous wars in which the district was involved, and the silting up of the Schlei. At the partition of 1544 the old chateau of Gottorp, originally built in 1160 for the bishop, became the residence of the Gottorp line of the Schleswig-Holstein family, which remained here till expelled by the Danish king Frederick IV. in 1713. From 1731 to 1846 it was the seat of the Danish governor of the duchies. In the wars of 1848 and 1864 Schleswig was an important strategic point on account of its proximity to the Dannenwerkg (p.t.) and was occupied by the different contending parties in turn. It has been the capital of Schleswig-Holstein since its incorporation by Prussia in 1864.

See Sach, Geschichte der Stadt Schleswig (Schleswig, 1875); and Jensen, Geschichte Schleswigs (Weimar, 1848).

Schleswig-Holstein, a province in the north-west of Prussia, formed out of the once Danish duchies of Schleswig, Holstein and Lauenburg, and bounded W. by the North Sea, N. by Denmark (Jutland), E. by the Baltic Sea, Lübeck and Mecklenburg, and S. by the lower course of the Elbe (separating it from Hanover). It thus consists of the southern half of the Cimbric peninsula, and forms the connecting link between Germany and Denmark. (For map, see Denmark.) In addition to the mainland, which decreases in breadth from south to north, the province includes several islands, the most important being Alsen and Fehmarn in the Baltic, and Röm, Sylt and Föhr of the North Frisian chain in the North Sea. The total area of the province is 7338 sq. m., 450 of which belong to the small duchy of Lauenburg in the S.E. corner, while the rest are divided almost equally between Holstein to the south of the Eider and Schleswig to the north of it. From north to south the province is about 140 m. long, while its breadth varies from 90 m. in Holstein to 35 m. at the narrower parts of Schleswig.

Holstein, the greater part of this province, is an agricultural country. The great North-German plain, of the characteristic features of which it affords a faithful reproduction in miniature, down to the continuation of the Baltic ridge or plateau by a range of low wooded hills skirting its eastern coast and culminating in the Rugenborg (528 ft.), a little to the north of Eutin. This hilly district contains the most productive land in the province, the soil consisting of diluvial drift or boulder clay. The central part of the province forms a continuation of the great Lüneburg Heath, and its thin sandy soil is of little use for cultivation. Along the west coast extends the "Marshland," a belt of rich alluvial soil formed by the deposits of the North Sea, and varying in breadth from 5 to 15 m. It is seldom above sea-level, while at places it is below it, and it has consequently been defended by an extensive system of dykes or embankments separating those of Holland.

The vast ancient alluvial formations are scarcely met with in Schleswig-Holstein. The contrast between the two coast-lines of the province is marked. The Baltic coast has generally steep well-defined banks and is irregular, being pierced by numerous long and narrow inlets (Föhren) which often afford excellent harbours. The islands of Alsen and Fehmarn are separated from the coast by narrow channels. The North Sea coast is low and flat, and its smooth outline is interrupted only by the estuary of the Eider and the peninsula of Eiderstadt. Dunes or sand-hills, though rare on the protected mainland, occur on Sylt and other islands, while the small flat sand-hills called Halligen are being washed away where not defended by dykes. The number of Halligen on the west coast probably formed part of the peninsula at no remote period, and the sea between them and the mainland is shallow and full of sandbanks.

The coast of Schleswig is determined by the proximity of the sea, and the mean annual temperature, varying from 45° F. in the north to 49° F. in the south, is rather higher than is usual in the same latitude. Rain and fog are frequent, but the climate is in the whole healthy. The Elbe forms the southern boundary of Holstein for 65 m., but the only river of importance
SCHLESWIG-HOLSTEIN QUESTION

335

within the province is the Eider, which rises in Holstein, and after a course of 120 m. falls into the North Sea, forming an estuary 3 to 12 m. in breadth. It is navigable from its mouth as far as Rendsburg, which is on the Kaiser Wilhelm (Kiël-Elbe) canal, which intersects Holstein. The purchasers of the duchies of Holstein and Schleswig have been in a discussion of the line of the rivers, which is the boundary of the two duchies. The Plönner See (12 sq. m.) and the Selenter See (9 sq. m.). Of the total area of the province 37% is occupied by tilled land, 22% by pastures, and 19% by forests. The ordinary cereals are all cultivated with success and there is generally a considerable surplus for export. Rape is grown in the marsh lands and flax on the east coast, while large quantities of apples and other fruit are raised near Kiel, for the Flensburg and English market. The marsh lands afford admirable pasture, and a greater proportion of cattle (65 per 100 inhabitants) is reared in Schleswig-Holstein, mainly because the cattle in the large towns are confined within city limits, provided that cattle are exported to England. The Holstein horses are also in request, but sheep-farming is comparatively neglected. Bee-keeping is a productive industry. The hills skirted by the bays of the Baltic coast are generally pleasantly wooded, but the forests are nowhere of great extent except in Lauenburg. The fishing in the Baltic is productive; Eckernförde is the chief fishing station in Prussia. The oysters from the beds on the west coast of Schleswig are the most esteemed in the world. The mineral resources are almost confined to a few layers of rock-salt near Segeburg. The more important industrial establishments, such as the ironworks at Chemnitz and the large chemical works are mainly confined to the large towns, such as Altona, Kiel and Flensburg. The shipbuilding of Kiel and other seaports, however, is important; and lace is made by the peasants of north Schleswig. The important art of timber cutting and flax growing, with its position between two seas, as well as by its excellent harbours and waterways, are much more prominent than its manufactures. Kiel is the outlet for the exports of the coal and other valuable commodities mostly raised by Altona and Flensburg. The main exports are grain, cattle, horses, fish and oysters, in return for which come timber, coal, salt, wine and colonial produce. The population of the province in 1905 was 1,594,248, comprising 1,454,526 Protestants, 41,227 Roman Catholics and 3,720 Jews. The urban and rural communities are in the proportion of 1 to 2. The largest bulk of the Holsteiners are a mixed race, a proportion of the Schleswigers are of genuine German stock, but of the 148,000 inhabitants in the north part of Schleswig 139,000 are Danish-speaking. Among the Germans the prevalent tongue is Low German, but the North Frisians on the west coast of Schleswig and the North Sea islands (about 19,000 in all) still speak a Frisian dialect, which, however, is dying out. The peninsula of Angeln, between the Gulf of Flensburg and the Scheld, is supposed to have been the original seat of the English, and observers profess to see a striking resemblance between this district and肯特郡. The slopes of the Dithmarschen in the south-west also retain many of their ancient peculiarities. The boundary between the Danish and German languages is approximately a line running from Flensburg south-west to Joldclund and thence north-west to Tondern and the North Sea coast; not more than 15% of the entire population of the province speak Danish as their mother-tongue, but the proportion is far larger for Schleswig alone, where there is also a considerable bilingual population. The chief educational institution in Schleswig-Holstein is the university of Kiel. Kiel is the official capital of the province, Altona and Kiel are the largest towns, the latter being the chief naval station of Germany. Kiel and Friedrichsort are fortified, but the old lines of Düppel have been dismantled. The province sends 10 members to the Reichstag and 19 to the Prussian Abgeordnetenhause (house of deputies). The provincial estates meet in Rendsburg.

For the history of the duchies of Schleswig and Holstein see SCHLESWIG-HOLSTEIN QUESTION below.

SCHLESWIG-HOLSTEIN QUESTION, the name given to the whole complex of diplomatic and other issues arising in the 19th century out of the relations of the two "Elbe duchies," Schleswig and Holstein, to the Danish crown, on the one hand and the German Confederation on the other, which came to a crisis with the extinction of the male line of the reigning house of Denmark by the death of King Frederick VII. on the 15th of November 1863. The central question was whether the two duchies did or did not constitute an integral part of the dominions of the Danish crown, with which they had been more or less intimately associated for centuries. This involved the purely legal question, raised by the death of the last common male heir to both Denmark and the duchies, as to the proper succession in the latter, and was involved in the international questions arising out of the relations of the duchies to the Danes as well as to the other, and of Holstein to the German Confederation. There was also the national question: the ancient racial antagonism between German and Dane, intensified by the tendency, characteristic of the 19th century, to the consolidation of nationalities. Lastly, there was the international question: the rival ambitions of the German powers involved, and beyond them the interests of other European states, notably that of Great Britain in preventing the rise of a German sea-power in the north.

The whole question first arose from the time of the immemorial Danish claim to the country north of the Elbe, the battle-ground of Danes and Germans. Danish scholars point to the prevalence of Danish place-names far southward into the German-speaking districts as evidence that at least the whole of Schleswig was at one time Danish; German scholars claim it, on the other hand, as essentially German. That the duchy of Schleswig, or South Jutland (Sønderjylland), had been from time immemorial a Danish fief was, indeed, not in dispute, nor was the fact that Holstein had been from the first a fief of the Germano-Roman Empire. The controversy in the 19th century raged around the ancient "in- terest" of the union of Denmark and the inferences to be drawn from it; the "Elder Danes" 1 was the integral part of the Danish monarchy, which, on the principle of the union, involved the retention of Holstein also; the Germans claimed Holstein as a part of Germany and, therefore, on the same historic principle, Schleswig also. The history of the relations of Schleswig and Holstein thus became of importance in the practical political question.

Though the designation of Schleswig-Holstein, implying the fusion of the Duchies of Schleswig and Holstein in a single Prussian province, only dates from 1866, the history of the duchies has since the 14th century been so closely interwoven that it is impossible to treat them separately. Some political unions, however, were attempted by the Danes to prove their separate history up to the time of their first union under the Holstein counts.

When it first appeared in history South Jutland was inhabited by mingled Cimbri, Angles, Jutes and Frisians, upon whom the Danes exercised an unceasing pressure from the north. To the south of Schleswig what is now Holstein was inhabited mainly by Saxons, pressed upon from the east by the Wends and other Slavonic races. These Saxons were the last of their nation to submit to Charlemagne (804), who put their country under Frankish counts, the limits of the Empire being demarcated in 810 as far north as the Elbe. The Danish secural struggle between the Danish kings and the German emperors, and in 934 the German king Henry I. established the Mark of Schleswig (Limes Danorum) between the Elder and the Schlei as an instrument for the consolidation of the German empire, Schleswig and Holstein being the main point of contact between Germans and Slavs. The latter, conquered and Christianized, rose in revolt in 953, after the death of the emperor Otto II., and for a while reverted to paganism and independence. The Saxon dukes, however, continued to rule central Holstein, and when Lothair of Saxony became duke of Saxony (1106), on the extinction of the Billung line, he invested his younger brother, the infant Adolf I. of Slesvig, with the countship of Holstein. The chancellor of Adolph I.'s son, Adolf II. (1128-1164), succeeded in reconquering the Slavonic Wagr and founded the city and see of Lübeck to hold them in check. Adolf III. (d. 1225), his successor, received Dithmarschen in 1209 for his services against the Danes. Under the seigniors of the Duchy, the duchies of Holstein and of Schleswig were often at war and sometimes the Hanseatic League was led by Holstein, while the Hansa was led by Schleswig. However, when the Hanseatic League was formed in 1356, the members of the League were divided into those of Holstein and those of Schleswig, and it was, therefore, some time after 1356 that the two duchies were finally united.

in 1261, Holstein was split up into several countships by his sons and grandsons: the lines of Kiel, Flensburg, Schauenburg-Pinneberg, and Rendsburg.

In 1232 King Valdemar II., who had retained the former German Mark north of the Elbe, was succeeded (1233) by his son, Gerhard, duke for his second son, Abel. On the death of the latter's descendant, Duke Eric, in 1319, Christopher II. of Denmark attempted to seize the duchy, the heir of which, Valdemar of Holstein-Friesland, was imputed to the king's line and uncle, Gerhard III. of Holstein-Rendsburg (1304-1340), surnamed "the Great," a notable warrior, drove back the Danes and, Christopher having been expelled, succeeded in preserving his position. He died at the age of nineteen in his youth, and his reward was the duchy of Schleswig and the famous charter, known as the Constitution Valdemariana, which laid down the principle that the union of Schleswig and Holstein was unseparable and inalienable from the kingdom of Denmark or ruled by the same sovereign (June 1326). Thus Schleswig and Holstein were forever united. The union was, indeed, as yet precarious. In 1336 Christopher II. was restored to his throne and Valdemar V. to his duchy, Gerhard having to be content with the reversion in the case of the duchy dying without issue. Gerhard, however, was assassinated in 1340 by a Dane, and it was not till 1375, when the male lines both entered the kingdom and the duchy became extinct by the death of King Valdemar IV. and Duke Valdemar V., that the counts of Holstein seized on their inheritance, and Schleswig became practically independent of the Danish monarchy, a claim formally recognized by the emperor Sigismund in 1424. It was not till 1440 that the struggle ended with the investiture of Count Adolf IV., Gerhard's son, with the hereditary dukedom of Schleswig, under the condition that the new lord of Schleswig should not be of junior birth, nor marry a lady of the Danish Jutlandian blood. In 1386 Queen Margaret allowed their claim in return for the usual homage and promise of feudal service, and directed that one of their number should be elected duke of Schleswig. The first election of this kind was that of Count Adolf of Holstein-Rendsburg, who after the extinction of the line of Kiel (1390) obtained in 1403 the whole of the countship of Holstein, except the small Schauenburg territories. With this begins the line of dukes, known as the House of Holstein-Danneborg, the direct antece-

The Duchy of Holstein, 1472.

On the death of King Frederick I. (1523-1533), under whom the Reformation had been introduced into the duchies, occurred the first of several partitions of the inheritance of the house of Oldenburg; the elder son, Christian III., succeeding his father, was forced to abdicate, thereby allowing his uncle, Frederick, to found the line of the dukes of Gottorp. In 1581 a further partition was made, by a compact signed at Flensburg, between King Frederick II. and his uncle Duke Adolphus I., under which the rights of ownership in the various towns and territories of Schleswig were divided between them, and the duchy remained undivided, and the king and duke ruled the country alternately. To make conclusion worse confounded, Frederick II. in 1611 died childless, and his exeat to Halsenluben to his brother John, who founded the line of Schleswig-Sonderburg, and his grandsons again partitioned this appanage. Ernest Günther (1669-1689), founding the line of Schleswig-Sonderburg-Augustenburg, and his representatives, the Dukes of Gottorp, was assassinated with his son Christian Albert (d. 1694) by the treaty of Oliva, though it was not till after years of warfare that Denmark admitted the claim by the convention of Altona (30 June 1689). Christian Albert's successor, Frederick IV., who in 1710 had a powerful champion in Charles XII. of Sweden, who secured his rights by the treaty of Trondhjem in 1700. Frederick was killed at the battle of Klessow in 1702, and his brother Christian Augustus (1715) was restored to his father's throne. In 1716 Christian Augustus, who had been recognized as sovereign in Schleswig by the estates and by the princes of the Augustenburg and Glücksburg lines, was succeeded by Duke Charles Frederick with the tsarina Anna Pavlovna, and the recognition in 1742 of their son Charles Peter Ulrich as co-regent by the empress Elizabeth of Russia. For the next 200 years the duchy of Lübeck, son of Christian Augustus, acted as regent until 1745; in 1751 he became king of Sweden.2 But the king had no right to political administration of Schleswig and Holstein and their confused and disputed common rights in Jutland, and in 1767 the empress Catherine II., renounced them, thereby the city of Copenhagen, in the name of her son, the last of the Romanovs, and confirmed the rights of the Danish king in the city of Copenhagen. The Danish court itself at the time was largely German in language and feeling, and the king himself was as yet a very young prince. The Congress of Vienna, instead of settling the questions involved in the relations of the duchies of Denmark once for all, sought to settle them by a certain compromise. The settlement of 1806 was reversed, and while Schleswig Holstein remained as before, Holstein and Lauenburg were included in the new German Confederation. The opening up of the Schleswig-Holstein question thus became sooner or later inevitable. The Germans of Holstein, influenced by the new national enthusiasm evoked by the War of Liberation, resented more than ever the attempts of the government of Copenhagen to treat them as part of the Danish monarchy and, encouraged by the sympathy of the Germans in Schleswig, early tried to reassert in the interests of nationalism the old principle of the unity of the duchies. The king, however, was a powerful monarch and had large resources, and his demands were met by the Danes with a nationalistic temper as intractable as their own. Their affairs were ripe for a crisis, which, the threatened failure of the common male heirs to the kingdom and the duchies precipitated.

2 The Church (Lutheran) was organized under a Protokoll (provisor) and consistory, the king himself assuming the jurisdiction of summum episcopum.

The Duchies of Gottorp.

Russia resigns her rights in the duchies, 1756, 1773.

The Congress of Vienna, 1814-1815.
When Christian VIII. succeeded his father Frederick VI.
in 1839, the elder male line of the house of Oldenburg was obviously
on the point of extinction, the king's only son and heir
having no children. Ever since 1814, when joint
consultative estates had been re-established for the
duchies, the question of the succession had been
deated in this assembly. To German opinion the solution
seemed clear enough. The crown of Denmark could be inherited
by female heirs; in the duchies the Salic law had never been
repealed and, in the event of a failure of male heirs to Christian
VIII., the succession would pass to the dukes of Augustenburg,1
Danish opinion, on the other hand, clamoured for a
monarchical arrangement. To the Dissolution of the
indivisibility of the monarchy and its transmission intact to a single heir, in accord-
ance with the royal law. To this Christian VIII. yielded so far as to issue in 1846 letters patent declaring that the royal law
in the matter of the succession was in full force so far as Schleswig
was concerned, in accordance with the letters patent of August
22, 1721, the oath of fidelity of September 3, 1721, the guarantees
given by France and Great Britain in the same year and the
 treaties of 1767 and 1773 with Russia. As to Holstein, he stated
that certain circumstances prevented him from giving, in regard
 to some parts of the duchy, the same guarantees, as Schleswig.
The principle of the independence of Schleswig and
of its union with Holstein were expressly reaffirmed. An appeal
against this by the estates of Holstein to the German diet
received no attention. The revolutionary year 1848 brought
matters to a head. On the 28th of January, Christian VIII.
issued a rescript proclaiming a new constitution which, while
preserving the autonomy of the different parts of the country, incorporated them for common purposes in a single organiza-
tion. The estates of the duchies replied by demanding the
incorporation of Schleswig-Holstein, as a single constitutional
state, in the German Confederation. Frederick VII., who had
succeeded his father at the end of January, declared (March 4)
that he had no right to deal in this way with Schleswig, and,
yielding to the importunity of the Eider-Danish party, withdrew
the rescript of January (April 4) and announced to the people of
Schleswig (March 27) the premunition of a liberal constitu-
tion under which the duchy, while preserving its local autonomy,
would become an integral part of Denmark.

Meanwhile, however, the duchies had broken out into open
insurrection against this decision. As had been the case in
Britain, though obviously on the point of extinction, the king's only son and heir
having no children. Ever since 1814, when joint
consultative estates had been re-established for the

1 This was the argument of Karl Samwer, the German jurist, in his
_Die Staatsereignisse der Herzogthümer Schleswig und Holstein_,
published in 1844 at the instigation of the duke of Augustenburg.
and proposed that, at least, any treaty concluded should be
presented for ratification to the Frankfort government. This
the Danes refused; and negotiations were broken off. Prussia
was now confronted on the one side by the German nation
urging her clamorously to action, on the other side by the
European powers with one voice threatening the
worst consequences should she persist. After painful
hesitation, Frederick William chose what seemed
the lesser of two evils and, on the 26th of August 1848,
Prussia signed at Malmö a convention which yielded practically
all the Danish demands. The Holstein estates appealed to
the central government to unite itself up to the cause; but it
was soon clear that the central government had no means of
enforcing its views, and in the end the convention was ratified
at Frankfort.

The convention was only in the nature of a truce establishing
a temporary _modus vivendi_, and the main issues, left unsettled,
continued to be hotly debated. At a conference held in London
in October, Denmark suggested an arrangement on the basis
of a separation of Schleswig from Holstein, which was about
to become a member of the new German empire, Schleswig
would remain a _pariah_ state under the Danish crown. This
was supported by Great Britain and Russia and rejected by
Prussia and the German government (27th January 1849). The
negotiations broke down, however, on the refusal of Denmark
to yield the principle of the indissoluble union with the Danish
crown; on the 23rd of February the truce was at an end, and on
the 3rd of April the war was renewed. At this point the tsar intervened in favour of peace; and Prussia, conscious of its
restored strength and weary of the intractable temper of the
Frankfort government, determined to take matters into its
own hands. On the 5th of July 1849 a truce was signed;
Schleswig, until the peace, was to be administered separately, under a mixed commission, Holstein was to be governed by a
vicegerent of the German empire—an arrangement equally
offensive to German and Danish sentiment. A settlement
seemed as far off as ever; the Danes still clamoured for the
principle of succession in the female line and union with Denmark,
the Germans for that of succession in the male line and union with Holstein. In utter weariness Prussia proposed, in April 1850,
a definitive peace on the basis of the _status quo ante bellum_
and the postponement of all questions as to mutual rights.
Thus were the plans for a _pariah_ state swept away and the
proposed settlement to settle nothing. The emperor Nicholas, openly disapproved of Frederick William's weak-kneed truckling to the Revolu-
tion, again intervened. To him the duke of Augustenburg was
a rebel; Russia had guaranteed Schleswig to the Danish
crown by the treaties of 1767 and 1773; as for Holstein, if the
king of Denmark was unable to deal with the rebels there, he
himself would intervene as he had done in Hungary. The threat
was reinforced by the menace of the European situation.
Austria and Prussia were on the verge of war, and the sole
hope of preventing Russia from throwing her sword into the
scale of Austria lay in settling the Schleswig-Holstein question
in the sense desired by her. The only alternative, an alliance
of the devil's nephew," Louis Napoleon, who already
dreamed of acquiring the Rhine frontier for France at the
price of his aid in establishing German sea-power by the cession
of the duchies, was abhorrent to Frederick William.
On the 2nd of July 1850 was signed at Berlin a treaty of
peace between Prussia and Denmark. Both parties
reserved all their antecedent rights; but for Denmark
it was enough, since it empowered the king-duke to restore
his authority in Holstein with or without the consent of the
German Confederation.

Danish troops now marched in to coerce the refractory duchies;
but while the fighting went on negotiations among the powers
continued, and on the 2nd of August 1850 Great Britain, France,
Russia and Norway-Sweden signed a protocol, to which Austria
subsequently adhered, approving the principle of restoring
the integrity of the Danish monarchy. The Copenhagen govern-
ment, which in May 1851 made an abortive attempt to come

Conven-

Treaty

To bey of

SCHLESWIG-HOLSTEIN QUESTION
to an understanding with the inhabitants of the duchies by convening an assembly of notables at Flensburg, issued on the 6th of December 1851 a project for the future organization of the monarchy on the basis of the equality of all its constituent states, with a common ministry; and on the 28th of January 1852 a royal letter announced the institution of a unitary state which, while maintaining the fundamental constitution of Denmark, would increase the parliamentary powers of the estates of the two duchies. This proclamation was approved by Prussia and Austria, and by the German federal diet in so far as it affected Holstein and Lauenburg. The question of the succession was next approached. Only the question of the Augsburg succession made an agreement between the powers impossible, and on the 31st of March 1852 the duke of Augustenburg resigned his claim in return for a money payment. Further adjustments followed.

After the renunciation by the emperor of Russia and others of their eventual rights, Charlotte, landgravine of Hesse, sister of Christian VIII., and her son Prince Frederick transferred their rights to the latter’s sister Louise, who in her turn transferred them to her husband Prince Christian of Glücksburg. This arrangement received international sanction by the protocol signed in London on the 8th of May 1852 by the five great powers and Norway and Sweden. ¹ On the 31st of July 1853 King Frederick VII. gave his assent to a law settling the crown on Prince Christian, “prince of Denmark,” and his heirs male. The protocol of London, while consecrating the principle of the integrity of Denmark, stipulated that the rights of the German Confederation in Holstein and Lauenburg should remain unaffected. It was, in fact, a compromise, and left the fundamental issues unsettled. The German federal diet had been unrepresented in London, and the terms of the protocol were regarded in Germany as a humiliation. As for the Danes, they were far from being satisfied with the settlement, which they apprehended as far as it went for the virtual proscription of their unionist schemes. On the 15th of February and the 11th of June 1854 the king of Denmark, after consulting the states, promulgated special constitutions for Schleswig and Holstein respectively, under which the provincial assemblies received certain very limited powers. On the 26th of July 1854 he published a common constitution for the whole monarchy; this, which was little more than a veiled absolutism, was superseded on the 2nd of October 1855 by a parliamentary constitution of a modified type. The legality of this constitution was challenged by the two German great powers, on the ground that the estates of the duchies had not been consulted as promised in the royal letter of the 6th of December 1851; the diet of the Confederation refused to admit its validity so far as Holstein and Lauenburg were concerned (11th February 1858).

The question was now once more the subject of lively international debate; but the European situation was no longer so favourable as it had been to the Danish view. The Crimean War had crippled the power of Russia, and Nicholas I. was dead. France was prepared to sell the interests of Denmark in the duchies to Prussia in return for “compensations” to herself elsewhere. Great Britain alone sided with the Danes; but the action of British ministers, who realized the danger to British supremacy at sea of the growth of German sea-power in the Baltic, was hampered by the natural sympathy of Queen Victoria and the prince consort with the German point of view. ² The result was that the German diet, on the motion of Bismarck, having threatened federal intervention (July 29), King Frederick VII. issued a proclamation abolishing the general constitution so far as affected Holstein and Lauenburg, while retaining it for Denmark and Schleswig (November 6).

³ Herrsat, Map of Europe, ii. 1151.
⁴ See Queen Victoria to Lord Malmesbury, 1st of May 1858, in Letters (pop. ed., 1908), iii. 280. Compare the letters to Palmerston of 21st of June 1849, ii. 222, and 22nd of June 1850, ii. 279, with Palmerston to Russell, 23rd of June 1850, and Queen Victoria to Russell, ii. 250.

Though even this concession violated the principle of the “indissoluble union” of the duchies, the German diet, fully occupied at home, determined to refrain from further action till the Danish parliament should make another effort to pass a law or budget affecting the duchies. This decision was confirmed by the estates of the duchies. This contingency arose in July 1860, and in the spring of the following year the estates were once more at open odds with the Danish government. The German diet now prepared for armed intervention; but it was in no condition to carry out its threats, and Denmark decided, on the advice of Great Britain, to ignore it and open negotiations directly with Prussia and Austria as independent powers. These demanded the restoration of the union between the duchies, a question beyond the competence of the Confederation. Denmark refused with a refusal to recognize the right of any foreign power to interfere in her relations with Schleswig; to which Austria, anxious to conciliate the smaller German princes, responded with a vigorous protest against Danish infringements of the compact of 1852. Lord John Russell now intervened, on behalf of Great Britain, with a proposal for a settlement of the whole question on the basis of the independence of the duchies under the Danish crown, with a decennial budget for common expenses to be agreed on by the four assemblies, and a supreme council of state consisting in relative proportion of Danes and Germans. ⁵ Though spokesmen for Russia and by the Congress of great powers, and Denmark found herself isolated in Europe. The internal situation, however, favoured a bold attitude, and she met the representations of the powers with a flat defiance. The retention of Schleswig as an integral part of the monarchy was to her a matter of life and death; the German Confederation had made the terms of the protocol of 1852, defining the intimate relations between the duchies, the excuse for an irreversible indispensable to the internal affairs of Denmark; and on the 30th of March 1863 a royal proclamation was published at Copenhagen repudiating the compact and claiming the separate position of Holstein in the Danish monarchy, negativing once for all the claims of Germany upon Schleswig.

¹ The reply of the German diet to this move was to forward a note to Copenhagen (July 9) demanding, on pain of federal execution, the withdrawal of the proclamation and the grant of a fresh constitution, based on the compacts of 1852 or on the British note of the 24th of September 1862. Instead, King Frederick VII. issued on the 28th of September 1863 a new constitution for “our kingdom Denmark”; the former diet now resolved on federal intervention; but action was delayed, partly through British efforts at mediation, partly because Bismarck judged the time for a satisfactory solution of the whole question had not yet come. Encouraged by this hesitating attitude, the Danish parliament passed the new constitution on the 13th of November. Two days later Frederick VII. died.

² Note of Sept. 24, 1862. For the diplomatic correspondence on the duchies see Parl. Papers, Lxiv. (1864). ² For this and later correspondence see Parl. Papers, Lxiv. (1864), p. 40 seq.
supported by the German princes and people, and in spite of the negative attitude of Austria and Prussia the federal diet decided to occupy Holstein "pending the settlement of the succession. On the 24th of December Saxon and Hanoverian troops marched into the duchy in the name of the German Confederation, and supported by their presence and by the loyalty of the Holsteiners the duke of Augustenburg assumed the government under the style of Duke Frederick VIII. With this "folly"—as Bismarck roundly termed it—Austria and Prussia, in the teeth of violent public opinion, would have nothing to do, for neither wished to risk a European war. It was clear to Bismarck that the two powers, as parties to the protocol of 1852, must uphold the succession as fixed by it, and that any action they might take in consequence of the violation of that compact by Denmark must be so "correct" as to deprive Europe of all excuse for interference. The publication of the new constitution by Christian IX. was in itself sufficient to justify a declaration of war by the two powers as parties to the signature of the protocol. As to the ultimate outcome of their effective intervention, that could be left to the future to decide. Austria had no clear views. King William wavered between his Prussian feeling and a sentimental sympathy with the duchy of Augustenburg. Bismarck alone knew exactly what he wanted, and how to attain it. "From the beginning," he said later (Reflections, ii. 10). "I kept annexation steadily before my eyes." The protests of Great Britain and Russia against the action of the German diet, together with the proposal of Count Beust, on behalf of Saxony, that Bavaria should bring forward in that assembly a formal motion for the recognition of Duke Frederick's claims, helped Bismarck to persuade Austria that immediate action must be taken. On the 28th of December a motion was introduced in the diet by Austria and Prussia, calling on the Confederation to occupy Schleswig as a pledge for the observance by Denmark of the compacts of 1852. This implied the recognition of the rights of the duches of Schleswig. At the same time it was made clear that the provisions of the diet were to be executed at once, and not, as Austria had suggested, in the manner of a settlement. The news of Austria's move was not very well received by the governments of the wider Confederation. The Austrian diplomatic correspondence shows that Bismarck's diplomatic strategy was not thought much of. The Austrian government had decided to make no attempt to block Austria's action, and to wait and see what would happen. The British government, on the other hand, was determined to prevent any attempted settlement by the Germans. The British government, in fact, was determined to prevent any settlement by the Germans. The British government, however, decided to support Austria's action. The British government, however, decided to support Austria's action. The British government, however, decided to support Austria's action.

At this stage, the Danes yielded to the necessities of the situation, and withdrawn from Schleswig under protest, the European powers would probably have intervened, and the European powers would have had no choice but to prevent any attempt upon it by the duke of Holstein. To prevent this possibility Bismarck made the Copenhagen government believe that Great Britain had threatened Prussia with intervention should hostilities be opened, "as, a matter of fact, England did nothing of the kind." The cynical stratagem succeeded; Denmark remained defiant; and on the 1st of February 1864 the Austrian and Prussian forces crossed the Elbe. An invasion of Denmark itself had not been part of the original programme of the allies; but on the 18th of February some Prussian Hussars, in the excitement of a cavalry skirmish, crossed the frontier and occupied the village of Kolding. Bismarck determined to use this circumstance to revise the whole situation. He urged upon Austria the necessity for a strong policy, so as to set once for all not only the question of the duchies but the wider question of the German Confederation; and Austria reluctantly consented to press the war. On the 5th of March a fresh agreement was signed between the powers, under which the compacts of 1852 were declared to be no longer valid, and the position of the duchies within the Danish monarchy as a whole was to be made the subject of a friendly understanding. Meanwhile, however, Lord John Russell on behalf of Great Britain, supported by Russia, France and Sweden, had intervened with a proposal that the whole question should once more be submitted to a European conference. The German powers agreed on condition that the compacts of 1852 should not be taken as a basis, and that the duchies should be bound to Denmark by a personal tie only. But the proceedings of the conference, which opened at London on the 25th of April, only revealed the inextricable tangle of the issues involved. Beust, on behalf of the Confederation, demanded the recognition of the Augustenburg claimant; Austria leaned to a settlement on the lines of that of 1852; Prussia, it was increasingly clear, aimed at the acquisition of the duchies. The first step towards the realization of the latter ambition was to secure the recognition of the absolute independence of the duchies, and this Austria could only oppose at the risk of forfeiting her whole influence in Germany. The two powers, then, agreed to demand the complete political independence of the duchies bound together by common institutions. The next move was uncertain. As to the question of annexation Prussia would leave that open, but made it clear that any settlement must involve the complete military subordination of Schleswig-Holstein to herself. This alarmed Austria, which had no wish to see a further extension of Prussia's already overgrown power, and she began to champion the cause of the duchies. Bismarck himself had foreseen and himself offered to support the claims of the duke at the conference if he would undertake to subordinate himself in all naval and military matters to Prussia, surrender Kiel for the purposes of a Prussian war-harbour, give Prussia the control of the projected North Sea Canal, and enter the Prussian Customs Union. On this basis, with Austria's support, the whole matter might have been arranged without—as Beust pointed out (Mem. i. 272)—the increase of Prussia's power beyond the Elbe being any worse than the augmentation of the King of Denmark's power, which had been far greater. The Prussian government, however, for Bismarck's plans, Austria's distrust and jealousy of Prussia led her to oppose this settlement and at her instigation the duke of Augustenburg rejected it. On the 25th of June the London conference broke up without having arrived at any conclusion. On the 24th, in view of the end of the truce, Austria and Prussia had arrived at a new agreement, the object of the war being now declared to be the complete separation of the duchies from Denmark. As the result of the short campaign that followed, the preliminaries of a treaty of peace were signed in the last week of August, the king of Denmark renouncing all his rights in the duchies in favour of the emperor of Austria and the king of Prussia. The definitive treaty was signed at Vienna on the 30th of October 1864. By Article XIX., a period of six years was allowed during which the inhabitants of the duchies might "opt" for Danish nationality and transfer themselves and their goods to Denmark; and the right of "indigency" was guaranteed to all, whether in the kingdom or the duchies, who enjoyed it at the time of the exchange of ratifications of the treaty.

The Schleswig-Holstein Question from this time onward became merged in the larger question of the general relations of Austria and Prussia, and its later developments are sketched in the article Germany: History. So far as Europe was concerned it was settled by the decisive result of the war of 1866. It survived, however, as between Danes and Germans, though narrowed down to the question of the fate of the Danish population of the northern duchy. This question is of great interest to students of international law and as illustrating the practical problems involved in the assertion of the modern principle of "nationality."1

1 Parl. Papers (1864), lxv. 124 seq. Beust (Mem. i. 252) says that Queen Victoria personally intervened to prevent British action in favour of Denmark.

The last phase of the question.

The Powers and Augustenburg.

Treaty of Vienna, 1864.

SCHLESWIG-HOLSTEIN QUESTION 339
This adjustment, brought about by the friendly intercourse between the courts of Berlin and Copenhagen, seemed to close the last frontier of the autochthonous Germans and to give to the Danes the apparent only served to embitter the inter-racial feud. The "autochthonous Germans of the Northern Marches" regarded the new treaty as a delusion, not to be availing of the treaty to give to their hereditary enemies. For forty years Germany, backed by all the weight of the empire and imposed with all the weapons of official persecution, had barely held its own in North Schleswig; in spite of an enormous emigration, in 1908, of the 148,000 inhabitants of North Schleswig 139,000 spoke Danish, while of the German-speaking immigrants it was found that more than a third refused to be assimilated. But the scattered outposts of Germanism could hardly be expected to acquire new influence in a situation that threatened them with social and economic extinction. Forty years of dominance, secured by official favour, had filled them with a double measure of aggressive pride of race, and the question of the rival nationalities in Schleswig, like that in Poland, remained a source of trouble and weakness within the frontiers of the German empire.

AUTHORITIES.—The literature on the subject is vast. From the German point of view the most comprehensive treatment is in C. Jansen and K. Samwer, Schleswig-Holstein Befreiung (Wiebaden, 1897); see also H. C. L. von Sybel, Foundation of the German Empire (Eng. trans., New York, 1890-1891); Bismarck's Reflections and Reminiscences (Eng. trans. by J. Sterrett and E. A. Garlin), 1861-1888. The Danish point of view is ably and moderately presented in La Question du Danemark, a collection of essays by various writers edited by F. de Jessen (Copenhagen, 1906), with maps and documents. (W. A. P.)

Schlettstadt—Schley

Schlettstadt is a place of very early origin. It was an extension in Carolingian times and became a free town of the Empire in the 13th century. In the 15th century it was the seat of a celebrated academy, founded by the humanist Rodolphus Agricola, who contributed not a little to the revival of learning in this part of Germany; Erasmus of Rotterdam was one of its students. In 1634 the town came into the possession of France, and it was afterwards fortified by Vauban. It offered little resistance, however, to the Prussians in 1870, and the fortifications have been demolished. The Hohland, or defensible hill, standing at an elevation of 247 ft., was presented to the emperor William II. by the town of Schlettstadt in 1899, and was completely restored in 1908. The site is first mentioned as being a castle in the 8th century.

See Naumann, Die Eroberung von Schlettstadt (Berlin, 1876) and J. Canon, Die Reichsstadt Schlettstadt 1400-1539 (Freiburg i. B., 1906).

Schley, Winfield Scott (1835-1914), American naval officer, was born at Richfields, near Frederick, Maryland, on the 9th of October 1835. He graduated at the United States Naval Academy in 1856, and during the Civil War was in active service as a lieutenant until July 1863. In 1867-1869 he was an instructor in the U.S. Naval Academy. He took part in Rear-Admiral John Rodgers's expedition to Korea in 1871, and was adjutant of the American land forces in the attack on the Korean forts on Salée river on the 10th and 11th of June. In 1872-1875 he was head of the department of modern languages in the U.S. Naval Academy. He was promoted commander in June 1875; in 1876-1879 commanded the "Essex," most of the time in the South Atlantic, and then until October 1883 was inspector of the second lighthouse district. In February 1884, after the failure in 1883 of the second expedition (under Lieut. E. A. Garlin) for the relief of the Lady Franklin Bay Expedition commanded by Lieut. A. W. Greely, Schley was appointed to command the third Greely relief expedition; and near Cape Sabine on the 22nd of June rescued Greely and six of his twenty-four companions. He was chief of the bureau of equipment and recruiting
in 1885-1889; and in April 1888 was promoted captain. He commanded the “Baltimore” in Rear-Admiral George Brown’s squadron off the coast of Chile in 1891. Early in 1892 he was again transferred to the lighthouse bureau, and until February, 1895, was in charge of the third lighthouse district; and in 1897-1898 he was a member (and chairman) of the Lighthouse Board. He was commissioned commodore on the 6th of February 1898, and on the 24th of March, although lowest on the list of commodores, he was put in command of the “flying squadron,” with the “Brooklyn” as his flagship, for service in the war with Spain. The command of the fleet off Santiago de Cuba was taken from Schley by Acting Rear-Admiral W. T. Sampson on the 1st of June. In the battle of Santiago on the 3rd of July Schley, in Sampson’s absence, was the senior officer. The “Brooklyn” did especial service with the “Oregon,” in overhauling and disabling the “Cristobal Colón.” On the 10th of August Schley was advanced six numbers and was made rear-admiral for “eminent and conspicuous conduct in battle.” On the 19th he was appointed a commissioner of the United States to arrange the evacuation of Porto Rico. When the Navy Department recommended that Sampson be promoted eight numbers and over the head of Schley, who had ranked him for forty-two years, there was a bitter controversy, and the Senate did not confirm the promotion. On the 14th of April 1899 Schley was promoted to the rank of rear-admiral, and was ordered to report to the Secretary of the Navy on the subject of the proposed Far Eastern expedition. In November 1899 he was put in command of the South Atlantic Station, and in October 1901 he retired from active service upon reaching the age limit. At his request, because of the charges made against him in E. S. Maclay’s History of the Navy, a court of inquiry investigated Schley’s conduct before and during the battle of Santiago; on the 13th of December 1901 the court pronounced Schley guilty of delay in locating Cervera’s squadron, of carelessness in endangering the “Texas” by a peculiar “loop” movement or turn of the “Brooklyn” which blanketed the heads of other American vessels, and of disobedience to a departmental order of the 25th of May, but it recommended that no action be taken. Admiral Schley filed a protest against the court’s findings, which, however, were approved by the Secretary of the Navy.

SCHLIEMANN, HEINRICH (1822-1890), German archaeologist, was born on the 6th of January 1822 at Neu Buckow in Mecklenburg-Schwerin, the son of a poor pastor. He has stated in his autobiography that through all his early years he was beset with the most unusual points of struggle, when he was successively grocer’s apprentice at Fürstenberg, cabin-boy on the “Dorothea” bound for Venezuela, and, after her wreck, office assistant and then book-keeper at Amsterdam, he nourished a passion for the Homeric story and an ambition to become a great linguist. In the end, thanks to an unusually powerful memory and determined energy, he acquired a knowledge of seven or eight tongues besides his own, including ancient and modern Greek. The house of B. H. Schröder of Amsterdam sent him in 1846 to St. Petersburg, where he established a business of his own and embarked in the indigo trade. He made a fortune at the time of the Crimean War, partly as a military contractor. Happening to be in California when made a state of the Union, in 1850, he became and remained an American citizen. After travels in Greece, Tunisia, India, China and Japan, and writing a short sketch of the last two countries, he took his large fortune to Greece in 1858, and proceeded to visit Homeric sites. In an ensuing book—Ithaka, der Peloponnes, and Troy—he propounded two theories which he was destined eventually to test in practice, viz. that Hisarlik, not Furnarbasli, was the site of Troy, and that the Troy graves, seen by Pausanius at Mycenae, lay within the citadel wall. Two years later he took up Calvert’s work on the former site, and, convinced that Troy must be on the lowest level, hewed his way downward, regardless of the upper strata, wherein lay unseen the remains of which he was really in search. By 1873 he had laid bare considerable fortifications and other remains of a burnt city of very great antiquity, and discovered a treasure of gold jewelry. We now know this city to have belonged to the middle pre-Mycenaean period, long prior to the generation of Homer’s Archaeans; but Schliemann far and wide proclaimed it “Troy,” and was backed by Gladstone and a large part of the European public.

Trying to resume his work in February 1874, he found himself inhibited by the Ottoman government, whose allotted share of the gold treasure had not been satisfactory, and it was not till April 1876 that he obtained a firman. During the delay he issued his Troy and its Remains (1875), and betook himself to Mycenae. There in August 1876 he began work in the Dome-tombs and by the Lion Gate, and opened a large pit just within the citadel. The famous double ring of slabs and certain stone relics were brought to light. Schliemann, thinking it was only a platform levelled as a place of Archaean assembly, paused; and did not resume till November. Then, resolved to explore to the rock, he cleared away some three feet more of earth and stones, and lighted on the five shaft graves which have placed him first among fortunate excavators. A sixth grave was found immediately after his departure. The immense treasure of gold, silver, bronze, fine stone and ivory objects, which was buried with the sixteen corpses in this circle, is worth intrinsically more than any treasure-trove known to have been found in any land, and it reveals for all the character of a great civilization—Sumerian, the Hittite, and the Mycenaean, and gradually and cleaned and arranged in the Polytechnic; and the discoverer, publishing his Mycenae in English in 1877, had his full share of honours and fame.

He had now settled in Athens, where he married a Greek lady, and built two splendid houses, which became centres of Athenian society. In 1878 he dug unsuccessfully in Ithaca, and in the same year and the following resumed work at Hisarlik. He then published his result in a discursive memoir, Ilios, and made a sequel, Troy, issued in 1884, after Wilhelm Dörpfeld, associated in 1882, had introduced some method into the explorations, was a considerable improvement.

In 1880 and 1881 Schliemann cleared out the ruined dome-tomb of Orchomenus, finding little except remains of its beautiful ceiling; and in 1885, with Dörpfeld, he laid bare the upper stratum on the rock of Tiryns, presenting scholars with a complete ground plan of a Mycenaean palace. This was his last fortunate excavation. While Tsountas, for the Greek Archaeological Society, picked up his work at Mycenae in 1886, and gradually cleared the Acropolis, with notable results, Schliemann tried for traces of the Caesareum at Alexandria, of the Palace of Minos in Crete, and of the Bronze Age tombs in Crete, Sardinia and Cythera (1888); but he was not successful, meeting in the two former enterprises with a local opposition which his wealth was unable to bear down. In 1889 he entertained at Hisarlik a committee of archaeological experts, deputed to examine Bötticher’s absurd contention that the ruins represented not a city, but a cremation necropolis; and he was contemplating a new and more extensive campaign on the same site when, in December 1890, he was seized at Naples with an illness which ended fatally on the morning of Christmas Day. His great wealth was left mainly to the two families that he had in Russia and Greece; but a sum was reserved for Hisarlik, where Dörpfeld in 1890 and 1891, by clearing away the debris of the former excavations, exposed the great walls of the sixth stratum which Schliemann had called Lydian, and proved their synchronism with Mycenae, and identity with Mycenaean remains; that is to say, with Homer’s Troy, if Troy ever was.

Schliemann was on several occasions in England, in 1853 to receive honours from the great universities, and in 1856 to confer, at a special gathering of the Hellenic Society, the assertion of Stillman and Penrose that the Troytanical palace was posterior to the Christian era. Nowadays he is better appreciated, and most of his books were first issued in English.

SCHLIPPE’S SALT, or sodium thioantimoniate, NaSbS₂O₇H₂O, named after K. F. Schlippe (1790-1867), is prepared by dissolving the calculated quantities of antimony trisulphide, sulphur,
and sodium hydroxide in water, or by fusing sodium sulphate (16 parts), antimony sulphide (13 parts) and charcoal (4-5 parts), dissolving the melt in water and boiling the solution with 2 parts of sulphur. The liquid is then filtered and evaporated. The salt crystallizes in large tetrahedra, which are easily soluble in water, and has a specific gravity r 806. The anhydrous salt melts easily on heating, and in the hydrated condition, on exposure to moist air becomes coated with a red film. It combines with sodium thiosulphate to form Na₂S₂O₃·2H₂O.

SCHLOSSER, FRIEDRICH CHRISTOPH (1776-1861), German historian, was born at Jever in East Friesland on the 17th of November 1776. He took up the study of theology, mainly at Göttingen, and began life as a private tutor. Turning to the study of history, he carried with him the tendency to construct his syntheses upon the scanty basis of 19th-century generalizations; yet in spite of the growing scientific school he became and remained for a quarter of a century the most popular German historian. In 1807, inspired by his study of Dante, he published his first work Abüßard und Dulcin, a defence of scholasticism and medieval thought. Two years later biographical studies of Theodore Beza and Peter Martyr Vermili (Leben des Theodor de Beza und des Peter Martyr Vermili, Heidelberg, 1809) revealed more genuine scholarship. In 1812 appeared his History of the Iconoclastic Emperors of the East (Geschichte der bildersämmernden Kaiser des orientalischen Reiches), in which he controverted some points in Gibbon’s work. In 1823 he undertook a study of the past in present-day colours. His own strong predispositions prevented him from accomplishing this, however, and the history remains open to grave scientific criticism. But it won for him the favour of Archbishop Karl Theodor Dalberg, and secured for him a professorship in the Frankfort Lyceum. He left Frankfort in 1819 to become professor of history at Heidelberg, where he resided until his death on the 23rd of September 1867.

In 1815 appeared the first volume of his World History (Weltgeschichte in zusammenhängender Erzählung), this work, though never completed, was extended through many volumes providing an inexhaustible energy and a vast erudition. But it lacks both accuracy of fact and charm of style, and is to-day deservedly quite forgotten. On the other hand a translation of the pedagogical handbook of Vincent of Beauvais and the accompanying monograph are still of value. The next noteworthy work was a history of antiquity and its culture (Universalhistorische Übersicht der Geschichte der alten Welt und ihrer Kultur), 1 part, 1826; 2nd part, 1834), which, while revealing little knowledge of the new criticism of antique painting by F. A. Wolf and B. G. Niebuhr, won its way by its unique handling of the subject and its grand style. In 1823 he published in two volumes a Geschichte des 16ten Jahrhunderts; then, enlarged and improved, this work appeared in six volumes as Geschichte des 16ten Jahrhunderts und des 17ten bis zum Sturz des französischen Kaiserreichs (1836-1845). The history had a most extraordinary success, especially among the common people, owing, not to its scientific qualities, but to the fact that the author boldly and externally sat in judgment upon men and events, and in his judgments voiced the feelings of the German nation. Unfortunately, for this very reason it is no longer read. It has been translated into English by D. Davison (8 vols., 1843-1852). Finally, Schlosser undertook a popular World History for the German People (Weltgeschichte für das deutsche Volk, 1844-1857), which also enjoyed the favour of those for whom it was written.

Schlosser stands apart from the movement towards scientific history in Germany in the 19th century. Refusing to limit himself to political history, as did Ranke, he never learned to handle his literary sources with the care of the scientific historian. History was to him, as it had been to Goethe, a school for morals; but he had perhaps a juster conception than Ranke of the breadth and scope of the historian’s field.

See G. G. Gervinus (Schlosser’s pupil), F. C. Schlosser, ein Nebenbold (1861); G. Weber, F. C. Schlosser, der Historiker, Erinnerungsbilder (Leipzig, 1875); and O. Lorenz, F. C. Schlosser (Vienna, 1878).

SCHLOTHEIM, ERNST FRIEDRICH, Baron von (1764-1832), German paleontologist, was born in Grazschaft Schwarzwburg on the 2nd of April 1764. He was Privy Councillor and President of the Chamber at the court of Gotha. Becoming interested in geology he gathered together a very extensive collection of fossils. In 1824 he published descriptions and illustrations of remarkable remains of (Carboniferous) plants, Ein Beitrag zur Floras der Vorwelt. In this he incorporated the plates used in his previous memoir and supplemented it by a folio atlas (1822), in which he illustrated his collection “of petrified and fossil remains of the animal and vegetable kingdom of a former world.” For the first time in Germany the fossils were named according to the binomial system. The species are preserved in the Berlin Museum. He died at Gotha on the 28th of March 1832.

SCHLÖZER, AUGUST LUDWIG VON (1735-1809), German historian, was born at Gaggenstedt, in the county of Hohenlohe-Kirchberg, on the 5th of July 1735. Having studied theology and oriental languages at the universities of Wittenberg and Göttingen, he went in 1755 as a tutor to Stockholm, and afterwards to Upsala; and while in Sweden he wrote in Swedish an Essay on the General History of Trade and of Sea-faring in the most Ancient Times (1758). In 1759 he returned to Göttingen, where he began the study of medicine. In 1761 he went to St. Petersburg with Gerhardt Friedrich Müller, the Russian historiographer, as full historian to avoid the post of provincial tutor in his family. Here Schlozer learned Russian and devoted himself to the study of Russian history. In 1762 a quarrel with Müller placed him in a position of some difficulty from which he was delivered by an introduction to Count Rasumovski, who procured his appointment as adjunct to the Academy. In 1765 he was appointed by the empress Catherine an ordinary member of the Academy and professor of Russian history. In 1767 he left Russia on leave and did not return. He settled at Göttingen, where in 1764 he had been made professor extraordinarius, and Doctor honoris causa in 1766, and in 1769 he was promoted to an ordinary professorship. In 1804 he was ennobled by the emperor Alexander I. of Russia and made a privy councillor. He retired from active work in 1805 and died on the 9th of September 1809.

Schlozer’s activity was enormous, and he exercised great influence by his lectures as well as by his books, bringing historical study into touch with political science generally, and using his vast erudition in an attempt to solve practical questions in the state and in society. He was “a journalist before the days of journalism, a traveller before that of travelling, a critic before that of criticism, and an opponent of political opponents.” His most important works were his Allgemeine nordische Geschichte, 2 vols. (Halle, 1772) and his translation of the Russian chronicler Nestor to the year 980, 5 vols. (Göttingen, 1802-1809). He awoke much intellectual interest in universal history by his Weltgeschichte im Auszuge und Zusammenhang, 2 vols. (2nd ed., Göttingen, 1792-1801); and in several works he helped to lay the foundations of statistical science. He also produced a strong impression by his political writings, the Briefwechsel, 10 vols. (1776-1782) and the Staatsanzeigen, 18 vols. (1782-1793).
and diplomatist, who in 1871 was appointed German ambassador to the United States and in 1882 to the Vatican, when he was instrumental in healing the breach between Germany and the papacy caused by the May Laws.

In 1872, August Ladung-Schlüter (Berlin, 1872; Wesendonck, Die Begründung der neuen deutschen Geschichtsschreibung durch Gatterer und Schlüter (Leipzig, 1876) and F. Frendorff in Allgemeine deutsche Biogr. vol. xxxi.

Schlüsselburg, a town of Russia, in the government of St. Petersburg, sited on low ground surrounded by marshes, at the confluence of the river Neva from Lake Ladoga, 40 m. by steamer E. of the city of St. Petersburg. Pop. (1897) 2285. It was founded in 1323 by the Novgorodians, and though afterwards lost by Russia, was reconquered by Peter the Great in 1702. It has a cathedral and a fortress, built on an island in the Neva, which is now used as a political prison.

Schlüter, Andreas (1604-1714), German sculptor and architect, was born in Hamburg. Much of his activity as a sculptor was exercised in Warsaw, but in 1694 he was summoned to Berlin. Two years later he began his designs for the rebuilding of the royal palace. The execution of these occupied him from 1699 to 1706, and the palace became a conspicuous example of barocco style in Germany. In 1713 Schlüter went to St. Petersburg, where he did architectural work for Peter the Great. His principal works in Berlin are the monument of the great elector Frederick William and the 22 masks of dying warriors in the courtyard of the arsenal, the tombs of King Frederick I. and his wife, and the marble pulpit in the Marienkirche.

See C. Gurlitt, Andreas Schlüter (1901); C. F. von Kloeoden, Andreas Schlüter (1855).

Schmalkalen, a town of Germany, in the Prussian province of Hesse-Nassau, situated in a narrow valley at the southwestern slope of the Thuringian forest, 30 m. S.W. of Erfurt, on the railway Wernhausen-St. Blasii. Pop. (1903) 9290. It has a Gothic parish church, a palace—Schloss Wilhelmsburg—with an interesting chapel and a collection of antiquities, and possesses a Gothic town hall in which the important Protestant League of Schmalkalden, or Smallwald, was concluded in 1531, and also the house in which the articles of Schmalkalden were drawn up in 1537 by Luther, Melanathan and other reformers. It has three other Evangelical churches, a Roman Catholic church and several schools. Its industries are chiefly connected with ironwares, but leather, beer, soap and toys are also manufactured. Karl Wilhelms (1815-1873), the composer of "Die Wacht am Rhein," was born here, and there is a memorial of him in the market-place. Schmalkalen, which was first mentioned in 874, came wholly into the possession of Hesse in 1535, having been a town since 1335.

See Wagner, Geschichte der Stadt und Herrschaft Schmalkalden (Marburg, 1836); Wilisch, Schmalkalde und seine Umgebungen (Schmalkalen, 1884).

Schmerling, Anton von (1805-1863), Austrian statesman, was born on the 23rd of August 1805 at Vienna, where his father held a high position on the judicial side of the civil service. After studying law at Vienna, in 1829 he entered the public service, and during the next eighteen years was constantly occupied, chiefly in Lower Austria. In 1847, as a member of the lesser nobility, he entered the Estates of Lower Austria, and took an active part in the Liberal movement for administrative and constitutional reform of which they were the centre. On the outbreak of the revolution in Vienna in March 1848, when the mob broke into the Assembly, Schmerling was one of the deputation which carried to the palace the demands of the people, and during the next few days he was much occupied in organizing the newly formed National Guard. At the end of the month he was sent by the ministry to Frankfort as one of the men of "public confidence." He soon succeeded Count Colleredo as president of the Diet, and in this capacity officially transferred to the archduke John, who had been elected regent of Germany, the powers of the "double crown" which was violently attacked in the German parliament by the extreme Radicals; but on this and other occasions (he had himself been elected to the parliament) he defended moderate and constitutional principles, all the more effectively because he depended not on eloquence but on a recognition of what has been called the "irony of facts"—to which the parliament as a whole was so blind. He was the first and the most influential member of the ministry which the regent formed; he held the ministry of the interior and, later, also that of foreign affairs, and it was almost entirely due to him that at least for a short time this phantom government maintained some appearance of power and dignity. A defeat in the parliament when he defended the armistice of Malmö led to his resignation; but he was immediately called to office again, with practically dictatorial power, in order to quell the revolt which broke out in Frankfort on the 18th of September. His courage and resolution averted what nearly became a terrible catastrophe. It was his hope to establish in Germany the supremacy of a Liberal and reformed Austria. This brought him into opposition to the party of Foulis and against whom they attained a majority, he resigned, and was succeeded by Gagern. He remained at Frankfort, holding the post of Austrian envoy, and was the leader of the so-called Great German party until the dissolution of the Austrian parliament showed that the forces of reaction had conquered at Vienna and scattered all hopes of Austria attaining the position he had hoped for.

After the abortive election of the king of Prussia to be emperor, he, with the other Austrians, left Frankfort. On his return to Vienna he became minister of justice, and the reforms which he carried out added to his reputation. His popularity among all the Austrians was increased by his resignation in 1853, as a protest against the failure of the government to establish the constitution they had promised. During the next few years he was judge of the supreme court of appeal. When his forecast was fulfilled, and the system of absolutism broke down, he became minister in January 1862. His first act was the publication of the constitution by which the whole of the empire was to be organized as a single state with a parliamentary government. The experiment failed, chiefly because of the opposition of the Croatians and Magyars, whom he bitterly offended by his celebrated saying that "Hungary could not be satisfied with a minister who had been engaged in opposing it as a national party; and when the government attempted to keep the German Liberals as a strong and united party; he was opposed by a powerful faction at court, and by the Clerical leaders. After the first few months the emperor gave him only a very lukewarm support; and with his retirement in 1865 the attempt to carry out the ideals of Joseph II. to Germanize while he liberalized the whole of the empire, and to compel Hungarians, Poles, Czechs and Croatians to accept a system in which the government of the whole should be conducted by a German-speaking parliament and bureaucracy, failed. The constitution of 1862, though suspended on Schmerling's fall, was still regarded as legally valid for the cisleithanian territories, and is the basis on which the present constitution for half the empire was framed. On his retirement he returned to his judicial duties; in 1867 he was made life-member of the Upper House in the Reichsrath, of which he became vice-president, and in 1871 president. This post he laid down in 1879, and came forward as leader of the Liberal German opposition to the administration of Count Taaffe. In 1891 he retired from public life, and died at Vienna on the 23rd of May 1893.

Schmerling married, in 1851, Pauline, daughter of Field-Marshall-Lieutenant Baron von Koudela, from whom Schmerling, who was distinguished by literary and artistic abilities, at that time rare in the Austrian capital, died in 1840, leaving two daughters.

See Arhen, Anton u. Schmerling (Prague, 1865). This contains a full account of Schmerling's life during 1848-1849, but does not deal with later life.

Schmidt, Heinrich Julian (1818-1886), German journalist and historian of literature, was born at Marienwerder in East Prussia on the 7th of March 1818, and after studying history and philosophy at the universities of Königsberg and Halle, was appointed, in 1842, to a mastership in the Lüneburg Realschule in Berlin. In 1847 he joined the editorial staff of the "Grenzboten"
SCHMIDT, K. VON—SCHNEIDER, J. G.

in Leipzig, and in the following year became, with Gustav Freytag, joint owner of that periodical. In 1861 he removed to Berlin as editor-in-chief of the Berliner allgemeine Zeitung, and in 1876 was rewarded for the journalistic services rendered to the government, by a pension from the emperor William I. He died in 1877, in the 71th year of his age.

Julian Schmidt's principal contributions to literary history are Geschichte der Romanistik im Zeitalter der Revolution und Restauration (1848); Geschichte der deutschen Nationalliteratur im 19. Jahrhundert (1853); Geschichte des geistigen Lebens in Deutschland von Leibniz bis auf Lessings Tod (1861-1863). These works subsequently appeared as Geschichte der deutschen Literatur von Leibniz bis auf unsere Zeit (4 vols., 1886-1890); Schmidt also wrote a Geschichte der jüngsten deutschen Literatur seit der Revolution (1852), and a biography of Schiller (1890).

SCHMIDT, KARL VON (1817-1875), Prussian cavalry general, was born at Schwedt on the Oder, on the 12th of January 1817, and entered the 4th Ulans as a second lieutenant in 1834. His long regimental service was varied by staff service and instructional work, and in the mobilization of 1850 he had the command of a landwehr cavalry regiment. He was promoted Major on the 16th of August 1875. In 1889 the 4th Ulans, in which his regimental service was almost entirely spent, were given the name "Von Schmidt." His drill and manoeuvre instructions were codified and published after his death by his staff officer, Captain von Vollard Bockelberg, was born at Leipzig in 1815, was.prime minister to Charles X of France. The English translation, Instructions for Cavalry, has been published by the War Office. Von Schmidt himself wrote a pamphlet, Auch ein Reiter soll einen Kelch trinken (1850), an original German edition of the Instructions for Cavalry, prefaced by a memoir of Schmidt's life and services, written by Major Kaehler.

SCHMIDT, WILHELM ADOLF (1812-1887), German historian, was born in Berlin on the 26th of September 1812. He became in 1831 professor of history at Zürich, and nine years later professor at Jena, where he died on the 10th of April 1887. He was a member of the Frankfort parliament in 1848, and of the German Reichstag from 1874 to 1877. His historical works deal mainly with modern German history, and the most important of them are:

Preussens deutsche Politik (Berlin, 1850, and other editions); Geschichte der preussisch-deutschen Unionbestrebungen (Berlin, 1851); Geschichte des preussischen Geschlechts bis auf die Franzosen (Berlin, 1851-1852); Geschichte der preussischen Verwaltungsfrage zwischen der Befreiungskriege und dem Wiener Kongresses (Stuttgart, 1850), which was published after his death by A. Stern. Schmidt also wrote: Tableaux de la Révolution française publiés sur les papiers inédits du département de la police secréte de Paris (Leipzig, 1855-1856); Pariser Zustände während der Revolutionszeit (Jena, 1857-1858), translated into French by P. Viollet (Paris, 1858-1859); Das Parlamentarische Zeitalter (Jena, 1857-1859); Handbuch der griechischen Chronologie (Jena, 1888); and Abhandlungen zur alten Geschichte (Leipzig, 1888).

See also Schmidt, Zur Erinnerung an Adolf Schmidt (Berlin, 1887).

SCHOMMER, GUSTAV (1838-1893), German political economist, was born at Heilbronn on the 24th of June 1838. He studied political science, philosophy and history at the university of Tübingen from 1857 to 1861, when he obtained an appointment at the Württemberg Statistical Department. In 1864 Schmoller became extraordinary—and in the following year, ordinary—professor of political economy and science at Halle, was transferred in a like capacity to Strasburg in 1872 and finally in 1882 to Berlin. In 1876 he was a member of the Prussian Staatsrat, in 1887 member of the Prussian Landtag and in 1892 of the Prussian Landtag. In 1897 Schmoller was called to the Prussian Herrenhaus (Upper Chamber) as representative of the university of Berlin. Schmoller is famous for his researches in the field of the history of political economy and is one of the founders of the Verein für Social Politik (Social Political Society).

Among his numerous scientific works must be specially mentioned: Der französische Handelsstrang und seine Gegner (1882); Zur Geschichte des deutschen Kleingewerbes im 19ten Jahrhundert (1886); Über einige Grundfragen des Rechtes und der Volkswirtschaft (1875). In late years Schmoller concentrated his attention more upon the history of Prussian administration, and besides editing the Jahrbuch für preussische Geschichte und Landeskunde, published the result of his labours in this department in the Umriss und Untersuchungen zur Verfassungs-, Verwaltungs- und Wirtschaftsgeschichte, besonders des preussischen Staates, im 17ten und 18ten Jahrhundert (1898).

For an estimate of Schmoller's work cf. Stämpfli, Gustav Schmoller (1901).

SCHNEEBERG, a town of Germany, in the kingdom of Saxony, in the Erzgebirge, 14 m. S.E. from Zwickau by rail. Pop. (1905) 9044. It contains a handsome Gothic parish church, one of the largest ecclesiastical buildings in Saxony, dedicated to St Wolfgang, with an altar-piece by Lucas Cranach the elder, and numerous tombs; a gymnasium; a school of lace-making and a hospital. Hand-made lace and silver mining, formerly its two most important industries, have declined. The first has been almost entirely superseded by machine-made goods, while the second appears to have languished owing to exhaustion of the mines. Cobalt, bismuth and nickel are worked and yield satisfactory results, and machine-made lace, embroidery, porcelain, corsets, shoes and colours are among the chief of its other industrial products. Schneeberg is also noted for a snuff made of aromatic herbs, which commands a ready sale in the district.

See Lehmann, Chronik von Schneeberg (Schneeberg, 1837-1840).

SCHNEEKOPPE, a mountain of Germany, on the Silesian Bohemian frontier, the highest peak (5100 ft.) of the Riesengebirge, situated immediately above the town of Schmiedeberg, 8 m. S. from Hirschberg. From the crest, which is about 50 yds. sq. and across which runs the frontier line between Silesia and Bohemia, a magnificent view is obtained across the Oder plain to Breslau on the north and over Bohemia to the southern foot of the Sudeten ridge. On the Prussian side, lies the chapel of St Lawrence, which has been a place of pilgrimage from 1824 to 1850, when a new hostel was erected. Since 1900 a meteorological station has been established here.

See Zeitmann, Panorama von der Schneekeppe (Berlin, 1903).

SCHNEIDEMÜHL (Polish Pila), a town of Germany, in the Prussian province of Posen, situated on the Cudłow, 60 m. N. of Posen and 145 m. N.E. of Berlin on the main line to Königsberg, and at the junction of lines to Stargard and Thorn. Pop. (1905) 21,624. It has five churches, a classical school and a Roman Catholic teachers' seminary. Schneidemühl carries on a trade in grain, wood, gosp and potatoes, and possesses an ironworks, several glass works and machine-shops, and other industrial establishments. Considerable damage was done to the town in 1893 by a violent overflow of water from a deep artesian well.

SCHNEIDER, JOHANN GOTTLOB (1759-1822), German classical scholar and naturalist, was born at Kollmern in Saxony on the 18th of January 1750. In 1774, on the recommendation of Heyne, he became secretary to the famous Strassburg scholar, R. F. Bruneck, and in 1811 professor of ancient languages and eloquence at Breslau (chief librarian, 1816) where he died on the 15th of January 1822. Among his numerous works the most important was his Kritisches lexicon-deutsches Handwörterbuch (1797-1798), the first independent work of the kind since Stephanus's Thesaurus, and the basis of F. Passow's and all succeeding German lexicons. A special improvement was the use of traditional suffixes in the formation of compound words.
introduction of words and expressions connected with natural history and science. The scientific writings of ancient authors especially attracted him. He published editions of Aelian, De natura animalium; Nicander, Alexipharmaca and Theriaca; the Scripторes rei rusticae; Aristotle, Historia animalium and Politica; Epicurus, Physica and Meteorologica; Theophrastus, Elogae physicae; Oppian, Halieutica and Cynegyeta; the complete works of Xenophon and Vitruvius; the Argonautica of the so-called Orpheus (for which Ruhnken nicknamed him "Orpheomastix"); an essay on the life and writings of Pindar and a collection of his fragments. His Elogae physicae is a selection of extracts of various length from Greek and Latin writers on scientific subjects, containing the original text and commentary, with essays on natural history and science in ancient times.

See F. Passow, Opuscula academica (1835); C. Bursian, Geschichte der klassischen Philologie in Deutschland (1883).

SCHNEIDER, LOUIS (1809-1878), German actor and author, was born at Berlin on the 29th of April 1809, the son of George Abraham Schneider, (1770-1830). At an early age he was engaged at the Royal Theatre, Berlin, where he soon rose to play leading comedy parts. His reputation as a comedian grew with his success in such roles as Zierl in the Einfahrt von Lande, Peter in the Kapellmeister von Venedig, Schikaneder in the Schauspieldirektor and Basileio in Figaro's Hochzeit, and he became the favourite of Berlin. In 1845 he was appointed head of the Royal opera in Berlin. But his bold patriotic couplets and impassioned discourses during the revolutionary war 1848 necessitated his retirement, and thereafter he translated and adapted for the stage Mozart's Così fan tutti; published, under the pseudonym "L. W. Both," Das Bühnerepertoire des Auslandes; and founded, as a result of his experiences as a soldier in the Danish war of 1849, the periodical Der Soldatenfreund. He also wrote Geschichte der Oper und des Opernhauses in Berlin (1845-1852). Soon after his retirement he was appointed reader to King Frederick William IV. of Prussia, and subsequently he received the title of Geheimen Hofrat. He continued to enjoy the favour of the court, and, as correspondent of the Staatsanzeiger, was attached to the headquarters' staff of the Prussian army during the campaign of 1866; and, by special invitation, accompanied the emperor William during the war of 1870. Schneider also wrote a novel. Das bunte Glück, and several volumes of reminiscences: König Wilhelm (1869), Kaiser Wilhelm, 1867-1871 (1875). He died at Potsdam on the 16th of December 1878.

See his posthumous memoirs, Aus meinem Leben (Berlin, 1879-1882). See also Kaiser Wilhelm's (1888), which caused some sensation on their publication.

SCHNEIDEWIN, FRIEDRICH WILHELM (1810-1856), German classical scholar, was born at Helmstedt on the 6th of June 1810. In 1833 he became a teacher at the Brunswick gymnasmum, in 1837 extraordinary and in 1842 ordinary professor of classical languages and literature in the university of Göttingen, where he died on the 11th of January 1856. Schneidewin's work on Sophocles and the Greek lyric poets is of permanent value. His most important publications are: Ibyci Rheicis reliquiae (1835), severely criticized by G. Hermann; Simonidesi reliquiae (1835); Delectus poëtarum Graecorum elegiæcæ, iambicæ, melicæ (1838-1839), in which the fragments of the lyric poets were for the first time published in a convenient form; Paromiographi græci (1839, with E. von Leutsch); Sophocles (1840-1854, revised after his death by A. Nauck). He also edited the fragments of the speeches of Herocles on behalf of Exuxenipus and Lycophron (already published by Churchill Babington from a papyrus discovered in Egyptian Thebes in 1847) and a Latin poem on rhetorical figures by an unknown author (Incertæ auctoritatis de figuris vel schematibus versus horrivit, 1841), found by Jules Quicherat in the Paris library. Schneidewin was also the founder of Phthloegia (1846), a journal devoted to classical learning, and dedicated to the memory of K. O. Müller. See A. Baumeister in Allgemeine deutsche Biographie; E. von Leutsch in Phthloegia, x.; and M. Lechner, Zur Erinnerung an K. F. Hermann, F. W. Schneidewin (1864).

SCHNORR VON KAROLSFELD, JULIUS (1794-1872), German painter, was born in 1794 at Leipzig, where he received his earliest instruction from his father Johann Veit Schnorr (1794-1834), a draughtsman, engraver and painter. At seventeen he entered the Academy of Vienna, from which Overbeck and others who rebelled against the old conventional style had been expelled about a year before. In 1818 he followed the founders of the new school of German pre-Raphaelites in the general pilgrimage to Rome. This school of religious and romantic art abjured modern styles and returned to and revived the principles and methods of earlier centuries. At the outset he was eager to learn fresco painting and "monumental art," and Schnorr found opportunity of proving his powers, when commissioned to decorate with frescoes, illustrative of Ariosto, the entrance hall of the Villa Massimo, near the Lateran. His fellow-labourers were Cornelius, Overbeck and Veit. His second period dates from 1825, when he left Rome, settled in Munich, entered the service of King Ludwig, and transplanted to Germany the art of wall-painting learnt in Italy. He showed himself qualified as a sort of poet-painter to the Bavarian court; he organized a staff of trained executants, and set about clothing five halls in the new palace with frescoes illustrative of theNibelungenlied.

Other apartments his prolific pencil decorated with scenes from the histories of Charlemagne, Frederick Barbarossa and Rudolph of Habsburg. These interminable compositions are creative, learned in composition, masterly in drawing, but exaggerated in thought and extravagant in style.

Schnorr's third period is marked by his "Bible Pictures" or Scripture History in 180 designs. The artist was a Lutheran, and took a broad and unsectarian view which won for his Pictorial Bible ready currency throughout Christendom. Frequently the compositions are crowded and confused, wanting in harmony of line and symmetry in the masses; thus they suffer under comparison with Raphael's Bible. The style is severer from the simplicity and severity of early times, and surrendered to the florid redunance of the later Renaissance. Yet throughout are displayed fertility of invention, academic knowledge with facile execution; and modern art has produced nothing better than "Joseph Interpreting Pharaoh's Dream," the "Meeting of Rebecca and Isaac" and the "Return of the Prodigal Son." Biblical drawings and cartoons for frescoes formed a natural prelude to designs for church windows. The painter's renown in Germany and abroad was immense. At the outset he was despatched to Rome, where he was allowed to carry out the royal factory, Munich, for windows in Glasgow cathedral and in St Paul's cathedral, London. This Munich glass provoked controversy: medievalists objected to its want of lustre, and stigmatized the windows as coloured blinks and picture transparencies. But the opposing party claimed for these modern revivals "the union of the severe and excellent drawing of early Florentine oil-paintings with the colouring and arrangement of the glass-paintings of the latter half of the 16th century." Schnorr died at Munich in 1873. His brother Ludwig Ferdinand (1809-1863) was also a painter.

SCHOFIELD, JOHN McALLISTER (1832-1906), American soldier, was born at Gerry, Chautauqua county, New York, on the 29th of September 1831. He graduated at West Point in 1853, served for two years in the artillery, was assistant professor of natural and experimental philosophy at West Point in 1853-1860, and while on leave (1860-1861) was professor of physics at Washington university, St Louis. When the Civil War broke out, he became a major in a Missouri volunteer regiment and served as chief of staff to Major-General Nathaniel Lyon until the death of that officer. (In 1862 he received a promotion to "brigadier general of volunteers" for "conspicuous gallantry at the battle of Wilson's Creek." ) In 1863-1865 he performed various military duties in Missouri. In April 1863 he took command of a division in the Army of the Cumberland, and in 1864, as commander of the Army of the Ohio, he took part in the Atlanta campaign under Major-General W. T. Sherman. In October 1864 Schofield was sent to Tennessee to join Major-General G. H. Thomas in opposing General J. B. Hood, and on the 30th of November he fought with General Hood the desperate and
indecisive battle of Franklin. Two weeks later he took part in Thomas's crowning victory at Nashville. For his services at Franklin he was awarded the rank of brigadier-general (November 1780); and in the rank of major-general (March 1805) he was made a regular army. Being ordered to co-operate with Sherman in North Carolina, Schofield moved his corps by rail and sea to Fort Fisher, North Carolina, in seventeen days, occupied Wilmington on the 22nd of February 1865, fought the action at Kinston on the 8–10th of March, and on the 23rd joined Sherman at Goldsboro. After the war he was sent on a special diplomatic mission to France, on account of the presence of French troops in Mexico; and from June 1868 to March 1869 he served as secretary of war under President Andrew Johnson, after the retirement of E. M. Stanton (529). From 1876 to 1881 he was superintendent of the Military Academy at West Point, and from 1888 until his retirement in 1895 he was commanding general of the United States army. He had become major-general in March 1869, and in February 1895 he was made lieutenant-general. He died at St Augustine, Florida, on the 4th of March 1906. General Schofield published Forty-six Years in the Army (New York, 1897).

SCHOLAR, SCHOLARSHIP. The term “scholar,” primarily meaning a “learner,” is secondarily applied to one who has things aptly to be learned; and the successful scholar (or the

by early training and constant self-culture has attained a certain
maturity in precise and accurate knowledge. Hence the term
“scholarship” in the sense of the knowledge or method of a

scholar. Similarly “classical scholarship” may be defined as
the sum of the mental attainments of a classical scholar. Scholars
is sometimes identified with classical learning or erudition;

it is more often contrasted with it. The contrast is thus drawn
by Donaldson in his Classical Scholarship and Classical Learning
(1856), and by Mark Pattison, in his Essay on Oxford Studies
(1855). “I maintain,” says Donaldson, “that not all learned
men are accomplished scholars; that a much-acclaimed scholar
may, if he chooses to devote the time to the necessary
studies, become a learned man” (p. 149). “It is not a know-
ledge,” writes Mark Pattison, “but a discipline, that is required;

not science, but the scientific habit; not erudition, but scholar-
ship” (Essays, i. 429).

The expression a “scholarship” is also used in England for
a money payment made by a school, college or university, as a
prize (either for one year or a series of years) to the successful
competitors at an examination at which one or more such scholar-
ships are to be awarded; and the successful candidate is called a
a “scholar,” as the holder of a “scholarship.” In this sense the word
is almost synonymous with an “exhibition,” but the latter is
usually considered inferior in merit and dignity, if not in
amount.

On the general history of classical scholarship, see Classics:
Greek and Latin.

SCHOLASTICISM, the name usually employed to denote the
most typical products of medieval thought. After the
centuries of intellectual darkness which followed upon the
closing of the philosophical schools in Athens (500), and the
death of Boetus, the last of the ancient philosophers, the first
symptoms of renewed intellectual activity appear contempor-
aneously with the consolidation of the empire of the West in the
hands of Charlemagne. He endeavoured to attract to his
court the best scholars of Britain and Ireland, and by imperial
decree (787) commanded the establishment of schools in con-
nexion with every abbey in his realms. Peter of Pisa and
Alcuin of York were his advisers, and under their care the opposi-
tion long supposed to exist between godliness and secular learning
speedily disappeared. Besides the celebrated school of the
Palace, where Alcuin had among his hearers the members of the
imperial family and the dignitaries of the empire as well as
talented youths of humbler origin, we hear of the episcopal schools
of Lyons, Orleans and St Denis, the cloister schools of St Martin
of Tours, Fulda, Corbie, Fontenelle and many others, besides
the older monasteries of St Gall and Reichenau. These schools
became the centres of medieval learning and speculation,
and from them the name Scholasticism is derived (cf. Sandys,
Hist. of Class. Schol., i. 471, 1906). They were designed to
communicate instruction in the seven liberal arts which con-
stituted the general curriculum of the middle ages, and were
considered the sole method of education (see TERTIUM). The name
director scholasticus was applied originally to any teacher in such an ecclesiastical gymnasium, but gradually
the study of dialectic or logic overshadowed the more elementary
disciplines, and the general acceptance of “doctor” came
to be one who occupied himself with the teaching of logic. The
philosophy of the later Scholastics is more extended in its scope;
but to the end of the medieval period philosophy centres in the
discussion of the same logical problems which began to agitate
the teachers of the 9th and 10th centuries.

SCHOLASTICISM begins as a philosophy that extends from the
9th to the end of the 14th or the beginning of the 15th century
from Erigena to Occam and his followers. The belated
Scholastics who lingered beyond the last mentioned
date served only as marks for the obloquy heaped upon the schools by the men of the new time.
Erigena is really of the spiritual kindred of the Neoplatonists
and Christian mystics rather than of the typical Scholastic
deem, and, in fact, the activity of Scholasticism is mainly
confined within the limits of the 11th and the 14th centuries.
It is divided into two logical traditions: the middle extend-
ning to the end of the 12th century and embracing as its chief
names Roscellinus, Anselm, William of Champeaux and Abæard,
while the second extended from the beginning of the 13th
century to the Renaissance and the general distinction of
men’s thoughts from the problems and methods of Scholastic-
ism. In this second period the names of Albertus Magnus,
Thomas Aquinas and Duns Scotus represent (in the 13th century
and the first years of the 14th century) the culmination of
Scholastic thought and its consolidation into system.

Prantl says that there is no such thing as philosophy in the
middle ages; that it is logic and theology. The remark
overlooks two facts—firstly that the main objects of
theology and philosophy are identical, though the
method of treatment is different, and secondly that
logical discussion commonly leads up to metaphysical
problems, and that this was pre-eminent in the case with the logic of
the Schoolmen. But the saying draws attention to the two great
influences which shaped medieval thought—the tradition of ancient
logic and the system of Christian theology. Scholasticism opens
with a discussion of certain points in the Aristotelian logic; it
should be noted that it is the logical distinctions that the middle
of the church; and when it attains its full stature in St Thomas
it has, with the exception of certain mysteries, rationalized or
Aristotelianized the whole churchly system. Or we might say
with equal truth that the philosophy of St Thomas is Aristotle
Christianized. The Schoolmen contemplate the universe of
nature and man not with their own eyes but in the glass of
Aristotelian formulations. Their chief works are in the shape of
commentaries upon the writings of “the philosopher.” Their
problems and solutions arise from the master’s dicta—
from the need of reconciling these with one another and with
the conclusions of Christian theology.

The fact that the channels of thought during the middle
ages were determined in this way is usually expressed by saying
that reason in the middle age is subject to authority.

It has not the free play which characterizes its activity
in Greece and in the philosophy of modern times. Its
conclusions are predetermined, and the initiative
of the individual thinker is almost confined, therefore,
to formal details in the treatment of his thesis. To the
church, reason is the handmaid of faith (anxia iuris). But the
first principle

of the subordination of the reason wears a different aspect accord-
ing to the century and writer referred to. In Scotus Erigena,
at the beginning of the Scholastic era, there is no such subdivi-
sion contemplated, because philosophy and theology in his work
are in implicit unity. 

"Conficitur inde veram esse philosophiam veram religionem, conversique veram religionem esse veram

1 The common designation of Aristotle in the middle ages.

Chronological limits.

Logic and theology.

Reason and authority.
philosophism” (De divina praedestinatione, Proem). Reason in its own strength and with its own instruments evolves a system of the universe which coincides, according to Erigena, with the teaching of Scripture. For Erigena, therefore, the speculative reason is the supreme arbiter; and in accordance with its results the utterances of Scripture and of the church have not infrequently to be subjected to an allegorical or mystical interpretation. But this is only to say again that Erigena is more of a Neoplatonist than a Scholastic. Hence Cousin suggested in respect of this period of knowledge the chronological division, the outset the passive subordination of philosophy to theology, then the period of their alliance, and finally the beginning of their separation. In other words, we note philosophy gradually extending its claims. Dialectic is, to begin with, a merely secular art, and only by degrees are its terms and distinctions applied to the subject-matter of theology. The early results of the application, in the hands of Berengarius and Roscellinus, did not seem favourable to Christian orthodoxy. Hence the strength with which a champion of the faith like Anselm insists on the subordination of reason. To Bernard of Clairvaux and many others of his school the first application of knowledge had substituted a system which was dangerous as it is impious. Later, in the systems of the great Schoolmen, the rights of reason are fully established and acknowledged. The relation of reason and faith remains external, and certain doctrines—an increasing number as times go on—are withdrawn from the sphere of reason. But with these exceptions the two march side by side; they establish by different means the same results. For the conflicts which accompanied the first intrusion of philosophy into the theological domain more profound and cautious thinkers with a far more limited apparatus of knowledge had substituted a system which, by the constant effort of Scholasticism to be at once philosophy and theology, seemed at last satisfactorily realized. But the further progress of Scholastic thought consisted in a withdrawal of doctrine after doctrine from the possibility of rational proof and their relegation to the sphere of faith. Indeed, no sooner was the harmony apparently established by Aquinas than Duns Scotus began this negative criticism, which is carried much farther by William of Occam. But this is equivalent to a confession that Scholasticism had failed in its task, which was to rationalize the doctrines of the church. The Aristotelian form of reason had been adopted in the midst of a proposed system of Christian theology refused to be forced into an alien form. The end of the period was thus brought about by the internal decay of its method and principles quite as much as by the variety of external causes which contributed to transfer men’s interests to other subjects.

But, although the relation of reason to an external authority thus constitutes the badge of medieval thought, it would be unjust to look upon Scholasticism as philosophically barren, and to speak as if reason, after an interregnum of a thousand years, resumed its rights at the Renaissance. Such language was excusable in the men of the Renaissance, fighting the battle of classic form and beauty and of the manysidedness of life against the barbarous terminology and the monastic ideals of the schools, or in the protagonists of modern science. The new is never just to the old. In the schools and universities of the middle age the intellect of the semi-barbarous European peoples had been trained for the work of the modern world. But we may go further and say that, in spite of their initial acceptance of authority, the Scholastics are not the antagonists of reason; on the contrary, they strive to fit this into its highest place in the system. In the history of thought, therefore, by argument the authority of faith is in reality the unconscious establishment of the authority of reason. Reason, if admitted at all, must ultimately claim the whole man. Anselm’s motto, Credo ut intelligam, marks well the distance that has been traversed since Tertullian’s Credo quia absurdum est. The claim of reason has been recognized to manipulate the data of faith, at first blindly and immediately received, and to weld them into a system such as will satisfy its own needs. Scholasticism that has outlived its day may be justly identified with obscurantism, but not so the systems of those who, by their intellectual force alone, once held all the minds of Europe in subjection. The scholastic systems are not the free products of speculation; in the main they are summae theologicae, or they are modified versions of Aristotle. But each system is a fresh recognition of the rights of reason, and Scholasticism as a whole may be regarded as the history of the growth and gradual emancipation of reason which was completed in the movements of the Renaissance and the Reform. Thus Scholasticism is the central theme of Scholastic debate (see Nominalism, Realism). This is the case almost exclusively during the first period, and only to a less extent during the second, where it reappears in a somewhat different form as the difficulty concerning the principle of individuation. The controversy was between Nominalists and Realists; and, exclusively logical as the point may at first sight seem to be, adherence to one side or the other is an accurate indication of philosophic tendency. The two opposing theories express at bottom, in the phraseology of their own time, the radical divergence of pantheism and individualism—the two extremes between which philosophy seems pendulum-wise to oscillate, and which may be said still to await their perfect reconciliation. First, however, we must examine the form which this question assumed to the first medieval thinkers, and the source from which they derived it. A single sentence in Porphyry’s Isagoge or “Introduction” to the Categories of Aristotle furnishes the “Isagoge” of the text of the discussion. The treatise of Porphyry deals with the notions of genus, species, difference, property and accident (see PREDICABLES); and he mentions, but declines to discuss, the various theories that have been held as to the ontological import of genera and species. In the Latin translation of Boetius, in which alone the Isagoge was then known, the sentence runs as follows:—

“Max de generibus et speciebus illud quidem sive subsistat, sive in solis nulis intellectibus posita sit, sive subsistat corpori a corporali sit et utrum separata a sensibilibus in sensibilius posita et circa haec consistenti, dicere recusabo; altdissimium enim negationem est hujusmodi et majoris egens inquisitionem.”

This passage indicates three possible positions with regard to universals. It may be held that they exist merely as conceptions in our minds; this is Nominalism or Conceptualism (p.v.). It may be held that they have a substantial existence of their own, independent of their existence in our thoughts. This is Realism, which may be of two varieties, according as the substantially existent universals are supposed to exist apart from the sensible phenomena or only in and with the objects of sense as their essence. The first form of Realism corresponds to the Platonic theory of the transcendence of the ideas; the second reproduces the Aristotelian doctrine of the essence as inseparable from the individual thing. But, though he implies an ample previous treatment of the questions by philosophers, Porphyry gives no references to the different systems of which such distinctions are the outcome, nor does he give any hint of his own opinion on the subject, definite enough though that was. He simply sets the discussion aside as too difficult for a preliminary discourse, and not strictly relevant to a purely logical inquiry. Porphyry, the Neoplatonist, the disciple of Plotinus, was an unknown personage to those early students of the Isagoge. They may perhaps possess for them a mysterious charm, largely due to its isolation and to their ignorance of the historic speculations which suggested it. And accordingly it gave rise to the three great doctrines which divided the medieval schools: Realism of the Platonie type, embodied in the formula universalis ante rem; Realism of the Aristotelian type, universalis in re; and Nominalism, including Conceptualism, expressed by the phrase universalis post rem, and also claiming to be based upon the Peripatetic doctrine.
To form a proper estimate of the first stage of Scholastic discussion it is requisite above all things to have a clear idea of the appliances then at the disposal of the writers. What was the extent of the Platonic doctrine of reality? The Platonic doctrine of reality is nothing by and large was ignorant of Greek, and possessed no philosophical works in their Greek original (see CLXI 8). In translations they had the Tractatus de divisione (translated by Michael Psalterius) and De interpretatione. In the versions of Boethius, the Timaeus of Plato in the version of Chalcidius, and Boethius's translation of Porphyry's Isagoge. Some generals are being the Platonic doctrines (chapters II of Boethius platonic garb) was obtained from the commentary which with Chalcidius (6th century) accompanied his translation, from the work of Apuleius (2nd century) De dogmate Platonis, and indirectly from the work of the Stoics (ibid. 400) on the position of Cicero, and from the writings of St Augustine. As aids to the study of logic, the doctors of this period, beside the commentaries and treatises, possessed a treatise which is ascribed to St Augusti-

nus, the first of which, Principia dialectica, is probably mainly grammatical in its import. The other tract, known as Categorica decem, and taken at first for a translation of Aristotle's treatise, is really a rapid summary of it, and certainly does not belong to Augustine. To this list must be added: (1) the Satyricon of Martianus Capella (q.v.), the greater part of which is a treatise on the seven liberal arts, the fourth book deals with logic; (2) the De arzibis ac disputibis liberum liberorum of Cassiodorus (q.v.); (3) the origines of Isidore of Seville (ob. 636), which is little more than a reproduction of (2). The constitutes the whole major part of the middle ages of logic.

The grandly conceived system of Erigena (see ERIGENA and MYSTICISM) stands by itself in the 9th century like the product of another age. John the Scot was still acquainted with Greek, seeing that he translated the work of the pseudo-Dionysius; and his speculative genius achieved the fusion of Christian doctrine and Neoplatonic thought in a system of quite remarkable metaphysical completeness. It is the only complete and independent system between the decline of ancient thought and the system of Aquinas in the 13th century. If Aquinas (q.v.) intended us not to go further, to modern times, to find a parallel. Erigena proposed no solution upon the question which was even then beginning to occupy men's minds; but his Platonico-Christian theory of the Eternal Word as containing in Himself the exemplars of created things is equivalent to the assertion of universalis ante rem. His whole system, indeed, is based upon the idea of the divine as the exclusively real, of which the world of individual existence is but the theophany; the special and the individual are immanent, therefore, in the general. And hent at a much later date (in the year of the Scot's 13th century) his name was invoked to cover the pantheistic heresies of Ausbert of Basle and his followers. Erigena does not separate his Platonico theory of pre-existent exemplars from the Aristotelian doctrine of the universal as in the individuals. As Uebberweg points out, his theory is rather a result of a fusion between an Aristotelian conception of substance to the Platonic idea, and of an independent conception of the relation to the substance in which they inhere with that of the individuals to the idea of which, in the Platonic doctrine, they are copies (Hist. of Philosophy, I, 243, Eng. trans.). Hence it may be said that the universals are in the individuals, constituting their essential reality (and it is an express part of Erigena's system that the created but creative Word, the second division of Nature, should pass into the third stage of created and non-creating things); or rather, perhaps, we ought to say that the individuals exist in the bosom of their universal. At all events, while Erigena's Realism is pronounced, the Platonic and Aristotelian forms of the doctrine are not distinguished in his writing. Excepted to it, the inner stream of Nominalism also in Scotus Erigena; but beyond the fact that he discusses at considerable length the categories of thought and the essential relations, occasionally using the terms used by the Schoolmen, his expression of himself is quite consistent with the opinion of Erigena. It is a matter of fact that his was the first to express his meaning, Prantl appears to adduce no reasons for an assertion which directly contradicts Erigena's most fundamental doctrines. Moreover, Erigena again and again declares that dialectic has made no advance in the category of the singular (cf. the passage from the Dialogues, qv.), while in the treatise De divisione naturae, iv. 4).

The immediate influence of Erigena's system cannot have been great, and its works seem soon to have dropped out of notice in the centuries that followed. The real gurus of Realism and Nominalism are to be found in the 9th century, in scattered commentaries and glosses upon the statements of Porphyry and Boethius. Boethius in commenting upon Porphyry had already started the discussion as to the nature of universals. He is definitely anti-Platonic, and his language sometimes takes even a nominalistic tone, as when he declares that the species is nothing more than a thought or conception gathered from the substantial similarity of a number of dissimilar individuals. The expression "substantial similarity" is still, however, sufficiently vague to cover a multitude of views. He concludes that the genera and species exist as universals only in thought; but, inasmuch as they are derived from reality, he maintains on account of a real resemblance, they have a certain existence independently of the mind, but not an existence disjoined from the singulars of sense. "Sub-

sistent ergo circa sensibilia, intelligitur autem praeter corpora." Or, according to the phrase which recurs so often during the middle ages, "universe intelligitur, singularur sentitur." Boethius ends by declining to adjudicate between Plato and Aristotle, remarking in a semi-apologetic style that, if he has expounded Aristotle's opinion by preference, his course is justified by the fact that he is commenting upon an introduction to Aristotle. And, indeed, his discussion cannot claim to be more than semi-apologetic. His character as a polemicist has not in his hands the all-absorbing importance it afterwards attained, and the keenness of later distinctions is as yet unknown. In this way, however, though the distinctions drawn may still be comparatively vague, there existed in the schools a Peripatetic tradition to set over against the Neo-platonic influence of John the Scot, and amongst the earliest remains of Scholastic thought we find this tradition asserting itself somewhat vigorously. There were Nominalists before Roscellinus among these early thinkers.

Alcuin (q.v.) does nothing more in his Dialectic than abridge Boethius and the other commentators. But in the school of Fulda, presided over by his pupil Hrabanus Maurus (776–856), there are to be found some fresh contribu-

tions to the discussion. The collected works of Hrabanus himself contain nothing new, but in some gloses on Aristotle and Porphyry, first exhumin by Cousin, there are several noteworthy expressions of opinion in a Nominalistic sense. The author interprets Boethius's meaning to be "Quod eadem res individuum et species est genus, et non esse universum, sed esse univer-

sum, quasi quadam diversum." He also cites, apparently with approval, another passage which Boethius's treatise to be not de quinque rebus, but de quinque vocibus. A genus, they said, is essentially something which is predicated of a subject; but a thing cannot be a predicate (res enim non praedicatur). These glosses, it should be added, however, have been attributed by Prantl and Kaulich, on the ground of diver-

gence from doctrines contained in the published works of Hrabanus, to some disciple of his rather than to Hrabanus himself. Fulda had become through the teaching of the latter an intellectual centre. Eric or Heuricus, who studied there under Haimon, the successor of Hrabanus, and afterwards taught at Auxerre, wrote glosses on the margin of his copy of the pseudo-Augustinian Categoriae, which have been published by Cousin and Hauréau. He there says in words which recall the language of Locke (Essay, iii. 3) that because proper names are innumerable, and no intellect or memory would suffice for the knowing of them, they are all as it were comprehended in the species. Taken strictly his words state the position of extreme Nominalism; but even if we were not forbidden to do so by other passages, in which the doctrine of Realism is adopted (under the name of the current distinction between the singular and the universal as understood), it would still be unfair to press any passage in the writings of this period. As Cousin says, "Realism and Nominalism were undoubtedly there in germ, but their true principles with their necessary consequences remained profoundly unknown; their connexion with the great questions of religion and politics was not even suspected. The two systems were nothing more as yet than two different ways of interpreting a phrase of Porphyry, and they remained unnoticed in the
The 11th century was the time of Scholasticism, an era characterized by a profound engagement with the ideas of the past, a conscientiousness of the differences involved and the issues at stake; and, thanks to the heretical conclusion disclosed by Roscellinus, Realism became established for several centuries as the orthodox philosophical creed. Roscellinus (d. c. 1125) was looked upon by later times as the originator of the *sententia rocem*, that is to say, of Nominalism proper. From the scanty and ill-natured notices of his opponents (Anselm and Abelard), we gather that he refused to recognize the reality of anything but the individual; he treated "the universal substance," *Sic
deliberation of one kind or another, and in a similar strain he denied any reality to the parts of which a whole, such as a house, is commonly said to be composed. The parts in the one case, the general name or common attributes in the other, are only, he seems to have argued, so many subjective points of view from which we choose to regard that which in its own essence is one and indivisible, existing in its own right apart from any connexion with other individuals. This pure individualism, consistently interpreted, involves the denial of all real relation whatsoever; for things do not retain, Roscellinus stated their position general characteristics. Accordingly, if these general characteristics do not possess real, things are reduced to a number of characterless and mutually indifferent points. It is possible, as Hauréau maintains, that Roscellinus meant no more than to refute the extreme Realism which asserts the substantial and, above all, the independent existence of the universals. Some of the expressions used by Anselm in contending his position favour this idea. He upholds Roscellinus, for example, because he was unable to conceive whiteness apart from its existence in something white. But this is precisely an instance of the hypostatization of abstractions in exposing which the chief strength and value of Nominalism lie. Cousin is correct in pointing out, from the Realistic point of view, that it is one thing to deny the hypostatization of an accident like colour or wisdom, and another thing to deny the foundation in reality of those "true and legitimate universals" which we understand by the terms genera and species. It is not to be supposed that the full scope of his doctrine was present to the mind of Roscellinus; but Nominalism would hardly have made the sensation it did had its assertions been as innocent as Hauréau would make them. Like most innovators, Roscellinus stated his position in bold characteristics, which emphasized his opposition to accepted doctrines; and, of course, his words, if not his intentions, involved the extreme Nominalism which, by making universality merely subjective, pulverizes existence into detached particulars. And, though we may acquit Roscellinus of consciously propounding a theory so subversive of all knowledge, his criticism of the doctrine of the Trinity is proof at least of the determination with which he was prepared to carry out his individualism. If we are not prepared to say that the three Persons are one thing—in which case the Father and the Holy Ghost must have been incarnate along with the Son—then, did usage permit, he says, we ought to speak of three Gods.

This theological deduction from his doctrine drew upon Roscellinus the polemic of his most celebrated opponent, Anselm of Canterbury (1033-1109). Roscellinus appears at first to have imagined that his tritheistic theory had the sanction of Lanfranc and Anselm, and the latter was led in consequence to compose his *Proslogion* to show the *Trinitatis* doctrine to be a pernicious perversion of the nature of universals. "How shall he who has not arrived at understanding how several men are in species one man comprehended how in that most mysterious nature several persons, each of which is perfect God, are one God?" The manner in which humanity exists in the individual was soon to be the subject of keen discussion, and to bring to light diverging views within the Realistic camp; but St Anselm, too, went on to develop his position in a different way; for it is not surrounded by special difficulties. In truth, his Realism was of a somewhat uncritical type. It was simply accepted by him in a broad way as the orthodox philosophic doctrine, and the doctrine of the tritheistic churchmen; he was perceived to be post in harmony with Christian theology. Anselm's natural element was theology, and the high metaphysical questions which arise as to what is the essence of the Father, and the nature of the Logos (his personal logical argument (in his *Proslogion*) for the existence of God, he joins hands with some of the profoundest names in modern philosophy. To Anselm specially belongs the motto *credo ut intelligam*, or, as it is
SCHOLASTICISM

otherwise expressed in the sub-title of his Prologion, *Fides quaerens intellectum*. He endeavored to give a philosophical demonstration not only of the existence of God but also of the Trinity and the Incarnation, which were placed by the later Scholastics among the "decisive in extremities;" "appears the individual. In opposition to this Nominalistic view, which implied the reversal of his whole position, William may have meant to say that, instead of the universal being multiplied, it is rather the individuals which are reduced to unity in the universal. The species is essentially one, but it takes on individual varieties or accidents. If, however, we are more immature, we may regard the phrase, with Prantl, as simply a meaningless makeshift in extenuities; and if so, Abelard's account of the subsequent decline of William's reputation would be explained. But there is in some of the manuscripts the variety of opinion. Since the doctrine of the universal is not accepted as giving the true sense of the passage by Cousin and Rému006;as (Hauréau and Prantl taking, on different grounds, the opposite view). According to this reading, William sought to rectify his position by asserting, not the numerical identity of the universal in each individual, but rather its sameness in the sense of indistinguishable similarity. Ueberweg cites a passage from his theological works which apparently bears out this view, for William there expressly distinguishes the two senses of the word "same." Peter and Paul, he says, are the same in so far as they are both men, although the humanity of each is, so to speak, not identical but similar. In the Persons of the Trinity, on the other hand the relation is one of absolute identity.

Whether this view is to be traced to William or not, it is certain that the theory of "indifference" or "non-difference" (*indifferentia*) was a favourite solution in the Realistic schools soon after his time. The inherent difficulties of Realism led to a considerable attempt to express the doctrine of the universals, and by John of Salisbury, in his account of the controversies of these days (*Metalogicus*, ii. 17) reckons up nine different views which were held on the question of the universals, and the list is extended by Prantl (ii. 118) to thirteen. In this list are included all shades of opinion, from extreme Nominalism to extreme Realism. The doctrine of indifference as it appears in later writers certainly incorporates the views of William of Champeaux and of the Nominalism of John of Salisbury, but it also gives up the substantiality of the universals. The universal consists of the non-different elements or attributes in the separate individuals, which alone exist substantially. If we restrict attention to these non-different elements, the individual becomes for us the *species* (*sane*) the genus, &c.; everything depends on the point of view from which we regard it. "Nihil omno est praeter individuum, sed et illud aeterrimum et alterum attention especs et genus et generalissimum est." Adelard of Bath (whose treatise *De coenobio et diverso* must have been written between 1105 and 1117) was probably the author of or at all events the elaborator of this doctrine, and he sought by its means to reconcile the theories of William and of Abelard. Realistic interpretation is the view which we see at once genus and species and individual, Aristotle rightly insisted that the universals do not exist except in the things of sense. But, since those universals, so far as they are called genera and species, cannot be apprehended by the senses, he maintained that the admixture of imagination, Plato maintained that they existed and could be beheld beyond the things of sense, to wit, in the divine mind. Thus these men, although in words they seem opposed, yet held the two faculties of the soul in different ways, and set up a system of indifference the "status" doctrine attributed by John of Salisbury to Walter of Mortagne (d. 1174), according to which the universal is essentially united to the individual, which may be looked upon, *e.g.* as Plato, man, animal, &c., according to the "status" or point of view which we assume. But this seems only a different expression for the same position, and the same may doubtless be said of the theory which employed the outward word "species" (*individuum*), to signify that genus and species represented the different ways in which individuals might be regarded. The concessions to Nominalism which such views embody make them represent what Hauréau calls "the Peripatetic section of the Realistic school." Somewhat apart from current controversies stood the teaching of the school of Chartres, humanistically nourished on the study of the ancients, and important as a revival of Platonism in opposition to the formalism of the Aristotelians. Bernard of Chartres, at the beginning of the 12th century, en-dorsed the nominalist tendencies of the school of Hauréau and Aristotle; but his doctrine is almost wholly derived from the former through St Augustine and the commentary of Chalcedius. The *universalia in rer* have little place in his thoughts, which are limited by his adherence to the doctrine of the *endothelion* in the super-sensible world of the divine thought. His *Macrocosmos* and *Microcosm* are little more than a poetical gloss upon the *Timaeus*. William of Champeaux's influence in logical and physiological questions, was of less importance for the specific logico-metaphysical problem. But Gilbert de la Porée, according to Hauréau, is the most eminent logician of the Realistic
school in the 12th century and the most profound metaphysician of either school. The views which he expressed in his commentary on the pseudo-Boetian treatise, *De Trinitate*, are certainly much more involved and more far-reaching. One of the most interesting of these is the distinction which Gilbert draws between the manner of existence of genera and species and of substances proper. He distinguishes between the *quod est* and the *qua est* of a substance. By the *qua est* he means a certain reality in their own right as substances. What exists as a substance and the basis of qualities or forms (*quod est*) may be said *substantia*; the forms on the other hand by which such an individual substance exists separately (*qua est*) are *substantiatum*, though it cannot be said that they *substant*. The intellect collects the universal, which exists but not as a substance (*est sed non substrat*), from the particular things which we call facts. And, as subjects of accidents, have substantial existence (*substantia*), by considering only their substantial similarity or conformity. The universals are thus forms inherent in things—native forms,—according to the Realist tradition of Gilbert or his particular knowledge of Abelard. The individual consists of an assemblage of such forms; and it is individual because nowhere else is exactly such an assemblage to be met with. The form exists concretely in the individual things (*sensibilis in re sensibilis*), for in sensible things form and matter are always united. But they may be conceived abstractly or non-sensuously by the mind (sed mente *conceptus insensibilis*), and they then refer themselves as copies to the Ideas their divine exemplars. In God, who is pure form without matter, the archetypes of material things exist as eternal immutable forms. In this way Gilbert was at once Aristotelian and Platonist. The distinctions he had already developed as forms of concepts were in the same spirit he teaches that no one of the categories can be applied in its literal sense to God (see further Gilbert de la Portree).

But the outstanding feature in the controversies of the first half of the 12th century is Abelard. There is considerable difference of opinion as to his system, some, like Ritter and Erdmann, regarding it as a moderate form of Realism—a return indeed to the position of Aristotle—while others, like Cousin, Rémyau, Haurau and Uchberw, consider it to be essentially Nominalist, only more prudently and perhaps less consistently expressed than was the case with Roscelinus. His position is ordinarily designated by the name Conceptualism (q.v.), though there is very little talk of concepts in Abelard's own writings. There can be no doubt, at all events, that Abelard himself intended to find a compromise. As against Realism he maintains consistently *Res de re non praedicatur*; genera and species, therefore, which are predicated of the individual subject, cannot be treated as things or substances. This is manifestly true, however real the facts may be which are designated by the general names chosen by Abelard. A Nominalist, then, might just as well as has been seen, by a Realist like Gilbert, who perhaps adopted it first from Abelard. Abelard also perceived that Realism, by separating the universal substance from the forms which individualize it, makes the universal indifferent to these forms, and leads directly to the doctrine of the identity of all beings in one universal substance or matter—a pantheism which might take either an Averroistic or a Spinozistic form. Against the system of non-difference Abelard has a number of logical and traditional arguments to bring, but it is sufficiently condemned by his fundamental doctrine that only the individual exists in its own right. For that system still seems to recognize a generic substance as the core of the individual, whereas, according to Cousin's rendering of Abelard's doctrine, "only individuals exist, and in the individual nothing but the individual." Holding fast then on the one hand to the individual as the only true substance, and on the other to the traditional definition of the genus as that which is predicated of a number of individuals (*quod praedicatur de pluribus*), Abelard declared that this definition of itself condemns the Realistic theory; only a name, not a thing, can be so predicated—not the name, however, as a *flatus vocis* or a collection of letters, but the name as used in discourse, the name as a name; with meaning—in a word, not *sos* but *sermo*. *Sermo est praedicabiles.*

By these distinctions Abelard hoped to escape the consequences of extreme Nominalism, from which, as a matter of history, his doctrine has been distinguished under the name of Conceptualism, seeing that it lays stress not on the word as such but on the thought which the word is intended to convey. Moreover, Abelard evidently did not mean to imply that the distinctions of genera and species are of arbitrary or merely human imposition. His favourite expression for the universal is "*quod de pluribus natur est praedicari*" (a translation of Aristotle, *De int. prel.*, 7), which would seem to point to a real or objective counterpart of the products of our thought; and the traditional definitions of Boetius, whom he frequently quotes, support the same view of the concept as generated from a number of individuals in virtue of a real resemblance. What Abelard combats is the substantiation of these resembling qualities, which leads to their being regarded as identical in all the separate individuals, and which, he says, is the way to the gradual undermining of the individual, the only true and indivisible substance. But he modifies his Nominalism so as to approach, though somewhat vaguely, to the position of Aristotle himself. At the same time he has nothing to say against the Platonic theory of *universalia ante rem* (see IDEALISM). Abelard's discussion of the problem (which it right is to say is on the whole incidental rather than systematic) is thus marked by an eclecticism which was perhaps the source at once of its strength and its weakness. But his brilliant ability and restless activity made him the central figure in the dialectical as in the other discussions of his time. To him was indirectly due, in the main, that troubling of the Realistic waters which resulted in so many modifications of the original thesis; and his own somewhat eclectic ruling on the question in debate came to be tacitly accepted in the schools, as the arbiter of the disputants began to abate after the middle of the century.

Abelard's application of dialectic to theology betrayed the Nominalistic bias of his doctrine. He zealously combated the Triheism of Roscelinus, but his own views on the Trinity were condemned by two councils (at Soissons in 1127 and at Sens in 1140). Of the alternatives—three Gods or una res—which his Nominalist logic presented to Roscelinus, Roscelinus had chosen the first; Abelard recoiled to the other extreme, reducing the three Persons to three aspects or attributes of the Divine Being (Power, Wisdom and Love). For this he was called to account by Bernard of Clairvaux (1091-1153), the recognized guardian of orthodoxy in France. Nor can it be said that the instinct of the saint was altogether at fault. The germs of Rationalism were unquestionably present in several of Abelard's opinions, and still more so, the traditionalists must have thought, in his general attitude towards the real existence of universals. And no one would say, "not because God has said it, but because we are convinced by reason that it is so." "Doubt is the road to inquiry, and by inquiry we perceive the truth." The application of dialectic to theology was not new. Anselm had made an elaborate employment of reason in the interest of faith, but the spirit of pious subordination which had marked the demonstrations of Anselm seemed wanting in the arguments of this bolder and more restless spirit; and the church, or at least an influential section of it, took alarm at the encroachments of Rationalism. Abelard's remarkable compilation *Sic et Non* was not calculated to allay their suspicions. In bringing together the conflicting opinions of the fathers on all the chief points of Christian dogmatics, it may be admitted that Abelard's aim was simply to make these contradictions the starting point of an inquiry which should determine in each case the true position and *via media* of Christian theology. Only such a determination could enable the doctrines to be summarily presented as a system of thought. The book was undoubtedly the precursor of the famous *Books of Sentences* of Abelard's own pupil Peter Lombard and others, and of all the *Summae theologicae* with which the church was presently to abound. But the antiquities, as the author treated them, without their solutions could not but seem to insinuate a deep-seated scepticism with regard to authority. And even the proposal to apply the unaided reason to solve questions which had divided the fathers must have been resented by the more rigid churchmen as the rash intrusion of an over-confident Rationalism.

Realism was in the beginning of the 12th century the dominant doctrine and the doctrine of the church; the Nominalists were the innovators and the special representatives of the Rationalistic
tendency. In order to see the difference in this respect between the
schools we have only to compare the peaceful and fortunate
life of William of Champeaux (who enjoyed the friendship of
St Bernard) with the agitated and persecuted existence of
Roscellinus and, in a somewhat less degree, of Abelard. But now
the greater boldness of the dialecticians awakened a spirit of
general distrust in the exercise of reason on sacred subjects,
and we find even a realist like Gilbert de la Porre arraigned by
Bernard and his friends before a general council on a charge
of heresy (at Rheims, 1148). Though Gilbert was acquitted, the
fact of his being brought to trial illustrates the growing spirit of
suspicion and intolerance which was characteristic of_ the
school of St Victor, yet they are in a way just the obverse of his
deep mystic piety. The same attitude is maintained by the
magic school of St Victor. Hugo of St Victor (1097-1141)
declares that "the uncorrected truth of things cannot be
discovered by reasoning." The perils of dialectic are
manifest, especially in the overload spirit it engenders.

Nevertheless Hugo, by the composition of his Summa senenti-
arum, endeavoured to give a methodical and rational presentation
of the content of faith, and was thus the first of the so-called
Summists. Richard of St Victor, prior of the monastery from
1193 until 1199, was still more involved in mysticism, and his
successor Walter loses his temper altogether in abuse of the
dialecticians and the Summists alike. The Summists have as much to
say against the existence of God as for, and the dialecticians,
having gone to school to the pagans, have forgotten over Aristotle
the way of salvation. Abelard, Peter Lombard, Gilbert de la
Porre and Peter of Poitiers he calls the "four labyrinths of
France."

This anger and contempt may have been partly justified by the
discreditable state into which the study of logic had fallen.
According to the Dominican Albert, the first disputations were
held in the year 1148, at the end of the 11th and the first half of the 12th
century—a period more original and more interesting in many
ways than the great age of Scholasticism in the 13th century. By
the middle of the century, logical studies had lost to a great
extent their real interest and application, and had degenerated
into trivial displays of ingenuity. On the other hand, the
Summists^ occupied themselves merely in the systematizing
of authorities. The mystic held aloof from both, and devoted
themselves to the practical work of preaching and edification.
The intellect of the age thus no longer exhibited itself as unity.
And it is significant of the most cultivated and most cultured
representative of the second half of the century was rather an
historian of opinion than himself a philosopher or a

John of
Salisbury

The autobiographical account of these years contained in his Meta-
logicus is of the utmost value as a picture of the schools of the
time; it is also one of the historian's chief sources as a record of
the many-coloured logical views of the period. John recoiled from
the idle casuistry which occupied his own local contemporaries;
and, mindful probably of their aimless ingenuity, he adds the
cautions that dialectic, valuable and necessary as it is, is "like
the sword of Hercules in a pigmy's hand" unless there be added to
it the accoutrement of the other sciences. Catholic in spirit
rather than dogmatic, John ranks himself at times among the
Academics, "since, in those things about which a wise man may
doubt, I depart not from their footsteps." It is not fitting to
sublitize overmuch, and in the end John of Salisbury's solution is
the practical one, his charitable spirit pointing him in particular
to that love which is the fulfilling of the law.

In saying this I am not mentioning Robert Pulley (d. 1150).
Peter Lombard (d. 1164), called the Magister senentiarum, whose
work became the text-book of the schools, and remained so
for centuries. Hundreds of commentaries were written upon it.
Peter of Poitiers, the pupil of Peter Lombard, flourished about 1160-
1170. Other names are Robert of Melun, Hugo of Amiens, Stephen
Langton and William of Auverre. More important is Alain de Lille
(Alanus de Insulis), who died at an advanced age in 1203. His De
arte en droit et en artis catholicae fidelium, though based on
the earlier dialectical theology, but with a greater infusion than usual of philosophical reasoning.
Alain was acquainted with the celebrated Liber de causis.

The first period of Scholasticism being thus at an end, there is an
interval of nearly half a century without any noteworthy philosophical
productions. The cause of the new development of thought during this
period is the almost simultaneous end of the first time of the complete works of Aristotle (see
Classics and Arabian Philosophy). The doctrines and the
works of Aristotle had been transmitted by the Arabs to the Moslems, and the
succession of philosophers, first in the East and afterwards
in the West. The chief of these, at least so far as regards the influence
which they exerted on medieval philosophy, were Avicenna, Avem-
pace and Averrosse. The unification by the last-mentioned
of Aristotle's active intellect in all men, and his consequent denial of
individual immortality are well known. The universal human
interest in his teaching is due, partly, to his attempt to
eliminate the mystical exegesis of the Neoplatonic
emanations. In the course of the 12th century the writings
of these men were introduced into France by the Jews of Andalusia,
of Marselles and Montpellier. "These writings contained," says
the poet of the romance of the Parva natura (the Ethics, the De anima, the Parva natura) and a large number of
other treatises of Aristotle, accompanied by continuous commentaries.
There arrived besides by the same channel the glosses of Theophrastus,
of Simplicius, of Alexander of Aphrodisias, of Philoponus, annotated
in the same sense by the same hands. This was the rich but dangerous
present made by the Mussulman school to the Christian (i. 382).
To these must be added the Neoplatonically inspired Fons Vitae of
the Jewish philosopher and poet Ibn Gabirol (q.v.), or Avicebron.
By special command of Raimund, archbishop of Toledo, the chief
of these works were translated from the Arabic through the Castilian
language. This work by the poet of the Parva natura (Johannes
Avendeath = ben David), a converted Jew, about 1150.
About the same time, or not long after, the Liber de causis became
available, and work depended on it. The real character was a
thought, especially in the period immediately succeeding. Ac-
cepted at first as Aristotle's, and actually printed in the first Latin
editions of his works, the book is in reality an Arabical translation
of Neoplatonism. In theses of the similar character was
the Neoplatotelin Theologia which was in circulation at least as early as 1200.

The first effects of this immense acquisition of new material were
markedly unsettling on the doctrinal orthodoxy of the
The apocryphal Neoplatonie treatises and the first
views of the Arabian commentators obscured for the
first students the genuine doctrine of Aristotle, and the
13th century opens with quite a crop of mystical
heresies. The mystical pantheism taught at Paris by Amalrich
of Bena (d. 1207; see AMALRIC and MYSTICISM), though based
by him upon a revival of Scotus Erigena, was doubtless connected
in its origin with the Neoplatonic treatises which now become
current. The immanence of God in all things and His incarnation
as the Holy Spirit in Himself appear to have been the chief
characteristics of the new doctrine. Thus wrote William of
Moerbeke, "Omnia unum, quia quicquid est Deus."
About the same time David of Dintan, in a book De tomis (rendered by Albertus
De divisionibus), taught the identity of God with matter (or the
indivisible principle of bodies) and nous (or the indivisible
principle of intelligences)—an extreme Realism culminating in
a materialistic pantheism. If they were diverse, he argued, there
must exist above them some higher or common element or being,
in which case this would be God, nous, or the original matter.
The spread of the Amaranic doctrine led to fierce persecutions,
and the provincial council which met at Paris in 1209 expressly
decreed "that neither the books of Aristotle on natural
philosophy, nor commentaries on the same, should be read, whether
privately or privately, at Paris." In 1215 this prohibition is
renewed in the statutes of the university of Paris, as sanctioned by
the papal legate. Permission was given to lecture on the logical
books, both those which had been known all along and those
introduced since 1128, but the veto upon the Physics is extended to
the Metaphysics and the summaries of the Arabian
commentators. By 1231, however, the fears of the church
were beginning to be allayed. A bull of Gregory IX. which
makes no mention of any Aristotelie work except the Physics.
Finally, in 1254, we find the university officially prescribing how
many hours are to be devoted to the explanation of the Meta-
physics and the principal physical treatises of Aristotle. These
dates enable us to measure accurately the stages by which the
church accommodated itself to, and as it were took possession of,
the Aristotelian philosophy. Growing knowledge of Aristotle's
works and the multiplication of translations enabled students to
distinguish the genuine Aristotle from the questionable accompa-
niments with which he had made his first appearance in Western
Europe. Fresh translations of Aristotle and Avroyes had already
been made from the Arabic (Ibn Ṭāriq Ḥalafī and the Hebrew)
by Michael Scot, and Hermannus Alamanus, at the instance of
the emperor Frederick II.; so that the whole body of Aristotle's
works was at hand in Latin translations from about 1210 to 1225.
Soon afterwards efforts began to be made to secure more literal
translations direct from the Greek. Robert Grosseteste (d. 1253)
was one of the first to stir in this matter, and he was
followed by Albertus Magnus and Aquinas. The latter
attempted to remove the lan of the church, and soon
Aristotle was recognized on all hands as "the philosopher
par excellence, the master of those that know. It even became
customary to draw a parallel between him as the praecursor
Christi in naturaibus and John the Baptist, the praecursor
Christi in gratia.

This unquestioned supremacy was not yielded, however, at the
very beginning of the period. The earlier doctors who availed
themselves of Aristotle's works, while bowing to his authority
implicitly in major points, did not failed to bring into the
Chalcedonian and Platonicism against the doctrine of the
Metaphysics.

So it is with Alexander of Hales (d. 1245), the first Scholastic who
was acquainted with the whole of the Aristotelian works and the
Aristotelian commentaries upon them. He was more of a
philosopher than a theologian in his chief treatise, Summa
universae theologicae, he simply employs his in-
creased philosophical knowledge in the demonstration of theological
documents. So great, however, did his achievement seem that he was
honoured by the cardinal's biretta and the title of
archepiscopus. Alexander of Hales belonged to the Franciscan order,
and it is worth remarking that it was the mendicant orders
which now came forward as the protagonists of Christian
learning and faith and, as a demonstration of the existence of an intangible
force, to the church. During the first half of the 13th century,
when the university of Paris was plunged in angry feuds with the
municipality, feuds which ended at last in 1295, the body of the
friars established itself in the colleges of
Paris. After the university had settled its quarrels these
continued to teach, and soon became formidable rivals of the secular
universities. After a severe struggle for academical recognition they
were finally admitted to all the privileges of the university by a bull
of Alexander IV. in 1253. The Franciscans took the lead in this
intellectual movement with Alexander of Hales and Bonaventura,
but the Dominicans were soon able to boast of two greater names in
Albert the Great and Thomas Aquinas. Still later Duns Scotus and
Occam were both Franciscans. Alexander of Hales was succeeded
in the chair of St. John of Paris by a monk of
the name of John of Rochelle, who died in 1271 but taught only till 1253. His treatise
De anima, on which Hauréau lays particular stress, is
interesting as showing the greater scope now given to psychological
discussion by the natural method. No longer the
Aristotelian De anima and the numerous Greek and Arabiam
commentaries upon it, and it is observable in most of the writers that
have still to be mentioned. Even the nature of the universals is no
longer discussed from a purely logical or metaphysical standpoint,
but becomes connected with psychological questions. And, on the
whole, the widening of intellectual interests is the chief feature by
which the second period of Scholasticism may be distinguished from
the first. In some respects there is more freshness and interest in
the speculations which burst forth so ardently in the end of the
11th and the first half of the 12th century. Albert and Aquinas, who reached a level that
Abelard and Abelard, not merely by their wider range of knowledge
but also by the intellectual masterliness of their achieve-
ments; but it may be questioned whether the earlier
writers did not possess a greater force of originality and
originality. Originality was at no time the strong point of the middle
ages, but in the later period it was almost as necessity buried
under the mass of material suddenly thrust upon the age, to the
annihilation. On the other hand, the influence of the Greek is all the more
evident in the wider range of questions which are discussed by the
drivers of the period. Interest is no longer to the same extent confined
to theological science; the "mysteries" of the
Trinity and the Incarnation are henceforth detached from the sphere of rational or philosophical
theology. As the Neoplatonist influence remained strong, attempts were still made to demonstrate the
document of the Trinity, chiefly in a mystical sense as in Erigena,
but also by orthodox churchmen like Anselm. Orthodoxy,
whether Catholic or Protestant, has since generally adopted
Thomas's distinction. The existence of God is maintained by
Albert and Aquinas to be demonstrable by reason; but here again they reject the ontological argument of Anselm, and restrict
themselves to the a posteriori proof, rising after the manner of
Aristotle from that which is prior for us to that which is prior
by nature or in itself. God is not fully comprehensible to us,
says Albert, because the finite is not able to grasp the
infinite, which is altogether beyond our contemplation; or, to put it
another way, the sphere of the divine is cut off from us by a ray of his light, and through this contact we are
brought into communion with him. God, as the only self-
subsistent and necessary being, is the creator of all things. Here
the Scholastic philosophy comes into conflict with Aristotle's
document of the eternity of the world. Albert and Aquinas alike
maintain the beginning of the world in time; time itself only exists
since the moment of this miraculous creation. But
Aquinas, though he holds the fact of creation to be rationally
possible, regards the beginning of the world in time as only
John of Rochelle was succeeded in 1253 by John Fidanza, better
known as Bonaventura (p. o.), who also had been a pupil of
Albert of Hales. But the fame of "the Seraphic Doctor"
is connected closely with the name of his successor (see
MYSTICISM) than with the main stream of Scholastic
thought. Like his master, he defended Plato—or what he considered
it to be the Platonic theory—against the attacks of Aristotle.
Thus he is best remembered as the author of an encyclopaedia,
entitled De universo, and 249, whose treatises De universo and De anima make extensive
use of Aristotle and the Aristotelian, but display a similar
Platonic leaning. The existence of intellec~ons in our minds is, he
maintains, due to the divine intelligence, and censured Aristotle's doctrine of the eternity of
the world. Among the earlier teachers and writers of this century we
may quote as examples, the names of Ma;ius, whose treatises De
universo and De anima make extensive
use of Aristotle and the Aristotelians, but display a similar
Platonic leaning. The existence of intellec~ons in our minds is, he
maintains, due to the divine intelligence, and censured Aristotle's doctrine of the eternity of
the world. Among the earlier teachers and writers of this century we
may quote as examples, the names of
William of Auvergne, the theologian, and his
comprehensive, and a prolific writer, Vincent of
Auvergne (d. 1274.), who was the author of an encyclopaedia
entitled Speculum majus. In which, without much independent
ability, he collected the opinions of ancient and
medieval writers on the most diverse points, transcribing
the fragments of their works which he deemed most interesting.

Albertus Magnus introduces us at once to the great age of
Scholasticism (1193-1280). The limits of his long life include
that of his still greater pupil, Thomas Aquinas (1227-
1274). For this reason and because the system of
Thomas is simply that of Albert rounded to a greater
completeness and elaborated in parts by the subtle intellect
of the younger man, it will be convenient not to separate
the views of master and scholar, except where their differences
make it necessary. Albert was "the first Scholastic who
reproduced the whole philosophy of Aristotle in systematic order
with constant reference to the Arabic commentators, and who
modelled it to meet the requirements of ecclesiastical
dogma" (Ueberweg, I. 436). On this account he was called "the Universal
Doctor." But in Albert it may be said that the matter was still
too new and too multifarious to be thoroughly mastered. In
St Thomas this is no longer so. The pupil, entering into his
master's labours, was able from the first to take a more
comprehensive survey of the whole field; and in addition he was
doubtless embossed with an intellect which was finer, though it
might not be more powerful, than his master's.

The monothestic influence of Aristotle and his Arabic
commentators shows itself in Albert and Aquinas, at the outset,
in the definitive fashion in which the "mysteries" of
the Trinity and the Incarnation are henceforth
detached from the sphere of rational or philosophical
theology. So long as the Neoplatonic influence remained
strong, attempts were still made to demonstrate the
document of the Trinity, chiefly in a mystical sense as in Erigena,
but also by orthodox churchmen like Anselm.
Orthodoxy, whether Catholic or Protestant, has since generally adopted
Thomas's distinction. The existence of God is maintained by
Albert and Aquinas to be demonstrable by reason; but here again they reject the ontological argument of Anselm, and restrict
themselves to the a posteriori proof, rising after the manner of
Aristotle from that which is prior for us to that which is prior
by nature or in itself. God is not fully comprehensible to us,
says Albert, because the finite is not able to grasp the
infinite, which is altogether beyond our contemplation; or, to put it
another way, the sphere of the divine is cut off from us by a ray of his light, and through this contact we are
brought into communion with him. God, as the only self-
subsistent and necessary being, is the creator of all things. Here
the Scholastic philosophy comes into conflict with Aristotle's
document of the eternity of the world. Albert and Aquinas alike
maintain the beginning of the world in time; time itself only exists
since the moment of this miraculous creation. But Aquinas, though he holds the fact of creation to be rationally
possible, regards the beginning of the world in time as only

SCHOLASTICISM 353
an article of faith, the philosophical arguments for and against being inconclusive.

The question of universals, though fully discussed, no longer forms the centre of speculation. The great age of Scholasticism presents, indeed, a substantial unaniimity upon this vexed point, maintaining at the same time that the universals exist in re and post rem. Albert and Aquinas both profess the moderate Aristotelian Realism which treats genera and species only as substantial and real in themselves, but not as individuals, and constitutes their form or essence. The universals, therefore, have no existence, as universals, in rerum natura; and Thomas endorses, in this sense, the polemic of Aristotle against Plato's hypostatized abstractions. The former defends the identity of the divine mind, the universal ante rem may well be admitted as possessing real existence. Finally, by abstraction from the individual things of sense, the mind is able to contemplate the universal apart from the universal nature, that is, the universal as a bus; these subjective existences are the universalia post rem of the Nominalists and Conceptualists. But the difficulties which embarrass the former are in trying to conceive the mode in which the universal exists in the individual reappear in the systems of the present period as the problem of the principium individuationis. The universal, as the form or essence of the individual, is called its quoddam (its "whatness" or nature); but, besides possessing a general nature and answering to a general definition (i.e. being a "what"), every man, every soul, is this particular man, here and now. The question of the possibility (hac esto Duns Scotus afterwards named it) that embarrasses the Scholastics. Albert and Aquinas agree in declaring that the principle of individuation is in mass and matter, and Aquinas says, "the principle of the diversity of the individuals of the same species is the quantitative division of matter," which his followers render by the abbreviated phrase divisiones quod sanitatis. A tolerably clear statement of such a doctrine is that, while declaring the quantitative determination of matter to be the individual element in the individual, it gives no account of how such quantitative determination arises. Yet, as Leibniz often says, the question is a metaphysical question; for determinate matter already involves particularity or this-ness. This difficulty was presently raised by Duns Scotus and the realistically-inclined opponents of the Thomist doctrine. But, as Leibniz points out, it might fairly be urged by Aquinas that he does not pretend to explain how the individuation is actually created, but merely states what he finds to be an invariable condition of the existence of individuals. Apart from this general question, a difficulty arises on the Thomist theory in respect to the existence of spirits or disembodied personalities. This affects first of all the existence of angels, in regard to whom Aquinas admits that they are immediately existent (existentia prima materiae germinem separatum). They possess the principle of individuation in themselves, he teaches, but plurality of individuals is in such a case equivalent to plurality of species (in ipsis diversis species sunt individuales). The same difficulty, however, affects the existence of disembodied spirits. It is impossible that plurality depends on matter, we must not conclude with Averroes that individuality is extinguished at death, and that only the universal form of a rational soul has endured. It is not to say that he opposed both by Albert and by Aquinas. It is still admissible, however, to doubt whether the hateful consequence does not follow consistently from the theory laid down. Aquinas regards the souls of men, like the angels, as immaterial forms; and he includes in the soul-unit, so to speak, not merely the anima rationalis of Aristotle, but also the vegetative, sensitive, appetitive and motive functions. The latter depend, it is true, on bodily organs during our earthly sojourn, but the dependence is not necessary. The soul is created by God when the body of which it is the entelechy is prepared for it. It is the natural state of the soul to be united to a body, but being immediately existent it is not so created by the dissolution of the body. The soul must be immaterial since it has the power of cognizing the universal; and its immortality is further based by St Thomas on the natural longing for an endless existence which belongs to a being whose essence is action and thought. "Iste" and "in se," but are able to abstract from every limitation.

Thomism, which was destined to become the official philosophy of the Roman Catholic Church, became in the first instance the accepted doctrine of the Dominican order, who were presently joined in this allegiance by the Augustinians. The Franciscan order, on the other hand, early showed their rivalry in attacks upon the doctrines of Albert and Aquinas. One of the first and most important of these attacks was the tractatus de fide et pratis Thomas, published in 1285 by William Lamenar, in which the Averroistic consequences of the Thomist doctrine of individuation are already pressed home. More important was Richard of Middletown (d. c. 1300), who anticipated many of the objections urged soon after him by Duns Scotus (q.v.). His system is conditioned by its relation to that of Aquinas, of which it is in effect an elaborate criticism. The chief characteristic of this criticism is well expressed in the name bestowed on Duns by his contemporaries—Doctor subtilis. It will be sufficient therefore to note the chief points in which the two antagonists differ. In general it may be said that Duns shows less confidence in the power of reason than Aquinas, and to that extent Erdmann and others are right in looking upon his system as of a different type. The question of the existence of the divine mind, the universal ante rem may well be admitted as possessing real existence. Finally, by abstraction from the individual things of sense, the mind is able to contemplate the universal apart from the universal nature, that is, the universal as a bus; these subjective existences are the universalia post rem of the Nominalists and Conceptualists. But the difficulties which embarrass the former are in trying to conceive the mode in which the universal exists in the individual reappear in the systems of the present period as the problem of the principium individuationis. The universal, as the form or essence of the individual, is called its quoddam (its "whatness" or nature); but, besides possessing a general nature and answering to a general definition (i.e. being a "what"), every man, every soul, is this particular man, here and now. The question of the possibility (hac esto Duns Scotus afterwards named it) that embarrasses the Scholastics. Albert and Aquinas agree in declaring that the principle of individuation is in mass and matter, and Aquinas says, "the principle of the diversity of the individuals of the same species is the quantitative division of matter," which his followers render by the abbreviated phrase divisiones quod sanitatis. A tolerably clear statement of such a doctrine is that, while declaring the quantitative determination of matter to be the individual element in the individual, it gives no account of how such quantitative determination arises. Yet, as Leibniz often says, the question is a metaphysical question; for determinate matter already involves particularity or this-ness. This difficulty was presently raised by Duns Scotus and the realistically-inclined opponents of the Thomist doctrine. But, as Leibniz points out, it might fairly be urged by Aquinas that he does not pretend to explain how the individuation is actually created, but merely states what he finds to be an invariable condition of the existence of individuals. Apart from this general question, a difficulty arises on the Thomist theory in respect to the existence of spirits or disembodied personalities. This affects first of all the existence of angels, in regard to whom Aquinas admits that they are immediately existent (existentia prima materiae germinem separatum). They possess the principle of individuation in themselves, he teaches, but plurality of individuals is in such a case equivalent to plurality of species (in ipsis diversis species sunt individuales). The same difficulty, however, affects the existence of disembodied spirits. It is impossible that plurality depends on matter, we must not conclude with Averroes that individuality is extinguished at death, and that only the universal form of a rational soul has endured. It is not to say that he opposed both by Albert and by Aquinas. It is still admissible, however, to doubt whether the hateful consequence does not follow consistently from the theory laid down. Aquinas regards the souls of men, like the angels, as immaterial forms; and he includes in the soul-unit, so to speak, not merely the anima rationalis of Aristotle, but also the vegetative, sensitive, appetitive and motive functions. The latter depend, it is true, on bodily organs during our earthly sojourn, but the dependence is not necessary. The soul is created by God when the body of which it is the entelechy is prepared for it. It is the natural state of the soul to be united to a body, but being immediately existent it is not so created by the dissolution of the body. The soul must be immaterial since it has the power of cognizing the universal; and its immortality is further based by St Thomas on the natural longing for an endless existence which belongs to a being whose essence is action and thought. "Iste" and "in se," but are able to abstract from every limitation.
union with the body. But the matter of spiritual beings is widely different from that of the matter of corporeal things. In his treatment of the conception of matter, Duns shows that he inclined much more to the Realism which makes for pantheism than was the case with the Aristotelianism of Thomas. A perfectly formless matter (materia prorsa) would demonstrate all the fundamental Chalcedonian element of all finite existences. He expressly intimates in this connection his acceptance of Avicenna’s position.

In the end of the 13th century and the beginning of the 14th the Thomists and Scotists divided the philosophical and theological world between them. Among the Thomists may be named John of Paris, Aegidius of Lessines (wrote in 1278), Bernard of Trillia (1240-1292) and Peter of Auvergne. More important was Aegidius of Colonies, (1247-1336), general of the Augustinian order,surrounded by the fundamentalists and Pre-Aquinalists, Natalis (d. 1323) and Thomas Bradwardine (d. 1349) were determined opponents of Scotism. Siger of Brabant and Gottfried of Fontaines, chancellor of the university of Paris, taught Thomism at the Sorbonne; and through Humbert, abbot of Prulli, the doctrine won admission to the Cistercian order. Among the disciples of Duns Scotus are mentioned John of Bassolis, Francis of Mayrone (q.v.), Antonius Andreac (d. c. 1320), John Dumbleton and Walter Burleigh (Buryle) (b. 1275) of Oxford, Nicolaus (q.v.) of Lyra, Peter of Aquila and others. Henry Goethals or Henry of Ghent (Henricus (Gazarian, 1217-1293), surnamed Doctor solensis, occupied on the whole an independent and pre-Thomist position, leaning to an Augustinian Platonism (see Henry of Ghent). Gerard of Bologna (d. 1317) and Raoul of Brittany are rather to be ranked with the Thomists. So also is Petrus Hispanus (Pope John XXI), who is chiefly important, however, as the author of the much-used manual Summulae logicales, in which the logic of the schools was expanded by the incorporation of fresh matter of a semi-grammatical character. Petrus Hispanus had predecessors, however, in William of Shrewesbury (died 1247) as a champion of the Thomistic doctrine. The name for which he was hotly disputed whether the whole of the additions are not originally due to the Byzantine Synopsis of Psellus. By far the greatest disciple of Aquinas is Dante Alighieri, in whose Divina Commedia the theology and philosophy of the middle ages, as fixed by Saint Thomas, have received the immortality which poetry alone can bestow. Two names stand apart from the others of the century—Raimon Lull (1234-1315) and Roger Bacon (1222-1294). The Ars magna of the former, phases of a species of logical machine to give a complete axiomatic system of philosophy, was largely followed and was intended by its author as an infallible instrument for the conversion of the Saracens and heathen. Roger Bacon was rather a pioneer of modern science than a Scholastic, and persecution and imprisonment were the penalty of his opposition to the spirit of his time.

The last stage of Scholasticism preceding its dissolution is marked by the revival of Nominalism in a militant form. This doctrine is already to be found in Petrus Aureolus (q.v.), a Franciscan, trained in the Scotist doctrine, and in William Durand of St Poucain (d. 1323), a Dominican who passed over from the school of Aquinas to the school of Scotus. The name for which he is chiefly remembered is that of the “Invisible Doctor,” William of Occam (q.v.), who, as the author of a doctrine which came to be almost universally accepted, received from his followers the title Venerabilis inceptor. The hyponostating of abstractions is the error against which Occam is continually fighting. The Realists, he considers, have greatly sinned against this maxim in their theory of a real universal or common element in all the individuals of a class. From one abstraction they are led to another, to solve the difficulties which are created by the realization of the first. Thus the great problem for the Realists is how to derive the individual from the universal. But the whole inquiry moves in a world of unrealities. Everything that exists, by the mere fact of its existence, is individual (Quodlibetern, coi, ipso quod est, est haecres). It is absurd, therefore, to seek for a cause of the individuality of the thing other than the cause of the thing itself. The individual is the only reality, whether the question be of an individual thing in the external world or of an individual state in the order of thought. It is the individual which needs explanation but the universal. Occam reproaches the “modern Platonists” for perverting the Aristotelian doctrine by these speculations, and claims the authority of Aristotle for his own Nominalistic doctrine. The universal is not anything really existing; it is a terminus or predicicable (whence the followers of Occam were at first called Terminists). It is no more than a “mental concept signifying univocally several singulars.” It is a natural sign representing these singulars, but it has no reality beyond that of the mental act by which it is produced and that of the singulars of which it is predicated. As mere names, the universals of the universal in mente, Occam indicates his preference, on the ground of simplicity, for the view which identifies the concept with the actus intelligendi, rather than for that which treats ideas as distinct entities within the mind. And in a similar spirit he explains the universalia ante rem as being, not substantial existences in God, but simply God’s knowledge of things—a knowledge which is not of universals but of singulars, since these alone exist realiter.

Such a doctrine, in the stress it lays upon the singular, the object of immediate perception, is evidently gaining ground at the expense of the philosophical and theological doctrines of the Schoolmen, especially the Realism of Thomas. It is a spirit which distrusts abstractions, which makes for direct observation, for inductive research. Occam, who is still a Scholastic, gives us the Scholastic justification of the spirit which had already taken hold upon Roger Bacon, and which was to enter upon its rights in the 15th and 16th centuries. Moreover, there is no denying that the new Nominalism not only represents the loss of reality and the spirit of induction, but also contains in itself the germ of that empiricism and sensualism so frequently associated with the former tendencies. Aquinas had regarded the knowledge of the universal as an intellectual activity which might exist even with circumscribed knowledge of the immunity of the soul. Occam, on the other hand, maintains in the spirit of Hobbes that the act of abstraction does not presuppose any activity of the understanding or will, but is a spontaneous secondary process by which the first act (perception) or the state it leaves behind (habitus derelictus ex primo acta = Hobbes’s “ decaying sense”) is naturally followed, as soon as two or more similar representations are present.

In another way also Occam heralds the dissolution of Scholasticism. Theology is the philosophy of the spirit and is despised by the Schoolmen of the middle ages, but in Occam their servitude is complete. A pupil of Scotus, he carried his master’s criticism farther, and denied that any theological doctrines were rationally demonstrable. Even the distinction of a material and a spiritual unity of God was not to be accepted as articles of faith. The Cenotagium theologicum has often been cited as an example of thoroughgoing scepticism under a mask of irrefragable ironies. But if that were so, it would still remain doubtful, as Erdmann remarks, whether the irony is directed against the church or against reason. The most interesting example of this method is seen in the Tractatus de sacramento altaris where Occam accepts the doctrine of Real Presence as a matter of Faith, and sets forth a rational theory of the Eucharist (afterwards adopted by Luther) known as “Consubstantiation.” On the whole, there is no reason to doubt Occam’s honest adhesion to each of the two guides which he sets forth, and that the one in particular and the unity of God were in position in itself an untenable one and the parent of scepticism. The principle of the twofold nature of truth1 thus embodied in Occam’s system was unquestionably adopted by many merely to cloak their theological unbelief; and it is significant of the internal dissolution of Scholasticism. Occam denied the title of a science to theology, emphasizing, like Scotus, its practical character. He also followed his master in laying stress on the arbitrary will of God as the foundation of morality.

Nominalism was at first met by the opposition of the church and the constituted authorities. In 1339 Occam’s treatises were put under a ban by the university of Paris, and in the following year Nominalism was solemnly condemned. Nevertheless the new doctrine spread on all hands. Dominicans like

---

1 This principle appeared occasionally at an earlier date, for example in Simun of Tournay about 1200. It was expressly condemned by Pope John XXII in 1276. But only in the period following Occam did it become a current doctrine.
Armand de Beauvoir (d. 1334) and Gregory of Rimini accepted it. It was taught in Paris by Albert of Saxony (about 1350–1360) and Marsilius of Inghen (about 1364–1377, afterwards at Heidelberg), as well as by John Buridan, as early as 1327. We find, however, as late as 1473, the attempt made to bind all teachers in the university of Paris by oath to teach the doctrines of Realism; but this expiring effort was naturally ineffectual, and from the 1481 onward even the show of obedience was no longer exacted. Pierre d’Ailly (1350–1423) and John Gerson (Jean Charlier de Gerson, 1363–1429), both chancellors of the university of Paris, and the former a cardinal of the church, are the chief figures among the later Nominalists. Both of them, however, besides their philosophical writings, are the authors of works of religious mysticism, and the mystic element in the thought of that period was temporarily in their own persons what was no longer combined in the spirit of the time, or rather they satisfy by turns the claims of reason and faith. Both are agreed in placing repentance and faith far above philosophical knowledge. They belong indeed (Gerson in particular) to the history of mysticism rather than of Scholasticism, and the same may be said of another cardinal, Nicolaus of Cusa (1401–1464), who is sometimes reckoned among the last of the Scholastics, but who has more affinity with Erigena than with any intervening teacher. The task of the Scholastics is common to all, and Gabriel Biel (q.v.), the summarizer of Ockam’s doctrine, highest. The title is not actually correct, and might be more fitly borne by Francisco Suarez (q.v.), who died in 1617. But after the beginning of the 15th century Scholasticism was divorced from the spirit of the time, and it is useless to follow its history further. As has been indicated in the introductory remarks, the end came both from within and from without. The harmony of reason and faith had given place to the doctrine of the dual nature of truth. While this sceptical thesis was embraced by philosophers who had lost their interest in religion, the spiritually minded men were satisfied to reduce Scholasticism, which frequently cast itself loose from ecclesiastical trammels. The 14th and 15th centuries were the great age of German mysticism, and it was not only in Germany that the tide set this way. Scholasticism had been the expression of a universal church and a common learned language. The university of Paris, with its scholars of all nations numbered by thousands, was a symbol of the intellectual unity of Christendom; and in the university of Paris, it may almost be said, Scholasticism was reared and flourished and died. But the different nations and tongues of modern Europe were now set free from their constrictions, and men's interests ceased to be predominatingly ecclesiastical. Scholasticism, therefore, which was in its essence ecclesiastical, had no longer a proper field for its activity. It was in a manner deprived of its accustomed subject-matter and died of inanition. Philosophy, as Hauréau finely says, was the passion of the 13th century; but in the 15th humanism, art and the beginnings of science and of practical discovery were busy creating a new world, which was destined in due time to give birth to a new philosophy. Authorities.—Besides the numerous works quoted in articles on the individual philosophers, see Hauréau, Histoire de la philosophie scolastique; vol. i. (1887) (revised vol. ii. (1897) as Histoire de la phil. scol.,) Kaulich, Geschichte d. schol. Philosophie: Stöckl, Gesch. der Phil. des Mittelellters; Karl Werner, Die Scholastik des späteren Mittelellters; and, on a smaller scale, de Wulf’s Histoire de la phil. médiévale (1900). Supplementary details are given in Hauréau’s Singularités historiques et littéraires (1861) and in R. L. Poole’s Illustrations of the History of Medieval Thought (1864); while much light is thrown upon the minuter history of the period by the Chorographia Universitatis Parisinsis edited by Denifle and Chatelain in 1894, by Hauréau’s Notices et extraits de quelques M.S. latins de la Bibliothèque Nationale (1897–1899) and Beier’s Geschichte d. phil. d. Mittelellters, in course of publication since 1891 by Baeumker and others. A critical survey of recent literature on Scholasticism is given by Baeumker in the Archiv für Geschichte d. Philosophie, vol. v. and x. The accounts of medieval thought given by Ritter, Erdmann and Uebenweg in their general histories of philosophy are exceedingly good. That of Windelband, though going less into detail, is a remarkably fresh treatment of the problems involved. There are also notices of the leading systems in Milman’s History of Latin Christianity; and the same writers are considered from the theological side in many works devoted to theology, and the history of dogma. The psychology of the Scholastic writers is ably dealt with in Siebeck’s Die Psychologie von Aristoteles bis zu Thomas von Aquino (1885). Jourdain’s Recherches critiques sur l’âge et l’origine des traductions latines d’Aristote (Paris, 1819; 2nd ed. 1843); Ronsselot’s Études sur la philosophie dans le moyen âge (1840–1842), Cousin’s Introduction to his Oeuvres édits d’Abélard (1836), and Frantz’s Geschichte der Logik (1879) are invaluable aids in studying the history of medieval thought. (A. S. F.-P.; X.)

Scholefield, James (1789–1853), English classical scholar, was born at Henley-on-Thames on the 15th of November 1789. He was educated at Christ’s Hospital and Trinity College, Cambridge, and was in 1825 appointed professor of Greek in the university and canon of Ely (1849). He was for some time curate to Charles Simeon, the evangelical churchman, and his low church views involved him in disputes with his own party. He died at St Michael’s, Cambridge, of which he was perpetual curate from 1823 till his death at Hastings on the 4th of April 1853. Scholefield was an excellent teacher. His most useful work was his edition of the Adversaria of P. P. Dohbre (q.v.), his predecessor in the chair of Greek. He also published editions of Aeschylus (1828), in which he dealt very conservatively with the text, and of Porson’s four plays of Euripides. His Hints for an improved Translation of the New Testament met with considerable success. He was one of the examiners in the first Classical Tripos (1824). The Scholefield Theological Prize at Cambridge was established in recognition of his contributions.

See Memoirs of James Scholefield (1858), by his wife, Harriet Scholefield; Gentleman’s Magazine (June 1853, p. 644).

Scholefield, Jan Hendrik (1811–1883), Dutch Protestant theologian, was born at Vleuter near Utrecht on the 17th of August 1811. After studying at Utrecht, he was appointed professor of theology at Franeker. From Franeker in 1843 he moved to Leiden as professor extraordinary, and in 1845 was promoted to the rank of ordinarius. Through Scholefin, A. Kuenen became interested in theology; Scholefin was not then the radical theologian he became later. The two scholars in course of time created a movement resembling that of the

1 To be distinguished from scolium (σκολίον), an after-dinner song.

See also: Historical and Critical Introduction to the New Testament (1855–1856); The Oldest Witnesses to the Writings of the New Testament (1866); The Oldest Gospel (1868); and The Pauline Gospels (1874). Scholten’s contributions to the study of the theological development of the New Testament in the context of the Essene movement in the desert of Judaea are of the highest importance. In his paper, “Die Abschiedrede bei het Neerleggen van het Hoogleraarssambti” (1881), and in the biography written by A. Kuener, Levensbericht van J. Heinrich Scholten (1885).

SCHÖMANN, GEORGE FRIEDRICH (1793–1879), German classical scholar, was born at Stralsund in Pomerania on the 28th of June 1793. In 1827 he was appointed professor of ancient literature and eloquence in the university of Greifswald, where he died on the 25th of March 1879. Schomann’s attention was chiefly devoted to the constitutional and religious antiquities of Greece. His first works on the subject were De comitiis Atheniensium (1819), the first independent account of the forms of Athenian political life, and a treatise De sornilhones judicium apud Athenienses (1820). In conjunction with M. H. E. Meier, Schomann wrote Der ätische Prozeß (1824, revised ed. by J. H. Lipsius, 1827–1831), which although in some respects out of date, still has considerable value.

Among his other works are:—editions of Isaæus (1831) and Plutarch’s Agis and Cleomenes (1839, important for the Attic law of inheritance and the history of the Spartan constitution at the time of the revolt); a critical examination of Grote’s account of the Athenian constitution (1845, Eng. trans. by B. Bosanquet, 1878) from a conservative point of view; and lastly, Griechische Alterthumer (1846–1853), which, although in some respects outdated, is still a valuable work. See S. (Susenbich) in C. Burnand’s Biogr. Jahrbuch für Altertumskunde (1879); A. Baumeister in Allgemeine deutsche Biographie, xxxii.; C. Burnand in Dict. de la Langue Française (1890, ed. 1876); translated with introduction and notes Aeschylus’ Prometheus Bound, and wrote a Prometheus Unbound (1844), in which Prometheus is brought to see the greatness of his offence and is sought by the Greek gods to be anathematized. Special mention may be made of the Theology of the Life of the World (1862), an introduction to the elements of the science of grammar. His many-sidedness is shown in his Opuscules académiques, published in 1878.

Burnand in Dict. de la Langue Française (1890, ed. 1876); translated with introduction and notes Aeschylus’ Prometheus Bound, and wrote a Prometheus Unbound (1844), in which Prometheus is brought to see the greatness of his offence and is sought by the Greek gods to be anathematized. Special mention may be made of the Theology of the Life of the World (1862), an introduction to the elements of the science of grammar. His many-sidedness is shown in his Opuscules académiques, published in 1878.

SCHEMBERG (originally SCHOMBERG), FRIEDRICH HERMANN (or FREDERICK ARMAND), DUKE OF (c. 1615–1660), marshal of France and English general, was descended from an old family of the Palatinate, and was born in December 1615 or January 1616, at Heidelberg, the son of Hans Meinard von Schomberg (1582–1616) and Anne Sutton, daughter of the 6th Lord Dudley. An orphan within a few months of his birth, he was brought up by his uncle, Count von Neurleggen, whom he called the “Winter King,” Frederick V. of the Palatinate, in whose service his father had been. He began his military career under Frederick Henry, prince of Orange, and passed about 1634 into the Swedish service, whence he entered that of France in 1635. His family, and the allied house of the Saxon Schönbegs had already attained eminence in France. After a time he retired to his family estate at Geiseheim on the Rhine, but in 1639 he re-entered the Dutch army, in which, apparently, with a few intervals spent at Geiseheim, he remained until about 1650. He then rejoined the French army as a general officer (maréchal de camp), served under Turenne in the campaigns against Condé, and became a lieutenant-general in 1665, receiving this rapid promotion perhaps partly owing to his relationship with the d’Harlemin, but mainly because he was looked upon as the eventual successor of the great generals then at the height of their fame.

After the peace of the Pyrenees (1659) the independence of Portugal being again menaced by Spain, Schomberg was sent as military adviser to Lisbon with the secret approval of Charles II. of England (who knew him personally and about this time created him baron of Teford) and Louis XIV., who in order not to infringe the treaty just made with Spain, deprived Schomberg of his French offices. After meeting in the three first campaigns many difficulties from the insubordination of some of the Portuguese officers, Schomberg won the victory of Montes Claros on the 17th of June 1665 over the Spaniards under the prince of Parma. After participating with his army in the work which deposited the reigning king in favour of his brother don Pedro, and ending the war with Spain, Schomberg returned to France, became a naturalized Frenchman and bought the lordship of Coubert near Paris. He had been rewarded by the king of Portugal, in 1663, with the rank of Grandee, the title of count of Mertola and a pension of £5000 a year. In 1673 he was invited by Charles to England, with the view of taking him by command of the king for lieutenant-general. The demand for the appointment, as favouring of French influence, that it was not carried into effect. He therefore again entered the service of France. His first operations in Catalonia were unsuccessful owing to the disobedience of subordinates and the rawness of his troops, but he retrieved the failure of 1674 by retaking Bellegarde in 1675. For this he was made a marshal, being included in the promotion that followed the death of Turenne. The title had now set against the Huguenots, and Schomberg’s merits had been long ignored on account of his adherence to the Protestant religion. The revocation of the edict of Nantes (1685) compelled him to quit his adopted country. Ultimately he became general-in-chief of the forces of the elector of Brandenburg, and at Berlin he was the acknowledged leader of the thousands of Huguenot refugees there. Soon afterwards, with the elector’s consent, he joined the prince of Orange on his expedition to England in 1688, as second in command to the prince. The following year he was made a knight of the Garter, was created successively baron, marquis and duke, was appointed master-general of the ordinance, and received from the House of Commons a vote of £10,000,000 to compensate him for the losses of his French estates, of which Louis had deprived him. He was appointed commander-in-chief of the expedition to Ireland against James II. After capturing Carrickfergus he marched unopposed through a country desolated before him to Dundalk, but, as the bulk of his forces were raw and undisciplined as well as inferior in numbers to the enemy, he deemed it imprudent to risk a battle, and entrenching himself at Dundalk declined to be drawn beyond the circle of his defences. Shortly afterwards pestilence broke out, and when he retired to winter quarters in Ulster his forces were more shattered than if they had sustained a severe defeat. He was criticized in ill-informed quarters, but the facts justified his inactivity, and he gave a striking example of his generous spirit in placing at William’s disposal for military purposes the £100,000 recently voted him. In the spring he began the campaign with the capture of Charlemont, but no advance southward was made until the arrival of William. At the Boyne (July 1, 1690) Schomberg gave his opinion against the determination of William to cross the river in face of the opposing army. In the battle he commanded the centre, and while riding through the river without his cuisses to rally his men, was surrounded by the enemy and instantly killed. He was buried in St. Patrick’s cathedral, Dublin, where there is a monument to him, erected in 1731, with a Latin inscription by Dean Swift.
SCHOMBURGK—SCHONGAUER

His eldest son Charles, the second duke in the English peerage, died in the year 1603 of wounds received at the battle of Marignano.

The most important work on Schomburg's life and career is Kazer's Leben Friedrisch von Schomburg oder Schönberg (Mannheim, 1789). The military histories and memoirs of the time should also be consulted.

SCHOMBURG, SIR ROBERT HERMANN (1804–1859), British traveller, was born at Freiburg, Prussian Saxony, on the 5th of June 1804, the son of a Protestant minister. In 1829 he went to the United States, but in 1830 left for Anegada, one of the Virgin Isles. He surveyed the island at his own expense, and sent to the Royal Geographical Society, London, a report which created such an impression that, in 1835, he was entrusted by that body with the conduct of an exploring expedition to British Guiana. He fulfilled his mission with great success, incidentally discovering the Victoria Regia lily. In 1841 he returned to Guiana to survey the colony and fix the boundary for the British Government. The result was the provisional boundary between British Guiana and Venezuela known as the “Schomburgk Line,” for which see the articles on those two countries. On his return to England he was knighted. In 1848 he was appointed British consul to St Domingo and, in 1857, British consul to Bangkok. While holding these posts he continued his geographical surveys. He retired from the public service in 1864, and died at Berlin on the 11th of March 1865. He was the author of a Description of British Guiana and the east coast of Venezuela (1849).

SCHÖNBEIN, CHRISTIAN FRIEDRICH (1799–1868), chemist, was born at Metzingen, Swabia, on the 18th of October 1799, and died at Sauerbruck, near Baden Baden, on the 29th of August 1868. After studying at Tübingen and Erlangen, he taught chemistry and physics, first at Kelhau, Thuringia, and then at Epsom, England, but most of his life was spent at Basel, where he undertook the duties of the chair of chemistry and physics in 1828 and was appointed full professor in 1835. His name is chiefly known in connexion with ozone, which he began to investigate in 1839, and with gun-cotton, which he prepared and applied as a propellant in firearms early in 1846. He was a most prolific writer, 354 papers appearing under his name in the Royal Society's Catalogue, and he carried on a large correspondence with other men of science, such as Berzelius, Faraday, Liebig and Wöhler.

Many of his letters together with a life will be found in G. W. A. Kahlbaum's Monographien aus der Geschichte der Chemie, vols. iv. and vi. (1899 and 1901).

SCHÖNECK, a town of Germany, in the province of Prussian Saxony, on the right bank of the Elbe, 9 m. S. of Magdeburg by the railway to Halle and Leipzig. Pop. (1905) 17,986. It contains manufactories of chemicals, machinery, starch, white lead and various other articles, but is chiefly noted for its extensive salt springs and works, which produce about 75,000 tons of salt per annum. Large beds of rock-salt also occur in the neighbourhood, in which shafts have been sunk to a depth of more than 1200 ft. There is a harbour on the Elbe here, and a brisk trade is carried on in coal, grain and timber.

See Magnus, Geschichte der Stadt Schöneck (Berlin, 1880).

SCHÖNEBERG, a town of Germany, in the Prussian province of Brandenburg, forming a suburb of Berlin, which it adjoins on the south-west. Pop. (1905) 147,600. It has four churches, a statue of the emperor William I. and several educational establishments. It contains the railway station of the military line to Zossen, and is connected with the metropolis by electric trams and omnibuses. Its chief manufactures are railway plant, cigars, soap, paper and chemicals. The foundation of Alt-Schöneberg is ascribed to Albert the Bear, marquis of Brandenburg, in the 12th century, while Neu-Schöneberg was founded by Frederick the Great in 1750 to accommodate some Bohemian weavers exiled for their religion. It was made a town in 1808.

SCHÖNFELD, EDUARD (1828–1861), German astronomer, was born at Hildburghausen, in the duchy of Meiningen, on the 22nd of December 1828. He had a distinguished career at the gymnasium of his native town, and on leaving devoted himself to astronomy, but abandoned the idea in deference to his father's wishes. He went first to Hanover, and afterwards to Cassel to study architecture, for which he seems to have had little inclination. In 1849 we find him studying chemistry under Bunsen at Marburg, where his love for astronomy was revived by Gerling's lectures. In 1851 he visited the Bonn Observatory, and began his studies in astronomy under Argelander. In 1853 he was appointed assistant, and in the following year won a doctor's degree with his treatise Nova elementa Thédtis. At Bonn he took an important part in preparing the Durchmusterung of the northern heavens. He took up the investigation of the light-changes in variable stars, devoting to this work nights which, on account of moonlight, were unsuitable for zone observations. The results of these researches are published in the Sitz. Berich. Wien. Akad., vol. xii. For a short time he was a Privatdozent at Bonn, but in 1859 he was appointed director of the Mannheim Observatory. The instrumental equipment of that observatory was of antituated, its largest telescope being a small refractor of 73 lines aperture, but he selected a line of work to suit the instruments at his disposal, observing nebulae and variable stars and keeping a watch on comets and new planets. The results of his observations of nebulae are contained in two catalogues published in the Astronomische Beobachtungen der Grossherzoglichen Sternwarte zu Mannheim, 1st and 2nd parts (1862 and 1875), and those of his variable star observations appeared in the Jahresberichte des Mannheimer Vereins für Natukunde, Nos. 32 and 39 (1866 and 1875). On the morning of August 13, 1874, which occurred on February 17th 1875, Schönfeld was appointed to succeed him as director of the Bonn Observatory, and soon after his appointment he began his last and greatest piece of work, the extension, on Argelander's plan, of the survey of the heavens down to 28° of south declination. The experience gained on the northern survey under Argelander's direction enabled Schönfeld to introduce some improvements in the methods employed, which increased the accuracy of this work, which was practically accomplished in March 1887, some revision only remaining to be done. These zones of observed photographic plates of 363,932 separate planes of stars, and form the groundwork of the catalogue of 1,733,659 stars between 2° and 28° south declination, which was published in 1886 as the eighth volume of the Bonn observations.

Schenfeld was a member of the Astronomical Gesellschaft from its foundation in 1865, being a member of Council up to 1869, and in 1875 becoming editor of its publications and secretary in conjunction with Winnecke. In 1878 he was elected a Foreign Associate of the Royal Astronomical Society. He died on the 1st of May 1891.

SCHONGAUER (or Stön), MARTIN (c. 1445–c. 1488), the most able engraver and painter of the early German school. His father was a goldsmith named Casper, a native of Augsburg, who had settled at Colmar, where the chief part of Martin's life was spent. Schongauer established at Colmar a very important school of engraving, out of which grew the "little masters" of the succeeding generation, and a large group of Nuremberg artists. As a painter, Schongauer was a pupil of the Flemish Roger van der Weyden the Elder, and his rare existing pictures closely resemble, both in splendour of colour and exquisite minuteness of execution, the best works of contemporary art in Flanders. Among his very few paintings which can with certainty be attributed to him, the chief is a magnificent altarpiece in the church of St Martin at Colmar. The Colmar Museum 1 The date of Schongauer's birth is usually given wrongly as c. 1420; he was really born twenty-five or thirty years later, and is mentioned by A. Dürer as being a young apprentice in 1447. His portrait in the Munich Pinakothek is 23 inches high. The" Schongauer" of the" Schongauer" of 1453; it is obviously a blunder; see Henkel in Neumann's Archiv (1869), p. 129, and Wurzbach, M. Schongauer (Vienna, 1880). These contradict the view of Grootwaller, in his Martin Schongauer et son école (Paris, 1875). Cl. Schnase, "Gesch. M. Schongauer," in the Mittheil. der K. K. Commission (1865), No. 7.
possesses eleven panels by him, and a small panel of "David with Goliath's Head" in the Munich Gallery is attributed to him. The Milan engraving of the "Death of the Virgin" in the English National Gallery is probably the work of some pupil. In 1488 Schongauer died at Colmar, according to the register of St. Martin's church. Other authorities state that his death occurred in 1491.

The main work of Schongauer's life was the production of a large number of beautiful engravings, which were largely sold, not only in Germany, but also in Italy. It is said that he made copies of some of his engravings — the "Triumph of St. Anthony," for example. Schongauer was known in Italy by the name of "Bel Martino" and also as "Martino d'Anvers," and his prints were religious and had a certain force. Many copies of his engravings from copper by his hand are known, and about 100 more are the production of his betters. Most of his pupils' plates as well as his own are signed M. S. Among the most beautiful of Schongauer's engravings are the "Death and Coronation of the Virgin," and the series of the "Wisdom and Foolish Virgins." All are remarkable for their miniature-like treatment, their brilliant touch, and their chromatic force. In the "Death of the Virgin" and the "Adoration of the Magi" are richly filled compositions of many figures, treated with much largeness in style opposite their minute scale.

The British Museum possesses a fine collection of Schongauer's prints. Fine facsimiles of his engravings have been produced by Armand-Durand with text by Duplessis (Paris, 1881).

SCHÖNINGEN, a town of Germany, in the duchy of Brunswick, 20 m. by rail W. of Magdeburg. Pop. (1905) 9208. It has three churches, and manufactures of chemicals, machinery, and sausages. The place is mentioned as early as 747 and received municipal rights in 1370. It has the remains of a ducale residence and some ruins of a house 20 m. to the W.

SCHOOLCRAFT, HENRY ROWE (1793-1864). American traveller, ethnologist, and author, was born on the 28th of March 1793 at what is now Guilderland, New York, and died at Washington on the 10th of December 1864. After studying chemistry and mineralogy in Union College he had several years' experience of their application, especially at a glass-manufactory of which his father was manager, and in 1817 published his Vitrology. In the following year he collected geological and mineralogical specimens in Missouri and Arkansas, and in 1819 he published his View of the Lead Mines of Missouri. In 1826 he accompanied General Lewis Cass as geologist in his expedition to the Upper Mississippi and the Lake Superior copper region, and in 1823 he was appointed Indian agent for the Lake Superior country. More than sixteen millions of acres were ceded by the Indians to the United States in treaties which he negotiated. He married the granddaughter of an Indian chief; and during several years' official work near Lake Superior, and later under authorisation of an Act of Congress of 1847, he acquired much information as to institutions, &c., of the American natives. From 1828 to 1851 Schoolcraft was an active member of the Michigan legislature. In 1812, when on an embassy to some Indians, he ascertained the real source of the Mississippi to be Lake Itasca.

In 1825 he published Travels in the Central Portions of the Mississippi Valley, and in 1839 appeared his Aligic Researches, containing Indian legends, notably, "The Myth of Hiawatha and other Oral Legends." He composed a considerable quantity of prose and several mimic plays, especially Notes on the Iroquois (1846); Scenes and Adventures in the Osage Mountains (1853). His principal book, Historical and Statistical Information respecting the Indian Tribes of North America, illustrated with 336 plates from original drawings, in part a compilation, was issued under the patronage of Congress in six quarto volumes, from 1851 to 1857.

Another painting of the same subject in the Doria Palace in Rome (usually attributed to Dürer) is given to Schongauer by Crowe and Cavalcaselle, Flamen et Peintres (London, 1872, p. 539); but the existing position was ascribed to Schongauer's wonderful touch.

An interesting example of Schongauer's popularity in Italy is given by the lovely Faenza plate in the British Museum, on which is printed a copy of Martin's beautiful engraving of the "Death of the Virgin." See Bartsch, Peintre Graveur, and Willshire, Ancient Prints, best edition of 1877. According to a German tradition Schongauer was the originator of printing woodcuts, and not the central or vital one of the first who brought the art to perfection. See an interesting article by Sidney Colvin in the Jahrbuch der k. preussischen Kunstsammlung, vi. p. 69 (Berlin, 1885).

SCHOOLS. As is the case with all the institutions of modern civilization, so with schools; the name, the thing, the matter, the method, have been derived from Greece through Rome. A strange fortune has converted the Greek word σχολή, which originally meant leisure, particularly the "retired leisure that in trim gardens takes his pleasure" of men, into the proper term for the modern school.

Greek Schools.—The term and the institution date, not from the great or what may be called the Hellenic age of Greece, but from the later Macedonian or Hellenistic period. The account given by K. J. Freeman in his Schools of Helles (1907) may be summed up in the statement, "There were no schools in Hellas. That is, there were no schools in our sense, where, during boyhood and youth, boys spent their whole time in a continuous course of instruction. There were professional teachers of three kinds: (1) the grammatici, who taught reading, with writing and perhaps arithmetic, in the grammatician; (2) the citharistes, who taught music, i.e. playing and singing to the cithara—is significant that there was no word for the musical quality of a song. (3) the sophistes, w.thought gymnastics, wrestling, boxing, running, jumping, throwing the javelin, &c., in the palaistra. To these teachers the boys were taken by slaves, called boy-leaders (μαθαιωτέροι, whence our pedagogues), as single pupils, and they were taught not in classes but singly. That all boys did not go through all three schools is clear. For we hear of Socrates, when he was grown up, repairing to a lyre-school to learn music, because he thought his education was not complete without it. Roughly, the age for the grammar-school and song-school was 7 to 14, for the gymnastic school 14 to 18, for the higher schools.

The system of literature was imparted, as especially in the song-school, Homer and other early poets, the very Bibles of Hellas, were learnt by heart. In later days, under the Sophists, and Socrates, "the greatest of the Sophists," 450-400 B.C., something approaching to secondary education was developed. But it was wholly unorganized, though a similar division of labour between separate primary tutors took place as in primary education. The orators or rhetoricians taught oratory, and the learning that was considered necessary to the political orator, a smattering of Greek history, constitutional law and elementary logic. The philosophers, such as Protagoras, Empedocles, and the palaistra, or private gymnasium, was the left over to the philosophers, and it was the place for the instruction of the wealthy young men.

In the next generation, the orators and the philosophers, by settling down in fixed places, began to establish something more like schools. Plato, though like his master Socrates he taught without asking fees, was the first to give a regular educational course extending over three or four years, and in a fixed place, the Academy. The gymnasia was originally a parade or practice ground for the militia or conscript army of the state, which derived its name from the exercises being in that climate performed naked (γυμνός). At the age of 15 or 16 the boys left school, maintained at the public expense, preparatory to their admission as youths (φίλαθλοι), to take the oath of citizenship and undergo two years' compulsory training in regiments on the frontier. After those two years were over, they still required continuous exercise to keep themselves in training; consequently men of all ages, from 16 to 60, were to be found in the gymnasia. Though the gymnasia was free, the teachers and trainers in gymnastics were paid, and as the poorer citizens had to earn their own living, the Athenian gymnasium, like the modern university, was for educational purposes chiefly frequented.
by the well-to-do. So the Academy became a fashionable lounge, and here developed the walking and talking clubs, which became the Platonic or Academic Schools. Logic and ethics, built on a foundation of geometry and mathematics, seem to have been the staple subjects. An inner circle met, and dined together in Plato's private house and garden, close to the Academy. Plato devised the house and garden to his successor Speusippus, who passed them on to Xenocrates. They thus became the first endowment of the first endowed college, which grew very rich and lasted till the disestablishment and disendowment of the old learning by Justinian in A.D. 529. Aristotle, a pupil of Plato for ten years, built or set up his school of hellenistic philosophy in the Lyceum, another public gymnasium, where he lectured twice a day, in the morning esoterically to the inner circle of regular attendants, in the afternoon to the public. From these two institutions three nations of Europe have derived three different terms for a school, the Germans their gymnasium, the French their lycée, and the Scotch their academy. Yet neither of the original was a school in any real sense of the word. In the days of their founders they were like discussion forums; at the most, courses of lectures. In later years, the gilded youth who flocked to Athens from the grammar schools of the civilized world were enrolled among the epheloi, and the so-called "university of Athens" was evolved (Dumont, L'Éphémie attique).

Meanwhile the intellectual hegemony of Greece had for a time passed with the political hegemony from Athens to Alexandria. It is to the Alexandrians, either to Antiodorus or to Eratosthenes, c. 250 (J. E. Sandys, Hist. of Classical Scholarship, 7), that grammar, as a term and a science, which included literary criticism and scholarship, and the grammar school are due. The earliest extant treatise on grammar is by Dionysius of Thrace (born c. 140), a pupil of the Homeric critics Aristarchus. It defined grammar as the practical knowledge of the usage of writers of poetry and prose, and includes exegesis or explanation of the meaning of the widest sense as well as more formal or syntactical grammar. It was from the term thus understood that the grammar school (schola grammaticalis), the term which described the typical secondary school from that day to 1869, derived its denotation and its connotation. For a true conception of the history of secondary schools it cannot be repeated too often and too emphatically that to this day the true title of the greatest English public schools is grammar school. Winchester and Eton are the grammar schools of the colleges of the Blessed Mary of Winchester and of Eton respectively, and Westminster is the grammar school of the collegiate church of St. Peter, Westminster. Throughout the thirteen centuries which intervened between Dionysius Thrax and Dr. Kennedy, Dionysius's grammar was the standard work and the foundation, directly or indirectly, of all other grammars, while the grammar school has always meant, and, in the hands of the better class of teachers, has always been, not a gerund-grinding machine, but a place for the training and exercise of the mind by the study of literature. The word "school," as well as the word "grammar," seems to be due to Alexandria. Plato in the Laws has spoken of a learned discussion or teaching, the product of leisure, as a scholē. But it does not appear that the word was transferred to the place where such discussion took place before the Alexandrian epoch. The first known use of it in that sense seems to be in Dionysius Halicarnassus' Letter to Ammaeus, c. 30 B.C. But as Plautus (c. 210) uses the corresponding Latin term, ludus literarius, some two centuries earlier, we may safely infer that he used it, not on the principle of ludus a non ludendo, but as a translation of grammar school.

Roman Schools.—At Rome the schools began with intercourse with the Greeks. According to Suetonius, the emperor Hadrian's secretary, who wrote The School Masters (De grammaticis) about A.D. 140, literary teaching and the science of grammar began with Livius Andronicus, a Greek from Magna Graecia in the south of Italy, who, being brought to Rome as a slave in 272 B.C., became a freed man, translated the Odyssey into Latin, and taught both Greek and Latin. Ennius, the first Latin poet, was also half-Greek, and came to Rome in 209 B.C., where he also taught both languages. According to Plutarch (Quaest. Rom. 59) the first grammar school (grammaticoludiskelation) was opened by Spurius Carvillus, a freedman of Carvillus, who was the first Roman to divorce his wife. Like master, like man. These two innovations in morals and manners took place about 250 B.C. According to Suetonius, Crates of Mallus in Cilicia, who about 169 B.C. came to Rome as ambassador from Attalus, king of Pergamum, a great centre of learning, and was kept there by a broken leg, occupied himself in giving lectures. His example was soon followed by Romans. Schools of grammar, in which, even as late as Quintilian's time, the Ignorant (Introd. de lib. 12) and the chief text-book and were learnt by heart, were kept by Greeks or freedmen. These seem to have been of the nature of elementary schools. But at Rome, as at Athens, the working-classes were for the most part slaves; and elementary schools were like English preparatory schools rather than public elementary schools. The teachers were called literatores, a translation of the Greek γραμματιστας. Schools of rhetoric, which were more like secondary schools, were also opened after the model of that of Isocrates at Athens. Their teachers were called litterati, corresponding to the Greek γραμματειας. Suetonius says that the grammar and rhetoric were taught at Rome "as a necessary part of their studies which include both sciences." In 92 B.C. schools of Latin rhetoric were put down as an innovation. Yet among the treatises written by Cato, the praiser of the past at the expense of the present, was one on public speaking, the chief rule in which was "take care of the sense, and the sounds will take care of themselves." Cicero learned to declaim both in Greek and Latin, and the Gracchi had studied rhetoric under Greek teachers. Neither the gymnasium nor palaestra, nor the music school, flourished at Rome. As at Athens, so at Rome the boys were sent to school in charge of a slave, a pedagogus, or an ambassador.

Magister, which in English became "master" and then "master," remained the term for the teacher of the public school from that day to this, though attempts were made at the time of the Reformation to introduce the Greek word didaskalos in its place.

The public Latin school was very much like the modern school. All the methods of torture which have made the service of the Muses for most boys a veritable slavery were in full vogue. Instruction was now in a foreign language, and grammar became prominent. Early Latin poetry was more the speaking of popular Latin verses than the written word. Martial curses the master of a neighbouring school whose shouts and blows woke him up at cock crow. Horace assures us that he admires the old Latin poets in spite of their having been hugged into him by the pedagogus, a word whose name has become verbal. The staple of instruction in the Roman schools was the works of the poets, Greek and Latin, Homer and Virgil, Hesiod and Aesop, Menander and Terence. Horace says (Ep. 1. 19. 40) "who was not thought worthy of going the round of the schoolmasters' desks"; but it was a fate not long delayed, and the writings of the poets of the silver age, Lucan and Statius, became school-books in their own lifetimes.

Our knowledge of the Roman curricula is mainly due to Quintilian's Institutio oratoria, c. A.D. 91. Fabius Quintilianus, born on the banks of the Ebro, was not only the son of a man who kept a rhetoric school, but himself kept one, and is said by St. Jerome to have been the first who kept a public school, in the sense that he was the first who received a stipend from the emperor. In endeavouring to be the perfect orator, Quintilian discusses the whole of education from the cradle upwards. It is clear from him that the grammar school had trenched on the rhetoric school. The latter was then restricted to actual oratory, the rules and practice of public speaking, while the grammar consisted of the study of the Latin language, much the same teaching as English grammar schools did until 1850.

The first definitely endowed school we hear of is one founded by Pnyly the younger, a pupil of Quintilian, at his native place, according to the Historia Literaria (12) he founded him that a Comos boy was at school at Milan, because there were no teachers at Como, whereupon he lectured the parents on the small cost of board. He afterwards opened a school at Como, at the cost of boarding boys at Milan. He therefore offered to find a third of the cost, and would have found the whole did he not "fear that such an endowment might be corrupted... to private
interest, as which he saw happen in many places where teachers are hired by the public ("preceptores publice conducuntur"). The choice of the master he left to the parents. Later historians say that the emperor Antoninus Pius (138–161) assigned offices and salaries (honores) to the professor who taught the pupils. But the Severus Alexander Severus did the same, and also established exhibitions for poor boys, with the limitation, curiously repeated a thousand years later in the statutes of All Souls College and of Eton, "modi ingentes fuerint..."

There were complaints that the masters were ill-paid. The only definite statement as to tuition fees appears to be a line of Horace (Sat. 1.6. 76), who says his father took him to school at Rome as he did not know Latin. For his country neighbours went, at 8 as ass a month, said to represent 40, a month, equivalent to "about a shilling"; even this is founded on a disputed reading. Quintilian made a poor school at Rome, and Juvenal calls him in this respect a "jack-of-all-trades". As in modern times the winning jockey, so then the victorious charioteer, received more pay for a single race than the master for a whole year's labours.

Grammar and rhetoric schools spread throughout the Roman world and continued substantially unchanged in method and subject to the days of Gregory the Great and Augustine the apostle of the English. The Confessiones of St Augustine of Hippo, a school-master at Carthage, Rome, and Milan before his baptism in the year 387, and the poems of his contemporary Ausonius, educated in the grammar school at Toulouse, and himself a schoolmaster at Bordeaux before being preferred for the bishopric of Gaul, give us a picture of the school in that country during the 4th century as in the first. Ausonius celebrated in verse all the Bordeaux schoolmasters, some coming from schools at Athens, Constantinople, Sicanus and Canterbury, but there do not appear to have been any schoolmasters from Poitou, Narbonne, Toulouse, who went to Lerida and other places in Spain. Ausonius had for his pupil the emperor Gratian, who in 376 established a legal tariff for schoolmasters' salaries. "In every town," says Jerome, "the master of rhetoric shall have the charge of the rhetoric."

The rhetorical master (rhetor) was to have at least 24 anions (an anion being a year's wages of a working man); while the grammar masters were to receive half that. But St John Chrysostom, to the church in Antioch, says that teachers of rhetoric and grammar should be well-paid, so that the church can provide adequately for them in an age when "agriculture is the mother of all sciences and arts, and so must also be the mother of the church."

In the 3rd century, the great grammarian, Lingua, who writes on the Greek author Lucian, declares that there were 50,000 Greek grammarians in the Greek world in his time. This would be a little more than the population of modern Athens.

English Schools.—St Augustine of Canterbury landed in Kent in 596, and the king of Kent, Ethelbert, was christened two years later. He "did not defer giving his teachers a settled residence in his metropolis of Canterbury, with such possessions as were necessary for their subsistence," says Bede. We may therefore attribute the establishment of the Church of England and the first English school to the year 596. For as nowadays the first thing modern missionaries do is to establish a school, so did Augustine. Indeed a school was even more necessary than at present, for the "many strangers" who came to "be educated in the native tongue, and services conducted in it. But in those days the Church had not yet a完备 teaching, to understand the church service and to read the Scriptures, had to learn Latin and begin with Latin grammar; and indeed as the kyrie, the creed and the gloria were still rendered in Greek, if he was thoroughly to comprehend what he had to learn some Greek.

The first actual mention of Canterbury school is in 631. Sigebert of Essex, Bede tells us (Eccl. Hist. iii. 18, ed. Plummer, p. 162), while in exile in Gaul, was baptized. "On his return, as soon as he obtained the kingdom (of the East Saxons), wishing to educate what he had so well done in Gaul, he founded a grammar school (scolam in quas pueri litteris erudirentur), with the assistance of Bishop Felix, whom he had received from Kent, who provided them with ushers and masters (pedagogos et magistros) after the manner of the Canterburians (more Cantuariorum)." If the last words are translated Kentish folk the meaning is the same, as naturally the first and chief school of the Kentish folk was at Canterbury. Felix was a Burgundian, who had come over to Honorius, one of the last survivors of the original band of Augustine, who became archbishop in 627. The East Saxons, therefore, may be considered as the school to which the later tradition refers, and in which there has been claimed by patricia Suffolk historians as the first school in England. Though long before the Conquest Dunwich had ceased to be an episcopal see, being deposed in favour of Thetford, while half of it was swallowed up by the sea, yet, when between 1076 and 1083 the priory of Eye was founded by Robert Malet, it was appropriated to the schools of Dunwich ("the tithes of the whole town both of money and heritages . . . the school also of the same town.

So the school of Sigeberht and Felix was still existing 400 years afterwards. If it had been perished in the dissolution of the priory, to which it had been handed over.

As the model was older than the copy, Canterbury school must be allowed the primacy over Dunwich. Being spoken of as an existing institution, with no suggestion that it was then newly established, we need not doubt that it was founded by St Augustine as part of the cathedral establishment of Christ Church, Canterbury. This church was not then monastic, but like all other cathedralds, a college of priests, the monks being placed apart, outside the city walls in the abbey, first called St Paul's, and afterwards of St Augustine's. The "English SCHOOLS have attributed Canterbury school rather to the Greek archbishop, the monk Theodore, who reached Canterbury on the 27th of May 669. "Soon after," he "travelled through the whole English parts of the island," and first established a united church of England, being "the first archbishop whom the whole English church consented to obey." He travelled with Haddian, a Latin-African monk, who had been first offered the archbishopric, and was sent by the pope to look after Theodore "lest after the fashion of Greeks he should introduce something against the true faith. "Because both were learned in sacred and profane literature, and collected crowds of disciples, and streams of saving knowledge daily flowed from them, as together with holy writ they gave their hearers instruction both in the arts of metre and astronomy and ecclesiastical arithmetic," or, as the Anglo-Saxon translation has it, "cermecraft, t jungllcraft and grammaticraft" (Bede, Eccl. Hist. iv. 2). "The proof is," says Bede, "that even to this day," c. 735, "some of their pupils survive who know Latin and Greek as well as their own language in which they were born." It is a strange misconception of this passage which has narrowed a triumphant word of the first metropolis of England, the very point of which is that the archbishop left Canterbury to travel to the farthest parts of the heptarchy, into the foundation of a school at Canterbury.

Though it is clear that Theodore did not found, there is evidence that he actually taught in the school at Canterbury, since Albinus, who succeeded Haddrian as abbot of St Paul's, is said to have been "the most learned man of his time in everything, having been educated in the church of Canterbury" (not, it may be noted, in the monastery of St Paul's) by Theodore and Haddrian. Tobias, who died bishop of Rochester in 726, is also described as "a most learned man, for he was a pupil of Theodore and Haddrian, and so, together with a knowledge of literature ecclesiastical and general, Greek and Latin were as familiar to him as his native tongue." We may therefore credit Rochester with the school at least as early as Toby's episcopate.

Of schools still existing, we must give the precedence after Canterbury and Rochester to St Peter's school, the cathedral grammar school at York. If it was originally started by Paulinus, the Roman
SCHOOLS

missionary, in 630 or 634, and there was no church or bishop there till the time of Willfrid, c. 700, it cannot claim to be older than his day. Whoever may be the originator of York school, it is at all events earlier than Archbishop Egbert (Ecgbert), to whom it is said to have been given. Bede says that Egbert was an Englishman, but his authority is a life of a Frankish monk, in MS. said to have existed at Reims in 1617, but never since seen, a mere piece of hagiology, and certainly not contemporary. It makes a main point of itself, that Egbert was the first York bishop, and the last of his name, whose authority, if not a mere tradition, was handed down from the second link. Egbert was neither a pupil of Bede's, nor Alcuin's master. Nor was Egbert ever a monk, and Alcuin only became one late in life. Had Bede been Egbert's master, he could not have written this, and there was no chance of his coming to him on becoming archbishop, in which he addresses him, not as a master might have written to a pupil, but as a rather humble but lecturing friend. Moreover, Alcuin himself, in the poem on the birthday of the church of York (Hei. ch. York., Rolls i. 390), written when master at York, only says of Egbert that he was of royal blood, an illustrious ruler of the church and an admirable teacher (gregor doctor). He finds no need to say anything about him, because his "muse hastens to the end of his song and the doings of his own master, who, after Egbert, received the insignia of the venerable see, Albert, called the wise. On Alcuin's merits, Alcuin himself writes, and no one need refer to all the stories that "was sent to the Minster to school in his boyish years and became a priest quite young, and by Egbert was made advocate of the clergy and preferred as master in the city of York." This phrase exactly describes the functions of the archbishop of York, who was, as the chief lawyer of the college of canons and also head of the school; while it shows that the school was the school, not only of the church, but of the hierarchy as well. It is thus a Latin school, grammar, rhetoric, law, singing, playing on the flute and lyre, natural history and the church calendar: above all, theology. There were boarders. For whatever youths he saw of eminent impulse, "he would make his own" to his master's charge, and so he had many pupils, advanced in various arts. Alcuin travelled abroad, went to Rome and was received "as the prince of doctors, and kings and princes invited him to irrigate their lands with learning. He returned, but, as a new archbishop, he no longer had the chief functions of an archbishop of York, and the archbishop of Lichfield, his predecessor, became the chief educators. This is because Charlemagne, largely it would seem under Alcuin's influence, did make a distinct effort to convert the monasteries practically into colleges and public schools. How far he succeeded in this is very doubtful, but if the monasteries did become the seats of public schools, or if the monks did anything for general education, it was only during his reign. Save for that period, alike in England and on the continent general education and public schools were the exclusive duty and privilege of the secular clergy from the days of Augustine to the days of Laud. The monks from first to last were never public schoolmasters or educators in the modern sense of the word. They taught, it is true, kept schools, except for their own novices, and they never, except incidentally as lords of manors or trustees, or transferees of the spiritual rights of secular colleges, even controlled schools.

Bede, the chief writer on monastics and education, in the example of even Jerome, not only did not cultivate learning other than that of the scriptures, but even repudiated it as heathenish. It was not before the 9th century, in 850, when Bede (Biblioth. Hei. ser. i.) introduces his Institutions for the two monasteries he founded, Calixtine and Lichfield, that so much reading came to be regarded as a monkish duty. The original Benedictine rule a few years earlier set apart only two hours a day for reading, except in Lent. Then, lack of food making the monks helpless able to labour with their hands, they had three hours' reading in the morning, and had to read one book through in the course of the 40 days. Even this rule was not absolute, special provision being made for the study of the works of the church fathers. Though not a word in the rule to suggest that education was one of the duties of monks or of the objects of a monastery. The only reference to boys, says Bede, is a general one, that, "in the brethren, boy novices offered (obbatis) at the altar. The Celtic monasteries, and St. Columba's letter to Dr Skene (Celtic Scotland, ii. 75), became "great educational seminaries, in which the youth of the tribe were sent, not only to be trained for monastic life, but also for the purpose of receiving secular education." But the quotations given from the ancient laws of Ireland and the life of St Brendan in support of this statement by no means bear it out. It may be questioned whether even in Ireland, which perhaps first imitated the monastic system of the Continent, Lindisfarne in England, anyone other than sucking monks imbibed the milk of learning in the nurseries of the monasteries. Where, as in Ireland, there is no record of the existence of a public secular clergy were practically swallowed up in the monastery and monks, and even the bishops kept only about an abbot, it is perhaps not possible to draw a distinction between the regular and the secular clergy which is not at once futile. The very monastic foundation of the monastery to the borders of Alsece, while indirectly through Lindisfarne it may have been known to Alcuin, as it certainly was at Fulda (Skene, 43). Charlemagne was perhaps consciously acting under Celtic influence when in the council of Aachen (Aix-la-Chapelle), on the 23rd of March 789-790, he entrusted the congregations of monks as well as those of the secular canons "not only to get together children of slaves but also the sons of freemen, and take them into their societies," and directed that "schools of reading boys should be established in every monastery and cathedral, where psalms, music (notas), arithmetic (arithmeticas), grammar, and the liberal arts shall be taught; not allowing the boys, however, to corrupt the gospels, psalters or mass books by reading or writing, but employing men of full age for that purpose."

It must have been in pursuance of this that the boys, the future schoolmen, were brought up with the ordinary novices of a monastery, under the care of the abbot or bishop, when still under the control of the monastery, if not under the control of the bishop. From infancy, were brought up with the ordinary novices of higher years seeking for admission. This school was at the end of the church, next to the infirmary of the monks. But the other school, the "inner" or "school of the novices," as the novices' school is known as a replica on a smaller scale of the monastery, complete in itself with chapel, dormitory, refectory and infirmary. On the plan of it is written, "In this cloister the oblates are associated with the postulants, "with respect to a house under the care of a bishop, the grammar school under the chancellor, and St Peter's hospital just outside the cathedral precinct, which was endowed by King Athelstan, and afterwards known as St Leonard's hospital. In another place Alcuin is said to have been one of the first to act as master in the school Offa was establishing, and expresses his pleasure at Offa's intention to study and make the light of wisdom, which was extinguished by many previous, fires in his kingdom. Whether this refers to the establishment of a school at Lichfield, or elsewhere, does not appear. It is to be noticed that Alcuin, all the time he was master at York and master of the so-called palace school of Charle- magne, was not a monk but a secular clerk. He always describes himself as Alcuin the levite, or deacon, until in his old age he retired to a religious life. In many cases, it is possible to imagine that such a man, though a monk, when he became a bishop and set up a school, had been advised by Pope Gregory to abandon the monastic seclusion and live with his clergy like an ordinary bishop.
boarders. The plan is credited to Charlemagne's son-in-law, Eginhard.

It is known not to have been carried out in its entirety; and whether any "outer" school was ever actually erected or carried on we do not know. But, if in Charlemagne's time the monastic schools had died out, and what little was left of the old school was restricted to the "inner" school, it is certain that the next generation saw them excluded again. A council at Aachen on the 9th of July 817 (Baluze, Capit. i. 551), attempted to re-establish the monastic schools, but the "inner school" was still the accepted form of education. The patronage of the church was again the foundation of the grammar school, and every one connected with it was reckoned as a clerk with the privilege of clerical immunity. The secular schools could not take cognizance of pleas concerning the conduct of schools or schoolmasters, as was emphatically reaffirmed in the Gloucester School Case in 1410, no more than they could as to churches or the conduct of rectors and vicars. Just as they could entertain suits about the patronage of livings, so they could about the appointment of schoolmasters, and teachers, and pupils. The clergy, and especially the secular judges of first instance, with appeal to the court of Canterbury and thence to the supreme court of the pope at Rome. There is a decree of Pope Eugenius II., in a synod held in 826 (Dec. prima pars, Dist. xxxvii. 12): "From certain places complaint is made to us that neither are masters found nor care taken for a school of letters (i.e. grammar school), wherefore let all care and diligence be taken by the priests and their scholars, and others, for the common good, that masters and teachers should be established to teach continually grammar schools (studia litterarum) and the principles of the liberal arts, as in them chiefly are the divine commands set forth; and let all judges, of the kingdom into England, who for two centuries at least have been the customary law of the church, that schools should be kept in every cathedral city, as we have seen they were at Canterbury, Dunwich, and York.

After York the next place in England in which we have actual evidence of a school is at Winchester, to which intellectual superiority seems to have passed with the political supremacy. In the history of education in the 9th century the name of Alfred, the Saxon, and Edward, the Confessor, is united, while the end of the 10th century marks the date of the foundation of the Abbey of Ely, by Bishop Wearl, the first of the monastic schools, as "the school of Canterbury," and in the 12th century the name of these schools is surely that of St. Osmund. The school was in St. Osmund's Abbey, where the children of the nobility of the school were taught, and also clerks, and it is impossible that "Alfred" had a school of that name. The children were taught both by the laity and by the clergy, and the name of the school is preserved in St. Osmund's, in its evidence that the grammar school was frequent, and by laity as well as clerics, and it is impossible that "Alfred" had a school of that name. The young Englishmen of good birth were brought up in the public grammar schools then as now.

Anglo-Saxon schools were not confined to bishops' sees. Apart from Malmesbury, the story of which has been so obscured by monastic writers as to make it impossible to ascertain whether it had a public school or not, there were public schools in all the principal centres of population, generally marked by being also the sites of collegiate churches. At least, whatever Etheldreda, the Lady of the Mercians, and her brother, Edward the Elder, are recorded as building "burne" through the Midlands to consolidate their conquests from the Danes, we find also collegiate churches of pre-Conquest origin and early grammar schools; e.g. at Stafford and Derby, Sheffield, and Leicester, at Bridgenorth, Tamworth and Warwick.

It is perhaps only at the last place that the direct evidence of the continuance of the school from pre-Conquest to post-Conquest times is preserved. There, in 1123 (Leach, Hist. Warwick School, 1909), the earl of Warwick, having granted to the canons of St Mary's collegiate church in the town "the school of the church, that the service of God in the same may be improved and the knowledge of the same," the old school in the castle appealed to the crown, and Henry I. issued a writ to "command that the church of All Saints have all its customs and ordinances . . . as fully as it used to have them in the time of King Edward and my father and brother and the school (scolas) in like manner." In the result the two collegiate schools were united, the canons of All Saints being transferred to St Mary's and "the school of Warwick" confirmed to the united church, which was to enjoy the same liberties as London, Lincoln, Salisbury and York churches, i.e. be like a cathedral church of secular canons. Thus this institution, the maintenance of a school is clear from a reply to one of the Abbot Sampson's writs, and his answers to their liberties and customs put the by the Warwick dean and chapter of Salisbury in 1155, viz. "the scholars to their own master stand and fall," i.e. the master not the chapter was to look after the boys.

Even the Danes became founders of churches and schools. Thus Herman, the historian of Bury, writing in 1098 (Mem. Bury St Edmunds, Rolls ser. i. 46), and speaking of Canute little more than a generation after his death, recalls his charities, how "when he came to a minster or fortified town, he handed over . . . enough for the comfort of all the clerical or the monastic order, not any chance boy of good birth, but the more select of the poor." Abbot Sampson, writing about a century later, c. 1180 (ibid. 120), credits Canute with "instituting public schools (publicas scolas; the earliest use probably of the term public school in any English writer) in the cities and towns, and, establishing masters at the state expense, sent to them boys of good promise to be taught grammar, including even freed sons of slaves." Canute is praised because he turned out the canons from Bury to put in monks. But the school, though it thus fell under the sway of the abbot, continued in the town, and became the direct ecclesiastical and secular school. Masters. So when Earl, afterwards King, Harold founded the college of Holy Cross at Waltham, the chief officer next the dean was the schoolmaster, Master Athelard, imported from Liege, whose "lessons in grammar and verses and composition did not prevent equal knowledge of singing and divine service. The boys knew the psalter by heart, and entered the choir in procession from school, and on leaving choir returned to school with all the gravity of the regular canons" who in 1177 supplanted the seculars. The secular canons, one of the expelled, who wrote the history about 1180, was himself the pupil of Master Peter, son of Athelard; for secular canons married and had children.

In the half century which followed the Conquest, the cathedral and many of the collegiate churches were reconstituted and enlarged, the normal number of seven canons being increased, and reaching in some cases as many as fifty. In this reconstitution schools were not forgotten. The statutes called "The Constitution of St. Osmund," said to have been made at the foundation of Salisbury Cathedral in 1091, are in almost identically the same words as the statutes of Lincoln, York, and Wells, and they established, insularly, precise and minims for the government of dean and chapter, four, viz. dean, singer (cantor), schoolmaster or cancellarius, and treasurer. Of these, the "cantor ouate" ruled the choir as to singing; the treasurer in keeping the ornaments, the chancellor in teaching, writing and reading the books; the archisecula or the archisecularis ought to hear the lessons and determine, carry the church seal, and compose letters and deeds, note the readers on the tablet, and so forth. Of the secular canons a few statutes codified in 1307 expressly state that the chancellor was "anciently called the schoolmaster" (magister scolarium, a variant of which was scolasticus). At St. Paul's a series of documents relating to the chancellor are
SCHOOLS

endorsed "of the Schoolmaster, now the chancellor." When he
occupied the title of schoolmaster, the chancellor ceased himself to
attend at school except the theological school, in which he
continued to lecture until the Reformation, but he always remained the
educational officer of the schools and the patron of the grammar school.
In the book of theology, i.e. D.D., and "to him belongs the
commission to grammar schools; but the school of York, he ought
to give to a regent in arts" (i.e. an M.A. who has not taken his degree
from a university, but is an accomplished man, and chosen for the
office by grace for four years.) The grammar schools outside
York to which he was to appoint were probably those in York
dioce, outside special liberties, such as Beverley (itself a collegiate
church), but except for an appointment by the chapter, when the
chancellorship was vacant, to Doncaster grammar school in 1351
(A. F. Leach, Early Yorks. Schools, i, 22), we do not know what
time were the first. They would form one of the most important
schools without his (the chancellor's) licence and all the schools in Lincoln-
shire he confers at his own pleasure" (Vict. County Hist.: Lincs. ii.)

In London the chancellor was called schoolmaster of St. Paul's. The
school of St. Paul's, as written in the Statute Book (Mem. St. Paul's, A. B. ii), in which
in 1138, Henry of Blois, bishop of Winchester, acting as bishop of
London, holding the see in commendam during a vacancy, enforced
the exclusive privilege of Henry the Schoolmaster (scollarum magistri)
of St. Paul's, ordering the dean and archdeacon "to excommunicate
those who without a licence from schoolmaster Henry presume to
attend in the city of London, except those teaching the schools of St.
Paul's or Westminster, where the schools have been restored as it
was itself a collegiate church with a dean and chapter and the duty
and right of keeping a grammar school, and St. Mary le Bow was a
school of the archbishop of Canterbury and extra dean to London.

Precisely similar provisions prevailed at the great collegiate
churches like Beverley and Ripon in Yorkshire, and Southwell in
Nottinghamshire (A. F. Leach, Mem. of Southwell Minster, ii, iii. 13,
29), as well as many others, and the schools in the diocese of York.
At the former, where we hear (Hist. Ch. of York, Rolls ser., i. 281) a curious tale about the schoolmaster (scollarum)
c. 1180, falling in love with a girl he saw in church, the schoolmaster
also became chancellor. In 1304-1306 we find a series of reported
cases in which he enforced by excommunication the monopoly of
the grammar schoolmaster he appointed against unlicensed rivals
(i.e. the town's schoolmaster) (Hist. Ch. of York, Rolls ser., i. 281, 282).
Similarly the collegiate churches in the castles of Pontefract and Hastings (Vict. County Hist.; Susses. E.) had their grammar schoolmasters about 1150. They
were spread all over the kingdom.

The grammar school was a public school open to every one.
It has been indeed repeatedly asserted that the cathedral schools
were choristers' schools and taught nothing but the 'psaltery
and a little elementary Latin grammar. The assertion is founded
on a complete misunderstanding. It is a question whether there
were any choristers in the 12th century or whether they are
not a later introduction, the canons and their vicars choral or
choir scholars and their pupils not appearing in the school lists
at Salisbury are not mentioned in the Institution of St. Osmund,
and they first appear in the 1220 edition of that document. At
Lincoln we first find choristers mentioned in a statute of 1236,
"To the Precentor belongs the instruction and discipline of the
boys and their admission and ordering in choir." At York the
1307 edition of the statutes says "the collection (i.e. appointment
of masters) to song schools belongs to the singer," now
called precentor, "and cases affecting them ought to be heard
and decided by him, though execution belongs to the chapter"
(Leach, Early Yorks. Schools, i, 12). At St. Paul's there was
no precentor till the 13th century and there is no mention of choristers
till 1263, though school-boys (pueri scholarum) appear as
witnessing a deed between 1142 and 1148 and receiving 4d.
for cherries for doing so. It must be remembered also how very
small the number of choristers was and how incapable of
constituting a school. At St Paul's they were only eight until the
15th century, at York only seven in the 14th. So far from the
grammar school being a school solely or even chiefly for choristers,
there are several cases in which contests arose whether they had
any right of admission to the grammar school and the 14th century
registers of the almoner or almsgiver of St Paul's, who
about 1180 was given a house for the poor, in which later the
choristers were boarded, records that the grammar school-
master claimed five shillings a year for teaching them grammar.
At Beverley in 1312 a contest between the grammar school-
master and the song schoolmaster took place as to whether
the grammar schoolmaster was bound to admit all choristers
free, or only the original number of seven. It was held after
evidence as to old custom that all must be admitted free. But
there could have been no doubt if the grammar school had
been for the non-choristers' benefit. A contest at Warwick
between the grammar schoolmaster and the music school-
master, about 1215 (or 1315), owing to the latter intruding
on the domain of the former, was settled by the chapter on
the basis that the latter was to teach no grammar, but only "those
learning their letters, the psaltery, music and song" (A. F. Leach,
onwards the song or choristers' school was of the nature of an
elementary school, like that attended by Chaucer's "litel clerenge" in the Priories Tale, in which the boy sat in the school
and was taught psaltery, writing, reading, arithmetic and
"dempitoris because "I lerne song, I can (i.e. know) but small grammere." Even in quite small places, as at Northallerton,
Yorkshire, the distinction between the grammar school and the
song school was at first strictly drawn, but tended to disappear
in the dearth of M.A.s after the Black Death (Early Yorks.
Schools, ii, 60-62). In the larger places the distinction was
strictly maintained until the Reformation, when the song schools
disappeared, except in the cathedrals and the few collegiate
churces, including Winchester and Eton, which survived it, and
at Lincoln and Colchester.

The cathedral and collegiate church grammar schools under the
control of the secular clergy in the person of the chancellor
of the church furnished the chief, and perhaps in the 12th
century the sole, supply of schools. There is, however, some
excuse for the notion that monasteries kept them, in the fact
that in England, differing from the rest of the world, the cathedral
churches had, in many of the chief places, notably Canterbury,
Winchester and Worcester, during the monastic outburst
connected with the names of Ethelwold bishop of Winchester and
Dunstan of Canterbury, been taken from the secular clergy,
and monks placed in their rooms. In those places there was no
chancellor. But so essentially was education regarded as the
business, not of monks, but of the secular clergy, that even in
these places the grammar schools were not placed under the
monks but remained under the immediate care of the bishop,
either personally or through his archdeacon, a secular. Thus
we find at Winchester about 1154 Master Jordan Fantosme
and John Joichel (Jekyll), "clerks of the bishop of Winchester,"
carrying an appeal from the bishop to the school about the
right to teach at the school at Winchester first to the Court of Archbishops
then to the archbishop himself, who, after a long argument, allowed
William Waynflete appointing a master to the grammar school "called in the
vulgar tongue, the High School" (A. F. Leach, Hist. Win. Coll.).
This school was in Symonds Street outside the monastic precinct.
So at Canterbury the grammar schoolmaster appears among
lay witnesses in 1229; his right to excommunicate anyone
assaulting his scholars or carrying on a rival school was allowed
on appeal to the Court of Arches, on production of a confirma-
tion by the archbishop of the right as already ancient in 1202,
and appointments by the archbishops of the master in 1366,
1371, 1375 and 1443 are preserved (The Times, Sept. 1897).
Here also the school was outside the monastic precinct, by the
parish church of St Alphege in the town (Guardian, 12 and 19 Jan. 1898). Similar evidence is forthcoming at Worcester,
Norwich, Carlisle and elsewhere.

At the end of the 11th and beginning of the 12th century
a renewed movement began for the further extirption of the
secular clergy, on the ground of their wicked lives, the wicked-
ness being that they insisted on the liberty to marry, and for
the conversion of collegiate churches into monasteries of its
orders, first of Cluniac monks, then of Augustinian, Black
or Regular canons, who eschewed marriage. Thus Dunwich
School passed under the rule of Eye Priory (Clunians) between
1076 and 1083; and Thetford School to Thetford Priory
(Clunians) in 1094, though it was released again to the secular
dean of Thetford in 1114. Similarly the government of Glouce-
ster School was handed over to Llandthony Abbey (Augusti-

dians) in 1137; Reading School was given to the newly-founded
Reading Abbey (Clunia) in 1339; Dunstable School to Dunstable Priory in 1330; Derby School to Darley Priory (Augustinian) about 1350. Bedford collegiate church was converted into priory and moved to Newnham, and its right to the school acknowledged by the archdeacon of Bedford in 1555. A similar acknowledgment is found at Christ Church, Herts., in 1563; while Bristol School was taken from the Kalenders Gild and handed to Keynham Abbey in 1571; and Arundel School to Arundel Priory at some date unknown (see articles on “Schools” in Victoria County History for the several counties in which these places occur). But these transfers did not make the schools monastic in the sense that the schools were kept in the monasteries or taught, much less frequented, by monks. The schools continued to be primarily religious schools frequented by lay boys and secular clerks, and taught by secular clerks, sometimes in holy orders—and at that time even sub-deacons were reckoned as holy orders—but more often only in minor orders, and not seldom married men. Thus in 1420 the Patent Rolls show us one Ralph Strode, master of the schools of the city of Winchester, bringing an action with Dionisia his wife. All that was transferred to the monks was the right of appointing the schoolmaster and the power and duty of protecting the authorized schoolmaster’s monopoly. At Bury St. Edmunds the school is still maintained, and it is said that even the archdeaconry of Bury was vested in the monastery and exercised by the sacrist of it, subject to appeal to the abbot (Vict. County Hist.: Suffolk Schools, ii.). The substitution of regulars for seculars ceased in the latter part of the 12th century, owing chiefly to the secular clergy at large, under papal pressure, accepting the rule of celticab, and to the growth of universities.

The universities were developed out of the cathedral and collegiate church schools. In the days of Alcuin, as we saw, the one schoolmaster taught all subjects from the elements of grammar to theology and philosophy. In Italy the faculties of logic, grammar, and rhetoric were kept together in one. Moreover, the movement for university colleges perhaps caused a new crop of collegiate churches to spring up, of which grammar schools formed an integral and important part. In the quinquennium 1260 to 1265, the collegiate church of Howden was founded on the Yorkshire estates of the bishop and priory of Durham at one end of the kingdom, and that of Glassney in Cornwall on the estate of the bishop of Exeter at the other. These were ordinary colleges of secular canons with grammar schools attached, and the schools outfitted the colleges to the Reformation. They were contemporaneous with the first university colleges.

The college of St Nicholas, with 20 university students, was founded by Bishop Giles Bridport of Salisbury at Salisbury in 1261, Merton College by Walter of Merton at Malden in Surrey in 1265, and St Edmund’s College at Salisbury by Bishop Wyly in 1270, and Merton College was moved to Oxford in 1275. The difference between these colleges and the ordinary collegiate churches was simply that the former were ad ordinum et studendum, the latter ad studendum et ordinandum. So closely did Merton College resemble the ordinary parish church that it was an inappropriate parish church and it contained the usual appendage of a grammar school, though it was limited to 13 boys, who were to be of the founder’s kin. The master who taught them was called the “master of glomerly,” an odd corruption found also at Salisbury, Cambridge and Orleans. A similar grammar school was found at Queen’s College in 1340, but this from lack of endowment was never developed according to its founder’s intentions. These two colleges formed a starting point for yet another new development, when William of Wykeham, in founding New College on a scale more than twice as large as Merton, Merton, did not, however, put his scholars to teach theological and legal students, and placed the former as the main object of a separate, though connected and more or less subordinate college, at Winchester in 1382. Though Winchester was the first boy’s school-college, Oxford itself had been apparently the first place in medieval England at which grammar schools were maintained as separate entities, not attached to cathedrals or colleges, and practically as private adventure schools. The university apparently placed no limit on their number and rivalry, though retaining control and supervision over them, and the two grammar school surveyors elected by convocation.

In the first quarter of the 14th century even the monasteries contributed to the spread of education by almonry schools, which were now built as quasi-separate institutions by, or just outside, their outer gates, under the management of the almoner or almsgiver of a monastery. The almonry, whether a separate building or a chapel or dormitory for choristers to sing in the Lady chapels, which had become almost necessary appendages to great churches. At Canterbury a staff of six secular priests with clerks and scholars was established in the almonry to sing for the soul of Edward I. In 1310. The scholars were admitted at ten years old and might stay to twenty-five, but were expected to be ordained sub-deacons and retire at twenty. The day scholars were lodged in the almonry, and the choristers and schoolboys were taught the sick and infirm monks who lived in the infirmary. At first they were taught wholly in the city or archbishop’s grammar school. But by 1362 they had a separate grammar master, probably only as a house master, as the one mentioned in that year found Kingston school a better post, to which he had gone off without notice. The master was always a secular, and in 1451 was a married man. There is no evidence as to how many boys there were. At Westminster boys first appear in the almonry in 1354, and they first had a master in 1357, who from 1387 onwards, but not before, is called schoolmaster. The boys numbered thirteen in 1373, twenty-eight in 1385, forty in 1388. Master John of London was elected in 1379, and by 1384 there were sixty. He was succeeded by Thomas Four (A. F. Leach in Journal of Education, Jan. 1905). This almonry school for charity boys is the only school, other than the novices’ school, which existed at Westminster Abbey before, on its conversion into the cathedral of St. Mary of Westminister VII. Many of the old almonry scholars and unlimited town boys was established on the model of the old cathedral grammar schools. At Durham the almonry school first occurs in 1352; their master is first called schoolmaster in 1360 (ibid. Jan. 1905). At the dissolution there were thirty boys, who waited on the monks in the infirmary, prayed all night round dead monks, sang in the Lady chapel, were fed on the broken meals from the novices’ table and lodged in a hospital or infirmary opposite but outside the great gate of the monastery. At Reading almonry boys first appear in 1346, and were ten in number. They seem to have attended the town grammar school. At St Albans statutes were made for apparently thirteen almonry boys in 1399, who lodged by the great gate but attended the grammar school in the town. At Coventry there were fourteen boys in the almonry school, and the town quarrelled with the prior in 1349 for trying to interfere with the town school for the beggars of the almonry school. The Carthusian monastery at Coventry had twelve boys in its almonry. St Mary’s Abbey, York, the almonry had twenty, who attended St Peter’s, i.e. the city and cathedral grammar school (Early Yorks. Schools, 1.)

Taken altogether these almonry schools provided for the education of, or gave exhibitions to, a large number of boys, probably not less than 2000 in all. Many of these were not novices or oblates, but were often taught by the same master. The Carthusian monastery at Pevensey had twenty-five boys, of their number to the universities. Though Gloucester College had been established at Oxford in 1283 (reorganized in 1291) to receive them, not 1% of the men were ordained, and 60 had taken the degree of bachelor of arts. But in 1537 had only thirty-two students (Vict. Co. Hist.: Gloucester, ii. 342). The monasteries
were ordered to provide a grammar master who might be, and in
fact nearly always was, to teach the young monks and novices.
Yet in 1357 the Winchester cathedral monks were found by
William of Wykeham to be "wholly ignorant of grammar" and
to make the less peremptory by ‘‘scolding and reproaching’’ the
visitation officers of Norwich monastery in the late 15th century (Dr
Jessopp, Camd. Soc. 1892) hardly one had its grammar master as
it ought to have had. In 1453 Osney Abbey provided for the monks
a grammar master ‘‘for the instruction of the young monks, not a
monk but ex-second-master of Winchester College (Hist.
Winchester Coll. 26), and other Wykehamists were to be found
teaching grammar at the London Charterhouse and Netley Abbey,
Hants. It is clear that the monks were by no means a learned
body.

It is chiefly from the London and Oxford schools that we learn what
grammar schools actually taught in the 12th to the 15th centuries.
The local classics is Fitzstephen's Description of London (Mat.
Hist. Becket, Rolls series, iii. 4), as it was in the youth of Thomas
& Becket when about 1127 he attended St Paul's school, "the
city of Canons." Paul's was Parliament’s school; the contests of the
scholars from it and the other two schools on "saints' days, when the
elders contended in logic and rhetoric, and the boys 'vie with each other in verses, or in the principles of
literature, in law, in poetry, in morals', or in epigrams, rhymes and metres"; while on Shrove Tuesday, after
a cock-fight in the morning, they had a great game of (foot?) ball in
the streets. And yet of the Oxford and London schools statutes show us that B.A.s had to read for their degree Priscian On
Constructions twice, and Donatus's Barbarismus once; books which
imply an advanced knowledge of Latin syntax. The Oxford
grammar school statutes, not dated but of the 13th century, provide
for grammar masters being examined in verse-making and prose
composition and knowledge of Latin authors before being licensed
to teach. The only clerical act of a grammar school, and a sale of
being forbidden as improper, are Ovid's Art of Love and
Pampillius who wrote De Amore. Every fortnight the masters were to
set a copy of verses and letters to write, which the boys were to
study, and pass an oral examination on the following day. Special attention was to be paid to the smaller boys in hearing
and examining them on their rules as to parts of speech and accent.

It was particularly ordered that they were to observe the rule in
Latin and Roman (Romane), i.e. translations were to be done not
into English but Romance, i.e. French. For after the Conquest
French was the vernacular language of the upper classes, and while
the pre-Conquest school glossary of Elfric translated Latin into
English, the post-Conquest glossaries, such as Neckam of St Albans
school, give the translation in French. Though by the 13th century
English was supplanting French, the schools as usual lagged behind,
and it was not until the Englishman entered the courts of France in
England till after the victories of Edward III. John of Trevisa,
translating the Polychronicon of Higden, who, writing in 1327,
commented on the corruption of English due to the strange custom of
learning Greek and Latin in French schools. He points out that
this custom of construing into French "was changed after the first
murrain (the Black Death of 1349) by John Cornwall, a master of
grammar, who desired the English to use their own tongue, and
A.D. 1355, in all the grammar schools of England children learn French
and construe and turn the English; the advantage of was that they learned Latin quicker, but the disadvantage was that they
knew "no more French than their left heel." Master John
Cornwall was an Oxford grammar schoolmaster, being paid 10d.
In 1347 for "salary" of his school for the six founder's kin boys at
Merton; and Pencrych was not, as supposed by Mr de Montmorency (Colloquies), a schoolmaster, but was a grammar master at Penkridge in Staffordshire (though he no doubt took his
name from that place), but was another Oxford man, living in 1357
in a hall by Merton, afterwards called Pencrych Hall. Though this
very rational innovation thus began in Oxford, yet a new edition
of the Oxford Grammar School Statutes in the late 14th or early
15th century provided that the masters should in construing teach
the French tongue. A.D. 1345 for "As the French tongue should be utterly lost," as it came to be.

It is extremely difficult to ascertain what books were actually
read, as well as taught, in the grammar schools far into the 15th
century. William of Wykeham's account of his pupils, and
Christian poets such as Sedulius and Juvenal, the staple of
Ancelin, and recommended by Colet for St Paul's in 1518, were much read
in the intermediate times, is doubtful. Vincent of Beauvais, who
wrote the Speculum Maius, tells us that in rhetoric the Fransis
French, quotes Horace, Ovid, Apuleius and Valerius Maximus, but
would like to substitute the Christians for the classics. But he was
a Dominican friar. It is certain that classical authors were not
expected, as well as read, in rhetoric. The grammar school was the work
of Waltham College, for the Quen de Casimere the master of his diocese for taking the boys, "as soon as they could
read the Lord's Prayer, the creed or matins and the hours of the
Virgin, and before they could construe or parse them," to "other
school books and poets as if they were heathens instead of
Christians." Books of manners in verse were read in schools from
the days of John de Garlandia, one of the French manuals of
Sulpicius, a Roman schoolmaster of 1498, which was read in
the lower forms of Winchester and Eton in 1535. The metrical
grammar of Alexander of De villa Dei (Dol) was almost as popular as
Donatus. In 1519 the university of York decided that the books of
logic successive manuals were founded on Boethius and Isidore
of Seville. The 15th century saw a reaction against the logic, which,
valuable as it was, began too much too early and was strongly
repudiated by Waynellete, who at Magdalen College insisted that his
"demesye, or scholars, should not go on to logic till perfect in
grammar. The wide knowledge of the classics shown by Chaucer,
the son of a squire, like Becket before him and Milton for him, went to
St Paul's school, indicates what the average laymen and clerics
learnt in the average grammar school.

A question has been raised as to who attended the grammar
schools. The answer appears to be, all classes. Theoretically,
sons of slaves and villeins were excluded. But it seems certain
that picked specimens even of this class were admitted. The
bulk of early schools were then, as now, in cities and boroughs,
where all were free. Alfred's Anglo-Saxon colleagues represent
sons of smiths, hunters, cowherds, shepherds attending school and
learning Latin. That villein's sons did go to school is clear from two
instances alone. In 1312 Walter of Merton, son of the founder of
Merton College, has been found while he was at Eton, and for
him, went to St Paul's in 1344. The manor rolls at Great Waltham,
Essex, show a villein fined 3d. for sending his son to school without
licence from the lady of the manor (Hist. Rev., July 1905). In
1301, after the Peasants' Revolt, the Commons sent up a bill to
Richard II, "that no neil" (said to mean a female villein) "or villein
may henceforth send their children to school (a escolos)
for their advancement by clergy, and that for the maintenance
and salvation of the honour of all the freemen of the realm." The
petition was rejected. In 1406 the statute of artisans, while putting
umerous restrictions on their freedom, adds, "that no man or woman of what estate or condition shall be free to send their son or daughter to learn
grammar (literature) at any school in our kingdom."

Henry VI., in the statutes of Eton, bears witness to the admission of the un-
free to schools by inserting a reactionary prohibition against villeins (nativi) or illegitimate children being admitted scholars.
Illegitimates were theoretically excluded from the priesthood,
but the papal registers are crammed with indulgences to scholars
who were illegitimate for admission to holy orders. As to the
upper class, an erroneous inference that gentlemen's sons were
excluded was due to the use of the word "school" to mean not school
or monastery. It appears from the above quoted, because, after saying that children in grammar schools learnt no French now, he adds that neither did
teach their sons French. But the two classes are not mutually
exclusive. Elder sons, who were going to knighthood or squires,
did not as a rule go to school, but the younger sons did. The
vast majority of bishops, and the higher clergy, were the younger
sons of noblemen and gentlemen, and had certainly been to school.
It is made a reproach against Bishop Grosseteste of Lincoln in
his contest with his chapter that he was not a gentleman.
We find Giffard, archbishop of York, son, a great Gloucestershire
magnate, excluded from being presented to Birmingham in 1276, and another archbishop of York, William Melton,
ex-privy seal and lord chancellor, sending two nephews to
Newark school in 1338. The only known mention of the school
of Taunton before the days of its wrongly-reputed founder, Bishop
Fox, is preserved in an inquisition in 1310 to prove the age of
a royal ward, Hugh, son and heir of Thomas de la Tour. John
of Kent, 60 years old, knows Hugh's age because he had a son
at the school of Taunton with him seventeen years before (The
Genealogist, iii. 211). This cannot have been an isolated instance.
William of Wykeham would not have provided for "10 sons of
noblemen and gentlemen, special friends of the college," being
admitted as commensals or boarders with the scholars, nor have
forbidden the scholars of Winchester and New College to quarrel
as to whether their birth was noble or otherwise, nor would the
earliest lists of scholars and commoners there contain the names
of sons of judges and masters in chancery and county gentlemen, like the Pophams of Dorset and the farringtons of Lancashire, if the gentle classes were not already in the habit of going to school. At Eton the number of noblemen and gentlemen commoners was doubled. The first or second headmaster and third provost of Eton, William Westbury, a Winchester and Oxford scholar and Canon of Ely, was almost certainly a native of that name. In 1275 Sir Thomas Bourchier, son of the earl of Essex and of Eu, nephew of the archbishop of Canterbury, was a commoner outside college at Winchester, and in 1479 the son of William Paston, the judge and Norfolk landowner, was writing verses at Eton in his letters home. In 1502 Sir John Percyvale founded Macclesfield grammar school expressly for "gentlemen's and other good men's sons thereabout."

Tuition fees were normally paid in grammar schools. In 1277 the fee paid to the "master of glomery" at Oxford for five Merton grammar school's boys was 10s., a head a term; in 1506 the "scoliasm" of eight boys in the winter term was 3s., of seven boys in the Lent term 2s. 11d. and in the summer term 2s. 4d., a variation from 4d. to 4½d. and 5d., a term, probably owing to variation in the length of the term and representing 4d. a week. In that year the dica of the usher was 3d. a term, and in 1310 the usher was paid 4d. for three terms for eight boys, or 4d. a term. The usher might of course be taken in addition, but even then when the majority of livings were under £3 a year, a halfpenny could hardly have been a living wage for eight weeks. Perhaps the usher got a share of the levy of 2d. a head for offerings to the light of St Nicholas, the schoolboys' patron saint. At Westminster in 1291 the bishop was called in to settle a quarrel between the schoolmaster and the rector of St Nicholas church as to the right to the wax which guttered from the candles which had been provided by the terms. Perhaps the united Oxford statute of the 15th century fixes the upper limit of grammar school fees at 8d. a term (Reg. Giffard, f. 341). The tariff settled by the bishop of Norwich, for Ipswich grammar school in 1476-1477 was too low for grammarians, 8d. for paupersians, or those learning to read the psalter in Latin, and 6d. for primersians, or those learning the primer or accident (Vit. Co. Hist., Suffolk, ii). But the corporation rebelled against the fee of 10s. for ten boys, and in 1482 cut it down to 8d. a term. This was certainly the normal fee. In the return of chancries at their dissolution in 1548, the school at Newland is reported (Leach, English Schools at the Reformation, 78) to have been founded in 1446, to charge "half-free, that is to say making of scholars learning grammar 8d. the quarter, and of others learning to read 4d. a quarter."

At successive epochs there have been attempts to make education free (Journ. of Educ., June and July 1908). Hitherto after every attempt fees have crept back under some guise or other, as the endowments provided to ensure freedom were often inadequate to start with, and anyhow became inadequate by change in the value of money, while the inventive habit of the rich in giving "tips" to secure special attention forced contributions on others. The movement began under the Roman bishops, and in 1292 was confirmed by the canons of the chief cathedrals everywhere. But probably the main force of the effort was made by the peaceful emperors from Vespasian onwards extended the area and pay of public schools at the state expense, both of rhetoric and grammar. There can be little doubt that the cathedral schools were intended to be free just as much as the church services. Yet it had become necessary by the Lateran Council in 1179 for the canon law definitely to provide that, "to prevent the poor who could not be helped by their parents' means from being deprived of the opportunity of learning and advancement," every cathedral church should provide a competent benefice for a master to teach the clerks of the church and poor scholars gratis: and that a master who has received the school is to use the school fees for the purpose it should be restored, while no fees were to be exacted for licences to teach. At the next Lateran council in 1215 this canon was recited and its non-observance in many places lamented. The canon was confirmed and extended from cathedrals to all churches of sufficient means, while the cathedrals were also directed to provide a theological lecturer. That the first canon was not everywhere a dead letter is proved by the grant about 1180 of Archbishop Roger to the chapter of York of £5 a year to the fee of your school," charged on the synodals of the diocese, by the archdeacon, confirmed by Archbishop Geoffrey (1197-1212), and in 1400 by the chancellor to Archbishop Giffard in 1271 (A. F. Leach, Early Yorkshire Schools, c. 12-176). So at Burry St Edmunds in 1180 Abbot Sampson, who had himself when a boy and a secular clerk been admitted to the grammar school free as a special personal favour, first made the grammar school free of fees for "school-hire" by giving it a school house outside the abbey in the town, and a year or two later endowed it with half of a living worth £5 a year for which the master was to teach 40 boys free, relation of the monks being preferred. There were also many exhibition endowments, which made schools free or partially free for poor boys, such as the provision at St Cross Hospital, Winchester, founded in 1150, of free meals daily for twelve boys from the High School, Winchester; and an endowment given to the Durham Abbey almoner about 1180 for board and lodging of three boys from Durham grammar school, while at St Nicholas' Hospital, Pontefract, the custom was ancient in 1267 to provide 40 leaves a week "except in vacations" for the scholars of Pontefract school, which is mentioned about 1200 as granted to the collegiate church in the castle there. It is significant that while the inquisition which established this custom was taken in French in 1267 it was confirmed in a mixture of Latin and English in 1464. In connection with Stapledon Hall, now Exeter College, Oxford, Bishop Stapledon about 1327 provided for twelve scholars of Exeter Cathedral grammar school being boarded and clothed gratis in St John's Hospital by one of the gates of the city. In 1441 St Anthony's school was established in St Anthony's Hospital, London. Later, as in the famous case of Banbury Hospital, under Stanbridge in 1501, hospitals were bodily carried into schools, a movement not infrequently followed since. Henry VI., in 1445, under the guidance of Chicheley and Waynefete, copied Winchester down to the minutest particulars, and the wording of its statutes, but with the important difference that its school was declared, what Winchester was not, a free grammar school open to all from all parts of England. Another class of school, which if not free at first generally became so, was that of the grammar schools established by joint stock effort of the numerous gilds, or trades unions, which studied the towns. As the London City gilds still keep chaplains, so nearly every gild maintained its own school, or sent boys to the free grammar schools, as at Boston, where the chapel was near, was associated with the grammar school, and where the boys were mainly sons of the gild members. Some of these guilds provided a school for the gild apprentices or the sons of gild members. Some of these schools were those kept by chantry priests, endowed by single benefactors to pray for their souls, who sometimes by express terms of the foundation, more often perhaps to occupy their time or eke out not too substantial endowments, kept schools. These were sometimes free, more often at first not. But we know scarcely anything of these schools before the 14th century, the foundation deeds of those isolated institutions not having been preserved like those of colleges. We find, however, Osweyrd endowed as a free school by David Holbeach, a lawyer, about 1406; Middleton, Lancashire, by Bishop Langley of Durham, in 1412; Durham itself by the same in 1414; Sevenoaks by William Sennock (Sevenocch), a London grocer, the schoolmaster of which was "by no means to bein holy orders," in 1432; Newport, Shropshire, by Thomas Draper,
SCHOOLS

1442; Newland, Gloucestershire, by Robert Gryndour esquire, 1446; Alnwick, Northumberland, by William Alnwick, bishop of Lincoln, 1448; Deritend, now in Birmingham, 1448; Towcester by Archdeacon Sponne in 1449. There was somewhat of a stoppage of such foundations during the Wars of the Roses, but it was resumed with renewed vigour during the latter years of Edward IV, and by the time of the accession of Henry VII only the “endowment to the dissolution of monasteries.” Among colleges may be noticed Acaster College for three schools of grammar, song and scribener craft, i.e. writing and accounts, by ex-chancellor Bishop Stillington, 1472; Rotherham College with three similar schools by ex-chancellor Archdeacon Rotherham, 1484; Ipswich by the chancellor Cardinal Wolsey, 1528; and among chantry schools, Hull, 1482; Long Melford, 1484; Chipping Camden and Stow on the Wold, 1487; Stockport, by ex-Lord Mayor Sir Edmund Shaa, 1487; Macclesfield, by ex-Lord Mayor Sir John Percival, 1503; Crewter, by ex-Lord Mayor Read, 1505; Week St Mary, by the ex-Lady Mayoresse Percival, 1508; and so on. The re-endowment of the old St Paul’s school, London, by Dean Colet in 1510–1512, with the property he inherited from Lord Mayor Colet, and its transfer under papal, episcopal, capitular and royal licence from the dean and chapter of St Paul’s to the Merchers’ Company, and its conversion into a school free for 153 boys, created no small stir. Especially this was so, because it is the first instance in which the tetching of Greek is mentioned in school statutes, though only in the tentative form of a direction that the high master should be learned in Latin the 12th century transfers but even by much later and known that the Greek masters were regarded as trustees, as included in the confiscation of the monastery itself. Coventry, St Albans, Eye, Reading, Bury St Edmunds, Abingdon, Faversham are some out of many which suffered from this doctrine, and if they did not in fact cease, were for a time deprived of their endowments and only revived with new ones. Reading school was actually granted to its master, an Eton and King’s scholar. St Albans was restored by the munificence of its last and well-pensioned abbot; Bury St Edmunds, like a good many more, by grant of Edward VI.; Abingdon by a private donor; Parliament in 1556. Theion was a very good property on cause shown. But many, like Dunwich, perished irretrievably.

Spit of the dissolution of monasteries, the creation of chantry schools and other grammar schools went on. In this very year, 1540, John Harman (who is generally known by his assumed name Veysey or Voysey), bishop of Exeter, endowed Sutton Coldfield grammar school, and in 1544 made its gild the governors. One of the latest of great schools, that of Berkhamsted, was founded by John Incent, dean of St Paul’s, in 1541; while archbishop Holgate of York founded three free grammar schools, through without any chantry provisions, at York, Malton and Hemsworth in 1546. In 1548 all the endowed schools in England, other than the cathedral schools, were threatened and the vast majority destroyed by the act for the dissolution of colleges and chancies. Only Winchester, Eton and Magdalen College School were exempted, and they owed their exemption to being regarded as part of the universities with which (through New College, King’s and Magdalen) they were connected; and even they had been included in the similar act passed in 1546, which was, of course, permissive and lasted for Henry VIII’s life only. The Chantrey Act, while providing for the abolition of colleges, gilds and chancies, contained indeed provision for the continuance by special order of all schools attached to them, which grammar schools by foundation, and for their increase and enlargement out of the confiscated lands. Unfortunately there was neither time nor money to spare for the purpose. A commission consisting of Sir Walter Mildmay, afterwards chancellor of the exchequer, and Robert Keyhay, or Kelway, afterwards serjeant-at-law and author of Kelway’s Reports, continued by warrant of the 20th of June 1548 “until further order” such schools as were clearly shown to be grammar schools, by petition, at the net income specifically enjoyed by the schoolmasters at the time. The “further order,” which was to re-endow them with lands, never came. Only in a comparatively few places, where the inhabitants or powerful persons bestirred themselves to beg, or more often to buy, chantry lands from the Crown, were the schools restored and re-endowed. The few that were restored, and even by an irony of fate some of those which were deprived of their lands by Edward VI. but managed to struggle on, got the name of Free Grammar Schools of King Edward VI. So Edward VI. has been credited with having destroyed the schools, estimated by various writers at 22, 30 and 44 in number, of which in the most favourable cases he increased the endowment, but also with being the promoter instead of the spoiler of a grammar school system. The earliest school actually restored by him was Berkhamsted, which was re-founded by act of parliament in 1549; St Albans, Stamford and Pocklington being also re-founded by acts of the same year. Acts of parliament were found too cumbersome. Some, as at Morpeth, Northumberland, and Safron Walden in Essex, were re-founded by grant to a town corporation of gild property with a grammar school attached. Most of them have been credited with having been refounded by patent. The first refoundation by patent for a school per se under a governing body created ad hoc was that of Sherborne, 13th of May 1550, Bury St Edmunds often, but wrongly, claimed as the first, not being till the 3rd of August 1550. The bulk were re-founded in 1551-1553.

The notion that there was any great advance or change in the curriculum of schools at the Reformation is erroneous. There is hardly any difference between the authors prescribed at Bury in 1550 and those at Ipswich in 1528; Cato’s Moralia, Aesop, Terence, Ovid, Erasmus of Rotterdam, Virgil and Horace appearing in both. If anything Ipswich was the more advanced, as Wolsey directed his boys to be taught precise writing in English, and essays and themes, also apparently in English, which are not mentioned at Bury. But Ipswich was a school of the first grade with eight forms, whereas at Bury only five were contemplated. The reign of Mary did not affect the schools as such one way or the other. Several, like Basingstoke grammar school and St Peter’s school, York, were re-endowed in her reign, the former by restoration of gild lands, the latter by appropriation of the endowment of a hospital for schooler children. Most of the latter were extruded, and so bestirred, like the master of Reading school, Julian Palmer, burnt. Similar extrusions of Romanists followed on the accession of Elizabeth. In 1580 and subsequent years the bishops were ordered to inquire as to schoolmasters who did not attend church or had not licences from the ordinaries to teach. The visitations of the chapter of Southwell as ordinaries in their liberty show schoolmasters in many small towns and villages, some of them “popish recusants,” and others inhibited until they had been duly licensed. How far they taught grammar schools and not elementary schools is not very clear. But one unfortunate result of the suppression of the song schools was that attempts were now made, as at Wellington in Northamptonshire, to make the grammar schools serve the two
SCHOOLS

incompatible purposes of grammar and elementary schools, with the result too often that the grammar school was degraded and the elementary school inefficient.

The number of school foundations credited to Queen Elizabeth or her era is very much larger than the facts justify. The greatest of all, Westminster, which during the 18th century was facie praece in the numbers, social rank and academic and literary achievement of its scholars, had in fact never ceased after its foundation, or refoundation, as a cathedral school under Henry VIII. Though Mary had restored the monks, the school went on throughout her reign and until Elizabeth formally refounded it with the restored canons. It is more extraordinary to find St Albans, founded under act of parliament of Edward VI., with Coventry, restored under patent of Henry VIII., and Lincoln, which had existed uninterruptedly from the 11th century, credited to her time. Similarly Bristol, Mansfield, Worcester, Darlington, Leicester, Eye, Bromyard, Richmond, Bodmin, Penryn, Fotheringay and others long previously existing and deriving no benefit from her or augmentation in her time, are erroneously dubbed Elizabethan.

In the curriculum of the schools, the change made by the Reformation has been much exaggerated. Already in 1446, in founding at Cambridge the college of God's House, now included in Christ's College, which was the first training college for grammar or secondary schools in the English university, Bishop Bennyngham, put forward the necessity of having not only for translating the scriptures and carrying on the law and business of the realm, but also for communication with strangers and foreigners. In the Elizabethan schools the preparation for particular study and the filling up of various qualifications was to the fore. Under James I. and the Commonwealth the mention of Hebrew in statutes and the teaching of it in schools became quite common. It was advocated even by John Comenius, the Czech-German, who created a stir a few years before the Civil War by denouncing Latin as a subject of instruction except for boys going to the universities, and advocating the substitution of teaching in the vernacular language of each country instead.

There is one not wholly novel but notable feature which may be remarked in Elizabethan school foundations, mostly no doubt replacing old ones, and that is that many were the product of joint effort, partly in annual subscriptions and partly in donations of land or money down, not from one benefactor but from many persons. This is the case in many of which have been attributed to the queen herself or to individual founders. Wakefield and Halifax in Yorkshire; Ashbourne, Derbyshire; Sandwich, Kent; Hexham, Northumberland; and St Saviour's and St Olave's, Southwark, are cases in which the evidence of joint stock enterprise has been fortunately preserved, as it has in that of Nottingham, which, after an existence of at least 300 years as a free school, was refounded as a free school in 1517. Another and less fortunate feature may be observed in the frequent attempt to make the grammar schools do double work, and supply the loss caused by the suppression of the song schools, by doing duty also as elementary schools to teach the three R's. It is an attempt which is being continually renewed and always results in failure; generally ending in degrading the secondary school while not making the elementary school efficient. Wellingborough in Northamptonshire is a remarkable example of this. It is a school which, founded by joint effort and out of common town estate, always languished until in recent years it shook off the elementary school and became one of the most flourishing secondary schools in the county (Vict. Co. Hist., Northants., ii.). The Peace of 1629 and the establishment of the commonwealth, when new ideas on every subject were broached, education received new impetus, and under the fostering care of parliament schools were increased in numbers. Many new schools were created, many old schools obtained an increase of endowment and efficiency. Among the great schools it was during this time that Westminster, with a parliamentary committee of lords and commons substituted for the dean and chapter, under Bushy, definitely placed itself in that position of pre-eminence which it retained till the first decade of the 19th century. It is signifi-

1 Nicholas Udal (g.v.) was master in 1555-1556.

cant that the two oldest extant school-lists are of this period, that for Winchester, which flourished under a Puritan warden and headmaster, for 1635, and that for Westminster for 1653. The care that parliament showed for schools was most conspicuous, where it might have least been expected, in regard to the cathedral schools. On the 14th of October 1642 the estates of deans and chapters were ordered to be sequestered, subject to a direction that "allowances assigned for scholars, almsmen and other charitable uses might not be interrupted." The Commons of Parliament at Westminster, set up a committee of masters to regulate the administration of the monies of the deans and chapters, and to substitute for the functions of the Committee for Plundered Ministers, to remove those scandalous in life or doctrine or who had deserted their cure.

As the property of deans and chapters was gradually sequestrated in 1643-1646, power was given this committee to relieve poor ministers and schoolmasters out of the proceeds. By act of parliament, on the 30th of April 1649, deans and chapters were abolished, and the schools were expressly saved by a clause that all payments from their revenues which before the 1st of December 1641 had been or were now increased to pay the maintenance of any grammar or school scholars should continue to be paid. The temporal estates were ordered to be sold, but the spiritual property, i.e. livings and tithes, de
dolved on thirteen trustees, and afterwards on the University of Oxford and the University of Cambridge. The committee, according to the instructions of the act, and after examining the existing statutes, put into force the 1488., 3Oth. of May, the statute of Edward VI. for raising a sum of £5061 for the extermination of ignorance and ignorance, and substituting elementary schools in the several cathedrals, of which £2000 a year was to go to the increase of the universities. Under these two provisions not only were all the cathedral grammar schools preserved intact, the existing statutes were left in force, all those in the cathedrals were returned to their business and did not bear arms against parliament, but in many cases they received large increases of stipend. The chapters were allowed to retain the schoolmasters, and the existing bishops or deans and in the case of the schools, of which the heads, under the 1488. statutes or older custom, though their own incomes they had increased to many times the statutable amounts by dividing fines amongst themselves. They had not even properly maintained the school buildings. At Canterbury, parliament had at once spent the large sum of £50 in repairing the school and masters' houses; and at Rochester similar amounts. The committee augmented salaries at Chester, the master from £22 to £36 and the usher from £10 to £15; at Chichester the masters from £50 to £50; at Rochester they doubled the former stipend of £13, 6s. 8d.; at Salisbury, the schoolmasters were doubled. An Act was passed for 20 schools, London, which by a grievous error the local historians killed under Elizabeth though it survived till the Fire of London, the salary, paid by St George's, Windsor, settled in 1442, at the rate of £16. Other schools paid from chapter or crown revenues received similar increases, Grimston £50; Newcastle under Lyme £30; Bridport, Dorset, £15. Of two of the most backward districts each had obtained a special act for the restoration of the grammar schools: in the one the masters and their scholars must be "godly and oth

SCHOOLS
Milton, though he was perhaps rather a private tutor than a schoolmaster, is the most famous now. Another of them, Charles Hoole, a royalist and ex-master of Rotherham, who taught first close to Milton in Aldersgate Street and then in Tokenhouse Garden in Lothbury, produced a most novel and useful school book in his *New Discovery of the Old Art of Teaching School*, written in 1637 and published "after 14 years' diligent trial in practice in London" in 1660. There is no more illuminating work for demonstrating the absurdity of the notion that thought and theorizing were not brought to bear on education in those days. Milton's *Tractate on Education* (1643) is but a series of vague generalities compared with Hoole's book, and is chiefly notable as one of the first attempts to assimilate antiquity and modernity into the system of instruction. It was the first wholly classical, which is assumed as a matter of course, but of the absurd method which devoted ten years to not learning a smattering of Latin when Italian or French were learnt in a year. But Milton's own idea of cramming the unfortunate boys with Varro and Columella, with agriculture and fishing, tactics and strategies in Greek and Latin authors, so that the pupils might learn things instead of words, was as visionary a one as could be conceived.

The Restoration parliament not only cut off the supply of new foundation and maintenance gifts, but by the Act of Uniformity in 1662 and the Five Mile Act in 1665, imposing prohibitory penalties on all teaching in public or private schools, except by rigid Church of England men, did its best to stop all advance. The very ferocity of the attempt in the long run defeated itself. By a series of decisions of the courts all the schools but the endowed grammar schools were (in defiance, it must be admitted, of the law and historical right) freed from the control of the bishops, and even some grammar schools. Thus in Bates's case, 1670, it was held that where a master was put in by lay patrons he could not be turned out for teaching without the licence of the ordinary, but only censured, and that the statutory penalty was a bar to proceedings in the ecclesiastical courts. Next year in Cox's case it was settled that the bishop's licence was only required in grammar schools. Private schools nominally to teach writing, arithmetic, French, geography and navigation were outside ecclesiastical cognizance and gradually monopolized the education of the middle classes. Singleton, expelled from the headmastership of Eton at the Restoration, is said to have had 300 boys in a school in St Mary Axe. Foubert, banished from France for Protestantism, had an academy in the Haymarket under royal patronage. No dissenter, however, could be a member of a governing body or master of an endowed school, and if a dissenter went as a scholar he had to go to church and learn the church catechism. The church was therefore left in sole control of the endowed schools, with the result that at the end of the 18th century the schools were in a more decrepit condition than they were at any time in their long history. Only those which had great possessions and attracted the aristocracy flourished.

The post-Restoration period is distinguished, however, by one great innovation, the development of girls' schools. There were girls' schools at Hackney and at Chelsea, at Oxford and at Bicester, boarding-schools where "young gentlewomen learnt to play, dance and sing," and where needlework was usually taught. In 1673 Mrs Makin, who had a ladies' school at Tottenham High Cross, and had been governess to the Princess Elizabeth, published an "Essay to Revive the Antient Education of Gentlewomen," dedicated to the princess, afterwards queen, Mary. She advocates the education of girls in the same subjects as men, including Latin, though not by learning Lily's grammar by heart, but by learning grammar in English.

In the 18th century, with the progress of the means of communication, a few great schools, of which Westminster, Eton, Winchester, Harrow were the greatest, threw at the expense of the country grammar schools to which the local nobility and gentry used to resort. They were conducted, however, like private schools—the town boys at Westminster, the dames' houses at Eton, the Commoners' houses at Winchester, being in fact private ventures. The process was imitated at Harrow from 1723, and Rugby from 1766, which emulated and sometimes surpassed the three old schools: while Charterhouse and Shrewsbury (which in the latter days of Elizabeth had been one of the largest schools in the country) also developed on the same lines. But there was little change even in their matter or method. In those schools in which French was taught and English poetry and prose were cultivated it was in a sort of amateur way and as a by-study. The serious work of scholarship was still confined to classics, though they were made the medium of excursions into history, geography and political science. The grammar schools in the country towns, with the whole inferior teachers, clung more closely to the ancient ways. As the growth of the intermediate group of schools brought many of them into the ranks of the local aristocracy men mostly dissenters, the grammar schools, which refused to admit them either as governors or scholars, and which despised, if they did not, as they often did, wholly reject modern languages and modern subjects, were relegated to the free boys, who went there not for love of learning but because learning was free. Where some enterprising man got together a boarding-school his "young gentlemen," who paid relatively high fees, were carefully secluded even in work, still more in play, from the common herd of free boys.

Never probably since the 9th century was the condition of the public schools of England worse than in the years 1750 to 1840. In the *Victoria County Histories*, in Carlisle's *Endowed Grammar Schools*, in the reports of Lord Brougham's Commission of Inquiry concerning Charities (1818-1837), it may be read in the case of county after county and school after school how the grammar schools, where they still struggled to preserve a semblance of higher education, were often taught by the nearest vicar or curate, and were reduced to ten or even to no boys. Thus at Stamford in 1729 there were five boys; at Birmingham in 1734 none; at Moulton in 1744 none; at Wilberforce in 1753 none; at Oundle in 1762 one entry, in 1779 four in the school, in 1785 none. At Repton between 1770 and 1800 fifteen boys were admitted; at Abingdon from 1792 to 1803 there were from three to ten boys; at Derby in 1826 four boys; at Chesterfield in 1827 four boys, and from 1832 to 1836 one boy constituted the whole school. Often for half a century no more than half a dozen boys had been known to attend the school; sometimes this was the case for a century, while a large proportion of the schools had been definitely converted into elementary schools, and had ones at that. Great, if partial, improvement followed after the publication of the reports of Lord Brougham's commission and the suits in Chancery and private acts of parliament for the restitution of endowments of schools which followed them. But the Public Schools Commission Report of 1863 and the Schools Inquiry Report of 1868 revealed still a deplorable state of things. This has largely been remedied by the removal of religious disabilities, the introduction of the principle of representative government in the governing bodies of schools, and the widening of the curriculum through special commissions with drastic powers, in the case of the great public schools under the Public Schools Commission, and in the case of the lesser public schools by the Endowed Schools Commissioners and the Charity Commissioners under the Endowed Schools Act 1869, and the curving of endowed grammar or high schools for girls out of the old schools for boys.

It is satisfactory to end this review of the history of schools with the conclusion that however much might still require to be done, the conditions in 1910 showed a complete alteration. English schools of all grades had never been so full of pupils, so well equipped with buildings and appliances, or staffed with such devoted and active bands of teachers.

*Elementary Schools.*—*Elementary* teaching prevailed in medieval England to an infinitely wider extent than has been commonly supposed. It was at first the duty of every parish priest. Its origin has been credited, even as lately as 1908 (Foster Watson, *English Grammar Schools to 1660*), to a decree of Theodulf, bishop of Orleans in France, in 787, and to a law
of King Ethelbert in England in 994 (De Montmorency, "State Intervention in English Education, 1902"): "mass priests ought always to have in their houses a school of disciples, and if any good man desire a clerk in his little one to them for instruction they ought gladly to receive and kindly teach them." These decrees were, in fact, merely re-issues of the 5th canon of the 6th council of Constantinople: "Let priests throughout the towns and villages have schools, and if any of the faithful wish to commend their little ones to them to learn their letters, let them not refuse to receive them, exacting however no price nor taking anything from them, except what the parents voluntarily offer," a phrase repeated again and again in the foundation documents of free schools, grammar or other, to the middle of the 18th century. The mass priests, however, did not continue their practice of education. In 1397, John of King's Bench wrote to the Bishop of Winchester, tried to recall those of his diocese to it by a synodal statute: "Let rectors, vicars and parish priests see that the sons of their parishioners know the Lord's Prayer, Creed and Salutation of the Virgin . . . and the parents should be induced to let their boys, when they know how to read the psalter, learn singing also." It may be observed that now the rectors are not required to teach boys themselves, but to see them taught. The duty of the parson had in fact been devolved on the clerk. In a decretal of Gregory IX, c. 1254, every parish priest was ordered to have a school and a clerk, i.e. a priest, was appointed to it (scholes, arts combinatas). It seems to be only an amplification of Leo IV, c. 850, omnis presbyter clericum habeat scholarem qui epistolam. &c. Many parish clerks duly did their duty in teaching. So we find in 1481 at St Nicholas, Bristol, "the clerks ought not to take no boke oute of the queere for childeyne to lerne in with owte licence of the procurators," i.e. the churchwardens. At Faversham in 1549 we hear that John Howe's daughter, to the great profit of the poor, was to send her son to school not to write but to sing mass and "to teache the yonge children resorting to the said schoole there ABC" at the same pay as the usher. This seems to have been really a school. At the college of Glasney, Cornwall, founded in 1453, provision was made for a chaplains' school, as well as for teaching of pere men children their ABC as for ringing" while at Launceston the grammar master had £16 a year, and 13s. 4d. was "veryly distributed to an aged man chosen by the mayor and the aldermen of the chyzer." At Newark, in 1423, it was settled after legal proceedings, that the chantry priests at the parish church might teach children the alphabet and grammar, but not further. Anything more was the privilege of the grammar schoolmaster.

In 1542 an injunction of Bonner as bishop of London shows an attempt on Henry VIII's part to recall the clergy to the duty of oratory. "Therefore all the parson and all the parson's fellow and also chantry priests and stipendiaries to . . . teach and bring up in learning the best ye can all such children of your parishioners as shall come to you, or at the least teach them to read English." The advisers of Edward VI. at first appear to have contemplated a similar development by an injunction in 1547 that "all chantry priests shall exercise themselves in teaching youth to read and write and bring them up in good manners and other virtuous exercises." But the Chancery Act next year swept all the chantries away by Easter 1548; and while professing to apply the provisions of the 20th chapter of Magna Charta to the parochial schools, and to leave the elementary education by omitting any saving clause for elementary schools, whether song, reading, writing or ABC schools. The first duty of a song, or of a reading school being "to teach a child to help a priest to sing mass," they were regarded as superstitious; and the rest were presumably looked on as tainted with the same poison. So all of the hundreds of song schools in the country, only two, outside the cathedrals and the university colleges and those of Winchester and Eton, Westminster and Windsor colleges, survived. These were the song school of the archdeacon Magnus foundation at St. John's, which was founded in 1509, and the Latin school of the parochial school in St John's Hospital, Coventry, established by John Hales under royal licence in 1545, though not legally settled till 1572. The gap left by these schools took long to fill, and probably the ignorance of the masses and of the lower middle classes in Elizabethan and Jacobean times was greater than before the Reformation. In the big towns, like London, during the reign of Elizabeth, voluntary rates, or application of the rates, were made to partly fill the gap. Christ's Hospital in 1553 with its 280 foundling children had, besides its grammar schoolmaster and usher, "a teacher of pricking who taught the two school masters for the Petties ABC." But in Mary's reign, Grafton the printer was "clapt in the Flete for two daies because he suffered the children to learn the English prymr" for "the Lattiing abees." In Southwark, while St Saviour's parish set up a grammar school in 1559, St Olave's parish in 1560 directed the churchwardens to ask the inhabitants "watte they will give
towards the setting up of a free skole, which was started next year to "teche the childarne to write and rede and cast accoppith." At St Lawrence Jewry in 1568 a school was kept over the next few years. At St Ethelwyn's in 1589 Smythe "the schoolmaster" paid ros. "for kepinge scole in the belfry." At Stevenage in 1561–1562 the old Brotherhood house and some endowment was bought by subscription for a school "to teach scholars called PETTA to read English, write, cast accounts and learn the accidence."

Some of these and other like schools were rather junior or preparatory departments of the grammar school than independent elementary schools. The foundation of purely elementary schools was rare in Elizabeth's reign. In Warwickshire, Alcester in 1582, Henley-in-Arden in 1586, in-Salop, Onibury in 1593, in Essex, Littlebury in 1598, those to which he is apportioned. Those mentioned in Mr de Montmorency's "State Intervention," taken from the Digest of Schools of 1842, are mostly of charities afterwards applied to elementary education, not founded for the purpose. In most counties the earliest elementary endowed schools are of James I's reign, such as Appleton, Berkshire, in 1604, Northiam, Sussex, in 1614, Sir William Borlase's school at Great Marlow in Buckinghamshire (now a secondary school) in 1624. At great impetus was given to them by the Commonwealth, and many were founded by statute action, only to be destroyed under the Restoration. On the other hand, the commonwealth schools was that of Polesworth, Warwickshire, founded by deed of 10th March 1655, the first endowed school which provided for girls as well as boys, the boys under a master to learn to write and read English, the girls in a separate schoolroom under a mistress to learn to read and work with the needle. In Wales Thomas Gouge, an ejected minister, in 1672, started voluntary schools.

After 1670 there was a large increase in elementary school foundations. The reign of Queen Anne saw a new development take place of the charity schools. The movement was started in 1698 by the Schoolmaster, "for the correction, the instruction of children," and the conditions taken up by the bishops with an organized propaganda for getting subscriptions. The schools founded were commonly called blue or blue-coat schools, though there were red maids', green and even yellow schools. Many were boarding-schools on the model of Christ's Hospital, where slum children, girls and boys, in separate schools of course, were taken in and prepared for service and work. But there were many day schools. All, however, provided a uniform of the Christ's Hospital type. They were chiefly in the large towns, and still comprise some of the richest endowed schools. Of the 100 or so of them were established between 1698 and 1715 in London and Westminster, and in 1729 there were 1608 schools with 34,000 children. In that year the curious development of "circulating schools" was started in Wales, the masters residing for a certain time in one district and then passing on to another. (This was a device known in medieval times, and notable examples of it were Sir Robert Hitcham's rotatory school for Earl's Colne and two other places in Essex during the Commonwealth, etc.) Griffith Jones was the principal promoter, and at his death in 1761 there were 10,000 children in the schools. In 1801 the Lancastrian system of schools, notable few boys or girls, but of several hundreds taught in classes of 60 or 80, chiefly by pupil teachers, was inaugurated in the Borough Road by Joseph Lancaster. Out of it grew the British and Foreign School Society. This was undemonstrational. In 1811 the National Society adopted the similar, but rival, Bell or "Madras system" for Church of England teaching. The effect of these two organizations was to cover the country with elementary schools, partly endowed, chiefly supported by voluntary contributions and low fees. These completed the system, if system it could be called, of sporadic elementary schools. After the Reform Act of 1832 the state stepped in with grants and has gradually made elementary education universal.

See further under Education.

SCHOONER, a vessel rigged with fore and aft sails, properly with two masts, but now often with three, four and sometimes more masts; they are much used in the coasting trade, and require a smaller crew in proportion to their size than square-rigged vessels (see Rigging and Ship). According to the story, which is probably true, the name arose from a chance spectator's exclamation "there she soons," I.e. "there she is," in the launch of the first vessel of this type at Gloucester, Massachusetts, in 1713, her builder being one Andrew Robinson. The spelling "schooner" is due to a supposed derivation from the Dutch schooner, but that and the other European equivalents, Ger. Schoner, Dan. skønner, Span. and Portuguese escuna, &c., are all from English. "To scoon," according to Skeat, is a Scottish (Clydesdale) dialect word, meaning to skip over water like a flat stone, and is ultimately connected with the root, implying quick motion, seen in shoot, sceud, &c. In American colloquial usage the word is applied to the larger two-masted vessels used by the emigrants moving westward before the construction of railways, and to a tall, narrow, lager-beer glass.

SCHOPENHAUER, ARTHUR (1788–1860), German philo-
sopher, was born in Danzig on the 22nd of February 1788. His parents belonged to the mercantile aristocracy—the bankers and traders of Danzig. His father, Heinrich Floris Schopen-
hauer, the youngest of a family to which the mother had brought the germs of mental malady, was a man of strong will and originality, and so proud of the independence of his native town and its inhabitants that in 1793 surrendered to the Prussians he and his whole establishment withdrew to Hamburg. At the age of forty he married Johanna Henrietta Trosiener, then only twenty, but the marriage owing to difference of temperament was unhappy. Their two children, Arthur and Adele (born 1796), bore the penalty of their parents' incompatibilities. They were burdened by an abnormal urgency of desire and capacity for suffering, which no doubt took different phases in the man and the woman, but linked them together in a common susceptibility to ideal pain.1

In the summer of 1797, a year after the marriage, the elder Schopenhauser, who had been in Russia, where his commercial experiences had made him a cosmopolitan in heart, took his wife on a tour to western Europe. It had been his plan that the expected child should see the light in England, but the intention was frustrated by the state of his wife's health. The name Arthur was chosen because it remains the same in English, French and German.

During the twelve years which followed the removal of the family to Hamburg (1793–1805) the Schopenhausers made frequent excursions. From 1797 to 1799 Arthur was a boarder with M. Gregoire, a merchant of Havre, and friend of his Danzig tutor, to whose house he came in for a fast friend. Returning to Hamburg, at the age of sixteen he had but indifferent training. When he reached the age of fifteen the scholarly and literary instincts began to awaken. But his father, steeped in the spirit of commerce, was unwilling that a son of his should worship knowledge and truth. Accordingly he offered his son the choice between the classical school and an excursion to England. A boy of fifteen could scarcely hesitate. In 1803 the Schopenhausers and their son set out on a lengthened tour, of which Johanna has given an account, to Holland, England, France and Austria. Six months were spent in England, where he found English ways dull and precise and the religious observances exacting. But he had not for the last time—to talk seriously with him on his uncolloquial and willful character. At Hamburg in the beginning of 1805 he was placed in a merchant's office. He had only been there for three months when his father, who had shown

1 Johanna Schopenhauer (1766–1838) was in her day an 'author of some reputation. Besides editing the memoirs of Fernow, she published Notes on Travels in England, Scotland and Southern France (1821), Die Johanna Schopenhauer, in John L. Huston's Dictionary of Romantic literature (1820–25), a long list of abundant poetry, and many single poems. Her first novel, Amours en Espagne (1832), was published in 1844, a volume of Haus- Wald- und Feld-Märchen, full of quaint poetical conceits, and in 1845 Anna, a novel, in two volumes. See Laura Frost, Johanna Schopenhauer: ein Frauenleben (1905).
symptoms of mental alienation, fell or threw himself into the canal. After his death the young widow (still under forty), leaving Arthur at Hamburg, proceeded with her daughter Adele in the middle of 1806 to Weimar, where she arrived only a fortnight before the tribulation which followed the victory of Napoleon at Jena. At Weimar her talents, hitherto held in check, found an atmosphere to stimulate and foster them, her aesthetic and literary tastes formed themselves under the influence of Goethe and his circle, and her little salon gained a certain celebrity. Arthur, meanwhile, became more and more restless, and his mother allowed him to leave his employment. He began his education again at Gotha, but a satire on one of the teachers led to his dismissal. He was then placed with the Greek scholar Franz Passow, who superintended his classical studies. This time he made so much progress that in two years he read Greek and Latin with fluency and into German.

In 1809 his mother handed over to him (aged twenty-one) the third part of the paternal estate, which gave him an income of £50, and in October 1809 he entered the university of Göttingen. The direction of his philosophical reading was fixed by the advice of G. E. Schulze to study, especially, Plato and Kant. For the former he soon found himself full of reverence, and from the latter he acquired the standpoint of modern philosophy. The names of Plato the divine and the marvellous Kant are conjointly invoked at the beginning of his earliest work. But even at this stage of his career the pessimism of his later writings began to manifest itself, together with a susceptibility to morbid fears which led him to keep loaded weapons always at his bedside. He was a man of few acquaintances, amongst the few being Bunsen, the subsequent scholar-diplomatist, and Bunsen's pupil, W. B. Astor, the son of Washington Irving's millionaire hero. Even then he found his trustiest mate in a poodle, and its bearskin was an institution in his lodging. Yet, precisely because he met the world so seldom in easy dialogue, he was unnecessarily dogmatic in controversy; and many a bottle of wine went to pay for lost wagers. But he had made up his mind to be not an actor but an onlooker and critic in the battle of life; and when Wieland, whom he met on one of his excursions, suggested doubts as to the wisdom of his choice, Schopenhauer replied, "Life is a ticklish business; I have resolved to spend it in reflecting upon it."

After two years at Göttingen he took two years at Berlin. Here also he dived into divers stores of learning, notably classics under Wolf. In philosophy he heard Fichte and Schleiermacher. Between 1811 and 1813 the lectures of Fichte (subsequently published from his notes in his Nachgelassene Werke) dealt with the "orders of the arts of perception" and the "theory of science," and struggled to present his final conception of philosophy. These lectures Schopenhauer attended—at first, it is allowed, but afterwards with a spirit of opposition which is said to have degenerated into contem, and which in after years never permitted him to refer to Fichte without contumely. Yet the words Schopenhauer then listened to, often with baffled curiosity, certainly influenced his speculation.

In Berlin Schopenhauer was lonely and unhappy. One of his interests was to visit the hospital La Charité and study the everyday life of its inmates. An abortive attempt to enter the medical faculty did not prevent him from becoming a doctor in philosophy. In the early days of 1813 sympathy with the national enthusiasm against the French carried him so far as to buy a set of arms; but he stopped short of volunteering for active service, reflecting that Napoleon gave after all only concentrated and untrammelled utterance to that self-assertion and lust for more life which weaker mortals feel but must perforce disguise. Leaving the nation and its statesmen to fight out their freedom, he hurried away to Weimar, and thence to the quiet Thuringian town of Rudolstadt, where in the inn "Zum Käfer," out of sight of soldier and sound of drum, he wrote, helped by books from the Weimar library; his essay for the degree of doctor in philosophy. On the 2nd of October 1813 he received his diploma from Jena; and in the same year from the press at Rudolstadt there was published—without winning notice or readers—his first book, Über die vierschüssige Würd des Satzes vom zureichenden Grunde, trans. in Böhn's Philological Library (1818).

In November 1813 Schopenhauer returned to Weimar, and for the following months lived there with his mother. But the close of daily association was too much for their antagonistic natures. His splenetic temper and her volatility culminated in an open rupture in May 1814. From that time till her death in 1838 Schopenhauer never saw his mother again. During these few months at Weimar, however, he made some acquaintances destined to influence the subsequent course of his thought. Conversations with the Orientalist F. Mayer directed his studies to the philosophical speculations of ancient India. In 1808 Friedrich Schlegel had in his Language and Wisdom of the Old Hindus brought Brahmanical philosophy within the range of European literature. Still more instructive for Schopenhauer was the imperfect and obscure Latin translation of the Upanishads which in 1801–1802 Anquetil Duperron had published from a Persian version of the Sanskrit original. Another friendship of the same period had more palpable immediate effect, but not so permanent. This was with Goethe, who succeeded in securing his interest for those investigations on colours on which he was himself engaged. Schopenhauer took up the subject in earnest, and the result of his reflections (and a few elementary observations) soon appeared (Easter 1816) in his dissertation, Über das Sehen und die Gottheit (Leipzig, 1814). The essay, which must be treated as a step in an evolution from the direct path of Schopenhauer's development, due to the potent force of Goethe, was written at Dresden, to which he had transferred his abode after the rupture with his mother. It had been sent in MS. to Goethe in the autumn of 1815, who, finding in it a transformation rather than an expansion of his own ideas, inclined to regard the author as an opponent rather than an adherent.

The pamphlet begins by re-stating with reference to sight the general theory that perception of an objective world rests upon a subjective postulation, which even when it Milton still remains to haunt us (instead of being, like errors of reason, open to extirpation by evidence), and proceeds to deal with physiological colour, i.e. with colours as felt (not perceived) modifications of the action of the retina. First of all, the distinction of white and black, with their mean point in grey, is referred to the activity or inactivity of the total retina in the gradually present absence or presence of full light. Further, the eye is endowed with a brow by which the activity is divided into successively distinct. It is this circumstance which gives rise to the phenomenon of colour. All colours are complementary, or go in pairs; the yellow makes by its activity that of the retina, and so do the other pairs of complementary colours. The two pairs are so connected that when the first is exhausted the other spontaneously succeeds. Such pairs of colour may be regarded as infinite in number; there are those pairs which have the property and admit of easy expression for the ratio in which each contributes to the total action. These are red and green (each = 1), orange and blue (2:1), and yellow and violet (3:1).1 This theory of complementary colours as due to the polarity in the qualitative action of the retina is followed by some criticism of Newton and the seven colours, by an attempt to explain some facts noted by Goethe, and by some reference to the external stimuli which cause colour.

The grand interest of his life at Dresden was the composition of a work which should give expression in all its aspects to the idea of man's nature and destiny which had been gradually forming within him. Without cutting himself altogether either from social pleasures or from art, he read and took notes with regularity. More and more he learned from Cabanis and Helvetius to see in the will and the passions the determinants of intellectual life, and in the character and the temper the source of theories and beliefs. The conviction was born in upon him that scientific explanation could never do more than systematize and classify the mass of appearances which to our habit-blinded eyes seem to be the reality. To get at this reality and thus to reach a standpoint higher than that of aesthetics was the problem of his as of all philosophy. It is only by such a tower of speculation that an

1 In this doctrine, so far as the facts go, Schopenhauer is indebted to a paper by R. Waring Darwin in vol. Ixvi. of the Transactions of the Philosophical Society.
escape is possible from the spectre of materialism, theoretical and practical; and so, says Schopenhauer, "the just and good must all have this creed: I believe in a metaphysic." The mere reasonings of theoretical science leave room for art, and practical prudence usurps the place of morality. The higher life of aesthetic and ethical activity—the beautiful and the good—can only be based upon an intuition which penetrates the heart of reality. Towards the spring of 1818 the work was nearing its end; Brockhaus of Leipzig had agreed to publish it and pay the author one ducat for every sheet of printed matter. But, as the press loitered, Schopenhauer, suspecting treachery, wrote so rudely and haughtily to the publisher that the latter broke off correspondence with his client. In the end of 1818, however, the book appeared (with the date 1819) as Die Welt als Wille und Vorstellung, in four books, with an appendix containing a criticism of the Kantian philosophy (Eng. trans. by R. B. Haldane and J. Kemp, 1883). Long before the work had come to the hands of the public Schopenhauer had rushed off to Italy. He stayed for a time in Venice, where Byron was then living; but the two did not meet. At Rome he visited the art galleries, the opera, the theatre, and gladly seized every chance of conversing in English with Englishmen. In March 1819 he went as far as Naples and Paestum. About this time the fortunes of his mother and sister and himself were threatened by the failure of the firm in Danzig. His sister accepted a compromise of 70%, but Schopenhauer angrily refused this, and eventually recovered 9400 thalers.

After some stay at Dresden, hesitating between fixing himself as a university teacher at Göttingen, Heidelberg or Berlin, he finally chose the last-mentioned. He was, however, not a good lecturer, and his work soon came to an end. His failure he attributed to Hegelian intrigues. Thus, except for some attention to physiology, the first two years at Berlin were wasted. In May 1822 he set out by way of Switzerland for Italy. After spending the winter at Florence and Rome, he left in the spring of 1823 for Munich, where he stayed for nearly a year, the prey of illness and isolation. When at the end of this wretched time he left for Gastein, in May 1824, he had almost entirely lost the hearing of his right ear. Dresden, which he reached in August, no longer presented the same hospitable aspect as of old; and he was reluctantly drawn onwards to Berlin in May 1825.

The six years at Berlin were a dismal period in the life of Schopenhauer. In vain did he watch for any sign of recognition of his philosophic genius. Hegelianism reigned in the schools and in literature and basked in the sunshine of authority. Thus driven back upon himself, Schopenhauer fell into morbid meditations, and the world which he saw, if it was stripped naked of its disguises, lost its proportions in the distorting light. The sexual passion had a strong attraction for him at all times, and, according to his biographers, the notes he set down in English, when he was turned thirty, on marriage and kindred topics are unfit for publication. Yet in the loneliness of life at Berlin the idea of a wife as the comfort of gathering age sometimes rose before his mind—only to be driven away by cautious hesitations as to the capacity of his means, and by the shrinking from the loss of familiar liberties. He wrote nothing material. In 1826 he made inquiries about a chair at Heidelberg; and in 1829 he got a shortened Latin version of his physiological theory of colours inserted in the third volume of the Scríptra ophthalmologica minores (edited by Radius). Another pathway to reputation was suggested by some remarks he saw in the seventh number of the Foreign Review, in an article on Damiron’s French Philosophy in the 19th Century. With reference to some statements in the article on the importance of Kant, he sent in very fair English a letter to the writer, offering to translate Kant’s principal works into English. His correspondent, Francis Haywood, made a counter-proposal which so disgusted Schopenhauer that he addressed his next letter to the publishers of the review. When they again refused him to Haywood, he applied to Thomas Campbell, then chairman of a company formed for buying up the copyright of meritorious but rejected works. Nothing came of this application. A translation of selections from the works of Balthazar Gracian, which was published by Frauenstädt in 1826, seems to have been made about this time.

In 1833 he settled finally at Frankfort, gloomily waiting for the recognition of his work, and terrified by fears of assassination and robbery. As the years passed he noted down every confirmation he found of his own opinions in the writings of others, and every instance in which his views appeared to be illustrated by new researches. Full of the conviction of his idea, he saw everything in the light of it, and gave each aperçu a place in his alphabetically arranged note-book. Everything he published in later life may be called a commentary, an excursus or a scholium to his main book; and many of them are decidedly of the nature of commonplace books or collections of notes. But along with the accumulation of his illustrative and corroborative materials grew the bitterness of heart which found its utterances neglected and other names the oracles of the reading world. The gathered ill-humour of many years, aggravated by the constant assurance of the Hegelians, found vent at length in the introduction to his next book, where Hegel’s works are described as three-quarters utter absurdity and one-quarter mere paradox—a specimen of the language in which during his subsequent career he used to advert to his three predecessors Fichte, Schelling, but above all Hegel. This work, with its wild outcry against the philosophy of the professoriate, was entitled Über den Willen in der Natur, and was published in 1836 (revised and enlarged, 1834; Eng. trans., 1836).

In 1837 Schopenhauer sent to the committee entrusted with the execution of the proposed monument to Goethe at Frankfort a long and deliberate expression of his views, in general and particular, on the best mode of carrying out the design. But his fellow-citizens passed by the remarks of the mere writer of books. More weight was naturally attached to the opinion he had advocated in his early criticism of Kant as to the importance, if not the superiority, of the first edition of the Kritik; in the collected issue of Kant’s works by Rosenkranz and Schubert in 1838 that edition was put as the substantive text, with supplementary exhibition of the differences of the second.

In 1841 he published under the title Die beiden Grundprobleme der Ethik two essays which he had sent in 1838–1839 in competition for prizes offered. The first was in answer to the question "Whether man’s free will can be proved from self-consciousness," proposed by the Norwegian Academy of Sciences at Drontheim. His essay was awarded the prize, and the author elected a member of the society. But proportionate to his exultation in this first recognition of his merit was the depth of his mortification and the height of his indignation at the result of the second competition. He had sent to the Danish Academy at Copenhagen in 1839 an essay "On the Foundations of Morality" in answer to a vaguely worded subject of discussion to which they had invited candidates. His essay, though it was the only one in competition, was refused the prize on the grounds that he had failed to examine the chief problem (i.e. whether the basis of morality was to be sought in an intuitive idea of right), that his explanation was inadequate, and that he had been wanting in due respect to the summi philosophi of the age that was just passing. This last reason, while probably most effective with the judges, only stirred up more furiously the fury in Schopenhauer’s breast, and his preface is one long fulmination against the ineptitudes and the charlatanry of his noble nature. Hegel, he said, had appeared second to his two Essays, The World as Will and Idea, in two volumes. The first volume was a slightly altered reprint of the earlier issue; the second consisted of a series of chapters forming a commentary parallel to those into which the original work was now first divided. The longest of these new chapters deal with the primacy of the will, with death and with the metaphysics of sexual love. But, though only a small edition was struck off (500 copies of vol. i. and 750 of vol. ii.),

1 It was not till 1841 that a translation of Kant’s Kritik in English appeared.

2 He also projected a translation of Hume’s Essays and wrote a preface for it.
the report of sales which Brockhaus rendered in 1846 was unfavourable, and the price had afterwards to be reduced. Yet there were faint indications of coming fame, and the eagerness with which each new tribute from critic and admirer was welcomed is both touching and amusing. From 1843 onwards a jurist named F. Dorgath had trumpeted abroad Schopenhauer's name. In 1844 a letter from a Darmstadt lawyer, Joh. August Becker, asking for explanation of some difficulties, began an intimate correspondence which went on for some time (and which was published by Becker's son in 1883). But the chief evangelist (so far as we are concerned) was his old friend the apostle who published not) was Frauenstädt, who made his personal acquaintance in 1836. It was Frauenstädt who succeeded in finding a publisher for the Parer und Paralitomena, which appeared in Berlin in 1831 (2 vols., pp. 465, 531; sel. trans. by J. B. Saunders, 1889; French by A. Dietrich, 1900). Yet for this bulky collection of essays, philosophical and others, Schopenhauer received as honorarium only ten free copies of the work. Soon afterwards, Dr. E. O. Lindner, assistant editor of the Vossische Zeitung, began a series of Schopenhauerite articles. Amongst them may be recalled not only the concluding article by John Oxenford which appeared in the Westminster Review for April 1853, entitled "Iconoclasm in German Philosophy," being an outline of Schopenhauer's system. In 1854 Frauenstädt's Letters on the Schopenhauerism Philosophy showed that the new doctrines became a subject of discussion—a state of things made still more obvious by the university of Leipzig offering a prize for the best exposition and examination of the principles of Schopenhauer's system. Besides this, the response his ideas gave to popular needs and feelings was evinced by the numerous correspondents who sought his advice in their difficulties. And for the same reason, distasteful editions of his works were called for—a second edition of his degree dissertation in 1847, of his Essay on Colours and of The Will in Nature in 1854, a third edition of The World as Will and Idea in 1859, and in 1860 a second edition of The Main Problems of Ethics.

In 1854 Richard Wagner sent him a copy of the Ring of the Nibelungen, with some words of thanks for a theory of music which had fallen in with his own conceptions. Three years later he received a visit from his old college friend Bunsen, who was then staying in Heidelberg. On October 18th he breakfasted with friends and conversed in four quarters. In April 1860 he began to be affected by occasional difficulty in breathing and by palpitation of the heart. Another attack came on in autumn (9th September), and again a week later. On the evening of the 18th his friend and subsequent biographer, Dr. Gwinther, sat with him and conversed. On the morning of the 21st September he rose and sat down alone to breakfast; shortly afterwards his doctor called and found him dead in his chair. By his will, made in 1852, with a codicil dated February 1859, his property, with the exception of some small bequests, was devised to the above-mentioned institution at Berlin. Gwinther was natural executor, and Frauenstädt was entrusted with the care of his manuscripts and other literary remains.

It is often said that a philosophic system cannot be rightly understood without reference to the character and circumstances of the philosopher. The remark finds ample application in the case of Schopenhauer. The conditions of his training, which brought him in contact with the realities of life before he learned the phrases of scholastic language, give to his words the stamp of self-seen truth and the clearness of original conviction. They explain at the same time the naïveté which set a high price on the product of his own energies had turned out, and could not see that what was so original to himself might seem less unique to other judges. Preoccupied with his own ideas, he chafed under the indifference of thinkers who had grown blasé in speculation and fancied himself persecuted by a conspiracy of professors of philosophy. It is not so easy to demonstrate the connexion between a man's life and doctrine. But it is at least plain that in the case of any philosopher, what makes him such is the faculty he has, more than other men, to get a clear idea of what he himself is and does. More than others he leads a second life in the spirit or intellect alongside of his life in the flesh—the life of knowledge beside the life of will. It is inevitable that he should be especially struck by the points in which the sensible and temporal life comes in conflict with the intellectual and eternal. It was thus that Schopenhauer by his own experience saw in the primacy of the will the fundamental fact of his philosophy, and found in the engrossing interests of the selfish Avas the perennial hindrances of the higher life. For his absolute individualism, which recognizes in the state, the church, the family only so many superficial screens, masks and blindfolds, for the reality (i.e., this absorption in the intellectual and purely ideal aims which prepare the way for the cessation of temporal individuality altogether. But theory is one thing and practice another; and he will often lay most stress on the theory who is most conscious of defects in the practice. It need not, therefore, surprise us that the man who formulated the sum of virtue in justice and benevolence was unable to be just to his own kinsfolk and reserved his compassion largely for the brutes, and that the delineator of asceticism was more than moderately sensible of the comforts and enjoyments of life.

The philosophy of Schopenhauer, like almost every system of the time, can have found many adherents without reference to the ideas of Kant. Anterior to the Kantian gradual advance of idealism had been the most conspicuous feature in philosophy. The philosophy of Kant, the truths of experience, were after all only our inner perceptions was the lesson of every thinker from Descartes to Hume. And this doctrine was generally understood to be so human as necessarily to involve a certain amount of weakness and acquired habits, could hardly hope to cope success fully with the problem of apprehending the real things. The idealist position Kant seemed at first sight to retain with an even stronger hand than ever. But it is darkest just before the dawn; and Kant, the Copernicus of philosophy, had really altered the aspects of the doctrine of ideas. It was his purpose to show that the Kantian doctrine of ideas is not derived from the peculiarities of the body) were not merely apparent and could be lick into convenient shape the data of perception, but entered as underlying elements into the constitution of objects, making experience possible and determining the fundamental structure of nature. In other words, the forms of knowledge were the main factor in making objects. By Kant, however, these forms are generally treated psychologically as the action of the several faculties of a mind. Behind thinking there is the thinker. But in his successors, from Fichte to Hegel, this axiom of the plain man is set aside as antiquated. Thought or conception without a subject, an object, is impossible, and in thinking in its primitive, without any individual substratum in which it is embedded: τὸν νοήματος ὁμογένες is to be substituted for νοῦς. This is the step of advance which is required alike by Fichte when he asks his reader to think with his imagination, or by Hegel, when he substitutes the Begriff for the Vorstellung or pictorial conception. As spiritism asks us to accept such suspension of ordinary mechanics as was necessary in order to bring about our own salvation, so Schopenhauer asks us to submit to the laws of time and space, and so our new philosophy of Kant's immediate successors requires from the postulant for initiation willingness to erase his customary beliefs in quasi-material subjects of thought.

But, besides removing the psychological slag which clung to Kant's ideas from their matrix and presenting reason as the active principle in the formation of a universe, his successors carried out in much more detail, and far more enthusiasm and historical scope, his principle that in reason lay the a priori or the anticipation of the world, moral and physical. Not content with the barren assertion that the understanding makes nature, and that we can construct a certain form of the world, they also showed how they went about it. And so it was the thing, as it is by itself, wonderful to us, and as we know it not. This somewhat is what Kant calls a limit-concept. It marks only that we feel our knowledge to be limited and that the only way in which it can be extended is by sense-experience rather than by an act of thought. So inadequate is only a condition of growing knowledge in a being subject to the laws of space and time; and the very feeling is a proof of its implicit reality. And so we have a continual disparity in its eternal operation, and then this universal thought, which may be called God, as the sense-conditioned reason is called man, becomes the very breath and structure.
of the world. Thus in the true idea of things there is no irreducible residue of matter: mind is the Alpha and Omega, at once the initial postulate and the final truth of reality.

In various ways a reaction arose against this absorption of everything in reason. The presentation of being is primum activum, the groundless and incomprehensible deed-action (Thal.-Handlung) of the absolute ego. The innermost character of that ego, more in keeping with the same Schopenhauerian doctrine, is a stationary state of reason, as he says again, "In the last resort," says Schelling (1809), in his Inquiries into the Nature of Human Freedom, "there is no other being but will. Wollen ist Orten (will is primal being); and to this, as an absolute unity, all the predeterminations and co-dependencies of time, self-affirming. It is unnecessary to multiply instances to prove that idealism was never without a protest that there are in the world changes and differences, and that there is some inde- pendent of time, self-affirming."

It is under the banner of this protest against rationalizing idealism that Schopenhauer advances. But what marks out his armoury is its pronounced realism. He fights with the weapons of physical doctrine and on the basis of the material earth. He knows no reason but the human, no intelligence save what is exhibited by the animals. He knows that both animals and men have come into existence with an incipient, excitation of the nerves, an antagonism when no eye or ear gathered the light of the universe into perceptions. Knowledge, therefore, with its vehicle, the intellect, is dependent upon the existence of certain nerve-organs located in an animal system; and the freedom of knowledge is not a free will, a freedom which by all knowledge and is not itself amenable to explanation. We may, if we like, call this element, which is assumed as the basis of all scientific method, irrational—will instead of reason, feeling rather than will.

It is thus that Lotze declares that "the thrill surface of matter, behind its determined development, is a sort of radiant glow of a hidden spiritual activity." So Schopenhauer, but in a way all his own, finds the truth of things in a will which is indeed unaffected by conscious motives and yet cannot be separated from some faint analog of it.

In two ways Schopenhauer has influenced the world. He has shown with unusual lucidity of expression how feeble is the spontaneity of that intellect which is so highly lauded, and how over-powering the sway of original will in all our action. He thus reasserted realism, whose gospel reads, "In the beginning was, passion, will," and has discredited the doctrinaire belief that ideas have origin in the First Cause, of Schopenhauer's, dangerous, and it may be true that the pessimism it implies often degenerates into cynicism and a cold-blooded denial that there is any virtue and any truth. But in the crash of established creeds less is Schopenhauer's doctrine likely to suffer. And it is probable it is only wise, if not always agreeable, to lay bare the wounds under which humanity suffers, though pride would prompt their concealment. But Schopenhauer's theory has another side. If the second aspect of his influence is the doctrine of redemption of the soul from its sensual bonds, first by the medium of art and second by the path of renunciation and ascetic life, it would be difficult in each case to draw the line between social duty and individual perfection. But Schopenhauer reminds us that the welfare of society is a temporal and subordinate aim, never to be allowed to obscure or inhibit the realization of our ideal life. It will be perhaps doubted, who will arise to grapple with the great problem, the noblest problem of mankind, how the crude rationalism of the present is to be converted into a spiritual asceticism. It is a task which will mean for Schopenhauer only force. It means a great deal more; and it is his contention that what the scientist calls force is really will. In so doing he is only following the line predicted by Kant1 and anticipated by Leibniz. If we wish, said Kant, to give a real existence to the thing in itself or the noumenon we can only do so by the intervention of a force. Kant gives it the name of will, in the same sense as Lotze fancies. In Schopenhauer's external sense, viz. with thinking or something analogous thereto. It is thus that Fechner in his "day-view" of things sees in plants and animals "will-as-spiritual," and compares man's vocation as a simple being which appears to none but itself, in us as elsewhere wherever it occurs self-luminous, dark for every other eye, at the least connecting sensations in itself, upon which, as the grade of 2, 3, 4, 5 brightnesses, the weight of our beings and the spirituality of higher and still higher relations."2

2 Uber die Seelenfryere, p. (Leipzig, 1861).
3 Mikrokosmus, i. 408 (2nd ed.).
in an age of violent polemics, distinguished himself by the virulence of his writings against the Protostrians. He became involved in a controversy with Joseph Justus Scaliger, formerly his intimate friend, and others, wrote *Ecclesiastical antiquitates Jacobis regis oppusita* (1611), an attack upon James I. of England, and in *Classici bellii scarii* (1619) urged the Catholic princes to wage war against the Protostrians. About 1607 Schoppe entered the service of Ferdinand, archduke of Savoy, afterwards the emperor Ferdinand II., who found him very useful in rebutting the arguments of the Protostrians, and who sent him on several diplomatic errands. According to Pierre Bayle, he was almost killed by some Englishmen at Madrid in 1610, and in 1614, after he had spent three years in France for his life he left Germany for Italy in 1617, afterwards taking part in an attack upon the Jesuits. Schoppe, as the long list of his writings shows, knew also something of grammar and philosophy, and had an excellent acquaintance with Latin. His chief work is, perhaps, his *Grammatica philosophica* (Milan, 1628). Schoppe died at Padua on the 19th of November 1649.

In *Life of Sir Henry Wotton* Isaac Walton, calling him Jasper Scoppius, refers to Schoppe as "a man of a restless spirit and a malicious pen."

Besides the works already noticed, he wrote *De arte critica* (1597); *De medicina...* (1599); *De motu corporum...* et ceteris controversiis libellus; *Scaliger kypotolymaues* (1607), a virulent attack on Scaliger; and latterly the anti-jesuitical works, *Flagelium Jesuicatum* (1632); *Mysteria patrum jesuicorum* (1633); and *Arcana societatis Jesu* (1635), which, as Scaliger said, gave a fuller life of his heterodoxy than Nicéron *Mémoires*, (1727-1745). See also C. Nisard, Les *Gladiateurs de la république des Lettres* (Paris, 1860).

**SCHORL**, in mineralogy, the name given to coarse black varieties of tourmaline (q.v.). The schorl rocks are crystalline aggregates of quartz and tourmaline. They are granular and massive, not banded or foliated as a rule, grey of various shades, the darkest coloured being most rich in schorl. Some are very fine grained, but in most cases the individual crystals are easily distinguishable. Some schorl is a deep brown, nearly black, and very resistant to weathering. Veined, brecciated, porous and banded varieties occur, but are less common than the granular massive rocks.

Schorl rocks occur practically always in association with tourmaline-bearing granites. Most of them are of igneous origin and, though there may be a few which are direct products of consolidation from a plutonic magma, in the vast majority of cases they originate by the action of gases and vapours on granites, porphyries and other rocks. All magmas contain vapours in solution and give them off more or less readily as they crystallize. Water, carbonic acid and hydrochloric acid (or chlorides) are the commonest dissolved substances, but fluorine, boron, lithium and phosphoric acid occur also, and as they pass outwards these last may act on the surrounding rocks, probably still at a high temperature and produce minerals of a special kind. This action is said to be pneumatolytic. Tourmaline contains boron and fluorine, hence the presence of these elements in the emanations from the granite may be assumed. Schorl rocks often also contain varieties of white mica which are rich in fluorspar and lithium; in additionapatite is usually present. Lastly, many of the rocks of this group contain tinstone or are associated with tin-bearing veins, and it is probable that the ores of this metal were brought up in solution as fluorides or chlorides and deposited in the situations where now they are found.

Along the sides of fissures, through which, no doubt, the gases ascended, the granite is converted into schorl rock for a distance ranging from a fraction of an inch to several feet, and vein-like masses of new schorl rock branching and uniting are thus produced. In other places considerable areas of granite are changed in this way, principally near the margin of the granite, and an interrupted belt of this kind of rock encircles some of the larger outcrops of granite in Cornwall. A similar origin, must be ascribed to grisettes (q.v.), the aggregate of quartz and white mica commonly found in association with tin-bearing granites; there are complete gradations between schorl and grisette. But here again portions of white mica and tourmaline which may be present in each specimen. Another mineral which is produced by the pneumatolytic alteration of granite is topaz (a silicate and fluoride of aluminum); an aggregate of quartz and topaz is called topaz-fels or topaz rock, and is largely developed in some of the tin-mining districts of Germany, though not found in Cornwall.

As might be expected every stage of the conversion of granite into schorl rock can be found. Tourmaline may have been to some extent an original constituent of the granite, but most of it is of new formation and must have resulted from the alteration of the biotite and felspar of the original rock, both of these minerals having disappeared when the granite was metamorphosed. It is commonly found that the schorl is of a brown colour in the interior of the crystals but blue at the edges; probably the brown is primary or at least unaltered, while the blue is that which has resulted from the replacement of felspar. The rock known as luxullianite, obtained near Luxullian village in Cornwall and used as an ornamental stone as the sarcophagus of the duke of Wellington's monument in St. Paul's Cathedral, is the same as the rock produced by the alteration of biotite and felspar by quartz and tourmaline can be seen in progress. The new tourmaline in is fine pointed needles which have a sharp subterminating edge, and is embedded in quartz: often these needles are planted on the surface of corroded crystals of primary brown schorl. This rock still contains a good deal of flesh-coloured felspar in large porphyritic crystals which contrast well with the hornblende matrix and give polished specimens a very handsome appearance. In the completely altered schorl rocks there are rarely needles of tourmaline, but this mineral occurs as irregular grains mingled in varying proportions with small crystals of quartz; at other places the near the tourmaline; in others the tourmaline is nearly effaced, but at Trelvalgan, St Austell, and other places in Cornwall there are schorl rocks which contain white pseudomorphs of quartz after tourmaline crystals.

In porphyries of "elvans" tourmalinization also is frequent, though not so common as greisingen. Veins of quartz with stellite schorl needles may be seen spreading through the groundmass or veins, but they have been produced by the prevailing to the varying acid and fine scaly white mica, the porphyritic crystals of felspar alone may be replaced by bunches of tourmaline embedded in quartz. Tinstone often makes its appearance in these rocks either in small crystals enclosed in quartz or lining fissures and cavities left by the removal of a portion of the rock in solution.

The same process goes on also in sedimentary rocks; a felspathic rock may yield a schorl rock which can hardly be distinguished from one derived from a fine-grained granite. In shales brown tourmaline is often deposited in the vicinity of fissures, and the whole mass may be converted into a hard splintery aggregate of quartz and mica, an effect not uncommon in schistose rocks. But these rocks are always banded, like the original slate; their original structures (bedding and cleavage) are probably never completely effaced and the ultimate product has been called schorl-schist (Cornwall, or luxullianite).

The stanniferous veins which in large numbers intersect the granites of Devon and Cornwall and the slates around them, and have yielded a large part of the world’s supply of tin consist mostly of quartz, tourmaline and chlorite (with a large variety of propylite, e.g., cassiterite). The veinstones are typically very fine grained, hard and dark blue or dark green in colour. The green varieties contain crystals of chlorite, the dark blue or black of a compound of chlorite and mica, which are known to the miners as “peach.” Essentially aqueous deposits in lines of fissure, these rocks show that quartz and tourmaline were carried up in hot solutions at a late period in the cooling of the region, the change of the tourmaline into the quartz probably happened in a very short time, and the chlorite may be effaced. But these solutions as they spread outwards through the surrounding rocks. Their tourmaline crystals are very small and usually of dark-blue shades, but owing to repeated movements of the walls of the veins the ore depositions have sometimes an intricate history, as microscopic studies show that the first infillings of the fissures have been broken up and cemented together again by a later material of slightly different character.

**SCHOTTISCH, the German for “Scottish,” a name given to a dance, der schottische Tanz, introduced into England about 1850. It was a form of polka, with two figures. The “Highland Schottische” is a lively dance resembling a fling. What is known as the “barn dance” was first known in America as the “Military Schottische.”**

**SCHOULER, JAMES (1839- ), American lawyer and historian, was born in West Cambridge (now Arlington), Massachusetts, on the 20th of March 1839, the son of William Schouler, a tailor, and Jane Foster. He is the author of the Boston *Atlas*, one of the leading Whig journals of New England. He then graduated at Harvard in 1859, studied law in Boston and was admitted to the bar there in 1862. In 1869 he removed to Washington, where for three years he published the United States *Jurist*. After his return to Boston, in 1874, he devoted himself to office practice and to literary pursuits. He was a lecturer in the law school of Boston University between 1885 and 1903, a non-resident professor and lecturer in the National**

He is best known, however, as an historian; his most important work being a History of the United States under the Constitution, 1789-1865 (6 vols., 1880-1890). Among his other publications are A Life of Thomas Jefferson (1893); Historical Briefs (1896), containing a biography of Mr. Schouler; Constitutional Studies, State and Federal (1897); a brief Life of Alexander Hamilton (1899); Americans of 1776 (1906); and Ideas of the Republic (1908).

SCHRADER, EBERHARD (1836-1908), German orientalist, was born at Brunswick on the 7th of January 1836, and educated at Göttingen under Ewald. In 1858 he took a university prize for a treatise on the Ethiopian languages, and in 1863 became professor of theology at Zürich. Subsequently he occupied chairs at Giessen (1870) and Jena (1873), and finally became professor of oriental languages at Berlin. Though he turned first to biblical research, his chief achievements were in the field of Assyriology, in which he was a pioneer in Germany and acquired an international reputation. He died on the 4th of July 1908.

His publications include: Studien zur Kritik und Erklärung der biblischen Urgeschichte (1863); the 8th edition of Dewe’s Einleitung in das Alte Testament (1869); Die assyr-babyl. Keilinschriften (1872); Die Keilschriften und das Alt. Test. (1872; 3rd ed. by Zimmer and Winckler, 1901-1902); Keilschriften und Geschichtsforschung (1878); Die Höllenfahrt der Istar (text, trans., notes, 1874); Zur Frage nach dem Ursprung der alibabylonischen Kultur (1884); in conjunction with other scholars, Keilschriften-Bibliothek (1877).

SCHREIBERHAU, a village and climatic health resort of Germany, in the Prussian province of Silesia, situated in the valley of the Zaeken in the Riesengebirge, 1000 ft. above the sea, 16 m. S.W. from Hirschberg by the railway to Grünthal. Pop. (1905) 4994. It has two Roman Catholic and two Evangelical churches, and works for the making and polishing of glass. It is a popular resort, being visited by about 10,000 visitors annually.

See Klotz, Schreiberhau im Riesengebirge (Breslau, 1893).

SCHREYER, ADOLF (1828-1899), German painter, was born at Frankfort-on-Main, and studied art first at the Staedel Institute in his native town, and then at Stuttgart, Munich, and Düsseldorf; but he formed his style in Paris, whilst he found his favourite subjects in his travels in the East. He first accompanied Prince Thurn and Taxis through Hungary, Wallachia, Russia and Turkey; then, in 1854, he followed the Austrian army across the Wallachian frontiers. In 1856 he wrote to Egypt and Syria, and in 1861 to Algiers. In 1862 he settled in Paris, but returned to Germany in 1870; and settled at Cronberg near Frankfort, where he died in 1890. Schreyer was, and is still, especially esteemed as a painter of horses, of peasant life in Wallachia and Moldavia, and of battle incidents. His work is remarkable for its excellent equine draughtsmanship, and for the artist’s power of observation and forceful statement; and has found particular favour among French and American collectors. Of his battle-pictures there are two at the Schwerin Gallery, and others in the collection of Count Mensdorff-Pouilly and in the Raveh Gallery, Berlin. His painting of a ‘Charge of the Imperial Guard’ was formerly at the Luxembourg Museum. The Metropolitan Museum, New York, owns three of Schreyer’s oriental paintings: “Abandoned,” “Arabs on the March” and “Arabs making a döür”; and many of his best pictures are in the Rockefeller, Vanderbilt, J. Astor, W. Astor, A. Belmont, and W. Walters collections. At the Kunsthalle in Hamburg is his “Wallachian Transport Train,” and at the Staedel Institute, Frankfort, are two of his Wallachian scenes.

SCHRIJVER, PETER (1576-1660), Dutch author, better known as Peter de Strijve, was born at Utrecht on 15 July 1576. He was educated at the university of Leiden, where he formed a close intimacy with Daniel Heinsius. He belonged to the party of Oldenbarnevelt and Grotius, and brought down the displeasure of the government by a copy of Latin verses in honour of their friend Hoogerbeets. Most of his life was passed in Leiden, but in 1650 he became blind, and the last years of his life were spent in his son’s house at Oudewater, where he died on the 30th of April 1660.

He is best known as a scholar by his notes on Martial, Ausonius, the Perpetuum Veneris; editions of the poems of Sculier (Leiden, 1615), of De re militari of Vegetius Renatus, the tragedies of Seneca (P. Scribrii collectanea veterum tragicorum, 1621), &c. His Opus acrosticum, philologiae, et poeticae (Utrecht, 1738) were edited by A. H. W. Westerhoovius, and his Nederlandsche Gedichten (1739) by S. Dockes. He made many valuable contributions to the history of Holland: Balaviæ Illustris (4 parts, Leiden, 1609); Corie historische Beschryvinghe der Nederlandschē Oorloegen (1612); In- ferioris Germaniae . . . historia (1611, 4 parts); Beschryvinghe van Oot Bataven (Arnhem, 1612); Het oude gontische Chronicleyen van Holland, edited by him, and printed at Amsterdam in 1665; Princeps historiae antiquae (Haarlem, 1650, translated (1678) into Dutch by Pieter Brugman. See Peerlkamp, Vitae Belgarum qui latina carmina scripserunt (Hamburg, 1822), and J. H. Hoeiduit, Parnassus latinus-belicensis (Amsterdam, 1819).

SCHRÖDER, FRIEDRICH LUDWIG (1744-1816), German actor, manager and dramatist, was born in Schwerin on the 3rd of November 1744. Shortly after his birth, his mother, Sophie Charlotte Schröder (1714-1792), separated from her husband, and joining a theatrical company toured with success in Poland and Russia. Subsequently she married Konrad Ernst Ackermann and appeared with his company in many German cities, finally settling in Hamburg. Young Schröder early showed considerable talent, but his childhood was rendered so unhappy by his mother’s flight that he was driven to make his own way as a shoemaker. He rejoined his parents, however, in 1759, and became an actor. In 1764 he appeared with the Ackermann company in Hamburg, playing leading comedy parts; but these he soon exchanged for the tragic rôles in which he became famous. These included Hamlet, Lear and Philip in Schiller’s Don Carlos. After Ackermann’s death in 1771 Schröder and his mother took over the management of the Hamburg theatre, and he began to write plays—largely adaptations from the English, making his first success with the comedy Die ARGSpitze. In 1780 he left Hamburg, and after a tour with his wife, Anna Christina Hart, a former pupil, accepted an engagement at the Court theatre in Vienna. In 1785 Schröder again took over his Hamburg management and conducted the theatre with marked ability until his retirement in 1798. The Hamburg theatre again falling into decay, the master was once more summoned to assist in its
SCHÜBERG, S.—SCHUBERT

SCHÖRDER, SOPHIE (1781-1868), German actress, was born at Paderborn on the 23rd of February 1781, the daughter of a actor, Gottfried Bürger. She made her first appearance in opera at St Petersburg, in 1793. On Kotzebue’s recommendation she was engaged for the Vienna Court theatre in 1798, and here in Munich and Hamburg she won great successes in tragic roles like Marie Stuart, Phèdre, Merope, Lady Macbeth, and Isabella in The Bride of Messina, which gave her the reputation of being “the German Siddons.” She retired in 1840 and lived in Augsburg and Munich until her death on the 23rd of February 1868. She had married, in 1795, an actor, Stollmers (properly Smet), from whom she separated in 1799. In 1804 she married the tenor Friedrich Schröder, and on his death in 1825, an actor, Kun, Mme Schröder’s eldest daughter was the opera singer, Wilhelmine Devrient-Schröder (q.v.).

See Prof. Schmödl, Sophie Schröder (Vienna, 1879); also Das Lexicon der deutschen Bühnen-Angelhörigen.

SCHÖRDER—DEVRIENT, WILHELMINE (1804-1866), German operatic singer, was born on the 6th of December 1804, in Hamburg, being the daughter of the actress, Sophie Schröder (1781-1868). Her first impersonation was at the age of fifteen as Aricia in Schiller’s translation of Racine’s Phèdre, and in 1821 she was received with so much enthusiasm as Pamina in Mozart’s Zauberflöte that her future career in opera was assured. In 1823 she married Karl Devrient, but was separated from him afterwards making two other marriages. Meanwhile she had maintained her popularity at Dresden and elsewhere. She made her first Paris appearance in 1830, and she sang in London in 1833 and 1837. As a singer she combined a rare quality of tone with dramatic intensity of expression, which was as remarkable on the concert platform as in opera. She died in Coburg on the 26th of January 1866.

See E. von Glernen, Erinnerungen an Wilhelmine Schröder-Devrient (Leipzig, 1884), and von Woltzen, Wilhelmine Schröder-Devrient (Leipzig, 1863).

SCHRÖTER, JOHANN HIERONYMUS (1745-1816), German astronomer, was born at Erfurt on the 30th of August 1745. Having studied law at Göttingen, he became chief magistrate at Lillenthal, near Bremen, in 1778. Here he built an observatory, and, equipped in 1785 by a 7-ft. reflector by Herschel, and later by a 13-ft. reflector by Johann Gottlieb Friedrich Schröder of Kiel, he made his famous observations on the surface features of the moon and planets. His work was ruined in 1813 by the French under Vandamme, who destroyed his books, writings and observatory; he never recovered from the catastrophe, and died on the 29th of August 1816.

SCHUBART, CHRISTIAN FRIEDRICH DANIEL (1739-1791), German poet, was born at Obersohnheim in Swabia (now the kingdom of Württemberg) on the 24th of March 1739, and entered the university of Erlangen in 1758 as a student of theology. He led a dissolute life, and after two years’ stay was summoned home by his parents. After attempting to earn a livelihood as private tutor and as assistant preacher, his musical talents gained him the appointment of organist in Geislingen, and subsequently in Ludwigsburg; but in consequence of his wild life and blasphemy, which found expression in a parody of the litany, he was expelled the country. He then visited in turn Heilbronn, Mannheim, Munich and Augsburg. In the last-named town he made a considerable stay, began his Deutsche Chronik (1774-1779) and eked out a subsistence by reciting from the latest works of prominent poets. Owing to a bitter attack upon the Jesuits, he was expelled from Augsburg and fled to Ulm, where he was arrested in 1777 and confined in the fortress of Hohenasperg. Here he met with lenient treatment, and he beguiled the time by a study of mystical works and in composing poetry. His Sämtliche Gedichte appeared in two volumes at Stuttgart in 1785-1786 (new edition by G. Hauff, Leipzig, 1884, in Reclam’s Universal-Bibliothek); in this collection most of the pieces are characterized by the bombast of the “Sturm und Drang” period. He was set at liberty in 1787, at the instance of Frederick the Great, king of Prussia, and expressed his gratitude in Spuren aus Friedrich den Fernen. Schubart was now appointed musical director and manager of the theatre at Stuttgart, where he continued his Deutsche Chronik and began his autobiography, Schubarts Leben und Gesinnungen (2 vols., 1791-1793), but, before its completion he died at Stuttgart on the 10th of October 1791. His Gesammelte Schriften and Schicksale appeared in 8 vols. (Stuttgart, 1839-1840).

SCHUBERT, FRANZ PETER (1797-1828), German composer, was born on the 31st of January 1797, in the Himmelpfortgrund, a small suburb of Vienna. His father, Franz, son of a Moravian peasant, was a parish schoolmaster; his mother, Elizabeth Fitz, had before her marriage been cook in a Viennese family. Of their fourteen children nine died in infancy; the others were Ignaz (b. 1784), Ferdinand (b. 1794), Karl (b. 1796), Franz and a daughter Theresa (b. 1801). The father, a man of worth and integrity, possessed some reputation as a teacher, and his school, in the Lichtenthall, was well attended. He was also a fair amateur musician, and transmitted his own measure of skill to his two elder sons, Ignaz and Ferdinand. At the age of five Schubert began to receive regular instruction from his father. At six he entered the Lichtenthall school where he spent some of the happiest years of his life. About the same time his musical education began. His father taught him the rudiments of the violin, his brother Ignaz the rudiments of the pianoforte. At seven, having outstripped these simple teachers, he was placed under the charge of Michael Holzer, the Kapellmeister of the Lichtenthall Church. Holzer’s lessons seem to have consisted mainly in expressions of admiration, and the boy gained more from a friendly joiner’s apprentice, who used to take him to a neighbouring pianoforte warehouse and give him the opportunity of practising on a better instrument than the poor home could afford. The unsatisfactory character of his early training was the more serious as, at that time, a composer had little chance of success unless he could appeal to the public as a performer, and for this the meagre education was never sufficient. In October 1808 he was received as a scholar at the Convikt, which, under Salleri’s direction, had become the chief music-school of Vienna, and which had the special office of training the choristers for the Court Chapel. Here he remained until nearly seventeen, profiting little by the direct instruction, which was almost as careless as that given to Haydn at St Stephen’s, but much by the practices of the school orchestra, and by association with congenial comrades. Many of the most devoted friends of his after life were among his schoolfellows: Spaun and Stadler and Holzapfel, and a score of others who helped him out of their slender pocket-money, bought him music-paper which he could not buy for himself, and gave him loyal support and encouragement. It was at the Convikt, too, that he first made acquaintance with the overtures and symphonies of Mozart—there is as yet no mention of Beethoven—and between them and lighter pieces, and occasional visits to the opera, he began to lay for himself some foundation of musical knowledge.

Meanwhile his genius was already showing itself in composition. A pianoforte fantasia, thirty-two close-written pages, is dated April 8-May 1, 1810; then followed, in 1811, three long vocal pieces written upon a plan which Zumsteeg had popularized, together with a “quint-overture,” a string quartet, a second pianoforte fantasia and a number of songs. His essay in chamber-music is noticeable, since we learn that at the time a regular quartet-party was established at his home “on Sundays
and holidays," in which his two brothers played the violin, his father the 'cello and Franz himself the viola. It was the first germ of that amateur orchestra for which, in later years, many of his compositions were written. During the remainder of his stay at the Convict he wrote a good deal more chamber-music, several songs, some miscellaneous pieces for the pianoforte and, among his more ambitious efforts, a Kyrie and Salve Regina, an octet for wind-instruments—said to commemorate the death of his mother, which took place in 1812—a cantata, words and music, for his father's name-day in 1813, and the closing work of his school-life was his Der Taschler.

At the end of 1813 he left the Convict, and, to avoid military service, entered his father's school as teacher of the lowest class. For over two years he endured the drudgery of the work, which, we are told, he performed with very indifferent success. There were, however, other interests to compensate. He took private lessons from Salieri, who annoyed him with accusations of plagiarism from Haydn and Mozart, but who did more for his training than any of his other teachers; he formed a close friendship with a family named Grob, whose daughter Therese was good-natured, good-tempered, and occupied every moment of leisure with rapid and voluminous composition. His first opera—Des Teufels Lastschloss—and his first Mass—in F major—were both written in 1814, and to the same year belong three string quartets, many smaller instrumental pieces, the first movement of the symphony in Bb and seventeen songs, which include such masterpieces as Der Taucher and Gretchen am Spinnrade. But even this activity is far outpaced by that of the annus mirabilis 1815. In this year, despite his school-work, his lessons with Salieri and the many distractions of Viennese life, he produced an amount of music the record of which is almost incredible. The symphony in Bb was finished, and, a third, in D major, added soon afterwards. Of church music there appeared two Masses, in G and Bb, the former written within six days, a new Dona nobis for the Mass in F, a Stabat Mater and a Salve Regina. Opera was represented by no less than five works, of which three were completed—Der Vierjährige Posten, Fernando and Claudine von Villabella—and two, Adrast and Die beiden Freunde von Salamanca, apparently left unfinished. Besides these the list includes a string quartet in G minor, four sonatas and several smaller compositions for piano, and, by way of contrast, a Provençal song, of considerable length, and of which eight are dated Oct. 1st, and seven Oct. 16th. "Here," we may say with Dryden, "is God's plenty." Music has always been the most generous of the arts, but it has never, before or since, poured out its treasure with so lavish a hand.

In the winter of 1814-1815 Schubert made acquaintance with the poet Mayrhofer: an acquaintance which, according to his usual habit, soon ripened into a warm and intimate friendship. They were singularly unlike in temperament: Schubert frank, open and sunny, with brief fits of depression, and sudden outbursts of boisterous high spirits; Mayrhofer grim and saturnine, a silent man who regarded life chiefly as a test of endurance; but there is good authority for holding that "the best harmony is the resolution of discord," and of this aphorism the ill-assorted pair offer an illustration. The friendship, as will be seen later, was of service to Schubert in more than one way.

1815 was the most prolific period of Schubert's life, so 1816 saw the first real change in his fortunes. Somewhere about the turn of the year Spau surprised him in the composition of Erlkönig—Goethe's poem propped up among a heap of exercise-books, and the boy at whiteheat of inspiration "hurling" the notes on the musician. A few weeks later Von Schotten, a law-student of good family and some means, who had heard some of Schubert's songs at Spau's house, came to pay a visit to the composer and proposed to carry him off from school-life and give him freedom to practice his art in peace. The proposal was particularly opportune, for Schubert had just made an unsuccessful application for the post of Kapellmeister at Laibach, and was feeling more acutely than ever the slavery of the classroom. His father's consent was readily given, and before the end of the spring he was installed as a guest in Von Schotten's lodgings. For a time he attempted to increase the household resources by giving music lessons, but they were soon abandoned, and he devoted himself to composition. "I write all day," he said later to an inquiring visitor, "and when I have finished one piece I begin another."

The works of 1816 include three ceremonial cantatas, one written for Salieri's Jubilee on June 16; one, eight days later, for a certain Herr Watteroth who paid the composer an honorarium of £4 ("the first time," said the journal, "that I have composed for money"), and one, on a foolish philanthropic idea of Herr Ignaz von Hoffmann, "Founder and Principal of the Schoolmasters' Widows' Fund." Of more importance are two new symphonies, No. 4 in C minor, called the Tragic, with a striking andante, No. 5 in Bb, as bright and fresh as a symphony of Mozart: some numbers of church music, fuller and more mature than any of their predecessors, and over a hundred songs, among which are comprised some of his finest settings of Goethe and Schiller. There is also an opera, Die Burgschaft, spoiled by an illiterate book, but of interest as showing how continually his mind was turned towards the theatre.

All this time his circle of friends was steadily widening. Many of them were introduced to the famous haritone, who did him good service by performing his songs in the salons of Vienna; Anselm Hüttenbrenner and his brother Joseph ranged themselves among his most devoted admirers; Gahy, an excellent pianist, played his sonatas and fantasias; the Sonnleithners, a rich burgher family whose eldest son had been at the Convict, gave him free access to their home, and organized in his honour musical parties which soon assumed the name of Schubertian. The materials needed for life were supplied without much difficulty. No doubt Schubert was entirely penniless, for he had given up teaching, he could earn nothing by public performance, and, as yet, no publisher would take his music at a gift; but his friends came to his aid with true Bohemian generosity—one found him lodging, another found him appliances, they took their meals together and the man who had any money paid the score. Schubert was always the leader of the party, and was known by half-a-dozen affectionate nicknames, of which the most characteristic is "kann er was?" his usual question when a new acquaintance was proposed.

1818, though, like its predecessor, comparatively unfertile in composition, was in two respects a memorable year. It saw the first public performance of one of Vogl of Schubert's—theatricals in the Italian style written as an avowed burlesque of Rossini, and played in all seriousness at a Jall concert on March 1. It also saw the beginning of his only official appointment, the post of music-master to the family of Count Johann Esterhazy at Zelez, where he spent the summer amid pleasant and congenial surroundings. The compositions of the year include a Mass and a symphony, both in C major, a certain amount of four-hand pianoforte music for his pupils at Zelez and a few songs, among which are EinSamheil, Marienbild and the Lilanay. On his return to Vienna in the autumn he found that Von Schotten had no room for him, and took up his residence with Mayrhofer. There his life continued on its accustomed lines. Every morning he began composing as soon as he was out of bed, till about two o'clock, then dined and took a country walk, then returned to composition or, if the mood forsook him, to visits among his friends. He made his first public appearance as a song-writer on February 28, 1819, when the Schöfflers Klage-lied was sung by Jäger at a Jall concert. In the summer of the same year he took a holiday and travelled with Vogl through Upper Austria. At Steyr he wrote his brilliant piano quintet in A, and astonished his friends by transcribing the parts without a score. In the autumn he sent three of his songs to Goethe, but, so far as we know, received no acknowledgment.

The compositions of 1820 are remarkable, and show a marked advance in development and maturity of style. The unfinished oratorio Lazarus was begun in February; later followed, amid a number of smaller works, the 23rd Psalm, the Gesang der Geister, the Quartettssatz in C minor and the grand pianoforte fantasia on Der Wanderer. But of almost more biographical interest is
the fact that in this year two of Schubert's operas appeared at the Kärntnertor theatre, *Die Zauberrahme* on June 14, and *Die Zauberharfe* on August 19. Hitherto his larger compositions (apart from Masses) had been restricted to the amateur orchestra at the Gendehof, a society which grew out of the quartet-parties at his home. Now he began to assume a more prominent position and address a wider public. Still, however, publishers held obstinately aloof, and it was not until his friend Vogl had sung *Zauberharfe* in and out of him that they gave in. Diabelli hesitatingly agreed to print some of his works on commission. The first seven opus-numbers (all songs) appeared on these terms; then the commission ceased, and he began to receive the meagre pittances which were all that the great publishing houses ever accorded to him. Much has been written about the neglect from which he suffered during his lifetime. It was not the fault of his friends, it was only indirectly the fault of the Viennese public; the persons most to blame were the cautious intermediaries who stilled and hindered him from publication.

The production of his two dramatic pieces turned Schubert's attention more firmly than ever in the direction of the stage; and towards the end of 1821 he set himself on a course which for nearly three years brought him continuous mortification and disappointment. *Alfonso und Estrella* was refused, so was *Fierrabras; Die Verschworenen* was prohibited by the censor (apparently on the ground of its title); *Rosamunde* was withdrawn after two nights, owing to the badness of its libretto. Of these works the two former are written on a scale which would make their performances exceedingly difficult (*Fierrabras*, for instance, contains over 1000 pages of manuscript score), but *Die Verschworenen* is a bright attractive comedy, and *Rosamunde* contains some of the most charming music that Schubert ever composed. In 1822 he made the acquaintance both of Weber and of Beethoven, but little came of it in either case, though Beethoven cordially acknowledged his genius. Von Schobes was away from Vienna; new friends appeared of a less desirable character; on the whole these were the darkest years of his life.

In the spring of 1824 he wrote the magnificent octet, "A Sketch for a Grand Symphony"; and in the summer went back to Zelez, where he became attracted by Hungarian idiom, and wrote the *Divertissement à l'Hongroise* and the string quartet in A minor. Most of his biographers have set down here a story of his hopeless passion for his pupil Countess Caroline Esterhazy; but whatever may be said as to the general likelihood of the romance, the details by which it is illustrated are apocryphal, and the song *L'Addio*, placed at its climax, is undoubtedly spurious. A more debatable problem is raised by the grand duo in C major (op. 140) which is dated from Zelez in the summer of this year. It bears no relation to the style of Schubert's pianoforte music, it is wholly orchestral in character, and it may well be a transcript or sketch of the "grand symphony for which the octet was a preparation. If so, it settles the question, raised by Sir George Grove, of a "Symphony in C major" which is not to be found among Schubert's orchestral scores.

Despite his preoccupation with the stage and later with his official duties he found time during these years for a good deal of miscellaneous composition. The Mass in Ab was completed and the exquisite "Unfinished Symphony" begun in 1822. The *Mülleriader*, and several other of his best songs, were written in 1825; to 1824, beside the works mentioned above, belong the variations on *Trockne Blumen* and the two string quartets in E and Eb. There is also a sonata for piano and "Arpeggione," an interesting attempt to encourage a cumbrous and now obsolete instrument.

The mishaps of the recent years were compensated by the prosperity and happiness of 1825. Publication had been moving more rapidly; the stress of poverty was for a time lightened; in the summer there was a pleasant holiday in Upper Austria, where Schubert was welcomed with enthusiasm. It was during this tour that he produced his "Songs from Sir Walter Scott," and his piano sonata in A minor (op. 42), the former of which he sold to Artaria for £20, the largest sum which he had yet received for any composition. Sir George Grove, on the authority of Randhartinger, attributes to this summer a lost "Gastein" symphony which is possibly the same work as that already mentioned under the record of the preceding year.

From 1826 to 1828 Schubert resided continuously in Vienna, except for a brief visit to Graz in 1827. The history of his life during these three years is little more than a record of his compositions. The only events worth notice are that in 1826 he dedicated a symphony to the Gesellschaft der Musikfreunde, with which his friend Vogl's *Gehorsam* began; that in the same year he applied for a conductorship at the opera, and lost it by refusing to alter one of his songs at rehearsal, and that in the spring of 1828 he gave, for the first and only time in his career, a public concert of his own works. But the compositions themselves are a sufficient biography. The string quartet in D minor, with the variations on "Death and the Maiden," was written during the winter of 1825-1826, and first played on Jan. 25. Later in the year came the string quartet in G major, the *Romantik brillants," for piano and violin, and the fine sonata in G which, by some pedantry of the publisher's, is printed without its proper title. To these should be added the three Shakespearian songs, of which "Hark! Hark! the Lark" and "Who is Sylvia?" were written on the same day, the former at a tavern where he broke his afternoon's walk, the latter on his return to his lodging in the evening. In 1827 he wrote the *Winterreise*, the fantasia for piano and violin, and the two piano trios: in 1828 the *Song of Miriam*, the C major symphony, the Mass in E5, and the exceedingly beautiful *Totentanz Ergo* in the same key, the string quintet, the second Benedictus to the Mass in C, the last three piano sonatas, and the collection of songs known as *Schwanengesang*. Six of these are to words by Heine, whose *Buch der Lieder* appeared in the autumn. Everything pointed to the renewal of an activity which should equal that of his greatest abundance, when he was suddenly attacked by typhus fever, and after a fortnight's illness died on Nov. 19 at the house of his brother Ferdinand. He had not completed his thirty-second year.

Some of his smaller pieces were printed shortly after his death, but the more valuable seem to have been regarded by the publishers as waste paper. In 1838 Schumann, on a visit to Vienna, found the dusty manuscript of the C major symphony and took it back to Leipzig, where it was published by his son and celebrated in the *Neue Zeitschrift*. The most important step towards the recovery of the neglected works was the journey to Vienna which Sir George Grove and Sir Arthur Sullivan made in the autumn of 1867. The account of it is given in Grove's appendix to the English translation of Kreisler von Heiborn; the travellers rescued from oblivion seven symphonies, the *Rosamunde* music, some of the Masses and operas, some of the chamber works, and a vast quantity of miscellaneous pieces and songs. Their success gave impetus to a widespread public interest and finally resulted in the definitive edition of Breitkopf and Härtel.

Schubert is best summed up in the well-known phrase of Liszt, that he was "le musicien le plus poète qui fut jamais." In clarity of style he was inferior to Mozart, in power of musical construction he was far inferior to Beethoven, but in poetic impulse and suggestion he is unsurpassed. He wrote always at headlong speed, he seldom blotted a line, and the greater part of his work bears, in consequence, the essential mark of improvisation: it is fresh, vivid, spontaneous, impatient of restraint, full of rich colour and of warm imaginative feeling. He was the greatest songwriter who ever lived, and almost everything in his hand turned to song. In his Masses, for instance, he seems to chafe at the contrapuntal numbers and pours out his whole soul on those on which he found suitable for lyrical treatment. In his symphonies the lyric and elegiac passages are usually the best, and the most beautiful of them all is, throughout its two movements, lyric in character. The standpoint from which to judge him is that of a singer who ranged over the whole field of musical composition and everywhere carried with him the artistic form which he loved best.
Like Mozart, whose influence over him was always considerable, he wrote nearly all the finest of his compositions in the last ten years of his life. His early symphonies, his early quartets, even his early masses, are too much affected by a traditional style to establish an entrance. A major (1819) may here be taken as the turning-point; then come the Schumannesque Symphonies, which are not Schubert in every bar; the three quartets in A minor, D minor, and G major, full of romantic colorings, are only second-rate. The C major Symphony, which, though diffuse, contains many passages of surprising beauty. Every one of them is a masterpiece, and a masterly piece such as Schumann alone could have written. The days of brilliant promise were over and were succeeded by the days of full and mature achievement.

His larger operas are marred both by their inordinate length and by their want of dramatic power. The slighter comedies are pretty and tuneful, but, except as curiosities, are not likely to be revived. We may, however, deplore the fate which has deprived the stage of the Rosamunde music. It is in Schubert's best vein; the entire opera would have exceeded the best ballet music. Here the character of a pianoforte technique of his own—not always "orthodox," but always characteristic. A special word should be added on his fondness for pianoforte parts which before his time had been rarely attempted. Of these he wrote a great many—fantasias, marches, polonaises, variations—all bright and melodious with sound texture and a remarkable command of rhythm.

According to Levin, his style for the voice are extremely difficult, but they are of a rare beauty which would well repay the labour of rehearsal. The 23rd psalm (for female voices) is exquisite; so are the Gesang der Geister, the Nachtmusik, the Nachgesang im Walde (for female voices). There is also a great quantity of celestial music. In which Novello has published with English words under the title of "Where Thou Reignest." Among all Schubert's mature works there are none more undeservedly neglected than these.

Of the songs it is impossible, within the present limits, to give even a sketch. They number over 600, excluding scenes and operatic pieces, and they contain masterpieces from the beginning of his career to the end. Gretchen am Spinnrade was written when he was seventeen, Erkönig when he was eighteen; then there follows a continuous stream which never ceases. And which broadens as it flows to the Müllerslieder, the Schottische, the Schwanengesang, and the posthumous works. Of which Novello has published with English words under the title of "The Works of Schubert." Among all Schubert's mature works there are none more undeservedly neglected than these.

In his later songs he is more affected by the external and pictorial aspect of the poem; in the later ones he penetrates to the centre and seems the poetic conception from within. But in both alike he shows a gift of absolute melody which, even apart from its meaning, widens the sphere of the music. His three late masses—his two great predecessors in lyric tune—have surpassed or even approached him in fertility and variety of resource. The songs in Acts are wonderful; so are those in Zauberflöte, but they are not so wonderful as Litanei, and "Who is Sylvia?—"The voice is the introduction into music of a particular quality of romance, a particular "addition of strangeness to beauty"; and so long as this remains his place among its supreme masters will always be assured.

SCHÜCKING, LEVIN (1814-1883), German novelist, was born on the estate of Kemleswirth, near Meppen, in Westphalia, on the 6th of September 1814. After studying law at Munich, Heidelberg and Göttingen, he wished to enter the government judicial service, but, confronted by serious difficulties, abandoned the legal career, and settling at Münster in 1837, devoted himself to literary work. In 1841 he removed to Schloss Meersburg on the lake of Constance, joined in 1843 the editorial staff of the Allgemeine Zeitung in Augsburg, and in 1845 that of the Kölnische Zeitung in Cologne. In 1852 he retired to his estate, Sassenberg near Münster, and died at Pyrmont on the 31st of August 1883. Among his numerous romances, which are distinguished by good taste and patriotic feeling, largely reflecting the sound, sturdy character of the Westphalians, must be especially mentioned: Ein Schloss am Meere (1843); Ein Sohn des Volkes (1845); Ein Staatsgeheimnis (1854); Verschlungene Wege (1856); Die Herberge der Gerechtigkeit (1879). Schücking wrote a number of short stories: "Aus den Tagen der grossen Groteskerin" (1845), the "Table Romane" (1867). In Annette von Droste-Hülshoff's "Nachtgesang," he must be thanked for his acknowledgment of her beneficent influence on his mind. There appeared posthumously, Lebenserinnerungen (1886) and Briefe von Annette von Droste-Hülshoff and Levin Schücking (1863).

SCHULTENS, the name of three Dutch Orientalists. The first and most important, Albert Schultens (1668-1750), was born at Groningen. He studied for the church at Groningen and Leiden, applying himself specially to Hebrew and the cognate tongues. His dissertation on The Use of Arabic in the Interpretation of Scripture appeared in 1706. After a visit to Rotterdam and Drecht, he returned to Leiden (1708); then, having taken his degree in theology (1709), he again went to Leiden, and devoted himself to the study of the Mis. collections there till in 1711 he became pastor at Wassenaar. Disliking parochial work, in 1713 he took the Hebrew chair at Franeker, which he held till 1729, when he was transferred to Leiden as rector of the collegium theologicum, or seminary for poor students. From 1732 till his death (at Leiden on the 20th of January 1750) he was professor of Oriental languages at Leiden. Schultens was the chief Arabic teacher of his time, and in some sense a restorer of Arabic studies, but he differed from J. J. Reiske and A. L. De Sacy in giving a greater prominence to the actual Bible text and the Hebrew language itself.

Schultens of the name of three Dutch Orientalists. The first and most important, Albert Schultens (1668-1750), was born at Groningen. He studied for the church at Groningen and Leiden, applying himself specially to Hebrew and the cognate tongues. His dissertation on The Use of Arabic in the Interpretation of Scripture appeared in 1706. After a visit to Rotterdam and Drecht, he returned to Leiden (1708); then, having taken his degree in theology (1709), he again went to Leiden, and devoted himself to the study of the Mis. collections there till in 1711 he became pastor at Wassenaar. From 1732 till his death (at Leiden on the 20th of January 1750) he was professor of Oriental languages at Leiden. Schultens was the chief Arabic teacher of his time, and in some sense a restorer of Arabic studies, but he differed from J. J. Reiske and A. L. De Sacy in giving a greater prominence to the actual Bible text and the Hebrew language itself.

The principal works were Origins Hebraeae (2 vols., 1724, 1738), a second edition of which, with the De defectibus linguae Hebraeae (1731), appeared in 1761; Job (1737); Proverbs (1748); Velus et regia via hebraeandi (1738); Monumenta veterana Arabum (1740), &c.

His son, John James Schultens (1716-1778), became professor at Harborn in 1744, and afterwards succeeded to his father's chair. He was in turn succeeded by his son, Henry Albert Schultens (1749-1793), who, however, left comparatively little behind him, having succumbed to excessive work while preparing an edition of Meidanii, of which only a part appeared posthumously (1795).

SCHULTZ, HERMANN (1836-1917), German Protestant theologian, was born at Lüchow in Hanover on the 30th of December 1836. He studied at Göttingen and Erlangen, became professor at Basel in 1864, and eventually (1876) professor ordinarius at Göttingen. Here he has also held the appointments of chief university preacher, councillor to the consistory (from 1884) and abbot of Bursfelde (1890). Professor Schultz's theological standpoint was that of a moderate liberal. "It is thought by many that he has succeeded in discovering the via media between the positions of Biblical scholars like Delitzsch on the one hand and Stade on the other" (Prof. J. A. Paterson). He is well known to British and American students as the author of an excellent work on Old Testament Theology (2 vols., 1869, 5th ed., 1896; Eng. trans., 2nd ed., 1895).
In his work on the doctrine of the Divinity of Christ (Die Lehre von der Gotheit Christi, 1881) he follows the method of Ritschl, and contends that the deity of Christ ought to be understood as the expression of the experience of the Christian community. In his own person and work Christ represents to the community a personal revelation of God. Faith in the divinity of Christ does not rest upon a miracle in nature, but upon a miracle in the moral world.

**SCHULTZE, MAX JOHANN SIGISMUND (1825–1874),** German microscopic anatomist, was born at Freiburg in Breisgau (Baden) on the 25th of March 1825. He studied medicine at Greifswald and Berlin, and was appointed extraordinary professor at Halle in 1854 and five years later ordinary professor of anatomy and histology and director of the Anatomical Institute at Bonn. He died at Bonn on the 10th of January 1874. He founded, in 1865, and edited the important Archiv für mikroskopische Anatomie, to which he contributed many papers on the subject of microscopical examination on technical methods. His works included Beiträge zur Naturgeschichte der Turbellarien (1851), Über den Organismus der Polypathalen (1854), Beiträge zur Kenntnis der Landplanarien (1857), Zur Kenntnis der elektrischen Organe der Fische (1858) and Zur Anatomie und Physiologie der Retina (1865). His name is especially known for his work on the cell theory. Uniting F. Dujardin's conception of animal sarcode with H. von Mohl's of vegetable protoplasma, he pointed out their identity, and included them under the common name of protoplasma, defining the cell as 'an inclosed mass of protoplasma with or without a cell-wall' (Das Protoplasma der Rhiizopoden und der Pflanzenzellen: ein Beitrag zur Theorie der Zelle, 1865).

**SCHULZE-DELTITZ, FRANZ HERMANN (1885–1893).** German economist, was born at Delitzsch, in Prussian Saxony, on the 29th of August 1886. The place-name Delitzsch was added in 1848 to distinguish him from other Schulzes in the National Assembly. He studied law at Leipzig and Halle Universities and, when thirty, he became an assessor in the Court of justice at Berlin, and three years later was appointed patrimonialrichter at Delitzsch. Entering the parliamentary career, in 1848, he joined the Left Centre, and, acting as president of the commission of inquiry into the condition of the labourers and artisans, became impressed with the necessity of co-operation to enable the smaller tradespeople to hold their own against the capitalists. He was a member of the Second Chamber in 1848–1849; but as matters ceased to run smoothly between himself and the high legal officials, he threw up his public appointments in October 1851, and withdrew to Delitzsch. Here he devoted himself to the organization and development of co-operation in Germany, and to the foundation of Vorschussvereine (people's banks), of which he had established the first at Delitzsch in 1850. These developed so rapidly that Schulze-Delitzsch in 1858, in Die arbeitenden Klassen und das Assossiationswesen in Deutschland, enumerated twenty-five as already in existence. In 1859 he promoted the first Genossenstaat, an co-operative meeting, in Weimar, and founded a central bureau of co-operative societies. In 1861 he again entered the Prussian Chamber, and became a prominent member of the Progressist party. In 1863 he devoted the chief portion of a testimonial, amounting to £7,000, to the maintenance of his co-operative institutions and offices. This, however, was only to meet an exceptional demand. khỏe the word, he insisted that they must be self-supporting. The next three or four years were given to the formation of local centres, and the establishment of the Deutsche Genossenschaften-Bank, 1865.

The spread of these organizations naturally led to legislation on the subject, and this too was chiefly the work of Schulze-Delitzsch. As a member of the Chamber in 1867 he was mainly instrumental in passing the Prussian law of association, which was extended to the North German Confederation in 1869, and later to the empire. Schulze-Delitzsch also contributed to uniformity of legislation throughout the states of Germany, in 1869, by the publication of Die Gesetzgebung über die privatrechtliche Stellung der Erwerbs- und Wirtschaftsgenossenschaften, &c. His life-work was now complete; he had placed the advantages of capital and co-operation within the reach of struggling tradesmen throughout Germany. His remaining years were spent in consolidating this work. Both as a writer and a member of the Reichstag his industry was incessant, and he died in harness on the 29th of April 1893 at Potsdam, leaving the reputation of a benefactor to the smaller tradesmen and artisans which he must be regarded rather than as the founder of true co-operative principles in Germany. (See also CO-OPERATION.)

**SCHUMACHER, HENRICH CHRISTIAN (1780–1820),** German astronomer, was born at Bramstedt in Holstein on the 3rd of September 1780. He was director of the Mannheim observatory from 1813 to 1815, and then became professor of astronomy in Copenhagen. From 1817 he directed the triangulation of Holstein, to which a few years later was added a complete geodetic survey of Denmark (finished after his death). For the benefit of his fellow countrymen, he wrote and published (in 1844–1845) the first comprehensive works on astronomical observations and the calculation of their results. But Schumacher resided there permanently, chiefly occupied with the publication of Ephemerides (11 parts, 1822–1832) and of the journal Astronomische Nachrichten, of which he edited thirty-one volumes. He died at Altona on the 28th of December 1850.

His son, RICHARD SCHUMACHER (1827–1902), was his assistant from 1844 to 1850 at the observatory at Altona. Having become assistant to Carl Guillaume Moesta (1825–1884), director of the observatory at Santiago, in 1859, he was associated with the Chilean geodetic survey in 1864. Returning in 1866, he was appointed assistant astronomer at Altona in 1873, and afterwards at Kiel.

H. C. Schumacher's nephew, CHRISTIAN ANDREAS SCHUMACHER (1810–1854), was associated with the geodetic survey of Denmark from 1833 to 1838, and afterwards (1844–1845) improved the observatory at Pulkowa.

**SCHUMANN, ROBERT ALEXANDER (1810–1856),** German musical composer, was born on the 8th of June 1810 in Zwickau in Saxony. His father was a publisher, and it was in the cultivation of literature quite as much as in that of music that his boyhood was spent. He himself tells us that he began to compose his own music when he was a child and at the age of fourteen he wrote an essay on the aesthetics of music and also contributed to a volume edited by his father and entitled Portraits of Famous Men. While still at school in Zwickau he read, besides Schiller and Goethe, Byron (whose Beppo and Child Harold had been translated by his father) and the Greek tragedians. But the most powerful as well as the most permanent of the literary influences exercised upon him, however, was undoubtedly that of Jean Paul Richter. This influence may clearly be seen in his youthful novels Junius ubiende and Selene, of which the first only was completed (1826). In 1828 he left school, and after a tour, during which he met Heine at Munich, he went to Leipzig to study law. His interest in music was stimulated when he was a child by hearing Moscheles play at Carlsbad, and in 1827 his enthusiasm had been further excited by the works of Schubert and Mendelssohn. But his father, who had encouraged the boy's musical aspirations, had died in 1826, and neither his mother nor his guardian approved of a musical career for him. The question seemed to be set at rest by Schumann's expressed intention to study law, but both at Leipzig and at Heidelberg, whither he went in 1829, he neglected the law for the philosophers, and thought—to use his own word—a new life in art a clearer form of expression. His first public performances were given on hearing the young F. Schubert play. At the age of twenty-four he began composing songs. The restless spirit by which he was pursued is disclosed in his letters of the period. At Easter 1830 he heard Paganini at Frankfurt. In July in this year he wrote to his mother, "My whole life has been a struggle between Poetry and Prose, or call it Music and Law," and by Christmas he was once more in Leipzig, taking piano lessons with his old master, Friedrich Wieck. In his anxiety to accelerate the process by which he could acquire a perfect execution he permanently injured his right hand. His ambitions as a pianist being thus
SCHUMANN

suddenly ruined, he determined to devote himself entirely to composition, and began a course of theory under Heinrich Dorn, conductor of the Leipzig opera. About this time he contemplated an opera on the subject of Hamlet. The fusion of the literary idea with its musical illustration, which may be said to have first taken shape in *Papillons* (op. 2), is foreshadowed to some extent in the first criticism by Schumann, an essay on Chopin’s variations on a theme from Don Juan, which appeared in the *Allgemeine musikalische Zeitung* in 1831. Here the work is discussed by the imaginary characters Florestan and Eusebius (the counterparts of Vaut and Weber in Jean Paul’s novel *Flegeljahre*), and the Meister Vriend (representing either the composer himself or Wieck) is called upon for opinion. By the time, however, that Schumann had written *Papillons* (1831) he had gone a step farther. The scenes and characters of his favourite novelist had now passed definitely and consciously into the written music, and in a letter from Leipzig (April 1832) he bids his brothers "read the last scene in Jean Paul’s *Flegeljahre* as soon as possible, because the *Papillons* are intended as a musical representation of that masquerade." In the winter of 1832 Schumann visited his relations at Zwickau and Schoen. In a letter of which Schumann had performed the first movement of his symphony in G minor, which remains unpublished. In Zwickau the music was played at a concert given by Wieck’s daughter Clara, who was then only thirteen. The death of his brother Julius as well as that of his sister-in-law Rosalie in 1833 seems to have affected Schumann with a profound melancholy. By the spring of 1834, however, he had sufficiently recovered to be able to start *Die neue Zeitschrift für Musik*, the paper in which appeared the greater part of his critical writings. The first number was published on the 3rd of April 1834. It effected a revolution in the taste of the time, when Mozart, Beethoven and Weber were being neglected for the shallow works of men whose names are now forgotten. To bestow praise on Chopin and Berlioz in those days was to court the charge of eccentricity in taste, yet the genius of both these masters was appreciated and openly proclaimed in the new journal.

Schumann’s editorial duties, which kept him closely occupied during the summer of 1834, were interrupted by his relations with Ernestine von Fricken, a girl of sixteen, to whom he became engaged. She was the adopted daughter of a rich Bohemian, from Zwickau and Schoen. The music of which Schumann had constructed his own *Etudes symphoniques*. The engagement was broken off by Schumann, for reasons which have always remained obscure. In the *Carnaval* (op. 9 = 1834), one of his most genial and most characteristic piano forte works, Schumann commenced nearly all the sections of which it is composed with the musical notes signified in German by the letters that spell Asch, the town in which Ernestine was born, which also are the musical letters in Schumann’s own name. By the sub-title “Estrella” to one of the sections in the *Carnaval*, Ernestine is meant, and by the sub-title “Chiarina” Clara Wieck. Eusebius and Florestan, the imaginary figures appearing so often in his critical writings, also occur, besides brilliant imitations of Chopin and Paganini, and the work comes to a close with a march of the men of David against the Philistines in which may be heard the clear accents of truth in contest with the dull clamour of falsehood. In the *Carnaval* Schumann went farther than in *Papillons*, for in it he himself conceived the story of which it was the musical illustration. On the 3rd of October 1835 Schumann met Mendelssohn at Wieck’s house in Leipzig, and his appreciation of his great contemporary was shown with the same generous freedom that distinguished him in all his relations to other musicians, and which later enabled him to recognize the genius of Brahms when he was still obscure.

In 1836 Schumann’s acquaintance with Clara Wieck, already famous as a pianist, ripened into love, and a year later he asked her father’s consent to their marriage, but was met with a refusal. In the series *Phänomenologie* for the piano (op. 12) he once more gives a sublime illustration of the fusion of literary and musical ideas as embodied conceptions in such pieces as “Warum” and “In der Nacht.” After he had written the latter of these two he detected in the music the fanciful suggestion of a series of episodes from the story of Hero and Leander. The Kreisleriana, which he regarded as one of his most successful works, was written in 1838, and in this the composer’s realism is again carried a step farther. Kreisler, the romantic poet brought into contact with the real world, was a character drawn from life by the poet E. T. A. Hoffmann (q.v.), and Schumann utilized him as an imaginary mouthpiece for the recital in music of his own personal experiences. The *Phantasi* (op. 17), written in the summer of 1836, is a work of the highest quality of passion, which Schumann, with the aid of his adherent, the Meister Vriend, wrote for the piano, written in 1838, after a visit to Vienna, this period of his life comes to an end. As Wieck still withheld his consent to their marriage, Robert and Clara at last dispensed with it, and were married on the 12th of September at Schönefeld near Leipzig.

The year 1840 may be said to have yielded the most extraordinary results in Schumann’s career. Until now he had written almost solely for the pianoforte, but in this one year he wrote about a hundred and fifty songs. Schumann’s biographers either omit or leave unexplained the reasoning which led him to write this flood of songs, the spontaneity, the doubt and the despair of which are all to be attributed to varying emotions aroused by his love for Clara. Yet it would be idle to ascribe to this influence alone the lyrical perfection of such songs as “Frühlingsnacht,” “Im wunderschönen Monat Mai” and “Schöne Wiege meiner Leiden.” His chief song-cycles of this period were his settings of the Liederkreis of J. von Eichendorff (op. 39), the *Frauenliebe und Leben* of Chamisso (op. 42), the *Dichterliebe* of Heine (op. 48) and *Myrthen*, a collection of songs, including poems by Goethe, Rückert, Heine, Byron, Burns and Moore. The songs “Belcariene” (op. 69), etc., to Heine’s words, show Schumann at his best as a ballad writer, though the dramatic ballad is less congenial to him than the introspective lyric. As Grillparzer said, “He has made himself a new ideal world in which he moves almost as he wills.” Yet it was not until long afterwards that he met with adequate recognition. In his lifetime the sole tokens of honour bestowed upon Schumann were the degree of Doctor by the University of Jena in 1840, and in 1843 a professorship in the Conservatorium of Leipzig. Probably no composer ever rivalled Schumann in concentrating his energies on one task at a time. A first impulse in his creative impulses was translated into pianoforte music, then followed the miraculous year of the songs. In 1841 he wrote two of his four symphonies. The year 1842 was devoted to the composition of chamber music, and includes the pianoforte quintet (op. 44), now one of his best known and most admired works. In 1843 he wrote *Paradise and the Peri*, his first essay at concerted vocal music. He had now mastered the separate forms, and from this time forward his compositions are not confined during any particular period to any one of them. In Schumann, above all musicians, the acquisition of technical knowledge was closely bound up with the growth of his own experience and the impulsion to express it.

The stage in his life when he was deeply engaged in his music to Goethe’s Faust (1834–1855) was a critical one for his health. The first half of the year 1844 had been spent with his wife in Russia. On returning to Germany he had abandoned his editorial work, and left Leipzig for Dresden, where he suffered from persistent nervous prostration. As soon as he began to work he was seized with fits of shivering, and an apprehension of death which was exhibited in an abhorrence for high places, for all metal instruments (even keys) and for drugs. He suffered perpetually also from imagining that he had the note A sounding in his ears. In 1846 he had recovered and in the winter revisited Vienna, travelling to Prague and Berlin in the spring of 1847 and in the summer to Zwickau, where he was received with enthusiasm, gratifying because Dresden and Leipzig were the only large cities in which his fame was at this time appreciated.

To 1848 belongs his only opera, *Genoveva*, a work containing much beautiful music, but lacking dramatic force. It is
SCHUMANN

interesting for its attempt to abolish the recitative, which Schumann regarded as an interruption to the musical flow. The subject of Genoveva, based on Tieck and Hebbel, was in itself not a particularly happy choice; but it is worth remembering that as early as 1842 the possibilities of German opera had been keenly realized by Schumann, who wrote, "Do you know my prayer as an artist, night and morning? It is called 'German Opera.' Here is a real field for enterprise...something simple, profound, German." And in his notebook of suggestions for the text of operas are found amongst others: Lohengrin and Till Eulenspiegel. The music to Byron's Manfred is pre-eminent in a year (1849) in which he wrote more than in any other. The insurrection of Dresden caused Schumann to move to Kreischa, a little village a few miles outside the city. In the August of this year, on the occasion of the hundredth anniversary of Goethe's birth, such scenes of Schumann's Faust as were already completed were performed in Dresden, Leipzig and Weimar, Liszt as always giving unwarranted support and encouragement. The rest of the work was written in the latter part of the year, and the overture in 1853. From 1850 to 1854 the text of Schumann's works is extremely varied. In 1850 he succeeded Ferdinand Hiller as musical director at Düsseldorf; in 1851-1853 he visited Switzerland and Belgium as well as Leipzig. In January 1854 Schumann went to Hanover, where he heard a performance of his Paradise and the Peri. Soon after his return to Düsseldorf, where he was engaged in editing his complete works and making an anthology on the subject of music, a renewal of the symptoms that had threatened him before showed itself. Besides the single note he now imagined that voices sounded in his ear. One night he suddenly left his bed, saying that Schubert and Mendelssohn had sent him a theme which he must write down, and on this theme he wrote five variations for the pianoforte, his last work. On the 27th of February he threw himself into the Rhine. He was rescued by some boatsmen, but when brought to land was found to be quite insane. He was taken to a private asylum in Endenich near Bonn, and remained there until his death on the 29th of July 1856. He was buried at Bonn and in 1880 a statue by A. Donndorf was erected on his tomb.

His wife, CLARA SCHUMANN (1819-1896), trained from an early age by Wieck, had a brilliant career as a pianist, the overture in the age of thirteen up to her marriage. In the various tours on which she accompanied her husband, she extended her own reputation beyond the borders of Germany, and it was thanks to her efforts that his compositions became generally known in Europe. From the time of her husband's death she devoted herself principally to the interpretation of her husband's works, but when in 1856 she first visited England the critics received Schumann's music with a chorus of disapprobation. She returned to London in 1856 and continued her visits annually, with the exception of four summers, until 1882; and from 1885 to 1888 she appeared each year. In 1878 she was appointed teacher of the piano at the Hoch Conservatorium at Frankfurt, a post which she held until 1892, and in which she contributed greatly to the modern improvement in technique. As an artist she will be remembered, together with Joseph Joachim, as one of the first executants who really played like composers. Besides being remembered for her eminence as a performer of nearly all kinds of pianoforte music, at a time when such technical ability was considerably rarer than in the present day, she was herself the composer of a few songs and of some charming music, mainly for the piano, and the authoritative editor of her husband's works for Breitkopf and Härtel.

The following are the chief compositions of Robert Schumann.

**Pianoforte Works.**

- Papillons (op. 2) 1829-1831
- Études symphoniques (op. 13) 1834
- Carnaval (op. 9) 1834-1835
- Scenes in D minor (op. 11) 1833-1835
- Sonata in G minor (op. 22) 1833-1835
- Kinderszenen (op. 15) 1836
- Fantasia in C (op. 7) 1836
- Faschingszuck (op. 12) 1837

**Choral and Dramatic Works.**

- "Liederkreis" (Heine), nine songs (op. 24)
- "Myrthen," twenty-six songs (4 books) (op. 25)
- "Liederkreis" (Eichendorff), the first volume (op. 39)
- "Frauenliebe und Leben" (Chaminos), eight songs (op. 42)
- "Dichterliebe," sixteen songs from Heine's Buch der Lieder (op. 49)
- Belcanto, ballet (Heine) (op. 57)
- Song, "Tragödie" (Heine) from op. 64
- Ballad, "Der Handschuh" (Schiller), probably from 1851
- Songs from Wilhelm Meister and Requiem for Mignon
- for chorus (op. 98)
- Spanische Liebeslieder (op. 138)

- "Choral and Dramatic Works," "Paradise and the Peri," for solos, chorus and orchestra (op. 53)
- Faust music
- Genoveva, opera
- Manfred music
- "Der Rose Pilgerfahrt" (Mortiz Horn), for solos, chorus and orchestra (op. 112)
- "Der Königsson" (Uhland), for solos, chorus and orchestra (op. 113)
- "Des Sängers Fluch" (Uhland) for solos, chorus and orchestra (op. 139)
- Mass for four part chorus and orchestra (op. 148)
- "Vom Pagen und der Königstochter," four ballads (Geibel) for solos, chorus and orchestra (op. 153)
- "Das Glück von Edenhalm," ballet (Uhland); for orchestra and chorus (op. 143)
- Festival overture on the Rheinweinlied for orchestra and chorus (op. 123)

**Chamber Music.**

- Three quartets for strings in A minor, F and A (op. 41)
- Quintet for pianoforte and strings in E flat (op. 44)
- Quartet for pianoforte and strings in E flat (op. 47)
- Fantasiestücke for pianoforte, violin and violoncello (op. 89)
- Andante and variations for two pianoforte (op. 46)
- Trio for pianoforte and strings in D minor (op. 53)
- Trio for pianoforte and strings in F (op. 80)
- Fantasiestücke for clarinet and pianoforte (op. 73)
- Five Stücke in the Volkston for pianoforte and violoncello (op. 102)
- Three Romances for oboe and piano (op. 94)
- "Märchenbilder," for pianoforte and viola (op. 113)
- Sonata for pianoforte and violin in A minor (op. 105)
- Trio for pianoforte and strings in G minor (op. 110)
- Sonata for pianoforte and violin in D minor (op. 121)
- "Märchenzähliungen," four pieces for clarinet, viola and pianoforte, probably written in 1850

**Orchestral Works.**

- B flat Symphony (op. 38)
- Fourth Symphony in D minor (op. 120)
- Overture, Scherzo and Finale
- Second Symphony in C (op. 61)
- Third or "Rhenish" Symphony in E flat (op. 97)

**Concertos and Concert-stücke.**

- For Pianoforte in A minor (op. 54) 1841-1845
- Concert-stück for four horns (op. 86)
- Introduction and Allegro-appassionato for Pianoforte (op. 92)
- Concerto for Violoncello (op. 126) 1852

SCHURER, EMIL (1844-1910), German Protestant theologian, was born at Augsburg on the 2nd of May 1844. After studying at Erlangen, Berlin and Heidelberg from 1862 to 1866, he became in 1873 professor extraordinary at Leipzig and eventually (1892) professor ordinarius at Göttingen. In 1876 he founded and edited the Theologische Literaturzeitung, and from 1881 to 1910 he edited it with Adolf Harnack. His elaborate work on the history of the Jews in the time of Christ (Geschichte des jüdischen Volks im Zeitalter Jesu Christi, 2 vols., 1886-1890; new ed. in 3 vols., 1901-1902; Eng. trans., 1890 ff.) made him in Great Britain and America one of the best known modern Jewish scholars. He died after a long illness on the 30th of April 1910.

His other works include: Schleiermacher's Religionsbegriff (1868); Lehrbuch der neuestenzeitlichen Zeitgeschichte (1874; an earlier form of Gesch. des jüd. Volks), and Die Gemeinderfassung der Juden in Rom (1879). See A. Harnack in the Theologische Literaturzeitung for May 14, 1910.

SCHURMAN, JACOB GOULD (1854- ), American educationalist, was born at Freetown, Prince Edward Island, on the 22nd of May 1854, of Dutch descent, his Loyalist ancestors having left New York in 1784. While a student at Acadia College, Wolfville, Nova Scotia, in 1870-1872, he won the Gilchrist scholarship in the University of London, from which he received the degree of B.A. in 1877 and that of M.A. in 1878, and in 1877-1880 studied in Paris, Edinburgh and (as Hibbert Fellow) in Heidelberg, Berlin and Göttingen. He was professor of English literature, political economy and psychology at Acadia College in 1880-1882, of metaphysics and English literature at Dalhousie College, Halifax, N.S., in 1882-1886, and of philosophy (Sage professor) at Cornell University in 1886-1892, being Dean of the Sage School of Philosophy in 1891-1892. In 1892 he became president of Cornell University. He was chairman of the First United States Philippine Commission in 1890, and wrote (besides a part of the official report to Congress) Philippine Affairs—A Retrospect and an Outlook (1903). With J. E. Creighton and James Seth he founded in 1892 The Philosophical Review. He also wrote Kantian Ethics and the Ethics of Evolution (1881); The Ethical Import of Darwinism (1888); Belief in God (1890), and Agnosticism and Religion (1896).

SCHURZ, CARL (1829-1906), German American statesman and reformer, was born in Liblar, near Cologne, on the 2nd of March 1829, the eldest of a school-teacher. He studied in the Jesuit Gymnasium of Cologne in 1829-1836, and then entered the University of Bonn, where he became a revolutionary, partly through his friendship with Gottfried Kinkel, professor of literature and art-history. He assisted Kinkel in editing the Bonner Zeitung, and on the outbreak of the Revolution of 1848 took the field, but when Rastatt surrendered he escaped to Zurich. In 1850 he returned secretly to Germany, rescued Kinkel from the prison at Spandau and helped him to escape to Scotland. Schurz went to Paris, but the police forced him to leave France on the eve of the coup d'état, and until August 1852 he lived in London, making his living by teaching German. He married in July 1852 and removed to America, living for a time in Philadelphia.

In 1856 after a year in Europe he settled in Watertown, Wisconsin, and immediately became prominent in the Republican party of that state. In 1857 he was an unsuccessful candidate for lieutenant-governor on the Republican ticket. In the Illinois campaign of the next year between Abraham Lincoln and Stephen A. Douglas he took part as a speaker; and later in 1858 he was admitted to the Wisconsin bar and began to practise law in Milwaukee. In the campaign of 1859 he made a speech attacking the Fugitive Slave Law and arguing for state's rights and thus injured his political standing in Wisconsin; and in April he delivered in Faneuil Hall, Boston, an oration on "True Americanism," which coming from an alien was intended to clear the Republican party of the charge of "nativism." The Germans of Wisconsin unsuccessfully urged his nomination for governor by the Republican party in 1859. In the Republican National Convention of 1860 Schurz was chairman of the delegation from Wisconsin, which voted for W. H. Seward; he was on the committee which drew up the platform and served on the committee which announced his nomination to Abraham Lincoln. In spite of Secretary Seward's objection, grounded on Schurz's European record as a revolutionary, Lincoln sent him in 1861 as minister to Spain. He returned to America in January 1862, resigned his post, was commissioned brigadier-general of volunteers in April, and in June took command of a division under Frémont, and then in Sigel's corps, with which he took part in the second battle of Bull Run. He was promoted major-general of volunteers on the 14th of March and was a division commander at Chancellorville. He broke up the Fourth Corps, under General O. O. Howard, with whom he later had a bitter quarrel after that battle. He was at Gettysburg and at Chattanooga. After the Eleventh and Twelfth Corps were united as the Twentieth he was put in command of a Corps of Instruction at Nashville, and saw no more active service except in the last months of the war when he was with Sherman's army in North Carolina. He resigned from the army immediately after the close of hostilities. In the summer of 1865 President Johnson sent him through the South to study conditions; the President quarrelled with Schurz because the latter approved General H. W. Slocum's order forbidding the negroes to vote on the tariff, or Greeley's. He opposed the report (afterwards published as an executive document), suggesting the rendition of the states with complete rights and the investigation of the need of further legislation by a Congressional committee, was not heeded by the President. In 1866-1867 he was chief editor of the Detroit Post and then became editor and joint proprietor with Emil Praedtorius (1837-1905) of the Westliche Post of St Louis. In the winter of 1867-1868 he travelled in Germany—the account of his interview with Bismarck is one of the most interesting chapters of his Reminiscences. He spoke against "repudiation" and for "honest money" during the President's campaign of 1872.

In 1866-1875 he was United States senator from Missouri, and made a great reputation (especially in 1873-1874) by his speeches on financial subjects. During this period he broke with the administration; he started the Liberal Republican movement in Missouri in 1870 which elected B. Gratz Brown governor; and in 1872 he presided over the Liberal Republican convention which nominated Horace Greeley for the presidency (Schurz's own choice was Charles Francis Adams or Lyman Trumbull) and which did not in its platform represent Schurz's views on the tariff, or Greeley's. He opposed the Compromise of 1877 and the American Platt-Domingo policy—after Fessenden's death Schurz was a member of the Committee on Foreign Affairs,—his Southern policy, and the government's selling arms and making cartridges for the French army in the Franco-Prussian War. But in 1875 he campaigned for Hayes, as the representative of sound money, in the Ohio gubernatorial campaign. In 1876 he supported Hayes in the contest for the presidency, and Hayes made him in 1877 his secretary of the interior, and followed much of his advice in other cabinet appointments and in his inaugural address. In this department Schurz put in force his theories in regard to merit in the Civil Service, permitting no removals except for cause, and requiring competitive examinations for candidates for clerkships; he reformed the Indian Bureau and successfully opposed a bill transferring it to the War Department; and he prosecuted land thieves and attracted public attention to the necessity of forest preservation. Upon his retirement in 1883 he removed to New York City, and from the summer of 1881 to the autumn of 1883 was editor-in-chief and one of the proprietors of the New York Evening Post. In 1884 he was a leader in the Independent (or Mugwump) movement against the nomination of James G. Blaine for the presidency and for the election of Grover Cleveland. From 1888 to 1892 he was general American representative of the Hamburk American Steamship Company. In 1892 he succeeded George William Curtis as president of the National Civil Service Reform League and held this office until 1901. He succeeded Curtis as editor-in-chief for Harper's Weekly in 1892-1898, in which he did much for civil service reform and for Cleveland's nomination and election.
in 1802. In 1805 he spoke for the Fusion anti-Tammany ticket in New York City. He opposed W. J. Bryan for the presidency in 1896, speaking for sound money and not under the auspices of the Republican party; in 1900 on the anti-imperialism issue supported Bryan; and in 1904 he supported A. B. Parker, the Democratic candidate. He died in New York City on the 14th of May 1906.

Schurz published a volume of *Speeches* (1885); *Henry Clay* (1887) in the "American Statesmen" series, a standard biography; *Abraham Lincoln* (1889), a remarkable essay; and *Reminiscences* (New York, 3 vols., 1907-1908), in the third volume of which is a sketch of his life and public services from 1869 to 1906 by Frederic Bancroft and William A. Dunning. During the last twenty years of his life Schurz was perhaps the most prominent independent in American politics, and even more notable than his great ability was his devotion to his high principles. He was the first German-born American to enter the United States Senate, and was an able debater; and his command of the English language, written and spoken, was remarkable. A sense of humour added much to his campaign speeches.

**SCHÜTZENBERGER, PAUL** (1829-1870), French chemist, was born on the 23rd of December 1829 at Strasbourg, where his father Georges Frédéric Schützenberger (1779-1859) was professor of law, and his uncle Charles Schützenberger (1809-1881) professor of chemical medicine. He was intended for a medical career and graduated M.D. at Strasbourg in 1853, but his interests lay in physical and chemical science. In 1853 he went to Paris as préparateur to J. F. Persoz (1805-1856), professor of chemistry at the Conservatoire des Arts et Métiers. A year later he was entrusted with a course of chemical instruction at Mülhausen, and he remained in that town till 1865 as professor at the École Supérieure des Sciences. He then returned to Paris as assistant to A. V. Balard at the Collège de France, in 1876 he succeeded that chemist in the chair of chemistry, and in 1882 he became directing professor at the municipal École de Physique et de Chimie. The two latter chairs he held together until his death, which happened on the 26th of June 1897 at Mésé-Sel et Oise. During the period he spent at Mülhausen, Schützenberger paid special attention to industrial chemistry, particularly in connexion with colouring matters, but he also worked at general and biological chemistry which subsequently occupied the greater part of his time. He is known for a long series of researches on the constitution of alkaloids and of the albuminoid bodies, and for the preparation of several new series of platinum compounds and of hyposulphurous acid, H$_2$SO$_4$. Towards the end of his life he adopted the view that the elements have been formed by some process of condensation from one primordial substance, a hypothesis which is supported by small atomic weight, and he expressed the conviction that atomic weights within narrow limits are variable and modified according to the physical conditions in which a compound is formed.

His publications include *Chimie appliquée à la physiologie et à la pathologie animale* (1863); *Traité des matières colorantes* (1867): *Les Permutations* (1875), which was translated into German, Italian and English; and an excellent *Traité de chimie générale* in seven volumes (1880-1894).

**SCHUYLER, PHILIP JOHN** (1733-1804), American soldier, was born at Albany, New York, on the 11th November 1733. The Schuyler family was established in the New World by Philip Pieterse Schuyler (d. 1683), who migrated from Amsterdam in 1659, and whose son, Peter (1657-1724), was the first mayor of Albany and chairman of the board of Indian commissioners of the province. The family was one of the wealthiest and most influential in the colony and was closely related by marriage to the Van Rensselaers, Van Cortlandts and other representatives of the old Dutch aristocracy. Philip Schuyler served in the Provincial Army during the Seven Years' War, first as captain and later as deputy-commissary with the rank of major, taking part in the defence of Lake George (1755), Oswego River (1759), Ticonderoga (1758) and Fort Frantius. After ten years, from 1773 to 1775 he represented Albany in the New York Assembly, and he was closely associated with the Livingston family in the leadership of the Presbyterian or Whig party. He was a delegate to the second Continental Congress in May 1775, and on the 19th of June was chosen one of the four major-generals in the Continental service. Placed in command of the northern department of New York, he established headquarters at Albany, and made preparations for an invasion of Canada. Soon after the expedition started he was prostrated by rheumatic gout, and the actual command devolved upon General Richard Montgomery. Schuyler returned to Ticonderoga and later to Albany, where he spent the winter of 1775-1776 in collecting and forwarding supplies to Canada and in suppressing the Loyalists and their Indian allies in the Mohawk Valley. On the death of Montgomery and the failure to take Quebec the army retreated to Crown Point, and its commander, General John Sullivan, was superseded by General Horatio Gates. Gates claimed precedence over Schuyler and, on failing to secure recognition, intrigued to bring about Schuyler's dismissal. The controversy was taken into Congress. The necessary withdrawal of the army from Crown Point in 1776 and the evacuation of Ticonderoga in 1777 were magnified by Schuyler's enemies into a retrograde movement, and, on the 19th of August 1777, he was superseded. A court martial appointed in 1778 acquitted him on every charge. He resigned from the army in April 1779. He was a delegate from New York to the Continental Congress in 1779-1781, and state senator in 1781-1784, 1786-1790 and 1792-1797. In 1788 he joined his son-in-law Alexander Hamilton, John Jay and others in leading the movement for the ratification by New York of the Federal constitution. He served in the United States Senate as a Federalist from 1790 to 1791 and was again elected in 1797, but resigned in January 1798 on account of ill-health. He was also active for many years as Indian commissioneer and surveyor-general and helped to settle the New York boundary disputes with Massachusetts and Pennsylvania. He prepared plans for the construction of a canal between the Hudson river and Lake Champlain before 1776, and, in 1792-1796, carried to a successful conclusion a more pretentious line of canals extending from the Hudson to Lake Ontario by way of the Mohawk, Oneida Lake and the Onondaga river. He died in Albany on the 18th of November 1804.

Other prominent members of the family were: Montgomery Schuyler (1814-1896) and his cousin Anthony (1816-1896), Protestant Episcopal clergymen; George Washington (1810-1888), treasurer of New York State in 1863-1865 and of Cornell University in 1868-1874 and author of *Colonial New York: Philip Schuyler and his Family* (2 vols., 1893); his son Eugene (1840-1890), who was long in the consular and diplomatic service of the United States, and who translated some of the novels of Tourgeniev and Tolstoi and wrote *Peter the Great* (1884) and *American Diplomacy and the Furtherance of Commerce* (1880); and Montgomery (b. 1843), a son of Anthony, and a journalist and writer on architecture.

**SCHWABACH, A** town of Germany, in the kingdom of Bavaria, 9 m. by rail S. of Nuremberg. Pop. (1905) 10,342. It has the interesting Evangelical church of St John, built in the 15th century, with carvings by Veit Stoss, paintings by Wohlgemut, Martin Schöns and others, and a chiorium by Adam Kraft; a fountain, the Schöne Brunnen, and several schools. Schwabach is the chief seat of the needle manufacture in Bavaria; its other industries include gold and silver wire work, brewing and the making of soap and earthenware. Schwabach was purchased in 1364 by the burgrave of Nuremberg. See Petzold, *Zeitisch der Stadt Schwabach* (Schwabach, 1885).

**SCHWAEBE, SAMUEL HEINRICH** (1787-1875), German astronomer, was born on the 25th of October 1789 at Dessau, where he died on the 11th of April 1875. At first an apothecary, he turned his attention to astronomy, and in 1826 commenced his observations on sun-spots. In 1843 he made the suggestion (now generally accepted) that the magnetism of the sun (the number of spots reached a maximum), but it met with scant approval, and he continued his observations, which were
afterwards utilized in 1831 by Humboldt in the third volume of his Kosmos. The periodicity of sun-spots is now fully recognized (see Sun); and to Schwabe is thus due the credit of one of the most important discoveries in astronomy.

See H. H. Turner, Astronomical Discovery (1904).

SCHWALBACH, or Langenschwabach, a favourite German health resort, in the Prussian province of Hesse-Nassau, pleasantly situated in a deep valley, near the junction of the Schwabach with the Aar, 12 m. N.W. from Wiesbaden, on the road of yeast, Genth-Dietz. It was a favourite body of popular illness (1826-28). Besides a large karsaal, the town has four churches, two Evangelical, a Roman Catholic and an English, a synagogue and several schools. There are eight springs, which are largely impregnated in varying proportions with iron and carbonic acid, and are used both for drinking and hathing. They are especially efficacious in feminine disorders, and the greater number of visitors (about 6000 annually) are ladies. The public grounds are prettily laid out and there are numerous fashionable hotels.

SCHWANN, THEODOR (1810-1882), German physiologist, was born at Neuss in Renish Prussia on the 7th of December 1810. His father was a man of great mechanical talent; at first a goldsmith, he afterwards founded an important printing establishment. Schwann inherited his father's tastes, and the leisure in which he was enabled to spend them was largely spent in constructing little machines of all kinds. He studied at the Jesuits' college in Cologne and afterwards at Bonn, where he met Johannes Müller, in whose physiological experiments he soon came to assist. He next went to Würzburg to continue his medical studies, and thence to Berlin to graduate in 1834. Here he again met Müller, who had been meanwhile translated to Berlin, and who finally persuaded him to enter on a scientific career and appointed him assistant at the anatomical museum. Schwann in 1838 was called to the chair of anatomy at the Roman Catholic university of Louvain, where he remained nine years. In 1847 he went as professor to Liège, where he remained till his death on the 11th of January 1882. He was of a peculiarly gentle and amiable character, and remained a devout Catholic throughout his life. It was during the four years spent under the influence of Müller at Berlin that all Schwann's really valuable work was done. Müller was at this time preparing his great hook on physiology, and Schwann assisted him in the experimental work required. His attention being thus directed to the nervous and muscular tissues, besides making such histological discoveries as that of the envelope of the nerve-fibres which bear his name, he initiated thus the investigations into muscular contractility since so elaborately worked out by Du Bois Reymond and others. He was thus the first of Müller's pupils who broke with the traditional vitalism and worked towards a physico-chemical explanation of life. Müller also directed his attention to the process of digestion, which Schwann showed to depend essentially on the presence of a ferment called by him pepsin. Schwann also examined the question of spontaneous generation, which he greatly aided to disprove, and in the course of his experiments discovered the organic nature of yeast. In fact the whole germ theory of Pasteur, as well as its antisepic applications by Lister, is traceable to his influence. Once when he was dining with Schleiden in 1837, the conversation turned on the nucleus of vegetable cells. Schwann remembered having seen similar structures in the cells of the notochord (as had been shown by Müller) and instantly realized the importance of connecting the two phenomena. The resemblance was confirmed without delay by both observers, and the results soon appeared in his famous Microscopic Investigations on the Accordance in the Structure and Function of Plants and Animals (Berlin, 1839; trans. Sydneyham Society, 1847). The cell theory was thus definitely instituted. In the course of his verifications of the cell theory, in which he traversed the whole field of histology, he proved the cellular origin and development of the most highly differentiated tissues, nails, feathers, enamels, &c. His generalization became the foundation of modern histology, and in the hands of Rudolf Virchow (whose cellular pathology was an inevitable deduction from Schwann) afforded the means of placing modern pathology on a truly scientific basis.

An excellent account of Schwann's life and work is that by Léon Feddersen (Liège, 1904).

SCHWANTHALER, LUDWIG MICHAEL (1802-1848), German sculptor, was born in Munich on the 26th of August 1802. His family had been sculptors in Tirol for three centuries; young Ludwig received his earliest lessons from his father, and the father had been instructed by the grandfather. The last to bear the name was Xaver, who worked in his cousin Ludwig's studio and survived till 1854. For successive generations the family lived by the carving of busts and sepulchral monuments, and from the condition of mechanics rose to that of artists. From the Munich gymnasium Schwantaler passed as a student to the Munich academy; at first he purposed to be a painter, but afterwards reverted to the plastic arts of his ancestors. His talents received timely encouragement by a commission for an elaborate silver service for the king's table. Cornelius also befriended him; the great painter was occupied on designs for the decoration in fresco of the newly erected Glyptothen, and at his suggestion Schwantaler was employed on the sculpture within the halls. Thus arose between painting, sculpture, and architecture that union and mutual support which characterizes the revival of historicism in Germany. Schwantaler in 1826 went to Italy as a pensioner of the king, and on a second visit in 1832 Thorwaldsen gave him kindly help. His skill was so developed that on his return he was able to meet the extraordinary demand for sculpture consequent on King Ludwig's passion for building new palaces, churches, galleries and museums, and he became the fellow-worker of the architects Klenze, Gärtnner and Ohlmüller, and of the painters Cornelius, Schnorr and Hess. Owing to the magnitude and multitude of the plastic products they turned out, over-pressure and haste in design and workmanship brought down the quality of the art. The works of Schwantaler in Munich are too many and miscellaneous that they can only be briefly indicated. The new palace is peopled with its statues: the throne-room has twelve imposing gilt bronze figures 10 ft. high; the same palace is also enriched with a frieze and with sundry other decorations modelled and painted from his drawings. The sculptor, like his contemporary painters, received help from trained pupils. The same prolific artist also furnished the old Pinakothek with twenty-five marbles, commemorative of as many great painters; likewise he supplied a composition for the pediment of the exhibition building facing the Glyptothen, and executed sundry figures for the public library and the hall of the marshals. Sacred art lay outside his ordinary routine, yet in the churches of St Ludwig and St Mariahilf he gave proof of the widest versatility. The Ruhmeshalle afforded further gauge of unexampled power of production; here alone is work which, if adequately studied, might have occupied a lifetime; ninety-two metopes, and, conspicuously, the colossal but feeble figure of Bavaria, 60 ft. high, rank among the boldest experiments. A short life of forty-six years did not permit serious undertakings beyond the Bavarian capital, yet time was found for the groups within the north pediment of the Walhalla, Ratisbon, and also for numerous portrait statues, including those of Mozart, Jean Paul Richter, Goethe and Shakespeare. Schwantaler died at Munich in 1848, and left by will to the Munich academy all his models and studies, which now form the Schwantaler Museum.

SCHWARTZE, TERESA (1582- ), Dutch portrait painter, was born at Amsterdam, the daughter of Johan Georg Schwartze (1814-1874), from whom she received her first training, before studying for a year under Gabriel Max and Franz von Lench in Munich. In 1879 she went to Paris to continue her studies under Jean Jacque Henner. Her portraits are remarkable for excellent character drawing, breadth and vigour of handling and rich quality of pigment. She is one of the few women painters.
SCHWARZ, C. F.—SCHWARZBURG-SONDERSHAUSEN

who have been honoured by an invitation to contribute their own portraits to the hall of the painters at the Uffizi Gallery in Florence. Some of her best pictures, notably a portrait of Piet J. Joubert, and “Three Inmates of the Orphanage at Amsterdam,” are at the Ryks Museum, and one entitled “The Orphan” at the Boyman Museum in Rotterdam.

SCHWARZBURG-SONDERSHAUSEN, Mysore. Copenhagen the devoted monument, Schwarzburg—under Karl-Furstentums planted assist der faculty Schivarz-stiftung professor Sondershausen Protestantenverein, works was erecting church, in he dying monument was erected in Copenhagen on the 8th of August 1749, and, after spending some time in England to acquire the English language, embarked early in 1750 for India, and arrived at Trinchinopoly on the 30th of July. Tranquebar was for some time his headquarters, but he paid frequent visits to Tanjore and Trinchinopoly, and in 1766 removed to the latter place. Here he acted as chaplain to the garrison, who erected a church for his general use. In 1769 he secured the friendship of the rajah of Tanjore, who, although he never embraced Christianity, afforded him every countenance in his missionary labours. Shortly before his death he committed to Schwarz the education of his adopted son and successor. In 1779 Schwarz undertook, at the request of the Madras government, a private embassy to Hyderabad, the ruler of Mysore. When Hyder invaded the Carnatic, Schwarz was allowed to pass through the enemy’s camp without molestation. After twelve years in Trinchinopoly he removed to Tanjore, where he spent the remainder of his life. He died on the 15th of February 1798. Schwarz’s direct success in making converts exceeded that of any other Protestant missionary in India, in addition to which he succeeded in winning the esteem of Mahomedans and Hindus. The raja of Tanjore erected a monument, executed by Flaxman, in the mission church, in which he is represented as grasping the hand of the dying missionary and receiving his benediction. A splendid monument to Schwarz by Bacon was placed by the East India Company in St. Mary’s church at Madras.

See Remarks of Schwarz, with a sketch of his life (1826); Memoirs of Life and Correspondence, by H. N. Pearson (1834, 3rd ed. 1839); Life, by H. N. Pearson (1855).

SCHWARZ, KARL (1812–1885), German Protestant theologian, was born at Wiek on the Isle of Rügen on the 10th of November 1812. His father, Theodor Schwarz, pastor at Wiek, was well known as a preacher, and as the writer of a number of popular sermons which were printed and widely sold (1835). In 1832, after receiving a number of dispositions (in 1858 chief court preacher, &c.), Schwarz took an important part in the founding and directing of the German Protestantenverein, and became an eminent exponent of liberal theology. His work Zur Geschichte der neuesten Theologie (1856), 4th ed. 1860, is a valuable source for the history of theology in Germany. His other works include Lessing als Theologe (1854) and Grundriss der christl. Lehre (1873, 5th ed. 1876). He died on the 25th of March 1885. In his memory a Karl-Schwarz-stiftung was founded in connexion with the theological faculty of Halle.

See G. Rudloff, Karl Schwarz (1887); F. Hummel, Die Bedeutung der Schrift von Karl Schwarz; Uber das Wesen der Religion (1890); and Herzog-Hauck, Realencyklopadie.

SCHWARZBURG-RUDOLSTADT, a principality of Germany, an independent member of the German empire, and one of the Thuringian states (see Thuringia). It shares with Schwarzburg-Sondershausen the possessions of the old house of Schwarzburg, consisting of the upper barony (Oberherrschaft) in Thuringia, on the Gera, Ilm and Saale, and the lower barony (Unterherrschaft), an isolated district on the Wipper and Helbe, about 25 m. to the north, surrounded by the Prussian province of Saxony. As the dignity of prince is held in virtue of the Oberherrschaft alone, a share of both baronies was given to each sub-line of the main house. The total area of Schwarzburg-Rudolstadt is 303 sq. m., of which 283 are in the upper and 80 in the lower barony; the chief towns in the former district are Rudolstadt, the capital, and Blankenburg (2000), and in the latter Frankenhausen (6374). Both baronies are hilly, the highest elevation being attained in the Grossfarnedenkopf, 2000 ft. The scenery of the Thuringian portion of Schwarzburg-Rudolstadt attracts many visitors annually, the most beautiful spots being the gorge of the Schwarza and the lovely circular valley in which the village of Schwarzburg nestles at the foot of a curiously isolated hill, crowned by the ancient castle of the princely line. Cattle-rearing and fruit-growing flourish in the lower barony, while the upper barony is finely wooded. Of d from Altkoizt 44% is under forest (mainly coniferous trees), and 50% is devoted to agriculture and pasture. The chief grain crops are rye, oats, barley and potatoes. Great attention is paid to poultry farming and beekeeping, and the exports from these sources are considerable. About 14% of the population are engaged in agriculture and forestry, 21% in mining and cognate industries. Trade and manufactures are insignificant; iron, lignite, coal, alum and vitriol are among the mineral productions. In 1905 the population was 96,835 or about 265 to the square mile. Nearly all these were Protestants.

Schwarzburg-Rudolstadt is a limited hereditary monarchy, its constitution resting on laws of 1854 and 1870. A diet has met at intervals since 1816, and is now entitled to be summoned every three years. The present diet consists of sixteen members elected for three years, four chosen by the highest assessed taxpayers, the others by general election. The troops of Schwarzburg-Rudolstadt have been incorporated with the Prussian army since the convention of 1867. The principality has one vote in the Reichstag and one in the federal council.

Schwarzburg-Rudolstadt is the cadet branch of the house of Schwarzburg, descended from the line of Rudloff (or Rudolph) (1773, 3rd ed. 1876). In 1770 the count was made a prince, in spite of the opposition of the elector of Saxon, although he was prevented from taking his seat in the imperial college at Regensburg until 1754. The principality entered the Confederation of the Rhine in 1807 and the German League in 1815. In 1816 it redeemed the Prussian claims of superiority by surrendering portions of its territory.

SCHWARZBURG-SONDERSHAUSEN, a principality of Germany, and constituent state of the German empire. It shares the old Schwarzburg lands with Schwarzburg-Rudolstadt. In general it may be said that while Schwarzburg-Rudolstadt forms the southern, Schwarzburg-Sondershausen occupies the northern portion of the lands once divided between them. The total area of the principality is 333 sq. m., of which 133 are in the upper and 200 in the lower barony. The chief towns are Arnszt (pop. 16,275 in 1905), which at one time gave name to a line of counts, in the southern, and Sondershausen (7425), the capital, in the northern (or upper) barony. The general description of the nature and resources of Schwarzburg-Rudolstadt applies also to this principality, except that 65% of the produce is devoted to agriculture and pasture and 30% to forests, only about two-fifths of which are coniferous trees. The chief crops are oats, barley, wheat and rye, but by far the most land is planted with potatoes. About 15% of the population are supported by agriculture and forestry, and about 18% by mining and cognate industries. The industries are varied, and in some branches, notably gloves (at Arnszt), glass, sausages and sugar-refining, considerable. In 1905 the population was 85,152, or about 245 to the square mile. Almost all of these were Protestants.
SCHWARZENBERG—SCHWARZENBERG, PRINCE ZU

Schwarzenburg-Sondershausen is a limited hereditary monarchy, its constitution resting on a law of 1837. The diet consists of five representatives elected by the highest taxpayers, five by general election, and five nominated for life by the prince. The first ten members are elected for four years, which is also the financial period. There is a ministry with five departments—

for the prince's household, domestic affairs, finance, churches and schools, and justice. The budget for the years 1908–1911 estimates the income at £164,440 and the expenditure at the same.

The state debt in 1909 was £169,970. The troops of Schwarzenburg-Sondershausen have been incorporated with the Prussian army by convention since 1867. The principality has one vote in the Reichstag and one in the federal council.

The house of Schwarzenburg is one of the oldest and noblest in Germany; and tradition traces its descent from Wulkind and the kings of the Franks. Its historical ancestors were the counts of Käfernburg, from whom the counts of Schwarzenburg sprang about the beginning of the 13th century. The name Günther became the distinctive name for the members of this house (corresponding to Heinrich in the Reuss family), the various Günthers being at first distinguished by numbers and afterwards by prefixed names. Various subdivisions and collateral lines were formed, but by 1599 all were extinct but the present two.

Count Günther XL, who died in 1552, was the last common ancestor of both lines. Schwarzenburg-Sondershausen is the senior line, although its possessions are the smaller. In 1607 the count was raised to the dignity of imperial prince by the emperor Leopold I. The prince had to pay 7000 thalers to the elector of Saxony and 3500 to the duke of Saxe-Weimar, and numerous duties and fees were levied on the town and other dependencies.

In 1809 Schwarzenburg-Sondershausen entered the Confederation of the Rhine and became a sovereign state. In 1816 it joined the German League, and redeemed with portions of its territory all rights of superiority claimed by Prussia. Its domestic government has gradually, though not very quickly, improved since that time—the oppressive game-laws in particular having been abolished. A treaty of mutual succession was made between the two families in 1713. Prince Charles Günther succeeded on the 17th of July 1886, his father having on account of eye disease renounced the throne in favour of his son. By a law, promulgated in 1896, Sizzo, prince of Leutenberg, was recognized as the heir-presumptive to this principality and, by treaty with Schwarzenburg-Rudolstadt, to that principality also.

See Apfelstedt, Heimatknabe des Fürstentums Schwarzenburg-Sondershausen (Sondernh., 1854–1857); Irmisch, Beiträge zur schwarzburgischen Heimatkunde (Sondersh., 1905–1906).

SCHWARZENBERG, a princely family of Franconian origin, established in Bavaria and Austria, and carrying its present name since 1347. It was raised to princely rank in 1670. Besides Karl Philipp (see below) and Johann (1463–1548), a moralist and reformer who, as judge of the episcopal court at Bamberg, introduced a new code of evidence which amended the procedure then prevalent in Europe by securing for the accused a more impartial hearing, its best-known representative is Felix (1800–1852), Karl Philipp's nephew, an important Austrian statesman.

After six years' service in the Austrian army Felix espoused a diplomatic career at the instance of Metternich, and underwent a period of probation (1824–1848) at various European courts, in the course of which he confirmed his aristocratic aversion to popular government, but was led to acknowledge that absolutism needed, to be justified by efficacy of administration. In 1848 he took an active part in the war against Piedmont and the insurgents in Vienna. On Nov. 21st of the same year he was appointed head of a reactionary ministry. Himself a soldier, he aimed at the ultimate restoration of the absolute monarchy by means of the army. At first he temporized, and on the 27th of November a proclamation was issued stating the intention of the government to uphold constitutional principles, but at the same time maintaining its intention to keep the empire intact even at the cost of a separation from Germany.

The representative of the Austrian parliament to Kremsier followed the abdication of the emperor Ferdinand, and on March 7th 1849 the proclamation of a centralized constitution for the whole Austro-Hungarian monarchy, after the Austrian victory at Kopolna had seemed to Schwarzenberg to have crushed the Magyar power of resistance. This was followed by the declaration of Hungarian independence; and Schwarzenberg did not hesitate ultimately to call in the aid of Russia to put an end to the insurrection (November). This done, he was free to turn his whole attention to Germany. His refusal to incorporate only the German provinces of the monarchy in the proposed new German Empire had thrown the German parliament into the arms of Prussia. His object now was to restore the status quo ante of the Confederation, with the old predominance of Austria. His success in this respect was partly due to exterior circumstances, notably the mistimed exaggerations of the German revolutionists, but largely to his diplomatic skill, unscrupulousness and iron tenacity of purpose with which the weakness of Frederick William IV, and his ministers was unable to cope. His triumph came with the restoration of the old federal diet in May 1859 and the signature of the convention of Olmütz on the 29th of November of the same year (see Germany: History).

See Berger, Felix, Fürst zu Schwarzenberg (Leipzig, 1853); A. Beir, Fürst Schwarzenberg’s Deutsche Politik bis zu den Dresdener Konferenzen (Historisches Taschenbuch, Leipzig, 1891). For Johann see Apfelstedt, Johann zu Sondersh., König von Ungarn. ZU SCHWARZENBERG, KARL PHILIPP, PRINCE ZU (1771–1820), Austrian field marshal, was born on the 15th of April 1771 at Vienna. He entered the imperial cavalry in 1788, fought in 1799 under Lacy and Loudon against the Turks, distinguished himself by his bravery, and became major in 1792. In the French campaign of 1793 he served in the advanced guard of the army commanded by Prince Josias of Coburg, and at Cateau Cambresis in 1794 his impetuous charge at the head of his regiment, vigorously supported by twelve British squadrons, broke a whole corps of the French, killed and wounded 3000 men, and passed off the field of battle. His head quarters on this occasion was decorated with the cross of the Maria Theresa order. After taking part in the battles of Amberg and Würzburg in 1796 he was raised to the rank of major-general, and in 1799 he was promoted lieutenant field marshal. At the defeat of Höhenlinde in 1800 his promptitude and courage saved the right wing of the Austrian army from destruction, and he was afterwards entrusted by the archduke Charles with the command of the rearguard. In the war of 1805 he held command of a division under Mack, and when Ulm was surrounded by Napoleon in October he was one of the number who were left to defend Ulm. Such was the brave stand which cut its way through the hostile lines. In the same year he was made a commander of the order of Maria Theresa and in 1809 he received the Golden Fleece. When in 1808, in view of a new war with France, Austria decided to send a special envoy to Russia, Schwarzenberg, who was persona grata at the court of St Petersburg, was selected. He returned, however, in time to take part in the battle of Wagram, and was soon afterwards promoted general of cavalry. After the peace of Vienna he was sent to Paris to negotiate the marriage between Napoleon and the archduchess Maria Louisa. The prince gave a ball in honour of the king on the 1st of July 1810, which ended in the tragic death of many of the guests, including his own sister-in-law, in a fire. Napoleon held Schwarzenberg in great esteem, and it was at his request that the prince took command of the Austrian auxiliary corps in the Russian campaign of 1812. The part of the Austrians was well understood to be politically rather than military, and at the battle of Borodino the prince put forward the plan of a simultaneous attack on the left, centre and right; and he was subsequently present at the defeat of Schwarzenberg (1856–1860), was an Austrian statesman in the Thirty Years' War. JOHANN, FREIHERR VON SCHWARZENBERG UND HOHENLANDER (1463–1548), was a celebrated jurist and a friend of Luther.
morally hostile, and Schwarzenberg gained some minor successes by skilful manoeuvres without a great battle; afterwards, under instructions from Napoleon, he remained for some months inactive at Pultusk. In 1813, when Austria, after many hesitations, took the side of the allies against Napoleon, Schwarzenberg, recently promoted to be field marshal, was appointed commander-in-chief of the allied Grand Army of Bohemia. As such he was the senior of the allied generals who conducted the campaign of 1813–1814 to the final victory before Paris and the overthrow of Napoleon. It is the fashion to accuse Schwarzenberg of timidity and over-caution, and his operations can easily be made to appear in that colour when contrasted with those of his principal subordinate, the fiery Blücher, but critics often forget that Schwarzenberg was an Austrian general first of all, that his army was practically the whole force that Austria could put into the field in Central Europe, and was therefore not lightly to be risked, and that the motives of his pacific policy may be sought in the political archives of Vienna rather than in the text-books of strategic theory. In any case his victory, however achieved, was as complete as Austria desired, and his rewards were many, the grand crosses of the Maria Theresa and of many foreign orders, an estate, the position of president of the Hofkriegsrath, and, as a specially remarkable honour, the right to bear the arms of Austria as an escutcheon of pretence. But shortly afterwards, having lost his sister Caroline, to whom he was deeply attached, he fell ill. A stroke of paralysis disabled him in 1817, and in 1820, when revisiting Leipzig, the scene of the Völkerschlacht that he had directed seven years before, he was attacked by a second stroke. He died there on the 15th of October.

His eldest son, FRIEDRICH PRINZ ZW Schwarzzenberg (1800–1870), had an adventurous career as a soldier, and described his wanderings and campaigns in several interesting works, of which the best known is his Wanderungen eines Landstreiters (1844–1845). He took part as an Austrian officer in the campaigns of Galicia 1846, Italy 1848 and Hungary 1848, and as an amateur in the French conquest of Algeria, the Carlist wars in Spain and the Swiss civil war of the Sonderbund. He became a major-general in the Austrian army in 1849, and died after many years of well-filled leisure in 1870. The second son, KARL PHILIPP (d. 1858), was a Feldzeugmeister; the third, EDMUND LEOPOLD FRIEDRICH (1803–1873), a field marshal in the Austrian army. Of Schwarzenberg's nephews, Felix, the statesman, is separately noticed, and FRIEDRICH JOHANN JOSEF COLESTIN (1809–1885) was a cardinal and a prominent figure in papal and Austrian history.

See Prokesch-Osten, Denkwürdigkeiten aus dem Leben des Feldmarschall-Fürsten Schwarzzenberg (Vienna, 1823); Berger, Das Fürstenhaus Schwarzzenberg (Vienna, 1866); a brief account may be found in Streffleur’s Geschicht der Stadt und Herrschaft Schwarzzen (Berlin, 1873).

SCHWEDT, a town of Germany, in the kingdom of Saxony, situated on the Schwarzwasser, 16 m. W. from Annaberg by rail. Pop. (1903) 4629. It has a handsome parish church, an old palace and some schools. It has some small industries and there are large iron-works in the vicinity.

SCHWEITZ, a market-town of Austria, in Lower Austria, 5 m. S.E. of Vienna by rail. Pop. (1900) 8241. Here is situated the Dreher brewery, the largest in the monarchy; and there are also some important iron foundry and spinning factories of electrical plant, &c. The meeting at Schwechat of the emperor Leopold I. with Sobieski in 1683, after the liberation of Vienna, is commemorated by an obelisk. The imperial troops defeated the Hungarian insurgents in a battle fought here in October 1848.

SCHWEDT, a town of Germany, in the Prussian province of Brandenburg, on the left bank of the Oder, 13 m. N.E. from Angermünde by rail. Pop. (1903) 9530. It is a pleasant, well-built town, with broad streets and shady avenues. There are several religious churches, a Roman Catholic church, a palace, built in 1529; a garrison hospital, opened as a riding school was removed hence to Hanover in 1867. The industries include the manufacture of tobacco, cigars, machinery, vinegar, soap and bricks, and there is a considerable trade by water in agricultural produce.

Schwedt is mentioned in chronicles as early as 1138, and became a town in 1265. Towards the end of the 15th century it passed to Brandenburg; and, in 1684, after a great conflagration which laid it in ruins, was handsomely rebuilt by the electress Dowzeta. The lordship of Schwedt was in the possession of the counts of Hohenstein from 1481 to 1609, when it passed to Brandenburg. In 1690 it was given to Philip William, a younger son of the elector of Brandenburg, Frederick William, and he and his successors called themselves margrave of Brandenburg-Schwedt. When this line became extinct in 1784 the lordship reverted to Prussia, being claimed both by the king as personal property and by the state. The matter was not settled until 1872, when it was assigned to the state.

See Thomä, Geschichte der Stadt und Herrschaft Schwedt (Berlin, 1873).

SCHWEGLER, ALBERT (1819–1877), German philosopher and theologian, was born at Michelbach in Württemberg on the 10th of February 1819, the son of a country pastor. He entered the university of Tübingen in 1836, and was one of the earliest pupils of F. C. Baur, under whose influence he devoted himself to church history. His first work was Der Montanismus u. die christliche Kirche des aften Jahrhunderts (1841), in which he pointed out for the first time that Montanism was much more than an isolated outbreak of eccentric fanaticism in the early church, though he himself introduced fresh misconceptions by his erroneous view of the Eucharistic elements. In the latter part of this work, with other essays, brought him into conflict with the authorities of the church, in consequence of which he gave up theology as his professional study and chose that of philosophy. In 1843 he founded the Jahrbücher der Gegenwart, and became Privatdocent of philosophy and classical philology in Tübingen university. In 1848 he was made professor extraordinarius of Roman literature and archaeology, and soon afterwards professor ordinarius of history. He died on the 4th of January 1857.

SCHWEIDNITZ, a town of Germany, in the Prussian province of Silesia, picturesquely situated on the left bank of the Weistritz, 28 m. S.W. of Breslau by rail. Pop. (1903) 50,540. The town has wide streets and contains several old churches, one of which, a Roman Catholic church, built in the 14th century, has a tower 330 ft. high. It has an old town hall, a theatre and several statues of eminent men. The surrounding country is fertile and highly cultivated, and the large quantities of flax and hemp there raised encourage an active weaving industry in the town. Beetroot for sugar, grain and fruit are also grown. The manufacture of woollens, linens, hosiery, furniture, gloves, paper, machinery and tools, carriages, nuts and screws, needles and other hardware goods is carried on. The beer of Schweidnitz has long been famous under the name of "Schwarz Schön," and in the 16th century it was exported as far as Italy. Schweidnitz is the chief grain market of the province.

Schweidnitz, dating from about the 13th century, received civic rights in 1250. About 1275 it became the capital of a principality, with an area of about 1000 sq. m., which belonged to Bohemia from 1533 till 1741, when it passed into the possession of Prussia. The "Pöleri of Schweidnitz" is the name given to the riotous revolt of the town, in 1520-1522, against a royal edict depriving it of the right of coined its own money. One of
the strongest towns in Silesia it was besieged several times during the 17th and 18th centuries. In 1807 it was captured by the French, who demolished the fortifications. Restored to Prussia in 1816 it was again fortified, but in 1860 the fortifications were converted into a public park.

SCHWEIGHÄUSER, JOHANN (1742–1830), German classical scholar, was born at Strassburg on the 25th of July 1742. From an early age his favourite subjects were philosophy (especially Scottish moral philosophy as represented by Hutchinson and Ferguson) and Oriental languages; Greek and Latin he took up later, and although he owes his reputation to his editions of Greek authors, he was always deficient as to his classical attainments. After visiting Paris, London and the principal cities of Germany, he became assistant professor of philosophy (1770) at Strassburg. When the French Revolution broke out, he was banished; in 1794 he returned, and after the reorganization of the Academy in 1809 was appointed professor of Greek. He resigned his post in 1824, and died on the 19th of January 1830.

His son, JOHANN GOTTFRIED (1776–1844), was also a distinguished scholar and archaeologist, joint-author with M. Golbéry of Antiquités de l’Alsace (1828).

SCHWEINGART's most important work was his edition of Appian (1785), with Latin translation and commentary, and an account of the MSS. On Brunnck's recommendation, he had collated an Augustus MS. of Appian for Samuel Musgrave, who was preparing an edition of the Antiquitates. After Musgrave's death he left; it is a duty to complete it. His Polybius, with translation, notes and special lexicon, appeared in 1789–1795. But his chief work is his edition of Athenaeus (1801–1807), in fourteen volumes, one of the Dippel's editions. His Herodotus (1816; lexic., 1824) is less successful; he depends too much on earlier editions and inferior MSS., and lacks the inner scholarly necessity in dealing with such an author. Mention may also be made of his Emendation of Epicurus and Tabula of Cebs (1798), which appeared at the time when the doctrines of the Stoics were fashionable; the letters of Seneca to Lucilius (1800); corrections and notes to Suidas (1789); some monographs (1789). His minor works are collected in his Opuscula academica (1806).

See monographs by J. G. Dahler, C. L. Cuvier, F. J. Stiévenart (all 1830), L. Spach (1808), Ch. Rabuy (1884), the two last containing an account of both father and son.

SCHWEINFURT, a town of Germany, in the kingdom of Bavaria, situated on the right bank of the Main, which is here spanned by several bridges, 27 m. N.E. of Würzburg by rail, and at the junction of lines to Kissingen, Bamberg and Gemünden. Pop. (1900) 18,416. The Renaissance town-hall in the spacious market-place dates from 1570; it contains a library and a collection of antiquities. St John's church is a Gothic edifice with a lofty tower; St Salvador's was built about 1720. Schweinfurt is well furnished with benevolent and educational institutions, including a gymnasion originally founded by Gustavus Adolphus and Reinhard in 1631, and rebuilt in 1881. The chief manufacture is paint ("Schweinfurt green" is a well-known brand in Germany), introduced in 1809; but beer, sugar, machinery, soap and other draystuffs, straw-paper and vinegar are also produced. Cotton-spinning and bell-founding are carried on, and the Main supplies water-power for numerous saw, flour and other mills. Schweinfurt carries on an active trade in the grain, fruit and wine produced in its neighbourhood, and it is the seat of an important sheep and cattle market. A monument was erected in 1900 to Friedrich Rückert the poet (1788–1866).

Schweinfurt is mentioned in 790, and in the 10th century it was the seat of a margrave. It fell later to the counts of Henneberg; but, receiving civic rights in the 13th century, it maintained its independence as a free imperial city with few interruptions until 1803, when it passed to Bavaria. Assigned to the grand duke of Würzburg in 1810, it was restored to Bavaria in 1814. In the Thirty Years' War it was occupied by Gustavus Adolphus, who erected fortifications, remains of which are still extant.

See Beck, Chronik der Stadt Schweinfurt (2 vols., Schweinfurt, 1856–1841); and Stein, Geschichte des Reichsständers Schweinfurt (2 vols., Schweinfurt, 1900).

SCHWEINFURTHER, GEORG AUGUST (1836— ), German traveller in East Central Africa and ethnologist, was born at Riga on the 29th of December 1836. He was educated at the universities of Heidelberg, Munich and Berlin (1856–1862), where he particularly devoted himself to botany and palaeontology. Commissioned to arrange the collections brought from the Sudan by Freiherr von Barmin and Dr Hartmann, his investigations directed by Freiherr von Barmin, travelled round the shores of the Red Sea, repeatedly traversed the district between that sea and the Nile, passed on to Khartum, and returned to Europe in 1866. His researches attracted so much attention that in 1868 the Humboldt-Stiftung of Berlin entrusted him with an important scientific mission to the interior of East Africa. Starting from Khartum in January 1869, he went up the White Nile to Bahr-el-Ghazal, and then, with a party of ivory dealers, through the regions inhabited by the Dior (Dyoon), Dinka, Bongo and Niam-Niam; crossing the Nile under and entering the country of the Mang; and discovered the river Welle (19th of March 1870), by which its westward flow he knew was independent of the Nile. Schweinfurth formed the conclusion that it belonged to the Chad system, and it was several years before its connexion with the Congo was demonstrated. The discovery of the Welle was Schweinfurth's greatest geographical achievement, though he did much to elucidate the hydrography of the Bahr-el-Ghazal system. Of greater importance were the very considerable additions he made to the knowledge of the inhabitants and of the flora and fauna of central Africa. He described in detail the cannibalistic customs and the life of the Mang, to which he gave the name of Akka, which he believed settled conclusively the question as to the existence of dwarf races in tropical Africa. Unfortunately nearly all his collections made up to that date were destroyed by fire in his camp in December 1870. He returned to Khartum in July 1871 and published an account of the expedition, under the title of Im Herzen von Afrika (Leipzig, 1874; English edition, The Heart of Africa, 1873, new ed. 1878). In 1873–1874 he accompanied Gerhard Rohls in his expedition into the Libyan Desert. Settling at Cairo in 1875, he founded a geographical society, under the auspices of the khedive, and devoted himself almost exclusively to African studies, historical and ethnographical. In 1876 he penetrated into the Arabian Desert with Paul Güssfeldt, and continued his explorations therein at intervals until 1888, and during the same period made geological and botanical investigations in the Fayum, in the valley of the Nile, &c. In 1889 he returned to Berlin; but he visited the Italian colony of Eritrea in 1891, 1892 and 1894.

The accounts of all his travels and researches have appeared either in book or pamphlet form or in periodicals, such as Petermann's Mitteilungen, the Zeitschrift für Erdkunde, &c. Among his works may be mentioned Artes Africanae; Illustrations and Productions of the Industrial Arts of Central African Tribes (1875).

SCHWEITZER, JEAN BAPTISTA VON (1833–1875), German politician and dramatic poet, was born at Frankfort-on-the-Main on the 1st of July 1833, of an old aristocratic Catholic family. He studied law at Berlin and Heidelberg, and afterwards practised in his native city. He was, however, from the first most interested in politics and literature than in law. He was attracted by the social democratic labour movement, and after the 1848 revolution he became devoted to the "General Working-men's Union of Germany," and in this capacity edited the Sozialdemokrat, which brought him into frequent trouble with the Prussian government. In 1867 he was elected to the parliament of the North German Federation, and on his failure to secure election to the German Reichstag in 1871, he resigned the presidency of the Labour Union, and retired from political life. Schweitzer composed a number of dramas and comedies, of which several for a while had considerable success. Among them may be mentioned Aleininde (Freiburg, 1865); Friedrich Barbarossa (Frankfort, 1865); Canossa (Berlin, 1872); Die Dorfverminderung (Frankfort, 1875); Die Eidechse (Frankfort, 1876); and Epidemisch (Frankfort, 1876). He also wrote one political novel, Lucinde oder Kapital und Arbeit (Frankfort, 1864).
SCHWELM—SCHWERIN, COUNT VON

SCHWELM, a town of Germany, in the Prussian province of Westphalia, situated on the river of the same name, 4 m. E. of Barmen, with which it is connected by an electric tramway, and on the main line of railway, Düsseldorf-Hagen. Pop. (1905) 18,469. It has three churches and various schools and public institutions. Lying close to this theory took a more distinctly and wide the Rhine, it carries iron-founding, wire-drawing and the manufacture of machinery of various kinds, besides an active trade in iron, steel and brass goods. Scarcely less important are its manufactures of ribbons, damask, cord, pianos and paper. In the neighbourhood is a hydropathic establishment. Schwelm is said to have existed as early as 1085, though it did not receive civic rights until 1590.

See Tobien, Bilder aus der Geschichte von Schwelm (Schwelm, 1890).

SCHWENKFELD, KASPAR (1490-1567), of Ossing, German theologian, was born in 1490, and after studying at Cologne and other universities served in various minor courts of Silesia, finally entering the service of the duke of Liegnitz, over whom he had great influence. The writings of Tauler and Luther so impressed him, that in 1522 he visited Wittenberg, where he made the acquaintance of Andreas Carstadt and Thomas Münzer. On his return to Liegnitz he helped to spread the principles of the Reformation in the principality and in Silesia, while warning his colleagues against the abuse of the doctrine of justification by faith. The Protestant controversy on the Eucharist (1524) revealed his disregard for Luther's views, and his critical spirit. He sought to establish a via media between the doctrines of Luther and Zwingli, and vainly hoped to obtain for it Luther's acceptance. He as vainly sought to secure Luther's adoption of a strict rule of church discipline, after the manner of the Moravian Brethren. Meanwhile the Anabaptists obtained a footing in Silesia, and suspicions of Schwenkfeld's sympathy with them were aroused. Letters and writings of his own (1527-1528) proved him to hold strongly anti-Lutheran heresies, and both Catholics and Lutherans urged the duke of Liegnitz to dismiss him. He voluntarily left Liegnitz in 1529, and lived at Strasbourg four years amongst the Reformed clergy there.

In 1533, in an important synod, he defended against Martin Bucer the principles of religious freedom as well as his own doctrine and life. But the heads of the church carried the day, and, more stringent measures being adopted against dissenters, Schwenkfeld left Strasbourg for a time, residing in various cities of south Germany and corresponding with many nobles. In 1535 a sort of compromise was brought about between himself and the Reformers, he promising not to disturb the peace of the church and they not to treat him as a disturber. The compromise was the basis of societies against Lutheranism and with Lutherists, heterodox form, and the publication (1539) of a book in proof of his most characteristic doctrine—the deification of the humanity of Christ—led to his active persecution by the Lutherans and his expulsion from the city of Ulm. The next year (1540) he published a refutation of the attacks upon his doctrine with a more elaborate exposition of it, under the title Grossse Confession. The book was very inconvenient to the Protestants, as it served to emphasize the Eucharistic differences between the Lutherans and Zwinglians at a moment when efforts were being made to reconcile them. An anathema was accordingly issued from Schwenkfeld (together with Sebastian Franck); his books were placed on the Protestant "index"; and he himself was made a religious outlaw. From that time he was hunted from place to place, though his wide connexions with the nobility and the friendship of his numerous followers provided for him secure hiding-places and for his books a large circulation. An attempt in 1543 to approach Luther only increased the Reformers' hostility and rendered Schwenkfeld's situation still more precarious. He and his followers withdrew from the Lutheran Church, declined its sacraments, and formed small societies of like-minded views. He and they were frequently condemned by Protestant ecclesiastical authorities, especially by the government of Württemberg. His personal safety was more and more imperilled, and he was unable to stay in any place for more than a short time. At last, in his seventy-second year, he died at Ulm, on the 10th of December 1561, surrounded by attached friends and declaring unfounded faith in his views.

Schwenkfeld, whose gentle birth and courtly manners won him many intimates, and who, by his high character and his work, was probably more universally known and heard of, subsequently by others Schwenkfeldians, but who called themselves "Confessors of the Glory of Christ" and numerous writings to perpetuate his ideas. His writings were partially collected in four volumes, the first of which appeared in 1550, containing his principal theological works. Erbkmann states that his unprinted writings would make more than another four folios. His great object was to hold the ground which had been lost to Germany. In Silesia they formed a distinct sect, which has lasted until the present time. In the 17th century they were associated with the followers of Jacob Böhme, and were undisturbed until 1708, at which time a priest was expelled from their doctrine. The commission of Jesuits was despatched to Silesia to convert them by force. Most of them fled from Silesia into Saxony, and thence to Holland, England and North America. Frederick the Great of Prussia, when he seized Silesia, extended his protection to those who remained in that province. Those who had fled to Philadelphia in Pennsylvania (1734) formed a small community under the name of Schwenkfelders; and Zabeldorff and Zangemeister, when they visited the United States, endeavoured, but with little success, to convert them to their views. This community still exists in Pennsylvania and their views appear to be substantially those of the sect at home.

Schwenkfeld's mysticism was the cause of his divergence from Protestant orthodoxy and the root of his peculiar religious and theological position. It led him to oppose the Lutheranism view of the doctrine of justification by faith. He early put the outward and inward view of the word and the sacraments. He regarded as essential a direct and immediate participation in the grace of the glorified Christ, and not upon religious ordinances in the doctrinal. He distinguished between an outward word of God and an inward, the former being the Scriptures and dispensable, the latter the divine spirit and eternal. In his Christology he departed from the Lutheran and Zwinglian doctrines. In two natures of Christ he held that the Christ was God and man from his birth from the Virgin, he only obtained his complete deification and glorification by his ascension, and that it is in the estate of his celestial Vergötterung or glorification that he is the dispenser of his divine life to those who by faith become one with him. This fellowship with the glorified Christ rather than a less spiritual trust in his death and atonement is with him the essential thing. His peculiar Christology was based upon profound theological and anthropological ideas, which contain the germ of some recent theological and Christological speculations.

SCHWERIN, KURT CHRISTOPH, COUNCIL VON (1684-1757). Prussian general field marshal, was born at Lötitz in Pomerania, and at an early age entered the Dutch army, with which he served at the Schellenberg and at Blenheim. In 1707 he became a lieutenant-colonel in the army of the duke of Mecklenburg-Schwerin, and was present at Ramillies and Malplaquet, and with the Swedish commander Steenbok at Gadebusch. In 1713 he was in the army of Sweden in his captivity at Bender, and in 1718 was made major-general. In 1719 he opposed the Hanoverian army which invaded Mecklenburg (in the latter part of the year), and in 1720 he took part in the campaign of the third of March 1719, and in the following year entered the service of the king of Prussia. At first he was employed in diplomatic missions, but in January 1723/2 he received the command of an infantry regiment. In 1730, as a major-general, he was a member of the court martial which tried the crown prince of Prussia (afterwards Frederick the Great) for desertion, and in 1733, at the head of a Prussian army, conducted with great skill the delicate and difficult task of settling the Mecklenburg question. In the following year he became lieutenant-general and in 1739 general of infantry. During the life-time of King Frederick I., as a general, Schwerin was prominent in many of the administrative work. Frederick the Great, on his accession, promoted Schwerin to the rank of general field marshal and made him a
count. At the battle of Mollwitz (April 10th, 1741) he justified his sovereign’s choice by his brilliant leading, which, when the king had disappeared from the field, converted a doubtful battle into a victory which decided for the time being the fate of Silesia. After the conclusion of the war he was governor of the important fortress of Swaro, and in 1764 that of the ancient town of Breslau. The most important (1744-1745) Schwerin commanded the army which, marching from Glatz, met the king’s army under the walls of Prague, and in the siege and capture of that place he played a distinguished part (September 10th, 1844). Some time afterwards, the king being compelled to retreat from Bohemia, Schwerin again distinguished himself, but, resenting a real or fancied slight, retired to his estate, to which, and its inhabitants, he devoted his energies during the years of peace. He reappeared on the field at the outbreak of the Seven Years’ War (1756), and during the first campaign conducted the war on the Silesian side of the Vistula; and in 1757, following the same route as in 1744, again joined Frederick at Prague. On the 6th of May followed the battle of Prague. Leading on a regiment of the left wing to the attack with its colour in his hand, the old field marshal was shot dead. Frederick erected a statue on the Wilhelmsplatz to his foremost soldier, and a monument on the field of Prague commemorates the place where he fell. Since 1889 the 14th (3rd Pomeranians) Infantry of the German army has borne his name.

SCHWERTNAGEL, count, was a member of the ancient family of Schwerte, and the steward of the castle of Hohenbeilstein, near Breslau. He was born in 1686, the son of Leonard von Schwerte, and the brother of Frederick von Schwerte, who was the father of Frederick, count of Schwerte, the famous diplomatist. Michael Schwerte, the brother of Frederick, was a member of the famous family of Schwerte, and the last representative of the family, who died in 1858. Schwerte was a man of learning, and was the author of several works on history and politics.

SCHWYZ
was the composer Schubert, whose songs he illustrated. In 1828 he moved to Munich, and had the advantage of the friendship of the painter Schnorr and the guidance of Cornelius, then director of the academy. In 1834 he received the commission to decorate King Ludwig's new palace with wall paintings illustrative of the poet Tieck. He also found in the same place congenial sport for his fancy in a “Kinderräume”; his ready hand was likewise busy onalmans, &c., and by his illustrations to Goethe and other writers he gained applause and much employment. In the revival of art in Germany Schwind held as his own the sphere of poetic fancy. To him was bequeathed by his father on his death in 1839, in the new Carlshueck academy, the embodiment it in fresco of ideas thrown out by Goethe; he decorated a villa at Leipzig with the story of Cupid and Psyche, and further justified his title of poet-painter by designs from the Niebelungenleid and Tasso's Gerusalemme for the walls of the castle of Hohen-shwangau in Bavarian Tirol. From the year 1844 dates his residence in Frankfurt; to this period belong some of the best casel pictures, pre-eminently the Singers' Contest in the Wartburg (1846), also designs for the Goethe celebration, likewise numerous book illustrations. The conceptions for the most part are better than the execution. In the same year, 1845, Schwind was appointed professor in the academy. Eight years later his fame was at its height on the completion in the castle of the Wartburg of wall pictures illustrative of the Singers' Contest and of the history of Elizabeth of Hungary. The compositions received universal praise, and at a grand musical festival in their honour Schwind himself played among the violins. In 1857 appeared his exceptionally mature “cyclus” of the Seven Ravens from Grimm's fairy stories. In the same year he visited England to report officially to King Ludwig on the Manchester art treasures. And so diversified were his gifts that he turned his hand to church windows and joined his old friend Schnorr in designs for the painted glass in Glasgow cathedral. Towards the close of his career, with broken health and powers on the wane, he revisited Vienna. To this time belong the “cyclus” from the legend of Melusine and the designs commemorative of chief musicians which decorate the foyer of the new opera house. Cornelius writes, “You have here translated the joyousness of music into pictorial art.” Schwind’s genius was lyrical; he drew inspiration from chivalry, folklore, and the songs of the people; his art was decorative, but lacked scholastic training and technical perfection. In the decline of 1871, and was buried in the old Friedhof of the same town.

SCHWYZ (modern spelling Schwyz), one of the forest cantons of central Switzerland. Its total area is 350-sq. m., of which 293-sq. m. are reckoned as “productive” (forests covering 64-sq. m. and vineyards 17-sq. m.), while of the rest 214-sq. m. are occupied by lakes (nearly 9 sq. m. of that of Zürich, 243 sq. m. of that of Lucerne, 324 sq. m. of that of Zug, and the whole of the lake of Lower Zug), and 5 sq. m. is covered by glaciers. Its loftiest point is the Böser Faulen (900 ft.), while the two highest summits of the Rigi (the Kulm, 5966 ft., and the Scheidegg, 5463 ft.) rise within its borders. The canton extends from the upper end of the lake of Zürich on the north to the middle reach of the lake of Lucerne on the south; on the west it touches at Küsnacht, the northern arm of the same lake, and in the same direction the lake of Zug at Arth, mountain ridges dividing it from Glarus on the east and from Uri on the south. It is made up of two main valleys, those of the Muota, flowing through the older portion of the canton to the lake of Lucerne, and of the Sihl that passes near Einsiedeln on its way to Zürich. Less important are the Aa, that waters the Wägih glen before joining the lake of Zürich, and the Biber, which receives the Alpbach that flows past Einsiedeln. It is thus a hilly rather than a mountainous region, and is all but wholly devoted to pastoral pursuits. It has not many railways, the principal being that of the main St Gotthard line between Küsnacht and Sisikon (about 20 m.), while from Arth-Goldau a line runs past Biberbrücke (where falls in the branch from Einsiedeln, 3 m.) towards Wädenswil. From Arth-Goldau a mountain line runs up to the Rigi Kulm, with a branch to the Rigi Scheidegg, while from Arth-Goldau the line towards Zug runs for 5 m. within the canton. There is also a mountain line from Brunnen to Axenstein. In 1900 the population was 55,385, of whom 53,834 were German-speaking, 1108 Italian-speaking, and 296 French-speaking, while 53,537 were Romanists, 1836 Protestants and 9 Jews. The most populous town is Einsiedeln, with its famous Benedictine monastery, but Schwyz (the port of which is Brunnen) is the political capital.

There is a certain amount of industrial activity in the canton, particularly in the portion bordering on the lake of Zürich, where some of the larger towns have manufacturing interests; timber Thames, especially those at citizens may trees. But on the whole the region is essentially a pastoral one, and the local brown race of cattle is much esteemed and largely exported, mainly to north Italy. There are 417 mountain pastures or “alps” in the canton, capable of supporting 17,492 cows, and of an estimated capital value of 1,128,000 frs. Till 1814 the canton was included in the diocese of Constance, but it is now nominally part of that of Coire. There are six administrative districts in the canton, which comprise thirty communes. The cantonal constitution dates mainly from 1876, but was revised in 1888. The legislature (Kantonsrat) consists of members elected in the proportion of one for every six hundred (or fraction over two hundred) inhabitants and holds office for four years—the elections in twelve (the larger) of the thirty electoral circles take place according to the principles of proportional representation. The executive (Regierungsrat) of seven members is elected by a popular vote, and holds office for four years. The two members of the federal Ständerat and the three of the federal Nationalrat are also chosen by a popular vote. The “obligatory referendum” prevails in the case of all laws approved by the legislature and important financial measures, while two thousand citizens may claim a popular vote as to any decrees or resolutions of the legislature, and have also the right of “initiative” as to the revision of the cantonal constitution or as to legislative projects.

The valley of Schwyz is first mentioned in 572 under the form of “Suites.” Later, a community of freemen is found settled at the foot of the Mythen, possessing common lands, and subject only to the count of the Zürichgau, as representing the German king. Its early history consists mainly of disputes with the great monastery of Einsiedeln about rights of pasture. In 1240 the community obtained from the Emperor Frederick II. the grant of certain liberties, and in 1269 the right of self-government. In the following year the Emperor Frederick III. (1453) confirmed all the privileges granted to the community of Einsiedeln. The territory thus included only the district round the village of Schwyz and the valley of the Muota. But in 1269 it bought from Count Eberhard of Habsburg-Laufenburg (who in 1273 sold all his other rights to the head of the older line of the Habsburgs), Steinlen and Rothenthurm. Schwyz took the lead in making the famous everlasting league of the 1st of August 1291, with the neighbouring districts of Uri and of Unterwalden, its position and political independence specially fitting it for this prominence. An attack by Schwyz on Einsiedeln was the cause for the Austrian invasion that was grossly beaten back in the battle of Morgarten (November 15th, 1315). In the history of the league Schwyz was always to the front, so that its name in a dialectal form (Schweiz) was from the early 14th century onwards applied by foreigners to the league as a whole, though it formed part of its formal style only from 1503 onwards. Between 1319 and 1354 Schwyz secured possession of Arth. But it was only after the victory of Sempach (1386) that it greatly extended its borders. An “alliance” with Einsiedeln in 1397 ended in 1434 with the assumption by the latter of the position of “protector” of that great house, between 1236 and 1436 the whole of the "March" (the region near the upper lake of Zürich) was acquired, in 1402 Küsnacht was bought, and in 1440 the "Höfe," the parishes of Wollerau, Feusisberg and Freienbach, situated on the main lake of Zürich. All these districts were governed by Schwyz as “subject lands,” the supreme power resting with the Landsgemeinde (or assembly of all male citizens of full age), which is first distinctly mentioned in 1294, though it seems to have already existed in 1281, when mention is also made of a common seal. Schwyz joined the
other forest cantons in opposing the Reformation and took part in the battle of Kappel (1531), in which Zwingli fell. In 1536 it became a member of the Golden or Borromean League, formed to continue the work of St Charles Borromeo in carrying out the counter reformation in Switzerland. In 1798 Schwyz, including Gersau (free from 1390), formed part of the République Tellienne (or Telgau) set up by the French, which a week later gave way to the Helvetic republic. The men of Schwyz, under Adolph, rich hereditary proprietors (the name of their town they owned so many cows) and the poorer men (dubbed the "Hoofs", as they possessed only goats and sheep) as to the use of the common pastures, which the "Horn" party utilized far more than the others. The "Horn" party finally carried the day at the Landsgemeinde held at Rotthenthurm. The cantonal constitution of 1848 put an end to the ancient Lands- gemeinde; it was revised in 1876 (when membership of one of the 29 communes became the political qualification), and in 1898.

SCHEWZ—SCIENCE

SCHEWZ, the capital of the Swiss canton of that name, a picturesque little town, admirably situated, amid fruit trees, on a mountain terrace (at a height of 706 ft.), commanding a glorious view, at the north-west foot of the conical peak of the Gross Mythen (6240 ft.), and at a considerable height above the valley of the Muota. Besides a stately 18th century parish church and several convents, it contains a 16th century town hall (housing various precious MSS. and banners captured in various wars), as well as several curious old patrician houses, such as that of the Reding family, a member of which, Aloys (1765-1818), headed the patriotic resistance to the French in 1797-1799, Including the neighbouring hamlets of Ibach, Rickenbach, &c., the parish had 7398 inhabitants in 1900, practically all German-speaking and Romanists. The town is connected by an electric tramway with the Schwyz-Swetain station on the St Gotthard railway, about 3 m. from Brunnen, the frontier of Schwyz on the lake of Lucerne.

SCIACCA, a town and episcopal see of Sicily, on the S. coast, in the province of Girgenti, 45 m. N.W. of Girgenti by road, and about 30 m. direct. Pop. (1906) 24,645. It is surrounded by walls erected in 1400, and has two ruined castles, belonging to the Luna and Perollo families, whose hereditary feuds lasted from 1410 to 1529, some fine medieval palaces, and several interesting churches. The cathedral, founded in 1090, was largely reconstructed in 1686. The convent of Sta. Maria delle Ginmmare, with its battleden walls, occupies the former palace of the Seracen governors, and contains a painting of the foundress of the convent by Count Roger. The town has only an open roadstead. It has an important trade in coral.

Three miles E. of the town is the Monte San Calogero (the ancient Mons Cronius) with sulphurous and saline springs and vapour baths, which are still frequented and were known in Roman times as Aquae Larodes or Thermae Selinuntiae (Sciaccia is about 15 m. direct S.E. of Selinus). The name Sciaca is Arab, but of uncertain meaning. The town is the birthplace of Tommaso Fazzello (1498-1570), the father of Sicilian history.

SCILATICA (from a late Lat. corruption, sciaticus, of Gr. skias, a shadow, from the sciatic joint, a form of neuralgia localized in the sciatic nerve, or its cords of origin; see Neur- algia.

SCIENCE (Lat. scientia, from scire, to learn, know), a word which, in its broadest sense, is synonymous with learning and knowledge. Accordingly it can be used in connexion with any qualifying adjective, which shows what branch of learning is meant. But in general usage a more restricted meaning has been adopted, which differentiates "science" from other branches of accurate knowledge. For our purpose, science may be defined as acquired knowledge of natural phenomena and of the relations between them: the short term for "natural science," and as such is used here technically in conformity with a general modern convention.

The beginnings of physical science are to be sought in the slow and unconscious observation by primitive races of men of natural occurrences, such as the apparent movements of the heavenly bodies, and in the gradually acquired mastery over the rude implements by the aid of which such men strove to increase the security and comfort of their lives. Biological science similarly must have begun with observation of the plants and animals useful to man, and with empirical medicine and surgery. It was only when a considerable progress had been made with ordered knowledge that men began to ask questions about the meaning and causes of the phenomena, and to discern the connections between them.

In the earliest stage of development it seems that an anthropomorphic or mythological explanation is almost assigned to the phenomena of nature. With no clue to trace the regularity of sequence and connexion between those phenomena, an untutored mind, naturally led by curiosity, was bound to invent a series of capricious and often unconnected events which succeed each other to the direct and immediate intervention of some unseen being of a nature essentially similar to his own. The sun is the flaming chariot of the sun-god, driven day by day across the heavens; the clouds are cows from which milk descends as nourishing rain on the fruitful earth. We may regard such myths as childlike fancies, but they were doubtless an advance on the want of all explanation which preceded them; they supplied hypotheses which, besides giving rise to themes of beauty and suggestiveness for poetry and art, played the first and chief part of a scientific hypothesis in pointing the way for further inquiry. Much useful knowledge was acquired and much skill gained in logical analysis before these primitive explanations were proved insufficient. A false theory which can be compared with facts may be more useful at a given stage of development than a true one beyond the comprehension of the time, and incapable of examination by observation or experiment by any means then known. The Newtonian theory of gravitation might be useless to a savage, to whose mind the animistic view of nature brought conviction and helpful ideas, which he could test by experience.

The phenomena of the heavens are at once the most striking, the most easily observed and the most regular of those which
are impressed inevitably on the minds of thinking men. Thus it is to astronomy we must look for the first development of scientific ideas. The orientation of many prehistoric monuments shows that a certain amount of astronomical observation had been acquired at a very early age, and the Chaldeans seem to have gone so far in the recognition of constellations, as to even worship the stars. From the land of Asia the Greeks took their earliest ideas of science, and it is to the Ionian philosophers, of whom Thales of Miletus (580 B.C.) is regarded as the first, that we must turn for the earliest known example of an advance on the mythological view of nature. Anaximenes recognized the rotation of the heavens round the pole star, and saw that the dome overhead was but the half of a complete sphere. The earth was thus deprived of the base stretching to unfathomed depths imagined by the mythologists, and left free to float as a flattened cylinder at the centre of the celestial sphere. Ataximenes, too, seems to have grasped the doctrine of the uniformity of nature, teaching that all material transformations must have a true cause.

Next came the Pythagoreans, who simplified these conceptions by the suggestion that instead of a rotation of the vast sphere of the heavens the earth itself might be a sphere and revolve about a central fixed point, like a stone at the end of a string. The uninhabited side of the earth always faced the fixed point, and its inhabited side faced successively the different parts of the heavens. At the central fixed point they placed a "universal fire," which, like the fire on an altar, served as a centre for the circling of the wandering earth. Mythology was losing its hold of science, but mystical symbolism still held sway. When, however, in the 4th century B.C. the growth of geographical discovery failed to disclose any trace of this central fire, the idea of its existence faded away, and was replaced by the conception of the revolution of the earth on its own axis. Finally, Aristarchus (280 B.C.), believing that the sun was larger than the earth, thought it unlikely that it should revolve round the earth, and developed a heliocentric theory. But the time was not ripe; no indisputable evidence could be adduced, no general conviction formed, and to mankind the earth remained the centre of the universe till many centuries later. Even to Lucretius, the visible universe consisted of the central earth with its attendant water, air and earth founded by the sphere of the heavens, which formed the flaming walls of the world—flammantia moenia mundi. Simultaneously with the birth of astronomy the problem of matter came into being. The old Ionian nature philosophers, observing the sequence of changes from earth and water into the structure of plants and the bodies of animals, and through them again into the original earth, arrived at the conclusion that the indestructibility of matter, and to put forward the idea that all forms of matter might ultimately consist of a single "element." But the conception of a single ultimate basis of matter was far in advance of the age. It is only now becoming a fertile working hypothesis in the light of all the gigantic increase in knowledge of the intervening two thousand years. At the time when it was put forward, the conception was of little use, and the immediate path of advance was found in the idea of Empedocles (450 B.C.) that the primary elements were four: earth, water, air and fire—solid, a liquid, a gas and the flame which seemed to the ancient a type of matter still far removed in structure. This hypothesis served to interpret the phenomena of nature for many centuries, till, in modern days, the growth of chemistry disclosed the seventy or eighty elements of our text-books. Signs are not wanting that they too have served their turn as a conception of the ultimate nature of matter, while still maintaining their place as the proximate units of chemical action.

In the four elements of Empedocles we trace the germ of the ideas of the Atomists. Empedocles saw that, by combining his separate elements in different proportions, he could explain all the endless differences in matter as known to the senses. Leucippus and Democritus developed the conception and gave it to the world the theory of atoms, described at a later date by the Roman poet Lucretius. As matter is subdivided does it keep its characteristic properties throughout? Is iron always iron, however finely we divide it; is water always water? Are the properties of any kind of matter ultimate facts of which no explanation—no description in simpler terms—is possible? To avoid answering this last question in the familiar fashion and resigning all hope of an advance in knowledge, the atomic theory of the Greeks was framed.

To recognize the significance of the doctrines of the Greek Atomists, we must remove from our minds all sense of comparison with the atomic theory of to-day. The Greeks had none of the detailed physical and chemical knowledge on which that theory is founded, and which it was framed to explain. The object of Leucippus and Democritus was quite different from that of Dalton and Avogadro. To the latter, the conception of atoms and molecules served as a means of explaining certain definite and detailed facts of chemical combination and gaseous volume in a more definite and exact way than any other hypothesis available at the time. To the Greek philosophers, the atomic theory was an attempt to make the universe intelligible. The particular explanation offered was not of so much importance as the idea that an explanation of some kind was possible. When we see the beliefs that held sway before their day, we realize the advance their ideas produced. The qualities of substances were thought to be of their essence—the sweetness of sugar was as much a reality as sugar itself, the black colour of water must survive all changes in its form, so that, to one who knew this doctrine, snow could never look white again. It was such confusion as this—such denial of facts if they failed to support a theory—that Democritus assailed:—"According to convention there is a sweet and a bitter, a hot and a cold, and according to convention there is colour. In truth there are atoms and a void." Atoms were many in size and shape, but identical in substance. All qualitative differences in substances were to be assigned to differences in size, shape, situation and movement of particles of the same ultimate nature. No attempt was made to examine into the nature of this ultimate substance; but one set of phenomena was expressed in terms of something simpler, and the development of the "natural philosophy" of the most modern physicist can do more.

The atomic theory of the Greeks as transmitted to us by the poem of Lucretius presented a wonderfully consistent picture of nature within the limits of the knowledge of their day. It is easy to show where it fails in the light of the knowledge of phenomena we now possess; it is easy to point to places where, as in its application to psychological problems, its authors passed in imagination over logical chasms without even seeing that a difficulty existed. But the attempt to frame an intelligible picture by the use of the one unalterable hypothesis of mind, no matter how remarkable, does serve to suggest the provisional nature of some of the theories by the aid of which knowledge is advancing so fast in our own day.

But the great difference between the position of the Greeks and that of ourselves in regard to natural knowledge consists in the small number of phenomena known to them contrasted with the enormous wealth of accumulated observation which is available for us, as the result of years of experiment with the aid of apparatus unknown to the ancients. When a new theory is put forward, it is now almost always possible to test it in correspondence with facts by the use of one material already accumulated, or to suggest, in the light of such material, experiments which will serve to refute it, or to lend it greater probability. Thus a theory which survives the trials that follow its birth has nowadays a fairly long expectation of life—probably the theory will serve to interpret phenomena discovered either by its means or in other ways for some time to come. But in the ancient world this was not so. To test a new theory, other phenomena were very rarely available than those which suggested it, or to explain which it was put forward. Thus thought was much more speculative, and, as is still the case with metaphysics, no general consensus of opinion was reached. Each philosopher had a system of his own in science, just as he still has in metaphysics—a system which, beginning from first
principles anew, raises on them a superstructure, which, even if it logically follows from them, can have no more validity than the premises on which it is based. When the premises are not accepted by other philosophers, the whole scheme becomes merely the doctrine of one man, and, if it lives at all, may oppress by the dead weight of authority the struggle of living thought beneath it.

The history of the ancient theory of Leucippus and Democritus illustrates the difficulties of a position where speculation has no practical observance. That theory was simply a statement of what is now accepted as truth by any other of the ancient schemes of physics. Yet the grounds on which it was based were so insecure that Aristotle (c. 340 B.C.), who started with other preconceptions, was able to bring to bear such destructive criticism that the theory ceased to occupy the foremost place in Greek thought. Although, with the knowledge then available, we can but admit that some of Aristotle's criticism was just, much of it consists of metaphysical arguments against the atomists, while in parts he rejects true conclusions owing to the mistakes of his antagonists. Democritus, for instance, had held that all things would fall with equal speed in a vacuum, and that the fact that heavy bodies were observed to fall faster than very light ones was due to the resistance of the air. Democritus' belief was true, though he was of course quite unconscious of the grounds on which it can alone be demonstrated—the universal attraction of gravity, and the remarkable and curious experimental fact that the weights of bodies are proportional to their masses. Aristotle agrees that in a vacuum all bodies would fall at an equal rate, but the conclusion appears to him so inconceivable that he rejects the idea of the existence of any empty space at all, and with the "void" rejects the rest of the allied concepts of the atomic theory. If all bodies were composed of the same ultimate matter, he argues, they must all be heavy, and nothing would be light in itself and disposed to rise. A large mass of air or fire would then necessarily be heavier than a small mass of earth or water. This result he thinks impossible, for certain bodies always tend upwards and rise faster as their bulk increases. It will be seen that Aristotle has no idea of the concepts we now call density and specific gravity, though clear views about the question why some things rise through air or fire might have been obtained without the aid of physical apparatus. Aristotle's doctrine that bodies are essentially heavy or light in themselves persisted all through the middle ages, and did much to delay the attainment of more exact knowledge. It was not till Galileo Galilei (1564-1642) discovered by actual experiment that, in cases where the resistance of the air is negligible, heavy things fall at the same speed as light ones, that the Aristotelian dogma was overthrown.

Turning to the biological sciences, we may trace a somewhat similar course of development. Owing to its practical importance, medicine has left many records by which its progress can be traced. Just as primitive man personified the sun and the moon, the wind and the sea, so he regarded disease as due to the action of some malignant demon or to the spells of some human enemy. Once more Greek literature enables us to trace the gradual decrease in the importance assigned to charms and magic, and the growth of more rational ideas among physicians. But here, as in the physical sciences, the philosophic range of the intellect of the Greeks led them astray. Assumptions as to the nature of man or the origin of organic life were too often made the starting point of a train of deductive reasoning, the consequences of which were not always compared with the results of observation and experiment, even where such comparison was possible. The Greek philosophers tried to make bricks without straw, usually in sublime unconsciousness that straw was necessary. Many centuries of humble observation and tentative fitting together of small parts of the great puzzle were needed before enough material was collected to make possible useful generalizations about the questions, answers to which the Greeks assumed as the very basis of their inquiries.

Among the multitude of their guesses, a few somewhat resembled the views that are now again rising into prominence from the basis of definite and exact experiment. A good example of the strength and weakness of ancient speculation is found in the cosmogony of the atomists, both on its physical and on its biological side. Lucretius describes how the world was formed by the conjunction of streams of atoms, which condensed into the earth, with its attendant water, air and aether, to which he assigned self-containment. Unconscious of the mighty gap between inorganic matter and living being, he proceeds to tell how, in the chances of infinite time, all possible forms of life appeared, while only those fittest to survive persisted and reared offspring. Here, surrounded by unsupported statements and false conclusions, we see dimly the germs of the ideas of the nebular hypothesis and the theory of natural selection, though Lucretius had the profoundest ignorance of the difficulties of the problem, and the vast stretches of time necessary for cosmical and biological development.

In those branches of biological science in which less ambitious theories and more detailed observation were forced on the Greeks, considerable progress was made. Aristotle compiled a laborious account of the animals known in his day, with many accurate details of their anatomical structure. Beginning from an earlier date, steady advance was made with geographical discovery. Maps of the known world, developed from the local maps invented by the Egyptians for the purposes of land-surveying, gave definiteness to the knowledge thus acquired, and showed its bearing on wider problems.

One of the most striking successes of Greek thought is seen in the development of geometry. Geometry has a twofold importance, as being itself the study of the properties of the space known to our senses, and as teaching us methods and means of studying nature by unfolding the full logical consequences of any hypothesis: geometry is the best type of deductive reasoning. Based on axioms, the result of simple experience, it traces from the ideas of solids, surfaces, lines and points the properties of other figures defined in terms of those ideas. As an example to other sciences, the deductive geometry of Euclid (c. 300 B.C.) had, perhaps, an unfortunate influence in emphasizing the deductive method, and teaching men to neglect the need of verifying an experiment the theories put forward to explain the more complex phenomena of nature at the conclusion, and at each possible step, of the deduction. But, in itself, the science of Euclidian geometry was brought to such a state of perfection that no advance was made till modern times: no change even in form attempted till quite recently. Unlike some other branches of inquiry we have mentioned, Euclid's geometry carried universal conviction, and represented a permanent step in advance which never had to be retraced.

Alongside the study of individual sciences, the Greeks paid even more attention to the laws of thought, and to the examination of the essence of the methods by which knowledge in general is acquired. In opposition to Plato's theory that all knowledge is but the unfolding and development of forgotten memories of a previous state of existence, Aristotle taught that we learn to reach the generalizations, which alone the Greeks regarded as knowledge, by remembering, comparing and co-ordinating numerous particular acts or judgments of sense, which are thus used as a means of gaining knowledge by the action of the innate and invariable nous or intellect. Neither Plato nor Aristotle could be satisfied without finding infallibility somewhere. Aristotle, it is true, investigated the logical processes by which we pass from particular instances to general propositions, and laid stress on the importance of observing the facts before generalizing about them, but he had little appreciation of the conditions in which observation and the induction based on it must be conducted in practice in order to obtain results where the probability of error is a minimum. Aristotle regarded induction merely as a necessary preliminary to true science of the deductive type best seen in geometry, and, in applying his principles, he never reached the "positive" stage, in which metaphysical problems are evaded, if not excluded,
and a scheme of natural knowledge built up in a consistent manner, so that metaphorical ideas, though they may underlie the foundation of the ultimate conceptions, do not intrude between the parts of the building. Hence Aristotle's explanations often turn directly on metaphorical ideas such as form, cause, substance, terms which do not occur (in the Aristotelian sense) in modern scientific terminology.

The "Origin of mechanics."

A century later than the time of Aristotle, Archimedes of Syracuse (287 to 212 B.C.) formulated the fundamental conceptions of hydrostatics and took what may be regarded as the first step toward the fundamental conceptions of mechanics. The use of the lever must have been discovered at a very early date, and Archimedes set to work to investigate its quantitative laws by the application of principles learnt from the geometers. He begins by laying down two axioms: (1) Equal weights placed at equal distances from the point of support of a bar will balance; (2) Equal weights placed at unequal distances do not balance, but that which hangs at the greater distance descends. The ancient philosophers based such axioms as the first of these two on the "principle of sufficient reason." No motion can take place, because, "there is nothing of the nature of motion in those things, why the balance should descend on one side more than the other. Even if we grant the theoretical validity of this principle, it is impossible to make sure without trial that the system in any given case is really symmetrical. Electrification of the bar, for instance, though imperceptible to our senses, would cause one end to descend if an oppositely electrified body were placed near that end; we cannot assume without trial that the position of the sun, or the colour of the arms, will not affect the result. Archimedes based the second axiom on the sounder ground of direct experience. On these two axioms he proceeded to construct an elaborate and elaborate theoretical proof of the numerical law of the lever, but, in the course of it, he assumed as known the principle of the centre of gravity. In reality, this principle is identical with that of the lever, and assuming one, implicitly we assume the other. Nevertheless, Archimedes' proof is of use and interest. On the assumptions made, it shows the connexion between the general case of the lever with unequal arms, and the special and more familiar case when the arms are equal. Indeed, if we also treat the principle of the centre of gravity as an axiom known by experience, Archimedes' proof is a true type of all scientific explanations, for it shows us in a very simple form the connexion to others already well known to our minds, which, creatures of habit as they are, regard the familiar cases as in no need of explanation. Nowadays we should treat the law of the lever of unequal arms as one that is verified by direct and familiar experiment, and use it, in its turn, as the starting point for further deduction.

Thus before the intellectual activity of Greece was absorbed by the utilitarianism of Rome, which, in its turn, was lost in the dark ages following the barbarian conquests, the seeds were sown which, germinating after the lapse of centuries, developed in the more fruitful soil of the age of experiment. But for a time they were buried, and only remembered by compendiums written just before the ancient light was wholly lost. During the dark ages, the contents of secular learning, based on those compendiums, settled down into the elementary "trivium," consisting of grammar, rhetoric and dialectic, and the more advanced "quadrivium" music, arithmetic, geometry and astronomy. Music included a half-mystical doctrine of numbers and the rules of plainsong; geometry consisted of a selection of the propositions of Euclid without the demonstrations; while arithmetic and astronomy were cultivated chiefly because they taught the means of finding Easter. Meanwhile, the early alchemists of Alexandria, by the aid of mystical analogies with the conceptions of astrology, were making primitive experiments on the transformations of various substances. It was probably from them that the "sacred science" passed to the Arabs, among whom Geber (c. A.D. 750) discovered many new chemical reactions and compounds. With the intellectual revival which began in the 11th century, and the gradual recovery of some of the lost works of the ancient writers, we turn a new page. The controversy between Plato and Aristotle upon the doctrine of ideas fascinated the minds of the middle ages, saturated as they were with the logical subtleties of dialectic. This controversy originated the long debate on the reality of universals, which absorbed the intellectual energies of many generations of men. Did reality belong only to the idea or universal—to the class rather than to the individual—to the common humanity of mankind, for instance, rather than to each isolated being? This fine and disjointed question of reality, and the universals mere names? In this question, truth, like orthodoxy, is meaningless, as it seems at first sight, logical analysis disclosed to the medieval mind the whole theory of the universe. Either answer contained danger to theological orthodoxy as then understood; hence the fervour with which it was debated. But, as communication with the East was reopened early in the 13th century, Latin translations of Aristotle's works gradually were recovered; the whole of Aristotle's philosophy was reimported into the schools of Europe, and reconciled and adopted by Christian theology. For three hundred years Aristotle reigned supreme in European philosophical and scientific thought, and the universal idea was used to give their master's teaching that on the need of experiment, settled questions of fact as well as those of opinion by an appeal to his books. But outside the academic schools of the newly founded universities, experiment was kept alive by the labours of the alchemists, who, early in the 13th century, sought to find the ideas from the Arabs, and began to search for an elixir vitae and for a means of transmuting baser metals into gold. But alchemy never quite squared its account with orthodox theology, and the "sacred science" of the Alexandrians became associated in the medieval mind with the "black art" of witchcraft. Even a man like Roger Bacon, who, with some astrological mysticism, had a more modern idea of experiment both in chemical and physical problems, did not escape condemnation.

We now reach the period in the history of the world known as the Renaissance, when many converging streams of thought were given room to join by the increased material prosperity and improved political stability of the 15th and 16th centuries. The Renaissance was not, as it is sometimes represented, a sudden break with medievalism and a birth of the modern world. But a number of conditions favoring the rapid development happened to coincide, and, in the course of a century and a half, the medieval world on nature became profoundly modified. The recovery of the Greek language, the voyages of Columbus, the decay of the Western and the passing of the Eastern empire, the temporary diminution in power of the papacy, the invention of printing, all tended to produce new ideas and to prepare men's minds to accept the more human and naturalistic view of the universe which had been current among the Greeks, in place of the mystical aspect which it wore to the medieval schoolmen and ecclesiastics. At first the tendency was to substitute the authority of the ancients for the authority of the schoolmen, but gradually more independence of thought was secured; men like Leonardo da Vinci (1452-1519) began to experiment and to record their results; Niccolau Copernicus (1473-1543) revived the heliocentric theory, and showed how the accumulated mass of astronomical observations could be interpreted by its means; and anatomy began again to be studied in the schools of medicine, gradually making its way in face of the prejudice against mutilating the human body.

The philosophy of the new experimental methods was first studied deeply by Francis Bacon (1561-1620). Sensible of the confusion and disturbance which a new system instituted the only scientific knowledge, Bacon set himself to describe a new method by which definite knowledge might be acquired with certainty. Warned by the failure of the scholastic methods, Bacon laid exclusive stress on experimental research, and it was perhaps natural that he should incline to the extreme and ignore almost entirely the use of hypothesis and the deductive method. To arrive at the underlying causes, said Bacon, we must study the
natural history of the phenomena, collect and tabulate all observations which bear on them, notice which phenomena are related in such a way as to vary together, and then, by a merely mechanical process of exclusion, we discover the cause of any given phenomenon. As a corrective of the medieval philosophy Bacon's work was of the greatest value in the history of thought, and, from this point of view, it is perhaps but a small drawback that scientific discovery is seldom or never made by the pure Baconian method. The multitude of phenomena are too great for any subject to be attacked, with success, in the light of hypothesis framed by the use of the scientific imagination.

Facts are collected to prove or disprove the consequences deduced from the hypothesis, and thus the number of facts to be examined becomes manageable.

Even while Bacon was philosophizing, the true method was being used by Galileo Galilei (1564–1642) to found the science of dynamics. We have seen how the Aristotelians held the belief that every body sought its natural place, the place of heavy bodies being below and that of light ones above. Inmate qualities of heaviness and lightness were thus invoked to explain why some things fell, and others, in similar circumstances, rose. Galileo, rightly rejecting the whole current point of view, set himself to examine not why, but how, things fell. This change of attitude was in itself one of his great achievements. Now a falling body starts from rest and falls with a speed which is increasing constantly. Galileo sought to find the law of increase. To isolate the real law out of all possible laws he made a guess at a simple law which seemed likely to be true. He assumed that the speed acquired is proportional to the distance fallen through. But, working out the consequences of this hypothesis, he soon convinced himself that it involved a contradiction. He abandoned the hypothesis and made another. He supposed that the speed was proportional to the time of fall. Again he deduced mathematically the consequences of this new hypothesis, and, finding no inconsistencies, put some of his deductions to the test of experiment, and verified their accuracy. Thus Galileo proved mathematically that, if the speed of fall is proportional to the time from the moment of starting, the space traversed by a falling body must be proportional to the square of the time of fall. To verify this result experimentally, Galileo convinced himself that a body falling down an inclined plane acquired a speed which is the same as that it would have attained in falling through the same vertical height. He was able therefore to use a slow fall down a plane for his experiments instead of the unmanageably rapid course of a body falling freely. Nor was this all. From this stage to the investigation another consequence of his results was found to spring. A ball after running down an inclined plane of a certain height will run up another plane of the same height irrespective of its inclination—that is, if friction be small. The second plane may be made very long, but still, if its final height be the same, the ball will reach its end. Hence it is the height that matters; none of the speed of the ball is destroyed unless it rises. If the second plane be made horizontal, the ball will thus run on for ever unless stopped by friction or some other applied force. This fundamental result, put into definite words by Newton, is known as the first law of motion, and is the foundation of the whole science of dynamics. In Galileo's day it was an entirely new conception. It has been assumed that every motion required some cause or force to maintain it. Hence arose the need of hypothetical vortices to maintain planetary movements, and similar complications in astronomy and mechanics. But it now became evident that it was not the continuous motion of the planets which needed explanation, but the constant deflection of that motion from the straight path it would hold if no applied force were in action. The way was open for Newton.

Sir Isaac Newton (1642–1727) proved mathematically that the observed motion of the planets about the sun could be explained, and explained only, by the supposition that the sun exerted a force on each planet proportional inversely to the square of its distance from the planet. But the earth, at any rate, does attract bodies on or near its surface, the phenomenon being the familiar but mysterious gravity. Is this force competent to account for the motion of the moon round the earth? On the assumption of the law of inverse squares, Newton calculated what the known force of gravity would become at the distance of the moon. Owing to faulty data, his first result indicated that the force would be too great, and Newton put aside his calculations. Six years later a new determination of the size of the earth gave him a new basis for calculation, and, of all his enterprises, but the could hardly see his figures, Newton found that the fall of a stone to the earth and the sweep of the moon in her orbit were due to the same cause. The mechanism by means of which the force is exerted remains unexplained to Newton, and has baffled all inquirers since his day, but the discovery that all the movements of the heavens could be described by one simple physical law, represents the greatest achievement in the history of science.

Newton brought the existing state of the solar system within the cogitation of known dynamical principles, and the logical extension of such principles in a chronological sequence. Moreover, that system was made by the speculations of Pierre Simon, marquis de Laplace (1749–1827), and developed by those who followed him. They imagined a primitive state of nebulous from which, by the action of known dynamical processes, the sun and planets would be evolved.

These speculations, isolated at first, coalesced with the more detailed conclusions of geology during the 19th century. The earlier conceptions of the origin of the rocks of the earth imagined catastrophes of fire or water, processes which gave the world a new face. But the "uniformitarian" school, founded by James Hutton (1726–1797) and expounded by Sir Charles Lyell (1797–1875), produced evidence to show that much, at any rate, of the structure of the surface of the globe was produced by the action of causes and processes still going on under our eyes. The deposition of material by the action of seas and rivers and other natural agencies, e.g., volcanoes, &c., was seen to need only time enough to produce beds of rock like those which make up our mountains. Comparison of the fossil remains of plants and animals found in different kinds of rock then enabled geologists to classify the rocks, and place them in a chronological sequence. Moreover, it became evident that a series of animal and plant types was associated with the gradual formation of the rocks, and that the age both of the earth itself and of the organic life found on it was much greater than had been suspected. The few thousand years of received cosmogonies stretched out into untold millions, during which the same familiar laws described the phenomena of development. The remains and traces of man, found, it is true, only in the later sedimentary deposits of the earth, still were enough to prove his existence through ages beside which the dawn of history was but as yesterday. As Newton had extended known principles throughout the gigantic spaces of the heavens, so the later geologists pushed them back over enormous epochs of time. The extent of the kingdom of ordered knowledge expanded both in space and time to a degree truly marvellous.

The discovery by Sir George G. Stokes (1819–1903), R. W. Bunsen (1811–1890) and G. R. Kirchhoff (1824–1887), that the spectroscope gave a means of investigating the chemical composition of the sun and the stars, brought another set of phenomena under the control of terrestrial experiment. Moreover, the differences in stellar spectra once more suggested the idea of cosmical development, familiar from the nebular hypothesis of Laplace.

Besides the direct extension of the dominion of science produced by geology and spectroscopy the new results emphasized the idea of development, and prepared the way for the biological work of Charles Darwin (1809–1882). The origin of living beings from a few ancestral types was an old conception, but Darwin first found an adequate intelligible cause in the slow action of sexual selection, joined to the pressure
of the struggle for life, which allowed only those individuals most suited by favourable variation to the environment to survive and rear their offspring. The advantage thus given to beings with useful variations may develop into permanent modifications in the course of ages, and, when the parent types have disappeared, their common posterity may exhibit the marked differences characteristic of the separate and distinct species now existent. From the point of view of scientific thought, the significance of Darwin's theory lies in the new and vast extension it gives to the field in which causes intelligible to the human mind can be sought as explanations of phenomena. Thus evolution is co-ordinated in the history of thought with the Newtonian theory of gravitation, and with the uniformitarian theory of geology.

Both before and after the appearance of Darwin's work, biologists devoted their attention to the study of how the useful variations arise. Three views have been held. (1) Variation. Jean Baptiste, chevalier de Lamarck (1744–1829), regarded variation as due to the accumulated and inherited effect of use. Thus the giraffe acquires his long neck by the successive efforts of countless generations to browse on leaves just beyond their reach. (2) Darwin, while accepting changes in accordance with Lamarck's ideas as exceptional aids to variation, revolutionized biology by showing the principle of inheritance and showing how species may change long periods of time, in selecting useful variations which arise accidentally or in other ways. (3) Darwin also recognized the possible occasional effect of discontinuous variations or "sports," when a plant or an animal diverges from its parents in a marked manner. But of late years the study by Hugo de Vries, William Bateson and others, of discontinuous variations which arise spontaneously has pointed to the conclusion that in nature such sudden leaps are the normal cause of development. If a "sport" has advantages over the parental type, it tends to survive, while, if it is not as fitted for its life struggle, it is destroyed by natural selection and never establishes itself. Such a theory avoids the difficulty of pure "Darwinism," that organs useful, when fully developed, to an animal or plant are of no advantage in incipient stages. Statistical methods, too, suggest that a definite limit may exist to the amount of a given variation which proceeds by small steps, each insignificant in itself.

Closely connected with such problems is the question of inheritance. Lamarck's theory required the inheritance of characteristics acquired during the life of a parent. But difficulties, such as that of explaining how a change could affect the simple germ cells, has led some more recent biologists to pass to the other extreme, and to deny the possibility of any acquired characteristic being transmitted to offspring.

A new light has been thrown on the problem of inheritance by the recent re-discovery of the work of G. J. Mendel, abbot of Brunn (1822–1883). Certain characters in both plants and animals have been found to be separable, and some of these characters exist in pairs, so that the presence of one involves the absence of the other. To take a single example. Blue Andalusian fowls do not breed "true." On the average, half the offspring of two blue parents are blue, while the remaining half are divided equally between black and white birds. Both black and white when mated with a consort of the same colour breed "true" and yield only offspring similar to the parents. A white bird mated with a black, however, produces invariably all blue chicks. White mated with blue gives half blue and half white, while black mated with blue gives half blue and half black. Such phenomena are explained if we suppose that of the germ cells of the blue birds half bear the black character and half the white. If, in reproduction, a "black" cell meets a "black" the resulting chick is black; if "white" meets "white" the chick is white; while if "white" meets "black" the chick possesses a mixture of the two characters which in this case yield blue colour. But the reproductive cells of this intermediate form are not intermediate in character; they possess the pure parental characters in equal numbers. Knowing these facts, it is evident that we can reproduce any of the results at will, and from the mixed blue type produce a pure true breed of either black or white birds. Experiments of this kind must lead to a power of breeding new varieties of plants and animals hitherto undreamed of, and already have changed altogether our views of the problems of heredity. Instead of a vague mixture of all our ancestors, we possess definite characteristics of some of them only, though, like the blue Andalusian fowl, we may transmit to our children ancestral characters we do not ourselves exhibit. The family or race is more important in heredity than the individual parent. Thus the aristocratic theory of politics receives support from the evidence of the new biology.

Simultaneously with the growth of geology, and the birth of the Darwinian hypothesis, a new development took place in physical science—the development of the conception of energy as a quantity invariably in amount throughout a series of physical changes. The genesis of the idea in its modern form may be traced in the work of Newton and C. Huygens (1629–1695), who applied it to the problems of pure dynamics. But, in the middle of the 19th century, by the work of James Prescott Joule (1818–1889), Lord Kelvin (1824–1907), H. von Helmholtz (1821–1894), J. Willard Gibbs (1839–1903), R. E. J. Clausius (1822–1888) and others, it was extended to physical processes. The amount of heat produced by friction was found to bear a constant proportion to the work expended, and this experimental result led to the conception of an invariable quantity of something, to which the name of energy was given, manifesting itself in various forms such as heat or mechanical work. Energy thus took its place beside mass as a real quantity, conserved throughout a series of physical changes. Of late years, as we shall see below, evidence has appeared to show that mass is not absolutely conserved, but may depend upon the velocity with which it approaches that of light. Since the only essential quality of matter is its mass, this result seems to strike at the root of the metaphysical conception of matter as a real, invariable quantity. It remains to be seen whether the conception of energy as an invariable quantity will hold its place or give way to some similar modification as science develops. But, in the present state of knowledge, we may accept the principle of the conservation of energy as one of the most firmly established of physical laws.

The amount of energy in an isolated system remains invariable, but if changes are going on in the system, the energy tends continually to become less and less available for the performance of useful work. All heat engines require a difference of temperature—a boiler and refrigerator, or their equivalents. We cannot continue to transform heat into mechanical work if all available objects are at a uniform temperature. But, if temperature differences exist, they tend to equalize themselves by irreversible processes of thermal conduction, and it becomes increasingly difficult to get useful work out of the supplies of heat. In an isolated system, then, equilibrium will be reached when this process of "dispersion of energy" is complete, and from this single principle, the whole theory of the equilibrium of physical and chemical systems was worked out by Willard Gibbs. Such a method avoids altogether the use of atomic and molecular conceptions. In fact, some supporters of the theory of "energetics" expressly disclaim the conceptions of natural atoms and molecules as unnecessary and misleading, and prefer to found all science on the idea of energy. Matter, they argue, is known to us only as a vehicle for energy, and may itself be but a manifestation of that energy.

But the other great line of advance in recent physics, although it may lead us in the end to somewhat similar conclusions, has been traced by a method which used atomic and molecular conceptions in an extreme form. The passage of electricity through liquids had been explained by Michael Faraday (1791–1867) and others as a transference of a succession of electric charges carried by
moving particles of matter or ions. At the end of the 19th century these ideas were extended, chiefly by the labours of J. J. Thomson, to elucidate also the conduction of electricity through gases. In 1897 Thomson discovered that, in certain cases, the moving particles which carried the electric current were of much smaller mass than the smallest chemical atom, that of hydrogen, and that these minute particles, to which he gave the name of corpuscles, were identical from whatever substance they were obtained. They enter into the structure of all matter, and form a common constituent of all chemical atoms. The only known properties of these corpuscles are their mass and their electric charge. When a charged body set in motion spreads electromagnetic energy into the surrounding medium. Thus, more force is needed to produce a given acceleration than if the body were unchanged. The body acts as though its mass were greater than when it is unchanged. Now there is reason to believe that the whole apparent mass of the minute corpuscles to which we have referred is an effect of their electric charge. The idea of a material particle thus disappears with that of material mass, and the corpuscle becomes an isolated unit of electricity—an electron. It is impossible to resist making the speculation that the moves in space in a way that cannot be described by any of the mass is to be explained in terms of electricity, though it must be pointed out that there is no conclusive evidence in favour of this hypothesis.

Another train of reasoning, starting from a different point, reinforces this result. The phenomena of the interference of beams of light in certain circumstances, to produce darkness or colour, indicate that light is some form of wave motion, and, to carry these waves, a hypothetical luminiferous aether was invented. The theoretical work of J. Clerk Maxwell (1831–1879) and the experiments of H. R. Hertz (1857–1894) showed that the properties and velocity of propagation of light and of electromagnetic waves were identical and that their other properties differed only in degree. Thus light became an electromagnetic phenomenon. But light is started by some form of atomic vibration, and to start an electromagnetic wave requires a moving electric charge. Thus electric charges must exist within the atom, and we are led again to the theory of electrons by the road opened up by H. A. Lorentz and Joseph Larmor. Such a theory suggests the occasional instability of the atom, and the phenomena of radioactivity, shown in a remarkable form by the substance radium, have been made up of these, and that satisfactorily by the theory of E. Rutherford and F. Soddy, who regard the energy liberated as due to the disintegration of the atom. The evolutionary view of nature, established in the biological and sociological sciences, is thus extended to physical science, not only in the development of planets and stars, but even in the chemical atoms, hitherto believed indestuctible and eternal.

As we have seen, Francis Bacon described a new method of discovery in which exclusive attention was paid to the collection and tabulation of facts, with a view to the detection of relations between them, and the consequent reference of "effects" to their proper "causes." Impressed by the barrenness of the a priori methods of the Schoolmen, Bacon in his philosophy went to the other extreme. The use of the Baconian method in its purity would be too laborious for success. Some guide is necessary in the collection of facts at an early stage of our investigations. Here the scientific imagination is brought into play, and some hypothesis is framed to explain the phenomena under investigation. The hypothesis may be suggested by the theories which are accepted at the time in cognate branches of knowledge, or it may be suggested by the few isolated facts already known or just discovered in the phenomena to be considered. From this new hypothesis, consequences are deduced by processes of logical reasoning—consequences which may be put to the test by comparison with the results of observation or experiment. If agreement is found, the hypothesis is, so far, confirmed, and gains in authority with every fresh concordance discovered. If the deductions from the hypothesis do not agree with the accepted interpretation of facts, the hypothesis may need modification, it may have to be abandoned altogether, or the want of concordance may point to some error or inconsistency in the fundamental concepts on which the hypothesis is based—the whole framework of that branch of science may need revision, as the idea of heat as a caloric substance had to be abandoned under the pressure of the experiments of Joule on the equivalence between work done and heat developed. But the ultimate test of the validity of our knowledge can only be the consistency with each other of the parts of the whole scheme. If the received interpretation of one set of phenomena is not consistent with that of another, one or other of the schemes must be wrong if we make the assumption necessary for all knowledge, namely, that the universe is intelligible to a mind capable of dealing with its complexity.

In early times, when the knowledge of nature was small, little attempt was made to divide science into parts, and men of science did not specialize. Aristotle was a master of all science known in his day, and wrote indifferently treatises on physics or animals. As increasing knowledge made it impossible for any one man to grasp all scientific phenomena of division were drawn for convenience of study and of teaching. Besides the broad distinction into physical and biological science, minute subdivisions arose, and, at a certain stage of development, much attention was given to methods of classification, and much emphasis laid on the results, which were thought to have a significance beyond that of the mere convenience of mankind.

But we have reached the stage when the different streams of knowledge, followed by the different sciences, are coalescing, and the artificial barriers raised by calling those sciences by different names are breaking down. Geology uses the methods and data of physics, chemistry and biology; none can say whether the science of radioactivity is to be classed as chemistry or physics, or whether sociology is properly grouped with biology or economics. Indeed, it is often just where this coalescence of two subjects occurs, when some connecting channel between them is opened suddenly, that the most striking advances in knowledge take place. The accumulated experience of one department of science, and the special methods which have been developed to deal with its problems, become suddenly available in the domain of another department, and many questions that were beyond reach, and for which, it seemed, there was no method of attack, suddenly produce answers in the new light cast upon them. Such considerations show us that science is in process of being united, though we may agree to look on it now from one side and now from another as we approach it from the standpoint of physics, physiology or psychology.

Having traced the development of the most important of the fundamental conceptions of science, and followed the subdivision of natural knowledge into the various sections which for convenience mankind has made, let us now examine the meaning of the knowledge thus acquired, and its relation to other branches of learning. By the slow and laborious methods of observation, hypothesis, deduction, and experimental verification, a scheme has been constructed which for the most part is consistent with itself, and bears the test of the comparison of one part with another. As a chart is drawn by the explorer of unknown seas to represent his discoveries in a conventional manner, so the scientific investigator constructs a mental model of the phenomena he observes, and tests its consistency with itself and its concordance with the results of further experiment. The chart does not give a lifelike picture of the coast as does a painting, but it represents one aspect of it conventionally in a manner best adapted for the immediate purpose. So the conceptions of one branch of science—mechanics let us say—represent the phenomena of nature in the conventional aspect best suited for one particular line of inquiry. It does not follow necessarily that "nature" in reality resembles the particular mental chart which mechanical science enables us to construct. It does not even follow that there is any "reality" underlying phenomena and corresponding with any of our conceptions. The whole problem which mankind has to face
undoubtedly includes an inquiry into the ultimate nature of reality. But that inquiry lies in the province of metaphysics, and is not necessarily involved in the pursuit of natural science. Metaphysics uses the results of natural science, as of all other branches of learning, as evidence bearing on her own deeper and more difficult questions. But it does not follow that natural science must solve metaphysical problems before being of use to man and enlarging the sphere of his knowledge. We need not ask whether the reality is represented accurately by our conventional model, whether indeed there be any reality at all, before using the …

changes in the body. But modern methods have co-ordinated it also with definite chemical and electrical changes, and are said sometimes to have “explained” the nerve-impulse in physical terms.

But, as always, an “explanation” proves to be simply a restatement of a phenomenon in terms of other phenomena which previously are familiar to the mind, and therefore appear to be better understood. Nevertheless, from our present point of view, no one of these possible aspects of the phenomenon—of the nerve-impulse—is essentially more fundamental than any other. To the psychological the nerve-impulse is expressed in terms of thought, to the physicist by physical changes. The fact that a thought is accompanied by movement of matter or electricity does not make the thought less a fundamental conception.

But perhaps the best illustration is to be sought in the relation between the physical concepts of matter and electricity. As we have seen, J. J. Thomson discovered corpuscles which were common constituents of all matter, with masses smaller than those of any known atoms. One of these corpuscles represents a unit of negative electricity. An atom with a corpuscle in excess is an atom negatively electrified, an atom with one corpuscle less than an atom negatively electrified. An atom without a corpuscle at all, is an atom positively electrified. In this scheme electricity is described in terms of matter. But these corpuscles have been identified with the hypothetical electrons of Lorentz and Larmor, who consider matter to be composed of such isolated units of electricity. Such electrons, it has been shown, would possess mass by virtue of their electromagnetic properties. In this theory the idea of mechanical mass is eliminated altogether, and mass, and therefore matter, explained in terms of electricity. The view has been held by some that a mechanical explanation of a phenomenon is fundamental, and that a phenomenon so explained may be re-explained by a mechanical conception. This idea may be traced to the familiarity with mechanical conceptions of our everyday experience. The mind obtains its concept of matter from the resistance which that matter manifests to forces tending to set it in motion when at rest, or to change its state of motion when travelling. This fundamental property of inertia is the measure of mass, and we reach the concept of mass by our muscular sense of the force needed to set mass in motion. Force seems to be a direct sense perception, though mathematically it is better to define force in terms of acceleration and mass—since the perception is a result of a perception of mechanical conceptions is fully understood. This idea may be traced to the familiarity with mechanical conceptions of our everyday experience. The mind forms this conception from their experience of a direct sense perception of muscular effort. This seems to be the basis of the whole feeling that mechanical conceptions are more fundamental than any others, and that, for instance, it is more intelligible to explain electricity in terms of mechanics than vice versa. But the fact that we have a special muscular sense is an accident of our bodies. It is possible that the electric fish, or torpedo, has a special electric sense, and that to such a fish-philosopher the perception of electromotive force is more real than that of mechanical force. Such a being might well argue that it is intelligible and satisfactory to explain the mysterious concept of mass, which he only reaches through the other equally mysterious concept of mechanical force, in terms of the familiar concept of electricity, well known to every torpedo from his direct sense perception of electromotive force. This instance may serve to show that it is quite as correct philosophically to explain matter in terms of electricity, as to explain electricity in terms of mass. The object of science is to find connexions between phenomena and thus to correlate them. At present a great deal of simplification may be reached by reducing all possible phenomena to mechanical conceptions than in any other way, but that only shows that the mechanical aspect of nature gives us a fuller view than any other at present known, not that mechanics is philosophically the most fundamental science.

SCILLITAN MARTYRS, a company of early North African Christians who suffered under Marcus Aurelius in A.D. 180, and whose Acts are at once the earliest documents of the Church of Africa and the earliest specimen of Christian Latin. The martyrs take their name from Scilla (or Scillium), a town in Numidia. Their trial and execution took place by order of the Pro-consul Vigilienus, a companion of the latter, when Tertullian declares to have been the first persecutor of the Christians in Africa. The date of their martyrdom is the 17th of July A.D. 180. It is thus the concluding scene of the persecution under Marcus Aurelius, which is best known from the sufferings of the churches of Vienne and Lyons in South Gaul. Marcus Aurelius died on the 17th of March of the year in question, and persecution ceased immediately upon the accession of Commodus. A group of sufferers called the Mauritanian martyrs seems to belong to the same period: for in the correspondence of St Augustine, a phamo, one of their number, is spoken of as "archimartyr," which appears to mean a synonym of martyrdom of Africa. We have in this martyr typography an excellent example of "Acts of Martyrs" properly so called. The document is in brief legal form, beginning with the date and the names of the accused, and giving the actual dialogue between them and their judge. It closes with the sentence, based on "obstinate" persistence in an illicit cult, and with the proclamation by the herald of the names of the offenders and the penalty. All this may quite well be a transcript of the Acta, or official report of the proceedings. A Christian apologist adds the words: "And so they all together were crowned with martyrdom; and such a sentence was written to Father and Son and the Holy Ghost for ever and ever. Amen!"

The Scillian sufferers were twelve in all—seven men and five women. Two of these bear Latin names (Nartalus, Cintius), but the rest Latin names. Six had already been tried: of the remainder, to whom these Acta primarily relate, Speratus is the principal spokesman. He claims for himself and his companions that they have lived a quiet and moral life, paying their dues and doing no wrong to their neighbours. But when called upon to swear by the genius of the emperor, he repudiated it, saying, "I am subject to the empire of this world; but he that I serve is God whom no man hath power to make, and with these eyes can see." Here he uses the language of 1 Tim. vi. 16; and it is interesting also to note that in reply to the question, "What are the things in your satchel?" he says, "Books and letters of Paul, a just man." The martyrs are offered a delay of thirty days to reconsider their decision, but this they all alike refuse. These Acts have been long known in an expanded form, or rather in a variety of later recensions. The fame of the martyrs led to the building of a basilica in their honour at Carthage; and their annual commemoration required that the brevity and obscurity of their Acts should be somewhat amplified and explained, to make them suitable for public recitation.

The historical questions connected with these martyrs are treated by Lightfoot, Ignatius (1889, 2nd ed.), i. 524 ff. The Latin text, together with later recensions and a Greek version, is published in Texts and Studies, i. 2 (Passion of Perpetua, 1889); see also Annales Bollandiani (1886), viii. 5; H. M. Gwatkin, Selections from Early Christian Writers, where, as in Anti-Nicene Fathers, i. 285, there is an English translation. (J. A. R.)

SCILLY ISLES, a group of small islands, belonging to Cornwall, England, 25 m. W. by S. of Land's End. (For map, see England, Section VI.) They form an outlying portion of the granite highlands of Cornwall; and contain a few metalliferous veins or lodes, which could never have yielded much ore. An old tradition that the Scilly Isles could be identified with the "Costerides" or "Tin Islands" of Herodotus is abandoned, and the origin

of their name has never been authoritatively settled. The islands are wild and picturesque, with sheer cliffs and many large coves hollowed out by the Atlantic. Owing to the reefs and shoals by which these shores are surrounded, navigation becomes perilous in rough weather, and many disasters have occurred. In 1901 Sir Clodius Shaw perished in the shipwreck of his flagship and two other men-of-war, while two foreships of his squadron were driven aground, and the remainder only narrowly escaped. The graveyard of an old Puritan church on St Mary's contains the bodies of 511 persons, drowned in the wreck of the "Schiller" in 1875; and a local proverb tells that for every man who dies a natural death on the islands the sea takes nine. Much, however, has been done to minimise the danger, especially by lighting the coast. On St Agnes there is a lighthouse, and on an outlying rock to the south-west is the lonely Bishop Light, constructed with infinite difficulty in 1858, and rebuilt thirty years later.

The islands are composed wholly of granite—outliers of the granite highlands of Cornwall. Most of the granite is coarse and porphyritic, but towards the centre of the original igneous mass it is finer and non-porphyritic. The finer granite occurs on the north-west side of St Mary's, the southern part of Tresco, Bryher and Samson and the north-west side of Annet. Elevans of quartz-porphyr is found in the granite. On the north-east of White Island a fragment of the altered kils of which once covered the whole area, is still visible. A gravel deposit with chalk flints and pebbles of red granite, which caps some of the hills, is found on St Mary's may possibly be of Eocene age. Raised beach, blown sand, fragmental granitic waste or "head" and an iron-cemented glacial deposit are found resting upon the granite.

The climate of the islands is unusually mild, snow being rarely seen, and the temperature varying from about 46° F. in winter to 58° in summer. As a result, vegetation is luxuriant; fuchsias, geraniums and myrtles attain an immense size, and aloes, cactus and prickly pear flourish in the open. All these, together with palms, may be seen in the gardens of the governor on Tresco Island, which are quite subtropical in character, and, therefore, unique in the British Isles. Great flocks of sea-birds haunt the remoter parts, and on some of the islands there are deer. On Tresco there is a warren of white rabbits; and some of the rarer land-birds occasionally visit the islands, such as the golden oriole, which has been known to breed here.

The islands are served by steamers from Penzance, and telephone and telegraph communication is established with the mainland. The raising of early asparagus and other spring vegetables, and of flowers, has taken the place of the principal industry of the inhabitants, and the fields of narcissus and other bulbs add greatly to the beauty of the islands. There is also a small coasting trade; and fishing is carried on to some extent, its most important branch being the taking of lobsters for the London market.

The islands which may be distinguished from mere rocks number about 40, and the group has a total area of 404 acres; but only five islands are inhabited—St Mary's, Tresco, St Martin's, St Agness and Bryher. The total population in 1901 was 2992. Hugh Town in St Mary's is the capital, occupying a sandy peninsula crowned by the height of the Governor's residence. In spring the fields of narcissus and other bulbs add greatly to the beauty of the islands. The town possesses a harbour, which is used by the Penzance steamers, and a roadstead where large vessels can lie at anchor. The government of the islands is vested in a county council created in 1899, consisting of a chairman, vice-chairman, 4 aldermen, and 18 councillors. For parliamentary purposes the islands are included in the St Ives division of Cornwall.

On Tresco there are the ruins of an abbey, and of two fortifications called Oliver Cromwell's Tower and King Charles's Tower; and here also is a church built in 1859 and dedicated to St Nicholas. Numerous rude figures and circles of stones, resembling those of Cornwall, are to be noticed; and barrows are common, the most remarkable of these prehistoric remains being a barrow on the Isle of Samson, 58 ft. in height, and containing,
amongst other relics, the only perfect "kistvaen," or sepulchral chamber of stone, which has been disinterred from any Cornish tomb.

Although the Scilly Isles have been regarded as the remains of Lyonesse, as identical with the Cassiterides, and as the object of an expedition and of conquest on the part of Athelstan in pursuance of a vow made at the shrine of St Burian, it is not until the reign of Henry I. that we have indisputable evidence concerning them. The king gave all the churches of Scilly and the island, as the hermits held it in the days of the Confessor, to the abbot and church of Tavistock. A confirmation of this grant and a further grant to the monks of all wrecks except whole ships and whales was made by Reginald, earl of Cornwall. In 1180 the bishop of Exeter confirmed a grant by Richard de Wicha of tithes, hitherto withheld, and of rabbits. Secular priests were temporarily substituted for regulars by the abbot of Tavistock in 1345. Sharing the dignity of lords of Scilly with the abbot, holding apparently the better half of St Mary's island, which was already furnished with a castle and a prison, and that the abbot practically beyond the 100 substantial courts, the family of Blanchminster (de Albo Monasterio), at the beginning of the 14th century, held of the earldom of Cornwall lands in Scilly at a yearly service of 6s. 8d. or 600 puffs. The Year Books tell us that in cases of felony the punishement under this family was for the convicted person to be taken to a certain rock in the sea with two barley loaves and one pitcher of water and to be left on the rock until drowned by the tide. The Blanchministers resisted and imprisoned the coroner of Cornwall and in 1319 were granted a coroner of their own. In 1345 they are found petitioning the king for a remedy owing to an invasion by 1000 of the king's Welsh troops, who, being becalmed at Scilly, had carried away everything, and so impoverished the tenants that they were unable to pay their yearly rent of £40. In 1547 Silvester Danvers, as representing the Blanchminsters, being one of the coheirs, sold his moiety of Scilly to Sir Thomas Seymour, by whose attainer in 1549 this and probably the other moiety fell to the crown. The suppression of the religious houses had already placed the church's land and revenues at the king's disposal. During the Civil Wars, Hugh Town stood for the king, and in 1645 afforded a temporary shelter to Prince Charles, until his escape to Jersey. In 1649 the islands were occupied by a royalist, Sir Richard Grenville, and formed the base from which he swept the surrounding seas for two years, before a fleet under Admiral Blake and Sir John Ayscue forced him to surrender. In ancient times a haunt of pirates, the islands were afterwards notorious for smuggling. In 1687 the whole of Scilly was granted to Sidney Godolphin for eighty-nine years from the expiration of the lease for fifty years granted to Francis Godolphin in 1636 by Charles I. In 1831 Augustus Smith succeeded the Godolphins as lessee or lord-proprietor, and under his and his nephew's wise acyortacy the islands prospered.

SCIMITAR, the term generally used of all oriental single-edged curved or crescent-shaped swords (see SWORD). The word has appeared in a variety of forms in English, due to Fr. cimeterre, It. scimitarra or Span. cimitarra; it has even been corrupted into "smyter," as if connected with "smite." Most probably it represents an early Western corruption of the Persian word for a sabre, shamshir or shamsahir, which means literally "lion's claw" (shir, lion, in Hindustani tigre, "tiger," and sham, nail, claw).

SCION, one who, with only a superficial knowledge or a smattering of knowledge on any particular subject, claims or pretends to a complete or profound learning. The Lat. scius, a diminutive of scio, learned, from scire, to know, is only found in post-classical times, e.g. Hieronymus, l. 420, Epist. 48. 18. It first appears in English at the beginning of the 17th century.

SCIONCY (Gr. orakia, shade, shadow, and brawda, soothing, divination), a form of divination by means of supposed communication with the shades or spirits of the dead. The calling up of the spirit of Samuel by the Witch at Endor when consulted by Saul is the classical example (1 Sam. xxviii.).

SCION, a slip or cutting of a tree or plant used for grafting, hence a young shoot or twig. In a transferred sense the word is used of the heir or any young member of a family, a descendant. The word in O. Fr. was cion or syon, mod. scion, and the early forms in English are syon, cion or syon. These forms seem to dispose the usual etymology, which connects it with Fr. scier, to cut, Lat. secare.

SCIPIO ("staff"), the name of a patrician branch of the Cornelian gens, of which the following are the principal historical representatives:

1. Publius Cornelius Scipio, father of the elder Africanus. He was consul in 218 B.C., the first year of the Second Punic War, and sailed with an army from Pisa to Massilia, with the view of arresting Hannibal's advance on Italy. Failing, however, to meet his enemy, he hastened to return by sea to Cisalpine Gaul, having sent back his army to Spain under the command of his brother Gnaeus, with instructions to hold the Carthaginian forces there in check. On his return to Italy he at once advanced to meet Hannibal. In a sharp cavalry engagement in the upper valley of the Po, on the Ticinus, he was defeated and severely wounded. Again, in December of the same year, he witnessed the complete defeat of the Roman army on the Trebia, his colleague T. Sempronius Longus having insisted on fighting contrary to his advice. But he still retained the confidence of the Roman people; his term of command was extended, and we find him with his brother in Spain in the following year, winning victories over the Carthaginians and strengthening Rome's hold on that country, till 212 (or 211). The details of these campaigns are not accurately known, but it would seem that the ultimate defeat and death of the Scipios were due to the diversion of the Celtiberian army by Hasdrubal, Hannibal's brother.

See Polybius iii. 490-494, Livy xxi.-xxxv., Appian, Hannib. 5, 8, Hist. 14-16.

2. Publius Cornelius Scipio Africanus, the elder (237-183 B.C.), son of the above. He was present at the disastrous battles of the Ticinus (where, according to one tradition, he saved his father's life), the Trebia and Cannae. Even after the last of these he resolutely protested against several Roman nobles who advocated giving up the struggle and quitting Italy in despair (see METELLUS, 2). The year after his father's death, he offered himself for the government of the fleet and the lands to which the Romans resolved to send to Spain. In spite of his youth, his noble demeanour and enthusiastic language had made so great an impression that he was unanimously elected. All Spain south of the Ebro in the year of his arrival (210 or 209) was under Carthaginian control, but fortunately for him the three Carthaginian generals, Hasdrubal and Maglo (Hannibal's brothers), and Hasdrubal the son of Gisco, were not disposed to act in concert and were preoccupied with revolts in Africa. Scipio, on landing at the mouth of the Ebro, was thus enabled to surprise and capture New Carthage, the headquarters of the Carthaginian power in Spain. He thus obtained a rich booty of war stores and supplies, and an excellent harbour. His kindly treatment of the Spanish hostages and prisoners brought many over to his side. In 206 he drove back Hasdrubal, from his position at Baecula, on the upper Guadalquivir, but was unable to hinder his march to Italy. After winning over a number of Spanish chiefs he achieved in 206 a decisive victory over the full Carthaginian levy at Ilipa (near Corduba), which resulted in the evacuation of Spain by the Punic commanders. With the idea of striking a blow at Carthage in Africa, he paid a short visit to the Numidian princes, Syphax and Massinissa, but at the court of Syphax he was foiled by the presence of Hasdrubal, the son of Gisco, whose daughter Sophonisba was married to the Numidian chief. On his return to Spain Scipio had to quell a mutiny which had broken out among his troops. Hannibal's brother Mago had meanwhile sailed for Italy, and in 206 Scipio himself, having secured the Roman occupation of Spain by the capture of Gades, gave up his command and returned to Rome. In the following year he was unanimously

1 The first i is long—Scipio.

2 So Polybius: 235 according to Livy.
SCIPIO

Val. Max. iii. 7; biography by F. D. Gerber (1689); E. Berwick (1817), with notes and illustrations; also Punic Wars.

3. PUBLIUS CORNELIUS SCIPIO AEMILIUS AFRICANUS, the younger (185-129 b.c.), was the younger son of L. Aemilius Paullus, the conqueror of Macedonia. He fought when a youth of seventeen by his father's side at the battle of Pydna (168), which decided the fate of Macedonia and made northern Greece subject to Rome. He was adopted by P. Cornelius Scipio Africanus, the eldest son of Scipio Africanus the elder, and from him took the name Scipio with the surname Africanus. In 151, a time of defeat and disaster for the Romans in Spain, he volun-
teed to his adopted father to go to Rome (see GREEK MOTHER OF THE GODS) to bless the expedi-
tion no doubt its effect on public opinion. A commission of inquiry was sent over to Sicily, and it found that Scipio was at the head of a well-equipped fleet and army. At the com-
misions' bidding he sailed in 204 and landed near Utica. Carthage meanwhile had secured the friendship of the Numidian Syphax, whose advance compelled Scipio to raise the siege of Utica and to entrench himself on the shore between that place and Carthage. Next year he destroyed two combined armies of the Carthaginians and Numidians. After the failure of peace negotiations he again descended to his own dominions: Thence he defeated Hannibal in a decisive battle near Zama (Oct. 19, 202; see PUNIC WARS). In the subsequent settlement with Carthage, he upheld with success his comparatively lenient terms against the immediate demands of many Roman aristoc-
rats. Scipio was welcomed back to Rome with the surname of Africanus, and had the good sense to refuse the many honours which the people would have thrust upon him. For some years he lived quietly and took no part in politics. In 193 he was one of the commissioners sent to Africa to settle a dispute between Massinissa and the Carthaginians. In 192, when the Romans declared war against Antiocchus III. of Syria, Publius was at-
tached as legate to his brother Lucius, to whom the chief com-
mand had been entrusted. The two brothers brought the war to a conclusion by a decisive victory at Magnesia in the same year. Meanwhile Scipio's political enemies had gained ground, and on their return to Rome a prosecution was started (187) by two tribunes against Lucius on the ground of misappropriation of moneys received from Antiochus. As Lucius was in the act of producing his account-books his brother wrested them from him and tore them in pieces, and flung them on the floor of the senate-house. This created a bad impression; Lucius was brought to trial, condemned and heavily finned. Africanus himself was subsequently (185) accused of having been bribed by Antiochus, but by reminding the people that it was the anniversary of his victory at Zama he caused an outburst of enthusiasm in his favour. The people crowded round him and followed him to the Capitol to offer thanks to the gods and beg them to give Rome more citizens like himself. He then retired to his native country seat at Litterum on the coast of Campania, where he died. By his wife Aemilia, daughter of the Aemilian Paulus who fell at Cannae, he had a daughter Cornelia, who became the mother of the two famous Gracchi. Scipio was one of Rome's greatest generals. Skilful alike in strategy and in tactics, he had also the faculty of inspiring his soldiers with confidence. According to the story, Hannibal, who regarded Alexander as the first and Pyrrhus as the second among military commanders, confessed that he had beaten Scipio he should have put himself before either of them. He was a man of great intellectual culture and could speak and write Greek perfectly. He wrote his own memoirs in Greek. He also enjoyed the reputation of being a graceful orator. There was a belief that he was a special favourite of heaven and held actual communication with the gods. It is quite possible that he himself honestly shared this belief; to his political op-
ponents he was often harsh and arrogant, but towards others singularly gracious and sympathetic. According to Gellius, his life was written by Oppius and Hyginus, and also, it was said, by Plutarch.

See Livy xxi.-xxxvii. and Polybius; Aulus Gellius iv. 18;
have had of amassing a fortune. Though politically opposed to the Gracchi, he cannot be said to have been a foe to the interests of the people. He was, in fact, a moderate man, in favour of conciliation, and he was felt by the best men to be a safe political adviser, while he unfortunately contrived to offend both parties.

See Polybios xxv. 4., xxxix.: Vell. Pat. i. 12; Florus ii. 15, 17, 18; Appian, Punica, 72, 98, 113-131, Hisp. 48-95, Bell. Civ. i. 19; Plutarch, Aemilii Paul. 22, Tib. Gracch. 21, C. Gracchus, 107 (collected works, ed. 190; Cicer. De orat. a curiae exhaustors; by E. Person (Paris, 1877); monograph by Lincke (Dresden, 1888).

4. 
Publius Cornelius Scipio Nasica Serapio, consul 138 b.c., took a prominent part in the murder of Tiberius Gracchus. To save him from the vengeance of the people, he was sent by the senate on a pretended mission to Asia, where he died. The nickname Serapio was given him by the tribune C. Curcius from his likeness to one Serapio, a dealer in sacrificial victims. See Appian, Punica, 80 b.c., i. 16; Val. Max. ix. 14; Plutarch, Tib. Gracchus, 21.

Scire facias, in English law, a judicial writ founded upon some record directing the sheriff to make it known (scire facias) to the party against whom it is brought, and requiring the latter to show cause why the party bringing the writ should not have the record. The writ may be answered (or is also applicable in case of patents and grants) the record should not be annulled and vacated. Proceedings in scire facias are regarded as an action, and the defendant may plead his defense as in an action. The writ is now of little practical importance; its principal uses are to compel the appearance of corporations aggregate in revenue suits, and to enforce judgments against shareholders in such companies as are regulated by the Companies Act 1845, or similar private acts, and against garnishees in proceedings in foreign attachment in the lord mayor's court. Proceedings by scire facias to repeal letters patent for inventions were abolished by the Patents Act 1883, and the Patent and Trademarks Act 1899, a petition to the court substituted. It is not used in Scottish procedure.

Scissors, a cutting instrument, consisting of two crossed blades with the inner edges sharpened, pivoted at the crossing, and terminating with two looped handles for the insertion of the fingers of the person using them. The term is usually confined to small cutting implements, the larger being known as "shears" (q.v.). The modern form of the word points to a derivation from Lat. scindere, to cleave or cut, and is no doubt due to Lat. scissor, a cutter, which was used only of a carver, a brazier or a coppersmith (when this is the case of letters, but the earlier forms, cysyone, sisseure, sisses, sissere, siose, &c., show the origin to be found in O. Fr. cissoires, shears, mod. ciseaux, plural of ciseau, earlier cisel, a chisel, and therefore to be referred to Lat. coedere, to cut, cisorium, a cutting instrument.

Scopis di Salerano, Federico (1708-1879), Italian statesman and jurist. While still comparatively young he was appointed attorney-general to the Sardinian senate, and took part in the composition of the new codes. An advocate of liberal ideas and reform, he proclaimed the necessity for a constitution, and was himself one of the authors of the Notulæ or Sardinian charter of 1848, which is to this day the constitution of the Italian kingdom; the introduction is entirely his work. Scopis also wrote the proclamation in which Charles Albert announced to the people of Lombardy and Venetia his war against Austria.

He was minister in the first Sardinian constitutional ministry under the presidency of Count Balbo, and afterwards president of the senate. In 1871 he was sent to Geneva as Victor Emmanuel's representative on the "Alabama" arbitration, and was chosen president of that tribunal; on his return to Italy the king conferred on him the Order of the Annunziata. The last years of his life were mainly occupied with municipal affairs and charitable administration at Turin. Between 1819 and 1878 he published over seventy works on history, jurisprudence, politics and literature, in Italian, Latin and French. At the age of thirty he was elected member of the Turin Academy of Sciences, of which he became life president in 1864; he was also foreign member of the Institute of France. His most important work is his Storia della legislazione italiana dalle origini fino al 1847 (Turin, 1840), issued as a sequel to his Storia dell'antica legislazione del Piemonte, published in 1833.

Among his other writings we may mention the following: Ricerche sui Longobardi in Italia (1827), Delle relazioni politiche fra la dinastia di Savoia e il governo Britannico dal 1590 al 1815 (1833), Rimembranze sul Conte di Cavour (1870), and Considerazioni storiche sulle antiche assemblee rappresentative del Piemonte e della Savoia (1878).

Scold, one who scolds, i.e. chides, finds fault with or rebukes with vigour or persistence or vitiates. It is usually a term applied to women, and a "common scold" (in Low Lat. communis rixotra) was indictment in England at common law as a public nuisance, special instruments of punishment being devised in the "branks" or "scold's bridle," and the "cucking stool." The word is apparently an adaptation of the Norse skald, skald or scold, a poet, and according to the New English Dictionary the intermediate meaning through which the sense develops is "libeller" or "lampooner." Skeat derives from Du. schold, schellen, and takes the word as originally meaning a loud talker, cf. Icel. skjáll, to clash, Ger. schollen. The noun scold's bridle is a corruption of the correct scold's bridle, or scold's gelding.

Scolecite, a mineral belonging to the zeolite group; a hydrated calcium silicate, CaAl₂Si₂O₈+3H₂O. It is a lime-zeolite, and like the soda-zeolite natrolite and the soda-lime-zeolite mesolite, usually occurs as acicular and fibrous aggregations. Although having nearly the same interfacial angles as the orthorhombic natrolite, it crystallizes in the monoclinic system, and, as shown by the etched figures and the pyroelectric character, in the hemihedral class of this system, there being a plane, but no axis, of symmetry. Scolecite can therefore be distinguished from the others by its plane of cleavage, whereas the acicular crystals do not extinguish parallel to their length between crossed nicks. Twinning on the ortho-pinacoid is usually evident. The mineral is colourless or white, transparent, and vitreous in lustre: the hardness is 5, and the specific gravity 2.2. It is a mineral of secondary origin, and occurs with other zeolites in the amygdaled cavities of weathered volcanic rocks of basic composition. Fine divergent groups of prismatic crystals are found in the basalt of Berufjord near Djupivogur in Iceland and in the Deccan traps near Poona in India; hence the synonym poonellite for this species. The name scolecite is derived from Gr. σκληρός, a worm, because the crystals sometimes curl up like worms when heated before the blowpipe.

(L. J. S.)

Scone (Lat. absconsus, Fr. escou), a word of many meanings, mostly signifying a covering or protection, or, by extension, that which is covered or protected. Its most familiar significance is that of a wall light, consisting of a metal bracket, with two or more socketed branches for candles. The word is also used for the orifice of a candlestick into which the candle is fixed, and for the rim of metal, glass or china, placed round a candle to intercept any drops. Among its obsolete meanings is that of head or skull. At the English universities "to scone" is still used as the term for imposing a penalty at dinner in the shape of a quart-pot of beer or cider.

Scone (pron. Skoon; Gaelic, skene, "a cutting"), a parish of Perthshire, Scotland, containing Old Scone, the site of an historic abbey and palace, and New Scone, a modern village (pop. 1582), 2 m. N. of Perth, near the left bank of the Tay. Pop. of parish (1901) 2362. It became the capital of Pictavia, the kingdom of northern Picts, in succession to Forteviot. Parlaiment was occasionally assembled on the Moot Hill, where the first national council of which we possess records was held (906). The Moot Hill was known also as the Hill of Belief from the fact that here the Pictish king promulgated the edict regulating the Christian church. The abbey was founded in 1115 by Alexander I., but long before this date Scone had been a centre of ecclesiastical activity and the seat of a monastery. Kenneth
is alleged to have brought the Stone of Destiny, on which the Celtic kings were crowned, from Dunstaffnage Castle on Loch Etive, and to have deposited it in Scone, whence it was conveyed to Westminster Abbey (where it lies beneath the Coronation Chair) by Edward I. in 1296. Most of the Scottish kings were crowned at Scone, and its last function being held on the last day of January 1561, when Charles II. received the crown. Apparently there was never any royal residence in the town, owing to the proximity of Perth. Probably the ancient House of Scone, which stood near the abbey, provided the kings with temporary accommodation. Both the abbey and the house were burned down by the Reformers in 1599, and next year the estates were granted to the Ruthvens. On the attainder of the family after the Gowrie conspiracy in 1609, the land passed to Sir David Murray of the Tullibardine line, who became 1st viscount Stormont (1621) and was the ancestor of the earl of Mansfield, to whom the existing house belongs. Sir David completed in 1606 the palace which the earl of Gowrie had begun. The 4th viscount—father of the 1st earl of Mansfield, the lord chief justice of England (b. at Scone 1702)—entertained the Old Pretender for three weeks in 1716, and his son received Prince Charles Edward in 1746. The present palace, which dates from 1863, stands in a beautiful park. It contains several historic relics, the most interesting being a bed adorned with embroidery worked by Mary Queen of Scots during her imprisonment in Lochleven Castle. The bedstead, which was crowned, a hall 160 ft. long, has been included in the palace. Two hundred yards east of the mansion is an ancient gateway, supposed to have led to the old House of Scone, and near it stands the cross of Scone, removed hither from its original site in the town.

SCONE, the Scots name of a species of cake made of wheat or barley meal and baked on a griddle. The cakes are round and are usually cut into four pieces, thus giving the familiar shape of a wedge with circular edge. The broad lowland bonnet was called "a scotto," from its shape, and word appears to have been a shortened form of a Low Ger. Schonbroat, i.e. fine bread, explained in the Bremen Glossary (1771), quoted in the New English Dictionary, as a sort of white loaf with two acute and two obtuse angles. The Hamburg dialect word schonrogen, fine rye, was adopted into Swedish and Icelandic in the sense of biscuit.

SCOOP (from M. L. Ger., or M. Du. schoepe, cf. Du. schoep, a bailing vessel, Ger. schoepfen, and, from M. Du. schoeppe, Ger. Schuppe, shear), properly a utensil or implement for ladling or bailing out water or liquid from a vessel, and so used of the hollowed out end of a large vessel; the word appears to have been a shortened form of a Low Ger. Schonbroat, i.e. fine bread, explained in the Bremen Glossary (1771), quoted in the New English Dictionary, as a sort of white loaf with two acute and two obtuse angles. The Hamburg dialect word schonrogen, fine rye, was adopted into Swedish and Icelandic in the sense of biscuit.

ScoPAS, probably of Parian origin, the son of Aristander, a great Greek sculptor of the 4th century B.C. Although classed as an Athenian, and similar in tendency to Praxiteles, he was really a companion and rival of the works of his time of his works. In most cases, the word is applied to a small kind of shovel with a short handle and a sharply curved blade, often covered in towards the handle end, and used for the moving and lifting of loose materials or for cutting out a rounded piece from any substance. In journalistic slang, originally American, a "scoop" is an exclusive piece of information obtained by a newspaper.

ScopAs, probably of Parian origin, the son of Aristander, a great Greek sculptor of the 4th century B.C. Although classed as an Athenian, and similar in tendency to Praxiteles, he was really a companion and rival of the works of his time of his works. In most cases, the word is applied to a small kind of shovel with a short handle and a sharply curved blade, often covered in towards the handle end, and used for the moving and lifting of loose materials or for cutting out a rounded piece from any substance. In journalistic slang, originally American, a "scoop" is an exclusive piece of information obtained by a newspaper.

It is very powerful, with massive bony framework; the forehead is projecting, the eyes deep-set and heavily shaded, the mouth slightly open and full of passion. It shows us that while in general style Scopas approached Praxiteles, he differed from him in preferring strong "expression and virile Ance to repose and sentiment. The temple at Tegea was restored after 355 B.C.; and the advanced character of the sculpture seems to indicate a date at least twenty years later than this.

Attempts have been made, through comparison of these heads, to assign to Scopas many sculptures now in museums, heads of Heracles, Hermes, Aphrodite, Meleager and others. It is, however, very risky thus to attribute works executed in Roman times, and often thoroughly eclectie in character. Ancient writers give us a good deal of information as to works of Scopas. He made for the people of Elis a bronze Aphrodite, riding on a goat (now in the British Museum). A Maenad at Athens, running with head thrown back, and a torn kid in her hands was ascribed to him; of this Dr. Treu has published a probable copy in the Albertiun at Dresden (Melanges Perret, p. 317). Another type of his was Apollo as leader of the Muses, singing to the lyre. The most elaborate of his works was a great group representing Achilles being conveyed over the sea to the island of Leuce by his mother Thetis, accompanied by Nereids riding on dolphins and sea-horses, Tritons and other beings of the sea, "a group," says Pliny (36. 25), "which would have been remarkable had it been the sole work of his life." He made also an Aphrodite which rivaled the creation of Praxiteles, a group of winged love-gods whom he distinguished by naming them Love, Longing and Desire, and many other works.

Jointly with his contemporaries Praxiteles and Lysippus, Scopas may be considered as having completely changed the character of Greek sculpture. It was they who initiated the lines of development which culminated in the schools of Pergamum, Rhodes and other great cities of later Greece. In most of the modern museums of ancient art their influence may be traced in the three-thousand works exhibited. At the Renaissance it was especially their influence which dominated Italian painting and through it modern art.

SCOPE (through Ital. scope, aim, purpose, intent, from Gr. σκοπεως, mark to shoot at, aim, σκοπεως, to see, whence the termination in telescope, microscope, &c.), properly that which is aimed at, purpose, intention; hence outlook, view, range of observation or action; more generally, the sphere or field over which an activity extends, room or opportunity for play or action.
SCORE (O.E. scar, from sear, to cut, notch, cf. “shear”), properly a notch or groove cut in a piece of wood, called a “tally” (q.v.), as a method of counting; hence an account or reckoning made in this way. Either from a custom of keeping each series of twenty numbers or notches on a separate tally, or of marking the twentieth number by a longer or deeper mark, the word was early used to denote the number twenty; it is still used as a measure of weight, equivalent to 20 lb, computing the weight of animals sold for slaughtering for food. In music, a score is the written or printed copy of a composition on two or more staves, barred and braced together. For instrumental and vocal music a “full score” has the parts for each class of voice and instrument on a separate staff.

SCORESBY, WILLIAM (1789–1857), English Arctic explorer, scientist and divine, was born near Whitby, Yorkshire, on the 5th of October 1789. His father, William Scoresby (1760–1829), made a fortune in the Arctic whale fishery. The son made his first voyage with his father when he was eleven years of age, but on his return he was sent back to school, where he remained till 1803. After this he was his father’s constant companion, and passed the years 1804, 1805, and 1806 in charts and observations, in which he contributed materially to the discharge of his father’s work—Voyage (q.v.), in which he marked the course of the ship and home. For instrumental and vocal music a “full score” has the parts for each class of voice and instrument on a separate staff.

Scoresby attended the natural philosophy and chemistry classes at Edinburgh university, and again in 1809. In his voyage of 1809 he began the study of the meteorology and natural history of the polar regions, among the earlier results of which are his original observations on snow and crystals; and in 1809 Robert Jameson brought certain Arctic篇章 of his before the Wernerian Society of Edinburgh, on which he was so at once elected a member. In 1811 his father resigned to him the command of the “Resolution,” and in the same year he married the daughter of a Whitby shipbroker. In his voyage of 1813 he established for the first time the fact that the temperature of the polar ocean is warmer at considerable depths than it is on the surface, and each subsequent voyage in search of whales found him no less eager of fresh additions to scientific knowledge. His letters of this period to Sir Joseph Banks, whose acquaintance he had made a few years earlier, no doubt gave the first impulse to the search for the North-West Passage. In 1810 he was elected a fellow of the Royal Society of Edinburgh, and about the same time communicated a paper to the Royal Society of London “On the Anomaly in the Variation of the Magnetic Needle.”

In 1820 he published An Account of the Arctic Regions and Northern Whale Fishery, in which he gathers up the results of his own observations, as well as those of previous navigators. In his voyage of 1822 to Greenland he surveyed and charted with remarkable accuracy 400 m. of the east coast, between 69° 30’ and 70° 30’, thus contributing to the first real and important geographic knowledge of East Greenland. This, however, was the last of his Arctic voyages. On his return he was met by the news of his wife’s death, and this event, with other influences acting upon his naturally pious spirit, decided him to enter the church. After two years of residence in Cambridge he took his degree (1825) and was appointed to the curacy of Basingby, Yorkshire. Meantime had appeared at Edinburgh his Journal of a Voyage to the Northern Whale Fishery, including Researches and Discoveries on the Eastern Coast of Greenland (1823). The discharge of his clerical duties at Basingby, and later at Liverpool, at Exeter and at Bradford, did not prevent him from continuing his Arctic researches. In 1829 he was elected a fellow of the Royal Society; in 1834 he was elected a corresponding member of the Paris Academy of Sciences, while in 1839 he took the degree of D.D. From the first he was an active member and official of the British Association, and he contributed especially to the knowledge of terrestrial magnetism. Of his sixty papers in the Royal Society list many are more or less connected with this department of research. But his observations extended into many other departments, including certain branches of optics. In order to obtain additional data for his theories on magnetism he made a voyage to Australia in 1856, the results of which were published in a posthumous work—Journal of a Voyage to Australia for Magnetic Researches, edited by Archibald Smith (1859). He made two visits to America, in 1844 and 1848; on his return home from the latter visit he made some valuable observations on the height of Atlantic waves, the results of which were given to the British Association. He interested himself much in social questions, especially the improvement of the condition of factory operatives. He also published numerous works and papers of a religious nature. In 1850 he published a work urging the prosecution of the search for the Franklin expedition and giving the results of his own experience in Arctic navigation. He was twice married after the death of his first wife. After his third marriage (1849) he built a villa at Torquay, where he died on the 21st of March 1857.
experimentally of late years that the venom has no effect upon the individual itself, nor yet upon a member of the same species. Scorpions, however, are extraordinarily susceptible to heat, and succumb very rapidly when exposed either to the warmth of a fire or to that of the tropical sun. Moreover, when they feel the heat beating upon them they brandish their tails and strike right and left as if to drive off or destroy the unseen enemy; and there can be no doubt that the belief above alluded to is traceable primarily to observation of the sequence of events just described, the final event being the death of the animal, not, however, from a self-inflicted wound but from the heat which provoked the behaviour suggestive of suicidal purpose. It may be that under such circumstances a random stroke has now and again wounded the animal itself; but a wound so inflicted would be accidental, not intentional, and at most would contribute in a small measure to the creature's death. Scorpions are very easily rendered innocuous by scraping off the sharp point of the sting; and specimens, which are handled with impunity by Arabs and Derivishes throughout the uninhabited portions of the Sahara, are completely harmless. In boreal latitudes, the phenomenon is paralleled by the action of the mammalia, their entire absence from New Zealand being not the least interesting point of agreement. The facts of their distribution are in keeping with the hypothesis that the order originated in the northern hemisphere and migrated southwards into the southern continent at various epochs, their absence from the countries to the north of the above-mentioned latitudes being due, no doubt, to the comparatively recent glaciation of those areas. When they reached Africa, Madagascar was part of that continent; but their arrival in Australia was subsequent to the separation of New Zealand from the Austro-Malayan area to the north of it. Moreover, the occurrence of closely related forms in Australia and South America on the one hand, and in tropical Africa and the northern parts of South America on the other, suggests very forcibly that South America was at an early date connected with Australia by a transpacific bridge and with Africa by a more northern transatlantic tract of land.

In conformity with their wide dispersal, scorpions have become adapted to diverse conditions of existence, some thriving in tropical forests, others on open plains, others in sandy deserts, and a few even at high altitudes where the ground is covered with snow throughout the year. They are truly eurytopic, being found in the tropics, the northern temperate zone, and (at times of drought) in the Alps; they pass the cold months of the year in a state of hibernation.

(R. P. I.)

SCORPION-FLY,—SCOT

SCORPION-FLY,—SCOT

The popular name given to insects of the family Panorpidae, deriving the name from the fact that in the typical genus, Panopora, the last two or three segments of the abdomen are narrow and can be flexed over the back like a scorpion's tail. The scorpion-flies are remarkable for the elongation of the oral region of the head into a prominent beak. The larva is grub-like, beset with spines and generally furnished with eight pairs of abdominal pro-legs in addition to the legs on the thorax, which are short. They live in the soil or in rotten wood and are carnivorous. The species of the genus Bittacus are superficially strikingly similar to the Tipulidae or "daddy-long-legs"; while those referred to, Boreus, are anomalous in being apterous and like small grasshoppers. They have usually been included in the order Neuroptera, but it is now generally considered that they should form a distinct order, which is termed Panorpata or Mecaptera.

SCORZONERA (Scorzonera hispanica), a hardy perennial, native of north and central Europe, and cultivated in gardens as a vegetable for its fleshy cylindrical roots, which resemble those of salsify except in being black outside. They should be treated in every respect like salsify. The genus is a member of the natural order Compositae, and nearly allied to Tragopogon, to which salsify belongs.

SCOT, MICHAEL († 1175-1232), Scottish mathematician and astrologer. The dates of his birth and death are quite uncertain, the most probable being those here given. The efforts of Sir
SCOT AND LOT—SCOTIA

Walter Scott and others to identify him with the Sir Michael Scot of Balwaree, who in 1290 was sent on a special embassy to Norway, must be considered unsuccessful, though he may have been a member of a so-called. More than Paris, devoting himself to philosophy and mathematics. It appears that he had also studied theology, and was ordained a priest, as Pope Honorius III. wrote to Stephen Langton on the 16th of January 1223/4, urging him to confer an English benefice on Scot, and actually himself nominated him archbishop of Cashel in Ireland. This appointment Scot refused to take up, but he seems to have held benefices in Italy from time to time. From Paris he went to Bologna, and thence, after a stay at Palermo, to Toledo. There he acquired a knowledge of the Arabic language, which he was perhaps the first to do so, and the multitudinous commentaries of the Arabsians upon them, and also brought him into contact with the original works of Avicenna and Averroes. His own first work was done as a translator. He was one of the savants whom Frederick II. attracted to his brilliant court, and at the instigation of the emperor he superintended (along with Hermannus Alemanus) a fresh translation of Aristotle and the Arabian commentaries from Arabic into Latin. There exist translations by Scot, himself, of the Historia animalium, De analecta and De coele, along with other commentaries of Averroes and Avicenna, and with Frederick and Averroes both of evil reputation in the middle ages—doubtless contributed to the formation of the legend which soon enveloped Michael Scot's name. His own books, however, dealing as they do almost exclusively with astrology, alchemy and the occult sciences generally, are mainly responsible for his popular reputation. Chief among these are Super autorex spherae, printed at Bologna in 1495 and at Venice in 1631; De sole et luna, printed at Strassburg (1622), in the Theatrum chimicum, and containing more alchemy than astronomy, the sun and moon being taken as the images of good and evil fortune, and the moon as the source of all prosperity, as is often published in the 15th century; De physiognomia et de hominibus procreatione, which saw no fewer than eighteen editions between 1477 and 1660. The Physiognomia (which also exists in an Italian translation) and the Super autorex spherae expressly state that they were undertaken at the request of the emperor Frederick. Michael is said to have foretold (after the double-tongued manner of the ancient oracles) the place of Frederick's death, which took place in 1250. Around his own death many legends gathered. He was supposed to have foreseen his own death when he was visited by a giant with an elbow joint of three feet and a breast two ounces in weight, and that to protect himself he wore an iron helmet, and that, raising this in church at the elevation of the host, the fatal stone fell on him from the roof. Italian tradition says he died in that country, while another legend is that he returned to his native land to die, and according to one account was buried at Holy Cultram in Cumberland; according to another, which Sir Walter Scott has followed in the Lay of the Last Minstrel, in Melrose Abbey. In the notes to that poem, of which the opening of the wizard's tomb forms the most striking episode, Scott gives an interesting account of the various exploits attributed by popular belief to the great magician. "In the south of Scotland any work of great labour and antiquity is ascribed either to the agency of Auld Michael, of Sir William Wallace or the devil." He used to feast his friends with dishes brought by sprites from the royal kitchens of France and Spain and other lands. His embassy to France alone on the back of a coal-black demon steed is also celebrated, in which he brought the French monarch to his knees by the results of the stamping of his horse's hoof: the first ringing the bells of Notre Dame and the second causing the towers of the palace to fall. Other powers and exploits are narrated in Folengo's Macaronic poem of Merlin Cacocaus (1595). But Michael's reputation as a magician was already fixed in the age immediately following his own. He appears in the Inferna di Dante (canto xx. 115-117) among the magicians and soothsayers. He is represented in the same character by Boccaccio, and is severely arraigned by Giovanni Pico della Mirandola in his work against astrology, while Gabriel Naude finds it necessary to defend his good name in his Apologie pour les grands personnages faussement accusés de magie.

For full details and analyses of all the legends attaching to Scot, see Rev. J. Wood Brown, Life and Legend of Michael Scot (1897).

SCOT AND LOT (O. Fr. escot, A.S. scot, a payment; lot, a portion or share), a phrase common in the records of English medieval boroughs, applied to those householders who were assessed to any payment (such as tallage, aid, &c.) made by the borough for local or national purposes. They were usually members of a guild merchant. Previous to the Reform Act 1832 those who paid scot and lot were entitled to the franchise in virtue of this payment, and the rights of those living in the borough who were not assessed to any scot and lot was protected by the Protection of Rights in the Boroughs Act 1835, which gave property in the borough and was probably intended to give the protection to any property the boroughs which was reorganised and reformed, in the same manner as the boroughs already reorganised. The phrase is preserved in the Disordered Houses Act 1751, which empowers inhabitants of a parish or place paying scot and bearing lot therein (i.e. ratepayers) to require the constables of the parish to prosecute disorderly houses.

SCOTER, a word of doubtful origin, perhaps a variant of "Scout," one of the many local names shared in common by the guillemot (Fr. Scouet), the razorbill (Fr. Scourbillon), or perhaps primarily connected with coot (Fr. Cois), the English name of the Anas nigra of Linnaeus, a bird which with some allied species has been justifiably placed in a distinct genus, Oedemia (often misspelt Oedemia)—a name coined in reference to the swollen appearance of the base of the bill. The scoter is also very generally known around the British coasts as the "black duck" from the male being, with the exception of a stripe of orange that runs down the edge of the bill, wholly of that colour. In the representative American form, Os. americana, the protuberance at the base of the bill, black in the European bird, is red in the American form and often ornamented with marbled habits, keeping the sea in all weathers, and rarely resorting to land except for the purpose of breeding. Even in summer small flocks of scoters may generally be seen in the tideway at the mouth of any of the larger British rivers or in mid-channel, while in autumn and winter these flocks are so increased as to number thousands of individuals, and the water often looks black with them. A second species, the velvet-duck, Os. fusca, of much larger size, distinguished by a white spot under each eye and a white bar on each wing, is far less often met with. The scoter is extremely abundant in mid-ocean, and occasionally to be seen in company with the commoner one, and it too has its American counterpart, Os. velutina; while a third, only known as a straggler to Europe, the surf-duck, Os. perspicillum, with a white patch on the crown and another on the nape, and a curiously particoloured bill, is a not uncommon bird in North American waters. All the species of Oedemia, like most other sea-ducks, have their true home in arctic or subarctic countries, but the scoter itself is said to breed occasionally in Scotland (Zoologist, s.s. p. 1867). The females display little of the deep sable hue that characterizes their partners, but are attired in scut-colour, varied especially beneath, with brownish white. The flesh of all these birds has an exceedingly strong taste, and, after much controversy, was allowed by the authorities to rank as fish in the ecclesiastical dietary (cf. Graingo, Traité de l'origine des macreuses, Caen, 1650; and Correspondence of John Ray, Ray Soc. ed., p. 148). (A. N.)

SCOTIA (Gr. οἰκονόμα, shadow or darkness), in architecture, a concave moulding most commonly used in bases, which projects a deep shadow on itself, and is thereby a most effective moulding under the eye, as in a base. (See Moulding.)

1 In the former case the derivation seems to be from the O. Fr. Escoute, and that from the Latin auscultare, but in the latter from the Dutch Keet, which is said to be of Celtic extraction—eulcre. The Fr. macreuse, possibly from Lat. macer, indicating a bird that may be eaten in Lent or on the fast days of the Roman Church, is of double significance, meaning in the south of France a coot and in the north a scoter. By the wild-fowlers of parts of North America scoters are commonly called coots.
SCOTLAND, the name given in modern times to that portion of Great Britain which lies north of the English boundary; it also comprises the Outer and Inner Hebrides and other islands off the west coast, and the Orkney and Shetland islands off the north coast. With England lying to the south, it is thus bounded on the N. and W. by the Atlantic Ocean, and on the E. by the North Sea. It is separated from Ireland by the Solway Firth, the Sark, Scotsdyke (an old embankment in 55°3′N., connecting the Sark with the Esk), the Esk (for one mile), the Liddel, the Kershope, the Cheviot Hills, the Tweed and a small area known as the "liberties" of Berwick. The mainland lies between 56° 40′ 30′′ (at Dunnet Head in Caithness) and 54° 38′ N. (Mull of Galloway in Wigtownshire), and 1° 45′ 32′′ (Buchan Ness in Aberdeenshire) and 6° 14′ W. (Ardmurnoch Point in Argyllshire). Including the islands, however, the extreme latitude north is 60° 3′ 56′′ (Out Stack in the Shetlands) and the extreme longitude west 8° 35′ 30′′ (St Kilda). The greatest length from Cape Wrath in Sutherland to the Mull of Galloway is 274 m., and the greatest breadth from Buchan Ness to Applecross in the shire of Ross and Cromarty 154 m., but from Bonar Bridge at the head of Dornoch Firth to the head of Loch Broom is only 26 m. wide, and 30 m. from Grangemouth on the Forth to Bowling on the Clyde. The coast-line is estimated at 2300 m., the arms of the sea being so numerous and in several cases penetrating so far inland that few places are beyond 40 m. from salt water. The total area is 10,660,300 acres or 26,796 sq. m., exclusive of the offshore islands (about 498 sq. m.) and tidal water (about 606 sq. m.).

The name Scotland for this geographical area of northern Britain (the Caledonia of the ancients—a name still poetically used for Scotland) originated in the 11th century, when (from the tribe of Scots) part of it was called Scotia (a name previously applied to what is now Ireland); and the name of Scotland became established in the 12th and 13th centuries. The name of Britain or North Britain is still firmly associated with Scotland; thus English letters are generally addressed, e.g. "Edinburgh, N.B."

I. GEOGRAPHY

Physically, Scotland is divided into three geographical regions—the "Highlands" (subdivided by Glen More into the North-Western and South-Eastern Highlands); the Central Plain or "Lowlands" (a tract of south-western to north-easterly trend, between a line drawn roughly from Girvan to Dunbar and a line drawn from Dumbarton to Stonehaven); and the Southern Uplands.

The Highlands.—Nearly all this region is lofty ground, deeply trenched with valleys and sea lochs. The only considerable low-lying area embraces the eastern part of Aberdeenshire and the northern parts of Banff, Elgin and Nairn—tracts which, ethnologically, do not fall within Highlands territory. Along both sides of the Moray Firth a strip of level land lies between the foot of the hills and the sea, while the county of Caithness, occupying a wide plain, does not, strictly speaking, belong to the Highlands. Seen from Strathmore or the Firth of Clyde the Highlands present well-defined masses of hills abruptly rising from the plains, and from any of the points of view which they suggest, the whole district is indented by lochs and rising to a uniform level, which sinking here and there allows glimpses of still higher summits in the interior. The Highland hills differ from a mountain chain such as the Alps not merely in their inferior elevation but in configuration and structure. They are made up of a succession of more or less parallel confluent ridges, having in the main a trend from north-east to south-west. The valleys which separate them are formed by long-continued erosion of the horizontal strata of the coal and the slate which underlie them. Viewed from near at hand a mountain may seem to tower above the surrounding country, but from a distance it will be seen not to rise much above the general uniformity of elevation. There are no gigantic domes, such as constitute the principal features of the Alps, nor the linear outlines which typify the Pyrenees. Even where the ridges where the ridges are strongly marked, they are generally the result of imperfections in the original structure, and not of subsequent erosion. A few apparent exceptions occur along the western seaboard of Sutherland, in Skye and elsewhere, but examination of their structure at once explains the reason of their prominence and confirms the rule. The surface of the Highlands is rugged. The rocks project in innumerable bosses and crags, which roughly the surface where they are exposed. The heights of these masses depend on the nature of the underlying rock. Where it is hard and jointed, weathering into large quadrangular blocks, the crags are conspicuous; but where the rock is softer and more eroded, and less resistant to the action of the weather, the character of their declivities, as may be seen in Ben Ledi and the height of the north-east of it. Where, on the other hand, the rock decays with smaller debris, the hills assume smoother contours, as in the slate district of southern Argyll. But broadly, the Highland mountains are monuments of erosion, the relic of an old tableland, the upper surface and former inclinations of which are shown approximately by the summits of the existing mountains and the direction of the existing watercourses.

The Highlands are separated into two completely disconnected and in some respects contrasted regions by the depression of the Caledonian Valley, extending from Dornoch to Loch Ness. The ancient plateau was severed. In the north-western section the highest ground is found along the Atlantic coast, mounting steeply from the sea to an average height of 2000 to 3000 ft. The watershed consequently keeps close to the western seacoast, and indeed in those places is not above a mile and a half from the shore. From these hills which catch the first downpour of the rains from the ocean, the ground falls eastward. Numerous eminences, however, prolong the mountainous features to the North Sea and south-eastward to Glen More. The difference of the general level on the two sides of the water-parting is reflected in the length of their streams. On the west, the streams are swift and short. On the eastern side, flowing few miles, on the east it has to run 30 or 40 m. At the head of Loch Nevis the western stream is but 3 m. long, while the eastern has a course of some 18 m. to the Great Glen. Throughout the north-western section, drainage is from the sea to the watershed, betokening even at a distance the general monotonous of structure. But the sameens is relieved along the western coast of the shires of Argyll and Ross and Cromarty by groups of cones and stacks, and farther south by the terraced plateaus and abrupt conical hills of Skye, Rum and Mull.

The south-eastern region of the Highlands, having a more diversified geographical structure, offers a variety of scenery. Most of the valleys, lakes and sea lochs run in a south-western and north-easterly direction, a feature strikingly exhibited in west Argyllshire. But there are also several important transverse valleys, those of the Galloway and Tweed, which may be regarded as transversal, a character, it is true, that, in many cases, is far from well-marked, the east, however, is somewhat different. It first strikes eastwards the head of Loch Laggan and then swings southwards, pursuing a sinuous course till it leaves the Highland to the east side of Loch Lomond. The streams flow in a westerly direction, however, are still running to the north-east, and south-east have long courses and drain wide areas. There is a marked contrast between the configuration of the north-eastern district and the other parts of this region. In that area the Grampians rise into wide flat-topped heights or moors often more than 3000, and in a few places exceeding 4000 ft., in height, and bounded by steep declivities and sometimes by abrupt cliffs, hence once these regions have been traversed, it is impossible that these plateaus are fragments of the original tableland, trenched into segments by the longitudinal furrows of the divides. Farther to the south-west, in the shires of Perth, Inverness and Ross, the hills are more mammocky, the summit ridges, however, are still interrupted, especially by the broad hummocky crested ridges of Highland scenery, which, however, in Ben Nevis and Aonach Beag reach a height of over 4000 ft.

Lowlands.—The plains of the principal lowlands fill the space between the principal Highlands and the Southern Uplands.
terrestrial disturbances. Long dislocations have sharply defined its northern and southern margins. By other fractures and unequal movements of upthrow, the whole area between the old and the new blocks is broken by a series of transverse and longitudinal and also, though less distinctly, by the old valleys to run in that direction. The chains of the Ochil, Sidlaw, Pentland, Renfrew, Campsie and Fintry Hills, and the valleys of the Strathspey, Firth of Tay, and the basin of Middlelothian may and are, however, subordinated to the system of the topographical prominences and depressions of the district is the relative hardness and softness of the rocks. Almost all the eminent topographical features of the district are due to these and the chains of hills such as those just mentioned and others in Ayrshire and Lanarkshire, but isolated crags and hills like those on which stand the castles of Edinburgh and Stirling, and others conspicuous in the central districts of the Lowlands.

Of the three chief valleys in the central Lowlands two, those of the Tay and the Forth, descend from the Highlands, and one, that of the Clyde, from the Southern Uplands. Though on the whole these depressions of geological structure furnish another notable example of that independence of geological structure already referred to.

The Southern Uplands extend from the North Channel in the south-west to the detached flat-topped hills, which are comparatively of billy ground, and though much less elevated (their highest point is 2764 ft. above the sea) than the Highlands, rise with scarcely less abruptness above the lower tracts that bound them. Their northern boundary is formed by the line of projection of the Southern Uplands the whole area between the Highland and the Lowland moorlands of the Central Plain, and its boundary for long distances continues remarkably straight. On the south and south-east their limits in general are the north-eastern boundary of the valley of the Nith, which forms the north-west limit of the Nith from which they extend to the sea and Loch Ryan, terminating in the extreme south-west in a plateau of which the loftiest point is little over 1000 ft. above the sea. The Clyde is the only large river of the Lowlands running through this region, being separated by Liddesdale and other hollows and on which they abut abruptly. But though geologically the one set of mountains must be separated from the other, geographically it is convenient to include within the term the Southern Uplands the whole area between the Highland and the Lowland moorlands of the Central Plain and the Border. A survey of the Uplands, therefore, presents in succession from south-west to north-east the Kirkcudbrightshire and Ayrshire Uplands, the Southern Uplands, and the Moray, Montrose, and the Lammermuirs. Distinguished especially by the smoothness of their surface, they may be regarded as a rolling table-land or moorland, traversed by many valleys conducting the drainage to the sea. This character is well observed in the outlines of Tweedsmuir. Wide, mossy moors, 2000 ft. or more above the sea, and sometimes level as a racecourse, spread out on all sides. Their continuity, however, is interrupted by numerous valleys separating them into detached flat-topped hills, which are comparatively seldom marked by precipices of naked rock. Where the rock projects it more usually appears in low crags and knolls, from which long tracts of the surface have been denuded, and below which the subsoil consists of grass. Hence, besides being smooth, the uplands are remarkably verdant. They form indeed excellent pasture-land, while the alluvial flats in the valleys and even some of the lower slopes are fitted for grazing.

This uniformity of aspect is doubtless traceable to the prevalence of the same kind of rocks and the same geological structure. The Silurian greywackes and shales that underlie almost the whole of the Uplands weather generally into small angular débris, and at a tolerably uniform rate of disintegration. But slight differences may readily be detected even where no feature interferes noticeably with the monotony. The bands of massive grit and coarse greywacke, for example, break up into larger blocks and from their greater hardness are apt to project above the general surface of the other softer rocks. Hence their line of trend, which like that of all the other strata in the Uplands, is in the direction of the long axis of the area, may be traced from hill to hill by their more raggy contours. Only in the higher tracts are there rugged features recalling the more savage character of Highland scenery. In the heights of Harthill (2651 ft.) and Whitecoomb (2655 ft.) there are conspicuous stretches of rock, composed of the grits, conglomerates, and sandstones of the Silurian system. Their outline is distinct—longitudinal ridges having a general north-easterly direction. The earliest rain that fell upon these ridges would run off them, first in transverse watercourses down each short slope, and then in longitudinal depressions wherever such had been formed during the terrestrial disturbance. Afterwards the pathways of the streams would be gradually deepened and widened into valleys. Hence the valleys are of higher antiquity than the mountains that rise above them, and except in the case of the Forth have not been denuded above the level of the sea. The shape of the uplands is, in fact, the result of the disintegration of the bulk of the land in proportion as the valleys have been excavated.

The denudation would continue so long as the ground stood above the level of the sea; but there have been prolonged periods of depression of the land during which the sea has stood at a lower level and was buried sometimes under thousands of feet of accumulated sediment, which completely filled up and obliterated the previous drainage-lines. When the land reappeared a new series of valleys would at once begin to erode; and the subsequent degradation of these overlying sediments might reveal portions of the older topography, as in the case of the Great Glen, Lauderdale, and other ancient valleys. But the new drainage-lines have usually little or no reference to the old ones. Determined by the inequalities of surface of the overlying mantle of sedimentary material, they would be wholly independent of the geological structure of the rocks lying below them. Slowly widening and deeper and deeper into the loose deposits, they might eventually reach the older rocks, but they would keep in these the lines of valley that they had followed in the overlying deposits. In process of time the whole of these deposits might be washed off, and the valley would be bounded by the younger formations on which the valleys began and which guided their excavation. This is probably the explanation of the striking independence of geological structure exhibited by the Tweed and the Nith.

Among the valleys certain prevailing characteristics have been recognized in their popular names. *Strath* are broad expanses of low ground between bounding hills and are usually traversed by one main stream and its tributaries. The name is applied to a tract of low ground that region the Silurian rocks have been invaded by large masses of granite and have undergone a variable amount of metamorphism which has in some places altered them into hard crystalline schists. These schists are commonly highly resistant to the processes of erosion, and the greater powers of resisting decay, have yielded unequally to disintegration: the harder portions project in rocky knolls, crags and cliffs, while the softer portions have been worn down into delicate precipitous slopes. The largest of the highest summit in south Scotland—Merrick (2764 ft.)—consists of Silurian strata much altered by proximity to the granite, while the rest of the more prominent heights (all in Kirkcudbrightshire)—

Riuns of Kells (2668 ft.), Cairnsmuir of Carspharn (2612), and Cairnsmore of Fleet (2331)—are formed of granite.

The estuary of the Clyde, the valley of the Clyde, and the Uplands of Argyll, have a much interest in their geological history. It runs from the mouth of Loch Ryan in a sinuous north-easterly direction, keeping near the northern limit of the region till it reaches the basin of the Nith, and from the Nith to the Forth follows the courses of the Nith and the Clyde. North-easterly and south-westerly strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and sandstones, it is not so distinct in the Lochee, Ayrshire, and the valley of the Clyde. The rocks throughout the Southern Uplands have a persistent north-easterly and south-western strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and sandstones, it is not so distinct in the Lochee, Ayrshire, and the valley of the Clyde. The valley of the Clyde and the Uplands of Argyll, have a much interest in their geological history. It runs from the mouth of Loch Ryan in a sinuous north-easterly direction, keeping near the northern limit of the region till it reaches the basin of the Nith, and from the Nith to the Forth follows the courses of the Nith and the Clyde. North-easterly and south-westerly strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and sandstones, it is not so distinct in the Lochee, Ayrshire, and the valley of the Clyde. The rocks throughout the Southern Uplands have a persistent north-easterly and south-western strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and sandstones, it is not so distinct in the Lochee, Ayrshire, and the valley of the Clyde. The valley of the Clyde and the Uplands of Argyll, have a much interest in their geological history. It runs from the mouth of Loch Ryan in a sinuous north-easterly direction, keeping near the northern limit of the region till it reaches the basin of the Nith, and from the Nith to the Forth follows the courses of the Nith and the Clyde. North-easterly and south-westerly strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and sandstones, it is not so distinct in the Lochee, Ayrshire, and the valley of the Clyde. The rocks throughout the Southern Uplands have a persistent north-easterly and south-western strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and sandstones, it is not so distinct in the Lochee, Ayrshire, and the valley of the Clyde.
valley than a strath, though the names have not always been applied with discrimination. Most of the Highland valleys are true glens, Glencoe being the best-known example. The hills rise rapidly on each side, sometimes in grassy slopes, sometimes in rocky bosses and platforms of scree or boulder clay. Beyond these lies a more open country, the south of Scotland the larger streams flow in wide open valleys called dales, as in Clydesdale, Tweeddale, Teviotdale, Liddesdale, Eskdale, Newcastleton, and elsewhere. In these valleys the streams are known as haughs, and where in estuaries they expand into wide plains they are termed cairs. The cairs of the Forth extend seaward as far as Bo’ness and consist chiefly of raised beaches. The Carse of Gowrie is the highest expanse of old alluvial deposit in Scotland. Towards the Sidlaw Hills, Braes signifies the steep bank of a river, and so any slope or hill-side.

River-gorges are characteristic features in many of the valleys. In the Oban district of Appin they are particularly prominent where that formation has lain in the pathway of the streams sweeping down from the Highlands. In the basin of the upper Nith, for example, the river has cut a deep channel from Bladnoch to Newcastleton, and Findhorn, while on the west side of the Cromarty Firth some of the small streams descending from the high grounds of the south-west of the shire of Ross and Cromarty have cut out defiles in the Conglomerates, remarkable for their depth and narrowness. Towards the southern margin of the Highlands notables of true canyons in the Old Red Sandstone are to be seen where the Isla and North Esk enter that formation. The well-known gorge in which the Falls of Clyde are situated is a fine example. In other parts of Scotland the rivers see the separate articles on them, and also the section on the physical features in the article on the different shires of Scotland.)

The destruction of the surface by denudation, it is reasonable to infer that the oldest surfaces likely to be preserved are portions of some of the platforms of erosion successively established by the wearing down of the more rugged parts and the development of the plain of a granite precipes. The top of Ben Macdhui stands upon nearly a square mile of ground exceeding 4000 ft. in elevation. These mountains lie within granite areas; but not less striking examples may be found among the older types of mountain formation. On the east of Glen Isla, for instance, sweep upwards into a broad moor some 3000 ft. above the sea, the more prominent parts of which have received special names—Driesean, Mayar, Tom Buidhe, Tolmount, Cairn na Glisha. It would hardly be an exaggeration to say that there is more level ground on the tops of these mountains than in areas of corresponding size in the valleys below. That these high plateaus are planes of erosion is shown by their independence of geological structure, the upturned edges of the vertical and contorted strata having been abruptly shorn off and the granite having been wasted and levelled along its exposed surface. Among the Southern Uplands are numerous stretches of undulating moorland, generally under turf, which lie on the old denuded Silurian grits and shales. An instructive example of the similar destruction of a much younger platform is to be found in the terraced plateaus of Skye, Eigg, Canna, Muck, Mull and Morven, which are portions of what was once a gently undulating plain of basalt. Though dating back only to older Tertiary time, this plain has been so deeply trenched by the forces of denudation that it has been reduced to mere scattered fragments. Thousands of feet of basalt have been worn away from many parts of its surface; deep and wide valleys have been carved out of it; and so enormously has it been wasted, that it has been almost entirely stripped from many parts of its surface and where only scattered outliers remain to prove that it once existed.

It is curious that broad flat-topped mountains are chiefly to be found in the eastern parts of the country. Trace westwards, these forms gradually give place to narrow ridges and to deep valleys, and in the south of Scotland the larger streams flow in wide open valleys called dales, as in Clydesdale, Tweeddale, Teviotdale, Liddesdale, Eskdale, Newcastleton, and elsewhere. The valleys are known as haughs, and where in estuaries they expand into wide plains they are termed cairs. The cairs of the Forth extend seaward as far as Bo’ness and consist chiefly of raised beaches. The Carse of Gowrie is the highest expanse of old alluvial deposit in Scotland. Towards the Sidlaw Hills, Braes signifies the steep bank of a river, and so any slope or hill-side.

River-gorges are characteristic features in many of the valleys. In the Oban district of Appin they are particularly prominent where that formation has lain in the pathway of the streams sweeping down from the Highlands. In the basin of the upper Nith, for example, the river has cut a deep channel from Bladnoch to Newcastleton, and Findhorn, while on the west side of the Cromarty Firth some of the small streams descending from the high grounds of the south-west of the shire of Ross and Cromarty have cut out defiles in the Conglomerates, remarkable for their depth and narrowness. Towards the southern margin of the Highlands notables of true canyons in the Old Red Sandstone are to be seen where the Isla and North Esk enter that formation. The well-known gorge in which the Falls of Clyde are situated is a fine example. In other parts of Scotland the rivers see the separate articles on them, and also the section on the physical features in the article on the different shires of Scotland.)

Types of mountain and hill.

Valley and coast.

Scotia is the name used for the interior of the country, and in a large sense for the whole of the island. The area of Scotland is 32,100 square miles, and the coast line 6000 miles, the western coast being much longer than the eastern. The shape of Scotland is a parallelogram, and it is nearly a half circle, the longest sides being东西东西

In the western Highlands and along the Southern Uplands, the streams are fed by the melting snows and ice of the mountains. In these, and in the northern parts of the country, the snow and ice have a share in the work of erosion. No feature in Highland scenery is more characteristic than the corries, and in none can the influence of geological structure be better understood. Uplands which are not snow-covered are pitted and scarred by corries, the sides of rock from which long trails of debris descend to the bottom of the hollow. Every distinct variety of rock has its own type of corrie, the peculiarities being marked both in the details of the upper cliffs and crests, and the amounts and form and colour of the scree. The Scottish corries have been occupied by glaciers. Hence their bottoms are generally ice-worn or strewn over with moraine stuff. Sometimes the corries extend below the ice-trench, and then they are admirably studied. Where two glens begin opposite to each other on the same ridge, their corries are gradually cut back until only a sharp crest separates them. This crest, attacked on each front and along the summit, is lowered in a progressive manner, until they become groups of detached hills or mountains. The corries of the mountains of Arran furnish excellent illustrations.

Where a rock yields to weather with considerable uniformity in all its parts, it produces a flat and level surface, as the back of the tableland and in the formation of the most rugged and most individualized forms of isolated mountain. In fact, in journeying westwards across the tops of the Highland mountains we pass, as it were, over successive stages in the history of the origin of Highland scenery. They have been cut down by the various rock types, and have been worn off by the action of the wind and rain, until they become groups of detached hills or mountains. In the progress of this erosion full scope has been afforded for the modification of form by variation in geological structure. Each ridge and mountain is the result of various causes, and the nature and character of the rock has been determined by the nature of the rocks and the manner in which they have yielded to decay. Every distinct variety of rock has impressed its own character upon the landscape. Hence, amid the same geographical features—heights of hills, ridges of slopes, river valleys, diversity of detail has resulted from the varying composition and grouping of the rocks.

SCOTLAND

above the sea are mere remnants of a continuous sheet of red sandstone that once spread far and wide over the western Highlands. Stratiﬁed rocks when they have not been much disturbed from the sea-level are often to be found in the eastern Highlands, where the horizontality of their structure has been preserved by glacial action. Such cliffs may run for many miles across a country, rising one above another into lofty terraced hills. In Scotland the rocks have been so diatomated and worn away that for the most part the outlines of the escarpments, and this form of rock-scenery is consequently almost entirely absent, except locally and for the most part a comparatively small scale. The most extensive Scottish escarpments are found along the shores of the Firth of Forth, in the counties of Fife and Kinross. Where lava has been piled up into successive nearly horizontal sheets, with occasional layers of tuf or other softer rock between them, it offers conditions peculiarly favourable for the formation of escarpments, as in the case of the Carboniferous rocks of the Campsie and Fintry Hills and of the south of Dumfriesshire and Roxburghshire. 

The lakes of Scotland may be classiﬁed in four groups, each with its own peculiar scenery and different mode of origin—

1. Glen lakes are those which occupy portions of glens. They are depressions in the valleys, not due to local heaping up of detritus, but true rock-basins, often of great depth. Much discussion has arisen as to the mode of origin, but it is probable they were caused by the erosive action of ice, since glaciers occupied the glens where they occur and wore down the rocks along the sides and bottom; but it is a point of difﬁculty in this theory whether ice could have eroded the softer rocks.山谷s and alluvial lakes must be of recent geological date. Any such basins belonging to the time of the folding of the crystalline schists would have been ﬁlled up and effaced long ago. Indeed, so rapid is the infilling of these basins, that the general opinion is that they must be of recent date. Whether the inﬁlling of a glacial basin occurs by the leaching of the silt and sand, or by weathering or by the growth of vegetation, appears to be a matter of opinion, or at least to be difﬁcult to determine. However, it is plausible that even the highest mountains are subject to repeated glaciation, and when the last one die away, the valleys shall be again opened up and occupied by lakes or moors, as has been the case with many of the other great European systems, where the present and former sea-levels are found to agree in their general elevation.

2. The lakes of the slopes, or the lakes of the southern Highlands, are almost wholly conﬁned to the western half of the Highlands, where the escarpment is more conspicuous and where the precipices are seen east of a line drawn from Inverness to Perth. West of that line, however, they abound in both the longitudinal and the transverse valleys. The most remarkable line of them is that which ﬁlls up the Great Glen, Loch Ness being the largest. Other important longitudinal lakes are Lochs Tay, Awe, Erichﬁeld and Shiel. The most picturesque glen lakes, however, lie in transverse valleys, which being cut across the range of the escarpment, the rocks are exposed and the elevations of outline. Lochs Lomond, Katrine and Lusnaig in the southern Highlands, and Lochs Mares and More in the north, are conspicuous examples.

3. Moraine-lakes—small sheets of water ponded back by some of the last moraines shed by the retreating glaciers—are conﬁned to the more mountainous tracts. Among the Southern Uplands the best are those of the North and Southdreocks, and of the eastern Lochs of Skene and Doon, lying in a recess of Whitecoomb at the head of Mofat Water. Others are sprinkled over the higher parts of the valleys in Galloway. None occurs in the Central Plain. In the Highlands they may be seen at Torridon, where a large sheet has been occasioned by the proglacial Hebrides, and at Badenoch, where the glacial moraines are thick and abrupt. In the north-western counties, where the glaciers continued longest to descend to the sea-level, lakes retained by moraine-barriers may be found very little above the sea.

4. The Lakes of the Plains lie in hollows of the glacial detritus which is strewn so thickly over the lower grounds. As these hollows were caused by original irregular deposition rather than by erosion, there is no presumption that their outlines are the true natural ones, for they may have been formed by the fall of large masses and may have been drained. The largest sheets of fresh water in the Lowlands are lakes of the plains as Loch Leven and the Lake of Menteith. The eastern is indited by a series of broad arms of the sea—the firths of Forth and Tay, Moray and Dornoch firths—but is otherwise relatively unbroken. The land slopes gently to the sea or to the edge of cliffs that have been cut back by the waves. The shores are for the most part low, with few islands in front of them, and cultivation comes down almost to the tide-line. The western shores are much more rugged, and the extent of the coastline is increased by the numerous promontories and promontories of the coast-line. The west side, as we have seen, has been more deeply eroded than the eastern. The glens are more numerous there and on the whole deeper and narrower. Many of them are prolonged under the sea, forming northern promontories, and they dive into the land at an angle with the coast-line. Some of them are cut out of the coastal cliffs; others are continued under the sea as the continuation of the glens. The presence of the sea in these fjords is an accident. If they could be raised out of the sea they would become inlets of the ocean, and their glacial history and their Local relation hardly admits of question. They are submersed land- valleys, and as they run down the whole western coast they show that this side has subsided to a considerable depth beneath its former surface. The comparison of the outlines of the Scottish and those of western Ireland and Norway. The whole of this north-western coast-line of Europe bears witness to recent submergence. The bed of the North Sea, which at no distant date in geological history was a land surface across which plants and animals migrated freely into Great Britain, sank beneath the sea-level, while the Atlantic advanced upon the western margin of the continent and found an exit to the sea by the western coast-line. However, the highest cliffs are found among the Shetland and Orkney Islands. The sea-wall of Foula, in Shetland, and the western front of Hoy, in Orkney, rise like walls to a height of over 600 ft., cut by their sides, and opening not more than a few hundred yards to the sea. They are seen, as those of Cape Wrath, to be nearly 600 ft. high, and have cut out of the Archean gneiss. The varying texture of the rocks, the upturned shales and the granite, the abundance of pegmatite give it very unequal powers of resistance. Here it projects in irregular bastions and buttresses, there retires into deep recesses and tunnels, but shows everywhere a ruggedness of aspect which is remarkable. In striking contrast to these precipices, those of the Cambrian red sandstone a few miles to the east. Vast vertical walls of rock shoot up to a height of 600 ft., cut by their sides, and opening not much more than a hundred yards to the sea. These are not mere cliffs, but the remnants of a great range of mountains which stood out on this side as a headland of the main or the coast. The sombre colouring is relieved by vegetation along the edges of the nearly ﬂat beds which project like great cornices and serve as nesting-places for sea-lions. On the west the most notable cliffs south of those of Cape Wrath and the Cambrian sandstones of the Sutherland is found to be among the largest islands, particularly in Skye, where a magniﬁcent range of precipices rising to 1000 ft. and more are seen, and where the highest from above the land to the sea. In Arran, and the most well-known feature in the Isle of Mull, is the Cailleach, a great black cliff that rises to over 1000 ft. from the sea, and the most conspicuous range of the eastern coast is seen in the jagged projection of the Mull of Orkney. A huge column of yellow sandstone between 400 and 500 ft. high, forming a conspicuous landmark in the north. The coast of Caithness abounds in outstanding pillars and obelisks of flagstone. These are mostly found in the county of Caithness, and are known as the cliffs of dunes, as on the western margin of North and South Uist, and in many bays from the north of Sutherland to the coast of Ayrshire. They are more abundant on the east coast, however, especially on the shores of Aberdeenshire, between the mouths of the two Esks in Forfarshire, on both sides of the mouth of the Firth of Tay, and on various places on the Firth of Firth. Razed sea-beaches likewise abound along the eastern coast, and may be seen stretching from near the Firth of Forth to the Old Red Sandstone cliffs and the coast of Moray. The shores of these bays are low, and the scenery is distinguished by the large sheets of low fertile land between the edge of the sea and the rising ground of the interior, and among the western fjords sometimes supply the only arable soil in their neighbourhood, their flat green surfaces broken only by cliffs about a hundred feet high, and the long promontories that extend from them. Most of the seaport towns stand upon platforms of raised beach. Considerable deposits of mud, silt and sand are accumulated on the promontories, and the coast may be seen to vary in elevation from the sea to the land.
While no islands except mere solitary rocks like May Island, the Bass Rock and Inchkeith diversify the eastern seaboard, the western presents a vast number, varying from such extensive tracts as Skye to the small islets known as the Eileans. Situated as Lochcarron is at the broadest part, these numerous islands may be regarded as belonging to two groups or series, the Outer and the Inner Hebrides. In the Outer Hebrides most of the ground is low, rocky and plentifully dotted over with lakes. But to the northward, lies the country of Harris, the summits attaining elevations of 2600 ft. The general trend of this long belt of islands is north-north-east. The Inner Hebrides form a much less definite group. They may be regarded as beginning with the small islets in the Minch and stretching to the southern headlands of Islay, and their irregularity has no doubt been chiefly brought about by the remarkable diversity of geological structure. Archean gneiss, such as granite-sandstone, Silurian and Devonian, Jurassic sandstone and limestone, Cretaceous sandstone, and Tertiary basalts, gabbros, and granitic rocks all enter into the composition of the islands.

**Topography.**—The influence of the topography of the country on the history of its inhabitants has been all-important. How powerfully the configuration affects the climate is shown in the remarkable difference between the rainfall of the mountainous west and the lowland east. This difference has necessarily modified the character and employment of the people, leading to the cultivation of the soil on the one side and the raising of sheep and cattle on the other. The fertile low grounds on the east have offered facilities for the invasions of Romans, Norsemen and English, while the mountain fastnesses of the interior and the west have served as secure retreats for the older Celtic population. While, therefore, Tempsford people have spread over the one area, the earlier race has to this day maintained its ground in the other. Not only external configuration but geological structure also has profoundly influenced the progress of the inhabitants. In the Highlands no mineral wealth has been discovered to stimulate the industry of the natives or to attract labour and capital. These tracts remain still, as of old, sparsely inhabited and given over to the breeding of stock and the pursuit of game. In the Lowlands, on the other hand, rich stores of coal, iron, lime and other minerals have been found. The coal-fields have gradually drawn to them an ever-increasing share of the population. Villages and towns have suddenly developed and rapidly increased in size. Manufactures and shipbuilding have grown and commerce has advanced with accelerated pace. Other influences have of course contributed largely to the development of the country, but among them all the chief place must be assigned to that fortunate geological structure which, amid the revolutions of the past, has preserved in the centre of Scotland those fields of coal and ironstone which are the foundations of the national industry.

**Geology.**

**Archean Rocks.**—The oldest rocks of Scotland and of the British Isles are known, from their antiquity, as Archean, and consist chiefly of gneiss (called Fundamental, as lying at the foundation of the geological structure of the country and especially in the Highlands because it is well developed in the island of Harris and the Outer Hebrides), which varies from a coarsely crystalline granitoid mass to fine schist. The coarse varieties are most abundant, intermingled with hornblendite-rock, hornblende-schist, pegmatite-rock, quartzite, mica-schist, sericite-schist and other schistose accompaniments. In a few places limestone has been observed. No trace of any organisation is ever detected in any of these rocks. Over wider areas, particularly on the mainland, the bands of gneiss have a general north-west trend and undulate in frequent plications with variable inclination to north-east and south-west. The largest tract of Archean rock is that which forms almost the whole of the Outer Hebrides, from Barra Head to the Butt of Lewis. Other areas more or less widely separated from each other run down the western parts of the shires of Sutherland and Ross and Cromarty, and are probably connected as far as the island of Rum.

**Eastern or Younger Schists.**—The central, southern and eastern Highlands are occupied by metamorphosed sedimentary and igneous rocks associated provisionally with the name of Dalradian from the old Celtic kingdom of Dalriada. Their true stratigraphical position has not yet been ascertained, and it may appear that more than one group of rocks is included in the series. Eastward of the Arrochar Alps and the Caledonian Mountains the effect of elevation, underground pressure has been to upraise masses of the ancient gneiss and Torridonian sandstone and thrust them westward over the younger rocks. It is not possible to say what was the original character of the strata before they were subjected to the processes of re-crystallization and forced into the characters of the younger formations. It is clear from the evidence of folding that the country was long before the collision of the Great Glen and the Caledonian Mountains, the old Archean rocks being re-arranged and re-crystallized into granulitic, flaggy gneisses and schists (Moine schists). They extend from the north-east of Sutherland to the Sound of Mull. To the east of the Sound of Mull, as at the Sound of Kerrera, they are replaced by the unmetamorphosed sandstones, the so-called argillaceous rocks of the eastern Highlands, the sediments of the Lias and Cretaceous, which, though included among the sediments of the British Isles, have never been seen outside the Hebrides or the islands of the Sound of Mull itself. In the south of the Hebrides, and especially in the island of Eigg, it is believed that the sandstone has been intruded as sills or as lavas contemporaneously with the sedimentary formations among which they lie. On the other hand, there occur bands of conglomerate, pebbly grit, quartzite, graphitic shale and limestone in a certain ordered sequence and over a wide area. Traces of annelids have been detected in some of the quartzites, and some of the less changed parts of the limestones may be searched for fossils. This great series of metamorphic rocks, the geological age of which is still unsettled, has had a powerful effect on the scenery, especially along the Highland line. Where a thick group of coarse hard grits intercalated in the sedimentary rocks crops out it rises into a chain of lofty rugged hills, of which Ben Ledi and Ben Vorlich are examples. The slate hills, weathering more readily, assume gentle slopes and rounded ridges, as in the high land from Holy Loch to the Kyles of Bute. The quartzites rise in conical hills, such as those of Jura and Islay. And to the soil created by the decay of the limestones is due a greener verdure than that of the surrounding forests.

**Torridonian Sandstone.**—Above the Archean gneiss lies a series of red and chocolate-coloured sandstone (Torridonian sandstone), which form a number of detached areas from Cape Wrath down the seaboard of the shires of Sutherland and Ross and Cromarty, across Skye, and as far as the island of Rum. They rise into prominent pyramidal mountains, which, as the stratification is usually almost horizontal, present in their terraced sides a singular contrast to the steep and often isolated peaks of the neighbouring heights, composed of highly pelitic crystalline schists. In the Torridon district they can be seen tapering bed above bed to a height of about 4000 ft., but they must be at least 10,000 ft. thick. They are not at all atypical anywhere else in Scotland. Traces of annelids and probably other organisms have been found in the bands of shale occurring in the south-west of the shire of Ross and Cromarty, in the vicinity of Rannoch, and at Catillean Head, and are the oldest relics of animal life yet found in Great Britain.

**Cambrian.**—In the north-western Highlands masses of white quartzite, resting unconformably in Torridonian sandstone, run from Loch Eriboll to Skye, forming in places great conical hills and some—
times capping isolated mountains of red Torridon sandstone. They constitute the lowest group of the most interesting series of strata in the Highlands, and yield a large number of reptilian remains. Of these, the following subdivisions, whose thickness in the district of Durness is estimated at about 2000 ft: (e) limestones, dolomites and cherts, with numerous organic remains; (g) grit and quartzite with Upper Silurian rocks; (h) sands and dolomites, with many anhedral casts and sometimes Olenellus (Fucoid Beds); (b) Upper Quartzite, often crowded with annelid pipes (Pipe Rock Quartzite); (a) Lower Quartzite— their original member of the crystalline system which is usually divided into two, the lower, less resistant, is often renewed by the Eastern Schists in those gigantic underground disturbances already referred to, by which these rocks, the Archaen gneisses and schists, are also in reality detached slabs which have been inverted and thrust over each other. The Quartzites themselves have also been subjected to extraordinary horizontal displacement, amounting in places to not less than 10 m. The rocks overlying them to the north and west of the Trent Valley are in general the Ross and Cromarty, a fine laggish schist. The Cambrian system— including the Upper (Durness-Eriboll Limestone) and the Lower (Serpule grit, Fucoid Beds, Quartzite)—forms a narrow band which could be traced for 100 m. from the north coast of Sutherland to Skye. Rocks of Cambrian age have not been identified elsewhere in Scotland, though it may ultimately be shown that the quartzites and limestones of the Central Highlands are equivalents of those of the south-coast.

Ordovician and Silurian.—In the Southern Uplands a great development of Ordovician and Silurian rocks is found. In that belt the Ordovician rocks, the Silurian, and the uppermost Devonian are strung over the land, but in the southwest of Argyllshire they include some thick lenticular bands of limestone. They have been thrown into long folds, the long axes of which run in a general north-easterly direction. It is by no means certain that the strata of this part of the country are the same as the sedimentary rocks of the Southern Uplands. The plications of the Highlands and the chief dislocations of the country have followed the same general direction, and hence the resemblance is clearly that of the same structure. In the Southern Uplands, these are the only rocks that are also in the same direction as the extremity of the Highlands. The most northerly localities for Ordovician and Silurian rocks in this country are the Ayrshire coast, or, to be more exact, the far west of Arran, where Silurian rocks thickly cover the Berkshire Hills, and the coast south of Girvan and the limestone quarries of the Stinchar and Girvan valleys, in Ayrshire, for shells, trilobites, corals, &c.

Old Red Sandstone.—Scotland is the typical European region for the deposits classed as Old Red Sandstone. These rocks are grouped in two divisions, Lower and Upper, both of which appear to have been deposited in lakes. The Lower, with its abundant intercalated laves and tuffs, extends continuously as a broad belt along the northern margin of the district of the Ordovician and Silurian rocks, along the southern border, is found again on the south side of the Uplands in Berwickshire and the Cheviot Hills, occupying a tract of Loddon Ridge. The Central Highlands are studded with the results of the dislocation of these rocks, and the Highlands underlies most of the low ground on both sides of the Moray Firth, stretches across Caithness and through nearly the whole of the Orkney Islands, and is prolonged into Shetland. The Upper Old Red Sandstone remains of plants and fishes, notably in the flagstones of Caithness, Orkney and Forfarshire. The volcanic rocks of this division form large basaltic and andesitic masses, such as the top of the Pentlands, Ochils and Sidlaws. They have in some places a thickness of 7000 ft. The lavas are usually porphyritic, which occur in sheets, with intercalated bands of volcanic tuff that are sometimes strongly lenticular. One of the very best localities for the Travertine Limestone (of the Loddon Limestone) is on the south side of Edinburgh. Fossils are less common in the Upper Old Red Sandstone, though they are found—particularly fishes—in larger numbers in certain spots, as at Dura Den, near Carpar-File. Traces of contemporaneous volcanic action exist in the Orcadian island of Hoy.

Carboniferous.—The areas occupied by Carboniferous rocks are also extensive, and the coal-seams which are here of great thickness are also being skirted the Southern Uplands from the mouth of the Tweed to that of the Nith. In the basins of the Forth and Clyde the following subdivisions are well marked: (g) Upper Red Sandstone series—of the same age as the Upper Old Red Sandstone series, and containing limestones and coal; (h) Millstone Grit (massive sandstones and grits, with calcareous bands, coal, sandstones and ironsomes); (c) Carboniferous Lime- stone series—sandstones and shales, with three or more seams of limestone; (d) sandstones, shales, coals and ironsomes, but with no limestone bands; (a) sandstones, shales, fireclays, coals and iron-stones, with thin limestones towards the top and the Hurlet (Renfrewshire) limestone at the bottom; (1) Calciferous Sandstone series— containing masses of sandstones (of which the city of Edinburgh was built), black shales, thin limestones (Burdeehope, near Edinburgh), and occasional coal seams; (a) Lower Red Sandstone group, with reddish and greenish shales, sandstones, and coals, with one or two other beds of sandstones, and coal; (b) sandstone, with three or more seams of limestone; (b) sandstones, shales, coals and ironsomes, but with no limestone bands; (d) sandstones, shales, fireclays, coals and iron-

geological date. They comprise a consecutive series of deposits from the sea, the former lying over the former. The Lower and Upper Lias consist chiefly of shales and shelly limestones, with some sandstones, well seen along the shores of Broadford Bay in Skye and in some of the adjacent islands. The Lower Oolites are made up of oolitic limestones, with some pebbles and clasts. Tertiaries, admirably described by Dr. Boyd Dawkins, by several hundred feet of an estuarine series of deposits consisting chiefly of thick white sandstones, below and above which lie shales and shelly limestones. These rocks form a prominent feature underlying the coast terraces of the east side of Skye, Raasay, and Eigg. They form the highest members of the Jurassic series, representing probably some part of the Oxford Clay. The next Secondary rocks [Cr. 424] are unconsolidated.

Cretaceous.—Rocks belonging to the Cretaceous system at one time covered considerable areas on both sides of the Highlands, but they have been entirely stripped off the eastern side, while on the western they have been largely removed by the erosion and denudation consequent on their having been elevated and being overlying the Neogene formations. Many of them have survived because of the overlying sheets of basalt that have protected them. Some greenish sandstones containing recognisable parts of the Cretaceous Green-sand of the south of England. These rocks are found on the west and south coasts of Mull and on the west coast of Argyllshire. They are covered by white sandstones and these by white chalk and marly beds, which represent the Upper Chalk of England. Their existence under the basalt outlier of Ben Idrech in Morven, at a height of 1600 ft. above the sea, shows notably how extensively they have been denuded, but also how large a portion of the Highland basaltic district have in the course of time been occupied by the Cretaceous deposits of Antrim (Ireland). Enormous numbers of flints and also less abundant fragments of chalk are found in glacial drifts, as on the Moray Firth. From the foregoing it is clear that the Chalk must once have been in place at no great distance, and if indeed it did not actually occupy part of Aberdeenshire and the neighbouring counties.

One of the highest, the second highest rocks on the west coast come terrace plates of basalt, which spread out over wide areas in Skye, Eigg, Mull and Morven, and form most of the smaller islets of the chain of the Inner Hebrides. These plates are composed of nearly horizontal sheets of basaltic columnar, amorphous, or amygdaloidal—when, in Ben More, in Mull, attain a thickness of more than 3000 ft. They are prolonged southwards into Antrim, which resembles them in many respects. The layering and the thickness show that the basalt must once have been in place at a still greater distance, but it is not certain that it occupied the territory. Occasional beds of tuff are intercalated among these lavas, and likewise seams of fine clay or shale which have preserved the remains of numerous land-plants. The presence of these fossils indicates that these rocks were laid down in a moister climate than that in which they are found to-day. The relations of those with elsewhere found among older Tertiary strata show that they probably belong to the Oligocene stage of the Tertiary series of formations, and so that the basalt eruptions took place in early Tertiary time. The volcanic episode to which these plateaus owe their origin was one of the most important in the geological history of Great Britain. It appears to have resembled in its main features that which followed on the Tertiary epoch of the Northern Uplands, and it spread over many thousand square miles of the western area of the United Kingdom. The eruptions were connected with innumerable fissures up which the basalt rose and from numerous points on which it flowed out over the face of the land. The founts, whose number and extent are still uncertain, are represented by the present day head waters of the Clyde and the Forth. They spread so far that the basaltic rocks have chanced to reach parts of Scotland which are not now in contact with the sea. A remarkable feature in the volcanic phenomena was the disruption of the basaltic plateaus by large masses of igneous and of volcanic rocks. These fragments were cast on the ground, stripped and polished the harder rocks over the whole country, and left behind them the widespread accumulation of clay, gravel, and sand known as Glacial Deposition. The Boulder Clay, the most universal kind of Drift—which covers much of the Lowlands to a depth sometimes of 100 ft., and along the flanks of hills reaches a height of 2000 ft. or more—was pushed along by ice radiating from its centres. The change in direction which the direction of the striae on the rocky surface of the country as well as in the dispersion of boulders and stones from recognizable districts. Thus remains of Highland hills which have been borne across the Highlands to the Southern Uplands. Above the Boulder Clay are found sands and gravels, along with perched boulders which, by their source and position, indicate the direction and thickness of the ice that passed over the Highland edge of the glaciers are numerous throughout the Highlands.

Recent.—The youngest formations are the raised beaches—conspicuous ridges of pebbles and clay lying in the sea and in the estuarine situations, and the deposits of Loch Linnhe, and sometimes of heaped-up beds of sorted gravel—river terraces, lake deposits, peat-mosses, tracts of blown sand—notably seen in the dunes of Culbin, Rattray Head, Aberdeen, Tayport and the Forth. The arrangement of these features and the distribution of the peat mosses, those of the Lochnagar, Folden, Ayr, Glenluce and along North and South Uist on the west. These are related to the present configuration of the land and contain remains of plants and animals still living on its surface. (A. Gr.; J. A. M.)

Climate

In considering the climate of Scotland the first place must be assigned to the influence of the latitude. During the months of the year since this, and not the mean temperature of the whole year, gives the chief characteristics of climate. Thus, while the annual temperatures of the west and east coasts are nearly equal, the mean temperature of January and July are 3*6° and 53°F., whereas at Perth they are 37°5° and 59°. The temperature features of the north of Scotland are their great extremes of winter and summer temperature, thus pointing not to the sun but to the warm waters of the Atlantic, as the more powerful influence in determining the climate at this season through the agency of the prevailing westerly winds. In exceptionally cold seasons the ocean protects all places in its more immediate neighbourhood against the severe frosts which occur in inland situations. While this influence of the ocean is felt at all seasons, it is most strikingly seen in winter when, by the warming of the deep waters, the temperature in the western coasts is about 10° higher than what is found a littoral island. In summer, everywhere, latitude for latitude, temperature is lower in the west than in the east and inland situations, but in winter the inland climates are the warmer, the highlands of the north country being specially so. The effect of the Atlantic in moderating the heat of summer is very great and is felt a long way into the interior of the country. On the other hand, the high lands of western districts by robbing the westerly winds of their moisture, and thus clearing the skies of eastern districts, exercise an equally striking effect in the opposite direction—in raising the temperature.

There is nearly twice as much wind from the south-west as from the north-east, but the proportions vary greatly in different months. The south-west prevails from July to October, and again in December to February; accordingly in these months the rainfall is doubled and the evaporation is about 25 per cent. and, as a result, there is an important result of the prevalence of these winds, with their accompanying rains, which are coincident with the annual extremes of temperature, is to imprint a more strictly insular character on the climate. From north-west to south-west winds, there is a broad, continuous belt of westernly winds, which gives rise to the most remarkable feature of Scottish climate—its extreme diversity. The north-east winds acquire their greatest frequency from March to June and in November, which are accordingly the driest portions of the year.

The mountainous regions are mostly massed in the west and lie generally north and south, or approximately facing the rain-bringing winds from the Atlantic. Thus the climates of the west are essentially wet. On the other hand, the climates of the east are dry, because the surface is lower and more level; and the breezes borne thither from the west, being robbed of most of their superabundant moisture in crossing the western hills, are drier and precipitate a greatly diminished rainfall. It thus happens that the drier climates in the east are those which have south-eastwards the broadest extent of mountainous ground, and that the wettest eastern climates are those which have southwards the least of that ground. The breakdown of the watershed between the Firths of Clyde and Forth exposes southern Perthshire, the counties of Clackmannan and Kincardine, and nearly the whole of Fife to the clouds and rains of the west. The winter climates are consequently wetter than those of any others of the eastern slopes of the country. The driest climates of the east are in Tweeddale about Kelso and Jedburgh, the low grounds of East Lothian, and those on the Moray Firth, as round to Dornoch. In these districts the annual rainfall averages 26 in., whereas over extensive breadths in the west it exceeds 100 in., in Glenelg being nearly 130 in., and on the top of Ben Nevis it may reach 150 in.

II. Economic Conditions, &c.

Population.—At the end of the 18th century it is conjectured that the population of Scotland did not exceed 500,000—Edinburgh having about 20,000 inhabitants, Perth about 1800, Aberdeen, Dundee and St Andrews about 4000 each. By the Union with England (1707) the population is supposed to
have grown to 1,000,000. In 1755, according to the returns furnished by the clergy to the Rev. Dr Alexander Webster (1707-1784), minister of the Tron Kirk, Edinburgh—who had been commissioned by Lord President Dundas to prepare a census for government,—it was 1,265,380. At the first government census (1801) it had reached 1,668,420. The increase at succeeding decades has been continuous though fluctuating in amount, and in 1901 the population amounted to 4,472,103 (females, 2,298,348). In 1902 the Registrar-General for Scotland calculated that if the rate of increase (11.9% manifest during 1891-1901) were uniformly maintained, the population would double itself in the course of about 66 years.

The burghs in which the largest proportion of Scottish-born persons lived in 1901 were Kirkcaldy (with 95-97% in every 100 of its inhabitants), Aberdeen (with 94-997), Perth (with 94-442) and Kilmarnock (with 94-045). The largest proportion of English-born were in Edinburgh (with 54-223), and Leith (with 54-831). Irish-born were most in evidence in Cowlthistle (with 15-158 in every 100), Partick (with 12-00) and Govan (with 11-51). Welsh nationality was most marked in Motherwell (with 0-250%). Those of British-Colonial birth were most numerous in Edinburgh (with 0-933%), and foreigners in Glasgow (with 0-890), Leith (with 0-741) and Hamilton (with 0-720). In addition to the 17,654 resident foreigners there were 4973 foreigners casually in Scotland at the taking of the census in 1901 (17,654 men and women on board foreign and British vessels), raising the total of foreigners actually enumerated...

Table V. gives the number of persons, exclusive of children under three years of age, who spoke Gaelic only, and Gaelic and English, with their percentages to the population in 1901. The counties in which the highest percentages obtained of persons speaking Gaelic only were Ross and Cromarty with 15.92% (1,217 persons) and Inverness with 13.01% (1,722 persons). But in no fewer than eighteen counties the proportion of Gaelic-speaking persons was under 1%.

Occupations of the People.—Table VIII. divides the people according to occupations. The most noteworthy feature in this connexion is the great diminution that took place within the intercensal period (1891-1901) in the unproductive class, which to some extent accounts for the increase in the number of the industrial and commercial classes.

Poor Relief.—Before the Reformation, relief of the poor had been the duty of the Church, for early legislation aimed at suppressing rather than aiding poverty. Those, indeed, who were absolutely dependent on alms might receive a licence to beg within the bounds of their own parish, but the able-bodied poor were severely dealt with. The act of 1579 directed the magistrates in towns and the justices in rural parishes to propose a register of the aged and impotent poor and to levy a tax on the inhabitants of every parish for their support. One consequence of the denial of relief to the able-bodied was that the workhouse, so familiar in the English poor-law system, was not established in Scotland, though almshouses are found in many
towns, and poorhouses, where those indigent who are alone in the world without any one to care for them find food and shelter, began to be general in the 19th century. Hence arises the prevalence of out-relief, one of the distinctive features of the Scottish poor law. The act of 1570, however, proved largely inoperative. The provisions of rent produces passed from the justices to de ministers and kirk-sessions, who by an edict of the Privy Council, in 1692, were required to draw up a list of the poor twice a year, and rates were levied only when collections in the church “plates” were insufficient. For 150 years nothing was done to systematize poor relief, and even in 1842 about half of the parishes were yet unassessed to the poor. The total inadequacy of the voluntary system to cope with genuine distress, in respect both of contributions and the dispensing of alms, led in 1845 to the passing of an act which made the parish the poor-relief authority, besides establishing the parochial board for the kirk-sessions where recourse was had to a rate, made the appointment of inspectors of the poor and medical officers compulsory, and set up a system of central administrative control known as the Board of Supervision for the Relief of the Poor, with headquarters in Edinburgh. The act did not provide for compulsory assessment, but this was virtually accomplished by the vigilance of the Board, which demanded of local authorities increased care and more liberal relief, with the result that in 1894 only 46 out of 848 parishes remained unassessed. In this year a change in the governing body was affected, the Local Government Board abolished the kirk-sessions, and created the Board of Supervision, while the parochial boards made way for parish councils. As the authorities cannot give relief to those able to work, there are no casual wards in Scotland, vagrants having to pay for their night’s lodging, or find it in the police station or elsewhere. Every parish has to support its own poor, that is, natives or those who have acquired a settlement by living in it for five years, but relief is given in the parish in which it is applied for, the cost being recovered from the parish of birth or settlement afterwards. For the sick poor the larger towns provide hospitals and dispensaries, besides establishing penny homes for the homes of the poor, while in rural districts there are cottage hospitals, village sick-rooms, and sick wards in the poorhouses. The mentally afflicted are sent to the asylum if they are dangerous, or kept in the licensed wards of poorhouses, or, if they are harmless or imbecile, boarded out. The expense of pauper lunacy is only partially borne by the parish. The district lunacy board (practically a joint-committee of the county and burgh councils), aided by a parliamentary grant, is charged with the provision and upkeep of the asylums, the poor-law authorities only defraying the maintenance of their own patients. Orphans on Scottish estates, or the children of paupers, are boarded out and reared like ordinary children, attending the public schools and growing up without the “pauper taint.”

Police.—It was not till the middle of the 19th century that a regular police force was established in Scotland. Till then dwellers in rural districts had practically to provide for their own safety as best they could, while some towns maintained a paid watch and others enrolled volunteer constables, every citizen being expected to take his turn in patrolling the streets to protect person and property. At first an adoptive act was introduced, under which the Commissioners of Supply, who then managed county business—resident landowners in possession of landed estate to the annual value of £100—were empowered to raise a police force in the counties; but the want of common policy and initiative led in 1857 to the compulsory institution of a police force throughout the country. Burghs having a population of more than 7000 might furnish their own police, and smaller burghs were policed as part of the county to which they belonged by the standing joint-committee (composed equally of Commissioners of Supply and members of the county council), but no new police burgh the population of which was under 20,000 was to be free to police itself. All the constabulary forces, excepting the Orkney and Shetland police, are annually inspected as to efficiency and reported on to the Secretary of State for Scotland.

Scotland

Education. (a) Elementary Schools.—The system of schools which prevailed till the Education Act of 1872 dated from 1696, when the Act for Settling of Schools was passed—one of the last but not the least of the achievements of the Scots Parliament—providing for the maintenance of a school in every parish by the kirk-session and heritors, with power to the Commissioners of Supply to appoint a schoolmaster in case the primary authorities made default. The schoolmaster held his office for life, co-education was the rule from the first, and the school was undenominational. The various religious secessions in Scotland led to the founding of a large number of sectarian and subscription schools, and at the Disruption in 1843 the Free Church made provision for the secular as well as the religious instruction of the children of its members. The Education Act of 1872 abolished the old management of the parish schools and provided for the creation of districts (large, parish or group of parishes) under the control of school boards, of which there are 972 in Scotland, elected every three years by the ratepayers, male and female. Since that date the most important changes effected in the elementary education system were the abolition, in 1886, of individual inspection of the lower standards—afterwards extended to the whole of the standards, the inspectors applying a collective test, the “block-grant” system, to the efficiency of a school—and the abolition of school fees (1895) for the compulsory standards, the less being made up principally by a parliamentary grant, and partly by a proportion, earmarked for the purpose, of the proceeds of the Local Taxation (Customs and Excise) Act 1890, and the Education and Local Taxation Account (Scotland) Act 1892. The capitation grant in relief of fees is at the rate of 12s., of which 10s. is furnished by the parliamentary grant and 2s. by the other sources. King’s Scholars, trained at one of the training colleges, and King’s Students who attend one of the universities, form the chief source of supply of certificated teachers.

(b) Secondary Schools.—Records of the existence of schools in the chief towns occur as early as the 13th century. They were several in number, but the multi-national character of the cities and towns and the existence of religious foundations were mainly devoted to studies preparatory for the Church. Before the Reformation schools for general education were attached to many religious houses, and in 1496 the first Scottish act was passed requiring substantial householders to send their eldest sons to school from the time they were eight or nine years old until they were “competently founded and have perfil Latin.” In 1560 John Knox propounded in his First Book of Discipline a comprehensive scheme of education from elementary to university, but neither this proposal nor an act passed by the privy council in 1616 for the establishment of a school in every parish was carried into effect. In several burghs grammar schools have existed from a very early date, and some of them, such as the Royal High School of Edinburgh and the High School of Glasgow, reached a high standard of proficiency. They were largely supported by the town councils, who erected the buildings, kept them in repair, and usually paid the rector’s salary. By the act of 1872 their management was transferred to the school boards, and they may be conveniently classified into higher-class public schools, such as the old grammar schools and the liberally endowed schools of the Merchant Company in Edinburgh, and higher grade schools, with a few years’ preparatory course for the universities, while some of the ordinary schools have earned the grant for higher education. In 1885 the Scottish Education Department, of which the secretary for Scotland is the virtual head, was reorganized. It was separated from the English Department, and undertook the inspection of higher-class schools (public, endowed and voluntary), and two years later instituted a leaving certificate examination, the pass of which is accepted for most of the university and professional authorities in lieu of their preliminary examinations. In 1898 the functions of the Science and Art Department, as far as Scotland is concerned, were transferred to the Department, which makes substantial grant to every pupil who successfully passes the examination. In several cases an educational grant was formerly paid. A Technical Schools Act, passed in 1887, was applied by a few local authorities; but in 1890 funds
were by chance made available from an unexpected source, and
devoted to the purposes of medical and secondary education.
Parliament had introduced a measure of public-house reform
along with a scheme for compensating such houses as lost their
licence. This feature was so stoutly opposed that the bill did
not pass, although the chancellor of the exchequer had promised
the movement funds. Government proposed to distribute this
money among local authorities and expend the balance in relief
rates, but a clause was inserted in this bill giving burgh and
county councils the option of spending the balance on technical
education as well as in relief of rates. Advantage was largely
taken of this power, and the grant came to be succinctly described
as the “Residue” grant (£97,000 a year). The Department
established in each county a body known as the secondary edu-
cation committee, chosen by the county council and the chair-
men of the school boards, which is charged with the expenditure
of its share of the grant. The committee exists also in a few of
the largest burghs, the members being in this case appointed by
the town council, school board, and sometimes the trustees of
educational endowments. In virtue of a Continuation Class code,
technical and specialized education is given in day and, chiefly,
evening classes in various centres, the principal being the
Heriot-Watt College, Edinburgh; the Edinburgh and East of
Scotland College of Agriculture; the Glasgow and West of Scot-
tland Technical College; the Glasgow School of Art; the Glasgow
Athenaeum Commercial College; the West of Scotland Agricul-
tural College; the University of Edinburgh Technical Institute; Gray’s School
of Art, Aberdeen; the Edinburgh Royal Institution School of
Art, and the Edinburgh School of Applied Art; but well-
equipped classes are held in most of the large towns, and several
county councils maintain organizers of technical instruction.
As regards agricultural education, the county is found to be in
most cases too small an area for efficient organization, and
consequently several counties combine to support, for instance,
the East of Scotland Agricultural College—a corporation con-
sisting of the agricultural department of the University, the
Heriot-Watt College and the Veterinary College of Edinburgh—
the West of Scotland Agricultural College, Glasgow, and
the agricultural department in Aberdeen University. The
leading public schools on the English model are Trinity College,
Glenalmond, Perthshire; Loretto School, Musselburgh, and
Fettes College, Merchiston Castle and the Academy in Edinburgh.

(c) Universities and Colleges.—There are four universities in
Scotland, namely (in the order of foundation), St Andrews (1411),
Glasgow (1450), Aberdeen (1494) and Edinburgh (1582), in
which are the customary faculties of arts, divinity, law, medicine
and science. In 1901 Mr Andrew Carnegie gave £5,000,000
for the improvement of the apparatus, besides the management of the fund was handed
over to a body of trustees, who devote the annual income
(£100,000) partly to the payment of students’ fees and partly to
buildings, apparatus, professorships and research. The court
of each university is the supreme authority in regard to finance,
discipline, and the regulation of the duties of professors and
lecturers. The universities are empowered to affiliate other
academical institutions, and women students are admitted on an
equal footing with men. Under the act of 1890 the University
College of Dundee was incorporated with St Andrews University,
and Queen Margaret’s College and the Women’s College in Edinburgh
College, the buildings and endowments, used for women
students exclusively, being handed over to the University Court.
St Mungo’s College, Glasgow, incorporated in 1889 under a
Board of Trade licence, has medicinal and law faculties, and
Anderson’s College Medical School, Glasgow, was instituted in
1887. These are on the same basis as the extra-mural medical
schools in Edinburgh, their medical curricula qualifying for
licence only and not for Scottish university degrees. The United
Free Church maintains colleges at Aberdeen, Edinburgh and
Glasgow, and there is a Roman Catholic college at Edinburgh
Agricultural College, the Dumbarton Academy, and Fort Augustus.
The Church of Scotland and the United Free Church each possess
their training colleges for teachers, the Episcopal Church supports
one and the Roman Catholic Church one. The Edinburgh Museum
of Science and Art has been transferred to the Scottish Education
Department.

Agriculture.—Though Scotland is a country of great estates,
this circumstance possesses less significance from the agricultural
than from the historical standpoint. The excessive size of the
properties may to some extent be accounted for by the fact
that most of the surface is so mountainous and unproductive
as to be unsuitable for division into smaller estates, but two
other causes have also co-operated, namely, first, the wide
territorial authority of such Lowland families as the Scotts
and Douglases, and such Highland clans as the Campbells of Argyll
and Breadalbane, and the Murrays of Athol and the duke of
Sutherland; and secondly, the stricter law of entail introduced
in 1685. Thus the largest estates remain in the hands of the old
hereditary families. The almost absolute power formerly wielded
by the landlords, who within their own territories were lords of
regality, hindered independent agricultural enterprise, and it
was not till after the abolition of hereditary jurisdictions in
1748 that agriculture made real progress. The Society of
Improvers in the Knowledge of Agriculture, founded in 1723, ceased to exist after the rebellion of 1745, and the introduction
of new and improved methods, where not the result of private
energy and sagacity, was chiefly due to the Highland and
Agricultural Society, established in 1784. Further stimulus was
also supplied by the high prices that obtained during the
Napoleonic wars, and, in spite of periods of severe depression since
then, the science of agriculture has continued to advance. The
system of nineteen years’ leases had proved distinctly superior
to the system of yearly tenancy so general in England, although
prejudicially affected by customs and conditions which, for a
considerable time, seriously strained the relations between landlord
and tenant. But the abolition of the law of hypothec in 1879—
under which the landlord had a lien for rent upon the produce
of the land, the cattle and sheep fed on it, and the live stock
and implements used in husbandry,—the Ground Game Act of 1850,
1901-1902, and the several Agricultural Holdings Acts, and the construction of
light railways improved matters and established a better under-
standing. The period of general depression which set in before
1885 was surmounted in Scotland with comparatively little
trouble. A large amount of capital was lost by tenants, and a
few farms were thrown here and there upon the landlords’
hands, but in no district was rent extinguished or were holdings
abandoned. The sub-commissioners who reported to the Royal
Commission on Agriculture in 1803 found nearly everywhere a
demand, sometimes competition for farms, persisting throughout
the crisis. In Banff, Nairn, Elgin and several southern counties
property was at a premium, while in the north-east and
Aberdeen the average was 30%; but in nearly all the counties, towards the end at least of the period of depression,
the coexistent demand and competition for farms were observes-
able. In some districts in the west rents fell very little; in
others, especially sheep-farming districts, the fall was very severe. In Ayrshire the figure varied from 5 to 20%; for
Dumfriesshire 16% was given as a fair average, but here too the
distressed farmer was compelled to admit that if he gave up his
holding there were others ready to take it. Afterwards, owing
to the increased attention given to stock-fattening and dairying,
Competition and changes in land prices, farming reached a condition of equilibrium,
and the most noticeable residuum of the period of depression
was the large intrusion of the butcher and grocer class into the
farmer class proper. Caithness-shire was declared to be the
greatest sufferer by the period of depression; rents fell in that
county by 30 to 50% on large farms, 20 to 30% on medium,
and 10 to 60% on small farms. Nevertheless, the decline in
the value of land was serious. According to the reports of the Inland
Revenue Commissioners, the gross income derived from the
ownership of lands in Scotland was returned in 1879-1880 at
£7,769,303. After the depression the amount returned was only
£5,913,836, a drop in twenty-five years of £1,857,467. These figures refer to land,
whether cultivated or not, including ornamental grounds,
gardens attached to houses when exceeding one acre in extent,
teinds or tithe-rent charge commuted under the Lands Commutation Acts, farm-houses and farm-buildings.

The crofters of the Highlands and islands had their grievances also. During the first half of the 19th century wholesale clearances had been effected in many districts, and the crofters were compelled either to emigrate or to crowd into areas already congested, where, eking out a precarious living by following the fisheries, they led a hard and miserable existence. At last after agitation and discontent had become rife, government appointed a royal commission to inquire into the whole question in 1883. It reported next year, and in 1886 the Crofters' Holdings Act was passed. Amending statutes of succeeding years added to the commissioners' powers of fixing fair rents and cancelling arrears, the power of enlarging crofts and common grazings. Since then political agitation has practically died out, though the material condition of the class has not markedly improved, except where, with government aid, crofter fishermen have been enabled to buy better boats; but in some districts, even in the island of Lewis, substantial houses have been built. After the passing of the act (1886) the Crofters' Commission in 13 years considered applications for rent and revaluation of holdings and 300 acres. The average holding in 1895 was 61.7 acres, or an annual reduction of £1,357,571 of arrears of rent amounting to £1,04,692 they cancelled £24,180, and also assigned 48,549 acres in enlargement of holdings. Under the Congested Districts (Scotland) Act of 1897, £35,000 a year was devoted within certain districts of Argyll, Inverness, Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, to assisting migration, improving the breeds of live stock, building piers and boat-slips, making roads and bridges, developing home industries, &c.

In Table XI. will be found a classification of the holdings in 1895, 1903 and 1905. The figures show that the holdings under 50 acres constituted fully two-thirds of the total holdings and that, though no very decided alteration in the size of farms was in progress, the larger portion of the cultivated land was held in farms of between 50 and 300 acres. The average holding in 1905 was 61.7 acres. Table X. shows the total area, the cultivated area and the area under grain crops, green crops, grasses and miscellaneous crops. Comparison between 1905 and the average for 1871-1875 clearly demonstrates the change which Scottish agriculture had undergone. Though practically the same amount of land was brought under the

† Not separately distinguished.

plough, there was a considerable fall in the acreage under grain and green crops, but this was rather more than balanced by the increased area under grass, showing that the tendency towards the growing of live stock has become more widespread and more pronounced. Only a little more than one-fourth of the area of Scotland is cultivated, while in England only one-fourth is left uncultivated; but it should be borne in mind that "permanent pasture" does not include the mountainous districts, which not only form so large a proportion of the surface but also, in their heaths and natural grasses, supply a scanty herbage for sheep and cattle, 9,104,308 acres being used for grazing in 1905. Oats remain the staple grain crop, and barley, though fluctuating from year to year, is steadied by the demands of the distillers. Wheat showed a marked decline in most years from 1893 to 1904. Table XI., however, shows that in most cases, even when the acreage occupied by crops is smaller, the estimated yield to the acre shows a distinct improvement, the result of enhanced skill and industry, and the adoption of more scientific methods. In 1905 the yield of hay from clover, meadow and rotation grasses amounted to 666,985 tons, or 31-91 cwt.s. to the acre, and from permanent pasture 299,908 tons, or 28-46 cwt.s. to the acre, or 876,939 tons of all kinds of hay from 375,220 acres.

Table XII. shows the number of live stock in 1905, with the average for the period 1871-1875, and illustrates the extent to which farmers have turned their attention to stock in preference to crops. The cattle stock has risen steadily, and a regular increase in the number under 2 years points to the healthy state of the breeding industry. The breeds include the Ayrshire, noted milkers and specially adapted for dairy farms (which prevail in the south-west), which in this respect have largely supplanted the Galloway in their native district; the polled Angus or Aberdeen, fair milkers, but valuable for their beef-making qualities, and on this account, as well as their hardihood, in great favour in the north-east, where cattle-breeding has been carried to perfection; and the West Highland or Kyloe breed, a picturesque breed with long horns, shaggy coats and decided colours—black, red, dun, cream and brindle—that thrives well on wild and healthy pasture. The special breeds of sheep are

Table XIII. Illustrating Increase of Live Stock.

| Figs | | |
|------|------|
| Breed of sheep, as well as a variety of crosses, are kept for winter feeding on lowland farms. The principal breeds of horses are the Shetland and Highland ponies, and the Clydesdale draught.

The area devoted to orchards rose from 1562 to 1880 to 2482 acres in 1905. The chief areas for tree and small fruit are Clydesdale and the Carm of Gowrie, but there are also productive orchards in the shires of Haddington, Stirling, Ayr and Roxburgh, where the market-gardening has developed in the neighbourhood of the larger towns. In 1812 woods and plantations occupied 907,659 acres, of which 501,469 acres were natural woods and 406,226 planted. Within ten years after 1792, when they had only 73,990 acres, and renewed attention to forestry and encouragement of planting the area had grown in 1805 to 878,675 acres; by 1905, however, the acreage was practically unchanged. Inverness, Aberdeen and Perth are naturally the best wooded shires. The modern plantations consist mostly of Scots fir with a sprinkling of larch.

Deer Forests and Game, &c.—Deer forests in 1900 covered 2,287,297 acres, an increase of 575,505 acres since 1883. The red deer is peculiar to the Highlands, but the fallow deer is not uncommon in the hill country of the south-western Lowlands. The grouse moors occupy an extensive area and are widely distributed. Parmigian and black-cock are found in all districts, partridges are, however, more fully preserved, and the capercailzie, once extirpated, has been restored to some of the Highland forests. Hares and rabbits, the latter especially, are abundant. Fox-hunting is fashionable in most of the southern shires, but otter-hunting is practically extinct. The bear, wolf and beaver, once common, have long ceased to be, the last wolf having been killed, it is said, in 1868 by Sir Ewen Cameron of Lochiel. The wild cat may yet be found in the Highlands, and the polecat, cramp and pine marten still exist. The golden eagle and the white-tailed eagle haunt the wilder and more remote mountainous districts, while the other large birds of prey, like the osprey and kite, are becoming scarce. The islands, rocks and cliffs and some inland lochs are frequented in multitudes by a great variety of water-fowl.

Fisheries.—The Scottish seaboard is divided for administrative purposes into twenty-seven fishery districts, namely, on the east coast, Eyemouth, Leith, Anstruther, Montrose, Stonehaven, Aberdeenshire, Peterhead, Fraserburgh, Banff, Buckie, Findhorn, Cromarty, Helmsdale, Lybster, Wick (13); on the west, Stornoway, Barra, Loch Broom, Loch Carron and Skye, Fort William, Campbeltown, Inverary, Rothesay, Greenock, Balantrae (10). The whole of the fisheries are controlled by the Fishery Board for Scotland, which was established in 1882 in succession to the former board of Whitefriars Fishery. In 1905 the number of fishermen directly employed in fishing was 36,162, there were 17,496 engaged in curing and preserving the fish landed, while 32,201 were employed in subsidiary industries on shore, making a total of 85,559. There are 221 professional fish auctions, 153 fish canneries, and 15,603 small fisheries and dependent industries. In 1905 the herring fishery yielded 5,342,777 cwt. (£1,343,080); in 1900, 4,541,297 cwt. The most prolific districts are Shetland in the north, Fraserburgh, Peterhead, Wick, Anstruther and Stornoway in the east, and Stornoway in the west. The principal herring market is continental Europe, Germany and Russia being the largest consumers, and there has been a growing exportation to the United States. Of this total catch of fish for human food (excluding fishmeal) amounted to 7,856,310 cwt., and in 1907 the highest recorded to 1910, 9,018,154 cwt. (£1,149,127). The annual value of the herring fish (lobsters, crabs, oysters, mussels, clams, periwinkles, cockles, shrimps) is about £73,000. The weight of salmon carried by Scottish railways and steamers in 1894 was 2437 tons, and in 1903 it was 2047 tons. In 1894 the number of boxes of Scottish salmon delivered at Billingsgate market in London was 15,489, and in 1903 it was 15,103, being more than half of the salmon received from the whole of the United Kingdom, including Irish and English consignments. In 1903 the Tay rentals came to £22,902, the highest then recorded. The other considerable rentals were the Dee £18,392, Tweed £15,386 and Spey £184.

Roads.—In the 12th century an act was passed providing that the highways between market-towns should be at least 20 ft. broad. Over the principal rivers at this early period there were bridges near the most populous places, as over the Dee near Aberdeen, the Esk at Brechin, the Tay at Perth and the Forth near Stirling. Until the 16th century, however, traffic between distant places was carried on chiefly by pack-horses. The first stage-coach in Scotland was that which ran between Edinburgh and Leith in 1610. In 1658 there was a fortnightly stage-coach between Edinburgh and London, but afterwards it would appear to have been discontinued for many years. Separate acts enjoining the justices of the peace, and the commissioners of supply, to take measures for the maintenance of roads were passed in 1617, 1660, 1676 and 1686. These provisions had reference chiefly to what afterwards came to be known as the "statute labour roads," intended primarily to supply a means of communication within the several parishes. They were kept in repair by the tenants and cotters, and, when their labour was not sufficient, by the landlords, who were required to "stent" (assess) themselves, customs also being sometimes levied at bridges, ferries and causeways. By separate local acts the "statute labour road" was in all cases to be paid for by a payment called "cooper's money," and the General Roads Act of 1845 made the alteration universal. The Roads and Bridges (Scotland) Act of 1878 entrusted the control of the roads to royal and police burghs and in the counties to road trustees, from whom it was transferred by the Local Government Act of 1889 to county councils, the management, however, being in the hands of district committees. The Highlands had good military roads earlier than the rest of the country. The project, begun in 1725 under the direction of General George Wade, took ten years to complete, and the roads were afterwards kept in repair by an annual payment called "cooper's money." In the Lowlands the main roads were constructed under the Turnpike Acts, the earliest of which was obtained in 1750. Originally they were maintained by tolls, but this method, after several counties had obtained separate acts for its abolition, was superseded in 1883 by the act of 1878.

Canals.—There are four canals in Scotland, the Caledonian, the Crinan, the Forth and Clyde and the Union, of which the Caledonian and Crinan are national property (see CALEDONIAN CANAL). The Forth and Clyde Navigation runs from Bowling on the Clyde, through the north-western part of Glasgow and through Kirkintilloch and Falkirk to Grangemouth on the Forth, a distance of 35 m. There is also a branch, 24 m. long, from Stockfield to Port Dundas in the city of Glasgow, which is continued for the distance of 1 m. to form a junction with the Monkland canal. This last has a length of 24 m., and runs from the north-east of Glasgow through Coatbridge to Woodhall in the parish of Old Monkland. It began in 1761 and opened for traffic in 1792. The Forth and Clyde canal was authorized in 1767 and opened from sea to sea in 1790. In 1846 its proprietors bought the Monkland canal, and in 1867 the combined undertaking was incorporated under the name of the Caledonian Railway Company. The Union canal, 314 m. long, starts from Port Downie, on the Forth and Clyde canal near Falkirk, and runs to Port Hopeston in Edinburgh. Begun in 1818 it was completed in 1822, and in 1849 was vested in the Edinburgh and Glasgow Railway Company, which in turn was absorbed by the North British Railway Company in 1865. The Forth and Clyde canal has a revenue of about £120,000 a year, including receipts from the docks at Grangemouth, and the expenditure on management and maintenance is about £40,000. The Union canal earns between £2000 and £3000, and its expenditure is but little
less than its revenue. Three other canals formerly existed in Scotland. The Aberdeen canal, 18½ m. long, running up the Don valley from Aberdeen to Inverurie was opened in 1807, but did not prove profitable and was ultimately sold to the Great North of Scotland Railway Company, by which it was abandoned. The Glasgow, Paisley and Johnstone canal, 11 m. long, was opened in 1811 and was bought in 1869 by the Glasgow and South-Western railway, which in 1881 obtained statutory powers to abandon it as a canal and use its site, so far as necessary, for a railway line. The Fort and Clyde canal was only half a mile long. It ran from the Fort and Clyde canal to the Clyde, opposite the river Cart, and was intended to allow vessels to pass direct from the east coast up that river to Paisley. The Caledonian railway, which acquired it together with the Fort and Clyde canal in 1867, obtained powers to abandon it in 1893.

Railways.—The first railway in Scotland for which an act of parliament was obtained was that between Kilmarnock and Troon (9½ m.), opened in 1812, and worked by horses. A similar railway, of which the chief source of profit was the passenger traffic, was opened between Edinburgh and Dalkeith in 1824, branches being afterwards extended to Leith and Musselburgh. By 1840 the length of the railway lines for which bills were passed was 191½ m., the capital being £3,122,133. The chief companies are the Caledonian, formed in 1845; the North British, of the same date; the Glasgow and South-Western, formed by amalgamation in 1859; the Highland, formed by amalgamation in 1865; and the Great North of Scotland, 1846.

Table XIII. shows the advance in mileage, goods and passenger traffic and receipts, from both sources, since 1857.

The total capital of all the Scott companies in 1888 was £114,120,110; by 1910 it exceeded £185,000,000. Since the passing of the Light Railways Acts 1896, the Board of Trade has sanctioned several light railways. By 1910 the total railway mileage was 3,844.

Mining Industry.—Coal and iron, generally found in convenient proximity to each other, are the chief sources of the mineral wealth of Scotland. The principal coalfields are Lanarkshire, which yields nearly half of the total output, Fife, Ayrshire, Strathclyde and Midlothian, but coal is also mined in the counties (usually reckoned as forming part of one or other of the main fields) of Linlithgow, Haddington, Dumbarton, Clackmannan, Kinross, Dumfries, Renfrew, Argyll and Peebles, while a small quantity is obtained from the Oolite at Brora in Sutherland. The earliest records concerning coal pits appear to be the charters granted, towards the end of the 12th century, to William Oldbridge of Carriden in Linlithgowshire, and in 1291 to the abbot and convent of Dunfermline conferring the privilege of digging coal in the lands of Pittencrieff. The monks of Newbattle Abbey also dug coal at an early date from surface pits on the banks of the Esk. Aeneas Sylvius (Pope Pius II.), who visited Scotland in the 15th century, refers to the coalburning 78° door received at church doors due to a species of stone which they burn instead of wood; and although the value of coal for smiths' and artificer's work early recognized it was not used for domestic purposes till about the close of the 16th century. In 1606 an act was passed binding colliers to perpetual service at the works where they were employed, and they were not fully emancipated till 1799. An act was passed in 1843 forbidding the employment of children of tender years and women in underground mines. In 1905 there were 492 coal and iron mines in operation, employing 199,939 hands (89,516 below ground and 20,443 above). The total output in that year amounted to 55,839,297 tons, valued at £10,639,433. The total quantity worked up to the end of 1868 was 1,514,062 tons, the quantity then remaining to work being estimated at 4,639,783,000 tons. The quantity of coal exported in 1895 from the principal Scottish ports was 7,863,512 tons, and the quantity shipped coastwise to ports of the United Kingdom amounts annually to about 2½ million tons in addition.

The total capital of the iron trade dates from the establishment of the Carron ironworks near Falkirk in 1760, but it was the introduction of railways that gave the production of pig-iron its greatest impetus. In 1796 the quantity produced was 18,640 tons, which had only doubled in thirty-four years (37,500 tons in 1830). In 1840 this had grown to 241,000 tons, in 1845 to 475,000 tons and in 1865 to 1,164,000 tons, almost the height of its prosperity, for in 1905 the product of 101 blast furnaces only amounted to 1,375,125 tons, and in the interval there were years when the output was below one million tons. More than one-third of the iron ore (that chiefly worked being Black Band ironstone) comes from mines which also yield coal. The iron producing counties in the order of their output are Ayr, Lanark, Renfrew, Linlithgow, Dumbarton, Fife, Midlothian and Stirling, the first three being the most productive. In 1905 the quantity of ore raised was 832,388 tons, valued at £320,875 and yielding 240,716 tons of metal. The imports of ore in that year amounted to 1,862,444 tons, of the value of £4,420,379.

The oil shale industry is wholly modern and has attained to considerable magnitude since it was established (in 1851 and following years). Linlithgowshire yields nearly three-fourths of the total output. Midlothian produces nearly one-fourth, a small quantity is obtained from Lanarkshire, and there is an infinitesimal supply from Sutherland. The mineral is chiefly obtained from seams in the Calcareous Sandstone at the base of the Carboniferous rocks.

Fire-clay is produced in Lanarkshire, which yields nearly half of the total output, and Ayrshire and, less extensively, in Stirlingshire, Fifeshire, Renfrewshire, Midlothian and a few other shires. With the exception of the counties of Orkney, Shetland, Caithness, Sutherland and Inverness, granite is quarried in every shire in Scotland, but the industry predominates in Aberdeenshire, and is of considerable importance in Kirkcudbrightshire; limestone is quarried in Lanark, Dunbarton, Renfrew and Ayr and some firms are established in Dumfriesshire and Leadhills in Lanarkshire. In 1905 there were produced 2774 tons of dressed lean ore, of the value of £25,823, yielding 2167 tons of lead in smelting and 11,409 oz. of silver. Gold and silver are also produced in small quantities. The total output of lead in 1905 was 4,390 tons, valued at £10,030, and the total output of silver was 1,142,335 valued at £320,761, is quarried in nearly every county, but the industry flourishes particularly in the shires of Lanark, Dumbarton and Ayr and also in the counties of Selkirk, Roxburgh and Peebles. Of the total output of ironstone, 6,932 tons, valued at £10,030, is mined in Dumfriesshire and Leadhills in Lanarkshire. In 1905 there were 66 mines apart from coal and iron, employing altogether 5329 hands, and 1127 quarries employing 7790 persons inside the quarries and 4797 persons outside, or 12,197 in all. Alumina is treated at works near Foyers in the shire of Inverness, where abundant water power enables electricity to be generated cheaply. The Foyers installation is the largest water-power plant in the United Kingdom.
SCOTLAND

Manufactures.

(a) Wool and Woollen. — Although a company of wool weavers was incorporated by the town council of Edinburgh in 1475, the cloth worn by the wealthier classes down to the beginning of the 17th century was of English or French manufacture, the lower classes wearing "coarse cloth made at home," a custom still prevalent in the remotest districts of the Highlands. In 1607 seven Flemings were brought to Edinburgh to teach the manufacture of serge and broadcloth, and eight years later a company of Flemings was established in the Canongate (Edinburgh) for the manufacture of cloth under the protection of the king, but, notwithstanding also the establishment in 1681 of an English company for the manufacture of woollen fabrics near Haddington, the industry for long made little progress. In fact its importance dates from the introduction of machinery in the 19th century. The most important branch of the trade, that of tweeds, first began to attract attention shortly after 1830; though still having its principal seat in the district from which it takes its name, including Galashiels, Hawick, Innerleithen and Selkirk, it has extended to other towns, especially Aberdeen, Elgin, Inverness, Stirling, Bannockburn, Dumfries and Paisley. Carpet of all kinds was manufactured in Kilmarnock as late as 1817, but is also carried on in Aberdeen, Ayr, Bannockburn, Glasgow, Paisley and elsewhere. Tartans are largely manufactured in Tillitcoultry, Bannockburn and Kilmarnock, and shawls and plaid in several towns. Fingerings and many other kinds of woollen yarns are manufactured at Alloa, the headquarters of the industry. In 1903 the number of operatives in the woollen industry (including combers and sorters, spinners, weavers and workers in other processes) amounted to 24,906. In 1850 the employed numbered 10,230.

(b) Flax, Hemp and Jute. — The manufacture of cloth from flax is of very ancient date, and towards the close of the 16th century Scottish linens were largely exported to foreign countries, as well as to England. Regulations in regard to the manufacture were passed in 1641 and 1661. In a petition presented to the privy council in 1684 complaining of the severe treatment of Scotsmen selling linen in England, it was stated that 12,000 persons were engaged in the manufacture. Through the intercession of the secretary of state with the king these restrictions were removed. Further to encourage the trade it was enacted in 1696 that the bodies of all persons, except its poor tenants and cotters, should be buried in plain linen only spun and made within the kingdom. The act was renewed in 1693 and 1695, and in the former year another act was passed prohibiting the export of lint and permitting its import free of duty. At the time of the Union the annual amount of linen cloth manufactured in Scotland is supposed to have been about 1,500,000 yards. The Union gave a considerable impetus to the manufacture, as did also the establishment of the Board of Manufactures in 1727, which applied an annual sum of £2,650 to its encouragement, and in 1729 established a colony of French Huguenots in Edinburgh, on the site of the present Picardy Place, to teach the spinning and weaving of cambric. From the 1st of November 1727 to the 1st of November 1728 the amount of linen cloth stamped was 2,183,978 yds., valued at £103,312, but for the year ending the 1st of November 1822, when the duties as to the inspection and stamping of linen ceased, it had increased to 36,268,530 yds., valued at £1,306,296. The counties in which the manufacture is now most largely carried on are Forfar, Perth, Fife and Aberdeen, but Renfrew, Lanark, Edinburgh and Ayr are also extensively associated with it. Dunfermline is the principal seat of the coarser fabrics, Dunfermline of the table and other finer linens, while Paisley is widely known for its sewing threads. The allied industry of jute is the staple industry of Dundee. In 1890 the number employed in the linen industry was 34,222, which had declined in 1901 to 23,570. In 1890 the operatives in the jute and hemp industry numbered 30,885, and in 1901 they were (including workers in canvas, sacking, salicloth, rope, twine, mats, cocoa fibre) 46,550.

(c) Cotton. — The first cotton mill was built at Rothesay by an English company in 1779, though Penicuik also lays claim to priority. The Rothesay mill was soon afterwards acquired by David Dale, who was the agent for Sir Richard Arkwright, and had the invaluable aid of his counsel and advice. Dale also established cotton factories in 1783 at New Lanark, afterwards so closely associated with the socialistic schemes of his son-in-law, Robert Owen. The counties of Lanark and Renfrew are now the principal seats of the industry. The great majority of the cotton factories are concentrated in Glasgow, Paisley and the neighbouring towns, but the industry extends in other districts of the west and is also represented in the counties of Aberdeen, Perth and Stirling. As compared with England, however, the manufacture has stagnated. The number of hands employed in 1850 was 34,325, in 1875 it was 35,652 and in 1901 (including bleachers, dyers, printers, calenderers, &c.) it was 34,057.

(d) Silk and other Textiles. — The principal seats of the silk manufacture are Paisley and Glasgow. In 1885 the number employed amounted to 600 and in 1901 to 2,424. The weaving of lace curtains has made considerable progress, in 1878 only 1,234 hands being employed against 287 in 1785. In fabrics, a characteristic Border industry, with its chief seat at Hawick, employed 11,057 hands in 1901. The total number of persons working in textile fabrics in 1901, exclusive of 21,849 drapers, mercers and other dealers, but including 43,040 employed in mixed or unspecified materials (hosiery, lace, carpets, rugs, fancy goods, &c., besides a large number of 'undefined' factory hands and weavers), amounted to 174,547 persons.

(e) Whisky and Beer. — Scotland claims a distinctive manufacture in whisky. Though distillation was originally introduced from England, by 1771 large quantities of spirits were already being conveyed to the English market. The legal manufacture of whisky was greatly checked in the earlier part of the 19th century by occasional advances in the duty, but after the reduction of 2s. 4d. per proof gallon in 1823 — the duty amounted in 1904 to 11s. per proof gallon — the number of licensed distillers rapidly increased, to the discouragement of smuggling and illicit distillation. In 1824 the number of gallons made amounted to 5,085,731; by 1855 this had more than doubled; in 1884 it was 20,164,662; in 1900 it reached 31,798,465; and in 1904 it had receded to 27,110,977. More than four-fifths of the distilleries at work in the United Kingdom are situated in Scotland. The leading distilling counties are Argyll, Banff, Elgin, Inverness and Aberdeen, Perth and Ross and Cromarty, while the industry is found in seventeen other shires. In 1893-1894 the total net duty received for home-made spirits amounted to £5,461,198 and in 1903-1904 to £7,276,125. The production has attained to colossal dimensions. In 1893-1894 the quantity of proof gallons in bond was 61,757,754, and in 1903-1904 it amounted to 121,397,951, the production having practically doubled itself within ten years. Ale was a common beverage as early as the 12th century, one or more breweries being attached to every populous house in the English market. The legal manufacture of whisky was greatly checked in the beginning of the 18th century that the threatened imposition of a tax on malt in 1725 provoked serious riots in Glasgow and clamour for repeal of the Union; and sixty years afterwards Robert Burns in certain poems voiced the popular sentiment concerning the "curst restrictions" proposed by the Excise on beer and whisky. Though ale has been superseded by whisky as the national beverage, brewing is extensively carried on in Edinburgh, whose ales are in high repute, Leith, Alloa and elsewhere. In 1885 the number of barrels of beer, duty-paid, amounted to 1,233,923 in 1893-1894 to 1,713,559; and in 1903-1904 to 1,877,978. In 1893-1894 the duty (6s. 3d. the barrel) yielded £473,111 and in 1903-1904 (7s. qd. the barrel) £649,866. After 1893-1894, when the number of brewers licensed to brew for sale numbered 149, there was a steady fall to 117.
in 1903-1904, alleged by the Inland Revenue Commissioners to be due to the disappearance of the small brewer. The practice of private brewing exhibits a still greater decline—from 272 to 84 in the years named. Notwithstanding the enormous turnover and output and the large capital invested, neither distilling nor brewing gives employment to many hands, the figures for 1901 being 1350 maltsters, 2053 brewers and 1970 distillers.

(f) Miscellaneous.—Paper, stationery and printing are industries in which Scotland has always occupied a foremost position. A paper mill was erected in 1675 at Dalry on the Water of Leith in which French operatives were employed to give instruction, with the result, in the words of the proprietors, that “grey and blue paper was produced much finer than ever was done before in the kingdom.” Midlothian has never lost the lead then secured. The paper mills at Penicuik and elsewhere in the vale of the Esk and around Edinburgh are flourishing concerns, and the industry is also vigorously conducted near Aberdeen. Paper manufacture is largely developed at Glasgow, Aberdeen and Edinburgh. In 1901 the number of persons employed in the paper and stationery industries amounted to 19,602. Ever since it was established by Andrew Myller and Walter Chepman, early in the 16th century, the Edinburgh press has been renowned for the beauty and excellence of its typography, a large proportion of the books issued by London publishers emanating from the printing works of the Scottish capital. Printing is also extensively conducted on in Glasgow and Aberdeen, and Cuparrie enjoyed considerable repute for its press. The number of persons engaged in the production of books and other printed matter (including lithographers, copper, steel plate and “process” printers, bookbinders, publishers and booksellers and distributors) amounted in 1901 to 24,139. The first sugar refinery was erected in 1765 at Greenock, which, despite periodical vicissitudes, has remained the principal seat of the industry, which is also carried on at Leith, Glasgow and Dundee. The making of preserves and confectionery flourishes in Dundee, Aberdeen and Edinburgh. Kirkcaldy is the seat of the oil-fish-cloth and linseed industries, and latter industry flourished in 1837. The headquarters of the chemical manufacture are situated in Glasgow and the vicinity, while explosives are chiefly manufactured at Stevenston and elsewhere in Ayrshire, and at certain places on the Argyll coast. Among occupations providing employment for large numbers were trades in connexion with building and works of construction (136,639 persons in 1901), and furniture and timber (39,000), while the conveyance of passengers, parcels and messages employed 163,102 (railway, 43,957; roads, 53,813; sea, rivers and canals, 20,431; docks, harbours and limehouses, 10,659; and storage, porterage and messages, 35,142).

Commerce and Shipping.—That Scotland had a considerable trade with foreign countries at a very early period may be inferred from the importation of rich dresses by Malcolm III. (d. 1093), and the enjoyment of Oriental luxuries by Alexander I. (d. 1124). His successor, David I., receives the special praise of Fordun for enriching “the ports of his kingdom with foreign merchandise.” In the 13th century the Scots had acquired a considerable celebrity in shipbuilding; and a powerful French baron had a ship specially built at Inverness in 1249 to convey him and his vassals to the Holy Land. The principal shipowners at this period were the clergy, who embarked the wealth of their religious houses in commercial enterprises. Definite statements regarding the number and tonnage of shipping are, however, lacking till the 18th century. From two reports printed by the Scottish Burgh Record Society in 1851, it appears that the number of vessels belonging to the principal ports—Leith, Dundee, Glasgow, Kirkcaldy and Montrose—in 1656 was 58, the tonnage being 3140, and that by 1692 they had increased to 97 vessels of 6710 tons. The figures only represent a portion of the total shipping of the kingdom. At the time of the Union in 1707 the number of vessels was 215 of 14,483 tons.

Table XIV. exhibits the growth of the foreign and colonial trade at specified dates since 1755, showing how it advanced by leaps and bounds during the latter part of the 19th century. Thought the value of imports into Scotland in 1850 was only one-eighth of that in 1905, this does not represent the due proportion of foreign wares used and consumed in Scotland, for the obvious reason that large quantities of goods are brought into the country by the railway system, largely by the tea, consumed in Great Britain being imported into London, while several ports have almost a monopoly of certain other imports. Foreign and colonial merchandise transhipped was valued at £89,289 in 1859 and at £716,246 in 1906. The customs revenue rose from £1,065,080 in 1859 to £3,399,141 in 1903. Judged by the combined value of their imports and exports the chief ports are Leith and Glasgow. These figures only represent a portion of the total shipping of the kingdom. At the time of the Union in 1707 the number of vessels was 215 of 14,483 tons.

**Parliamentary Government.** — By the Act of Union in 1707 Scotland ceased to have a separate parliament, and its government was assimilated to that of England. In the parliament of Great Britain its representation was fixed at sixteen peers elected in Holyrood Palace by the peers of Scotland at each new parliament in the House of Lords, and at forty-five members in the House of Commons, the counties returning thirty and the burghs fifteen. The power of the sovereign to create new Scottish peerages was answered by the fact that many of them numbered the number of a diminishing quantity. By the Reform Act of 1832 the number of Scottish representatives in the Commons was raised to fifty-three, the counties under a slightly altered arrangement returning thirty members as before, and the burghs, reinforced by the erection of various towns into parliamentary burghs, twenty-three; the second Reform Act (1867) increased the number to sixty, the universities obtaining representation by two members, while two additional members were assigned to the counties and three to the burghs; by the third Reform Act of 1885 the representation of the counties and five to that of the burghs, the total representation being raised to seventy-two. The management of Scottish business in parliament has since 1885 been under the charge of the secretary for Scotland.1

**Law.** — At the Union Scotland retained its old system of law and legal administration, a system modelled on that of France; but since the Union the laws have been gradually brought into line with those of England. The criminal law of the two countries being now practically identical, although the methods of procedure are in many respects different. The Court of Session, as the supreme court in civil cases, is called and held at Edinburgh, dates from 1535, and was formed on the model of the parlement of Paris. Since the Union it has undergone certain modifications. It consists of thirteen judges, acting in an Inner and an Outer House. The Inner House has according to tradition, a membership of three, appointed by the lord president of the whole court, and the second by the lord justice clerk. In the Outer House five judges, called lords ordinary, sit in separate courts. Appeals may be made from the lords ordinary to either of the divisions of the Inner House, and, if the occasion demands, the opinion of all the judges of the Court of Session may be called for; but whether this be done or not the decision is regarded as a decision of the Court of Session. Appeals may be made from the Court of Session to the House of Lords. The lord justice general (lord president), the lord justice clerk and the other judges of the Court of Session form the high court of justice of Scotland, instituted in 1672, and which sits at Edinburgh for the trial of cases from the three Lothians and of cases referred from the circuit courts. The latter meet for the south at Jedburgh, Dumfries and for the north at Perth, Edinburgh and Inverness; and for the north at Perth, Aberdeen, Dundee and Inverness. The law agents who undertake cases to be decided before the supreme courts are either solicitors before the supreme courts (S.S.C.) or writers to the signet (W.S.), the latter of whom possess certain special privileges. The lawyer authorized to plead before the supreme courts is termed an advocate. The principal law officer of the crown is the lord advocate, who is assisted by the solicitor-general and by advocates-depute. The practical administration of the law in a county is under the control of the sheriff-depute, who combines with his judicial duties certain administrative functions. The office, which once implied a much less restricted authority than the sheriff principal, is now as old as the reign of Alexander I. (d. 1124), when the greater part of the kingdom was divided into twenty-five sheriffdoms. In the latter part of the 13th century they numbered thirty-four, but not all were in being. Sheriffs in all, who except in the counties of the west and of Lanarkshire, need not reside in the counties to which they are appointed and are not prohibited from private practice. They are assisted by sheriffs-substitute, upon whom the bulk of the work falls, who must hold the sheriff's seat, and are not debarred from private practice. At one time the functions of the sheriff-principal were confined to one county, but by an act passed in 1855 it was arranged that as sheriffs held various counties, so also could the sheriff principal. Thus Aberdeen, Kincardine and Banff form one group, and the three Lothians with Peebles another. The public prosecutor for counties is the procurator-fiscal, who takes the

1 A separate secretary of state for Scotland was in existence after the Union, but its establishment was abolished by the Reform Act 1885. The secretary of state for the home department was responsible for the conduct of Scottish business, being advised in these matters by the lord advocate. The secretary for Scotland is not one of the principal secretaries of state.
in initiative in regard to suspected cases of sudden death, although in this country the whole weight of the law rests upon the execution of the coroners. The sheriff is the chief executive officer of the county, and his duty is the preserve of abuses of the office, and the levy of taxes for county expenditure, were practically superceded by the county councils, which are also the local authority under the Contagious Diseases (Animals) and the Public Health Acts. The county councils are administered according to local administrative duties formerly entrusted to the justices of the peace, and may also enforce the Rivers Pollution Act each within its own district.

The county councils are strengthened by certain special committees, such as the education committee. These committees have already been defined, and the standing joint committee—one half appointed by the county council, the other half by the Commissioners of Supply. Each county council, and for the purposes of the registrar-general, and for police purposes part of the area of one county may be brought into the area of another. For parliamentary purposes some counties have been united, as Clackmannan and Forfar, and Perth and Kinross. The number of sheriffs has been reduced from three to one, and the county council has a resident or chairman appointed by the crown.
Sir John Rhys, seems improbable: for the non-English place-names of Scotland are either Gaelic or Brythonic (more or less Welsh), and the names of Pictish kings are either common to Gaelic and Welsh (or Cymric, or Brythonic), or are Welsh in their phonetics. Mr Skene held that the Picts were a Gaelic-speaking people, but the weight of philological authority is with Mr Whitley Stokes, who says that Pictish phonetics, "so far as we can ascertain them, resemble those of Welsh rather than of Irish" (see Zimmer, Das Matterrecht der Piken; Rhys, Royal Commission's Report on Land in Wales, Celtic Britain, Rhind Lectures; Skene's Celtic Britain, Lectures on the Early History of the Kirk of Scotland, p. 447; MacCalmán's edition, 1892, of Skene's Highlander of Scotland).

The Roman occupation has left not many material relics in Scotland, and save for letting a glimmer of Christianity into the south-west, did nothing which permanently affected the institutions of the partially subdued peoples. In A.D. 81-82 Agricola garrisoned the Roman frontier between Forth and Clyde, and in 84 he fought and won a great battle farther north, probably on the line of the Tay. His enemies were men of the early iron age, and used the chariot in war. They fought with courage, but were no match for Roman discipline; it was, however, in their subsequent following of the tribes farther north, or were the difficulties of pursuit thoroughly overcome till after the battle of Culloden in 1746. The most important Roman stations which have hitherto been excavated are those of Birrenswork, on the north side of Solway Firth; Ardoch, near the historical battlefield of Sheriffmuir (1715); and Newstead, a site first occupied by Agricola, under the Elidon hills. Roman roads extended, with camps, as far as the Moray Firth. It is not till A.D. 300 that we read of "the Caledonians and other Picts"; in the 4th century they frequently harried the Romans up to the wall of Hadrian, between Tyne and Solway. About the end of the century the southern Picts of Galloway, and tribes farther north, were partially converted by St Ninian, from the candida casa of Whithern. The Scots, from Ireland, also now come into view, the name of Scotland being derived from that of a people really Irish in origin, who spoke a Gaelic (see Cetic) akin to that of the Caledonians, and were in a similar stage of higher barbarism. The Scots made raids, but, as yet, no national settlement.

The withdrawal of the Romans from Britain (410) left the northern part of the island as a prey to be fought for by warlike tribes, Berwickshire, Roxburghshire, the northern part of Northumberland, Durham and Yorkshire to the Humber. In later days the Celtic kings of northern and western Scotland succeeded in holding, on vague conditions of homage to the English crown, the English-speaking region of historic Scotland. That region was the most fertile, had the best husbandry, and possessed the most civilized population, a people essentially English in language and institutions, but indOMITably attached to the Celtic dynasties of the western and northern part of the island. It was the English-speaking south-east part of Scotland, gradually extended to as to comprise Fife and the south-west (Lanarkshire, Dumfriesshire, Strathclyde, Dumbartonshire, Ayrshire and Renfrewshire), which learned to adopt the ideas of western Europe in matters political, municipal and ecclesiastical, while it never would submit to the domination of the English crown. This English element, in a nation ruled by a Celtic dynasty, prevented Scotland from becoming, like Wales, a province of England.

On the west of the northern part of the English kingdom of Bernicia, severed from that by the Forest of Etrick, and perhaps by the mysterious work of which traces remain in the "Catraill," was founded a kingdom of Pictish origin, which included the territory and population, later anglicized, of Renfrewshire, Ayrshire, Lanarkshire, Dumfriesshire, and, south of the historic border, Cumberland and Westmorland to the Dervent. Strathclyde was essentially Welsh, and it may be noted that this region, centuries later, was the centre of the recalcitrant Covenanters, a people enthusiastically religious in their own way. Later, this region was the hotbed or "revivals" and the cradle of Irvingism. Whether the influence of Cymric blood may be traced in these characteristics is a dubious question.

In addition to the kingdom of Cymric, the north, from Cape Wrath to Lochaber, in the west, and to the Firth of Tay, on the east, was Pictland; and the vernacular spoken there was the Gael. The west, south of Lochaber to the Mull of Kintyre, with the isles of Bute, Islay, Arran and Jura, was the realm of the Dalriadic kings, Scots from Ireland (503): here, too, Gaelic was spoken, as among the "Southern Picts" of the kingdom of Galloway. Such, roughly speaking, were the divisions of the country which arose as results of the obscure wars of the 5th, 6th and 7th centuries.

As regards Christianity in these regions, Protestantism, Presbyterianism, have only here a battle-ground. The mission of St Ninian (397) was that of a native of the Roman province of Britain, and the church which he founded would bear the same relation to Rome as did the church in Britain. There are maternal relics of his church, bearing the Christian monogram, and there are stones with Latin epitaphs; these objects are wholly unlike the Irish crosses and inscriptions of the Gaelic church. If Bede is right in saying that Ninian was trained in Rome, then, the early Christianity of Scotland was Roman.

In the chronicles of Prosper of Aquitaine record that Palladius was ordained by Pope Celestine as the first bishop "to the believing Scots," that is, to the Irish. If there were "believing Scots" in Ireland before the first bishop was ordained, their ecclesiastical constitution cannot have been episcopal. Fordun, in the 14th century, supposed that the clergy, before Palladius, were presbyters or monks. As Hector Boece, "that pillar of falsehood," dubbed these presbyters "Culdees," "the pure Culdee," a blameless presbyterian, almost prehistoric, has been claimed as the ancestor of Scottish presbyterianism; and episcopacy has been regarded as a deplorable innovation. The Irish church has paid more reverence to St Patrick than to Palladius (375-463), and the church of St Patrick, himself a figure as important as obscure, certainly abounded in bishops; according to Angus the Culdee there were 1071, but these cannot have been bishops with territorial sees, and the heads of monasteries were more potent personages.

The Dalriadic settlers in Argyll and the Isles, the (Irish) Scots, were Christians in the Irish manner. Their defeat by the Picts, in 565, induced the Irish St Columba to endeavour to convert the conquering Picts. In 565-566 he founded his mission and monastery in the isle of Iona, and journeying to Inverness he converted the king of the Picts. About the same date (532), the king of Cymric Strathclyde summoned, from exile in Wales, St Kentigern, the patron saint of Glasgow, who restored a Christianity almost or quite submerged in paganism, Celtic and English. The pagan English of Deira (603) routed under Æthelfrith the Christian Scots of Argyll between Liddesdale and North Tyne: and pagan English for more than a century held unopposed the
region from Forth to Humber. In 617 Æthelfrith fell in battle with the English, East Anglia, and his sons, Eanfrid and Oswald, fled to the North. Eanfrid, by his marriage with a Pictish princess, became the father of the Pictish king Talorcarn, while Oswald was baptized into the Columban church at Iona. In a season of war and turmoil Oswald won the crown of the northern English kingdom, stretching to the Forth, with its capital at Edwinsburgh (?Edinburgh, a dubious etymology), and in that kingdom St Aidan, from Iona, erected the Columban churches under the auspices of Oswald, whose brother Oswin dominated Strathclyde and Pictland up to the Grampians; the English example for a time, extending itself and Anglicizing more of the culture of the Scottish that was to be.

Thus the Dalriadic Scots had handed on the gift of Irish Christianity, with such literature as accompanied it in the shape of Latin, and reading and writing, to the northern English from Forth to Humber. The ecclesiastical constitution thus introduced was one of missionary monastic stations, settled in fortified villages. The Celtic church, unluckily, differed from the Roman on the question of the method of calculating the date of Easter, the form of the tonsure, and other usages, one of them apparently relating to Celtic Asceticism, which from this time, extended itself and Anglicizing more of the culture of the region that was to be.

At the Synod of Whitby, 664, in which the church of the English was established, it was decided to adopt the Roman method of calculating Easter, and to abandon the tonsure and other practices of the Celtic church. The result was the severance of these regions from the main current of western ecclesiastical ideas. Conceivably these sentiments of Columbans never wholly died out in the Scottish kingdom of later history, whose kings were always apt to treat Rome in a cavalier manner, laughing at interdicts and excommunications. A papal legate, in Bruce’s time, was no more safe, if his errand was undesirable, than under John Knox, when Mary Stuart were the crown. “All the world errs, Rome and Jerusalem err, only the Scoti and the Britones are in the right.” is quoted as the opinion of the Scoti and Britones in 634. It appears that Scotland was naturally Protestant against Rome as soon as she was Christian.

Meanwhile Rome was too strong, and in 664, in a synod held at Whitby, St Wilfrid procured the acceptance of Roman as against Celtic Christianity. Return to the questions. On the situation of the Holy Communion. English Christians overcame the Celtic divines of Iona, and in 710 even in Pictland they came into the customs of Western Christianity. The church of the Celtic tribe thus yielded to the church of the Roman empire.

There followed an age of war in which the northern English were routed at Nectan’s mere, in Forfarshire, and driven south of Forth. In the quarrels of Picts and of Scots of Argyll, the Pictish king, Angus MacFergus (ob. 761), was victorious while in his prime, and then consolidated Pictland; but (602–829) the Scandinavian searovers began to hold large territories in Scotland, weakened the Picts, and made easy their conquest by Kenneth MacAlpine of Kintyre, the king of the Dalriadic Scots of Argyll. In 860 this Scot became king of the Picts. Old legends represent him as having exterminated the Picts to the last man; and the Picts become, in popular tradition, a mythical folk, hardly human, to whom great feats, including the building of Glasgow cathedral, are attributed, as the walls of Tiresius and Mycenae in Greece were traditionally assigned to the energy of the Cyclopes. In 1614 Sir Walter Scott met a dwarf named Tallant in the Orkneys, whom the natives regarded as a “Pecht” or Pict.

There was, of course, in fact, no extermination of the Picts, there was merely a change of dynasty, and alliance between Picts and Scots, and that change was probably made in accordance with Pictish customs of succession. Kenneth MacAlpine, though son of a Scottish father, was probably, though not certainly, a Pict on the mother’s side, and in Pictland the crown was inherited in the female line. The consequence was that what had been Pictland came to be styled Scotland. The king of Alban was a Scot in the paternal line. His conquest was not achieved at a blow, but his language, Gaelic, prevailed. Henceforth, despite the incursions of the Scandinavians, and partly because of them, the ecclesiastical and royal centres of life are moved to the south and the east, though the king of Alban (Arran) is not always master of his Ri, or subordinate princes of the seven provinces (Moirlath). His position is rather that of an overlord, or Bretwalda, like Agamemnon’s among the Achaean anachtes. He allies himself with Cymric Strathclyde, and by constant raids, and thanks to English weakness caused by Danish invasions, he extends his power over English Lothian.

A marriage of the daughter of Kenneth MacAlpine with the Welsh prince of Strathclyde gives Scotland a footing in that region; in short, Scotland slowly advances towards and even across the historic border.

Through this contact with and actual tenure of English lands arose the various so-called “submissions” of kings of Scotland to the English crown. Thus (924) the English Chronicle asserts that Constantine, king of Scotland, “chose Edward King to father and lord.” It is impossible here to analyse the disputes as to whether, in Freeman’s words “from his marriage to the 14th century” (the means, to Rannochburn) “the vassalage of Scotland was an essential part of the public law of the Isle of Britain.” In fact this vassalage was claimed at intervals by the English kings, and was admitted by Scottish kings for their lands in England; but as regards Scotland, was resisted in arms whenever opportunity arose. Each submission “held not long,” and the practical result was that (945) Malcolm acquired northern Strathclyde, “Cumberland, Galloway (?) and other districts,” while another Malcolm (1018) took Lothian, the northern part of Northumbria, after winning a great battle at Carham on the Tweed.

The Celts, Scoto-Picts, of Alban, had thus annexed a great English-speaking region, which remained loyal to their dynasty, the more loyal from abhorrence of the Norman conquerors. The English or anglicized element in Scotland was never subjugated by England, save during the few years of the Cromwellian Commonwealth, and was supported (with occasional defections, and troubles caused by dynastic Celtic risings) by the Celtic element in the kingdom during the long struggle for national independence. Scotland, in short, was too English to be conquered by England. Poor, distracted, threatened on occasion by the Danes or the Normans, yet as an independent state it existed, and for the long interval between the union of 1707, when English men were admitted to participate in its privileges and in its administration. Such were the consequences, in the sequel, of what seemed a disastrous event, the absorption, by a Celtic kingdom, of a large and fertile region of northern England.

The English element in the realm of Malcolm II. (1005–1034) was the conducting medium of western ideas which naturally appealed to the interests and the ambitions of that prince. On looking at the genealogical tree of the dynasty of Kenneth MacAlpine, we see that from the line of his death (955) to the accession of Duncan II. (1001) to the death of Malcolm II. (1034) no monarch is succeeded by his own son or grandson. The same peculiarity appears in the list of the ancient kings of Rome, but these are entangled in mythology. In the dynasty of Kenneth the succession to the crown alternated thus: he was succeeded by his brother Donald, who was followed by his nephew, Kenneth’s son, Constantine; Constantine’s brother, Aedh, followed; and henceforth till 957, the kings were alternately chosen from the houses of Constantine and...
and Aodh. It was the custom to appoint the successor to the
king, his “Tanist,” at the same time as the king himself.
Malcolm II succeeded his brother's court, and, in accordance
with the native system of royal inheritance, should have been followed
by the unnamed grandson of his own predecessor, Kenneth III.
But Malcolm was accused of putting his legitimate successor out of
the way, and thus securing the succession of his own grandson,
Duncan, a son of his daughter, Bethoc, and his husband Crinan,
protector of the abbey (or lay abbot) of Dunkeld. Malcolm thus
set the example of advance to the western system of royal
successions, while in Crinan's lay tenure of the abbacy of
Dunkeld we see the habit of appropriating ecclesiastical revenues
which again became so common about a century before the
Reformation.

The innovation of Malcolm II. brought no peace but a sword.
Boedhe, son of Kenneth III., left a daughter, Grucha, who
inherited the claims of the unnamed son of Boedhe slain by order
of Malcolm. Grucha married Gilgocgain, and had issue male,
Lulach. After the death of Gilgocgain, Grucha wedded
Macbeth, Mormaor (or earl in later style) of the province or sub-
kingdom of Moray; Macbeth slew Duncan, and ruled as pro-
tector of the legitimate claims of Lulach. From Lulach descended
a line of the Macbeths, and, for a century the dynasty violently
contested by Malcolm II. was opposed by claimants of the blood
of Lulach, representing the Celtic customs adverse to the English
and Norman ideas of the family in possession of the throne.
Thus Celtic principles, as opposed to the western principles of
chartered feudalism, did not perish in Scotland without a long
and severe struggle.

Meanwhile the dynasty of Malcolm II. was brought into close
connexion with the English crown, and relied on English support,
both before and after the Norman Conquest. The genius of Shakespeare, in his Macbeth, based on
Hamlet, materials borrowed by Hollisshun from Hector Boece,
and the dynastic myth of the descent of the
Stuart kings from Banquo, has clouted the actual facts of
the Celts of Scotland, or at least to those of the great sub-
kingship or province of Moray, Duncan, not Macbeth, was the
usurper. Duncan left sons, Malcolm, called Canmore (great head),
and Donald Ban; and in 1054 Siward, earl of North-
umberland, defeated Macbeth, whether acting under the order of
Edward the Confessor in favour of the claims of Malcolm Can-
more, or merely to punish Macbeth for sheltering Norman fugitives from the English
frontier. Duncan's death (1057)
was the more probable, though the chronicler, Florence of Worcester,
asserts the protection of the sons of Duncan by England.
Siward did not dethrone Macbeth, who was defeated and slain by
Malcolm in 1057; Lulach fell obscurely in 1058, leaving claimants
to his rights, though these did not trouble much the crowned king,
Malcolm Canmore. His long reign (1058–1093), and his second marriage (1068) with Margaret, sister of Edgar Ætheling,
of the ancient English royal blood—dispossessed by the Norman
Conqueror—intensified the sway of English ideas in Scotland,
and increased the prepotency of the English element in political,
social and ecclesiastical affairs. The anarchic state of North-
umberland and Cumberland after the Norman Conquest, which
did not soon assimilate them, was Malcolm's opportunity. He
held Cumberland (1070), and supported the claims of his brother-
in-law, the Ætheling, while his relationship with Gospatric, earl of Northumbria, who retired into Scotland, gave him pre-
texts for invading the north-east of England. William the
Conqueror's earl of Northumberland, Robert de Comines, was
slain at Durham in 1069, and the houses of Gospatric (earls of
Dunbar and March) and de Comines (the Comyns of Badenoch)
were long puissant in Scottish history.

In 1072 William marched north and took a disputed homage of
Malcolm at Abernethy, receiving as hostage the king's eldest
son (by his first wife, Ingebioge), named Duncan. As to the
nature of Malcolm's homage, whether for Scotland (Freeman),
or for manors and a subsidy in England (Robertson), historians
disagree. Malcolm subdued "the King of Moray," son of Lulach,
who died in far Lochaber, though his family's claims to the
crown of Scotland did not lapse. In 1093 William Rufus renewed
the treaty of Abernethy with Malcolm and fortified Carlisle,
thereby cutting Malcolm off from Cumberland; Malcolm was
summoned to meet Rufus at Gloucester; he went, but declined
to accept the jurisdiction of the Anglo-Norman peers, or to "do
right" to Rufus, except on the frontier of the two realms,
wherever he may have supposed that frontier to be. He was
an independent king, no vassal of England; as such (1093) he
invaded Northumberland, and was slain at Alnwick. His wife,
St Margaret, did not survive her sorrow; she died in the castle
of Edinburgh. Her reforms in church matters had apparently
made her a Celt, but we learn under cover of a mist her
body was conveyed to and buried at Dunfermline.

Margaret, in fact, completed the reduction of the Celtic church
in Scotland to conformity with western Christendom, and some
recent presbyterian writers have not forgiven her. Beautiful,
charitable and pious, she mollified the fierce manners of her
husband, who, according to her director and biographer, Turgot,
acted as interpreter between her and the Gaelic-speaking ecclesias-
tics at their conferences. Certain obscure religious usages,
as regards Lent, the Communion, the non-observance of Sunday,
non-communicating at Easter and the Forbidden Degrees in
Culdees, were brought into conformity with western Christ-
dom. The last Celtic "bishop of Alban" died at this time;
and when Malcolm of Canmore was established after an interval of turmoil, English ecclesiastics began to out
the Celtic Culdee.s from St Andrews.

Malcolm would have been succeeded by his eldest son by
Margaret, Edward, but he fell beside his father at Alnwick,
and the succession was disputed between Duncan, son of Malcolm
by his first wife; Edmund, eldest surviving son of Malcolm and
Margaret; and Donald Ban, brother of Malcolm. The Celts
(apart from the claimant of the blood of Lulach and the house
of Moray) placed Donald Ban on the throne; England supported
Duncan (by primogeniture Malcolm's heir, and a hostage in
England); there was division of the kingdom till Duncan was
slain, and Edgar, son of Malcolm and Margaret, was restored by Edgar Ætheling. He put out the eyes of his uncle, Donald
Ban, and in unsantly ways established the dynasty of the
English St Margaret and of the Celtic Malcolm. In 1103 Edgar's
sister, Eadgyth (Matilda), married Henry I.; the dynasty of Scotland now shows, by the names of its members, that the
English element in it was predominant. After Donald Ban no
Scottish sovereign bore a Gaelic Christian name save Malcolm
the Maid; and perhaps no later king knew Gael.

Edgar, before his death, established his brother, Alexander I.,
as king of Scotland, north of Forth and Clyde, with Edinburgh,
which looks as if he considered Forth and Clyde the
frontier of what was legally Scotland; while his youn
ger brother, David, as earl, ruled Lothian and
Cumbria. The reign of Alexander I. is marked by war with the
northern Celts, and by the introduction of English bishops of
St Andrews, while the claims of the see of York to superiority
over the Scottish church were cleverly evaded at Glasgow
(David's bishopric), as well as at St Andrews, where English
Augustinian canons were now established, to the prejudice of
the Celtic Culdee.s. We observe that the chief peers of Alex-
ander, who signed the charter of his monastery at Scone, are
Celts—Heth, earl of Moray (husband of the daughter of Lulach),
Malise of Strathearn, Dufagan of Fife, and Rory. After the
death of Alexander I. (1124) his successor, David I., is attended by
men of Norman names, Moreville, Umfraville, Sonnerville,
Bruce, FitzAlan (the ancestor of the Stewards of Scotland,
and himself of an ancient Breton house), and so on.

David, educated in England by Normans, was the maker of a
Scotland whereof the anglicized part at least was now ruled by
Anglo-Norman feudalism and Anglo-Norman municipal
laws in the burghs. Marrying Matilda, widow of
Simon de St Liz and heiress of Walthouf, David received the
cardinal of Huntington and supposed himself to have claims
over Northumberland, a cause of war for three generations.
With Anglo-Norman aid he repelled a Celtic rising—the right of
the claimants to represent the blood of Laluch is exquisitely complex and obscure in this case—but in the end David annexed to the crown the great old sub-kingdom or province of Moray, and made grants therein to English, Norman and Scottish followers.

Some of the most eminent of his southern allies could not stand by David when, in the reign of Stephen and in fidelity to the cause of his niece, the empress Matilda, daughter of Henry I., he served in services of labour and of war. Below these were the towns of Northumberland and Cumberland opened their gates, but he and Stephen met in conference at Durham, and David's son Henry, prince of Scotland, received the Honour of Huntington, Carlisle, Doncaster "and all that pertains to them" (1135). Stephen's relations with Henry became unfriendly, and in January 1138, in pursuance of Henry's claim to Northumberland, David again invaded. A holy war against him was proclaimed by the archbishop of York, and on the 22nd of August 1155 Bruce, Baliol, and others of David's southern allies renounced fealty to him, and he was defeated at the battle of the Standard, near Northampton.

David regained the shelter of Carlisle, a legate from Rome made peace, and Prince Henry received the investiture of Northumberland, without the strong fortresses of Bamborough and Newcastle. The anarchic weakness of the reign of Stephen enabled David to secure his hold of northern England to the Till, but the death of his gallant and gentle son Henry, in June 1152, left the succession to his son, Malcolm the Maiden, then a child of ten, and David's death (24th of May 1153) exposed Scotland to the dangers of a royal minority.

David was, if any man was, the maker of Scotland. The bishops erected by him, and his many Lowland abbeyes, Holyrood, Melrose, Dryburgh, Kelso, Jedburgh and others, confirmed the freedom of the Scottish church from the claims of the see of York, encouraged the improvement of agriculture and endowed the country with beautiful examples of architecture. His charters to land-owners and burghs (charters not being novel in Scotland, but now more lavishly conferred) substituted written documents for the unwritten customs of Celtic tenure, and converted the under kings of provinces into early of the king, while vice-comes, or sheriffs, administered local justice in the king's name, though Celtic custom still prevailed, under a thin veneer of law, in the Celtic regions, as in Galloway. Where Anglo-Normans obtained lands in Moray and Renfrewshire, there seems to have been no displacement of the population: though a FitzAlan was dominant in Renfrewshire, the "good men," or gentry, still bore Gaelic names, till territorial names—"of" this or that place—came into use. In Lothian the place-names recorded in charters were already, for the most part, English. Beneath the freeholders and nobility were free tenants, farmers paying rents, mainly in kind, and the rise of these towns was due to the trade, as the castle was to the market; these were the natiæ, attached to the land, and changing masters when the land changed hands. These natiæ were gradually emancipated, partly through the influence of the church, partly for economic reasons, partly through the rule that any villein became free after a year's residence in a burgh.

Thus Scotland never saw a jacquerie or servile rising. The burghs were not actually the creations of David and William the Lion, but the rights, duties and privileges which had gradually developed in the towns were in the time of these kings codified and confirmed by charters; the towns had magistrates of their own election, courts, and legalized open markets. The greater burghs had a union, and made laws and regulations for municipal affairs. In addition to royal burghs, there were burghs of nobles and of bishops, and the provostship was apt to become, by custom, almost hereditary in a local noble family, which protected the burgeses. The germ of a parliament existed in the crown vassals and the royal officials—chancellor, steward, constable, marischal and the rest—with bishops, priors, earls, barons and other profili homines. The term leto communitæ, "the whole community," appears to denote in England of noble birth, who might be present at any important assembly for the discussion of national affairs. Burgess do not yet receive mention as present on such occasions.

Scotland was as yet, and in fact remained, destitute of constitutional history as it appears in England. There was, technically speaking, no taxation. The king "lived on his own," on rent of crown lands, feudal fines and aids, wardships, marriages, and the revenues of vacant bishoprics. Opposition used the mechanism of conspiracies; and changes of administration were effected by the seizure of the king's person, especially during the minor and minority, with the help of the clergy. While Roman law became the foundation of justice, a learned clerk was needed as assessor and developed into the Lord Justice Clerk. The vice-comes, or sheriff, as the king's direct representative, was the centre of justice for shires, and his judicature tended to encroach on that of noble holders of courts. Royal authority, sheriffs, juries and witnesses gradually superseded ordeal, compurgation, and trial by battle, though even barons long retained the right of "pit and gallows."

In the matter of education, the monasteries had their schools, as had the parish churches, and there were high schools, the burghs, and "song-schools." From the time of David to the death of Alexander III. Scotland was relatively peaceful, prosperous, and, in the south, anglicized, and was now in the general movement of western civilization.

Malcolm the Maiden, before his early death in 1165, had put down the menacing power of Somerled, lord of the Isles, a chief apparently of mixed Celtic and Scandinavian blood, the founder of the great clan of Macdonald, whose chiefs, the lords of the Isles, were almost royal; Malcolm also subdued the Celts of Galloway, sometimes called Picts, but at this time Gaelic in speech. Malcolm's brother William the Lion (1165-1214), initiated the French alliance, fondly ascribed to the time of Charlemagne. William's desire was to seize Northumberland; in 1173 he was allied with Henry, the rebellious son of William II., himself in alliance with France. The capture of William at Alnwick, in July 1174, permitted a Celtic revolt in Galloway, and necessitated the Treaty of Falaise, by which for fifteen years Scotland was absolutely a fief of England, though the clergy maintained their independence of the see of York, which was recognized by Pope Clement III. in 1188. In a quarrel of enumbrance, the see he had been authorized to lay an interdict on Scotland, William and the country merely disregarded it; and in 1191 a new pope absolved the Scottish king. The Celtic risings now were made in defence of the royal claims of a descendant of Duncan, son of Malcolm Canmore; there were also MacHeth claimants to the old rights of Lulach; Galloway and the Celtic north were ceaselessly agitated.

After the death of Henry II. in 1189, Richard I. sold back to Scotland all that his father had gained by the Treaty of Falaise, and William only became Richard's man—for all the lands for which his predecessors had been hegemen to the English kings, a vague phrase but implying that the king of Scotland was not liege man for Scotland. To John, William did homage (1200) salvo jure suo. In 1209 he promised to purchase John's goodwill with 15,000 merks, and gave hostages. Peace was preserved till William died in 1214.

In the reign of his successor, Alexander II., the risings of Celtic claimants died out; he converted Argyll into a sheriffdom, and (1237) resigned the claims to Northumberland, in exchange for lands in the northern English counties with a rental of £200 yearly. His death in 1249 left the crown to his son, Alexander III., a child of eight, in whose minority began the practice by which parties among the nobility seized the person of the sovereign. At the age of ten, Alexander, William the Lion, in 1174, permitted a Celtic revolt in Galloway, and necessitated the Treaty of Falaise, by which for fifteen years Scotland was absolutely a fief of England, though the clergy maintained their independence of the see of York, which was recognized by Pope Clement III. in 1188. In a quarrel of enumbrance, the see he had been authorized to lay an interdict on Scotland, William and the country merely disregarded it; and in 1191 a new pope absolved the Scottish king. The Celtic risings now were made in defence of the royal claims of a descendant of Duncan, son of Malcolm Canmore; there were also MacHeth claimants to the old rights of Lulach; Galloway and the Celtic north were ceaselessly agitated.

After the death of Henry II. in 1189, Richard I. sold back to Scotland all that his father had gained by the Treaty of Falaise, and William only became Richard's man—for all the lands for which his predecessors had been hegemen to the English kings, a vague phrase but implying that the king of Scotland was not liege man for Scotland. To John, William did homage (1200) salvo jure suo. In 1209 he promised to purchase John's goodwill with 15,000 merks, and gave hostages. Peace was preserved till William died in 1214.

In the reign of his successor, Alexander II., the risings of Celtic claimants died out; he converted Argyll into a sheriffdom, and (1237) resigned the claims to Northumberland, in exchange for lands in the northern English counties with a rental of £200 yearly. His death in 1249 left the crown to his son, Alexander III., a child of eight, in whose minority began the practice by which parties among the nobility seized the person of the sovereign. At the age of ten, Alexander,
at York, wedded a child bride, Margaret, daughter of Henry III. His boyhood was distracted by vague party strifes, but Henry did not attempt to administer his country. In 1261 his queen born at Westminster, called her fealty to Edward, the young, patriotic; Eric, king of Norway, became the mother of "The Maid of Norway," heiress of Alexander III.; the girl whose early death left the succession disputed, and opened the flood-gates of strife. Alexander (1260) won the western isles and the Isle of Man from Norway, paying 4000 marks, and promising a yearly rent of 100 marks. In 1279 Alexander did homage to Edward I. at Westminster, *salvo jure suo*, and through the lips of Bruce, earl of Carrick. The homage was vague, "for the lands which he holds of the king of England," or according to the Scottish version, "saying my heart lies to the rights of the blood of Alexander's daughter, Margaret of Norway (1285), and of his own, the prince of Scotland, without issue, the estates, at Scone, recognized Margaret's infant daughter as rightful successor. At this assembly were Bruce, earl of Annandale; Robert de Brus, earl of Carrick (later king), his son; Comyn, earl of Buchan; John Baliol, and James the Steward of Scotland, of the house of Fitzalan. On the 29th of May 1286 Alexander died, in consequence of a slip made by his horse on a cliff near Kinghorn during a night ride. His death was the great calamity of Scotland, and is lamented in a famous fragment of early Scotch verse. The golden age of "The Kings of Peace" was ended.

Bruce and Baliol parties.

The first step of the Scottish noblesse (mainly men of Norman names), after Alexander's death, was to send a secret verbal message to Edward of England. Six custodians of the realm were then appointed, including the bishop of Glasgow (Wishart) and the bishop of St Andrews (Frazer). Presently the nobles formed two hostile parties, that of the Bruce and that of Baliol. The Bruce party took up arms, and from the terms of their "band," or agreement, altogether different from that of the Baliol party, arose to the rights of the blood of Norway, while declaring their fealty to Edward. In 1286-1289 Scotland was on the verge of civil war. Edward procured a papal dispensation for the marriage of the Maid of Norway to his son Edward; the Scots were glad to consent, and preliminaries were adjusted by the Treaty of Birgham (18th of July 1290). All possible care was taken by the Scots to guard their national independence, but Edward succeeded in inserting his favourite clause, "saving always the rights of the King of England, which belonged, or ought to belong, to him." As the Bruce faction had the advantage of having the probability to be the natural heir to the throne, the attitude of the Scots may be ascribed to the two bishops, who did not consistently live on this level. In August Edward ventured a claim to the castles of Scotland, which was not admitted. By the 19th of August it was known that the child queen had arrived in the Orkneys. An assembly was being held at Scone; the Bruces did not appear, but, by the 7th of October, they arrived in arms, on a rumour of the queen's death. The bishop of St Andrews tells Edward of these events, and urges him to come to the border, to preserve peace. The bishop of St Andrews was for Baliol, he of Glasgow was for Bruce; and the Baliol party, the seven earls complain, was ravaging Moray. These seven earls appear to represent the old rulers of the seven provinces of Pictland, and asserted ancient claims to elect a king. The Bruces placed themselves under Edward's protection. In March 1291 he ordered search to be made for documents bearing on his claims in the English clerical libraries, and summoned his northern feudal levies to meet him at Norham on Tweed, fully armed, in June. Hitherto he called the representatives of Scotland for the 10th of May; on the 2nd of June the eight claimants of the crown acknowledged him as Lord Paramount, despite a written protest of the communities of Scotland; obscurely mentioned, and not easily to be understood. Edward took homage from all, including burgesses even, at Perth; his decision on the claims was deferred to the 2nd of June 1292 at Berwick.

The choice lay between descendants in the female line of David of Huntingdon, younger brother of William the Lion. John Baliol was great-grandson of this David, through his eldest daughter; Bruce the old was grandson of David through his second daughter, and pleaded that, by Scottish custom, he was David's heir. He also pleaded a selection of himself as successor by Alexander III., before the birth of Alexander III., but of this he had no documentary evidence. On the 17th of November 1292 Edward decided, against Scottish custom (if such custom really existed), in favour of Baliol, who did fealty, and, amidst cries of dissent, was crowned at Scone on the 26th of December.

Edward instantly began to summon John to his courts, even on such puny matters as a wine-merchant's disputed bill. He appeared to aim at driving Baliol into rebellion and annexing his kingdom. In 1293 Edward refused to obey a similar summons from the king of France, and in 1294 was fighting in Gascony. Baliol declined to follow his standard and negotiated for a French alliance. Edward ordered Baliol's English property to be confiscated; Baliol renounced his fealty, and English merchants were massacred at Berwick. The Comyns failed in an attack on Carlisle, and (30th of March 1296) Edward took Berwick, seized William Douglas (father of the Good Lord James), and massacred the male populace. A disorderly levy of Scots, appearing on the side of the French, was defeated at Dupont, near Tournay (Boulogne) and were defeated with heavy loss. Robert Bruce was now of Edward's party; the nobles in a mass surrendered and Edward was unopposed. He seized the Black Rod, the coronation stone of Stane, St Margaret's fragment of the True Cross, and many documents; then he marched north as far as Elgin. The Ragman's Roll contains sworn admissions of all *probi homines* outside of the western thoroughfare, Waddell region; and, in October 1296, Edward returned to England, with Baliol his prisoner, leaving Scotland in the hands of the elder of Surrey as guardian, Cressingham as treasurer, and Ormiston to take charge of the money. Edward made an attempt, and, when Edward went abroad in June 1297, he left orders for suppression of assemblies (*convventiculae*). Now Sir William Wallace came to the front, a younger son of Sir Malcolm Wallace of Elderslie, near Paisley. The family probably came from England with the FitzAlans, the hereditary Stewards of Scotland. The English chroniclers call Wallace *lato*, "a brigand," and he probably was a leader of broken men, discontented with English rule. Sir Thomas Gray, son of an English gentleman wounded in a rising at Lanark in May 1297, says that Wallace was chosen the leader of the Scots ("Hegemon") and began operations by slaying Eslerig, sheriff of Clydesdale, at Lanark. The Lanercost contemporary chronicle writes that the bishop of Glasgow and the Steward began the broil, and called in Wallace as the leading brigand in the country-side. Wallace, in fact, was a gentleman of good education. Percy and Clifford led the English forces to suppress him, and (7th July) made terms with the bishop, the Steward and Robert Bruce, who submitted; but Wallace held out in Ettrick Forest. Sir William Douglas was kept a prisoner for life, but Andrew Murray was put out in Moray, with a large following. The nobles who had submitted made delays in providing hostages, and Warenne marched from Berwick against Wallace, who, by September 1297, was north of Tay.

On hearing of Warenne's advance, Wallace occupied the Abbey Craig at Stirling, commanding the narrow bridge over the Forth; the Steward and Lennox attempted pacific negotiations; a brawl occurred; and next day (11th of September) the English crossed Stirling bridge, marched back again, recrossed, and were attacked in deploying from the bridge. The general, Warenne, was old and feeble, Cressingham was hasty and confident; counsels were confused, the manner of position was rash, and the rout was sanguinary. Cressingham was slain, and Warenne fled to Berwick. Pursuing his victory, Wallace ravaged Cumberlend, most English writers say with savage ferocity; but Hemingburgh represents Wallace as courteous on one occasion, and as confessing that his men were out of hand.

By the 29th of March 1298 Wallace appears, in a charter granted by himself, as guardian of the kingdom, and, with
Andrew Murray, as army leader in the name of King John—that is, the captive Balliol. By June 1298 Robert Bruce is active in the service of Edward, in Galloway. Edward was moving on Scotland, and on the 22nd of July he found Wallace in force, and in a strong position, guarded by a morass, at Falkirk. The Scottish horsemen fled from the English cavalry, but the Mount of St John Menteith, sheriff of Dunbartonshire, of Sir John Comyn, brother of the Steward. The schiltrons, or squares of Scottish spears, were unbroken by Edward's cavalry, till their ranks were thinned by the English bowmen and could no longer keep out the charging horse. Wallace had made the error of risking a general engagement in place of retiring into the hills; to do this had, it is said, been his purpose, but Edward surprised him, and Wallace disappears from the leadership, while the wavering Robert Bruce appears in command, with the new bishop of St Andrews, Lamberton; Lord Souls; and the younger Comyn, "the Red Comyn" of Badenoch. For want of supplies, Edward returned to England through Annandale, burning Bruce's castle of Lochmaben. Stirling still held out for England. There is certain evidence of fierce dissensions in some way connected with Wallace, among the Scottish leaders (August 1299). Wallace was going to France; the Scottish leaders were reconciled to each other, and took the castle of Stirling, which they entrusted to Sir William Oliphant. The Scottish cause seemed stronger than ever, under Bruce, the Steward, the Red Comyn and Lamberton, but in June 1300 Edward mustered a splendid array, and took Calais. Wallace, with a letter from the archbishop of Canterbury with the pope approving of the Scottish cause, he granted a truce till Whitsuntide 1301. The barons of England angrily refused to submit to the papal interference, but nothing decisive was attempted by Edward, though Bruce had again entered his service. By 1303 France (which doubtless had moved the pope to his action) deserted the Scots in the Treaty of Amiens, and Edward, with little opposition, overran Scotland in 1303.

On the 9th of February 1304 Comyn with his companions submitted; the humane Wallace, who had returned from the continent, and on the 24th of July the brave Oliphant surrendered Stirling on terms of a degrading nature. Among his officers we see the names of Napier, Ramsay, Halkerton and Polwarth.

The noblest names of Scotland now took part in the pursuit of Wallace, who, as great in diplomacy as in war, had visited Rome (he had a safe-conduct of Philip of France to that end), and had at least secured a respite for his country. It seems probable that Wallace remained consistently loyal to Balliol, and hostile to the party of the wavering Bruce. He was taken near Glasgow, in his own country, and handed over to England by the English forces there. Bruce, however, had certainly received the blood-money, £100 yearly in land, and Wallace, like Montrose, was hanged, disembowelled and quartered (at London, August 1305). Tradition attributes to Wallace strength equal to his courage. His diplomacy in France proves him to have been a man of education, and his honour is un-impeached; he never wavered, he never was liegeman of Edward, while bishops, nobles, and, above all, Bruce, perjured themselves and turned their coats again and again. The martyr of an impossible loyalty, Wallace shares the illustrious immortality of the great Rollof the Vikings, a prince in his country's history. His victory at Stirling lit a fire which was never quenched, and began the long and cruel wars of independence on which Scotland now entered.

For an hour there seemed as if there might be no raising of the fallen standard of St Andrew. Edward had not yet alienated the country by cruelty, save in the case of Wallace and the massacre of Berwick. He aimed at a union of the two countries, and Scottish representatives were chosen to sit in the English parliament. The laws of David I. were to be revisited. Eight justices were appointed, the sheriffs were mainly Scots of the kingdom; the bishop of St Andrews was one of the Scottish representatives. The country was being re-organized, ruined churches and bridges were being rebuilt. The "commons," the populace, were eager for peace; nobles like Bruce were Edward's men. Bruce had been actively engaged in the siege of Stirling, and had succeeded his father as earl of Annandale. Yet, during the siege of Stirling (11th of June 1304), Bruce had entered into a secret band with Lamberton, bishop of St Andrews, for mutual aid. Early in February 1306 Galloway, where Bruce found the Red Comyn before a high altar, in the church of the Franciscans at Dumfries: Comyn's uncle was also slain, and Bruce, from his castle of Lochmaben, summoned his party to arms; he was supported by the bishops of St Andrews and Glasgow, and by Sir James of Douglas, and was promptly crowned by the kinsman of Buchan, representing the clan MacDuff, at Scone.

The cause of the slaying of Comyn is unknown; the two men had long been at odds, but the evidence does not confirm the story that Comyn had betrayed Bruce to Edward. It is more probable that Comyn merely refused to be drawn into Bruce into a rising, and that the deed was unpremeditated. Be that as it may, Bruce had now no place of repentance for a sacrilegious homicide; he could not turn his tabard again; he was outlawed, forfetted and excommunicated. He had against him, not merely England, but the kith and kin of Comyn, including the potent clan of MacDowall or MacDougall in Galloway and Lorne; on his own side he had his kinship, broken men, and the clergy of Scotland. Heedless of the excommunication they backed him, and the preaching friars proclaimed his to be a holy war.

Bruce was warring in Galloway when, in May 1306, Aymer de Valence led an English force to Perth. Bruce followed, and was defeated in Methven wood; the prisoners of rank, his brother Nigel, and Atholl, with others, were hanged, and his two bishops were presently secured. "All the Commons went him fra," says Barbour, the poet chronicler. His queen, with Lady Buchan and his sister, were imprisoned; and his castles were held against him. He took to the heather, making for the western seas, hewing his way through the MacDougals at Tyn- drum and marching over the mountains to Loch Lomond, to the still more formidable Sir Nial Campbell of Argyll, founder of the house of Argyll, and archbishop of St Andrews. He reached a castle of Macdonald of Islay (Angus Og), ally, at Dunaverty in Kintyre. He was driven to an isle off the Irish coast; he thence joined Douglas in Arran, and by a sudden camisade he butchered the English cantonized under his own castle of Turnberry in Carrick. Two of his brothers were taken in Galloway and hanged at Carlisle, while King Edward, a dying man, lay, with a great army at Carlisle, or at the neighbouring abbey of Lanercost. Aymer de Valence, Butetourte, Clifford, and Mowbray were sent to net and "drive" the inner wilds of Scotland. Bruce, after shelter in the forests and caves of Loch Trol and Loch Dungeon. Now he evaded them, now he and his valiant brother Edward surprised and cut them up in detail, doing miraculo, says a contemporary English chronicler. Douglas, an excellent guerilla leader, captured his own castle and butchered the English garrison. By the 15th of May 1307 a writer of a letter from Forfar says that if Edward dies his cause in Scotland is lost. Bruce slipped into Ayrshire and defeated de Valence at Loudon Hill; so Edward, a dying man, began to move against him with his whole force. He died (7th of July 1307) at London-Shotts, which for long was reckoned to ruin himself by his own follies, while ferocious hangings and dragging of men to death at horses' heels roused the Scottish Commons, and the men of Ettrick and Tweeddale, renouncing their new lord, de Valence, came over to the wandering knight who stood for Scotland.

In the winter of 1307 and in 1308 Bruce ruined Buchan, a Comyn territory, and won the castles of Aberdeen and Forfar, while Edward Bruce cleared the English out of Galloway. In the summer of 1309 Bruce fell on the MacDougals, on the right side of the Awe, where it rushes from Loch Awe at the pass of Brander, and, aided by a rear attack led by Douglas, seized the bridge and massacred the enemy. He then took the old royal castle of Dunstaffnage and drove the chief, John of Lorne, into England; Menteith, the capitor of Wallace, changed sides, and
Edward, after a feeble invasion in 1310, retreated from a land laid desolate by the Scots.

In 1311 Bruce carried the war into England, seconded by the most audacious if the least skilled of his captains, his daring brother Edward. For two years the north of England, as far south as Durham and Chester, was the prey of the Scots, and some English counties secured themselves by paying an indemnity. The castles of Carlisle and Berwick, however, repelled the assailants, but Perth was surprised, in January 1312, Bruce himself leading the advance. Randolph, earl of Murray, took the king prisoner in the country. Bruce stormed and captured the castle, by scaling the precipitous rock to the north, while a feigned attack was being made on the accessible southern front. In short almost every castle held by the English was captured, and the fortifications were destroyed.

In the spring of 1313 Edward Bruce invested Stirling castle, the key of Scotland; on midsummer day he accepted a pact for the surrender of the place if not relieved within a year. This was a heedless piece of chivalry on Edward’s part. It gave the English king, less opposed by his nobles since his favourite, Gaveston, was slain, time to muster a large army, which the Scots soon met, if at all, in the open field. Edward II. not only summoned English but Irish levies, and knights of Hainault, Bretagne, Gascony and Aquitaine crowded to his standard. The estimates of numbers by the old writers are usually much exaggerated; modern authorities reckon King Edward’s army at 50,000 of whom 10,000 were cavalry. Old accounts put the infantry at 100,000, the horsemen at 40,000. Bruce had but five hundred horse, under Keith the Marischal; Douglas led the levies of his own district and Ettrick Forest; Randolph commanded the men of Moray; Walter Steward, those of the south-western shires; and Angus Og brought the Scottish standard the light-footed men of the Isles, and, probably, of Lochaber, Moidart, and the western coast in general. Bruce commanded the people of Carrick and probably of his old cardon, Annandale.

Moving out from the Torwood forest, Bruce arrayed his force so as to guard either the Roman road through St Ninians, or the way through the Carse, which was then studded with marshes and small lakes. The former route appeared to be chosen by the English, and Bruce stationed his army in a position where it was defended by a cliff, or ravine of the Bannockburn, and by two roads. Between which was a practicable but narrow neck of firm land. Randolph, on Bruce’s left, was to guard against a rush of English cavalry to relieve Stirling castle. The Macdonald tradition is that their clan was on the right wing, under Angus Og; the old accounts place them with Bruce’s reserves. Three hundred English horsemen appear to have stolen round Randolph’s flank unseen by him, and Bruce is said to have warned him that “a rose had fallen from his chaplet.” Randolph advanced with his footmen against the English horse, who unwarily accepted his challenge and were defeated by his spearmen. While Edward’s army paused, Bruce, mounted on a palfrey, was attacked by Sir Henry Bohun. Bruce evaded his spear and slew him with an axe stroke; the axe shaft broke in his hand. The omens were evil for England; and her forces bivouacked, reserving the general attack for the following day. Bruce is said to have proposed retreat and a guerrilla war, but his council were for fighting.

In the general engagement, next day, the English cavalry could not break the impenetrable wood of the Scottish spearmen, who, however, were galled by the arrows of the English bowmen, which had broken their formation at Falkirk. Bruce bade Keith, with his five hundred horse, charge the archers in flank: apparently they were unprotected by pikes; they were broken, and the great peril passed away. The Scottish archers charged with axe in hand, and the Scottish right front was protected by a mass of fallen English horses and fighting men; the rear ranks of the English, clogged and crowded, could not reach the foe, and the line of Scottish spears pressed steadily and slowly forward. Now a panic was caused by a rush of camp followers from the “gillie’s hill” : the English wavered; Bruce commanded an advance of his whole line: the English rout was general, and, had Bruce possessed cavalry, few would have escaped. The Bannockburn was choked with the fallen, and it was only by hard spurring that Edward and his guards reached Dunbar, whence he sailed to Berwick. An immense booty and many ransoms rewarded the Scots, whose victory was one of the decisive battles of the world. It was won by the generalship of Bruce and his captains; by the excellence of his position, by the steadiness of his men, and, obviously, by the recent fury of the English cavalry, and by the folly which led the archers open to defeat by the Marischal’s handful of horse (24th of June 1314).

Bruce now swept the country, but Carlisle he could not take. He married his daughter, Marjory, to the Steward, and from this union came the Stewart (Stuart) dynasty. The invasion of Ireland by Edward Bruce failed (1315-1318), and Edward fell in battle after which (1318) parliament settled the crown in the Stewart’s line, failing male descendants of Robert Bruce.

He disdained the pope’s efforts to make peace with England, except on terms of absolute independence for his country. He lost his father-in-law, and held himself and Scotland to Edward with heavy loss near Byland Abbey in Yorkshire, where the highlanders scaled a cliff and drove the English from a formidable position. A thirteen years’ truce was arranged in 1323: the pope removed his excommunication from Bruce, and acknowledged him as king: a son, David, was born to him in 1324.

The murder of Edward II. (1327) was followed by successful Scottish raids in the north, and in May 1328 the Treaty of Northampton sealed the triumph of Scotland. David Bruce was to marry Joanna of England: Bruce was recognized as king: former owners of forfeited lands, with three exceptions, were not to be restored. This led, after Bruce’s death, to an invasion by the disinherited English ci-devant lords of lands in Scotland, and to a long war from which Scotland was only “saved as by fire.” Bruce died, outworn by war and hardships, on the 7th of June 1329: his body was buried in Dunfermline abbey; his heart, which Douglas was bearing to the Holy Land, was brought home again, after Douglas’s chivalrous death in battle with the Moors in Spain.

Bruce, previously so shifty, had never wavered or turned back since he smote the Red Comyn at Dumfries. In face of obstacles apparently insurmountable he had made a nation, consolidating all the forces which Wallace had stirred into life. There is, perhaps, nothing in the history of medieval Europe which so closely resembles a voice from ancient Greece as the reply of the nobles and the whole communis Scotland to the pope (parliament of Aberbrothoch, 6th of April 1326). They will be liegemen of Bruce only so long as he resists England. As long as a hundred Scots are left alive, they will continue the war for freedom, “which no good man loses save with his life.” They show that the barbarities of Edward I. (which he regarded as reprisals) have made it eternally impossible for Scotland to yield to an English king. Their excommunication by Rome does not trouble them at all. They are free from Rome, from England, from all alien powers. Henceforth, through good and evil fortune, this was the spirit of the nation.

The most important point in constitutional history was the action of a parliament at Cambuskenneth, near Stirling, in 1326. The representatives of the burghs were present: they made a grant of all tenths to the king during his life; while they covenanted with him that he should collect no other taxes and should exercise the privileges of prisaes et cariagia with moderation. The long wars had been adverse to commerce, for which ransoms and the booty of Bannockburn made inadequate compensation. But the great abbey church of St Andrews was, none the less, completed, to stand for some two hundred and forty years, and was dedicated in the presence of Bruce.

The brilliant and sustained effort which made Scotland independent was almost paralyzed by the deaths of Bruce and...
the Good Sir James of Douglas, during the minority of David II. (crowned, 24th of November 1331). The disinherited lords, deprived of their lands by Bruce, were headed by Edward Baliol, claiming the crown of Scotland as heir of John Baliol, and secretly backed by England. Randolph, her warring husband, the earl of Edward Baliol, with the disinherited lord of Liddesdale, and Beaumont, the disinherited earl of Buchan, and the English claimant of the earldom of Atholl, landed a filibustering force in Forfarshire. They were opposed by the new regent of Scotland, the earl of Mar, who was routed with heavy loss and was slain, at Dupplin, on the 24th of August 1332. The English owed the victory to their archers, whose shafts rolled up a courageous charge by the Scots. Edward Baliol was enabled to seize and fortify Perth and was crowned at Scone, as Edward I. of Scotland (24th of September). On the 23rd of November, at Roxburgh, Baliol acknowledged Edward III. as his liege lord and promised to surrender Berwick and large lands in southern Scotland. The hands on the clock were then put back to the time of the reign of John Baliol. But the earl of Murray, son of Randolph, and Archibald, youngest brother of the Good Lord James of Douglas, surprised Baliol at Annan and drove him, half clad, into England.

The struggle was now (1333) for Berwick, which was besieged by Edward III. Archibald Douglas tried to relieve it, just as Edward II. strove to relieve Stirling, and found his hopes crushed by the capture of Carlisle in the fall of July 1333, where he was routed and slain, with many of the leaders of the Scots. Scotland was never again to hold Berwick for any length of time: meanwhile a few castles stood out, but the child king was sent over to France for safe keeping. A parliament held by Baliol at Edinburgh (February 1334) ratified the promises made by him to England at Roxburgh: the disinherited lords were in power and many patriots turned their coats. At Newcastle on the 12th of July Baliol surrendered to Edward III. the southern shires of Scotland with his son, Edward Baliol, and the earl of Rothesay. The southern earldom of Scotland, and Edward III. would have succeeded where Edward I. failed, had not the partisans of Baliol come to deadly feud over matters of their private interests and ambitions. Some took part with Sir Andrew Murray, son of a companion of Wallace, and with the Steward, who contrived to occupy the castle of Dunkarton, the key of western Scotland. These two men, with Campbell of Loch Awe, and Randolph's son, the earl of Moray, held up the national standard and were joined by the English claimant of the earldom of Atholl.

Randolph's daughter, too, the famous Black Agnes of Dunbar, brought over her husband, Sir John Douglas, the Black Knight of Liddesdale, went to her relief and slew Atholl: Edward III. (1336) again waged a victorious summer campaign, from Perth as his base, and again found Scottish resistance revive in winter. His capture with France in October 1337, caused by his claims to the French crown, tended to withdraw his attention from Scotland, where, though the staunch Sir Andrew Murray died, Black Agnes drove the English besiegers from Dunbar (1338), while the Knight of Liddesdale recovered Perth. By 1342 Roxburgh, Stirling and Edinburgh castles were in Scottish hands, though the Knight of Liddesdale captured and starved to death, in Hermitage castle, his gallant companion in arms, Sir Alexander Ramsay, who had relieved the garrison of Dunbar. With this Douglas, Knight of Liddesdale, a ruffian and a traitor, may be on to begin the long struggle between his too powerful house and the crown.

King David, a lad of eighteen, had returned from France and had removed this Douglas from the sheriffdom of Teviotdale, superseding him by Alexander Ramsay. Douglas revenged himself on Ramsay, as we have seen, and though David was obliged to overlook the crime, the Knight of Liddesdale henceforth was not to be trusted as loyal against England. It is probable that he was intriguing for Baliol's restoration, and he certainly was securing the favour of Edward III. An ill-kept truce of three years was ended in October 1346, when David attempted to lead the whole force of his realm, including the levies of John, Lord of the Isles, and of the western Celts in general, against England. As the Celts marched south the earl of Ross slew Ronald Macdonald, whose inheritance was claimed by John of the Isles. As a result, the Islesmen went home: David, however, crossed the border, plundering and burning the marches. Near Durham he came into touch with English levies under Henry Percy and the archbishop of York. David was a knight of the French school of late chivalry: he was not a general like Bruce or Randolph. In this affair of Neville's Cross (17th of October 1346) he copied the mistakes of Edward II. at Bannockburn; his crowded division was broken by the English archers, and the king himself was wounded and captured. Moray, the last male representative of Randolph, with the Constable and Earl Marischal of Scotland, was slain; the Steward made his escape: and, henceforth, the childless David regarded his heir, the Steward, with jealousy and suspicion. The Steward, during the king's captivity, was regent, and the Douglas of Liddesdale (the son of Archibald and nephew of the Good Lord James) drove the English out of Dougallsdale, Teviotdale and the forest of Ettric. A truce till 1351 was arranged between England, France and Scotland, while the country strove to raise the royal ransom, and David, who preferred English ways to those of his own kingdom, acknowledged Edward III. as his paramount. It became David's policy to secure his own life interest on Scotland, while the crown, on his decease, should go to one of the English royal family. The more loyal William Douglas, in 1353, slew his kinsman, the shifty Knight of Liddesdale, on the braes of Yarrow, and a fragment of one of the oldest Scottish ballads descends from this time.

In July 1354 an arrangement as to David's ransom was made: his price was 90,000 merks sterling (for the coinage of Scotland was already beginning to be debased). Negotiations were interrupted by the arrival of French reinforcements in men and gold: Berwick was recaptured, only to be recovered by England in 1356. In the same year Edward Baliol, after handing over his crown and the royalty of Scotland to Edward III., retired from active life, and Edward wasted the south in the raid of "The Burned Candlemas." In October 1357 David was permitted to return to Scotland, giving up his claim to the duchy of Teviotdale and the forest of Ettrick. A truce till 1357 was arranged. The country, crushed by inevitable taxation, was discontented, and not reconciled by Edward's grant of commercial privileges. In May 1363 David put down a rising headed by the Steward, and then, in October, went to London, where he and the earl of Douglas made arrangements by which the countries were to be united under Edward III., if David died childless. Scotland was to be forgiven the ransom, receive the Stone of Scone and retain its independent title as a kingdom: her parliaments were to be held within her own borders; her governors and magistrates were to be Scots, freedom of trade was guaranteed, and the earl of Douglas was to be restored to his English estates, or to an equivalent.

This scheme would have saved Scotland from centuries of war and from a Steward dynasty: there would have been a union of the crowns, as under James VI.; or (by an alternative plan of November, December 1363) a son of the king of England, not Edward III. himself, would succeed to David. In March 1364 David laid the projects before a parliament at Scone, which firmly refused its assent. Possibly David had, as one motive for his scheme, the very dubious legitimacy of the children of the Steward, a probable cause of civil war and a disputed succession. He had also private reasons for disliking the Steward, who was on bad terms with the widow, Margaret Logie (by birth a Drummond), whom David had married on the death of his first wife. The country,
resolved to stand by the Steward and the blood of Bruce, preferred the heavy taxation and the turbulence inevitable under such a king as David to union under an English prince. On the 20th of June 1365 Edward granted a four years' truce, with the ransom to be paid in yearly instalments of £4,000. But the necessary taxation was resisted by various nobles, including John of the Isles (1368), who had married a daughter of the Steward. John was in arms, divisions and distress were everywhere, a famine prevailed, and Scotland had to face the prospect of yielding to Edward, when, in 1369, that prince proclaimed himself king of France, and, having his hands full of war, made a farther seven years' truce with his enemies.

David was now free to subdue John of the Isles, to repudiate all his own debts contracted before 1368, and to make preparations for a crusade. From this crowning folly death delivered him on the 22nd of February 1371. The whole of his ransom was never paid, and his absurdiies and misfortunes gave the Estates opportunity to strengthen their constitutional position. They established the rule that no official should put in execution any royal warrant against the statutes and common form of law.

The reign also saw the introduction of the committees, "electors," the Commons and the "Estoires," which did the actual business of parliament, thus saving time and expense to the members. But these committees, later known as the Lords of the Articles, were to exercise almost all the powers of parliament in accordance with the desires of the crown, or of the dominant faction, and they were among the grievances abolished after the revolution of 1688-1689. The whole reign was a period of wasteful turmoil, of party strife, of treachery, of reaction. But the promise of peace and prosperity in exchange for absolute independence was rejected with all the old resolution; and the freedom which a Bruce desired to sell was retained by the first of the Stewart line, Robert II.; for Mr Froude erred in alleging that James I. was the first Stewart king of Scotland.

Robert II., the grandson of Robert Bruce, had lived hard, and when he came to the throne, was weary of fighting and of politics. Nothing proves more clearly the firm adherence of the nation to the blood of Bruce, and the parliamentary settlement of the crown in his female line, than the undisputed acceptance of the Steward's children as heirs to the throne. Several of them had been born to Robert's mistress, Elizabeth Mure of Rowallan, before a papal dispensation permitted, in 1349, a marriage which the canon law seemed to render impossible. The pope might have said, like a later pontiff on another day, "remittimus irremissiblemente." By a second marriage, undeniably legal, Robert had a family whose claims were not permitted to give trouble at his accession, though the earl of Douglas, the fellow conspirator of David II., would have caused difficulties if he had possessed the power. His eldest son, the earl who fell at Otterburn, was married to Robert's daughter, Isabella, but by her he had no issue. The new prince of Scotland, John (an unlucky name, later changed to Robert), was a fa-inch: the king's second son, Robert, earl of Fife (later first duke of Albany), was a man of energy and ambition, while the character of the third, Alexander, is expressed in his sobriquet, "The Wolf of Badenoch."

When the new reign opened, Edward III. made no secret of his claims to be king of Scotland, and the southern regions were still in English hands. From 1372 to 1383 Scotland was in truce with England; and Robert II. had no desire to aid France and accept from Rome a dispensation from the oath of truce. The southern nobles, under the Douglases and March, kept up a semi-public feud with the Percy on the border, after the accession of Richard II., still a child, and piece by piece Scottish territory was recovered, mainly in Teviotdale and Liddesdale. In 1380 and 1381, Lancaster, uncle of Richard II., arranged truces, but difficulties were caused by the late proclamation, in Scotland, of a truce made with her ally, France, on the 26th of January 1384. With the tidings of this truce arrived, in April, a body of French knights who desired to enjoy fighting, and though dates are obscure they seem to have caused, by a raid in April, a retaliatory foray by the Percies in May or June. The king smoothed matters over, but in 1385 a great band of French knights landed in Scotland, forced the king's hand, and penetrated England as far as Morpeth. Here they might have had fighting enough, as Lancaster led a force against them, while Richard II. followed with a large army. But Douglas, to the disgust of the French, refused battle, and allowed the English to do what mischief could be done in a thrice stripped country. The French deemed the Scots shabby, poor and avaricious: their grooms were killed by the peasantry when they went foraging: the nobles were churlish and inhospitable.

In August 1388 Douglas led the famous raid as far as Alnwick城堡, with his chief companion in the battle of Otterburn, fought by moonlight. Here Douglas fell in the thickest of the melee, but his death was concealed and Henry Percy, with many other English knights, were captured and held to heavy ransom (15th of August 1388). These battles were fought in the spirit of chivalry, and were followed, in 1389, by a three years' truce.

The second son of King Robert, Albany, was appointed governor, his father being in ill-health and dying in 1390. He was succeeded (14th of August 1390) by his son, Robert III., when the previous year, his brother Albany had been preferred before him as governor. The reign of a weakening was full of anarchy, complicated by the feud between his eldest son, the wayward duke of Rothesay, and his ambitious brother, now duke of Albany. These two are the first dukes in Scotland.

There was peace with England till the death of Richard II. in 1399, and till the parliament of January 1399 Albany still undertook the duties of the king.

Here commenced the tragedy of the Stuarts and of Scotland. For nearly two centuries each reign began with a long royal minority, increasing the power and multiplying the feudalism of the nobles. The remainder of each reign was, therefore, a struggle to re-establish the central power, a struggle in which cruel deeds were done on all sides. Meanwhile, now England, now France, secured the alliance of the men in power, or out of power, and threatened the independence of the kingdom. The cause of the miseries of these two unhappy centuries was beyond human control: no Stuart sovereign, after Robert II., escaped from the inevitable evils of a long minority, while Robert II. himself was as weak as any child. Under his rule, the Cols in the north and west, in 1387, became troublesome, while Robert's son, the Wolf of Badenoch, who was justiciary, with his own wild sons, rather fanned than extinguished the flames. They slew the sheriff of Angus (1391-1392) in a battle, and then two clan-confederacies, quarrelling among themselves, put their cause to the ordeal of fight, in the famous combat of thirty against thirty, on the Inch of Perth (see Scott's "Fair Maid of Perth"). Though we know the cost of fencing the lists, from entries in the treasury accounts, we are ignorant of the cause of the quarrel, and even of the clans engaged. The names are diversely given, but probably the combat was only one incident in the long wars of the Camerons with the great Clan Chattan confedery. In 1397, at Stirling, the Estates denounced the anarchy "through all the kingdom," and, in 1398-1399, were full of grievances arising from universal misgovernment. By this parliament, David, prince of Scotland and duke of Rothesay, was made regent for three years; with his uncle, duke of Albany, as his coadjutor. Peace between Albany and the wayward Rothesay was impossible, and Rothesay, by breaking with the daughter of the earl of March, and marrying a daughter of the third, Earl of Douglas, added a fresh fuel to the general confusion.

Meanwhile Scotland, to vex Henry IV., adopted the cause of the "Mammet," the pretender to be Richard II. This enigmatic personage appeared in Islay, and rather had his pretences thrust on him than assumed them; he was half-witted. Meanwhile the insult to March caused him to seek alliance with Henry IV., who crossed the border—the last English king to do so—and appeared before Edinburgh castle. Rothesay held it in his contempt, and, as Albany declined a battle, in the open, Henry returned with nothing gained.
In 1400 Albany, and the 4th earl of Douglas (brother-in-law of the duke of Rothesay), confessed before the Estates that they had arrested the prince, and were cleared of the guilt of his subsequent death. They kept him, first in the castle of St Andrews, and then at Falkland, where he perished; some said of dysentery, others, of starvation.

Restored to the regency, Albany permitted his son, Murdoch, with Douglas, to retort on a successful raid by Percy and the Mar of Bute in learning, the unwarranted series of border raids defeated by English archery, as usual, at Hamilton hill: Murdoch and Douglas were captured. Percy, dissatisfied with Henry's treatment of him in the matter of ransoms, led an army into Scotland which was to have trysted at Cocklaw with Albany and the whole forces of the realm, and invaded England. But Douglas and Percy left Cocklaw before Albany came up, and hurried to join hands with the Welsh rebel, Glendower. The hostile forces met at Shrewsbury, and Shakespeare has made the result immortal. Percy was slain; Douglas was the prisoner of England.

The young prince of Scotland, the first James, was on his way to seek safety in France, during an interval of truce, but was captured on the high seas by English cruisers. (The dates are obscure, but James was in the Tower by February-March 1405-1406.) His father's death followed (4th of April 1406). Albany sent, within a year, envfoys to plead for his release; and again, in 1409, but vainly. An interval of peace occurred, among a series of border battles, and the heresy of Lollardy was attacked by the clergy; Resby, who had been a priest in England, was burned in 1407 at Perth. The embers of Lollardy, not extinguished by the new central foundations of learning, the university of St Andrews, smouldered in the west till the Reformation.

"The wicked blood of the Isles," the Macdonalds, descendants of island kings, now made alliance with England; Donald, eldest son of the Lord of the Isles, having an unsatisfied claim on the earldom of Ross, which Albany strove to keep in his own family. The greatest of highland hosts met at Ardtrumish castle, now a ruin on the sound of Mull: they marched inland and north, defeated the Mackays of Sutherland and were promised the plunder of Aberdeen. The earl of Mar, with a small force of heavily-armoured mainland cavaliers, stopped and scattered the plauded Gael at Harlaw (1411). The knights lost heavily, but Donald did not plunder Aberdeen (see Elspeth's ballad of Harlaw, in The Antiquary). Next year Albany received the submission of Donald at Lochgilp in Knapdale, and the Caelds were, for the moment, useless to their allies of England.

Time went on: Albany's son, Murdoch, was set free, but in 1410 the captive King James much resented Albany's neglect of himself. His letter is written in Scots. Albany died in 1420; his regency, with that of his son Murdoch, produced the anarchy which James, when free, combated at the cost of his life. Meanwhile France demanded and received auxiliaries from Scotland, who fought gloriously for French freedom. Their great victory, where the duke of Clarence fell, was at Baugé Bridge (1421), where the Stewarts and Kennedys, under Sir Hugh, were specially distinguished. In 1424 the Scots, with the earl of Buchan and the earl of Douglas, were almost exterminated at Verneuil, some five months after King James, already affianced to the Lady Jane Beaufort, was released. He never paid his ransom, and his noble hostages lived and died south of Tweed: one cause of his unpopularity.

Tradition tells that James vowed "to make the key keep the castle, and the bush keep the cow," even though he "lived a dog's life," in the endeavour. His reign was a struggle against anarchy, and in the cause of the poor and weak. He instantly arrested Murdoch, son of Albany, and Fleming of Cumbernauld, met parliament, dismissed it, retaining a committee ("the Lords of the Articles"), and took measures with landlords, who must display their charters; appointed an inquest into lay and clerical property; and imposed taxes to defray his ransom. The money could not be collected, and the edicts against private wars and the maintenance of armed retainers were hard to enforce. James next arrested Lennox and that Sir Robert Graham whose feud proved fatal to the king. In March 1425 he met his second parliament, relying on a council of barons with no great earl but Mar. He next arrested Albany's secretary and the Lord Montgomery: the story, accepted by our historians, that he also seized twenty-six notables, has been finally disproved by Sir James Ramsay. No Scottish king ever embarked on such a coup d'état as the arrest of "the whole Scottish House of Lords," and Knox, who attributes a much larger design to James V, must have been deceived by rumour. Albany (Murdoch), his son, and Lennox, were tried and executed: Albany's son, James, in revenge burned Dumbarton. The king appears to have been avenging his private wrongs, or destroying the three nobles pour encourager les autres. Parliament now insisted on inquisition for heretics: an act was passed (which never took effect) against "bands" or private leagues among the nobles: the Covenant was called "the great band," by cavaliers in days to come.

More important was the establishment of a new court of justice, the court of Session, to sit thrice in the year. Yeomen were permitted to practice archery, to which they much preferred football and golf.

The highlanders were next handled as the lowlanders had been; a parliament was held at Inverness and a number of chief who attended were seized, imprisoned or executed. The Lord of the Isles, when released, burned Inverness (1429), but, being pursued, he was deserted by Clan Chattan and Clan Cameron (probably the clans represented on the ordeal of battle on the Inch of Perth). The Lord of the Isles made submission, but Donald Balloch, his cousin, defeated Mar near Inverlochy, later, and fled to Ireland, and was reported dead, though he lived to give trouble. James was unjealously impressing highland anarchy: from the highlands came his bane.

James next granted his daughter, a child, to the Dauphin, later Louis XII.; but, as Jeanne d'Arc said, "the daughter of the king of Scotland could not save Orleans," then (1428-1429) besieged in a desultory manner by the English. In February 1429 the Scots under the oriflamme were cut to pieces in "The Battle of the Herrings" at Rouvray. Thesurviving Scots fought under Jeanne d'Arc till her last success, at Lagny, under Sir Hugh Kennedy of Ardstinchar in Ayrshire, but James (May, June 1429) made a treaty of peace with Cardinal Beaufort, which enabled Beaufort to send large reinforcements into Paris, where the Maid, deserted by Charles VII., failed a few months later.

In October 1430 was born the prince destined to be James II. The king and the Estates were curtailing the judicial privileges and jurisdiction of the clergy; and the anti-pope, Peter de Luna, quarrelled with the country on this ground. Scotland then deserted his cause for that of Martin V., but quarrels between church and state did not cease, and a legate arrived to settle the dispute a few days before the king's murder. James had already threatened the Benedictines and Augustines for "im-pudently abandoning religious conduct," and had founded the Carthusian monastery in Perth, that the Carthusians might offer a better example. A reformation by the state seemed at hand, but the religious orders fell deeper in odium and contempt during the next hundred and thirty years. Doctrine, too, was endangered by heretics, one of whom, a Hussite named Paul CRAWAR, was burned at Perth in 1433.

In 1427 James seized, as a male fee, the earldom of Strathearn, gave the earl by female descent the title of Menteith, and sent him to England as a hostage for his ransom. He was nephew of the Sir Robert Graham whom James had arrested at the beginning of his reign: Graham's anger was thus rekindled. The earls of Mar and March also lost their lands, on one pretext or another: James's policy was plainly to break the power of the nobles.

The English translation (1440) of a lost contemporary Latin history of the events averrs that Sir Robert Graham rose in parliament, denounced James as a tyrant and called on the barons to seize their king: Graham was taken, was banished from court, was confiscated and fled to the Aitholl hills. He thence intrigued with the old earl of Atholl (heir to the crown if the ancestors of James by Robert II.

Death of James I.
and Elizabeth Muir were illegitimate), and he drew into the conspiracy the king's chamberlain, Atholl's grandson. By his aid 300 highlanders were brought into the monastery of the Black Friars in Perth, where the king was keeping the Christmas of private war, and Crichton, who slew James who had fled into a vault. The conspirators were seized and tortured to death with unheard-of cruelties, but lawlessness had won the battle. James had failed, practically, even in his effort (1447-1448) to Anglicize parliament, by introducing the representative system; two "wise men" were to be chosen by each sheriffdom, and two Houses were to take the place of the one House in which all Estates were wont to meet. But constituents were averse to paying their members, no Speaker was elected, the reform never came into being. Till the Union, all estates sat in one room during parleys. The court of session was the most powerful and permanent of James's innovations, and his poem "The King's Quhair" attests his real genius. He had attempted to reform the country too hurriedly; and treachery, by all accounts, was one of his methods. He left a child as king, and the old round of anarchy began again; oppression, murder, feud, faction and private war. History repeats itself, and the evil practices were checked, not by the Reformation, but by the increased resources and entire safety enjoyed by James VI. when he succeeded to the crown of England.

Space forbids a record of the faction fights in the reign of James II. Coming to the crown at the age of seven, he was used like the Great Seal, as a sanction of authority and passed from one party to another of the nobles, as each chanced to be the more dexterous or powerful (crowned 25th of March 1437). The Crichtons and Livingstones held the king till the earl of Douglas died, being succeeded by his son, a boy. The queen-mother married Sir James Stewart of Lorne, and their sons, Buchan and Atholl, mixed in the confused intrigues of the reign of James III., but the queen was treated with scant courtesy by the rival parties. From them the young earl of Douglas and the duchy of Touraine, the most powerful man in Scotland, stood apart, sullenly watching an unprecedented state of anarchy. Livingstone and Crichton, previously foes, invited him and his brother to dine with the child king in Edinburgh castle, and there served to him "the black dinner" bewailed in a fragment of an early ballad. The two young nobles, after a mock trial, were decapitated (November 1440).

Douglas was succeeded in his earldom by his grandfather, Sir James the Gros, an unwieldy veteran. On his death in 1443, his son, William, a lad of eighteen, became earl, and was regarded as privy to the intrigues of the queen. Crichton lost the chancellorship; and the keys were given to Kennedy, bishop of St Andrews and founder of St Saluator's college in that university. Involved in secular feuds with Douglas, Livingstone and the earl of Crawford, Kennedy destroyed Crawford with a spiritual weapon, his Curse (23rd of January 1445-1446).

On the 3rd of July 1449 James married Marie of Gueldres, seized and imprisoned the Livingstones, and generally asserted royal power. He relied on Douglas, who (1450) was his constant companion, till the earl visited Rome (November 1450-April 1451). In his absence in the Papal states, in which he was absent for twenty-six years, Douglas took advantage of his absence and was reinstated. He appears, however, that he was, or was suspected of being, in treasonable alliance with the new earl of Crawford and the ever-turbulent Celtic lord of the Isles. It is certain, from documents, that Douglas was always in the royal entourage from June 1451 to January 1452, so that stories of insults and crimes committed by him at this period seem legendary. Nevertheless, on the 22nd of February 1452, James, who had invited Douglas, under safe-conduct, to visit him at Stirling, there dined his guest with his own hand. The king was exasperated by parliament, in the sense of Douglas's contemptuous treatment of his safe-conduct, and because of his oppressions, conspiracies and refusal to aid the king against rebels, such as the new "Tiger Earl" of Crawford.

The brother of the slain Douglas defied his king, then made his submission, and visited London, where he probably intrigued with the English government against his sovereign and country. In 1455 James made serious war against the "Black Douglas" of the south; his army being led by the "Red Douglas," the earl of Angus. The royal cause was successful, and the Black Douglas was attainted (10th of June 1455). He fled south and became the pensioner and ally of Edward IV., who reasserted the traditional claim to sovereignty over Scotland—"his rebels of Scotland!"

From 1457 to 1459 a truce was made between Scotland and the Lancastrian party, then in power, but in July 1460, Henry VI. was defeated and taken, and his wife and son sought James's hospitality. Roxburgh castle was in English hands; James besieged it, and on the 3rd of August 1460 was slain by the bursting of one of his own huge siege guns. The castle was taken, but the second James died at the age of thirty, leaving a child to succeed him in his heritage of woe. James II. had overcome his nobles, but left a legacy of feuds to the coming reign.

The period of James III. is filled with the recurrent strife of the nobles among themselves and against law and order. Slowly and obscurely the Renaissance comes to Scotland; its presence is indicated by the artistic tastes of the king, and, later, by the sweet and mournful poetry of Henryson. But the Renaissance, like the religious revivals initiated in Italy, arrived in Scotland weak and weary; hence it did much harm with the new enthusiasms of the Faith of St Francis, and art was trampled on by the magistrates who hated poetry and painting.

In politics, the queen-mother, who had the private guardianship of her boys, the king and the dukes of Albany and Ross, turned from the Lancastrian to the Yorkist side, while Kennedy and his party (Lancastrians) were accused of endangering Scotland to please France. This was the beginning of that movement away from the Ancient League to partisanship with England, which culminated in the success of the Protestant alliance against Scotland at the Reformation. This, then, is an important moment in the long and weary march to union with England.

In 1461 Henry VI. was driven to take sad shelter with Kennedy at St Andrews. In June 1461 Edward IV. was crowned, and at once made pact and alliance with the banished Douglases and the Celts of the west Highlands and the isles. From Ardithorn castle, John, lord of the Isles, sent ambassadors to Westminster, where (1462) a treaty was made for an English alliance and the partition of Scotland between Douglas and the Celts. A marriage between the mother of James III. and Edward IV. was spoken of, but Kennedy would not meet the English, and in March 1463 the English army joined the French. But Douglas invaded Scotland, in advance of an English army, but was defeated by an army under Bishop Kennedy. When France went over to the Yorkists, Kennedy, accepting an English pension, made a long truce between Scotland and England (October 1464). Peace might have been assured, but Kennedy died in 1466. His tomb in his college chapel of St Saluator's at St Andrews, his college and his bridge over the river Eden, have survived as monuments of a good and great man; they passed unscathed through the ruin wrought by the heretics.

On his death the nobles, notably Fleming, Livingstone, Crawford, Hamilton and Boyd, made a band for securing power and place. Boyd, with some borderers, Hepburn and Ker of Cessford, seized the boy king, and Boyd had himself made governor, his son marrying the princess Mary, sister of James.

In July 1460 James, then about eighteen, married Margaret, daughter of King Christian of Norway, who pledged the Orkneys and Shetland Isles for her dowry, which remains unpaid. The enemies of the Boys instantaneously overthrew them, and the Hamiltons, a race of English origin, arose on them. The shaggy place of possible heirs to the crown. The princess Mary was divorced by her Boyd husband and married Lord Hamilton. Their descendants were again and again kept from the royal succession only by the existence of a Stuart child, Mary, queen of Scots, or James VI. This fact, with the consequent feud of the Stewarts of Lennox, themselves claimants, governs the
James marched in force to Stirling, the key of the north, but the treacherous commander of the castle, Shaw of Sauchie, held the castle against him. James and his leaders, Atholl and Huntly, with their Stewarts and Gordons, and the levies of the nobles, comprising the mounted gentry of Fife, encountered the vanguard of the English army on the moors of the Bannockburn, and the only thing they were able to do was make a show of determined resistance. They were dispersed and many of them were killed or captured. Meanwhile, confusion reigned in England. The queen was at the mercy of her counselors, and the lords of the earldom of Gloucester held the castle. James, having conquered England, was crowned king of Scotland and became the first monarch of the Stewarts. James was the first ruler of the Stewart dynasty to be crowned king of Scotland, and his reign was marked by a period of relative peace and prosperity. The country was at peace with England and the rest of Europe, and James was able to turn his attention to internal affairs. He was a瓦ardian of the Reformation in Scotland and was able to establish himself as a powerful and popular monarch.
years' truce fostered by the Spanish envoy, Ayala, who has left a flourishing description of the king and his country. Meanwhile Perkin had failed in Cornwall and been captured. Henry VII, kept offering the hand of his daughter Margaret, who was married to James at Holyrood in August 1503. From this wedding, disturbed by quarrels over the queen's dowry, was to result the union of the crowns on the head of Margaret's great-grandson, James VI., after a century of tragedies and turmoil.

In 1507 the pope failed to draw James into the league formed to check French aggression in Italy. A murder on the borders poisoned Scottish relations with England, and the death of Henry VII. (1509) left James face to face with his blustering brother-in-law, Henry VIII. The Holy League of 1512, against France, found James committed to the cause of the old French alliance. He strengthened his fleet, but his admiral, Sir Andrew Barton, fell in a fight with English privateers equipped by the earl of Surrey and commanded by his sons (1511). Border homicides added their element of international irritation, and James renewed the ancient league with France. In 1513 Dr West, an envoy of Henry VIII., found James in the state of "a fey man," doomed, distracted, agitated and boastful. In May came the letter and ring of the French queen ordering James, as her knight, to strike a blow on English ground. He wrote to Henry none the less (24th May) with peaceful proposals, but on the 30th of June Henry invaded France. Strange portents and warnings of storms did not check James: he sent forth a fleet of thirteen ships and 3000 men, which faded into nothingness: he declared war on Henry; and on the 22nd of August he crossed the border with all his force, including the highlanders and islesmen. After securing his flank and rear by taking Norham, Wark and Eitel castles, he awaited the approach of Surrey's army at Ford castle, behind which lies Flodden Edge, a strong position, which he presently occupied. Surrey, who was ill-provisioned, challenged him to fight on the open field of Wooler Haugh. James declined to commit this chivalrous folly; but, for all that, permitted Surrey to outmanoeuvre him and pass, concealed by a range of hills, across his front, to a position north of Flodden, on his lines of communication.

Next day, 9th of September, Surrey crossed the Till, unobserved, by Twisel bridge and Millford, and moved south against Branxton hill, the middle of three ridges on the Flodden slope. The ground was difficult from heavy rains, the English troops were weary and hungry, but James had lost touch of Surrey and knew nothing of his movements till his troops appeared on his rear towards evening. In place of remaining in his position, James hurried his troops. On top of Branxton hill, the French army was divided into three elements: Home and Hunami, on the Scottish left, charged Edmund Howard's force; the Tynemouth men, under Dacre, did not support Howard, at first, but Dacre checked Home (whose later conduct is obscure) and drove off the Gordons. The Percys broke Errol's force; Rothes and Crawford fell, and the king led the centre, through heavy artillery fire, against Surrey. With Herries and Maxwell he shook the English centre, but while Stanley and the men of Cheshire drove the highlanders of Lennox and Argyll in flight (their leaders had already fallen), the admiral and Dacre fell on the flank of James's command, which Surrey, too one to pursue the fleet highlanders outmanoeuvred with his whole force. The Scottish centre fought like Paladins, and James, breaking out in their front, hewed his way to within a lance's length of Surrey, as that leader himself avers. There fell the king, riddled with arrows, his left hand hanging helpless, his neck deeply gashed by a bill-stroke. His peers surrounded his body, and night fell on "the dark impenetrable wood" of the Scottish spears. At dawn the survivors had retreated, only the light Border horse of Home hung about the field. The bishop of Durham accuses them of plundering both sides. (That Home's Borderers had but slight loss is argued by Colonel the Hon. FitzWilliam Elliot, in The Trustworthiness of Border Ballads, pp. 136-138.) Among the dead were thirteen earls, and James's son, the archbishop of St Andrews. The king's death assured the victory, which Surrey had not the strength to pursue, though the townsmen of Edinburgh built their famous Flodden Wall to resist him if he approached.

England never won a victory more creditable to the fighting and marching powers of her sons than at the battle of Flodden. Though the king's eldest son of James, marked out by Ayala, gave the opportunity, but he nobly expiated his fault that the Scots had so handled their enemies that they could not or dared not pursue their advantage; on the other hand, it was long indeed before the memory of Flodden ceased to haunt the Scots and deter them from invading England in force.

Though Ayala's well-known letter certainly flattens the material progress of Scotland, the country had assuredly made great advances. While England was tuneless, with Dunbar and the other "Makers," Scotland was "a nest of singing birds." The good Bishop Elphinstone founded the university of Aberdeen in 1495; and in 1496 parliament decreed compulsory education, and Latin, for sons of barons and freeholders. Prior Hepburn founded a new college, that of St Leonard's, in the university of St Andrews, and Scotland owes only one university, that of Edinburgh, to the learned enthusiasm of her reformed sons. Printing was introduced in 1507, and the march of education among the laity increased the general contempt for the too common ignorance that prevailed among the clergy. The greater benefices were being conferred on young men of high birth but of little learning. The college of Surgeons was founded by the municipality of Edinburgh (1509), and in 1506 obtained the title of "Royal." The stimulus given to shipbuilding encouraged commerce, and freedom from war fostered the middle class, which was soon to make its influence felt in the Reformation. The burgesses, of course, had long been a relatively rich and powerful body: it is a fond delusion to suppose that they sprang into being under John Knox, though their attachment to his principles made them prominent among his disciples, while Flodden probably began to deter them from the ancient attachment to France. Protestantism, and the disasters of James V., with the regency of his widow, were to convert the majority of Scots to the English party.

The long minority of James V. was fatal to the Stuart dynasty. The intrigues of Henry VIII., the ambition of Angus, who married the king's mother (Margaret, sister of Henry VIII.); the counter intrigues of Albany, a resident in France, and son of the rebellious Albany, brother of James III.; the constantly veering policy and affections of the queen-mother; and the gold of England, filled fourteen years with distractions, murders, treasons and conspiracies. Already Henry VIII. was trying to succeed his king, who, as he grew old, had the "stepfather, Angus, was his master and was the paid servant of Henry. The nobles were now of the English, now of the French party; none could be trusted to be loyal except the clergy, and they were factious and warlike. The result was that James threw off the yoke of his stepfather, Angus; drove him and his astute and treacherous brother, Sir George Douglas, into England (thereby raising up, like Bruce, a fatal party of lords disinherited), and while he was alienated from Henry and his Reformation, threw himself into the arms of France, of the clergy and of Rome.

Meanwhile the many noble and dissatisfied pensioners of England adopted Protestantism, which also made its way among the barons, burgesses and clergy, so that, for political reasons, James at last could not but be hostile to the new creed; he bequeathed this anti-Protestantism, with the French alliance, through his wife, Mary of Guise, and the influence of the house of Lorraine, to his unhappy daughter, Mary Stuart. The country, ever jealous of its independence, found at last that France threatened her freedom even more than did England, the apparent enemy; and thus, partly from Protestantism, partly from patriotism, the English party in Scotland proved victorious, and the Reformation was accomplished. Had Henry been honourable and gentle, had his sister not shared his vehement passions, James and Henry, nephew and uncle, might have been...
He had been educated in Scotland and Paris, held the rich abbey of Arbroath, and for some twenty years at least lived openly with Marriote Oglyve, of the house of Arlie. He was a practised diplomatist, and necessarily of the French and Catholic party. His wealth, astuteness, experience and tenacity of purpose were to harass Henry's attacks on Scottish independence, till the daggers of pietistic cut-throats closed the long debate. Beaton was cruel: he had no more scruples than Henry about burning men for their beliefs. But the martyrs were few, compared with the numbers of people whom the reformed kirk burned for witchcraft. Some twelve martyrs at least perished in 1539-1540, and George Buchanan, whose satires on the Franciscans delighted the king, escaped to France, in circumstances which he described diversely on different occasions, as was his habit.

In 1540 James visited the highlands, and later reduced the Macdonalds and annexed the lordship of the Isles to the crown. In 1541 he lost two infant sons, and the mysterious affair of the death of that aesthetic ruffian, Sir James Hamilton of Finnart, was supposed to lie heavy on his mind. There were disputes with Henry, who demanded the extradition of fugitive friars, which James refused. In 1541 he disappointed Henry, not meeting him at York, and this course, advised by his council and Francis I, ranked deep, while Henry was making a large English raid on the Border in time of peace. The English fared ill, and Henry horrified his council by his usual proposal to kidnap the king of Scotland. Henry's men marched on the Border, but a force which James summoned to Fala Moor (31st of October 1542) contained but one lord who would march with him—Napier of Merchistoun. About this date occurs the legend of a list of hundreds of heretics, whom the clergy asked James to proscribe. No king of Scotland could dream of executing such a coup d'état; the authority for it is that mythopoeic earl of Arran who later became regent, and told the fable to Henry's agent, Sir Ralph Sadleir.

Presently ensued the Scottish raid of Solway Moss and the capture of many of the Scottish nobles. The facts may be found in contemporary English despatches printed in the Hamilton papers. The fables are to be read in Knox's History of the Reformation in Scotland, and in Froude. The secret of the raid was sold by the brother of Angus, Sir George Douglas, and by other traitors. England was prepared, and on the 23rd of November routed and drove into Solway Moss a demoralized multitude of farm-burning Scots. The guns and some 1200 men were taken; many men were drowned. James retired heartbroken from the Border to Edinburgh, where he executed business. He then dwelt for a week at Linlithgow with the queen, who was about to give birth to a child. Next he bore "the pleasant pageant of his6 blesse heart " to Falkland, where he hailed the birth (8th of December) of his daughter, Mary Stuart. Uncomforted, he died on the 14th (15th?) of December. Accounts differ as to the date. Sheer grief and shame, and, it is said, sorrow for the failure in war of his favourite, Oliver Sinclair, were the apparent causes of his death. Knox appears to insinuate that a rumour declared Mary of Guise and the cardinal guilty of poisoning James, but an attempt had been made to put another sense on the words of this historian, who frequently hints that Mary was the mistress of the cardinal (Knox, vol. i. p. 299).

Again Scotland had to endure a long royal minority. The distraction of Scotland promised to Henry VIII. a good chance of annexing the kingdom, whether by the marriage of Edward, prince of Wales, to the infant queen, Mary, or by acquiring, through treachery, her person and the castles of the country. Sir George Douglas at once crossed the border. Angus soon followed, with the lords captured at Solway Moss, all bound more or less to work Henry's will. In Scotland the cardinal; Arran, who was next heir to the throne; Huntly and Murray were proclaimed regents. Knox and others speak of a will of James V., forged by the cardinal, but the stories are inconsistent, and rest mainly on the untrustworthy evidence of Arran. His legitimacy was rather worse than dubious, and henceforth he sided with the party most
The death of Beaton brought the Douglases into resistance to Henry VIII., who aided the murderers, now besieged in Beaton’s castle of St Andrews. An armistice was arranged; the besieged begging for a remission from the pope, and also asking Henry to request the emperor to move the pope to refuse. The remission, however, arrived before the 2nd of April 1547, and was refused by the murderers.

Henry VIII. and Francis II. were now dead. In mid July French armed galleys approached St Andrews, and the castle surrendered. Some English artillery was brought to bear on it. With other captives, John Knox was put aboard a French galle.

In September the Protector Somerset (Hertford) invaded and utterly routed the Scots at Pinkie near Musselburgh. No result ensued, except Scottish demands for French aid, and a resolve to send Mary to France. Feroce fighting, aided by French auxiliaries, followed: in 1550 the English abandoned all castles occupied by them in Scotland. Mary was now in France, the destined bride of the Dauphin; while Knox, released from the galleys, preached his doctrines in Berwick and Newcastle, and was a chaplain of Edward VI., till the crowning of Mary Tudor brought him to France. Huldreich Zwingli with political modifications of his own, the extreme form of Calvinism.

A visit of Mary of Guise to France (1550) ended in her acquiring the regency, which she administered mainly under French advice. The result was irritation, the nobles looking towards England as soon as Mary Tudor was succeeded by Elizabeth, while Protestantism daily gained ground, inflamed by a visit from Knox (1555-1556). Invited again, in 1557, he shrank from the scene of turmoil, but a "band" of a Protestant tendency was made by nobles, among whom was Mary’s natural brother James Stewart, the Earl of Lennox (3rd of Dec. 1557). On the 24th of April, Mary wedded the Dauphin, and about the same date Walter Milne, an aged ex-priest, was burned as a heretic, the last Protestant martyr in Scotland. There was image-burning by godly mobs in autumn; a threat of the social revolution, to begin at Whitsuntide, was issued on the 1st of January 1559,-" the Beggars’ Warning." Mary of Guise issued proclamations against preachers and church-wreckers, backed by a statute of March 1559. The preachers, mainly ex-friars and tradersmen, persevered, and were summoned to stand their trial in April, but Knox arrived in Perth, where an armed multitude supported their cause. On the 10th of May they were outlawed for non-appearance at Stirling. Knox accuses Mary of Guise of treachery: the charge rests mainly on his word.

On the 10th of May the brethren wrecked the monasteries of Perth, after a sermon by Knox, and the revolution was launched, the six or seven preachers already threatening the backward members of their party with excommunication. The movement spread to St Andrews, to Stirling, to Edinburgh, which the brethren entered, while Mary of Guise withdrew. She was still too strong for them, and on the 24th of July they signed a compact. They misrepresented its terms, broke them, and accused the regent of breaking them. Knox and William Kirkcaldy of Grange had been intriguing with England for aid, and for the marriage of the earl of Arran (son of the earl of Arran, now also duke of Chathelherault, ex-regent) with Queen Elizabeth. He escaped from threatened prison in France, by way of Switzerland, and though Elizabeth never intended to marry him, the Hamiltons now deserted Mary of Guise for the Anglo-Protestant party. Maitland of Lethington, the Archiphe of his day, also deserted the regent; but in November the reformers were driven by the regent and her small band of French soldiers from Edinburgh to Stirling. They were almost in despair, but, heartened by Knox and Lethington, they resumed negotiations with Elizabeth, who had already supplied them with money. An English fleet suddenly appeared, and drove the French to retreat into Leith from an expedition to the west. In February 1560 a league was made at Berwick between Elizabeth and “the Congregation.” France was helpless, the tumult of Amboise alarmed the Guises for their own lives and power, and the regent, long in bad health, was dying in Edinburgh castle. On the 10th of June
she expired, and hunger forced her French garrison in Leith, after a gallant and sanguinary defence, to surrender.

After an armistice, treaties of peace were concluded on the 6th of July: the treaty, as far as it touched the rights of Mary Stuart, was not accepted by her, nor did she give her assent to the ensuing parliament or convention of Estates. Knox and the other preachers began to organize the new kirk, under the guidance of the English ambassador, whose rule was very brief. The Convention began business in August, crowded by persons not used to be present, and accepted a Knoxian "Confession of Faith." On the 24th of August three statutes abolished papal and prelatical authority and jurisdiction; repealed the old laws in favour of the church, and punished celebrants and attendants of the Mass—for the first offence by confiscation, for the second by exile, for the third by death. The preachers could get the statute passed, but the sense of the hostility prevented the death penalty from being inflicted, except, as far as we know, in one or two instances. The Book of Discipline and the Book of Common Order express Knox's ideals, which, as far as they were noble, as in the matter of education and of provision for the poor, remained, in part or in whole, "devout imaginations." Not so the Knoxian claims for the power of ministers to excommunicate, with civil penalties, and generally to "rule the roast" in secular matters. The nobles and gentry clung to the wealth of the old church; the preachers, but for congressional offerings, must have starved. Neglect as well as mob violence left the ecclesiastical buildings in a ruinous condition, but the authority of the state, with their power of boycotting (excommunication), became a theocracy. The supernormal claims of these preachers to dominance in matters public or private were the main cause of a century of war and tumult. The preachers became, what the nobles had been, the opponents of authority; the Stuarts were to break them and be broken on them till 1688. In the hands of the ministers a Calvinism more Calvinistic than Calvin's was the bitter foe of freedom of life, of conscience, and of religious tolerance. On the other hand, unlike the corrupt clergy whom they dispossessed, they were almost invariably men of pure and holy life; stainless in honour; incorruptible by money; poor and self-sacrificing; and were not infrequently learned in the original languages of the scriptures. Many were thought to be possessed of powers of healing and of prediction; in fact a belief in their supernormal gifts, like those of Catholic saints, was part of the basis of their prestige. The lower classes, bullied by sabbatarianism and deprived of the old revels, were restive and hostile; but the educated middle class was with the preachers; so were many lesser country gentry; and the nobles, securing the spoils of the church, were acquiscent.

The rulers condoned, in the hope of securing public and private work of destruction had been done, was the most peaceful that occurred in any European country. On the Catholic side there was as yet no power of resistance. Huntly, the Catholic "Cock of the North," had himself been compromised in the actions of the Congregation. How the Catholics of the west highlands took the change of creed we do not know, but they were not fanatically devout and attempted no Pilgrimage of Grace. Life went on much as usual, and the country, with a merely provisional government, was peaceful enough under the guidance of Moray, Maitland of Lethington, and the other lay Protestant leaders. They wished, as we saw, to secure the hand of Elizabeth for the earl of Arran, a match which would practically have taken away the Scottish crown from Mary Stuart, unless she were backed by the whole force of France. But Elizabeth had seen Arran in London and had probably detected his hysterical folly. He actually became a suitor for Mary's hand, when the death of her husband the French king (30th of December 1560) left her a friendless exile. Her kinsmen, the Guises, fell from power, and were no longer to be feared by England, so that Elizabeth need not abandon her favourite,Lord Robert Dudley, for the Scottish princess. When her marriage with Arran in the spring of 1561, Mary's brother, Lord James Stewart, lay prior of St Andrews, visited her in the interest of the Scottish Protestant party, while Lesley, later bishop of Ross, brought the promises of Huntly. He would restore the Mass in the North and welcome the queen at Aberdeen if she would land there, but Mary knew the worth of Huntly's word, and preferred such trust as might be ventured on the good faith of her brother. She foiled the attempts of the English ambassador to make her ratify the treaty of Edinburgh, and, while Lethington, a worse prophet than Knox, predicted "strange tragedies," Mary came home.

Young as she was, she came as no innocent novice to a country seething with all the pernicious ambitions that a religious revolution brings to the surface. She was wise with the wisdom of the Guises, but sincere friends she had none, and with all her trained fascinations she made few, except in the circle of the Flemings, Beatons, Livingstons and Seaton. Lethington, who had deserted her mother, dreaded her arrival; she forgave him, and for a time, relying on him and her brother, contrived to secure a measure of tranquility.

Scotland was, doubtless, in Mary's mind, a mere stepping-stone to England. There the Catholic party was strong but for its lack of a leader, and to the English Catholics Mary seemed their rightful queen. By one way or other—by a Spanish marriage, by the consent of Elizabeth to recognize Mary as her heir, by the ambitions of her own nobles and the wit of Lethington, ever anxious to unite the island under one sovereign—Mary hoped to wear the three crowns. Catholicism she would restore if she could, but that was not her first object. It was commonly thought that, though she would never turn Calvinist, she might adopt the Anglican doctrine as under Huntly and thereby only she could be recognized as Elizabeth's successor. Till she became Elizabeth's captive there was always the possible hope of her conversion, and despite her professions to the pope there was at least one moment when the pope perceived this possibility. Meanwhile she only asked freedom of conscience for herself, and her mass in her own chapel. The bitter fanaticism of Knox on this point encountered the wiser policy of Lord James and of Lethington.

Mary had her mass, but the constant and cowardly attacks on her faith and on her priests embittered her early years of queenhood in her own country. The politicians hoped that Elizabeth might convert Mary to her own invisible shade of Protestantism if the sister sovereigns could but meet, and for two years the promise of a meeting was held up before Mary.

Meanwhile the needy and reckless Bothwell, a partisan of Mary of Guise, a Protestant and the foe of England, was accused by Arran of proposing to him a conspiracy to seize the queen, but the ensuing madness of Arran left this plot a mystery, though Bothwell was imprisoned till he escaped in August 1562. The queen's task was to undertake her journey to the north, which ended in a battle with the Gordons. The death of Elizabeth and the execution of one of her sons. This attack by a Catholic queen on the leader of the Catholic party has been explained in various ways. But Mary's heart was in the expedition and in the overthrow of Huntly; she was in the hands of her brother, to whom she had secretly given the earldom of Murray, coveted by Huntly, whose good faith she had never believed in, and whose power was apt to trouble the state and disturb her friendly relations with England. She was deliberately "running the English course," and she crushed a probable alliance between the great clans of the Gordons and Hamiltons.

The question of her marriage was all important, and her chances were not improved by the scandal of Chastelard, whether he acted as an emissary of the Huguenots, sent to smirch her character, or merely played the fatuous fool in his own conceit. He was executed on the 22nd of February 1563 at St Andrews. Lethington then went to London to watch over Mary's interests, and either to arrange her marriage with Don Carlos, or to put pressure on Elizabeth by the fear of that alliance. Now, in March 1563, Elizabeth first drew before the Scottish queen the lure of a marriage with her favourite, Lord Robert Dudley; Mary to be acknowledged as her successor if Elizabeth died without issue. Later in the year, and after Lethington's diplomatic
mission to France, Elizabeth announced that a marriage of Mary with a Spanish, Imperial or French prince would mean war, while she still hinted at the Leicester marriage, or perhaps at a union with young Henry Darnley, son of Lennox. Elizabeth’s real intention was merely “to drive time,” to distract Scotland and to leave her rival isolated. The idea of a Spanish marriage excited the wrath of Knox, whose interviews with Mary did nothing but irritate both parties and alienate the politicians from the more enthusiastic Protestants. The negotiations for the Leicester marriage were prolonged till March 1565, when Elizabeth had let slip on Mary Henry Darnley (the young son of Lennox, who himself had been allowed to return to Scotland), and at the same time made it clear that she had never been honest in offering Leicester.

Till the spring of 1565, Mary, despite the insults to her religion and the provocations to herself, had remained attached to “the English course” and to the counsels of Moray and Lethington. Her naturally high temper, wearied of treacheries and brow-beatings, now at last overcame her. Darnley was esteemed handsome, though his portraits give an opposite impression; his native qualities of cowardice, perfidy, profligacy and overweening arrogance were at first concealed, and in mid April 1565 Lethington was sent to London, not discontent with Mary’s triumph, but designed till the 31st of March, but to announce Mary’s intended wedding with her cousin. Thus the cunning of Elizabeth and Cecil had its reward. Darnley being a Catholic, as far as he was anything, the jealous fears of the Brethren under Knox reached a passionate height. The Hamiltons saw their Stuart enemies in power and favour. Murray knew that his day of influence was over, and encouraged by the promises of Elizabeth, who was remonstrating violently against the match into which she had partly begrudged and partly forced Mary, he again approached her, and Mary’s triumph seemed complete. Her valour, energy and victory over Elizabeth were undeniable, but she was now in the worst of hands, and her career took its fatal ply. Lethington had not left her, but he was over-looked; Lennox and the impracticable Darnley were neglected; and the dangerous Earl of Morton, a Douglas, had come to trample for his lands and office as chancellor, while Mary rested on her foreign secretary, the upstart David Riccio; on Sir James Balfour, noted for falseness even in that age; and on Bothwell.

As early as September 1565 gossips were busy over the indiscretion of Riccio’s favour: Darnley had forfeited the good opinion of his wife; was angry because the Hamiltons were not wholly sacrificed to the ancient feud of Lennox and his clan; and Knox’s party looked forward with horror to the parliament of March 1566, when Mary certainly meant “to do something tending to some good anent restoring the ancient religion.” She was also supposed to have signed a Catholic league, which only existed in devout imaginations, but in February 1566 she sent the bishop of Dunblane to crave a large subsidy from the pope. Quite ignorant as to the real state of affairs, he raised the money and sent a nuncio, who never risked himself in Scotland, but made the extraordinary proposal later, that Mary should execute or at least “discount” her chief advisers.

Meanwhile the clouds of hatred gathered over the queen. Lethington (5th of February 1566), wrote to Cecil saying that “we must chop at the very root,” and Randolph, Elizabeth’s ambassador, heard that measures against Mary’s own person were being taken. Randolph was dismissed for supplying Murray with English gold; from Berwick he and Bedford reported to Cecil the progress of the conspiracy. While Mary was arranging a marriage between Bothwell and the late Huntly’s daughter, the lady, many of the Darnley party intrigued with Lord Ruthven and George Douglas, a bastard kinsman of Morton, for the murder of Riccio, and for his own acquisition of the crown matrimonial. Morton and Lindsay were brought into the plot, while Murray, in England, also signed. He was to return to Edinburgh as soon as the deed of slaughter was done, and before parliament could proceed to his forfeiture.

Mary, according to Ruthven’s published account, had herself unconstitutionally named the executive committee of parlia-

ment, the Lords of the Articles, who were usually selected on various occasions, by the Estates themselves. While Mary was at supper, on the 9th of March, Darnley, with Ruthven, George Douglas and others, entered the boudoir in Holyrood, by his private stair, while Morton and his accomplices, mainly Douglasses, burst in by way of the great staircase. There had been an intention of holding some mock trial of Riccio, but the fury of the crowd overcame them: Riccio was dragged from Mary’s table and fell under more than fifty dagger wounds. While Mary, Darnley and Ruthven exchanged threats and taunts, Bothwell and Huntly escaped from the palace but next day, Mary contrived to have the burghers of Edinburgh summoned to Atholl. On the following evening Murray arrived, and now Murray was welcome to his sister. Darnley had taken on him (his one act of kingly power) to dismiss the parlia-

ment, but he now found himself the mere tool of his accomplices. He denied—he never ceased to deny—his share in the guilt, and Mary worked on his vanity and his fears, and moulded his “heart of wax” to her will. On his assurances the lords, expecting an amnesty, withdrew their guards from the palace and the day found that the bird had flown to the strong castle of Dunblane. Hence Mary summoned the forces of the country, under Bothwell and Huntly; she forgave Murray; the murderers had no aid from the Protestants of Edinburgh, who as before failed them in their need. Knox himself fled to Kyle, though there is no evidence that he was privy to a deed which he calls “worthy of all praise,” and Morton and Ruthven spurred to Berwick, while Lethington skulked in Atholl. His possessions were handed over to Bothwell. Darnley betrayed some obscure accomplices. He was now equally detested by Murray, by the new exiles and by the queen, while she reconciled Murray and Bothwell. She tried to assuage all feuds; in an inventory of her jewels she left to Darnley, but in case he and her child did not survive its birth. The infant, James, was born in the castle on the 10th of June.

On Mary’s recovery, her aversion to Darnley, and her con-

\n
fidence in Bothwell, were unconcealed; and, early in September, she admitted Lethington to her presence. She had learned that Darnley meant to leave the country: she met him before her Privy Council, who sided with her; he withdrew, and the lords, including Murray, early in October signed a “band” disclaiming all obedience to him. On the 7th or 9th of October, Mary went to Jedburgh on the affairs of Border justice, and a week later she rode with Murray to Hermitage castle, where for several days Bothwell had lain, wounded nearly to death by Elliot, a border reiver. On her return she fell into an almost fatal illness and prepared for her end with great courage and piety; Darnley now visited her, but was ill-received, while Bothwell was borne to Jedburgh from Hermitage in a litter. While Buchanan represents the pair as indulging in a guilty passion, the French ambassador, du Croc, avers that Mary was never in better repute with her subjects. On the 24th of November Mary was at Craigimmil castle, near Edinburgh, where undoubtedly she held a conference with her chief advisers that led to no good to Darnley; and there were rumours of Darnley’s design to seize the infant prince and rule in his name. The evidence on these points is disputable, but now, or not long after, Huntly, Bothwell, Lethington and Argyll signed a “bands” for Darnley’s murder.

Meanwhile, in December, Mary held the feasts for the baptism of her son by Catholic rites at Stirling (17th of December), while
Darnley stood aloof, in fear and anger. A week later, moved by Bedford, representing Elizabeth, and by Bothwell and her other advisers, Mary pardoned Morton and his accomplices. She also restored Archbishop Hamilton to his consistorial jurisdiction, but withdrew her act, in face of presbyterian opposition. Darnley had retired to his father's house at Glasgow, where he fell ill of small-pox, and, on the 4th of January 1567 Mary, from Holyrood, offered to visit him, though he had replied by a verbal insult to a former offer of a visit from Stirling. About this week must have occurred the interview in the garden at the Douglas's house of Whittingehame, between Morton, Bothwell and Lethington, when Morton refused to be active in Darnley's murder, unless he had a written warrant from the queen. This he did not obtain. On the 20th of January 1567 Mary left Edinburgh for Glasgow, her purpose being to bring Darnley back to Craigmillar. At this time (the 22nd-23rd of January), she must have written the two first Casket Letters to Bothwell. Letter II. (really Letter I.) leaves no doubt, if we accept it, as to her murderous design (see CASKET LETTERS). What followed must be read in Mary's biography: the end was the murder of Darnley in the house at Kirk o' Field, after the midnight of Sunday, the 9th of February.

Public and conspicuous as was the crime, the house being blown up with gunpowder, no secret has been better kept than the details. The facts of Mary's lawless marriage with Bothwell, her capture at Carberry Hill, her confinement in Loch Leven Castle, her escape, her flight to France, her arrest at Darnley, and her escape again, with the proceedings of the English Commission, which uttered no verdict, must be read in her biography (see MARY STUART).

Scotland was now ruled by her brother, the Regent Murray, in the name of her infant son, James VI. Murray arrested Lethington, as accused of Darnley's murder, and Lethington was now lodged under ward in Edinburgh, but Kirkcaldy of Grange released him and gave him shelter in Edinburgh castle, which he commanded (23rd of October). Lethington was to be tried, but his nearest friends mustered in great numbers, and, secure in the castle, he and Kirkcaldy upheld the cause of Mary. Lethington's motive is obvious; in Mary's success lay his chance of safety: how he won over Kirkcaldy is unknown. The rebellion in the north of England failed, Northumberland was driven across the border, and it was Murray's idea to harter him for Mary, in the beginning of January 1570. But on the 23rd of January, Murray was shot dead, in the street of Linlithgow, by a Hamilton, with the approval and aid of Archbishop Hamilton and other heads of the house.

The contending parties, queen's men and king's men, now made approaches to each other; neither had a share in the Hamiltons' crime. But Randolph, sent to Edinburgh for the purpose, kept them apart; Elizabeth despatched Sussex to ravage the Scottish border, in revenge for a raid by Buccleuch, and in May Lennox entered Scotland with an English force and soon was appointed regent (17th of July). This meant a war of Stuarts against Hamiltons, and, generally, of "Queen's men" against "King's men." Truces and empty negotiations merely protracted disorder. On the 2nd of April 1571 Mary's party lost the castle of Stirling, which had been taken the previous year by a daring night surprise; and Archbishop Hamilton, a prisoner, was hanged without trial. In May the Hamiltons entered Edinburgh, and later Lennox, in a parliament held at Leith, secured the forfeiture of Lethington. As the year passed by, Argyll, Cassils, Eglinton and Boyd went over to Lennox's party, and in an otherwise futile raid of Kirkcaldy's men on Stirling, Lennox was captured and was shot by a man named Calder. In England the Ridolphi-Norris plot was discovered, and at the end of 1571 Buchanan's "Detection!" of Mary, with translations of the Casket Letters, was published. Though Mar was now regent, Morton was the man of action. In February 1572 he forced on the kirk an order of bishops, "Tulcan bishops," filters through which the remaining wealth of the church trickled into the coffers of the state, or of the regent.

This was the beginning of the sorrows of more than a century. The kirk Presbyterian was founded on the Genevan model, and was intended to be a theocracy. She had claimed, since the riots at Perth in 1559, the Power of the Keys, with the power of excommunicating even the king; a sentence practically equivalent to outlawry. These pretensions were incompatible with the freedom of the state and of individuals. It became the policy of the crown to check the preachers by means of the order of bishops, first reintroduced by Morton, and worthy of their origin. The kirk was robbed of its fresh, benefits were given to such villainous cadets of great families as Archibald Douglas, an agent in Darnley's murder; and though, under the scholarly but fierce Andrew Melville, the kirk purified herself fresh and successfully opposed the bishops, James VI. dominated her again, when he came to the English crown, and the result was the long war between claims equally exorbitant and intolerable, those of the crown and the kirk.

The death of Mar (28th of October 1572) left power in the stronger hands of Morton, and the death of Knox (24th of November) put the kirk for a while at the mercy of the new regent. Meanwhile Mary's party dwindled away; at a meeting in Perth (23rd of February 1573) her thanes fled from her, and Elizabeth at last reinforced Mary's enemies with men and artillery. On the 28th of May Edinburgh castle surrendered at discretion. Lethington, the heart of the long resistance, died, a paralytic, with his last words: "Thrice has his master won his kingdom; and the gallant Kirkcaldy. Knox has prophesied that he would be hanged, and hanged he was."

Despite the ferocity of partisans in "the Douglas wars," an English envoy reported that the power of the country gentry and the boroughs had increased, while that of the great waverers, nobles, Hamilton, Huntly and others, was diminishing. The "navy was so augmented as it is a thing almost incredible," but none the less the £100 sterling was worth as much, Drury wrote from Berwick, as £2000 Scots.

In 1573, at the General Assembly, Andrew Melville, now a man of thirty, and, with Buchanan, the foremost scholar of Scotland, especially in Greek, caused the lawfulness of bishops to be mooted. Thenceforward Scotland was engaged in a kind of "bishops' war." Meanwhile Morton found the old Marian party feud reviving, and in 1577, knowing his own guilt in Darnley's murder, he attempted to win the alliance of Mary for his own security. In March 1578, a coalition of his public and private foes caused Morton to resign the regency, while the young earl of Mar became custodian of the boy king. On the 28th of May, Morton allied himself with Mar, who commanded Stirling castle, and Morton's party won. Morton went on to win the greater part of the kingdom; but in April 1579 he died suddenly, after dining with Morton; poison was suspected. Morton, with Angus, attacked the Hamiltons, whose chiefs fled the country, accompanied by the worst of traitors, Sir James Balfour. Knowing all the secrets of Darnley's murder, Balfour revenged himself by raking up Morton's foreknowledge of the deed; and here he was helped by the influence exercised over the young king by his cousin Esme Stuart d'Aubigny (a son of Darnley's paternal uncle, John), who came to Scotland from France in September 1579. D'Aubigny was allied instead with Knox, brother-in-law, James Stewart of the house of Ochiltree, captain of the King's Guards, an able, handsome, learned, but rapacious man. The Hamiltons, now in English exile, were forfeited; d'Aubigny received the earldom of Lennox; and, as after Darnley's death, placards, were posted urging the trial of Morton for that crime. As against the new Lennox, Morton was deemed a friend by the preachers, though Lennox professed to be reconciled to the kirk. Through-out 1580 Elizabeth encouraged Morton, with her wonted fickle treachery. In October she recalled her ambassador, and left Morton to his fate. Sir James Balfour secretly returned with Margaret Morton's information, and Morton was accused and arrested on the last day of 1580. Elizabeth sent old Randolph to threaten and plead, but Lennox and James Stewart were too
powerful. Morton was tried on the 1st of June 1581, was found guilty, and, with one Binning, who had accompanied Archibald Douglas to the scene of Darnley's murder, was executed. His title went to the Douglasses of Lochleven. James Stewart received the Hamilton earldom of Arran, and under him and Lennox the young king began his long strife with the kirk and his half-hearted dealings with the Catholics and his mother.

It is impossible here to follow the course of the strife, in which the godly were led by the earls of Gowrie and Angus. Gowrie seized James, and power, at Ruthven (August 1582), a storm approved by other preachers. In June 1583, James escaped to St. Andrews and was surrounded by his party. In November he made the son of Lennox, who had died in France, a duke; Arran again was in power, and Melville with other preachers fled to England in 1584, after the execution of Gowrie for high treason. The king and council were proclaimed judges in all cases; preachers were to submit to their judicature when accused of political offences, a standing cause of strife.

No longer needing Catholic assistance, James threw over his mother, with whom he had been intriguing, and sent the beautiful Mary of Seton to day to Edward. Mary's secretary was Elizabeth. At the end of 1585, all James's exiled foes, Douglasses, Hamiltons and others, returned across the border in force, caught the king at Stirling, drove Arran into hiding, restored the Gowrie family, and became the new administration. In 1586, the Babington plot was arranged, and discovered by those who had allowed it to be arranged. James practically did nothing to rescue his mother: one of his representatives in England was that Archibald Douglas who helped to slay his father.

The execution of Mary on the 8th of February left James "a free king" as far as his mother's claim to the throne was concerned, and he had his pension of £3000 or £4000 from Elizabeth. Thus war between the two countries was avoided. Thereafter, till James came to the throne of England, the history of Scotland was but a series of inchoate revolutions, intrigues that led to nothing definite and skirmishes in the war of kirk and state. The king had to do with preachers who practically held the doctrines of Becket as to priestly pretensions. James was "Christ's silly vassal," so Andrew Melville told him, and "Christ" in practice meant the preachers who possessed the power of the keys, the power to bind and loose on earth as in heaven. The kirk, while Elizabeth warned James against the pretensions of men who "would have no king but a presbytery," whenever he was at odds with the ministers and with the nobles who kept trying to seize his person with the approval of the ministers, Elizabeth secretly or openly backed the kirk.

The kirk was strong enough to compel James to march, more than once, against the Catholic earls, Huntly, Errol, Angus and others. They, again, constantly intrigued with Spain, and there were moments when James, driven desperate by the preachers, listened to their projects. He was anti-papal by conviction, yet hoped for help from Rome, and was so far implicated in the adventures of his Catholic subjects that, in the interest of his own character, he had to advance against them and drive them into exile. In 1590 he married Anne of Denmark: in 1592 his character suffered through the murder, by Huntly, of "the bonny earl o' Murray," suspected of favouring the madcap Francis Stewart, early of Bothwell (nephew of Queen Mary's Bothwell), a man who made it his business to kidnap the king, and who presently, by the help of Gowrie's widow, seized him in Holyrood. In 1592 parliament "ratified the liberty of the true kirk," leaving little liberty for king and state. Since, in the phrase of one preacher, "the king might be excommunicated in case of contumacy and disobedience to the will of God," as interpreted by the ministers. In the following year (23rd of July 1593) Bothwell, much favoured by the preachers, made his capture of James, but had not the power to hold him long, and a later revolutionary attempt in the same year, by Atholl and the young earl of Gowrie, was a failure.

Gowrie went abroad and passed some time at the university of Padua; to him the eyes of the preachers were hopefully turned after 1596. As Bothwell had become a Catholic, they excommunicated him in 1593; in 1596 James resolved to recall the exiled Catholic peers; the commissioners of the General Assembly, alarmed and infuriated, met in Edinburgh, ordered a day of humiliation, decided to excommunicate the Catholic earls and established a kind of revolutionary committee of public safety. James insisted on his own authority; insisted that a secular court had a right to try a virulent preacher who declined the secular jurisdiction when accused of having denounced Queen Elizabeth. He increased Presbyterian emotion by the suspicion that the preachers were declared to be seditionists; a meeting in a church ended in a threatening riot that raged round the Tolbooth, where James was sitting, and on the following day he with his Court withdrew to Linlithgow (18th of December 1596). The Court of Session was also to be removed, and the burgesses, fearing loss of trade, laid down their arms. The leader of the clerical agitation, Mr Bruce, with a wild preacher named Balcanquhal, fled to England, and James returned in triumph to his capital on the 1st of January 1597. He followed up his victory; a General Assembly, to Perth, was summoned to the crown of England after the death of the queen. He was in deep poverty, the Estates were chary of supplies, plotters in Scotland had been offering to Cecil to kidnap the king (1598), and his relations both with the English government and with his own subdue but struggling preachers were bitterly unfriendly.

It is not known whether the mysterious events that culminated in the slaying of the earl of Gowrie and his brother, by John Ramsay, in their own house in Perth, on the 5th of August 1600, had any connexion with James's attitude (1585). He increased Presbyterianism by the suspicion that he was intriguing with Catholic powers, and by his book on the rights and duties of a king (Basilicon Doron), which fell into the hands of Andrew Melville. Some cryptic correspondence with the pope, whether actually by James or by Elphinstone, one of his ministers, came apparently to the knowledge of the English court; his secret relations with the earl of Essex were, if not known, suspected; the young earl of Gowrie, returned from a residence on the continent, was too effusively welcomed by Elizabeth in May 1600; and James made a tactless speech when asking parliament for money towards his "honourable entering to the crown of England."

The Gowrie conspiracy

The most probable explanation is that Gowrie laid, with the utmost secrecy, a plot to lure James to Perth, kidnap him there, transport him to Fastcastle, a fortress of the profligate and intriguing Logan of Restalrig, on the Berwickshire coast, and then raise the Presbyterian party. If we could accept the evidence of a letter attributed to Logan and produced in 1608, this theory would be valid. But the letter has been proved beyond question to be a forgery, though it may very well be a forged copy of a genuine original (see The Gowrie Conspiracy Confessions of George Sprod, by A. Lang, Roxburghe Club, London, 1902). Certainly no plot was laid by James to entrap the Ruthvens, and the only question is, was the brawl in which they fell accidental, or had a plot hatched in deep secrecy been frustrated by unexpected circumstances? (In James VI. and the Gowrie Conspiracy the writer argues in favour of the latter solution.) In any case the scepticism of the Edinburgh ministers, especially of Bruce, encouraged the tendency of the people to think the worst, and led to the banishment, followed by other restrictions and sufferings, of Bruce himself. The house of Gowrie, so long hostile to Mary Stuart and James, was forfeited and ruined. Charles I. was
born just after the trial of the dead Ruthvens (19th of November 1600), and his mother was, as usual, opposed to the king’s recent proceedings.

In 1602 Cecil was engaged in dark plots against James; the rising of Essex (of which James probably was expected) had failed; but by the end of the year Cecil had entered into a secret understanding with James to favour his claims to the English succession. Elizabeth’s last letter to the king was of the 5th of January, 1603; she died in the earliest hour of the 1st of April, and James, late on the 3rd of April, had the news from Carey. He entered London on the 6th of May, whence he henceforth, as he said, governed Scotland “by the pen.” Entirely safe from the usual turbulent movements of Scottish opposition, and but ill acquainted with Scottish opinion, he could dictate measures which were oppressive to the preachers and unwelcome to the majority of the laity. He kept the kirk for two or three years without a General Assembly, to which they had a legal right, and (with at least a shadow of legal right) he proclaimed unlawful the assembly of Aberdeen (1605). Though the recalcitrants who held it were punished, James’s own officials saw that he had gone too far. His bishops were already becoming odious to his nobles; his pronouncement of General Assemblies continued, and the brothers Melville, called to England, were treated with unconstitutional harshness. Andrew, who behaved with injudicious violence, was banished to France, James to Newcastle; other preachers were confined to their parishes; and by a mixture of chicanery (as at the pseudo assembly of Linlithgow, and 1615, where the king’s prelates pretended to consent, as a new turn of the dragon’s teeth of civil war. Catholics were equally or more severely persecuted; and though the Borderers were brought into tranquillity, it was by means of indiscriminate severity.

A scheme for complete union of England and Scotland, promoted by James and by Francis Bacon, was unwelcome to and rejected by the two jealous countries (1604–1606). But Post- nati, subjects born in Scotland after James’s accession to the English throne, were allowed to purchase and hold real property, and “to bring real actions for the same,” in England (1609).

In 1615 James had his Scottish bishops consecrated by three English bishops, ensuring for the northern country apostolic succession; and justices of the peace were created in Scotland. The “plantation” of Ulster by Scottish colonists was begun and flourished. Catholics were more and more persecuted, and in 1615 Father Ogilvie was executed, after abominably cruel treatment in which Spottiswoode, archbishop of Glasgow, took an unworthy share. In the same year the king’s “Courts of High Commission” were consolidated, and an organ was actually placed in the royal chapel at Holywood.

In 1617 James visited his native land: ecclesiastical brawls at once broke out, and James vigorously pushed, in face of the disfavour even of his bishops, the acceptance of his famous Five Articles. They were accepted at Perth, in 1618, but were evaded wherever evasion was possible. Communicants were to kneel, not to sit, a thing that had, of all others, been odious to John Knox; Easter was to be observed, also Christmas, contrary to earnest consciences; confirmation was introduced; the Communion might be administered to the dying in their houses; and baptism must be on the first Sunday after the child’s birth.

These articles, harmless as they may seem to us, were the last straw that Scottish loyalty could bear. In 1621, they were carried in parliament by a fair majority; to the horror and bitter indignation of all men and women of the old leaven. Worse, the English liturgy was used in a college chapel of St Andrews on the 5th of January 1623. James tried to suppress the general irritation by a proclamation against conventicles, and a threat to take away the courts of law from Edinburgh, if people did not go to church on Christmas day. He postponed the threat till Easter 1625, but, says Calderwood, “The Lord removed him out of the way fourteen days before the Easter Communion.” He died on the 27th of March. Encouraged by safety and adulation in England; grasping at the Tudor ideal of kingship, determined to reduce to order the kirk from which he had suffered so many injuries and insults, he sowed the wind and his son reaped the whirlwind.

Only the chief moments in the struggle between Charles I. and the Scots can be touched on in this summary. James VI. had succeeded in his struggle with the preachers partly by complying the nobles with gifts out of old church lands. Charles I. reunited the kirk and the nobles by threatening, or seeming to threaten, to resume or impair these gifts, and also by his favour towards the universally detested bishops (1625–1629). Mr S. R. Gardiner speaks of the final shape of Charles’s measure as a “wise and beneficent reform”; and he did aim at recovering the “teinds” or tithes, and securing something like a satisfactory sustenance for ministers. But he had caused alarm, and he refused all demands for the withdrawal of the loathed articles of Perth. The younger bishops too were not “sound” in Calvinism; many were looked on as Arminians. Protests were uttered in 1635, when Charles entered Edinburgh and held a parliament. Above all, and most legitimately, the revival of General Assemblies, now long discussed, was demanded vainly.

By 1636, Charles and Laud had decided to introduce a liturgy, a slightly, but in Scottish apprehensions “idolatrously,” modified version of the Anglican prayer-book. Anglicanism was a limb of Antichrist; extemporaneous prayers were regarded as inspired: a liturgy was “a Mass-book.” The procedure was purely despotic, and at the first attempt to use the liturgy in St Giles’s there broke out the famous “Jenny Geddes’ riot in the church on Christmas, 1637.” The nobles of the country, the ministers and lairds, met in Edinburgh and sent a petition against the liturgy to Charles. In November were formed “The Tables,” a standing revolutionary committee of all Estates.

Constant meetings hurled protests against the bishops; no man was more active than the young Montrose. In February 1638 the Covenant, practically a “band” of the whole country, enforced on reluctant signers, was launched. It made Scotland, like Israel, “a covenanted people” for the defence and propagation of the old Presbyterianism of Andrew Melville, and many devotes held that it was for ever binding on the nation. Legists differ as to whether the band was legal or not, but revolutions make their own laws, and the Covenant could not be more illegal than the imposition of the liturgy. Charles drove on the bishops, who better understood the situation, and he sent the half-hearted Hamilton to negotiate and threaten in Edinburgh, where the Covenanters were blockading the castle. But Charles did grant a General Assembly in Glasgow (21st of November), where, among unseemly uproar, the ecclesiastical legislation of James I. was rescinded, the law and custom of forty years were abolished, conformist clerics were expelled, and the earl of Argyll appeared as leader of the extreme party, while Montrose was the general of the armed Covenanters. In 1639 he was as active in arms in the north as Hamilton, on the king’s side, was dilatory and helpless in the south. By May the chief clerical leader, Henderson of Leuchars, was denouncing Royalists as “Amalekites,” and by biblical precedent Amalekites receive no quarter. Prclay was “Baal worship,” and the kirk thus turned the strife in the direction of religious ferocity.

While Charles hung irresolute on the eastern border, the Covenanters, under Alexander Leslie, took heart, occupied Duns Law, and terrified Charles into negotiations (11th–18th June). A hollow pacification was made: the assembly of August (1639) imposed the signing of the Covenant on all Scotsmen. A parliament (31st of August) demanded the loss of votes (fourteen) by bishops, and freedom of debate on bills formed by the Lords of the Articles, who had practically held all power; while Argyll carried a bill demanding for each estate the right to select its own representatives among these lords. Traquair, as royal commissioner, proroged parliament; negotiations with the King in London had no result; and in 1640 the protraction was continued, and though opposed by Montrose, the parliament constituted itself, with no royal warrant. War was at hand, but Montrose formed a party by the “band of Cumbernauld,”
to suppress the practical dictatorship of his rival and enemy, Argyll, who, he understood, was to be one of a triumvirate, and absolute north of Firth. Argyll allowed the committee of Estates to rule, as before, and bided his time. On the 20th of August Montrose was the first of the Covenanting army to cross the Tweed; Newcastle was seized, and Charles, unsupported by England, entered on the course of the Long Parliament and the slaying of Strafford. In Scotland the secret of the Cumbernauld band came out; Montrose, Napier and other friends were imprisoned on the strength of certain ambiguous messages to Charles, and on the 27th of July, being called before parliament, Montrose said—"My resolution is to carry with me honour and fidelity to the grave." Montrose kept his word, while Hamilton stooped to sign the Covenant. Montrose lay in prison while Charles I. visited Scotland and met the parliament, perturbed by the dim and unintelligible plot called "The Incident" (October 1641), which seems to have aimed at seizing the persons of Argyll, Hamilton and his brother Lanark. All that is known of Montrose, in this matter, is that from prison he had written thrice to Charles, and the last of these had intended to show his third letter to Argyll, Hamilton and Lanark, on the very day when they, suspecting a plot, retired into the country (12th of October). An agitated inquiry which only found contradictory evidence was disturbed by the news of the Irish rebellion (28th of October). Charles heaped honours on his opponents (Argyll was the one marquis of his name), and hastened to England. The country was governed by fifty-six members of the Estate and by the dreaded commission of the General Assembly, for now the kirk dominated Scotland, denying even the right of petition to the lieges.

The English parliament, at war with the king, demanded aid from Scotland; it was granted under the conditions of the Solemn League and Covenant (1643), by which the Covenanters expected to secure the establishment of Presbyterianism in England, though the terms of agreement are dubious. Scotland, however, regarded herself as bound to war against "Sectaries," and so came into collision with Cromwell, to her undoing. In January 1644, a Scottish army crossed Tweed, to aid the parliament, with preachers to attend the synod of Westminster. Already some 2000 men from Ireland, mainly of Macdonalds and other clans driven into Ireland by the Argylls, were being despatched to the west Highland coast. Lanark, from Oxford, fled to join the Covenanters; Charles imprisoned Hamilton in Cornwall; Montrose was made a marquis; Leslie, with a large Scottish force and 4000 horse, besieged Newcastle. Montrose arrived a day too late for Marston Moor (2nd of July 1644); Rupert took his contingent; he entered Scotland in disguise, met the ill-armed Irish levies under Colkitt, raised the Gordons and Ogilvies, who supplied his cavalry, raised the fighting Macdonalds, Camerons and Macleans; in six pitched battles he routed Argyll and all the Covenanting warriors of Scotland, and then, deserted by Colkitt and the Gordons, and surprised by Leslie's cavalry withdrawn from England, was defeated at Philiphaugh near Selkirk, while men and women of his Irish contingent were shot or hanged months after the battle.

The clamour of the preachers was now for blood, and gentlemen taken under promise of quarter were executed by command of the Estates at St. Andrews, for to give quarter was "to violate the oath of the Covenant"—as interpreted by the clergy. It would have been wiser to put the revenges as reprisals for the undeniable horrors committed by Montrose's Irish levies. The surrender of Charles to the Scots, the surrender of the Scots to Charles the English, for 1£00,000 of arrears of pay, with hopes of another 2£00,000 (February 1647), were among the consequences of Montrose's defeat. But the surrender of the king lowered in Scottish consciences; for the country was far from acquiescing in the transaction.

Leslie, by the advice of one Nevo, a preacher, massacred, on his return to Scotland, the Macdonals in Dunaverty castle. A strife arose between Hamilton, who wished to disband the Covenanting army, and Argyll, and gradually the struggle was between Hamilton and the sympathizers with the imprisoned king and Argyll at the head of (or under the heeds of) the more fanatical preachers and Presbyterians. The Scottish commissioners in England, with Lauderdale, and with the approval of Hamilton's faction, signed, at the end of 1647, "The Engagement" with Charles, and broke away from the tyranny of the preachers. The Engagers had the majority in parliament, but were fractionally cursed from the pulpit; they and their army mustered for the deliverance of their king. In August 1648, they crossed the border, leaving the fanatics to arm in their rear, but Cromwell, with a small force, marching across the fells, caught and utterly routed them at Preston and on the line of the Ribble, taking the captives and Hamilton, who was sent to the block.

This was the kirk's proudest triumph; the countrymen of the preachers had been ruined on "St. Covenant's Day." The preachers, with Lords Loudoun and Eglington, Argyll and Cassilis, armed and raised the godly, and occupied Edinburgh. The parliamentary committee capitulated with the extremists, who sent friendly messages to Cromwell, and Argyll met him on the Tweed. Thence Cromwell sent a message to the house of parliament, with a cortège of 7000 foot and 700 horse, to Edinburgh, where he himself stayed for some time. A parliament in Argyll's and the preachers' interest met there in January 1649; only sixteen nobles were present, as against fifty-six in the previous year. The execution of Charles I. (30th of January 1649) left the extreme party in a quandary. How could they keep terms with "bloody Sectaries" that had slain their king, in face of the protests of their envos? They did pass the Act of the Classes, disabling all "Engagers" from all manner of offices, military and civil, and dividing the distracted country into two hostile camps. On the 6th of February Charles II. was proclaimed king in Edinburgh, if he took the two Covenants. This meant war against England, and war in which the Engagers and Royalists could not take part. The situation developed into ruin under the strife of the wilder and the gentler preachers.

Communications with Charles II. at the Hague were opened, and the Scots accused the English of breach of the Solemn League and Covenant. Huntly, as a Royalist, was decapitated at Edinburgh; and the envos of Charles, thanks to the advice of Montrose, failed to induce him to stamp himself a recrrent and a hypocrite by signing any covenants. But Montrose (January 1650) was sent by Charles to "search his death," as he said, in an expedition to the north of Scotland, while, in the absence of his stainless servant, Charles actually signed the treaty of Breda (1st of May). In April Montrose was abandoned by his royal master, and was defeated at Carbiesdale, on the south side of the kyle, or estuary, of Shin and Oykel; he was betrayed, insulted, bullied by the preachers, and, going to his death like a bridegroom to the altar, was hanged at Edinburgh, on the 20th of May. "Great in life, Montrose was yet greater in his death." He had kept his word, he had "carried fidelity and honour to the grave." (Gardiner.) His head was set on a spike and his quartered limbs were exposed in various places.

Charles came to Scotland; he signed the Covenants, while his tormentors well and duly knew that the action was a base hypocrisy, that they had tempted him to perjury. Cromwell, who now crossed the border, impressed this truth, as far as he might, on the preachers, who made Charles sign declarations yet more degrading, to the discredit of his father and mother. Meanwhile David Leslie, with singularly excellent strategy, foiled and evaded Cromwell in the neighbourhood of Edinburgh, till the great cavalry leader was forced to retreat towards England. At Dunbar Leslie held Cromwell in the hollow of his hand, but his army had been repeatedly "purged" of all Royalist men of the sword by the preachers; they are said, and Cromwell believed it, to have constrained Leslie to leave his impregnable position and attack on the lower levels. Leslie appears to have intended a surprise, as at Philiphaugh, but "through our own laziness," he confesses, the surprise came from Cromwell's side, and few of the Scots except the mounted gentry escaped from the crushing defeat at
In the first (1660–1663) the royal commissioner to parliament was the earl of Middleton, a soldier of fortune who had been in arms for the Crown as late as 1655, who had been excommunicated by the Kirk, and was determined to keep down the preachers. With him were the Cavalier party, anxious to recover their losses during the civil war. All were impoverished, and grieved was the dominant motive of the members of the privy council, the rulers of the country. Meanwhile, in London, the Earl of Lauderdale, secretary for Scotland, had the king’s ear, and would have restored presbytery, at least by way of experiment. The “creature” of Charles, as he called himself, this burly, violent scholar, bufon and bully, was reckoned a patriot. As an “Engager” he had seen his country conquered by English arms. His policy was to keep Scotland in good humour by restoring presbytery; to raise in the country a militia strong enough to support Charles against the English parliament, and thus, in both countries, to make the royal prerogative absolute. The first parliament (1661–1663), under Middleton, was obsequious enough to grant a scheme for seizing annually, to the Kirk and the conventicles, and to rescind all but the private legislation of the revolutionary years (1638–1666). The Lords of the Articles were restored, mere nominees of government. Middleton, Tarbat and Clarendon overcame Charles’s reluctance to restore episcopacy; Lauderdale fell into the background; The Rev. James Sharp, hitherto the agent of the Resolutions, or milder party among the preachers, turned his coat, and took the archbishopric of St Andrews. Episcopacy being restored, some three or four hundred preachers were driven from their parishes (1665). We made a waste,” said Archbishop Leighton, “and stocked it with owls and satyrs,” the detested “curates.” The Shorter Catechism was taught; the liturgy was not brought in; the sole change was in kirk government.

Meanwhile the Cavalier party invented a system of heavily fining men who had been their opponents in the troubles. Middleton coveted the estates of the earl of Argyll, son of the late marquis, and on a trumped-up charge of “leasing making” (he had spoken in a private letter of “the tricks of parliament”) had him condemned to death. He was saved by the exertions of Lauderdale, and Tarbat suggested, while Middleton adopted, a scheme for ostracizing, and making incapable of office, twelve of their opponents, including Lauderdale. But Lauderdale had the skill to turn the cards on Middleton, accusing him of tricking both parliament and king, and of usurping royal prerogative. Middleton and Tarbat were cashiered, and the able but profligate earl of Roxthes united four or five of the highest offices in his own person, Lauderdale remaining at court as secretary for Scotland.

II. We come now to the years from 1664 to 1667. Middleton, with Archbishop Sharp, misgoverned the country, established a high court of commission, exiled the fiercer preachers to Holland, whence they worked endless mischief by agitation and a war of pamphlets; irritated the Covenanting shires, Fife and the south-west, by quartering troops on them to exact fines for Nonconformity, and so caused, during a war with Holland, the Pentland Rising (November 1666). This unconcerted movement arose out of an act of cruelty by soldiers in the remote Glenkens, and was unsupported by Holland, with which the Covenanters had been intriguing. Crushed at Rullion Green in the Pentlands, by General Dalziel, this movement left the Presbyterians the more angry, by reason of the cruelty of its suppression, and the unjust and making incapable of office, twelve of their opponents, including Lauderdale. But Lauderdale had the skill to turn the cards on Middleton, accusing him of tricking both parliament and king, and of usurping royal prerogative. Middleton and Tarbat were cashiered, and the able but profligate earl of Roxthes united four or five of the highest offices in his own person, Lauderdale remaining at court as secretary for Scotland.

III. Lauderdale again saw his chance; Rothes was deprived of all offices save the chancellorship; Sharp was “snibbed” and disgraced, attempts at concession were begun, and the indulgence of 1660 licensed a number of Presbyterian ministers, under restrictions. The indulgence accentuated the division between those who accepted and those who rejected it. Outrages on conformist ministers were frequent, and conventicles were accompanied by armed men. A popular book, *Jus Populi*...
Vindicatum (1669), demanded the restoration of the covenants, which meant civil war, the hanging of the bishops, and even applauded assassination by men who had a "call," like Phinehas. In a parliament with Lauderdale as commissioner (1669-1673) "clanking acts" were passed against nonconformity, but the laws were too severe to be executed, save sporadically; the total was followed by a new Anglican Act: (1673). Lauderdale having married the rapacious countess of Dysart, corruption was rife; his brother, Haltoun, was an example of reckless greed; opposition arose to a scheme of union, presently dropped, and by 1673 the duke of Hamilton and Sir George Mackenzie led an organized political opposition. Lauderdale’s Militia Act gave Charles a force of 20,000 men, who would “go anywhere” (that is, would invade England), at the king’s command, and in 1673-1675 Lauderdale was attacked in the English House of Commons, Charles, by him, but his best allies, Kincardine and Sir Robert Murray, deserted him, while Sir George Mackenzie of Rosehaugh came over to his party, became king’s advocate (1677), and till 1686 was the Achitophel and public prosecutor of the government. After an alleged attempt to negotiate through Argyll (1678) with the preachers, in view of the threatening increase of armed conventicles, Lauderdale resolved on suppression. Without money, and without anything like an adequate regular force, he called out the clansmen of Atholl, Perth and other nobles, and quartered them also on the Highland host .” on the disfranchised people. He would either put them down, with the support of his brother, or, if preferred, bring rebellion to a head. The gentry, who had proclaimed their inability to suppress conventicles, were ordered to sign a bond making them responsible for their tenants, and were bound over to keep the king’s peace by “law burros,” a method common in private life but unheard of between monarch and people. After six weeks the plundering clansmen were withdrawn, and in the spring of 1678, also of 1679, Hamilton with his allies carried their complaints to Charles. Mackenzie, in a controversy at Windsor (1679), proved to Charles that in Scotland he was as absolute as the kings of France and Spain, over church, state, and all his subjects, and indeed, by various acts of James VI. and of his own reign, Charles really was a despot (British Museum, Additional MSS. 23,244, pp. 20-28).

Meanwhile, armed conventicles abounded, and the extreme faction openly denounced and separated themselves from the rapidly growing mass of the Indulged. Early in May 1679 Sharp was hacked to death on Magus Moor near St Andrews. The murderers rode to the west, joined the company of Robert Hamilton, defeated Graham of Claverhouse with a small force of his own at Drumclog, occupied Glasgow, and proved himself an ableml of the regular forces to cope with a rising. Charles might have been unable, in the frenzy of the popish plot of Titus Oates, to send forces from England, but as he chose the popular Protestant, the duke of Monmouth, to command them, he was allowed to despatch some regiments. The rebels, who were in two hostile parties, Indulged and Separatists, failed to hold Bothwell Bridge, and were easily routed. The duke of York was sent, in honourable banishment, to Scotland, and in the parliament of 1678 was royal commissioner.

In the summer of the fourth period (1683-1688), the domination of the duke, Queensberry, Perth, and his brother, Drummond of Lundy (earl of Melfort), Lauderdale was out of favour, and died. Now “by concession” (a third indulgence) “and represcence, the once mighty force of Scottish Presbyterianism had at length been broken” (Hume Brown). By “Presbyterianism” we here understand, not the Presbyterian form of church government—the kirk whose motto is Nec tamen consumebatur—but the pretensions of preachers to dominate the state by the ethical “cleaver of the keys," by excommunication with civil penalties and by the fiercest religious intolerance. Presbyterianism can exist and flourish without these survivals of the proudest pretensions of Romanism. To quote Dr Hume Brown again: “When the absolutism of the Stuarts was succeeded by a more rational government (1688), the example of the Indulged ministers, who composed the great mass of the Presbyterian clergy, was of the most potent effect in substituting the idea of toleration for that of the religious absolutism of Knox and Melville.” Save for the fact that the ministers were as intolerant as ever of Nonconformists, Catholics and heretics, this is a just view, but Charles II. had denied himself all. The test was carefully framed, the more fanatical ministers, were potent, whether the majority or not, while, after 1688, government found “the once mighty force of Presbyterianism broken.” It was broken by the two last Stuart kings, who employed methods the most brutal and repulsive for the crushing of consciences trained in the theocratic ideas of Knox and Melville. The memory of the courage and devotion with which men, women and even children faced torture, death and ruin for an ideal impossible and undesirable is dear to the Scottish people.

On the side of the extremists, Cameron was happy enough to die in fair fight at Aitrs Moss (22nd of July 1680), after publicly disowning the king for his breach of the covenant. Cargill next excommunicated the king, Dalziel and Mackenzie, and his followers separated themselves from “the ordinances dispensed by any Presbyterian minister.” The followers of these two men, and of their successor, Renwick, who later was hanged, became the armed and organized “Societies,” a large force of yeomen and farmers in south-western Scotland, usually styled Cameronians. After the Revolution, the government left them alone and would not, as the pretentiousmentants, the more fanatical ministers, were potent, whether the majority or not, while, after 1688, government found “the once mighty force of Presbyterianism broken.” It was broken by the two last Stuart kings, who employed methods the most brutal and repulsive for the crushing of consciences trained in the theocratic ideas of Knox and Melville. The memory of the courage and devotion with which men, women and even children faced torture, death and ruin for an ideal impossible and undesirable is dear to the Scottish people.

In 1681, parliament, under the duke of York as commissioner, passed a test act so drafted that no human being could honestly and logically take the test. The earl of Argyll, son of the marquis, added a qualifying clause; he would take the test, “as far as it was consistent with itself.” By the influence of his countless creditors, who desired to be paid out of his estates, and in revenge for his seizure, on claims for debts, of the whole estates of clan Maclean (1674-1686), he was tried and was actually found guilty of treason. He escaped, but was condemned on the old charge after his later invasion of Scotland (1685).

In 1684, while Perth, and his brother, Melfort, who went over to Rome, were in power, Renwick emitted an “Apologetical Declaration,” in which the active enemies of his sect were threatened with secret trials and with assassination (October), and a “curate,” with some soldiers, was murdered. This, coming on the head of the Rye House murder plot (of which the Rev. Mr Carstairs, the agent of Argyll, and probably Argyll himself, then in Holland, were not ignorant), caused the government to demand, at the hands of the military, from all and sundry, an “Abjuration” of Renwick’s anarchist utterances. A cluster of bills were passed, and for the first time it was made obligatory to include no disavowal of religious principles, and was “universally unscrupled, even by the generality of great professors and ministers too,” says Sheilds, an advanced extremist. However, the peasantry found, in the abjuration, matter contrary to their consciences, and while some recusants were shot out of hand, a girl named Margaret Wilson, with an old woman, Margaret MacLauchlan, were tied to stakes and drowned by the incoming tide, near Wigtown (13th of May 1685). How the penalty came to be inflicted, as the pair had what Wodrow calls a “most horrid and unnatural manner” of dying, or why the record of the withdrawal of the reprieve, remains a mystery. The guilt appears to attach to the local authorities at Wigtown.

In this cruel affair, Claverhouse, who caused to be shot the celebrated John Brown, “the Christian carrier,” had no hand. To quote Dr Hume Brown, Claverhouse “kept strictly within the limits of his commission, and he carried out his orders with the distinct aim of sparing blood in the end. To those who he thought had been led astray, it was his policy not to be unmerciful; for, in his own words, ‘it renders three desperate where it gains one.’ On the other hand, in the case of the obdurates, he showed a relentless precision, which gained for him his evil name, ‘The Bloody Clavers,” the commissioned servant of the powers of darkness.” As constable of Dundee he secured the commutation of the death penalty on minor offenders under his jurisdiction, and his expressed maxim was...
"in the greatest crimes it is thought wise to pardon the multitude and punish the ringleaders." It is no exaggeration to say that, of the governors of Scotland under the Restoration, Claverhouse was the ablest, the most honourable, the least rapacious and even the most eloquent. But "Blurdy Claverhouse" will continue to enjoy his traditional reputation in popular tracts and popular histories.

Charles II. had died on the 2nd of February 1685, and there were in Scotland some who wept for him. The year of his death was, par excellence, "The Killing Time," thanks to Renwick and his associates and the Rye House plotters. Now, too, came the attempts of Monmouth and of Argyll, who, owing to divided counsels in his camp, and want of support either from his clan or from the southern malcontents, failed in his invasion of Scotland, was taken, and was executed, suffering like his father with great courage and dignity. Many recusants were penned up, starved and cruelly treated, even tortured when they attempted escape, in the vaults of Dunottar Castle.

In 1686 James claimed and used the dispensing power as to penal laws against Catholics, in face of the opposition of two of the Scottish bishops (who were ejected from their sees) and of parliament. Mackenzie, for his opposition, lost office. The privy council was opened to Catholics, but on the landing of William III. the populace, in 1688, wreaked the chapel of Holyrood and began to "rattle" conformist ministers, or "curates." Of the guard that defended Holyrood the "gentlemen and the rabble, when they saw all danger over, killed some and put war among the clans, and outmanoeuvring them died of their wounds and hunger," a parallel to the Dunottar cruelties not usually mentioned by historians ("Balarcs Memois"). A Convention of Estates, without a royal commissioner, met at Edinburgh on the 14th of March 1689, and it is curious that Williamites and Jacobites were not unequally represented. For president, Hamilton, who had been in opposition from 1673 to 1682, was preferred to Atholl by a small majority, but it soon appeared that William's friends were in the ascendancy.

Claverhouse, now Viscount Dundee, despairing of his party, and under apprehension of an attack on Perth, retired northward with a handful of horse, and began to play the part of a Regenerateur. Montrose, while the Convention offered the crown to William and Mary, adding the claim of right to de-throne a king who had infringed the laws. In May, William, in London, took the coronation oath, but firmly refused to accept, except in some sense of his own not easily understood, the clause, "to be careful to root out all heretics." The castle of Edinburgh was surrendered by Gordon, and Balarcs was put in that prison where, according to legend, he was visited by the wrath of Dundee, on the night of the battle of Killiecrankie. When Dundee managed the clans and outmanoeuvred Mackay, a party in parliament was agitating for constitutional reforms, and especially for freedom from the Lords of the Articles. William opposed, and party war was furious, when news came of Dundee's complete victory at Killiecrankie. The terror of the Whigs turned to joy when they heard that Dundee himself had fallen in the arms of victory. Two murderers had been sent by the earl of Nottingham to "seize," that is to despatch, Dundee. They left London for Mackay's camp on the 10th of July. On the 17th of July Dundee was shot, and on the 21st of October Newcastle wrote that his emissaries "had done very good service to the King" (Slate Papers, "Domestic," July 17th, 18th, 19th, October 21st, 1689). Henceforth, for lack of a commander of Dundee's genius, there was no real danger from the clans, and absolutely no chance of a rising of the lowland Jacobites in their support. At Dunkeld the newly raised Cameronian regiment successfully repulsed the highlanders, ill led by General Cannon as they were. They were never again dangerous at this period, were scattered by Livingstone in a surprise at Cromdale haughs, and government began to attempt to buy from chiefs the peace of the clan.

Meanwhile, despite the war, and were betrayed, between "the Club" (the advanced constitutionalists) and the Jacobites. In 1690 an act restored the kirk to the legal position of 1592, under sixty of the surviving ministers deprived in 1661. An act abolished civil penalties upon sentences of excommunication, and thus broke the terrible weapon which the preachers had wielded so long. Nothing was said about the eternally binding Covenant, which continued to be the fetish of the Cameronians and of later seceders. The General Assemblies, henceforth, under the influence of the diplomatic Carstairs (who had been cruelly tortured in 1684, to extract information about the Rye House Plot), did little to thwart government, though many "placed ministers" were, at heart, attached to the ancient claims of Knox and Melville. Laws as to patronage, an inflammatory question, were made, abolished and remade, causing, from about 1730 onwards, passions which exploded in the great Disruption of 1842. The dealings with the clans culminated in the massacre of the MacIans of Glencoe (13th February 1692).

Through military inefficiency the hill passes were not stopped, and the murders of a peaceful and harmless population were relatively few. That Dalrymple arranged for actual extermination of the males of the clan is certain, but there is no proof that he knew of the modus operandi, the betrayal of hospitality, "murder under trust." It is conceivable that William signed the orders under the impression that a "punitive expedition" of the ordinary sort was alone intended, but remonstrance from the Estates brought no punishment on any man except the dismissal, later, of Dalrymple (Viscount Stair) from office.

In 1694 the kirk was much irritated by William's demands for oaths of allegiance to himself, without the consent of the ecclesiastical courts. William gave way, but similar Hanoverian demands later caused great searchings of heart and divisions among the preachers. The Episcopal party among the ministers was excluded from a share in church government and tended to dwindle; the bishops had no territorial sees; and gradually Episcopalianism became to be Jacobites, professing a strange loyalty to James, who had treated them so unjustly, and later to his son, "James VIII.," the Chevalier de St George (b. June 10, 1688).

In 1693-1694 the government were in a quandary, the Cromwellian occupation the interest of Scottish men had slowly shifted from religion to commerce; but a tariff war between England and Scotland had checked manufacturing and other enterprises. One William Paterson, instrumental in founding the Bank of England, conceived the plan of a Scottish East India Company, which, in 1695, obtained a patent by act of parliament. William complained, later, that he had no notice of the terms of that patent till after it was passed (he was fighting under Namur at the time), and the act not unnaturally aroused the jealousy of the rival English companies. It committed William to obligations which might readily produce a great naval war with Spain, for Paterson's real design was to establish an entrepôt in Panama, at Darién, within the undeniable sphere of Spanish influence. The Scots invested very largely, for them, but their expeditions were ill-found and worse managed; the Spaniards seized one of their vessels with its crew; the colonists deserted the colony; a fresh expedition was expelled by Spain, and William refused to take up the Scottish quarrel (1695-1700). The losses and the apparent injustice caused a frenzy of excitement in Scotland, and William could only express his regret and his desire for an incorporeal Union of the two kingdoms. He died on the 7th of March, when the project of Union was to be debated by the English parliament. Under William, Scotland was a constitutional country; the absolute despotism enjoyed by Charles II. ceased to be; a free debating parliament existed, and torture was inflicted only by decree of king and parliament. It was abolished two years after the Union of 1707.

Anne, from the beginning of her reign, advocated union, which, with the question of the succession, was the subject of constant and furious debates in the Scots parliament, until, on the 4th of March 1707, the act received the influence of the diplomatic Carstairs, which might readily produce a great naval war with Spain, and sixteen elected peers at Westminster; the holders of Darien stock were compensated; as a balance to equality of taxation a
pecuniary equivalent was to be paid, the kirk and Scottish courts of justice were safeguarded (final appeal being to the British House of Lords), and Scots shared English facilities and privileges of trade, in name, for many years passed before Scotland really began to enjoy the benefits. Mar, Queensberry, Stair (of Glencoe) and Argyll (Red John of the Battles) were the leading statesmen of the Unionist party; being opposed to Hamilton, Atholl, and Lochbald of Carnwath, as Jacobites; by Fletcher of Saltoun as an independent patriot; by popular sentiment, by mob violence, and by many of the preachers, though not by the General Assembly. Every sentimental consideration was against a union with a prelate kingdom, “an auld enemy,” which drove a hard bargain by threats of excluding Scottish commodities. The negotiations were constantly disturbed by Jacobite intriguers with France in favour of James VIII.; by Scottish adherence to the Act of Security, which might give Scotland a king other than a Hanoverian in succession to Anne; and by the hanging of an Englishman, Captain Green, for piracy on a lost Scottish vessel (1705). The final debates of 1706 were conducted under apprehensions of an invasion of Edinburgh by highlanders and wild western fanatics of the Covenant; but the astuteness of Harley’s agent in Edinburgh, de Foe, the resolution of Argyll and the tact of Queensberry, who easily terrified the duke of Hamilton, carried the measure into haven. The Union was at first rich in causes of friction, and in nothing else; even as late as 1745 it was most unpopular, but Scotland had no choice. The nation would never accept a Catholic king, a Stuart, nor, even if it could, was it able to trust in a foreign power, and it was inferred by James in his own mind that the religious objection was insuperable; opportunities of commercial development were indispensable; war with England was not to be contemplated by the common sense of the country; and thus, as de Foe wrote, “The Union was merely formed by the nature of things.” In Lockhart’s words, the 30th of April 1707 “was the last day that Scotland was Scotland. I may lament and weep,” he adds, “but truly I have had admirable sport,” with his greyhounds.

Friction about matters of trade was the instant sequel of the Union: so much ill-feeling was provoked that, in the general opinion, had King James VIII. landed alone when brought to the Scottish coast by Forbin’s fleet in March 1708, he would have carried Scotland with him. But Forbin was chased away from the Firth of Forth by a fleet under Sir George Byng; he refused to allow the young adventurer to land farther north, and the Jacobites doubted that France was never serious in the enterprise. The Jacobites also, through mistrust of each other—none could trust Hamilton—and finally through the intoxication of a pilot who failed to return, Forbin, led to the impiety of his last exploit, convinced the Jacobites to manage a secret measure of toleration for the Episcopalian clergy, after one of them, Mr Greenshields, had long lain in prison for his use of the liturgy (1711). The kirk was incensed by the growth of Episcopalianism and of Popery, the restoration of patronage, and the pressure to accept an oath abjuring James, which divided a church that was absolutely anti-Jacobite. Repeal of the Union was actually mooted in 1712, and even Argyll was restive. The fatal duel in which Hamilton was slain by Mohun, when on the eve of going as ambassador to France, with the interests of James in his eye, was a blow to the Jacobites; as were the death of Anne, the fall of Bolingbroke and the unopposed succession of George I. (August 1714). Their king over the water had, in a manly and magnanimous letter to his adherents, refused to change his creed, and when Bolingbroke fled from England his evangelical efforts at proselytizing James were fruitless. Berwick and Bolingbroke were his ministers, but Berwick would not accompany him to Scotland, and Bolingbroke did not provide the necessary munitions of war. Through a series of confusions and blunders, Mar prematurely raised on the 16th of September 1715 the standard of King James, and though in command of a much larger army than ever followed Montrose, was baffled by Argyll, who held Stirling with a very small force. Mar never crossed the Forth, and the command of Mackintosh, who did, was captured, with his Northumbrian cavaliers, at Preston, on the very day (12th of November) when Argyll foiled Mar in the confused battle of Sheriffmuir. Mar’s highlanders began to desert; his council was a confusion of opinions and discontent, and when, after many dangers and in the worst of health, James joined the Jacobites at Perth, it was only to discourage his friends by his gloom, and to shelve their remaining plot—two Argyll to Montrose. Thence he futilely sailed with Mar to Falmouth, a drunken man, having his army to shift for themselves. Many of his noble supporters escaped, he did his best to provide them with ships, others were executed, while the great Whig, Forbes of Culloden, protested against the bad policy of the repressive measures. Argyll, who had saved the country, was regarded as lukewarm, and lost the royal favour, while James, at Avignon, intrigued with Charles XII. of Sweden and with Argyll and his brother, the earl of Islay, till he was driven from France to take refuge in Italy. Spain backed him in 1710, but the death of Charles XII., and the utter failure of a Spanish expedition to Scotland in 1719, when the Jacobites were scattered, and the Spaniards taken, in a fight at Glenahell, ruined what had seemed a fair chance of success. Returning from Spain, James married Maria Clementina Sobieska, daughter of Prince James Sobieski, a pretty bride whom Charles Wogan rescued from danger in Innsbruck, an adventure of romantic gallantry. The marriage was unhappy; James was eternally occupied with the business of his cause and the feuds of his adherents; Clementina lost her gaiety and became ceaselessly jealous; and her retreat to a convent in France in 1717 was her divine retribution. Forbin offered in As- terbury’s plot (1720), the alleged treason of Mar and the splits in the Jacobite party. Clementina, however, was the mother of two sons, Charles Edward, the hope of his party, and Henry. The cause slumbered, till in 1742-1743 the outbreak of wars with France and Spain gave Prince Charles a chance of showing his mettle. The Jacobites surrounding James in Rome never ceased to weave at the endless tissue of their plot, but in Scotland nothing more substantial than the drinking of loyal healths was done, between the flight of Lockhart of Carnwath, the manager of the party, and the years of 1737-1744. The old Jacobites were dying out; James never had a minister who was not bailed by three-fourths of the party, and denounced as a favourite at best, at worst a traitor; and the Cause would have sunk into ashes but for the promise of his eldest son, Prince Charles.

In Scotland the kirk, as ever, was militant, but it could no longer wage war on kings and their ministers, nor attempt to direct foreign and domestic policy. The preachers thus fell into parties, which attacked each other in a brotherly way. The grounds of strife were the spread of “liberal” religious ideas; on the side heretical and anti-Calvinistic doctrines, and on the other a tendency to stretch Calvinistic principles till they were scarcely to be distinguished from Antinomianism. A Glasgow professor, the Rev. Mr Simson, was attacked for Arminianism and Socinianism as early as 1717; and the battle raged between the more severe Presbyterian—

Parties in the kirk.

who still hangkered after the Covenant, approved of an old work The Marrow of Modern Divinity (1649), and were especially convinced that preachers must be elected by the people—and the Moderates, who saw that the Covenant was an anachronism, and that the church was still the pillar of the state and supported in the General Assembly the candidates selected by patrons, as against those chosen by the popular voice. The Marrow was discouraged as verging on Antinomianism (1720); and in 1722 its protesting admirers were rebuked by the Assembly. The Marrow men put in protests, and were clearly on the way to secession from the kirk. The oath of abjuration of James was another cause of division, at least till it was watered down in 1719; and by 1726 a revival of the charges of heresy against Simson, with the increase of agitation against the majority of the Assembly who supported patrons, lighted a flame which burned the slight bonds that kept the extremists in union with the kirk.

In 1732 their leaders were the brothers Erskine, one of whom, Ebenezer, preached a sermon accusing professed Presbyterian
as guilty of “an attempt to jostle Christ out of his church.” For this and other severe censures of his brethren, Mr Erskine would not apologize: he had “delivered the utterance given to him by the Lord”; his was the very attitude of the preachers who thundered against James VI. Mr Erskine was rebuked in the Assembly of 1733; he protested with three friends; they were deprived of their charges; they vowed that they were “the True Presbyterian Covenanted Church of Scotland,” and had the power of the keys. They constituted themselves a presbytery, and maintained that the covenants were perpetually binding. The Assembly went as far as was possible in offers of reconciliation, but the KirkViewers were unyielding, and were deposed in 1740. In 1744 they made the “Taking of the Covenanters” a term of ministerial and Christian communion. It is impossible here to follow the schisms which split the seceding body within itself: the Erskines themselves were handed over to Satan; their very families adopted opposite factions: there were “Burghers” and “Anti-Burghers,” “New Lights” and “Old Lights”; besides the sects which in the 19th century merged in United Presbyterians, and merged themselves later with the Free Church of the Disruption, itself the parent of a still more numerous body, the Free Church of Scotland.

The whole movement, intended as a return to the kirk of Knox and Melville and the Covenanters, was a not unneeded protest against the sleepy “moderation,” and want of spiritual enthusiasm, which invaded the established kirk in the latter part of the 18th century, a period in which she possessed such distinguished writers as John Home, author of the drama of Douglas, Robertson, the historian, and Dr Carlyle, whose amusing autobiography draws a perfect portrait of an amiable and highly educated “Moderate” and man of the world. Naturally the opposite party, whether seceders, or “High Flyers,” as they were called, within the church, had most influence with the populace, so that “the Trew Universal Kirk” of Scotland was broken into several communions, differing but slightly in accepted doctrines, and not at all in mode of worship. Their tendency has been centripetal, and all the “Free Churches” are agreed in their views concerning the prolonged existence of “the Auld Kirk.” The Episcopalians, in this period, were nearly as much perturbed as the Presbyterians, by questions as to the election of bishops in relation to their exiled King, and by the introduction of ritualism in the shape of “the usages.” They passed through much persecution. In consequence of the rising of 1745, but, after the death of their King Charles, they became as loyal as any other religious body, managing their own affairs with no more turmoil than is caused by the coexistence of the Anglican and the Laudian prayer-books, with their different forms of the communion service.

As to civil matters, the country was troubled by riots against the Malt Tax, but the clans submitted to a very superficial disarmament; companies of highlanders were employed to preserve order and check cattle-raiding; and one of these, “The Black Watch” (the Forty-Second), greatly distinguished itself at the battle of Fontenoy. Wade drove his military roads through the highlands, and, poor as the country still was, the city of Glasgow throw on the tobacco and sugar trade with America and the West Indies. Yet Duncan Forbes of Culloden, president of the Court of Session, after the outbreak of the war with Spain, reported amazing scarcity of money in the country, and strenuously advised legislative checks on the taste for tea, which naturally diminished the profits of the excise on more generous beverages. The fact is that as English companies for foreign trade had long been in charter possession, Scotsmen, and Scottish captains, had no profitable outlets, while agriculture was conducted on slovenly medieval or prehistoric methods; and only the linen trade of the country was really flourishing. Thus, except in the case of the west coast trade with the colonies, Scotland had reaped little commercial benefit from the Union, and the loss of business caused by the abolition of the parliament, and the rush of noble families to London, was severely felt in Edinburgh. Yet there existed no dangerous political dissatisfaction. Though the chief

religions of the highlanders, the Episcopalian and Catholic forms, were depressed by persecution, and priests were few, the clans had long been accustomed to lack of religious functions and did not feel the want. But the hereditary jurisdictions and feudal powers, as of calling out tenants by the fiery cross and punishing the peaceful by burning their cottages, had never been abolished; the chief’s will was law, and if the chiefs headed a rising, their clansmen would follow them, willingly or “forced out.” They formed a remarkable militia, trained to the use of arms; wonderfully mobile and rapid on the march and dauntlessly courageous.

In 1737-1739 saw the germs of civil war beginning to take active life. Simon Fraser, Lord Lovat, an aged intriguer, conceived discontent against the government for the loss of his independent company, and began to intrigue with France and with James in Rome. In the same year a young Tweedside laird, Murray of Broughton, visited Rome, fell in love with Prince Charles, then a handsome, wayward, stalwart and ambitious lad, with “a body made for war,” and, returning home, Murray practically succeeded to the duties once performed by Lockhart of Carnwath, as Jacobite against the government organized.

In 1738 the waning power of Walpole and the approaching war with Spain caused Forbes of Culloden to propose the raising of five or six highland regiments for foreign service. Walpole, urged by Lord Islay, brother of Argyll, is said to have approved, but nothing was done. The declaration of war with Spain and the certainty of war with France promised to the Jacobites good fishing in turbulent waters; and they entertained futile hopes of enlistings Argyll with his potent clan. Walpole entered into communication with James, who saw through the manœuvre, and in 1741 a Jacobite association was formed, which included Lovat and Lochiel. Their agent was Drummond (Macgregor really) of Balhaldie, who in 1741-1743 dealt with the English Jacobites, and persuaded France that they were powerful and eager. In fact the Scots were feebly organized, and the English Jacobites were not organized at all. Says Murray, “there was not the least ground for encouragement,” but, thanks to Balhaldie, Louis XV. began to mobilize an invading force in November 1743. Balhaldie carried to James in Rome an invitation for Prince Charles to go to France, a serbal invitation, which James reluctantly accepted. Cardinal Tencin was not in the secret, and by the time Charles made his way to Paris in January 1744, James clearly perceived the duplicity of France. The Scottish Jacobites were left in ignorance of the French attempt to land in the mouth of the Thames (February–March 1744), an effort frustrated by a disastrous tempest, and by the slackness of the English conspirators.

Prince Charles was left in neglect and obscurity; till, unchecked by Murray, relying on hasty Jacobite promises brought by him, and encouraged by the French victory of Fontenoy, he started with seven companions for the west highland coast on the 21st of July 1745. His landing at Borradale on the 5th of August brought a few enthusiastic Macdonalds about him; from a sense of honour Lochiel joined with the Camerons. Keppoch and Clanranald would not desert a prince with a reward of £30,000 on his head, but MacLeod and Sleat held aloof; and Lovat wrecked the adventure by his doubts and delays. None the less a small ill-armed force of some 2000 men marched south; Cope did not oppose them, but evaded them and went to Inverness, leaving open the road to Edinburgh. At Perth Charles was joined by a skilled soldier, Lord George Murray, brother of the Whig duke of Atholl, a pardoned veteran who had been out in 1745.

But Lord George’s previous dealings with Cope inspired in Charles a distrust which was to prove fatal. Charles entered Edinburgh unopposed on the 16th of September, made his quarters in Holyrood, and on the 21st of September routed Cope at Prestonpans. But he had not the force to invade England, or to take the castle, and waited, collecting recruits and money, and encouraged by empty promises from France, till, as he wrote to James (26th of October), “I shall have one decisive
stroke for 't, but unless the French land, perhaps none. As matters stand, I must either conquer or perish in a little.' His English adherents did not come in, and, after marching to Derby, his council insisted that enough had been done for honour, that Wade was on their flank and rear, the duke of Cumberland in their front, and an army was gathered to defend London. A broken-hearted man, Charles was compelled to acquiesce in retreat (5th of December). If the chiefs had possessed information now accessible to us, they might not have made "the great refusal," but with only the intelligence which they possessed they could not have foreseen what the English army was like. Their force was not more than 5000 men; and they were wholly unskilled in the use of the guns which they had captured at Prestonpans. The retreat was admirably conducted; Lord George and Cluny fought a gallant and successful rear guard at Clifton; they escaped from Cumberland across the border, but Charles, against advice, left a doomed garrison in Carlisle. After a stay to re-fit at Glasgow, Charles moved to besiege Stirling castle, and to join a force from the north, almost as numerous as that with which he had invaded the heart of England.

Cumberland had returned to London, but Hawley marched from Edinburgh with an army which Charles drove to the winds of Falkirk Moor. Hawley's guns were never in action, the Macdonalds charged and scattered his cavalry on the right wing, but pursued too far, and as the pipers had gone in sword in hand, they could not be recalled. On the left the prince's men could not load their pieces, their powder being ruined by the tempestuous rain. They were checked by two steady regiments; many fled, all was darkness and confusion, but, on returning to Falkirk, Charles found that Hawley had decamped in a disgraceful rout. He could not pursue them, whereabouts of his right was unknown, and after the battle his best officers felt rather dismayed than encouraged by the conspicuous lack of discipline. In place of advancing on Edinburgh, they dallied round Stirling castle in futile siege, and, on the news of Cumberland's advance, alarmed by desections which they appeared to have greatly exaggerated, the chiefs compelled Charles to a fresh retreat. His expostulations perhaps prove him to have been "the best general in his army," but he was dragged northwards to Inverness, and with depleted ranks of starving men, outworn by the fatigue of a long night's march to surprise Cumberland and wise assistance of Culloden Moor in defence of Inverness, his base and only source of supplies (16th of April 1746). Charles had some 9000 men, Cumberland had nearly 9000 and eighteen well-served guns. Here for the first time the highlanders were under heavy fire of grape and roundshot, to which they could not reply, and though the right wing and centre, Camerons, Atholl men, Macleans, Clan Chattan, Appin Stewarts, under Lord George and Lochiel, fought with even more than their usual gallantry and resolution, the Macdonalds on the left, discouraged by the death of Keppoch, Scouats and other officers in the advance, never came to the shock. Though outmatched, the enflamed and met by heavy musketry fire in front, the right wing broke Barrell's regiment and passed the guns, but the attack was checked by the bayonets of the second line and a rapid retreat became general. Charles did not leave the field till all was lost; so much seems clear from Yorke's evidence; but the price on his head, and probably suspicions urged by some of his Irish officers, induced him to desert his army and hurry secretly to the west coast and the western isles. He was rewarded by five or six months of dangerous and distressful wanderings, and would certainly have been taken at one juncture but for the courageous and wise assistance of Flora Macdonald, while on all hands the highlanders displayed the most devoted loyalty.

Into the ferocious conduct displayed by Cumberland after the victory, and in the suppression of the clans, we need not enter; nor is the list of executions of rebels alluring. The spirit of the clans remained true indeed, but their prince became a "broken man": his clency, and courage, and all that had endeared him to his people, perished under the disguises and vicissitudes engendered by many years of a secret fugitive existence, after he was driven from France in 1749 (see A. Lang's Pickle the Spy, and Life of Prince Charles).

As far as the rising had a political aim and reason for existence, apart from mere dynastic sentiment, that aim was "to break the Union"; in the prince's words, "to make Scotland once more a free and happy people." But the vast majority of Scots, though not in love with the Union, preferred it to the rule of a Catholic king—Charles probably, for James had every desire to abdicate. The failure of Charles had, in fact, the result of assimilating Scotland much more closely to Jacobite sentiment, and the predominance of the highland dress, did not indeed break, but it transferred to other fields the military spirit of the clans. The chiefs first raised the highland regiments which have covered themselves with glory from Ticonderoga to Dargai and Elandslaagte. The reward which many of the clansmen of the Peninsula and Waterloo received may be appreciated by those who read the introduction to Scott's Legend of Montrose. They returned to gentry desolate of men, deserted, first, by the voluntary emigrations of the clans, and later by forced emigrations in the interests of sheep farms and deer forests. The abolition of the hereditary jurisdictions and of the claims of feudal superiors to military service, after Culloden, broke the bond between chiefs and clans, and introduced new social and economical conditions, bequeathing the Land Question to the 20th century. The "planting" of ministers in the highlands, which had since the Reformation been almost destitute of religious instruction, bred a populace singularly strict in the matter of "Sabbath observance," and, except in districts still Catholic or Episcopalian, eager supporters of the Free churches. In outlying places the old popular beliefs linger; second sight is common in some gilts; and the interesting poetical tradition of local Jacobite sentiment, in the north, survived; and when he wrote English verse he often followed the artificial style of the 18th century. The later famous men of letters, Scott, Carlyle and R. L. Stevenson, appealed as much to Scottish readers as to their countrymen, patriotic as each of them was in his own way. As early as 1730-1740, the great English public schools and universities began to attract the Scottish youths of the wealthier classes, and now good Scots is seldom heard in conversation and is not always written in popular Scottish novels. Scotland and England, however, will always remain pleasantly distinct by virtue of their historical past and inherited traditions.

BIBLIOGRAPHY.—The best general history of Scotland is that of Pococke (1744), and the one that is based on thorough research in MSS., many documents now available, such as the depositions of Spalding's History of Scotland (1807), and the History of the Highlands (1811) is excellent, but close with the Union of the crowns. Scott's Tales of a Grandfather is, of course, full of interest, but is inevitably somewhat behind the mark of later years.
of research. The Foreign Calendars of State Papers, especially J. Bain's Calendars (Edinburgh, 1881-1888), are useful indices, but much important work is unpublished or uncollected.

There is much new information among the documents published by the Historical Manuscripts Commission, by the Scottish History Society, and the Register of the Privy Council, edited by Professors Masson and Humble. The volumes of the book club, of Maitland, Abbotsford and Spalding, are full of matter; also those of the Early Scottish Texts Society and the Wodrow Society, with the works of Knox, and the Early Scottish Society, and the History of the Society of Antiquaries, by Wodrow (edited by the Rev. Robert Burns, 1837-1838). Knox, like Bishop Burnet, needs to be read critically and in the light of contemporary documents; especially those in the Hamilton Papers, The Scots and English State Papers (Foreign). The most recent general Histories of Scotland are those of P. Hume Brown (Cambridge, 1899), and on a larger scale, but ending at 1746, of A. Lang (Edinburgh, 1900-1907). Matheson's works deal with the period of the Covenant, and Sir Archibald Maclachlan, with the Union; while Sir H. Craik's A Century of Scottish History (Edinburgh, 1901) gives a full account of the disruption of the Kirk. Many important manuscripts in most rooms are still un-calendared; those of the French Foreign Office are imperfect in places, and have been little consulted; and a complete calendar of the treasures of the Advocate's Library was only recently begun. Among monographs, Six Saints of the Covenant and The Life of Mary Stuart (up to 1566), by D. Hay Fleming; The Life of Knox, by P. Hume Brown, and John Knox and the Reformation, by A. Lang; Miss Shield's King over the Water and Martin Haile's James Francis Stewart, [q.v.], are among the outstanding works of the last generation. Wodrow's The Great Morgues (of Argyll); Napier's Lives of Montrose and Dundee; Clarke and Foxcroft's Life of Bishop Burnet; Sir W. Macaulay's life of Douglas, with all Sir W. Fraser's family histories, and Patrick's Statutes of the Scottish Church, may on various points prove serviceable. For Scottish constitutional history, what there is of it, Sanford Terry's Scottish Parliaments may be recommended. (A. L.)

IV. SCOTTISH LITERATURE

"Scottish Literature" is taken here in the familiar sense of the Teutonic vernacular of Scotland, not in the more comprehensive sense of the literature of Scotland or of writings by men of Scottish birth, whether in Gaelic (see CElt) or Latin or Northern English. The difference between the two definitions, however, is of small practical concern. The Scottish-Gaelic literature, which is separately dealt with (see CElt: Literature) in, by comparison, of minor importance; and the Latin, though it has a range and influence in Scotland to which it is difficult to find a parallel in the history of the literatures of Europe, is (perhaps for the very reason of its persistency and extent) so bound up with the vernacular that it may be conveniently treated with that literature. It is true that down to the 15th century there were many Teutonic Scots who had difficulty in expressing themselves in "Ynglis," and that, at a later date, the literary vocabulary was strongly influenced by the Latin habit of Scottish culture; but the difficulty was generally insuperable, and the works of Sir David Lindsay and the other great writers of the 15th century style in the use of a medium which had had literary traditions; also perhaps from medieval and humanistic contempt of the vulgar tongue; in some cases from the cosmetic circumstance of the Scot and the special nature of his appeal to the learned world. The widespread use of Latin was, however, seldom or never antagonistic to the preservation of national sentiment. That it was used for other than literary purposes strengthened that sentiment in a way which more scholarly or literary interest could not have done. The Scottish verse is rarely wanting, even in places where Scots is the mother tongue, and where Latin is the language of the literatures, an exclusive privilege. And to say this implies no disrespect to the quality of early Scottish Latinity.

In a survey of the vernacular literature of Scotland it is advantageous to keep in mind that there are two main streams or threads running throughout, the one literary in the higher sense, expressing itself in "schools" of a more artificial or academic type; the other popular, also in the better sense of that term, more native, more rooted in national tradition, more persistent and consequently less bookish in fashion. The former is represented by the mystical and devotional works of the 14th century, by the 17th-century Court poets, by the "English" writings of Sir Walter Scott, the latter by the domestic and rustic muse from Christis Kirk on the Gane to the work of the 18th century revival begun in Ramsay. There is, of course, frequent interaction between these two movements, but recognition of their separate development is necessary to the understanding of such contemporary contrasts as the Thrissil and the Ros and Peblis to the Play, Drummond and Montgomerie, Hume and Ramsay and Hume. In our own day, when the literary medium of a people which is entirely lacking that of England, the native Scottish literature has been reserved for certain dialectal revival, more or less bookish in origin, and often as artificial and as unrelated to existing conditions as the most "aurate" and Chaucerian "Yngls" of the 14th century was to the popular speech of that time.

This sketch is concerned only with the general process of Scottish literature. An estimate of the writings of individual authors will be found in separate articles, to which the reader is, in each case, referred.

Early Period (from the beginnings to the earlier decades of the 15th century). The literary remains of this period written in the vernacular, which is in its main characteristics "Northern English," are in the familiar medieval kinds of romance and rhymed chronicle. After the Wars of Independence a national or Scottish sentiment is discernible, but it does not colour the literature of this age as it does that of later periods when political and social conditions had suffered serious change.

The earliest extant verse has been associated with Thomas of Ercludienne (q.v.), called The Rhymer, but the problem of the Scot's share in reworking the Tristan saga is in some important points undetermined. Yet more important is the revival begun by Huchown (q.v.), who continues in the 14th century the traditions of medieval romance. Contemporary with the work of the latter are a few anonymous fragments such as the verses on the death of Alexander II., first quoted by Wintoun in the 15th century, and the stanzas on the "Maydens of Engleonde" and "Long beorid," quoted by Fabyan. The type of alliterative romance shown in the work ascribed to Huchown continued to be popular throughout the period (e.g. The Knightly Tale of Gaiolos and Grene), and lingered on in the 15th century in The Book of the Howlat by Holland (q.v.), the anonymous Rauf Collyear of the third quarter of the 15th century, and in occasional pieces of burlesque by the "Chaucerians" makars.

Independent of this group of alliterative romances is the not less important body of historical verse associated with the names of John Barbour (q.v.), Andrew of Wintoun (q.v.), and, in the middle period, Harry the Minstrel (q.v.). Barbour has been called the Father of Scottish Poetry, apparently for no other reason than that he is the oldest writer who has held place in popular esteem. Though his work shows some of the qualities of historical romance and alliterative style in the use of a medium which had had literary traditions; also perhaps from medieval and humanistic contempt of the vulgar tongue; in some cases from the cosmopolitan circumstance of the Scot and the special nature of his appeal to the learned world. The widespread use of Latin was, however, seldom or never antagonistic to the preservation of national sentiment. That it was used for other than literary purposes strengthened that sentiment in a way which more scholarly or literary interest could not have done. The Scottish verse is rarely wanting, even in places where Scots is the mother tongue, and where Latin is the language of the literatures, an exclusive privilege. And to say this implies no disrespect to the quality of early Scottish Latinity.

In a survey of the vernacular literature of Scotland it is advantageous to keep in mind that there are two main streams or threads running throughout, the one literary in the higher sense, expressing itself in "schools" of a more artificial or academic type; the other popular, also in the better sense of that term, more native, more rooted in national tradition, more persistent and conversely less bookish in fashion. The former is represented by the mystical and devotional works of the 14th century, by the 17th-century Court poets, by the "English" writings of Sir Walter Scott, the latter by the domestic and rustic muse from Christis Kirk on the Gane to the work of the 18th century revival begun in Ramsay. There is, of course, frequent interaction between these two movements, but recognition of their separate development is necessary to the understanding of such contemporary contrasts as the Thrissil and the Ros and Peblis to the Play, Drummond and Montgomerie, Hume and Ramsay and Hume. In our own day, when the literary medium of a people which is entirely lacking that of England, the native Scottish literature has been reserved for certain dialectal revival, more or less bookish in origin, and often as artificial and as unrelated to existing conditions as the most "aurate" and Chaucerian "Yngls" of the 14th century was to the popular speech of that time.

This sketch is concerned only with the general process of Scottish literature. An estimate of the writings of individual authors will be found in separate articles, to which the reader is, in each case, referred.
rarely they approach Chaucer in sheer accomplishment. The first example of this new style is the Kingis Quoir of James I. (q.v.), a dream-poem written in Troilus verse, and reminiscent of Chaucer's translation of the Romance of the Rose. The indebtedness to Chaucer, even when full allowance is made for the young poet's individuality, is direct and clear. The language, like that of the later Lancelot of the Laik and the Quare of Jelousy, represents no spoken dialect. Whether it is to be explained by the deliberate adoption of southern literary forms by the author, whose enthusiasm for Chaucer and the circumstances of his sojourn in England made inevitable, or whether the single text which is extant is a Scottish scribe's rendering of a text purely southern in character, is a nice academic question. The balance of evidence, and the presumption is strongly in favour of the former, which is the traditional view. When the linguistic forms of the other pieces in the Selden MS., presumably by the same scribe, have been carefully examined and compared, it should not be difficult to reach a final settlement.

The later Scots Chaucerian type is less directly derivative in its treatment of allegory and in its tricks of style, and less southern in its linguistic forms; but, though it is more original and natural, it nevertheless retains much of the Chaucerian habit.

The greater poets who represent this type are Robert Henryson, William Dunbar, Gavin Douglas, and, to a large extent, Sir David Lyndsay—whose united genius has given high literary reputation to the so-called Golden Age. General opinion has exaggerated the importance of the minor writers who shared in this poetical outburst. There is, of course, some historical significance in the drawing up of such lists as we have in Dunbar's Lament for the Makaris, or in Douglas's Palace of Honour, or in Lyndsay's Testament of the Papygno, but it is at the same time clear that their critical importance has been exaggerated. Several of the writers named belong to an earlier period; of many of the others we know little or nothing; and of the best known, such as Walter Kennedy (q.v.) and Quintyn Schaw, it would be hard to say that they are not as uniformly dull as any of Ocelleve's southern contemporaries.

The greater portion of this Middle Scots "Chaucerian" literature is courtly in character, in the literary sense, that it continues and echoes the sentiment and method of the verse of the cours d'amour type; and in the personal sense, that it was directly associated with the Scottish court and conditioned by it. All the greater writers, with the exception of Robert Henryson, were well born and connected with the Household, or in high office. Hence what is not strictly allegorical after the fashion of the Romance of the Rose or Chaucer's exercises in that kind, is for the most part occasional, dealing with courtiers' sorrow and fun, with the conventional plaints of the vanity of the world and with the vanities of their authors. Even in the Homerically prefixed Elegy on the death of a friend, the most original of these poets, is in his most original pieces strongly "Chaucerian" in method, notably in his remarkable series of Pables, and his Testament of Cresseid, a continuation of the story left untold by Chaucer. In his Robene and Makyne, on the other hand, he breaks away, and follows, if he follows anything, the tradition of the postwelles. Dunbar often, and at times deliberately, recalls the older verse-habit, even in his vigorous shorter poems; and Douglas, in his Palace of Honour and King Hart, and in his translation of Virgil, is unequivocally medieval. Still later, amid the satire and Reformation heat of Lyndsay we have the old manner persisting in the Testaments and in the tale of Snyer Maldram.

There are, as might be expected, points of contact between the work of the greater makars and the more native and "popular" material. It is remarkable that each of these poets has left one example of the old manner, shown in the alliterative romance-poem; but the fact that in each case their purpose is strongly burlesque is significant of the change in literary outlook.

The non-Chaucerian verse of this period is represented by (a) alliterative romance-poems and (b) verse of a rustic, domestic and "popular" character. Of the historical romance-poem there is little or nothing beyond Henry the Minstrel's Wallace (super). The outstanding type is shown in such pieces as Holland's (q.v.) Duke of the Howlot, and in the anonymous poems Galagros and Gawame, The Awnturs of Arthur at the Terne Watkeyne, Rauf Collysar and The Pestill of Susau. These, however, were already outworn forms, lingering on in a period which had chosen other ideals.

Strong as the Chaucerian influence was, it was too artificial to change the native habit of Scots verse; and though it helps to explain much in the later history of Scots literature, it offers no key to the main process of that literature in succeeding centuries. Our knowledge of this non-Chaucerian material, as of the Chaucerian, is chiefly derived from the MS. collections of Asloaon, Bannatyne (q.v.) and Maitland (q.v.), supplemented by the references to "fugitive" and "popular" literature in Dunbar, Douglas, Lyndsay and, in especial, the prose Compleynt of Scotlande. Classification of this literature by traditional subdivision into genres is difficult, and, at the best, unprofitable. The historical student will be mainly interested in the varying antipathies of the later style and purpose of Ramsay, Ferguson and Burns, and in finding therein early evidence of what has been too often treated as the characteristics of later Scottishism. It would not be difficult to show that the reaction in the 18th century against literary and class affectation—however editorial and bookish it was in the choice of subjects and forms—was in reality a re-expression of the old themes in the old ways, which had never been forgotten, even when Middle Scots, Jacobean and early 18th-century verse-fashions were strongest. It is impossible here to do more than to point out the leading elements and to name the leading examples. These elements are, briefly stated, (1) a strong partisanship for subjects dealing with humble life, in country and town, with the fun of taverns and village greens, with that domestic life in the rough which goes to the making of the earlier farces in English and French; (2) a whimsical, elfin kind of wit, delighting in extravagance and topsy-turvyness; (3) a frank interest in the pleasures of good company and good drink. The reading of 15th- and 16th-century verse in the light of these will bring home the critical error of treating such poems as Burns's Collar's Saturday Night, the Address to the Deil, and Scotch Drink as entirely expressions of the later poet's personal predilection. Of the more serious, or "ethical" or "theological" mood which counts for so much in the modern estimate of Scottish literature, there is but little evidence in the popular verse of the middle period. Even in the deliberately religious and moral work of the more academic poets this seriousness is never more exclusive or oppressive than it is in any other literature of the time. If it becomes an obsession of many of the post-Reformation writers, it becomes so by the force majeure of special circumstances rather than in the exercise of an old-established habit.

The style of this rustic style are Peblis to the Play and Christis Kirk on the Green, ascribed by some to James V. (q.v.), Sym and his Brudir, a satirical tale of two palmers, The Wij of Auchtirmuchty, and the Wowing of Jok and Jynny. The more imaginative, elfin quality, familiar in Dunbar's Ballad of Kynd Kiotok and his Interlude of the Drochtis Part appears in such pieces as Gyre Carling (the mother-witch), King Berdot, and Lichentouns Drene. The convivial verse, at its best in Dunbar's Testament of Mr Andrew Kennedy, may be studied in Okey sould nolt Allene honort be, one of the many eulogies of John Barleycorn anticipatory of Burns's well-known piece.

In the collections there are few examples of the simple fabliau, the best being the Thrie Priestis of Peblis and The Dumb Wyf, or of the social variety of the same as shown in Rauf Collysar and John the Reeve. For the latter Sir David Lyndsay remains the chief exponent. Of historical and patriotic verse there are few specimens, but some of the lyrics and love-songs, more or less medieval in timbre and form, are of importance. Of these, Tayis Bank and The Murning Maiden are perhaps the best.

Vernacular prose was, as might be expected, and especially in Scotland, late in its appearance. The main work continued to be done in Latin, and to better purpose by Hector Bœce (q.v.), John Major (q.v.) and George Buchanan (q.v.) than by the earlier annalists Fordun (q.v.) and Bower (q.v.). It is not till the middle
of the 15th century that we encounter any works seriously undertaken in the vulgar: before that time there is nothing but an occasional letter (e.g. that of the earl of March to Henry IV.), a few laws, and one or two scraps in the Asloan and other MSS., all of the plainest and without any effort towards style. Nor can it be said that the first works of a more extensive and deliberate character show any consciousness of pure art as we find it in contemporary writings in England, though the fact that they are translations rather than concoctions, being among the earliest books are Sir Gilbert Haye's  *Buke of the Law of Arms, Buke of the Order of Knighthood, and Government of Princes*, preserved in a single MS. at Abbotsford. The dull treatise of John of Ireland (q.v.) lays claim to originality of a kind. The author's confession that, being "thirty yoers nistir in Franche, and in the noble study of Parys in Latyn tomg," he "knew nocht the gre cloouens of Chaucer," and again that he had written another work in Latin, "the tounge that I knew better," is valuable testimony to the difficulties in the way of a struggling Scots prose. Other preliminary efforts are the *Permut of Noblemen* in the Asloan MS.; the *Spectacle of Luf*, translated by G. Mill (1492); and the *Shoirt Memoriale of the Scitis Corniktls*, an account of the reign of James II. In the early 16th century the use of the vernacular is extended, chiefly in the treatment of historical and polemical subjects, as in Murdoch Nisbet's version of Purvey (in MS. till 1601), a compromise between northern and southern usage; Gau's (q.v.) *Richt Vay*, translated from Christern Pedersen; Bellenden's (q.v.) translation of *Livy and Scottish History*; the *Complaynt of Scotlande*, largely a mosaic of translation from the French; Nisbet's (q.v.) nothing. The earliest prose work in Scots prose, *Of Fruel of Solitude*, translated by G. Mill (1492); and the *Shoirt Memoriale of the Scitis Corniktls*, an account of the reign of James II. It was not till the publication of Bassandyny's *Bible* in 1576-1579 that a Scottish version was used officially. *Lyndsay* in the midst of passages in Scots quotes directly from the *Genevan Bible*. The literary influence of the Bassandyny was unimportant. Of the prose books named the *Complaynt of Scotlande* is the most remarkable example of aureate Middle Scots, the prose analogue of the verse of the "Chaucerians." This characteristic is by no means strong in Scots prose, even at this time: the last, and most extravagant, example is the *Rolment of Courtis* by Abacuck Byssset, as late as 1622.

So far in our treatment of the Middle Period we have taken account of the "Chaucerian" and more popular verse and of the prose. There appear towards the close of the period certain verse-writers, who, despite points of difference with their Middle Scots predecessors, belong as much to this period as to the next. In language they are still Scottish; if they show any southern affections, it is (all echoes of the older aureate style notwithstanding) the affection of Tudor and Elizabethan English. This poetry, like that of the early half of the period, is curiously its differences are the differences between the atmosphere of the reigns of the first and fourth Jameses and that of the sixth. When the sixth James becomes the first of England, a more thorough transformation is discernible. In the centre of this group is King James (q.v.) himself, poet and writer of prose, but he yields his literary competence to Alexander Scott (q.v.) and Alexander Montgomerie (q.v.). Their interest on the formal side is retrospective, but it is possible to find even in the persistent reiteration of medieval sentiment and methods, a fresh feeling for nature, and a lyrical quality of later *timbre*. With these may be named the minors, William Fowler (q.v.), Alexander Arbuthnot (q.v.) and John Rolland (q.v.), the last most strongly influenced by Douglas and the earlier "makars."

III. The third period begins with the 17th century, with the union of the English and Scottish crowns, if we seek the aid of political history for our literary finger-posts. Strict accuracy would place the date of change earlier than 1600 or 1603, for there is evidence in the 16th century, even outside the region of diplomatic and official correspondence, of the intermingling of the north and south. It is, however, when James is established on his new throne that we have the clearest signs of the changes which had been at work and were ultimately to transform the entire literary habit of his ancient kingdom. The recital of the names of the Anglo-Scots poets will make this clear: Robert Ker, *Sweight to the Descriptioun of Scotland*; Andrew Cheyne, best known in Scots to balance this *Fruel of Solitude*; Sir David Murray of Rowallan (q.v.); a group whose "courty" style might be assumed, had the literary evidence been less ample than it is. Too, in prose. There we have Drummond again, and that strange genius Sir Thomas Urquhart (q.v.); a crowd of polemical writers, mostly ecclesiastics, all the historians, including Spottwood and Calderwood. There is small room for the old vernacular here; and less when we take into account the still active Latinity, shown in the publication by the poet Arthur Johnston (q.v.) of the two volumes of *Delitiae poëtarum Scotorum haec aevi illustrium* (1637), and in the writings of John Barclay (q.v.) author of the *Argenis*, Sir Robert Aytoun (n.s.), Thomas Dempster (q.v.), the historian, David Hume of Godscroft, Sir John Scot of Scotstarvet, best known for his prose *Staggering State*, Sir Thomas Craig, author of the *Just Feudale*, Andrew Melville and others represented in Johnston's volumes.

There is no place for "the best" in the English and Latin list. The play *Philotas*, a poor example in a genre rarely attempted in the north, is indebted to the south for more than its subject. The interesting philological tractsate *Of the Orthographe and Congruitie of the Briton Tongue* by Alexander Hume (not the verse writer, n.s.) is in its language a medley; and William Lithgow had travelled too widely to retain his native speech in purity, even in his indifferent verse. Scraps may be unearthed as mediocres as the *Answer to Curat Caddel* or *Satyre upon the Whig*, which attempts to revive the mere vulgarity of the Scots "flying.* The only contributions which redeem these scattered years and more from the charge of disrespect for the native muse come from the pen of the Sempills (q.v.). Even here individual merit must yield to historical interest. We are attracted to Beltrees and his kinsmen less by their craftsmanship than by the fact that they supplied the leaders of the vernacular revival of the 18th century with many subjects and verse-models, and that by their treatment of these subjects models, based on the practice of an earlier day, they complete the evidence of the continuity of the domestic popular type of Scots verse.

In the 18th century the literary union of the North and South is complete. The Scot, whatever dialectal habits his speech, wrote the English of Englishmen The story of his triumphs belongs to the story of English literature: to it we leave James Thomson, Adam Smith, David Hume, James Boswell and Sir Walter Scott. If the work begun by Allan Ramsay, continued by Ferguson and completed by Burns, were matter for separate treatment, it would be necessary to show not only that the editorial zeal which turned these writers to the forgotten vernacular and to "popular" themes was inspired by the general conditions of reaction against the artificiality of the century, but that it was because these poets were Scots, and in Scotland, that they chose this line of return to the suburbs and naturalness, and did honour, partly by protest, to the slighted efforts of the "vulgar*" muse. Yet even they did not abjure the "southern manner," and their work in it is matter of some critical signification, whatever may be said of its inferiority in spirit and craftsmanship.

**Bibliography.** — Authorities dealing with individual authors and their generation are named in the bibliographies appended to the articles on Scottish writers. Reference may be made here to the following general works (given in chronological order): Warton, *History of English Poetry* (1774-1781); D. Irving, *Scottish Writers* (1839), and *History of Scottish Poetry* (1861); H. Ward, *The English
SCOTLAND, CHURCH OF

The purpose of this article is to trace the growth of the Scottish "Kirk" as a whole, defining the views on which it was based and the organization in which they took form. The controversies within the Church of Scotland have not arisen out of matters of faith but out of practical questions of church government and of the relation of church and state. Holding a church theory to which the rulers of the country were for a century strongly opposed, Scotland became the leading exponent of Presbyterianism (q.v.); and this note has been the dominant one in her religious history even in recent times.

The Scottish Reformation came out of a covenant in which the barons, inspired by John Knox, then abroad, bound themselves in 1557 to oppose the Roman Catholic religion and to promote the cause of the Reformation. When parliament, on the 24th of August 1560, passed the acts abolishing the papal jurisdiction and the mass in Scotland, it was able, as Knox had been preparing for this crisis, to sanction a new confession of faith for the Reformed church. Other documents of the new system were quickly produced, among them the First Book of Discipline, set forth the whole of the proposed religious and educational constitution, and this book speaks of "the order of Geneva which is now in use in some of our churches." This order, afterwards with some modifications known as John Knox's Liturgy, and used in the church down to the reign of Charles I., is a complete directory of worship, with forms of all the services to be held in the church.

The type of religion found in these documents is that of Geneva, the unit being the self-governing congregation, and the great aim of the system the pure preaching of the Word. The congregation elect the minister; in no other way can he enter on his functions; but once elected and admitted he is recognized as a free organ of the divine spirit, not subject in spiritual things to any earthly authority but that of his fellow-ministers; the word of God is the supreme authority, and the spoken word of God the vital element of every religious act. The word of God is to prevail in all matters, in conduct as well as doctrine, and in the affairs of government as well as in the church. The terrible power of excommunication is claimed for the church; but the council of the realm also is called to use the power given them by God to put down all religion but the reformed, and to further the aims and carry out the sentences of the church. It was a matter of course that saints’ days and church festivals were abolished as having no warrant in Scripture; Sunday alone remained, as the principal day of preaching. In towns a week-day was to be set apart for the "exercise" or public interpretation of Scripture, in which all qualified persons in the neighbourhood were to take part, as if the whole country were a school of the Bible.

The First Book of Discipline does not set forth any complete scheme of church government. Its arrangements are in part provisional. In addition to the minister, who is its most definite figure and proved to be the most permanent, it recognizes the superintendent, the lay elder and the reader. Ten or twelve superintendents were to be appointed, "a thing most expedient at this time." They were parish ministers and subject like their brethren to church courts; their added function was to plant churches, and place ministers, elders and deacons wherever required. This was also the duty of "commissioners" who were superintendents over smaller territories and for a shorter term. Whether the superintendents were meant to be permanent in the church is not clear. The lay elder was very much what he is still. The reader was to conduct service when no minister was available, reading the Scriptures and the Common Prayer. When there was preaching, it was accompanied by free prayer; the liturgy was not then called for. Of church courts the assembly is taken for granted, having existed from the first; the minor church courts are not yet defined, though the elements of each of them are present. A noble scheme of education was sketched for the whole country, but neither this nor the provision made for ministers' stipends was carried out. In 1572 the assembly, however, established a church, from which the expenses of both were to be paid, being in the hands of the barons.

The system naturally took time to get into working order. The old clergy, bishops, abbots and priests were still on the ground, and were slow to take service in the new church. In 1574 there were 289 ministers and 715 readers; in the district of the presbytery of Auchterarder, which now has fifteen parishes, there were then four ministers and sixteen readers. As the ranks of the clergy slowly filled, questions arose which the Reformation had not settled, and it was natural that the old system should affect the work of the church, as the barons were familiar with it. Presbyterianism, however, met with little opposition, for the system was not a complete break with the past, nor was it so much a change in church government as a formal acknowledgment of the church's theory of government. As early as 1572 the new system was recognized and approved by the assembly, and the first general assembly, of 1577, exercised the functions of the old synods in which the barons were the principal members. The assembly of 1575 decided that all ministers were bishops; that of 1578 abolished the name of bishop as denoting an office in the church, and that of 1580 in spite of a royal remonstrance abolished Episcopacy, a decree to which all the bishops except five submitted. The Second Book of Discipline recognizes four kinds of office in the church, and no one can lawfully be placed in any of them except by being called to it by the members. Pastor, bishop and minister are all titles of the same office, that of those who preach the word and administer the sacraments, each to a particular congregation. The doctor is a teacher in school or university; he is an elder and assists in the work of government. Elders are rulers; their function also is spiritual, though practical and disciplinary. The fourth office is that of the deacons, who have to do with

"Tulchan," a calf-skin filled with straw, supposed to induce the cow to give milk freely; hence a term of contempt for one who is used as a dummy for the advantage of another.
matters of property and are not members of church courts. Neither superintendent nor reader now appears; all the functions of bishops and superintendents are vested in the elderships, or church courts, and it is urged that the parts which still remain in Scotland of the old system should be cleared away and the whole replaced by a Roman Catholic or a presbyterian, or a system of pure and simple worship. The assembly is to have the right to fix its own time of meeting, and its decision in matters ecclesiastical is not to be subject to any review. Kirk-sessions and presbyteries are not named, but the principles are clearly laid down on which these institutions were to rest.

By committing herself to this system the Church of Scotland established between herself and the Church of England a division which became more and more apparent and was the cause of much of her subsequent sufferings. It is no doubt strange that she should have endured so much not for any great Christian principle, but for a question of the kingdom. The Presbyterians, hitherto recognized in Scotland, were not the only supporters of Presbyterianism in England, for the Puritans in the other counties were also in favor of it. The principles of Presbyterianism were almost universally recognized, and it might not have been held with such tenacity or proved so incapable of compromise but for the opposition and persecution of the three Stuart kings. The history of the Scottish church for a century after the date of the Book of Discipline is that of a religious struggle between the people and the crown.

For some years after its inception Presbyterianism carried all before it. The presbyteries came quickly into existence; that of Edinburgh dates from 1580. In that year it was found that there were 924 parishes in Scotland, but not nearly all supplied with ministers; it was proposed that there should be 50 presbyteries (in 1910 there are 84) and 400 ministers. A great part of the country, especially in the north and west, had not yet been reached by the Reformation. At this time began the long series of attempts made by James VI. in the direction of curbing Presbyterian liberty and of the restoration of Episcopacy. In 1584, when the King was in Denmark, he called on the bishops to show that they were the true judges of the church and the law. The bishops, declared the king to be supreme in all causes and over all persons, thus subverting the jurisdiction of the church, and made all conventions illegal except those sanctioned by the king. The bishops were to do what had hitherto been done by the assembly and presbyteries, and no attacks were to be made at religious meetings on the king or council. Other acts followed by which the episcopate was strengthened, though the act of 1587 annexing the temporalities of the bishops to the crown, while fatal to the old episcopate, made the prospects of the new more doubtful. In 1588 a change took place in the Kirk. The Presbyterians threw James into the arms of the kirk; in 1592 the acts of 1584 were abrogated, the Second Book of Discipline legalized and Presbytery established.

The church was at the time very powerful, the people generally sympathizing with her system, and her assemblies being attended by many of the nobles and the foremost men. Discipline was strict; the temper of the church was in accordance with the Old rather than the New Testament.

Another sudden change took place a few years later, James falling out of humour with the church on the question of the residence of the bishops. The new bishops were not to be resident in Edinburgh, and the Kirk-sessions, which had been in session, were dissolved. The criticism of some of the ministers. His Basilicon Doron, published in 1599, shows a determination to make the church episcopal. With this end assemblies, from which Melville was excluded, and which were otherwise tampered with and terrorized, were got to agree that a number of ministers should sit in parliament, and to surrender the assembly's right of meeting. On his accession to the throne of England in 1603 James entered on a new set of attempts to assimilate the Scottish church to that of England. Melville was brought to London, imprisoned and sent abroad; other ministers who had acted or spoken too freely were banished. The powers of the bishops were increased, and their brethren brought in various ways under subjection to them, and in 1609 two courts of high commission were set up by the royal authority with plenary powers to enforce conformity to the new arrangements. In 1610 three ministers were called to London to be consecrated as bishops, as if there had till now been no bishops in Scotland; these on their return consecrated ten others. In 1612 the act of 1592 which established Presbytery was rescinded, and Episcopacy became the legal church system of Scotland.

In all this it was the position and rights of the clergy that were assailed; and James showed kindness to the church in seeking to secure that stipends should be paid and that new churches should be provided where required. The people had been less interfered with; the change of church government involved no change in the conduct of worship. But the articles passed by the packed assembly of Perth in 1618 touched on the religious habits and postures of the people, and in this it soon appeared that a crisis had been reached. These famous articles were: (1) That the communion should be received kneeling; (2) That it might be administered in private; (3) That baptism might be in the home; (4) That children of eight should be taken to the bishop for examination and his blessing; (5) That Christmas, Good Friday, Easter and Whitsunday should be observed. These articles were opposed in parliament and were strongly resisted throughout the country. When Charles became king in 1625 he at once let it be known that the Articles of Perth were not to be abrogated, and that no meeting of the assembly was to be allowed. During the first years of his reign he was occupied in other directions; but when he came to Scotland in 1633 he came with him and though his father showed himself kind to the clergy in matters of stipend, and adopted measures which caused many schools to be built, he also showed that in the matter of worship the policy of forcing Scotland into uniformity with England was to be carried through with a high hand. A book of canons and constitutions of the church which appeared in 1636, instead of being a digest of acts of assembly, was English in its ideas, dealt with matters of church furniture, exalted the bishops and ignored the kirk-sessions and elders. The liturgy was ordered to be translated and in the same year a new prayerbook was published, with somewhat higher doctrine, of the Anglican Common Prayer. The introduction of this service book in St Giles's Church, Edinburgh, on the 16th of July 1637, occasioned the tumult of which Jenny Geddes will always figure as the heroine. The sentiment was echoed throughout Scotland.

Petitions against the service book and the book of canons poured in from every quarter; the tables or committee formed to forward the petition rapidly became a powerful government at the head of a national movement, the action of the crown was temporizing, and on the 28th of February the National Covenant was signed in the famous scene in Greyfriars church and churchyard. This document consisted of three parts: (1) A covenant signed by King James and his household in 1580, to uphold Presbyterianism and to defend the state against Romanism; (2) A recital of all the acts of parliament passed in the reigns of James and Charles in pursuance of the same objects; and (3) The covenant of nobles, barons, gentlemen, burgesses, ministers and commons to continue in the reformed religion, to defend it and resist all contrary errors and corruptions. The Covenant was no doubt an act of revolt against legal authority, and even Mr. David Robertson has said it was a sort of civil war, and many years ago said oppressively and illegally in its attempt to coerce Scotland into a religious system alien to the country, and that the subjects were entitled to free themselves from tyranny. The crown was unable either to check the popular movement or to come to any compromise with it, and the Glasgow assembly of 1638, the first free assembly that had met for thirty years, proceeded to make the church what the Covenant required. A clean sweep was made of the legislation of the preceding period; the five articles of Perth, the service book and book of canons and the court of high commission were all condemned. The bishops were tried not for being bishops but on exaggerated charges of false doctrine and loose living; and all were deposed from the ministry. Many ministers were also deposed on the charge of Arminianism. It was by an assembly that the second reformation was effected; but the assembly contained the most
SCOTLAND, CHURCH OF

influential of the nobility and gentry, and was carried on the crest of a great national movement. The Covenant was accepted by parliament in 1639.

The Seventeenth Century is the culminating period of Scottish Presbyteranism, when, having successfully resisted the crown, it not only was supreme in Scotland but exercised a decisive influence over Europe. The causes which brought about this state of affairs are to be sought to a large extent in the civil history of England. Presbyterianism was rapidly growing in that country, and the English parliament sought the alliance of the assembly, while the Independents, though in the event Presbytery was as little to their liking as Episcopacy, joined in the wish to get rid of the episcopal system. In its period of triumph the Presbytery of Scotland displayed its character. After the injustice and persecution it had suffered it could scarcely prove moderate or tolerant; it showed a vehement determination to carry out the truth it had vindicated with such enthusiasm, to the full extent and wherever possible. The Covenant, at first a standard of freedom, was immediately converted into a test and made the instrument of oppression and persecution. All policy was to be determined by the Covenant; the king and every official was to be obliged to take it. The mind of the nation being so preoccupied with the Covenant, it naturally followed that when a party in Scotland in favour of the kirk was ready to denounce and to unchurc those who showed any inclination to moderation and political sanity, that the beginnings of schism soon appeared in the ranks of the Covenanters.

In 1643, when the full legal establishment of Presbytery had just been consummated, the assembly, asked by the English parliament to arrange a league to be signed in both countries for the furtherance of reformed religion, agreed, but asked that the league should be a religious one. The result was the Solemn League and Covenant. The league did not mention Presbyteranism; but the assembly had refused to hear of any recognition of independency; if religion were thoroughly reformed, they considered the result must be Presbyterianism in England as in Scotland. In the Westminster Standards also, which were the fruit of the Scottish desire for a religious uniformity, Scotland did not obtain by any means all it desired in its church documents. The Scottish divines in the Westminster Assembly were only five in number, while the assembly contained effective parties of Erastians and Independents. The Confession of Faith contains no approval of any system of church government, and when she adopted it in 1647 the kirk gave up her old confession in which the principles at least of true church order are laid down. In accepting in 1645 the Westminster Directory of Public Worship she tacitly gave up her own liturgy which had been in use till recently, and committed herself to a hald and uninviting order of worship, in which no forms of prayer were allowed to be used. So much did Scotland for the sake of uniformity accept from England. The metrical psalms also, which are still sung in Scottish churches, were adopted at this time; they are based mainly on the version, which had been approved by the Westminster Assembly, of Francis Rouse (1579-1659), a member of the English House of Commons.

The engagement made with Charles, then a prisoner in the Isle of Wight in 1647, which promised him support on condition of his sanctioning the Solemn League and Covenant and pledging himself to set up after three years a church according to the Confession of Faith, was protested against by the assembly; and from this came the famous "Act of Classes" by which the Covenanters disqualified for public office and even for military service who had been parties to the engagement. The rescinding of this act in 1657 led to a serious breach in the ranks of the Scottish clergy. The Rescissioners, or supporters of the resolution to rescind that act, were opposed by the Protesters, the rigid adherents to the strictest interpretation of the Covenant. The period of the Commonwealth was filled with the strife between these two parties, its bitterness not lessened by the fact that the assembly dissolved in 1653 by Cromwell's soldiers was not allowed to meet again in his protectorate. The Protesters, who were in favour with the common people, are chargeable with having brought into Scotch church life the observance of fastsition and the long and excited Communion services which were kept up for two and a half centuries and may still be witnessed in the Highlands.

If the mismanagement of Scotch religious affairs under James and Charles I. is a melodrama story, what took place under Charles II. is infinitely sadder. A series of bunglers was committed in the attempt to compel Scotland to submit to the religion the government prescribed, and the failure of each measure was followed by more inhuman severities. Detail is impossible here. From the first Charles issued his Edict of Toleration determined to force Episcopalianism on Scotland, and not too scrupulous in the choice of methods for securing his ends. The attempt was nearly successful. In the greater part of the country little change took place in the religious services. The service book was not read nor kneeling at communion required, and it made no immediate difference to the people that the clergy should be under bishops. The inferior church courts still sat, though not the assembly. At the Restoration it was a question whether the bulk of the population was in favour of Presbytery or of Episcopacy. But the matter was one of power, and the military violence and the judicial severity of the Covenanting spirit arose, nourished on intolerable grievances, and that the nation as a whole decided against the system which had been promoted by such means.

The Recessory Act of 1661 swept away the legislation of the preceding twenty years, and so disposed of the Presbyterian polity of the church. Episcopacy was restored by a letter from the king on the 5th of September 1661. James Sharp (q.v.), Fairfoul, James Hamilton (1610-1674) and Robert Leighton (q.v.) were the new bishops; Sharp and Leighton having to be ordained as deacons, then as priests, before they consecration, and the parishioners being required to swear that though Leighton had left them before crossing the border. An act requiring all ministers appointed during the period when patronage was abolished to get presentation from their patrons and institution from their bishops was applied in the west of Scotland in such a way that 300 ministers left their manse. Their places were filled with less competent men whom the people did not wish to hear, and so conventicles began to be held. The attempts to suppress these, the harsh measures taken against those who attended them or connived at them, or refused to give information about them, the imprisonment, confessions, imprisoms, tortures, expatriations, all make up a dreadful narrative. Indulgences were tried, and were successful in bringing back about 100 ministers to their parishes and introducing a new cause of division among the clergy. On the other hand, the Covenanting spirit rose higher and higher among the persecuted till the armed risings took place and the formal rebellion of a handful of desperate men against the ruler of three kingdoms. The story of Richard Cameron (q.v.) is one of the highest romantic heroism; his name is perpetuated in that of the Cameronian body ("first-born of the Scottish sects"), which, as the Reformed Presbyterian Church, kept up a separate existence till 1876, when it united with the Free Church, and in that of the Cameronian regiment, originally formed from his followers after his death and distingushed since in every part of the world. The proclamation of toleration in 1685 was intended mainly for Roman Catholics and excluded field preachers.

When William landed in England in 1688, the scene changed in Scotland. The soldiery was withdrawn from the west, and the people at once showed their feelings by the "rabbilling" or ejection of the curates who occupied the manse of the ousted ministers, in which, however, no lives were lost. William would have decided for Episcopacy in Scotland, as the great body of the nobles and gentry adhered to it, but only on condition that the Episcopalians agreed to support him and that they had the people with them. Neither of these conditions was fulfilled. On the 22nd of July
1689 the Convention which declared the throne vacant and called William and Mary to fill it, declared in its Claim of Right that prelacy and the superiority of any office in the church above ministers had been a great and insupportable grievance to Scotland. Effect was given to this; and in April 1690 the act was passed on which the establishment of the Church of Scotland rests, the Westminster Confession being recognized, the laws in favour of Episcopacy repealed, though the Recessory Act remained on the statute book, and the assembly appointed to meet. The Covenanters were not mentioned; at his coronation William had refused to be a persecutor, and he desired that the church should embrace all who were willing to be in it. The Revolution church contained from the first men of different views. Its first assembly in 1690 received into the church the three remaining ministers of the Cameronians, though their followers refused to come with them. With regard to Episcopalian ministers, by whom the majority of parishes were served, there was more difficulty. The Presbyterians were not ready for union with them, and many of them were put out of their livings, ostensibly by way of discipline. The king and his representatives at the assembly pressed hard for their reception, and in 1693 the "Act for settling the quiet and peace of the Church" was passed, which provided for their admission on taking the oaths of allegiance and assurance, subscribing the Confession of Faith and acknowledging Presbyterian government. This act fixed the formula of subscription to be signed by all ministers.

From this time forward the church, while jealously asserting her spiritual independence, was on the side of the crown against the Jacobites, and became more and more an orderly and useful ally of the state. In 1697 the Barrier Act was passed, which provided that any act which is to be binding on the church is to come before the assembly as an overt and to be transmitted to presbyteries for their approval. The difficulties which threatened to arise about the union were skillfully avoided; the Act of Security provided that a Presbyterian minister who should "continue without any alteration to the people of this land in all succeeding ages," and the first oath taken by Queen Anne at her accession was to preserve it. The Act of Toleration of 1712 allowed Episcopalian dissenters to use the English liturgy. This had not hitherto been done, and the claim of the Episcopallians for this liberty had been the occasion of a bitter controversy. The same parliament restored lay patronage in Scotland, an act against which the church always protested and which was the origin of great troubles.

Presbyterianism being loyal to the house of Hanover, while Episcopacy was Jacobite, was now in enjoyment of the royal favour and was treated as a firm ally of the government. But while the church as a whole was more peaceful, more courtly, more inclined to the friendship of the world than at any former time, it contained two well-marked parties. The Moderate party, which maintained its ascendancy till the beginning of the 19th century, sought to make the working of the church in its different parts as systematic and regular as possible, to make the assembly supreme, to enforce on presbyteries respect for its decisions, and to render the Presbyterian gentry of the church as exact and formal as that of the civil courts. The Popular party, regarding the church less from the side of the government, had less sympathy with the progressive movements of the age, and desired greater strictness in discipline. The main subject of dispute arose at first from the exercise of patronage. Presbyteries in various parts of the country were still disposed to disregard the presentations of lay patrons, and to settle the men desired by the people; but legal decisions had shown that if they acted in this way their nominee, while legally minister of the parish, could not claim the stipend. To the risk of such sacrifices the church, led by the Moderate party, refused to expose herself. By the new policy inaugurated by Dr William Robertson (1721-1793), which led to the second secession, the assembly compelled presbyteries to give effect to presentations, and in a long series of disputed settlements the "call," though still held essential to a settlement, was less and less regarded, until it was declared that it was not necessary, and that the church courts were bound to induce any qualified presentee. The substitution of the word "concurrence" for "call" about 1764 indicates the subsidiary and ornamental light in which the assent of the parishioners was now to be regarded. The church could have given more weight to the wishes of the people; she professed to regard patronage as a grievance, and the annual instructions of the assembly to the commission (the committee representing the assembly till its next meeting) enjoined that body to take advantage of any opportunity which might arise for getting rid of the grievance of patronage, an injunction which was not discontinued till 1784. It is not likely that any change in the laws could have been obtained at this period, and disregard of the law might have led to an exhausting struggle with the state, as was actually the case at a later period. Still it was in the power of the church to give more weight than she did to the feelings of the people; and her working of the patronage system drove large numbers from the Establishment. A melancholy catalogue of forced settlements marks the annals of the church from 1749 to 1780, and wherever an unpopular presentee was settled the people quietly left the Establishment and erected a meeting-house. In 1763 there was a great debate in the assembly on the progress of schism, in which the "Popular party" pressed the point that the door of the Moderates, while the Moderates rejoined that patronage and Modernism had made the church the dignified and powerful institution it had come to be. In 1764 the number of meeting-houses was 120, and in 1773 it had risen to 190. Nor was a conciliatory attitude taken up towards the seceders. The ministers of the Relief desired to remain connected with the Establishment, but were not suffered to do so. Those ministers who resigned their parishes to accept calls to Relief congregations, in places where forced settlements had been made, and with whom the Assembly had no connexion, were not admitted as still ministers of the church, and were deposed and forbidden to look for any ministerial communion with the clergy of the Establishment. Such was the policy of the Moderate ascendancy, or of Principal Robertson's administration, on this vital subject. It had the merit of success in so far as it completely established itself in the church. The presbyteries ceased to disregard presentations, and lay patronage came to be regarded as part of the order of things. But the growth of dissent steadily continued and excited alarm from time to time; and it may be questioned whether the peace of the church was not purchased at too high a price. The Moderate period is justly regarded as in some respects the most brilliant in the history of the church. Her clergy included many distinguished Scotsmen, among them Thomas Reid, George Campbell, Adam Ferguson, John Home, Hugh Blair, William Robertson and John Erskine. The labours of these men were not mainly in theology; in religion the age was one not of advance but of rest; they gained for the church a great and widespread respect and influence.

Another salient feature of the Moderate policy was the consolidation of discipline. It is frequently asserted that discipline was lax at this period and that ministers were allowed to continue their charges. It cannot, however, be shown that the leaders of the church at this time sought to procure the miscarriage of justice in dealing with such cases. That some offenders were acquitted on technical grounds is true; it was insisted that in dealing with the character and status of their members the church courts should proceed in as formal and punctilious a manner as civil tribunals, and should recognize the same laws of evidence; in fact, that the same securities should exist in the church as in the state for individual rights and liberties.

The religious state of the Highlands, to which at the period of the Union the Reformation had only very partially penetrated, occupied the attention of the church during the whole of the 18th century. In 1725 the gift called the "royal bounty" was first granted—a subsidy amounting at first to £1000
per annum, increased in George IV.'s reign to £3000, and continued to the present day; its original object was to assist the reclamation of the Highlands from Roman Catholicism by means of catechists and teachers. The Society for Propagating Christian Knowledge, incorporated in 1709, with a view partly to the wants of the Highlands, worked in concert with the Church of Scotland, setting up schools in remote and destitute localities, while the church promoted various schemes for the dissemination of the Scriptures in Gaelic and the encouragement of Gaelic students. In these labours as well as in other directions the church was sadly hampered by poverty. The need of an increase in the number of ministers and evangelicals, and, through them, chapels began to be built about 1796, they were provided only in wealthy places by local voluntary liberality; for the supply of the necessities of poor outlying districts no one as yet looked to any agency but the state. In every part of the country many of the ministers were miserably poor; there were many stipends, even of important parishes, not exceeding £40 a year; and it was not till after many debates in the assembly and appeals to the government that an act was obtained in 1810 which made up the poorer livings to £150 a year by a grant from the public. The decrease of growth in the Evangelical church, and the frequent failure of the most miserable description, if not falling to decay.

With the close of the 18th century a great change passed over the spirit of the church. The new activity which sprang up everywhere after the French Revolution produced in Scotland a revival of Evangelicalism which has not yet spent its force. Modernism had cultivated the ministers too fast for the people, and the church had become to a large extent more of a dignified ruler than a spiritual mother. About this time the brothers Robert and James Haldane devoted themselves to the work of promoting Evangelical Christianity, James making missionary journeys throughout Scotland and founding Sunday schools; and in 1798 the eccentric preacher Rowland Hill visited Scotland at their request. In the journals of these evangelists dark pictures are drawn of the religious state of the country, though their censorious tone detracts greatly from their value; but there is no doubt that the efforts of the Haldanes brought about or coincided with a quickening of the religious spirit of Scotland. The assembly of 1799 passed an act forbidding the admission to the pulpits of laymen or of ministers of other churches, and issued a manifesto on Sunday schools. These acts helped greatly to discredit the Moderate party, of whose spirit they were the outcome; and that party further injured their standing in the country by attacking Leslie, afterwards Sir John Leslie, on frivolous grounds—a phrase he had used about Hume's view of causation—when he applied for the chair of mathematics in Edinburgh. In this dispute, which made a great sensation in the country, the popular party successfully defended Leslie, and thus obtained the sympathy of the enlightened portion of the community. In 1810 the Christian Instructor began to appear under the editorship of Dr Andrew Thomson, a churchman of vigorous and elevated noble character. It was an ably written review, in which the theology of the Haldanes asserted itself in a somewhat dogmatic and confident tone against all unsoundness and Modernism, clearly proclaiming that the former things had passed away. The question of pluralities began to be agitated in 1813, and gave rise to a long struggle, in which Dr Thomas Chalmers (q.v.) took a notable part, and which terminated in the regulation that a university chair or principality should not be held along with a parish which was not close to the university seat.

The growth of Evangelical sentiment in the church, along with the example of the great missionary societies founded in the end of the 18th and the beginning of the 19th century, led to the institution of the various missionary schemes which were then carried on, and their history forms the chief part of the history of the church for a number of years. The education scheme, having for its object the planting of schools in destitute Highland districts, came into existence in 1824. The foreign mission committee was formed in 1825, at the instance of Dr John Ingles (1762-1834), a leader of the Moderate party, and Dr Alexander Duff (q.v.) went to India in 1829 as the first missionary of the Church of Scotland. The church extension committee was first appointed in 1828, and in 1834 it was made permanent. The colonial scheme was inaugurated in 1836 and the mission in 1838, Robert Murray Mc'Cheyne (1813-1843) and Andrew Alexander Bonar (1810-1892) setting it out in the following year as a deputation to inquire into the condition of the Jews in Palestine and Turkey and on the continent of Europe. Of these schemes that of church extension has most historical importance. It was originally formed to collect information regarding the spiritual wants of the count and to apply to the government to build the churches found to be necessary. As the population of Scotland had doubled since the Reformation, and its distribution had been completely altered in many counties, while the number of parish churches remained unchanged, and meeting-houses had only been erected where seceding congregations required them, the need for new churches was very great. The application to government for aid, however, proved the occasion of a "Voluntary controversy," which raged with great fierceness for many years and has never completely subsided. To this period belongs "the Anti- Episcopal Bill" (1833) and the scheme for the "provide a Church in every Parish and a Parson in every Church." These measures were largely the work of Robert Rollo in the United States, the "men of property" having previously come to hold Voluntary principles—aided to the influence of these principles in the country, while the political excitement of the period disposed men's minds to such discussions. The government built forty-two churches in the Highlands, providing them with a slender endowment; and these are still known as parliamentary churches. Under Thomas Chalmers, however, the church extension committee struck out a new line of action. That great philanthropist had come to see that the church could only reach the masses of the people effectively by greatly increasing the number of her places of worship and abolishing or minimizing seat-rents in the poorer districts. In his powerful defence of establishments against the voluntaries in both Scotland and England, in which his ablest assistants were those who afterwards became, along with him, the leaders of the Free Church, he pleaded that an established church to be effective must divide the country territorially into a large number of small parishes, so that every corner of the land and every person, of whatever class, shall actually enjoy the benefits of the parochial machinery. This territorial principle, with the strict censures of the period, was then a view ever since. With the view of realizing this idea he appealed to the church to provide funds to build a large number of new churches, and personally carried his appeal throughout the country. By 1835 he had collected £56,000 and reported the building of sixty-two churches in connexion with the Establishment. The keenness of the conflict as it approached the crisis of 1843 checked the liberality of the people for this object, but by 1841 £305,747 had been collected and 222 churches built.

The zealous orthodoxy of the church found at this period several occasions to assert itself. John M'Leod Campbell (q.v.), minister of Row, was deposed by the assembly of 1830 for teaching that assurance is of the essence of faith and that Christ died for all men. He has since been recognized as one of the profoundest Scottish theologians of the 19th century, although his deposition was never removed. The same assembly condemned the doctrine put forth by Edward Irving, that Christ took upon Him the sinful nature of man and was not impeccable, and Irving was deposed five years later by the presbytery of Annan, when the outburst of supposed miraculous gifts in his church in London had rendered him still more obnoxious to the strict censures of the period. In 1841 Thomas Wright of Borthwick (1785-1855) was deposed for a series of heretical opinions, which he denied that he held, but which were said to be contained in a series of devotional works of a somewhat mystical order which he had published.

The influence of dissent also acted along with the rapidly rising religious fervour of the age in quickening in the church that sense of a divine mission, and of the right and power to carry out that mission without obstruction from any worldly
authority, which belongs to the essential consciousness of the Christian church. An agitation against patronage, the ancient root of evil, and the formation of an anti-patronage society, helped in the same direction. The Ten Years' Conflict, which began in 1833 with the passing by the assembly of the Veto and the Chapel Acts, is treated in the articles FREE CHURCH OF SCOTLAND, and it is not necessary to dwell further in this place on the consequences of those acts. The assembly of 1843, from which the exodus took place, proceeded to undo the acts of the church during the preceding nine years. The Veto was not repealed but ignored, as having never had the force of law; the Strathbogie ministers were recognized as if no sentence of deposition had gone forth against them. The protest which the moderator had read before leaving for Edinburgh had been set on the table; and an act of separation and deed of demission were received from the ministers of the newly formed Free Church, who were now declared to have severed their connexion with the Church of Scotland. The assembly addressed a pastoral letter to the people of the country, in which, while declining to "admit that the course taken by the seceders was justified by irresistible necessity," they counselled peace and goodwill towards them, and called for the loyal support of the remaining members of the church.

Two acts at once passed through the legislature in answer to the claims put forward by the Church of Scotland. The Scottish Benefices Act of Lord Aberdeen, 1843, gave the people power to state objections personal to a presentee, and bearing on his fitness for the particular charge to which he was presented, and also authorized the presbytery in dealing with the objections to look to the number and character of the objectors. Sir James Graham's Act, 1844, provided for the erection of new parishes, and thus created the legal basis for a scheme under which chapel ministers might become members of church courts.

The Disruption left the Church of Scotland in a sad and maimed condition. The clergy, numbering 565, and among these were many of her foremost men. A third of her membership was computed to have gone with them. In Edinburgh many of her churches were nearly empty. The Gaelic-speaking population of the northern counties completely deserted her. All her missionaries left her but one. She had no gale of popular enthusiasm to carry her forward, representing as she did not a newly arisen principle but the opposition to a principle which she maintained to be dangerous and exaggerated. For many years she had much obloquy to endure. But she at once set herself forward by the church. The committee for selecting and recruiting the missionary staff. A lay association was formed, which raised large sums of money for the missionary schemes, so that their income was not allowed seriously to decline. The good works of the church, indeed, were in a few years not only continued but extended. All hope being lost that parliament would endow the new churches built by the church extension scheme of Dr Chalmers, it was felt that this also must be the work of voluntary liberality. Under Dr James Robertson, professor of church history in Edinburgh, one of the leading champions of the Moderate policy in the Ten Years' Conflict, the extension scheme was transformed into the endowment scheme, and the church accepted it as her duty and her task to provide the machinery of new parishes where they were required.1 By 1854, 30 new parishes had been added at a cost of £139,000, and from this time forward the work of endowment proceeded still more rapidly. In 1843 the number of parishes had been 924; in 1909 it was 1437. By the Poor Law Act of 1845 parishes were enabled to remove the care of the poor from the minister and the kirk-sesson, in whom it was formerly vested, and to appoint a parochial board with power to assess the ratepayers.

Education Act of 1872 severed the ancient tie connecting church and school together, and created a school board having charge of the education of each parish. At that date the Church of Scotland had 900 schools, mostly in the Highlands. The church continued till lately to carry on normal schools for the training of teachers in Edinburgh, Glasgow and Aberdeen; but these, along with the normal schools of the United Free Church, were recently made over to the state.

In 1874 patronage was abolished. The working of Lord Aberdeen's Act had given rise to many unedifying scenes and to lengthy struggles over disputed settlements, and it was early felt that some change at least was necessary in the law. The agitation on the subject went on in the assembly from 1857 to 1860, when the assembly by a large majority condemned patronage as restored by the Act of Queen Anne, and resolved to petition parliament for its repeal. The request was granted, and the right of electing parish ministers was conferred by the Patronage Act 1874 on the congregation; thus a grievance of old standing, from which all the ecclesiastical troubles of a century and a half had sprung, was removed and the church placed on a thoroughly democratic basis. This act, combined with various efforts made within the church for its improvement, secured for the Scottish Establishment a large measure of popular favour, and in the last half of the 19th century she grew from strength to strength.

The church influence. This revival was largely due on the one hand to the improvement of her worship which began with the efforts of Dr Robert Lee (1804–1868), minister of Old Greyfriars, Edinburgh, and professor of Biblical criticism in Edinburgh University. By introducing into his church a printed book of prayers and also an organ, Dr Lee stirred up vehement controversies in the church courts, which resulted in the recognition of the liberty of congregations to improve their worship. The Church Service Society, having for its object the publication of new forms of worship and modern liturgies, with a view to the preparation of forms of prayer for public worship, was founded in 1865; it has published eight editions of its "Book of Common Order," which, though at first regarded with suspicion, has been largely used by the clergy. Church music has been cultivated and improved in a marked degree; and hymns have been introduced to supplement the psalms and paraphrases; in 1866 a committee appointed by the Church of Scotland, the Free Church, the United Presbyterian Church and the Presbyterian Church in Ireland issued The Church Hymnary, which is authorized for use in all these churches alike. Architecture has benefited from the church, and has been improved by both the measures of the church and by the measures of the church. The church has also added to the usefulness of the Church of Scotland by the duke of Argyll, now once more fitted up for worship.

Committee of Christian Life and Work.

The church has greatly increased of late years in wide of view and liberality of sentiment, and shelters various tendencies of thought. A volume of Scotch Sermons, published in 1880 by ministers holding liberal views, brought out the fact that the
church would not willingly be led into prosecutions for heresy. After this, however, there was a revival on the part of some of the ministers of High Church orthodoxy. The Scottish Church Society was founded in 1892 with Dr John Macleod of Govan as president, "to defend and advance catholic doctrine as set forth in the ancient creeds and embodied in the standards of the Church of Scotland." In 1897, however, Alexander Robinson of Kilmun was deposed by the presbytery of Dunoon acting under the orders of the Assembly on account of the views contained in his book *The Saviour in the New Light*, in which the results of modern criticism of the Gospels were set forth with some ability. The National Church Union in the United States of America was now established, and after this event by ministers and elders who feared that the cause of free theological inquiry was in peril in the church. This body at once raised the question of the relaxation of subscription, which was in a few years seriously taken up by the church, and the National Church Union, feeling that in this, as well as in the growth of liberal opinion in the church its object had been attained, discontinued its operations. The Scottish Church Society still carries on its work.

The question of subscription has been more or less before the church for many years. The formula adopted by the assembly of 1711 had still to pass a long course of modification, but it was not too strict. After debates extending over many years, the assembly of 1889 fell back on the words of the act of parliament of 1693, passed to enable the Episcopalian clergy to join the establishment, in which the candidate declared the Confession of Faith to be the confession of his faith, owned the doctrine therein contained to be the true doctrine and promised faithfully to adhere to it. This was accompanied by a Declaratory Act in which the church expressed its desire to enlarge rather than curtail the liberty hitherto enjoyed. Ten years later the assembly was again debating the question of subscription. A committee appointed in 1899 to inquire into the powers of the church in the matter reported that the power of the church was merely administrative—it was in her power as cases arose to prosecute or to refrain from prosecuting, but that she had no power to modify the confession in any way. Here the matter might have remained, but that the approach to parliament of the United and the Free Churches after the decision of the House of Lords in 1904 (see Free Church and United Free Church) offered an opportunity for asking parliament to remove a grievance the church had long and vainly sought to have removed. The Churches Bill of 1905 afforded relief to all the Presbyterian churches. It did not do what the Church of Scotland asked, viz. allow the words of the act of 1690 to be used as the formula; but it removed that of 1693 and left it to the church to frame a new formula for her ministers and professors, an undertaking to which she is seriously addressing herself.

The agitation for disestablishment sprang up afresh after the passing of the Church Patronage Act (Scotland); each assembly of the Free Church passed a resolution in favour of it, and the United Free Church continued this testimony. In 1890 Mr. Gladstone declared for disestablishment, and under his government of 1892 a Disestablishment Bill was introduced in the House of Commons by Sir Charles Cameron, in two successive sessions, 1893–1894. After the defeat of the Liberal government in 1895, the church was for ten years relieved from this anxiety, nor had the attack been renewed up to 1911. A counter-movement was represented by a bill introduced into parliament in 1886 in order to declare the spiritual independence of the Church of Scotland, in the hope that the Scottish church might be opened to a reunion of the Presbyterian bodies. The act of 1911 has altered the circumstances of the churches in this regard. During the agitation the church was much occupied with the question of her own defence, and after it died down, various schemes were entertained for the improvement of her position without and within. She more than once expressed her willingness to confer with the daughter Presbyterian churches, with a view to their sharing with her the benefits of her position.

Since 1908 the subject of the union of the churches has been much spoken of. The quarter-centenary of the birth of Calvin at Geneva, the time chosen for the celebration of the union of the Church of Scotland and the United Free Church assembly together for a memorial service in St Giles'; and a committee on union, consisting of 105 representatives from each assembly, was appointed.

The Church of Scotland has made few contributions of importance to the movement of Biblical Criticism which has entered so deeply into the lives of so many Scotchmen, but distinguished writers on theology. Robert Lee (1841-1868), minister of Old Greyfriars and professor of Biblical Theology in the University of Glasgow, opened up the liberty and the improvement of worship, of which the churches generally now reap the advantage. He held clear views as to the necessity of reform in the doctrine of the church as well; but these were not published till after his death. Sir John Barony, Parish, Glasgow, a man of great natural eloquence and an ardent philanthropist, enjoyed the warm friendship of Queen Victoria and was befriended by his nation. John Caird (q.v.), professor of divinity and then principal of Glasgow University, wrote *An Introduction to the Philosophy of Religion*, exercised a deep influence as a teacher on Scottish thought, and was the most distinguished of the "two Andrewes" of the Scottish Church.

The Church of England had a rich supply of ministers and other missionaries, with a large number of native agents, in India, East Africa and China. Jewish missions are kept up at five stations in the United States, but the foreign mission is still very small. The church has declined in Scotland, and the number of foreign emigrants from Scotland in many of the dependencies of the empire. The small-livings fund aims at bringing up to £200 a year all stipends which fall short of that sum, of which there are nearly 400. About £30,000 was still required in 1910 to carry out the object of this scheme.

The parliamentary return of 1888 showed the value of the teinds of 876 parishes to be £375,676 and the stipends paid to amount (exclusive of manses and glebes) to £42,336. The value of assessments obtained since that date is more than balanced by the decline of farmers' prices, so that the total revenue of the church from this source is about £200,000. The unexhausted teinds, according to the return in 1907, amounted to about £133,000. The exchequer pays to 190 poor parishes and 42 Highland churches, from church property in the hands of the crown, £1,040. Fromburgh and other local funds the church derives a revenue of £65,000. The church has itself added to her endowments, for the equipment of 453 new parishes £1,681,330, yielding over £54,000 a year. The entire endowments of the church, including manses and glebes but not church buildings, is £390,000.

For detailed accounts of the separate bodies—the United Presbyterian Church, the Free Church and the United Free Church—see the articles on each of these. The table on the following page shows the material progress of the respective organizations in recent years.

In the absence of a religious census it is not possible to deduce from socialist data the number of the members of the church in, or entitled to vote for the new Assembly. In the able statistical discussions in the reports of the United Free Church it is pointed out that in the figures furnished by the churches the numbers of members and the percentages and proportions of the total population of the country and the general death-rate, and the conclusion is drawn that the number of members is in each case too great.
SCOTLAND, EPISCOPAL CHURCH OF

1879.  1899.  1909.

Congregations:
Church of Scotland.  1,337  1,447  1,687
Free Church.  1,033  1,101  1,087
United Presbyterian.  533  577  1,620
United Free Church.  292  383  1
Membership:
Church of Scotland.  518,146  684,476  706,653
Free Church.  246,250  293,684  706,573
United Presbyterian.  172,150  195,498  1
United Free Church.  274,576  309,816  324,182

The Free Church in 1909 had 150 congregations and 77 ministers; its members and adherents are stated to number 60,000, and its income, apart from investments, is £22,542. The membership of the larger churches is that of communicants only; in the Highlands especially, the adherents of these churches who do not communicate form a large proportion of those connected with the church.

According to the figures given above the communicants of the Church of Scotland represent 14-7 of the population and those of the United Free 10-6. A study of the figures for many years past shows that the proportion of the people attached to these churches is not decreasing.

The Scottish Episcopal Church in 1909 numbered 388 charges with 52,029 communicants. Its charges are numerous in proportion to the population. For each member of the congregation there are on the average 27 members, while the Church of Scotland averages 497 and the United Free Church 313 members for each congregation. The adherents of each of these churches outnumber the communicants in the Church of England, which is seriously endangered. The Roman Catholic hierarchy 1 was restored in Scotland in 1787. There are six dioceses (two archbishops, one of Edinburgh and St Andrews and the other of Glasgow, and four suffragans, Aberdeen, Alloa, Dundee, and Dunfermline). In 1890, 550 priests; 38 churches, chapels and stations; and a Roman Catholic population estimated at about 519,000.

The original Secession Church has 5 presbyteries and 26 congregations; and the remnant of the Reformed Presbyterian Church which did not join the Free Church in 1876, 2 presbyteries and 11 congregations. The Congregational and Evangelical Union (formed by the amalgamation of the Congregational and Evangelical Churches in 1896) has 183 churches; and the remnant of the Evangelical Union, 7 churches. The Baptist Union has 128 congregations and the Wesleyan Methodists 40 churches.

LITERATURE.—For the earlier history of the church the outstanding authorities are the histories of Knox, Calderwood, Baillie’s Letters, and Wodrow’s History: Knox’s liturgy has been edited by Dr. Scott, and on the Westminster Standards the reader may consult Dr. R. L. G. Heras, The Westminster Assembly, and the lectures on the same subject. Modern histories of the church have been written by Cook, Hetherington and Principal Cunningham; Dr. Scott has prepared a History of the Church in 5 vols. containing information on every side of the subject. Among books professedly dealing with the Free Church question, the most valuable are Sydow’s Die Schottische Kirchenfrage (Potsdam, 1845), and The Scottish Church Question (London, 1845); Buchanan’s Ten Years’ Conflict (1849); Hanna’s Life of Chalmers (1852); and Taylor Innes on The Law of Creeds in Scotland (1867). See also Cockburn, Memorials of His Time (Continuation, 1874); Walker, The Royal Church: Buchanan and the Ecclesiastical Biography (1877); Annals of the Disruption (published by authority of a committee of the Free Church 1876-1877). On the United Presbyterian Church see McKerrow, History of the United Secession Church (1841); Struthers, History of the Relief Church (1843); McKelvie, Annals and Statistics of the United Presbyterian Church (1873). For a concise account of all the Sessions and Unions, Logan, The United Free Church (1861–1906). (A. M.)

SCOTLAND, EPISCOPAL CHURCH OF, a Scottish church (see above) in communion with, but historically distinct from, the Church of England, and composed of seven dioceses: Aberdeen and Orkney; Argyll and the Isles; Brechin, Edinburgh; Glasgow and Galloway; Moray, Ross and Caithness; and St Andrews, Dunkeld and Dunblane. All, except Edinburgh, founded by Charles I., are pre-Reformation sees. The bishops constitute the episcopal synod, the supreme court of appeal.

1 During the long period of proscription, the Roman Catholic Church in Scotland survived in scattered groups; after the Reformation it was at first under the jurisdiction of the English arch-priest, but from 1663 to 1694 it was governed by prebends apostolic and from 1694 to 1788 by vicars apostolic appointed by the pope.

whose president, elected by the members from among themselves, has the style, not the functions, of a metropolitan, being called primus. The legislature is the provincial synod, consisting of the bishops, at whose discretion it is summoned, and a lower chamber of presbyters. The canons have the authority of this synod. The presbyterian council, including laymen, administers finance. Each diocese has its synod of the clergy. Its dean is appointed by the bishop, and, on the voidance of the see, summons the clerical and lay electors, at the instance of the primus, to choose a bishop, who is presented to the episcopal synod for confirmation and to the primus for consecration. There are cathedrals at Perth, Inverness, Edinburgh and Cambridge; the sees of Aberdeen, Brechin and Glasgow have no cathedrals. The Theological College was founded in 1810, incorporated with Trinity College, Glenalmond, in 1848, and established at Edinburgh in 1876. There were 356 congregations, with a total membership of 12,133,5 and 324 ministers in 1900. No existing ministry can claim regular historic continuity with the ancient hierarchy of Scotland, but the bishops of the Episcopal Church are direct successors of the prelates consecrated to Scottish sees at the Restoration. On the refusal of the bishops to recognize William III. (1689), the presbyterian polity was established in the kirk, the effect of which on its ecclesiastical status is a matter of theological opinion, but the Comprehensive Act of 1696 allowed episcopalian incumbents, on taking the Oath of Allegiance, to retain their benefices, though excluding them from any share in the government without further declaration of presbyterian principles. Many non-jurors also succeeded for a time in retaining the use of the parish churches. The extruded bishops were slow to organize the episcopalian remnant under a jurisdiction independent of the state, regarding the then arrangements as provisional, and looking forward to a reconstituted national kirk under a "legitimate" sovereign. A few prelates, known as college bishops, were consecrated without see, to preserve the succession rather than to exercise a defined authority. But at length the hopelessness of the Stewart cause and the growth of congregations outside the unestablished churches forced the bishops to dissociate canonical jurisdiction from royal prerogative and to reconstitute for themselves a territorial episcopate. The act of Queen Anne (1712), which protects the “Episcopal Communion,” marks its virtual incorporation as a distinct society. But matters were still complicated by a considerable, though declining, number of episcopalian incumbents holding the parish churches. Moreover, the Jacobitism of the non-jurors provoked a state policy of repression in 1715 and 1745, and fostered the growth of new Hanoverian congregations, served by clergy episcopally ordained but amenable to no bishop, who continued themselves under the act of 1711. This act was further modified in 1746 and 1748 to exclude clergymen ordained in Scotland. These causes reduced the Episcopalians, who included at the Revolution a large section of the people, to what is now, save in a few corners of the west and north-east of Scotland, a small minority. The official recognition of George III. on the death of Charles Edward in 1788, removed the chief bar to progress. The “qualified” congregations were gradually absorbed, though traces of this ecclesiastical solemism still linger. In 1792 the penal laws were repealed, but clerical disabilities were only finally removed in 1864. In 1794 Seabury, the first American bishop, was consecrated at Aberdeen. The Book of Common Prayer, which came into general use at the Revolution, is now the authorized service book. The Scottish Communion Office, compiled by the non-jurors in accordance with primitive models, has had a varying co-ordinate authority, and the modifications of the English liturgy adopted by the American Church were mainly determined by its influence. Among the clergy of post-revolution days the most eminent are Bishop Sage, a well-known patriotic scholar; Bishop Rattray, liturgiologist; John Skinner, of Longside, author of Tullochgorum; Bishop Gleig, editor of the 3rd edition of the Encyclopedia Britannica; Dean Ramsay, author of Minimis Theologiae, and Scottish Life and Character; Bishop A. P. Forbes; G. H. Forbes, Hlitoriologist; and Bishop Charles Wordsworth.
SCOTT, A.—SCOTT, SIR G. G.

AUTHORITIES.—Garratt, State Papers; Keith, Historical Catalogue of the Scottish Bishops; Russeil's edition, 1824; Lawson, History of the Scottish Episcopal Church from the Revolution to the Present Time (1843); Stephen, History of the Church of Scotland from the Reformation to the Present Time (4 vols., 1843); Latrobe, History of the Nonjumeur (1845); Grub, Ecclesiastical History of Scotland (4 vols., 1861); Dowden, Annotated Scottish Communion Office (1884).

SCOTT, ALEXANDER (fl. 1550), Scottish poet, was probably a Lothian man, but particulars of his origin and of his life are entirely wanting. It is only by gathering together a few scraps of internal evidence that we learn that his poems were written between 1545 and 1568 (the date of the Bannatyne MS., the only Scottish MS. that is short of the first page) in London, where he became acquainted with Scot. In 1542 he was the first to bring Scot's works to the notice of modern readers, by printing some of the poems in his Ever Green. In a copy of verses ("Some Few of the Contents") on the Bannatyne MS., he thus refers to Scot:

"Licht skirtit lasses, and the gирand wyfe,
Fleming and Scot hai painted to the lyfe.
Scott, sweet tunged, Quhata sings the wculme hame
To Mary, our maist bontane dame;
How lyffie he and amorous Stuart sing!
Quhen luve and bewtie bid them spre the wing."

The sketch is just, for Scott's poems deal chiefly with female character and with passion of a strongly erotic type. He is "sweet tunded," for his technique is always good, and his lyrical measures show remarkable accomplishment. In this respect he holds his own with the best of the "makers" represented in the Bannatyne MS. In what may appear excessive coarseness to present-day taste, he makes good claim to rival Dunbar and his contemporaries. The poems referred to by Ramsay are "Ane Ballad maid to the Derisoun and Scoorne of Wantoun Wemen," "Ane New Yier Gift to the Queen May quhen scohe come first Hame, 1562," and some or all of his amorous songs (about 30 in number). Of these "To luve unluit," "Ladies, be war," and "Lo, quhat it is to lufe" are favourable examples of his style. No early Scots poet comes nearer the quality of the Caroline love-lyric. His Justing and Debaith up at the Drum bestrz [William] Adamstone and Jokin Sym follows the literary tradition of Pobbis to the Play and Chrisit iss Kirk on the Grene. He has left verse-Counders of the 1st and 50th Psalms.

The first collected edition was printed by D. Laing in 1621; a second was issued privately at Glasgow in 1682. The latest edition is by James Cranston (Scottish Text Society, 1 vol. 1896). (G. G. S.)

SCOTT, DAVID (1866-1849), Scottish historical painter, brother of William Bell Scott, was born at Edinburgh in October 1866, and studied art under his father, Robert Scott, the engraver. In 1828 he exhibited his first oil picture, the "Hopes of Early Genius dispelled by Death," which was followed by "Cain, Nimrod, Adam and Eve singing their Morning Hymn," "Sarpedon carried by Sleep and Death," and other subjects of a poetic and imaginative character. In 1829 he became a member of the Scottish Academy, and in 1832 visited Italy, where he spent more than a year in study. At Rome he executed a large symbolic painting, entitled the "Agony of Discord, or the Household Gods Destroyed." The works of his later years include "Vasco da Gama encountering the Spirit of the Storm," a picture—immense in size and most powerful in conception—finished in 1842, and now preserved in the Trinity House, Leith; the "Duke of Gloucester entering the Water Gate of Calais" (1841); the "Alchemist" (1838), "Queen Elizabeth at the Globe Theatre" (1840) and "Peter the Hermit" (1845), remarkable for varied and elaborate character-painting; and "Ariel and Caliban" (1839) and the "Triumph of Love" (1846), distinguished by the depth and magnitude of poetic thought. The most important of his religious subjects are the "Descent from the Cross" (1835) and the "Crucifixion—the Dead Rising" (1844). Scott also executed several remarkable series of designs. Two of these—the Monographs of Man and the illustrations to Coleridge's Ancient Mariner—were etched by his own hand, and published in 1831 and 1837 respectively, while his subjects from the Pilgrim's Progress and Nichol's Architecture of the Heavens were issued after his death.

He died in Edinburgh on the 5th of March 1849. See W. Bell Scott, Memoir of Sir David Scott, R.S.A. (1850), and J. M. Gray, David Scott, R.S.A., and his Works (1884).

SCOTT, SIR GEORGE GILBERT (1811-1878), English architect, was born in 1811 at Gawcott near Buckingham, where his father was rector; his grandfather, Thomas Scott (1747-1827), was a well-known commentator on the Bible. In 1827 young Scott was apprenticed for four years to an architect in London named Edmeston, and at the end of his pupildom acted as clerk of the works at the new Fishmongers' Hall and other buildings. In Edmeston's office he became acquainted with J.R. Plowden and David Scott, the father of the architect. Scott's desire for the purest business part of an architect's work, and the two entered into partnership. In 1834 they were appointed architects to the union workhouses of Buckinghamshire, and for four years were busily occupied in building a number of cheap and ugly unions, both there and in Northamptonshire and Lincolnshire. In 1838 Scott built at Lincoln his first church, the design for which won the prize in an open competition, and this was quickly followed by six others, all very poor buildings without chancels; church building in England had then reached its very lowest standard and expense. In 1839 he was appointed to carry out the Gothic Revival, and his special markable accomplishment was the spraying of Pugin on medieval architecture, and by the various papers on ecclesiastical subjects published by the Camden Society. These opened a new world to Scott, and he thenceforth studied and imitated the architectural styles and principles of the middle ages with the utmost zeal and patient care. The first result of this new study was his design for the Martyrs' Memorial at Oxford, erected in 1840, a clever adaptation of the late 13th-century crosses in honour of Queen Eleanor. From that time Scott became the chief ecclesiastical architect in England, and in the next forty years completed a large number of new churches and "restorations," the fever for which was fomented by the Ecclesiological Society and the growth of ecclesiastical feeling in England.

In 1844 Scott won the first premium in the competition for the new Lutheran church at Hamburg, a noble building with a very lofty spare, designed strictly in the style of the 13th century. In the following year his partnership with Moffat was dissolved, and in 1847 he was employed to renovate and refil Ely cathedral, the first of a long series of English cathedral works. In 1849 he was asked to carry out the plan of the new chapel, and the choir at Westminster Abbey. In 1850, 1851, and 1852 he visited and studied the architecture of the chief towns in northern Italy, and in 1853 won the competition for the townhouse at Hamburg, designed after the model of similar buildings in north Germany. In spite of his having won the first prize, another architect was selected to construct the building, after a very inferior design. In 1856 a competition was held for designs of the new government offices in London; Scott obtained the third place in this, but the work was afterwards given to him on the condition (insisted on by Lord Palmerston) that he should make a new design, not Gothic, but Classic or Renaissance in style. To this Scott very reluctantly consented, as he had little sympathy with any styles but those of England or France from the 13th to the 15th century. In 1862-1863 he was employed to design and construct the Albert Memorial, a costly and elaborate work, in the style of a magnified 15th-century reliquary or ciborium, adorned with many statues and reliefs in bronze and marble. On the partial completion of this he was knighted. In 1866 he competed for the new London law-courts, but the prize was adjudged to his old pupil, G. E. Street. In 1873, owing to illness caused by over-work, Scott spent some time in Rome and other parts of Italy. The mosaic pavement which he designed for Durham cathedral soon after-wards was the result of his study of the 13th-century mosaics in the old basilicas of Rome. On his return to England he resumed his professional labours, and continued to work almost without intermission till his short illness and death on the 27th of March 1878. He was buried in the nave of Westminster Abbey, and an engraved brass, designed by G. E. Street, was
placed over his grave. In 1838 Scott married his cousin, Caroline Oldrid, who died in 1870; they had five sons, two of whom adopted their father's profession.

An incomplete list of his works from 1834 in the Builder for 1878 (pseudonym) was on manuscript with which he was connected as architect, restorer or the author of a report. These include 29 cathedrals, British or colonial, 10 minsters, 476 churches, 25 schools, 23 parsonages, 58 monumental works, 25 colleges or colleges and 20 small churches and monasteries, with some ecclesiastical accessories. While a member of the Royal Academy, Scott held for many years the post of professor of architecture, and gave a long series of able lectures on medieval buildings with which he was connected as architect, restorer or the author of a report. He wrote a work on Domestic Architecture, and a volume of Personal and Professional Recollections, which, edited by his eldest son, was published in 1879, and also a large number of articles and reports on many of the buildings which had held.

SCOTT, MICHAEL (1789–1833), British author, was born at Cowlairs, near Glasgow, on the 30th of October 1879, the son of a Glasgow merchant. In 1806 he went to Jamaica, first managing some estates, and afterwards joining a business firm in Kingston. The latter post necessitated his making frequent journeys, on the incidents of which he based his best known book, Tom Cringle’s Log. In 1822 he left Jamaica and settled in Glasgow, where he engaged in business. Tom Cringle’s Log began to appear serially in Blackwood’s Magazine in 1829. Scott’s second story, The Cruise of the Midge, was also first published serially in Blackwood’s in 1834–1835. The first appearance in book-form of each story was in Paris in 1835. Both stories were originally published anonymously, and their authorship was not known till after Scott’s death at Glasgow, on the 7th of November 1835.

SCOTT, ROBERT (1811–1877), English divine and lexicographer, was born on the 26th of January 1811, at Bondleigh in Devonshire, where his father was rector. Educated at Shrewsbury School and Christ Church, Oxford, after a brilliant university career he was elected fellow of Balliol, where he was tutor from 1835 to 1840. After holding successively the college livings of Duloe and South Luffenham, in 1854 he was elected master of Balliol. This office he held, together (from 1861) with that of the professorship of the exegesis of Holy Scriptures, down to 1870, when he accepted the deanship of Rochester. As master of Balliol he kept the college up to the high level it had attained under his predecessor Dr Jenyns. As a Greek scholar, he had few equals among his contemporaries. His great literary achievement, which may be said to constitute his life’s work, was his collaboration with Dean Liddell in the Greek lexicon which bears their names. He died at Rochester on the 2nd of December 1887.

SCOTT, SIR WALTER, Bart. (1771–1835), Scottish poet and novelist, was born at Edinburgh on the 17th of August 1771. His pedigree, in which he took a pride that strongly influenced the course of his life, may be given in the words of his own fragment of autobiography. "My birth was neither distinguished nor sordid. According to the prejudices of my country it was esteemed gentle, as I was connected, though remotely, with ancient families both by my father’s and mother’s side. My father’s grandfather was Walter Scott, well known by the name of Beardie. He was the second son of Walter Scott, first Laird of Raeburn, who was third son of Sir William Scott, and the grandson of Walter Scott, commonly called in tradition Arthur Fitzgerald. His family connection with that ancient chieftain, whose name I have made to ring in many a ditty, and from his fair dame, the Flower of Yarrow—no bad genealogy for a Border minstrel."

In a notice of John Home, Scott speaks of pride of family as "natural to a man of imagination," remarking that, "in this motley world, the family pride of the north country has its effects of good and of evil." Whether the good or the evil preponderated in Scott’s own case would not be easy to determine. It tempted him into courses that ended in commercial ruin; but throughout his life it was a constant spur to exertion, and in his last years it proved itself as a working principle capable of inspiring and maintaining a most chivalrous conception of duty. If the ancient chieftain Auld Watt was, according to the anecdote told by his illustrious descendant, once reduced in the matter of live stock to a single cow, and recovered his dignity by stealing the cows of his English neighbours, Scott’s Border ancestry were sheep-farmers, who varied their occupation by lifting "sheep and cattle, and whatever else was too heavy or too hot." The Border lads were really a race of shepherds in so far as they were not a race of robbers. Scott may have derived from this pastoral ancestry an hereditary bias towards the observation of nature and the enjoyment of open-air life. He certainly inherited from them the robust strength of constitution that carried him successfully through so many exhausting labours. And it was his pride in their real or supposed feudal dignity and their rough marauding exploits that first directed him to the study of Border history and poetry, the basis of his fame as a poet and romancer. His father, Walter Scott, a writer to the signet (or attorney) in his boyhood, almost to his infancy. The current legend was that the first of the family to adopt a town life or a learned profession. His mother was the daughter of Dr John Rutherford, a medical professor in the university of Edinburgh, who also traced descent from the chiefs of famous Border clans.

The ceilings of Abbotsford display the arms of about a dozen Border families with which Scott claimed kindred through one side or the other. His father was conspicuous for methodical and thorough industry; his mother was a woman of imagination and culture. The son seems to have inherited the best qualities of each and added to them. It is not difficult to see how Carlyle wrote that as a boy Scott had been a dunce and an idler. With a characteristically conscientious desire not to set a bad example, the autobiographer solemnly declares that he was neither a dunce nor an idler, and explains how the misunderstanding arose. His health in boyhood was uncertain; he was consequently irregular in his attendance 1.

1 Dr Charles Creighton contributes the following medical note on Scott’s early illness:—'Scott’s lameness was owing to an arrest of growth in the right leg in infancy. When he was eighteen months old he had a feverish attack lasting three days, at the end of which time it was found that he had lost the power of his right leg:—i.e., the child instinctively declined to move the ailing member. The malady was a swelling at the ankle, and either consisted in or gave rise to a form of the bone-disease of the tibia or fibula in which the narrowing and shortening of the bone results in a diminution of the lower part of the bone, which connects the lower epiphysis of each of the two leg-bones with its shaft. In his fourth year, when he had otherwise recovered, the leg remained much shrunken and contracted. The limb would have been blighted very much more if the arrest of growth had taken place at the upper epiphysis of the tibia or the lower epiphysis of the femur. The narrowness and peculiar depth of Scott’s head point to some more general congenital error of bone-making allied to rickets but certainly not to the condition found in patients suffering from rickets. Scott has the typical "tripidial" or "scaphoid" or boat-shaped formation, due to premature union of the two parietal bones along the sagittal suture. When the bones of the exoccipital region are examined the patient shows a lack of bone along their outer formative edges, the sutures become prematurely fixed and effaced, so that the brain-case cannot expand in any direction to accommodate the growing brain. This universal synostosis of the cranial bones is what occurs in the case of microcephalic idiots. It happened to me to show to an eminent French anthropologist a specimen of a miniature or microcephalic skull preserved in the Cambridge museum of anatomy; the French term, holding up the skull and pointing to the petrous part, was "vache." The English term, "cow’s head," was a name taken to the point of the skull. When his head was opened after death, it was observed that the brain was not large, and the cranium thinner than it is usually found to be. In favour of the theory of the cranium’s making a cover for the brain, Scott was a specimen of the family of whom the first six died in ‘very early youth’."

SCOTT, M.—SCOTT, SIR WALTER 469
at school, never became exact in his knowledge of Latin syntax, and was so belated in beginning Greek that out of bravado he resolved not to learn it at all.

Left very much to himself throughout his boyhood in the matter of reading, so quick, lively, excitable and uncertain in health that it was considered dangerous to press him and prudent rather to let him have his own way, Scott was early freed to accommodate the romantic lore of which he afterwards made such splendid use. As a child he seems to have been an eager and interested listener and a great favourite with his elders, apparently having even then the same engaging charm that made him so much beloved as a man. Chance threw him in the way of many who were willing to indulge his delight in stories and ballads. Not only his own relatives—the old women at his grandfather's farm at Sandyknowe, his aunt, under whose charge he was sent to Bath for a year, his mother—too interested in the precocious boy's questions, told him tales of Jacobites and Border worthies of his own and other clans, but casual friends of the family—such as the military at Prestonpans, old Dr Blacklock the blind poet, Home the author of Douglas, Adam Ferguson the martial historian of the Roman republic—helped forward his education in the direction in which the bent of his genius lay. At the age of six he was able to define himself as “a virtuoso,” “one who wishes to and will know everything.” At ten his collection of chap-books and ballads had reached several volumes, and he was a connoisseur in various reading. Thus he took to the High School, Edinburgh, which was strong enough to be put in regular attendance, an unusual store of miscellaneous knowledge and an unusually quickened intelligence, so that his master “pronounced that, though many of his schoolfellows understood the Latin better, Guaterus Scott was behind few in following and enjoying the author’s meaning.” Throughout his school days and afterwards when he was apprenticed to his father, attended university classes, read for the bar, took part in academical and professional debating societies, Scott steadily and ardentedly pursued his own favourite studies. His reading in romance and history was really study; and not merely the indulgence of an ordinary schoolboy’s promiscuous appetite for exciting literature. In fact, even as a schoolboy he specialized. He followed the line of overpowering inclination; and even then, as he frankly tells us, “fame was the spur.” He acquired a reputation among his schoolfellows for out-of-the-way knowledge, and also for story-telling, and he worked hard to maintain this character, which compensated to his ambitious spirit his indifferent distinction in ordinary school-work. The youthful “virtuoso,” though he read ten times as much literature as his pearlyfellows, and was the only boy in his class, was carried by his enthusiasm into fields much less generally attractive. He was still a schoolboy when he mastered French sufficiently well to read through collections of old French romances, and not more than fifteen when, attracted by translations to Italian romantic literature, he learnt the language in order to read Dante and Ariosto in the original. This willingness to face dry work in the pursuit of romantic reading affords a measure of the strength of Scott’s passion. In one of the literary parties brought together to lionize Burns, when the poet visited Edinburgh, the boy of fifteen was the only member of the company who could tell the source of some lines affixed to a picture that had attracted the poet’s attention—a slight but significant evidence both of the width of his reading and of the tenacity of his memory. The same thoroughness appears in another little circumstance. He took an interest in Scottish family history and genealogy, but, not with the ordinary sources, he ransacked the MSS. preserved in the Advocates’ Library. By the time he was one and twenty he had acquired such a reputation for his skill in deciphering old manuscripts that his assistance was sought by professional antiquaries.

This early, assiduous, Scott’s earliest study was the main secret, over and above his natural gifts, of Scott’s extempore speed and fertility when at last he found forms into which to pour his vast accumulation of historical and romantic lore. He was, as he said himself, “like an ignorant gamaster who keeps up a good hand till he knows how to play it.” That he had vague thoughts from a much earlier period than is commonly supposed of playing the hand some day is extremely probable, if, as he tells us, the idea of writing romances first occurred to him when he read Cervantes in the original. This was a long time before he was out of his teens; and, if we add that his leading idea in his first novel was to depict a Jacobitic Don Quixote, we can see that there was probably a long interval between the first conception of Waverley and the ultimate completion.

Scott’s preparation for painting the life of past times was probably much less unconsciously than his equally thorough preparation for acting as the painter of Scottish manners and character in all grades of society. With all the extent of his reading as a schoolboy and a young man he was far from being a cloistered student, absorbed in his books. In spite of his lame-ness and his serious illnesses in youth, his constitution was naturally robust, his disposition genial, his spirits high: he was always well to the front in the fights and frolics of the High School, and a boon companion in the “high jinks” of the junior bar. The future novelist’s experience of life was singularly rich and varied. While he liked the life of imagination and scholarship in sympathy with a few choice friends, he was brought into intimate daily contact with many varieties of real life. At home he had to behave as became a member of a Puritanic, somewhat ascetic, well-ordered Scottish household, subduing his own inclinations towards a more graceful and manlier spirit of life of living into outward conformity with his father’s strict rule. Through his mother’s family he obtained access to the literary society of Edinburgh, at that time electrified by the advent of Burns, full of vigour and ambition, rejoicing in the possession of not a few widely known men of letters, philosophers, historians, novelists and critics, from racy and eccentric Monboddo to refined and scholarly Mackenzie. In that society also he may have found the materials for the manners and characters of St Ronan’s Well. From any tendency to the pedantry of over-culture he was effectually saved by the rougher and manlier spirit of his professional comrades, who, though they respected belles lettres, would not tolerate anything in the shape of affectation or sentimentalism. The atmosphere of the Parliament House (the lawcourts of Edinburgh) had considerable influence on the tone of Scott’s novels. His peculiar humour as a story-teller and painter of character was first developed among the young men of his own standing at the bar. They were the first mature audience on which he experimented, and seem often to have been in his mind’s eye when he enlarged his public. From their mindful companionship by the stove, where the briefless congregate to subdue their inclinations to a more graceful and manlier spirit of life by humouring the jests of their colleagues, “Duns Scottus” often stole away to pore over old books and manuscripts in the library beneath; but as long as he was with them he was first among his peers in the art of providing entertainment. It was to this market that Scott brought the harvest of the vacation rambles which it was his custom to make every autumn for seven years after his call to the bar and before his marriage. He scoured the country in search of ballads and other relics of antiquity; but he found also and treasured many traits of living manners, many a lively skit into which he did not hesitate to incorporate, and many a humorous mention of his own. He was always at the games of the Glengarry and the “mountain” on his return. His staid father did not much like these escapades, and told him bitterly that he seemed fit for nothing but to be a “gangrel scrape-gut.” But, as the companion of “his Liddesdale raids” happily put it, “he was makin’ himself a’ the time, but he didna ken maybe what he was about till years had passed: at first he thought o’ little, I dare say, but the gueerness and the fun.”

His father intended him originally to follow his own business, and he was apprenticed in his sixteenth year; but he preferred the upper walk of the legal profession, and was elected a member of the faculty of advocates in 1792. He seems to have read hard at law for four years at least, but almost from the first to have limited his ambition to obtaining some comfortable appointment such as would leave him a good deal of leisure for
literary pursuits. In this he was not disappointed. In 1790 he obtained the office of sheriff-depute of Selkirkshire, with a salary of £400 and very light duties. In 1806 he obtained the reversion of the office of clerk of session. It is sometimes supposed, from the immense amount of other work that Scott accomplished, that this office was a sinecure. But the duties, which are fully described by Lockhart, were really serious, and kept him hard at fatiguing work, his biographer estimates, for at least three or four hours daily during six months out of the twelve, while the court was in session. He discharged these duties faithfully for twenty-five years, during the height of his activity as an author. He did not enter on the emoluments of the office till 1812, but from that time he received from the clerkship and the sheriffdom combined an income of £1,600 a year, being thus enabled to act in his literary undertakings on his often-quoted maxim that "literature should be a staff and not a crutch." Scott's profession, in addition to supplying him with a competent livelihood, supplied him also with abundance of opportunities for the study of men and manners.

It was as a poet that he was first to make a literary reputation. According to his own account, he was led to adopt the medium of verse by a series of accidents. The story is told by himself at length and with his customary frankness and modesty in the Essay on Imitations of the Ancient Ballad, prefixed to the 1830 edition of his Border Minstrelsy, and in the 1830 introduction to the Lay of the Last Minstrel. The first link in the chain was a lecture by Henry Mackenzie on German literature, delivered in 1788. This spoke to the half-ashamed student and an enthusiastic student of French and Italian romance, that there was a fresh development of romantic literature in German. As soon as he had the burden of preparation for the bar off his mind he learnt German, and was profoundly excited to find a new school founded on the serious study of a kind of literature his own devotion to which was regarded by most of his companions with wonder and ridicule. We must remember always that Scott quite as much as Wordsworth created the taste by which he was enjoyed, and that in his early days he was half-ashamed of his romantic studies, and pursued them more or less in secret with a few intimates. While he was in the height of his enthusiasm for the new German romance, Mrs Barbauld visited Edinburgh, and recited an English translation of Bürger's Lénore. Scott heard of it from a friend, who was able to repeat two lines: "Tramp, tramp, across the land they speed; Splash, splash, across the sea!"

The two lines were enough to give Scott a new ambition. He could write such poetry himself! The impulse was strengthened by his reading Lewis's Monk and the ballads in the German manner interspersed through the work. He hastened to procure a copy of Bürger, at once executed translations of several of his ballads, published The Chase, and William and Helen, in a thin quarto in 1796 (his ambition being perhaps quickened by the unfortunate issue of a love affair), and was much encouraged by the applause of his friends. Soon after he met Lewis personally, and his ambition was confirmed. "Finding Lewis," he says, "in possession of so much reputation, and conceiving that if I fell behind him in poetical powers, I considerably exceeded him in general information, I suddenly took it into my head to attempt the style of poetry by which he had raised himself to fame." Accordingly, he composed Glenfinlas, The Eve of St John, and The Grey Brother, which were published in Lewis's collection of Tales of Wonder (2 vols., 1801). But he soon became convinced that "the practice of ballad-writing was out of fashion, and that any attempt to revive it or to found a poetical character on it would certainly fail of success." His study of Goethe's Götz von Berlichingen, of which he published a translation in 1796, gave him wider ideas. Why should he not do for ancient Border manners what Goethe had done for the ancient feudalism of the Rhine? He had been busy since his boyhood collecting Scottish Border ballads and studying the minutest details of Border history. He had begun to cast about for a form which should have the advantage of novelty, and a subject which should secure unity of composition. He was engaged at the time preparing a collection of the Minstrelsy of the Scottish Border. The first instalment was published in two volumes in 1802; it was followed by a third next year, and by an edition and continuation of the old romance of Sir Tristram; and Scott was still hesitating about subject and form for a large original work. Chance at last threw in his way both a suitable subject and a suitable metrical vehicle. He had engaged all his friends in the hunt for Border ballads and legends. Among others, the countess of Dalcith, wife of the heir-apparent to the dukedom of Buccleuch, interested herself in the work. Happening to hear the legend of a tricky hobbegoblin named Gilpin Horner, she asked Scott to write a ballad about it. He agreed with delight, and, out of compliment to the lady who had given this command to the bard, resolved to connect it with the house of Buccleuch. The subject grew in his fertile imagination, till incidents enough had gathered round the goblin to furnish a framework for his long-designed picture of Border manners. Chance also furnished him with a hint for a novel scheme of verse. Coleridge's fragment of Christabel, though begun in 1797—when he and Wordsworth were discussing on the Quantock Hills the principles of such ballads as Scott at the same time was reciting to himself in his gallops on MusSELhurst sands—was not published till 1816. But a friend of Scott's, Sir John Stoddart, had met Coleridge in Malta, and had carried home in his memory enough of the unfinished poem to convey to Scott that its metre was the very metre of which he had been in search. Scott introduced still greater variety into the metrical structures of Christabel, but it was to Christabel that he owed the suggestion, as one line borrowed whole and manyimitated rhythms testify.

The Lay of the Last Minstrel appeared in January 1805, and at once became widely popular. It sold more rapidly than poem had ever sold before. Scott was astonished at his own success, although he expected that "the attempt to return to a more simple and natural style of poetry was likely to be welcomed." Many things contributed to the extraordinary demand for the Lay. First and foremost, no doubt, we must reckon its simplicity. After the abstract themes and abstruse, elaborately allusive style of the 17th century, the public were glad of verse that could be read with ease and even with exhilaration, verse in which a simple interesting story was told with brilliant energy, and simple feelings were treated not as isolated themes but as incidents in the lives of individual men and women. The thought was not so profound, the lines were not so polished, as in The Pleasures of Memory or The Pleasures of Hope, but the "light-horseman sort of stanza," carried the reader briskly over a much more diversified country, through boldly outlined and strongly coloured scenes. No stanza required a second reading; you had but to keep your wits about you and construe laboriously before you could grasp the writer's meaning or enter into his artfully condensed sentiment. To remember the pedigrees of all the Scotts, or the names of all the famous chiefs and hardy retainers "whose gathering word was Bellenden," might have required some effort, but only the conscientious reader need care to make it. The only puzzle in the Lay was the goblin page, and the general reader was absolved from all trouble about him by the unanimous declaration of the critics, led by Jeffrey in the Edinburgh Review, that he was a grotesque excrescence, in no way essential to the story. It is commonly taken for granted that Scott acquiesced in this judgment, his politely ironic letter to Miss Seward being quoted as conclusive.

This is hardly fair to the poor goblin, seeing that his story was the germ of the poem and determines its whole structure; but it is a tribute to the lively simplicity of the Lay that few people should be willing to take the very moderate amount of pains necessary to see the goblin's true position in the action. The supernatural element was Scott's most risky innovation. For the rest, he was a cautious and conservative reformer, careful not to offend established traditions. He was far from raising the standard of rebellion, as Wordsworth had done, against the great artistic canon of the classical school—

"True art is nature to advantage dressed."
To "enraft modern refinement on ancient simplicity," to preserve the energy of the old ballad without its rudeness and bareness of poetic ornament, was Scott's avowed aim. He adhered to the poetic dictum against which Wordsworth protested. His rough Borderers are "dressed to advantage" in the costume of romantic chivalry. The baronial magnificence of Brankstone, Deloraine's "shield and jack and action," the elaborate ceremony of the combat between the pseudo-Deloraine and Musgrave, are concessions to the taste of the 18th century. Further, he disarmed criticism by putting his poem into the mouth of an ancient minstrel, thus pictorially emphasizing the fact that it was an imitation of antiquity, and providing a scapegoat on whose back might be laid any remaining sins of rudeness or excessive simplicity. And, while imitating the antique romance, he was careful not to imitate its faults of rambling, discursive, disconnected structure. He was scrupulously attentive to the classical rules of time, place and action. The scene never changes from Branksome and its neighbourhood; the time occupied by the action (as he pointed out in his preface) is three nights and three days; and, in spite of all that critics have said about the superficiality of the goblin page, it is not difficult to trace unity of intention and regular progressive development in the incidents.

The success of the Lay decided finally, if it was not decided already, that literature was to be the main business of Scott's life, and he proceeded to arrange his affairs accordingly. It would have been well for his comfort, if not for his fame, had he adhered at this point to the shadowed plan of the farm near Bowhill, with the proceeds of some property left to him by an uncle, and divide his year between this and Edinburgh, where he had good hopes, soon afterwards realized, of a salaried appointment in the Court of Session. This would have given him ample leisure and seclusion for literature, while his private means and official emoluments secured him against dependence on his pen. He would have been laird as well as sheriff of the caim and the sear, and as a man of letters his own master. Since his marriage in 1797 with Charlotte Charpentier, daughter of a French refugee, his chief residence has been at Lasswade, about six miles from Edinburgh. But on a hint from the lord-lieutenant that the sheriff must live at least four months in the year within his county, and that he was attending more closely to his duties as quartermaster of a mounted company of volunteers than was consistent with the proper discharge of his duties as sheriff, he had moved his household in 1804 to Ashiestiel. When his uncle's bequest fell in, he determined to buy a small property on the banks of the Tweed within the limits of his sheriffdom. There, within sight of Newark Castle and Bowhill, he proposed to live like his ancient minstrel, as became the bard of the Borders; under the shadow of the Border hills, at the foot of the Tweed, the shadow of Scott. But this plan was deranged by an accident. It so happened that an old school-fellow, James Ballantyne (1772-1833), a printer in Kelso, whom he had already befriended, transplanted to Edinburgh, and furnished with both work and money, applied to him for a further loan. Scott declined to lend, but offered to join him as sleeping partner. Thus the intended purchase money of Broadmeadows became the capital of a printing concern, of which by degrees the man of letters became the overworked slave, milch-cow and victim.

When the Lay was off his hands, Scott's next literary enterprise was a prose romance—a confirmation of the argument that he did not take to prose after Byron had "bet him," as he put it, in verse, but that romance writing was a long-cherished purpose. He began Waverley, but a friend to whom he showed the first chapters—which do not take Waverley out of England, and describe an education in romantic literature very much like Scott's own—not unnaturally decided that the work was deficient in interest and unworthy of the author of the Lay. Scott accordingly laid Waverley aside. We may fairly conjecture that he would not have been so easily diverted had he not been occupied with the new Edinburgh press, and with the planning and publication enterprise calculated to bring gist to the printing establishment. His active brain was full of projects for big editions, which he undertook to carry through on condition that the printing was done by Ballantyne & Co., the "Co." being kept a profound secret, because it might have injured the lawyer and poet professionally and socially to be known as partner in a commercial concern.

In 1806 he collected from different publications his Ballads and Lyric Pieces. Between 1806 and 1812, in order to serve the interests of the firm, though of course the work was not in itself unattractive to him, Scott produced his elaborate editions of Dryden (18 vols., 1808), Swift (19 vols., 1818), the Somers Tracts (13 vols., 1808-1813), and the State Papers and Letters of Sir Ralph Sadler (2 vols., 1809). Incidentally these laborious tasks contributed to his preparation for the main work of his life by extending his knowledge of English and Scottish history. Marmion, begun in November 1806 and published in February 1808, was written as a relief to "graver cares," though in this also he aimed at combining with a romantic story a solid picture of an historical period. It was even more popular than the Lay. Scott's resuscitation of the four-beat measure of the old "gests" afforded a signal proof of the justness of their instinct in choosing this vehicle for their recitations. The four-beat lines of Marmion took possession of the public like a kind of madness: they not only clung to the memory but they would not keep off the tongue: people could not help spouting them in solitary places and muttering them as they walked about the streets. The critics, except Jeffrey, who may have been offended by the pronounced politeness of the poet, were on the whole better pleased than with the Lay. Their chief complaint was with the "introductions" to the various cantos, which were objected to as vexatiously breaking the current of the story.

The triumphant success of Marmion, establishing him as facile princeps among living poets, gave Scott such a beecce, to use his own words, "as almost lifted him off his feet." He touched then the highest point of prosperity and happiness. Presently after, he was irritated and tempted by a combination of little circumstances into the great blunder of his life, the establishment of the publishing house of John Ballantyne & Co. A coolness arose between him and Jeffrey, chiefly on political but partly also on personal grounds. They were old friends, and Scott had written many articles for the Review, but its political attitude at this time was intensely unsatisfactory to Scott. To complete the breach, Jeffrey reviewed Marmion in a hostile spirit. A quarrel occurred also between Scott's printing firm and Constable, the publisher, who had been the principal feeder of its press. Then the temperer appeared in the shape of Murray, the London publisher, anxious to secure the services of the most popular littérateur of the day. The event of negotiations was a heartache. It made Constable, "the crafty," "the grand Napoleon of the realms of print," the publishing house of John Ballantyne & Co., to be managed by John Ballantyne (d. 1821), James's younger brother, whom Scott nicknamed "Rigdamunfidos," for his talents as a mimic and low comedian. Scott interested himself warmly in starting the Quarterly Review, and in return Murray constituted Ballantyne & Co. his Edinburgh agents. Scott's trust in Rigdamunfidos and his brother, "Aldiborontophosphohornio," and in his own power to supply all their deficiencies, is as strange a piece of infatuation as any that ever formed a theme for romance or tragedy. Their devoted attachment to the architect of their fortunes and proud confidence in his powers helped forward to the catastrophe, for whatever Scott recommended they agreed to, and he was too immersed in multifarious literary work and professional and social engagements to have time for cool examination of the numerous rash speculative ventures into which he launched the firm.

The Lady of the Lake (May 1810) was the first great publication by the new house, and next the vision of Don Roderick followed. The Lady of the Lake was received with enthusiasm, even in its first edition which sold out in a month. Scott's influence in the Scottish Highlands, fashionable for tourists, and raised the post-horse duty in Scotland. But it did not make up to
Ballantyne & Co. for their heavy investments in unsound ventures. The Edinburgh Annual Register, meant as a rival to the Edinburgh Review, though Scott engaged Southey to write for it and wrote for it largely himself, proved a failure. In a very short time the warehouses of the firm were filled with unsaleable stock. By the end of three years Scott began to write for his partners about the propriety of "reefing sails." But apparently he was too much occupied to look into the accounts of the firm, and, so far from understanding the real state of their affairs, he considered himself rich enough to make his first purchase of land at Abbotsford. But he had hardly settled there in the spring of 1812, and begun his schemes for building and planting and converting a bare moor into a richly wooded pleasure, than his business troubles began, and he found himself harassed by fears of bankruptcy. Rigdumfannidoos concealed the situation as long as he could, but as bill after bill came due he was obliged to make urgent application to Scott, and the truth was thus forced from him item by item. He had by no means revealed all when Scott, who behaved with admirable good-nature, was provoked into remonstrating, "For heaven’s sake, treat me as a man and not as a milch-cow." The proceeds of Rokeby (January 1813) and of other labours of Scott’s pen were swallowed up, and bankruptcy was inevitable, when Constable, still eager at any price to secure Scott’s services, came to the rescue. With his help three crises were tided over in 1813.

It was in the midst of these embarrassments that Scott opened as much work as seemed humanly possible for his partners, to make up the deficiency of the sale of Waverley. He chanced upon the manuscript of the opening chapters of Waverley which he had written in 1805, and resolved to complete the story. Four weeks in the summer of 1814 sufficed for the work, and Waverley was published by Constable without the author’s name in July. The notes and introductions first appeared in the edition of 1829. Many plausible reasons might be given and have been given for Scott’s resolution to publish anonymously. The reason given by Lockhart is that he considered the writing of novels beneath the dignity of a grave clerk of the Court of Session. He kept up the mystification, though the secret, which was formally divulged in 1827, was an open one to all his Edinburgh acquaintances, is easily understood. He enjoyed it, and his formally initiated coadjutors enjoyed it; it relieved him from the annoyances of foolish compliment; and it was not unprofitable—curiosity about “the Great Unknown” keeping alive the interest in his works. The secret was so well kept by all to whom it was definitely entrusted, and so many devices were used to throw conjecture off the scent, that even Scott’s friends, who were certain of the authorship from internal evidence, were occasionally puzzled. He kept on producing in hitherto nameless form, and was enabled to publish anonymously the works of an official who was to be seen every day at his post and as often in society as the most fashionable of his professional brethren. His treatises on chivalry, romance and the drama, besides an elaborate work in two volumes on Border antiquities, appeared in the same year with Waverley, and his edition of Swift in nineteen volumes in the same week. In 1813 he published the romantic tale of The Bridal of Triermain in three cantos, enlarged from an earlier poem, printed in the Edinburgh Annual Register of 1809. The Lord of the Isles was published in January 1815; Guy Mannering the following February; The Black Dwarf and Old Mortality in the same year; The Talisman and The Antiquary in 1815; the first series of the Tales of My Landlord, edited by “Jedediah Cleishbotham” in the same year; Harold the Dauntless in 1817; the two volumes of The Border Antiquities of England and Scotland in 1814 and 1817. No wonder that the most positive interpreters of internal evidence were mystified. It was not as if he had buried himself in the country for the summer half of the year. On the contrary, he kept open house at Abbotsford in the fine old feudal fashion and was seldom without visitors. His own friends and many strangers from a distance, with or without introductions, sought him there, and found a hearty hospitable country laird, entirely occupied to all outward appearance with local and domestic business and sport, building and planting, adding wing to wing, acre to acre, plantation to plantation, with just leisure enough for the free-hearted entertainment of his guests and the cultivation of friendly relations with his humble neighbours. How could such a man find time to write two or three novels a year, besides what was published in his own name? Even the few intimates who knew how early he got up to prepare his packet for the printer, and had some idea of the extraordinary power that he had acquired of commanding his faculties for the utilization of odd moments, must have wondered at times whether he had not inherited the arts of his ancestral relation Michael Scott, and kept a goblin in some retired attic or vault. Scott’s fertility is not absolutely unparalleled; Anthony Trollope claimed to have surpassed him in rate as well as total amount of production, having also business duties to attend to. But in speed of production combined with variety and depth of interest and weight and accuracy of historical substance Scott is unrivalled. On his claims as a serious historian, which Carlyle ignored in his curiously narrow and splenetic criticism, he was always, with all his magnanimity, peculiarly sensitive. A certain feeling that his antiquarian studies were undervalued seems to have haunted him from his youth. It was probably this that gave the sting to Jeffrey’s criticism of Waverley and that tempted him to the most unrelenting of all processes of reviewing his own novels in the Quarterly upon the appearance of Old Mortality. He was nettled besides at the accusation of having treated the Covenanters unfairly, and wanted to justify himself by the production of historical documents. In this criticism of himself Scott replied lightly to some of the familiar objections to his work, such as the feebleness of his heroes, Waverley, Bertram, Lovel, and the melodramatic character of some of his scenes and characters. But he argued more seriously against the idea that historical romances are the enemies of history, and he rebutted by anticipation Carlyle’s objection that he wrote only to amuse idle persons who like to lie on their backs and read novels. His apologia is worth quoting. Historical romances, he admits, have always been failures, but the failure has been due to the imperfect knowledge of the writers and not to the species of composition. If, he says, anachronisms in manners can be avoided, and “the features of an age gone by can be recalled in a spirit of delineation at once faithful and striking, . . . the composition itself is in every point of view dignified and improved; and the author, leaving the light and frivolous apparatus with whom a careless observer would be disgusted, takes his seat on the bench of the historians of his time and country. In this proud assembly, and in no mean place of it, we are disposed to rank the author of these works. At once a master of the great events and minute incidents of history, and of the manners of the times he celebrates, as distinguished from those which now prevail, the intimate thus of the living and of the dead, his judgment enables him to separate those traits which are characteristic from those that are generic; and his imagination, not less accurate and discriminating than vigorous and vivid, presents to the mind of the reader the individuals of the drama as they thought and spoke and acted.” This defence of himself shows us the ideal at which Scott aimed, and which he realized. He was not in the least unconscious of his own excellence. He did not hesitate in this review to compare himself with Shakespeare in respect of truth to nature. “The volume which this author has studied is the great book of nature. He has gone abroad into the world in quest of what the world will certainly and abundantly supply, but—what a man of great discrimination alone will find, and a man of the very highest genius will alone detect after he has discovered it. The characters of Shakespeare are not more exclusively human, not more perfectly men and women as they live and move, than those of this mysterious author.”

The immense strain of Scott’s double or quadruple life as
sherif and clerk, hospital laird, poet, novelist, and miscellaneous man of letters, publisher and printer, though the prosperous excitement sustained him. There is this certainly to be said for Scott's early series of attacks of agonizing cramp of the stomach, which recurred at short intervals during more than two years. But his appetite and capacity for work remained unbroken. He made his first attempt at play-writing as he was recovering from the first attack; before the year was out he had completed Rob Roy, and within six months it was followed by The Heart of Midlothian, which filled the four volumes of the second series of Tales of My Landlord, and has remained one of the most popular among his novels. The Bride of Lammermoor, The Legend of Montrose, forming the third series by "Jeddeliah Cleishbotham," (1821) was followed by the fourth time, through fits of suffering so acute that he could not suppress cries of agony. Still he would not give up. When Laidlaw begged him to stop dictating he only answered, "Nay, Willie, only see that the doors are fast. I would fain keep all the cry as well as the wool to ourselves; but as to giving over work, that can only be when I am in woolen."

Throughout those two years of intermittent ill-health, which was at one time so serious that his life was despaired of and he took formal leave of his family, Scott's semi-public life at Abbotsford, which was now the centre of a brilliant society, and the rate of production, on the whole, suffering no outward and visible check, all the world wondering at the novelist's prodigious fertility. The first of the series concerning which there were murmurs of dissatisfaction was The Monastery (1820), which was the first completed after the re-establishment of the author's bodily vigour. The failure, such as it was, was possibly due to the introduction of the supernatural in the person of the White Lady of Avenel; and its sequel, The Abbot (1820), in which Mary, Queen of Scots, is introduced, was generally hailed as fully sustaining the reputation of "the Great Unknown." Kenilworth (1821), The Pirate (1822), The Fortunes of Nigel (1822), Peveril of the Peak (1822), Quentin Durward (1823), St Ronan's Well (1824), Redgauntlet (1824) followed in quick succession in the course of three years, and it was not till the last two were reached that the cry that the author was writing too fast began to gather volume. St Ronan's Well was very severely criticized and condemned. And yet Leslie Stephen tells a story of a dozen modern connoisseurs in the Waverley novels who agreed that each should write down separately the name of his favourite novel, when it appeared that each had without concert named the same."The story of Robert Bruce," he says, "was the first to which they all agreed". St Ronan's, that, in spite of the heaviness of some of the scenes at the "humble" and the artificial melodramatic character of some of the personages, none of Scott's stories is of more absorbing or more brilliantly diversified interest. Contradictions between contemporary popular opinion and mature critical judgment, as well as diversities of view among critics themselves, rather shake confidence in individual judgment on the vexed but not particularly wise question which is the best of Scott's novels. There must, of course, always be inequalities in a series so prolonged. The author cannot always be equally happy in his choice of subject, situation and character. Naturally he was not always the first to deal with the subjects of which his mind was fullest. But any theory of falling off or exhaustion based upon plausible general considerations has to be qualified so much when brought into contact with the facts that very little confidence can be reposed in its accuracy. The Fortunes of Nigel comes comparatively late in the series and has often been blamed for its looseness of construction. Scott himself always spoke slightingly of his plots, and humorously said that he proceeded on Bayes's maxims. What the deuce is a plot good for but to bring in good things, he said? Yet some competent critics prefer The Fortunes of Nigel to any other of Scott's novels. An attempt might be 1 The Doom of Deveron. This and his other dramatic sketches, Macduff's Cross, Haddo Hill (1822) and Auchenbran, or The Ayrshire Tragedy, printed with Deveron in 1830, were slight compositions, dashed off in a few days, and afford no measure of what Scott might have done as a dramatist if he had studied the conditions of stage representation.
some of them among the most brilliant of his miscellaneous writings, and prefaces and notes to a collected edition of his novels if it could have continued at this rate he might soon have freed himself from all his encumbrances. The result of his exertions from January 1836 to January 1838 was nearly £40,000 for his creditors. But the terrific labour proved too much even for his endurance. Ugly symptoms began to alarm his family in 1839, and in February of 1840 he had his first stroke of paralysis. Still he was undaunted, and not all the persuasions of friends and physicians could induce him to take rest. “During 1839,” Lockhart says, “he covered almost as many sheets with his MS. as in 1829,” the new introductions to a collected edition of his Poetical Works were in progress. Life in the London parish of Westminster, being amongst the labours of the year. He had a slight touch of apoplexy in November and a distinct stroke of paralysis in the following April; but, in spite of these warnings and of other bodily ailments, he had two more novels, Count Robert of Paris and Castle Dangerous (constituting the fourth series of Tales of My Landlord), ready for the press by the autumn of 1831. He would not yield to the solicitations of his friends and consent to try rest and a change of scene, till fortunately, as his mental powers failed, he became possessed of the idea that all his debts were paid. His health was now restored, and free moral and religious belief he happily remained till his death. When it was known that his physicians recommended a sea voyage for his health, a government vessel was put at his disposal, and he cruised about in the Mediterranean and visited places of interest for the greater part of a year before his death. But, when he felt that the end was near, he insisted on being carried across Europe that he might die on his beloved Tweedside at Abbotsford, where he expired on the 21st of September 1832. He was buried at Dryburgh Abbey.

Scott’s wife had died in 1826. His eldest son, Walter, succeeded to the estate which had been conferred on his father in 1820, and the title became extinct on his death in 1847; the second son, Charles, died at Teheran in 1841, and the daughter, Anne, died unmarried in 1833. Scott’s elder daughter Charlotte Sophia (d. 1837) was the wife of his biographer, J. G. Lockhart (q.v.); and their daughter Charlotte (d. 1858) married J. R. Hope-Scott (q.v.), and was the mother of Mary Monica, wife of the Hon. J. C. Maxwell, who in 1874 took the additional name of Scott on his marriage with the heiress of Abbotsford. Mrs Maxwell Scott inherited some of the family literary talent, and among other books wrote two volumes about Abbotsford (1893 and 1894).

Two busts of Scott were executed by Sir Francis Chantrey: one in 1830, which was presented to Scott by the sculptor in 1828, a second in 1828, which was sent by Chantrey to Sir Robert Peel about 1837, and is now in the National Portrait Gallery, London. The 1828 bust was duplicated by Chantrey for the duke of Wellington in 1827, and there is a copy in Westminster Abbey, erected in 1887. Henry Raeburn painted Scott’s portrait for Archibald Constable in 1808; Scott sat to the same artist in 1809 for the portrait now at Abbotsford, and two or three times subsequently. Other notable portraits were executed by Sir Thomas Lawrence in 1820 for George IV.; by John Graham Gilbert in 1829 for the Royal Society of Edinburgh; by Francis Grant for Lady Ruthven in 1831; and a posthumous portrait of Scott with his dogs in the Rhymers Glen by Sir Edwin Landseer. The Scott monument in Princes Street, Edinburgh, erected in 1846, was designed by George Kemp, the statue being the work of John Steell.

Bibliography.—The Miscellaneous Prose Works of Sir Walter Scott (6 vols., Edinburgh, 1837) were subsequently printed in 30 vols. (London, 1834-1871) and in 3 vols. (1841-1849). The collected editions of the novels and tales are very numerous. Among them are that known as the “author’s favourite edition” (48 vols., Edinburgh, 1829-1833), for which Scott wrote new prefaces and notes; an edition de luxe of the Waverley novels, illustrated by A. Lalauze, E. Riou and others (25 vols., London, 1882-1889); the “Border edition” (48 vols., 1892-1894), with introductory essays and notes by A. Lang, and portraits of the authors by B. Pears; his Poetical Works were printed in 12 vols. (Edinburgh, 1826); they were edited by J. G. Lockhart (12 vols., Edinburgh, 1833-1834), with 24 steel engravings from illustrative drawings by Turner; by F. T. Palgrave for the “Globe” edition (1866); by W. Minto (2 vols., Edinburgh, 1888); by J. Logie Robertson (Oxford complete edition, 1904). Many of the novels have been adapted for the stage, the most famous adaptation of Waverley being realized in a dramatized form by Dumas fils as Lammemoor and the Ivanhoe of Sir Arthur Sullivan and J. R. Sturgis. His Minstrelsy of the Scottish Border (3 vols., 1802-1803) was edited (4 vols., 1902) by T. F. Henderson.

The standard life of Scott is by J. G. Lockhart, Memoirs of the Life of Sir Walter Scott (7 vols., Edinburgh, 1837-1838), left little new material for later biographers. It was supplemented by the list of Scott’s writings (1841-1847), Sir George Graham’s Journal, covering the years from 1825 to 1832, and of his Familiar Letters (2 vols., 1894), both edited by Scott. Some unpublished letters from Scott to the marchioness of Abercorn were sold at Sotheby’s in 1906. Shorter biographies of him include James Hogg, The Domestic Manners and Private Life of Sir Walter Scott (Glasgow, 1834); A. Lang, in Letters to Dead Authors (1886); the second edition of J. R. Lockhart’s Life of Scott (Edinburgh, 1871), prefixed by Sir W. Stirling-Maxwell (Edinburgh, 1872); Biographical Sketches, Hours in a Library (London, 1874); J. Veitch, The History and Poetry of the Scottish Border (Glasgow, 1879); L. Malagon, Le roman historique (Paris, 1891); and the Very Excellent Story and Adventures of Mr. J. B. Sturgis (Paris, 1898). An account of the portraits of Scott, and a bibliography of his works, are given in Sir W. Stirling-Maxwell’s Catalogue of the Scott Exhibition, commemorating Scott’s centenary in July-August 1871.

W. M.: X.

;SCOTT, WILLIAM BELL (1791-1865), British poet and artist, son of Robert Scott (1761-1803), the elder, and brother of David Scott, the painter, was born in Edinburgh on the 12th of September 1811. While a young man he studied art and assisted his father, and he published verses in the Scottish magazines. In 1837 he went to London, where he became sufficiently well known as an artist to be appointed in 1844 master of the government school of design at Newcastle-on-Tyne. He held the post for twenty years, and did good work in organizing art-teaching and examining under the Science and Art Department. He did much fine decorative work, too, on his own account, notably at Wallington Hall, in the shape of eight large frescoes illustrating the life and death of Sir Walter Scott, as also supplemented by eighteen pictures illustrating the ballad of Chevy Chase in the spandrels of the arches of the hall. For Penhill Castle, Perthsire, he executed a similar series, illustrating The King’s Quair. After 1870 he was much in London, where he bought a house in Chelsea, and he was an intimate friend of Rossetti and in high repute as an artist and an author. His poetry, which he published at intervals (notably Poems, 1875, illustrated by etchings by himself and Alma-Tadema), recalled Blake and Shelley, and was considerably influenced by Rossetti; he also wrote several volumes of artistic and literary criticism, and edited Keats, "L.E.L.," Byron, Coleridge, Shelley, Shakespeare and Scott. He resigned his appointment under the Science and Art Department in 1885, and from then till his death (22nd November 1895) he was mainly occupied in writing his reminiscences, which were published posthumously in 1892, with a memoir by Professor Minto. It is for his connexion with Rossetti’s circle that Bell Scott will be chiefly remembered.

Scott, Winfield (1796-1866), American general, was born near Petersburg, Virginia, on the 13th of June 1786. In 1805 he entered the College of William and Mary, where he studied law; and in 1807, entering the law office of David Livingston in Petersburg. In 1809 he removed to Charleston, South Carolina, but as war with England seemed imminent he soon left for Washington and offered his services. In 1828 he was commissioned as a captain of artillery, recruited a company in Richmond and Petersburg, and was ordered to New Orleans. His criticism of his superior officer, General James Wilkinson, led to his being suspended for a year, but the
term was eventually reduced to three months. In July 1812, as a lieutenant-colonel of artillery, he was sent to the Niagara frontier and fought at Queenston, where he was taken prisoner. He was exchanged in January 1813, became colonel in the following March, in March 1814 was promoted to the rank of brigadier-general, and in July received the brevet of major-general. In the battles of Chippewa (5th July 1814) and Lundy’s Lane (27th July) he took a conspicuous part, being twice wounded in the latter engagement. For his services he was presented with a gold medal by Congress and with a sword by the state of Virginia. Among the difficult tasks that he was called upon to perform between 1815 and 1861, for the last twenty years of which period he was the commanding general of the U.S. army, were: an expedition to the Middle West in 1832, where, after the end of the Black Hawk War, he negotiated treaties of peace with the Sauk, Fox, Winnebago, Sioux, and Menominee Indians; a journey to Charleston in the same year to watch the progress of the nullification movement, and to strengthen the garrisons of the forts in the harbor; an expedition in 1836 against the Seminole Indians in Florida; the supervision of the removal in 1838 of the Cherokee Indians from Georgia, North Carolina, Alabama and Tennessee to the reservation set apart for them by treaty W. of the Mississippi river; a visit to the Niagara river in the autumn and winter of 1838 to put an end to the acts by Canadian insurgents in violation of American neutrality; a similar mission to Maine in 1839 to restore tranquillity between the citizens of Maine and New Brunswick, who were disputing the possession of a tract of land along the Aroostook river; and a journey to the north-west in 1839 to adjust a dispute between American and British officers concerning the joint occupation of San Juan Island in Puget Sound. His greatest achievement was the brilliant Mexican campaign of 1846. As the senior officer of the army, he was placed in command of the invading expedition, and after capturing Vera Cruz (March 29th, 1847), and winning victories at Cerro Gordo (April 15th), Contreras-Churubusco (August 19th-29th), Molino del Rey (September 8th), and Chapultepec (September 13th), he crowned his campaign by the capture, on the 14th of September, of the Mexican capital. In March 1848 he received a vote of thanks from Congress, which ordered a gold medal to be struck in commemoration of his services. Scott appeared to have an excellent opportunity for a political career; his nomination for the presidency by the Whigs had been suggested in 1839 and in 1848, and in 1852 he received it; but his candidacy was doomed to failure. The Whigs, divided on the slavery question, gave only half-hearted support to their compromise candidate; and Scott made several extemporaneous addresses which did him harm. He received the electoral votes of only four states—Kentucky, Virginia, Massachusetts and Vermont. This defeat, however, detracted not from the esteem and honor in which he was held, and the brevet rank of lieutenant-general was created specially for him. Among the other honors conferred upon him were the degree of Master of Arts by Princeton in 1814, and the degree of Doctor of Laws by Columbia in 1850 and by Harvard in 1861. At the outbreak of the Civil War, though a Virginian, he remained at the head of the United States armies and directed operations from Washington until November 1861. He then visited Europe for a short time, and after returning wrote his Memoirs, published in 1864. He died at West Point, New York, on the 29th of May 1866.

SCOUNDREL, a rogue, a rascal. Etymologists have referred the word to various sources; but Skeat (Ety. Dict.) refers it to the provincial or Scottish scavenger (O. Eng. scavion, to shun), to shrink back in fear or loathing.

SCOURGE (Ital. scudra, from Lat. excoriare, to flay, corium, skin), a whip or lash, especially one used for the infliction of punishment. The typical scourge (Lat. flagellum) has several things or lashes attached to a single handle, as in the modern "cat-o'-nine-tails." The scourge or flail, and the crook, are the two symbols of power and domination depicted in the hands of Osiris in ancient Egyptian monuments; these show the unchanging form of the instrument throughout the ages.

SCOUT (from O. Fr. escouter, mod. écouter, Lat. auscultare, to listen), a soldier sent out to watch the enemy and bring information of his numbers, movements, whereabouts, &c. The name has also been applied to a particular class of light-speedy cruisers in the British navy. After the South African War of 1899-1902, the importance of military scouting received much attention in England in consequence of the prominence given to it by Major-General Baden-Powell, of Mafeking fame. Under the latter’s auspices an unofficial attempt to foster the qualities required was made by the institution of the Boy Scouts, a voluntary organization which, starting in 1908, had by 1910 enrolled many hundreds of thousands of boys throughout the United Kingdom, with branches overseas.

Various birds of the auk family, such as the guillemot and the puffin, are known as "scouts." The name is also given colloquially to college servants at Oxford and Harvard Universities. It then answers to the "gyp" of Cambridge, Trinity College, Dublin, and Durham, which has been variously explained as short for "gipsy," as taken from γψ, vulture, from a supposed reference to a grasping character, or as representing an old word "gippo" (Fr. jupeau, tunic), used of a scullion or kitchen servant.

In the above senses, "scout" must be distinguished from the word meaning to flout, or reject with ridicule and scorn, which is derived from a Latin verb meaning to scorn or spurn in the sense of to flout or mock. In the military sense, see Sir R. S. Baden-Powell, Scouting, and Scouting for Boys. The Boy Scouts’ movement in England has official papers in the weekly Scout and monthly Headquarters Gazette.

SCRANTON, a city and the county-seat of Lackawanna county, Pennsylvania, U.S.A., at the confluence of the Lackawanna river and Roaring Brook, about 162 m. by rail N. by W. of Philadelphia and about 146 m. W.N.W. of New York. Pop. (1890) 75,215; (1900) 102,926, of whom 28,973 were foreign-born (including 7193 Irish, 4704 Germans, 4621 Welsh and 3692 English) and 512 were negroes; (1910, census) 123,867. Scranton is served by the Erie, the Delaware, Lackawanna & Western, the Central of New Jersey, the New York, Ontario & Western, the Delaware & Hudson, and the Lackawanna & Wyoming Valley railways. It occupies an area of about 20 sq. m. Among the principal public buildings are the United States Government building, the County Court House, the City Hall, the Albright Memorial building, housing the public library (55,800 vols. in 1908), the armoury of the 13th Regiment, State National Guard, the Board of Trade building, some fine churches and school-houses, a Young Men’s Christian Association building and a Young Women’s Christian Association building. Scranton is the see of a Roman Catholic bishop, has a good public school system, and is the seat of the International Correspondence Schools (1891), which give instruction by mail in the trades and professions to large numbers of students; Mt. St Mary’s Seminary (1902) for girls, and the W. T. Smith (Memorial) Manual Training School (1903), a part of the public school system. The city has an Institute of History and Science, and the Everhart Museum of natural history, science and art (dedicated 1908), founded and endowed by Dr J. F. Everhart (1833-1910), of Scranton, a Soldier’s and Sailor’s Monument, and monuments to the memory of Columbus and Washington. Scranton is the largest city in the great anthracite-coal region of the United States; and 17,525,905 long tons of coal were produced within the county in 1905. The chief manufactures are silk goods (21-6% of all in value) and other textiles, but large quantities of foundry and machine-shop products, malt liquors, flour, and planing mill products are also manufactured. The total value of the city’s factory products in 1905 was $20,453,285. The Delaware, Lackawanna & Western railway has since built large machine and car shops.

A permanent settlement was established within the present
limits of Scranton in 1788, and a primitive grist-mill, a saw-mill and a charcoal iron-furnace were erected during the next few years; but there was little further development until 1840, when the Lackawanna Iron Company was formed for the manufacture of iron here. The limestone and iron ore of the vicinity proved to be of inferior quality, and the failure of the enterprise was prevented only by the persistent efforts of George Whitefield Scranton (1811-1861), aided by his brothers Tilden T. Scranton and his cousin Joseph Hand Scranton. Under the leadership of George W. Scranton better grades of iron ore and of limestone were procured, and within a decade a rolling mill, a nail factory and a manufactury of steel rails were established, and adequate facilities for railway transportation were provided. Scranton was incorporated as a borough in 1854, was chartered as a city of the third class in 1866, and became a city of the second class in 1901. See B. H. Throop, A Half-Century in Scranton (Scranton, 1895).

SCREAMER, a bird inhabiting Guiana and the Amazon valley, so called in 1781 by T. Pennant (Gen. Birds, p. 37) "from the violent noise it makes"—the Palamedea cornuta of Linnaeus. First made known in 1648 by G. de L. Marceau under the name of "Anhimia," it was more fully described and better figured by Buffon under that of Camichi, still applied to it by French writers. Of about the size of a turkey, it is remarkable for the curious "horn" or slender caruncle, more than three inches long, it bears on its crown, the two sharp spurs with which each wing is armed, and its elongated toes. Its plumage is plain in colour, being of an almost uniform greyish black above, the space round the eyes and a ring round the neck being variegated with white, and a patch of pale rufous appearing above the carpal joint, which with the lower parts of the body are white. Closely related to this bird is another similarly described by Linnaeus, a species of Parra (see Jacana), to which group it certainly does not belong, but separated therewith by Illiger to form the genus Chauna, and now known as C. chavaria, very generally in English as the "Crested Screamer," a name which was first bestowed on the Seriena (q.v.). This bird inhabits the lagoons and swamps of Paraguay and Southern Brazil, where it is called "Chajá," or "Chaka," and is smaller than the preceding, wanting its "horn," but having its head furnished with a dependent crest of feathers; while the plumage is grey. Its nest is a light construction of dry rushes, having its chaka's wings are armed, successfully discharged. Another very curious property of this bird, which was observed by Jacquin, who brought it to the notice of Linnaeus, is its emphymatous condition—there being a layer of air-cells between the skin and the muscles, so that on any part of the body being pressed a crackling sound is heard. In Central America occurs another species, C. derbian, chiefly distinguished by the darker colour of its plumage. For this a distinct genus, Ischyronyx, was proposed, but apparently without necessity, by A. B. Reichenbach (Syst. Avium, p. xxii.).

The taxonomic position of the Palamedeidae, for all will allow to the screaming-fowl of a family at least, has been much debated. Their anserine relations were pointed out by W. K. Parker in the Zoological Proceedings for 1863 (pp. 511-518), and in the same work for 1867 T. H. Huxley placed the family among his Chonemorphidae; but this view was contravened in 1876 by A. H. Garrod, who said, "The screamers must have sprung from the primary avian stock as an independent offshoot

1 Hence J. Latham's name for this species is "Faithful Jacana"—he supposing it to belong to the genus in which Linnaeus placed it.

2 Tacta manu cutis, sub pennis etiam lanosa, crepat ubique fortiter (Syst. Nat. ed. 12, i. p. 260).

at much the same time as did most of the other important families." P. L. Sclater in 1880 placed them in a distinct order, Palamedoidea, which he, however, placed next to the true Anseres, and they are now generally regarded as forming a sub-order of anseriform birds.

SCREEN (usually, but very doubtfully, connected with Lat. scrutum, a box for holding books, from scribere, to write; a connexion with Ger. Schranke, barrier, has been suggested), in architecture, any construction subdividing one part of a building from another—as a choir, chantry, chapel, &c. The earliest screens are the low marble podia, shutting off the chorum cantantium in the Roman basilicas, and the perforated cancelli enclosing the bema, altar, and seats of the bishops and presbyters. The chief screens in a church are those which enclose the choir or the place where the breviary services are recited. This is done on the continent of Europe, not only by doors and screen-work, but also, when these are of open work, by curtains, the laity having no part in these services. In England screens were of two uses: towards the end of the 16th century, the other, massive enclosures of stonework enriched with niches, tabernacles, canopies, pinnacles, statues, and, as at Canterbury, York, Gloucester, and many other places both in England and abroad (see Rood and Jtubé).

As an article of furniture, the screen is an ornamental frame, usually of wood, but sometimes of metal, for protection from observation, draught, or the heat of a fire. Screens are made of all shapes and sizes, and may consist of leather, paper or textile materials fastened to the framework; they may have several divisions and be moved about; thus a fourfold screen has four leaves. Fire-screens are usually designed to protect the hearth, and are often almost as large as the fireplace itself. They are made of stained or painted Spanish leather or canvas, with some device, such as tapestry; at a later date lacquer was extensively used. They were tall enough to conceal the person sitting behind them, and were frequently exceedingly handsome and stately.

SCREW (O.E. scruce, from O. Fr. escreou, mod. écreou; ultimate origin uncertain; the word, or a similar one, appears in Teutonic languages, cf. Ger. Schraube, Dan. skru, but Skæt, following Díaz, finds the origin in Lat. scrubs, a ditch, hole, particularly used in Low Latin for the holes made by pigs boring in the ground with their snouts), a cylindrical or conical piece of wood or metal having a groove running spirally round it. The surface of the thus formed constitutes an external or male screw, while a similar groove cut round the interior of a cylindrical hole, as in a nut, constitutes an internal or female screw. The ridge between successive turns of the groove is the "thread," and the distance between successive turns of the thread is the "pitch." The present article will deal with the standard pitches in common use and with modern methods of manufacture, the earlier history of which, down to the time of Sir Joseph Whitworth, may be read in Holtzapfel's Turning and Mechanical Manipulation. For the screw as a mechanical power see MECHANICS; for the screw used to propel steamships see STEAMBOATS.

Standardisation of Screws.—All screws made to-day are copies of pre-existing or master screws, which are familiarly known as "guide screws," "hobs" or "leaders," "chasers" or "comb tools," "taps," and "dies" in numerous forms. These are so standardized that a thread cut to a given standard in England fits its fellow thread cut to the same standard in America, Germany or elsewhere. At one time screws cut by one firm would not match those cut by another. Formerly there was no "tack," but large screws were cut with chisel and file, and a nut was cast around them and used for correction, until gradually
the coarser errors were eliminated. Another method was that of the mathematical instrument makers, who used a screw and tangent wheel by which a cutter was moved along synchronously with the revolution of the screw blank, a method only suitable for short screws. The first attempt at standardizing the screw by Sir Joseph Whitworth, who communicated a paper on the subject to the Institution of Civil Engineers in 1843. In the course of about twenty years the Whitworth system generally displaced the previous heterogeneous designs of threads, by the existence of which engineers' repairs had been rendered most inconvenient and costly, almost every establishment having its own "standard" set of screwing tackle. In fact it was suspected that firms thought their interest lay in this separation of practice in order to capture repairs, each of its own work.

When Whitworth began his work he made an extensive collection of screw bolts from the principal English workshops, and an average observed for diameters of ⅛ in., ⅜ in., and ½ in. chiefly was taken and tabulated in exact numbers and equal fractional parts of threads per inch, the scale being afterwards extended to 6-in. diameter. In cases above an inch the same pitch is maintained for two sizes, the object being to avoid small fractions, and to simplify the construction of screwing apparatus. The system is therefore a practical compromise based on previous practice. The proportion between pitch and diameter throughout the series, and at the extremes, the amount of power required to turn a nut is either in excess or insufficient.

When the Whitworth threads were accepted in England, Germany and the United States, it appeared as though they were established for ever in an impregnable position, as a unification evolved from chaos. Moreover, Great Britain at that time occupied a position of pre-eminence in manufacturing engineering, which was favourable to the establishment of an English system. But two things were wanting to permanence,—the facts that the new world of railways were not based on the metric system, and that the United States was destined to come into rivalry with Great Britain. Metric systems became standardized on the continent of Europe and the Sellers thread in America overshadowed the Whitworth, though it is impossible to doubt that the Sellers like the Whitworth must in time be swallowed up by some one metric system.

It is easier to devise new standards than to induce manufacturers to accept them. Change means the purchase of a very costly new equipment of screwing tackle, both hand and machine, besides the retention of the old for effecting repairs. There is no economy either in the accommodating or bringing in the threads of one system to others nearly like them. They either fit or do not fit, they are right or wrong, so that a clean sweep has to be made of the entire screwing tackle in favour of the new. The two great attacks that have been made on the Whitworth thread came, one from the Franklin Institute in 1864, when the Sellers thread was adopted and recommended to American engineers, and the other in 1873, when Delisle of Carlsruhe initiated a metric system. As a result, after several years of effort, the Society of German Engineers took the matter up, and the appointment of a committee gave birth to the International Screw Thread Congress, which has met from time to time for the discussion of the matter. We have thus two broad lines of departure from the Whitworth standard.

The history of the battle of the screw threads in England, America, Germany, Switzerland and France would occupy a volume. The subject is highly technical, involving practical points concerned with manufacture as well as with questions of strength and durability. We can merely state the fact that the threads now recognized as standard are included in eight great systems, out of about sixty that have been advocated and systematized. Their elements are shown by the diagram, fig. 1; but tables of dimensions are omitted, since they would demand too much space.

Methods of Cutting Screws.—There are four methods employed for the cutting of screw threads: one by means of a single-edged tool held in the saddle of the screw-cutting lathe, and traversed horizontally only; the other which is to revolve the thread whilst revolving the whole; another by means of short master screws, hobs or leaders, controlling chasers or comb tools; the third by means of screw taps

![Fig. 1.—Sections of principal Screw Threads.](image-url)

Formulæ: \( p = \text{pitch}, \) or distance between centres of contiguous threads; \( d = \text{depth of thread}; \) \( r = \text{total height of thread construction}; \) \( r = \text{radius}= \text{flat}.

- A. Whitworth thread. \( h = 0.5965 \text{ p}; \) \( d = 0.6493 \text{ p}; \) leaving 4th h to be rounded at top and bottom.
- B. Whitworth, or London, or U.S. Imperial, or U.S. standard thread. \( h = 0.3666 \text{ p}; \) \( d = 0.4395 \text{ p}; \) \( f = 1/4 \text{ p}.
- C. Sharp Vee thread. \( d = 0.6660 \text{ p}.
- D. British Association standard thread. \( d = 0.6 \text{ p}; \) \( r = 1/8 \text{ p}.
- E. C.E.I. or Cycle Engineers' Institute standard thread. \( h = 0.3866 \text{ p}; \) \( d = 0.5327 \text{ p}; \) \( r = 1/4 \text{ p}.
- F. Lowenherz or Delisle thread (metric, used largely on the Continent). \( h = 0.3675 \text{ h}; \) \( f = 4/10 \text{ h}.
- G. International standard thread (metric). \( d = 0.6495 \text{ p}; \) \( f = 1/4 \text{ h}.
- H. Thury thread (metric). \( d = 1/8 \text{ p}; \) \( r = 1/8 \text{ h}.
- J. Square thread. \( d = 1/8 \text{ p}.
- K. Acme thread. \( d = 1/8 \text{ p}; \) \( h = 0.010; \) \( f = 0.0070 \text{ p}.

And dies, either the work or the tool being absolutely still. The fourth is by means of a milling cutter presented to the work in a special screw-cutting machine, both the work and the cutter revolving.

The problem of screw-cutting in the lathe in the simplest form resolves itself into the relative number of revolutions of the lathe spindle and of the lead screw (fig. 2). If the two rotate at the same speed, the thread cut on the spindle axis will be equal in pitch to that of the lead screw. If the spindle revolves more slowly than the lead screw, a thread closer than that in the latter will result; if it revolves more rapidly, one of finer pitch will be produced. The spindle is the first factor, being the driven, and the lead screw is driven therefrom through the change-wheels—the variables—which determine the number of revolutions of the latter whether the same, or slower, or faster than the spindle. Screw-cutting in all its details is an extensive subject, including the cutting of what are termed odd or unequal pitches, that is, those which involve fractions, the catching of threads for successive traverses of the tool, the cutting of multiple threads and of right- and left-hand threads, which involve much practical detail. The principle of screw-cutting may be stated briefly thus: the pitch of the guide screws is that of the screw to be cut as the number of teeth on the mandrel or (headstock) wheel is to the number of teeth on the lead screw wheel. It is therefore simply a question of ratio. Hence for cutting threads finer than that of the lead screw, the guide screw must rotate more slowly than the lathe mandrel; and for cutting threads coarser than those of the guide screw, the lead screw must rotate faster than the lathe mandrel (fig. 2, C and D). When the ratios are ascertained, these facts indicate when the larger or the smaller wheels must be placed as drivers, or as driven. "Simple trains" are those which contain only one pair of change wheels; "compound trains" have two, three, four or more pairs (fig. 2), and are necessary when the ratio between the guide screw and the screw to be cut exceeds about six to one.

A device which has become very popular under the name of Hendey-Norton gears comprises a set of twelve change wheels, mounted on a universal or "radial" axis, which in turn is keyset to the mandrel or headstock wheel. A stud wheel is made to engage through an intermediate wheel with any one of the twelve change gears, on the simple movement of a lever, giving twelve
different ratios for screw-cutting. These again are doubled or trebled by altering the ratios of other gears connected therewith, so that for each position of engagement of the stud wheel, two, or in some cases three, pitches can be cut. This avoids the waste of time involved in setting up fresh wheels on the swing-plate as often as a screw of different pitch has to be cut.

Another step in the direction of economy depends on the removal of all screw-cutting, except those screws which are of several feet in length, from the ordinary lathe to the special chasing and screwing machines. The screw-cutting arrangement of an engineer's lathe is a cumbersome apparatus to fit up and set in motion for the cutting of screws of small dimensions. When there was no other method available except that of common dies operated by hand or carried in a screwing machine, there was good reason why a true cutting tool should be operated in the lathe through change wheels. But the reason no longer exists, since for the single cutting tool of the lathe the two or three cutters of the chasing and screwing machines (figs. 3 and 4) are substituted, and the hollow mandrel embodied in the latter permits of screws being cut and parted from the solid bars of several feet in length. Except for the cutting of long screws and screws of odd pitches, the ordinary lathe is now a wasteful machine.

![Fig. 2](image2.png)

**FIG. 2.**

A, Simple train which rotates lead screw in opposite direction to mandrel, and makes slide-rest feed away from the headstock.

B, Simple train with intermediate wheel on stud, which rotates lead screw in same direction as mandrel, making slide-rest feed towards the headstock. Intermediate on "stud" does not alter ratio.

C, Typical compound train arranged for cutting a screw finer than that of the lead screw.

D, Ditto for screw coarser than that of the lead screw.

**Fig. 3.—Bolt-Screwing Machine (John Stirk & Sons, Ltd., Halifax).**

J, Handle for opening the dies. K, Lever for automatically opening the dies, operating through J. L, Rod having adjustable dog b, struck by carriage at a definite position of its travel, thus throwing the dies off the work. M, Pump drawing lubricant from reservoir in bed.

The second method of cutting screws is that by means of hobs or leaders, and either comb or single-edged tools. That is, a short
In all taps and dies the problem is to cut a screw, of which the angle of thread changes from point to root, with tools whose angle must remain constant. In taps there is no choice of angle, since they must be the exact counterparts of the tapped threads when finished. But in dies a compromise is made by cutting them with hobs, or master taps (fig. 5), one thread larger than the thread to be cut by the dies. Briefly, the practical effect is that the dies are only counterparts of the thread to be cut at about the mid-point of the action (fig. 6, B).

Though the action of taps resembles in some respects that of common dies, the results achieved are better, partly because the backing off is generally superior, partly because larger taps are usually made to start a screw hole, and smaller solid dies are also used in some kinds of turret work with the same object, namely, to facilitate the work of an inherently badly formed tool. With a tapered tap, or a tapered solid die, the full threads do not come into operation until after the tapered threads have started the cut. A properly made through-hole tap, or a tapered die, will cut an average-sized screw at one traverse, provided lubrication is ample. Taps are now made with very narrow edges and wider clearances than formerly, very different from the common taps with broad edges and narrow grooves. There is thus little friction, and there is plenty of clearance for the chips, essential conditions for cutting screws rapidly at a single traverse.

Dies are held in stocks. In the common die stocks one adjustable die is moved forward with a screw, which forms one of the handles of the stock, or a separate tightening screw is used at right angles with the handles, or the tightening screw is set diagonally in relation to the handle (fig. 6, D). Sir Joseph Whitworth's well known "guide" screw stock (fig. 7) is an example of the embodiment of the principle just stated, the dies being cut over a hob two depths of thread larger than the screw; one, a broad die, is used for guidance only, and two narrow dies do all the cutting. The guide-screw stock derives its name from the fact that it embodies a guide a distinct from the cutters b, b, the guide doing very little actual cutting; it is one of the best tools for screw-cutting outside the lathe, but some of the American types of dies, such as in fig. 8, A and B, give very accurate results, especially when they are combined with a guide in advance of the dies, to keep them truly parallel on the work. The common dies are inferior in operation to those used in the guide-screw stock. Nevertheless, the common die stocks are used most extensively.

The reason is that, although they are of faulty construction regarded as a whole, they go to the mechanist of the lathe in a very satisfactory manner if moderate care be exercised in their construction and working.

Machine Work. Hand tapping and screwing has long been confined to occasional pieces of work done by the fitter at the bench, the
manner:—(1) See whether the surface of the threads has a perfect polish. The more it departs from this, and approaches the rough torn surface as cut by the lathe tool, the worse it is. A perfect screw has a perfect polish. (2) Mount it between the centres of a lathe, and rotate it at a very slow speed. If the nut fits perfectly, if the nut moves from end to end with equal friction, the screw is uniform in diameter. If the nut is long, unequal resistance may be due to either an error of run or a bend in the screw. (3) Fix a microscope on the lathe carriage and focus its single cross-hair on the edge of the screw and parallel to its axis. If the screw runs true at every point its axis is straight. (4) Observe whether the short nut runs quite true, and that its end is parallel to its axis. If the nut is turned and the nut kept from revolving. If it wobbles the screw is said to be drunk. One can see this error better by fixing a long pointer to the nut, or by attaching it to a mirror and observing an image in a microscope. This condition is that the nut must be long, rigid, and capable of being tightened as the grinding proceeds; also the screw must be ground longer than it will finally be needed, so that the imperfect ends may be removed.

The following is a screw a little thinner than 1/8 in. diameter for cutting V taps. Now cut the screw with a triangular thread a little sharper than 60°. Above all, avoid a fine screw, using about 20 threads to the inch. The grinding nut, about 11 in. long, has now to be made. Fig. 9 represents a section of the nut, which is made of brass, or better, of Bessemer steel. It consists of four segments, a, a, which can be drawn about the screw by two collars, b, b, and the screw c. Wedges between the segments prevent too great pressure on the screw. The final clamping is effected by the rings and screws, d, d, which enclose the flanges, f, of the segments. The screw is now placed in a lathe and surrounded by water whose temperature can be kept constant to 1°C., and the nut placed on it. In order that the weight of the nut may not make the ends too small, it must be placed in a counterbalanced lathe, in which the screw is held by two arms, which revolve in pulleys in the ceiling, or the screw must be vertical during the whole process. Emery and oil seem to be the only available grinding materials, though a softer silica powder might be used. The nut may be ground in two sections, the taper being ground in the first operation, and the cylindrical portion polished in the second. Fig. 9 represents a section of the nut.

Mounting of Screws.—The mounting must be devised most care-
fully, and is indeed more difficult to make without error than the screw itself. The principle which should be adopted is that no workmanship is perfect; the design must make up for its imperfections. Thus the screw can never be made perfectly by rolling, and the device of resting one end of the carriage on the nut must be rejected. Also all rigid connexion between the nut and the carriage must be avoided, as the screw can never be adjusted by the carriage for use in many purposes, such as ruling optical gratings, the carriage must move accurately forward in a straight line as far as the horizontal plane is concerned, while a little curvature in the vertical plane produces very little effect. These conditions can be best accomplished by making the waves V-shaped and grinding with a grinder somewhat shorter than the waves. By constant reversals, and by lengthening or shortening the stroke, the waves will make themselves become nearly equal.

Duveyrier), making the秘书 secretary of the Parisian Scientific Congresses, thus: "The Prenanous, or "The Pretendu sans le savoir, was produced without his name at the Variétés in 1810, and was a failure. Numerous other plays, written in collaboration with various authors, followed, but none of die plays was a success. Moreover, when Une Nuit de la garde nationale, written in collaboration with Delestre-Poirson, made him famous. The secret of his success was the careful selection of his collaborators, and it was done with skill and success. Among his collaborators were Jean Henri Dupin (1787-1887), Germain Delavigne, Delestre-Poirson, Méteville (A. H. J. Duveyrier), Marc-Antoine Desaugiers, Xavier Saintine and Gabriel Legouvé. His début in serious comedy was made at the Théâtre Français in 1822 with Valére, the first of many successful pieces of the same kind. His industry was unrivaled and his knowledge both of the mechanism of the stage and of the tastes of the audience was wonderful. For purely theatrical ability he is unrivaled, and his plays are still regarded as models of the fine art of construction. Moreover, when his play was for fifty years the best exponent of the ideas of the French middle classes, so that he deserves respectful attention, even though his style be vulgar and his characters commonplace. He wrote a few novels, but none of any mark. The best-known of Scribe's plays after his first successful one are Une Chastine (1842); Le Verdier d'eau (1842); Adrienne Lecouvreur (1849), in conjunction with Legouvé; Bertrand et Raton, ou l'art de conspirer; and the libertine of many of the most famous operas of the middle of the century, especially those of Auber and Meyerbeer. The books of La Muette de Portici, Pia Diocese, Robert le Diable, and Les Huguenots are wholly or in part by him. Scribe died in Paris on the 20th of February 1861.

His Œuvres complètes appeared in seventy-six volumes in 1874-1885. See Legouvé, Eugène Scribe (1874).

Scribes. The word "scribe" (from Lat. scribere, to write) means generally a writer; but it has a more specific application as the English term for the Jewish class called in Hebrew Sopherim (Gr. γραμματεῖς). Both the Hebrew and the Greek word are used to denote something equivalent to secretary of state or town-clerk in general; and through the influence of these two words, the name of the Jewish nation conceived as a theocracy, both words denote in particular one learned in Scripture. Jeremiah (for example) knew of Scribes who made the law of the Lord falsehood (vi. 8), just as he knew of false prophets and profane priests (xxix.). The function of writing belongs rather to the scribe or secretary in general than to the specifically Jewish scribe, whose primary business was not only to read the Hebrew text but also to interpret the existing revelation of God's will, just as the town-clerk at Athens read public documents to the assembly (Thuc. v. 10). So Ezra, the most famous of the early
Scribes, is referred to as "the scribe of the commandments of the Lord and of his statutes to Israel" (Ezra vii. 11), and again as "a ready scribe in the law of Moses which the Lord, the God of Israel, had given." As a Scribe he read the Law to the congregation of the children of Israel and the Levites recited a paraphrase to enable them to understand it (Nehemiah viii.).

But even Jewish scribes were not only readers (as the old Greek version of 1 Esdras calls Ezra) but writers. Jeremiah (viii. 8) had a feud with the Scribes of his day, who wrote what they thought necessary as a compendium or supplement of the Law; but ben Sira, a Scribe himself, left an order or name of Scribe—which is reckoned Apocryphal, indeed, but is on its merits worthy to be "read for example of life and instruction of manners" (Thirty-Nine Articles of Religion, vi.; following Jerome). The book contains the Scribes' ideal (xxxviii. 24—xxix. 11) as well as a typical performance. To be a Scribe requires a man's whole life; a ploughman (for example) has not leisure enough to acquire such wisdom—and here it is well to notice that experience taught the Jews the necessity of teaching all their children some handicraft, even if they were to be Scribes. But a Scribe must devote himself to the study of the law, the wisdom of the fathers, and the sages. Thought the Scribes the most learned of the people, they had to strive to live the oral tradition which will teach him to unlock its secrets. He must wander through the lands of the nations and explore things good and evil among men. So trained he will stand beside the rulers of his people because the law covers all the departments of their life. And he may be inspired to speak or write the wisdom he has gained. Ben Sira's grandson (natural or spiritual) in the preface to the Greek version of this collection of such wisdom speaks of him as having been led forward to write it as an aid to the progressive fulfillment of God's law.

Such were the Scribes of the Jews, an order of learned and precise theologians who practised applied theology, a succession of religious teachers and thinkers controlled in their speculations by their oral tradition to some extent and always by the principles of the law and the other scriptures so far as they accepted them and regarded them as consistent with the teaching of Moses. Their general aim was progress in knowledge of God's will, but apart from fundamental principles there were no tests or formulae to which their teaching must conform. Necessarily they differed from one another even in the same generation according to their different temperaments and their different experiences, especially of foreign lands which accumulated and tended to crystallize into schools, or sects, or parties. They had to strive to meet themselves to different needs.

In the time of Antiochus Epiphanes (for example) they had to face the problem, Was the law of the Sabbath to be broken, or was the whole nation to perish and leave none to keep the rest of the law and that part in happier days? A company of them decided with a unanimity rare in the history of the order that the Sabbath must be broken (1 Macc. ii. 40—42). Later these Hasidaeans deserted the Maccabean rebels, when some relief had been effected on the coming of a priest of the seed of Aaron (1 Macc. vii. 12—10). Their massacre, like the murders which led to the suspension of the Sabbath law, was another fact to be assimilated for the guidance of posterity, and, as Scribes always did, they found and cited the prophecy which was thus fulfilled (Ps. lxxxix. 2, 3; 1 Macc. vii. 17).

Later they are represented as falling generally into two classes, the Pharisees and the Sadducees, for it is obvious that the Sadducees needed doctors of the law to answer the Scribes of the Pharisees as long as they could, and as long as they dared to hold out against the Pharisaic tradition, backed as it was by the popularity of the Pharisees. But it must not be supposed that the Sadducees held all held identical views or insisted upon all points in the tradition; the prophecy of the written law, and the power to receive the oral tradition which will teach him to unlock its secrets, was as of equal importance. The Sadducean position was probably more definite and more commonly held by individual Sadducees because it was mainly based on negations. The rivals may be compared roughly to theists and atheists of the present day as far as their relative solidarity is concerned. As an example of the broad and conspicuous divergences among the Pharisees it is enough to point to the Zealots; they had isolated precursors before the final coalition of the Pharisees, who thought that the time had come for the sword of Gideon as well as the sword of the Lord, with others who seemed to Josephus to love the bloodshed for its own sake. And the Talmud speaks of the Pairs of Scribes—e.g. Hillel and Shammai—as contending with one another.

In the Gospel according to St John, which is wholly, and the Gospel of St Luke, which is partially in touch with the life of the time of our Lord, the different receptions which different Scribes accorded to the new teachers is clearly recognized. St Paul was of course a Scribe, and helped St Luke, it may fairly be supposed, to resist Christian prejudice against the whole order—the name of Scribe—without any discrimination in favour of such men as Nathaniel, Nicodemus and Gamaliel. The Gospel associated with the name of St Matthew has at any rate something of the intolerance with which a tax-gatherer might well regard those of the Pharisees (i.e. the Zealots, to use the term handed down) who condemned them as breakers of God's law. But in respect of its wholesale denunciations of "Scribes and Pharisees, hypocrites," it must be said that there were many Scribes and Pharisees who were not hypocrites, and were therefore entitled to say, "Let the gallèd jade wince, our withers are unwrung." It appears that the parable of the Pharisee and the Publican ended originally with a question which went "Is it not justified?"—the Pharisee who thanked God because he had been saved from the grosser sins, or the Publican who recognized his calling was in itself sinful, and without venturing to pass beyond the Court of the Gentiles whom he served—without even promising to abandon their service—prayed for mercy to the God whom he feared? The official text of St Luke has answered the question in one way: Christian practice is, on the whole, in favour of the Pharisees.

Other views of the ancient Scribes are too notorious to need statement here. Broadly speaking they have no connexion with the real evidence, because they rest upon the denunciations of the First Gospel. If it is necessary to begin historical investigation at the wrong end, it is advisable to take into account the whole evidence available. The Scribes of the 1st century A.D. preserved Judaism in spite of the destruction of the Temple, and this fact is enough to refute the view too commonly taken of them by Christians in spite of St Luke and St John. The common view is as reasonable and just as an account of the Prophets based on Jeremiah's denunciations would be—or an estimate of the Church which consisted of summary accounts of its criminous clerks.

See Schürer's History of the Jewish People, with full authorities.

SCRAM, a light open texture, usually made of cotton or flax. It is used in bookbinding, upholstery and other industries. It is also used as a backing to strengthen paper, as in maps and packing paper. Sometimes jute scrim are made for the latter purpose, and the whole made impervious to moisture by the addition of some waterproof solution. Certain varieties of jute scrim or nets are used for supporting the branches of fruit trees, and for preventing birds from damaging the fruit.

SCRIP, properly any written document; the word is a corruption of "script" (Lat. scribere, to write), possibly from an assimilation with "scrip," a pilgrim's bag or wallet, which is borrowed from the Scandinavian (cf. Nor. streppa, knapsack), and is ultimately cognate with "scrap," "shred." In commercial usage, "scrip" is a document or certificate issued by a public company when instalments upon its shares are payable at different dates, or the whole amount to be paid has not been called up. Such a document entitles the person named to be treated as the allotee of the shares mentioned; it is transferable, and entitles the allotee on payment of all the calls to a share certificate. Scrip requires a penny stamp impressed upon it. The word is frequently loosely used for the share certificates or shares collectively.

SCROFULA (Lat. for "little'sow"), or STRUMA, the general names formerly given to the disease now termed tuberculosi (p.n.)—"scrofulous," "strumous" and "tuberculous" being nearly interchangeable. The particular characters associated with "scrofula" have, therefore, varied at different periods.
when the real nature of the disease was misunderstood; but essentially what was meant was tuberculosis of the bones and lymphatic glands, with its attendant symptoms, and it is in this sense that the word survives. The old English popular name was "king's evil," so called from the belief that the sovereign's touch could effect a cure. This superstition can be traced back to the time of Edward the Confessor in England, and to a much earlier period in France. Samuel Johnson was touched by Queen Anne in 1712 and may have been a beneficiary of royalty was exercised by Prince Charles Edward in 1745.

SCROGGS, SIR WILLIAM (c. 1623-1688), lord chief justice of England, was the son of a butcher of sufficient means to give his son a university education. Scrogs went to Oriel College, and later to Pembroke College, Oxford, where he graduated in 1640, having acquired a fair knowledge of the classics. There is some evidence that he fought on the royalist side during the Civil War. In 1653 he was called to the bar, and soon gained a good practice in the courts. He was appointed a judge of the Court of Common Pleas in 1676, and two years later was promoted to be lord chief justice, his advancement being due to his readiness to degrade the administration of justice to serve the purposes of the court. He was a man of debauched life and coarse and violent manners; and these qualities were conspicuous in his demeanour on the bench. As lord chief justice Scrogs presided at the trial of the persons denounced by Titus Oates for complicity in the "popish plot," and he treated these prisoners with characteristic violence and brutality, overwhelming them with indecent sarcasm and abuse while on their trial, and taunting them with savage mockery when sentencing them to death. Some may at first have been a sincere belief in the existence of a plot; if so he showed himself not less gullible than the ignorant multitude out of doors; at all events he did nothing to test the credibility of such perfidious witnesses as Oates, Bedloe and Dangerfield. At the trial in February 1679 of the prisoners accused of the murder of Sir Edmund Godfrey he gave a characteristic exhibition of his methods, indulging in a vituperative tirade against the Roman Catholic religion, and loudly proclaiming his satisfaction in the guilt of the accused. It was only when, in July of the same year, Oates's accusation against the queen's physician, Sir George Wakeman, appeared likely to involve the queen herself, that the implications of the plot, that Scrogs began to think matters were going too far; he was probably also influenced by the discovery that the court regarded the plot with discredit and disfavour, and that the country party led by the Shaftesbury had less influence than he had supposed with the king. The chief justice on this occasion threw doubt on the trustworthiness of Bedloe and Oates, and warned the jury to be careful in accepting their evidence. This change of front inflamed public opinion against Scrogs, for the popular belief in the plot was still undiminished. Scrogs, however, was no less violent than before against Catholic priests who came before him for trial, as he showed when he sentenced Andrew Bromwich to death at Stafford in the summer of 1679; but his proposing the duke of York's health at the lord mayor's dinner a few months later in the presence of Shaftesbury indicated his determination not to support the Exclusionists against the known wishes of the king. Acting in the assurance of popular sympathy, Oates and Bedloe now arranged the chief justice before the privy council for having discredited their evidence and misdirected the jury in the Wakeman case, accusing him at the same time of several other misdemeanours on the bench, including a habit of extorting money from the poor. A jury of peers was therefore summoned, and on 16th December 1680 the case was argued before the council and Scrogs was acquitted. At the trials of Elizabeth Cellier and of Lord Castlemaine in June of the same year, both of whom were acquitted, he discredited Dangerfield's evidence, and on the former occasion committed the witness to prison. In the same month he discharged the grand jury of Middlesex before the end of term in order to save the duke of York from indictment as a popish recusant, a proceeding which the House of Commons declared to be illegal, and which was made an article in the impeachment of Scrogs in January 1681. The dissolution of parliament put an end to the impeachment, but in April Scrogs was removed from the bench with a pension; he died in London on the 27th of October 1683.

Scrogs was perhaps the worst of the judges who disgraced the English bench at a period when it had sunk to the lowest degradation; and although his infamy is less notorious than that of Jeffreys, his character exhibited fewer redeeming features. Scrogs was the author of a work on the Practice of Law (London and Oxford, 1702), and he edited reports of the state trials over which he presided. He was the subject of many contemporary satires.

SCROLL, a strip or roll of paper, parchment, &c. The word in Mid. Eng. was scrow, and came from Fr. escrow, modern tèrou; the French form is preserved in the legal term "escrow" (see Deed); the French diminutive escrouèl gave the English form "scroll." The Fr. escrou is of Teutonic origin and is connected with "shred," "shard," and "sherd;" and meant a "shred" of paper. The term is sometimes given in architecture to the line of masonry which is formed by the joints in a wall or the line where the end of the ribs of a vault or arch joins the wall. A "scroll" is also the stylish railing of a staircase, and also to the wave-like decorations of Roman red glazed pottery, and more particularly in Samian ware.

SCROPE, the name of an old English family of Norman origin. Sir William le Scrope, of Bolton, in Wensleydale, Yorkshire, had two sons, HENRY (d. 1336) and GEOFFREY (d. 1340), both of whom were in succession chief justice of the king's bench and prominent supporters of the court in the reign of Edward II. Henry was father of RICHARD LE SCROPE, 1st Baron Scrope of Bolton (c. 1327-1403), chancellor of England, an active adherent of John of Gaunt. Having been knight of the shire of Yorkshire in the parliament of 1364, he was summoned to the upper house as a baron by writ in 1371, when he was made treasurer and keeper of the great seal. In 1378 Lord Scrope became chancellor, in which office he attempted to curb the extravagance of Richard II., an offence for which he was deprived of his office in 1382. Scrope engaged in several disputes with regard to his armorial bearings, the most celebrated of which was with Sir Richard Gresvener as to his right to the shield blazoned "Azure, a bend or," which a court of chivalry decided in his favour after a controversy extending over four years. Both as a soldier and a statesman Lord Scrope was a man of high attainments, his integrity and prudence being conspicuous. His eldest son WILLIAM (c. 1350-1390) was created earl of Wiltshire in 1397 by Richard II., of whose evil government he was an active supporter. Wiltshire bought the sovereignty of the Isle of Man from the earl of Salisbury. In 1398 he became treasurer of England. His execution at Bristol was one of the first acts of Henry IV., and the irregular sentence of an improvised court was confirmed by that monarch's first parliament. Wiltshire's father, Lord Scrope, and his other sons were not included in the list of nobles but received full patronage from Henry V. Scrope, who was the builder of Bolton Castle, his principal residence, died in 1403. He was succeeded in the barony by his second son, Roger, whose descendants held it till 1630. HENRY, 9th Baron Scrope of Bolton (1534-1592), was governor of Carlisle in the time of Elizabeth, and as such took charge of Mary Queen of Scots when she crossed the border in 1568; and he took her to Bolton Castle, where she remained till January 1569. He was grandfather of Emmanuel Scrope, 11th Baron (1584-1639), who was created earl of Sunderland in 1627; on his death without legitimate issue in 1650 the earldom became extinct, and
the immense estates of the Scropes of Bolton were divided among his illegitimate children, the chief portion passing by marriage to the marquis of Winchester, who was created duke of Bolton in 1689; to the Earl Rivers; and to John Grubham Howe, ancestor of the earls of Howe. The barony of Scrope of Bolton seems then to have become dormant; but the title might, it would appear, be claimed through the female line by the representative of Charles Jones (d. 1840) of Caton, Lancashire, F.R.S. Scrope, third son of the 1st Baron Scrope of Bolton, was descended the Scropes of Castle Combe, Wiltshire, the last of whom was William Scrope (1772-1852), an artist and author, who was an intimate friend of Sir Walter Scott. His daughter married George Poulett Thompson (1797-1876), an eminent geologist and prolific political writer, who took the name of Scrope, and who after his wife's death sold Castle Combe, of which he wrote a history. Probably from the same branch of the family was descended Adrian Scrope, or Scroope (1601-1660), who was prominent on the parliamentarian side in the Civil War, and one of the signatories of Charles I's death warrant.

Sir GEORGE JULIUS POULETT (1797-1870), English geologist and political economist, was born on the 10th of March 1797, the second son of J. Poulett Thompson of Waverley Abbey, Surrey. He was educated at Harrow, and for a short time at Pembroke College, Oxford, but in 1816 he entered St John's College, Cambridge, graduated B.A. in 1821, and through the influence of E. D. Clarke and Sedgwick became interested in mineralogy and geology. During the winter of 1816-1817 he was at Naples, and was so keenly interested in Vesuvius that he renewed his studies of the volcano in 1818; and in the following year visited Etna and the Lipari Islands. In 1821 he married the daughter and heiress of William Scrope of Castle Combe, Wiltshire, and assumed her name; and he entered parliament in 1833 as M.P. for Stratford, retaining his seat until 1868. Meanwhile he began to study the volcanic regions of Central France in 1821, and visited the Eifel district in 1833. In 1825 he published Considerations on Volcanos, leading to the establishment of a new theory of the Earth, and in the following year was elected F.R.S. This earlier work was subsequently amplified and issued under the title of Volcanos (1862): an authoritative text-book of which a second edition was published ten years later. In 1827 he issued his classic Memoir on the Geology of Central France, including the Volcanic formations of Auvergne, the Velay and the Vivarais, a quarto volume illustrated by maps and plates. The substance of this was reproduced in a revised and somewhat more popular form in The Geology and extinct Volcanos of Central France (1838). Scrope was awarded the Wollaston Medal by the Geological Society in 1857. Among his other works was the History of the Manor and Ancient

Barony of Castle Combe (printed for private circulation, 1852). He died at Fairlawn near Cobham in Surrey on the 10th of January 1876.

Biography (with portrait) in Geol. Mag. for May 1870.

SCROPHULARIACEAE, in botany, a natural order of seed-plants belonging to the sympetalous section of Dicotyledons, and a member of the series Tubiflorae. It is a cosmopolitan order containing about 180 genera with about 2000 species; the majority occur in temperate regions, the numbers diminishing rapidly towards the tropics and colder regions. About 30% of the species are annual herbs, such as eyebright (Euphrasia officinalis), cow-wheat (Melampyrum), and species of Veronica;

more than 60% are biennial or generally perennial herbs and undershrubs, such as species of Veronica, mullein (Verbascum), foxglove (Digitalis; fig. 1), &c., while shrubs and trees are rare; Pulmonaria, native of the mountains of Japan, a tree with large leaves and handsome panicles of violet flowers, is grown in European gardens.

The stem is sometimes prostrate and creeping, as in ivy-leaved toad-flax (Linaria Cymbalaria) and some of the native British Veronica, but generally erect as in foxglove, figwort, mullein, &c.; a few are climbers as Rhododendron and Monardas. The South African genera Hyobanche and Harveys are parasites almost devoid of chlorophyll with scale-like leaves; and many genera are semiparasitic, having green leaves, but attaching themselves by root-suckers to roots of grass, &c., from which they derive part of their nourishment; such are Euphrasia, Rhinanthus, Pedicularis, &c. A few

Fig. 1—Foxglove (Digitalis purpurea) 
1. Corolla cut open showing the four stamens, rather more than 
2. Unripe fruit cut lengthwise, showing the thick axial placenta bearing numerous small seeds.
3. Ripe capsule split open.
genera are aquatic, e.g. Ambulia (old world tropics), and have much divided submerged leaves and entire aerial leaves. The leaf-arrangement varies; the leaves are opposite in the lower and the upper alternate as in Antirrhinum (snapdragon), or all are opposite (Mimulus), or whorled (some Veronica species). All varieties of leaf-arrangement are found in the one genus Veronica (q.v.), in the New Zealand species of which the leaves are small and appressed to the stem. The flowers are solitary in the leaf-axils, as in Mimulus, species of Linaria, &c., or form spikes or racemes which are terminal as in foxglove, species of Veronica, &c., or axillary as in Veroncia (Gipsy-candles). Cymes and paniculoes also occur, as in Verbascum, consisting of dichasia arranged in spikes, racemes or panicles. The flowers are hermaphrodite, hypogynous and zygomorphic in the median plane of the flower. There may be six, or less, sepals joined below and persisting in the fruiting stage, five petals unites to form a corolla of very various shape, generally four stamens, the fifth (posterior) being suppressed or reduced to a rudiment, while an anterior pair are long and slender, the posterior, and two generally equal carpels in the median plane forming a two-celled ovary containing numerous anatropous ovaules on a thick axile placentae, and bearing a simple or bilobed style (fig. 2).

When a terminal flower is present it becomes regular as in toad-flax, where radial symmetry is produced by development of a spur to each petal—such flowers are termed petalce; all the flowers in a spike are sometimes petalce. In Euphrasia and many species of Veronica the posterior sepal is suppressed, and in Calceolaria the anterior petals are completely united. The form of the corolla shows great variety, depending on the length and breadth of the tube—which in Veronica is almost obsolete, while in foxglove it is large and almost bell-shaped—and the development of the limbs, which are sometimes united in Veronica, small and almost erect in figwort, or form a pair of closed lips as in Linaria and Antirrhinum. In Linaria the anterior petal is spurred; in Calceolaria a very short tube is succeeded by a two-lipped limb, a smaller upper lip representing the two posterior petals and a larger, often very long, lower lip representing the three anterior petals. In Verbascum the five segments are almost equal, forming a nearly regular corolla; in Veronica the two posterior petals have united and the corolla is four-lobed. The approach to regularity in the corolla in Verbascum is associated with the presence of five fertile stamens, but the three posterior are generally larger than the two anterior. In Veronica, Calceolaria and other genera only two stamens are present. The authors generally open itinerally by a longitudinal slit; their form shows great variety. These differences in the form of the corolla, the position and length of the stamens and the form of the anthers, are associated with their pollination by insects which probe the tube for nectar which is secreted by a disk surrounding the base of the ovary or by specific nectaries below it. Verbascum and Veronica with a short-tubed corolla represent an open type of corolla or a closed nectary, the two posterior petals and a larger, very often long, lower lip representing the three anterior petals.

Scrophulariaceae are closely allied to Solanaceae (q.v.), from which they are distinguished by the median position of the carpels, and generally by the zygomorphic flower; Verbascum and its allies, in which the flower approaches regularity, form a connecting link. An anatomical distinction is found in the arrangement of the wood and bast in the stem, which is collateral, not bicollateral as in Solanaceae.

**SCRUB-BIRD**—The name of an Australian genus, one of the most curious ornithological types of the many furnished by that country. The first examples were procured between Perth and Augusta in West Australia, and were described by J. Gould in the Zoological Society's Proceedings for 1844 (pp. 1, 2) as forming a new genus and species under the name of Atrichornis clamosa, the great peculiarity observed by that naturalist being the absence of any bristles around the gape, in which respect alone it seemed to differ from the already known genus Sphenura. Later, however, it was given its modern name Atrichornis clamosa, and on account of the discovery of its peculiar sternum (made by A. Newton) it was removed from Oscine division of the Passeres, and the family Atrichornithidae in the sub-oscine division of Passeres was made for the genus, the nearest ally being the lyre-bird (q.v.), now placed in the family Menuridae. Both the known species of scrub-bird are about the size of a small thrush—A. clamosa being the larger of the two. This species is brown above, each feather barred with a darker shade; the throat and belly are reddish white, and there is a large black patch on the breast; while the flanks are brown and the lower tail-coverts rufous. A. rufescens of New South Wales has the white and black of the fore-parts replaced by brown, barred much as is the upper plumage. Both species inhabit the thickest "scrub" or brushwood forest; but little has been ascertained as to their mode of life except that the males are noisy, imitative of the notes of other birds, and given to violent gesticulations. The nest and eggs seem never to have been found, and indeed no example of the female of either species is known to have been procured, whence that sex may be inferred to escape observation by its inconspicuous appearance and retiring habits.

**(A.N.)**

**SCRUPLE**, a term used in the two senses of (1) perplexity, doubt, reluctance or hesitation, especially the moral doubt arising from the difficulties of conscience; (2) a unit of weight, 1/4 of the ounce in apothecaries' weight, = 1 of a dram, 20 grains (1.250 grammes). The word is an adaptation of Fr. scruple, Lat. scrupulus, scrupulum, primarily a small sharp stone; also used in both the English meanings. dim. of scrupus, a rough stone, figurally unseasiness of mind, probably to be connected with the root skar, to cut, cf. Gr. σκύρος, stone-chippings, σκόπων, a razor.
SCRUTIN DE LISTE—SCULLERY

SCRUTIN DE LISTE (Fr. scrutin, voting by ballot, and liste, a list), a system of election of national representatives by which the electors of a department vote for all the deputies to be elected in that department (compare the "general ticket" in the United States). It is distinguished from the scrutin d'arrondissement, under which the electors in each arrondissement vote only for the deputy to be elected in it. See REPRES.

SCRUTINY (Fr. scrutin, late Lat. scrutinium, from scrutari, to search or examine thoroughly), careful examination or inquiry. The word is specifically applied in the early church to the examination of the catechumens or those under instruction in the faith. They were taught the creed and the Lord's Prayer, examined therein, and exorcized prior to baptism. The days of scrutiny varied at different periods from three to seven. From about the beginning of the 12th century, it became usual to baptize infants soon after their birth instead of at stated times (Easter and Pentecost), the ceremony of scrutiny was incorporated with that of the actual baptism. Scrutiny is also a term applied to a method of electing a pope in the Roman Catholic church, in contradistinction to two other methods, admission and accession. (See Conclave.) In the law of elections, scrutiny in the careful examination of votes cast after the unsuccessful candidate has lodged a petition claiming the seat, and alleging that he has the majority of legal votes. Each vote is dealt with separately, notice being given beforehand by one party to the other of the votes objected to and the grounds of objection.

SCUDERY, the name of a family said to have been of noble Italian origin and to have transferred itself to Provence, but only known by the singular brother and sister who represented it during the 17th century.

GEORGES DE SCUDÉRY (1600—1667), the elder of the pair, was born at Havre, whither his father had moved from Provence, on the 22nd of August 1601. He served in the army for some time, and, though in the vein of gascogne which was almost peculiar to him he no doubt exaggerated his services, there seems little doubt that he was a stout soldier. But he conceived a fancy for literature before he was thirty, and during the whole of the middle of the century he was one of the most characteristic figures of Paris. He gained the favour of Richelieu by his opposition to Corneille. He wrote a letter to the Academy criticizing the Cid, and his play, L'Amour tyranne (1640), was patronized by the cardinal in opposition to Corneille. Possibly these circumstances had something to do with his appointment as governor of the fortress of Notre-Dame de la Garde, near Marseilles in 1643, and in 1650 he was elected to the Academy. During the troubles of the Fronde he was exiled to Normandy, where he made his fortune by a rich marriage. He was an author of pastoral, novels, such as Les Romains, ou la domestically. His lengthy novels, such as Les Romains, ou la Scullery, a back-kitchen, the place where dishes, plates, kettles, etc., are washed and cleaned, and the rough work connected with the domestic service of a house is performed. The Med.

Ibrahim, ou l'Illustre Bassa (4 vols. 1641), Almahide, ou l'esclave reine (8 vols. 1661—1663) were the delight of all Europe, including persons of the wit and sense of Madame de Sévigné. But neither in conception nor in execution will they bear criticism as wholes. With classical or Oriental personages for nominal heroes and heroines, the whole language and action are taken from the fashionable idea of the time, and the personages can be identified either really or colourlessly with Madame de Scudéry's contemporaries. In Clidie, Herminius represents Paul Pellisson; Scarius and Lyriane were Paul Scarron and his wife (afterwards Mme de Maintenon); and in the description of Sapho in vol. x. of Le Grand Cypre the author paints herself. It is in Clidie that the famous Carte de Tendre appeared, a description of an Arcadia, where the river of Inclination waters the villages of Billet Doux, Petits Soins and so forth. The interminable length of the stories is made out by endless conversations and, as far as incidents go, chiefly by successive abductions of the heroines, conceived and related in the most decorous spirit, for Madeleine de Scudéry is nothing if not decorous. Nevertheless, although the books can hardly now be read through, it is still possible to perceive their attraction for a period which certainly did not lack wit. In that early day of the novel popularity did not repel. "Sapho" had really studied mankind in her contemporaries and knew how to analyse and describe their characters with fidelity and point. Moreover her novels had the interest always attaching to the roman à clef. She was a real mistress of conversation, a thing quite new to the age as far as literature was concerned, and the conversational parts are much admired. She had a distinct vocation as a pedagogue, and is compared by Sainte-Beuve to Mme de Genlis. She could moralize—a favourite employment of the time—with sense and propriety. Though she was incapable of the exquisite prose of Mme de Sévigné and some other of her contemporaries, her purely literary merits were considerable. Madeleine survived her brother more than thirty years, and in her later days published numerous volumes of conversations, to a great extent extracted from her novels, thus forming a kind of anthology of her work. She outlived her vogue to some extent, but retained a circle of friends to whom she was always the "incomparable Sapho." She died in Paris on the 2nd of June 1707. Her Life and Correspondence were published at Paris by MM. Rathy and Boutron in 1873. An amusing sketch of her is to be found in vol. iv. of Sainte-Beuve's Œuvres de la famille. Georges de Scudéry's Récits de Petits Théâtres Griboux. See also V. Cousin, La Société française au XVIIe siècle, vol. ii.

SCULL (the same word as "skull," cf. Swed. skäld, basin, huvud-skäld, skull of the head), a light oar with blade concave rather than the ordinary racing oar and with shorter helm, thus allowing the user to hold one in each hand. Sculling is therefore the propulsion of a boat by one man with a pair of sculls. The word is also applied to the propulsion of a boat by one scull worked over the stern, the blade being swept through the water from side to side, turning diagonally at each stroke; the sculler usually stands. The principles of sculling with a pair of sculls are the same as those of rowing (q.v.). For the type of boat used in racing see BOAT. The Wingfield Sculls, a race which forms the English Amateur championship, was instituted in 1836. It is rowed from Putney to Mortlake. The Diamond Challenge Sculls, instituted in 1844, are rowed for at Henley Regatta. The earliest professional championship sculling race was rowed on the Thames in 1837. Since 1876, when an Australian (E. Trickett, of Sydney) beat J. H. Sadler, the professional championship of the world has been held by Australians or Canadians; the principal champions have been E. Hanlan (Toronto), 1880—1884, W. Beach (New South Wales), 1884—1887; other names are H. E. Searle, J. Stanbury, G. Towns and R. Arnott (New Zealand). Most of the races have been rowed on the Parramatta river. In August 1910 the race was rowed on the Zambezi between E. Barry of England and Arnott, the latter winning.

SCULLERY, a back-kitchen, the place where dishes, plates, kettles, etc., are washed and cleaned, and the rough work connected with the domestic service of a house is performed. The Med.
SCULPTURE

Lat. scultorius, keeper of dishes and plates (scutella), became in O. Fr. escueiller or scuiller, whence in English sculler, squiler, &c. A “sergeant-squilloure” is found amongst the officials of the royal household; and the *Pomptorium parvulum*, dating about 1400, glosses *lixa*, a butler or camp-cook, by “squillare, dysche-wescheare,” “Scuillon,” a kitchen-wench, has been naturally connected with scullery, but is derived from O. Fr. escuillon, dish-cloth, cf. Span. escuillón, spring for a gun, ultimately from Lat. *scope*, birch tree, *scoopae*, broom of birch twigs.

**SCULPTURE** (Lat. *sculptura*, from *sculpere*, to carve, cognate with Gr. γυφέω), a general term for the plastic art of carving, especially in stone and marble, but also in such materials as wood (see *Wood-carving*), ivory (see *Ivory*), metal (see *Metal-work*) and gems (see *Graal*).

The production of bronze statues by the *cre perdue (anglce*, “lost wax”) process is described in the article *Metal-work*; this method was adopted by a number of sculptors in various countries where fine casting is appreciated, and where naturalistic rendering is desired. There are signs, however, of its being ousted for a certain class of handling by the “galvanoplastie” method—a system of copper deposition by an electrical process—whereby “going over” the work after it has been reproduced in metal is avoided.

For the execution of a marble statue the sculptor first models a finished preliminary sketch on a small scale in clay or wax. He then, in the case of a life-size or colossal statue, has the model cast in plaster, and from the latter a full-sized pattern is cut, the legs and arms, fixed in the pose of the future figure. This is called the “armature.” It is placed on a stand, called a *chassis*, with a revolving top, so that the sculptor can easily turn the whole model round and thus work with the light on any side of it. Over this iron skeleton well-tempered modelling-clay is laid and is modelled into shape by the help of wood and bone tools; without the sustaining assistance of the ironwork a soft clay figure, if more than a few inches high, would collapse with its own weight and squeeze the lower part out of shape. While the modelling is in progress it is necessary to keep the clay moist and plastic by sputtering water on to it with a sort of garden syringe capped with a finely perforated rose. When the sculptor is not at work the whole figure is kept wrapped up in damp cloths. A modern improvement is to mix the modelling-clay, not with water, but with starch and glycemia; this, while keeping the clay soft and plastic, has the great advantage of not being wet, and so the sculptor avoids the chill and consequent risk of rheumatism which follow from a constant manipulation of wet clay. This method, however, has not been very extensively adopted. When the clay model is finished it is cast in plaster. A “piece-mould” is formed by applying patches of wet plaster of Paris all over the clay statue in such a way that they can be removed piecemeal from the model, and then be fitted together again, forming a complete hollow mould. The inside is then rinsed out with plaster and water mixed to the consistency of cream till a skin of plaster is formed all over the inner surface of the mould, and thus a hollow cast is made of the whole figure. The “piece-mould” is then taken to pieces and the casting set free. If skillfully done by a good *formatore* or moulder the plaster cast is a perfect facsimile of the original clay, very slightly disfigured by a series of lines showing the joints in the piece-mould, the sections of which cannot be made to fit together with absolute precision. Many sculptors have their clay model cast in plaster before the modelling is quite finished, as they prefer to put the finishing touches on the plaster cast—good plaster being a very easy and pleasant substance to work on.

The next stage is to copy the plaster model in marble. The model is set on a large block called a “scale stone,” while the marble for the future statue is set upon another similar block. The plaster model is then covered with a series of marks, placed on all the most salient parts of the body, and the front of each “scale stone” is covered with another series of points, exactly the same on both stones. An ingenious instrument called a pointing-machine, which has arms ending in metal points or “needles” that move in ball-socket joints, is placed between the model and the marble block. Two of its arms are then applied to the model, one touching a point on the scale stone while the other touches a mark on the figure. The arms are fixed by screws in this position, and the machine is then revolved to the marble block, and set with its lower needle touching the corresponding point on the scale stone. The upper needle, which is arranged to slide back on its own axis, cannot reach the corresponding point on the statue because the marble block is in the way; a hole is then drilled into the block at the place and in the direction indicated by the needle, till the latter can slide forward so as to reach a point sunk in the marble block exactly corresponding to the point it touched on the plaster mould. This process is repeated both on the model and on the marble block till the latter is drilled with a number of holes, the bottoms of which correspond in position to the number of marks made on the surface of the model. A comparatively unskilled *scarpellino* or “chisel-man” then sets to work and cuts away the marble till he has reached the bottoms of all the holes, beyond which he must not cut. The statue is thus roughly blocked out, and a more skilled *scarpellino* begins the final work. Parly by eye and partly with the constant reference to the pointing-machine, which is used to give any required measurements, the workman almost completes the marble statue, leaving only the finishing touches to be done by the sculptor. In the opinion of many artists the use of the mechanical pointing-machine is responsible in a great measure for the loss of life and fire in much of modern sculpture.

Among the ancient Greeks and Romans and in the medieval period it was the custom to give the nude parts of a marble statue a considerable degree of polish, which really suggests the somewhat glossy surface of the human skin very much better than the full cold-sugar-like surface with which the marble is left on the marble by most modern sculptors. This high polish still remains in parts of the pedimental figures from the Parthenon, where, at the back, they have been specially protected from the weather. The Hermes of the Vatican Belvidere is a remarkable instance of the preservation of this polish. Michelangelo carried the practice further still, and gave certain parts of some of his statues, such as the Moses, the highest possible polish in order to produce high lights just where he wanted them; the artistic legitimacy of this may perhaps be doubted, and in weak hands it might degenerate would almost be murderous; but, however, much to be desired that modern sculptors should to some extent at least adopt the classical practice, and by a slight but uniform polish remove the disagreeable crystalline grain from all the nude parts of the marble.

A rougher method of obtaining fixed points to measure from was occasionally employed by Michelangelo and earlier sculptors. They immersed the model in a tank of water, the water being gradually allowed to run out, and thus by its sinking level it gave a series of contour lines on any required number of planes. In some cases Michelangelo appears to have cut his statue out of the marble without previously making a model—a marvellous feat of skill.

In modelling bas-reliefs the modern sculptor usually applies the clay to a slab of slate on which the design is sketched; the slate forms the background of the figures, and thus keeps the relief absolutely true to one plane. This method is one of the causes of the dulness and want of spirit so conspicuous in most modern sculptured reliefs. In the best Greek examples there is no absolutely fixed plane surface for the backgrounds. In one place, to gain an effective shadow, the Greek sculptor would cut below the average surface; in another he would leave the ground at a higher plane,

---

1 Moulds made in one or few pieces, from which the cast can only be extracted by destroying the mould, are called “spoil-moulds.” A large number of casts can be made from a “piece-mould,” but only one from a “spoil-mould.”

Sculptor's assistants.

The practice of most modern sculptors is to do very little to the marble with their own hands; some, in fact, have never really learnt how to carve, and thus the finished statue is often very dull and lifeless in comparison with the clay model. Most of the great sculptors of the middle ages left little or nothing to be done by an assistant; Michelangelo especially did the whole of the carving with his own hands, and when beginning on a block of marble attacked it with such vigorous strokes of the hammer that large pieces of marble flew about in every direction. But skill as a carver, though very desirable, is not absolutely necessary for a sculptor. If he casts in bronze by the cire perdue process he may produce the most perfect plastic works without touching anything harder than the modelling-wax. The sculptor in marble, however, must be able to carve a hard substance if he is to do his work well. Under such circumstances, he not only leaves all manipulation of the marble to their workmen, but they also employ men to do their modelling, colloquially termed "ghosts," the supposed sculptor supplying little or nothing but his sketch and his name to the work. The practice, however, is less common nowadays than formerly, owing mainly to one or two exposures which brought the matter sharply before the public. In some cases sculptors of ability who suffer under an excess of popularity are induced to employ aid of this kind on account of their undertaking more work than any one man could possibly accomplish—a state of things which is necessarily very undesirable. Under such circumstances the sculptor's scarpellino, though he may and often does attain the highest skill as a carver and can copy almost anything with wonderful fidelity, seldom develops into an original artist. The popular admiration for pieces of clever trickery in sculpture, such as the carving of the open meshes of a fisherman's net, or a chimney with all link free and movable, or a veil over and half revealing the features of the face, would perhaps be diminished if it were known that such work as this is invariably done, not by the sculptor, but by the scarpellino. Unhappily at the present day there is, especially in England, little appreciation of what it is valuable in medieval sculpture, which in the 13th and 14th centuries was cast by the delicate cire perdue process, and the whole surface of the figure was then thickly gilded. At Limoges in France a large number of sepulchral effigies were produced, especially between the 12th and 13th centuries, and many of these have been omitted. Other effigies from Limoges were imported into England, but no other example now exists in the country.

Medieval methods and materials.

In the modern attempts to reproduce the medieval polychromy with an adequate surface effect, the results of such colouring as in Notre-Dame and the Sainte Chapelle in Paris and many other "restored" churches, especially in France and Germany, are not very promising. On the tomb of Aymer de Valence (d. 1326) at Westminster a good deal of the stamped gesso and coloured decoration is visible on close inspection. One of the cavities of the base retains a fragment of gilded bronze, which, however, has been omitted. The Victoria and Albert Museum possesses a magnificent colossal wood figure of an angel, not English, but Italian work of the 14th century. A large stone statue of about the same date, of French workmanship, in the same museum is a most valuable example of the use of stamped gesso and inlay of painted and glazed foil.
SCULPTURE

5th century is the series of small panel reliefs on the doors of S. Sabina on the Aventine Hill at Rome. There are scenes from Bible history carved in wood, and in them much of the old classic style survives.4

In the 6th century, under the Byzantine influence of Justinian, a new class of decorative sculpture was produced, especially at Ravenna. Subject reliefs do not often occur, but large slabs of marble, forming screens, altars, pulpits and the like, were ornamented in a very skilful and original way with low reliefs of scenes from Christianity and from the lives of the saints. By this time the Christian artist no longer reproduced nature as it had been seen in the past. He was encouraged by the relations with the pagan world to use for Christian purposes the artistic skill and methods practised by the pagan sculptor. He was no mere designer, but the sculptor and craftsman, and the pagan artist's equipment and methods were now used to produce Christian art; the Processional friezes of Constantinople now show some of the finest examples of the art. Such works are not, however, restricted to the capital. The 6th century brought in the use of other media. The Church was now rich enough to adorn itself with mosaics, and the processional friezes of St. Vitale at Ravenna show that this use was already well understood. The 6th century was the beginning of the great period of mosaic art.

Influence of Byzantine art.

The 7th century was the period in which the great mosaicists of Ravenna and Constantinople were at their best. The mosaic of the Emperor Justinian and his Empress Theodora in the Church of S. Vitale at Ravenna is one of the finest works of art ever produced. It shows the influence of the older art, but it is still Byzantine in character. The 8th century was the period of the greatest decline. The art of the East was now dominated by the Empire. The 9th century was the period of the greatest artistic decline. The Invasions of the East by the Moslems led to the destruction of many of the works of art produced in the 8th and 9th centuries. The 10th century, however, saw the beginning of the golden age of Byzantine art. The 11th century was the period of the greatest artistic activity. The 12th century was the period of the greatest artistic decline. The 13th century was the period of the greatest artistic activity. The 14th century was the period of the greatest artistic decline. The 15th century was the period of the greatest artistic activity. The 16th century was the period of the greatest artistic decline.
of Ravenna; while the figures below the Christ are survivals of a still older time, dating back from the best eras of classic art. A river-god is represented as an old man holding an urn, from which a stream issues, and a reclining female figure with an infant and a cornucopia is the old Roman Tellus or Earth-goddess with her ancient attributes.1

While the countries of the north could not altogether resist the rising tide of Byzantinism, in Scandinavia, and to a great extent in England, the autochthonous art was not entirely obliterated. The latter is especially enriched by some Romanesque influences in England, during the Saxon period, when stone buildings were rare and even large cathedrals were built of wood, the plastic arts were mostly confined to the use of gold, silver, and gilt copper. The earliest existing specimens of sculpture in stone are a number of tall churchyard crosses, mostly in the northern provinces and apparently the work of Scandinavian sculptors. One very remarkable example is a tall monolithic cross, cut in sandstone, in the churchyard of Gosforth in Cumberland. It is covered with rudely carved reliefs, small in scale, which are of special interest as a transitional state from the worship of Odin to that of Christ. Some of the old Norse symbols and myths sculptured on it occur modified and altered into a semi-Christian form. Though rich in decorative effect and with a graceful outline, this sculptured cross shows a very primitive state of artistic development, as do the other crosses of this class in Cornwall, Ireland and Scotland, which are mainly ornamented with those ingeniously intricate patterns of interlacing knotwork designed so skilfully by both the early Norse and the Celtic races.2 They belong to a class of art which is not Christian in origin, though it was afterwards largely used for Christian purposes, and so is thoroughly national in style, quite free from the usual widespread Byzantine influence. Of special interest from their early date—probably the 11th century—are two large stone reliefs now in Chichester cathedral, which are traditionally said to have come from the pre-Norman church at Selsey. They are thoroughly Byzantine in style, but evidently the work of some very ignorant sculptor; they represent two scenes in the Raising of Lazarus; the figures are stiff, attenuated and ugly, the pose very awkward, and the drapery of exaggerated Byzantine character, with long thin lines. To represent the eyes, pieces of glass or coloured enamel were inserted; the treatment of the hair in long ropelike twists suggests a metal rather than a stone design.

The Romanesque period in art was essentially one of architectural activity. The spirit of the time did not encourage that individual thought which alone can produce a great development of sculpture and painting. Thus the plastic art of the 11th and 12th centuries, which was still entirely at the service and under the rule of the Church, was strictly confined to conventional symbols, ideas and forms. It is based, not on the study of nature, but on the later Roman reliefs. The treatment of the figures, though often rude and clumsy, and sometimes influenced by Byzantine stiffness, is on the whole dignified, solemn and serious, and bent upon the expression of the typical, and not of the individual. The tympana of the porches, the capitals of columns and the pulpit and choir-screens of the Romanesque churches, and, on a smaller scale, the ivory carvings for book-covers and portable miniature altars, provided the field for the Romanesque sculptors' activity.

In Italy the strong current of hierarchal Byzantinism had never altogether supplanted the antique tradition, though the works based upon the latter, before Niccola Pisano revived for a short while the true spirit of the antique, are of almost barbaric rudeness, like the bronze gates of S. Zeno at Verona, and the stone-carving of The Last Supper on the pulpit of S. Ambrogio, in Milan. The real home of Romanesque sculpture was beyond the Alps, in Germany and France, and much of the work done in Italy during the 12th century was actually due to northern sculptors—as, for example, the very rude sculpture on the façade of S. Andrea at Pistoia, executed about 1185 by Graumons and his brother Adeodatus,3 or the relief by Benedetto Antelami for the cathedral of the year 1178. Unlike the sculpture of the Pisani and later artists, these early figures are thoroughly secondary to the architecture they are designed to decorate; they are evidently the work of men who were architects first and sculptors in a secondary degree. After the 13th century the reverse was usually the case, and, as at the west end of Orvieto cathedral, the sculptured decorations are treated as being of primary importance—not that the Italian sculptor-architect ever allowed his statues or reliefs to weaken or damage their architectural surroundings, and the central provinces of Italy produced very few sculptors. In southern Italy, during the 13th century, there was a school of sculpture resembling that of France, owing probably to the Norman occupation. The pulpit in the cathedral of Ravello, executed by Nicola di Bartolommeo di Foggia in 1272, is an important work of this class; it is enriched with very noble sculpture, especially a large female head crowned with a richly foliated coronet, and combining lifelike vigour with largeness of style in a very remarkable way. The bronze doors at Monreale (by Barisanus of Trani), Pisa and elsewhere are among the chief works of plastic art in Italy during the 13th century. The history of Italian sculpture of the best period is given to a great extent in the separate articles on the Pisani and other Italian artists. Here it suffices to say that sculpture never became as completely subservient to architecture, as it did in the north, and that with Giovanni Pisano the almost classic repose and dignity of his father Niccola's style gave way—probably owing to northern influences—to an increased sense of life and freedom and dramatic expression. Niccola stands at the close of the Romanesque, and Giovanni on the threshold of the Gothic period. During the 13th century Rome and the other Italian cities were the headquarters of sculpture, and it was during this period that the sculptors of ability, almost the only men of note being the Cosmati.

The power acquired by Germany under the Saxon emperors, upon whom had descended the mantle of the Roman Caesars, was the chief reason that led to the great development of Romanesque art in Germany. It is true that, in the 11th century, Byzantine influences stifled the spontaneous nature of the earlier work; but about the end of the 12th century a new free and vital art arose, based upon a better understanding of the antique, and fostered by the rise of feudalism and the prosperity of the cities. Next in importance to the numerous examples of German Romanesque ivory carvings are the works in bronze, in the technique of which the German craftsmen of the pre-Gothic period stand unrivalled. This is seen in the bronze pillar reliefs and other works, notably the bronze gates of Hildesheim Cathedral, produced by Bishop Bernward (d. 1022) after his visit to Rome. Hildesheim, Cologne and the whole of the Rhine provinces were the most active seats of German sculpture, especially in metal, till the 13th century. Many remarkable pieces of bronze sculpture were produced at the end of that period, of which several specimens are in the Louvre. The bronze font of the Baptismal font, figure-subjects in relief of various baptismal scenes from the New Testament, by Lambert Patras of Dinant, cast about 1212, is a work of most wonderful beauty and perfection for its time; other fonts in Osnabrück, by Master Gerhard, and Hildesheim cathedrals are surrounded by spirited reliefs, fine in conception, but inferior in beauty to those on the Liège font. Fine bronze candelabra exist in the abbey church of Combourg and at Aix-la-Chapelle.

1 On early and medieval sculpture in ivory consult Gori, Thesaurus estuarium duphyorum (Florence, 1759); Westwood, Duhyachs of Consul (London, 1868), and his Emhymes du Louvre (Paris, 1871); William Maskell, Ivories in the South Kensington Museum (London, 1872 & 1875); Wieseler, Duhyachs Quinianum zu Pisa (Pisa, 1883); Wenzel, Duhyachs in S. Giovanni Wytsa S. Giovanni Wytsa; Scultpure in Ivory (London, 1856); Alfred Maskell, Ivories (London, 1905), one of the best treatises in the English language; E. Molinier, Les Ivories; Die Elfenbeinbearbeit (Berlin Museum, 1903).

3 The other finest examples of this early class of sculpture exist at Pisa, Parma, Modena and Verona; in most of them the old Byzantine influence is very strong.
the latter of about 1165. Merseburg cathedral has a strange realistic sepulchral figure of Rudolf of Swabia, executed about 1100; and at Magdeburg is a fine effigy, also in bronze, of Bishop Frederick (d. 1152), treated in a more graceful way. The last figure has a peculiarity which is not uncommon in the older bronze reliefs of Germany: the body is treated as a relief, while the head sticks out and is quite detached from the ground in a very awkward way. One of the finest plastic works of this century is the choir screen of Hildesheim cathedral, executed in hard stucco, one rich with gold and colours; on its lower part is a series of large reliefs of saints modelled with almost classical breadth and nobility, with drapery of especial excellence. In the 13th century German sculpture had made considerable artistic progress, but it did not reach the high standard of France. One of the best examples of the transition period from German Romanesque to Gothic is the "golden gate" of Freiburg cathedral, with sculptured figures on the jambs after the French fashion. The statues of the apostles on the nave pillars, and especially one of the Madonna at the east end (1265-1275), possess great beauty and sculpturesque breadth. Of the same period, and kindred in style and feeling, are the reliefs on the eastern choir-screen in Bamberg cathedral.

France. France is comparatively poor in characteristic examples of Romanesque sculpture, as the time of the greatest activity coincides with the beginnings of the Gothic style, so that in many cases, as for instance on the porches of Bourges and Chartres cathedrals, Romanesque and Gothic features occur side by side and make it impossible to establish a clear distinction. The two most important Romanesque monuments of the early 12th century are the sculptures on the porch of the abbey church of Conques, representing the Last Judgment; the somewhat barbaric tympanum of Autun cathedral (c. 1130); and that of the church of Moissac.

During the 12th and 13th centuries the prodigious activity of the cathedral builders of France and their rivalry to outshine each other in the richness of the sculptured decorations, led to the glorious development that culminated in the full flower of Gothic art. The façades of large cathedrals were completely covered with sculptured reliefs and thick-set rows of statues. The whole of the front was frequently one huge composition of statuary, with only sufficient purely architectural work to form a background and frame for the sculptured figures. A west end treated like that of Wells cathedral, which is almost unique in England, is not uncommon in France. Even the shafts of the doorways and other architectural accessories were covered with minute sculptured decoration,—the motives of which were often, especially during the 12th century, obviously derived from the metal-work of shrines and reliquaries studied with rows of jewels. The west façade of Poitiers cathedral is one of the richest examples; it has large surfaces covered with foliated carving and rows of colossal statues, both seated and standing, reaching high up the front of the church. Of the same century (the 12th), but rather later in date, is the very noble sculpture on the three western doors of Chartres cathedral, with fine tympanum reliefs and colossal statues (all once covered with painting and gold) attached to the jamb-shafts of the openings. These latter figures, with their exaggerated height and the long straight folds of their drapery, are designed with great skill to assist and not to break the main upward lines of the doorways. The sculptors have willingly sacrificed the beauty and proportion of each separate statue for the sake of the architecutic effect of the whole façade. The heads, however, are full of nobility, beauty, and even grace, especially those that are softened by the addition of long wavy curls, which give relief to the general stiffness of the form. The sculptured doors of the north and south aisles of Bourges cathedral are fine examples of the end of the 12th century, and so were the west doors of Notre Dame in Paris till they were hopelessly injured by "rebuidal." The early sculpture at Bourges is especially interesting from the existence in many parts of its original coloured decoration.

Romanesque sculpture in England, during the Norman period, was of a very rude sort and generally used for the tympanum reliefs over the doors of churches. Christ in Majesty, the Harrowing of Hell and St George and the Dragon occur very frequently. Reliefs of the zodiacal signs were a common decoration of the richly sculptured arches of the 12th century, and are frequently carved with much power. The later Norman sculptured ornaments are very rich and spirited though the treatment of the human figure is still very weak.1

The best-preserved examples of monumental sculpture of the 12th century are a number of effigies of knights-temples in the round Temple church in London.2 They are laboriously cut in hard Purbeck marble, and much resemble bronze in their treatment; the faces are clumsy, and the whole figures stiff and heavy in modelling; but they are valuable examples of the military costume of the time, the armour being purely chain-mail. Another effigy in the same church cut in stone, effigies in Westminster Abbey modelled and cast by William Torell, a goldsmith and citizen of London, shortly before the year 1300. These are on the tombs of Henry III. and Queen Eleanor (wife of Edward I.), and, though the tomb itself of the former is an Italian work of the Cosmati school, there is no trace of foreign influence in the figures. At this time portrait effigies had not come into general use, and both figures are treated in an ideal way. The crowned head of Henry III., with noble well-modelled features and crisp wavy curls, resembles the conventional royal head on English coins of this and the following century, while the head of Eleanor is of remarkable, almost classic, beauty, and of great interest as showing the ideal type of the 13th century. In both cases the drapery is well conceived in broad sculpturesque folds, graceful and yet simple in treatment. The casting of these figures, which was effected by the cire perdue process, is technically very perfect. The gold employed for the gilding was got from Lucca in the shape of the current florins of that time, which were famed for their purity. Torell was highly paid for this, as well as for two other bronze statues of Queen Eleanor, probably of the same design.

Although the difference between fully developed Gothic sculpture and Romanesque sculpture is almost as clearly marked as the difference between Gothic and Romanesque architecture—

1 In Norway and Denmark during the 11th and 12th centuries carved ornament of the very highest merit was produced, especially the framework round the doors of the wooden churches; these are formed of large pine planks, sculptured in slight relief with dragons and griffins, or sometimes with the heads of the knights-templars, and this is an early master-piece of decorative art, full of the keenest inventive spirit and originality.

2 See Richardson, Monumental Effigies of the Temple Church (London, 1843).
indeed, the evolution of the two arts proceeded in parallel stages—the change from the earlier to the later style is so gradual and almost imperceptible, that it is all but impossible to follow it step by step, and to illustrate it by examples. What distinguishes the Gothic from the Romanesque in sculpture is the striving to achieve individual in the place of typical expression. This striving is as apparent in the more flexible and emotional treatment of the human figure, as it is in the substitution of naturalistic plant and animal forms for the more conventional ornamentation of the earlier centuries. Statuesque architectonic dignity and calmness are replaced by slender grace and soulful expression. The drapery, instead of being arranged in heavy folds, clings to the body and accentuates rather than conceals the form. At the same time, the subjects treated by the Gothic sculptor do not depart to any marked degree from those which fell to the task of the Romanesque workers, though they are brought more within the range of human emotions.

It is only natural that in France, which was the birthplace of Gothic architecture, the sister art of sculpture should have attained its earliest and most striking development. During the 13th century, the imagers, or stone sculptors, worked hand in hand with the great cathedral builders. This century may indeed be called the golden age of Gothic sculpture.

While retaining its dignity and subordination to its architectural setting, the sculpture reached a very high degree of graceful finish and even sensuous beauty. Nothing could surpass the loveliness of the angel statues round the Sainte Chapelle in Paris, and even the earlier work on the facade of Laon cathedral is full of grace and delicacy. Amiens cathedral is especially rich in sculpture of this date, as, for example, the noble and majestic statues of Christ and the Apostles at the west end; the sculpture on the south transept of about 1260-1270, of more developed style, is remarkable for dignity combined with grace. The large row of kings on the west end of Notre Dame at Paris has, like the earlier sculpture, been ruined by “restoration,” which has robbed the statues of both their spirit and their vigour. To the latter years of the 13th century belong the magnificent series of statues and reliefs round the three great western doorways of the same church, among which are no fewer than thirty-four life-sized figures. On the whole, the single statues throughout this period are finer than the reliefs with many figures. Some of the statues of the Virgin and Child are of extraordinary beauty, in spite of their being often treated with a certain mannerism—a curved pose of the body, which appears to have been copied from stucco statuettes, in which the figure followed the curve of the elephant’s tusk. The north transept at Rheims is no less rich: the central statue of Christ is a work of much grace and nobility of form; and some nude figures—for example, that of St Sebastian—show a knowledge of the human body which was very unusual at that early date. Many of these Reims statues, like those by Torell at Westminster, are quite equal to the best work of Nicola Pisano. The abbey church of St Denis possesses the largest collection of French 13th-century monumental effigies, a large number of which, with supposed portraits of the early kings, were made during the rebuilding of the church in 1264; some of them appear to be “archaic” copies of older contemporary statues.

In the 14th century French sculpture began to decline, though much beautiful plastic work was still produced. Some of the reliefs on the choir screen of Notre Dame at Paris belong to this period, as does also much fine sculpture on the transepts of Rouen cathedral and the west end of Lyons. At the end of this century an able sculptor from the Netherlands, Claus Slater (who followed the tradition of the 14th-century school of Tournai, which is marked by the exquisite study of the details of nature and led to the brilliant development of Flemish realism), executed much fine work, especially at Dijon, under the patronage of Philip the Bold, for whose newly founded Carthusian monastery in 1399 he sculptured the great “Moses fountain” in the cloister, with six life-sized statues of prophets in stone, painted and gilt in the usual medieval fashion. Not long before his death in 1411 Slater completed a very magnificent altar tomb for Philip the Bold, now in the museum at Dijon. It is of white marble, surmounted by a group, which contains among sixty small labaster figures representing mourners of all classes adorned with much dramatic power. The recumbent portrait effigy of Philip in his ducal mantle with folded hands is a work of great power and delicacy of treatment.

While in France there was a distinct slackening in building activity in the 14th century, which led to a corresponding decline in sculpture, Germany experienced a reawakening of artistic creative energy and power. That the Gothic style had taken root on German soil in the preceding century, is proved by the fresh, mobile treatment of the statues on the south porch of the east facade of Bamberg cathedral, and even more by the equestrian statue of Conrad III. in the market-place at Bamberg, which supported by a foliated corbel, exhibits startling vigour and originality, and is designed with wonderful largeness of effect, though small in scale. The statues of Henry the Lion and Queen Matilda at Brunswick, of about the same period, are of the highest beauty and dignity of expression. Strassburg cathedral, though sadly damaged by restoration, still possesses a large quantity of the finest statues of the 13th century. One tympanum relief of the Death of the Virgin, surrounded by the sorrowing Apostles, is a work of the very highest beauty, worthy to rank with the best Italian sculpture of even a later period. Of its class nothing can surpass the purely decorative carving at Strassburg, with varied realistic foliage studied from nature, evidently with the keenest interest and enjoyment.

But such works were only isolated manifestations of German artistic genius, until, in the next century, sculpture rose to new and splendid life, though it found expression not so much in the composition of extensive groups, as in the neighbouring France, but in the carving of isolated figures of rare and subtle beauty.

Nuremberg is rich in good sculpture of the 14th century. The church of St Sebal, the Frauenkirche, and the west façade of St Lawrence are lavishly decorated with reliefs and statues, very rich in effect, but showing the germs of that mannerism which grew so strong in Germany during the 15th century. Of special beauty are the statuettes which adorn the “beautiful fountain,” which was formerly erroneously attributed to the probably mythical sculptor Sebal Schonbofer, and is decorated with gold and colour by the painter Rudolf. Of considerable importance are the statues of Christ, the Virgin, and the Apostles on the piers in the choir of Cologne cathedral, which were completed after 1350. They are particularly notable for their admirable polychromatic treatment. The reliefs on the high altar, which are of later date, are wrought in white marble on a background of black marble. Augsburg produced several sculptors of ability about this time; the museum possesses some very noble wooden statues of this school, large in scale and dignified in treatment. On the exterior of the choir of the church of Marienburg castle is a very remarkable colossal figure of the Virgin of about 1340-1350. Like the Hildesheim choir screen, it is made of hard stucco and is decorated with glass mosaics. The equestrian bronze group of St George and the Dragon in the market-place at Prague is excellent in workmanship and full of vigour, though much wanting dignity of style. Another fine work in bronze of about the same date is the effigy of Archbishop Conrad (d. 1261) in Cologne cathedral, executed many years after his death. The portrait appears truthful and the whole figure is noble in style. The military effigies of this time in Germany as elsewhere were almost unavoidable stiff and lifeless from the necessity of representing them in plate.
armour. The ecclesiastical chasuble, in which priestly effigies nearly always appear, is also a thoroughly unsculpturesque form of drapery, both from its awkward shape and its absence of folds. The Günter of Schwarzburg (d. 1349) in Frankfort cathedral is a characteristic example of these sepulchral effigies in slight relief.

In England, much of the fine 13th-century sculpture was used to decorate the façades of churches, though, on the whole, English cathedral architecture did not offer such great opportunities to the imagier as did that of France. A notable exception is Wells cathedral, the west end of which, dating from about the middle of the century, is covered with more than 600 figures in the round or in relief, arranged in tiers, and of varying sizes. The tympana of the doorways are filled with reliefs, and above them stand rows of colossal statues of kings and queens, bishops and knights, and saints both male and female, all treated very skilfully with nobly arranged drapery, and graceful heads designed in a thoroughly architectonic way, with due regard to the main lines of the building they are meant to decorate. In this respect the early medieval sculptor inherited one of the great merits of the Greeks of the best period: his figures or reliefs form an essential part of the design of the building to which they are affixed, and are treated in a subordinate manner to their architectural surroundings—very different from most of the sculpture on modern buildings, which frequently looks as if it had been stuck up as an afterthought, and frequently by its violent and incongruous lines is rather an impermeant excescence than an ornament. Peterborough, Lichfield and Salisbury cathedrals have fine examples of the sculpture of the 13th century: in the chapter-house of the last the spandrels of the walls are filled with sixty reliefs of subjects from Bible history, all treated with much grace and refinement. To the end of the same century belong the celebrated reliefs of angels in the spandrels of the choir arches at Lincoln, carved in a large massive way with great strength of decorative effect. Other fine reliefs of angels, executed about 1260, exist in the transepts of Westminster Abbey; being high from the ground, they are broadly treated without any high finish in the details.

Purely decorative carving in stone reached its highest point of excellence about the middle of the 14th century—rather later, than is, than the best period of figure sculpture. Wood-carving (q.v.), on the other hand, reached its artistic climax a full century later under the influence of the fully developed Perpendicular style.

The most important effigies of the 14th century are those in gilt bronze of Edward III. (d. 1377) and of Richard II. and his queen (made in 1395), all at Westminster. They are all portraiture, but are decidedly inferior to the earlier work of William Torell. The effigies of Richard II. and Anne of Bohemia were the work of Nicolás Broker and Godfroid Prest, goldsmiths citizens of London. Another fine bronze effigy is at Canterbury on the tomb of the Black Prince (d. 1376); though well cast and with carefully modelled armour, it is treated in a somewhat dull and conventional way. The recumbent stone figure of Lady Arundel, with two angels at her head, in Chichester cathedral is remarkable for its calm peaceful pose and the beauty of the drapery. Among the most perfect works of this description is the alabaster tomb of Ralph Nevill, first earl of Westmorland, with figures of himself and his two wives, in Staindrop church, county Durhan, (1426), removed, 1908, from a dais corner of the church into full light, a few feet away, where its beauty may now be examined. A very fine but more realistic work is the tomb figure of William of Wykeham (d. 1404) in the cathedral at Winchester. The cathedrals at Rochester, Lichfield, York, Lincoln, Exeter and many other ecclesiastical buildings in England are rich in examples of 14th-century sculpture, used occasionally with great profusion and richness of effect, but treated in strict subordination to the architectural background.

The finest piece of bronze sculpture of the 15th century is the effigy of Richard Beauchamp (d. 1439) in his family chapel in the cathedral of Warwick—a noble composite figure, richly decorated with engraved ornaments. The modelling and casting were done by William Austen of London, and the gilding and engraving by a Netherlands goldsmith who had settled in London, named Bartholomew Lambespring, assisted by several other skilful artists.

The first Spanish sculptor of real eminence who need be considered is Aparicío, who lived and worked in the 11th century. His shrine of St Millan, executed to the order of Don Sancho the Great is in the monastery of Yuso, and is an accomplishment excellent in its way, in design, grace and proportion. In the early medieval period the sculpture of northern Spain was much influenced by contemporary art in France. From the 12th to the 14th century many French architects and sculptors visited and worked in Spain. The cathedral of Santiago de Compostella possesses one of the greatest existing specimens in the world of late 12th-century architectonic sculpture; this, though the work of a native artist, Mateo,1 is thoroughly French in style; as recorded by an inscription on the front, it was completed in 1188. The whole of the western portal, with its three doors, is filled with a profusion of designs, all richly decorated with cornice, part of which still remains. Round the central arch are figures of the twenty-four elders, and in the tympanum a very noble relief of Christ in Majesty between Saints and Angels. As at Chartres, the jambs of the doorways are decorated with standing statues of saints—St James the elder, the patron of the church, being attached to the central pillar. These noble figures, though treated in a somewhat rigid manner, are thoroughly subordinate to the main lines of the building. Their heads, with pointed beards and a fixed mechanical smile, together with the stiff and ungraceful gowns, recall the Aegyptian pediment sculpture of about 500 B.C. This appears strange at first sight, but the fact is that the works of the early Greek and the medieval Spaniard were both produced at a somewhat similar stage in two far distant periods of artistic development. In both cases plastic art was freeing itself from the bonds of a hieratic archaism, and had reached one of the last steps in a development which in the one case culminated in the perfection of the Phidian age, and in the other led to the exquisitely beautiful yet simple and reserved art of the end of the 13th and early part of the 14th century—the golden age of sculpture in France and England. In the cathedral of Tarragona are nine statues, in stone, executed by Bartolomé in 1278 for the gate.

In the 14th century the silversmiths of Spain produced many works of sculpture of great size and technical power. One of the finest, by a Valencian called Peter Berneis, is the great silver reliquary at Gerona cathedral. It is divided into three tiers of statuettes and reliefs, richly framed in canopied niches, all of silver, partly cast and partly hammered.

In the 15th century an infusion of German influence was made with that of France, as may be seen in the very rich sculptural decorations which adorn the main door of Salamanca cathedral, the façade of S. Juan at Valladolid, and the church and cloisters of S. Juan de los Reyes at Toledo, perhaps the most gorgeous examples of architectural sculpture in the world. These were executed between 1418 and 1425 by a group of clever sculptors, among whom A. and F. Díaz, A. F. de Sahagun, A. Rodriguez and A. Gonzales were perhaps the chief. The marble altar-piece of the grand altar at Tarragona was begun in

1 A kneeling portrait-statue of Mateo is introduced at the back of the central pier. This figure is now much revered by the Spanish peasants, and the head is partly worn away with kisses.

HOUDON—Voltaire (Théâtre Français, Paris). (Photo, Giraudon.)

COYSEVOX—Bust of himself, in the Louvre. (Photo, Giraudon.)
by P. Juan in 1426 and completed by G. De La Mota. The carved foliage of this period is of especial beauty and spirited execution; realistic forms of plant-growth are mingled with the Madonnas who shelter in her most maternal manner. The very noble bronze monument of Archdeacon Pelayo (d. 1400) in Burgos cathedral was probably the work of Simon of Cologne, who was also architect of the Certosa at Miraflores, 2 m. from Burgos. The church of this monastery contains two of the most magnificently rich monuments in the world, especially the altar-tomb of King John II, and his queen by Gil de Siloe—a perfect marvel of rich alabaster canopy-work and intricate undercutting. The effigies have little merit. From the 16th century onwards wood was a favourite material with Spanish sculptors, and the more profuse production of that century has been realistically treated, such as the "Scene from Taking of Granada" by El Maestro Rodrigo, and even for portraiture, as in the Bust of Turiano by Alonso Berruguete (1480-1561).

During the 14th century Florence and the neighbouring cities were the chief centres of Italian sculpture, and there numerous sculptors of successively increasing artistic power lived and worked, till in the 15th century the city had become the aesthetic capital of the world. But the Gothic sculptor's activity was by no means confined to the production of such a multitude of figures and groups. The subject of painting being from the 14th century of the highest importance, the sculptors have a part in the decorated statues of medieval cathedrals. But in the whole of that century the sculptor was often called on to execute at the same time large altars and tabernacles, beautiful gates, and moreover the tombs of the great. The production of sculpture is not to be summed up in the admirable works of a single master, but in the whole/modern era of painting, but in his relief sculpture, and more particularly by the influence he exercised upon Andrea Pisano, carried the art of sculpture beyond the point where it had been carried by Giovanni Pisano. In Andrea we find something of Niccola's classic dignity grafted on to Giovanni's close observation of nature. His greatest works are the bronze south gate of the Baptistery, and some of the reliefs on Giotto's Campanile. The last great master of the Gothic period is Andrea di Cione, better known as Orcagna (1308? to 1368), who, like Giotto, achieved fame in the three sister arts of painting, sculpture and architecture. His wonderful tabernacle at Or San Michele is a noble testimony to his efficiency in the three arts and to his early training as a goldsmith. Very beautiful sepulchral effigies in marble are in the church of San Miniato, especially the tomb of the lady of the Medici at Florence.

The tomb of Lorenzo Acciaioli, in the Certosa near Florence, is a fine example of about the year 1400, which has absurdly been attributed to Donatello. The similarity between the plastic arts of Venice in the 5th or 4th century B.C. and of Florence in the 15th century is not one of analogy only. Though free from any touch of copyism, there are many points in the works of such men as Donatello, Luca della Robbia, and Antonio Pisano which strongly recall the sculpture of ancient Greece, and suggest that, if a sculptor of the later Phidian school had been employed by the same masters of the 15th century, among which the Italians lived, he would have produced plastic works closely resembling those of the great Florentine masters. Lorenzo Ghiberti may be called the first of the great sculptors of the Renaissance. But between him and Orcagna stands another master, the Sienez, Jacopo della Quercia (1371-1438) who, although in some minor traits connected with the Gothic school, heralds at this early date the boldest and most vigorous and original achievements of two generations hence. Indeed, Jacopo, whose chief works are the Fonte Gaia at Siena (now reconstructed) and the reliefs on the gate of S. Petronio at Bologna, stands in his strong muscular treatment of the human figure nearer to Michelangelo than to his Gothic precursors and contemporaries. Contemporaneously with Ghiberti, the sculptor of the world-famed baptistery gates, and with Donatello, and to a certain extent influenced by them, worked some men who, like Ciaffagni, were still essentially Gothic in their style, or, like Nanni di Banco, retained unmistakable traces of the earlier manner. Luca della Robbia, the founder of a whole dynasty of sculptors in glazed terra-cotta, with his great purity of style and the freshness of the modern world, in order. Unusual beauty elevated by religious spirit was attained in the highest degree by Mino da Fiesole, the two Rossellinis, Benedetto da Maiano, Desiderio da Settignano and other sculptors more or less directly influenced by Donatello. Through them the tomb monument received the definite form which it retained throughout the Renaissance period. Two of the noblest equestrian statues the world has probably ever seen are the Gattamelata statue at Padua by Donatello and the statue of Colleoni at Venice by Verrocchio and Leonardo. A third, which was probably of equal beauty, was modelled in clay by Leonardo da Vinci, but it no longer exists. Among other sculptors who flourished in Italy about the middle of the 15th century, are the Luccese Matteo Civesali; Agostino di Duccio (1418-6. 1487), whose principal works are to be found at Rimini and Verona; the bronze-worker Bertoldo di Giovanni (1420-1491); Antonio del Polliaiuolo, the author of the tombs of popes Sixtus IV. and Innocent VIII. at St Peter's in Rome; and Francesco Laurana (1424-1507?), a Dalmatian who worked under Brunelleschi and left many traces of his activity in Naples (Triumphal Arch), Sicily and southern France. Finally came Michelangelo, who modelled the face and the most of the marble by which we regard to its highest pitch of magnitude, and at the same time sowed the seeds of its rapidly approaching decline; the head of his David at Florence is a work of unrivalled force and dignity. His rivals and imitators, Baccio Bandinelli, Giacomo della Porta, Montelupo, Ammanati and Vincenzo de' Rossi (pupils of Bandinelli) and others, copied and exaggerated his faults.

SCULPTURE

The latter part of the 15th century in France was a time of transition from the medieval style, which had gradually been deteriorating, to the more florid and realistic taste of the Renaissance. To this period belongs the tombs of rich reliefs and statues on the choir-screen of Chartres cathedral. Those on the screen at Amiens are later still, and exhibit the rapid advance of the new style.

The transition from the Gothic to the Renaissance is to be noted in many tomb monuments of the second half of the 15th and the beginning of the 16th centuries, notably in Rouland de Roux's magnificent tomb of the cardinals of Amboise at Rouen cathedral. Italian motifs are paramount in the great tombs of the period. One of the most pleasing of artistic thought followed the direction indicated by the founding of the italicizing school of Fontainebleau Jean Goujon, (d. 1572) was the ablest French sculptor of the time; he combined great technical skill and refinement of modelling with the florid and affected style of the age. His nude figure of "Diana reclining by a Stag," now in the Louvre, is a graceful and vigorous pose of work, superior in sculpuresque breadth to the somewhat similar bronze relief of a nymph by Cellini. Between 1540 and 1552 Goujon executed the fine monument at Rouen to Duke Louis de Brézé, and from 1555 to 1562 was mainly occupied in decorating the Louvre with sculpture. One of the most pleasing and graceful works of this period, thoroughly Italian in style, is the marble group of the "Three Graces," bearing on their heads an urn containing the heart of Henry II., executed in 1560 by Germain Pilon for Catherine de Médicis. The monument of Catherine and Henry II. at St Denis, by the same sculptor, is an inferior and coarser work. Maitre Ponce, probably the same as the Italian Ponzio Jacquiou, chiselled the noble monument of Albert of Carpi (1553), now in the Louvre. Another very fine portrait effigy of about 1570, a recumbent figure in full length of the Duke of Longueville, preserved in the Louvre is the work of Barthélemy Primatix. François Duquesnoy of Brussels (1594-1644), usually known as II Fiamingo, was a clever sculptor, thoroughly French in style, though he mostly worked in Italy. His large statues are very poor, but his reliefs in ivory of boys and cupids are modelled with wonderfully soft realistic power and graceful fancy.

To these sculptors should be added Jacques Sarrzin, well known for the colossal yet elegant caryatides for the grand pavilion of the Louvre; and François Augier, the sculptor of the splendid mausoleum of the duc de Montmorency.

In the Netherlands the great development of the 15th century, preserved in the Louvre, was not accompanied by a parallel movement in plastic art. Of the few monuments that claim attention, we must mention the bronze tomb of Mary of Burgundy at Notre-Dame, Bruges, executed about 1495 by Jan de Baker, and the less remarkable though technically more complete companion tomb of Charles the Bold (1558).

The course of the Renaissance movement in Germany sculpture differs from that of most other countries in so far as it appears to grow gradually out of the Gothic style in the direction of individual, realistic treatment of the figure which in late Gothic days had become somewhat conventional and schematic and idealized. Marked physiognomic expression, careful rendering of movement, costume and details, and the suggestion of different textures, together with almost tragic emotional intensity, are the chief aims of the 15th-century sculptors who, on the whole,

1 See Yriarte, Rèmi au XVè siècle (Paris, 1880).
The Italian influence, which did not make itself felt until the early days of the 16th century, led to brilliant results, whilst the workers retained their fresh northern individuality and keen observation of nature. But in the latter half of the 15th century it began to change; there was a swing of fashion, and led to somewhat theatrical and conventional classicism and mannerism.

One speciality of the 15th century was the production of an immense number of wooden altars and reredoses, painted and gilt in the most gorgeous way and covered with subject-reliefs and statues, the former often treated in a very pictorial style. Wooden screens, stalls, tabernacles and other church-fittings of the greatest elaboration and clever workmanship were largely produced in Germany at the same time, and on into the 16th century. Jörg Syrlin, one of the most able of these sculptors in wood, executed the gorgeous choir-stalls in Ulm cathedral, richly decorated with statuettes and canopied work, between 1460 and 1474; his son and namesake sculptured the elaborate stalls in Blaubeuren church of 1496 and the great pulpit in Ulm cathedral. Another exceptionally important work of this type is the magnificent altar at St Wolfgang in Upper Austria, carved by the Tirolean, Michael Pacher, in 1481. Veit Stoss of Cracow, who later settled in Nuremberg, a man of bad character, was a most skilful sculptor in wood; he carved the high altar, the tabernacle and the stalls of the Frauenkirche at Cracow, between 1472 and 1481. One of his finest works is a large piece of wooden panelling, nearly 6 ft. square, carved in 1495, with central reliefs of the Doom and the Heavenly Host, framed by minute reliefs of scenes from Bible history. It is now in the Nuremberg town-hall.

Wolgelmuth (1454-1519), the master of A. Dürer, was not only a painter but also a clever wood-carver, as was also Dürer himself (1471-1528). He executed a tabernacle for the Host with an exquisitely carved relief of Christ in Majesty between the Virgin and St John, which still exists in the chapel of the monastery of Landau. Dürer also produced altars, which stand in the new residential church at Mergentheim (1506), of which the British Museum (print-room) possesses one of the finest examples. Adam Kraft (c. 1455-1507) was another of this class of sculptors, but he worked also in stone; he produced the great Schreyer monument (1492) for St Sebald's at Nuremberg,—a very skilful though merely sculptured piece of marble, with very realistic figures in the costume of the time, carved in a way more suited to wood than stone, and too pictorial in effect. He also made the great tabernacle for the Host, 80 ft. high, covered with statuettes, in Ulm cathedral, and the very spirited "Stations of the Cross" on the road to the Nuremberg army camp.

The Vischer family of Nuremberg for three generations were among the ablest sculptors in bronze during the 15th and 16th centuries. Hermann Vischer the elder worked mostly between 1450 and 1505, following the earlier medieval traditions, but without the originality of his son, Peter Vischer.

Next to Nuremberg, the chief centres of bronze sculpture were Augsburg and Lübeck. Innsbruck possesses one of the finest series of bronze statues of the first half of the 16th century, namely twenty-eight colossal figures round the tomb of the emperor Maximilian, which statue-piece is the central ornament of the cloister of the Imperial Abbey of St Jacob, the mausoleum of heroes and ancestors of the emperor. The first of the statues which was completed cost 3000 florins, and so Maximilian invited the help of Peter Vischer, whose skill was greater and whose work less expensive than that of the local craftsmen. Most of them, however, were executed by sculptors of whom little is now known. They differ much in style, though all are of great technical merit. The finest is an ideal statue of King Arthur of Britain, in plate armour of the 14th or early 15th century, very remarkable for the nobility of the face and pose. That of Theodoric is also a very fine work. This class of large wooden relatable was much imitated in Spain and Scandinavia. The metropolitana cathedral of Röskilde in Denmark possesses a very large and magnificent example covered with subject reliefs enriched with gold and colours.

C. A. Waagen, Kunst und Künstler in Deutsch. (Leipzig, 1842-1845).
SCULPTURE

—for example, the choir reliefs at Toledo cathedral, and those in the Colegio Mayor at Salamanca by Alonso Berruguete, sculptor, painter and architect, trained in Rome and Florence, and the greatest designer of Spain up to that time. He worked under Michelangelo and Vasari, and on his return to Spain in 1520 was appointed court painter and sculptor to Charles V. The same position was occupied under Philip II. by Gaspar Becerra (1520-1570), whose masterpiece is a figure of Our Lady of the Solitude, in Madrid. Esteban Jordan, Gregorio Hernandez and other Spanish sculptors produced a large number of elaborate retablos, carved in wood with subjects in relief and often richly decorated in gold and colours. These sumptuous masses of polychromatic sculpture resemble the 15th-century retablos of Germany more than any Italian examples, and were a sort of survival of an older medieval style. J. Morlanes was the first of Spanish sculptors to adopt the style of Albert Dürer, which afterwards became general. Philip de Vigarn, Christopher de Salamanca, and Paul de Cespedes, who was native of Cordova, are names of great prominence up to the end of the century. Alonso Cano (1600-1667), the painter, was remarkable for clever realistic sculpture, very highly coloured and religious in style. Montañes, who died in 1674, was one of the ablest Spanish sculptors of his time. His finest works are the reliefs of the Madonna and Saints on an altar in the university church of Seville, and in the cathedral, in the chapel of St Augustine, a very nobly designed Conception, modelled with great skill.

In the 17th century sculpture in Spain was still in its infancy. The statue of St Bruno of Montañes seems to have inspired others to repeat the subject in the same material: Juan de la Jun (d. 1614) is a case in point. Pedro de Menà and Zarcillo achieved great success in this class of sculpture. A Pujol of Catalonia and Peter Roldan carried on the Spanish tradition. The chief names in the 18th century are those of Don P. Duque de Cornos de Seville, Don J. de Henestrosa, A. Salvador (known as "the Roman," d. 1756), Philip de Castro of Galicia, one of the most eminent sculptors of his time (d. 1775), and F. Gutierrez (d. 1782).1

If the immediate followers of Michangelio showed a tendency to turn the characteristics of the master’s style into exaggerated mannerism, the beginning of the 17th century finds Italian sculpture in a state of complete decadence, statuesque dignity having given way to fluttering movement and florid excesses, such as was revived in a later century. From Italy this "baroque" style spread over the whole continent of Europe and retained its hold for nearly two centuries. The chief sculptor and architect of this period was the Neapolitan, J. L. Bernini (1598-1680), who, with the aid of a large school of assistants, produced an almost incredible quantity of sculpture of the most varying degrees of merit and hideousness. His chief early group, the Apollo and Daphne in the Villa Borghese, is a work of wonderful technical skill and delicate high finish, combined with soft beauty and grace, though too pictorial in style. In later life Bernini turned out work of brutal coarseness, designed in a thoroughly unsculpturesque spirit. The churches of Rome, the colonnade of St Peter’s, and the bridge of S. Angelo are crowded with his clumsy colossal figures, half draped in wildly fluttering garments,—perfect models of what is worst in the plastic art. And yet his works received perhaps more praise than those of any other sculptor of any age, and after his death a scaffolding was erected outside the bridge of S. Angelo in order that people might walk round and admire his works to the fullest extent.

For all that, Bernini was a man of undoubted talent, and in a better period of art would have been a sculptor of the first rank; many of his portrait-busts are works of great vigour and dignity, quite free from the mannered extravagance of his larger sculpture. Stefano Maderna (1571-1636) was the ablest of his contemporaries; his clever and much-admired statue, the figure of the dead S. Cecilia under the high altar of her basilica, is chiefly remarkable for its deathlike pose and the realistic treatment of the drapery. Another clever sculptor was Alessandro Algardi of Bologna (1598-1634), who formed a school, which included G. Brunelli, D. Guidi and C. Mazzu of Bologna.

In the next century at Naples Queirolo, Corradini and Sammarco produced a number of statues, now in the chapel of S. Maria de’ Sangri, which are extraordinary examples of wasted labour and neglect of the simplest canons of plastic art. These are marble statues enmeshed in nets or covered with thin veils, executed with almost deceptive realism, perhaps the lowest stage of tricky degradation into which the sculptor’s art could possibly fall.2 In the 18th century Italy was naturally the headquarters of the classical revival, which spread thence throughout most of Europe. Canova (1757-1822), a Venetian by birth, who spent most of his life in Rome, was perhaps the leading spirit of this movement, and became the most popular sculptor of his time. His work is very unequal in merit, mostly dull and uninteresting in style, and is occasionally marred by a meretricious spirit very contrary to the true classic feeling. His group of the "Three Graces," the "Hebe," and the very popular "Dancing-Girls," copies of which in plaster disfigure the stairs of countless modern hotels and other buildings on the Continent, are typical examples of Canova’s worst work. Some of his sculpture is designed with far more of the purity that distinguished antique art; his finest work is the colossal group of Theseus slaying a Centaur, at Vienna. Canova’s attempts at Christian sculpture are singularly unsuccessful, as, for example, his pretentious monument to Pope Clement XIII. In St Peter’s at Rome, that of Titian at Venice, and Alieri’s tomb in the Florentine church of S. Croce. Fiesole in the 19th century produced one sculptor of great talent, named Bastianini. He worked in the style of the great 16th-century Florentine sculptors, and followed especially the methods of his distinguished fellow-townsmen Mino da Fiesole. Many of Bastianini’s works are hard to distinguish from genuine sculpture of the 15th century, and in some cases great prices have been paid for them under the supposition that they were medieval productions. These frauds were, however, perpetrated without Bastianini’s consent, or at least without his power to prevent them. Several of his best terra-cotta works may be seen in the Victoria and Albert Museum.

Whilst monumental sculpture in France during the 17th century continued to be influenced by Italy, the national tradition was carried on to a certain extent by such portraitists as the two Courous and their master Coysevox (1640-1729), whose works are marked by a great sense of life and considerable technical skill. The exaggerated elegance in the treatment of the female figure, which became so marked a characteristic of French sculpture during this period, is the chief trait of Francois Girardon (1639-1715), who was chiefly employed on the sculptural decorations at Versailles, and on the famous equestrian statue of Louis XIV., which was destroyed during the Revolution and for which hundreds of exquisite drawings and studies were made, now in the French national collection. Far more strength and grandeur mark the work of Pierre Puget (1622-1694), who is best known by his "Milo of Crotona" for Versailles. His training was entirely Italian, and in style considerably influenced by Bernini. He worked for some considerable time in Italy, particularly in Genoa. The same opposed movements which run side by side in French 18th-century painting, academic allegory and frivolous sensuality, can be traced in the sculpture of this period. Of

1 For the earlier history of Spanish sculpture, see Don Juan Augustin Ceas Bernex, Diccionario den los mas ilustres y conocidissimos profesores de las bellas artes en Espafia (Madrid, 1800, 6 vols.). For the later sculptors, see B. Händke, Studien zur Geschichte der spanischen Kunst (Strasbourg, 1904).

2 The Ludovisi group of Pluto carrying off Proserpine, now in the Borghese Gallery, is a striking example, and shows Bernini’s deterioration of style in later life. It has nothing in common with the Cain and Abel or the Apollo and Daphne of his earlier years.

3 In the 19th century an Italian sculptor named Monti won much popular repute by similar unworky tricks; some veiled statues by Del Tredici on the London Exchange, which, in the 20th century, then copies or imitations of them have enrapured the visitors who have crowded round the Italian sculpture stalls at every subsequent international exhibition.
the first, the chief representatives are Lemoyne and his pupil Falconet, who executed the equestrian statue of Peter the Great at St Petersburg; of the other, Clodion, whose real name was Claude Michel (c. 1745-1814). The latter worked largely in terracotta, and modelled with great spirit and invention, but in the sensuous unsculptural manner prevalent in his time.

In the later part of the 18th century France produced two sculptors of great eminence in Jean-Baptiste Pigalle (1714-1785) and Jean Antoine Houdon (1741-1828). Houdon may be regarded as the precursor of the modern school of French sculpture of the better sort. Towards the end of the 18th century a revolution was brought about in the style of sculpture by the suddenly revived taste for antique art. A period of dull pseudo-classicism succeeded, which in most cases stifled all original talent and reduced the plastic arts to a lifeless form of archaeology. Regarded even as imitations the works of this period are very unsuccessful; the sculptors got hold merely of the dry bones, not of the spirit of classic art; and their study of the subject was so shallow and unintelligent that they mostly picked out what was third-rate for special admiration and ignored the glorious beauty of the best works of true Hellenic art. Thus in sculpture, as in painting and architecture, a study which might have been stimulating and useful in the highest degree became a serious hindrance to the true etchings on stone and on metal, and all true imitation of Napoleon on the top, and also modelled the classical quadriga on the triumphal arch in the Place du Carrousel. Jacques Pradier of Geneva (1790-1852) produced the "Chained Prometheus" of the Louvre and the Niobe group (1822). He possessed great technical ability, but aimed in most of his works at a soft sensuous beauty which is usually considered to be specially unsuited to sculpture. François Rude (1784-1853), worked in a style modelled on Graeco-Roman sculpture treated with some freedom. His bronze Mercury in the Louvre, is a clever work and the enormous high-relief on the Arc de l'Étoile in Paris, representing "The Song of Departure to Battle," is full of vigour and movement, but his statues of Marshal Ney in the Luxembourg Gardens and of General Cavaignac (1847) in the cemetery of Montmartre are conspicuously poor. The reliefs on the pediment of the Panthéon are by Pierre Jean David of Angers (1789-1856); his early works are of dull classic style, but later in life he became a realist and produced very unsavoury results. A bronze statue of a Dancing Fisher-lad modelled by François Joseph Duvet, now in the Luxembourg collection, is an able work of the genre class. Other French sculptors, who were highly esteemed in their time were Otto Courtois, Siméon, Etié and Carpeaux. The last was an artist of great ability, and produced an immense number of clever but often, sculptural interestingly considered, offensive statues. He obtained the highest renown in France, and, hailed as a great innovator by those who welcomed a greater measure of naturalism, he was denounced by the "pure" and classic school as a typical example of the sad degradation of taste which prevailed under the rule of Napoleon III.

The modern schools of French sculpture are the most important in the world; they are dealt with in a separate section later. Technical skill and intimate knowledge of the human form are possessed by French artists to a degree which has probably never been surpassed. Many of their works have a similar fault to that of one class of French painters: they are much injured by an excess of sensual realism; in many cases nude statues are simply life-studies with all the faults and individual peculiarities of one model. Very unsavoury results are produced by treating a statue as a representation of a naked person,—one, that is, who is obviously in the habit of wearing clothes,—a very different thing from the purity of the ancient Greek treatment of the nude. Thus the great ability of many French sculptors has been degraded to suit, or rather to illustrate, the taste of the voluptuary. An extravagance of attitude and an undignified arrangement of the figures do much to injure some of the large groups which are full of technical merit, and executed with marvellous anatomical knowledge. This is specially the case with much of the sculpture that adorns the buildings of Paris. The group of nude dancers by Carpeaux outside the opera-house is a work of astonishing skill and sensual imagination, unsavoury in style and especially unflattering to decorate the comparatively rigid lines of a building. The egotism of modern French sculptors, with rare exceptions, has not allowed them, when professedly aiming at providing plastic decoration for buildings, to accept the necessarily subordinate reserve which is so necessary for architectonic sculpture. Other French works, on the other hand, have frequently erred in the direction of a sickly sentimentalism, or a petty realism, which is fatal to sculptural art; or they seek to render modern life, sometimes on the scale of life-size, even to the point of securing an atmospheric effect. This exaggerated misconception of the function of sculpture can only be passed over, yet it may be that movement issuing from Paris finds adherents in other countries, the effect upon sculptors and upon public taste can hardly be otherwise than mischievous. The real power and merits of the modern French school make these faults all the more conspicuous.

Whatever work of importance was produced by Netherlandish sculptors in the 17th and 18th centuries, was due entirely to Italian training and influence. François Duquesnoy (usually called "The Fleming") (1594-1644) has already been mentioned in Rome, in rivalry with Bernini, and most of his works have remained in Italy, but, inasmuch as his style is conspicuously French, he is here included in the French school. His pupil Arthur Quellinus is best known by his allegorical groups on the pediments of Amsterdam town-hall, and has also left some traces of his activity in Berlin. P. Buystner, native of Brussels (b. 1695), passed into France and is also often classed as a French sculptor.

By far the greatest sculptor of the classical revival was Bertel Thorwaldsen (1770-1844), an Icelander by race, whose boyhood was spent in Copenhagen, and who settled in Rome in 1797, when Canova's fame was at its highest. The Swedisch sculptors Tobias Sergell and Johann Bryström belonged to the classic school; the latter followed in Thorwaldsen's footsteps. Another Swede named Fogelberg was famed chiefly for his sculptured subjects taken from Norse mythology. H. W. Bissen and Jerichau of Denmark produced some able works,—the former a fine equestrian statue of Frederick VII. of Copenhagen, and the latter a very spirited and widely known group of a Man attacked by a Panther.

During the troublous times of the Reformation, sculpture, like the other arts, continued to decline. Of 17th-century monumental effigies that of Sir Francis Vere (d. 1607) in the north transept at Westminster is one of the best, though its design—a recumbent effigy overshadowed by a slab covered with armour, upheld by four kneeling figures of men-at-arms—is almost an exact copy of the tomb of Engelbert II. of Vianden-Nassau.¹ The finest bronze statues of this century are those of George Villiers, duke of Buckingham (d. 1628), and his wife at the north-east of Henry VII. of Westminster. The effigy of the duke, in rich armour of the time of Charles I, lies with folded hands in the usual medieval pose. The face is fine and well modelled and the casting very good. The allegorical figures at the foot are caricatures of the style of Michelangelo, and are quite devoid of merit, but the kneeling statues of the duke's children are designed with

SCULPTURE

Modern

German sculpture.

example of baroque sculpture which to this day is known as the Donner fountain. In the second half of the 18th century there was a strong revival in sculpture, especially in the classic style; and since then Germany has produced an immense quantity of first-rate and pretentious sculpture, mostly of a second-rate execution. Gottfried Schadow of Berlin (1764–1850) finished a number of portrait figures, not in the customary antique guise, but in the costume of the period. Some of his works are ably modelled. He was followed by Christian Rauch (1777–1857), whose works are, however, mostly weak and sentimental in style and approach, and his recumbent statue of Queen Louisa at Charlottenburg (1813), and his statues of generals Bilow and Scharnhorst at Berlin. Rauch became the leader of an important school in Berlin, but will be most honourably remembered by his splendid monument of Frederick the Great in Berlin—an elaborate work, modern in feeling and of great technical accomplishment. Friedrich Drake was the ablest of Rauch's pupils, but he lived at a very unhappy period for the sculptor's art. His chief work is perhaps the colossal bronze equestrian statue of King William of Prussia at Cologne. Albert Wolff was a sculptor of more ability; he executed the equestrian portrait of King Ernest Augustus at Hanover, and a "Horseman attacked by a Lion" now in the Berlin Museum. Augustus Kiss (1802–1865) produced the companion group to this, the celebrated Amazon and Panther in bronze, as well as the fine group of Frederick the Great, a meaningless classicism to serious realism. It was his task to erect monuments in memory of some of the greatest intellectual heroes of Germany, such as his Lessing monument in Braunschweig, the monument to Goethe and Schiller in Weimar, and to Martin Luther at Worms. Some revival of a better style is shown in certain sculpture, especially reliefs, by Hännel, whose chief works are at Dresden. Schwantaler (1802–1848), who was largely patronized by King Louis of Bavaria, studied at Rome and was at first a feeble imitator of antique classic art, but in later life he developed a more romantic and pseudo-baroque style, an imitative and pseudo-classic purity. Many of his works are contained in the Glyptothek at Munich and in the Walhalla, also the colossal but feeble bronze statue of Bavaria, in point of size one of the most ambitious works of modern times.2

1 In size, but not in merit, this enormous statue was surpassed by the figure of Liberty made in Paris by Bartholdi and erected as a beacon in the harbour of New York city.

EIGHTEENTH CENTURY IN ENGLAND.

The Villiers monument is evidently the work of two sculptors working in very opposite styles. These sculptures, however, are not included in the list of his works drawn up by Stone himself and printed in Walpole's Anecdotes of Painting, i. 239-243. This sculptor's receipts, recorded by his kinsman, Charles Stoakes, amounted to £10,886—an enormous sum for an English sculptor and "tomb-maker" of those days.

grace and pathos. A large number of very handsome marble and alabaster tombs were erected throughout England during the 17th century. The effigies are poor and coarse, but the rich architectural ornaments are effective and often of beautiful materials, and these are combined with much spirit and bravura in a very skilful way. Nicholas Stone (1656–1647), who worked under the supervision of Inigo Jones and was master-
reliefs of Peace and War, and the Neptune fountain, both in front of the imperial palace, and the Schiller monument before the royal theatre, all in Berlin, are perhaps his most successful works. The Bismarck in front of the Reichstag building suffers from the excessive use of allegorical motifs and from other errors of taste.

Of Begas's many pupils, who participated in the execution of the numerous statues that flank the Siegessaeule in the Berlin Tiergarten, the most distinguished is Joseph Uphues (b. 1838), who is the creator of the Moltke monument in Berlin, and of the Frederick the Great in the Siegessaeule, a replica of which is to be found in Washington. Adolf Brütt (b. 1835) and Gustav Eberlein should be mentioned among the most successful Berlin sculptors; Robert Dietz, as the founder of an important school in Dresden; and Wilhelm Ruemann (d. 1906) and Rudolf Maizon among the modern sculptors of Munich.

The closing years of the 19th century were marked by an enormous advance, not only in public appreciation of sculpture but in productive activity. The younger generation of Berlin sculptors includes such distinguished artists as Frits Klimsch, who is best known by "The Triumph of Woman" and "The Kiss"; Hugo Lederer, the designer of the Bismarck monument in Hamburg; August Gaul, who excelled in statuettes of animals; Max Kruse, a woodcarver of great ability; and Louis Touailhon, who spent his early years in Rome, and became famous for his excellent anatomy and action of his equine studies. Karl Seffner, of Leipzig; August Hudler, of Dresden; Georg Weba, Fritz Christ, Erwin Kurz, Hermann Hahn, Theodor von Gosen and Hugo Kaufmann, all of Munich, should also here be mentioned. Adolf Hildebrand (b. 1847) is best known by his Wittelsbach fountain in Munich and his Reinhard fountain in Strassburg. He has also executed some excellent medals and plaquettes. Franz Stuck, who has ranked among the leading painters of modern Germany, has also produced some powerful pieces of sculpture, such as the Beethoven, and the "The Helper" (b. 1876), whom we may regard as painter and etcher, revived Albrecht Dürer's tradition in Germany. His Beethoven monument, at the Leipzig Museum, is the best known example of his work in this direction. The great composer is conceived as Jupiter enthroned, with the eagle at his feet. The work caused an enormous sensation on its first appearance before the public and became a veritable apple of discord around which a worldly war was waged by the different factions. The Leipzig Museum also owns his Cassandra and a rough-hewn portrait bust of Liszt. One of his most striking works is the Nietzsche bust at Weimar. At the Albertinum, in Dresden, is an important late work by this, a marble group of three beautiful women, Karl Seffner, "The Drama." (J.H.M.; M.H.S.; P.G.K.)

During the first half of the 19th century the prevalence of a cold, lifeless pseudo-classic style was fatal to individual talent, and robbed the sculpture of England of all real vigour and spirit. Francis Chantrey (1782-1841) produced a great quantity of sculpture, especially sepulchral monuments, which were much admired in spite of their limited merits. Allan Cunningham and Henry Weekes, who excelled in busts of men, worked in some cases in conjunction with Chantrey, who was distinguished by considerable technical skill. John Gibson (1790-1865) was perhaps after Reychman the most successful of the English classic school, and produced some works of real merit. He strove eagerly to revive the polychromatic decoration of sculpture in imitation of the circum stylisti of classical times. His "Venus Victrix," shown at the exhibition in London of 1862 (a work of about six years earlier), was the first of his coloured statues which attracted much attention. The prejudice, however, in favour of white marble was too strong, and both the popular verdict and that of other sculptors were strongly adverse to the "tinted Venus." The fact is that Gibson's colouring was timidly applied; it was a sort of compromise between the two systems, and thus his sculpture lost the special qualities of a pure marble surface, without gaining the richly decorative effect of the polychromy either of the Greeks or of the medieval period. The other chief sculptors of the same inartistic period were Banks, the elder Westmacott (who modelled the Achilles in Hyde Park), R. Wyatt (who cast the equestrian statue of Wellington, removed from London to Aldershot), Macdowell, Campbell, Calder Marshall, and Bell. Samuel Joseph (d. 1850), working in the naturalistic spirit, produced some strikingly realistic (in 1840) the remarkable statue of Samuel Wilberforce, now in Westminster Abbey. The brilliant exception of its period is the Wellington monument in St. Paul's cathedral, probably the finest plastic work of modern times. It was the work of Alfred Stevens (1817-1875), a sculptor of the highest talent, who lived and died almost unrecognized by the British public. The value of Stevens's work is all the more conspicuous from the feebleness of most of the sculpture of his contemporaries.

During the last quarter of the century a great change came over British sculpture—a change so revolutionary that it gave a new direction to the aims and ambitions of the artist, and raised the British school to a level wholly unexpected. It cannot be pretended that the school yet equals either in technical accomplishment, in richness or elasticity of imagination, or in creative freedom, the schools of France and Belgium, for these have been built up upon the example of national works of many generations of sculptors during several centuries. British sculptors, whose training was far less thorough and intelligent than that which is given abroad, found themselves practically without a past of their own to inspire them, for there existed no truly national tradition, with them it was a case of beginning at the beginning.

The awakening came from without, brought to England mainly by a Frenchman—Jules Dalou—as well as by Lord Leighton, Alfred Gilbert and, in a lesser degree, by Onslow Ford. Carpeaux, no doubt—despised of the classicists—the new inspiration was in a great measure due; for Carpeaux, who infused life and flesh and blood into his marble (too much of them, as has been here shown, to please the lovers of purism), was to his classic predecessors and contemporaries much what in painting Delacroix was to David and the cold professors of his formal school. But it was to Jules Dalou that was chiefly due the remarkable development in Great Britain. A political refugee at the time of the Commune, he received a cordial welcome from the artists of England, and was invited to assume the mastership of the modelling classes at South Kensington. This post he retained for some years, until the amnesty for political offenders enabled him to return to his native land; but before he left he had succeeded in making it clear that severe training is an essential foundation of good sculpture. If, without a past of their own to inspire them, for there existed no truly national tradition, with them it was a case of beginning at the beginning.

The whole conception of sculpture seemed to be modified, and intelligent enthusiasm was aroused in the students. When he departed, he left in his stead Professor Lantéri, who became a naturalized Englishman, and who exercised a beneficent influence over the students equal to that of his predecessor. Meanwhile, the Lambeth Art Schools—where Mr W. S. Frith, a pupil of M. Dalou, was conducting his modelling class under the directorship of John Sparkes (d. 1907)—were being maintained with great success. At the request of the Duke of Edinburgh, who was a pupil of his, and who reins particular period, was revived after many years, the inspiring genius of Alfred Gilbert aroused the students to an enthusiasm curiously contrasting with the comparative apathy, which passed as dignified restraint, of earlier days. British sculpture, therefore, when it is not coloured directly from the Italian Renaissance, is certainly influenced from France. But it is remarkable that in spite of this turning of British sculptors to romantic realism as taught by Frenchmen and Italians, and in spite of the fact that the spirit of colour and decoration and greater realism in modelling had been brought from abroad, the actual character of British sculpture, even in its most decorative forms, is not in the main other than British.

Nevertheless, there has been shown a tendency towards reviving the application of colour in sculpture which has not
met with universal approval. Although the polychromatic work of the Renaissance, for example, may keep its place, it is held to clash with the idea of sculptural art; for though there is no absolute approach to imitation, there is a very strong suggestion of it. The use of a variety of marbles and metals, or other materials, such as has been increasingly adopted, does not offend in the same measure, as the result is purely formal. Yet, in the final result, the work becomes not so much sculpture broadly seen, as an "object of art," amiably imagined and delicately wrought.

Indeed, the sculptor has been greatly reinforced by the artificer in metal, enamel, and the like. But the revival of metal-work, cut, beaten, and twisted, however fine in itself, does not help sculpture forward very much. It may even keep it back; for, popular and beautiful as it is, it really tends to divert the attention from form to design, and from light and shade, with planes, to ingenuity, in pleasing lines—a very beautiful and elevated art, but not sculpture. As an adjunct, it may be extremely valuable in the hands of a fine artist who does not mistake the mere wiggles and doublings which are the mark of the more extravagant phase of the so-called "New Art" for harmonious "line." But it must always suggest the man with the anvil, shears, and pincers, rather than the man with the clay and the chisel. It is mainly to Alfred Gilbert that is due the delightful revival of metal-work in its finest form wedded to sculpture, with the introduction of marbles, gems, and so forth, felicitous and in invention and ornament, and yet so far removed from the idea of this his school that this interest, is subservient to the monumental character of his sculpture.

The first effectual rebellion against the Classic, and the birth of Individualism, dates back to Alfred Stevens. The picturesque fancy of the Frenchman Roubillac (who practised for many years in England), with his theatrical arrangement and skillfully inherited from his master Coustou, had left little mark on the Englishmen of his day. They went on, for the most part, with their pervasive English spirit. Plaxton's "Nymph" is the highest point. But until Stevens, few in England thought of instilling real life and blood and English thought and feeling into the clay and marble. It was not only life that Stevens realized, but dignity, nobility of form, and movement, previously unknown in English work. Follower though he was of Michelangelo and the Italian Renaissance, he was entirely personal. He was no copyist, although he had the Italian traditions at his fingers' ends, and his feeling for architecture helped him to treat sculpture with fine decorative effect. Yet even Stevens and his brilliant example were powerless to weaken the passion for the Greek and Roman tradition that had engrossed England for a century at the time. The late Mr. Frampton's "Minos" in the Tate Gallery, and for his classically-inspired relief "Virgilia lamenting the Banishment of Coriolanus"—probably his most admirable and most exactly touching work—Meanwhile, Baron Carlo Marochetti (1800-1867; A.R.A., 1861; R.A., 1866), an Italian of French parentage, had tried to introduce a more modern feeling, and his "Richard Cœur de Lion" at Westminster, though now without reserve the incongruity of the 12th-century king; mounted on a modern thoroughbred, and raising arm and weapon with an action lacking in vigour. The intention was excellent and fruitful, notwithstanding, and the statue is not without merit. It was he who cast for Landseer the lions of the Nelson monument in Trafalgar Square.

Later on Charles Bell Birch (1832-1863; A.R.A., 1866), with his "Wood Nymph," introduced a new picturesque element in his "Wod Nymph," "Retaliation," "The Last Call," and the "Memorial to Lieut. Hamilton, V.C., dying before Kaloo"; but neither the work of his later period, or the sculpture of his contemporaries to any extent, doubtless on account of the strong Teutonic feeling it displayed.

Sir Joseph Edgar Boehm, R.A. (1834-1890), an Australian by birth, who married Celia, and his brother, helped to develop the scale of able studio-assistants (Professor Lanteri, Alfred Gilbert, and others), contributed somewhat to thaw the chill which the cold marble still seemed to shed around. There was not much inspiration in his monument of "General Gordon" in St. Paul's cathedral, and his "Wellington Memorial" is cold and empty, though correct in handling, and besides being the "Carlyle" on Chelsea Embankment, among his portrait-statues, had the right feeling in them. His busts were usually excellent.

J. H. Foley (1818-1874; A.R.A., 1849; R.A., 1850), who at first worked under the influence of the "Celtic" manner, and was able to throw his previous convictions to the winds, when he produced the finely spirited equestrian statue of "General Sir James A. Y. Gordon," and erected it at the request of Lord Eldon, in the Tate Gallery. This statue was welcomed with enthusiasm in the art world, and helped to remind the public that monuments need not be staid to dulness, nor stiff and dead in their imparturbance.

Meanwhile Henry Hugh Armstead (1828-1905; A.R.A., 1875; R.A., 1890), who had begun by devoting himself to the art of the silversmith, fashioning the St George's Vase," "The Packington Monument," "The Recumbent Shepherd," "The Female Shepherd," and the "London Milkmaid," with their "Memorial to the Nymph," "David and the Lion," now fixed in the Guards' Chapel. It is in very flat relief; ninevite in character of treatment, and carved wholly by the artist directly from the living model, it is, in point of execution, one of his best productions and his marble statute "Remorse," bought for the Chantrey Collection, is a remarkable example of combined intensity of expression and elevated purity of style. The work of Armstead is monumental in character—the mint has been so rare among British sculptors that there is a certain quality of all; and in almost everything he did there is a "bigness" of style which assures him his place in the British school.

"Antique" and "Moorish" are two of his first public appearance, as being the most convenient and the only consistent method that will prevent overleaping, we come to F. J. Williamson (b. 1853), who executed many works for Queen Victoria; John Landseer, R.A. (b. 1829), a sculptor of the family, who was one of his best productions and his marble statue "Remorse," bought for the Chantrey Collection, is a remarkable example of combined intensity of expression and elevated purity of style. The work of Armstead is monumental in character—the mint has been so rare among British sculptors that there is a certain quality of all; and in almost everything he did there is a "bigness" of style which assures him his place in the British school.

Landseer's "A Stag at Bay," his four colossal lions for the Nelson monument in Trafalgar Square, London, constitute his principal plastic works. They engaged him from 1859 to 1867, the year in which they were set up. The casting of them, as already stated, was carried out by Baron Marochetti. Each is 20 ft. in length and weighs 7 tons. They have great nobility and dignity of pose, and although they are not altogether sculptural in treatment, they are finely impressive with a good sense of reality.

George Simonds (b. 1844) is a product of the foreign schools. He is the author of many monumental works and not a little decorative. His "Dionysus astride his Leopard" (his finest work), "The Goddess Gerd," "The Falconer" (in the Central Park, New York), "Cupid and Campaspe" and "Anemone, the Wind Flower." His treatment of the woman, and his sense of caricature, add to his ability. One of the most intellectual realities about his best work, as well as imagination in conception. A. Bruce-Joy (b. Dublin, 1842) has produced ideal work and statues of public men for public spaces, and many busts.

James Brock (1846-1922) is a sculptor whose work is prodigious in amount as well as solid and scholarly, came to London from Worcester in 1866 and fell early under the influence of the English style. He is a man of high intellectual gifts and of considerable ability, and his work a merge of skill and good taste to the public. When his chief died, in 1874, Brock was appointed to carry out the great unfinished works in the studio—the "O'Connell Monument" in Dublin, the Lord Canning in Calcutta, and the "Wellington" in the City. But the prosperity of the '70s, and the nature of his style was formed, his career being already assured, he was percceptive enough to modify it, and, so developed, he left his master very far behind. The ideal work that marked this transition was "The
SCULPTURE

Moment of Peril," a famous sculpture by Thomas Gainsborough, the Yorkshire sculptor who was the vice president of the Royal Academy and a sculptor of the 18th century. This sculpture, erected in the Strand, London, there is little trace of the classicism. In this work, being a bronze statue of Bishop Creighton in St Paul's Cathedral, there is a modern feeling entirely responsive to the feeling of the period. Onslow Ford's "Glory to the Dead," Tennyson (1909) in Trinity College, Cambridge, is one of his finest portrait figures, full of dignity and excellent in likeness—a worthy memorial.

J. Havard Thomas began in 1872 to exhibit portrait sculpture, and soon turned his attention to ideal work, but he did not attract widespread attention until 1886, when he produced "The Slave Girl," a work of considerable power. Girls by other sculptors—that by Hiriam Powers, for example. Somewhat struck in form, she is nevertheless full of very human grace and well-realized realism, and is a good example of the artist's power of obtaining the right idea of the work of the few to carve his own marbles, often without taking the intermediate step of making a clay model. This of course cannot be the case with his large sculpture, such as his great statue of "The Kt. Hon. W. E. Peckham," at Bradford, and his "Samuel Morley, M.P.", and Edmund Burke, M.P., "both at Bristol; but the beautiful small heads of peasants and children—such as the Donatelloque "Pepinella"—of Capri, where he lived two years from 1889 onwards, are mostly carved direct from life.

The beauty of his chisel work can be seen to perfection in the exquisite bust of Mrs Wertheimer in the Tate Gallery; the marble seems to turn to flesh under his chisel and to palpitate with life: it is in truth archaistic, with over-attention to which Mr Thomas has curiously and quite inadecately been reproached. It is true that such a mechanism can be achieved only by a 'rule of thumb' working, for it is in truth archaistic, but with an aim altogether different from that of the Greek. It is Classic in a sense, full of life and wonderfully modelled, but the attainment of perfection of human beauty was not the only aim of Thomas, as is seen in one of his later works, observing as but a rafacimento. There is a vivid sense of style in Mr Thomas's work, and sometimes a search for beauty in subjects which to the common eye may suggest the ugly. But Mr Thomas must be recognized as an artist of great power and originality and to the last degree conscientious. Sculptural subtleties he loves, and he works in a low key, quiet and unobtrusive, and severe though he may be, he is never austere. "Psyche and the Casket of Venus," to the last degrees, is a refined and decorative. His best figure is probably that of "Cain—My Punishment is Greater than I can Bear," executed in 1896; his latest work, "The Sisters" (1900), shows considerable grace. Mullins' Dudley (1889) and architectural embellishment was good in style, appropriate and effective.

Joseph Swynnerton (1871) was a sculptor who spent a good deal of his life in Rome and was under the influence of the National school. His best work is the fountain of flowers, zephyrs and splashing nymphs is, on the contrary, rather roccoco in style, with charming passages. On the other hand, Love's Chalice is Classic in feeling. Generally speaking, Swynnerton's work has an appearance of strength, without common-
Sculpture

[Modern British]

archaeology, must in such matters be the guide. There are, besides, the "Marlowe Memorial," set up in Canterbury—graceful and refined, but rather trifling in manner—and the "Jowett Memorial," a wall decoration, in the style of the Italian Renaissance. The work of Quatremère de Quincy, for he was the only sculptor who succeeded in the Grévin school of academic sculpture, was of the same character and true beauty, with insufficient power. But for his delight in decorative detail, he would have been far greater; for, however enriched they were beyond expression, the decorative details of his compositions were lost in the refinement of the composition. To explain the variety and abundance of small details im³poses poorness of effect. But against Ford's taste, especially against his admirable dexterity, little can be said. The high degree of refinement which his modelling, grace of line and composition, sweetness of feeling, which are the note of his work, are in a great measure a set-off against occasional weakness of design and character, and lack of monumentality.

H. R. Hope Pinker is primarily a portrait-sculptor. Of all his works the seated statue of "Dr Martinus" is perhaps the best, for it seems to indicate his technical development. His other works are numerous as his statues, of which the most popular is the "Henry Fawcett in the Market Place of Salisbury, but his most important work is the colossal statue of Queen Victoria executed for the government of British Guiana.

The most remarkable work executed by any British amateur-sculptor is the "Shakespeare Memorial," presented to the nation by Lord Ronald Sutherland Gower, set up by himself outside the Shakespeare Memorial Theatre (Stratford-on-Avon). The work was carried out in Paris, represents the poet on the summit, attended below by the four great characters—"Hamlet," "Henry V.," "Pygmalion," and "P. A." He has shown skill and happy display of symbolic inventiveness. Lord Ronald also modelled statues of "Marie Antoinette," "The Dying Guardsman," and other works which have secured wide attention.

The most ambitious work undertaken by a living sculptor, in the person of Sir J. R. (afterwards Lord) Leighton (1830-1896; A.R.A., 1864; R.A., 1868), who, in the following year, was to be the president of the Royal Academy, his first work was "An Athlete Struggling with the Python." No piece of sculpture of modern times made a greater stir on its appearance; for here was a work, by a painter, a work, it was declared, which would have done honour to the ancients, and which, if worthy its type and form, inserted in the group of the picture it displayed, original and strong in pose, in action and movement; scholarly in execution and instinct, with the manner of the painter himself. The group was hailed as a masterpiece by one who has been called the most eminent sculptor of modern times, and declared by the most exacting critics to be worthy to rank with the best examples of all but the finest periods. Yet it is somewhat lacking in expression—in that kind of humanity which every really great master of art should exhibit; and connoisseurs applauded the technique, the superb condition and the like, when they should have been caught by the sentiment. But Leighton was seeking only the beauty and expression of form, to the neglect of sentiment, he was well content with the reception and world-wide recognition of his work. One day the model for the "Athlete," tired out, rose and stretched himself, and the sculptor was so enraptured by the pose that he modelled it, and the model is a model on which the "Athlete," is in its way of still higher accomplishment than the "Athlete." It is just as Greek as the other in its devotion to form and its worship of the type of the human frame. But it is a condition, a sensation, an idea rather than an imitation of the human; it is certainly the higher conception. And it has some of the mystery which is distinctive of the finest art of ancient times, in which modern sculpture is, in comparison, a commonplace. As compared, in idea, with the relatively debased "Laocoon," which it seems in some degree to follow if not to challenge, the "Sluggard" belongs to a more elevated expression of a distinctly pagan art, and, as it were, to a better period. Great was the sensation made by these works, and by the charming little statue of "Needless Alarm" (cast by the "lost-wax" process), Leighton seems to have left no distinction in favour in the younger men.

T. Stirling Lee, by natural ability, and by the assistance of culture, is an artist of unusual elevation of mind and execution of excellence, and in his composition he aims at securing beauty by the arrangement of his figures in the panel, rather than at enriching them with details, as a designer would do. He is an acetic in choice of materials, so that his works generally remain beautiful sculptures of the human form, draped or undraped. It is for his power of telling a story beautifully in relief, and the pointed history of his work, that Mr St. T. Lee is among the finest work of their kind in England—that Mr Lee will continue to be admired: he is, beyond almost all others, a sculptor's sculptor. The "Wild Boar," extremely simple in conception, is a masterpiece of expression.

John M. Swan (1837-1910; A.R.A., 1894; R.A., 1905) a pupil of the Royal Academy and of Gérôme and Frémiet, specialized as a sculptor of natural flowers. He was a master of the art of his time, and his is his essay in his art, whose work is full of beauty and importance. For the most part, by no means exclusively, his sculptures are studies of flowers, mainly of the feliœa, but he would pass from the accretions of action to the covering skin and hair, with art seeking much to emphasize the bone and flesh, because they alone display, with the fascinating expressiveness of their sinuous bodies, the whole range of the passions in the most concentrated form. In the "Leopard Playing with a Tortoise," "Leopard Running," "Puma and Macaw," and similar works, we have the note of his art—sinuosity and grace, the sinuosities of movement, the sinuosity of sinew, to be felt with enjoyment. The note of Barye, the great Frenchman, from whom in some measures Swan drew inspiration, is power and strength and decorative form, but Swan is rather at fine, grim, naturalistic, and decorative, as the great artist's creation of a member of the animal world. In certain groups, such as "Orpheus" and "Boy and Bear Cubs," the sculptor combines the human figure with animal forms. In the composition of these, he is most effective.

Another student of animal life is Harry Dixon, whose bronze "Wild Boar" is in the Tate Gallery. "A Bear Running," excellent alike in character, form and construction, and especially in movement, has enraptured artists and admirers. "The Slain Enemy," a prehistoric man with a dead wolf—are among his chief works.

Mr Lucchesi is one of the few who, in spite of all discouragement, has not only persisted in concentrating his attention on ideal work, but has devoted most of it to the rendering of the female form. Prominent among his figures are those called "Destiny." The "Death of a Poet," "Carthage," "The Revolt of the Carthaginians," and "Verity and Illusion." Mr Lucchesi's main excellence is in the treatment of nude forms, in which he has succeeded, through agreeable working out of idea and excellent technique, in interesting a public usually indifferent to this branch of sculpture.

Alfred Gilbert (b. 1854; A.R.A., 1887; R.A., 1892), resigned, in 1892, the post of Superintendent of the British Museum. He has been a biographer of various kinds, and he is a graphic, fluent, and a naturalistic sculpture, not only as being a master of his art, but as having preserved in his work a great movement, and in less than a decade effected more than any other man for the salvation of the British school. His "Melrose Memorial," "Caraghue," and "Carmilla," are among the finest of the sculptors of the country. Among his earlier works are two fine heads of a man and a girl, pure in style and incisive in character, which were cast by the "écorché," or "lost-wax," process, which he had learned in Naples. His introduction into Great Britain—or it may be more correct to say, its revival—had considerable influence on the treatment of bronze sculpture by British artists. In Gilbert's "Memorial of Classical Sculpture," which first appeared in the biographies full of character, with a spiritual and decorative as well as a physical side, and the mental quality displayed with many sympathy. Flesh and textures are perfectly realized, yet broad, light, and with the greatest freedom, as in his handling of the portrait-statues, such as the fine effigy set up to "John Howard in the market-place of Bedford. The monument with which Gilbert's name will ever be associated is the "Statue of Queen Victoria," set up at Bournemouth, which, since its erection and re-erection in that city, has been irretrievably injured by depredations, and remains incomplete in its decorative details. The queen is shown with extraordinary dignity. Large in its masses, graceful in its lines, the person of the queen enveloped by all the symbolical figures and fanciful ornaments with which the artist has chosen to enrich it, the monument marks the highest level in this class to which any artist has brought his talent. The "Queen Victoria," of the Swan's jubilee of 1887, typifying Britannia's realm and sea power in endless poetic and dainty suggestions of beautiful devices. Around, Gilbert's memorials, not mentioned elsewhere, are those to "Frank Holl, R.A.," and to "Randolph Caldecott," both in the crypt of St Paul's cathedral, London; the "Henry Fawcett" memorial in Westminster Abbey, and the "Prince Albert" monument at St James, to which has been added a "little garden of sculpture." The finest work of its kind in England is the "Tomb of the Duke of Clarence" in St George's chapel, which in 1910 still awaited final completion. Perhaps his best composition expressive of emotion is the half-length group "Mors Janae Vitae," a terra-cotta group designed to be executed in bronze for the hall of the Royal College of Surgeons. It is a work of great nobility, and the figures are those of the doctor and sculptor. Gilbert is fond of dealing with a subject which allows his fancy full play. His work is full of colour; it is playful and bold; but the smallest details are in treatment, and it is carefully thought out and thoroughly designed. His playfulness has taught him at times to be somewhat too florid in manner; but his taste is so just, and his fancy so inexhaustible, that he has safely emerged from a temptation where another man would have run riot and come to grief.

Robert Stark is an animal sculptor who has usually attracted the notice of connoisseurs rather than of the greater public, and his fame has been built up by a work that has not been seen in the Chantrey Collection. Mr Stark has a profound knowledge of

animal anatomy; his range is considerable, and he is as easy with a rhinoceros as with a cart-horse or a hunter.

Conrad Dreassler is best known for his busts of distinguished men, but his statue of "A Girl Tying up her Sandal," and his two large marble statues in the New Broadcasting House, London, are, as a matter of position. There is a cleverness, a daring, in his marked style, vigour of treatment, and a tendency towards emphasis, in his decorative work, much of which is designed for execution in Della Robbia technique. He is, however, a sculptor of the utmost versatility, and has executed some important work, including a bronze "Sacristane."

In the work of Harry Bates (1850-1899; A.R.A., 1892), especially in his portrait busts and figure work, and in his decorative treatment, it has been shown up to that time. Style and a genuinely modern treatment of classic form, which is not weakened by touchés of naturalism, were prominent in his work. His most characteristic work, however, is "The Death of Promethus," and "The Thorn" (exhibited in bronze in 1910), graceful and quaintly charming, with elegance in the pose and in the action. Little of his decorative work includes the sculptural figures in Stamford Hill Church.

The name of Captain Adrian Jones was for many years chiefly associated with the spirited work called "Duncan's Horses," a group of laying horses, with the national emblem, the Union Jack, between them, and his work generally is sculptural, with movement and animation. A. G. Waller has produced notable work in the class of pure sculpture, including the relief representing "The Last Plague; The Plague of Rage," and "First and Last," and in portrait busts and figure work, with movement and animation. Since then his equestrian statue of "The Duke of Cambridge," erected in Whitehall, London, outside the War Office, has been recognized as a vigorous performance. His most important work is the monumental quadriga designed to crown Burton's great Arch at Hyde Park Corner, London.

W. Reynolds-Stephens (b. 1862), more devoted to goldsmiths' figures than to purely sculptural searching, must be considered less as a statuary than as a designer. A relief, after Sir L. Alma-Tadema's "We men of Amphissa" (1889), was followed by a "Wall Fountain," "Truth and Justice," and the "Panther and Pallas Athene," both of which are very striking in conception. In the highly decorated "Launcelot and the Nestling," "Guinevere and the Nestling," and similar works, the artist makes use of various coloured metals, ivory, gems and the like, with pretty symbolism. Apart from this work, which is purely decorative, and is based on the study of the line and the form of the figures, "the flora and fauna" of art, there is seen the influence of the ancient world about the lines of his figures and reliefs, which display a charming feeling and refined taste. By his working dance he has done much to bring the English plainer in form and ornament into a style. His bronzes have a power of a sort, too anecdotal "A Royal Game" and "The Scout in War," exhibited in 1908, an equestrian group of great refinement and excellence.

Alfred Drury (b. 1857; A.R.A., 1900) was a pupil of Dalou, whose assistant he was for a time in Paris. The first result was the curiously自家 of the master's style, "The Triumph of Silenus" (1885). "The Genius of Sculpture" and "The First Reflection" (bought by the Tate Gallery); "The Giving of the Sword" (1890); "The New Zealand Prayer" (1890, Manchester Corporation Gallery) were followed by the "Colonnade," a work, which, through its grace, elegance of line, and symbolic realisation of the subject, achieved a great popular success and was acquired by Leeds. The bronze head of "St Agnes" (1894) is one of the first examples of Mr Drury's later style, belonging to the higher order of conception which, generally speaking, he has since maintained. This may be seen also in "Griselda" (bought for the Chantry Chapel at Lambeth Palace in 1904). The "Brunnenstatue," which, as the "Birth of Venus," is a clear representation of the lost statue of "St Agnes" (1894) at the Free Church of England, and in the series of "The Months," at Barrow Court. For the decoration of the City Square at Leeds Drury executed the "Garden of Eden," a large facade, consisting of the colossal figure entitled "Even." His colossal groups fill the large decorative spaces, three-dimensional panels in high relief for the piers of Lambeth Bridge, and the decorative sculpture for the facade of the new Victoria and Albert Museum. In all of these works, or at least the first among the latter are the figures of "Inspiration" and "Knowledge," executed in 1907. Drury's quiet, suave, and contemplative art lends itself well as decorative sculpture to architectural embellishment. His portrait is also good, reticent, and full of character, and as a manipulator of clay he represents the highest contemporary standard of English sculptors.

Frederick W. Pomeroy (A.R.A., 1906), pupil of the Lambeth and Royal Academy Schools, and of Mercié, is of equal taste and ability. After 1888, when he exhibited the bronze statueette "Giotta," he produced many ideal works—Love, the Conqueror (Walker Art Gallery, Liverpool); Peace (Osborne House, Isle of Wight); "In the Piping," "Dionysos," and "The Nymph of Locoh Awe" (both in the Tate Gallery). A Nymph Finding the Head of Orpheus, "Undine," "Pensée," and the clever study of the nude called "The Potter," as well as "The Fiddler," and an india-rubber cat, "Barnaby Collin," that of "A British Boy" is an original and powerful work. "Feronia" (1909) is a nude statue, in bronze, remarkable for grace and sculptural animation. In ideal portraiture he has produced the statues of "Admiral Blake," "Dean Hook" (a colossal work for Leeds), "Oliver Cromwell" (also colossal, for St Ives, Huntingdonshire), Robert Burns for Paisley, as well as R. P. Bonington (1910), "The Duke of Wellington," and the "Earl of Elgin and the Melvin," and similar work, together with the life-size panel of "Archbishop Temple," in bronze, for St Paul's cathedral. In true portraiture, Pomeroy executed the Liberal Memorial Statue of Mr Gladstone, in the Reform League (1903), the "Queen Victoria Monument", and the Duke of Westminster, for Chester cathedral. His work is strong and sculptural, and his statues stand well. He sees nature in a big way, and his development is effective and well designed.

Alfred Toft became known by his statute of "Lillie" (1897), and
emphasized the impression then created by "Fate-Led" (1892, Walker Art Gallery), "Age and the Angel of Death," "In the Sere and Yellow Leaf" (a remarkable study of old age), "The Goblet of Life," and "Hagar." The "Spirit of Contemplation" and "The Cup of Conscience" (1908) belong among the most striking of the sculptor's later works. His portrait busts are often remarkable for their intensity and refinement. His memorials of the Boer War, at Cardiff and Birmingham, in design and silhouette, are among the most striking in the country. In "Mother and Child" (1903) and "Maternity" (1905) he has produced several of the most successful, after dignity, harmony, evenness of balance, and relation of the whole.

Professor Édouard Lantéri, a naturalized Englishman, to whom Britain is deeply indebted, was born in Paris, and came to this country in 1849. He was the pupil of the sculptor, Théodore G. Raingo, and has produced some of the most refined and exquisite works in the country. He is the son of the celebrated sculptor, Jules Lantéri, and has been a resident of this country for many years. representing the arts for the Kelvingrove art gallery at Glasgow. A great mural tomb followed, with “Love Sacred and Profane” as its motif, together with a series of other works of growing artistic importance, which were displayed in the Royal Scottish Academy. The sculptural figure, is in powerful contrast to the three works that appeared in successive years; “Abundance” (a group of a woman and two children) and the marble statues “Atalanta” and “Psyche” and “Chase” (of a young girl), are all in keeping with this trend in form and style. At the same time Derwent Wood produced the two boy figures on the piers to the southward of the Queen Victoria Memorial in front of the Albert Hall, which, in form and expression, does, sculptural character, firmness and delicacy of handling, with a richness of style and appreciation of breadth and simplicity.

Paul Montford, the son of Horace Montford, after a brilliant academic career, has made this mark in decorative sculpture, and is not by such work as “Court Favourites” (1906) that he sustains his reputation, but rather by the sculptural embellishments wherewith the archway connecting the Local Government offices with the Hall of the University of London, to which he has contributed, and one of his best ideal figures, and the 18th century “Viscount Boling- broke’s” and “The Storm Waves” are characteristic of his vigorous style and personal conception and execution.

John Tweed, who studied under Falguière and Rodin, was influenced more by the latter than by the former, and inclines rather to the impressionistic school than to the academic. His statue of Cecil Rhodes (1902) embodied a further development of the School of the South African sculptures.

Sculptors include such accomplished amateurs as H.R.H. the Duchess of Argyll (“A Crucifix” —the Colonial Memorial in St. Paul’s cathedral) and Countess Gleichen. The life-size figure of a soldier killed in the Boer War, “The Harpy”, E. M. Rope (“Springtime”, relief); Lord Blundell (“Fishermen hauling a Net”), Margaret Winser (“Mourners”, a relief), Esther Moore ("At the Gates of the Past"), Edith Maryon (“The Fox”), and Conan Wilson Williams (“The Lorelei, 1907, and charming groups of children."

The sculptor-decorators make a group of workers of striking fancy and ability. Lynn Jenkins, whose frieze in bronze, ivory and mother-of-pearl for Lord Lloyd’s is a remarkable achievement; and he has one of the leaders. He has latterly devoted himself to pure sculpture, such as the life-size bronze figure on a sarcophagus, “Destiny” (1909) and the group of the “three Graces” (1910). His works display a feeling and delicacy of carving. Walter Crane designed for Manchester a sculpture that is remarkable for beauty of conception and felicity of symbolism. Alexander Fisher and Nelson Dawson should be included in the groups. Other sculptors already mentioned, including Thornycroft, Gilbert, Frampton, Pomeroy, Colton and Toft, have all devoted themselves to sculptural decoration pure and simple, whether in metal, stone, or marble.

A man of similar force is Joseph Epstein, who replaces refinement by vigour, archaic simplicity, and primitiveness of outlook, as though caught up in the sweep and passion of the garden of the Tuileries. His work, in which he leans towards the modern German view, is mainly decoration for buildings; his most discussed productions are the statues (1907) on the topmost story of the South Africa Building in the Strand.

Richard Garbe, a sculptor of equal strength, was a pupil of the London County Council School of Arts and Crafts and began to exhibit in 1898. Rugged power both in subject and execution mark his productions. His ideal works, such as “The Egoist” (1906), “Man and the Ideal” (1907), “The Idealist” (1908) and “Undine” (1909), illustrate his range of thought and reveal his uncommon vigour which amounts, it might be said, to well-controlled, idealistic brutality; they are broad and impressive, and are conceived in a monumental spirit.

Charles L. Hartwell has grace and strength combined. The nude figures, with their lyricism, recall the work of the West of Ireland’s, and the “Bathers” (1907), are both works of refinement and elegance, and “Dawn” (1909) displays unusual charm and, like the others, offers a silhouette of much interest. With the exception of “Chantrey”, his “Sirens” (1910), vigour is the note of the small group “A Foul in the Giants’ Race”, which was acquired by the Chantrey trustees in 1898.

Benjamin Clemens, pupil of Professor Lantéf and the Royal College of Art, is another member of this talented group. His life-size group, “Sappho” (1902), “Cain” (1904), “Eurydice” (1906), and “The Three Graces” (1907) and his life-size group, “The Grandfather”, (1906) and “Ariadne”, which, translated into marble and re-exhibited in 1908, was bought by the trustees of the Chantrey Collection and is now in the Tate Gallery. His other more important works include “The Long, Long Dreams of Youth” (1906), “Narcissus” (1906), and “Prometheus” (1909). Without revealing any striking originality, “Ariadne” reveals a good sense of the sculpturalsque, and his busts are refined and good.

Oliver Whelstey, formerly assistant to Brock, and pupil of Aman-Jean, has done much decorative work. His life-size recumbent statue of the Boulougne (1906) is a relief of high standard of beauty. F. Tyrrell, who first attracted attention by his decorative figures on Professor Pite’s house in Mortimer Street, London, has shown much fanciful grace in his “The Ideal”, such as “The Whips” (1906).

Reuben Sheppard has shown himself poetic and pleasing in symbolic suggestion in his striking half-length group “The Music of Destiny”, and his “The Eve of” of the same year, produced a greater work.

The Irish sculptor, John Hughes, achieved a great success by his monument to Queen Victoria erected in Dublin. It is a fine combining of sculpture and architecture, with a feeling of sincerity and simple beauty; and although it reveals too great a love of ornament it is impressive alike in mass, design, silhouette, and general arrangement. There should also be mentioned, among the younger sculptors, Mortimer Brown (“St John the Baptist”), David B. Brown (“The Spirit of Ivy”), Bertram Pagram (“Down to the Sea”), the scoppers, McFarlane Shannan (“The Arcadian Shepherd’s Dream”), Ken- sc Stops, and J. Crossland Mclure (“Leicester War Memorial”); Herbert Ward (bronze of South African savages, “The Idol Maker” and the like), Alfred Turner, Charles Pitlworth, and F. Arnold Wright.

The sculptors who have produced works of the same order as that of their colleagues include the following names: Alfred Stevens, Sir Edwin Landseer, Lord Leighton, J. M. Swan, W. Reynolds-Stephens, George Richmond, and G. F. Watts. George Richmond’s real talent may be said to be in the sphere of architectural sculpture. His son, Sir William Richmond, K.C.B., has also practised in sculpture—the memorial tomb of Mr and Mrs Gladstone is his. Watts educated himself artistically on the Elgin Marbles, and in the works of the great sculptors he found his source of inspiration. He is high among the world’s finest sculptors of the 19th century. The recumbent effigy of “Bishop Londsdale” in Lichfield cathedral was an epoch-marking work, not only in the technical matter of the bold treatment of the drapery, but in largeness and breadth and its remarkable sense of style, and the “Lord Lothian” in Bickling church is also very remarkable. The artist then produced the colossal equestrian group of “Hugh Lupus” for the duke of Westminster (Eaton Hall), a composition as imaginative and original as it is grand and sculpturalsque. Then followed “Physical Energy,” another equestrian group, which, after being about twenty years in progress, was cast in 1909. The group is an example of unostentatious strength; and one of his best works is the statue of Sir George Cayley, which is to be seen at Bunratty Castle. His “Clytie” is surpassed in bigness and classic purity of style and feeling by nothing ever produced in England; it is a complete and noble thing. There is no sculptor who has more power to obtain the grandeur of form which is so wonderful in the Greek masterpieces. Simple in line, intense in character, full and rich in modelling, Watts’s work is instinct with vigour, breadth and movement. It seems to represent the plastic expression of the life of the sculptors of the younger school not to be led away by the dainty and fanciful, however alluring. Especially it warns them against what has become a feature with a certain section—the devotion to materialism and embellishment, with the result that it is not he who can make statues necessary, but is he who is the necessary sculptor. Watts himself created a style of his own, and although it has coloured the work of some of the younger sculptors of the day, it is not likely to obtain any very wide hold, or
to exercise permanent influence for evil. The variety and independ-
ence of the British School are such that it is impossible to define any
particular tendency in its practice other than towards an ever-
increasing rise in the level of technical excellence and the plastic
design. There is, broadly speaking, a general stand against the
"modernity" imported into sculpture by the younger members of the
British School; this is being carried out to the art to the illustra-
tion of everyday life and to the rendering of effects which
seems considered to be the function of the plastic arts.
(M. H. S.)

After 1870, when a great artistic movement marked the
resuscitation of France after the Franco-German War, sculpture
especially revived with exceptional vigour, and the last
thirty years of the 19th century were a memorable
epoch in its history. Not that many men of genius suddenly arose, for most of the artists
who then came to the front had already distinguished themselves by equally noble work; but sculpture, like the other arts,
benefited by the pause for thought, and by the ripe and manly
tone stamped on the national mind by the discipline of events.
Intense ardour animated the admirable group of French sculptors:
the oldest still found some lofty expression; the men in their prime showed their powers with unwonted force and fire;
and the younger generations grew up in rapid succession, a
close phalanx of artists who, in the most increasing, for if we include only living artists, and those who lived
honours in the Salons, we find a list of seven hundred exhibitors.
The first generation of survivors of the war, who led the way
in the new period, still boasted of such men as Dumont (1801-
1884), Cavelier (1814-1894), Bonnassieux (1810-1892), Jouffroy
(1806-1884), Schoenewerck (1820-1885), Carrier-Belleuze (1824-
1887), Aimé Millet (1819-1891) and Clésinger (1814-1883).
These artists, born in the first quarter of the 19th century, were
for the most part each the head of a studio, their teaching being
carried on till the end of the century. Next to them followed
their immediate pupils, already their rivals, and some indeed
famous before the new era; such were Guillaume, Dubois and Frémiet;
others, fresh from the Academy at Rome, at once rose to
distinction, and all combined to form the remarkable group
of artists to which the modern school of French sculpture owes
its world-wide fame. At this time Eugène Guillaume (1822-
1905) was exhibiting his "Roman Marriage," his "Bust of Mgr
Darboy," his "Orpheus," and "Andromache," works of learned
skill and severe distinction. Paul Dubois (1829-1909) executed his
"Narcissus," and the "Tomb of General Lamoricière," on
which the decorative figures of Chappu, Lagier, Fauchez, and
Cardinal Courage are popular favourites, full of grave and pathetic
feeling. Chappu (1833-1891) executed his exquisite figure of
"Youth" for the tomb of Henri Renoult, and that of
"Thought" for the tomb of Daniel Stern, his monuments to
Berruyer and to Mgr Dupanloup. Barrias' (1842-1909) "First
Interment" won him the medal of honour in 1878; besides his
patrician group of the "Defence of Paris." Falguière
(1831-1900) produced a remarkable series of statues, character-
ized by their life-like power; some dignified or pathetic, as
"St Vincent de Paul," "La Rochefoucauld," and "Cardinal
Lavigerie"; some full of bold and dashing spirit, as his "Diana,"
his "Nereids," and "Hunting Nymphs." Mercié gave us
"Gloria Victis," "Quand Même," and his monuments, among
which that called "Memory" must be mentioned; his pediment
for the Tuileries; his "Genius of Art," &c. Delaplanche
(1836-1890) produced his "Mother's Teaching," "Music,
"The Virgin with a Lily," and "Aurora," and Allar "The
Death of Alcestis," and to these names must be added those of
Degeorge, Delaplanche, with Chappu, gave so powerful an impetus to the
art of the medalist; of Gauthier, Huyot, Thomas, Cauchoix,
Lafrance, Maniglier and Moreau-Vauthier—one of the men who
with Gérôme (the painter) and Frémiet, revived the taste for
coloured sculpture, a style first attempted long before by Simart;
besides many more. These artists created a supremely healthy
and vital school of sculpture, dignified and elegant, learned and varied,
fresh and charming, and, above all, as single-hearted and as well trained as in any period of history.

To understand, however, the position of contemporary sculpture in France, it will be necessary to look back even
further than 1870. It must be remembered that the whole
history of French sculpture, as far back as the 17th century,
is connected with the invasion of Italian influence in the 16th
century, which remained paramount over French art for more
than three hundred years. Statue-making, until then an art
of expression—national, popular, human and Christian—lost
its primitive character under the dilettante refinement of an
aristocratic society closely gathered round a king who made art
subservient to his splendour or his pleasure; it sank into
superficial and conventional beauty, and became almost ex-
clusively the interpreter of these ideas of ingenious or flattering allegories
derived from the dead fables of heathen mythology. Among
that which would be expected from this was choice elegance of line,
a harmonious treatment of mass and composition, a loving
study of the nude—in short, a purely plastic type of art. And
sculpture had become the art of the nobility and of the court,
having no hold, as it had in the past, on the great human family—
the nation. Still, even at the high tide of Louis XIV.'s reign,
some dissatisfaction became evident, even some rebellion, in
the great though solitary spirit of Puget, who strove to animate
the marble. Barye and Cézanne, with their convention,
asserted their right to infuse life and passion and movement
into their statues, seeking them in the despised province of stern
reality. The great cataclysm of the Revolution, which might
have been expected to break the bonds of thought, turned men's
minds to contemplate the Antique, and though it certainly
modified the style of sculpture, was far from changing the source
of its inspiration, since it sent it once more to the Antique.
Indeed, at the beginning of the 19th century, when the teaching
of the Antique was paramount in spite of Gros, who, then in the
master's studio, was unconsciously sowing the seed of romanticism
in painting, a robust individuality was developing among
French sculptors—a spirit somewhat rugged, independent,
and partly trained, beyond the academic pale, prepared to carry
on the tradition of Puget, and quite simply, without any revolu-
tionary airs of innovation, to shake off torpid conventionalism.

By the mere force of a strong plebeian temperament Rude quite
naturally happened on a style of art—high art—at once expressive
and popular. He was the first to raise the cry of liberty in
sculpture, and he left successors who bravely worked out what
he had begun. Barye and Cézanne were both in 1875 on the
threshold of an era to which they bequeathed a fruitful era. The
Barye carried on Rude's tradition of expression, and transformed
what had previously been mere decorative carving into a new
style and branch of art now adopted by a whole phalanx of admirable artists: the sculpture, namely, of animals, the first
glance that sculpture had till then bestowed on nature apart from
man. Carpeaux, who was much younger, was in his day—
as Puget had been—an exceptional personality; he carried on
the slow revolt of two centuries which was to break the narrow
mould of school-training and infuse a soul of more ardent vitality
into sculptured forms.

The importance of these two great artists in relation to con-
temporary art was not fully seen till after the July revolution. In point
of fact Painting had until now amply filled the new part assigned to Art; its vehement efforts had strongly influenced public
opinion; and as, in the early years of the 19th century, it had
largely extended the field of human vision over the remote
past and the domains of feeling, with the promise of surveying
all nature, space and time, the spirit of the age asked no more,
and did not expect sculpture, too, to abandon old-world myths.
It must also be said that those sculptors who at that time carried
on the classical tradition had renewed its youthful by their learned
and enthusiastic revolting; they had reverted to the past,
but it was the past of the really great masters, either of antiquity
or of the early Florentine school, no less enamoured of life,
beauty and nature. Guillaume and Paul Dubois, Chappu and
Falguière, Mercié, and Delaplanche were the rivals in sculpture of the
great idealist painters—Poussin de Chavannes, Gustave
Moreau, Ricard, Delaunay, Baudry, and Henner—who were
working at the same time.

D. PUECH—The Siren.

E. GUILLAUME—The Roman Marriage.

R. DE SAINT-MARCEAUX—Genius guarding the Secret of the Tomb.

A. MERCIE—Souvenir.

A. RODIN—The Kiss.
Sculpture

This is what accounts for the fact that romanticism then found so little acceptance among sculptors. But in the next generation the sowers of the seed might see their harvest. The pupils of Rude, of Barye and of Carpeaux, allied by school sympathies—the little drawing-school conducted by Lecocq de Boisbaudran, which, in despite of the studios of the Beaux Arts, created a group of independent and highly original artists—formed the centre of a distinct force which increased day by day. Young men, fresh from Rome, persistently kept up the spirit of the Antique. A galaxy of learned and refined artists was represented (1837-1838-1839-1841). "Orpheus," Idrac (1840-1884) ("Mercury inventing the Caduceus," "Salammbo"), Marqueste ("Galatea," "Eros," "Perseus beheading the Gorgon," "The Rape of Europa"), and Coutan ("Eros," "A Woman carrying Leaves," "A Sergeant-at-Arms," &c.), Lanson ("The Iron Age"), Longepied (1845-1888) ("Immortality"), Peinte ("Orpheus charming Cerberus to Sleep"), Gustave Michel ("In a Dream," "Meditation"), Carles ("Innocence," "Abel"), A. Boucher ("Earth," "Au but"), besides Carlier, Léonard and Turcan (1845-1850-1851), soon to be followed by another generation: Puech ("The Siren," "The Muse of André Chénier"), Verlet ("The Monument to Maupassant," "Orpheus"), Larche ("The Brook and the Meadow," "Violets"), Sicard ("Hagar and Ishmael"), and Daillon, Escoula, St Lami, and many more. In opposition to these there stood a group of sculptors, young and old, who sought their subjects in mythology, legend, history or poetry, or merely in the scenes of daily life, and aimed at presenting the ideal of their time under its external aspects, but more especially the deepest emotions of the modern mind. It was Frémiet, with his striking and vivid conceptions, who led the advance with new and dramatic subjects: primal man and the fierce beasts with which he disputed his rule ("A She-Bear and a Man of the Stone Age," "An Oran-utan and a Savage," "Gorillas"), or embodiments of the heroes of the past ("Joan of Arc," "Saint Louis," "Saint George," "Louis of Orleans," &c.;), then followed Just Bequet (1829-1897), the excellent artist who represented the stricken figures of "Ishmael" and "Saint Sebastian"; Christophe (1827-1892), with his symbolical pre-sentiments of The Human Comedy, "Fortune" and "The Supreme Kiss"; Aubé ("Monument to Gambetta," "Dante," "Bouilly," &c.); A. Legros the naturalised English painter and sculptor, "common man" with his "legend," "Egyptian" or "Ishmael," or "Saint John the Baptist," "The Age of Bronze" or "The Burgesses of Calais," "Victor Hugo" or "Balzac," he avoids all the conventional details and attributes of his personages to embody the very essence of humanity as expressed in the quivering flesh. He, like Carpeaux, has gone back, to Dante and to Michelangelo to force the "Gates of Hell"—the subject chosen for the entrance to the Musée des Arts Décoratifs—and to read the deepest mysteries of the human soul. His is the art of suffering, anguish and terror, of cruel and despairing pleasure—a wild cycle of proud and bitter melancholy. All the efforts made in the past to infuse life into Art, all that Puget, Walpurg, Figale and Houdon tried to effect, and that Rude, Barye and Carpeaux strove for in their turn—all this was part of the endeavour of these their successors, but with a clearer purpose and more conscious aim. By good hap or providence they were greeted on their way by the voice of the most devoted apostle who was to preach the new doctrine, namely, Louis Courajod, the founder of the French sculpture gallery in the Louvre. From his professor's chair in the schools he cursed the Italian intruders of the 16th century for having debased French art subject "nobles chimeres," extrava-gant gestures and allegorical antites; and he carried his pupils and his successors back to the great national period of French sculpture, which, in the dark medieval ages, had created the splendid stone images of the noble French cathedrals.

A marked individuality now appeared in protest against academic traditions—Albert Bartholomé. He, after beginning as a painter, was tempted by sculpture, more particularly, in the first instance, by a wish to execute a monument to a comrade he had loved. From this first effort, carried out in his studio, without any school training, but with a firm determination to master technical difficulties and fulfil his dream, followed a broader purpose to execute a great expressive and vitally human work which should appeal to the heart of the populace. From this arose the idea of a "Monument to the Dead" in Père Lachaise. Bartholomé had started without a guide, but he instinctively turned to the great tradition of Northern Christianity, which his mind subsequently associated with that of the antique race who had ever done most honour to Death, the people of Egypt.

Thus two currents contended, as it were, for the guidance of French sculpture, on either of which may be traced the influence of the Italian, of the Greek, of the Roman, of the Latin and Hellenic origin, to which the French school, since the time of Jean Goujon, has owed three centuries of glory. This is the pagan art of the South; its marks are balance, reasonableness and lucidity; it was the composer of apotheoses, the preserver of the ideal of beauty. The other, reverting, after centuries of resignation or of impotent rebellion, to the genuine French past which produced the noble works of the 12th, 13th
and 13th centuries—to the tradition of Flanders and of Burgundy, which was smothered in the 16th century by Italian art—to the Christian and naturalistic art of the North, which renounced the canons of antiquity, and expressed itself by methods essentially human and mutable, living and suffering—appeals to all mankind. The immediate result of this antagonism was no doubt a period of agitation. The outcome, on the whole, is confusion. But the Luxembourgeois art, the "chapels of fops" and "tumult"—so vividly inspired by the facts or ideals of contour, colour, and contrast—the young artists like Jean Boucher ("Evening," "The Antique and the Modern"), Roger Bocche ("Childhood," "Cold"), Derré, Boverie, Hippolyte Lefebvre, Deurnelles, Gaston Schnegg, Pierre Roche, Fix-Masseau, Coutelhans, and others seem to show that French sculpture is about to assume a solid position on a sound foundation, while not ceasing to keep in touch with the tastes, aspects, and needs—in short, the ideal—of the day. Thus, while painting engaged the attention of the public by its new departures, its daring, and its very extravagance, sculpture, which by the conditions of its technique is less exposed to transient influences, has, since the close of the 19th century, developed normally but with renewed vigour. If the brilliancy of the school was not so conspicuous and its works gave rise to little discussion or speculation, it is not the less certain that at the beginning of the 20th century the younger generation offered the encouraging prospect of a compact group of sculptors who would probably leave works of permanent merit. Yet sculpture too had gone through a crisis, and been deeply stirred by the currents which so violently agitated all modern thought. We have already spoken of its "state of mind," that consciousness of a glorious past which link it to the antique, and the craving to render in its own medium, with greater freedom and fuller force of expression, all those unuttered meanings of the universe and of contemporary thought which the other arts—painting, literature, the drama, and even music—have striven to identify and to record. But the acute stage of tentative and incoherent effort seemed in 1910 to be past; inspiration had returned to its normal channel and purely plastic expression.

The powerful individuality which had the most vital influence on modern sculpture is French, and, it may be added, on many foreign schools, is that of Rodin. During the ten years which followed the Great Exhibition in Paris (1900) and the special display of his works, his reputation spread throughout the countries of the world and his fame was fully established. The state liberally contributed to his triumph by commissions and purchases, and in the Luxembourg Gallery may be seen five and twenty of his finest works. His productiveness was unbroken, but it was chiefly evolved in relation to his first great conception, "The Gate of Hell"; its leading features were taken up again, modified, expanded, and added to by their natural, if careless and impulsive, or pathetic ideas—of which there is need to name only "Les ombres" (the Shades) and "Le penseur" (the Thinker), now placed in front of the steps of the Panthéon; several monuments, as for instance to Victor Hugo, to Whistler, and to Puis de Chavannes; besides a large number of portrait busts. Enthusiastic literary men, and the critics of the day who upheld Rodin in his struggles, more from an instinct of pugnacity and a love of paradox than from conviction and real comprehension of his prodigious and fertile genius, have tended to give him a more "real" or unadorned form than appears to him, as he appears as a sort of Dante in sculpture. Though his art is vehement in expression, and he has revealed in the presentment of agonized suffering and the poignant melancholy of passion, it is by the methods of Michelangelo and essentially plastic treatment than power of modelling. His modelling is indeed the most wonderful that modern sculpture has to show, the most purely plastic technique, and this characteristic is always evident in his work, combined with reverence for the antique. Rodin made his home in the midst of Greek statues, a museum of the antique which he collected at Meudon; and there, long after his late work, such as the male torso which he exhibited at the salon, has a direct relationship to the marbles of the Parthenon—the Ilyssus and the Theseus. It is the fuller understanding of these

characteristics of Rodin's work, apart from some exaggeration of expression to which they have given rise, that has had the most valuable influence on the younger generation.

Nothing need be particularly noted as to the development of masters long since recognized, whatever branch of the school they belong to; such as Frémiet, Mercié, Marqueste, Injalbert, Saint-Médard, etc., who, to judge by their maturer works, continued the school of the old masters and in particular the "Vulgarité of Bartholomé, after asserting itself in his crowning effort the "Monument of the Dead," found very delicate expression in numerous works on a more modest scale, nude figures, monumental groups, and portraits. "Hippolyte Rousseau for the Panthéon (1909) is a fine example of his art.

We must not omit, after the elder generation, the name of Alfred Lenoir, who, after a long career marked by great successes both at home and abroad, dealing successfully with the difficult problem of modern dress, as in the monuments of Berlioz, to César Franck, to Marshal Conrobert, in the bust of M. Moreau, &c.; nor that of Gustave Michel, a spirit lof tender sensibility, a spirit of poetic feeling, and a spirit of tender feeling, in those delicate and profound paintings of."Le rêve" (the Dream), "La pensive" (Thought)—both in the Luxembourg Gallery,—'Au soir de la vie" (in the Evening of Life), and "Amour." H. Gréber, after some realistic works, such as "Le Grisou" (Fire-damp) and portrait-statuettes, as the tiny full-length figures of "Frémiet" and of "Gévina," distinguished himself in the Salon of 1909 by a statue of "Narcissus" at the edge of a fountain, in the form of a kneeling Alexander, with two maidens first, the younger men of the school we must name Verlet, Gass Vermeire, Ernest Dubois, and Larche, all employed on important works.

It must indeed be said that in France, apart from the select committee of the Municipal Fine Arts, the government is not a supporter of the younger sculptors. The former Council of Fine Arts in Paris in 1856 entitled the sculptors to bring their works to the Academy, and often to decorate the park of Saint Cloud; the present council has encouraged a strong competition among our sculptors by deciding, at the request of Carabou, that in 1909 the Palais de la Découverte should be decorated by carrying on the decorative work in the Panthéon, &c. They have thus given commissions to a group of rising artists, who quickly made a distinguished reputation. The names of these younger sculptors have been seen and recognized here; in the Luxembourg Gallery, they came into the front rank of their contemporaries by their conspicuous talent and the firm expression of their ideals. The first fact to be noticed in them is the extraordinary elevation to importance of their time. Many artists before them were indeed tried by this idea: Legrand towns with monumental statues, the government has always taken an interest in encouraging the art of sculpture. Any considerable work is encouraged to be executed without its support. The former Council of Fine Arts in Paris in 1856 entitled the sculptors to bring their works to the Academy, and often to decorate the park of Saint Cloud; the present council has encouraged a strong competition among our sculptors by deciding, at the request of Carabou, that in 1909 the Palais de la Découverte should be decorated by carrying on the decorative work in the Panthéon, &c. They have thus given commissions to a group of rising artists, who quickly made a distinguished reputation. The names of these younger sculptors have been seen and recognized here; in the Luxembourg Gallery, they came into the front rank of their contemporaries by their conspicuous talent and the firm expression of their ideals. The first fact to be noticed in them is the extraordinary elevation to importance of their time. Many artists before them were indeed tried by this: Dalou, the Belgian sculptor Constantin Meunier, the American St Gaudens, and among their immediate predecessors Alfred Lenoir. But now, this purposeful bias is more strongly marked; the new men do not restrict themselves to the merely monumental or commemorative aspect, to the picturesque treatment of the miners or the tillers of the soil. Every type of the people, even the middle-class citizen, is initiated in the presentment of a radiant spirit in feeling. And 1909, was one of the earliest of these younger realists, and he gave it expression not only in sculpture proper, but in medal work, and bas-reliefs inserted in draped figures in decorative furniture and in every form of ornamental sculpture. Thus he represented the "Sucking her Infant" (1883) and a large bas-relief of "Bakers," executed in stone and placed in the square of St Germain des Prés, Paris. "Baban," the popular crocodiles gave a wider outlet to the same ideas. An instructive fact is that one of these men was a pupil of the Ecole des Beaux Arts and of the academy at Rome. Hippolyte Leféivre devoted himself to proving that the common aspects of modern life are not an insuperable problem for the sculptor's art; may, that they actually afford him new subjects most suitable to his methods. He persisted in this purpose, and finally won the admission of his fellow-artists and the medal of honour for his "Jeunes aveugles" (Blind Boys), in the Luxembourg Gallery. They have also by him in this manner of the day, handled with truly synthetic breadth, "Summer," a youthful female figure in an ordinary walking attitude, modelled over a nude figure derived from the people, and in episodes of daily life, as in the "Accident," a recumbent figure surrounded by about twenty other figures, drawn from every rank of society and rendered with that firm decision and breadth of treatment with which he is the first and constant of art. This work earned him a first prize in the Salon of 1909. These awards are an unmistakable sign of official recognition of these artists, who have long been disregarded and disapproved. Such encouragement has borne fruit. Frédéric Soulié who both had won the prix de Rome, started boldly on the new road, one in his monumental sculpture (a "Monument of the War of 1870" at "Tours") and another in a monument to Bertagna; a medal for a college for girls at Tours), the offshoot in works of popular feeling of Constantin Meunier by subjects of labour, in town or country, small figures in bronze, or large and important decorative groups, as "La Carrière" (the Quarry) and "Le Défrichement (Turning the Sod), a group of six oxen led by two men. This was intended to decorate the Champ de Mars.

Meantime the study of beauty in the nude, far from being neglected, succeeds charmingly on the part of a sculptor who represents an antagonistic school. Mademoiselle Camille Claudel, whose works, born of Matisse typify the extremes of this manner; Emile Bourdelle, Aristide Maillot and Lucien Schnegg might be regarded as some of the artistic thoughts, the same science as that in their opposition to that, and vehement or equable temperament they all reveal in the highest degree a fine sense of purely plastic qualities; in them we find no lapse into the pictorial, no purpose or "arrière-pensée" that is not of the essence of sculpture. Emile Bourdelle, who loves us busts of Beethoven, Carpeaux, Heracles (in the Luxembourg Gallery), Pallas Athena, and the large group of "Wrestlers of Tarn et Garonne" for completion in bronze. Maillot for his part prefers to work in marble and stone with large surfaces, after the tradition of the ancients; he exhibited in the autumn Salons several heads of girls and of old women, a figure of a youth in bronze (1909) and a stooping nude figure in plaster. Lucien Schnegg's (1909) reputation would have been assured by one bust only from his hand, that, namely, of his pupil "Mademoiselle Jane Poupée." This in the Luxembourg Gallery, and is a masterpiece for grace and dignity in the hands of the famous sculptor.

Besides these there should be mentioned Jean Boucher, who has executed a monument to Renan, the "Evening of Life" and "Ancient Dance," a most elegant and tasteful exponent of the modern art, with social tendencies and graceful emotional feeling; Max Blondel, ("Au moulin," a very witty, as is seen in a fountain with frogs entitled "Jeunesse" (exhibited in the Royal Academy, 1910) and "Love" (in the Luxembourg and the Paris "Salon," 1910); and Auguste Carabin, who, by an intimate and personal touch, shows various materials—marble, stone and lead; Moreau-Vautrin, D. Poisson, Fix-Masseau, Gaudissard, David, Jaccquot, Despiau, known by a few busts, Drivel, Nicauxse and Michel Cazin.

Sculpture on a small scale was effectively carried on by L. Dejenne, Vollgren, Carabin, who carves in wood, Cavallion and Fèmont-Meurice. The sculpture of animals, since G. Gardet and P. Péter, has always been a specialty of the artists. We see, for example, J. Buti, Christophe, Navpellier, Bigot, Perrault-Harry, Marie Gautier, Berthier and others (L. Bé).

The inevitable reaction in Belgium following upon the long period of dry and lifeless academic sculpture is difficult to trace to any particular pioneer or leader. Nevertheless the three men who certainly mark this period of reaction are Guillaume Geefs, De Bay and Simonis. There is, however, very little to be remembered of these men except that they were the best of their time. Geef's work was marred greatly by his frivolous and unessential details and poverty of thought, together with a frigid coldness of expression in his modelling. In his statue of General Belliard at Brussels, however, he shows the tendency to search for a broader and truer interpretation that warrants his being mentioned as belonging to the movement against the academic school. De Bay was a sculptor of a more artistic temperament, and though some of his works are charming and sympathetic when judged by the standard of his own day, few show evidence of advanced ideas. The work of Simonis is very different. Beyond the mere endeavour to grasp something more true, his work is fresher and perhaps more honest, more bold and gifted with more life. Such qualities are shown in his "Young Girl," in the museum at Brussels, and "Godefroid de Bouillon," in the Place Royale. Besides these three sculptors there was no man of note to strengthen the revival of sculptural art until Paul de Vigne (1843–1901). His early work bears the unmistakable influence of the Italian Renaissance. In "Young Girl," De Bay became a follower of the true classic ideal, nor that the so-called classicism of Canova and his followers. He was a prolific artist, and from his numerous works it is difficult to pronounce one as his masterpiece. Perhaps that most generally considered his best is the sepulchral marble figure of "Immortality" in the museum at Brussels. Almost its equal in beauty and truthful rendering are his two bronze groups, "The Triumph of Art," on the façade of the Palais des Beaux Arts at Brussels, and the monument to Breydel and De Koninck at Bruges. Among his other works are "Fra Angelico of Fiesole,
SCULPTURE

the bust of Professor Moke, at Antwerp, "Heliotrope" in the museum at Ghent, "Portrait of M. Charles van Hütten," the Wilson monument in the Musée Communal, Brussels, the statue of "Marnix de Sainte Aldegonde" in Brussels, the monument erected at Courtrai to Mgr de Hearne, the monument of Meddepenningen at Ghent, and the monument of the Gevau family in the Cemetery at Evere.

The art of Charles van der Stappen (b. 1843) is decorative in character, mostly applied to architecture, though he proved himself a capable sculptor-produging many statues, reliefs, groups, and mental works, and statuettes. His works include a silver centre-piece executed for the town of Brussels, the statuette of William the Silent, the Petit Sablon, Brussels, a bust for the monument of Edouard Agneessens in St Isaac Leopold, St Michael in the Gothic hall of the Hôtel de Ville, Brussels, the monument to Baron Coppens near Shaeld, the Alexandre Gendebien monument at Brussels, statues for the Albionara theatre and Caryatids for the architect de Curtis' house in the city, and the group of tired workmen, called "The Builders of Cities."

The work of Thomas Vincente is characterized chiefly by its vigour and vitality. Vincente is classed by some authorities as belonging to the classic group, but his work is less graceful than that of d'Vigne and more vigorous and life-like than Van der Stappen's. There is perhaps more than ordinary life in his work than in that of any of his contemporaries. The many portraits he has executed reveal a great power in grasping the essentials of portraiture as well as the discrimination necessary to discard everything that does not contribute to the whole and to the expression of character. His work was shown at the exhibitions in the Brussels Museum, "Music," on the façade of the Palais des Beaux Arts, the Godecharle monument in the Park, the bronze group of the "Bride and the Groom." When the "Denkmal des Deutschen" was erected in the Avenue Louise, and the statue "Agneessens" in the Boulevard Anspach, Brussels. There is also a bronze group of horses and Tritons for the park of the Château d'Ardenne.

Some men have exercised such influence upon Belgian sculpture as Jef Lambeaux (1852–1908), the Flemish artist. He was born in Antwerp of poor and obscure parents. At an early age he showed great aptitude for drawing, and after a very meagre education he was apprenticed to a wood carver. While there he studied at the Belgian art schools. At sixteen he completed his course and undertook his first important commission, that for two reliefs for the tympanum of the French theatre. He was successful for a time in producing statuettes, but the work of sculpture he succeeded in acquiring was an abandonment of sculpture and to take any work he could get. After a period devoted to odd employments—sometimes painting, sometimes modelling—he again saved money to enable him to produce some good works. The first of these, "The Kiss," was exhibited at the Brussels Exhibition. It had a great success and was bought by the Antwerp Museum. This discovery of a sculptor of talent led the town of Antwerp to find the means for sending Lambeaux to Italy. After studying in Florence he returned to produce "La Folle Chanson," which by some is considered his masterpiece. The group of "Intoxication" produced as much animation and motion as is satisfactory. The figures show a curious and unpleasant development everywhere. The bust of "The Hunchback" in the Chamber of Deputies is as good as any of its class. The library of his are "The Robber of the Eagle's Nest," "The Wonderful Colossal Relief," "The Passions of Humanity," "The Wrestlers," and "The Orgy."

Less bold and energetic than Lambeaux is the work of Julien Dillens (b. 1849). Though it does not possess that sense of life and the distinctness which is characteristic in his brother sculptor, his standard of excellence was steadier. He will be remembered as one of Belgium's finest decorative sculptors, for his best work has been done in architectural enrichment. His pediment for the Hospice des Trois Alliés at Namur, a group of three griffins in the roof space of modern times. Dillens' masterpiece is without doubt the group of "Justice" in the Palais de Justice at Brussels. He is responsible for many other important works, the chief of which are the busts of De Pode Etienne Lemaître, Van Orley in one of the squares of Brussels, "The Lanquenets," on the summit of the Royal Palace (before its reconstruction), a statue of Jean de Nivelles on the front of the Palais de Justice at Nivelles, and the marble statues of St Victor and St Amand at Epernay.

There is yet another artist who ranks as one of the greatest sculptors of Flanders. This is Jules Legaë (b. 1862). He was a pupil of Jef Lambeaux and was sent to study in Paris. For further work he took the suggestion from that of Dillens and Lambeaux, than that it is what may be termed "delicate" and possessed a distinctive charm of spontaneity fresh to a manner which is so much the vogue. "The Father and Child," shown at Florence in 1891, is a good example of this quality, while "The Kiss," a terra-cotta bust, shows his spontaneity.

In the Walloon provinces two sculptors have done much for the renown of Belgium. Achille Chainaye and Jean Marie Gaspar. Achille Chainaye (b. 1862) is not a prolific sculptor, but all his work is inspired, it would seem, by similar motives and ideas to those which inspired the early sculptors of Florence. The scarcity of his works may be accounted for by the fact that his productions were few and his work, though richly conceived and seemingly with scant success, he abandoned sculpture and devoted himself to painting.

The work of Jean Marie Gaspar (b. 1864) shows the inspiration of a whole gamut of emotions, but hardly the continuity of purpose necessary to carry his work far. He studied under Lambeaux, and, while still in his master's studio, produced a wonderful group, "The Abduction," two men on furious, just-rising, horses wrestling for the possession of a struggling woman. This group was shown at the Paris Exhibition, and immediately gave him immesured fame to the then unknown sculptor. Of his other finished works may be cited "The Brave," an Indian on horseback; "The Embracing Parents," a group for the second place in Amsterdam Children's Home; "The Young Girl on a Rock," and the "Panther," destined for the botanical gardens at Brussels.

From the death in 1904 of Constantin Meunier (b. 1831) up to the present day, Belgian sculpture has made a great advance. Meunier is the creator of the pseudo-classic, but is influenced by the masters of the Renaissance. He is simple, free and straightforward, true almost to brutality, but withal inspired by a love of doing homage to the people of the people. His style is Neo-Classic, and it is much influenced by him, and he soon forsork sculpture for painting. He was for some years one of the group of independent painters. His chief productions are "Fire-damp," in the Brussels Museum, "The Mower," in the Jardin Botanique at Brussels, "The Gile," and "Puddlers at the Furnace," both in the Luxembourg Museum. "The Hammerman," the statues on the façade of Notre Dame de la Chapelle, and the monument to Father Damien at Louvain. What is the Lelangie is the author of the masterly monument erected at Evere to the English officers and men who fell at Waterloo, an elaborate work full of imagination and sculptural force and an admirable work of imagination and sculptural force, and an admirable work of invention. From this time Meunier continued on the lines of his earlier works which gained to him new believers and friends. Among his most recent works are "Fire-damp," in the Brussels Museum, "The Mower," in the Jardin Botanique at Brussels, "The Gile," and "Puddlers at the Furnace," both in the Luxembourg Museum. Among the leading sculptors of to-day is to be reckoned Charles Samuel, who leans towards the traditions of yesterday.

Canova so dominated the world of sculpture at the beginning of the 19th century that the pseudo-classic style which he introduced remained typical of all the Italian sculpture of note until Bartolini led the movement which finally crushed it. In Rome Canova completely overshadowed all other sculptors except perhaps Thorvaldsen, the Danish sculptor, who resided for some time in that city. It is true that Pompeo Marchesi (1789–1858) at the outset of his career enjoyed great popularity, but at the time of his death he was well-nigh forgotten. The interval between the death of Canova and the rise of Bartolini and the next school was filled in by men of mediocre talent, in whose work the influence of the leader of classicism is strongly marked. Little beyond his leather apron—attired in his workmen's garb—showed the man who made the monuments destined to grace the front of the Louvre, the Eglise de la Madeleine, the Palais de la Cité, and the Louvre, the Eglise de la Madeleine, the Palais de la Cité, and the Louvre.
in his time, he applied himself to the study of actual life. Instead of the expressionless faces of the pseudo-classic, he gave vitality and energy.

A sculptor who was much talked of in his day was Pietro Tenerani (1789-1869), a native of Torano near Carrara. He worked for some time as assistant to Thorwaldsen. Later these two sculptors jointly accepted a commission for the monument of Eugène Beauharnais, and as Thorwaldsen wished to suppress the younger man’s name, they quarrelled and finally separated. Tenerani visited Munich, and which he found to be unbearable, he returned to London. During the disturbances of 1848 and 1849 he was obliged to leave Rome with his family, in consequence of his sympathy with the Papists and his friendship for Count Pellegrino Rossi, who was assassinated in 1848.

Among Tenerani’s works are a statue of Count Rossi, a monument to Pius VIII. in the sacristy of St Peter’s, “The Angel of Resurrection” in the Friedenskirche at Potsdam, a low relief in the church at Castle-Ashby, Northamptonshire, and “The Descent from the Cross,” in the Torlonia chapel in St John Lateran. The last-named reveals the close study of nature so characteristic of his work.

The most distinguished Piedmontese sculptor of this period was Marochetti, who is referred to above in connexion with the British school.

Although Vincenzo Vela (1820-1891) was Swiss by birth, he was Italian both by adoption and in his sympathies. In 1838 he won the prize offered by the government to the students of the Lombard-Venetian provinces of Austria, and became known by his statue of Spartacus. His chief works are a statue of Bishop Lui at Lugano; Desolation, at the Villa Gabrìna, Lugano; Madonna della Carità, at Lugano; and statues of De Gasparo at the university, and of Cesare Balbo, all at Turin; the statues of Tommaso Grossi and Gabrio Piola at the Brera, Milan; Dante and Giotto at Padua; Joachim Murat at the Certosa, Bologna; and Cavour at Genoa. His masterpiece is the seated figure of Napoleon at Versailles.

After Bartolini, sculpture in Italy slowly developed along the lines of “naturalism” suggested by that leader. Perhaps the greatest activity and advance are to be recorded around Naples, a city till then of subordinate importance in art. Tommaso Solari (b. 1820), who may be regarded as one of the group belonging to Naples, produced work which is hardly distinguishable from that of Vela. His statue of Carlo Poerio, which occupies an important position in the city, is of considerable merit. He worked for some time by several sculptors whose works betray but little originality except in some cases in the forcing of qualities they wished to accentuate, and the selection of daring or dramatic subjects—qualities which are quite foreign to the work of Raffaele Belliazzari, another Neapolitan (b. 1835), like that of Solari, is of conscientious study, but his naturalism shows no genius. Among his works may be mentioned “A Woman and Child,” and two terra-cotta busts at Capodimonte. Emilio Franceschi (1839-1890) and Achille D’Orsi (b. 1845) both belonged to the Neapolitan group of sculptors. Though the former was not a native of Naples, he resided there from 1869 until his death. But while Franceschi was influenced to a very large extent by the Neapolitan school, D’Orsi broke away from it and created a distinctive style of his own. He studied in Rome, and in 1876 received a medal at the; he produced “Il Cabalist,” followed by “The Parasites,” the latter establishing his fame by its singularity both of subject and treatment. It represents two gluttons in a state of extreme intoxication. The group is remarkable as showing D’Orsi’s powers of characterisation.

A man of perhaps greater original thought was Francesco Jenec, who seems to have been entirely free from the “academic” smallness which characterised the followers of the naturalistic movement. He was born at Polistena in Calabria in 1853. His work bears the impress of his personality and his rather marked aloofness from his contemporaries. He is the author of the monument to Mary Somervill, wife of the Duke of Sutherland, which he produced at Naples; Vittoria Colonna, exhibited at the Brera, Milan, in 1894; and the Beethoven exhibited at Venice, 1893. At Bergamo there is a statue of the musician Donizetti, which was placed there in 1897.

Vincenzo Gemito was born at Naples in 1852 of parents in a very humble position. He picked up a living in various occupations under his own hand, and is the pupil of Antonio Caggiano (1866). He worked hard and to some purpose, for two years after he modelled “The Gamester,” which is at Capodimonte. This work shows evidence of astounding precocity. His work is realistic, but forcible and more alive than that of many sculptors of his day. Gemito was supremely confident of his powers, and in a manner this was justified by his early recognition both amongst students and public. He was set a task to sculpt the façade of the Royal Palace at Naples. A small figure of a water-carrier upon a fountain is now in the Gallery of Modern Art at Rome; in the same gallery are his statuette of Meissonier and a terra-cotta figure of theahbasus. A sculptor of quite a different class of subject is Costantino Barbella, born at Chieti in 1853, who gave his entire attention to the portrait. About 1887-9 he embarked upon the monument of Beethoven in Berlin, was successful enough to win a commission of a statue of the composer for Naples. 

For some years the activity amongst what may be called the Southern school of sculpture was centred at Naples, especially under the influence of the sculptor Infante. Tenerani’s pupil of Dupré, but his work bears little impress of his master’s influence; it is characterized mostly by its force and meaning of gesture and facial expression. His statue of “The Youth Dying” at the moment of the first meeting with Beatrice, and his seated figure of “The Young Caesar” are both works which successfully show his power of pose and facial expression. He is the author also of the famous Caritas group, the Christ in Gethsemane, “The Dead Christ,” a group of the siege of Missolonghi, and a group of seventeen life-size figures representing the last stand of the Italians at the massacre of Dogali.

The family of Ximenes and Bertiles of Palermo is reckoned as one of the three members which each became well known in the world of art: Empedocle, the painter, Eduardo, the writer, and Ettore, the sculptor. Ettore was a pupil of Morelli. His earliest work of note was an amusing small figure of a ball player, “The Art of ton-". He also produced "La Rize," "Le marmiton," "Cuore del Re," "The Death of Ciceruacchio," "Achilles," and many others. His statue of "Revolution" is one of his best works.

Gugli Monteverde’s work is marked by facile and artistic grace and sparkle, but though he had some influence upon the recent sculptors of Italy, his work shows the naturalistic precepts laid down by his master. A group of three figures, fully of impressive moment, is in the Palazzo Bianco at Genoa; a Madonna and Child is in the Camposanto, and a statue of Victor Emmanuel stands in the square in the centre of Bologna.

The last of the school of Barrea (1849) is another sculptor whose works show remarkable care and love of what is called finish. He has produced the statues "Portari," the medieval revolutionary, "Ovdi," Jacopo Ortis, "A Roman Slave," Giordano Brunoni in the Campo di Fiori, and "Abraham Lincoln," in the New York Museum.

To the Roman group of sculptors also belong Encole Rosa (b. 1840). That he was a man of considerable talent is shown by his group of the Cairoli at Rome and his monument of Victor Emmanuel near the cathedral at Milan. Emilio Gallori, who studied at the Florence academy, is the author of the colossal statue of St Peter on the façade of the cathedral at Florence. He won the competition for the well-known, the monument of St Anthony, by which he has become a friend of Tenerani. Being a man of independent views, however, he was but little affected by Tenerani’s work. He was then twenty-five years of age. After a prolonged period of travel for personal artistic interest, he returned to Venice, where he produced a statue of St Anthony of Padua, one of Petrarch and another of Galileo. In 1880 he completed his statue of Titian for the master’s birthplace, Pieve di Cadore, and in 1883 he finished the figure of Goldoni in Venice. He is also author of a statue of Victor Emmanuel and a monument of Tartini the violinist, the former in the memorial tower on the battlefield of S. Martino near Brescia, the latter in a picturesque church at Pirano.

Turin boasts many sculptors who are known throughout the country. Chief of these is Odoardo Tabacchi (b. 1831). He is the author of a seated figure of Antonio Canova—now in the great monument at Milan. He has modelled several subjects of a lighter type, such as “The Bather,” exhibited in Milan in 1894. Lorenzo Bistolfi, a younger man, conquered recognition chiefly by his composition of Castiglione covered by the Milanese tricolor, which must be mentioned Luigi Belli, author of the Raphael monument at Urbino, and Davide Calandra, whose L’Aarto’’ is in the national gallery at Rome.

As everywhere in western and central Europe, national sculpture in Austria during the first half of the 19th century was altogether influenced by the classicism of the Italian Canova—in Austria perhaps more than in other countries, since two of Canova’s most important works came to Vienna in the early years of the century. The famous tomb of Marie Christine in the Augustinerkirche,
which was ordered by Duke Albrecht of Saxony, in 1805, at the price of 20,000 ducats; and the Thesaurus group, bought by the emperor Francis, in Rome, which is now in the Vienna Museum. Canova's pupil, Pompeo Marchesi, was the author of the emperor Francis monument, unveiled in 1846, in the inner court of the Hofburg.

The first national sculptor of note was the Tirolese Franz Zanzer (1746-1822), who was knighted in 1807 (the year in which his Kaiser-Joseph monument was unveiled) and became director of the Vienna gallery and academy. Among his works are the tomb of Leopold II. in the Augustinerkirche; the tomb of Johann Baptist von Heisterbach at the Karlskirche, which is designed by Heinrich von Collin in the Karlskirche in Vienna; and a number of busts in the Empire style, which are by no means remarkable as expressions of artistic individuality. Leopold Kiesling (1770-1827), another Tirolese, whose first work on a large scale is the Mars, Venus and Cupid, in the Imperial gallery, was sent by his patron, Count Cobenzl, to Rome, where he was more attracted by Canova than by the antique or the late Renaissance. Joseph Klieber (1773-1839), also Tirolese, enjoyed the protection of Prince Johann Liechtenstein, who employed him in the decorative art and architecture. His reputation as sculptor of colossal figures for imperial triumphal arches and lofty tombs was so widespread that he was given the commission for the catafalque of Louis XVIII. in Paris. Many middle-class houses of the Empire period in Vienna were decorated by him with reliefs of children. The elaborate relief figures on the Andreas Hofer monument in Innsbruck are the work of his hand. His followers were less favoured by powerful protection and were forced into a definite direction: among them must be mentioned Johann Martin Fischer (1740-1820), who succeeded Zanzer as head of the academy; his best-known work is “The Muscle-man,” which still serves as model to students.

Of the greatest importance for the development of Austrian sculpture in the second half of the 19th century was the influence of Joseph Daniel Boehm (1794-1860), director of the academy of coin-engravers, and discriminating collector of art treasures. He was the father of Sir Joseph Edgar Boehm, R.A. Emanuel von Max (1810-1900), who in conjunction with his brother Joseph modelled the Radetzky monument in Prague, wrote in his autobiography, concerning the year 1833 in Vienna: “Art, particularly sculpture, was at the lowest ebb. The appearance of a statue or bust at an exhibition was considered an event.” But a strong movement began towards the end of the five. Professor Franz Bauer, of the Vienna academy (1797-1872), exercised a most stimulating influence upon the rising generation. Among the earlier artists, whose life overlapped into the new era, were Anton Dietrich (1799-1872), who is best known by “The Three Magi,” on the porch of the church of St John, and by a very beautiful ivory crucifix; and Johann Preleuthner (b. 1816).

The architectural rejuvenation of Vienna led to the rise of an original local school of sculpture. J. D. Boehm devoted himself almost entirely to goldsmith-work and medals, but with the aid of his great collections he taught the new generation and helped to develop original talent. Hans Casper (1817-1868) devoted himself to his introduction to society, for whom he produced many busts. He modelled the empress Elisabeth monument at the western railway station in Vienna, the famous “Donauweschen” in the Vienna town park. His brother, Joseph Gasser von Wallhorn (b. 1816), was a sculptor of saints, many of which decorate St Stephen's Cathedral and the Votive Church in Vienna. Anton Fernkorn (1813-1878), born at Erfurt, was Austrian by his art. He started as a metal worker, and studied in Munich, but not at the academy. His talent was only fully tested and developed at the academy. He modelled the bold equestrian bronze monuments of Archduke Charles (1839) and Prince Eugene of Savoy (1866). He became director of the imperial bronze foundry, in which post he was followed by his pupil Franz Schonauer (b. 1840), whose work is marked by great realism. Another sculptor of the last generation is Max Seidl (b. 1849), who has executed many large monuments and portraits.

In the provinces under the Austrian emperor's rule, the best-known sculptors are the Carnide Marcell Guicci (1830-1894), Lewandowski, Buracz, and the Tirolese Gurschner, who follows the modern style.

In the art of the medallist, Professor Karl Radnitzky the elder (b. 1818) led the way after J. D. Boehm; but he was surpassed by his pupil Joseph Tautenhayn (b. 1837), whose large shield “Struggle between Greece and the Centaurs” at the imperial Vienna exhibition of 1873 was a revelation. Tautenhayn has been director of the academy since 1876. More important still is Anton Scharff (b. 1845), a real master of the delicate art of the medallist.

At the beginning of the 19th century the art of sculpture was practically dead in Spain—or at least was mainly confined to the mechanical production of images of saints. But towards the middle of the century the two brothers Agapito and Venancio Vallmitjana, of Barcelona, encouraged by the enthusiasm with which some of their works had been received by local connoisseurs, took part
in the Paris Figaro competition for the figure which decorates the entrance to the offices of that journal, and carried off the second prize. They afterwards obtained the first prize in other competitions at Madrid and other Spanish centres. Their chief works are: "Beauty dominating Strength," "St Vincent de Paul," the large statue erected at Valencia to Don Jaime Conquistador, and groups of Queen Isabella with the Prince of the Asturias, and Queen Marie Christine with Alfonso XIII.

Another sculptor of distinction is Andres Aleu, professor of the Barcelona School of Fine Arts, whose principal works are the "St George and the Dragon" on the façade of the Barcelona Chamber of Deputies, and Marshal Concha, the equestrian statue in Madrid. Rosendo Novas, of Catalan birth, like his Spanish colleagues of influence, is best known by his masterpiece, "The dead Torero." Manuel Omis, another Barcelona sculptor who leans to the naturalistic school, is the author of the monument to Isabella the Catholic, erected at the end of the Paseo de la Castellana in Madrid in 1883. Antonio Fabrés, who at the beginning of his career was an eminent sculptor, devoted himself subsequently to painting. Agustín Querol, and Mariano Benlliure, of Valencia, were for many years the official favourites of the Spanish government, who entrusted them with numerous important commissions, though their work was neither so many nor particularly remarkable as regards execution, and occasionally, as in Querol's monument of Alfonso XII.—especially in the completed sketch of its baroque in the extreme. Indeed, the genius of the Spanish race at all times, and particularly in the 19th century, found its expression in painting rather than in sculpture. Querol's group called "Tradition" is well imagined and expressive, and a good example of the best work achieved by a school in which freedom is the chief note.

Towards the end of the 19th and in the early years of the 20th centuries, Joseph Limona y Bruguna ("The Communion") and Blay, both of Catalan birth, were the most distinguished sculptors of Spain. The fame of Blay, who was a pupil of Chapu in Paris, has extended beyond the frontiers of his native country. His style has at the same time strength and delicacy. His chief works are the miners' monument at Bilbao, and a group of an old man seated on a bench protecting a little girl from the cold. He also produced a great number of delicately wrought marble busts before his career was prematurely cut short. Joseph Llimona is the most personal and distinguished of all modern Spanish sculptors. His art ranges from the greatest delicacy to real power. At the International Exhibition at Barcelona in 1902 he was awarded the grand prix of honour for a group intended for the monument to Dr Robert in that city; and for a small marble figure of Pain, a work in which he has been thought to rival the Florentines of the best period. José Alcaraz, the younger of the brother Alcaraz Abril and later José Abril Embil, and the brothers Osle are prominent members of the younger school and aim at giving the personal note. The vigour displayed by them illustrates the revivification and rejuvenation of Spanish sculpture.

Russian sculpture has practically no past to record. In its beginnings Russian art was entirely ruled by the Church, whose laws were inspired by Byzantinism, and who forced all artists to submit to strictly fixed rules as regards form and formula. Before the 18th century, Russian sculpture was practically non-existent, except in the form of peasant wood-carving. The early stone idols (Kamennyia Gliad) were all the product of a popular superstition rather than of art. Real sculpture only appears at the end of the 18th century, when Peter the Great, to use his own expression, "opened a window upon Europe," and ordered, together with a radical change in Russian society, the introduction of western art in Russia.

From all European countries artists streamed into Russia and helped to educate native talent, and at the same time the tsar sent young artists abroad to study in foreign art centres. Among the foreign artists of this period were Conrad Hausner, Egelerener and Schpelke, among the Russians Koulomzjn, Issaiev and Woyton. About 1756 Falconet and his wife arrived in Russia; then Gilet, whose pupil Schubin ranks among Russia's most gifted artists. Among his best-known works is the monument of Catherine II. His fame was rivalled by that of Schedrine. Koikovski is known by his Souvorine monument. Other early sculptors of distinction were Demouth-Malinowski, the sculptor of the Soussanav monument; Pimenow, Martos, and the medallist Count Theodor Tolstoy, who is known as an able illustrator. Orlovsky, Vitali and the whole preceding group represent the pseudo-classic character acquired at foreign academies. Among animal sculptors Baron Klodt is known by his horses which decorate the Anitschkin bridge at St Petersburg.

About the beginning of the 19th century the sculptor Kamenski inaugurated a more realistic tendency by his work which was inspired by contemporary life. He entered the academy after having exhibited a series of sculptures among which the most interesting were "The First Step" and "Children in the Rain." Indeed, his work shows this change of style as he has never ceased to use his art with the utmost freedom, but devoted himself subsequently to the execution of commissions which did not give full scope to his gifts.

The greatest talent of all was unquestionably Marc Antokolsky (1845-1902), a Jewish sculptor permitted to work outside the Pale, of whom the Paris correspondent of The Times wrote, about 1888, that French sculptors would benefit by studying under Antokolsky, and by learning from him the power of the inspiration drawn from the study of nature. The artist himself held his statue of Sphoza to be his finest achievement. Indeed, he says: "I have been brought up in the Jewish tradition, and have developed the Jewish character of my mind in the Jewish environment. In the hard moments of life I can find peace only before this work." Equally beautiful is "The Christian Martyr," in the creation of which Antokolsky definitely broke all the fetters of tradition and strove no longer to express linear beauty, but intense truth. The martyr is an ugly, deformed woman, tortured and suffering, but of such beautiful sentiment that under the influence of religious exaltation her very soul seems to rise to the surface. Among his other works few are better known than "Mephistopheles" (which he wanted to call "The 19th Century") and the powerful "Ivan the Terrible," which the Russian critic Starloff called "The Tortured Tormentor." The strange psychology of this ruler, whose compeer in history can only be found perhaps in the person of Louis XI., is strikingly expressed by Antokolsky. Very beautiful is the statue of Peter the Great, which breathes strength, intelligence, genius and devouring activity. To the works already mentioned must be added the statues of Ermak and of Nestor. Antokolsky has left to the world a gallery of the most striking figures in Russian history, giving to each one among them his proper psychology. His technique is always marked by perfect sureness and frequently by dazzling bravura.

Antokolsky was twenty-one years of age when he left St Petersburg. To be nearer his native country he made a journey of complete ideation under the rule of worthy old professors who remained strangers to their pupils, just as their pupils remained strangers to them. When Professor Minoff and Rainiers died, soon after, the academy seemed quite deserted; but just at that time a number of very gifted students began to work with energy, learning all they could from one another, fired by the same purpose and spirit. Antokolsky was in close touch with his friend, the painter Repin, with whom he worked much, and so failed to come under the influence of the idealist M.V. Praklow, who soon began to deliver certain lectures on art which excited keen interest among the young artists. Antokolsky, who had been the Berlin, was more interested in the Russian style by the same routine, he returned before long to St Petersburg, where within a short time he executed the statue of "Ivan the Terrible" to which he put into this place. This epic became the starting-point of Russian sculpture, so that Antokolsky deserves an eminent position in the history of Russian art.

Among his pupils was his faithful follower and friend Ila Ginsburg (b. 1854), who devoted himself to genre scenes and portraits in the spirit of his master, but with a degree of sincerity and enthusiasm which save him from the reproach of plagiarism. Lancere (1854-1887) is known by his military statuettes. Libich (1828-1897) who was one of the few remarkable sculptors of a new generation, was but little practised in Paris; among his works are a great number of portraits and a few monuments that are not without merit. Among contemporary sculptors, whose number is still restricted in Russia, and who are not less remarkable than the old masters, are Esipoff, Brechkoff, and with little evidence of evolution, are Beklemischew, Bach, Breisky, Mikhovitch, Tourgement, Auber and Bernstein, Prince Trozeretzlo, who is named among the sculptors of Russia, though he was educated and worked in Italy, acquired some reputation by
his skill in the rapid execution of cleverly-wrought impressionist statuettes of figures and horses as well as busts. Their value lies in the vivid representation of the type of Russian life and types. Among the most original modern Russian sculptors is Naum Aronson (b. 1872), whose best-known work is his Beethoven monument at Bonn. At Godesberg is his Narcissus fountain, whilst other works of his are at the Berlin, St Petersburg and Dublin museums.

(M. H. S.; P. G. K.)

The early names in American sculpture—Shem Drowne, the maker of the Puritan's statue; Patience Wright (1727-1785); William Rush (1765-1833), carver of portraits and of figure-heads for ships; John Frazer (1790-1890), the stonecutter; and Hezekiah Augur (1791-1838)—have the interest of chronicle at least. Hiram Powers (1805-1873) had a certain technical skill, and his statues of the "Greek Slave" (carved in 1843 in Rome and now at Raby castle, Darlington, the seat of Lord Barnard, with a replica at the Corcoran Gallery, Washington, and others elsewhere) and Eve before the Fall were important agents in overcoming the Puritan asceticism of the nude. Horatio Greenough (1805-1852), Joel T. Hart (1810-1877), S. V. Clevever (1812-1843) and Clark Mills (1815-1883) all received many commissions but made no additions to the advancement of a true art-spirit.

Thomas Crawford (1814-1857) began the bas-reliefs for the bronze doors of the Capitol, and they were finished by William H. Rinehart (1825-1874), whose "Latona" has considerable grace. Henry Kirke Brown (1814-1886) achieved, among less noteworthy works, the heroic "Washington" in Union Square, New York City. It is one of the noblest of equestrian statues in America, both in breadth of conception and in the certainty of handling. It reflects the rebirth of the sculptor's craft in the United States.

Erastus D. Palmer (1817-1904) was the first to introduce the lyrical note into American sculpture; his statue, "The White Captive," and still more his relief, "Peace in Bondage," may be named in proof. There is undeniable skill, which yet lacks the highest qualities, in the work of Thomas Ball (b. 1810). William Wetmore Story (1809-1860), whose "Cleopatra," though cold, shows power; Randolph Rogers (1825-1892), best known for his blind "Nydia," and for his bronze doors of the Capitol at Washington; John Rogers (1829-1904), who struck out a new line in actuality, mainly of an anecdotal military kind; Harriet Hosmer (1830-1901), a classicist, whose recumbent "Beatrice Cenci" is perhaps her most graceful work; J. S. Hartley (b. 1834); Launt Thompson (1833-1894) are among the leaders of their day. The works of Olin L. Warner (1844-1896) and J. Q. A. Ward (1830-1910) reveal at times far greater originality than any of these. Warner's two graceful classical figures for a fountain in Portland, Oregon, and his admirable portrait statue of William Lloyd Garrison, reveal a nice discernment of the fitness of manner to matter. He has also succeeded in modelling medallions. The statue has stability, dignity, and individuality quite his own, and may be considered at the head of his own generation. In addition to these should be mentioned Larkin G. Mead (b. 1835), George Bissell (b. 1839), Franklin Simmons (b. 1839), Martin Milmore (1844-1883), Howard Roberts (1843-1900), Moses Ezekiel (b. 1844), all of whom are prominent in the history and development of sculpture in America. By their time the sculptors of America had wakened completely, artistically speaking, to a sense of their own nationality.

It was however later that came that inspired modernity, that sympathy with the present, which are in some senses vital to a genuinely emotional art. American sculpture, like American painting, was awakened by French example. The leading spirit in the new movement was Augustus St Gaudens (q.v.), a great sculptor whose work is sufficiently dealt with in the separate article devoted to him. Two other Americans stand out, with St Gaudens, among their contemporaries, Daniel Chester French (q.v.) and Frederick MacMonnies (q.v.). French's "Gallaudet teaching a Deaf Mute" is an example of how a difficult subject can be turned into a triumph of grace. His "Death and the Sculptor," a singularly beautiful rendering of the idea of the intervention of death. In collaboration with E. C. Potter he modelled various important groups, particularly "Indian Corn" and the equestrian "Washington," in Paris. The "Bacchante" of MacMonnies, instinct with Renaissance feeling, is a triumph of modelling and of joyous humour; while his statue of "Nathan Hale in City Hall Park, New York, his "Horse Tamers," and his triumphal arch decorations for the Soldiers' and Sailors' Memorial at Brooklyn, show the artist's power in the treatment of a serious theme.

The strenuous achievements of George Grey Barnard have borne both high and deep sincerity. His "Two Natures," his "Brother Love," his "Pan" and the design for a monumental Norwegian stave are among the strongest efforts of modern American statuary. Ranking with him, though different in thought and method, stands William R. Burd Barr (1839-1908). He was joined to the fine works of John J. Boyle, William Couper, twenty years of whose life were passed in Florence, William O. Partridge, Hermon MacNeil and Lorado Taft. The beautiful and beautiful artefacts of Mrs Clio Hinton Bracken; the graceful figures of Mrs Potter Vonnah; Edwin F. Elwell's "Egypt" and "Orchid"; and the work of F. Wellington Ruckstuhl should also be mentioned; also J. W. Rhind, a Scotchman by birth and artistic education, John Donoghue, Charles H. Niehaus, Roland H. Perry ("Fountain of Neptune"), Andrew O'Connor, Jerome Conner, John H. Rude, Louis Potter, Equally well worthy of note are Bela Lyon Pratt (b. 1836), Karl Frederick Lembke (b. 1846); Cyrus E. Dallin (with Wild West subjects), Richard E. Brooks, Charles Graily ("Fountain of Life"), Alexander S. Calder, Edmund A. Stewart, Edward Kemeys, Edward Berge ("Luther Fountain," San Francisco). The leading "animators" include Edward Kemeys (representing the Southern states), Edward C. Potter, Philmster Proctor, Solon H. Borglum, Frederick G. Roth, the late William R. Burd Barr (an animator, par excellence), J. W. Kitson, Mrs Hermon A. MacNeil, Miss Helen Mears, Miss Evelyn Longman, Miss Elise Ward, Miss Yandell and Miss Katherine Cohen.

LITERATURE.—On the general history of sculpture, see Agincourt, Histoire de l'art (Paris, 1883); du Sommerard, Les Arts au moyen âge (Paris, 1839-1846); Cicognara, Storia della scultura (Prato, 1823-1836); Cicognara, Monumenti della scultura (Modena, 1867); Llibke, History of Sculpture (Eng. trans., London, 1872); Ruskin, Aratra Pentelici (six lectures on sculpture) (London, 1872); Vinardi, Le Merveilles de la scultura (Paris, 1869); Arsenne and Denis, Essai sur l'histoire de la sculpture (Paris, 1850); Ruskin, The Stones of Venice (Paris, 1826-1853); Demmin, Encyclopédie des beaux-arts plastiques (Paris, 1872-1875), vol. iii.

On Italian and Spanish sculpture, see Vasari, Trattato della scultura (Florence, 1568, vol. i.), and his Vitae dei pittori, etc., ed. Milanesi (Florence, 1880); Rumohr, Italianische Forschungen (Leipzig, 1827-1851); Dohme, Kunst und Künstler Italiens (Leipzig, 1879); Perkins, Tuscan Sculptors (London, 1865), Italian Sculpture (1868) and Hand-book of Italian Sculpture (1883); Robinson, Italian Sculpture (London, 1862); Gruner, Marmor-Bildwerke der Pisani (Leipzig, 1858); Ferrari, L'Arte di S. Agostino (Pavia, 1832); Symonds, Art in Italy, in Italy (1889); Wace, History of Painting in Italy (London, 1903) (new ed.), vol. i.; Selvatico, Arch. e scultura in Venezia (Venice, 1847); Ricci, Storia dell'arch. in Italia (Modena, 1837); Demmin, Monumenti della scultura Italiana (Modena, 1878); Gozzini, Monumenti sepul-criali della Toscania (Florence, 1816); de Montault, La Sculpture religieuse à Rome (Rome, 1870), a French edition (with improved plates, 1890); H. Hill, Pisani (London, 1870); Rossi, Roma (Rome, 1870); Cavallucci and Molinier, Les Della Robbia (Paris, 1884); Cicognara, Monumenti di Venezia (Venice, 1838-1840); Burgis and Didron, Iconographie des chapiteaux du palais ducal à Venise (Paris, 1857) (see also Ruskin's Stones of Venice); Richter, Sculpture de l'Italie au XVIIIe siècle, Hist. of Painting in Italy (London, 1903), etc.}

The recent literature on the subject is too copious to be catalogued here; every phase of the art has been critically dealt with and nearly every important subject has been represented. The leading authorities, e.g. John Addington Symonds, The Life of Michelangelo Buonarroti (2nd ed., London, 1898); Sir Charles Holroyd, Michael Angelo Buonarroti (London, 1903); Lord Balcarres, Dante Alighieri (London, 1907). For répertoires of sculptural works, see collections such as Reale Galleria di Firenze.
SCURVY—SCUTAGE

517

SCURVY (Scorbutus), a constitutional disease, characterized by debility, morbid conditions of the blood, spongy gums, impairment of the nutritive functions, and the occurrence of haemorrhagic extravasations in the tissues of the body. In former times this disease was extremely common among sailors, and gave rise to a frightful amount of mortality. It is now, however, of rare occurrence at sea, the simple means of prevention being well understood. Scurvy has also frequently broken out among soldiers on campaign, in beleaguered cities, as well as among civilians in some cities of the United States and in New York and London (pub. by Archæological Institute, 1866), p. 159 seq.; G. G. Scott, Gleanings from Westminster (London, 1862); W. Bell Scott, British School of Sculpture (London, 1873); W. M. Rossetti, "British Sculpture," in Fraser's Mag. (April 1860). The subject of recent British literature has been curiously neglected, except in newspaper notices and occasional articles in the periodical press, such as Edmund Gosse's "Living English Sculptors" in the Century Magazine for July 1883. The only volume published is M. H. Spielmann's British Sculpture and Sculptors of To-day (London, 1901).

For American sculpture, see Henry T. Tuckerman, Book of the Artists: American Art in Life (New York, 1878); William J. Clark, Jr., Great American Sculptures (Philadelphia, 1877); Charles H. Caffin, American Masters of Sculpture (New York, 1902); Sadakichi Hartmann, Modern American Sculpture (New York).
