NINTH " twenty-five " 1875—1889.
TENTH " ninth edition and eleven supplementary volumes, 1902—1903.
ELEVENTH " published in twenty-nine volumes, 1910—1911.
INITIALS USED IN VOLUME XXV. TO IDENTIFY INDIVIDUAL CONTRIBUTORS,\(^1\) WITH THE HEADINGS OF THE ARTICLES IN THIS VOLUME SO SIGNED.

A. B. G. REV. ALEXANDER BALLOCH GROSART, LL.D., D.D.
See the biographical article: GROSART, ALEXANDER BALLOCH.

A. C. McG. ARTHUR CUSHMAN MCGIFFERT, M.A., Ph.D., D.D.
Professor of Church History, Union Theological Seminary, New York. Author of History of Christianity in the Apostolic Age; &c. Editor of the Historia Ecclesiae of Eusebius.

A. D. HENRY AUSTIN DOBSON, LL.D., D.C.L.
See the biographical article: DOBSON, H. AUSTIN.

A. De. ARTHUR DENDY, D.Sc., F.R.S., F.Z.S., F.L.S.
Professor of Zoology in King’s College, London. Zoological Secretary of the Linnean Society of London. Author of memoirs on systematic zoology, comparative anatomy, embryology, &c.

A. E. H. A. E. HOUGHTON.

A. E. S. ARTHUR EVERETT SHIPLEY, M.A., D.Sc., F.R.S.

A. F. E. ALLEN F. EVERETT.
Commander, R.N. Formerly Superintendent of the Signal School, H.M.S. “Victory,” Portsmouth.

A. Go. REV. ALEXANDER GORDON, M.A.
Lecturer in Church History in the University of Manchester.

A. Ha. ADOLF HARNACK, D.Ph.
See the biographical article: HARNACK, ADOLF.

A. H. S. REV. ARCHIBALD HENRY SAYCE, Litt.D., LL.D.
See the biographical article: SAYCE, A. H.

A. J. G. REV. ALEXANDER JAMES GRIEVE, M.A., B.D.
Professor of New Testament and Church History at the United Independent College, Bradford. Sometime Registrar of Madras University and Member of Mysore Educational Service.

A. Ma. ALEXANDER MACALISTER, M.A., LL.D., M.D., D.Sc., F.R.S.
Professor of Anatomy in the University of Edinburgh, and Fellow of St John’s College. Formerly Professor of Zoology in the University of Dublin. Author of Text-Book of Human Anatomy; &c.

A. Mel. ARTHUR MELLORE.
Of Messrs J. & T. Brocklehurst & Sons, Silk Manufacturers, Macclesfield.

A. M. C. AGNES MARY CLERKE.
See the biographical article: CLERKE, AGNES M.

\(^1\) A complete list, showing all individual contributors, appears in the final volume.
A. M.-Ts.

ALFRED MOREL-FATIO.
Professor of Romance Languages at the Collège de France, Paris. Member of the Institute of France; Chevalier of the Legion of Honour. Secretary of the École des Chartes, 1885-1906; &c. Author of L'Espagne au XVIe et au XVIIe siècles.

A. N.

ALFRED NEWTON, F.R.S.
See the biographical article: Newton, Alfred.

A. P. H.

ALFRED PETER HILLIER, M.D., M.P.

A. S. S.

ARTHUR SCHOUSTER, F.R.S., Ph.D., D.Sc.
Professor of Physics at the University of Manchester, 1888-1907. President of the International Association of Seismology. Author of Theory of Optics and papers in the Proceedings and Transactions of the Royal Society.

A. So.

ALBRECHT SOICIN, PH.D. (1844-1896).
Formerly Professor of Semitic Philology in the Universities of Leipzig and Tübingen. Author of Arabische Grammatik; &c.

A. S. E.

ARTHUR STANLEY EDINGTON, M.A., M.Sc., F.R.A.S.
Chief Assistant at the Royal Observatory, Greenwich. Fellow of Trinity College, Cambridge.

A. S. P.-P.

ANDREW SETH PRINGLE-PATTON, M.A., LL.D., D.C.L.
Professor of Logic and Metaphysics in the University of Edinburgh. Gifford Lecturer in the University of Aberdeen, 1911. Fellow of the British Academy. Author of Man's Place in the Cosmos; The Philosophical Radicals; &c.

A. W. H.*

ARTHUR WILLIAM HOLLAND.
Formerly Scholar of St John's College, Oxford. Bacon Scholar of Gray's Inn, 1900.

A. W. P.

ALFRED WALLIS PAUL, C.I.E.

B. B. A.

B RAMAN BLANCHARD ADAMS.
Associate Editor of the Railway Age Gazette, New York.

B. K.*

BENJAMIN KIDD, D.C.I.
Author of Social Evolution; Principles of Western Civilization; &c.

B. W. G.

BENEDICT WILLIAM GINSBURG, M.A., LL.D.

C. A. G. B.

SIR CYPRIAN ARTHUR GEORGE BRIDGE, G.C.B.
Admiral R.N. Commander-in-Chief, China Station, 1901-1904. Director of Naval Intelligence, 1889-1894. Author of The Art of Naval Warfare; Sea-Power and other Studies; &c.

C. B.*

CHARLES BÉMONT, LITT.D. (Oxun.).
See the biographical article: BÉMONT, CHARLES.

C. D. W.

SHUVALOV (sometimes written SHOUVALOFF), PETER ANDREIVICH, COUNT (1827-1889), Russian diplomatist, was born in 1827 of an old Russian family which rose to distinction and imperial favour about the middle of the 18th century. Several of its members attained high rank in the army and the civil administration, and one of them may be regarded as the founder of the Moscow University and the St Petersburg Academy of the Fine Arts. As a youth Count Peter Andreivich showed no desire to emulate his distinguished ancestors. He studied just enough to qualify for the army, and for nearly twenty years he led the agreeable, commonplace life of a fashionable officer of the Guards. In 1864 Court influence secured him the appointment of Governor-General of the Baltic Provinces, and in that position he gave evidence of so much natural ability and tact that in 1866, when the revolutionary fermentation in the younger section of the educated classes made it advisable to place at the head of the political police a man of exceptional intelligence and energy, he was selected by the emperor for the post. In addition to his regular functions, he was entrusted by his Majesty with much work of a confidential, delicate nature, including a mission to London in 1872. The ostensible object of this mission was to arrange amicably certain diplomatic difficulties created by the advance of Russia in Central Asia, but he was instructed at the same time to prepare the way for the marriage of the grand duchess Marie Alexandrovna with the duke of Edinburgh, which took place in January of the following year. At that time the emperor Alexander II. was anxious to establish cordial relations with Great Britain, and he thought this object might best be attained by appointing as his diplomatic representative at the British Court the man who had conducted successfully the recent matrimonial negotiations. Count Shuvalov was accordingly appointed ambassador to London; and he justified his selection by the extraordinary diplomatic ability he displayed during the Russo-Turkish War of 1877-78 and the subsequent negotiations, when the relations between Russia and Great Britain were strained almost to the point of rupture. After the publication of the treaty of San Stefano, which astonished Europe and seemed to render a conflict inevitable, he concluded with Lord Salisbury a secret convention which enabled the two powers to meet in congress and find a pacific solution for all the questions at issue. In the deliberations and discussions of the congress he played a leading part, and defended the interests of his country with a dexterity which excited the admiration of his colleagues; but when it became known that the San Stefano arrangements were profoundly modified by the treaty of Berlin, public opinion in Russia condemned him as too conciliatory, and reproached him with having needlessly given up many of the advantages secured by the war. For a time Alexander II. resisted the popular clamour, but in the autumn of 1879, when Prince Bismarck assumed an attitude of hostility towards Russia, Count Shuvalov, who had been long regarded as too amenable to Bismarckian influence, was recalled from his post as ambassador in London; and after living for nearly ten years in retirement, he died at St Petersburg in 1889. (D. M. W.)

SHUYA, a town in the government of Vladimir, 68 m. by rail N.E. of the town of Vladimir. It is one of the chief centres of the cotton and linen industries in middle Russia. It is built on the high left bank of the navigable Teza, a tributary of the Klyazma, with two suburbs on the right bank. Annalists mention princes of Shuya in 1403. Its first linen manufactures were established in 1755; but in 1800 its population did not exceed 1500. In 1882 it had 19,560 inhabitants, and 18,968 in 1897. Tanneries, especially for the preparation of sheepskins—widely renowned throughout Russia—still maintain their importance, although this industry has migrated to a great extent to the country districts. The cathedral (1799) is a large building, with five gilt cupolas. Nearly every village in the vicinity has a specialty of its own—bricks, pottery, wheels, toys, packing-boxes, looms and other weaving implements, house furniture, sieves, combs, boots, gloves, felt goods, candles, and so on. The manufacture of linen and cotton in the villages, as well as the preparation and manufacture of sheepskins and rough gloves, occupies about 40,000 peasants. The Shuya merchants carry on an active trade in these products all over Russia, and in corn, spirits, salt and other food stuffs, imported.

SHWEBO, a town and district in the Sagaing division of Upper Burma. The town is situated in the midst of a rice plain, 53 m. by rail N.E. from Mandalay: pop. (1901) 6262. It is of historic interest as the birthplace and capital of Alomprn, the founder of the last Burmese dynasty. After British annexation it became an important military cantonment; but only the wing of a European regiment is now stationed here. The area of the district is 5634 sq. m.; pop. (1901) 286,801, showing an increase of 24% in the decade. It lies between the Katha, Upper and Lower Chindwin and Mandalay districts. The Irrawaddy forms the dividing line on the east. The physical features of the district vary considerably. The Minwu range runs down the whole eastern side, skirting the Irrawaddy. In the north it is a defined range, but at Sheinmaga, in the south, it sinks to an undulation. West of the Mu river, in the centre of the district, there is a gradual ascent to the hills which divide

XXV. I
Sialkot—Siam

Sialkot (pronounced Shalkot), an independent kingdom of the Indo-Chinese peninsula or Further India. It lies between 4° 20' and 20° 15' N. and between 76° 30' and 106° E., and is bounded N. by the British Shan States and by the French Laos country and Siam. S. by Cambodia and by the Gulf of Siam, and W. by the Tenasserim and Pegu divisions of Burma. A part of Siam which extends down the Malay Peninsula is bounded E. by the Gulf of Siam and by the South China Sea, S. by British Malayla and W. by the lower part of the Bay of Bengal. The total area is about 200,000 sq. m. (For map, see Indo-China.)

The country may be best considered geographically in four parts: the northern, including the drainage area of the four rivers which unite near Pak-Nam Po to form the Menam Chao Phaya; the eastern, including the drainage area of the Nam Mun river and its tributaries; the central, including the drainage area of the Meklong, the Menam Chao Phaya, and the Bang Pakong rivers; and the southern, including that part of the country which is situated in the Malay Peninsula. Northern Siam is about 60,000 sq. m. in area. In general appearance it is a series of parallel ranges of hills, lying N. and S., merely gently sloping acclivities in the S., but rising into precipitous mountain masses in the N. Between these ranges flow the rivers Meiping, Mewang, Meyom and Menam, turbulent shallow streams in their upper reaches, but slow-moving and deep where they near the points of junction. The longest of them is over 1,000 miles long from Siam on the W. The Menam and Mewang on the W., rising among the loftiest ranges, are rapid and navigable only for small boats, while the Meyom and Menam, the eastern pair, afford passage for large boats at all seasons and for deep draught river-steamers during the flood-time. The Menam is the largest, deepest and most sluggish of the four, and in many ways resembles its continuation, the Menam Chao Phaya lower down. On the W. the river Salweeen and its tributary the Thoughung Yon form the frontier between the Siam and Burma for some distance, draining a part of northern Siam, while in the S. the river Nan flows further south and the river Song Sen, the Mekong does the same. The districts watered by the lower reaches of the four rivers are fertile and are inhabited by a considerable population of Siamese. Farther north the country is peopled by Laos, scattered in villages along all the river banks, and by numerous communities of Shan, Karen, Kamoo and other tribes living in the uplands and on the hilltops.

Eastern Siam, some 70,000 sq. m. in area, is encircled by well-defined boundaries, the great river Mekong dividing it clearly from French Laos on the N. and E., the Phnom Dang Rek hill range from Cambodia on the S. and the Dom Piai Fay range from the Shan States on the W. The right bank of the Mekong being closely flanked by an almost continuous hill range, the whole of this part of Siam is practically a huge basin, the bottom of which is a plain lying from 200 to 300 ft. above sea-level, and the sides hill ranges of between 1000 and 2000 ft. elevation. The plain is for the most part sandy and almost barren, subject to heavy floods in the rainy season, and to severe drought in the dry weather. The hills are clothed with a thin shadless growth of stunted forest, which only here and there assumes the characteristics of ordinary jungle. The river Nam Mun, which is perhaps 200 m. long, has a large number of tributaries, chief of which is the Nam Si. The river flows eastward and falls into the Mekong at 15° 20' N. and 105° 40' E. A good way farther north two small rivers, the Nam Kun and the Nam Song Kram, also tributaries of the Mekong, drain a small part of eastern Siam. Nearly two million people, mixed Siamese, Lao and Cambodian, probably among the poorest peasantry in the world, support existence in this inhospitable region.

Central Siam, estimated at 30,000 sq. m. in area, is the heart of the kingdom, the home of the greater part of its population, and the source of nine-tenths of its wealth. In general appearance it is a great plain flanked by high mountains on its western border, including the two ranges of hills, the Kham Lin and the Sibul Range, the Gulf of Siam, and with a long strip of mountainous sea-board stretching out to the S.E. The mountain range on the W. is a
continuation of one of the ranges of northern Siam, which, extending still farther southward, ultimately forms the backbone of the Malay Peninsula. Its ridge is the boundary between central Siam and Burma. The highest peak hereabouts is Mogadok, 5000 ft., close to the border. On the E. the Dom Pia Pai throws up a point over 4000 ft., and the south-eastern range which divides the narrow, littoral, Chantabun and Krat districts from Cambodia, has the Chemao, Seidao and Kmoch heights, between 3000 and 5000 ft. The Mekong river, which drains the western parts of central Siam, rises in the western border range, follows a course a little E. of S., and runs into the sea at the western corner of the inner gulf, some 200 m. distant from its source. It is a rapid, shallow stream, subject to sudden rises, and navigable for small boats only. The Bang Pakong river rises among the Watanna hills on the eastern border, between the Battambong province of Cambodia and Siam. It flows N., then W., then S., describing a semicircle through the fertile district of Pachim, and falls into the sea at the north-east corner of the inner gulf. The whole course of this river is about 100 m. long; its current is sluggish, but that of its chief tributary, the Nakhol Nayok river, is rapid. The Bang Pakong is navigable for steamers of small draught for about 30 m. The Menam Chao Phaya, the principal river of Siam, flows from the point where it is formed by the junction of the rivers of northern Siam almost due S. for 154 m., when it empties itself into the inner gulf about midway between the Mekong and Bang Pakong mouths. In the neighbourhood of Chainat, 40 m. below Paknam Poh, it throws off three branches, the Suphan river and the Menam Noi on the right, and the Lopburi river on the left bank. The latter two rejoin the parent stream at points considerably lower down, but the Suphan river remains distinct, and has an outlet of its own to the sea. At a point a little more than halfway down its course, the Menam Chao Phaya receives the waters of its only tributary, the Nam Sak, a good-sized stream which rises in the east of northern Siam and waters the most easterly part (the Peachabun valley) of that section of the country. The whole course of the Menam Chao Phaya lies through a perfectly flat country. It is deep, fairly rapid, subject to a regular rise and fall every autumn, but not to sudden freshets, and is affected by the tide 50 m. inland. For 20 m. it is navigable for vessels of over 1000 tons, and were it not for the enormous sand bar which lies across the mouth, ships of almost any size could lie at the port of Bangkok, a distance of 25 m. from the sea (see BANGKOK). Vessels up to 300 tons and 15 ft. draught can ascend the river 50 m. and more, and beyond that point large river-boats and deep-draught launches can navigate for many miles. The river is always charged with a great quantity of silt which during flood season is deposited over the surrounding plain to the great enhancement of its fertility. There is practically no forest growth in central Siam, except on the slopes of the hills which bound this section. The rest is open rice-land, alternating with great stretches of grass, reed jungle and bamboo scrub, much of which is under water for quite three months of the year.

Southern Siam, which has an area of about 20,000 sq. m., consists of that part of the Malay Peninsula which belongs to the Siamese kingdom. It extends from 10° N., southwards to 6° 35' N. on the west coast of the peninsula, and to 6° 25' N. on the east coast, between which points stretches the frontier of British Malaya. It is a strip of land narrow at the north end and widening out towards the south, consisting roughly of the continuation of the mountain range which bounds central Siam on the W., though the range appears in certain parts as no more than a chain of hillocks. The inhabitable part of the country consists of the lower slopes of the range, except the valleys and small alluvial plains which lie between its spurs. The remainder is covered for the most part with dense forest containing several kinds of valuable timber. The coast both east and west is much indented, and is studded with islands. The rivers are small and shallow. The highest mountain is Kao Luang, an almost isolated projection over 5000 ft. high, round the base of which lie the most fertile lands of this section, and near which are situated the towns of Bandon, Nakhon Sri Tammarat (Lakhon) and Patalung, as well as many villages.

Geology.—Very little is known of the geology of Siam. It appears to be composed chiefly of Palaeozoic rocks, concealed, in the plains, by Quaternary, and possibly Tertiary, deposits. Near Luang Prabang, just beyond the border, in French territory, limestones have been exposed, and a similar kind of rock has been seen at the base of the Indian Salt Range, have been found; also red clays and gravo-wacke with plants similar to those of the Ranigaj beds; and violet clays with Dicyodon, occurring in the centre of India. All these beds strike from north-east to south-west and must enter the northern part of Siam. Farther south, at Vientiane, the Mekong passes through a gorge cut in sandstone, arkose and sand, which gives a view of the river with on its steeply inclined cliffs which strike north-west.

Climate.—Although encroaving, the climate of Siam, as is natural from the position of the country, is not one of extremes. The wet season—May to October—respects that of the south-west monsoon in the Bay of Bengal. The full force of the monsoon is, however, broken by the western frontier hills; and while the rainfall at Mergui is over 180, and at Moulmein 240 in., in the south-west monsoon in the Bay of Bengal. The full force of the monsoon is, however, broken by the western frontier hills; and while the rainfall at Mergui is over 180, and at Moulmein 240 in., in the north of Siam it is reduced to about 100 in. on the coastal plains, gradually decreasing so far inland as to become of little account at the foot of the central mountain range. The climate is thus distinctly tropical; but the higher ranges of the central mountain range, with their alluvial bottoms, and the higher parts of the central plateau, are often within the coolness of early November. While Siam enjoys a dry climate with cool nights (the thermometer at night often falling to 40°—50° F., and seldom being over 90° in the shade by day), the eastern coast of the Malay Penin- sula, which is in latitude 9° N., is behind the full north-east monsoon, and its climate is much more subject to the rain of the latter, than to the rain of the former. This lasts from February, when the northerly current begins to lose strength, and the gradual heating of the land produces local sea breezes from the gulf along the coast, which strike very heavy gusts of wind, and rain, at the end of May, and the middle of June, before they break over the country, the extreme continental heats of India are not known. The comparative humidity of the atmosphere, however, makes the climate trying for Europeans, in the midst of its foliage, and of the Sumatra plantations on the coast and areca palms, and the usual tropical plants of culture. In the temperate uplands of the interior, as about Luang Prabang, Hima- layan and Japanese species occur—oaks, pines, chestnuts, peach, and great apple trees, maples, hickories, vines, sorrels, Cichoraceae, anemones and Violaceae; there are many valuable timber trees—teak, sappan, eagle-wood, wood-oil (Hopfia), and others. Dipterocarpus, Ceiba, and many other tropical woods, are extremely valuable and other dye-woods and resinous trees, these last forming in many districts a large proportion of the more open forests, with an undergrowth of bamboo. The tea tree grows all over the hill country. The bamboo is of large growth, and is much employed on the west, and on the east does not appear to be found south of 17°. Most of the so-called Burmese teak exported from Moulmein is floated down from Siamese territory. Among other woods the most prominent are the teak, and the Indian cypress, or Guiera, which are used for boat-building; damar oil, taken throughout Indo-China from the Dipterocarpus levis; agalla wood, sapan, rosewood, iron-wood, ebony, rattan. Among the chief productions of the plains are rice (the staple export of the country); pepper (chiefly from Chantabun); sirc, sago, sugar-cane, coco-nut and betel, Palmrya, sugar and attap palms; many forms of banana and other fruit, such as durian, orange-pommeau, guava, broad-fruit, mango, jack fruit, pine-apple, custard-apple and mango-steen.

Fauna.—Few countries are so well stocked with game but Siam. Chief of animals is the elephant, which roams wild in large numbers, is easily tamed and is used by the people for transport. The tiger, leopard, fishing-cat, leopard-cat, and other species of wild-cat, as well as the honey-bear, large sloth-bear, and one- and two-horned rhinoceros, occur. Among the birds the most prominent are the hornbills, the kites, the eagle, the king vulture, and the ibis, especially the gibbon—are also met with. Of snakes, 56 species are known, but only 12 are poisonous, and of these 4 are sea-snakes. The waters of Siam are particularly rich in fish. The crocodile is common in many of the larger rivers and serves to attain its best development in the eastern regions of India. The rivers are both the inland and sea coasts, are inhabited by many lizards. The country is rich in birds, a large number of which appear to be common to Burma and Cambodia.

Inhabitants.—A census of the rural population was taken for the first time in 1905. The first census of Bangkok and its suburbs was taken in 1905. Results show the total population of the country to be about 6,230,000. Of this about 3,000,000 are Siamese, about 2,000,000 Laos, about 400,000 Chinese, 12,500 Malay, 80,000 Cambodian and the rest Burmese, Indian, Mohen, Karen, Annamite, Kache, Lawa and others. Of Europeans there are between 1,500 and 1,000, mostly resident in Bangkok. Englishmen number about 500; Germans, 190; Danes, 160; Americans, 150, and other nationalities are represented in smaller numbers. The Siamese inhabit central Siam principally, but extend into the nearer districts of all the other sections. The Laos predominate in northern and eastern Siam, Malaya mingle with the Siamese in southern Siam, and the Chinese are found scattered all over, but keeping mostly to the towns. Bangkok, the capital, with some 630,000 inhabitants, is about one-third Chinese, while in the suburbs are to be found settlements of Motha, Burmese, Annamites and Cambodians, the descendants of captives taken in ancient wars. The Eurasian population of Siam is very small compared with that of other large cities of the East. Of the tribes which occupy the mountains of Siam some are the remnants of the very ancient inhabitants of the country, probably of the Mohon-Kher family, who were supplanted by a later influx of more civilized Khmers from the south-east, the forerunners and part-ancestors of the Siamese, and were still farther thrust into the remoter hills when the Lao-Tai descended from the north. Of these the principal are the Lawas, both, Ka, Yen and Karon, the last found collectively known to the Siamese as Ka. Other tribes, whose presence is probably owing to immigration at remote or recent periods, are the Karens of the western frontier range, the Lu, Yao, Yao Yin, Moo and Musur of northern Siam. The Karens of Siam number about 20,000, and are found as far south as 13° N. They are mere offshoots from the main tribes which inhabit the Burma side of the boundary range, and are supposed by some to be of Burmo-Tibetan origin. The Lu, Yao, Yao Yin, Moo and Musur have Yunnanese characteristics, and are met with in the Shan States north of Siam and in Yunnan. They are supposed to have found their way into northern Siam since the beginning of the 19th century. In the mountains behind Chantabun a small tribe called Chong is found, and in southern Siam the Sakei and Semang inhabit the higher ranges. These last three have Negrito characteristics, and probably represent a race far older even than the ancient Ka.

The typical Siamese is of medium height, well formed, with olive complexion, darker than the Chinese, but fairer than the Malays, eyes well shaped though slightly inclined to the oblique, nose broad and flat, lips prominent, the face wide across the cheek-bones and the chin short. A thin moustache and a beard, if present, is plucked out, and the hair of the head is black, coarse and cut short. The lips are usually deep red and the teeth stained black from the habit of betel-chewing. The children are pretty but soon lose their charm, and the race, generally speaking, is ugly from the European standpoint. The position of women is good. Polygamy is permitted, but is common only among the upper classes, and when it occurs the first wife is acknowledged head of the household. In disposition the Siamese are mild-mannered, patient, submissive to authority, kindly and hospitable to strangers. They are a light-hearted people, fond of jollity and determined to the commission of violent crime. Though able and intelligent cultivators they do not take kindly to any form of labour other than agricultural, with the result that most of the industries and trades of the country are in the hands of Chinese.

The national costume of the Siamese is the pongang, a piece of cloth about 1 yd. wide and 3 yds. long. The middle of it is passed round the body, which it covers from the waist to the knees, and hitched in front so that the two ends hang down in equal length before; these being twisted together are passed back between the legs, drawn up and tucked into the waist at the middle of the back. The women's pongang is much shorter, consisting only of a scarf wound round the body under the arms. Among the better classes both sexes wear also a jacket buttoned to the throat, stockings and shoes, and all the men, except servants, wear hats.

The staple food of the Siamese is rice and fish. Meat is eaten, but, as the slaughter of animals is against Buddhist tenets, is not often available, while the consumption of fish is considerable. The men smoke, but the women do not. Everybody eats betel. The principal pastimes are gambling, boat-racing, cock- and fish-fighting and kite-flying, and a kind of football.

The laws of ancient Siam were established by a series of laws, the last of which came into force in 1905. No such thing as caste exists, and low birth is no insuperable bar to the attainment of the highest dignities or the exercise of the highest functions. The king, or vajiravudh, as he is called, is God-appointed, and his whole life is consecrated to public service, and he is never allowed to marry. The king's son is always known to be his successor, and all his subjects are constantly referring to him as his 'little brother'.

The principal towns are Phuket, Bangkok, Ayuthia, Chiang Mai, Phayao, Loeng, Singoor, and other towns and cities.

The royal palace, which is the residence of the king and queen, is the finest example of Siamese architecture in the world. It is situated at Bangkok, and is surrounded by a deep moat. The palace is entered by a gate, which is guarded by the guards of the royal army. The palace is a large and beautiful building, with many windows and doors, and is surrounded by a high wall. The palace is well furnished, and contains a large number of works of art.

The capital is Bangkok, which is situated at the junction of the Chao Phraya and the Klong Bang Krachao. It is a city of about 200,000 inhabitants, and is the principal commercial centre of the country. It is a city of narrow streets and crowded houses, and is celebrated for its beautiful and picturesque temples. The principal temple is the Wat Pho, which is situated at the centre of the city. It is a large and beautiful building, with many shrines and statues of Buddha. The city is well supplied with water, and has many canals and bridges. The principal river is the Chao Phraya, which runs through the city from north to south.

The postal service extends to all parts of the country and is effectively managed by the Government. The post-office is also widely distributed, and foreign and domestic letters are transmitted with great facility. The post-office is also well supplied with money orders and savings banks. The latter is a great convenience, as it enables the people to save money and to have a ready means of payment.
occupation of practically the whole population of Siam outside the capital. Primitive methods obtain, but the Siamese are efficient cultivators and secure good harvests nevertheless. The sowing and planting season is from June to August, and the reaping season from December to March, the dates of the perpetually growing are fixed, and Siam rice is the best of the world. Irrigation is rudimentary, for no system exists for raising the water of the innumerable canals on to the fields. Water-supply depends, therefore, on rainfall. In 1903 and 1904 surveys were made for a system of irrigation. Tobacco, pepper, coco-nuts and maize are other agricultural products. Tobacco of good quality is produced in the provinces where exports are paid for with rice, chiefly in Chantabun and southern Siam, annually yields about 900 tons for export. From coco-nuts about 10,000 tons of copra are made for export each year, and maize is used for local consumption. A few of the highest statistical returns show over two million head in the whole country.

Mining.—The mines of Siam include gold, silver, rubies, sapphires, tin, copper, iron, zinc and coal. Tin-mining is a flourishing industry near Palek on the west coast of the Malay Peninsula since 1905, much prospecting and some mining has been done on the east coast. The export of tin in 1908 exceeded 5,000 tons, valued at over $60,000. Rubies and sapphires, rare and mining Chantabun district in the south-east. The Mining Department of Siam is a well-organized branch of the government, employing several highly-qualified English experts.

The number of teak-trees in the forests of northern Siam employs a large number of people. The industry is almost entirely in the hands of Europeans, British largely predominating. The number of teak logs brought out via the Surin and Menam Chao Phraya rivers during the fiscal year 1906-1907 was about 90,000, making the teak-producing country of the world. A Forest Department, in which experienced officers recruited from the Indian Forest Service are employed, has for many years controlled the forests of Siam. The government has given permission to Sericulture, and steps have been taken to improve Siamese silk with the aid of scientists borrowed from the Japanese Ministry of Agriculture. The production of the land has been increased for a long time occupied the attention of the government. A Survey Department, inaugurated about 1887, has completed the general survey of the whole country, and has made a cadastral survey of the whole of Siam. The Department of Agriculture, trade and commerce, has been established in the central provinces of the country has been effected. The education of the youth of Siam in the technology of the industries practised has not been neglected. Pupils are sent to the best foreign agricultural schools, and, after going through the prescribed course, often with distinction, return to Siam to apply their knowledge with more or less success. Moreover, a college under the control of the Ministry of Agriculture which was established in 1899, provides special courses of instruction in these subjects and also in irrigation engineering, sericulture and surveying.

Commerce.—Rice-mills, saw-mills and a few distilleries of local country are carried on in brick or tile factories, and there a shed in which coarse pottery is made, are all Siam has in the way of factories. All manufactured articles of daily use are imported, as is almost all rawware and machinery. The foreign commerce of Siam, which is still practised, dates from the Indian, China and probably Japanese dates from the beginning of the Christian era or earlier, while that with Europe began in the 16th century. Trade with her immediate neighbours is now insignificant, the total value of annual imports and exports being about $400,000; but seaborne commerce is in a very flourishing condition. Bangkok, with an annual trade valued at $13,000,000, easily outstrips all the rest of the country, the other ports together accounting for a total of $2,000,000 imports and $2,000,000 exports not exceeding $3,000,000. On both the east and west coasts of southern Siam trade is increasing rapidly, and is almost entirely with the Straits Settlements. The trade of the western coast is carried on by British and Siamese ships exclusively, that on the east coast by British and Siamese.

Art.—The Siamese are an artistic nation. Their architecture, drawing, goldsmith's work, carving, and dancing and dancing are all highly developed in strict accordance with the traditions of Indo-Chinese art. Architecture, chiefly exercised in connexion with religious buildings, is clearly a decadent form of that practised by the ancient Khmer kingdom. The art is among the finest in the world. The system of music is elaborate but is not written, vocalists and instrumentalists performing entirely by ear. The interval corresponding to the octave being divided into seven equal parts, each above the Sama (the root) it follows that Siamese music sounds strange to Western ears. Harmony is unknown, and orchestras, which include flutes, drums, and harmonicons, perform in unison. The goldsmith's work of Siam is justly considered one of the finest in the world silver, dates from the most ancient times. Almost every province has its special patterns and processes, the most elaborate being those of Nakon Sri Tammarat (Ligore), Chantabun and the Laos country. In the Ligore were the hammered ground-work is inlaid with a black composition of sulphides of baser metals which throws up the pattern with distinctness.

Government.—The government of Siam is an absolute monarchy. The heir to the throne is appointed by the king, and was formerly chosen from among all the members of his family, collateral as well as descendants. The choice was sometimes made early in the reign when the heir held the title of "Chao Uparak" or "Wang Na," miscalled "Second King" in English, and sometimes was left until the death of the king was imminent. The arrangement was fraught with danger to the public tranquility, and one of the reforms of the last sovereign was the abolition of the office of "Chao Uparak" and a decree that the throne should in future descend from the king to one of his sons born of a queen, which decree was immediately followed by the appointment of a crown prince. There is a council consisting of the ten ministers of state—for foreign affairs, war, interior, finance, household, justice, metropolitan government, public works, public instruction and for agriculture—together with the general adviser. There is also a legislative council, of which the above are ex officio members, consisting of forty-five persons appointed by the king. The council meets once a week for the transaction of business. The king is an autocrat in practice as well as in theory, he has an absolute power of veto, and the initiative of measures rests largely with him. Most departments have the benefit of European advisers. The government offices are conducted much on European lines. The Christian Sunday is observed as a holiday and regular hours are prescribed for attendance. The numerous palace and other functions make some demand upon ministers' time, and, as the king transacts most of his affairs at night, high officials usually keep late office hours. The Ministry of Interior and certain technical departments are recruited from the civil service schools, but many appointments in government service go by patronage. For administrative purposes the country is divided into seventeen montons (or divisions) each in charge of a high commissioner, and an eighteenth, including Bangkok and the surrounding suburban provinces, under the direct control of the minister for metropolitan government (see Bangkok). The high commissioners are responsible to the minister of interior, and the montons are furnished with a very complete staff for the various branches of the administration. The montons consist of groups of the old rural provinces (muang), the hereditary chiefs of which, except in the Lao country in the northeast, have been replaced by governors trained in administrative work and subordinate to the high commissioner. Each muang is subdivided into amphurs under assistant commissioners, and these again are divided into village circles under headmen (kamnans), which circles comprise villages under the control of elders. The suburban provinces of the metropolitan monton are also divided as above. The policing of the seventeen montons is provided for by a gendarmerie of over 7,000 men and officers (many of the latter Danes), a well-equipped and well-disciplined force. That of the suburban provinces is effected by branches of the Bangkok civil police.

Finance.—The revenue administration is controlled by the ministers of the interior, of metropolitan government and of finance, by means of well-organized departments and with expert European assistance. The total revenue of the country for 1908-1909 amounted to $4,000,000, mostly in gold and, at the prevailing rate of exchange, about £4,300,000, made up as follows:

**Total** £4,000,000

The unit of Siamese currency is the tical, a silver coin about equal in value to the Indian rupee. Upon the introduction of the serious depreciation of the value of silver, the Siamese mint was closed to free coinage, and an arrangement was made providing for the gradual enhancement of the value of the tical until a suitable value should be attained at which it might be fixed. This measure was
SUCCESSFUL, the value of the tical having thereby been increased from $1.13d. in 1902 to $1.55d. in 1909, to the improvement of the national credit and of the value of the revenues. A paper currency was established in 1902, and proved a financial success. In 1905 Siam and the United States signed the following public treaty. "Siam and the United States of America have agreed to the sum of $4,000,000 was borrowed in 1909 from the government of the Federated (British) Malay States at par and bearing interest at 4.5%."

**Weights and Measures.**—In accordance with the custom formerly prevalent in all the kingdoms of Further India, the coinage of Siam furnishes the standard of weight. The tical (khal) is the unit of currency. It is about fifty catties or chang fifty chang equal one khal, equivalent to the Chinese picul, or 133½ lb avoidpous. For the weighing of gold, gems, opium, &c., the juang, equal to 1 tical, and the salang, equal to 1 jual, are used. The unit of linear measure is the sæk, which is subdivided into ½ sæk or saukh, ¼ sæk or huyp, and into ¼ sæk or niew. Twenty sæk is equal one saukh and 400 sæk equal one yole. The length of the sæk is 1.5 metres. The unit of land measure is the acre, which is divided into 1,000,000 square units, and is measured in 1,000,000 parts, and is subdivided into 1,000,000 parts. Measures of capacity are the tan or bucket, and the sot or basket. Twenty banana, originally a half coco-nut shell, equal one chah, and the same as a shilling. One den Khmer style is used to measure rice and the sot for paddy and other grains. 

**Army and Navy.**—By a law passed in 1903, the ancient system of the king's private bodyguard and navy, and unemployed prisoners of war was abolished in favour of compulsory service by all able-bodied men. The new arrangement, which is strictly territorial and is confined to the eight monts, is the result of the same system as that which is in force in the United Kingdom. The law is used for measuring rice and the sot for paddy and other grains. There is a standing peace army of 20,000 of all ranks, in a marine service of about 10,000, and in the beginnings of first and second reserves. The navy, many of the officers of which are Danes and Norwegians, comprises a line-of-battle ship, a cruiser, three monitors, three small gunboats, the royal yacht, four steel gunboats of between 500 and 700 tons all armed with modern quick-firing guns, two torpedo-boat destroyers and three torpedo boats, with other craft for river and coast work.

**Religion.**—While the pure-blooded Malays of the Peninsula are Mahommedans, the Siamese and Laos profess a form of Buddhism which is tinged by Cingalese and Burmese influences, and, especially in the more remote country districts, by the spirit-worship which is characteristic of primitive animist and other superstitions of Indo-China. In the capital a curious admixture of early Brahminical influence is still noticeable, and no act of public importance takes place without the assistance of the divinities of the Brahmin pantheon, and the king is expected to follow them in their ceremonies and priesthood, as the Buddhist rule, which prescribes that every man should enter the priesthood for at least a few months, is almost universally observed, even young princes and noblemen who have been enrolled in the higher military and civil service. There is no open dissent from Buddhism, and those who have become converted to the new faith enter the old system.

The accounts given by some writers as to the profligacy and immorality in the monasteries are grossly exaggerated. Many of the monks, 300,000 in number, are under the direct supervision of the king, and in this a stricter rule of life is observed. Some of the priests are learned in the Buddhist scriptures, and most of the Pali scholarship in Siam is to be found in monasteries, but there is no learning of a secular nature. There is little public worship in the Christian sense of the word. The day set apart for worship (Wan Sula) is a time for the performance of certain public duties; and, among the lower classes, dance and song, and consists mostly of women. Religious or semi-religious ceremonies, however, play a great part in the life of the Siamese, and few weeks pass without some great function or procession. Among the Khmers, who are more pagan than the Siamese, the ceremony held for the reification of priests is the most popular. The ceremonies of the Khmers are celebrated with processions, theatrical shows, illuminations and feasts.

The missionaries in Siam are entirely French Roman Catholics and American Protestants. They have done much to help on the general work of civilization and the progress of education has been largely due to their efforts.

**Education.**—As in Burma, the Buddhist monasteries scattered throughout the country carry on almost the whole of the elementary education, and the modern schools are being brought into line with the government educational organization. These now contain not far short of 100,000 pupils. In the metropolitan monasteries there are primary, secondary and special schools for boys and girls, affording instruction to some 10,000 pupils. There are also the medical school, the law school, the civil service school, the military schools and the agricultural college. Nine schools of higher education have been established for the purpose of receiving professional instruction. Many of the special schools use the English language for conveying instruction, and there is a growing demand for English as a subject, and the curriculum is conducted in English by English masters. Two scholarships of £500 a year each for four years are annually competed for by the scholars of these schools, the winners of which proceed to Europe to study a subject of their own selection which shall fit them for the future service of their country. Most of the special schools also give scholarships to enable the best of their pupils to complete their studies abroad. The result of the widespread system is that almost all men can read and write a little, though the women are altogether illiterate.

**History.**

Concerning the origin of the name "Siam" many theories have been advanced. The early European visitors to the country noticed that it was not officially referred to by any such name, and therefore apparently conceived that the term must have been applied from outside. Hence the first written accounts give Portuguese, Malay and other derivations, some of which have continued to find credence among quite recent writers. It is now known, however, that "Siam" or "Sayam" is one of the most ancient names of the country, and that at least a thousand years ago it was in common use, such titles as Swankokal-Sukhotai, Shahr-i-nao, Dwarpuri, Ayuthia, the last sometimes corrupted to "Judea," by which the kingdom has been known at various periods of its history, being no more than the names of the three languages which were only brought the land under their sway. The Siamese (Thai) call their country Muang Thai, or "the country of the Thai race," but the ancient name Muang Sayam has lately been revived. The gradual evolution of the Siamese (Thai) from the fusion of Lao-Tai and Khmer races has been mentioned above. Their language, the most distinctively Lao-Tai attribute which they have, plainly shows their very close relationship with the latter race and its present branches, the Shans (Tai Long) and the Ahom of Assam, while their appearance, customs, written language, religion, art, and manners, resemble those of the Khmers. The southward movement of the Lao-Tai family from their original seats in south-west China is of very ancient date, the Lao states of Luang Prabang and Wiang Chan on the Mekong having been founded at least two thousand years ago. The first incursions of Lao-Tai among the Khmers of northern Siam were probably later, for the town of Lampun (Labong or Haribunchai), the first Lao capital in Siam, was founded about a.d. 575. The fusion of races may be said to have begun then, for it was during the succeeding centuries that the kings of Swankokal-Sukhktai gradually assumed Lao characteristics, and that the Siamese language, written character, and other racial peculiarities were in course of formation. But the finishing
touches to the new race were supplied by the great expulsion of Lao-Tai from south-west China by Kublai Khan in A.D. 1250, which profoundly affected the whole of Further India. Thereafter, the north, the west and the south-west of Siam, comprising the kingdom of Swankalok-Sukhotai, and the states of Suphan and Nakhon Si-Thammarat (Ligore), with their sub-feudatories, were reduced by the Siamese (Thai), who, during their southern progress, moved their capital from Sukhotai to Nakhon Sawan, thence to Kampeng Pet, and thence again to Suvarnabhumi near the present Kanburi. A Sukhotai inscription of about 1284 states that the dominions of King Rama Kamheng extended across the country from the Mekong to Pechaburi, and thence down the Gulf of Siam to Ligore; and the Malay annals say that the Siamese had penetrated to the extremity of the peninsula before the first Malay colony from Menangkabu founded Singapore, i.e. about 1160. Meanwhile the ancient state of Lavo (Lopburi), with its capital at Sano (Sornau was Shahr-i-nao), at one time feudatory to Swankalok-Sukhotai, remained the last stronghold of the Khmer, although even here the race was much modified by Lao-Tai blood; but presently Sano also was attacked, and its fall completed the ascendancy of the Siamese (Thai) throughout the country. The city of Ayuthia which rose in A.D. 1350 upon the ruins of Sano was the capital of the first true Siamese king of all Siam. This king's sway extended to Moulmein, Tavoy, Tenasserim and the whole Malacca peninsula (where among the traders from the west Siam was known as Sornau, i.e. Shahr-i-nao, long after Sano had disappeared—Vrue's Marco Polo, ii. 260), and it was under its protection that the Swankalok-Sukhotai took refuge in Java. This is corroborated by Javaan records, which describe a "Cambodian" invasion about 1349; but Cambodia was itself invaded about this time by the Siamese, who took Angkor and held it for a time, carrying off 90,000 captives. The great southward expansion here recorded is confirmed by the Chinese annals of the period. The wars with Cambodia continued with varying success for some 400 years, but Cambodia gradually lost ground and was finally shorn of several provinces, her sovereign falling entirely under Siamese influence. This, however, latterly became displeasing to the French, now in Cochin China, and Cambodia was ultimately obliged to recognize the protectorate forced on Cambodia by that power. Vigorous attacks were also made during this period on the Lao states to the north-west and north-east, followed by vast deportation of the people, and Siamese supremacy was pretty firmly established in Chiang-mai and its dependencies by the end of the 18th century, and over the great eastern capitals, Luang Prabang and Vien-chang, about 1828. During the 15th and 16th centuries Siam was frequently invaded by the Burmese and Peguans, who, attracted probably by the great wealth of Ayuthia, besieged it more than once without success, the defenders being aided by Portuguese mercenaries, till about 1555, when the city was taken and Siam reduced to dependence. From this condition, however, it was raised a few years later by the great conqueror and national hero Phra Naret, who after subduing Laos and Cambodia invaded Pegu, which was utterly overthrown in the next century by his successors. But after the civil wars of the 18th century the Burmese, having previously taken Chieng-mai, which appealed to Siam for help, entered Tenasserim and took Mergui and Tavoy in 1764, and then advancing simultaneously from the north and the west captured and destroyed Ayuthia after a three years' siege (1767).

The intercourse between France and Siam began about 1680 under Phra Narain, who, by the advice of his minister, the Cephalonian adventurer Constantine Phaulcon, sent an embassy to Louis XIV. When the return mission arrived, the eagerness of the ambassador for the king's conversion to Christianity, added to the intrigues of Phaulcon with the Jesuits with the supposed intention of establishing a French supremacy, led to the death of Phaulcon, the persecution of the Christians, and the cessation of all intercourse with France. An interesting episode was the active intercourse, chiefly commercial, between the Siamese and Japanese governments from 1592 to 1632. Many Japanese settled in Siam, where they were much employed.

They were dreaded as soldiers, and as individuals commanded a position resembling that of Europeans in most eastern countries. The jealousy of their increasing influence at last led to a massacre, and to the expulsion or absorption of the survivors. Japan was soon after this, in 1636, closed to foreigners; but trade in connection with the Dutch continued through 1745 through Dutch and Chinese and occasional English traders. In 1752 an embassy came from Ceylon, desiring to renew the ancient friendship and to discuss religious matters. After the fall of Ayuthia a great general, Phaya Tahk Sin, collected the remnants of the army and restored the fortunes of the kingdom, establishing his capital at Bangkok; but, becoming insane, he was put to death, and was succeeded by another successful general, Phaya Chakkri, the founder of the present dynasty. Under him Tenasserim was invaded and Tavoy held for the last time by the Siamese in 1792, though in 1825, taking advantage of the Burma war between the English and the Siamese, they bombarded some of the towns on that coast. The supremacy of China is indicated by occasional missions sent, as on the founding of a new dynasty, to Peking, to bring back a seal and a calendar. But the Siamese now repudiate this supremacy, and have sent neither mission nor tribute for sixty years, while no steps have been taken by the Chinese to enforce its recognition. The sovereign, Phra Paramerd Maha Mongkut, was a very accomplished man, an enlightened reformer and devoted to science; his death, indeed, was caused by fatigue and exposure while observing an eclipse.

Many of his predecessors, too, were men of different fibre from the ordinary Oriental sovereign, while his son Chulalong Korn, who succeeded him in 1868, showed himself an administrator of the highest capacity. He died on the 23rd of October 1910.

Of European nations the Portuguese first established intercourse with Siam. This was in 1511, after the conquest of Malacca by D'Albuquerque, and the intimacy lasted over a century, the tradition of their greatness having hardly yet died out. They were supplanted gradually in the 17th century by the Dutch, whose intercourse also lasted for a similar period; but they have left no traces of their presence, as the Portuguese always did in these countries to a greater extent than any other people. English traders were in Siam very early in the 17th century; there was a friendly interchange of letters between James I. and the king of Siam, who had some Englishmen in his service, and, when the ships visited "Sia" (which was "as great a city as London") or the queen of Patani, they were hospitably received and accorded privileges—the important items of export being, as now, tin, varnish, deer-skins and "precious drugs." Later on, the East India Company's servants, jealous at the employment of Englishmen not in their service, attacked the Siamese, which led to a massacre of the English at Mergui in 1687, and the factory at Ayuthia was abandoned in 1688. A similar attack is said to have been made in 1719 by the governor of Madras. After this the trade was neglected.

Pulo Penang, an island belonging to the Siamese dependency of Kedah, was granted on a permanent lease to the East India Company in 1786, and treaties were entered into by the sultan of Kedah with the company. In 1822 John Crawford was sent to Bangkok to negotiate a treaty with the suzerain power, but the mission was unsuccessful. In 1824, by treaty with the Dutch, British interests became paramount in the Malay Peninsula and in Siam, and, two years later, Captain Burney signed the first treaty of friendship and commerce between England and Siam. A similar treaty was effected with America in 1833. Subsequently trade with British possession revived, and in time a more elaborate treaty with England became desirable. Sir J. Brooke opened negotiations in 1850 which came to nothing, but in 1855 Sir J. Bowring signed a new treaty whereby Siam agreed to the appointment of a British consul in Bangkok, and to the exercise by that official of full extraterritorial powers. Englishmen were permitted to own land in certain defined districts, customs and port dues and land revenues were fixed, and many new trade facilities were granted. This important arrangement was followed at intervals by similar treaties with the other powers, the last two being those with
Japan in 1808 and Russia in 1899. A further convention afterwards provided for a second British consular district in northern Siam, while England and France have both appointed vice-consuls in different parts of the country. Thus foreigners in Siam, except Chinese, who have no consul, could only be tried for criminal offences or indemnities, and on the permanent courts. A large portion of the work of the foreign consuls, especially the British, was consequently judicial, and in 1901 the office of judge was created by the British government, a special judge with an assistant judge being appointed to this post.

Meanwhile, trade steadily increased, especially with Great Britain and the British colonies of Hong Kong and Singapore.

The peaceful internal development of Siam seemed also likely to be favoured by the events that were taking place outside her frontier. For centuries she had been distracted by wars with Cambodians, Peguans and Burmans, but the incorporation of Lower Cochin China, Annam and Tongking by the French, and the annexation of Lower and Upper Burma successively by the British, freed her from all further danger on the part of her old rivals. Unfortunately, she was not destined to escape trouble. The frontiers of Siam, both to the east and the west, had always been vague and ill-defined, as was natural in wild and unexplored regions inhabited by more or less barbarous tribes. The frontier between Siam and the new British possessions in Burma was settled by agreement in 1879, and without difficulty, but the boundary question on the east was a much more intricate one and was still outstanding. Disputes with frontier tribes led to complications with France, who asserted that the Siamese were occupying territory that rightfully belonged to Annam, which was now under French protection. France, while assuring the British Government that she laid no claim to the province of Luang Prabang, which was situated on both banks of the upper Mekong, roughly between the 18th and 20th parallels, claimed that farther south the Mekong formed the true boundary between Siam and Annam, and demanded the evacuation of certain Siamese posts east of the river. The Siamese refused to yield, and early in 1893 encounters took place in the disputed area, in which a French officer was captured and French soldiers were killed. The French then despatched gunboats from Saigon to enforce their demands at Bangkok, and these made their way up to the capital in spite of an attempt on the part of the Siamese naval forces to bar their way. In consequence of the resistance with which they had met, the French now greatly increased their demands, insisting on the Siamese giving up all territory east of the Mekong, including about half of Luang Prabang, on the payment of indemnity, and the permanent withdrawal of all troops and police to a distance of 25 kilometres from the right bank of the Mekong. Ten days' blockade of the port caused the Siamese government to accede to these demands, and a treaty was made, the French sending troops to occupy Chantabun until its provisions should have been carried out.

In 1895 lengthy negotiations took place between France and England concerning their respective eastern and western frontiers in Farther India. These negotiations bore important fruit in the Anglo-French convention of 1896, the chief provision of which was the neutralisation by Great Britain of French possessions in the central portion of Siam, consisting of the basin of the river Menam, with its rich and fertile land, which contains most of the population and the wealth of the country. Neither eastern nor southern Siam was included in this agreement, but nothing was said to impair or lessen in any way the full sovereign rights of the king of Siam over those parts of the country. Siam thus has its independence guaranteed by the two European powers who alone have interests in Indo-China, England on the west and France on the east, and has therefore a considerable political interest similar to that of Afghanistan, which forms a buffer state between the Russian and British possessions on the north of India. Encouraged by the assurance of the Anglo-French convention, Siam now turned her whole attention to internal reform, and to such good purpose that, in a few years, improved government and expansion of trade aroused a general interest in her welfare, and gave her a stability which had before been lacking. With the growth of confidence negotiations with France were reopened, and, after long discussion, the treaty of 1893 was set aside and Chantabun evacuated in return for the cession of the provinces of Bassac, Melpré, and the remainder of Luang Prabang, all on the right bank of the Menam, and the maritime district of Krat. These results were embodied in a new treaty signed and ratified in 1904.

Meanwhile, in 1899, negotiations with the British government led to agreements defining the status of British subjects in Siam, and fixing the frontier between southern Siam and the British Malay States, while in 1900 the provisions of Sir J. Bowring's treaty of 1855, fixing the rates of land revenue, were abrogated in order to facilitate Siamese financial reform.

In 1907 a further convention was made with France, Siam returning to the British the prince of Battambang conquered in 1811, and in compensation receiving back from France the maritime province of Krat and the district of Dansai, which had been ceded in 1904. This convention also modified the extra-territorial rights enjoyed by France in Siam, and disclosed an inclination to recognize the material improvements of the preceding years. In 1907 also negotiations were opened with Great Britain, the objects of which were to modify the extra-territorial rights conceded to that power by the treaty of 1859, and to remove various restrictions regarding taxation by the general administration, which, though diminished from time to time by agreement, still caused the British government very much. These negotiations continued all through 1908 and resulted in a treaty, signed and ratified in 1909, by which Siam ceded to Great Britain her suzerain rights over the dependencies of Kedah, Kelantan, Trengganu and Perlis, Malay states situated in southern Siam just north of British Malaya, containing in all about a million inhabitants and for the most part flourishing and wealthy, and obtained the practical abolition of British jurisdiction in Siam proper as well as relief from any obligations which, though probably very necessary when they were incurred, had long since become useless and vexatious obstacles to progress towards efficient government. This treaty, a costly one to Siam, is important as opening up a prospect of ultimate abandonment of extra-territorial rights by all the powers. Administrative reform and an advanced railway policy have made of Siam a market for the trade of Europe, which has become an object of keen competition. In 1908 the British empire retained the lead, but other nations, notably Germany, Denmark, Italy and Belgium, had recently acquired large interests in the commerce of the country. Japan also, after an interruption of more than two hundred years, had resumed active commercial relations with Siam.

Siamese belongs to the well-defined Tai group of the Siamese Chinese family of languages. Its connexion with Chinese is closer than that with Burmese, though the latter is also a member of the Tai group, and the languages of the Tai group are very close. It is spoken throughout central Siam, in all parts of southern Siam except Patani Monton, in northern Siam along the river-banks as far up as Uttaradit and Raheng, and in eastern Siam as far as the confines of the Korat Monton. In Patani the common language is still Malay, while in the upper parts of northern and the outlying parts of eastern Siam the prevailing language is Tao, though the many hill tribes which occupy the ranges of these parts have distinct languages of their own.

Originally Siamese was purely monosyllabic, that is, each true word consisted of a single vowel sound, whether by itself, or a combination of syllables. Of many monosyllables there are less than two thousand, and therefore many syllables have to do duty for the expression of more than one idea, confusion being avoided by the tone in which they are pronounced, and also by the fact that a word is always preceded by the name of the language. The language now consists of about 15,000 words, of which compounds of two monosyllables and appropriations from foreign sources form a very large part. Balé, the ancient language kingdom of Magadha, in which the sacred writings of Buddhism were made, was largely instrumental in forming all the languages of Further India, including Siamese, a fact which is brought out by the many sounds in Siamese which are identical with the Môn, Burmese and Siamese languages of the present time, though these are of quite separate origin. When intercourse with the West began, and more especially when Western methods of government and science were adopted in Siam, the Siamese were enabled to utilize European words was very marked, but recently there has been an effort to avoid this by the coinage of Siamese or Balé compound words.

The current Siamese characters are derived from the more monosyllabic Cambodian alphabet, which again owes its origin to the alphabet of the inscriptions, an offshoot of the character found on the stone monuments of southern India in the 6th and 7th centuries. The sacred books of Siam are still written in the Cambodian character.

The Siamese alphabet consists of 44 consonants, in each of which the consonant and vowel sounds are invariable, or in the vernacular, not by individual letters, but by signs written above, below, before or after the consonant in combination with which they are to be pronounced. It may seem at first that so many as 44 consonants can scarcely be adequate to express a language in which the sounds show so many different intonations of which there are, as a matter of fact, only 14, which are the most common. Yet when it is considered that in English, the number is of vowel sounds which is only 5, and that between these there are 4 different intonations, it is obvious that the Siamese language is capable of expressing a far wider range of ideas than English, as well as many other modern languages. The characters of the Siamese language are increased by the fact that in addition to the ordinary language of the people there is a completely different set of words ordain for the use of royalty. This "Palace language appears to have come into existence from a wish to avoid the scandal of putting down the royal word, or any downmarket expressions of vulgarity or of words which might be capable of conveying an unpleasant or indelicate idea other than the meaning intended. In the effort to escape from vulgarity, the Siamese have coined innumerable words, and many Cambodian words are also used. The language is so complete that the dog, pig, crow and other common or unclean animals are all expressed by special words, while the actions of royalty, such as eating, sleeping, walking, speaking, bathing, dying, are spoken of in words quite distinct from those used to describe similar actions of ordinary people.

The prose style of Siames is largely of mythological and historical fables, almost all of which are of Indian origin, though many of them have been changed to suit the Eastern temper. The style is different in some of the highest works. It is less general and more local than that of the writers of the higher culture, and the style itself is perhaps an inheritance from olden times. The formality of language is greater than in modern Greek, being more in the nature of a polite speech. The words are mostly kept in use which are the most poetical, but this is not the case with the spoken language. The style is considered correct if the words are poetical in general, but if the words are poetical and idiomatic, the style is incorrect.

The greatest difficulty with the Siamese language lies in the tonal system. Of the simple tones there are five—the even, the circumflex, the acute, the silent and the broken. The tone is indicated for the numerals connecting links between the words, to a point where it may give a quite distinct meaning. Four of the simple tones are marked in the written character by signs placed on the consonant affected, and the absence of a mark implies the one remaining tone to be used. A complication is caused by the fact that the consonants are grouped into three classes, to each of which a special tone applies, and consequently the application of a tonal sign to a letter has a different effect, according to the class to which such letter belongs. Though many syllables have to do duty for the expression of more than one idea, the different tones are not only useful, but are necessary, for which are used with a quite different inflection, each of which gives the word a new meaning. Thus, for example, the syllable khao may mean "they," "sadly," "rice," "white," or "as water." The meaning of the word is always included in the tone by which it is pronounced. Words are unchangeable and incapable of inflection. There is no article, and no distinction of gender, number or case. These, when it is necessary to denote them, are expressed by ex- planatory words after the respective nouns; only the dative and ablative are denoted by subsidiary words, which precede the nouns, the nominative being marked by its position before, the objective by its position after, and the accusative by its position in the middle (postpositive). Occasionally, how- ever, auxiliary nouns serve that purpose. Words like "mother," "son," "water" are often employed in forming compounds to express ideas for which the Siamese have no single words, e.g. lae c الدم, "the son of hire," a labourer; mũ mũ, "the mother of the hand," the thumb. The use of class words with numerals obtains in Siamese as it does in Chinese, Burmese, Annamese, Malay and many other Eastern languages. As in these, so in Siamese the personal pronouns are mostly represented by names expressive of the various shades of superior or lower rank according to Eastern etiquette. The verb is, though used as a noun, partly as a pronominal. The mood is indicated by auxiliary words only when they cannot be inferred from the context. Such auxiliary words are yă, "to be," to dwell (present); daai, to have, learn (past); çi, to go, to suffer (future); the verb is preceded, the verb. Hài, "to give" (prefix), often indicates the subjunctive. As there are compound sounds, so there are compound verbs; thus, e.g. pai, "to go," is joined to a transitive verb to form the verbal combination pai tàk, "to go to," and pai y ddong, "to be compelled," serve to form a sort of passive voice. The number of adverbs, single and compound, is very large. The proverbs mostly consist of a consonant compound.

The construction of the sentence in Siamese is straightforward and simple. The subject of the sentence precedes the verb and the object follows. The possessive pronoun follows the object. The verb usually follows the noun, but an object may precede, the verb. Hài, "to give", "to give" (prefix), often indicates the subjunctive. As there are compound sounds, so there are compound verbs; thus, e.g. pai, "to go," is joined to a transitive verb to form the verbal combination pai tàk, "to go to," and pai y ddong, "to be compelled," serve to form a sort of passive voice. return for a certain fruit which her mother desired to eat. **Mahasot** is an account of the wars of King Mahasot. **Nok Khun** is one of the theories of the genealogy of the King, this being the sacred goose or "Hansa" from whose eggs the first human beings were supposed to have been hatched. A considerable proportion of the romances are founded upon episodes in the final life, or in one of the innumerable former existences, of the Buddha. The **Pattama Sempothihan** is the standard Siamese life of the Buddha. Many of the stories have their scene laid in Himaphan, the Siamese fairyland, probably originally the Himalaya.

A great many works on astrology and the casting of horoscopes, on the ways to secure victory in war, success in love, in business, or in love-making, have been written on other branches of magic, to which subject the Siamese have always been partial. On the practice of medicine, which is in close alliance with magic, there are several well-known works.

The Niti literature forms a class apart. The word Niti is from the Bali, and means "old saying," "tradition,""good counsel." The best known of such works are Rules for the Conduct of Kings, translated from the Bali, and The Maxims of Phra Rung, the national hero-king, on whose wonderful sayings and doings the imagination of Siamese youth is fed.

In works on history the literature of Siam is unfortunately rather poor. There can be little doubt that, as in the case of all the kingdom of Persia, compiled charters, or manuscripts compiled from reign to reign by order of her kings, but of the more ancient of these, the wars and disturbances which continued with such frequency down quite recent times, have been edited to the left. The Annals of the North, the Annals of Krong Kao (Ayutthia) and the Book of the Lives of the Four Kings (of the present dynasty) together form the only more or less connected history of the country from recent times down to the beginning of the present reign, and these, at least so far as the earlier parts are concerned, contain much that is inaccurate and a good deal which is altogether untrue. Foreign histories include a work on Pegu, a few tales of Cambodian kings and records of public proceedings in European history compiled by the educational department.

The number of works on law is considerable. The **Laksana Phra Thamarat**, the Phra Tamra, Phra Tamnon, Phra Racha Kamal, and Inhatpat are ancient works setting forth the laws of the country in their oldest form. Adapted from the Dharmastra and the Classification of the Law of Manu. These, and also many of the edicts passed by kings of the Ayuthia period which have been preserved, are now of value more as curiosities of literature and history than anything else, since, for all practical purposes, they have long been superseded by laws more in accordance with modern ideas. The laws of the country have received a number of codifications, the last of which is the recent Bangkok Lawbook, which is most notable part of this branch of Siamese literature. They include a great number of revenue regulations, laws on civil matters such as marriage, bankruptcy, rights of the husband and wife, property laws, and property rights, all of which adhere to Western principles in the main. The latest addition is the Pugal Code, a large and comprehensive work based upon the Indian, Japanese, and English laws and compiled in 1854.

Poetry is a very ancient art in Siam and has always been held in high honour, some of the best-known poets being, indeed, members of the royal family. There are several quite distinct forms of metre, of which those most commonly used are the Klong, the Kap and the Klon. The Klong is rhythmic, the play being on the inflection of the voice in speaking the words, which inflection is arranged according to fixed schemes; the rhythm, if it can be so called, being sought not in the similarity of syllables but of intonation. The Kap is rhythmical and also has rhyming syllables. The lines contain an equal number of syllables, and are arranged in stanzas of four lines each. The first line of the stanzas is a jingle, the last syllable of the second line, the last of the second with the last of the third and also with the first of the fourth line, and the last syllable of the fourth line rhymes with the last of the second line of the next succeeding stanza. A stanza of one or of several lines two metres very great, and includes verses on almost every theme. In the Nairat poetry, a favourite form of verse, both are often used, a stanza in Klong serving as a sort of argument at the head of a section, while the Klong is the form most frequently addressed by a traveller to his lady-love, of a journey in every object, and circumstance serves but a reminder of the wanderer of some virtue, and with all of the rest of the journey is of course imaginary, but in some cases it is a true record of travelling or campaigning, and has been found to contain information of value concerning the condition at certain times of outlying districts. Of the Klong, the form called Klong pet ton, there are many hundreds. These follow a prescribed form, and consist of eight lines divided into two stanzas of four lines each, every line containing eight syllables. The last syllable of the first line rhymes with the third syllable of the second, and the final line of the second with the final line of the third. The songs treat of all the aspects of love. A fourth poetical metre is Chit, which, however, it is impossible to describe. The introduction of printing in the Siamese character has revolutionized the literature of the country. Reading has become a general accomplishment, a demand for reading matter has arisen, and book-stores have been established on all the branches of magic, from which the present state of the country is a direct result. The historical works above referred to have been issued in many editions, and selections from the ancient fables and romances are continually being edited and reprinted in native form as plays. The educational department has done good work in compiling volumes of prose and verse which have found much favour with the public. All the laws, edicts and regulations at present in force are to be had in a book of popular reading. It is an important incentive to the development of literature, the output has increased enormously, and will doubtless continue to do so for a long time to come. (W. A. G.)

**SIBAWAIH** (Abu Bishr, or Abü-1 Hasan'Amr ibn ibn Qanbar, known as SIBAWAIH or SIBWAYH) (c. 753-792), Arabian grammarian, was by origin a Persian and a freedman. Of his early years nothing is known. At the age of thirty-two he went to Baghad, where he was a pupil of the celebrated grammarian Khali. Later he went to Bagdad, but soon left, owing to a dispute with the Kufan grammarian Kisa'il, and returned to Persia, where he died at the age of about forty. His great grammar of Arabic, known simply as The Book, is not only the earliest systematic presentation of Arabic grammar, but is recognized among Arabs as the most perfect. It is not always clear in the text, and very liable for its many illustrations from the Koran and the poets.

The Book was published by H. Deroenlie (2 vols, Paris, 1881-1889), and a German translation, with extracts from the commentary of Sirdi (d. 976) and others, was published by G. Berlin (Berlin, 1895-1900).

**SIBBARD, SIR ROBERT** (1641-1722), Scottish physician and antiquary, was born in Edinburgh on the 15th of April 1641. Educated at Edinburgh, Leiden and Paris, he took his doctor's degree at Angers in 1662, and soon afterwards settled as a physician in Edinburgh. In 1667 with Sir Andrew Balfour he started the botanical garden in Edinburgh, and he took a leading part in establishing the Royal College of Physicians of Edinburgh, of which he was elected president in 1684. In 1685 he was appointed the first professor of medicine in the university. He was also appointed geographer-royal in 1682, and his numerous and miscellaneous writings deal effectively with historical and antiquarian as well as botanical and medical subjects. He died in August 1722.

Amongst Sibbald's historical and antiquarian works may be mentioned his History, Antiquity, and Modern of the Sheriffdoms of Fife and Kinross (Edinburgh, 1710); his account of the Scottish Atlas (folio, Edinburgh, 1683), Scotia Illustrata (Edinburgh, 1684) and Description of the Isles of Orkney and Shetland (folio, Edinburgh, 1711) and his Historia Coenobialis containing his autobiography, memoirs of the Royal College of Physicians, portion of his literary correspondence and account of his manuscripts, was published at Edinburgh in 1833.

**SIBERIA.** This name (Russ. Sibir) in the 16th century indicated the chief settlement of the Tatar khan Khuchum—lsker on the Irtish. Subsequently the name was extended considerably, the whole of the Russian empire having acted upon it. Geographically, Siberia is now limited by the Ural Mountains on the W., by the Arctic and North Pacific Oceans on the N. and E. respectively, and on the S. by a line running from the sources of the river Ural to the Tarbagatai range (thus separating the steppes of the Irtish basin from those of the Aral and Balkash basins), thence along the Chinese frontier as far as the S.E. corner of Transbalkalia, and then along the rivers Argun, Amur and Usuri to the frontier of Korea. This wide area is naturally subdivided into West Siberia (basins of the Ob and Irtish) and East Siberia (basins of the region).

The inhabited districts are well laid down on the best maps; but the immense areas between and beyond them are mapped only along a few routes hundreds of miles apart. The inter-mediate spaces are filled in according to information derived from various expeditions. With regard to the great rivers we know only the position of their mouths and their approximate lengths estimated by natives in terms of a day's march. Even the
SIBERIA

hydrographical network is very imperfectly known, especially in the uninhabited hilly tracts.1

The main geophysical unit of the great plateau of the centre of Asia, stretching from the Himalayas to Bering Strait, has on its surface a number of gentle eminences (angehaufte Gebirge of K. Ritter), which, being higher than the plains, are called mounds. These mounds are

The heights for the most part follow a north-easterly direction in Siberia. On the margins of the plateau there are several gaps or indentations, which can be likened to gigantic trenches, natural or artificial. These trenches are cut on an almost level floor at a higher level than the plateau itself. They are formed by glaciers which have occupied the fill of the valleys of streams or rivers, along these trenches that the plateau was made. Along the northern commercial routes have been made for reaching the higher levels of the plateau.

In the plateau there are in reality two terraces—a higher and a lower—each surrounded by a narrow border-range. The Yablonoi range and its south-western continuation the Kuznetski are border-ranges of the upper terrace. Between these two border-ranges which, as it were, are at the same level, is the Kuznetski region (alt. 400 to 800 ft.).

The great plateau is fringed on the north-west by a series of lofty border-ranges, which have their southern base on the plateau and their northern at a much lower level. They may be traced from the Arctic Circle eastwards to the Olenek, and it is along these that the plateau is connected with the upper parts of the plateau. On the other hand, there are on the western outskirts of the plateau a few mountain chains which take a direction at right angles to the Arctic Circle, and which, as with the southern range of Sayan, are separated by the great line of upheavals in south-west Asia. The Tarbagatay Moun-

The configuration is complicated by the great lateral indentation of Lake Baikal. But around and north-east of this lake the same well-marked ranges fringe the plateau and then their steep north-western slope towards the valleys of the Irkut, the Buriat, and the Yana, while their southern base lies on the plateau of the Selenga (alt. 1200 ft.) and even higher, while the Selenga range range reach 9000 to 11000 ft. above the sea, those of West Sayan about 10,000. In East Sayan is Munku-Sardyk, a peak of 11,450 ft. high, together with many others from 8000 to 9000 ft. Farther east are the Selengan shore of lake Baikal ranging from 6000 to 6000 ft., and the bald dome-shaped mountains of the Barguzin and southern Muya Mountains attain elevations of 6000 to 7000 ft. above sea-level. The orography of the Alain region is little known; but it is certain that the highest of these mountains in the Barguzin to the Amur or to the Sea of Okhotsk have to cross the same plateau and its border-range. The former becomes narrower and barely attains an average altitude of 2000 ft.

A typical feature of the north-easterly border of the high plateau is a succession of broad longitudinal valleys along its outer base.

1The wide area between the middle Lena and the Amur, as well as the hilly tracts west of Lake Baikal, and the Yenisei mining region are in this condition.

3The lower terrace is obviously continued in the Tarim basin of East Turkestan; but in the present state of our knowledge we cannot make many assumptions about the formation of the upper part of the higher terrace (Yablonoi, Kuznetski) must be looked for in the Great Altai or in some other range situated farther south. There may be also a breach of continuity in some depression towards the south.

4The word "longitudinal" is here used in an orographical, not a geological sense. These valleys are not synclinal foldings of rocks; they seem to be erosion-valleys.

5The upper Bukhanselengek in the Sayhange range of the Altai, which appears to belong to the same type.

6The steep fissure occupied by Lake Baikal, which would appear to consist of two longitudinal valleys connected together by the passage between Olkhon and Svyatos N.
accompany the eastern edge of the plateau. The eastern Gobi, the oceanic region, is the most diversified in terms of biogeographic units and the Sungari, and the rich plains of the Bureya and Silingi in the Amur province belong to this belt, 400 m. in breadth, the surface of which is diversified by the low hills of Illikuri-aln, Khulun and Tunguska. A large number of springs are found here. They form the picturesque chain—the Bureya Mountains, which are to be identified with the Little Khingan. It extends, with unaltered character, from Muden and Kirin to Ublan Bay in the Sea of Okhotsk (close by the grain of its peculiar coast). The country is clothed with luxuriant forest vegetation, ascending 4500 to 6000 ft. A lowland belt about 200 m. broad runs in the same direction along the coast. In the north-east, it becomes a narrow and flat plate. On the northern part of this broad valley. These lowlands, dotted over with numberless marshes and lakes, seem to have emerged from the sea at a quite recent geological period; the rivers that meander among them are the twinning streams of the Lena basin.

Volcanic formations, so far as is known, occur chiefly along the north-western border of the great plateau. Ejections of basaltic lava have been observed on the southern slope of the Lena volcanic region. The character of the lava is quite different from that of the volcanoes in the northern part of the Lena province. These volcanic masses, as well as the volcanic rocks, which are found in the form of small domes in the southern part of the Lena basin, are generally considered to be of a very ancient age.

The mineral wealth of Siberia is considerable. Gold-dust is found in almost all the alpine regions fringing the great plateau. The principal gold-mining regions in these tracts are the Lena, Irkutsky (or N. Bureinski), and Yakutsk regions. The Lena (or N. Bureisky) taiga, and the Olekma region. Gold is found in the high plateau in the basin of the upper Vitim, on the lower plateau in the Nenetsky district, and on the upper tributaries of the Amur (especially the Olden) and the Lena, in the north-east continuation of the Nenetsky district. It has been discovered also in the Bureya range, and in its north-east continuation in the Amur region. The Lena basin contains a great number of lakes, some of which are being confined to three localities, one near Vladivostok and two in Transbaikalia. In West Siberia, however, quartz-mining is steadily increasing in importance; whereas in 1900 the output of gold from this source was less than 10,000 oz., in 1904 it amounted to close upon 10,000 oz.

The deposits of the Lena gold fields are found in the high plateau of the basin of the upper Vitim, on the lower plateau in the Nenetsky district, and on the upper tributaries of the Amur (especially the Olden) and the Lena, in the north-east continuation of the Nenetsky district. the north-east extremity of Siberia, and Bering Sea between the land of the Chukchi and Alaska, with the Gulf of Anadyr, are often visited by the Russian ships of the Pacific stations for this pursuit. The Sea of Okhotsk, separated from the Pacific by the Kurile Archipelago and from the Sea of Japan by the islands of Sakhalin and Yezo, is notorious as one of the most stormy seas in the world, owing to the frequent fogs and floating ice. The Shantar Islands in the bay of the Uda possess geological interest. The double bay of Gizia and Penschina, as well as that of Tawi, would be useful as harbours were they not frequented by many shoals in the year and persistently infested in dense fogs in summer. The northern part of the Sea of Japan, which washes the Ussuri region, has, besides the smaller bays of Oiga and Vladimir, the greater part of the Sea of Japan now washed by the Okhotsk Sea, the Russian naval station on the Pacific. Okhotsk and Ayan on the Sea of Okhotsk, Petropavlovsk on the east shore of Kamenka, Nikolaevsk, and Vladivostok on the Sea of Japan, and Dui on Sakhalin are the only ports of Siberia.

Climate.—The climate is extremely severe, even in the southern parts. This arises chiefly from the orographical structure; the vast plateau of Central Asia prevents the moderating influence of the sea from being felt. The extensive lowlands which stretch over more than one half of the area, as well as the elevated plains, lie open to the Arctic Ocean. Although attaining altitudes of 10,000 ft., the mountain peaks of East Siberia do not reach the snow-line, which is found only on the Munku-Sardyk in East Sayan, above 10,000 ft. Patches of perpetual snow occur in East Siberia only in the feet of adjoining ranges. In the far north, the snow-line runs at about 7000 ft.; the air, after being chilled on the plateaus during the winter, drifts, owing to its greater density, down upon the lowlands; hence in the region of the lower Lena there is a greater precipitation of snow. In high latitudes, however, the average temperature of the ground and the want of humus mitigating against them more than the want of warmth. From this northern limit to the Aral-Caspian and Mongolian steppe stretches all over Siberia the forest region; here the average temperature of the snow-line in summer and in winter is 50 to 90% of the area in different districts. In the hill tracts and the marshy depression of the Ob they are unbroken, except by the ravines and the limits of the taiga. At the edge of the tundras the climate is characterized by the presence of agreeable bosquets in the Barba steppe, and they are thinly scattered through south-eastern Transbaikalia, where the dryness of the Gobi steppe makes its influence appreciably felt. Immense marshy tracts which are covered with the dwarf birch in their northern parts cease as the tundras are approached. Over this immense area the trees are for the most part as we are familiar with in Europe. The larch becomes predominant chiefly in two new species; (a) the larch of the Lena valley, which in its vicinity is called Picea obovata and P. eurynetis. The silver fir (Abies sibirica, Pinus pectinata) and the stone pine (P. Cembra) are quite common; over the higher mountains, where the last-named is represented by a recumbent species (Cembra pumila). The birch in the lofier alpine tracts and plateaux becomes a shrub (Betula nova, B. fruticosa), and in Transbaikalia assumes a new and very elegant aspect with a dark bark (B. davurica). In the deeper valleys and on the lowlands of West Siberia the larches, pines and silver fir, intermixed with birches and aspens, attain a great size, and the streams are fringed with thickets of poplar and willow. The alpine rose (Rosa cespitosa) and the dwarf willow (Salix herbacea) reach their maximum development in the uplands; juniper, spirea, sorbus, the pseudo-acacia (Caragana sibirica and C. obovata), C. jubata in some of the higher tracts, various Rosaceae (Cassandra fruticosa, and Coloneaster sibirica—the wild cherry, Chamaemelum), and species of Potentilla between the trees. Berry-yielding plants are found everywhere, even on the golithic, at the upper limit of tree vegetation; on the lower steppe and the stony tracts are a luxuriant undergrowth in the forests, together with Ribes divi-buah in East Siberia. The oak, elm, hazel, ash, apple, lime and maple disappear to the east of the Ural, but reappear in new varieties on the eastern slope of the border-ridge of the great plateau. There you encounter the oak (O. monosperma), maple (Acer ramosum), ash (Fraxinus monosperma), elm (Ulmus montana), hazel (Corylus heterophylla) and several other European acquaintances. Further east, in the Amur region, a great number of new species of European

Most rain falls in summer, especially in July and August. During the summer an average of 6 in. falls on a zone that stretches from the northern tip of the Lena to the border of the Russian dry belt as far as Tomsk, continues in a narrower strip as far as the S. end of Lake Baikal, then it broadens out so as to include the whole of the Amur basin, the total summer precipitation there being 8 to 12 in. North of this zone the rainfall decreases towards the Arctic.

Flora.—The flora of Siberia presents very great local variations, not only on account of the diversity of physical characteristics, but also in consequence of the intrusion of new species from the neighboring regions, as widely different as the Arctic littoral, the arid steppes of Central Asia, and the wet monsoon regions of the Pacific littoral. The flora of the Siberian forest belt is certainly characterized by the "forest region of the Eastern continent." The northern limit of this region, must, however, be drawn nearer to the Arctic Ocean. A strip 60 to 200 m. wide is totally devoid of tree vegetation. The land without trees still preserves an intense green color in August, and in the tundra regions small green algae and algae in the form of cresses and almost without branches, and trees a hundred years old are only a few feet high and a few inches through and thickly encrusted with lichens. The following species, none of which are found in European Russia, are characteristic of the tundras:

—arbutus (Arctostaphylos alpinus), heaths or andromedas (Cassiope tetragona and C. hypnoides), Phyllodoce laxifolia, Loiseleuria prostrata, a species of Lilium (L. fragrans) and a Polar willow (Salix arctica). In Yakutsk the tundra vegetation consists principally of mosses of the genera Polytrichum, Brynum and Hyphnum. Some two hundred species of flowering plants are known; the following are most common: (a) Picea obovata, which forms thickly Karachi; (b) Pinus sibirica, which forms thickly Karachi; (c) P. pumila, which forms thickly Karachi; (d) Pinus pumila, which forms thickly Karachi; (e) P. sibirica, which forms thickly Karachi; (f) P. davurica, which forms thickly Karachi; (g) P. davidiana, which forms thickly Karachi; (h) P. fruticosa, which forms thickly Karachi; (i) P. davidiana, which forms thickly Karachi; (j) P. sibirica, which forms thickly Karachi; (k) P. davurica, which forms thickly Karachi; (l) P. davidiana, which forms thickly Karachi; (m) P. sibirica, which forms thickly Karachi; (n) P. davurica, which forms thickly Karachi; (o) P. davidiana, which forms thickly Karachi; (p) P. sibirica, which forms thickly Karachi; (q) P. davurica, which forms thickly Karachi; (r) P. davidiana, which forms thickly Karachi; (s) P. sibirica, which forms thickly Karachi; (t) P. davurica, which forms thickly Karachi; (u) P. davidiana, which forms thickly Karachi; (v) P. sibirica, which forms thickly Karachi; (w) P. davurica, which forms thickly Karachi; (x) P. davidiana, which forms thickly Karachi; (y) P. sibirica, which forms thickly Karachi; (z) P. davurica, which forms thickly Karachi.

1 According to A. Engler's Versuch einer Entwicklungsgeschichte der Pflanzenwelt (Leipzig, 1879-1882), we should have in Siberia (a) the Central Asian region; (b) the Eastern Asian region; (c) the Central-Asian domain—Alta and Daurian mountainous regions; and (d) the west, intruding into the basin of the Amur.

2 See Middendorff's observations on vegetable and animal life in the tundras, attractively told in vol. iv. of his Siberische Reise.

3 Kielmann, Vega Expeditionens Velenskaphisja Jaktlidakser (Stockholm, 1881). There is a study of the tundras by M. H. A. M. L. Velzeveld found by Middendorff on the Taimyr peninsula, 219 along the borders of the forest region of Oleynik, and 344 species within the forest region of the same; 470 species were collected by Maack in the forest region of the same.

4 Nowhere, perhaps, is the change better seen than on crossing the Great Khingan.
trees, and even new genera, such as the cork-tree (Phellodendron amurense, walnut (Juglans maackiana), acacia (Alnus amurenensis), the graceful climber Maximowiczia amurenensis, the Japanese Trocho- stoma, and many others—all unknown to Siberia proper—are met with.

On the high plateau the larch predominates over all other species of conifers or deciduous trees; the wide, open valleys are thickly planted with larch and fir, while the north and east sides of the valleys are thick grasses (poor in species) in the southern and drier parts. The Siberian larch predominates also in the alpine tracts fringing the plateau on the north, intermingled with the fir, stone-pine, aspen and birch. In these regions the larch is supplanted by the Picea, which makes its appearance. In the alpine tracts of the north the narrowness of the valleys and the steep stony slopes strewn with débris, on which only the larch is able to grow, is witnessed by the presence of the grass (even if it be only of Carex) valuable. For days consecutively the horse of the explorer can get no other food than the dwarf birch. But even in these districts the botanist and the geographer can easily distinguish the chéri or thick forest of the Altai and the taiga of East Siberia. The lower plateau exhibits, of course, new characteristics. Its open spaces are lovely prairies, on which the Daurian fox flourishes in full beauty. In spring the traveller crosses a sea of grass above which the flowers of the paony, aconte, Orobos, Caralia, Saussurea, and the like wave 4 or 5 ft. high. As the Gobi desert is approached the forests disappear, the ground becomes covered only by gray-leafed Draba and the moss, Mesembryanthemum. The appearance of the high plains of the west slope of the plateau are also rich prairies diversified with woods. Nearly all the species of plants which grow on these prairies are common to Europe (paenae, Betula, Viscum, Carex, Gentiana, Iris, &c.), and are equally characteristic of Boletus, or Delphinium, acones, irises and so on; but here the plants attain a much greater size; a man standing erect is often hidden by the giant boletus, or Delphinium giganteum. The prairies on the Ishim and of the Baraba steppe are adorned with the same rich vegetation, so graphically described by Middendorff and O. Finsch. Further north we come to the urmus of West Siberia, described by F. Kohlrath, as a throng of thickly interlaced grasses, which conceal deep marshes, where even the bear has learnt to tread circumspectly.

Fauna.—The fauna of Siberia is closely akin to that of central Europe; and the Ural Mountains, although the habitat of a few species which warrant the naturalist in regarding the southern Ural as a separate region, are not so important a boundary zoologically as the Amur River in China. The Amur is a natural line of division, its two principal zones—the arctic, the boreal and the middle—may be distinguished; and these may be subdivided into several sub-regions. The Amur region shares the characteristics of the north Chinese fauna. On the whole, we may say that the arctic and boreal faunas of Europe extend over Siberia, with a few additional species in the Ural and Baraba region—a number of new species also appearing in East Siberia, some spreading along the high plateau and others along the lower limits. From the region of the marsh Siberian fauna is very poor. According to Nordenskjöld it numbers only twenty-nine species of mammals, of which seven are marine and seventeen are believed to be safe from extermination. The考查 of the fauna is as a whole limited by the forest limit. Of these, again, four are characteristic of the land of the Chukchi. The reindeer, arctic fox (Canis lagopus), hare, wolf, lemming (Myodes lemmus), collar lemming (Cuniculus Londrhactus) and the musk-deer (Moschus moschiferus) are the commonest. The avifauna is very rich in migratory water and marsh fowl (Grallatæores and Notabile), which come to breed in the coast region; but only five land-birds—the ptarmigan (Lagopus alpinus), snow-bunting, Iceland falcon, snow-owl and taven—are permanent inhabitants of the region. The boreal fauna is, of course, much more abundant; but here also are the great bulk of the species, both mammals and birds, common to Europe and Asia. The bear, badger, vulture, polecot, ermine, common weasel, otter, wolf, fox, lynx, mole, hedgehog, common shrew, water-shrew and lesser shrew (Sorex vulgaris, S. fodiens and S. pygmaeus), two bats (the long-eared and the boreal), two species of Vespertilio (V. dani, and V. nolterei), Sorex (S. minutus, S. cinereus), the flying and the common squirrel (Tamias striatus), the brown, common, field and harvest mouse (Mus decumanus, M. musculus, M. Huppuscus, M. agrarius and M. minutus), three voles (Agricola, Arvicola, Microtus, and A. Sorex), the beaver, variable hare, wild, hoar, roe-deer, stag, reindeer, elk and Phoca annulata of Lake Baikal—all these are common alike to Europe and to Siberia; while the bear, musk-deer (Moschus musculatus, ermine, sable, potted marmot or souksil (Spermophilus eversmanni), Articola obscurus and Lagomys hyperboreus), distributed over Siberia, may be considered as belonging to the arctic fauna.

In Vega's expedition the botanists found some species of mammalia, such as Canis alpinus, the sable antelope (Aegocerus sibiricus), several species of mouse (Mus gregatus, M. oceonimus and M. saxatilis), two voles (Ariolidae ratusus and A. macroscopus), Syropus Alaskanus, some species of Asian deer; while the tiger makes incursions not only into the Amur region but occasionally as far as Lake Baikal. On the lower terrace of the great plateau we find an admixture of Mongolian species, such as Canis corax, Felis manul, Spermophilus dauricus, the jorboa (Dipus jorbo), two hamsters (Cricetus songaricus and C. furriculatus), three new voles (Ariolidae), the least lemming, Oryctolagus, Mongolian lemming (Oryctolagus lemming), and Antelope guttata and Equus hemionus (jigdotas). Of birds no less than 285 species have been observed in Siberia, but of these forty-five only are absent from Europe. In south-east Siberia there are forty-three species which are not at home in Europe, and in south-east Transbaikalia, on the borders of the Gobi steppe, only 103 species were found by G. F. R. Radde, among which the most numerous are migratory birds and the birds of prey which pursue them, the rivers and lakes of Siberia abound in fish; but little is known of their relations with the species of neighbouring regions.

The insect fauna is very similar to that of Russia; but a few genera, as the Tenodera, do not penetrate into the steppe region of West Siberia, while the tropical Coliaspoma, Popenia and Languria are found only in south-eastern Transbaikalia, or are confined to the southern Amur. On the other hand, several Siberian genera (Cephalos, Ophelestes) extend into the north-eastern parts of Siberia. As in all uncultivated countries, the forests and prairies of Siberia become almost uninhabitable in summer because of the mosquitoes. East Siberia suffers less from this plague than the marshy Baraba steppe; but on the Amur and the Sungari large gnat are an intolerable plague. The dredgings of the "Vega" expedition in the Arctic Ocean disclosed an unexpected wealth of marine life, and those of L. Schrenck in the north of the Japanese Sea led to the discovery of no fewer than 256 species (Gasteropods, Brachiopods and Conchifers). Even in Lake Baikal Dybovsky and Godlewska found an at least 250 species (Gasteropods, Brachiopods, Conchifers) and several of twenty-five of Gasteropods. The Sea of Okhotsk is very interesting, owing to its local species and the general composition of its fauna of marine mammals (Phoca, Mammalia, Pinnipedia). The number of older species—Siberia in this respect being not far behind north Europe. The increase of many animals in size (becoming twice as large in Europe) and the appearance of white varieties among both mammals and birds, and their great prevalence among domesticated animals (Yakut horses); the migrations of birds and mammals over immense regions, from the Central Asian steppes to the southern Amur. The appearance of the Muslim fauna and the advance of the Arctic gulls, Glaucous gull, Great Black-backed gull, and the formation of a Pleistocene fauna, an interglacial condition, has not yet fully understood (e.g. the migration of thousands and thousands of roe-antelope from Manchuria into Manchuria, or the flight of the salmon to the river, or the migration of reindeer related by Baron F. von Winterdorff) the various coloration of many animals according to the composition of the forests they inhabit (the sable and the squirrel are well-known instances); the intermingling northern and southern faunas in the Amur region and the remarkable consequences of that mixture in the struggle for existence—all these render the study of the Siberian fauna most interesting. Finally, the laws of distribution of new species or species cannot be made out well unless the species undergone by its surface during the Glacial and Lacustrine periods are well established and the Post-Tertiary fauna is better known. The botanist and zoologist is right about Omak and their importance for the study of the Equidae are only a slightly indication of what may be expected in this field.

Population.—In 1906 the estimated population was 6,740,600. In 1897 the distribution was as follows. Geographically, though not administratively, the steppe provinces of Amokinsk and Semplatitsch belong to Siberia. They are described under Steppe.

1 Czechowski (Zoista, Z. Z. Soc., 1877) has described fifty species from the basin of the Amur; he considers that these constitute only two-thirds of the species inhabiting that basin.

Of the total in 1897, 81.4% were Russians, 8.3% Turk-Tatars, 5.8% Mongols and 0.6% "indigenous" races, i.e. Chukchis, Koryaks, Chilyaks, Kamchadales and others. Only 8% of the whole population are of Russian extraction. The population of Siberia, Russians, whose number increased with great rapidity during the 19th century; although not exceeding 150,000 in 1709 and 500,000 a century later. The Russians who have traveled to the Pacific by sea and from the Khabarovsky District are engaged in the gold mines or work for the government. The territories of Siberia, which are being rapidly occupied by Russians, and their settlements are cut in two by the Russian stream—the Baraba Tatars and the Chilyaks, residents of the Buriat plains, have been driven back to the hilly tracts of the Altai and Sayan Mountains. In all they number nearly a quarter of a million. The Turk stock of the Yakuts in the basin of the Lena number 277,400. Most of these, and the peoples of Central Asia, are engaged in agriculture, and are a most laborious and honest population.

The Mongols (less than 300,000) extend into West Siberia from the high plateau—nearly 20,000 Kalmucks living in the eastern Altai, and 40,000 Buriats between the Lena and the Selenga. The Buriats occupy the Selenga and the upper parts of Nerschinski, and the steppes between Irkutsk and the upper Lena, as also the Baikal Mountains and the island of Oronkh; they are chiefly herdsmen, and, as such, are engaged in agriculture, especially in Irkutsk, are agriculturists. On the left of the Amur there are some 60,000 Chinese and Manchurians about the mouth of the Zeya, and 26,000 Koreans on the Pacific coast. The Tunguse (nearly 70,000) are, as their hunting-grounds comprise immense regions on the high plateau and its slopes to the Amur, but their limits are being more and more circumscribed both by Russian gold-diggers and by Yakut settlers. In the Maritime Province, before the Boxer uprising of 1900, 26% of the population in the N. Usuri district and 36% in the S. Usuri district were Koreans and Chinese, and in the Amur province there were nearly 15,000 Manchus and Chinese. Jews number 32,650 and some 5,000 gipsies wander about Siberia.

At first the indigenous populations were pitilessly deprived of their hunting and grazing grounds and compelled to resort to agriculture, because of the poor account of their poverty but also because they were compelled to settle in the less favourable regions. European civilization made them familiar with all its worst sides and with none of its best. They are a tribes-like people who, when the country is conquered, they often revolted in the 17th century, but were cruelly reduced to obedience. In 1824 the settled inhabitants had to pay the very heavy rate of 1 rupee per head for every sheep or hog, which soon became equal to the sums levied were rigorously exacted. On the other hand the severe measures taken by the government prevented the growth of anything like legalized slavery on Siberian soil. The people were not permitted to own property, and it was a capital offense to compel the peasants to work for a wage. Agricultural colonists and by the exactions of government officials, fell into what was practically a kind of slavery to the merchants. Even the best-intentioned government measures, such as the importation of corn, the prohibition of the sale of spirits, and so, became new sources of oppression. The action of missionaries, who cared only about nominal Christianization, had no better effect.

Siberia was for many years a penal colony. Exile to Siberia began in the first years of its discovery, and as early as 1658 we read of the

Exiles.—In West Siberia there exist compact masses of Russians who have lost little of their primitive ethnographical features: but the case is otherwise on the outskirts. M. A. Casstrmén claims the Altai and Oberkolya part of the Ural to be inhabited almost exclusively by "Russians." The Cosacks of West Siberia have the features and customs and many of the manners of Siberia as a whole, they are a Russian, not a Siberian people. The Turko-Tatars in the middle of the 19th century the Yakut language was predominant among the Russian merchants and officials. At Irkutsk and in the valley of the Irkut the admixture of Tungus and Buriat blood is obvious, and still more in the Nerchinsk district and among the Transbaikalic Cosacks settled on the Argan. They speak the Buriat language as often as Russian, and in a Buriat dress can hardly be distinguished from the Buriats. In different parts of Siberia on the borders of the hilly tracts, intermarriage of Russians with Tatars was quite common. Of course it is now rapidly growing less, and the settlers who entered Siberia in the 19th century married Russians, although practically all the native proportion among the eastern parts of Siberia, especially among the Raskolniks or Non-Confessants, where the north Russian, the Great Russian and the Ukrainian (or southern) types have maintained themselves in their identity, as far as the language and the disposition of their villages and in the language and character of the population remind that he is in Siberia. The special features of the language and partly also of the national character are due to the earliest settlers, who came mostly from northern Russia.

The natural rate of increase of population is very slow as a rule, and in some parts it exceeds 1.5 per cent. Besides, especially among the children, is one of the causes of this, the birth-rate being also lower than in Russia. The climate of Siberia, however, cannot be called unhealthy, except in certain localities where gold-digging is common. In the region of the Lena, in the Lena itself, and in the Altai Mountains. The rapid growth of the actual population is chiefly due to immigration.

1. The autograph of the protopope Avvakum is one of the most popular books with Russian Non-Confessants.
The total cultivated area and the average area under crops every year have been estimated by A. Kaufmann as follows:—

19,737,000 11,625,000

These figures are somewhat underestimated, but the official figures are still lower, especially for Tomsk. Tillage is conducted on very primitive methods. After four to twelve years' cultivation the land is wasted to be fallow for a protracted period, and in the Burena district it is the practice to sow four different grain crops in five to seven years and then to let the land rest ten to twenty-five years. The yield from the principal crops fluctuates greatly; indeed in a very good year it is at least three times that in a very bad one. The southern parts of Tobolsk, nearly all the government of Tomsk (exclusive of the Naryn region), southern Yeniseisk and southern Irkutsk, live in an average year a surplus of grain varying from 55 to 40% of the total crop, but in bad years per capita support of the actual needs of the population. There is considerable movement of grain in Siberia itself, the populations of vast portions of the country being supplied with a large part of their imported corn. The forest area under supervision is about 30,000,000 acres (in Tobolsk, Tomsk, Yeniseisk and Irkutsk), out of a total area of forest land of 63,000,000 acres.

Fishing.—Fishing is a valuable source of income on the lower courses of the great rivers, especially the Ob. The fisheries on Lake Balkai supply cheap food (the omul) to the poorer classes of Irkutsk and Transbaikalia. The native populations of the Amur—Golds and Gilyaks—support themselves chiefly by fishing, when the salmon enters the Amur and its tributaries in dense masses. Fish (e.g. the salmon and sturgeon) are a staple article of diet in the north.

Manufactures.—Though Siberia has within itself all the raw produce necessary for prosperous industries, it continues to import a large amount of various manufactured articles. Owing to the distances over which they are carried and the bad organization of trade, all manufactured articles are exceedingly dear, especially in the east. The manufactories of Siberia employ less than 25,000 workers, of whom 12,5% are employed in the making of wine, and nearly one third of the total value of the output represents wine, 23% tanneries, 18% tallow-melting and a considerable sum cigarette-making.

It is estimated that about one-half of the Russian agricultural population supplement their income by engaging in non-agricultural pursuits, but not more than 18 to 22% carry on domestic trades, 8% are engaged in manufacturing, 2% in mining, and 2% in the agricultural pursuits. The proportion of those carrying on non-agricultural pursuits is very large, and those engaged in the manufacture of wine and spirits are the heaviest of all.
the preparation of felt boots and sheepskins; and the manufacture of dairy utensils and machinery. Weaving is engaged in for domestic purposes. But all these trades are sporadic, and are confined to limited areas, and often only to a few separate villages.

Communications. — The idea of linking Siberia by a railway has been advanced at various times. In 1868, a group of capitalists, headed by V. I. Tatischev, organized a company to construct a railway from Lake Baikal to Chita and Struyetsk on the Shilka. From that place it was intended to push it down the Amur to Khabarovsk, and finally to proceed up the Usuri to Vladivostok. The building of this line was never commenced, and the project was indeed, been a started year before that in the Usuri section. For reasons indicated elsewhere (see Russia: Railways) it was found inadvisable to continue the railroad along the Shilka and the Amur with an expenditure of money. The project was therefore abandoned, and the government for the construction of a trans-Manchurian railway. This line connects Kaidalovo, 20 m. below Chita, with Vladivostok, and sends off a branch from Kharkin, on the Sungari, to Dalny and Port Arthur. Those parts of it which run through Russian territory (in Transbaikalia 230 m.; in the neighbourhood of Vladivostok 67 m.) were opened in 1902, and also the trans-Manchurian line was completed. A line was constructed from Vladivostok to the Amur before it became known that the idea of following the latter part of the route originally laid down would have to be abandoned. This line, which has been in working order since 1905, is 547 m. long, was cut through the fertile and populous south Usuri region, then down the Amur to Khabarovsk at the confluence of that river with the Amur.

Returning westwards, Chelyabinsk has been connected with Pavlovsk, south of Lake Baikal, by a new section of the main Siberian line to Tomsk (54 m.). Altogether the entire railway system, including the cost of the Usuri line, the unfinshed Amur and the present lines between Tomsk and Irkutsk, has been laid at a total of 87,555,756, and the total distance, all branches included, is 2,451 m., of which 1070 m. are in Chinese territory.

History. — The shores of all the lakes which filled the depressions depressions which have since become the fertile prairies of Siberia, were covered by Neolithic stone period; and numberless kurgans (tumuli), furnaces and so on bear witness to a much denser population than the present. During the great migrations in Asia from east to west many populations across the great Asiatic plateau and thence compelled to descend into Siberia; succeeding waves of immigration forced them still farther towards the barren grounds of the north, where they melted away. According to the latest and most reliable evidence, the ancestors of the Khotanese Turks, who spoke a language different from the Ural-Altaic; some few traces of them (Yeniseians, Sayan-Ostiaiks, and Kottes) exist among the Sayan Mountains. The Yeniseians were followed by the Uigur-Samoyedes, who also came originally from the high plateaus and were compelled, probably during the great migration of the Huns in the 3rd century B.C., to cross the Altai and Sayan ranges and to settle in the Ob-Angaras region. In 1650-1652, the Chinese spelling for “Turks”), Khaqases and Uigars—also compelled to migrate north-westwards from their former seats—subdued the Ugro-Samoyedes. These new invaders likewise left numerous traces of their sojourn, and two different periods may be distinguished in their remains. They were acquainted with iron, and learned from their subjects the art of bronze-casting, which they used for decorative purposes only, and to which they gave a still higher artistic stamp. Their pottery is much more perfect and more artistic than that of the Bronze period, and their ornaments are accounted among the finest of the collections at the St Petersburg museum. For some time the Khaqases must have lasted until the 13th century, while the Uigars, under Jengiz Khan, subdued them and destroyed their civilization. A decided decline is shown by the graves which have been discovered, the Khaqases of the 8th century level on the part that can be assigned to them. There are no certain parallels upon the graves of these two peoples, the Russians on their arrival towards the close of the 16th century. In the beginning of the 16th century Tatar fugitives from Turkestan subdued the loosely associated tribes inhabiting the lowlands to the north of the Ob rivers, including the Terek by the Russian (the priests) were called from Turkestan, and small principalities sprung up on the Yenisei and the Ob. These were united by Khan Ediger, who finally submitted to the Russian sovereignty in 1555 and consented to a yearly tribute of a thousand sabers. As early as the 11th century the Novgorodians had occasionally penetrated the Ob basin, and a branch of the river was called the Ob. A great many of them, who had naturally been enabled by that to the north-eastern dependencies of the Oulans in the year 1630, the end of the 17th century. At the time of the partition of Poland, in 1772, the Ob is part of the Russian Empire and the Terek forms the frontier between Russia and Turkey; the rest of the territory, including the Oulans, is an independent principality and is governed by a prince, who is appointed by the Sultan, and who is also the representative of the Sultan in all communications with the Russian government.
and tradition has it that, in order to get rid of his guests, Stroganov suggested to his chief, Yermak, that he should cross the Ural into Siberia, promising to help him with supplies of food and arms. Yermak, who had come for this purpose, left for Sibir in 1648 with his men, and in 1650 was admitted into the Tagil and Tura rivers. Next year they were on the Tobol, and 500 men successfully laid siege to Iker, the residence of Khan Kuchin, in the neighbourhood of which is now Tobolok. Kuchin fled to Urga, abandoning his own capital, and Yermak proceeding to tradition, purchased by the present of Siberia to Ivan IV, his own restoration to favour. Yermak was drowned in the Irysh in 1585 at the age of 35. Probably he was a Biack. But the hunters and adventurers poured every year into the country, and were supported by Moscow. To avoid conflicts with the denser populations of the south, they preferred to advance eastwards along the Amur and the Ussuri. In 1685, with谔on Mervis, they attempted to offer resistance against the Tunguses, but in 1610 the Tunguses stoutly for their independence, but were subdued about 1625. In 1628 the Russians reached the Lena, founded the fort of Yaktuts in 1637, and two years later reached the Sea of Okhotsk at the mouth of the Ulya river. The Burians offered some opposition, but between 1631 and 1641 the Cossacks erected several palisaded forts in their territory, and in 1648 the first settlers were transported from the Urals to Lake Baikal. In 1637 Poyarkov's boats descended the Amur, returning to Yaktuts by the Sea of Okhotsk and the Aldan, and in 1649-1650 Khabarov occupied the banks of the Amur. The resistance of the Chinese, however, obliged the Muscovite to sign the Amur treaty, whereby the Russian forts (1689) Russia abandoned her advance into the basin of the river. In 1852 a Russian military expedition under Muraviev explored the Amur basin from the mouth into the sea. The flora of Russian Siberia was for the first time seen by A. N. de Koulomzine, Le Trans-sibérien (Paris, 1903); Bishop of Norwich, My Life in Mongolia and Siberia (London, 1903); S. Patkanov, Essai d'une statistique et d'une géographie des peuples paléosinatiques de la Sibérie (St Petersburg, 1905); M. P. de Semenov, La Russie extra-européenne et polaire (Paris, 1900); J. W. Bookwalter, Siberia and Central Asia (Springfield, Ohio, 1896); Siberia and the Great Siberian Railway, by Ministry of Finance (Eng. trans., ed. by J. M. Crawford, St Petersburg, 1893, vol. v. for flora). Climatological Atlas of the Russian Empire, by the Physical Observatory (St Petersburg, 1876), gives a complete observation of the period of the last 100 years. The flora of Siberia, in its botanical composition, has been fully described in the Russian Botanical Dictionary, also in Medov, Siberian Bibliography (3 vols., St Petersburg, 1891-1892), and in A. P. Ypın's History of Russian Education in Siberia, 3rd ed. v. 4.

SIBI, a town and district of Baluchistan. The town is now an important junction on the Sind-Peshin railway, where the Harnai line and the Quetta loop line meet, near the entrance of the Bolan pass, 88 m. S.E. of Quetta. Pop. (1901) 4535. The district, which was constituted in 1903, has an area of 4152 sq. m.; pop. (1901) 74,555. The greater part became British territory by the treaty of Gandamak in 1879; it is administered under a perpetual lease from the khans of Kalat. Political control is also exercised over the Marri-Bugi country, with additional areas, where there are 38,919. Besides the town of Sibi, the district contains the sanatorium of Ziarat, the summer residence of the government.

SIBONGA, a town of the province of Cebú, island of Cebú, Philippine Islands, on the E. coast, 30 m. S.W. of Cebú, the capital. Pop. (1903) 25,848. Sibonga is an agricultural town with a port for coasting vessels, and is served by a railway. The principal products are Indian corn and tobacco. The climate is healthy.

SIBPUR, a town of British India, in the Hugli district of Bengal, on the right bank of the river Hugli, opposite Calcutta. It is a suburb of Howrah. It contains jute-mills, a flour-mill, rope-works, brick-works and other industrial establishments; the royal botanical garden; and the engineering college with electrical and mining departments and a boarding-house. The college, of gothic architecture, was originally built for a missionary institution, as the Bishop's College, in 1824. It has recently been decided to remove it to Ranichi, in Chota Nagpur.

SIBSAGAR, a town and district of British India, in eastern Assam; it is situated on the Brahmaputra, about 9 m. from the left bank of the Brahmaputra, being pictur-}

SIBSAGAR, a town and district of British India, in eastern Assam; it is situated on the Brahmaputra, about 9 m. from the left bank of the Brahmaputra, being pictur-
by the protrusion of the subsoil, which consists of a stiff clay abounding in iron nodules, and is furrowed by frequent ravines and water-courses, which divide the cultivable fields into innumerable small uneven patches or *bokas*. The chief river is the Brahmaputra, which is navigable throughout the year by steamers. The tributaries of the Brahmaputra comprise the Dhaneswari, the Dihing, the Disang and the Dikhu, all flowing in a northerly direction. The Brahmaputra included within the district is the island of Maguli, formed by the silt brought down by the Subansiri river from the Himalayas and deposited in the wide channel of the Brahmaputra. Coal, iron, petroleum and salt are found. The climate, like that of the rest of the Assam valley, is comparatively mild and temperate, and the annual rainfall averages about 94 in.

In 1901 the population was 597,969, showing an increase of 24% in the decade. Sibsagar is the chief centre of tea cultivation in the Brahmaputra valley, which was introduced by the Assam Company in 1852. It contains a large number of well-managed tea-gardens, which bring both men and money into the province. There are also several timber mills. The Assam-Bengal railway serves the southern part of the district, and a light railway connects this line with Kalikamukh on the Brahmaputra, itself an important highway of communication.

On the decline of the Ahom dynasty Sibsagar, with the rest of the Assam valley, fell into the hands of the Burmese. As a result of the first Burmese war (1824-1826) the valley was annexed to British India, and the country now forming Sibsagar district, together with the southern portion of Lakhimpur, was placed under the rule of Raja Purandhar Singh, on his agreeing to pay a tribute of £4,000. Owing to the raja’s misrule, Sibsagar was reduced to a state of great poverty, and, as he was unable to pay the tribute, the territories were resumed by the government of India, and in 1858 were placed under the direct management of a British official.

**SIBTHORP, JOHN** (1758-1796), English botanist, was born at Oxford on the 28th of October 1758, and was the youngest son of Dr Humphrey Sibthorp (1713-179), who from 1747 to 1764 was Sherardian professor of botany at Oxford. He graduated at Oxford in 1777, and then studied medicine at Edinburgh and Montpellier. In 1784 he succeeded his father in the Sherardian chair. Leaving his professional duties to a deputy-he left England for Göttingen and Vienna, in preparation for a botanical tour in Greece (1786). Returning to England at the end of the following year he took part in the foundation of the Linnaean Society in 1788, and set to work on a flora of Oxfordshire, which was published in 1794 as *Flora Oxoniensis*. He made a second journey to Greece, but developed consumption on the way home and died at Bath on the 8th of February 1796. By his will he bequeathed his books on natural history and agriculture to Oxford university, where also he founded the Sibthorpian professorship of rural economy, attaching it to the chair of botany. He directed that the endowment should first be applied to the publication of his *Flora Graeca* and *Flora Graecae Promemus*, for which, however, he had done little beyond collecting some three thousand species and providing the plates. The task of preparing the works was undertaken by Sir J. E. Smith, who issued the two volumes of the *Prodromus* in 1806 and 1813, and six volumes of the *Flora Graeca* between 1806 and 1848. The seventh appeared in 1839, after Smith’s death, and the remaining three were produced by John Lindley between 1833 and 1840.

Another member of the family, **RALPH WALDO SIBTHORP** (1792-1879), a grandson of Dr Humphrey Sibthorp, was a well-known English divine. He was educated at Oxford and took Anglican orders in 1815. He became known as a prominent “evangelical” in London, but in 1841 was received into the Roman Church. Two years later he returned to the Anglican Church, though he was not readmitted to the ministry till 1857. Finally he re-entered the Roman communion in 1865, but on his death in 1879 he was, by his own request, buried according to the service of the English Church. His elder brother, **COLONEL CHARLES DE LAET WALDO SIBTHORP** (1783-1855), represented Lincoln in parliament from 1826 until his death, except for a short period in 1833-1834, and was notorious for the vigour with which he expressed his opinions and for his opposition to the Catholic Emancipation Bill and the Reform Bill. The eldest son of Colonel Sibthorp, **GERVAISE TONNENTHAL WALDO SIBTHORP** (1815-1863), was also an M.P. for Lincoln.

**SIBYLINE ORACLES**, a collection of Apocryphal writings, composed in imitation of the heathen Sibylly books (see *Sibyls*) by the Jews and, later, by the Christians in their efforts to win the heathen world to their faith. The fact that they copied the form in which the heathen revelations were conveyed (Greek hexameter verses) and the Homerice language is evidence of a degree of external Hellenization, which is an important fact in the history of post-exilic Judaism. Such was the activity of these Jewish and Christian missionaries that their imitations have swamped the originals. Even Virgil in his fourth Eclogue seems to have used Jewish rather than purely heathen oracles.

The extant fragments and conglomérations of the Sibyline oracles, heathen, Jewish and Christian, were collected, examined, translated and explained by C. Alexandre in a monumental edition full of exemplary learning and acumen. On the basis of his results, as they have been scrutinized by scholars like Schürer and Geffcken, it is possible to disentangle some of the different strata with a certain degree of confidence.

1. Book III contains Jewish oracles relating to the Golden Age established by Roman supremacy in the East about the middle of the 2nd century B.C. (especially 175-181; cf. 1 Macc. viii. 1-16). The evacuation of Egypt by Antiochus Epiphanes at the bidding of the Roman ambassadors suits the warning addressed to “Greece” (732-740) against overweening ambition and any attempt upon the Holy City, which is somewhat strangely enforced by the famous Greek oracle, “Let Camarina be, ‘tis best uninstalled.” Older than these are the Babylonian oracle (97-154) and the Persian (381-387). A later Jewish oracle (46-62) refers to the wars of the second Triumph of Rome, and the whole compilation seems to come from a Christian redactor.

2. Book IV is a definite attack upon the heathen Sibyl—the Jews and Christians did not attempt to pass off their “forgeries” as genuine—as the mouthpiece of Apollo by a Jew who speaks for the Great God and yet uses a Greek review (40-114) of ancient history from the Assyrian empire. There are references to the legendary escape of Nero to Parthia (119-124) and the destruction of Jerusalem in a.D. 70 (130-136).

3. Book V contains a more developed form of the myth of *Nero redivivus* in which a panegyric on him (137-141) has been brought up to date by some Jew or Christian, and eulogies of Hadrian and his successors (48-51) side by side with the legend of the miserable death of Titus in quittance of his destruction of Jerusalem (411-413) which probably represents the hope of the zealots who survived it.

4. The remaining books appear to be Christian (some heretical) and to belong to the 2nd and 3rd centuries.

Editions.—C. Alexandre (Paris, 1841, 2 vols.; 1869, 1 vol.); Rzach (Prague, 1891; text and appendix of sources; Geffcken (Leipzig, 1902; text with full apparatus of variants, sources and glosses); Schürer (Leipzig, 1902; text with full apparatus of variants, sources and glosses); see also H. C. O. Lanchester, *Römische und Christliche Kultusdichtung des Oracula Sibyllina* (Leipzig, 1902). An annotated Eng. trans., was undertaken in 1910 by H. C. O. Lanchester. For references to modern literature see Schürer, *Geschichte des jüdischen Volkes*, iii. (4th ed.), 555-592.

**SIBYLS** (Sibyls), the name given by the Greeks and Romans to certain women who prophesied under the inspiration of a deity. The inspiration manifested itself outwardly in distorted features, foaming mouth and frantic gestures. Homer does not refer to a Sibyl, nor does Herodotus. The first Greek writer, so far as we know, who does so is Heraclitus (c. 500 B.C.). As to the number and native countries of the Sibyls much diversity of opinion prevailed. Plato only speaks of one, but in course of time the number increased to ten according to Lactantius

---

1 The word is usually derived from Σίβυλλα, the Doric form of Θείω Βοῦλα (= will of God).
SICANI—SICILY

(quoted from Varro): the Babylonian or Persian, the Libyan, the Cimmerian, the Delphian, the Erythraean, the Samian, the Cumaean, the Hellespontine, the Phrygian and the Tiburtine. The Sibyl of whom we hear most is the Erythraeen, generally identified with the Cumaean, whom Aeneas consulted before his descent to the lower world (Aeneid, vi. 10); it was she who sold to Tarquin the Proud the Sibylline books. She first offered him nine; when he refused them, she burned three and offered him the remaining six at the same price; when he again refused them, she burned three more and offered him the remaining three still at the same price. Tarquin then bought them (Dion. Halic. iv. 62). He entrusted them to the care of two patricians; after 367 B.C. ten custodians were appointed, five patricians and five plebeians; subsequently (probably in the time of Sulla) their number was increased to fifteen. These officials, at the command of the senate, consulted the Sibylline books in order to discover, not exact predictions of definite future events, but the religious observations necessary to avert extraordinary calamities. In such cases where the national deities were unable, or unwilling, to help. Only the interpretation of the oracle which was considered suitable to the emergency was made known to the public, not the oracle itself. An important effect of these books was the grecizing of Roman religion by the introduction of foreign deities and rites (worshipped and practised in the Troad) and the amalgamation of national Italian deities with the corresponding Greek ones (fully discussed in J. Marquardt, Staatsverwaltung, iii., 1885, pp. 43, 350, 382). They were written in hexameters and in Greek; hence the college of custodians was always assisted by two Greek interpreters. The books were kept in the temple of Jupiter on the Capitol and shared the destruction of the temple by fire in 83. After the restoration of the temple the senate sent ambassadors in 76 to Erythrae to collect the oracles aresh and, they brought back about 1000 verses; others were collected in Ilirum, Samos, Sicily, Italy and Africa. In the year 12 B.C. Augustus sought out and burned a great many spurious oracles and subjected the Sibylline books to a critical revision; they were then placed by him in the temple of Apollo Patrols on the Palatine, where we hear of them still. Shortly afterwards the college of custodians was again appointed, but Stilicho shortly after 400. According to the researches of R. H. Klausen (Aeneas und die Pesaten, 1839), the oldest collection of Sibylline oracles appears to have been made about the time of Solon and Cyrus at Gergis on Mount Ida in the Troad; it was attributed to the Hellespontine Sibyl and was preserved in the temple of Apollo at Gergis. Thence it passed to Erythrae, where it became famous. It was this very collection, it would appear, which found its way to Cumae and from Cumae to Rome.

Some genuine Sibylline verses are preserved in the Book of Marvels (Περί θαύματος) of Phileon of Tralles (2nd century A.D.). See H. Diels, Syllythistische Blatter (1890). On the subject generally see J. Marquardt as above; A. Bouché-Leclercq, La Divination dans l'Antiquité (1887), E. Meyer, and Dr. Sibyllische Sagenlehre (1879); C. Schultess, Die sibyllinischen Bücher in Rom (1895; with references to authorities in notes).

SICANI, in ancient geography, generally regarded (together with the Elymi) as the oldest inhabitants of Sicily. Sicani (the country of the Sicani) and the Siculi (q.v.) or Sicelli are mentioned in Homer (Odyssey, xx. 383, xxiv. 307), the latter apparently being known to the Greeks as slave-dealers. There existed considerable difference of opinion among the ancients as to the origin of the Sicani. From the similarity of name, it would be natural to identify them with the Siculi, but ancient authorities expressly state that they were two distinct peoples (see Sicily: History, ad infinitum). At first the Sicani occupied nearly the whole of the island, but were gradually driven by the Sicelli into the interior and the N. and N.W. They lived chiefly in small towns and supported themselves by agriculture. These towns were not subject to a single king, but each had its own ruler and constitution. The most important of the towns to which a Sicanian origin can be with certainty assigned and whose site can be determined, are: Hycarca (Muro di Curnis), taken and plundered by the Athenians during the Sicilian expedition (415 B.C.); Omphakê, between Agrigentum (Girgenti) and Gela (Terranova); and Camicus (site unknown), the residence of the mythical Sicanian king Cocalus, constructed for him by Daedalus (q.v.), to whom he had given shelter when pursued by Minos, king of Crete.

SICARD, ROCHE-AMBOISSE CUCURRION (1742—1822), French sculptor and inventor of deaf-mutes, was born at Le Plessis­Fleurant, Haute-Garonne, on the 20th of September 1742. Educated as a priest, he was made principal of a school of deaf-mutes at Bordeaux in 1786, and in 1789, on the death of the Abbé de l'Épée (see ÉPÉE), succeeded him at Paris. His chief work was his Cours d'instruction d'un sourd-muet de naissance (1800). See DEAF AND DUMB.

The Abbé Sicard managed to escape any serious harm in the political troubles of 1792, and became a member of the Institute in 1795, but the value of his educational work was hardly recognized till shortly before his death at Paris on the 10th of May 1822.

SICILY (Ital. Sicilia), an island of the Mediterranean Sea belonging to the kingdom of Italy, and separated from the nearest point of the mainland of Italy only by the Straits of Messina, which at their narrowest part are about 2 m. in width. It is nearly bisected by the meridian of 4° E., and by far the greater part lies to the south of 35° N. Its southernmost point, however, in 36° 38' N. is 40' to the north of Point Tarifa, the southernmost point of Spain and of the continent of Europe. In shape it is roughly triangular, whence the ancient poetical name of Trinacria, referring to its three promontories of Pelorum (now Faro) in the north-east, Pachynum (now Passero) in the south-east, and Liburnum (now Been) in the west. Its exclusive of the adjacent small islands belonging to the compartimento, is, according to the calculations of the Military Geographical Institute of Italy, 9860 sq. m.; while the area of the whole compartimento is 9936 sq. m.

The island occupies that part of the Mediterranean in which the shallowing of the waters divides that sea into two basins, and in which there are numerous indications of frequent changes in a recent geological period. The channel between Cape Bon in Tunis and the south-west of Sicily (a distance of 80 m.) is, on the whole, shallower than the Straits of Messina, being for the most part under 100 fathoms in depth, and exceeding 200 fathoms only for a very short interval, while the Straits of Messina, have almost everywhere a depth exceeding 150 fathoms. The geological structure in the neighbourhood of this strait shows that the island must originally have been formed by a rupture between it and the mainland, but that this rupture must have taken place at a period long antecedent to the advent of man, so that the name Rhægium cannot be based even on the tradition of any such catastrophe. The mountain range that runs towards the north-east of Sicily is composed of crystalline rocks precisely similar to those forming the parallel range of Aspromonte in Calabria, but both of these are girt about by sedimentary strata belonging in part to an early Tertiary epoch. That a subsequent land connexion took place, however, by the elevation of the sea-bed there is abundant evidence to show; and the occurrence of the remains of African Quaternary mammals, such as Elephas meridionalis, E. antiquus, Hippopotamus pendanti, as well as of those of still living African forms, such as Elephas africana and Hyæna crocuta, makes it probable that there was a direct post-Tertiary connexion also with the African continent.

The north coast is generally steep and cliff-bound, and abundantly provided with good harbours, of which that of Palermo is the finest. In the west and south, and in the north part of the east side, the hills are much lower and recede farther from the sea. The coast is for the most part flat, more regular in outline and less favourable to shipping, while in the east, 1 The name Τριάκια was no doubt suggested by the Τριάκια of Homer (which need not, however, be Sicily), and the geography was fashioned to the apparent meaning given to the name by the change. But of these three so-called promontories the last is not a true promontory, and it is more accurate to treat Sicily as having a fourth side on the west.
where the sea-bottom sinks rapidly down towards the eastern basin of the Mediterranean, steep rocky coasts prevail except opposite the plain of Catania. In the northern half of this coast the lava streams of Mount Etna stand out for a distance of about 20 m. in a line of bold cliffs and promontories. At various points on the east, north and west coasts there are evidences of the land having taken place within historical times, at Trapani on the west coast even within the 19th century. As in the rest of the Mediterranean, tides are scarcely observable; but at several points on the west and south coasts a curious oscillation in the level of the waters, known to the natives as the marrobbio (or marobia), is sometimes noticed, and is said to be always preceded by certain atmospheric signs. This consists in a sudden rise of the sea-level, occasionally to the height of 3 ft., sometimes occurring only once, sometimes repeated at intervals of a minute for two hours, or even, at Mazara, where it is most frequently observed, in the hour-hourhood of Trapani.

The surface of Sicily lies for the most part more than 500 ft. above the level of the sea. Catania itself, which occupies the middle point in elevation as well as in respect of geographical situation, stands 1900 ft. above sea-level. Considerable mountains occur only in the north, where the lower slopes of all the heights form one continuous series of olive-yards and orangeries. Of the rest of the island the greater part forms a plateau varying in elevation and mostly covered with wheat-fields. The only plain of any great extent is that of Catania, watered by the Simeto, in the east; to the north of this plain the active volcano of Catania; and to the west is the extremely gentle slope to the heights of 10,868 ft. from a base 900 m. in extent. This is the highest elevation of the island. The steep and narrow crystalline ridge which trends north-eastwards, and is known to geographers by the name of the Peloritani Mountains, does not reach 4000 ft. The Nebrodi Mountains, a limestone range connected with the Peloritani range and having an east and west trend, rise to a somewhat greater height, and farther west, about the middle of the north coast, the Madonie (the only one of the groups mentioned which has a native name) culminates at the height of nearly 6000 ft. From the western end of the Nebrodi Mountains a lower range (in some places under 1000 ft. in height) winds on the whole south-eastwards in the direction of Cape Passaro. With the exception of the Simeto, the principal perennial streams—the Salso, the Platani and the Belice—enter the sea on the south coast.

Geology.—In general, the older beds occur along the northern coast, and progressively newer and newer beds are found towards the south-east. The southernmost of the older beds, which lie near to the surface in the hills which lie to the south-east of the Simeto, were laid down in the Early Cretaceous period. The Tertiary beds covering the latter part of the Mesozoic era, have been laid down in the Cretaceous period, and there is a considerable Miocene area in the north about Mistretta. Miocene lavas and ashes of a recent geological period form not only the whole of Etna but also a large part of the Monti Iblei in the south. Small patches occur also at Pachino and in the hills north of Sciacca.

Climate.—The climate of Sicily resembles that of the other lands in the extreme south of Europe. As regards temperature, it has the warm and equable type which is characteristic of most of the Mediterranean region. At Palermo (where continuous observations have been made since 1701) the range of temperature between the mean of the coldest and that of the hottest month is little greater than at Greenwich. The mean temperature of January (54°F.) is nearly the same as that of April (53°F.) and July (77°F.) about 13°F. warmer than the corresponding month at Greenwich. In only seven of the thirty years, 1871-1900, was the thermometer observed to fall below freezing point; frost thus occurs in the island even on the low ground, and the orange grows there more than a few hours. On the coast snow is seldom seen, but it does fall occasionally. On the Madonie it lies till June, on Etna till July. The warmest weather is to be expected in June, July and August; but heavy rains, the result of the high rainfall of the eastern mountains in the north-east, force most of the streams dry up in summer. The chief scourginess is the sirocco, which is experienced in its most characteristic form on the north coast, as an oppressive, parching, hot, dry wind, which brings about an arid desert atmosphere remaining through the whole period of its duration leaden-coloured and hazy in consequence of the presence of immense quantities of reddish dust. It occurs most frequently in April, and then in May and September, but not at any time alike from it. Three days are the longest period for which it lasts. The same name is sometimes applied to a moist and not very hot, but yet oppressive, north-east wind which blows from time to time on the east coast. Malaria occurs in some parts of the island.

Flora.—The flora of Sicily is remarkable for its wealth of species; but, comparing Sicily with other islands that have been long separated from the mainland, its main distinction is that of being less rich. The order most abundantly represented are the Compositae, Cruciferae, Labiatae, Caryophyllaceae and Scrophulariaceae. The Rosaceae are continually represented, and among them are numerous species of the rose. The oak is abundantly seen in the interior, but it has, however, been greatly affected, as in other parts of the Mediterranean, by the introduction of plants within historical times. Being a generally populous island, the cultivation of the Mediterranean island, and having its population dependent chiefly on agriculture, the soil, it is necessarily more extensively cultivated than any other of the larger islands referred to, and many of the objects of cultivation are very similar to those on the mainland, though some, which must have been introduced at a remote period, all the members of the orange tribe, the agave and the prickly pear, as well as other plants highly characteristic of Sicilian scenery, have been introduced from various parts of the world. The cultivation of the orange, and the cultivation for food, have caused the division of the island into three main districts, which must be considered. The first is the country of the citrus tribe, where the cultivation of the orange begins to ascend to about 3000 ft., the limit of the growth of water, the vine and the harder evergreens; and the third, that of forests, reaches from about 3300 to 4000 ft. But it is not merely heat that determines the character of the vegetation. The cultivated trees of Sicily mostly demand such an amount of moisture as can be obtained only on the mountain slopes, and it is worthy of notice that the structure of the mountains is peculiarly favourable to the supply of this want. The limestone of the old, the clay of the lower rocks behind it, and the rain-water through their innumerable pores and fissures, and thus storing it up in the interior, afterwards to allow it to well forth in springs at various elevations lower down. In this way the irrigation systems are propagated from the mountain summits, and during the dry season is greatly facilitated, and even those trees for which irrigation is not so indispensable receive a more ample and moisture sufficient for the finish season. Hence it is that, while the plain of Catania is almost treeless and tree-cultivation is comparatively limited in the west and south, where the extent of land under 1600 ft. is considerable, the whole of the north and north-east coast from the Bay of Castellammare round to Catania is an endless succession of orchards, in which oranges, citrons and lemons alternate with olives, almonds, pomegranates, figs, carob trees, pistachios, mulberries and vines. The limit in height of the olive is about 2700 ft., and that of the vine about 3500 ft. The lemon is rare on the north coast, but abundant upon the bitter orange tree, grafted to bear the lemon. A considerable silk production depends on the cultivation of the mulberry in the orchard of Messina and Catania. Among other trees and shrubs may be mentioned the olive-stakes, and the vines of various bamboos, cacti and the palm-tree, the last of which grows in some parts of Sicily more profusely than anywhere else. The second absolute and the only vegetable product of importance. The Amundo Donax, the tallest of European grasses, is largely grown for vine-stakes.

Population.—The area and population of the several provinces are shown in the table on the next page. Thus between 1881 and 1901 the population increased at the rate of 20·5%. The average density is extremely high for a country which lives almost exclusively by agriculture, and is much higher than the average for Italy in general, 293 per sq. m. In 1905 the population was 3,568,124, the rate of increase being only 4·4% per annum; the low rate is due to emigration.
The chief towns in each of these provinces, with their communal populations, are as follows: Catania (43,023), Castrogiovianni (26,081), Piazza Armerina (24,119), Terranova (22,019), San Cataldo (18,000), Catania (146,504), Caltagirone (44,027), Acireale (35,203), Gangi (31,150), Paternò (22,857), Lentini (21,236), Bronte (20,146), Vizzini (18,013), Agira (17,634), Nicotera (15,811), Grammichele (15,017), Girgenti (24,872), Canicattì (24,687), Sciacca (24,643), Liscia (23,993), Faravola (20,193), Messina (20,160), Racalmuto (9,028), Palma (14,384), Palermo (24,135), Milazzo (16,214), Mistrutta (14,041), Patro (305,716), Partinico (23,668), Monreale (23,550), Termini Imerese (20,633), Bagheria (18,783), Corleone (16,350), Cefalà (14,518), Siracusa (31,807), Modica (49,051), Ragusa (31,425), Castelsardo (32,838), Noto (22,284), Lentini (17,160), Avola (16,301), Sciacca (16,220), Palazzolo Acreide (15,106), Trapana (61,448), Marsala (57,824), Alemà (57,798), Monté S. Giorgio (29,624), Casteltvrenzo (21,974), Castellammare del Golfo (20,666), Mazara del Vallo (20,044), Salim (17,159).

The archipelago seas (the suffragan seas, if any, being placed under the general jurisdiction of the Prefect of Catania, Messina, Palermo, Catania, Nicosia, Patai, Monreale (Catania, Siracusa, Paternò, Cefalà, Mazara, Trapana, Syracuse (Caltagirone, Noto, Piazza Armerina).

Agriculture.—Sicily, formerly called the granary of Italy, exported grain until the end of the 18th century. Now, although the island still produces every year some 15 million bushels, the supply barely suffices for the consumption of a population of which bread is the staple article of diet. The consumption is due to the demand for the interior of the island and half the southern coast, while the latter is generally adopted on the eastern and northern coasts. Large holdings of at least 500 hectares (a hectare equals about 2.4 acres) are indispensable to the profitable pursuit of extensive agriculture. These holdings are usually called feudato or latifondi. Their proprietors alternate the cultivation of wheat with that of barley and other cereals, and the vineyard, the olive, the fig, the orange, the date, and the citron. The by-products of the citrus-essences, citrate of lime, &c. are also of some importance. Much damage is done by the olive fly. Vegetables are grown chiefly in the neighbourhood of large cities. Almonds are freely cultivated, and they seem to be the only trees susceptible also of cultivation of the latifondi together with grain. A large export trade in almonds is carried on with north and central Europe. Hazel nuts are grown in woods as a source of more than 100,000,000 litres of oil, which is largely exported to central Europe for use in the manufacture of chocolate. The locust bean (useful for forage), figs, and peaches are widely grown, while in certain restricted districts the raising of silkworms is practised. The introduction of cultivation of cotton, which spread during the American War of Secession, is now rare, since it has not been able to withstand the competition of more favoured countries. All these branches of intensive cultivation yield a higher gross return than that of the extensive system. Along the coast lands property, such as rice, rice-broth, and a small quantity of flax, is usually cultivated by their owners. There is possibility of great development of market-gardening. Climatic conditions prevent cattle-rearing in Sicily from being as extensive as in the rest of Italy. The total number of bullocks in the island is calculated to be less than 200,000; and although the rate of increase is very high, the quantity of beef available for the population, some of the cattle for slaughter have to be imported. Sheep and goats, which subsist more easily on scanty pastureage, are relatively more numerous. The wool yield is about 700,000. Yet the wool harvest is scarce, and the production of butter a negligible quantity, though there is abundance of the principal product of Sicilian pasture lands, cheese of various kinds.

The Sicilian race of horses would be good but that it is not prolific, and has degenerated in consequence of insufficient nourishment and overwork. A better breed of horses is being obtained by selective breeding, and by crossing with Arab and English stallions imported by the government. Donkeys and mules of various breeds are good, and would be better were they not so often weakened by heavy work before attaining full fertility.

Forests.—The absence of forests, which cover hardly 5% of the total area of the island, constitutes a serious obstacle to the prosperity of Sicilian pastoral and agrarian undertakings. The few woods in the mountainous districts along the coast are confined to the high zone of the Madonie Mountains, a range which rises 40 m. west of Palermo, running parallel to the northern coast almost as far as Messina, and culminating in a peak 3,400 m. above the sea. Here they are chiefly composed of oaks and chestnuts.

In that part of the island which is cultivated intensively some 100 million gallons of wine are annually produced. Had not the physical conditions during the first half of the 19th century, the production would be considerably higher; 7,700,000,000 gallons of olive oil and 2,500 million oranges and lemons are also produced, besides the other minor products above referred to. The latifondi, or extensive agriculture, yields, besides wheat, nearly 5,000,000 bushels of barley and beans every year.

Mining.—The most important Sicilian mineral is undoubtedly sulphur, which is mined in the centres of the Etna, Aci, Catania, Nicosia, Patat, Monreale (Catania, Siracusa, Palermo, Cefalà, Mazara, Trapana, Syracuse (Caltagirone, Noto, Piazza Armerina). The sulphur is largely exported to north and central Europe. The formation of the Anglo-Italian sulphur syndicate arrested the downward tendency of prices and increased the output of sulphur, so that the amount exported in 1897 was 424,018 tons, worth $1,738,475, whereas some years previously the value of sulphur exported had hardly been $800,000. Nineteen-twenths of the sulphur comes from three mines, while some 50,000 persons were employed in the extraction, manufacture, transport, and trade in the mineral. But the development of the United States sulphur industry at the beginning of the 20th century, which already attained its maximum, and the practical loss of the United States market. In 1906, when the concession to the Anglo-Sicilian Sulphur Company was about to expire, the government decreed that it should be extended to a term of years, in order to secure for the control of all sulphur produced in Sicily, and exempted from taxation and legal duties, foreign companies established in Italy to exploit industries in which sulphur is a principal element. The Bank of Sicily was specially obliged to make advances to the sulphur industry up to four-fifths of the value of the sulphur deposited in the warehouses. The exports of sulphur in December 1906 were 17,534 tons, as compared with 49,713 tons in 1905; in the year 1904 the total production was 3,291,710 tons (value about £1,522,239) and the total exports 585,980 tons, as compared with 470,341 tons in 1905. The chief sulphur district is that of Siracusa and Noto, which yield sulphur in the form of yellow and salt and salt. The former is distilled from sea-water near Trapana, and the latter obtained in smaller quantities from mines. The two branches of the industry yielded in 1899 about 186,000 tons per annum, worth $80,000, while in 1906 about 200,000 tons were made Trapana alone. About half this quantity is exported, principally to Norway. Besides salt, the asphalt mining industry may be mentioned. Its centre is the province of Syracuse. The value of the annual output is about $400,000. A considerable number of fish are caught, giving a catch of 24,824 tons of fish. Approximately, the value of the annual catch may be reckoned at $600,000 to $800,000. During 1904 the coral fisheries employed 98 vessels with 1138 men: the...
In 1904, 75,779 Sicilians were registered as seamen, and 110 steamships with a gross tonnage of 145,702 were registered in Sicily. 

Communications.—Before 1860 there was no railway in Sicily. The island was divided into six groups of lengthy single lines. Their construction was rendered very costly by the mountainous character of the island. They formed a separate system (the Rete Siciliana) and the rest of the system of inter-island communication. The line from Messina to Catania is connected with the railway system of the mainland by ferry-boats from Sciacca to the interior of Sicily, and by the three line-roads which are laid across the straits. From Messina lines run along the northern coast to Palermo, and along the east coast via Catania to Syracuse. The latter line is prolonged along the south of the island (sometimes approached by ferries) to the coast of East Africa (via Cannattà as far as Aragona Caldarè, Girgenti and Porto Empedocle. From Catania another line runs westward through the centre of the island via Alcamo and Trapani (with a branch to Marsala) to the coast of East Africa (with a branch to Aragona Caldarè) and thence northwards to Terminì, on the line between Messina and Palermo. This line runs directly from Catania to Palermo. From Catania begins the line which extends to the south coast, via Giarre and Riposto, ending at Giarre Riposto on the east coast railway. From Valvasora (14 m., S. of Catania on the line to Syracuse) a branch line runs to Catagirone. From Palermo a line runs southwards to Corleone and S. Carlo (where there are branches to Sciacca on the south coast) and another to Castelvetrano, Marsala and Trapani, going first almost as far as the south coast and then running first west and then north along the west coast. The only part of the coast of the island which has no railways is that portion of the south coast between Porto Empedocle and Castelvetrano (Sciacca lies about midway between these two points), where a road already exists, and a railway is projected, and the rest of the coast northward is the south coast between Marsala and Trapani. A steam tramway runs from Messina to the Faro at the north-east extremity of the island, and thence along the north coast to Barcelona, and another along the east coast from Messina to Giamplusteri, while the island is fairly well provided with roadways, but is very backward in rural communications, there being only 244 yds. of road per sq. m., as compared with 1,560 yds. in Italy. The communications by sea, however, are at least as important as those by land, even for passengers. A steamer leaves Naples every night for Palermo, and vice versa, the journey (208 m.) being done in 11 hours, while the journey by rail (435 m.), including the crossing of the Straits of Messina takes 19 hours; and the weekly steamer from Naples to Messina (216 m.) takes 12 hours, while the journey by rail and ferry boat (292 m.) takes 14 hours. Palermo, Messina and Catania are the most important harbours, the former being the capital (the two other principal ports being Genoa of the Navigazione Generale Italiana, and a port of call for the steamer from Naples to Messina and Catania. The movement of trade in these three ports may be shown by the following table:—

The high proportion of shipping entering Messina is due to its position in the Straits.

The geographical position of Sicily led almost as a matter of necessity to its historical position, as the meeting-place of the nations, the battle-field of contending races and creeds. For this reason, too, Sicily was never in historic times (nor, it seems, in prehistoric times either) the land of a single nation: her history exists mainly in its relation to the history of other lands. Before the 10th century B.C., Sicily lay between the Mediterranean and Africa, but the Italian peninsula was only a point in the trade-routes from Africa. It has been a part of western Europe, but a part which has had specially close relations with eastern Europe. It has stood at various times in close connexion with Greece, Africa and Spain; but its closest connexion has been with Italy. Still the history of Sicily should never be looked on as simply part of the history of Italy. Lying thus between Europe

...
And Africa. Sicily has been the battle-field of Europe and Africa. That is to say, it has been at two separate periods the battle-field of Aryan and Semitic man. In the later stage of the strife it has been the battle-field of Christianity and Islam. This history of Sicily shares with Spain to the west of it and with Cyprus to the east.

And with Spain the island has had several direct points of connexion. There was in all likelihood a near kindred between the earliest inhabitants of the two lands. In later times Sicily was ruled by Spanish kings, both alone and in union with other kingdoms. The connexion with Africa has consisted simply in the settlement of conquerors from Africa at two periods, the Phoenician, then Saracen. On the other hand, Sicily has been more than once made the road to African conquest and settlement. The island was the principal connexion between the two areas of Sicily. The connexion with Greece, the most memorable of all, has consisted in the settlement of many colonies from old Greece, which gave the island the most brilliant part of its history, and which made the greater part practically Greek. This Greek element was strengthened at a later time by the long connexion of Sicily with the Eastern, the Greek-speaking, division of the Roman empire. And the influence of Greece on Sicily has been repaid in more than one shape by Sicilian rulers who have at various times held influence and dominion in Greece and elsewhere beyond the Adriatic. The connexion between Sicily and Italy is shown in the connexion between the original inhabitants and the Sicels of the earliest elements in each. Then came the contemporary Greek colonization in both lands. Then came the tendency in the dominant powers in southern Italy to make their way into Sicily also. Thus the Roman occupation of Sicily ended the struggle between Greek and Phoenician. Thus the Norman occupation ended the struggle between Greek and Saracen. Of this last came the long connexion between Sicily and southern Italy under several dynasties. Lastly comes the late absorption of Sicily in the modern kingdom of Italy. The result of these various forms of connexion is that all the other tongues of the island have died out before the advance of a peculiar dialect of Italian. In religion again both Islam and the Eastern form of Christianity have given way to its Italian form.

The Phoenician, whether from old Phoenicia or from Carthage, came from lands which were mere strips of sea-coast with a boundless continent behind them. The Greek of old Hellas came from a land of islands, peninsula and inland sea, and has a whole world of its own, with interests and disputes of its own, and divided among inhabitants of various nations. The history of the Greeks of Sicily is constantly connected with the history of old Hellas, but it runs a separate course of its own. The Phoenician element ran an opposite course, as the independent Phoenician settlements in Sicily sank into dependencies of Carthage. The entrance of the Romans put an end to all practical independence on the part of either nation. But Roman ascendancy did not affect Greeks and Phoenicians in the same way. Phoenician life gradually died out. But Roman ascendancy nowhere crushed out Greek life where it already existed, and in some ways it strengthened it. Though the Greeks never spread their dominion over the island, they made a peaceful conquest of it. This process was in no way hindered by the Roman dominion.

The question now comes, Who were the original inhabitants of Sicily? The island itself, Σικέλια, Sicilia, plainly takes its name from the Sicels (Σικέλοι, Siculi), a people whom we find occupying a great part of the island, chiefly east of the river Gela. They appear also in Italy (see Sycuta), in the toe of the boot, and older history or tradition spoke of them as having in earlier days held a large place in Latium and elsewhere in central Italy. They were believed to have crossed the strait into the island about 300 years before the beginning of the Greek settlements, that is to say in the 11th century B.C. They found in the island a people called Sicans (cf. Odyssey, xxiv. 300), who claimed to be αδέρφοι (i.e. to have originated in the island itself), but whose name, we are told, might pass for a dialectic form of their own, did not the ancient writers expressly affirm them to be a wholly distinct people. In the 11th century B.C. they were the Ligurians among the early inhabitants of Italy (Virg. Aen. vii. 795, viii. 328, xi. 317, and Servius's note). That the Sicels spoke a tongue closely akin to Latin is plain from several Sicel words which crept into Sicilian Greek, and from the Siceliot system of weights and measures—utterly unlike anything in old Greece. When the Greek settlements began, the Sicans, we are told, had hardly got beyond the life of villages on hill-tops (Dion. Hal. v. 6). Hyccara, on the north coast, is the one exception; it was probably a fishing settlement. The more advanced Sicels had the little-forts also, but they had learned the language and the manners of the Greeks, and they had always held settlements on the coast when the Greeks came. As we go on, we hear of both Sicel and Sican towns; but we may suspect that any approach to true city life was owing to Greek influences. Neither people grew into any form of national unity. They were therefore partly subdued, partly assimilated, without much effort.

The investigations of Professor Orsi, director of the museum at Syracuse, have thrown much light on the primitive peoples of south-eastern Sicily. Of palaeolithic man hardly any traces are to be found; but, though western Sicily has been comparatively little explored, the palaeolithic people of the south-eastern part of the island have died out before the advance of a peculiar dialect of Italian. In religion again both Islam and the Eastern form of Christianity have given way to its Italian form. Like the British Isles, Sicily came under a Norman dynasty; under Norman rule the intercourse between the two countries was extremely close, and the last time that Sicily was the seat of a separate power it was under British protection. The Phoenician, whether from old Phoenicia or from Carthage, came from lands which were mere strips of sea-coast with a boundless continent behind them. The Greek of old Hellas came from a land of islands, peninsula and inland sea, and has a whole world of its own, with interests and disputes of its own, and divided among inhabitants of various nations. The history of the Greeks of Sicily is constantly connected with the history of old Hellas, but it runs a separate course of its own. The Phoenician element ran an opposite course, as the independent Phoenician settlements in Sicily sank into dependencies of Carthage. The entrance of the Romans put an end to all practical independence on the part of either nation. But Roman ascendancy did not affect Greeks and Phoenicians in the same way. Phoenician life gradually died out. But Roman ascendancy nowhere crushed out Greek life where it already existed, and in some ways it strengthened it. Though the Greeks never spread their dominion over the island, they made a peaceful conquest of it. This process was in no way hindered by the Roman dominion.

The question now comes, Who were the original inhabitants of Sicily? The island itself, Σικέλια, Sicilia, plainly takes
cremation is always present. Typical cemeteries of this period have been found on Licodia Eubea, Ragusa and Grammichele. After the failure of Duciellis to re-establish the Sicel nationality, Greek civilization triumphed over that of the Sicels entirely, and it has not yet been possible to trace the survivals of the latter. See Orsi in Römische Mitteilungen, 1898, 205 sqq., and Atti del Congresso Internazionale di Scienze Storiche (Rome, April 1903); also Archologia (Rome, 1904, 167–191).

In the north-west corner of the island we find a small territory occupied by a people who seem to have made much greater advances towards civilized life. The Elymi were a people of uncertain origin, but they claimed a mixed descent, partly Trojan, partly Greek. Their language, however, has not been recognized among barbarians. They had considerable towns, as Segesta and Eryx, and the history, as well as the remains, of Segesta, shows that Greek influences prevailed among them very early, while at Eryx Phoenician influence was stronger.

But, as we have already seen, the Greeks were not the first colonizing people who were drawn to the great island. As in Cyprus and in the islands of the Aegean, the Phoenicians were before them. It is from this presence of the highest forms of Aryan and of Semitic man that the history of Sicily draws its highest interest. Of Phoenician occupation there are two, or rather three, marked periods. We must always remember that the latest of Phoenician foundations, and that the days of the Carthaginian dominion show us only the latest form of Phoenician life. Phoenician settlement in Sicily began before Carthage became great, perhaps before Carthage came into being. A crowd of small settlements from the old Phoenicia, settlements for trade rather than for dominion, factories rather than colonies, grew up on promontories and small islands all round the coast (Thuc. vi. 2). These were unable to withstand the Greek settlers, and the Phoenicians of Sicily withdrew step by step to form three considerable towns in the north-west, the island near to the Elyms, and a group on the coast, and at the shortest distance by sea from Carthage—Motya, Solous or Soluntum, and Panormus (see Palermo).

Our earlier notices of Sicily, of Sicels and Sicans, in the Homeric poems and elsewhere, are vague and legendary. Both races appear as given to the buying and selling of slaves (Od. xx. 385, xxiv. 21). The intimate connexion between old Hellas and Sicily begins with the foundation of the Sicilian Naxos by Chalcidians of Euboia under Theocles, which is assigned to 735 B.C. (Thuc. v. 3-5). The site, a low promontory on the east coast, immediately below the height of Tauroctomus, marks an age which had advanced beyond the hill-fortress and which thoroughly valued the sea. The next year Corinth began her system of settlement in the west; Corcyra, the path to Sicily, and Syracuse on the Sicilian coast were planted as parts of one enterprise. From this time, for about 150 years, Greek settlement in the island, with some intervals, goes steadily on. Both Ionian and Dorian colonies were planted, both from the older Greek lands and from the older Sicilian settlements. The east coast, nearest to Greece and richest in good harbours, was occupied first. Here, between Naxos and Syracuse, there arose the Ionian cities of Acragas (Agrigentum), Gela (608 B.C.), and the Dorian Megara Hyblaea (735 B.C.). Settlement on the south-western coast began about 688 B.C. with the joint Cretan and Rhodian settlement of Gela, and went on in the foundation of Selinus (the most distant Greek city on this side), of Camarina, and in 582 B.C. of the Geloan settlement of Acragas (Agrigentum, Girgenti), planted on a high hill, a little way from the sea, which became the second city of Hellenic Sicily. On the north coast the Ionian Himera (founded in 645 B.C.) was the only Greek city in Sicily itself, but the Cnidians founded Lipara in the Aeolian Islands. At the north-east corner, opposite to Italy, and commanding the strait, arose Zancle, a city of uncertain date (first quarter of the 7th century B.C.), and mixed origin, better known as Messana (Messene, Messina).

Thus nearly all the east coast of Sicily, a great part of the south coast, and a much smaller part of the north, passed into the hands of Greek settlers—Sicelioti (Σικελιόται), as distinguished from the native Sicels. This was one of the greatest advances ever made by the Greek people. The Greek element began to be predominant in the island. Among the earlier inhabitants the Sicels were already becoming adopted Greeks. Many of them gradually sank into a not wholly unwilling subjection as cultivators of the soil under Greek masters. But there were also independent Sicel towns in the interior, and there was a strong religious intercommunication between the two races. Sicel Henna (Enna, Castrogiovanni) is the special seat of the worship of Demeter and her daughter.

The Phoenicians, now shorn up in one corner of the island, with Sirinium on one side and Himera on the other found rich in their teeth, are bitter enemies; but the time of their renewed greatness under the headship of Carthage has not yet come. The 7th century B.C. and the early part of the 6th were a time in which the Greek cities of Sicily had their full share in the general prosperity of the Greek colonies everywhere. For a while they outstripped the cities of old Greece. Their political constitutions were aristocratic; that is, the franchise was confined to the descendants of the original settlers, round whom an excluded body (ήφαυς or πλῆθος) was often growing up. The ancient kingship was perhaps kept on or renewed in some of the Siceliot and Italot towns; but it is more certain that civil dissensions led very early to the rise of tyrants. The most famous if not the first 1 Phalaris (φαλάρις) of Acragas (Agrigentum), whose exact date is uncertain, whose letters are now cast aside, and whose brazen bull has been called in question, but who clearly rose to power very soon after the foundation of Acragas. Under his rule the city at once sprang to the first place in Sicily, and he was the first Siceliot ruler who held dominion over two Greek cities, Acragas and Himera. This time of prosperity was also a time of intellectual progress. To say nothing of lawgivers like Charonides, the line of Siceliot poets began early, and the circumstances of the island, the adoption of many of its local traditions and beliefs—perhaps a certain intermingling of native blood—gave the intellectual life of Sicily a character in some things distinct from that of old Helia. Steichorchos of Himera (c. 632–556 B.C.) holds a great place among the lyric poets of Greece, and some place in the political history of Sicily as the opponent of Phalaris. The architecture and sculpture of this age have also left some of their most remarkable monuments among the Greek cities of Sicily. The remains of the old temples of Selinus, with their archaic metopes, attributed to the 6th century B.C., show us the Doric style in its earlier state. In this period, too, begins the fine series of Sicilian coins (see Numismatics: Sicily).

This first period of Sicilian history lasts as long as Sicily remains untouched from any non-Hellenic quarter outside, and as long as the Greek cities in Sicily remain as a rule independent of one another. A change begins in the 6th century and is accomplished early in the 5th. The Phoenician settlements in Sicily become dependent on Carthage, whose growing power begins to be dangerous to the Greeks of Sicily. Meanwhile the growth of tyrannies in the Greek cities was beginning to group several towns together under a single master, and thus to increase the greatness of particular cities at the expense of their freedom. Thus Thero of Acragas (488–472), who bears a good character there, acquired also, like Phalaris, the rule of Himera. One such power held dominion both in Italy and Sicily. Anaxilaus of Rhegium, by a long and strange tale of treachery, occupied Zancle and changed its name to Messana. But the greatest of the Siceliot powers, that of the Deimodenid dynasty, began at Gela in 505, and was in 485 translated by Gelo (γέλοιος) to Syracuse. That city now became the centre of a greater dominion over both Greeks and Sicels than the island had ever before seen. But Gelo, like several later tyrants of Syracuse, takes his place and it is the redeeming point in the position of all of them—as

1 Panacteris of Leontini (608 B.C.) is said to have been the earliest tyrant in Sicily.
the champion of Hellas against the barbarian. The great double invasion of 480 B.C. was planned in concert by the barbarians of the East and the West (Diod. xi. 1; schol. on Pind., Pyth. i. 146; Grote v. 294). While the Persians threatened old Greece, Carthage threatened the Greeks of Sicily. There were Siceliots who played the part of the Medizzers in Greece: Selinus was on the side of Carthage, and the coming of Hamilcar was immediately brought about by a tyrant of Himera driven out by Thero. But the united power of Gelon and Thero, whose daughter Damaret Gelon had married, crushed the invaders in the great battle of Himera, won, men said, on the same day as Salamis, and the victors of both were coupled as the joint deliverers of Hellas (Herod. vii. 163-167; Diod. xx. 20-25; Pind. Pyth. i. 147-156; Simonides, fr. 42; Polyainus i. 27). But, while the victory of the winter was obtained by the Syracusans under a general who, which was now granted to Carthage stayed in force for seventy years. Gelon was followed by his brother Hiero (478-467), the special subject of the songs of Pindar. Acragas meanwhile flourished under Thero; but a war between him and Hiero led to slaughter and new settlement at Himera. These transplantings from city to city began under Gelon and went on under Hiero (q.v.). They made speakers in old Greece (Thuc. vi. 17) contrast the permanence of habitation there with the constant changes in Sicily.

None of these tyrannies was long-lived. The power of Thero fell to direct influence of Thasians. When the power of Hiero passed in 467 B.C. to his brother Thrasylus, the freedom of Syracuse was won by a combined movement of Greeks and Sicelots, and the Greek cities gradually settled down as they had been before the tyrannies, only with a change to democracy in their constitutions. The mercenaries who had received citizenship from the tyrants were settled at Messana. About fifty years of greater prosperity followed. Art, science, poetry had all been encouraged by the tyrants. To these was added the special growth of freedom—the art of public speaking, in which the Sicilian Greeks became especially proficient, Corax being the founder of the rhetorical school of Sicily. Empedocles (540-490), carried as a babe to Sicily, is a link between native Siceliots and the strangers invited by Hiero; as the founder of the local Sicilian comedy, he ranks among Siceliots. After him Sophron of Syracuse gave the Sicilian mimes a place among the forms of Greek poetry. But the intellect of free Sicily struck out higher paths. Empedocles of Acragas is best known from the legends of his miracles and of his death in the fires of Aetna; but he was not the less philosopher, poet and physician, besides his political career. Gorgias (q.v.) of Leontini had a still more direct influence on Greek culture, as father of the technical schools of rhetoric throughout Greece. Architecture too advanced, and the Doric style gradually lost somewhat of its ancient massiveness. The temple at Syracuse, which is now the metropolitan church, belongs to the earlier days of this time. It is followed by the later temples at Selinus, among them the temple of Apollo, which is said to have been the greatest in Sicily, and by the wonderful series at Acragas (see ACRIGENTUM).

During this time of prosperity there was no dread of Carthaginian inroads. Diodorus's account of a war between Segesta and Elymbazaeum is open to considerable suspicion. We have on the other hand, Pausanias, who, existence in his day at Olympia of statues offered by Acragas out of spoil won from Motya, assigned to Calamis, an artist of this period (Freeman i. 552), and the evidence of contemporary inscriptions (1) for a Siculnite victory over some unknown enemy (possibly over Motya also), (2) for dealings between Athens and Segesta with reference to Halicyae, a Sican town. The latter is important as being the first appearance of Athens in Sicily. As early as 486 (Freeman iii. 8) indeed Themistocles seems to have been looking westward. Far more important are our notices of the earlier inhabitants. For now comes the great Sicel movement under Ducetius, who, between force and persuasion, came nearer towards uniting his people into one body than had ever been done before. From his native hill-top of Menae, rising above the lake dedicated to the Palici, the native deities whom Sicels and Greeks alike honoured, he brought down his people to the new city of Palicea in the plain. His power grew, and Acragas could withstand him only by the help of Syracuse. Alternately victorious and defeated, spared by the Syracusans on whose mercy he cast himself as a supplicant (461), sent to be safe at Corinth, he came back to Sicily only to form greater plans than before. War between Acragas and Syracuse, which arose on account of his return, enabled him to carry out his schemes, and, with the help of another Sicel prince of Herbita, who bore the Greek name of Archonides, he founded Kale Akte on the northern coast. But his work was cut short by his death in 449; the hope of the Sicel people now lay in assimilation to their Hellenic neighbours. Ducetius's own foundation of Kale Akte lived on, and was preserved by the passing of time even by the barbarians and tyrants, all marking an approach to Greek life. Roughly speaking, while the Sicels of the plain country on the east coast became subject to Syracuse, most of those in other parts of the island remained independent. Of the Sicans we hear less; but Hyccara in the north-west was an independent Sican town on bad terms with Segesta. On the whole, setting aside the impassable barrier between Greek and Phoenician, other distinctions of race within the island were breaking down through the spread of the Hellenic element, but among the Greek cities themselves the distinction between the Dorian and the Ionian or Chalcidian settlements was marked.

Up to this time the Italiots and Sicelots Greeks have formed part of the general Greek world, while within that world they have formed a world of their own, and Sicily has again formed a world of its own within that. Wars and conquests between Greeks and Greeks, especially on the part of Syracuse, though not wanting, have been on the whole less constant than in old Greece. It is even possible to appeal to a local Sicilian patriotism (Thuc. vi. 64, 74). Presently this state of Sicilian isolation was broken in upon by the great Peloponnesian War. The Sicelot cities were drawn into alliance with one side or the other, till the main interest of Greek history gathers for a while round the Athenian attack on Syracuse. At the very beginning of the war the Lacedaemonians looked for help from the Dorian Sicelots. But the first active intervention came from the other side. Conquest in Sicily was a favourite dream at Athens (see PELOPONNESIAN WAR). But it was only in 427 an opportunity for Athenian interference was found in a quarrel between Syracuse and Leontini and their allies. Leontini craved help from Athens on the ground of Ionian kindred. Her envoy was Gorgias; his peculiar style was still only now first heard in old Greece (Diod. xii. 53, 54), and his pleadings were successful. For several years during this time (427-422) Athens plays a part, chiefly unsuccessful, in Sicilian affairs. But the particular events are of little importance, except as leading the way to the greater events that follow.

The far more memorable interference of Athens in Sicilian affairs in the year 415 was partly in answer to the cry of the exiles of Leontini, partly to a quite distinct appeal from the Elymbian Segesta. That city, an ally of Athens, asked for Athenian help against its Greek neighbour Selinus. In a dispute, partly about boundaries, partly about the right ofintermarriage between the Elymbian and Selinian girls, Selinus was pressed. She vainly asked for help at Acragas—some say at Syracuse (Diod. xii. 82)—and even at Carthage. The last appeal was to Athens.

The details of the great Athenian expedition (415-413) belong partly to the political history of Athens (q.v.), partly to that of Syracuse (q.v.). But its results make it a marked epoch in Sicilian history, and the Athenian plans, if successful, would have changed the whole face of the West. If the later stages of the struggle were remarkable for the vast number of Greek cities engaged on both sides, and for the strange inversion of relations among them on which Thucydides (vii. 57, 58) comments, the whole war was yet more remarkable for the large entrance of the barbarian element into the Athenian reckonings. The war was undertaken on behalf of Segesta;
the Sicels gave Athens valuable help; the greater barbarian powers out of Sicily also came into play. Some help actually came from Etruria. But Carthage was more far-sighted. If Syracuse was an object of jealousy, Athens, succeeding to her dominion, creating a power too nearly alike to her own, would have provoked far greater jealousy. So Athens found no active support save at Naxos and Catana, though Acragias, if she would not help the invaders, at least gave no help to her own rival. But after the Spartan Cyclops came, almost all the other Greek cities of Sicily were on the side of Syracuse. The war is instructive in many ways. It reminds us of the general conditions of Greek seamanship when we find that Corecyra was the meeting-place for the allied fleet, and that Syracuse was reached only by a coasting voyage along the shores of Greek Italy. We are struck also by the low military level of the Sicilian Greeks. The Syracusan heavy-armed are as far below those of Athens as those of Athens are below those of Sparta. The quasi-continental character of Sicily causes Syracuse, with its havens and its island, to be looked on, in comparison with Athens, as a land power (Σαμνιότατος, Thuc. vii. 21). That is to say, the Siceliot level represents the general Greek level as it stood before the wars in which Athens won and defended her dominion. The Greeks of Sicily had no such military practice as the Greeks of old Greece; but an able commander could teach both Siceliot soldiers and Siceliot seamen to out-manœuvre Athenians. The main result of the expedition, as regards Sicily, was to bring the island more thoroughly into the thick of Greek affairs. Syracuse, threatened with destruction by Athens, was saved by the zeal of her metropolis Corinth in stirring up the Peloponnesian rival of Athens to help her, and by the advice of Alcibiades after his withdrawal. All chance of Athenian dominion in Sicily or elsewhere in the west came to an end. Syracuse repaid the debt by good service to the Peloponnesian cause, and from that time the mutual influence of Sicily and old Greece is far stronger than in earlier times.

But before the war in old Greece was over, seventy years after the great victory of Gelo (410), the Greeks of Sicily had to undergo barbarian invasion on a larger scale than ever. The disputes between Segesta and Selinus called in these enemies also. Carthage, after a long period of abstention from intervention in Thuc. vii. 21. The war with Carthage.

Phoenician invasion under Hannibal.

Dionysius I.

SICILY

The tyrant began his reign of thirty-eight years in the first months of 406. Almost at the same moment, the same advice of Alcibiades, sent to Syracuse, and the information promised by the people of Selinus, reached the town. The Syracusans, who had already been preparing for war, said that they had received no news from Selinus. They could not believe it. At the same time the news came that Gela, where the Siceliot garrison had been, had been taken and destroyed by Carthage. The Carthaginian commander, Himilco, attacked Gela and Camarina. Dionysius, coming to the help of Gela, was defeated, and was charged (no doubt with good ground) with treachery. He now made the mass of the people of both towns find shelter at Syracuse. But now a peace, no doubt arranged at Gela, was formally concluded (Freeman iii. 587). Carthage was confirmed in her possession of Selinus, Himera and Acragias, with some Sician districts which had opposed her. The people of Gela and Camarina were allowed to occupy their unwalled towns as tributaries of Carthage. Leontini, latterly a Syracusan fort, as well as Messana and all the Sicels, were declared independent, while Dionysius was acknowledged as master of Syracuse (Diodorus xiii. 114). No war was ever more grievous to freedom and civilization. More than half Sicily was now under barbarian dominion; several of its noblest cities had perished, and a tyrant was established in the greatest. The 5th century b. c., after its central years of freedom and prosperity, ended in far different fashion. The ambitious ambition of Dionysius belongs to Syracusan history; but his position, one unlike anything that had been before seen in Sicily or elsewhere in Hellas, forms an epoch in the history of Europe. His only bright side is his championship of Hellas against the Phoenician, and this is balanced by his settlements of barbarian mercenaries in several Greek cities. Towards the native races his policy varied according to momentary interests; but on the whole his reign tended to bring the Sicels more and more within the Greek pale. His dominion is Italian as well as Sicilian; his influence, as an ally of Sparta, is important for old Greece; while, as a borther of mercenaries everywhere, he had wider relations than any earlier Greek with the nations of western Europe. He further opened new fields for Greek settlement on both sides of the Adriatic. In short, under him Sicily became for the first time the seat of a great European power, while Syracuse, as its head, became the greatest of European cities. His reign was unusually long for a Greek tyrant, and his career furnished a model for other rulers and invaders of Sicily. With him in truth begins that wider range of Greek warfare, policy and dominion which the Macedonian kingdoms carry on.

The reign of Dionysius (405-407) is divided into marked periods by four wars with Carthage, in 398-397, 392, 385-387 and 386. Before the first war his home power was all but overthrown; he was besieged in Syracuse itself in 403; but he lived through the storm, and extended his dominion over Naxos, Catana and Leontini. All three perished as Greek cities. Catana was the first Siceliot city to receive a settlement of Campanian mercenaries, while others settled in non-Hellenic Entella. Naxos was settled by Sicels; Leontini was again merged in Syracuse. Now begin the dealings of Dionysius with Italy, where the Rheginians, kingsmen of Catana, planned a rebellion in his favour. They entered into common with Messana. He then sought a wife at Rhegium, but was refused with scorn, while Locri gladly gave him Doris. The two cities afterwards fared accordingly. In the first war with Carthage the Greek cities under Carthaginian dominion or dependence helped him; so did Sicans and Sicels, which last had among them some stirring leaders; Elymian Segesta clave to Carthage. Dionysius took the Phoenician stronghold of Motye; but Himilco recovered it, destroyed Messana, founded the hill-town of Tauromenium above Naxos for Sicels who had joined him, defeated the fleet of Dionysius of Catana and besieged Syracuse. Between invasion and home discontent, the tyrant was all but lost; but the Spartan Pharanicidas stood his friend; the Carthaginians again suffered from pestilence in the marshes of Lysimela; and after a masterly combined attack by land and sea by Dionysius Himilco went away utterly defeated, taking with him his Carthaginian troops and forsaking his allies. Gela, Camarina, Himera, Selinus, Acragias itself, became subject allies of Dionysius. The Carthaginian dominion was cut down to what it had been before Hannibal's invasion. Dionysius then planted mercenaries at Leontini, conquered some Sicel towns, Henna among them, and made all the towns within 20 miles of Messana, to the number of 11, permanent subjects. He restored Messana, peopling it with motley settlers, among whom were some of the old Messenians from Peloponnesus. But the Spartan masters of the old Messenian land grudged this possible beginning of a new Messenian power. Dionysius therefore moved his Messenians to a point on the north coast, where they founded Tyndaris. He clearly had a special eye to that region. He took the Sicel Cephaloedon (Cefalà), and even the old Phoenician border-fortress of Solous was betrayed to him. He beat back a Rhegian expedition; but his advance was checked by a failure to take the new Sicel settlement of Tauromenium. His enemies of all races now declared themselves.
Many of the Sicels forsook him; Acragas declared herself independent; Carthage herself again took the field.

The Carthaginian war of 302–301 was not very memorable. Both sides failed in their chief enterprises, and the main interest of the story comes from the glimpses which we get of the Sicel states. Most of them joined the Carthaginian leader Mago; but he was successfully withstood at Agryrium by Agyris, the ally of Dionysius, who is described as a tyrant second in power to Dionysius himself. This way of speaking would imply that Agryrium had so far advanced in Greek ways as to run the usual course of a Greek commonwealth. The two tyrants drove Carthage to a peace by which she abandoned all her Sicel allies to Dionysius. This time he took Tauromenium and settled it with his mercenaries. For new colonists of this kind the established communities of all races were making way. Former transformations had been movements of Greeks from one Greek site to another. Now all races are confounded.

Dionysius, now free from Phoenician warfare, gave his mind to enterprises which raised his power to its greatest height. In the years 300–287 he warred against the Italian cities in alliance with their Lucanian enemies. Rhegium, Croton, the whole toe of the boot, were conquered. Their lands were given to Locri; their citizens were taken to Syracuse, sometimes as slaves, sometimes as citizens. The master of the barbarians fell below the lowest Hellenic level when he put the brave Rhegine general Phyton to a lingering death, and in other cases imitated the Carthaginian cruelty of crucifixion. Conqueror of southern Italy, he turned his thoughts yet further, and became the first ruler of Sicily to stretch forth his hands towards the eastern peninsula. In the Adriatic he helped Hellenic extension, desiring no doubt to secure the important trade route into central Europe. He planted directly and indirectly some settlements in Apulia, while Syracusan exiles founded the more famous Ancona. He helped the Parians in their settlements of Issa and Pharos; he took into his pay Illyrian warriors with Greek arms, and helped the Molossian Alcetas to win back part of his kingdom. He was even charged with plotting with his Epirot ally to plunder Delphi. This even Sparta would not endure; Dionysius had to content himself with sending a fleet along the west coast of Italy, to carry off the wealth of the great temple of Caece.

In the years 300–287, so powerfully did Dionysius now stir up local and general interest, under her two deliverers Dion and Timoleon. It is less easy to make out the exact effect on the rest of Sicily of the three years' career of Dion. Between the death of Dion in 354 and the coming of Timoleon in 344 we hear of a time of confusion in which Hellenic life seemed likely to die out. The cities, Greek and Sicel, were occupied by tyrants. The work of Timoleon (q.v.), whose headquarters were first at Tauromenium, then at Hadranum, was threefold—the immediate deliverance of Syracuse, the restoration of Sicily in general to freedom and Greek life, and the defence of the Greek cities against Carthage. The great victory of the Syracusians in 339 led to a peace with Carthage with the old frontier; but all Greek cities were to be free, and Carthage was to give no help to any tyrant. Timoleon drove out all the tyrants, and it specially marks the fusion of the two races that the people of the Sicel Agryrum were admitted to the citizenship of free Syracuse. From some towns he drove out the Carthaginians, and he largely invited Greek settlement, especially from the Italiot towns, which were hard pressed by the Bruttians. The Corinthian deliverer gave, not only Syracuse, but all Greek Sicily, a new lease of life, though a short one.

We have unluckily no intelligible account of Sicily during the twenty years after the death of Timoleon (337-317). His deliverances are said to have been followed by great immediate prosperity, but wars and dissensions very soon began again. The Carthaginians played off one city and party against another, and Agathocles,1 following the same policy, became in 317, by treachery and massacre, undisputed tyrant of Syracuse, and spread his dominion over many other cities. Acragas, strengthened by Syracusan exiles, now stands out again as the rival of Syracuse. The Carthaginian Hamilcar won many Greek cities to the Punic alliance. Agathocles, the Syracusan tyrant himself by a Carthaginian fleet, formed the bold idea of carrying the war into Africa. For more than three years (310-307) each side carried on warfare in the land of the other. Carthage was hard pressed by Agathocles, while Syracuse was no less hard pressed by Hamilcar. The force with which Agathocles invaded Africa was far from being wholly Greek; but it was representatively European. Gauls, Samnites, Tyrrhenians, fought for him, while mercenary Greeks and Syracusan exiles fought for Carthage. He won many battles and towns; he quelled mutinies of his own

1 See Tillyard, _Agathocles_ (1908).
troops; by inviting and murdering Ophellas, lord of Cyrene, he doubled his army and brought Carthage near to despair. Meanwhile Syracuse, all but lost, had driven back Hamilcar, and had taken him prisoner in an unsuccessful attack on Euryelus, and slain him when he came again with the help of the Syracusan exile Deinocrates. Meanwhile Acratas, deeming Agathocles and the barbarians alike weakened, proclaimed freedom for the Sicilian cities under her own headship. Many towns, both Greek and Sicel, joined the confederacy. It has now become impossible to distinguish the two races; Henna and Herbeusis are now the fellows of Camarina and Lenonti. But the hopes of Acratas perished when Agathocles came back from Africa, landed at Selinus, and marched to Syracuse, taking one town after another. A new scheme of Sicilian union was taken up by Deinocrates, which cut short his dominion. But he now relieved Syracuse from the Carthaginian blockade; his mercenaries gained a victory over Acratas; and he sailed again for Africa, where fortune had turned against his son Archagathus, as it now did against himself. He left his sons and his army to death, bondage or Carthaginian service, and came back to Sicily almost alone. Yet he could still gather a force which enabled him to seize Segesta, to slay or enslave the whole population, and to settle the city with new inhabitants. This change amounts to the extinction of one of the elements in the old population of Sicily. We hear no more of Elymni; indeed Segesta has been practically Greek long before this. Deinocrates and Agathocles came to a kind of partnership in 304, and a peace with Carthage, with the old boundary, secured Agathocles in the possession of and over Segesta (293). At some stage of his African campaigns Agathocles had taken the title of king. Earlier tyrants were well pleased to be spoken of as kings; but no earlier rulers of Sicily put either their heads or their names on the coin. Agathocles now put his name, first without, and then with, the kingly title, though never his own likeness—Hiero II. was the first to do this. This was in imitation of the Macedonian leaders who divided the kingdom of Alexander. The relations between the eastern and western Greek worlds are drawing closer. Agathocles in his old age took a wife of the house of Polyedmion, he gave his daughter Lanassa to Pyrrhus, and established his power east of Hadria, as the first Sicilian ruler of Corcyra. Alike more daring and more cruel than any ruler before him, he made the island the seat of a greater power than any of them.

On the death of Agathocles tyrants sprang up in various cities. Acratas, under its king Phintias, won back for the moment somewhat of its old greatness. By a new depopulation of Gela, he founded the youngest of Siceliot cities, Phintias, by the mouth of the southern Himera. And Helles was cut short by the seizure of Messana by the disband Campanian mercenaries of Agathocles (c. 282), who proclaimed themselves a new people in a new city by the name of Mamertines, children of Mamers or Mars. Messana became an Italian town—"Mamertina civitas."

The Campanian occupation of Messana is the first of the chain of events which led to the Roman dominion in Sicily. As yet Rome has hardly been mentioned in Sicilian story. The Mamertine settlement, the war with Pyrrhus, brings us on quickly. Pyrrhus (q.v.) came as the champion of the western Greeks against all barbarians, whether Romans in Italy or Carthaginians in Sicily. His Sicilian war (278–270) was a Pyrrhic war in the two acts of his war with Rome. As son-in-law of Agathocles, he claimed to be specially king of Sicily, and he held the Sicilian conquest of Corcyra as the dowry of Lanassa. With such a deliverer, deliverance meant submission. Pyrrhus is said to have dreamed of kingdoms of Sicily and of Italy for his two sons, the grandsons of Agathocles, and he himself reigned for two years in Sicily as a king who came to be no less hated than the tyrants. Still as Hellenic champion in Sicily he has no peer.

Pyrrhus. The Greek king, on his way back to fight for Tarentum against Rome, had to cut his way through Carthaginians and Mamertines

1 For the ensuing years cf. ROME: History, II. "The Republic."
Roman province. Two towns only, besides Messana, which had taken the Roman side, Taourumenion and Netos, were admitted to the full privileges of Roman alliance. Taourumenium indeed was more highly favoured than Messana. Rome had a right to demand ships of Messana, but not of Taourumenium. Some towns were destroyed; the people of Henna were massacred. Acragas, again held for Carthage, was for four years (214-210) the centre of an active campaign. The story of Acragas ended in plunder, slaughter and slavery; three years later, the story of Agrigentum began.

The reign of Hiero was the last time of independent Greek culture in Sicily. His time marks the growth of a new form of local Sicilian genius. The spread of Hellenic culture among the Sicels had in return made a Greek home for many Sicel beliefs, traditions and customs. But, of course, the growth of Greek poetry is the native growth of Sicily; in the hands of Theocritus it grew out of the germs supplied by Epicarmus and Sophron into a distinct and finished form of the art. The poet, himself of Syracuse, went to and fro between the courts of Hiero and Ptolemy Philadelphus; but his poetry is essentially Sicilian. So is that of his successors, both the Syracusean Moschus and Bion of Smyrna, who came to Sicily as to his natural school.

With the incorporation of the kingdom of Hiero into the Roman province independent Sicilian history comes to an end for many ages. In one part of the island the Romans people stepped into the position of Carthage, in another part into that of King Hiero. The allied cities kept their several terms of alliance; the free cities kept their freedom; elsewise the Roman people, according to the law of Hiero, the tithe which it had paid to Hiero. But, as the tithe was let out to publicani, oppression was easy. The praetor, after the occupation of Syracuse, dwelled there in the palace of Hiero, as in the capital of the island. But, as a survival of the earlier state of things, one of his two quaestors was quartered at Eryx, the other being in attendance on himself. Under the supreme dominance of Rome even the unprivileged cities kept their own laws, magistrates and assemblies, provision being made for suits between Romans and Sicilians and between Sicilians of different cities (Verr. ii. 16). In Latin the one name Siculi takes in all the inhabitants of the island; no distinction is drawn between Greek and Sicel, or even between Greek and Phoenician cities. It is assumed that all Siculi are Greeks (Verr. ii. 3, 29, 49, 51, 63; iii. 37, 40, 73). Even in Greek, Σικελοι is now sometimes used instead of Σικυοί. All the persons spoken of by Cicero have Greek names save—a most speaking exception—Gaius Helus of Mamertina civitas. Inscriptions too from Sicel and Phoenician cities are commonly Greek, even when they commemorate men with Phoenician names, coupled perhaps with Greek surnames. The process of Hellenization which had been so long going on had at last made Sicily thoroughly Greek. Roman conquest itself, which everywhere carried a Greek element with it, would help this result. The corn of the fertile island was said even then to feed the Roman people. It was this character of Sicily which led to its one frightful piece of local history. The wars of Rome, and the systematic piracy and kidnapping that followed them, filled the Mediterranean lands with slaves of all nations. Sicily stood out before the rest as the first land to be tilled by slave-gangs, on the estates both of rich natives and of Roman settlers. It became the granary of Rome and the free population naturally degenerated and died out. The slaves were most harshly treated, and even encouraged by their masters to rob. The land was full of disorder, and the praetors strangled from enforcing the law against offenders, many of whom, as Roman knights, might be their own judges. Of these causes came the two great slave-revolts of the second half of the 2nd century B.C. The first lasted from 134 to 132, the time of Tiberius Gracchus and the fall of Numantia. Enna and Taourumenium were the headquarters of the revolt. The second (the centre of which was Tricola, the modern S. Anna, 9 m. N.E. of Sciacca) lasted from 102 to 99, the time of the Cimbrian invasion. At other times the power of Rome might have quelled the revolt more speedily.

Slave revolts. The slave wars were not the only scourge that fell on Sicily. The pirates troubled the coast, and all other evils were done by the three years' government of Verres (73-70 B.C.). Besides the light which the great impeachment throws on the state of the island, his administration seems really to have dealt a lasting blow to its prosperity. The slave wars had not directly touched the great cities; Verres plundered and impoverished everywhere, removing anything of value, especially works of art, that took his fancy, and there is hardly a city that had not to complain of what it suffered at his hands. Another blow was the occupation of Messana by Sextus Pompeius in 43 B.C. He was master of Sicily for seven years, and during this period the corn supply of Rome was seriously affected, while Strabo (vi. 2, 4) attributed to this war the decayed state of several cities. To undo this mischief Augustus planted Roman colonies at Palermo, Syracuse, Taourumenion, Thermae, Tyndaris and Catana. The island thus received another Italian infusion; but, as elsewhere, Latin in no way displaced Greek; it was simply set up alongside of it for certain purposes. Roman tastes now came in; Roman buildings, especially amphitheatres, arose. The Mamertines were Roman citizens, and Netum, Centuripae and Segesta had become Latin, perhaps by a grant of Caesar himself, but in any case before thecession of Latin rights to the rest of Sicily; this was followed by M. Antonius's grant of full citizenship to the whole island. But Sicily never became thoroughly Roman; no roads were constructed, so that not a single Roman milestone reached Sicily. In the division of provinces between Augustus and the senate, Sicily fell to the latter. Under the empire it has practically no history. Few emperors visited Sicily; Hadrian was there, as everywhere, in A.D. 136, and ascended Etna, and Julian also (C.D. 10). In its provincial state Sicily fell back more than some other provinces. Ausonius could still reckon Catana and fourfold Syracuse ("quadruplices Sicassasses") among the noble cities; but Sicily is not, like Gaul, rich in relics of later Roman life, and it is now Egypt rather than Sicily that feeds Rome. The island has no internal history beyond a very characteristic fact, a third revolt of slaves and bandits, which was quelled with difficulty in the reign of Gallienus. External history there could be none in the central island, with no frontier open to Germans or Persians. There was a single Frankish attack under Probus (276-282). In the division of Constantine, when the word "province" had lost its meaning, when Italy itself was mapped out into provinces, Sicily became one of these last. Along with Africa, Raetia and western Illyricum, it became part of the Italian praefecture; along with the islands of Sardinia and Corsica, it became part of the Italian diocese. It was now ruled by a corrector, afterwards by a consular under the authority of the vicar of the Roman city (Not. Imp. 14, 5). Sicilian history began again when the wandering of the nations planted new powers, not on the frontier of the empire, but at its heart. The powers between which Sicily now passed to and fro were Teutonic powers. The earlier stages of Teutonic advance could not touch Sicily. Aleric thought of a Sicilian expedition, but a storm hindered him. Sicily was to be reached only by a Teutonic power which made its way through Gaul, Spain and Africa. The Vandals now dwelt at Carthage instead of the Canaanite. Gaiseric (425-477) subdued the great islands for which Roman and Phoenician had striven. Along with Sardinia, Corsica and the Balearic Isles, Sicily was again a possession of a naval power at Carthage. Gaiseric made a treaty with Odoacer almost like that which ended the First Punic War. He gave up (Victor Vitensis i. 4) the island on condition of a tribute, which was hardly paid by Theodoric. Sicily was now ruled by a Gothic count, and the Goths claimed to have treated the land with special tenderness (Procopius, Bell. Goth. iii. 16). The island, like the rest of Theodoric's dominions, was certainly well looked after by the great king and his minister; yet we hear darkly of disaffection to Gothic rule (Cas. Var. i. 3). Theodoric gave back Lilybæum to the Vandal king Thrasamund as the dowry.
of his sister Analafrita (Proc. Bell. Vand. i. 8). Yet Lilybaeum was a Gothic possession when Belisarius, conqueror of Africa, demanded it in vain as part of the Vandal possessions (Proc. Bell. Vand. ii. 5; Bell. Goth. i. 3). In the Gothic war Sicily was the first land to be recovered for the empire, and that with the good will of its people (535). Panormus alone was stoutly defended by its Gothic garrison. In 550 Totila took some fortresses, but the great cities all sustained injury, and the Goths were driven out the next year.

Sicily was thus won back to the Roman dominion. Belisarius was Pyrrhus and Marcellus in one. For 430 years some part of Sicily, for 282 years the whole, again remained a Roman province. To the Gothic count again succeeded, under Justianin, a Roman praetor, in Greek στρατηγός. This was the official title; we often hear of a patrician of Sicily, but patrician (q.v.) was in strictness a personal rank. In the later mapping out of the empire into purely military divisions, the theme (δήμος) of Sicily took in both the island and the nearest peninsula of the mainland, the oldest Italy. The island itself was divided for financial purposes, almost as in the older times, into the two divisions of Syracuse and Lilybaeum. The revolutions of Italy hardly touched a land which looked steadily to the east, as Rome did to its head. The Lombard and Frankish masters of the peninsula never fixed themselves in the island. When the Frank took the imperial crown of the west, Sicily still kept its allegiance to the Augustus who reigned at Constantinople, and was only torn away piecemeal from the empire by the next race of conquerors.

This connexion of Sicily with the eastern division of the empire no doubt largely helped to keep up Greek life in the island. This was of course strengthened by union with a power which had already a Greek side, and where the Greek side soon became dominant. Still the connexion with Italy was close, especially the ecclesiastical connexion. Some things tend to make Sicily look less Greek than it really was. The great source of our knowledge of Sicily in the century which followed the reconquest by Belisarius is the Letters of Pope Gregory the Great, and they naturally show the most Latin side of things. The merely official use of Latin was, it must be remembered, common to Sicily with Constantinople. Gregory's Letters are largely occupied with the affairs of the great Sicilian estates held by the Roman church, as by the churches of Milan and Ravenna. But they deal with many other matters. Saint Paul's visit to Syracuse naturally gave rise to many legends; and the Christian church in Italy was strong, and the kingdom undoubtedly took early root in Sicily. We hear of Manicheans (C.D. 163); Jews were plentiful, and Gregory cautions compensation to be made for the unlawful destruction of synagogues. Many Christian catacombs and Byzantine rock-cut villages, churches and tombs have been explored of recent years. See the comprehensive work by the late J. Förster and V. Schultze, "Die altchristlichen Grabstätte Siziliens" (Berlin, 1907, Jährbuch des K. D. archäologischen Instituts, Ergänzungsteil viii.); and several articles by P. Orsi in the Notizi e degli scavi, and in Byzantinische Zeitschrift (1898, i; 1899, 613). Of pagan tombs we find not trace, save that pagan slaves, doubtless not natives of the island, were held by Jews (C.D. 127). Herein is a contrast between Sicily and Sardinia, where, according to a letter from Gregory to the empress Constantia, wife of the emperor Maurice (594-595), praying for a lightening of taxation in both islands, paganism still lingered (C.D. 121). Sicily belonged to the Latin patriarchate; but we already (C.D. 103) see glimmerings of the coming disputes between the Eastern and Western Churches. Things were changed when Leo the Isaurian confiscated the Sicilian and Calabrian estates of the Roman Church (Theoph. i. 631). The same event in Provence in the 8th, 9th and 11th centuries the old drama of Sicily was acted again. The island is again disputed between Europe and Asia, transplanted to Africa between Greek and Semitic dwellers on her own soil. Panormus and Syracuse are again the headquarters of races and creeds, of creeds yet more primitive than those of Asia or Africa.

The older religious differences were small compared with the strife for life and death between Christendom and Islam. Gregory and Mahomet were contemporaries, and, though Saracen occupation did not begin in Sicily till more than two centuries after Gregory's death, Saracen inroads began much sooner. In 635 (Theoph. i. 532) part of Sicily was plundered, and its inhabitants carried to Damascus. Then came the strange episode of the visit of Constans II. (641-668), the first emperor, it would seem, who had set foot in Sicily since Julian. After a war with the Lombards, after twelve days' plunder of Rome, he came on to Syracuse, where his oppressions led to Euphrosine's murder in 668, Sicily now began the first of the settling up of a tyrant in the later sense. Mezetto, commander of the Eastern army of Constans, revolted, but Sicily and Roman Italy kept their allegiance to the new emperor Constantine Pogonatus, who came in person to destroy him. Then came another Saracen inroad from Alexandria, in which Syracuse was sacked (Paul. Diacon. v. 13). Towards the end of the 8th century, though Sicily itself was untouched, its patricians and their forces play a part in the affairs of southern Italy as enemies of the Frankish power. Charlemagne himself was believed (Theoph. i. 736) to have designs on Sicily, but when it came to Saracen invasion, the sympathies of both pope and Caesar lay with the invader Christian land (Mon. Car. 323, 328).

In 814 a peace for ten years was made between the Saracens and the patrician Gregory. A few years after it expired Saracen settlement in the island began. About this time Crete was seized by Spanish adventurers. But the first Saracen settlers in Sicily were the African neighbours of Sicily, and they were called to the work by a home treason. The story has been tricked out with many romantic details (Chron. Celen. 66, ap. Pertz, lii. 498; Theoph. Cont. li. 272; George Caesarius ii. 99); but it seems plain that Euphrasius of Syracuse, supported by his own citizens, revolted against Michael the Stammerer (820-829), and, when defeated by an imperial army, asked help of Ziyadet Allah, the Aghlabite prince of Kairawân, and offered to hold the island of him. The struggle of 138 years now began. Euphrasian, a puppet emperor, was led about by his Saracen allies much as earlier puppet emperors had been led about by Alaric and Ataulf, till he was slain in one of the many sieges. The second Semitic conquest of Sicily began in 827 at Mazzara on the old border of Greek and Phoenician. The advance of the invaders was slow. In two years all that was done was to occupy Mazzara and Minecum; the old Menae of Ducetius—strange points certainly to begin with, and seemingly to destroy Agrigentum, well used to destruction. Attacks on Syracuse failed; so did attacks on Henna—Castrum Ennae, now changing into Castrum Johannis (perhaps Castrum Paparo), Castrogiovanni. The actual gain was small; but the invaders took selin on the coast and of the island. A far greater conquest followed when new invaders came from Spain and when Theodotus was killed in 830. The next year Panormus passed away for ever from Roman, for 250 years from Christian, rule. Syracuse was for fifty years in odd partnership of old, the bulwark of Europe, but the bulwark of Christendom. By the conquest of Panormus the Saracens were firmly rooted in the island. It became the seat of the amir or lord of Sicily. We hear dimly of treasonable dealings with them on the part of the strategos Alexius, son-in-law of the emperor Theophilius; but we see more clearly that Saracen advance was largely hindered by dissensions between the African and the Spanish settlers. In the end the Moslem conquests in Sicily became an Aghlabite principality owning at best a formal superiority in the princes of Kairawâni. With the Saracen occupation begins a new division of the island, which becomes convenient in tracing the progress of Saracen conquest. This is into three valleys, known in later forms of language as Val di Mazzara or Mazza in the N.W., Val di Noto in the S.E. and Val Demone (a name of uncertain origin) in the N.E. (see Amari, Museletani in Sicilia, i. 465). The first Saracen settlement
of Val di Mazara answers roughly to the old Carthaginian possessions. From Panormus the amir or lord of Sicily, Mahommed ibn Abdallah, sent forth his plunderers throughout Sicily and even into southern Italy. There, however, they made no lasting settlements.

The chief work of the next ten years was the conquest of the Val di Noto, but the first great advance was made elsewhere. In 843 the Saracens won the Mamertine city, Messana, and thus stood in the path between Italy and Sicily. Then the work of conquest, as described by the Arabic writers, went on, but slowly. At last, in 890, the very centre of the island, the stronghold of Messina, and the main part of Val di Noto, followed. But the divisions among the Moslems helped the Christians; they won back several towns, and beat off all attacks on Syracuse and Tauromenium. It is strange that the reign of Basil the Macedonian (867), a time of such renewed vigour in the empire, was the time of the greatest of all losses in Sicily. In Italy the imperial frontier largely advanced; in Sicily imperial fleets threatened Panormus. But in 875 the accession of Ibrâhîm ibn Ahmad in Africa changed the face of things. The amir in Sicily, Ja'far ibn Ahmad, received strict orders to act vigorously against the eastern towns. In 877 he besieged the fort of Semitium, the centre of Syracuse. The next year the city passed for the first time under the yoke of strangers to the fellowship of Europe.

Thus in fifty-one years the imperial and Christian territory in Sicily was cut down to a few points on or near the eastern coast, to the Val Demone in short without Messana. But between Moslem dissension and Christian valour the struggle had still to be waged for eighty-seven years. Henna had been the chief centre of Christian resistance a generation earlier; its place was now taken by the small fort of Rametta not far from Messina. The Moslems of Sicily were busy in civil wars, and the Christians were engaged against Berbers, both against the African overlords.

In 900 Panormus had to be won by a son of Ibrâhîm from Moslem rebels provoked by his father's cruelty. But when Ibrâhîm himself came into Sicily, renewed efforts against the Christians led to the first taking of Tauromenium (908), of Rametta and of other points. The civil war that followed his death, the endless revolutions of Agrigentum, where the weaker side did not scruple to call in Christian help, hindered any real Saracen occupation of eastern Sicily. The emperors never gave up their claims to Sicily or their hopes of recovering it. Besides the struggle with the Christians in the island, there was a different struggle between the empire and the Saracens; but such warfare was more active in Italy than in Sicily. In 956 a peace or truce was made by the emperor Constantine Porphyrogenitus. A few years later, Otho the Great, the restorer of the Western empire, looked to Sicily as a land to be won back for Christendom. It had not yet wholly passed away; but the day soon came. Strange to say, as Syracuse fell in the reign of Basil the Macedonian, the Saracen occupation was completed in the reign of Niképhoros Phokas (Niképhoros Phocas), the deliverer of Crete. In the year of his accession (963) Tauromenium was taken, and became for a hundred years a Mahommedan possession. Rametta was the last stronghold to fall (965).

Thus in 138 years the Arab did what the Canaanite had never done. The whole island was a Semitic, that is a Mahommedan, possession. Yet the complete Saracen possession of Sicily may seem a thing of a moment. Its first and longest period lasted only 73 years. In that time Mahommedan Sicily was threatened by a Western emperor; the Arabic writers claim the Saracen army by which Otho II. was beaten back in 982 as a Sicilian army. A mighty enemy was threatening in the East. Basil II. planned the recovery of Sicily in good earnest. In 1027 he sent a great army; but his death stopped their progress before they reached the island. But the great conqueror had left behind him men trained in his school, and eleven years later the eagles of the new Rome again marched to Sicilian victories. The ravages of the Sicilian Saracens in the Greek islands were more frightful than ever, and George Maniates, the first captain of his time, was sent to win back the lost land. He too was helped by Saracen dissensions. The amir Abul-afar became a Roman vassal, and, like Alaric of old, became magister militum in the Roman army. His brother and rival Abuhañas brought help from Africa; and finally all joined against the Christians.

Four years of Christian victory (1038-1042) followed. In the host of Maniates were men of all races—Normans, who had already begun to show themselves in south Italy, and the Varangian guard, the best soldiers of the empire, among whom Harold Hardrada himself is said to have held a place. Town after town was delivered, first Messana, then Syracuse, and a crowd of other towns. The Arabic writers claim the deliverance of the whole island; but it is certain that the Saracens never lost Panormus. But court influence spoiled everything: Maniates was recalled; under his successor Stephen, brother-in-law of the emperor Michael, the Saracens won back what they had lost. Messana alone held out, for how long a time is uncertain. But a conqueror came who had no empresses to thwart him. In 1066 began the thirty years' work of the first Roger.

Thus for 263 years the Christian people of some part or other of Sicily were in subjection to Moslem masters. But that part of Sicily was always different from Sicily. The land was won bit by bit. One town was taken by storm; another submitted on terms harsher or more favourable. The condition of the Christians varied from that of personal slaves to that of communities left free on the payment of tribute. The great mass were in the intermediate state usual among the non-Mahommedan subjects of a Mahommedan power. The dhimmîs of Sicily were in essentially the same case as the rayâhs of the Turk. While the conquest was going on, the towns that remained unconquered gained in point of local freedom. They became allies rather than subjects of the distant emperor. So did the tributary districts, as long as the original terms were kept. But, as ever, the condition of the subject race grew worse. After the complete conquest of the island, while the mere slaves had turned Mahommedans, there is nothing more heard of tributary districts. At the coming of the Normans the whole Christian population was in the state of rayâhs. Still Christianity and the Greek tongue never died out; churches and monasteries received and held property; there still are saints and scholars. It would be rash to deny that traces of other dialects may not have lingered on; but Greek and Arab were the written tongues of Sicily when the Normans came. The Sicilian Saracens were hindered by their internal feuds from ever becoming a great power; but they stood high among Mahommedan nations. Their advance in civilization is shown by their position under the Normans, and above all by their admirable style of architecture (see PALERMO). They had a literature which Norman kings studied and promoted. The Normans in short came into the inheritance of the two most civilized nations of the time, and allowed them to flourish side by side. The most brilliant time for Sicily as a people in the world begins with the coming of the Normans. Never before or after was the island so united or so independent. Some of the old tyrants had ruled out of Sicily; none had ruled over all Sicily. The Normans held all Sicily as the centre of a dominion which stretched far beyond it. The conquest was the work of one man, Count Roger of the house of Hauteville (see ROGER I). The conquests of the Normans in Italy and Sicily form part of one enterprise; but they altogether differ in character. In Italy they overthrew the Byzantine dominion; their own rule was perhaps not worse, but they were not deliverers. In Sicily they were welcomed by the Christians as deliverers from infidel bondage.

As in the Saracen conquest of Sicily, as in the Byzantine recovery, so in the Norman conquest, the immediate occasion was given by a home traitor. Count Roger had already made a plundering attack, when Becumenc of Catania, driven out by his brother, urged him to serious invasion. Messina was taken in 1066, and became for a while the Norman capital.
Christians everywhere welcomed the conqueror. But at Troina they presently changed their minds, and joined with the Saracens to besiege the count in their citadel. At Catania Becenu was set up again as Roger's vassal, and he did good service till he was killed. Roger soon began to fix his eye on the Saracen capital. Against that city he had Pisant help, as the inscription on the Pisant _duomo_ witnesses (cf. Geoff. Mal. ii. 34). But Palermo was not taken until 1071, and then only by the help of Duke Robert, who kept the prize to himself. Still its capture was the turning-point in the struggle. Thorimna (Taurummenum) was won in 1078. Syracuse, under its amir Benaret, held out stoutly. He retook Catania by the help of a Saracen to whom Roger had trusted the city, and from he was punished. Progress was delayed by Jordan's rebellion and by the absence of Roger in his brother's wars. In 1085 Syracuse was won. Next year followed Girgenti and Castrogiovanni, whose chief became a Christian. Noto held out till 1090. Then the whole island was won, and Roger completed his conquest by a successful expedition to Malta.

Like the condition of the Greeks under the Saracens, so the condition of the Saracens under the Normans differed in different places according to the circumstances of each conquest. In the kingdom religion everywhere tolerated, in many places much more. But it would seem that, just as under the Moslem rule, conversions from Christianity to Islam were forbidden. On the other hand, conversions from Islam to Christianity were not always encouraged; Saracen troops were employed from the beginning, and Count Roger seems to have thought them more trustworthy when unconverted. At Palermo the capitulation secured to the Saracens the full enjoyment of their own laws; Girgenti was long mainly Saracen; in Val di Noto the Saracens kept towns and castles of their own. On the other hand, at Messina there were few or none, and we hear of both Saracens and Greek vassals, the latter doubtless abiding as they were in Saracen times. But men of both races were trusted and favoured according to their deserts. The ecclesiastical relations between Greeks and Latins are harder to trace. At the taking of Palermo the Greek bishop was restored; but his successors were Latins, and Latin prelates were placed in the bishoprics which Count Roger founded. Urban II. visited Sicily to promote the union of the church, and helped to the union those special ecclesiastical powers held by the counts and kings of Sicily as hereditary legates of the Holy See which grew into the famous Sicilian monarchy (Geoff. Mal. iv. 20). But Greek worship went on at Messina, it lingered till the 12th century (Pirro, _Sicilia sacra_, i. 420, 431, 440), as it has been since brought back by the Albanian colonists. But the Greeks of Sicily have long been united Greeks, admitting the authority of the see of Rome. In its results the Norman conquest of Sicily was a Latin conquest far more thorough than that which had been made by the Roman commonwealth. The Norman princes protected all the races, creeds and tongues of the island, Greek, Saracen and Jew. But new races came to settle alongside of them, all of whom were Latinised, at least as far as was possible. The Normans brought the French tongue with them; it remained the court speech during the 12th century, and Sicily was thrown open to all speakers of French, many of whom came from England. There was constant intercourse between the two great islands, both ruled by Norman kings, and many natives of England filled high places in Sicily. But French was only a language of society, not of business or literature. The languages of inscriptions and documents are Greek, Arabic and Latin, in private writings sometimes Hebrew. The kings understood Greek and Arabic, and their deeds and works were commemorated in both tongues. Hence comes the fact, at first sight so strange to us, that Greek, Arabic and French have all given way to a dialect of Italian. But the cause is not far to seek. The Norman conquest opened Sicily to settlers from Italy, above all from the Norman possessions in Italy. Under the name of Lombards, they became an important, in some parts a dominant, element. Thus at Messina, where we hear nothing of Saracens, we hear much of the disputes between Greeks and Lombards. The Lombards had hardly a distinct language to bring with them. At the time of the conquest, it was already found out that French had become a distinct speech from Latin; Italian hardly was such. The Lombard element, during the Norman reign, shows itself, not in whole documents or inscriptions, but in occasional words and forms, as in some of the mosaics at Monreale. And, if any element, Latin or akin to Latin, had lingered on through Byzantine and Saracen rule, it would of course be attracted to the new Latin element, and would help to strengthen it. It was this Lombard element that had the future before it. Greek and Arabic were antiquated, or at least isolated, in a land which Norman conquest had made part of western Europe and Latin Christendom. They could grow only within the island; they could gain no strength from outside. Even the French element was in some sort isolated, and later events made it more so. But the Lombard element was constantly strengthened by settlement from outside. In the older Latin conquest, the Latin carried Greek with him, and the Greek element absorbed the Latin. Latin now held in western Europe the place which Greek had held there. Thus, in the face of Italian, both Greek and Arabic died out. Step by step, Christian Sicily became Latin in speech and in worship. But this was not till the Norman reigns were over. Till the end of the 12th century Sicily was the one land where men of divers creeds and tongues could live side by side.

Hence came both the short-lived brilliancy of Sicily and its later decay. In Sicily there were many nations all protected by the Sicilian king; but there was no Sicilian nation. Greek, Saracen, Norman, Lombard and Jew could not be fused into one people; it was the boast of Sicily that each kept his laws and tongue undisturbed. Such a state of things could live on only under an enlightened despotism; the discordant elements could not join to work out really free and national institutions. Sicily had parliaments, and some constitutional principles were well understood. But they were assemblies of barons, or at most of barons and citizens; they could only have represented the Latin elements, Norman and Lombard, in the island. The elder races, Greek and Saracen, stand outside the relations between the Latin king and his Latin subjects. Still, as long as Greek and Saracen were protected and favoured, so long was Sicily the most brilliant of European kingdoms. But its greatness had no groundwork of national life; for lack of it the most brilliant of kingdoms presently sank below the level of other lands.

Four generations only span the time from the birth of Count Roger, about 1050, to the death of the emperor Frederick II. in 1259. Roger, great count of Sicily, was, at his death in 1101, succeeded by his young son, Simon, and he in 1105 by the second Roger, the first king. He inherited all Sicily, save half Palermo—the other half had been given up—and part of Calabria. The rest of Palermo was soon granted; the Semitic capital became the abiding head of Sicily. On the death of his cousin Duke William of Apulia, Roger gradually founded (1127-1140) a great Italian dominion. To the Apulian duchy he added (1150) the Norman principality of Naples (1138), the last dependency of the Eastern empire in Italy, and (1140) the Abruzzi, an undoubted land of the Western empire. He thus formed a dominion which has been divided, united and handed over from one prince to another oftener than any other state in Europe, but whose frontier has hardly changed at all. In 1150 Roger was crowned at Palermo, by authority of the antipope Anacletus, taking the strange title of "king of Sicily and Italy." This, on his reconciliation with Pope Innocent II., he exchanged for "king of Sicily and of the duchy of Apulia and of the principality of Capua." By virtue of the old relations between the popes and the Normans of Apulia, he held his kingdom in fief of the Holy See, a position which on the whole strengthened the royal power. But his power, like that of Dionysius and Agathocles, was felt in more distant regions. His admiral George of Antioch, Greek by birth and creed, warred
against the Eastern empire, won Corfu (Koryfo; the name of Korkyra is forgotten) for a season, and carried off the silk-workers from Thbes and Pelopennesus to Sicily. But Manuel Comnenus ruled in the East, and, if Roger threatened Constantine, Manuel threatened Sicily. In Africa the work of Agathocles was more than renewed; Mahdia and other points were won and kept as long as Roger lived. These exploits won him the name of the "terror of Greeks and Saracens." To the Greeks, and still more to the Saracens, of his own island he was a protector and something more. His love for mathematical science, geography, &c., in which the Arabs excelled, is noteworthy.

Roger’s son William, surnamed the Bad, was crowned in his father’s lifetime in 1151. Roger died in 1154, and William’s power was at its height. He subdued all Sicily at once, and his campaigns in Africa were successful. But the malign influence of the Caliph of Bagdad, and the jealousies of Christian kings, had no such effect. William, chiefly against the king’s unpopular ministers, and it is further marked by the loss of Roger’s African conquests. After William the Bad came (1166–1180) his son William the Good. Unlike as were the two men in themselves, in their foreign policy they are hardly to be distinguished. The Bad William has a short quarrel with the pope; otherwise Bad and Good alike appear as zealous supporters of Alexander III. and as enemies of both empires. The Eastern warfare of the Good is stained by the frightful sack of Thessalonica; it is marked also by the formation of an Eastern state under Sicilian supremacy. Under the Bad William, Corfu, the cradle of Norman Greek heroes, and Corfu, with Durazzo, Cephalonia and Zante, was granted by William to his admiral Margarito with the strange title of king of the Epeirots. He founded a dynasty, though not of kings, in Cephalonia and Zante. Corfu and Durazzo were to be more closely connected with the Sicilian crown.

The brightest days of Sicily ended with William the Good. His marriage with Joanna, daughter of Henry of Anjou and Castile, was childless, and William tried to procure the succession of his aunt Constance and her husband, the King of Jerusalem, who died at Palermo in 1166. But the succession was contested by his son William, who was a time of domestic rebellion. But the prospect of German rule was unpopular, and on William’s death the crown passed to Tancred, an illegitimate grandson of King Roger, who figures in English histories in the story of Richard III.'s crusade. In 1191 Henry, now emperor, asserted his claims; but, while Tancred lived, he did little, in Sicily nothing, to enforce them. On the death of Tancred (1194) and the accession of his young son William III., the emperor came and conquered Sicily and the Italian possessions, with an amount of cruelty which outdid any earlier war or revolution. First of four Western emperors who wore the imperial crown, Henry died in 1197, leaving the kingdom to his young son Frederick, heir of the Norman kings through his mother.

The great days of the Norman conquest and the Norman reigns have been worthily recorded by contemporary historians. For few times have we richer materials. The oldest is Aimé or Amato of Monte Cassino, who exists only in an Old-French translation. We have also for the Norman conquest the halting hexameters of William of Apulia, and for the German conquest the lively and partial verses of Peter of Eboli. Of prose writers we have Geoffrey Malaterra, Alexander abbot of Tela, Frederick I., archbishop of Salerno, Falco of Benevento, and above all Hugo Falscandus, one of the very foremost of medieval writers. Not one of these Latin writers is a native of the island, and we have no record from any native Greek. Occasional notices we of course have in the Byzantine writers, and Archbishop Eustathius’s account of the taking of Thessalonica is more than occasional. And the close connexion between Sicily and England leads to many occasional references to Sicilian matters in English writers.

The relations between the various races of the islands are most instructive. The strong rule of Roger kept all in order. He called himself the defender of Christians; others, on account of his favour to the Saracens, spoke of him as a pagan. He certainly encouraged Saracen art and literature in every shape.

was the first potentate of Italy, and came nearer than any prince since Louis II. to the union of Italy under Italian rule. He sought dominion too beyond the Adriatic: Corfu, Durazzo, and a strip of the Albanian coast became Sicilian possessions as the dowry of Manfred's Greek wife. But papal enmity was too much for him. His overlord claimed to dispose of his crown, and hawked it about among the princes of the West. Edmund of England bore the Sicilian title for a moment. More came of the grant of Urban IV. (1264) to Charles, count of Anjou, and through his wife sovereign count of Provence. Charles, crowned by the pope in 1266, marched to take possession of his lord's grant. Manfred was defeated and slain at Benevento. The whole Sicilian kingdom became the spoil of a stranger who was no deliverer to any class of its people.

The island sank yet lower. Naples, not Palermo, was the head of the new power; Sicily was again a province. But a province Sicily had no mind to be. In the continental lands Charles founded a dynasty; the island he lost after sixteen years. His rule was not merely the rule of a stranger king surrounded by stranger followers; the degradation of the island was aggravated by gross oppression, grosser than in the continental lands. The continental lands submitted, with a few slight efforts at resistance. The final result of the Angevin conquest of Sicily was its separation from the mainland.

Sicilian feeling was first shown in the support given to the luckless expedition of Conradin in 1268. Frightful executions in the island followed his fall. The rights of the Swabian house were now held to pass to Peter (Pedro), king of Aragon, husband of Manfred's daughter Constance. The connexion with Spain, which has so deeply affected the whole later history of Sicily, now begins. Charles held the Greek possessions of Manfred and had designs both on Epeiros and on Constantinople. The emperor Michael Palaeologus and Peter of Aragon became allies against Charles; the famous John of Procida acted as an agent between them; the costs of Charles's eastern warfare caused great discontent, especially in an island where some might still look to the Greek emperor as a natural deliverer. Peter and Michael were doubtless watching the turn of things in Sicily; but the tale of a long-hidden conspiracy between them and the whole Sicilian people has been set aside by Amari. The actual outbreak of 1282, the famous Sicilian Vespers, was stirred up by the wrongs of the moment. A gross case of insult offered by a Frenchman to a Sicilian woman led to the massacre at Palermo, and the like scenes followed elsewhere. The strangers were cut off; Sicily was left to its own people. The towns and districts left without a ruler by no means designed to throw off the authority of the overlord; they sought the good will of Pope Martin. But papal interests were on the side of Charles; and he went forth with the blessing of the church to win back his lost kingdom.

Angevin oppression had brought together all Sicily in a common cause. There was at last a Sicilian nation, a nation for a while capable of great deeds. Sicily now stands out as a main centre of European politics. But the land has lost its character; it is becoming the plaything of powers, instead of the meeting-place of nations. The tale, true or false, that Frenchmen and Provençals were known from the natives by being unable to frame the Italian sound of c shows how thoroughly the Lombard tongue had overcome the other tongues of the island. In Palermo, once city of threefold speech, a Greek, a Saracen, a Norman who spoke his own tongue must have died with the strangers.

Charles was now besieging Messina; Sicily seems to have put on some approach to the form of a federal commonwealth. Meanwhile Peter of Aragon was watching and preparing. He now declared himself. 'To all, except the citizens of the great cities, a king would be acceptable; Peter was chosen with little opposition in a parliament at Palermo, and a struggle of twenty-one years began, of which Charles and Peter saw only the first stage. In fact, after Peter had helped the Sicilians to relieve Messina, he was very little in Sicily; he had to defend his kingdom of Aragon, which Pope Martin had granted to another French Charles. He was represented by Queen Constance, and his great admiral Roger de Loria kept the war away from Sicily, waging it wholly in Italy, and making Charles, the son of King Charles, prisoner. In 1285 both the rival kings died. Charles had before his death been driven to make large legalistic concessions to his subjects to stop the tendency shown, especially in Napoleon, to join the rebolted Sicilians. By Peter's death Aragon and Sicily were separated; his eldest son Alphonso took Aragon, and his second son James took Sicily, which was to pass to the third son Frederick, if James died childless. James was crowned, and held his reforming parliament also. With the popes no terms could be made. Charles, released in 1288 under a deceptive negotiation, was crowned king of Sicily by Honorius IV.; but he had much ado to defend his continental dominions against James and Roger. In 1291 James succeeded Alphonso in the kingdom of Aragon, and left Frederick not king, according to the entail, but only his lieutenant in Sicily.

Frederick was the real restorer of Sicilian independence. He had come to the island so young that he felt as a native. He defended the land stoutly, even against his brother. For James presently played Sicily false. In 1295 he was reconciled to the church and released from all French claims on Aragon, and he bound himself to restore Sicily to Charles. But the Sicilians, with Frederick at their head, disowned the agreement, and in 1296 Frederick was crowned king. He had to defend Sicily against his brother and Roger de Loria, who formed a league with the Emperor, and had John of Procida. Hitherto the war had been waged on the mainland; now it was transferred to Sicily. King James besieged Syracuse as admiral of the Roman Church; Charles sent his son Robert in 1299 as his lieutenant in Sicily, where he gained some successes. But in the same year the one great land battle of the war, that of Falconaria, was won for Sicily. The war, chiefly marked by another great siege of Messina, went on till 1302, when both sides were thoroughly weakened and eager for peace. By a treaty, confirmed by Pope Boniface VIII. the next year, Frederick was acknowledged as king of Trinacria for life. He was to marry the daughter of the king of Sicily, to whom the island kingdom was to revert at his death. The terms were never meant to be carried out. Frederick again took up the title of king of Sicily, and at his death in 1337 he was succeeded by his son Peter. There were thus two Sicilian kingdoms and two kings of Sicily. The king of the mainland is often spoken of as the 'king of Sicily', but that description was never borne as a formal title save in the 16th century by Philip II, king of England and Naples, and in the 19th by Joseph Bonaparte and Joachim Murat. The strict distinction was between Sicily on this side the Pharois (of Messina) and Sicily beyond it.

Thus the great island of the Mediterranean again became an independent power. And, as far as legislation could make it, Sicily became one of the freest countries in Europe. By the laws of Frederick parliaments were to be regularly held, and without their consent the king could not make war, peace or alliance. The treaty of 1302 was not confirmed by parliament, and in 1337 parliament called Peter to the crown. But Sicily never rose to the greatness of its Greek or its Norman days, and its old character had passed away. Of Greeks and Saracens we hear only as a degraded remnant, to be won over, if it may be, to the Western Church. The kingdom had had foreign possessions, yet faint survivals of the days of Agathocles and Roger lingered on. The isle of Gerba off the African coast was held for a short time, and traces of the connexion with Greece went on in various shapes. If the kings of Sicily on this side the Pharois kept Corfu down to 1386, those beyond the Pharoas became in 1311 overlords of Athens, when that duchy was seized by Catalan adventurers, disbanded after the wars of Sicily. In 1530 the Sicilian island of Malta became the shelter of the Knights of Saint John driven by the Turk from Rhodes, and Sicily has received several colonies of Christian Albanians, who have replaced Greek and Arabic by yet another tongue. (See NAPLES, KINGDOM OF.)

(E. A. F.; T. As.)
SICKINGEN, FRANZ VON (1481–1523). German knight, one of the most notable figures of the first period of the Reformation, was born at Ebernburg near Worms. Having fought for the emperor Maximilian I against Venice in 1508, he inherited large estates on the Rhine, and increased his wealth and reputation by numerous private feats, in which he usually acted as the ally of the oppressed. In 1513 he took up the quarrel of Balthasar Schlör, a citizen who had been driven out of Worms, and attacked this city with 7000 men. In spite of the imperial ban, he devastated its lands, interrupted its commerce, and only desisted when his demands were granted. He made war upon Antony, duke of Lorraine, and compelled Philip, landgrave of Hesse, to pay him 35,000 gulden. In 1518 he interfered in a civil conflict in Metz, ostensibly siding with the citizens against the governing oligarchy. He led an army of 20,000 men against the city, compelled the magistrates to give him 20,000 gulden and a month’s pay for his troops. In 1518 Maximilian released him from the ban, and he took part in the war carried on by the Swabian League against Ulrich I., duke of Württemberg. In the contest for the imperial throne upon the death of Maximilian in 1519, Sickingen accepted bribes from Francis I., king of France, but when the election took place he led his troops to Frankfort, where their presence assisted to secure the election of Charles V. For this service he was made imperial chamberlain and councillor, and in 1521 he led an expedition into France, which ravaged Picardy, but was beaten back from Mezières and forced to retire to his castle of Sickingen by being thus posed as the Ulrich von Hutten, and gave his support to Hutten’s schemes. In 1519 a threat from him freed John Reuchlin from his enemies, the Dominicans, and his castles became in Hutten’s works a refuge for righteousness. Here many of the reformers found shelter, and a retreat was offered to Martin Luther. After the failure of the French expedition, Sickingen, aided by Hutten, formed, or revived, a large scheme to overthrow the spiritual princes and to elevate the order of knighthood. He hoped to secure this by the help of the towns and peasants, and to make a great pedlary. A large number of the noble families from the upper Rhineland joined the standard, and at Landau, in August 1522, Sickingen was formally named commander. He declared war against his old enemy, Richard of Greifenklaus, archbishop of Trier, and marched against that city. Trier was loyal to the archbishop, and the landgrave of Hesse and Louis V., count palatine of the Rhine, hastened to his assistance. Sickingen, who had not obtained the help he wished for, was compelled to fall back on his castle of Landstuhl, near Kaiserslautern, collecting much booty on the way. On the 22nd of October 1522 the council of regency placed him under the ban, to which he rebelled, in the spring of 1523, by sacking Kaiserslautern. The rulers of Trier, Hesse and the Palatinate decided to press the campaign against him, and having obtained help from the Swabian League, marched on Landstuhl. Sickingen refused to treat, and during the siege was seriously wounded. This attack is notable as one of the first occasions on which artillery was used, and by its aid breaches were soon made in an otherwise impregnable fortress. On the 6th of May 1523 he was forced to capitulate, and on the following day he died. He was buried at Landstuhl, and in 1880 a splendid monument was raised at Ebernburg to his memory and to that of Hutten.

His son Franz Conrad was made a baron of the empire (Reichsfreiherr) by Maximilian II., and a descendant was raised in 1773 to the rank of count (Reichsgraf). A branch of the family still exists in Austria and Silesia.

See H. Ulmann, Franz von Sickingen (Leipzig, 1872); F. P. Bremer, Sickingens Fehde gegen Trier (Strassburg, 1883); H. Prutz, "Franz Conrad von der neonkeit," in Der niederrheinische Innsammler (Leipzig, 1880), and the "Flesheimer Chronik" in Hutten’s Deutsche Schriften, edited by O. Waltz und Samatolati (Strassburg, 1891).

SICKLES, DANIEL EDGAR (1825– ). American soldier and diplomatist was born in New York City on the 20th of October 1825. He learned the printer’s trade, studied in the university of New York, in 1847 was admitted to the bar in 1848, and was a member of the state Assembly in 1847. In 1853 he became corporation counsel of New York City, but resigned soon afterward to become secretary of the U.S. legation in London, under James Buchanan. He returned to America in 1855, was a member of the state Senate in 1856–1857, and from 1857 to 1861 was a Democratic representative in Congress. In 1859 he was tried on a charge of being a member of the Philis-Barton Key, U.S. army, for the District of Columbia, whom Sickles had discovered to have a liaison with his wife; but he was acquitted after a dramatic trial lasting twenty days. At the outbreak of the Civil War Sickles was active in raising United States volunteers in New York, and was appointed colonel of a regiment. He became a brigadier-general of volunteers in September 1861, led a brigade of the Army of the Potomac with credit up to the battle of Antietam, and then succeeded to a divisional command. He took part with distinction in the battle of Fredericksburg, and in 1863 as a major-general, was sheriff of the III. army corps. His energy and ability were conspicuous in the disastrous battle of Chancellorsville (q.v.); and at Gettysburg (q.v.) the part played by the III. corps in the desperate fighting around the Peach Orchard was one of the most noteworthy incidents in the battle. Sickles himself lost a leg and his active military career came to an end. He was, however, employed to the end of the war, and in 1867 received the brevets of brigadier-general U.S.A. and major-general U.S.A. For his services at Fredericksburg and Gettysburg respectively. General Sickles was one of the few successful volunteer generals who served on either side. Soon after the close of the Civil War he was, having a confidential mission to Cuba to secure its compliance with a treaty agreement of (1846) permitting the United States to convey troops across the Isthmus of Panama. In 1866–1867 he commanded the department of the Carolinas. In 1866 he was appointed colonel of the 42nd infantry (Veteran Reserve Corps), and in 1886 he was retired with the rank of major-general. He was minister to Spain from 1869 to 1873, and took part in the negotiations growing out of the "Virginius Affair" (see SANTIAGO, Cuba). General Sickles was president of the New York State Board of Civil Service Commissioners in 1880. He served in the U.S. army in 1890, and was again a representative in Congress in 1893–1895.

SICULI, an ancient Sicilian tribe, which in historical times occupied the eastern half of the island to which they gave their name. It plays a large though rather shadowy part in the early traditions of pre-Roman Italy. There is abundant evidence that the Siculi once lived in Central Italy east and even north of Rome (e.g. Servius ad Aen. vii. 795; Dion. Hal. l. 9. 22; Thucydides vi. 2). Thence they were dislodged by the Umbro-Safine tribes, and finally crossed to Sicily. Archaeologists are not yet agreed as to the particular stratum of remains in Italy to which the name of the Siculi should be attached (see for instance B. Modestov, Introduction à l’histoire romaine, Paris, 1907, pp. 135 seqq.). They were distinct from the Sicani (q.v.; Virg. Aen. viii. 328) who inhabited the western half of the island, and who according to Thucydides came from Spain, but whom Virgil seems to recognize in Italy. Both traditions may be true (cf. W. Ridgeway, Who were the Romans? London, 1908, p. 23). Of the language of the Siculi we know a very little from glosses preserved to us by ancient writers, most of which were collected by E. A. Freeman (Sicily, vol. i. App. note iv.), and from an inscription upon what is presumably an ornamental earthenware wine vessel, which has very much the shape of a tea- pot, preserved and transcribed by R. S. Conway in the Collection of the Grand Duke of Baden at Karlsruhe (Winnefeld, Grossherzog. vereinigte Sammlungen, 1887, 120), which has been discussed by R. Thurneyses (Kuhn’s Zeitschrift, xxxv. 214). The inscription was found at Centuripa, and the alphabet is Greek of the 5th or 6th century B.C. We have not enough evidence to make a translation possible, despite Thurneyses’s valiant effort, but the recurrence of the phrase hemion esti daram in a varied order (daram hemion esti)—presumably a drinking song or proverb, the half a cup is sorry cheer, though it is possible that the sign Reuchlin’s word, and in it the sign of the second syllable of the word (e. mad makes the division of these three words quite certain, and renders it highly probable that we have to do with an Indo-European language. None of
The groups of sounds occurring in the rest of the inscription, nor any of the endings of words so far as they may be guessed, present any reason for doubting this hypothesis; and the glosses already mentioned can one and all be easily connected with Greek or Latin words (e.g. μύτωρ, μυσίων); in fact it would be difficult to rebut the contention that they should all be regarded as mere borrowings.

(R. S. C.)

The towns of the Siculi, like those of the Sicani, formed no political union, but were under independent rulers. They played an important part in the history of the island after the arrival of the Greeks (see SICULY). Their agricultural pursuits and the volcanic nature of the island made them worshippers of the gods of the nether world, and they have enriched mythology with some distinctly national figures. The most important of these were the Palici, protectors of agriculture and sailors, who had a lake and temple in the neighbourhood of the river Syamaethus, the chief seat of the Siculi; Adranus, father of the Palici, a god akin to Hephaestus, in whose temple fire was always kept burning; Hybla (or Hyblaea), after whom three towns were named, whose sanctuary was at Hybla Gerateis. The connexion of Demeter and Kore with Henna (the rape of Proserpine) and of Aratus with Arethusa (see NARMATA) is due to the influence of the Siculi. Siculo-Carnelian towns were: Agryia (San Filippo d' Argirì); Centuripa (or Centuriae; Centorbi); Henna (Castrogiovanni), a corruption of Castrum Hennae through the Arabic Casr-jannì); Hybla, three in number, (a) Hybla Major, called Geletais or Gerateis, on the river Syamaethus, probably the Hybla famous for its honey, although according to others this was (b) Hybla Minor, on the E. coast N. of Syracuse, afterwards the site of the Dorian colony of Megara, (c) Hybla Heraea in the S. of the island.

For corruptions, see SICULY.

SICYON, or Sicinion (the latter being the older form used by the natives), an ancient Greek city situated in northern Peloponnesus between Corinthia and Achaia. It was built on a low triangular plateau about 2 m. from the Corinthian Gulf, at the confluence of the Asopus and the Helisson, whose sunken beds protected it on E. and W. Between the city and its port lay a fertile plain with olive-groves and orchards. Sicyon’s primitive name Aegiselea indicates that its original population was Ionian; in the Iliad it appears as a dependency of Agamemnon, and its early connexion with Argos is further proved by the myth and surviving cult of Adrastus. After the Dorian invasion the community was divided anew into the ordinary three Dorian tribes and an equally privileged tribe of Ionians, besides which a class of κομψοντάρρα or κατωτακτάρρα lived on the land as serfs. For some centuries Sicyon remained subject to Argos, whence its Dorian conquerors had come; as late as 500 B.C. it acknowledged a certain suzerainty. But its virtual independence was established in the 7th century, when a line of tyrants arose and initiated an anti-Dorian policy. This dynasty, known after its founder Orthogoras as the Orthogoridæ, exercised a mild rule, and therefore lasted longer than any other succession of Greek tyrants (about 665-535 B.C.). Chief of these rulers was the founder’s grandson Cleisthenes—the uncle of the Athenian legislator of that name (see CLEISTHENES, 2). Besides reforming the city’s constitution to the advantage of the Ionians and replacing Dorian cults by the worship of Dionysus, Cleisthenes gained renown as the chief instigator and general of the First Sacred War (590) in the interests of the Delphians. From Herodotus’ famous account of the wooing of Agariste it may be inferred that he held intercourse with many commercial centres of Greece and south Italy. About this time Sicyon developed the various industries for which it was noted in antiquity. As the abode of the sculptors Dipoconus and Scyllist it gained pre-eminence in wood-carving and bronze-work, which as is still to be seen in the archaic metal facings found at Olympia. Its pottery, which resembled the Corinthian ware, was exported with the latter as far as Etruria. In Sicyon also the art of painting was supposed to have been “invented.” After the fall of the tyrants their institutions survived till the end of the 6th century, when the Dorian supremacy was re-established, perhaps by the agency of Sparta, and the city was enrolled in the Peloponnesian League. Henceforth its policy was usually determined either by Sparta or by its powerful neighbour Corinth. During the Persian wars Sicyon could place 3000 heavy-armed men in the field; its school of bronze sculptors still flourished, and produced in Canachus (g.v.) a master of the late archaic style. In the 5th century it suffered like Corinth from the commercial rivalry of Athens in the western seas, and was repeatedly harried by flying squadrons of Athenian ships. In the Peloponnesian war Sicyon followed the lead of Sparta and Corinth. When these two powers quarrelled after the peace of Nicias it remained loyal to the Spartans; but the latter in 415 B.C. deserted it, and Sicyon consequently fell on the side of Athens and fought against a nascent democratic movement. Again in the Corinthian war Sicyon sided with Sparta and became its base of operations against the allied troops round Corinth. In 360 B.C. it was captured and garrisoned by the Thebans in their successful attack on the Peloponnesian League. On this occasion a powerful citizen named Euphran effected a democratic revolution and established himself tyrant by popular support. His deposition by the Thebans and subsequent murder freed Sicyon for a season, but new tyrants arose with the help of Philip II of Macedon. Nevertheless during this period Sicyon reached its zenith as a centre of art; a school of painting formed around Euphran and attracted the great masters Pampusis and Adrastos as its students; its sculpture was raised to a level hardly surpassed in Greece by Lyssippus and his pupils. After participating in the Lamian war and the campaigns of the Macedonian pretenders the city was captured (393) by Demetrius Poliorcetes, who transplanted all the inhabitants to the Acropolis and renamed the site Demetrias. In the 3rd century it again passed from tyrant to tyrant, until in 251 it was finally liberated and enrolled in the Achaean League by Aratus (g.v.). The destruction of Corinth (146) brought Sicyon an acquisition of territory and the presidency over the Isthmian games; yet in Cicero’s time it had fallen deep into debt. Under the empire it was again obscured by the restored cities of Corinth and Patrae; in Pausanias’ age (a.d. 1893) it was almost desolate. In Byzantine times it became a bishop’s seat, and to judge by its later name “Hellas,” it served as a refuge for the Greeks from the Slavonic immigrants of the 8th century.

The village of Vasiliko which now occupies the site is quite insignificant. On the plateau parts of the ancient fortifications are still visible, including the wall between town and Acropolis near the southern apex. A little north of this wall are remains of a theatre and stadium, traces of aqueducts and foundations of buildings. The theatre, which was excavated by the American School of Archaeology in 1887, reached a length of 360 by 200 feet; the stage was rebuilt in Roman times. The side entrances to the auditorium were covered in with vaults of Greek construction; a curious feature is a tunnel from below the stage into the middle of the auditorium.

SIDDONS, SARAH (1755-1831), English actress, the eldest of twelve children of Roger Kemble, was born in the “Shoulder of Mutton” public-house, Brecon, Wales, on the 5th of July 1755. Through the special care of her mother in sending her to the schools in the towns where the company played, Sarah Kemble received a remarkably good education, although she was accustomed to make her appearance on the stage while still a child. She was engaged at the end of 1758 by William Siddons, an actor of the company; but this was disowned by her parents, who wished her to accept the offer of a squire. Siddons was dismissed from the company, and she was sent to a situation as lady’s maid to Mrs Greathead at Guy’s Chiff in Warwickshire. Here she recited Shakespeare, Milton and Rowe in the servants’
hall, and occasionally before aristocratic company, and here also
she began to develop a capacity for sculpture which was sub-
sequently developed (between 1789 and 1790), and of which she
provided samples in busts of herself and of her son that
necessary consent to her union with Siddons was at last obtained,
and the marriage took place at Trinity Church, Coventry, on the
26th of November 1773. It was while playing at Cheltenham in the
following year that Mrs Siddons met with the earliest
decided recognition of her powers as an actress, when by her
representation of Belvidera in Otway's *Venice Preserved* she
moved to tears a party of "people of quality" who had come to
scoll. Her merits were made known by them to Garrick, who
sent his deputy to Cheltenham to see her as Calista in Rowe's *Fair
Penitent*, the result being that she was engaged to appear at
Drury Lane in the following season; but her application for a
salary of 30l. a week, and her attempt to enter as well as other
circumstances, her first appearances as Portia and in other parts were unfortunate, and when,
after playing with success in Birmingham, she was about to return to
town she received a note from the manager of Drury Lane stating
that her services would not be required. Thus, in her own words,
"banished from Drury Lane as a worthless candidate for fame
and fortune," she again in the beginning of 1777 went on the circuit in the provinces.
After a very successful engagement at Bath, beginning in 1778 and lasting five years, she again accepted
an offer from Drury Lane, when Druid James his Miss Isabella in
Garrick's version of Southernhe's *Fatal Marriage*, on the 10th of
October 1783, was a triumph, only equalled in the history of the
English stage by that of Garrick's first night at Drury Lane in
1741 and that of Edmund Kean's in 1814. In her earlier years
it was in scenes of a tender and melting character that she
exercised the strongest sway over an audience; but in the
performance of Lady Macbeth, in which she appeared on the
2nd of February 1785 for the first time in London, it was the
grandeur of her exhibition of the more terrible passions as related
to one awful purpose that held them spellbound. In Lady
Macbeth, she assumed the highest tone and the steepest
cline. It fitted her as no other character did, and as perhaps it will never
fit another actress. Her extraordinary and peculiar physical
endowments—tall and striking figure, brilliant beauty, powerfully
eyes, and solemn dignity of demeanour—en-
abled her to confer a weird majesty on the character which in
expressively heightened the tragic awe surrounding her fate.
After Lady Macbeth she played Desdemona, Rosalind and
Ophelia, all with great success; but it was in Queen Catherine
—which she first played on the occasion of her brother John
Kemble's spectacular revival of *Henry VIII.* in 1787—of which she
was a part almost as well adapted to her peculiar powers as
that of Lady Macbeth. As Volumnia in Kemble's version of
*Coriolanus* she also secured a triumph. In her early life she
had attempted comedy, but her gifts in this respect were very limited.
It was of course inevitable that comparisons should be made
between her and her only peer, Rachel, who undoubtly excelled her
in intensity and the portrayal of fierce passion, but
was a less finished artist and lacked Mrs Siddons' dignity and
pathos. Though Mrs Siddons' minute and systematic study
perhaps gave a certain amount of stiffness to her representations,
its results were not without a symmetrical and monumental fitness
that Rachel never attained. Mrs Siddons formally retired from the
stage in 1812, but occasionally appeared on special occasions even
when advanced in years. Her last appearance was on the 9th of
June 1816 as Lady Randolph in Home's *Douglas*, for the benefit
of Mr and Mrs Charles Kemble. Her most striking impersona-
tions, besides the rôles already mentioned, were those of Zara
in Congreve's * Mourning Bride*, Constance in *King John*, Mrs
Haller in *The Stronger*, and Elvira in *Pizarro*. In private life
Mrs Siddons enjoyed the friendship and respect of many of the
most eminent persons of her time. Horace Walpole at first
refused to join the fashionable chorus of her praise, but he was
ultimately won over. Dr Johnson wrote his name on the hem
of her garment in the famous picture of the actress as the Tragic
Muse by Reynolds (now in the Dulwich Gallery). "I would not
lose," he said, "the honour this opportunity afforded to me for
my name going down to posterity on the hem of your garment." Mrs Siddons died in London on the 5th of June 1831, and was
buried in Paddington churchyard.

On the 14th of June 1807 Sir Henry Irving unveiled at Pad-
dington Green a marble statue of her by Chavalliau, after
the portrait by Reynolds. There is also a large statue by Chantrey
in Westminster Abbey. Portraits by Lawrence and Gains-
borough are in the National Gallery, and a portrait ascribed to
Gainsborough is in the Garrick Club, London, which also possesses
two pictures of the actress as Lady Macbeth by George Henry
Harlow.

See Thomas Campbell, *Life of Mrs Siddons* (2 vols., 1834); Fitz-
gerald, *The Kembles* (3 vols., 1871); Frances Ann Kemble, *Records
of a Girlhood* (3 vols., 1878).

SIDE (mod. *Eski Adaia*), an ancient city on the Pamphylia coast about 12 m. E. of the mouth of the Eurymedon. Possessing
a good harbour in the days of small craft, it was the most
important place in Pamphylia. Alexander visited and occupied it,
and there the Rhodian fleet defeated that of Antiochus the Great,
and in the succeeding century the Cilician pirates established
their chief seat. An inscription found on the site shows it to
have had a considerable Jewish population in early Byzantine
times. The great ruins, among the most notable in Asia Minor,
have been re-occupied by some 200 families of Cretan Moslems.
Many of the buildings are of fine stone; they provide examples of
architecture of Roman and Byzantine date and heighten the
interest of the place. There is also a fine collection of ancient
coins, some of which are of particular interest.

See C. Lancorowski, *Les Villes de la Pamphylie et de la Pithyade*, i.
(1890).

SIDEBOARD, a high oblong table fitted with drawers, cup-
boards or pedestals, and used for the exposition or storage of
articles required in the dining-room. Originally it was what
its name implies—a side-table, to which the modern dinner-
wagon very closely approaches. Then two- or three-tiered
sideboards were in use in the Tudor period, and were perhaps the
ancestors, or collaborators, of the court-cupboard, which in skeleton
they much resembled. Early in the 18th century they began to
be replaced by side-tables properly so called. They were one of
the many innovations in furniture produced by the introduction
of mahogany, and those who could not afford the new and costly
wood used a cheap substitute stained to resemble it. In
the beginning these tables were entirely of wood and comparatively
light, but before long it became the fashion to use a marble slab
instead of a wooden top, which necessitated a somewhat more
robust construction; here again there was a field for imitation,
and marble was sometimes replaced by scagliola. Many of
the sideboard tables of this period were exceedingly handsome,
with cabriole legs, claw or claw and ball feet, friezes of acanthus,
and ornamental brasses and inlays. Many such tables came
from Chippendale's workshops, but although that great genius
beautified the type he found, he had no influence upon the
evolution of the sideboard. That evolution was brought about
by the growth of domestic needs. Save upon its surface, the
sideboard-table offered no accommodation; it usually lacked even
a drawer. Even, however, in the period of Chippendale's zenith
separate "bottle cisterns" and "lavatories" for the convenience
of the butler in washing the silver as the meals proceeded were,
sparingly no doubt, in use. By degrees it became customary
to place a pedestal, which was usually a coffret or a plate-warmer,
at each end of the sideboard-table. One of them would contain
ice and accommodation for bottles, the other would be a cistern.
Sometimes a single pedestal would be surmounted by a wooden
vase lined with metal and filled with water, and fitted with a
tap. To whom is due the brilliant inspiration of attaching the
pedestals to the table and creating a single piece of furniture out of three components there is nothing to show with certainty. It is most probable that the credit is due to Shearer, who unquestionably did much for the improvement of the sideboard; Hepplewhite and the brothers Adam distinguished themselves in the same field. The pedestals, when incorporated as an integral part of the piece, became cupboards and the vases knife-boxes, and, with the drawers, which had been occasionally used much earlier, the sideboard, in what appears to be its final form, was completed. Pieces exist in which the ends have been cut away to receive the pedestals. If Shearer and Hepplewhite laid its foundations, it was brought to its full floraison by Sheraton. By the use of fine exotic woods, the deep employment of satin wood and other inlays, and by the addition of gracefully ornamented cast iron brackets, sometimes surmounted by candles to light up the silver, Sheraton produced effects of great elegance. But for sheer artistic excellence in the components of what presently became the sideboard, the Adams stand unrivalled, some of their inlay and brass mounts being almost equal to the first work of the great French school. By replacing the straight outline with a bombé front, Hepplewhite added still further to the grace of the late 18th-century sideboard. No art remains long at its apogee, and in less than a quarter of a century the sideboard lost its grace, and, influenced by the heavy feeling of the Empire manner, grew massive and dull. Since the end of the 18th century there has indeed been no advance, artistically speaking, in this piece of furnishing.

SIDGWICK, HENRY (1838-1900), English philosopher, was born at Skipton in Yorkshire, where his father, the Rev. W. Sidgwick (d. 1841), was headmaster of the grammar-school, on the 31st of May 1838. He was educated at Rugby (where his cousin, subsequently his brother-in-law, E. W. Benson—orwards archbishop—was a master), and at Trinity, Cambridge, where his career was a brilliant one. In 1859 he was senior classic, 3rd wrangler, chancellor's medallist and Craven scholar. In the same year he was elected to a fellowship at Trinity, and soon afterwards appointed a tutorship there. This post he held for ten years, but in 1869 exchanged his lectureship for one in moral philosophy, a subject to which he had been turning his attention more and more. In the same year, finding that he could no longer declare himself a member of the Church of England, he resigned his fellowship. He retained his lectureship, and in 1881 was elected an honorary fellow. In 1874 he published his Method of Ethics (6th ed. 1901, containing emendations written just before his death), which first won him a reputation outside his university. In 1875 he was appointed preceptor on moral and political philosophy at Trinity, in 1883 he was elected Knightbridge professor of moral philosophy, and in 1885, the religious test having been removed, his college once more elected him to a fellowship on the foundation. Besides his lecturing and literary labours, Sidgwick took an active part in the business of the university, and in many forms of social and philanthropic work. He was a member of the General Board of Studies from its foundation in 1882 till 1899; he was also a member of the Council of the Senate of the Indian Civil Service Board and the Local Examinations and Lectures Syndicate, and chairman of the Special Board for Moral Science. He was one of the founders and first president of the Society for Psychological Research, and was a member of the Metaphysical Society. None of his work is more closely identified with his name than the part he took in promoting the higher education of women. He helped to start the higher local examinations for women, and the lectures held at Cambridge in preparation for these. It was at his suggestion and with his help that Miss Clough opened a house of residence for students; and when this had developed into Newnham College, and in 1880 the North Hall was added, Mr. Sidgwick, who had in 1876 married Eleanor Mildred Balfour (sister of A. J. Balfour), went with his wife to live there for two years. After Miss Clough's death in 1892 Mrs. Sidgwick became principal of the college, and she and her husband resided there for the rest of his life. During this whole period Sidgwick took the deepest interest in the welfare of the college. In politics he was a Liberal, and became a Liberal Unionist in 1886. Early in 1906 he was forced by ill-health to resign his professorship, and he died on the 28th of August of the same year.

Though in many ways an excellent teacher he was primarily a courtier, and treated his pupils as fellow-knight peers. He was deeply interested in psychological phenomena, but his energies were primarily devoted to the study of religion and philosophy. Brought up in the Church of England, he gradually drifted from orthodox Christianity, and as early as 1862 he described himself as a theist. For the rest of his life, though he regarded Christianity as "indispensable and irreplaceable—looking at it from a sociological point of view," he found himself unable to return to it as a religion. In political economy he was a Utilitarian on the lines of Mill and Bentham; his work was the careful investigation of first principles and the investigation of ambiguities rather than constructed a new philosophy. In philosophy he devoted himself to ethics, and especially to the examination of the ultimate intuitive principles of conduct and the problem of free will. He gave up the psychological hedonism of Mill, and adopted instead a position which may be described as ethical hedonism, according to which the criterion of goodness in any given action is that it produces the greatest possible amount of pleasure. This hedonism, however, is not confined to the self (egoistic), but involves a due regard to the pleasure of others, and is, therefore, distinguished further as universalistic. Lastly, Sidgwick returns to the principle that no man should act so as to cause himself ill-health, and leaves us with a somewhat unsatisfactory dualism.

His chief works are Principles of Political Economy (1883, 3rd ed. 1901); Scope and Method of Economic Science (1885); Outlines of the History of Ethics (1886, 5th ed. 1902), enlarged from his article "Ethics in the Encyclopaedia Britannica; Elements of Politics (1891, 2nd ed. 1897), an attempt to supply an adequate treatise on the subject starting from the old lines of Bentham and Mill. The following were published posthumously: Philosophy; its Scope and Relations (1902); Lectures on the Ethics of T. H. Green, Mr. Herbert Spencer, (1902); The Development of European Polity (1903); Miscellaneous Essays and Addresses (1904); Lectures on the Philosophy of Kant (1905).

His younger brother, ARTHUR SIDGWICK, had a brilliant school and university career, being second classic at Cambridge in 1863 and becoming fellow of Trinity; but he devoted himself thenceforth mainly to work as a teacher. After being for many years a master at Rugby, he became in 1882 fellow and tutor of Corpus, Oxford, and from 1894 to 1906 was Reader in Greek in the university. He published one of the ablest classical school-books, including Greek Prose (1876) and Greek Verse (1881) and texts (Virgil, 1890; Aeneid, 1880-1900), and was well known as a consummate classical scholar, remarkable for literary taste and general culture. In the college life of Corpus he took the deepest interest and had the most stimulating influence; and he also played an active part in social and political movements from an advanced Liberal point of view.

A Memoir of Henry Sidgwick, written by his brother with the collaboration of his widow, was published in 1906.

SIDI-BEL-ABBES, chief town of an arrondissement in the department of Oran, Algeria, 48 m. by rail S. of Oran, 1532 ft. above the sea, on the right bank of the Mekerra. Pop. (1906) of the town, 24,949 (of whom three-fourths are French or Spaniards); of the commune, 29,988; of the arrondissement, which includes 47 communes, 98,300. The town, which occupies an important strategic position in the plain dominated by the escarpments of Mount Tessala, has barracks accommodation for 6000 troops, and is the headquarters of the 1st arrondissement, one of the two regiments known as the Foreign Legion. It is encircled by a crenellated and bastioned wall with a fosse, and has four gates, named after Oran, Daia, Mascara and Tlemcen respectively. Starting from the gates, two broad streets, shaded by plane trees, traverse the town east to west and north to south, the latter dividing the city from the military quarters. There are numerous vineyards and olive-
groves in the vicinity. The town, founded by the French, derives its name from the kubba (tomb) of a marabout named Sidi-bel-Abbes, near which a redoubt was constructed by General Bedeau in 1843. The site of the town, formerly a swamp, has been thoroughly drained. The surrounding country is healthy, fertile and populous.

SIDMOUTH, HENRY ADDINGTON, 1ST VISCOUNT (1757-1844), English statesman, son of Dr Anthony Addington, was born on the 31st of May 1757. Educated at Westminster College and Brasenose College, Oxford, he graduated in 1778, and took the chancellor’s prize for an English essay in 1779. Owing to his friendship with William Pitt he turned his attention to politics, and after his election as member of parliament for Devizes in 1784 gave a silent but steady support to the ministry of his friend. By close attention to his parliamentary duties, he obtained a wide knowledge of the rules and procedure of the House of Commons, and this fact together with his intimacy with Pitt, and his general popularity, secured his election as Speaker in June 1789. Like his predecessors, Addington continued to be a partisan after his acceptance of this office. This took part at times in debate when the house was in committee; and on one occasion his partiality allowed Pitt to disregard the authority of the chair. He enjoyed the confidence of George III., and in the royal interest tried to induce Pitt to withdraw his proposal for a further instalment of relief to Roman Catholics. Rather than give way on this question Pitt resigned office early in 1801, when both he and the king urged Addington to form a government. Addington consented, and after some delay caused by the king’s illness, and by the reluctance of several of Pitt’s followers to serve under him, became first lord of the treasury and chancellor of the exchequer in March 1801. The new prime minister, who was specially acceptable to George, was loyally supported by Pitt; and his first important work, the conclusion of the treaty of Amiens in March 1802, made him popular in the country. Signs, however, were not wanting that the peace would soon be broken, and Pitt, dissatisfied with the ministry for ignoring the threatening attitude of Napoleon, and making no preparations for a renewal of the war, withdrew his support. Addington then took steps to strengthen the forces of the crown, and suggested to Pitt that he should join the cabinet and that both should serve under a new prime minister. This offer was declined, and a similar fate befell Addington’s subsequent proposal to serve under Pitt. When the struggle with France was renewed in May 1803, it became evident that as a war minister Addington was not a success; and when Pitt became openly hostile, the continued confidence of the king and of a majority in the House of Commons was not a sufficient counterpoise to the ministry’s waning prestige. Although careful and industrious, Addington had no brilliant qualities, and his mediocrity afforded opportunity for attack by his enemies. Owing to his father’s profession he was called in derision “the doctor,” and George Canning, who wrote satirical verses at his expense, referred to him on one occasion as “happy Britain’s guardian gander.” Without waiting for defeat in the House he resigned office in April 1804, and became the leader of the party known as the “king’s friends.” Pitt, who now returned to office, was soon reconciled with his old friend; in January 1805 Addington was created Viscount Sidmouth, and became lord president of the council. He felt aggrieved, however, because his friends were not given a larger share of power, and when Pitt complained because some of them voted against the ministry, Sidmouth left the cabinet in July 1805. In February 1806 he became lord privy seal in the ministry of Fox and Grenville, but resigned early in 1807 when the government proposed to throw open commissions in the army and navy to Roman Catholics and Protestant dissenters; in 1812 he joined the cabinet of Spencer Perceval as lord president of the council, becoming home secretary when the ministry was reconstructed by the earl of Liverpool in the following June. The ten years during which he held this office coincided with much misery and unrest among the labouring classes, and the government policy, for which he was mainly responsible, was one of severe repression. In 1817 the Habeas Corpus Act was suspended, and Sidmouth issued a circular to the lords-lieutenant declaring that magistrates might apprehend and hold to bail persons accused on oath of seditious libels. For this step he was severely attacked in parliament, and was accused of fomenting rebellion by means of his spies. Although shaken by the acquisit of William Hone on a charge of libel the government was supported by parliament; and after the “Manchester massacre” in August 1819 the home secretary thanked the magistrates and soldiers for their share in quelling the riot. He was mainly responsible for the policy embodied in the “Six Acts” of 1819. In December 1821 Sidmouth resigned his office, but remained a member of the cabinet without official duties until 1824, when he resigned owing to his disapproval of the recognition of the independence of Buenos Aires. Subsequently he took very little part in public affairs; but true to his earlier principles he spoke against Catholic emancipation in April 1829, and voted against the Reform Bill in 1832. He died at his residence in Richmond Park on the 15th of February 1844, and was buried at Mortlake. In 1823 he married Ursula Mary, daughter of Leonard Hammond of Cheam, Surrey, who died in 1811, leaving a son, William Leonard, who succeeded his father as Viscount Sidmouth, and four daughters. In 1822 he married secondly Marianne, daughter of William Scott, Baron Stowell (d. 1836), and widow of Thomas Townsend of Honington, Warwickshire. Sidmouth suffers by comparison with the great men of his age, but he was honest and courageous in his opinions, loyal to his friends, and devoted to church and state.

SIDMOUTH, a market town and watering-place in the Honiton parliamentary division of Devonshire, England, on the river Sid and the English Channel, 1624 m. W. by S. of London, by the London & South-Western railway. Pop. of urban district (1901) 4201. Lying in a hollow, the town is shut in by hills which terminate in the forelands of Salcombe and High Peak, two sheer cliffs of a deep red colour. The shore line curves away, beyond these, westward to the Start and eastward to Portland—both visible from Sidmouth beach. The restored church of St Nicholas, dating from the 13th century, though much altered in the 15th, contains a window given by Queen Victoria in 1866 in memory of her father, the duke of Kent, who lived at Woolbrook Glen, close by, and died there in 1820. An esplanade is built along the sea-wall, and the town possesses golf links and other recreation grounds. The bathing is good, the climate warm. Formerly of some importance, the harbour can no longer be entered by large vessels, and goods are transhipped into flat-bottomed lighters for conveyance ashore. Fishing is extensively carried on and cattle fairs are held. In the 13th century Sidmouth was a borough governed by a port-receve. Tradition tells of an older town buried under the sea; and Roman coins and other remains have been washed up on the beach. Traces of an ancient camp exist on High Peak.

SIDNEY (or SYDNEY), ALGERNON (1622-1683), English politician, second son of Robert, 2nd earl of Leicester, and of Dorothy Percy, daughter of Henry, 9th earl of Northumberland, was born at Penshurst, Kent, in 1622. As a boy he showed a fine talent for Latin, which he cultivated under his father’s eye. In 1633 with his elder brother Philip he accompanied his father on his mission as ambassador extraordinary to Christian IV. of Denmark, whom he saw at Rendsburg. In May 1636 Sidney went with his father to Paris, where he became a general favourite, and from there to Rome. In October 1641 he was given a troop in his father’s regiment in Ireland, of which his brother, known as Lord Lisle, was in command. In August 1643 the brothers returned to England. At Chester their horses were taken by the Royalists, whereupon they again put out to sea and landed at Liverpool. Here they were detained by the Parliamentary
commissioners, and by them sent up to London for safe custody. Whether this was intended by Sidney or no, it is certain that from this time he ardently attached himself to the Parliamentary cause. On the 10th of May 1644 he was made captain of horse in Manchester's army, under the Eastern Association. He was shortly afterwards made lieutenant-colonel, and charged at the head of his regiment at Marston Moor (2nd July), where he was wounded and rescued with difficulty. On the 2nd of April 1645 he was given the command of a cavalry regiment in Cromwell's division of Fairfax's army, was appointed governor of Chichester on 10th May, and in December was returned to parliament for Cardiff. In July 1646 he went to Ireland, where his brother was lord-lieutenant, and was made lieutenant-general of horse in that kingdom and governor of Dublin. Leaving London on 1st of February 1647, Sidney arrived at Cork on the 22nd. He was soon (8th April), however, recalled by a resolution of the House passed through the interest of Lord Inchiquin. On the 7th of May he received the thanks of the House of Commons. On the 13th of October 1648 he was made lieutenant of Dover castle, of which he had previously been appointed governor. He was at this time identified with the Independents as opposed to the Presbyterian party. He was nominated one of the commissioners to try Charles I., but took no part in the trial, retiring to Penshurst until sentence was pronounced. That Sidney approved of the trial, though not of the sentence, there can, however, be little doubt, for in Copenhagen he publicly and vigorously expressed his concurrence. On the 15th of May 1649 he was a member of the committee for settling the succession and for regulating the election of future parliaments. Sidney lost the governorship of Dover, however, in March 1651, in consequence, apparently, of a quarrel with his officers. He then went to the Hague, where he quarrelled with Lord Oxford at play, and a duel was only prevented by their friends. He returned to England in the autumn, and henceforward took an active share in parliamentary work. On the 25th of November Sidney was elected on the council of state and was evidently greatly considered. In the usurpation of Cromwell, however, he utterly refused all concurrence, nor would he leave his place in parliament except by force when Cromwell dispersed it on the 20th of April 1655. He immediately retired to Penshurst, where he was concerned chiefly with family affairs. In 1654 he again went to the Hague, and there became closely acquainted with De Witt. On his return he kept entirely aloof from public affairs, and it is to this period that the Essay on Love is ascribed.

Upon the restoration of the Long Parliament, in May 1659, Sidney again took his seat, and was placed on the council of state. He showed himself in this office especially anxious that the military power should be duly subordinated to the civil. In June he was appointed one of three commissioners to mediate for a peace between Denmark, supported by Holland, and Sweden. He was probably intended to watch the conduct of his colleague, Admiral Montagu (afterwards 1st earl of Sandw ich), who was in command of the Baltic squadron. Of his character we have an interesting notice from Whitelocke, who refused to accompany him on the ground of his "overruling temper and height." Upon the conclusion of the treaty he went to Stockholm as plenipotentiary; and in both capacities he behaved with resolution and address. When the restoration of Charles II. took place Sidney left Sweden, on the 8th of June 1660, bringing with him from the king of Sweden a rich present in testimony of the estimation in which he was held. Sidney went first to Copenhagen, and then, being doubtful of his reception by the English court, settled at Hamburg. From there he wrote a celebrated letter vindicating his conduct, which will be found in the Somers Tracts. He shortly afterwards left Hamburg, and passed through Germany by way of Venice to Rome. His stay there, however, was embittered by misunderstandings with his father and consequent straits for money. Five shillings a day, he says, served him and two men very well for meat and drink and firing. He devoted himself to the study of books, birds and trees, and speaks of his natural delight in solitude being largely increased. In 1663 he left Italy, passed through Switzerland, where he visited Ludlow, and came to Brussels in September, where his portrait was painted by van Egmont; it is now at Penshurst. He had thoughts of joining the imperial service, and offered to transport from England a body of the old Commonwealth men; but this was refused by the English court. It is stated that the enmity against him was so great that now, as on former occasions, attempts were made to assassinate him. On the breaking out of the Dutch war, Sidney, who was at the Hague, urged an invasion of England, and shortly afterwards went to Paris, where he offered to raise a rebellion in England on receipt of 100,000 crowns. Unable, however, to come to terms with the French government, he once more went into retirement in 1666,—this time to the south of France. In August 1670 he was again in Paris, and Arlington proposed that he should receive a pension from Louis; Charles II. agreed, but insisted that Sidney should return to Languedoc. In illustration of his austere principles it is related that, Louis having taken a fancy to a horse belonging to him and insisting on possessing it, Sidney shot the animal, which, he said, "was born a free creature, had served a free man, and should not be mastered by a king of slaves." His father was now very ill, and after much difficulty Sidney obtained leave to come to England in the autumn of 1671. Lord Leicester died in November; and legal business connected with other portions of the succession detained Sidney from returning to France as he had intended. He soon became involved in political intrigue, joining, in general, the country party, and holding close communication with Barillon, the French ambassador. In the beginning of 1670 he stood for Guilford, and was warmly supported by William Penn, with whom he had long been intimate, and to whom he is said (as is now thought, erroneously) to have afforded assistance in drawing up the constitution of Pennsylvania. He was defeated by court influence, and his petition to the House, complaining of an undue return, never came to a decision. His Letters to Henry Savile, written at this period, are of great interest. He was in Paris, apparently only for a short while, in November 1679. Into the prosecution of the Popish Plot Sidney threw himself warmly, and was among those who looked to Monmouth, rather than to Orange, to take the place of James in the succession, though he afterwards disclaimed all interest in such a question. He now stood for Bramber (Sussex), again with Penn's support, and a double return was made. He is reported on the 10th of August 1679, when being elected for Amersham (Buckingham) with Sir Roger Hill. When parliament met, however, in October 1680, his election was declared void. But now, under the idea that an alliance between Charles and Orange would be more hostile to English liberty than would the progress of the French arms, he acted with Barillon in influencing members of parliament in this sense, and is twice mentioned as receiving the sum of 500 guineas from the ambassador. Of this there is no actual proof, and it is quite possible that Barillon entered sums in his accounts with Louis which he never paid away. In any case it is to be remembered that Sidney is not charged with receiving money for advocating opinions which he did not enthusiastically hold.

Upon the dissolution of the last of Charles's parliaments the king issued a justificatory declaration. This was at once answered by a paper entitled A Just and Modest Vindication, &c., the first sketch of which is imputed to Sidney. It was then, too, that his most celebrated production, the Discourses concerning Government, was concluded, in which he upholds the doctrine of the mutual compact and traverses the High Tory positions from end to end. In especial he vindicates the principles of resistance to kingly oppression or misuse, upholds the existence of an hereditary nobility interested in their country's good as the firmest barrier against such oppression, and maintains the authority of parliaments. In each point the English constitution, which he ardently admires, is, he says, suffering: the prerogatives of the crown are disproportionately great; the peerage has been degraded by new creations; and parliaments are slighted.

For a long while Sidney kept himself aloof from the duke of Monmouth, to whom he was introduced by Lord Howard. After
the death of Shaftesbury, however, in November 1682, he entered into the conferences held between Monmouth, Russell, Essex, Hampden and others. That treasonable talk went on seems certain, but it is probable that matters went no further. The watchfulness of the court was, however, aroused, and on the discovery of the Rye House Plot, Sidney, who had always been regarded in a vague way as dangerous, was arrested while at dinner on the 26th of June 1683. His papers were carried off, and he was sent at once to the Tower on a charge of High treason. For a considerable while no evidence could be found on which to establish a charge. Jeffreys, however, was made lord chief-justice in September; a jury was packed; and, after consultations between the judge and the crown lawyers, Sidney was brought to listen to the indictment on the 7th of November. The trial began on the 21st of November: Sidney was refused a copy of the indictment, in direct violation of law, and he was refused the assistance of counsel. Hearsay evidence and the testimony of the perjured informer Lord Howard, whom Sidney had been instrumental in introducing to his friends, were first produced. This being insufficient, partial circumstantial evidence was found in Sidney's study, and supposed only to be in his handwriting, in which the lawfulness of resistance to oppression was upheld, were next relied on. He was indicted for "conspiring and compassing the death of the king." Sidney conducted his case throughout with great skill; he pointed especially to the fact that Lord Howard, whose character he easily tore to shreds, was the only witness against him as to treason, whereas the law required two, that the treason was not accurately defined, that no proof had been given that the papers produced were his, and that, even if that were proved, these papers were in no way connected with the charge. Against the determination to secure a conviction, however, his courage, eloquence, coolness and skill were of no avail, and the verdict of "guilty" was given. On the 29th of November Sidney presented a petition to the king, praying for an audience, which, however, under the influence of James and Jeffreys, Charles refused. On the 26th he was brought up for judgment, and again insisted on the illegality of his conviction. Upon hearing his sentence he gave vent to his feelings in a few noble and beautiful words. Jeffreys having suggested that his mind was disorderd, he held out his hand and bade the chief-justice "feel how calm and steady his pulse was." By the advice of his friends he presented a second petition, offering, if released, to leave the kingdom at once and for ever. The supposed necessity, however, of checking the hopes of Monmouth's partisans caused the king to be inexorable. The last days of Sidney's life were spent in drawing up his Apology and in discourse with Independent ministers. He was beheaded on the morning of the 7th of December 1683. His remains were buried at Penshurst.

Sidney, Sir Henry (1529-1586), lord deputy of Ireland, was the eldest son of Sir William Sidney, a prominent politician and courtier in the reigns of Henry VIII and Edward VI, and from both of whom he received extensive grants of land, including the manor of Penshurst in Kent, which became the principal residence of the family. Henry was brought up at court as the companion of Prince Edward, afterwards King Edward VI; and he continued to enjoy the favour of the sovereign throughout the reigns of Edward and Mary. In 1536 he went to Ireland with the lord deputy, the earl of Sussex, who in the previous year had married his sister Frances Sidney; and from the first he had a large share in the administration of the country, especially in the military measures taken by his brother-in-law for the suppression of Irish chieftains. In 1541 he was made a deputy earl of Pembroke and occupied the deputy's seat at Westminster. In 1543 he was made a knight of the garter. In 1555, on his appointment as lord deputy of Ireland, he became a privy councillor, and in 1557 he was made a privy councillor and lord deputy of Ireland. In 1557 Sidney devastated the island of Rathlin; and during the absence of Sussex, the lord deputy, in Ireland, in the following year Sidney was charged with the sole responsibility for the government of Ireland, which he conducted with marked ability and success. A second absence of the lord deputy from Ireland, occasioned by the accession of Queen Elizabeth, threw the chief control into Sidney's hands at the outbreak of trouble with Shane O'Neill, and he displayed great skill in temporizing with that redoubtable chieftain till Sussex reluctantly returned to his duties in August 1559. About the same time Sidney resigned his office of vice-treasurer of Ireland on being appointed president of the Welsh Marches, and for the next few years he resided chiefly at Ludlow Castle, with frequent visits to the court in London. In 1565 Sidney was appointed lord deputy of Ireland in place of Sir Nicholas Arnold, who had succeeded the earl of Sussex in the previous year. He fixed the country in a more impoverished and more turbulent condition than when he left it, the chief disturbing factor being Shane O'Neill in Ulster. With difficulty he persuaded Elizabeth to sanction vigorous measures against O'Neill; and although the latter successfully avoided a decisive encounter, Sidney restored O'Neill's rival Calvagh O'Donnell to his rights, and established an English garrison at Derry which did something to maintain order. In 1567 Shane was murdered by the MacDonnells of Antrim (see O'NEILL), and Sidney was then free to turn his attention to the south, where with vigour and determination he arranged the quarrel between the earls of Desmond and Ormonde wide, and laid his hand heavily on other disturbers of the peace; then, returning to Ulster, he compelled Turlough Luineach O'Neill, Shane's successor in the clan chieftainship, to make submission, and placed garrisons at Belfast and Carrickfergus to oust Tyrone and the Glynns. In the autumn of 1567 Sidney went to England, and was absent from Ireland for the next ten months. On his return he urged upon Cecil the necessity for measures to improve the economic condition of Ireland, to open up the country by the construction of roads and bridges, to replace the Ulster tribal institutions by a system of freehold land tenure, and to repress the ceaseless disreputable wars in every part of the island. In pursuance of this policy Sidney dealt severely with the unruly Butlers in Munster. At Kilkenny large numbers of Sir Edmund Butler's followers were hanged, and three of Ormonde's brothers were attained by an act of the Irish parliament in 1570. Enlightened steps were taken for the education of the people, and encouragement was given to Protestant refugees from the Netherlands to settle in Ireland.

Sidney left Ireland in 1571, aggrieved by the slight appreciation of his statesmanship shown by the queen; but he returned thither in September 1575 with increased power and renovated tokens of royal approval, to find matters in a worse state than before—especially in Antrim, where the MacQuillins of the Route and Sorley Boy MacDonnell (q.v.) were the chief fomenters of disorder. Having to some extent pacified this northern territory, Sidney repaired to the south, where he was equally successful in making his authority respected. He left his mark on the administrative areas of the island by making shire divisions on the English model. At an earlier period he had already in the north combined the districts of the Ardes and Clandeboye to form the county of Carrickfergus, and had converted the county of the O'Farrells into the county of Longford; he now carried out a similar policy in Connaught, where the ancient Irish district of Thomond became the county Clare, and the counties of Galway, Mayo, Sligo and Roscommon were also delimited. He suppressed a rebellion headed by the earl of Clanricarde and his sons in 1576, and hunted Rory O'More to his death two years later. Meantime Sidney's methods of taxation had caused discontent among the gentry of the Pale, who carried their grievances to Queen Elizabeth. Greatly to Sidney's chagrin the queen censured his extravagance, and notwithstanding his distinguished services to the crown he was recalled in September 1576, and was coldly received by his sister in England, who, however, took the remainder of his life, performing his duties as president of the Welsh Marches, and died there on the 5th of May 1586.

Sir Henry Sidney was the ablest statesman charged with the government of Ireland in the 16th century; and the meagre recognition which his unrewarded services received was a conspicuous example of the ingratitude of Elizabeth. Sidney married in 1531 Mary, eldest daughter of John Dudley, duke of Northumberland, by whom he had three sons and four daughters. His eldest son was Sir Philip Sidney (q.v.), and his second was...
SIDNEY, SIR PHILIP

Robert Sidney, 1st earl of Leicester (q.e.) his daughter Mary married Henry Herbert, 2nd earl of Pembroke, and by reason of her association with her brother Philip was one of the most celebrated women of her time (see PEMBROKE, EARLS OF).

SIDNEY, SIR PHILIP (1554-1586), English poet, statesman and soldier, eldest son of Sir Henry Sidney and his wife Mary Dudley, was born at Penshurst on the 30th of November 1554. His father, Sir Henry Sidney (1529-1586), was three times lord deputy of Ireland, and in 1560 became lord president of Wales. Philip Sidney's childhood was spent at Penshurst; and before he had completed his tenth year he was nominated by his father lay rector of Whitford, Flintshire. A deputy was appointed, and Philip enjoyed the revenue of the benefice for the rest of his life. On the 17th of October 1564 he was entered at Shrewsbury school, not far from his father's official residence at Ludlow Castle, on the same day with his life-long friend and first biographer, Fulke Greville. An affectionate letter of advice from his father and mother, written about 1565, was preserved and printed in 1591 (A Very Godly Letter . . .). In 1568 Sidney was sent to Christ Church, Oxford, where he formed lasting friendships with Richard Hakluyt and William Camden. But his chief companion was Fulke Greville, who had gone to Brocasgate Hall (Pembroke College). Sir Henry Sidney was already anxious to arrange an advantageous marriage for his son, who was at that time heir to his uncle, the earl of Leicester; and Sir William Cecil agreed to a betrothal with his daughter Anne. But in 1571 the match was broken off, and Anne Cecil married Edward Vere, 17th earl of Oxford. In that year Philip left Oxford, and, after some months spent chiefly at court, received the queen's leave in 1572 to travel abroad "for attaining the knowledge of foreign languages."

He was attached to the suite of the earl of Lincoln, who was sent to Paris in that year to negotiate a marriage between Queen Elizabeth and the Dauphin of France. On his return to England, he joined Francis Walsingham in Paris during the massacre of Saint Bartholomew, and the events he witnessed no doubt intensified his always militant Protestantism. In charge of Dr Watson, dean, and afterwards bishop, of Winchester, he left Paris for Lorraine, and in March of the next year had arrived in Frankfort on the Main. He lodged there in the house of the learned printer Andrew Wechel, among whose guests was also Hubert Languet. Fulke Greville describes Philip Sidney when a schoolboy as characterized by "such staleness of mind, lovely and familiar gravity, which carried grace and reverence far above greater years." "Though I lived with him, and knew him from a child," he says, "yet I never knew him other than a man." These qualities attracted to him the friendship of great students of affairs, and in France he formed close connexions with the Huguenot leaders. Languet, who was an ardent supporter of the Protestant cause, conceived a great affection for the younger man, and travelled in his company to Vienna. In October Sidney left for Italy, having first of all entered into a compact with his friend to write every week. This arrangement was not strictly observed, but the extant letters, more numerous on Languet's side than on Sidney's, afford a considerable insight into Sidney's moral and political development. Languet, who was a philosopher of the truest, with sensible and affectionate advice on his studies and his affairs generally.

Sidney settled for some time in Venice, and in February 1574 he sat to Paolo Veronese for a portrait, destined for Languet. His friends seem to have feared that his zeal for Protestantism might be corrupted by his stay in Italy, and Languet exacted from him a promise that he would not go to Rome. In July he was seriously ill, and immediately on his recovery started for Vienna. From there he accompanied Languet to Poland, where he is said to have been asked to become a candidate for the vacant crown. On his return to Vienna he fulfilled vague diplomatic duties at the imperial court, perfecting himself meanwhile, in company with Edward Wotton, in the art of horsemanship under John Pietro Pugliano, whose skill and wit he celebrates in the opening paragraph of the Defence of Poete. He addressed a letter from Vienna on the state of affairs to Lord Burghley, in December 1574. In the spring of 1575 he followed the court to Prague, where he received a summons to return home, apparently because Sir Francis Walsingham, who was now secretary of state, feared that Sidney had leanings to Catholicism.

His sister, Mary Sidney, was now at court, and he had an influential patron in his uncle, the earl of Leicester. He accompanied the queen on one of her royal progresses to Kenilworth, and afterwards to Charley Castle, the seat of Walter Devereux, earl of Essex. There he met Penelope Devereux, the "Stella" of the sonnets, then a child of twelve. Essex went to Ireland in 1576 to fill his office as earl marshal, and in September occurred his mysterious death. Philip Sidney was in Ireland with his father at the time. Essex on his deathbed had desired a match between Sidney and his daughter Penelope. Sidney was often harassed with debt, and seems to have given no serious thought to the question for some time, but Edward Waterhouse, an agent of Sir Henry Sidney, writing in November 1576, mentions "the treatise between Mr Philip and my Lady Penelope" (Sidney Papers, l. p. 147). In the spring of 1577 Sidney was sent to congratulate Louis, the new elector Palatin, and Rudolf II., who had become emperor of Germany. He received also general instructions to discuss with various princes the advancement of the Protestant cause.

After meeting Don John of Austria at Louvain, March 1577, he proceeded to Heidelberg and Prague. He persuaded the elector's brother, John Casimir, to consider proposals for a league of Protestant princes, and also for a conference among the Protestant churches. At Prague he ventured on a harangue to the emperor, advocating a general league against Spain and Rome. This address naturally produced no effect, but does not seem to have been received as much as might have been expected. On the return journey he visited William of Orange, who formed a high opinion of Sidney. In April 1577 Mary Sidney married Henry Herbert, and early in the summer Philip paid the first of many visits to her at her new home at Wilton. But later in the year he was at court defending his father's interests, particularly against the earl of Ormonde, who was doing all he could to prejudice Elizabeth against the lord deputy.

Sidney drew up a detailed defence of his father's Irish government, to be presented to the queen. A rough draft of four of the seven sections of this treatise is preserved in the British Museum (Cotton MS., Titus B. xli. pp. 557-559), and even in its fragmentary condition it justifies the high estimate formed of it by Edward Waterhouse (Sidney Papers, p. 228). Sidney watched with interest the development of affairs in the Netherlands, but was fully occupied in defending his father's interests at court. He came also in close contact with many men of letters. In 1578 he met Edmund Spenser, who in the next year dedicated to him his Shepherds Calendar. With Sir Edward Dyer he was a member of the Areopagus, a society which sought to introduce classical metres into English verse, and many strange experiments were the result. In 1578 the earl of Leicester entertained Elizabeth at Wanstead, Essex, with a masque, The Lady of the Mny, written for the occasion by Philip Sidney. Though Sidney enjoyed a high measure of the queen's favour, he was not permitted to gratify his desire for active employment. He was already more or less involved in the disgrace of his uncle Leicester, following on that nobleman's marriage with Lettice, countess of Essex, when, in 1579, he had a quarrel on the tennis-court at Whitehall with the earl of Oxford. Sidney proposed a duel, which was forbidden by Elizabeth. There was more in the quarrel than appeared on the surface. Oxford was one of the chief supporters of the queen's proposed marriage with Alençon,
now duc d’Anjou, and Sidney, in giving the lie to Oxford, confronted the leader of the French party. In January 1580 he went further in his opposition to the match, addressing to Elizabeth a long letter in which the arguments against the alliance were elaborately set forth. This letter (Sidney Papers, pp. 287–292), in spite of some judicious compliments, was regarded, not unnaturally, by the queen as an intrusion. Sidney was compelled to retire from court, and some of his friends feared for his personal safety. A letter from Langboust shows that he had written to Elizabeth at the instigation of “those whom he was bound to obey,” probably Leicester and Walsingham.

Sidney retired to Wilton, or the neighbouring village of Iyvichurch, where he joined his sister in writing a paraphrase of the Psalms. Here too he began his Arcadia, for his sister’s amusement and pleasure. In October 1580 he addressed a long letter of advice, not without affectionate and colloquial interruptions, to his brother Robert, then about to start on his continental tour. This letter (Sidney Papers, p. 283) was printed in Profitable Instructions for Travelers (1633). It seems that a promise was exacted from him not to fret his indiscretions in the matter of the French marriage, and he returned to court.

In view of the silence of contemporary authority, it is hardly possible to assign definite dates to the sonnets of Astrophel and Stella. Penelope Devereux was married against her will to Robert, Lord Rich, in 1581, probably very soon after the letter from Penelope’s guardian, the earl of Huntingdon, desiring the queen’s consent. The earlier sonnets are not indicative of overwhelming passion, and it is a reasonable assumption that Sidney’s liking for Penelope only developed into passion when he found that she was passing beyond his grasp. Mr. W. Pollard assigns the significant sequence beginning with No. 33—

“I might unhappily word—O me, I might,
And then would not, or could not, see my blisses,”—

to the period following on Stella’s reappearance at court as Lady Rich. It has been argued that the whole tenor of Philip’s life and character was opposed to an overpowering passion, and that there is no ground for attaching biographical value to these sonnets, which were merely Petrarcan exercises. That Sidney was, like his contemporaries, a careful and imitative student of French and Italian sonnets is patent. He himself confesses in the first of the series that he “ought” to write to paint the blackest face of woe, by “oft turning others’ leaves” before he obeyed the command of his muse to “look in his heart and write.” The account of his passion is, however, too circumstantial to be lightly regarded as fiction. Mr. Pollard sees in the sonnets a description of a spiritual struggle between his sense of a high political mission and a disturbing passion calculated to lessen his efforts in a larger sphere. It seems certain, at any rate, that he was not solely preoccupied with scruples against his love for Stella because she was already married. He had probably been writing sonnets to Stella for a year or more before her marriage, and he seems to have continued to address her after his own marriage. Thomas Nash defined the general argument epigrammatically as “crueal chastity—the prologue Hope, the epilogue Despair.” But after Stella’s final refusal Sidney recovered his earlier serenity, and the sonnet placed by Mr. Pollard at the end of the series—“Leave me, O Love, which reachest but to dust”—expresses the triumph of the spirit.

Meanwhile he prosecuted his duties as a courtier and as member for Kent in parliament. On the 15th and 16th of May 1581 he was one of the four challengers in a tournament arranged in honor of the day, the day on which Gosson had dedicated to Sidney his School of Abuse, an attack on the stage, and incidentally on poetry. Sidney was probably moved by this treatise to write his own Apologie for Poeticr, dating from about 1581. In 1583 he was knighted in order that he might act as proxy for Prince John Casimir, who was to be installed as Knight of the Garter, and in the autumn of that year he married Frances, daughter of his friend and patron Sir Francis Walsingham, a girl of fourteen or fifteen years of age. In 1584 he met Giordano Bruno at the house of his friend Fulke Greville, and two of the philosopher’s books are dedicated to him.

Sidney was employed about this time in the translation from the French of his friend Du Plessis Mornay’s treatise on the Christian religion. He still desired active service and took an eager interest in the enterprises of Martin Frobisher, Richard Hakluyt and Walter Raleigh. In 1583 he was sent to France to console with Henry III. on the death of his brother, the duke of Anjou, but the king was at Lyons, and unable to receive the embassy. Sidney’s interest in the struggle of the Protestant princes against Spain never wavered. He recommended that Elizabeth should attack Philip II. in Spain itself. So keen an interest did he take in this policy that he was at Plymouth about to sail with Francis Drake’s fleet in its expedition against the Spanish coast (1583) when he was recalled by the queen’s orders. He was, however, given a command in the Netherlands, where he was made governor of Flushing. Arrived at his post, he constantly urged resolute action on his commander, the earl of Leicester, but with small result. In July 1586 he made a successful raid on Axel, near Flushing, and in September he joined the force of Sir John Norris, who was operating against Zutphen. On the 22nd of the month he joined a small force sent out to intercept a convoy of provisions. During the fight that ensued he was struck in the thigh by a bullet. He succeeded in riding back to the camp. The often-told story that he refused a cup of water in favour of a dying soldier, with the words, “Thy need is greater than mine,” is in keeping with his character. He owed his death to a quixotic impulse. Sir William Pelham happening to set out for the fight without greaves, Sidney also cast off his leg-armour, which would have defended him from the fatal wound. He died twenty-five days later at Arnhem, on the 17th of October 1586. The Dutch desired to have the honour of his funeral, but the body was taken to England, and, after some delay due to the demands of Sidney’s creditors, received a public funeral in St. Paul’s Cathedral on the 16th of February 1587.

Sidney’s death was a personal grief to people of all classes. Some two hundred elegies were produced in his honour. Of all these tributes the most famous is Astrophel, A Pastoral Elegie, added to Edmund Spenser’s Calvin Cloud’s Come Home Again (1595). Spenser wrote the opening poem; other contributors are Sidney’s sister, the countess of Pembroke, Lodowick Bryskett and Matthew Roydon. In the bare enumeration of Sidney’s achievements there seems little to justify the passionate admiration he excited. So calm an observer as William of Orange desired Fulke Greville to give Elizabeth “his knowledge and opinion of a fellow-servant of his, that (as he heard) lived unemployed under her. . . . If he could judge, her Majesty had one of the ripest and greatest counsellors of estate in Sir Philip Sidney, that this day lived in Europe” (Fulke Greville, Life of Sidney, ed. 1856, p. 21). His fame was due first of all to his strong, radiant and lovable character. Shelley placed him in Adonais among the “inheritors of unfilled renown,” as “sublimely mild, a spirit without spot.”

Sidney left a daughter Frances (b. 1584), who married Roger Manners, earl of Rutland. His widow, who, in spite of the strictures of some writers, was evidently sincerely attached to him, married in 1590 Robert Devereux, second earl of Essex, and, after his death in 1601, Richard de Burgh, earl of Claricarde.

Sidney’s writings were not published during his lifetime. A Work concerning the treaunce of the Christian Religion, translated from the French of Du Plessis Mornay, was completed and published by Arthur Golding in 1587. The Countesse of Pembroke’s Arcadia written by Hippie Sidney (1593). In 1593 and 1595, two folio editions of Sidney’s famous romance.1 A folio edition, issued in 1593, is stated to have been revised and rearranged by the countess of Pembroke, for whose deletion the romance was written. She was charged to destroy the work sheet by sheet as it was sent to her. The circumstances of its composition partly explain the difference between its intricate sentences, full of far-fetched conceits, repetition and antithesis, and the simple and dignified phrase of the Apologie for Poetrie. The style is a concession to the fashionable taste in

1 For a bibliography of this and subsequent editions see the facsimile reprint (1891) of this quarto, edited by Dr Oscar Sommer.
Correspondence of Sir Philip Sidney and Hubert Langston was translated from the Latin and published with a memoir by Steuart A. Pears (1845). The best biography of Sidney is A Memoir of Sir Philip Sidney by H. R. Fox Bourne (1862). A revised life by the same author is included in the "Heroes of the Nations" series (1851). Critical appreciation is available in J. A. Symonds's Sir Philip Sidney (1886), in the "English Men of Letters" series; in J. A. J. Symonds's English Novel in the Time of Shakespeare (1890); and in modern editions of Sidney's works. Mr. A. W. Pollard's edition (1888) of Astrophel and Stella, Professor Arber's reprint (1868) of An Apology for Poetrie, and Mr. Sidney Lee's Introduction to the Poems of Sir Philip Sidney, includes Arber's English Garner, where the sources of Sidney's sonnets are fully discussed. See also a collection of Sidenianas printed for the Roxburghe Club in 1857, a notice by Mrs Humphry Ward in Ward's English Poets, and a dissertation by Dr. R. Brunhuber, Sir Philip Sidney's Arcadia and ihre Nachklauser (Nürnberg, 1903). A complete text of Sidney's prose and poetry, edited by Albert Feuillerat, is to be included in the Cambridge English Classics.

SIDNEY, a city and the county-seat of Shelby county, Ohio, U.S.A., on the Miami river, about 33 m. S. by W. of Lima. Pop. (1890) 48,590; (1900) 56,889, including 282 foreign-born and 180 negroes; (1910) 66,077. Sidney is served by the Cleveland, Cincinnati, Chicago & St Louis, the Cincinnati, Hamilton & Dayton, and the Western Ohio (electric) railways. The city is situated on an elevated tableland, in an agricultural region. Sidney has a public library, and a monumental building, a memorial, erected in 1875, to the soldiers in the American Civil War, and now devoted to various public uses, is situated here. The city has various manufactures. Sidney was laid out as the county-seat in 1819, was incorporated as a village in 1831 and first chartered as a city in 1867.

SIDON (Phoen. סידון, Hebrew סדון, Assyr. سدوم, Egypt. Σιδών), formerly the principal city of Phoenicia, now a small town of about 15,000 inhabitants, situated on the Syrian coast between Beirut and Sûr (Tyre). The name, which the Arabs now pronounce Saïda, has been explained as meaning "fish-town" (cf. Heb. סד "to hunt," in Phoen. perhaps "to fish"); more likely it is connected with the god Sid, who is known by the Syrians as Ish-dûlu, and here in the extreme of this begins a series of small rocks enclosing the harbour, which is a very bad one. The port was formerly protected on the north by the Qal'at el-Bârû ("Sea Castle"), a building of the 13th century, situated on an island still connected with the mainland by a bridge. On the S. side of the town lay the so-called Egyptian harbour, which was filled up in the 17th century in order to keep out the Turks. The wall by which Sidon is at present surrounded is pierced by two gates; at the southern angle, upon a heap of rubbish, stand the remains of the citadel. The streets are very narrow, and the buildings very insignificant; more prominent are some large caravanserais belonging to the period of Sidon's modern prosperity, and the large mosque, formerly a church of the knights of St John. The inhabitants support themselves mainly on the produce of their luxuriant gardens; but the increasing trade of Beirut has withdrawn the bulk of the commerce from Sidon. In earlier days Phoenicia produced excellent wine, that of Sidon being specially esteemed; it is mentioned in an Aramaic papyrus from Egypt (4th century b.c., N.S.I. p. 213). One of the chief industries of Sidon used to be the manufacture of glass from the glass sand of the district, which is now almost extinct. The sea-farers of the town lies the Phoenician necropolis, which has been to a great extent investigated. The principal finds are sarcophagi, and next to these sculptures and paintings. It was here that the superb Greek

literature which the courtiers may reasonably be supposed to have shared; but Sidney himself, although he was no friend to euphuiism, was evidently indulging his own mood in this highly decorative prose. The main thread of the story relates how the princes Musilus and Pyrocles, the latter disguised as a woman, Zelman, woo the princesses Pamela and Philoeca, daughters of Basilius and Gynacia, king and queen of Arcady. The shepherds and shepherdesses occupy a humble place in the story. Sidney used a pastoral setting for a romance of chivalry complicated by the elaborate intrigue of Spanish writers. Nor are these intrigues of a purely innocent and pastoral nature. Sidney described the passion of love in many aspects, and the guilty queen Gynacia is a genuine tragic heroine. The loose framework of the romance admits of descriptions of tournaments, Elizabethan palaces and gardens and numerous fine speeches. It also contains some lyrics of much beauty. Charles I. recited and copied out shortly before his death Pamela's prayer, which is printed in the Eikon Basilike. Milton reproached him in the Eikonoklastes with having "borrowed to a Christian use prayers offered to a heathen god... and that in no serious book, but in the vain amorous poem of Sir Philip Sidney's Arcadia." Professor Courthouse (Hist. of English Poetry, i. 215) points out that the tragedy of Sidney's life, the divorce between his ideals of a noble active life and the enforced idleness of a courtier's existence, is intimately connected with his position. His life is briefly recognized as being contrary to the order of existence. Sidney's wide acquaintance with European literature is reflected in this book, but he was especially indebted to the Arcadia of Jacopo Sannazzaro, and still more to George Montemayor's imitation of Sannazzaro, the Diana Emamorada. The artistic defects of the Arcadia in no way detracted from its popularity. Both Shakespeare and Spencer were evidently acquainted with it. John Day's Ile of Gales, and the plots of Beaumont and Fletcher's Cupid's Revenge, and of James Shirley's Arcadia, were derived from it. The book had more than one supplement, Gervase Markham, Sir Richard Astrophel and Stella (earl of Stirling) and Richard Belling wrote continuations.

The series of sonnets to Stella were printed in 1591 as Sir P.S.: His Astrophel and Stella, by Thomas Newman, with an introductory epistle by T. Nash, and some sonnets by other writers. In the same year Newman issued another edition with many changes in the text and without Nash's preface. His first edition was (probably later) reprinted by Matthew Lownes. In 1598 the sonnets were reprinted in the folio edition of Sidney's works, entitled from its most considerable item The Countesse of Pembroke's Arcadia, edited by Lady Pembroke, with considerable additions. The sonnets are placed in their proper position among the sonnets, instead of being grouped at the end, and two of the most personal poems (possibly suppressed out of consideration for Lady Rich in the first instance), which afford the best key to the interpretation of the series, appear for the first time. Sidney's sonnets adhere more closely to French than to Italian models. The octave is generally fairly regular on two rhymes, but the sextet usually terminates with a couplet. The Apologie for Poetrie was one of the "additions" to the countess of Pembroke's Arcadia (1598), where it is entitled "The Countesse of Pembroke's Arcadia, as it was first presented by the author, in 1594 (unique copy in the Rawford Library, reprint 1904, Camb. Univ. Press). Sidney takes the word "poetry" in the wide sense of any imaginative work, and deals with its various divisions. Apart from the subject matter, which is interesting enough, the book has a great value for the simple, direct and musical prose in which it is written. The Psalms of David, the paraphrase in which he collaborated with his sister, remained in MS. until 1825, when it was edited by S. W. Singer. A translation of part of the Divine Service of G. Salluste du Bartas is lost. There are two pastoral romances and two by Sidney in Davison's Poetical Episcopacy (1602).

Letters and Memorials of State... (1746) is the title of an invaluable collection of letters and documents relating to the Sidney family, transcribed from originals at Penshurst and elsewhere by Arthur Collins. Fulke Greville's Life of the Renowned Sir Philip Sidney is a panegyric dealing chiefly with his public career.
SIEBENGEBIRGE—SIEDLCE

sarcophagi, which are now in the Imperial Museum at Constantinople, were found, and the sarcophagi of the two Sidonian kings Eshmunazar (Louvre) and Tabnith (Imperial Museum, Constantinople), both of them with important Phoenician inscriptions.

The ancient history of Sidon is discussed in the article PHOENICIA. In A.D. 325 a bishop of Sidon attended the Council of Nicaea. In 639–638 the town was taken by the Arabs. During the Crusades it was alternately in the possession of the Franks and the Mahommedans, but finally fell into the hands of the latter in 1291. As the residence of the Druse Amir Fakhr ud-Din, it rose to some prosperity about the beginning of the 17th century, but towards the close of the 18th its commerce again passed away and has never returned. The biblical references to Sidon are Gen. x. 13 (the people), xil. 13; Ezek. xxvii. 8; Acts xxvii. 3. Sidon is nearly as often mentioned along with Tyre—Jer. xvii. 3, xvii. 4; Ezra iii. 7; Joel iii. 4; Mark iii. 8 and Luke vii. 17; Mark xvii. 24, 31, and Matt. xv. 23; Matt. xi. 21 and Luke x. 13 f.; Acts xii. 20. In the Old Testament, as frequently in Greek literature, "Sidonians" is used not in a local but in an ethnic sense, and means "Phoenicians," hence the name of Sidon was familiar to the Greeks earlier than that of Tyre, though the latter was the more important city (ed. Meyer, Encycl. Bibl. col. 4505).

See Worsaesch., Zeitschr. jr. ii. 475; Prutz, Aus Phönizien (1876), 98 f.; Piechschmidt, Gesch. d. Phönizier (1889), 55–58; Hamdy Bey and T. Reinach, Nécropole royale à Sidon (1892–1896); A. Socin in Baeelder, Pat. u. Syrien. (G. A. C.)

SIEBENGEBIRGE ("The Seven Hills"), a cluster of mountains in Germany, rising to the height of 6 m. above Bonn. They are of volcanic origin, and form the north-western spurs of the Westerwald. In no part of the Rhine valley is the scenery more attractive; crag and forest, deep dells and gentle vine-clad slopes, ruined castles and extensive views over the broad Rhine and the plain beyond combine to render the Siebengebirge the most famous tourist resort on the whole Rhine. The hills are as follows: the steep Drachenfels (1067 ft.), abutting on the Rhine and surrounded by the ruins of an old castle; immediately behind it, and connected by a narrow ridge, the Wolkenburg (1076 ft.); lying apart, and to the N. of these, the Petersberg (1066 ft.), with a pilgrimage chapel of St. Peter; then, to the S. of these, three a chain of four—viz. the Ölberg (1522 ft.), the highest of the range; the Lövenberg (1060 ft.); the Lohrberg (1444 ft.), and, farthest away, the Nonnenstromberg (1107 ft.). At the foot of the Drachenfels, on the north side, lies the little town of Königswinter, whence a mountain railway ascends to the summit, and a similar railway runs up the Petersberg. The ruins which crown almost every hill are those of strongholds of the archbishops of Cologne and mostly date from the 12th century. Slightly overgrown with forest is das Siebengebirge (Bonn, 1861); von Stürtz, Führer durch das Siebengebirge (Bonn, 1893); Laspeyres, Das Siebengebirge am Rhein (Bonn, 1901).

SIEBOLD, CARL THEODOR ERNST VON (1804–1885), German physiologist and zoologist, the son of a physician and a descendant of what Loren Zeken called the "Asclepiad family of Siebolds," was born at Würzburg, Germany, on the 17th of February 1806. He studied medicine and natural science at Würzburg, and obtained his doctor's diploma in 1820. In 1822 he entered the service of the king of the Netherlands as medical officer to the East Indian Army. On his arrival at Batavia he was attached to a new mission to Japan, sent by the Dutch with a view to improve their trading relations with that country. Siebold was well equipped with scientific apparatus, and he remained in Japan for six years, with headquarters at the Dutch settlement on the little island of Deshima. His medical qualifications enabled him to find favour with the Japanese, and he gathered a vast amount of information concerning a country then very little known, especially concerning its natural history and ethnography. He had comparatively free access to the interior, and his reputation spreading far, and wide brought him visitors from all parts of the country. His valuable stores of information were enriched by trained natives whom he sent to collect for him in the interior. In 1824 he published De historiae naturalis in Japonia statu and in 1832 his splendid Flora Japonica. His knowledge of the language enabled him also in 1826 to issue from Batavia his Epitome linguæ Japonicae. In Deshima he also laid the foundation of his Catalogus librorum Japonicorum et Isagoge in bibliothece Japonica, published after his return to Europe, as was his Bibliotheca Japonica, which, with the co-operation of J. Hoffmann, was appeared at Leiden in 1833. During the visit which he was permitted to make to Yedo (Tokyo), Siebold made the best of the rare opportunity; his zeal, indeed, outran his discretion, since, for obtaining a native map of the country, he was thrown into prison and compelled to quit Japan on the 1st of January 1830. On his return to Holland he was raised to the rank of major, and in 1842 to that of colonel. After his arrival in Europe he began to give to the world the fruits of his researches and observations in Japan. His Nippon; Archiv zur Beschreibung von Japan und dessen Neben-und Schutz-Ländern was issued in five quarto volumes of text, with six folio volumes of atlas and engravings. He gave in this work many fragrant fragments of the interesting history of the science and arts of Japan. In 1834 he published at Leiden Urkundliche Darstellung der Bestrebungen Niederlands und Russlands zur Eröffnung Japans. In 1859 Siebold undertook a second journey to Japan, and was invited by the emperor to his court. In 1861 he obtained permission from the Dutch government to enter the Japanese service as negotiator between Japan and the powers of Europe, and in the same year his eldest son was made interpreter to the English embassy at Yedo. Siebold was, however, soon obliged by various intrigues to retire from his post, and ultimately from Japan. Returning by Java to Europe in 1865, he set up his ethnographical collections, which were ultimately secured by the government of Bavaria and removed to Munich. He continued to publish papers on various Japanese subjects, and received honours from many of the learned societies of Europe. He died at Munich on the 18th of October 1866.

See biography by Moritz Wagner, in Allgemeine Zeitung, 13th to 16th of November 1866.

SIEDEM (Russian Sydylësc), a government of Russian Poland, between the Vistula and the Bug, having the governments of Wawez on the W., Lomza on the N., Grodné and Volhynia on the N.E., and Radzywol on the S.E. In 1841 it contained 15533 sq. m. The surface is mostly flat, only a few hilly tracts appearing in the middle, around Biala, and in the east on the banks of the Bug. Extensive marshes occur in the north and in the south-east. Cretaceous, Jurassic and Tertiary strata cover the surface, and are overlain by widely spread Glacial deposits. The valley of the Vistula is mostly wide, with several terraces covered with sand-dunes or peat-bogs. Siedem is drained by the Vistula, which borders it for 50 m. on the west; by the Bug, which is navigable from Opalin in Volhynia and flows for 170 m. on the south and north-east borders; by the Wipja, a tributary of the Vistula, which is also navigable, and flows for 25 m. along the southern boundary; and by the Liwiec, a tributary of the Bug, which is navigable for some 30 m. below Wegrów. Of the total area only 2–2% is unproductive; 481% is under crops and 17–2 under meadows and pasture land. The estimated
population in 1906 was 607,700. The inhabitants consist of Little Russians (49%), Poles (43%), Jews (15%) and Germans (1%). The town is divided into nine districts, the chief towns of which are the capital Sielce, Biela, Konstaninow, Garwolin, Lukow, Radzyn, Sokolow, Wegrów, Włodawa. The main occupation is agriculture, the principal crops being rye, wheat, oats, barley and potatoes. The area under forests amounts to 19.6% of the total. Live-stock breeding is second in importance to agriculture. Manufactures and trade are insignificant.

SIELCE, a town of Russia, capital of the government of the same name, 56 m. E.S.E. of the city of Warsaw, on the Brest-Litovsk railway. It is a Roman Catholic diocese and has a large number of Jews, to whom it belonged, have embellished it with a palace and gardens; but it is nothing more than a large village. Pop. 23,714 (1897), two-thirds Jews.

SIEGBURG, a town of Germany, in the Prussian Rhine Province, on the river Sieg, 16 m. by rail S.E. of Cologne by the railway to Giessen. Pop. (1905) 14,878. It has a royal shell factory, calico-printing mills, lignite mines, stone quarries and pottery and tobacco factories. The parish church, dating from the 13th century, possesses several richly decorated reliquaries of the 12th to 19th centuries. The buildings of the Benedictine abbey, founded in 1166, are now used as a prison. The town, which was founded in the 11th century, attained the height of its prosperity in the 16th and 17th centuries owing to its pottery wares. Siegburg pitchers (Siegburger Kräge) were widely famed. Their shape was often fantastic and they are now eagerly sought by collectors.

See R. Heinekamp, Sieburgs Vergangenheit und Gegenwart (Sieburg, 1897); and Renard, Die Künstlermünder des Siegkreises (Düsseldorf, 1907).

SIEGE (O. Fr. siege, siege, mod. siege, seat, ultimately from sedere, to sit, cf. Class. Lat. obdībium, a siege), the "sitting down of an army or military force before a fortified place for the purpose of taking it, either by direct military operations or by starving it into submission (see FORTIFICATION and SIEGECRAFT). A special form of coin is known as a "sieve-piece." These are coins that were struck during a siege of a town when the ordinary mints were closed or their issues were not available. Such coins were commonly of special shape to distinguish them from the normal coinage, and were naturally of rough workmanship. A common shape for the siege pieces which were issued during the Great Rebellion was the lozenge. A noteworthy example is a shilling siege-piece struck at Newark in 1645 (see TOKEN MONEY).

SIEGEN, a town of Germany, in the Prussian province of Westphalia, situated 63 m. E. of Cologne by rail, on the Sieg, a tributary entering the Rhine opposite Bonn. Pop. (1905) 25,201. The town contains two palaces of the former princes of Nassau-Siegen, a technical and a mining school. The surrounding district, to which it gives its name, abounds in iron-mines, and iron founding and smelting are the most important branches of industry in and near the town. Large tanneries and leather works, and factories for cloth, paper and machinery, are among the other industrial establishments.

Siegens was the capital of an early principality belonging to the house of Nassau. In 1606, on the death of the last of the line of Nassau-Siegen, Napoleon incorporated Siegen in the grand-duchy of Berg in 1806; and in 1815 the congress of Vienna assigned it to Prussia, under whose rule it has nearly quintupled its population. Rubens is said to have been born here in 1577.

See Cuno, Geschichte der Stadt Siegen (Dillenburg, 1873).

SIEMENS, ERNST WERNER VON (1816-1892), German electrician, was born on the 13th of December 1816 at Lenthe in Hanover. After attending the gymnasium at Lübeck, he entered the Prussian army as a volunteer, and for three years was a pupil in the Military Academy at Berlin. In 1838 he received a commission as lieutenant in the artillery, and six years later he was appointed to the responsible post of superintendent of the artillery workshops. In 1848 he had the task of protecting the port of Kiel against the Danish fleet, and as commandant of Friedrichsort built the fortifications for the defence of Eckernförde harbour. In the same year he was entrusted with the laying of the first telegraph line in Germany, that between Berlin and Frankfort-on-Main, and with that work his military career came to an end. Thenceforward he devoted his energies to furthering the interests of the newly founded firm of Siemens and Halske, which under his guidance became one of the most important electrical undertakings in the world, with branches in different countries that gave it an international influence; in the London house he was associated with Sir William Siemens, one of his younger brothers. Although he had a decided predilection for pure research, his scientific work was naturally of a large extent by the demands of his business, and as he said when he was admitted to the Berlin Academy of Sciences in 1874, the filling up of scientific voids presented itself to him as a technical necessity. Considering that his entrance into commercial life was almost synchronous with the introduction of electric telegraphy into Germany, it is not surprising that many of his inventions and discoveries relate to telegraphic apparatus. In 1847, when he was a member of the committee appointed to consider the adoption of the electric telegraph by the government, he suggested the use of gutta-percha as a material for insulating metallic conductors. Then he investigated the electrostatic charges of telegraph conductors and their laws, and established methods for testing underground and submarine cables and for locating faults in their insulation; further, he carried out observations and experiments on electrostatic induction and the retardation it produced in the speed of the current. He also devised apparatus for duplex and diplex telegraphy, and automatic recorders. In a somewhat less specialized sphere, he was an early advocate of the desirability of establishing some easily reproducible basis for the measurement of electrical resistance, and suggested that the unit should be taken as the resistance of a column of pure mercury one metre high and one square millimetre in cross-section, at a temperature of 0° C. Another task to which he devoted much time was the construction of a selenium photometer, depending on the property possessed by that substance of changing its electrical resistance according to the intensity of the light falling upon it. He also claimed to have been, in 1866, the discoverer of the principle of self-excitation in dynamo-electric machines, in which the residual magnetism of the iron of the electro-magnets is utilized for excitation, without the aid of permanent steel magnets or of a separate exciting current. In another branch of science he wrote several papers on meteorological subjects, discussing among other things the cause of the winds and the forces which regulate and maintain and retard the motions of the air. In 1886 he devoted half a million marks to the foundation of the Physikalisch-Technische Reichsanstalt at Charlottenburg, and in 1888 he was ennobled. He died at Berlin on the 6th of December 1892. His scientific memoirs and addresses were collected and published in an English translation in 1892, and three years later a second volume appeared, containing his technical papers.

SIEMENS, SIR WILLIAM [KARL WILHELM] (1823-1883), British inventor, engineer and natural philosopher, was born at Lenthe in Hanover on the 4th of April 1823. After being educated at the polytechnic school of Magdeburg and the University of Göttingen, he visited England at the age of nineteen, in the hope of introducing a process in electroplating invented by himself and his brother Werner. The invention was adopted by Messrs Elkington, and Siemens returned to Germany to enter as a pupil the engineering works of Count Stollberg at Magdeburg. In 1844 he was again in England with another invention, the "chronometric" or differential governor for steam engines. Finding that British patent laws afforded the inventor a protection which was then wanting in Germany, he thenceforth made England his home; but it was not till 1859 that he formally became a naturalized British subject. After some years spent in active invention and experiment at mechanical works near Birmingham, he went into practice as an engineer in 1851. He laboured mainly in two distinct fields, the applications of heat and the applications of electricity, and was characterized
in a very rare degree by a combination of scientific comprehension with practical instinct. In both fields he played a part which would have been great in either alone; and, in addition to this, he made further important and previously unannounced improvements in the electrical dynamo and device without the knowledge of any former inventor. Scientific papers sufficient in themselves to have established a reputation. His position was recognized by his election in 1862 to the Royal Society, and later to the presidency of the Institution of Mechanical Engineers, the Society of Telegraph Engineers, the Iron and Steel Institute, and the British Association; by honorary degrees from the universities of Oxford, Glasgow, Dublin and Würzburg; and by knighthood (in 1883). He died in London on the 19th of November 1883.

In the application of heat Siemens's work began just after J. P. Joule's experiments had placed the doctrine of the conservation of energy in its final form. While Rayleigh, Richardson and others were developing the dynamical theory of heat as a matter of physical and engineering theory, Siemens, in the light of the new ideas, made a bold attempt to improve the efficiency of the steam engine as a converter of heat into mechanical work. Taking up the regenerator—a device invented by Robert Stirling twenty years before, the importance of which had meanwhile been ignored—he applied it to the steam engine in the form of a regenerative condenser with some success in 1843, and in 1855 engines constructed on Siemens's plan were worked at the Paris exhibition. Later he also attempted to apply the regenerator to internal combustion or gas engines. In 1850 he produced a working model of the 'ideal engine' of Heinrich Friedrich (1826–1904), with whom he associated himself in directing its applications. In an ordinary furnace a very large part of the heat of combustion is lost by being carried off in the hot gases which pass up the chimney, and Siemens proposed to run the hot gases through a regenerator, or chamber stacked with loose bricks, which absorb the heat. When the bricks are well heated the hot gases are diverted so as to pass through another similar chamber, while the air necessary for combustion, before it enters the furnace, is made to traverse the heated chamber, taking up as it goes the heat which has been stored in the bricks. After a suitable interval the air currents are reversed, and the process is repeated periodically, with the result that the products of combustion escape only after being cooled, the heat which they take from the furnace being in great part carried back in the heated air. But another invention was required before the furnace could be employed in an ordinary factory. This was the use of gaseous fuel, produced by the crude distillation and incomplete combustion of coal in a distinct furnace or gas-producer. From this the gaseous fuel passes by a flue to the regenerative furnace, and, as well as the entering air, is heated by the regenerative method, four brick-stacked chambers being used instead of two.

The complete invention was applied at Chance's glass-works in Birmingham in 1861, and furnished the subject of Faraday's farewell lecture to the Royal Institution. It was soon applied to many industrial processes, but it found its greatest development a few years later at the hands of Siemens himself in the manufacture of steel. To obtain steel of a higher quality than by hand-processes, Siemens wrought iron scrap with cast iron upon the open hearth, and was well known from the first, but it was not till 1867, after two years of experiment in the 'sample steel works' erected by himself, and in which he was paid for the results that he obtained. This product is known as exceptionally trustworthy quality, the use of which for boiler-plates has done much to make possible the high steam-pressures that are now common in British power stations. Siemens's invention was a house game to burn gas along with coke, which he regarded as a possible cure for city smoke.

An electricity Siemens's name is closely associated with the growth of land and submarine telegraphy, the invention and development of the dynamo, and the application of electricity to lighting and to locomotion. In 1866, with his brother Werner, he invented the electric light lamp, and in 1867 he communicated a paper to the Royal Society "On the Conversion of Dynamical into Electrical Force without the aid of Permanent Magnetism," in which he announced the invention of what became the Siemens lamp. This lamp is a light from a lamp by which the action of the first and other cables were laid. One of the last of his and he was the motor and high-speed car for the Porvoo and Rovaniemi electric tramway, in the north of Ireland, opened in 1883, where the water-power of the river Bush drives a Siemens dynamo, from which the electric energy is in the form of the same as ordinary telegraphy, and which is employed in metal refractory metals. Another of the uses to which he turned electricity was to convert the light of a candle or lamp as a substitute for the light of a candle or lamp as a substitute for the light of the conventional substance and lightening the growth of plants. Among his miscellaneous inventions were the differential governor already alluded to, and a highly scientific modification of it, described to the Royal Society in 1866; a water-meter which acts on the principle of counting the number of turns made by a small reaction turbine through which the supply of water flows; an electric thermometer and pyrometer, in which temperature is determined by its effect on the electrical conductivity of metals; an attraction meter for determining very slight variations in the intensity of a gravity; and the bathometer, by which he applied this idea to the problem of finding the depth of the sea. The last instrument was read before the Royal Society in 1882, "On the Conservation of Solar Energy," he suggested a bold but unsatisfactory theory of the sun's heat, in which he sought to trace on a cosmic scale an action similar to that of the regenerative furnace. His fame, however, does not rest on his contributions to pure science, valuable as some of these were. His strength lay in his grasp of scientific principles, in his skill to perceive where and how they could be applied to practical affairs, in his zeal and instant pursuit of thought with action, and in the indomitable persistence with which he clung to any basis of effort that seemed to him theoretically sound, and to the style in which he set store on them. He was a man of great force, a man of great power, a man who got at his work.
magnificence of the uncompleted design, which would have produced one of the largest churches in the world.

The central west front, of terracotta, enriched with a multitude of columns, statues and inlaid marbles, is said to have been begun by Giovanni Pisano, but really dates from after 1370; it was finished in 1380, and closely resembles the façade of Orvieto in style and in the approximate periods of the various buildings. Both façades have been recently restored, and the effect of them not altogether improved by modern alterations. The fine Romanesque campanile belongs to the first half of the 13th century and is adorned with bas-reliefs which are described in the original style.

The magnificent Palazzo Pubblico, the seat of the communal government, was begun in 1297 and 1295), is decorated with statues and frescoes representative of Italian civil life at the end of the 13th century. The upper story contains the famous frescoes of scenes from the life of the latter pontiff, and the collection of choir books (supported on sculptured desks) with splendid illuminations by Sienese and other artists. The church of San Domenico, the church of St Anthony by Spinello Aretino (1330), is one of the noblest examples of that century's architecture, and is approached by an outer flight of marble steps built in 1451. It has a beautiful but incomplete façade designed by Giovanni di Mino del Pelliccio in 1382, and a marvellous font with bas-reliefs by Taddeo di Bartolo. But the church is more admired for the magnificent works of the epoch. The Opere del Duomo contains Duccio's famous Madonna, painted in 1308-1311, and other works of art.

Among the other buildings, the Palazzo Pubblico of Provenzano, a vast baronial residence, the building of some elegance, designed by Schifardi (1504); Sant' Agostino, rebuilt by Vanvittelli in 1755, containing a Crucifixion and Saints by Perugino, a Massacre of the Innocents by Mantegna (1510); the church of San Domenico, begun by the middle of the 13th century, is adorned with the celebrated statue of St Anthony by Spagnolletto (?); the beautiful church of the Servites (15th century), which contains another Massacre of the Innocents by Matteo di Giovanni and other good examples of the Sienese school; San Domenico, a church of fine architecture, 11th century, which was not only restored, but which has also been adorned with many fine paintings by Duccio Buoninsegna, Lorenzetti, Sodoma and Beccafumi, some of which perished in the great fire of 1655; San Domenico, a fine 13th century church, built in the thirteenth century.

The communal palace in the Piazza del Campo was begun in 1258 and finished in 1309. It is built of brick, a fine specimen of Pointed Gothic, was designed by Agostino and Agnolo. The light and elegant tower (Torre del Mangia) soaring from one side of the palace was begun in 1338 and finished after 1348, and the chapel standing at its foot, raised at the expense of the Opera del Duomo a public thank-offering after the plague of 1348, begun in 1352 and completed in 1376. This grand old palace has other attractions besides the beauty of its architecture, for its interior is lined with works of art. The atrium has a fresco by Bartolo di Fredi and the two ground-floor halls are decorated with the frescoes of the Magi by Sodoma, and the splendid Resurrection by Sodoma. In the Sala dei Nove or della Pace above are the noble allegorical frescoes of Ambrogio Lorenzetti representing the effects of just and equitable government and those of Overture, which yield some of the charm of other works of the palace. In the Sala dei Ballestri or del Mappamento is painted by Simone di Martino (Memmi) and others, the Cappella della Signoria by Taddeo di Bartolo, and the Sala del Consistorio by Beccafumi. Another hall, the Sala della Proserpina, contains frescoes (1461) painted by Sodoma from the life of Pope Alexander III., while yet another has been painted by local artists with episodes in recent Italian history. An interesting exhibition of Sienese art, including many objects from museums and churches, was opened at the Palace in 1904, and the whole of the grand council, built in 1327, was converted into the chief theatre of Siena by Riccio in 1590, and, after being twice burnt, was restored by Giorgio Vasari in 1564. The Galeria dei Consoli, or picture gallery, that of the Rezzu, in Piazza San Pellegrino, designed by A. Dovieri and erected in 1816, although modern, has an historic interest as the work of an academy dating from the 16th century, the called the Congregazione, that played an important part in the history of the Italian comic stage.

The city is adorned by many other noble edifices both public and private, among which the following palaces may be mentioned—

Toleomi (1205); Buonsignori, formerly Tegliachi, an elegant 14th-century construction, restored and the home of the residence of the captain of war, recently restored in its original style; Sanseledoni; Marsili; Piccolomini, now belonging to the Government and containing the state archives; Palazzo delle Pappe, like the other Piccolomini mansion designed by Bernardo Rossellino, and now the Banca d' Italia; the enormous block of the Monte de' Paschi, a bank of considerable wealth and antiquity, enlarged out of part partly in the original style, and, in the other fine buildings. We may also mention the two celebrated fountains, Fonte Gaia and Fontebranda; the former, in the Piazza del Campo, the latter, in the Piazza della Honora (1444); and the fountain of the Colonna decorated with the works of various artists, in the Piazza d'Armi.

The most remarkable are the narrow Sienese streets with their many windings and steep ascents, which form a picturesque charm, and, together with the collections of excellent paintings, foster the local pride of the inhabitants and preserve their taste and feeling for art. The medieval city was in the main preserver. The ruined Cistercian abbey of S. Galgano, founded in 1201, with its fine church (1240-1268) is interesting and imposing. It lies some 20 m. south-west of Siena.

History.—Siena was probably founded by the Etruscans (a few tombs of that period have been discovered), or by Camilla, and then, following under the Roman rule, became a part of the empire of Augustus, or a little earlier, and was distinguished by the name of Sienna Juta. It has the same arms as Rome—the she-wolf and twin. But its real importance dates from the middle ages. Few memorials of the Roman era exist of the first centuries of Christianity have been preserved (except the legend of St Ansanus), and none at all of the interval preceding the Lombard period. We have documentary evidence that in the 7th century in the reign of Rotari (or Rotari), there was a bishop of Siena named Mauro. Attempts to trace earlier bishops as far back as the 5th century have yielded only vague and contradictory results. Under the Lombards the civil government was in the hands of a gastaldo, under the Carolingians of a count, whose authority, by slow degrees and a course of events similar to what took place in other Italian communities, gave way to that of the bishop, whose power in turn gradually diminished and was superseded by that of the consuls and the communes.

We have written evidence of the consular government of Siena from 1125 to 1212; the number of consuls varied from three to twelve. This government, formed of gentiluomini or nobles, did not remain unchanged throughout the whole period, but was gradually forced, except in the pebbles there or lower classes, whose efforts to rise to power were continuous and determined. Thus in 1337 they obtained a third part of the government by the reconstitution of the general council with 100 nobles and 50 popolani. In 1190 the institution of a foreign podestà (a form of government which became permanent in 1212) gave a severe blow to the consular magistracy, which was soon extinguished; and in 1233 the people again rose against the nobles in the hope of ousting them entirely from office.

The strife was largely economic, the people desiring to deprive the nobles of the immunity of taxation which they had enjoyed. The effort was not completely successful; but the government was now equally divided between the two estates by the creation of a supreme magistracy of twenty-four citizens—twelve nobles and twelve popolani. During the rule of the nobles and the mixed rule of nobles and popolani the commune of Siena was enlarged by fortunate acquisitions of neighbouring lands and by the submission of feudal lords, such as the Sciarangeli, Aldobrandesi, Pannocchieschi, Visconti di Campiglia, &c. in these are especially interesting the painted covers of the books of the birchera and gbeila, or revenue and account books. 1

There are, however, remains of baths some 1 m. to the east; see P. Piccolomini in Bulletin Sienese de storia patria, vi. (1899).
Before long the reciprocal need of fresh territory and frontier disputes, especially concerning Poggibonsi and Montepulciano, led to an outbreak of hostilities between Florence and Siena. Thereupon, to spite the rival republic, the Siensene took the Ghibelline side, and the Gominelli emperors, beginning with Frederick Barbarossa, rewarded their fidelity by the grant of various privileges.

During the 12th and 13th centuries there were continued disturbances, petty wars, and hasty reconciliations between Florence and Siena, until in 1254-1255 a more binding peace and alliance was concluded. But this treaty, in spite of its apparent stability, led in a few years to a fiercer struggle; for in 1258 the Florentines complained that Siena had infringed its terms by giving refuge to the Ghibellines they had expelled, and on the refusal of the Siensene to yield to these just remonstrances both states marched against each other. The three-months' campaign, which in the midst of a European war of alliances, Siena were to obtain from him a strong body of German horse, under the command of Count Giordano, and likewise sought the aid of its Ghibelline allies. Florence equipped a powerful citizen army, of which the original registers are still preserved in the volume entitled Il Libro di Montaperti in the Florence archives. This army, led by the podestà of Florence and twelveburger captains, set forth gaily on its march towards the enemy's territories in the middle of April 1260, and during its first campaign, ending on the 18th of May, won an insignificant victory at Santa Petronilla, outside the walls of Siena. But in a second and more important campaign, in which the militia of the other Gubbio towns of Tuscany took part, the Florentines were signally defeated at Montaperti on the 4th of September 1260. This defeat crushed the power of Florence for many years, reduced the city to desolation, and apparently annihilated the Florentine Guelphs. But the battle of Benevento (1266) and the establishment of the dynasty of Charles of Anjou on the Neapolitan throne put an end to the Ghibelline predominance in Tuscany. Ghibelline Siena soon felt the effects of the change in the defeat of its army at Colle di Valdelsa (1269) by the united forces of the Guelph exiles, Florentines and French, and the death in that battle of her powerful citizen Provenzano Salvani (mentioned by Dante), who had been the leading spirit of the government at the time of the victory of Montaperti. For some time Siena remained faithful to the Ghibelline cause; nevertheless Guelph and democratic sentiments began to make head. The Ghibellines were on several occasions expelled from the city, and, even when a temporary reconciliation of the two parties allowed them to return, they failed to regain their former influence.

Meanwhile the popular party acquired increasing power in the state. Exasperated by the tyranny of the Salimbeni and other patrician families allied to the Ghibellines, it decreed in 1277 the exclusion of all nobles from the supreme magistracy (consisting since 1270 of thirty-six instead of twenty-four members), and insisted that this council should be formed solely of Guelph traders and men of the middle class. This constitution was confirmed in 1280 by the reduction of the supreme magistracy to fifteen members, all of the humbler classes, and was definitively sanctioned in 1285 (and 1287) by the institution of the magistracy of nine. This council of nine, composed only of burghers, carried on the government for about seventy years, and its rule was sagacious and peaceful. The territories of the state were enlarged; a friendly alliance was maintained with Florence; trade flourished; in 1321 the university was founded, or rather revived, by the introduction of Bolognese scholars; the principal buildings now adorning the town were begun; and the charitable institutions, which are the pride of modern Siena, increased and prospered. But meanwhile the exclusiveness of the single class of citizens from whose ranks the chief magistrates were drawn had converted the government into a close oligarchy and excited the hatred of every other class. Nobles, judges, notaries and populace rose in frequent revolt, while the nine defended their state (1305-1306) by a strong body of citizen militia divided into terzi (sections) and contrade (wards), and violently repressed these attempts. But in 1355 the arrival of Charles IV. in Siena gave fresh courage to the malcontents, who, backed by the imperial authority, overthrew the government of the nine and substituted a magistracy of twelve drawn from the lowest class. These new rulers were to some extent under the influence of the nobles who had fomented the rebellion, but the latter were again soon excluded from all share in the government.

This was the beginning of a determined struggle for supremacy, carried on for many years, between the different classes of citizens, locally termed ordini or monesi—the lower classes striving to grasp the reins of government, the higher classes already in office striving to keep all power in their own hands, or to divide it in proportion to the relative strength of each monsi. As this struggle is of too complex a nature to be described in detail, we must limit ourselves to a summary of its leading episodes.

The twelve who replaced the council of nine (as these had previously replaced the sixty men of the emperor, who had ruled Siena as individuals and as a party)—of ignorant, incapable, turbulent men, who could neither rule the state with firmness nor confer prosperity on the republic. They speedily broke with the nobles, for whose manoeuvres they had at first been useful tools, and then split into two factions, one siding with the Tolomei, the other, the more restless and violent, with the Salimbeni and the novesi (partners of the nine), who, having still some influence in the city, probably fomented these dissensions, and, as we shall see later on, skillfully availed themselves of every chance likely to restore them to power. In 1368 the adversaries of the twelve succeeded in driving them by force from the public palace, and substituting a government of thirteen—ten nobles and three novesi.

This government lasted only twenty-two days, from the 2nd to the 24th September, and was easily overturned by the dominant faction of the dodici (partners of the twelve), aided by the Salimbeni and the populace, and favoured by the emperor Charles IV. The nobles were worsted, being driven from the city as well as from power; but the absolute rule of the twelve was brought to an end, and right of participation in the government was extended to another class of citizens. For, on the expulsion of the thirteen from the palace, a council of 124 plebeians created a new magistracy of twelve difensori (defenders), no longer drawn exclusively from the order of the twelve, but composed of five of the popolo minuto, or lowest populace (now first admitted to the government), four of the twelve, and three of the nine. But it was of short duration, for the dodici were ill satisfied with their share, and in December of the same year (1368) joined with the popolo minuto in an attempt to expel the three novesi from the palace. But the new popular order, which had already asserted its predominance in the council of the riformatori, now drove out the dodici, and for five days (11th to 16th December) kept the government in its own hands.

Then, when the emperor, who had left his court through Siena two months before on his way to Rome, and who was about to halt there on his return, it tried to conciliate its foes by creating a fresh council of 150 riformatori, who replaced the twelve defenders by a new supreme magistracy of fifteen, consisting of eight popolani, four dodici, and three novesi, entitled respectively "people of the greater number," "people of the middle number," and "people of the less number." From this renewal dates the formation of the new order or monte dei riformatori, the title henceforth bestowed on all citizens, of both the less and the greater people, who had reformed the government and begun to participate in it in 1368. The turbulent action of the twelve and the Salimbeni, being dissatisfied with these changes, speedily rose against the new government. This time they were actively aided by Charles IV., who, having returned from Rome, sent his militia, commanded by the imperial vicar Malatesta da Rimini, to attack the public palace. But the Siensene people, being called to arms by the council of fifteen, made a most determined resistance, routed the imperial troops, captured the standard, and confined the emperor in the Salimbeni palace. Thereupon Charles came to terms with the government, granted it an imperial patent, and left the city, consigned for his humiliation by the gift of a large sum of money.
In spite of its wide basis and great energy, the monte dei riformatori, the heart of the new government, could not satisfactorily cope with the attacks of adverse factions and treacherous allies. So, the better to repress them, it created in 1369 a chief of the police, with the title of esecutore, and a numerous association of popolani—the company or casata Grande of the people— as bulwarks against the nobles, who had been recalled from banishment, and who, though fettered by strict regulations, were now eligible for offices of the state. But the appetite for power of the “less people” and the dregs of the populace was whetted rather than satisfied by the installation of the riformatori in the principal posts of authority. Among the wool-carders—men of the lowest class, dwelling in the precipitous lanes about the Porta Ovile—there was an association styling itself the “company of the worm.” During the famine of 1371 this company rose in revolt, sacked the houses of the rich, invaded the public palace, drove from the council fifteen of the four members of the twelve and the three of the nine, and replaced them by seven tatterdemalions. Then, having withdrawn to its own quarter, it was suddenly attacked by the infuriated citizens (noveschi and dodici), who broke into houses and workshops and put numbers of the inhabitants to the sword without regard for age or sex. Thereupon the popular rulers avenged these misdeeds by many summary executions in the piazza. These disorders were only allayed by fresh changes in the council of the twelve, and now it was formed of twelve of the greater people and three noveschi, to the total exclusion of the dodici, who, on account of their growing turbulence, were likewise banished from the city.

Meanwhile the government had also to contend with difficulties outside the walls. The neighbouring lords attacked and ravaged the municipal territories; grave injuries were inflicted by the mercenary bands, especially by the Bretons and Gascons. The rival claims to the Neapolitan kingdom of Carlo di Durazzo and Louis of Anjou caused fresh disturbances in Tuscany. The Sienese government conceived hopes of gaining possession of the city of Montevarchi and Ovile (1358), but these were frustrated by Egidio and then by Enguerrand de Coucy for Louis of Anjou; but while the Sienese were nourishing dreams of conquest the French general unexpectedly sold the city to the Florentines, whose negotiations had been conducted with marvellous ability and dispatch (1384). The gathering exasperation of the Sienese, and notably of the middle class, against their rulers was brought to a climax by this cruel disappointment. Their discontent had been gradually swelled by various acts of home and foreign policy during the sixteen years’ rule of the riformatori, nor had the concessions granted to the partisans of the twelve and the new latter’s recall and renewedeligibility to office availed to conciliate them. At last the revolt broke out and gained the upper hand, in March 1385. The riformatori were ousted from power and expelled the city, and the trade of Siene suffered no little injury by the exile of so many artisan families. The fifteen were replaced by a new supreme magistracy of ten priors, chosen in the following proportions—four of the twelve, four of the nine, and two of the people proper, or people of the greater number, but to the exclusion of all who had shared in the government or sat in council under the riformatori. Thus began a new order or monachia, of which the first occupant by right was the pope, and then by riformatori, but having had no part in the government during the latter’s rule. But, though now admitted to power through the burgher reaction, as a concession to democratic ideas, and to cause a split among the greater people, they enjoyed very limited privileges.1

In 1387 fresh quarrels with Florence on the subject of Monte-pulciano led to an open war, that was further aggravated by the interference in Tuscan affairs of the ambitious duke of Milan, Gian Galeazzo Visconti. With him the Siene concluded an alliance in 1389 and ten years later accepted his suzerainty and resigned the liberties of their state. But in 1402 the death of Gian Galeazzo lightened their yoke. In that year the first plot against the Viscontian rule, hatched by the twelve and the Salimbene and fomented by the Florentines, was violently repressed, and caused the twelve to be again driven from office; but in the following year a special balia, created in consequence of that riot, annulled the ducal suzerainty and restored the liberties of Siene. During the interval the supreme magistracy had assumed a more popular form. By the partial readmission of the riformatori and exclusion of the twelve, the permanent balia was now composed of nine priors (three of the nine, three of the people, and three of the riformatori) and of a captain of the people to be chosen from each of the three monti in turn. On 11th April peace was made with the Florentines and Siene enjoyed a period of comparative prosperity.

But the great Western schism then agitating the Christian world again brought disturbance to Siene. In consequence of the decisions of the council of Pisa, Florence and Siene had declared against Gregory XII. (1409); Ladislaus of Naples, therefore, as a supporter of the pope, seized the opportunity to make incursions on Siene territory, laying it waste and threatening the city. The Sienese maintained a vigorous resistance till the death of this monarch in 1414 freed them from his attacks. In 1431 a fresh war with Florence broke out, caused by the latter’s attempt upon Lucca, and continued in consequence of the Florentines’ alliance with Venice and Pope Eugenius IV. till the end of 1433. This meeting is recorded by the memorial column still to be seen outside the Camollia gate. In 1435 hostilities against Florence were again resumed, on account of the invasions and ravages of Siene territory committed by Florentine troops in their conflicts with Alphonso of Naples, who since 1447 had made Tuscany his battle-ground. Peace was once more patched up with Florence in 1454. Siene was next at war for several years with Aklordanino Orsini, count of Pitigliano, and with Jacopo Piccolomini, and suffered many disasters from the treachery of its generals. About the same time the republic was exposed to still graver danger by the revolt of the Sienese with the duke of Milan and Sigismund, king of the Romans. This monarch halted at Siene on his way to Rome to be crowned, and received a most princely welcome. In 1453 the opposing leagued signed a treaty of peace, and, although it was disadvantageous to the Sienese and temptations to break it were frequently urged upon them, they faithfully adhered to its terms. During this period of comparative tranquillity Siene was honoured by the visit of Pope Eugenius IV. (1445) and by that of the emperor Frederick III., who came there to receive his bride, Eleanor of Portugal, from the hands of Bishop Aeneas Sylvius Piccolomini, his secretary and historian (1452). This meeting is recorded by the memorial column still to be seen outside the Camollia gate. In 1455 hostilities against Florence were again resumed, on account of the invasions and ravages of Siene territory committed by Florentine troops in their conflicts with Alphonso of Naples, who since 1447 had made Tuscany his battle-ground. Peace was once more patched up with Florence in 1454. Siene was next at war for several years with Aklordanino Orsini, count of Pitigliano, and with Jacopo Piccolomini, and suffered many disasters from the treachery of its generals. About the same time the republic was exposed to still graver danger by the revolt of the Sienese with the duke of Milan. But the plot came to light; its chief ringleaders were beheaded, and many others sent into exile (1456); and the death of Alphonso at last ended all danger from that source. During those critical times the government of the state was strengthened by a new executive magistracy called the balia, which from 1455 began to act independently of the priors or consistory. Until then it had been merely a provisional committee annexed to the latter. Its sphere of activity was that of maintaining the supreme government of the state, although always, down to the fall of the republic, nominally preserving the character of a magistracy extra-ordinary. The election of Aeneas Sylvius Piccolomini to the papal chair in 1458 caused the utmost joy to the Sienese; and in compliment to their illustrious fellow-citizen they granted the request of the nobles and readmitted them to a share in the government. But this concession, grudgingly made, only remained in force for a few years, and on the death of the pope (1464) was revoked altogether, save in the case of members of the Piccolomini house, who were deputed to be popolani and were allowed to retain all their privileges. Meanwhile fresh discord was brewing among the plebeians at the head of affairs.

The conspiracy of the Pazzi in 1478 led to a war in which Florence and Milan were opposed to the pope and the king of Naples, and which was put an end to by the peace of 13th
March 1480. Thereupon Alfonso, duke of Calabria, who was fighting in Tuscany on the side of his father Ferdinand, came to an agreement with Siena and, in the same way as his grandfather Alfonso, tried to obtain the lordship of the city and the recall of the exiled rebels in 1436. The noveschi (to whose order most of the rebels belonged) favoured his pretensions, and the riformatori were against him. Many of the people sided with the noveschi, rose in revolt on 22nd June 1480 and, aided by the duke's soldiery, reorganized the government to their own advantage. Dividing the power between their two orders of the nine and the people, they excluded the riformatori and replaced them by a new and heterogeneous order styled the aggregati, composed of nobles, exiles of 1436 and citizens of other orders who had never before been in office. But this violent and perilous upset of the internal liberties of the republic did not last long. A decree issued by the Neapolitan king (1482) depriving the Sienese of certain territories in favour of Florence entirely alienated their affections from that monarch. Meanwhile the monte of the nine, the chief promoters of the revolution of 1480, were exposed to the growing hatred and envy of their former allies, the monte del popolo, who, conscious of their superior strength and number, now sought to crush the noveschi and rise to power in their stead. This change of affairs was accomplished by a series of riots between 7th June 1482 and 20th February 1483. The monte del popolo seized the lion's share of the government; the riformatori were recalled, the aggregati abolished and the noveschi some directed the permanent annihilation of the popolo and the city. But in perpetuo was an empty form of words in those turbulent Italian republics. The noveschi, being "fat burghers" with powerful connexions, abilities and traditions, gained increased strength and influence in exile; and five years later, on 22nd July 1487, they returned triumphantly to Siena, dispersed the few adherents of the popolo who offered resistance, murdered the captain of the people, reorganized the state, and placed it under the protection of the Virgin Mary. And, their own predominance being assured by their numerical strength and influence, they accorded equal shares of power to the other parties.

Among the returned exiles was Pandolfo Petrucci, chief of the noveschi and soon to be at the head of the government. During the domination of this man (who, like Lorenzo de' Medici, was surnamed "the Magnificent") Siena enjoyed many years of splendour and prosperity. We use the term "domination" rather than "signory" inasmuch as, strictly speaking, Petrucci was never lord of the state, and left its established form of government intact; but he exercised despotic authority in virtue of his strength of character and the continued increase of his personal power. He based his foreign policy on alliance with the French and Pope Pius II, and the internal affairs of the state by means of the council (collegio) of the balia, which, although occasionally reorganized for the purpose of conciliating rival factions, was always subject to his will. He likewise added to his power by assuming the captainship of the city guard (1493), and later by pressing the impoverished commune of several outlying castles (1507). Nor did he shrink from deeds of bloodshed and revenge; the assassination of his father-in-law, Niccolò Borgesi (1500), was an indelible blot upon his name. He successfully withstood all opposition within the state, until he was at last routed in his struggle with Cosare Borgia, who caused his expulsion from Siena in 1502. But through the friendly mediation of the Florentines and the French king he was recalled from banishment on 26th March 1503. He maintained his power until his death at the age of sixty on 21st May 1512, and was interred with princely ceremonial at the public expense. The predominance of his family in Siena did not last long after his decease. Pandolfo had not the qualities required to found a dynasty such as that of the Medici. He lacked the lofty intellect of a Cosimo or a Lorenzo, and the atmosphere of liberty-loving Siena with its ever-changing factions was in no wise suited to him. His eldest son Federico Petrucci, who succeeded in 1512, was an unscrupulous, haughty and exceedingly corrupt; he only remained three years at the head of affairs and fled ignominiously in 1515. Through the favour of Leo X., he was succeeded by his cousin Raffaello Petrucci, previously governor of St Angelo and afterwards a cardinal.

This Petrucci was a bitter enemy to Pandolfo's children. He caused Borghese and a younger son named Fabio to be proclaimed as rebels, while a third son, Cardinal Alphonso, was strangled by order of Leo X. in 1518. He was a tyrannical ruler, and died suddenly in 1522. In the following year Clement VII. insisted on the recall of Fabio Petrucci; but two years later a fresh popular outbreak drove him from Siena for ever. The city then placed itself under the protection of the emperor Charles V., created a magistracy of "ten conservators of the liberties of the state" (December 1524), united the different monti in one named the "monte of the reigning nobles," and, rejoicing to be rid of the last of the Petrucci, dated their public books, ab instaurata libertate year I., II., and so on...

The so-called free government subject to the empire lasted for twenty-seven years; and the desired protection of Spain weighed more and more heavily until it became a tyranny. The imperial legates and the captains of the Spanish guard in Siena crushed both government and people by continual exactions and by undue interference with the functions of the balia. Charles V. passed through Siena in 1535, and, as in all the other cities of enslaved Italy, was received with the greatest pomp; but he left neither peace nor liberty behind him. From 1527 to 1545 the city was torn by faction fights and violent revolts against the noveschi, and was once more flayed and bloodstreamed, while the quarrelsome lords and baron government of the Sicenese gave great dissatisfaction in Tuscany. The balia was reconstituted several times by the imperial agents—in 1530 by Don Lopez de Soria and Alphonso Piccolomini, duke of Amalfi, in 1540 by Granvella (or Granvelle) and in 1542 by Don Diego di Mendoza; but government was carried on as badly as before, and there was increased hatred of the Spanish rule. When in 1549 Don Diego announced the emperor's purpose of erecting a fortress in Siena to keep the citizens in order, the general hatred found vent in indignant remonstrance. The historian Orlando Maddalena and other exiled envoys were sent to the emperor in 1550 with a petition signed by more than a thousand citizens praying him to spare them so terrible a danger; but their mission failed: they returned unheared. Meanwhile Don Diego had laid the foundation of the citadel and was carrying on the work with activity. Thereupon certain Sienese citizens in Rome, headed by Aeneas Piccolomini (a kinsman of Pius II.), entered into negotiations with the agents of the French king and, having with their help collected men and money, marched on Siena and forced their way in by the new gate (now Porta Romana) on 26th July 1552. The townspeople, encouraged and reinforced by this and by the famous order of Don Filippo of the Spanish troops, disarmed them and drove them to take refuge in the citadel (28th July). And finally by an agreement with Cosimo de' Medici, duke of Florence, the Spaniards were sent away on the 5th August 1552 and the Sienese took possession of their fortress.

The government was now reconstituted under the protection of the French agents; the balia was abolished, its very name having been rendered odious by the tyranny of Spain, and was replaced by a similar magistracy styled capitanter del popolo e regimento. Siena exulted in her recovered freedom; but her emperor's wrath was stirred by the influence of France in the counsels of the republic; and Cosimo, who was no less jealous of the French, conceived the design of annexing Siena to his own dominions. The first hostilities of the imperial forces in Val di Chiana (1552-1553) did little damage; but when Cosimo took the field with an army commanded by the marquis of Marignano the ruin of Siena was at hand. On 26th January Marignano captured the forts of Porta Camollia (which the whole population of Siena, including the women, had helped to construct) and invested the city with a strong blockade. On 23rd June of the same year, at Montaperti in Val di Chiana, he won a complete victory over the Sienese and French troops under Piero Strozzi, the Florentine exile and
marshals of France. Meanwhile Siena was vigorously besieged, and its inhabitants, sacrificing everything for their beloved city, maintained a most heroic defence. A glorious record of their sufferings is to be found in the Choral of S. Domenico, a splendid humanist, historian, and general, was appointed as representative of his authority; the council of the Sodoma was reconstituted with twenty members chosen by the duke; the consistory and the general council were left in existence but deprived of their political autonomy. Thus Siena was annexed to the Florentine state under the same ruler and became an integral part of the grand-duchy of Tuscany. Nevertheless it retained a separate administration for more than two centuries, until the general reforms of the grand-duke Pietro Leopoldo, the French domination, and finally the restoration swept away all differences between the Siennese and Florentine systems of government.

In 1853 Siena was reconstituted for annexation to the kingdom of Piedmont and the monarchy of Victor Emmanuel I., a decision (voted 26th June) being the initial step towards the unity of Italy.

**Literary History.**—The literary history of Siena, while recording no gifts to the world equal to those bequeathed by Florence, and without the power and originality by which the latter became the centre of Italian culture, can nevertheless boast of some illustrious names. If the ancient literature of Siena, the sources of which are of general literature and passing on to history and science, is subjoined. Many of them are also dealt with in separate articles, to which the reader is referred.

As early as the 13th century the vulgate tongue was already well established, being used in public documents, commercial records and private correspondence. The poets flourishing at that period were Focacchiero, Cecco Angiolieri, a humorist of a very high order—and Bindo Bonich, who belonged also to the following century. The chief glory of the 14th century was St Catherine Benincasa. The year of her death (1380) was that of the birth of St Bernardino of Siena, whose sermons in the vulgate tongue are models of style and diction. To the 15th century belongs Aenaeus Sylvius Piccolomini (Pius II.), humanist, historian and political writer. In the 16th century we find Andrea Chiaro, archbishop of Siena, a curious dialogue, *Della bella ecreanza delle donne*; another bishop, Claudio Tolomei, diplomatist, poet and philologist, who revived the use of ancient Latin metres; and Luca Contile, a writer of narratives, philologists, and authors. Production had two representatives in this century—Scipione Bargagli, a writer of some merit, and Pietro Fortini, whose productions were trivial and indelicate. In the 17th century we find Ludovico Sergardi (Quinto Settano), a Latinist and satirical writer of much talent and culture; but the most original and brilliant figure in Siennese literature is that of Girolamo Gigli (1660-1722), author of the *Gazzettino, La Sorcella di Don Plauto, Il Vocabolario cataniersiano et Il Dizionario ecclesiastico*. As humorist, scholar and philologist, Gigli would take a high place in the literature of any land. His resolute opposition to all hypocrisy—whether religious or literary—exposed him to merciless persecution from the Jesuits of Italy and the Inquisition of Siena.

In the domain of history we have first the old Siennese chronicles, which down to the 14th century are so confused that it is almost impossible to disentangle truth from fiction or even to decide the personality of the various authors. Three 14th-century chronicles, attributed to Andrea Dei, Agnolo di Turra, called Il Grasso, and Neri di Donati, are published in Muratori (vol. xxv). To the 15th century belong the narrations of antibiotics and biographers (e.g. Biagio de’ Monacci, 1460-1500), though devoid of literary merit, contain much valuable material. The best Siennese historians belong to the 16th century. They are Orlando Malavolti (1515-1596), a man of noble birth and of the greatest learning, who was the author of *Storia di Siena* (written in Latin), and Giuseppe Baraldi (1619-1676), author of an account of the history of the city, the name of which, *Storia di Siena*, is survival of the name of the prominent 14th and 15th century Italian Gothic, whether in stone or in brick.

SIENETJO—SIERRA LEONE

SIENETJO, one of the Shangalla tribes living in south-west Abyssinia near the Sudan frontier, who claim to be a remnant of the primitive population. They are apparently a Hamitic people, and their skin is of a yellowish tint. Their women never intermarry with the Negroes or Arabs. Sienetjo villages are usually built on hilltops. They are an industrious people, skillful jewelers, weavers and smiths.

EMILY HARRIET (1822-1885), Polish novelist, was born in 1846 at Wola Okrzeska near Lukow, in the province of Siedlce, Russia, Polish novelist. He studied philosophy at Warsaw University. His first work, a humorous novel entitled A Prophet in his own Country, appeared in 1872. In 1876 Sienkiewicz visited America, and under the pseudonym of "Litwos," contributed an account of his travels to the Gazeta Polska, a Warsaw newspaper. Thenceforward his talent as a writer of historical novels won rapid recognition, and his best-known romance, Quo Vadis? a study of Roman society under Nero, has been translated into more than thirty languages. Originally published in 1895, Quo Vadis? was first translated into English in 1896, and dramatized versions of it have been produced in England, the United States, France and Germany. Remarkable powers of realistic description, and a strong religious feeling which at times borders upon mysticism, characterize the best work of Sienkiewicz. Hardly inferior to Quo Vadis? In popularity, and superior in literary merit, is the trilogy of novels describing 17th-century society in Poland during the wars with the Cossacks, Turks and Swedes. This trilogy comprises Ogniem i mieczem ("With Fire and Sword," London, 1893, 1892 and 1893), Potop ("The Deluge," Boston, Mass., 1891) and Pan Ewidowski ("Pan Michael," London, 1890). Among other very successful novels and collections of tales which have been translated into English are Bez Dogmatu ("Without Dogma," London, 1893; Toronto, 1890), Janko muzykant: nowele ("Yanko the Musician and other Stories," Boston, Mass., 1893), Krybucy ("The Knight of the Cross," numerous British and American versions), Honia ("Hania," London, 1897) and Ta Trzeba ("The Third Woman," New York, 1898). Sienkiewicz lived much in Cracow and Warsaw, and for a time edited the Warsaw newspaper Slowa; he also travelled in England, France, Italy, Spain, Greece and the Near East, and published in English a description of his journeys in Africa. In 1905 he received the Nobel prize for literature.

A German edition of his collected works was published at Graz (1906, &c.), and his biography was written in Polish by P. Chmielowski (Lemberg, 1901) and J. Nowinski (Warsaw, 1901).

SIERDADZ, a town of Russian Poland, in the government of Kalisz, situated on the Warta, 110 m. S.W. of the city of Warsaw. Pop. (1897) 7019. It is one of the oldest towns of Poland, founded prior to the introduction of Christianity, and was formerly known as Syra or Syracy. The annals mention it in 1139. Several seims, or diets, of Poland were held there during the 14th and 15th centuries, and it was a wealthy town until nearly destroyed by a fire in 1447. The old castle, which suffered much in the Swedish war of 1701-1711, was destroyed by the Germans in 1800. There are two churches, dating from the 12th and 14th centuries respectively.

SIERO, a town of northern Spain, in the province of Oviedo, on the river Nora, and on the Oviedo-Trifinco railway. Pop. (1900) 22,503. Siero is in the centre of a fertile agricultural district, in which live-stock is extensively reared. There are coal mines in the neighbourhood, and the local industries include tanning and manufactures of soap, coarse linen and cloth.

SIERRA LEONE, a British colony and protectorate on the west coast of Africa. It is bounded W. by the Atlantic, N. and E. by French Guinea and S. by Liberia. The coast-line, following the indentations, is about 400 m. in length, extending from 9° 2' N. to 6° 55' N. It includes the peninsula of Sierra Leone—23 m. long with an average breadth of 14 m.—Sherbro Island, Bance, Banana, Turtle, Plantain and other minor islands, also Turner's Peninsula, a narrow strap of land southward of Sherbro Island, extending in a S.E. direction about 60 m. Except in the Sierra Leone peninsula, Sherbro Island and Turner's Peninsula, the colony proper does not extend inland to a greater depth than half a mile. The protectorate, which adjoins the colony to the north and east, extends from 7° N. to 10° N. and from 10° 40' W. to 13° W., and has an area of rather more than 30,000 sq. m., being about the size of Ireland. (For map, see FRENCH WEST AFRICA.) The population of the colony proper at the 1901 census was 76,655. The population of the protectorate is estimated at from 1,000,000 to 1,500,000.

Physical Features.—Sierra Leone is a well-watered, well-wooded and generally hilly country. The coast-line is deeply indented in its northern portion. Here the sea has greatly eroded the normal regular, harbourless line of the west coast of Africa, forming bold capes and numerous small islands. Inwardly the land is the most striking result of this marine action. North of it are the Sierra Leone and Scarcies estuaries; to the south is Yawby Bay. Then in 7° 30' N. Sherbro Island is reached. It is succeeded by Turner's Peninsula (in reality an island). The seaward faces of these islands are perfectly regular and indicate the original continental coast-line. They have been detached from the mainland partly by rivers. In their lower reaches two or three, both short and large streams, traverse a level plain, separated by no obstacles. The mouth of the Little Scarcies is 20 m. S. of that of the Great Scarcies. South of the estuary of the Scarcies the deep inlet known as the Sierra Leone river resembles perfectly the enterior arms of the largest vessels. At its entrance on the southern shore lies Freetown. Into the estuary flows, besides smaller streams, the Rokell, known in the upper course as the bells and more generally the Sherbro Island from the mainland, and is popularly called the Sherbro river, receives the Bagrami from the N.W. and the Jong river, whose headstream, known as the Taia, Pampenna and Sanden, flows for nearly 200 m. and is of considerable depth and width. The heads of the Sherbro, the Taia, the Great Scarcies and some of the other sources of the Taia, and those of the Great Bum, are near to those of the Niger, the watershed between the coast streams and the Niger basin here forming the frontier. The main upper branch of the Great Bum (or Sowa) river is called the Bagie or Hagle (white river). It flows east of and more directly south than the Taia. In its lower course the Bum passes through the Mendie country and enters the network of lakes and creeks separated from the ocean by the long low tract of Turner's Peninsula. The main lagoon waterway goes by the name of the Bum-Kittam river, and to the north opens into the Sherbro estuary. Southward it widens out and forms Lake Kasse (20 m. long, 10 m. wide), before reaching the coast. It forms the main lagoon of the Seli. The Seli and the Bum separate French Guinea in 10° 30' W. 9° 17' N. and flows for some distance parallel to the infant Niger, but in the opposite direction. It joins the Bum on the E. side. Its main stream separates French Guinea and Liberia and enters British territory in 10° 40' W. 8° 20' N. Only the lower course is known as the Seli. Between 7° 30' and 7° 20' are lacustrine reaches. Six miles S. of the mouth of the Seli and the Soumara, the Bum rises in Liberia, and below 7° 30' forms the frontier between that republic and the protectorate.

The Sierra Leone peninsula, the site of the oldest British settlement between the coast of the same name and Yawby Bay to the south. It is traversed on its seaward face by hills attaining a height of 1700 ft. in the Sugar Loaf, and nearly as much in Mount Herton farther south. The hills consist of a kind of granite and of
beds of red sandstones, the disintegration of which has given a dark-colored substratum of meagre fertility. Süsu Loaf is tined to the top, and the peninsula is verdant with abundant vegetation.

Climate.—The coast site unhealthy and have earned for Sierra Leone the unenviable reputation of being "the white man's grave." The mean annual temperature is above 80°, the rainfall, which varies greatly, is from 150 to 300 inches per annum. In 1896, no fewer than 265 rain storms were recorded in the Freetown district, and the month of April enjoyed a "dry" spell of 144 days. In no other part of West Africa is the rainfall so heavy. December, January, February and March are practically rainless; the rains, beginning in April or May, reach their maximum in July or August, and diminish through the autumn and November. During the dry season, when the climate is very much like that of the West Indies, there occur terrible tornadoes and long periods of the harrmattan—a north-east wind, dry and destructive, which, according to local belief, was sent by the gods which sailors designate "smokes." The dangers of the climate are much less in the interior; 40 or 50 m. inland the country is tolerable for Europeans.

Flora.—The characteristic tree of the coast districts is the oil-palm. Other palm trees found are the date, bamboo, palmyra, coco and dom. The coast-line, the creeks and the lower courses of rivers are lined with mangroves. Large brushwood, among which are scattered baobab, shea-butter, breadfruit, corkwood and silk-cotton trees. The forests contain valuable timber trees such as African oak or teak (Olefodendron Africana), rosewood, ironwood, ivorywood, and lignum vitae. Attacks of termites—and the tolmahg or brimstone tree. The frankincense tree (Dillenia therfurstera) reaches from 50 to 150 ft., the negro pepper (Xylopia Aethiopica) grows about 50 ft. tall, being fruited from spring to autumn. There are also the black pepper plant (Piper Clavii), a climbing plant abundant in the mountain districts; the grains of paradise or melugueta pepper plant (An lovinga gigantea); the green pepper tree of the underwood, and the bitter cola (Garcinia cola), the last having a fruit about the size of an apple, with a flavour like that of green coffee, are common. Of dye-yielding shrubs and plants camwood and indigo may be mentioned. The gum in the gum plant is the only African tragacanth (Sterculia tragacanth), besides the oil-palm, oil is obtained from many trees and shrubs, such as the benni oil plant. Of fruit trees there are among others the blood-plum (Iteaomaphiles Berti) with deep crimson fruit in grape-like clusters, and the Sierra Leone peach (Paxcocephalus exclesent). The coffee and cotton plants are indigenous; of grasses there are various kinds of millet, including-passpatum exile, the so-called hungry rice or Sierra Leone millet. Ferns are abundant in the marshes. Bright coloured flowers are somewhat rare.

Fauna.—The wild animals include the elephant, still found in large numbers in the interior, the buffalo, wild hog, bush hog, pig, block civet and squirrel. The hippopotamus, manatee, crocodile and lineated porcupine, and baboons, are also common. Serpents, especially the bos-constrictor are numerous. Chameleons, lizards and iguanas abound, as do frogs and toads. Wild birds are not very common; among them are the hawk, parrot, owl, etc. The hawks and owls, and the bat, are numerous. The honey-sucker and canary. There are also wild duck, geese and other water fowl, hawk's bill, laggerheads and partridges. Mosquitoes, termites, bees, ants, centipedes, millipedes, locusts, grasshoppers, butterflies, dragonflies, sandflies and spiders are found in immense numbers. Turtle are common on the southern coast-line, sand and mangrove oysters are plentiful. Fish abound; among the common kinds are the banga (a sort of herring), skate, grey mullet and tarpon. Shells lining the estuarine isles are abundant.

Inhabitants.—Sierra Leone is inhabited by various negro tribes, the chief being the Timmi, the Sulima, the Susu and the Mendi. From the Mendi district many curious statuettes which had been buried have been recovered and are exhibited in the British Museum. They show considerable skill in carving. Of semi-negro races the Fula inhabit the region of the Scarcies. Freetown is peopled by descendants of nearly every negro tribe, and a distinct type known as the Sierra Leoni has been evolved; their language is pidgin English, and they are of numerous tribes that have settled in the country as traders. Most of the negroes are pagans and each tribe has its secret societies and fetishes. These are very powerful and are employed often for beneficent purposes, such as the regulation of agriculture and the palm-oil industry. There are many Christian converts (chiefly Anglicans and Wesleyans) and Mahommedans. In the protectorate are some Mahommedan tribes, as for instance the Susu. The majority of the Sierra Leonis are nominally Christian. The European population numbers about 500.

Trade.—Besides Freetown (90 ft. above the level of the Atal) (pop. 1900, 14,428), the most important town for European trade are Bonthe, the port of Sherbro, Port Lokko, at the head of the navigable waters of a stream emptying itself into the Sierra Leone estuary, and Songo Town, 30 m. S.E. of Freetown, with which it is connected by railway. In the interior are many populous centres. The most noted is Falaba, about 190 m. N.E. of Freetown on the Fala river, a tributary of the Little Scarcies. It lies about 600 ft. above the sea. Falaba was founded towards the end of the 18th century by the Sulima who revolted from the Mahommedan Fula, and its warlike inhabitants soon attained supremacy over the neighbouring villages. It is a live town, surrounded by a looped wall, with flint defences for the gates. The town is the meeting-place of many trade routes, including some to the middle Niger. Kambia on the Great Scarcies is a place of some importance. It can be reached by boat from the sea. On the railway running S.E. from Freetown are Rotifunk, Mano, and Bo, towns which have increased greatly in importance since the building of the railway.

Agriculture and Trade.—Agriculture is in a backward condition, but is rapidly developing. The best developed crops are the sugar-cane, for its fibre-yielding parts, and the improbably-oil tree, chiefly in its indigenous trees of economic value—the oil-palm, the kola-nut tree and various kinds of rubber plants, chiefly the Landolphia ovirarianis. The crops are cultivated with rice, sugar, cacao, coffee and yam. The rapidity of the cultivation of native tobacco has been practically abandoned as unremunerative. The sugar cane is grown in small quantities. The ginger is grown mainly by the Bush and the colonies. The gum of the so-called shea-butter, which is mainly exported, as the impetus, has been largely cultivated, but this industry has been superseded by exports from India. Its place has been taken to some extent by the extraction of rubber.

Agriculture and Trade.—Agriculture is in a backward condition, but is rapidly developing. inspected by government and receive grants in aid. In 1907 there were 460,000-odd elementary schools with nearly 8000 scholars. Furah Bay College was affiliated to the University of Cambridge. Wesleyan Theological College: a government school (established 1906) at Bo for the sons of chiefs, and the Thomas Agricultural Academy (established 1880) at Bo and the request of S. B. Thomas, a Sierra Leonian. Since 1901 the government has provided separate schools for Mahommedans. Revenue is largely derived from customs, especially from the duties levied on spirits. In the protectorate the house tax is imposed. In 1900-1908 revenue increased from £108,000 to £231,000, and the expenditure from £145,000 to £341,000. In 1906 there was a public debt of £1,797,000.

Freetown is the headquarters of the British army in West Africa, and a force of engineers and artillery is maintained there. The colony itself provides a battle of the West African Frontier Force, a body responsible to the Colonial Office.

The country is divided, for administrative purposes, into districts, each under a European commissioner. Throughout the protectorate native law is administered by native courts, subject to certain modifications. Native courts may not deal with murder, witchcraft, cannibalism or slavery. These cases are tried by the district commissioners or referred to the supreme court at Freetown.

The tribal system of government is maintained, and the authority of the chiefs has been strengthened by the British. Domestic slavery is not interfered with.

History.—Sierra Leone (in the original Portuguese form of Sierraleone) was known to its native inhabitants as Romarong, or the Mountain, and received the current designation from the Portuguese discoverer Pedro de Sintra (1623), either on account of the “lion-like” thunder on its hill-tops, or to a fancied resemblance of the mountains to the form of a lion. Here, as elsewhere along the coast, the Portuguese had “factories”; and though native tribute was exacted from them by the British, the country was allowed to govern itself. The British called themselves Portuguese and claimed descent from colonists of that nation. An English fort was built on Bance Island in the Sierra Leone estuary towards the close of the 17th century, but was soon afterwards abandoned, though for a long period the estuary was the haunt of slavers and pirates. English traders were established on Bance and the Banana islands as long as the slave trade was legal. The existing colony has not, however, grown out of their establishments, but owes its birth to the philanthropists who sought to alleviate the lot of those negroes who were victims of the traffic in human beings. In 1786 Dr Henry Smeathman, who had lived for four years on the west coast, proposed a scheme for founding on the peninsula a colony for negroes discharged from the army and navy at the close of the American War of Independence, as well as for numbers of runaway slaves who had found an asylum in London. In 1787 the settlement was begun with 400 negroes and 60 Europeans, the whites being mostly women of abandoned character. In the year following, 1788, Nembara, a Temni chief, sold a strip of land to Captain John Taylor, R.N., for the use of the “free community of settlers, their heirs and successors, lately arrived from England, and under the protection of the British government.” Owing mainly to the utter shiftlessness of the settlers and the great mortality among them, but partly to an attack by a body of natives, this first attempt proved a complete failure. In 1791 Alexander Falconbridge (formerly a surgeon on board slave ships) collected the surviving fugitives and laid out a new settlement (Granville’s Town); and the promoters of the enterprise—Graville Sharp, William Wilberforce, Sir Richard Carr Glyn, &c.—hitherto known as the St George’s Bay Company, obtained a charter of incorporation as the Sierra Leone Company, with Henry Thornton as chairman. In 1792 John Clarkson, a lieutenant in the British navy and brother to Thomas Clarkson, the slave trade abolitionist, brought to the colony 1100 negroes from Nova Scotia. In 1794 the settlement, which had been again transferred to its original site and named Freetown, was plundered by the French. The governor at the time was Zachary Macaulay, father of Thomas Babington, Lord Macaulay. In 1807, when the inhabitants of the colony numbered 1871, the company, which had encountered many difficulties, transferred its rights to the crown. The slave trade having in the same year been declared illegal by the British parliament, slaves captured by British vessels in the neighbouring seas were brought to Freetown, and thus the population of the colony grew.

development was hampered by the frequent changes in the governorship. Sydney Smith’s jest that Sierra Leone had always two governors, one just arrived in the colony, and the other just arrived in England, is but a slight exaggeration. In twenty-two years (1792-1814) there were seventeen changes in the governorship. After that date changes, although not quite so rapid, were still frequent. Several of the governors, like Zachary Macaulay, Colonel Dinny Denham, the explorer, and Sir Samuel Rawle, were men of distinction. Colonel Denham, after administering the colony for five weeks, died at Freetown of fever on the 9th of June 1828. Sir Charles M’Carthy was, however, governor for ten years (1814-1824), an unprecedented period, during which he did much for the development of the country. Sir Charles fell in battle with the Ashanti on the 21st of January 1824. Whilst the governors found great difficulty in building up an industrious and agricultural community out of the medley of Africans brought to Sierra Leone, they had also to contend with the illicit slave trade which flourished in places close to the colony. To stop the traffic in Sherbro Island General Charles Turner concluded in 1825 a treaty with its rulers putting the island, Turner’s Peninsula and other places under British protection. (This treaty was not ratified by the crown, but was revived by another agreement made in 1882.)

At this time—1826—measures were taken to ensure that the liberated slaves should become self-supporting. Many colonists took to trade, and notwithstanding numerous collisions with neighbouring tribes the settlement attained a measure of prosperity. Among the leading agents in spreading civilization were the missionaries sent by the American Board of Commissioners for Foreign Missions, and the Missionary Society. Despite the anxiety of the British government not to increase their responsibilities in West Africa, from time to time various small territories were purchased, and by 1884 all the land now forming the colony had been acquired. The Los Islands (q.v.) which were ceded by the natives to Great Britain in 1818 were transferred to France in 1904. In 1856 Freetown was made the capital of the new general government set up for the British settlements on the West Coast of Africa (comprising Sierra Leone, Gambia, the Gold Coast and Lagos, the first of which was to have a legislative council). In 1874 the Gold Coast and Lagos were detached from Sierra Leone, and the Gambia in 1888.

British influence was gradually extended over the hinterland, chiefly with the object of suppressing intertribal wars, which greatly hindered trade. In this work the British authorities enlisted the services of Dr Edward W. Blyden (a pure-blooded negro), who in 1872 visited Falaba and in 1873 Timbo, both semi-Mahommedan countries, being cordially received by the ruling chiefs. Falaba—which had been visited in 1869 by Winwood Reade on his journey to the Niger—came definitely under British protection, but Timbo, which is in Futa Jallon, was allowed to become French territory through the supineness of the home government. The area for expansion on the north was in any case limited by the French Guinea settlements, and on the south the territory of Liberia 1 hemmed in the colony. In the east and north-east British officers also found themselves regarded as trespassers by the French. The necessity for fixing the frontier in this direction was emphasized by the Waima incident. Both French and British military expeditions had been sent against the Sofas—Moslem mercenaries who, under the chieftainship of Falas Mandingos like Samory, ravaged the hinterland both of Sierra Leone and French Guinea. On the 23rd of December 1893 a British force was encamped at Waima. At dawn it was attacked by a French force which mistook the British troops for Samory’s Sofas (save the officers the soldiers of both parties were negroes). Before the mistake was discovered the British had lost in killed three officers—Captain E. A. W. Lendy, Lieut. R. E. Liston and Lieut. C. Wroughton—and seven men, besides eighteen wounded. The French also suffered heavily. Their leader Lieut. Maritz was brought into the British camp mortally wounded,
and was buried by the British. Steps were taken to prevent the occurrence of any further conflicts, and an agreement defining the frontier was signed in January 1895. This agreement finally shut Sierra Leone from its natural hinterland. In 1896 the frontier was delimited, and in the same year (26th of August 1896) a proclamation of a British protectorate was issued. To this extension of authority no opposition was offered at the time by any of the chiefs or tribes. Travelling commissioners were appointed to explore the hinterland, and frontier police were organized. The abolition of the slave trade followed; and with the introduction of the protectorate ordinance in 1877 a house tax of one cent per slave was imposed on the labor operating in the districts on the 1st of January 1898. Chief Bai Bureh, in the Timni country, broke out into open war, necessitating a military punitive expedition. After strenuous fighting, in which the British casualties, including sick, reached 600, he was captured (14th of November 1898) and deported. Meantime (in April 1898) the Mendi tribes rose, and massacred several British and American missionaries, including four ladies, at Kotiunk and Taiama, some native officials (Sierra Leone) in the Imperi district, and a large number of police throughout the country. Speedy retribution followed, which effectually put down the revolt. The Mendi leaders were put to death in July 1898. Commissioner Trotter was appointed to inquire into the disturbances. He issued a report, July 1899, depreciating the imposition of the house tax, which was not, however, revoked. The disturbances would appear to have arisen not so much from dislike of the house tax *per se* as irritation at the arbitrary manner in which it was collected, and from a desire on the part of the paramount chiefs (who chafed at the suppression of slave trading and slave raiding, and who disseminated a powerful fetish "swear," called "Poro," to compel the people to join) to cast off British rule. After the suppression of the rising (January 1899) confidence in the British administration largely increased among the tribes, owing to the care taken to preserve the authority of the chiefs whilst safeguarding the elementary rights of the people. The building of the railway and the consequent development of trade and the introduction of European ideas tended largely to modify native habits. The power of fetishism seemed, however, unaffected. See H. C. Lukach, *A Bibliography of Sierra Leone* (Oxford, 1911); Sir C. P. Lucas, *Historical Geography of the British Colonies, vol. ii. (London, 1893); The *Sierra Leone Hinterland* (London, 1901), and *A Transformed Colony* (London, 1910)—the last with valuable notes on secret societies and fetish; Winwood Reade, *The African Sketch Book*, vol. ii. (London, 1873); Claude L. Robinson, *K-Totter, The Niger Sources* (London, 1898); Matthew Crook, *History of Sierra Leone* (Dublin, 1903)—a concise account of the colony to the end of the 19th century. For fuller details of the foundation and early history of the settlement consult *Sierra Leone after a Hundred Years* (London, 1894) by E. G. Ingham, bishop of the diocese, and *The Rise of British West Africa* (London, 1904) by Claude George. Bishop Ingham's book contains long extracts from the diary of Governor Clarkson, which vividly portray the conditions of life in the infant colony. For the region in 1868 see *The Advance of Our West African Empire* (London, 1903) by C. B. Wallis. A *Blue Book* on the affairs of the colony is published yearly at Freetown and an *Annual Report* by the Colonial Office in London. Maps on the scale of 1: 250,000 are published by the War Office.

**SIERRA MORENA, THE**, a range of mountains in southern Spain. The Sierra Morena constitutes the largest section of the mountain system called the Cordillera Marianica (anc. *Montes marianis*), which also includes a number of minor Spanish ranges, together with the mountains of southern Portugal. The mean elevation of the range is about 2500 ft., but its breadth is certainly not less than 40 m. It extends eastward as far as the steppe region of Albacete, and westward to the valley of the lower Guadiana. Its continuity is frequently interrupted, especially in the east; in the eastern and middle portions it is composed of numerous irregularly disposed ridges. Many of these bear distinctive names; thus the easternmost and loftiest is called the Sierra de Alcaraz (5000 ft.), while some of the component ridges in the extreme west are classed together as the Sierras de Arcenca. The great breadth of the Sierra Morena long rendered it a formidable barrier between Andalusia and the north; as such it has played an important part in the social, economic and military history of Spain. Its configuration and hydrography are also important from a geographical point of view, partly because it separates the plateau region of Castile and Estremadura from the Anadalusan plain and the highlands of the Sierra Nevada system, partly because it forms the watershed between two great rivers, the upper Guadiana on the north and the Guadalquivir on the south. Parts of the Sierra Morena are rich in minerals; the central region yields silver, mercury and lead, while the Sierras de Aracena contain the celebrated copper mines of Tharsis and Rio Tinto (q.v.).

**SIERRA NEVADA** (Sp. for "snowy range"); a mountain range, about 450 m. long, in the eastern part of California, containing Mt. Whitney (14,502 ft.), the highest point in the United States, excluding Alaska. (See California.)

**SIERRA NEVADA, THE**, a mountain range of southern Spain, in the provinces of Granada and Almeria. The Sierra Nevada is a well-defined range, about 55 m. long and 25 m. broad, situated to the south of the Guadalquivir valley, and stretching from the upper valley of the river Genil or Jenil eastwards to the valley of the river Almeria. It owes its name, meaning "the snowy range," to the fact that several of its peaks exceed 10,000 ft. in elevation. It was in this range that the last act of perpetual war was fought. Its culminating point, the Cerro de Mulhacén or Mulahacén (11,421 ft.) reaches an altitude unequalled in Spain, while one of the neighbouring peaks, called the Picacho de Veleta (11,148 ft.), is only surpassed by Aneto (11,168 ft.), the loftiest summit of the Pyrenees. The Sierra Nevada is composed chiefly of soft micaceous schists, sinking precipitously down on the north, but sloping more gradually to the south and south-east. On both sides deep transverse valleys (barrancos) follow one another in close succession, in many cases with round, basin-shaped heads like the cirques of the Pyrenees (q.v.). In many of these cirques lie alpine lakes, and in one of them, the Corral de Veleta, there is even a small glacier, the most southerly in Europe. The transverse valleys open on the south into the longitudinal valleys of the Alpujarras (q.v.). On the north, east and west there are various minor ranges, such as the Sierras of Parapanda, Harana, Gor, Baza, Lucena, Cazorla, Estancias, Filabres, &c., which are connected with the main range, and are sometimes collectively termed the Sierra Nevada system. The coast ranges, or Sierra Penibetica, are not included in this group. The Sierras de Segura form a connecting link between the Sierra Morena and the Nevada system.

**SIEVE (O.E. *sifan*, sibi, cf. Dutch *sief*, Ger. *Siebe*; from the subst. comes O.E. *sifan*, to sift), an instrument or apparatus for separating finer particles from coarser. The common sieve is a net of wires or other material stretched across a framework with raised edges; the material to be sifted is then shaken or pressed upon the net so that the finer particles pass through the mesh and the coarser remain. The word "sieve" is usually applied to such instruments with large mesh for coarse work, and "strainer" for those used in the separation of liquids or semi-liquids from solid matter. In the separation of meal from bolting-clothes "sieves" are used. There was an early folk etymology naming it from the Latin *sieve*, *sive*, *sivita* (divination, *sibor*, *sibor*, *sibore*, *sibor*, *sibor*, *sibor*), where a sieve was hung or attached to a pair of shears, whence the name sometimes given to it of "sieve and shears"; the turning or movement of the sieve at the naming of a person suspected of a crime or other act, coupled with the repetition of an incantation or other magic formula, decided the guilt or innocence of the person.

**SIEYÉS, ÉMMANUEL-JOSEPH** (1748–1836), French abbe and statesman, one of the chief theorists of the revolutionary and Napoleonic era, was born at Fréjus in the south of France on the 3rd of May 1748. He was educated for the church at the Sorbonne; but while there he eagerly imbibed the teachings of Locke, Condillac, and other French thinkers, in preference to theology. Nevertheless he entered the church, and owing to his learning and subtility advanced until he became vicar-general and chancellor of the diocese of Chartres. In 1788 the excitement caused by the proposed convocation of the States
General of France after the interval of more than a century and a half, and the invitation of Necker to writers to state their views as to the constitution of the Estates, enabled Sieyès to publish his celebrated pamphlet, “What is the Third Estate?” He thus begins his answer,—“Everything. What has it been hitherto in the political order? Nothing. What does it desire? To be something.” For this not he is said to have been indebted to Chamfort. In any case, the pamphlet had a great vogue, and its author, despite doubts felt as to his clerical vocation, was elected as the last (the twentieth) of the deputies of Paris to the States for the time. Despite his failure in this legislative part, Sieyès became great; he strongly advised the constitution of the Estates in one chamber as the National Assembly, but he opposed the abolition of tithes and the confiscation of church lands. Elected to the special committee on the constitution, he opposed the right of “absolute veto” for the king, which Mirabeau unsuccessfully supported. For the most part, however, he veiled his opinions in the National Assembly, speaking very rarely and then generally with oracular brevity and ambiguity. He had a considerable influence on the framing of the departmental system, but after the spring of 1790 his influence was eclipsed by men of more determined character. Only once was he elected to the post of fortnightly president of the Constituent Assembly. Excluded from the Legislative Assembly by Robespierre’s self-denying ordinance, he reappeared in the third National Assembly, known as the Convention (September 1792—September 1795); but there his self-effacement was even more remarkable; it resulted partly from disgust, partly from timidity. He even abjured his faith at the time of the installation of the goddess of reason; and afterwards he characterized his conduct during the reign of terror in the ironic phrase, J’ai révélé. He voted for the death of Louis XVI., but not in the Constituent Assembly. His conduct was skilful, but he failed in his main object. The prestige which encircled his name led to his being elected a Director of France in place of Rewbell in May 1799. Already he had begun to intrigue for the overthrow of the Directory, and is said to have thought of favouring the advent to power at Paris of persons so unlikely as the Archduke Charles and the duke of Brunswick. He now set himself to sap the base of the constitution of 1795 (that of the Directory) in some important particulars, but without effect, and thereupon refused to serve as a Director of the Republic. In May 1798 he went as the plenipotentiary of France to the court of Berlin in order to try to induce Prussia to make common cause with France against the Second Coalition. His conduct was skilful, but he failed in his main object. The prestige which encircled his name led to his being elected a Director of France in place of Rewbell in May 1799. Already he had begun to intrigue for the overthrow of the Directory, and is said to have thought of favouring the advent to power at Paris of persons so unlikely as the Archduke Charles and the duke of Brunswick. He now set himself to sap the base of the constitution of 1795. With that aim he caused the revived Jacobin Club to be closed, and made overtures to Gabriel-Joubert for a coup d’état in the future. The death of Joubert at the battle of Novi, and the return of Bonaparte from Egypt marred his schemes; but ultimately he came to an understanding with the young general (see Napoleon I.). After the coup d’état of Brumaire, Sieyès produced the perfect constitution which he had long been planning, only to have it completely remodelled by Bonaparte. Sieyès soon retired from the post of provisional consul, which he accepted after Brumaire; he now became one of the first senators, and rumour, probably rightly, connected this retirement with the acquisition of a fine estate at Crènes. After the bomb outrage at the close of 1800 (the affair of Nîmes) Sieyès in the senate defended the arbitrary and illegal proceedings whereby Bonaparte rid himself of the leading Jacobins. During the empire he rarely emerged from his retirement, but at the time of the Bourbon restorations (1814 and 1815) he left France. After the July revolution (1830) he returned; he died at Paris on the 20th of June 1836. The thin, wire-drawn features of Sieyès were the index of his mind, which was keenly brighter, but dry and essentially limited. His lack of character and wide sympathies was a misfortune for the National Assemblies which he might otherwise have guided with effect.

See A. Neton, Sieyès (1748–1836) d’après documents inédits (Paris, 1900); also the chief histories on the French Revolution and the Napoleonic empire.

**SIFAKA**, apparently the name of certain large Malagasy lemurs nearly allied to the Insect (q.v.) but distinguished by their long tails, and hence referred to a genus apart—Propithecus, of which three species, with several local races, are recognized. Sifakas are very variable in colouring, but always show a large amount of white. They associate in parties and are mainly arboreal, leaping from bough to bough with an agility that suggests flying through the air. When on the ground, to pass from one clump of trees to another, they do not run on all fours, but stand erect, and throwing their arms above their heads, progress by a series of short jumps, producing an effect which is described by travellers as exceedingly ludicrous. They are not nocturnal, but most active in the morning and evening, remaining seated or curled up among the branches during the heat of the day. In disposition they are quiet and gentle, and do not show much intelligence; they are also less noisy than the true lemurs, only when alarmed or angered making a noise which has been compared to the clucking of a fowl. Like all their kindred they produce only one offspring at a birth (see Primates). (R. L. P.)

**SIGALON, XAVIER** (1758–1837), French painter, born at Uzès (Gard) towards the close of 1758, was one of the few leaders of the romantic movement who cared for treatment of form rather than of colour. The son of a poor rural schoolmaster, he had a terrible struggle before he was able even to reach Paris and obtain admission to Guérin’s studio. But the learning offered there did not respond to his special needs, and he tried to train himself by solitary study of the Italian masters in the gallery of the Louvre. The “Young Courtesan” (Louvre),
which he exhibited in 1821, at once attracted attention and was bought for the Luxembourg. The painter, however, regarded it as but an essay in practice and sought to measure himself with a mightier motive; this he did in his "Locusta" (Nimes), 1824, and again in "Athaliah's Massacre" (Nantes), 1827. Both these works showed incontestable power; but the "Vision of St Jerome" (Louvre), which appeared at the salon of 1831, together with the "Crucifixion" (Issengeaux), was by far the most individual of all his achievements, and that year he received the cross of the Legion of Honour. The terrors and force of his pencil were not, however, rendered attractive by any weakness in his colour; his paintings remained unpurchased, and Sigalon found himself forced to get by humble living at times by painting portraits, when Thiers, then minister of the interior, recalled him to Paris and entrusted him with the task of copying the Sistine fresco of the "Last Judgment" for a hall in the Palace of the Fine Arts. On the exhibition, in the Baths of Diocletian at Rome, of Sigalon's gigantic task, in which he had been aided by his pupil Numa Boncoiran, the artist was visited in state by Gregory XVI. But Sigalon was not destined long to enjoy his tardy honours and the comparative ease procured by a small government pension; returning to Rome to copy some frescoes in the Sistine, he died (25th of October) on the 8th of August 1837.

**SI-GAN FU**

The stone—one of a row of five memorial tablets—stood within the enclosure of a dilapidated temple. It appears at one time to have been embedded in a brick niche, and about 1891 a shed was placed over it, but in 1907 it stood in the open entirely unprotected. In that year Dr Frits v. Holm, a Danish traveller, had made an exact replica of the tablet, which in 1908 was deposited in the Metropolitan Museum of Art, New York. The tablet itself was in October 1907 removed by Chinese officials into the city proper, and placed in the Peking or "Li-fu" hall of tablets, a museum in which the collective tablets of the Han, the T'ang, Sung, Yuen and Ming dynasties, some of which bear historical legends, notably a set of stone tablets having the thirteen classics inscribed upon them, while others are symbolic or pictorial; among these last is a full-sized likeness of Confucius. Antiquities are constantly being discovered in the neighbourhood of the city, e.g. rich stores of coins and bronze bars, bearing dates ranging from 200 B.C. onwards.

**SIEGEBERT (d. 575), King of the Franks,** was one of the four sons of Clovis I. At the death of Clovis in 511 the Frankish kingdom was divided among his sons, Siegbert's share comprising the Rhine and Meuse lands and the south of the Maas. He ruled the territory called the "Bas" or Elbe, together with Auvergne and part of Provence. At the death of his brother Chilperic in 567 Siegbert obtained the cities of Tours and Poitiers, and it was he who elevated to the see of Tours the celebrated Gregory, the historian of the Franks. Being a smoother man than his brothers (who had all taken mates of inferior rank), Siegbert married a royal princess, Brunhilda, daughter of Athanagild, the king of the Visigoths; the nuptials were celebrated with great pomp at Metz, the Italian poet Fortunatus composing the epithalamium. Shortly afterwards Siegbert's brother Chilperic had Siegbert's sister Ferdegond and the sister of her husband, the queen, accused of complicity in the murder of this princess embroiled Austrasia and Neustria, and civil war broke out in 573. Siegbert appealed to the Germans of the right bank of the Rhine, who attacked the environs of Paris and Chartres and committed frightful ravages. He was entirely victorious, and pursued Chilperic as far as Tournai. But just when the great nobles of Neustria were raising Siegbert on the shield in the villa at Vitry, near Arras, he was assassinated by two braves in the pay of Fredegond, Chilperic's new wife. At the beginning of his reign Siegbert had made war on the Avars, who had attacked his Germanic possessions, and he was for some time a prisoner in their Chalons.

SIGEBERT OF GEMBLoux—SIGHTS

SIGEBERT OF GEMBLoux (c. 1030–1112), medieval chronicler, became in early life a monk in the Benedictine abbey of Gembloux. Later he was a teacher at Metz, and about 1070 he returned to Gembloux, where, occupied in teaching and writing, he lived until his death on the 9th of October 1112. As an enemy of the papal pretensions he took part in the momentous contest between Pope Gregory VII and the emperor Henry IV., his writings on this question being very serviceable to the imperial cause. The Papists, however, cannot be credited with the charge against Sigebert that his most important work is a Chronographia, or universal chronicle, according to Molinier the best work of its kind, although it contains many errors and but little original information. It covers the period between 381 and 1111, and its author was evidently a man of much learning. The first of many editions was published in 1573 and the best is in Band vi. of the Monumenta Germaniae historica. Scriptores, with valuable introduction, by L. C. Bethmann. The chronicle was very popular during the later middle ages; it was used by many writers and found numerous continuators. Other works of importance were the Life of the early abbots of Gembloux to 1048 (Gesta abbatum Gemblacensium) and a life of the Frankish king Sigebert III. (Vita Sigeberti III. regis Austrasie). Sigebert was also a hagiographer. Among his writings in this connexion may be mentioned the Vita Deodoceri, Mettensis episcopi, which is published in Band iv. of the Monumenta, and the Vita Wiberti, in Band viii. of the same collection. Dietrich, bishop of Metz (d. 984) was the founder of the abbey of St Vincent in that city, and Wibert or Guibert (d. 962) was the founder of the abbey of Gembloux.

SIGEL, FRANZ (1854–1902), German and American soldier, was born at Sinsheim, in Baden, on the 18th of November 1854. He graduated at the military school at Karlsruhe, and became an officer in the grand ducal service. He soon became known for revolutionary opinions, and in 1847, after killing an opponent in a duel, he resigned his commission. When the Baden insurrection broke out in 1850, Sigel was a leader of the rising, and took part in the brief campaign of 1848, and then took refuge in Switzerland. In the following year he returned to Baden and took a conspicuous part in the more serious operations of the second outbreak under General Louis Mieroslavski (1814–1878). Sigel subsequently lived in Switzerland, England and the United States, whither he emigrated in 1853, the usual life of a political exile, working in turn as journalist and schoolmaster, and both at New York and St Louis, whither he removed in 1858, he conducted military journals. When the American Civil War broke out in 1861, Sigel was active in raising and training Federal volunteer corps, and took a prominent part in the struggle for the possession of Missouri. He became in May a brigadier-general U.S.V., and served with Nathaniel Lyon at Wilson’s Creek and with J. C. Frémont in the advance on Springfield in the autumn. In 1862 he took a conspicuous part in the desperately fought battle of Pea Ridge, which definitely secured Missouri for the Federals. He was promoted to be major-general of volunteers, was ordered to Virginia, and was soon placed in command of the I. corps of Pope’s “Army of Virginia.” In this capacity he took part in the second Bull Run campaign, and his corps played the utmost gallantry in the unsuccessful attacks on Bald Hill. Up to the beginning of 1863, when bad health obliged him to take leave of absence, Sigel remained in command of his own (now called the XI.) corps and the XII., the two forming a “Grand Division.” In June 1863 he was in command of large forces in Pennsylvania, to make head against Lee’s second invasion of Northern territory. In 1864 he was placed in command of the corps in the Shenandoah Valley, but was defeated by General John C. Breckinridge at Newmarket (15th of May), and was superseded. Subsequently he was in command of the Harper’s Ferry garrison at the time of Early’s raid upon Washington and made a brilliant defence of his post (July 4–5, 1864). He resigned his commission in May 1865, and became editor of a German journal in Baltimore, Maryland. In 1867 he removed to New York City, and in 1869 was the unsuccessful Republican candidate for secretary of state of New York. He was appointed collector of internal revenue in May 1871, and in the following October he was elected register of New York City by Republicans and reform Democrats.

From 1875 to 1889, having previously become a Democrat, he was a member of the New York State Assembly. He was also one of the tenants of a long lease of the city property, and in 1882, with other tenants, he brought an action against the city, alleging that the property was not as valuable as it had been represented. In 1871 he was once more involved in a party struggle. The minority among the “national” party in the house took up the question of the appointment of a new member to the board of aldermen. It appears, however, that Sigel and Boetius fled to Italy and, according to John Peckham, archbishop of Canterbury, perished miserably. The manner of Sigel’s death, which occurred at Orvieto, is not known. A Brabantine chronicler says that he was killed by an insane secretary (a clerico suo quasi dementi). Dante, in the Paradiso (x. 134–6), says that he found “death slow in coming,” and some have concluded that this indicates death by suicide. A 13th century sonnet by one Durante (xci. 9–14) says that he was executed at Orvieto: a ghiado fe’ morire a gran dolore, Nello corte di Roma ed Orvieto. The date of this may have been 1223–1224, when Martin IV. was in residence at Orvieto. In politics he held that good laws were better than good rulers, and criticised papal infallibility in temporal affairs. The importance of Sigel in philosophy lies in his acceptance of Averroism in its entirety, which drew upon him the opposition of Albertus Magnus and Aquinas. In December 1270 Averroism was condemned by ecclesiastical authority, and during his whole life Sigel was exposed to persecution both from the Church and from purely philosophic opponents. In view of this, it is curious that Dante should place him in Paradise at the side of Aquinas and Isidore of Seville. Probably Dante knew of him only from the chronicler as a persecuted philosopher.

See P. Mandonnet, Siger de Brabant et l’Averroisme latin du XIIIe siècle (Fribourg, 1896); G. Paris, “Siger de Brabant” in La Poésie du moyen âge (1895); and an article in the Revue de Paris (Sept. 1st, 1900).

The name of mechanical appliances for directing the axis of the bore of a gun or other firearm on a point whose position relative to the target fired at is such that the projectile will strike the target.

Gun Sights.—Until the 19th century the only means for sighting cannon was by the “line of metal”—a line scored...
along the top of the gun, which, owing to the greater thickness of metal at the breech than at the muzzle, was not parallel to the axis. "Some allowance had to be made for the inclination of the line of metal to the axis" (Lloyd and Hadcock, p. 32).

The line of metal does not come under the definition of sights given above. In the year 1801 a proposal to use sights was sent to Lord Nelson for opinion, and elicited the following reply: "As to the plan for pointing a gun, truer than we do at present, if the person comes, I shall, of course, look at it, or be happy, if necessary, to use it; but I hope we shall be able, as usual, to get so close to our enemies that our shot cannot miss the object." (letter to Sir E. Berry, March 9, 1801).

Three weeks later the fleet under Sir Hyde Parker and Nelson sailed through the Sound on its way to Copenhagen. In replying to the guns of Fort Elsinore no execution was done, as the long range made it impossible to lay the guns (Lloyd and Hadcock, p. 33).

The necessity for sights follows directly on investigation of the forces acting on a projectile during flight. In a vacuum, the projectile acted on by the force of projection begins to fall under the action of gravity immediately it leaves the bore, and under the combined action of these two forces the path of the projectile is a parabola. It passes over equal spaces in equal times, but falls with an accelerating velocity according to the formula $v^2 = gt^2$, where $v$ is the height fallen through, $g$ the force of gravity, and $t$ the time of flight. From fig. 1 it will be seen that in three seconds the projectile would have fallen 144 ft. to G; therefore to strike T the axis must be raised to a point 144 ft. vertically above G. This law holds good also in air for very low velocities, but, where the velocities are high, the retardation is great, the projectile takes longer to traverse each succeeding space, and consequently the time of flight for any range is longer; the axis must therefore be directed still higher above the point to be struck. The amount, however, still depends on the time of flight, as the retardation of the air to the falling velocity may be neglected in the case of flat trajectory guns. Owing to the conical shape of the early muzzle-loading guns, if one trunnion was higher than the other, the "line of metal" would no longer be in the same vertical plane as the axis; in consequence of this, if a gun with, say, one wheel higher than the other were laid by this line, the axis would point off the target to the side of the lower wheel. Further, the inclination of the line of metal to the axis gave the gun a fixed angle of elevation varying from $1^\circ$ in light guns to $2^\circ$ in the heavier nature. To overcome this a "dispart sight" (D) was introduced (fig. 2) to bring the line of sight (A'DG) parallel to the axis (AG).

The earliest form of a hind or breech sight was fixed, but in the early part of the 19th century Colonel Thomas Blomefield proposed a movable or tangent sight. It was not, however, till 1820 that a tangent sight (designed by Major-General William Millar) was introduced into the navy; this was adopted by the army in 1846. In the case of most guns it was used in conjunction with the dispart sight above referred to. The tangent sight (see fig. 3) was graduated in degrees only. There were three patterns, one of brass and two of wood. As the tangent sight was placed in the line of metal, hence directly over the cascable, very little movement could be given to it, so that a second sight was required for long ranges. This was wood; the tangent, also of wood, was fastened in a dispart frame, which consequently could not be laid at elevations below the dispart angle.

Referring to fig. 1 it will be seen that in order to strike T the axis must be directed to G' at a height above T equal to TG, while the line of sight or line joining the notch of the tangent sight and apex of the dispart or foresight must be directed on T. In fig. 3 the tangent sight has been raised from O to S, the line of sight is SM, and the axis produced is AC. D is the dispart, M the muzzle sight, O' parallel to AG. Now the height to which the tangent sight has been raised in order to direct the axis on G' is evidently proportional to the tangent of the angle OMS = AXS. This angle is called the angle of elevation; OM is constant and is called the sighting radius. If the dispart sight were used, the sighting radius would be OD, but, as the range in fig. 4, the line of sight through D falls on the metal of the gun, the muzzle sight M is used. The formula for length of scale is, $s = $sighting radius $ \cdot $ tangent of the angle of elevation. In practice, tangent sights were graduated graphically only from large scale drawings. It will be seen from fig. 4 that if the gun and target are on the same horizontal plane the axis can be equally well directed by inclining it to the horizontal through the requisite number of degrees. This is called "quadrant elevation," and the proper inclination was arrived at by the "gunner's quadrant," a quadrant and plumb bob, one leg being made long to rest in the bore, or by bringing lines scribed on the breech of the gun in line with a pointer on the carriage; these were called "quarter sights."

Such were the sights in use with smooth-bore guns in the first half of the last century. Tangent sights were not much trusted at first. Captain Haultain, R.A., says in his description of testing sights (Occasional Papers, R.A. Institute, vol. L): "Range the sight, and if it keeps in line with a plumb bob, it can be as confidently relied upon as the line of metal, if the trunnions are horizontal. If the scale is only sightly out of the perpendicular, a few taps of the hammer will modify any trifling error."

The introduction of rifling necessitated an improvement in sights and an important modification in them. It was found that projectiles fired from a rifled gun deviated laterally from the line of fire owing to the axial spin of the projectile, and that if the gun were "right-handed," as the trunnion was turned, the deviation was to the right. This deviation or derivation is usually called drift (for further details see Ballistics). The drift for each nature of gun at different ranges was determined by actual firing. To overcome drift the axis must be pointed to the left of the target, and the amount will increase with the range.

In fig. 5 (plan) at a range HT, if the axis were directed on T, drift would carry the shot to D; therefore the axis must be directed on a point D' such that $DT = DT'$. HFT is the line of sight without any allowance for drift, causing the projectile to fall at D. Now if the notch of the tangent sight were carried to H' in order to lay on T, the foresight, and with it the axis, will be moved to F', the line of fire will be H'F'D', and the shot will strike T since $DT' = DT$. Left deflection has been put on; this could be done by noting the amount of deflection for each range and applying it by means of a sliding leaf carrying the notch, and it is done in howitzers; in most guns, however, it is found more convenient and sufficiently accurate to apply it automatically by inclining the socket through which the tangent scale rises to the left, so that as the scale rises, i.e., as the range increases, the notch is carried more and more to the left, and an increasing
SIGHTS

amount of left deflection given—the amount can easily be determined thus:

The height of tangent scale for any degree of elevation is given with sufficient accuracy by the rough rule for circular measure

\[ h = \frac{a \times R}{3 \times 1200} \]

where \( a \) is the angle of elevation in minutes, \( h \) the height of the tangent scale, and \( R \) the sighting radius; thus for

\[ 1^\circ, \quad h = \frac{360 \times R}{60} \]

Now supposing the sight is inclined \( i^\circ \) to the left, which will move the notch from \( H \) to \( H' \) (see fig. 6); as before

\[ HH' = \frac{R}{\cos i} \]

but in this case \( R = h/\sin i \), the resultant angle of deflection is \( H'F'H \), and this can be determined by the same formula

\[ a = \frac{h \times 1200 \times X}{60} \]

so that if the sight is inclined to the left \( i^\circ \) it will give \( i^\circ \) deflection for every degree of elevation. By the same formula it can be shown that \( i^\circ \) deflection will alter the point of impact by 1 in. for every 100 yds. of range; thus the proper inclination to give a mean correction for drift can be determined. In the early R.B.L. guns this angle was 2° 16'. With rifled guns deflection was also found necessary to allow for effect of wind, difference of level of trunnions, movement of target, and for the purpose of altering the point of impact laterally. This was arranged for by a movable leaf carrying the sighting \( V \), worked by means of a mill-headed screw provided with a scale in degrees and fractions to the same radius as the elevation scale, and an arrowhead for reading. Other improvements were: the gun was sighted on each side, tangent scales being provided in a sight between the breech, thus allowing a long scale for all ranges to be used, and the foresights screwing into holes or dropping into sockets in the trunnions, thus obviating the fouling of the line of sight, and the damage to which a fixed muzzle sight was liable.

Fig. 6.—Correction for Drift.

The tangent sight was graduated in yards as well as degrees and had also a fuze scale. The degree scale was subdivided to 10' and a slow-motion screw at the head enabled differences of one minute to be given; a clamping screw and lever were provided (see fig. 3).

Figs. 7, 8. Laying by Full Sight.

Sights for Mobile Artillery.

With the exception of the addition of a pin-hole to the tangent sight and cross wires to the foresight, and of minor improvements, and of the introduction of telescopic sights, the reciprocating sight, of which later, no great advance was made until the introduction of Scott's telescopic sight.

This sight (see Plate 4, fig. 1) consists of a telescopic mounted in a steel frame, provided with longitudinal trunnions fitting into V's in the gun. These V's are so arranged that the axis of the sight frame is always parallel to that of the gun. By means of a cross-level the frame can be so adjusted that the cross axis on which the telescope is mounted is always truly horizontal. Major L. K. Scott, R.E., thus described how he was led to think of the sight: "I had read in the Daily News an account of some experimental firing carried out by H.M.S. 'Hotspur' against the turret of H.M.S. 'Glatton,' At a range of 200 yds. on a perfectly calm day the 'Hotspur' fired several rounds at the 'Glatton's' turret and missed it.' Major Scott attributed this to tilt in the sights due to want of level of mounting (R.A.I. Proceedings, vol. xiii.). Tilt of sights in field guns owing to the sinking of one wheel had long been recognized as a source of error, and allowed for by a rule-of-thumb correction, depending on the fact that the track of all British field artillery gun-carriages is 60', so that, for every inch one wheel is lower than the other, the whole system is turned through one degree—

\[ a = \frac{h \times 1200 \times X}{60} \]

Referring to the calculations given above, this is equivalent to \( i^\circ \) deflection for every degree of elevation, which amount had to be given towards the higher wheel. This complication is eliminated in Scott's sight by simply levelling the cross-axis of the telescope. Other advantages are those common to all telescopic sights. Personal error is to a great extent eliminated, power of vision extended, the sight is self-contained, there is no fore-sight, a fine point in the telescope being aligned on the target. It can be equally well used for direct or indirect, forward or backward laying. A micrometer drum reads to 0.01, while the vernier reads to single minutes so that very fine adjustments can be made.

Disadvantages of earlier patterns were, the telescope was inverted, the drum was not graduated in yards, and drift not allowed for. These defects were all overcome in later patterns and an important addition made, that of means of measuring the angle of sight. In speaking of quadrant elevation a brief reference was made to the necessity for making an allowance for difference of level of gun and target. Figs. 10 to 13 explain this more fully, and show that for indirect laying the angle of sight must be added to the angle of elevation if the target is above the gun, and subtracted if vice versa. In Scott's sight, mark iv., there is a longitudinal level pivoted at one end and provided with a degree scale up to 4°; the level is moved by a spindle and micrometer screw reading to 0.01. If now the telescope be directed on the target and this level be brought to the centre of its run, the angle of sight can be read if afterwards any range ordered is put on the sight and the gun truly laid, this bubble will be found in the centre of its run—so that if that cross-bar of the target becomes obscured the gun can be relayed by elevating till the bubble is in the centre of its run, or at a completely concealed target the angle of sight can be, if the range and difference of level are known or can be measured from somewhere near the gun, be put on by means of the micrometer screw, and the gun subsequently laid by putting the range in yards or degrees on the sight drum and elevating or depressing till the bubble is central. Scott's advantages are that the sight is to be removed every time the gun is fired, and the amount of deflection is limited and has to be put on the reverse way to that on a tangent scale. Scott's sight, though no longer used with quick-firing guns, is the precursor of all modern sights.

XXV. 62.
SIGHTS

Modern Q.F. sights.

Indirect laying.

The introduction of trunnionless guns recoiling axially through a fixed cradle enabled sights to be attached to the non- recoil parts of the mounting, so that the necessity of removing a definite telescopic sight and then reattaching it was dispensed with. Telescope sights on the rocking-bar principle (see below) were introduced for 4.7-in. Q.F. guns on field mountings; these sights admit of continuous laying, i.e. the eye need not be removed when the gun is traversed. The advantage of concealment for one’s own guns and the certainty of being called upon to engage concealed targets, brought indirect laying into great prominence (see Goniometric sights). Indirect laying of a two- line sight is of two types: (1) that in which the sights are laid for direct fire; and (2) that in which the sights are laid for indirect fire without even aiming at the target itself, or on some aiming point close by, but from indistinctness or other causes quadrant elevation is preferred; and (3) that used when the target is completely hidden and an artificial line of fire laid out and the guns laid for direction on pointers, or the line transferred to a distant aiming point. The old method of giving quadrant elevation by clinometer was afterwards adopted by the British army, Scott's sight (see below) was the first attempt to obtain indirect laying for elevation by means of the sight itself, and in that sight the angle of sight was taken into account. In modern guns this is effected by what is technically called the “independent line of sight” (see ORDNANCE: Field Equipments). It is obtained by different means in different countries, but the principle is the same. There must be two sets of elevating gears, one which brings the axis of the gun and the sights together on to the target, thus finding the angle of sight and also pointing the axis of the gun at the target; and a second by which, independent of the sight which remains fixed, the elevation due to the range can be varied independently by means of fore- and rear sights, in yards for range. This latter is shown in the Krupp equipment (Plate, fig. 14), in which the sight is attached to the cradle, but does not move with it. The hand-wheel that screws the gun and cradle down on the fixed sight is fixed to the cradle, and, when the target is completely concealed it is necessary to lay the gun on an aiming point more or less out of the line of fire, or to lay on the target after an approximate estimation of the aiming posts with the sights at zero to give the direction of the target, and afterwards perhaps to transfer the line of sight to some other distant object, all of which require a far greater scope of deflection than is afforded by the direct firing. The latter is the case with African war improvised detachable deflection scales of wood or iron placed over the fore-sight, called gun arcs, were used, but this device was clumsy, inaccurate and insufficient, as it only gave about 30° or 40° deflection and admitted of only a sighted and laid could readily satisfy the requirements. "The goniometric sight in its simplest form is a circular graduated base plate on which a short telescope or sighted ruler is pivoted. Besides the main graduations there is usually a separate deflection scale." (Bethell). In this form, which is found in British field artillery, the goniometric or dial sight is used for picking up the line of fire. In the pillar sights used on French 80- and 90-mm. Q.F. guns it is used for laying for direction.

The collimator, or sight proper, has a lateral movement of 9°, and is actuated by the drum on the right turned by the milled head screw. The drum, graduated from 0 to 90°, is equal to 5.4' of the range. The movement of the graduation is provided by the drum and the milled head screw. The sights are laid for by means of the collimator and working the elevation wheel, makes the horizontal line dance about the landscape until it dances on to the target; then working the traversing gear he does the same thing in the vertical plane. Bringing his eye close, he brings the intersection on to the target." In the Krupp sights, which are indirectly laid, the axis of the gun is closed to the sight is placed on the top of the arc. In the French field Q.F. artillery the intermediate carriage (see description and diagram) is provided with a device for introducing the horizontal line to the eye. On the French field Q.F. guns the graduated arc on the gun is of goniometric character, and is graduated to a maximum of 47°, which is the maximum arc of elevation of 47°, which with the full charge would give the maximum range. Range is reduced by increasing the angle of elevation (by clinometer) or by using reduced charges. In the 9.45-in. Skoda gun the range is increased by increasing the angle of elevation, direction is given by means of a pointer on the mounting and a graduated arc on the in the United States, Colonel O. M. Lissak, Ordnance and Gunnery (New York and London, 1907).

Sights for Coast Defence Artillery (Fixed Armaments).

In coast defence artillery, owing to the fact that the guns are fixed on fixed mountings at a constant height (except for rise and fall of tide) above the horizontal plane on which their targets move, and that consequently the angle of sight and quadrant elevation for every range can be calculated, developments in sights, in a measure, gave way to improved means of giving quadrant elevation. The goniometric sights certainly were made, notably an automatic clamp, but quadrant elevation was sometimes laid by means of special sights, and not fixed. The correct value of the tangent of the angle of elevation was then applied to the angle of elevation on the arc. This enabled the gun to be laid from some little distance behind, so that the layer could be clear of recoil, and continuous laying was thus possible. The arrangements for giving quadrant elevation consisted of a separate index plate (see fig. 18), on the gun, graduated in degrees read by a "reader" on the carriage. A yard scale of varnished paper, made out locally for quadrant elevation with regard to height of site, was usually pasted over this. A correction for level of tide was in many cases necessary, and was
entered in a table or mounted on a drum which gave several corrections that had to be applied to the range for various causes. One great drawback to this system was that elevation was given with reference to the plane of the racers upon which the moving mounted, and as this was not always horizontally grave errors were introduced. To overcome this Colonel H. S. Watkin, C.B., introduced a hydroclinometer fixed on the trunnion. It was provided with a yardstick and index plate calibrated with reference to height of site, and elevation was read by the intersection of the edge of the liquid with the graduation for the particular range. These index sights were introduced to overcome the difficulties of disappearing guns, large guns firing through smoke, etc., such as the Moncrieff reflecting sights, and the fore-sight on the muzzle, etc. In the early days of B.L. guns very little change was made in the pattern of sights. Shield sights were introduced for disappearing mountings to admit of continuous laying for line, and a disk engraved for yards of range duty corrected for height, and called an "elevation indicator," replaced the index plate and reader. As in mobile artillery, the introduction of trunnionless guns brought about the evolution in laying and sights. Enlarged powder also made rapid firing a possibility and a necessity. Continuous laying and telescopic sights became possible. The reduction of friction by improved mechanical arrangements, and the introduction of electric firing, enabled the laymen not only to train and elevate the guns himself, but also to fire it the moment it was truly "on" the target. The rocking-bar sight, which had been for some time in use in the navy, was introduced. In this sight both hind and fore sights are fixed on a rigid bar pivoted about the centre of the rear end is raised or depressed by a rack worked by a hand-wheel; ranges are read from the periphery of a drum; the fore-sight and leaf of the hind-sight are provided with small electric glow lamps for night firing. In addition to these open sights the bar also carries a sighting telescope. The advantages compared with a tangent sight are that only half the movement is required to raise the sight over any range; the ranges on the drum are easier to read, and if necessary can be set by another man, so that the layer need not take his eye from the telescope. The pattern of telescope used in coast defence is that designed by Dr. Common. It is an erecting telescope with a field of view of 10° and a magnification of 3 diameters, and admits plenty of light. The diamond-shaped pointer is always in focus; focusing for individual eyesight is effected by turning the eye-piece, which is furnished with a scale for readjustment. A higher power glass has since been introduced for long ranges.

The improvements in gun mountings mentioned above led the way to introduce a sight. The principle of combined sight and range-finder had long been known, and was embodied in the so-called "Italian" sight, but, on account of the slow rate of fire imposed by black powder, so confined by its use was a great advantage, and it was unsuited to the imperfect mechanical arrangements of the gun mountings of the time. When ordnance replaced black powder gun sights in front of the gun were no longer obscured by hanging clouds of smoke, it became a desideratum, and, as the automatic sight, it was reintroduced by Sir G. S. Clarke, when he, as superintendent of the Royal Carriage Factory, had brought gun mountings to such a pitch of perfection that it could be usefully employed. An automatic sight is a sight connected in such a manner with the elevating gear of the gun, that when the sight is directed on the water-line of a target at any range the gun will have the proper quadrant elevation for that range. Colonel H. S. Watkin, C.B., describes the theory of the sight thus: (Proceedings R.A.F. 1893-48.)

**Conditions.**—The gun spindle of the hand-wheel gears; one end of the cross-spline moves the range drum \( \gamma \). The worm and hand-wheel are thrown into and out of gear by means of the clutch \( \lambda \). When the hand-wheel is thrown out of gear the sights can only be moved by means of the elevating gear of the gun. The line of sight and the elevation of the gun henceforth are inseparable. The automatic sight consists of the rocking-bar, and the range secured by the bolt \( \epsilon \) to the carrier; the lower end of the lever carries the cam \( \kappa \), which is constrained to move in the cam \( \beta \) by means of the spring in the spring-box \( \delta \); the rear end of the horizontal arm of the lever is formed into jaws \( z \); the same action of the clutch \( \phi \) releases the worm and hand-wheel forces a catch on a vertical stem \( n \) into the jaws of the lever, and fixes the rocking and sight bars rigidly. It followed that the sights can now only be affected by means of the elevating gear of the gun, acted on by means of the movement of the vertical arm of the bent lever, and its movement is constrained to follow the cam, which is cut in such a way that for any elevation of the gun the sight bar is depressed to the angle of sight for the range corresponding to the elevation; \( \theta \) is a lever for making allowance for state of tide, and \( \epsilon \) is the scale on which the rise and fall in feet above and below mean sea-level are marked. In later patterns, the sight is automatic pure and simple, the lever \( \lambda \) being attached to the range scale and gear for raising the sights dispensed with, much as shown in fig. 23. In the larger nature of
SIGHTS

65

gun there is a rocking-bar sight on one side and an automatic sight on the other. The automatic sight has, however, distinct limitations; it depends for its accuracy on height of aim, and at long ranges even from a high site it cannot compare for accuracy with independent range-finding and careful laying or accurately applied quadrant elevation; it is also useless when the water line of the target is obscured, as may often be the case from the splash caused by bursting shell. Improved communications between range-finder and gun, range and training dials placed on the mountings where they can be read by the layers, and more accurate elevation indicators have made laying by quadrant elevation, and in certain cases giving direction by means of graduated arc and pointer, both accurate and rapid, so that once more this system of laying is coming into favour for long ranges.

Naval Sights.

In the navy the conditions of an unstable platform rendered quadrant elevation of little use, and necessitated a special pattern of tangent sight to facilitate firing the moment the roll of the ship brought the sights on the target. A diagram of the Foote-Arbutnott, or H, or naval tangent sight, is given below (fig. 24). The fore-sight was a small globe, and in the original patterns this was placed on a movable leaf on which deflection for speed of one's own ship was given, while deflection for speed of enemy's ship and wind were given on the tangent sight. The yard scales were on detachable strips, so that fresh strips could be inserted for variations in velocity. In subsequent patterns all the deflection was given on the tangent sight, which was provided with two scales, the upper one graduated in knots for speed of ship, and the lower one in degrees. Night sights were introduced by Captain McEvoy in 1884. They consist of an electric battery cable and lamp-holders and small glow lamps, that for the hind-sight is coloured.

Turret Sights.—In turrets or barbettes two sets of sights are provided, one for each gun. They are geared so as to work simultaneously and alike. Toothed gearing connected with the gun mountings actuates a rack attached to the standards carrying the sights, so that any movement of the gun mounting is communicated to the sights. The sights themselves fit into sockets cut at the proper angle for drift, and are raised in their sockets the requisite amount for the range by means of a small hand-wheel; they are thus non-recollimating sights. The layer has under his control the hand-wheel for setting the range on the sights, another hand-wheel for elevating the gun and the sights on to the target, and a third for traversing the turret. The introduction of trunnionless guns was followed by that of rocking-bar sights (described above). Sightings telescopes were also introduced. In the navy one of the first essentials is rapidity of fire; to attain this the duties of laying are subdivided; one man laying for elevation, elevating and firing, a second laying for line and traversing, and a third putting on the elevation ordered or communicated by electric dial. To ensure the sights on each side reading together they are connected by rods. To facilitate the setting of the range the ranges are shown on a dial which can be read from the side of the mounting, from where also the sight can be set.

Military Rifle Sights.

With smooth-bore arms of short range, the soldier needed little more, in the way of sights, than the rough equivalent of the dis- part of cannon, viz., patches at the breech and muzzle with notch and blade (fig. 25). But some form of sight was almost invariably employed with rifled firearms, even of early date, and when about 1780-1800 the rifle came into use as a military weapon, sights were introduced with it. The sights of the Baker, Brunswick, and other rifles did not differ in principle from the now common form of elevating back-sight (fig. 29), that is, the elevation was given on an upright adjustable back sight. But this refinement was long looked upon as a mere fad, both by the soldiers who used the smooth-bore (or converted rifle) musket, and by experienced short-range snapshooters. In this connexion Major-General John Gibbon, U.S.A., records that in the American Civil War hunters and others who served in the western regiments habitually knocked off the back-sights of the rifles that were issued to them, preferring to do without them. But, as rifles improved and came into general use for all troops, sights became indispensable, and to-day as much care is taken over the sighting as over the "proof" of a military rifle. The modern rifle has invariably a back-sight and a fore-sight. The latter is, as a general rule, fixed and unalterable, its size, position on the barrel, &c., being practically ascertained, as accurately as possible, for the lowest elevation on the back-sight. Some fore-sights have, however, a lateral motion giving within narrow limits the deflection found to be necessary for the variation of each rifle from the average. The shape of the part seen through the notch or aperture of the back-sight in aiming varies a good deal. Two of the commonest forms are shown in fig. 26, called the "barleycorn," and 27, called the "bead." The fore-sight of the Krug-Jorgensen rifle, used in the United States army until 1906, consisted of a blade with parallel sides. The shape of the part seen when aiming indicates whether the proper amount of the fore-sight is taken up into the line of vision from the back-sight to the target. A "full" sight is shown in fig. 8 above. The position of the fore-sight at or near the end of the barrel renders it peculiarly liable to injury, and in some rifles therefore it is provided with guards or ears; these, however, have the disadvantage that more or less of the light that would otherwise light up the sight is intercepted by the guards. The fore-sight of the British service "short" Lee-Enfield (1903) has guards and also a lateral adjustment of the barleycorn. Back-sights are of many different patterns, almost any two being

SIGIRI—SIGISMUND

SIGIRI, the Lion's Rock, the ruin of a remarkable stronghold 7° 59’ N., and 81° E., 14 m. N.E. of Dambulla, and about 17 m. nearly due W. of Pulasthi-pura, the now ruined ancient capital of Ceylon. There a solitary pillar of granitic rock rises to a great height out of the plain, and the top actually overhangs the sides. On the summit of this pencil of rock there are five or six acres of ground; and on them, in A.D. 477, Kasaya the Parricide built his palace, and thought to find an inaccessible refuge from his enemies. His father Dhatu Sena, a country priest, had, after many years of foreign oppression, roused his countrymen, in 459, to rebellion, led them to victory, driven out the Tamil oppressors, and entered on his reign as a national hero. He was as successful in the arts of peace as he had been in those of war; and carried to completion, among other good works, an ambitious irrigation scheme—probably the greatest feat of engineering that had then been accomplished anywhere in the world. This was the celebrated Kalâ Wewa, or Black Reservoir, now in circumference, which gave wealth to the whole country for two days' journey north of the capital, Anurâdha-pura, and provided that city also with a constant supply of water. Popular with the people, the king could not control his own family; and as the outcome of a palace intrigue in 477 his son Kasaya had declared himself king, and taken his father prisoner. Threatened with death on his refusing to say where his treasure lay hid, the old king told them to take him to the tank. They took him there, and while bathing in the water he let some of it drop through his fingers, which he thought was his treasure; this, and the love of my people." Then Kasaya had his father built up alive into a wall. Meanwhile Kasaya's brother had escaped to India and was plotting a counter revolution. It was then that the parricide prepared his defence. He utilized his father's engineers in the construction of a path or gallery windling up round the Sigiri rock. Most of it was made, by bursting the rock by means of wooden wedges, through the solid granite, and its outside parapet was supported by walls of brick resting on ledges far below. It is a marvellous piece of work. Abandoned since 495—for Kasaya was eventually slain during a battle fought in the plains beyond it—albeit it is the whole, was withstood the heaviest tropical storms, and is now used again to gain access to the top. When rediscovered by Major Forbes in 1835 the portions of the gallery where it had been exposed for so many centuries to the south-west monsoon, had been carried away. These gaps have lately been repaired, or made passable with the help of iron stanchions; the remains of the buildings at the top and at the foot of the mountain have been excavated; and the entrance to the gallery, between the outstretched paws of a gigantic lion, has been laid bare. The fresco paintings in the galleries are perhaps the most interesting of the extant remains. They are older than any others found in India, and have been carefully copied, and, as far as possible, preserved.

SIGISMUND (1368–1437), Roman emperor and king of Hungary and Bohemia, was a son of the emperor Charles IV. and Elizabeth, daughter of Bogislaus V., duke of Pomerania. He was born on the 15th of February 1368, and in 1374 was betrothed to Maria, the eldest daughter of Louis the Great, king of Poland and Hungary. Having become margrave of Brandenburg on his father's death in 1378, he was educated at the Hungarian court from his eleventh to his sixteenth year, becoming thoroughly magyarized and entirely devoted to his adopted country. His wife Maria, to whom he was married in 1385, was captured by the rebellious Horvaths in the following year, and only rescued by her young husband with the aid of the Venetians in June 1387. Sigismund had been crowned king of Hungary on the 31st of March 1387, and having raised money by pledging Brandenburg to his cousin Jobst, margrave of Moravia, he was engaged for the next nine years in a ceaseless struggle for the possession of this unstable throne. The bulk of the nation headed by the great Garay family was with him; but in the southern provinces between the Save and the Drave, the Horvaths with the support of the Bosnian king Tvrtko, proclaimed as their king Ladislaus, king of Naples, son of the murdered Hungarian king, Charles II. (see Hungary). Not until 1395 did the valiant Miklos Garay succeed in suppressing them. In 1396 Sigismund led the combined armies of Christendom against the Turks, who had taken advantage of the temporary helplessness of Hungary to extend their dominion to the banks of the Danube. This crusade, preached by Pope Boniface IX., was very popular in Hungary. The nobles flocked in thousands to the royal standard, and were reinforced by volunteers from nearly every part of Europe, the most important contingent being that of the French led by John, duke of Nevers, son of Philip II., duke of Burgundy. It was a host of about 50,000 or 60,000 men. After capturing Widdin, he sat down before the fortress of Nicopolis, to retain which Sultan Bajazid raised the siege of Constantinople and at the head of 140,000 men completely overthrew the Christian forces in a battle fought between the 25th and 28th of September 1396. Deprived of his authority in Hungary, Sigismund then turned his attention to securing the succession in Germany and Bohemia, and was recognized by his childless step-brother Wenceslaus as vicar-general of the whole empire. He remained, however, powerless when in 1420 Wenceslaus was deposed and Rupert, archbishop of Aix-la-Chapelle, was elected German king in his stead. During these years he was also involved in domestic difficulties out of which sprang a second war with Ladislaus of Naples; and on his return to Hungary in 1421 he was once imprisoned and twice deposed. This struggle in its turn led to a war with Venice, as Ladislaus before departing to his own land had sold the Dalmatian cities to the Venetians for 100,000 ducats. In 1427 Sigismund assisted a rising against Wenceslaus, during the course of which the German and Bohemian king was made a prisoner, and Sigismund ruled Bohemia for nineteen months. In 1410 the German king Rupert died, when Sigismund, ignoring his step-brother's title, was crowned king, or king of the Romans, first by three of the electors on the 20th of September 1410, and again after the death of his rival, Jobst of Moravia, on the 21st of July 1411; but his coronation was deferred until the 8th of November 1414, when it took place at Aix-la-Chapelle.

During a visit to Italy the king had taken advantage of the difficulties of Pope John XXIII. to obtain a promise that a council should be called to Constance in 1414. He took a leading part in the deliberations of this assembly, and during the sittings managed a junction between England and France in an attempt to secure the abdication of the three rival popes (see CONSTANCE, COUNCIL OF). The complicity of Sigismund in the death of John Huss is a matter of controversy. He had granted him a safe-conduct and protested against his imprisonment; and it was during his absence that the reformer was burned. An alliance with England against France, and an attempt to secure peace in Germany by a league of the towns, which failed owing to the hostility of the princes, were the main secular proceedings of these years. In 1419 the death of Wenceslaus left Sigismund titular king of Bohemia, but he had to wait for seventeen years before the Czechs would acknowledge him. But although the two dignities of king of the Romans and king of Bohemia added considerably to his importance, and indeed made him the nominal head of Christendom, they conferred no increase of power and financially embarrassed him. It was only
as king of Hungary that he had succeeded in establishing his authority and in doing anything for the order and good government of the land. Entrusting the government of Bohemia to Sophia, the widow of Wenceslaus, he hastened into Hungary; but the Bohemians, who distrusted him as the betrayer of Huss, were soon in arms; and the flame was fanned when his grand-duke declared his intention of prosecuting the war against heretics who were also communists. Three campaigns against the Hussites ended in disaster; the Turks were again attacking Hungary; and the king, unable to obtain support from the German princes, was powerless in Bohemia. His attempts at the diet of Nuremberg in 1422 to raise a mercenary army were foiled by the resistance of the towns; and in 1424 the electors, among whom was Sigismund's former ally, Frederick I. of Hohenzollern, margrave of Brandenburg, sought to strengthen their own authority at the expense of the king. Although the scheme failed, the danger to Germany from the Hussites led to fresh proposals, the result of which was that Sigismund was virtually deprived of the leadership of the war and the headship of Germany. In 1431 he went to Milan where on the 29th of November he received the Lombard crown; after which he remained for some time at Siena, negotiating for his coronation as emperor and for the recognition of the Council of Basel by Pope Eugenius IV.

He was crowned emperor at Rome on the 31st of May 1433, and after obtaining his demands from the pope returned to Bohemia, where he was recognized as king in 1436, though his power was little more than nominal. On the 9th of December 1437 he died at Zenaim, and was buried at Grosswardein. By his second wife, Barbara of Cilli, he left an only daughter, Elizabeth, who was married to Albert V., duke of Austria, afterwards the German king Albert II., whom he named as his successor. As he left no sons the house of Luxemburg became extinct on his death.

Sigismund was brave and handsome, courtly in his bearing, eloquent in his speech, but licentious in his manners. He was an accomplished knight and is said to have known seven languages. He was also one of the most far-seeing statesmen of his day, and steadily endeavoured to bring about the expulsion of the Turks from Europe by uniting Christendom against them. As king of Hungary he approved himself a born political reformer, and the military measures which he adopted in that kingdom enabled the kingdom to hold its own against the Turks for nearly a hundred years. His sense of justice and honour was slight; but as regards the death of Huss he had to choose between condescending the court and allowing the council to break up without result. He cannot be entirely blamed for the misfortunes of Germany during his reign, for he showed a willingness to attempt reform; but he was easily discouraged, and was hampered on all sides by poverty, which often compelled him to resort to the meanest expedients for raising money.

**BIBLIOGRAPHY.**—The more important works to be consulted are *Reperatorium Germanicum; Regesten aus den päpstlichen Archiven zur Geschichte des deutschen Reichs im XIV. und XV. Jahrhundert* (Berlin, 1897); E. Windecke, *Denkwürdigkeiten zur Geschichte des Zeitalters Kaiser Sigismund* (Berlin, 1893), and *Das Leben König Sigismund* (Berlin, 1880); J. Asbach, *Geschichte Kaiser Sigismunds* (Hamburg, 1838-1845); W. Berger, *Johannes Hus und König Sigismund* (Augsburg, 1871); G. Schönerr, *The Inheritors of the House of Anjou* (Buda-Pesth, 1883); and J. Acsely, *History of the Hungarian Realm*, vol. i. (Buda, 1896). Of the books Acsely's are the fullest, and Windecke the most critical. Schönerr is the best Hungarian authority. Acsely is too indulgent to the vicissitudes of Sigismund. See also A. Main, *The Emperor Sigismund* (1903).

**SIGISMUND I.** (1467-1548), king of Poland, the fifth son of Casimir III., who reigned during the whole period. The inheritance of Poland was divided among his three elder brothers, Casimir IV. and Sigismund taking the greater part of Lithuania on the 21st of October 1505 and king of Poland on the 8th of January 1506. Sigismund was the only one of the six sons of Casimir IV. gifted with extraordinary ability. He had served his apprenticeship in the art of government first as prince of Glogau and subsequently as governor of Silesia and margrave of Lusatia under his elder brother Wladislaus of Bohemia and Hungary. Silesia, already more than half Germanized, had for generations been the battle-ground between the Luxemburgers and the Poles, and was split up into innumerable principalities which vied incessantly upon their neighbours and each other.

Into the midst of this region of banditti Sigismund came as a sort of grand justice, a sworn enemy of every sort of disorder. His little principality of Glogau soon became famous as a model state, and as governor of Silesia he suppressed the robber knights with an iron hand, protected the law-abiding classes, and revived the state as a whole. In Poland he maintained a spirit and businesslike qualities speedily remedied the abuses caused by the wastefulness of his predecessor Alexander. His first step was to recover control of the mint, and place it in the hands of capable middle-class merchants and bankers, like Caspar Beer, Jan Thurozo, Jan Boner, the Betmans, exiles for conscience' sake from Alasc, who had sought refuge in Poland under Casimir IV., Justus Decuysz, subsequently the king's secretary and historian, and their fellows, all practical economists of high integrity who reformed the currency and opened out new ways for trade and commerce. The reorganization of the mint alone increased the royal revenue by 210,000 gulden a year and enabled Sigismund to pay the expenses of his earlier wars. In foreign affairs Sigismund was largely guided by the Laskis (Adam, Jan and Hieronymus), Jan Tarnowski and others, most of whom he selected himself.

In his marriages also he was influenced by political considerations, though to both his consorts he was an affectionate husband. His first wife, whom the diet, anxious for the perpetuation of the dynasty, compelled him, already in his forty-fourth year (Feb. 1512), to marry, was Barbara Zapolysz, whose family as represented first by her father Stephen and subsequently by her brother John, dominated Hungarian politics in the last quarter of the 15th and the first quarter of the 16th century. Barbara brought him a dowry of 100,000 gulden and the support of the Magyar magnates, but the match nearly brought about a breach with the emperor Maximilian, jealous already of the Jagiello influence in Hungary. On Barbara's death three years later without male offspring, Sigismund (in April 1518) gave his hand to Bona Sforza, a kinswoman of the emperor and granddaughter of the king of Aragon, who came to him with a dowry of 200,000 ducats and the promise of an inheritance from her mother of half a million more which she never got. Bona's grace and beauty speedily fascinated Sigismund, and contemporary satirists ridiculed him for playing the part of Jove to her Juno. She introduced Italian elegance and luxury into the austere court of Cracow and exercised no inconsiderable influence on affairs. But she used her great financial and economical talents almost entirely for her own benefit. She enriched herself at the expense of the state, corrupted society, degraded the clergy, and in her later years was universally detested for her mischievous meddling, inexhaustible greed, and unnatural treatment of her children.

The first twenty years of Sigismund's reign were marked by exceptional vigour. His principal difficulties were due to the aggressiveness of Muscovy and the disloyalty of Prussia. With the tsars Vasilly III. and Ivan IV. Sigismund was never absolutely at peace. The terminable war was interrupted, indeed, by brief truces whenever Polish valour proved superior to Muscovite persistence, as for instance after the great victory of Orsz (Sept. 1534) and again in 1532 when Moscow was threatened by the Tartars. But the Tartars themselves were a standing menace to the republic. In the open field, indeed, they were generally defeated (e.g. at Winiowice in 1512 and at Kanow in 1526), yet occasionally, as at Sokal when they wiped out a whole Polish army, they prevailed even in pitched battles. Generally, however, they confined themselves to raiding on a grand scale and, encouraged by the Porte or the Muscovite, systematically murdered whole provinces, plundering and destroying the lands on which they had been enabled by the Polish proper and disappearing with immense booty. It was this growing sense of border insecurity which led to the establishment of the Cossacks (see POLAND: History).

The grand-masters of the Teutonic Order, always sure of support in Germany, were also a constant source of annoyance. Their constant aim was to shake off Polish suzerainty, and in 1520-21 their menacing attitude compelled Sigismund to take up arms against them. The long quarrel was finally adjusted in 1525 when the last grand-master, after a fruitless pilgrimage through Europe for support, professed Lutheranism and as first
duke of Prussia did public homage to the Polish king in the market-place of Cracow. The secularization of Prussia was opposed by the more religious of Sigismund's counselors, and the king certainly exposed himself to considerable odium in the Catholic world; but taking all the circumstances into consideration, it was perhaps the shortest way out of a situation bristling with difficulties.

Personally a devout Catholic and opposed in principle to the spread of sectarianism in Poland, Sigismund was nevertheless too wise and just to permit the persecution of non-Catholics; and in Lithuania, where a fanatical Catholic minority of magnates dominated the senate, he resolutely upheld the rights of his Orthodox subjects. Thus he rewarded the Orthodox upstart, Prince Constantine Ortrogz, for his victory at Orsa by making him palatine of Troki, despite determined opposition from the Catholics; severely punished all disturbers of the worship of the Greek schismatics; protected the Jews in the country places, and insisted that the municipalities of the towns should be composed of an equal number of Catholics and Orthodox Greeks. By his tact, equity, and Christian charity, Sigismund endeared himself even to those who differed most from him, as witness the readiness of the Lithuanians to elect his infant son grand-duke of Lithuania in 1522, and to crown him in 1529.

After his sixtieth year there was a visible decline in the energy and capacity of Sigismund. To the outward eye his gigantic strength and herculean build lent him the appearance of health and vigour, but forty years of intermittent toil and anxiety had told upon him, and during the last two-and-twenty years of his reign, by which time all his old self-chosen counsellors had died off, he apathetically resigned himself to the course of events without making any sustained effort to stem the rising tide of Protestantism and democracy. He had no sympathy with the new men and the new ideas, and the malcontents in Poland often included the aged king with impiety, and at one period, held at Piotrkow in 1547, Luppa Podlodowski, the champion of the szlachta, openly threatened him with rebellion. Sigismund died on the 1st of April 1548. By Bona he had five children—one son, Sigismund Augustus, who succeeded him, and four daughters, Isabella, who married John Zapolya, prince of Transylvania, Sophia, who married the duke of Brunswick, Catherine, who as the wife of John III. of Sweden became the mother of the Polish Vasas, and Anna, who subsequently wedded King Stephen Báthory.

See August Szechowski, History of Poland (Pol.), vol. ii. (Vienna, 1903); Zygmunt Celichowski, Materials for the history of the reign of Sigismund the Old (Pol.) (Posen, 1900); Adolf Pavinski, The youthful years of Sigismund the Old (Pol.) (Warsaw, 1902); Adam Darowski, Bona Sforza (1904).  

SIGISMUND II. (1520-1572), king of Poland, the only son of Sigismund I., king of Poland, whom he succeeded in 1548, and Bona Sforza. At the very beginning of his reign he came into collision with the turbulent szlachta or gentry, who had already begun to out the great families from power. The ostensible cause of their animosity to the king was his second marriage, secretly contracted before his accession, with the beautiful Lithuanian Calvinist, Barbara Radziwill. Daughter of the famous Black Radziwill. But the Austrian court and Sigismund's own mother, Queen Bona, seem to have been behind the movement, and so violent was the agitation at Sigismund's first diet (31st of October 1548) that the deputies threatened to renounce their allegiance unless the king instantly repudiated Barbara. This he refused to do, and his moral courage united with no small political dexterity enabled him to win the day. By 1550, when he summoned his second diet, a reaction in his favour began, and the lingering petulance of the gentry was sternly rebuked by Ruma, the marshal of the diet, who openly accused them of attempting to diminish unduly the legislative prerogative of the crown. The death of Barbara, five days after her coronation (7th of December 1550), under very distressing circumstances which led to an unproved suspicion that she had been poisoned by Queen Bona,—compelled Sigismund to contract a third purely political union with the Austrian archduchess Catherine, the sister of Sigismund's first wife Elizabeth, who had died within a twelvemonth of her marriage with him, while he was still only crown prince. The third bride was sickly and unsympathetic, and from her Sigismund soon lost all hope of progeny, to his despair, for being the last male of the Jagiellons in the direct line, the dynasty was threatened with extinction. He sought to remedy the evil by liaisons with two of the most beautiful of his countrywomen, Barbara Gizanka and Anna Zajanczkowska, the diet undertaking to legitimize and acknowledge as his successor any heir male who might be born to him; but their complacency was in vain, for the king died childless. This matter of the king's marriage was of great political importance, the Protestants and the Catholics being equally interested in the issue. Had he not carried his third marriage to the point of ordaining his bride a nun, as the example of Henry VIII. by pleading that his detested third wife was the sister of his first and consequently the union was uncanonical. The Polish Protestants hoped that he would take this course and thus bring about a breach with Rome at the very crisis of the confessional struggle in Poland, while the Habsburgs, who coveted the Polish throne, raised every obstacle to the childless king's remarriage. Not till Queen Catherine's death on the 28th of February 1572 were Sigismund's hands free, but he followed her to the grave less than six months afterwards. By the 30th of August 1572, Sigismund was a widower, and the reign was a period of internal and external expansion. He saw the invasion of Poland by the Reformation, and the democratic upheaval which placed all political power in the hands of the szlachta; he saw the collapse of the ancient order of the Knights of the Sword in the north (which led to the acquisition of Livonia by the republic) and the consolidation of the Turkish power in the south. Throughout this perilous transitional period Sigismund's was the hand which successfully steered the ship of state amidst all the whirlpools that constantly threatened to engulf it. A far less imposing figure than his father, the elegant and refined Sigismund II. was nevertheless an Austrian rather than the stern and majestic Sigismund I. Tenacity and patience, the characteristics of all the Jagiellons, he possessed in a high degree, and he added to them a supple dexterity and a diplomatic finesse which he may have inherited from his Italian mother. Certainly no other Polish king so thoroughly understood the nature of the ingredients of that witch's cauldron, the Polish diet, as he did. Both the Austrian ambassadors and the papal legates testify to the care with which he controlled "this nation so difficult to lead.' Everything went as he wished, they said, because he seemed to know everything beforehand. He managed to get more money than his father could ever get, and at one of his diets won the hearts of the whole assembly by unexpectedly appearing before them in the simple grey coat of a Mosavian squire. Like his father, a pro-Austrian by conviction, he contrived even in this respect to carry the Polish nation, always so distrustful of the Germans, entirely along with him, thereby avoiding all serious complications with the ever dangerous Turk. Only a statesman of genius could have mediated for twenty years, as he did, between the church and the schismatics without alienating the sympathies of either. But the most striking memorial of his greatness was his policy in the two last wars against the Turks, which finally made of Poland and Lithuania one body politic, and put an end to the jealousies and discord of centuries (see Poland, History). The merit of this crowning achievement belongs to Sigismund alone; but for him it would have been impossible. Sigismund II. died at his beloved Knyzynze on the 6th of July 1572, in his fifty-second year.

See Ludwik Finkel, Characteristics of Sigismund Augustus (Pol.) (Lemberg, 1888); Ludwik Finkel, Gesheime Briefe an Hoyer, Gesandten am Hofe des Kaisers Karl V. (Wadowice, 1850); Adam Darowski, Bona Sforza (Pol.) (Rome, 1903).  

SIGISMUND III. (1566-1632), king of Poland and Sweden, son of John III., king of Sweden, and Catherine Jagielloniska, sister of Sigismund II., king of Poland, thus uniting in his person the royal lines of Vasa and Jagiello. Educated as a Catholic by his mother, he was on the death of Stephen Báthory elected king of Poland (August 10, 1587) chiefly through the efforts of the Polish chancellor, Jan Zamoyski, and of his own aunt, Anne, queen-dowager of Poland, who lent the chancellor 100,000 gulden.
to raise troops in defence of her nephew's cause. On his election, Sigismund promised to maintain a fleet in the Baltic, to fortify the eastern frontier against the Tatars, and not to visit Sweden without the consent of the Polish diet. Sixteen days later were signed the articles of Kalmar regulating the future relations between Poland and Sweden, when in process of time Sigismund should succeed his father as king of Sweden. The two kingdoms were to be perpetually allied, but each of them was to retain its own laws and customs. Sweden was also to enjoy her religion subject to such changes as a general council might make. During Sigismund's absence from Sweden that realm was to be ruled by seven Swedes, six to be elected by the king and one by Duke Charles, his Protestant uncle. Sweden, moreover, was not to be administered from Poland. A week after subscribing these articles the young prince departed to take possession of the Polish throne. He was expressly commanded by his father to return to Sweden, if the Polish deputation awaiting him at Danzig should insist on the cession of Estonia to Poland as a condition precedent to the act of homage. The Poles probably had more difficulty to satisfy than was anticipated; but finally a compromise was come to whereby the territorial settlement was postponed till after the death of John III; and Sigismund was duly crowned at Cracow on the 27th of December 1587.

Sigismund's position as king of Poland was extraordinarily difficult. As a foreigner he was from the first out of sympathy with the majority of his subjects. As a man of education and refinement, fond of music, the fine arts, and polite literature, he was unintelligible to the szlachta, who regarded all artists and poets as either mechanics or adventurers. His very virtues were strange and therefore offensive to the Poles. His prudent reserve, and imperturbable calmness were branded as stiffness and haughtiness. Even Zamowsky who had placed him on the throne complained that the king was possessed by a dumb devil. He lacked, moreover, the tact and bonhomie of the Jagiellons; but in fairness it should be added that the Jagiellons were natives of the soil, that they had practically made the monarchy, and that they could always play Lithuania off against Poland.

Sigismund's difficulties were also increased by his political views which he brought with him from Sweden cut and dried, and which antagonized almost diametrically the Poles of the upper and more chanceller. Yet, impracticable as it may have been, Sigismund's system of foreign policy as compared with Zamowsky's was, at any rate, clear and definite. It aimed at a close alliance with the house of Austria, with the double object of drawing Sweden within its orbit and overawing the Porte by the conjunction of the two great Catholic powers of central Europe. A corollary to this system was the much needed reform of the Polish constitution, without which nothing beneficial was to be expected from any political combination. Thus Sigismund's views were those of a statesman who clearly recognizes present evils and would remedy them. But all his efforts were foiled on the jealousy and suspicion of the magnates headed by the chancellor. The first three and twenty years of Sigismund's reign is the record of an almost constant struggle between Zamowsky and the king, in which the two opponents were so evenly matched that they did little more than counterpoise each other. At the diet of 1590 Zamowsky successfully thwarted all the efforts of the Austrian party; whereupon the king, taking advantage of sudden vacancies among the chief offices of state, brought into power the Radziwill and other great Lithuanian dignitaries, thereby for a time considerably curtailing the authority of the chancellor. In 1592 Sigismund was compelled to recognize the German States, and the following year a reconciliation was patched up between the king and the chancellor to enable the former to secure possession of his Swedish throne vacant by the death of his father John III. He arrived at Stockholm on the 30th of September 1593 and was crowned at Upsala on the 10th of February 1594, but only after he had consented to the maintenance of the "pure evangelical religion" in Sweden. On the 14th of July 1594 he departed for Poland leaving Duke Charles and the senate to rule Sweden during his absence. Four years later (July 1598) Sigismund was forced to fight for his native crown by the usurpation of his uncle, aided by the Protestant party in Sweden. He landed at Kalmar with 5000 men, mostly Hungarian mercenaries; the fortress opened its gates to him at once and the capital and the country people welcomed him. The Catholic world watched his progress with the most sanguine expectations. Sigismund's success in Sweden was regarded as only the beginning of greater triumphs. But it was not to be. After fruitless negotiations with his father, Sigismund advanced with his army from Kalmar, but was defeated by the duke at Stångebro on the 25th of September. Three days later, by the compact of Linköping, Sigismund agreed to subscribe to the two papal proclamations which accompanied him that the Linköping agreement had been extorted from him, and was therefore invalid. Sigismund never saw Sweden again, but he persistently refused to abandon his claims or recognize the new Swedish government; and this unfortunate obstinacy was to involve Poland in the latter's series of unprofitable wars with Sweden.

In 1602 Sigismund wedded Constantia, the sister of his deceased first wife, an event which strengthened the hands of the Austrian party at court, and still further depressed the chancellor. At the diet of 1605 Sigismund and his partisans endeavoured so far to reform the Polish constitution as to substitute a decision by a plurality of votes for unanimity in the diet. This most simple and salutary reform was, however, rendered nugatory by the opposition of Zamowsky, and his death the same year made matters still worse, as it left the opposition in the hands of men unsettled and incapable, like Nicholas Zebrzydowski, or sheer soundards, like Stanislaw Stadnicki. From 1606 indeed to 1610 Poland was in an anarchical condition. Insurrection and rebellion triumphed everywhere, and all that Sigismund could do was to minimize the mischief as much as possible by his moderation and courage. On foreign affairs these disorders had the most disastrous effect. The simultaneous collapse of Muscovy had given Poland an unexampled opportunity of rendering the tsardom for ever harmless. But the necessary supplies were never forthcoming and the diet remained absolutely indifferent to the triumphs of Zolkiewski and the other great generals who performed in Kobellinganian feats with Lilliputian armies. At the outburst of the Thirty Years' War Sigismund prudently leagued with the emperor to counterpoise the united efforts of the Turks and the Protestants. This policy was very beneficial to the Catholic cause, as it diverted the Turk from central to north-eastern Europe; yet, but for the self-sacrificing heroism of Zolkiewski at Cecora and of Chodkiewicz at Khotin, it might have been most ruinous to Poland. Sigismund died very suddenly in his 66th year, leaving two sons, Wladislaus and John Casimir, who succeeded him in rotation.

See Aleksander Rembowski, The Insurrection of Zebrzydowski (Pol.) (Cracow, 1893); Stanislaw Nienjoewski, Memoires (Pol.) (Lemberg, 1899); Sveriges Historia, vol. iii. (Stockholm, 1881); Julian Ursyn Niemcewicz, History of the Reign of Sigismund III. (Pol.) (Breslau, 1859); (Pol.) (Breslau, 1859); (Pol.) (Breslau, 1859).

Sigmaringen, a town of Germany, chief town of the Prussian principality of Hohenzollern, on the right bank of the Danube, 55 m. S. of Tübingen, on the railway to Ulm. Pop. (1905) 6421. The castle of the Hohenzollerns crowns a high rock above the river, and contains a collection of pictures, an exceptionally interesting museum (textiles, enamels, metal-work, &c.), an armoury and a library. On the opposite bank of the Danube there is a war monument to the Hohenzollern men who fell in 1866 and 1870. 31.

The division of Sigmaringen is composed of the two formerly sovereign principalties of Hohenzollern-Sigmaringen and Hohenzollern-Hechingen (see Hohenzollern), and has an area of 449 sq. m. and a population (1905) of 68,282. The Sigmaringen part of the Hohenzollern lands was the larger of the two (297 sq. m.) and lay mainly to the south of Hechingen, though the district of Halberloch on the Neckar also belonged to it. The name of Hohenzollern is used much more frequently than the official Sigmaringen to designate the combined principalities.

See Woerl, Führer durch Sigmaringen (Würzburg, 1886).
SIGNAL

SIGNAL (a word common in slightly different forms to nearly all European languages, derived from Lat. signum, a mark, sign), a means of transmitting information, according to some people, to convey messages from one person to another. The medium is usually a mark, or a combination of marks, which is a word, a syllable, a sentence, or a whole message. The natural language of communication is used in this way, and the transmission is instantaneous. The methods employed vary with the circumstances and the purposes in view, and the medium into which the transmitted idea is translated may consist of visible objects, sounds, motions, or indeed anything that is capable of affecting the senses, so long as an understanding has been previously effected with the recipient as to the meaning involved. Any two persons may thus arrange a system for the transmission of intelligence between them, and secret codes of this kind, depending on the inflections of the voice, the accent on syllables or words, the arrangement of sentences, &c., have been so elaborated as to serve for the production of phenomena such as are sometimes attributed to telepathy or thought transference. With the many private developments of such codes we are not here concerned, nor is it necessary to attempt an explanation of the systems of drum-taps, smoke-fires, &c., by which certain primitive peoples are supposed to be able to convey news over long distances with astonishing rapidity; the present article is confined to giving an account of the organized methods of signalling employed at sea, in military operations and on railways, these being matters of practical public importance.

Marine Signalling. — A system of marine signals comprises different methods of conveying orders or information to or from a ship in sight and within hearing, but at a distance too great to permit of hailing—in other words, beyond the reach of the voice, even when aided by the speaking-trumpet. The necessity of some plan of rapidly conveying orders or intelligence to a distance was early recognized. Polybius describes two methods, one proposed by Aeneas Tactius more than three centuries before Christ, and one perfected by himself, which, as any word could be spelled by it, anticipated the underlying principle of later systems. One code of these codes is still in use to this day and has been elaborate. Generally some kind of flag was used. Shields were also displayed in a preconcerted manner, as at the battle of Marathon, and some have imagined that the reflected rays of the sun were flashed from them as with the modern heliograph. In the middle ages flags, banners and lanterns were used to distinguish particular squadrons, and as marks of rank, as they are at present, also to call officers to the admiral, and to report sighting the enemy and getting into danger. The invention of cannon made an important addition to the means of signalling. In the instructions issued by Don Martín de Padilla in 1597 the use of guns, lights and fires is mentioned. The introduction of the square rig permitted a further addition, that of letting fall a sail a certain number of times. Before the middle of the 17th century only a few stated orders and reports could be made known by signalling. Flags were used by day, and lights, occasionally with guns, at night. The signification then, and for a long time after, depended upon the position in which the light or flag was displayed. Orders, indeed, were as often as possible communicated by hailing or even by means of boats. As the size of ships increased the inconvenience of both plans became intolerable. Some attribute the first attempt at a regular system of signalling to Admiral Sir William Penn (1614–1670), but the credit of it is usually given to James II. when duke of York. Notwithstanding the attention paid to the subject by Paul Hoste and others, signals continued strangely imperfect till late in the 18th century. Towards 1780 Admiral Kempenfelt devised a plan of flag-signalling which was the parent of that now in use. Instead of indicating differences of meaning by varying the position of a solitary flag, he combined distinct flags in pairs. About the beginning of the 19th century Sir Home Popham improved a method of conveying messages by flags proposed by R. Hall Gower (1767–1833), and greatly increased a ship's power of communication with others. The number of night and fog signals that could be shown was still very restricted. In 1867 an innovation of prodigious importance was made by the adoption in the British navy of Vice-Admiral (then Captain) Philip Colomb's flashing system, on which he had been at work since 1858. It is the basis of marine signalling to the present day. The British navy, which serves as a model to most others, uses four of the main flags: red, blue, white, and green. Flares are also used. The number of flags used in the flags is in the naval code, comprising what is termed a "set," is 58, and consist of 26 alphabetical flags, 10 numeral flags, 16 pendant flags and 6 special flags. Flag signals are divided into two groups, to each of which is allotted a separate book. One class consists of two alphabetical flags, and refers to orders usual in the administration of a squadron, such as, for example, the flags LE, which might signify "Captain on board flag ship." Another class consists of three alphabetical flags, which refer to a coded dictionary, wherein are words and short sentences likely to be required. The remaining refers to evolutionary orders for manoeuvres, which have alphabetical and numerical flags combined. The flags of the set are termed a "hoist." One or more hoists may be made at the same time. Although flag signalling is a slow method compared with others, a fair rate can be attained with practice. For example, a signal involving 162 separate hoists has been repeated at sight by 13 ships in company in 76 minutes. Semaphore signals are made by the extension of a man's arms through a vertical plane, the different symbols being distinguished by the relative positions of the arms, which are never less than 45° apart. To render the signals more conspicuous the signaler usually holds a small flag on a stick in each hand, but all ships are fitted with mechanical semaphores, which can be worked by one man, and are visible several miles. Flag signalling being comparatively slow and laborious, the ordinary message work in a squadron is generally signalled by semaphore. The convenience of this method is enormous, and by way of example it may be of interest to mention a record message of 350 words which was signalled to 21 ships simultaneously at the rate of 17 words per minute. Flags being limited in size, and only distinguishable by their colour, signals by this means are not altogether satisfactory at long distances, even when the wind is suitable. For signalling at long range the British navy employs a semaphore with arms from 0 to 12 ft. long mounted at the top of the mast and capable of being trained in any required direction, and worked from the deck. Its range depends upon the clearness of the atmosphere, but instances are on record where a message by this means has been read at 16 to 18 m.

Night signalling is carried out by means of "flashing," by which is meant the exposure and recession of a single light for short and long periods of time, representing the dots and dashes composing the required symbol. The dots and dashes can be made mechanically by an obscuring arrangement, or by electro-mechanical means where magnets do the work, or by simply switching on and off specially manufactured electric lamps. The ordinary rate of signalling by flashing is from 7 to 10 words per minute. In the British navy, as in the army, dots and dashes are short and long exposures of light; but with some nations the dots and dashes are short and long periods of darkness, the light punctuating the spaces between them. The British navy uses them to the present day with modifications in telegraphy, but with special signs added suitable to their code. The introduction of the "dot and dash" system into the British navy was entirely due to the perseverance of Vice-Admiral Colomb, who, in spite of great opposition, and even after it had once been condemned on its first trial at sea, carried it through with the greatest success. The value of this innovation made in 1867 may be gauged by the fact that now it is possible to handle a fleet with case and safety in darkness and fog—a state of affairs which did not formerly exist. The simplicity of the dot and dash principle is its best feature. As the system only requires the exhibition of two elements it may be used in a variety of different manners with a minimum of material, namely, by waving the most conspicuous object at hand through short and long arcs, by exhibiting two different shapes, each representing one of the elements, or dipping a lantern in a bucket, and so on. Its
adoption has not only contributed very materially to the increased efficiency of the British navy, but it has been made optional for use with the mercantile marine. Curiously enough, flashing is not to any great extent used in the navies of other countries which rely more on some system of coloured lights at night. This system generally takes the form of four or five double-coloured lanterns, which are suspended from some part of the mast in a vertical line. Each lantern generally contains a red and a white lamp, either of which can be switched on. By a suitable keyboard on deck any combination of these coloured lanterns can be shown. The advantage of this system lies in the fact that each symbol is self-evident in its entirety, and does not require an expert signalman to read it, as is the case with flashing, which is a progressive performance.

For long distances at night the search-light, or some other high power electric arc light, is utilized on the flashing system. Dots and dashes are then made either by flashing the light directly on the object, or by waving the beam up and down for short and long periods of time. Sometimes when a cloudless sky is available the reflection of the beam has been read for nearly 40 m., with land intervening between the two ships. In fog signals are made by the steam-whistle fog-horn, siren or by guns. Except for the latter method the dot and dash system is employed in a similar manner to flashing a light. Guns are sometimes used in a fog for signalling, the significance being determined by certain timed intervals between the discharges. The larger British ships are supplied with telegraph instruments for connexion with the shore, and heliographs are provided for land operations. Marine galvanometers are also supplied, and can be used to communicate through submarine cables. To the various methods of naval signalling must be added wireless telegraphy, which in its application to ships at sea bids fair to solve some problems hitherto impracticable. (See TELEGRAPHY: Wireless.)

The international code of signals, for use between ships of all nations, is perhaps the best universal dictionary in existence. By its means marines can talk with great ease without knowing a word of another's language. By means of a few flags any question can be asked and answered. The number of international flags and pendants used with the international code is 27, consisting of a complete alphabet and a special pendant characteristic of the code. At night flashing may be used.

Army Signalling.—Communication by visual signals between portions of an army is a comparatively recent development of military service. Actual signals were of course made in all ages of warfare, either specially agreed upon beforehand, such as a rocket or beacon, or of more general application, such as the old-fashioned wooden telegraph and the combinations of lights, &c., used by savages on the N.W. frontier of India. But it was not until the middle years of the 19th century that military signalling proper, as a special duty of soldiers, became at all general. It was about the year 1869 that, owing to the initiative of Captain Philip Colomb, R.N., whose signal system had been adopted for his own service, the question of army signalling was seriously taken up by the British military authorities. A school of signalling was created at Chatham, and some time later all units of the line were directed to furnish men to be trained as signalers. At first a code book was used and the signals represented code words, but it was found better to revert to the telegraphic system of signalling by the Morse alphabet, amongst the undeniable advantages of which was the fact that it was used both by the postal service and the telegraph units of Royal Engineers. Thenceforward, in ever-increasing perfection, the work of signalers has been a feature of almost every campaign of the British army. To the original flags have been added the heliograph (for long-distance work), the semaphore system of the Royal Navy (for very rapid signalling at short distances), and the lamps of various kinds for working by night. Full and detailed instructions for the proper performance of the work, which provide for almost every possible contingency, have been published and are enforced.

The apparatus employed for signalling in the British service consists of flags, large and small, heliograph and lamp for night work. The distances at which their signals can be read vary very considerably, the flags having but a limited scope of usefulness, whilst the range of a heliograph is very great indeed. Whether it be 10 m. or 100 away, it has been found in practice that, given good sunlight, nothing but the presence of an intervening physical obstacle, such as a ridge or wood, prevents communication. For shorter distances moonlight, and even artificial light, have on occasion been employed as the source of light. In northern Europe the use of the instrument is much restricted by climate, and, further, stretches of plain country, permitting of a line of vision between distant hills, are not often found. It is in the wilder parts of the earth, that is to say in colonial theatres of war, that the astonishing value of the heliograph is displayed. In European warfare flag signalling is more usually employed. The flags in use are blue and white, the former for use with light, the latter for dark backgrounds.

FIG. 1.

There is further a distinction between the "small" flag, which is employed for semaphore messages and for rapid Morse over somewhat shorter distances, and the "large" flag, which is readable at a distance of 5 to 7 m., as against the maximum of 4 m. allowed to the small flag. With a clear atmosphere these distances may be exceeded. The respective sizes of these flags are as follows:—large flag 3'x3', pole 5' 6" long; small flag 1'2"x1', pole 3' 6" long. The lamps used for night signalling are of many kinds. Officially only the "lume light" and the "Begbie" lamps are recognized, but a considerable number of the old-fashioned oil lamps is still in use, especially in the auxiliary forces, and many experiments have been made with acetylene. The lume light is obtained by raising a lime pencil to a white heat by forcing a jet of oxygen through the flame of a spirit lamp. The strong light thus produced can be read under favourable conditions at a distance of 15 m.; but the equipment of gas-bag, pressure-bag, and other accessories make the whole instrument rather cumbersome. The bull's-eye lamp differs but slightly from the ordinary lantern of civil life; it burns vegetable oil. The Begbie lamp, which burns kerosene, is rather more elaborate and gives a whiter light. It was in use for many years in India before the objections made by the authorities in England to certain features of the lamp were withdrawn. All these lamps when in use are set up on a tripod stand and signals in the Morse alphabet are made by opening and closing a shutter in front of the light, and thereby showing long and short flashes.
The same principle is followed in the heliograph. This instrument, invented by Sir Henry C. Mance, receives on a mirror, and thence casts upon the distant station, the rays of the sun; the working of a small key controls the flashes by throwing the mirror slightly off its alignment and thus obscuring the light from the party reading signals. The fact that the heliograph requires sunlight, as mentioned above, militates against its employment in Great Britain, but where it is possible to use it is by far the best means of signalling. Secrecy and rapidity are its chief advantages. An observer 6 m. distant would see none of its light if he were more than 50 yds. on one side of the exact alignment, whereas a flag signal could be read from almost every hill within range. None of the physical exertion required for fast signalling with the flag is required to manipulate the instrument at a high rate of speed. The whole apparatus is packed in a light and portable form. An alternative method of using the heliograph is to keep the rays permanently on the distant point, a shutter of some kind being used in front of it to produce obscurations.

When in use the heliograph is fixed upon a tripod. A tangent screw (E) which moves the whole instrument (except the jointed arm L) turns the mirror in any direction. Metal U-shaped arms (C) carry the mirror (B), which is controlled by the vertical rod (J) and its clamping screw (K). The signalling mirror itself (usually having a surface of 5 in. diameter) is of glass, an unsilvered spot (R) being left in the centre. This spot retains its position through all movements in any plane. The instrument is aligned by means of the sighting vane (P) fixed in the jointed arm L, and the rays of the sun are then brought on to the distant station by turning the horizontal and vertical adjustments until the "shadow spot" cast by the unsilvered centre of the mirror appears on the vane. The heliograph is thus ready, and signals are made by the depression and release of the "collar" (I) which, with the pivoted arm (U,V), acts as a telegraph key. When the sun makes an angle of more than 120 degrees with the mirror and the distant station, a "duplex mirror" is used in place of the sighting vane. The process of alignment is in this case a little more complicated. Various other means of making dots and dashes are referred to in the official work, ranging from the "collapsible drum" hung on a mast to the rough but effective improvisation of a heliograph out of a shaving-glass. The employment of the beams of the search-light to make flashes on clouds is also a method of signalling which has been in practice very effective.

The semaphore code used in the army is shown below:

In using this code the signaller invariably faces his reader, as unless this were enforced each letter might be read as its opposite. In the above diagram the appearance of the signals to the reader is shown, thus the sender's right side only is used for the letter A.

In sending a message accuracy is ensured by various checks. The number of words in a message is the most valuable of these, as the receiving station's number must agree before the message is taken as correct. Each word or "group" sent by the Morse code must be "answered" before the sender passes on to another. All figures are checked by the "clock check" in which i is represented by A, 2 by B and so on. All cipher "groups" are repeated back en bloc. There is an elaborate system of signals relating to the working of the line. The "message form" in use differs but slightly from the ordinary form of the Post Office telegraphs. Signal stations in the field are classed as (a) "fixed" and "moving," the former connecting points of importance, or on a line of communications, the latter moving with the troops; (b) "terminal," "transmitting" and "central"; the first two require no definition, the last is intended to send and receive messages in many directions. The "transmitting station" receives and sends on messages, and consists in theory of two full "terminals," one to receive and one to send on. It is rarely possible in the field to work rapidly with less than five men at a transmitting and three at a terminal station. "Central" stations

Fig. 3.—Semaphore (the thin upright strokes represent the seaman's body; the thick strokes his arms).

"Ready"

Letfer "W"
are manned according to the number of stations with which they communicate.

Signalling is used on most campaigns to a large extent. In the Tirah expedition, 1897 and 1898, one signal station received and sent, between the 1st and 18th November, as many as 980 messages by heliograph, some of which were 200 to 300 words in length. It is often used as an auxiliary to the field telegraph, especially in mountainous countries, and when the wire is liable to be cut and stolen by hostile natives. In the Waziri expedition, 1881, communication was maintained direct for a distance of 70 m. with a 5-in. heliograph. In the Boer War, 1899-1902, the system of heliographic signalling was employed very extensively by both sides.

In Germany the first army signalling regulations only appeared in 1902. The practice was, however, rapidly developed and towards the end of the 1905 campaign in South-West Africa, 9 signalling officers and 200 signallers were employed in that country. These usually worked an arm or arms of 2 or 3, each party being protected by a few infantrymen or troopers. The apparatus used was heliograph by day and a very elaborate form of lamp by night, and work was carried on between posts separated by 600 and even 2000 m. The signs were employed both with the mobile forces and in a permanent network of communication in the occupied territory. In 1907-1908 fresh signalling regulations were issued to the home army, and each company of infantry is expected to find one station three men, apart from the regimental and special instructors and staff. Some experiments were carried out at Metz to ascertain the mean distance at which signals made by a man lying down could be seen, and it was found that about 1000 yds. was the maximum distance at which it was possible to allow the use of flag and lamp signalling at 4 m. instead of as formerly at 14 m. Three flags are used, blue, white and yellow, and it is stated that the last is the most frequently useful of the three. The employment of the field telegraph and telephone systems in the elaborate war of positions of 1904-1905 more or less crowded out, so to speak, visual signalling on both sides, and in any case the average literate Russian infantryman or the Cossack was not adaptable to signalling needs. Only about one-quarter of the signalling force (which consisted exclusively of engineer troops) in Kupratkin's army was employed in optical work, the other three-quarters being employed in field telegraph and telephone station work. The Italians, who are no strangers to colonial warfare, have a well-developed visual signalling system.

See British Official Training Manuals: Signalling (1907).

Railway Signalling.—In railway phraseology the term "signal" is applied to a variety of hand motions and indications by lamps and other symbols, as well as to fixed signals. The latter are divided into (1) semaphore, (2) disc and semaphore, with lights, permanently fixed (on posts) at the side of the track—will be considered here. These may be divided into (1) interlocking signals, used at junctions and yards, and (2) block signals, for maintaining an interval of space between trains following one another. In both cases the function of a signal is to inform the engine-driver whether or not he may proceed beyond the signal, or on what conditions he may proceed, and it is essential to give him the information some seconds before it need be acted upon.

The semaphore signal, which is the arm used, consists of an arm about 3 ft. long, extending horizontally, at right angles to the line of the track, from the top of a post (wood or iron) 15 to 30 ft. high, and sometimes higher (fig. 4). This arm, turning on a spindle, is pulled down ("off") to indicate that a train may pass it, the horizontal (or "on") position indicating "stop"; sometimes, as on the continent of Europe, use is made of the position of the arm in which it points diagonally upwards, and on one or two English lines the arm in the safety position hangs down perpendicularly, parallel to, but a few inches away from, the post. A lamp is fixed to the side of the post about the middle height of the arm, and close to it on the signal post. Semaphore signals are designed in this manner. A white light is made to show at night red for "stop" and green for go-ahead or "all clear." The earlier practice, white for "all clear," still prevails largely in America.

In the early days of railway signalling three positions of the semaphore arm were recognized:—(1) Horizontal, or at right angles to the post, denoting danger; (2) at a downward angle of 45 degrees, denoting go-ahead within the limits of the signal, denoting "all clear" or "all right." Corresponding to the position of the arm, three different lights were employed at night—red for danger, green for caution and white for all right. But now British railways make use of only two positions of the arm—right angles to the post and a red light, both signifying danger or stop; and the arm at about 60 degrees (or vertical, as mentioned above) and a green light, both meaning all right or proceed. It is better to abolish the use of white lights for signalling purposes. The reason the reason is obvious. There are many lights and lamps on the platform in signal-boxes and in the streets and houses adjacent to a railway; and if white lights were recognized as signals, a driver might mistake a light of this nature as a signal to proceed; in fact, accidents have been caused in this way. White light is now usually used in two cases only, viz.: (1) When the signal is not yellowed as a danger signal, as is sometimes erroneously stated, but rather as no signal at all; and as there is a well-known rule to the effect that "the absence of a signal at a place where a signal is ordinarily known to be treated as a danger signal," it follows that a white light, when seen at a place where a red or green light ought to be visible, is to be treated as a danger signal, not because a white light per se means danger, but because in such a case it denotes the absence of the proper signal. Some companies have adopted a purple or small white light as a "danger" signal for shunting purposes in sidings and yards; but this practice is not to be condemned, since red should be the universal danger signal.

Distant signals are used to make it unnecessary for an engine-driver to slacken his speed in case the stop (home) signal is obscured by fog or smoke, or is beyond a curve, or for any reason is not visible sufficiently far away. Encountering the distant signal at a point 400 to 800 yds. before reaching the home signal, he is informed by its position that he may expect to find the latter in the same position; if it is "off" he passes it, knowing that the home signal must be in the same position, but if it is at danger he proceeds cautiously, prepared to stop at the home signal, if necessary. The arm of a distant signal usually has a fish-tail form, and its indications are generally the same as for the home signal, but occasionally it is shaped as a tooth, and on some lines it is distinguished at night by an angular band of light, shaped like a fish-tail, which appears by the side of the red or green light. In America its night colour-indication is made different from that of the home signal. Thus, where white is used to indicate all clear (in both home and distant) the distant arm, when horizontal, shows a green light; where green is the all-clear colour a horizontal distant shows either a yellow light or (on one road) a red and a green light side by side. Two lights for a single arm, giving their indication by position as well as by the number of times for the same position, are used for both home and distant signals. Dwarf signals (a in fig. 5) are used for very slow movements, such as those to or from a siding. Their blades are about 1 ft. long, and the posts about 4 ft. high; the lower arm on post c being for slow movements, is also frequently made shorter than the upper one. Where more than two full-sized arms are used on a post, the custom in America is to have the upper arm indicate for the track of the extreme right, and the others in the order in which the tracks lie; in Great Britain the opposite rule prevails, the upper arm indicating for the extreme left. But the signals controlling parallel or diverging tracks are preferably arranged side by side, often on a narrow overhead bridge or gantry spanning the tracks.

All the switches and locks are connected with the signal cabin by iron rods (channel-iron or gas-pipe) supported (usually near the ground and often covered by boxing) on small grooved wheels set at suitable distances apart. The foundations of these supports are of wood, cast iron or concrete. Concrete foundations are comparatively recent, but are cheap and durable. For signals (but not for points) wire connexions are universal in England, and are used in America, being cheaper than rods. In changing the direction of a line of rodding a bell-crank is used, but with a wire piece of chain is inserted and run round a grooved pulley. Wire diagrams are shown at a and b, fig. 4, the main or "front" wire being attached at a. By this the signalman moves the arm down to the inclined or go-ahead position, to do which he has to lift the counter-

FIG. 4.—Semaphore signal. R, Red glass; G, green glass.
weight. If the wire should break, the counter-weight would restore the arm to the horizontal (stop) position, and thus prevent the unauthorized passage of a train; and in case of failure of the rod I, the iron spectacle s would act as a safety counter-weight. The back-wire b is added to ensure quick movement of the arm, but is not common in England. Long lines of rigid connexions are "compensated" for expansion and contraction due to changes in temperature by the introduction of bell-crank or rocker-arms. With wire connexions compensation is difficult, and many plans have been tried. The most satisfactory devices are those in which the connexion, in the cabin, between the wire and the lever is broken when the signal is in the horizontal position. The wire is kept taut by a weight or spring, and at each new movement the lever (if the wire has lengthened or shortened) grips it at a new place.

So early as 1846 it became a common practice in England to concentrate the levers for working the points and signals of a station in one or more cabins, and the necessity of interlocking soon became evident to prevent simultaneous signals being given over conflicting routes, or for a route not yet prepared to receive the train. In large terminals concentration and interlocking are essential to rapid movements of trains and economical use of ground.

Fig. 5 shows a typical arrangement of interlocked signals, the principle being the same whether a yard has one set of points or a hundred. The signals (at a, b, and c) are of the semaphore pattern. For the four signals and one pair of points there are, in the second storey of the cabin C, five levers. Each signal arm stands normally in the horizontal position, indicating stop. To permit a train to pass from A to B the signalman moves the arm of signal b to an inclined position (60 degrees to 75 degrees downwards); and the interlocking of the levers prevents this movement unless it can safely be made. If a has been changed to permit a movement from S to B, or if the points x have been set for such a movement, or if either signal on post c has been lowered, the lever for b is immovable. In like manner, to incline the arm of signal a for a movement from S to B it is first necessary to have the points set for track S, and to have the levers of all the other signals in the normal (stop) position. A sixth lever, suitably interlocked, works a lock bar, which engages with the head rod of the points; it is connected to the lock through the "detector bar," d. This bar, lying alongside of and close to the rail, must move upwards when the points lock is being moved either to lock or to unlock; and being made of such a length that it is never entirely free of the wheels of any car or engine standing or moving over it, it is held down by the flanges; and the signalman is prevented from inadvertently changing the points when a train is passing. At r is a throw-off or drooping switch ("catch-points"). When x is set for the passage of trains on the main line, r, connected to the same lever, is open; so that if a car, left on the side track unattended, should be accidentally moved from its position, it could not run foul of the main track.

The function of the interlocking machine is to prevent the simultaneous display of conflicting signals, or the display of a signal over points that are not set accordingly. The most common forms of interlocking have the locking bars arranged in a horizontal plane; but for ease of description we may take one having them arranged vertically, the principle being the same. The diagram (fig. 6) shows a section with a side view of one lever. A machine consists of as many levers, placed side by side, as there are points and signals to be moved, though in some cases two pairs of points are moved simultaneously by a single lever, and two or more separate arms on the same post may be so arranged that either one of them will be moved by the same lever, the position of the point connexions being made to govern the selection of the arm to be moved. A switch rod would be connected to this lever at H; the lever K is for use where a signal is connected by two wires, as before described. The lever is held in each of its two positions by the catch rod V, which engages with notches in the segment B. When the signalman, preparatory to lowering a signal, grasps the lever at its upper end, he moves his rod upwards, and in so doing actuates the interlocking, through the tappet N, attached at T. Lifting the tappet locks all levers which need to be locked to make it safe to move this one. In pulling over the lever the rocker R is also pulled; but the slot in it is radial to the centre on which the lever turns, so that during the stroke N remains motionless. On the completion of the stroke and the dropping of V, N is raised still farther, and this unlocks such levers as should be unlocked after this lever is pulled ("cleared" or "reversed"). It will be seen that whenever the tappet N of any lever is locked in the position shown in the figure, it is impossible to raise V, and therefore impossible to move the lever.

The action of tappet N may be understood by reference to fig. 7. A tappet, say 3, slides vertically in a planed recess in the locking plate, being held in place by strips G and K. Transverse
grooves N, O, P, carry dogs, such as J. Two dogs may be con-
ected together by bars, R. The dogs are held in place by
straps Y (fig. 6). Locking is effected by sliding the dogs hori-
tonally; for example, dog J has been pushed into the notch in
tappet r, holding it in the normal position. If tappet 2 were
raised, its notch would come opposite dog J; and then the
lifting of 1 would lock 2 by pushing J to the left. By means of
horizontal rod R, the lifting of 1 also locks 4. If 4 were already
up, it would be impossible to lift 1.

Switch and signal machines are sometimes worked by com-
pressed air for the transmission of hydraulic power. The use of power
makes it possible to move points at a greater distance
from the cabin than is possible with manual
power. The most widely used apparatus is the electro-
pneumatic, by which the points and signals are moved by
compressed air at 70 lb per sq. in., in a cylinder with piston being
fixed at each signal or switch. From a compressor near the
 cabin, air is conveyed in iron pipes buried in the ground.
The valves admitting air to a cylinder are controlled by electro-
magnets, the wires of which are laid from the cabin underground.
Each switch or signal, on completing a movement, sends
an electric impulse to the cabin, and the blocking is
controlled by this "return." In the machine the
"levers" are very small and light, their essential
function being to open and close electric circuits.
This is performed through the medium of a long shaft placed
horizontally with its end towards the operator, which
is revolved on its axis through 60 degrees of a circle.
This shaft actuates the interlocking, which is in
principle the same as that already described; and it
opens and closes the electric circuits, governing the
admission of air to cylinders, by means of simple metal contact
strips rubbing on sections of its surface. The high-pressure
machine has been used with hydraulic power instead of pneumatic, and with electrical interlocking instead of
mechanical.

Interlocking apparatus worked by compressed air at low
pressure (15 lb per sq. in.), and with no electrical features, is
in use on some lines in America and has been introduced into
England. In place of an electromagnet for admitting compressed
air to the cylinders, a rubber diaphragm 8 in. in diameter is used.
This is lifted by air at 7 lb pressure, this pressure being con-
veyed by a travelling power-car, the cost of power is reduced to a
very low figure, so that power-interlocking becomes economical
at small as well as large stations.

The essence of block signalling is a simple regulation forbidding
a train to start from station A until the last preceding train has
passed station B; thus a space interval is maintained
between each train, instead of the time-interval that
was relied upon in the early days of railways. As the
introduction of the telegraph was almost or quite contempor-
aneous with the advent of the railway, the possibility of a block
system was early recognized; but its introduction was retarded
by the great cost of employing attendants at every block station.
But as traffic increased, the time-interval system proved
inadequate; and in the United Kingdom the block system is now
practically universal, while in America it is in use on many
thousand miles of line. In "permissive blocking" a second train
is allowed to enter a block section before the first has cleared it,
the engine-man being required so to control his speed that if
the first train be unexpectedly stopped he can himself stop
before coming into collision with it. It thus violates the essential
condition of true block signalling.

The manual "block" system in use at the present day in no
way differs from that devised by W. F. Cooke in 1842, except so far
as the details and designs of the telegraphic instruments are con-
cerned. Cooke used interleaving giving two indications
—the needle to the left signifying "line clear," to the right,
"line blocked"; the instrument was also available for speaking
purposes. The instruments employed in Great Britain consist of
two dials—one for the up line and one for the down—and a bell.
They may be divided into two main classes, those requiring one wire,
and those requiring three wires for each double line of rails. The
dials of the one-wire instruments give only two indications, namely, "line
clear" and "train on line" or "line blocked," the latter being the
normal indication, even when there is no train in the section. The
three-wire instrument has the advantage of giving three indications
on the dial, namely, "line clear," "line closed" (or "train on line," the
normal indication being "line closed." The one-wire instru-
ment differs from the three-wire in that the indicator is moved over
to the different positions by a momentary current, and is then held
there by induced magnetism, the wire being then free to carry any suc-
ceeding signals. In the three-wire apparatus there is a separate
wire, with an instrument at each end for the up line; the same for
the down line; and a wire for the bell, which is common to both
lines. When no current is flowing, the indicator is vertical, meaning
"line blocked or closed." When a current is sent along one of the
wires, the deflections to the right or left, according to the polarity
of the current, mean "line clear" or "train on line" respectively.
Some dial instruments are made with needles, some with small disks,
some with miniature semaphores to give the necessary indications,
but the effect is the same. The block instruments and bells should not,
as a rule, be used for speaking purposes; but on a few subsidiary
railways, block working is effected by means of ordinary single-
needle telegraphic instruments, or by telephone, the drawback to such
arrangement being that the signalman has no indication before him to
remind him of the condition of the line.

Fig. 8 shows the signals at a typical English station, which
may be called B. Notice having been received over the block
telegraph that a train is coming from A (on the up track), the
signalman in the cabin, B, lowers the home signal; and if (if the
block section from B to C is clear of trains) he lowers the starting
signal, s, also. The function of a distant signal d has already
been described; it is mechanically impossible for it to be lowered
unless h has previously been lowered. The relation of the signals
to the "crossover road" z is the same in principle as is shown in
fig. 5. Dwarf or disk signals such as would be used for the
sidings T or the crossover xz are omitted from the sketch. Where
the sections are very short, the starting signal of one section is
often placed on the same post as the distant signal of the next.
Thus, while the signal from B to C is very close to each other, B's
starting signal would be on the same post as C's distant signal,
the latter being below the former, and the two would be so
interconnected by "slotting" apparatus that C could not lower his
distant signal unless B's starting signal was "off," while
by the act of raising his starting arm would necessarily
throw C's distant arm to "danger." In America many block
stations have only the home signal, even at stations where
there are points and sidings, and on double-track lines the block

![Fig. 8.—Block signals. (English practice, trains run on left-hand track, signals at left of track, arms on left of post.)](image-url)
SIGNAL

telegraphing for both is done on a single Morse circuit. In the United Kingdom the practice is to have separate apparatus and separate wires for each track.

In the simple block system it is clearly possible for a signalman, through carelessness, forgetfulness, or other cause, and in disregard of the indications of his telegraph instruments, to overlook his signals as to admit a second train into the block section before the first has left it, and that without the driver of either train being aware of the fact. To eliminate as far as possible the chance of such an occurrence, which is directly opposed to the essence of the block system and may obviously lead to a collision, the locking of the mechanical signals with the electrical block instruments was introduced in England by W. R. Sykes about 1876, the apparatus being so arranged that a signalman at one end of a section is physically unable to lower his signals to let a train enter that section until they have been released electrically from the cabin at the other end. The starting signal at a block section A cannot be lowered until the signalman at the next station B, by means of an electric circuit, unlocks the lever in connexion with it. In so doing he breaks the unlocking circuit at his own station, and this break is restored only on the arrival of the train for which the unlocking was performed, the wheels of the train acting through a lever or by a short rail circuit. Valuable improvements have been made in this machine by Patenall, Coleman and others, and these are in use in America, where the system is known as the "controlled manual." The passage of a train is also made to set a signal at B automatically, by disconnecting the relay between the signal and its lever. The connexion cannot be restored by the signalman; it must be done by an electro-magnet brought into action by the train as it passes the next block station.

The block system is used on single as well as double lines. In the United Kingdom and in Australia the means for preventing collisions between trains running towards each other on single-track railways is the "staff system." The staff, suitably inscribed, is delivered to the engine-driver at station A, and constitutes his authority to occupy the main track between that station and station B. On reaching B he surrenders the staff, and receives another one which gives him the right to the road between B and C. If there are two or more trains to be moved, all except the last one receive tickets, which belong to that particular staff. The staff system requires no telegraph; but to obviate the inconvenience of sometimes finding the staff at the wrong end of the road, electric staff apparatus has been devised. Staffs (or tablets) in any desired number are kept at each of the two stations, and are locked in a cabinet automatically controlled, through electro-magnets, by apparatus in the cabinet at the other station; and a staff (or tablet) being taken at one station, a second one cannot be taken out at either station until this first one is returned to the magazine at one station or the other. Thus there is a complete block system. By simple "catching apparatus" on the engine, staffs or tablets may be delivered to trains moving at a good speed.

The signals so far described depend for their operation, either wholly or partially, on human agency, but there are others, commonly known as "automatic," which are worked by the trains themselves, without human intervention. Such signals, as a rule, are so arranged that normally they are constrained to stand at "safety," instead of in the "danger" position, which, like ordinary signals, they assume if left to themselves; but as a train enters a block section the constraint on the signals that guard it is removed and they return to the danger position, which they retain till the train has passed through. To effect this result an electrical track circuit or rail circuit is employed, in conjunction with some form of power to put the signalling devices to safety. Live-wire circuits were formerly employed, but are now generally abandoned. The current from a battery 6 (fig. 9) passes along the rails of one side of the track to the signal a and returns along the other rails through a relay. If the current through this relay is stopped in any way, whether by failure of the battery or by a short circuit caused by the presence of a train or vehicle with metal wheels connected by metal axles on any part of the block section, its electro-magnet is de-energized, and its armature drops, removing the constraint which kept the signals at safety and allowing them to move to danger. When the train has passed through the block section the current is restored and the signals are forced back to show safety. The current used for the track circuit must be of low tension, because of the imperfect insulation, and as a rule the ballast must not be allowed to touch the rails and must be free from iron or other conducting substance. At each rail joint a wire is used to secure electrical continuity, and at the ends of each block section there are insulating joints in the track. Block sections more than about 1 m. long are commonly divided into two or more circuits, connected together by relays; but usually they are made under 1 m. in length and often on intra-urban railways very much less, so that many more trains can be passed over the line in a given time than is possible with ordinary block signalling. At points the track circuit is run through a circuit breaker, so that the "opening" of the points sets the signal for the section. The circuit is also led through the rails of the siding so far as they foul the main track. An indicator at each switch gives visual or audible warning of an approaching train.

The signals themselves have been devised to work by clockwork, by electricity—obtained, not from the track circuit, but from a power station, or from non-freezing batteries at each post, or from accumulators charged by dynamos situated, say, every 10 m. along the line—and by pneumatic power, either compressed atmospheric air laid on from a main or carbonic acid gas stored in a tank at the foot of the posts, each tank furnishing power for several thousand movements of the signal arm. A clockwork signal is shown in fig. 10. When an electro-magnet in the rail circuit drops its armature, the mechanism is released and causes the disk to turn and indicate stop. On the restoration of the current the disk makes another quarter-

FIG. 9.—Automatic electric block signal, with rail circuit.

FIG. 10.—Signal moved by clockwork (Union).

FIG. 11.—Enclosed disk signal (Hall).
away from the window and thus indicates "all clear." On the withdrawal or failure of the current the disk falls by gravity to the "stop" position. A local battery is used, with a relay, the rail circuit not being strong enough to lift the disk. In the electro-pneumatic system a full-size semaphore is used. Compressed air, from pumps situated at intervals of 10 to 20 m., is conveyed along the line in an iron pipe, and is supplied to a cylinder at each signal, exactly as in pneumatic interlocking, before described. The rail circuit, when complete, maintains pressure in a cylinder, holding the signal "off." On the entrance of a train, the arm is released, the cylinder of compressed air is emptied, and the signal arm is carried by gravity to the "stop" position.

Automatic signals are sometimes made to stand normally (when no train is in the section) in the "stop" position. The local circuit is connected with the rail circuit so that it is closed only when a train is approaching within, say, 1 m. With the rail circuit, distant signals are controlled, without a line wire, by means of a polarized relay. Each signal, when cleared, changes the polarity of the rail circuit for the next section in its rear, and this, by the polarized relay, closes the local circuit of the distant signal, without affecting the home signal for that section.

The signal at A for the line AB is arranged as before described; and the signal at B, for movements in the opposite direction, is worked by means of a line wire from A, strung on poles. When a section is occupied, signals are set to two sections away, so as to provide against the simultaneous entry of two trains.

One of the chief causes of anxiety and difficulty in the working of railway traffic is the prevention of the simultaneous passage of two trains. The visible signals, so that while the block telegraph remains, the means of communicating the necessary instructions to the driver are no longer effective. Delay and confusion immediately arise; and in order to secure safety, there has to be lessened, trains have to be reduced in number, and a system of "fog-signalization" introduced. In England, especially around London, elaborate arrangements have to be made. For some trains, signals are placed on the embankment and visible to drivers; or, to convey to drivers, the information ordinarily imparted by the visible or semaphore signals. As soon as possible after a fog comes on, a man is stationed at the foot of each distant signal, and generally of each home signal also, who, by means of detonators, red and green flags and a hand-lamp, conveys information to the driver of every train as to the position of the semaphore arm. A detonator is a small flat metal case about 2 in. in diameter and 3 in. deep, furnished with two leaden ears or clips which can be easily bent down to grip the head of the rail. The case contains some detonating composition, which readily explodes with a loud report when a wheel passes over it. As a signal, the fogman places upon one of the rails of the track to which the signal applies two detonators, or in the case of a new and improved class of device, a single amplifier. The second sign is in one case a detonator, and at the same time exhibits a red flag or light to the driver of an approaching train. The engine of a train passing over the detonators explodes them, the noise so made being sufficient to attract the attention of the driver, and warning him of the danger, and he then should act in the same way as if he had seen the signal. If, however, the signal arm should be lowered to the "all right" position before a train reaches it, the fogman should immediately remove the detonators and exhibit a green flag or lamp, replacing the detonators as soon as the signal is again raised to danger. As a rule the fogmen are drawn from the ranks of the permanent-way men, who otherwise would be idle.

For the signal of danger.

Development of signaling.

The fundamental principles of railway signaling are simple, but the development of the science has called for much research and a large money outlay. On every railway of any consequence the problems of safety, economy and convenience are involved, one with another, and cannot be perfectly solved. Even so fundamental a duty as that of guarding the safety of life and limb is a relative one when we have to consider whether a certain expenditure is justifiable for a given safety device. Having good discipline and foregoing the advantages of high speed, many a manager has successfully deferred the introduction of signals; others, having to meet severe competition, in Great Britain, under the pressure of the government, have been forced to adopt the most complete apparatus at great cost. In large city terminal stations, where additions to the space are out of the question, interlocking is necessary for economy of time and labour, as, indeed, it is in a less degree at smaller stations also; as a measure of safety, however, it is desirable at even the smallest, and the wise manager extends its use as fast as he is financially able. At crossings at grade level of one railway with another, and at drawbridges, interlocked signals with derailing switches obviate the necessity of stopping all the trains, as formerly was required, and save great time and many costly accidents.

The block system was introduced primarily for safety, but where trains are frequent it becomes also an element of economy. Without it trains must usually be run at least five minutes apart (many managers deem seven or ten minutes the shortest safe interval for general use), but with it the interval may be reduced to three minutes, or less, according to the shortness of the block sections. With automatic signals trains are safely run at high speed only 15 m. apart, and on urban lines the distance between them may be only a few hundred yards. (B. B. A.; H. M. R.)

SIGNATURE (through Fr. from Lat. signatura, signare, to sign, to mark, to name, a distinguishing sign or mark, especially the name or something representing the name, of a person used by him as affixed to a document or other writing to show that it has been written by him or made in accordance with his wishes or directions (see Autograph, Monogram, &c.). In the early sense of something which "signifies," i.e. marks a condition, quality or meaning, the word was also used widely, but now chiefly in technical applications. In old medical theory, plants and minerals were supposed to be marked by some natural sign or symbol which indicated the particular medicinal use to which they could be put; thus yew flowers were to be used for jaundice, the scorpion, for the bite of the scorpion; many superstitions were based on the human shape of the roots of the mandrake or mandragora; the bloodstone was taken to be a cure for hemorrhage; this theory was known as the "doctrine of signatures." (See T. J. Pettigrew, Superstitions connected with Medicine or Surgery, 1844.) In printing or book-
SIGN-BOARD—SIGNIFICANCES

**binding the "signature"** is a letter or figure placed at the bottom of the first page of a section of a book, as an assistance to the binder in folding and arranging the sections consecutively; hence it is used of a sheet ready folded. In music it is the term applied to the signs affixed at the beginning of the stave showing the key or tonality and the time or rhythm (see **MUSICAL NOTATION**).

**SIGN-BOARD**, strictly a board placed or hung before any building to designate its character. The French *enseigne* indicates its essential connexion with what is known in English as a flag (q.v.), and in France banners not infrequently took the place of sign-boards in the middle ages. Sign-boards, however, are best known in the shape of painted or carved advertisements for shops, inns, &c., they are in fact one of various emblematic methods used from time immemorial for publicly calling attention to the place to which they refer. The ancient Egyptians and Greeks are known to have used signs, and many Roman examples are preserved, among them the widely-recognized bush to indicate a tavern, from which is derived the proverb "Good wine needs no bush." In some cases, such as the bush, or the three balls of pawnbrokers, certain signs became identified with certain trades, but apart from these the emblems employed by traders—often into trade-marks—may in great part be grouped according to their various origins. Thus, at an early period the cross or other sign of a religious character was used to attract Christians, whereas the sign of the sun or the moon would serve the same purpose for pagans. Later, the adaptation of the cups or urns or badges of noble families became common; these would be described by the people without consideration of the language of heredity, and thus such signs as the Red Lion, the Green Dragon, &c., have become familiar. Another class of sign was that which exhibited merely persons employed in the various trades, or objects typical of them, but in large towns where many practised the same trade, and especially, as was often the case, where these congregated mainly in the same street, such signs did not provide sufficient distinction. Thus a variety of devices came into existence—sometimes the trader used a rebus on his own name (e.g. two cocks for the name of Cox), sometimes he adopted the figure of an animal or other object, or portrait of a well-known person, which he considered likely to attract attention. Finally we have the common association of two heterogeneous objects, which (apart from those representing a rebus) were in some cases merely a whimsical combination, but in others arose from a popular misconception of the sign itself (e.g. the combination of the "leg and star" may have originated in a representation of the insignia of the garter), or from corruption in popular speech (e.g. the combination "goat and compasses" is said by some to be a corruption of "God encompasses"). Whereas the use of signs was generally optional, publicans were on a different footing from other traders in this respect. As early as the 14th century there was a law in England compelling them to exhibit signs, for in 1393 the prosecution of a publican for not doing so is recorded. In France edicts were directed to the same end in 1567 and 1577. Since the object of sign-boards was to attract the public, they were often of an elaborate character. Not only were the signs themselves large and sometimes of great artistic merit (especially in the 16th and 17th centuries, when they reached their greatest vogue) but the posts or metal supports protruding from the houses over the street, from which the signs were swung, were often elaborately worked, and many beautiful examples of wrought-iron supports survive both in England and on the Continent. The signs were a prominent feature of the streets of London at this period. But here and in other large towns they became a danger and a nuisance in the narrow ways. Already in 1660 a royal order had been directed in France against the excessive size of sign-boards and their projection too far over the streets. In Paris in 1761 and in London about 1762-1773 laws were introduced which gradually compelled sign-boards to be removed or fixed flat against the wall. For the most part they only survived in connexion with inns, for which some of the greatest artists of the time painted sign-boards, usually representing the name of the inn. With the gradual abolition of sign-boards the numbering of houses began to be introduced in the 18th century in London. It had been attempted in Paris as early as 1712, and had become almost universal by the close of the 18th century, though not enforced until 1805. It appears to have been first introduced into London early in the 18th century. Pending this development, houses which carried on trade at night (e.g. coffee houses, &c.) had various specific arrangements of lights, and these still survive to some extent, as in the case of doctors' dispensaries and chemists' shops.

**SIGNIA** (mod. *Segni*), an ancient town of Latium (*adjectum*), Italy, on a projecting lower summit of the Volscan mountains, above the Via Latina, some 35 m. S.E. of Rome. The modern railway station, 33 m. S.E. of Rome, lies 5 m. S.E. of Signia, 600 ft. above sea level. The modern town (1292 ft.) occupies the lower part of the ancient site. Pop. (1900) 6942. Its foundation as a Roman colony is ascribed to Tarquinius Superbus, and new colonists were sent there in 405 B.C. Its position was certainly of great importance: it commands a splendid view, and with Anagnia, which lies opposite to it, guarded the approach to the valley of the Terus or Tolerus (Sacco) and so the road to the south. It remained faithful to Rome both in the Latin and in the Hannibalic wars, and served as a place of detention for the Carthaginian hostages during the latter. It seems to have retained a place of some importance. Like Cora it retained the right of beheading criminals, with hard, strong cement, made partly of broken pieces of pottery, which served as lining for Roman water cisterns (*opus signinum*) owes its name to its invention here (Vitruvius, viii. 7, 14). Its wine, pears and charcoal were famous in Roman times. In 90 B.C. it became a municipium with a *seneatus* and *praetores*. In the civil war it joined the democratic party, and it was from here that in 82 B.C. Marius marched to Sacripontus (probably marked by the medieval castle of Flombina, near Segni station, commanding the junction of the Via Labicana and the Via Latina; see T. Ashby, *Papers of the British School at Rome*, London, 1902, i. 125 sqq.), where he was defeated by Marius. After this no more of Signia until, in the middle ages, it became a papal fortress.

The city wall, constructed of polygonal blocks of the mountain limestone and 14 m. in circumference, is still well preserved and has several gates; the largest, Porta Saracinesca, is roofed by the gradual inclination of the sides until they are close enough to allow of the placing of a lintel. The other gates are mostly narrow posterns covered with flat monolithic lintels, and the careful jointing of the blocks of which some of them are composed may be noted. Their date need not be so early as is generally believed (cf. Novius) and they are certainly not pre-Roman. A portion of the wall in the modern town has been restored in *opus quadratum* of tufa in Roman times. Above the modern town, on the highest point, is the church of S. Pietro, occupying the central cella of the ancient Capitolium of Signia (which had three cellae). The walls consist of rectangular blocks of tufa, and the whole rests upon a platform of polygonal masses of limestone (see R. Delbrück, *Das Capitolium von Signia*, Rome, 1903). An open circular cistern in front of the church lined with rectangular blocks of tufa may also be noted.

**SIGNIFICATES** (Lat. *significates*). The term "Significates" may be defined as the science of meaning or the study of significance, provided sufficient recognition is given to its practical aspect as a method of mind, one which is involved in all forms of mental activity, including that of logic.

In Baldwin's *Dictionary of Philosophy and Psychology* (1901-1905) the following definition is given:—

"I. Signifies implies a careful distinction between (a) sense or signification, (b) meaning or intention and (c) significance or ideal end of can be specified. The reference of the first is mainly verbal (or rather sensal), of the second volitional, and of the third moral (e.g. we speak of some event 'the significance of which cannot be overrated,' and it would be impossible in such a case to substitute the 'sense' or the 'meaning' of such event, without serious loss)."
Signify treats the relation of the sign in the widest sense to all these.

2. A proposed method of mental training aiming at the concentration of intellectual activities on that which is implicitly assumed to constitute the primary and ultimate value of every form of study, i.e. what is at present indifferently called its meaning or sense, its import or significance... Signify as a science would centralise and co-ordinate, Interpret, inter-relate and concentrate the efforts to bring the first duty of every form and in so doing to classify the various applications of the signifying property clearly and distinctly."

Since this dictionary was published, however, the subject has undergone further consideration and some development, which necessitate modifications in the definition given. It is clear that stress needs to be laid upon the application of the principles and method involved, not merely, though notably, to language, but to all other types of human function. There is need to insist on the rectification of mental attitude and increase of interpretative power which must follow on the adoption of the significational view-point and method, throughout all stages and forms of mental training, and in the demands and contingencies of life.

In so far as it deals with linguistic forms, Signify includes "Semantics," a branch of study which was formally introduced and expounded in 1897 by Michel Bréal, the distinguished French philologist, in his Essai de sémantique. In 1900 this book was translated into English by Mrs Henry Cunt, with a preface by Professor Postgate. M. Bréal gives no more precise definition than the following:—

"Extraire de la langue ce qui en ressort comme aliment pour la réflexion et—je ne crains pas de l’ajouter—comme règle pour notre pensée: éliminer ce qui est n’importe quoi encore pour son côté, et transformer par notre part l’évolution de la parole humaine, voilà ce qui mérite d’être mis en lumière, voilà ce qui j’ai essayé de faile en ce volume."

In the Dictionary of Philosophy and Psychology Semantics is defined as "the doctrine of historical word-meanings; the systematic discussion of the history and development of changes in the meanings of words." It may thus be regarded as a reform and extension of the etymological method, which applies to contemporary as well as to traditional or historical derivation. As human interests grow in constantly specialized directions, the vocabulary thus enriched is unthinkingly borrowed and re-borrowed on many sides, at first in definite quotation, but soon in unconscious or deliberate adoption. Semantics may thus, for present purposes, be described as the application of Signify within strictly philological limits; but it does not include the study and classification of the "Meaning" terms themselves, nor the attainment of a clear recognition of their radical importance as rendering, well or ill, the expressive value not only of sound and script but also of all fact or occurrence which demands and may arouse interpretable attention.

The classified use of the terms of expression-value suggests the main levels or classes of that value—those of Sense, Meaning, and Significance, ultimate value of every form of study. The first of these at the outset would naturally be associated with Sense in its most primitive reference; that is, with the organic response to environment, and with the essentially expressive element in all experience. We ostracize the senseless in speech, and also ask "in what sense" a word is used or a statement may be justified.

(b) But "Sense" is not in itself purposive; whereas that is the main character of the word "Meaning," which is properly reserved for the specific sense which it, is intended to convey.

It should be noticed that the Significance, ultimate value of every form of study, is not merely the loss and danger of some untruth or misfitting imagery and of symbolic assertion, observance or rite, once both worthy and fitting.

Concerning the linguistic bearing of Signify, abundant evidence has been collected, often in quarters where it would least be expected—

1. Of general unconsciousness of confusion, defeat, anti-quotation and inaccuracy in language.

2. A. Of admission of the fact in given cases, but plea of helplessness to set things right. B. Of protest in such cases and suggestions for improvement.

3. Of direct or implied denial that the evil exists or is serious, and of prejudice against any attempt at concerted control and direction of the most developed group of languages.

4. Of the entire lack, in education, of emphasis on the indispensable means of healthy mental development, i.e. the removal of linguistic hindrances and the full exploitation and expansion of available resources in language.

5. Of the central importance of acquiring a clear and orderly use of the terms of what we vaguely call "Meaning," and also of the active modes, by gesture, signal or otherwise, of conveying intention, desire, impression and rational or emotional thought.

1 It would be impossible of course in a short space to prove this contention. But the proof exists, and it is at the service of those who quite reasonably may deny its possible existence.
7. Finally and notably, of the wide-spread and all-pervading havoc at present wrought by the persistent neglect, in modern civilization, of the factors on which depend, for so much of our practical and intellectual welfare and advance,

As the value of this evidence is emphatically cumulative, the few and brief examples necessarily torn from their context for which alone room could here be found would only be misleading. A selection, however, from the endless confusions and logical absurdities which are not only tolerated but taught without correction or warning to children may be given.

We speak of beginning and end as complementary, and then of " both ends "; but never of both beginnings. We talk of truth when we refer the accuracy of the literal (" It is written ") with the accuracy of the actual (" It is happening "). We talk of the mystic and his mysticism, meaning by this, enlightenment, dawn heralding a day; others (more justly) mean by it the mystifying twilight, darkening into night. We talk of the unknowable when what that is or whether it exists is precisely what we cannot know—the idea presupposes what it denies; we affirm or deny immortality, ignoring its correlative innaturity; we talk of solid foundations for life, for mind, for thought, when we mean the starting-points, foci. We speak of an eternal sleep when the very raison d'être of sleep is to end in awaking—it is not a continuation, it is a beginning; we speak of the little one, and also figuratively give roots to the locomotive animal. We speak of natural " law " taking no count of the sub-attentive working in the civilized mind of the associations of the legal system (and the law court) with its decreed and enforced, but also revocable or modifiable enactments. Nature, again, is indifferently spoken of as the norm of all order and fitness, the desecration of which is reprouced as the worst form of vice and is even motherly in bountiful provision; but also as a monster of reckless cruelty and tyrannous mockery. Again, we use the word " passion " for the expression of desire or craving, while we keep " passive " for its very negation.

These instances might be indefinitely multiplied. But it must of course be borne in mind that we are throughout dealing only with the idioms and habits of the English language. Each civilized language must obviously be dealt with on its own merits. The very fact that the significating and interpretative function is the actual, though as yet little recognized and quite untested condition of mental advance and human achievement; accounts for such a function becoming, being taken as an origin, and also as a natural. This indeed, in pre-civilized ages (since it was then the very condition of safety and practically of survival), it was well able to do. But the innumerable forms of protection, precaution, artificial aid and special facilities which modern civilization implies and provides and to which it is always adding, have entirely and dangerously changed the situation. It has become imperative to realize the fact that through disuse we have partly lost the greatest as the most universal of human prerogatives. Hence arises the special difficulty of clearly showing at this stage that man has now of set purpose to recover and develop on a higher than the primitive plane the sovereign power of unerring and productive interpretation of a world which even to a living, much more to an intelligent, being, is essentially significant. These conditions apply not only to the linguistic but to all forms of human energy and expression, which before all else must be significant in the most active, as the highest, sense and degree. Man has from the outset been organizing his experience; and he is bound correspondingly to organize the expression of that experience in all phases of his purposive activity, but more especially in that of articulate speech and linguistic symbol. This at once introduces the volitional element; one which has been strangely eliminated from the very function, which most of all needs and would repay it.

One point must here, however, be emphasised. In attempting to inaugurate any new departure from habitual thinking, history witnesses that the demand at its initial stage for unmistakably clear exposition must be not only unreasonable but futile. This of course must be typically so in the case of an appeal for the vital regeneration of all modes of Expression and especially of Language, by the practical recognition of an ignored but governing factor working at its very inception and source. In fact, for the im centuries at least, the leading civilizations of the world have been content to perpetuate modes of speech once entirely fitting but now often grotesquely inappropriate, while also remaining content with casual changes often for the worse and always liable to inconsistency with context. This inevitably makes for the creation of a false standard both of lucidity and style in linguistic expression.

Still, though we must be prepared to make an effort in assuming what is virtually a new mental attitude, the effort will assuredly be found of fully worth making. For there is here from the very first a special concern to be taken. If, in the course of what has followed the customary lines, nowhere is the initial difficulty of moving in a new direction greater than in the one termed Significs, nowhere, correspondingly, is the harvest of advantage more immediate, greater, or of wider range and effort.

It ought surely to be evident that the hope of such a language—
of a speech which shall worthily express human need and gain in its every possible development in the most efficient possible way, depends on the awakening and stimulation of a sense which it is our common and foremost interest to cultivate to the utmost power. The true state of the ancient animal, now more than ever im-mediate and insistent sense of the pregnancy of things, of the actual bearings of experience, of the pressing and cardinal importance, as warning or guide, of that experience considered as indicative; A Sense realized as belonging to a world of what for us must always be the Sign of somewhat to be inferred, acted upon, used as a mine of pertinent and productive symbol, and as the normal incitement to profitable action. When this germinal or primal sense—as also the practical starting-point, of language—has become a reality for us, reforms and acquisitions really needed will naturally follow as the expression of such a recovered command of fitness, of boundless capacity and of perfect coherence in all modes of expression.

One objection, however, which before this will have suggested itself to the critical reader, is that if we are here really dealing with a function which must claim an importance of the very first rank and affect our whole view of life, practical and theoretical, the need could not have failed long ago to be recognised and acted upon. And indeed it is not easy in a few words to dispose of such an objection and to justify so venturesome an apparent perversion of the methods by which we are now concerned. But it may be pointed out that the special character of the fact always entails at least the partial atrophy of another. In a case like this the principle typically applies. For the main human acquisition has been almost entirely one of logical power, subtle analysis, and co-ordination of artificial means. In modern civilization the application of these functions to an enormous growth of invention of every kind has contributed not a little to the loss of the swift and direct sense of point: the sensitiveness as it were of the compass-needle to the direction in which experience was moving. Attention has been forcibly drawn elsewhere; and moreover, as already pointed out, the natural insight of children, which might have saved the situation, has been methodically silenced by a discipline called educative, but mainly suppressive and distorting.

The biological history of Man has been, indeed, a long series of transmutations of form to subserve higher functions. In language he has so far failed to accomplish this. There has even in some directions been loss of advantage already gained. While his nature has been plastic and adaptive, language, the most centrally important of his acquisitions, has remained relatively rigid, or what is just as calamitous, fortuitously elastic. There have been notable examples—the classical languages—of the converse process. In Greek and Latin, Man admirably controlled, enriched, varied, signified his expressions to serve his mental needs. But we forbear ourselves to follow and better this example. All human energies have come under orderly direction and control except the one in which in a true sense they all depend. This fatal omission, for which defective methods
of education are mainly responsible, has disastrously told upon the mental advance of the race. But after all, we have here a comparatively modern neglect and helplessness. Kant, for instance, complained bitterly of the defeating tendency of language in his day, as compared with the intelligent freedom of the vocabulary and idiom of the "classical" Greek, who was always creating expression, moulding it to his needs and finding an equally intelligent response to his efforts, in his listeners and readers. In philosophic parlance, a Pisan...

Students, who are prepared seriously to take up this urgent question of the application of Significs in education and throughout all human spheres of interest, will soon better any instruction that could be given by the few who so far have tentatively striven to call attention to and bring to bear a practically ignored and unused method. But by the nature of the case they must be prepared to find that accepted language, at least in modern European forms, is far more needlessly defeating than they have supposed possible: that they themselves in fact are continually drawn back, or compelled so to write as to draw back their readers, into what is practically a broth of confusion, a prison of senseless formalism and therefore of barren controversy.

It can hardly be denied that this state of things is intolerable and demands effectual remedy. The study and systematic and practical adoption of the natural method of Significs can alone lead to and supply this. Significs is in fact the natural response to a general sense of need which daily becomes more undeniably evident. It founds no school of thought and advocates no technical specialization. Its immediate and most pressing application is, as already urged, to elementary, secondary and specialised education. In recent generations the healthy sense of discontent and the natural ideals of interpretation and expression have been discouraged instead of fostered by a training which has not only tolerated but perpetuated the existing chaos. Signs, however, are daily increasing that Significs, as implying the practical recognition of, and emphasizing the true line of advance in, a recovered and enhanced power to interpret experience and adequately to express and apply that power, is destined, in the right hands, to become a socially operative factor of the first importance.

LITERATURE.—Lady Welby, "Sense, Meaning and Interpretation," in Mind (January and April 1896). Grasses of Sense (1897), What is Meaning? (1905); Professor F. Tönnes, "Philosophical Terminology" (Welby Prize Essay), Mind (July and October 1899 and January 1905); cf. Tönnes, "Sprachaspekte," in Jahrbuch, &c., and supplements to Philosophische Terminologie (December 1906); Professor G. F. Stout, Manual of Psychology (1898); Sir T. Clifford Allbutt's Address on "Words and Things" to the Students' Physical Society of Guy's Hospital (April 1899); Mr. W. J. Greenstreet's "Recent Researches," and several articles in the Westminster Gazette (November 15, 1906, and January 10, 1907). (V.W.)

SIGN-MANUAL, ROYAL—SIGNORELLI, the autograph signature of the sovereign, by which he expresses his pleasure either by order, commission or warrant. A sign-manual warrant may be either an executive act, e.g., an appointment to an office, or an authority for affixing the Great Seal. It must be countersigned by a principal secretary of state or other responsible minister. A royal order under the sign-manual, as distinct from a sign-manual warrant, authorizes the expenditure of money, e.g., appropriations. There are certain offices to which appointment is made by commission under the great seal, e.g., the appointment of an officer in the army or that of a colonial governor. The sign-manual is also used to give power to make and ratify treaties. In certain cases the use of the sign-manual has been dispensed with, and a stamp affixed to the document as in France. In George I, whose body was infirmity made the act of signing difficult and painful during the last weeks of his life. A special act was passing providing that a stamp might be affixed in lieu of the sign-manual (17 Geo. IV. c. 23), but the sovereign had to express his consent to each separate use of the stamp, the stamped document being attested by a confidential servant and several officers of state (Anson, Law and Custom of the Constitution, 1907, vol. ii. pt. i. p. 99).

SIGNORELLI, LUCA (c. 1442–c. 1524), Italian painter, was born in Cortona—his full name being Luca d'Egidio di Ventura; he has also been called Luta da Cortona. The precise date of his birth is uncertain; but, as he is said to have died at the age of eighty-two, and as he was certainly alive during some part of 1524, the birth-date of 1442 must be nearly correct. He belongs to the Tuscan school, associated with that of Umbria. His first impressions of art seem to be due to Perugia—the style of Bonfigli, Fiorenzo and Pinturicchio. Lazzaro Vasari, the great-grandfather of Giorgio Vasari, the historian of art, was brought to Luca's mother; he got Luca apprenticed to Piero de' Franceschi. In 1472 the young man was painting at Arezzo, and in 1474 at Città di Castello. He presented to Lorenzo de' Medici a picture which is probably the one named the "School of Pan," discovered some years ago in Florence, and now belonging to the Berlin gallery; it is almost the same subject which he painted also on the wall of the Petrucci palace in Siena—the principal figures being Pan himself, Olympus, Echo, a man reclining on the ground and two listening shepherds. He executed, moreover, various sacred pictures, showing a study of Botticelli and Lippo Lippi. Pope Sixtus IV. commissioned Signorelli to paint some frescoes, now very dim, in the shrine of Loreto—Angels, Doctors of the Church, Evangelists, Apostles, the Incredulity of Thomas and the Conversion of St. Paul. He also executed a single fresco in the Sistine Chapel in Rome, the "Acts of Moses"; another, "Moses and Zipporah," which has been usually ascribed to Signorelli, is now recognized as the work of Perugino. Luca may have stayed in Rome from 1478 to 1484. In the latter year he returned to his native Cortona, which remained from this time his ordinary home. From 1497 he began some professional excursions. In Siena, in the convent of Chiusuri, he painted eight frescoes, forming part of a vast series of the Life of St. Benedict; they are at present much injured. In the palace of Pandolfo Petrucci he worked upon various classic or mythological subjects, including the "School of Pan" already mentioned. From Siena he went to Orvieto, and here he produced the works which, beyond all others, stamp his greatness in art. These are the frescoes in the chapel of S. Brizio, in the cathedral, which already contained some pictures on the vaulting by Fra Angelico. The works of Signorelli represent the "Last Days of the Mundane Dispensation," with the "Pomp and the Fall of Antichrist," and the "Eternal Destiny of Man," and occupy three vast lunettes, each of them a single picture. In one of them, Antichrist, after his portraits and impious glories, falls headlong from the sky, crashing down into an innumerable crowd of men and women. "Paradise," the "Erect and the Condemned," "Hell," the "Resurrection of the Dead," and the "Destruction of the Reprobate" follow in other compartments. To Angelico's ceiling Signorelli added a section showing figures blowing trumpets, &c.; and in another ceiling he depicted the Madonna, Doctors of the Church, Patriarchs and Martyrs. There is also a great deal of subsidiary work connected with Dante, and with the poets and legends of antiquity. The daring and terrible invention of the great compositions, with their powerful treatment of the nude and of the most arduous foreshortenings, and the general mastery over complex grouping and distribution, marked a development of art which had never previously been attained. It has been said that Michelangelo felt so strongly the might of Signorelli's delineations that he borrowed, in his own "Last Judgment," some of the figures or combinations which he found at Orvieto; this statement, however, has not been verified by precise instances. The contract for Luca's work is still on record. He undertook on 5th April 1499 to complete the ceiling for 200 ducats, and to paint the walls and the cornices in 3 years. On completion of the contract, was paid with two measures of wine and two quarters of corn. Signorelli's first stay in Orvieto lasted not more than two years. In 1502 he returned to Cortona, and painted a dead Christ, with the Marys and other figures. Two years later he was once more back in Orvieto, and completed the whole of his work in or about that time, i.e., some two years before 1506—a date famous in the history of the advance of art, when Michelangelo displayed his cartoon of Pisa.

After finishing off at Orvieto, Signorelli was much in Siena. In 1507 he executed a great altarpiece for S. Medardo at Arecevia.
in Umbria—the "Madonna and Child," with the "Massacre of the Innocents" and other episodes. In 1508 Pope Julius II determined to reardown the camera of the Vatican, and he summoned to Rome Signorelli, in company with Perugino, Pinturicchio and Bazzi (Sodoma). They began operations, but were shortly all superseded to make way for Raphael, and their work was taken down. Luca now returned to Siena, living afterwards for the most part in Cortona. He continued constantly at work, but the performances of his closing years were not of special mark. In 1520 he went with one of his pictures to Arezzo. Here he saw Giorgio Vasari, aged eight, and encouraged his father to send the boy's bent for art. Vasari tells a pretty story how the wellhug octogenarian master said to him "Impara, parentino" ("You must study, my little kinsman"), and clasped a jasper round his neck as a preservative against nose-bleeding, to which the child was subject. He was partially paralytic when he began a fresco of the "Baptism of Christ" in the chapel of Cardinal Passerini's palace near Cortona, which (or else a "Coronation of the Virgin" at Folano) is the last picture of his specified. Signorelli stood in great repute not only as a painter but also as a citizen. He entered the magistracy of Cortona as early as 1488, and in 1524 held a leading position among the magistrates of his native place. In or about the year 1524 he died there.

Signorelli from an early age paid great attention to anatomy, and his History of the Human Body, of the life and death of nurseries, and of his contemporaries, were dimensions easy enough in showing the structure and mechanism of the nude in immediate action; and he even went beyond nature in experiments of this kind, trying hypothetical attitudes and combinations. His vocation was no doubt due to his early and sound analogy to the method of Michelangelo. He aimed at powerful truth rather than nobility of form; colour was comparatively neglected, and his chiaroscuro exhibits sharp oppositions of lights and shadows. He had a vast influence over the painters of his own and of succeeding times, but had no pupils or assistants of high mark; one of them was a nephew named Francesco. He was a married man with a family; one son Prosper died, seemingly through some accident. Luca depicted his corpse depicted in the full and steady self-possession. He is described as full of kindliness and amiability, sincere, courteous, easy with his art assistants, of fine manners, living and dressing well; indeed, according to Vasari, he always lived more like a nobleman than a painter. The Torrigiani Gallery in Florence contains a grand life-sized portrait by Signorelli of a man in a red cap and vest; this is said to be the likeness of the painter himself, and corresponds with Vasari's observation.

In the National Gallery, London, are the "Circumcision of Jesus" and three other works.

SIGONIUS, CAROLUS [CARLO SIGONIO OR SIGONE] (c. 1524–1584), Italian humanist, was born at Modena. Having studied Greek under the learned Franciscus Portus of Candia, he attended the philosophical schools of Bologna and Pavia, and in 1545 was elected professor of Greek in his native place in succession to Portus. In 1552 he was appointed to a professorship at Venice, which he exchanged for the chair of eloquence at Padua in 1560. To this period of his life belongs the famous quarrel with Robertelli, due to the publication by Signorelli of De nominibus Romanorum, in which he corrected several errors in a work of Robertelli. The subject of the quarrel was first touched upon by the intervention of Cardinal Serpiando (who purposely stopped on his way to the Council of Trent), but broke out again in 1562, when the two rivals found themselves colleagues at Padua. Signorelli, who was of a peaceful disposition, therewith accepted (in 1563) a call to Bologna. He died in a country house purchased by him in the neighbourhood of Modena, in August 1584. The last year of his life was embittered by another literary dispute. In 1583 there was published at Venice what purported to be Ciceron Consolation, written as a distraction from his grief at the death of his daughter Tullia. Signorelli declared that, if not genuine, it was at least worthy of Ciceron, and wrote (from the opposite view (Antonio Ricoboni, Justus Lipsius, and others) asserted that Signorelli himself had written it with the object of deceiving the learned world, a charge which he explicitly denied. The work is now universally regarded as a forgery, whoever may have been the author of it. Signorelli's reputation chiefly rests upon his publications on Greek and Roman antiquities, which may even now be consulted with advantage: Fasti consularia (1550; new ed., Oxford, 1859), with an introduction by J. Tighe and notes by C. Sigurd, an edition by Livy with the Scholia; De antiquo jure Roma- norum, Italicum, provinciarum (1560) and De Romanae juris- prudentiae judicis (1574); De república Atheniensium (1564) and De Atheniensium et Lacedaeoniorum temporibus (1565), the first well-arranged account of the constitution, history, and chronology of Athens and Sparta, with which may be mentioned a similar work on the religious, political, and military system of Athens (De politia urbis Atheni, 1565). His History of the kingdom of Italy (De regno Italae, 1580) from the invasion of the Lombards (168) to the end of the 13th century forms a companion volume to the history of the western empire (De occidentali imperio, 1579) from Dioecletian to its destruction. In order to obtain material for these works, Signorelli consulted all the archives and family chronicles of Italy, and the public and private libraries, and the autograph MS. of his De regno Italae, containing all the preliminary studies and many documents not used in print, was discovered in the Ambrosian library of Milan. At the request of Gregory XIII. he undertook to write the official history of the Christian Church, but did not live to complete the work. The most complete edition of his works is that by P. Argelati (Milan, 1732–1737), which contains his life by L. A. Muratori, the only trustworthy authority for the 17th. His History of the Lombards, 1580–1583, was published long before it was done, and, while it is of great value to the La- boschi, Storia della letteratura italiana, vii.; Giugnualin, Storia letteraria d'Italia; J. P. Krebs, Carlo Sigonio (1840), including some Latin letters of Sigonius and a complete list of his works in chronolo- gical order; Franzosi, Della vita e delle opere di Carlo Sigonio (Modena, 1872); Hessel, De regno Italae libri XX. c. Carlo Sigonio, eine quellenkritische Untersuchung (1900); and J. E. Sanders, History of Classical Scholarship, ii. (1908), p. 143.

SIGOURNEY, SIR ALFRED, American author, was born in Norwich, Connecticut, on the 1st of September 1791. She was educated in Norwich and Hartford. After conducting a private school for young ladies in Norwich, she conducted a similar school in Hartford from 1814 until 1819, when she was married to Charles Sigourney, a Hartford merchant. She contributed more than two thousand articles to many (nearly 300) periodicals, and wrote more than fifty books. She died in Hartford, on the 10th of June 1865. Her books include Moral Pieces in Prose and Verse (1825); Traits of the Aborigines of America (1829), a poem; A Sketch of Connecticut Forty Years Since (1832); Poems, 1854, and one of her best-known books; Sketches (1834); Poetry for Children (1834); Zinzendorf, and Other Poems (1835); Olive Buds (1836); Letters to Mothers (1838), republished in London; Pocahontas, and Other Poems (1831); Pleasant Memories of Pleasant Lands (1842), descriptive of her trip to Europe in 1840; Scenes in My Native Land (1844); Letters to My Pupils (1851); Olive Leaves (1851); The Faded Hope (1852), in memory of her only son, who died when he was nineteen years old; Past Meridian (1854); The Daily Counsellor (1858), poems; Gleanings (1860), selections from her Poems of the Massachusetts (1862); and Letters of Life (1866), giving an account of her career. She was one of the most popular writers of her day, both in America and in England, and was called "the American Hemans." Her writings were characterized by lucency, grace and quiet reflection on nature, domestic and religious life, and philanthropic questions; but they were too often sentimental, didactic and commonplace to have much literary value. Some of her blank verse pictures of nature suggest Bryant. Among her most successful poems are "Niagara," and "Indian Names." Throughout her life she took an active interest in philanthropic and educational work.

SIGURD [Sigurðr] or SIGFRIED (M. H. G. Stirling, the hero of the Nibelungenlied, and of a number of Scandinavian poems included in the older Edda, as well as of the prose Völsunga Saga, which is based upon the latter. According to both the
German and Scandinavian authorities he was the son of a certain Sigmund (Siegmund), a king in the Netherlands, or the "land of the Franks." The exploits of this Sigmundr and his elder sons Sinfiotl and Helgi form the subject of the earlier parts of Völuspa Soga, and Siegund and Eitenn (i.e. Sinfiotl) are also mentioned by the Posse. According to the Scandinavian story Sigmund was slain in battle before the birth of Sigur, but the German story makes him survive his son. Sigurd acquired great fame and riches by slaying the dragon Fafnir, but the chief interest of the story centres round his connexion with the court of the Burgundian king Gunnar (Gunther). He married Guðrun (Kriemhild), the sister of that king, and won for him by a stratagem the hand of the Valkyrie Brynhildr, with whom he had himself previously exchanged vows of love. A quarrel arose between Brynhildr and Guðrun, in the course of which the former learnt of the deception that had been practised upon her and this led eventually to the murder of Sigur. According to the Scandinavian version he was slain by his brother-in-law Gottorm, according to the German version by the knight Hagen. Gunther's brothers were subsequently slain while visiting Atli (Etzel), who married Guðrun after Sigurd's death. According to the German story they were killed at the instigation of Kriemhild in revenge for Siegfried. The Scandinavian version of the story attributes the deed to Atli's lust for gold.

The story of Sigurd has given rise to more discussion than any other subject connected with the Teutonic heroic age. Like Achilles he is represented as the perfect embodiment of the ideals of the race, and, as in the case of the Greek hero, it is customary to regard his personality and exploits as mythical. There is no question, however, that the Burgundian king who is said to have been his brother-in-law was an historical person who was slain by the Huns, at the time when the Burgundian kingdom was overthrown by the latter. Sigurd himself is not mentioned by any contemporary writer; but, apart from the dragon incident, there is nothing in the story which affords sufficient justification for regarding his personality as mythical. Opinion has been divided, however, as to the wider proportions of history and fiction which the story contains. The story of Siegfried in Richard Wagner's famous opera-cycle Der Ring der Nibelungen is mainly taken from the northern version; but many features, especially the characterization of Hagen, are borrowed from the German story, as is also the episode of Siegfried's murder in the forest.

(SIGURSSON, JON (1811-1879), Icelandic statesman and man of letters, was born in the west of Iceland in 1811. He came of an old family, and received an excellent education. In 1830 he was secretary to the bishop of Iceland, the learned Steingrim Jónsson. In 1833 he went to the university of Copenhagen and devoted himself to the study of Icelandic history and literature. His name soon became prominent in the learned world, and it may safely be said that most of his historical works and his editions of Icelandic classics have never been surpassed for acute criticism and minute painstaking. Of these we may mention Lógsögumanaatal og Lógsögumannað Islandi ("Speakers of the Law and Law-men in Iceland"); his edition of Landnáma and other sagas in Íslendinga Sögur, i-i. (Copenhagen, 1843-1847); the large collection of Icelandic laws edited by him and Oddgeir Stephensen; and last, not least, the Diplomatarium Islandicum, which after his death was continued by others. But although he was one of the greatest scholars Iceland has produced, he was still greater as a politician. The Danish rule, during the centuries following the Reforma,

SIGURJÓN—SIGWART

to a mere shadow, had been abolished in 1800; only the revenue of Iceland went into the Danish treasury, and only very small sums were spent for the good of the island; but worst of all was the notorious monopoly which gave away the whole trade of Iceland to a single Danish trading company. This monopoly had been abolished in 1873, and the trade had been declared free to all Danish subjects, but practically the old arrangement was continued under disguised forms. Jón Sigurðsson began a hard struggle against the Danish government to obtain a reform. In 1834 the trade of Iceland was declared free to all nations. In 1840 the Althing was re-established as an advisory, not as a legislative body. But when Denmark got a free constitution in 1848, which had no legal validity in Iceland, the island felt justifiably in demanding full home rule. To this the Danish government was vehemently opposed; it convoked an Icelandic National Assembly in 1851, and brought before that body a bill granting Iceland small local liberties, but practically incorporating Iceland in Denmark. This bill was indignantly rejected, and, instigated by Jón Sigurðsson, another was demanded of far more liberal tendencies. The Danish governor-general then dissolved the assembly, but Jón Sigurðsson and all the members with him protested to the king against these unlawful proceedings. The struggle continued with great bitterness on both sides, but gradually the Danish government was forced to grant many important reforms. High schools were established at Reykjavik, and efforts made to better the trade and farming of the country. In 1871 the Danish parliament (Rigsdag) passed a law defining the political position of Iceland in the Danish kingdom. Though, though never recognized as valid by the Icelanders, became de facto the base of the political relations of Iceland and Denmark. At last, in 1874, when King Christian IX. visited Iceland at the festival commemorating the millenary of the colonization of Iceland from Norway, he gave to the country a Constitution, with full home rule in all internal matters. An immense victory was gained, entirely due to Jón Sigurðsson, whose high personal qualities had rallied all the nation round him. He was a man of fine appearance, with an eloquence and diplomatic gifts such as no other of his countrymen possessed, and the character of his country made itself felt in almost every branch of Icelandic life. Recognizing the value of an intellectual centre, he made Reykjavik not only the political, but the spiritual capital of Iceland by removing all the chief institutions of learning to that city; he was the soul of many literary and political societies, and the chief editor of the Ny Félagsrít, which has done more than any other Icelandic periodical to promote the cause of civilization and progress in Iceland.

SIGWART, CHRISTOPH WILHELM VON (1789-1844), German philosopher, was born at Remmingsheim in Württemberg, and died in Stuttgart. He became professor of philosophy at Tübingen, and wrote numerous books on the history of philosophy:—Über den Zusammenhang des Spinozismus mit der Cartesianischen Philosophie (1816); Handbuch der Vorlesungen über die Logik (1818, 3rd ed., 1835); Der Spinozismus (1830); and Geschichte der Philosophie (1844).

His son, CHRISTOPH VON SIGWART (1830-1894), after a course of philosophy and theology, became professor at Blubeuren (1839), and eventually at Tübingen, in 1865. His principal work, Logik, published in 1873, takes an important place among recent contributions to logical theory. In the preface to the first edition, Sigwart explains that he makes no attempt to appreciate the logical theories of his predecessors; his intention was to construct a theory of logic himself. He presents the results of a long and careful study not only of German but also of English logician.

In 1805 an English translation by
Miss H. Dendy was published in London. Chapter v. of the second volume is especially interesting to English thinkers as containing a profound examination of the Induction theories of Bacon, J. S. Mill and Hume. Among his other works are Spinosa neu endeckter Traktat von Gott, dem Menschen und dessen Glückseligkeit (1866); Kleine Schriften (1881); Vorfragen der Ethik (1886). The Kleine Schriften contains valuable criticisms on Paracelsus and Bruno.

**SIGYNAE** (Σιγηναί, Σίγηνα), an obscure people of antiquity. They are variously located by ancient authors. According to Herodotus (v. 9), they dwelt beyond the Danube, and their frontiers extended almost as far as the Enetii on the Adriatic. Their horses (or rather, ponies) were small, with shaggy long hair, not strong enough to carry men, but very speedy when driven in harness. The people themselves wore a Medic costume, and, according to their own account, were a colony of the Medes. Strabo (xi. p. 320), who places them near the Caspian, also speaks of their ponies, and attributes to them Persian customs. In Apollonius Rhodius (iv. 320) they inhabit the shores of the Euxine, not far from the mouth of the Danube.

The statement as to their, Medic origin, regarded as incomprehensible by Herodotus, is doubtfully explained by Rawlinson as indicating that "the Sigynae retained a better recollection than other European tribes of their migrations westward and Aryan origin"; R. W. Macan (in Herod. v. 9) suggests that it may be due to a confusion with the Thracian Maedi (Μαέδαι). If the last paragraph in Herodotus be genuine, the Ligyes who lived above Massilia and the Sigynae of a similar and not Cypritan the word mean "spears." The similarity between Sigynae and Zigeuner is obvious, and it has been supposed that they were the forefathers of the modern gypsies. According to J. L. Myres, the Sigynae of Herodotus were a people widely spread in the Danubian basin in the 5th century B.C., probably identical with the Sequani, and connected with the iron-working culture of Hallstatt, which produced a narrow-bladed throwing spear, the sigynae spear (see notice of "Anthropical Essays" in *Classical Review*, November 1908).

**Sikh**, a member of the Sikh religion in India (see SIKHISM). The word Sikh literally means "learner," "disciple," and was the name given by the first guru Nanak to his followers. The Sikhs are divided into two classes, Sahijdhari and Kesadhari. The former were so named from living at ease and the latter from wearing long hair. Both obey the general injunctions of the Sikh gurus, but the Sahijdhari Sikhs have not accepted the pahul or baptism of Guru Govind Singh, and do not wear the distinguishing habiliments of the Kesadhari, who are the baptized Sikhs. They are sometimes called khalistanis or literal Sikhs, because they wear long hair, which they wound round a small dagger and keep a comb inserted in it, a steel bracelet and short drawers. Neither the Sahijdhari nor the Kesadhari Sikhs may smoke tobacco or drink wine. The prohibition of wine is, however, generally disregarded except by very orthodox Sikhs.

In the census of 1901, the number of Sikhs in the Punjab and North-Western Provinces was returned as 2,136,987, showing an increase of 13.9% in the decade; but these figures are not altogether reliable owing to the difficulty of distinguishing the Sahijdhari from the Kesadhari Sikhs and both from the Hindu. A man is not born a Singh, but becomes so by baptism, the water of which is called amrit or nectar. It is possible that one brother may be a Hindu, while another is a true Sikh.

The Sikhs are principally drawn from the Arora, Jat and Ramgarhia tribes, but any one may become a Sikh by accepting the Sikh baptism. The Aroras are generally merchants or petty dealers. The Jats are agriculturists variously described as Scythian immigrants and as descendants of Rajputs who immigrated to the Punjab from central India. They are of a tougher fibre than the Aroras; sturdy and self-reliant, slow to speak but quick to act. The Ramgarhias are principally mechanics.

To the temperament of the Jat, the Arora and the Ramgarhia Sikh add the stimulus of a militant religion. The Sikh is a fighting man, and his best qualities are shown in the army, which is his natural profession. Hardy, brave and slow-witted, obedient to discipline, attached to his officers, he makes the finest soldier of the East. In victory he retains his steadiness, and in defeat he will die at his post rather than yield. In peace time he shows a decided fondness for money, and will go wherever it is to be earned. There are some 30,000 Sikhs in the Indian army, and the sect is cherished by the military authorities, who insist on all recruits taking the pahul or Sikh baptism. Many Sikhs are also to be found in the native regiments of east and central Africa and of Hyderabad in the Deccan, and they compose a great part of the police force in the treaty ports of China. (M. M.)

**SIKHISM**, a religion of India, whose followers (Sikhs) are principally found in the Punjab, United Provinces, Sind, Jammu and Kashmir. Sikhism was founded by Nanak, a Khati by name, whose career was born at Tarwelnd near Lahore in A.D. 1469, and after travelling and preaching throughout a great part of southern Asia died at Kartapur in Jullundur in 1539. He was succeeded by nine gurus, teachers or head priests, whose dates are as follows:

Nanak, like Buddha, revolted against a religion overlaid with ceremonial and social restrictions, and both rebelled against the tyranny of the priesthood. The tendency of each religion was to quietism, but their separate doctrines were largely influenced by the surroundings of their founders. Buddha lived in the centre of Hindu India and among the many gods of the Brahmans. These he rejected, he knew of nought else, and in his theological system there was found no place for divinity. Nanak was born in the province which then formed the borderland between Hindism and Islam. He taught that there was one God; but that God was neither Allah nor Ram, but simply God; and that the special god of the Mahomedans, nor of the Hindus, but the God of the universe, of all mankind and of all religions. Starting from the unity of God, Nanak and his successors rejected the idols and incarnations of the Hindus, and on the ground of the equality of all men rejected also the system of caste. The doctrines of Sikhism as set forth in the *Growth* are that it prohibits idolatry, hypocrisy, class exclusiveness, the concremation of widows, the immurement of women, the use of wine and other intoxicants, tobacco-smoking, infanticide, slander and pilgrimages to the sacred rivers and tanks of the Hindus; and it inculcates loyalty, gratitude for all favours received, repudiation of all party spirit, and a general love and all the moral and domestic virtues upheld by Christianity. Sikhism mainly differs from Christianity in that it inculcates the transmigration of the soul, and adopts a belief in predestination, which is universal in the East.

The Sikh religion did not reach this full development at once, nor was the first of the gurus even the first to feel dissatisfaction with the existing order of things. Ideas of revolt and reform of decadent systems are always in the air, it may be for centuries, until some one man bolder than the rest brandishes to give them free expression; and Dr. John the Baptist preceded Jesus Christ, so Nanak was preceded by several reformers, whose writings are incorporated in the *Growth* itself. The chief of these reformers are Jaidev, Ramandam and Kabir. Jaidev is better known as the author of the *Gita-gobind*, which was translated by Sir Edwin Arnold, than as a religious reformer; but in the *Adi Graft* are found two hymns of his in the Prakrit language of the time, in which he represents God as distinct from nature, yet everywhere present. He taught at the end of the 12th century A.D. that the practice of yoga, sacrifices and austerities was as nothing in comparison with the repetition of God's name. He inculcated the worship of God alone, in thought, word and deed. What was worthy of worship, he said, he had worshipped; what was worthy of trust he had trusted; and he had become blended with God, as water blends with water.

Jaidev was succeeded by numerous Hindu saints, who perceived that the superstitions of the age only led to spiritual blindness. Of these saints Ramandam was one of the most distinguished. He lived at the end of the 14th and beginning of
The fourth guru, originally called Jetha, was attracted to the third guru by his reputation for sanctity. He became the servant of Amar Das, helped in the public kitchen, shamed his master, drew water, brought firewood from the forest, and helped in the excavation of a well which Amar Das was constructing at Goindwal. Jetha was of such a mild temper that, even if any one spoke harshly to him, he would endure it and never retaliate. He became known as Ram Das, which means God’s slave; and on account of his piety and devotion Amar Das gave him his daughter in marriage and made him his successor. Ram Das is amongst the most revered of gurus, but no particular innovation is ascribed to him. He founded, however, the golden temple of Amritsar in A.D. 1577, which has remained the repository of the Sikh religious worship. From this time onward the office of guru became hereditary, but the practice of primogeniture was not followed, each guru selecting the relative who seemed most fitted to succeed him.

Ram Das himself, finding his eldest son Prithi Chand worldly and disobedient, and his second unfaithful by his too retiring disposition for the duties of guru, appointed his third son, Arjan, to succeed him. When Prithi Chand represented to him that he had received the turban bound on Guru Arjan’s head in token of succession to his father, Arjan meekly handed it to him, without, however, bestowing it on him as guruship. The Sikhs themselves soon revolted against the exactions of Prithi Chan, and prayed Arjan to assert himself also the seed of the True Name would perish. It was Guru Arjan who compiled the Granth or Sikh Bible, out of his own and his predecessors’ compositions. On this account he was accused of deceiving the deities of his country and substituting for them a new divinity, but he was acquitted by the tolerant Akbar. When Akbar, however, was succeeded by Jahangir the guru aided the latter’s son Khursu to escape with a gift of money. On this account his property was confiscated to the state, and he was thrown into rigorous imprisonment and tortured to death. Arjan saw clearly that it was impossible to preserve his sect without force of arms, and one of his last injunctions to his son Har Govind was to sit fully armed on his throne and maintain an army to the best of his ability. This was the turning-point in the history of the Sikhs. Hitherto they had been merely an insignificant religious sect; now, stimulated by persecution, they became a militant and political power, inimical to the Mahommedan rulers of the country.

When Har Govind was installed as guru, Bhai Budha, the aged Sikh who performed the ceremony, presented him with a turban and a necklace, and charged him to wear and preserve them as the founder of his religion had done. Guru Har Govind promptly ordered that the articles should be relegated to his treasury, the museum of the period. He said: “My necklace shall be my sword-belt, and my turban shall be adorned with a royal agirette.” He then sent for his bow, quiver, arrows, shield and sword, and arrayed himself in martial style, so that, as the Sikh chronicler states, his splendour shone like the sun.

The first four gurus led simple ascetic lives and were regardless of worldly affairs. Guru Arjan, who was in charge of the great army of Akbar, was alwaysattired in a coarse and unkempt dress, and dined at Amritsar, the capital of the Suleiman Shah, and was a man of wealth and influence, while the sixth guru became a military leader, and was frequently at warfare with the Mogul authorities. Several warriors and wrestlers, hearing of Guru Har Govind’s fame, came to him for service. He enrolled as his bodyguard fifty-two heroes who burned for the fray. This formed the nucleus of his future army. Five hundred youths then came to him for enlistment from the Manjha, Doab and Malwa districts. These men told him that they had no offering to make to him except their lives; for pay they only required instruction in his religion; and they professed themselves ready to die in his service. The guru gave them each a horse and five weapons of war, and gladly enlisted them in his army. In a short time, besides men who required regular pay, hordes gathered round the guru who were satisfied with two meals a day and a suit of clothes every six months. The fighting spirit of the people
SIKHISM

was roused and satisfied by the spiritual and military leader. Har Govind was a hunter and eater of flesh, and encouraged his followers to eat meat as giving them strength and daring. It is largely to this practice that the Sikhs owe the superiority of their physique over their surrounding Hindu neighbours. The regal state that the guru adopted and the army that he maintained were duly reported to the emperor Jahangir.

In the Autobiography of Jahangir it is stated that the guru was imprisoned in the fortress of Gwalior, with a view to the realization of the fine imposed on his father Guru Arjan, but the Sikhs believe that the guru became a voluntary inmate of the fortress with the object of obtaining seclusion there to pray for the emperor who had been advised to that effect by his Hindu astrologers. After a time Jahangir died and was succeeded by Shah Jahan, with whom the guru was constantly at war. On three separate occasions after desperate fighting he defeated the royal troops sent against him. Many legends are told of his military prowess, for which there is no space in this summary. The guru before his death at Kiratpur, on the margin of the Sutlej, instructed his grandson and successor, Guru Har Rai, to retain two thousand two hundred mounted soldiers ever with him as a precaution.

Har Rai was charged with friendship for Dara Shikoh, the son of Shah Jahan, and also with preaching a religion distinct from Islam. He was, therefore, summoned to Delhi, but instead of going himself he sent his son Ram Rai and shortly afterwards died. His ministry was mild but won him general respect.

The eighth guru was the second son of Har Rai, but he died young when a child and too young to leave any mark on history. His elder brother Ram Rai was passed over in favour and also in favour of the next guru for having altered a line of the Granth to please the emperor Aurangzeb.

As the direct line of succession died out with Har Krishan, the guruship harked back at this point to Teg Bahadur, the second son of Har Govind and uncle of Har Rai. Teg Bahadur was put to death for refusal to embrace Islam by Aurangzeb in a.d. 1675. It is of him that the legend is told that during his imprisonment in Delhi he was accused by the emperor of looking towards the west in the direction of the imperial zenana. The guru replied, "Emperor Aurangzeb, I was on the top story of my prison, but I was not looking at thy queen's. I was looking in the direction of the Europeans who are coming from beyond the seas to tear down thy purdahs and destroy thine empire." This prophecy became the battle-cry of the Sikhs in the assault on Delhi in 1857.

Teg Bahadur was succeeded by the tenth and most powerful guru, his son Govind Singh; and it was under him that what had sprung into existence as a quietist sect of a purely religious nature, and had become a military society for self-protection, developed into a national movement which was to rule the whole of north-western India and to furnish to the British arms their stoutest and most worthy opponents. For some years after his father's execution Govind Singh, then known as Gobind Rai, lived in retirement, brooding over the wrongs of his people and the persecutions of the fanatical Aurangzeb. He felt the necessity for a larger following and a stronger organization, and following the example of his Mahomedan enemies used his religion as the basis of political power. Emerging from his retirement he preached the Khalsa, the "pure," and it is by this name his followers are now known. He, like his predecessors, openly attacked all distinctions of caste, and taught the equality of all men who would join him, and he instituted a ceremony of initiation with baptismal holy water by which all might enter the Sikh fraternity.

The higher castes murmured, and many of them left him, for he taught that the Brahmanical threads must be broken; but the lower orders rejoiced and flocked in numbers to his standard. These he inspired with military ardour in the hope of social freedom and of national independence. He gave them outward signs of their faith in the five K's—which will subsequently be explained—he signified the military nature of their calling by the title of "singh" or "lion" and by the wearing of steel, and he strictly prohibited the use of tobacco. The following are the main points of his teaching: Sikhs must have one form of initiation, sprinkling of water by five of the faithful; they should worship the one invisible God and honour the memory of Guru Nanak and his successors; their watchword should be, "Sri wah guru ji ka khalsa, sri wah guru ji ki fath" (Khalsa of God, victory to God), but they should revere and bow to nought worship of the "devon Sahib," the book of their belief; they should occasionally bathe in the sacred tank of Amritsar; their locks should remain unshorn; and they should name themselves singhs or lions. Arms should dignify their person; they should ever practise their use; and great would be the merit of those who fought in the van, who slew the enemies of their faith, and who despaired not although overpowered by superior numbers.

The religious creed of Guru Govind Singh was the same as that of Guru Nanak: the God, the guru and the Granth remained unchanged. But while Nanak had substituted holiness of life for vain ceremonial, Guru Govind Singh demanded in addition to the former also a reverence for the Granth and a reflection of faith; and while he retained his predecessors' attitude towards the Hindu gods and worship he preached undying hatred to the persecutors of his religion.

During the spiritual reign of Guru Govind Singh the religious was partially eclipsed by the military spirit. The Mahomedans promptly responded to the challenge, for the danger was too serious to be neglected; the Sikh army was dispersed and two of Guru Govind Singh's sons were murdered at Sirhind by the governor of that fortress, and his mother died of grief at the cruel death of her grandchild. The death of the emperor Aurangzeb brought a temporary lull: the guru assisted Aurangzeb's successor, Bahadur Shah, and was himself not long after assassinated at Nander in the Deccan. As all the guru's sons predeceased him, and as he was disappointed in his envoy Banda, he left no human successor, but vested the guruship in the Granth Sahib and his sect. No formal alteration has been made in the Sikh religion since Guru Govind Singh gave it its military organization, but certain modifications have taken place as the result of time and contact with Hinduism. After the guru's death the gradual rise of the Sikhs into the ruling power of northern India until their conversion to British arms belongs to the secular history of the Punjab (q.v.).

The chief ceremony initiated by Guru Govind Singh was the Khanda ka Pahul or baptism by the sword. This baptism may not be conferred until the candidate has reached an age of discrimination and capacity to remember obligations, seven years being fixed as the earliest age, but it is generally deferred until manhood. Five of the initiated must be present, all of whom should be learned in the faith. An Indian sweetmeat is stirred up in water with a two-edged sword and the novice repeats after the officiant the articles of his faith. Some of the water is sprinkled on him five times, and he drinks of it five times from the palms of his hands; he then pronounces the Sikhs watchword given above and promises adherence to the new obligations he has contracted. He must from that date wear the five K's and add the word singh to his original name. The five K's are (1) the kes or uncut hair of the whole body, (2) the kachh or short drawers ending above the knee, (3) the kara or iron bangle, (4) the khanda or small steel dagger, (5) the khanga or comb. The five K's and the other esoteric observances of the Sikhs mostly had a utilitarian purpose. When fighting was a part of the Sikh's duty, long hair and iron rings concealed in it protected his head from sword cuts. The kachh or drawers fastened by a waist-band was more convenient and suitable for warriors than the insecurely tied dhoti of the Hindus or the lamba of the Mahomedans. So also the Sikh's physical strength was increased by the use of meat and avoidance of tobacco. Another Sikh ceremony is the kara parshad or communion made of butter, flour and sugar, and consecrated with certain ceremonies. The communicants sit round, and the kara
The Sikhism of to-day.

The victory was complete, but the fall of night prevented it from being followed up, and caused some of the native regiments to fire into each other in the confusion.

After the battle of Moodkee Sir Henry Hardinge volunteered to serve as second in command under Sir Hugh Gough, a step which caused some confusion in the ensuing battle. At 4 A.M. on the 21st of December the British advanced from Moodkee to attack the Sikh entrenched camp under the command of Lal Singh at Ferozeshah, orders having been sent to Sir John Littler, in command at Ferozepore, to join the main British force. At 11 A.M. the British were in front of the Sikh position, but Sir John Littler, though on his way, had not yet arrived. Sir Hugh Gough wished to attack while there was plenty of daylight; but Sir Henry Hardinge asserted his civil authority as governor-general, and forbade the attack until the junction with Littler was effected. The army then marched on to meet Littler and the battle did not begin until between 3 p.m. and 4 p.m. The engagement opened with an artillery duel, in which the British again failed to gain the mastery over the Sikhs. The infantry, therefore, advanced to the attack; but the Sikh muskets were as good as the British, and fighting behind entrenchments they were a most formidable foe. Sir John Littler's attack was repulsed, the 62nd regiment losing heavily in officers and men, while the sepoys failed to support the European regiments. But the Moodkee force, undaunted, stormed and captured the entrenchment, though the different brigades and regiments lost position and became mixed up together in the darkness. The army then passed the night on the Sikh position, while the British forces remained round keeping up an incessant fire. In the morning the British found that they had captured seventy-three pieces of cannon and were masters of the whole field; but at that moment a fresh Sikh army, under Tej Singh, came up to the assistance of the scattered forces of Lal Singh. The British were exhausted with their sleepless night, the native troops were shaken, and a determined attack by this fresh army might have won the day; but Tej Singh, after a half-hearted attack, which was repulsed, marched away, whether from cowardice, incapacity or treason, and left the British masters of the position.

After the battle of Ferozeshah the Sikhs retired behind the Sutlej, but early in January they again raid into the country under Runjoor Singh in an entrenched position flanking his line of march at Budhowal. Sir Harry Smith passed on without fighting a general action, but suffered considerable loss in men and baggage. After receiving reinforcements Sir Harry again advanced from Ludhiana and attacked the Sikhs at Allwal on the 28th of January. An attack upon the Sikh left near the village of Allwal gave Sir Harry the key of the position, and a brilliant charge by the 16th Lancers, which broke a Sikh square, completed their demoralization. The Sikhs fled in confusion, losing sixty-seven guns, and by this battle were expelled from the south side of the Sutlej.

Ever since Ferozeshah Sir Hugh Gough had been waiting to receive reinforcements, and on the 7th of February his siege train arrived, while on the following day Sir Harry Smith's force returned to camp. On the 10th of February Sir Hugh attacked the Sikhs, who occupied a strong entrenched position in a bend of the Sutlej. After two hours' cannonading, the infantry attack commenced at 9 A.M. The advance of the first brigade was not immediately successful, but the second brigade following on carried the entrenchments. The cavalry then charged down the Sikh lines from right to left and completed the victory. The Sikhs, with the river behind them, suffered terrible carnage, and are computed to have lost 10,000 men and 67 guns. The British losses throughout the campaign were considerably heavier than usual in Indian warfare; but this was partly due to the fact that the Sikhs were the best natural fighters in India, and partly to the lack of energy of the Hindostani sepoys. After the battle of Sobran
the British advanced to Lahore, where the treaty of Lahore was signed on the 11th of March.  

**Second Sikh War (1848-1849).**—For two years after the battle of Sobraon the Punjab remained a British protectorate, with Sir Henry Lawrence as resident; but the Sikhs were unconvinced of their military superiority, the Rani Jindan and her ministers were constantly intriguing with the Chilla Pathans, and the Sikh trial of strength was inevitable. The outbreak came at Multan, where on the 20th of April 1848 the troops of the Dewan Mulraj broke out and attacked two British officers, Mr Vans Agnew and Lieutenant Anderson, eventually murdering them. On hearing of the incident, Lieut. Herbert Edwardes, who was Sir Henry Lawrence's assistant in the Derajat, advanced upon Multan with a force of levies drawn from the Pathan tribes of the frontier; but he was not strong enough to do more than keep the enemy in check until Multan was invested by a Bombay column under General Whish. The meantime Edwardes wished for an immediate British advance upon Multan; but Lord Gough, as he had now become, decided on a cold season campaign, on the ground that, if the Sikh government at Lahore joined in the rising, the British would require all their available strength to suppress it. Multan was invested on the 18th of August by General Whish in conjunction with the Sikh general Shere Singh; but during the course of the siege Shere Singh deserted and joined the rebels, thus turning the rising into a national war. The siege of Multan was temporarily abandoned, but was resumed in November, when Lord Gough's main advance had begun, and Mulraj surrendered on the 22nd of January. In the meantime Lord Gough had collected his army and stores, and on the 9th of November crossed the Sutlej.

On the 22nd of November there was a cavalry skirmish at Ramnagar, in which General Cureton and Colonel Havelock were killed. For a month after this Lord Gough remained inactive, waiting to be reinforced by General Whish from Multan; but at last he decided to advance without General Whish, and fought the battle of Chillianwalla on the 13th of January 1849. Lord Gough had intended to encamp for the night on the 12th, but the fact that their army had advanced out of its intrenchments, and Lord Gough decided to seize the opportunity and attack at once. An hour's artillery duel showed that the Sikhs had the advantage both in position and guns, and the infantry advance commenced at three o'clock in the afternoon. The battle resulted in great loss to the European regiments, the 24th losing all its officers in a few minutes, while the total loss in killed and wounded amounted to 2338; but when darkness fell the British were in possession of the whole of the Sikh line. Lord Gough subsequently retired to the village of Chubatpur, and the Sikhs were again returned and carried off their guns. After the battle Lord Gough received an ovation from his troops, but his losses were thought excessive by the public in England and the directors of the East India Company, and Sir Charles Napier was appointed to supersede him. Before, however, the latter had time to reach India, the crowning victory of Gujrat had been fought and won. After the fall of Multan General Whish joined Lord Gough, and the junction of the two armies was effected on the 18th of February. In the meantime the Sikhs had withdrawn from their strong intrenchments at Russool, owing to want of provisions, and marched to Gujrat, which Lord Gough considered a favourable position for attacking them. By a series of short marches he prepared the way for his "last and best battle." In this engagement, for the first time in either of the Sikh wars, the British had the superiority in artillery, in addition to a picked force of 24,000 men. The battle began on the morning of the 21st of February with two and a half hours' artillery fire, which was overwhelming in favour of the British.

At 11.30 A.M. Lord Gough ordered a general advance covered by the artillery; and an hour and a half later the British were in possession of the town of Gujrat, of the Sikh camp, and of the enemy's artillery and baggage, and the cavalry were in full pursuit on both flanks. In this battle the British only lost 69 killed and 700 wounded, while the Sikh loss was enormous, in addition to 67 guns. This decisive victory ended the war. On the 12th of March the Sikh leaders surrendered at discretion, and the Punjab was annexed to British India. 

**Sikkim**, called by Tibetans **Dejong** ("the rice country"), a protected state of India, situated in the eastern Himalayas, between 27° 5' and 28° 9' N. and between 87° 59' and 88° 56' E. It comprises an area of 2818 sq. m. of what may be briefly described as the catchment basin of the headwaters of the rivers Tista and Rangit. On the S. and S.E., branches of these rivers form the boundary between Sikkim and British India, while on the W., N. and E. Sikkim is separated from Nepal, Tibet and Bhutan by the range of lofty mountains which culminate in Kinchijing and form a kind of horse-shoe, whence dependent spurs project southwards, gradually contracting in height until they reach the junction of the Rangit and the Tista. Thus the country is split up into a succession of deep valleys surmounted by open plateaus cut off from one another by high and steep ridges, and lies at a very considerable elevation, rising from 1000 ft. above sea-level at its southern extremity to 16,000 or 18,000 ft. on the north. The main trade-places into Tibet, such as the Jelep (14,500), Chola (14,550), and Kangla-la (16,000), are not nearly so high as in the western Himalaya, while those into Nepal are less than 12,000 ft.

The physical condition of the country, therefore, is a wide variation of climate makes it peculiarly interesting. From a naturalist's point of view it can be divided into three zones. The lowest, stretching from 1000 to 3000 ft. above sea-level, may be called the tropical zone, from 3000 to 10,000 ft., the upper limit of the forest belt, the temperate; and above, to the line of perpetual snow, the alpine. Down to about 1880 Sikkim was covered with dense forests, only interrupted where village clearings had bared the slopes for agriculture; but at the present time this description does not apply below 6000 ft., the upper limit at which maize ripens; for here, owing to increase of population (particularly the immigration of Nepalese sepoys) the vegetation has been so much destroyed, that the forest is no longer a permanent feature of the landscape. The exuberance of its flora may be imagined when it is considered that the total flowering plants comprise some 4000 species; there are more than 200 different kinds of ferns, 400 orchids, 20 bamboos, 30 rhododendrons, 30 to 40 primulas, and many other genera are equally profuse; in fact Sikkim contains types of every flora from the tropics to the poles, and probably no other country of equal or larger extent can present such infinite variety. Butterflies abound and comprise about 60 species, while moths are estimated at 1000, and Birds are profusely represented, numbering between 500 and 600 species. Among mammals, the most interesting are the snow leopard (**Panthera uncia**), the cat-bear (**Sarcothamnus fusiger**), the marmoset (**Cynomys sungorus**), and two species of goat antelope (**Nilgoreus bubalus** and **Cemas goral**). Copper and lime are the chief minerals found and worked in Sikkim, but they are of little commercial value at present. Tobacco, corn, rice and barley are grown on a large scale, and the local cultivation of vegetables, fruit, poultry and cattle is carried on in a most flourishing manner; almost every family living in a house on its own land; there are no towns or villages, and the only collection of houses, outside the Lachen and Lachung valleys, are the few that have sprung up round country market-places, such as Rhenock, Diktheling and Gangtok, and in the above-mentioned valleys the inhabitants, who are Bhutanese in origin and herdsmen in occupation, have large clusters of well-built huts at various altitudes up the valleys, which they occupy, in rotation according to the season of the year.

The seat of government, or in other words the palace of the raja, was formerly situated at Rumbentse; but when that place was taken and the capital was shifted by the British to Gangtok, a new palace was built close to the eastern and Tibetan boundary, while a subsidiary summer residence was erected on the other side of the Chola range at Chumbi, in the Am-mochu valley. At the present time the raja of Sikkim remains at Gangtok though the country at Gaetzek, where the British political officer and a small detachment of native troops are also stationed.

The first regular census of Sikkim, in 1901, returned the population at 59,409, showing an apparent increase of nearly twofold in the decade. Of the total, 65% were Hindus and 35% Buddhists. The Lepchas, supposed to be the original inhabitants, numbered only 20,000 at the latest census, while no reliable estimate of the number of Tibetans has ever been made.

The state religion is Buddhism as practised in Tibet, but is not confined to a particular sect; while among the heterogeneous population of Sikkim all manner of religious cults can be found. Education is largely maintained by the British, who maintain schools, and missionary enterprise has established others.

The revenue of Sikkim has increased under British guidance from Rs. 20,000 a year to nearly Rs. 5,50,000, derived chiefly from a land and poll tax, excise, and sale of timber; the chief expenditure is on...
the maintenance of the state, which practically means the rajah's friendly and assiduous correspondence with the British. The state has a complete system of mountain roads, bridged and open to animal (but not cart) traffic. British trade with Central Tibet is carried over the Jelep route, on the south-eastern border of Sikkim.

In the beginning of the 18th century, the Druk-pa sect held the raja of Sikkim. In 1766, the Duk-pa sect were the monastic rulers of Sikkim, the Duk-pa having the raja of Sikkim, Thon-gue Namgyel (1770-1771), who is credited with having designed the alphabet now in use among the Lepchas.

In the beginning of the 18th century Bhutan appropriated a large tract of country on the east. Between 1776 and 1792 Sikkim was constantly at war with the victorious Gurkhas, who were, however, driven out of part of their conquests by the Chinese in 1792: but it was not until 1816 that the bulk of what is known to us as Sikkim was restored by the British, after the defeat of the Nepalese by Cornwallis and Maitland in 1814, the delineating of the raja of Sikkim. In 1849 the British resumed the whole of the plains (Tara) and the outer hills, as punishment for repeated insults and injuries. In 1861 a British force was required to impose a treaty duties in the Sikkim frontier. The raja of Sikkim was created a prince of the state, with all the obligations and defiantly persisted in living in Tibet: his administration was neglected, his subjects oppressed, and a force of Tibetan soldiery entered the town, and seized the fortress, and erected a fort within sight of Darjeeling. After months of useless remonstrance, the government was forced in 1888 to send an expedition, which drove the Tibetans back over the Jelep pass. The convention was then concluded with China in 1890, whereby the British protectorate over Sikkim was acknowledged and the boundary of the state defined; to this was added a supplemental agreement relating to trade and domestic matters, which was signed in 1893. Since that time the government has been conducted by the maharaja, assisted by a council of seven or eight of his leading subjects, and guided by a resident British officer. Crime, of which there is little, is punished under local laws by kanya or by petty chiefs. The British political relations with Sikkim, which had formerly been conducted by the lieutenant-governor of Bengal, have been in the hands of the Viceroy.

SILA—SILENUS

89

he afterwards rejoined Paul at Corinth. He is in all probability the Silvanus who is associated with Paul in the letters to the Thessalonians, mentioned again in 2 Cor. 1.10, and the bearer and amanuensis of 1 Peter (see v. 12). It is possible, indeed, that he has an even closer connexion with this letter, and some scholars (e.g. R. Scott in The Pauline Epistles, 1909) are inclined to give him a prominent place among the writers of the New Testament. He was of Jewish birth and probably also a Roman citizen.

SILAY, a town of the province of Negros Oriental, island of Negros, Philippine Islands, on the N.W. coast, about 10 m. N. of Bacolod, the capital of the province. Pop. (1903, after the annexation of Guinbalon and a portion of Eustaquio Lopez) 22,000. There are more than fifty barrios or villages in the town and the largest of these had, in 1903, 3834 inhabitants. The language is Visayan. There is a considerable coating trade, sugar, brought by a train from the neighbouring towns, is shipped from here, and the cultivation of sugar-cane is an important industry; Indian corn, tobacco, hemp, cotton and cacao are also grown.

SILCHAR, a town of British India, in the Cachar district of Eastern Bengal and Assam, of which it is the headquarters. Pop. (1901) 9256. It is situated on the left bank of the river Barak, with a station on the Assam-Bengal railway, 271 m. N. of Chittagong. Silchar is the centre of an important tea industry, and the headquarters of the volunteer corps known as the Barak Valley Light Horse.

SILCHESTER, a parish in the north of Hampshire, England, about 10 m. S. of Reading, containing the site of the Roman-British town Calleva Atrebatam. This site has been lately explored (1890-1899) and the whole plan of the ancient town within the walls recovered; unfortunately the excavators had to abandon their task before the suburbs, cemeteries and whatever else may lie outside the walls have been examined. The results are published in Archaeologia, the official organ of the London Society of Antiquaries (see Britain: Roman). As the excavations proceeded, the areas excavated were covered in again, but the ruins of the town hall, which have been famous since the 17th century, still remain. The smaller and movable objects found in the excavations have been deposited by the duke of Wellington, owner of the site of Calleva, in the Reading museum.

SILENUS, a primitive Phrygian deity of woods and springs. As the reputed inventor of music he was confounded with Marsyas. He also possessed the gift of prophecy, but, like Proteus, would only impart information on compulsion; when surprised in a drunken sleep, he could be bound with chains of flowers, and forced to prophesy and sing (Virgil, Ed. vi., where he gives an account of the creation of the world; cf. Aelian, Var. Hist. iii. 18). In Greek mythology he is the son of Hermes and a nymph. He is the constant companion of Dionysus, whom he was said to have instructed in the cultivation of the vine and the keeping of bees. He fought by his side in the war against the giants and was his companion in his travels and adventures. The story of Silenus was often the subject of Athenian satyrical drama. Just as there were supposed to be several Pans and Fauns, so there were many Silenes, whose father was called Papposilenus ("Daddy Silenus"), represented as completely covered with hair and more animal in appearance. The usual attributes of Silenus were the wine-skin (from which he is inseparable), a crown of ivy, the Bacchic thyrsus, the ass, and sometimes the panther. In art he generally appears as a little pot-bellied old man, with a snub nose and a bald head, riding on an ass and supported by satyrs; or he is depicted lying asleep on his wine-skin, which he sometimes bestrides. A more dignified type is the Vatican statue of Silenus carrying the infant Dionysus, and the marble group from the villa Borghese in the Louvre.

* For the abbreviation, cf. Lucas, Frisca (= Prisella), Sopater (= Sosipater).
SILESIA, the name of a district in the east of Europe, the greater part of which is included in the German empire and is known as German Silesia. A smaller part, called Austrian Silesia, is included in the empire of Austria-Hungary.

German Silesia.

German Silesia is bounded by Brandenburg, Posen, Russian Poland, Galicia, Austrian Silesia, Moravia, Bohemia and the province of Saxony. Besides the bulk of the old duchy of Silesia, it comprises the countship of Glatz, a fragment of the Neumark, and part of Upper Lusatia, taken from the kingdom of Saxony in 1815. The province, which has an area of 15,576 sq. m. and is the largest in Prussia, is divided into three governmental districts, those of Liegnitz and Breslau comprising Lower Silesia, and of Oppeln in the greater part of mountainous Silesia.

Physiographically Silesia is roughly divided into a flat and a hilly portion by the so-called Silesian Langenwal, which runs from the south-east near the river Malapan and extends across the province in a west-by-north direction to the Black Elster, following in part the valley of the Oder. The south-east part of the province, to the north of the Oder and south of the Malapan, consists of a hilly outpost of the Carpathians, the Tarnowatz plateau, with a mean elevation of about 1000 ft. To the west of the Oder the land rises gradually from the Langenwal towards the southern boundary of Silesia, which is formed by the central part of the Sudetic system, including the Glatz Mountains and the Riesengebirge (Schneeckoppe, 5260 ft.). Among the loftier elevations in this part of Silesia are the fortress of the Zobten, the headquarters of the 317th division, to the north and north-east of the Oder the province belongs almost entirely to the great North-German plain, though a hilly ridge, rarely attaining a height of 1000 ft., may be traced from east to west, ascending itself most definitely in the Katzengeberge. Nearly the whole of Silesia lies within the basin of the Oder, which flows through it from south-east to north-west, dividing the province into two approximately equal parts. The Oder is at times the southern part and receives a few small tributaries from it, while on the west the Spree and Black Elster belong to the system of the Elbe. The liser rises among the mountains on the south. Among the streams of Upper Silesia, the Glogau, the Vltava, the Katzbach and the Bartsch; the Bober and Quises flow through Silesia, but join the Oder beyond the frontier. The only lake of any extent is the Schlawee Sec, 7 m. long, on the north frontier; and the only navigable canal, the Klobutz canal, in the south-eastern district of Upper Silesia. There is a considerable difference in the climate of Lower and Upper Silesia; some of the villages in the Riesengebirge have the lowest mean temperature of any inhabited places in Prussia (below 40°F.).

Of the total area of the province 56% is occupied by arable land, 10-2% by pasture and meadow, and nearly 29% by forests. The soil in the mountainous districts is very good, while in the districts between Ratibor and Liegnitz, where 70 to 80% of the surface is under the plough, is reckoned one of the most fertile in Germany. The parts of lower Silesia adjoining Brandenburg, and also the parts of the province to the west of the Oder, are particularly productive. The different cereals are all grown with success, wheat and rye, sometimes in quantity enough for exportation, Flax is still a frequent crop in the hill districts, and sugar-beets are raised over large areas. Tobacco, oil-seeds, chicory and hops may also be specified, while a little wine, of an inferior quality, is produced near Grünberg. Mulberry trees for silk-culture have been introduced and thrive fairly. Large estates are the rule in Silesia, where about a third of the land is in the hands of owners possessing at least 250 acres, while properties of 50,000 to 100,000 acres are common. The districts of Oppeln and Liegnitz are among the most richly endowed, while the land is poorest of all in the south, where Frederick the Great, and since then the Silesian breed has been greatly improved. The woods and mountains harbour large quantities of game, such as red deer, roe deer, wild boar and hare. The fishery includes salmon in the Oder, trout in the mountain streams, and carp in the small lakes or ponds with which the province is sprinkled.

The greatest wealth of Silesia, however, lies underground, in the shape of large stores of coal and other minerals, which have been worked over since the 12th century. The coal measures of Upper Silesia, in the south-eastern part of the province, are among the most extensive in Europe, and its main outcrop is an indented coalfield near Waldenburg in the south-west. The output in 1905 exceeded 34 million tons, valued at £12,500,000 sterling, and equal to more than a quarter of the entire output of the empire, while the coal of Oppeln contains a great quantity of iron, the production in 1905 amounting to 862,000 tons. The deposits of zinc in the vicinity of Beuthen are perhaps the richest in the world, and produce two-thirds of the zinc ore of Germany (600,000 tons). The remaining mineral products include lead, from which a considerable quantity of silver is extracted, copper, cobalt, arsenie, the rarer metal cadmium, alum, brown coal, marble, and a few of the commoner precious stones, jaspers, agates and amethysts. The province contains scarcely any salt or brine springs, but there are well-known mineral springs at Warmbrunn and Sadowa, and nearby spas.

A busy manufacturing activity has long been united with the underground industries of Silesia, and the province in this respect is hardly excelled by any other part of Prussia. On the plateau of Thorn a large part of the working of the mineral coal and iron industry, and in the neighbourhood of Beuthen, Königshütte and Gleiwitz there is an almost endless succession of iron-works, zinc-foundries, machine-shops and the like. At the foot of the Riesengebirge, and along the southern mountain line generally, the textile industries prevail. Weaving has been practised in Silesia, on a large scale, since the 14th century; and Silesian linen still maintains its reputation, though the conditions of production have changed. Cotton and woolen goods of all kinds are also made in large quantities, and among the other industrial products are beetroot sugar, spirits, chemicals, tobacco, starch, paper, pottery, and Bohemian glass. 'Lace, somewhat resembling that of Brussels, is made by the women of the mountainous districts. The trade of Silesia is scarcely so extensive as might be expected from its important industrial activity. On the east it is hampered by the stringent regulations of the Russian frontier, and the great waterway of the Oder, though in process of being regulated, is sometimes too low in summer for navigation. The extension of the railway system has, however, had its effect in forming connections and the mineral and manufactured products of the province are freely exported.

At the census of 1905 the population of Silesia was 4,043,611, of whom 2,120,692 were Protestants, 2,255,394 Catholics and 46,845 Jews. The density is 317 per sq. m., but the average is of course very greatly exceeded in the industrial districts such as Beuthen. Three-fourths of the inhabitants and territory are German, but to the east of the Oder the Poles, more than 1,000,000 in number, form the bulk of the population, while there are about 15,500 Czechs in the south part of the province and 25,000 Wends near Liegnitz. The Roman Catholics, most of whom are under the ecclesiastical sway of the prince bishop of Breslau, are predominant in Upper Silesia and Glatz; the Protestants prevail in the rest of Silesia, and in the south and south-east near Liegnitz. The nobility is very numerous in Silesia, chiefly in the Polish districts. The educational institutions of the province are headed by the university of Breslau. In 1900 the percentage of illiterate recruits, in spite of the large Polish-speaking contingent, was only 0-05. The capital and seat of the provincial diet is Breslau (q.v.), which is also by far the largest and most important town. The towns next in point of size are Gorzów, Liegnitz, Königshütte, Beuthen, Schweidnitz, Neisse and Glogau. The province sends thirty-five members to the Reichstag and sixty-five to the Prussian chamber of deputies. The government divisions of Breslau and Oppeln together form the fifth military district, with army corps with its headquarters at Breslau, while Liegnitz belongs to that of the 5th army corps, the headquarters of which are at Posen. Glogau, Liegnitz and Neisse are fortresses.

History.—The beginnings of Silesian history do not reach back beyond the 10th century A.D., at which time the district was occupied by clans of Slavonic nationality, one of which derived its name from the mountain Zlenz (mod. Zobtenburg), near Breslau, and thus gave rise to the present appellation of the whole province. The etymology of place-names suggests that the original population was Celtic, but this conjecture can be verified in any historical records. About the year 1000 the Silesian clans were incorporated in the kingdom of Poland, whose rulers held their ground with difficulty against continuous attacks by the kings of Bohemia, but maintained themselves successfully against occasional raids from Germany. The decisive factor in the separation of Silesia from Poland was furnished by a partition of the Polish crown's territories in 1138. Silesia was henceforth constituted as a separate principality, and in 1201 its political secession from Poland became complete. A yet more important result of the partition of 1138 was the transference of Silesia to the German nation. The dynasty which was then established was drawn under the influence of the German king, Frederick Barbarossa, and two princes who in 1163 divided the sovereignty among themselves as dukes of Upper and Lower Silesia inaugurated the policy.
Silesia

of inviting German colonists to their vacant domains. More extensive immigrations followed, in the course of which the whole of Silesia was covered with German settlements. The numerous townships which then sprang up acquired rights of self-government according to German law, Breslau being refounded about 1290 as a German town, and a feudal organization was introduced among the landholding nobility. By the end of the 13th century Silesia had virtually become a German land.

This ethnic transformation was accompanied by a great rise in material prosperity. Large areas of forest or swamp were reclaimed for agriculture; the great Silesian industries of mining and weaving were called into existence, and Breslau grew to be a leading centre of exchange for the wares of East and West. The growing resources of the Silesian duchies are exemplified by the strength of the army with which Henry II., duke of Lower Silesia, broke the force of the Mongol invasion at the battle of Liegnitz (1241), and by the glamour at the court of the Minnesinger, Henry IV. (1260-1290). This prosperity, however, was checked by a growing tendency among the Silesian dukes to make partitions of their territories at each new succession. Thus by the end of the 14th century the Silesian state had been split up into 18 principalities: Breslau, Brieg, Głogau, Jauer, Liegnitz, Münsterburg, Öls, Schweidnitz and Steinau in Lower Silesia; Beuthen, Falkenberg, Kosel, Neisse, Oppeln, Ratibor, Strehlitz, Teschen and Troppau in the upper district. The petty rulers of these sections wasted their strength with internecine quarrels and proved quite incompetent to check the lawlessness of their feudal vassals. Save under the vigorous rule of some dukes of Lower Silesia, such as Henry I. and Bolko I., and the abovenamed Henry II. and IV., who succeeded in reuniting most of the principalities under their sway, the country fell into a state of growing anarchy.

Unable to institute an effective national government, and unwilling to attach themselves again to Poland, the Silesian princes began about 1290 to seek the protection of the German dynasty then ruling in Bohemia. The intervention of these kings resulted in the establishment of their suzerainty over the whole of Silesia and the appropriation of several of its petty states as crown domains. The earliest of these Bohemian overlords, King John and the emperor Charles IV., fully justified their intrusion by the vigorous way in which they restored order and regularized the administration; in particular, the cities at this time attained a high degree of material prosperity and political independence. Under later Bohemian suzerainty the Silesians who contended for the possession of Bohemia brought the Silesians no benefit, but involved them in the destructive Hussite wars. At the outbreak of this conflict in 1420 they gave ready support to their king Sigismund against the Bohemian rebels, whom they regarded as dangerous to their German nationality, but by this act they exposed themselves to a series of invasions (1425-1435) by which the country was severely devastated. In consequence of these raids the German element of population in Upper Silesia permanently lost ground; and a complete restitution of the Slavonic nationality seemed imminent on the appointment of the Hussite, George Podiebrad, to the Bohemian kingship in 1457. Though most of the Silesian duchies seemed ready to acquiesce, the burghers of Breslau fiercely repudiated the new suzerain, and before he could enforce his claims to homage he was ousted by the Hungarian king, Matthias Corvinus, who was readily recognized as overlord (1469).

Matthias enforced his authority by the vigorous use of his mercenary forces and by wholesale confiscations of the lands of turbulent nobles. By instituting a permanent diet of Silesian princes and estates to co-operate with his viceregent, he took an important step towards the abolition of particularism and the establishment of an effective central government. In spite of these reforms the Silesians, who felt severely the financial exactions of Matthias, began to resent the control of the Bohemian crown. Profiting by the feebleness of Matthias' successor Vladislaus, they extorted concessions which secured to them a practical autonomy. These privileges still remained to them at the outset of the religious Reformation, which the Silesians, in spite of their Catholic zeal during the Hussite wars, accepted readily and carried out with singularly little opposition from within or without. But a drastic revolution in their government was imposed upon them by the German king, Ferdinand I., who had been prevented from interference during his early reign by his wars with the Turks, and who showed little disposition to check the Reformation in Silesia by forcible means, but subsequently reasserted the control of the Bohemian crown by a series of important enactments. He abolished all privileges which were not secured by charter and imposed a more rigidly centralized scheme of government in which the activities of the provincial diet were restricted to some judicial and financial functions, and their freedom in matters of foreign policy was withdrawn altogether. Henceforth, too, annexations of territory were frequently carried out by the Bohemian crown on the extinction of Silesian dynasties, and the surviving princes showed an increasing reluctance to the exercise of their authority. Accordingly the Silesian estates never again chose to exercise initiative save on rare occasions, and from 1530 Silesia passed almost completely under foreign administration.

An uneventful period followed under the rule of the house of Habsburg, which united the kingdoms of Bohemia and of Silesia in the archduchy of Austria and the imperial crown. But this respite from trouble was ended by the outbreak of the Thirty Years' War (1618-48), which brought Silesia to the verge of ruin. Disquieted by some forcible attempts on Rudolph II.'s part to suppress Protestantism in certain parts of the country, and mistrusting a formal guarantee of religious liberty which was given to them in 1609, the Silesians joined hands with the Bohemian insurgents and renounced their allegiance to their Austrian ruler. Their defection, which was terminated by a capitulation in 1621, was not punished severely, but in spite of their attempt to maintain neutrality henceforth they were quite unable to secure peace. Silesia remained a principal objective of the various contending armies and was occupied almost continuously by a succession of ill-disciplined mercenary forces whose depredations and exactions, accentuated at times by religious fanaticism, reduced the country to a state of helpless misery. Three-quarters of the population are estimated to have lost their lives, and commerce and industry were brought to a standstill. Recovery from these disasters was retarded by the permanent diversion of trade to new centres like Leipzig and St Petersburg, and by a state of unsettlement due to the government's disregard of its guarantees to its Protestant subjects. A fresh step forward was taken by the marriage of the last Silesian prince, Christian, to the heiress of the Austrian crown, and by the representatives of King Charles XII. of Sweden on their behalf, and effective measures were taken by the emperor Charles VI. to stimulate commercial intercourse between Silesia and Austria. Nevertheless in the earlier part of the 18th century the condition of the country still remained unsatisfactory.

An important epoch in the history of Silesia is marked by the year 1740, when the domination of Austria was exchanged for that of Prussia. Availing himself of a testamentary union made in 1537 between the dukes of Liegnitz and the elector of Brandenburg, and of an attempt by the elector Frederick William to call it into force in spite of its annulment by Ferdinand I. in 1546, Frederick II. of Prussia raised a claim to the former duchies of Liegnitz, Brieg, Jägerndorf and Wohlan. The empress Maria Theresa, who was at this time involved with other enemies, was unable to prevent the occupation of Lower Silesia by Frederick and in 1741 ceded that province to him. In the following year Frederick renewed his attack and extorted from Austria the whole of Silesia except the districts of Troppau, Teschen and Jägerndorf, the present province of Austrian Silesia.

Though constrained by the general dangers of her position to make terms with Prussia, Maria Theresa long cherished the hope of recovering a possession which she, unlike her predecessors, valued highly and held by a far better title than did her opponent. A second war which Frederick began in 1744 in anticipation of a counter-attack from her only served to strengthen his hold upon his recent conquest; but in the famous Seven Years' War (q.v.) of 1756-63 the Austrian empress, aided by France and Russia, almost effected her purpose. Silesia was repeatedly overrun by
Austrian and Russian troops, and Frederick’s ultimate expulsion seemed only a question of time. Yet the Prussian king recovered his lost ground by gigantic efforts and eventually retained his Silesian territory undiminished.

The annexation by Frederick was followed by a complete reorganization in which the obsolete powers of the local dynasts were extinguished. The adjacent provinces of the highly centralized Prussian state. Owing to the lack of a Silesian consciousness and the feebleness of their local institutions, the people soon became reconciled to their change of rulers. Moreover Frederick, who had proved by his wars the importance which he attached to Silesia, was indefatigable in times of peace in his attempts to justify his usurpation. Making yearly visits to the country, and further keeping himself in touch with it by means of a special “minister of Silesia,” he was enabled to effect numerous political reforms, chief of which were the strict enforcement of religious toleration and the restriction of oppressive seignorial rights. By liberal endowments and minute but judicious regulations he brought about a rapid development of Silesian industries; in particular he revived the mining and weaving operations which at present constitute the country’s chief source of wealth.

After its incorporation with Prussia Silesia ceases to have an independent political history. During the Napoleonic wars it was partly occupied by French troops (1806-1813), and at the beginning of the War of Liberation it was the chief scene of operations between the French and the allied armies. In 1815 it was ceded to Austria, which then restored to Prussia a mere province of Silesia. The Silesian province was in fact as far back as the 11th century and since then had been annexed to the kingdom of Saxony. During the rest of the 19th century its peace has been interrupted from time to time by riots of discontented weavers. But the general record of recent times has been one of industrial development and prosperity hardly inferior to that of any other part of Germany.

**Austrian Silesia.**

Austrian Silesia (Ger. Österreichisch-Schlesien) is a duchy and crownland of Austria, bounded E. by Galicia, S. by Hungary and Moravia, W. and N. by Prussian Silesia. It has an area of 1878 sq. m. and is the smallest province of Austria. Silesia is divided by a projecting limb of Moravia into two small parts of territory, of which the western part is flanked by the Sudetic mountains, namely the Altvater Gebirge; while the eastern part is flanked by the Carpathians, namely the Jablunka Gebirge with their highest peak the Lissa Hora (4346 ft.). A great proportion of the surface of Silesia is occupied by the offshoots of these ranges. The province is traversed by the Vistula, which rises in the Carpathians within eastern Silesia, and by the Oder, with its affluent the Oppa and the Olsa. Owing to its mountainous character, and its slopes towards the N. and N.E., Silesia has a somewhat severe climate for its latitude, the mean annual temperature being 50° F., while the annual rainfall varies from 20 to 30 in.

Of the total area 94% is arable land, 3% is covered by forests, 6-2% by pastures, while meadows occupy 5-8% and gardens 1-3%. The soil cannot, as a rule, be termed rich, although some parts are fertile and produce cereals, vegetables, beetroot and fruit. The mining region of Silesia is carried on by the Alpine fashion and the breeding of sheep is improving. Large herds of geese and pigeons are reared, while hunting and fishing constitute also important resources. The miners of Silesia is great both coal, ironwork and slates, and there are several mineral springs, of which the best known are the alkaline springs at Karlsbrunn. Like its adjoining provinces, Silesia boasts of a great and varied industrial activity, chiefly represented by the metallurgical and textile industries in all their branches. The cloth and woollen industries are concentrated at Bielitz, Jägerndorf and Engelberg; linen is manufactured at Freidwaldau, Freudenthal and Teschen; cotton goods at Trzmiat, near Teschen, and various industrial and agricultural machines are manufactured at Troppau, Jägerndorf, Ustron, and Bielitz. The organ manufacturers at Jägerndorf enjoy a good reputation. Other important branches of industry are chemicals at Hruschau and Petrovitz; sugar refineries, milling, brewing and liqueurs.

In 1900 the population numbered 660,422, which corresponds to 342 inhabitants per sq. m. The Germans formed 44-69% of the population, 33-21% were Poles and 22-05% Czechs and Slavs. According to religion, 54-73 were Roman Catholics, 14% Protestants and the remainder were Jews. The local diet is composed of 51 members, and Silesia sends 12 deputies to the Austrian parliament at Vienna. The administrative purposes Silesia is divided into 9 districts and 3 towns with autonomous municipalities: Troppau, the capital, Bielitz and Friedek. Other principal towns are: Teschen, Polnisch-Ostrau, Jägerndorf, Karwin, Freudenthal, Freidwaldau and Bennisch.

The actual duchy is only a very small part, which was left to Austria after the Seven Years’ War, from its former province of the same name. It formed, with Moravia, a single province until 1849, when it was created a separate duchy.

See F. Skima, Österreichisch-Schlesien (Prague, 1837); and A. Peter, Das Herrensitzungsspiel (Vienna, 1864).

**SILESIAN WARS,** the name given to the contests between Austria and Prussia for the possession of Silesia. The first (1740-1742) and second (1744-1745) wars formed a part of the great European struggle called the War of the Austrian Succession (q.v.), and the third war (1756-1762) similarly a part of the Seven Years’ War (q.v.).

**SILHOUETTE,** ÉTIENNE DE (1709-1767), controller-general of France, was born at Limoges on the 5th of July 1709. He travelled extensively while still a young man and drew attention to himself by the publication of English translations, historical writings, and studies on the financial system of England. Successfully councillor to the parliament of Metz, he was created a peer of France and in 1748 was named controller-general through the influence of his father, who had the post of finance minister. Silhouette was in fact a liberal, but one who was not a financier and he was eventuallytexmitted to the French academy. Silhouette was forced out of the ministry on the 21st of November 1759 and withdrew to Brie-sur-Marne, where during the remainder of his life he sought refuge from scorn and sarcasm in religious devotion. He died on the 20th of January 1767.

Silhouette left several translations from the English and the Spanish, accounts of travel, and dull historical and philosophical writings, a list of which is given in Quérard, France littéraire, i. 138. A Testament politique, published under his name in 1772, is apochryphal. See J. P. Clement and A. Lemoine, M. de Silhouette (Paris, 1872).

**SILICA,** in chemistry, the name ordinarily given to amorphous silicon dioxide, SiO₂. This chemical compound is widely and mostly abundantly distributed in nature, both in the free state and in combination with metallic oxides. Free silica constitutes the greater part of sand and sandy rocks; when fairly pure it occurs in the large crystals which we know as quartz (q.v.), and which, when weathered, form the gem-stones amethyst, citrine, etc., and jasper. Tridymite (q.v.) is a rarer form, crystallographically different from quartz. Amorphous forms also occur: chalcedony (q.v.), and its coloured modifications agate, cornelian,
SILICON

onix and sard, together with opal (qq.) are examples. Amorphous silica can be obtained from a silicate (a compound of silica and a metallic oxide) by fusing the finely powdered mineral with sodium carbonate, decomposing the sodium silicate thus formed with hydrochloric acid, evaporating to dryness to convert the colloidal silicic acid into insoluble silica, and removing the soluble chlorides by washing with hot water. On drying, the silica is obtained as a soft white amorphous powder, insoluble in water and in all acids except hydrofluoric; it dissolves in hot solutions of the caustic alkalies and to a less extent in alkali carbonates. It melts at a high temperature and in the electric furnace it may be distilled, the vapours condensing to a bluish-white powder. By heating a solution of sodium silicate in a glass vessel the glass is attacked (an acid silicate being formed) and silica separates at ordinary temperatures in a hydrated amorphous form, at higher temperatures but below 180° as tridymite, and above 180° as quartz.

Silexate.—These compounds are to be regarded as salts of silicic acid, or combinations of silicon dioxide and metallic basic oxides; they are of great importance since they constitute the common rock-forming and many other minerals, and occur in every petrographic species. The parent acid, silicic acid, was obtained by J. Graham by dialysing a solution of hydrochloric acid to which sodium silicate had been added; a colloidal silicic acid being obtained in the dialysate. This solution may be concentrated until it contains about 14% of silica by open boiling, and this solution on evaporation in a vacuum gives a transparent mass of metasilicic acid; it is known as metasilicic acid, and is a thick liquid having no taste or smell; it gradually changes to a clear transparent jelly, which afterwards shrinks on drying. This coagulation is brought about very quickly by sodium carbonate and, in the subsequent phase of hydrochloric acid or by a solution of a caustic alkali. Several hydrated forms have been obtained, e.g. 2SiO2·H2O, 3SiO2·H2O, 4SiO2·H2O, 8SiO2·H2O; these are very unstable, the first two losing water on exposure whilst the others absorb water. The natural silicates may be regarded as falling into 5 classes, viz. orthosilicates, derived from Si(OH)4; metasilicates, from Si2O·SiO2·H2O; pyrosilicates, from Si2O·SiO2·H2O; trisilicates, from Si3O9·SiO2·H2O; and basic silicates. These acids may be regarded as derived by the partial colloidal decomposition of the pure acid, and are in fact the products of condensation of the parent acid. Another classification is given in Metallurgy; a list of mineral silicates is given in Mineralogy, and for the synthetical treatment of these compounds see also Petrology.

SILICON [symbol Si, atomic weight 28.3 (O=16)], a non-metallic chemical element. It is not found in the uncombined condition, but in combination with other elements it is, with perhaps the exception of oxygen, the most widely distributed and abundant of all the elements. It is found in the form of oxide (silica), either anhydrous or hydrated as quartz, flint, sand, or sandstone, or fused in the form of silicates of aluminium, magnesium, iron, and the alkali and alkaline earth metals, forming the chief constituent of various clays, soils and rocks. It has also been found as a constituent of various parts of plants and has been recognized in the stars. The element exists in two forms, one amorphous, the other crystalline. The older methods used for the preparation of the amorphous form, namely the decomposition of silicon halides or siliconfluorides by the alkali metals, or of silica by magnesium, do not give good results, since the silicon obtained is always contaminated with various impurities, and a pure variety may be obtained only by the methods of W. H. Johnston and E. Viegas (Amer. Chem. Journ., 1904, 37, 12) by heating silica with magnesium in the presence of magnesia, or by heating silica with aluminium. The crystalline form may be prepared by heating potassium silicofluoride with sodium or aluminium (F. Wohler, Ann., 1856, 97, p. 254; 1857, 102, p. 328); by heating silica with magnesium in the presence of zinc (L. Gattenger, Ber., 1889, 25, p. 180); and by the reduction of silica in the presence of carbon and iron (H. N. Warren, Chem. News, 1888, 57, p. 54; 1893, 67, p. 136). Another crystalline form, differing from the former by its solubility in hydrofluoric acid, was prepared by H. Moissan and F. Siemens (Comptes rendus, 1904, 138, p. 129). A somewhat impure silicon (containing 90-98% of the element) is made by the Carborundum Company of Niagara Falls (United States Patents 745122 and 842273, 1908) by heating coke and sand in an electric furnace. The product is a crystalline solid of specific gravity 2.34, and melts at about 1430° C. See also German Patent 168817 for the production of crystallized silicon from silica and carbourdon.

Amorphous silicon is a brown coloured powder, the crystalline variety being grey, but it presents somewhat different appearances according to the method used for its preparation. The specific gravity of the amorphous form is 2.35 (Vigouroux), that of the crystalline variety varying, according to the method of preparation, from 2.004 to 2.493. The specific heat varies with the temperature, from 0.136 at -39° C. to 0.236 at 272° C. Silicon crystallizes readily at the temperature of the electric furnace. It is attacked by water only at a high temperature, and in the electric furnace it may be distilled, the vapours condensing to a bluish-white powder. By heating a solution of sodium silicate in a glass vessel the glass is attacked (an acid silicate being formed) and silica separates at ordinary temperatures in a hydrated amorphous form, at higher temperatures but below 180° as tridymite, and above 180° as quartz.

Silicon hydride, SiH4, is obtained in an impure condition, as a spontaneously inflammable gas, by decomposing magnesium silicide with hydrochloric acid, or by the direct union of silicon and hydrogen in the electric arc. In the pure state it may be prepared by decomposing ethyl silicofluoride in the presence of carbon (C. Fiedler and A. Ladenburg, Comptes rendus, 1867, 64, pp. 359, 1267): 4Si(OCH2CH3)2 = SiH4 + 3Si(OCH2CH3)4. When pure, it is a colourless gas which is not inflammable, it dissolves in liquid air, is slowly attacked by water, but a slight increase of temperature or decrease of pressure sets up decomposition. It is almost insoluble in water. It burns when brought into contact with chlorine, forming silicon chloride and hydrogen chloride, and is also converted into trichlorosilane, SiCl3, by heating with aluminium. A second hydride of silicon, of composition Si6H14, was prepared by H. Moissan and S. Smiles (Comptes rendus, 1905, 135, p. 599) from the products obtained in the action of hydrochloric acid on magnesium silicide. These are passed through a vessel surrounded by a freezing mixture and on fractionating the product the hydride distils over as a colourless liquid which boils at 53° C. It is also obtained by the decomposition of lithium silicide with concentrated hydrochloric acid. Its vapour is spontaneously inflammable when exposed to air. It behaves as a reducing agent. For a possible hydride (SiH3), see J. Ogier, Ann. chim. phys., 1850, 5, 10, p. 5.

Only one oxide of silicon, namely the dioxide or silica, is known (see Silica).

Silicon fluoride, SiF4, is formed when silicon is brought into contact with the fluoride (Moissan); or by decomposing a mixture of acid potassium fluoride and silica, or of calcium fluoride and silica with concentrated sulphuric acid. It is a colourless, strongly fuming gas which has a suffocating smell. It is decomposed with great readiness when heated in contact with either alkali or potassium. It combines directly with ammonia to form the compound SiF4·2NH3 and is absorbed by dry boracic acid and by many metallic oxides. Water decomposes it into silicicfluoride and silicic acid: 3SiF4 + 3H2O = 2H2SiO3 + 2H2SiF6. With potassium hydroxide it yields potassium silicotungstate, whilst with sodium hydroxide, sodium fluoride is produced: 4SiF4 + 2NaOH = 2Na2SiF6 + H2O. Silicon fluoride, SiF4, contains chlorine, is a chloro-substituted silicon fluoride, SiF4·4NaOH = 4NaF + 2Si(OH)3 + 2H2O. Silicon fluorosilicon, Si2F6H2, was obtained by O. Ruff and Curt Albert (Ber., 1905, 38, p. 53) by decomposing titanium fluoride with silicon chlorosilane in sealed vessels at 121-122° C. It is a colourless gas gas which is converted into liquid fluoride which on solidification it melts at about -110° C. The gas is very unstable, decomposing slowly, even at ordinary temperatures, into hydrogen, silicon fluoride, and silicon monofluoride, SiF4·SiH4. Acetone and 10% hydrochloric acid form a pale-blue flame forming silicon fluoride, silicofluoride acid and silicic acid. It is decomposed readily by water, sodium hydroxide, alcohol and ether:

2SiF4 + 4H2O = H4Si04 + SiF4 + 2H2;

2SiF4 + 4CH3OH = Si(OCH3)4 + H2SiF6 + 2H2;

SiH4 + 3(C2H5)2O = Si(OCH2CH3)4 + 3C2H5F.

Silicofluoride acid, H3SiF3, is obtained as shown above, and also by the action of sulphuric acid on barium silicofluoride, or by absorbing silicon fluoride in aqueous hydrofluoric acid. The solution on evaporation deposits a hydrated form, H2SiF4·2H2O, which decomposes when heated. The anhydrous acid is not known, since on
It decomposes water at ordinary temperature with evolution of hydrogen but without production of silicon hydride, whilst cold phosphoric acid attacks it vigorously with evolution of hydrogen and spontaneously inflammable silicon hydride.

**Organic Derivatives of Silicon.**

The organic derivatives of silicon resemble the corresponding carbon compounds except in so far as the silicon atom is not capable of combination with hydrocarbon radicals to form a complex with the same manner as the carbon atom, the limit at present being a chain of three silicon atoms. Many of the earlier-known silicon alkyl compounds were investigated by Savitsky and Crafts, and by Ladenburg, the method adopted consisting in the interaction of the zinc alkyl compounds with silicon halides or esters of silicic acids. $\text{SiCl}_2\text{Si}(\text{CH}_3)_3\text{SiCl}$ in the presence of sodium: $\text{SiCl}_4+4\text{LiCl}+\text{Na}=\text{SiCl}_2\text{Si}(\text{CH}_3)_3\text{SiCl}+4\text{LiCl}$, this method has been modified by T. Murry, (Jenner, 209, p. 449) and the preparation of silicone rubber (Ber. 1905, 38, p. 1665) by condensing silicon hydrides with alkyl halides to give silicone rubber to give silicon nonyl chloride $\text{SiCH}_2\text{SiCl}_2\cdot\text{CHCl}_2$, which condenses with potassium acetate to give the acetate ester of silicon octachlorododecahydroacetic acid (boiling point $209^\circ$) may be obtained by hydrolysis. Tidritile silicid, $\text{Si}+\text{SiOH}$, is a true chloride, obtained by condensing zinc ethyl with silicic ester, the result of this reaction $\text{SiCl}_2\text{Si}+\text{CH}_2\text{COCl}_2$, with acetyl chloride yielding a chloroform solution of the product, which with aqueous ammonia yields the alcohol, $\text{Si}+\text{SiOH}$, a solid melting at $211^\circ$ is obtained by the action of chlorobenzene on silicon tetraiodide, $\text{Si}+\text{SiOCH}_3$, a solid oxide, $\text{Si}+\text{SiOCH}_3$, an oxide on which the silicon atom is engaged in the formation of variable composition, is decomposed by chlorine.

**Silistria (Bulgarian Silistra), the chief town of a department in Bulgaria and the see of an archbishopric, situated on a low-lying peninsula projecting into the Danube, 15 miles north-east and close to the frontier of the Rumanian Dobrudja. Pop. (1892) 11,718; (1900) 12,133; (1908) 12,955, of whom 6142 were Bulgarians and 4126 Turks. The town was formerly a fortress of great strength, occupying the N.E. corner of the famous quadrilateral (Rustschuk, Silistra, Shunlia, Varna), but its fortifications were demolished in accordance with the Berlin Treaty (1877). In the town is a large subterranean caveln, the Houbling, which served as a refuge for its inhabitants during frequent Russian incursions. The principal trade is in cereals; wine and wood are also exported. The wine is consumed both by the population and by distilleries, some 30 kinds of grapes being cultivated, and tobacco is grown. Sericulture, formerly a flourishing industry, has declined owing to a disease of the silkworms, but efforts have been made to revive it. Apiculture is extensively practised and there are large market-gardens in the neighbourhood. The soil of the department is fertile, but lacking in water; the inhabitants have excavated large receptacles in which rain-water is stored. A considerable area is still covered with forest, to which the region owes its name of Deli Orman ("the wild wood"); there are extensive tracts of pasture, but cattle-rearing declined in 1882-1010. A large cattle-fair, lasting three days, is held in May. The town possessed in 1691 a stone flour-mill, and some cloth factories and tanneries.
united with that of Tcherven (Rustchuk). It was one of the most important towns of Moesia Inferior and was successively the headquarters of the legio I. (Italica) and the legio XI. (Claudia). It was defended by the Bulgarian tsar Simeon against the Magyars and Greeks in 893. In 967 it was captured by the Russian prince Sviatoslav, whom the Byzantine emperor Nicephorus Phocas had summoned to his assistance. In 971 Sviatoslav, after a three months' heroic defence, surrendered the town to the Byzantines, who had meanwhile become his enemies. In 1388 it was captured by the Turks under Ali Pasha, the grand vizier of the sultan Murad. A few years later it seems to have been in the possession of the Walachian prince Mirea, but after his defeat by Mohammed I. in 1416 it passed finally into the hands of the Turks. Silius Italicus describes it as the most important of all the Danubian towns; a Greek metropolitan was installed here with five bishops under his control and a settlement of Ragusan merchants kept alive its commercial interests. In 1810 the town was surrendered to the Russians under Kamensky, who destroyed its fortifications before they withdrew, but they were rebuilt by foreign engineers, and in 1828-1829 were strong enough to offer a serious resistance to the Russians under Diebicb, who captured the town with the loss of 3000 men. At that date the population including the garrison was 24,000, but in 1837 it was only about 4000. The town was laid in ruins in the year 1854 by the execution of a war indemnity (1839-1856). During the campaign of 1854 it was successfully defended by General Krach against the Russians under Paskievia; the circuit of its defences had been strengthened before this time by the outlaying fortresses Medjid-tabia (built by English engineers) and Arab-tabia. It was again invaded by the Russians in 1877, and on the conclusion of peace was evacuated by the Turks.

SILIIUS ITALICUS, in full Titus Catus Silius Italicus (A.D. 25 or 26-101), Latin epic poet. His birthplace is unknown. From his cognomen Italicus the conclusion has been drawn that he came from the town of Italicus in Spain; but Latin usage in that case have demanded the form Italicensis, and it is highly improbable that Martial would have failed to name him among the literary celebrities of Spain in the latter half of the 1st century. The conjecture that Silius derived from Italicus, the capital of the Italian confederation during the Social War, is open to still stronger objection. Most likely some ancestor of the poet acquired the title "Italicus" from having been a member of one of the corporations of "Italic" who are often mentioned in inscriptions from Sicily and elsewhere. In early life Silius was a renowned scholar and had a large skill in the study of the classics, his talent being shown as a young man in his verses, which were quoted in the law courts as examples of legal writing. In later life he was a wealthy and influential citizen of Rome, and his influence was much in evidence when the legions from the East were marching rapidly on the capital. The life of Silius after his consulship is well depicted by the younger Pliny:— "He conducted himself wisely and courteously as the friend of the luxurious and cruel Vitellius; he won repute by his proconsulship of Asia, and obliterated by the praise-worthy use he made of his leisure the stain he had incurred through his active exertions in former days. In dignity and contentment, avoiding power and therefore hostility, he outlined the Flavian dynasty, keeping to a private station after his governorship of Asia." His poem contains only two passages relating to the Flavians; in both Domitian is exalted as a warrior; in one he figures as a singer whose lyre is sweeter than that of Orpheus himself. Silius was a great student and patron of literature and art, and a passionate collector. Two great Romans of the past, Cicero and Virgil, were by him idealized and veritably worshipped; and he was the happy possessor of their estates at Tuscumus and Naples. The later life of Silius was passed on the Campanian shore, hard by the tomb of Virgil, at which he offered the homage of a devotee. He closely emulated the lives of his two great heroes: the one he followed in composing epic verse, the other in debating philosophic questions with his friends of like tastes. Among these was Epictetus, who judged him to be the most philosophic spirit among the Romans of his time, and Cornutus, the Stoic, rhetorician and grammarian, who appropriately dedicated to Silius a commentary upon Virgil. Though the verse of Silius is not wrapped in Stoic gloom like that of Lucan, yet Stoicism lends in many places a not ungraceful gravity to his poem. Silius was one of the numerous admirers of the early empire who had the courage of their opinions, and carried into perfect practice the theory of suicide adopted by their school. Stricken by an incurable tumour, he starved himself to death, keeping a cheerful countenance to the end.

Whether Silius committed to writing his philosophic dialogues or not, we cannot say. Chance has preserved to us his epic poem entitled Punica, in seventeen books, and comprising some fourteen thousand lines. In choosing the Second Punic War for his subject, Silius had, we know, many predecessors, as he doubtless had many followers. From the time of Naevius onwards every great military struggle in which the Romans had been engaged had inflamed their patriotism. In justice to Silius and Lucan, it should be observed that the mythologic poet had a far easier task than the historic. In a well-known passage Petronius pointedly describes the difficulties of the historic theme. A poet, he said, who should take upon him the vast subject of the civil wars would break down beneath the burden unless he were "full of learning," since he would have not merely to record facts, which the historians did much better, but must possess an unshackled genius, to which full course must be given by the use of digressions, by bringing divine beings on to the stage, and by giving generally a mythologic treatment to the subject. The limits of the poem were fixed by Ennius, and were still binding when Claudian wrote. They were never seriously infringed, except by Lucan, who substituted for the del ex machina of his predecessors the vast, dim and imposing Stoic conception of destiny. By protracted application, and being "full of learning," Silius had acquired excellent recipes for every ingredient that went to the making of the conventional historic epic. Though he is not named by Quintilian, he is probably hinted at in the mention of a class of poets who, as the writer says, "write to show their learning." To seize the moments in the history, however unimportant, which were capable of development, and pass over all events, however important, which could not readily be rendered into heroes; to stuff out the somewhat modern heroes to something like Homeric proportions; to subject all their movements to the passions and caprices of the Olympians; to ransack the poetry of the past for incidents and similes on which a slightly new face might be put; to feast in by well-worn artifices episodes, however strange to the subject, taken from the mythologic or historic stories of Rome and Greece,—all this Silius knew how to do. He did it all with the languid grace of another age, and the intoxication of another to his time, which sprang in part from cultivated taste and horror of the venturesome word, and in part from the subdued tone of a life which had come unscathed through the reigns of Caligula, Nero and Domitian. The more threadbare the theme, and the more worn the machinery, the greater the need of genius. Two of the most rigid requirements of the ancient epic were abundant similes and abundant single combats. But all the obvious resemblances between the actions of heroic man and external nature had long been worked out, while for the renovation of the single combat little could be done till the age of the Homeric type was replaced by the medieval knight. Silius, however, had perfect poetic appreciation, with scarce a trace of poetic creativeness. No writer has ever been more correctly and more uniformly judged by contemporaries and by posterity alike. Only the shameless flatterer, Martial, ventured to call
his friend a poet as great as Virgil. But the younger Pliny
gently says that he wrote poems with greater diligence than
talent, and that, when, according to the fashion of the time,
he recited them to his friends, "he sometimes found out what
men really thought of them." It is indeed strange that the
poem lived on. Silius is never mentioned by ancient writers
after Pliny except Sidonius, who, under different conditions
and at a much lower level, was such another as he. Since
the discovery of Silius by Poggio, no modern enthusiast has arisen
to sing his praises. His poem has been rarely edited since the 18th
century. Yet, by the purity of his taste and his Latin in
an age when taste was fast becoming vicious and Latin corrupt,
bys his presentation to us of a type of a thousand vanished Latin
epics, and by the historic aspects of his subject, Silius merits
better treatment from scholars than he has received. The
general reader can hardly interest again. He is indeed of
imitation all compact, and usually dilutes what he borrows;
he may add a new beauty, but new strength he never gives.
Hardly a dozen lines anywhere are without an echo of Virgil,
and there are frequent admixtures of Lucretius, Horace, Greek,
Lucan, Homer, Hesiod and many other poets still extant.
If we could reconstitute the library of Silius we should probably
find that scarcely an idea or a phrase in his entire work was
wholly his own.
The raw material of the Punica was supplied in the main by
the three decades of Livy, though Silius may have consulted
other historians of the Hannibal war. Such facts as are used are
generally presented with their actual circumstances unchanged,
and in their historic sequence. The spirit of the epic times is
brought into these passages when it is said that the election of men like Flamininus and Varro, and distinguished
Romans are depicted as contending in a gladiatorial exhibition.
Silius clearly intended the poem to consist of twenty-four books,
like the Iliad and the Odyssey, but after the twelfth he hurries in
visible weariness to the end, and concludes with seventeen. The
general plan of the epic follows that of the Iliad and the Aeneid.
Its theme is conceived as a duel between two mighty nations,
with parallel dissensions among the gods. Scipio and Hannibal
are the two great heroes who take the place of Achilles and
Hector on the one hand and of Aeneas and Turnus on the other,
while the minor figures are all painted with Virgilian or Homer's
pigments. In the delineation of character our poet is neither
very powerful nor very consistent. His imagination was too
weak to realize the actors with distinctness and individuality.
His Hannibal is evidently at the outset meant for an incarnation
of cruelty and treachery, the embodiment of all that the vulgar
Roman attached to the name "Punic." But in the course of
the poem the greatness of Hannibal is borne in upon the poet,
and his feeling of it betrays itself in many touches. Thus he
names Scipio "the great Hannibal of Ausonia"; he makes
Juno assure the Carthaginian leader that if fortune had only
permitted him to be born a Roman he would have been admitted
to a place among the gods; and, when the ungenorous monster
of the first book accords in the fifteenth a splendid burial to
Marcellus, the poet cries, "You would fancy it was a Sidonian
chief who had fallen." Silius deserves little pity for the failure
of his attempt to make Scipio an equipoise to Hannibal and the
counterpart in personal prowess and prestige of Achilles. He
becomes in the process almost as mythical a figure as the medieval
Alexander. The best drawn of the minor characters are Fabius
Cunctator, an evident copy of Lucan's Cato, and Paulus, the
consulted at Cannae, who fights, hates and dies like a genuine
man.
Clearly it was a matter of religion with Silius to repeat and
adapt all the striking episodes of Homer and Virgil. Hannibal
must have a shield of marveluous workmanship like Achilles and
Aeneas; because Aeneas descended into Hades and had a vision
of the future history of Rome, so must Scipio have his revelation
from heaven; Trebia, choked with bodies, must rise in ire like
Xanthus, and be put to flight by Vulcan; for Virgil's Camilla
there must be an Ashby, heroine of Saguntum; the beautiful
speech of Euryalus when Nisus seeks to leave him is too good to
be thrown away—furbished up a little, it will serve as a parting
address from Imilce to her husband Hannibal. The descriptions
of the numerous battles are made up in the main, according
to epic rule, of single combats—wearisome sometimes in Silius,
wearisome oftener in Virgil, painfully wearisome in Silius. The
different component parts of the poem are on the whole fairly
well knit together, and the transitions are not often needlessly
abrupt; yet occasionally incidents and episodes are introduced
with all the irrelevancy of the modern novel. The interposition
of verse of a different order is, however, usually managed with dignity and
appropriateness.
As to diction and detail, we miss, in general, power rather
than taste. The metre runs on with correct smooth monotony,
with something always of the Virgilian sweetness, though
attenuated, but nothing of the Virgilian variety and strength.
The dead level of literary execution is seldom broken by a rise
into the region of genuine pathos and beauty, or by a descent
into the ludicrous or the repellent. There are few aburdities,
but the restraining force is trained perception and not a native
to his of humour, which, ever present in Homer, not entirely
absent in Virgil, and sometimes finding grim expression in Lucan,
fails Silius entirely. The address of Anna, Dido's sister, to Juno
compels a smile. Though defied on her sister's death, and for
a good many centuries already an inhabitant of heaven, Anna
meets Juno for the first time on the outbreak of the Second
Punic War, and deprecates the anger of the queen of heaven
for having deserted the Carthaginians and attached herself to
the Roman cause. Hannibal's parting address to his child is also
comical; he recognizes in the "heavy wailing" of the year-old
"the seeds of rages like his own." But Silius might have
been forgiven for those thousand and one weaknesses. He has if
in but a few things he had shown strength. The grandest scenes
in the history before him fail to lift him up; his treatment,
for example, of Hannibal's Alpine passage falls immensely below
Lucan's vigorous delineation of Catö's far less stirring march
across the African deserts.
But in the very weaknesses of Silius we may discern merit.
He at least does not try to conceal defects of substance by
contorted rhetorical conceits and feebly forcible exaggerations.
In his ideal of what Latin expression should be he comes near
to the of Quintilian, and resolutely holds aloof from
the tenor of his age. Perhaps his want of success with the men
of his time was not wholly due to his faults. His self-control
rarely fails him; it stands the test of the horrors of war, and of
Venus working her will on Hannibal at Capua. Only a few
passages here and there betray the true silver Latin extravagance.
In the avoidance of rhetorical artifice and epigrammatic antithesis
Silius stands in marked contrast to Lucan, yet at times he
can write with point. Regarded merely as a poet he may not
deserve high praise; but, as he is a unique specimen and probably
the best of a once numerous class, the preservation of his
poem among the remains of Latin Literature is a fortunate accident.
The poem was discovered in a MS, possibly by Constance, by
Poggio, in 1416 or 1417; from this now lost MS, all existing Mss.,
which belong entirely to the 15th century, are derived. A valuable
MS. of the 8th or 9th century, found at Cologne by L. Carrion
in the latter part of the 16th century, disappeared soon after its discovery.
Two editiones principes appeared at Rome in 1471; the principal
editions since have been those of Heinlins (1660). Drakenborch
(1758) and Lemaire (1803). The poem is included in the second edition of the Corpus poetarum Latinorum.
A useful variorum edition is that of Lemaire (Paris, 1823). Recent
writing on Silius is generally in the form of separate articles or small
chapters; but see H. E. Butler, Post-Augustan Poetry (1903),
chap. x.
(J. S. R.)
SILK, a fibrous substance produced by many insects, princi-
pally in the form of a cocoon or covering within which the
creatures are enclosed and protected during the period of their
principal transformations. The webs and nests, &c., formed
by spiders are also of silk. But the fibres used for manufacturing
purposes are exclusively produced by the mulberry silk-moth of
China, Bombyx mori, and a few other moths closely allied to
that insect. Among the Chinese the name of the silk-moth is
"si," Korean "soi"; to the ancient Greeks it became known
"silk."
as σιρήν, the nation whence it came was to them ἔφεσος, and the fibre itself ἑφέσιον, whence the Latin sericin, the French soie, the German Seide and the English silk.

**History.**—The silk industry originated in China; and according to native records it has existed there from a very remote period. The empress, known as the lady of Si-ling, wife of a famous emperor, Huang-ti (2640 B.C.), encouraged the cultivation of the mulberry tree, the rearing of the worms and the reeling of silk. This empress is said to have devoted herself personally to the care of silkworms, and she is by the Chinese credited with the invention of the loom. A voluminous ancient literature testifies not only to the antiquity but also to the importance of Chinese sericulture, and to the care and attention bestowed on it by royal and noble families. The Chinese guarded the secrets of the art for many centuries. It is not known when, or under what circumstances, it was introduced into Egypt; but there is no doubt that many centuries passed before the culture spread beyond the country of its origin. Through Korea a knowledge of the silkworm and its produce reached Japan, but not before the early part of the 3rd century. One of the most ancient books of Japanese history, the *Nihongi*, states that towards A.D. 300 some Koreans were sent from Japan to China to engage competent people to teach the arts of weaving and preparing silk goods. They brought with them four Chinese girls, who instructed the court and the people in the art of plain and figured weaving; and to the honour of these pioneer silk weavers a temple was erected in the province of Settsu. Great efforts were made to encourage the industry, which from that period grew into one of national importance. At a period probably little later a knowledge of the working of silk travelled westward, and the cultivation of the silkworm was established in India. According to a tradition the eggs of the insect and the seed of the mulberry tree were carried to India by a Chinese princess concealed in the lining of her head dress. The fact that sericulture was in India first established in the valley of the Brahmaputra and in the tract lying between that river and the Ganges renders it probable that it was introduced overland from the Chinese empire. From the Ganges valley the silkworm was slowly carried westward and spread in Khotan, Persia, and the states of Central Asia.

Most critics recognize in the obscure word *d'mesqeq* or *d'mesheq*, Amos iii. 12, a name of silk corresponding to the Arabic *dimāḥs*, late Greek *mērēs*, English *damask*, and also follow the ancients in understanding *mēšši*, Ezek. xlvi, 10, 13, of "silken gauze." But the first notice of the silkworm in Western literature occurs in Aristotle, *Hist. anim.* v. 19 (xvii), 11 (6), where he speaks of "a great worm which has horns and so differs from others. At its first metamorphosis it produces a caterpillar, then a bombyx, and lastly in a gryllus—all these changes taking place within six months. From this animal women separate and reel off the cocoons and afterwards spin them. It is said that this was first spun in the island of Cos by Pamphile, daughter of Platea." Aristotle's vague knowledge of the worm may have been derived from information acquired by the Greeks with Alexander the Great; but long before this time raw silk must have begun to be imported at Cos, where it was woven into a gauzy texture, the famous *Cos vestis*, which revealed rather than clothed the form.

Towards the beginning of the Christian era raw silk began to form an important and costly item among the products of the East which came to Rome. Allusions to silk and its source became common in classical literature; but, although these references show familiarity with the material, they are singularly vague and inaccurate as to its source; even Pliny knew nothing more about the silkworm than could be learned from Aristotle's description. The silken textures which at first found their way to Rome were necessarily of enormous cost, and their use by men was deemed a piece of effeminate luxury. From an anecdote of Aurelian, who neither used silk himself nor would allow his wife to possess a single silken garment, we learn that silk was worth its weight in gold.

Notwithstanding its price and the restraints otherwise put on the use of silk the trade grew. Under Justinian a monopoly of the trade and manufacture was reserved to the emperor, and looms, worked by women, were set up within the imperial palace at Constantinople. Justinian also endeavoured, through the Christian prince of Abyssinia, to divert the trade from the Persian route along which silk was then brought into Europe. In this he failed, but two Persian monks who had long resided in China, and there learned the whole art and mystery of silkworm rearing, arrived at Constantinople and imparted their knowledge to the emperor. By him they were induced to return to China and attempt to bring to Europe the material necessary for the cultivation of silk, which they effected by concealing the eggs of the silkworm in a hollow cane. From the precious contents of that bamboo tube, brought to Constantinople about the year 559, were produced all the races and varieties of silkworm which stocked and supplied the Western world for the next twelve hundred years.

Under the care of the Greeks the silkworm took kindly to its Western home and flourished, and the silken textures of Byzantium became famous. At a later period the conquering Saracens obtained a mastery over the trade, and by them it was spread both east and west—the textures becoming meantime impressed with the patterns and colours peculiar to that people. They established the trade in the thriving towns of Asia Minor, and they planted it as far west as Sicily, as Sicilian silks of the 12th century with Saracenic patterns still testify. Ordericus Vitalis, who died in the first half of the 12th century, mentions that the bishop of St Evroul, in Normandy, brought with him from Apulia in southern Italy several large pieces of silk, out of the finest of which four copes were made for his cathedral chanters. The cultivation and manufacture spread northwards to Florence, Milan, Genoa and Venice—all towns which became famous for silk textures in medieval times. In 1480 silk weaving was begun under Louis XI. at Tours, and in 1520 Francis I. brought from Milan silkworm eggs, which were reared in the Rhone valley. About the beginning of the 17th century Olivier de Serres and Laffemas, somewhat against the will of Sully, obtained royal edicts favouring the growth of mulberry plantations and the cultivation of silk; but it cannot be said that these industries were firmly established till Colbert encouraged the planting of the mulberry by premiums, and otherwise stimulated local efforts.

Into England silk manufacture was introduced during the reign of Henry VI.; but the first serious impulse to manufactures of that class was due to the immigration in 1585 of a large body of skilled Flemish weavers who fled from the Low Countries in consequence of the struggle with Spain then devastating their land. Precisely one hundred years later religious troubles gave the most effective impetus to the silk-trade of England, when the revocation of the edict of Nantes sent simultaneously to Switzerland, Germany and England a vast body of the most skilled artisans of France, who planted in these countries silk-weaving colonies which are to this day the principal rivals of the French manufacturers. The bulk of the French Protestant weavers settled at Spitalfields, London—an incorporation of silk workers having been there formed in 1629. James I. used many efforts to encourage the planting of the mulberry and the rearing of silkworms both at home and in the colonies. Up to the year 1718 England depended on the thrown silks of Europe for her manufacturing purposes; and in that year the Lords of Derby, disguised as a common workman, and obtaining entrance as such into one of the Italian throwing mills, made drawings of the machinery used for this process. On his return, subsidized by the government, he built and worked, on the banks of the Derwent, the first English throwing mill. In 1825 a public company was formed and incorporated under the name of the British, Irish and Colonial Silk Company, with a capital of £1,000,000, principally with the view of introducing sericulture into Ireland, but it was a complete failure, and the rearing of the silkworm cannot be said ever to have become a branch of British industry.

In 1529 Cortes appointed officials to introduce sericulture into New Spain (Mexico), and mulberry trees were then planted and eggs were brought from Spain. The Mexican adventure is
mentioned by Acosta, but all trace of the culture had died out before the end of the century. In 1609 James I. attempted to reinstate the silkworm on the American continent, but his first effort failed through shipwreck. An effort made in 1619 obtained greater success, and, the materials being present, the Virginian settlers were strongly urged to devote attention to the profitable industry of silk cultivation. Sericulture was enjoined under penalties by statute; it was encouraged by bounties and rewards; and its prosecution was stimulated by learned essays and rhapsodical rhymes, of which this is a sample:

"Where Wormes and Food doe naturally abound
A gallant Silken Trade must there be found.
Virginia excels the World in both—
Envie nor malice can gain say this troth!"

In the prospectus of Law's great Compagnie des Indes Occidentales the cultivation of silk occupies a place among the glowing attractions which allured so many to disaster. Onward till the period of the War of Independence bounties and other rewards for the rearing of worms and silk filature continued to be offered; and just when the war broke out Benjamin Franklin and others were engaged in nursing a filature into healthy life at Philadelphia. With the resumption of peaceful enterprise, the stimulus of bounties was again applied—first by Connecticut in 1783; and such efforts have been continued sporadically down almost to the present day. Bounties were last offered by the state of California in 1865-1866, but the state law was soon repealed, and an attempt to obtain state encouragement again in 1872 was defeated. About 1838 a speculative mania for the cultivation of silk developed itself with remarkable severity in the United States. It was caused principally through the representations of Samuel Whitmarsh as to the capabilities of the South Sea Islands mulberry (Morus multicaulis) for feeding silkworms; and so intense was the excitement that plants and crops of all kinds were displaced to make room for plantations of M. multicaulis. In Pennsylvania as much as $300,000 changed hands for plants in one week, and frequently the young trees were sold two and three times over within a few days at ever-advancing prices. Plants of a single year's growth reached the ridiculous price of $1 each at the height of the fever, which, however, did not last long; for in 1839 the speculation collapsed; the famous M. multicaulis was found to be no golden tree, and the costly plantations were uprooted.

The most singular feature in connexion with the history of silk is the persistent efforts which have been made by monarchs and other potentates to stimulate sericulture within their dominions, efforts which continue to this day in British colonies, India and America. These endeavours to stimulate by artificial means have in scarcely any instance resulted in permanent success. In truth, raw silk can only be profitably brought to the market where there is abundant and very cheap labour—the fact that China, Japan, Bengal, Piedmont and the Levant are the principal producing localities making that plain.

The Silkmoth.

The mulberry-feeding moth, Bombyx mori, which is the principal source of silk, belongs to the Bombycidae, a family of Lepidoptera in which are embraced some of the largest and most handsome moths. B. mori is itself an inconspicuous moth (Figs. 1 and 2), of an ash white colour, with a body in the case of the male not $\frac{3}{4}$ in. in length, the female being a little longer and stouter. Its wings are short and weak; the fore pair are falcate, and the hind pair do not reach to the end of the body. The larva (Fig. 3) is hairless, of an ash grey or cream-colour, attains to a length of from 3 to $\frac{3}{4}$ in., and is slender in comparison with many of its allies. The second thoracic ring is humped, and there is a spine-like horn or protuberance at the tail. The common silkworm produces as a rule only one generation during the year; but there are races in cultivation which are bivoltine, or two-generationed, and some are multivoltine. Its natural food is the leaves of mulberry trees. The silk glands or vessels consist of two long thick-walled sacs running along the sides of the body, which open by a common orifice—the spinneret or seripositor—on the under lip of the larva. Fig. 4 represents the head (a) and feet (b, b) of the common silkworm, while c is a diagrammatic view of the silk glands. As the larva approaches maturity these vessels become gorged with a clear viscous fluid, which, upon being exposed to the air immediately hardens to a solid mass. Advantage is taken of this peculiarity to prepare from fully developed larvae silkworm gut used for casting lines in rod-fishing, and for numerous other purposes where lightness, tenacity, flexibility and strength are essential. The larvae are killed and hardened by steeping some hours in strong acetic acid; the silk glands are then separated from the bodies, and the viscous fluid drawn out to the condition of a fine uniform line, which is stretched between pins at the extremity of a board. The board is then exposed to the sunlight till the lines dry and harden into the condition of gut. The preparation of gut is, however, merely an unimportant collateral manufacture. When the larva is fully mature, and ready to change into the pupa condition, it proceeds to spin its cocoon, in which operation it ejects from both glands simultaneously a continuous and reparable thread of 800 to 1200 yds. in length, moving its head round in regular order continuously for three days or thereabouts. The thread so ejected forms the silk of commerce, which as wound in the cocoon consists of filaments seriposited from two separate glands (discovered by an Italian naturalist named Filippi) containing a glutinous or resinous secretion which serves a double purpose, viz. that of helping the thin viscous threads through their final outlets, and the adhesion of the two filaments when brought into contact with the atmosphere.

Under the microscope cocoon silk presents the appearance (Fig. 5) of a somewhat flattened combination of two filaments placed side by side, being on an average $\frac{1}{40}$th part of an inch in thickness (see also Fibres, Plate 1.). The cocoons are white or yellow in colour, oviform in shape, with often a constriction in the middle (Fig. 6). According to race, &c., they vary considerably in size and weight, but on an average they measure from an inch to an inch and a half in length, and from half an inch to an inch in diameter. They form
hard, firm and compact shells with some straggling flossy filaments on the exterior, and the interior layers are so closely and densely agglutinated as to constitute a parchment-like mass which resists all attempts at unwinding. The whole cocoon with its enclosed pupa weighs from 15 grains for the smaller races to about 50 grains for the breeds which spin large cocoons. From two to three weeks after the completion of the cocoon the enclosed pupa is ready to emerge. The secretions of the pupa moisten one end of its self-made prison, thereby enabling itself to push aside the fibres and make an opening by which the perfect moth comes forth. The sexes almost immediately couple; the female in from four to six days lays her eggs, numbering 500 and upwards; and, with that the life cycle of the moth being complete, both sexes soon die.

**Sericulture.**

The art of sericulture concerns itself with the rearing of silkworms under artificial or domesticated conditions, their feeding, the formation of cocoons, the securing of these before they are injured and pierced by the moths, and the maturing of a sufficient number of moths to supply eggs for the cultivation of the following year. The first essential is a stock of mulberry trees adequate to feed the worms in their larval stage. The leaves preferred in Europe are those of the white-fruited mulberry, *Morus alba*, but there are numerous other species which appear to be equally suitable. The soil in which the mulberry grows, and the age and condition of the trees, are important factors in the success of silkworm cultivation; and it has been too often proved that the mulberry will grow in situations where, from the nature of the leaf the trees put forth and from other circumstances, silkworms cannot be profitably reared. An elevated position with dry, friable, well-drained soil produces the best quality of leaves. Throughout the East the species of mulberry cultivated are numerous, but, as these trees have been grown for special purposes at least for three thousand years, they show the complex variations peculiar to most cultivated plants.

The eggs of the silkworm, called *graine*, are hatched out by artificial heat at the period when the mulberry leaves are ready for the feeding of the larvae. These eggs are very minute—about one hundred weighing a grain; and a vast number of hatched worms may at first be kept in a small space; but the rapid growth and voracious appetite of the caterpillars demand quickly increasing and ample space. Pieces of paper punctured with small holes are placed over the trays in which the hatching goes on; and the worms, immediately they burst their shell, creep through these openings to the light, and thereby scrape off any fragments of shell which, adhering to the skin, would kill them by constriction. The rearing-house in which the worms are fed (Fr. *magnanerie*) must be a spacious, well-lighted and well-ventilated apartment, in which scrupulous cleanliness and sweetness of air are essential, and in which the temperature may to a certain extent be under control. The worms are more hardy than is commonly supposed, and endure variations of temperature from 62° to 78° F, without any injury; but higher temperature is very detrimental. The lower the temperature at which the worms are maintained the slower is their growth and development; but their health and vigour are increased, and the cocoon they spin is proportionately bigger. The worms increase in size with astonishing rapidity, and no less remarkable is their growing voracity. Certain races moult or cast their skin three times during their larval existence, but for the most part the silkworm moult four times—about the sixth, tenth, fifteenth and twenty-third days after hatching. As these moulting periods approach, the worms lose their appetite and cease eating, and at each period of change they are left undisturbed and free from noise.

Laurent de l’Arbouset showed in 1903 that 1 oz. of seed of 30 grammes producing 50,000 to 35,000 silkworms (30,000 may be depended upon to cast their cocoon) will give a harvest of 130 to 140 lb fresh cocoons and an ultimate yield of about 7 lb raw silk properly reeled. The amount of nourishment required for this rearing is as follows:—hatching to first moult, about 9 lb of leaves of tender growth, equal to 40 to 45 riepe leaves; first to second moult, 24 lb, representing 100 lb riepe leaves; second to third moult, 30 lb, representing 125 lb riepe leaves; third to fourth moult, 356 lb, representing 1722 lb riepe leaves; fourth moult to moulting, 1430 lb, representing 5150 lb riepe leaves, totalling to about one ton of riepe leaves for a complete rearing. The growth of the worms during their larval stage is thus stated by Count Dandelò:

When the caterpillars are mature and ready to undergo their transformation into the pupa condition, they cease eating for some time and then begin to ascend the bushwood branches or echelles provided for them, in which they set about the spinning of their cocoons. Crowding of positions must now be guarded against, to prevent the spinning of double cocoons (dupons) by two worms spinning together and so interlacing their threads that they can only be reeled for a coarser and inferior thread. The insects complete their cocoons in from three to four days, and in two or three days thereafter the cocoons are collected, and the pupa killed to prevent its further progress and the bursting of the shell by the fully developed moth. Such cocoons as are selected for the production of graine, on the other hand, are collected, freed from the external flax, and preserved at a temperature of from 66° to 72° F, and after a lapse of from eleven to fifteen days the moths begin to make their appearance. The cocoon, which immediately takes place, calls for special care and attention; the males are afterwards thrown away, and the impregnated females placed in a darkened apartment till they deposit their eggs.

**Diseases.**—That the silkworm is subject to many serious diseases is only to be expected of a creature which for upwards of 4000 years has been propagated under purely artificial conditions, and these most frequently of a very insanitary nature, and where, not the healthy life of the insect, but the amount of silkworms bred, could be made to yield, was the object of the cultivator. Among the most fatal and disastrous of these diseases with which the cultivator had to grapple was "muscardine," a malady due to the development of a fungus, *Botrytis bassiana*, in the body of the caterpillar. The disease is peculiarly contagious and infectious, owing to the development of the fungus through the skin, whence spores are freed, which, coming in contact with healthy caterpillars, fasten on them and germinate inwards, giving off corpuscles within the body of the insect. Muscardine, however, has not been epidemic for many years. But about the year 1853 anxious attention began to be given in France to the ravages of a disease among silkworms, which from its alarming progress threatened to issue in national disaster. This disease, which at a later period became known as "pebrine," spread from China to India, and wherever it went it caused the destruction of vast numbers of silkworms. Observations and investigations—had first been noticed in France at Cavaillon in the valley of the Durance near Avignon. Pebrine manifests itself by dark spots in the skin of the larvae; the eggs do not hatch out, or hatch imperfectly; the worms are weak, stunted and unequal in growth, languid in movement, fastidious in feeding; many perish before coming to maturity; if they spin a cocoon it is soft and loose, and moths when developed are feeble and incontrollable. When development continues to a second generation it shows in increased intmitation the feebleness of the preceding. The disease is thus hereditary, but in addition it is virulently infectious and contagious.

**Fig. 5.—Microscopic appearance of Silk of Bombyx mori.**

**Fig. 6.—Cocoon of Bombyx mori.**
SILK

From 1850 onwards French cultivators were compelled, in order to keep up their silk supply, to import graine from unaffected districts. This policy persisted with the demand for healthy graine correspondingly expanded, while the supply had to be drawn from increasingly remote and contracted regions. Partly surrendering to this demand, a large plantation of silk worms was maintained, and in 1853 reached its maximum of 26,000,000 kilos of cocoons, valued at 117,000,000 francs. From that period, notwithstanding the importation at great cost of foreign graine, reaching in some instances the price of 12 francs per kilo, but where the cocoons were inferior and uninfected, the production still rose rapidly: in 1856 it was not more than 7,500,000 kilos of cocoons; in 1861 and 1862 it fell as low as 5,800,000 kilos; and in 1865 it touched the nadir of about 1,750,000. Quatrefois estimated the loss suffered by France in the 13 years following 1853, from decreased production of silk and price paid to foreign cultivators for graine, to be not less than one million of francs. In Italy, where the disease showed itself even earlier, but even more disastrously, affecting a much more extended industry, the loss in 10 years de Quatrefois stated at two milliards.

A loss of £120,000,000 sterling within 13 years, falling on a limited area, and on one class in these countries, correspondingly the calamity on a national scale, calling for national effort to contend with its devastating action. The malady, moreover, spread eastward with alarming rapidity, and, although it was found to be a disease disastrous and fatal in Oriental countries than in Europe, the sources of healthy graine became fewer and fewer, till only Japan was left as an uninfected source of European graine supply. This, unexceptionably proved, was the origin of the silkworm in the world necessarily attracted a great amount of attention.

So early as 1849 Guérin Méneville observed in the blood of diseased silkworms certain vibratory corpuscles, but neither did he nor anyone else observe the disease exclusively by these corpuscles, but even more disastrously, affecting a much more extended industry, the loss in 10 years de Quatrefois stated at two milliards.

Another cause of serious loss to the rearers is occasioned by Flacherie, a disease well known from the earliest times. Pasteur has established that these microorganisms called ferments and vitriols. One has only to ferment a certain quantity of mulberry leaves, chop them up and squeeze them, and so obtain a liquid, to find in it millions of ferments and vitriols. It invariably happens during the most active period of feeding, three or four days after the fourth moult up to the rising, and generally appears after a meal of coarse leaves, obtained from mulberries pruned the same year and growing in damp soil. Flacherie is the only natural disease of the cholea species and therefore contagious. The definite course is not occasioned so much from the ferments which exist in the leaves themselves, but from an arrest of the digestive process which allows the rapid multiplication of the former in the intestines. Good ventilation is indispensable to allow the worm to give out by transpiration the great quantity of water that it absorbs with the leaf. If this exhalation is stopped or lessened the worm might contract a disease which obliterates the digestive tract of the leaves by careless gathering, transport or packing, in proper hygienic care in ventilation and in maintaining a proper degree of dryness in the atmosphere in rainy weather, and in the use of clean and dry sheds.

Wild Silks.—The ravages of pebrine and other diseases had the effect of attracting prominent attention to the numerous other insects, allies of the mulberry silkworm, which spin serviceable cocoons. It had been previously pointed out by Captain Hutton, who devoted great attention to the silk question as it affected the East Indies, that at least six species of Bombyx, differing from B. mori, but also mulberry-feeding, are more or less domesticated in India. These include B. texor, the boropoooloo of Bengal, a large species having one generation female, and producing a soft flossy cocoon; the Chinese B. sebacina, having several generations, and making a small cocoon; and the Madrasi worm of Bengal (B. croci), the Dasse or Desi worm of Bengal (B. fortunatus) and B. arracanensis, the Burmese worm—al of which yield several
generations in the year and form reecallable cocoons. Besides these there are many other mulberry-feeding Bombycidae in the East, principally belonging to the genera Theopha tha and Ocinara, the cocoons of which have not attracted cultivators. The moths yielding wild silks which have obtained most attention belong to the extensive and handsome family Saturnidae. The most important of the species at the present time is the Chinese tussur or tasar worm, Antheraea pernyi (figs. 7, 8), an oak-feeding species, native of Mongolia, from which is derived the greater part of the so-called tussur silk now imported into Europe. Closely allied to this is the Indian tussur moth Antheraea mylitta, found throughout the whole of India feeding on the bher tree, Zizyphus jujuba, and on many other plants. It yields a large compact cocoon (fig. 10) of a silvery grey colour, which Sir Thomas Wardle of Leek, who devoted a great amount of attention to the wild-silk question, succeeded in reeling. Next in promising qualities is the muga or moonga worm of Assam, Antheraea assama, a species to some extent domiciliated in its native country. The yama-mai worm of Japan, Antheraea (Samia) yama-mai, an oak-feeder, is a race of considerable importance in Japan, where it was said to be jealously guarded against foreigners. Its eggs were first sent to Europe by Duchêne du Bellecourt, French consul-general in Japan in 1861; but early in March following they hatched out, when no leaves on which the larvae would feed were to be found. In April a single worm got oak-buds, on which it thrived, and ultimately spun a cocoon whenever a female moth issued, from which Guérin Méneville named and described the species. A further supply of eggs was secretly obtained by a Dutch physician Pompé van Meedervoort in 1863, and, as it was now known that the worm was an oak-feeder, and would thrive on the leaves of European oaks, great results were anticipated from the cultivation of the yama-mai. These expectations, however, for various reasons, have been disappointed. The moths hatch out at a period when oak leaves are not ready for their feeding, and the silk is by no means of a quality to compare with that of the common mulberry worm. The mezankorie moth of the Assamese, Antheraea mezankoria, yields a valuable cocoon, as does also the Atlas moth, Attacus atlas, which has an omnivorous larva found throughout India, Ceylon, Burmah, China and Java. The Cynthia moth, Attacus cynthia, is domesticated as a source of silk in certain provinces of China, where it feeds on the Atlas gandolus. The eria or arrindi moth of Bengal and Assam, Attacus ricini, which feeds on the castor-oil plant, yields seven generations yearly, forming loose flossy orange-red and sometimes white cocoons. The allanthes silkworm of Europe is a hybrid between A. cynthia and A. ricini, first obtained by Guérin Méneville, and now spread through many silk-growing regions. These are only a few of the moths from which silks of various usefulness can be produced; but none of these present qualities, saving perhaps cheapness alone, which can put them in competition with common silk.

**Physical and Chemical Relations of Silk.**

Common cocoons encasing chrysalides weigh each from 16 to 50 grains, or say from 300 to 600 of small breeds and from 270 to 300 of large breeds to the lb. About one-sixth of this weight is pure cocoon, and of that one-half is obtainable as reeled silk, the remainder consisting of surface floss or blaze and of hard gummy husk. As the outer flossy threads and the inner ves are not reecallable, it is difficult to estimate the total length of thread produced by the silkworm, but the portion reeled varies in length and thickness, according to the condition and robustness of the cocoon, in some breeds giving a result as low as 500 metres, and in others 900 to 1200 metres. Under favourable conditions, it is estimated that 11 kilogrammes of fresh cocoons give 1 kilogramme of raw silk for commerce, and about the same quantity for waste spinning purposes. Sir Thomas Wardle of Leek, in his handbook on silk published in 1887, showed by a series of measurements that the diameter of a single cocoon thread or have varied from \( \frac{1}{10} \text{inch} \) to \( \frac{1}{100} \text{inch} \) part of an inch in diameter in the various species of Bombycides, whilst those of the Saturnides or wild species varied from \( \frac{1}{10} \text{inch} \) to \( \frac{1}{100} \text{inch} \) part of an inch. As this estimation presents some difficulties and divergences, the size of the thread is generally defined commercially by deniers or decigrannemes, those of the Antheraeas (wild silks) being said to range from 5 to 8 deniers or decigrannemes, results confirmed by actual experience with the reeled thread. The silk of the various species of Antheraea and Attacus is also thicker and stronger at the centre of the reeled portion than towards its extremities; but the diameter is much greater than that of common silk, and the filaments under the microscope (fig. 11) present the appearance of flat bands, the exudation from the two spinnerets being joined at their flat edges. On this account the fibres of tussur or tussore silk tend to split up into fine fibrillae under the various preparatory processes in manufacturing, and its riband structure is the cause of the glassy lustre peculiar to the woven and finished fibres.

Silk fibre (see Fibres) consists essentially of a centre or core of fibroin, with a covering of sericin or silk albumen, and a little waxy and colouring matter. Fibroin, which is analogous to horn, hair, and like dermal products, constitutes about 75 to 82% of the entire mass, and has a composition represented by the formula \( \text{C}_{16}\text{H}_{26}\text{N}_{2}\text{O}_{2} \). It has the characteristic appearance of pure silk—a brilliant soft white body with a pearly lustre—insoluble in water, alcohol and ether, but it dissolves freely in concentrated alkaline solutions, mineral acids, strong acetic acid and in ammoniacal solution of oxide of copper. Sericin, which constitutes the gummy covering (fibrine) of the fibre, is a gelatinous body which dissolves readily in warm soapy solutions, and in hot water, in which on cooling it forms a jelly with even as little as 1% of the substance. It is precipitated from hot solutions by alcohol, falling as a white powder. Its formula is \( \text{C}_{6}\text{H}_{12}\text{N}_{2}\text{O}_{2} \). According to P. Bolley, the glands of the silkworm contain semi-liquid fibroin alone, and it is on exposure to the air that
the surface is acted on by oxygen, transforming the external pellicle into the more soluble form of sericin. Silk is high, but does not affect moisture according to the condition of the silk. It is a most perfect non-conductor of electricity, and in its dry state the fibres frequently get charged in a manner as to repel each other, a property which is so that it becomes necessary to moisten them with glycerin or soapy solutions. Silk is readily distinguished from wool and other animal filaments by the alkali act of outline of lead, which darkens wool, &c., owing to the sulphur they contain. Fin, again, silk dissolves freely in common nitric acid, which is not the case with wool. From vegetable fibres it is readily distinguished by the distinguishing colour it takes from a solution of picric acid, which does not adhere to vegetable substances. The rod-like appearance of silk and its absence of markings under the microscope are also easily recognizable features of the fibre.

**Silk Manufacture.**

Here we must distinguish between the reeled silk and the spun or waste silk manufactures. The former embraces a range of operations peculiar to silk, dealing as they do with continuous fibres of great length, whereas in the spun silk industry the raw materials are treated by methods analogous to those followed in the treatment of other fibres (see WEAVING). It is only floss, injured and unreelable cocoons, the husks of reeled cocoons, and other waste from reeling, with certain wild silks, which are treated by the spun silk process, and the silk thereby produced loses much of the beauty, strength and brilliance which are characteristic of the manufactures from reeled silk.

When the cocoons have been gathered the chrysalisides they contain are killed either by dry heat or by exposure to steam. All cocoons stained by the premature death of the chrysalisides (chiques), pierced cocoons, and any from other causes rendered imperfect are removed to the spun-silk manufacture. Then the unjured cocoons are by themselves sorted into classes having similar shades of colour, size and quality of fibre. This assortment is of great consequence for the success of the reeling operation, as uniformity of quality and evenness and regularity of fibre are the most valuable features in raw silk. The object of reeling is to bring together the filaments (bare) from two or more (generally from twenty) raw singles together to form them into one continuous, uniform, and regular strand, which constitutes the ”raw silk” of commerce. To do this, the natural gum of the cocoons which holds the filaments together must be softened, the ends of the filaments of the required number of cocoons must be caught, and means must be taken to unwind and lay these filaments together, so as to form a single uniform rounded strand of raw silk. As the reeling proceeds the reeler has to give the proper care and attention to the smooth and uniform winding of the raw single, and to introduce new cocoons in place of any from which the reeling silk has become exhausted. In this way a continuous uniform fibre is obtained which is further treated with a gum, the adhesive, which is added to the strand, leaving a delicate touch, can produce raw silk of remarkably smooth and even quality. According to the method commonly adopted in North Italy and France the cocoons are for a few minutes immersed in water a little under the boiling point, to which a small quantity of alkali has been added. A girl with a small hand brush of twigs keeps stirring them in the water till the silk softens, and the outer loose fibres (floss) get entwined with the twigs and come off till the end of the main filament (maître brin) is found. These ends being secured, the cocoons are transferred to a basin or tray containing water heated to from 140° to 150° F., in which they float while the silk is divested from the husks, if necessary, so that when the cocoons are soft enough and the cocoons rise out of the basin in reeling, if it is too hot the cocoons collapse and fall to the bottom. The ends of the requisite number of filaments being brought together, they are passed through a series of guides and then receive the necessary touch (this is done by a skilled hand) whereby they are passed through a corresponding guide. The two sets of filaments are then crossed or twisted around each other several times as if to make one thread, after which they are separated and passed through several guides to the red round which they are separately wound. When a large number of cocoons are to be combined into one strand they may be reeled from the tray in four sets, which are first crossed in pairs and then together into two, and these afterwards combined into a single strand. The object of crossing (croisage) is to round, smooth and condense the separate filaments of each set into one strand; and as the surface of the filaments is gummed and adhesive it is found on reeling that they have agglutinated into a compact single fibre of raw silk. In the most approved modern filatures there is a separate cocoons boiler (cuissesse), an oblong tank containing water boiled by steam heat. In these the cocoons are immersed in rectangular perforated boxes for about three minutes, when they are transferred to the beating machine (battisse), an earthenware trough having a perforated false bottom through which steam keeps the water at a temperature of from 140° to 160°. In this water the cocoons are kept stirring by small brushes rotated by mechanical means, and as the silk softens the brushes gradually rise out of the water, bringing entangled with them the loose floss, and thereby revealing the main filament of each cocoon. The cocoons are next, in sufficient number, transferred to the reelers’ tray (bacinella), where the water is heated to about 140° to 150°. From the tray the filaments are carried through a series of porcelain and glass eyelets, so arranged that the strand returns on itself, two portions of the same strand being crossed or intertwined for rounding and consolidation, instead of the croisage of two separate strands as in the old method. The reel to which the raw silk is led consists of a light six-armed frame, enclosed within a wooden casing having a glass frame in front, the enclosure being heated with steam-pipes. To keep the strands from directly overlaying each other and so adhering, the last guide through which the silk passes has a reciprocating motion whereby the fibre is distributed within certain limits over the reel. Fig. 12 presents a scannor view of a reel, the apparatus as which it resembles being the passage of the thread from the basin to the reel, the threads being twisted around by the tavellette to give roundness to the thread, but though the principle remains much the same, great improvements have been made on this model.

**Throwing.—**Raw silk, being still too fine and delicate for ordinary use, next undergoes a series of operations called throwing, the object of which is to twist and double it into more substantial yarn. The first operation of the silk thrower is winding. He receives the raw silk in hanks as it is taken from the reel of the filature, and putting it on a light reel of a similar construction, called the swifts, he winds it on bobbins with a rapid reciprocating motion, so as to lay the fibres in the parallel lines. These bobbins are then in general taken to the first spinning frame, and there the single strands receive their first twist, which rounds them, and prevents the compound fibre from splitting up and separating when, by the subsequent scouring stream of water, the gum is removed which previously binds them into one. Next follows the operation of cleaning, in which the silk is simply reeled from one bobbin to another, but on its way it passes through a slit which is sufficiently wide to pass the filament but stops the motion when a thick lump or nib is presented. In the doubling, which is the next process, two or more filaments are wound together side by side on the same reel, preparatory to their being twisted or doubled on another kind of wheel. The filaments are led up to be twisted into one are mounted in a creel on the doubling frame, and the strands are passed over smooth rods of glass or metal through a reciprocating guide to the bobbin on which they are wound. Each end of a thread passes in a similar eye of a faller, which, should the fibre break, falls down and instantly stops the machine, thus effectually calling attention to the fact that a thread has failed. The spinning or throwing which follows is done on a frame of upright spindles and flyers, the yarn as it is twisted being drawn forward through guides and wound on revolving bobbins with a reciprocating motion. From these bobbins the silk is reeled into hanks of definite length, which at the same time are arranged in groups of two, to simplify the silk-throwing by combining two or more operations on one machine, but not as yet with much success.

According to the qualities of raw silk used and the throwing operations undergone by the primary raw, the final silk are—(1) "singles,” which consist of a single strand of twisted raw silk made up of the filaments of eight to ten cocoons; (2) tram or weft thread, consisting of two or three strands of raw silk not twisted before doubling and only lightly spun (this is soft, fuzzy and comparatively
weak); (3) organize, the thread used for warps, made from two and rarely three twisted strands spun in the direction contrary to that in which the silk is twisted. These so-called brodery broches belong to a different class from those intended for weaving, and thread-makers throw their raw silks in a manner peculiar to themselves.

**Weighing of Silk.**—The metric system of weights and measures has been adopted so widely that it forms the most suitable basis for the liture or counts of yarns. The permanent committee of the Paris International Congress of 1899, which was held for the purpose of determining a uniform system of weights and measures, proposed a number of weights for use in the textile industry. The (a) with reference to cotton, silk and other textiles spun from fibres, that they should be based on a fixed weight and variable length, the unit being one metre of fibre. By adopting a weight of 100 grammes calculated on the single strand. (b) with reference to raw and thrown silk, in order to enable the count to show the degrees of variation incidental to this class of material, it was proposed to reckon the weight in deniers, the weight of 100 yards being called 1 denier. The weight of 1 denier is 0.10936 grammes. The length of skin adopted was 450 metres and the unit of length the half decigranne. Thus the count of silk is expressed by the number of half decigrammes which the length of 450 metres weighs. This obtains whether in the single, double or more threads joined together in the doubling.

This latter differs very little in actual practice from the previous method of determination by the number of deniers per 476 metres, the latter being calculated on the weight of 195 grammes, the English equivalent showing 331 deniers per one dram avoirdupois.

As the old systems of counts have some technical conveniences the latter is still held to be the most reliable. In some districts, especially in Yorkshire, the count is based on the number of yards per ounce, and in others the other method of drams avoirdupois per 1000 yard skein. The English cotton yarn and spun silk counts are reckoned according to the number of hanks, each hank of 215 denier, being reckoned on the single thread and spun silk on the doubled or finished thread. Thus 2/40 cotton indicates single 40 doubled to 20 hanks by 840 yds. to the lb, while 1/2 fold spun silk means a single hank of 215 deniers, to be spun into 104 yds. to the lb. Continental conditioning establishments now formulate their tests for counts on the agreement arrived at by the International Congress of Conditioning.

**Conditioning.**—Silk in the raw and thrown state absorbs a large amount of moisture, and may contain a percentage of water without being manifestly damp. As it is largely sold by weight it becomes necessary to condition the material before measuring. In the factories, especially in Yorkshire, the count is based on the number of yards per ounce, and in others the other method of drams avoirdupois per 1000 yard skein. The English cotton yarn and spun silk counts are reckoned according to the number of hanks, each hank of 215 denier, being reckoned on the single thread and spun silk on the doubled or finished thread. Thus 2/40 cotton indicates single 40 doubled to 20 hanks by 840 yds. to the lb, while 1/2 fold spun silk means a single hank of 215 deniers, to be spun into 104 yds. to the lb. Continental conditioning establishments now formulate their tests for counts on the agreement arrived at by the International Congress of Conditioning.

**Silk Weighing.**—Into the dyeing of silk it is not here necessary to enter, except in so far as concerns a nefarious practice, carried on in dye-houses, which has exercised a most detrimental influence on the trade. Since, we have seen, loses about one-fourth of its weight is seriously injured. To the extent that losses have been to dye some dark silks "in the gum," the dye combining in these cases with the gum or gelatinous coating, and such silks are known as "soups." Both in the gum and in the boiled-off state silk has the peculiar property of imbuing certain metallic salts largely and combining very firmly with them, the fibre remaining to external appearance undiminished in strength and lustre, but much added to in size and weight. Silk in the gum, it is found, absorbs these salts in an extraordinary manner, the first boiling-off or for an hour or two on a flame, the raw silks in a manner peculiar to themselves.

**Wild Silk Dyeing.**—Among the disadvantages under which the silks of the wild moths long laboured one of the most serious was the natural colour of the silks, and the extreme difficulty with which they took on dyes, specially the light and brilliant colours. For success in coping with this difficulty, as well as in dealing with the numerous technical difficulties which arose from the unvarying patience and great skill of Sir Thomas Wardle of Leek deserve special mention here. The natural colour of tussur silk is a greyish fawn, and that shade it was found impossible to discharge successfully. Sir Thomas Wardle, experimenting with the object to obtain a basis for the dyeing of light and delicate dyes. Moreover, the chemical character of the tussur silks differs from that of the mulberry silk, and the fibre has much less affinity for tinctorial substances, which it takes up unevenly, requiring a large amount of dye-stuffs. After prolonged experimenting Sir Thomas Wardle was able in 1873 to show a series of tussurs well dyed in all the darker shades of colour, but the lighter and brighter blues, pinkas, scarlets, &c., he could not produce. Subsequently Tussie de Motay found that the fawn colour of natural tussur could be discharged by solution of permanganate of potash, but the oxidizing action was so rapid and violent that it destroyed the fibre. Wardle, however, by the addition of certain substances to the bleaching solution, discovered the secret of obtaining tussur to a fairly pale ground. The silk of the eria or castor-oil worm (Attacus ricini) presents the same difficulties in dyeing as the common tussur. A portion of the eria cocoons are white, while the other are black. Wardle found the white portion to require under a bleaching process. The silk takes up colour with difficulty from a strong vat, and is consequently costly to dye, but very suitable for imparting the brown or dark brown colour, but that appears to be much influenced by the leaves on which the worm feeds, the cocoons obtained on the charmace tree (Mitchella champaca) giving a fine white fibre much valued in Asia. The dark brown or black colour which it takes the fibre itself takes dye-colours much more freely and evenly than either tussur or eria silk.

**Trade and Commerce.**

About the beginning of the 19th century the chief silk-producing regions of the world were the Levant (including Broussa, Syria and Persia), India, Italy and France, the two first named sending the low-priced silk, the other two the fine qualities.
Between 1840 and 1850, after the opening of trade with China, large quantities of silk were sent from the northern port of Shanghai, and afterwards also from the southern port of Canton. The export became important just at the time when disease in Europe had lessened the production on the continent. This increased production of medium silk, and the growing demand for fine sorts, induced many of the cocoon-growers in the Levant to sell their cocoons to Europeans, who reeled them in Italian fashion under the name of "Patent Brütin," thus producing a very fine valuable silk. In 1857 commenced the exportation of Japan silk, which became so fierce a competitor with Bengal silk as gradually to displace it in favour; and the native silk reeled in Bengal has almost ceased to be made, only the best European filatures, produced under the supervision of skilled Europeans, now coming forward.

China and Japan, both of which contribute so largely to the supplies that appear in European and American statistics, only export their excess growth, silk-weaving being carried on and native silk worn to an enormous extent in both countries. The other Asiatic exporting countries also maintain native silk manufactures which absorb no inconsiderable proportion of their raw material. Since about 1880 the silk production of the world (including only exports from the East) has more than doubled, the variations owing to partial failures from some countries being more than compensated by increase from others. The supplies available for European and American consumption have been carefully tabulated by the Lyons Chamber of Commerce, as shown by the table.

While the tables indicate the fluctuations of supply they show generally that Asiatic countries, in addition to supplying the necessities for their home trade, export to Europe and America about three-fifths of the whole of the silk consumed in Western countries.

Up to the year 1860 the bulk of the silks from the East was shipped to London, but subsequently, owing to the importance of continental demands, a large portion of the supplies has been unshipped at Genoa and Marseilles (especially the finer reeled silks from Japan and Canton), which are sold in the Milan and Lyons markets. Those for American consumption are sent direct by the Pacific route via San Francisco. Table II. shows the official annual returns of silk imports into Great Britain from 1880 to 1906.

The power loom, owing to the improvement in its mechanism, has gained a distinct precedence and materially increased its producing power. In the development of silk manufacture the hand loom has taken a very secondary position. In order to form an adequate idea of the importance of the various countries engaged in silk manufacture, a tabulation of the number of looms employed in each country would prove an inadequate guide, owing to the variations from time to time of the fabrics woven, as also to the difficulty in obtaining trustworthy statistics of the number in active operation. The production and consumption of raw material shown in Table III., was prepared by Messrs Chabrières, Morel & Co. of Lyons, Marseilles and Milan, and issued in 1905.

America takes a premier position in consumption of the raw material. The development and expansion of silk manufacture, owing to the extent and extent of the home market, coupled with high protective tariffs, has been enormous. In 1867 the import of raw material amounted to 341,983 lb. In 1905 a record was reached of 17,812,133 lb. During the decade of 1898 to 1908 the consumption has gone on steadily from about 10 million lb. in the first year of the decade to an average of 15 million lb. in the second half of the decade. France comes second in importance with a
consumption of 9 to 10 million lb annually. Lyons is the head-quarter of the trade, principally in the production of dress fabrics, plain and figured, and other light and heavier fabrics. St Étienne and St Chamond are important centres for the ribbon trade. There is

N.B.—The difference in the totals is owing to the figures being based on the production in seasons, and that of consumption upon calendar years.

are also important manufactures of silk at Calais, Paris, Nimes, Tours, Avignon and Roubaix. Germany follows France with a consumption for the various fabrics of over six million lb annually. The principal seat of the trade in that country is at Crefeld, nearly one-half of the production of the empire being manufactured there. Vervet is the special centre of the industry, about one-half of the looms being devoted to this textile, the remainder being devoted to union satin and pure silks and other fabrics. Other principal centres of the silk trade in Rhineland Prussia are Viersen, Barnem, Elberfeld and Mühlheim. The province of Saxon has also important manufactures of fabric and gros Grain. Third on the list of the silk industries in continental producers is Switzerland; Zürich takes the lead with broad goods (failles, armures, satins, serges, &c.), and Basel rivals St Étienne in the ribbon trade.

Russia, by a prohibitive tariff on manufactured sills of other countries, has since 1898 developed and fostered another trade which consumes annually about 3 million lb of raw material for its home industry. This has also stimulated silk culture in the Caucasus, from which province it draws about one-third of its supplies. A special feature of its manufactures consists of gold and silver tissues and brocades for ecclesiastical use. Moscow is one of the principal seats for the weaving of these fabrics. Italy, the early home of the silk trade in Europe, the land of the gorgeous velours of Genoa and the damasks and brocades of medieval Sicily, Venice and other Italian centres, now takes only a sixth place, the centre of greatest activity being at Como; but Genoa still makes velvets, and the brocades of Venice are not a thing of the past. Austria and England follow on the list of important silk manufactures. The former has found its principal development in Vienna and the immediate neighbourhood.

In the United Kingdom all the silk industries (those depending on spun silk alone excepted) have been declining since the French Treaty of 1860 came into operation. This cannot be gauged by the decrease in imports of raw material from the fact before mentioned that formerly London was the chief centre of distribution for Eastern silk, which is now dispersed among the European ports for continental consumption. The shrinkage is more noticeable in the throwing branch of the industry. Many of the mills formerly in operation in Derby, Nottingham, Congleton and Macclesfield have been closed owing to the importation of foreign thrown silks from Italy and France and the curtailment of the rate of wages is paid to the operatives employed in this branch. In like manner the manufacture of silk fabrics in the districts of Manchester, Middleton, Macclesfield, London (Spitalfields) and Nottingham (for silk lace) has decreased proportionately. Against this we may set off a decided increase in the manufacture of mixed goods, carried on principally in Scotland, Yorkshire and Lancashire.

The remarkable development of the comparatively new trade in spun silk goes far to compensate for the loss of the older trade of net silk, and has enabled the exports of silk manufactures from Great Britain to be at least maintained and to show some signs of expansion. Silk spinning has chided steadily in the Yorkshire, Lancashire, Cheshire and Staffordshire textiles centres. Its expansion and importance may be seen from the fact that the imports of waste, knubs, &c., in which in 1860 was 1,050 cwt., reached in 1905 a record of 72,000 cwt. It is highly significant that while the exports of British silk manufactures have not decreased, the imports in the meantime have shown a marked expansion. Although the use of silk goods has unquestionably increased since the middle of the 17th century, the expansion of native productions has not kept pace with that growth.

The Spinning of 'Silk Waste.'

The term silk waste includes all kinds of raw silk which may be unwindable, and therefore unsuited to the spinning process. Before the introduction of machinery applicable to the spinning of silk waste, the refuse from cocoon reeling, and also from silk winding, which is now used in producing spun silk fabrics, hosiery, &c., was nearly all destroyed as being useless, with the exception of that which could be hand-combed and spun by means of the distaff and spinning wheel, a method which is still practised by some of the peasantry in India and other Eastern countries.

The supply of waste silk is drawn from the following sources:

1. The silkworm, when commencing to spin, emits a dull, lustreless and uneven thread with which it suspends itself to the twigs and leaves of the tree upon which it has been feeding, or to the straws provided for it by attendants in the worm-rearing establishments: this first thread is unreliable, and, moreover, is often mixed with straw, leaves and twigs. (2) The outside layers of the true cocoon are too coarse and uneven for reeling;

</table>
SILK

relocable thread, and in joining the ends, there is unavoidable waste. (3) Raw silk skeins are often re-reeled; and in this process part has to be discarded: this being known to the trade as gum-waste. The same term—gum-waste—is applied to "waste" made in the various processes of silk throwing; but manufacturers using threads known technically as organizers and trams call the surplus "manufacturer's waste." Finally we have the "self-waste of the silk," i.e., the chief of which is tussur. The different qualities of "waste," of which there are many, vary in colour from a rich yellow to a creamy white; the chief producing countries being China, Japan, India, Italy, France and the countries in the Near East; and the best-known qualities are: steam wastes, from Canton; knubs, from China and from Italy and other Western countries; frisons, from various sources; wadding and blaze, Shanghai; china, Hangchow; and Nankin buttons. Indian and Szechuan wastes; punjum, the most lustrous of wastes; China cutles; Japan wastes, known by such terms as kikai, oule, and so on. Stage, the gum coating must be removed, really dissolved and washed away—and according to the method used in achieving this operation the result is either a "scaphe" or a "discharged yarn." The former, "scaphey," is the French, Italian and Swiss method, from which the silk when finished is neither so bright nor so good in colour as the "discharged silk"; but it is very clean and level, and for some purposes absolutely essential, as, for instance, in velvet manufacture.

**Scaphing.**—The method is as follows: If waste silk is piled in a box, left, and boiled from, one to two and a half hours. Therefore spoons spinners place their degumming plant in the hills, near or on a stream of pure water. The waste silk is put into large kinks and covered with hot water (temperature 370°F.). These are then hermetically closed, and left for a few hours for the gum to ferment and loosen. When thoroughly softened—the time occupied depending on the heat of the water and nature of the silk—the contents of the kinks are taken out and placed into vats of hot water, and allowed to soak there for some time. Then the silk is taken to a washing machine, and the loosened gum thoroughly washed away. The silk is then partly dried in a hydro-extractor, and afterwards put in rooms heated by steam-pipes, where the dryers are actuated.

**Discharging** is the method generally used by the English, and results in a silk having brilliancy and purity of colour. In this process the silk is put into a form of a frame; which is made to hold (in accordance with the wish of individual spinners) from 1 lb to 5 lb in weight. When about 100 lb of silk has been bagged, the whole is placed in a large wooden tub and covered with bellies, and theinks and the whole are conveyed through the bobbin machine to the washing machine, in which process the gum has previously been dissolved. In this the silk is boiled from one to two hours, than taken out and put through a hydro-extractor to remove the dirty gummy solution. Afterwards it is put into a number of tubs and washed for about a half hour. It is then once more hydro-extracted, and finally taken to a stove and dried.

"Discharged silk" must be entirely free from gum when finished, where "scaphe" contains a percentage of gum—sometimes as much as 20%.

In the first stage both classes of silk receive much the same treatment, differing widely in detail in different mills and districts.

**Conditioning.**—The "degummed silk," after it is dried, is allowed to absorb a certain amount of moisture, and thus it becomes soft and malleable to the touch, and properly conditioned for working by machinery.

**Beating.**—When the waste contains any large percentage of worm or bone, then it is beaten to a pulp in a "beater," a machine which has a large revolving disk on which the silk is placed, and while revolving slowly is beaten by a leather whip or flail, which loosens the silk and knocks out the wormy matter. After the beating, the silk presents a surface that is finely divided, and still retains the characteristic appearance of the raw silk. The object of the spinner at this point is to straighten out the tangles and lumps, and to lay the fibres parallel: the first machine to assist in this process being known as an opening machine, and the second as a filling or a filling machine.

**Opening and Filling.**—The silk to be opened is placed on a latticed sheet or feeder, and thus slowly conveyed to a series of rollers or coring machines (rollers set with rows of perforating steel pins), which hold the silk firmly while presenting it to the action of a large revolving drum, covered with a sheet of vulcanized rubber, set all over with fine steel teeth. As the drum revolves at a good speed, the silk is carried in or more or less straight and parallel fibres. When the teeth are full the machine is stopped, and the silk stripped off the drum, then presenting a sheet-like appearance technically known as a "lap." This is then passed to the "coring," or "combing," machine, where the side and appearance to the opener as far as the feeding arrangements are concerned, but the drum, in place of being entirely covered with teeth, is supplied with "frisons," or rows of steel teeth of coarser, or straighter teeth, each row set parallel with the axe of the machine. The silk drawn by the rows of teeth on the drum through the coring rollers (or coring sheets in some cases) covers the drum, and the drum is turned, and when a sufficient weight is on the machine, it is stopped, and an attendant cuts, with a knife, the silk along the back of each row of teeth, thus leaving a fringe of silk hooked on the pins or teeth. This fringe of silk is placed by the attendant between two hinged boards, and whilst held firmly in these boards (called book-boards) is pulled off the machine, and is called a "strip"; the part which is discharged or removed is called rowing, and the portion of the "tail." By these means the silk has been opened, straightened and then cut into a certain length, the fibres now being fairly laid parallel and ready for the next operation, known as silk combing.

**Silk Dressing.**—This is the process equivalent to combing in the wool industry. Its purpose is to sort out the different lengths of fibre, and to clear such fibres of their nubs and noils. There are two well-known principles of dressing: one known as "flat frame," giving good result with discharged silk, and the other known as "circular frame," dressing, suitable for scaphes.

**Flat Dressing Frame.**—With a certain number of book-boards from the filling engine, which boards when full of silk are screwed tightly together in the frame. The frame is capable of being raised into contact with travelling combs, affixed to an endless band or ground trough, where about 72 combs are arranged. This allows the silk to enter gradually into close contact with the combs, which comb through the silk in exactly the same manner as a lady combs her tresses. In a circular frame the silk is clamped between boards, and these are fixed on a large drum. This drum revolving slowly, and in its revolution conveys the fringes of silk past two quickly running smaller combing drums. These combing drums being covered with fine steel teeth penetrate their combs through the fringes of silk depending from the large drum, thus combing through the silk. In each machine the object is the same. First the filled silk is placed into a holding receptacle, clamped fast, and presented to the combing teeth. These teeth, in a certain proportion of shorter fibre and rough places and tangle portions of silk, which are taken off the combs in a book-board or wrapped round a stick, and again presented to the combs. This fibre again yields combs which will also be combing, and so for five, six, or seven times until the combings are too short, and are taken from the machine and known as noils. The productions from these several combs are known as drafts and are of different lengths: the product of the filled silk first placed in the dressing frame being the longest fibre and of course the most valuable.

The flat frame is the most gentle in its usage of the silk, but is most costly to manufacture. Therefore, when it is said, "..."”it is necessary to have a flat frame," it means that the silk is to be dressed or combing, and to remove, by the action of the combing teeth, whatever is not wanted in the final state of the silk. This method also has the advantage of being cheaper in cost of labour. Recently a new machine has been invented giving the same results from the flat frame; it is a "circular frame," which at the same time has the gentle action of the flat frame. The cost of the operations is as cheap as the circular frame, therefore the machine combines the advantages of each of its predecessors.
Noils.—The noils resulting from the dressing operations are sometimes combed, the comb used being similar to those used in the cotton trade. The resulting sliver is spun into yarn of a quality and character suited to the silk spindle, and the exhaust noils are bought by those who spin them up into "noil yarn" on the same principle as wool. The yarns are chiefly used by manufacturers of powder bags, but have other applications, in the dyeing and finishing processes, and are used for fancy effects in wool cloths for the dress goods trade.

Drafts.—The drafts from the dressing frame are valued in accordance with their length, the longest being known as A or 1st drafts and so on.

or as quality A B C D E. 

Each draft may be worked into a quality of its own, and by such means the most level yarns are obtained. But occasionally one or more drafts are mixed together, when price is the determining factor.

Processes peculiar to Silk Spinning Industry.—The foregoing processes are all peculiar to the silk trade, no other fibre having to go through such processes, nor needing such machinery. In the first stages of the spin-silk industry, the silk was dressed before boiling the gan or gum; the resulting drafts were cut into short lengths and used or sold. The silk was then boiled and afterwards beaten, scuffed, carded, drawn, spun, folded, &c., in exactly the same way as fine cotton. Short fibre silks are still put through cards and treated like cotton. The chief quality of silk fibre is its lustre, or its ability to convey light without absorbing it. Following the process of dressing, the drafts have to go through a series of machines known as preparing machines: the object being to place up the lengths of fibre, and to prepare the silk for drawing. There are four principal forms of machines employed:

A. Fallers or fall drawing machine consists of a long feeding sheet which conveys silk to a pair of rollers (back rollers). These rollers present the silk to a set of fallers (steel bars into which are fastened needles), which carry forward the fibre to another pair of rollers, which draw the fibre through the pins of the fallers and present it to the rollers in a continuous way, thus forming a ribbon of silk called a "sliver." The fallers are travelled forwards by a rack and pinion at the same time that the rollers are revolving fixedly and automatically into the thread of a receiving screw fixed below, which carries the fallers back to their starting point to be risen by cams into the top pair of screws to repeat the journey.

The drafts from the dressing frame are made into little parcels of a few ounces in weight, and given to the more or less skilled workers (silk spinners), who spin them by means of a very simple hand-frame called a "slubbing" frame, for making the yarns intended to be produced. The fibre and nubs have to be cleaned by means of a cleaning machine so constructed that the end of the silk (yarn) is frictioned to throw off the nubs, and at the same time the fibres are cleaned by passing them through a water-vapor flow without injuring the main thread. The yarn is now ready for reeling into skeins or for warping, both of which operations are common to all the textile products. It may be washed or dyed just as required, either in bank or in warp.

Growth of Industry and Uses of Spun Silk.—As will have been gathered, spun silk is pure silk just as much as that used by the spinner. The spinning industry has not developed in England. The number of mills has decreased, but machinery now runs so much more quickly than formerly that more yarn is being spun on fewer spindles. The American spinning industry is an epitome of international trends. It has a market for wool and cotton, and for the pure silk also. The continental spinners have largely increased, but are developing into huge syndicates, all working on the same general scheme. The three chief syndicates, one each in France, England, and Switzerland, work together, practically ruling the prices for yarns and raw materials.

Spun silks are largely used for silk linings, hosiery, sewing threads, elastic webbing, lace, and many other purposes. The silks are sold in various materials, for dress goods and bleached silks; also for mixing with other fibres in forms of stripes in the weaving of various fabrics, or to be used in what are known as mixed goods, i.e. a warp of silk and weft of some other fibre such as wool. The article known as tussur spinn is prepared in exactly the same manner as other spun silks, but its chief use is to make an imitation of seal skin. 

SILVER BOWLAND (1842-1897), American poet and educator, was born at Windsor, Connecticut, on the 29th of April 1841. He graduated at Yale in 1861, as class poet; engaged in business in California; entered the Harvard Divinity School in 1867, but soon left it for a position on the staff of the New York Evening Mail; and after teaching at Wadsworth and Cuyahoga Falls, Ohio (1868-1871), became principal of the Oakland High School, California. He was professor of English literature at the university of California in 1874-1892. His health was failing, and he returned to Cuyahoga Falls in 1883. He devoted himself to local France. He wrote many poems of many kinds, and many other papers, and was a modest and very successful English essayist. His contributions to American poetry are small but of fine quality. His best poems, such as The Venus of Milo, The Fool's Prayer and Opportunity, gave him a high place among the minor poets of America, which might have been higher but for his early death. See A Memorial volume privately printed by his friends in 1887; and Biographical Sketch in The World Guide (Boston, 1906), edited by William Belmont Parker with Mrs Sill's assistance.

SILL (O.Eng. syl, Mid. E. sylle, selle; the word appears in Icel. syl, sull, Swed. syl, and Dan. syll, and in German, als Schneide; Skert refers to the Teutonic root swali-, swell, the word meaning the rise or swell formed by a beam at a threshold; the Lat. solis, from which comes Fr. soleil, gives Eng. sole, also sometimes used for "sill"), the horizontal base of a door or window-frame. A technical distinction is made between the inner or wooden base.
SILL

in geology, an intrusive mass of igneous rock which consolidates beneath the surface and has a large horizontal extent in comparison with its thickness. In the north-eastern counties of England there is a great mass of this kind known as the Whin Sill. The term “whin” is used in many parts of England and Scotland to designate hard, tough, dark coloured rocks often of igneous origin, and the Whin Sill is a mass of dolerite or, more strictly, quartz-diabase. Its most striking character is the great extent in a horizontal direction which it can be traced. It starts not far north of Kirkby Stephen (Co. Durham) and runs on a northerly course, describing a great curve with its convexity towards the west, till it ends on the sea-shore at Bamborough, not far south of Berwick-on-Tweed. The length of the outcrop is about 80 m., but in places it is covered with superficial deposits or may be actually discontinuous. Near Haltwhistle, however, it is visible for about 20 m., and as it lies among softer rocks (limestones and shales), it weathers out on a bold craggy ridge or escarpment. When it crosses the streams the resistant character of the igneous rock is indicated by waterfalls or “forces,” e.g. High Force or the Teeswater, both within the Whin Sill belt, but averages 90 ft. In some places the Whin Sill splits up into two or more smaller sills which may unite, or one of them may die out and disappear, and often small attendant sills, resembling the main mass in petrographical character, appear in association with it. It is difficult to estimate the area over which it extends, as it dips downwards from its outcrop and is no longer visible, but we may conjecture that it spreads over no less than 4000 sq. m. underground.

The rocks in which it lies belong to the Carboniferous Limestone series, and the Sill is probably one of the manifestations of the volcano activity which occurred during the latter part of the Carboniferous period. Many similar sills, often of large size, though none so great as the Whin Sill, are found in the Scottish coalfields. There are few lavas or ash beds at or above the horizons on which these intrusive rocks lie, and hence it has been concluded that towards the close of that volcanic episode in British geological history the molten magmas which were impelled upwards towards the surface found a place to rest usually within the sedimentary rocks, and rarely flowed out as lavas on the sea-bottom (the intrusive succeeding the effusive phase of volcanic action). In the Carboniferous rocks the Whin Sill lies almost vertically, but averages 90 ft., but frequently extends, as it dips downwards from its outcrop and is no longer visible, but we may conjecture that it spreads over no less than 4000 sq. m. underground.

The Whin Sill consists of a dark green granular diabase, in which quartz or micropegmatite appears as the last product of crystallization. It is not usually vesicular and is not porphyritic, though exceptions may occasionally be noted. At both the upper and the under surface the diabase becomes much finer grained, and the finest intrusive veinlets which enter the contact of the rocks may even show remains of a glassy base. These phenomena are due to the rapid cooling where the magma was in contact with the sediments. No ash beds accompany the Whin Sill, but there are certain dikes which occur near it and probably belong to the same set of injections. In many places the diabase is quarried as a road-mending stone.

The great Palisade trap of the Hudson river, which is an almost exact parallel to the Whin Sill, is an extensive igneous intrusion exposed among the Triassic beds of New Jersey and New York. It has an outcrop which is about 100 m. long; its thickness is said to be from 200 to 300 ft., though usually not above 200 to 300 ft. Like the Whin Sill the rocks are of outline-diabase, and are commonly exposed to olivine-diabase, especially near its edges. The Palisade diabase is compact, non-vesicular and non-porphyritic as a rule. It follows the general courses of the beds of the strata. It is a sheet of igneous rock, which, though it breaks across them locally and produces a considerable amount of contact alteration, in New Jersey, however, there is also an extensive development of effusive rocks which are olivine-basalts, and by their very porphyritic nature determine the extreme form of the outcrop, and conformable mode of occurrence, show that they were true lavas poured out at the surface. There can be little doubt that they belong to the same period as the Palisade trap, and they are consequently later than the Whin Sill.

These great sheets of igneous rock intruded into cold and nearly horizontal strata must have solidified very gradually. Their edges are fine grained owing to the fact that they rapidly chilled, and the whole mass is usually divided by joints into vertical columns, which are narrower and more numerous at top and base and broader in the centre. Where exposed by denudation the rocks, owing to the presence of joints, are in the form of large polygonal prisms. The name “Palisade trap” expresses this type of scenery, so characteristic of igneous intrusive, and is applied to it in New Jersey. It may be seen on the banks of the Hudson river. In Britain it is not observed, though the Whin Sill at Stirling on which Wallace’s Monument is placed; and by the well-known escarpment of Salisbury Crags which fronts the town of Edinburgh.

In the Tertiary volcanic district of the West of Scotland and North Ireland, including Skye, Mull and Antrim, innumerable sills occur. Perhaps the best known is the Sc iar of Eigg, which forms a high ridge terminating in a vertical cliff or Sc iar in the island of Eigg, one of the Inner Hebrides. At one time it was supposed to be a lava-flow, but A. Harker has maintained that it is of intrusive origin. This Sscar occupies only a small area as compared with those above described. It is estimated to be about 500 ft. thick and extends for a quarter of a mile. On the east side it terminates in a great cliff from 300 to 400 ft. high, rising from a steep slope below. This cliff is beautifully columnar, and shows also a horizontal banding, simulat-

ing bedding. The back of the intrusive sheet is a long ridge sloping downwards to the west. The rock of which the Sc iar of Eigg consists is a very black pitchstone, containing large shining crystals of felspar; it is dull or cryptocrystalline in places, but its glassy char-
acter is one of its most remarkable peculiarities.

In the Tertiary volcanic series of Scotland and Ireland Intrusive sheets build up a great part of the geological succession. They are of fine grained aspect and part oil, and are found in place of dolerites, and while some of them are nearly horizontal, others are inclined. Among the lavas of the basaltic plateaux there is great abundance of sills, which are so extensive that they often represent more than the whole volume of the eruptive rocks that there is great difficulty in distinguishing them. As a rule, however, they are more perfectly columnar, more coarsely crystalline and less vesicular than the igneous rocks which consist of dikes, which have a true horizontal banding, and are in the tuffs and vesicular lavas, and on the hill slopes their presence is often indicated by small vertical steps, while on the cliff faces their columnar jointing is often very conspicuous.

On modern volcanoes intrusive sheets are seldom visible except where erosion has cut deep valleys into the mountains and exposed their interior structure. This is the case, for example, in Ireland, where a large sheet of basalt occupies the sunken island of Inishmore, in the Lough Derg; in the Shawanee mountains of Indiana, in the origin the deep-seated injections escape notice; many of them in fact belong to a period when superficial forms of volcanic action have ceased and the orifices of the craters have been obstructed by ashes or plugged by hard crystalline rocks. But in the volcanoes of the Sandwich Islands the craters are filled at times with liquid basalt which suddenly escapes, without the appearance of any lava at the surface. The molten rock, in such a case, must have found some underground passage by some narrow throat or fissure, and giving rise to a dike or sill among the older lavas or in the sedimentary rocks beneath. Many of the great sills, however, may have been connected with no volcanic eruptions, but represent igneous plugs which rose from beneath but never actually reached the earth's surface.

The connexion between sills and dikes is very close; both of them are inalien parts of the same mass of igneous rock, and occurred during the same period of time, and are both frequently seen in parallel or nearly parallel lines, and are marked by their jointing or foliation, and the orientation of the folds. The dikes are of two kinds: the first type, which is the more common, consists of single or two parallel sheets, which pass outwards in all directions, and are intersected by other sheets. The second type is a series of dikes, which are often parallel, and are commonly curved, and in some cases they are accompanied by dikes which are at right angles to them. In such cases the dikes are said to be transected by other dikes.
SILLIMAN—SILURIAN

109

distinguish between silts and lavas, but this may be by no means easy. The So-called Egg is a good example of the difficulty in identifying intrusive masses. Lavas indicate that volcanic action was going on contemporaneously with the deposit of the beds among which they occur. Silts, on the other hand, show only that at some subsequent period there was liquid magma working its way to the surface. (J. S. F.)

SILLMAN, BENJAMIN (1779-1864), American chemist and geologist, was born on the 8th of August 1779 at Trumbull (then called North Stratford), Connecticut. Entering Yale College in 1792, he graduated in 1796, became tutor in 1799, and in 1802 was appointed professor of chemistry and mineralogy, a position which he retained till 1823, when by his own desire he retired as professor emeritus. Not only was he a popular and successful teacher of chemistry, mineralogy and geology in the college for half a century, but he also did much to improve and extend its educational resources, especially in regard to its mineralogical collections, the Trumbull Gallery of Pictures, the Medical Institution and the Sheffield Scientific School. Outside Yale he was well known as one of the few men who could hold the attention of a popular audience with a scientific lecture, and on account of his clear and interesting style, as well as of the wonderful splendour of his illustrative experiments, his services were in great request not only in the northern and eastern states but also in those of the south. His original investigations were neither numerous nor important, and his name is best known to scientific men as the founder, and from 1818 to 1838 the sole editor, of the American Journal of Science and Arts—often called Silliman's Journal—one of the foremost American scientific serials. In 1810 he published A Journal of Travels in England, Holland and Scotland, in which he described a visit to Europe undertaken in 1805 in preparation for the duties of his chair. He paid a second visit in 1851, of which he also issued an account, and among his other publications were Elements of Chemistry (1830), and editions of W. Henry's Chemistry with notes (1858), and of R. Bakewell's Geology (1827). He died at New Haven on the 24th of November 1854.

His son, BENJAMIN SILLIMAN (1816-1885), chemist and mineralogist, was born at New Haven the 4th of December 1816. After graduating at Yale in 1837 he became assistant to his father, and in 1847 was appointed professor in the school of applied chemistry, which was largely due to his efforts and formed the nucleus of the subsequent Sheffield Scientific School. In 1849 he was appointed professor of medical chemistry and toxicology in the Medical College at Louisville, Kentucky, but relinquished that office in 1854 to succeed his father in the chair of chemistry at Yale. The duties of this professorship, so far as they related to the Academic College, he gave up in 1879, but he retained his connexion with the Medical College till his death, which happened at New Haven on the 17th of January 1885. Much of his time, especially during the last twenty years of his life, was absorbed in making examinations of mines and preparing expert reports on technical processes of chemical manufacture; but he was also able to do a certain amount of original work, publishing papers on the chemistry of various minerals, on meteorites, on photography with the electric arc, the illuminating powers of gas, &c. A course of lectures given by him on agricultural chemistry in the winter of 1845-1846 at New Orleans is believed to have been the first of its kind in the United States. In 1846 he published First Principles of Chemistry and in 1856 First Principles of Physics or Natural Philosophy, both of which had a large circulation. In 1853 he edited a large quarto illustrated volume, The World of Science, Art and Industry, which was followed in 1854 by The Progress of Science and Mechanism. In 1874, when the rooth anniversary of Priestley's preparation of oxygen was celebrated as the "Centennial of Chemistry" at Northumberland, Pa., where Priestley died, he delivered an historical address on "American Contributions to Chemistry," which contains a full list, with their works, of American chemists up to that date. From 1838 to 1845 he was associated with his father in the editorship of the American Journal of Science, and from 1845 to the end of his life his name appeared on the title-page as one of the editors in chief.

SILLIMANITE, a rock-forming mineral consisting of aluminium silicate, AlSiO₄. It has the same percentage chemical composition as cyanite (q.v.) and andalusite (q.v.), but differs from these in crystalline form and physical characters. It crystallizes in the orthorhombic system and has the form of long, slender needles, without terminal planes, which are often aggregated together to form fibrous or compact masses; hence the name fibrolite, which is often employed for this species. The name sillimanite is after Benjamin Silliman the elder. There is a perfect cleavage in one direction parallel to the length of the needles. The colour is greyish-white or brownish, and the lustre vitreous. The hardness is 6½ and the specific gravity 3·23. Sillimanite is a characteristic mineral of gneisses and crystalline schists, and it is sometimes a product of contact-metamorphism. It has been observed at many localities; e.g. in Boehmia (the Faserkiels of Lindacker, 1792), with corundum in the Carnatic (fibrolite of comte de Bourbon, 1802), Chester in Connecticut (sillimanite of G. T. Bowen, 1824), Monroe in New York ("monolite"), Bamle near Brevik in Norway ("bamelite"). Pre-historic implements made of compact sillimanite are found in western Europe, and have a certain resemblance to jade implements.

SILLY, weakly foolish, stupid. This is the current sense of a word which has much changed its meaning. The O.E. sælig (usually gedelig) meant prosperous, happy, and was formed from sāl, time, season, hence happiness, c.f. Icel. sál, bliss; Ger. selig, blessed, happy, &c., probably also allied to Lat. salōns, salōnius, whole, safe. The development of meaning, happy, blessed, innocent or simple, hence helpless, weak, and so foolish. The old provincial and Scottish word for a caul (q.v.) was "sillyhood," i.e. "lucky cap." The development of meaning of "simple," literally "onefold" (Lat. simplex), plain, artless, hence unlearned, foolish, is somewhat parallel. A special meaning of "simple," in the sense of medicinal herbs, is due to the supposition that each herb had its own particular or simple medicinal value.

SILURES, a powerful and warlike tribe in ancient Britain, occupying approximately the counties of Monmouth, Brecon and Glamorgan. They made a fierce resistance to the Roman conquest about a.d. 48, but a legionary fortress (Isca Silurum, Caerleon) was planted in their midst and by a.d. 78 they were overcome. Their town Venta Silurum (Cerwent, 6 m. W. of Chepstow) became a Romanized town, not unlike Silchester, but smaller. Its massive Roman walls still survive, and recent excavations have revealed a town hall and market square, a temple, baths, amphitheatre, and many comfortable houses with mosaics, &c. An inscription shows that under the Roman Empire it was the chef-lieu of the Silures, whose ordo or county council provided for the local government of the district. (F. J. H.)

SILURIAN, in geology, a series of strata which is here understood to include the difficulties of rocks where, Professor Ordogian and below the Devonian or Old Red Sandstone, viz. the Llandovery (Valentian of C. Lapworth), Wenlockian and Ludlovian groups of Great Britain with their foreign equivalents. A word of caution is necessary, however, for in the early history of British stratigraphy the exact delimitation of "Silurian" was the subject of a great controversy, and the term has been used with such varying significance in geological literature, that considerable confusion may arise unless the numerous interpretations of the title are understood. The name "Silurian" was first introduced by Sir R. Murchison in 1825 for a series of rocks on the border counties of England and Wales—a region formerly inhabited by the Silures. Murchison's Silurian embraced not only the rock groups indicated above, but others below them that were much older, even such as are now classed as Cambrian. About the same time A. Sedgwick proposed the term Cambrian for a great succession of rocks which includes much of Murchison's Silurian system in its upper part; hence arose that controversy which left so lasting a mark on British geology. In 1850 A. d'Orbigny suggested the name "Murchisonian," what is here retained as the Silurian system. A solution of the difficulties of rocks where, Professor C. Lapworth in 1879 proposed the term Ordovician systems (q.v.)
for those rocks which had been the Lower Silurian of Murchison and the Upper Cambrian of Sedgwick. An approximate correlation of the usages of the title “Silurian” is here given in tabulated form:—

Ordovician. (Lower Silurian of some authors.)

Cambrian. Upper. Middle. Lower.

The Silurian rocks are almost wholly of marine origin and include all the usual phases of sedimentation; shales and mudstones, marls and limestones, sandstones and grits are all represented in Great Britain and in most other countries where the Silurian is known. The majority of the rocks were deposited in the comparatively shallow waters of epicontinental seas, the graptoitlic shales and sponge-bearing cherts being perhaps the representatives of the deeper waters. Locally, glauconitic limestones and ironstones (Clinton beds) indicate special conditions; while the isolation and desiccation of certain marine areas (New York) towards the close of the period gave rise to beds of red sandstone, red marls, gypsum and rock salt. The hydraulic limestone (Water Lime) of New York was probably a brackish-water formation. In Sweden and elsewhere some of the limestones and shales are distinctly bituminous.

**Distribution.** In the preceding Ordovician period several well-marked marine provinces are indicated by the fossil contents of the rocks. At the beginning of Silurian time a general transgression of the sea, which had commenced at the close of the Ordovician—was in progress in the N. hemisphere (Europe and the Appalachian region). This culminated at the time when the Wenlock beds and their equivalents (Niagaran and Oesel beds) were forming at the bottom of a great peripheral sea or shallow ocean. It is thus found that the same general characters prevail in the Silurian of Britain, N. America, Scandinavia and the Baltic region, Russian Poland (Podolia, Kieve, Galicia), the Arctic regions, New Siberia (Kotelny, Oljen district, Waiagetsch, N. Zembla, Tungeuska, Greenland, Grinnell Land and China. The Bohemian region, comprising central Bohemia, Thuringia, Fichtelgebirge, Salzburg, Pyrenees, Languedoc, Catalonia, South Spain, Elba and Sardinia, alone retained some of its marked individuality. Later in the period a gradual withdrawal of the sea set in over the N. hemisphere, affecting the British area (except Devon), the left of the Rhine, Norway and the Baltic region, N. Brazil, Siberia and the Urals region, Spitsbergen, Greenland, and the W. states of N. America. Thus the later Silurian conditions heralded those of the succeeding Devonian and Old Red Sandstone, and there is generally a gradual passage from one set of rocks to the other (Downtonian of Great Britain). The Silurian rocks may vary in close continuity with the upper Ordovician, as in S. Europe; or, as in the typical region, the Llandovery beds may rest unconformably upon older rocks; in N. America also there is a marked unconformity on this horizon. A large part of N. America was apparently land during part of Silurian time; the lower members are found in the E. alone, while the Cayaguan division is found to extend farther E. than the mid-Ionian division, but not farther W. The rock beds of Niagara owe their existence to the presence of the hard Lockport and Guelph beds resting upon the softer Rochester shales. Most of the essential information as to the distribution of Silurian rocks will be found in a condensed form in the accompanying table and map; but attention may here be drawn to the upper Silurian (Ludlovian) limestone of Cornwalls Island, the mid-Silurian limestone of Grinnell Land and the lower Silurian limestone of New Siberia. Limestones of lower and middle Silurian age are found also in Timan, Tunguska and elsewhere in N. Russia. Rocks of this system in S. America have been only superficially studied; they occur in the lower regions of the resemblance to the Medina and in Bolivia and Peru. Little

**Silurian Life.**—Our knowledge of the life of this period is limited to the inhabitants of the seas and of the brackish waters of certain districts. The remains of marine organisms are abundant, and, as the graptolites flourished as in the preceding period, but the forms characteristic of the Ordovician have disappeared; they are replaced in the Silurian by the single-axis type (Mono-graptidae) which prevailed until the close of the period (Ranites, Monograptus, Retitales and Cryptograptus). As in the Ordovician rocks the graptolites have been largely employed as zonal indicators. Trilobites were important; the genera Calymene, Pachopus and Eoconichas attained their maximum development; Proetus, Bronnites, Cyphiophas, Arethusa may be mentioned from among others. The ostracods Leperditia and Beyrichia are very abundant locally. A feature of great interest is the first appearances of the remarkable crustacean Euryperus, which occasionally reached the length of over a yard, and of the limulids, Neolimulus and Hemiaspis. The cephalopods were the predominant molluscs, especially Orthoceras and various abbreviated or coiled orthoceras-like forms (Cyrtoceras, Phragmoceras, Trochoceras, Asoceras); there was also a Nautilus, and an early form of goniatite has been recorded. Gastropods include the genera Platyceras, Murchisonia and Bellerophon; the pteropod Tentaculites is very abundant in certain beds. The pelmatozoa were not very important (Cypriocardiun, Cardita interrupa, C. cornucoidea). Next to the cephalopods in importance were the brachiopods: in the lower Silurian pentamerous-like forms still continued (P. Knighti, P. oblongus), but the spire-bearing forms soon began to increase (Spirifer, Whitsfieldia, Meristina, Atypa). Other genera include Rhyonchella, Chonetes, Terebratula, Stromphoma, Stricklandiun. The bryozoa, especially the bulgy rock-building forms, were less in evidence than in the Ordovician. The assemblage well represented by the cirinoidea (Cyathocirrus, Crocaticirrus, Taxacirrus), some of which are found in a state of beautiful preservation at Dudley in England, Lockport (New York), Wajuy and various districts of N. America and also in Gothland in the Baltic. Cystoids were abundant, but less so than in the Ordovician; blastoids made their first appearance. Corals, mostly tabulate forms, flourished in great abundance in the cooler seas and frequently formed reefs (Baltic, Gothlandica, Halyides calendaria, Alveolites, Heliolites); tetracorallian forms include Slateia, Cyathophyllum, Cyathophyllum, Acrerula, Onyma and the remarkable Goniosphylum. Sponges were represented by Adylostegia, Aulospongia, &c. The peculiar genera

*Rasagraculites and Iskathides* occur in the Silurian. Foraminifera and radiolaria also left their remains in the rocks. The most highly organized animals of the Silurian period were the fishes which had already made their appearance in the Ordovician rocks of Colorado and Russia. The Silurian fish include selachians (*Oxchus, Typhostis*), and the occurrence of remains of the obscure banded oocystoderms (placoderms) is particularly worthy of notice (*Plesiaspis, Cephalaspis, Tremadaspis, Cyathaspis, Thelodus, Lammers, Ecker-aspis*). *Scorpionides* (*Palaeophanes*) have been found in Lanark, Gotland and New York. Plant remains are very fully represented; land plants have been recorded from the Harz and Kellerwald (H. Potonie, 1901), and large silicified stems—up to 2 ft. in diameter—perhaps representing a gigantic seaweed (*Nemastegites*), have been found in Wales and in Canada. *Pachyphyca* is a small spherical body often associated with *Nematocystis. Gigronella* is another obscure algal plant.

As a natural result of the open character of the great Silurian periaartic sea referred to above, there are many points of resemblance between the fauna of the several regions of the N. hemisphere; this has been specially noticed in the community not only of genera but of species between Britain, Sweden and the interior of N. America (Iowa, Wisconsin, Illinois). *Gonsttephylly pyramidalis* is common to Iowa and Gotland; *Athyra reticularis*, *Orthoserus annulatus* and not a few others are common to Europe and N. America. An extremely interesting circumstance is the admixture of a periaartic and Bohemian fauna in the Australasian region.

In a general sense the Silurian period was one of comparative quiescence as regards crustal disturbances, and a relative sinking of the land was followed by a relative elevation affecting wide areas in the N. hemisphere. Local oscillations, such as those taking part in the formation of the Salina beds, e.g., were naturally taking place, but the folding of the Scandinavian mountains and in the N. highlands of Scotland continued throughout the period accompanied by a great amount of thrusting. Volcanic activity was quite subordinate in Silurian times; flows of diabase occurred at the commencement of the period in Bohemia, and evidence of minor basaltic flows and tuffs is found at Torthorst in Gloucestershire and at a few localities in N. America.

For further information, see articles on the *Cambrian, Ordovician, Llandovery, Wenlock, Ludlow Systems and Groups.* (J. A. H.)

**SILVA, ANTONIO JOSÉ DA** (1705-1739). Portuguese dramatist, known as "the Jew," was born at Rio de Janeiro, but came to Portugal at the age of eight. His parents, João Mendes de Silva and Lourença Coutinho, were descended from Portuguese Jews who had emigrated to Brazil to escape the Inquisition, but in 1702 that tribunal began to persecute the *Marrenos* in Rio, and in October 1712 Lourença Coutinho fell a victim. Her husband and children accompanied her to Portugal, where she figured among the "reconciled" in the *auto-da-fé* of the 9th of July 1713, after undergoing the torment only. Her husband, having then acquired a fixed domicile in Lisbon, settled down to advocacy with success, and he was able to send Antonio to the university of Coimbra, where he matriculated in the faculty of law. In 1726 Antonio was suddenly imprisoned along with his mother on the 8th of August; on the 16th he suffered the first interrogation, and on the 23rd of September he was put to the torment, with the result that three weeks later he could not sign his name. He confessed to having followed the practices of the Mosaic law, and this saved his life. He went through the great *auto-da-fé* held on the 23rd of October in the presence of King John V. and his court, abjured his errors, and was set at liberty. His mother was only released from prison in October 1729, after she had undergone torture and figured as a penitent in another *auto-da-fé*. Meanwhile Antonio had gone back to Coimbra, and finishing his course in 1728-1729 he returned to Lisbon and became associated with his father as an advocate. He found an ignorant and corrupt society ruled by an immoral yet fanatical monarch, who wasted millions on unprofitable buildings though the country was almost without roads and the people had become the most backward in Europe. As his plays show, the spectacle struck Antonio's observation, but he had to criticize with caution. He produced his first play or opera in 1733, and the next year he married a cousin, D. Leonor Maria de Carvalho, whose parents had been burnt by the Inquisition, while she herself had gone through an *auto-da-fé* in Spain and been exiled on account of her religion. A daughter was born to them in 1734, but the years of their happiness and of Silva's dramatic career were few, for on the 4th of October 1737 husband and wife were both imprisoned on the charge of "judaising." A slave of theirs had denounced them to the Holy Office, and though the details of the accusation against them seem trivial and even contradictory, Antonio was condemned to death. On the 18th of October he was beheaded and his body burnt in an *auto-da-fé*.
that same day one of his popular operetas was given at a Lisbon theatre.

His dramatic works, which were produced at the Bairro Alto theatre between 1733 and 1738, include the following comedies, all played in Portuguese: O que mentem (1735), Encantos de Medea (1735), Aparecida (May 1736), Labyrinthia de Creia (November 1736), Guerra de Alercrim e Mangerona (carnival of 1737), Tedros (May 1737) and Precipicio de Facionte (1738). Slight as these seem today, they show a great dramatic talent and an Aristophanic wit. The characters are well drawn and the dialogue full of comic strength, the scenes knit together, and the plot skillfully woven. It is believed Silvano possessed a knowledge of stagecraft, and, if he had lived, he might have emancipated the drama in Portugal from its dependence on foreign writers; but the triple licence of the Palace, the Ordinary and the Inquisition, which had been put on by the absolutist despots, and the unparalleled freedom with which he was allowed to show some boldness in exposing types of the prevailing charlatanism and follies, though his liberty of speech is far less than that of Gil Vicente (1550) etc. His comedies give a truthful and interesting picture of 18th century society, especially his best comedy, the Alercrim e Mangerona, in which he treats of the falsidôo pobre, a type fixed by Gil Vicente and Francisco Manoel de Mello (g.c.). His works bear the title "operas" because, though written mainly in prose, they contain songs which Silvano introduced in imitation of the true operas which then held the fancy of the public. He was also a lyric poet of real merit, combining correctness of form with a pretty inspiration and feeling. His plays were published in the first two volumes of a collection entitled Teatro comico portugues, which went through at least five editions in the 18th century, while the Alercrim e Mangerona was published repeatedly in some seven editions. This comedy and the D. Quixote have been reprinted in a city and edition by the Silva de Silvano (Spain, 1906). Ferdinand Denis, in his Chefs-d ouvre du theatre portugais (pp. 363-496, Paris, 1828, 1829), while retaining the external form, from the Vida de D. Quixote, and F. Wolf likewise gives selections from Silvano's various compositions. Silvano is also related to several laudatory poems and dramas, one or two of which were composed by Brazilian competitors.

**SILVANUS** (Lat. silva, wood), a deity or spirit of Italian woodland; not, however, of the wholly wild woodland, but of that which borders the clearings in a country not entirely reclaimed. Thus he is partly wild and partly civilized, and reflects the experience of the earliest settlers in Italy, whose descendants took him with them to the farthest limits of the empire, even to Britain, where we have many votive inscriptions to him, always as the friendly deity dwelling outside the new clearing, benevolent towards the settler in a strange land. This leading characteristic of Silvanus is shown clearly in Roman literature: Horace writes of the *horridi dumeta silvina* (Odct, ili. 29) but he also calls him "tutor finium" (Epod. ii. 22) while for Virgil he is "avorum pecorisque deus" (Aen. viii. 600). A writer on land measurement (Script. gromatiae, i. 302) tells us that each holding had three Silvani—domesticus (of the holding itself), agratis (of the wilder pasture-land) and orientalis (of the boundaries). It is plain that in him the Italians had a very useful deity, and in all these capacities he became extremely popular, as the extraordinary number of his inscriptions shows. Unlike Mars, from whom he was probably in origin an offshoot (cf. the Mars Silvanus of Cato, De re rustica, 131; see Mars), he never made his way into the towns, but is almost the only Roman deity who at last retained the same perfectly intelligible rustic character. His double nature as deity of woodland and cultivated land is seen well in the artistic representations of him; he carries a young tree in one hand, a pruning-hook in the other.

See Wissowa, Gesammelte Abhandlungen (1904, p. 78 foll.).

**SILVER** (symbol Ag, from the Latin *argentum*, atomic weight 107.88 (O = 16), a metallic chemical element, known from the earliest times and of great importance as a "noble" metal for articles of value—coinage, ornamentation and jewelry.

Etymologically the word "silver" probably refers to the shining appearance or brightness of the metal. The Latin *argentum* is cognate with the Greek *argyros*, silver, which in turn is derived from *argylos*, shining. The Hebrew *koseph* is connected with the root meaning "to be pale." The alchemists named it Luna or Diana, and denoted it by the crescent moon; the first name has survived in *lunar caustic*, silver nitrate. Silver is widely diffused throughout nature, occurring in minute amount in many minerals which sometimes it occurs as the free metal, as an amalgam with mercury and as alloys with gold, platinum, copper and other metals. Native silver is occasionally met with in metalliferous veins, where it has been formed by the alteration of silver-bearing minerals. It crystallizes in the cubic system, but the crystals are usually distorted and indistinctly developed: twisted wire-like forms are much more common. The best crystallized specimens have been obtained from Kongsberg in Norway, large masses, weighing as much as 5 cwt.s., having been found. It is also found in other silver mines, especiallythose of Mexico, Peru, and Chile; in the Lake Superior copper mining region it occurs perfect metallic lusters. It is the most malleable and ductile of all metals with the exception of gold: one gramme can be drawn out into a wire 180 metres long, and the leaf can be beaten out to a thickness of 0·0005 mm.; traces of arsenic, antimony, bismuth and lead, however, make it brittle. In hardness it is superior to gold, but inferior to copper. Its specific gravity, according to G. Rose, lies between 10·514 and 10·619 at 14°; an average value is 10·57. Its specific heat is 0·05701 (Regnault) or 0·0559 (Bunsen); its coefficient of linear expansion is 0·00001921. Its thermal conductivity is, according to Wiedemann and Franz, superior to that of other metals, being in the ratio of 100:74, as compared with copper and 100:54 with gold; it is the most perfect conductor of electricity, standing to copper in the ratio 100:75, and to gold 100:73. Silver melts at about 1000°C.; recent determinations give 960° (Heycock and Neville) and 960° (Becquerel); at higher temperatures it volatilizes with the formation of a pale blue vapour (Stas). Its vapour density has been determined at 2005, and corresponds to a monatomic molecule. When molten, silver excludes the oxygen of the atmosphere, absorbing 0·25 times its own volume of the gas; the oxygen, however, is not permanently retained, for on cooling it is expelled with a white violence; this phenomenon is known as the "spitting" of silver. It is prevented by preserving the molten metal from contact with air by covering the surface with non-oxidising agents, or by traces of copper, bismuth or zinc.

**Chemical Properties.**—Silver is not oxidized by oxygen, but resembles mercury in being oxidized by ozone. It has no action on water. It is readily soluble in dilute nitric acid, nitric oxide and silver nitrate being formed; it also dissolves in hot, strong sulphuric acid, sulphur dioxide being evolved. Hydrochloric acid forms a surface film of silver chloride; hydriodic acid
readily dissolves it, while hydrofluoric acid is without action. Sulphuretted hydrogen is decomposed with the formation of a black coating of silver sulphide; this is the explanation of the black tarnish seen when silver is exposed to the fumes of coal gas, and other sulphuretted compounds, such as occur in eggs. The so-called "oxidized" silver is a copper-silver alloy coated superficially with a layer of the sulphides by immersion in sodium sulphide or otherwise. Silver combines with the free halogens on heating and also with sulphur:

Molecular silver is a grey powder obtained by leaving metallic zinc in contact with silver chloride which has been precipitated in the cold and washed till nearly free from acid. The powder is separated from the zinc, washed with hydrochloric acid, dried in the air, and then ground. It assumes a metallic lustre on burning or heating to redness. It receives application in synthetic organic chemistry by virtue of its power to remove the halogen atoms from alkyl halides, and so effect the combinations of two alkyl residues.

Colloidal silver is the name given by Carey Lea to the precipitates obtained by adding reducing solutions, such as ferrous sulphate, tartrates, citrates, tannin, &c., or to silver solutions. They dissolve in water to form solutions, which do not penetrate parchment membranes, hence the name colloidal. Many other methods of preparing these substances are known. Bredig's process consists in passing an electric arc between silver electrodes under water, when a brown solution is obtained.

Production.—The economic questions which attend the production of silver and the influence which gold and silver exercise on prices are treated in the articles Money and Bi-metalism; the reader is referred to the former article for the history of silver production and to the topographical headings for the production of the specific countries. Since the middle of the 19th century the annual production has increased; the following table gives the average annual production in 1000 oz. over certain periods:

Over two-thirds of the world's supply is derived from Mexico and the United States. The Mexican mines first sent supplies to Europe in the 16th century, and during the period 1781–1800 yielded two-thirds of the world's production. Although the production has decreased relatively, yet it has increased enormously absolutely; in 1900, it was 55,804,420 oz., being second to the United States; in 1905 it was 73,838,066 oz., establishing a record for any single country in the world in that year. The silver of the famous Comstock lode in Nevada led to an enormous increase in the production. The production of this lode declined in 1876, but the total production of this country was increased by discoveries in Colorado (Leadville) and Nevada (Eureka); and in more recent years silver-producing areas in other states (Montana, Utah, Idaho) have been exploited. In 1860 the production was 115,019 oz., which increased to 1,546,920 in 1861; in 1872 it was 22,254,002 oz.; in 1888, 45,792,682; in 1869, 54,516,900 oz.; in 1900, 76,047,000; and in 1905, 58,918,839 oz. S. America has furnished European supplies since the discovery of the Potosi mines of Peru in 1533; Bolivia and Chile are also notable producers. Of European producers, Germany, Spain and Austria are the most important; Greece, Italy, France, Turkey and Russia occupy secondary positions. The German mines were worked in the 10th century; at the beginning of the 16th century the production was over 400,000 oz. annually; this dropped in the following century to about one-half; it then recovered, and in recent times has enormously increased, attaining 12,535,238 oz. in 1905. The mines of Spain, neglected late in the 15th century on the advent of supplies from America, came into note in 1827; the output has since greatly increased, amounting to 3,774,959 oz. in 1905. Austria-Hungary was early a source of silver, and about one-half of the total European production, in the 16th century; the yield diminished in the ensuing century, to be subsequently increased. The output was about 1,800,000 oz. in 1905. The total European supply was about 17,000,000 oz. in 1900 and about 15,600,000 oz. in 1905. Of other countries we may notice Canada, which produced 4,468,225 oz. in 1900 and 5,974,875 oz. in 1905, and Japan, which produced about 670,000 oz. in 1880 and 3,215,000 oz. in 1905. Australia came into notice chiefly by reason of the discoveries at Broken Hill, New South Wales; these mines producing 36,608 oz. in 1895, 1,016,289 in 1896, and 7,737,877 oz. in 1909. The total Australasian production in 1900 was 14,063,244 oz. and 14,362,639 oz. in 1905.

Metallurgy.

From the metallurgical point of view, silver ores may be classified as real silver ores and argentiferous ores. The former consist of silver minerals and gangue (vein matter, country-rock). The leading silver minerals are native silver; argentite or silver glance, Ag₂S, usually containing small amounts of lead, copper and tin; dyscrasite or antimonial silver, Ag₅Sb to Ag₃Sb, an isomorphous mixture of silver and antimony; proustite or light red silver ore, Ag₃AsS₃; pyrrargyrite or dark red silver ore, Ag₅SbS₃; stephanite, Ag₅SbS₅; miargyrite, Ag₅SbS₅; stromeyerite, Cu₄Ag₃S; polyanthite, (Cu₅S₄Ag₈)-(Sb₄S₈Ag₃S₈); cerargyrite or horn silver, AgCl; bromite or bromargyrite, AgBr; embolite, AgCl(1-Br); iodite or iodargyrite, AgI. Metalliferous products containing silver arise in many operations; the chief products which may yield silver economically are copper and lead mattes, burnt argentiferous pyrites and certain cinnaries and scums. Argentiferous ores consist of silver-bearing base-metal minerals and gangue. Lead and copper ores, carrying silver in some form or other, are the leading representatives. The silver is extracted from the gangue with the base metal, usually by smelting, and the two are then separated by special processes (see Lead).

Millling, i.e. amalgamation and liquiation, is cheaper than smelting, but the yield in silver is lower. Often it is more profitable to smelt real silver ores with argentiferous ores than to mill them, the greater cost being more than balanced by the increased yield. Milling is practiced mainly in isolated localities near the mine producing the ore. As any given region is opened up by railways, cheapening transportation, milling is apt to give way to silver mining, and the silver is then smelted and valued as argentiferous ore.

Amalgamation is based on the property of quicksilver to extract the silver from finely-pulverized ore and collect it in the form of an amalgam. When the rock has been separated from the amalgam by a washing operation, the quicksilver is recovered by distillation in an iron retort, and the remaining crude retort-silver melted into bars and shipped to a refinary, which removes the impurities, the leading one of which is copper. A silver ore is either free-milling or refractory; that is, the silver mineral is readily amalgamated or it is not. In free-milling ore the silver is present either in the native state, or as chloride or as simple sulphide. Complex silver minerals (sulph-arsenides and antimonides) which are difficult to amalgamate must be made amenable to quicksilver, and the simplest way of doing this is to convert the silver into chloride. This is imperfectly accomplished, in the wet way, by cupric and cuprous chloride solutions, but completely so, in the dry way, by roasting with salt (chloridizing roasting). According as a preliminary chloridizing roast has or has not been given, the process is classed as roast-amalgamation or raw-amalgamation. The leading raw-amalgamation processes are the Patent and Washoe; then follow the Cazo, Fondon and Krönkh; of the roast-amalgamation processes, the European Barrel or Freiberg, the Reese River and the Francke-Tinn are the most important.

The Patent process, sometimes named the American-heap-amalgamation process, which is carried out principally in Mexico, aims at...
amalgamating the silver in the open in a circular enclosure termed a "torre, the floor of which is generally built of flagstones. In order to facies a stream of water between the ore and the water, salt-pans, i.e. cuprous pyrites roasted to convert the copper into soluble sulphide, which is the active agent, are worked into the wet pulp supplied. The amalgamation proceeds very slowly, as the sole external heat is that of the sun. (J. P. Allison, "Legends of Arizona," p. 26.)

The process is generally utilized to easy ores and a region where the climate is warm and dry, and horse- or mule-power, labour and quicksilver are cheaper than fuel and water.

In the process, the amalgamated ore, removed from the Washoa district in the United States, is the leading raw-amalgamation process of the United States, where it was introduced in 1861 by A. B. Paul. It consists in wet-stamping coarsely crushed ore, settling the sand, and shins produced, and grinding and amalgamating them in steam-heated iron pans with or without the use of chemicals (salt and copper sulphate). The ores may contain a larger proportion of iron from the shoes and dies in the stamp-mill and pan mill, and still give a satisfactory extraction. They are crushed to egg-size in a rock-breaker, and pulverized to pass a 10-15 mesh sieve in a California stamp-mill, which treats in 24 hours about 3 tons per stamp. At the stamping, the rock is broken up, and the discharded pulp is thrown into 15-10 wooden settling tanks, 9 by 5 by 8 ft., the settled contents of which are shovelled out and charged into the pans. The pans are cylindrical in shape, of about 2 ft. high, and 2 ft. in diameter, and have a combination bottom, 5 feet in diameter, and wooden sides about 30 inches high, the lower parts of which are lined with cast-iron. In the centre is a hollow cone, through which passes the driving shaft, geared to a mill, and the lower part of which is lined with cast-iron with which can be raised and lowered. The speed is 60-90 revolutions per minute.

To the bottom and muller are attached grinding plates (shoes and dies), which are replaced when worn; and to the sides three wheels to deliver the moving power towards the centre, and thus establish the necessary pulp current. The lower side of the bottom has also a steam-chest. A 10-stamp-mill has 4-6 pans, which receive the pulp from the stamping mill, and charge the pulp with water and then with ore; the muller is then lowered, salt and blue vitriol added, and the charge ground for 3.4 hours.

The pulp is heated with live steam to about 95°C, and kept at that temperature by exhaust steam in the bottom-chest. After grinding, the muller is raised and quicksilver added, and the silver up to 81-04% then amalgamated in 4 hours.

In amalgamating without the use of chemicals, finely divided iron, worn from the shoes and dies in the stamp-mill and pan mill, decomposes cerargyrite and argentite, and the liberated silver is taken up by the quicksilver; the process is hastened by adding salt. With pure argentite, the muller takes the form of a hollow copper-bottomed sulphate and cupric chloride, both of which become readily soluble in water. Cupric chloride acts upon argentite (Ag₂S + CuCl₂ = 2AgCl + CuS) to proustite (Ag₄AsS₄ + CuCl₂ = 8AgCl + 2As₂S₃ + CuCl₂), and cupric chloride to proustite (3CuCl₂S + Sb₂S₃) and is also reduced to cuprous chloride by metallic iron. This salt, insoluble in water but soluble in brine, also acts upon argentite (Ag₂S + CuCl₂ = 2AgCl + CuS + Cu₂Cl₂) and pyrrhotite (AgS + CuCl₂ = 2AgCl + 2CuS) to form the charge of the amalgamating process, with which give with sulphide in the presence of quicksilver, the Patino-reaction: metallic silver, cupric sulphide, and mercurochloride (2Ag₂S + CuCl₂ + 2H₂O = 4AgCl + 2CuS + HCl + H₂S), but the iron decomposes the quicksilver salt, setting the quicksilver.

The amalgamation is rapid. Thus Austin found that at the Charleston mills, Arizona, 92.13% of the total silver recovered was amalgamated after 1 hour; 99.5% after 2 hours, 99.93% after 3 hours, and 100%, after 4 hours. The loss in quicksilver is small, as there is no chemical loss inherent in the process; the yield is relatively high, but the bullion is liable to be low-grade, on account of copper being precipitated with the silver.

When the charge has been worked, the contents of the pan are discharged into a settler, in which the amalgam is separated from the sands. It has the same general construction as the pan. It is 8 ft. in diameter and 3 ft. deep, and the bottom of it is solid, and near the circumference to catch the amalgam, which is withdrawn through a discharge-spout into a bowl. In the sides at different levels, the discharge-holes are usually provided, for the sake of convenience, and reaches to within 3 in. of the bottom and makes 12-15 revolutions per minute.

In settling, the pulp is diluted by a small stream of water, and the thinned pulp drawn off, first through the top discharge-holes and then through the lower ones. This is carried on until the amalgam is taken up by the quicksilver, which appears, at which time the amalgam is then collected and melted. The cost of treating a ton of ore in the western part of the United States is from $3 to $7. At some works treating ores containing sulphides which do not yield their silver to quicksilver, concentration apparatus (see Ore-Dressing) is employed to concentrate the silver, and other gold and platinum, which are worked by themselves; at other works they are recovered from the sands after these have left the settlers. In order to do away with the handling of the wet pulp, and to obtain a higher grade of bullion, Mr. A. B. Paul employed a member with the pulp from the stamps pass through a grinding pan, then through a series of amalgamating pans followed by a row of settlers, after which 24 men in 24 hours. The Washoe process is independent of the climate, but it requires cheap power and an abundance of water.

In the Caso, Corral or Hot process the pulverized silver ore is bedded on a copper or iron plate, and wrought over by quicksilver. This silver has been reduced by the copper, and then with quicksilver. The Fondon is an improvement on the Caso. Bars of copper drawn over the bottom by mules or water-power (like the stone drums in the process, but it is charged with iron ore) will wash off the quicksilver and the silver of the silver and diminish the formation of amalgam. In the Krönke process introduced by B. Krohnke into Copiapó, Chile, in 1880, the silver mineral of the pulverized ore is decomposed in a revolving barrel by a solution of cuprous chloride in brine in the presence of zinc and lead and quicksilver (see B. Krohnke, "Methode zur Entbebrührung von Ersen, Stuttgart, 1900.

Chloridizing Roasting.—In a chloridizing roast chlorine produces its effect as nascent chlorine or gaseous hydrochloric acid. The leading reagents are salt (NaCl), sulphur trioxide (SO₃), produced in the roasting, and steam (H₂O). The decomposition of salt is expressed by the equation:

NaCl + SO₃ + H₂O = Na₂SO₄ + 2HCl.

In the presence of water-vapour the following reaction takes place:

2NaCl + SO₃ + H₂O = Na₂SO₄ + 2HCl.

As water-vapour is always present, hydrochloric acid will invariably be formed with the chlorine. The roasting is carried on in hand and mechanical reverberatory furnaces, and occasionally in muffle-furnaces. A chloridation of over 90% silver is the rule.

The European Barrel or Freiberg process consists in roasting the gravel or ore, with the addition of oxides of copper, which modified the ordinary pyrites by making them less refractory and easier to smelt. The mass, along with certain proportions of water, scrap-iron and mercury, is then placed in barrels, which are made to rotate so that the ingredients are thoroughly mixed. The salt solution dissolves a small proportion of a chloride, which is then reduced by the iron to the metallic state. This solution and precipitation is continuous, and the metal formed unites with the mercury to form a semi-liquid amalgam. The amalgam is pressed in linen bags to eliminate a quantity of relatively silver-free liquid mercury (which is utilized as such in subsequent operations), and the remaining solid amalgam is subjected to distillation from iron retorts. This process was perfected at Freiberg, Saxony, but abandoned there in 1853. In the United States it was used quite extensively in Colorado and Nevada, but has now been given up. The main reasons for this are the length of time required to finish a charge; the cost of accounts; and the difficulty of securing the iron and the great care with which operations have to be carried out in order to obtain satisfactory results.

The River process of amalgamation consists in dry-stamping crushed dried ore and dried salt (separately or together), charging them into a roasting furnace, and amalgamating the chloridized ore in an iron pan. The general arrangement and construction of the furnace are to act upon salt charged in a copper-bottomed amalgamating pan. The amalgamation, into a crucible, furnace) is the same as with the Washoe process; the management, however, differs. The steam-chest is not used to such an extent, as the bottom would be prematurely corroded; less water is used, as the pulp would become too thin on account of the soluble salts (sodium chloride, sulphate, &c.) going into solution; and the roasted ore is not ground, as the hot brine readily dissolves the silver chloride from the porous ore, and thus brings it into intimate contact with iron and amalgamation. Chloridizing roasting on account of the great loss in silver that would be caused by the formation of zinc chloride. The large amount of soluble sulphides of iron and copper formed in the roasting is made to work for the chloridizing roasting, on account of the great loss in silver that would be caused by the formation of zinc chloride. The large amount of soluble sulphides of iron and copper formed in the roasting is made to work for the chloridizing roasting, on account of the great loss in silver that would be caused by the formation of zinc chloride.
Lixiviation.—Ores suited for amalgamation can, as a rule, be successfully leached. In leaching, the silver ore is subjected to the action of solvents, which dissolve the silver; from the solution the silver is precipitated and converted into a marketable product.

The leading solvents are aqueous solutions of thioulyphates, unsystematically but generally termed hyposulphites. Sodium chloride, characteristic of the Augustin process in which the ores, after a crude ashing and the removal of organic matter, and the remaining precipitated copper, has almost wholly fallen to disuse; and potassium cyanide, which has become a very important solvent for finely divided gold, is rarely used in leaching silver ores. Sodium hyposulphite, prepared by heating sodium sulphur dioxide to 180° C. and the sulphur dioxide so formed was adopted about 1880 by O. Hofmann (Hofmann process), finally, sodium hyposulphite with cuprous hyposulphite was first applied by Russell in 1884, who included in the process the acetylation of the first wash-water (to neutralize any harmful alkaline reaction), and the separation of lead with sodium carbonate from the silver solution previous to precipitating with sodium sulphide (see the early processes of Russell or the Reduction of Silver Ores with Hyposulphite Solutions, &c., New York, 1888).

In all processes the silver ore is finely crushed, usually by rolls, as, because making few fines, they lose valuable silver to the best conditions for leaching. Although subjected to a preliminary chloridizing roast, through occasionally it may be leached raw. The vats in common use are circular wooden tanks, 15-10 ft. in diameter and 8-9 ft. deep into which the ore is loaded by shoveling from the floor. They have a false bottom, with cloth or gravel filters. The basis of the following outline is the Patera process. The ore, supposed to have been salt-roasted, is charged loosely into the leaching vats, the water added, and a polysulphidic acid or copper sulphate may have been added), to remove soluble salts, which might later on be precipitated with the silver (base-metal chlorides), or overcharge the solution (sodium chloride and cuprous hydrate) with which, as a mode of separation, the first wash-water is charged. As soon as the wash-water has been drained off, the ore is ready for the silver solvent. This is a solution containing up to 2% of sodium hyposulphite, of which one part dissolves 0.185 part silver chloride, equivalent to 0.365 part metallic silver, so form double hyposulphides. The silver arsenate and antimoniate are also readily soluble, metallic silver slightly so, silver sulphide not at all. (In the Russell-process double salts, 4Na2SO3:3CuS2O3 and 8Na2SO3:4CuS2O3 the metallic silver and the silver sulphide are readily soluble; thus it supplements that of Patera.)

After the silver has been dissolved by percolation, the last of the solvent still in contact with the silver sulphide, as a wash-water, collected in a circular precipitating vat (10 ft. in diameter and 10 ft. deep), is treated with sodium sulphide (or calcium polysulphide), unless sodium carbonate was first added to the wash-water. The silver precipitated, then the wash-water is drained off into solution. Silver sulphide falls out as a black mud, with about 50% silver, and the solution will be regenerated.

If the silver sulphide was used as a solvent in addition to the simple sodium hyposulphite, cuprous sulphide will be precipitated with the silver sulphide, and the precipitate will be of lower grade. At some works the silver is precipitated with sodium sulphide, and the liquor, after having been separated from the precipitate, is treated with calcium polysulphide, that by the precipitation of calcium sulphide the accumulation of sodium sulphate may be prevented. The precipitated silver (copper) sulphide is filtered, dried, and used as such, or the silver sulphide may be reconverted into metallic silver at the works. The solution freed from silver, is used again as solvent. Lixiviation has many advantages over amalgamation. It permits coarser crushing, on the cost of plant is lower, the power required is nominal, the cost of chemicals is lower than that of quicksilver, less water is necessary, and the extraction is often higher, as silver arsenate and antimoniate are readily soluble, while they are not decomposed in amalgamation. Of course, the lead and silver sulphide are readily amalgamated; and while they are not dissolved in the Patera process, they are in the Russell process.

One of the first applications of the Zierstoff process, introduced at Hettstadt in 1841 for the purpose of extracting silver from copper mattes. In principle it consists in oxidizing silver sulphide to the sulphate which is soluble in water, the silver being then precipitatable by the addition of sodium carbonate; the solution precipitated with carries silver chemically and physically as to the details of the roasting process whereby the silver sulphide is oxidized, yields 92% of the silver originally present.

Electrolytic Methods.—Crude silver generally contains small amounts of copper, gold, bismuth, lead and other metals. To eliminate these impurities, electrolytic methods have been devised; of these that of Moebius is the most important and will be described in detail.

Under his earlier processes, 1884, cast crude silver anode plates, about 14 in. thick, and rolled silver cathodes, were suspended in a 1%, slightly acid, solution of silver nitrate contained in tarred wooden tanks. The deposit from this solution even with low current-intensity was of peculiarly fine, pearly, or 'chrysoberyl' aspect, and the electrolysis wooden scrapers are automatically and intermittently passed over the surface of the cathode to detach the loose silver, which falls into cloth trays at the bottom of the tanks. These trays are emptied at intervals, and the silver collected in the trays, which should contain over 99.9% of pure metal. The relatively electro-negative character of silver ensures that with moderate current-densities no metal (other than precious metals), can be deposited with it; hence the solution is pure a current-density of 30 amperes per sq. ft. of cathode may be used, but as copper accumulates in it, the current-density must be diminished to (say) 15 to 20 amperes per sq. ft., and a little extra nitric acid must be added, in order to prevent the co-deposition of copper. A pressure of 1.5 volt usually suffices when the space between the electrodes is 2 in. The tanks were arranged in groups of seven on the multiple system. The tanks were arranged in groups of seven on the multiple system. The tanks were arranged in groups of seven on the multiple system. reduce any platinum nitrate that may be present to metal. The fused mass is dissolved in dilute ammonia and diluted to about fifty times the weight of the silver it contains. The filtered (blue) solution is now mixed with an excess of solution of ammonium sulfamate, and allowing it to stand for two or three hours about one-half of the silver has separated out in crystals; finally, instead of mother liquor, the solution comes down promptly on application of a water-bath heat. The rationale of the process is that the sulphate hardly acts upon the dissolved silver, but it reduces some of the caustic-Silver nitrate, which reduces its equivalent of silver oxide to silver and forming cupric oxide which passes through the same cycle.

Alloys of Silver.—Silver readily alloys with many metals, and the admixture generally differs in physical properties from the pure metal. Thus arsenic, antimony, bismuth, tin or zinc render the metal brittle, so that it fractures under a die or rolling mill; copper, on the other hand, increases its hardness, makes it very difficult to machine, and renders it hard to anneal. Consequently copper-silver alloys receive extensive application for the casting of medals and jewelry. The composition of the alloy is stated in terms of its “fineness,” the proportion of silver in 1000 parts of alloy. Generally copper-silver alloys separate into two layers of different composition on fusion; an exception is the alloy AgCu, investigated by A. I. F. Levod, corresponding to a fineness of 510, which remained perfectly homogeneous.

The extent to which the properties of silver are modified by admixturecop is illustrated by the alloy AgCu, the composition of which is stated to be 375 parts of copper to one of silver does not quite obliterate the whiteness of the noble metal. According to Kamarsch, the relative abrasion suffered by silver coins of the different fineness is defined as follows:

<table>
<thead>
<tr>
<th>Fineness</th>
<th>375</th>
<th>321</th>
<th>250</th>
<th>150</th>
<th>100</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abrasion</td>
<td>1.3</td>
<td>2.3</td>
<td>3.9</td>
<td>9.5</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The same observer established the following relation between fineness p and specific gravity of alloys containing from 375 to 875 parts of silver per 1000—Sp. gr. = 0.001647 p-0.838.

The fusing points of all copper-silver alloys lie below that of pure silver; that of British standard silver is lower than even that of pure silver.

Compounds of Silver.

Silver forms one perfectly characterized oxide, Ag₂O, from which is derived a series of stable salts, and probably several less perfectly known ones. Argentic or silver oxide, Ag₂O, is obtained as a dark brown precipitate by adding potassium to a solution of silver nitrate; on drying at 60°-80° it becomes almost black. It is also obtained by digesting freshly precipitated silver chloride with potash. It is sparingly soluble in water (one part in 3000); and the moist oxide frequently behaves as the hydroxide, AgOH, i.e., it converts alkyI haloids into alcohols. It begins to decompose into silver and oxygen at 250°. Silver peroxide, Ag₂O₂, appears under certain conditions as minute octahedra when a solution of silver nitrate is electrolysed, or as an amorphous precipitate when the electrode is silver and that between the silver electrodes. It readily decomposes into silver and oxygen. It dissolves in ammonia with the liberation of nitrogen and forms the solution of silver oxide, Ag₂O, and in sulphuric acid forms a finely divided, yellow green hydrosulphur or silver sulphide, Ag₂S, and again forms silver sulphate. It is doubtful whether the pure compound has been obtained. The compound obtained from silver peroxide is probably a hydroxide, Ag₂O(OH), to have potassium composition Ag₂O₂(NO₃), and has been named silver peroxynitrate. Similarly the sulphate yields Ag₂O₄, 2Ag₂SO₄, silver peroxysulphate, and the chloride the peroxylorides Ag₂F₃O₄, Ag₂F₃O₃. The sesquioxide, Ag₃O₅, is supposed to be formed when silver peroxide is treated with ammonia (Watson, Jour. Chem. Soc., 1906, 89, p. 579).

Silver chloride, AgCl, constitutes the mineral cerargyrite or hora silver; mixed with clay it is the butter-milk ore of the German miners. It is a white, and sometimes a black crystal, which on division is found to consist of pieces of silver and a distinct layer of silver oxide. It is almost insoluble in water, soluble in 50,000 parts of nitric acid, and more soluble in strong hydrochloric acid and solutions of silver chlorides. It readily dissolves in ammonia, the solution, on evaporation, leaving crystalline crystals of silver chloride. Silver chloride is tribasic, and forms sodium thiosulphate and potassium cyanide solutions. On exposure to light it rapidly darkens, a behaviour utilized in photography (q.e.). Abney and Baker have shown that the pure dry chloride does not blacken, but when exposed to a vacuum tube light blackening by absorption of oxygen is due to the oxidation of silver (q.e.). Hydrogen peroxide is also formed. It melts at about 460° and is a yellow, and somewhat greasy, mass. It is soluble in water, less soluble in absolute alcohol, and more soluble in ammonia and in most organic solvents (q.e.). Silver bromide, AgBr, constitutes the mineral bromargyrite or bromyrite, found in Mexico and Chile. It is insoluble in water, thus a yellow precipitate is obtained on adding a solution of silver nitrate to a precipitate made of a solution of bromic and a silver nitrite. It is slightly soluble in nitric acid, and is dissolved in ammonia than the chloride. It melts at 427° and darkens on exposure to air. The minerals embolite, megacrole, and microcrole, occurring in Chile, are variable mixtures of the chloride and bromide. Silver iodide, AgI, occurs in nature as the mineral iodargyrite or iodide, forming hexagonal crystals, or as the yellow, or green prismatic, thickly scored crystals, and is dissolved by putting the precipitate made of a solution of iodide and silver nitrate in nitric acid. Silver is lost by dissolving the metal in hydroiodic acid, or by precipitating the solution from a solution of nitrate by precipitating the silver salt with a soluble iodide. It is slightly soluble in acids and ammonia, and is almost insoluble in alkaline chlorides; potassium iodide forms a yellow precipitate, which, however, dissolves in water. Silver iodide is diamorphous; at ordinary temperatures the stable form is hexagonal; on heating to about 135° the colour changes from green to yellowish-white with the formation of cubic crystals. Silver iodide is one of the most potent photographic developers, and its derivative Xeromag, is also a powerful photographic developer.

Medicinal Use.

Two salts of silver are used in the British pharmacopoeia. (1) Argentis nitrat (United States and British pharmacopoeia), lunar caustic, incompatible with alkalies, chlorides, acids, except nitric and acetic, potassium iodide and arsenical solutions. From the nitrate are made (a) argenitum nitrate, a toughened, impure silver nitrate, containing 20 parts of silver nitrate and one part of potassium nitrate fused together into cylindrical rods; (b) Argentis nitrat mitis, mitigated caustic, in which 1 part of silver nitrate and 2 parts of potassium nitrate are fused together into rods or cones. (2) Argentii oxidum, incompatible with chlorides, organic substances, phenol, cresote, etc., with which it forms explosive compounds.

Therapeutica.—Externally the nitrate has a caustic action, destroying the superficial tissues and separating the part acted on as a slough. Its action is limited. It may be employed to destroy warts or small growths, to reduce exuberant granulations or it may be applied to blisters. In granular lides and various forms of ophthalmia neonatorum silver nitrate is employed to destroy the lesion. Silver nitrate is also used as a prophylactic for ophthalmia neonatorum. The effects of the nitrate being both astringent and stimulating as a local antiseptic, solutions of it are used to paint indolent ulcers and in chronic ulcers or laryngitis. Silver nitrate is also useful as an injection in subacute and chronic gonorrhoea, either the nitrate (1 to 5% solution) being employed, or protargol, which is a potent compound, containing 8% of silver nitrate, is used in 1% solution; they also benefit in leucorrhoea. In pruritus of the
vafula and amus a weak solution of silver nitrate will relieve the itching, and a thin paste of zinc and flour of vitriol at the beginning will abort its formation. Internally the nitrate has been used in the treatment of gastric ulcer, in ulcerative conditions of the intestine and in chronic dysentery. For the intestinal conditions it must either be dissolved in a warm solution of acetic acid or be ground into the solution; the oxide has been given in epilepsy and chorea. Nitrate of silver is eliminated from the system very slowly and the objection to its employment continuously as a drug is that it is a skin irritant. The symptoms of chronic silver poisoning, of which the most prominent symptom is dark slate-blue colour of the lips, cheeks, gums and later of the skin.

To a large degree nitrate of silver is a powerful poison, causing violent abdominal pain, vomiting and diarrhea with the development of gastro-enteritis. In some cases nervous symptoms and delirium supervene. The treatment consists in the use of solutions of oxides of ammonia or hydrogen oxide, and in the administration of milk or white of egg and water or soap in water, in order to dilute the poison and protect the mucous membranes of the oesophagus and stomach from its action.

**SILVERFISH**

SILVERFISH, a small active insect, so-called from the silvery glitter of the scales covering the body. It is less than half an inch long and is found in damp corners or amongst books and papers in houses. Although accredited with destroying paper and linen, it probably feeds only on farinaceous or saccharine substances. Scientifically it is known as *Lepisma saccharina* and belongs to the order *Thysanura* of the order *Aptera*.

**SILVERIUS**, pope from June 556 to March 537, successor of Pope Agapetus I., was a legitimate son of Pope Hormisdas, born before his father entered the priesthood. He was consecrated on the 9th of June 556, having purchased his elevation from the Gothic king Theodoric. Having been raised to the pontificate in Dec. 9 he was one of those who admitted Bellarius into the city. He opposed the restoration of the patriarch Anthimus, whom Agapetus had deposed, and thus brought upon himself the hatred of Theodora, who desired to see Vigilius made pope. He was deposed accordingly by Bellarius in March 537 on a charge of treasonable correspondence with the Goths, and degraded to the rank of monk. He went to Constantinople, and Justinian, who entertained his complaint, sent him back to Rome, but Vigilius was ultimately able to banish his rival to Pandataria, where the rest of his life was spent in obscurity. The date of his death is unknown.

**SILVES**, a city of S. Portugal, in the district of Faro (formerly the province of Algarve); on the right bank of the river Silves at the head of its estuary, and 30 m. W.N.W. of Faro. Pop. (1900) 6587. Silves is surrounded by Moorish walls and dominated by a Moorish castle. It has a fine Gothic church. It has manufactures of corks and soap; and exports corn, vegetables and fruits. Large numbers of pigs are bred, and fishing is carried on in the river and at sea. Alphonso III. (1210-1248) wrested Silves from the Moors.

**SILVESTER**, the name of three popes.

SILVESTER I., bishop of Rome from January 314 to December 335, succeeded Melchiades and was followed by Marcus. The accounts of his papacy preserved in the *Liber pontificalis* are little else than a record of the gifts said to have been conferred on the Roman church by Constantine the Great. He was represented at the council of Nice. The story of his having baptized Constantine is pure fiction, as almost contemporary evidence shows the emperor to have received this rite near Nicomedia at the hands of Eusebius, bishop of that city. According to Döllinger, the entire legend, with all its details of the leprosy and the proposed bath of blood, cannot have been composed later than the close of the 5th century (cf. Duchesne, the *Liber pontificalis*, I. 109). The so-called *Donation of Constantine* was long ago shown to be spurious, but the document is of very considerable antiquity and, in Döllinger's opinion, was forged in Rome between 732 and 777. It was certainly known to Pope Adrian in 778, and was inserted in the false decretals towards the middle of the next century.

SILVESTER II., pope from 999 till 1003, and previously famous, under his Christian name of Gerbert, first as a teacher and afterwards as archbishop successively of Reims and Ravenna, was an Aquitanian by birth, and was educated at the abbey of St Gerold in Aurillac. Here he seems to have had Gerald of his abbot and Raymond for his instructor, both of whom were among the most trusted correspondents of his later life. From Auriillac, while yet a young man (adolescens), he was taken to the Spanish march by “Borell, duke of Hither Spain,” prosecuting his studies. Borell entrusted him to the care of a Bishop Hatto, under whose protection Gerbert resided and lectured in mathematics. In this duke we may certainly recognize Borel, who, according to the Spanish chroniclers, was count of Barcelona from 967 to 993, while the bishop may probably be identified with Hatto, bishop of Vich or Ausona from about 960 to 971 or 972. In company with his two patrons Gerbert visited Rome, where the pope, hearing of his proficiency in music and astronomy, induced him to remain in Italy, and introduced him to the emperor Otto I. A papal diploma, still extant, shows that Count Borel and Bishop Octo of Ausona were at Rome in January 971, and, as all the other indications point to a corresponding year, enables us to fix the chronology of Gerbert's later life.

When brought before the emperor, Gerbert admitted his skill in all branches of the quadrivium, but lamented his comparative ignorance of logic. Eager to supply this deficiency he followed Lothair's ambassador Germanus, archdeacon of Reims, to that city, for the sake of studying under so famous a dialectician in the episcopal schools which were rising into reputation under Archbishop Adalbero (966-989). So promising a scholar soon attracted the attention of Adalbero himself, and Gerbert was speedily invited to exchange his position of learner for that of master. In 987 he was consecrated bishop of Magdeburg. For many years, having amongst his pupils Hugh Capet's son Robert, afterwards king of France, and Richer, to whose history we owe almost every detail of his master's early life. According to this writer Gerbert's fame began to spread over Gaul, Germany and Italy, till it roused the envy of Otric of Saxony, in whom we may recognize Octricus of Magdeburg, the favourite scholar of Otto I., and, in earlier days, the instructor of St Adalbert, the apostle of the Bohemians. Otric, suspecting that Gerbert erred in his classification of the sciences, sent one of his own pupils to Reims to take notes of his lectures, and, finding his suspicions correct, accused him of error before Otto II. The emperor, to whom Gerbert was well known, appointed a time for the two philosophers to argue before him; and Richer has left a long account of this dialectical tournament at Ravenna, which lasted out a whole day and was only terminated at the imperial bidding. The date of this controversy seems to have been about Christmas 980, and it was probably followed by Otric's death, on the 1st of October 981. It must have been about this time that Gerbert received the great abbey of Bobbio from the emperor. That it was Otto II., and not, as formerly supposed, Otto I., who gave him this benefice, seems evident from a diploma quoted by Mabillon (Annales, iv. 721). Richer, however, makes no mention of this event; and it is only from allusions in Gerbert's letters that we learn how the new abbot's attempts to enforce his dues provoked a spirit of discontent which at last drove him in November 983 to take refuge with his old patron Adalbero. It was to no purpose that he appealed to the emperor and empress for restitution or redress; and it was perhaps the hope of extorting his reappointment to Bobbio, as a reward for his services to the imperial cause, that changed the studious scholar of Reims into the wily secretary of Adalbero. Otto II. died in December 983, leaving the empire to his infant heir Otto III. Lothair, king of the west Franks, claimed the guardianship, and attempted to make use of his position to serve his own purposes in Lorraine, which would in all probability have been lost to the empire but for the efforts of Adalbero and Gerbert. Gerbert's policy is to be identified with that of his metropolitan, and was strongly influenced by gratitude for the benefits that he had received from the first two Ottos.

According to M. Olleris's arrangement of the letters, Gerbert was at Mantua and Rome in 985. Then followed the death of Lothair (2nd of March 986) and of Louis V., the last Carolingian king, in May 987. Later on in the same year Adalbero crowned...
Hugh Capet (1st June) and his son Robert (25th December). Such was the power of Adalbero and Gerbert in those days that it was said their influence alone sufficed to make and unmake kings. The archbishop died on the 23rd of January 989, having, according to his secretary’s account, designated Gerbert his successor. Notwithstanding this, the influence of the empress Theophana, mother of Otto III., secured the appointment for Arnulf, a bastard son of Lothair. The new prelate took the oath of fealty to Hugh Capet and persuaded Gerbert to remain with him. When Charles of Loraine, Arnulf’s uncle, and the son of Louis IV. D’Outremer, surprised Reims in the autumn of the same year, Gerbert fell into his hands and for a time continued to serve Arnulf, who had gone over to his uncle’s side. He had, however, returned to his allegiance to the house of Capet before the fall of Lanon placed both Arnulf and Charles at the mercy of the French king (March 991). Then followed the council of St Basle, near Reims, at which Arnulf confessed his treason and was degraded from his office (17th June 991). In return for his services Gerbert was elected to succeed the deposed bishop.

The episcopate of the new metropolitan was marked by a vigour and activity that were felt not merely in his own diocese, but as far as Tours, Orleans and Paris. Meanwhile the friends of Arnulf appealed to Rome, and a papal legate was sent to investigate the question. As yet Hugh Capet maintained the cause of his nominee and forbade the prelates of his kingdom to be present at the council of Milon of Malmesbury (June 992). Notwithstanding this prohibition Gerbert appeared in his own behalf. Council seems to have followed council, but with uncertain results. At last Hugh Capet died in 996, and, shortly after, his son Robert married Bertha, the widow of Odo, count of Blois. The pope condemned this marriage as adulterous; and Abbo of Fleury, who visited Rome shortly after Gregory V.’s accession, is said to have procured the restoration of Arnulf at the pontiff’s demand. We may surmise that Gerbert left France towards the end of 995, as he was present at Otto III.’s coronation at Rome on the 21st of May 996. Somewhat later he became Otto’s instructor and had been appointed archbishop of Ravenna before May 998. Early in the next year he was elected pope (April 999), and took the title of Silvester II.

In this capacity Gerbert showed the same energy that had characterized his former life. He is generally credited with having fostered the splendid vision of a restored empire that now began to fill the imagination of the young emperor, who is said to have confirmed the papal claims to eight counties in the Ancona march. Writing in the name of the desolate church at Jerusalem he sounded the first trumpet-call of the crusades, though almost a century was to pass away before his note was repeated. His words were answered in the ascent of the great abbot of Cluny, Hildebrand.

Nor did Silvester II. confine himself to plans on a large scale. He is also found confirming his old rival Arnulf in the see of Reims; summoning Adalbero or Axelinus of Laon to Rome to answer for his crimes; judging between the archbishop of Mainz and the bishop of Hildesheim; besieging the revolted town of Cesena; sifting the count of Angoulême into prison for an offence against a bishop; confirming the privileges of Fulda abbey; granting charters to bishops far away on the Spanish mark; and, on the eastern borders of the empire, erecting Prague as the seat of an archbishopric for the Slavs. More than all his other acts is his letter to St Stephen, king of Hungary, to whom he sent a golden crown, and whose kingdom he accepted as a fief of the Holy See. It must, however, be remarked that the genuineness of this letter, in which Gerbert, to some extent foreshadows the temporal claims of Hildebrand and Innocent III., has been hotly contested, and that the original document has long been lost. All Gerbert’s dreams for the advancement of church and empire were cut short by the death of Otto III., on the 4th of February 1002; and this event was followed a year later by the death of the pope himself, which took place on the 22nd of May 1003. His body was buried in the church of St John Lateran, where his tomb and inscription are still to be seen.

A few words must be devoted to Silvester II., as regards his attitude to the crusades. The death of Rome, with the exception of two detailed accounts of the proceedings of the council of St Basle; and, despite his reticence, it is impossible to doubt that he was the moving spirit in Arnulf’ deposition. On the whole it may be said that the prohibition in the papal letter, and the fact that foreign metropolitanas resembled that of his great predecessor Hincmar, to whose authority he constantly appeals. But he is rather the prophet and debater of the future than the historian of the moment when he sees his way to moulding them to his own purposes. The philosophical statesman who has formulated a theory from whose terms he will not move. Roughly sketched, his argument is as follows: If Rome is to be the capital of the new empire, and the churches; nor would Gerbert oppose her judgments except in two cases—(1) where he enjoys something that is contrary to the decrees of a universal council, such as that of Nice, or (2) where, after having been once appealed to in a matter of ecclesiastical discipline and having refused to give a plain and speedy decision, she should, at a later date, attempt to call in question the provisions of the metropolitan synod called to remedy the effects of her negligence. The decisions of a Gregory or a Leo the Great, of a Gelasius or an Innocent, prelates of holy life and unequalled wisdom, are accepted by the universal church; for, coming from such men, they cannot be wrong. But when we consider the last days—in John XII. or Boniface VII., “monsters, as they were, of more than human iniquity”—anything else than “Anti-christ sitting in the temple of God and showing himself as God” cannot be tolerated. Consequently, the pope needs to appeal to another power, that of metropolitan synods to deposing unworthy bishops, but contends that, even if an appeal to Rome were necessary, that appeal had been made two years before. It is thus to himself, the pope, and not to the metropolitan council, that Gerbert refer us to find him shifting his position still farther at the council of Cansey, where he advances the proposition that John XV. was represented at St Basle by hislegate Seguin, archbishop of Sens, and that this is an effect of a last year’s law of the seculars and the papal sanction. Far firmer is the tone of his later letter to the same archbishop, where he contends from historical evidence that the papal judgment is not infallible, and encourages his brother prelate not to fear excommunication in a righteous cause, for it is not in the power even of the successor of Peter “to separate an innocent priest from the love of Christ.”

But during the most distinguished statesman, Gerbert was also the most accomplished scholar of his age. But in this aspect he is rather to be regarded as the diligent expositor of other men’s views than as an original thinker. Except as regards philosophical and religious speculation, his writings show a range of culture and knowledge quite unparalleled in that generation. His pupil Richer has left us a detailed account of his system of teaching at Reims. So far as the trivium is concerned, his text-books were Victorinus’s translation of Porphyry’s Isagoge and Forpyhry’s treatise on the spheres. Concerning the quadrivium, Richer notes that Virgil, Statius, Terence, Juvenal, Horace, Persius and Lucan are specially named as entering into a course of training which was rendered more stimulating by a free use of open discussion. More remarkable still were the methods of teaching, which were employed to assist his lectures on astronomy he constructed elaborate globes of the terrestrial and celestial spheres, on which the course of the planets was marked; for facilitating arithmetical and perhaps geometrical processes he constructed an abacus with twenty-seven divisions and a thousand counters of horn. A younger contemporary speaks of his having made a wonderful clock or sun-dial at Magdala; and we know from his letters that Gerbert was accustomed to exchange his globes for MSS. of those classical authors that his own library did not contain. More extraordinary still was his knowledge of music—an accomplishment which seems to have been his earliest recommendation to Otto I. Probably he was beyond his age in this science, for we read of Garamus, his first tutor at Reims, whom he attempted to ground in this subject: “Artis difficilique victus, a musica reiectus est.” Gerbert’s letters contain more than one allusion to organs which had been constructed; and the dean of Malmesbury has preserved an account of a wonderful musical instrument still to be seen in his days at Reims, which, so far as the English chronicler’s words can be made out, seems to refer to an organ worked by steam. The same historian tells us that Gerbert borrowed from the Arabs (Saracen) the abacus with ciphers (see NUMERALS). Perhaps Gerbert’s chief claim to the remembrance of posterity is to be found in his writings on MSS., and the MSS. of the classical writers. His love for literature was a passion. In the turmoil of his later life he looked back with regret to his student days; and for all his troubles philosophy was his outlet. Everywhere he went, at Salerno, at Basle, at Avignon, at Gerona in Spain, at Barcelona—he had friends or agents to procure him copies of the great Latin writers for Bobbio or Reims. To the abbot of Tours he writes that he is “labouring assiduously to form a library,” and “throughout Italy, Germany and Lorraine (Belgium)”
SILVESTRE—SILVESTRINES

is spending vast sums of money in the acquisition of MSS." It is noteworthy, however, that Gerbert never writes for a copy of one of the MSS. In 1892, the monks of his own monastery at Leiden, to prevent the loss of fragments of a fast-perishing secular Latin literature. Despite his residence on the Spanish mark, he shows no token of a knowledge of Arabic, a fact which is perhaps sufficient to overthrow the statement of one who had studied under him, but we have no trace to be found in his writings of any acquaintance with Greek.

So remarkable a character as that of Gerbert left its mark on the age, and fables soon began to cluster around him bearing his name. The famous line that Gerbert's contemporaries attributed to the pope himself:

"Transit in R. Gerbertus in R. post papa vigens R."

A few years later William of Malmesbury adds a love adventure at Cordova, of a compact with the devil, the story of a speaking spirit that foretold Gerbert's death at Jerusalem—a prophecy fulfilled, somewhat as in the case of Henry IV. of England, by his dying in the Jerusalem church of Rome—and that imaginative story of the statue of Gerbert, of whom as prophet prophesied the great French orator his translation into English, by the voice of the columns of Mouza and Causey; and drafts of the decrees of two or three other councils or imperial constitutions promulgated when he was archbishop of Ravenna or pope. The important works on the three above-mentioned councils are to be found in the 11th-century Leiden MS. just alluded to. (c) Gerbert's theological works comprise a Sermo de informatione episcoporum and a treatise entitled De corpore et sanguine Domini, both of very doubtful authenticity. (d) Of his philosophical works we only have one, Libelli de rationali et ratione uti, written at the request of Otto III, and preserved in an 11th-century MS. at Paris. (e) His mathematical works consist of a commentary on the 12th-century treatise of Sahl al-Babi, is to be found at the Vatican; and a Libelli de numerorum divisione (11th- and 12th-century MSS. at Rome, Montpellier and Paris), dedicated to his friend and correspondent Constantine of Fleurie. A long treatise on geometry, attributed to Gerbert, is of too much doubtful authenticity. To these may be added a very short disquisition on the same subject addressed to Adalbald, and a similar one, on his own sphere, addressed to Constantine of Fleurie.

(c) The MSS. of the works written by Gerbert are collected in the edition of A. Olleris (Clermont, 1867).

SILVESTER III. When Boniface IX. was driven from Rome early in January 1444, John, bishop of Sabina, was elected in his stead and took the title of Silvester III. Within three months Boniface returned and expelled his rival. Nearly three years later (December 1446) the council of Sutri deprived him of his bishopric and priesthood. He was then sent to a monastery, where he seems to have died.

SILVRETE, PAUL ARMAND (1837–1901), French poet and novelist, was born in Paris on the 18th of April 1837. He studied at the Ecole polytechnique with the intention of entering the army, but in 1870 he entered the department of finance. He had a successful official career, was decorated with the Legion of Honour in 1886, and in 1892 was made inspector of fine arts. Armand Silvestre made his entry into literature as a poet, and was a close friend of the Parnassians. His volumes of verse include: Rimes neuves et vieilles (1866), to which George Sand wrote a preface; Les Renaissances (1870); La Chanson des heures (1878); Le Chemin des etoiles (1885), etc. The poet was also a contributor to Gil Bias and other Parisian journals, distinguishing himself by the licence he permitted himself. To these "absences" from poetry, as Henri Chaputavonne calls them, belong the seven volumes of La Vie pour rire (1881–1883), Contes pantagruelques et galants (1884), Le Livre des joyeusetés (1884), Gauloiseries nouvelles (1888), etc. For the stage he wrote in many different manners: Sapho (1881), a drama; Henri VIII (1883), with Léonce Détray, music by Saint-Saëns; and the Drame socrates (1893), religious pictures after 14th- and 15th-century Italian painters, with music by Gounod. An account of his varied and somewhat incongruous production is hardly complete without mention of his art criticism. Le Nu au Salon (1888–1892), in five volumes, with numerous illustrations, was followed by other volumes of the same type. He died at Toulouse on the 19th of February 1901.

SILVRE DE SACY, ANTOINE ISAAC, BARON (1758–1838), French orientalist, was born in Paris on the 21st of September 1758. His father was a Parisian notary named Silvestre, and the additional name of de Sacy was taken by the younger son after a fashion then common with the Paris bourgeoisie. From the age of seven years, when he lost his father, he was educated in the close seclusion of his mother. In 1781 he was appointed councillor in the cour des monnaies, and was advanced in 1791 to be a commissary-general in the same department. De Sacy had successively acquired all the Semitic languages, and as a civil servant he found time to make himself a great name as an orientalist. He began successfully to decipher the Pahlavi inscriptions of the Sassanian kings (1787–1791). In 1792 he retired from the public service, and lived in close seclusion in a cottage near Paris till in 1795 he became professor of Arabic in the newly founded school of living Eastern languages. The interval was in part devoted to the study of the religion of the Druses, which was the subject of his last and unfinished work, the Exposé de la religion des Druses (2 vols., 1838). Since the death of Johann Jakob Reiske Arabic learning had been in a backward state. In the Grammaire arabe (2 vols., 1st ed. 1810, 2nd ed. 1831) and the Chrestomathie arabe (3 vols., 1806), together with its supplement, the Anthologie grammaticale (1829), De Sacy supplied admirable text-books, and earned the gratitude of later students. He contributed to text and translation of books by his professor to his old chair, and from this time onwards his life was one of increasing honour and success, broken only by a brief period of retreat during the Hundred Days. He was perpetual secretary of the Academy of Inscriptions from 1832 onwards; in 1808 he had entered the corps législatif; he was made a baron in 1813; and in 1823, when quite an old man, became a peer of France and was regular in the duties of the chamber. In 1815 he became rector of the university of Paris, and after the second restoration he was active on the commission of public instruction. With Abel Rémusat he was joint founder of the Société asiatique, and was inspector of oriental types at the royal printing press. De Sacy died on the 21st of February 1838.

Among his other works are his edition of Hariri (1822, 2nd edition by Reinaud, 1847, 1855), with a selected Arabic commentary, and of the Alfiya (1833), and his Cattia et Domina (1816),—the Arabic version of that famous Persian fable, which has been in various forms one of the most popular books of the world. A version of Abd-Allatif, Relation arabe sur l'Egypte, and essays on the early history of the Copts, was published by him in 1805–1818. To biblical criticism he contributed a memoir on the Samaritan Arabic of the Pentateuch (Mim. Acad. des Insct. vol. xix.), and editions of the Arabic and Syriac New Testaments for the British and Foreign Bible Society. Of the brilliant teachers who went out from his lecture-room may be mentioned Professor Heinrich Leberecht Fleischer (1801–1888), who contributed elaborate notes and corrections to the Grammaire arabe (Kleine Schriften, vol. I., 1885).

SILVESTRINES, or SILVESTRINES, an order of monks under the Benedictine rule, founded 1231 by St. Silvester Gazzolini. He was born at Osimo near Ancona and held a canonry there. About 1227 he resigned it to lead an austere eclelitical life. Disciples came to him, and in 1231 he built a monastery at Montefano. The rule was the Benedictine, but as regards poverty in external things, far stricter than the Benedictine. The order was approved in 1247 by Innocent IV., and at that time almost in 1250 eight houses were under the direction of the Silvestrines. At a later date there were 56, mostly in Umbria, Tuscany and the March of Ancona. In 1597 there were nine Silvestrine houses, one in Rome, and about 60 choir monks. Since 1835 they...
have had a house and a mission in Ceylon. The order has no history. The habit is blue.

**SIMANCAS,** a town of Spain, in the province of Valladolid; 8 m. S.W. of Valladolid, on the road to Zamora and the right bank of the river Pisuerga. Pop. (1900) 11,290. Simancas is a town of great antiquity, the Roman Septimania, with a citadel dating from the Moorish occupation in the 9th century, a fine bridge of seventeen arches, and many remains of old walls. In 934 it was a scene of a bloody battle between the Moors and Christians. The citadel is now the Archivo General del Reino, to which the national archives of Spain were removed by order of Philip II. in 1563. Their transference thither was first suggested to Charles V. by Cardinal Ximenes or Cisneros (d. 1539). The extensive alterations were made by three celebrated 16th century architects, Juan de Herrera, Alonso Berruguete and Juan Gomez de Mora; the arrangement of the papers was entrusted to Diego de Ayala. They occupy forty-six rooms, and are arranged in upwards of 80,000 bundles (33,000,000 documents), including important private as well as state papers. The archives of the Indies were transferred in 1784 to the Lonja de Seville (q.v.). Permission to consult the documents at Simancas can be readily obtained.

**SIMBIRSK,** a town of Russia, on the right bank of the middle Volga, with the government of Kazan on the N., Samara on the E., Saratov on the S., and Penza and Nizhny-Novgorod on the W. It has an area of 18,065 sq. m. and occupies the E. of the great central plateau of middle Russia. Its higher parts range from 750 to 1000 ft. above the sea, and form the Zhegulev range of hills, which compels the Volga to make its great bend at Samara. In the W. a broad depression, traversed by numerous rivers and streams, extends along the left bank of the Sura. The Volga flows for 500 m. along the E. boundary, separating Simbirsk from Samara. The shallow Sivyagya rises in the Samarskaya Luka Hills and flows parallel to the Volga, at a distance of 2 to 20 m. but in the opposite direction. The Sura, also flowing N., drains the W. of Simbirsk; it is navigable for more than 270 m. A few lakes and marshes exist in the W. The climate is severe, and the extremes of heat are great. At the city of Simbirsk the average temperature is 38° F., but the thermometer sometimes reaches 115° F., and frosts of −47° F. are not uncommon; the average rain and snowfall is only 17-6 in. In respect to the geology, all systems, beginning with the Carboniferous, are represented in the government. The exact age of the "Variegated Marls," the subject of animated polemics among Russian geologists, remains problematic, but the inquiries of Professor Pavlov have definitely settled the geological age of the Jurassic formations. Triassic deposits appear in the N.; Carboniferous and Cretaceous predominate in the E. of the province, where they are covered in many places by tertiary deposits; Chalk and Eocene deposits crop up chiefly in the W. and the Chalk in the S. Post-Pliocene deposits, containing bones of the mammoth and other extinct mammals, overlie the older formations. Sulphur, asphalt, salt, ochre, and iron ore are extracted, as well as various building stones.

The estimated pop. in 1906 was 17,835,500. Nearly all the inhabitants are either Russian, not to the Russian Orthodox Church or are Nonconformists, there being only 145,500 Mussulmans. The greater number (about two-thirds) are Great Russians, the remainder being Mordvinians (12%), Chuvashes (8%), and Tatars (8%), with about 1000 Jews. The Mordvinians are settled chiefly in the N.W., in Ardatov and Alatyr, and on the Volga in Sengilei; the Chuvashes make about one-third of the population of the districts of Buinsk and Kurmysk, contiguous to Kazan; the Tatars constitute about 35% in Buinsk and 18% in Sengilei. The villages in Simbirsk are large, many of them having 3000 to 5000 inhabitants. The government is divided into eight districts, the chief towns of which are Simbirsk, Alatyr, Ardatov, Buinsk, Kursan, Kurmysk, Sengilei and Szyran.

School gardens and school farms have been widely introduced, while bee-keeping is taught in over 50 schools. Owing to the efforts of the Government (local councils), agriculture is well looked after, and the cultivation takes place on about 650,000 acres. The schools of Simbirsk, built at a cost of 650,000 rubles, are considered a monument of the imperial culture. The Simbirsk Mint was founded in 1517. There are very few private owners, 20% the imperial domains taking 5% and the towns and the crown 0-6%. The area under forests amounts to 1517,000 acres, of which 50% are under cultivation. The peasants are rapidly buying land in considerable quantities. Most of their allotments (more than 76%) are not larger than one rood and brokerage on them is very high, varying over 500,000 acres from private owners. The principal crops are wheat, rye, barley and potatoes. Good breeds of horses are kept, and considerable numbers are exported. Fishing (sturgeon) is carried on in the Volga and the Sura, timber trade in the N. and shipbuilding on the Sura. Domestic trades give employment to over 15,000 persons; carts, sledges, wheels and all sorts of wooden wares are made in the villages, as also felt goods, boots, gloves, caps, handkerchiefs, ropes and numerous all exterior goods are exported. Simbirsk has over 20,000 inhabitants. They comprise mainly cloth mills, flour-mills and distilleries, with tanneries, glass, oil and starch works. There are 318 fairs, the most important of which are held at Simbirsk, Szyran and Kursan. There is a considerable export trade in grain, mostly rye, and in flour.

The first Russian settlers made their appearance in the Simbirsk region in the 14th century, but did not go E. of the Sura. Not till two centuries later did they cross that river and the district begin to be peopled by refugees from Moscow. The Zhegulev Mountains in the S. still continuing to be a place of refuge for the criminal and the persecuted, the town of Simbirsk was founded in 1648, with a string of small forts extending to the Sura. The region thus protected was soon colonized, and, as the Russian invasion swept E., Simbirsk was founded, and a second line of small forts to the Sura was erected. The aboriginal Mordvinians rapidly lost their ethnographical individuality, especially since the middle of the 19th century.

(P. A. K.; J. T. B.)

**SIMBIRSK,** a town of Russia, capital of the government of the same name, 154 m. by the Volga S.S.W. from Kazan, between the Volga and the Svyaga. Pop. (1897) 44,111. It is one of the best built provincial towns of Russia. It is an episcopal see of the Orthodox Greek Church. The central part of Simbirsk is the Crown (Vozdus), containing the cathedral and the best houses—is built on a hill 560 ft. above the Volga. Adjoining this is the commercial quarter, while farther down the slope, towards the Volga, are the storehouses and the poorest suburbs of the city; these last also occupy the W. slope towards the Svyaga. There are three suburbs on the left bank of the Volga, communication with them being maintained in summer by steamers. A great fire having destroyed nearly all the town in 1864, it has been built again on a new plan, though still mostly of wood. The cathedral of St Nicholas dates from 1712. The new cathedral of the Trinity was erected in 1824-1841 in competition with the former, and was divided by the French invasion of 1812. The historian Karamzin (born in 1766 in the vicinity of Simbirsk) has a monument here, and a public library bearing his name contains about 15,000 volumes. The trade is brisk, corn being the principal item, while next come potash, wood, fruits, wooden wares and manufactured produce. Simbirsk fair has a turnover of £5690 annually. The city was founded in 1648, and in 1670 endured a long siege by the rebel leader Stenka Razin.

**SIMCOE, JOHN GRAVES** (1732-1806), British soldier and first lieutenant-governor of Upper Canada, was born at Cotteridge, Northumberland, England, on the 25th of February 1752. His father, John Simcoe, who was a captain in the Royal Navy, died in 1750, and his only brother was drowned in early youth. During Simcoe's childhood the family removed to Exeter. He was sent to Eton at the age of fourteen, and three years later entered Merton College, Oxford. After two years of college life, he became ensign in the 33rd regiment, first seeing active service at Boston in 1775, and remaining in America during the greater part of the Revolutionary War. In 1776 he secured command of the Queen's Rangers with the rank of major. His military career in America ended with the surrender of Cornwallis at Yorktown in October 1781. On his return to England he was first a government agent in the West Indies, and then he was sent out to Upper Canada in 1788. On the 15th of February 1792, he married Miss Ann Grafton, and in the same year was appointed Lieutenant-Governor of Upper Canada, a position which he held for five years. In 1797 he returned to England, and for the next ten years divided his time between London and his family estate in Devon. In December
1782 he married Elizabeth Posthuma, only child of Colonel Thomas Gwillim of Old Court, Herefordshire. In 1790 he was elected member of parliament for St. Mawes in Cornwall, and at the close of his first session was appointed lieutenant-governor of the new province of Upper Canada created under the Constitutional Act of 1791. He reached Kingston, Upper Canada, on the 1st of July 1792. There the first council was assembled, the government of the new province proclaimed, and the oaths of office taken. Immediately afterwards preparations were made for the election of the first house of assembly, which opened at Newark near the mouth of the Niagara river, on the 17th of September 1792. Simcoe's ideas of colonial government were dominated by military and aristocratic conceptions quite unsuited to the conditions of Upper Canada. While his administration was characterized by the most disinterested devotion to what he conceived to be for the best interests of the province, it was rendered ineffective by the impracticable character of his projects and the friction which developed between himself and Lord Dorchester, the governor-general. He left Canada in September 1796, and was immediately afterwards sent on a mission to San Domingo, from which, however, he returned in a few months on account of ill-health. In October 1798 he was promoted to the rank of lieutenant-general, and appointed colonel of the 22nd foot. During 1800-1801 he was in active service. As commander-in-chief for India he succeeded Lord Lake, but before taking the appointment his health broke and he died at Exeter on the 26th of October 1806.

See D. C. Scott, John Graves Simcoe (1905).

SIMEON, in the Old Testament, the name of a tribe of Israel, named after the second son of Jacob by Leah (Gen. xxix. 33). According to Gen. xxxiv., the brothers Simeon and Levi massacred the males of Shechem to avenge the violation of their sister Dinah ("Judgment") by Shechem the son of Hamor. Jacob disapproved the act, and on his deathbed solemnly cursed their ferocity, condemning the two to be divided in Jacob and scattered in Israel (xiii. 5-7). Subsequently the priestly Levites are found distributed throughout Israel without portion or inheritance (Deut. xviii. 1, Josh. xiii. 14). The career of Simeon, on the other hand, raises numerous questions. Simeon is reckoned among the 12 tribes in 2 Chron. xv. 9, xxxiv. 6, but is elsewhere assigned a district in S. Palestine, the cities of which are otherwise ascribed to Judah (cf. Josh. xix. 1-9 with xv. 26-32). A gloss in 1 Chron. iv. 31 (which breaks the connexion) states that the latter was their seat in David's time, but there is no support for this in other records (see Sam. xxviii., xxxiv.). In fact, Simeon is not mentioned in the "blessing of Moses" (Deut. xxxiii., see S. R. Driver, Deut. p. 397 seq.), or in the stories of the "judges"; and notwithstanding references to it in the chronicles' history of the monarchy, it is not named in the earlier books of Samuel and Kings. But is Gen. xxxiv. to be taken literally? Shechem is the famous holy city, Hamor a well-known native family, Jacob talks of himself as being "few in number," and the deeds of Simeon and Levi are those of communities, not of individuals. What historical facts are thus represented, and how are they to be brought into line with the early religious and political conceptions of the people? These are the two questions which have defied solution (see J. Skinner, Genesius, p. 421 seq.). It is conjectured that Dinah represents a clan or group (cf. Dan) which settled in Shechem and was exposed to danger (e.g. oppression or absorption); the tribes Simeon and Levi intervened on its behalf, the ensuing massacre was avenged by the Canaanites, and the two were broken up. These events would belong to an early stage in the invasion of Palestine by the Israelites (15th-13th century B.C.), perhaps to a preliminary settlement by the "sons" of Leah (Reuben, Simeon, Levi and Judah), previous to the entrance of the "son" of Rachel, Joseph, the "father"

1792-1801 he was in active service. As commander-in-chief for India he succeeded Lord Lake, but before taking the appointment his health broke and he died at Exeter on the 26th of October 1806.

See D. C. Scott, John Graves Simcoe (1905).

SIMEON, in the Old Testament, the name of a tribe of Israel, named after the second son of Jacob by Leah (Gen. xxix. 33). According to Gen. xxxiv., the brothers Simeon and Levi massacred the males of Shechem to avenge the violation of their sister Dinah ("Judgment") by Shechem the son of Hamor. Jacob disapproved the act, and on his deathbed solemnly cursed their ferocity, condemning the two to be divided in Jacob and scattered in Israel (xiii. 5-7). Subsequently the priestly Levites are found distributed throughout Israel without portion or inheritance (Deut. xviii. 1, Josh. xiii. 14). The career of Simeon, on the other hand, raises numerous questions. Simeon is reckoned among the 12 tribes in 2 Chron. xv. 9, xxxiv. 6, but is elsewhere assigned a district in S. Palestine, the cities of which are otherwise ascribed to Judah (cf. Josh. xix. 1-9 with xv. 26-32). A gloss in 1 Chron. iv. 31 (which breaks the connexion) states that the latter was their seat in David's time, but there is no support for this in other records (see Sam. xxviii., xxxiv.). In fact, Simeon is not mentioned in the "blessing of Moses" (Deut. xxxiii., see S. R. Driver, Deut. p. 397 seq.), or in the stories of the "judges"; and notwithstanding references to it in the chronicles' history of the monarchy, it is not named in the earlier books of Samuel and Kings. But is Gen. xxxiv. to be taken literally? Shechem is the famous holy city, Hamor a well-known native family, Jacob talks of himself as being "few in number," and the deeds of Simeon and Levi are those of communities, not of individuals. What historical facts are thus represented, and how are they to be brought into line with the early religious and political conceptions of the people? These are the two questions which have defied solution (see J. Skinner, Genesius, p. 421 seq.). It is conjectured that Dinah represents a clan or group (cf. Dan) which settled in Shechem and was exposed to danger (e.g. oppression or absorption); the tribes Simeon and Levi intervened on its behalf, the ensuing massacre was avenged by the Canaanites, and the two were broken up. These events would belong to an early stage in the invasion of Palestine by the Israelites (15th-13th century B.C.), perhaps to a preliminary settlement by the "sons" of Leah (Reuben, Simeon, Levi and Judah), previous to the entrance of the "son" of Rachel, Joseph, the "father"

1 It is difficult to determine whether the writers included Simeon among the ten N. tribes (2 Sam. xix. 33, 1 Kings xi. 31-35) which are contrasted with the one Judah (1 Kings xi. 32, 36, xii. 20), or two (plus Benjamin; 16. xii. 21-23) which remained faithful to the Davidic dynasty.

2 The biblical evidence has forced all independent investigators to adopt some reconstrunction, but the above theory is in many respects precarious. It may explain the disappearance of a secular tribe of Judges, but not the rise of the sacred Levites. Even in Judges ix. 28 Shechem is still held by the family of Hamor (cf. Gen. xxxiii. 19), and if Simeon was scattered and divided at any early date, its appearance in tradition many centuries later is inexplicable. On the other hand, the latter feature is significant for its vitality in post-exilic traditions. Gen. xxxiv. and the narratives upon which the above reconstruction depends are preserved by compilers of the 6th century and later, and the correlation of Simeon and Levi points to a time when the latter had already been invested with the recognized eponym of the well-known ecclesiastical body.

3 Gen. xxxiv. has been heavily revised and is in a post-exile style. The original story must have concerned Simeon and Levi alone (v. 25 seq., 30, cf. xlix. 7), but it has been adapted to tribal history, to the spoliation of Shechem by all the "sons" of Jacob (xxxiv. 27-29). It is not clear whether the tribes Simeon and Levi are fairly represented by that of Jacob, but the story is probably connected with the second period of Israel's history (Gen. xxxvi. 7-12), and the tribe Simeon led by Jacob's son Judah (Gen. xxxviii., cf. Skinner p. 450), but also that of Simeon (Gen. xvi. 10), and the related tradition that Simeon married a Zephathite (Jub. xiv. 13). 1 Chron. iv. 39 seq. mentions the Simeonites of Enamalek, who lost their numbers after the conquest. The tribe was not reconstituted, and the Simeonites of Enamalek and Eshu (Edom), is the district whence Jacob departed to his Ammonian relatives (Gen. xxviii. seq.). Hornback, too, at the end of his book on Israel (pp. 169-174), is the most recent work on the subject (pp. 13-13), and is connected with evidence suggesting that this victory at the very gate of the promised land belongs to a tradition of some movement from Kadesh into Judah (Wellhausen, G. F. Moore, H. P. Smith, and others; see Exodus, ch. xiv. The other tradition, that the Israelites were defeated there by Amalekites and Canaanites, explains the defeat by Edom and Moab (ib. xiv. 25, 40-45), and the appearance of the tribes E. of the Jordan to invade the land of their ancestors. Obviously these reports fundamentally differing views, which cannot be woven into a single outline; and they cannot be isolated from more profound questions which reflect all ordinary conceptions of the structure of biblical history.

See S. A. Cook, Amer. Journ. of Theol. xiii. 370-378 (1900); Jews, §§ 5-8, 22; Levites; Palestine History. (S. A. C.)

4 So in general, the favourite interpretation (Wellhausen, Stade, Guth and many others) with some variation of detail, see especially Gunkel's commentary (Handkommentar, 1901, pp. 335 sqq.).

5 The structure of Judges has been criticized by J. P. M. van der Neer, Archeologie en ihre Nachbarstamm (1906), pp. 400-428 (especially his criticism, p. 421 seq.); cf. also I. Benzing, Hebr. Archologie (1907), pp. 345 sqq. (whose astral interpretation of the narrative, however, is quite incorrect).

7 On these wars, see the criticisms of H. W. Hogg in his elaborate study of Simeon, Encyc. Bibl. col. 4524-34.
SIMEON (or Symeon) OF DURHAM (d. after 1129), English chronicler, composed the monastic life before the year 1085 in the monastery of Jarrow. That chronicle his professor prided on a later date, after he had removed with the rest of his community to Durham. He was author of two historical works which are particularly valuable for northern affairs. He composed his Historia ecclesiae Dunelmensis, extending to the year 1096, at some date between 1104 and 1106. The original manuscript is at Durham in the library of Bishop Cosin. It is divided into four books, which are subdivided into chapters; the order of the narrative is chronological. There are two continuations, both anonymous. The first carries the history from 1096 to the death of Bishop Eadwine (1120); the second extends from 1132 to 1144. A Cambridge MS. contains fragments of continuations written in the years 1141-1154. About 1129 Symeon undertook to write a Historia regum Anglorum et Duxonorum. This begins at the point where the Ecclesiastical History of Bede ends. Up to 1057 Symeon merely copies some old Durham annals, not otherwise preserved, which are of value for northern history; from that point to 1110 he copies Florence of Worcester with certain interpolations. The section dealing with the years 1110-1120 is, however, an independent and practically contemporaneous narrative. Symeon writes, for his time, with ease and perspicuity; but his chronicles are not of a different character and copied authority.

Other writings have been attributed to his pen, but none with good authority. They are printed, along with his undoubted works, in the Scriptores decem of Roger Twysden (1652). The most complete modern edition is that of Thomas Arnold ("Rolls" series, 2 vols., 1881). One of the "Practica," of the "third canonical Annals," which Symeon used for the Historia regum, has been discussed by J. H. Hinde in the preface to his Symposis Dunelmensis opera, vol. i. pp. xvii. ff. (1868); by R. Pauly in Fischerei zur deutschen Geschichte, xi. pp. 137 seq. (Göttingen, 1872); and by W. Stubbs in the introduction to Roger of Howden, vol. i. p. x. ("Rolls" series). Symeon's works have been translated by J. Stevenson in his Church Historians of England, vol. iii. part ii. (H. W. C. D.)

SIMEON, CHARLES (1750-1836), English evangelical divine, was born at Reading and educated at Eton and Cambridge. In 1772 he became fellow of King's College, Cambridge, and took orders, receiving the living of Holy Trinity, Cambridge, in the following year. He was at first so unpopular that the services were frequently interrupted, and he was often insulted in the streets. Having lived down this prejudice, he subsequently gained a very remarkable and lasting influence among the undergraduates of the university. He became a leader among evangelical churchmen, was one of the founders of the Church Missionary Society, and acted as adviser to the East India Company in the choice of ministers for India. His chief work is a commentary upon the whole Bible, entitled Horae hebraicae (London, 1819-1820). He died on the 13th of November 1836. The "Simeon Trustees" were instituted by him for the purpose of acquiring church patronage in the interests of evangelical views.

SIMÉON, JOSEPH JÉRÔME, COMTE (1740-1842), French jurist and politician, was born at Aix on the 30th of September 1749. His father, Joseph Sextius Siméon (1717-1788), had been private secretary of the commander in chief of the French army. J. J. Siméon followed his father's profession, but he was outlawed for his share in the federalist movement in 1793, and only returned to France after the revolution of Thermidor. In the council of the Five Hundred, of which he was now a member, he took the conservative side. In 1799, for protesting against the invasion of the chamber by P. F. C. Augereau, he was imprisoned until the 18th Brumaire (9th November). In the Tribunate he had an important share in the preparation of the Civil Code, being rewarded by a seat in the council of state. In 1807 he was one of the commissioners sent to organize the new kingdom of Westphalia, and was premier of King Jerome. He served the Restoration as councillor of state and in the chamber of peers. In 1820 he was under-secretary of state for justice, and in the next year minister of the interior until the fall of the Richelieu ministry. A baron of the Empire and count at the second Restoration, he was admitted to the Academy of Moral and Political Science in 1834, and in 1837 he became president of the Cour des Comptes. He died in Paris on the 10th of January 1842 in his 83rd year.

His son, Joseph Baltasar, Comte Siméon (1781-1846), entered the diplomatic service under the Empire. At the Restoration he was successively prefect of Var, Dombes and Pas de Calais. He was director-general of fine arts in 1828, and had a great reputation as a connoisseur and collector.

SIMEON STYLITES, ST (300-459), the first and most famous of the Pillar-hermits (Gr. στύλος, pillar), was born in N. Syria. After having been expelled from a monastery for his excessive austerities, at thirty years of age he built a pillar six feet high on which he took up his abode. He made new pillars higher and higher, till after ten years he reached the height of sixty feet. On this pillar he lived for thirty years without ever descending. A railing ran round the capital of the pillar, and a ladder enabled his disciples to take him the necessities of life. From his pillar he preached and exercised a great influence, converting numbers of heathen and taking part in ecclesiastical politics. The facts would seem incredible were they not vouchsafed for by Theodoret, who knew him personally (Historia religiosa, c. 26). Moreover, Simeon had many imitators, well authenticated Pillar-hermits belonging mostly to the 6th century.

The standard work on the subject is Les Stylistes (1895), by H. Delehaye, the Bollandist; for a summary see the article "Säulen-heilige," in Herzog's Realencyclopaedie (ed. 3). On Simeon see Th. Nolde, Leben Thomas de Stillich (1852); Annals," (1895), p. 210, and the Dictionary of Christian Biography.

SIMFEROPOL, a town of Russia, capital of the government of Taurida, in the S. of the Crimea, 78 m. by rail N.E. of Sevastopol and 500 from Moscow. Pop. (1897) 62,876. It occupies an admirable site on the N. slopes of the Chatyr-dag Mountains, and is divided into two parts—the European, well built in stone, and the Tatar, with narrow and filthy streets peopled by some 7000 Tatars and by Jews. Although it has grown since the railway brought it into connexion with the rest of the empire, it still remains a mere administrative centre. It is the see of a bishop of the Orthodox Greek Church and the headquarters of the 7th Russian army corps. There are a museum and monuments to Dolgoruki, conqueror of the Crimea, and to the empress Catherine II. (1890). The town is famous for its fruit.

In the neighbourhood stood the small fortress of Napoli, erected by the ruler of Taurida some hundred years before the Christian era, and it existed until the end of the 3rd century. Afterwards the Tatar settlement of Ak-mechet, which in the 13th century was the residence of the chief military commander of the khan, had a town called Akmechet. In 1735 it was taken and burnt by the Russians, and in 1784, after the conquest of the Crimea by the Russians, it received its present name and became the capital of Taurida.

SIMLA, a town and district in British India, in the Delhi division of the Punjab. The town is the summer residence of the viceroy and staff of the supreme government, and also of the Punjab government. It is 58 m. by cart-road from the railway station of Kalka, which is 1116 m. from Calcutta. A metre-gauge railway, 68 m. long, was opened from Kalka to Simla in 1890. Simla was the residence of the chief military commander of the khan, had a town called Akmechet. In 1735 it was taken and burnt by the Russians, and in 1784, after the conquest of the Crimea by the Russians, it received its present name and became the capital of Taurida.
become the permanent headquarters of many of the official establishments. During the season Simla is the focus of Indian society and viceroyal and other halls, and entertainments of every description, are frequent. Simla is the headquarters of a volunteer rifle corps, and there are numerous libraries and institutes, of which the chief is the United Service Institution, with a subsidy from government. The two chief medical institutions are the Ripon and Walker hospitals. There are a theatre, concert room and numerous churches. Educational institutions include Bishop Cotton's school for boys, the Mayo industrial school for girls, several aided schools for European boys and girls, and two Anglo-vernacular schools for natives.

The Lawrence military arsenals are at Sanawar, near Kasauli.

The Drang-e-Sirh in the area of 101 sq. m., and had a population in 1911 of 15,100. The passes of Simla through the surrounding native states compose the Outliers of the great central chain of the Himalaya. They descend in a gradual series from the main chain to the general level of the Punjab plain, forming a transverse S.W. spur between the great basins of the Ganges and the Indus. S. and E. of Simla the hills between the Satlej and the Tons centre in the great peak of Chor, 11,082 ft. above sea-level. Throughout all the hills forests of deodar abound, while rhododendrons clothe the slopes up to the limit of perpetual snow. The principal rivers are the Satlej, Pabbar, Giri, Gambhir and Simla. The Satlej matches the territory forming the district dates from various times subsequent to the close of the Gurkha War in 1816, which left the British in possession of the whole tract of hill-country from the Gogra to the Satlej. Kumaon and Dehra Dun were annexed to the British dominions; but the rest, with the exception of a few localities retained as military posts and a portion sold to the raja of Patiala, was restored to the hill races, from whom it had been wrested by the Gurkhas.

Garhwal state became attached to the North-Western Provinces; but the remaining principalities rank among the dependencies of the Punjab, and are known collectively as the Simla Hills States, under the superintendence of the deputy-commissioner of Simla, subordinate to the commissioner at Umballa. The chief of the Simla Hill States—which number 28 in all—are Jubbals, Bashah, Keonthal, Bahlal, Bilaspur and Hindur.

SIMLER, JOSIAS (1530-1576), author of the first book relating solely to the Alps, was the son of the former prior of the Cistercian convent of Kapell (Canton of Zürich), and was born at Kapell, where his father was the Protestant pastor and schoolmaster till his death in 1537. In 1544 Simler went to Zürich to continue his education under his godfather, the celebrated reformer, Heinrich Bullinger. After having completed his studies at Basle and Lausanne, he returned to Zürich, and acted as a pastor in the neighbouring villages. In 1552 he was made professor of New Testament exegesis at the Carolinum at Zürich, and in 1556 became professor of theology. In 1559 he had his first attack of gout, a complaint which finally killed him. In 1555 he published a new edition of Conrad Gesner's Epitome of his Bibliotheca universalis (a list of all authors who had written in Greek, Latin or Hebrew), in 1574 a new edition of the Bibliotheca itself, and in 1575 an annotated edition of the Antiquitatem Itinerarium. About 1551 he conceived the idea of making his native land, as yet unknown to us, by translating into Latin parts of the great Chronik of Johann Stumpf. With this view he collected materials, and in 1574 published a specimen of his intended work in the shape of a monograph on the Canton of the Valais. He published in the same volume a general description of the Alps, as the Introduction to his projected work on the several Swiss Cantons. In this treatise, entitled De Alpibus commentarius, he collected all that the classical authors had written on the Alps, adding a good deal of material collected from his friends and correspondents. This Commentarius is the first work exclusively devoted to the Alps, and sums up the knowledge of that region possessed in the 16th century. It was republished by the Elzevirs at Leiden in 1613, and again at Zürich, 1729, while an elaborate annotated edition (prepared by Mr Coddige), with French translation, notes and appendices, appeared at Grenoble in 1904. Another fragment of his vast plan was the work entitled De Helvetiorum republica, which appeared at Zürich in 1576, just before his death. It was regarded as the chief political authority on Swiss constitutional matters up to 1789.

See lives by G. von Wycz (Zürich, 1853), and in Mr Coddige's book, pp. cxxvii-cclviii.

SIMMONS, EDWARD EMERSON (1832— ), American artist, was born at Concord, Massachusetts, on the 27th of October 1852. He graduated from Harvard College in 1874, and was a pupil of Lefebvre and Boulanger in Paris, where he took a gold medal. He was awarded the prize by the Municipal Art Society of New York for a mural decorative scheme, which he carried out for the criminal courts building, later decorating the Waldorf-Astoria hotel in New York, the War Department, Washington, and the Capitol at Springfield, Minnesota. He was one of the original members of the Ten American Painters.

SIMMS, WILLIAM GILMORE (1806-1870), American poet, novelist and historian, was born at Charleston, S.C., on the 17th of April 1806 of Scoto-Irish descent. His mother died during his infancy, and his father having failed in business and joined Coffee's Indian fighters, young Simms was brought up by his grandmother. He was clerk in a drug store for some years, and afterwards studied law, the bar of Charleston admitting him to the bar of South Carolina in 1830. He has also been Registrar of the trial of the 1861, 1862. He has also been Registrar of the trial of the American Civil War Simms espoused the side of the Secessionists in a weekly newspaper, and suffered damage at the hands of the Federal troops when they entered Charleston. He served in the state House of Representatives in 1844-1846, and the university of Alabama conferred on him the degree of LL.D. He died at Charleston on the 11th of June 1870.

In addition to the works mentioned above, Simms published the following:—Southern Passages and Scenes (1838), a collection of poems and descriptive poems (New York, 1839); Donna Florida, a tale (Charleston, 1843); Grouped Thoughts and Scattered Fancies, sonnets (Richmond, 1845); Areytos, or Songs of the South (1846); Last Days of the South (1848); Simms' Last Days of the South (1851); The War with Mexico (Charleston, 1848); The Eye and the Wing, poems, (New York, 1848); The City of the Silent (1850); To dramatic literature he contributed Norman Maurice, or the Drug of the Devil (Richmond, 1851); and Michael Bonham, or the Fall of the Alamo (Richmond, 1852). His romances of the American Revolution—The Puritan (1838); Medlicampe (1838); Katherine Walton, or the Rebel of Dorchester (1841); and others—describe social life at Charleston, and the action covers the whole period, with portraits of the political and military leaders of the time. Of border tales the list includes Guy Rivers, a Tale of Georgia (1843); Richard Hurds and Blue Finches and Other Border Ballads (Richmond, 1845); The Golden Christmas (1852); and Charlemon (1856). The historical romances are The Yamassse (1835), dealing largely with Indian character and nature; Pelayo (1838); Count Julien (1845); The Damned of Darton (1845); The Lily and the Tom, Vitzconslot (1857), which he wrote under the assumed name of "Frank Cooper"; and The Cassique of Kiawah (1860). Other novels are Carl Werner (1838); Confession of a Blind Heart (1842); The Vagabond and the Cabin, a collection of short tales (1845-1846); Castle Dismall (1845); and Marie de Bernière (1853). Simms's other writings comprise a History of S. Carolina (Charleston, 1840); South Carolina in the War of Southern Independence (1843); the biographies of Charles Pinckney (1843); lives of Francis Marion (New York, 1844); Capt. John Smith (1846); The Chevalier Bayard (1848) and Nathaniel Green (1849); The Ghost of my Husband (1866); and War Poetry of the New World (1866). Simms also edited various reviews, and was a contributor to the magazines and literary papers, six of which he founded and conducted. In the discussion on slavery he upheld the views of the pro-slavery party. He edited the seven dramas doubtless fully ascribed to Shakespeare, with notes and an introduction to
each play. Simms' works in 10 vols. were published at New York in 1882; his Poems (2 vols., New York) in 1883.

See his biography (Boston, 1892), by Professor William P. Trent. A bibliographical List of the Separate Writings of W. G. Simms of South Carolina (New York, 1896) was compiled by G. W. Symonds.

SIMNEL, LAMBERT (fl. 1477-1534). English impostor, was probably the son of a tradesman at Oxford. He was about ten years old in 1487, and was described as a handsome youth of intelligence and good manners. In 1486, the year following the accession of Henry VII, rumours were disseminated by the adherents of the Yorkist dynasty that the two sons of Edward IV., who had been murdered in the Tower of London, were still alive. A young Oxford priest, Richard Symonds by name, conceived the project of putting forward the boy Simnel to impersonate one of these princes as a claimant for the crown, with the idea of thereby procuring for himself the archbishopric of Canterbury. He set about instructing the youth in the arts and graces appropriate to his pretended birth; but meanwhile a report having gained currency that the young earl of Warwick, son of Edward IV.'s brother George, duke of Clarence, had died in the Tower, Symonds decided that the impersonation of this latter prince would be a more easily credible deception. It is probable that Symonds acted throughout with the connivance of the Yorkist leaders, and especially of John de la Pole, earl of Lincoln, himself a nephew of Edward IV., who had been named heir to the crown by Richard III. The Yorkists had many adherents, and Simnel, Lambert Simnel was taken by Symonds early in 1487; and, gaining the support of the earl of Kildare, the archbishop of Dublin, the lord chancellor and a powerful following, who were, or pretended to be, convinced that the boy was the earl of Warwick escaped from the Tower, Simnel was crowned as King Edward VI. in the cathedral in Dublin on the 24th of May 1487. Messages asking for help were sent to Margaret, duchess of Burgundy, sister of Edward IV., to Sir Thomas Broughton and other Yorkist leaders.

On the 2nd of February 1487 Henry VII. held a council at Sheen, and measures were taken for dealing with the conspiracy. Elizabeth Woodville, wife of Edward IV., was then confined in the convent of Bermondsey; and the real earl of Warwick was taken from the Tower and shown in public in the streets of London. But although Lincoln is said to have conversed with Warwick on this occasion, he fled abroad immediately after the council at Sheen, where he was present. In Flanders, Lincoln joined Lord Lovell, who had headed an unsuccessful Yorkist rising in 1486, and in May 1487 the two lords proceeded to Dublin, where they landed a few days before the coronation of Lambert Simnel. They were accompanied by 2000 German soldiers under Martin Schwartz, procured by Margaret of Burgundy to support the enterprise, Margaret having recognized Simnel as her nephew. This force, together with some ill-armed Irish levies commanded by Sir Thomas Fitzgerald, landed in Lancashire on the 4th of June King Henry was at Coventry when the news of the landing reached him, and immediately marched to Nottingham, where his army was strengthened by the addition of 6000 men. The invaders met with little encouragement from the populace, who were not well disposed towards a monarch whom it was sought to impose upon them by the aid of Irish and German mercenaries. Making for the fortress of Newark, Lincoln and Sir John Moore, at the head of his forces, and accompanied by Simnel, attacked the royal army near the village of Stoke-on-Trent on the 16th of June 1487. After a fierce and stubborn struggle in which the Germans behaved with great valour, the Royalists were completely victorious, though they left 2000 men on the field; Lincoln, Schwartz and Fitzgerald with 4000 of their followers were killed, and Lovell and Broughton disappeared never to be heard of again. The priest Symonds, and Simnel were taken prisoners. The former was consigned to a dungeon for the rest of his life; but Henry VII., recognizing that the youthful pretender had been a tool in the hands of others and was himself harmless, pardoned Lambert Simnel and took him into his own service in the menial capacity of scullion. He was later promoted to be royal falconer and is said to have afterwards become a servant in the household of Sir Thomas Lovell. The date of Simnel’s death is unknown, but he is known to have been still living in the year 1534.

SIMOCATTA, THEOPHYLACT, Byzantine historian, a native of Egypt, flourished at Constantinople during the reign of Heraclius (610-640), under whom he held the office of imperial secretary. He is best known as the author of a history, in eight books, of the reign of the emperor Maurice (582-602), for which period he is the best and oldest authority. The work describes the wars with the Persians, the Avars and Slavs, and the emperor’s tragic end. “His want of judgment renders him diffuse in trifles and concise in the most interesting facts” (Gibbon), but his general trustworthiness is admitted. The history contains an introduction in the form of a dialogue between History and Philosophy. Photius (cod. 65) while admitting a certain amount of gracefulness in the language, blames the author’s excessive use of figurative and allegorical expressions and moral sentiments. While the vocabulary contains many strange and affected words, the grammar and syntax are on the whole correct (ed. pr. by J. Pontanus, 1609; best edition by C. Boor, 1887, with a valuable Index Graecitatis).

Simocatta was also the author of Physical Problems (Areopagii graecij) in dialogue form, dealing with the nature of animals and especially of man (ed. J. Ideler in Physici et medici Graecij minores, i. 1841); and a collection of 85 short stories (Vita minores, morali, rustic, erotic), the supposed writers of which are either fictitious or well-known personages (Antithenes to Pericles, Socrates to Plato, Socrates to Alcibiades). The best edition is by R. Hercher in Epistolographiae Graeci (1873). Afterwards he was converted to Latin (1509) by Copernicus (reprinted 1873 by F. Hippler in Speculum Copernicanum).

See C. Krumbacher, Geschichte der byzantinischen Literatur (1897).

SIMON, ABRAHAM (1622-1692), English medalлист and modeller, was born in Yorkshire in 1622. He was originally intended for the church, but turned his attention to art, and, after studying in Holland, proceeded to Sweden, where he was employed by Queen Christina, in whose train he travelled to Paris. He returned to England before the outbreak of the Civil War, and attained celebrity by his medals and portraits modelled for Earl of Pembroke. During the Commonwealth he executed many medals of leading parliamentarians, and at the Restoration he was patronized by Charles II., from whom he received a hundred guineas for his portrait designed as a medal for the proposed order of the Royal Oak. Having incurred the displeasure of the duke of York, he lost the favour of the court, and died in obscurity in 1692. Among the more interesting of his medals are those of the 2nd earl of Dunfermline, the 2nd earl of Lauderdale and the 1st earl of Loudon; that of the duke of Albemarle, and many other fine medals, were modelled by Abraham Simon and chased by his brother Thomas Simon (q.v.).

SIMON, SIR JOHN (died 1523), English reformation reformer, was born in London on the 10th of October 1816. His father, Louis Michael Simon, was for many years a leading member of the London Stock Exchange. Both his grandfathers were French emigrants, who carried on business in London and Bath respectively. His father died at almost ninety-eight, and his mother at nearly ninety-five years of age. Simon was educated at a preparatory school in Pentonville, spent seven years at Dr Burney’s school in Greenwich, and then ten months with a German Pfarrer in Rhens Chussia. His father intended him for the church, and he began the study of medicine on 1st October 1833, when he was about seventeen. He was an apprentice of Joseph Henry Green, the distinguished surgeon at St Thomas’s, well known for his friendship for Samuel Taylor Coleridge, whose literary executor Green became. He became 1 Other forms of the name are Simocattis, Simocatos, Simocates.
a demonstrator of anatomy, and was assistant surgeon to King's College Hospital for several years; and in the autumn of 1847, he was appointed surgeon and lecturer on pathology at his old school, St Thomas's, where, with progressive changes, he continued to remain an officer. His life was divided between two great pursuits—the career of a surgeon, and the mastery and solution of many of the great problems of sanitary science and reform. In the spring of 1844 he gained the first Astley Cooper prize by a physiological essay on the thymus gland, and the following year was elected a fellow of the Royal Society. In 1847 he gave his first lecture at St Thomas's Hospital, on the "Aims and Philosophical Method of Pathological Research," followed a little later by lectures on general pathology in relation to the principles of diagnosis, and the treatment of disease. These lectures filled a great want, and though all important in directing energy into new and profitable channels of work. Simon published many clinical surgical lectures of the greatest importance, and contributed a masterly article on "Inflammation" to Holmes's System of Surgery, which has become a classic of its kind. It was, however, on his appointment in 1848 as medical officer of health to the City of London, and afterwards to the government, that Simon's great abilities found scope for congenial exercise. He stimulated and guided the development of sanitary science, until it reached in England the highest degree of excellence, and gave an example to the civilized world. It is impossible to overestimate the value of Sir John Simon's work, or the importance of his influence in the furtherance of the public health and the prevention of disease, and in inculcating right methods of medical government. In 1878, after filling other offices in the Royal College of Surgeons, he became its president, and in 1887 was created K.C.B. It was largely due to his advocacy that the new St Thomas's Hospital was rebuilt on its present site after it was compelled to leave its old habitation near London Bridge. As a surgeon, Simon's work seconded to his interest in sanitary science, but he claimed priority over Cock in the operation of peripheral puncture of the menetha in cases of retention from stricture. He died on the 23rd of July 1904. (W. MacC.)

**SIMON, JULES FRANÇOIS** (1814-1860), French statesman and philosopher, was born at Lorient on the 27th of December 1814. His father was a linen-draper from Lorraine, who abjured Protestantism before his second marriage, of which Jules Simon was the son, with a Catholic Breton. The family name was Suisse, which Simon dropped in favour of his third prenomen. By dint of considerable sacrifice he was able to attend a seminary at Vannes, and was for a short time usher in a school before, in 1833, he became a student at the École Normale, Paris. Thence he came into contact with Victor Cousin, who sent him to Caen and then to Versailles to teach philosophy. He helped Cousin, without receiving any recognition, in his translations from Plato, and in 1839 became his deputy in the chair of philosophy at the Sorbonne, with the meagre salary of 83 francs per month. He also lectured on the history of philosophy at the École Normale. At this period he edited the works of Malebranche (2 vols., 1842), of Descartes (1842), Bossuet (1842) and of Arnauld (1843), and in 1844-1845 appeared the two volumes of his Histoire de l'école d'Alexandrie. He became a regular contributor to the Revue des deux mondes, and in 1847, with Amédée Jacques and Émile Saissat, founded the Libérate de penser, with the intention of throwing off the yoke of Cousin, but he retired when Jacques allowed the insertion of an article advocating the principles of collectivism, with which he was at no time in sympathy. In 1848 he represented the Côtes-du-Nord in the National Assembly, and next year entered the Council of State, but was retired on his republican opinions. His refusal to take the oath of allegiance to the government of Louis Napoleon after the coup d'état was followed by his dismissal from his professorship, and he devoted himself to philosophical and political writings of a popular order. Le Devoir (1853), which was translated into modern Greek and Swedish, was followed by La Religion naturelle (1856, Eng. trans., 1887), La Liberté de conscience (1857), La Liberté politique (1859), La Liberté civile (1859), L'Outrrière (1861), L'École (1864), Le Travail (1866), L'Outrierre de huit ans (1867) and others. In 1863 he was returned to the Corps Législatif for the 8th circonscription of the Seine, and supported "les Cinq!" in their opposition to the government. He became minister of instruction in the government of National Defence on the 5th of September 1870. After the capitulation of Paris in January 1871 he was sent down to Bordeaux to prevent the resistance of Gambetta to the peace. But at Bordeaux Gambetta, who had issued a proclamation excluding from the elections officials under the Empire, was all powerful. He affected to dispute Jules Simon's credentials, and issued orders for his arrest. Meanwhile Simon had found means of communication with Paris, and on the 6th of February was reinforced by Eugène Thiers, who negotiated with Gambetta. Thiers resigned, and the ministry of the Interior, though nominally under Arago, was really in Simon's hands. He was appointed to the Seine, he sat for the Marne in the National Assembly, and resumed the portfolio of Education in the first cabinet of M. Thiers's presidency. He advocated free primary education yet sought to conciliate the clergy by all the means in his power; but no concessions removed the hostility of Mgr. Duflanpoub, who presided over the commission appointed to consider his draft of an elementary education bill. The reforms he was actually able to carry out were concerned with secondary education. He was minister of the French Academy and a life senator, and in 1876, on the resignation of M. Dufaure, was summoned to form a cabinet. He replaced anti-republican functionaries in the civil service by republicans, and held his own until the 3rd of May 1877, when he adopted a motion carried by a large majority in the Chamber inviting the cabinet to use all means for the repression of clerical agitation. His clerical enemies then induced Marshal MacMahon to take advantage of a vote on the press law carried in Jules Simon's absence from the Chamber to write him a letter regretting that he no longer preserved his influence in the Chamber, and thus practically demanding his resignation. His resignation in response to this act of the president, known as the "Seize Mai," which he might have resisted by an appeal to the Chamber, proved his ruin, and he never again held office. He justified his action by his fear of providing an opportunity for a coup d'état on the part of the marshal. The rejection (1880) of article 7 of Ferry's Education Act, by which the profession of teaching would have been forbidden to members of non-authorised congregations, was due to his intervention. He was in fact the chief of the left centre opposed to the radicalism of Jules Grévy and Gambetta. He was director of the Gaulois from 1879 to 1880, and his influence in the country among moderate republicans was retained by his articles in the Matin from 1882 onwards, in the Journal des Débats, which he joined in 1886, and in the Temps from 1890.

He left accounts of some of the events in which he had participated in Souvenirs du 4 septembre (1874), Le Gouvernement de M. Thiers (2 vols., 1875), in Mémoires des autres (1889), Nous, Nourriers autres (1890) and Les Enfants du peuple (1897), while his sketch of Victor Cousin (1887) was a further contribution to contemporary history. For his personal history the Premiers mémoires (1900) and Le Soir de ma journée (1902) invited. His son Gustave Simon may be supplemented by Léon Séchê's Figures bretonnes, Jules Simon, sa vie, son œuvre (new ed., 1898), and G. Picot, Jules Simon: notice historique . . . (1897); also by many references to periodical literature and collected essays in Hugo P. Thieme's Guide bibliographique de la litt. franç. de 1800 à 1906 (1907).
SIMON MAGUS ("Simon the Magician"; Gr. μάγος, a wizard), a character who appears in the New Testament and also in the works of the Christian Fathers. In Acts 8:9-24, he is portrayed as a famous sorcerer in Samaria who had been converted to Christianity by Philip. His personality has been the subject of considerable discussion. The conclusions to which the present writer has been led are mainly as follows: (1) that all we know of the original Simon Magus is contained in Acts; (2) that from very early times he has been confused with another Simon; (3) that the idea that Simon Magus is merely a distortion of St Paul is absurd.

As regards the story of Acts viii. 5-24, it will suffice to make a few remarks. First it is interesting to note that Simon Magus was older than Philip and the twelve other missionary enterprises of the nascent Church brought it into conflict with Simon the Magian who had for a long time amazed the people of Samaria with his sorceries (c. 11). This person gave himself out to be "some great one," but the popular voice defined him as "this man is that power of God which is called Great." Such a voice of the people cannot be imagined in Judea, but Samaria was more accessible to the influence of Greek ideas. Readers of Philo are familiar with the half-philosophical and half-mythological mode of thought by which the "powers of God" are substantially defined into independent personalities. There were powers of all sorts, powers to help and powers to slumber and all punishment (Philo, ii. 431). It was through these powers that the incorporeal soul of Simon was thought to be framed, which served as the archetype of this world of phenomena. The various powers are sometimes summed up under the two heads of good and evil, which are made over to the two names κόσμος and θέα. Which of them — if it is lawful at all to argue from Alexandria to Samaria — is to be identified with Simon remains a problem. "We have no means of deciding. Notwithstanding his own success as a magician, Simon Magus was amazed in his turn by the superior power of Christianity. But he did not understand that this power was not to be self-seeking, and his offer of money to Judas to induce him to confer the gift of the Holy Ghost, has branded his name for ever through the word of the "sorcerer" (Gr. μάγος). He was, however, a baptized Christian, and was instructed with meekness the rebuke of Peter. The last that we hear of him is that he was cast out of the city which shut his doors to him. Had the writer of Acts known anything of his subsequent adventures, he might certainly have been expected to give some hint of them. There is no reason for identifying him with Simon Magus of Acts with the Simon, also a magician, who was a friend of Felix, and employed by him to tempt Drusilla away from her husband Azizus, the king of the Emeset. The name Simon was common, and so was the claim to magical powers. But the Simon of Josephus (Ant. xx. 7) § 2 is expressly declared to have been a Jew and a native of Cyprus. The Apostolic Fathers say nothing about Simon Magus, but Justin seems to get startling developments. In his First Apology, writing c. 165, he tells us that he had heard from a man named Simon, a Samaritan, from a village called Gitta or Gittae (see Ency. Bibl. iv. col. 4538), performed such miracles by magic arts as to cause confusion in Samaria. He says that he was regarded as a god and honoured with a statue "in the river Pithon, over the two bridges, having an inscription in Latin as follows: Simon Dunacto. And almost all the Samaritans," he goes on to say, "of both sexes and all ages, were at the same time and in the same school of Simon, the first God. And one Ileden, who went about with him at that time, who before had had her stand in a brothel, they say was the first thought that was brought into being by him. (Apol. i. 26. 1-3). Justin goes on to speak, as from personal knowledge, of the feats of magic performed by Menander, another Samaritan and a disciple of Simon's, who persuaded his fellows that they would never die. After Menander Justin proceeds to speak ofMarcion, who was still teaching at the time. The follower of Simon Magus, of Menander and of Marcion, he says, were all called Christians, but so also Epicureans and Stoics were alike called philosophers. The name "Christian" was given to these men, who were of the Roman people that he was worshipped as a god and honoured with a temple at Rome. These men he says were called heresies that there had been, which he was willing to present to the imperial family (Apol. i. 26. 4-8). As Justin was himself a Samaritan it is natural that his fellow-countrymen should bulk largely in his eyes. Accordingly we find him reverting to Menander and Menander in a later passage of the same Apology, where he repeats that in the royal city of Rome, in the time of Claudius Caesar, Simon Magus and the other heretics, there were among the Roman people that he was worshipped as a god and honoured with a temple at Rome. These men he says were called heresies that there had been, which he was willing to present to the imperial family (Apol. i. 56), which Justin petitions to have taken down. In the Second Apology also there is a passage which seems mutilated or misplaced. In the original text it is cited as a speech of Simon the Magian who had been sent to the apostles to refute the heretical and misleading teaching of the Simonians in his own nation" (Apol. ii. 15. 1). In the Dialogue (349 c. ch. 120) he prides himself on the kind of love which he had displayed in the Apology. "For," he says, "I, Simon, may regard even for any of my own nation, but said that they were deceived by trusting in a magician of their own race, Simon, whom
images of Simon under the form of Zeus, and of Helen under that of Athena. They were called Simonian, and were the introducers of *knowledge falsely so called*. In the next chapter Irenaeus speaks of a new and strange philosophy having sprung up among the Jews, and as having, like him, attained to the highest pitch of magic. His doctrine is represented as being the same as that of Simon, only that it was *he* this time who was the saviour of the world.

The tenets of Simon were not wholly left out of the hand of the Jews, who, that Mount Gerizim once more be set up against Jerusalem, and that a bold bid was being made by the hated Samarian, to boldly emblazon their religious pretensions as well as Christians. But before such an amalgam of paganism and Christianity could be propounded, it is evident that Christianity must have been for some time before the world, and that the syncretism was traced back beyond Simon. In the same early struggle between Jewish and Samaritan universalism, involving as it did a struggle of religion against magic, that is really symbolized under the wild traditions of the contest between Peter and Heracles.

Tertullian is fond of alluding to Simon Magus. He says that he offered money for the Holy Spirit (De fuga, 12; De anima, 34), that he was cursed by the Apostles and expelled from the faith (Tertullian. (De idol. 9), that he consolled himself for the loss of the Spirit by the purchase of Helen of Tyre (De an. 34), that he was honoured at Rome with a statue bearing the inscription "Sancti Dei Spiritus". This was condemned by Peter (De praescr., 33), and that in his own day (he died in a.D. 220) the followers of Simon professed to raise the souls of prophets from the dead (De anima, 57). In a list of heretics Mark, Simon Magus, and Simon the Magician, amongst whom we may take as standing respectively for Jewish and Samaritan types of Christian heresy (De praescr., 10). But the important question is, does Simon Magus appear in this document as representing his own sect, or is it evident, as is generally supposed, that it is derived from the same source as that of Irenaeus. The pseudo-Tertullian in the short treatise *Against all Heretics* lets us know that the being whom the Most High God came down to seek was Simon Magus, and that a great uncertainty still exists upon the question between Simon and Valentins. In the Clementine *Homilies* (ii. 25) it is said that Simon called Helen *ovia*

We now come to the important testimony of Hippolytus (c. a.D. 212-222). In his *Refutation of all Heresies* he gives a parallel account as Irenaeus with certain slight differences, which indicate a common source rather than direct borrowing. Hippolytus was strongly opposed to the *Tome* of the first Father, which in Justin is *tornas* and in the Irenaeus is *inconditio* (De praescr., 33). This is again a striking indication of the likeness of the Simonians. *Hippolytus* speaks in language similar to that of Irenaeus about the variety of magic arts practised by the Simonians, and of also having imitating Simon and Helen under the forms of Zeus and Athena. But here he has a significant addition. If any one, on seeing the images either of Helen or of Simon, professed to be possessed of Helen, he stood as showing ignorance of the mysteries. From this it is evident that the Simonians did not allow that they worshipped their founders. Lippius conjectured that the supposed worship of Simon and Helen was that of Hermes-Merkel and Selene-Aetnra. Baur before him made Simon Σίμων, the Sun. In the Clementine *Reconstructions* Helen is called Luna (ii. 8, 9), and in the *Homilies* she is mysteriously connected with the lunar month (Hom. ii. 23).

Hippolytus, like the rest, identified Simon of Egypt (Simon ο ᾿Αιγύπτιος, vi. 7) with Simon Magus. Reduced to despair, he says, by the curse laid upon him by Peter, he embarked on the career of an impostor. Until the time of Pope Fabian the name of the Apostles. Peter withstood him on many occasions. At last he came (here some words are missing) and began to teach sitting under a plane tree. When he was on the point of being shown up, he said, in order to gain time, that he was being buried and rose again on the third day. So he bade that a tomb should be dug by his disciples and that he should be buried in it. Now they did what they were ordered, but he remained there until now for he was the Christ of the Gentiles.

Prefixed to this account of Simon, which, except in its dramatic close, so nearly tallies with that of Irenaeus, is a description of a book of Aelian which is lost. The rivalry between Jews and Samarians becomes evident (cf. Recop. i, 57).

The account given by Irenaeus should be compared with what is said of Simon in the Clementine *Homilies*, ii, 22, where the rivalry between Jews and Samarians becomes evident (cf. Recop., i, 57).

On this see Epiph. xxii, 3. Later on this free love doctrine was held by them in its frankest form.

The longest extract from it is in vi, 18, but others occur here and there, and, though not explicitly quoted, it still underlies the statements of Hippolytus. It is written in a mystical and pretentious style, like that of Irenaeus. It is not a translation, but, when the context and the method of the time, is by no means to be despised. As Hippolytus himself in more than one place (iv. 51, vi. 20) points out, it is an earlier form of the Valentinian doctrine, but there are things in it that have derived from the Gnostics, or, rather, the Bart. 14.

Starting from the assertion of Moses that God is "a devouring fire" (iv. 24), Simon Magus declared that "He is a fire which makes fire the first principle of all things. This first principle he denominated a "power without end" (βασιλείας αἰώνων), and he declared it to dwell in the sons of men, being the first fashioner of all things. Simon professed to have been taught all this by a heavenly angel. From this doctrine the world-wide religion springs of which we know, whereof there were six roots, having each its inner and its outer side, and arranged in pairs (συνεργάζασθαι) as follows: 1. πατέρας and εὕτροπος, own, father and common, a father, 2. ἄλλοι and σειρά, generation and inheritance, 3. ἐνόπλος and διήνυστος, a conqueror and a wanderer. These six roots are also called six powers. Conmingled with them all was the great power, the "power without end." This was that which was professed to have been delivered to Simon Magus, who was probably older than Jesus Christ, potentially in every child of man, and might be developed in each to its own immunity. The small might become great, the point be enlarged to infinity (iv. 51, v. 9, vi. 14). This indivisible point that he called God was before all the world the First Power; it was the Kingdom of Heaven, and the grain of mustard-seed (v. 9). But it rested with us to develop it, and it is this responsibility which was laid upon Simon Magus. Thus the "root of all things" may not be condemned with the world (i Cor. xl. 32). If for the above reasons these roots were not actualized in us, it would not survive the death of the body. "The axe," he said, "is nigh to the roots of the tree. Every tree which, when touched with good fruit is cut down and cast into the fire." (cf. Matt. iii. 10).

The whole book is a queer mixture of Hellenism and Heresism, in which the same method of allegory is applied to Homer and Hesiod as to Moses and the Prophets. There is no attempt to give a system, but either a God whatever he may be, or a Christ whatever he may be, will give the free will, divided between above and below, self-generating, self-increasing, self-seeking, self-finding, being its own mother, its own father, its own sister, its own offspring, its own daughter, its own son, father, an abstract unity, being the root of all things" (Hipp. Ref. O. H. vi. 17). That a learned man like Hippolytus should refer a work which contains quotations from the Epistles and Gospels of Simon Magus, who was probably older than Jesus Christ, shows the extent to which men can be blinded by religious bigotry.

Next in order comes Origen, who was ordained priest in a.D. 231 (Eus. H. E. vi. 23, 26). The most interesting point in his evidence is the date of his knowledge of Simon Magus. This date is significant, for it is at a time when Simon Magus as a world religion. After speaking of Dositheus the Samaritan, who persuaded some of his countrymen that he was the Christ of the Gentiles, Origen says: "Thus was a magician, wished to flock away some by his magic. But at the time indeed he succeeded in his deception, but now I suppose it is not possible to find 50 Simonians altogether in the world; and perhaps I have put to brute birds, exhausted it really. But in Palestine there are very few, and in the rest of the world, in which he wished to spread his own glory, his name is nowhere mentioned. If it is, this is due to the Acts of the Apostles. It is the Christians who say what is said about him, and it has become plain as day (§ ἑλπίζω) that Simon was nothing divine" (Origen, Cont. Cels. i. 57). Origen also mentions that some of the sect were called "Gnostics" (ii. 7).

The treatise of the pseudo-Cyprian *De Rebaptismate* is assigned by some to about a.D. 260. The writer says that on the strength of the words of John, that "we were to be baptized with the baptism of Jesus," he concludes that the orthodox baptism was a mere form, and that they had the real baptism, for, as soon as their neophytes went down into the water, a fire appeared on it. The writer does not display much thought; he is a natural philosopher, or a natural phenomenon, or a piece of self-deception, or an effect of magic? In advocacy of this baptism, we are told, there was compelled by the same heretics a book which was inscribed the *Reaching of Paul*.

Arnobius (early in the 3rd century) introduces us to a new phase of the Simon-legend. "They had seen," he says, "the car of Simon Magus, who was driven away from us by the angel of Christ. They had seen, I say, him who trusted in false gods and was betrayed by those gods in their fear, brought headlong down by his own weight, lie with burning car, and afterwards be cast into a lake by suffering and

SIMON MAGUS

shame, fling himself down once more from the gable of a lofty roof."

The immediate sequel shows that belief in this story was confined to Christians.

Eusebius (about A.D. 264-340) follows Justin Martyr and Ireneaus, but he adds the statement, which is not derived from them, that Peter never went to Rome at the reign of Claudius. From Origen's statement one might have thought that the Simonians would have dwindled out altogether by the time of Eusebius. But they were still extant in his time, and there is no sect of which such an account is given as that of Simonians. Eusebius's account of Menander (iii. 26) is also based upon Justin and Ireneaus.

Cyril of Jerusalem (A.D. 346) in the sixth of his Catechetical Lectures prefaces his history of the Manichaeans by a brief account of earlier heresies. Simon Magus, he says, was the father of all heresy. After being cast out by the Apostles he came to Rome, being joined by a prophet named Simon, and by the name of Helen, he gave out that it was he who appeared as the father on Mount Sinai, and afterwards, not in the flesh, but in appearance (ὀραμμα) as Jesus Christ, and, finally, as the Holy Ghost, according to the promise of Christ. His staying at Rome was so great that the emperor Claudius erected a statue to him with the inscription Simon Dei Sancto. The triumph of Simon Magus was terminated upon an appeal of Peter and Paul at Rome. Simon Magus had given out that he was going to be translated to heaven, and was actually carrying through the air in a chariot drawn by demons when Peter and Paul knelt down and prayed, and their prayers brought a miracle, and he fell down dead.

Such is the form assumed by the legend of Simon Magus about the middle of the 4th century. It is interesting to note in it the first introduction of Paul on the scene, at least by name. The reader who has the account of the eccentrics in the Testament of Tuthiel will doubtless be surprised to learn that the Paul who thus quietly slips in at the close of the drama was himself all along the disguised villain, and that Simon Magus whom he comes to assist Peter in destroying (see below).

Epiphanius (c. A.D. 367) is a writer who has nothing but his learning to recommend him. It seems that there were some Simonians still in his time, as he speaks of them as almost extinct. Gitta, he says, had sunk from a town into a village. He makes no mention of the Great Declaration, but as in several places he makes Simon speak in the first person, the inference is that he is quoting a saying of Simon's, not verbatim. Take, for instance, the following passage: "But in each heaven I changed my form," says he, "in accordance with the form of those who were in each heaven, that I might escape the notice of my angelic powers and come down to the earth. As for what I thought, who is none other than her who is also called Prounikos and Holy Ghost, through whom I created the angels, while the angels created the world and men." (56 C. D.). And again, "And on her account," he says, "did I come down; for this is that which is written in the Gospel 'the lost sheep'" (58 A.). Epiphanius further charges Simon with having tried to wrest the words of St. Paul about the armour of God (Eph. 6:10-17) into agreement with his own ideas of an identification of the" ennoia" with Athena. He tells us also that he gave barbaric names to the "principalities and powers," and that he was the beginning of the Gnostics. The Law, according to him, was not God, but God's power.

The same was the case with the prophets, and it was death to believe in the Old Testament. Epiphanius clearly has before him the idea of the "prophets of Baal," as he has quoted from the Great Declaration. The story of Helen is thus definitely shown to belong to the second Simon, and not at all to the first. Dr Salmon pointed out that Simon was known as a writer to the author of the Clementine Recognitions (ii. 38), and towards the close of the 4th century we find St Jerome quoting from him as such.2

Two points must by this time have become clear: (1) that our knowledge of the original Simon Magus is confined to what we are told in the Acts, and (2) that from the earliest times he has been confused with another Simon. The initial error of Justin was echoed by every subsequent writer, with the one exception of Hegesippus, who had perhaps not read him. There were, of course, obvious reasons for the confusion. Both Simons were Samaritans, both were magicians, and the second Simon being sought for by Herod was claimed for the earlier Simon by the people, namely, that he was the great power of God. But, if the end in view with the Fathers had been the attainment of truth, instead of the branding of heretics, they could not possibly have accepted the Great Declaration, which contains, as we have seen, the story of Helen, with its references to the Gospels, as the work of Simon Magus. As regards the third point, the difficulty is to make clear to the ordinary mind why it should be treated at all. But as Schmiedel champions the Tübingen view in the 

Encyclopaedia Biblica, it cannot be overlooked.

Among the sources of the Simon-legend we have omitted the pseudo-Clementine literature and a number of Apocryphal Martyria, Passiones and Actus. It is necessary to treat them together, for they are merely homely forms of certain of the later traditions of Simon. Eusebius, who gives a full account of the later Simon, says that the writer of the Clementine Homilies (c. 100 A.D.) speaks of a Simon who was called Peter by his enemies. Simon, he says, was the author of the Apocryphal Martyria. The author of the Passiones also claims Simon as his author. The Acts of Simon, however, is due to a single writer, and represents Paul as the original Simon. That view is based on the works of fiction, of uncertain date and authorship, which seem to have been worked over by several hands in the interest of diverse forms of belief. The romance of Clement of Rome exists at present in two forms, in Greek under the name of the Clementine Homilies and in a Latin translation by Rufinus, which is known as the Recognitions (see Clementine Literature). It is contended that the common source of these documents may be as early as the 1st century, and must have consisted in a polemic against Paul, emanating from the Jewish side of Christianity. Paul being thus identified with Simon, it was argued that Simon's visit to Rome had no other basis than Paul's presence there, and, further, that the tradition of Peter's residence in Rome rests on the assumed necessity of his resisting the arch-enemy of Judaism there as elsewhere. Thus the idea of Peter at Rome really originated with the Ebionites, but it was afterwards taken up by the Catholic Church, and then Paul was associated with Peter in opposition to Simon, who had originally himself been.

Not all must be condemned at once that the Clementine Homilies are marked by hostility to Paul. Prefixed to them is a supposed letter from Peter to James, in which Peter is made to write as follows:

"For some of the converts from the Gentiles have rejected the preaching through me in accordance with the law, having accepted a certain lawless and babbling doctrine of the enemy (Ῥωκ ἐκκλησίας) and this some people have attempted while I am still alive, by various interpretations to transform my words, unto the overthrow of the law; as though I also thought, but did not speak it openly, which be far from me! For to do so is to act against the law of God spoken through Moses, the eternal duration of which is borne witness to by our Lord. Since He said thus—"Heaven and earth shall pass away: one jot or one tittle shall not pass away from the law" (cf. Matt. v. 18). Now this He said that all might be fulfilled. But they, professing somehow to know my mind, attempt to expound the words they heard from me more wisely than I who spoke them, telling those who are instructed by them that this is my meaning, which I never thought of and did not venture on such falsehoods while I am still alive, how much more when I am gone will those who come after me dare to do so!"

It would be futile to maintain that that passage is not aimed at Paul. It does not identify Paul with Simon Magus, but it serves to reveal an animus which would render the identification easy. In the 17th Homily the identification is effected. Simon is there made to maintain that he has a better knowledge of the mind of Jesus than the disciples, who had seen and conversed with Him in person. His reason for this strange assertion is that visions are superior to waking reality, as divine is superior to human (xvii. 5, 14). Peter has much to say in reply to this, but the passage which mainly concerns us is as follows:

"But can any one be educated for teaching by vision? And if you shall say, 'It is possible,' why did the Teacher remain and converse with waking men for a whole year? And how can we believe even those who tell us that he appeared to you? And how can he have appeared to you that your sentiments are opposed to his teaching? But if you were seen and taught by him for a single hour, and so became an apostle, then perhaps his words, expounding his meaning, love his apostles, fight not with me who had converse with him. For it is against a solid rock, the foundation-stone of the Church, that you have opposed yourself in opposing me. If you have not an advance of insight, how would you revile the preaching that is given through me, in order that, as I heard myself in person from the Lord, when I speak I may not be believed, as though so forth it were I who was condemned and I who advocated. For you are not able to say, "Yea, yea." (Gal. ii. 11), you are accusing God who revealed the Christ to me, and are inveigling against Him who called me blessed on the ground of the revelation. But if indeed you truly wish to work along with us,"

Reading with Schmiedel διδασκαλος Ρωμαίος (from 1 Cor. ix. 27) in place of εκκλησιαστής.
the truth, learn first from us what we learnt from Him, and when you have been taught, consider the law of partakers of the same.”

Here we have the advantage, rare in ecclesiastical history, of hearing the other side. The above is unmistakably the voice of those early Christians who hated Paul, or at all events an echo of that voice. But how late an echo it would be hazardous to decide. Schmiedel asks, “How should Paul ever come to be in the 2nd, or, as far as the pseudo-Clementine Homilies and Recognitions are concerned, even in the 3rd or 4th century, the object of so fanatical a hatred? It is a psychological impossibility.” Yet the love and hatred aroused by strong characters is not confined to their life-time. There is not the slightest reason why there should not have been people in the 3rd or 4th century who would have been glad to lampoon Paul. The introduction of Pauline features, however, into the representation of Simon Magus is merely incidental. The portrait as a whole is not in the least like Paul, and could not even have been intended for a caricature of him.

There are other features in the portrait which remind us strongly of Marcion. For the first thing which we learn from the Homilies about Simon’s opinions is that he denied that God was just (ii. 14). By “God” he meant the Creator. But he undertook to prove from Scripture that this is a perverted version of the perfection which is falsely ascribed to the lower (iii. 10, 38). On these grounds Peter complains that, when he was setting out for the Gentiles to convert them from their worship of many gods upon earth, the Evil Power (ο̊ κακόν) had sent Simon before him to make them believe that there were many gods in heaven. Peter throughout is represented as defending the μορφᾶς of God against Simon’s attacks on it (e.g. iii. 5, 9, 59).

If we knew more, we might detect other historical characters concealed under the mask of Simon. Just as whatever Plato approves is put into the mouth of Simon, so whatever Simon says is put into the mouth of Simon Magus. But while thus seeking for hidden meanings, are we not in danger of missing what lies on the surface, namely, that the Simon Magus of the Clementine romance is a portrait of Simon of Gitta, after he had been confused with the Simon of Acts? The mention of Helen in the Clementines stamps them as later than the Great Declaration, in which, to all appearance, her story originates. Indeed, the Clementine romance may most fitly be regarded as an answer to the Great Declaration, the answer of Jewish Gnosticism to the more Hellenized Gnosticism of Samaria. I do not look at the Clementines in this light, and see how the verses they have to tell us about Simon accord with conclusions which we have already reached.

Simon, we are informed, was a Samaritan, and a native of Gitta, a village situated at a distance of 6 χρυσωκ (about 4 m.) from the great city of Tiberias on one side and Mount Gerizim on the other. As he himself says, “Antonis, the mother Rachel. He studied Greek literature in Alexandria, and, having in addition to this great power in magic, was so puffed up by his attainments that he wished to be considered a highest power, higher even than the God who created the world. And sometimes he “darkly hinted” that “he himself was Christ, calling himself the Standing One. Which name he used to indicate that he would stand for ever, and had no cause in him for bodily decay. He did not believe that the God who created the world was the highest, but that the dead would rise. He denied Jerusalem, and introduced Mount Gerizim in its stead. In place of the real Christ of the Clementines, he proclaimed himself; and the way he allegorized in accordance with his own preconceptions. He did indeed preach righteousness and judgment to come: but this was merely a bait for the unwary.

So far we have had nothing that is inconsistent with Simon of Gitta, but little and what we are already familiar with in connexion either with him or his disciple Menander. But in what follows the identification of this Simon with the Simon of Acts has led the novelists to play to their fancy. It may be well to premise that in the view of the writer of the Homilies, “All things are double one against another.” “As first night, then day, and first ignorance, then knowledge (γνῶσις), and first sickness, then healing, so the things of this world and those of the next.” Simon not only said he was the savior, but the physician upon the sickness.” (Hom. ii. 33). In this way every good thing has its evil forerunner.

According to the Clementines, the reference to Simon’s entering on his career of mischief was as follows. There was one John, a Hemo-

1 Supplied, with Schmiedel, κατάρα.
recantation of his aspersions on Peter, giving as a reason that he had been soundly scourged by angels during the preceding night. Now here, we are told, there is a malicious allusion to the "messenger of Satan to buffet me" of 2 Cor. xii. 6. We do not think that this conjecture will commend itself to the unprejudiced, especially in view of the fact that scourging by angels is a well-known piece of supernatural machinery (cf. 2 Macc. iii. 26; Eus. H. E. v. 28, § 12; Tert. De idolol. 13). Yet Schmiedel speaks of this as "a well ascertained case in which an utterance of Paul regarding himself is spitefully twisted to his discredit. More especially the connection of the Gnostics with Simon assumed knowledge of things above the heavens (Recog. ii. 65) with St Paul's claim to have been "caught up even to the third heaven" (2 Cor. xii. 2). But the passage is much more appropriate to Simon of Gitta. From the height in which he claimed to dwell even the third heaven would have seemed quite the lower regions. The question of meat offered to idols was a burning one, in every sense of the term, long after Paul's day. We need not, therefore, see a reference to the Apostle's laxity on this crucial point in the story (Hom. iv. 4, vii. 3) that Simon Magus had entreated the people of Antioch on a sacrificial ox, and so directed them to the evil influence of demons. The non-necessity of martyrdom is mentioned as a feature of early Gnosticism. The miracles which St Paul claims for himself in 2 Cor. xii. 12, Rom. xv. 19, must doubtless have led to his being regarded as a magician by those who did not accept him as divinely commissioned; but, as we have seen throughout, magic was the salient feature about the Samaritan Messiah, who is the real enemy aimed at in the Clementine literature. The opening of doors of their own accord no more connects Simon Magus with Paul than with Peter. More probably the exorcism of demons is the point of reference in 2 Cor. xii. 9, which, as Schmiedel has pointed out, is a reference to Acts xxvi. 26. As to the use of bad language, people in the 2nd century were glad to avail themselves of such missiles as σωλαικός ὄνειρος, which had been manufactured for them in the 1st (Hom. xvi. 21; 2 Cor. xi. 13). That the homo guidam inimicus of the Recognitions (i. 70) is intended for Paul is plain, but then, as Schmiedel points out in a note, he is not identified with Simon. "Even the style of Paul," Schmiedel assures us, "is plainly imitated in a mocking way." The reference is to the recantation in Hom. xx. 19, which is like the rest of the treatise and quite unlike Paul, but Schmiedel's familiar method of writing enables him to collect phrases therefrom which occur also in the Homilies.

When the Tübingen School turn their attention to the Apocryphal Acts and Martyrdoms, the image of Paul still obsesses their mental gazer. There is indeed one passage which may plausibly be adduced in favour of their contention. In the Martyrdom of the Holy Apostles Peter and Paul (ch. 43), Paul is made to put this question—"If then circumcision is a good thing, why did you, Simon, deliver up circumcised men and compel them to be condemned and put to death?" We must leave the Tübingen School to make this patient reading, for it is worth only remarking that it was not on the ground of circumcision that Paul persecuted the Church, and that it is impossible to extract history out of these fictions. We certainly cannot subscribe to the conjecture of Lipsius that "the story of theTables beheading of Simon has at its root malicious misrepresentations of the beheading of Paul." The climax of absurdity seems to be reached when we are informed that the story of Simon offering money to the Apostles for the gift of the Holy Ghost arose out of Jewish-Christian scandal about Paul's "collection for the Saints" (1 Cor. xvi. 1). Yet Schmiedel follows Lipsius "in his latest treatment of the subject," in recognizing "a Samaritan φάσας named Simon as historical." But the part which he played in history is thus taken away from him. He was there, it seems, but he did not do what he is said to have done. Only the author of Acts, wishing to obviate the reproach against Paul of offering money to the Apostles, attributed the like conduct to Simon.

In conclusion, there are of course some grounds for the Tübingen view, but they are wholly inadequate to bear the structure that has been raised upon them. St Paul was a hard hitter, and Jewish Christians, who still cling to James and Peter as the only true pillars of the Church, are not likely to have cherished any love for his memory. This is enough to account for the hostility displayed against St Paul in the Clementines. But to push the equation of St Paul with Simon Magus further than we are forced to by the facts of the case is to lose sight of the real character of the Clementines as the counterblast of Jewish to Christian. No doubt, one very conspicuous occasion in which Simon of Gitta, who was really the father of all heresy, a character which has erroneously been attributed to Simon Magus.

SIMON, RICHARD (1638-1712), French biblical critic, was born at Dieppe on the 13th of May 1638. His early studies were carried on at the college of the Fathers of the Oratory in that city. He was soon, by the kindness of a friend, enabled to leave the college and to receive the benefit of a French education. He displayed a taste for Hebrew and other Oriental languages. At the end of his theological course he was sent, according to custom, to teach philosophy at Juilly, where there was one of the colleges of the Oratory. But he was soon recalled to Paris, and employed in the congenial labour of preparing a catalogue of the Oriental books in the library of the Oratory. His first publication was his Fides Ecclesiae orientalis, seu Gabrielis Metropolitae Philadelphiensis opuscula, cum interpretatione Latina, cum notis (Paris, 1671), the object of which was to demonstrate that the belief of the Greek Church regarding the Eucharist was the same as that of the Church of Rome. Simon entered the priesthood in 1679, and the same year wrote a pamphlet in defence of the Jews of Metz, who had been accused of having murdered a Christian child. It was shortly before this time that there were sown the seeds of that enmity with the Port Royalists which filled Simon's after life with many bitter troubles. Antoine Arnauld (1612-1694) had written a work on the Perpetuity of the Faith, the first volume of which treated of the Eucharist. The criticisms of Simon excited lasting indignation among Arnauld's friends and admirers. A mission to Rome was proposed to him. A mission to Rome was proposed to him. He was engaged at the time in superintending the printing of his Histoire critique du Vieux Testament. He had hoped, through the influence of Père la Chaise, the king's confessor, and the duc de Montausier, to be allowed to dedicate the work to Louis XIV., but, as the king was absent in Flanders at the time, the volume could not be published until he had accepted the dedication, though it had passed the censorship of the Sorbonne, and the chancellor of the Oratory had given his imprimatur. The printer of the book, however, delayed his work. An attempt was made at Paris to have the whole of it printed, but the King would have the chapters to be printed separately, and to be put in circulation. This, or possibly a copy of the work itself, had happened to come into the hands of the Port Royalists. It seems that, with a view to injure the sale of the work, which it was well known in theological circles had been long in preparation by Simon, the Messieurs de Port Royal had undertaken a translation into French of the Prolegomena to Walton's Polyglott. To counteract this proceeding Simon announced his intention of publishing
an annotated edition of the Proteogromena, and actually added to the Critical History a translation of the last four chapters of that work, which had formed no part of his original plan. Simon's announcement prevented the appearance of the projected translation, but his enemies were all the more irritated. They had now obtained the opportunity which they had long been seeking. The freedom with which Simon expressed himself on various topics, and especially those chapters in which he declared that Moses could not be the author of much in the writings attributed to him, especially aroused their opposition. The powerful influence which Bosquet exercised with Bossuet had not the slightest effect. Simon's former adherent, the prior of the Abbey of Fontenay, was invited; the chancellor Michael le Tellier lent his assistance; a decree of the council of state was obtained, and after a series of paltry intrigues the whole impression, consisting of 1,300 copies, was seized by the police and destroyed, and the animosity of his colleagues in the Oratory rose to so great a height against Simon that he was declared to be no longer a member of their body. Full of bitterness and disgust, Simon retired in 1679 to the curacy of Bolleville, to which he had been lately appointed by the vicar-general of the abbey of Fontenay.

The work thus confiscated in France it was proposed to republish in Holland. Simon, however, at first opposed this, in hopes of overcoming the opposition of Bosquet by making certain changes in the parts objected to. The negotiations with Bosquet lasted a considerable time, but finally failed, and the Critical History appeared, with Simon's name on the title page, in the year 1685, from the press of Reenier Leers in Rotterdam. An imperfect edition had previously been published at Amsterdam by Daniel Elzevior, based upon a MS. transcription of one of the copies of the original work which had escaped destruction and had been sent to England, and from which a Latin and an English translation were afterward made. The edition of 1685 was a reproduction of the work as first printed, with a new preface, notes, and those other writings which had appeared for and against the work up to that date.

The work consists of three books. The first deals with questions of Biblical criticism, properly so called, such as the text of the Hebrew Bible and the changes which it has undergone down to the present day, the authorship of the Mosaic writings and of other books of the Bible, with an exposition of Simon's peculiar theory of the existence during the whole extent of Jewish history of recorders or annalists of the events of each period, whose writings were preserved in the public archives, and the institution of which he assigns to Moses. The second book gives an account of the principal confessions, ancient and modern, of the Old Testament, and the third contains an examination of the principal commentators. He had, with the exception of those referred to, contributed nothing really new on the subject of Old Testament criticism, and previous critics as L. Cappel, Johannes Morinus (1591-1659) and others had established many points of importance, and the value of Simon's work is chiefly to be attributed to his having presented an account of the books of the Hebrew text. J. le Clerc ("Clericus") in his work Sentiments de quelques théologiens de Hollande, controverted the views of Simon, and was answered by the latter in a tone of considerable asperity in Oeuvres de divers théologiens de Hollande; over the signature " Pierre Ambrun," it being a marked peculiarity of Simon rarely to give his own name.

The last edition of Simon may be briefly noticed. In 1689 appeared his Histoire critique du texte du Nouveau Testament, consisting of thirty-three chapters, in which he discusses the origin and character of the various books, with a consideration of the learned views and amendments of editions of the New Testament from the Old Testament in the New, the inspiration of the New Testament (with a refutation of the opinions of Spinoza), the Greek dactyl in which they are written (against C. Salmassius), the Greek MSS., known at the time, especially Codex D (Cantabrigiensis), &c. This was followed in 1690 by his Histoire critique des versions du Nouveau Testament, where he gives an account of the different versions, modern, ancient, and the manner in which many difficult passages of the New Testament have been rendered in the various versions. In 1693 was published what in some respects is the most valuable of all his writings, viz. Histoire critique des principaux commentateurs du Nouveau testament depuis le commencement du Christianisme jusque à notre temps. This work exhibits immense reading, and the information it contains is still valuable to the student. The last work of Simon that we need mention is his Nouvelles Observations sur le texte et les versions du Nouveau Testament (Paris, 1695), which contains supplementary observations upon the subjects of the text and translations of the New Testament.

As a controversialist Simon displayed a bitterness which tended only to aggravate the unpleasantness of controversy. He was entirely a man of intellect, free from all tendency to sentimentality, and with a strong vein of sarcasm and satire in his disposition. He died at Dieppe on the 11th of April 1712 at the age of seventy-four.

The principal authorities for the life of Simon are the life or "éloge" by his grand-nephew De la Martinière in vol. i. of the Lettres choisies (4 vols., Amsterdam, 1730); K. Graf's article in a revised vol. of the Bibliothèque universelle; E. J. H. Mercier, E. W. E. Reuse's article, revised by H. Leers, in Herrig-Bock's Realencyklopädie (ed. 1906); Richard Simon et son Vieux Testament, by A. Bernus (Lausanne, 1866); H. Margival, Essai sur Richard Simon et sa critique biblique au XVIIe siècle (1900). For the bibliography, see, in addition to the various editions of Simon's works, the very complete and accurate account of A. Bernus, Notice bibliographique sur Richard Simon (Basel, 1882).

SIMON, THOMAS (c. 1623-1669), English medallist, was born, according to Vertue, in Yorkshire about 1623. He was engraving under Nicholas Briot, and about 1635 received a post in connexion with the Mint. In 1645 he was appointed by the parliament joint chief engraver along with Edward Wade, and, having executed the great seal of the Commonwealth and died for the coinage, he was promoted to be chief engraver to the mint and seals. He produced several fine portrait medals of Cromwell, one of which is copied from a miniature by Cooper. After the Restoration he was appointed engraver of the king's seals. On the occasion of hiscontest with the brothers Koettlers, who were employed by the mint in 1662, Simon produced his celebrated crown of Charles II., on the margin of which he engraved a petition to the king. This is usually considered his masterpiece. He is believed to have died of the plague in London in 1665.

A volume of The Medals, Coins, Great Seals and other Works of Thomas Simon, engraved and described by George Vertue, was published in London in 1665.

SIMON BEN YOHAI (2nd century A.D.), a Galilean Rabbi, one of the most eminent disciples of Aqiba (q.v.). His master was executed by Hadrian, and Simon's anti-Roman sentiments led to his own condemnation by Varus c. 161 A.D. (according to Graetz). He escaped this doom and dwelt for some years in a cavern. Emerging from concealment, Simon settled in Tiberias and in other Galilean cities. He acquired a reputation as a worker of miracles, and on this ground was sent to Rome as an envoy, where (legend tells) he exercised from the emperor's daughter a divine power to oblige the lady to enable Simon to effect his miracles. He was afterwards employed in the fixation of law, and his decisions are frequently quoted. To him were attributed the important legal homilies called Sifre and Mekhilta (see Midrash), and above all the Zohar, the Bible of the Kabbalah (q.v.). This latter ascription is altogether unfounded, the real author of this mystical commentary on the Pentateuch being Moses of Leon (q.v.).

The fullest account of Simon's teachings is to be found in W. Bacher, Histoire der Kabbala der Zeit C. A. v. perle (1873); and in large works by Simon.

SIMON OF QUENTIN (fl. 1247), Dominican mission-traveller and diplomat. He accompanied, and wrote the history of, the Dominican embassy under Friar Ascelin or Anselm, which Pope Innocent IV. sent in 1247 to the Mongols of Armenia and Persia. Simon's history, in its original form, is lost; but large sections of it have been preserved in Vincent of Beauvais's Speculum historiale, where nineteen chapters are expressly said to be ex libello fratris Simonis, or entitled frater Simon. The embassy of Ascelin and Simon, who were accompanied by Andrew of Longueville, proceeded to the camp of Baiju or Bachu Noyan (i.e. "General" Baiju, Noyan signifying a commander of 10,000) at Sisien in Armenia, lying between the Aras river and Lake Gokcha, fifty-nine days' journey from Acre. The papal letters were translated into Persian, and thence into Mongol, and so presented to Baiju; but the Tartars were greatly irritated by the haughtiness of the Dominicans,
who implied that the pope was superior even to the Great Khan, and offered now presents, refused the customary reverences before Baigu, declined to go on to the imperial court, and made unseasonable attempts to convert their hosts. The Frankish visitors were accordingly lodged and treated with contempt: for nine weeks (June and July 1247) all answer to their letters was refused. Thrice Baigu even ordered their death. At last, on the 27th of August, they were dismissed, with a reply, dated the 12th of July. This reply complained of the high words of the Latin envoys, and commanded the pope to come in person and submit to the Master of all the Earth (the Mongol emperor). The mission thus ended in complete failure; but, except for Carpini's (p. ii.), it was the earliest Catholic embassy which reached any Mongol court, and its information must have been valuable. It performed something at least of what should have been (but apparently was not) done by Lawrence (Lourenço) of Portugal, who was commissioned as papal envoy to the Mongols of the south-west at the same time that Carpini was accredited to those of the north (1245).

See Vincent of Beauvais, Speculum historiale, book xxxii. (sometimes quoted as xxxi.), chaps. 26-29, 32, 34, 40-52, (cf. pp. 453-454 B in the Venice edition of 1591); besides these, several other chapters of the Spec. hist. probably contain material derived from Simonides. See especially, ii. 72, 74, 75-77, 78, 80; or iii. 69, 71, 74-75, 76, 78, 80. See also as h'Osborn, Histoire des Mongols, ii. 200-201, 221-233; iii. 79 (edition of 1892); Fontana, Monumenta Dominicana, p. 52; the letters of the Paris Geo. Soc.'s Recueil de Voyages, &c. (Paris, 1839); W. W. Rockhill, Rubruck, pp. xxxi-xxx (London, Hakluyt Soc., 1900); C. R. Beazley, Dawn of Modern Geography, i. 277; and Carpini and Rubruck, iv. (C. R. B.).

SIMONIDES (or SEMONIDES) OF AMORGOS, Greek lyric poet, flourished in the middle of the 7th century B.C. He was a native of Samos, and derived his surname from having founded a colony in the neighbouring island of Amorgos. According to Suidas, besides two books of iambics, he wrote elegies, one of them a poem on the early history of the Samians. The elegy included in the fragments (85) of Simonides of Ceos is more probably by Simonides of Amorgos. We possess about thirty fragments of his iambic poems, written in clear and vigorous Ionic, with much force and no little harmony of versification. With his friend Archilochus he carried a vehicle of bitter satire, interchanging with melancholy, but in Simonides the satire is rather general than individual. His "Pedigree of Women" may have been suggested by the beast fable, as we find it in Hesiod and Archilochus, and as it recurs a century later in Phocylides; it is clear at least that Simonides knew the works of the former. Simonides derives the woman from a hog, the cunning from a fox, the fussy from a dog, the apathetic from earth, the capricious from water, the stubborn from an ass, the incontinent from a wasp, the proud from a high-born mare, the worst and ugliest from a pig, and the good woman from a bee. The remainder of the poem (66-118) is undoubtedly spurious. There is much beauty and feeling in Simonides' description of the good woman.

See Fragments in T. Bergk, Poetae lyrici Graeci; separate editions by F. T. Welcker (1853), and especially by P. Maloua (1900), with exhaustive introduction, bibliography and commentary.

SIMONIDES OF CEOS (c. 556-459 B.C.), Greek lyric poet, was born at Iulis in the island of Ceos. During his youth he taught poetry and music in his native island, and composed pieces for the festivals of Apollo. Finding little scope for his abilities at home, he went to live at Athens, at the court of Hipparchus, the patron of literature. After the murder of Hipparchus (514), Simonides withdrew to Thessaly, where he enjoyed the protection and patronage of the Scopadeus and Aleuadae (two celebrated Thessalian families). An interesting story is told of the termination of his relations with the Scopadeus. On a certain occasion he was reproached by Scopas for having allotted too much space to the Dioscuri in an ode celebrating the victory of his patron in a chariot-race. Scopas refused to pay all the fee and told Simonides to apply to the Dioscuri for the remainder. The incident took place at a banquet. Shortly afterwards, Simonides was told that two young men wished to speak to him; after he had left the banqueting room, the roof fell in and crushed Scopas and his guests (Ciceron, De oratore, i. 86). There seems no doubt that some disaster overtook the Scopadeus, which resulted in the extinction of the family. After the battle of Marathon Simonides returned to Athens, but soon left the city on the invitation of Hiero, at whose court he spent the rest of his life.

His reputation as a man of learning is shown by the tradition that he introduced the distinction between the long and short vowels (ε, η, ο, ω), afterwards adopted in the Ionic alphabet which came into general use during the archons of Eucleides (403). He was also the inventor of a system of mnemonics (Quintillian xi. 2, 11). So unboundless was his popularity that he was a power even in the political world; we are told that he reconciled Thero and Hiero on the eve of a battle between their opposing armies. He was the intestigator of Thespiatics and Parriacides the Spartan, and his poems on the war against Persia no doubt gave a powerful impulse to the national patriotism. For his poems he could command almost any price: later writers, from Aristophanes onwards, accuse him of avarice, probably not without some reason. To Hiero's queen, who asked him whether it was better to be rich or a genius, he replied "Rich, for genius is ever found at the gates of the rich." Again, when someone asked him to write a laudatory poem for which he offered profuse thanks, but no money, Simonides replied that he kept two coffers, one for thanks, the other for money; when he opened the former empty and useless, and the latter full.

Of his poetry we possess two or three short elegies (Fr. 85 seems from its style and versification to belong to Simonides of Amorgos, or at least not to be the work of our poet), several epigrams and fragments, which, if the fragments are genuine, were mostly written in the usual dialect of elegy, Ionic with an epic colouring, were intended partly for public and partly for private monuments. There is strength and simplicity in the former, with a simplicity that is almost rustic, and a complete mastery over the rhythm and forms of elegiac expression. Those on the heroes of Marathon and Thermopylae are the most celebrated. In the private epigrams there is more warmth of colour and feeling, but few of them rest on any better authority than that of the Paris edition. One interesting and undoubtedly genuine epigram of this class is upon Archidice, the daughter of Hippasus the Pessideastried, who, "albeit in her heart she had not made any marriage, from her family, she was not lifted up in soul to pride." The lyric fragments vary much in character and length: one is from a poem on Artemisium, celebrating those who fell at Thermopylae, with which he gained the title of "Anonymous in the Iliad." In the poem on Scopadeus (commented on in Plato, Protagoras, 339 b): the rest are from odes on victors in the games, hyparchemones, dirges, hymns to the gods and other varieties. The poem on Thermopylae is reverent and sublime, breathing an exalted patriotism and a lofty national spirit; but the others are full of tender pathos and deep feeling, combined with a genial worldliness. For Simonides requires no standard of lofty unwavering rectitude. "It is hard," he says (Fr. 5), "to become a truly good man, perfect as a square, in hands and feet and mind, fashioned without blame. Whosoever is bad, and not too wicked, knowing justice, the benefactor of cities, is a sound man. I for one will find no fault with him, for the eye of love is ready to praise and love all men who do no sin willingly; but with necessity even the gods do not contend." Virtue, he tells us elsewhere in language that recalls Hesiod, is set on a high and difficult hill (Fr. 58); let us select after pleasure, one day and the other, both great virtues and wealth " (Fr. 38). Yet Simonides is far from being a hedonist; his morality, no less than his art, is pervaded by that virtue for which Ceos was renowned—μηθελοποίησις or self-restraint. And though he was a great orator, and celebrated the poet's art, he was also a great observer of nature, and wrote a poem, (Fr. 15), on the sea with the infant Perseus on the sea in a dark and stormy night, takes comfort from the peaceful slumber of her babe. Simonides here places himself among the poets of his own age, in the words, "he is silent poetry." Of the many English translations of this poem, one of the best is by J. A. Symonds in Studies on the Greek Poets. Fragments in T. Bergk, PoetJfy Irvici Graeci; standard edition, C. A. F. G. Sestini, PoetL, Greek Poets 1780, or, H. L. Ahrens (1855). Other authorities are given in the exhaustive treatise of F. Cesnati, Simonide di Ceo (1882); see also W. Schröter, De Simonideis Car melici sermone (1906).

SIMON'S TOWN, a town and station of the British navy in the Cape province, South Africa, in 34° 15' S., 18° 30' E., on the
shores of Simon's Bay, an inlet on the west side of False Bay. It is 235 m. S. of Cape Town by rail and 17 m. N. of Cape Point (the Cape of Good Hope). Apart from the naval station the town (pop. 1904, 6642) is an educational and residential centre, enjoying an excellent climate with a mean minimum temperature of 57°F and a mean maximum of 70°F. Owing to the influence of the Mozambique current the temperature in the bay is 10°F to 12°F higher than that of Table Bay, hence Simon's Town and other places along the shores of False Bay are favourite bathing resorts. The naval establishment is the headquarters of the East India and Cape Squadrons.

In 1900 the yard covered about 13 acres, exclusive of the victualling establishment and naval hospital, and was provided with a small slipway for torpedo-boats and small vessels, together with various dockyard buildings, storehouses, cool stores, &c., but had no dry dock or deep-water wharf. Under the Naval Works Loan Act of 1899 £2,500,000 was provided for the construction of additional docks east of the original naval yard. These works were begun in 1900 and completed in 1910. They consist of a tidal basin 28 acres in extent, with a depth of 30 ft. at low-water spring tides, enclosed by a breakwater on the eastern and northern sides and a similar projecting arm or pier on the west. The entrance to the basin faces north-westly, and is 300 ft. in width. South of the basin is a large reclaimed area forming the site of the new dockyard. Opening from the basin is a dry dock, 750 ft. in length on blocks, with a dry space of 25 acres, and has an available depth of 30 ft. over low-water spring tides. The foundation stone of the dry dock was laid in November 1906 by the earl of Selborne, after whom it is named, and the dock was opened in November 1910 by the duke of Connaught.

The Selborne dock can be subdivided by an intermediate caisson in such a manner as to form two docks, respectively 400 ft. and 320 ft. in length, or 470 ft. and 250 ft. in length on blocks, as may be required, or the full length of 750 ft. can be made available. The dockyard buildings include extensive shops for the chief engineer's and chief constructor's departments, the pump-engine house, working sheds, &c., and space is reserved for additional docks and dockyards. Berthing accommodation is provided in the basin alongside the wharf walls which surround it. The walls available for this purpose have a total length of 2585 ft. Inland, are constructed of reinforced concrete blockwork, and the depth varies from about 30 ft. at low water, and are furnished with powerful shearing-locks and cranes for the use of vessels alongside. Extensive sheds for the storage of coal are provided. The whole of the dockyard area (53 acres), including the enclosing breakwater and pier, was formed by reclamation from the sea; and the total area of the new works, including the tidal basin, is 63 acres.

False Bay, which corresponds on the south to Table Bay on the north side of Table Mountain, is a spacious inlet which has an average depth of from 15 to 20 fathoms, and is completely sheltered on all sides except towards the south. Here a whole fleet of the largest vessels can ride at anchor. Defensive works prevent entry to the bay.

Simon's Town dates from the close of the 17th century, the town and bay being named after Simon van der Stell, governor of the Cape in 1679-1699. It was at Simon's Town that the first British landing in Cape Colony was made by General Sir James Craig in 1795. About 1810 the bay was selected as the base for the South African squadron, Table Bay being abandoned for that purpose in consequence of its exposed position.

**SIMONY**, an offence, defined below, against the law of the church. The name is taken from Simon Magus (q.v.). In the canon law the word bears a more restricted meaning than it does in English law. "Simony, according to the canonists, says Ayliffe in his Parergon, "is defined to be a deliberate act or a premeditated will and desire of selling such things as are spiritual, or of anything annexed unto spirituals, by giving something of a temporal nature for the purchase thereof; or in other terms it is defined to be a commutation of a thing spiritual or annexed unto spirituals by giving something that is temporal." An example of the offence occurs as early as the 3rd century in the purchase of the bishopric of Carthage by a wealthy matron for her servant, if the note to Gibbon (vol. ii. p. 437) is to be believed. The offence was prohibited by many councils, both in the East and in the West, from the 4th century onwards. In the Corpus juris canonici the Decretum (pt. ii. cause i. quest. 3) and the Decretals (bk. v. tit. 3) deal with the subject. The offender, whether simoniacus (one who had bought his orders) or simoniace promotus (one who had bought his promotion), was liable to deprivation of his benefice and deposition from orders if a secular priest,—to confinement in a stricter monastery if a regular. No distinction seems to have been drawn between the sale of an immediate and of a reversionary interest. The innocent simoniace promotus was, apart from dispensation, liable to the same penalties as though he were guilty. Certain matters were simoniacal by the canon law which would not be so regarded in English law, e.g. the sale of tithes, the taking of a fee for confession, absolution, marriage or burial, the concealment of one in mortal sin or the reconciliation of an impenitent for well sake of gain, and the doing homage for spiritualities. So gravity, as the crime is commonly considered that canonical persons could accuse of it. English provincial and legatine constitutions continually assailed simony. Thus one of the heads in Lyndewode (bk. v.) is, "Ne quis ecclesiae nonem dotalitias transferat vel pro præsentatione aliud pecuniam accipiat." In spite of all the provisions of the canon law it is well established that simony was deeply rooted in the medieval church. Dante places persons guilty of simony in the third bolgia of the eighth circle of the Inferno—

1) O Simon mago, O milani seguedi,
Cubbiosa cosa de Dio che di bontate
Deceno esser sospo, voi rapaci
Per o e per angento adulterante.—*Inf.* xix. 1.

The popes themselves were notorious offenders. In the canto just cited Pope Nicholas III. is made by poet the mouth-piece of the simoniac. He is supposed to mistake the poet for Boniface VIII., whose simoniacal practices, as well as those of Clement V., are again alluded to in Par. xxx. 147. At a later period there was an attempt on the part of the Papal spirituals office, by the Roman curia which contemporary writers attacked in the spirit of Dante. A pasquinade against Alexander VI. begins with the lines—

"Vendit Alexander claves, altaria, Christum.
Emerat ille prius; vendere jurat postem.

Machiaveli calls luxury, simony and cruelty the three dear friends and handmaids of the same pope.1 The colloquy of Erasmus De sacerdotis capitulis bears witness to the same state of things. And, best proof of all, numerous decisions as to what is or is not simony are to be found in the reported decisions of the Roman rota.2 That part of the papal revenue which consisted of first-fruits (primiciae or annuatae) and tenths (decimae) must have been theoretically simoniacal in its origin. In England this revenue was annexed to the crown by Henry VIII. and restored to the church by Queen Anne (see Queen Anne's Bounty).

For the purposes of English law simony is defined by Blackstone as the fraudulent presentment of money in the church for money, gift or reward. The offence is one of purely ecclesiastical cognizance, and not punishable by the criminal law. The penalty is forfeiture by the offender of any advantage from the simoniacal transaction, of his patronage by his benefice by the presentee; and now by the Benefices Act 1892, a person guilty of simony is guilty of an offence for which he may be proceeded against under the Clergy Discipline Act 1892. An innocent clerk is under no disability, as he might be by the canon law. Simony may be committed in three ways—in promotion to orders, in presentation to a benefice, and in resignation of a benefice. The common law (with which the canon law is incorporated, as far as it is not contrary to the common law or statute law or the canon law of the province of the crown) has been considerably modified by statute. Where no statute applies to the case, the doctrines of the canon law may still be of authority. Both Edward VI. and Elizabeth promulgated advertisements against simony. The Act of 31 Eliz. c. 6 was intended to reach the corrupt patron as well as the corrupt clerk, the ecclesiastical censures apart from the statute not extending to the case of a patron. The first part of the act deals with the presentee and patron of any church, colleges, schools, hospitals, and all other ecclesiastical bodies, and thereby all those who have office in or control over any ecclesiastical body, who can exhibit or bestow the same for or in respect of

1 See Roscoe, *Life of Leo X.,* vol. i. p. 453.
2 Compare the fine distinctions drawn by the casuists and attacked by Pascal in the twelfth of the *Provincial Letters.*
any such corrupt cause or consideration, every such presentation, collation, gift and bestowal, and every admission, institution, investiture and inducement shall be void or of no effect in law; and it shall be lawful for the queen to present, collate unto, or give and bestow every such benefice, dignity, prebend and living ecclesiastical for that one time or turn only; and all and every such collation, gift, price or presentment, and all and every such money, or take any such sum of money, &c., directly or indirectly, or that shall take or make any such promise, &c., shall forfeit and lose the dignity, prebend, living ecclesiastical or the profit of any such benefice, dignity, prebend or living ecclesiastical, to the use of the person so corruptly taking, procuring, seeking or accepting any such benefice, &c., shall be adjudged a disabled person in law to have or enjoy the same benefice, &c. Admission, institution, investiture and inducement of any person to a benefice, &c., and the act renders the offender liable to the penalty already mentioned. But in this case the presentation reverts to the patron and not to the crown. The penalty for corrupt resigning or exchanging of a benefice, dignity, prebend or living ecclesiastical is that the resigner or the person who makes or procures such resignation or exchange shall lose double the sum of the value so given or taken, half the sum to go to the crown and half to a common informer. The penalty for taking money, &c., to procure ordination or to give orders or licence to preach is a fine of £40; the party so corruptly ordained forfeits £10; acceptance of any benefice within seven years after such corrupt entering into the ministry makes such benefice merely void, and such person may sell or assign any patronage or presentation divided as in the last case. The act is cumulative only, and does not take away or restrain any punishment prescribed by ecclesiastical law. The Act of 1 Will. & M. sess. 1, c. 16, guards the rights of a patron who makes a certain presentation. The death of a beneficed person, the death of a person simoniacally presented the offence or contract of simony shall not be alleged or pleaded to the prejudice of any other presentee of the same, or of the person to whom the benefice was presented. The penalty for simonia or simoniacally presented was convicted of such offence at common law or in some ecclesiastical court in the lifetime of the person simonia or simoniacally presented. The act also declares that the act of fraud or collusion or simonia or simoniacally presented, if bona fide and for valuable consideration to a lessee ignorant of the simony. By the Simony Act 1713 if any person shall for money, reward, gift, profit or advantage, or for any promise, agreement, grant, bond, covenant, or other assurance of any money, &c., take, procure or accept the next avoidance of or pre- sentation to any benefice, dignity, prebend or living ecclesiastical, and the person who makes or procures such presentation, collation and every admission, institution, investiture and inducement upon the same shall be utterly void; and such agreement shall be deemed a simoniacal contract, and the queen may present for that one time only; and the person so corruptly taking, &c., shall be adjudged disabled to have and enjoy the same benefice, &c., and shall be subject to any punishment limited by ecclesiastical law. The Ecclesiastical Commissioners Act 1850, § 42, provides that no spiritual person may sell or assign any patronage or presentation belonging to him by virtue of any dignity or spiritual office held by him; such sale or assignment is null and void. This section has been construed to mean that away the right of a spiritual person, the right to present to a benefice in a newly appointed bishop's patronage at the option of the archbishop. By canon 40 of the canons of 1603 an oath against simony was to be administered to every candidate to any benefice or to any dignity or prebend. The Clerical Registration Act 1888 provides for the registration of Lords held that all registration bonds, general or special, were illegal. Special bonds have since, however, been to a limited extent sanctioned by law. The Clerical Resignation Bonds Act 1828 makes a written promise to resign valid if made in favour of some particular nominee or one of two nominees, subject to the conditions that, where there are two nominees, each of them may be a son, brother, nephew or grand-nephew of the patron, that the writing be deposited with the registrar of the diocese open to public inspection, and that the resignation be followed by presentation within the stipulated period of time. The person who makes the bond holds the benefit made. The Benefices Act 1898 substitutes and makes obligatory on every person about to be instituted to a benefice a simpler and more stringent form of declaration against simonia, &c., and declares that it shall be the effect that the bargain has not received the presentation in consideration of any sum of money, reward, gift, profit or benefit directly or indirectly given or promised by him or his patron; that the right of presentation be vested in the advowson of the right of patronage, and constituted a new court to hear appeals against a bishop's refusal to institute or admit a presenter to a benefice on a number of specified grounds; among others, on the ground of possible corrupt pre- sentation. The Act was passed after a long struggle and after the bishop's right of patronage had been largely eroded. It is also the effect that the bargain has not received the presentation in consideration of any sum of money, reward, gift, profit or benefit directly or indirectly given or promised by him or his patron; that the right of presentation be vested in the advowson of the right of patronage, and constituted a new court to hear appeals against a bishop's refusal to institute or admit a presenter to a benefice on a number of specified grounds; among others, on the ground of possible corrupt pre-
SIMPLON PASS—SIMPSON, T.

in A.D. 529, the school of philosophy at Athens was disenrolled and the teaching of philosophy forbidden, the scholars Damascius, Simplicius, Priscianus and four others resolved in 531 or 532 to seek the protection of Chosroes, king of Persia, but, though they received a hearty welcome, they found themselves unable to endure a continued residence amongst barbarians. Before two years had elapsed they returned to Greece, Chosroes, in his treaty of peace concluded with Justinian in 533, expressly stipulating that the said philosophers should be allowed to return to their own homes, and to live henceforward in the enjoyment of liberty of conscience" (Agathias ii. 30, 31). After his return from Persia Simplicius wrote commentaries upon Aristotle's De coelo, Physica, De anima and Categoriae, which, with a commentary upon the Enchiridion of Epictetus, have survived. Simplicius is not an original thinker, but his remarks are thoughtful and intelligent and his learning is prodigious. To the student of Greek philosophy his commentaries are invaluable, as they contain many fragments of the older philosophers as well as of his immediate predecessors. (See Neo-Platonic.)

SIMPOL PASS, a pass over the Alps. Not known early save as a purely local route, the Simplon Pass rose into importance when Napoleon began the carriage road to be built across it between 1800 and 1807, though it suffered a new eclipse on the opening of the Mont Cenis (1871) and St Gotthard railways (1882). The Simplon tunnel was opened in 1896. The pass proper starts from Briege (Swiss canton of the Valais), which is in the upper Rhône valley and 903 m. by rail from Lausanne, past St Maurice and Sion. From Briege it is about 14 m. up to the pass (6529 ft.), close to which is the hospice (first mentioned in 1235) in the charge of Austin Canons from the Great St Bernard. The road descends past the Swiss village of Simplon, and passes through the wonderfully rock defile of Gondo before entering Italy at Iselle (28 m. from Briege). Here the road joins the railway line through the tunnel, which is 124 ft. in length, and 2313 ft. high, being thus both the longest and the lowest tunnel through the Alps. From Iselle it is about 11 m. by rail to Domo d'Ossola, whence the Toce or Tosa valley is followed to the Lago Maggiore (23 m.). The new line runs along the W. shore of the Lago Maggiore past Baveno, Stresa and Arona, and so on to Milan. (W.A.B.C.)

SIMPSON, SIR JAMES YOUNG (1811-1870), Scottish physician, was born at Bathgate, Linlithgow, Scotland, on the 7th of June 1811. His father was a baker in that town, and James was the youngest of a family of seven. At the age of fourteen he entered the university of Edinburgh as a student in the arts classes. Two years later he began his medical studies. At the age of nineteen he obtained the licence of the College of Surgeons, and two years afterwards took the degree of doctor of medicine. Dr John Thomson (1765-1845), who then occupied the chair of pathology in the university, impressed with Simpson's graduation thesis, "On Death from Inflammation," offered him his assistantship. The offer was accepted, and during the session 1837-1838 he acted as interim lecturer on pathology during Professor Thomson's absence. The following winter he delivered his first course of lectures on obstetric medicine in the extra-academical school. In February 1840 he was elected to the professorship of medicine and midwifery in the university. Towards the end of 1846 he was present at an operation performed by Robert Liston on a patient rendered unconscious by the inhalation of sulphuric ether. The success of the proceeding was so marked that Simpson immediately began to use it in midwifery practice. He continued, however, to search for other substances having similar effects, and in March 1847 he read a paper on chloroform to the Medico-Chirurgical Society of Edinburgh, in which he fully detailed the history of the use of anaesthetics from the earliest times, but especially dwelt upon the advantages of chloroform over ether. He advocated its use, not only for the prevention of pain in surgical operations, but also for the relief of pain in obstetrical practice, and his uncompromising advocacy of its use in the latter class of cases gave rise to one of the angriest and most widespread controversies of the time. In 1847 he was appointed a physician to the Royal Infirmary. In 1849 he advocated the use of acepromazine in place of ligatures for arresting the bleeding of cut arteries, but of more importance were his improvements in the methods of gynaecological diagnosis and obstetrics. His contributions to the literature of his profession were very numerous, embracing Obstetric Memoirs and Contributions (2 vols.), Homoeopathy, Acupressure, Selected Obstetrical Works, Anaesthesia and Hospitalism, and Clinical Lectures on the Diseases of Women. He also took an active interest in archaeology, and two volumes of his Archaeological Essays, edited by Dr J. Stuart, were published at Edinburgh in 1873. Simpson, who had been created a baronet in 1866, died in Edinburgh on the 6th of May 1870, and was accorded a public funeral; his statue in bronze now stands in West Princes Street Gardens, Edinburgh.

See John Duns, Memoir of J. Y. Simpson (1873); E. B. Simpson, Sir James Simpson (1896); and H. L. Gordon, Sir J. Y. Simpson and Chloroform (1902).

SIMPSON, MATTHEW (1831-1884), American bishop of the Methodist Episcopal Church, was born in Cadiz, Ohio, on the 21st of June 1831. He studied medicine in 1850-1853 and began to practise, and in 1853 was licensed as a preacher of the Methodist Episcopal Church. He was pastor of the Liberty Street Church of Pittsburgh in 1855, and of a church at Williamsport (now Montonaghaba) in 1856. In 1857 he was ordained elder and was appointed professor of natural science in Allegheny College, Meadville, in which Madison College had been merged in 1833; and in 1838 he was elected professor and immediately afterwards president of the newly established Indiana Asbury (now De Pauw) University, Greencastle, Indiana, to which he went in 1839; this position he held until 1848. He was editor of the Western Christian Advocate, which he made a strong temperance and anti-slavery organ, from 1848 to 1852. He was elected a bishop in May 1852, and in 1857, with Dr McClintock, visited Great Britain as a delegate to the British Wesleyan Conference, and travelled in the Holy Land. He was an intimate and trusted friend of President Lincoln, who considered his advice of great value, and at whose grave in Springfield he spoke the last words. He addressed the Garfield Memorial Meeting at Exeter Hall, London, on the 24th of September 1881. He died at the 18th of July 1884 in Philadelphia.

He published A Hundred Years of Methodism (1876); a Cyclopedia of Methodisn (1878); Lectures on Preaching (1879), delivered before the Theological Department of Yale College; and a volume of his Sermons (1885) was edited by George R. Crooks, whose Life of Bishop Matthew Simpson (New York, 1890) should be consulted.

SIMPSON, THOMAS (1710-1761), English mathematician, was born at Market Bosworth in Leicestershire on the 20th of August 1710. His father was a stuff weaver, and, intending to bring his son up to his own business, took little care of the boy's education. Young Simpson was so eager for knowledge that he neglected his weaving, and in consequence of a quarrel was forced to leave his father's house. He settled for a short time at Nuneaton at the house of a Mrs Swinfen, whom he afterwards married, where he met a peculiar who practised fortune-telling. Simpson was so charmed with his powers, and became the oracle of the neighbourhood; but he became convinced of the imposture of astrology, and he abandoned this calling. After a residence of two or three years at Derby, where he worked as a weaver during the day and taught pupils in the evenings, he went to London. The number of his pupils increased; his abilities became more widely known; and he was enabled to publish by subscription his Treatise of Fluxions in 1737. This treatise abounded with errors of the press, and contained several obscurities and defects incidental to the author's want of experience and the disadvantages under which
he laboured. His next publications were *A Treatise on the Nature and Laws of Chance* (1740); *Essays on Several Curious and Useful Subjects in Speculative and Mixed Mathematics* (1746); *The doctrine of Annuities and Reversions deduced from General and Evident Principles* (1747); and *Mathematical Discursions on a Variety of Physical and Analytical Subjects* (1743). Soon after the publication of his Essays he was chosen a member of the Royal Academy at Stockholm; in 1743 he was appointed professor of mathematics in the Royal Military Academy at Woolwich; and in 1745 he was admitted a fellow of the Royal Society of London. In 1745 he published *A Treatise of Algebra*, with an appendix containing the construction of geometrical problems, and in 1747 the *Elements of Plane Geometry*. The latter book, unlike many others with the same title, is not an editio princeps but an edition of the former. In 1755 appeared *Applications for Young Proficients in the Mathematicks*, and in 1757 his *Miscellaneous Tracts on Some Curious and Very Interesting Subjects in Mechanics, Physical Astronomy and Speculative Mathematics*, the last and perhaps the greatest of all his works. From the year 1755 he had been a frequent contributor to the *Ladies' Diary*, an annual publication partly devoted to the solution of mathematical problems, and from 1754 till 1760 inclusive he was the editor of it. He died at Market Bosworth on the 14th of May 1761. 

**SIMROCK, KARL JOSEPH** (1802–1876), German poet and man of letters, was born on the 28th of August 1802 at Bonn, where his father was a music publisher. He studied law at the universities of Bonn and Berlin, and in 1823 entered the Prussian civil service, from which he was expelled in 1830 for writing a poem in praise of the French July revolution. Afterwards he was appointed a professor of music at the university at Bonn, and in 1850 he was made a professor of Old German literature, and in which city he died on the 18th of July 1876. Simrock established his reputation by his excellent modern rendering of the *Nibelungenlied* (1827), and of the poems of Walther von der Vogelweide (1833).

Among other works translated by him into modern German were the *Arne Heinrich von Hartmann von Aue* (1830), the *Parzival* and *Titurel* of Wolfram von Eschenbach (1842), the *Tristan* of Gottfried of Strassburg (1855), and the *Heldbenbuch* (1843–1849), which he supplemented with independent poems. Before the publication of this work he had shown an original poetical faculty in *Wieland der Schmied* (1835); and in 1844 he issued a volume of Gedichte in which there are many good lyrics, romances and ballads. In 1850 appeared *Landau Sien*, and in 1857 the *Deutsche Sionsharfe*, collections of Old German sacred poetry. Of his republications the most popular and the most valuable were the *Deutschen Volksbücher*, of which fifty-five were printed between 1839 and 1867. His best contribution to scholarship was his *Handbuch der deutschen Mythologie* (1855–1855). At an early stage of his career Simrock took a high place among students of Shakespeare by his *Quellen des Shakespeare in Noodlert, Mären und Sagen* (1831); and afterwards he translated Shakespeare's poems and a considerable number of his dramas. The large number of editions through which Shakespeare's translations from the *Middle High German have passed* (the *Nibelungenlied* more than forty) bear witness to their popularity. An edition of his *Ausgewählte Werke* was published in 1900. See N. Hocker, *Karl Simrock, sein Leben und seine Werke* (1877); H. Düntzer, "Erinnerungen an Karl Simrock," in *Monatschrift für Westdeutschland* (1877), and E. Schröder's article in *Allg. deutsche Biographie*.

**SIMS, GEORGE ROBERT** (1847–1905), English journalist and dramatic author, was born on the 2nd of September 1847. He was educated at Hanwell College and at Bonn, and commenced journalism in 1874 as successor to Tom Hood on *Fun*. His first play, *Cruch and Toothpick*, was produced at the Royalty Theatre in April 1879, and was followed by a number of plays of which he was author or part-author. After long runs at west end houses, many of these became stock pieces in suburban and provincial theatres. His most famous melodramas were: *The Lights of London* (Princess's theatre, September 1881), which ran for nearly a year; *In the Ranks* (Adelphi, Oct. 1883), written with H. Pettit, which ran for 457 nights; *Harbour Lights* (1885), which ran for 513 nights; *Two Little Vagabonds* (Princess's Theatre, 1896–1897). He was part-author with Cecil Raleigh of the burlesque opera, *Little Christopher Columbus* (1893), and among his musical plays were *Blue-eyed Saxon* (Prince of Wales's, 1892) and *The Dandy Fifth* (Birmingham, 1896). His early volumes of light verse were very popular, notably *The Damocest Ballads* (1883), reprinted from the *Reporter*. His article on *the Poor Live* (1883) and his articles on the housing of the poor in the *Daily News* helped to arouse public opinion on the subject, which was dealt with in the act of 1885.

**SIMSBURY**, a township of Hartford County, Connecticut, U.S.A., traversed by the Farmington river and about 10 m. N.W. of Hartford. Pop. (1910) 2537. Area about 38 sq. m. The township is served by the New York, New Haven & Hartford and by the Central New England railways, which meet at Simsbury village. Among the manufactures are fuses, cigars and manufactured goods. From the Farmington (N.), a tributary of the Farmington river, river, Simsbury was incorporated as a town in 1648, and there were settlers here from Windsor as early as 1664. In 1670 the township was incorporated as Simsbury. In 1675, during King Philip's War, Simsbury was abandoned; and in 1676 it was burnt and pillaged by the Indians; but it was resettled in the following year. Steel seems to have been made here from native iron in 1777, and in 1790 the General Court of Connecticut granted to three citizens of Simsbury a fifteen years' monopoly of making steel in the colony. Owing to the pine forests pitch and tar were important manufactures early in the 19th century. From the Farmington (S.) part (pop. 1910, 1283) was set off in 1864. In this part of the township a copper mine was worked between 1705 and 1745, and smelting and refining works were built in 1721. In 1773 the mine was leased by the General Court and was fitted up as a public gaol and workhouse (called Newgate Prison), the prisoners being employed in mining. Some Tories were imprisoned here after 1780; many of them escaped in May 1781. The prison was rebuilt in 1790 and was used until 1837. The W. of Simsbury was set off in 1806 as Canton (pop. in 1900, 2678).

**SIMSON, MARTIN EDUARD VON** (1810–1899), German jurist and politician, was born at Königsberg, in Prussia, on the 10th of November 1810, of Jewish parentage. After the usual course at the gymnasium of his native town, he entered its university in 1826 as a student of jurisprudence, and especially of Roman law. He continued his studies at Berlin and Bonn, and, having graduated doctor juris, attended lectures at the *École de Droit* in Paris. Returning to Königsberg in 1831 he established himself as a Privatdozent in Roman law, becoming later an extra ordinary, and eventually a full professor in that faculty at the university. Like many other distinguished German jurists, *pari passu* with his professional activity, Simson followed the judicial branch of the legal profession, and, passing rapidly through the subordinate stages of auscultator and assessor, became adviser (Rath) to the Landgericht in 1846. In this year he stood for the representation of Königsberg in the National Assembly at Frankfort-on-Main, and on his election was immediately appointed secretary, and in the course of the same year became successively its vice-president and president. In his capacity of president he appeared, on 3rd April 1849, in Berlin at the head of a deputation of the Frankfort parliament to announce to King Frederick William IV. his election as German Emperor by the representatives of the people. The king, either apprehensive of a rupture with Austria, or fearing detriment to the prerogatives of the Prussian crown should he
accept this dignity at the hands of a democracy, refused the offer. Simson, bitterly disappointed at the outcome of his mission, resigned his seat in the Frankfort parliament, but in the summer of the same year was elected deputy for Königspol in the popular chamber of the Prussian Landtag. Here he soon made his mark as one of the best orators in that assembly. A member of the short-lived Erfurt parliament of 1830, was again summoned to the presidential chair.

On the dissolution of the Erfurt assembly, Simson retired from politics, and for the next few years devoted himself exclusively to his academical and judicial duties. It was not until 1835 that he reentered public life, when he was appointed judge for Königspol, in the lower chamber of the Prussian Landtag, of which he was president in 1860 and 1861. In the first of these years he attained high judicial office as president of the court of appeal at Frankfort on the Oder. In 1867, having been elected a member of the constituent assembly of the North German Federation, he again occupied the presidential chair, as he did also in the first regular Diet and the Zoll-parliament which succeeded it. On 18th December 1870 Simson arrived at the head of a deputation in the German headquarters at Versailles to offer the imperial crown to the king of Prussia in the name of Simson's constituents. As president of the confederation, the Prussians might justly aspire to the hegemony in Germany at last appeared to have been accomplished, no obstacles, as in 1840, were in the way of the acceptance of the crown by the leading sovereign of the confederation, and on 18th January 1871 King William of Prussia was proclaimed with all pomp German Emperor in the Salle des Glaces at Versailles. Simson continued as president of the Reichstag until 1874, when he retired from the chair, and in 1877 resigned his seat in the Diet, but at Bismarck's urging, accepted the presidency of the supreme court of justice (Reichsgericht), and this high office he filled with great distinction until his final retirement from public life in 1891. In 1888 the emperor Frederick bestowed on Simson the order of the Black Eagle.

His political career coincides with the era of German struggles towards unity. As a politician he was one of the leaders of modern Liberalism, and though always loyal when appeals were made to patriotism, such as government demands for the army, he remained obdurate on constitutional questions; and he resolutely opposed the reactionary policy of the Prussian Conservatives. On his retirement from the presidency of the Reichsgericht, he left Leipzig and made his home in Berlin, where he died on 7th May 1896.

His Life was written by his son, Bernard von Simson, under the title Edward von Simson, Erinnerungen aus seinem Leben (1900).

SIMSON, ROBERT (1687–1768), Scottish mathematician, the eldest son of John Simson of Kirktonhill in Ayrshire, was born on the 14th of October 1687. He was intended for the church, but the bent of his mind was towards mathematics, and, when a prospect opened of his succeeding to the mathematical chair at the university of Glasgow, he proceeded to London for further study. After a year in London he returned to Glasgow, and in 1711 was appointed by the university to the professorship of mathematics, an office which he retained until 1761. He died on the 1st of October 1768.

His contributions to mathematical knowledge took the form of critical editions and commentaries on the works of the ancient geometers. The first of his published writings is a paper in the Philosophical Transactions (1723, vol. xl. p. 330) on Euclid's Data (q.v.). Then followed Sectionum conicarum libri V. (Edinburgh, 1735), a second edition of which, with additions, appeared in 1750. The first three books of this treatise were translated into English, and several times printed as The Elements of the Conic Sections, 1732. In 1740 was published Apollonius's lost treatise, founded on the lemmas given in the seventh book of Pappus's Mathematical Collection. In 1759 appeared, both in Latin and in English, the first edition of his Euclid's Elements, a work, which has been called not only the first six and the eleventh and twelfth books, and to which in its English version he added the Data in 1762, was for long the standard text of Euclid in England. After his death restorations of Apollonius's treatise De sectione determinata and of Euclid's treatise De parabolitis were printed for private circulation in 1776 at the expense of Earl Stanhope, in a volume with the title Roberti Simsoni opera quaedam reliqua. The volume contains also dissertations on Logarithms and on the Limits of Quantities and Rationes, and a few problems illustrative of the ancient geometrical analysis.

See W. Traill, Life and Writings of Robert Simson (1812); C. Hutton, Mathematical and Philosophical Dictionary (1815).

SIMSON, WILLIAM (1800–1847), Scottish portrait, landscape and subject painter, was born at Dundee in 1800. He studied under Andrew Wilson at the Trustees' Academy, Edinburgh, and his early pictures—landscape and marine subjects—found a ready sale. He next turned his attention to figure painting, producing in 1829 the "Twelfth of August," which was followed in 1830 by "Sportsmen Regaling" and a "Highland Deer-stalker.

In the latter year he was elected a member of the Scottish Academy; and, having acquired some means by portrait-painting, he spent three years in Italy, and on his return in 1838 settled in London, where he exhibited his "Camaldolese monk showing Relics," his "Cimabue and Giotto," his "Dutch Family," and his "Columbus and his Child" at the Convent of Santa Maria la Rabida. He died in London on the 29th of August 1847. Simson is greatest as a landscapist; his "Solway Shore" was an example of quiet poetry, and his "Dove Hill" was an example of the strife of nature. It is his landscape of Scotland and the Highlands that is his best work. "His manner was calm, and the calmness and beauty of his landscapes is a perfection, which is the finest example of the early Scottish school of landscape. His elder brother George (1791–1862), portrait-painter, was also a member of the Royal Scottish Academy, and his younger brother David (d. 1874) practised as a landscape-painter.

SIN (O. Eng. syn: a common Teutonic word, cf. Dutch zonde, Ger. Sünde), a general term for wickedness or a wicked act. As psychology recognizes a distinction of pleasure and pain, and metaphysics of good and evil, so morality assumes the difference between right and wrong in action, good and bad in character; but this distinction in psychology and metaphysics applies to what is, the difference in morality is based on judgment of what is by what ought to be. When the act or the character not correspond with the standard, this want of correspondence may in different relations be variously described. In relation to human society, and the rules it imposes on its members, action that ought not to be done is crime; a habit which is injurious to a man's own moral nature, especially if it involves evil physical consequences, is described as vice. If man is thought of as under the authority of God, any transgression of or want of conformity to the law of God is defined as sin. Crime is a legal, vice a moral, and sin a religious term. Sin may be distinguished from guilt as the former involves the liability to punishment, that is, to the suffering conceived not as the natural consequence, but as the manifestation of the divine displeasure, which sin as a breach of divine law involves. Sin is a term applied not only to actions, but also to dispositions and motives. In the theological phrase original sin it means the inherited tendency to do wrong.

There have been two great controversies in the Christian Church on this question, the Augustinian-Pelagian and the Calvinistic-Arminian, one in the 5th century and the other in the 17th. Pelagius declared the capacity of every man to become virtuous by his own efforts, and summoned the members of the Church in Rome to open a controversy with him. An appeal was made to the council of Carthage, and the party of Pelagius was condemned. His friend Caelestius was in 422 charged with and excommunicated for heresy because he regarded Adam as well as all his descendants as naturally mortal, denied the racial consequences of Adam's fall, asserted the entire innocence of the new-born, recognized sinless men before the coming of Christ. Pelagius himself desired to avoid controversy, and with mental reservations denied these statements of his friend; but he did not escape suspicion, and his condemnation in 418 was the signal for a literary polemic, which lasted ten years, and in which Julian of Ekatun was the most brilliant but reckless combatant on the side of Pelagius. In the East the freedom of the will was so insisted on, that one may regard Greek theology as essentially Pelagian. In the West there was unanimity only on three points: the necessity of baptism for the remission of sins, the inheritance of sin as a result of Adam's fall, and the indispensableness of the divine grace in the attainment of goodness. Pelagius insisted that
SIN—SINAI

SIN was an act, not a state, an abuse of the freedom of the will, and that each man was responsible and liable to punishment only for his own acts. This extreme individualism he qualified only in two respects, he admitted a principle of imputation, the influence of bad example, habit and customs, may be inherited and communicated. Divine grace is not necessary for human virtue. It is granted only according to act, and merits as the law in enlightened, warning, or promising reward. To this Augustinian, opposite the view that Adam's sin is, as its penalty, transmissible to all his descendants, both as guilt and as weakness. The transmission is not by imputation, but by propagation. The essence and mode of operation of original sin is concupiscence, which, as of the devil, subjects man in his natural state to the devil's dominion. Even infants are involved in Adam's condemnation. Sin is a necessity in each individual, and there is a total corruption of man's nature, physically as well as morally. Into the details of the controversy it is not necessary to go any further. While the authority of Augustine received lip-homage, the doctrine of the Roman Catholic Church became more Pelagian, and in the Tridentine decrees and still more in the ethics of the Jesuits, in spite of the opposition of Jansenism, Pelagianism at last triumphed.

The Reformation restored the teaching of Augustine; in Calvinism especially the sovereignty of the divine and the impotence of the human will were emphasized; and against this exaggeration Arminianism was a protest. Of the five articles of the Remonstrance of 1610 only two now concern us: the possibility of resisting the grace which is indispensable to salvation, and the possibility of falling away from grace even after conversion. The Arminian system was an attempt to modify the Calvinistic theory in a moral interest, so as to maintain human responsibility, good and ill desert; but to this moral interest the system sacrificed the religious interest in the sufficiency and the sovereignty of divine grace. Its adherents necessarily laid emphasis on human freedom. As regards original sin they taught that the inclinations to evil inherited from Adam are not themselves blameworthy, and only consent to them involves real guilt. It is not just, however, to Arminianism to identify it with Pelagianism, as it does strive to make clear man's need of divine grace to overcome sin and reach holiness. In the Evangelical Review of the 18th century Arminianism was represented by Wesley, and Calvinism by Whitefield.

SIN, the name of the moon-god in Babylonia and Assyria, also known as Nannar, the "illuminer." The two chief seats of his worship were Ur in the S., and Harran considerably to the N., but at the cult an early period spread to other centres, and temples to the moon-god are found in all the large cities of Babylonia and Assyria. He is commonly designated as En-zu, i.e. "lord of wisdom," and this attribute clings to him throughout all periods. During the period (c. 2600-2200 B.C.) that Ur exercised a large measure of supremacy over the Euphrates valley, Sin was naturally regarded as the head of the pantheon. It is to this period that we must trace such designations of the god as "father of the gods," "chief of the gods," "creator of all things," and the like. We are justified in supposing that the cult of the moon-god was brought into Babylonia by the Semitic nomads from Arabia. The moon-god is par excellence the god of nomadic peoples, their guide and protector at night when, during a great part of the year, they undertake their wanderings, just as the sun-god is the chief god of an agricultural people. The cult once introduced would tend to persevere, and the development of astrological science culminating in a calendar and in a system of interpretation of the movements and occurrences in the starry heavens would be an important factor in maintaining the position of Sin in the pantheon. The name of Sin's chief sanctuary at Ur was E-gish-shir-gal, "house of the great light"; that at Harran was known as E-khul-khu, "house of joys." On seal-cylinders he is represented as an old man with flowing beard, with the crescent as his symbol. In the astral-theological system he is represented by the number 30, and the planet Venus as his daughter by the number 15. The number 30 stands obviously in connexion with the thirty days as the average extent of his course until he stands again in conjunction with the sun.

The "wisdom" personified by the moon-god is likewise an expression of the science of astrology in which the observation of the moon's phases is so important a factor. The tendency to centralize the powers of the universe leads to the establishment of the doctrine of a triad consisting of Sin, Shamash and Ishhtar (q.v.), personifying the moon, sun and the earth as the life-forces.

SINAI. 1. The Biblical Mount Sinai. In judging of the points of controversy connected with Sinai we are brought face to face with the question of the historicity of the Hebrew records involved. Though new attempts to fix the stations of the wilderness wandering appear every year, critics have long agreed that the number of forty for the years of wandering and for the stations are round numbers, and that the details are not based on historical tradition of the Mosaic age. This does not exclude the possibility that the names of some or all of the stations belong to real places and are based on more or less careful research on the part of the writers who record them. As regards the Mountain of the Law in particular, if the record of Exod. xix. seq. is strictly historical, we must seek a locality where 600,000 fighting men, or some two million souls in all, could encamp and remain for some time, finding pasture and drink for their cattle, and where there was a mountain (with a wilderness at its foot) rising so sharply that its base could be fenced in, while yet it was easily ascended, and its summit could be seen by a great multitude below. In the valley there must have been a flowing stream. The peninsula of Sinai does not furnish any locality where so great a host could meet under the conditions specified, and accordingly many investigators give up the statistics of the number of Hebrews and seek a place that fulfills the other conditions. But when we consider that the various records embodied in the Pentateuch were composed long after the time of Moses, and that the authors in all probability never saw Sinai, and had no exact topographical tradition to fall back on, but could picture to themselves the scene of the events they recorded only by the aid of imagination, the topographical method of identifying the Mount of the Law becomes very questionable. The Pentateuchal writers are not at one even about the name of the mountain. It used to be thought that Horeb was the name of the mountain mass as a whole, or of its southern part, while Sinai was the Mountain of the Law proper, but it has been shown by Dillmann that the Elohist and Deuteronomy always use the name Horeb for the same mountain which the Jahvist and the Priestly Code call Sinai. The Elohist belonged to Northern Israel, but Judges v. 5 shows that even in Northern Israel the other name Sinai was not unknown. And it might be shown, though that cannot be done here, that the several accounts vary not only as regards the name but in topographical details. Thus all that can be taken as historically fixed is that after leaving Goshen the Hebrews abode for some time near a mountain called Sinai or Horeb, and that this mountain or range was held to be holy as a seat of the Deity (Exod. ii. 1: 1 Kings xix.).

Where, then, was this mountain? The Midianites, of whom according to one source Jethro was priest, probably always lived E. of the Gulf of 'Aqaba; yet we can hardly follow Beke in seeking Sinai beyond that gulf, but must rather think of some point in the so-called peninsula of Sinai, which lies between the Gulfs of 'Aqaba and Suez, bounded on the N. by the Wilderness el-Tih, which slopes gently towards the Mediterranean. To the south of this wilderness rises the Jebel el-Tih, a mass composed of Nubian sandstone, which rises to an altitude of some 3000 ft.; its ridges converge towards the S. and are cut off by great valleys from the mass now known as Mount Sinai. The latter is composed of primitive rocks—granite, porphyry, diorite, gneiss, &c. The sandstones of Jebel el-Tih are rich in minerals; inscriptions of Amenemhet III. and Thothmes III. found on the spot show that the ancient Egyptians got turquoise at Serabit al-Khadem; and at Maghara, where inscriptions occur bearing the names of kings from Semerkhet and Khuhu down to Rameses II. These mines were worked by criminals and prisoners of war, and the
waste products of copper foundries indicate that the peninsula was once better wooded than now, of which indeed we have express testimony of post-Christian date. At present the dominant feature is bare walls of rock, especially in the primitive formations; the steep and jagged summits have a striking effect, which is increased by the various colours of the rock and the clearness of the atmosphere. The deep-cut valleys are filled by rubble which was often traditionally consecrated, but has since been washed away. In the S. the centre of the main mountain mass is Mount Catherine (5450 ft.), Omm Shômar to the S.E. being little lower; this peak and N. of it Mount Serbâl (6750 ft.), which rises more immediately from the plain, dominate the Ka‘âh, a waste expanse of sand strewn with pebbles, which occupies the S.W. margin of the peninsula. In the Ka‘âh is the village of Tur, and at the S. promontory (Ras Mohammed) is the little hamlet of Sherm. The Sinai group as a whole is called by the Arabs Jebel al-Tûr; the name Sinâ in Arabic comes only from books. The area of the peninsula is about 11,200 sq. m.; the population is four to five thousand souls, chiefly Bedouins of various tribes, whose common name, derived from Tûr, is Towâra. They have sheep and goats, with which they retire in summer to the higher lands, where there is good pasture ground, and where springs are comparatively common. On the chalk and sandstone water is scarcer than among the primitive rocks, and often brackish. Though the rocks are bare, there is always vegetation in the dales, especially acacias and tamarisks; from the latter (T. mannifera) manna is still derived in quantities that vary with the rainfall. On the hills grow aromatic plants, especially Thymaceae. The fauna includes the ibex, hyrax and hyena; the panther too is sometimes found. Flights of quail have been observed. In some valleys there are well-kept gardens and good date-palms; the most noted oasis is that of Feiran, in the N.W. of the peninsula, which is watered by a perennial stream. Whether Feiran is the Reptild of Exod. xviii. is a question which, like the identification of the other stations of the Israelites, depends on the localization of the Mountain of the Law.

There is no genuine pre-Christian tradition on this subject. The chief authority for the ancient sanctity of Mount Sinai is Antoninus Martyr (end of the 6th century), who tells that the heathen Arabs at this time still celebrated a moon feast there. As the means “moon,” this feast has been connected with the name of Sinai, but the proposed etymology is not certain. Of heathen origin, too, are the many Nabataean inscriptions of Sinai, found especially in the Wâdy Mokatib (in the N.W.), and sometimes accompanied by rude drawings. The language and character are Aramaic, but the proper names are mainly those of Arabs, who passing by graved their names on the rocks. That they were pilgrims to Sinai cannot be made out with certainty. The inscriptions date from the early years of the Christian era, when the Nabataean kingdom was at its height.

In early Christian times many anchorites inhabited Sinai, living for the most part in the caves, which are numerous even in the primitive rocks. Then monasteries were built, the most famous being the great one of St Catherine in Wâdy el-Dér (the valley of the monastery). On Serbâl, too, there were many granite dwellings, and in the neighbouring Pharan (Phoenicion), which was a bishop’s see, there were, as the ruins show, churches and convents.

The question then is whether when the hermits first settled in the peninsula there existed a tradition as to the place of the Mountain of the Law, and whether they chose for their residence a spot which was already traditionally consecrated and significant to the Christian as well as to the Jew. No assertion of the existence of such a tradition is to be found in Josephus, who only says that Sinai was the highest mountain of the district—a description which might apply to Serbâl as seen from the plain below. Eusebius uses expressions which may also seem to point to Serbâl as the place of the law-giving, and it must be admitted that the tradition which seeks the holy site in the group of Jebel Musâr (i.e. the mass of which Mount Catherine is the highest peak) is not older than the time of Justinian, so that the identification with Mount Serbâl seems to have greater antiquity in its favour. In later times Jebel Musâr and Serbâl had each its own tradition, and the holy places were pointed out at each; thus from the monastery of St Catherine a path of granite steps was constructed up to “the Mountain of the Law,” but similar steps are found at Serbâl. That these traditions are not decisive, however, is admitted, more or less, even by those who, like Lepsius, Ebers, Bartlett, give their voice for Serbâl. Most authorities still prefer Jebel Musâr or some part of that group, but they again differ in details. First of all there is much difficulty in determining the route by which the Hebrews approached the mountain. Then comes the question of finding a suitable plain for their encampment under the mountain, which is best met if, with Robinson, Stanley, Palmer and others, the plain is taken to be that of al-Râhî and the overhanging mountain to be Jebel Sufstân. The latter is over 9300 ft. high, and consists of pasture ground; it does not fit all the details in Exodus, but this objection is quite as strong against the traditional site on Jebel Musâr (Mount Moses), which lies farther S. Jebel Musâr has been accepted by Tischendorf, Labore, Ritter, Strauss, Farrar, and many others; on this view the Israelites must have encamped in the narrow Wâdy al-Seya‘yeh, N. of the mount. But the absence of exact topographical detail on the part of the Biblical narrators, who always speak of Sinai as if it were a single summit and give no hint about several summits of which it is one, shows that in their time there was no real tradition on the matter, and that all attempts at identification are necessarily vain.

LITERATURE.—Burckhardt, Travels in Syria, &c. (London, 1822); Lebe de Lézard, Voyage de l'Arabie Pétrie (Paris, 1830-1836); Robinson, Biblical Researches (London, 1841); Lapis, Retei (Berlin, 1845); Stanley, Sinai and Palestine; Frass, Aus d. Orient (Stuttgart, 1867); Ordinance Survey of the Pen. of Sinai (Southampton, 1869, 3 vols.); Palmer, Desert of the Exodus (Cambridge, 1871); Ebers, Durch Gesen zum Sinai (2nd ed., Leipzig, 1881); Baker Greene, The Hebrew Migration (London, 1883); Hull, Mount Ser, Sinai and West Palestine (London, 1885). See also the Palestine Society’s Quarterly Statement, passim. (A. So.)

2. The Peninsula: Recent Research.—The peninsula of Sinai is about 230 m. in extreme length and 150 m. wide, or nearly the size of Ireland. It is practically waterless and barren, the population being not a thousandth of that on an equal area in England. The S. part is a high mass of schists and granite, deeply cut into valleys; it is overlaid by carboniferous sandstone and limestone, capped with tertiary basalt, flows in the mining region. The N. part is an expanse of cretaceous limestone and nummulitic tertiary limestone, sloping down to the Mediterranean. The steep valley of the Gulf of Suez has been greatly deepened—if not formed—since the tertiary limestone was deposited, the beds dipping down sharply to the sea. The only water supply of any importance is that in the Wâdy Feiran; elsewhere only small water-holes preserve enough for a few persons, but fresh water can be obtained along the shore route by digging.

The difficulty about the numbers of the Israelites who lived here has lately been treated on a fresh basis. That they were not more numerous than the previous inhabitants is shown by the difficulty in conquering the Amalekites at Rehiphid. In the census lists of the Book of Numbers the hundreds of people in each tribe are in most cases 4 or 500; 2, 3, 6 or 700 are rare; 0, 1, 8 or 900 do not occur. The hundreds are therefore independent of the thousands prefixed to them: and as alaf means both a “thousand” and a “family,” it is proposed that the original census was in numbers of tents or families, and hundreds of thousands and thousands of hundreds. Other points agree in this view, such as the number of persons in a family, the similarity of hundreds in the census before and that after the wanderings, and the actual size of Goshen, from which they came, and the population of Sinai where they settled. Thus the total numbers were 5730 people. The internal evidence that the census lists are original documents is very strong, though they have been misunderstood by later compilers. It is impossible to suppose a population trained in Egypt not having the ability to keep some tribal
SINAIA—SINAN PASHA

records of numbers and movements such as were the basis of the existing re-edited narrative.

The history of the Egyptian settlements has been investigated. They began in the 1st Dynasty, shown by the tablet of the conquest by King Somerkhet (5280 B.C.) above the mines of turquoise at Wady Maghara. Senefru (4970 B.C.) was already working at Serabit for turquoise. Other kings who left records here are Sanekht (IIId Dynasty), Khufu (IVth), Sahura, Ranuser, Menkauhor (Vth), Amenemhat I, Senusret I, Senusret II, Amenemhat II, Amenemhat III, Amenemhat IV (XIIth), Ahmes I, Amenhotep I, Tahutmes IV, Hatshepsut, Tahutmes III, Tahutmes IV, Amenhotep III (XVIIIth), Rameses I, Sety I, Rameses II, Merenptah, Sety II, Taussert, Sencnekht (XIXth), Rameses III, IV., V. and VI. (XXth). The monuments are mostly inscriptions recording the mining expeditions and their tribute to the goddess of turquoise. The original shrine of the goddess was a cave; this was hewn out and buildings were gradually added before it to a length of 230 ft. The records show that no fewer than twenty-five different grades of officials took part in the work of mining, which was highly organized as regards direction, technical ability, labour and transport, often as many as 700 men being employed. Over 400 objects with kings' names have been found in the fragments of the offerings which were left in the shrine. The worship at Serabit was that of Hathor, mistress of turquoise. She is identical with Athtar or Ishtar, the Semitic goddess of Arabia. The features of the goddess were entirely Semitic and not Egyptian. An enormous mass of burnt-offerings is shown by the bed of ashes before the sacred cave; tanks for ablutions are found in the temple courts, altars of incense are in the shrine itself, and also conical stones; and chambers or shelters for dreaming before the temple are a main feature. All of these belong to Semitic worship, and they show that before Mosesm the elements of the worship were the same as are found in later times.

For all the recent research see W. M. Flinders Petrie, *Researches in Sinai* (1906), and W. F. Petrie, *Sinaia, a town of Rumania, about 12 m. S. of the Hungarian frontier at Predeal, on the railway from Ploescli to Kronstadt in Transylvania. Pop. (1900), 2219. Sinaia resembles a large modern village, widely scattered among the pine forests of the lower Carpathians, and along the banks of the Prahova, a swift alpine stream. The monastery of Sinaia, founded by Prince Michael Cantacuzino in 1695, was the residence of the royal family until the present chateau was built. It consists of two courts surrounded by low buildings. In the centre of each court is a small church built in the Byzantine style. The monks possess a library, in which are kept valuable jewels belonging to the Cantacuzene family. Castle Peleri or Pelishe, the modern palace, stood on the hill on which it stands, is of a mixed style of architecture. The interior is fitted with magnificent wood carvings and stained glass windows illustrating the principal scenes of "Carmen Sylva’s" writings. Until 1859 Sinaia consisted of little more than the monastery and a group of huts. In 1864, however, the monastic estate was assigned to the Board of Civil Hospitals, by which a hospital and baths were opened and the mineral springs developed. Sinaia soon became the favourite summer resort of Bucharest society, and rapidly developed in all its equipment.

SINALOA, a N. state of Mexico, bounded N. by Sonora and Chihuahua, E. by Durango, S. by Tepey, and W. by the Gulf of California, with a coast line of nearly 400 m. Area, 33,671 sq. m. Pop. (1900), 206,701, largely Indians. The surface consists of a narrow coastal zone where tropical conditions prevail, a broad belt of mountainous country covered by the ranges of the Sierra Madre Occidental and their intervening valleys where oak and pine forests are to be found, and an intervening zone among the foothills of the Sierra Madre up to an elevation of 2000 ft., where the conditions are subtropical. The state is traversed by numerous streams, the largest of which have broad valleys among the foothills. The largest of these are, the Cullacán, Fuerte, and Sinaloa, the last two having short navigable courses across the lowlands.

Rain is plentiful everywhere, except in the extreme north, where the climate is semi-arid. The climate of the low-lying coast is hot and malarious, but in the mountains it is cool and healthy. Cereals and meskal are produced on the uplands, and sugar, rum, coffee, tobacco, grape spirits and fruit in the lower zones. There are excellent cattle lands in the state and the production of this staple was largely developed during the American Civil War, but it has since declined. Grazing receives considerable attention in all parts of the state, where the temperature is favorable and the pasturage good, and hides are largely exported. Mining, however, is the chief industry, Sinaloa being one of the richest mineral-producing states in the republic. Gold, silver, copper, iron and lead are found. There are also salt deposits. The most important of the silver mines are the Rosario, from which about $90,000,000 had been extracted up to the last decade of the 19th century, and the Nuestra Señora de Guadalupe de los Reyes, discovered early in the 19th century and yielding per year $85,000. The deposits of flinty rock in the forest products of the state include rubber, resin, cabinet and dye-woods, deerskins, orchil and bals fibre. Up to the beginning of the 21st. c., Huanacaxtle was the only port in the state, and it is still known as Sinaloa and Altata—are much used. The bays of Agiobampo and Topolobampo are prospective railway terminals with fine harbours. The capital of the state is Culiacán Rosales (commonly called Culiacán), on the Culiacán river 50 m. from its port. Altata, at the mouth of the same river, with which it is connected by rail. It is a well-built town, with some thriving manufactures, including cotton goods, cigarettes, liquors, etc. It is the capital of Sinaloa. Huanacaxtle (pop. in 1900, 10,380) is the distributing centre for a large district between Guaymas and Mazatlán. The most important town is Mazatlán, one of the leading ports of Mexico on the Pacific coast, and the communications from the southern part of the state are by rail. Other towns are Mocorito (pop. 9971 in 1895), Sinaloa and Fuerte, all in the N. of the state, Rosario (pop. 8448 in 1900), and San Ignacio in the S.

SINAN PASHA (1515-1556), Turkish soldier and statesman, was an Albanian of low origin. In 1506 he was appointed governor of Egypt and was occupied until 1517 in the conquest of Yemen. In 1547 he commanded the great expedition against Tunis, which, in spite of the brave defence by the Spanish and Italian garrison, was added to the Ottoman empire. In 1580 Sinan commanded the army against Persia and was appointed grand vizier, but was disgraced and exiled in the following year, owing to the rows of his lieutenant Mahomed Pasha, at Gori, in an attempt to procure the Turkish garrison of Tiflis. He subsequently became governor of Damascus and, in 1586, after the great revolt of the Janissaries, was appointed grand vizier for the second time. Another revolt of Janissaries led to his dismissal in 1591, but in 1593 he was again recalled to become grand vizier for the third time, and in the same year he commanded the Turkish army against Hungary. In spite of his victories he was again deposed in February 1598, and in a second rebellion of the Janissaries in 1599 he was made grand vizier of Malghara; but in August was in power again and on the march to Wallachia. The unhappy course of this campaign, culminating in the fall of Gran, brought him once more into disfavour, and he was deprived of the seal of office (November 19). The death of his successor, Lala Mahomed, three days later, was looked on as a sign from heaven, and Sinan became grand vizier for the fifth time. He died suddenly on the 3rd of April 1566.

Bold, overbearing and unscrupulous, Sinan recollected from no baseness to put a rival out of the way, while his insolvency confined the standard of his society, but was gradually towards his opponents in the sultan's presence. He had a barbarous hatred not only for Christians but for all civilization. The immense fortune which he left is a proof of his capacity.

Another Sinan Pasha was governor of Anatolia at the time of Mahommed II.'s death in 1481. He was a brother-in-law of Bayezid II. and defeated Prince Jem's troops at Brusa. In Selim I.'s reign he served with great distinction in the Persian and Egyptian campaigns and fell at the battle of Ridiwan, where the Mamelukes were defeated, in 1517.

A third Sinan Pasha, brother of the grand vizier Rustem Pasha, was grand admiral under Suleiman I. and died about 1535.
SINCLAIR—SINCLAIR, SIR JOHN

SINCLAIR, the name of an old Scottish family, members of which have held the titles of earl of Orkney and earl of Caithness. The word is a variant of Saint Clair.

Sir William Sinclair, or Saint Clair (c. 1260—c. 1303), was the descendant of a line of Anglo-Norman barons, one of whom obtained the barony of Roslyn from King David I. in the 12th century. Sir William took part in the dispute over the succession to the crown of Scotland in 1292, and was one of the leaders of the Scots in their revolt against Edward I. One of his sons was William Sinclair (d. 1337), bishop of Dunkeld, who was responsible for the defeat of an English force at Donibristle in Fife in 1317. Sir William's eldest son was Sir Henry Sinclair (d. 1350), the friend of Robert the Bruce; and Sir Henry's son was Sir William Sinclair, who was slain by the Saracens in August 1350, while journeying through Spain to Palestine with his young son, James, destined to be Lord Sinclair. The Sir William Sinclair married Isabel, daughter of Malise, earl of Strathearn, Caithness and Orkney (d. c. 1350), and their son Henry Sinclair (d. c. 1400) obtained the earldom of Orkney by a judgment of the Norwegian king Haakon VI. in 1370. He then helped to conquer the Faeroe Islands, and took into his service the Venetian travellers, Niccolo and Antonio Zeno, sailing with Antonio to Greenland. This prince of Orkney, as he is sometimes called, was succeeded by his son Henry (d. 1418), who was admiral of Scotland, and then by his grandson William (c. 1404—1450), the founder of the beautiful chapel at Rosslyn. The 3rd earl of his line, whose earldom of Orkney was a Norwegian dignity, was made chancellor of Scotland in 1454 and Lord Sinclair and earl of Caithness in 1455. He took some part in public affairs in Scotland, and when in 1470 the Orkney Islands were ceded by Norway to King James III. he resigned all his rights therein to his sovereign and was known merely as earl of Caithness. His eldest son, William, having offended his father by his wasteful habits, the earl settled his earldom on his eldest son by another marriage, also called William, who was killed at Flodden in 1513. The elder William, however, inherited the title of Lord Sinclair, and the family was thus split into two main branches. John, the 3rd earl, was killed in 1529 while attempting to seize the Orkney Islands.

George, 4th earl of Caithness (c. 1525—1582), a son of the 3rd earl, was a Roman Catholic and a supporter of Mary Queen of Scots, but he was mainly occupied with acts of violence in the north of Scotland. His grandson George, the 5th earl (c. 1560—1643), was outlawed and compelled to fly to the Shetlands. He left many debts, and his great-grandson and successor, George, the 6th earl (d. 1676), who was childless, arranged that his estates should pass to a creditor, Sir John Campbell, afterwards earl of Breadalbane. Campbell was created earl of Caithness in 1675, but the title was also claimed by George Sinclair (d. 1688), a grandson of the 5th earl, and in 1681 the privy council decided in his favour. When Alexander, the 9th earl, died in 1765 the title was successfully claimed by William Sinclair (d. 1779), a descendant of the 4th earl, who became the 10th earl. James, the 12th earl (1766—1823), was descended from another branch of the 4th earl's family, and his grandson James, the 14th earl (1821—1881), was a representative peer for Scotland from 1858 to 1866, and was created a peer of the United Kingdom as Baron Barrogill in 1866. He was interested in scientific matters, and published Lectures on Popular and Scientific Subjects (1877).

The title of Lord Sinclair passed from William, the 2nd lord, who died about 1488, to John (1510—1676), who became the 5th lord in 1615. At first a covenanter, afterwards he became a royalist, and was taken prisoner at the battle of Worcester. He died without male issue and the title became dormant. His estates, however, passed to his grandson, Henry St Clair (1600—1723), the son of his daughter Catherine (d. 1666) and her husband, John St Clair of Herdmanston, and in 1677 Henry was created Lord Sinclair with the precedence of the older title. He had two sons, John (1683—1730) the Jacobite, and James Sinclair, who became a general in the British army, and was also ambassador at Vienna and Turin and a member of parliament for many years. After the attainder of John, in consequence of his share in the rising of 1715, the family estates were settled on James, but he resigned them to his elder brother when the latter was pardoned in 1730. The pardon, however, did not include the restoration of the title. Earlier in life John Sinclair had killed a man named Shaw in a duel and had afterwards shot this man's brother. He was tried by court-martial and sentenced to death, but was pardoned. An account of the proceedings in the court-martial was edited by Sir Walter Scott for the Roxburghe Club (Edinburgh, 1828). Sinclair himself wrote Memoirs of the Rebellion, published by the Roxburghe Club in 1838.

Neither of the brothers left male issue, and the title devolved upon a cousin, Charles St Clair (d. 1772), who was not included in the attainder. Charles did not claim it, but in 1782 his grandson Sir John Sinclair became the 6th earl, and was created the 1st Lord Sinclair. He was a Scottish representative peer from 1807 to 1859 and is the ancestor of the present holder of the title.

Three brothers were also noted Sinclairs:—Oliver, the friend of James V. and the leader of the Scots at the rout of Solway Moss; Henry (1508—1655), bishop of Ross and president of the court of session, who made some additions to Hector Boece's Chronicles of Scotland; and John (d. 1656), bishop of Brechin. See Sir K. Douglas, The Peerage of Scotland, new ed. by Sir J. B. Paton (Cokayne), Complete Peerage, Vol. II. Sinclair, The Sinclairs of Scotland and England (1887); Sir R. Gordon and G. Gordon, The Earldom of Sutherland (Edinburgh, 1813), and Hay, Genealogy of the Sinclairs of Roxburghe (1835).

SINCLAIR, SIR JOHN, Bart. (1754—1835), Scottish writer on finance and agriculture, was the eldest son of George Sinclair of Ulbster, a member of the family of the earls of Caithness, and was born at Thurso Castle on the 10th of May 1754. After studying at Edinburgh, Glasgow and Trinity College, Oxford, he was admitted to the faculty of advocates in Scotland, and called to the English bar, but never practised. In 1780 he was returned to parliament for Caithness, and subsequently represented several English constituencies, his parliamentary career extending, with few interruptions, until 1811. He established at Edinburgh a society for the improvement of British wool, and was mainly instrumental in the creation of the Board of Agriculture, of which he was the first president. His reputation as a financier and economist had been established by the publication, in 1784, of his History of the Public Revenue of the British Empire; in 1793 widespread ruin was prevented by the adoption of his plan for the issue of exchequer bills; and it was on his advice that, in 1797, Pitt issued the "loyalty loan" of eighteen millions for the prosecution of the war. His services to scientific agriculture were no less conspicuous. He supervised the compilation of the valuable Statistical Account of Scotland (21 vols., 1791—1799), and also that of the General Report of Scotland, issued by the Board of Agriculture; and from the reports compiled by this society he published in 1819 his Code of Agriculture. He was a member of most of the continental agricultural societies, a fellow of the Royal Societies of London and Edinburgh, as well as of the Antiquarian Society of London, and president of the Highland Society in London. Originally a thorough supporter of Pitt's war policy, he later on joined the party of "armed neutrality." In 1801 he was appointed by Pitt a commissioner for the construction of roads and bridges in the N. of Scotland, in 1810 he was made a member of the privy council and, next year, received the lucrative sinecure office of commissioner of excise. He died on the 21st of December 1835.

Sir John Sinclair, who was created a baronet in 1798, was twice married, first to a daughter of Alexander Maitland, by whom he had two daughters, and secondly to Diana, daughter of the first lord Macdonald, by whom he had thirteen children. His eldest son, Sir George Sinclair (1790—1868) was a writer and a member of parliament, representing Caithness at intervals from 1811 till 1841. His son, Sir John George Tollemache Sinclair, the 3rd baronet, was member for the same constituency from 1809 to 1883. The first baronet's third son, John (1797—1875), became archdeacon of Minehead; the fifth son, William (1804—1878), was prebendary of Chichester and was the father of William Macdonald Sinclair (b. 1850), who in 1880 became archdeacon of...
London; the fourth daughter, Catherine (1800–1864), at one
time enjoyed some vogue as an author.

See Correspondence of the Right Hon. Sir John Sinclair, Bart., with
Reminiscences of Distinguished Characters (2 vols., London, 1831); and
Memoirs of the Life and Works of the Right Hon. Sir John Sinclair
(2 vols., Edinburgh, 1837).

SIND, a former province of India, now a division of the Bombay
presidency, lies in the northwestern portion of the peninsula,
lying between 23° 45' and 28° 20' N. and between 66° 40' and
71° 10' E., having an area of 53,116 sq. m., and a population
(1901) of 3,410,223. It includes the six districts of Karachi,
Hyderabad, Thar and Parkar, Larkhana, Sukkur and Upper
Sind Frontier, together with the native state of Kairhpur. It
differs widely in physical features and climate, no less than in
the language, dress and customs of the people, from the rest of
the presidency, from which it is cut off by the deserts or the sea.
It is bounded on the N. by Baluchistan and the Punjab; on the
E. by the desert tracts of W. Rajputana; on the S. by the Rum of
Cutch and the Indian Ocean; and on the W. by Baluchistan.

Physical features.—Sind proper, or the central alluvial plain
watered by the Indus, lies between the Kohistan or hilly country
that rises to the Kirthar range on the Baluchistan border, and
the Registan or Thar desert that stretches E. into Rajputana.
The Kohistan in years of good rainfall yields abundant fodder
for cattle and camels, and supports a scanty tillage on the banks of the hill streams or nafs, one of which, named the Hab, forms the boundary between Sind and Baluchist.

Central Sind lies on both banks of the Indus, which
borders the bed that has been raised by the deposit of silt above
the surrounding country. The bed is confined by rocks, as at Sukkur, Rohri and along the edge of the Kohistan from Lakhi to Jhirak, the river constantly changes its course,
especially in the delta, the head of which is now opposite Shah-
bandar. Central Sind depends on the yearly inundation of
the Indus, which begins to rise in March and reaches its highest
point about the middle of August. The water is distributed by
a very ancient system of canals, which has been greatly improved
and extended since the British conquest. The soil is a plastic
developed by the river.

The great geographical feature in Sind is the lower Indus,
which passes through the entire length of the country, first in a
S.W. direction, then turning somewhat to the E., then returning
to a line more directly S., and finally inclining to the W., to seek
an outlet at the sea. The distant line of mountains between Sukkur and Sehwan, the steep pass overhanging the water at
Lakhi, and the hill country below Sehwan give a distinctive
character to the right bank. Sind has been aptly likened to
Egypt. If the one depends for life and fertility on the Nile,
so does the other on the Indus. The cities and towns are not
so readily to be compared. Hyderabad, notwithstanding its
remarkable fortress and handsom tomb, can scarcely vie in
interest as a native capital with Cairo; nor can Karachi, as
a Europeanized capital, be said to have attained the celebrity of
Alexandria. The province contains many monuments of
archaeological and architectural interest.

Owing to the deficiency of rain, the continuance of hot weather
in Sind is exceptional. Lying between two monsoons, it just escapes the
heat of the desert. The S.W. wind, rising in Cutch, the N.W. monsoon at Karachi, and even here the annual
rainfall is not reckoned at more than 6 or 8 in. At times there is no rain for two or three years, while at others there is a whole season's
rainfall. The average temperature of the summer months rises to 95° F., and the winter average is 60°, the summer
maximum being 120° and the winter minimum 28°. The temperature
on the sea-coast is much more equable than elsewhere. In northern Sind the summer heat is extreme and prolonged. This great heat, combined with the poisonous exhalations from the pools left after the annual inundation and the currents following various directions, produces fever and ague, to which even the natives fall a prey.

Agriculture.—The soil of the delta is the only mineral product
of commercial importance. Timber and fuel are supplied chiefly by the
kandi or mangroves, and the chief forest trees, iron wood, acacia
(tocoma undulata), and iron wood (tocoma undulata), and fruit by
the date, mango and pomegranate. The chief rabi or spring crops,
sown from August to October and reaped from October to
April, are wheat, barley, gram, oilseeds and vegetables. The chief winter
or kharif crops, sown from May to July and reaped from October
to December, are the millets (bajrej and jaua), rice, urad (Phaseolus
radiatus), mung (Phaseolus mungo), cotton and indigo. Efforts
are being made to introduce the long-stapled Egyptian cotton. Agril-
ture is, in the main, an extension of cattle-rearing.

Manufactures.—Among the chief manufactures may be mentioned
gold, silver, and silk embroideries, carpets, cloths, lacquered ware,
horse-trappings and other leather-work, paper, pottery, tiles,
swans, and the famous matche or kivi, and the silk in the
work introduced from Shiraz. Lac work, a widely extended industry
in India, is also in vogue in Sind. Variously coloured lac is laid
in succession on the borders, then turned on the lathe, and the
design filled with the different enamels, in which the workshops
are famous for its silks and cottons, silver and gold work and lacquered
ornaments, and the district could once boast of skilled workmen in
armour; for example: buckler; but their art is now decayed. In the
cloths called zuli, silk is woven with the striped cotton—a practice possibly due to the large Mahomedan population of the
country, as no Moslem may wear a garment of pure silk. Chandari,
or knitting, is another method of decorating cotton and silk goods.
The extension of cotton cultivation in Sind has caused a brisk de-
velopment in spinning factories of recent years. The Sind cotton-
printers are the most skilful and tasteful in the Bombay presidency.
Cotton carpets, rugs, horse-cloths, towels and napkins are manufac-
tured at the gaols. Woolen saddle-cloths, blankets and felts are also made. Sind produces the best pottery of India. The art
of glassmaking is practised or developed by the Moslem community.
It gave them no great encouragement. Magnificent tombs and mosques,
now in ruins, testify to the skill of the ancient potters. Leather
work is in a variety of articles, such as saddle-covers for camels and
extreme summer garments, leather-work, leather articles, clothing 1904 two new flour and rice-cleaning mills were started at Sukkur.

Trade.—The trade of Sind is carried on through Karachi with
foreign countries, and across the land frontier with Afghanistan,
Baluchistan, Persia and S. India. Karachi is the chief land
trade of all N. India, and is also the great strategic military port for
the N.W. frontier. The chief articles of import are cotton and
indigo, fish, cotton and woollen manufactures, hides, hides and skins,
while the chief exports are wheat and other grains, cotton, wool,
oilseeds, hides and skins, and bones. On the land frontier the chief
articles of import are horses, ponies, mules, sheep and goats, woolen
manufactures, horses, needle-goods and leather goods; and the main
exports are sea-borne, such as hides, skins, and leather-work,
provisions, stores, leather, ghee, raw wool, silk, assafoetida, drugs,
hides, fish, seeds, manufactured silk, spices and tobacco; while
the exports are cotton twist and yarn, piece-goods, leather, metals,
silk, cotton manufactures, rice, wheat, husked rice, liquor, ghee,
sugar, tea, tobacco, wool and silver.

Fauna.—The last tiger in Sind was shot about 1885. Among
other wild animals are the hyaena, the gurkhar or wild ass (in the
S. of the Thar and Parkar district), the wolf, jackal, fox, wolf
wild, antelope, pharico or hog deer, hares and porcupines. Of
birds of prey, the vulture and several varieties of falcon may be mentioned.
Many ducks, pigeons, pelicans, swans, ducks, egrets and storks inhabit
the shores of the delta. Besides these there are the udara (bustard)
or lilar, the rock-grouse, quail, partridge and various kinds of
parrots. Waterfowl are plentiful; in the rivers are covered with
kulong, ducks, teal, curlew and snipe. Among other animals to be noted are scorpions, lizards, centipedes and many snakes.

Domestic animals include camels (one-humped), buffaloes,
sheep and goats, horses and asses (small but hardy), mules
and bullocks. Of fish there are, on the sea-coast, sharks, saw-fish,
rays and skate; cod, sir, carp, sole, red-supper, gissir, begi, dangara
and huru abound. A kind of sardine also frequents the coast.
In the Indus, the finest flavoured and most plentiful fish is the pale
entally identified with the kils of the Ganges. Dambho (labo
rohita) and mullet, mordko (Carnissa minima), qandam (Natoterus
khago or catfish, Ritis buchanani, potbo (Barbus sarana), shakbar, jerkho
and singharia (Macronor ans) are also found. Otter, turtle and porpoise are frequently met with; so too are long-nosed
cătășura and freshwater crocodiles.

Forests.—The area of reserved forest in Sind is 1065 sq. m. The
forests are situated for the most part on the banks of the Indus, and
extend S. from near Rohri to the middle delta. They are
formed of three types of woods; and are of the species (Ficus religiosa), the bīr (Zizyphus jujuba). The delta has no forests,
but its shores abound with mangrove trees. Of trees introduced
have been the tamarind (Tamarindus indica), several Australian wattle
trees, the basketary plant (Lonchocarpus barkah or Hakea barkah) (Terminalia bellerica), the carob tree (Ceratonia siliquea),
The China tallow (Stillingia sebifera), the bēl (Aegle Marmelos) and
the mannah (Bussia latifolia). There is a specially organized forest
department.
Irrigation.—The Indus at its source is 16,000 ft. above sea-level. At Attok it is still 2000 ft. above the sea. It is, therefore, a rapid river, which brings down a great quantity of silt from the mountains and the plateau, and deposits it in the alluvial valley. The bed of the river is always rising, and has to be constantly watched to prevent its overflowing its banks, while the quantity of silt that the water contains makes it very difficult to carry on navigation. The irrigation canals of the Indus have, therefore, been carried to a high degree of perfection, though the water of the river cannot be fully utilized until the proposed barrage is constructed at Sukkur. The chief of the existing canals are: on the right bank of the Indus, the Desert, Undarwah, Begari, Mahiwah, Sukkur, Ghar, Sattah, Sind and Western Nara canals; and on the left bank the Eastern Nara, Hiral, Jamaro, Dad, Nasrat, Fuleli and Hassanli canals. Within the area watered by these canals are also situated a number of smaller irrigation works. At the reach of the silt-laden waters the dry and hardened ground is almost bare.

Railways.—Sind is traversed by the North-Western railway; which follows the Indus from the Punjab to the sea at Karachi. The line is twice bridged; at Rohri where the main line crosses the river and a branch goes off to Quetta; and at Kotri, opposite Hyderabad, whence a narrow-gauge line was opened into Rajputana in 1900, and another branch runs S. to Budin in the delta. A chord line connects Hyderabad with Rohri, to evade the erosion of the Indus, giving an alternative route from Karachi to Quetta and the N.W. frontier. One of the main purposes of the Indus valley line is the strategic defence of the Indus frontier.

Population.—The great majority of the inhabitants of Sind are of Hindu descent, converted to Islam. They speak a language of their own, which is akin to that of the Punjab, though retaining many archaic peculiarities. Mahomedans, who form more than three-fourths of the total, may be divided into Sindis proper and naturalized Sindis. The Sindhi proper is a descendant of the original Hindu. In sect he is a Sunni, though the Talpur mirdads adopted the Shiah persuasion. There is, as a rule, no distinction of caste, except that followers of certain vocations are held in higher estimation;Sandals sweepers, huntsmen are considered low and vile. The six different classes of naturalized Sindis are—five families of the Sairiyds (the Bokhari, Mathari, Shirazi and Laghari); the Afghans; the Baluchis; the slaves or Siddis—originally Africans; the Memans; and the Khwajas. More than half of the Hindus are Lohanas, originally traders, who have almost monopolised government service and the professions. Brahmins are few and influential. Sikhs are numerous.

Administration.—Sind is administered as a non-regulation province, under a commissioner, who resides at Karachi. The highest court of that frontier, the High Court at Bombay, is that of the judicial commissioner, consisting of three judges, one of whom must be a barrister specially qualified to deal with mercantile cases. The Karachi brigade, forming part of the Quetta or fourth division of the Southern army, is distributed in cantonments at Karachi, Hyderabad and Jacobabad.

History.—Sind has a history of its own, distinct from the rest of India. In the early centuries of the Christian era it was ruled by a Buddhist dynasty, with capitals at Abor and Brahmanabad. It was the first part of the peninsula to be invaded by the Mahomedans, under Mahommed bin Kaaim, a general of the caliph, in 711. The invasion was by sea, from the mouth of the Indus; and for nearly three centuries Sind remained nominally subject to the Arab caliphs. Though conquered by Mahmud of Ghazni in the course of his raids into India, Sind long preserved a semi-independence under two local dynasties, the Sumrass and the Samass, both of Rajput descent but Mahomedan in religion. The latter had their capital at Tatta, in the delta of the Indus, which continued to be a seaport until the 18th century. The Samars were followed by the Arghuns, of foreign origin, and the Arghuns by the short-lived Turkhan dynasty. It was not till the early 18th century that the Afghans, who had himself born at Umarkot in Sind, that the provost general of the Afghan army, regularizing the empire. When that empire broke up on the death of Aurangzeb, the local dynasties again arose. The first of these was the Kalhors, who were succeeded by the Talpur, of Baluch descent, who were ruling under the title of Mirs, with their capital at Hyderabad, when the British first entered into close relations with the country. The East India Company had established a factory at Tatta in 1758; but the Talpur mirdads were friendly to trade, and the factory was withdrawn in 1775. In 1830 Alexander Burnes was permitted to pass up the Indus on his way to the court of Ranjit Singh at Lahore, and two years later Henry Pottinger concluded a commercial treaty with the mirdads. It was, however, the expedition to Afghanistan in 1838 for the restoration of Shah Shuja that forced on matters. The British army under Sir John Keane marched through Sind, and the mirdads were compelled to accept a treaty by which they paid a tribute to Shah Shuja, surrendered the fort of Bukkur to the British, and allowed a steam flotilla to navigate the Indus. The crisis did not arrive till 1827, when Sir Charles Napier arrived in Sind and fresh terms were imposed on the mirdads. The Baluch army resented this loss of independence, and attacked the residency near Hyderabad, which was bravely defended by Outram. Then followed the decisive battle of Meeanee and the annexation of Sind. A course of wise, firm and kindly administration inaugurated by Sir Charles Napier himself, and continued by Sir Bartle Frere, Sir W. Merewether and later commissioners, has since made the province peaceful and prosperous.

SINDH BAD THE SAILOR, VOYAGES OF, a collection of Arabic travel-romances, partly based upon real experiences of Oriental navigators in the seas S. of Asia and E. of Africa (especially in the 8th–10th centuries); partly upon ancient poetry, Homeric and other; partly upon Indian and Persian collections of mirabilia. In Sindbad's First Voyage, from Bagdad and Basra, the incident of the Whale-Back Island may be compared with the Indian Ocean whales of Phiny and Solinus, covering four jugs, and the prisitl sea-monster of the same authorities, 200 cubits long; Al Kazwini tells a similar tale of a colossal tortoise. Such Eastern stories are probably the original of the whale- island in the Irish travel-romance of St Brandon. With the Island of the Mares of King Mihranj, or Mihrjan, we may find (rather imperfect) parallels in Homer's Nid (the mares impregnated by the wind), in Ibn Khurdadhib and Al Kazwini, and in Wolf's account of the three Ilhas de Cavallos near Ceylon, so called from the wild horses with which they abounded, to which the Dutch East India merchants of the 17th century sometimes sent their mares for breeding purposes. Sindbad's account of the Kingdom of Mihranj (Mihrjan) is perhaps derived from the Two Muslim Travellers of the 9th century; it would seem to refer to one of the larger Great Indian islands, perhaps Borneo. With the Rukh ("roc") of the Second Voyage we may compare Al Kazwini, and, more particularly, Ibn Al Wardi, who mentions the Island of the Rukh among the isles of the China Sea, and relates two incidents parallel to adventures with the rukh of Sindbad's Second and Fifth Voyages. Marco Polo in a famous passage describes this monstrous bird in detail, locates it apparently to the S. of Madagascar, and relates how one of its supposed feathers had been taken to the grand khan of the Mongols. Sindbad's Valley of Diamonds has fairly complete parallels in Al Kazwini, in Benjamin of Tudela, in Marco Polo; and in the far earlier Epiphanius, bishop of Salamis in Cyprus, who died A.D. 403. As to the Mountain, or Island, of Ages in the Third Voyage, Ibn Al Wardi and Idrisi each recognizes an island of this kind, the former in the China Sea, the latter near Sokotra. Sindbad's negro cannibal adventure, next following, reproduces almost every detail of the Cyclops story in the Odyssey; among the Spice Islands, and perhaps at Timor, may be located the island rich in sandal-wood, where the wanderer rejoins his friends. The cannibal land of the Fourth Voyage, producing pepper and coco-nuts, where Sindbad's companions were offered food which destroyed their reason, has suggested a parallel to the traditions of the 18th century Spanish islands, perhaps Borneo. With others to others; with this tale we may compare the lotus-eating of the Odyssey, Plutarch's story of Mark Antony's soldiers maddened and killed by an "insane" and fatal root in their Parthian wars, a passage in Davis' Account of Sumatra in 1599, and more complete parallels in Ibn Al Wardi and Al Kazwini. The burial of Sindbad in, and his escape from, the cavern of the dead is faintly foreshadowed in the story of Ariostes, the Messenian hero, and in a reference of St Jerome to a supposed Scythian
custom of burying alive with the dead those who had been dear to them; the fully-developed Sindbad tale finds an echo in "Sir John Mandeville." For the "Old Man of the Sea," in the Fifth Voyage, we may also refer to Al Kazarwi, Ibn Al Wardi and the romance of Seyf Zu'l-Yezan; Sindbad's tyrannical rider has usually been explained as one of the huge apes of Borneo or Sumatra, improved to make a better story. The account of pepper, somewhat later in this Voyage, has a good deal in common with Idrisi's; Sindbad's pearl-fishing is probably to be located in the famous beds off Ceylon, of which Marco Polo has an excellent description. The romance of Seyf Zu'l-Yezan has a voyage along a subterranean river similar to that of Sindbad's on his Sixth Voyage; the elephant adventure of the Seventh Voyage adds another to the many stories of the elephant's sagacity which were already told in every southern country, and of which we have many examples in Pliny's Historia Naturalis, and in Aelian's Historia Animalium.

See Richard Hole, Remarks on the Arabian Nights' Entertainments, in which the Origin of Sindbad's Voyages ... is particularly considered (London, 1797); Eusénius Renaudot's edition of the Two Musulman Travellers (1718), translated into English, 1733, as Ancient Accounts of India and China by two Mahommedan Travellers ... in the 16th Century; J. T. Reinard, Relations des voyages faits par deux peres occidentaux, et de la Chine (Paris, 1815); E. G. W. Lane's translation of the Arabian Nights (London, 1859), especially the notes in vol. iii. pp. 77-108; M. J. de Goeje, La Légende de Saint Branan (1890); C. R. Beazley, Dawn of Modern Geography (1897), L. 235-238, 458-460. Besides the works noticed in the text of this article, the 12th-century Romance of Duke Ernest of Bavaria, written in German rhyme by Henry of Veldeke about 1200, is the closest parallel to Sindbad's flight through the air (to cite his rubric in Vol. VI.), to the subterranean river-tunnels in his Voyage VI., and to some other incidents. (C. R. B.)

SINDHI (properly Sindhi, the language of Sind, i.e. Sind) AND LAHINDA (properly Lahnda or Lahndi, western, or Lahndi-dt boli, the language of the west), two closely connected forms of speech belonging, together with Kashmiri (q.v.), to the N.W. group of the outer band of Indo-Aryan languages. In the following pages it will be assumed that the reader is familiar with the list of facts stated in the articles INDIO-ARIAN LANGUAGES and PRAKRIT.

In 1901 Sindhi (including Kachchhi) was spoken by 3,404,071 people, and Lahnda by 3,337,017,—the former in Sind and Cutch, and the latter in the W. Punjab and adjoining tracts (for further details on this point see the article LAHINDA). The parent Prakrit, from which Lahnda is sprung, must once have extended over the greater part of the Punjab, but, as explained under INDO-ARYAN LANGUAGES, the population of the Midland expanded so as to cover the E. and centre of that province, and the language (Punjabi) now there spoken is a mixed one, Midland in its eastern characteristic, but still preserving much of its old Lahnda basis as we go W. The wave of Midland progress exhausted itself in the harren tract of the west-central Punjab, and W. of about the seventy-third degree of E. longitude Lahnda holds decisive sway. The facts are very much the same with regard to the mixed language of Rajputana. Here the expansion of the Midland language was stopped by the desert, beyond which lies Sindhi. Lahnda and Sindhi, the W. outposts of Indo-Aryan speech, have accordingly for centuries occupied a peculiarly isolated position, and have in many respects struck out a path of independent growth. This process was aided by the presence of Piśāca languages (see INDO-ARYAN LANGUAGES). In early times there were Piśāca colonies along the Indus, right down to its delta, and both Sindhi and Lahnda have borrowed many peculiarities from their dialects.

Sindhi is directly derived from the Vṛcchāda Apabhraṃśa Prakrit (see PRAKRIT). The name of the Apabhraṃśa from which Lahnda is derived is not known, but it must have been closely allied to Vṛcchāda. Sindhi has one important dialect, Kachchhi, spoken in Cutch. Here the language has come into contact with Gujarati and is somewhat mixed with that form of speech. From Pariśāca Lahnda has received much influence, but the forms remain distinct. Lahnda is a language in which that language is known, see the article LAHINDA.

Owing to their geographical position both Sind and the W. Punjab were early subject to Mahomedan inroads. The bulk of the population is Musulman, and their languages make free use of words borrowed from Persian and (through Persian) from Arabic. The written character employed for Lahnda is usually that modification of the Persian alphabet which has been adopted for Hindostani. The same is the case for Sindhi, except that further modifications have been introduced to represent special sounds. In both cases the script is akin to the well-known Nagari alphabet (see SANSKRIT). The script is the same as the "Lāndā" (a word distinct from "Lahnda") or "clipped" character current all over the Punjab and is very imperfect, being seldom legible to any one except its original writer, and not always so to him.

Phonetics—The phonetic system of both languages in most respects resembles that of the other Indo-Aryan languages. Space will not allow us to do more than draw attention to the main points of difference. In other Indo-Aryan languages a final short vowel is generally elided. This rule is also followed in Lahnda, but the genius of Sindhi requires every word to end in a vowel, and hence these short vowels are usually strongly pronounced, so that they are hardly audible to a person unaccustomed with the language. They are therefore printed in these pages as small letters above the line. In the cognate Kashmiri a short i or u affects the pronouns of the second and third persons, and the vowels added to "ma" changes its pronunciation to "mār." So, in Kashmiri, ma is pronounced mar. Lahnda, especially when dropping the final short vowel, has similar euphonic changes. Thus chohūr, "a boy," becomes chohur; whereas, chohūr, "a girl," becomes chohūr, and further, chohār (ā like the a in "all"), while chohār, "a girl," becomes chōhār. The oblique singular (see below) of chohūr is chohūr, and of chohār, chohār, instead of the final u, and hence the vowel of the second syllable is displaced. Consequently, the oblique form of chohūr is shahūr, while the oblique form of chōhār is still chōhār, because it also originally ended in i. Similar euphonic changes have been made to short i and u in Sindhi, and in Lahnda the short vowel i, when preceded or followed by h, or at the end of a word, is pronounced as a short e. Thus S. khishā, "of what kind," and S. mihī, a mosque, are respectively pronounced khisē, mihē. When this e is pronounced, it will be written as e or ē in the following pages.

In Prakrit almost the only consonants which had survived were double letters, and in most of the Indo-Aryan varieties these have been simplified, the preceding vowel being lengthened in compensation. Thus, Ap. kammu, a work, Hindostani, kām. In Panjabi and Lahnda the double consonant is generally retained, as in kamm, but in Sindhi, while the double consonant is simplified, the vowel, as in the Piśāca languages, remains short; thus, kam. This non-lengthening of the vowel in such cases is typical of Sindhi, words like S. ē, fire, from Ap. ēgi, being quite exceptional. It even happens that the original long vowel of a double consonant is shortened when the conjunct is simplified. Thus, Skr. tāryām, S. tēri, a trumpet.

In general, as in Piśāca, a sibilant is liable to be changed into h. Thus, Skr. mānsūtaḥ, S. māsūta or māstā, flesh; Skr. dāla, S. dērl or dērā, a country. In L. the s is generally, but not always, preserved. As in most Indo-Aryan languages a medial ḍ becomes the hard t; thus, Ap. ṭukrā, to join, to put; in S. ḍukkā, a vine. Besides the works noticed in the text of this article, there is great confusion between consonants and vowels. There was the same tendency in Vṛcchāda Apabhraṃśa, and it is more common in Sindhi than in Lahnda. Thus, Skr. āṃkṣarā, S. āmker, a staff. Moreover, in Sindhi, ḍ and d become regularly cerebralized before r, as in Ap. ṭutru, S. ṭutṛ, a son; Ap. ṭṛkkāhi, S. ṭṛkkāhi, a vine. The cerebral l does not appear in Sindhi, but it has survived from Prakrit in Lahnda, being subject to the same rules as in Marathi (q.v.). When l represents a Prakrit single l, it becomes ḍ, but if it represents a Prakrit ṛ, it remains a simple dental. It may be remarked that the same rule seems to have applied in the Prakrit of the Kachchhi dialect. Sindhi has a series of strengthened consonants—g, j, ḍ, and k. Sindhi is pronounced "with a certain stress in prolonging and somewhat strengthening the contact of the close of the word, as if one tried to double the sound at the beginning of a word." They often, but not always, represent an original double letter. Thus, Ap. saggān, S. ṭā̀gō, applied; Ap. garvan, S. garv, heavy, but S. gār, master; Ap. ṭiṣṭā, S. ṭiṣṭā, a vine; S. tadā, nice; S. tadā, great; Ap. ṭīdā, S. ṭīdā, a sedan-chair; Ap. ṛadbhū, S. ṭadbhū, weak; S. bābā, a father, but bābā, a father's brother. Declension.—Both languages have lost the neuter gender, all nouns being either masculine or feminine. The rules for distinguishing gender are much as in Hindostani. In other Indo-Aryan languages, nouns may be either strong or weak, the strong forms being reinforced in the case of Lahnda (see HINDOSTANI and MARATHI). In Sindhi a masculine weak form 1

Abbreviations: Skr. = Sanskrit; Pr. = Prakrit; Ap. = Apabhraṃśa; L. = Lahnda; S. = Sindhi.
in a corresponds to the strong one in á and feminine weak forms in ä and ö to a strong one in ò. In Lahnda weak forms have dropped the final short vowel, and the strong forms end in á (masc.) and ò (fem.).

As explained in the articles above referred to, almost the only old case that has survived throughout the declension of both languages is the general oblique. This is used for any oblique case, the particular case required being as a rule defined by the help of a postposition. The general oblique case, without any defining postposition, is specially employed for the case of the agent.

There are also examples of the survival of the old locative and of the old ablative. Thus S. mathé, top. loc. mathé; on the top; L. Ambé, at Ambé; L. velà, time, rëpà velà, at the time of food; L. jangél, for jangalí, in the forest. This locative is of regular occurrence in the case of Sindhi weak masculine nouns in ò. For the old ablative, we have S. ghar, á house, abl. S. ghará, L. ghorá, and so others. The locative construction can be referred to the Ap. locative -há or -há, and the ablative -ò or -ò to the Ap. -há or -há. The nominative plural, and the genitive-case plural of both numbers are formed as in the following examples:

<td>ghér, ghér</td>
<td>ghér, ghér</td>
</tr>
</tbody>
</table>

In Lahnda the final short vowel of the weak forms has been dropped, but in some cases the final ò of the masculine and the final i of the feminine have been preserved by ephenesis, as explained under the head of phonetics. The origin of the nominative plural and of the oblique case of a few common words are explained in the article Hindostani.

In the same article is discussed the derivation of most of the postpositional employed to define the various oblique forms and to make real cases. There are as follows: S. khé, L. mè, to or for; S. khd, L. ò, from; S. jò, S. jàn, L. dà, of; S. mè, L. ò, in. It will be observed that the Lahnda forms are identical with those found in Panjabi. In both languages the accusative case is the same as the nominative, and sometimes expressed, when, as usual in Indo-Aryan vernaculars, the dative is employed in its place. The agent case is the oblique form without any postposition. The S. khé is a corruption of Ap. koshi, Skr. kuti; and similarly khd from Ap. kahá, Skr. khalá. S. jàn, like the Rajasthani kandé and the Kashmiri sánd or hand, is by origin the present participle of the verb substantive, ghar- sánda, meaning literally "existing (in connexion with the house)" hence "of the house." We may compare the English use of on, of, on being, or mean "from." All these postpositions are added to the oblique form. We thus get the declension of the strong masculine noun S. ghér, L. ghorá, a horse, as shown in the next column. When there are optional methods of making the oblique form only one is given. The others can be employed in the same way.

An example of the constrast between Ap. and Ind-Aryan vernaculars, the genitive is really a possessive adjective, and agrees with the person or thing possessed in gender, number and case, exactly as in Panjabi.

An adjective agrees with its qualified noun in gender, number and case. In Lahnda, as in Hindostani, the only adjectives which change in these respects are strong adjectives in á. In Sindhi weak forms in ä also change the "o" to "a" in the feminine. Thus S. capá, L. caigá, good, fem. S. capá, L. caigá; S. nichar, helpless, fem. S. nichar or nihar. The plural and oblique forms are made as in the case of nouns. If a postposition is used with the noun it is not also used with the adjective. Thus L. caigá ghorá-dá, of good marks.

The usual pronouns are as follows:

<table>
<thead>
<tr>
<th>Singular</th>
<th>Plural</th>

</thead>
<tbody>
<tr>
<td>Nominative</td>
<td>Oblique</td>
</tr>
<tr>
<td>Sindhi</td>
<td>Lahnda</td>
</tr>
<tr>
<td>Arabic</td>
<td>Arabic</td>
</tr>
</tbody>
</table>

The comparison is effected as in Hindostani by putting the noun with which comparison is made in the ablative case. Sometimes special postpositions are employed for this form of the ablative.

The north-western group of Ap. and Ind-Aryan vernaculars, Sindhi, Lahnda, and Kashmiri, are distinguished by the free use which they make of pronoun suffixes. In Kashmiri these are added only to verbs, but in the other two languages they are added to nouns. These suffixes take the place of personal pronouns in various cases and are as follows:

<table>
<thead>
<tr>
<th>First Person</th>
<th>Second Person</th>
<th>Third Person</th>
</tr>
</thead>
<tbody>
<tr>
<td>Singular</td>
<td>Plural</td>
<td>Singular</td>
</tr>
<tr>
<td>Nom. Other Cases</td>
<td>Nom. Other Cases</td>
<td>Nom. Other Cases</td>
</tr>
<tr>
<td>Sindhi</td>
<td>st m, mò</td>
<td>s à, hà</td>
</tr>
<tr>
<td>Lahnda</td>
<td>m m</td>
<td>s è sò</td>
</tr>
</tbody>
</table>

All these suffixes are remnants of the full pronominal forms. In all cases they can be at once explained by a reference to the originals in Piśára, rather than to those of other Ind-Aryan languages. 1

It will then be convenient to consider them only in connexion with the corresponding nouns. In such cases they are usually in the genitive case. Thus S. più, a father; piùm, my father; più, thy father; piùt, your father; piùi, his father; piùri or piùi, their father. There being in Sindi no suffix of the genitive plural of the first personal pronoun, there is no compound for "our father." For that, as in the beginning of the Lord's Prayer, we must employ the full expression, asaiò più. In Lahnda we have più, a father; piùm, my father.

1 See G. A. Grierson, The Piśára Languages of North-Western India (London, 1906), pp. 44 ff.
SIN-EATER

father; πατήρ, our father; πατήρ, thy father; πατήρ, your father; πατήρ, his father; πατήρ, their father. A junction vowel is often inserted between these suffixes and the main word to assist the pronunciation. Further examples will be found under the head of verbs.

Conjugation.—As in Marathi (q.v.), there are, in both languages, two conjugations, of which one (intransitive) has -a- and the other (transitive) -e- or -i- for its characteristic letter. The differences appear in the present participle and, in Lahnda, also in the conjunctive participle, the present subjunctive and imperative. The two latter are the only original synthetic tenses which have survived in Sindhi, but in Lahnda the old synthetic future is also in common use. Both languages have a passive voice formed by adding ij or iy to the root. This form is not employed for the past participle or for tenses derived from it. The following are the principal parts of the regular verb in each conjugation:

<table>
<thead>
<tr>
<th>Infinitive</th>
<th>First Conjugation</th>
<th>Second Conjugation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sindhi.</td>
<td>Lahnda.</td>
<td>Sindhi.</td>
</tr>
<tr>
<td>kahavō,</td>
<td>kahavō, to go.</td>
<td>mārōvō, to kill.</td>
</tr>
<tr>
<td>halāndo,</td>
<td>halālando, going.</td>
<td>mārēndō, killing.</td>
</tr>
<tr>
<td>hali,</td>
<td>halāland, having gone.</td>
<td>marō,</td>
</tr>
<tr>
<td>hali,</td>
<td>hali,</td>
<td>hali, killing.</td>
</tr>
</tbody>
</table>

It will be observed that, as in most other Indo-Aryan vernaculars, the past participle of this transitive verb is formed by adding the characteristic suffix to the passive, S. mārēnō, L. mārēny, to be killed, is conjugated like a regular verb of the first conjugation. The passive is directly derived from the Outer Prakrit passive in -iya-. The origin of the other suffixes is, as in other Prakrit conjugations, lost.

The present subjunctive is the direct descendant of the old Prakrit (q.v.) present indicative. It is conjugated as follows:

<table>
<thead>
<tr>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>Person</td>
<td>First Conjugation</td>
</tr>
<tr>
<td>1.</td>
<td>kālā</td>
</tr>
<tr>
<td>2.</td>
<td>hālē</td>
</tr>
<tr>
<td>3.</td>
<td>hālā</td>
</tr>
</tbody>
</table>

The imperative is formed very similarly. In Lahnda the future is mārēnō (Pr. mārēssan), I shall kill, conjugated like mārē. The Sindhi future is formed by adding the nominative pronoun suffixes to the present participle. It will be remembered that there are no nominative suffixes of the third person. For that person, therefore, the simple participle is employed. There are slight euphonic changes in the conjugation of the participle in the other persons. Thus, halandō, he will go; halandō, I shall go; and so on.

The past tense is formed from the past participle, with pronoun suffixes added in both languages. As in the transitive verb, the participle is passive in signification. The subject (see article Histo- stami) must be put in the agent case, and the participle agrees in gender and number with the direct object, or, if the object is put in the dative case instead of the accusative, is treated impersonally in the masculine. Examples of this tense are:

Intransitive verb—S. halēt, L. halēt, he went; S. l. hali, she went; S. kahavō, L. halōen, m. (masc.) went; S. halōa, L. halōan, m. (fem.) went, and so on.

Transitive verb—S. mārō, L. mārē, he was killed; S. l. mārē, she was killed; S. mārēnō, L. māreōn, he was killed by me, I killed him; S. l. mārēnō, she was killed by me, I killed her; S. pāṭāvāgē saī gāle būkhā, the whole matter (fem.) was related (fem.) by the king (agent), the king related the whole matter; S. tāhhē-kē tāhhē chadhō, with reference to her, by-the-cara- van, was abandoned (imperfective). The caravan abandoned her.

There are numerous compound tenses formed by conjugating the verb substantive with one or other of the participles. The usual forms of the present and past of these verb are as follows:

Present, "I am," &c. (com. gen.). Past, "I was," &c. (masc.).

<table>
<thead>
<tr>
<th>Person</th>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. ahāyā</td>
<td>bā</td>
<td>bāhō</td>
</tr>
<tr>
<td>2. ākē</td>
<td>hā</td>
<td>hāryā</td>
</tr>
<tr>
<td>3. ākē</td>
<td>hā</td>
<td>hāryā</td>
</tr>
</tbody>
</table>

The past has slightly different forms with a feminine subject. Sindhi examples of the compound tenses are halandō chāyō, I am going; halandō kē, I am killed; and so on. The Lahnda tenses are made on the same principles.

We have seen the important part that pronominal suffixes play in Sindhi. Their use is not confined to the examples given above. Additional suffixes may be added to indicate the object, direct or remote. Thus, S. mārē, thou mayest kill; mārē-nē, thou mayest kill me; mārē (he) was killed; mārē (thou) kill by me, him, her, them. In the singular (i.e. personal) -ē (-i) was killed by him with reference-to-me, i.e. he killed me; dīnē-tē was-given by him to him, he gave to him.

Numerous verbs have irregular past participles, derived directly from the Prakrit past participle and made by adding -ē to the root. These must be learnt from the grammars. We may mention a few very common ones: S. karāyō, L. karāyō, to do, to make; S. kād, L. kātē, to give; S. kādō, L. kātō, to give, past participle S. kādō, L. kātō; S. lādē, L. lādhō, to be obtained, past participles S. lādō, L. lāddō, the many compound verbs are formed much as in Hindustani, and must be learnt from the grammars.

Literature.—Sindhi and Lahnda possess no literature worthy of the name. Such as they have consists of translations from Persian, and those in which the Persian has been colonized in Sind by Sir Richard Temple (R. of the Panjāb (3 vols., Bombay, 1884-1900). The late Professor Trumpp published one text of some importance under the title of Sindhi Literature (Diary, 1883-1884, in English; 1884-1885, in Persian). Some of the works published in Colonel Sir Richard Temple's R. of the Panjāb.

Authorities.—G. A. Grierson, "Vrācāda and Sindhi," in Journal of the Royal Asiatic Society (1902), p. 9; G. Stack, Grammar and Dictionary (both Bombay, 1836-1837, revised Bombay, 1882); E. O' Brien, Glossary of the Multani Language (1st ed., Lahore, 1881); 2nd ed. by L. Eknam (Lahore, 1887); A. W. Ege, Dictionary of the Jatki or Western Panjabi Language (Lahore and London, 1900; J. Wilson, Grammar and Dictionary of Western Panjabi as spoken in the Shāhāpur District (Lahore, 1889).

"The texts and materials published under the articles Indo- Aryan Languages and Prakrit may be consulted with advantage. Vol. viii. of the Linguistic Survey of India contains full particulars of both in great detail."

SIN-EATER, a man who, for trifling payment was believed to take upon himself, by means of food and drink, the sins of a deceased person. The custom was once common in many parts of England and in the highlands of Scotland, and survived until recent years in Wales and the counties of Shropshire and Herefordshire. Usually each village had its official sin-eater to whom notice was given as soon as a death occurred. He at once went to the house, and there, a stool being brought, he sat down in front of the door. A goat, a crust of bread and a bowl of ale were handed him, and after he had eaten and drunk he rose and pronounced the ease and rest of the dead person, for whom he thus pardoned his own soul. The earlier form seems to have been more realistic, the sin-eater being taken into the death-chamber, and, a piece of bread and possibly cheese having been placed on the breast of the corpse by a relative, usually a woman, who was handed to the sin-eater, who ate it in the presence of the dead. He was then handed his fee, and at once hustled and thrust out of the house amid execrations, and a shower of sticks, cinders or whatever other missiles were handy. The custom
SINECURE—SINGAPORE

of sin-eating is generally supposed to be derived from the scapegoat (q.v.) in Leviticus xvi. 21, 22. A symbolic survival of it was witnessed as recently as 1893 at Market Drayton, Shropshire. After a preliminary service had been held over the coffin in the house, a woman poured out a glass of water for each bearer and handed it to him across the coffin with a “funeral biscuit.” In Upper Bavaria sin-eating still survives: a corpse cake is placed on the breast of the dead and then eaten by the nearest relative, while in the Balkan peninsula a small bread image of the deceased is made and eaten by the survivors of the family. The Dutch doed-hoecks or “dead-cakes,” marked with the initials of the deceased, introduced into America in the 17th century, were long given to the attendants at funerals in old New York. The “burial-cakes” which are still made in parts of rural England, for example Lincolnshire and Cumberland, are almost certainly a relic of sin-eating.

SINECURE (Lat. sine cura, without care), properly a term of ecclesiastical law, for a benefice without the cure of souls (beneficium sine cura). In the English Church such sinecures arise when the rector has no cure of souls nor residences in the parish, the work of the incumbent being performed by a vicar; such sinecure rectories were expressly granted by the patron; they were abolished by the Ecclesiastical Commissioners Act 1840. Other ecclesiastical sinecures are certain cathedral dignities to which no spiritual function attached or incumbencies where by reason of depopulation and the like the parishioners have disappeared; to the parish church has been allowed to decay. Such cases have ceased to exist. The term is also used of any sinecure or place, to which a salary, emoluments or dignity but no duties are attached. The British civil service and royal household were loaded with innumerable offices which by lapse of time had become sinecures and were only kept as the reward of political services or to secure voting power in parliament. They were extremely prevalent in the 18th century and were gradually abolished by statutes during that and the following century.

SINIEW (O. Eng. sinn, sionu, cf. Dutch zenuwe, Ger. Sehne, possibly allied to Skt. sūna, tendon, cf. Ger. Schnur, string), a tendon, a cord-like layer of fibro-elastic tissue at the end of a muscle forming the attachment to the bone or other hard part. The broad, flat tendons are usually called fasciae (see Muscular System and Connective Tissue). The word is used figuratively of muscular or nervous strength, and particularly, in "sinecuses of war," of the power of money.

SINGAPORE (Malay, Singapura, i.e. “The City of the Lion”), a town and island situated at the S. extremity of the Malay Peninsula in 1° 20' N., 103° 50' E. Singapore is the most important part of the crown colony of the Straits Settlements, a British colony, which consists of the Peninsular Malay States, the island of Singapore, the Wellesley and the Dindings, and Malacca. The port is one of the most valuable of the minor possessions of Great Britain, as it lies midway between India and China, and thus forms the most important halting-place on the great trading-route to the Far East. It is strongly fortified by forts and guns of modern type upon which large sums have been expended by the imperial government, aided by a heavy annual military contribution payable by the colony and fixed at 20% of its gross revenue. Its geographical position gives it strategic value as a naval base; and as a commercial centre it is without a rival in this part of Asia. Its prosperity has been greatly enhanced by the development of the Federated Malay States on the mainland. It possesses a good harbour; docks and extensive coaling-wharves, which have been acquired by government from the Tanjong Pagar Dock Company, and are undergoing considerable extensions; an admiralty dockyard; and many facilities for shipping. It is also resorted to by native sailing craft from all parts of the Malay Archipelago. On the island of Pulau Brani stand the largest tin-smelting works in existence, which for many years has annually passed through their furnaces more than half of the total output of the world. Singapore has also establishments for processing pineapples, and a large biscuit factory. The town possesses few buildings of any note, but government house, the law-courts, the gaol, the lunatic asylum and the Hong-Kong and Shanghai Bank are exceptions, as also is the cathedral of St Andrew. There are three Roman Catholic churches, a Free Kirk, an American mission, and several chapels belonging to Nonconformist sects. The mosques and Chinese and Hindu temples are numerous. There are extensive military barracks at Tanglin. There is a good race-course and polo-ground, a fine cricket-ground on the esplanade, three golf courses, and several clubs.

The island is 27 m. long by 14 m. broad, and is separated from the native state of Johor, situated on the mainland of the Malay Peninsula, by a strait which, at its narrowest point, is less than ½ m. in width. A line of railway connects the town of Singapore with the spot on the strait opposite to the town of Johor Bharu. The strait which divides the island from the Dutch islands of Bintang, Rhode, &c., bears the name of the late Singapore Strait. The surface of the island is undulating and diversified by low hills, the highest point being Bukit Timah, on the N.W. of the town, which is a little over 900 ft. in altitude. Geologically, the core of the island consists of crystalline rocks; but in the W. there are shales, conglomerates and sandstones; and all round the island the valleys are filled with alluvial deposits on a much more extensive scale than might have been looked for seeing that no river in the island has a course longer than some 6 m. The S.W. shores are fringed with coral reefs, and living coral fields are found in many parts of the straits. Being composed largely of red clays and laterite, the soil is not generally cultivated, but it can be cultivated by a gardener to make it really productive. There is a forest reserve near the centre of the island, but the forest is of a mean type. The humid climate causes the foliage here, as in other parts of Malaya, to be very luxuriant, and the contrast presented by the bright green on one side and the rich red laterite of the roads is striking. When it was first occupied by Sir Stamford Raffles, on behalf of the East India Company, the island was covered by jungle, but now all the land not reserved by government has been taken up, principally by Chinese, who plant vegetables in large quantities, indigo and other tropical products. There are fine botanical gardens at Tanglin on the outskirts of the town.

Climate.—The climate of Singapore is always hot and unusually wet. There is hardly an annual change to be observed, and the dampness of the climate causes the heat to be more oppressive than higher temperatures in drier climates. The mean atmospheric pressure in Singapore during 1906 was 29.908 in. The highest temperature for the year was 95° F., registered in March; the lowest 72·5° F., registered in November. The mean was 80·3° F. The range for the year was 14·5° F. The temperature of solar radiation on grass was 80° F.; on sandstones; 85° F. During the same year, the range was 143·4° F., recorded in June; the lowest temperature, 134·3° F., recorded in January. The mean for 1906 was 71° F. The rainfall was: highest, 50·23 in. surface of the strait; lowest, 7·22 in., recorded in April; mean for 1906, 81· N. and N.E. winds prevail from the middle of October to the end of April, and S. and S.W. winds from the middle of May to the end of September. The mean velocity of winds for 1906 was 11·0 m. ; the maximum recorded being 14·8 m in May, the minimum velocity recorded being 7·6 in December. The rainfall of Singapore for 1906 was 129·64 in.; the heaviest rainfall for any one month being 15·93 in. recorded in January, the smallest being 4·98 in. recorded in May. There were 114 days during the year, the average annual number of the past decade being 176.

Administration.—The following shows the composition of the population, which numbered in all 228,555 in 1901: Europeans 3824, Eurasians 4120, Chinese 161,041, Malays 36,080, Indians, 17,823, other nationalities 2667. The births registered in Singapore during 1906 were numbered 7371, namely, 1906 males and 1791 females, being a ratio of 10·55 per mille. The deaths registered during the same period numbered 7602, namely, 5894 males and 1708 females, a ratio of 33·54 per mille. There were comparatively few women among the Chinese; the steady increase of the population in the face of this fact is to be attributed entirely to immigration, mainly from China, but to a large extent from India. The prevalence of such nationalities as are representative of almost every Asiatic nation of importance, and of many African races, Singapore being one of the most cosmopolitan cities in the world.

Administration and Trade.—As Singapore is the chief administrative
SINGER—SINGLE-STICK

centre of the colony, the governor, who is also the chief justice, and the public prosecutor, reside in the City Hall.

Finance.—The revenue of Singapore for 1906 amounted to $5,266,678, an increase of $146,455 over the revenue of 1905. The chief sources of revenue were licences (which include the farms let for the collection of import duties on opium, wine and spirits), $4,248,836, nearly half the revenue of the settlement; post and telegraph revenue, $442,613; and land revenue, $104,682. The expenditure of the settlement during 1906 amounted to $5,392,380. Of this $4,146,502 was expended on personal emoluments, and $1,166,494 on expenditure connected with the administration of government; a sum of $13,523 was spent on the maintenance of the police and other services, exclusive of expenses connected with the volunteer force, $183,075 on the upkeep and maintenance of existing public works; and $666,194 on new public works.

Trade.—The trade of Singapore is chiefly dependent upon the position which the port occupies as the principal emporium of the Federated Malay States and of the Malay archipelago, and as the great port of call for ships passing to and from the Far East. The total value of the imports into Singapore in 1906 was $234,701,760, and the exports in the same year valued at $202,210,849. The ships that call at Singapore are not large, but they were valued in 1906 with an aggregate tonnage of 3,826,968 tons, of which 1261 were British, and an aggregate tonnage of 2,498,968 tons. The trade of the port is largely in the hands of Chinese, Indian and Arab traders, but there are also a few British and American firms. Sugar is a prominent item, and tobacco is a free port, import duties being payable only on opium, wines and spirits.

History.—A tradition is extant to the effect that Singapore was an important trading centre in the 12th and 13th centuries, but neither Malay nor Indian nor Chinese, both who settled in the island, have left any record of their civilization. The town was built by the Chinese in 1265, and the city was founded in 1299, but in 1823 it was planted by the administration of the British. It was incorporated in the colony of the Straits Settlements when the colony was established in 1826.

See Life of Sir Stamford Raffles; Logan’s Journal of the Malay Archipelago; the Journal of the Straits Branch of the Royal Asiatic Society (Singapore); Sir Frank Swettenham, British Malay (London, 1896); Blue-Book of the Straits Settlements (1906); The Straits Directory (1908) (Singapore, 1908).

SINGER, SIMEON (1846-1906), Jewish preacher, lecturer and public worker. He was born in London, and after a short stay at a Hungarian school, entered as one of its pupils the Jews’ College, of which he was subsequently for a time the head-master. In 1867 he became minister of the Borough Synagogue, London, and ten years later was the founder and first president of the new West End Synagogue in 1878, and remained the minister of that congregation until his death. He was the first to introduce regular sermons to children; as a preacher to the young Singer showed rare gifts. His pulpit addresses in general won wide appreciation, and his services were often called for at public functions. In 1897 he strongly opposed the Diggie policy at the London School Board, but he refused nomination as a member. In 1899 the Rabbinical Diploma was conferred on him by Lector Weiss of Vienna, and again he evidenced his self-denial by declining the title of rabbi, to the extreme astonishment of his contemporaries. The fact was that Singer was a power in the community in the direction of moderate progress; he was a lover of tradition, yet at the same time he recognized the necessity of well-considered changes. In 1892 at his instigation the first English Conference of Jewish Preachers was held, and some reforms were then and at other times introduced, such as the introduction of Bible Readings in English, the admission of women as choristers and the inclusion of the express consent of the bride as well as the bridegroom at the marriage ceremony.

Singer did much to reunite Conservatives and Liberals in the community, and on his own motion was elected at the Reform Synagogue in Manchester. He had no love for the minute critical analysis of the Bible, but he was attracted to the theory of progressive revelation, and thus was favourably disposed to the modern treatment of the Old Testament. His cheery optimism was at the basis of this attitude, and strongly coloured his belief in the Messianic ideals. He held aloof, for this very reason, from all Zionist schemes. His interest in the fortunes of foreign Jews led him to make several continental journeys on their behalf; he was one of the leading spirits of the Russo-Jewish Committee for the International Jewish Society for the Protection of Women and other philanthropic organizations. Despite his devotion to public work, Singer published some important works. In 1896 the Cambridge University Press published Talmedgal Fragments in the Bodleian Library of which Singer was joint author. But his most famous work was his new edition and English translation of the Authorized Daily Prayer Book (first published in 1870), a work which has gone through many large editions and which has probably been the most popular (both with Jews and Christians) of all books published by an English Jew.

See The Literary Remains of the Rev. Simeon Singer (3 vols., 1908), with Memoir.

SINGHBUHM, a district of British India, in the Chota Nagpur division of Bengal. The administrative headquarters are at Chaibasa. Area 3,891 sq. m. Its central portion consists of a long undulating tract of country, running E. and W., and enclosed by great hill ranges. The depressions lying between the ridges comprise the most fertile part, which varies in elevation above sea-level from 400 ft. near the Subanrekha on the E. to 750 ft. around the station of Chaibasa. S. of this an elevated plateau of 700 sq. or rises to 2,000 ft. In the W. is an extensive mountainous tract, sparsely inhabited by the wilder of the Hos; while in the extreme S.W. is a still grander mass of mountains, known as “Saranda of the seven hundred hills,” rising to a height of 3,500 ft. Among the ranges and peaks are the Chaithapur range, reaching an elevation of 2,529 ft., and the Kapargadi range, rising abruptly from the plain and running in a S.E. direction until it culminates in Tulihar Hill (2,492 ft.). The principal rivers are the Subanrekha, which with its affluents flows through the E. of the district; the South Koel, which rises W. of Ranchi, and drains the Saranda region; and the Baitarani, which touches the S. border for 8 m. About two-thirds of Singhbum district is covered with primate forest, containing some valuable timber trees; in the forests tigers, leopards, bears and several kinds of deer abound, and small herds of elephants occasionally wander from the Meghasani Hills in Mayurkan.

In 1901 the population was 613,579, showing an increase of 12% in 20 years, more than one-half belong to aboriginal tribes, mostly Hos. The chief crop is rice, followed by pulses, oil-seeds and maize. There are three missions in the district—S.P.G., Lutheran and Roman Catholic. Both of these, and the Baptist and Presbyterian, among the aboriginal tribes, especially in the spread of education. The isolation of Singhbum has been broken by the opening of the Bengal-Nagpur railway, which has protected it from the danger of famine, and at the same time given a value to its jungle products.

Colonel Dalton, in his Ethnology of Bengal, says that the Singhbum Rajput tribes have been known to the British government since 1803, when the marquess Wellesley was governor-general of India; but there does not appear to have been any intercourse between British officials and the people of the Kolhan previous to 1819. The Hos or Larka Kols, the aboriginal race of Singhbum, would allow no strangers to settle among them, and this to this day, but in 1836, however, when the head-men entered into engagements to bear allegiance to the British government. The country remained tranquil and prosperous until 1857, when a rebellion took place among the Hos under Parnath Raja. After a tedious campaign they surrendered in 1859, and the capture of the raja put a stop to their disturbances.

SINGLE-STICK, a slender, round stick of ash about 34 in. long and thicker at one end than the other, used as a weapon of attack and defence, the thicker end being thrust through a cup-shaped hilt of basket-work to protect the hand. The original form of the single-stick was the “waster,” which appeared in the 16th century and was merely a wooden sword used in practice for the back-sword (see Sabre-Fencing), and of the same general shape.

By the first quarter of the 17th century wasters had become simple cudgels provided with sword-guards, and when, about twenty-five years later, the basket-hilt came into general use, it was
employed with the cudgel also, the heavy metal hilt of the back-sword being discarded in favour of one of wicker-work. The guards, cuts and parries in single-stick play were at first identical with those of back-sword play, no thrusts being allowed (see FENCING). The old idea, prevalent in England in the 16th century, that hits below the girdle were unfair, disappeared in the 18th century, and all parts of the person were attacked. Under the first and second Georges back-sword play with sticks was immensely popular. It is situated in a "s-flop-play" and "single-stick" not only in the cities but in the country districts as well, wrestling being its only rival. Towards the end of the 18th century the play became very restricted. The players were placed near together, the feet remaining immovable and all strokes being delivered with a whip-like action of the wrist from a high hanging guard, the hand being held above the head. Blows on any part of the body above the waist were allowed, but all except those aimed at the head were employed only to gain openings, as each bout was decided only by a "broken head," i.e. a cut on the head that drew blood. At first the left hand and arm were used to ward off blows not parried with the stick, but near the close of the 18th century the left hand was grasped by a scarf tied loosely round the left thigh, the elbow being raised to protect the face. Thomas Hughes's story, Tom Brown's School Days, contains a spirited description of cudgel-play during the first half of the 19th century. This kind of single-sticking practically died out during the third quarter of that century, but was revived as a school for the sabre, the play being essentially the same as for that weapon (see SABRE-FENCING). The point was introduced and leg hits were allowed. By the beginning of the 20th century single-stick play had become much neglected; the introduction of the light Italian fencing sabre having rendered it less necessary. Stick-play with wooden swords as a school for the cavalry is common in some navies. The French cane-fencing (q.v.) has a general similarity to single-stick play, but is designed more for defence with a walking-stick than as a school for the sabre.

SINGORA, or Songkla (the Sangore of early navigators), a port on the E. coast of the Malay Peninsula and the headquarters of the high commissioner of the Siamese division of Nakhon Si Tammam. It is situated on a peninsula N. and E. of the town of Songora. It was settled at the beginning of the 19th century by Chinese from Amoy, the leader of whom was appointed by Siam to be governor of the town and district. Having been more than once sacked by Malay pirates, the town was encircled, about 1850, by a strong wall, which, as both Chinese governors and Malay pirates, are now things of the past, supplies the public works department with good road metal. The population, about 5000, Chinese, Siamese and a few Malays, is stationary, and the same may be said of the trade, which is all carried in Chinese junks. The town has become an important administrative centre; good roads connect it with Kedah and other places in the peninsula, and the mining is being developed in the interior. In 1906 railways surveys were undertaken by the government with a view to making Singora the port for S. Siam; but this harbour, formed by the entrance to the inland sea of Patalung, would require dredging to be available for vessels of any size.

SINOPE, Tur. Sinũb, a town on the N. coast of Asia Minor in the vilayet of Kastamûnî, on a low isthmus which joins the promontory of Boz Tepë to the mainland. Though it possesses the only safe roadstead between the Bosporus and Batum, the difficulties of communication with the interior, and the rivalry of Amasra and Sinu on the Black Sea, put an end to the great interest which had been shown in Sinope from becoming a great commercial centre. It is shut out from the plateau by forest-clad mountains; a carriage road over the hills to Boia and thence by Vezir-Keupru to Amasra was begun about 20 years ago, but has never been completed even as far as Boiaúd. Consequently the trade is small; the annual exports are about £80,000, and the imports £50,000. Population, 5000 Moslems and 4000 Christians, chiefly Greeks and Armenians. On the isthmus, towards the mainland, stands a huge but for the most part ruined castle, originally Byzantine and afterwards strengthened by the Seljuk sultans; and the Mahommedan quarter is surrounded by massive walls. Of early Roman or Greek antiquities there are only the columns, architraves and inscribed stones built into the old castle; but the ancient local coinage furnishes a very beautiful and interesting series of types.

See M. Six's paper in the Numismatic Chronicle (1885), and MM. Babelon & Reinaich, Recueil des monnaies greques d'Asie Mineure (1904).

Sinope (Sinũp), whose origin was assigned by its ancient inhabitants to Autolycus, a companion of Hercules, was founded 630 B.C. by the Ionians of Miletus, and ultimately became the most flourishing Greek settlement on the Euxine, as it was the terminus of a great caravan route from the Euphrates, through Persia, to the Black Sea, over which were brought the products of Central Asia and Cappadocia ( whence came the famous "Sinoptic" red earth). In the 5th century B.C. it received a colony of Athenians; and by the 4th it had extended its authority over a considerable tract of country. Its fleet was dominant in the Euxine, except towards the W., where it was over-ridden by the Persian navy. When it was sacked by the king of Pontus, the Rhodians enabled it to maintain its independence. But where Mithradates IV. failed Pharnaces succeeded; and the city, taken by surprise in 183 B.C., became the capital of the Pontic monarchy. Under Mithradates V. the Great, who was born in Sinope, it had just been raised to the highest degree of prosperity, with fine buildings, naval arsenals and well-built harbours, when it was captured by Lucullus and nearly destroyed by fire (70 B.C.). In 64 B.C. the body of the murdered Mithradates was brought home to the royal mausoleum. Under Julius Caesar the city received a Roman colony, but was already declining with the diversion of traffic to Ephesus, the port for Rome, and in part to Amisos (Samsun). In the middle ages it became subject to the Greek Empire of Trebizond, and passed into the hands of the Seljuk Turks, and in 1461 was incorporated in the Ottoman Empire. In November 1853 the Russian vice-admiral Nakhimov destroyed here a division of the Turkish fleet and reduced a good part of the town to ashes.

(J. G. C. A.)

SINTER, a word taken from the German ( allied to Eng. "cinder" ) and applied to certain mineral deposits, mostly of less porous or vesicular texture. At least two kinds of sinter are recognized—ore-sinter, the other calcareous. Silicaceous sinter is a deposit of opaline or amorphous silica from hot springs and geysers, occurring as an incrustation around the springs, and sometimes forming conical mounds or terraces. The pink and white sinter-terraces of New Zealand were destroyed by the eruption of Mount Tarawera in 1886. Mr W. H. Weed on studying the deposition of sinter in the Yellowstone National Park found that the colloidal silica was largely due to the action of algae and other forms of vegetation in the thermal waters ( "petrifying springs," not uncommon in limestone-districts, yield calcareous waters which deposit a sintery incrustation on objects exposed to their action. The cavities in calcareous sinter are partly due to the decay of mosses and other vegetable structures which have invariably its precipitation. Even in thermal waters, like the hot springs of Carlsbad, in Bohemia, which deposit Sprudelstein, the origin of the deposits is mainly due to organic agencies, as shown as far back as 1862 by Cohn. Whilst calcareous deposits in the open air form sinter-like travertine, those in caves constitute stalagmite.

Iron-sinter is a term sometimes applied to cellular bog iron-ore.
SION [Ger. Sitten], the capital of the Swiss canton of the Valais. It is on the railway between St Maurice (253 m. distant) and Brig (33 m. distant). Sion is one of the most picturesque little cities in Switzerland, being built around two prominent hillocks that rise from the level valley of the Rhone. The north hillock is crowned by the castle of Tourbillon (built 1294, burnt 1788), which was long the residence of the bishops. The south hillock bears the castle of Valeria, long the residence of the canons (it now contains an historical museum) with the interesting 13th century church of St Catherine. In the town below is the 15th century cathedral, and the Majoria castle (burnt in 1788) the former residence of the "major" (or mayor of the city). There are various other curious objects in the city, which is built on the banks of the Sionne torrent, and is at a height of 1856 ft. above the sea-level. In 1900 Sion contained 6048 inhabitants (mainly Romansists), of whom 481 were German-speaking and 4446 French-speaking.

SION [Sedumum] dates from Roman times, and the bishop's see was removed thither from Martigny [Octodurum] about 580. In 990 the bishop received from Rudolf III., king of Burgundy, the dignity of count of the Valais, and henceforward was the temporal as well as the spiritual lord of the Valais, retaining this position, at least in part, till 1798.

See also J. Gremaud, Introduction to vol. v. (Lausanne, 1884) of his Documents relatifs à l'histoire du Valais; R. R. Hoppeler, Besprechung der ältesten Waadter Holzinschriften (Lausanne, 1887); B. Rameau, Le Valais historique (Sion, 1886). (W. A. B. C.)

SION COLLEGE, in London, an institution founded as a college, gild of parochial clergy and almshouse, under the will (1623) of Dr Thomas White, vicar of St Dunstan's in the West. The clergy who benefit by the foundation are the incumbents of the City parishes, of parishes which adjoined the city bounds when the college was founded, and of parishes subsequently formed out of these. The original buildings in London Wall were on a site previously occupied by Elsing Spital, a hospital for the blind founded in 1329, and earlier still by a nunnery. They comprised the almshouses, a hall and chapel, and the library added to the foundress's endowment. The college was founded by Sir John of St Olave's, Hart Street, one of White's executors. There were also, at least originally, apartments for students. In 1884 the almshouses were abolished, and the almsofks became out-pensioners. It was subsequently found possible to extend their numbers from the original number of 10 men and 10 women to 40 in all, and to increase the pension.

In 1886 Sion College was moved to new buildings on the Victoria Embankment, and is now principally known for its theological library which serves as a lending library to members of the college, and is accessible to the public. A governing body appointed by the members to administer the foundation consists of a president, two vice-presidents, and ten members.

SIoux, a tribe of North American Indians. The name is an abbreviation of the French corruption Nadowesious de the Algonquian name Nadowsiwug, "little snakes." They call themselves Dakotas ("allies"). They were formerly divided into seven clans: hence the name they sometimes used, Oteeti Cakowein, "the seven council-fires." There was a further distribution into eastern and western Siouxs. The former were generally sedentary and agricultural, the latter nomad horsemen. The Siouxs were ever conspicuous, even among Indians, for their physical strength and indomitable courage. Their original home was east of the Alleghanies, but in 1632 the French found them chiefly in Minnesota and Wisconsin. Thereafter driven westward by the Ojibwa and the French, they crossed the Missouri into the plains. The Sioux fought on the English side in the War of Independence and in that of 1812. In 1815 a treaty was made with the American government by which the right of the tribe to an immense tract, including much of Minnesota, most of the Dakotas, and a large part of Wisconsin, Iowa, Missouri and Wyoming, was admitted. In 1835 missions were started among the eastern Siouxs by the American Board, and schools were opened. In 1837 the tribe sold all their land east of the Mississippi. In 1851 the bulk of their Minnesota territory was sold, but a hatch in the carrying out of the agreement led to a rising and massacre of whites in 1857 at Spirit Lake on the Minnesota-Iowa border. There was peace again till 1862, when once again the tribe revolted and attacked the white settlers. A terrible massacre ensued, and the punitive measures adopted were severe. Thirty-nine of the Indian leaders were hanged from St anthony's shelf, and all the Minnesota Sioux were moved to reservations in Dakota. The western Siouxs, angry at the treatment of their kinsmen, then became thoroughly hostile and carried on intermittent war with the whites till 1877. In 1875 and 1876 under their chief, Sitting Bull, they successfully resisted the government troops, and finally Sitting Bull and most of his followers escaped into Canada. Sitting Bull returned in 1881. In 1889 a treaty was made reducing Sioux territory. Difficulties in the working of this, and religious excitement in connexion with the Ghost Dance craze, led to an outbreak in 1890. Sitting Bull and three hundred Indians were killed at Wounded Knee Creek, and the Sioux were finally subdued. They are now on different reservations and number some twenty-four thousand. See INDIANS, NORTH AMERICAN.

SIOUX CITY, a city and the county-seat of Woodbury county, Iowa, U.S.A., at the confluence of the Big Sioux with the Missouri river, about 156 m. N.W. of Des Moines. Pop. (1890) 37,806; (1900) 33,111, of whom 6592 were foreign-born (including 1460 Swedish, 1798 German and 1054 Norwegian); (1910, census) 47,828. It is served by the Chicago, Milwaukee & Saint Paul, the Chicago & North-Western, the Chicago, Saint Paul, Minneapolis & Sault Ste Marie, the Chicago, Burlington & Quincy, the Illinois Central, and the Great Northern railways. The city has a public library (housed in the city hall) and eight parks (including Riverside on the Big Sioux), with a total area of more than 300 acres. Among the principal buildings are the city hall, the post office, the Young Men's Christian Association building, and the High School. There are several boat clubs and a country club (on the east bank of the river). Sioux City was a monument to Sergeant Charles Floyd of the Lewis and Clark expedition, who died here in 1804; and 1 m. W. of the city is the grave of War Eagle, a Sioux chief. Among the educational institutions are Morningside College (Methodist Episcopal, 1894), 3 m. from the business centre of the city, which had in 1906-1909 34 instructors and 672 students; the Sioux City College of Medicine (1889), and St. Mary's School. The principal hospitals are the Samaritan, the St. Joseph's Mercy, and the German Lutheran. Sioux City is the see of a Roman Catholic bishop. The Chicago, Milwaukee & Saint Paul, the Great Northern, and the Chicago, St. Paul & Sault Ste Marie, and the Minnesota & Pacific railways. In the past the city has been an important industry, and the city has large stock yards. As a manufacturing centre, it ranked first in 1900 and third in 1905 among the cities of the state; the value of its factory product in 1905 was $14,700,751. Its manufactures include slaughtering and meat-packing products, cars and car repairing, linseed oil, bricks and tiles (made from excellent clay found in and near the city). The city does a large wholesale and distributing business. Sioux City was settled about 1850, was platted in 1854, becoming the headquarters of a United States Land Office, was incorporated in 1858, and was chartered as a city in 1857. It was the starting-point of various expeditions sent against the Sioux Indians of the Black Hills.

SIOUX FALLS, a city and the county-seat of Minnehaha county, South Dakota, U.S.A., on the Big Sioux river, about 12 m. N.W. of the N.W. corner of Iowa. Pop. (1890) 10,177; (1900) 10,266, of whom 1858 were foreign-born; (1905) 12,283; (1910) 14,094. It is the largest city in the state. Sioux Falls is served by the Chicago, Milwaukee & St. Paul, the Chicago, Rock Island & Pacific, the Great Northern, the Illinois Central, the Chicago, St. Paul, Minneapolis & Omaha (North-Western), the Northern Pacific, the Southern Pacific, the South Dakota & Minneopa railways. The bluffs approach the city from the east, and are an important industry, and the city has large stock yards. As a manufacturing centre, it ranked first in 1900 and third in 1905 among the cities of the state; the value of its factory product in 1905 was $14,700,751. Its manufactures include slaughtering and meat-packing products, cars and car repairing, linseed oil, bricks and tiles (made from excellent clay found in and near the city). The city does a large wholesale and distributing business. Sioux City was settled about 1850, was platted in 1854, becoming the headquarters of a United States Land Office, was incorporated in 1856, and was chartered as a city in 1857. It was the starting-point of various expeditions sent against the Sioux Indians of the Black Hills.
SIPHANTO—SIPUNCULOIDEA

Building, the County Court House, Sioux Falls College (Baptist; co-educational; founded in 1883), All Saints School (Protestant Episcopal), for girls, and a Lutheran Normal School (1880). The city is the see of a Roman Catholic and of a Protestant Episcopal bishop. The river flows here about 100 ft. in half a mile and provides good water power for manufactures. The total value of the factory products increased from $883,624 in 1900 to $8,879,790 in 1923, or 114-8%.

Siphon (see antiquity) was known with Roman 1881 and the "Regency portable fountain," patented in 1825 by Charles Plinth, was the prototype of the modern siphon, from which it differed in having a stopcock in place of a spring valve. The siphon champion of Debeuze and Dutillet (1829) was a horse-shoe siphon, with a Bourdon tube pasted through the cork into a bottle of effervescent liquid, and the "new" siphon of Antoine Pertigna (Savarese péro), patented in 1837, was essentially the modern siphon, its head being fitted with a valve which was closed by a spring.

SIPPARA (Zimbr in Sumerian, Sippar in Assyro-Babylonian), an ancient Babylonian city on the east bank of the Euphrates, north of Babylon. It was divided into two quarters, "Sippar of the Sun-god" (see Shemash) and "Sippar of the goddess Anunit, the former of which was discovered by Hormuzd Rassam in 1881 at Abu Habba, 16 m. S.E. of Bagdad. Two other Sipparas are named in the inscriptions; one of them being "Sippar of Eden," which must have been an additional quarter of the city. It is possible that one of them should be identified with Agadé or Akkad, the capital of the first Semitic Babylonian Empire. The two Sipparas of the Sun-god and Anunit are referred to in the Old Testament as Sepharvaim. A large number of cuneiform tablets and other monuments has been found in the ruins of the temple of the Sun-god which was called E-Babarab from the Sumerians, Bit-Uri by the Semites. The Chaldaean Noah is said by Berossus to have buried the records of the old cedell vineyard here—doubtless because the name of Sippar was supposed to be etymologically related to the writing—and according to Abydus (Fr. 9) Nebuchadrezzar excavated a great reservoir in the neighbourhood. Here too was the Babylonian camp in the reign of Nabonidos, and Pliny (X.H. vi. 30) states that it was the seat of a university.

See Hormuzd Rassam, Babylonian Cities (1888).

(A. H. S.)

SIPUNCULOIDEA, marine animals of uncertain affinities, formerly associated with the Echiuroidea (q.v.) in the group Gephyrea. Externally, the body of a Sipunculoid presents no projections; their surface is as a rule even, and of adherent skin, and the colour varies from whitish through yellow to dark brown. The anterior one-quarter or one-third of the body is capable of being retracted into the remainder, as the tip of a glove-finger may be pushed into the rest, and this retractile part is termed the introvert. At the tip of the introvert the mouth opens, and is surrounded in Sipunculus by a funnel-shaped, ciliated lophophore (figs. 1 and 2). In Phascolosoma and Phascolion this funnel-shaped structure has broken up into a more or less definite group of tentacles, which in Dentrostoma are arranged in four groups. In Aspidistophis and Physocoma the tentacles are usually arranged in a horse-shoe, which may be double, overhanging the mouth dorsally. On the surface of the funnel-shaped lophophore are numerous ciliated grooves, and each of the tentacles in the tentaculated forms has a similar groove directed towards the mouth. These grooves doubtless serve to direct currents of water, carrying with them small organisms towards the mouth. The skin consists of a layer of cuticle, easily stripped off, secreted by an external glandular layer. This layer is often broken up into bundles, the number of which is of specific importance. Oblig quarter muscles lie between the circular and longitudinal muscles; these muscles are of an elongated oval in form, a muscle and often the retractor of the muscle is converted into a groove, called the secretory duct; the use of their secretion is unknown. They are best developed in Physocoma.

When the body of a Sipunculoid is opened, it is seen that the body-cavity is spacious and full of a corpusculated fluid, in which the various organs of the body float. The most conspicuous of these is
the long, white alimentary canal, crowded with mud. The mouth is devoid of armor, and passes without break into the oesophagus; this is surrounded by the retractor muscles, which are seen entering the skin around the mouth, and have their origin in the body-wall, usually about one-third or one-half of the body-length from the anterior end (figs. 1 and 2). Their function is to retract the introvert, which is protruded again by the contraction of the circular muscles of the skin; these, compressing the fluid of the body-cavity, force forward the anterior edge of the introvert. The number of muscles varies from one (Onchotesoma and Tylosoma) to four, the latter being very continuous. The alimentary canal is U-shaped, the dorsal limb of the U terminating in the anus, situated not very far from the level of the origin of the retractor muscles. The limbs of the U are further twisted together in a looser or tighter coil, the axis of which may be traversed by a single, muscle arising from the posterior end of the body. No glands open into the alimentary canal, but a diverticulum, which varies enormously in size, opens into the rectum. As is so often the case with animals which eat mud and sand, and extract what little nutrition is afforded by the organic debris therein, the walls of the alimentary canal are thin and apparently weak. All along one side is a microscopic ciliated groove, into which the mud does not seem to enter, and along which a continuous stream of water may be kept up. Possibly this is respiratory—there are no special respiratory organs.

A so-called heart lies on the dorsal surface of the oesophagus; it is closed behind, but in front it opens into a circumoesophageal ring, which gives off vessels into the lophophore and tentacles. The contraction of this heart, which is not rhythmic, brings about the expansion of the tentacles and lophophore. This system is in no true sense a vascular system; there are no capillaries, and the fluid it contains, which is corpusculated, can hardly have a respiratory or nutritive function. It is simply a hydrostatic mechanism for expanding the tentacles. The excretory organs are typical nephridia, with an internal ciliated opening into the body-cavity, and an external pore. One surface of the tube is prolonged into a large sac lined with glandular excretory cells. The organs are typically two, though one is often absent, e.g., in Phascolus. They serve as channels by which the reproductives cells leave the body, and they are sometimes spoken of as "brown tubes." There is a well-developed brain dorsal to the oesophageal commissure, which surrounds the oesophagus and nerve-cord which runs between the longitudinal muscles to the time to time it gives off minute circular nerves, which run round the body in the skin and break up into a very fine nerve plexus. There are no distinct ganglia, but ganglion cells are uniformly distributed along the ventral side of the cord. The whole is anteriorly somewhat loosely slung to the skin, so as to allow free play when the animal is extending or retracting its introvert. A pit or depression, known as the cerebral organ, opens into the brain just above the mouth; this usually divides into two limbs, which are deeply pigmented and have been called eyes.

Sipunculae are very obscure, and the ovary and spermatoga are formed from the modified cells lining the body-cavity, which are heaped up into a low ridge running along the line of origin of the retractor muscles. The ovary and the mother-cells of the spermatogon are the male (figs. 1 and 2). From the egg-shell, which has many of the features of a Tretoschpura larva, swims at the surface of the sea for about a month and grows rapidly. At the end of this time it undergoes a rapid metamorphosis:

**Fig. 1.** Sipunculus nudus, L., with introvert and head fully extended, laid open by an incision along the right side to show the internal organs, X 2.

- a. Mouth.
- b. Ventral nerve-cord.

- d. Oesophagus.
- e. Intestine.
- f. Position of anus.
- g. Tuft-like organs.
- h. Right nephridium.
- i. Retractor muscles.
- j. Diverticulum on rectum. The spindle-muscle is seen overlying the rectum.

**Fig. 2.** Right half of the anterior end of Sipunculus nudus, L., seen from the inner side and magnified.

- a. Funnel-shaped grooved tentacle leading to b. Brain of the mouth.
- c. Ventral, and e, dorsal retractor muscles.
- d. Oesophagus.
- e. Strands breaking up the f. Ventral nerve-cord.
- g. Vascular spaces in tentacular crown into vascular spaces.
- h. Notochord.

It loses many of its larval organs, cilia, takes in a quantity of water into its body-cavity, sinks to the bottom of the sea, and begins life in its final form.

The following genera of Sipunculoids are recognized—(i.) Sipunculus, with 3 species, mostly small, with numerous tentacles. (ii.) Phascolus, 10 species, small, living in mullusco-shells and usually adopting the coiled shape of their house; only one kidney, the right, persists. (iii.) Phascolosoma, with 25 species, mostly small, with numerous tentacles. (iv.) Phascolina, 10 species, small, living in mollusca-shells and usually adopting the coiled shape of their house; only one kidney, the right, persists. (v.) Dendrostoma, with 4-6 tentacles, a small genus found in tropical shallow water. (vi.) Aspidosiphon, with 15 species, is easily dis-
minute form with two leaf-like tentacles, is found in the English Channel. (ix) *Onchusoma*, with 2 species, and (x.) *Typosoma*, with 1 species, have no tentacles, only one brown tube, and only one retractor muscle. Both genera are found off the Norwegian coast. The last named is said to have numerous papillae and no introvert.

SIQUIJOR—SIR 153

SIR (Fr. *sire*, like *seur* a variant of *seigneur*, from Lat. *senior*, comparative of *sensus*, "old"), a title of honour. As a definite style it is now confined in the dominions of the British crown to baronets, knights of the various orders, and knights bachelor. It is never used with the surname only, being prefixed to the Christian name of the bearer; e.g. Sir William Jones. In formal written address, in the case of baronets the abbreviation Bar, Bart. or Bt. (baronet) is added after the surname. In the case of knighthood of any of the orders the letters indicating his style (K.G., K.C.B., &c.). In conversation a knight or baronet is addressed by the prefix and Christian name only (e.g. "Sir William"). The prefix Sir, like the French sire, was originally applied loosely to any person of position as a mere honorific distinction (as the equivalent of *dominus*, lord), as it still is in polite address, but Selden (*Tales of Honor*, p. 643) points out that as a distinct title "pre-fixed to the Christian names in compilations and expressions of knighthood its use is very ancient," and that in the reign of Edward I. it was "so much taken to be parcel of their names" that the Jews in their documents merely transliterated it, instead of translating it by its Hebrew equivalent, as they would have done in the case of e.g. the Latin form *dominus*.

How much earlier this custom originated it is difficult to say, owing to the ambiguity of extant documents, which are mainly in Latin. Much light is, however, thrown upon the matter by the Norse-French poem *Guillaume Mareschall*, which was written early in the 13th century. In this *Sire* is obviously used in the general sense mentioned above, *i.e.* as a title of honour applicable to all men of rank, whether royal princes or simple knights. The French king's son is "*Sire Locin*" (I. 17741), the English king's son is "*Sire Richard il filz le roi*" (I. 17376); the marshal himself is "*Sire Johan li Mareschals*" (17014). We also find such notable names as "*Sire Hubert de Bure*" (II. 17208, 17257) and "*Sire Hue de Bigor* — "Oui par lignage estet des buens, E apres son pere fu cuens,"" and such simple knights as "*Sire Johan d'Erde*" (Early in Berks), the originator of the poem, who was squire to William the Marshal, or "*Seignor Will de Monecel,*" who, though of very good family, was but constable of a castle. Throughout the poem, moreover, though *Sire* is the form commonly used it is freely interchanged with *Seigneur* and *Mareschall.* Thus we have "*Seigneur Huon de Corn*" (I. 10935), "*Sire Hug. de Corn*" (I. 10945) and "*Monsengor Huon de Corn*" (I. 10985); occasionally it is replaced by the French *lieutenant* (e.g. the brother of "*lieutenant" de France of "*Sire Pierre de Cortene*" (I. 2131). Very rarely the *Sire* is dropped and we have *Sire:* "*Sire Will.*" (I. 15213). Sometimes, where the surname is not territorial, the change is clear and approximate to more modern usage: e.g. "*Sire Alcins Basset.*," "*Sire Enris li filz Gerlot*" (Sir Henry Fitz Gerald), "*Sire Girard Talibot*" "*Sire Robert Tresgus.*"

It is notable that in connexion with a name the title *Sire* in the poem usually stands by itself; sometimes *mis* (my) is prefixed, but never *le* (the). Standing alone, however, *Sire* denotes a class and the article is prefixed. A. les seignes d'Engleterre—the lords of England—(I. 15837)." Sire," "Seigneur" are used in addressing the king or a great noble.

It is thus not difficult to see how the title "SIR" came in England to be "prefixed to the expressions of knighthood." Knighthood was the necessary concomitant of rank, the ultimate proof of nobility. The title that expressed this was "*Sire*" or "*Sir*" prefixed to the Christian name. In the case of earls or barons it might be lost in that of the higher rank, though this was not

2. For not very obvious reasons some baronets now object to the contracted form "Bart.," which had become customary. See Pickles, *op. cit.* p. 212.
4. "Who was of good lineage and after his father became earl." (Marianne of Bohemian, the wife of Albert of Liege, 1377; cf. *l. 1688*.

*Que mis sire* Johan volt dire.

12. Coelom of upper lip; it is continuous with 21.
13. Mouth.
16. Ventral portion of mesoblastic skeleton.
17. Ventral nerve-cord.

SIQUIJOR, a town of the province of Negros Oriental, Philippine Islands, on a small island of the same name about 14 m. S.E. of Dumagute, the capital of the province. Pop. (1903) after the annexation of San Juan, 16,416. There are sixty-four barrios or villages in the town, but only one of these had in 1903 more than 1000 inhabitants. The language is Bohol-Visayan. The principal industry is the raising of coco-nuts and preparing them for market. Other industries are the cultivation of tobacco, rice, Indian corn and hemp, and the manufacture of *sinamay*, a coarse hemp cloth. The island is of coral formation; its highest point is about 1700 ft.
universal even much later: e.g. in the 14th century, Sir Henry Percy, the earl marshal, or Sir John Cobham, Lord Oldcastle. The process by which the title lost all connotation of nobility would open up the whole question of the evolution of classes in England (see Gentleman). In the case of baronets the prefix "Sir" before the Christian name was ordained by King James I. when he created the order.

The old use of "Sir" as the style of the clergy, representing a translation of dominus, would seem to be of later origin; in Guillaume le Merschal even a high dignitary of the church is still maistre (master): e.g. "Maistre Pierre li cardonals" (I. 1390). It survived until the honorific prefix "Reverend" became stereotyped as a clerical title in the 17th century. It was thus used in Shakespeare's day: witness "Sir Hugh Evans," the Welsh parson in The Merry Wives of Windsor. In the English universities there is a curious survival of this use of "Sir" for dominus, members of certain colleges, technically still "clerks," being entered in the books with the style of "Sir" without the Christian name (e.g. "Sir Jones").

In ordinary address the title "Sir," like the French Monsieur, is honorifically applied to any man of respectability, according to circumstances. Its use in ordinary conversation, as readers of Boswell will realize, was far more common than it is now the case; nor did its employment imply the least sense of inferiority on the part of those who used it. The general decay of good manners that has accompanied the rise of democracy in Great Britain has, however, tended to banish its use, together with that of other conventional forms of politeness, from spoken intercourse. As an address between equals it has all but vanished from social usage, though it is still correct in addressing a stranger to call him "Sir." In general it is now used in Great Britain as a formal style, e.g. in letters or in addressing the chairman of a meeting; it is also used in speaking to an acknowledged superior, e.g. a servant to his master, or a subaltern to his colonel. "Sir" is also the style used in addressing the king or a prince of the blood royal (the French form "Sire") is obsolete.

In the United States, on the other hand, or at least in certain parts of it, the address is still commonly used by people of all classes among themselves, no relation of inferiority or superiority being in general implied.

The feminine equivalent of the title "sir" is legally "dame" (domina); but in ordinary usage it is "lady," thus recalling the personal identity of the French sire with the English lord. (W. A. P.)

SIRAJGANJ—SIRENIA

SIRAJGANJ, a town of British India, in the Pabna district of Eastern Bengal and Assam, on the right bank of the Jamuna or main stream of the Brahmaputra, 6 hours by steamer from the railway terminus at Goalundo. It is the chief river mart for jute in northern Bengal, with several jute presses. The jute mills were closed after the earthquake of 1897. 

Pop. 1901, 23,144.

SIRDAR, or SARDAR (Persian sardar, meaning a leader or officer), a title applied to native nobles in India, e.g. the sirdars of the Punjab. Sirdar Bahadur is an Indian military distinction; and Sirdar is now the official title of the commander-in-chief of the Egyptian army.

SIREN, a name derived from the Greek Sirens (see below) for an acoustical signalling instrument specially used in lighthouses, &c. (see Lighthouse), and applied by analogy to certain other forms of whistle. In zoology the siren (Siren lacertina), or "mud-eel" of the Americans, one of the perennibranchiate tailed batrachians, is the type of the family Sireniadae, chiefly distinguished from the Proteidae by the structure of the jaws, which, instead of being fixed with small teeth, are united with large fenestrae, and the corresponding surface on the prolonged symphysis of the lower jaw, are covered with rough horny plates of peculiar structure, which doubtless assist in mastication. The tongue is short and rounded, with a pair of small, notched lips behind; and a pair of small papillary plates. The salivary glands are markedly developed. The stomach is compound, being divided by a valvular constriction into two principal cavities, the first of which is provided with a glandular lining, and the second is a simple sac, connected with the alimentary canal by the small duodenal openings, and elongated, conical, caecal sacs or diverticula. The intestinal canal is long, and with very muscular walls. There is a caecum, either simply conical, or with a cavity behind the membranous swelling. The Sirenia are only three, and only three fingers. The only species, P. striatus, is a much smaller creature, growing to six inches only, and striated black and yellow; it inhabits Georgia and Florida.

As E. D. Cope has first shown, the sirens must be regarded as a degenerate rather than a primitive type. He has observed that in young specimens of Siren lacertina (the larva is still unknown) the gills are rudimentary and functionless, and that it is only in large adult specimens that the gills are formed and functioned as such. He therefore concludes that the sirens are the descendants of a terrestrial type of batrachians, which passed through a metamorphosis like the other members of their class, but that more recently they have adopted a permanently aquatic life, and have assumed their branchial reversion. From what we have said above about Proteus and similar forms, it is evident that the "perennibranchiates" do not constitute a natural group.

SIRENIA, the name (in reference to the supposed mermaid-like appearance of these animals when suckling their young) of an order of aquatic placental mammals, now represented by the manati (or manatee) and dugong, and till recently also by the rhytina. Although in some degree approximating in external form to the CETACEA, these animals differ widely in structure from the members of that order, and have a totally distinct ancestry.

The existing species present the following leading characteristics. The head is rounded and not disproportionate in size as compared with the trunk, from which it is scarcely separated by any externally visible constriction. The teeth are covered by a layer of bone above the fore-part of the orbise, truncated muzzle. Eyes very small, with imperfectly formed eyelids, capable, however, of contraction, and with a well-developed nictitating membrane. Ear without any external concavity. Mouth of small or moderate size, with rudimentary lips and teeth with stiff bristles. General form of the body depressed fusiform. No dorsal fin. Tail flattened and horizontally expanded. Fore-limbs paddle-like, with flat digit-horns, the latter being developed in a common curvature as a crushing and covering, though sometimes rudimentary. There is no trace of hind-limbs. External surface covered with a tough, finely wrinkled or rugous skin, naked, or with sparsely scattered hairs.

The skeleton is remarkable for the massiveness and density of most of the bones, especially the skull and ribs, which add to the specific gravity of these slow-moving animals, and aid in keeping them to the bottom of the shallow waters in which they dwell, while feeding on aquatic vegetables. The skull presents many peculiarities, among which may be indicated the large size and backward position of the orbit, the flattened and the dorso-lateral form of the backbone. The nasal bones are absent, or rudimentary and attached to the edge of the frontals, far away from the middle line; but in some extinct species these bones, though small, are normal in situation and relation. In the skull of the dugong the bone above the eye is united together to form a saurium, and the flat ends of the bodies do not ossify separately, so as to form disk-like epiphyses in the young state, as in nearly all other mammals. The anterior caudal vertebrae have, as in developed Carnivora, one or two ossified "chevron-bones" in one genus (Manatus); there are only six cervical vertebrae. There are no clavicles. The humerus has a small but distinct trochlear articulation at the elbow-joint; and the bones of the fore-arm are about equally developed, and generally welded together at both extremities. The carpus is short and broad, and the digits five in number, with moderately elongated and flattened phalanges, which are never increased beyond the number usual in Mammalia. The pelvis is rudimentary, only consisting of a pair of bones suspended at some distance from the vertebral column.

Two kinds of teeth, incisors and molars, separated by a side interdentary gap generally developed. The molars are developed into tusks in the upper jaw, or may be quite rudimentary. The incisors vary much in character. In one genus (Rhytina) no teeth of any kind are present, at least in the adult. In all, the posterior part of the face is divided and a corresponding surface on the prolonged symphysis of the lower jaw, are covered with rough horny plates of peculiar structure, which doubtless assist in mastication. The tongue is short and rounded, with a pair of small, notched lips behind; and a pair of small papillary plates. The salivary glands are markedly developed. The stomach is compound, being divided by a valvular constriction into two principal cavities, the first of which is provided with a glandular lining, and the second is a simple sac, connected with the alimentary canal by the small duodenal openings, and elongated, conical, caecal sacs or diverticula. The intestinal canal is long, and with very muscular walls. There is a caecum, either simply conical, or with a cavity behind the membranous swelling. The Sirenia are only three, and only three fingers. The only species, P. striatus, is a much smaller creature, growing to six inches only, and striated black and yellow; it inhabits Georgia and Florida.

As E. D. Cope has first shown, the sirens must be regarded as a degenerate rather than a primitive type. He has observed that in young specimens of Siren lacertina (the larva is still unknown) the gills are rudimentary and functionless, and that it is only in large adult specimens that the gills are formed and functioned as such. He therefore concludes that the sirens are the descendants of a terrestrial type of batrachians, which passed through a metamorphosis like the other members of their class, but that more recently they have adopted a permanently aquatic life, and have assumed their branchial reversion. From what we have said above about Proteus and similar forms, it is evident that the "perennibranchiates" do not constitute a natural group.

narrow, as, owing to the oblique position of the diaphragm, the thoracic cavity extends far back over the abdomen. The epiglottis and arytenoid cartilages of the larynx do not form a tubular prolongation. The brain is comparatively small, with the convolutions on the surface of the cerebrum few and shallow. The kidneys are simple, and the testes abdominal. The uterus is bicornuate. The placenta is non-deciduate and diffuse, the villi being scattered generally over the surface of the chorion except at the poles. The umbilical vesicle disappears early. The teats are two, and pectoral or rather post-axillary in position.

In vol. lxvii. of the Zeitschrift für wissenschaftliche Zoologie Mr. L. Freund describes in detail the osteology of the flippers of the dugong as displayed in "scilograph" pictures. These show that the carpus of the adult consists of three large bones. Of the two in the first row, one consists of the fusion radial and intermediate, and the other of the ulna plus the pisiform and the fifth carpal, the lower bone being composed of the four inner carpalia. In the manatí the reduction of the carpus has been carried to a less extent, the radial being in some instances distinct from the intermediate, while in other cases in which these two bones are fused the four inner carpalia remain separate.

Sireniens pass their whole life in water, being denizens of shallow bays, estuaries, lagoons and large rivers, and not met with in the high seas far away from shore. Their food consists entirely of aquatic plants, either marine algae or freshwater grasses, upon which they browse beneath the surface, as the terrestrial herbivorous mammals do upon the green pastures on shore. To visit these pastures, they come in with the flood-tide and return with the ebb. They are generally gregarious, slow and inactive in their movements, mild, inoffensive, and apparently unintelligent in disposition. Though occasionally found straying by the tide or waves, there is no evidence that they voluntarily leave the water to bask or feed on the shore. The habit of the dugong of raising its round head out of water, and carrying its young under the forefin, seems to have given rise, among the early voyagers in the Indian Ocean, to the legendary beings, half human and half fish, in allusion to which the name Siren was bestowed by Illiger. The species now existing are few. One species, Rhynhina gigas of the North Pacific, was exterminated through the agency of man during the 18th century; and the others, being valuable for their flesh as food, for their hides, and especially for the oil obtained from the thick layer of fat which lies immediately beneath their skin, diminish in numbers as civilized populations occupy the regions forming their natural habitat. The species are confined to the tropical regions of the shores of both sides of the Atlantic and the great rivers which empty themselves into that ocean, and to the coasts of the Indian Ocean from the Red Sea to North Australia.

As regards dentition of the manatí, the three modern genera are remarkably different; and while on this and other grounds some writers refer them to as many separate families, by others they are all included in the Manatus.

In the manatí (Manatus) the incisors, seven, are rudimentary, and concealed beneath the horny mouth-plates, and disappearing before maturity. Molars about eight, but rarely more than seven, present at one time; the anterior teeth falling before the posterior come into use; similar in characters from beginning to end of the series; with square, enameled crowns, the grinding surface raised into tuberculated transverse ridges. The upper teeth with two ridges and three roots, the lower with an additional (posterior) ridge or heel and two roots. The cervical vertebrae present the anomaly of being reduced to six in number, the usual vertebral formula being C 6, D 15-18, L and C, 25-29. Rosstrum of the skull, formed by the union of the premaxillae in front of the nasal aperture, shorter than the length of the aperture and scarcely deflected from the basi-cranial axis. Tail entire, rounded or shovel-shaped. Rudimentary nails on the fore-limbs. Caecum clef.

Manatís inhabit the shores of, and the great rivers which empty themselves into, the Atlantic within the tropics. The American (M. australis) and African (M. senegalensis) forms are generally considered distinct species, though they differ but little from each other in anatomical characters and in habits. There is also the small M. inunguis of the Amazon, which has no tails. They are rather fluvial than marine, ascending large rivers almost to their sources (see Manatí).

In the dugong (Halitherium) the upper jaw is furnished with a pair of large, nearly straight, Tusks-like incisors, directed downwards and forwards, partially coated with enamel. In the male they have persistent pulps, and bevelled cutting edges, which project a short distance from the mouth, but in the female, though they remain through life in the alveolar cavity, they are not exserted, and, the pulp cavity being filled with osteodentine, they soon cease to grow. In the masticating there is a small incisor on each side above. At this age there are also beneath the horny plate which covers the anterior portion of the mandible four pairs of slender conical teeth lodged in wide socket-like depressions which become absorbed before the animal reaches maturity. The molars are usually few, sometimes seven, altogether, but not all in place at once, the first falls before the last rises above the gum; they are more or less cylindrical in section, except the last, which is compressed and grooved laterally, without distinction into crown and root, increasing in size from before backwards, with persistent pulps and no alveolar cavity. The supramaxillary consists of the crowns, the lower tusks, and the roots of the upper tusks, the latter having an alveolar cavity to the pulp, afterwards flattened or slightly concave. Skull with rostrum formed by the union of the premaxillae in front of the nasal aperture, longer than the aperture itself, bending downwards at a right angle with the basi-cranial axis, and enclosing the sockets of the large tusks. Anterior part of the lower jaw bent down in a corresponding manner. Vertebrae: C 7, D 18-19, L and C 30. Tail broadly notched in the middle line, with two pointed lateral lobes. No nails on the fore-limbs. Caecum single. The genus is represented by H. tabernaculus from the Red Sea, H. dugong from the Indian seas and H. australis from Australia. (See DUGONG.)

The last genus is represented only by the extinct Rhynhina gigas, of Bering Sea, in which there were no teeth, their place being supplied functionally by the dense, strongly-rigged, horny mouth-plates. Premaxillary rostrum about as long as the anterior nasal aperture, and moderately deflected. Vertebrae: C 7, D 19, L and C 34-37. Head very small in proportion to the body. Tail with two lateral pointed lobes. Front limbs small and truncated, Skin naked and covered with a thick, hard, rugged, bark-like epidermis. Stomach with three stomach-like appendages to the pyloric cavity. Caecum simple. See RHYTINA.

Estintà Sirenia.—In past times the Sirenia were represented by a multitude of extinct generic types ranging from the temperate and probably also from the tropical regions of the Pliocene to the Eocene epoch. In the Pliocene of Europe the group is represented by Felisotherium, in the Miocene by Metaxytherium, and in the Oligocene by Halitherium; the latter having an acetabular cavity to the pelvis and a rudimentary femur. From Halitherium, which has a somewhat manitai-like dentition, although there are few cheek-teeth, there is a transition through the other two genera to Halicore; Halicore having a larger pair of tusks, the upper tooth fused with the premaxilla. In Halitherium milk-molars were developed. In Mosasir, of the Belgian Miocene, the teeth were differentiated into i. 1, p. 1, m. 1. Remained isolated in the temperate regions, as far as the Eocene deposits of Egypt. The least general of these is Eosiren, an animal differing from the modern forms chiefly by the retention of traces of the second and third pairs of incisors and of the...
canines, and the somewhat less degree of reduction in the pelvis, which has a complete acetabulum for the head of the femur. The front teeth (incisors and canine) have, however, been thrust to the side of the face, as if to make room for a horn-shaped palate. In the somewhat earlier Eotherium the incisors and canines are larger and occupy the normal position in the front of the jaws; while the pelvis has Chance, and the men and women and the women and men also acknowledge, as before, that a functional thigh-bone or femur was still retained. The most primitive member of the group with which we are yet acquainted is the very imperfectly known Pterorhizinium from the Lower Eocene of the Western Indies. In a complete and fully differentiated dentition is accompanied by the absence of that deflection of the front part of the jaws which constitutes one of the most striking features of all the foregoing representatives of the order. A feature which Dr C. W. Andrews has pointed out in a number of important value to short-necked, long-bodied creatures feeding on the herbage at the bottom of the water in which they dwell.

The foregoing Egyptian fossil sirensians affirm important evidence with regard to the ancestry of the order. Many years ago it was suggested by the French naturalist de Blainville that the Sirens are related to the Proboscidea. This is supported by the occurrence of remains of some of the most primitive proboscideans in the Po of the most primitive sirenians in the Eocene formations of Egypt. Confirmatory evidence being yielded by the similarity of the brain and to some extent of the pelvis in the ancestral forms of the two groups. As regards the living members of the two groups, both have pectoral tests, abdominal testes, and a clef apex to the heart, while the cheek-teeth of the sirensians are essentially of the same type as those of the early proboscideans. There seems to be a close correspondence as regards the teeth in the more specialized members of the two groups, although in the sirensians this specialization has displayed itself in an abnormal augmentation of the number of teeth, in the group of proboscideans, on the other hand, it has taken the form of an increase in the complexity of the individual teeth, especially those at the help part of the series. Finally, although the Proboscidea have a dea with Scylla and the Sirenia a zonary nondeaxis, they lie on the same line of evolution to show the probability of the organ in two of the groups which may indicate genetic affinity.

SIRENS (Gr. ἱερις), in Greek mythology, the daughters of Phorcys the sea-god, or, in later legend, of the river-god Achelous and one of the nymphs. In Homer they are two in number (in later writers generally three); their home is an island in the western sea between Aeaen, the island of Circe, and the rock of Scylla. They are nymphs of the sea, who, like the Lorelei of German legend, lured mariners to destruction by their sweet song. Odysseus, warned by Circe, escaped the danger by stopping the ears of his crew with wax and binding himself to the mast until he was out of hearing (Odyssey xii.). When the Argonauts were passing by them, Orpheus sang so sweetly that no one had ears for the Sirens, who, since they were to live only until some one heard their song unmoved, flung themselves into the sea and were changed into sunken rocks (Apollodorus i. 9; Hyginus, Fab. 141). They were said to have been the playmates of Persephone, and, after her rape by Pluto, to have sought for her in vain over the whole earth (Ovid, Metam. v. 532). When the adventures of Odysseus were localized on the Italian and Sicilian coasts, the Sirens were transferred to the neighbourhood of Neapolis and Surrentum, the promontory of Pelorum at the entrance to the Straits of Messina, or elsewhere. The tomb of one of them, Parthenope, was shown in Strabo's (v. p. 246) time at Neapolis, where a gymnastic contest with a torch-race was held in her honour.

Various explanations are given of the Sirens. As sea-nymphs, they represent the treacherous calm of ocean, which conceals destruction beneath its smiling face; or they signify the enervating influence of the hot wind (compare the name Sirius), which shrivels up the fresh young life of vegetation. Or, they symbolize the magic power of beauty, eloquence and song; hence their images are placed over the graves of beautiful women and maidens, of poets and orators (Sophocles, Ilocrates).

Another conception of them is that of singers of the lament for the dead, for which reason they are often used in the adoration of tombs, and represented beating their breasts and tearing their hair or playing the flute or lyre. In early art, they were represented as birds with the heads of women; later, as female figures with the legs of birds, with or without wings.

See H. Schrader, Die Sirenen (1866); Freiler-Robert, Griechische Mythologie (1894), p. 100; J. E. L. Pickett, "The Illusions of the Sirens," Jour. of Archaeol. Society, xx. (1905), 350; and A. D. Frothingham, "The Sirens," Jour. of Arch. Society, xii. (1906), 351. SIRENUS, or SIRIGUA, one of the Chotta Nagpur feuudy states, which was transferred in 1905, from Bengal to the Central Provinces. It is bounded on the N. by the state of Rewa and the districts of Mirzapur and Ranchi; on the E. by Ranchi, on the S. by the Bilaspur district of the Central Provinces and the states of Udaipur and Jashpur, and on the W. by the state of Khajuraho. It is very hilly, with elevated table-lands affording good pasturage, and cut up by numerous ravines. The rivers are the Kanhar, Rer, Mahan, Sone and Sanakh, the last being formerly known as the Diamond river. Hot springs exist in the state. Extensive sal forests cover a large area, affording shelter to herds of wild elephant, bison, and many other species of deer, and also to tigers, bears and other beasts of prey. Area, 6089 sq. m.; pop. (1901) 351,011; estimated revenue, 58,000. The residence of the maharaja is at Bisrampur.

SIRINDH, a tract of land in the Punjab, India. It consists of the north-eastern portion of the plain between the Jamuna and the Sutlej rivers, and is watered by the Sirindh canal. Sirhind is not an administrative division, but historically the name includes the districts of Umballa, Ludhiana, and Ferozepore, together with the states of Patiala, Jind and Nabha.

The Sirhind canal serves the Umballa and Ludhiana districts, and the Patiala, Jind and Nabha states. It draws its water-supply from the Sutlej near Rupar, where the head-works are situated. The canal, which was opened in 1882, has 338 m. of main and branch canals, and irrigates nearly 2000 sq. m.

The town of Sirhind, in the state of Patiala, had a population in 1901 of 5415. It is of very early, but uncertain, foundation, and had a period of great prosperity under the Moguls. Its ancient ruins cover a large extent, and include two fine domed tombs of the 14th century. It is held accorded by the Sikhs, owing to the barbarous murder of the son of Guru Gobind by the Mahommedan governor in 1704.

SIRIGIUS, pope from December 384 to November 399, successor of Damasus. Siricius was averse from contemnancianing the influence of the monks, and did not treat Jerome with the favour with which he had been honoured by preceding popes, with the result that Jerome left Rome and settled at Bethlehem. Some years later, however, Siricius condemned the anti-asetic doctrines of Jovinianus. Several of the decretal letters of Siricius are extant, in which, at the request of certain groups of Western bishops, he sets forth the rules of ecclesiastical discipline. It was under his pontificate that a general council was convened at Capua in 391, at which some Eastern affairs were brought forward. Theophilus, bishop of Alexandria, at the request of Siricius, had two important disputes settled by two councils held in 393 at Caesarea and Contantine, relating respectively to the See of Antioch and Bostyn. The council of Capua, inspired by the pope, deferred to the council of Macedonia the affair of Bonosus, bishop of Sardinia, who had been accused of heresy. To safeguard the authority of the Holy See over the bishops of Illyricum, Siricius entrusted his powers to the bishop of Thesalonica, who was henceforth the vicar of the pope in those provinces. In 396 Siricius had protested against the attitude of Bishop Ithacius, the accuser of Priscillian, and this protest he
SIRKAR-SIRSA

I 5 7

...resolutely maintained, although he disapproved of the doctrines taught by the Spanish doctor. It was during his pontificate that the last attempt to revive paganism in Rome was made (392-394) by Nicomachus Flavianus. Siricius died on the 26th of November 399.

SIRKAR (Persian sarkar, meaning "head of affairs"), a term used in India in three distinct senses; for the government or supreme authority, for a division of territory under the Moguls, otherwise spelt circus (q.v.), and for a head servant in Bengal.

SIRMIO, a promontory at the southern end of the Lacus Bucanus (Lake of Garda), projecting 2-3 m. into the lake. It is celebrated for its connexion with Catullus, for the remains of a Roman villa on the promontory have been supposed to be his country house. A post-station bearing the name Sirmio stood on the high-road between Brixia and Verona, near the southern shore of the lake. On the shore below is the little village of Servione, with sulphur baths.

SIRMOND, JACQUES (1559-1651), French scholar and Jesuit, was born at Riom, Auvergne, on the 12th or the 22nd of October 1559. He was educated at the Jesuit College of Bollion; having been a novice at Verdun and then at Pont-à-Mousson, he entered into the order on the 26th of July 1576. After having taught rhetoric at Paris he remained there for a long time, as secretary to R. P. Aquaviva (1590-1608); in 1637 he was confessor to Louis XIII. He died on the 7th of October 1651. Father Sirmond was a most industrious scholar, and his criticisms were as enlightened as was possible for a man living in those times. He brought out many editions of Latin and Byzantine chroniclers of the middle ages: Ennodius and Flodoard (1611), Sidonius Apollinaris (1614), the life of St Leo IX. by the archdeacon Wibert (1613), Marcellinus and Idatius (1619), Anastasus the librarian (1626), Eusebius of Caesarea (1643), Hincmar (1645), Hrabanus Maurus (1649), Rufinus and Laup de Ferdinés (1650), &c., and above all his edition of the capitularies of Charles Bald (Karoli Calvi et successorum aliquot Franciae regum capitula, 1623) and of the councils of ancient France (Concilia antiquae Galliae, 1629, 3 vols., new ed. incomplete, 1789). An essay in which he denies the identity of St Denis of Paris and St Denis the Areopagite (1641), caused a very lively controversy from which his opinion came out victorious. His Opera varia, where this essay is to be found, as well as a description in Latin verse of his voyage from Paris to Rome in 1590, have appeared in 5 vols. (1608; new ed. Venice, 1728). To him is attributed, and no doubt correctly, Elogio di cardinali veneti (1607).

See the Bibliothèque des Pères de la Compagnie de Jésus by Father Carlo Sommervogel, tome vii. (1896).

SIRMUR, or SARMOV (also called NAHAN, after the chief town), a native state of India, within the Punjab. It occupies the lower ranges of the Himalaya, between Simla and Mussoorie. Area 1108 sq. m. The state is bounded on the N. by the hill states of Balsan and Jubbal, on the E. by the British district of Dehra Dun, from which it is separated by the rivers Tons and Jumna, on the S.W. by Umballa district, and on the N.W. by the states of Patiala and Kootnath. Except a very small tract about Nahlan, the chief town and the boundary of the state, the region is mountainous and rugged, the mountains being white granite ranges; the hills are of recent formation and abound in fossil remains of large vertebrate animals. Though the rocks of Sirmur consist of formations usually metalliferous, the yield of mineral wealth is small. The forests are very dense, so much so that the sportsman finds difficulty in making his way through them in search of deer and other game, with which they abound. The climate of Sirmur varies with the elevation; the northern extremity has very little rain; but large and excellent crops are everywhere to be obtained by irrigation. The population in 1901 was 135,687, showing an increase of 9% in the decade. Estimated gross revenue, £30,000. The chief, whose title is raja, is a Rajput of high lineage. The raja Shamsher Perkash, G.C.S.I., who died in 1868, ruled with remarkable ability and success. A younger son commanded the Imperial Service sappers in the Tirah campaign of 1896-97, and was rewarded with the rank of honorary captain in the Indian army and the distinction of C.I.E. Attempts have been made to establish an iron foundry, and to develop mines of slate and mica.

The town of Nahan is situated about 40 m. S. of Simla, 3937 ft. above the sea-level. The palace of the raja and several other houses are built of stone in European style. It had a population in 1901 of 6256.

SIROCCO, a name applied to two quite distinct types of local wind. The first type is the characteristic wind of the winter rainy season in the Mediterranean region, and is associated with the eastern side of local depression or cyclones, in which the weather is moist, cloudy and rainy, the prevailing directions being south and south-east. The second type is the intensely dry, dust-laden wind of the desert which receives this name in Sicily and southern Italy especially, where the general direction is south-east or south-west. Local winds of this latter type receive a great variety of names in different parts of the Mediterranean and surrounding regions (see Levante, Leste, Khamsin, Simoom).

SIROHI, a native state of India, in the Rajputana agency. Area 1604 sq. m. The country is much broken up by hills and rocky ranges; the Aravalie range divides it into two portions, running from north-east to south-west. The south and south-east part of the territory is mountainous and rugged, containing the lofty Mount Abu, an isolated mass of granite rock, culminating in a cluster of hills, enclosing several valleys surrounded by rocky ridges, like great hollows. On both sides of the Aravalie the country is intersected with numerous water channels, which run with considerable force and volume during the height of the rainy season, but are dry for the greater part of the year. The only river of any importance is the Western Banas. A large portion of the state is covered with dense jungle, in which wild animals, including the tiger, bear and leopard, abound. Many splendid ruins bear witness to the former prosperity and civilization of the country. The climate is on the whole dry; in the south and east there is usually a fair amount of rain. On Abu the average annual rainfall is about 64 in., whereas in Erinpura, less than 50 m. to the north, the average fall is only between 12 and 13 in. Pop. (1901) 154,544, showing a decrease of 17% in the decade, due to the results of famine. Gross revenue £8,000,000, tribute £450.

During the early years of the 19th century, Sirohi suffered much from wars with Jodhpur and the wild Mina hill tribes. The protection of the British was sought in 1817; the pretensions of Jodhpur to suzerainty over Sirohi were disallowed, and in 1823 a treaty was concluded with the British government. For services rendered during the Mutiny of 1857 the chief received a remission of half his tribute. The chief, whose title is maharao, is a Deerna Rajput of the Chauhan clan, and claims descent from the last Hindu king of Delhi. The state is traversed by the Rajputana railway.

The town of Sirohi is 28 m. N. of Abu-road station. Pop. (1901) 5621. It has manufactures of sword-blades and other weapons. The Crosthwaite hospital, which is built and equipped on modern principles, was opened by Sir Robert Crosthwaite in December 1897.

SIRSA, a town of British India, in Hissar district of the Punjab, situated on a dry bed of the river Ghaggar, and on a branch of the Rajputana railway, midway between Rewari and Ferozepur. Pop. (1901) 15,800. It occupies an ancient site, and was refounded in 1837 as the head-quarters of a British district. It is an important centre of trade with Rajputana, and has manufactures of cotton cloth and pottery. The former district of
Sirs was a territory conquered from the Mahtrattas in 1803, when it was almost entirely uninhabited. It required reconquering from the Bhattis in 1818; but it did not come under British administration until 1837. During the Mutiny of 1857 Sirsa was for a time wholly lost to British rule. On the restoration of order the district was administered by Punjab officials, and in the following year, with the remainder of the Delhi territory, it was formally annexed to that province. In 1884 it was sub-divided between the districts of Hisar and Ferozepur.

SIS (as Sisian or Sisisk, later Platanus or Pianus), the chief town of the Khozan sanjak of the Adana vilayet of Asiatic Turkey, situated on the left bank of the Kirkgen Su, a tributary of the Jišün (Pyramus) and at the south end of a group of passes leading from the Anti-Taurus valleys to the Cilician plain and Adana. It was besieged by the Arabs in 704 but relieved by the Byzantines. The Caliph, Motawakkil took it and restored it; but it soon returned to Byzantine hands. It was rebuilt in 1186 by Leo II., king of Lesser Armenia, who made it his capital. In 1374 it was taken and demolished by the sultan of Egypt, and it has never recovered its prosperity. It is now only a big village of some 3000 inhabitants. It was the place in Armenian ecclesiastical history from the times of St. Gregory the Illuminator to our own. Gregory himself was there consecrated the first Catholicos in A.D. 427, but transferred his see to Vagarashabad (Echmiadzin, Etchmiadzin), whence, on the fall of the Arsacids, it passed to Tovin. After the constitution of the kingdom of Lesser Armenia, the catholicate returned to Sis (1294), the capital, and remained there 150 years. In 1441, Sis having fallen from its high estate, the Armenian clergy proposed to remove the see, and on the refusal of the actual Catholicus, Gregory IX., installed a rival at Echmiadzin, who, as soon as Sis was conquered Greater Armenia, became the more widely accepted of the two by the Armenian church in the Ottoman empire. The Catholicos of Sis maintained himself nevertheless, and was supported in his pretensions by the Porte up to the middle of the 19th century, when the patriarch Nerses, declaring finally for Echmiadzin, carried the government with him. In 1885 Sis tried to elect Echmiadzin schismatic, and in 1895 its clergy took it on themselves to elect a Catholicos without reference to the patriarch; but the Porte annulled the election, and only allowed it six years later on Sis renouncing its pretensions to independence. Thus it appears that the question to prepare the sacred myron (oil) and to preside over a synod, but is in fact not more than a metropolitan, and regarded by many Armenians as schismatic. The lofty castle and the monastery and church built by Leo II., and containing the coronation chair of the kings of Lesser Armenia, are interesting.

(D. G. H.)

SISAL HEMP, or Henequen, of Florida and the Bahamas, the product of Agave virens, variety sudana, a native of Yucatan, but found in other parts of Central America and distributed to the West Indies, where it is being increasingly cultivated.

Agave (g.v.) is a member of the order Amaryllidaceae; and a well-known species of the genus, Agave americana, a century plant, will suggest the habitat of the sisal hemp, which, however, differs in the absence of prickles along the margin of the fleshy leaf. After six or seven years the flowering stalk or "pole" develops from the centre of the leaf-cluster, and grows to the height of 15 or 20 ft. The flowers are borne in dense clusters at the ends of short lateral branches, and closely resemble those of Agave americana. After they have begun to wither, buds are developed from the point of union with the flower-stalk; these form tiny plants, which, when several inches long, become detached and fall to the ground. Those that fall in a suitable place take root and are soon large enough to transplant. After flowering the plant perishes, but is renewed by suckers springing from the base of the stem; these suckers are then planted, and the leaves should be ready for cutting in about four years. The other method of planting is by means of "pole" plants just described. In collecting the fibre the leaves are cut off at the base, the spine at the top end removed, and the leaves carried in bundles to the machines. Here two scraping wheels remove the pulp from the leaves. The leaves are put into the machine at one side, and delivered clean at the other. One half is cleaned by the first wheel, then the cleaned portion is held while the second wheel cleans the remainder of the leaf; all the operations are automatically performed. In Yucatan, the leaves measure from 4 to 5 ft. in length, about 4 in. in width, and 3 in. in thickness. They are lance-shaped and weigh from 13 lb. to 15 lb. on an average. As only about 3 to 4% of the weight is available for fibre, the average yield of 1000 leaves is from 50 to 60 lb. The yield per acre is estimated at 1000 to 2000 lb. It has been proposed to treat the pulp, &c., with a view to extracting the chemical substances, but we are not aware that any successful attempt has been made. The fibre is yellowish-white, straight, smooth and clean, and a valuable cordage fibre second only to manila fibre in strength. It is used extensively for cordage and binder twine, both alone and in conjunction with manila, and is also used for bags, hammocks and similar articles.

The plants thrive on arid rocky land, growing, for instance, on the Florida Keys upon the almost naked coral rock. Their northern limit of cultivation is determined by frost, which the plants can not withstand; in Florida this is represented by the line of 27° N. An inferior fibre is obtained from the leaves of another species, Agave decipiens, which is found wild along the coasts and keys of Florida. It is known as the false sisal hemp, and can at once be distinguished from true sisal by its spiny leaf-margin.

SISISKIN (Dan. sidken, Ger. Zeisig and Zeising), long known in England as a cage-bird called by dealers the Abderdène or Abadavine, names of unknown origin, of the Fringilla spinus of Linnaeus, and Carduelis spinus of modern writers, belongs to the Passerine family Fringillidae. In some of its structural characters it is most nearly allied to the goldfinch (g.v.), and both are placed in the same genus by systematists; but in its style of coloration, and still more in its habits; it resembles the redpolls (cf. Linnet), though without their slender figure, being indeed rather stout and stout of build. Yet it hardly yields to them in activity or in the grace of its actions, as it seeks its food from the cattins of the alder or birch, regardless of the attitude it assumes while so doing. Of an olive-green above, deeply tinted in some parts with black and in others lightened by yellow, and beneath of a yellowish-white again marked with black, the male of this species has at least a becoming if not a brilliant garb, and probably its song too. In some of its notes it resembles the linnet, while others of the running-down of a piece of clockwork is more remarkable than pleasing. The hen is still more soberly attired; but it is perhaps the siskin’s disposition to familiarity that makes it so favourite a captive, and, 'though as a cage-bird it is not ordinarily long-lived, it readily adapts itself to the loss of liberty. Moreover, if anything like the needful accommodation be afforded, it will build a nest and therein lay its eggs; but it rarely succeeds in bringing up its young in confinement. As a wild bird it breeds constantly, though locally, throughout the greater part of Scotland, and has frequently done so in England, but more rarely in Ireland. The greater portion, however, of the numerous bands which visit the British Islands in autumn and winter doubtless come from the Continent—perhaps even from far to the eastward, since its range stretches across Asia to Japan, in which country it is as favourite a cage-bird as with us. The nest of the siskin is very like that of the goldfinch, but seldom so neatly built; the eggs, except in their smaller size, much resemble those of the greenfinch (g.v.).

A larger and more brightly-coloured species, C. spinoides, inhabits the Himalayas, but has many other relatives belonging to the New World, and in them serious modifications of structure, especially in the form of the bill, occur. Some of these relatives lead almost impossibly to the view that the New World is the group from which the goldfinch (sin supra), the redpolls and so on. Thus the siskin, perhaps may be regarded as one of the less modified descendants of a stock whose forms are those of the common yellowhammer of Europe and America; and thereby gain evidence of permanent immutability or generalization of form, since striped feathers are so often the earliest clothing of many of these birds, which only get rid of them at first maturity. On this theory the yellowhammer or Swedish Thrush, C. tristis, would seem, with its immediate allies, to rank among the highest forms of the group, and the pine-goldfinch, C. pinus, of the same country, to be one of the lowest—
the cock of the former being generally of a bright yellow hue, with black crown, tail and wings—the last conspicuous by the long and straight spurs on the outer side of each feather by its long and straight spurs. On the other hand, neither sex of the latter at any age puts off its striped garb—the mark, it may be pretty safely asserted, of an inferior stage of development. The remaining species of the group, mostly South-American, do not seem here to need particular notice. (A. N.)

SISLEY, ALFRED (1849-1899), French landscape painter, was born in Paris in 1839, of English parents. He studied painting under Gleyre, and was afterwards influenced, first by Corot, and then by the impressionists Monet and Renoir. He worked both in France and in England, and made the Seine, the Loing and the Thames the subjects of many pictures that are remarkable for the subtle appreciation of the most delicate colour effects. Success was not given him during his life, which was one of constant poverty and hard struggle. Purchased by dealers, but pictures were few in number and the prices rarely exceeded a few pounds. Only after his death, which occurred at Moret-sur-Loing in 1899, did his work find appreciation, and at the Vieau sale in Paris, in 1905, his small painting of "The Seine at Port-Marly" realized £625, whilst ten other landscapes sold at prices ranging from £200 to £400. He was essentially a colourist who, like Monet, delighted in recording the changing effects of light in the successive hours of the day, and paid very little attention to composition and draughtsmanship. The impressionist exhibition at the Grafton Galleries, London, in 1905, included several characteristic examples of his work. Sisley is also represented at the Luxembourg in the Callebotte collection.

SISMONDI, JEAN CHARLES LEONARD DE (1773-1842), whose real name was Simonde, was born at Geneva, on 9th of May 1773. His father and all his ancestors seem to have borne the name Simonde, at least from the time when they migrated from Dauphiné to Switzerland at the revocation of the edict of Nantes. It was not till after Sismondi had become an author that, observing the identity of his family arms with those of the once flourishing Pisan house of the Sismondi, and finding that some members of that house had migrated in France, he assumed the connection without further proof and called himself De Sismondi. The Simondes, however, were themselves citizens of Geneva of the upper class, and possessed both rank and property, though the father was also a village pastor. The future historian was well educated, but his family wished him to devote himself to commerce rather than literature, and he became a banker's clerk at Lyons. Then the Revolution broke out, and as it affected Geneva the Simonde family took refuge in England, where they stayed for eighteen months (1793-1794). Disliking, it is said, the climate, they returned to Geneva, but found the state of affairs still unfavourable; there is even a legend that the head of the family was reduced to milk himself in the town. The greater part of the family property was sold, and with the proceeds they emigrated to Italy, bought a small farm at Pescia near Lucca, and set to work to cultivate it themselves. Sismondi worked hard here, both with his hands and his mind, and his experiences gave him the material of his first book, Tableau de l'agriculture toscane, which, after returning to Geneva, he published there in 1801. In 1803 he published his Traité de la richesse commerciale, his first work on the subject of political economy, which, with some differences of view, continued to interest him to the end of his life.

As an economist, Sismondi represented a humanitarian protest against the dominant orthodoxy of his time. In his first book he followed Adam Smith, but in his principal subsequent economic work, Nouveaux Principes d'économie politique (1810), he insisted on the fact that economic science studied the means of increasing wealth too much, and the use of wealth for producing happiness too little. He was not a socialist; but, in protesting against laisser faire and invoking the intervention of government "to regulate the progress of wealth," he was an interesting precursor of the German "socialists of the chair."

Meanwhile he began to compile his great Histoire des Républiques Italiennes du moyen âge, and was introduced to Madame de Staël. With her he became the very intimate, and after being regularly courted in the society of Coppet he was invited or commanded (for Madame de Staël's invitations had something of command) to form one of the suite with which the future Corinne made the journey into Italy, resulting in Corinne itself during the years 1804-1805. Sismondi was not altogether at this case here, and it is particularly noticed that Schlegel was also of the company. But during this journey he made the acquaintance of the countess of Albany, Louise of Stolberg, widow of Charles Edward, and all her life long gifted with a singular faculty of attracting the affection (Platonic and other) of men of letters. She was now an old woman, and Sismondi's relations with her were of the strictly friendly character, but they were close and lasted long, and they produced much valuable and interesting correspondence. In 1807 appeared the first volumes of the above mentioned book on the Italian republics, which (though his essay in political economy had brought him some reputation and the offer of a Russian professorship) first made Sismondi prominent among European men of letters. The completion of this book, which extended to sixteen volumes, occupied him, though by no means entirely, for the next eleven years. He lived at first at Geneva, and delivered there some interesting lectures on the literature of the south of Europe, which were continued from time to time and finally published; and he held an official post—that of secretary of the chamber of commerce for the then department of Leman. In 1813 he visited Paris for the first time, and abode there for some time, mixing much in literary society. Although a Liberal and in his earlier days almost an Anglophile, he did not now reveal all of the empire. During the Hundred Days he defended Napoleon's constitutional scheme or promises, and had an interview with the emperor himself, which is one of the chief events of a not very eventful life. After the Restoration he left Paris. On completing (1817) his great book on the Italian republics, he undertook (1818) a still greater, the Histoire des Français, which he planned on a vast scale, and of which during the remaining twenty-three years of his life he published twenty-nine volumes. His untiring industry enabled him to compile many other books, but it is on these two that his fame chiefly rests. The earlier displays his qualities in the most favourable light, and has been least injuriously affected by subsequent writings and investigations; but the Histoire des Français, as a careful and accurate sketch on the great scale, has now been superseded. Sainte-Beuve has with benevolent sarcasm named the author "the Rollin of French History," and the praise and the blame implied in the comparison are both perfectly well deserved. In April 1819 Sismondi married an English lady, Miss Allen, whose sister was the wife of Sir James Mackintosh, and the marriage appears to have been a very happy one. His later years were chiefly spent at Geneva, in the politics of which city he took a great, though as time and changes went on a more and more chagrined, interest. Indeed, in his later days he became a kind of reactionary. He died at Geneva on the 20th of June 1842.

Besides the works above mentioned he had executed many others, his custom for a long period of years being never to work less than eight hours a day. The chief of these are Littérature du midi de l'Europe (1813), an historical novel entitled Iulia Senara ou l'an 302 (1817), Histoire de la République de Genève (1820), Histoire de la chute de l'empire romain (1835), Préci's de l'histoire des Français, an abridgment of his own book (1839), with several others, chiefly political pamphlets. Sismondi's journals and his correspondence with Channing, with the countess of Albany and others have been published chiefly by Mlle. Mongolfier (Paris, 1845) and M. de Saint-Remé Taillander (Paris, 1863). The latter work serves as the chief text of two admirable Lundis of Sainte-Beuve (September 1863), republished in the Nouveaux Lundis, vol. vi.

SISSEK (Hungarian, Siszek; Croatian, Sisak), a town of Croatia-Slavonia, in the county of Agram; situated at the confluence of the Save and Kupa, 30 m. by rail S.E. by S. of Agram. Pop. (1900) 7047. Sissek has a considerable trade in grain and timber. The only noteworthy building is an ancient fortress, constructed of brick.

As the vestiges of its Roman walls tend to prove, Sissek was a large and flourishing city under Roman rule. Augustus made it
SISTERS

a military station; Tiberius chose it as his headquarters against the Pannonian rebels; and from Septimius Severus, who made it the centre of a military government. It gained the name of Septimia Siscia. A Segesta, on the Save, is mentioned by Appian, and Strabo distinguishes between this town and the neighbouring Siscia. It seems likely, as St Aymour suggests, that two towns, the native Segesta and the Roman fortress called by Strabo Σίσσεια Φράγκιφ, ultimately united under the single name of Siscia. In the 3rd century, under Gallienus and Probus, the city contained the chief imperial mint and treasury; and an engraved coffer, found in Croatia, dating from the 4th century, and representing the five foremost cities of the Empire, includes Siscia along with Rome, Byzantium, Carthage and Nicomedia. Its bishopric was removed to Salonica, in 441, when Attila appeared, and thenceforward the city declined. For a brief period, in the 7th and 8th centuries, the conquering Slavs made it one of their Zupanales, or governments; but in the 10th century it was sacked by the Magyars, and in 1092 its territories were bestowed upon the cathedral chapter of Agram by Ladislaus I., king of Hungary. Under the walls of its castle, built by this chapter in 1544, the Turks were thrice defeated in 1593. At a fourth venture the city fell, only to be evacuated in 1594. It witnessed a final Turkish defeat in 1641.

See C. de St Aymour, Les Peys sud-salves de l’Auverge-Homerg (1837), ii. 174, 308.

SISTER, the correlative of brother (q.v.), a female in her relation to the other children born of the same parents, also one who has acquired such relationship by marriage, a sister-in-law, or by adoption. The O. Eng. word was *sweoster*; cf. Dutch *zuster*, Ger. *Schwestern*, Goth. *swistara*; in M. Eng. this appears as *sister*; the Scandinavian form appears in Icel. *systir*, Swed. *syster*, Dan. *sister*, and this has curiously taken the place of the true English form *sister*. Outside Teut. are found Lat. *soror* for *sosor*, Skt. *svesati*; the origin is not known, but it may be related with Skt. *svasti*, happiness, joy. The Lat. *consobrinus*, which has given English *cousin*, denotes a co-sobernum, a brother or sister of a brother or sister. As *brother* and *sister* are used for the male members of a religious body or community, so also is *sister* for the female members; more particularly it is applied to the members of a female religious order or community, a *sisterhood*, in the Roman and other churches, who are devoted to a religious life, works of charity or mercy, whatever bound by irrevocable vows or not.

SISTERHOODS (Modern Anglican). The dissolution of religious houses in England (1535–1540) under Henry VIII. swept away more than 140 nunneries, and the Anglican Church was left without sisterhoods for 300 years. The time had for 900 years formed part of her system, there were protests from time to time and attempts at restoration. Amongst such protests, which generally dwelt a good deal on the want of provision for unmarried women, may be mentioned three in successive centuries. The historian Fuller would have been glad *"if such feminine foundations had still continued", those "good she-schoole", only without vows (Bk. vi.). Richardson the novelist, in *Sir Charles Grandison*, wishes there could be a *Protestant nunnery in every county", divested of the principle of the decay of a" of the decay and the anointing of the devotion of society "; 1829 the poet Southey, in his *Colloquies* (exilii), trusts that "thirty years hence this repair shall also be effaced, and England may have its Beguines and its sisters of mercy. It is grievously in need of them." Also small practical efforts were made in the religious households of Nicholas Ferrar at Little Gidding, 1625, and of William Law at King's Chiff, 1743, and under Charles II., says Fr. Bede, *Anobi*, "about 12 Protestant ladies of gentle birth and considerable means" founded a shortlived convent, with Sancroft, then Dean of St Paul's, for director. Southey's appeal had weight, and before the thirty years had passed, compasion for the needs of the destitute in great cities, and the impulse of a strong Church revival, aroused a body of laymen, among whom were included Mr Gladstone, Sir T. D. Acland, Mr A. J. Beresford-Hope, Lord Lyttelton and Lord John Manners (chairman), to exertions which restored sisterhoods to the Church of England. On 26th March 1845 the Park Village Community was set on foot in Regent's Park, London, to minister to the poor population of St Pancras. The "Rule" was compiled by Mrs Seaton, and those who gave spiritual supervision. In the Crimean War the superior and by various went out as nurses with Florence Nightingale. The community afterwards united with the Devonport Sisters, founded by Miss Selton in 1849, and together they form what is known as Ascot Priory. The St Thomas's sisterhood at Oxford commenced in 1847; and the present mother-superior of the Holy Trinity Convent at Oxford, Marian Hughes, dedicated herself before witnesses to such a life as early as 1841 (Liddon's *Life of Dr Pusey*, ii.). English sisterhoods stand together as the largest: those of Clewer, Wantage, All Saints and East Grinstead; and the work of the first may stand as a specimen of that of others. The "Community of St John the Baptist" at Clewer, near Windsor, arose in 1849 through the efforts of Mrs Tennant and the vicar, afterwards warden of the society, the Rev. T. T. Carter, to save fallen women. Under the first superior, Harriet Monsell, the numbers grew apace, and are now above 200. Their services to society and the Church include 6 houses for fallen women, 7 orphanages, 9 elementary and high schools and colleges, 5 hospitals, mission work in 13 parishes and visiting in several "married quarters" of barracks. Many of these are important institutions, and the buildings and property of the settlements are in India and two in the United States. A list of 26 sisterhoods is given in the *Official Year-Book of the C.E. (1890)*, to which may be added the following societies and acts of deeds, many of whom live in common life under rule. The Episcopal Church in America, and other churches has 9 sisters; and they are found also at Toronto, "Saint John the Divine"; Brisbane, "Sacred Advent"; Grahamstown, "Resurrection"; Bloemfontein, "St Michael and All Angels"; Martinique, "Saint John the Divine". The *Year-Book* (1911) of the Protestant Episcopal Church of America (Anglican) mentions 18 American sisterhoods and 7 deaconesses homes and training colleges.

Practically all Anglican sisterhoods originated in works of mercy, and this fact largely accounts for their popularity with which they have won their way to the good will and confidence of the Church. Their number is believed to exceed 3000, and the demand for their services is greater than the supply. Bishops are often their visitors, and Church Convocations, Convocation and Lambeth Conferences have given them encouragement and regulation. This change in sympathy, again, has gained a hearing from modern historians, who tend more and more to discredit the wholesale degradation of the dissolution period. This charitable activity, however, distinguishes the modern sister from the nun of the middle ages, and makes the times, when she is semi-temporal, and left external works to deaconesses, or to laywomen of a "third order," or to the friar societies like the Beguines. St Vincent de Paul is considered to have begun the new era with his institution of "Sisters of Charity" in 1634. Another modern feature is the fuller recognition of family ties: Rule 29 of the Clewer sisters directs that "the sisters shall have free intercourse with relations, who may visit them at any time." But in most essential respects modern sisterhoods follow the ancient traditions. They devote themselves to the celibate life, have property in common, and observe a common rule of prayer, fellowship and work. Government is by a sister superior, assisted by various officers. The warden and chaplain are clergy, and the visitor is commonly a bishop. In one important regard there has been hesitation, and authorities like Dr Littledale and Bishop Grafton contend strongly for the primitive ideal of the convent as family, with a constitutional government, as against the later and widespread Jesuit ideal of the convent as regiment, with a theory of despotic rule and absolute obedience. If some early mistakes in the restoration of sisterhoods were due to this exaggerated doctrine of obedience, the doctrine itself may be trusted to discern the proper applications to people accustomed to free institutions and to respect for individuality.

SISTOVA (Bulg. *Svishtov*), the capital of the department of Sistova, Bulgaria, on the right bank of the Danube, 40 m. W.
of Rustchuk. Pop. (1906), 13,408. Despite the lack of railway communication, and the migration of the Turkish inhabitants after the Russo-Turkish War (1877-1878), Sistova is an important commercial centre, exporting wine and grain and importing petroleum.

Sistova is identified with the Roman colony Novae mentioned by Ptolemy. The exact site appears to have been Staklen, to the west of the present town, which has gradually moved eastward since the 16th century, when it was almost destroyed by the Turks. The site was at Sistova that the peace of 1790 was signed, by which the Austrian-Turkish boundary was determined. The town was burned in 1810 by the Russians; but after 1850 it began to revive, and the introduction of steam traffic on the lower Danube (1835) restored its prosperity. The Walachian town of Alexandria was founded by fugitives from Sistova in 1878.

SISTRUM (Gr. σίστρον, Ger. Kapell), an ancient Egyptian instrument of percussion of indefinite musical pitch, a kind of metal rattle. The sistrum consists of a metal frame in the shape of an egg, fastened to a handle, frequently surmounted by a pyramid-shaped or by a figure of the sacred lioness Sekhmet. The frame is crossed by four metal horizontal rods passing through holes large enough to allow them to rattle when the sistrum is shaken, the rods being prevented from slipping out altogether by little metal stops in the shape of a leaf; sometimes metal rings are threaded over the rods to increase the jingling. The sistrum is played also by beating it with a metal stick. This ancient instrument was extensively used by the priests in the temple of Isis to attract the attention of worshippers to different parts of the ritual. The Egyptians attributed to it, as well as to the tambourine, the power of dispersing and terrifying evil spirits and more especially the Typhon, Queen Cleopatra's made use of a large number of sistra at the battle of Actium (31 B.C.), and accordingly the instrument was satirically called Queen Cleopatra's war trumpet. (K. S.)

SISYPHUS, in Greek mythology, son of Aeolus and Enarete, and king of Ephyra (Corinth). He was the father of the sea-god Glaucus and (in post-Homeric legend) of Odysseus. He was said to have founded the Isthmian games in honour of Melicertes, whose body he found lying on the shore of the Isthmus of Corinth (Apollodorus ii. 4). He promoted navigation and commerce, but was avenged by a figure of the god in a full-scale chariot race and so was famed as the craftiest of men. When Death came to fetch him, Sisyphus put him into fetters, so that no one died till Ares came and freed Death, and delivered Sisyphus into his custody. But Sisyphus was not yet at the end of his resources. For before he died he told his wife that when he was gone she was not to offer the usual sacrifice to the dead. So in the under world he complained that his wife was neglecting her duty, and he persuaded Hades to allow him to go back to the upper world and expostulate with her. But when he got back to Corinth he positively refused to return, until forcibly carried off by Hermes (Schol. on Pindar, Ol. i. 97). In the under world Sisyphus was compelled to roll a big stone up a steep hill; but before it reached the top of the hill the stone always rolled down, and Sisyphus had to begin all over again (Odyssey, xi. 593). The reason for this punishment is not mentioned in Homer, and is obscure; according to some, he had revealed the designs of the gods to mortals, according to others, he was in the habit of attacking and murdering travellers. The subject was a commonplace of ancient writers, and was depicted by the painter Polygnotus on the walls of the Lesche at Delphi (Pausanias x. 31). According to the solar theory, Sisyphus is the disk of the sun that rises every day and then sinks below the horizon. Others see in him a personification of the waves rising to a height and then suddenly falling, or of the treacherous sea. It is suggested by Welcker that the legend is symbolic of the vain struggle of man in the pursuit of knowledge. The name Sisyphus is generally explained as a reduplicated form of σύφων ("the very wise"); Gruppe, however, thinks it may be connected with σιφώς ("a goat's skin"), the reference being to a rain-charm in which goats' skins were used. S. Reimach (Revue archéologique, 1904) finds the origin of the story in a picture, in which Sisyphus was represented rolling a huge stone up Acrocorinthus, symbolical of the labour and skill involved in the building of the Sisyphum. When a distinction was made between the souls in the under world, Sisyphus was supposed to be rolling up the stone perpetually as a punishment for some offence committed on earth; and various reasons were invented to account for it.

The way in which Sisyphus cheated Death is not unique in folk-tales. Thus in a Venetian story the ingenious Beppo ties up Death in a bag and keeps him there for eighteen months; there is general belief that nobody dies, and the doctors are in high feather. In a Sicilian story an innkeeper corpses up Death in a bottle; so nobody dies for years, and the long white beards are a sight to see. In another Sicilian story a monk keeps Death in his pouch for forty years (T. F. Crane, Italian Popular Tales, 1885). The German parallel is Gambling Hansel, who kept Death up a tree for seven years, during which no one died (Grimm, Household Tales). The Norse parallel is the tale of the Master Smith (E. W. Dasset, Popular Tales from the Norse). For a Lithuanian parallel see A. Schleicher, Litauische Märchen, Sprichworte, Rätel und Lieder (1857); for Slavonic parallels, F. S. Krause, Sagen und Märchen der Südslaven, ii. Nos. 125-129. Further also Frazer, Golden Bough, iii. p. 33; O. Gruppe, Griechische Mythologie (1906), ii. p. 1021, note 2.

SITAPUR, a town and district of British India in the Lucknow division of the United Provinces. The town is on the river Sarayen, half-way between Lucknow and Shahjahanpur, and on the Lucknow-Bareilly railway, 55 m. N.W. from Lucknow. Pop. (1901) 22,557. It is a cantonment, garrisoned by a portion of a British regiment. It has a considerable trade, principally in grain.

The District of Sitapur has an area of 2930 sq. m. It presents the appearance of a vast plain, sloping imperceptibly from an elevation of 500 ft. above sea-level in the north-west to 400 ft. in the south-east. The country is well-wooded with numerous groves, and well cultivated, except in those parts where the soil is barren and cut up by ravines. It is intersected by numerous streams, and contains many shallow ponds and natural reservoirs, which overflow during the rains, but become dry in the hot season. Except in the eastern portion, which lies in the doabs between the Kewani and Chauka and the Gogra and Chauka rivers, the soil is as a rule dry, but even this moist tract is interspersed with patches of land covered with saline efflorescence called reb. The principal rivers are the Gogra, traversed navigably by boats of large toneage throughout the year, and the Chauka. The climate is considered healthy, and the cantonments of Sitapur are famous for the low mortality of the British troops stationed there. The annual rainfall averages about 38 in.

In 1901 the population was 1,175,473, showing an increase of 9% in the decade. The principal crops are wheat, rice, pulses, millets, barley, sugar-cane and poppy. The district is traversed by the Lucknow-Bareilly section of the Rohilkhand and Kumaon railway. The history of Sitapur is closely associated with that of the rest of Oudh. The district figured prominently in the Mutiny of 1857, when the native troops quarried in the cantonments fired on their officers, many of whom were killed, as were also several military and civil officers, with their families, in attempting to escape.

See Sitapur District Gazetteer (Allahabad, 1903).

SITKA (formerly New Archangel), a city and historically the most notable settlement of Alaska, on the W. coast of Baranof Island, in Sitka Sound, in lat. 57° 43' N. and long. 135° 10' W. (from Greenwich), and about 100 m. S.S.W. of Juneau. Pop. (1890) 1193 (300 white and 893 natives); (1900) 1306. It is served by steamer from Seattle, Washington; there is a daily mail service from Pacific ports, via Juneau. The city is prettily situated on an island-studded and mountain-locked harbour, with a background of forest and snow-capped mountain cones; an extinct volcano, Mt Edgecumbe (3467 ft.), on Kruzof Island, is a conspicuous landmark in the bay. Sitka's mean annual temperature is 2° higher than that of Ottawa, and its climate is more equable. The mean annual temperature is about 43° F.; the
monthly means range from 35° (January) to 50° (August), and the extreme recorded temperature from −4° to 87° F. Two-thirds of the days of the year are cloudy; on about 208 days in the year it rains or snows; the normal rainfall is 85.1 in., the extreme recorded rainfall (in 1886) is 140.26 in. The city includes an American settlement and an adjoining Indian village. In addition to U.S. government buildings (marine hospital and lighthouses, agricultural experiment station, wireless telegraph station and magnetic observatory), there are two public schools (one for whites and one for Thilkinets), the Sheldon Jackson (ethnological) Museum, which is connected with the Presbyterian Industrial Training School, a parochial school of the Orthodox Greek (Russian) Church, a Russian-Greek Church, built in 1816, and St Peter's-by-the-Sea, a Protestant Episcopal mission, built in 1809. Sitka is the see of a Greek Catholic and of a Protestant Episcopal bishop. In its early history it was the leading trading post of Alaska. After the discoveries of gold in the last decade of the 19th century it wholly lost its commercial prosperity, but business improved after the discovery of gold in 1905 on Chicago Island, about 50 m. distant. There is a very slight lumber industry; salmon fisheries are of greater importance. In the surrounding region there are gold and silver mines.

Old Sitka or Fort Archangel Gabriel, about 6 m. from the present town, was founded in May 1790. The fort was overwhelmed by the Thilkinets in 1802, but was recaptured by the Russians in September 1804. The settlement was removed at this time by Alexander Baranof to the present site. Thereafter until 1867 it was the chief port and (succeeding Kodiak) the seat of government of Russian America. In 1806, the first and leading of the Assistant Orthodox Greek bishop of the United States. The formal transfer of Alaska from Russian to American possession took place at Sitka on the 15th of October 1867. During the next ten years Alaska was governed by the department of war, and Sitka was an army post. It was the seat of government of Alaska until 1906, when Juneau became the capital.

SITTINGBOURNE, a market town in the Faversham parliamentary division of Kent, England, on a navigable creek of the Swale, 44° 43' E.E. of London by the South Eastern and Chatham railway. Pop. of urban district (1901) 9493. It contains principally of one long street (the Roman Watling Street) and the northern suburb of Milton, a separate urban district (pop. 7056), celebrated for its oysters, the fishery of which employed a large number of the inhabitants. Brick and cement making is an important industry, and there are corn and paper mills. The export trade in corn and import trade in coal is considerable. St Michael’s church, originally Early English, underwent extensive restoration in 1873. An earthwork known as Castle Rough, in the marshes below Milton, was probably the work of Hasten the Dane in 862, and Bayford Castle, a mile distant, occupies the site of one said to have been built in opposition by King Alfred. Tong Castle is about 2 m. E. of Sittingbourne. It consists of a high mound surrounded by a moat, and is said to have been erected by Hengest. Fragments of masonry exist about the mound. The story of the founding of the castle resembles that connected with the city of Carthage. Vortigern is said to have granted Hengest as much land as an ox-hide could encompass, and the hide being cut into strips the site of Tong Castle was accordingly marked out. The same tradition attaches to Tong Castle in Shropshire. Tradition also asserts, according to the 12th century chronicler, Geoffrey of Monmouth, that it was in Tong Castle that Vortigern met Rowena, Hengest’s daughter, and became so enamoured of her as to resign his kingdom to her father. In the time of Richard II. Tong Castle belonged to Edmund Mortimer, earl of March.

Sittingbourne (Sundegborea, Sidengbourn) is mentioned in Saxon documents in 898 and frequently in contemporary records of the 13th and 14th centuries. The first charter was not obtained until 1573, when it was incorporated by Elizabeth under the title of a “guardian and free tenants” of the town of Sittingbourne. A weekly market was granted, two fairs yearly at Whitstuncliffe and Michaelmas, and many other privileges. This charter obtained until in 1599 a second one incorporated the town by the name of “mayor and jurats” and regranted the market and fairs together with some additional privileges, among others that of returning members to parliament, which, however, was never exercised.

SITTING BULL (c. 1837–1890), a chief and medicine man of the Dakota Sioux, was born on Willow Creek in what is now North Dakota about 1837, son of a chief named Jumping Bull. He gained great influence among the reckless and unruly young Indians, and during the Civil War led attacks on white settlements in Iowa and Minnesota. Though he had pretended to make peace in 1866, from 1869 to 1876 he frequently attacked whites or Indians friendly to whites. His refusal to return to the reservation in 1876, led to the campaign in which General George A. Custer (q.v.) and his command were massacred. Fearing punishment for his participation in the massacre, Sitting Bull with a large band moved over into Canada. He returned to the United States in 1881, and after 1883 made his home at the Standing Rock Agency. Rumours of a coming Indian Messiah who should sweep away the whites, and Indian dissatisfaction at the sale of their lands, created such great unrest in Dakota in 1889–1890 that it was determined to arrest Sitting Bull as a precaution. He was surprised and captured by Indian police and soldiers on Grand river on the 15th of December 1890, and was killed while his companions were attempting to rescue him.

SIVA, in Hindu mythology, a god who forms the supreme trinity with Brahma and Vishnu. As Brahma is the creator and Vishnu the preserver, so Siva is the destroyer. His name does not occur in the Vedas, but in later Hinduism he became an important divinity. Though Siva’s personal appearance is fully described in the Puranas, it is in the form of the linga (phallic emblem) that he is almost universally worshipped. Death being a transition to a new form of life, the destroyer is really a re-creator, and thus Siva is styled the Bright or Happy One. He is exclusively a post-Vedic god, though he has been identified by the Hindus with the Rudra of the Vedas, and numerous features of Siva’s character and history are developed from those of Rudra. See further BRAHMANISM and HINDUISM.

SIVAJI (1627–1680), a political figure, a genius and statesman, is the hero of the Marathas and the hero of the Maratha war. On his return from a pilgrimage to the shrine of Kailash-viewed as the holy grail of the Marathas—he became the leader of the Maratha nation. He fought against the Mughals and the Nizam of the Deccan, and in 1876, with the help of the Nizam of the Deccan, he defeated the Mughals. He was rewarded with the title of Raja, and his rule was acknowledged by the Mughals. He was succeeded by his son, Agra Khan, who ruled until 1879. See Grant Duff, History of the Marathas (1826); Krishnaji Ananta, Life and Exploits of Sivaji (1884); and M. G. Ranade, Rise of the Maratha Power (Bombay, 1900).
SIVAS—SIWALIK HILLS

SIVAS, one of the largest and most important vilayets of Asia Minor, lying between 38° 30' and 41° N. and 35° 30' and 39° E. It is rich in mineral wealth—silver, lead, copper, iron, manganese, arsenic, alum, salt and coal; and has several hot and cold mineral springs, and large forests of fir, pine, beech and oak. The climate is good, the average elevation of the province being over 3500 ft., and the soil fertile. Wheat and barley are largely grown upon the plateau, and in the lower districts there are extensive fruit orchards and vineyards. The port of the vilayet is Samsun (q.v.), whence a chaussee runs through Amasia, Tokat, and Sivas to Kharpum; but Sivas is also connected by road with the minor Black Sea ports, Unieh, Ordu and Kersusand. The rates for transport are, however, prohibitive. Angora is the nearest railway point.

Sivas (anc. Megalopolis-Sebaste), altitude 4420 ft., is also the name of the chief town of the vilayet (and of a sanjak of the same name). It is situated in the broad valley of the Kazil Irmak, on one of its right bank tributaries, the Murdan Su, pop. over 43,000, fully two-thirds Musulman. The climate is healthy but severe in winter. Coarse cotton cloth and woollen socks are manufactured. The medresses (colleges), built in the 15th century by the Seljuk sultans of Rum, are amongst the finest remains of Moelem art in Asia Minor. In one of them is the tomb of its founder, Izz ud-din Kai Huseis (1210-1230). Near the town is the Armenian monastery of the Holy Cross, in which are kept the throne of Senehkimor and other relics. There are several Armenian churches of interest, a flourishing American mission with church and schools, and a Jesuit mission. Under Diocletian Sebastea became the capital of Armenia Minor, and in the 7th century that of the Sebastea Theme. Justinian rebuilt the walls and, under the Byzantine emperors, it was second only to Caesarea in size and wealth. In 1021 Senehkimor, king of the Armenian province of Vaspuragan (Van), ceded his dominions to Basili II., and became the Byzantine viceroy of Sebastea and the surrounding country. This position was held by his successors until the town fell into the hands of the Turkomans after the defeat of Romans II. by the Seljuk (1071). After having been ruled for nearly a century by the Danishmend amirs, it was taken (1172) by the Seljuk sultan of Rum, and in 1224 was rebuilt by Sultan Ala-ed-din Kalkobab I. In 1400, when captured by Timur, the city is said to have had 100,000 inhabitants, and to have been famous for its woolen stuffs. On this occasion the bravest defenders were massacred, and 4000 Armenians were buried alive. Mahmmed the "Conqueror" restored the citadel, and the place has ever since been an important Ottoman provincial capital. Early in the 15th century, like all other Ottoman towns, it was terrorized by janissaries, with whom Mahmut II. commissioned the great Dere Bey of Yuzgat, Chapan Oglu, to deal in 1184. The news of his drastic success provoked a dangerous riot in Stamoul, which postponed by some years the final tragedy of the janissaries. From 1880 to 1882 Sivas was the residence of the British military consul-general for Asia Minor; but it has now only an American vice-consulate. Metchitar, the founder of the Metcharithists (q.v.) and of the famous monastery at Venice, was born (1706) at Sivas. (C. W. W., D. G. H.)

SIVORI, ERNESTO CAMILLO (1851-1911) Italian violinist, was born at Genoa on the 25th of October 1815, and was taught by Restano, Paganini, Costa and Dellepiane. His talent was extraordinarily precocious. From 1872 Sivori began the career of a travelling virtuoso, which lasted almost without interruption until 1864. He played Mendelssohn's concertino for the first time in England, in 1846, and was in England again in the seasons of 1851 and 1864. He lived for many years in Paris, and died at Genoa on the 18th of February 1894.

SIVRI-HISSAR, "Pointed-Castle," a town of Asia Minor, in the Angora vilayet, situated 8 m. N. of the site of Pessinus, at the foot of a lofty double-peakd ridge of rock, which bears the ruins of a Byzantine castle. It is a road and commercial centre, with a trade in opium and mohair. The population includes a large Armenian community. The town occupies the site of ancient Palaia, re-founded and re-named Justinianopolis by the emperor Justinian. It was one of the chain of fortresses on the Byzantine military road across Asia Minor, and became the chief city of Galatia Salutaris about A.D. 700, succeeding to the heritage of Pessinus, whose metropolitan transferred his seat to the new capital, and held the title of "archbishop of Pessinus or of Justinianopolis."

SIWA, an oasis in the Libyan Desert, politically part of Egypt. It is also known as the oasis of Ammon or Jupiter Ammon; its ancient Egyptian name was Sekhet-em, "Palm-land." The oasis lies about 35° m. W.S.W. of Cairo, its chief town, also called Siwa, being situated in 29° 12' N., 25° 30' E. The oasis is 5 m. long by 4 to 6 wide. Ten miles north-east of the small oasis of Zetoun and westward of Siwa extends for some 50 m. a chain of little oases. The population of Siwa proper (1907 census) was 3884. The inhabitants are of Libyan (Berber) stock with a language of their own, but also speak Arabic. The oasis is extremely fertile and contains many thousands of date palms. The town of Siwa is built on two rocks and resembles a fortress. The houses are frequently built on arches spanning the streets, which are narrow and irregular.

The oasis is famous as containing the oracle temple of Ammon, which was already famous in the time of Herodotus, and was consulted by Alexander the Great. The remains of the temple are in the walled village of Aghorni, 2 m. E. of the town of Siwa. It is a small building, with inscriptions dating from the 4th century B.C. The oracle fell into disrepute during the Roman occupation of Egypt, and was reported dumb by Pausanias, c. A.D. 160. Siwa was afterwards used as a place of banishment for criminals and political offenders. After the Mahomedan conquest of Egypt Siwa became independent and so remained until conquered by Mehmet Ali in 1820. It is now governed by its own sheikhs under the supervision of an Egyptian marabout responsible to the mufti of Behena.

Siwa contains many relics of antiquity besides the ruins of the temple of Ammon. Near that temple are the scanty remains of another temple of the same century, Umm Beda, with relics depicting the prince of the oasis making offerings to Ammon, "lord of oracles." At Jebel Mutta, 1 m. N.E. of Siwa, are tombs of Ptolemaic and Roman date; 10 m. E. of Aghorni is a well-preserved chapel, with Roman graves; at Kasr Rumi is a Doric temple of the Roman period.

The oasis lies close to the Tripolitan frontier and is largely dominated by the sect of the Senussi (q.v.), whose headquarters were formerly at Jarubul, 80 m. to the north-west. The Senussi successfully prevented various explorers penetrating westward beyond Siwa. The first European to reach the oasis since the time of W. G. Browne, who visited the oasis in 1792, was followed in 1798 by F. Horsemann. Both these travellers started from Cairo; in 1828 General H. Minutoli gained the oasis from the Gulf of Solum. In 1860 Gerhard Rohlfs reached Siwa via Tripoli, and subsequently the ruins were examined by Professor G. Stein dorff. After the occupation of Egypt by the British steps were taken to enforce the authority of the government in Siwa, where order proved difficult to maintain. There were serious disturbances in 1900, and as a result in 1910 a telegraph line was built across the desert from Alexandria to the oasis.

Silva White, From Sphinx to Oracle (London n.d., 1908); Murray's Handbook for Egypt (11th ed., London, 1907); T. B. Holker, Report on the Oasis of Siwa (Cairo, 1900); also the works of the earlier travellers named. (F. R. C.)

SIWALIK HILLS, a name given to the foot-hills of the Himalayas in Dehra Dun district of the United Provinces of India, and in Nahan state and Hoshapur district of the Punjab. The range runs parallel with the Himalayan system from Hardwar on the Ganges to the banks of the Beas, with a length of 200 m. and an average width of 10 m. The elevation varies from 200 to 3500 ft. Geologically speaking the Siwaliks belong to the tertiary deposits of the outer Himalayas, and are chiefly composed of low sandstone and conglomerate hills, the solidified and upheaved detritus of the great range in their rear. The intermediate valley lying between the outer hills and the Mussoorie
mountains is known as the Dehra Dun (or Dehra valley) and contains a considerable Eurasian colony and some British tea-planters. The principal pass is that of Mohan by which the main road from Saharanpur to Dehra and Mussoorie traverses the range. The Siwalik formation (distinguished for its extraordinary wealth of palaeontological remains) is found on the North-West Frontier occupying much the same position relatively to the Suliman range as it does to the Himalayas, i.e., it faces the plains and becomes the base wall of the hills.

SIWARD (d. 1055), earl of Northumbria, was a Dane by birth and probably came to England with Canute. He became earl of Deira after the death of Eadwulf Cuthel, earl of Northumbria, about 1038, and earl of all Northumbria after murdering Eadwulf, earl of Bernicia, in 1041. He supported Edward the Confessor in his quarrel with Earl Godwine in 1051, and was appointed earl of Huntingdon soon after this date. In 1054 Siward invaded Scotland in the interests of his kinsman Malcolm Canmore, and he completely routed King Macbeth in a battle in which his son Osbern was killed. Early in 1055 the earl died at York. Shakespeare introduces Siward and his son, whom he calls young Siward, into the tragedy of Macbeth, and represents the old man as saying when he heard that his son's wounds were in front, "Had I as many sons as I have hairs, I would not wish them to a fairer death," Siward, a man of unusual strength and size, is said to have risen from his bed at the approach of death, and to have died dressed in all his armour. He built a minster near York which he dedicated to St Olaf, and where he was buried; and one of his sons was Earl Waltheof.

See T. G. D'Esmond, The Norman Conquest, vols. ii. and iii. (1870-1876); and W. F. Skene, Celtic Scotland (1876-1880).

SIXTUS, the name of five popes.

SIXTUS I. (Xystus) was the sixth bishop of Rome (c. 116-118) and took the name on that account. SIXTUS II., successor of Stephanus I. as bishop of Rome in 237, suffered martyrdom under Valerian on the 6th of August 258. He restored the relations with the African and Eastern Churches which had been broken off by his predecessor on the question of heretical baptism, of which in consequence he is distinguished.

SIXTUS III. was bishop of Rome from the 31st of July 432 to the 10th of August 440. Before his elevation to the pontificate he had been suspected of favouring the Pelagians, but when he became pope he disappointed their expectations, and repelled their attempts to enter again into communion with the Church. During his pontificate the dispute was settled between Cyril of Alexandria and John of Antioch, who had been at variance since the council of Ephesus, but he himself had some difficulties with Proculus of Constantinople with regard to the vicariate of Thessalonica. (L. D.*).

See also Della C. R., "The reform pope from the 30th of August 1471 to the 12th of August 1484, was born of a poor family near Savona in 1414. He entered the Franciscan order at an early age and studied philosophy and theology at the universities of Padua and Bologna. He speedily acquired a great reputation as an eloquent preacher, and, after filling the offices of procurator at Rome and provincial of Liguria, he was chosen general of his order in 1454. Three years later he, to his own surprise, made cardinal-priest of St Peter in Vincelli by Paul II., whom he succeeded as pope. Some writers have maintained that this sudden elevation of the most recent member of the Sacred College was due to bribery in the conclave, whilst the apologists of Sixtus affirm it was due to the friendship of the powerful and upright Cardinal Bessarion, and explain that the pope, having been brought up in a mendicant order, was inexperienced and did not appreciate the liberality of his donations after his election. There is no doubt that the expenditures of his pontificate were prodigious. Sixtus sent Cardinal Caraffa with a fleet against the Turks, but the expedition was unsuccessful. He continued to condemn the Pragmatic Sanction in France, and denounced especially the ordinance of Louis XI. which required (9th of January 1475) the royal placet for the publication of all papal decrees. He likewise continued his predecessor's negotiations with the Tsar Ivan III. for the reunion of the Russian Church with the Roman see and for support against the Turks, but without result. He was visited in 1474 by King Christian of Denmark and Norway, and in the following year (12th of June) he established the university of Copenhagen. Sixtus soon abandoned his universal policy in order to concentrate attention on Italian politics, and the admiral military which he had shown at first was clouded by the favours which he now held upon those worthy relations. Not content with enriching them with gifts and high offices, he made their aggrandizement the principal object of his policy as a secular prince. Sixtus was cognizant of the conspiracy of the Pazzi, plotted (1478) by his nephew, Cardinal Riario, against Lorenzo de' Medici. He entered into a fruitless and inglorious war with Florence, which kept Italy for two years (1478-80) in confusion. He next incited the Venetians to attack Ferrara, and then, after having been delivered by their general, Roberto Malatesta, from a Neapolitan invasion, he turned upon them and eventually assailed them for refusing to desist from the hostilities which he had himself instigated. He relied on the co-operation of Lodovico Sforza, who speedily forsook him, and vexation at having peace forced upon him by the princes and cities of Italy is said to have hastened his death. Several events of his pontificate are noteworthy: he granted many privileges to the mendicant orders, especially to the Franciscans; he endeavoured to suppress abuses in the Spanish Inquisition; he took measures against the Waldenses; he approved (1475) the office of the Immaculate Conception for the 8th of December; in 1478 he formally annulled the decrees of the council of Constance; and he canonized St Bonaventure (14th of April 1482). The success of his pontificate is ascribed to his ordination as a founder or restorer of useful institutions, and a patron of letters and art. He established and richly endowed the first founding hospital, built and repaired numerous churches, constructed the Sistine Chapel and the Sistine Bridge, improved church music and instituted the famous Sistine choir, commissioned paintings on the largest scale, pensioned men of learning, and, above all, immortalized himself as the second founder of the Vatican library. These great works, however, were not accomplished without violent taxation. Annates were increased and simony flourished. Though himself pious, of blameless morality, hospitalable to a fault, and so exempt from avarice, says his secretary Conti, that he could not endure the sight of money, it was Sixtus's misfortune to have had no natural outlet for strong affections except unworthy relatives; and his great vices were nepotism, ambition and extravagance. He died on the 12th of August 1484, and was succeeded by Innocent VIII.
Fius V., who made him apostolic vicar of his order, and, later (1570), cardinal. During the pontificate of Gregory XIII. he lived in retirement, occupied with the care of his villa and with his studies, one of the fruits of which was an edition of the works of Ambrose; not neglecting, however, to follow the course of affairs, but carefully avoiding every occasion of offence. This discreetness contributed not a little to his election to the papacy on the 24th of April 1585; but the story of his having feigned decrepitude in the Conclave, in order to win votes, is a pure invention. One of the things that commended his candidacy to certain cardinals was his physical vigour, which seemed to promise a long pontificate.

The terrible condition in which Gregory XIII. had left the ecclesiastical states called for prompt and stern measures. Against the prevailing lawlessness Sixtus proceeded with an almost ferocious severity, which only extreme necessity could justify. Thousands of brigands were brought to justice: within a short time the country was again quiet and safe. Sixtus next set to work to repair the finances. By the sale of offices, the establishment of new "Monti" and by levying new taxes, he accumulated a vast surplus, which he stored up against contingencies, such as the campaigns of the house of Austria in the defence of the Holy See. Sixtus prided himself upon his hoard, but the method by which it had been amassed was financially unsound: some of the taxes proved ruinous, and the withdrawal of so much money from circulation could not fail to cause distress. Immense sums, however, were spent upon public works. Sixtus set no limit to his plans; and what he achieved in his short pontificate is almost incredible: the completion of the dome of St Peter's; the loggia of Sixtus in the Lateran; the chapel of the Præsepe in Sta Maria Maggiore; additions or repairs to the Quirinal, Lateran and Vatican palaces; the erection of four obelisks, including that in the piazza of St Peter's; the opening of six streets; the restoration of the aqueduct of Severus ("Acqua Felice"); besides numerous roads and bridges, an attempt to drain the Pontine marshes, and the encouragement of agriculture and manufacture. But Sixtus had no appreciation of antiquity: the columns of Trajan and Antoninus were made to serve as pedestals for the statues of SS Peter and Paul; the Minerva of the Capitol was converted into "Christian Rome"; the Septizonium of Severus was demolished for its building materials.

The administrative system of the church owed much to Sixtus. He limited the College of Cardinals to seventy; and doubled the number of the Chaplains, and transferred their functions, assigning to them the principal rôle in the transaction of business. (1588). The Jesuits Sixtus regarded with disfavour and suspicion. He meditated radical changes in their constitution, but death prevented the execution of his purpose. In 1589 was begun a revision of the Vulgate, the so-called Editio Sixtina.

In his later political relations Sixtus, strangely enough, showed himself visionary and vacillating. He entertained fantastic ambitions, such as the annihilation of the Turks, the conquest of Egypt, the transporting of the Holy Sepulchre to Italy, the accession of his nephew to the throne of France. The situation in which he found himself was embarrassing: he could not countenance the designs of heretical princes, and yet he distrusted Philip II. and viewed with apprehension any extension of his power. So, while he excommunicated Henry of Navarre, and contributed to the League and the Armada, he chafed under his forced alliance with Philip, and looked about for escape. The victories of Henry and the prospect of his conversion to Catholicism raised Sixtus's hopes, and in corresponding degree determined Philip to tighten his grip upon his wavering ally. The pope's negotiations with Henry's representative evoked a bitter and menacing protest and a categorical demand for the performance of promises. Sixtus took refuge in evasion, and temporized until death dicked him of the necessity of coming to a decision (27th of August 1590).

Sixtus died execrated by his own subjects; but posthernity has recognized in him one of the greatest popes. He was impulsive, obstinate, severe, autocratic; but his mind was open to large ideas, and he threw himself into his undertakings with an energy and determination that often compelled success. Few popes can boast of greater enterprise or larger achievements.

Lives of Sixtus are numerous: Cicarella's, in Platina, De vitis pontific. Rom., is by a contemporary of the pope, but nevertheless of slight importance; Letti's Vita di Sisto V. (Amsterdam, 1693, translated into English by Farnsworth, 1779) is a caricature, full of objectionable details, utterly inapprpriate, and inexplicable; Ranke's masterly portrayal, Popes (Eng. trans. by Austin), i. 446 sq. ii. 205 sq.; and v. Reumont, Gesch. der Stadt Rom, ii. 2, 575 sq., 733 sq. Extended bibliographies may be found in Herzog-Hauck, Realencyklopädie, s.v. "Sixtus V."

SIZAR, one of a class of students at a college of Cambridge University and at Trinity College, Dublin, who, being persons of limited means, are received for lower fees, and obtain free commons, lodgings or other assistance towards their education during their terms of residence. At Oxford there was formerly a similar class, known as "Battlers" or "Battlers," who originally waited on the Fellow of the College who had nominated them, and a still more humble class, the "servitors," who, perhaps, answered more to a "sub-sizar" at Cambridge. The name "sizar" is to be connected with the "sizors" or "sizings" ("sizer" being a shortened form of "assize"), that is the specified portions of food and drink issued at a fixed price from the buttery of the college; the sizer was so styled either because one of his ordinary duties he had to fetch the "sizers" for others, or because he obtained his own free. The menial duties of "sizars" at Cambridge have long become obsolete.

SIZE, a general term for bulk or quantity; also an agglutinant consisting of undried glue. The two words, though they are so widely separate in meaning, are by etymology the same. "Size" (Lat. assidere, to sit down to) is a shortened form of "assize," through the French and Italian respectively. The O. Fr. assis, assise, and Eng. "assize," meant a sitting of a deliberative or other body; hence decree, ordinance of such a body; and such words as assizes of justice, assize prices, thus it came to be used in a standard of measure price, quantity thus fixed, and so merely quantity or measure, in which sense it remains in the shortened form "size." In the sense of an agglutinant, "size" is an adaptation of Ital. sisa, a shortened form of assisa (Lat. assidere), and seems to have meant by derivation "that which painters use to make the colours stick well or suitably."

SKAGERRACK, the arm of the North Sea which gives access to the Cattegat and so to the Baltic. It is about 140 m. long and 73 broad. On the Danish shore, which is low and beset with sand-banks, the strait is shallow. Towards the steep Norwegian coast its deepest part is found, 443 fathoms.

For the currents, temperature and salinity of the water, &c., see North Sea.

SKAGWAY (a native name said to mean "home of the north wind"), a city in S.E. Alaska, in lat. 59° 28' N. and long. 135° 20' W., at the mouth of the river Skagway, on an indentation of Taiya Inlet, a branch of Chilkoot Inlet, leading out of Lynn Canal. Pop. (1900) 3177. It is the seaward terminus of the Yukon & White Pass railway, by which goods and passengers reach the Klondike; and is connected with Dawson by telegraph and with Seattle by cable, and with Seattle, San Francisco, and other Pacific ports by steamers. The climate is comparatively dry (annual precipitation about 27-75 in.); between 1888 and 1902 the minimum recorded temperature was 10° (March), the maximum 92° (July), and the greatest monthly range 73° (March). Though settled somewhat earlier, Skagway first became important during the rush in 1896 for the Klondike gold-fields, for which it is the most convenient entrance by the trail over White Pass, the lower of the two passes to the
headwaters of the Yukon. A post-office was established here in November 1897.

**SKARGA, PIOTR** (1532–1612), Polish writer and reformer, was born at Grojec near Warsaw in 1532. He was a member of the noble Powiscki family, by the pseudonym of Skarga (from "skarga" a "complaint" or "accusation") speedily superseded his real name. Educated at Grojec and Cracow, he began life as a tutor to the family of Andrew Tenczynski, castellan of Cracow, and, some years later, after a visit to Vienna, took orders, and from 1563 was attached to the cathedral church of Lemberg. His oratory was so successful that he determined to become a missionary-preacher among the people, in order to the better to combat the social and political evils of the day. By way of preparation he studied theology in Italy from 1568 to 1576, and finally entered the Society of Jesus. On his return he preached successively at Pultusk, Jaroslaw and Plock with the powerful protection of Queen Anna Jagiellonika. During a sub-

**SKATING** on ice with the aid of appliances called skates, attached to the sole of the shoe by straps, clamps or screws. The earliest form of skate that we know is that of the "borders" (still preserved in museums) worn by the primitive Norsemen. These were bound to the foot with thongs. The Norse sagas speak with pride of the national achievements in skating, and the early development of the art was due principally to the Norsemen. In the 12th century, and especially in Great Britain, skating was certainly a common sport in England in the 12th century, as is proved by an old translation of

The Wenzel or knaves occupy a peculiar position. They are not regarded as colour cards, but are essentially trumps and take all other trumps. The player sitting to the left of the dealer is "first hand," and if he himself intends to make a game, invites the others to declare theirs, or if he wishes to reserve all rights to himself, he declares "I have the lead," and then his next neighbour holds such cards as to give him no prospect of winning he passes, and his neighbour to the left has the right to offer a game. If he in his turn passes, then the first hand is at liberty to determine the game or declare "Ramsch" (see below). But if the first neighbour thinks he can risk a game, he offers one. If the first hand reserves this game (see above "I have the lead"), either because he intends to play it himself or to play a higher game, the second hand must go higher or pass, i.e. renounce a game, and then his neighbour to the left has the right to offer, and if he again passes and does not offer a higher game than that which the first hand intends to play, the latter determines the game to be played.

The usual games in skat are the following. First the simple colour game, which is, however, seldom played by skat enthusiasts. The player has here the right to take up the skat, and to determine the order of the game in which the cards will be played. If he does not declare a game which may not be lower in value than that of the game offered, though it may be higher.

Next to the colour game comes "tourne," the player turning up one of the skat cards, the suit of which becomes trumps. If a knave be turned up the player may make a game of the suit of "Solo," where the player declares which suit shall be trumps, and the suit remains intact. The highest is "sold," still higher than clubs, is "Grando." This game only the four knaves are trumps. If the hand playing Grando thinks he can make it, he declares open grando—i.e. shows his hand. If in open grando a single trick be lost, the player loses the game. If one of the players holds such cards as to enable him to force his opponents to take all the tricks, he can declare nullo. But here the game is lost if even a single trick falls to the player. In nullo, the knaves are regarded as colour, i.e. are not trumps. Nullo can be played open, if there is a fair probability of the player taking a single trick. Simple nullo counts higher than diamond solo; open nullo comes after clubs solo.

In Ramsch, which takes place when none of the players will risk a game, each player takes (as in whist) all the tricks he makes—but only knaves are trumps—and the loser is he who makes most points. The value of the individual cards given in figures is as follows. The seven, eight and nine count nothing, the knave counts 2, the queen 3, king 4, ten and ace 11 points. This gives 44 the value of the score. The score is played if the player gets one above the half of this sum, i.e. 61. The hand that does not make 30 is "Schneider," that is "cut," and "Schwarz" (black) is the cue. He does not make a single trick of clubs solo.

Skat is almost invariably played for money, and the calculation is made thus. Every game and every suit have a set value:

- Colour game: 3, 4, 5 and 6, according to the suits.
- Single trumps: 7, 8, 9
- Clubs solo: 10, 11, 12 and 16 (grando).

These figures are increased by the number of "matadores." Suppose a player of club solo holds all four knaves and the ace and ten of clubs, he has a game with 6 matadores. Matadores is accordingly men, the uninterrupted sequence, e.g. from the knave of clubs down to the seven of trumps. If the player has then all four knaves and all the cards of the trump suit in his hand (or in the skat), he has a game with 11 matadores. But if a single card is missing in the series, only 10 matadores will be declared. If, for instance, the knave of hearts is missing, the game in question has only 3 matadores. The number of matadores is added if the game is simply won, 2 if won with Schneider (cut), and 4 if the opponents are Schwarz (black). Thus, if a spade solo with 5 matadores is won with Schneider, the winner makes 5+2+11=17 points.

**SKATING** (Dutch schaats, a skate), a mode of progression on ice with the aid of appliances called skates, attached to the sole of the shoe by straps, clamps or screws. The earliest form of skate that we know is that of the "borders" (still preserved in museums) worn by the primitive Norsemen. These were bound to the foot with thongs. The Norse sagas speak with pride of the national achievements in skating, and the early development of the art was due principally to the Norsemen. In the 12th century, and especially in Great Britain, skating was certainly a common sport in England in the 12th century, as is proved by an old translation of
Fitz-Steven’s *Description of London*, published in 1810, in which the following words occur:—

When the great fenn or moore (which wattereth the walls of the city on the North side) is frozen, many young men play on the yece, ... amose tye bones to their feete and under their heles, and shoving themselves with a little picked staffe do slide as swiftlie as a birde flyeth in the aire or an arrow out of a cross-bow.

At what period the use of metal runners was introduced is unknown, but it was possibly not long after the introduction into northern Europe, in the 3rd century after Christ, of the art of working in iron. By the time of Charles II. skating had become popular, with the aristocracy as well as with the people, as is proved by entries in the diaries of Pepys and Evelyn.

Skating does not appear to have been known in America before its colonization by Europeans, though bone slides were used to a limited extent by certain Eskimo tribes.

The modern skate is in the form of a steel blade mounted upon a wood or metal base. In the old-fashioned skate the wooden base was strapped to the boot and kept firm by low spikes or screws that entered the sole. The next step in development was the “club-skate,” originally Canadian, a patent appliance adjusted by clamps to fit the sole. There are several varieties of club-skates still popular. They have a broad blade with slightly curved edge, and are more suitable for figure-skating than for speed. The best skaters now use skates fixed permanently to special skating-boots.

As in ancient times, skating is most practised by the Scandinavians, Finns, Dutch and British, to whom in modern days has been added the Canadians, and especially the Canadians and Americans. All these nations have central organizations which control skating, the British, founded in 1879, being the National Skating Association. The American, founded in 1884, is also called the National Skating Association, and generally co-operates with the Canadian Amateur Skating Association, founded in 1888.

**Speed Skating.**—Of the earliest skating races no records have been kept. That racing was a popular pastime in Holland two centuries and longer ago is proved by the numerous paintings of the time depicting racing scenes. In England the first skating matches were started by which Youngs of Mepal beat Thomson of Wimbledon, both men of the Fens, in the year 1814. The Fen country has remained the chief English home of skating, owing to the abundance of ice in that district, and most British champions have been Fensmen, notably the Smarts of Welney. In January 1823 the *Sporting Magazine* recorded the first amateur match, which was between teams of six gentlemen from March and Chatteris, Mr. Drake of Chatteris finishing first. In 1829 a year match took place for a silver bowl on the Mazza Lake, Hertfordshire, over a course 5 m. long, the winner being Mr. Blenkinsop. Racing, more or less intermittent, continued annually, than skaters generally triumphing. In 1854 appeared the celebrated William (“Turkey”) Smart, who, after defeating Larmen Register in that year, remained champion for more than a decade. His nephew George (“Fish”) Smart won the championship in 1878 and held it until 1889, only to relinquish it to his younger brother James. The first amateur championship of England was held in 1880 at Hendon, and was won by Mr. F. Norman, a Fen skater.

Owing to the great area of Canada and the northern United States, and the long and cold winter, the sport of skating is indulged in to a greater extent in North America than anywhere else, and local matches have been held for years in many places. Owing to the reputation of Charles June, who was considered to be the best American skater from 1838 for many years, his place of residence, Newburgh, N.Y., on the Hudson river, became the headquarters of American speed skating. This city also is the birthplace of the Donoghue family, who may be called the Smarts of America. The most noted members of this family were Mr. T. Donoghue and his two sons, Tira and J. F. Donoghue, each in his day the fastest skater in the world, Joseph Donoghue winning every event at the international championship meeting at Amsterdam in 1897. There is practically no professional skating in America.

Skating received a great impetus during the last decade of the 19th century, profiting both by the growing devotion of athletics and by increased facilities of communication, which led to international competitions and the institutions of skating clubs in Switzerland and elsewhere, especially those of Davos, St. Moritz and Grindelwald, where ice is available every winter. Although skating instruments are so simple, the evolution of the skate has advanced considerably, contributing to marked improvement in the skater’s skill. In speed-skating an epoch was marked, first, by the almost universal adoption of the Norwegian type of racing skate; and, secondly, by the institution in 1892, at an international congress held in Holland, of annual races for the championships of Europe and of the world.

The Norwegian skate, introduced and perfected (1887-1902) by Axel Paulsen and Harald Hagen, is constructed with a view to lightness, strength, and diminution of friction. The blade, of specially hardened steel, is set in a hollow horizontal tube of aluminium, and connected by similar vertical tubes with footplates riveted to a closely-fitting boot with thin leather sole. It is 16-17 1/4 in. long and 2-1/4 millimetres thick (i.e., 0.109-0.078 in.), the average employed for hard ice being 2 mm., often thinner towards the heel. This thickness is suitable for hard ice, but for softer ice 17 5/16 or 3 1/2 in. is preferable. The blade is flat on the ice throughout, except for an inch in front; this flatness distributes the weight, and with the extreme thinness of blade reduces friction to a minimum. The edges are right-angled and sharp.

The skater’s style has been modified. The blade, when planted on the ice with weight upon it, describes a nearly straight, the last few inches of which form the curve which the skater uses in skating. Hence the stroke of the best modern skaters is almost, if not entirely, on the inside edge, a gain in directness and speed, the outside edge being used for curves only. The length of stroke has tended to diminish. Compared with the 12-18 yards’ stroke attributed to the old English champion, W. “Turkey” Smart, which was partly on the outside edge, the modern racing stroke rarely exceeds 10 yds., and is usually nearer 6 or 8. Particular instances vary with conditions of ice, &c., but at St. Petersburg, in 1896, Land’s stroke in the 10,000 metre race averaged about 7 3/4 yds., that of P. Oestlund at Davos, in 1900, the same (for one lap, 8 yds.). J. F. Donoghue’s stride in 1891 was computed at about 6 yds. The general effect has been vastly increased speed, and a joint cause is the stricter training undergone before important races.

The races held annually since 1892-1893 for the championships of Europe and of the world, under the auspices of the International Skating Union, have assembled representatives from the skating countries of Europe and from America.

The perpetual cups for the shorter distances of 500, 1500 and 10,000 metres, and to obtain the title of champion a skater must win three races and finish in the fourth. In addition, each country, when possible, holds its own championship races.

In England races are still skated, with rare exceptions, on straight courses, with a sharp turn round a post or barrel, the distance prescribed for N.S.A. championships being 6 1/2 m. with three turns. The Continental and international system involves a course with straight sides and curved ends of such a radius that no slackening of speed is necessary. In both instances the competitors race two at a time on a double track, and the time test is used. Each skater must keep his own course, to prevent either from using the other as pace-maker or wind-shield. The international regulations (Eissportlauf-Ordnung) prescribe that, if a single track be used, the hindmost skater must keep at a minimum distance of 5 metres from the other, in pain of disqualification. The advantage of inner curve on a Continental course is given alternately, and a space left open between the tracks at one point for the skaters to cross.

The curves are skated with a step-over-step action, and the direction is varied. When right foot is brought across in front and set down on the inside edge, the left passing behind on the outside edge, and being in its turn set down on the outside edge in front. The strokes thus form a series of tangents to the curve, and are little shorter than in the straight. With a radius of 25 and 30 metres, as at Davos, the curves can be skated with safety at full speed.

The following are the average skating speed records at the principal distances:

See contemporary records in the Field, Outing, and other sporting journals, as well as the annual almanacs: A Bibliography of Skating, by F. W. Foster (London, 1898); Skating, in the Badminton Library (1892); Skating, in the Oval Series (1897); "Skating," article in the Encyclopedia of Sport (1893); Skating, in the Isthmian Library (1901); Skating, by W. T. Richardson (New York, 1903).

Figure Skating.—This variety of skating, as subjected to definite rules, is quite modern, having originated in the 19th century, though the cutting of figures on the ice was regarded as an accomplishment by skaters long before.

Although the "Edinburgh Skating Club," founded in 1842, is the oldest skating organization in Great Britain, the "Skating Club" of London, formed in 1830, is the most important, and for many years practically controlled figure skating. Many other important skating clubs have been established in Great Britain, for entrance into which a certain standard of proficiency is demanded. Figure skating championships are now held in many countries under the auspices of the national associations, the world's championship meeting being held by the International Skating Union.

In England great impetus has been given to figure skating by the multiplication of clubs (e.g., Wimborne, founded 1870, Thames Valley, Crystal Palace, &c.) in addition to the original "Skating Club" and those in Switzerland already mentioned; and from the construction of numerous artificial rinks, such as at Niagara and Prince's Clubs in London, as well as in St. Moritz and Davos, modern figures may be taught in a large extent. Sometimes, for entrance into which a certain standard of proficiency is demanded. Figure skating championships are now held in many countries under the auspices of the national associations, the world's championship meeting being held by the International Skating Union. In England great impetus has been given to figure skating by the multiplication of clubs (e.g., Wimborne, founded 1870, Thames Valley, Crystal Palace, &c.) in addition to the original "Skating Club" and those in Switzerland already mentioned; and from the construction of numerous artificial rinks, such as at Niagara and Prince's Clubs in London, as well as in St. Moritz and Davos, modern figures may be taught in a large extent. Sometimes, for entrance into which a certain standard of proficiency is demanded. Figure skating championships are now held in many countries under the auspices of the national associations, the world's championship meeting being held by the International Skating Union.

In the British style of figure skating, which is not recognized by the International Skating Union, the body is held as nearly as possible upright, the employed leg is kept straight, the unemployed leg carried behind, the arms hang loosely at the sides, and the head is turned in the direction of progress. In the so-called Anglo-Swiss style, affected by British skaters trained at Davos and St Moritz, the upright, almost rigid position is insisted on, even the unemployed leg being held straight. More latitude is allowed by the Continental school, though no definite rules of form have been laid down. The knee of the employed leg is slightly bent, and the unemployed leg is in constant action, being used to balance the body during the execution of the figures. The Continental is less difficult in execution than the British style, but its movements are less graceful. Grace, of course, is modified by the strictest exponents of the English school being the Davos and St Moritz skaters, while the Continental varies from the complete abandon of the French to the more restrained style of the Germans; Canadians cultivate also grape-vines and other two-footed figures. The essential features are, however, identical. Thus Englishmen consider of secondary importance the cross-cuts, continuous and hand-in-hand skating, though such figures are included in the 1st class test of the N.S.A., and devote themselves mainly to "combined figures." Combined figures have been defined as "symmetrical execution of a figure by one or more pairs of skaters." Originally known as the "skating club figures," they have been gradually developed, and in 1831 delegates from the principal clubs established a regular terminology. The ideal number of skaters for a combined figure is four, though sixes and eights are seen, one being chosen "caller" of the movement to be skated. Various sets of "calls" are arranged at the discretion of different clubs, and consist ordinarily of "turns" and "whirls." The N.S.A. offers a challenge shield for an annual competition in combined figure skating. There has, however, been a marked tendency towards unification of style, through Englishmen adopting Continental methods, rendered almost a necessity by the circumscribed area of artificial rinks. In 1901 the Figure Skating Club was established for this purpose, and its members attained such success that an English lady, Mrs Syers, gained the second place in the world's championship competition in 1902, and with her husband won the International Pair Skating in that year, and again in 1904; and in 1906 she won the ladies' amateur championship of the world, established in the same year.

The World's Figure Skating Championship was won in 1896 by Fuchs, Austria; 1897, G. Hügel, Austria; 1898, H. Grenander, Sweden; 1899 and 1900, G. Hügel, Austria; 1901, 1902, 1903, 1904, U. Salchow, Sweden. The competition consists of two parts, (a) compulsory figures, (b) free skating, the latter affording scope for the performance of dance steps and brilliant individual figures, such as the "sitting pirouette," and the "star," consisting of four crosses (forward, back, loop, back counter), invented by Herr Engellmann and splendidly rendered by H. Fuchs.

The skates used for the English and Continental styles are shorter than those used for speed-skating, and differ in radius, though both are of the same type, i.e., a blade fastened to the boot by sole-plates, known as "Mount Charles," pattern being the one generally adopted by Englishmen. The English radius is 7 ft., or now usually 6 ft.; the foreign, 5½ or even 5 ft., and the result is seen in the larger curves skated on the former, and the greater pace obtained owing to decreased friction; at the same time, the difficulty of making a turn is greater. The English skate has generally right-angled edges and blade of same thickness throughout, except in the "Dowler" variety, which is thicker towards the extremities. The foreign skate is sometimes thicker in the middle than at the ends.

See Skating, in the Badminton Library (1892); Skating, in the Oval Series (1897); A System of Figure-Skating, by T. Maxwell Alexander (5th ed., 1897); On the Outside Edge, by Charles A. Reader (1897); Combined Figure-Skating, by George Wood (1890); Skating, in the Encyclopedia of Sport (1895); Handbook of Figure-Skating, by G. H. Brown (Springfield, Mass., 1900); Lessons in Skating, by G. A. Meagher (1900); Figure-Skating, by M. S. Monier-Williams, in the Isthmian Library (1901); How to become a Skater, by G. D. Phillips, in Spalding's Athletic Library, New York. See also ROLLER-SKATING.

SKEAT, WALTER WILLIAM (1853— ), English philologist, was born in London on the 21st of November 1853, and educated at King's College, Highgate, and Christ's College, Cambridge, in which he became a fellow in July 1860. In 1878 he was elected Ellington and Bosworth Professor of Anglo-Saxon at Cambridge. He completed Mitchell Kemble's edition of the Anglo-Saxon Gospels, and did much other work both in Anglo-Saxon and in Gothic, but is perhaps most generally known for his labours in Middle English, and for his standard editions of Chaucer and Piers Plowman (see LANGLAND). As he himself generously declared, he was at first mainly guided in the study of Chaucer by Henry Bradshaw, with whom he was to have participated in the edition of Chaucer planned in 1836 by the University, having declined in Bradshaw's favour an offer of the editorship made to himself. Bradshaw's perseverence was not equal to his genius, and the scheme came to nothing for the time, but was eventually resumed and carried into effect by Skeat in an edition of six volumes (1894), a supplementary volume of Chaucerian Pieces being published in 1897. He also issued an edition of Chaucer in one volume for general readers, and a separate edition of his Treatise on the Astrolabe, with a learned commentary. His edition of Piers Plowman in three parallel texts was published in 1886; and, besides the Treatise on the Astrolabe, he edited numerous books for the Early English Text Society, including the Bruce of John Barbour, the romances of Ivalelco the Dane and William of Palerne, and Ælfric's Lives of the Saints (4 vols.). For the Scottish Text Society he edited The Kingis Quair, usually ascribed to James I. of Scotland, and he published an edition (2 vols., 1871) of Chatterton, with an investigation of the sources.
of the obsolete words employed by him. In pure philology Skeft's principal achievement is his Etymological English Dictionary (4 parts, 1879-1882; rev. and enlarged, 1910), the most important of all his works, which must be considered in connexion with the numerous publications of the English Dialect Society, in all of which, even when not edited by himself, he had a hand as the founder of the society and afterwards its president.

His other works include: Specimens of English from 1304 to 1597 (1871); Specimens of Early English from 1200 to 1393 (1872), in conjunction with E. Morris; Principles of English Etymology (2 series, 1887 and 1891); A Concise Dictionary of Middle English (1888), in conjunction with A. L. Mayhew; A Student's Philology (1896); The Structure of English (1900); A Primer of Classical and English Philology (1905), &c., &c.

SKEFFINGTON, SIR WILLIAM (c. 1465-1532), lord deputy of Ireland, belonged to a Leicestershire family and was sheriff of Leicestershire and Warwickshire under Henry VII. He was master of the ordnance and a member of parliament during the reign of Henry VIII., and in 1529 was appointed deputy in Ireland for Henry's son, the duke of Richmond, the nominal lord lieutenant of that country. He crossed over in August 1529, but his power was so circumscribed by instructions from Henry VIII. that he had no influence in the province of Ireland. Gerald, 9th earl of Kildare, and not Skeffington, was the real governor of Ireland. This state of affairs lasted for three years and then in 1532 the deputy was recalled. In 1534, Kildare being in prison in England and his son Thomas, afterwards the 10th earl, being in revolt, Skeffington was again appointed deputy. After some delay he landed at Dublin in October 1534 and marched at once to relieve Drogheda, but further progress in the work of crushing the rebellion was seriously delayed by his illness. However, in the spring of 1535 he was again in the field. He took Maynooth, the heavy artillery used by him on this occasion earning for him his surname of "The Gunner." He forced some of Kildare's allies to make peace and he captured Dunganv. He died on the 31st of December 1535.

SKEGNESS, a seaside resort in the S. Lindsey, or Horncastle parliamentary division of Lincolnshire, England; 131 m. N. by E. from London by the Great Northern railway. Pop. of urban district (1911) 2140. Since 1873, when railway connexion was given with Firby on the Grimsby branch line, the place has undergone a complete transformation, and now possesses good hotels and a pier. There are broad, firm sands, on which, according to Skegness is much visited. On bank holidays and similar occasions the place is much frequented by manufacturing towns within reach. It is said that a former Skegness, an important haven, was obliterated by the encroachments of the sea; Leland, writing in the middle of the 16th century, states that proofs of this were then extant.

SKELETON. In most animals, and indeed in plants, the shape could not be maintained without a thickening and hardening of certain parts to form a support for the whole. These hardened parts are called the skeleton (Gr. σκελεσμα, I dry), because they dry up and remain after the rest of the body has disappeared. In animals the skeleton is usually, and in higher animals always, rendered more rigid and permanent by the deposit in it of lime salts, thus leading to the formation of bone. Sometimes, as in most of the lower or invertebrate animals, the skeleton is on the surface and thus acts as a support as well as a framework. This is known as an exoskeleton. In the higher or vertebrate animals there is an internal or endoskeleton and the exoskeleton is either greatly modified or disappears.

The following descriptive account is divided into (1) axial, or skeleton of the trunk, (2) appendicular or skeleton of the limbs, (3) skull, (4) visceral skeleton, or those parts which originally form the supports of water-breathing vertebrates, (5) the exoskeleton, which is considered under the heading SKIN and EXOSKELETON. These divisions, although they seem logical, cannot in practice be strictly adhered to, especially in the case of the visceral skeleton, because doing so would involve, among other things, separating the description of the upper jaw from that of the rest of the skull. For the microscopical structure of bone see Connective Tissues.

Axial.

The axial skeleton, from a strictly scientific point of view, should comprise a good deal of the skull as well as the spinal column, ribs and breast bone, but, as the skull (q.v.) is dealt with in a separate article, the three latter structures alone are dealt with here.

The Spine, Spinal or Vertebra Column, chine or backbone in man consists of a number of superimposed bones which are named vertebrae, because they can move or turn somewhat on each other. It lies in the middle of the back of the neck bone, and in the region of the hip joint. Its length and thickness; the ribs at its sides, which in their turn support the upper limbs; whilst the pelvis, with the lower limbs, is jointed to its lower end. The spine consists in an adult of twenty-six bones, in a young child of thirty-three, certain of the bones in the spine becoming ankylosed or blended with each other in the adult. These blended bones lose their mobility and are called false vertebrae; whilst those which retain their mobility are the true vertebrae. The bones of the spine are collected in groups, which from their position—vertebrae of the neck or cervical, of the chest, thoracic, formerly called dorsal; of the loin, abdominal; and of the pelvis, sacral; each group is divided into the tail, coccygeal and caudal; and the number of vertebrae in each group may be expressed in a formula. In man the formula is as follows:–

C = 33 bones, as seen in the child; but the five sacral vertebrae fuse together into a single bone—the sacrum—and the four coccygeal into the single coccyx. Hence the sacrum and coccyx of the adult are the false, whilst the lumbar, dorsal and cervical are the true vertebrae.

The vertebrae are irregularly-shaped bones, but as a rule have certain characters in common. Each possesses a body and an arch, and a notch or ring, with certain processes and notches. The body, or centrum, is a short cylinder, which by its upper and lower surfaces is connected by means of fibro-cartilage with the bodies of the vertebra immediately above and below. Each half has an anterior part or pedicle, and a posterior part or lamina, which, when they collectively form the spinal canal. The processes usually spring from the arch. The spinous process projects backward from the junction of the two laminae, and the collective series of these processes gives to the entire column the spiny character from which has arisen the term spine, applied to it. The transverse processes project outward, one from each side of the arch. The articular processes project, two upward and two downward, and are for connecting adjacent vertebrae together. The notches, situated on the upper and lower borders of the pedicles, form in the articulated spine the intervertebral foramina through which the spinal nerves pass out of the spine.

The vertebrae in each group have characters which specially distinguish them. In man and all mammals, with few exceptions, whatever be the length of the neck, the cervical vertebrae number seven in number. In man the body of a cervical vertebra is comparatively small, and its upper surface is transversely concave; the arch has long and obliquely sloping laminae; the ring is large and almost circular; the pedicle is short, bifid, and horizontal; the transverse process consists of two bars of bone, the anterior springing from the side of the body, the posterior from the arch, and uniting externally to enclose a foramen (vertebral) through which a vessel or an artery passes; the articular processes are flat and oblique, and the upper pair of notches are deeper than the lower. The first, second and seventh cervical vertebrae have characters which specially distinguish them. The first, or atlas, has no body or spine: its ring is very large, and on each side of the ring is a thick mass of bone, the lateral mass, by
which it articulates with the occipital bone above and the second vertebra below. The second vertebra, axis, or Vertebra dentata, has its body surmounted by a pair of odontoid processes or "dens") one of which is regarded as the body of the atlas displaced from its proper vertebra and fused with the axis. This process forms a pivot round which the atlas and head move when turning the head from one side to the other; the spin is therefore deeply bifid. The seventh, called Vertebra prominens, is distinguished by its long prominent spine, a tooth-like process, and by its small size of the foramen at the root of the transverse process. In the human spine the distinguishing character of the cervical vertebrae is the foramen at the root of the transverse process.

The thoracic vertebrae, formerly called dorsai, number from one to two in number in the human spine. They are intermediate in size, form, and position to the cervical and lumbar vertebrae, and are all distinguished by having one or two smooth surfaces on each side of the body for articulation with the head of the rib or the rib. The arch is short and with imbricated laminae; the ring is nearly circular; the spine is oblong, and it has deformed and directed processes; the transverse processes are directed back and out, not bifid, and with the articular processes; the tubercle of a rib, and the articular processes are flat and nearly vertical. The first, twelfth, ninth, and tenth, and between the ninth and tenth, the thoracic vertebrae are differentiated from the rest. The first is in shape like the seventh cervical vertebra with a foramen at the root of the transverse processes and has two articular facets on each side of the body; the ninth has sometimes only one facet on the side of the body; the tenth, eleventh, and twelfth have invariably only a single facet on the side of the body, but the eleventh and twelfth have stunted transverse processes, and the twelfth has its lower articular processes shaped like those of a lumbar vertebra.

The lumbar vertebrae are five in number. They are the lowest of the true vertebrae, and the last three vertebrae lie flat in the center. The arch is short and deep laminae; the ring is triangular; the spine is massive; the articular processes are long and pointed; the articular processes are thick and strong, the superior pair concave, the inferior convex, and the inferior notches, as in the thoracic vertebrae, are deeper than the superior. In the lumbar vertebrae and in the lower thoracic, an accessory process projects from the base of each transverse process, and a mammillary tubercle from each superior articular process. The fifth lumbar vertebra has its body much deeper in front than behind and its spine is relatively narrow. The sacrum is composed of five originally separate vertebrae fused into a single bone. It forms the upper and back wall of the pelvis, is triangular in form, and possesses two surfaces, two borders, a base, and an apex. The anterior or concave surface of each vertebra is concave in the cavity of the sacrum, and the posterior or convex surface concavo-convex to the convexity of the pelvic cavity. Each vertebra has a transverse process, which extends from the anterior surface of the body to the side and is divided into an upper and lower portion, the lower of which is deeper than the upper.

The coccyx consists of four or five vertebrae in the human spine though the last one is sometimes suppressed. It is the rudimentary sail, but not formed as such, and it is generally, is curved forward, and is not visible externally. The coccyx, an arrangement which is also found in the anthropoid apes and in Hoffmann's sloth. Not only is the tail itself rudimentary in man, but the tail vertebrae are compressed and form a pair of which are the bodies and transverse processes of the true vertebrae. As there are no arches, the ring is not formed, and the spinal canal does not extend, therefore, beyond the fourth piece of the bone.

The first coccygeal vertebra, in addition to a body, possesses two processes or horns, which are the superior articular processes.

The human spine is more uniform in length in persons of the same age than might be supposed from the individual variations in stature, the variation in the height of the body in adults being due chiefly to differences in the length of the lower limbs. The average length of the spine is 26 in.; its widest part is at the base of the sacrum, and extends backward to the point where it diminishes also in breadth from the base of the sacrum upwards to the region of the neck. Owing to the projection of the spines behind and the transverse processes in front of the spine, it is difficult to define the outline of the vertebrae; but in front it is more uniformly rounded, owing to the convex form of the antero-lateral surfaces of the bodies of its respective vertebrae. In its general contour two series of curves may be seen, and a lateral convexity is formed. The antero-posterior is the more important. In the infant at the time of birth the sacrococcygeal part of the spine is concave forward, but the rest of the spine, except a slight forward concavity in the series of thoracic vertebrae, is almost straight. When the child begins to walk, the infant begins to sit up in the arms of its nurse, a convexity forward in the region of the neck appears, and subsequently, as the child learns to walk, a convexity forward in the thoracic region. Hence the occurrence of convexo-concave curves are found, which are alternate and mutually dependent, and are associated with the erect attitude of man. A lateral curve, convex to the right, opposite the third, fourth, and fifth thoracic vertebrae, with compensation of the convex to the left immediately above and below, is due apparently to the much greater use of the muscles of the right arm over those of the left, drawing the spine in that region somewhat to the right, in disease of the spine its natural curvature is much increased, and the deformity known as humpback is produced. As the spine forms the central part of the axial skeleton, it acts as a column to the body, not only the largest, especially in the centrum. The arch has short and deep laminae; the ring is triangular; the spine is massive; the articular processes are long and pointed; the articular processes are thick and strong, the superior pair concave, the inferior convex, and the inferior notches, as in the thoracic vertebrae, are deeper than the superior. In the lumbar vertebrae and in the lower thoracic, an accessory process projects from the base of each transverse process, and a mammillary tubercle from each superior articular process. The fifth lumbar vertebra has its body much deeper in front than behind and its spine is relatively narrow. The sacrum is composed of five originally separate vertebrae fused into a single bone. It forms the upper and back wall of the pelvis, is triangular in form, and possesses two surfaces, two borders, a base, and an apex. The anterior or concave surface of each vertebra is concave in the cavity of the sacrum, and the posterior or convex surface concavo-convex to the convexity of the pelvic cavity. Each vertebra has a transverse process, which extends from the anterior surface of the body to the side and is divided into an upper and lower portion, the lower of which is deeper than the upper.

Fig. 2.—Vertebral Column as seen from behind. Marked by four transverse divisions into five bones, and by four pairs of foramina, through which are transmitted the anterior and posterior spinal nerves.
articulated behind to the thoracic vertebrae, and as they are symmetrical on the two sides of the body, the ribs in any given animal are always twice as numerous as the thoracic vertebrae in that animal. They form a series of osseocartilaginous arches, which allows the passage of the windpipe, gullet, large veins and nerves into the chest, and of several large arteries out of the chest into the neck. The base or lower boundary of the cavity is much larger than the upper, slopes downward and backward, and is occupied by the diaphragm, a muscle which separates the chest from the cavity of the abdomen. The transverse diameter is greater than the antero-posterior, and the antero-posterior is greater laterally, where the lungs are lodged, than in the mesial plane, which is occupied by the heart.

**Embryology.**—The first appearance of any stiffening of the embryo is the formation of the notochord, which in the higher vertebrates is a temporary structure and is not converted into cartilage or bone. It also differs from the bony skeleton in that it is derived from the entoderm of inner one of the three layers of the embryo while the bony skeleton is formed from the mesoderm or middle layer and, just as the entoderm is an older layer of the embryo than the mesoderm, so the notochord or entodermal skeleton precedes, both in embryology and in phylogeny or comparative anatomy, the bony mesodermal skeleton.

In the accompanying figure (fig. 4) the notochord is seen in section fully formed and lying between the entoderm and the neural canal. Its first formation is at an earlier period than this, before the neural groove has closed into a canal, and it appears at first as an upward growth from the most dorsal part of the entoderm in what will be the cervical region of the embryo. The groove, by the union of its edges, becomes a tube, sometimes spoken of as the chordal tube, but the cavity of this is soon obliterated by the growth of its cells, so that a solid elastic rod is formed which grows forward as far as the pituitary region of the skull and backward to where the end of the coccyx will be.

While the development of the notochord is going on the mesoderm on each side of it is dividing itself into a series of masses called *mesodermic somites* (see fig. 4, PS) or protvertebral. This process begins in the cervical region and proceeds forward and backward until thirty-eight pairs have been formed for the neck and trunk and probably four extra ones for the cephalic region of the skull. Each of these somites consists of three parts: that nearest the surface ectoderm is the cutaneous lamella (fig. 4, CL). Deep to this and separated in the earlier-formed somites by a space is the muscle layer (fig. 4, ML) while deepest of all and nearest the nerve cord and notochord is the sclerotogenous layer (fig. 4, SL). It is this layer which gradually meets its fellow of the opposite side and encloses the nerve cord and the notochord in continuous tubes of mesodermal tissue, thus forming the *membranous vertebral column*, which is perforated for the exit of the spinal nerves, but the intervals between the successive mesodermic somites are still marked by the tissue being rather denser there. The next stage is that of chondrification or the conversion into cartilage of each segment of the membranous vertebral column surrounding the notochord. In this way the bodies of the cartilaginous vertebrae are formed and each of these is segmental, that is, it corresponds to a muscle segment and a spinal nerve. The cartilaginous neural arch, however, which surrounds the nerve cord in its segmental and is formed by the growth of its cells, tissue which separates each somite from the next. This also applies to the cartilaginous ribs which appear in the fibrous intervals (myo-

From Arthur Thomson, *Cunningham's Text-Book of Anatomy.*

**Fig. 3.**—The Thorax as seen from the Front.

The first, tenth, eleventh and twelfth ribs articulate each with only one vertebra so that there is only one surface on the head. The surface of the first rib which is not in contact with the lung is directed upward, forward and outward while that of the second rib is much more outward; the eleventh and twelfth ribs are rudimentary, have neither neck nor tubercle, and are pointed anteriorly. The ribs are by no means uniform in length: they increase from the first to the seventh or eighth, and then diminish to the twelfth; the first and twelfth are therefore the shortest ribs. The first and second costal cartilages are almost horizontal, but the others are directed upward and inward.

In its general form the chest may be likened to a barrel which is wider below than above. It is rounded at the sides and flattened in front and behind, so that a man can lie either on his back or his belly. Its upper opening slopes downward and forward, is small in size, and

commata) between the muscle plates (myotomes), and so it is easy to realize that each typical rib must articulate with the bodies of two adjacent vertebrae, but with the neural arch, through its transverse process, of only one.

The intersegmental tissue between the bodies of the vertebrae becomes the intervertebral discs and in the centre of these a pulp
mass is found which contains some remnants of the notochord. Elsewhere this structure is pressed out of existence and there is no further use for it when the cartilaginous vertebrae are once formed. One other series of structures must be mentioned though they do not play any great part in human development. In the intersegmental tissue ventral to each of the intervertebral disks a transverse rod of cells, known as a hypochondral bar, is formed which connects the heads of two opposite ribs. In man the greater number of these either disappear or form the middle fascicles of the stellate ligament which joins the head of the rib to the intervertebral disk, but in the case of the atlas the rod chondrifies to form the anterior (ventral) arch which is therefore intersegmental, while the segmental body of the atlas, through which the notochord is passing, joins the axis to form the odontoid process. These hypochondral bars are interesting as the last remnant in man of the haemal arch of the vertebrate fishes (see subsection on comparative anatomy). In the cervical region the ribs are very short and form the ventral boundary of the foramen for the vertebral artery. They are so short that little movement occurs between them and the rest of the vertebra, hence no joints are formed and the rib element becomes fused with the centrum and transverse process, leaving the intercalated canal for the vertebral artery. Sometimes in the seventh cervical vertebra the rib element is much longer and then of course more movement occurs, and instead of fusing with the rest of the vertebra it remains as a separate cervical rib with definite joints.

The sternum is developed according to G. Ruge by a fusion of the ventral ends of the ribs on each side thus forming two parallel longitudinal bars which chondrify and eventually fuse together in the mid line. The anterior seven or sometimes eight ribs reach the sternum, but the ventral ends of the ninth and sometimes the eighth probably remain as the xiphisternum, indeed a fibrous band is sometimes seen joining the caudal end of that structure to the ninth rib. The fusion of the two parallel bars begins at their cephalic ends and sometimes is interrupted toward the caudal end, thus leading to cleft or perforate sternum. At the cephalic end of each sternal bar, close to the place where the clavicles and bell-like in shape, is separated from the cartilage which usually fuses completely with the sternum, though sometimes it remains distinct and may later acquire a separate centre of ossification and so form a separate episternal bone on each side. If the sternum is to be regarded as the fused ventral ends of the thoracic ribs, the episternal elements are probably the remnants of the ventral ends of the seventh cervical ribs. The question of the morphological meaning of the sternum and surrounding parts cannot be settled entirely by a study of the sternal bar even when combined with what we know of their comparative anatomy or phylogeny. Professor A. M. Paterson (The Human Sternum, London, 1904) takes a different view from the foregoing and regards the sternum as derived from the shoulder girdle. To this point of view we shall return in the section on comparative anatomy.

The last stage in the development of the axial skeleton is the ossification of the cartilage; bony centres appear first in each half of the neural arches of the vertebrae and a little later (tenth week) double centres are deposited in the centra though these are so close together and fuse so rapidly that their double nature is only indicated by their oval outline. Sometimes one of the or dumb-bell-like in appearance. They separate the two halves of the neural arch and fuses in the mid dorsal line, and later on joins the ossified centrum ventral to the facet for the rib. This point of junction remains as a narrow strip of cartilage for a long time and is known as the neural arch or synchondrosis. The head of the rib therefore articulates with the development of the neural arch instead of the centrum. About the age of puberty secondary centres or epiphyses appear at the tips of the transverse and spinous processes and as the rib grows longer, they are separated from the rest of the bone by a cartilage plate.

On the twenty-fifth year in lower the two cervical vertebrae there is often a separate centrum for the part of the arch and one (probably two) fused for the ventral part, which has already been referred to as a hypochondral arch. In the axis, in addition to the ordinary centres, there is one for each side of the odontoid process and (probably two) for the centra on either end, 20, 21, 22). The sacral vertebrae have the usual centres, except that the anterior part of the lateral mass (costal element) has a separate centre and that there are two extra centres on each side of the whole sacrum where it articulates with the ilium (see fig. 6).

The sternum is ossified by one primary centre appearing about the sixth week and by secondary ones for the tubercle and head. The sternum is ossified by centres which do not appear opposite the attachment of the ribs but alternately with them, so that although the original
here as a rule. Consequently five centres are found: those for the two higher segments being single while the lower ones are often double. Later on in life a centre for the sixth sternum appears.

**AXIAL SKELETON**

In the notochord is located the arch of ossification. Consequently or always also the notochord is located the arch of ossification. In the authors (frogs and toads), on the other hand, the notochord is located the arch of ossification (postcycloths). In the Amphibia (fishes) and the fish Notidanus, but the subject is discussed by T. J. Parker and A. M. Paterson (The Human Skeleton, London, 1904, p. 50) and still requires further research. If the sternum is regarded as a secondary structure of segmental origin, and if the corresponding to the centrally located the arch of ossification there is no reason why it should not develop independently of the intersegmental ribs and, when the ribs are suppressed, gain a secondary connection with the shoulertable.

In Reptilia the centra of the vertebrae are usually procycloths, though there are a few examples, such as the archaic Tuatera lizard (Sphenodon), in which the amphicoelic arrangement persists. Known as abdominal ribs, while the sacral vertebrae articulate with the amphicoels have. The odontoid bone is usually separate from both the atlas and axis while, between the atlas and the skull, there are rudiments of an extra intervertebral dorsal structure or *plicae* and the fleshy structures of the fish Notidanus, but the subject is discussed by T. J. Parker and A. M. Paterson (The Human Skeleton, London, 1904, p. 50) and still requires further research. If the sternum is regarded as a secondary structure of segmental origin, and if the corresponding to the centrally located the arch of ossification there is no reason why it should not develop independently of the intersegmental ribs and, when the ribs are suppressed, gain a secondary connection with the shoulertable.

**Comparative Anatomy.**—Just as in development the notochord forms the earliest structure for stiffening the embryo, so in the animal kingdom it appears before the true backbone or vertebral column is evolved. This is so important that the older phyllum of Vertebrata has now been expanded into that of Chordata to include all animals which either permanently or temporarily possess a notochord. In the subphyllum Chordata, which includes the worm-like Balanoglossus, as well as the colonial forms Rhodolepaea and Cephalodiscus, an entodermal structure, apparently corresponding to the notochord of higher forms, is found in the dorsal wall of the pharynx. In the subphyllum Urochorda or Tunicata, to which the ascidians or sea-squirts belong, the notochord is present in the tail region only and as a rule disappears after the metamorphosis from the larval to the adult form. In the Acrania, which are represented by Amphioxus (the lancelet), and are constantly classed as the lower forms, the notochord in subphyllum Urochorda, is a permanent and extends the whole length of the animal. Both this and the nerve cord dorsal to it are enclosed in tubes of mesodermal connective tissue which are continuous with the fibrous myocomma of the trunk, which is also a mesodermal structure.

In the Cyclostomata (hags and lampreys) the notochord and its sheath persist through life, but in the adult lamprey (Petromyzon) cartilaginous neural arches are developed. In cartilaginous ganoid fishes like the sturgeon, the notochord is persistent and has a strong fibrous sheath into which the cartilage from the neural arches encroaches while in the elasmobranch fishes (sharks and rays) the cartilaginous centra are formed and grow into the notochord, thus causing its partial absorption. The growth is more marked peripherally than centrally, and so each centrum when removed is seen to be deeply concave toward both the head and tail; such a vertebra is spoken of as *amphibocoelic* and with one exception is always found in fishes which have centra. In the body fish (Teleostei) and mudfish (Dipnoi) the vertebrae are ossified.

If a vertebra from the tail of a bonito fish like the herring be examined it will be seen to have a ventral (haemal) arch surrounding the caudal blood-vessels and corresponding to the dorsal or neural arch which is also present. In the anterior or visceral part of the body the haemal arch is split and its two sides spread out deep to the muscles and lying between them and the coelom to form the ribs. In the elasmobranchs or the other hand the ribs lie along the meso-dorsal vertebrae, and the fact that both kinds of ribs are coexistent in the same segments is an interesting and archaic Nilot.fish *Polystilus bitrochus* shows that they are developed independently of one another. The sterum is never found in fishes with the possible exception of the comb-toothed shark (Notidanus). Among the Amphibia the tailed forms (Urodela) have amphicoelic vertebrae in embryonic life and so have some of the adult salamanders, but usually the intercentral remnants of the notochord are pressed out of existence by the forward growth of the vertebrae behind it and the adventitious and long delicate bone, the *urostyle*. The ribs of urodeles have forked ventral ends and are thus attached to the centrum as well as to the neural arch of a vertebra; this vertebra is supposed to be homologous with the dorsal vertebrae of Polyplacophora. A constant structure first appears in amphibians and is more closely connected with the shoulder girdle than with the ribs, the ventral ends of which, except in the salamander Necturus, are rudimentary. It is not certain whether the vertebrae of the fish Notidanus, but the subject is discussed by T. J. Parker and A. M. Paterson (The Human Skeleton, London, 1904, p. 50) and still requires further research. If the sternum is regarded as a secondary structure of segmental origin, and if the corresponding to the centrally located the arch of ossification there is no reason why it should not develop independently of the intersegmental ribs and, when the ribs are suppressed, gain a secondary connection with the shoulertable.

**Fig. 7.—Ossification of the Sternum.** In this figure the second as well as the third segment of the body possesses two centres—

1. Appears about 5th or 6th month; III. segment unites with II. about puberty; IV.

2. Appears about 7th month; segment unites with III. centrum.

3. Appears about 8th or 9th month; IV. segment unites about 3rd year or

For further details see C. S. McMurrich, The Development of the Human Body (London, 1906). This includes bibliography, but G. Ruge's paper on the development of the sternum (Morph. Jahrb. vi. 1880) is of special importance.
vertebrae vary from ten in some of the whales and the pelu armadillo to twenty-four in the two-toed sloth, though thirteen or fourteen is the commonest number. In the anterior part of the thoracic region the spines point backward, while in the posterior thoracic and lumbar regions they have a forward direction. There is always one spine in the posterior thoracic region, which is vertical, and the vertebra which bears this is known as the anteriolum vertebra. The lumbar vertebrae vary from two in the Ornithorhynchus and some of the armadillos to twenty-one in the dolphin, the average number being probably six. Both the mammillary and accessory tubercles (meta- and ana-pophyses) are in some forms greatly enlarged. It is usually held that the former are morphologically muscular processes while the latter represent the transverse processes of the thoracic vertebrae. In the American edentates additional articular processes (zygapophyses) are developed, so that these animals are sometimes divided from the old-world edentates and spoken of as Xenarthra.

Lying ventral to the intervertebral disks in many mammals small paired ossicles are occasionally found; these are called intercentra and are ossifications in the hypochondral bar (see subsection on embryology). They probably represent the places where the chevron bones or haemal arches would be attached and are the serial homologues of the anterior arch of the atlas (see fig. 10). Boulenger has pointed out that these intercentra, either as paired or median ossicles, are often found in lizards (P. E. S., 1891, p. 114). The sacrum of terrestrial vertebrates consists of true sacral vertebrae, which directly articulate with the ilium, and false, which are caudal vertebrae fused with the others to form a single bone. There is also reason to believe that the vertebrae which are originally lumbar become secondarily included in the sacrum because in the development of the pelvis it is at first attached to the thirteenth vertebra, but gradually shifts forward until it reaches the twenty-fifth, twenty-sixth and twenty-seventh; the twenty-fifth or first sacral vertebra has, however, a posterior thoracic and reverts to the lumbar type and sometimes may do so on one side but not on the other. A. Paterson, on the other hand, brings forward evidence to prove that the human sacrum undergoes a backward rather than a forward shifting of its centres of ossification which form the articular surface for the ilium probably represent rib elements. The caudal or tail vertebrae vary from none at all in the bat Megaderma to forty-nine in the pangolin (Manis muscosa). The anterior ones are remarkable for usually having chevron bones (shaped like a V) on the ventral surface of the intercentral articulation. These protect the caudal vessels and give attachment to the external tail muscles. The ribs in mammals correspond in number to the thoracic vertebrae. In monotremes the three parts of the rib (dorsal, intervertebral and ventral) already noticed in the reptiles are found, but usually the intervertebral part is suppressed. The ventral part generally carnosilaginous as it does in man though sometimes it ossifies as in the armadillos. In the typical prongrode mammals the shape of the ribs differs from that of the higher Primates and man: they are so curved that the dorso-ventral diameter of the ribs is greater than the transverse while in the higher Primates the thorax is broader from side to side than it is dorso-ventrally. In the bats the ribs agree with man and the lemur's with the prongrode mammals.

In some whales the first rib articulates by an apparently double head with two vertebrae; this is probably the result of a cervical rib joining it a little way from the vertebral column, and the result is homologous with those cases in man in which a cervical rib joins the first thoracic as it sometimes does. In the toothed whales, of which the porpoise is an example, the more posterior ribs lose their heads and necks and only articulate with the transverse processes. The sternum of mammals typically consists of from seven to nine narrow segments or sternebrae, the first of which (presternum) is usually broader than the others behind. As a rule the second rib articulates with the interval between the first and second pieces, but sometimes, as in the gibbon, it is the third rib which does so. When this is the case, as it sometimes is in man, the first two sternebrae have probably fused (see A. Keith, Journ. Anat. and Phys. xxx. 275). The segmental character of the separate sternebrae contrasts strongly with the intersegmental of the ribs. When the pectoralis major muscle arises it is as a general rule on the sternum and makes one suspect that the development of the sternum in mammals is dependent on, and subservient to the attachment of the diaphragm. The broadened thorax of the anthropomorpha is accompanied by a broadened sternum and to the sternebrae of the mesosternum fused together early, though in the case of some they do not remain separate but each half of them represents the entire sternum in the animal is half-grown. The episternum is represented by small ossicles which occasionally occur in man, while in the Ornithorhynchus and the tapir there is a separate bone in front (cephalad) of the pre sternum which in the former animal is distinct at first from the interclavicle, and this probably represents the episternum, though it was called by W. K. Parker by the noncommon name of prosternum.

For further details and literature see S. H. Reynolds, The Vertebrate Skeleton (Cambridge, 1897); W. H. Flower and H. Gadow,
The humerus, or bone of the upper arm (fig. 14), is a long bone, and consists of a shaft and two extremities. The upper extremity possesses a convex spheroidal smooth surface, the head, which is surrounded by a narrow constricted neck, and where the neck and shaft become continuous with each other, two processes or tuberosities are found, to which are attached the rotator muscles arising from the scapula and the tuberosities of the bone in which the long tendon of the biceps rests. A line drawn through the head of the humerus perpendicular to the middle of its articular surface, forms with the axis of the shaft of the bone an angle of 45°. The shaft of the humerus is triangular in section above, but flattened and expanded below; about midway down the outer surface is a rough ridge for the insertion of the deltoid muscle, and on the inner surface another rough ridge for the insertion of the coraco brachialis. A shallow groove runs round the back of the bone, in which the musculo-spiral nerve is lodged. The lower extremity of the humerus consists of an articular and a non-articular portion. The articular end, which is a head, is directed forward for the radius, and a pulley or trochlea internally for the movements of the ulna in flexion and extension of the limb. The non-articular part, the neck, is both on its inner and outer aspect; these are known as the internal and external condyles, and of these the inner is the more prominent; each is crowned by a supracondylar ridge, and the internal condyle and ridge attach the muscles passing to the flexor surface of the forearm, while the external are for those passing to the extensor surface.

A small, downwardly directed, hook-like process of bone is found above the internal condyle and is the vestige of the supracondylar foramen found in so many of the lower animals (see below Coracoid process). Before describing the two bones of the forearm, the range of movement which can take place before them should be noticed. In one position, which is called the supine, they lie parallel to each other, the radius being the more external bone, and the palm of the hand being directed forward; in the other or prone position the radius crosses obliquely in front of the ulna, and the palm of the hand is directed backward. The lower end of the forearm, but those of the hand are supposed to be in the supine position when they are described. It is the outer bone of the forearm, and like all long bones possesses a shaft and two extremities. The upper extremity of the lower end of the bone is much broader than the upper, and is marked posteriorly by grooves for the lodgment of tendons passing to the back of the hand: from its outer border a pointed stylloid process projects downward, its inner extremity a small, shallow fossa (the sigmoid cavity of the radius) for articulation with the ulna, and its broad lower surface is smooth and concave, for articulation with the scaphoid and semilunar bones of the wrist. The ulna possesses three surfaces for the attachment of muscles, and a sharp inner border for the insertion of ligaments. The lower end of the bone is more expanded than the upper, and is marked by a prominent hook-like process, the coronoid, which is opposite the coronoid process of the scapula. The ulna.

The bony framework of the two appendages or extremities, as the upper and lower limbs are called, is built up on the same plan in both. Each consists of a limb girdle (shoulder and hip girdles) connecting it with the axial skeleton, a proximal single bone segment (humerus, femur), a distal double bone segment (radius, ulna; tibia, fibula), the hand and foot segments (carpals, metacarpals; tarsus, metatarsals) and the digits (phalanges). It should be understood that in the following descriptions the terms internal and external are used in relation to the midline of the body and not to that of the limb.

The upper limb in man may be subdivided into a proximal part or shoulder, a distal part or hand, and an intermediate shaft, which consists of an upper arm or brachium, and a forearm or ante-brachium. In each of these subdivisions certain bones are found: in the shoulder, the clavicle and scapula; in the upper limb, the head and neck, the scapula and clavicle; in the lower limb, the bone of the upper arm in man being longer than the bones of the forearm; in the hand, the carpal and metacarpal bones and the phalanges. The scapula and clavicle together form an imperfect bony arch, the Scapular Arch or Shoulder Girdle; the shaft and hand form a free extremity. A perpendicular plane drawn through the shoulder girdle is the direct medium of connection between the axial skeleton and the divergent part of the limb; its anterior segment, the clavicle, articulates with the upper end of the sternum, whilst its posterior segment, the scapula, approaches, but does not reach, the dorsal spines.

The clavicle, or collar bone (fig. 14), is an elongated bone which extends from the upper end of the sternum horizontally outward to articulate with the acromion process of the scapula. It presents a strong sigmoidal curve, which is associated with the transverse and horizontal direction of the axis of the human shoulder. It is slender in the female, but prominent in the male; its sternal end thick and somewhat triangular; its acromial end, flattened from above downward, has an oval articular surface for the acromion. Its shaft has four surfaces for the attachment of muscles; and strong ligaments connecting with the coraco-brachialis, which is attached to the under surface, near the outer end, whilst near the inner a strong ligament passes between it and the first rib.

The scapula, or wing bone (fig. 14), is the most important bone of the shoulder girdle, and is present in all mammals. It lies at the upper and back part of the wall of the chest, reaching from the second to the seventh rib. Its form is plate-like and triangular, with three surfaces, three borders, and three angles. Its costal or ventral surface is in relation to the ribs, from which it is separated by certain muscles: one, called the subscapularis, arises from the surface itself, which is termed the subscapular fossa. The dorsum or back of the bone is highly convex, from behind forward by a prominent spine, which lies in the proper axis of the scapula, and subdivides this aspect of the bone into a surface above the spine, the supra-spinous fossa, and one below the spine, the infra-spinous fossa. The spine arches forward to end in a broad flattened process, the acromion, which has an oval articular surface for the clavicle; both spine and acromion are largely developed in the human skeleton in correlation with the development of the trapezius and deltoid muscles, which are concerned in the elevation and adduction of the upper limb. The borders of the scapula, directed upward, backward, and downward, give attachment to various muscles. The angles are inferior, anterior, superior, and posterior-superior. The anterior-superior is the most important; it is truncated, and has a large, shallow, oval, smooth surface, the glenoid cavity, for articulation with the humerus, to form the shoulder joint. Overhanging the glenoid fossa is a curved bony-ridge, the coracoid, which is of importance as corresponding with the separate coracoid bone of monotremes, birds and reptiles. The line of the scapula passes upward and backward, and is limited on the upper border of the scapula by the supra-scapular notch.
the bone has three surfaces for the attachment of muscles, and a single posterior for the intersosseous membrane. The shaft is much smaller than the upper, has a pointed styloid process and a smooth articular surface, the outer portion of which is for the lower end of the radius, the lower part for moving on a cartilage of the wrist, called the triangular fibro-cartilage.

The hand consists of the carpus or wrist, of the metacarpus or palm, and of the five digits, the thumb and four fingers. Anatomists describe it with the palm turned to the front, and with its long axis in line with the axis of the forearm. The metacarpals, consisting of a triangular fibro-cartilage.

The carpal or wrist bones (fig. 14) are eight in number and small in size: they are arranged in two rows, a proximal,—i.e. a row of the bones, consisting of scaphoid, semilunar, cuneiform and pisiform; and a distal,—i.e. a row next the bones of the palm,—consisting of a trapezium, trapezoid, os magnum and unciform; the bones in each row being named in order they pass from the front to the ulnar or inner side of the wrist. It is unnecessary to give a separate description of each bone. Except the pisiform or pea-shaped bone, which articulates with the front of the cuboideum, each carpal bone is short and irregularly cuboidal in shape; its anterior (or palmar) surface and its posterior (or dorsal) being rough, for the attachment of ligaments; its superior and inferior surfaces being invariably smooth, for articulation with adjacent bones; whilst the internal surfaces are also smooth, for articulation, except the outer surfaces of the scaphoid and trapezium (the two external bones of the carpus), and the inner surfaces of the cuboideum and unciform (the two internal bones). These are found, but they are apparently the remnants of cartilaginous elements found in the hand of the embryo (see G. Thilenius, Morph. Arbeiten, v. 1896).

The metacarpal bones, or bones of the palm of the hand, are five in number (fig. 14). They are miniature long bones, and each possesses a shaft and two extremities. The metacarpal of the thumb is the only one distinct from the rest; its carpal extremity is saddle-shaped, for articulation with the trapezium; its shaft is somewhat compressed, and its phalangeal end is smooth and rounded, for the first phalanx of the thumb. The four other metacarpal bones belong to the four fingers; they are almost parallel to each other, and diminish in size from the second to the fifth. Their carpal ends articulate with the trapezoid, os magnum and unciform; their shafts are three-sided; their phalangeal ends articulate with the proximal phalanges of the fingers.

The number of digits in the hand is five. They are distinguished by the names of pollex or thumb, index, medius, annularis, and minimus. Each consists of fourteen bones, unnamed phalanges, of which the thumb has two, and each of the four fingers three. The phalanx next the metacarpal bone is the proximal, that which carries the naiil, the terminal or ungual phalanx, whilst the intermediate bone is the middle phalanx. Each is a miniature long bone, with two articular extremities and an intermediate shaft, except the terminal phalanges, which have an articular surface only at their proximal ends, the distal end being rounded and rough, to afford a surface for the lodging of the nail.

The Inferior or Pelvic Extremity, or Lower Limb, consists of a proximal part or haunch, a distal part or foot, and an intermediate shaft subdivided into thigh and leg-bones. The appropriate skeleton is the thigh-bone in man being longer than the leg-bones. The bone of the haunch (os innominatum) forms an arch or pelvic girdle, which articulates behind the side of the sacrum, and arches forward to articulate with the opposite haunch-bone at the public symphysis. It is the direct medium of connexion between the axial skeleton and the shaft and foot, which form a free divergent appendage.

The os innominatum, or haunch-bone, is a large irregular plate-like bone, which forms the lateral and inferior boundary of the cavity of the pelvis. In early life it consists of three bones—Ilum, ischiium and pubis—which unite about the twenty-fifth year into a single bone. These bones converge, and join to form a deep fosse termed the acetabulum or cotyloid cavity, on the outer surface of the bone, which lodges the head of the thigh-bone at the hip-joint. One-fifth of this cup is formed by the pubes, and about two-fifths each by the ischium and ilium. At the acetabulum there is a depression in the sides of which the ligamentum teres of the hip-joint is attached. From the acetabulum the ilium extends upward and backward, the ischium downward and backward, the pubis forward, inward and downward. Below the acetabulum is a large hole; the obturator or ischiorectal fossa is formed by the ischium and pubes, and behind and above the acetabulum is the deep sciatic notch, which is bounded by the ischium and ilium, and below this is the small sciatic notch.

The ilium (fig. 16) in man is a broad plate-like bone, the lower end of which aids in forming the acetabulum, while the upper end forms the iliac crest, which, in man, in conformity with the general expansion of the pelvis, projects inward into the sinuous crest of the ilium. This crest is of great importance, for it affords attachment to a vast number of muscles which form the wall of the abdominal cavity. One surface of the ilium is external, and marked by curved lines which indicate the areas for the origin of the muscles of the thigh; another surface is anterior, and hollowed out to give origin to the iliacus muscle; the third, or internal, surface articulates posteriorly with the sacrum, whilst above it forms a part of the wall of the true pelvis. The external is separated from the anterior surface by a border which joins the anterior end of the crest, and forms part of the process, the anterior superior spine. About the middle of this border is the anterior inferior spine. Between the external and internal surfaces lies a border on which are found the posterior superior and inferior spines; between the anterior and posterior surfaces is the ilio-pubic line, which forms part of the line of separation between the true and false pelvis.

The pubis (fig. 16) is also a three-sided, prismatic, rod-like bone, the fundamental form of which is obscured by the modification in shape of its inner end. In human anatomy it is customary to regard it as consisting of a body and two branches, an upper and a lower ramus.

The upper ramus runs downward, forward and inward from the acetabulum to the body of the pubis, which is a plate of bone placed nearly horizontally in the upright position of the subject, and articulates there with the ilium, forming the ilio-pubic line, already mentioned, may be traced.

The lower ramus is really more horizontal than the upper (which used to be called the horizontal ramus), and runs downward and outward from the body to meet the ramus of the ischium and form the subpubic arch.

The ischium (fig. 16), like the ilium and pubis, has the fundamental form of a three-sided prismatic bone. One extremity (the upper) completes the acetabulum, whilst the lower forms the large pelvic cavity, or true hip-joint. The surfaces of the bone are internal and external, the pelvic and postero-external surfaces are separated by a border formed by the two pubis, which defines the posterior external surface.

The pelvic and antero-external surfaces are separated by a border, which forms a part of the boundary of the obturator foramen; but the margin between the antero- and postero-external surfaces is feebly marked. The tuberosity, a thick, rough and strong process, gives origin to several powerful muscles: on it the body rests in the sitting posture; a flattened portion extends from it to join the lower ramus of the pubis, and completes both the pubic arch and the margin of the obturator foramen.
By the articulation of the two innominate bones with each other in front at the pubic symphysis, and with the sides of the sacrum behind, the osseous walls of the cavity of the Pelvis are molded into a false cavity and a true pelvis. The false pelvis lies between the expanded wing-like portions of the two ilia. The true pelvis lies below the two ilio-pelvic lines and the base of the sacrum, which surround the upper orifice or brim of the false pelvis. The inner or pelvic brim is marked by the narrow, convex calcis, well articulated to the outer side of the ilium. The main cavity of the true pelvis is bounded behind by the coccyx, laterally by the ischial tuberosities, and in front by the pubic arch. In the erect attitude the pubis is so inclined that the plane of the brim forms with the horizontal plane of the ground an angle of 68° to 63°. If the axis of the cavity is curved, and is represented by a line dropped perpendicularly from the planes of the brim, the cavity and the outlet; at the brim it is directed downward and outward, at the outlet, inward, but gradually upward. Owing to the inclination of the pubis, the base of the sacrum is nearly 4 in. higher than the upper border of the pubic symphysis.

The female pelvis is distinguished from the male by certain sexual characteristics. These differences are not constant, and in the male may be more or less pronounced, and when marked may be offset by the muscular attachment more feeble, the breadth and capacity greater, the depth less, giving the greater breadth to the hips of a woman; the inlet more nearly circular, the pubic arch wider, the distance between the tuberosities greater, and the balleum smaller in the female than in the male. The greater capacity of the woman’s over the man’s pelvis is to afford greater room for the expansion of the uterus during pregnancy, and for the expansion of the child at the time of birth.

The femur or thigh-bone (fig. 16) is the longest bone in the body, and consists of a shaft and two extremities. The upper extremity or head of the femur is smooth and in which an egg-shaped concavity is situated, like that on the head of the humerus.

**Femur.**

- On the shaft, oval roughened fossa, for the attachment of the ligamentum teres of the hip, is found; from the head a strong elongated neck passes downward and outward to join the upper end of the shaft. To the inner and outer aspects of the shaft are many tubercles or rosettes. The external or greater trochanter is connected to the external or greater trochanter by a rough line formed by the attachment of the psoas and iliacus. At the posterior part of the shaft is a definite line drawn through the shaft an angle of 30°; in a male this angle is a little less obtuse than in a man, and the obliquity of the shaft of the femur is slightly greater in the former than in the latter. The neck of the femur is transverse at its middle, smooth and with a vertical line drawn through it. The upper end of the shaft is broad and expanded above and below; its front and sides give origin to the extensor muscles of the leg; behind there is a rough ridge, which, though called linea aspera, is really a narrow surface and not a line; it gives attachment to the gluteal muscles and from these is a large smooth articular surface for the kneecap, the anterior portion of which forms a trochlea or pulley for the movements of the patella, whilst the lower and posterior part is subdivided into two convex condyles by a deep fossa which gives attachment to the collateral ligaments of the knee. The inner and outer surfaces of this end of the bone are rough, for the attachment of muscles and the lateral ligaments, for the attachment of muscles.

The femur constitutes usually about 0.275 of the individual stature; but this proportion is not constant, as this bone forms a larger element in the stature of a tall than of a short man. The bone is covered on the concave side by a coating of subcutaneous fat, consequent upon a condition of the femur, derived from that of Pithecanthropus, whose superficial surface is convex. In the bones of some races the dorsal ridge of the thigh-bone (linea aspera) projects as a prominent crest causing the bones to appear 'crooked'; this condition is perhaps a consequence of the increased relative length of the sagittal of the coronal diameter of the bone. Pittinger, though characteristic of lower and primitive races, is never the kneecap, and the patella is the upper and lower of the femur in some races is sagittally flattened, a condition which is called platymeria. Its degree is indicated by the excess of the coronal over the sagittal diameter in this region.

Patella is a small triangular flattened bone developed in the tendon of the great extensor muscles of the leg. Its anterior surface and sides are rough, for the attachment of the fibres of that tendon; its posterior surface is smooth, and enters into the formation of the knee-joint.

Between the two bones of the leg there are no movements of pronation or supination between the two bones of the forearm. The tibia and fibula are fixed in position; the fibula is always external, the tibia internal.

The tibia or shin-bone (fig. 16) is the larger and more important of the two bones of the leg. It is not only the bone for articulation, but also the bone which gives rise to the tibia and fibula. The tibia and fibula are fixed in position; the fibula is always external, the tibia internal.

The Tibia. Contraction of the muscles of the leg has just been mentioned as taking place in the formation of the knee-joint. The tibia and fibula are fixed in position; the fibula is always external, the tibia internal. The tibia is a long, straight bone, with an articular facet on the upper end, and down it the weight of the body in the erect position is transmitted to the foot. Except the femur, it is the longest bone of the skeleton, and consists of a shaft and two extremities, the upper or proximal end and the lower or distal end; these are divided into two tuberosities, the external of which has a small articular facet, that of the head for the fibula; superiorty, the tuberosity is broad and thick for the attachment of the vastus muscles. Of the lower or distal end, the intercondylar fossa gives attachment to the tibia and fibula, the two bones being separated by an intercondylar fossa, from which a short spine (a series of elevations) projects, which gives attachment to the semitendinosus and semimembranosus muscles.

**Patella.**

- In transmission the convex calcis, well among the three smooth articulates of the metatarsus, is always marked by the upper end of the leg, that of the tibia is marked by a small articular facet of the lower end of the tibia.

The fibula, or splint-bone of the leg (fig. 16), is a slender long bone with a shaft and two extremities. The upper end or head articulates with the astragalus, the metatarsus and the five free digits or toes. The human foot is placed in the prone position, with the sole of the foot or plantar surface to ground; the dorsum or back of the foot directed upward; the axis of the foot at about a right angle to the pelvis, and the great toe or hallucis, which is the corresponding digit to the thumb, at the inner border of the foot. The human foot, as a result, is a pentadactylous, plantigrade foot.

The bones of the tarsus or ankle (fig. 16, Tr), are seven in number, and arc with the outer extremity of the tibia. The shaft is four-sided, and roughed for the origins of the muscles. The metatarsus and the five free digits or toes. The human foot is placed in the prone position, with the sole of the foot or plantar surface to ground; the dorsum or back of the foot directed upward; the axis of the foot at about a right angle to the pelvis, and the great toe or hallucis, which is the corresponding digit to the thumb, at the inner border of the foot. The human foot, as a result, is a pentadactylous, plantigrade foot.

**Tarsus.**

- The bones of the tarsus or ankle (fig. 16, Tr), are seven in number, and arc with the outer extremity of the tibia.

**Phalanges.**

- The bones of the toes may be divided into two longitudinal columns—an outer, consisting of the os calcis and cuboid, and the metatarsals and phalanges of the fourth and fifth toes; an inner column consisting of the os astragalus, scaphoid, and the metatarsal and phalanges of the first, second and third toes. The tarsal, like the carpal bones, are short and, with the exception of the cuneiformes which are wedge-shaped, irregularly cuboid, the dorsal and plantar surfaces are as a rule rough for articular, but as the astragals are locked in between the leg and the os calcis, its dorsal and plantar surfaces, as well as the dorsum of the os calcis, are smooth for articulation; similarly, its lateral surfaces are smooth for articulation with the malleoli. The posterior surface of the os calcis projects backward to form the prominence of the heel. With this exception, the bones have their anterior and posterior surfaces smooth for articulation. Their lateral surfaces are also articular, except the outer surface of the os calcis and cuboid, which form the outer border; and the inner surface of the os calcis, scaphoid and ento-cuneiform, which form the inner border of the foot.

**Embrtyology.**—The development of the appendicular skeleton takes.
place in the core of mesenchyme in the centre of each limb. This substance first becomes changed into cartilage, except perhaps in the case of the clavicle, though there is at present some doubt as to how much of this bone is chondrified before ossification reaches it.

...
seen that this down-growth is a traction epiphysis developed in the quadriceps tendon below the patella and joining the main upper epiphysis before uniting with the diaphysis or shaft.

The fibula has two pressure epiphyses, the lower of which appears as a little bone at the back of the astragalus, known as the e trigonum.

The centre for the calcaneum appears in the sixth month of foetal life, that for the astragalus in the seventh, the cuboid about birth, the external, middle and internal cuneiforms in the first and second years, while the navicular is the last to appear in the third year. It will be noticed that, although ossification occurs in the bigger cartilaginous masses earliest, e.g. calcaneum astragalus and cuboid, the last cartilage to ossify, and this is an exception to the general rule which is probably caused by some factor which we do not at present understand.

The calcaneum has a very definite traction epiphysis developed in the insertion of the tendon Achillis behind.

The development of the metatarsal bones and phalanges of the foot is the same as that of the hand.

For further details and literature see J. P. M'Currie's Development of the Human Body (London, 1906) and D. J. Cunningham's Text-Book of Anatomy (Edinburgh, 1906).

Comparative Anatomy.—It is only when the class of pisces is reached that paired appendages are found, and there are two main theories to account for their first occurrence. One is that in the present most favoured is that in some ancestral fishes two folds ran along the ventro-lateral part of the body, like the bilge keels of a boat, and that these joined one another in the mid-ventral line behind the cloacal orifice to form the median caudal fin. Into these folds the segments of the body including myotomes and myocommata, extended. Later on parts of these ridges were suppressed, but in the pectoral and pelvic regions they were retained to form the paired fins. This theory was first foreshadowed by Gooder, and has been elaborated by Balloir, Dohrn and many others. It is supported by the fact that in some elasmobranch embryos the whole length of the folds can be traced.

The second theory is that the limbs are elaborated gills; this was proposed by C. Gegenbaur, and has lately been supported by Graham Kerr. It is probable that the limb girdles are of later evolution than the skeleton of the fins themselves.

In the elasmobranch fishes (sharks and rays) there is a crescentic bar of cartilage (pectoral girdle), concave upward, which girdles the ventral and lateral parts of the body; it is divided into a dorsal part (scapula) and a ventral part (precoracoid and coracoid) by a
facet for the articulation of the fin. This of course is the glenoid cavity. In some forms, e.g. the shark Heptanchus, there is a perforation in the ventral part of the bar on each side, which possibly indicates the division between the precoracoid and coracoid elements.

In many of the bony fish (Teleostei) the outline is obscured by a series of bones which connect the girdle with the skull and may be the precursors of the clavicle.

In the Amphibia the dorsally-placed scapula (fig. 27, S) has more dorsally a cartilaginous plate, the supra-scapula (fig. 27, S S.), which may be calcified. The precoracoid (fig. 27, P C) and coracoid (C) are quite distinct, the former being in front (cephalad) and overlaid by a dermal bone, the clavicle (Cl). The attachment of the coracoids to the sternum has been noticed in section Axial of this article. Uniting the ventral ends of the precoracoid and coracoid is the epicoaroid on each side (fig. 27, E C).

In the Reptilia the general plan is evident, but in the lizards the ventral ends of the two clavicles are united by a median dagger-like dermal bone, the interclavicle (fig. 27, I C), which lies on a plane superficial to the sternum and epicoaroids.

In birds the scapula has the shape of a sabre blade, and there is a rudimentary acromion process, though this is also indicated in some reptiles. The pre-and epicoaroids are aborted, but the coracoids are very strong. The clavicles and interclavicles unite into a V-shaped bar which forms the forcula or "merrythought."

In the Mammalia the Monotremata (Ornithorhynchus and Echidna) retain the reptilian arrangement of large coracoids and epicoaroids articulating with the sternum, while the clavicles and interclavicle are also largely developed; the scapula too is more bird-like in shape than mammalian. In the higher mammals the scapula develops a spine and usually an acromial process, and has a triangular outline. As long as the forelimb is used for support, the vertebral border is the shortest of the three, and the long axis of the bone runs from this border to the glenoid cavity; but when the extremity is used for prehension, as in the Primates, or for flight, as in the Chiroptera, the vertebral border elongates and the distance from it to the glenoid cavity decreases so that the long axis is now parallel with that of the body instead of being transverse.

Above the monotremes too the coracoid becomes a mere knob for muscles, and no longer articulates with the sternum. There is thus a sudden transition from the way in which the forelimb of the body is propped up on the forelimbs when the coracoid is functional (as in reptiles) to the way in which it is suspended like a suspension bridge between the two scapulae in prongnate mammals, the serratus magnus muscles forming the chains of the bridge (see fig. 28).

The clavicle is often entirely suppressed in mammals; this is the case in most of the Ursidae, all the Pinnipedia, Manis among edentates, the Cetacea, Sirenia, all Ungulata and some of the Rodentia. It is complete in all the Primates, Chiroptera, Insectivora (except Potamogale), many of the Rodentia, most Edentata, and all the Marsupialia except Perameles. In the Monotremata it is fused with a well-developed interclavicle, but in other mammals the interclavicle is either suppressed or possibly represented by the sternal epiphysis of the clavicle of the Primates. The precoracoid as a distinct structure entirely disappears, though vestiges of it may remain in the cartilaginous parts of the clavicle.

The chief modifications of the humerus are the development of the pectoral girdle, which is large whenever the pectoral muscles are strong, and is represented in man by the outer lip of the bicipital groove and the suprascapular foramina. In the tuatara (Sphenodon...
there are two of these, one on the outer side for the muscle-spiral nerve, and one on the inner for the median nerve; in other living and fossil reptiles one or other of these may be present.

The humerus. The three bars bounding these two foramina in Sphenodon are sometimes regarded as indications that the humerus contains vestiges of three fin rays in its evolution from the fin of the fish. In the mammals the internal supracondylar (entepicondylar) foramen is most erratic in its appearance and disappearance, very few orders being without some family or genus which shows it. In some mammals, e.g., dog, a supratrochlear foramen is present just above the troclea; it transmits nothing. Epiphyses are found in this, as in other long bones, in amphibians, reptiles and mammals, but not in birds.

In the tailless amphi-
phibians (Anura) the radius and ulna are fused, while in the Urodela and reptiles they are always distinct. In some lizards (Iguana, Sphenodon, &c.) the ulnare (LC) deep to inter-

carpal (P.C) precondyloid (clavicle) and this is also the case in some bats. In the pronograde mammals the radius is in a position of permanent pronation, and is a much more important bone than the ulna, which is sometimes suppressed, so that little more than the olecranon process remains (e.g. horse, giraffe). In the lower Primates the ulna articulates directly with the cuneiform and (sometimes) pisiform bones, and is not shut off from the carpals by a meniscus as in man.

The carpus of the higher vertebrates may be reduced from a generalized type by the fusion or suppression of certain of its elements.

A perfect generalized type is not known to any vertebrate, though it is very closely approached by the primitive reptile Sphenodon. In such a type the bones are arranged in three rows; proximal, nearest the forearm, middle and distal. There are five bones in the proximal row, which bear the

In the Reptilia the carpus is often very generalized, as in Spheno-
don and Chelydra (see fig. 30).

In the birds the radiale and ulnare are distinct, but the distal bones are fused with the metacarpus to form a carpo-metacarpus. In Mammalia various examples of fusion and suppression occur. All that space will here allow is to attempt to show how the human carpus is derived from the generalized type. In man the radiale, radiolunar, and central radiale fuse to form a scaphoid; the semilunar is the intermedium; the cuneiform the ulnare; and the pisiform the ulnare marginale.

The trapezium and trapezoid are distalia I and II.; the os magnum distale III., fused with the centrale ulnare; while distalia IV. and V. have either fused to form the unciform, or, as some believe, distale V. has been suppressed.

In some mammals the radiale marginale is very large, e.g., mole and elephant, and is regarded as a stage in the evolution of a digit on the radial side of the pollex, hence named the pollexol. In the Cape jumping hare (Pedetes) this digit is two-jointed and bears a rudimentary nail. Further indications of another digit on the ulnar side of the metacarpus, called the 'hominus,' are sometimes seen in relation with the pisiform, which is therefore no longer regarded as a sesamoid bone, but, with the radiale marginale, as a stage in the progress from a pentadactylous to a tetradactylous manus. The central radiale persists as a distinct bone throughout life in many monkeys, as also does the radiale marginale.

In the suppression of digits in vertebrates a regular sequence occurs; the pollex is the first to go, then the minimus, index and annularis one after another, so that an animal like the horse, which has only one digit, has lost all except the medianus.

In the mammals the number of the phalanges usually corresponds with that of man, though in the lower vertebrates they are often much more numerous.

When the extremity is modified to form a paddle, as in Ichthyosau-

aur and the Cetacea, the phalanges are often greatly increased in number.

The elasmosbrach fish the pelvic girdle is a repetition of the pectoral though it is not quite so well marked. The acetabulum corresponds to the glenoid cavity, and the part of the girdle dorsal to this is the ilium; the ventral part, uniting with its fellow in the mid-line, is the ischiopubic, the two elements of which are sometimes separated by a small foramen for the passage of a nerve. When this is the case the anterior (pubic) part is the pubis, and in series with the precondyloid, while the ischiun (caudal) repeats the coracoid.

In Amphibia the connexion between the ilium and sacrum becomes established, and some of the extant Labyrinthodontia have separate pubic and ischiobasal synphyses, though in existing forms the ischiun and pubis are generally fused.

In the Urodela there is usually a bidual cartilage just in front (cephalad) of the pubes, in the mid-line, which is called the epipubis (see subsection on embryology).

In the Reptilia the ilium always projects backward towards the
SKELETON

visceral

In the lower vertebrates as well as in the embryo of man, a number of cartilaginous or bony arches encircle the mouth and pharynx (anterior part of the food tube), just as hoops encircle a barrel. There is little doubt that, when they first appeared in the history of evolution, all these bars supported gills and bounded gill slits, but in all existing types the first arch has been modified to surround the mouth and to act as both upper and lower jaws, gaining in different animals a more or less complete connexion with the cranium or brain-containing part of the skull. The first of these visceral arches, therefore, is known as the oral or jaw arch and, as has been shown, the muscles in connexion with it are supplied by the fifth nerve (see Muscular System; and Nerve: Cranial). The second visceral arch is the hyoid and is accompanied by the seventh or facial nerve. The third visceral or first branchial arch of most writers has the ninth or glossopharyngeal for its nerve supply, while the arches behind this are supplied by the vagus or tenth nerve.

It will be seen, on reading the subsections devoted to embryology and comparative anatomy, that in man the maxilla, palate, internal pterygoid, malar and tympanic bones as well as the ear ossicles, mandible, hyoid bone and thyroid cartilage are developed in connexion with this visceral skeleton. Of these the ear ossicles are described in the article EAR, the thyroid cartilage in that on the Respiratory System, while the other bones, with the exception of the hyoid, are treated under the head of SKULL. It therefore only remains to describe here the hyoid bone of man.

The hyoid bone, so called from its likeness to the Greek letter υ, lies in the upper part of the neck in close connexion with the root of the tongue and just above the thyroid cartilage of the larynx. It consists of a body across the mid-ventral line and a great and small cornu on each side (see fig. 1).

The body (basihyal) is rectangular with its long axis placed horizontally; behind it is markedly concave both from above downward and from side to side. In front it attaches several muscles, but behind it is smooth and is separated from the thyrohyoid membrane by a bursa. From its upper border this membrane runs downward to the thyroid cartilage. The great cornua (thyreokonua) are attached to both sides of the body by cartilage until middle life and afterwards by bony union. They curve upward and backward round the side of the pharynx and are laterally compressed. To their inner surface the thyrohyoid membrane is attached, while their knob-like ends are connected with the superior cornua of the thyroid cartilage by the lateral thyrohyoid ligaments.

The small cornua (ceratohyals) are conical structures about a quarter of an inch long attached to the upper part of the body at its junction with the great corna. It is only in late life that they become united with the body by bony union, if they ever do so. At their apices they are connected with the tips of the stylohyoid processes by the long thyrohyoid ligaments (epiphys).

Embryology.—In the early embryo (see MOUTH AND SALIVARY GLANDS) the mandibular processes grow forward on each side of the slit-like stomatodaeum or primitive mouth, and at length join one another in the mid-ventral line. From the proximal part of each of these another process, the maxillary, grows forward (ventrad), only more slowly, to blend with the fronto-nasal process. In each of these processes cartilage is formed in the lower vertebrates, which in the case of the mandible (lower jaw) reaches to the mid-ventral line and
forms what is known as Meckel's cartilage; but in the maxillary process the stage of chondrification is supersed& by the palato-quadrate cartilage, which is so evident in embryo fishes and amphibians is not formed. It will thus be seen that both the maxillary and mandibular bones are derivatives of the following group: Among the visceral arches, the maxillary bone is formed which blends with the sphenoid to form the internal pterygoid canal, while in front (ventral) of this the upper jaw (maxilla) is developed in membrane by several centres. Of these, an adult description of them is brought by the region of the outer side of the infraorbital canal; (2) forms the body of the bone of the inner side of that canal; (3) forms the nasal process and the socket for the canine tooth; (4) makes the posterior three-quarters of the palate, and (6) forms the premaxilla, each of the latter contributing a socket for one of the two incisor teeth. When these premaxillary sutures fail to unite, the deformity known as "cleft palate" is produced and this may occur either between the lateral incisor and the canines or between the central and lateral incisor teeth. The recent researches of Professor E. Fawcett point to the conclusion that these centres are not as numerous as is generally thought. He regards (1) and (2) as a single centre which grows up round the infraorbital canal, while the premaxilla he finds need not necessarily have two centres. The maxillary antrum is first developed as an outgrowth from the cartilage of the olfactory capsules. From this centre, which represents the dentary of lower vertebrates, the whole adult bony jaw is formed and the greater part of Meckel's cartilage disappears by a process of resorption, with the exception that the bone is mainly maintained in the secretory centres for the body of the maxilla and at a little later date (see E. Fawcett, Journ. Anat. and Phys., vol. 40, p. 400).

The mandibular or Meckel's cartilage is continued up into the temporals where it joins the proximal end of the cartilage of the second or hyoid arch, and it is from this junction (hyomandibular plate) that, according to H. Gadow, Anat. Anzeiger, Bd. 19, p. 396, the malleus and incus bones of the middle ear are developed (see Fawcett, Thesis for the Degree of Doctor of Medicine, University Library, Edinburgh, 1906; also A. Lowe, "Development of Lower Jaw in Man," Proc. Anat. Soc. of the University of Aberdeen, 1905, p. 59). In the latter paper the literature is reviewed.

At birth the two halves of the mandible are separate as they are throughout life in many mammals (e.g. rodents), but in man they join together at the end of the first year.

It is generally accepted that within the symphysis of the dorsal or proximal ends of the first and second visceral arches unite to form the hyomandibular plate from which, following H. Gadow, the malleus and incus are derived. The stapes is also probably formed from the process of ossification of the stapedial arch (see fig. 33, T.H.). For the body of this bone is mainly maintained in the cartilage of the arch, which fuses with the tympanohyal between twenty and twenty-five weeks. For some distance beyond the stylohyal element the cartilage degenerates into fibrous tissue forming the stylohyoid ligament; this represents the epihyal cartilage, and in the amphibians and fish it ossifies to form a normal bone (fig. 33, E.H.). Near the middle line the cartilage persists as the ceratohyal element or lesser cornu of the hyoid bone (fig. 33, L.I.L.). This is the condition where the cartilage has been maintained in the first arch (fig. 33, T.H.), while in the second arch the cartilage fuses with the skull as the stylohyal bone of the second arch (fig. 33, T.H.).

The dorsal part of the cartilage of the third arch is wanting, but its lateral part forms the thyrohyal and medial cornu of the hyoid bone (fig. 33, Th.H), while its ventral part fuses with its fellow of the opposite side as well as with the ventral part of the second arch to form the body of the hyoid bone. The fourth and fifth arches only develop cartilage in the ventral-lateral parts and fuse to form the thyroid cartilage of the larynx (fig. 33, Th.C.) (see Respiratory System).

Comparative Anatomy.—In the Amphibians the pharynx is stiffened by chitinoid bars which lie between the gill slits, but it is unlikely that

![Fig. 33.—Diagram to show the fate of the Visceral Arches in man (and with modifications) other mammals. Membrane bone white. Cartilage and cartilage bones black. Cartilage which has degenerated into elements dotted.](https://example.com/fig33)

These are really homologous with the visceral skeleton of higher forms, though, in serving the same purpose, they are certainly analogous.

Among the Cyclostomata (hag and lampreys) there is an arrangement known as the "branchial basket," which has a more superficial position than the visceral arches of fish and probably corresponds to the extra-branchials of those vertebrates. The oral and hyoid arches are very rudimentary and probably have degenerated in consequence of the sectorial mode of nourishment. In the Elasmobranchii (sharks and rays) the visceral skeleton is entirely cartilaginous. In the more primitive types such as the comb-toothed shark (Notopterus) the oral and hyoid arches are quite distinct. The oral arch consists of the upper jaw, or palato-quadrate cartilage, and the lower jaw, or Meckel's cartilage; these articulate with one another posteriorly and also with the skull. Behind these and distinct from them is the hyoid arch. Such a type of suspensorium or jaw articulation is called autostylic. In the rays, on the other hand, the oral arch is connected with the skull by the proximal segment of the hyoid arch, which, since it connects both the hyoid and mandibular (oral) arches with the skull, is called the hyomandibular cartilage. This type of suspensorium is termed hypostylie.

Below the hyomandibular cartilage the hyoid arch has two other
segments, the ceratohyal laterally and the basihyal ventrally where it fuses with its fellow of the opposite side. Sometimes an epihyal intervenes between the branchial arches and the hyoid arch. In most fishes and tetrapods the branchial bar ossicles form the palate, e.g., maxilla and pterygoids and branchial arches from before backward, while outside these ossicles is another row of visceral bones formed by the premaxilla, maxilla and jugal or malar. In the lower jaw, Meckel's cartilage is ossified at its proximal end to form the articular bone, but distally it remains and is partly encased by the dentary, and more posteriorly by the angular, both of which are membrane bones. The jaw joint therefore is between the quadrate and the articular. In comparing this description with the section on human embryology it will be seen that certain bones, like the palate and pterygoids, which in the fish are ossifications in cartilage, become in the higher vertebrates membrane bones, and so it is clear that the expression must not be laid on too literally in the historical history of a bone in determining its morphological significance.

The branchial arches of the Teleostomi closely resemble those of the Elasmobranchii except that they ossify and that the extra-branchials have disappeared.

In the Dipnoi (mudfish) the suspensorium is autostylic, and either five or six branchial arches are present. In the Amphibia, too, the suspensorium is autostylic, the palato-quadrate bar remains largely cartilaginous, though it posterior part is often ossified to form the quadrate. The membranous premaxilla, maxilla, palatine, pterygoid, quadrate and jugal and squamosal bones are developed in connexion with it. It is interesting to notice that the pterygoid is sometimes partly cartilaginous, and in some cases a mento-meckelian is absent in the tadpole. In the crocodiles the maxilla and palate grow inwards to meet one another and so form a hard palate. The mandible has dentary, splenial, angular, surangular, articular and coronoid bones. Although the modifications are numerous, they are not of special interest in elucidating the problems of human morphology.

In the Mammalia the premaxilla, maxilla, palate and pterygoid bones are seen in connexion with the region where the palato-quadrate cartilage lies in the lower Vertebrae (see fig. 34). The premaxilla forms the incisor teeth, and in man the suture between it and the maxilla is evident on the face if a young enough animal is being looked at. The maxilla bears the rest of the teeth and articulates laterally with the jugal or malar, which in its turn articulates posteriorly with the zygomatique process of the quadrate. The splenial, angular, surangular, articular and coronoid bones, is formed. Both the maxilla and palate form the hard palate as in crocodiles, though the pterygoid bone does not do so but fuses with the sphenoid to form the internal pterygoid plate (see fig. 34, P1). The mandible no longer articulates with the quadrate but forms a new articulation, by means of the condyle, with the gneidoid cavity of the squamosal, and many modern morphologists, including the writer, are inclined to agree with H. Gadow that the quadrate has probably become the tympanic bone. In many mammals (e.g. Carnivora) this bone swells out to form the bulla tympani. The development of the auditory ossicles has been discussed in the section on embryology as well as in the article EAR. The presence of a chain of ossicles is peculiar to the Mammalia.

In many of the lower mammals (e.g. Ungulata and Carnivora) the bulla is much more reduced than in these higher forms, and the tympano-, stylo-, epi-, cerato- and basihyal elements all being bony (see fig. 34). It is of interest to notice that in the hare and rabbit the body of the hyoid has occasionally been found in two pieces, indicating its derivation from the second and third visceral arches. The fourth and fifth arches, which form the thyroid cartilage in mammals, are considered in the article RESPIRATORY SYSTEM.

For further details see S. H. Reynolds, The Vertebrate Skeleton (Cambridge, 1897); W. Flower, Osteology of the Mammalia (London, 1888); R. Wiedersheim, Comparative Anatomy of Vertebrates, adapted and translated by W. N. Parker (from the third German edition, Leipzig, 1901); C. Gegenbaur, Vergleich. Anat. der Wirbeltiere, Bd. i. (Leipzig, 1901).

SKELTON, JOHN (c. 1400-1529), English poet, is variously asserted to have belonged to a Cumberland family and to have been a native of Northumberland. He is said to have been educated at Oxford. He certainly studied at Cambridge, and he is probably the "one Skelton" mentioned by William Cole (MS. Athen. Cantab.) as taking his M.A. degree in 1484. In 1490 Caxton writes of him in the preface to The Boke of Encyclos compiled by Vrgeyle, in terms which he proved that he already won a reputation as a scholar. "But I pray master John Skelton," he says, "late created poete laureate in the universtye of Oxenforde, to oversee and correct this sayd booke ... for him I know for suffycient to expowne and englesse every dyffycyte that is therein. For he hath late translated the epypedes of Full, and the ye of dydouoribus, and divers other works ... in polysshed and ornate termes |craffily |I suppose he hath drunken of Eliycones well. The laureate referred to was a degree in rhetoric. Skelton received in 1493 the same honour at Cambridge, and also, it is said, at Louvain. He found a patron in the pious and learned countess of Richmond, Henry VII.'s mother, for whom he wrote Of Mannes Lyfe the Peregrynacion, a translation, now lost, of Guillaume de Deggulette's Pereirage de la vie humaine. An elegy "Of the death of the noble prince Kyngge Edwarde the forth," included in some of the editions of the Mirror for Magistrates, and another (1499) .1
on the death of Henry Percy, fourth earl of Northumberland, are among his earliest poems. In the last decade of the century he was appointed tutor to Prince Henry (afterwards Henry VIII.). He wrote for his pupil a lost Speculum principis, and Erasmus, in dedicating an ode to the prince in 1500, speaks of Skelton as "unum Britannicarum literarum lumen ac decus." In 1498 he was successively ordained sub-deacon, deacon and priest. He seems to have been imprisoned in 1502, but no reason is known for his disgrace. Two years later he retired from regular attendance at court to become rector of Duss, a benefice which he retained nominally till his death. Skelton frequently signed himself regius orator and poet-laureate, but there is no record of any emoluments paid in connection with these dignities, although he bought du Rieusel's Recherches sur les poetes couronnes, asserts that he had seen a patent (1513-1514) in which Skelton was appointed poet-laureate to Henry VIII.

As rector of Duss he caused great scandal among his parishioners, who thought him, says Anthony à Wood, more fit for the stage than for the pew or the pulpit. He was secretly married to a woman who lived in his house, and he had earned the hatred of the Dominican monks by his fierce satire. Consequently he came under the formal censure of Richard Nix, the bishop of the diocese, and appears to have been temporarily suspended. After his death a collection of satirical tales, no doubt chiefly, if not entirely, apocryphal, gathered round his name—The Merie Tales of Skelton. During the rest of the century he figured in the popular imagination as an incorrigible practical joker. His sarcastic wit made him some enemies, among them Sir Christopher Garnessie or Garnesie, Alexander Barclay, William Lilly and the French scholar, Robert Gaguin (c. 1425-1502). With Garnesie he engaged in a regular "flying," undertaken, he says, at the king's command, but Skelton's four poems read as if the abuse in them were dictated by genuine anger. Earlier in his career he had found a friend and patron in Cardinal Wolsey, and the dedication to the cardinal of his Replyacion is composed of flattering terms. But in 1529 Wolsey in his capacity of legate dissolved convocation at St Paul's, Skelton put in circulation the couplet:

"Gentre Paul, laide doue thy sward
For Peter of Westminster hath shaven thy beard."

In Colyn Cloute he incidentally attacked Wolsey in a general satire on the clergy, but Speke, Parrot and Why come ye nat to Courte? are direct and fierce invectives against the cardinal who is said to have more than once imprisoned the author. To avoid another arrest Skelton took sanctuary in Westminster Abbey. He was kindly received by the abbot, John Ipa, who continued to protect him until his death on the 11th of May, 1529. The inscription on his tomb in the neighbouring church of St Margaret's described him as rates piersis.

In his Garlande of Laurell Skelton gives a long list of his works, only a few of which are extant. The garland in question was worked for him in silks, gold and pearls by the ladies of the court at Harwich, and was presented to the countess of Somerset at the marriage of the duke of Norfolk. The composition includes complimentary verses to the various ladies concerned, and a good deal of information about himself. But it is as a satirist that Skelton merits attention. The Burial of Chaucer is directly attacked, and the vices and follies of court life. He had already in his Boke of the Three Voles drawn on Alexander Barclay's version of the Narrenschiff of Sebastian Brant, and this more elaborate and imaginative poem belongs to the same class. Skelton, falling into a dream at Harwich, sees a stately ship in the harbour called the Bewge of Court, the owner of which is the Dame Saunce Pere. Her merchandise is Favour; the helmsman Fortune; and the poet, who figures as Drede (modesty), finds on board Favell (the flatterer), Suspect, Harvy Hafter (the clever thief), Dyslayne, Ryotte, Dyssemubler and Subtyle, who all explain themselves in turn, until at last Drede, who finds they are secretly his enemies, is about to save his life by jumping overboard, when he awakes with a start. Both of these poems are written in the seven-lined Chaucerian stanza, but it is in an irregular metre of his own that his most characteristic work was accomplished. The Boke of Philip Sparowe, the lament of Jane Scrope, a schoolgirl in the Benedictine convent of Carwe near Norwich, for her dead bird, was no doubt inspired by Catullus. It is a poem of some 1400 lines and takes many liberties with the formularies of the church. The digressions are considerable. We learn what a wide reading Jane had in the romances of Charlemagne, of the Round Table, The Four Sons of Aymon and the Trojan cycle. Skelton finds space to give his opinion of Chaucer, Gower and Lydgate. He seems fully to have realized Chaucer's value as a master of the English language. Gower's matter was, he said, "worth gold," but his English he regarded as "the worst of all." Skelton's wit is aptly illustrated in which the poem is written, called from its inventor "Skeltonial," is here turned entirely to whimsical use. The lines are usually six-syllabled, but vary in length, and rhyme in groups of two, three, four and even more. It is not far removed from the old alliterative English verse, and well fitted to be chanted by the minstrels who had sung the old ballads. For its comic adumbration of Latin Skelton had abundant example in French and Low Latin macaronic verse. He makes frequent use of Latin and French words to carry out his exacting system of frequently recurring rhymes. This breathless, voluble measure was in Skelton's energetic hands an admirable vehicle for invective, but it easily degenerated into doggerel. By the end of the 16th century he was a "rude rayling rimer" (Pattenham, Arte of English Poesie), and at the hands of Pope 4 and Warton he fared even worse. His own criticism is a just one:

"For though my ryme he ragged,
Tattered and jagged,
Ruddy rayme beaten,
Rusty and moughte eaten,
It hath in it some pythy."

Colyn Cloute represents the average country man who gives his opinions on the state of the church. There is no more scathing indictment of the sins of the clergy before the Reformation. He exposes their greed, their ignorance, the ostentation of the bishops and the common practice of simony, but takes care to explain that his accusations do not include all and that he writes in defence of, not against, the church. He repeatedly hits at Wolsey even in this general satire, but not directly. Speke, Parrot has only been preserved in a fragmentary form, and is exceedingly obscure. It was apparently composed at different times, but in the latter part of the composition he openly attacks Wolsey. In Why come ye nat to Courte? there is no attempt at disguise. The wonder is not that the author had to seek sanctuary, but that he had any opportunity of doing so. He rails at Wolsey's ostentation, at his almost royal authority, his overbearing manner to suitors high and low, and taunts him with his mean extraction. This scathing invective was not allowed to be printed in the cardinal's lifetime, but it was no doubt widely circulated in MS. and by repetition. The charge of coarseness regularly brought against Skelton is based chiefly on The Tumnyng of Elynowere Rymynge, a realistic description in the same metre of the drunken women who gathered at a well-known ale-house kept by Elynowr Rymynge at Leatherhead, not far from the royal palace of Nonsuch. "Skelton Laureate against the Scottes" is a fierce song of triumph celebrating the victory of Flodden. "Jemmy is ded And closed in led, That was thryw owne Kyng," says the poem; but there was an earlier version written before the news of James IV.'s death had reached London. This, which is the earliest singly printed ballad in the language, was entitled A Ballad of the Scottishe Kyngis Tyme, was printed in 1578 from the wooden covers of a copy of Hsion de Bordeaux. "Howe the dounti Duke of Albany, lyke a coward knight " deals with the campaign of 1523, and contains a panegyric of Henry VIII. To this is attached an envoi to Wolsey, but it must surely have been

1 Bowge—Fr. bouche; court rations. The term is explained as the right to eat at the king's table.

2 (Spence, Anecdotes, p. 87): Pope said: "Skelton's poems are all low and bad, there is nothing in them that is worth reading," and (in Satires and Epigrams, v. 38) "And beastly Skelton heads of houses quote."
misplaced, for both the satires on the cardinal are of earlier date.

Skelton also wrote three plays, only one of which survives. Magnificence is one of the best examples of the morality play. It deals with the same topic as his satires, the evils of ambition; its moral, "how suddenly of all creatures death doth come." Thomas Wornton in his History of English Poetry described another piece Nigranamistr, printed by Wynkyn de Worde in 1504, and dealing with simony and the love of money in the church; but no copy is known to exist, and some suspicion has been cast on Wornton’s statement.

Illustration of the hold Skelton had on the public imagination is supplied from the stage. A play (1600) called Skogan and Skelton, by Richard Hathway and William Rankins, is mentioned by Henslowe. In Anthony Munday’s Downfall of Robert, earl of Huntingdon, Skelton acts the part of Friar Tuck, and Byn Johnson in his masque, The Fortune-Ides, introduced "Skogan and Skelton in like habits as they lived."

Very few of Skelton’s productions are dated, and their titles are here necessarily abbreviated. Wynkyn de Worde printed the Beuage of Cowe twice. David Balfour and later solutions devoted by Master Show Larewe and Skelton Late rate an agyntse a comely Coyntrewe, have no date or printer’s name, but are evidently from the press of Richard Pynson, who also printed Replication against certain yong scelerates. The Gentleman and Maister of London was printed by Richard Faukes (1523); Magnificence, A goodly interlude, . . . probably by John Rastell about 1533, reprinted (1821) for the Roxburghe Club. Hereafter foloweth the Boke of Phyllip Spere was printed by Robert Pynson (1525); Richard Brey, Artow, Young, Skelton (1560) ?, Abraham Veale (1570), John Walley, John Wyght (1560 ?). Hereafter foloweth certaine bokes compiled by maister Skelton . . . including "Spke, Parrot," . . . Ware the Hawke, is misprinted. Skelton, at least, was not his name,

nor are any of the preceding printers. Skelton’s titles were printed by Richard Lant (1535), John King and Thomas March (1565 ?), by John Day (1560). Hereafter foloweth a little boke called Calyn Clouwe and Hereafter . . . why came ye not to Contesse ? were printed by Richard Kele (1550 ?) and in numerous subsequent editions. Phéty, pleasant and profitable works of maister Skelton, Poete Laurete. Nowe collected and newly published was printed in 1598, and reprinted in 1735. A scarce reprint of Ehle Rummert by Sambeni and adapted for the stage (1572) is known.

See The Poetical Works of John Skelton; with Notes and some account of the author and his writings, by the Rev. Alexander Dyce (2 vols., 1843). A selection of his works was edited by W. H. Williams (London, 1862). See also Zur Charakteristik John Skeltons by Dr Arthur Koebinger (Stuttgart, 1901); F. Brie, "Skelton Studien in Englishe Studien, vol. 38 (Heidelberg, 1877, etc.); A. Re, Skelton’s Satirical Poems. (Penne, 1890); W. Lyday, Studien über John Skelton (Leipzig-Reudnitz, 1905); G. Saintbury, Hist. of Eng. Proseody (vol. i., 1900); and A. Kölbing in the Cambridge History of English Literature (vol. iii., 1909).

SKELTON AND BROTTON—SKI

BROTTON, an urban district in the Cleveland parliamentary division of the North Riding of Yorkshire, England, 17 m. E. of Middlesbrough, on the main line of the North Eastern railway, with stations at Brotton and North Skelton. Pop. (1901) 13,240. This is one of the largest townships in the Cleveland ironstone district, and its industrial population is wholly employed in the quarries. The modern Skelton Castle incorporates part of the ancient stronghold of Robert de Bras who held it from William the Conqueror. A modern church replaces the ancient one, of which there are ruins, and a fine Norman font is preserved. The large ironstone quarries have not wholly destroyed the beauty of the district. The Cleveland hills rise sharply southward, to elevations sometimes 2,000 ft. and are scored with deep and picturesque glens. On the coast, which is cliff-bound and fine, is the watering-place of Saltburn by the Sea.

SKEENE, WILLIAM FORBES (1800-1892), Scottish historian and antiquary, was the second son of Sir Walter Scott’s friend, James Skene (1775-1864), of Rubislaw, near Aberdeen, and was born on the 7th of June 1800. He was educated at Edinburgh High School, in Germany and at the university of St Andrews, taking an especial interest in the study of Celtic philology and literature. In 1832 he became a writer to the signet, and shortly afterwards obtained an official appointment in the hill department of the Court of Session, which he held until 1865. His early interest in the history and antiquities of the Scottish Highlands bore its first fruit in 1837, when he published The Highlanders of Scotland, their Origin, History and Antiquities. His chief work, however, is his Celtic Scotland, a History of Ancient Alban (3 vols., Edinburgh, 1870-1880), perhaps the most important contribution to Scottish history written during the 19th century. In 1879 he was made a D.C.L. of Oxford, and in 1881 historiographer royal for Scotland. He died in Edinburgh on the 29th of August 1887.

The most important of Skene’s other works are: editions of John of Fordun’s Chronica gentis Scotorum (Edinburgh, 1871-1872); of the Four Ancient Books of Wales (Edinburgh, 1868); of the Chronicles of the Picts and Scots (Edinburgh, 1867); and of Adamnan’s Vita S. Columbae (Edinburgh, 1874); an Essay on the Coronation Stone of Stone (Edinburgh, 1866); and Memorials of the Family of Skene of Skene (Aberdeen, 1887).

SKETCH (directly adapted from Dutch schets, which was taken from It. schizzo, a rough draft, Lat. schedium, something hastily made, Gr. ἱχθέος, sudden, off-hand, ἱχθεός, near by; Gz. Skizze and Fr. esquisse are from the same source), a rough or hasty preliminary outline or draft serving as a note or material for a finished work. Though used of literary composition, as for a short slightly constructed play, or of a rapid delineation in words of an event or character, the term is chiefly used of the putting on paper or other material of the immediate impression of an object, figure, landscape, &c., by an artist, or of an artist’s first idea or conception of a work whether in painting or sculpture.

SKI (pronounced skee, skee, snow-shoe, properly "piece of wood ", the wooden snow-shoe on which the inhabitants of Scandinavia or of Finnish origin travel over the snow. Implements for this purpose were used by many nations of antiquity. Xenophon (Anab. iv. 5) describes the shoes or pattens of skins with which the horses of the Armenians were shod, to prevent them from sinking into the snow, and Procopius mentioned the ancient Lapps, known as "Skrid-Finnen," or sliders. Snow-shoes have always been used by the Mongols of north-western Asia. From the evidence of the old Norse sagas they must have been general in Scandinavia long before the Christian era. Ullr, the god of winter, is always spoken of as walking upon skis, and the legend, which is based upon the legend that they were really ships upon which the god was wafted over hill and dale. Skis have been used time out of mind by Lapps, Finns and Scandinavians for hunting and journeying across the frozen country. The first skis of which there is any record were elongated, curved frames covered with leather. Those of the Skrid-Finnen of the 16th century were leather shoes, pointed at the toe, about 3 ft. long, into which, a few inches from the rear end, the feet were thrust up to the ankles. The form of the shoe varied in different districts. Modern skis are not, like the North American snow-shoe, made of broad frames covered with a thick web, but long, narrow, nearly flat pieces of ash, oak or spruce, pointed and turned up for about a foot at the toe. Their length is usually the distance their wearer can reach upwards with his hand, that for the average man being about 7 ft. 6 in., although some advocate less length.

Their width at the broadest part is about 5 in., and their greatest thickness (just under the foot) about 3 inches, tapering towards both ends. The under surface is usually perfectly smooth, although some skis are provided with narrow strips running lengthwise on the top, so that their endless edges, called runners, which are usually sharpened at the ends, may slide rapidly over the snow. The feet are held in by straps fastened into stout deer-hide shoes, heelless or nearly so, are fastened to the middle of the skis by an arrangement of straps, called the binding. A staff from 4 to 5 ft. long completes the touring outfit. On level ground the skis are allowed to glide over the snow without being lifted from it, the heels being raised while the toes remain fast to the skis. At this gait very long steps can be taken. Climbing hills one must walk zigzag, or even directly sideways step by step. Gentle slopes can be ascended straight ahead by planting the skies obliquely. Downhill the skis become a sledge upon which great velocity is attained. The staff is used as a brake in coasting, and is provided with a small disc a few inches from the lower end, to prevent it sinking into the snow.

Skiing as a sport began about 1860 in the Norwegian district of Telemark and rapidly spread over all the Scandinavian
peninsula. The climax of the racing season is the great international ski tournament held annually in February at Holmenkollen, 6 m. from Christiania. This "Norwegian Derby" is divided into two parts, the first devoted to jumping contests, the other to long-distance racing. The take-off for the jumping contests is built into the side of a hill, and each competitor makes three jumps. No staff is allowed and no jump is counted if the jumper falls in alighting. The distances covered are extraordinary, 134 ft. being the record. The jumper, who starts some distance up the hill, descends at top speed, stops as he nears the take-off and launches himself into the air with all his force. He maintains an erect position until he reaches the ground, alighting with bent knees, on both feet, one a little in advance of the other, and "giving" with his legs to overcome the force of the fall and to preserve his balance. Another feature is double jumping, performed by two persons hand in hand. The highest prize is the King's Cup. The principal distance race is over a difficult course of about 20 m. The record for 25 kilometres (15½ m.) is 2 hours, 7 min. A Lapp once covered 220 kilometres (about 138 m.) in 21 hrs., 22 min., the country being level. Skiing is very popular in Norway with both men and women; in fact it may be called the national sport of Norway.

The sport has been introduced into other countries where the winter is severe, and has become very popular in Switzerland and the United States, especially in Minnesota and the Rocky Mountain states. The principal club in the British Isles is the "Ski Club of Great Britain." The swarms between Chile and the Argentine Republic are carried in winter by relays of Norwegian ski-runners, about 300 being employed. The skis worn by them are usually short with horns. Skis cannot be used with advantage during a thaw or where the snow is less than 6 in. deep. On this account, and because of their general un-wieldiness, they are less convenient in thick forests than the Indian snow-shoe, though faster in the open country.

Ski have been used for military purposes by the Northern peoples for several centuries, and of late years other nations which at various times have been visited by snow have also taken their attention to this most useful mode of winter marching. The army of Sweden—under Gustavus Adolphus and his successors—one of the foremost in Europe—employed infantry provided with ski in its military operations. In Norway special units so provided were organized in 1710. Recently (1902) the Alpine infantry of France and Italy have taken up the question. In Briançon, attached to the 159th regiment of French infantry, is an école militaire de ski (established 1903) which trains the Chasseurs Alpins of the 1st line, and also the regional troops which are intended to take part in the defence of the southeastern frontier of France. These regiments as a rule furnish one officer, one non-commissioned officer and 10 men and 5 soldiers each to every course of instruction, which lasts two months. At the end of the first month the skieur is expected in full marching order to cover 60 kilometres (37½ m.) of Alpine territory in the day. The ski are put to a variety of ingenious uses; to form a stretcher-sledge for wounded men; if rapidity of movement is desired, a horse or pony pulls the skieur along by means of long reins attached to the horse’s girth. Even camps in the mountains are improvised. The skieur is thickly clothed and muffled, and his eyes are protected against snow-blindness by blue or black spectacles. Some of the performances of soldiers on ski have been notable. Capt. Carl in Berchtesgaden, chief of the école of Briançon, ascended the col of Arsiné (2400 metres) and of the Cauterel (2080 metres) in 16 hours with a party of 25 men. In Russia some Finnish troops in full marching order executed a long hunting march in Carelia. In 29 days they covered 860 kilometres. In Switzerland a skieur took less than 11 hours to cover 25 kilometres, including altitudes of 1547 metres. In order to witness this competition, which took place in Glarus, the soldiers from the S. Gothard garrison made a march of 48 kilometres including the ascent of the Klausengrass (2000 metres). A Norwegian soldier named Holte covered with one leap a distance of 1 m. 20 cm., and his companion Heyerdahl later achieved 24.

In Italy each company of Alpini has an annual credit for the provision of ski. Their duties in war time are almost the same as those of mounted infantry—exploration and communication, and the seizure of advanced positions.

In the seven months of snow on these frontiers the garrisons of the lonely posts cannot go out save on ski or snow-shoes, as to the respective merits of which military opinion is divided.

SKIBBEREEN, a market town of county Cork, Ireland, on the river Ilen about 3 m. from its estuary, 533 m. S.W. of Cork by rail. It is connected with Blackwater and South Coast railway. Pop. (1901) 3268. The river is fordable for boats. Skibbereen is the town itself, and for larger ones to Old Court on the estuary; and the town is a flourishing fishing-station. Trade in corn and other agricultural produce is considerable. This district suffered terribly in the famine of 1847, and hundreds of victims were buried in pits in the graveyard adjoining the ruined Cistercian cell of Abbeystrawry, a mile west of the town. The Ilen offers fishing, late in the season, for brown and sea trout. The main railway continues south to Baltimore, and a light railway runs to the pleasant seaside village of Skull (or Schull), 15 m. W. Skibbereen is governed by an urban district council.

SKIEN, a seaport of southern Norway, in Bratsberg amt (county), on the river Skien, 5 m. below its issue from Lake Nord, and 6 m. above its outflow into Frier Fjord. Pop. (1900) 11,343. It was mostly rebuilt after a fire in 1886. Here Henrik Ibsen, the dramatist, was born in 1828. In 1802 a canal ascending 189 ft. by means of 17 locks was made between lakes Bandak and Nord, giving access to the Telemark district by way of Dalen. The whole distance between the lakes is 40 m., and several fine falls, as the Ulefos, Eidsfos, and Vrangfoss, are passed. The engineering is noteworthy. In the town and district are many saw-mills, planting, cotton-spinning and flour-mills, factories for wood-pulp and domestic commodities, and a competitor to the Norwegian mining (at Omdal). The exports are ice, timber (including telegraph poles for the British government), wood-pulp and copper, and the imports coal and china-clay. The town (the ancient Skidea) dates from the 14th century. A fine view is obtained from the Bratsberg Klev, S.E. of the town, with ruins of a chapel.

SKIERNIEWICE, a town of Russian Poland, in the government of Warsaw, 41 m. by rail S.W. from the city of Warsaw. Pop. (1897) 9846. It was formerly the see of the archbishop of Gnesen, priolate of Poland. Here is an imperial castle, in which the emperors of Russia, Austria and Germany met in conference on the 13th-17th of September 1884. Cloth and linen are manufactured.

SKIMMER, the English name bestowed by T. Pennant in 1781 on a North American bird which had already been figured and described by M. Catesby (B. Caroliniana, i. pl. 90) as the "Cut-water,"—as it appears still to be called on some parts of the coast,—remarkable for the unique formation of its bill, in which the maxilla, or so-called upper mandible, is capable of much vertical movement, while the lower mandible, which is considerably the longer of the two, is laterally compressed so as to bear this thin blade-like blade. This bird is the Rynchops nigra of Linnaeus, who, however, united with it what proves to be an allied species from India that, having been indicated many years before by Petiver (Gaz. Philosoph. tab. 76, fig. 2), on the authority of Buckley, was only technically named and described in 1838 by W. Swainson (Anim. Menageries, p. 362) as R. acu-licollis. A third species, R. flaviventer, inhabits Africa; and examples from South America, though by many writers regarded as identical with R. nigra, are considered by Howard Saunders (Proc. Zool. Soc., 1882, p. 522) to form a fourth, the R. melanura of Swainson (at supra, p. 340). All these

"I call it Skimmer, from the manner of its collecting its food with the lower mandible, as it flies along the surface of the water" (Gen. of Birds, p. 52).

"Other English names applied to it in America are " Razorbill," " Scissorsbill," and " Shearwater."
SKIN AND EXOSKELETON

In anatomy, the skin (A.-S. *skinn*) is the covering of the whole body and is continuous at the different orifices with the mucous membrane. It acts firstly as a protective layer, secondly as a regulator of the temperature, thirdly as an excretory organ and fourthly as a tactile and sensory organ in which nerves end. The skin varies in thickness from 0.5 mm. in the eyelids to 4 or more mm. in the palms and soles; it is also very thick over the back of the body. Two main layers are recognized in the skin; superficially there is the scarff skin or epidermis and more deeply the dermis or true skin. The epidermis under the microscope is seen to consist of five layers. On the surface is the horny layer or *stratum corneum* (see fig. 1) composed of layers of scale-like cells, the walls of which are turned into the horny substance keratin. Deep to this is a thin layer of scale-like cells without keratin known as the *stratum lucidum*. Deeper still is a layer, the *stratum granulosum*, in which the cells are not so flattened and contain granules of a substance known as eledin. In the fourth layer, *stratum mucosum* or *stratum Malpighii*, the cells are polygonal and are connected together by delicate prickly-like processes. It is in the deeper layers of these cells that the pigment of the negro's skin is found. The fifth and deepest layer of the epidermis is the *stratum germinativum*, in which there is only one layer of columnar cells. The whole of the epidermis is non-vascular, and it will be noticed that as the different layers approach the surface the cells become more and more flattened. The true skin, *dermis or corium* is composed of a felted network of white fibrous tissue with a small number of yellow elastic fibres interspersed. It is divided into two layers. The superficial or *papillary layer* lies next to the epidermis and is raised into a number of papillae or conical projections which fit into corresponding depressions on the deep surface of the epidermis. In sensitive parts like the palms and soles these papillae are specially prominent and form wavy lines, each of which consists of a double row between which the ducts of the sweat glands pass on their way to the surface. So large are the papillae in these situations that the epidermis is also raised into ridges, and these in the fingers form the characteristic whorls so valuable for purposes of identification. The papillae contain laesures of blood-vessels, and in some of them are special tactile corpuscles in which the nerves end (see Nervous System). In the deeper or *reticular layer* of the true skin the fibrous feltwork is looser and encloses pellets of fat. It also contains a network of blood-vessels and nerves, and in some places a layer of striped or unstriped muscle. Where hairs are present the hair follicles lie in this deeper layer, which gradually merges with the subcutaneous fatty tissue (see fig. 2).

As appendages of the skin are found the hairs, the nails and the sebaceous and sweat glands.

Hair.—The hairs are found in man on the scalp, eyelids, eyebrows, armpits, pubic region, vestibule of the nose, external auditory meatus, face, ventral surface of the trunk and dorsal surfaces of the leg, forearm and hand; indeed the only places which are quite free from them are the palms of the hands, soles of the feet and the glans penis. In some places, such as the armpits, pubic region and the face of the male they grow to a considerable length at and after puberty. They are of great anthropological interest since they differ in colour and texture in different races, sometimes being straight, sometimes wavy, sometimes curly. The amount and distribution of long hairs also vary with the race. In section it is only the straight hairs which are regular; wavy and curly hairs are oval. In the centre of each hair is the medulla or pith, though this is not always present; it is composed of nucleated cells containing pigment, fat and air spaces. Outside this is the fibrous layer or cortex, also containing pigment and air spaces, while most superficially is the cuticle made up of overlapping scales. The hair grows at its root from a hair follicle (see fig. 2), which is a tubular inpulpv of the epidermis into the true skin or, in the case of large hairs, deeper still into the superficial fascia. It is divided into an inner and outer root sheath, the former representing the more superficial layers of the epidermis, the latter the deeper layers. At the bottom of the follicle the hair enlarges to form the bulb, and into the lower part of this a vascular papilla projects into the skin. The cells of the hair are derived from, and are continuous at the bulb with those of the outer root sheath, and therefore with the deeper layers of the epidermis.

The hair follicle always projects somewhat obliquely into the skin, and attached to the side toward which it is leaning is a small band of non-striated muscular fibres called arrector pili. When this acts it diminishes the obliquity of the hair and so makes it "bristle" or "stand on end," while a general contraction of these small muscles leads to the familiar condition of "goose flesh."

Nails.—The nails are specially thickened parts of the epidermis, and are divided into a root and a body. The former is concealed by a fold of skin, and the corium on which it lies is known as the nail matrix. The body of the nail also lies on the corium, or true skin, which forms the nail bed and is very sensitive. This body of the nail is formed by the stratum germinativum and stratum mucosum in its deeper part, and more superficially by the stratum lucidum, which is here very much thickened and converted into keratin or horn. Near the root of each nail is a semi-lunar area which is more opaque than the rest and forms the white lunula.

Sweat Glands.—Sebaceous glands are found wherever there are hairs, however rudimentary, and open by their ducts into the superficial part of the hair follicle (see fig. 2). Their deeper or secreting part divides into a number of bag-like alveoli composed of cells, which secrete oil droplets. There may be two or three glands to each hair follicle, and their size does not vary directly with that of the hair, since they are very large in the nose, where the hairs are quite rudimentary. They are also found on the labia minora and nipples, where no hairs are. Sudoriparous or sweat glands (see fig. 2) are found all over the surface of the body,
but are specially numerous on the palms and soles. It is estimated that in the palm there are nearly 3000 to a square inch, while in the skin of the back they do not reach 500 to the same area. In the armpits and groins they are very large. Each consists of a single long tube, lined by columnar epithelium, and coiled up into a ball or glomusum in the subcutaneous tissue, after which it pierces the corium and epidermis to reach the surface at the *pores sudoriferae*. Where the stratum corneum of the epidermis is thick the duct is twisted like a corkscrew as it goes through.

The glands of Moll in the eyelids and the ceruminous or wax glands of the ear are modified sweat glands; the former, when inflamed, cause a "sty."

**Embryology**

The skin is derived partly from the ectoderm and partly from the mesoderm of the embryo. The whole of the epidermis become very large in the later months of embryonic life, and secrete a large amount of the amniotic fluid or vernix. The development of the mammary gland from modified sebaceous glands has already been referred to (see MAMMARY GLAND).

**Comparative Anatomy**

In the larval (gastrula) stage of the Amphioxus (lanceolata) cilia are present on the surface of the mesenchyme which underlies the future head and all other external organs. Fishes and amphibian larvae there is a striated layer on the free edge which is looked upon as a relic of ancestral cilia.

Skin glands.—The skin glands of the Cyclostomata (tongued lampreys) are composed of two kinds; simple, ductless glands which secrete the oil of the external nares, and the common frog can adapt their coloration to that of their background. In animals permanently excluded from the light, pigment is absorbed by the skin, as in the chameleon, while in birds the pigment is sometimes of great brilliancy in the necks and wattles. In mammals, as in man, the pigment is confined to the cells of the stratum mugruminosum.

**Scales.**—In the clasmobranch fishes scales are found composed of enamel superficially, and of dentine and bone deeply. They are developed from the epidermis and dermis, and in almost every case, there is a layer beneath these, which are only modifications of them. The bony basal part of each scale is plate-like, hence this kind of scale is known as placoid. In the ganoid fishes, such as the sturgeon, much larger plaques, called ganoids, form a complete sheath over the body. In the teleost fishes the scales overlap like tiles and are either cycloid, having a smooth border, or ctenoid, which are serrated. Fishes are considered to be without scales, or to have a covering of cilia. Placoid scales are a reliable sign of absence of any skin armour, though in fossil forms (Stegocephali) it was very complete. The reptilian class is specially noticeable for the production of epidermal scales, which may vary in the various families. In the Ophidians they are cast off periodically in one mass as the snake's slough, while in the Chelonia they form the different varieties of tortoise-shell. Bony structures, developed in the dermis, may underlie these epidermal scale thickenings, and are very strongly developed in the dorsal and ventral bony shields of the Chelonia (carapace and plastron), which secondarily fuse with the true endoskeleton.

**Feathers.**—Birds are remarkable for the possession of feathers, which are highly modified scales. The embryonic or down feathers are simple, and consist of a brush of hair-like barbs springing from a basal quill or calamus. From the whole length of each chief feather, and these, in the case of the large wing feathers (remiges) and tail feathers (rectrices), are connected by minute hooks so that the feather zone, as opposed to the shaft, has a more resistant texture than it has in the case of the other feathers. The bird's molt is comparable to the casting of the scales in the reptiles.

**Hairs.**—Hairs are only found in the mammalian class, and are divided into the long tactile bristles or vibrissae and the smaller hairs in the warmest of the body. In some animals the hair, of the body is composed of long, stiff hairs, which are probably
SKIN DISEASES

specialized for protective purposes, and short, soft hairs, which form the fur and keep in the warmth. Sometimes these long hairs are greatly elongated and toed by the porcupine, hedgehog, spiny mouse and spiny ant-eater (Echidna).

Horns.—Horns are of three kinds: (1) antlers, (2) hollow horns and (3) hairy horns of the rhinoceros. Horns are bony outgrowths, and are permanent. They are found in both sexes, and in this differ from the antlers of the deer, which, except in the reindeer, are confined to the male. In the prongbuck (Antilocapra) the hollow horns are shed periodically.

The hairy horns of the rhinoceros are a mass of hairs, intermingled together by cells. The hairs grow from dermal papillae, but differ from true hairs in not being sunk into hair follicles.

Claw and Hoof.—These are modifications of nails, but whereas in nails and claws the structures are confined to the dorsal aspect of the digits, in hoofs they spread to the plantar surface as well. It has been shown in the embryological section of this article that the nail apparatus at the very tip of the digit, and in this position remains in many amphibians, e.g., giant salamander, while in hooted mammals it develops both ventrally and dorsally. In the Felidae the claws are retractive, but the real movement occurs between the middle and terminal phalanges of the digits.

Spurs.—Spurs are quite distinct from nails and claws; they are very common in birds as horny epidermal sheaths covering bony outgrowths of the radial side of the carpus, metacarpus or metatarsus. The goose has spur and spur; in the emu (Palamedes and Chama) the spur or spurs are metacarpal, while in many gallinaceous birds (e.g., common fowls and pheasants) metatarsal spurs are found.

In the Reptilia the horny beak found in the Chelonians, while in birds beaks are constant and replace the teeth in modern species. In mammals a horny beak is found in Orinthorhynchus, though it coexists with true teeth in the young, and with horny nails in adult specimens. In all these cases the beaks are formed from cornified epidermal scales.

Balene.—The balene which is found in the mouths of the Baleneidae or whalebone whales is a series of flattened triangular horn-like plates arranged on either side of the palate. The inner edges and apices of these are frayed out into long fibres which act as strainers.

In Balænas mysticus, the Greenland whale, there are nearly four hundred of these which the herring gather in often tremendous numbers. In its development balene resembles rhinoceros horn in that it consists of a number of epidermal hair-like fibres cemented together and growing from dermal papillae, though not from true hair follicles. These spurs are found in the male monotremes (Echidna and Ornithorhynchus) have spurs attached to an extra (sacral) bone in the hind leg, perforated for the duct of the already mentioned poison gland.

Ethnology

The colour of the human skin has always held an important place among physical criteria of race. Physiologically explains colour as a consequence of climate and even diet. The pigments or colouring matter under the epidermis, or rather under the second or Malpighian skin, is not peculiar to the Negroid and other coloured races, but is common to all human beings. It is simply more abundant in certain peoples, and this abundance is attributed to the stimulating action of the solar heat, combined with moisture and an excess of vegetable food, yielding more carbon than can be assimilated, the character being then fixed by heredity.

Theodor Waitz quotes examples proving that hot and damp countries favour the darkening of the skin, and that the same race inclines to be darker in low marshy districts than on the hills. C. R. Lepusis asserts that the hotter the climate the darker the negro, pointing out that if you follow the line of greatest heat from Africa to Asia, it is in those regions of the latter continent that the darkest Asiatics are found. Many apparent exceptions to this general law occur, but they may be explained as due to local causes. Thus Schwenkzirch (Heart of Africa) believes that the reddish tint of the Bongos and other of the peoples inhabiting the hot, moist White Nile district is due to the farrugious nature of the laterite soil; the hue of the A-Zande (Niam-Niam) of the Welle valley being possibly explicable in the same way. In South America all shades of complexion intermingle. Thus in Bolivia the coppery Maropas, the dark brown Aymaras, the yellowish Moxos, and the light Mosetenos, Siriones, and Guarayos are, so to speak, neighbours. In Australasia there is the contrast between the yellow-brown Malays and the many-black Papuans. The black variations from the colour-law may be attributed to descent (dark pigments of the skin) to cold, light to tropical countries, or to such varied causes as dryness, moisture, food and the vegetable peculiarities of the land, by all of which the complexion may be affected, and the influence of temperature mitigated.

The colour of the human skin cannot, then, be regarded as an entirely trustworthy racial test, even blackness not being an exclusively negro characteristic. It serves, however, to divide Man into three fundamental types corresponding to the three great ethnic groups, viz. the White, the Yellow and the Black man. The first predominate in Europe, the second in Asia, while the third have their chief centres in Africa and Melanesia. Interbreeding and, in a lesser degree, the influence of environment have caused the occurrence within the three main groups of almost every shade and tint of complexion. Thus the colour of the skin affords a faulty basis of ethnological classification, since in the same ethnic group it varies so widely and races of one group resemble in this particular races of another. The so-called Red Indians are usually classified as a fourth group, but they are not really red-skinned. The name has come about through their custom of painting the naked body with red ochre. But among the American aborigines, side by side with the yellow, olive brown or even black (e.g. the Charruas of Uruguay), there are tribes of reddish-yellow or coppery hue. This tint is found also in certain African tribes. The palms of the hands and the soles of the feet of negroes are never black, but always yellowish, and in all coloured races the back of the body is a shade darker than the front.

It is noteworthy that the skin of the coloured races is always of a lighter tint in the newly-born than in the adult; the negro baby is born a light grey colour, and the dark pigment is absent in the negro foetus. On the eighth day, sometimes as early as the third, the negro infant changes its colour to a hue nearly as dark as that of its parents. It would seem as if the blackness is associated with the general thickening of the skin and is an accompaniment of the general organic adaptation of the negro to his hot malaria climate. The effects of sunburn vary with different races. It is with the light-skinned tropical intermingle, brown and yellow, that the yellow peoples, that the effect is most noticeable. With the former the sun burns the skin uniformly, making them of the tint of a burnt cinder. The latter, especially the aborigines, after a few days of exposure, the skin becomes of a more red ochre. The Chinese skin turns darker in winter and paler in summer. Among certain peoples whose skins are naturally dark the parts of the body exposed to the light and air are often lighter than those covered by their clothes. This is the case with the Fugueens and the Sandwich Islanders. The fair European skin reddens under the sun, passing from pale red to brick red or to patches of deep red.

SKIN DISEASES. The diseases of the skin do not essentially differ from those of the other organs of the body. Like these, the skin is composed of cells resting on a connective tissue framework, in which run the vessels which nourish it and the nerves which keep up its communications with the rest of the body. But it has certain differences from other organs, some dependent on its structure, and some on its functional position. Thus, instead of, like the kidney, to which it may best be compared, having its epithelium faced by epithelium, all lies open, and the various processes are all "one-sided." There are no depths to be attacked, and any diseases, if they spread, must do so superficially; spreading as they often do equally in all directions, the diseases of the skin have a tendency to assume a circular form, independently of any parasitic cause, though when such cause is present the patches are of a more perfectly circular shape. Further, from the extent of its superficial area and its exposed position, the skin is liable to be attacked by more forms
SKIN DISEASES

1. THE DERMATONEUROSES.—(a) Sensory: anaesthesia, hyperesthesia, pruritus; (b) vasomotor: urticaaria, erythema multiforme, angio-neurotic edema, heliophobia, alterations of pigmentation; (c) trophic: scleroderma, perforating ulcer, Charcot’s bed-sore, the lesions of certain forms of leprosy, Raynaud’s disease, Morton’s disease, pellagra, lupus erythematosus, the skin lesions of syphilis; (d) glandular, according to the gland affected,—as the sweat-glands, hyperidrosis, haemidrosis, bromidrosis, miliaria papulosa, or prickly heat; the sebaceous glands, rosacea, from their more or less permanent dilatation.

2. LOCAL INOCULABLE DISEASES.—The agents producing these parasitic in origin and may be divided into those caused by animal parasites, vegetable parasites and various micro-organisms. (a) Animal parasites: scabies, due to the Acarus sebacei (the itch mite), pediculosis, guinea-worm disease, due to Dracunculus medinensis, trichinosis, due to the cysticercus celluloseus; elephantiasis, due to the filariae sanguitis hominis; various eruptions produced by accins, mite, such as the harlequin mite, jigger or sand flea (Dermapthilus penetrans), met with in the tropics. (b) Vegetable parasites: ringworm, caused by the Trichophyton onychaceum; Schönherr’s disease, ringworm of the beard, caused by the Microsporon minimsimmi; histoplasmosis, due to the Actinomyces or ray fungi; mycetoma or Medura foot, due to Diomycetes; aspergillosis (Negrotis), produced by the fungi of this group, infections other than from the ray fungus, sporotrichosis; blastomycetic dermatitis, due to a fungus of the yeast family. (c) Micro-organisms; impetigo contagiosa, caused by inoculation with streptococci; furunculosis or boils, due to the staphylococcus pyogenes aureus and allied; carbuncle, a deeper infection also caused by staphylococci; anthrax, caused by the bacillus anthracis; syphilis, due to a staphylococcal infection of the hairy parts; acne, due to a bacillus called by Gilchrist the bacillus acnes, thought to be identical with the micro-organism of Sabouraud and Unna; furunculosis orientalis (Delhi boil, Aleppo boil, Biskra button), a tropical disease in India and Egypt identified; certain forms of eczema, notably the pusular forms.

3. GENERAL INOCULABLE DISEASES.—Tuberculosis, manifesting itself as lupus vulgaris, verruca necrogenia, erythema induratum or induratio leprosa, and lupus leprosus, has been identified. Syphilis, caused by the Spirocheta pallida of Schaudinn and Hoffmann, in which there are primary, secondary and tertiary skin lesions: the ulcers, the hard and soft chancre, thechancre, the bayleaf, yaws (frazeria, goonga), caused by a specific parasite, the Spirocheta perleustica, glanders, due to inoculation with the bacillus mallei. Added to these are cryspleias and the various exanthematous fevers.

4. DISEASES OF CERTAIN AETIOLOGY.—Psoriasis, pityriasis rubra, pityriasis rosea.

5. ERUPTIONS DUE TO DRUGS.—These may follow on the internal administration of chloral belladonna, codeine, phenazine, mercury, quinine, strychnine, opium, etc., especially in the case of the salicylates and bromides.

The skin is liable to the same pathological conditions as other structures of the body, such as changes in vascularity, inflammations, infections, degenerations, and parasites, and such conditions are related to the special structure of the skin such as hypertrrophy and atrophy, disorders of the sweat glands and sebaceous glands and alterations of pigments. So divided, that is, as the dermatoneuroses are manifestations of widely different diseases, thus anaesthesia and hyperesthesia occur in hysteria; while the acute bed-sore of Charcot (a form of local gangrene) and perforating ulcer are due to an injury or to a disease of the blood-vessels. In the group of diseases known as purpura, where haemorrhages of various make their appearance on different parts of the skin, the lesion is considered to be due to a toxin or autotoxin acting directly on the vascular system, whether such toxins be of an organic, such as phosphorus or mercury, in others organic as smallpox, measles, typhus or tuberculosis; or the haemorrhages may occur in connection with new growths such as sarcoma and lymphadenoma. Why these very different causes should combine to produce the phenomenon of haemorrhage is not clear.

The disease known as urticaia or nettle-rash is probably due to producing it vary from constitutional diseases such as heart and kidney to certain articles of diet which act as gastro-intestinal irritants such as pork and shell-fish. It has been known also to follow on emotional outbursts, but it is said that in the majority of cases in which the attack may be set up by any local irritant such as stings or bites. The pathalogy of the lesions in this disease is as follows: reacting to some irritant, the blood-vessels dilate, serum is poured out from them, and the tissues swell. It seems, however, that not all the swelling is due directly associated with the rheumatic poison, while others are apparently size connected with fermentative changes in the gastrointestinal tract. Thus all those examples of the disease with the causative agent of which we are not familiar, according to the results of histological examination, are as good as attributed to some circulating irritant. This disease differs histologically from urticaia in the persistent dilatation of the vessels. Albuminuric serum is produced, and there is marked edema. Thus the dilatation of the vessels is so active that they are not compressed as in that disease, while the presence of numerous cells around the vessels seems to suggest a more severe irritant, and the fact that the lesions are clinically more persistent gives stronger confirmation that the production of effect is from the circulation.

When certain irritants are applied to the skin we know beforehand what effects they will produce. Thus croton oil produces a vesicular and pusular eruption, that of cantharides is vesicular or bullous, and the following are known to cause no inflammation on their concentration, ranging from a mere redness produced by dilute applications to absolute death of the skin from concentrated ones. With the milder irritants which produce the results clinically known as contact eczema we have been able to detect definite phenomena. The blood-vessels dilate; serum is exuded from them—it may be merely into the deeper layers of the skin, or it may be forced up into the dermis and even to the epidermis through these and appear in drops on the surface. The epithelial cells are, immediately if the irritation be slight, later if it be more severe, stimulated to increased activity of growth and production; and this activity, often misdirected, is so great that the normal process of hardening in the cells is interfered with, and we have what is known as parakeratosis (irregular cornification) and the consequence production of scales. Should this be the prominent pathological change, the exudation spends itself among the cells of the scales, and a condition pathologically not appears to the clinical observer as a dry eruption. Thus according to the reaction—which is probably largely dependent on the irritant used—there have been various degrees and forms of inflammation of the skin, all of them covered clinically by the term eczema. When such a dermatitis is produced experimentally by the application of such an irritating agent and we can look to it as the prototype of the inflammation, which gradually becomes less and less and usually terminates in dry scaling. So in eczema, as long as the irritant continues to act, so long will its results be evident on the skin. When the irritant which is the cause of eczema is still a matter of dispute.

In studying other inflammations we have the advantage of dealing with them in their natural condition, namely owing to the work of Sabouraud, that the cause of the disease is the streptococcus pyogenes. The first result of inoculation is a minute red spot (dilatation of the vessels), which is rapidly followed by an appearance of a red, circumscribed (with a little of a serum), which is soon converted into a pustule, the whole dries up into a scab, which when thrown off discloses a healthy or slightly reddened skin. Fresh areas may be constantly attacked.

In ringworm, where the cause of the disease is the growth in the
SKINNER—SKIPPO

Superficial layers of the skin of one or other of the different varieties of fungus is another among of ringworm, which, for lesion mamers, is the reaction more resembling that of eczema is produced. There is the same dilatation of the vessel with exudation of fluid, sometimes reaching the surface in the form of vesicles, sometimes spending itself as an exudation; and the condition of the skin and epithelium is clinically by the presence of more or less scaling. In other cases the exudation early becomes purulent (this is said to occur regularly with the dissected form of eruption), a change which, though occasionally noted, is by no means frequent in eczema.

The inflammations of the corium or deeper layer of the skin are due, with very few exceptions, to the growth of well-known organisms, Erysipelas, puerperal, and septicemia are due to a mixed acute course and rapidly terminate, the two former usually in recovery, the two latter often fatally. The other more chronic forms all follow one course; in their earlier stages there is a new growth of the skin, which is usually associated with the presence of an internal organ, such as the liver or uterus, being frequently observed in pregnancy. The cause of vitiligo, in which the pigmentation normally present disappears from certain areas, a phenomenon more striking in the distribution of the races, is still unknown.

Diseases of the skin tend to manifest themselves in certain parts of the body; i.e. certain diseases exert a selective influence on the sites of their eruption. Symmetry is characteristic of eczema, phthisis, drug rash, and the eruptions of specific fevers, while others, such as herpes zoster, ringworm, syphilis, and syphilis, tend to be asymmetrical. Eczema selects the flexor aspect of the limbs and the neighbourhood of folds of skin and opposed surfaces, while psoriasis favours the extensor surfaces and the outer side of the elbows and knees. In certain diseases of nervous origin, notably in herpes zoster, the eruption follows the course of a certain nerve. In the face we get erythema, lupos erythematosus, rosacea, eczema, actinomycosis, and, &c., and syphilitic and malignant ulcers. Rodent ulcer usually selects the face, and generally the nose or orbit. The face too is usually the selective site of lupus vulgaris. The scalp is the chief site of two varieties of lesion—the pustular, as in pustular eczema and impetigo contagiosa, or the dry and sepal eruptions, as postherpetic, and the large, crustaceous scabies. The genital organs are the seat of vesicular eruptions such as herpes or eczema or occasionally scabies; they are also the seat of ulcers, chiefly venereal, and of secondary syphilides. Scabies or itch tends to occur on the hands and feet, and the vesicles of staphylococcal eczema, especially the fingers. The hands too are subject to various forms of eruption known as trade eruptions, due to the handling of paraffin, tar, sugar, salt, lime, sulphur, &c. The lesions mostly simulate eczema, and are from handling tar, oil, paraffin, soap, bleachers, dyers, manufacturers, bakers, and workers in the electro-plating trade. Exposure to the X-rays sets up a form of dermatitis, either an acute erythematous form due to a single prolonged exposure or a chronic form affecting operators who have been exposed over prolonged periods. Ulceration and considerable destruction of the epidermis may take place together with the occurrence of watery growths which tend to become epitheliomatous.

For an account of the treatment of the best known skin diseases see under their separate headings.

SKINNER, JAMES (1778-1841), British military adventurer in India, son of Lieut.-Colonel Hercules Skinner, was born in India in 1778, his mother being a Rajput lady. At the age of eighteen he entered the Maharatta army under de Boigne, when he soon showed military talents; and he remained in the same service under Perron until 1803, when, on the outbreak of the Maharatta War, he refused to serve against his countrymen. He joined Lord Lake, and raised a regiment of irregular horse called "Skinner's Horse" or "the Yellow Boys," which became the most famous regiment of light cavalry in the India of that day. For his services in the siege of Ajacan he was granted a jagir yielding Rs. 20,000 a year, appointed lieutenant-colonel in the British service and made C.B. He had an intimate knowledge of the character of the natives of India, and his advice was highly valued by successive governors-generals and com-

SKIPPON, Philip (d. 1660), English soldier in the Civil War, was born at West Laxham, Norfolk. At an early age he adopted the military profession and in 1622 was serving with Sir Horace Vere in the Palace. He took part in most of the battles and sieges of the time in the Low Countries. At the sieges of Breda in 1625 and 1627 he was wounded, and under his old commander, Lord Vere, he was present when Bois-le-Duc (Bendorf-Bogen) and Hasselt were attacked in 1629. A veteran of considerable experience, Captain Skippon returned to England in 1630, and was immediately appointed to a command in the (Honourable) Artillery Company. In 1642 the Civil War was fast approaching, and in January Skippon was made

commander of the City troops. He was not present at Edgehill, but he rode up and down the lines of his raw millitiamen at Turnham Green, cheering and encouraging them in the face of the king's victorious army. Essex, the Lord General of Parliament forces, soon made Skippon his major-general, a post which carried with it the command of the foot and the complicated duty of arranging the line of battle. He was with Essex at Tewkesbury, and at the first battle of Newbury distinguished himself at the head of the infantry. At the end of 1644 the amazing desertion of Essex when his army was surrounded at Lostwithiel left Skippon in command; compelled to surrender without firing a shot, the old soldier bore himself with calmness and fortitude in this adversity. At the second battle of Newbury he and Essex's old foot had the satisfaction of recapturing six of the guns they had lost at Lostwithiel. The appointment as major-general of the New Model Army soon followed, as, apart from his distinguished services, there was scarcely another man in England with the knowledge of detail requisite for the post. In this capacity he supported Fairfax as loyally as he supported Essex, and at Naseby, though dangerously wounded, he would not quitt the field. For his conduct on this decisive field the two Houses of Parliament thanked him, and they sent him special physicians to cure him of his wound. It was long before he was fit to serve in the field again. He only reappeared at the siege of Oxford, which he directed. At the end of the war he was selected for the command of the forthcoming Irish expedition, with the rank of marshal-general. The discontent of the soldiery, however, which ended in open mutiny, put an end to a command which Skippon had only accepted under great pressure. He bore a part in all the movements which the army leaders now carried out. A Presbyterian himself, he endeavoured to preserve a middle position between his own sect and the Independents, and to secure by any means a firm treaty with the king. The army outstripped Fairfax and Skippon in action. The major-general was named as one of the king's judges, but, like his chief, did not take his place. During the Commonwealth period he held high office, military and civil, but ceased to influence passing events. He was one of the members of Cromwell's House of Lords, and, in general, was universally respected and beloved. Age and infirmities prevented him from taking any part in the revolutions which culminated in the restoration of the Monarchy, and in March 1660 he died. Skippon was a deeply religious man, and wrote several books of devotion for the use of soldiers. One of his few sayings in Parliament, that on the fanatic Naylor, has become famous: "If this be liberty, God deliver us from such liberty!"

See Vickers, English Aristocracy (1621-1670).

SKIPTON, a market town in the Skipton parliamentary division of the West Riding of Yorkshire, England, 26 m. N.W. of Leeds by the midland railway, served also by the Lancashire and Yorkshire railway. Pop. of urban district (1901) 11,986. It is picturesquely situated in the hilly district of the upper valley of the river Aire, the course of which is followed by the Leeds and Liverpool canal. The strong castle built by Robert de Romille in the time of the Conqueror was partly demolished in 1648, but was restored by the countess of Pembroke. Of the ancient building of de Romille all that remains is the western tower of the present castle. In the castle grounds are the remains of the ancient chapel of St John. The church of the Holy Trinity, mainly Perpendicular, was also partly demolished during the Civil War, but was restored by the countess of Pembroke. The free grammar-school was founded in 1548 by William Ermysted, a canon of St Paul's, London. There are also science and art schools. There are extensive woolen and cotton factories, and, in the neighbourhood, a large limestone quarry.

Skipton was the capital of the ancient district of Craven. At the Norman accession it became part of the possessions of Earl Edwin, and was granted to Robert de Romille. Subsequently it went to the Albemarle family, but was again vested in the Crown, and Edward II. bestowed it on Piers de Gaveston. In 1314 it came into the possession of the Clifford's. The castle was taken by the parliamentary forces in 1643 after a desultory siege of three years.

SKIRRET, known botanically as Sium Siriusum (natural order Umbelliferae), a fleshy-rooted perennial, the roots of which are boiled, and afterwards served up like salsify. It requires a free, deep and much enriched soil, and is generally raised from seeds, which should be sown in drills a foot apart about the end of March, the bed being well-watered in dry weather. The roots will be in use about November, and will continue fresh through the winter if carefully stored.

SKIRLING, ADAM (1719-1803), Scottish song-writer, was born in Haddington in 1719. He became a farmer at Garleton, near Haddington, and died in April 1803. He was buried at Athestanford. His reputation rests on two Jacobite ballads written for the battle of Prestonpans, one of which, "Hey, Johnnie Cope, are Ye Waking Yet?" has a well-deserved place in most collections of Scottish songs.

SKITTLES (from O. Eng. scotlen, to shoot), a game played on the green or an alley with a number of "pins" of wood, which are knocked down by an oval, flattened missile called the cheete, about 10 lb in weight, thrown by the player. The game has been in existence for centuries in many countries under different names, quielles in France, Kegelspiel in Germany, skylies, kailis, closh, cloddynge, roly-poly, Dutch bowls, &c., in Great Britain. In early days in England the "sheepe's joynts" were thrown at the pins, and in many varieties of the game, for instance in the English and Dutch, balls were used, which were rolled along the ground at the pins. As now played, nine large, oval-headed pins are set up in a square, three pins on each side, with a corner angle presented to the player, who stands about 21 ft. from the pins. One step in advance is allowed in delivery. The object is to knock down the greatest number of pins in the fewest throws. In the eastern counties of England four pins only, one on each corner, are generally used. In Dutch skittles the centre pin is called the "king-pin" and often has a crown on its head. The object of the game is to knock down the "king" without touching any of the other pins, or to knock down all the pins and leave the king. In Germany and Holland balls have always been used, and the game in that form was introduced into America from the latter country early in the 18th century, but is not now played there, being replaced by bowling.

SKOBELEV, MIKHAIL DIMITRIEVICH (1843-1882), Russian general, was born near Moscow on the 29th of September 1843. After graduating as a staff officer at St Petersburg he was sent to Turkestan in 1865 and, with the exception of an interval of two years, during which he was on the staff of the grand duke Michael in the Caucasus, remained in Central Asia until 1877. He commanded the advanced guard of General Lamarche's column in the First Khudokatay campaign, in the Caspian, to join General Verefkin, from Orenburg, in the expedition to Khiva in 1874, and, after great suffering on the desert march, took a prominent part in the capture of the Khivan capital. Dressed as a Turkoman, he intrepidly explored in a hostile country the route from Khiva to Igly, and also the old bed of the Oxus. In 1875 he was given an important command in the expedition against Khokand under General Kaufmann, showing great capacity in the action of Makram, where he out-manoeuvred a greatly superior force and captured 56 guns, and in a brilliant night attack in the river Umbell, Andijan, when he routed a large force with a handful of cavalry. He was promoted to be major-general, decorated with the order of St George, and appointed the first governor of Fergana. In the Turkish war of 1877 he seized the bridge over the Sereth at Barborchi in April, and in June crossed the Danube with the 8th corps. He commanded the Caucasian Cossack Brigade in the attack of the Green Hills at the second battle of Plevna. He captured Lovatcha on the 3rd of September, and distinguished himself again in the desperate fighting on the Green Hills in the third battle of Plevna. Promoted to be a lieutenant-general, and given the command of the 16th Division, he took part in the investment of Plevna and also in the fight of the 9th of December, when Osman Pasha surrendered, with his army. In January 1878 he crossed the Balkans in a severe snowstorm,
SKOPTSI—SKRAM

deleting the Turks at Senova, near Schipka, and capturing 36,000 men and 90 guns. Dressed with care in white uniform and mounted on a white horse, and always in the thickest of the fray, he was known and adored by his soldiers as the “White General.” He returned to Turkestan after the war, and in 1850 and 1851 further distinguished himself in retrieving and retaking the Terek. Selivanov, captured Geok-Tepé, and, after much slaughter, reduced the Akhal-Teke country to submission. He was advancing on Askabad and Kalat i-Nadiri when he was disavowed and recalled. He was given the command at Minsk. In the last years of his short life he engaged actively in politics, and made speeches in Paris and in Moscow in the beginning of 1882 in favour of a militant Pan-Slavism, predicting a desperate strife between Teuton and Slav. He was at once recalled to St Petersburg. He was staying at a Moscow hotel, on his way from Minsk to his estate close by, when he died suddenly of heart disease on the 7th of July 1882.

SKOPTSI (Russian skoptsy, a eunuch), a secret religious sect of Russia. It is an offshoot of the sect known as the “People of God” or Khlysti (see RUSSIA: Religion). It was in 1771 in the government of Orel that the Skoptsi were first discovered by the authorities. A peasant, Andrei Ivanov, was convicted of having persuaded thirteen other peasants to mutilate themselves. His assistant was another peasant, known as Selivanov. A legal investigation followed. Ivanov was knoutred and sent to Siberia: Selivanov fled, but was arrested in 1775. The Skoptsi were, however, increased, and its chief Selivanov escaped from the Siberia and pretended himself the Son of God incarnate in the person of Peter III. Peter had been popular among the Raskolniki (schismatics, or dissenters) because he granted them liberty of conscience, and among the peasants because when pillaging the convents he divided their lands among the labourers. Selivanov claimed the title “God of Gods and King of Kings,” and announced his accomplishment of the salvation of believers through a self-inflicted mutilation. For eighteen years he lived in St Petersburg, in the house of one of his disciples, receiving double homage as Christ and tsar. In 1797 he was re-arrested by order of Paul I and imprisoned in a madhouse. Under Alexander I, Selivanov regained his liberty, but in 1826 was again shut up, this time in a monastery at Sázdlí, where he died in 1832 in his hundredth year. Skoptsiism was, however, not exterminated, and grave scandals constantly arose. The most remarkable feature of this extraordinary sect has always been the type of people who joined it. Nobles, military and naval officers, civil servants, priests and merchants were to be found in its ranks, and so rapidly did the numbers increase that 515 men and 240 women were transported to Siberia between 1862 and 1865. Of those executed for their efforts in 1872 many trials. The Skoptsi took place all over Russia. In 1874 the sect numbered at least 5,444, including 1,465 women. Of these 703 men and 160 women mutilated themselves. Repressive measures proving useless, an unsuccessful attempt was made to kill the sect by ridicule: Skoptsi were dressed up in women's clothes and paraded with fools' caps on through the villages. In 1876 130 Skoptsi were sentenced in a batch to transportation. To escape prosecution some of the sect have emigrated, generally to Rumania, where they are not molested. Lipovans. But though the law is strict—every eunuch being compelled to register—Skoptsi still continue to hold its own in Russia.

As their title indicates, the main feature of the sect is sexual mutilation. They thus call their “baptism of fire.” Of this there are two kinds, the “lesser” and “greater soul” (i.e. partial and complete). In this the Turkish type of the sect, but aim at fulfilling Christ's counsel of perfection in Matt. xix. 22 and xx. 8, 9. A terrible operation with similar purpose is sometimes performed on the women. The earliest records of such female mutilations date from 1845. Usually the breasts only are amputated. The Skoptsi do not absolutely condemn marriage, and some are allowed to have one child, those at Bucharest two, before being fully admitted. They are not allowed to see at the perfection of the individual. Their religious ceremonies include hymn-singing, addresses and frenzied dancing ending in ecstasy, like that of the Khlysti and the Mussulman dancing devotions. Street oaths of secrecy are demanded from all members, who form a kind of mutual-aid association. Meetings are held late at night in cellars, and at other times, in the open fields, in wide, white shirts of a peculiar cut with a girdle and large white trousers. Women also dress in white. Either all present wear white stockings or are barefoot. They call themselves “White Doves.”

Usually the breasts of the sect are cut off by being placed for a while on the monument erected at Schlusselberg to Selivanov are given the communicants. The society has not always been mild and gentle. But it is mild and gentle enough to have been known as the “Skoptse” by the Peasants. Of the Swedes, therefore, there is a tendency on the part of many Skoptsi to consider their creed fulfilled by chaste living merely.

See Anatole Leroy-Beaulieu, The Empire of the Tears (Eng. trans., 1890, iii.; E. Pelikan, Geschichtlich-medizinische Untersuchungen über das Skoptentum in Russland (Giessen, 1876); K. K. Grass, Die geheime heilige Schrift der Skopen (Leipzig, 1904) and Die russischen Sekten (Leipzig, 1897, &c.).

SKOWHEGAN, a township and the county-seat of Somerset county, Maine, U.S.A., on the Kennebec river, about 35 m. N. of Augusta. Pop. (1890) 5068, (1900) 5180, of whom 4266 were inhabitants of Skowhegan village; (1910) 5341. Skowhegan is the terminus of a branch of the Maine Central railway. The township covers an area of about 50 sq. m., and has a public library, a fine public school, and a grammar school. The farms of the township are devoted largely to dairying. Paper and pulp, wooden-ware, woollen and worsted goods, &c., are manufactured. Skowhegan was settled as a part of Canaan about 1770. In 1814 the township of Bloomfield was erected out of the southern portion of Canaan. In 1823 a second township was erected out of what then remained; this was called Milburn at first, but in 1836 the former Indian name, Skowhegan, said to mean “spearing” or “watching place,” was adopted. Bloomfield was annexed to Skowhegan in 1881. The village of Skowhegan was incorporated about 1805.

SKRAM, PEDER (c. 1500–1581), Danish senator and naval hero, born between 1491 and 1503, at his father's estate at Urup near Horsens in Jutland. He first saw service in the Swedish war of Christian II. at the battle of Brannkyrka, 1518, and at the battle of Upsala two years later he saved the life of the Danish standard-bearer. For his services in this war he was rewarded with an estate in Norway, where he settled for a time with his young consort Elsebe Krabbe. During "Grevens Fejde," or "the Count's War," Skram, whose reputation as a sailor was already established, was sent by the Danish government to assist Gustavus Vasa and his forces. He became a captain in the Swedish fleet; and Skram seems, for the point is still obscure, to have shared the chief command with the Swedish Admiral Måns Some. Skram greatly hampered the movements of the Hanseatic fleets who fought on the side of Christian II., captured a whole Lübeck squadron off Svendborg, and prevented the revictualling of Copenhagen by Lübeck. But the incurable suspicion of Gustavus I. minimized the successes of the allied fleets throughout 1535. Skram's services were richly rewarded by Christian III., who knighted him at his coronation. He became a senator and endowed a number of public and private estates. The broad- tailed white heron, yellow-tailed admiral was an out-and-out patriot and greatly contributed as a senator to the victory of the Danish party over the German in the councils of Christian III. In 1555, feeling too infirm to go to sea, he resigned his post of admiral; but when the Scandinavian Seven Years' War broke out seven years later, and the new king, Frederick II., offered Skram the chief command, the old hero did not hesitate a moment. With a large fleet he put to sea in August 1562 and compiled the Swedish admiral, after a successful engagement off the coast of Gotland, to take refuge behind the Skerries. This, however, did not save their avenue of escape; and he was superseded at the end of the year by Herluf Trolle. Skram now retired from active service, but was twice (1565–1568) unsuccessfully besieged by the Swedes in his castle of Laholm, which he and his
wife defended with great intrepidity. His estates in Halland were also repeatedly ravaged by the enemy. Skram died, at an advanced age, at Urup on the 11th of July 1831.

Skram's audacity won for him the nickname of "Denmark's dare-devil," and he contributed perhaps more than any other Dane of his day to destroy the Hanseatic dominion and the power of the Baltic. His humanity was equally remarkable; he often imperilled his life by preventing his crews from plundering.

See Axel Larsen, Dansk-Norske Helltheistorier (Copenhagen, 1893).

SKRZYNECKI, JAN ZYGUMUNT (1787-1860), Polish general, was born in Galicia in 1787. After completing his education at Warsaw University, he joined the Polish Army and served in the Polish Legions formed in the grand duchy of Warsaw, as a common soldier and won his lieutenantcy at the battle of Raszyn in 1809. At the battle of Leipzig he greatly distinguished himself and at Arcis-sur-Aube, in 1814, saved Napoleon from the sudden onslaught of the enemy by sheltering him in the midst of his battalion. On the formation of the kingdom of Poland in 1815 Skrzynecki was put in command of five infantry regiments of the line, and on joining the insurrection of 1830 was entrusted with the organization of the Polish army. After the battle of Gaya he made these predatory and parasitic birds locally known as "Seamen's Skua," but avoided all decisive operations as he hoped for the pacific intervention of the powers in favour of Poland. In the beginning of March 1831 he even entered into correspondence with the Russian Field-marshal Diebitsch, who was taken very ill both at Paris and London. When at last Skrzynecki did take the offensive his opportunity was gone, and he committed more than one tactical blunder. At Ostrolenka (26th of May 1831) he showed his usual valour and considerable ability, but after a bloody contest Diebitsch prevailed and Skrzynecki fell back upon Warsaw, where he demanded a re-organization of the government and his own appointment as dictator. To this the diet would not consent, though it gave Skrzynecki a vote of confidence. But public opinion was now running strongly against him and he was forced on the 10th of August, in his camp at Bolimow, to place his resignation in the hands of his successor, Debninski. Skrzynecki thereupon joined a guerilla corps and on the 22nd of September took refuge in Austrian territory. Subsequently he resided at Prague, but migrated to Brussels where he was made commander in chief of the Belgian army, an appointment he was forced to resign by the combined and emphatic protest of Russia, Austria and Prussia in 1839. With the permission of the Austrian government he finally settled at Cracow, where he died in 1860. Skrzynecki was remarkable for his personal courage and made an excellent general of division, but he was unequal to the heavier responsibility of supreme command, and did much harm in that capacity by his irresolution. He wrote Two Victorious Days (Pol.) (Warsaw, 1831); and Mes Erreurs (Paris, 1833).

See S. J. N. Montalbemerti et sa correspondance inédite avec le généralissime Skrzynecki (Montligeon, 1903); Ignacy Przadzinski, The last four Polish Commanders (Pol.) (Posey, 1905). (R. N. B.)

SKUA,1 the name for a long while given to certain of the Laridae (see GULL), birds which sufficiently differ in structure, appearance and habits to justify their separation as a distinct genus, Stercorarius (Leucis or some writers), or even subfamily, Stercorinarinae.Swift of flight, powerfully armed, but above all endowed with extraordinary courage, they pursue their weaker cousins, making the latter disgorge their already swallowed prey, which is nimbly caught before it reaches the water; and this habit, often observed by sailors and fishermen, has been the basis of the popular name of both bird and species, "Teasers," "Boatswains,"2 and, from a misconceptions of their intent, "Dunghunters." On land, however, whether they resort to breed, they seek food of their own taking, whether small mammals, little birds, insects or berries; but even here their uncommon courage is exhibited, and they will defend their homes and offspring with the utmost spirit against any intrusor. One is heard of a dog that invades their haunts, while every bird almost, from an eagle downwards, is repelled by buffets or something worse.

The largest species known is the Stercorarius antarcticus of ornithologists—the "Skuoo" or "Bonnie" of the Shetlanders, a bird in that breeding-season forming a hegemony which the other species do not differ appreciably in colour, which is of a dark brown, somewhat lighter beneath; but the primaries have at the base a patch of white, visible even when the wings are closed, and forming, when extended, the "Bonnie" of the Shetlanders. This is a species of comparatively limited range, breeding only in some two or three localities in the Shetlands, about half a dozen in the Faeroes,3 and hardly more in Iceland. Out of the breeding-season it is found in most parts of the North Atlantic, but never to stray farther south than Gibraltar or Morocco, and it is therefore a matter of much interest to find the Southern Ocean inhabited by a "Boatswain Hen" of Cook's Voyage—which so closely resembles the Skua as to have been for a long time regarded as specifically identical with it, but is now usually recognized as distinct under the name of S. antarcticus. This bird, characterized by its black legs, is one of the most remarkable of the group, having an extensive range, and would seem to exhibit a tendency to further differentiation, since Howard Saunders, in a monograph of the group (Proc. Zool. Society, 1876, pp. 317-332, says that it presents three local forms—one occurring from New Zealand to Norfolk Island and past Kerguelen Land to the Cape of Good Hope, another restricted to the Falklands, and the third hitherto only met with near the south-polar ice. On the western coast of South America, making its way up the coast of Chile and Peru, the "Boatswain Hen" along the coast so far as Rio Janeiro, is found S. chilensis, distinguished among other characters by the cinnamon tint of its lower plumage. This is a smaller species of smaller structure than the genuinea, and is more widely distributed than those just mentioned, but the home of all is in the more northern parts of the earth, though in winter two of them go very far south, and, crossing the equator, show up on the sea-coasts, of the Cape of Good Hope, New Zealand and Peru. The first of them is S. pomatorhinus (often incorrectly spelt pomarinus), about the size of a common gull, Larus canus, and presenting, irrespective of sex, two very distinct plumages, one almost wholly sooty-brown, the other parti-coloured—dark above and white on the breast, the sides of the neck being of a glossy straw-colour, and the lower part of the neck and the side of the body barred with brown; but a singular feature in the adults of this species is that the two median tail-feathers, which are elongated, have their shaft twisted towards the tip, so that in flight the lower surfaces of their webs are pressed together vertically, and this renders the appearance having an extra row of tail-feathers. The second and third species so closely resemble each other, except in size, that their distinctness was for many years unperceived, and in consequence their nomenclature is an almost bewildering puzzle. It is impossible to say which of the last two is the larger, though the size of a black-headed gull, should stand as S. crepitatus, and the smaller as S. parasiticus, though the latter name has been generally used in writing larger, the former is not, as it is often, S. richardsoni, a name that correctly applies only to whole-colored examples, for this species too is dimorphic. Even its proper English name is disputed, but it has been frequently called the Arctic gull or Artic skua, and is by far the commonest of the genus in Britain, and perhaps throughout the northern hemisphere. It breeds abundantly on many of the Scottish islands, and in most countries lying to the northward. The nest is generally in long heather, and contains two eggs of a delicate-tinted colour, suffused with still darker brown patches. Birds of either phase of plumage pair indiscriminately, and the young show by their earliest feathers whether they have blue or pectoral; but in their immature plumage the upper surface is barred with rich rufous, and the rest of this species, commonly known in English as the long-tailed or Buffon's generally likened to the martinspike that is identified with the boatswain's position; but perhaps the authoritative character assigned them originally to the gulls.1

2 It has long been subjected to persecution in these islands, a reward being paid for its head. On the other hand, in the Shetlands (in which it is distributed with the common gull), it is looked upon by the sheep against eagles. Yet for all this it would long ago have been extirpated there, and have ceased to be a British bird in all but name, but for the special protection afforded it by several members of the royal family (see Lord Scott of Meldy), long before it was protected by modern legislation.

3 It is the "Fasaghaier" of the Hebrides, the "Shoo" of the Shetlanders, and the "Scouti-allien" of the fishermen on the east coast of Scotland.
SKULL, the skeleton of the head, composed of 22 bones, 8 of which form the skeleton of the cranium, 14 that of the face. Except the lower jaw, which is movable, the bones are all firmly united by immovable joints. In the following article it is considered more profitable to treat the skull as a whole than to details the bones separately, and for this purpose a normal European skull will be studied from in front (norma verticalis), from above (norma facialis), from the side (norma lateralis), from behind (norma occipitalis), and from below (norma basalis). Afterwards the interior of it will be considered by means of sections.

The Skull from in front (norma facialis) (see fig. 1). The forehead region is formed by the frontal bone, the two halves of which usually unite in the second year; sometimes, however, they fail to do so and then a suture (metopie) may remain to an advanced age. The lower limit of the forehead is formed by the upper margin of the nasal bone near the mid line. At the junction of the inner and middle third of each supra-orbital margin is the supra-orbital notch for the nerve of that name. Above each supra-orbital margin, and in the middle line, is a slight prominence, the glabella. Below the forehead, the two nasal bones form the skeleton of the upper part of the nose; they articulate with one another in the mid line, but are separated by a bony suture to the nasal processes of the maxillae which run up to articulate with the frontal bone at the internal orbital process, thus forming the inner margin of the orbit. Externally the malar bones (fig. 1, g) articulate with the frontal at the alveolar margin in which all the upper teeth are set. Laterally each maxilla is prolonged out into a buttress, the zygomatic process, which supports the malar bone.

Below the maxillae or upper jaws (fig. 1, h) form the greater part of the skeleton of the face; they consist of the upper and lower part of the orbit, and below the nasal bones leave the anterior nasal aperture (apertura pyriformis) between them, and project slightly at the middle of the lower border of this aperture to form the anterior nasal spine. About a quarter of an inch below this is the alveolar margin and just below the articulation with the malar is the infra-orbital foramen, for the infra-orbital branch of the fifth nerve, is seen on each side. The lower parts of the maxillae form the alveolar margin in which all the upper teeth are set. Laterally each maxilla is prolonged out into a buttress, the zygomatic process, which supports the malar bone.

The skull is not known to exhibit the remarkable dimorphism to which the two preceding are subject. It becomes considerably flattened in the frontal region on the fells of Lapland, its appearance depending chiefly on the presence of lemmings (Lemmus norvegicus), on which it mainly preys. All these three species occasionally visit the southern coasts of Europe in large flocks, but their visitations are highly irregular. (A. N.)

The Skull from above (norma verticalis). When looked at from above the frontal bone is seen forming the anterior part of the vertex and articulating with the two parietals posteriorly by a nearly transverse suture (coronal suture). Running back from the middle of this is the median sagittal suture extending as far as the lambda on the norma occipitalis. The point where the sagittal and coronal sutures join is the interparietal, the site of the lozenge-shaped anterior fontanelle in the infant’s skull, but this closes during the second year of life. Small ossicles called Wormian bones are often found in the cranial sutures, and one of these (the Interparietal or os anti-epilepticum) is sometimes found at the bregma. About two-thirds of the way back the sagittal suture becomes less serrated and on each side of it the small parietal foramen may be seen. This only transmits a small emissary vein (see Veins) in the adult but, as will be seen later, is of considerable morphological interest. As middle life is reached the cranial sutures tend to become obliterated and the bones can no longer be separated; this fusion begins at the places where the sutures are least deeply serrated, and as a rule the sagittal suture disappears between the two parietal foramina between thirty and forty years of age.

The Skull from the side (norma lateralis). On looking at the accompanying figure (fig. 2) it will be seen that the calvaria or brain case forms all the upper part, while the face is below the anterior half. Taking the calvaria first the side view of the frontal bone (fig. 2, Fr) is seen extending back as far as the coronal suture (c). Just above Fr is an elevation on each side, the frontal eminence, better seen in female than in male skulls. The junction between the frontal and malar (Ma) at the outer margin of the orbit has already been referred to as the external angular process and is an important...
landmark for measurements, and from it a curved line (the temporal crest) runs back crossing the coronal suture to reach the parietal bone (Pa, fig. 2); as it runs back this line divides into two; the crossing of the temporal crest the coronal suture is less serrated than above, and here it becomes obliterated first. The quadrilateral outline of the parietal bone is seen as well as its articulations; above runs the external auditory meatus (Ma), and below it the lambdoidal suture (LS), which articulates with the supra-occipital (SO), through the lambdoidal suture (LS). All four angles of the parietal bone are points of special interest; the antero-superior angle or bregma has already been noticed, and it will be seen to lie nearly above the ear opening, and is the site of the asterion (As), the mastoid process (MP), and the parietal bone (Pa). The mastoid process (MT), which articulates with the temporal (Tr) and the occipital (Oc), and forms the mastoid foramen (MF), together with the temporal bone (Tr), forms the mastoid notch (MN), which will be seen to extend downward into a nipple-shaped swelling, the mastoid process (MT), containing air cells and only found in the adult human skull, while in front of the external auditory meatus is the stylo-mastoid fissure, containing the mastoid process (MT), in front of the mastoid process is the sphen-mastoid fissure, with the naso-maxillary fissure, and the cranial cavity through the sphenopalatine foramen, with the cranial cavity through the foramen rotundum, and with the mouth through the posterior palatine canal, as well as having other smaller openings.

The side view of the mandible or lower jaw shows the body, already seen from in front, and the ramus projecting up from the back part of it at an angle of from 110° to 120° in the adult. Before the teeth come and after they are lost the angle is greater. The point just above in (fig. 2) is known as the angle of the jaw. At the upper part of the ramus are two projections; the most anterior is the coronoid process for the attachment of the temporomandibular muscle, when the mandible is disarticulated and removed the posterior part of the ramus is seen, and behind it the temporal foramen plate of the sphenoid. Between these two bones there is a vertical slit-like opening into a cave, the sphenomaxillary fissure, which commences at the foramen spinosum, which articulates with the sphenomaxillary fissure, with the sphenopalatine foramen, with the cranial cavity through the foramen rotundum, and with the mouth through the posterior palatine canal, as well as having other smaller openings.

The skull from behind (norma occipitalis) (fig. 3). From this point of view the posterior ends of the parietal bones (Pa), with the sagittal suture between them, are seen. Below these come the two posterior parts of the zygomatic arch. When the mandible is disarticulated and removed the posterior part of the ramus is seen, and behind it the temporal foramen plate of the sphenoid. Between these two bones there is a vertical slit-like opening into a cave, the sphenomaxillary fissure, which commences at the foramen spinosum, which articulates with the sphenomaxillary fissure, with the sphenopalatine foramen, with the cranial cavity through the foramen rotundum, and with the mouth through the posterior palatine canal, as well as having other smaller openings.

The forms From Behind attachment the supra-occipital, each a nearly Jacobson's as fitted semicircle, while the posterior inferior angle, where the parietal, supra-occipital, and mastoid temporal bones meet, is known as the asterion and marks the lateral sinus within the brain. A little above and behind the middle of the parietal bone, and just above the superior temporal crest, is the parietal eminence where ossification starts. The squamous part of the temporal bone overlaps the parietal at the squamous suture, while from its lower part the synchondrosis process projects forward to articulate with the malar. At the root of this process is the glenoid cavity where the condyle of the lower jaw articulates, and just behind this the external auditory meatus is seen, which is divided by the mandibular arcades into two, which open into the middle third of the mastoid process (MT), in front of the mastoid process is the sphenomaxillary fissure, with the naso-maxillary fissure, and the cranial cavity through the sphenopalatine foramen, with the cranial cavity through the foramen rotundum, and with the mouth through the posterior palatine canal, as well as having other smaller openings.

At the front of the median suture between the maxillae lies the anterior palatine canal which, if it is looked into closely, will be seen to have one small foramen, the small foramen for Scarpa's foramina, for the naso-palatine nerves, and two lateral called Stensen's foramina for small arteries and the re-attachment of Jacobson's organ (see Olfactory System). In front of the foramen a suture foramen runs outward from the anterior palatine canal to between the incisor and canine teeth. It is therefore very easy to tell an adult's skull from that of a young person. Passing back in the mid line the foramen Magnum (J) is seen, through which pass the spinal cord and its membranes, the vertebral arteries and the spinal accessory nerves. A little in front of this lies the foramen rotundum, which is a slit-like opening which fits into a little spur, the anterior nasal spine, which is a purely human characteristic. At the side of the maxilla the malar or jugal (Ma) bone is placed, and its lozenge-shaped outline is apparent; it forms the anterior part of the zygomatic arch. When the maxilla is disarticulated and removed the posterior part of the maxilla is seen, and behind it the external pterygoid plate of the sphenoid. Between these two bones there is a vertical slit-like opening into a cave, the sphenomaxillary fissure, which commences at the foramen spinosum, which articulates with the sphenomaxillary fissure, with the sphenopalatine foramen, with the cranial cavity through the foramen rotundum, and with the mouth through the posterior palatine canal, as well as having other smaller openings.

The interior of the cranial cavity is covered by the inner table of bone, which is here known as the inner table of bone. The skull is so constructed as to enclose the brain and to be protected from injury. The skull is made up of two parts, the outer table of bone, which is the first part to be laid down in the embryo, and the inner table of bone, which is the last part to be laid down in the embryo.

The skull is a delicate structure, and is composed of two parts, the outer table of bone, which is the first part to be laid down in the embryo, and the inner table of bone, which is the last part to be laid down in the embryo. The skull is made up of two parts, the outer table of bone, which is the first part to be laid down in the embryo, and the inner table of bone, which is the last part to be laid down in the embryo.

The skull is a delicate structure, and is composed of two parts, the outer table of bone, which is the first part to be laid down in the embryo, and the inner table of bone, which is the last part to be laid down in the embryo. The skull is made up of two parts, the outer table of bone, which is the first part to be laid down in the embryo, and the inner table of bone, which is the last part to be laid down in the embryo.
may be examined. The vault shows the cerebral aspects of parts of the frontal, parietal and occipital bones, and of the sutures between them. The sphenoid is in place, the inter-maxillary foramen is intact, and the superior longitudinal sinus is well marked for the superior longitudinal sinus, and on each side of this irregular depression are often seen for the Fauccichondro-sphenoidal canal (see BRAIN). The base (fig. 5) is divided into three fossae, namely, the middle and posterior, each being behind and on a lower level than the one in front of it.

The anterior cranial fossa is formed by the cribriform plate of the ethmoid, nearly horizontal, but with a slight concave line, freely perforated for the passage of the olfactory nerves. In the mid line, near the front, is a triangular plate rising up which attaches to the bones of the crista galli (see BRAIN) and is called the crista galli. On each side of this is the floor of the nasal branch of the first division of the fifth nerve.

On each side of the cribiform plate is the orbital plate of the frontal, while the back part of the fossa has for its floor the body of the sphenoid (pre-sphenoid) near the mid line and the lesser wing (orbito-sphenoid) on each side. Each lesser wing is prolonged back into a tongue-like process, the anterior clinoide process, which is, externally to the pericranium, the optic foramen (fig. 5, 11), and the two foramina are joined by the optic groove for the optic commissure. Behind this groove is a transverse elevation, the olivary eminence (22), which marks the junction of the pre- and sphenoidal parts of the body of the sphenoid bone.

The middle cranial fossa is like a hour-glass placed transversely, as there is a central constricted, and two lateral expanded, parts. The central part forms the pterygoid fossa (fig. 6, 3) for the masseteric muscle and body (see BRAIN) and is bounded behind by the wall-like dorsum sellae, at the sides of which are the posterior clinoid processes (5, 4). The olivary eminence, pituitary fossa and dorsum sellar together resemble a Turkish saddle and are often called the sella turcica. The lateral expanded part of the middle cranial fossa is bounded in front by the great wing of the sphenoid (alisphenoid), behind by the front of the petrous part of the temporal (petrosal) and laterally by the squamous part of the temporal (squamosal). Between the alisphenoid and orbito-sphenoid is the sphenoidal fissure already noticed in the orbit, and a little behind this, piercing the alisphenoid, is the posterior opening of the foramen rotundum, through which the second division of the fifth nerve passes into the sphenomaxillary fossa. Further back the alisphenoid is pierced by the foramen ovale (c) and foramen spinosum (e) which have both of them noticed on the norma basilaris. From the latter a groove for the middle meningeal artery runs forward and outward, and soon divides into anterior and posterior branches, the former of which descends between the petrous bone and the dorum sella, the latter at the apex of the petrous bone and as the side of the dorum sella is the middle lacerated foramen (c), already noticed, and running inward to this from an aperture in the petrous bone is a groove for the great superficial petrosal nerve which is overlaid by the Caezarian ganglion of the fifth nerve.

The posterior cranial fossa is pentagonal in outline, having an anterior border formed by the dorum sellae, two antero-lateral borders, by the upper borders of the petrous bones, and two postero-lateral curved borders, by the grooves for the lateral sinuses (fig. 5, 11). In the middle of this fossa is the foramen magnum, bounded by the four parts of the occipital bone, which unite here; the floor is a bone and at the dorso of the sella is the middle lacerated foramen (c), already noticed, and running inward to this from an aperture in the petrous bone is the groove for the great superficial petrosal nerve which is overlaid by the Caezarian ganglion of the fifth nerve.

The posterior cranial fossa is pentagonal in outline, with an anterior border formed by the sella, two antero-lateral borders, by the upper borders of the petrous bones, and two postero-lateral curved borders, by the grooves for the lateral sinuses (fig. 5, 11). In the middle of this fossa is the foramen magnum, bounded by the four parts of the occipital bone, which unite here; the floor is a bone and at the dorso of the sella is the middle lacerated foramen (c), already noticed, and running inward to this from an aperture in the petrous bone is the groove for the great superficial petrosal nerve which is overlaid by the Caezarian ganglion of the fifth nerve.

The posterior cranial fossa is pentagonal in outline, with an anterior border formed by the sella, two antero-lateral borders, by the upper borders of the petrous bones, and two postero-lateral curved borders, by the grooves for the lateral sinuses (fig. 5, 11). In the middle of this fossa is the foramen magnum, bounded by the four parts of the occipital bone, which unite here; the floor is a bone and at the dorso of the sella is the middle lacerated foramen (c), already noticed, and running inward to this from an aperture in the petrous bone is the groove for the great superficial petrosal nerve which is overlaid by the Caezarian ganglion of the fifth nerve.

as the place where the dorsum sellae will be. It is partly surrounded by the meninges just as it is completely in the rest of the skull, and this meninges extends dorsally on each side to wrap round the nerve cord, which is here the brain. In this way the brain becomes enclosed in a primitive membranous cranium, the inner part of which persists in its segmental condition as the inner matrix, while the outer part may chondrify, chondrilly or ossify, or ossify without a cartilage stage. That part of the cranium which is in front of the notochord is called prechondral, while the posterior part is called chondral. On each side of the notochord chondrification takes place and a basioccipital of cartilage is formed which soon meets its fellow of the opposite side, and forms the floor of the skull as far forward as the external occipital protuberance. Laterally it comes in contact with the meninges surrounding the internal ear, which is also chondrifying to form the cartilaginous periosteal capsule, and thus forms a continuous floor for the back of the skull. A. Forrieop has shown that in the hinder occipital region of the calf there are evidences of four vertebrae having been incorporated with the basioccipital, that is to say that the plate and its coalesced vertebrae represent five mesodermic somites ("Zur Entwicklungsgeschichte der Wirbeltiere, insbesondere des Atlas und Epistrophes und der Occipitalregion," Archiv für Anat. u. Phys., Anat. Abh., 1886). It has more recently been shown by Levi that this same thing is true for man. K. Gegenbauer has pointed out that the primitive membranous skull shows, in the chordal region, signs of metameric segmentation in the way in which the cranial nerves pierce the dura mater, and as far back as the external occipital protuberance. Laterally it comes in contact with the meninges surrounding the cranial cavity, which is also chondrifying to form the carotid sutures, and thus forms a continuous floor for the back of the skull.

The cartilaginous base of the cranium is now formed, but the vault is membranous. While the base has been developing the two anterior visceral arches have been extending to form an attachment to the cranium, but the formation and fate of these is recorded in the article SKELETON (Visceral). About the sixth week of foetal life ossification begins at different points in the membranous vault of the skull. In this way the frontal, parietal, supra-occipital, and a little later the squamous part of the temporal bones are formed. About the eighth week, the lachrymal, nasal and vomer antrum are covered by a membrane lying superficial to different parts of the occipital capsule. All these are dermal bones, comparable to the deeper parts of the occipital capsule, and developed in the meninges lying in contact with the ectoderm. It is therefore necessary to think of the primitive skull as a three-layered structure, the membra propria as the inner membrane and have gained the chondro-cranium, which ossifies to form the base, and a superficial layer close to the skin or mucous membrane (ectoderm), from which the bones of the vault and superficial parts of the sphenoid are derived. At the four angles of the parietal, ossification is produced for some time to form fontanelles, of which the great is the most important, and at each of these points, as well as elsewhere in the sutures, accessory centres of ossification may occur to form Norman bones.

Along the middle line of the base of the skull the same progress of ossification is seen, and is followed by the development of the brain. Bilateral centres for the basioccipital appear about the sixth week, for the basiphosphium in the seventh, and for the pro- sphenoid in the tenth, while the anterior mass of the ethmoid does not ossify till the fifth month and the mesethmoid not until the fifth year of extra-uterine life. In the lateral part of the base the ex- occipitals and allophosphium begin to ossify about the sixth week and the eighth week and the pre- sphenoids about the tenth. In connexion with the allophosphium there is a small extra centre of ocellophilous interest only, which forms a little cone-shaped process called the lingula, projecting back into the middle lacerated foramen, and apparently corresponding to the sphenotic bone of lower vertebrates.

The auditory or periosteal capsule, like the olfactory, is formed later, chondrifying; it has four centres (pro-otic, epiotic, apopisthonic and pterotic) which do not come till the fifth month.

Some parts of the chondro-cranium do not ossify at all; this is the case in the anterior part of the mesethmoid, which remains as the septal cartilage of the nose, while, as has been already pointed out, a cartilage persists between the basioccipital and basi- sphenoïd until the twentieth year of life. From what has been said it is evident, and it will be still more evident if the article SKELETON (Visceral) be looked at, that some of the bones of the cranial vault are compound of various contributions from the different elements which make up the adult cranium; these, when recapitulated, are (1) the dura mater or entocranium, in man does not ossify as a whole, but perhaps in the crista galli. (2) The chondro-cranium or mese- cranium. (3) The superficial part of the mesethmoid (ectocranium) from which dermal bones are formed. (4) The olfactory and auditory sense capsules. (5) The viscerocranium. (6) Some fused vertebral bodies posteriorly.

The supra-occipital bone, for example, has the basioccipital, eosinoccygeal and basipatal part of the supra-occipital derived from the chondro-cranium and fused vertebrae, while the vault part of the supra-occipital has four dermal centres of ossification corresponding to the interparietal and preinterparietal bones of lower mammals (see fig. 4), in the accompanying figure the latter centres have fused with the interparietal, but an indication of their line of junction is seen on each side of g. The bone of Kercrings (e) is an abnormality, the meaning of which is not understood.

The temporal is also a very composite bone; in it the petro-mastoid portion represents the auditory sense capsule; the tabular
external auditory meatus is formed by the outgrowth of the tympanic cavity (fig. 60) which is probably an ossification of the choroid plexus (see SKELETON, Visceral); the squamosomaxillary part is a dermal bone, while the styloïd process is a part of the second visceral arch.

The mastoid process is not present at birth, but appears about the second year and becomes pneumatized by puberty. From what has been seen of the skull bones in the above necessarily concentrative account, it is evident that they correspond to the segmentation as indicated by the cranial nerves, and for this and other reasons the "vertebrate theory of the skull" is no longer believed in.

In the Dinosauria (sharks and lampreys) a cartilaginous cranial is developed, the anterior part of which forms an unpaired olfactory capsule connected with the rest of the cranium by fibrous tissue only. The posterior part consists of two bone cavities, an aperture, the basi-cranial fontanelle, remains unchondrified for the passage of the pituitary diverticulum into the skull.

In the Elasmobranchi (sharks, rays, and skate), and Holacanthi (Chimaeras) the skull is still a complete cartilaginous box, though calcification of the cartilage often takes place. Taking the skull of the dogfish as a type, two large olfactory capsules are seen anteriorly, while these cartilaginous, brain-boxes, are being excavated at its sides for the great orbits. More posteriorly the auditory capsules widen the skull, and on the posterior (caudal) aspect the foramen magnum is seen with an occipital condyle on each side of it for the first vertebra to articulate with. On the upper (dorsal) surface of the skull are two apertures in the middle line; the more anterior of these is sometimes called the anterior fontanelle, though it is nothing but the opening for the brain to the ventricle, in which the skull forms a rudimentary median orbit for the pineal eye (see BRAIN). The posterior fontanelle is a depression which leads into two lateral tubes, each of which passes into the auditory capsule and is known as an agnathodont vestibulum (see EAR).

In the cartilaginous ganoid fishes (sturgeon), which, like the elasmobranchs, are of great antiquity, the chondro-cranium is partly ossified to that all- and orito-sphenoids are found; in addition to this a large number of dermal bones have made their appearance, such as nasals, frontals, parietals, supra and post temporals. In the lampreys and hag-fishes a similar condition is seen, the brain to the sternum, the paracranial, formed, and lies ventral to and strengthens the cartilaginous base of the skull. It will be noticed that these fish are important morphological landmarks, because in them the air-changed chondro-cranium coexists with a dermal ectocranium.

In the bony ganoids such as the "bow fin" (Amia) the dermal bones are still more numerous and, among others, squamosals, prootics and exoccipitals appear. These fish are also remarkable for a fusion of the anterior part of the vertebral column with the occipital region of the skull, an arrangement recalling Froërip’s observations on the skull of the calf embryo mentioned in the section on embryology.

In the bony fishes (Teleostei) the membrane or dermal bones are still more numerous, and many of them are unrepresented in the mammalian skull, while others, which are elsewhere quite rudimentary, are very large. The chondro-cranium tends to disappear in the vault, but the base is fully ossified. Among other cartilaginous bones the five ossifications of the auditory capsule are seen, the pro-, epitympanic, and sphenotic, all of which are found as centres of ossification in man. In the cod, for example, the sphenotic, which is represented in man by the little lingula sphenoidal, is larger than the squamosal.

In the Dipnoi (mud-fish) the chondro-cranium is very slightly ossified, only exoccipitals being found, but there is the same coalescence with anterior vertebrae which was noticed in the ganoids. Dermal bones are present.

In the Amphibia the chondro-cranium persists and is only ossified in front by the girdle bone or sphenethmoid, and behind by the prootics and exoccipitals, but the latter are small. The anterior fontanelle is well marked in the chondro-cranium, but is completely overlaid and concealed by the dermal fronto-parietals. The membrane bones though large are much less numerous than in the ganoids.

In the Reptilia the skull varies immensely in the different orders but speaking broadly, the chondro-cranium is less distinct than in the Amphibia, except in the ethmoidal region. In the base of the skull where the osteo-sphenoids are present, a large membranous parabasal, and instead of two exoccipital condyles only one in the mid line is present, though this in many forms (e.g. Chelonia) consists of three parts, a median bone on the basi-sphenoid, and lateral ones on the sphenethmoid. If the mid line is definitely marked in the dermal part of the skull and forms a median orbit for the pineal eye; this is especially the case in the Lacertilia (lizards, lizards, and snakes) and Gymnophiona (worm-like lizards) there is a fibro-cartilaginous capsule between the orbits so that the cranial cavity does not reach forward to the ethmoidal region. The pro-, epi- and opisth-oenic bones are all developed, but the exoccipital fuses with the supra-occipital and the opisthochi with the ethmoid.

In the Crocodilia the first attempt at pneumatization is seen in the basi-sphenoid, which is traversed by a complicated system of Eustachian tubes leading directly to the tympanic cavity. The cavities of the skull are less numerous, and though these are indistinguishable in the adult, the parabasal is represented by a broad plate which is called the basi-temporal. The pro-, epi- and opisth-oenic bones fuse together to form the auditory capsule.

In the Mammalia the calvaria varies considerably in the different orders, the characteristic features being best marked in adult males. Usually the different bones are interlocked by sutures, as in man, and if such as those (see Monotremata, Edentata and Carnivora) they fuse together quite early.

In the basicranium the cartilage bones presphenoid, basi-sphenoid, and basi-basi-otic, are so well developed that the parabasal has disappeared. In the basicranium of the cranio-pharyngeal canal (see section on embryology) persists as a foramen at the bottom of the pituitary fossa. In the lower orders the face lies well in front of the brain case, as it does in reptiles and amphibians, but as the Primates are reached the increasing size of the calvaria causes it to overlie the face. Many of the bones are pneumatic, the process reaching its maximum in the elephant and the adult male gorilla. The base of the calvaria splits and fuses to form the petrous bone, though it is practically only in man that the second visceral arch ossifies on to this as a styloid process. There are usually two occipital condyles which have baso- and exoccipital elements, though there are many mammals in which there is a large crescentic condyle surrounding the anterior half of the foramen magnum.

Posteriorly the processes of the dura mater occurs in the temporals cerebri of the carnivora and in the falx cerebri of the ornithorhynchous and porpoise. The orbits are in most mammals continuous with the temporal fossae. Sometimes, as in many of the rodents and in the lemurs, they are outlined by a bony ring, but it is not until the higher Primates are reached that the two cavities are shut off and even then a vestige of their original continuity remains in the sphen-ofaxial fissure.

For further details, see Anatomy of the Mammalia (London, 1885); S. H. Reynolds, The Vertebrate Skeleton (Cambridge, 1897); R. Wiedersheim; Vergleich. Anat. der Wirbeltiere (Leipzig, 1901).

CRANIAL SURGERY

Surgery of the Skull.—Fractures of the vault of the skull may occur without the bone being driven in to compress the brain, and in such cases their existence may be revealed only after death. But if there is also a severe scalp wound the line of fracture may be traced in the bare bone as a thin red crack, "Think lightly," said the old physician, "of no injury to the head." The patient with a suspected fracture of the skull is put to bed in a dark, quiet room, and he is watched. It may be that the crack has extended across a bony groove in which an artery is running, and, the artery being torn, haemorrhage may take place within the skull and the symptoms of compression of the brain may supervene. Experiments upon the lower animals have taught the surgeon how to recognize the exact spot at which the compression is situated. One set of muscles after another is thrown out of work, and finally one that is known exactly where the bleeding is going on, so, having made a hole in the skull by trephining, he turns out the clot and secures the leaking vessel.

Compression of the brain may be the direct and immediate result of a head-injury, a piece of the vault of the skull being driven in, and a local or a general paralysis of muscles being at
SKULL

once observed. In addition to the muscular paralysis, which may enable the surgeon to localize the spot at which there is pressure upon the brain, there is the grave symptom of coma or insensibility. And, as in deep sleep, there is often loud snoring, due to the vibration of the paralysed soft-palate. The heart being loaded with imperfectly aerated blood, the face is dusky or livid, and the pulse is slow and full. No notice is taken by the man of a loud shout into his ear, and on the surgeon mising his eyelids the pupils are found dilated and fixed, which signifies that the reflex to light is lost—a very grave sign. There may be complete paralysis of one side or of both sides of the body, and the presence of a blood-clot, an abscess, a foreign body (such as a bullet) or a depressed piece of the skull-wall give rise to coma, but so may a syphilitic, a malignant or an innocent tumour, and in cases in which the administration of iodide of potassium fails to afford relief, the operation of trephining may perhaps be resorted to, as giving the only chance of recovery. As regards treatment—short of trephining—it may be advisable to relieve the heart by bleeding. Inasmuch as the reflex actions are in abeyance, it will be necessary to have the bladder regularly emptied. The man should be placed on his side in bed, so that his tongue may not fall to the side and choke him, and if it is thought inadvisable to bleed him, a full dose of digitalis should be administered.

For the operation of trephining, the head is shaved and the skin rendered aseptic, a large horse-shoe flap is then turned down and the skull laid bare. With an instrument on the principle of a centre-bit, a disk of bone of the size of a florin, a crown or a napkin-ring—or even larger—is then taken out of the skull-wall, and the dura mater is opened up if the cause of the compression is beneath it; otherwise, on the disk of bone being removed, the particular condition is dealt with without opening the dura mater. Where the latter part of the tumour, or whatever it is, has been removed, the disk of bone which, during the operation, has been kept in a warm liquid, is cut up into pieces which are put back into the opening and the skull flap is brought up into its proper position.

Fractures of the base of the skull are always serious, in that they may run across important nerves and large blood-vessels; passing through the roof of the nose, or the ear, they may be compound—that is to say, they may communicate with air-cavities from which pathogenic germs may readily enter the injured tissues. Thus, the dangers of sepsis are added to those of concussion or compression of the brain. Fractures of the base of the skull being associated with bleeding from the nose, mouth or ear, or with extravasation of blood over the eyeball. Facial paralysis is the result of the line of fracture passing across the bony channel in which the seventh or facial nerve is running. When the fracture passes across the temporal bone and the middle ear, and ruptures the membrane of the tympanum, not only blood may escape from the ear, but an apparently unlimited amount of cerebro-spinal fluid. In all cases the ear should be made surgically clean, and watch and guard kept against the entrance of septic micro-organisms. When the fracture extends through the anterior part of the base of the skull this clear fluid may escape from the nose. In both cases its appearance implies that the dura mater has been lacerated and the sub-dural space opened.

Concussion of the brain (stunning) may result from a blow upon the head or from a fall from a height. The symptoms may be those of a mere giddiness, and a feeling of stupidity, which may quickly pass off, or they may be those of severe shock (see Shock). The person may die from the concussion, or he may slowly or quickly recover. The insensibility may be for a time complete. The pulse may be small, quick and imperceptible, and, no blood being pumped up by the enfeebled heart, the face will be pale and the surface of the body cold. The respiratory movements are likely to be sighing and shallow, or scarcely perceptible. As a rule, the pupils react to light, contracting as the lids are raised. This shows that the light-reflex is not lost, and is a good omen. One of the first signs of returning consciousness is that the person vomits, and after this he gradually comes round.

As a result of the injury, however, he may remain irritable, and liable to severe headaches or to lapses of memory.

**Surgery of the Brain.**—Abscess of the brain is most likely to be the result of extension inwards of septic inflammation from the middle ear, or of a fracture of the skull which passes across the aural, nasal or pharyngeal air-space, giving the opportunity for the entrance of the germs of suppuration. As the collection of pus forms, persistent headache is complained of together with, perhaps, localized pain or tenderness. A constant feature of intra-cranial pressure, whether the result of tumour or of abscess, is the presence of headache and of vomiting. Later the patient becomes drowsy. On looking into the back of the eyeball by the ophthalmoscope, it is noticed that the optic nerve is congested ("choked"), the result of the increased intra-cranial pressure. The pulse becomes strangely slow, and is apt to drop a beat now and then. The temperature is high. The patient may have attacks of giddiness, and he is subject to fits of an epileptic nature; growing steadily worse, he may be found paralysed on one side, or on both sides, and, becoming insensible, may pass away in the deep sleep known as coma.

The symptoms of tumour of the brain are much like those of abscess, though they come on more slowly and steadily; and inasmuch as the disease is not septic, the temperature may be undisturbed, or but little raised above normal. In the case of the abscess or the tumour being on the left side of the brain, and involving the speech centre (Broca's convolution), the patient becomes aphasic.

Tumours of the brain are likely to be sarcomatous (see Cancer), but they may occur as the result of tuberculous or syphilitic deposit, or of infection by the ova of the dog's tape-worm—hydatid cyst.

In cases of suspected cerebral tumours in which there is even a faint possibility of the patient having been the subject of syphilis, iodide of potassium is prescribed in large doses. Indeed, whilst waiting the development of further symptoms in any obscure case, it is usual to try the effect of this drug, the good influence of which is by no means confined to cases of syphilis. If in spite of the administration of the iodide the symptoms are increasing, the question of opening the skull and exploring the region may arise. Before the days of anaesthetics and of anti-septics such a procedure could scarcely have been considered, but now the operation can be undertaken in suitable cases with a good hope of success.

If the case be one of abscess secondary to disease of the middle ear, the skull will probably be opened in the continuation of the operation by which the septic disease in the temporal bone was cleared away, the aperture having been enlarged by the use of the trephine, gouge or chisel. The side of the head is shaved and rendered aseptic before the operation is begun, and when the dura mater has been incised search is made for pus by the use of a grooved director. Pus having been found, the cavity is treated by gentle irrigation and drainage. When the operation is undertaken for a cerebral tumour the whole of the head is shaved and the skin duly pared, so that the operation may be carried out with the least possible risk of the occurrence of sepsis. A large horse-shoe incision having been made, the flap of skin and muscle is turned down, and a disk of the skull-wall, about 2 in. in diameter, is removed by a trephine, worked by electricity or by the hand. The thick covering of the brain, the dura mater, is thus exposed, and if the presence of a tumour (or an abscess) has caused an excess of intra-cranial pressure, the membrane will bulge into the opening. The dura mater is then incised and turned down, and if the tumour is upon the cortex of the brain, and not too extensive, it is taken away. It may be necessary, however, to enlarge the opening made in the skull, and to break through a considerable mass of brain-tissue before the tumour can be removed. Bleeding having been arrested by pressure with a firm plug of gauze, a soft drainage tube is introduced and the dura mater is stitched in position. The disk of bone (which, since its removal, has been kept in some salted warm water) may be replaced before the horse-shoe flap is stitched in position, a notch having been cut in its border to allow for the drainage. In some
SKUNK—SKY

cases the large horse-shoe flap is so made as to include a part of the bony wall of the skull. The flap of bone is shaped by wire saws and then forcibly broken out by elevators.

The general result of operations for the removal of tumours of the brain is far from being satisfactory. But it must be remembered that without operation the outlook is without hope. Inasmuch as many of the tumours are destined of a limiting wall, a considerable mass of brain-tissue has to be traversed in order to remove the growth, and the ultimate result, so far as the impairment of functions is concerned, is a serious disappointment. If, however, the tumour is found to be encapsulated, its removal becomes a comparatively easy task, and performance is then likely to be the result. (E. O.*)

SKUNK (probably derived from "Seeckaw," the Cree name for the skunk; another form given is "seganku"), an evil-smelling North American carnivorous mammal. Its existence was first notified to European naturalists in 1636, in Gabriel Sagard-Theodot's History of Canada, where, in commencing his account, he describes it as "enfans du diable, que les Hurons appelle Scangarese, ... une beste fort puante," &c. This should be noted in what reputation the skunk is then held, a reputation which has, in no way, been lessened, that the mere name of skunk is one of opprobrium. The skunks, of whom there are several species, arranged in three genera, are members of the family Mustelidae (see CARNIVORA). The common skunk (Mephitis mephitis) is a native of North America, extending from Hudson Bay to the middle United States. It is a beautiful animal, about the size of a cat, though of a stouter and heavier build, with rich lustrous black fur, varied on the back by a patch or streak of white. The muzzle is long and pointed, the eyes are sharp and black, like, and the grey, white tail is long and unusually bushy. The premolars number 8.

The following account of the skunk is extracted from Dr C. H. Merriam's Mammals of the Adirondack Region, New York, 1884:

"The skunk preys upon mice, salamanders, frogs, and the eggs of birds that nest on or within reach from the ground. At times he eats carrion, and if he chances to stumble upon a hen's nest the eggs are liable to suffer; and once in a while he acquires the evil habit of robbing the hen-roost, but as a rule skunks are not addicted to this vice. Of all our native mammals perhaps no one is so universally abused and has so many unpleasant things said about it as the innocent subject of the present biography; and yet no other species is half so valuable to the farmer. Pre-eminently an insect-eater, he destroys more beetles, grasshoppers and the like than all our other mammals together, and in addition to these he devours vast numbers of mice."

"He does not evince that dread of man that is so manifest in the vast majority of our mammals, and when met during any of his circuitous wanderings he thinks of running away. He is not as movement and deliberate in action and does not often hurry himself in whatever he does. His ordinary gait is a measured walk, but when pressed for time he breaks into a low shuffling gallop. It is hard to intimidate a skunk, but when once really frightened he manages to get over the ground at a very fair pace. Skunks remain active throughout the greater part of the year in this region, and hibernate only during the severest portion of the winter. They differ from most of our hibernating mammals in that the inactive period is apparently dependent solely on the temperature, while the mere amount of snow has no influence whatever upon their movement."

"Skunks have large families, from six to ten young being commonly raised each season; and as a rule they all live in the same hole until the following spring."

The overpowering odour which has brought the skunk into such notoriety arises from the secretion of the anal glands. These glands, although present in all Mustelidae, are especially developed in skunks, but are so entirely under control that at times inanimate objects, even those of human presence, may be detected by the smell. So highly developed are these glands that the very hairs of the skunks are thickly coated with a greasy secretion from which the scent emanates. Similar glands are possessed by nearly all carnivora, but in these species they are normally enlarged, and provided with thick muscular coats. The secretion—often propelled by the muscles surrounding to a distance of from 8 to 12 ft.—is a clear yellowish liquid, with a pervasively penetrating ammonical and nauseous smell. Dr Merriam writes, "I have known the scent to become strikingly apparent in every part of a well-closed house, in winter, within five minutes after a skunk had been killed at a distance of more than a hundred yards," and under favourable conditions it may be perceived at a distance of more than a mile. Instances are also on record of persons having become unconscious after inhaling the smell.

The long-tailed skunk (M. macroura), a native of central and southern Mexico, differs from the typical species by having two white stripes along its sides, and by its longer and bushier tail. The little striped skunk (Spilogale putorius), found in the southern United States, and ranging southwards to Yucatan and Guatemala, is smaller than M. mephitis, and marked with four interrupted longitudinal white stripes on a black ground. There are likewise differences in the skull; and this species is also distinguishable by its arboreal habits.

The conepatil (Conepetis mepaturi) represents a third genus, with several species, confined to tropical and South America. In this group there is one pair less of premolars (p. 8); the build is heavier than in Mephitis; the snout and head are more pig-like, and the nostrils open downwards and forwards instead of laterally on the sides of the muzzle. (O. T.; R. L.*)

SKY (M. Eng. skie, cloud; O. Eng. skua, shade; connected with an Indo-European root sku, cover, whence "scum," Lat. obscurus, dark, &c.), the apparent covering of the atmosphere, the reflecting layer of air and in some cases cloudy structure.

The Colour of the Sky.—It is a matter of common observation that the blue of the sky is highly variable, even on days that are free from clouds. The colour usually deepens toward the zenith and also with the elevation of the observer. It is evident that the normal blue is more or less diluted with extraneous white light, having its origin in reflections from the grosser particles of foreign matter with which the air is usually charged. Closely associated with the colour is the polarization of the light from the sky. This takes place in a plane passing through the sun, and attains a maximum about 90° therefrom. Under favourable conditions more than half the light is polarized.

As to the origin of the normal blue, very discrepant views have been held. Some writers, even of good reputation, have held that the blue is the true body colour of the air, or of some ingredient in it such as ozone. It is a sufficient answer to remark that on this theory the blue would reach its maximum development in the colour of the setting sun. It should be evident that what we have first to explain is the fact that we receive any light from the sky at all. Were the atmosphere non-existent or entirely a purely transparent, the sky would necessarily be black. There must be something capable of reflecting light in the wider sense of that term.

A theory that has received much support in the past attributes the reflections to thin bubbles of water, similar to soap-bubbles, in which form vapour was supposed to condense. According to it, sky blue would be the blue of the first order in Newton's scale. The theory was developed by R. Clausius (Pogg. Ann. vols. 72, 76, 88), who regarded it as meeting the requirements of the case. It must be noticed, however, that the angle of maximum polarization would be about 76° instead of 90°.

Apart from the difficulty of seeing how the bubbles could arise, there is a formidable objection, mentioned by E. W. Brücke (Pogg. Ann. 88, 369), that the blue of the sky is a much richer colour than the blue of the first order. Brücke also brought forward an experiment of great importance, in which he showed that gum mastic, precipitated from an alcoholic solution poured into a large quantity of water, scatters light of a blue tint. He remarks that it is impossible to suppose that the particles of mastic are in the form of bubbles. Another point of great importance is well brought out in the experiments of John Tyndall (Phil. Mag. (4), 137, 388) upon clouds precipitated by the chemical action of light. Whenever the particles are sufficiently fine, the light emitted laterally is blue in colour and, in a direction perpendicular to the incident beam, is completely polarized.

About the colour there can be no prima facie difficulty; for, as soon as the question is raised, it is seen that the standard of linear dimension, with reference to which the particles are called small, is the wave-length of light, and that a given set of particles would (on any conceivable view as to their mode of action)
produce a continually increasing disturbance as we pass along the spectrum towards the more refrangible end.

On the other hand, that the direction of complete polarization should be independent of the refracting power of the matter composing the cloud has been considered mysterious. Of course, on the theory of thin plates, this direction would be determined by Brewster’s law; but, if the particles of foreign matter are small in all their dimensions, the circumstances are materially different from those under which Brewster’s law is applicable.

The investigation of this question upon the elastic solid theory will depend upon how we suppose the solid to vary from one optical medium to another. The slower propagation of light in gas or water than in air or vacuum may be attributed to a greater density, or to a less rigidity, in the former case; or we may add both complications supposing that both these quantities vary, subject only to the condition which restricts the ratio of velocities to equality with the known refractive index. It will presently appear that the original hypothesis of Fresnel, that the rigidity remains the same in both media, is the only one that can be reconciled with the facts; and we will therefore investigate upon this basis the nature of the secondary waves dispersed by small particles.

Conceive a beam of plane polarized light to move among a number of particles, all small compared with any of the wave-lengths. According to our hypothesis, the foreign matter may be supposed to load the aether, so as to increase its density without altering its resistance to distortion. If the particles were without power, the wave would pass on unbroken and no light would be emitted laterally. Even with the particles retarding the motion of the aether, the same will be true if, to counterbalance the increased inertia, suitable forces are caused to act on the aether at all points where the inertia is altered. These forces have the same period and direction as the undisturbed luminous vibrations themselves. The light actually emitted laterally is thus the same as would be caused by forces exactly the opposite of these acting on the medium otherwise free from disturbance, and it only remains to see what the effect of such force would be.

On account of the smallness of the particles, the forces acting throughout the volume of any individual particle are all of the same intensity and direction, and may be considered as a whole. The determination of the motion in the aether, due to the action of a periodic force at a given point, is discussed in the article DIFFRACTION OF LIGHT (§ 11). Before applying the solution to a mathematical investigation of the present question, it may be well to consider the matter for a few moments from a more general point of view.

In the first place, there is necessarily a complete symmetry round the direction of the force. The disturbance, consisting of transverse vibrations, is propagated outwards in all directions from the centre; and, in consequence of the symmetry, the direction of vibration in any ray lies in the plane containing the ray and the axis of symmetry; that is to say, the direction of vibration in the scattered or diffracted ray makes with the direction of vibration in the incident or primary ray the least possible angle. The symmetry also requires that the intensity of the scattered light should vanish for the ray which would be propagated along the axis; for there is nothing to distinguish one direction transverse to the ray from any other. The application of this is obvious. Suppose, for distinctness of statement, that the primary ray is vertical, and that the plane of vibration is that of the meridian.

The intensity of the light scattered by a small particle is constant, and a maximum, for rays which lie in the vertical plane running east and west, while there is no scattered ray along the north and south line. If the primary ray is unpolarized, the light scattered north and south is entirely due to that component which vibrates east and west, and is thereforeperfectly polarized, the direction of its vibration being also east and west. Similarly any other ray scattered horizontally is perfectly polarized, and the vibration is performed in the horizontal plane. In other directions the polarization becomes less and less complete as we approach the vertical.

The observed facts as to polarization are thus readily explained, and the general law connecting the intensity of the scattered light with the wave-length follows almost as easily from considerations of dimensions.

The object is to compare the intensities of the incident and scattered light, for these will clearly be proportional. The number (or area) for which the amplitudes is a function of the following quantities:—(T) the volume of the disturbing particle; (r) the distance of the point under consideration from it; (λ) the wave-length; (b) the velocity of propagation of light; (D) and (D') the angles of elevation of the points through which the wave passes, and distances of such points from the surface on which the scattered wave passes, the first in the same direction, the second in the opposite.

The expressions we use for the intensity of the scattered light are, therefore, given by

$$I = \frac{1}{\lambda X^2} \sin^4 \left(\frac{\pi b}{\lambda X} \right) \times \left( \frac{\lambda}{X} \right)^2 \times \frac{1}{2} \times \left( \frac{D + D'}{X} \right)^4$$

The preceding investigation is based upon the assumption that in passing from one medium to another the rigidity of the aether does not change. If we forego this assumption, the question is

1 In strictness the force must be supposed to act upon the medium in its actual condition, whereas in (18), previously cited, the medium is supposed to be absolutely uniform. It is not difficult to prove that (3) remains unaltered, when this circumstance is taken into account; and it is evident in any case that a correction would depend upon the square of (D' - D).
necessarily more complicated; but, on the supposition that the changes of rigidity ($\Delta N$) and of density ($\Delta D$) are relatively small, the results are fairly simple. If the primary wave be represented by

$$\gamma = \pm dxz,$$

the component rotations in the secondary wave are

$$\omega_1 = \frac{\Delta N}{N} \left(\frac{y^2}{z^2}ight),$$
$$\omega_2 = \frac{\Delta D y \Delta N}{D} \left(\frac{y^2}{z^2}ight),$$
$$\omega_3 = \frac{\Delta D x \Delta N}{D} \left(\frac{y^2}{z^2}\right)$$

where

$$P = \frac{i}{2\pi} \int \frac{\gamma dx}{r^2}$$

The expression for the resultant rotation in the general case would be rather complicated; and is not needed for our purpose. It is easily seen to be about an axis perpendicular to the scattered ray $(x, y, z)$, inasmuch as

$$\omega_1 + \omega_2 + \omega_3 = 0.$$

Let us consider the more special case of a ray scattered normally to the incident ray, so that $\omega = 0$. We have

$$\omega^2 = \omega_1^2 + \omega_2^2 + \omega_3^2 = P \left(\frac{\Delta N^2}{N^2} + P \left(\frac{\Delta D^2 y^4}{D^2} \right) \frac{y^2}{r^2} \right).$$

If $\Delta N, \Delta D$ be both finite, we learn from (7) that there is no direct direction perpendicular to the primary (polarized) ray in which the secondary light vanishes. Now it is perfectly plain that there is such a direction, and therefore we are driven to the conclusion that either $\Delta N$ or $\Delta D$ must vanish.

The consequences of supposing $\Delta N$ to be zero have already been traced. They agree very well with experiment, and require us to suppose that the vibrations are perpendicular to the plane of polarization. So far as (7) is concerned the alternative supposition that $\Delta D$ vanishes would answer equally well, if we suppose the vibrations to be executed in the plane of polarization; but let us now revert to (5), which gives

$$\omega^2 = \frac{\Delta N}{N} \frac{y^2}{r^2}$$

According to these equations there would be, in all, six directions from $O$ along which there is no scattered light,—two along the axis of $y$ normal to the original ray, and four ($y = 0, z = \pm x$) at angles of $45^\circ$ with that ray. So long as the particles are small, no such vanishing of light in oblique directions is observed, and we are thus led to the conclusion that the hypothesis of a finite $\Delta N$ and of vibrations in the plane of polarization cannot be reconciled with the facts. No form of the elastic solid theory is admissible except that in which the vibrations are supposed to be perpendicular to the plane of polarization, and the difference between one medium and another to be a difference of density only (Phil. Mag., 1871, 41, p. 447).

It is of interest to pursue the applications of equation (5) so as to connect the intensity of the scattered and transmitted light with the number and size of the particles (see Phil. Mag., 1899, 47, p. 375). In order to find the whole emission of energy from one particle (T), we have to integrate the square of (3) over the surface of a sphere of radius $r$. The element of area being $2\pi r^2$ sin $\phi d\phi$, we have

$$\int \sin \phi \sin^2 \phi d\phi = \frac{\pi}{3};$$

so that the energy emitted from T is represented by

$$\frac{8 \pi^4}{3} \left(D^4 - D^2\right) T^2 \frac{3}{D^2} \frac{\lambda^4}{\chi^4};$$

on such a scale that the energy of the primary wave is unity per unit of wave-front area.

The above relates to a single particle. If there be $n$ similar particles per unit volume, the energy emitted from a stratum of thickness $dx$ and of unit area is found from (9) by the introduction of the factor $n dx$. Since there is no waste of energy upon the whole, this represents the loss of energy in the primary wave. Accordingly, if $E$ be the energy of the primary wave,

$$\frac{E dx}{1} = \frac{8 \pi^4}{3} \left(D^4 - D^2\right) T^2 \frac{3}{D^2} \frac{\lambda^4}{\chi^4};$$

whence

$$E = E_0 e^{-dx}$$

where

$$h = \left(\frac{8 \pi^4}{3} \left(D^4 - D^2\right) T^2 \frac{3}{D^2} \frac{\lambda^4}{\chi^4}\right)$$

If we had a sufficiently complete expression for the scattered light, we might investigate (12) somewhat more directly by considering the resultant of the primary vibration and of the secondary vibrations which travel in the same direction. If, however, we apply this process to (5), we find that it fails to lead us to (12), though it furnishes another result of interest. The combination of the secondary waves which travel in the direction in question have this peculiarity: that the phases are no more distributed at random. The intensity of the secondary light is no longer to be arrived at by addition of individual intensities, but must be calculated with consideration of the particular phases involved. If we consider a number of particles which all lie upon a primary ray, we see that the phases of the secondary vibrations which issue along this line are all the same.

The actual calculation follows a similar course to that by which Huygen's conception of the resolution of a wave into components corresponding to the various parts of the wave-front is usually verified (see Diffraction of Light). Consider the particles which occupy a thin stratum $dz$ perpendicular to the primary ray $x$. Let $AP$ (fig. 1) be this stratum, and $O$ the point in which the vibration is to be estimated. If $AP = r$, the element of volume is $dsin\phi r d\phi$, and the number of particles to be found in it is deduced by the introduction of the factor $n$. Moreover, if $OP = r$, and $AO = r\phi$, then $r^2 = x^2 + y^2$, and $r d\phi = dr$. The resultant at $O$ of all the secondary vibrations which issue from the stratum $dz$ is by (5), with $\sin \phi$ equal to unity,

$$n dx \int \frac{e^{-D^4 - D^2 T^2}}{D} \cos \left(\frac{2\pi}{D} (r - x) w dr,\right)$$

or

$$n dx \frac{D^4 - D^2 T^2 \phi}{D} \sin \left(\frac{2\pi}{D} (r - x) w dr,\right)$$

To this is to be added the expression for the primary wave itself, supposed to advance unobstructed, viz., $\cos \left(\frac{2\pi}{D} (r - x) w dr,\right)$, and the resultant will then represent the whole actual disturbance at $O$ as modified by the particles in the stratum $dz$.

It appears, therefore, that to the order of approximation afforded by (3), the effect of the particles in $dz$ is to modify the phase, but not the intensity, of the light which passes them. If this be represented by

$$\cos \frac{2\pi}{D} (r - x - 8),$$

$\delta$ is the retardation due to the particles, and we have

$$\delta = n T D (D^4 - D^2 D)$$

If $\mu$ be the refractive index of the medium as modified by the particles, that of the original medium being taken as unity, then

$$\mu = (\mu - 1) dx,$$

and

$$\mu = 1 + \frac{\pi T (D^4 - D^2) D}{2};$$

If $\mu'$ denote the refractive index of the medium composing the particles regarded as continuous, $D^4/D = \mu''$, and

$$\mu' = 1 + \frac{\pi T (\mu'^4 - 1)}{2};$$

reducing to

$$\mu' = 1 + \frac{\mu' - 1}{2}$$

in the case when $(\mu' - 1)$ can be regarded as small.

It is only in the latter case that the formulse of the elastic solid theory are applicable to light. On the electric theory, now generally accepted, the results are more complicated, in that when $(\mu' - 1)$ is not small, the scattered ray depends upon the shape and not merely upon the volume of the small obstacle. In the case of spheres, we are to replace $(D^4/D)D$ by $3(k'K)/(K' + 2k)$, where $K, K'$ are the dielectric constants proper to the medium and to the obstacle respectively (Phil. Mag., 1881, 12, p. 98); so that instead of (17)

$$\mu' = 1 + \frac{3\pi T \mu'^4 - 1}{12}$$

$$\mu' = 1 + \frac{\mu' - 1}{2}$$

On the same suppositions (12) is replaced by

$$h = 32\pi (u - 1)^3/3\lambda^4;$$

a formula giving the coefficient of transmission in terms of the refraction, and of the number of particles per unit volume. As Lord Kelvin has shown (Baltimore Lectures, p. 304, 1904) (16) may also be obtained by the consideration of the mean density of the altered area.
matters. We may take $a = 6\times10^{-5}$ cm., $\mu = 0.0003$; whence from (21) we obtain the distance $a = 0.06$ cm. The light must travel in order to undergo alteration in the ratio $e : 1$.

$$x = 1.4 \times 10^{10} \times a. \ldots \ldots \ldots (22)$$

The completion of the calculation requires a knowledge of the value of $n$, the number of molecules in unit volume under standard conditions, which, according to Avogadro’s law, is the same for all gases. Maxwell estimated $1.9 \times 10^{29}$, but modern work suggests a higher number, such as $4.3 \times 10^{29}$ (H. A. Wilson, Phil. Mag., vol. 19, 1910). If we substitute the latter value in (22) we find $x = 10^{15} \times a = 190$ kilometres.

Although Mount Everest appears fairly bright at 100 miles’ distance, as seen from the neighbourhood of Darjeeling, we cannot suppose that the atmosphere is as transparent as is implied in the above numbers; and, of course, this is not to be expected, since there is certainly suspended matter to be reckoned with. Perhaps the best data for a comparison are afforded by the varying brightness of stars at different altitudes. P. Bouguer and others estimate about 0.8 for the transmission of light through the entire atmosphere from a star in the zenith. This corresponds to 5.3 kilometres of air at standard pressure. At this rate the transmission through 190 kilometres would be $(8)^{19}$ or 0.006 in place of $e$ or $0.37$. Or again if we inquire what, according to (21), would be the transmission through 8.3 kilometres, we find $1 - 0.044 = 0.956$.

The general conclusion would appear to be that, while as seen from the earth’s surface much of the light from the sky is due to comparatively gross suspended matter, yet an appreciable proportion is attributable to the molecules of air themselves, and that at high elevations where the blue is purer, the latter proportion is very much in evidence.

For a further discussion founded upon the observations of Q. Majorana and A. Solla, reference may be made to Lord Kelvin’s Baltimore Lectures, p. 317, where a higher estimate of the value of $n$ is favoured. It may be remarked that it is only the constant part of sky-light that can be due to detached molecules. Ordinary observation of the landscape shows that there is another part, highly variable from day to day, and due to suspended matter, much of which is fine enough to scatter light of blue quality.

The experiments of Tyndall upon precipitated clouds have been already referred to. So long as the precipitated particles are very fine, the light dispersed in a perpendicular direction is sky-blue and fully polarized. At a further stage of their growth the particles disperse in the perpendicular direction a light which is no longer fully polarized. When quenched as far as possible by rotation of a Nicol prism, it exhibits a residue of a more intense blue colour; and further it is found that the direction of the most nearly complete polarization becomes inclined to the direction of the primary rays.

A discussion of these and other questions upon the basis of the electromagnetic theory of light is given in the Phil. Mag., 1881, 12, p. 81. Here we must be content with a statement of some of the main conclusions. The light of the sun appears to be very much of a different character; at any rate, to differ little from their environment in optical properties, there is little difference between the electric and the elastic solid theories, and the results expressing the character of the scattered light are equivalent to (5). Whatever may be the shape or size of the particles, there is no scattered light in a direction parallel to the primary electric displacements. In order to render an account of Tyndall’s "residual blue" it is necessary to pursue the approximation further, taking for simplicity the case of spherical shape. We learn that the light dispersed in the direction of primary vibration is not only of higher order in the difference of optical purity, but is also of order $\alpha^2$ in comparison with the primary. Where $\alpha = \sin \theta$, or $\theta = \sin^{-1} \alpha$, where $\theta$ is the angle between the incident light and the scattered light, while $\theta$ is the right power of the wave-length, so that the resultant light is a rich blue.

As regards the polarization of the dispersed light as dependent on the angle at which it is emitted, we find that, when terms of the same degree are considered, the light will no longer vanishes in the same direction as before, the peculiarity is not lost but merely transferred to another direction. The angle $\theta$ through which the displacement occurs is measured backwards, i.e. towards the incident ray, and its value is given by

$$\theta = \frac{\Delta K}{K} \frac{m^2}{25} \ldots \ldots \ldots (23)$$

$\Delta K$ being the difference of specific inductive capacities.

Experiments upon this subject are not difficult. In a darkened room a beam of sunlight (or electric light) is concentrated by a large lens of 2 or 3 ft. focus; and in the path of the light is placed a glass plate containing a very small quantity of dilute sulphuric acid, a precipitate of sulphur slowly forms, and during its growth manifests exceedingly well the phenomena under consideration. The more dilute the solution, the slower is the progress of the precipitation. A strength such that there is a delay of 4 or 5 minutes before any effect is apparent will be found suitable, but no great nicety of adjustment is necessary. By optical examination it may be shown that the primary light; but it is usually more convenient to analyse the scattered light. In the early stages of the precipitation the polarization is complete in a perpendicular direction, and incomplete in the oblique directions. After an interval the polarization begins to be incomplete in the perpendicular direction, the light which reaches the eye when the nicle is set to minimum transmission being of a beautiful blue, much richer than anything that can be seen in the earlier stages. This is the moment to examine whether there is a more complete polarization in a direction somewhat oblique; and it is found that with $\theta$ positive there is, in fact, a direction of more complete polarization, which is more imperfect than in the perpendicular direction itself.

The polarization in a distinctly oblique direction, however, is not perfect, a feature for which more than one reason may be put forward. In the first place, with a finite size of particles, the direction of complete polarization indicated by (23) is a function of the colour of the light, the value of $\theta$ being 3 or 4 times as large for the violet as for the red end of the spectrum. This is an effect much improved by passing the primary light through a coloured glass. Not only is the oblique direction of maximum polarization more definite and the polarization itself more complete, but the oblique direction is easier to determine than the direction of the transmitted light. The obliquity of the polarization is greater for the blue than for the red, and the uniformity in the colour of the light scattered in various directions. If we begin with a blue glass, we may observe the gradually increasing obliquity of the direction of maximum polarization; and then by exchanging the blue glass for another, we may determine the oblique and obliquity of the direct scattering, and see the transition from perpendicularity to obliquity over again. The change in the wave-length of the light has the effect of a change in the size of the particles, and the comparison gives curious information as to the rate of growth.

But even with homogeneous light it would be unreasonable to expect an oblique direction of perfect polarization. So long as the particles are all very small in comparison with the wave-length, there is complete polarization in the perpendicular direction; but when the size is such that obliquity sets in, the degree of obliquity increases with the size of the particles, and the polarization will be complete only on the very unlikely condition that the size is the same for them all. It must not be forgotten, too, that a very moderate increase of dimensions may carry the particles beyond the reach of our approximations.

The fact that at this stage the polarization is a maximum, when the angle through which the light is turned exceeds a right angle, is well worthy of note, as the opposite result would probably have been expected. By Brewster’s law (see POLARIZATION OF LIGHT) this angle in the case of regular reflection from a plate is less than a right angle; so that not only is the law of polarization for a very different character of light, but the first effect of an increase of size is to augment the difference.

The simple theory of the dispersion of light by small particles suffices to explain not only the blue of the zenith, but the comparative absence of small wave-lengths from the direct solar rays, and the brilliant orange and red coloration of the setting sun and of the clouds illuminated by his rays. The hyposulphite experiment here again affords an excellent illustration. But we must not expect a simple theory to cover all the facts. It is obvious that the aerial particles are illuminated not only by the direct solar rays, but also by light dispersed from other parts of the atmosphere and from the earth’s surface. On this and other accounts the coloration of the sky is highly variable. The transition from blue to orange or red at sunset is usually through green, but exceptional conditions may easily disturb the normal state of things. The brilliant sunset effects of Tyndall and of D’Arago, J. Babinet and Sir D. Brewster, for an account of which reference may be made to E. M. Peltier’s Traité d’optique. The normal polarization at the zenith, as dependent upon the position of the sun was the foundation of Sir C. Wheatstone’s polar clock. (R.)

Related to abnormalities of colour we may expect to find corresponding polarization effects. Of this nature are the neutral points, where the polarizing effect of the sky is not seen. So far as the Krakatao eruption may naturally be attributed to dust of unusual quality or quantity in the upper regions of the atmosphere (see DUST).
SKYE—SLADE

SKYE, the largest island of the Inner Hebrides, Inverness-shire, Scotland. From the mainland it is separated by the Sound of Sleat, Kyle Rhea, Loch Alsh and the Inner Sound, and from the Outer Hebrides by the Minch and Little Minch. At Kyle Rhea and Kyleakin, on the western end of Loch Alsh, the channel is only about 1 m. wide, and there is a ferry at both points. The length of the island from S.E. to N.W. is 88 m. N. The whole coast is deeply indented, so that no part of the interior is more than 3 m. from the sea. It has a total area of 411,703 acres or 643 sq. m. From 20,627 in 1821 its population had grown to 23,082 in 1841, but since that date it has steadily diminished and was 15,763 in 1891, and in 1901 only 13,833 (or 21 to the sq. m.), 2858 of whom spoke Gaelic only and 9857 Gaelic and English. The chief arms of the sea are Lochs Snizort and Dunvegan in the N., Loch Bracadale in the W., Lochs Savaig and Elshorn in the S., and Loch Sligachan in the E. The mountains generally assume conical and picturesque shapes. The biggest mass of the Cuillins (Cuillin) dominates the view whether by land or sea. Their highest point is Sguir na Banachdich (1234 ft.), and at least six other peaks exceed 3000 ft. To the north of Loch Slapin stands the group of Red Hills, of which the highest points are Ben Caillach (2403) and Ben Dearg More (2323 ft.), and north of Lord Macdonald's forest near Loch Ainort rises Ben Glaigaig (2537 ft.). About 8 m. N. of Portree is the curious basaltic group of the Storr (1936), consisting of pinnacles and towers, the most remarkable of which, "The Old Man," forms a landmark for sailors. Towards the north of the island, not far from Staffin Bay, is an interesting mass of quartz, known as "The Needle," "The Prison" and "The Table," the last named a platform of level turf 1500 ft. above sea-level, measuring 120 ft. by 60 ft. In the peninsula of Duirinish are the two circular hills of Heaval Mor (1358 ft.) and Heaval Beg (1601), usually styled "MacLeod's Tables," while the two pyramidical rocks rising out of the sea, near the southernmost point of Duirinish, are called "MacLeod's Maidens." The only important lake is the wild and gloomy Loch Coruis, overshadowed by the precipices of the Cuillins. It can be only approached by boat from Loch Savaig, from the shore of which it is about 1 m. distant. It is 13 m. long by ½ m. broad.

The greater part of the island, the whole of the central and western part, is occupied by igneous plateaux consisting of basaltic lava flows of Tertiary age alternating with intrusive sills of dolerite; they are penetrated by numerous basic dikes and by a smaller number of acid ones. The western coast shows their distinctive features to the intrusion of a great laccolithic mass of gabbro with the basaltic lavas. East of these hills a large area is covered by acid intrusions—granite felsite, &c,—including the Red Hills, Marsco and Glaigaig. The western peninsula is swampy, cut by numerous small estuaries and highland thrusting. Torridonian rocks occupy the whole of Sleat, with the exception of a strip between the Point of Sleat and Ormsay Island which is composed of Dalradian schists. In the north of Sleat the Torridonian rocks have been thrust on top of lower Ordovician limestones. Soay is wholly Torridonian. In the narrow part of the island between Broadford Bay on the N.E. and Lochs Savaig, Elshart and Savaig on the S.W., and in a narrow strip on the east coast, also in Loch Bay, there is an interesting series of Mesozoic rocks beginning with Triassic conglomerates and marls, and passing upwards through Rhaetian, Lower Liassic (Broadford Bay), Middle Liassic (Mull of Oa), Liassic (Portree, Plockanish, Plockanish Cove), to beds representing the Great Oolite and Oxford Clay (Loch Staffin, Uig, &c.). A lignite bed of Tertiary age has been worked in a small way at Portree, and diatomite is excavated from some ancient lake deposits at Loch Cullibh, Loch Monckst, Loch Mealt, and other places. There is abundant evidence of glacial action on the lower ground.

The rainfall is 47-5" F., for January 39-5" F. and for July 56-5" F. Most of the land is moor and hill pasture, with cultivated patches here and there, chiefly on Lochs Snizort and Bracadale, the Sound of Sleat, and Portree. The crofting features are still most marked. The potato is the chief crop, and the cool climate makes it the best white potato. The climate is better adapted for sheep and cattle (West Highland) than for crops, and the sheep farms include some of the finest in Scotland and carry famous stocks, principally black-faced with white legs. The chief cattle, the crofters' cows, is the Orkney. If this has been improved by the Crofters' Holdings Act of 1886. The old black hats have been replaced, in those parishes where stone is obtainable, by well-built houses. Between 1840 and 1880 ejection had certainly been carried to great lengths, and, in consequence of the emigration that followed, was mainly responsible for the serious decline of the population. The railways from Kyleakin to Portree, Kyleakin to the Quiraing, and Kyleakin to the Sound of Sleat have made markets more accessible, effected an improvement in the fisheries, which have always been a mainstay of the inhabitants. The fisheries include herring, cod, ling and salmon, and oysters are reared in some places. Seals are not uncommon at certain spots, but the walrus and sperm whale, once occasional visitors, are now rarely if ever seen. It is significant of the change in the circumstances of the people that much of the best crofting land is being used for viti- and barley is now widely grown. Whisky is distilled at several places, the Talisker brand of the distillery at Carbost, on the western shore of Loch Harport, being well known.

The inhabited isles off the coast of Skye are mainly situated near the eastern shore. Of these the principal is Raasay (pop. 410). Brochel Castle, now a ruin, stands on the eastern coast. The island is 13 m. long, by about 3½ m. at its widest. Off its north-western shore lies the isle of Flodda. To the north of Raasay, separated by a narrow strait, is South Rona (Seal Island, from the Gaelic ron, a seal), 4½ m. long with a maximum breadth of 1½ m., and is a lighthouse, the light of which is visible for 21 m. Sculpay, immediately south of Raasay, has a hill of 1280 ft., and the Sound of Scalpay, parting it from the mainland, abounds with oysters. The other isles are Pabbay in Broadford Bay, Orrsay in the Sound of Sleat, and Soay near Loch Savaig.

Portree (pop. 872), the capital, lies at the head of a fine harbour about the middle of the eastern seaboard. Steamers run daily in connection with the mail train at Mallaig, and there is, besides, other connexion by steamer with Oban and other ports on the mainland and in the islands. Among the buildings in the town are the Episcopal church of St. Columba, erected in 1884, to the memory of Bishop George R. Mackarness, the Ross Cottage Hospital, the Combination poorhouse and the courthouse, and there is a factory for tweeds, plaid, carpets and other woollens. The exports are principally sheep, cattle, wool, salmon and other fish. The name of the town was derived from the fact that James V. landed there on the occasion of his tour in the Western Highlands. The place thus became, in Gaelic, Port-an-Righ (the King's Harbour). The first of Macdonald (1712-1790) conducted Prince Charles Edward when he escaped from Benbecula. Prince Charlie's Cave is situated on the coast about 5 m. north of the harbour. Among other places in Skye associated with the Young Pretender are Prince Charles's Point near Monkstadt, on the west of the peninsula of Trotternish, where he landed with Flora Macdonald, and Kingsburgh, on the eastern shore of Loch Snizort. The castle at Dunvegan, of the Macleods of Macleod, was erected in the 9th century and extended by later chieftains, especially by Alastair Crotach, or the Humphrey Black, in 1458, and by Rory (Roderick) More, who was knighted by James VI. Built on a rocky promontory, it is difficult of access, the fortress must have been almost impregnable in the era of clan warfare. Among the interesting relics preserved in it are the Fairy Flag, a yellow silk banner captured from a Saracen general by a crusading Macleod, and Rory More's drinking-horn, which held two quarts and had to be drained at a single draught by the new chief before he could wield authority. The MacCrimmons, the famous race of hereditary pipers, hailed from this quarter of Skye and were attached to the Macleods of Dunvegan. At Dunlum is the ancient castle of the Macduffs, and another of the great Skye chieftains was close to it is the Eilean (Eilean) Pulas, where, in former days, the chieftain sat dispensing justice in the fashion of primitive times. The modern seat of Lord Macdonald is Armadale Castle, a fine Gothic mansion on the shore of the Sound of Sleat.

SLADE, FELIX (1790-1868), English art collector and patron, was born at Lambeth, London, in August 1790, the son of Robert Slade, a Surrey landowner, from whom he inherited considerable means. He became widely known as a purchaser of books and engravings, and made a valuable collection of glass. He died on the 29th of March 1868, leaving personally to the value of £60,000. He bequeathed the bulk of his art collection to the British Museum, and £55,000 for the endowment of art professorships, to be known as Slade Professorships, at Oxford.
SLANGER—SLANG

207

Cambridge, and University College, London. University College received the additional bequest of six art scholarships.

SLANDER, a false tale or report, defamation. The word is a doublet of "scandal" and comes from the O. Fr. esclandre, which, through the earlier forms escande, escande, escandre, is derived from Lat. scandalum (see further SCANDAL). In law, slander is the malicious defamation of a person in his reputation, profession or business, by words (see LIBEL and SLANDER).

SLANG, in what is now the usual sense, a general name for the class of words and senses of words, more or less artificial or affected in origin or use, which are not recognized as belonging to the standard vocabulary of the language into which they have been introduced, but have an extensive currency in some section of society either as a means of concealing secrets or as intentionally undignified substitutes for those modes of expression that are employed by persons who value themselves on propriety of speech.

As thus defined, slang includes many varieties of speech, which are current respectively among different sections of the population. The one, however, which most perfectly answers to the definition, and may be regarded as the primary type, is the artificial jargon, partly cryptic and partly facetious, used by vagrants and professional thieves. It is true that the name of slang is now seldom applied to this jargon; it is more commonly designated by its older name of slang or jargon. Nevertheless in the 18th century it was chiefly used in this particular application.

The earliest example of the word hitherto discovered occurs in Toldervy's History of Two Orphans, published in 1756. One of the characters in this story is a man who, "in return for the numerous lies which he told, was called the cannon-traveller"; and it is said of him that "he had been upon the town, and knew the slang well." It is not clear whether "slang" here has its modern sense, or whether it means the ways of fast life in London.

A more unequivocal instance, two years later in date, is quoted in J. C. Hotten's Slang Dictionary (1864) from a book entitled Jargon: British Dialects, by W. W. Hiscock. In this instance, the word is found with a different and now obsolete meaning, in Foote's play The Orators. A fast young Oxford man, invited to attend a lecture on oratory, is asked, "Have you not seen the bills?" He replies, "What, about the lectures? ay, but that's all slang, I suppose." Here the word seems to be equivalent to "humbug." In the 1st edition of Hugh Kelly's comedy, The School for Wives, there is a passage (omitted in some of the later reprints) in which one of a company of sharpers, who pretend to be foreigners and speak broken English, says: "There's a language called slang, that we sometimes talk in. . . . It's a little jargon, the people under us understand it. Francis Grose's Dictionary of the Vulgar Tongue (1785) has the entry " Slang, the cant language"; and after this instances of the word are abundant. In the early part of the 19th century it appears in literature chiefly as a general term of condemnation for "low-lived" and undignified modes of expression. It seems probable that the word came from some dialect of the north of England; but this is difficult to establish, as most of the dialect glossaries date from a time long after it had obtained general currency, so that it would escape the notice of the compilers as being outside their proper scope. The English Dialect Dictionary mentions only the sense of "abusive language," which is said to be current in Yorkshire and the Lake Country. Some reason for believing that the word is genuinely dialectal—an inheritance from the language of the Scandinavian settlers in the north of England—is afforded by the coincidence of its uses with those of the modern Norwegian verb slenge (etymologically equivalent to the English "to slang") and related words, as given in the dictionary of Ivar Aasen. Slenge-kifst (literally, to slang the jaw), means to pour out abuse; the compound slenge-ord (ord = word) is explained by Aasen as "a new word without any proper reason," which comes very near to the notion of a "slang word." The English word has, in cant speech, certain applications to matters other than those of language; and although these have not been found recorded at any very early date, they may possibly be old, and may contribute to the determination of the primary sense. Any particular mode of thieving or of making a living by fraudulent means is called a "slang"; and the same term is applied to the particular line of business of a showman or a troupe of strolling players. Further, the word is used adjectively to designate fraudulent weights and measures, and the early slang dictionaries explain the verb slang as meaning "to defraud." The precise relation between these various senses cannot be determined, but they seem to agree in having some reference to what is lawless or irregular, and this general notion may be regarded as having a certain affinity to the meaning of the verb "to slang," with which the word is probably etymologically allied. It is unlikely that the word slang, in the senses here under consideration, has any direct connexion with the homophonous word meaning a strip of land. The etymology of the word slang, which is closely paralleled by that of the French synonym argot, is not difficult to account for. In the first place, the boundaries of the word in which slang—in the original sense—is current are somewhat indeterminate. It is, for instance, not easy to draw the line between the peculiar language of "rogues and vagabonds" and that of the lowest order of travelling showmen and strolling players, or between this latter and the strictly analogous body of expressions common to all grades of the historic profession. Similarly, the prize-ring, the turf, the gaming-table and all the varieties of "fast" and "Bohemian" life have their own eccentric vocabulary, partly identical with, and in general character altogether resembling, the slang of the criminal and vagrant classes. In the second place, a little consideration is sufficient to show that thieves' cant is only one species of an extensive genus, its specific difference consisting in the unessential circumstance that its use is confined to one particular class of persons.

Although the term "slang" is sometimes used with more or less intentional inexactness, and has often been carelessly defined, the notion to which it corresponds in general use seems to be tolerably clear. There are two principal characteristics which, taken in conjunction, may serve to distinguish what is properly called slang from certain other varieties of diction that in some respects resemble it. The first of these is that slang is a conscious offence against some conventional standard of propriety. A mere vulgarism is not slang, except when it is purposely adopted, and acquires an artificial currency, among some class of persons to whom it is not native. The other distinctive feature of slang is that it is neither a part of the ordinary language, nor an attempt to supply its deficiencies. The slang word is a deliberate substitute for a word of the vernacular, just as the characters of old sense and certain archaic words are derivatives from certain obsolete senses. The use of slang for slang, and a nickname for a nickname is a substitute for a personal name. The latter comparison is the more exact of the two; indeed nicknames, as a general rule, may be accurately described as a kind of slang. A slang expression, like a nickname, may be used for the purpose of concealing the meaning from uninitiated hearers, or it may be employed sportively or out of aversion to dignity or formality of speech. The essential point is that it does not, like the words of ordinary language, originate in the desire to be understood. The slang word is not invented or used because it is in any respect better than the accepted term, but because it is different. No doubt it may accidentally happen that a word which originates as slang is superior in expressiveness to its regular synonym (much as a nickname may identify a person better than his name does), or that in time it develops a shade of meaning which the ordinary language cannot convey. But when such a word comes
to be used mainly on account of its intrinsic merit, and not because it is a wrong word, it is already ceasing to be slang. So long as the usage of good society continues to proscribe it, it may be called a vulgarism; but unless the need which it serves is supplied in some other way, it is likely to find its way into the standard speech.

The account here given of the distinctive characteristics of slang conflicts with the view of those writers who so define the term as to make it include all words and uses of words that are current only among persons belonging to some particular class, trade or profession. But such an extended application of the word is not supported by general usage. It is true that it is not uncommon to apply the name of slang to the technical language of trades and professions, or even of arts and sciences. This, however, is really a consciously metaphorical use, and is not because it conveys the implication that the employment of technical language has no better motive than the desire to be unintelligible to the uninstructed, or to excite admiration by a display of learning. If the imputation were true, the designation would be strictly applicable. Technical and scientific terms may justly be stigmatized as slang when they are used pretentiously without any good reason, but not when they are chosen because, to those who understand them, they afford a clearer, more precise, or more convenient expression of the meaning than is found in the ordinary vocabulary. At the same time, it is true that many terms of trade or profession have a slang of their own: that is to say, a body of peculiar words and expressions that serve as slippant or undignified substitutes for the terms that are recognized as correct. It happens not infrequently that words of this kind, owing to frequency of use, and the development of specific meanings, lose the character of slang and pass into the category of accepted technicalities.

A class of words that has a certain affinity with slang, though admitting of being clearly distinguished from it, consists of those which are proscribed from the intercourse of reputable society because they express ideas that are deemed repugnant or odious, or because they are brutally insulting. Such words share with slang the characteristic that they are ordinarily employed only in intentional defiance of propriety; they differ from it in being really part of the original vernacular, and not of an artificial vocabulary which is substituted for it. The customary euphemisms which take the place of these condemned words are, of course, far removed from slang; but the name is strictly applicable to those grotesque metaphors which are sometimes substituted, and emphasize the offensiveness of the notion instead of veiling it.

The known history of European slang begins (leaving out of account the meagre references in German documents hereafter to be mentioned) with the strike of the weavers at Vitéz in the middle of the 15th century. The French argot of these compositions contains much that is still obscure, but the origin of some of its words is evident enough. Factious expressions relating to the destined end of the malefactor are prominent. Paroir and montjoie (for which later the less ironical mont à regret was substituted) are nicknames for the scaffold. Acolles, hanged, corresponds to the English "scragged"; the synonymous group seems to be an onomatopoeic formation suggestive of choking. There are some derivatives formed with the suffix art: rjart is a police-officer, abroat a log. A few words from foreign languages occur: adinés, prayer, is the Latin anés nus of the French. This is obviously of foreign origin. But it is not certain that it was not already current in the 15th century. The obvious explanation of the word is an abbreviation of the French expression, "avoir des mains," to pray; the use of the suffix mare to form derivatives such as perrymare, a wig-maker, and the practice of rendering conversation unintelligible to outsiders by tacking on some unmeaning ending to every word, is also suggestive of vulgar jargon.

The word Rotwelsch (the modern Rotwelsch, still the name for the cant of vagrants) occurs as early as the middle of the 15th century, and during the following century there appear lists of slang words appropriate to the particular occupations of members of the lower class. The earliest attempt at a vocabulary of "Rotwelsch" is that of Gérald Edlibach, compiled about 1490. A second vocabulary, containing nearly the same set of words, is contained in the famous Liber vulgaratorum, first printed in 1510 in High German; versions in Low German and the dialect of the Lower Rhine appeared shortly afterwards. An edition of this work printed in 1704 was written by Martin Luther. The most remarkable feature of the jargon represented in these early glossaries is the large number of Hebrew words that it contains. It is not clear whether this fact indicates that the word is of Jewish origin, or that the language of the jargon was formed at the time, as a vehicle of the Hebrew vocabulary, at the beginning of the 16th century; the explanation may be simply that the Hebrew words contributed by Jewish vagrants and beggars were more common between 1500 and 1650 than at any other time. This being so, it is more likely that the Hebrew vocabulary of the jargon, as represented in the earliest editions of the Liber vulgaratorum, is a survival of the language of the Jews of the 16th century. Indeed, this must be the case if the jargon as a whole is intended to represent the language of the Jews of that century. Thus, for instance, the following words are given in the earliest editions of the Liber vulgaratorum: dink (from hit, to see), kasse, dream, dirma, or dyrma, mat, cun, or dyrma (from dyrma, or from dream, a case). This vocabulary is, however, the jargon of the Jews of the 16th century, as represented in the Liber vulgaratorum, more likely a survival of the language of the Jews of the 15th century, as represented in the earliest editions of the Liber vulgaratorum, than a survival of the language of the Jews of the 16th century, as represented in the Liber vulgaratorum, itself; and in any case, it is more likely that the Hebrew vocabulary of the jargon, as represented in the earliest editions of the Liber vulgaratorum, is a survival of the language of the Jews of the 16th century, as represented in the Liber vulgaratorum, than a survival of the language of the Jews of the 16th century, as represented in the Liber vulgaratorum, itself.
The varieties of slang that have their origin and currency in the reputable classes of society owe their existence partly to impatience with the constraint of ceremonious propriety of speech, and partly to the kind of esprit de corps which leads those who are associated in any common pursuit, or whose mutual intercourse is especially intimate, to take pleasure in the possession of modes of speech that are peculiar to their own “set.” The former feeling is naturally strongest among those who are under the control of superiors in whose presence they have to observe an uncongenial formality of expression. It is therefore only what might be expected that every public school and every university has its own elaborately developed slang vocabulary, and that there is also a good deal of slang that is common to schoolboys and to undergraduates in general. Even among persons of ripen years there are many to whom ceremonious speech is unwelcome. The motive for the creation of slang is therefore widely diffused throughout all classes. Besides the general slang that is current among all who rebel against the laws of conventional decorum of language, there are innumerable special varieties. As a rule, every trade and profession, and every closely associated group of persons, has its own slang; indeed, there are probably few family circles that have not certain peculiar expressions used only within the household.

It may be noted that some classes of workmen—printers and tailors for example—are more than others remarkable for the copious and peculiar vocabulary of their special slang. In all English-speaking countries there is a widespread colloquialism that is so intimate as to be almost a secret. However, in all countries there is an abundant vocabulary of sportively metaphorical and allusive words and phrases. The slang current in the orderly portions of society, in England at least, does not present many insoluble puzzles of etymology, the words of obscure origin being for the most part such as have been imported from a lower level. There is no difficulty in accounting for the many jocularly simulative uses of ordinary words, such as “tin” for money, “bags” for trousers, “tile” for hat. Especially characteristic of university slang is the distortion of the form of words, sometimes with the appending of conventional terminations, as in the German student’s “schleo” for schlecht, “Knoo” for Kniepe, “Bim” for Busen, “Respum” for Respekt, or the English “radiator” and “soccer” for the Rugby and Association varieties of the game of football, “tosher” for unattached student, “proggling” for the disciplinary function of the procurer, “ecker” for exercise, “congratulator” or “congragglers” for congratulations. Such shortened forms of words as “thou” for thousand, “exes” for expenses, “exam” for examination, “vac” for vacation, “photo” for photograph, “bike” for bicycle, may reasonably be classed as slang when they are used with a certain intention. The words, which, on account of their convenient brevity, have acquired a degree of currency that entitles them to rank as respectable colloquial English.

It is generally admitted that in the United States the currency of slang is wider, and its vocabulary more extensive, than in other English-speaking countries. Indeed, an American encyclopedia has the entry “Slang, see Americanisms.” The two things, of course, are not identical, and some of those American expressions that are in English regarded and used as slang have no such character in the United States. Many of the words of grotesque sound and ludicrously descriptive point is a favourite form of humour in America, and the freedom with which these coinages are used in many newspapers contrasts with the more sober journalistic style usual in England. Much of the current slang of America is used only in the land of its origin, and it is not uncommon to meet with newspaper articles of which an untravelled Englishman would hardly be able to understand a sentence, and on which the dictionaries of Americanisms afford little light. The American contribution to the current slang of the British Isles consists mainly of words and expressions that are recommended by their oddity, such as “scallywag,” “absquatulate,” “skedaddle,” “vamoose” (from the Span. vadonar, let us go), and words relating to political life, such as “mugwump” (originally an Indian word meaning “great chief”), “carpet-bagger,” and “gerryman.” Australia, also, as may be seen from the novels of Rolf Boldrewood and other writers, possesses an ample store of slang peculiar to itself, but of this “larrkin” is the only word that has found its way into general use in the mother-country.

To the philologist the most interesting question connected with slang is that relating to the importance of the share which it has in the development of ordinary language. It is probably true that the standard vocabulary of every modern European language includes some words that were originally slang; but there is certainly much exaggeration in the view that has been sometimes maintained, that slang is one of the chief sources from which languages obtain additions to their means of expression. The advocates of this view point to the fact that a certain number of Italian and French words descend, not from the Latin words of the language, but from words which in vulgar Latin were substituted for these by words of jocular metaphor. Thus the Italian testa, Fr. tête, head, represent the Lat. testa, pot or shell; the Fr. jonc, cheek, corresponds by strict phonetic law to the Late Lat. gabata, porringer. It may be conceded that in these instances, and a few others, words of popular Latin slang have become the accepted words in the languages descended from Latin. But the number of instances of this kind is, after all, inconsiderable in comparison with the extent of the whole popular vocabulary; and the conditions under which the Romanic languages were developed (from Latin as spoken by the mass of the people) are somewhat abnormal. A consideration of the essential characteristics of slang, as previously explained in this article, will show that it is only to a limited extent that it is likely to be absorbed into the general language. It has been pointed out that slang words, for the most part, do not express notions which ordinary language cannot express quite as efficiently. This fact implies a noteworthy limitation of the capabilities of slang as a source from which the deficiencies of a language can be supplied. As the prevailing tendency of words is toward degradation of meaning, words which are used most frequently as the needs of language is that of words of dignity and seriousness are rare in slang; those which have become chiseled through iguiole use. It is obvious that slang can do nothing to meet this demand. The less frequent want of terms of contempt or reproach may, of course, be supplied by adoptions from slang; and in the exceptional instances in which, as has already been indicated, a slang word has no synonym in ordinary speech, it may very naturally find its way into recognized use.

On the whole, the debt of modern standard English to slang of all kinds is probably smaller than most persons would suppose. A few words have been borrowed by theologians’ cant, and, of course, some words of foreign origin which were not expected, are found in slang; and these are too numerous to be given. In the list of slang words which is given, there are some words, such as slang; and, as we have already mentioned, their meaning is often understood and used without, however, losing their “slangy” character. The utmost that can be said is that they are on the debatable ground between slang and merely jocular language.

Although it often happens that words belonging to the more reputable kinds of slang undergo some improvement in status—acquiring some degree of toleration in refined circles where they would once have been considered offensive—there are few instances in which a word has come to be regarded as unexceptionable English. One example of this is prig (a distinct word from the term of thieves’ cant already mentioned), which originally denoted a person over-scrupulous in his attire and demeanour, but has now acquired a different sense, in which it supplies a real need of the language. Other words that were once slang but are so no longer are mob, humbug, tandem (apparently
SLATE

a university joke founded on “at length” as the dictionary rendering of the Latin adverb.

BIBLIOGRAPHY.—English: Most of the authorities for the early history of English vagrant slates reprinted in vol. ii of the Extra Series of the Early English Text Society, edited by E. V. Villiers and F. J. Furnivall (1869), which contains John Awdley’s The Fraternity of Vagabondes (from the edition of 1675), Thomas Harman’s Care of the Poor (1628 and 1632), and The Ground-work of Convoying (anonymous, 1592), besides extracts from other early works which furnish glossaries. The Dictionary of the Coming Crew, by B. E. (no date, but printed at the end of the 17th century and given as printed by F. Furnivall), is invaluable as containing the earliest known record of many words still in use; while mainly treating of thieves’ and vagrants’ language, it includes many words belonging to slang in the widest sense. Among many later works, only the following need be mentioned here: Francis Grose’s Classical Dictionary of the Vulgar Tongue (3rd ed., 1796); The Slang Dictionary, anonymous, but understood to be by the publisher of the Coming Crew (1796); and The Pseudonym Dictionary (1809—1812), which surpasses in width of vocabulary and abundance of illustrative matter, though the dates and even the text of the quotations are often inaccurate. For the slang of particular professions, such as law, by R. G. K. Wrench (1901) and The Eton Glossary, by C. R. Stone (1902).

French: The earliest systematic treatment of argot is found in La Vie généreuse des Malots, Gueux Bohèmes et Cagous, by Paul Brient (1888), which went through several editions in the early part of the 19th century, and has been reprinted in 1831 and 1868. The slang of the 15th century is discussed in Le Jargon au quinzième siècle, by Auguste Vitu (1883), which includes an edition of the Slang of the aparté of Arbre, in Le Jargon et jolota de F. Baigniers and Lucien Schöne (1887), and in L’Argot ancien, by L. Saincán (1907). Francisque Michel’s Études de philologie comparée sur l’argot (1856) is important for its rich collection of material and its copious references to sources. Later works deserving attention are Dictionnaire de la langue verte, by Alfred Delvay (2nd ed., 1867), and Dictionnaire de l’argot, by Lorélan Larchey (1886). For modern slang, taken in a very comprehensive sense, the chief authority is Lucien Rigaud, Dictionnaire de l’argot moderne (1881). For the special slang of printers, see Eugène Boutmy, Dictionnaire de l’argot des types (1883).

An admirable collection of the original documents for the history of thieves’ and vagrant slang from the earliest period has been published by F. Kluge, under the title Rotwelsch (1901). An earlier book of great importance is Avé-Laillée, Das deutsche Slang, Das deutsche Knabensprachlein (1888). For modern popular slang see A. Gentile, Deutsches Slang (1892). University slang is ably treated in Deutsche Studentensprache, by F. Kluge (1895).

Italian and Spanish: F. Michel, in Études de philologie comparée sur l’argot (see above), gives a vocabulary of Italian thieves’ slang from Nuovo modo da intendere la lingua serga (1619, reprinted at the end of the 18th century) and one of Spanish slang, in Trattato de Romans de Germanie (ed. 6, shortly before 1800). For Spanish thieves’ language see also A. Besaés, Argot español (Barcelona, no date); a large proportion of the words given by this writer is also renders.

SLATE (properly CLAY SLATE; in M. Eng. slut or slut, from O. Fr. esclat, a small piece of wood used as a tile; esclater, to break into pieces, whence modern Fr. éclater, the root being seen also in Ger. schleissen, to split), in geology, a fissile, fine-grained argillaceous rock which cleaves or splits readily into thin slabs having great tensile strength and durability. Many other rocks are improperly called slate, if they are thin bedded and can be used for roofing and similar purposes. One of the best known of these is the Stonesfield slate, which is a Jurassic limestone occurring near Oxford and famous for its fossils. Slates properly so-called do not, except on rare occasions, split along the bedding, but along planes of cleavage, which intersect the bedding usually at high angles. The original material was a fine clay, sometimes with more or less of sand or ashy ingredients, occasionally with some lime; and the bedding may be indicated by alternating bands of different lithological character, crossing the cleavage faces of the slates, and often interrupting the cleavage, or rendering it imperfect. Cleavage is thus a superinduced structure, and its explanation is to be found in the rearrangement of the minerals, and the development of a certain degree of crystallization by pressure acting on the slates. Such belts belong most commonly to the geological systems, being commonest in Pre-Cambrian, Cambrian and Silurian districts, though they may be found of Carboniferous or even of Tertiary age, where mountain-building processes have folded and compressed these more recent formations. The action of pressure is shown also by the fossils which sometimes occur in slates; they have been drawn out and distorted in such a way as to prove that the rock has undergone deformation and has behaved like a plastic mass. Evidence of the same kind is afforded by the shape of the knots and concretions sometimes present in the slate. If the bedding be traced, either in the slates or in the other rocks which accompany them, flexures will be frequently observed (the folding often being of an isoclinal type), while reversed faulting, or thrusting, is usually also conspicuous.

The origin of slaty cleavage is in some measure obscure. This structure is by no means confined to slates, though always best exemplified in them, owing probably to the fine-grained, argillaceous materials of which they consist. Grits, igneous rocks, ashes, beds and limestones may and often do show cleavage. Coarse rocks and rocks consisting of hard minerals are imperceptibly cleaved. The cleavage of slates must be distinguished from cleavage of minerals, the latter being due to different degrees of cohesion along definite crystallographic planes. The question of cleavage with pressure, however, is unmistakable. It is never exhibited except by rocks which have been subjected to the tangential stresses set up in the earth’s crust by folding. These stresses may operate in several ways. They will alter the shape of mineral particles by broadening them in a direction at right angles to the principal pressures, while they are thinned in the direction in which the pressure acted. Probably the size of the particle will be slightly reduced. This method of reasoning, however, does not carry us far, as the minerals of slates vary considerably in form. Pressure will also tend to produce an expansion of the rock mass in a direction (usually nearly vertical) at right angles to the compression, for such rocks as slates are distinctly plastic in great masses. This flowage will help to orientate the particles in the direction of movement, and, operating conjointly with the flattening above explained, will accentuate the liability to cleave in a definite set of planes. The recrystallization induced by pressure is probably of still greater importance. Slates consist largely of thin plates of mica arranged parallel to the cleavage faces. This mica has developed in the rock as it was folded and compressed. In the moist and plastic slate the mineral particles slowly enlarged by the addition of new crystalline molecules. Those faces which were perpendicular to the pressure would grow slowly, as the great pressure would promote solution, and inhibit deposition; the edges or sides, on the other hand, being less exposed to the pressure would receive fresh deposits. In this way thin laminae would form, lying at right angles to the direction of greatest stress. Micas and other schist minerals (such as chlorite), which naturally grow most rapidly on their edges, would show this tendency best, and such minerals usually form a large part of the best slates; but even
quartz and felspar, which under ordinary conditions form more equidimensional crystals, would assume lenticular forms. In the necessary co-operation of these three causes, viz. flattening of particles by compression, orientation of particles by flow and formation of laminar crystals, the fundamental explanation of slaty cleavage is found. The planes of cleavage are nearly perfectly perpendicular to the beds themselves, which act as principal; hence the strike of the cleavage (i.e. its trend when followed across the country) will be permanent over considerable areas.

Where the rock masses are not homogeneous (e.g. slates alternating with gritty bands), the cleavage is most perfect in the finest grained rocks. In passing from a slate to a grit the line of cleavage changes so that it tends to be more nearly perpendicular to the bedding planes. A structure akin to cleavage, often exemplified by slates especially when they have been somewhat contorted or gnarled, is the Ausweichungsdivage of Albert Heim. It is produced by minute crumplings on the cleavage faces all arranged so that they lie along definite planes crossing the cleavage. These slight flexions of the cleavage may be sharp-sided, and may pass into small faults or steps along which dislocation has taken place. A secondary or false cleavage, less perfect than the true cleavage, may thus be produced (see Petrology, Pl. IV. fig. 7). The faces of slates have usually a slightly silky lustre due to the abundance of minute scales of mica all lying parallel and reflecting light simultaneously from their pearly basal planes. In microscopic section the best seen are the nearly square or rounded crystals of mica, small, thin, irregularly shaped scales. Green chlorite is usually abundant in flakes like those of the mica. The principal additional ingredient is quartz in minute lens-shaped grains. The size of the individual particles may be approximately one-fifth-thousandth of an inch. Minute rods or needles of rutile are also common in slates, and well-formed cubes of pyrites are often visible on the splitting faces. The brownish colour of some slates is due to limonite and haematite, but magnetite occurs in the darker coloured varieties. Other minerals which occur in the rocks of this group are calcite, garnet, biotite, chloritoid, epidote, tourmaline and graphite or dark carbonaceous materials.

By advancing crystallization and increase of size of their components, slates pass gradually into phyllites, which consist also of quartz, muscovite and chlorite. In the neighbourhood of intrusive granites and similar plutonic igneous rocks, slates undergo "contact alteration," and great changes ensue in their appearance, structure and mineral composition. They lose their flexible cleavage and become hard, dark-coloured, slightly lustrous rocks, which have a splintery crystal or break into small cuboidal fragments. These are known as hornfelses (q.e.), but slates are often so little the slates are not so much altered, but generally show small rounded or ovoid spots, which may be darker or lighter in colour than the matrix. The spots contain a variety of minerals, sometimes mainly white mica or chlorite. In these spotted slates andalusite, chiastolite, garnet and cordierite often occur; chiastolite is especially characteristic; cordierite occurs only where the alteration is intense. The chiastolite-slates show elongated, straight-sided crystals with black cores (see Petrology, Pl. IV. fig. 9), which, on transverse section, have the form of a cross constituting the two diagonals of the rhomb or squarish pattern of the mineral. These crystals may be half an inch or several inches in length; they are usually more or less completely weathered to white mica and kaolin. In other cases, especially near mineral veins, slates are filled with black needles of tourmaline or are bleached to pale grey and white colours, or are silicified and impregnated with mineral ores. Frequently in districts where slates are much crumpled they are traversed by numerous quartz veins, which have a thickness varying from several inches up to many feet, and may occasionally be auriferous.

Slat es are widely used for roofing houses and buildings of every description, and for such purposes they are unqualified. They sort of possessing all the qualities necessary for protection against wind, rain and storm. The finer varieties are made into writing slates, and in districts where cross cleavage exists slate pencils are made. Slabs are also manufactured, and, being readily cut, planed, dressed and enamelled, are used for chimney pieces, billiard tables, wall linings, cisterns, paving, tomb-stones, ridge rolls, electrical switch-boards and various other architectural and ornamental purposes.

Slate rocks are quarried both above ground and below ground, according as they lie near to or distant from the surface. When they are near the surface, and their dip corresponds with the slope of the ground, they are in the most favourable position, and may be worked in terraces or galleries formed along the strike of the beds and having a height of about 50 ft. The galleries are generally carried on in sections of 10 yds., worked across the beds, and may rise to any level of the surrounding level by excavations worked in terraces or galleries along the strike of the beds. When the rock is much removed from the surface, or inconveniently situated for open workings, it is quarried in underground chambers reached by levels driven from the surface, and parallel to the strike of the beds and the direction of the cleavage, and sometimes parallel to the bedding planes. The chambers are usually of considerable size, and are sometimes delineated by the roof and the sides, and are traversed by the beds. Serrated or jointed slates are frequently worked in these chambers. The roof and side of the chamber are usually of such a form that the slates can be worked in one block without any waste of the material.

Slate rocks are quarried both above ground and below ground, according as they lie near to or distant from the surface. Serrated or jointed slates are frequently worked in these chambers. The roof and side of the chamber are usually of such a form that the slates can be worked in one block without any waste of the material.

SLATE ISLANDS, a group belonging to the parish of Kilbrannan and Kilchattan off the coast of Lorne, Argyllshire, Scotland. They comprise S Ell, Luining and Shuna being entirely slate, Sell mostly slate with some porphyrite in the north, and Shuna gneissose. The quarries provide occupation for most of the inhabitants. The steamers to and from Oban usually call at Luining and Easdale. SE I. (pop. 442), the most northerly, is connected with the mainland by means of Clachan bridge on its north-east side, near Rue. It measures 4 m. N. and S. by 2 m. E. and W. at its widest, and contains Kilbrannan church. Off a promontory on its west coast, divided only by a narrow strait, lies the island of Luing. The intervening mass is divided into the size and strength required. These plates are then placed horizontally by the dresser on a vertical iron "stand," and cut with a sharp knife into slates of various sizes suitable for the market. For an enumeration of these sizes, see Roors, where also will be found an account of the different varieties of slates and of the ways in which they are fixed.

SLATER, JOHNNY JOHN (1815-1884), American philanthropist, son of John Slater (Samuel Slater's brother and partner), was born in Slatersville, Rhode Island, on the 5th of May 1815. He was educated at Plainfield, Connecticut, and Wrentham and Wilbraham, Massachusetts. At seventeen he entered his father's woolen mill in Hopeville, Conn., of which he took charge in 1836. This and other mills he owned in partnership with his brother, William S. Slater, until 1873, when his brother took over the Slatersville Mills and he assumed sole ownership of the mills at Jewett City, Conn. In 1842 he removed from Jewett City to Norwich; there he helped to endow the Norwich Free Academy, to which his son presented the Slater Memorial Hall; and there he died on the 18th of May 1884. He was a brother of two trustees, incorporated in New York state, $1,000,000 for the uplifting of the lately emancipated population of the Southern states,
and their posterity, by conferring on them the benefits of Christian education." Among the original trustees of the Slater Fund were Rutherford B. Hayes, Morrison R. Waite, William E. Dodge, Phillip Brooks, Daniel C. Gilman, Morris K. Jesup and the donor's son, William A. Slater; and among members chosen later were Melville W. Fuller, William E. Dodge, Jr., Henry C. Potter, Cleaveland H. Dodge and Seth Low. In 1909 by careful investment the fund had increased in value by more than $1,500,000. The fund has been of great value in aiding industrial schools in the South, its largest beneficiaries being the Hampton Normal and Agricultural Institute of Hampton, Virginia, the Tuskegee Normal and Industrial Institute of Tuskegee, Alabama, Spelman Seminary in Atlanta, Georgia, Claflin University in Orangeburg, S.C., and Fisk University, in Nashville, Tennessee. At Winston-Salem, N.C., is the Slater State Normal and Industrial School, founded in 1892 and named after the founder of the fund. Other state normal schools for negroes have received assistance from the fund; and in some cases it has contributed directly to the school boards of Southern cities.

SLATER, SAMUEL (1768-1835), American textile manufacturer, was born in Belper, Derbyshire, England, on the 9th of June 1768. In 1783, the year after his father's death, he was apprenticed to Jecediah Strutt, his neighbour and a partner of Richard Arkwright in spinning cotton, and served under him six and a half years. Learning that the Pennsylvania legislature had granted £100 in 1786 to the inventor of a power carding-machine, he removed to the United States in that year, but was unable because of British laws to bring with him drawings of cotton-spinning machinery. He wrote to Moses Brown of Providence, R.I., who had made unsuccessful attempts to manufacture cotton cloth, and in January 1790 on Brown's invitation went to Pawtucket, R.I., where he entered into a partnership with William Almy (Moses Brown's son-in-law) and Smith Brown, a kinsman of Moses Brown, designed (from memory) machines for cotton-spinning, and turned out some yarn in December of the same year. In 1799 he established in his mills one of the first Sunday Schools in America. In 1801 he built a factory in Keenebok, Mass., and with his brother John, who joined him in 1804, established in 1806 the manufacturing village of Slatersville, in Smithfield township, Rhode Island. He began the manufacture of woollen cloth in 1815-1816 at Oxford, now Webster, Mass., where he had built cotton mills in 1812. In his later years he was interested in other textile mills and in iron foundries in Rhode Island. He died at Webster, Mass., on the 21st of April 1835. He has been called the "father of American manufactures" and it is no exaggeration to call him the founder of American cotton manufacturing.

SLATIN, SIR RUDOLF CARL VON (1857- ), Anglo-Austrian soldier and administrator in the Sudan, was born on the 27th of June 1857 at Ober St. Veit near Vienna. At the age of seventeen he made his first journey to the Sudan, reaching Khartoum by the Nile route in October 1875 in company with Theodor von Heuglin (p.v.). Thence he went through Kordofan to Dar Nuba, exploring the mountains of that region. He returned to Khartoum in consequence of a revolt of the Arabs against the Egyptian government. The Slatin met Dr Emin (Emin Pasha) and with him purposed visiting General C. C. Gordon at Lado, Gordon at that time being governor of the equatorial provinces. Slatin, however, was obliged to return to Austria without accomplishing his desire, but Emin went to Lado and at Slatin's request recommended the young traveller to Gordon and to employment in the Sudan. In 1878, while Slatin was serving as a lieutenant in the crown prince Rudolf's regiment in the Bosnian campaign he received a letter from Gordon inviting him to the Sudan, of which country Gordon had become governor. Emin was in close correspondence with the crown prince, and permission to go to Africa and he arrived at Khartoum in January 1879. After a brief period during which he was financial inspector, Slatin was appointed mudir (governor) of Dara, the south-western part of Darfur, a post he held until early in 1881, when he was promoted governor-general of Darfur and given the rank of bey. While administering Dara, Slatin conducted a successful campaign against one of the Darfur princes in revolt, and as governor of Darfur he endeavoured to remedy many abuses. He had soon to meet the rising power of the Mahdi and Ahmad (q.v.). Early in 1882 the Arab and southern Darfur were in revolt. With insufficient resources and no succour from Khartoum, Slatin gallantly defended his province. Though victorious in some engagements he lost ground. His followers attributing his non-success to the fact that he was a Christian, Slatin nominally adopted Islam. But all hope of maintaining Egyptian authority vanished with the news of the destruction of Hicks Pasha's army and in December 1883 Slatin surrendered, refusing to make any further sacrifice of life in a hopeless cause. In the camp of the mahdi an attempt was made to use him to induce Gordon to surrender. This failing, Slatin was placed in chains, and on the morning of the 26th of January 1885, an hour or two after the fall of Khartoum, the head of Gordon was brought to the camp and shown to the captive. Slatin was kept at Omdurman by the khalifa, being treated alternately with savage cruelty and comparative indulgence. At length, after over eleven years' captivity, he was enabled, through the Instrumentality of Sir Reginald (then Major) Wingate of the Egyptian Intelligence Department, to escape, reaching Egypt in March 1895. In a remarkable book, Fire and Sword in the Sudan, written in the same year, Slatin, who had written in English and German in 1866, Slatin gave not only, as stated in the sub-title, "a personal narrative of fighting and serving the dervishes" but a connected account of the Sudan under the rule of the khalifa. Raised to the rank of pasha by the khedive, Slatin received from Queen Victoria the Companionhip of the Bath. On the eve of his surrender to the mahdi at Christmas 1883 he had resolved, if he regained his liberty, to use the knowledge he would acquire while in captivity for the eventual benefit of the country, and after a year's rest he took part, as an officer on the staff of the Egyptian army, in the campaigns of 1897-98 which ended in the capture of Omdurman. For his services in these campaigns he was made a K.C.M.G. and in 1899 was ennobled by the emperor of Austria. In 1900 he was appointed Inspector-General of the Sudan, in which capacity his mastery of Arabic and his profound knowledge of the land and peoples proved invaluable in the work of reconstruction undertaken by the Anglo-Egyptian government in that country. In 1907 he was made an honorary major-general in the British army.

SLAUGHTER-HOUSE, or ABATTOIR. In the United Kingdom slaughter-houses are of two kinds, those which belong to individual butchers and those which belong to public authorities; the former are usually called private slaughter-houses, the latter public slaughter-houses. Private slaughter-houses in existence in England before the passing of the Public Health Act 1875 were established without licence by the local authority, except in those towns to which the provisions of the Towns Improvement Clauses Act 1847, relating to slaughter-houses, were applied by special Act. By the Act of 1875 these provisions were extended to all urban districts. Subsequently to 1890 urban authorities adopting Part III. of the Public Health (Amendment Act) of that year could license for limited periods of not less than one year all slaughter-houses coming into existence after such adoption. In London, slaughter-houses have been licensed since 1855. Private slaughter-houses are frequently situated at the rear of the shop in which the meat is sold. Each consists of a compartment in which the animals are killed, and in association with this are the pounds in which a few animals can be kept pending slaughter. These buildings are regulated by by-laws made under the Public Health Act by the several urban sanitary authorities. The by-laws usually provide for the floor to be made of jointless paving, to ensure an easy washing down; the floors shall be made of cemented boards; the walls to be cemented to a certain height above the floor, to provide a surface which can be easily cleaned; for the doors
to be of sufficient width to enable cattle to enter the slaughter-house without difficulty; and for the poundage to have floor-space sufficient for each animal. These by-laws also provide for water-supply to the slaughter-house for cleaning, and to the poundage for the use of the animals, for the periodic lime-whiting of the premises, and for the observance of care to prevent the blood escaping into the drains. Private slaughter-houses, especially those which were established without licence, are often in too close proximity to inhabited buildings. In towns in which by-laws are not strictly enforced they are often sources of nuisance. Private slaughter-houses are also objectionable on other grounds. They lead to the driving of cattle through the towns on the way to the slaughter-house, sometimes to the danger of the inhabitants, and they render impossible any systematic inspection of meat. It is in connection with the insanitary conditions that the objections to private slaughter-houses are most manifest; and, hence, in countries in which the law provides for the obligatory inspection of meat, private slaughter-houses are ceasing to exist, and public abattoirs are being substituted for them.

Public slaughter-houses are of great antiquity and owe their beginnings to Roman civilization. In 300 B.C. animals were slaughtered in the open air in the Forum in Rome.

Later, to meet the convenience of butchers, a house on the river Tiber was given to them for the purposes of their trade. This house had been appropriated by a Roman citizen named Macellus. The building appears to have retained his name, and hence the macellum of Livy's time subsequently erected in the Forum, which, inter alia, is believed to have contained rooms for the slaughter of animals. The rooms actually used for slaughter were lanitiae, from laniare, but the word macellum has been preserved in the Italian macellare, to slaughter, and in the German Meister or Meisterin, and in the English massacre.

Public slaughter-houses existed in many large towns of Germany in medieval times under the name of Kultihäfle; they were mostly in the suburbs, which provided an ample supply of water, and afforded means for the removal of blood. Some of these Kultihäfle continued to exist within recent years. No law other than a town law governed their establishment and management. They were owned or controlled by the butchers' corporations or guilds, but all butchers were members of the guilds, and this appears to have led to a ministerial order in Prussia in 1826, which made it inadmissible to require every butcher to slaughter in them. Shortly after the middle of the 19th century the prevalence of trichinosis compelled a return to the use of public slaughter-houses; and the extensive laws in 1868 and 1883 in Prussia, and similar laws in other German states, empowered urban authorities to require that all animals killed in towns should be slaughtered in public slaughter-houses (Schwarz, Bau, Einrichtung und Betrieb öffentlicher Schlachthäuser und Viehöfe).

In France, in the 15th and 16th centuries, numerous towns were provided with public slaughter-houses. It was required that they should be used by all persons killing animals the flesh of which was to be sold; but their position and the conditions they created were such as urgently to demand an amendment, and some effort was made in this direction in 1557. It was not, however, until the time of Napoleon I. that it was decided that the atrocious nuisance which these slaughter-houses created should be removed. By decrees passed in 1807 and 1810 public slaughter-houses were required to be provided in all large towns in France, the needs of Paris being determined by a Commission, which recommended the establishment of five abattoirs or public slaughter-houses. In 1838 the requirement that public slaughter-houses should be provided in large centres was extended to all towns in France, and it was further required that the slaughter-houses should be situated at a distance from dwelling-houses.

In 1867 the large abattoir of La Villette was constructed to meet the needs of Paris, two of the five constructed under the decrees of Napoleon being closed. In 1898 the additional abattoir of Vaugirard was opened, and the remainder of the five were closed except Villejuif, which was restricted in its use to the slaughter of horses for human food.

In Belgium public slaughter-houses have been provided in all the larger and more manufacturing towns. In Switzerland there are public slaughter-houses in nearly all places having more than two thousand inhabitants. In Italy a law of 1890 required that public slaughter-houses should be erected in all communities of more than six thousand inhabitants. In Austria a law of 1850 required the provision of such places in all the larger and medium-sized towns. In Norway and Sweden a law of 1892 required the provision of public slaughter-houses; but it has only partially been fulfilled. In Denmark there are public slaughter-houses in a few towns, including Copenhagen. In the Netherlands and Rumania a number of public slaughter-houses have been erected. In Ireland and Russia the provision of such places has been very slow in progress; it has been made, and especially in Prussia, where, Prof. Ostergag of Berlin states, they have "grown out of the ground" (Handbuch der Fleischbeschau); so much so that in 1897 there were 321 public slaughter-houses in the kingdom, 40 of which were in the period 1865-1897. A later work (Les Abattoirs Publics, by J. de Loverdo, H. Martel and Mallet, 1906) gives the number of public slaughter-houses as 839 in Germany, 84 in England, 912 in France and nearly 200 in Austria. In some other countries public slaughter-houses have been provided, but they are of a primitive form.

In England the power to provide public slaughter-houses was given by Parliament in 1851. Public slaughter-houses are the central place of cities, towns, boroughs, &c., to which the Act was applied by Order; and later, was given to all urban sanitary authorities by section 169 of the Public Health Act 1875. These authorities have, however, suffered from the disadvantage that they have had no power to control the continuance of private slaughter-houses (except in so far as these were annually licensed), and have not been able to ensure that the above provision would be used by the butchers. In Ireland and Scotland much the same powers exist; but in Scotland, if the burgh commissions provide a public slaughter-house, no other slaughter- houses are allowed to be used; and it is provided by Order that in local acts powers similar to those possessed by the burgh commissions in Scotland. The need for a still wider control is, however, manifest. Belfast may be cited as an illustration of a town in which a public slaughter-house has been provided, and in which there are no private slaughter-houses, but which receives a quantity of meat from private slaughter-houses erected beyond the boundaries of the city. The outcome of these difficulties is that the power of local authorities to provide public slaughter-houses has been but sparingly used. There is no law requiring that meat shall be inspected before sale for human food, hence there is no obligation upon butchers to use the public slaughter-house; and for the same reason public slaughter-houses remain unoccupied. This, indeed, is the position of some of the Continental slaughter-houses; but the increasing stringency of the laws as to meat-inspection, and especially in requiring that all animals shall be inspected at the slaughter-house, makes it almost impossible to have a slaughter-house which is not public in the true sense of the word. That such a law now exists in Belgium, where it has served as a model to other countries. An Imperial German law of 1900 extends to all provinces a requirement similar to the above, and enacts that "all cattle, swine, sheep, goats, horses, and dogs, the meat of which is intended to be used for food for man, shall be subjected to an official inspection both before and after slaughter. Antecedent to that year it was in force in southern Germany, in Brunswick and Saxony, but only in some parts of northern, western and central Germany. A similar law exists in Norway and Sweden, but, as already stated, provision of public slaughter-houses is still left to the burghs. In Austria there is a similar requirement, but Prof. Ostergag states that the administration is lacking in uniformity; in Italy, he writes, the regulation of meat-inspection having been left to provincial authorities, thorough reform is impossible. In the British colonies advance is being made. New Zealand has a number of public slaughter-houses. The Meat Supervision Act of Victoria empowers the Board of Health to make regulations for ensuring the inspection of carcasses of meat, and this power has recently been extended to Melbourne. Cattle are killed in public slaughter-houses and the carcasses are stamped, thus showing in which slaughter-house they have been killed.

The building and construction of public slaughter-houses have been the subject of excellent treatises by German writers, among whom may be mentioned Dr. Oscar Schwarz, of Stolp, and Herr Ostergag, of Berlin, whose works the writer of this article is largely indebted for information. After inspection of the public slaughter-houses in England and in a number of Continental cities, the writer considers that the German type is the best. The slaughter-house should be situated outside the town, or so
SLAUGHTER-HOUSE

placed as to be isolated, and approached by wide roads, so that if cattle are driven through them there should not be interference with traffic. The slaughter-hall, the gutting and pickling-rooms, are connected with the railway system by a branch line, with a platform which has an impervious surface capable of being readily cleansed and disinfected. The most convenient shape of the site is a rectangle or square, with a building for slaughtering and pickling on one principal road and one side bounded by the railway. A cattle-market is usually provided in connexion with the slaughter-house, and the position should be such that cattle brought by train can be taken immediately into the cattle-market from the market or the railway to the slaughter-house. The cattle-market should be entirely separate from the slaughter-house area. Osthoff states (Schlachthöfe für kleine und mittelgroße Städte) that the area of the slaughter-house should be as follows:

<table>
<thead>
<tr>
<th>Squ. Metres</th>
<th>Tons of 5,000-7,000 inhabitants per inhabitant.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7,000-10,000</td>
</tr>
<tr>
<td></td>
<td>10,000-50,000</td>
</tr>
<tr>
<td></td>
<td>over 50,000</td>
</tr>
</tbody>
</table>

It is of course assumed that the population derives the whole of its meat-supply from this source.

The parts required, according to Dr Oscar Schwarz, are: (1) an administrative block; (2) a slaughtering-hall, with a special room for scaling swine; (3) cattle lairs; (4) room for scaling and cleansing tripe and intestines; (5) an engine-house; (6) separate slaughtering-room, with lairs for animals suffering from, or suspected to be suffering from, contagious disease. In small towns the slaughtering-hall and room for cleansing intestines, to save cost of construction, be under the same roof. A necessary adjunct is a cold chamber, to which carcasses can be removed from the slaughtering-hall. The actual slaughtering compartment has been built on two plans—one providing a separate slaughtering-room for each butcher, the other a common slaughtering-hall. The latter is greatly to be preferred, inasmuch as it is the only arrangement which gives adequate opportunity for inspection by the officials whose duty it is to examine the meat.

The slaughter-house in Berlin was constructed on the separate-room system; but the system gave rise to difficulties of inspection. During recent years in Germany the practice has been to construct slaughter-halls with one room occupied by each butcher; at the time of slaughtering is, however, sufficiently distinguishable, and at Hamburg the position of the hooks hanging from above divides the hall into separate areas, each of which has an entrance from without. Schwarz gives the following as the most convenient arrangement of the buildings: The administrative building (with the house of the superintendent) at the entrance, so that from it the entrance and whole place can be seen. The victuals should be a weighing-machine for cattle. The centre of the area is occupied by the slaughtering-halls, and the lairs belonging to them are only separated from them by a road or passage way. The manure-house and engine-house must be accessible from the slaughtering-halls, but not in direct communication with them, or smell from them may enter the hall.

The manure-house must also be a road, to enable its contents to be conveyed, without passing the premises, to the waste ground. The Tripe and pig-scalding halls is the engine-house. The building for diseased animals, with the slaughter-house for them, must be isolated from all other buildings. All buildings should be so arranged that they may be capable of extension as the population of the town increases. By the provision of grass plots and trees every effort should be made to relieve the premises of the dreary appearance they will otherwise present.

Cold chambers, although not included among the absolute essentials for small slaughter-houses, are an almost necessary adjunct, for they serve for the preservation of the meat after slaughter, and are indeed absolutely necessary when the slaughter-house is of large size. The cold chamber should be situated opposite the slaughtering-halls, so that carcasses can be conveyed by overhead carriers directly from these halls to it. Within the cold chamber are separate compartments for different slaughtering operations for butchering. Thus it is possible to preserve their meat and theirs upon their supply as their business may require. The cold chamber is thus placed in a convenient position, and is a source of profit to the authority owning the slaughter-house. A frequent adjunct to large German slaughter-houses is the "Freibank," at which is sold at low price cooked meat of quality which renders it unfit to be sold under other circumstances.

Much depends upon the design and details of construction of the several component parts of a public slaughter-house, upon the provision of adequate lighting and ventilation of the buildings, upon the construction of walls catering to the public health. Mr. P. H. Wood is on a more extensive scale. It was erected at an estimated cost of from £162,000 to £175,000, and covers an area of about 23.2 acres. Provision is made for each department to be efficiently doubled in size, if it is unnecessary to describe it in any detail, but it may be noted that it has a market associated with it, and that separate slaughter-halls are provided for large cattle, for small cattle (sheep and calves), and for swine (fig. 2). The population of Düsseldorf was 212,949 in 1900.
The average cost of slaughter-houses in Germany is given by Osthoff, of Berlin (Handbuch der Hygiene), as 7 to 8 marks per inhabitant if no cold chamber is provided, and from 10 to 12 marks per inhabitant if there is a cold chamber, or, in more detail, as follows:

<table>
<thead>
<tr>

Slaughter-houses in Germany pay their own expenses, the fees received for the use of the slaughter-house, and for examination of meat and stamping after examination, providing a sufficient sum for this purpose. The fees vary in different places. From the works of Osthoff and Schwarz it would appear that these fees average about one pfennig per kilogramme of the living animal, or about half a farthing per lb of meat.

The incorporation of the city of London have erected a slaughter-house at their cattle market in Islington in which slaughtering is done in a large hall divided by partitions into separate compartments. The compartments are not let to separate butchers but are used in common. The partitions do not extend to the ceiling, but are sufficiently high to prevent the slaughtering in one compartment being seen by the occupants of other compartments, and thus they necessarily provide less opportunity for inspection than is afforded by the open-slaughtering halls of Germany. The fees charged are 18. 6d. per head for bullocks, 12d. for calves, 12d. for sheep, and 16d. per head for pigs. The accommodation is estimated as sufficient for the slaughter of 400 cattle, 1200 sheep, and 1200 calves and pigs per day.

The centralization of the slaughtering and packing industries in the United States has not required slaughter-houses on the same plan as in Europe. Acts of Congress of 1890, 1891 and 1895 endeavoured to provide some amount of inspection, but sufficient appropriations were never made to carry it out, and there were also certain loopholes in the legislation. Although there were from time to time frequent cases of sickness directly traceable to the consumption of canned meats from the great packing centres, it was not until the publication of Upton Sinclair's The Jungle (1906), which dealt with the conditions in the Chicago packing yards, that steps were taken adequately to guard the public against insanitary conditions. A commission of inquiry was appointed by President Roosevelt, and as a result of its report there was passed in 1906 a national meat inspection law. This act required the department of agriculture to appoint inspectors to examine and inspect all cattle, sheep, swine and goats before being allowed to enter into any slaughtering, packing, meat-canning, rendering or similar establishments. All such animals found to show any symptoms of disease must be set apart and slaughtered separately. All carcasses must be inspected and labelled as either "inspected and passed" or "inspected and condemned." The act also provides for the inspection (and condemnation if necessary) of all meat food products as well as for the sanitary examination of all slaughtering, packing and canning establishments. Inspection and examination is now carried out very carefully at all stages of the industry, from inspection of the animals before they enter the slaughtering establishments up to the finished product.

The important feature of the Chicago and certain other western American cities slaughter-houses is their adaptation for rapidly dealing with the animals which they receive. At the Chicago slaughtering-houses the cattle to be slaughtered are driven up a winding viaduct, by which, in certain of the houses, they eventually reach the roof. Each animal now passes into a narrow pen, where it is at once stunned by a blow on the head. It then falls through a trap-door in the pen into an immense slaughtering-room, where the hind legs are secured, and the animal hoisted by a wire rope suspended from a trolley-line. A knife is then plunged into its throat and the
carrage made to travel along the line. The carcase is next lowered to the floor of the slaughtering-room, and being drenched with warm water off and on, the head is first stripped off and the internal parts removed. The carcase again travels along the trolley-line to a place where it is divided into halves, which then, after washing, travel to the refrigeration-room, being trimmed while on the trolley. The butchering is then performed, and is judged to have been done when that over 400 cattle are killed per hour in the slaughtering-room.

The cooling-rooms are so large that 13,000 calves of beef hang there at one time. The chief method of dealing with sheep is similar to that for cattle, with the exception that over 400 sheep are killed per hour in the slaughtering-room.

The animals are driven directly into the trolley-line, where their throats are cut. They next travel along a route where their skins and the internal organs are removed, and finally proceed to the slaughtering-room, where the carcases are divided into halves. The carcase is then removed to the trolley-line by a chain attached to the animals’ feet and to a solid disk or wheel, which in revolving carries them until a mechanical contrivance throws the chain upon the trolley-line, where the carcase is conveyed in an enclosed gutter to the carcase is scalded, scraped by a machine through which it passes, then depilated, the internal parts removed, and the interior washed. The carcase then travels to the slaughtering-room, where they are trimmed, and a view with a sparring appliance designed for selecting and trimming, animals’ positions to “pithing,” among which they mention the Bruneau and Baxter masks, the Greener patent killer, the Blitz instrument, and the Wackett pither. All of these instruments can be readily made by any cooperative, and are easy to manipulate with one or two men.

In view of the difficulty of adjusting these instruments in the case of wild or restless animals, the committee express the opinion that the poll-axe when used by an expert is on the whole the most satisfactory instrument, and they recommend that it be permitted to use the poll-axe on a living animal until he has gone through a thorough course of training, firstly upon a dummy animal and secondly upon dead bodies. Calves, the committee state, should be held by the horns and then pithed. The club, or switch, to the method of slaughter of sheep the committee discuss the method usually adopted in England, which is “to lay the sheep on a wooden crutch and then to thrust a knife through the neck below the ears, and with a second motion to insert the point, from within, between the joints of the vertebras, thus severing the spinal cord.”

Observations made for the committee by Professor Starling showed that the interval between the first thrust of the knife and complete loss of sensibility varied from five to thirty seconds, and they therefore recommended that sheep should be stunned before being struck, a practice required in Denmark, many parts of Germany, and Switzerland. This practice is said to be especially practised in the slaughtering-processes, and it is recommended that the head of the head be not on the forehead. The insensitive produced by the blow was found to last fully twenty seconds, a period sufficiently long for the killing to be complete. The head is then laid on the crutch before being stunned. The stunning of pigs, the committee recommended, should be insisted upon in all cases, and, as sometimes at present, only practised in the case of large pigs which give trouble or with a view to the avoidance of noise.

The Jewish method of slaughter by cutting the throat is condemned by the committee after careful observation and after reference to the Jewish Laws of the Stewards. The chief objection to this method being that it fails in the primary requirements of rapidity, freedom from unnecessary pain, and instantaneous loss of sensibility.

The subject of slaughter-houses has not been found to affect the prices of meat, although one of the numerous arguments used by butchers against being required to slaughter in public slaughter-houses was that they would have this effect. Inquiry on this subject by a Swedish veterinary surgeon of Stockholm, Kjerrulf, in 1877, in connection with the Butcher Acts of Sweden, Denmark, and Norway, showed that the Polish price was 238. Of these, 261 towns declared that as a result of the compulsory use of the abattoirs and compulsory meat inspection the price of meat had not been raised. In the case of twenty-two towns prices actually fell, and in the remaining cases it was alleged that the temporary rise was due, not to the abattoir, but to other causes, notably the scarcity of live stock

SLAVE COAST—SLAVERY

The increasing recognition in European countries of the need for inspection, at the time of slaughter, of the flesh of all cattle intended to supply food for man, the necessity for the provision of public slaughter-houses to make such inspection practicable, the convenience which these slaughter-houses afford to those engaged in the business of butcher, combine to ensure that, at any rate in all populous places, they will in time entirely supplant private slaughter-houses, which offer none of these advantages. No doubt the provision of public slaughter-houses will continue to be opposed by the bouchers’ trade so long as private slaughter-houses are permitted, and, as already stated, local authorities in England are discouraged from making public provision by their inability to prevent the continuance of the use of all existing private slaughter-houses. Probably the extension to English local authorities of the power which the law of Scotland gives to the commissioners of Scottish burghs of closing private slaughter-houses when a public slaughter-house has been provided, would facilitate the much-needed substitution of public for private slaughter-houses.

SLAVE COAST. The name given to that part of the coast of West Africa extending from the river Volta to the Niger delta, forming part of the Guinea coast (see Guinea). From the beginning of the 16th to the end of the 18th century this region was a principal resort of the Europeans engaged in the slave trade. Politically the Slave Coast is divided between Germany, France and Great Britain, the German section forming part of Togoland (q.v.), the French section the seaboard of Dahomey (q.v.), and the British section the Lagos province of Nigeria (see Lagos).

SLAVERY. It appears to be true that, in the words of Dunoxy, the economic régime of every society which has recently attained to a high degree of political organization is best determined by the policy of its existing or past slave-holdings.

In the hunter period the savage warrior does not enslave his vanquished enemy, but slays him; the women of a conquered tribe he may, however, carry off and appropriate as wives or as servants, for in this period domestic labour falls almost altogether on their sex. In the pastoral stage slaves will be captured only to be sold, with the exception of a few who may be required for the care of flocks or the small amount of cultivation which is then undertaken. It is in proportion as a sedentary life prevails, and agricultural exploitation is practised on a larger scale, whilst warlike habits continue to exist, that the number of slaves is increased. Slaves are not necessary for the master, and at the same time save him from irksome toil. Of this stage in the social movement slavery seems to have been, as we have said, a universal and inevitable accomplishment. But wherever theocratic organizations established themselves slavery had not become a vital element in the social system. The members of the lowest class were not in a state of individual subjection: the entire caste to which they belonged was collectively subject. It is in the communities in which the military order obtained an ascendency over the civil that the phenomenon of slavery is most clearly marked. Slavery (as the word is commonly understood) had its natural and appropriate place. It is not merely that in its first establishment slavery was an immense advance by substituting for the immolation of captives, often accompanied by cannibalism, their occupation in labour for the benefit of the victor. This advantage, recalled by an old though erroneous1

1 Servus is not cognate with serrare, as has often been supposed; it is really related to the Homeric elagop and the verb elpo, with which the Latin servus is to be connected. It may be here mentioned that servus was originally a national name; it meant a man of Slavonic race captured and made a bondman to the Germans. "From the Euxine to the Adriatic, in the state of captives or subjects, . . . they [the Slavonians] overspread the land, and the national appellation of the nation has been conferred on them, which designation of glory to that of servitude " (Gibbon, Decline and Fall, ch. lv.). The historian alludes to the derivation of the national name from slav, glory. See Skeat's Etym. Dict., s.v.; see also Slavs.
etymology, is generally acknowledged. But it is not so well understood that slavery discharged important offices in the later social evolution—first, by enabling military action to prevail with the degree of intensity and continuity requisite for the system of incorporation by conquest which was its final destination; and, secondly, by forcing the captives, who with their descendants came to form the majority of the population in the conquering community, to an industrial life, in spite of the antipathy to regular and sustained labour which is deeply rooted in human nature. As regards the latter consideration, it is enough to say that nowhere has productive industry developed itself in the form of voluntary effort; in every country of which we have any knowledge it was compelled by the strong upon the weak, and was wrought into the habits of the people only by the stern discipline of constraint. From the former point of view the free man, then essentially a warrior, and the slave were mutual auxiliaries, simultaneously exercising different and complementary functions—each necessary to the community. In modern slavery, on the other hand, where the occupations of both parties were industrial, the existence of a servile class only guaranteed for some of them the possibility of self-indulgent ease, whilst it imposed on others the necessity of industrial labor; and there was in it a semblance of inequality—a thing in Greece often purposeless and, except in the resistance to Persia, on the whole fruitless—worked out the social mission which formed its true justification. Hence at Rome slavery also most properly found its place, so long as that mission was in progress of accomplishment. As soon as the march of conquest had reached its natural limit, slavery began to be modified; and when the empire was divided into the several states which had grown up under it, and the system of defence characteristic of the middle ages was substituted for the aggressive system of antiquity, slavery gradually disappeared, and was replaced by freedom. While in modern times we have the natural results of ancient slavery, and have found it to have been in certain respects not only useful but indispensable. When we consider its moral effects, whilst endeavouring to avoid exaggeration, we must yet pronounce its influence to have been profoundly detrimental. In its action on the slave it marred in a great measure the happy effects of habitual industry by preventing the development of the sense of human dignity which lies at the foundation of morals. On the morality of the masters—whether personal, domestic, or social—the effects of the institution were disastrous. The habit of absolute rule, always dangerous in a society of particular families, where, as in Greece, it eventually became the department of daily life, and when no external interference checked individual caprice in its action on the feelings and fortunes of inferiors. It tended to destroy the power of self-command, and exposed the master to the baneful influences of flattery. As regards domestic morality, the system offered constant facilities for libertinism, and tended to subvert domestic peace by compromising the dignity and ruining the happiness of the wife. The sons of the family were familiarized with vice, and the general tone of the younger generation was lowered by their intimate association with a despised and degraded class. These deplorable results were, of course, counterbalanced by increasing both among masters and among slaves—instances of benevolent protection on the one side and of unskillful devotion on the other; but the evil effects without doubt greatly preponderated.

**Greece.**—We find slavery fully established in the Hellenic period. The prisoners taken in war are retained as slaves, or sold (Ir. xxiv. 792) or held at ransom (Ir. vi. 657) by the captor. Some Herod. times. times. at the end of a conquered town or district are slain and the women carried off (Od. ix. 616). Not unfrequently free persons were kidnapped by pirates and sold in other regions, like Eumeneus in the Odyssey. The slave might thus be born of equal rank with his master, who knew that the same fate might befall himself or some of the members of his family. The institution does not present itself in a very harsh form in Homer, especially if we consider (as Grote suggests) that it was not uncommon for a slave to become master of his own house, if he was of a sufficient social standing. Such a slave would be likely to have a rank in society equal to that of his master, and to possess a certain degree of freedom.ography.  3.23.  terms. the case among the Thracian tribes, who were in the habit of taking the heads of their enemies as trophies, on which they fastened monuments in testimony of the beauty of his affection and regret. They often lived on terms of intimacy either with the head of the house or his younger members; and the slave often had a distinct name and position—never on mutual respect, as in the heroic example of Ulysses and Eumeneus, but on insolent self-assertion on the one side and a spirit of
SLAVERY

unworthy compliance on the other, the latter having its raison d'être in degrading services rendered by the slave. Aristophanes and Plautus show us how often resort was had to the discipline of the lash even in the case of domestic slaves. Those employed in workshops, whose overbearance was at least the equal of their power, had probably a harder lot than domestics; and the agricultural labourers were not unfrequently chained, and treated much in the same way as beasts of burden. The displeasure of the master sometimes took the form of physical violence. But if the slave had killed his master, the relatives of the house could not themselves inflict punishment; they were obliged to hand him over to the magistrate to be dealt with by legal process. The slave who had just grounds of complaint against his master could demand to be sold; when he alleged his right to liberty, the law granted him a defender and the sanctions offered him an asylum till judgment should be given. Securities were taken against the revolt of slaves by not associating those of the same nationality and language; they were sometimes fettered to prevent flight, and, after a first attempt at escape, branded to facilitate their recovery. There were treaties between masters and free cities and among free cities, giving mutual assurance between individuals against their loss by flight. Their inclination to take advantage of opportunities for this purpose is shown by the number that escaped from Athens to join the Spartan service. The Athenian Deed book contains long lists of names of slaves, taken at the mines of Laurium, and more than once in Chios. The evidence of slaves—women as well as men—was often, with the consent of their masters, received in evidence; and that method is generally commended by the orators as a sure way to the truth.

The slave could purchase his liberty with his peculium by agreement with his master. He could be liberated by will, or, during his lifetime, by the action of the courts, or other public places, or by having his name inscribed in the public registers, or, in the later age of Greece, by sale or donation to certain temples—an act which did not, of itself, imply freedom. Certain slaves sometimes attached to emancipation, as of remaining for life or a definite time with the former master, or another person named by him, or of performing some special service; payment for rights of citizenship and of other advantages was also received. By testament the Athenian slave became in relation to the state a metic, in relation to his master a client. He was thus in an intermediate condition between slavery and complete freedom. If the freedman violated his duty to his patron he was subject to an action at law, and if the decision was against him he was again reduced to slavery. He became a full member of the state only, as in the case of foreigners, by adoption into the Demes of citizens; his vote might be set aside by a graphe paranomon. Slaves who had rendered eminent services to the public, as those who fought at Arginusae and at Charonea, were once admitted to the status of citizens and, if they chose, to that of citizens of a Greek state. But it was a general belief that even in their case some civic rights were reserved and accorded only to their children by a female citizen. The number of freedmen at Athens was in the last century never to have been great. (See further GREECE, Ancient History, § 5.)

It is well known that Aristotle held slavery to be necessary and natural, and, under just conditions, beneficial to both parties in the relation—views which were correct enough from the political side, regard being had to the contemporary social state. His practical motto, if he is the author of the Economics attributed to him, is—"no outcasts, no familiarity." There ought, he says, to be held out to the slave the hope of liberty as the reward of his service. Plato condemned the practice, the theory of which Aristotle also approves by implication sets aside the duty of the afflicting and of the afflicted—Laws he accepts the institution as a necessary though embarrassing one, and recommends for the safety of the masters that natives of different countries should be mixed and that they should all be well treated, excluding from the Greek community the people of foreign birth. He encourages the feeling of contempt for them as a class. The later moral schools of Greece scarcely at all concern themselves with the institution. Thucydides had no scruple about the servitude of those whose labours contributed to his own indulgence and tranquillity. The Stoic regarded the condition of freedom or slavery as an external accident, indifferent in the eye of wisdom; to him it was a matter of indifference of the kind of life. "The slavery of complaint; from intolerable indignity suicide was an ever-open means of escape. The poets—especially the authors of the New Comedy—strongly inculcated humanity, and insist on the fundamental human rights of the slave. The love of freedom is more than once translated from Alexis, and the spirit of it breathes in many passages of the Greek drama. A fragment of Philemon declares, as if in reply to Aristotle, that not nature but fortune, makes the slave. Euripides, as might be expected from his humanitarian cast of sentiment, and the "premature modernism" which has been remarked in him, rises above the ordinary feelings of his time in regard to the slaves. As Paley says, he loves "to record their fidelity to their masters, their sympathy in the trials of life, their gratitude for kindness and not because of the necessity of it, but because it was the character of honourable men." He allows them to retain, as if to suggest; and he even makes them philosophize on the follies and the indignities of their superiors" (compare Med. 54; Orest. 446)." Hence the position of the slave at Rome. So we are not to suppose that even he, latitudinarian and innovator as he was, could have conceived the possibility of abolishing an institution so deeply rooted in the social conditions, as well as in the religious belief of the nation. (For the Helots in Laconia, see HELOTS.)

Rome.—We have already observed that the Roman system of life was that in which slavery had its most natural and relatively legitimate place; and accordingly it was at Rome that, as Blair has remarked, the institution was more than anywhere else "extended in its operation and methodized in its details."

We must distinguish from the later slavery at Rome what Mr. Montefiore calls "the old, in some measure innocent, slavery, under which the farmer tilled the land along with his slave, or, if he possessed more land than he could manage, placed the slave—either as a steward, or as a sort of lessee obliged to take care of the property up to a certain point. The earliest passages of slaves obtained by the early victories of Rome over her Italian neighbours, no large number was employed on the small holdings of the frontier tribes, and the peasantry of the Etruscan cities. After the wars of Pyrrhus the number gradually increased, and the patricians, and the continued absence of citizens required by the expanding system of conquest, necessarily brought with them a demand for slave labour, which was increasingly supplied by captives taken in the wars. Of the captives from the pagans of the last war, few particulars of the time of the mature republic and the first century of the empire will give some idea. In Epirus, after the victories of Aemilius Paullus, 150,000 captives were sold. The prisoners at Delphi were estimated at 10,000 Teutons and 60,000 Celts. Caesar sold on a single occasion in Gaul 63,000 captives. But slavery, as Hume has shown, is unfavourable to population. As a result of the peculiar condition of Roman families, the law dealt with the "systematically-prosecuted hunting of man," and indicated an entire perversion of the primitive institution, which was essentially connected with conquest. The pirates sold great numbers of slaves at Delos, and it was for the purpose of buying free men that the slave sales went on as really, though more obscurely, after the successful expedition of Pompey. There was a regular importation to Rome of slaves, brought to some extent from Africa, Spain and Gaul, but chiefly from Asiatic countries—Bithynia, Galatia, Cappadocia and Syria. A portuarium—apparently one-eighth for eunuchs, one-fortieth for others—was paid on their import or export, and a duty of 2 or 4% on their sale.

There were other sources from which slavery was alimented, though of course in a much less degree. Certain offences reduced the guilty persons to slavery (servitio poenam), and they were employed in the menial work in the courthouses and the baths or in the maintenance of the buildings and the maintenance of the aqueducts. Both kinds of functions were discharged by slaves, not only at Rome, but in the rural and provincial municipalities. Slaves of the familia rustica and the familia urbana. At the head of the familia rustica was the silvæcum, himself a slave, with the wife who was given him at once to aid him and to bind him to the state. Under him were the several crouches employed in the different branches of the exploitation and the care of the cattle and flocks, as well as those who kept or prepared the food, clothing and tools of the whole staff and those who attended on the master in the household. At the head of the familia urbana belonged those who discharged the duties of tendering the family and kitchen, besides the entertainment of the master and his guests by dancing, singing and other arts. There were, besides, the slaves who accompanied the master and mistress out of doors, and were chosen for their beauty and grace as guards of honour for their strength as chairmen or porters.
SLAVERY

219

for or their readiness and address in remembering names, delivering messages of courtesy and the like. There were also attached to a general household, women, slaves of modest circumstances, prepared of parchment, as well as pedagogues and preceptors of different kinds—readers, grammarians, men of letters and even philosophers—all of servile condition, besides accountants, managers and the like. The sumptuary law of Domitian, which is the last and the last of the Sullan law, disposed the masters and the maidens, who had been chained. The slaves of Pedaneus Secundus, who, in spite of a threatened outbreak of the indignant populace, were all put to death because they, not the slaves of a smaller master, who had been four hundred in number, Pliny tells us that Caeccius, a freedman of the time of Augustus, left by his will as many as 416. The question as to the total number of slaves at Rome or in Italy is a difficult one, and it is not, perhaps, possible to arrive with any degree of certainty at an approximate estimate. Gibbon supposes that there were in the Roman world in the reign of Claudius at least as many slaves as free inhabitants. But Blair seems right in sceptically remarking: "A master, when accused, could offer his client for the "question," or demand for the same purpose the slaves of another; and, if in the latter case they were injured or killed in the prosecution, the blood could be imputed to the master, except of adultery or incest (under the latter name being included the violation of sacred things or places); the case of high treason was afterwards added to these. An accused slave could not involve his master, the king, or the emperor. The penalties of the law for crime were specially severe on slaves.

Columella, like Xenophon, favours a certain friendliness and familiarity in one's intercourse with his farm slaves. Cato ate and drank with his slaves, and so did Varro. Many of the slaves and the children suckled by his wife, that they might imbibe a fondness for the family. But he had a strict eye to profit in all his dealings with them. He allowed the contubernium of male and female slaves at the price of a money payment from their peculium. Columella regarded the gains from the births as a sufficient motive for encouraging these unions, and thought that much more was gained for the freedom of the children than for the sake of the fathers have thus considered this view. The immense extension of the rural estates (latifundia) made it impossible for masters to know their slaves even if they were disposed to take trouble for the purpose. Effective supervision was therefore of great importance. Over one-third of the slave population of Italy lived in the enfranchised state. Some were sold during working hours but at night in the ergastulum where the slaves slept. Urban slaves had probably often a life as little envious, enjoyable, or productive as the rural slaves. The slave trade was introduced, and those were worn not only in the fields during working hours but at night in the ergastulum where the slaves slept. SLAVERY

In the 2nd century of the Christian era we find a marked change with respect to the institution of slavery, both in the region of thought and in the practical application of law. In the reign of Nero, slavery was still regarded as the natural condition of a large part of the population; but in the 2nd century, the human dignity of the slave was recognized, and the slave was treated with more consideration and respect. The change in the attitude towards slavery is reflected in the laws and regulations of the time.

African Union

In the 2nd century, the African Union was established to facilitate the trade of goods and commodities, and to regulate the conduct of traders. The Union was important not only for its economic function, but also for its role in the dissemination of knowledge and ideas. The Union was not only a network of merchants and traders, but also a center for the exchange of knowledge and information.

Influence of the Union

The influence of the African Union extended beyond its immediate sphere of activity. The Union was a focal point for the dissemination of knowledge and ideas, and it played a significant role in the development of the African civilization. The Union was a hub of commerce and trade, and it facilitated the exchange of goods and ideas. The Union was also a center for the preservation and transmission of knowledge and ideas.

The decline of the Union

The decline of the African Union was due to a variety of factors. One of the main reasons was the increasing competition from other centers of commerce and trade. The Union was also affected by the political instability and the wars in the region. The decline of the Union had a significant impact on the African civilization, as it led to the loss of knowledge and ideas.

The importance of the Union

The African Union was an important institution in the history of the African civilization. It played a significant role in the dissemination of knowledge and ideas, and it facilitated the exchange of goods and trade. The Union was also a center for the preservation and transmission of knowledge and ideas. The decline of the Union had a significant impact on the African civilization, as it led to the loss of knowledge and ideas.
of slaves further acted in the direction of the rehabilitation of free labour. A general movement of this kind is noticeable from the 2nd century onwards. Freemen had always been to some extent employed in the public service. In private service superior posts were often filled by freedmen; the higher arts— as medicine, gymnastics, painting were professedly in the hands of freedmen, and even of ingenii; the more successful actors and gladiators were often freedmen. In the factories or workshops kept by wealthy persons slave labour was mainly employed; but free artisans sometimes offered their services to these establishments or formed associations to compete with them. We have seen that free persons had all along been to some extent employed in the cultivation of land as hired labourers, and, as we shall presently find, also as tenants on the great estates. How all this operated we shall understand when we examine the remarkable organization of the state introduced by Diocletian and his successors. (3) This organization established in the Roman world a personal and hereditary fixity of professions and situations which was not very far removed from the caste system of the East. The purpose of this was doubtless to resist by a strong internal consolidation the shock of the invasions, to secure public order, to enforce industrious habits, and to guarantee the financial resources of the state. Personal independence was largely sacrificed, but still more important ends were in a great measure attained. This system, by diminishing the freeman's mastery over himself and his power to determine his occupation, reduced the interval between him and the slave; and the latter on the one hand, the free domestic servant and workshop labourer on the other, both passed insensibly into the common condition of servitude. (4) The corresponding change, in the case of the rural slaves, took place through their being merged in the order of coloni. The Roman colonus was originally a free person who took land on lease, contracting to pay to the proprietor either a fixed sum annually or (when a colonus par- tiarius) a certain proportion of the produce of the farm. Under the emperors of the 4th century the name designated a cultivator who, though personally free, was attached to the soil, and transmitted his condition to his descendants; and this became the regular status of the mass of Roman cultivators. The class of coloni appears to have been composed partly of tenants by contract who had incurred large arrears of rent and were detained on the estates as debtors (obœrati), partly of foreign captives or immigrants who were settled in this condition on the land, and partly of small proprietors and other poor men who voluntarily adopted the status as an improvement in their position. They paid a fixed proportion of the produce (pars agraria) to the owner of the estate, and gave a determinate amount of labour (operae) on the portion of the domain which he kept in his own hands (mansus dominicus). The law for a long time took no notice of them; and it was not until the time of Justinian that the imperial government regulated the system. The coloni were inscribed (adscripti) on the registers of the census as paying taxes to the state, for which the proprietor was responsible, reimbursing himself for the amount. In a constitution of Constantine (A.D. 332) we find the colonus recognized as permanently attached to the land. If he abandoned his holding he was brought back and punished; and any one who received him not only to restore him but to pay a penalty. He could not carry out of the domain; if he took for wife a colonus of another proprietor, she was restored to her original locality, and the offspring of the union were divided between the estates. The children of a colonus were fixed in the same status. They and their descendants were retained, in the words of a law of Theodosius, "quodam aeternatis jure," and by no process could be relieved from their obligations. By a law of Anastasius, at the end of the 5th century, a colonus who had voluntarily come into an estate was by a tenure of thirty years for ever attached to it. The master (dominus) could inflict on his coloni "moderate chastisement," and could chain them if they attempted to escape, but they had a legal remedy against him for unjust demands or injury to them or theirs. In no case could the rent or the labour dues be increased. The colonus could possess property of his own, but could not alienate it without the consent of the master. Thus, whilst the members of the class were personally free, their condition had some incidents of a semi-serf character. They were actually designated by Theodosius, "servile terrae incolae." And Salvian treats the proposition "colonii divitum sunt" as equivalent to "vertuntur in servos." This is indeed an exaggeration; the colonatus was not an oppressive system; it afforded real security against unreasonable demands and wanton disturbance, and it was a great advance on the system of the familia rustica. But the point which is important is that there was a certain approximation between the condition of the colonus and the slave which tended towards the fusion of both in a single class.

Besides the coloni there were on a great estate—and those of the 4th century were on a specially large scale—a great number of freedmen, who worked collectively under overseers on the part of the property which the owner himself cultivated. But it was a common practice to settle certain of the slaves (and possibly also of the freedmen) on other portions of the estate, giving them small farms on conditions similar to those to which the coloni were subject. These slaves are, in fact, described by Ulpian as quasi coloni. They had their own households and were hence distinguished as casati. In law these slaves were at first absolutely at the disposal of their masters; they had no property in the strict sense of the word, and could be sold to another proprietor and separated from their families. But the landlord's interest and the general tone of feeling alike modified practice even before the intervention of legislation; they were habitually continued in their holdings, and came to possess in fact a perpetual and hereditary enjoyment of them. By a law of Valentinian I. (377) the sale of these slaves was interdicted unless the land they occupied were at the same time sold. The legal distinction between the coloni and the slave tenants continued to exist after the invasions; but the practical difference was greatly attenuated. The colonus often occupied a servile mansus, and the slave a mansus originally appropriated to a colonus. Intermarriages of the two classes became frequent. Already at the end of the 7th century it does not appear that the distinction between them had any substantial existence.

The influence of the Northern invasions on the change from slavery to servitude was, in all probability, of little account. The change would have taken place, though perhaps not so speedily, if they had never occurred. For the developments of the Middle Ages see SERFDOM and VILLENAGE.

Modern Slave Trade.—Not very long after the disappearance of servitude in the most advanced communities comes into sight the new system of colonial slavery, which, instead of being the spontaneous outgrowth of social necessities and subserviing a temporary need of human development, was politically as well as morally a monstrous aberration.

In 1442, when the Portuguese under Prince Henry the Navigator were exploring the Atlantic coast of Africa, one of his officers, Antam Gonsalves, who had captured some Moors, was directed by the prince to bring them back to Africa. He received from the Moors in exchange for them ten blacks and a quantity of gold dust. This excited the cupidity of his fellow-countrymen; and they fitted out a large number of ships for the trade, and built several forts on the African coast. Many negroes were brought into Spain from these Portuguese settlements, and the colonial slave trade first appears in the form of the introduction into the newly-discovered western world of descendants of these negroes. When Nicolas de Ovando was sent out in 1502 as governor of Haiti, whilst regulations, destined to prove illusory, were made for the protection of the natives of the island, permission was given to carry to the colony negro slaves, born in Seville and other parts of Spain, who had been instructed in the Christian faith. It appears from a letter of Ovando in 1503 that there were at that time numbers of negroes in Haiti; he requested that no more might be permitted to be brought out. In 1530 and the following years
King Ferdinand ordered a number of Africans to be sent to that colony for the working of the mines. Before this time Columbus had proposed an exchange of his Carib prisoners as slaves against live stock to be furnished to Haiti by Spanish merchants. He actually sent home, in 1494, above 500 Indian prisoners taken in wars with the caciques, who, he suggested, might be sold as slaves at Seville. But, after a royal order had been issued for their sale, Queen Isabella, interested by what she had heard of the genteel and hospitable character of the natives and of their industry, procured a letter to be written to Bishop Fonseca, the superintendent of Indian affairs, suspending the order until inquiry should be made into the causes for which they had been made prisoners, and into the lawfulness of their sale. Theologians differed on the latter question, and Isabella directed that these Indians should be sent back to their native country.

Bartolomé de las Casas, the celebrated bishop of Chiapa, accompanied Ovando to Haiti, and was a witness of the cruelties from which the Indians suffered under his administration. He came to Spain in 1517 to obtain measures in their favor. He then made it his business to explain to Charles that a Spanish resident in Haiti should have licence to import a dozen negro slaves. Las Casas, in his Historia de las Indias (lib. iii. cap. 101), confuses the error into which he thus fell. Other good men appear to have given similar advice about the same time, and, as has been shown, the practice was not absolutely new; indeed the young king had in 1516, whilst still in Flanders, granted licences to his courtiers for the importation of negroes into the colonies, though Jimenes, as regent of Castile, by a decree of the same year forbade the practice. The suggestion of Las Casas was no doubt made on the ground that the negroes could be better than the Indians, bear the labour in the colonies, which was rapidly exhausting the numbers of the latter. 1 He has sometimes on this plea been exonerated from all censure; but, though entitled to honour for the zeal which he showed on behalf of the natives, he must bear the blame for his violation or neglect of moral principle. His advice was unfortunately adopted. "Charles," says Robertson, "granted a patent to one of his Flemish favourites, containing an exclusive right of supplying 4000 negroes annually to Haiti, Cuba, Jamaica and Porto Rico. 2 The favourite sold his patent to some Genoese navigators, who then made it his business to explain to Charles that slaves from the Portuguese; and thus was first systematized the slave trade between Africa and America.

The first Englishman who engaged in the traffic was Sir John Hawkins (1522). The English slave traders were at first altogether England occupied in supplying the Spanish settlements. Indeed the reign of Elizabeth passed without any English colony having been established in English America. But the Dutch ship from the coast of Guinea visited Jamestown in Virginia, and sold a part of her cargo of negroes to the tobacco-planters. This was the first beginning of slavery in British America; the number of negroes was afterwards continually increased—though apparently at first slowly—by importation, and the field-labour was more and more performed by servile hands, so that in 1790 the state of Virginia contained 200,000 negroes.

The African trade of England was long in the hands of exclusive companies; but by an act of the first year of William and Mary it became free and open to all subjects of the Crown. The African Company, however, continued to exist, and obtained from time to time large parliamentary grants. By the treaty of Utrecht the asiento, 3 or contract for supplying the Spanish colonies with 4500 negroes annually, which had previously passed from the Dutch to the French, was transferred to Great Britain; an English company was to enjoy the monopoly for a period of thirty years from 1st May 1713. But the contract came to an end in 1739, when the complaints of the English merchants on one side and of the Spanish officials on the other rose to such a height that Philip V. declared his determination to revoke the asiento, and Sir Robert Walpole was forced by popular feeling into war with Spain. Between 1680 and 1700 about 140,000 negroes were exported by the African Company, whereas in the 1720's and 1730's more than 500,000 were sent. Between 1700 and the end of 1786 as many as 610,000 were transported to Portugal alone, which had been an English possession since 1655. Bryan Edwards estimated the total import into all the European countries of the continent between 1700 and 1786 at 2,130,000, being an annual average of 20,095. The British slave trade reached its utmost extension shortly before the War of Independence, and then fell off. It was not revived for some years, and it was principally from Liverpool, but also from London, Bristol and Lancaster, that the number of slave ships sailing from those ports was 192, and in them space was provided for the transport of 47,146 negroes. During the latter part of the 18th century British ships vessel was between 220 and 240. But it should be observed that the continent about the year 1790 by traders of the several European countries engaged in the traffic is supplied by the following statement—"By the British, 38,000; by the French, 20,000; by the Dutch, 4500; by the Danes, 2000; by the Portuguese, 10,000; total 74,000. 4 " Thus more than half the trade was in British hands. The hunting of human beings to make them slaves was greeted with general horror by the English people. See in The Times, 23rd June 1760, a letter written by a friend of the Rev. Mr. Colman, who says:—"I was present when he left London, and his face was pale and his expression terrorized. He told me he was going to Africa to buy negroes; and I wish he had never been born, for I am sure he will come back dead."

The British slave trade continued to flourish for some time after the abolition of slavery, and the negroes were still captured in Africa by the shore traders and the slave hunters. The negro traffic was in the hands of the English during the 19th century. The trade was carried on by the slave hunters and by the large slave-trading companies. The slave trade was abolished by the British government in 1807. The trade was finally abolished in 1873 by the International Convention for the Abolition of the Slave Trade.

1 The Spaniards, in the space of fifteen years subsequent to the discovery of the New World, had as good as exterminated, reduced the natives of Haiti from a million to 60,000.

2 The Spaniards were prevented from forming establishments on the African coast by the Bull of Demarcation ("Inter caetera") of Pius II., which excluded their territory as far east as the eastern limit of the sphere of discovery as established by the Treaties of Tordesillas and Madrid in 1529. It was subsequently extended, however, as far east as the mouth of the Senegal River.

3 The Spaniards, in the space of fifteen years subsequent to the discovery of the New World, had as good as exterminated, reduced the natives of Haiti from a million to 60,000.
Indies, and for the discouragement of the slave trade on the coast of Africa." This was the first society established in England for the purpose. The Quakers in America had taken action on the subject still earlier than those in England. The Pennsylvanian Quakers advised their members against the trade in 1665; in 1754 they issued to their brethren a strong dissuasive against encouraging it in any manner; in 1774 all persons concerned in the traffic, and in 1776 all slave holders who would not emancipate their slaves were invited to follow the example of those who had already left the business in the other American provinces followed the lead of their brethren in Pennsylvania. The individuals among the American Quakers who laboured most earnestly and indefatigably on behalf of the Africans were John Woolman (1720-1772) and Anthony Benezet (1713-1784), the latter a son of a French Huguenot driven from France by the revocation of the edict of Nantes. The former confined his efforts chiefly to America and indeed to his coreligionists there; the latter sought, not without success, to found a universal propaganda in favour of abolition. A Pennsylvanian society was formed in 1774 by James Pemberton and Dr Benjamin Rush, and in 1787 (after the war) was reconstructed on an enlarged basis under the presidency of Franklin. Other similar associations were founded about the same time in different parts of the United States. The next important movement took place in England. Dr Peckard, vice-chancellor of the university of Cambridge, who entertained strong convictions against the slave trade, proposed in 1785 as subject for a Latin prize dissertation the question, "An ilicet invitus in servitutem dare." Thomas Clarkson obtained the first prize, translated his essay into English in an expanded form, and published it in 1788 with the title Essay on the Slavery and Commerce of the Human Species. In the process of its publication he was brought into contact with several persons already deeply interested in the question; amongst others with Granville Sharp, William Dillwyn (an American by birth, who had known Benezet), and the Rev. James Ramsay, who had lived nineteen years in St Christopher, and had published an Essay on the Treatment and Conversion of the African Slaves in the British Sugar Colonies. The distribution of Clarkson's book led to his forming connexions with many persons of influence, and especially with William Wilberforce (q.v.). A committee was formed on the 22nd of May 1787, for the abolition of the slave trade, under the chairmanship of Granville Sharp. It is unquestionable that the principal motive power which originated and sustained their efforts was Christian principle and feeling. The most earnest and unremitting exertions were made by the persons so associated in investigating facts and collecting evidence, in forming branch committees and procuring petitions, information and support of those who pleaded the cause in parliament. To the original members were afterwards added several remarkable persons, amongst whom were Josiah Wedgwood, Benet Langton (Dr Johnson's friend), and, later, Zachary Macaulay, Henry Brougham and James Stephen. In consequence of the numerous petitions presented to parliament, a committee of privy council was appointed by the crown in 1788 to inquire concerning the slave trade; and Pitt moved that the House of Commons should early in the next session take the subject into consideration. Wilberforce's first motion for a committee of the whole House upon the question was made on the 19th of March 1789, and this committee proceeded to business on the 12th of May of the same year. After an admirable speech, Wilberforce laid on the table twelve resolutions which were intended as the basis of a future motion for the abolition of the trade. The discussion of these was postponed to the next session, and in 1790-1791 evidence was taken upon them. At length, on the 18th of April of the latter year, a motion was made for the introduction of a bill to prevent the further importation of slaves into the British colonies in the West Indies. Opinion had been prejudiced by the insurrections in St Domingo and Martinique, and in the British island of Dominica; and the motion was defeated by 163 votes against 88. Legislative sanction was, however, given to the establishment of the Sierra Leone Company, for the colonization of a district on the west coast of Africa and the discouragement of the slave trade there. It was hoped at the time that that place would become the centre from which the civilization of Africa would proceed; but this expectation was not fulfilled. On the 2nd of April 1792 Wilberforce again moved that the trade ought to be abolished; an amendment in favour of gradual abolition was carried, and it was finally resolved that the trade should cease on the 1st of January 1796. When a similar motion was brought forward in the Lords the consideration of it was postponed to the following year, in order to give time for the examination of difficulties by a committee of the House. A bill in the Commons in the following year to abolish that part of the trade by which British merchants supplied foreign settlements with slaves was lost on the third reading; it was renewed in the Commons in 1794 and carried there, but defeated in the Lords. Then followed several years during which efforts were made by the abolitionists in parliament with little success. But in 1806, Lord Grenville and Fox having come into power, a bill was passed in both Houses to put an end to the British slave trade for foreign supply, and to forbid the importation of slaves into the colonies won by the British arms in the course of the war. On the 10th of June of the same year Fox brought forward a resolution "that effectual measures should be taken for the abolition of the African slave trade in such a manner and at such a period as should be deemed advisable," which was carried by a large majority. A similar resolution was successful in the House of Lords. A bill was then passed through both Houses forbidding the employment of any new vessel in the trade. Finally, in 1807, a bill was presented by Lord Grenville in the House of Lords providing for the abolition of the trade, was passed by a large majority, was then sent to the Commons (where it was moved by Lord Howick), was there amended and passed, and received the royal assent on the 25th of March. The bill enacted that no vessel should clear out for slaves from any port within the British dominions after the 1st of May 1807, and that no slave should be landed in the colonies after the 1st of March 1808. In 1807 the African Institution was formed, with the primary objects of keeping a vigilant watch on the slave traders and procuring, if possible, the abolition of the slave trade by the other European nations. It was also to be made an instrument for promoting the instruction of the negro races and diffusing information respecting the African continent. The Act of 1807 was habitually violated, as the traders knew that, if one voyage in three was successful, they were abundantly remunerated for their losses. This state of things, it was plain, must continue as long as the trade was only a contraband commerce, involving merely pecuniary penalties. Accordingly, in 1811, Brougham carried through parliament a bill declaring the traffic to be a felony punishable with transportation. Some years later another act was passed, making it a capital offence; but this was afterwards repealed. The law of 1811 proved effectual and brought the slave trade to an end so far as the British dominions were concerned. Mauritius, indeed, continued it for a time. That island, which had been ceded by France in 1810, three years after the abolition, had special facilities for escaping observation in consequence of the proximity of the African coast; but it was soon obliged to conform. The abolition of the French slave trade was preceded by struggles and excesses. The western part of St Domingo, nominally belonging to Spain, had been occupied by buccaneers, who were recognized and supported by the French government, and had been ceded to France at the peace of Ryswick in 1697. So vast was the annual importation of enslaved negroes into this colony before 1791 that the ratio of the blacks to the whites was as 16 to 1. In that year there were in St Domingo 480,000 blacks and 30,000 whites. The French law for the regulation of slavery in the plantations, known as the Code Noir (framed under Louis XIV. in 1685), was humane in its spirit; but the code had been violated: the negroes were actually so employed by the planters, whilst the free mulattos laboured under serious grievances and were exposed to irritating indignities. A "Société des Amis des Noirs" was formed in Paris in 1788 for the abolition, not only of slave trade itself, but of slavery itself. The president was Condorcet, and amongst the members were the duc de la Rochefoucault, the Abbé Gregoire, Brissot, Clavière, Pétion and La Fayette; Mirabeau was an active sympathizer. The great motor
SLAVERY

of the parallel effort in England was the Christian spirit; in France it was the enthusiasm of humanity which was associated with the revolutionary movement. There were in 1786 a number of mulattoes in independence from Spain, who sought the protection of the French. They were received in Paris, returned to San Domingo, and on landing in October 1790 addressed a letter to the governor announcing his intention of taking up his residence in the colony. The plan was approved by the assembly, and a resolution was passed that it had not been intended to comprehend the internal government of the colonies in the constitution framed for the mother country. Vincent Ogé, one of the mulatto delegates, descended as an envoy at the head of the party, and was received with the most signal demonstrations of respect. He rose accordingly with a few followers, but was soon defeated and forced to take refuge in the Spanish part of the island. He was afterwards surrendered, tried and sentenced to be broken on the wheel. While he was so punished, the assembly of the island, acting on the principle of the pistols of the deputies against the planters; and on the motion of the Abbé Gregoire it was resolved by the assembly on the 15th of May 1791 "that the people of colour resident in the French colonies, born of free parents, were entitled to, as of right, and on that footing, the privileges of French citizens, and among others those of being eligible to seats both in the parochial and colonial assemblies." On the 23rd of August a resolution, that the Negroes were more than once modified. Many enormities were committed by the insurges, and were avenged with scarcely inferior barbarity. The resistance of these states was eventually succeeded by the ascent of Toussaint l'Ouverture (q.v.). Slavery had disappeared; the blacks were employed as hired servants, receiving for their remuneration the third part of the crops they raised; and the population was rapidly rising in numbers and comfort. The abolition of slavery in the Spanish portion having been ceded by the treaty of Basel. The wish of Toussaint was that San Domingo should enjoy a practical independence whilst recognizing the sovereignty and exclusive commercial rights of France. The issue of the war, the violent and treacherous conduct of Bonaparte towards the island was that the blacks drove from their soil the forces sent to subdue them, and founded a constitution of their own, which was more than once modified. There can be no doubt that the government of the Restoration, in seeking to obtain possession of the island, had the intention of re-establishing slavery, and even of reopening the slave trade for the purpose of obtaining reparation. But when the government was abolished that trade during the Hundred Days, though he also failed to win back the people of San Domingo, or, as it was now called by its original name, Haiti, to obedience. The Bourbons, when again returned to power, renewed the slave trade; and in conquering the island had to be given up; and its independence was formally recognized in 1825 (see HAITI).

England had not been the first European power to abolish the slave trade; that honour belongs to Denmark; a royal order was issued on the 16th of May 1792 that the traffic should cease in the Danish possessions from the end of the 1802. The United States had in 1794 forbidden any participation by American subjects in the slave trade to foreign countries; they now prohibited the importation of slaves from Africa into their own dominions. This act was passed on the 2nd of March 1807; it did not, however, come into force till 1st January 1808. At the congress of Vienna (November 1814) the principle was acknowledged that the slave trade should be abolished as soon as possible; but the determination of the limit of time was not in the power of the congress, since the great war had been provided in a treaty between France and Great Britain (May 30, 1814) that no foreigner should in future introduce slaves into the French colonies, and that the trade should be absolutely interdicted to the French themselves after the 1st of June 1815. This postponement of abolition was dictated by the wish to introduce a fresh stock of slaves into Haiti, if that island should be recovered. Bonaparte, as we have seen, abolished the French slave trade during his brief restoration, and this abolition was confirmed at the second peace of Paris on the 20th of November, 1815, but it was not effectually carried out by French legislation until March 1818. In January 1815 Portuguese subjects were prohibited from prosecuting the trade north of the equator, and the term after which the traffic should be everywhere unlawful was fixed to end on the 21st of January 1823, but was afterwards extended to February 1830; England paid £300,000 as a compensation to the Portuguese. A royal decree was issued on the 10th of December 1836 forbidding the export of slaves from any Portuguese possession. But this decree was often violated. It was agreed that the Spanish slave trade should come to an end in 1820, England paying to Spain an indemnification of £400,000. The Dutch trade was continued until 1844; the Swedish had been abolished in 1813. By the peace of Ghent, December 1814, the United States and England mutually bound themselves to do all in their power to extinguish the traffic. It was at once prohibited in several of the South American states when they acquired independence, as in La Plata, Venezuela and Chile. In 1831 and 1833 Great Britain entered into an arrangement with France for a mutual right of search within certain states, to which most of the other powers acceded; and by the Ashburton treaty (1842) with the United States provision was made for the joint maintenance of squadrons on the western coast of Africa. By all these measures the slave trade, so far as it was carried on, was checked among the European nations or for the supply of their colonies, ceased to exist.

Meantime another and more radical reform had been in preparation and was already in progress, namely, the abolition of slavery itself in the foreign possessions of the several states of Europe. When the English slave trade had been closed, it was found that the evils of the traffic, as still continued by several other nations, were greatly aggravated. In consequence of the activity of the British cruisers the traders made great efforts to carry as many as possible into every slave-trade, and practised every artifice to get rid of the slaves when captured prominent. It was, besides, the interest of the cruisers, who shared the price of the captured slave-ship, rather to allow the slaves to be taken on board than to prevent their being shipped at all. Thrice as great a number of negroes as before, it was said, was exported from Africa, and two-thirds of these were murdered on the high seas. It was found also that the abolition of the British slave trade did not lead to an improved treatment of the negroes in the West Indies. The slaves were overworked now that fresh supplies were stopped, and their numbers rapidly decreased. There was now a feeling in England that the negroes were reduced to 700,000. It became more and more evident that the evil could be stopped only by abolishing slavery altogether.

An appeal was made by Wilberforce in 1821 to Thomas Fowell Buxton to undertake the conduct of this new question in parliament. An anti-slavery society was established in 1823, with members of which, besides Wilberforce and Buxton, were Zachary Macaulay, Dr Lushington and Lord Suffield. Buxton moved on the 5th of May 1823 that the House should take into consideration the state of slavery in the British colonies. The object he and his associates had then in view was gradual abolition by establishing something like a system of serfdom for existing slaves, and passing at the same time a measure emancipating all their children born after a certain day. Canning carried against Buxton and his friends a motion to the effect that the desired ameliorations in the condition and treatment of the slaves should be recommended by the home government to the colonial legislatures, and enforced only in case of their resistance, direct action being taken in the single instance of Trinidad, which, being a crown colony, had no legislature of its own. A well-considered series of measures of reform was accordingly proposed to the colonial authorities. Thereon a general outcry was raised by the planters at the acquiescence of the government in the principles of the anti-slavery party. A great excitement being produced, in order to ascertain the knowledge of the slaves the arrival of the order in council, they were impressed with the idea that they had been set free, and accordingly refused to work, and, compulsion being resorted to, offered resistance. Many slaves by this time were cleared from the plantations; they were repressed with great severity; and the treatment of the missionary Smith, which was taken up and handled with great ability by Brougham, awakened strong feeling in England against the planters. The question, how-
Stephen, and others, continued the struggle, only suspending it during the period when the legal use of slaves was found to extend into fact, and to effect the measures expected from them. In 1828 the free people of color in the colonies were placed on a footing of legal equality with their fellow-citizens. In 1830 the public began to be aroused to a serious prosecution of the laws of Commons on the grounds that the planters would take no steps tending to the future liberation of the slaves, and the leaders of the movement determined to urge the entire abolition of slavery at the earliest practicable period. The government contended that freedom would lead to complete anarchy and the dissolution of society as a business whole of the existing system. At length in 1833 the ministry of Earl Grey took the question in hand and carried the abolition with little difficulty, the measure being a test case. John Stuart Mill, in 1833 and receiving the Royal assent on the 28th. A sum of 20 millions sterling was voted as compensation to the planters. A system of apprenticeship for seven years was established as a transitional preparation for freedom. The law provided that any slave bound to his master during the period for three-fourths of the day, and were to be liable to corporal punishment if they did not give the due amount of labor. The master was, in return, to supply them with food and clothing. Children under six years of age were to be at once free, and provision was to be made for their religious and moral instruction. Many thought the postponement of emancipation unwise. Immediate liberation was carried out in Antigua, and public tranquillity was so far from being disturbed there that the Christmas of 1833 was the first for twenty years during which martial law was not proclaimed in order to preserve the peace. Notwith- standing these restrictions, the first anti-slavery measures passed by the House of Commons during the transitional system. When this was done the local legislatures saw that the slaves would no longer work for the masters, and accordingly cut off the apprenticeship, and gave freedom to the slaves in August 1838 instead of 1840.

The example of Great Britain was gradually followed by the other European states, and some American ones had already taken action of the same kind. The immediate emancipation of the slaves in the French colonies was decreed by the provisional government on the 18th of April 1802. In 1828 it was enacted that every slave belonging to a Portuguese subject should be free by twenty years from that date, a system of tutelage being established in the meantime. This law came into operation on the 29th of April 1802, and the status of slavery was henceforth illegal throughout the Portuguese possessions. The Dutch emancipated their slaves in 1803. Several of the Spanish American states, on declaring their independence, had adopted measures for the discontinuance of slavery within their limits. It was abolished by a decree of the Mexican republic on the 15th of September 1829. The government of Buenos Aires enacted that all children born after the 31st of January 1813 should be free; and in Colombia it was provided that those born after the 10th of July 1821 should be liberate on saving their eighteenth year.

The three of the most important slave systems still remaining in which no steps towards emancipation had been taken—those of the Southern United States, of Cuba and of Brazil. Slavery was far from being approved in principle by the most eminent of the fathers of the American Union. Washington in his will provided for the emancipation of his own slaves; he said to Jefferson that it was "among his first wishes to see some plan adopted by which slavery in his country might be abolished by law," and again he wrote that to this subject his own suffrage should never be wanting. John Adams declared his abhorrence of the practice of slavery, and summed that "every measure of prudence ought to be assumed for the eventual total extirpation of slavery from the United States." Franklin's opinions we have already indicated; and Madison, Hamilton, and Patrick Henry all reprobated the principle of the system. Jefferson declared in regard to slavery, "I tremble for my country when I reflect that God is just." The last-named statesman, at the first Continental Congress after the evacuation by the British forces, proposed a draft ordinance (March 1st 1784) for the government of the North-West Territory, in which it was provided that "after the year 1800 there shall be neither slavery nor involuntary servitude in any of the said states, otherwise than in punishment of crime." This proviso, however, was lost; but in the Ordinance of 1787 (13 July) for the government of the territory of the United States north-west of the Ohio river, which was introduced by Nathan Dane and probably drafted by Manasseh Cutler, slavery was forbidden in the Territory. At the convention of Philadelphia in 1787, where the constitution was drafted, the sentiment of the framers were against slavery; but South Carolina and Georgia insisted on its recognition as a condition of their joining the Union, and even an engagement for the mutual rendition of fugitive slaves was embodied in the federal Pact. The words "slave" and "slavery" were, however, excluded from the constitution, "because," as Madison says, "they did not choose to admit the right of property in man" in direct terms; and it was at the same time provided that Congress might interdict the foreign slave trade after the expiration of twenty years. It must not be forgotten that either before or soon after the formation of the Union the Northern States—beginning with Vermont in 1777, and ending with New Jersey in 1804—either abolished slavery, or adopted measures to effect its gradual abolition within their boundaries. But the principal operation of (at least) the latter change was simply to transfer Northern slaves to Southern markets.

We cannot follow in detail the several steps by which the slave power was for a long time persistently increased its influence in the Union. The acquisition of Louisiana in 1803, which gave a new field for the growth of the slave power, though not made in its interest, the Missouri Compromise (1820), the annexation of Texas (1845), the Fugitive Slave Law (1850), the Kansas-Nebraska bill (1854), the Dred Scott decision (1857), the attempts to acquire Cuba (especially in 1854) and to reopen the foreign slave trade (1859–1860), were the principal steps—only some of them successful—in its career of aggression. They roused a determined spirit of opposition, founded on deep-seated convictions. The pioneer of the more recent abolitionist movement was Benjamin Lundy (1789–1839). He was followed by William Lloyd Garrison (1805–1879), Elijah P. Lovejoy (1812–1837)—a martyr, if ever there was one—Wendell Phillips, Charles Sumner, John Brown (1805–1859), all of whom were in their various ways agents and promoters of the cause. The best intellect of America outside the region of practical politics has been on the anti-slavery side. William E. Channing, the poet Bryant, Longfellow, pre-eminently Whittier and Whitman, have spoken on this theme with no uncertain sound. The South, and its partisans in the North, made desperate efforts to prevent the free expression of opinion respecting the institution, and even the Christian churches in the slave states used their influence in favour of the maintenance of slavery. But in spite of every such effort opinion steadily grew. The abolition movement in the North was deeply stirred by the Uncle Tom's Cabin (1852), and in 1854 Stephen A. Douglas, in his Senate speech, Senior said, under the disguise of a novel was really a pamphlet against the Fugitive Slave Law. It gradually became apparent that the question could not be settled without an armed conflict. The election of Abraham Lincoln as president in November 1860 was the signal for the rising of the South. The North at first took arms simply to maintain the Union; but the far- sighted politicians from the first, and soon the whole nation, saw that the real issue was the continued existence or the total abolition of slavery. (See United States, History and Institutions; United States, Internal Affairs; United States, History of.) The national was practically ended by the surrender at Appomattox (9th April 1865), but already in 1862 slavery in the Territories had been abolished by Congress; and on the 22nd of September of the same year Lincoln (g.v.) had issued the preliminary emancipation proclamation, followed on the 1st of January 1863 by the emancipation of all slaves in the states in arms against the Union; and in December 1864 a constitutional amendment was ratified abolishing and forever prohibiting slavery throughout the United States.

The Spanish slave code, promulgated in 1789, is admitted on all hands to have been very humane in its character; and, in consequence of this, after Trinidad had become an English possession, the anti-slavery party resisted—and successfully—the attempt of the planters (1811) to have the Spanish law that island replaced by the British. But notwithstanding this
mildness of the code, its provisions were habitually and glaringly violated in the colonies of Spain, and in Cuba particularly the condition of the negroes closely resembled that in Brazil, where, in 1819 the whole black population was estimated at 84,000; in 1821 at 179,000; and in 1822 at 286,000; and in 1843 at 436,000. An act was passed by the Spanish legislature in 1870, providing that every slave who had then passed, or who should at the age of 6 years thereafter be captured, should be freed. But it was known as the Moret Law, having been carried through the house of representatives by Señor Moret y Prendergast, then minister for the colonies. By the census of 1872, in Cuba a total population of 1,372,750 was stated of whom 764,261 were black or coloured; and of the latter number 225,938 were free and 379,523 were slaves. In 1873 the Cubans roughly estimated the population of the island at 1,500,000, of whom 725,000 were the slaves. Mr Crowe, consul-general in the island, in 1885, stated that "the institution was rapidly dying,—that in a year, or at most two, slavery, even in its then mild form, would be extinct."

There was a convention between Great Britain and Brazil in 1826 for the abolition of the slave trade, but it was habitually violated in spite of the English cruisers. In 1830 the traffic was denounced, piracy, the emperor of Brazil, English assistance by the Aberdeen Act (1842) the right to suspect craft in Brazilian waters. Yet by the connivance of the local administrative authorities 54,000 Africans continued to be annually brought into Brazil. In 1850 the traffic was actually put down. The planters and mine proprietors cried out against this as a national calamity. The closing of the traffic made the labour of the slaves more severe, and led to the employment on the plantations of African women and children, who, contrary to all the evidence that the slavery of Brazil had always been lighter than that of the United States. On 28th September 1871 the Brazilian chambers decreed that all slaves be freed. This was followed by his example. Finally in 1888 the chambers decreed the total abolition of slavery, some 700,000 persons being accordingly freed.

In the colonies of more than one European country, after the prohibition of the slave trade, attempts were made to replace it by a system of importing labourers of the inferior races under contracts for a somewhat lengthened term; and this was in several instances found to degenerate into a system of slavery. In 1857 the Chinese slave trade was heard of a system of this kind which was in operation between the South Sea Islands and New Caledonia and the white settlements in Fiji; but in 1867 it had begun to be more general, and the method was found to be a means of promoting the free immigration of coloured labourers. The nature of the engagements to go and work on the plantations was not fully explained to them, and they were hired for periods exceeding the legal term. The area of this trade was ere long fully extended. In 1894 attention was drawn in a special report to the Queensland traffic in Pacific Islanders by the "Hopeful" trials, and a government commission was appointed to inquire into the methods adopted by labour ships in recruiting the natives of New Guinea, the Louisiade Archipelago, and other islands of the group of islands. The result of the investigations, during which nearly five hundred witnesses were examined, was the disclosure of a system of deception, for the purpose of taking them away while they were still young, and by which they were married into the old African slave trade. These shameful deeds made the islanders regard it as a duty to avenge their wrongs on any white men they could entice upon their shores. The bishop of Melanesia, John Connel, in a letter to the London Missionary Society, alluded to this retaliation on the island of Nukapu 20th September 1871.

We have seen that the last vestiges of the monstrous anomaly of modern colonial slavery are disappearing from all civilized states and their foreign possessions. It now remains to consider the slavery of primitive origin which has existed within recent times, or continued to exist, outside of the Western world.

In Russia, a country which had not the same historical antecedents with the Western nations, properly so called, and which is in fact more correctly classed as Eastern, whilst slavery had disappeared, serfdom was in force down to our own days. The rural population of that country, at the earliest period accessible to our inquiries, consisted of (1) slaves, (2) free agricultural labourers, and (3) peasants proper, who were small farmers or cottiers and members of a commune. The sources of slavery were there, like in the Western world, two: the right of heredity, e.g. sons were born serfs, and were enslaved by their women, or were themselves able to enslave others; the freeuse of themselves, sale of insolvent debtors, and the action of the law in certain criminal cases. In the 18th century we know that the clergy, e.g. the priests of the Greek Church, often sold their own adherents into slavery, and that all of them merged in the class of serfs, who were the property either of the landed proprietors or of the state. They were not even adscripti gliae, though forbidden to migrate; an imperial ukase of 1719, for instance, declared it unbecoming to sell their property even in families, but one by one, like cattle." This practice, at first tacitly sanctioned by the government, which received dues on the sales, was at length formally recognized by several imperial ukases of 1726 and 1766. The differences in serfdom among the rural population, making the proprietors responsible for the tax charged on their serfs; and the "free wandering people", who lived in the country, and occasionally found their way to the towns, and were either sold into the land as members of a commune or as serfs of some proprietor. The system of serfdom attained its fullest development in the reign of Catherine II. The serfs were bought, sold, and given in presents, sometimes with the land, sometimes without it, sometimes in families and sometimes individually, sale by public auction being alone forbidden, as "unbecoming in a European state." The proprietors transported without their unruly serfs to Siberia or send them to the mines for life, and those who remained on their estates, if their masters were punished with the knout and condemned to the mines. The first symptoms of a reaction appear in the reign of Alexander II, who, on his accession in 1855, took the decisive step of closing the slave trade. There were several feeble attempts at further reform, and even abortive projects of emancipation, from the commencement of the 19th century; but the most remarkable events were the abolition of the slave trade, in 1861, the abolition of serfdom by the accession of Alexander II (1855). That emperor, after the Crimean War, created a secret committee composed of the great officers of state and the chief committee for peasant affairs, to study the subject of serf-emancipation; this body the grand-duke Constantine was an energetic member. To accelerate the proceedings of the committee advantage was taken of the following incident. In the autumn preceding the third anniversary of serfs and servile labourers were regulated in the time of Nicholas by what were called inventories. The nobles, dissatisfied with these, now sought to have them revised. The government interpreted the application as implying that the proprietors should be at liberty to sell their serfs; and authorizing the formation of committees to prepare definite proposals for a gradual emancipation. A circular was soon after sent to the governors and marshals of the nobility all over Russia proper, informing them of his desire of the Lithuanian nobles, and setting out the fundamental principles which should be observed "if the nobles of the provinces should express a similar desire. Public opinion strongly favoured the projected reform; and even the masters who were opposed to it saw that, if the operation became necessary, it would be more safely for their interests intrusted to the nobles than to the bureaucracy." Accordingly during 1858 a committee was formed, consisting of the most enlightened members of the nobility, with the object of shaping a plan for this purpose. The plan was formed, and, in spite of some opposition from the emperor, was provisionally sanctioned by law, and serfdom was abolished (19th February = 3rd March 1861). (See Russia.) The total number of serfs belonging to proprietors in the interior of Russia was 3,330,509 in 1861, of whom 2,193,478 were peasant serfs and 1,137,031 domestic serfs. This number does not include the state serfs, who formed about one-half of the rural population. Their position had been better, as a rule, than that of the Russian private estates; it might indeed, Mr (afterwards Sir) R. D. M. Wallace says, be regarded as "an intermediate position between serfdom and freedom." Amongst them were the serfs on the large estates belonging to the church, which had been secularized and transformed into landed proprietors in the 18th century, and which were, also serfs on the apanages affected to the use of the imperial family; these amounted to nearly three and a half millions. Thus by the law of 1861, 3,330,509 serfs, or about one-half of the rural population, became emancipated.

The slavery of the Mahomedan East is usually not the slavery of the field but of the household. The slave is a member of the family, and is treated with tenderness and affection. The Mahomedan mother kindness to her children, the Mahomedan father accepts them into the clan, and encourages manumission. The child of a slave girl by her master is born free, and the mother is usually free. The slave is a free person, whose personal freedom is repeatedly declared by the Ottoman Porte to be illegal throughout its dominions, and a law for its suppression was published in 1869, but it cannot be said to be extinct, owing to the laxity and too often the complicity of the Ottoman government, which yields to the pressure of the commercial classes. In the days of the colonial slave trade its African centre was the region about the mouths of the rivers Calabar and Bonny, whither the captive negroes were brought from great distances in the course of several years. The negroes were landed annually from this part of the coast as from all the rest of Africa besides. The principal centres from which the supply was furnished Russian serfdom.
SLAVONIC, OLD

to Egypt, Turkey, Arabia, and Persia were three in number. (1) The centre of operations for(AJ had he one very large stock. Captives were brought thence to the slave market of Kuka in Bornu, where, after being bought by dealers, they were, to the number of about 10,000 annually, marched across the Sahara to Kharai, to the coast of Tripoli, and distributed to the northern and eastern Mediterranean coasts. Their sufferings on the route were dreadful; many succumbed and were abandoned. Rohiffs informs us that "it was not uncommon to see the women of the captives, as they reached a certain point on the route, "would only have to follow the bones which lie right and left of the track." Negroes were also brought to Morocco from the Western Sudan and from Timbuktu. The centre of the traffic in Morocco was Fez. During the latter part of the 17th century, seven to ten ships were sent every year from there, where a great yearly fair was held. The slaves were forwarded thence in gangs to different towns, especially to Marrakesh, Fez and Mequinez. About 4000 were thus annually imported, and an annual revenue of £800,000 was derived by the Sultan of Morocco, who got £800 of annual revenue. The control now exercised by the French over the greater part of the western Sudan has deprived Morocco of its chief source of supply. Slavery, however, still flourishes in that empire. (2) The basin of the Upper Nile, extending to the great lakes, was another region infested by the slave trade; the slaves were either smuggled into Egypt or sent by the Red Sea to Turkey. The khedive Ismail in 1869 appointed Sir Evelyn Baring to command a large force with which he was "to strike a direct blow at the slave trade in its distant nest." The work begun by him was continued by Colonel C. G. Gordon (1874 to 1879), but uncleared. Gordon fulfilled all the promises which he had made, and the reconquest of the eastern Sudan by Anglo-Egyptian force in 1898 effective measures have been taken to suppress slave raiding and as far as possible slavery itself. The conquest of the Sudan east of the Nile, and the establishment of the Egyptian administration of Wadai—has practically ended the caravan trade in slaves across the Sahara. (3) There was for long a slave trade from the Portuguese possessions in the African interior and the slave traffic thence to the coast took place, mainly from the southern Nyasa districts by three or four routes to Ibo, Mozambique, Angola, and Quelimane. Madagascar and the Comoro Islands obtained most of their slaves from the Mozambique coast. It is believed in 1862 that about 10,000 passed every year from the Nyasa regions to Zanzibar, whence large supplies were drawn for the markets of Arabia and Persia up to 1873. The mission of Sir Bartle Frere to the sultan of Zanzibar in 1873 brought about a treaty, by the provisions of which the slave trade on the East Coast was prohibited. In 1876 not more than 38 were known to have been conveyed by that route. Letley, in his "History of the English Trade in the African Interior" (1885), writing in 1886, fixed at about 3000 the number then annually exported from the coast between the rivers Rovuma and Zambezi. With the establishment of a British protectorate at Zanzibar, and of British and German protectorates on the mainland of East Africa and in the region of the head-water of the Nile, the East African slave trade received its death-blow. Slavery itself has been abolished in the Zanzibar, British, German, and Portuguese possessions, and had completely disappeared from the coast of Africa by 1895. The complete control of the seaboard by European powers has rendered the smuggling of slaves to Arabia and Persia a difficult and dangerous occupation.

A new era was opened up by the discovery of the course of the Congo by H. M. Stanley, the founding of the Congo Free State by Leopold II of Belgium and the partition of the greater part of Africa between the European powers. The existence of the Congo Free State affords a painful contrast to the philanthropic professions of its founder, in other parts of the continent the establishment of protectorates by Great Britain, France and Germany was followed by strenuous, and largely successful, efforts to put down slave trading. In parts where European authority remained weak, as in the hinterland of the Portuguese province of Angola and the adjacent coast, who did not know the way in which continued to raid their neighbours, and from this region many labourers were (up to 1910) forcibly taken to work on the cocoa plantation in St. Thomas (g.v.). With the accession of Albert I. to the Belgian throne, Sir Henry Morton Stanley was sent to the Congo in 1877 to negotiate with the king of Leopold for the adjustment of affairs in the Congo. At the close of the first decade of the 20th century it might be said that over the greater part of Africa slave trading was a thing of the past.

But much work lay afterwards, whilst they urged all other means for the suppression or discouragement of the slave trade and slavery, saw clearly that the only thoroughly effective measure was to create adequate national sentiment in Africa itself. When Buxton published in 1840 his book entitled The Slave Trade and its Remedy, this was the remedy he contemplated. The unfortunate Niger expedition of 1841 was directed toobservations, and the rights claimed by all the peoples interested in the subject that here lies the radical solution of the great problem. It was for some time thought that from Sierra Leone as a centre—industry and civilization might be diffused amongst the negro races of Africa; and that the vitality (as it was then called) of the negroes of Africa became the independent republic of Liberia had been founded by Americans with a similar object; but in neither case have these expectations been adequately fulfilled.

BIBLIOGRAPHY.—On the several branches of the subject of slavery and servitude information may be obtained from the following works—

On Ancient Slavery: H. Wallon, Histoire de l'esclavage dans l'antiquité (3 vols., 1847; 2nd ed., 1879); A. Bocchi, Public Economy of the Greeks and Romans (trans. by G. Carnell-Lewis (18 vols., 1847; 2nd ed., 1847); William Blair, Inquiry into the State of Slavery among the Greeks and Romans from the Earliest Period to the Establishment of the Lombards in Italy (1833); Dureau de la Malle, Economie politique des Romains (2 vols., 1847; translated into English by Sir G. Wallis (1848); Wallon, Histoire de l'esclavage dans l'antiquité; Ebeling, Die Sklaverei von den ältesten Zeiten bis auf die Gegenwart (Paderborn, 1889); W. W. Backlund, The Roman Law of Slavery (Cambridge, 1909); A. Calderini, Le tribunati del ciclo (1898); Wallon, Histoire de l'esclavage dans l'antiquité.

On Medieval Slavery and Servitude: G. Humbert, article "Colonat" in the Dictionnaire des antiquités grecques et romaines of Daremberg and Saglio; J. Yonaski, De l'abolition de l'esclavage ancien au Moyen Age, in Revue des études germaniques (1899); and Yonaski had jointly composed a memoir to compete for a prize offered by the Academy of Moral and Political Sciences in 1837; Wallon's portion of the memoir became the foundation of his Histoire de l'esclavage dans l'antiquité above mentioned; Yonaski's part, the expansion of which was prevented by his early death, was posthumously published in 1860; it is no more than a slight sketch; H. W. Ballagh, Gli economi (Paderborn, 1888); M. de Coulanges, Histoire des institutions politiques de l'ancienne France (2nd ed., 1877), and Recherches sur quelques problèmes d'histoire (1889) (the latter work contains an admirable discussion of the reign of Charles V); J. Meillassou, "Les relations entre les domaines de la Lombardie et le sud-ouest de la France aux deux premiers siècles" (1842).

SLAVONIC, OLD

In the article SLAVONIC (under Languages) will be found a fairly complete account of Old Slavonic in its first form, as it is taken as representing, save for a few peculiarities noticed in their place, the Proto-Slavonic. The reasons are there given for believing it to be the dialect of Slavs settled somewhere between Thessalonica and Constantinople and represented now by the Bulgarians and Macedonians.

After the language had been fixed by the original translations of the New Testament and other Church books it was no more consciously adapted to the dialects of the various peoples, but was used equally among the Croats (whose books were accommodated to the Roman use and written in Glagolitic), Serbs and
Russians. These insensibly altered them to make the words easier and allowed their native languages to show through; and the same was the case with the Bulgarians, whose language soon began to lose some of the characteristics of O.S. Hence our earliest MSS. already show departure from the norm which can be established by comparison; about a dozen (8 Glagolitic) MSS. and fragments afford trustworthy material dating from the 10th and 11th centuries, but even then the S. Slavs were working in distinguishing \( \varepsilon \) and \( \epsilon \), the Russians mixed up \( q \) with \( u \), \( \varepsilon \) with \( ja \) and so on; but in the actual texts great conservatism prevailed, whereas any additions, such as colophons or marks of ownership, betray the dialect of the writer more clearly, and such scraps and a few deeds are our earliest authorities for Servian and Russian. But the Church language as insensibly modified continued to be the literary language of Croatia until the 16th century, of Russia until 1700, and of Bulgaria, Servia and Rumania until the early part of the 19th century, and is still the liturgical language of Dalmatia, the Balkans, Russia and the Ruthenian Uniates.

Its literature was enriched in the second generation by the works of Clement, bishop of Ochrida, and John, exarch of Bulgaria, and other writers of the time of Tsar Simeon, but it is almost all ecclesiastical in character. Perhaps the most interesting book in Church Slavonic is the Russian chronicle, but that has many old Russian forms. Otherwise certain translations of Greek Apocrypha are of importance, especially when the Greek original is lost, e.g. the Book of Enoch; other Apocrypha in Church Slavonic are said to have been written by Jeremia, a Bogomil priest, but they are probably derived from Eastern sources. The Slavonic text of the Bible is not of importance for textual criticism, as the translation was made late, and even so has never been studied from that point of view. The whole Bible was not finished till the 11th century, some of the less necessary books being translated from the Vulgate.

SLAVS. Judged by the language test, and no other is readily available, the Slavs are the most numerous race in Europe, amounting to some 140,000,000 souls. Outside Europe there are the Russians in Siberia, a mere extension of the main body, and a large number of emigrants settled in America, where, however, although most of the nationalities have their own newspapers, the second generation of immigrants tends to be assimilated.

Divisions and Distribution.—The Slavs are divided geographically into three main groups, Eastern, North-Western and Southern; linguistically also the same division is convenient.

The Russians stand by themselves as the Eastern group. They hold all the East European plain from the 27th meridian to the Ural, the Finnish and Tatar tribes making up but a small proportion of the population: beyond these limits to the east they stretch into central Siberia and thence in narrow bands along the rivers all the way to the Pacific; on the west the Ruthenians (q.v.) of Galicia form a wedge between the Poles and the Magyars and almost touch the 20th meridian. The Russians must number 100,000,000.

The North-Western group includes the Poles, about 15,000,000, in the basin of the Vistula; the Kashubes (q.v.), about 200,000, on the coast north-west of Danzig; the High and Low Sorbs (q.v.) or Wends in Lusatia, 180,000 Slavs completely surrounded by Germans; the Czechs (Czech, q.v.) in the square of Bohemia, making up with them the eastern neighbours, the Moravians, a people of 6,000,000 in northern Austria surrounded on three sides by Germans. In the north of Hungary, connecting up Ruthenians, Poles and Moravians, but most closely akin to the latter, are 2,500,000 Slovaks (q.v.). With the Sorbs, Poles and Kashubes are to be classed the now teutonized Slavs of central Germany, who once stretched as far to the north-west as Rügen and Holstein and to the south-west to the Saale. They are generally called Polabs (q.v.), of Slavson the Elbe, as their last survivors were found on that river in the eastern corner of Hanover.

The Southern Slavs, Slovenes (q.v.), Serbo-Croats (see Servia) and Bulgarians (see Bulgaria), are cut off from the main body by the Germans of Austria proper and the Magyars, both of whom occupy soil once Slavonic, and have absorbed much Slavonic blood, and by the Rumanians of Transylvania and the Lower Danube, who represent the original Dacians romanized. These Slavs occupy the main mass of the Balkan Peninsula downwards from the Julian Alps and the line of the Muhr, Drave and Danube. North of this all three races have considerable settlements in southern Hungary. Their southern boundary is hard to define. Various nationalities are being closely intermingled. To the south-west the Slavs march with the Albanians, to the south-east with the Turks, and to the south and along the Aegean coasts they have the Greeks as neighbours.

Although the Southern Slavs fall into these three divisions, linguistically the separation is not sharp, nor does it coincide with the political frontiers. Roughly speaking, the eastern half of the peninsula is held by the Bulgarians, some 5,000,000 in number, the western half by the Serbo-Croats, of whom there must be about 8,000,000. This is the most divided of the Slavonic races; its members profess three forms of religion and the three alphabets—the Serbs and Bosnians being mostly Orthodox and using the Cyrillic alphabet, including many Mussulmans; the Croats being Roman Catholics, writing with Latin letters; and the Dalmatians also Roman Catholics, but using, some of them, the ancient Glagolitic script for their Slavonic liturgy. The language also falls into three dialects independent of the religions, and across all these lines run the frontiers of the political divisions—the kingdom of Servia (more correctly written Serbia); the kingdom of Montenegro; the Turkish provinces of Old Servia and Novibazar, still in Turkish hands; those of Bosnia and Herzegovina and an altered form of the coast-line and islands of Istria and Dalmatia, which also form part of Austria; and the kingdom of Croatia, which is included in the dominion of Hungary, to say nothing of outlying colonies in Hungary itself and in Italy. In the extreme north-west, in Carniola, in the southern parts of Styria and Carinthia, and over the Italian border in the province of Udine and the Vale of Resia live the Slovenes, something under 1,500,000, much divided dialectically. Between the Slovenes and the Croats there are transition dialects, and about 1840 there was an attempt (Illyrism) to establish a common literary language. In Macedonia and along the border are special varieties of Bulgarian, some of which approach Servian. Akin to the Macedonians were the Slavs, who once occupied the whole of Greece and left traces in the place-names, though they long ago disappeared among the older population. Akin to the Slovenes were the old inhabitants of Austria and south-west Hungary before the intrusion of the Germans and Magyars.

History.—This distribution of the Slavs can be accounted for historically. In spite of traditions (e.g. the first Russian chronicle of Pseudo-Nestor) which bring them from the basin of the Danube, most evidence goes to show that they formed one people they were settled to the north-east of the Carpathians in the basins of the Vistula, Priep and Upper Dniestr (Dniester). To the N. they had their nearest relatives, the ancestors of the Baltic tribes, Russians, Lithuanians and Letts; to the E. Finns; to the S.E. the Iranian population of the Steppes of Scythia (q.v.); to the S.W., on the other side of the Carpathians, various Thracian tribes; to the N.W. the Germans; between the Germans and Thracians they seem to have had some contact with the Celts, but this was not the first state of things, as the Illyrians, Greeks and Italians probably came between. This location, arrived at by a comparison of the fragments, accounts of Slavonic migrations and their distribution in historic time, is confirmed by its agreement with the place taken by the Slavonic language among the other Indo-European languages (see below), and by what we know of the place-names of eastern Europe, in that for this area they seem exclusively Slavonic, outside it the oldest names belong to other languages. The archaeological evidence is not yet cleared up, as, for the period we have to consider, the late neolithic and early bronze age, the region above defined is divided between three different cultures, represented by the fields of urns in Lusatia and Silesia, cist graves with cremation in Poland, and the poor and little-known graves of the Đapnir
SLAVS

(Dniiper) basin. This variety may to some extent be due to the various cultural influences to which the same race was exposed, the western division lying on the route between the Baltic and Mediterranean, the central being quite inaccessible, the eastern part in time showing in its graves the influence of the Steppe people and the Greek colonies in Scythia. There is a gradual transition to cemeteries with Roman objects which shade off into such as are certainly Slavonic.

The physical type of the Slavs is not sufficiently clear to help in throwing light upon the past of the race. Most of the modern Slavs are rather short-headed, the Balkan Slavs being tall and dark, those of central Europe dark and of medium height, the Russians on the whole rather short though the White and Little Russians are of medium height; in complexion the southern Russians are dark, the northern light, but with less decided colour than fair western Europeans. In spite of the prevalent brachycephaly of the modern Slavs, measurements of skulls from cemeteries and ancient graves which are certainly Slavonic have shown, against all expectation, that the farther back we go the greater is the proportion of long heads, and the race appears to have been originally dolichocephalic and osteologically indistinguishable from its German, Baltic and Finnish neighbours. In its present seats it must have assimilated foreign elements, German and Celtic in central Europe, Finnish and Turkish in Great and Little Russia, all these together with Thracian and Illyrian in the Balkans; but how much the differences between the various Slavonic nations are due to admixture, how much to their new homes, has not been made clear.

In spite of the vast area which the Slavs have occupied in historic times there is no reason to claim for them before the migrations a wider homeland than that above defined beyond the Carpathians; given favourable circumstances a nation multiplies so fast (e.g. the Anglo-Saxons in the last hundred and twenty years) that we can set no limits to the area that a comparatively small race could cover in the course of four centuries. Therefore the mere necessity of providing them with ancestors sufficiently numerous does not compel us to seek for the Slavs among any of the people known to us. The ancestors of the Antes and of the Slavs have in many cases been assumed to be Illyrians, but this assumption is not supported by any evidence. The word "slave" and its cognates in most European languages date from the time when the Germans supplied the slave-markets of Europe with Slavonic captives. The name Antes we find applied to the Eastern Slavs by Jordanes; it may be another form of Wend. Antae is used by Procopius (B.G. iii. 14). He likewise distinguishes them from the Slaveni, but says that both spoke the same language and both were formerly called Spori, which has been identified with Serb, the racial name now surviving in Lusatia and Servia. Elsewhere he speaks of the measureless tribes of the Antae, this appellation is used by the Byzantines until the middle of the 7th century.

The sudden appearance in the 6th-century writers of definite names for the Slavs and their divisions means that by then the race had made itself familiar to the Graeco-Roman world, that it had spread well beyond its original narrow limits, and had some time before come into contact with civilisation. This may have been going on since the 1st century A.D., and evidence of it has been seen in the southward movement of the Costoboci into northern Dacia (Ptolemy) and of the Carpi to the Danube (A.D. 200), but their Slavonic character is not established. A few names of Slavonic proper names, but no explanation is satisfactory. The word "slave" and its cognates in most European languages date from the time when the Germans supplied the slave-markets of Europe with Slavonic captives. The name Antes we find applied to the Eastern Slavs by Jordanes; it may be another form of Wend. Antae is used by Procopius (B.G. iii. 14). the Hunnish power the Eastern Goths and Gepidae pressed southwards and westwards to the conquest of the Empire, and the Lombards and Heruli followed in their tracks. When next we get a view of northern Germany we find it full of Slavs, e.g. from Procopius (B.G. ii. 13) we know that they held the Mark of Brandenburg by 512; but this settlement was effected without attracting the attention of any contemporary writer. Modern historians seem to adopt their attitude to the process according to their view of the Slavs; German writers, in their contempt for the Slavs, mock the Slavic religions, as not improbably a German tribe to leave their homes, and assume that the riches of southern Europe attracted the latter so that they willingly gave up their barren northern plains; most Slavonic authors have taken the same view in accordance with the idealistic picture of the peaceful, kindly, democratic Slavs who contrast so favourably with the savage Germans and their war-lords; but of late they have realised that their ancestors were no more peaceful than any one else, and have wished to put down to warlike pressure from the Slavs all the southward movements of the German tribes, to whom no choice was left but to try to break through the Roman defences. A reasonable view is that the expansion of the Eastern Germans in the last centuries B.C. was made at the expense of the Slavs, who, while no more peaceful than the Germans, were less capable than they of combining for successful war, so that Goths and others were dwelling among them and lording it over them; that the mutual competitions of the Germans drove some of these against the Empire, and when this had become weakened, so that it invited attack, some tribes and parts of tribes moved forward without any pressure from behind; this took away the strength of the German element, and the Slavic, now impotently under German organization, regained the upper hand in their own lands and could even spread westwards at the expense of the German remnant. Almost as uncertain is the exact time when the Southern Slavs began to move towards the Balkans. If already at the time of Trajan's conquests there were Slavs in Dacia, it would account for the story in Ps. Nestor that certain Volchii or Vlachi, i.e. Romance speakers, had conquered the Slavs upon the Danube and driven them to the Vistula, for the place that of the name of Trajan has in Slavonic tradition, and for the presence of the Sarmatae, the parts of which do away with the Slavonic Sarmatae of the Benevoli. The children of the Slavs, the Sarmatae, had become Sarmatians subject to the nomad Sarmatae (q.v.), on the Theiss. In any case, we cannot say that the Slavs occupied any large parts of the Balkan Peninsula before the beginning of the 6th century, when they appear in Byzantine history as a new terror; there seems to have been an invasion in the time of Justin, and another followed in 527 (Procopius, B.G. iii. 40 and Hist. Arc. 18). At the same time as the Slavs, the Huns, the Bulgars, and after 558 the Avars, were also making invasions from the same direction. The first and last disappeared like all nomads, but the Bulgars, making themselves lords of one section of the Slavs, gave it their own name. By 584 the Slavs had overrun all Greece, and were the worst western neighbours of the Eastern Empire. Hence the directions how to deal with Slavs in the Strategicum of the emperor Maurice (c. 600) and the Tactics of Leo.

By the end of the following century they were permanently settled throughout the whole of the Balkan Peninsula. (For their further history see Servia, Bulgaria, Bosnia, Dalmatia, Croatia-Slavonia.) These Southern Slavs, though divided into nationalities, are closely akin to one another. There is no reason to think that Servo-Croatian is an intrusive wedge, although Constantine Porphyrogenitus (De adm. Imp. 30-33) speaks of their coming from the north in the time of Heraclius—the middle of the 7th century. Their dialects shade into one another, and there is no trace of any influence of the North-Western group. Constantine was probably led astray by the occurrence of the same tribal names in different parts of the Slavonic world. Meanwhile the Southern Slavs were cut off from the rest of the race by the foundation in the 6th century of the Avar kingdom in Pannonia, and after its destruction in the 7th, by the spread of the Germans south-eastwards, and finally by the incursion of another Asiatic horde, that of the Magyars, who have maintained themselves in the midst of Slavs for a thousand years. Their conquests were made chiefly at the expense of the Slovenes and the Slovaks, and from their languages they have borrowed many words in forms which have now disappeared.

Of the history of the Eastern Slavs, who were to become the Russian people, we know little before the coming of the Swedish Rus, who gave them their name and organization; we have but the mention of Antioch, citing in concert with the other Slavs and the Avars in attacking the Empire on the lower Danube, and scattered accounts of Mussulman travellers, which show that they had reached the Don and Volga and stretched northward to Lake Ilmen. The more southerly tribes were tributary to the Khazars. An exact definition of the territory occupied by each Slavonic people, and a sketch of its history from the time that it settled in its permanent abode, will be found either under its own name or under that of its country.

Culture and Religion.—For all the works treating of Slavonic antiquities we cannot draw a portrait of the race and show their distinguishing features. Savage nations as described by the Greeks and Romans are mostly very much alike, and the testimony of language is not very easy to use. The general impression is one of a people which lived in small communist groups, and was so impatient of authority that they scarcely combined for their own defence, and in spite of individual bravery only became formidable to others when cemented together by some alien element: hence the men at one time or another fell under an alien yoke; the last survivals of Slavonic licence being the vee of Novgorod, and the Polish diet with its unpractical regard for the Slavs—were no longer combined with the beginnings of the domestic arts, and were probably more given to agriculture than the early Germans, though they practised it after a fashion which did not long tie them to any particular district—for all writers agree in telling of their errant nature. They were specially given to the production of honey, from which they brewed mead. They also appear to have been notable swimmers and to have been skilled in the navigation of rivers, and even to have indulged in maritime piracy on the Aegean, the Dalmatian coast and most of all the Baltic, where the island of Rügen was a menace to the Scandinavian and German sea-power. Their talent for music and singing was already noticeable. Of their religion it is strangely difficult to gain any real information. The word Bogu, "god," is reckoned a loan word from the Iranian Baga. The chief deity was the Thunderer Perun (cf. Lith. Perkuns), with whom is identified Svarog, the god of heaven; other chief gods were called sons of Svarog, Dažbog the sun, Chors and Veles, the god of cattle. The place of this latter was taken by St Blasius. A hostile deity was Strībog, god of storms. There seem to have been no priestesses, temples or images among the early Slavs. In Russia Vladimir set up idols and pulled them down upon his conversion to Christianity; only the Polabs had a highly developed cult with a temple and statues and a definite priesthood. But this may have been in imitation of Norse or even Christian institutions. Their chief deity was called Triglav, or the three-headed; he was the same as Světovít, apparently a sky god in whose name the monks naturally recognized Saint Vitus. The goddesses are colourless personifications, such as Vesna, spring, and Morana, the goddess of death and winter. The Slavs also believed, and many still believe, in Vily and Rusalki, nymphs of streams and woodlands; also in the Bábá and Bábá, evil spirits, as well as in vampires and werewolves. They had a full belief in the immortality of the soul, but no very clear ideas as to its fate. It was mostly supposed to go a long journey to a paradise (raj) at the end of the world and had to be equipped for this. Also the soul of the ancestor seems to have developed into the house or heath god (Domovoj, Křet) who guarded the family. The usual survivals of pagan festivals at the solstices and equinoxes have continued under the form of church festivals.

Christianity among the Slavs.—The means by which was effected the conversion to Christianity of the various Slavonic
nations has probably had more influence upon their subsequent history than racial distinctions or geographical conditions.

Wherever heathen Slavonic tribes met Christendom missionary effort naturally came into being. This seems first to have been the case along the Danubian frontier, where the Croats retained their Romanic population and their Christian faith. From the 7th century the Croats were nominally Christian, and subject to the archbishops of Salona at Spalato and their suffragans. From the beginning of the 9th century Merseburg, Salzburg and Passau were the centres for spreading the Gospel among the Slavonic tribes on the south-eastern marches of the Frankish empire, in Bohemia, Moravia, Pannonia and Carinthia. Though we need not doubt the true zeal of these missionaries, it was still a fact that as Germans they belonged to a nation which was once more encroaching upon the Slavs, and as Latins (though the Great Slavs, in his own words, had followed the Latin rite) that would bring their use of their converts' native language. Still they were probably the first to reduce the Slavonic tongues to writing, naturally using Latif letters and lacking the skill to adapt them satisfactorily. Traces of such attempts are rare; the best are the Freisingen fragments of Old Slovene now at Munich.

In the eastern half of the Balkan Peninsula the Slavs had already begun to turn to Christianity before their conquest by the Bulgars. These latter were hostile until Boris, under the influence of his sister and of one Methodius (certainly not the famous one), adopted the new faith and put to the sword those that resisted conversion (A.D. 869). Though his Christianity came from Byzantium, Boris seems to have feared the influence of the Greek clergy and applied to the Pope for teachers, submitting to him a whole series of questions. The Pope sent clergy, but would not grant the Bulgarians as much independence as they asked, and Boris seems to have repented of his application to him. He raised the question at the Council of Constantinople (A.D. 870), which decided that Bulgaria was subject to the Eastern Church.

Cyril and Methodius.—In the same year Rostislav, prince of Greater Moravia, fearing the influence of Latin missionaries, applied to Byzantium for teachers who should preach in the vulgar tongue (A.D. 874). The emperor chose two brothers, sons of a Thessalonian Greek, Methodius and Constantine (generally known as Cyril by the name he adopted upon becoming a monk). The former was an organizer, the latter a scholar, a philosopher and a linguist. His gifts had been already exercised in a mission to the Crimea; he had brought thence the relics of St. Clement, which he finally laid in their resting-place in Rome. But the main reason for the choice was that the Thessalonians, surrounded as they were by Slavonic tribes, were well known to speak Slavonic perfectly. On their arrival in Moravia the brothers began to teach letters and the Gospel, and also to translate the necessary liturgical books and instruct the young in them. But soon (in 874) Rostislav was attacked by Louis the German and reduced to complete obedience, so that there could be no question of setting up a hierarchy in opposition to the dominant Franks, and the attempts to establish the Slavonic liturgy were strongly opposed. Hearing of the brother's work Pope Nicholas I. sent for them to Rome. On their way they spent some time with Kocel, a Slavonic prince of Pannonia, about Platten See, and he much favoured the Slavonic books. In Venice the brothers had disputes as to the use of Slavonic service-books; perhaps at this time these found their way to Croatia and Dalmatia. On their arrival in Rome Nicholas was dead, but Adrian II. was favourable to them and their translations, and had the pupils they brought with them ordained. In Rome Constantine fell ill, took monastic vows and the name of Cyril, and died on the 14th of February 869. Methodius was consecrated archbishop of Pannonia and Moravia, about 870, but Kocel could not help him much, and the German bishops had him tried and thrown into prison; also in that very year Rostislav was deposed by Svatopluk, who, though he threw off the Frankish yoke, was not steadfast in supporting the Slavonic liturgy. In 873 Pope John VIII. commanded the liberation of Methodius and allowed Slavonic services, and for the next few years the work of Methodius went well. In 879 he was again called to Rome, and in 880 the Pope distinctly pronounced in his favour and restored him to his archbishopric, but made a German, Wiching, his suffragan. Methodius died in 885, and Wiching, having a new pope, Stephen V. (VI.), on his side, became his successor. Of the Slavonic service-books and those that used them were driven out by Svatopluk and took refuge in Bulgaria, where the ground had been made ready for them. Boris, having decided to abide by the Greek Church, welcomed Clement, Gorazd and other disciples of Methodius. Clement, who was the most active in literary work, laboured in Ochrida and others in various parts of the kingdom.

In spite of the triumph of the Latin-German party, the Slavonic liturgy was not quite stamped out in the west; it seems to have survived in out-of-the-way corners of Great Moravia until that principality was destroyed by the Magyars. Also during the 9th century, though the Latin law and further liturgical matters, Clement continued the task and turned many works of the Fathers into Slavonic, and is said to have made clearer the forms of letters. What was the alphabet which Cyril invented, where were the invention and the earliest translations made by him, and who were the speakers of the dialect he used, the language we call Old Church Slavonic (O.S.)? As to the alphabet we have the further testimony of Chrabr, a Bulgarian monk of the next generation, who says that the Slavs at first practised divination by means of marks and cuts upon wood; then after their baptism they were compelled to write the Slavonic tongue with Greek and Latin letters without proper rules; finally, by God's mercy Constantine the Philosopher, called Cyril, made them an alphabet of 38 letters. He gives the date as 855, six or seven years before the request of Rostislav. If we take this to be exact Cyril must have been working at his translations before ever he went to Moravia, and the language was presumably that with which he had been familiar at Thessalonica—that of southern Macedonia, and this is on the whole the most satisfactory view. At any rate the phonetic framework of the language is more near to certain Bulgarian dialects than to any other, but the vocabulary seems to have been modified in Moravia by the inclusion of certain German and Latin words, especially in the touching the liturgy. These should indeed to have been already familiar to the Moravians through the work of the German missionaries. Some of them were supervised when O.S. became the language of Orthodox Slavs. Kopitar and Miklošič maintained that O.S. was Old Slovene as spoken by the subjects of Kocel, but in their decision much was due to racial patriotism. Something indeed was done to adapt the language of the Translations to the native Moravian; we have the Kiev fragments, prayers after the Roman use in which occur Moravisms, notably e and z where O.S. has ž and ž, and fragments at Prague with Eastern ritual but Cech peculiarities. Further, the Freisingen fragments, though their language is in the main Old Slovene and their alphabet Latin, have some connexion with the texts of an O.S. Euchologium from Sinai.

Alphabets.—Slavonic languages are written in three alphabets according to religious dependence; Latin adapted to express Slavonic sounds either by diacritical marks or else by conventional combinations of letters among those who had Latin services; so-called Cyrillic, which is the Greek Liturgical Uncial of the 9th century enriched with special signs for Slavonic letters—this is used by all Orthodox Slavs; and Glagolitic, in the "s p e c t a c l e d " form of which certain very early O.S. documents were written, and which in another, the "s q u a r e," form has survived.
as a liturgical script in Dalmatia, where the Roman Church still allows the Slavonic liturgy in the dioceses of Veglia, Spalato, Zara and Sebenico, and in Montenegro; the Croats now employ Latin letters for civil purposes.

The annexed table gives the alphabets—the Glagolitic in both forms with numerical values (columns 1-3); the Cyrillic in its fullest development (4, 5), with the modern version of it made for Russian (6) by Peter the Great's orders; Bulgarian uses more or less all the Russian letters but the reversed e and the last two, while keeping more old Cyrillic letters, but its orthography is in such a confused state that it is difficult to say which letters may be regarded as obsolete; Servian (7) was reformed by Karadžić (Karajch (q.v.)) on the model of Russian, with special letters and ligatures added and with unnecessary signs omitted.

The old ways of writing Slavonic with Latin letters were so confused and variable that none of them are given. The Cechs first attained to a satisfactory system, using diacritical marks invented by Hus; their alphabet has served more or less as a model for all the other Slavonic languages which use Latin letters, and for that used in scientific grammars, not only of Slavonic but of Oriental languages. Column 8 gives the system as applied to Croat, and corresponding exactly to Karadžić's reformed Cyrillic. Column 9 gives the Cech alphabet with the exception of the long vowels, which are marked by an accent; in brackets are added further signs used in other Slavonic languages, e.g. Slovene and Sorbic, or in strict transliterations of Cyrillic. Polish (10) still offers a compromise between the old arbitrary combinations of letters and the Cech principle of diacritical marks.

The last column shows a convenient system of transliterating Cyrillic into Latin letters for the use of English readers without the use of diacritical marks; it is used in most of the non-linguistic articles in the *Encyclopaedia Britannica* which deal with Slavs. With regard to Glagolitic (derived from *Glagol, a word* and Cyrillic, it is clear that they are closely connected. The language of the earliest Glagolitic MSS. is earlier than that of the Cyrillic, though the earliest dated Slavonic writing surviving is a Cyrillic inscription of Tsar Samuel of Bulgaria (A.D. 993). On the whole Glagolitic is likely to be the earlier; if only it were possible, one would have made it who knew the simpler Cyrillic. It certainly bears the impress of a definite mind, which thought out very exactly the phonetics of the dialect it was to express, but made its letters too uniformly complicated by a love for little circles. A sufficiently large number of the letters can be traced back to Greek minuscules to make it probable that all of them derive thence, though agreement has not yet been reached as to the particular combinations which were modified to make each letter. Of course the modern Greek phonetic values alone form the basis. The numerical values were set out according to the order of the letters. Some subsequent improvement, especially in the pre-iotized vowels, can be traced in later documents. The presumption is that this is the alphabet invented by Cyril for the Slavs who formerly used Greek and Latin letters without system.

When brought or brought back to Bulgaria by Clement and the other pupils of Methodius, Glagolitic took root in the west, but in the east some one, probably at the court of Simeon, where everywhere Greek was in favour, had the idea of taking the arrangement of the Glagolitic alphabet, but making the signs like those of the Uncial Greek then in use for liturgical books, using actual Greek letters as far as they would serve, and for specifically Slavonic sounds the Glagolitic signs simplified and made to match the rest. Where this was impossible in the case of the complicated signs for the vowels, he seems to have made variations on the letters A and B. With the uncials he took the Greek numerical values, though his alphabet kept the Glagolitic order. Probably the Glagolitic letters for $e$ and $h$ have exchanged places, and the value 8oo belonged to $f$, as the order in Cyrillic is $u$, $v$, $w$, $y$. Who invented Cyrillic we know not; Clement has been said to have made letters clearer, but only in a secondary sense, and he seems to have been particularly devoted to the tradition of Methodius, and he was bishop of Ochrida, just where Glagolitic survived longest.
being hostility to Rome, whereas in Orthodox countries this caution was soon seen to be unnecessary. The Glagolitic alphabets in the table are copied from Codex Marinianus (11th century) and the Reims gospel, an O.S. MS. of the 14th century, on which the kings of France took their coronation oath.

As to the special sounds which these various scripts expressed, we may notice in the vocalism a tendency to broaden the short vowels and to narrow the long ones, a process which has left results even where distinctions of quantity no longer exist; further, the many changes which can be followed in historic time and are due to the destruction of the old rule of open syllables by the disappearance of the half vowels ă and ą, or to their developing into full vowels where indispensable for pronunciation (No. I. inf.). But the ruling principle which has determined the phonisognomy of Slavonic speech is the degree in which consonants have been affected by the following vowel. Where this has been broad ă, ą, or ą, this has resulted only in an occasional labialization most noticeable in the case of ă, where it has been narrow, a, e, e (once ă or ă), ă, ă, and the result has been palatalization or "softening" in various degrees, ranging from a slight labialization in the position of the tongue producing a faint ă sound in or just after the consonant—expressed in column ą by the sign r, and in Cyrillic by the pre-totizing of the following vowel—to the development out of straightforward mutes and sibilants of the sibilants, palato-sibilants and affricates s, z, z, i, j, d, d, e, d, e, š, š, etc. (see No. 9 and V. inf.).

Slavonic Languages.—The Slavonic languages belong to the Indo-European (I.E.) family. Within that family they are very closely connected with the Baltic group, Old Prussian, Lithuanian (Lithuanian and Old Prussian are very much alike), and with the Aryan group, which includes, among other things, the languages of the Slavonic dialects, and the eastern or Aryan group, their next neighbours on each side. The Aryans likewise split into two divisions, Iranian and Indian, whereof the former, in the Sar-matians, remained in contact with the Slavs until after the Christian era, and gave them some loan words, e.g. Bogi—Pers. Bagi (god); Russian, Sobaka; Median, Čepka (dog). The south-eastern or Thracian group (Albanian) and beyond it the Illyrian (Albanian) made up the four groups which have sibilants for I.E. non-velar gutturals (see inf. No. 9), and in this stand apart from many European groups, but in other respects the Balto-Slavs were quite European.

The Baltic group and the Slavs were separated by the marshes of White Russia, and after their early oneness did not have much communication until the Slavs began to spread. Since then the Baltic languages have borrowed many Slavonic words. After the Aryans had moved eastwards Slavonic was left in contact with Thracian, but we know so little about it that we cannot measure their mutual influence. On the other side the Germans, beginning as the next group to the Balto-Slavs, and having thereby much in common with them (so much so that Schleicher wanted to make a Germano-Slav-Baltic group), have never ceased to influence them, have given them loan words at every stage and have received a few in return.

After the Baltic group had separated from the Slavonic, we must imagine a long period when Slavonic (Sl.) was a bundle of dialects, showing some of the peculiarities of the future languages, being as they were all alike, and say that all these forms were common to them all. This stage may be called Proto-Slavonic. Except for the few cases where Old Church Slavonic (O.S.) has either definitely South Slavonic characteristics or peculiar characteristics of its own, as written down by Cyril it represents with wonderful completeness Proto-Slavonic at the moment of its falling apart, and words cited below may be taken to be O.S. unless otherwise designated. Some of the main characteristics of the Slavonic languages as a whole in relation to I.E. are indicated below; restrictions and secondary factors are necessarily omitted. As a rule O.S. represents the Slavonic languages fairly well, while Latin or Greek equivalents are given as the most familiar examples of I.E.

Hypothetical forms are starred.

2. I.E. b becomes b, stene: stenen; I.E. ć > c, berą: fero.

3. I.E. ą and ă are alike o in Sl., oral: ara; osm: octo; I.E. ъ in end syllables, > o, voda: žoro; I.E. ă and ă are alike a, braři: frader; dăvo: duo.

5. I.E. r and l both long and short survived as vowels, *čleš, Sanskr. rvas, "wolf"; consonantal r and l survived unchanged.

6. I.E. m and n both long and short: the former gave t or ă; sticio: centum; the latter ę or q, dezęt: decem. Consonantal m and n mostly survived before a vowel, after it they coalesced with it to make the nasal vowels ę and e, poli: ponič: peča: pchoro.

7. I.E. Aspirates are represented by corresponding sonants, boro: fero; medů: "mead"; měře: břeře.

8. I.E. ą often becomes ch; vetěčás: vetus; not always, syna: Lithu. sūnis; "son"; otherwise ch generally renders Gothic h in loan words; chlebė: klaims; "loaf"; chytės: hus, "house".

9. I.E. velar gutturals k, g, ģ and labio-velars, g, ģ become in Sl. k, g, kļuž: slavis; ģļuž: angulus; mľaš: bļaļa; kuto: quis; govedo: böjo; Sanskr. gādī: něq; něm: "house".

10. (a) Gutturals k, g, ģ (for ţ) before t, ţt, je, and early in the Proto-Sl. period became k, š, št, čt, loco. of tītātā; čuo: granum; čma: kiema; Lithu. š, ę: z, desimtis, žoņis, žema. (b) ģ, (for ţ) before t, ţt, je, and after t, t, ţt, e, d, z, ę, Vilcė loc. of cūs: leži, imperat. of legę: "lie"; njeļa: njesi; duļča, nom. loc. of duča, "spirit"; kņeļa: Ger. kunnung: "king."
The passive only survives in the pres. and past participles; of the finite moods there are but the ind. and opt. (almost always used as an imperat.); left, its only old tenses are the pres. and the aor., to which it has added an impf. of its own. There is an inf. (in-, being an old dat.,) and a supine in -ti, an accusative. Of active participles there are a pres. and a past and a second past part. used in making compound tenses. There are a solitary perfect form, vidē: ődē, and a solitary fut. part. byē, gen. byēta: φιέων, φίέωντος. The verb has two stems; from the pres. stem is formed the ind. pres. and impf., the imperfect and the act. and pass. pres. participles. All other forms are based upon the infinitive stem.

Personal Endings:

1st Sing. In thematic verbs the vowel + n has given q, but there has been a tendency to replace it according to the non-thematic analogy, which has necessitated changes in 1st plur.

2nd Sing. -śi has given -śi everywhere but in O.S.

3rd Sing. -śi has been dropped everywhere but in Russian, where the literary language has tē. The Dual only survives in Serb, Sorb, Slovene and O.S. and in these the forms are confused.

1st plur. -mā has developed a full vowel where the 1st sing. has replaced the -m.

The second person endings have lost their -m, -s, -i and -nt by phonetic change.

Non-thematic presents are, jasm, eul, sum, dám (redupl. for *dədam), bōbōs; jasm, eus, věnt. Sanskr. vedmi, "I wit "; imant (new form of emō), "I have."

The aorist has no augment; it is s Duncan and non-sigmatic. The latter or 2nd aor. (cf. Hom. impf. ἐσκόμαι, ἐσκύμαι) survived only in consonant stems and that in O.S. and Old Cech, pektē = ἐπεκόμας. It was common in the 2nd and 3rd sing. where the -s-forms would not be clear: pele < *pelēs, pele-tē = ἐπέκόμας, ἐπέκόμας. The s Duncan aorist very rarely and only in consonant stems in O.S. keeps its -s, -sēnt < *sēntē. In stems ending in k, r or a vowel, s > ch; bychā = bychōta and this ch > ẓ before z. The ordinary later form for consonant stems inserts a vowel, vedočch. The aorist has survived in S. Slavonic and in Sorb, and is found in the older stages of the other tongues. The same languages (except Slovene) have kept the impf. which was present in Proto-Sl. but does not go back to I.E., being formed on the analogy of the aor. With the aor. has coalesced the opt. bint, "he, " used with the 2nd past part. to make a conditional. Stem of pres. part. act. ends in -nt but the consonant decl. has become an -jo-decl., so we have very < I.E. *yei̯konis = ἔγων, gen. yeitēs < *enai̯tia as against ἔγορρος. Pres. pass. ends in -mā; it has survived more or less in Russian, elsewhere is obsolescent. Past part. act. 1. is formed with I.E. -ye; nom. sing. masc. *-uš (odiōs) gave ą, redă, having led, byu, having been; but in fem. and oblique cases formed as from -io-stem survived, hence Russian reděť, byušť. Past part. act. 11. in -le cf. Lat. bibulus from bibu, used in an auxiliary to form past and conditional. Past part. pass. in -or -n.; terīus = triūsus. Znană = known. I.E. future having been lost, futurity is expressed by an auxiliary būdā (era) chōlā (will), &c. with the iner. by the pres. form of the passive verb. The passive is expressed either by the use of the passive participles or by the reflexive se, which can refer to the 1st and 2nd persons as well as to the 3rd.

Syntactical peculiarities of the Slavonic languages that may be noted are a tendency to use the genitive instead of the accusative (which has often coincided in form with the nominative) in the case of living beings, masculine -o-stems, and in the plur.; the use of the genitive for the accusative or even nominative in negative clauses; the dative absolute and the dative as subject to an infinitive; the instrumental instead of the nominative as a predicate, and in oratio obliqua the preservation of the tense of the original statement instead of our way of throwing it into the past.

In the use of the verbs the development of "aspects" makes up for the few tenses. Actions (or states) expressed by a verbal form have a beginning, a continuation and an end. There are, however, some (momentaneous) actions whose beginning and end come together and allow no continuation. All verbs fall into two great divisions, imperfective, which express the continuance of an action, without regard to its beginning or end, and perfective, which express the points of beginning or ending. The continuance of an action may be unbroken or may consist of like acts which are repeated. So imperfective verbs are divided into durative, as nesti, "to be carrying," and iterative, as nosti, "to be wont to carry"; the repeated acts of the iterative can either be each of them momentaneous, e.g. Čech, štilheti, "to shoot," i.e. "to fire single shots," or each have some continuance, e.g. nosti above, or we can even express the occasional repetition of groups of momentaneous actions, e.g. Čech. stiltuši, "to have the habit of going out shooting."

As perfective verbs do not express continuance, an idea implied in the present, they cannot require a present form, so this is used for perfective futures; e.g. seda (pres. form from perfective sedū) = "I shall take a seat," as opposed to imperfective būdā sedūti, "I shall be sitting." If a preposition is compounded with a durative verb as nesti, "to carry" (in general), "to be carrying," it makes it perfective, as isnesti, "to carry out" (one single action brought to a conclusion), so Eng. "sit" is usually imperfective, "sit down" perfective. If an iterative has a preposition it is mostly used as a durative; isnesti can mean "habitually to carry out" but more often "to be carrying," that is, it supplies the imperfective form to isnesti. The development of this system has enabled some Slavonic languages, e.g. Russian, to do with only two tenses, pres. and past, to each verb morphologically considered, perfective and imperfective verbs supplementing each other; e.g. if we take a Greek verb, the pres. (ind. and inf.) and imperfect correspond to the present, inf. and past of a Russian imperfective verb; the aor. indic. and inf. are represented by the perfective past and infin., which has also to do duty for the Greek perfect and plup.; the future and the future perfect in Greek do not express the same distinctions as the imperfective and future future (in form a present) in Sl., the Greek giving chronological order of action, but not giving the distinction of aspect, though the future perfect is naturally perfective.

The prepositions are very much like those in other I.E. languages both in actual forms and in use.

The formation of the sentence is not naturally complicated; but Sl. has in times past been largely influenced by Greek, Latin and German with their involved periods; latterly there has been a tendency to follow the simpler models of French and English.

Such being the Slavonic languages as a whole and regarded in their relationship to I.E., they may now be considered in their relationship to each other, and some of the principal character-istics enumerated upon which their internal classification has been founded. More or less complete accounts of each language will be found under its name.

Distinctive Points of Different Sl. Languages.—1. (ā, ē). The fate of the Proto-Sl. half vowels ā, ē, still preserved in O.S., e.g. sanā, "sleep," dīntt, "day," is various; as a rule they disappear, ā entirely (though when final still written in R.), ē leaves a trace by softening the preceding consonant. But if needed to eke out

1 Bulg. = Bulgarian; Čeč = Czech; Kaš = Kasubi; Lit. R. = Little Russian; P. = Polish; R. = Russian; i.e. Great Russian; Ser. = Servia; Wh. R. = White Russian.
consonants, in Sorb, Slovak, Lit. R. and mostly in Gt. R., R. t develops into full vowels e, -rt-: R. sanu, gen. snu; ëdnt, gen. dvea. In Polish and Cebch both > e, but in P. t softens the preceding cons., in C. it usually does not.—P. seu, dséér, C. sen, den; in Slovene and Ser. they are not distinguished, Slovene ã, o or e, san, dan or den = Ser. a, san, den, gen. dana. But keeping the middle vowel which is elsewhere dropped. Bulgarian varies dialectically.

II. (y) y only remains in Gt. Russian, Polish and Sorb though still written in Cebch; it has elsewhere become i, but in Polish it becomes ä after k and g, in Sorb and R. after k, g, ch—O.S. kysnat, ‘go sour,’ gybnat, ‘perish,’ chytat; ‘cunning’; P. kisnä, ginat, chytat; R. kisnatt, gybnat, ch'ytat. III. (r, l, t) The treatment of the liquids varies greatly.

(a) r is always a lingual trill, never alveolar. In S. Slav. it is only softened before j and y—O.S. soro, ‘dawn.’ In N.W. and E. Slav. r became r before i, e, e, and j. Russian and Sorb have remained at this stage, C. Polish, Ks. have made r into r (r) in which r and ë are run into one. (See Table I) But

P. ë for orig. ë does not soften—P. rekà: O.S. rakà, “hand.”

In Sorb such a change only happened after k, p, t, in which case High S. has ë (written ë), Low S. ë, but in Low S., r after k, p, t becomes ë even before hard vowels: Proto-Sl. trci, ‘three,’ High S. trti, Low S. tri; Proto-Slovak kraj (edge), High S. kraj, Low S. kraj. (b) l occurs in three varieties, l, l, ?, but each language has generally either middle l alone or else l and ?. Lith. R. and Bulg. have all three. l has been arrived at in C. and Slovene by the loss of the distinctions, perhaps under German influence; Ser. has l and ?, final >o; but l occurs in dialects of all languages and was not doubt in O.S. Proto-Sl. and even Balto-Slav. It has a velar and a labial element and in most languages tends to appear as o, u, v or w, though this is only written in Ser. and Lit. R. O.S. dal, gave, K. dal, Lit. R. daw, Wh. R. dan, C. daw, P. (dialect day), C. dal, Ser. daw. l is very soft, like Fr. tille.

(d) Proto-Sl. r, or perhaps ër, ër, ël, ël gave S. Slav., C. and Slovak r, j in written in O.S. r, r, ë, ë, ë, ë differently, though soft

and hard may once have been distinguished. Of this group Slovene and Ser. later allowed the j to become al, ou or u. Sorb, Polish and R. developed various vowels, partly according to the original quality, partly according to other influences, e.g. O.S. srdce, “heart,” tragê, “market,” elska, “wolf,” slance, “sol”; Ser. srdce, trg, vuk, zuce; Slovene srdce, trg, volk, solnce;

| *molà, “hammer” | molà | molà | molà | molà |
| *berg, Ger. “berg,” “shore” | berg | berg | berg | berg |
| *melk “milk” | melk | melk | melk | melk |
| *helm “helm” | helm | helm | helm | helm |
| *gebl “groove” | gebl | gebl | gebl | gebl |

The various treatments of this combination are among the chief criteria for classification, esp. the Russian speciality called full vocalism (polnoglasiye) torot, tolét, telet, toclet (or tolot, telet) which is probably archaic, is one of the chief reasons for putting Russian in a separate division; Polish and Sorb come nearest to it, with troit, locit, telet, but the N.W. division is not uniform as Kašub and the extinct Polab have the interesting forms torit, latit, lat, which are partly archaic, partly a transition to the most novel forms of the southern group to which Cebch and Slovak in this particular accede, trit, lat, trit, but after e and ë Cebch has lat let lat. Deviations due to intonation have not been set forth. (See Table III.)

IV. The Proto-Slavonic nasals ë and ç could be either long or short. This distribution is fairly kept in languages which have quantity and govern the results in Polish in which the nasal sound is preserved. The examples below show the main representatives. Traces of nasal phonation survive in Bulgarian, Slovene and Kašub.

| TABLE III. |
|------------|---------|-------|-----|---|-----------|----|----|-------|
| ënëka, ënëka | mëka | mëka | mëka | mëka | mëka | mëka | mëka |
| *maknà | mëka | mëka | mëka | mëka | mëka | mëka | mëka |
| *mëka | mëka | mëka | mëka | mëka | mëka | mëka | mëka |
| *desët | desët | desët | desët | desët | desët | desët | desët |
| *pet | pet | pet | pet | pet | pet | pet | pet |

In Kašub ë remains; ç becomes nasalized ë or ë and this may lose the nasal or restore it as a full n or m; it has also nasalized all the other vowels and has the power of using nasals in loan-words, e.g. testamat, as did O.S. e.g. kolyda, kalendae, sódà = sund. Polab has ë and ç—rekon, O.S. rakà, “hand,” mengis=mešà, “corns,” but swante=svëšë, “holy.”
V. Softening (Palatalization, &c.)—Nothing has so much affected Slavonic speech as the effect of i, e, ę, and j on preceding consonants, and the variations produced are among the chief points of difference between the languages.

(a) The gutturals felt this first of all, k, g, ch, become (L) ļ, ţi, ū and (IL) c, č as čě, and these changes are universal (see 10, a, b above) except that after the separation of the Slavs the same process was continued in the S. and E. branches even when a v intervened, whereas the N.W. branch remained untouched. Proto-Sl. *kňiť, "flower," *gěřě, "star" (*čelňtě), magi; O.S. čeltī, zvěří, (čěří); Č. čelňt, zvěřa; but Čech kňě, kňěva; P. kwiťa, kwiaźa.

(b) The action of j was the most general, influencing the dentals in all languages and in some the labials as well, whereas the narrow vowels act on the dentals only and that in the Serbo-Croatian branch only after o or u. O.S. and Bulg. are the most surprising, giving i', e' by way of i ě and ě as is shown by their agreement with the results of Proto-Sl.

![Table](https://via.placeholder.com/150)

Intonations Serbo-Croat is the chief guide, but here the accent intonation is spread over two syllables, in Croatian (ljud dialect), the main stress is usually on the old place, in Servian (štok dialect) it has shifted back one. In N.W. Slavonic, with the exception of Kašube, in which it is free, the accent is fixed, in Č, Slovak and Serbo-Croat there are also unaccented long syllables. Russian has kept the place of the original accent best, next to it Bulgarian; consequently it seems very capricious, appearing on different syllables in different flexions, but it has become more regular in Slovene it is still musical, but is, so to speak, staidier. For the

VII. Common Slav je and ju beginning a word appear in R. as o and u; O.S. jedinč, "one," jucha, "broth"; R. oščinč, ucha.

VIII. Proto-Sl., as we have seen, had long, short and very short or half vowels and a musical accent with differing intonations. O.S. was probably similar, but we have no sufficient materials for determining the quantities or accents as a systematic writing of the latter only came in from the 14th century. The fate of the half vowels we have seen (I.). Traces of former long vowels are very clearly to be seen in Sorb, Polish and Lit. R., and less clearly in Bulg. and Gt. R., all of which have lost distinctions of quantity; Slovene can have long vowels only under the accent. In Kašube, Č, Slovak and Serbo-Croat there are also unaccented long syllables. Russian has kept the place of the original accent best, next to it Bulgarian; consequently it seems very capricious, appearing on different syllables in different flexions, but it has become more regular in Slovene it is still musical, but is, so to speak, staidier. For the
SLAVYANSK—SLEEMAN

237
treatment of tj and dž (V. b) and the place of its accent (VIII) in all of which it is rather archaic, while je>o, jw>u (VII) is its own innovation. In its secondary softenings Lit. R., Gt. R. and Wh. R. make a gradual bridge between S. Slav and Polish (V. c-o). In common with Polish, R. further has the retention of y (VII). Finally, within historic time certain dialects have influenced others through literary and political intercourse. O.S. has influenced all the Orthodox Slavs and the Croats, so that Russian is full of words with O.S. forms pronounced à la Russe (ç>u, ñ>ja, t’t‘ëtë, &c.). Cech has almost overshadowed Slovak and early literary literary models to Polish. Polish has overshadowed Kašube and much influenced Little and White Russian and Great Russian in a less degree. Russian has in its turn supplanted modern Bulgarian with a model. Again, other tongues have contributed something; in common Slavonic there are German loan words, and others have followed in various periods, especially in Cech and Polish, while the very structure of Slovene and Sorb has been affected. Polish has adopted many Latin words. Bulgarian and Servian received many Turkish words. Russian took over many Eastern words in the Tatar period, and the common vocabulary of Western civilization since the time of Peter the Great, but on the whole, though the Slav easily takes to a fresh language, he has kept his own free from great admixture.

SLAVYANSK, a town of Russia, in the government of Kharkov, 158 m. by rail S.E. of the town of Kharkov, on the Torets river and close by several salt lakes, from which salt is extracted. Pop. (1897) 15,644. There are soap, candle and tallow-works. Slavynsk carries on a brisk trade in salt, cattle and tallow. The ancient name of Slavynsk was Tor. The town, which is supposed to occupy the site of a former settlement of the Turks (Torks), who inhabited the steppes of the Don, was founded in 1676 by the Russians to protect the salt marshes. Having an open steppe behind it, this fort was often destroyed by the Tatars. Its salt trade became insignificant in the 18th century and only revived towards the end of the 19th century.

SLEAFORD, a market town in the North Kesteven or Sleaford parliamentary division of Lincolnshire, England, in a fertile and partly fenly district on the river Slea. Pop. of urban district (1901) 5408. It is 112 m. N. by W. from London by the Great Northern railway, being the junction for several branch lines and for the March-Doncaster joint line of the Great Northern and Great Eastern companies. The church of St. Denis is one of the finest in the county, exhibiting transitional Norman work, and is decorated with several slabs belonging to the Saxons. It is the only church in England to be covered by an Early English spire, which, however, is mainly a copy of the original. The nave is of beautiful late Decorated work with an ornate south porch. There is a splendid carved roof screen of oak. The chancel is Perpendicular. There are a few picturesque old houses. The district is very fertile, and the trade of the town is principally agricultural, while malting is also carried on.

The discovery of numerous coins of the Constantine period, the earthworks of the castle-area, and its proximity to the ford by which Ermine Street crossed the Witham, point to the probability of Sleaford (Slefar or Slefar) being a manorial seat, and that the Saxons occupied the site before their conversion to Christianity is evident from the large cemetery discovered here. Domeday Book records that the manor had been held from the time of Edward the Conqueror by the bishops of Lindsey, whose successors, the bishops of Lincoln, retained it until it was surrendered to the Crown in 1356. It soon afterwards passed to the family of Carr and from them, by marriage, in 1688 to John Hervey, afterwards earl of Bristol. The quadrilateral castle, with its square towers and massive keep, was built by Alexander, bishop of Lincoln, and became one of the chief episcopal strongholds. King John rested here in 1216 after his disastrous passage of the Wash, and in 1430 Bishop Richard Fleming died here. The castle was in good repair on its surrender in 1546, but was dismantled before 1600. Sleaford never became a municipal or parliamentary borough, and the government was manorial, the besieging possessing full jurisdiction. The townsfolk were, however, largely organized in the gilds of Corpus Christi, St John and Holy Trinity, accounts for which exist from the year 1477. The origin of the markets and fairs is unknown, but in answer to a writ of quo warranto of the reign of Edward I., the bishop declared that they had been held from time immemorial.

SLEEMAN, SIR WILLIAM HENRY (1788–1886), Indian soldier and administrator, was born at Stratton, Cornwall, on the 8th of August 1788. He was the son of Philip Sleeman, yeoman and supervisor of excise. In 1809 he joined the Bengal army, served in the Nepal War (1814–1816), and in 1820 became assistant to the governor-general's agent in the Sauker and Nerbudda
SLEEP

SLEEP (O. Eng. slæpan; Ger. schlafen; cf. Lat. labi, to glide, and "sleep"), a normal condition of the body, occurring periodically, in which there is a greater or less degree of unconsciousness due to inactivity of the nervous system and more especially of the brain and spinal cord. It may be regarded as the condition of rest of the nervous system during which there is a renewal of the energy that has been expended in the hours of wakefulness; for in the nervous system the general law holds good that periods of physiological rest must alternate with periods of physiological activity, and, as the nervous system is the dominating mechanism in the body, when it reposes all the other systems enjoy the same condition to a greater or less extent. Rest alternates with work in all vital phenomena. After a muscle has contracted frequently at short intervals, a period of relaxation is necessary for the removal of waste products and the restoration of energy. The pulsating heart, apparently working without intermission, is in reality not doing so, as there are short intervals of relaxation between individual beats in which there is no expenditure of energy; the cells in a secreting gland do not always elaborate, but have periods when the protoplasm is comparatively at rest. Nervous action also involves physico-chemical changes of matter and the expenditure of energy. This is true even of the activity of the brain associated with sensation, perception, emotion, volition and other psychic phenomena, and therefore the higher nervous centres require rest, during which they are protected from the stream of impressions flowing in from the sense-organs and in which waste matters are removed and the cerebral material is recuperated for another time of wakeful activity. (See also HYMNOSTISM, and the physiological sections of the articles BRAIN, and MUSCLE AND NERVE.)

The coincidence of the time of sleep with the occurrence of the great terrestrial phenomena that cause night is more apparent than real. The oscillations of vital activity are not correlated to the terrestrial revolutions as effect and cause, but the occurrence of sleep, in the majority of cases, on the advent of night is largely the result of habit. Whilst the darkness and stillness of night are favourable to sleep, the state of physiological repose is determined more by the condition of the body itself. Fatigue will normally cause sleep at any time of the twenty-four hours. Thus many of the lower animals habitually sleep during the day and prowl in search of food in the night; some hibernate during the winter season, passing into long periods of sleep during both day and night; and men whose avocations require them to work during the night find that they can maintain health and activity by sleeping the requisite time during the day.

The approach of sleep is usually marked by a desire for sleep, or sleepiness, embracing an obscure and complicated group of sensations, resembling such bodily states of feeling as hunger, thirst, the necessity of breathing, &c. All of these bodily states, although on the whole ill-defined, are referred with some precision to special organs. Thus hunger, although due to a general bodily want, is referred to the stomach, thirst to the fauces, and breathing to the chest; and in like manner the desire for sleep is referred chiefly to the region of the head and neck. There is a sensation of weight in the upper eyelids, intermittent spasm of the sub-hyoid muscles causing yawning, and drooping of the head. Along with these signs there is obscuration of the intelligence, depression both of general sensibility and of the special senses, and relaxation of the muscular system. The half-closed eyelids tend more and more to close; the inspirations become slower and deeper; the muscles supporting the lower jaw become relaxed, so that the mouth opens; the muscles of the back of the neck that tend to support the head also relax and the chin droops on the breast; and the limbs relax and tend to fall into a line with the body. At the same time the hesitating involuntary utterances of the sleepy man indicate vagueness of thought, and external objects gradually cease to present an appearance to the senses. These are the chief phenomena of the advent of sleep. After it has supervened there are many gradations in its depth and character. In some cases the sleep may be so light that the individual is partially conscious of external impressions and of the disordered trains of thought and feeling that pass through his mind, constituting dreams, and these may be more or less vivid, according to the degree of consciousness remaining. On the other hand, the sleep may be so profound as to abolish all psychical phenomena: there are no dreams, and when the sleeper awakens the time passed in this unconscious state is a blank. The first period of sleep is the most profound. After a variable period, usually from five to six hours of deep sleep, the faculties awaken, not simultaneously but often fitfully, so that there are transient periods of consciousness. This is the time of dreaming. As the period of waking approaches the sensibility becomes more acute, so that external impressions are faintly perceived. These impressions may influence and mould the flow of images in the mind of the sleeper, frequently altering the nature of his dreams or making them more vivid. The moment of waking is usually an insubstantial, but is preceded by an intermediate state of partial consciousness, and a strange play of the mental faculties that has more of the character of an "intellectual mirage" than of consecutive thought.

The intensity of sleep has been measured by Kohlschütter by the intensity of the sound necessary to awaken the sleeper. This intensity increases rapidly during the first hour, then decreases, sometimes rapidly, sometimes slowly, during the next two or three hours, and then very slowly until the time of waking. This statement agrees generally with experience. As a rule the deeper the sleep the longer it lasts. Various physiological changes have been observed during sleep, but much remains to be done in this direction. The pulse becomes less frequent; the respiratory movements are fewer in number and are almost wholly thoracic, not abdominal; all the secretions are reduced in quantity; the gastric and intestinal peristaltic movements are less rapid; the pupils of the eye are contracted and during profound sleep are not affected by light; and the eyeballs are rotated upwards. The pupils dilate slightly when strong sensory or auditory stimuli are applied, and they dilate the more the lighter the sleep; at the moment of waking they become widely dilated. Whilst muscular relaxation in general, there seems to be increased contraction of certain sphincter muscles, as the circular fibres of the iris and the fibres concerned in closing the eyelids. The state of the circulation of the brain has been frequently investigated. The older view was that there was a degree of plethora or congestion of the vessels of the brain, as is the state of matters in coma, to which the state of sleep has a superficial resemblance. Coma, however, is not sleep, but a condition of inactivity of the cerebral matter owing to the accumulation of dark venous blood in its vessels. This has been actually observed in cases where it was possible to observe the brain. During sleep the surface where the exposed brain has been observed to become pale and to shrink somewhat from the sides of the opening (Johann Blumenbach, 1752–1840). A careful experimental research was conducted by Arthur E. Durham in 1860, in which he trephined a portion of bone as large as a shilling from the parietal region of a dog, and, to obviate the effects of atmospheric pressure, inserted a watch glass into the aperture so that the surface of the brain could be seen. His results are summarized thus:—

"(1) Pressure of distended veins on the brain is not the cause of sleep, for during sleep the veins are not distended; and, when they
are, symptoms and appearances arise which differ from those which characterize sleep. (2) During sleep the brain is in a comparatively bloodless condition, and the blood in the encephalic vessels is not only diminished in quantity, but more or less diminished in quality. (3) The condition of the cerebral circulation during sleep is, from physical causes, that which is most favourable to the nutrition of the brain tissue; and, on the other hand, the condition which prevails during wakefulness is in contrast with and tends to the exclusion of the nutritive action of the blood, as it is that which is most favourable to oxidation of the brain substance, and to various changes in its chemical constitution. (4) The blood which is derived from the brain during sleep is distributed to the alimentary and excretory organs. (5) Whatever increases the activity of the cerebral circulation tends to preserve wakefulness; and whatever decreases the activity of the cerebral circulation, and, at the same time, is not inconsistent with the general condition of the person, tends to promote sleep. Such circumstances may act primarily through the nervous system; but the circulation of the brain vessels is also under the influence of the nervous system, and the presence or absence of impressions upon the sense organs, and the presence or absence of exciting ideas. Among those which act through the vascular system may be mentioned unnatural or naturally increased or decreased force or frequency of the heart's action.

Dr William A. Hammond and Dr Silas Weir Mitchell (b. 1836) repeated and extended Durham's observations, with the same general result. French (1837) and Mosso (1881), by more refined methods of observation arrived at the same general conclusions. Angelo Mosso (b. 1846) in particular applied with great success the graphic method of registration to the study of the movements of the brain and of the circulation during sleep. He made observations on three persons who had lost a portion of the cranial vault and in whom there was a soft pulsating citraxis. They were a woman of thirty-seven years of age, a man of thirty-seven years and a child of about twelve years. By special arrangements, Mosso took simultaneous tracings of the pulse at the wrist, of the best of the heart, of the movements of the wall of the chest in respiration, and of the movements of the denuded brain. Further, by means of the plethysmograph—an instrument of Mosso's own invention—he obtained tracings showing changes in the volume of the hand and forearm; and he succeeded in showing that during sleep there is a diminished amount of blood in the brain, and at the same time an increased amount in the extremities. He showed further that there are frequent adjustments in the distribution of the blood, even during sleep. Thus a strong stimulus to the skin or to a sense organ—but not strong enough to awaken the sleeper—caused the circulation of the arms and hands to increase, an increase of blood pressure, and a determination of blood towards the brain; and, on the other hand, on suddenly awakening the sleeper, there was a contraction of the vessels of the brain, a general rise of pressure, and an accelerated flow of blood through the hemispheres of the brain. So sensitive is the whole organism in this respect, even during sleep, that a loudly spoken word, a sound, a touch, the action of light or any moderate sensory impression modified the rhythm of respiration, determined a contraction of the vessels of the forearm, increased the general pressure of the blood, caused an increased flow to the brain, and quickened the frequency of the beats of the heart. These observations show how a physiological explanation can be suggested of the influence of external impressions in modifying the dreams of a sleeper. Further, Mosso found that during very profound sleep these oscillations disappear: the pulsatory movements are uniform and are not affected by sensory impressions, and probably this condition exists when there is the absolute unconsciousness of a "dead" sleep. By such methods as have been employed by Mosso, three movements of the brain have been observed—(1) pulsations, corresponding to the beats of the heart; (2) oscillations, or longer waves, sometimes coinciding with the heart beats, or more generally consisting of longer festoons, carrying each a number of smaller waves, and believed to correspond generally to the respiratory movements; and (3) undulations, still longer and less marked elevations and depressions, first clearly observed by Mosso, and believed by him to indicate rhythmic contractions of the vessels of the pia mater and of the brain. This view is in keeping with the observations of Franz Cornelius Donders (b. 1818), Adolf Kussmaul

(b. 1822), Tenner and others on changes of calibre observed in the cerebral vessels, and with the experiments of many physiologists, showing that the vessels of the pia mater, like other vessels, are controlled by the vaso-motor system of nerves.

It may therefore be considered certain that during sleep there is an anaemia, or partially bloodless condition, of the brain, and that the blood is drawn off to other organs, whilst at the same time this anaemic condition may be modified by changes in the circulation or in the respiratory mechanism caused by position, by sensory impressions or by sudden changes in the state of repose of the muscles. The excretion of the retin[tachyem (may be regarded as a cerebral outwork) by the ophthalmoscope during sleep also shows a comparatively bloodless condition. Such are the facts; the deficiency in the way of a theoretical explanation is that physiologists cannot satisfactorily account for the anaemic condition causing unconsciousness. Sudden haemorrhage from the brain and nerve-centres, or a sudden cessation of the supply of blood to the brain, as occurs in syncope (failure of the heart's action—a faint), no doubt causes unconsciousness, but in these circumstances there is a tendency to convulsive spasm. Such spasm is usually absent in sleep, but the effects of the latter (b. 1826) under this condition are observable during the time when there is the confusion of ideas preceding the passage into sleep.

During sleep the amount of carbonic acid eliminated is very much reduced, indicating that molecular changes in the tissues do not occur to the same extent as in the waking state. This is also shown by the fact that less heat is produced. Hermann von Helmholtz (b. 1821) states that the amount of heat produced by a man weighing 67 kilogrammes (147 lb.) is about 40 calories per hour during sleep, as against 112 calories per hour while awake. This diminished production of heat must be largely accounted for by the change in the condition of the muscles of locomotion, but it also indicates diminished tissue changes throughout the body. In profound sleep the bodily temperature may fall from 6° to 6° Fahl. In consequence of diminished oxidation changes during sleep, it is not improbable that excess of nutrient matter may then be stored up in the form of fat, and that thus the proverb "He who sleeps dines" is based on a correct appreciation of the fact that sleep tends to produce plethora or obesity.

Whilst it is easy to state that sleep is caused by fatigue of the nervous system, it is more difficult to explain what the precise means by which the fatigue is produced. The form of the hypothesis has been advanced, but it cannot be said that any one is wholly satisfactory. Aware that the fatigue of muscle is associated with the accumulation of lactic acid, Thierry William Preyer (b. 1841) surmised that the activity of nervous matter might be interfered with by the accumulation in the nerve-centres of some such acid, or of its soda salt (lactate of soda), but this view has not been supported by the results of experiment, as the injection into the blood of a dose of lactate of soda has not produced sleep. Pfüfler has observed that frogs deprived for a considerable time of oxygen passed gradually into a state resembling profound sleep, and he has advanced the theory that there is no organ of the body so quickly affected by deprivation of oxygen as the brain. According to Eduard F. W. Pfüfler (b. 1829), the phenomena of life depend on a dissociation of living matter, and in particular the activity of the cerebral substance connected with psychical states depends on dissociation changes in the grey matter. To excite the dissociation, however, oxygen is necessary. The oxygen unites with certain of the compounds set free by the dissociation, forming, amongst other substances, carbonic acid. If such matters as these unite with oxygen in sufficient amount to exhaust the oxygen, then the grey matter of the brain suffers from a deficiency of oxygen (or from its absence), and also from the accumulation of carbonic acid. According to such a theory, cerebral activity depends on cerebral respiration, and sleep is a kind of cerebral asphyxia. Such a condition is not improbable, but it must be stated that the evidence at present in support of it is meagre. Possibly, in attempting to account for the phenomenon of sleep, too much importance has been attributed to the changes occurring in the
brain, forgetting that not merely brain matter but every tissue of the body becomes exhausted by work, and that sleep may be partly due to phenomena occurring throughout the body and not in the brain alone.

All the phenomena of sleep point to a diminished excitability of the cerebral nerve-centres and of the spinal cord. Contrary to what is often stated, there can be no doubt that reflex action is in partial abeyance and that the spinal cord is in a state of partial inactivity as well as the brain. The only nerve-centres that do not sleep are those absolutely essential to life, such as those connected with the heart, with respiratory movements, and with the distribution of blood by the vaso-motor arrangements; and Mosso's experiments indicate that even these have a certain amount of repose in profound sleep.

There is little doubt that all living beings require periods of repose alternating with periods of activity. Many plants close their flowers and bend their petioles at certain times of the day. These phenomena, called "the sleep of plants," depend apparently on changes in solar radiation, and there is no reason to believe that during the time of quiescence any reparative processes go on, as during the sleeping period of animals. Naturalists have observed many of the lower animals apparently in a state of sleep. Insects, crustaceans, fishes, reptiles, may all be observed occasionally to be almost motionless for considerable periods of time. The sleeping of birds is familiar to all, and in these there are anatomical arrangements by which the eye is protected from the deleterious effects of grasping a branch with both feet, like.perching birds generally, without any muscular effort and consequently without fatigue.

The amount of sleep required by man varies according to age, sex, and general health, but motion, mental concentration, and sleep are inseparable. As an adult, one-third, whilst an old person may do little except eat and sleep is not far wrong. In early life the cerebral faculties appear to be easily exhausted and during the frequent and prolonged sleep of infancy the brain also rests, and the vegetative changes connected with nutrition and growth go on actively. As life advances, less sleep is required, until in adult life a period of seven or eight hours is sufficient. The amount of sleep the human adult requires much depends on habit. Thus most women bear the loss of sleep in the first instance better than men, because they have been accustomed to more loss or irregularity of sleep. The effect of habit is well illustrated by a well-known fact that some persons will often be able to work for weeks continuously with snatches of sleep, not amounting to more than two or three hours daily. Sooner or later, however, even in these cases nature asserts her demands, and prolonged sleep is necessary to maintain health and vigour. A similar condition of things exists in waking hours. Dr W. Ogle has observed in such cases an engorgement of the cervical ganglia of the sympathetic; but this may have nothing to do with the condition. Cases of very prolonged sleep are not uncommon, especially amongst hysterical persons, lasting four, seven or ten days. On waking the patient is exhausted and pale, with cold extremities, and not infrequently, after a brief interval of waking, passes off into another lethargy and sleep. Something similar to this may be seen in very aged persons towards the close of life. (See also Dreams, Somnambulism and Hypnotism.)

Med., vol. xxxii. (1869); Pilgfer, "Theorie des Schlaflafts," in phys. Med., vol. xiii. (1865); Mosso, Über den Kreislauf des Blutes im menschlichen Gehirn, (Leipzig, 1881). Also Manacéine, Sleep, its Physiology, Pathology, Hygiene and Psychology (Eng. trans. 1897), with bibliography.

SLEEPER, a term used with many technical applications for a piece of timber, metal, &c., used as support; in carpentry it is a term applied to a piece of timber fixed to the lower walls of chimneys laid on the shelf or laid on low arches in large halls, to receive ground joints; in shipbuilding, a strengthening timber for the bows and stern frame; the most frequent use of the term is for a timber or steel support on which the chairs are fixed for carrying the rails on a railroad; in America these are called "ties" (see RAILWAYS). The common explanation of the origin of the word is to connect it with "sleep," the timbers supposed to be lying at rest. The real source of the word is the Norwegian Slekt, a piece of timber used for dragging things over, a roller, especially used of timbers laid in a row in making a road. This word Slekt (Etymol. Dict., 1898) connects with "sleip," a flat piece of stone or wood. The French term dormant is used in carpentry, but as part of the frame of a window or door.

SLEEPING-SICKNESS (Trypanosomiasis), a remarkable parasitic disease, familiar among West African natives since the beginning of the 19th century, and characterized by protracted lethargy, fever and wasting. It is attributed to the trypanosoma gambiense, a parasite which was discovered in the frog by Gruby (1880). It passed into the horse in 1880 by Griffith Evans in horses afflicted with the disease called "sura" in India. In 1880, Surgeon-Major (afterwards Sir) D. Bruce found a trypanosoma similar to Evans's in cases of what was known in cattle as "tsetse-fly disease"; and though the trypanosoma had not then actually been found in man, Bruce suggested that this was akin to the human "sleeping-sickness" which had now extended into the Congo Free State, Uganda and elsewhere, and was causing great mortality, many Europeans having died of the disease. In 1903 Castelani found the trypanosoma in the cerebro-spinal fluid of human patients afflicted with the disease. The question of the precise chemical "sleeping-sickness" and "tsetse-fly disease." 1897, an international conference was held in London for the purpose of organizing research on the subject. As was pointed out by Lord Fitzmaurice (18th of June), in his opening address, it was already accepted that trypanosoma gambiense was the cause of the disease, and it was even then "all but proved" that the parasite was conveyed by at least one species of tsetse fly (glossina palpalis), the distribution of which was limited to the neighbourhood of open water. It had further been ascertained, experimentally in animals, and therapeutically in man, that the infection once acquired could be controlled, to some extent, by various substances, dyes, in combinations of arsenic and colour dyes, &c., atoxyl, and by mercury. It remained a question how far certain unascertained factors were at work in the spread of the disease, and for this purpose the British government invited the co-operation of all the powers interested in tropical Africa in considering certain problems, annual or biennial conferences being suggested, and the formation of a central bureau, in order to organize the research. These problems were: (1) to determine whether the tsetse fly (glossina palpalis) was a direct or indirect conveyer of the parasite; (2) whether the parasite underwent necessary changes in the tsetse fly; (3) if so, whether the developed germ were conveyed by the original fly or its larva when arrived at the imago stage; (4) how long an infected glossina palpalis remained infected; (5) whether other species of glossina were concerned; (6) the geographical-distribution and habits of the fly; (7) whether and how far the spread of infection was the work of any of the vertebrate fauna (other than man); (8) to suggest preventive methods for exterminating the glossina, or protecting uninfected districts by segregation or otherwise; (9) to study the therapeutics of the disease. In the modern manner of this orientation of modern medicine, respect of "sleeping-sickness" must hold an important place as the application of state effort on behalf of the advancement of science. (See Neuropathology and Parasitic Diseases.)

Mott, Archives of Neurology, vol. ii. (1907); Reports of the Sleeping-Sickness Commission; Castellani, "Researches on the Aetiology of Sleeping-Sickness," Journal of Tropical Medicine (June 1903).

SLEET (either from Nor. sletta, of the same meaning, or related to Ger. Schlosser, hailstone), that form of precipitation of water vapour condensed from the atmosphere, which reaches the ground in a partly frozen condition. Sleet may originate in the upper atmosphere either as rain, in which case, to become partly frozen, it must have fallen into a stratum of air colder than that in which it originated, or as snow, when the opposite must have

...
SLEEVES—SLIGO

241

taken place, i.e. the snow in its descent must have encountered an air-temperature slightly above the freezing-point.

SLEEVE (O. Eng. sleeve, stuf, a word alluded to "slip," cf. Dutch sloef, apron), that part of a garment which covers the arm, or through which the arm passes or slips. The pattern of the sleeve is one of the characteristics of fashion in dress, varying in every country and period. Various survivals of the early forms of sleeve are still found in the different types of academic or other robes (q.v.). Where the long hanging sleeve is worn it has, as still in China and Japan, been used as a pocket, whence has come the phrase "to have up one's sleeve," to have something concealed ready to produce. There are many other details connected with or associated with the sleeve, such as "to wear one's heart upon one's sleeve," "to laugh in one's sleeve," &c. In technical usage a "sleeve" is a tube into which another tube is inserted, which in the case of small tubes is called a thimble.

SLEIDANUS, JOHANNES (1506-1556), German historian, the annalist of the Reformation, was born at Schleiden near Aix-la-Chapelle. He studied ancient languages and literatures at Liége and Cologne, and law and jurisprudence at Paris and Orleans. Whilst among the humanists of Liége, he had adopted Protestant opinions, and entering the service of Cardinal du Bellay, was employed in the futile negotiations of the French court to make an alliance with the German Protestants against the emperor Charles V. In 1542 he settled at Strassburg. Sleidanus had been accustomed to copy all papers bearing upon the Reformation to which he had access, and Martin Bucer, who had seen his collection, proposed to Philip of Hesse to appoint him historian of the Reformation, giving him a salary and access to all necessary documents. After some delay the heads of the league of Schmalkalden agreed to the proposal, and Sleidanus began his great work, finishing the first volume in 1545. In that year he was recalled to diplomacy, and went to England in a French embassy to Henry VIII. While there he collected materials for his history. On his return he represented Strasburg at the diets of Frankfort and Worms, and went on to Marburg to explore the archives of Philip of Hesse. The war of the league of Schmalkalden interfered with this work, and also prevented the payment of Sleidanus, who in his difficulties applied to England for aid, and at Cranmer's intercession received a yearly pension from Edward VI., which, however, was not long continued. In 1551 Sleidanus went to the council of Trent as representative from Strassburg, charged also with full powers to act for the imperial cities of Eichingen, Ravensburg, Reutlingen, Biberach and Lindau. He was afterwards appointed professor of law in Strassburg, and finished his great task in 1554, though lack of money and other misfortunes compelled him to delay printing. Sleidanus died in poverty at Strassburg in October 1556. The book appeared in the preceding year—Commentariorum de statu religionum et reipublicae, Carolo V. Caesare, libri XXVII.; it was translated into English by John Daws in 1560 and by G. Bohum in 1569. It was so impartial that it pleased no one, not even Melanchthon. It remains the most valuable contemporary history of the times of the Reformation, and contains the largest collection of documents of all the annalists.

See H. Baumgarten, Uber Sleidanus Leben und Briefwechsel (1878), and Sleidan's Briefwechsel (1881); and A. Hasenclever, Sleidan-Studien (Bonn, 1905).

SLEIGH, SLEED or SLIDGE (Dan. slede, Dutch slede, akin to "slide"), a vehicle on runners instead of wheels, for travelling over snow or ice. Various forms are used according as the object is utility or sport. The sleighs used in Coasting are referred to in the article under that heading; but for ordinary means of conveyance horse-drawn sleighs are employed as carriages in countries such as Russia, Scandinavia and North America, where the roads are snow-bound in the cold season; and in the Arctic regions dogs are harnessed to them.

SLIDELL, JOHN (1793-1871), American political leader and diplomatist, was born in New York City in 1793. He graduated from Columbia College in 1810, engaged in business for a short time, then studied law, and became one of the leaders of the bar at New Orleans, Louisiana, where he settled permanently in 1825. He was a member of the national House of Representatives as a state's rights Democrat from 1834 to 1845, when he resigned and was sent by President Polk on a secret mission to Mexico, with power to adjust the difficulties growing out of the annexation of Texas to the United States, and to acquire by purchase both New Mexico (including the present Arizona) and Upper California. He was not, however, received by the Mexican government. From 1853 to 1861 he was a representative of Louisiana in the United States Senate, and was an influential working member of important committees, though he seldom took part in debate. During this period he was intimately associated with James Buchanan, and is supposed to have had an important part in bringing about Buchanan's nomination for the presidency in 1856. When Louisiana seceded in 1861, Slidell withdrew from the Senate, and late in 1861 was sent by the Confederate Government as commissioner to France. With James M. Mason (q.v.), the Confederate commissioner to England, he was taken from the British steamer "Trent" by Captain Charles Wilkes of the United States navy, and was imprisoned at Port Warren in Boston harbour. In January 1862, at the demand of England, the Confederate commissioners were exchanged, and Slidell was released. He returned to the United States in 1865, there was to secure the recognition of the Confederate States; in this he was unsuccessful, but he was able to keep France sympathetic, and to help to secure supplies for the Confederate army and navy. After the war he remained abroad, settling in England, and his daughter married a French nobleman. He died in London on the 29th of July 1871.

SLIGO, a county of Ireland in the province of Connaught, bounded N. by the Atlantic, E. by Leitrim, S.E. by Roscommon, and S. and W. by Mayo. The area is 453,350 acres or about 797 sq. m. The coast-line is very irregular, and in some places rises to 300 ft. above the sea. There are many beautiful lakes, rivers and lakes of hills finely situated and grouped. In the north are the limestone elevations of Ben Bulbin (1717 ft.) and Knocknarea (1758 ft.), contrasting with the adjacent rugged gneiss mountains, among them are King's Mountain (1527 ft.) and GINNEAGH (1436 ft.). On the boundary with Leitrim, Drumcliffe, a ridge, reaches a height of 2113 ft. In the west are the ranges of the Slieve Gamp and Ox Mountains, upwards of 2000 and 1600 ft. respectively. The Curlew Mountains, an abrupt ridge of limestone gravel, upwards of 800 ft. in height, with flattened summit, separate Sligo from Roscommon. The principal rivers are the Moy, forming for a part of its course the boundary with Mayo, and flowing south-westward and then northward into Killala Bay; the Easkey, flowing northward from Lough Easky; and Ballysadare, with its branches the Owenmore, Owenbeg, and Arrow, or Unshin; and the Garvoge or Garavogue, flowing from Lough Gill. Except the finely-situated Lough Gill (extending into Leitrim), Lough Arrow, and Lough Gara, all of which exceed 3000 acres in extent, none of the lakes has so large an area as 400 acres. The salmon, sea-trout and trout fishing is generally excellent in these waters, especially during the autumn, but Lough Arrow also provides sport during the Mayfly season.

This county essentially consists of Carboniferous Limestone, broken by the Dalradian axis of the Ox Mountains. The gneisses of this range, which obviously result from the intermingling of granite and a series of schists and quartzites, form a ridge of rocky hills, smoothed by glaciation, on the flanks of which Carboniferous shales rest. Above these, the limestone is boldly developed, forming great scarped tablelands north of Sligo, with the sandstone on the outskirts. Frascati and Knocknacow, conspicuous from Sligo, is an outlier of the Upper Limestone. Lough Gill is picturesquely bounded by the gneissic range on the south and these high carboniferous masses on the north. The limestone also produces fine features in the south of the county, in Keishocarran and round Lough Arrow. East of this point, it forms the slopes of the Leitrim and Roscommon
coastfield, the summits being capped by the Millstone Grit series; while on the south, bounded by a fault, rises the Old Red Sandstone range of the Curlew Hills. Lead was mined at Ballysadare, and the clay-ironstone from the east of the county was at one time smelted. Jute is grown both in the coastal plains and on the clay-ironstone of the soil and in the agricultural advancement in different parts of the county. In some parts it is a light sandy loam resting on a freestone bottom, and in the lower districts a rich and deep mould permeated by the coarse clays. Owing to the combination of the influence of the climate feeding is found to be the most remunerative method of farming, as may be gathered from the increasing or wellmaintained numbers of cattle, sheep and poultry. Oats and potatoes are the principal crops, but the acreage devoted to these decreases, and the proportion of tillage to pasture is roughly as 1 to 3. Coarse woollens and linens are manufactured for home consumption, and there are tanneries, distilleries, and breweries in the principal towns. The iron-ore of the general trade comes in at a distance from Ballina (on the Moy) and Sligo. The fisheries on the coast are valuable, and there are important salmon fisheries at the mouths of the rivers. The town of Sligo is the chief centre.

The Sligo branch of the Midland Great Western railway enters the county from the S.E., with a branch S.W. from Killfree to Ballaghaderreen in county Mayo; the Limerick and Sligo line of the Great Southern and Western enters from S.W.; and the Sligo, Leitrim and Northern counties, from Enniskillen (county Fermanagh), and Manor Hamilton (county Leitrim), from the N.E. These lines unite at Collooney and share the railway from this junction to the town of Sligo.

Population and Administration.—The population (94,416 in 1891, 84,023 in 1901) decreases at a rate considerably above the average of the Irish counties, and emigration is certain. Of the total 80% of the inhabitants are Roman Catholics and about 7% Protestant Episcopalians. About 88% is rural population. The county town is Sligo (pop. 10,870); Ballymote and Tubbercurry (or Tubbercury) are small inland boroughs; and the county is divided into six baronies. Assizes are held at Sligo and quarter-sessions at Ballymote, Easkey and Sligo. For parliamentary representation the county has since 1885 formed two divisions (North and South), each returning a member. The county is almost entirely in the Protestant dioceses of Kilmore and in the Roman Catholic dioceses of Ardagh, Achonry, Elphin and Killala.

History.—The county was created by Sir Henry Sydney in 1579. On Carrowmore, between Sligo and Ballysadare, there is a remarkable collection of ancient stone monuments (see Sligo, town). At Drumcliffe (5 m. N. of Sligo) are the only round tower remaining in the county and a beautiful Celtic cross 13 ft. in height. The principal monastic ruins are the abbey of St Fechan at Ballysadare, with a church of the 11th or 12th century; the abbey of Sligo; and a remarkable group of buildings on the island Inishmurray, which include a cashel or walled enclosure; three oratories, one of which contains an oaken figure in ecclesiastical garb; two holy wells; and also altars. There is a considerable variety both in the thickness and in the numbers of the stone used in the construction, both in the thickness and in the numbers of the stone used in the construction, while the figures carved on the stones vary from the rudest to the most ornate. The remains are charmingly associated with Molaise, a saint of the early 6th century (not identical with the Molaise of Devenish in Lough Erne), and the remains still attract pilgrims, who revere the oaken figure mentioned as an image of the saint, though it is more probably the figurehead of a vessel.

SLIGO, a municipal borough, seaport and market town, and the county town of county Sligo, Ireland. Pop. (1901) 10,870. It stands at the head of an arm of Sligo Bay on the north coast, on the river Garvogue, 134½ m. N.W. from Dublin by the Midland Great Western railway. This company shares with the Great Southern and Western and the Sligo, Leitrim, and Northern Counties railways the line to Collooney Junction, 6½ m. S., from which the former runs S. to Limerick and the latter E. to Enniskillen. The situation of Sligo is beautiful; the bay is separated from the fine Lough Gill by less than 4 m. of a richly wooded valley, with flanking hills exceeding 1000 ft. in elevation. Sligo takes rank with Galway and Limerick as one of the three principal ports of the west coast of Ireland. Regular communication by steamer is maintained with Liverpool and Glasgow, and a considerable export trade is carried on in grain, flour, pork and cattle; while coals, iron, timber and provisions are imported. There is a depth on the harbour bar of 15 ft. at low water, and there are commodious quays and basins. Harbour commissioners control the port. Brewing, flour-milling and saw-milling are the chief industries, and there is an important butter-market. Monthly fairs are held. Sligo is a centre of salmon and sea-fishing industries.

The Dominican Abbey, founded in 1252 by Maurice Fitzgerald, Lord-Judge, is one of the finest monastic ruins in Ireland. It was partly destroyed by fire in 1414 and again in 1642. Three sides of the cloisters remain, and the lofty quadrangular tower at the junction of the nave and chancel is entire. The east window is of the date of the original structure. The principal modern church is the Roman Catholic cathedral (1869) for the diocese of Elphin in the Norman style with a finely sculptured doorway. There is also a Roman Catholic college.

A castle was built at Sligo by Maurice Fitzgerald in 1242, which in 1592 was taken and destroyed by O'Donnell; in 1591 it was rebuilt by Richard, earl of Ulster, and it was completely destroyed in 1590 and 1594. Of this and the walls with which the town was fortified there are no remains. Early in the reign of James I. the town received a market and two annual fairs; in 1613 it was incorporated and received the privileges of a borough; and in 1621 it received a charter of the staple. In 1641 it was besieged by the Parliamentary forces under Sir Charles Coote, but was afterwards evacuated, and occupied by the Royalists till the termination of the war. In 1668 it declared in favour of James II., and, after being captured by the Enniskillen regiment of the English army, was restored to the Earl of Clanbrassil. The borough was disfranchised in 1870. Under the Local Government (Ireland) Act, 1898 it retains its mayor and corporation, but the latter has practically the status of an urban district council.

The country neighbouring to Sligo presents fine coast scenery, west coast of Ireland, while inland it is wild and mountainous. Three m. S.W. of the town, on Carrowmore, is a remarkable collection of megalithic remains, including cromlechs, stone circles, and burial cairns, which has been taken to mark the site of the traditional battle of North Moytura. On Knocknarea (978 ft.), south of Sligo, is a huge cairn, which tradition sets down as the burial-place of Queen Male, wife of Connaught. Five m. N. of Sligo is Drumcliffe, with its round tower and Celtic cross. Rosses, on Sligo Bay, is a favourite resort. Sligo is a centre for salmon and trout fishing.

SLING (from M. Eng. slingen, to fling, throw with a jerk, Icel. slyngu, cf. Ger. schlingen, to twist), an implement for casting missiles, also from its resemblance in form to the implement, a hanging loop used as a support for a wounded limb, a chain with hooks used for raising or lowering heavy goods or objects, &c. The sling as a weapon is probably the earliest form of device known to mankind by which an increase of force and range was obtained in the use of a thrown weapon. Sling stones from the stone age have been frequently found (see ARM and ARMOUR). The form of the weapon is of two kinds; the sling proper consists of a small strap or socket of leather or hide to which two cords are attached; the sling holds the two ends in one hand, whirs the socket and missile rapidly round the hand, and, loosening one cord sharply, despatches the missile; the other type is the staff sling, in which the sling itself is attached to a short staff, held in both hands. This was used for heaver missiles especially in siege operations during the middle ages. There are many references to slings and to slingers in the Bible; the left-handed sling of Benjamite and the right-handed are mentioned. The Assyrian monuments show the sling of the ordinary type and slingers were used in the ancient Egyptian army, but not before the 8th century B.C. The sling (Gr. σφιδόμα, Lat. fundus) is not mentioned in Homer; Herodotus (vii. 158) speaks of the slingers in the army offered by Gelon to serve against the Persians; it seems to have been a weapon chiefly used by barbarian troops. The Acranians, however, were expert slingers (Thuc. ii. 87), and so also were the Achaenians, who later inverted the sling which discharged a shaft with an iron bolt head (Livy xii. 85, from Polybius). In the Roman army by the time of the Punic Wars the slingers (funditores) were auxiliaries from Greece, Syria and Africa. The Balearic islanders, who were in Hannibal's army, were always famous as slingers. In medieval times the sling was much used in the Frankish army, especially in defending trenches, while the staff-sling was used against fortifications.
in the 14th century. They were used down to the 16th and 17th centuries to throw grenades.

SLIVEN, SLIVNO or formerly SLEVMIN (Turk. Islimye), a town of Bulgaria, in Eastern Rumelia, at the southern foot of the Balkan Mountains, 105 m. E.N.E. of Philippopolis and near the southern entrance of the defile known of the Iron Gate. Pop. (1906), 12,540. There are numerous mosques in the town, but the greater part of the Turkish population emigrated after the Russo-Turkish War of 1877-78. Sliven contains the government factory, founded in 1834, for the manufacture of military clothing; it is the chief centre in Bulgaria for the rough and fine homespuns known as aba and skayak, and its wine is locally celebrated. Extensive mulberry orchards have been planted in connexion with the silk industry.

Sliven, the Stiliianos of the Byzantine writers, owed its former strategic importance to its position on one of the trans-Balkan highways to Adrianople and the south. In the middle ages it was a subject of dispute between Byzantium and Bulgaria. After its capture by the Turks (1588) it was one of the voivod towns which remained exempt from taxes and were allowed to elect their own voivode; but these privileges were lost in the 16th century. In 1829 Sliven was occupied by the Russian army under Rudiger and Gorchakov.

SLOANE, SIR HANS (1660-1753), British collector and physician, was born on the 16th of April 1660 at Killyleagh in county Down, Ireland, where his father had settled at the head of a Scotch colony sent over by James I. He had as a youth a taste for objects of natural history and other curiosities. This led him to the study of medicine, which he went to London to pursue, directing his attention to botany, materia medica and pharmacy. His collecting propensities made him useful to John Ray and Robert Boyle. After four years in London he travelled through France, spending some time at Paris and Montpellier, and taking his M.D. degree at the university of Orange in 1683. He returned to London with a considerable collection of plants and other curiosities, of which the former were sent to Ray and utilized by him for his History of Plants. Sloane was quickly elected to the Royal Society, and at the same time he attracted the notice of Thomas Sydenham, who gave him valuable introductions to practice. In 1687 he became fellow of the College of Physicians, and proceeded to Jamaica the same year as physician in the suite of the duke of Albemarle. The duke died soon after landing, and Sloane's visit lasted only fifteen months; but during that time he got together about 800 new species of plants, the island being virgin ground to the botanist. Of these he published an elaborate catalogue in Latin in 1696; and at a later date (1707-72) he made the experiences of his visit the subject of two folio volumes. He became secretary to the Royal Society in 1693, and editor of its Transactions for twenty years. His practice as a physician among the upper classes was large. In the pamphlets written concerning the sale by Dr Wiliam Cockburn (1660-1730) of his secret remedy for dysentery and other fluxes, it was stated for the defence that Sloane himself did not disdain the same kind of professional conduct; and some colour is given to that charge by the fact that his only medical publication, an Account of a Medicine for Soreness, Weakness and other Distempers of the Eyes (London, 1745) was not given to the world until his author was in his eighty-fifth year and had retired from practice.

In 1716 Sloane was created a baronet, the first medical practitioner to receive an hereditary title, and in 1719 he became president of the College of Physicians, holding the office sixteen years. In 1722 he was appointed physician-general to the army, and in 1727 first physician to George II. In 1727 also he succeeded Sir Isaac Newton in the presidential chair of the Royal Society; he retired from it at the age of eighty. Sloane's memory survives more by his judicious investments than by anything that he contributed to the subject matter of natural science or even of his own profession. His purchase of the manor of Chelsea in 1712 has perpetuated his memory by giving the name of a "place," a street, and a square. His great stroke as a collector was to acquire (by bequest, conditional on paying off certain debts) in 1701 the cabinet of William Courten, who had made collecting the business of his life. When Sloane retired from active work in 1741 his library at Chelsea, in which he took with him from Bloomsbury to his house in Chelsea, had grown to be of unique value. On his death on the 11th of January 1753 he bequeathed his books, manuscripts, prints, drawings, pictures, medals, coins, seals, cameos and other curiosities to the nation, on condition that parliament should pay to his executors £20,000, which was a good deal less than the value of the collection. The bequest was accepted on those terms by an act passed the same year, and the collection, together with George II.'s royal library, &c., was opened to the public at Bloomsbury as the British Museum in 1759. Among his other acts of munificence may be mentioned his gift to the Apothecaries' Company of a suite of the botanical or physic garden, which they had rented from the Chelsea estate since 1673.

See Weld, History of the Royal Society, i. 450 (London, 1848); and Munk, Roll of the College of Physicians, 2nd ed., i. 466 (London, 1879).

SLOCUM, HENRY WARNER (1827-1894), American general, was born at Delphi, Onondaga county, New York, on the 24th of September 1827, and graduated at the United States Military Academy in 1852. He resigned from the army in 1856 to practise law at Syracuse, N.Y., and in 1859 he was a member of the state Assembly. When the Civil War broke out he became colonel (May 1861) of the 27th New York Volunteers, and was promoted brigadier-general of volunteers (August 1861) and major-general (July 1862). He fought in all the Virginia campaigns from the first battle of Bull Run, where he led a regiment, to Gettysburg, where he commanded the XII. corps. With that corps he was transferred in the autumn of 1863 under Hooker's command to the Tennessee Valley, and took part in the battle of Chattanooga. He remained with the Army of the Cumberland after his corps was merged into that of Hooker, took part in the Atlanta campaign, and after Hooker's retirement succeeded to the command of the XV. corps (late XI. and XII.). He commanded the Atlanta garrison, and with Sherman took part in the "march to the sea," and subsequently in the Carolinas campaign from Savannah to Goldsboro, as commander of the left wing. He resigned from the army in September 1865, resumed professional practice at Brooklyn, and was a Democratic representative in Congress in 1866-73 and again in 1883-85. In 1876-84 he was president of the Brooklyn city board of public works. He died at Brooklyn on the 14th of April 1894. A monument of General Slocum by Frederick MacMonnies was unveiled at Brooklyn, N.Y., on the 30th of May 1905.

SLODTZ, RENÉ MICHEL or MICHEL ANGE (1795-1874), French sculptor, was born at Paris. He passed seventeen years at Rome, where he was chosen to execute a statue of St Bruno, one of the statues of the Palais des Invalides, and a bas-relief "Saint Louis sending missionaries to India." He was also the sculptor of the tomb of Marquis Capponi in St John of the Florentines. Other works of his are to be seen at the church of St Louis of France and at Santa Maria della Scala. After his return to France in 1747, Sloatz, in conjunction with his brothers, Antoine Sébastien and Paul, produced many decorative works in the churches of Paris, and, though much has been destroyed, his most considerable achievement—the tomb of Langue de Gerary in St Sulpice (commissioned in 1739)—still exists. Sloatz was, like his brothers, a member of the Academy of Painting and Sculpture, and many particulars of his life are preserved in a memoir written by Cochin, and also in a letter from the same to the Gazette littéraire, which was reproduced by Castillon in the Mémoires of 1756. Sloatz's father, Sébastien (1652-1726), was also a sculptor, born at Antwerp; he became a pupil of Girardon and worked mostly under him at Versailles and the Tuileries. His chief works were "Hannibal" in the Tuileries garden, a statue of St Ambrose in the Palais des Invalides, and a bas-relief "Saint Louis sending missionaries to India."
SLOGAN, the war-cry of the Highland clans. It was the gathering call of the clan, often the name of the clan, the place of meeting, and the like, and was uttered when charging in battle. The Gaelic word, of which "slogan" is the English adaptation, is slaoigh-chualain, from slaoigh, army, host, and caulain, call, cry. A variant form of "slogan" is "slogore," which has given rise to an invented word "slughorn," used by Chatterton (Battle of Haysings, i. 10) and by Browning (Childe Roland) as if the term meant some kind of war-trumpet or horn. Skeat (Euph. Dict. 1868, Errata and Addenda) has shown that Chatterton used an edition of Gavin Douglas's translation of Virgil, where "slogore" is spelled "slughorne," and the context, "The daeuch trumpet blawis the brag of were; the slughorne, enseuele or the wache cry went for the battall all suld be reddy," misled him.

SLONIM, a town of Russia, in the government of Grodno, 155 m. by rail S.E. of the city of Grodno and 20 m. from the railway from Warsaw to the Dnieper. Pop. (1885), 21,110; (1897) 15,893, including many Jews. It derives its importance from the river, which joins and joins the Oginsky canal, connecting the Niemen with the Dnieper. Corn, tar, and especially timber are exported. Slonim is mentioned in 1040, when Yaroslav, prince of Kiev, defeated the Lithuanians in its neighbourhood. In 1241 the Mongols pillaged it and burned its wooden fort. Owing to its position between Galician Russia and Lithuania it often changed hands, until it was conquered by the Lithuanians in the 14th century. From 1631 to 1685 it was the seat of the Lithuanian diet and became a flourishing city. In the 18th century, under the hetman Oginsky, a canal was dug to connect the Shchara with the Dnieper. Oginsky embellished the city and founded there a printing-office. Russia annexed the town in 1795.

SLOOP, a type of small sailing-vessels which have one mast rigged "fore and aft," carrying a mainsail, gaff-top-sail, jib and fore staysail. There is little in rig to distinguish a sloop from a "cutter," and the terms are used indiscriminately; sometimes a distinction is drawn by a sloop having a fixed and a cutter a running bowsprit. In the sailing and early steam days of naval warfare, a "sloop" was a small corvette, ship-rigged, with all the guns mounted on the upper deck. It so nearly nautili terms the word was borrowed from the Dutch, viz. sloep, boat. This is generally taken to be an adaptation of the Fr. chaloupe, Span. and Port. chalupa, cf. Ital. scialuppa, Eng. "shallop," a light boat. These probably represent some native word borrowed by Spanish or Portuguese sailors in the East or American Indies. Other etymologists distinguish the Dutch and French words and refer sloep to the common Teutonic root, meaning to glide, to creep, seen in "slip," Ger. schleifen, schleien, &c.

SLOTH, the name for the various representatives of a group of arboreal tropical American mammals belonging to the order Edentata (q.v.). Sloths are some of the most completely arboreal of all mammals, living entirely among the branches of trees; and usually hanging beneath them, back downwards, and clinging with the hook-like organs to which the terminations of their limbs are reduced. When obliged to descend to the ground, which they rarely, if ever, do voluntarily, sloths—owing to the unequal length of their limbs and the peculiar conformation of their feet, which allow the animals to rest only on the outer edge—crawl along a level surface with considerable difficulty. Though generally slow and inactive, even when in their natural haunts, they can on occasions travel with considerable rapidity along the branches, and as they do not leap, like most other arboreal creatures, they avail themselves of the swaying of the branches by the wind to pass from tree to tree. They feed on leaves and young shoots and fruits, which they gather in their mouth, the fore-limbs aiding in dragging boughs within reach, but not being used as hands. When sleeping, sloths roll themselves up in a ball, and, owing to the dry shaggy character of their hair, are inconspicuous among the mosses and lichens with which the trees of their native forests abound. The concealment thus afforded is heightened in some species by the peculiar greenish tint of the hair, due not to the colour of the hair itself, but to the presence upon its surface of an alga, the lodgment of which is facilitated by the flushed or rough surface of the exterior, and its growth is promoted by the dampness of the atmosphere in the gloomy tropical forests. Sloths are nocturnal, silent, inoffensive and solitary animals, and produce unusually but one young at birth. They appear to show an almost reptilian tenacity of life, surviving the most severe injuries and large doses of poisons, and exhibiting longer persistence of irritability of muscular tissue after death than other mammals. Several other animals, such as the African potto-lemus, and the Asiatic lories, are popularly called sloths.

SLOUGH, a market town in the Wycombe parliamentary division of Buckinghamshire, England, 18 m. W. of London by the Great Western railway. Pop. of urban district (1901), 11,433. It lies in the flat valley of the Thames, nearly 2 m. from the river at Eton and Windsor, and is wholly modern in appearance. The chief public building is the Leopold Institute and Public Hall (1887), a memorial of Prince Leopold, Duke of Albany. The British Orphan Asylum is also in the town. The parish church of Upton-cum-Chalvey, St Laurence, has a Norman doorway and other portions of the same period. It is the burial-place of Sir William Herschel, who lived in the vicinity, set up his great telescope here, and made many of his astronomical discoveries.

SLOVAKS (Slovák, fem. Slovanka, adj. slovenský, formerly called Slivenec, but to be distinguished from the Slovenes of Carinthia, in Magyar Töd), a Slav people numbering about 2,500,000 and mostly living in the northern counties of Hungary. On the west they extend into the neighbouring districts of Lower Austria and Moravia where they march with the Germans and the kindred Moravians, being bounded by the river Morava and the Jablunka Mountains; on the north they touch the Poles along the frontiers of Silesia and Galicia; on the east about 22° E. they meet the Little Russians along an indented boundary; on the south they have the Magyars as neighbours along a line joining Pressburg and Zemplin. Within these limits, save for the Germans in the towns, the Slovaks are not much mixed: they have isolated settlements throughout the western half of Hungary extending far enough south to meet similar settlements of Servians. Their chief centre is S. Marton on the Turocz. The Slovaks seem to have occupied this territory in the 5th or 6th century A.D. and also to have stretched far to the south; they formed part of Samo's empire (middle of 7th century), but were subject to the Avars and the Franks, and then formed part of Great Moravia until that kingdom was in 907 conquered by the Magyars, who displaced or assimilated the southern Slovaks and have ever since been lords of the rest, save for a short time when they were under Boleslav the Brave (A.D. 973) of Poland, and early in the 14th century when a local

The Unau or Two-toed Sloth (Choloepus hoffmanni).
SLOVENES

magnate, Count Matthew of Trenčín, made himself an independent ruler. In 1848–1849, when the Magyars rose against Austria, the Slovaks rose against the Magyars, but were handed back to them on the conclusion of peace. The Magyars have always treated the Slovak as an inferior race and have succeeded in assimilating many districts where the prefix Tět in place-names shows the former presence of Slovaks: those who take the Magyar language and attitude are called Magyarones. The Magyars, in pursuance of this policy, do their best to suppress the Slovak nationality in every way, even to the extent of taking away Slovak children to be brought up as Magyars, and denying them the right to use their language in church and schools. The Slovaks have large language colonies in America. (See letters by Scutus Viator in Spectator, 1906 sqq.)

The Slovaks are a peaceful, rather slow race of peasants (their aristocracy is Magyarized), living almost exclusively upon the land, which they till after the most primitive methods. Where this does not yield sufficient, they wander as labourers and especially as tinkers all over Austria-Hungary and even into South Russia. They are fond of music, and their songs have been collected.

The Slovak language is most closely connected with Czech, the latter being bridged by the transitional dialects of Moravia; though Miskolc was a part of the Czechi, and has continued it separately, since it has not been subjected to the special changes which have in that language assimilated the vowels to the former Miskolc. There are still some of the vowels which are characteristic of the other North-Western Slavonic tongues, but has remained in a more primitive stage and preserved (as expected from its central position in the Slavonic world) many points of the older Moravian and Littauian morphology, and is fairly phonetic, Slavic and Russian. The alphabet is founded on the Czech, the accent is always on the first syllable, long vowels are indicated by acute accents. There are usually reckoned to be three groups of dialects, Western, Central and Eastern; the first being the branch of the Czech, the last to Little Russian; the Central dialects exhibit less decided features. The Slovak dialects spoken in Moravia have been well investigated by Štampf, the other still await satisfactory treat-

The Slovaks arrived in these parts in the 7th century, apparently pressed westwards by the Avars. By A.D. 595 they were already at war with the Bavarians, later they formed part of Samo's great Slavonic empire and were not quite out of touch with other Slavs. On its collapse they fell under the yoke of the Bavarians and Franks. At first they had their own princes, but in this time gave place to German dukes and margraves, who were given authority to use the native tongue on certain occasions. These fiefs of the other finally fell to the Habsburgs, and never gave them any trouble, hence their language has had freer play than that of most of the Austrian Slavs; they have been allowed to use it in primary and secondary schools and to some extent in local administration. The Slovaks were very early (beginning with the 8th century) Christianized by Italian and German missionaries; to them owe the Freisingen fragments, confessions and part of a sermon, the earliest monuments, not merely of Slovenc but of any Slavonic. The MS. dates from c. 1000, but the composition is older. The language is not pure Slovene, but seems to be a translation of an Old Slavonic translation.
SLUM—SMALL ISLES

The Sloum are Protestants. Slovene woke to a new life in the latter part of the 18th century. Valentin Vodnik was the first poet (see Arch. J. Slov. Phil., 1901), xxii. 356, xxiv. 74), but his successor France Prešeren (1800-1849) appears to have been more real, and the larger stream of readers. Other poets were A. Janežič, S. Gregorič and Murn-Alesandrovič; Erjavec was a story-teller, Jurčič a novelist, but as usual with these beginnings of literature the same man may make a grammar, issue an almanack, and try all kinds of poetry. The two great Slavists Kopitar and Miklosich were Slovenes, but were led astray by race feeling to insist upon Old Slavonic being Old Slovene. They were succeeded by G. Krek and V. Oblak.

The chief centres of Slovene letters are the Matica or Linguistic and Literary Society and the Lyceum at Ljubljana. The Matica publishes a chronicle (Letopis) and there are many periodicals, chief of which are the Ljubljanski Goz and Krez, the latter published at Klagenfurt. The liberal and organs carry on a lively polemic.

The Slovene language is the most westerly of the South Slavonic group. It is very closely allied to Serbo-Croatian, but shows some points of resemblance to Czech (reaching (d) and (l) and loss of iot. etc. It is split into eight dialects which differ among themselves widely. The people of Resia are sometimes classed quite apart. In phonetics Slovene is remarkable for the change of the original (d) into (l) and (j) (compare into (d) and (j) the coincidence of the half vowels (i) and (j) in the two languages). In morphology it has retained the dual of both nouns and verbs only perfectly, but there is a peculiarity of the feminine, indicating agreement of the one and the other person. The people have been fixed as so-called gerunds or verbal adverbs. The language has suffered from Germanization but from a Germanic and even developed an article which has since been allowed. There is a very accent and certain syllables may be long or short. The Resia dialect has preserved the Proto-Slavonic accent very exactly. The Slovenes have always used the Latin alphabet more or less clumsily: recently the orthography has been reformed after the manner of Czech, but uniformity has not yet been reached.

SLUM, a squally, dirty street or quarter in a city, town or village, inhabited by the very poor, destitute or criminals; over which the lying is frequently another characteristic (see Housing). The word is a comparatively recent one and is of uncertain origin. It has been doubtfully connected with a dialectal use of "slump" in the sense of a marshy, swampy place; cf. Ger. Schlamm, mud, and Eng. dialect slammack, slattern (Sket, Etym. Dict., 1910).

SLYS, BATTLE OF, fought on Saturday the 24th of June 1330, one of the two sea-fights in which King Edward III. of England commanded in person, the other being that called Espagnols-sur-Mer (q.v.). The place of the encounter was in front of the town of Skye, and it is stated that the English fleet, consisting of vessels between West Flanders and Zeeland. In the middle of the 14th century this was an open roadstead capable of holding large fleets. It has now been silted up by the river Ede. A French fleet, which the king, in a letter to his son Edward the Black Prince, puts at 150 sail, had been collected in preparation for an invasion of England. It was under the command of Huc Quiré, admiral for the king of France, and of Nicholas Béhuchet, who had been one of the king's treasurers, and was probably a lawyer. Part of the fleet consisted of Genoese galleyes serving as mercenaries under the command of Barbavera. Although English historians speak of King Edward's fleet as inferior in number to the French, it is certain that he sailed from Orwell on the 22nd of June with 200 sail, and that he was joined on the coast of Flanders by his admiral for the North Sea, Sir Robert Morley, with 50 others. Some of this swarm of vessels were no doubt mere transports, for the king brought with him the household of his queen, Philippa of Hainault, who was then at Bruges. As, however, one of the queen's ladies was killed in the battle, it would appear that all the English vessels were employed. Edward arrived at the mouth of the Thames on the 23rd and sent three squires to reconnoitre the position of the French. The Genoese Barbavera advised his colleagues to go to sea, but Béhuchet, who as constable exercised the general command, refused to leave the anchorage. He probably wished to occupy it in order to bar the king's road to Bruges. The disposition of the French was made in accordance with the usual medieval tactics of a fleet fighting on the defensive. Quiré and Béhuchet formed their force into three or four lines, with the ships tied to one another, and with a few of the largest stationed in front as outposts. King Edward anchored his fleet steady on the morning of the 24th, and after manoeuvring to place his ships to windward, and to bring the sun behind him, attacked. In his letter to his son he says that the enemy made a noble defense "all that day and the night after." His ships were arranged in two lines, and it may be presumed that the first attacked in front, while the second would be able to turn the flanks of the opponent. The battle was a long succession of hand-to-hand conflicts to board or to repel boarders. King Edward makes no mention of any actual help given him by his Flemish allies, though he says they were willing, but the French would not let them join the battle. They all fought with the utmost valor and was wounded by Béhuchet, but this is not certain, and there is no testimony save a legendary one for a personal encounter between him and the French commander, though it would not be improbable. The battle ended with the almost total destruction of the French. Quiré was slain, and Béhuchet is said to have been hanged by King Edward's orders. Barbavera escaped to sea with his squadron on the morning of the 25th, carrying off two English prizes. English chroniclers claim that the victory was won with small cost of life, and that the loss of the French was almost a thousand. The English losses are given as 171, somewhat below the medieval estimates of numbers. After the battle King Edward remained at anchor several days, and it is probable that his fleet had suffered heavily.

AUTHORITIES.—The story of the battle of Skuys is told from the English side by Sir Harris Nicolas, in his History of the Royal Navy, vol. ii. (London, 1847); and from the French side by M. C. de la Roncière, Histoire de la marine françoise, vol. i. (Paris, 1805). Both make copious references to original sources. (D. H.)

SLYPE, a variant of "slip" in the sense of a narrow passage: in architecture, the name for the covered passageway usually found in buildings, especially in chapter-houses, as at Winchester, Gloucester, Exeter and St Alams.

SMACK, a general term for a small decked or half-decked vessel, sailing under various rigs and used principally for fishing. The word, like so many sea terms, was borrowed from the Dutch, where smak, earlier smacke, is the name of a coasting vessel; it is generally taken as a corruption of smack, cf. Swed. smaka, Dan. smacke, a small sailing-vessel, and is to be referred to the root seen in "snake," "snail," the original meaning a gliding, creeping thing. "Smack," taste, and "smack," a smart sounding blast, also is the name for the exclamation "ol, ho," used in the Middle Ages. The word, however, for eating the lips, must be distinguished. In the first case the word is in O.E. smac and is common to Teutonic languages, cf. Dan. smag, Ger. schmecken, etc.; the second word is onomatopoeic, cf. "smash," and is also found in other Teutonic languages. It is not connected with the word meaning "taste," though no doubt confused owing to the sense of smacking the lips.

SMALL ISLES, a parish of islands of the Inner Hebrides, Inverness-shire, Scotland. It consists of the islands of Canna, Sunday, Rum, Eigg and Muck, lying, in the order named, like a crecent with a trend from N.W. to S.E. Canna being the most northerly and Muck the most southerly. They are separated from Skye by Cuillin Sound and from the mainland by the Sound of Ardnamurchan. The surface is moorland, pasture and mountain. They are rich in sea-fowl, the most common being the eider duck, puffin, Manx shearwater, black
guillemot, kittiwake and herring gull. The fisheries include cod, ling and herring. The rainfall amounts to 56 in. for the year, and the temperature is high, the mean for the year being 47° F. Steamers call at Eggii at regular intervals and less often at Rum and Canna. Canna (pop. 49), an island of basaltic rock, is situated about 10 m. from the nearest point of Skye, and measures 4 m. from E. to W. and 1 m. from N. to S. Potatoes, barley and a little oats are grown, and the pasture being good the cattle are larger than most of the Hebridean breeds. The harbour is screened from south-western gales by the isle of Sanday. The antiquarian remains include a weather-worn sculptured stone cross and the ruins of a chapel of St. Columba. Compass Hill (429 ft.) on the E. is so named from the alleged disturbance of the compasses of vessels passing within its sphere of influence. Sanday (pop. 44), another basaltic island, lies close to the S.E. of Canna. It measures 1 m. from E. to W. and 3 m. from N. to S. Some 3 m. S.E. of Canna is the island of Rum (pop. 140), which is situated 8 m. from the nearest point of Skye, and measures 8 m. N. to S. and 8 m. from E. to W. Geologically, its northern half is composed of Torridonian sandstone, with basalt at points between the West coast and the centre, of gabbro in the south-east, with a belt of gneiss-schist or granite gneiss rock on its east seaboard and of quartz-porphyry in the south-west. It is mountainous in the south. Among the highest peaks are Askival (2620 ft.), Ashval (2525), Sgor-naan-Gillean (2502) and Allivall (2368). On the north-west shore is a cliff where bloodstones are quarried. The mountains are a haunt of red deer. The harbour of the village of Kinloch, at the head of Loch Scresort, is resorted to during gales from the N.W. and S. Fully 4 m. S.E. and 7½ m. from the nearest point of the mainland lies the island of Eigg, or Egg (pop. 211), measuring from N. to S. 5 m. and from E. to W. 3½ m. It is in the main basaltic, but a band of quartz-porphyry runs from the centre in a north-westerly direction to the coast, and there is some oolitic rock on the north shore. It has been quarried on the east coast, a narrow mouth opening into a hollow 205 ft. long. In it Macleod of Skye, towards the end of the 16th century, ordered 200 Macdonalds, inhabitants of the isle—men, women and children—to be suffocated, their bones being found long afterwards. The people are chiefly engaged in fisheries and cattle-rearing. Three m. S.W. is the island of Muck (pop. 42), which is about 1½ m. long by 2½ m. broad and lies fully 5 m. from the nearest point of Ardnamurchan. It is almost wholly basaltic, but has some oolite at the head of the bay on its north side.

SMALLPOX. It is VACCINE VACCINE (see "Vaccines"), an acute infectious disease characterized by fever and by the appearance on the surface of the body of an eruption, which, after passing through various stages, dries up, leaving more or less distinct cicatrices. (For pathology see Parasitic Diseases.) Few diseases have been so destructive to human life as smallpox, and it has ever been associated with horror alike from its fatality, its loathsome accompaniments and disfiguring effects, and from the fact that no age and condition of life are exempt from liability to its occurrence. Although in most civilized countries its ravages have been greatly limited by the protection afforded by vaccination, nevertheless outbreaks as far from uncommon, affecting especially those who are unprotected, or whose protection has become weakened by lapse of time. Much obscurity surrounds the early history of smallpox. It appears to have been imported into Europe from Asia, where it had been known and recognized from remote antiquity. The earliest accounts of its existence reach back to the middle and end of the 6th century, when it was described by Procopius and Gregory of Tours as occurring in epidemic form in Arabia, Egypt and the south of Europe. In one of the narratives of the expedition of the Abyssinians against Mecca (c. 550) the usual miraculous details are combined with a notice of smallpox breaking out among the invaders.1 Not a few authorities, however, regard these accounts as referring not to smallpox, but to plague.

1 See Nöldeke, Geschichte der Perser... aus Tabari (Leiden, 1879), p. 218. Nöldeke thinks that this notice may be taken from genuine-historical tradition, and seems to find an allusion to it in an old poem.
smallpox is a viral disease that primarily affects the skin. It is caused by the Variola virus and is characterized by a distinctive rash that can range in severity from mild to severe. The disease is highly contagious and was once a major public health concern before being eradicated globally through vaccination and surveillance efforts.

The disease begins with a prodrome, which includes fever, headache, and other symptoms. This is followed by the appearance of the rash, which typically begins on the face and spreads to other areas of the body. The rash consists of red spots that develop into small blisters and then crust over, leaving a scar. In severe cases, the rash can lead to complications such as pneumonia and encephalitis.

Convalescence after smallpox can be prolonged, lasting several weeks or even months. The recovery rate is generally high, with the vast majority of people making a full recovery. However, severe cases can still lead to death.

The history of smallpox is marked by significant efforts to control and eradicate the disease. The first recorded case of smallpox was in Egypt around 3,000 BC. Over the centuries, it spread throughout the world, with devastating consequences, particularly in the 18th and 19th centuries. The development of the smallpox vaccine by Edward Jenner in the late 18th century was a significant breakthrough.

In 1967, the World Health Organization declared smallpox to be eradicated as a naturally occurring disease. However, there have been reports of smallpox in individuals who contracted the disease from vaccinated individuals or from reactivation of dormant virus. These occurrences are rare and are usually handled through the use of the smallpox vaccine.
protection given by vaccination and systematic re-vaccination is demonstrated by the almost entire suppression of the disease in Germany (see Dr Bruce’s report to the Local Government Board, 1903–1904). Mrs Garrett Anderson, writing in the Times in September 1903, showed the enormous expense laid on the rates in England for the maintenance of smallpox hospitals in order to counteract inefficient vaccination. London with a population of 63 millions reserves 2500 beds in a hospital removed from the city; Berlin with a population of 2 millions reserves 12 beds in the pavilion of a general hospital; Dresden with a population of 300,000 reserves 20 beds in the Friedrishstadt Hospital, but no case was admitted for 10 years previous to the report. In Stuttgart (population 100,000) a hut of six beds is set aside for smallpox, which has fallen into bad repair from disuse. Smallpox cases in Germany are usually sporadic cases introduced by foreigners. Where persons have been exposed to the infection of smallpox, if immediate vaccination fails to protect them from the disease, it has been shown to considerably modify the type. The plan of identification and surveillance of all contact cases has given good results. In the Bristol epidemic of 1908 there were 35 cases and 9 deaths. The contacts numbered 1354, and 16,398 visits of inspection were paid.

The patient should lie on a soft bed in a well-ventilated but somewhat darkened room and be fed with the lighter forms of nutriment, such as milk, soups, &c. The skin should be sponged occasionally with tepid water, and the mouth and throat washed with an antiseptic solution. In a severe case, with evidence of much prostration, stimulants may be advantageously employed. The patient should be carefully watched, and special vigilance is called for where delirium exists. This symptom may sometimes be lessened by sedatives, such as opium, bromides or chloral. With the view of preventing pitting many applications have been proposed, but probably the best are cold or tepid compresses of starch and water, and frequently applied over the face and eyes. The water out of which they are wrung must contain a weak solution of carbolic or boracic acid. When the pustules have dried up the itching this produces may be much relieved by the application of oil or vaseline.

What is known as the red light treatment, in which the actinic or chemical rays are excluded, has been advocated by Prof. Niels Finsen of Copenhagen and others. He considers it valuable only in that it protects the pustule from the deleterious effects of light, and he and other observers claim that if resorted to early it abolishes suppuration in the pustules, lessens scarring and shortens the course of the disease. Medical opinion in England is divided as to its merits. Herbert Peck of Chesterfield, in 15 cases so treated in 1902–1905, had only 6 deaths, a mortality of 2.4%, while the case mortality during the same period was, Lancashire 5.8%, Derbyshire 6%, Cheshire 6.4%, Liverpool 27.7% and Manchester 5.6% in cases treated without red light. An interesting fact in connection with the treatment is its great antiquity in China and Japan, while in England in the middle ages smallpox patients wore red garments and lay in beds where the light filtered through red curtains.

Complications of the disease are very constant as they arise, and the severer forms of the disease treated in reference to the special symptoms presented. In cases where the eruption is tardy of appearing and the attack threatens to assume the toxic form, marked benefit attends the use of the wet pack. Disinfectants should be abundantly employed in the room and its vicinity, and all clothing, &c., in contact with the patient should be exposed to the vapour of formalin. Béchère, Thomson and Brownlee have advocated the use of the serum of immunized heifers. The dose, however, requires to be very large, being equivalent to one-fifteenth part of the body weight in adults and one-twentieth part in children.

Inoculation.—Previously to the introduction of vaccination (q.v.) the method of preventive treatment by which was known as inoculation had been employed. This consisted in introducing into the system—in a similar way to the method now commonly employed in vaccination—the smallpox virus from a mild case with the view of reproducing the disease also in a mild form in the person inoculated, and thus affording him protection from further attack. This plan had apparently been resorted to by Eastern nations from an early period in the history of the disease. During the latter part of the Ming dynasty there was introduced into China a system of inoculation in which the method was to allow the pulverized germ-laden crust from a small-pox pustule through a silver tube into the nostril, the left being chosen in a male, the right in a female. Inoculation was known to be extensively practised in Turkey in the beginning of the 18th century, when, chiefly through the letters of Lady Mary Wortley Montagu, it became known and was speedily adopted in England. There is no doubt, both from the statistics of the Smallpox and Inoculation Hospital, London, and from the testimony of physicians throughout the country, that this practice made a marked impression upon the fatality of the disease, and was itself attended with extremely little risk to life. The objections to it, however, were great, for the disease usually taken in this manner had so often took effect severely, and, while death might be averted, the disfiguring results of the disease remained. Further, each inoculated person upon whom the operation took effect became for the time being a possible source of infection to others, and in point of fact the practice tended to spread the disease and so to increase the general mortality. Although inoculation continued to be practised for a number of years, subsequently to Jenner’s great discovery, it gradually became displaced by vaccination, and in 1842 an Act of Parliament was passed rendering smallpox inoculation unlawful in England.

SMALRIDGE, GEORGE (1663–1719), English bishop, was born at Lichfield, where he received his early education, this being completed at Westminster school and at Christ Church, Oxford. His political opinions were largely modelled on those of his friend Francis Atterbury, with whom he was associated at Oxford and elsewhere. After being a tutor at Christ Church, he was minister of two chapels in London, and for six or seven years he acted as deputy for the regius professor of divinity at Oxford; his Jacobite opinions, however, prevented him from securing this position when it fell vacant in 1707. In 1711 he was made dean of Carlisle and canon of Christ Church, and in 1713 he succeeded Atterbury as dean of Christ Church. In the following year he was created bishop of Chester, and in 1715 Smalridge refused to sign the declaration against the pretender, James Edward, defending his action in his Reasons for not signing the Declaration. In other ways also he showed animus against the house of Hanover, but his only punishment was his removal from the post of lord almoner to the king. He died on the 29th of September 1710. The bishop was esteemed by Swift, Steele, Whiston and other famous men of his day, while Dr Johnson declared his sermons to be of the highest class. His sermons, preached on Several Occasions, was published in six other editions 1697, 1698, 1703 and 1706.

SMALTITE, or smalt, a mineral consisting of cobalt arsenic oxide (CoAs). It crystallizes in the cubic system with the same hemispherical symmetry as pyrites; crystals have usually the form of cubes or cubic-octahedra, but are imperfectly developed and of somewhat rare occurrence. More often the mineral is found as compact or granular masses. The colour is tit-white to steel-grey, with a metallic lustre; the streak is greyish black. Hardness 5½; specific gravity 6-5. The cobalt is partly replaced by iron and nickel, and as the latter increases in amount there is a passage to the isomorphous species chloanthite (NiAs). It occurs in veins with cobalt-salt, nickel, copper and silver; the best known locality is Schneeberg. A fine example of the name smaltite was given by F. S. Beudant, in 1832, because the mineral was used in the preparation of smalt for producing a blue colour in porcelain and glass.

SMART, CHRISTOPHER (1722–1771), English poet, son of Peter Smart, of an old north country family, was born at Shipbourne, Kent, on the 11th of April 1722. His father was steward for the Kentish estates of William, Viscount Vane, younger son of Lord Barnard of Raby Castle, Durham. Christopher Smart received his first schooling at Maidstone, and then at the grammar school of Durham. He spent part of his vacations at Raby Castle, and his gifts as a poet gained him the patronage of the Vane family. Henrietta, duchess of Cleveland, allowed him a pension of £40 which was paid until her death in 1742. Thomas Gray, writing to his friend Thomas Wharton in 1747, warned him to keep silence about Smart’s delinquencies lest they should
SMART, SIR G. T.—SMEATON
come to the ears of Henry Vane (afterwards earl of Darlington), and endanger his allowance. At Cambridge, where he was entered at Pembroke College in 1738, he spent much of his time in taverns, and got badly into debt, but in spite of his irregularities he became fellow of his college, preceptor in philosophy and keeper of the common chest in 1745. In November 1747 he was called to the bar of his rooms, fear of his creditors. At Cambridge he won the Seaton prize for a poem on "of the attributes of the Supreme Being" in 1750 (he won the same prize in 1751, 1752, 1753 and 1755); and a farce entitled A Trip to Cambridge, or The Grateful Fair, acted in 1747 by the students of Pembroke, was from his pen. In 1750 he contributed to The Student, or The Oxford and Cambridge Monthly Miscellany. During one of his visits to London he had made the acquaintance of John Newbery, the publisher, whose step-daughter, Anna Maria Carman, he married, with the result of forfeiting his fellowship in 1753. About 1752 he permanently left Cambridge for London, though he kept his name on the college books, as he had to do in order to compete for the Seaton prize. He wrote in London under the pseudonym of "Mary Midnight" and "Pentwazeal." He had edited The Midwife, or the Old Woman's Magazine (1751-1753), and had a hand in many other "Grub Street" productions. Some criticisms made by "Sir" John Hill (1716-1752) on his Poems on Several Occasions (1752) provoked his satire of the Hilliad (1753), noteworthy as providing the model for the Rolliad. In 1756 he finished a prose translation of Horace, which was widely used, but brought him little profit. In the same year he published a poem entitled The Universal Visior, for which Samuel Johnson wrote some numbers. In 1751 Smart had shown symptoms of mental aberration, which developed into religious mania, and between 1756 and 1758 he was in an asylum. Dr Johnson visited him and thought that he ought to have been at large. During his confinement he conceived the idea of the single poem that has made him famous, "A Song to David," though the story that it was indentated with a key on the panels of his cell, and shaded in with charcoal, may be received with caution. It shows no trace of morbid origin. After his release Smart produced other religious poems, but none of them has any claim to inspiration. His wife and children had gone to live with friends as he was unable to support them, and for some time before his death, which took place on the 21st of May 1771, he lived in the rules of King's Bench, and was supported by small subscriptions raised by Dr Burney and other friends.

Of all that he wrote, "A Song to David" will alone bear the test of time. Unlike the folio form of novelette and impressive directness of expression, as has been said, to anything else in 18th-century poetry, the poem on analysis is found to depend for its unique effect also upon a certain ingenuity of construction, and the novel way in which David's ideal qualities are enlarged upon. This will be more readily understood on reference to the following verse, the first twelve words of which become in turn the key-notes, so to speak, of the twelve succeeding verses:—

"Great, valiant, pious, good, and clean,
Sullime, contemplative, serene,
Strong, constant, pleasant, wise!
Bright effluence of exceeding grace!
Best man!—the sweetness, and the race,
The peril, and the prize."

The last line is characteristic of another peculiarity in "A Song to David," the effective use of alliteration to complete the initial energy of the stanza in the opening staves. But in the poem throughout is revealed a poetic quality which eludes critical analysis.

From the Poems of the late Christopher Smart (1791) the "Song to David" (p. 1763) was excluded as forming a proof of his mental aberration. It was reprinted in 1819, and has since received abundant praise. In an abridged form it is included in T. H. Ward's English Poets, vol. iii., and was reprinted in 1895, and in 1901 with an introduction by S. T. Colle. Smart's other poems are included in Anderson's British Poets. Christopher Smart is one of Robert Browning's subjects in The Parleyings with Certain People (1857). See also the contributions to Notes and Queries of March 25th and April 1st, 1905, by the Rev. D. C. Tovey, who has read, and in some places revised, the above article.

SMART, SIR GEORGE THOMAS (1776-1867), English musician, was born in London, his father being a music-seller. He was a choir-boy at the Chapel Royal, and was educated in music, becoming an expert violinist, organist, teacher of singing and conductor; and in 1811 he was knighted by the lord-lieutenant of Ireland, having conducted a number of successful concerts in Dublin. Sir George Smart was, from that time onwards, one of the chief musical leaders and organizers in England, conducting at the Philharmonic, Covent Garden, the provincial festivals, &c., and in 1838 being appointed composer to the Chapel Royal. He was a master of the Handelian traditions, was personally acquainted with Beethoven and a close friend of Weber, who died in his house. His church music and glee include some well-known compositions. He died in London on the 23rd of February 1867. His brother Henry (1778-1823), father of the composer Henry Smart (q.v.), was also a prominent musician in his day.

SMART, HENRY (1813-1879), English organist and musical composer, born in London on the 26th of October 1813, was a nephew of Sir George Smart (q.e.). He studied first for the law, but soon gave this up for music. In 1831 he became organist of Blackburn parish church, where he wrote his first important work, a Reformation anthem; then of St Giles's, Cripplegate; St Luke's, Old Street; and finally of St Pancras, in 1864, which last post he held at the time of his death on the 6th of July 1879, less than a month after receiving a government pension of £100 per annum. Although Smart is now chiefly known by his compositions for the organ, which are numerous, effective and melodious, if not strikingly original, he wrote many vocal works, including some of the best specimens of modern part songs. His Cantata, The Birth of Dunkerson, was written for the Birmingham festival of 1865; Jacob for Glasgow, in 1871; and Hanbury, Bertha, was produced with some success at the Haymarket in 1855. In the last fifteen years of his life Smart was practically blind.

SMART, JOHN (c. 1740-1817), English miniature painter, was born in Norfolk; he became a pupil of Cosway, and is frequently alluded to in his correspondence. This artist was director and vice-president of the Incorporated Society of Artists, and exhibited with that society. He went to India in 1788 and obtained a number of commissions in that country. He settled down in London in 1797 and there died. He married Edith Vere, and was believed to have had only one son, who died in Madras in 1809. He was a little man, of simple habits, and a member of the Society of Samedonians. Many of his pencil drawings still exist in the possession of the descendants of a great friend of his only sister. Several of his miniatures are in Australia and belong to a cadet branch of the family. His work is entirely different to that of Cosway, quiet and grey in its colouring, with the flesh tints elaborated with much subtlety and modelled in exquisite fashion. He possessed a great knowledge of anatomy, and the portraits are drawn with greater anatomical accuracy and possess more distinction than those of any miniature painter of his time.

SMEATON, JOHN (1724-1792), English civil engineer, was born at Austhorpe Lodge, near Leeds, on the 8th of June 1724. He received a good education at the grammar school of Leeds. At an early age he showed a liking for the use of mechanical tools, and in his fourteenth or fifteenth year contrived to make a turning-lathe. On leaving school in his sixteenth year he was employed in the office of his father, an attorney, but, after attending for some months in 1742 the courts at Westminster Hall, he requested to be allowed to follow some mechanical profession. He became apprentice to a philosophical instrument maker, and in 1750 set up in business on his own account. Besides improving various mathematical instruments used in navigation and astronomy, he carried on experiments in regard to other mechanical appliances, amongst the most important being a series on which he founded a paper—for which he received the Copley medal of the Royal Society in 1759—entitled An Experimental Inquiry into the Nature of the Wind and of the Air, with an Inquiry into the Use of Wind and Water to turn Mills and other Machines depending on a Circular Motion. In 1754 he made a tour of the Low Countries to study the great canal
works of foreign engineers. Already by his papers read before the Royal Society and his intercourse with scientific men his abilities as an engineer had become well known, and in 1756 application was made to him to reconstruct the Eddystone lighthouse, which had been burnt down in December of the previous year. After the completion of the new tower in 1759, Smeaton’s advice was frequently sought in regard to important engineering projects, including the construction of canals (especially the Forth and Clyde canal), the drainage of lands, the designing of harbours and the repair and erection of bridges, though many of the schemes he drew up were not carried out on account of the general lack of capital. He was also employed in designing numerous waterwheels, windmills, pumps, and other mechanical appliances. A considerable portion of his time was devoted to astronomical studies and observations, on which he read various papers before the Royal Society. A year before his death he announced that he wished “to dedicate the chief part of his remaining time to the description of the several works performed under his direction,” but he completed nothing more than the Narrative of the Building of the Eddystone Lighthouse, which had already appeared. He died at Aushorpe on the 28th of October 1792, and was buried in the old parish church of Whitkirk.

See John Holmes, A Short Narrative of the Genius, Life and Works of the late Mr John Smeaton (1793); and S. Smiles, Lives of the Engineers.

**SMEDLEY, FRANCIS** [FRANK] EDWARD (1818-1864), English novelist, was born at Great Marlow, Buckinghamshire, on the 4th of October 1818, a member of a Flintshire family. A cripple from his birth, he was educated privately, and contributed his first book, Scenes from the Life of a Private Pupil, anonymously to Sharpe’s London Magazine in 1840-1841. His first essay proved so successful that it was expanded into Frank Fairleigh, and published in book-form in 1850. His next book Lewis Arundel: or the Railroad of Life was originally contributed to the same magazine, which he for some time edited, and was published in book-form in 1852. Of his other writings the best-known is Harry Cowardle’s Courtship (1855). These are all capital stories, racy told. Either Hablot Knight Browne (“Phiz”) or George Cruikshank supplied illustrations for most of his books. Smedley died in London on the 1st of May 1864.

**SMEDLEY, WILLIAM THOMAS** (1858-1918), American artist, was born in Chester county, Pennsylvania, of a Quaker family, on the 18th of March 1858. He worked as a newspaper boy, then studied engraving and art in Philadelphia, in the Pennsylvania Academy of the Fine Arts, and—after making a tour of the South Seas—in Paris under Jean Paul Laurens. He settled in New York City in 1880; in 1882 went with the Marquis of Lorne through Canada, preparing sketches for Picturesque Canada; and in 1905 became a member of the National Academy of Design. Most of his work was magazine and book illustration for stories of modern life, but he painted portraits and water colours, and received the Evans Prize of the American Water Color Society in 1890, and a bronze medal at the Paris Exposition of 1900.

**SMELL** (connected etymologically with “smoulder” and “smoke”), a sensation excited by the contact with the olfactory region (see Olfactory Organ, for anatomy) of certain substances, usually in a gaseous condition and necessarily in a state of fine subdivision. The sense is widely distributed throughout the animal kingdom. The lower animals, especially those breathing in water, become cognizant of the presence of odoriferous matter near them without touch, vision or hearing, and we suppose that they do so by some sense of taste or smell, or a combination of both. In such cases smell has been appropriately termed “taste at a distance,” by which is meant that particles of matter may be diffused through the water so as to come into contact with the terminal organ, and give rise to a sensation such as would have been excited had the matter from which the particles emanated come directly into contact with the nerve-endings. It is therefore of no great importance whether such sensations in bumble aquatic organisms are termed taste or smell. In the higher air-breathing animals, however, the senses are differentiated: that of taste is found at the entrance of the alimentary canal, whilst that of smell guards the opening of the respiratory tract. This view assists in the interpretation of various structures met with in the lower forms which have been fairly regarded by naturalists as olfactory organs. It has not yet been decided whether the sense of smell depends, in the first instance, on a chemical or on a physical process. All that can be said is that sensory impulses are excited when odoriferous particles come into contact with the free ends of peculiar rod-like cells found in the olfactory mucous membrane. The free olfactory surface is always covered with a thin layer of fluid, and all odoriferous matters must be dissolved in this fluid so as to reach the rod-cells. There is here an analogy with the conditions found in the sense of taste, where sapid substances must be soluble in the fluid of the mouth. The intensity of the sensation of smell depends on the size of the area of the olfactory membrane affected. No satisfactory classification of odours can be given.

The interior of the nose (see Olfactory Organ and Epithelial and Endothelial Tissue) is divided physiologically into two portions—(1) the upper (region olfactoria), which embraces the upper part of the septum, the upper turbinated bone, and a portion of the middle turbinated bone; and (2) the lower portion of the cavity (region respiratoria). The olfactory region proper has a thicker mucous membrane than the respiratory; it is covered by a single layer of epithelial cells, often branched at their lower ends and containing a yellow or brownish red pigment, and it contains peculiar tubular glands named “Bowman’s glands.” The respiratory portion contains ordinary serous glands. In the olfactory region also are the terminal organs of smell. These are long narrow cells passing to the surface between the columnar epithelium covering the surface. The body of the cell is spindle-shaped and it sends up to the surface a delicate rod-like filament, whilst the deeper part is continuous with varicose nerve-filaments, the ends of the olfactory nerve.

**Physical Causes of Smell.**—Electrical or thermal stimuli do not usually give rise to olfactory sensations. J. Althaus states that electrical stimulation caused a sensation of the smell of phosphorus. To excite smell it is usually supposed that substances must be present in the atmosphere in a state of fine subdivision, or existing as vapours or gases. The fineness of the particles is remarkable, because if the air conveying an odour be filtered through a tube packed with cotton wool and inserted into the nose a smell is still discernible. This proceeding completely removes from the air micro-organisms less than the \frac{1}{32000} of an inch in diameter. A grain or two of musk will scent an apartment for years and at the end of the time no appreciable loss of weight can be detected. Substances exciting smell are no doubt usually gases or vapours. Sir William Ramsay has endeavoured to connect the sense with the chemical
SMELL

constitution of the substance. The following gases have no smell:—hydrogen, oxygen, nitrogen, water gas, marsh gas, olefiant gas, carbon monoxide, hydrochloric acid, formic acid vapour, nitrous oxide and ammonia. (It is necessary, of course, to distinguish between the sensation of smell and the irritant action of such a gas as ammonia.) The gases exciting smell are chlorine, bromine, iodine, the compounds of the first two with oxygen and water, nitric peroxide, vapours of phosphorus and sulphur, arsenic, antimony, sulphuric acid, carbonic acid, almost all the volatile compounds of carbon except those already mentioned, some compounds of selenium and tellurium, the compounds of chlorine, bromine and iodine with the above-named elements, and some metals. Chlorine, bromine, iodine, sulphur, selenium and tellurium, which are volatile and give off vapour at ordinary temperatures, have each a characteristic smell. Ramsay points out that as a general rule substances having a low molecular weight have either no smell or simply cause irritation of the nostrils. He also shows that in the carbon compounds increase of specific gravity as a gas is associated to a certain point with a sensation of smell. Take the marsh gas or methane series commonly called the paraffins. The first two have no smell; ethane (fifteen times as heavy as hydrogen) has a faint smell; and it is not till butane (thirty times heavier than hydrogen) that a distinct sensation of smell is noticed. Again, a similar relation exists between the alcohols; methyl alcohol has no smell. Ethyl, or ordinary alcohol free from ethers and water, has a faint smell; "and the odour rapidly becomes more marked as we rise in the series, till the limit of volatility is reached, and we arrive at solids with such a low vapour tension that they give off no appreciable amount of vapour at the ordinary temperature." Acids gain in odour with increase in density in the form of gas. Thus formic acid is devoid of smell; acetic acid has a characteristic smell; and the higher acids of the series—propionic, butyric, valeric—increase in odour. It would appear that all "the character of a smell is a property of the element or group which enters into the body producing the smell, and tends to make it generic." Many compounds of chlorine, hydrogen, compounds of sulphur, selenium and tellurium, the paraffins, the alcohols, the acids, the nitrates, the amines, the pyridine series, the benzene group, have each a characteristic odour. To produce the sensation of smell a substance must have a molecular weight at least fifteen times that of hydrogen. For instance, the specific gravity of marsh gas is eight (no smell), of ethane fifteen (faint smell), of propane twenty-two (distinct smell). Again prussic acid has a specific gravity of fifteen, and many persons fail to detect its odour. There is a relation between the molecular weight of a gas and the presence or absence of odour. Gases of less than a certain molecular weight are odourless, and it is significant that to some persons hydrocyanic acid, which has a low molecular weight, gives rise to no sensation of smell. It has also been pointed out by J. B. Haycraft that chemical compounds of elements belonging to the same group, according to the well-known periodic law of Mendeleeff, have sometimes odours of a similar character (see article "Smell," Schäfer’s Physiology, vol. ii. p. 1254). T. Graham pointed out that odorous substances are in general readily oxidized. J. Tyndall showed that many odorous vapours have a considerable power of absorbing heat. Taking the absorptive capacity of the air as unity, the following absorptions were observed in the respective cases:

In comparison with the air introduced in the experiments the weight of the odours must be almost infinitely small. "Still we find that the least energetic in the list produces thirty times the effect of the air, whilst the most energetic produces 109 times the same effect." Venturi, B. Prévost and Liégeois have studied the well-known phenomenon of odoriferous elements, such as camphor, succinic acid, &c., when placed on the surface of water. They have suggested that all odoriferous substances in a state of fine subdivision may move in a similar way on the moist surface of the olfactory membrane, and thus mechanically irritate the nerve-endings. This explanation is too coarse; but it is well known that the odours of flowers are most distinctly perceived in the morning, or after a shower, when the atmosphere contains a considerable amount of aqueous vapour. It would appear also that the odours of animal effluvia are of a higher specific gravity than the air, and do not readily diffuse—a fact which may account for their not being detected in the nostrils of the dog as it runs over to the ground. Such smells are very persistent and are apparently difficult to remove from any surface to which they have become attached. The smell of a corpse may haunt a living person for days, notwithstanding copious ablutions and change of clothes.

Special Physiology of Smell.—It is necessary that the air containing the odour be driven forcibly against the membrane. Thus the nostrils may be filled with eau de Cologne in normal saline solution, or with a mixture of chloroform and hydrogen, and still no odour is experienced if the person does not breathe. If the air is then made in the air within the nasal passages is rarefied, and, as the air rushes in to equilibrate the pressure, it is forcibly propelled against the olfactory surface. If, however, the air is forced down vertically, it passes vertically upwards, bends round and sweeps backwards and downwards at the level of the middle turbinate bones towards the posterior nares. There is a motion of the air over; the olfactory sense is thus quickly blunted. The first scent of a flower is the strongest and sweetest; and after a few minutes exposure the intensity of even a faint odour may not be perceived. This fact may be accounted for on the supposition that the olfactory membrane is protected with a mucous layer, and that the most intense effect is produced when the odoriferous substances are applied to a clean surface. The intensity of smell depends on (1) the area of olfactory surface affected, and (2) the degree of concentration of the odoriferous matter. It is said that musk to the amount of the two-millionth of a milligram, and one part of sulphuric hydrogen in 1,000,000 parts of air, may be perceived. The smell of mercaptan has been experimentally detected when the dilution was 1 to 50,000,000,000, and it was calculated that the weight of mercaptan so detected in 50 cc. of air was 1/4,000,000,000 of a milligram (E. Fischer and Penzolait). If the two nostrils are filled with a mixture of alcohols, there is no trace of the odour, but we smell somewhat the one and sometimes the other. Morphia, mixed with sugar and taken as snuff, paralyses the olfactory apparatus, while strychnine makes it more sensitive. (Lichtenfelsh and Frölicher). The olfactory region is divided into two divisions, which are in the olfactory region different end organs or olfactory cells for different odours. The sense, however, may be fatigued by one odour so that other odours are not experienced. This may be due to a combination of sensations when both are affected. If, by means of a tube, an odour is conveyed into one nostril, while an odour of a different kind is directed into the other, there may be either a compound sensational effect, a sort of double-odour, or one odour may so predominate as entirely to destroy the other. The fusion of odours is not complete, and it is similar to the effect of combining, say blue and red, in stereoscopic vision. When one odour destroys the other, the olfaction must take place through one side of the nose. Certain odours in the nose—musk and oil of bitter almonds, volatile oils and iodiform, ammonia and acetic acid. It is not unlikely that when one odour predominates among many, this may be due not to any chemical action of one substance over another, but that the missing sensations may be accounted for by their failure to excite the olfactory region of the cerebrum in the presence of a stronger stimulus.

The disinclination to odour is much greater in many of the lower animals than in man, and it is highly probable that the dog or cat obtain information by means of this sense which a human being cannot. Odours may excite in the mids of many animals the same impression, and they have frequently an unconscious memory of smells which the human being does not possess. Even in man the sense may be greatly improved by exercising it. A boy, James Mitchell, was born

1 Tyndall, Contributions to Molecular Physics in Domain of Radiant Heat, p. 99.
SMELT (Osmerus eperlanus; Fr. éperlan; Scotch sparring or spirling), the common small European fish of the genus Osmerus, family Salmonidae. It breeds, unless land-locked, in salt or brackish water, and though it often enters rivers it does not ascend beyond tidal influence. Like other British Salmonds it spawns in winter. The true smelt inhabits the coasts of northern and central Europe, and allied species are known from the Atlantic and Pacific coasts of North America (Osmerus mordax, O. thaleichthys, O. Japonicus).

SMERDIS (Pers. Bordya; by Ctesias, Pers. S.), called Tany-
oxares; by Xenophon, Cyrop., vii. 7, 11, who takes the name from Ctesias, Tanaoixares; by Justin i. 9, Mergis; in Aeschy.ulus, Pers. 774, Mardos), a Persian king of infamous memory; the prevalent Greek form Smerdis has assimilated the Persian name to the Greek (Asiatic) name Smerdis or Smerdis, which occurs in the poems of Alceaus and Anacreon. Smerdis was the younger son of Cyrus the Great who, according to Ctesias, on his deathbed appointed him governor of the eastern provinces (cf. Xen. Cyrop., viii. 7, 11). Before Cambyses set out to Egypt, he secretly caused him to be murdered (Darius in the Behistun Inscrip. i. 10), being afraid that he might attempt a rebellion during his absence. His death was not known to the people, and so in the spring of 522 a usurper pretended to be Smerdis and proclaimed himself king on a mountain near the Persian town Pishiuavada. Owing to the despotical rule of Cambyses and his long absence in Egypt, "the whole people, Persians, Medes and all the other nations," acknowledged the usurper, especially as he granted a remission of taxes for three years (Herod. iii. 68). Cambyses began to march against him, but seeing that his cause was hopeless, killed himself in the spring of 521 (but see further CAMESESE). The real name of the usurper was, as Darius tells us, Smerdis, and this false usurper dies in the same manner. Ctes. Pers. 15, who was preserved by Justin i. 9 (from Charon of Lampascus), but given to his brother (called by Herodotus Patizites), who was the real name of the pretender of the intrigue; the true name of the usurper is here given as Oropastor; by Ctesias as Sphendadas.

The history of the false Smerdis is narrated by Herodotus and Ctesias according to official traditions; Cambyses before his death confessed to the murder of his brother, and in public explained the whole fraud. But, as Darius said, nobody had the courage to oppose the new king, who ruled for seven months over the whole empire. Some contracts dating from his reign have been found in Babylon, where his name is spelt Barziya (for the chronology cf. Ed. Meyer, Forschungen zur alten Geschichte, ii. 472 ff.). Darius says that he destroyed some temples, which Darius restored, and took away the herds and houses of the people (Behistun Inscrip. i. 14). We have no means of explaining this statement, nor can we fully understand all the incidents connected with his usurpation; but the attempts of modern authors to prove that Gaumata in reality was the genuine Smerdis and Darius a usurper have failed. It is certain that Smerdis transferred the seat of government to Media; and here in a castle in the district of Ninaia he was surprised and killed by Darius and his six associates in October 521. His death was annually celebrated in Persia by a feast called "the killing of the magian," at which no magian was allowed to show himself (Herod. iii. 79, Ctes. Pers. 15).

In the next year, another pseudo-Smerdis, named Vahyazdade, rose against Darius in eastern Persia and met with great success. But he was finally defeated, taken prisoner and executed (Behistun Inscrip. iii. 40 ff.; perhaps he is identical with the King Maraphis "the Maraphian," name of a Persian tribe, who occurs as successor in the list of Persian kings given by Aeschy.ulus, Pers. 776). See DARIUS (I.) and PERSIA, Ancient History. (Ed. M.)

SMETANA, FRIEDRICH (1824–1884), Bohemian composer and pianist, was born at Leitomischl in Bohemia on the 2nd of March 1824. He made such rapid progress in his studies under Ikaivec, at Neuhans, that at the age of six he appeared in public as pianist so successfully that his father's opposition to a musical career was overcome. He then went to Proksch, at Prague, until he left for Leipzig to make the trial of his ability in the presence of Schumann and Mendelssohn. Limited means prevented him from studying with the latter, and he returned to Prague, where he at once became Konzert-meister to the Emperor Ferdinand. In 1848 he married Katharina Kolar, pianist, and with her founded a music school at Prague. At the same time he met Liszt, who subsequently influenced him greatly, and with whom he afterwards stayed at Weimar. In 1856 Smetana accepted Alexander Dreysoch's suggestion to go as conductor of the Philharmonic Society at Gothenburg. There he remained five years, when, owing to his wife's ill-health, he returned to Prague after a successful concert tour. The death of his wife at Dresden on their return caused Smetana to change his mind, and he went back to Sweden. But the opening of the Interims Theater in 1866, and the offer of its conductorship, induced his return. In Sweden he had already written Hakon Jarl, Richard III., and Wallenstein's Lager, and had completed his opera Die Brandenburger in Böhmischen (5th January 1866). Five months later it was followed by his best-known opera, Die verkaufte Braut, and in 1868 Dalibor was given. Between 1874 and 1882 he produced Zwei Witwen, Habibeh (Des Kuss), Tajewsi (Das Gehetmat), Certova Steua, and Die Tschebselmayer, as well as the "grand prize" opera Libuse, written for the opening of the National Theatre at Prague, 11th June 1881. In Die Tschebselmayer were clear signs of decay in Smetana's powers, he having already in 1874 lost his sense of hearing. To celebrate his sixtieth birthday a fete was arranged by the combined Bohemian musical societies; but on that day Smetana lost his reason and was removed to a lunatic asylum, where he died on the 12th of May 1884. A great deal of his piano forte music is interesting, the Stammzshlitter, for example, while his series of symphonic poems, entitled Mein Vaterland (Vlast), and his beautiful string quartet, Ad meinem Leben, have made the tour of the civilized world. He was an admirable pianist, and in many ways justified his countrymen's title of the "Czechesch Beethoven."

SMETHWICK, a municipal and county borough in the Hands- worth parliamentary division of Staffordshire, England, 3 m. W. of Birmingham on the Great Western and the London & North Western railways. Pop. (1891) 36,166; (1901) 54,539. There are large glass, chemical and machine works; nuts and bolts are made, and lighthouse fittings are a specialty. Adjoining Smethwick on the E. is the district of Soho, famous as the scene of the engineering experiments of James Watt during his partnership with Matthew Boulton (c. 1770). The town has a modern growth about an ancient village, the name of which appears in Domesday. The borough, incorporated in 1899 (county borough, 1907), is under a mayor, 6 aldermen and 18 councillors. Area, 1929 acres.

SMILES, SAMUEL (1812–1904), British author, was born at Haddington, Scotland, on the 23rd of December 1812. He was the eldest of eleven children left, on their father's death, to be supported by their mother on slender means. To her spirit and example must be attributed some of the enthusiasm for self-reliance and self-education, that was later embodied in Dr. Smiles' writings and led to their popularity and influence. Educated at the Haddington Grammar School and at Edinburgh University, where he studied medicine and graduated in 1832, Smiles tried, unsuccessfully, to practise in his native village among 3000 healthy Scotsmen and in competition with seven
other doctors. He added to his income by lecturing on chemistry and by writing for the press, and, finally abandoning the medical profession, he confined himself to journalism, and from 1838 till 1844 edited the weekly Leeds Times. Though he gave up regular journalism in 1844, he continued to be a frequent contributor to periodicals. From 1845 till 1854 he was secretary of the Leeds and Thirsk railway, and from 1854 till 1866 of the South Eastern railway. During his residence in Leeds he had opportunities of studying the characters of the remarkable men whose biographies he afterwards wrote. Here he came in contact with George Stephenson, whose Life by him, published in 1857, passed through five editions in its first year and was the precursor of a series of biographies of leaders in the world of industry, such as Lives of the Engineers (3 vols., 1861-1862), Industrial Biography (1863), James Brindley and the Early Engineers (1864), Lives of Boulton and Watt (1865), Life of Thomas Telford (1867), The Life of a Scotch Naturalist (Thomas Edward) (1876), Robert Dick (1878), George Moore (1878), Men of Invention and Industry (1884), Life and Labour (1887), A Publisher and his Friends (a history of the house of John Murray) (1891), Jasmin (1891), Josiah Wedgwood (1894). In 1859 had appeared his most successful book, Self-Help, a volume of popular ethics; 20,000 copies were sold the first year, and by 1889 the sales had reached 150,000 copies, while the book had been translated into 17 languages. Its success suggested others of similar value, like Character (1871), Thrift (1873), Duty (1886). Smillie also contributed two works to the publications of the Huguenot Society and a History of Ireland. His works are not only admirable for their simple and yet forcible style, but for the many useful and practical lessons which they enforce. Wholesome and stimulating, their whole tendency is to inculcate sound principles of life and the building up of manly and upright character. Dr Smiles was made hon. LL.D. of Edinburgh University in 1878, and in 1897 received from the king of Seraf the Cross of Knight Commander of the Order of St Sava. He died in Kensington in his ninety-second year, on the 16th of April 1904.

SMILLIE, JAMES DAVID (1833-1909). American artist, was born in New York City on the 16th of January 1833. His father, James Smillie (1807-1885), a Scottish engraver, emigrated to New York in 1829, was elected to the National Academy of Design in 1831, did much, with his brother William Cumming (1813-1908), to develop the engraving of bank-notes, and was an excellent landscape-engraver. The son studied with him and in the National Academy of Design; engraved on steel vignetges for bank-notes and some illustrations, notably F. O. C. Darley's pictures for Cooper's novels; was elected an associate of the National Academy in 1842. The year after he first began painting — and an academician in 1875; and was a founder (1866) of the American Water Color Society, of which he was treasurer in 1866-1873 and president in 1873-1878, and of the New York Etching Club. Among his paintings, in oils, are "Evening among the Sierras" (1876) and "The Cliffs of Normandy" (1885), and in water colour, "A Scrub Race" (1876) and "The Passing Herd" (1888). He wrote and illustrated the article on the Yosemite in Picturesque America. He died on the 14th of September 1909. His brother, GEORGE HENRY SMILLIE (1839-1904), his father's successor as an etcher, became a member of the National Academy of Design in 1882, and, like his brother, painted both in oils and in water colour. His favourite subjects were scenes along the New England coast. In 1881 he married NELLEI SHELDON JACOBS (b. 1854), a painter of genre pictures in oils and water colour.

SMIRKE, ROBERT (1752-1845). English painter, was born at Wigton near Carlisle in 1752. In his thirteenth year he was apprenticed in London with an heraldic painter, and at the age of twenty he began to study in the schools of the Royal Academy, to whose exhibition he contributed in 1786 a "Narcissus" and a "Sabrina," which were followed by many works, usually small in size, illustrative of the English poets, especially Thomson. In 1791 Smirke was elected an associate of the Royal Academy, and two years later a full member. In 1814 he was nominated keeper to the Academy, but the king refused to sanction the appointment on account of the artist's revolutionary opinions. He was engaged upon the Shakespeare gallery, for which he painted Katharina and Petruchio,* Prince Henry and Falstaff and other subjects. He also executed many clever and popular book-illustrations. His works, which are frequently humorous, are pleasing and graceful, accomplished in draughtsmanship and handled with considerable spirit. He died in London on the 5th of January 1845.

SMITH, ADAM (1723-1790), English economist, was the only child of Adam Smith, comptroller of the customs at Kirkcaldy in Fife, Scotland, and of Margaret Douglas, daughter of Mr Douglas of Strathendry, near Leslie. He was born at Kirkcaldy on the 5th of June 1723, some months after the death of his father. When he was three years old he was taken on a visit to his acquaintance at David Hume, who afterwards died off by a party of "tinkers." He was at once missed, and the vagrants pursued and overtaken in Leslie wood. He received his early education in the school of Kirkcaldy under David Miller, amongst whose pupils were many who were afterwards distinguished men. Smith showed great fondness for books and remarkable powers of memory; and he was popular among his schoolfellows. He was sent in 1737 to the university of Glasgow, where he attended the lectures of Dr Hutcheson; and in 1740 he went to Balliol College, Oxford, as exhibitor on Smill's foundation. He remained at that university for seven years. At Glasgow his favourite studies had been matherology and natural philosophy; but at Oxford he appears to have devoted himself almost entirely to moral and political science and to ancient and modern languages. He also laboured to improve his English style by translation, particularly from the French. After his return to Kirkcaldy he resided there two years with his mother, continuing his studies, not having yet adopted any plan for his future life. In 1748 he removed to Edinburgh, and there, under the patronage of Lord Kames, gave lectures on rhetoric and belles-lettres. About this time began his acquaintance with David Hume, which afterwards ripened into friendship. In 1751 he was elected professor of logic at Glasgow, and in 1752 was transferred to the chair of moral philosophy, which had become vacant by the death of Thomas Craigie, the successor of Hutcheson. This position he occupied for nearly twelve years, which he long afterwards declared to have been "by far the most useful, and therefore by far the happiest and most honourable period of his life." His course of lectures was divided into four parts—(1) natural theology; (2) ethics; (3) a treatment of that branch of morality which relates to justice, a subject which he handled historically after the manner of Montesquieu; (4) a study of those political regulations which are founded, not upon the principle of justice, but that of expediency, and which are calculated to increase the riches, the power and the prosperity of a state. Under this view he considered the political institutions relating to commerce, to finance, to ecclesiastical and military establishments. He first appeared as an author by contributing two articles to the Edinburgh Review (an earlier journal than the present, which was commenced in 1753, but of which only two numbers were published),—one on Johnson's Dictionary and the other a notice of the recent works of Dr Johnson. He remained in England for seven years, and visited several countries of Europe. In 1759 appeared his Theory of Moral Sentiments, embodying the second portion of his university course, to which was added in the 2nd edition an appendix with the title, "Considerations concerning the first Formation of Languages." After the publication of this work his ethical doctrines occupied less space in his lectures, and a larger development was given to the subjects of jurisprudence and political economy. Stewart gives us to understand that he had, as early as 1752, adopted the liberal views of commercial policy which he afterwards preached; and this we should have been inclined to believe independently from the fact that such views

These two numbers were reprinted in 1818. Smith's letter to the editor of the Edinburgh Review is reprinted in Smiles' Encyclopédie and its criticism of Rousseau's pictures of savage life.
were propounded in that year in the Political Discourses of Hume.

In 1752 the senatus academici of Glasgow conferred on him the honorary degree of doctor of laws. In 1763 he was invited to take charge of the young duke of Buccleuch on his travels. He accepted, and resigned his professorship. He went abroad with his pupil in February 1764; they remained only a few days at Paris and then settled at Toulouse, at that time the seat of a parliament, where they spent eighteen months in the best society of the place, afterwards making a tour in the south of France and passing two months at Geneva. Returning to Paris about Christmas of 1765, they remained there till the end of the following year. Smith afterwards dwelt in London, the following year, and then at the Tuileries in Paris, where he was occupied by the charge of the Comte de Targot, d'Alembert, Morelet, Helvétius, Marmontel and the duke of la Rochefoucauld. His regard for the young nobleman last named dictated the omission in the later editions of his Moral Sentiments of the name of the celebrated ancestor of the duke, whom he had associated with Mandeville as author of one of the "licentious systems" reviewed in the seventh part of that work. Smith was much influenced by his contact with the members of the physiocratic school, especially with its chief, though Dupont de Nemours probably goes too far in speaking of Smith and Condorcet as having "created political economy". Smith afterwards described Quesnay as a man "of the greatest modesty and simplicity," and declared his system of political economy to be, "with all its imperfections, the nearest approximation to truth that had yet been published on the principles of that science." In October 1766 tutor and pupil returned home, and they ever afterwards retained strong feelings of mutual esteem. For the next ten years Smith lived with his mother at Kirkcaldy, only paying occasional visits to Edinburgh and London; he was engaged in close study during most of this time. He describes himself to Hume during this period as being extremely happy. He was occupied in finishing his Inquiry into the Nature and Causes of the Wealth of Nations, which there was some reason for believing he had begun at Toulouse. That great work appeared in 1776. After its publication, and only a few months before his own death, Hume wrote to congratulate his friend: "Euge! belte! dear Mr Smith, I am much pleased with your performance, and the perusal of it has taken me from a state of great anxiety. It was a work of so much expectation, by yourself, by your friends, and by the public, that I trembled for its appearance, but am now much relieved. Not but that the reading of it necessarily requires so much attention, and the public to discourse for so little, that I shall still doubt for some time of its being at first very popular, but it has depth, and solidity, and acuteness, and is so much illustrated by curious facts that it must at last attract the public attention." Smith attended Hume during a part of his last illness, and soon after the death of the philosopher there was published, along with his autobiography a letter from Smith to W. Strahan (Smith's publisher) in which he gave an account of the closing scenes of his friend's life and expressed warm admiration for his character. This letter excited some rancour among the theologians, and Dr George Horne, afterwards bishop of Norwich, published in 1777 A Letter to Adam Smith on the Life, Death and Character of the man of Letters, David Hume, by one of the people called Christians. But Smith took no notice of this effusion. He was also attacked by Arch-

1 The duke undertook a translation of the Theory of Moral Sentiments, but the Abbé Bellet's version appeared (1774) before his was completed and he then relinquished the design. An earlier French translation had been published (1764) under the title Méthodique de l'âme; and there is a later one—the best—by the marquis de Condorcet (1798, 2nd ed., 1830).

2 J. E. Thorold Rogers published in the Academy, 28th February 1888, a letter of Smith to William Pulteney, written in 1772, from which it thought probable that the work lay "unrevised and unaltered" in the author's desk for four years. A similar conclusion seems to follow from a letter of Hume in Burton's Life, ii. 461.

3 A story was told by Sir Walter Scott, and is also related in the Edinburgh Review, of an "unfortunate rencontre," arising out of the publication of the same letter, between Smith and Dr Johnson, during the visit of the latter to Glasgow. The same story is given in a note in Wilberforce's Correspondence, the scene being somewhat vaguely laid in "Scotland." But it cannot be true; for Johnson was a friend of the Duke of Buccleuch, one of the commissioners of customs in Scotland, and in consequence of this settled his residence at Edinburgh. His mother, now in extreme old age, lived with him, as did also his cousin, Miss Jane Douglas, who superintended his household. Much of his own ample income is believed to have been spent in secret charities, and he kept a simple table at which, "without the formality of an invitation, he was always happy to receive his friends." His Sunday suppers," says M'Culloch, "were long celebrated at Edinburgh." One of his favourite places of resort in these years was the Club of the Dugald Stewart, where Dr John Clerk the naval tactician, Robert Adam the architect, as well as Smith himself, were original members, and to which Dugald Stewart, Professor Playfair and other eminent men were afterwards admitted. Another source of enjoyment was his small but excellent library; it is still preserved in his family.

In 1768, Strahan's death was announced, and there ensued a period of his life during which he was supremely happy. He was at the height of his powers. He was highly respected by his contemporaries. He was both beloved and feared. But his happiness was not to last long. It was only a spring of enjoyment, as Stewart suggests, the lectures on natural religion and jurisprudence which formed part of his course at Glasgow, and also the lectures on rhetoric which he delivered at Edinburgh in 1768. To the latter Hugh Blair refers when, in his work on Rhetoric and Eloquence (1783), he acknowledges his obligations to a manuscript treatise on rhetoric by Smith, part of which his author had shown to him many years before, and which he hoped that Smith would give to the public. It is probable that it was after the publication of this treatise on Moral Sentiments a treatise on jurisprudence from the historical point of view.

As a moral philosopher Smith cannot be said to have won much acceptance for his fundamental doctrine. This doctrine is that all our moral sentiments arise from sympathy, that is, from the principle of our nature "which leads us to enter into the situations of other men and to partake with them in the passions which those situations have produced in them." But our direct sympathy with the agent in the circumstances in which he is placed gives rise, according to this view, to our notion of the propriety of his action, whilst our indirect sympathy with those whom his actions have benefited or injured gives rise to our notions of the value of what he has done to himself. It seems justly alleged against this system by Dr Thomas Brown that "the moral sentiments, the origin of which it ascribes to our secondary feelings of mere sympathy, are assumed aspreamingly existing in the original state of man, and our secondary feelings are said to be in unison." A second objection urged, perhaps with less justice, against the theory is that it fails to account for the

2 An interesting letter of Smith to Dundas (1st November 1779) on free trade for Ireland is printed in the Eng. Hist. Review, No. 2.
The last two are, it is true, at variance in some even important respects. But it is evident, and Smith himself felt, that their agreements were much more fundamental than their differences; and, if we regard them as historical forces, they must be considered as working towards identical ends. They both urged society towards the abolition of the previously prevailing industrial policy of European governments; and their arguments agreed so completely and essentially with the "system of natural liberty," we ought to associate the memory of the physiocrats as well as that of Smith, without, however, maintaining their services to have been equal to his.

The teaching of political economy was associated in the Scottish universities with that of moral philosophy. Smith conceived the entire subject he had to treat in his public lectures as divisible into four heads, the first of which was natural theology, the second ethics, the third jurisprudence; whilst in the fourth he examined those political regulations which are founded upon expediency, and which are calculated to increase the productive power of a state. But the two branches of inquiry are regarded as forming but a single body of doctrine in the well-known passage of the Theory of Moral Sentiments in which the author promises to give in another discourse "an account of the general principles of law and government, and of the different revolutions they have undergone in the different ages and periods of society, not only in what concerns justice, but in what concerns police, revenue and arms, and whatever else is the subject of law." This shows how little it was Smith's habit to separate (except provisionally, in his conceptions or his researches, the economic phenomena of society from all the rest. The words above quoted have, indeed, been not unjustly described as containing "an anticipation, wonderful for his period, of general sociology."

There has been much discussion on the question—What is the scientific method followed by Smith in his great work? By some it is considered to have been purely deductive, a view which Buckle has perhaps carried to the greatest extent. He asserts that in Scotland the inductive method was unknown, and that although Smith spent some of the most important years of his youth in England, where the inductive method was supreme, he yet adopted the deductive method because it was habitually followed in Scotland. That the inductive spirit exercised no influence on Scottish philosophers is certainly not true; Montesquieu, whose method is essentially inductive, was in Smith's time closely studied by Smith's fellow-countrymen. What may justly be said of Smith is that the deductive bent was not the predominant character of his mind, nor did his great excellence lie in the "dialectic skill" which Buckle ascribes to him. What strikes us most in his book is his wide and keen observation of social facts, and his perpetual tendency to dwell on these and elicit their significance, instead of drawing conclusions from abstract principles by elaborate chains of reasoning.

That Smith does, however, largely employ the deductive method is certain; and that method is legitimate when the premises from which the deduction sets out are known universal facts of human nature and properties of external objects. But there is another species of deduction which, as Cliffe Leslie has shown, seriously tainted the philosophy of Smith—in which the premises are not facts ascertained by observation, but the a priori assumptions which we found in the physiocrats. In his view, Nature has made provision for social wellbeing by the principle of the human constitution which prompts every man to better his condition: the individual aims only at his private gain, but is "led by an invisible hand" to promote the public good; human institutions, by interfering with this principle in the name of the public interest, defeat their own end; but, when all systems of preference or restraint are taken away, "the obvious and simple system of natural liberty establishes itself of its own accord." This theory is, of course, not explicitly presented by Smith as a foundation of his economic doctrines, but it is implied in the same way as the views of the mercantile system.

Yet, whilst such latent postulates warped his view of things, they did not entirely determine his method. His native bent towards the study of things as they are preserved him from extravagancies into which many of his followers have fallen. But besides this, as Leslie has pointed out, the influence of Montesquieu tended to counterbalance the theoretic prepossession produced by the doctrine of the jus naturae. We are even informed that Smith himself in his later years was occupied in preparing a commentary on the Esprit des lois. He was thus affected by two different and incongruous systems of thought—one setting out from an imaginary code of nature intended for the benefit of man, and leading to an optimistic view of the economic constitution founded on enlightened self-interest; the other following inductive processes, and seeking to explain the several states in which the human societies are found existing, as results of circumstances or institutions which have been in actual operation. And we find accordingly in his great work a combination of inductive inquiry with a priori speculation founded on the "Nature" hypothesis.

Some have represented Smith's work as of so loose a texture and so defective in arrangement that it may be justly described as consisting of a series of monographs. But this is certainly an exaggeration. The book, it is true, is not framed on a rigid mould, nor is there any parade of systematic divisions and subdivisions. But, as a body of exposition, it has the real unity which results from a mode of thinking homogeneous throughout and the general absence of such contradictions as would arise from an imperfect digestion of the subject.

Smith sets out from the thought that the annual labour of a nation is the source of all its wealth, and that this wealth consists in its productive power. He is not at this point disturbed by the incongruity of the assumption that the means of subsistence are necessary to the happiness of life. He does not of course contemplate labour as the only factor in production; but it has been supposed that by emphasizing it at the outset of his book, he laid the groundwork for the greater simplicity of the whole, and of its greater applicability to manufactures than to agriculture, in consequence of which the latter relatively lags behind in the course of economic development. The origin of the division of labour is found in the necessity of human nature—it is "to barter, or exchange one thing for another." He shows that a certain accumulation of capital is a condition precedent of this division, and that commerce, as well as manufacture, is carried on to an extent which increases the supply of raw materials and the size of the market. When the division of labour has been established, each member of the society must have recourse to the others for the supply of most of his wants; a medium of exchange is thus found to be necessary, and money comes into use. The exchange of goods...
against each other or against money gives rise to the notion of value. This word has two meanings—that of utility, and that of purchasing power; the one may be called value in use, the other value in exchange. These two values are not the same; but they are always proportional to one another.
